# The Broadway Bridge, Saskatoon

## A Multiple Concrete Arch Highway Bridge Over the South Saskatchewan River

*C. J. Mackenzie, M.C., M.E.I.C.,*

*Dean of Engineering, University of Saskatchewan, Saskatoon, Sask.*

**Paper to be presented at the General Professional Meeting of The Engineering Institute of Canada, Montreal, Que. February 8th and 9th, 1934.**

SUMMARY.—This reinforced concrete highway bridge is nearly 800 feet long, exclusive of the approaches, and consists of five arches of varying span. The roadway carries four lines of traffic and has a grade of 4 per cent. Much of the construction was carried on under very severe climatic conditions with air temperatures ranging from −36 degrees to over 100 degrees in the shade. After dealing with design and construction, the author discusses the observations made on the temperatures of the concrete in different portions of the structure during and after construction, extending over a period of more than twelve months.

The city of Saskatoon is cut diagonally by the South Saskatchewan river. Up until 1907 when the population was about four thousand, a primitive ferry was the only means of cross river communication. In that year the 19th street traffic bridge, a steel truss type, was formally opened. Its clear roadway of eighteen feet nine inches, ample for the ox carts and horse vehicles of 1907, was overcrowded in 1913 by the demands of a city of twenty-five thousand with a double line of street-car tracks and the advent of motor cars. The University bridge at 25th street, a concrete arch, was finished during the early war years and provides ample facilities for the northern section of the city. In 1928, when the city had a population of over forty thousand, a Town Planning Commission was formed to study and prepare a comprehensive plan for the Saskatoon of 1960. A careful study of traffic flow, population growth and a major street system indicated, among other things, that in the near future a third bridge at the approximate site of the old ferry crossing of 1907 would be necessary to relieve a badly overcrowded condition at the 19th street bridge. When in 1931 it was proposed to undertake, under the auspices of federal, provincial and municipal authorities, a programme of public works for relief purposes, the Broadway bridge was selected by Saskatoon.

The conditions set down by the authorities handling relief added greatly to the natural difficulties of such an undertaking. In the first place only a month was available between the time the project was authorized and the letting of the contract on December 12th, 1931. The year allowed for completion was further restricted owing to climatic and fluvial conditions which made it necessary to build the cofferdams and construct six piers, involving 9,000 cubic yards of concrete, within a period of eleven of the most severe winter weeks in which the average daily temperature was below zero most of the time and minimum temperatures of 40 degrees below zero prevailed for several days; further the flood conditions of the river in June make it impossible to construct falsework in the river until early in July, and as sub-freezing temperatures are common after the middle of October, it will be seen that the summer construction period for such work is also limited. Moreover all labour had to be obtained on requisition from the Relief Office and the use of machinery was restricted; the effect of these restrictions on construction methods and costs will be mentioned later.

The project will be dealt with in this paper under the following three general headings:

I. Design.
II. Construction and costs.
III. Technical data and records i.e. temperature records, expansions, arch and pier movements.

### I. Design

#### General and Aesthetic

At the site selected for the bridge the elevation of the existing street intersection on the south bank was approximately 63 feet higher than that on the north bank. The river at high water is over 800 feet wide and the distance between streets on the banks about 1,300 feet, an indicated grade between existing streets of nearly 5 per cent. It was decided to limit the grade of the proposed bridge to 4 per cent and eliminate a potentially dangerous grade crossing on the north bank by raising the bridge level at this point and diverting the existing river road underneath the approach spans. Building a bridge between two points of widely different elevation presents serious difficulties both in general proportioning and detailing as the use in elevation of horizontal lines must be studiously avoided. The concrete arch type for the main bridge was selected as being best suited aesthetically and also because it would provide the greatest amount of local employment. In deciding upon the general outlines, arrangement and dimensions of spans, both economic and aesthetic studies were made.

The south river bank presented a problem calling for serious study as it rises steeply to 100 feet above the river bed, and at several locations in the city serious slippage of banks has occurred; at the site of the bridge there was evidence of slippage and extensive borings had shown the presence of a deep stratum of impervious, slippery, blue clay overlaid with layers of sandy clay, quicksand and water, which combination indicates probable slides; remedial drains to relieve this condition had been proposed and were subsequently built. It was decided however to so design the south approaches that protection against slipping would be obtained even if the proposed drain did not give the results anticipated. Figure 1, a general elevation of the bridge, shows the layout of the approaches; the broken line above the footings indicates the elevation of the glacial drift, a very dense clay which is an excellent foundation stratum as will be described later. The south approach consists of four girder spans from 40 to 48 feet in length, supported on bents of four columns which rest on pedestals in the solid glacial drift. Each bent was braced laterally and, as is shown, a continuous line of struts was constructed, about 8 feet below ground surface, from the shore pier to each column in succession; the design was made on the basis that if the four columns at the refuge bay (chainage 12+22) acted as a solid retaining wall of a length equal to that of the entire width of the bridge, the pressure of the pedestals against the glacial drift on the bottom would prevent the base from moving and the struts would carry the thrust at the top of the columns to the abutment shore pier. At the location where the bridge floor met the original surface of the grade (chainage 12+67) the glacial drift was overlaid with quicksand layers of 10 to 15 feet, which made it difficult to put caissons down, and as it was felt some settlement of the ground in the vicinity might be experienced it was decided to build a floating span resting on a cap supported by piles; the continuity of this span was completely broken at the last column bent and any settlement of the floating end will not affect the main structure.

The north approach consists of three 45-foot girder spans and a retaining wall to harmonize with the south approach and arch spans.

In determining the number and size of multiple arch spans on a grade it seems that as the springing lines of all arches must be at the same elevation, either the arches must be of equal span and widely varying rise or of varying span with approximately constant rise-span ratio. Sketches indicated that the latter with a slightly increasing ratio gave the most pleasing elevation. Accordingly tentative designs were made for the river spans with arches varying in number from four to seven and computations indicated that a five-arch arrangement as shown in Fig. 1 was the most economical and moreover seemed to harmonize best with the shore connections.

From the architectural standpoint it was decided that no pretentious ornamentation, portals or pylons would be suitable on a relief project, that the design should be bold and simple emphasizing the structural functions of the various members and an attempt made to obtain the beauty inherent in a structure, well proportioned and suitable to its use. Figure 2 will indicate the measure of success obtained in this respect. It was decided to emphasize the straight line of the deck, making it continuous and well defined; this was obtained by using a simple poured railing, a well defined sidewalk fascia beam and a simple curtain wall to fill in the space between the top of the arch crowns and the floor system; this gave a line of about 11 feet depth, suitably relieved for close observation but from a distance giving a feeling of unity. The arch

Fig. 2—Broadway Bridge Completed.

rings and piers are plain and show their function naturally. The floor system was carried to the arch rings by simple columns.

At the ends of the girder approach spans, simple refuge bays with concrete lighting standards cast in place were constructed so as to make a suitable transition between the retaining wall sections and the bridge proper.

The features over the piers were complicated, due to two facts; first, the grade of the bridge made it essential to avoid horizontal lines or panels of ordinary design; further, as expansion joints in the floor system were used only over piers, provision had to be made for an actual movement of well over an inch between the two halves of the railing panel. The motif selected for the railing panel was used also in the refuge bays and railing terminal blocks.

### Structural

The roadway was designed for live loads due to four lines of 20-ton trucks, or to two lines of 50-ton street-cars with two lines of trucks. Allowances for impact were 40 per cent for slabs and stringers and 30 per cent for floor beams. A live load of 80 pounds per square foot plus 50 per cent impact was used for sidewalk design. For the arch rings live loads of 190 pounds and 100 pounds per square foot for the street railway area and balance of floor area respectively, were used without additional impact allowance. A temperature range of 120 degrees F. was used for arch design.

Stresses of 20,000 pounds per square inch in steel and 1,000 pounds per square inch for bending compression in

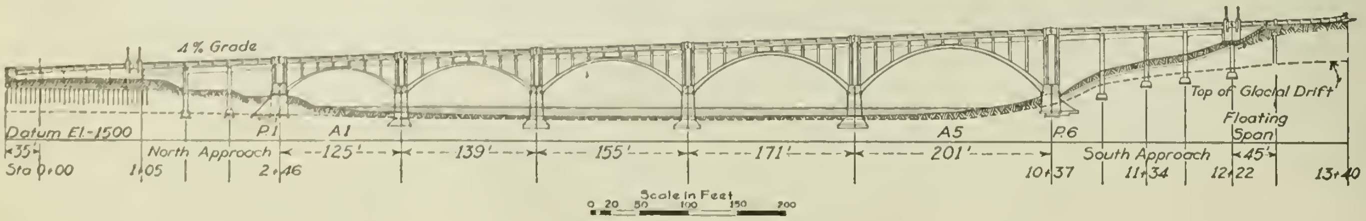

Fig. 1—Upstream Elevation of Bridge.

concrete were used. Canadian Engineering Standards Association specifications for reinforced concrete were used throughout.

*Foundations:*

At Saskatoon, as in most of the localities in the central prairies, bed rock cannot be reached at practicable depths and foundations must be placed on clay.

The glacial drift or till, often called boulder clay, which underlies the Saskatoon district is an excellent bearing soil and at the bridge site was found to lie, in the river bed, only about four feet below a blanket of silt, gravel and clay, while at the approach footings the covering varied in depth up to 25 feet. This glacial drift is a dense fine grained clay interspersed with small pebbles and sand grains and at the upper horizon usually carries large boulders. Information obtained concerning several bridges across the Saskatchewan river built on similar clay indicated that bearing pressures up to 5 tons per square foot normal dead load have been used successfully, that dead loads up to 3 tons per square foot were considered conservative and that the clay was safe for maximum pressures up to 8 tons per square foot. Bearing tests at the site gave similar indications and during excavation it was found that the clay had to be loosened with air chisels as it could not be readily picked and at the dry river piers blasting was necessary. The excavations for river piers were carried approximately ten feet into the glacial drift.

It was decided to adopt bearing pressures of 3.5 tons per square foot for normal dead load with 5.5 tons for maximum due to combined dead, unbalanced live load, wind and traction and an outside limit of 8 tons for possible extreme unbalanced conditions during construction. It will be seen below that the pressures during construction due to unbalanced loading will probably never be equalled again. Figure 3 shows the actual pressures realized at pier 5 which are typical.

The data on pier rotation presented later emphasize the need to study carefully the pressure conditions that may arise during the construction of elastic arches.

Foundation Pressures in Tons per Square Foot at Pier 5

| | |
|---|---|
| *After Completion* | |
| Dead load | 3.1 |
| Dead plus live on one span only | 5.2 |
| Probable max.—dead plus live on both spans | 3.6 |
| *During Construction* | |
| Arch ring 5 only | 4.2 |
| Arch rings 4 and 5 plus deck of 5 | 4.0 |
| Arch ring and deck of 5 only; condition never realized | 7.5 |

**Fig. 3.**

*Floor system:*

Figures 4 and 5 show the arrangement and dimensions of the floor system on the arches. As the arches are of varying spans the column and floor beam spacing had to be varied from 16 feet to 19 feet both for aesthetic and mathematical reasons. In fact a bridge built on a grade with increasing spans greatly multiplies the labour of detailing, as not only do the different arches with their floor systems have to be designed separately but the two halves of one arch differ in detail. The section of the slab carrying the street railway tracks was depressed 8 inches below the finished grade, this surface was waterproofed and the rails set on 4-inch by 3-inch by ⅜-inch angles as ties after which an 8-inch reinforced concrete slab was poured to grade; anchor rods run through the steel ties and the rails and ties become an integral part of the reinforced slab. The roadway section was paved with 2 inches of asphalt with a specially roughened surface suitable to steep grades. Under the roadway slab on the upstream side a conduit approximately 6 feet by 4 feet in the clear was constructed to carry telephone and electrical lines as well as provide space for future water and gas mains. This conduit, which has 4-inch floor and walls, was suspended from the curb stringer on one side and the floor slab on the other by ⅜-inch reinforcing rods bent U shaped so that they ran continuously from the curb stringer down one side wall across the floor and up the other side wall to anchorage in the floor slab. The handrail was poured monolithically with the sidewalk fascia beam which was carried by the cantilevers. The railing was designed to stand a horizontal thrust acting at the coping line of 400 pounds per lineal foot or a concentrated load of 2,700 pounds. At each cantilevered floor beam the railing consisted of a solid vertical panel which in turn was designed as a cantilever supporting the coping which as a beam could support the loads above mentioned; the dado was not assumed to take load.

Each floor beam was carried on four columns, two on each arch ring at 12-foot 8-inch centres with the two inner columns at 18 foot 4-inch centres. A careful analysis was made using influence lines and moment distribution at the joints of columns and floor beams.

The calculated reactions of inner and outer columns were as follows:

| *Max. Reactions* | Outer Col. on Arch | Inner Col. on Arch |
|---|---|---|
| Dead load | 79,500 | 65,200 |
| Live load plus impact | 33,400 | 120,600 |
| Total | 112,900 pounds | 185,800 pounds |

This indicates that the spacing of columns is reasonably satisfactory and that the column reactions on the arch ring

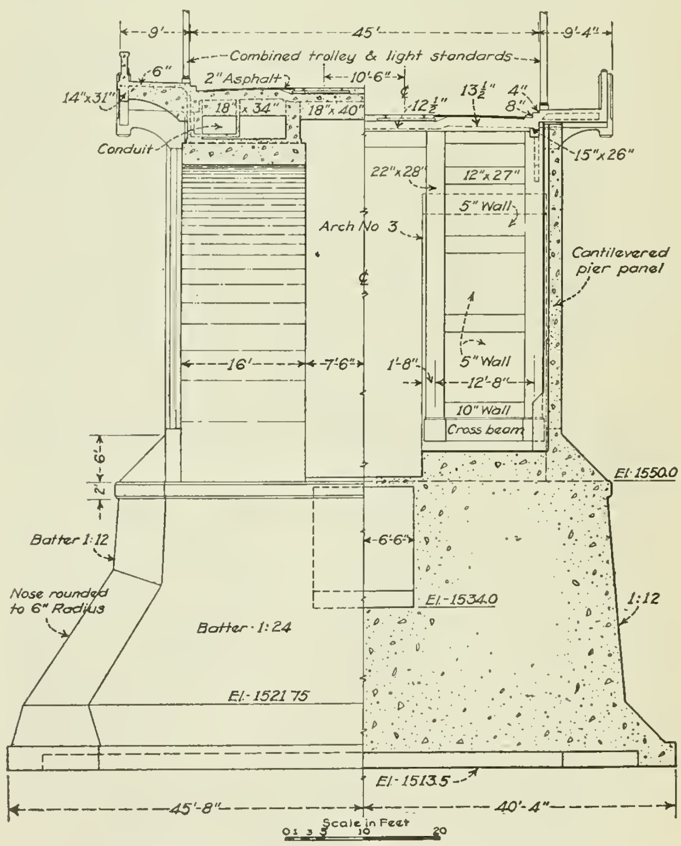

**Fig. 4— Section through Crown of Arch and Centre Line of Pier.**

will be so nearly equal that in designing the arch rings the weight may be considered as equally distributed. For dead load only the outer column carries 55 per cent of the load and the inner 45 per cent. The maximum live load condition will rarely if ever be realized and normal conditions will probably be dead plus one half maximum live, under which condition the outer column will carry about 45 per cent of load and the inner 55 per cent.

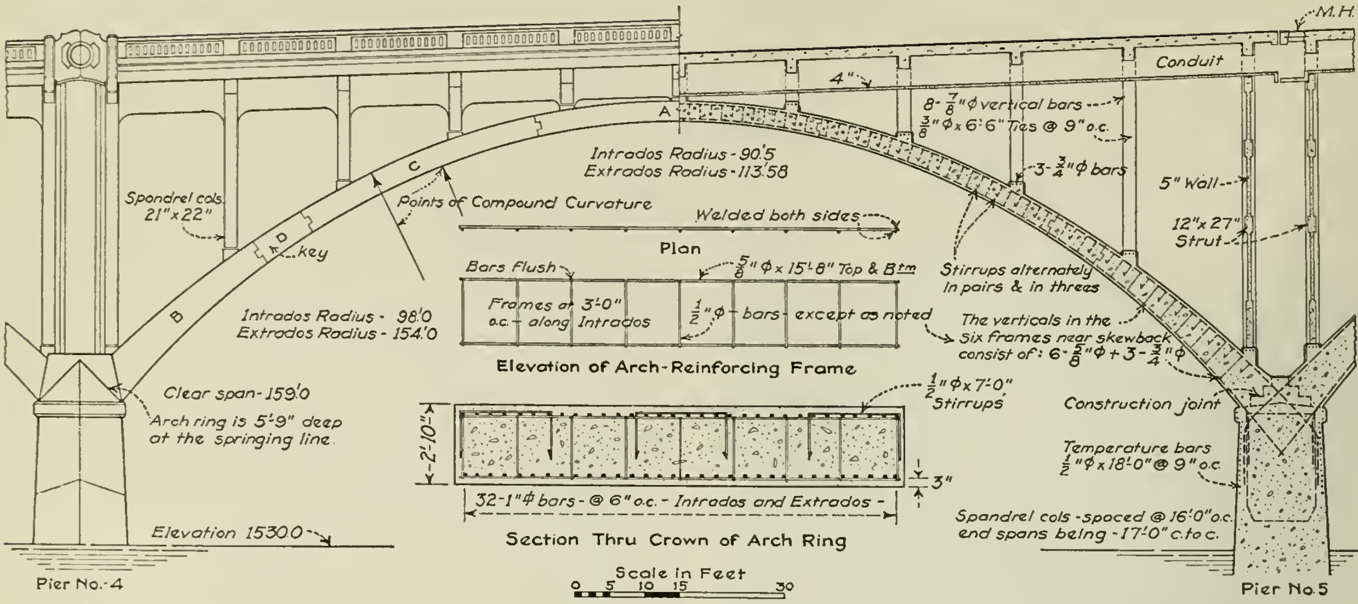

**Fig. 5—Half Elevation and Sections of Arch 4.**

Over the approaches a slab-stringer-floor beam system was found most economical. On the north approach there are one 45-foot simple span and two 45-foot continuous spans, the expansion being taken care of by flexible split columns as indicated in Fig. 1; on the south approach there are two 45-foot continuous spans and two adjacent continuous spans of 40 and 48 feet, these also are separated by flexible split columns. The floor slab is 8 inches, on top of which is placed the track and necessary fill. The four stringers under the rails are 24 inches by 48 inches and two under the centre of the roadway 24 by 46, the curb stringer 24 by 48 and the fascia beam on the sidewalk 24 by 31 inches. The floor beams are 33 inches by 52 inches under the tracks and 28 inches by 52 inches elsewhere. The interior columns are 40 inches by 42 inches and at the expansion joints are split to 20 inches by 42 inches. In calculating stresses in stringers and floor beams, which were considered continuous,

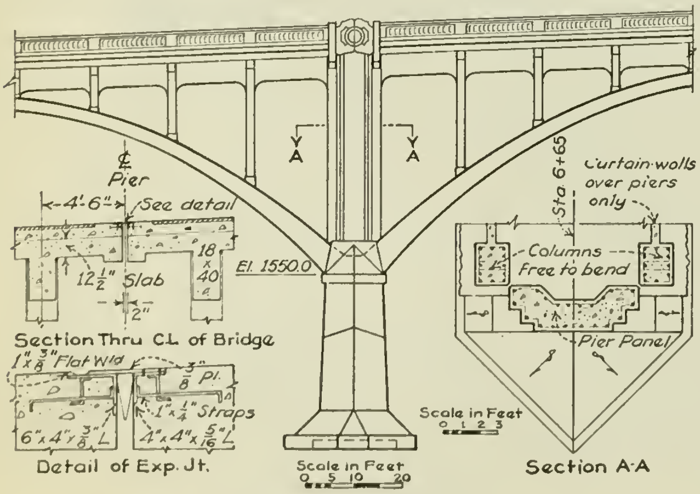

**Fig. 6—Elevation of Typical Pier.**

influence lines and tables for reactions, moments and shears were used. Expansion joints for the deck were located over the piers only on the arch spans and at the split columns on the approach spans: Fig. 6 shows the construction of the joints and the arrangement and details for the panel or pilaster over the pier. This latter unit had to be built as a vertical cantilever resting on the pier, and absolutely separated from the columns and deck which move freely under changes in temperature; it was designed to resist a horizontal wind pressure of 30 pounds per square foot.

*Columns:*

The design of the columns at the expansion joints, both on the approach girder spans and at the piers for the arch spans, was interesting as there was a range from very short columns over the shortest arch, which had to be hinged in order to avoid excessive stresses, to long columns on the south side with an $h/D$ ratio over 20, and all were subjected to moments of magnitude as compared to the axial loads. Further the moments due to bending of columns with deck expansion and those due to fixed end condition of columns at floor-beams, vary with the stiffness of the column, while those due to wind and traction, except for the portion due to end restraint, do not. Unlike the conditions normally found in building work the bridge columns have a stiffness factor much less than the other members at the joint; in the case of long columns at pier 5 the column had a stiffness factor of 50 as compared with values of 260 and 802 for the connected members. The deck columns and arch rings were considered as a frame and moment distribution at the joints was made by the Hardy Cross method of analysis. The following table will indicate the relative magnitudes of the forces in one of the shortest and one of the longest columns.

Stresses in Columns

| | (a) Long Column Size 24 inches by 30 inches Length 41.5 feet | (b) Short Col. without hinge Size 16 inches by 30 inches Length 22.5 feet | (c) Short Col. with hinge Size 14 inches by 28 inches Length 22.5 feet |
|---|---|---|---|
| Maximum moment at top.... | 1,705,000 | 1,600,000 | 1,048,000 |
| Corresponding axial load..... | 135,700 | 124,000 | 124,000 |
| Maximum moment at bottom. | 1,698,000 | 1,345,000 | zero |
| Corresponding axial load..... | 162,000 | 135,000 | |

**Fig. 7.**

The maximum moments in the above represent the greatest combinations of either maximum or minimum fixed end moment due to dead and live loads combined with moments due to either the greatest elongation or contraction of the deck under temperature changes together with wind and traction effects.

In case (*b*) a trial column of 16 inches by 30 inches 22.5 feet long gave moments as shown which in turn gave excessive unit stresses in the concrete of 1,300 pounds per square inch. If the column is increased in width the stiffness factor increases directly and as the principal moments due to dead and live loads and temperature changes in deck also increase with the stiffness of the column, and as the increased strength of the column in bending also increases directly as the width, there is little value in widening the column where the stresses due to moments are large as compared to axial stresses. On the other hand if the depth be increased the stiffness factor of the column increases as the cube of the depth, the moment increases in a different ratio according to the relative stiffness coefficients at the joint but, in such cases as are being dealt with, at a rate only a little less than the cube of the column depth. The strength of the column in bending increases however only as the square of the depth so that increasing the size of the column actually weakens it. A hinge at the bottom relieves the stresses as indicated by (*c*) and permits the use of a smaller column in which stresses in the concrete are below 1,000 pounds per square inch. The columns as in (*a*) presented no such difficulties, calculations indicated that decreasing the $h/D$ ratio, as was possible in many cases, tended to weaken the column but notwithstanding these theoretical calculations it was not considered wise to use ratios much above 20. In designing columns checks were made by using both the normal methods for direct stress plus bending and the tentative method suggested by Hardy Cross.*

When hinges were required a type of reinforced concrete hinge, similar in design to those used in Europe for arch rings, was made up on the job at a very small cost, and observations made throughout the past year indicate that these hinges are functioning well.

There is some uncertainty as to the forces acting on columns resting directly on the arch ribs; if the arch rib remained unchanged under temperature changes undoubtedly great bending stresses would be set up in these columns as the deck expanded or contracted under such influences but the arch ring where the column joins the rib undoubtedly rotates in a direction tending to relieve any stresses so set up. In designing such columns only the rigid frame moments due to dead load, live load, wind and traction were considered.

*Arch rings:*

In designing elastic arch rings the magnitude of the yearly temperature variations is an important factor, especially if the ratio of rise to span of arch is not great. At Saskatoon, temperatures ranging from 110 to minus 60 degrees F. may be experienced over a long period and yearly variations of 150 degrees can be expected frequently. Under such conditions arch rings wider and thinner are more advisable than would be the case in more temperate climates. A width of 16 feet was selected as most suitable, studies showed that for the longest arch with a rise-span ratio of 0.245, a 12-foot width containing less concrete would be more economical, but for the shortest arch with a ratio of only 0.201, the 16-foot width proved the more economical.

When the deck has expansion joints only at the piers the arch ring, columns and deck unquestionably act together structurally to an appreciable extent. While this problem of deck participation has been studied experimentally by many investigators** one hesitates to accept the results of such studies for design purposes except as qualitative indications, for the reason that constructional methods seriously influence the premises. The rings on the bridge under review were poured and the false work removed, the deck was then poured and before the concrete was set and the deck in a position to participate structurally, the arches were carrying, with consequent deformations of over one inch, the full dead load; this is a condition different from a model which has the deck attached before the arch rings are placed under any stress. No allowance was made for any possible strengthening of the arch rings due to deck participation, but the temperature moments and thrusts as calculated for the arch rings were increased about 75 and 150 per cent respectively at the springing section and extra steel provided to take care of this.

Figure 5 shows clearly the profile, dimensions and reinforcement of one arch. As shown, frames, made on the job by bars welded together, were used to support and tie together the longitudinal reinforcement, these frames were set on small precast concrete blocks which rested on the forming, and proved both economical and convenient. Concrete arch rings are usually poured in sections in order to relieve shrinkage stresses. Arch 4 as shown was poured in sections in the following order $A$, $B$ and $C$. The key $D$ which was left for several days was so located that all reinforcing bars were discontinuous between $B$ and $C$, the overlapping splice occurring in the keyway. As the rings were poured and settlement of falsework occurred, there was a slipping movement between the bars as follows:

At completion of pour except key way..... Ave. total slip 0.5 inches
Two days after completion of pour........ Ave. total slip 0.75 inches

At the end of two days the slipping had practically ceased and the keyways were poured. It occurs to one that the shortening of the arch ring due to settlement of the forms and falsework, which continues for some time, may be a more valid reason for pouring arch rings in sections and with keyways than the commonly accepted one of relief of shrinkage stresses.

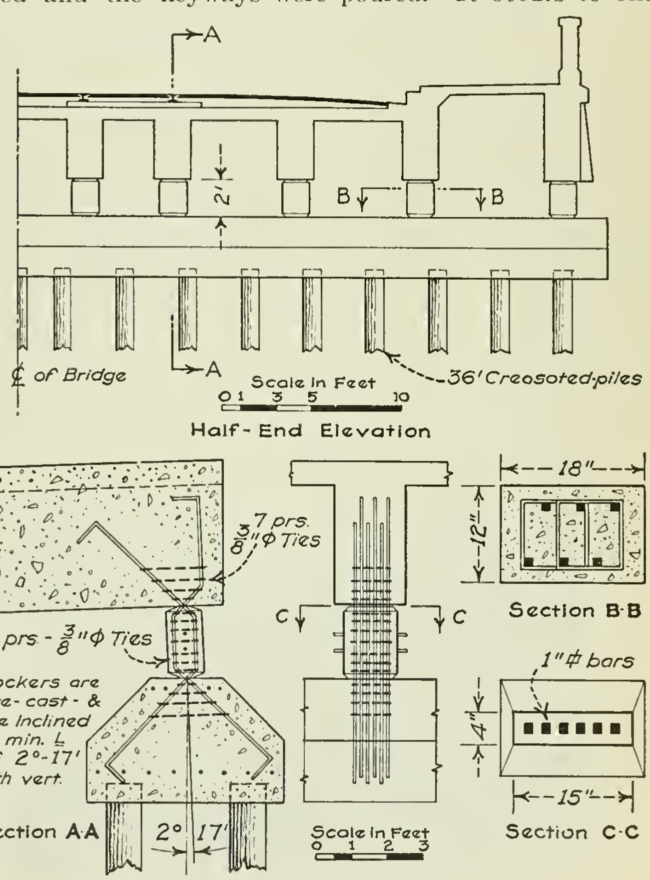

Fig. 8—Details of Hinged Rockers.

*Floating span:*

The design of the floating span involved some interesting details. As will be noted from Fig. 1 the girder spans are

* Journal American Concrete Institute, December 1929.

** Bulletin No. 226 University of Illinois; Civil Engineering, November 1932.

flanked on the shore ends by retaining walls, with refuge bays. On the north end a common gravity retaining wall on pile foundations was used, but on the south end foundation difficulties made it impracticable to build an ordinary retaining wall and aesthetic considerations demanded the appearance of one, accordingly the walls shown were suspended from the floor system and suitably braced at the bottom to prevent movement. A novel feature was introduced by using hinged rockers to carry the stringer reaction to the floating pedestal as detailed in Fig. 8. It was felt that due to the potentially unstable condition of the ground at this point, if an ordinary expansion joint were used there might be the danger that during the cold weather the pedestal supported by the piles would move riverwards if the expansion joint failed to function, that the sliding hill would then settle firmly behind and during the summer expansion period the earth resistance would make the expansion joint function, such an action if repeated yearly might produce serious results. Accordingly reinforced rockers were designed and so placed that the axis will always be off the vertical and in summer or winter whether the bridge is expanding or contracting there will always be a small component of the reaction acting up hill against the earth pressure.

The reinforcement was bent on the job and the complete rockers constructed and placed at the small cost of $15. each. These rockers, weighing 700 pounds apiece, were used under each of the ten stringers.

## II. Construction and Cost Data

The construction period was divided naturally into three parts.

First, the winter—From letting of contract December 12th, 1931, to middle of March 1933, during which time the river piers had to be constructed.

Second, the spring—From middle of March to first of July; from the time the ice started to go out until after the recession of the June floods little work could be done on the river and in this interval the shore approach spans were built.

Lastly, the summer—From the first of July to the middle of October the arch rings and floor system of the river spans had to be built.

The winter weeks were the most trying, during which a fight against time and the elements was waged continuously

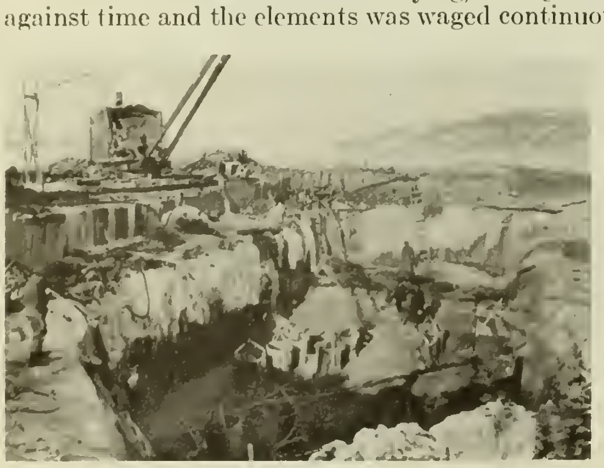

Fig. 9—Excavation for Pier 5, March 10th, 1932.

for nearly three months, twenty-four hours a day, seven days a week.

The excavations for piers 1 and 6 on the shores were made in the dry. For the other piers cofferdams made of two rows of 6-inch by 12-inch tongued and grooved sheet piling, were used. The cofferdams were designed so that no interior bracing would be necessary; a distinct advantage during excavation and forming. The inner row of piling was driven on a line 10 feet outside the edge of the footing, the two rows were driven 5 feet apart and the intervening space filled with clay puddle. The piles were supposed to be driven at least two feet into the glacial drift. When this was done comparatively little trouble was experienced, but on pier 3 there was a layer of gravel deeper than usual above the clay and the piles when first driven did not penetrate the clay. The result was that this dam broke in thirteen

Fig. 10—Work in Progress, February 19th, 1932.

times between the date it was started early in January and the time of completion late in February; eventually all the piles had to be redriven into the drift. All excavation work was, under "relief regulations," to be done by hand, the glacial drift was, however, so hard that air chisels were permitted. The soil was raised in buckets by a hoist. Figure 9 shows the excavation for pier 5, where a troublesome stratum of large boulders made driving difficult and in which leaks had to be fought constantly during a period of extremely cold weather. The ice in the river rose rapidly before this pier was finished and this illustration shows the ice close to the top of the cofferdam. Before completion the water level was within an inch of overtopping the dam.

The specially built combination pile driver and hoist, weighing about 12 tons, was for the most part moved directly on the ice, and was carried on timbers which spread the weight over 280 square feet. When first put into operation however, the ice, then only 10 inches thick, failed, and supporting piles had to be driven, but when the ice thickened to about 18 inches the load was carried safely. An incident showing the great adhesive force of ice happened in February. In building the cofferdams a channel about seven inches wide was cut with ice saws around the outline of the cofferdams, the piles were first set in place by hand around the entire site with a small opening left for the pile driver to enter the enclosure and drive the piles. (Figure 10 shows the piles so set for one cofferdam.) The weight of the pile driver was apparently supported by a small area of ice 106 by 45 feet, which had been cut almost completely around the periphery, no trouble was experienced until one night the firemen on the pile driver cleaned the boiler and allowed the hot water to flow out on the top of the ice. Almost immediately the ice and driver sank, fortunately only a few feet, as the hot water broke the bond between the ice and piles. The pile driver had been carried almost entirely by the adhesion between the piles just recently placed and the ice against which they rested.

During the winter all concrete was mixed and placed under cold weather conditions. Great difficulty was experienced in obtaining aggregates as there was no opportunity to stock material during the fall weeks. Due to relief considerations, tenders were called for gravel "loaded in trucks at the pit," the trucks to be supplied by the relief department of the city; the only bid that could be considered from the cost standpoint was from a pit 10 miles from the city on a local road, used little in summer time and never before in winter time; the pit was not equipped for winter operation and was badly equipped at best. During a very cold winter on the wind-swept open prairie, without shelter, stripping and excavating had to be done continuously under very strenuous conditions. In addition the roads became blocked with snow and a motor-driven snow plough had to be made quickly and operated at times night and day in biting and blinding blizzards. It soon became apparent that the screening apparatus would not operate under such conditions and delivery of pit run gravel was accepted during the winter months. This aggregate was deficient in both the finer sand grains and in the coarse sizes over ¼ inch, consequently it was necessary to obtain crushed rock and a very fine sand locally and to mix these three materials at the site. Fortunately it was possible to have the services of a competent concrete technician and three assistants, all engineers of experience, and by analysing the pit run material from hour to hour and changing the mixes as often if necessary, a satisfactory and economical concrete was obtained. Test cylinders of concrete from the buggies were taken every two hours, the average strength of which was 2,460 pounds per square inch, the specified strength being 2,250 pounds per square inch.

The aggregates were thoroughly studied in the Materials Testing Laboratory of the University of Saskatchewan and charts worked out so that the proportions could be easily changed according to the composition of the pit run samples. The consistency was checked regularly by the slump test. The specified strength was obtained by using 4.75 bags of cement to the yard with a maximum slump of 2 inches. The aggregate was delivered by trucks directly on top of the aggregate shed which was built into the side hill. Perforated 1½-inch steam pipes were laid at 6-foot centres across the floor of the shed and the aggregate, piled on top, was heated to a temperature varying from 70 to 100 degrees F. depending on outside conditions, the mixing water was also heated.

Relief restrictions also demanded that the concrete be wheeled by labourers from the mixers to the piers. For this purpose a trestle runway was built at the level of the springing line of the arches and all wheeling done at that level. (Figure 10 shows the trestle and also the aggregate shed located on the north bank.) Generally speaking, concrete had to be poured when the excavation was ready, regardless of weather conditions, as there was always the danger that the cofferdams would spring a leak. The common procedure was as follows: the mat for a depth of 2 feet was poured in the open directly against the clay, there being no side forms, the portion from that elevation to about river ice level was also poured in the open without protection but the forms were built as the concrete was being poured. The portion from the ice level to springing line level, about 25 feet, was usually housed in and heated by steam and stoves, but this housing was built as the pouring proceeded. A description of the procedure on one pier will be given as an indication of the cold weather methods used. Pier 6 on the south shore was located about 1,000 feet from the mixing shed; the excavation was finished and pouring started at 9 o'clock p.m. Thursday night. The outside temperature was then about 10 above zero but the weather changed suddenly and by 4 o'clock the following morning the thermometer had dropped to 25 degrees below zero and a stiff north west wind of about 20 miles per hour was blowing. The men wheeling the concrete in buggies on a platform high above the river had to make a round trip of 2,000 feet exposed to these unusually severe conditions, and it is a testimonial to relief labour that for two days and three nights under such conditions the work went on uninterruptedly. As concrete was being placed in the open, work could not be stopped, because the heat generated by the chemical reaction of setting in the mass concrete was the only protection available. The concrete left the mixers at an average temperature of 90 degrees and during the 1,000-foot haul only 2 degrees were lost; as the concrete was dumped into the footings the top exposed surface would freeze quickly but frost did not penetrate far

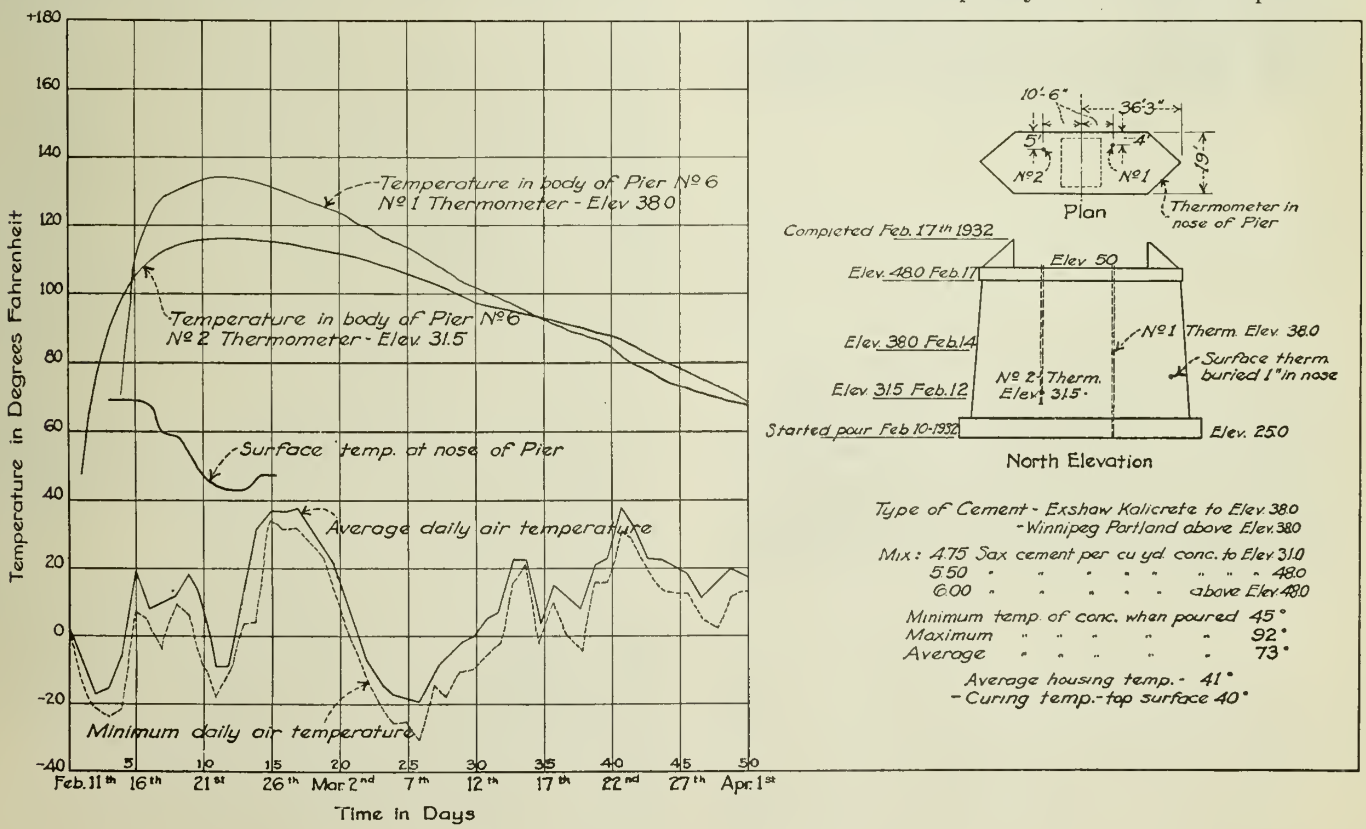

**Fig. 11—Temperatures of Concrete, Pier 6.**

as each layer was soon covered over with a heated mass and the frozen surface quickly thawed and there was no alternate freezing and thawing. When forming was started tarpaulins were used to cover the surface of one end while pouring was concentrated at the other, thermometers were buried in the mass and also on the inside of the forms. In the interior of the pier the temperature of the concrete rose rapidly and within a few hours stood at 100 degrees. The

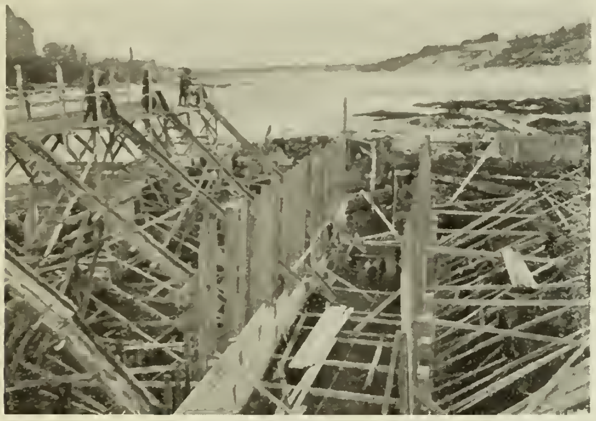

**Fig. 12—Forming and Pouring, Pier 3, February 26th, 1932.**

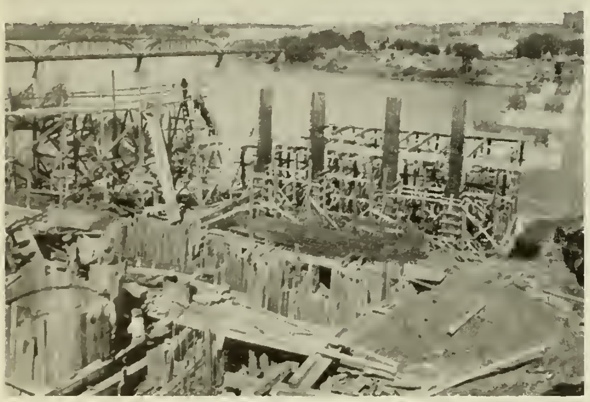

**Fig. 13—Spring Work, South Bank, May 23rd, 1932.**

forms alone gave such protection that the thermometer against the forms never read below 50 degrees. Altogether about 9,000 cubic yards of concrete were poured under sub-freezing conditions with satisfactory results. In the centre of all piers tubes were installed at different levels and temperatures were read daily for several months. Figure 11 shows the temperature rise and fall for pier 6. Figure 12 shows concrete being poured while forms are being built at pier 3.

During the spring period work was concentrated on the approach spans. In excavating the column footings, open caissons were used. The caisson consisted of 2-inch by 6-inch lagging supported by iron rings 3-inch by ⅜-inch in section and 7 feet in diameter, placed at centres varying from 3 feet at the greatest depths to 5 feet at the surface. These 7-foot holes were carried down easily and very cheaply to depths of 30 feet. At a few locations where quicksand was encountered the hole was enlarged to 9 feet for the first 10 feet. When the caisson had penetrated into the glacial drift, the excavation was undercut in the final 5 feet to a diameter of 11 feet and this truncated cone, filled with concrete, became the footing upon which the columns rested. Figure 13 shows a few of the caissons on the south bank. All foundations were tested for alkali ground water conditions. No concentrations of harmful strengths were found except in the deep column excavations on the south approach where the presence of about 1,300 p.p.m. of sulphates in the water indicated the wisdom of using Kalicrete, a high alkali-resistant cement, in all concrete work below the ground water level.

It was felt that as the summer period would be very brief for the amount of work to be done, it might be wise to construct during the spring the rings of arches 1 and 5 which adjoined the shores. The rings of arch 1, on the north bank, were poured on May 24th but in arch 5 only the driving of the pile bents on the south bank was completed before the high water in June. On June 7th the river rose 5 feet in four hours and by June 8th was 23 feet higher than the winter level, one of the four highest stages reached in twenty-five years. One of the pile bents on arch 1 was broken away by the damming of debris and later it was discovered that this practically had the effect of striking the entire falsework. The piles for arch 5 which, at pier 5, were capped about 20 feet above the river bottom, vibrated violently until the water covered the caps, but after the water receded these piles were tested and found unharmed.

As soon as the high water receded, work on all spans was prosecuted with vigour. The pile driving was completed without accident, the pile driver was carried across the river at the elevation of the top of the piers and was of such a size that it could pass over the piers between the thicket of reinforcing rods which protruded from the piers at the spring line of the two arch rings. The falsework for the arch rings was carried on 30-foot piles. The bents on the longest arch were driven at 13-foot centres and contained six piles, while on the shortest on the same centres only four piles to the bent were required. The maximum load to be carried on any pile was set at 20 tons and an inspector supervised the driving of every individual pile to see that the pile reached the glacial drift level in any case and also that it was driven until the penetration under a 5,500-pound hammer averaged only one inch during the last ten blows. For the falsework supporting the arch rings, with the exception of the caps on the piles and each tier, which were dimensioned fir 8 inches by 10 inches, spruce poles, 7 inch tops, were used for vertical struts, and for bracing, smaller spruce poles with tops only 3½ inches. As this material was obtained from northern Saskatchewan it not only provided local labour, but was very economical, as after demolition it was all sawn up into firewood and most of the first cost recovered. As the material for the falsework was delivered at the water's edge on the south bank it was sorted and cut to length there and then wheeled by one man on a dolly along a runway built at pier level right across the river; this method was used due to relief restrictions, but it also proved very efficient and all the material for the falsework of arch 5 was wheeled on a dolly from the stock pile to its place by one man in three working days.

The joists, carrying the 2-inch by 8-inch lagging which formed the floor of the arch ring forms, were cut from 3-inch by 10-inch and 3-inch by 14-inch fir. A deflection of ⅝ of an inch was allowed and the joists were cut to such a curve that after deflecting this amount at the centre they would conform to the true curvature of the arch.

All concrete for the arch spans, with the exception of the rings on arch 1, was mixed on the high south bank and wheeled down the 4 per cent grade, the return trip empty was not difficult. The reinforcing steel for the arches was also delivered from the same location, consequently a second runway had to be built a few feet above the finished deck line, this runway can be seen in Fig. 14. Back forms were used on the arch rings for a few feet adjoining the piers where the slope of the surface was in excess of 35 degrees. One of the difficulties lay in supporting the formwork for the cantilevered sidewalk; instead of driving an extra row of piles eight feet outside of the ring edge the top caps were extended six feet on the outside edge and reinforced by knee braces, struts in turn were erected on these caps and supported the sidewalk forms.

Figure 14 taken August 12th, 1932, is an interesting picture as it shows various aspects of the work proceeding simultaneously. The floor systems of the two approaches are completed and the hand rail is being poured on the north approach. The pile driver is finishing driving the piles for arch 2 and is about to pass over pier 2. On arch 3 the final falsework bents are being erected and the rings of arch 4 are being poured. The columns of arch 5 have been poured and the deck is being formed. Again the absence of machinery is evident.

The last part of the work presented some unforeseen difficulties due to the fact that in 1932 in Saskatoon the first two weeks of October were the coldest on record, i.e. average mean temperature 34.25, average minimum 23.0, average maximum 45.5 degrees F. Usually outside concrete work can be done quite safely until the middle of October. Late in September the temperature dropped slightly below freezing several nights and arrangements were made to heat the aggregate and mixing water for concrete work but it was not possible to protect the finished concrete. As the various members were poured, however, resistance thermometers with temporary leads were buried and a record kept of the temperature maintained at the various points and, as will be referred to later, this made it possible to determine if and when supports and forms might be removed. The floor slab of arch 3, the last to be completed, was finished on October 6th. The weather, which had been cold several days before, was mild while the pouring was going on, but at 5 p.m. on the 6th the temperature started to drop very rapidly and by 6 a.m. on the 7th the temperature was 18 degrees. When the temperature started to drop, the sidewalk as it was finished was covered with hot sand, sawdust and tar paper, but the road slab was too large to be protected in this manner. Fortunately there was available a steam boiler which had been used to heat the mixing water and the only thing possible was to run hot water over the slab. This was done for three days and four nights until the weather moderated and by this expedient the temperature in the centre of the roadway was kept up to 56 degrees for the first day, 48 degrees for the second and well above freezing for the duration of the cold snap. No harm was done to the roadway, but the sidewalk, which was fresher when subjected to the cold and difficult to keep covered, was affected superficially at the curb edges. The hand rail was poured under these conditions, the top of the coping was covered with tar paper, boards and manure and that, together with the forms which were quite heavy, prevented any freezing and contrary to fears at that time, no harmful effect is yet apparent. By October 11th it was evident that sub-freezing weather would continue and the street railway paving, the floating span on the south end, the sidewalks and railing on the curved approaches of the bridge structure remained to be done.

The work on the street railway trackway was complicated by the fact that curing as well as frost protection was necessary and this was difficult due to the sub-zero weather. The concrete aggregate and mixing water were both heated so that the resulting concrete left the mixer at approximately 90 degrees. In addition, calcium chloride was added to accelerate the setting of concrete poured after October 13th. As soon as possible the trackway was covered over with tar paper, carefully lapped and this was covered with sand and manure. While pouring, 10 to 12 degrees of frost were experienced during the nights. The temperature at the surface of the pavement went down from 90 degrees on the first day to 60 degrees by the fifth day. The temperatures inside of the slab were undoubtedly much higher, and considering the circumstances it is felt that satisfactory curing was obtained as there was little loss of moisture through the tar paper and reasonable temperatures were maintained for a week. The tar paper and manure were kept on for a month and after a year's use the roadway is in excellent condition.

Concrete pouring on the floating span was not started until October 28th, and by this time temperatures of 10 degrees below zero were experienced. Special XXX high-early-strength cement manufactured by the Canada Cement Company was used on this portion of the work with entire success. All aggregate and water were heated so that the concrete went in at 90 to 100 degrees. As soon as the surfaces hardened they were covered immediately with tar paper and manure, twenty-four hours after the slab was poured the street railway track was laid and the trackway pavement poured. In forty-eight hours the asphalt pavement was placed on the roadway portions and the 10-ton roller carried without any damage. Temperatures on the surface were maintained well above 70 degrees for several days and in the centre of the heavy 24 by 48 stringers temperatures of well over 100 degrees were maintained as will be referred to later.

The specifications called for a 2,500-pound concrete in the arch rings and deck and a 3,000-pound concrete in the trackway pavement. For the rings a mix with five and a half bags of cement to the yard, having a slump of from 2 to 4 inches gave an average strength in test cylinders of 2,620 pounds per square inch; for the decks a slump of 5 to 6 inches was necessary and six bags to the yard were used with average indicated strength results of 2,600 pounds per square inch. For the trackway pavement the concrete had a slump of from 1 to 2 inches, was vibrated in place by a mechanical vibrator and contained seven bags of cement per yard; the resulting concrete had strengths between 3,000 and 3,500 pounds per square inch.

During construction, readings were made of the settlements of forms and members and the following records for arch 4 are submitted as typical. It was calculated that when the arch rings were poured the top would settle 1.5 inches; the actual average settlement was 1.32 inches with a maximum at one point of 1.56 inches and of this settlement the piles which were carrying 15 tons each

Fig. 14—Progress at August 10th, 1932.

were responsible for 0.12 inches, the balance being in the verticals and connections of the falsework. As has been stated the supporting of the cantilevered sidewalk was difficult and for this portion instead of the one inch calculated settlement an average of 1.5 and a maximum of 2-inch deflection was realized.

The bridge was formally opened for traffic on November 11th, 1932, less than eleven months after the contract had been awarded. The arrangement of connecting streets and their paving was delayed until the summer of 1933.

Costs

Owing to the very limited time available for preparing plans and also to the necessity of spending at least fifty per cent of the expenditure in local labour, it was decided that the city, through the city engineer's department, should purchase all materials excepting lumber, and that the general contract would be essentially for labour and the supplying of lumber, tools, equipment and so forth. Tenders were called for on a unit price basis and the following are the prices bid by the successful contractor.

| Items | Unit | Approximate Quantity | Total |
|---|---|---|---|
| Excavation: | | | |
| East girder span col. footings. | $ 5.50 | 2,800 cubic yards | $ 15,400 |
| All other excavation | 6.58 | 7,460 cubic yards | 49,086 |
| Cofferdams | 4,440.00 | 4 | 17,760 |
| Embankment | .66 | 10,000 cubic yards | 6,600 |
| Concrete: | | | |
| In piers and abutments | 4.40 | 8,000 cubic yards | 35,200 |
| Above springing line of arches. | 10.30 | 11,600 cubic yards | 119,480 |
| Fence | 2.36 | 2,500 feet | 5,900 |
| Sidewalk over earth fill | 0.09 | 10,900 square feet | 981 |
| Curbs over earth fill | .17 | 1,770 feet | 301 |
| Carborundum rubbing | .25 | 12,000 square yards | 3,000 |
| Waterproofing | 1.20 | 6,795 square yards | 8,154 |
| Piling | 0.50 | 2,000 feet | 1,000 |
| General | | | 900 |
| Total | | | $263,762 |

The minimum schedule of wages to be paid was set forth in the contract for the various classifications of labour employed, based on a rate of 45 cents an hour for common labour. All workers with the exception of one lead man in ten were to be rotated, no worker to be allowed to work over ten hours a day or to work over a set number of days a month, i.e. a man with no children could not earn more than $25 per month, while the maximum for a man with a large family was $37.50. The contractor could select only three men from his own staff, i.e. general superintendent, general foreman and accountant, all other employees had to be requisitioned for and were supplied to the contractor by the city relief office. The contractor had the right to discharge incompetent employees with the consent of the superintendent of labour. The above regulations meant a compulsory large turn-over and actually during the year's work on the main bridge fifteen hundred and ninety-three different men were employed.

That the natural hazards of the job and the exacting relief conditions introduced a great element of uncertainty, was proved by the fact that the tender of the lowest and successful bidder was less than fifty per cent of that of the highest and thirty-three per cent lower than the next responsible bidder. The quotations given above were for the use of hand labour only, alternative bids were asked in which the use of any or all machinery was allowed, and it is a remarkable fact that the tenders of the successful bidder under both conditions differed only slightly.

The total amount of the general contract based on unit price bid and the estimated quantities, amounted to $263,762.00. The contractor's final estimate for this work was $266,333.93. The aggregate for the winter months was purchased at 35 cents per cubic yard in the pit and the truck drivers were allowed $1.20 per yard for hauling it 10 miles to the site. The crushed rock was crushed at the site by the city's machinery and the unit cost of all aggregate per cubic yard of concrete in place was $2.48. The cement was purchased from the Canada and Marlboro Cement Companies for $4.03 per barrel in cloth bags minus a rebate of twenty cents per bag. Twenty-eight thousand, eight hundred and eighty-seven barrels were used on the bridge proper and an additional three thousand, five hundred and sixteen barrels for pavements and other works on the connecting streets at the approach.

Altogether 1,000 tons of reinforcing steel were used, this was purchased from the Manitoba Rolling Mills, ordered cut to specified lengths for a base rate of $63.40 per ton. As a relief measure to provide additional local labour, all bending work was detailed in the designing office and actual bending supervised by that department. One machine was used for bending slab steel and roadway dowels and two for heavier bending; operating these three machines concurrently made it possible to keep in tune with the contractor's requirements. One and one-eight-inch and one inch square bars 68 feet long were bent without difficulty. While the bending was undertaken essentially as a relief measure, the actual costs of $4.53 per ton for heavy and $9.26 for light bending indicate that it was also economical.

The cost of the bridge proper, exclusive of the street alterations at the approaches, was approximately $640,000, of which $324,000 was paid in wages to residents of Saskatoon city. This works out at a cost of $7.30 per square foot for the entire bridge.

In one of the typical river piers actual costs were as follows: For excavation $3.60 per cubic yard. For concrete, including all overhead expenses $4.86 per cubic yard made up of forming $1.82, mixing, pouring, transportation, and placing $2.06. Heating and protection $0.98. The total cost of the cofferdam was $3,914.40.

For the concrete in the superstructure the figure of $10.20 per cubic yard which included all piling, falsework, forming, placing steel etc., while very low, was slightly greater than the actual cost.

The asphalt pavement on the roadway sections was laid for $2.42 per square yard.

The total cost of this project including the bridge proper, compensation for land and buildings expropriated, engineering, flotation and all expenses was $843,178.15. The original estimate was $850,000.

The Arrand Construction Company, Saskatoon, was the general contractor. The asphalt paving was done by Carter, Halls and Aldinger, Winnipeg.

## III. Technical Data and Records

### Temperature Measurements

As has been stated the temperature stresses in arch rings subjected to wide variations in temperature, are of major importance. In order to obtain data on the actual temperature variations in this structure, thermometers were buried during construction in an arch ring and also in a pier and in the floor system. Readings have now been taken over a complete calendar year after the arch was completed. The arch selected was 5, the longest and most southerly unit, the pier selected was 5, a river pier which is the north support of that arch. Arch 5 has a clear span of 186 feet and an axis rise of 46.8 feet, the rings are 16 feet wide, 3 feet 3 inches thick at the crown and 6 feet 3 inches at the springing; the intrados curve consists of two segmental sections with radii of 106 and 132.83 feet respectively, the reinforcement consists of seventy one-inch square bars increased by 50 per cent at the springing. Five thermometers were buried in the west ring of the arch as follows: at the crown one 3 inches and one 19½ inches deep, at the springing line one 3 inches, one 19 inches and one 33 inches deep, all thermometers were placed about midway between the outer faces of the ring. The section of the pier where the thermometers were installed is approximately 13 feet by 65 feet. Three thermometers were placed in the pier, one 18 inches, one 36 inches and the third 72 inches deep. In the floor system three thermometers were buried, one in the centre of the road slab which consists of 15½ inches of concrete covered by 2 inches of asphalt pavement, one in the street railway slab which consists of 22 inches of concrete and the third in the centre of the curb stringer which is 15 inches by 30 inches in cross section.

Resistance thermometers were made up by using commercial telephone 500 ohm coils, insulated and placed in a brass tube ¾ inch in diameter and 7 inches long, the ends were well sealed with a preparation of 50 per cent paraffin and 50 per cent rosin, poured while hot, the leads consisted of rubber covered mine cable, which extended 2 feet, from there on No. 18 solid copper weather proof wire was used. All leads were buried in the concrete of the arch rings and deck and carried a maximum of 190 feet, so buried, to pier 6, where a panel was placed in a specially constructed shelter. The terminals were all carefully marked and the readings were taken with a portable wheatstone bridge. All coils were calibrated and conversion charts prepared to convert all readings to degrees Fahrenheit. Studies indicate that the readings are accurate to one half of one degree Fahrenheit and with the exception of one of the eleven coils no trouble has been experienced.

In this paper those portions of the continuous yearly record will be selected which will best illustrate the fluctuations and trends set forth in the following discussion.

One of the general conclusions arrived at from a careful study of all the data is the surprising effect of the temperature flow from the water in the river, through the pier and up through 100 feet of arch ring to the crown at an elevation of about 75 feet above the water line. The effect was so great that in February when minimum air temperatures of 36 degrees below zero were experienced, while the roadway slab went to 30 degrees below zero the mean daily temperature at the centre of the arch crown was never lower than 22 degrees below zero, that at the centre of the springing lower than 10 degrees below and that at the 72-inch depth in the pier lower than 3 degrees above zero. In the extreme hot periods of the summer again the maximum temperature of the crown and springing sections did not get within about 20 degrees of that obtained in the floor system. That the flow of heat in such structures was of such practical magnitude was first suggested to the writer by J. Mould, Jr.E.I.C., a graduate student at the University of Saskatchewan, who carried out some preliminary experiments during one winter on a bridge in Saskatoon.

The temperatures, then, of the various portions of the bridge are affected not only by the temperatures of the outside air but also by the water in the river. The temperature in any pier will evidently vary from the base and that portion below the ice or water level, which will be affected almost wholly by water temperatures, to the top where the effect of the outside air will be appreciable. For the purposes of this paper "pier temperatures" will refer to the temperatures at the level 8 to 10 feet above normal water level, where the thermometers were installed, a location which data indicated to be affected more by the water than the air temperatures.

The range of air temperatures during the year of record varied from the coldest day, February 7th-8th, 1933, with an absolute minimum of 36 degrees below zero, maximum of 23.7 degrees below zero and a twenty-four-hour mean of 29.3 degrees below zero, to the hottest day, June 16th, 1933, with an absolute maximum of 103 degrees in the shade, minimum of 66 degrees and a twenty-four-hour mean of 84.5 degrees. On the charts shown mean twenty-four-hour temperatures are plotted.

To avoid further complicating the charts the water temperatures were not plotted in every instance. The water temperature during the winter months is of course approximately 32 degrees, and during the summer weeks from the middle of June to the middle of August it had a mean approximately equal to that of the air for the same period. During this period in 1933 the average water temperature was 69 degrees, which compares with that of other years for which records are available. From the middle or last week of August the water temperature falls gradually to near freezing by some date in November or December, depending on yearly conditions. After the spring ice break-up, which in 1933 was on April 19th, the temperature rose within four days to about 50 degrees where it was maintained until the middle of May when a further jump to 60 degrees was experienced, and this temperature was maintained with minor fluctuations until the warm weather of early June.

In discussing the yearly variations it is helpful to observe that about the middle of August makes the best starting point as at that time the mean temperature of air and water have been steady and equal for about two months and as a consequence the temperature of the piers, arch rings and floor system approximate the same mean daily temperature. From that time until November or early December, the air and water temperatures have a common downward trend until the mean temperature of 32 degrees is reached. The temperatures of the various members of the structure, while subject to greater or less fluctuations and lag, depending on size and location, follow in their means the same long time trend. On November 5th, 1933, just before the occurrence of the cold spell which froze the river over and carried the air temperature well below zero, the temperatures of all members were grouped between the limits of 35 degrees at the centre of the piers, the warmest, and 27 degrees in the floor slab, the coldest, portion of the bridge. From that date on however the temperature of the air with minor fluctuations dropped until it reached its lowest point in February when the daily mean was 29.3 degrees below zero (i.e. 61 degrees below the water temperature) and then climbed back to 32 degrees just before

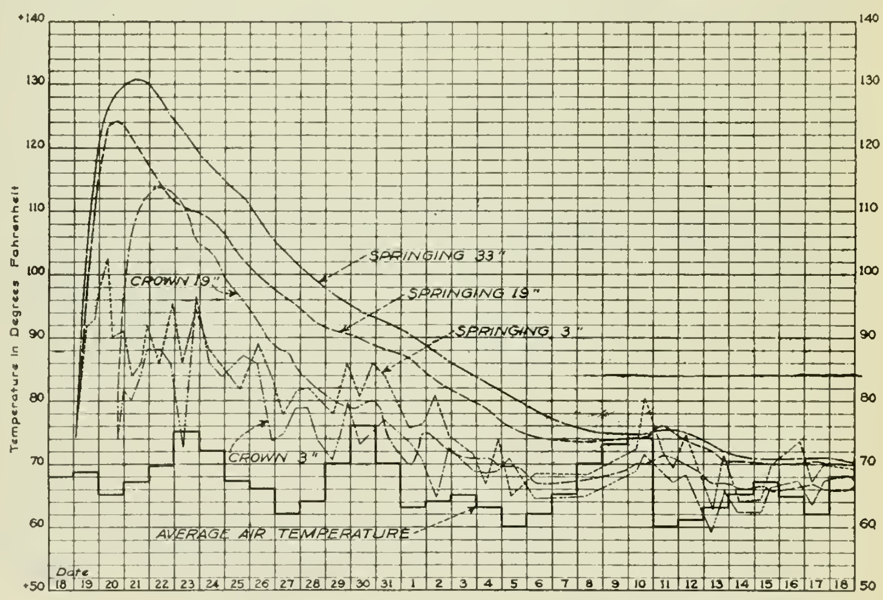

Fig. 15.

the spring break-up. The result is that temperatures of members vary depending on the relative influence of water and air temperatures, as will be illustrated in the charts. The temperature in the pier dropped due to air effect slowly but steadily from 32 degrees on December 12th to a minimum of 3 degrees on February 17th, an apparent lag of about nine days. From February 17th until the spring break-up the pier temperature rose slowly, reflecting a similar air trend; from break-up until early in July the trend upward under influence of both air and water was steeper until an average temperature of about 69 degrees was reached and held until the later weeks of August. The floor system on the other hand followed directly the mean daily air fluctuations with lags that will be referred to later. The temperatures in the arch ring followed a compromise course between the two. In the light of the above general discussion of trends the charts presented will be analysed briefly.

Figure 15 covers the period July 18th to August 18th, 1932, and includes records on the arch rings only, as the floor system was not poured until August 25th and the coils were not installed in the piers until September 17th. It is of interest only in that it shows accurately the temperature rise and fall due to the heat of chemical reaction during the setting period of the concrete and the time elapsed before return to the normal temperature for concrete at that time of year, i.e. about 70 degrees. At the springing section, which was poured on July 19th, a maximum temperature of 102.5 degrees was reached at the 3-inch coil in a little less than twenty-four hours and a widely fluctuating recession due to daily air temperature variations carried the temperature back to normal in about sixteen days. At the 33-inch location, as would be expected, a greater maximum of 131 degrees was reached after an interval of approximately sixty hours and a period of nearly a month elapsed before normal temperatures were again established. The curves for the crown section illustrate the effect in a mass only 38 inches in thickness as compared with the 66-inch springing section.

Figure 19 covers the period July 24th to August 12th, 1933, and while chronologically this period represented the

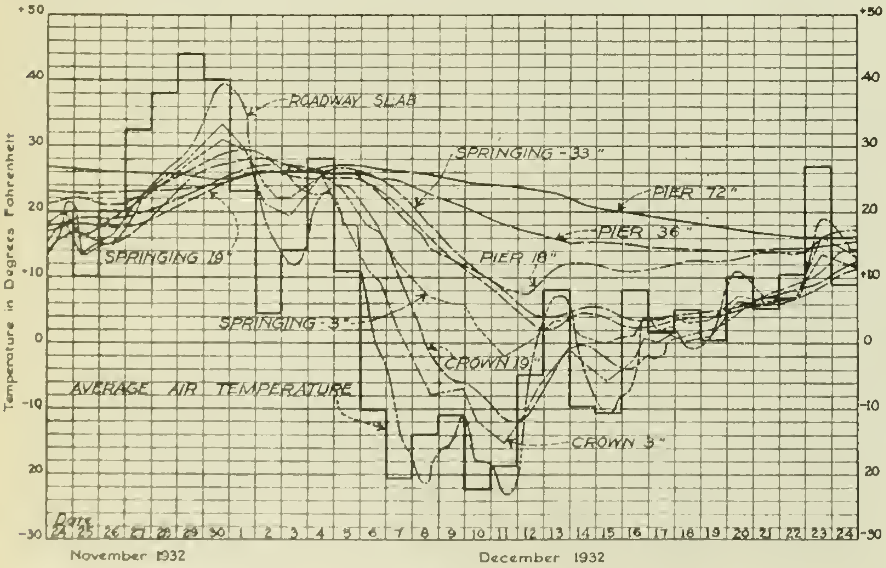

Fig. 16.

last portion of the observations, for the reasons stated in the preceding discussion it serves as an excellent starting point. The mean air temperature for this period is approximately 68 degrees as is also the mean of the water. It will be seen that the temperatures of pier at 18-inch, 36-inch and 72-inch depths are generally within 4 degrees of each other and are approaching the mean of 69 degrees. As would be expected the 18-inch readings fluctuate more than the 72-inch but all fluctuate less than the water and much less than the air. In plotting deck temperature only that of the coil in the roadway slab is recorded as for the most part the other two follow that one quite closely. The temperature of the roadway follows the average daily temperature quite closely as will be discussed later, and the springing and crown temperatures vary according to location and depth, all approach on the 12th the mean temperature of 69 degrees.

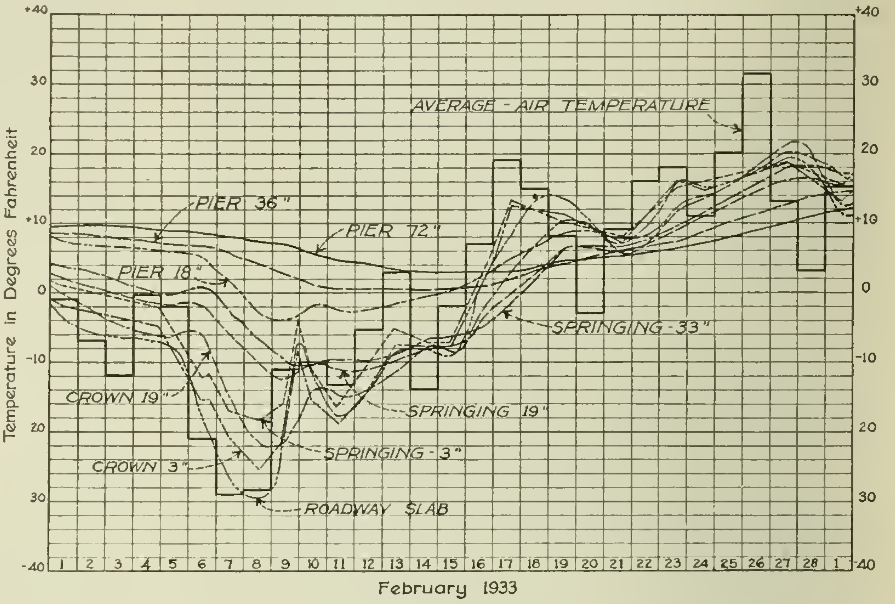

Fig. 17.

This general condition will undoubtedly prevail each year at some time during the middle or late part of August.

Figure 16, from November 24th to December 24th, 1932, shows the condition shortly after the date, November 13th, on which the river froze over. From November 1st to the 11th, the temperature of the air had been steadily falling and the water temperatures were approaching 32 degrees. The pier and arch ring temperatures were all lowering gradually while that of the roadway slab fluctuated with the air temperature more directly. On the 12th the air temperature dropped 16 degrees and another 8 degrees on the next day to 3 degrees below zero when the river froze over. This cold period lasted until the 19th when the temperature rose again. The roadway slab followed the outside temperatures directly, the 3-inch crown and, to a lesser degree, the 19-inch crown dipped steeply but less than the floor slab, the moderate drop of the 3-inch, 19-inch and 33-inch springing sections indicates the great effect of the pier as a heat regulator. The fall in the pier readings, especially at the 72-inch depth, was very moderate and steady and by November 27th when a mild spell set in the 72-inch pier temperature was only 6 degrees below the water temperature and the middle of the crown and springing temperatures 15 and 12 degrees respectively. The warm spell of November 27th to 30th caused all temperatures to rise and on December 1st again, as on November 11th, the temperatures at all the locations were within 4 degrees of each other. The cold spell, December 7th to 11th, was one of the two most severe dips of the year and is interesting as it shows clearly the drop and lag of the various thermometers. The roadway slab follows in a striking manner the mean daily temperatures but with a lag of about twenty-four hours on drops and much less on the rises. The pier temperatures are dropping slowly and will continue until the bottom of the trough is reached in February. The effect of piers as regulators on arch temperatures is again strikingly shown, the centre of the crown and springing section being respectively 11 degrees and 27 degrees above what would have been found in detached blocks of the same dimensions.

Figure 17, from February 1st to March 1st, shows the second and lowest drop in winter temperatures and the subsequent rise due to approaching spring, this chart and Fig. 18 showing the hottest condition of the year are especially interesting. During the coldest and hottest days readings were taken several times a day while normally readings were not taken more than once and sometimes when conditions were uniform only every other day, consequently excepting for the periods of extreme temperatures the curves are probably not accurate within two degrees. During the long cold spell in December (Fig. 16) it was found that the floor slab temperatures followed with remarkable regularity the mean daily temperature. The cold spell in February however was neither as long nor as steady as that in December although the absolute minimum temperature was lower. The road slab temperatures followed the minimum dip in the normal manner but in the preceding and following fluctuations the coincidence is not so good. No doubt this is due to the fact that after the first of February the sun was getting higher and often warm days with a high peak were combined with a long night period of uniform low temperature. Again quite mild and very cold days may alternate and the road temperature will not always follow violent fluctuations of one day only.

It will be seen in Fig. 17 that the pier temperatures were nearly uniform until the effect of the cold drop of the 6th on all pier readings is apparent and is quite marked on the 18-inch thermometer. Another interesting point is that the yearly low point on the 72-inch unit was reached about February 17th from which point a long swing upward started, the 36-inch and 18-inch locations had their turning point three to five days earlier and for the next half year the 72-inch location was the coldest of the three. In this cold dip, at the end of four cold months, the effect of the pier heat on the arch ring is very evident as even the 3-inch unit at the springing section had a minimum of about 11 degrees higher than would have been found in a detached block of the same thickness, while the centre of the springing was 17 degrees higher.

Figure 18, June 10th-26th, shows the hottest period of the year during which was recorded the highest maximum for a number of years. During the 15th, 16th and 17th, the hottest days, temperatures were read several times daily from early morning until late at night; the curves for these days then, will show daily fluctuations which are not available for the adjacent days. In this figure the river temperatures also are shown and it will be seen how the pier temperatures are approaching the water and air mean of about 68 degrees. During the very hot days the effect of direct radiation from the sun is apparent as the maximum temperatures in the floor system are well above the daily air mean but of course below the absolute air maximum. During the 16th, the hottest day, with a maximum air temperature of 103 degrees and a mean daily of 84 degrees, it is interesting to note that the road stringer which is 15 inches wide but not subjected to the direct rays of the sun reached a maximum temperature of 86.5 degrees. The street railway track which is 22 inches thick and receives the direct action of the sun on its surface reached a temperature of 86 degrees, while the roadway slab 15½ inches of concrete covered by a heat absorbent black asphalt surface reached a maximum of 93 degrees. It will also be noted that the 3-inch depths on both arch crown and springing sections were considerably affected by the action of the sun; the deeper locations at both sections fluctuated less violently and reached maximum temperatures of approximately 74 degrees within different periods of lag. Due to its location the springing section was more directly acted upon by the hot rays of the afternoon sun than was the crown and this effect is seen in the higher readings of the 3-inch springing section.

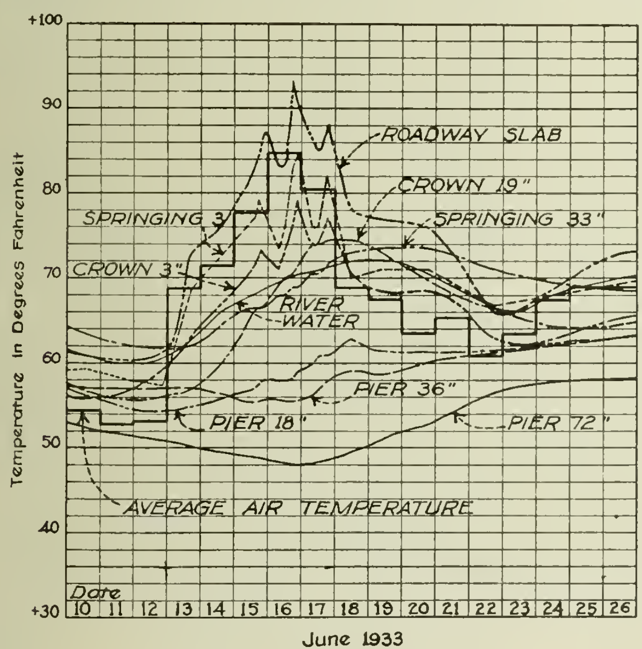

Fig. 18.

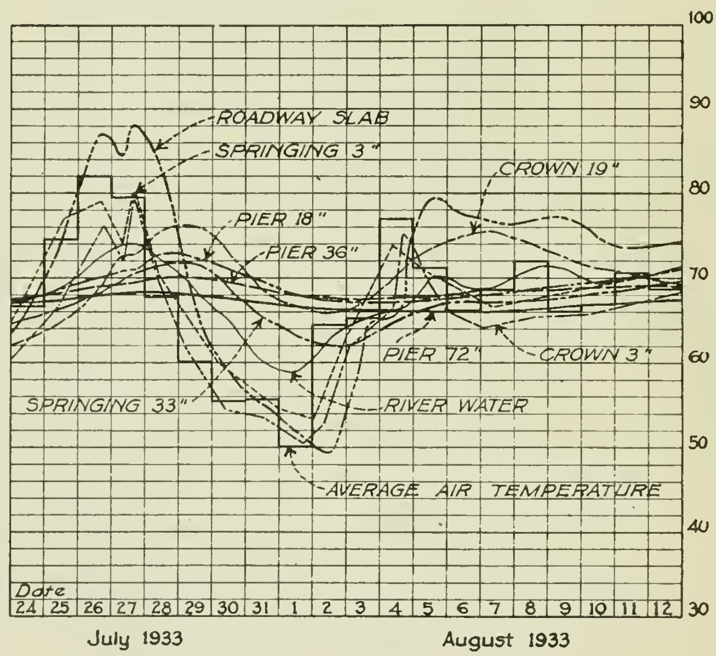

Fig. 19.

*Conclusions:*

In blocks thermally detached from contact with the ground or water the temperatures in blocks 2 feet thick, and probably in those 3 to 4 feet thick, will generally follow the daily mean of the air but if subjected to the sun in summer the temperatures will exceed the summer daily mean by 5 to 6 degrees.

In Saskatoon for such masses a safe range to assume for all time would probably be minimum temperatures of 48 degrees below zero and maximum of 100 degrees, this on the basis of possible minimum and maximum air temperatures of 60 degrees below zero and 110 degrees above.

For design of arches the problem is more complicated due to the fact that there will be differences between land and water spans, high and low arches and ribs of varying dimensions. For the arch under test probably the effective maximum for the arch as a whole will never exceed 90 degrees nor the minimum fall below minus 30 degrees. If the normal temperature be taken at 68 degrees this corresponds to a rise of 22 degrees and a fall of 98 degrees. In piers and structures in contact with water or ground the range of temperatures will vary widely depending upon the size, percentage of structure exposed to direct air temperatures and whether the pier is in water or on dry land.

### Deck Expansions

At each expansion joint on the bridge copper plugs were installed on both hand railings and records of movement have been kept throughout the year. With the temperature records which were always obtained simultaneously with the expansion readings, the coefficient of expansion may be calculated. From the coldest period in February with an average deck temperature of 26 degrees below zero to the hottest day in June with a deck temperature of approximately 90 degrees the total change in 1,117 feet of bridge was exactly 10 inches giving a coefficient of expansion for the reinforced concrete deck of 0.00000643 which checks remarkably well with a laboratory value of 0.0000065 for reinforced concrete of this quality. The flexible columns and expansion details have given no trouble and function with entire satisfaction.

### Arch Deflections

When the centring was struck under the rings of arch 5 a deflection of 0.84 inches was read and a further 0.36 inches when the deck was poured; theoretical calculations had indicated a total of 1.25 inches for these. Further readings have been taken throughout the year particularly during periods of extreme temperatures. The crown of arch 5 rose 1.47 inches in elevation in the period from the coldest spell in February when the calculated average temperature throughout the arch ring as a whole was 19 degrees below zero, to June 16th when the average ring temperature was 73 degrees. Theoretical analyses made previously had indicated a change of 1.31 inches for a 90-degree temperature difference which would give a theoretical change of 1.34 inches for the 92 degrees rise as compared with the actual 1.47 inches experienced. Considering the uncertainties in calculating average temperature conditions in a ring of changing cross section, and also the error that would be introduced by even a moderate uneven settlement of the supporting piers, the agreement between theory and results is reasonably close.

After recording temperature and expansion measurements throughout a year, and recalling that the deck changes in length almost one foot and the arch rings rise and fall about one and one half inches in every twelve months, one is impressed with a real appreciation of the deteriorating influences at work in all such structures.

### Strength of Partially Cured Concrete

Temporary installations of resistance thermometers proved very useful during the early days in October when, as has been set forth above, an unanticipated cold spell occurred during the pouring of the deck for arch 3. Due to the conditions surrounding the financing of the job it appeared to be necessary to have the contractor entirely complete the job before December 1st, 1932. This, of course, meant removing all forms and supports from the deck. This obviously involved a risk, as under such conditions it is normally impossible to calculate the strength developed in concrete members under subnormal curing temperatures; accordingly thermometers with temporary leads were placed in the roadway slabs, sidewalk slabs and floor beams, and readings taken several times every day until temperatures in these members reached 32 degrees. The following table will serve as typical of the temperatures in the floor beams:

Curing Temperatures in Floor Beam of Deck 5

| Date | Time | Air Temperature | Floor Beam Temperature |
|---|---|---|---|
| Oct. 5 | 16.30 | 68° | 81° |
| Oct. 6 | 8.30 | 38° | 97° |
| | 14.30 | 46° | 94° |
| | 16.45 | 42° | 92.5° |
| Oct. 7 | 11.00 | 40° | 73° |
| | 16.30 | 30° | 68.5° |
| Oct. 8 | 4.00 | — | 60.0° |
| | 9.40 | 25° | 55.5° |
| | 15.30 | 32° | 51.5° |
| Oct. 9 | 7.00 | — | 43.0° |
| | 17.30 | 30° | 39.0° |
| Oct. 10 | 9.30 | — | 36.0° |
| Oct. 11 | 9.30 | 36° | 34.5° |
| Oct. 12 | 11.30 | 52° | 34.5° |
| Oct. 13 | 17.00 | 56° | 38.0° |
| Oct. 14 | 9.00 | 42° | 38.5° |
| Oct. 15 | 9.00 | 35° | 40.5° |
| Oct. 17 | 14.00 | 30° | 32.0° |

**Fig. 20.**

It will be seen that this floor beam had approximately the following curing history: one day at 90 degrees; one day at 70 degrees; one day at 60 degrees; seven days at 38 degrees. According to tests* of the percentage of strength gained at different curing temperatures as compared with that at 70 degrees, it was calculated that the above floor beam had the equivalent of over seven days curing under normal conditions. Laboratory tests using the job cement and mix, indicated that seven-day strengths averaged about 1,500 pounds per square inch. As a further more severe check small cylinders were made up and stored in the laboratory for various periods from one to five days, after which they were placed in freezing temperatures and tested at twenty-eight days. It was found that no appreciable strength was gained after exposure to freezing conditions, but it was also found that for the mix being used, three days curing at 70 degrees could be depended upon to give strengths of about 1,200 pounds per square inch. It was found that a 2,000-pound mix would give 1,000 pounds per square inch and a 3,000-pound mix not more than about 1,300 pounds per square inch at three days. As it was certain that in the floor beam during the winter, stresses exceeding 600 pounds per square inch would not be developed, the contractor was permitted to load the span and remove the form supports after twenty-eight days. The temperatures in the slabs naturally did not rise as high nor were they maintained as long as those in the floor beam but similar calculations indicated that it would also be safe to remove forms and supports from these as well. When the above slab was being poured, test cylinders, unprotected, were placed on the slab and exposed to the air temperatures, these gave after two weeks of such curing only 500-600 pounds per square inch and it is apparent that there can be no useful comparisons made between the strength of concrete in a slab and that of a test cylinder of the same age which has cured under the same air conditions.

Thermometers were also placed in the stringers and roadway-slab of the floating span in which quick hardening

*Bulletin 81, Engineering Experimental Station, University of Illinois.

XXX Canada Cement was used and it may be interesting to note that, with air temperatures around 10 degrees and with the concrete being poured at 83 degrees, the temperatures in the stringer rose rapidly to a peak of 136 degrees in nine hours and temperatures above 70 degrees were maintained for five days. The thinner 8-inch slab dropped from 90 to 65 degrees in the first thirty minutes and then rose to 103 degrees within twenty-four hours, and remained above 70 degrees for a total of four days and as a result normal twenty-eight-day strengths were probably obtained in thirty-six to forty-eight hours. In a previous section details of methods for protecting these sections against frost have been given.

Probably the most unusual operation was the laying of the sidewalk immediately off the bridge resting on earth but supported by short piles, with outside temperatures well below freezing as previously noted. Thermometers were placed in the centre of this slab. Concrete was poured at a temperature of 85 degrees when the air temperature was 32 degrees. As the surface was being finished four hours later the concrete temperature had dropped to 51 degrees. After finishing, the surface was covered with tar paper and later manure placed on top of the paper, in another sixteen hours the temperature had only risen to 58 degrees—canvas tarpaulins were then spread over sections in turn and live steam applied, the temperature rose in twenty-four hours to 90.5 degrees under this treatment, the steam was then stopped and in twenty-four hours more the temperature fell to 64.5 degrees; the manure and paper were then removed and the sidewalk put in use, and after one year's use it appears to be in perfect condition.

## Pier Rotations

It is well known that during the construction of multiple arch bridges on yielding foundations the piers will rotate under the unbalanced thrusts developed. The magnitude of the rotation is a measure of the bearing value of the soil and Fig. 21 is a chart of the movements on the bridge under consideration. The measurements are recorded on the plan as inches of horizontal movement at the springing line. The actual measurements were taken by measuring the rotation of the vertical face of the pier. A plumb bob supported at a known distance from the face of the pier at the springing line was suspended and stilled in a container of oil, while at 2-foot intervals, vertically, four to seven permanent marks were made on the pier face and the horizontal distance from these points to the plumb line measured. As there were several points, a good check of the work was possible and unexpected accuracy was obtained. The angular deflection of the pier was changed to horizontal movement at the springing line and vertical movement at the edges of the pier footing by assuming that all movement took place about the longitudinal axis of the pier footing. Any error introduced by this assumption will not affect materially the calculated movements at the springing line, but there is possibility of serious error in estimating the actual settlement of the pier in this way. The other extreme premise would be to assume that the rotation occurred about the edge of the footing on which rotation would tend to relieve the pressure. For calculating the settlement of footings an average of these two methods has been used.

The dates of observation are given below the horizontal base line in each case, while the dates of completion of each particular operation on every span are placed directly above the illustration. The deflections of the springing line of the pier are given in magnitude in inches and the direction is indicated by placing these figures on the right or left of the vertical line through the pier according as the resulting movement was to the right or left. For instance the upper left hand line shows the date of completion of the various piers when the zero readings were taken. The next line shows that an observation was made on May 25th, and on the same date the rings of arch 1 were completed, and as a consequence pier 2 moved 0.25 inch to the right. The third line indicates that by June 2nd, pier 2 had moved 0.30 inch and that on July 20th, the arch rings of arch 5 were poured and no pier deflection was noted. The fourth line shows that after arch ring 4 had been completed there still was no movement indicated for pier 5, but that pier 2 had moved to the right a total of 0.60 inch by August 30th. As has been referred to before, the piling for arch 1 was driven in the spring when frost conditions undoubtedly caused imperfect driving of some piles and the high June floods carried away one bent of piles and although the remaining falsework seemed firm it evidently removed the greater part of the falsework support. This deflection of 0.60 inch on pier 2 was the most extreme noted and represents a settlement of the southerly pier edge of about 0.30 inch. It is interesting to note that this settlement according to the test data obtained corresponds to a pressure of about 5 tons per square foot, calculations indicated that with the rings of arch 1 poured and falsework removed the extreme pressure on the edge would be 4.5 tons per square

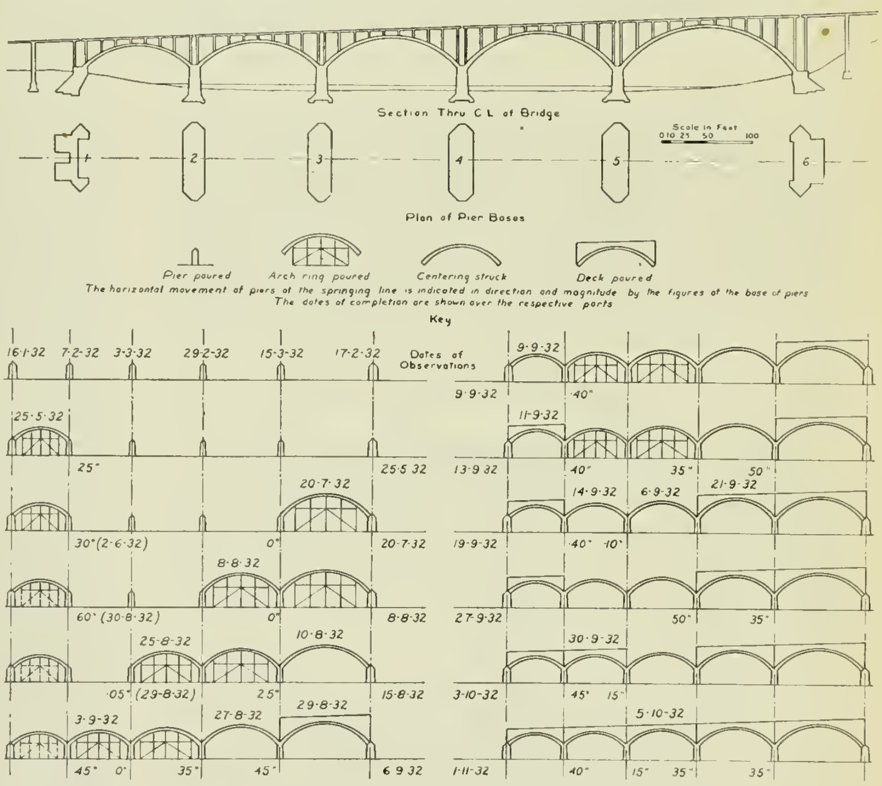

Fig. 21—Horizontal Movement of Piers during Construction.

foot. At pier 5 after the deck of arch 5 had been poured there was a displacement to the left of 0.50 inch, this indicates an excess settlement at the pier footings of 0.31 inch while the calculated maximum pressure is 4.0 tons per square foot, similar results were obtained at pier 4 under comparable load conditions. This analysis is interesting and suggestive but is not submitted as more than approximate. The last line on the left hand side shows that on September 6th, all arch rings had been poured, the falsework struck under arches 4 and 5 and the deck of 5 poured. Pier 2 has moved back to the left 0.15 inch since August 8th, pier 4 has moved to the left as would be expected after the striking of falsework on arch 4. The top lines on the right side show that pier 2 is still moving back and the third line down is interesting as it shows that even after the deck of arch 1 was poured and the falsework struck on arch 2, pier 2 did not move to the right as might have been expected. Once a series of arches is joined together the deflections do not always follow a logical order, and many apparently contradictory situations arise, for instance the last two lines seem to indicate that, with the completion of the final deck on arch 2, piers 3 and 4 both moved inward towards the centre of arch 3 instead of outward as might be expected. There is of course the possibility of error in measurement but the readings were checked and rechecked several times and the situation was probably caused by uneven settlement at piers 2 and 3. Undoubtedly there is a lag between load and settlement, also there are many other factors of uncertainty such as uneven settlement of falsework, slight variation of soil at different piers, difference in thrust of rings due to construction loads, etc., but it is felt that the measurements give valuable information about the bearing values of the soil and the behaviour of piers especially before several rings are joined.

Calculations indicate that the final deflection of pier 5 would introduce extra stresses in the concrete of arch 5 of 74 pounds per square inch at the springing and 95 pounds per square inch at the crown assuming the arch to be loaded with maximum live loads. The corresponding stresses introduced into arch 1 would be 197 and 250 pounds per square inch. These later stresses, while appreciable, are not alarming and in the author's opinion the plastic flow of the concrete in the rings will so adjust the internal stresses that these extra theoretical increases will not be serious.

The author, on leave of absence from the University of Saskatchewan, was responsible for the design and construction of this bridge as consulting engineer to the city engineer of Saskatoon, Mr. G. D. Archibald, under whose charge the project was carried out.

# Stresses in Stiffened Circular Tubes under External Pressure

*Raymond D. Johnson,*
*Consulting Engineer, New York*

**Paper to be presented at the General Professional Meeting of The Engineering Institute of Canada, Montreal, Que., February 8th and 9th, 1934.**

SUMMARY

The strength of circular tubes under external pressure has been considered by various authors in the past, but the methods adopted have not given results which can be used for purposes of practical design when dimensions are large and stiffening rings are of less than infinite rigidity. The usual treatment studies the elastic instability of perfectly circular tubes, rather than the stresses conformable to engineering practice; and circumferential stiffening rings or end conditions, if considered, are assumed to be of infinite stiffness. In short, the results cannot be interpreted in terms of thickness of plate, size of angle, stresses and true factor of safety.

The author of the present paper recognizes that perfectly circular tubes, especially in large sizes, can not be manufactured and he therefore includes this fact in his analysis. He recognizes that the stiffening rings, which are usually necessary, are not infinitely stiff and he therefore takes into account their yielding. The various possible forms of collapse, the spacing of stiffening rings and the stresses developed are also considered.

The elastic conditions of the case are complicated and the analysis can not be simple, but much of the work can be summarized in only two formulae, equations (27) and (40), which contain all an experienced designer is likely to need for daily use. The other results will, it is hoped, be of use to those who wish to study the subject in greater detail, and a numerical example is given.

The author has applied these methods for many years to the design of internal risers for his differential surge tanks, and he feels that the principles of the paper may hence be considered to have been abundantly verified by full size experiment. The same principles are also applicable to large penstocks under partial vacuum, to tunnel linings in soft ground and other problems not infrequently encountered.

* * * * *

The problem of the design of large circular steel tubes subject to external pressure, and of the arrangement of the stiffening rings, has long been a real nuisance to engineers because, so far as the author knows, a practical solution has not been available.

Such information as could be obtained from various studies of the matter has required on the part of the engineer too much inclusion of his own judgment, chiefly because the initial assumptions of perfection of shape and either no stiffeners or rigidly fixed ends led only to answers in terms of elastic instability under these ideal conditions, and not to stresses in a practicable structure. There has been no consideration of a proper factor of safety to be used with these answers, nor of the effect upon a factor of safety of the inevitable departures from theoretical perfection which must occur during construction. Hence one should assume at the beginning that the tube will not be perfectly circular, and that the stiffening rings will yield.

It will be shown that where the tube is not precisely round before external pressure is applied, the bending stresses are directly proportional to the initial amount of deviation from a true circle. It will be found that this consideration is so important that it is essential in the first place to know that the departure from a true circle is a certain specified small amount before a beginning, even, can be made toward the computation of the resulting stresses. In practice, therefore, it is necessary to assume a definite small variation within which it is no hardship for the manufacturer to keep and to base the design upon safe stresses according to the assumption.

It is then most important to check up the structure for roundness when it is finally in place; to make a record of the various eccentricities and if found to be out of round an amount greater than assumed, to reject the work or call upon the manufacturer to true it up according to specifications. If, fortunately, the structure is more nearly circular than was assumed, it will be proportionately safer.

Longitudinal butt joints should be used to avoid the eccentricity of laps, and the rib splices should be staggered and carefully designed. Standard riveting is usually adequate for the shearing stresses developed.

It may be interesting to describe just how a tube behaves when stiffened with circular ribs at intervals and subjected to uniform external pressure.

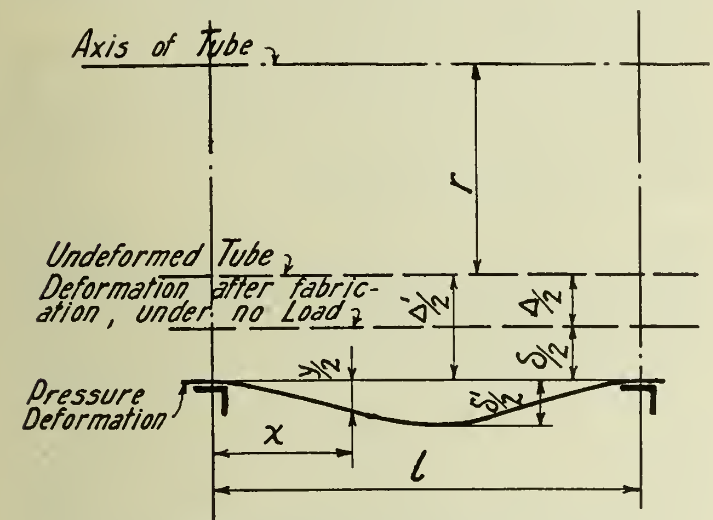

**Fig. 1—Longitudinal Section in Plane of Maximum Outward Deformation.**

When the tube is not precisely circular, its initial shape is usually slightly elliptical; two opposite sides bulging outward and the other two flattening inwards, with four symmetrically placed nodes where it intersects the equivalent circle. If uniform external pressure is applied to the tube, the various sections depart in varying amounts from the original ellipse, and this departure gradually increases with the distance from the ribs until it reaches a maximum at mid span, as shown in Figs. 1 and 2. Until failure occurs, these sections retain approximately the shapes of ellipses with various eccentricities. This variation in shape implies a longitudinal transfer of load to the ribs by beam action of the shell plating, which behaves as four beams having reactions at the ribs. Two of them bend towards each other in curves which are longitudinally concave outwards, and two bend away from each other in curves which are longitudinally convex outwards. These beams join at the nodes of the cross section, where the radius remains substantially unchanged.

Upon the application of pressure to such a structure, girth bending moments, both in ribs and plating, are created which are proportional to the initial deviation of the tube from circular form. These moments cause deflections which further increase the moments, and the process continues until equilibrium is attained, provided that the tube material is not stressed beyond its elastic limit. Complete failure occurs when the elastic limit is reached, as deflections then increase more rapidly than resisting moments, and the ultimate strength of the material does not become a consideration. That is, the ultimate strength of the structure is fixed by the elastic limit of the material in it. Otherwise expressed, if any permanent set remained upon removal of a load causing stresses beyond the elastic limit, it would be equivalent to the assumption of a greater initial deviation from circular form.

It will be shown that practical considerations of plate thickness, rib strength and spacing are usually such that the four-beam arrangement will continue through the point of failure provided a reasonable assumption of initial deviation is made. As long as the integrity of the four beams is maintained the shell will not tend to form a greater number, and this integrity usually prevails in practical cases where the initial deviation from the mean diameter is taken at 1 per cent of the radius.

If, however, the ribs are made disproportionately great in comparison with the shell thickness, other things being equal, it is possible to produce a design, though not a good one, where the integrity of the beams is not maintained at the point of failure of the shell plating.

When the beams are overloaded in this respect they will crumple up laterally beginning at the node points and if the material is perfectly homogeneous, and the thickness uniform, the shell will break into an even number of beams greater than the four already in evidence thus relocating a greater number of symmetrically placed nodes amounting to 6, 8, 10, 12, 14, 16, etc., according to conditions which will be set forth. A rib, however, although now under the influence of a larger number of beams tending to break it into a larger number of waves will, nevertheless, continue in its general elliptical form influenced only to a slight degree by the superimposed waves acting on the more or less stable ellipse.

The moment there is developed a number of beams greater than four, failure of the shell between the ribs immediately takes place because the beam resistance is enormously weakened by this readjustment, thus relieving the rib and throwing almost the whole burden upon the girth strength of the shell itself. Under these conditions the rib may remain practically intact.

It is clear that when the rib is not overdesigned in comparison with the shell thickness, it will fail simultaneously with the mid-girth of the shell and this will always take place with only four beams. Proper designs, therefore, exclude any number of beams greater than four.

The nature of the beam loads is interesting. As will be shown later, they are four in number, two positive and two negative. They comprise five components, of which the first two may be taken together to make one load, as follows:

*First*—(*a*) A uniform load (positive) proportional to the product of the pressure and the assumed initial departure from circular form.

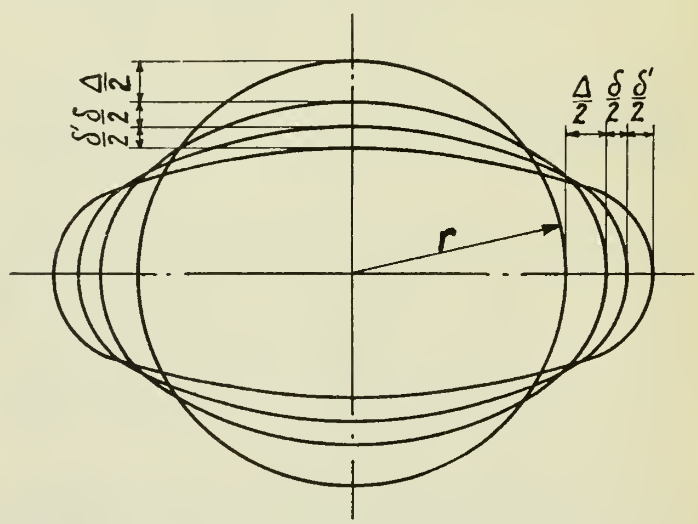

**Fig. 2—Exaggerated Cross Section Midway between Ribs.**

(*b*) A uniform load (positive) proportional to the product of the pressure and the further distortion of the rib due to the imposed load.

*Second*—A variable load (positive) proportional to the product of the pressure and the ordinates of the longitudinal elastic curve of the beam.

*Third*—A uniform load (negative) proportional to the further distortion of the rib.

*Fourth*—A variable load (negative) proportional to the ordinates of the longitudinal elastic curve.

Inasmuch as the individual deflections caused by each of these loads have their maximum at the same mid-point, the net deflection there resulting is the algebraic sum of the individual deflections and also the net maximum bending moment occurring at the rib is the algebraic sum of the individual bending moments.

Let us consider next the bending of these longitudinal beams under the loads described as variable, such that the load at any point on the length of the beam is proportional to the deflection at that point. In the interest of simplicity we may assume that the curve of such a loading is expressed by the equation

$$\frac{4\,x_c^2}{l^2} + \left(\frac{y_c}{h}\right)^{\frac{1}{2}} = 1 \qquad (1)$$

where $h$ is the (to be) known maximum ordinate and $x_c$ and $y_c$ are the co-ordinates of the curve, with the origin at mid span. This in fact is the equation of the deflection curve of a uniformly loaded beam with fixed ends. The mean ordinate of this curve is 8/15 times the maximum; the maximum deflection of a beam with fixed ends under this loading is $Bw_cl^4/EI'$ where $B = 0.0020213$ and $w_c$ is the maximum rate of loading at the centre. The end moments of the beam under this loading are $(2/35)(15\,W_Bl/8)$, where $W_B$ is the total load on the beam $= 8\,w_cl/15$.

By way of refinement of this assumption the author has determined, by empirical and graphical methods, a loading curve which is almost exactly proportional everywhere to the deflection which it causes on a beam with zero slope at its ends, and he finds the deflection coefficient $B' = 0.0019894$ differs by only 1.6 per cent from the value given by the approximate method above mentioned. The equation for this curve is

$$y_c = w\,(1 + \gamma^4 - 1.926\,\gamma^2 - 0.074\,\gamma) \qquad (2)$$

where $\gamma = 2\,x_c/l$ and $w$ is the maximum rate of loading. The deflection curve which results from this loading is

$$\frac{16EI'y_c}{wl^4} = 0.03183 - \gamma^2\left(-\frac{\gamma^6}{1680} + 0.00535\,\gamma^4 + 0.000617\,\gamma^3 - \frac{\gamma^2}{24} + 0.06812\right) \qquad (3)$$

Hence further correction of the loading curve to give closer agreement with the deflection curve is unnecessary. This value $B'$ is used with unyielding ribs; $B$ is used for yielding ribs.

The greatest error in using the approximate method of equation (1) would occur if applied to perfectly circular tubes with ribs of such excessive stiffness that the shell would fail without distorting them. Where there is any appreciable uniform load, and especially where it predominates, the error in using the method of equation (1) can be only a small fraction of 1.6 per cent and the use of this equation for yielding ribs is therefore entirely justified. Further, the deflection coefficients, if referred to total beam loads, differ only by 0.8 per cent.

The net loads on these beams alternate outward and inward, but the beams differ from free ones in that they are united at the node loci. This fact, however, introduces no particular complication, merely resulting in a shifting of the neutral axis from the centre of gravity of the arc to the base; i.e., to the chord through the nodes. This must be the case because otherwise if the beams were not united by shearing stresses, we should have equal and opposite stresses occurring at the same point. These beams, therefore, may accurately be treated as simple beams in which there is introduced just sufficient axial force, due to the shear, to shift the neutral axis from the centre of gravity to the edge.

To compute stresses and deflections in such a beam it is only necessary to make use of the large moment of inertia about the base. It is possible for these beams to deflect inwardly and outwardly with small motion without interference with each other, by virtue of a tangential slipping of the nodes, thus slightly humping up one beam while its neighbours are correspondingly flattened.

These relative girth motions disturb to a slight extent the accuracy of the moment of inertia figured on a true circular arc but for small motions such as we are considering, one is stiffened about as much as the other is weakened and no error is indicated because it is the joint or composite action in which we are interested.

The deflection of the beam as a whole is therefore considered to be that of the neutral axis at the base and this bears a definite relation to the deflection at the apex according to the number of beams developed. It should be distinctly borne in mind that such limiting equations as are herein set forth purporting to give the ultimate failure point of perfectly circular tubes are not recommended for the purpose of design and are given only to determine the proportions of a design in which stresses may be accurately figured with four beams and also possibly for the further reason of comparing such limiting results with those given by others who have treated only that phase of the question.

The author takes no particular interest in these limiting results because he has little confidence in them as criteria for the reasonable and economical design of large thin tubes with equally spaced *yielding* ribs, which is the only field intended to be covered by this analysis. The general polar equation of the elastic curve of the shell-girth which he has used, is the familiar one obtained by superimposing a sine curve upon a circle as follows:

$$R - r = (R_{\text{max.}} - r)\cos\frac{n\phi}{2} \qquad (4)$$

where $R$ is the radius vector and $n$ is the number of beams.

When $n$ is equal to four it will be seen that this curve approaches an ellipse as $R_{\text{max.}}$ approaches $r$ and the curve appears to be quite accurate enough for all practical purposes. The stress analysis will be carried out only with four beams because that is the only natural distortion which might exist and does exist, to some extent at least, prior to the application of load, either as a real measurable eccentricity or more subtly as a lack of homogeneity either of material or construction. The analysis will be based upon the assumption of a relatively thin shell and is intended only to cover a range in the values of $t/r$ of from 0.02 to 0.006, say.

It may be interesting to trace the behaviour of a perfect tube with fixed values of $a = l/r$ and $b = t/r$, but permitting both the rib and the pressure to increase in such a manner as just to produce failure.

Starting with a weak rib, it is clear that no more than four beams will be developed.

As the rib and load are increased, there would naturally come a time when the integrity of the beams could not be maintained and where there would be a sudden readjustment of the shell into a larger number of them.

This new number of beams may be any even number greater than four depending upon the values of $a$ and $b$. In other words, the number suddenly jumps from four to 6, 8, 10, 12, 14, 16, etc., without paying any attention to the intermediate possibilities when the number is greater than six. It increases as $a$ decreases so that if $b$ is fixed and $a$ is changed to the extent that the number of beams would have a free choice of two numbers and at the same time, of course, the same choice of keeping four, there would evidently be a series of values of $a$ for failure to take place with a free choice of three different numbers of beams for the same critical values of rib strength and pressure. This relationship can easily be demonstrated by trial with the equations given later, but it will not here be further considered as it is rather beside the point of the present purpose.

If the strength of the rib be further increased after the above critical point is reached an interesting thing happens.

It will be found that the corresponding increase in the pressure to keep at the point of failure needs to be practically nothing so that further increase of the rib strength all the way to infinity has a negligible effect upon the ultimate strength of the design. The reason for this is that the formation of a larger number of beams immediately relieves enormously the girth bending stresses in the rib and throws practically the whole burden upon the girth strength of the shell itself.

This is a fortunate circumstance because it is much simpler to figure the number of beams with a perfectly rigid and immovable rib and the critical pressure thus found is practically the same as would be required with a minimum finite rib just required to develop more than four beams.*

All these statements may be verified with the equations which are given later in the paper.

To begin the analyses, let us first consider a thin tube which, when under no load, has a cross section differing slightly from a circle according to equation (4). If a uniform pressure $p$ be then applied, the tube will deflect radially. If the maximum radial deflection is $\pm \delta/2$ and if $\pm\Delta/2$ and $\pm\Delta'/2$ are the initial and final maximum radial departures from circular form we have $\Delta'/2 = \Delta/2 + \delta/2$. An analysis of this case by well known methods of treating arch rings, not necessary here to elaborate, shows that the maximum bending moment $M$ where the radius vector is a maximum or minimum is

$$M = \frac{pr\Delta'}{2} \quad \text{(5)}$$

and likewise, when there are four beams

$$\delta = \frac{pr^3\Delta'}{3EI_o} \quad \text{(6)}$$

where $I_o$ is the moment of inertia of the wall of the tube or $t^3/12$ per unit length. In general terms, for any number of beams

$$\delta = \frac{4\,pr^3\Delta'}{EI_o\,(n^2 - 4)} \quad \text{(7)}$$

Hence

$$\delta = \frac{2\,r^2M}{3\,EI_o} \quad \text{(8)}$$

or in general terms

$$\delta = \frac{8\,r^2M}{EI_o\,(n^2 - 4)} \quad \text{(9)}$$

Also the extension or shortening of a side of an inscribed square, with its corners at the nodes, is found to be

$$\frac{pr^3\Delta'}{6\sqrt{2}\,EI_o} \quad \text{(10)}$$

or 0.3536 as much as that of the diameter.

The extension or shortening of a long side of an inscribed rectangle, the short side being the width of a beam, is found to be in general terms

$$\frac{8\,pr^3\Delta'\sin(\pi/n)}{EI_on\,(n^2 - 4)} \quad \text{(11)}$$

or $(4/n)\sin(\pi/n)$ as much as that of the radius.

Where $n$ is a multiple of 4, $\Delta'$ represents change in diameter.

*The greatest error due to this assumption occurs for values of $a\sqrt{b}$ between about 0.77 and 1.0.

Where $n$ is not a multiple of 4, $\Delta'$ represents twice the change in radius.

It may be argued that these deflections are strictly accurate only for inappreciable distortion because the distortion itself increases the moment, but in answer to this it may be pointed out that we are not now seeking absolute quantities but only the ratio of the deflection and bending moment which is highly accurate even for appreciable distortion.

With this preliminary step in mind, a table of nomenclature is given below for use in the subsequent development. The units are in terms of pounds and inches.

Nomenclature

$p$ = external pressure.

$p_v$ = that portion of the total pressure $p$ which is sustained by girth flexure of the tube plate at any section $x$ inches from a rib. It varies with $x$.

$p' = p - p_v$ = the portion of the total pressure $p$ at any section, which is transmitted by beam action to the adjacent ribs.

$p_b$ = value of $p$ for which $f = f_M$, that is, for which the maximum girth bending stresses in the ribs and at the midpoint of the shell are equal.

$p_e$ = value of $p$ for which $f = f_e$, that is, for which the maximum stress in the ribs reaches the elastic limit.

$p_e'$ = an approximate value of $p_e$.

$p_u$ = pressure of collapse for infinitesimal $\Delta$ with yielding ribs for suitable value of $n$.

$p_c$ = rupture pressure for infinitesimal $\Delta$ with unyielding ribs for suitable value of $n$.

$p_o = \frac{Et^3}{4r^3} = \frac{Eb^3}{4} = \frac{3EI_o}{r^3}$ = rupture pressure of an unstiffened tube for infinitesimal $\Delta$ with $n = 4$, or, in general terms,

$= \Theta Eb^3$ where $\Theta = \frac{n^2 - 4}{48}$ and $n$ = the number of beams.

$\rho = 1 - \frac{p_o}{p}$.

$r$ = radius of the undeformed tube.

$t$ = thickness of the tube shell.

$b = t/r$.

$l$ = spacing of ribs.

$a = l/r$.

$\Delta$ = maximum extension $\pm$ of the diameter initially existing before application of load, due to slightly imperfect construction.

$\delta$ = further extension of the diameter $\pm$ at a rib, due to the load.

$0.3536\,\delta$ = corresponding extension $\pm$ of the chord of a quadrant.

$\Delta' = \Delta + \delta$.

$\delta'$ = still further extension of the diameter at the midpoint between ribs, in excess of $\Delta'$.

$y$ = corresponding diametral extension at any point $x$ inches from a rib, varying from 0 to $\delta'$.

$I$ = moment of inertia of cross section of rib acting integrally with $d$ inches of tube plate, diminished by $d.t^3/12$. It is taken about the common centre of gravity of the two, just as if the rib were of infinite curvature. The value of $d$ is a matter of judgment and is considered later, but a few trials will easily show that its precise value is not of great importance.

$S$ = corresponding section modulus.

$e = I/S$.

$X = I/r^4$.

$s = S/r^3$.

$I'$ = the moment of inertia of a quadrant of unstiffened tube about its chord as a neutral axis = $0.0708\,r^3t$, for four beams, or in general terms,

$$I' = \frac{\pi\, t^3 r}{6\, n} \cos^2(\pi/n) + \left\{(\pi/n)\left[1 + 2\cos^2(\pi/n)\right] - 3\sin(\pi/n)\cos(\pi/n)\right\}\left\{r^3 t + \frac{r.t^3}{4}\right\}$$

$X' = I'/r^4$.

$S'$ = corresponding section modulus = $.2417\, r^2 t$ for $n = 4$.

$s' = S'/r^3$.

$E$ = modulus of elasticity.

$G = \frac{pr^3 l}{3\,EI} = \frac{pa}{3\,EX}$ or, in general terms, $G = \frac{4\,pa}{(n^2 - 4)\,EX}$.

$K = \frac{1.288\,p}{6.192\,Eb/a^4 - p\rho}$ with $n = 4$

$= \frac{Ap}{B'(\Sigma Eb/a^4 - p\rho)}$ in general terms, $n > 4$.

$C = 1 + \frac{8}{15}\,\rho K$.

$N = GC\rho$.

$f_c$ = unit girth stress of compression in rib = $pr/t$ (neglecting the area of rib). That is, the unit stress in the rib is assumed to be the same as the unit compressive stress in the plate, without the rib.

$f'$ = maximum girth bending stress in rib, including $d$ inches of plate.

$f = f_c + f'$ = maximum total girth stress in rib.

$f''$ = maximum longitudinal bending stress in a beam at a rib.

$f'''$ = maximum girth bending stress on a ring mid-way between ribs.

$f_M = f_c + f'''$ = maximum total girth stress in this ring.

$f_v$ = maximum girth bending stress in a ring of plate at any point $x$ inches from the rib.

$f_e$ = elastic limit of tube material.

$M'$ = maximum girth bending moment in rib corresponding to $f'$.

$M''$ = maximum longitudinal bending moment in plate corresponding to $f''$.

$m$ = maximum net girth bending moment per inch of plate at any point, $x$ inches from the rib, transferred to the rib by beam action.

$m'$ = corresponding bending moment sustained by the plate itself, giving rise to the stress $f_v$.

$A$ = .0026042 = 1/384 = deflection coefficient for a fixed beam uniformly loaded.

$B$ = .0020213 = deflection coefficient for yielding ribs.

$B'$ = .0019894 = deflection coefficient for unyielding ribs.

$w$ = beam load per running inch.

$W$ = total beam load.

$a'$ = value of $a$ when $f = f_M$ for infinitesimal values of $(p_u - p_b)$ and $\Delta$.

$$z = \frac{2\,e - t}{r}$$

$$\Sigma = \frac{X'\sin(\pi/n)}{nbB'\cot(\pi/n)}$$

* * *

When a tube, with circumferential ribs, is initially out of round by an amount $\Delta$ for its whole length, and when a uniform external pressure $p$ is applied, the maximum girth bending moment at any ring of unit length is, as in equation (5)

$$m + m' = \frac{pr\,(\Delta' + y)}{2} \qquad (12)$$

and the portion transferred to the rib is

$$m = \frac{p'r\,(\Delta' + y)}{2} \qquad (13)$$

whereas the remainder, sustained by the girth flexure of the plate is

$$m' = \frac{p_v r\,(\Delta' + y)}{2} \qquad (14)$$

We have already found in equation (8) that the deflection is $2\,r^2/3\,EI_o$ times the bending moment and as $I_o$ now equals $t^3/12$ we have for the deflection of a unit ring of plate

$$\delta + y = \frac{4\,p_v r^3\,(\Delta' + y)}{Et^3} \qquad (15)$$

whence

$$p_v = p_o\frac{(\delta + y)}{(\Delta' + y)} \qquad (16)$$

therefore

$$m = \frac{r}{2}\left[p\,(\Delta' + y) - p_o\,(\delta + y)\right] = \frac{pr}{2}\left[\Delta + \rho\,(\delta + y)\right] \qquad (17)$$

and

$$\int_o^l m\,dx = M'$$

With the assumed longitudinal curve of flexure, equation (1), this integration becomes simple with mean ordinate $y = 8\delta'/15$ and

$$M' = \frac{prl}{2}\left[\Delta + \rho\left(\delta + \frac{8}{15}\,\delta'\right)\right] \qquad (18)$$

We may now equate the deflection at the rib to $2\,r^2 M'/3\,EI$ and we have

$$\delta = G\left[\Delta + \rho\left(\delta + \frac{8}{15}\,\delta'\right)\right] \qquad (19)$$

We come now to the relation between the pressure and the beam load. If the girth stiffness and the beam action of the plate be temporarily neglected, then for any value of $x$ there are two opposing tangential forces, perpendicular to the longitudinal plane containing the tube axis and the centre line of the beam, each amounting to $p\,(\Delta' + y)\,dx/2$. The total of such forces on one beam is then

$$\int_o^l p\,(\Delta' + y)\,dx$$

Inasmuch as these opposing forces do not support each other with the girth stiffness neglected, they must somehow be entirely counteracted by the beam loads in a plane perpendicular to the plane joining adjacent nodes. As in Fig. 3 we can resolve into components along radii to the nodes, which cancel, and into components along radii to the centre

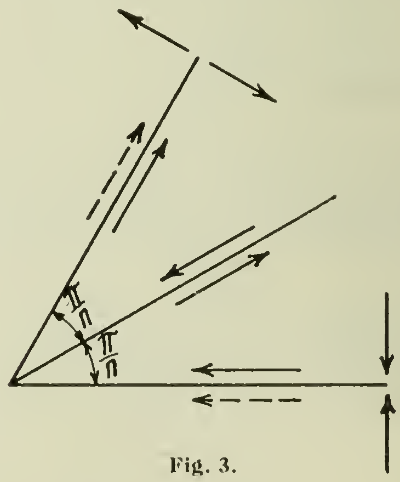

Fig. 3.

line which add, giving beam loads, when all beams are considered, amounting to $2\,p\,(\Delta' + y)\cot(\pi/n)\,dx/2$. If now we take into account the girth stiffness of the plate itself we have for each of four beams

$$w = p'\,(\Delta' + y) \qquad (20)$$

or in general terms

$$w = p' (\Delta' + y) \cot (\pi/n) \ldots\ldots\ldots\ldots (21)$$

and $$W = \int_o^l w\,dx$$

As the mean value of $y$ is $8\,\delta'/15$ this may be integrated with the aid of equation (16) and the relation $p' = p - p_v$ to give the total beam load which may be subdivided into the four components.

$W_1 = pl\,\Delta'$ (positive)
$W_2 = pl\delta'\,8/15$ (positive)
$W_3 = p_o l\,\delta$ (negative)
$W_4 = p_o l\delta'\,8/15$ (negative)

The deflection at the mid-span of the beam produced by the first and third rectangular load diagrams is

$$Al^3\,(W_1 - W_3)/EI'$$

and the deflection produced by the second and fourth load diagrams shaped like the deflection curve is

$$Bl^3\,(W_2 - W_4)\,15/8\,EI'.$$

The total deflection of the neutral axis at mid-span $= \dfrac{0.3536\,\delta'}{2}$

and this is made up of the algebraic sum of these deflections so we may write

$$\frac{\delta'}{2} = \frac{pl^4\,(A\Delta' + B\delta') - p_o l^4\,(A\,\delta + B\delta')}{0.3536\,EI'} \ldots\ldots (22)$$

Solving this we have $\delta' = K\,(\Delta + \rho\delta)$, and substituting in equation (19) and solving again we have

$$\delta = \frac{N\Delta}{\rho\,(1 - N)} = \frac{GC\Delta}{1 - N} \ldots\ldots\ldots (23)$$

Hence $$\delta' = \frac{K\Delta}{1 - N} \ldots\ldots\ldots\ldots\ldots\ldots (24)$$

Reverting now to equation (18) we may substitute for the deflections their values in terms of known quantities and write

$$M' = \frac{prl\,C\Delta}{2\,(1 - N)} \ldots\ldots\ldots\ldots\ldots (25)$$

whence the maximum girth bending stress in the rib is

$$f' = \frac{prl\,C\Delta}{2\,S\,(1 - N)} \ldots\ldots\ldots\ldots\ldots (26)$$

and adding the direct stress $f_c$ we get the maximum combined stress

$$f = f' + f_c \ldots\ldots\ldots\ldots\ldots\ldots\ldots (27)$$

Observe that $K$ is often nearly zero and may then be neglected. Consequently $C$ becomes $= 1$ and the preceding expressions are much simplified.

To obtain the stress $f'''$ we have from equations (14) and (16) $m' = \dfrac{p_o r\,(\delta + y)}{2}$.

Dividing this by the section modulus, $t^2/6$, we have

$f_v = \dfrac{3\,p_o r\,(\delta + y)}{t^2}$ or putting $y = \delta'$ we have

$$f''' = \frac{3\,Et\,(N + \rho K)\,\Delta}{4\,r^2\rho\,(1 - N)} \ldots\ldots\ldots\ldots (28)$$

and $$f_M = f''' + f_c \ldots\ldots\ldots\ldots\ldots\ldots (29)$$

Parenthetically, we may, in this equation, put $I = 0$ and obtain the girth bending stress for an unstiffened tube. $G$ and $N$ become $\infty$ and $f'''$ becomes

$$f_o' = \frac{3\,Et\Delta}{-\,4\,r^2\rho} = \frac{3\,Ebp\Delta}{(Eb^3 - 4\,p)\,r} \ldots\ldots\ldots (30)$$

And the total stress

$$f_o = f_o' + f_c \ldots\ldots\ldots\ldots\ldots\ldots (31)$$

It is apparent that failure will take place when $4\,p = Eb^3$ even for an infinitesimal value of $\Delta/r$, or, in other words, when $p = p_o$. This equation was stated by Boussinesq.

The stress $f''$ is usually unimportant, but it may be found in a manner similar to that used in deriving equation (22).

The longitudinal bending moment, in the plate at the stiffening ribs, produced by the rectangular loadings is $(W_1 - W_3)\,l/12$ and the bending moment at the same place produced by the loadings shaped like the deflection curve is

$$\frac{2}{35}\left(\frac{15}{8}\,(W_2 - W_4)\,l\right)$$

The total bending moment at the ribs is then the sum, so

$$M'' = \frac{1}{12}\,pl^2\left(\Delta + \rho\delta + \frac{24}{35}\,\rho\delta'\right)$$

and $$f'' = \frac{pl^2\left(1 + \frac{24}{35}.\,K\rho\right)\Delta}{12\,S'\,(1 - N)} \ldots\ldots\ldots (32)$$

Equating the values of $f'$ and $f'''$ and solving for $p$ we obtain the pressure which would produce equal maximum stresses in the rib and in the plate mid-way between them,

$$p_b = Eb\left[\frac{19.788}{a^4} - \frac{12.353\,X}{az}\right] + p_o \ldots\ldots\ldots (33)$$

or, in general terms, with $n > 4$

$$p_b = Eb\left[\frac{3.196\,\Sigma}{a^4} - \frac{49.411\,\theta X}{az}\right] + p_o \ldots\ldots (34)$$

Also, by forming the equation $N = 1$ and solving for $p$ we get a particular value of the pressure which produces an infinite stress in all equations and hence collapse even for infinitesimal $\Delta$. This pressure, which can not exceed $bf_c$ is

$$p_u = p_o + \frac{Q}{2} - \sqrt{\frac{Q^2}{4} - T} \ldots\ldots\ldots\ldots (35)$$

in which $$Q = \frac{E}{a}\left[\frac{19.788\,b}{a^3} + 9.588\,X\right]$$

and $T = \dfrac{59.364\,E^2 Xb}{a^5}$ for yielding ribs with $n = 4$,

or, in general terms, when $n > 4$,

$$Q = \frac{E}{a}\left[\frac{3.196\,\Sigma b}{a^3} + 38.352\,\theta X\right]$$

and $$T = \frac{38.352\,\Sigma\theta E^2 Xb}{a^5}$$

When $X$ is put $= \infty$ to give the pressure of collapse for unyielding ribs, the preceding equation becomes indeterminate, but upon evaluation by the theory of indeterminate forms we get another particular value of $p$, viz.:

$$p_c = Eb\left[\frac{\Sigma}{a^4} + \theta b^2\right] \ldots\ldots\ldots\ldots\ldots (36)$$

The same result may also be obtained by equating the denominator of $K$ to zero and solving for $p$.

It will be noted in the particular value given for $K$ when $n = 4$ that the coefficient of $Eb$ is slightly less than the value obtained by substituting $n = 4$ in the expression for $\Sigma$. This is because $B$ is used in the first and $B'$ in the second case.

When $p > p_b$, $f''' > f'$. When $p < p_b$, $f''' < f'$.

Eliminating $p$ in equations (33) and (35) and solving for the value of $a$, we have,

$$a' = \left[\frac{1.101\,z\,(z + 1.875\,b)}{X\,(z + 1.288\,b)}\right]^{\frac{1}{3}} = 1.033\sqrt[3]{\frac{z}{X}}\ \text{(nearly)} \ldots (37)$$

or, in general terms,

$$a' = \left[\frac{.0444\,\Sigma z\,(z + 1.875\,b)}{\theta X\,(z + 1.288\,b)}\right]^{\frac{1}{3}} = .354\sqrt[3]{\frac{\Sigma z}{\theta X}}\ \text{(nearly)} \ldots (38)$$

For infinitesimal values of $\Delta$ the following relations may be stated:

When $a < a'$, or $p_u < p_b$, failure is initiated at the rib causing simultaneous failure at the mid-point.

When $a > a'$, or $p_u > p_b$, failure occurs at the mid-point. The beam, at the point of failure, ceases to increase the load on the rib, although this is not taken into account in the derivation of equation (26). With $a$ only moderately greater than $a'$ the rib may not be strained beyond the elastic limit and may thus be left intact. No error is indicated in equation (26) for its intended purpose.

For appreciable values of $\Delta$, $f > f_M$ when $a = a'$ and $p < p_u$.

In practice it will seldom be found desirable or even advisable to make $p > p_b$ or even $a > a'$ and, therefore, equation (27) will practically always control the design.

In computing the stress $f$ care should be taken to choose a value of $p$ as great as is conceivably possible in the circumstances, because the stresses may increase rapidly if $p$ happens to be a little greater than was assumed. In any case the designer will probably grasp the method better if he repeats his calculations with a slightly higher value.

The importance of the quantity $\Delta$ has doubtless become apparent to the reader; in fact no intelligent idea of the stresses can be reached without it. Experience has shown that no hardship is imposed on a manufacturer if he is required to guarantee that $\Delta$ shall not be greater than one per cent of the radius, and this provision should be included in the specifications, and can hence be used as the basis for design, with reasonable stresses. If $\Delta$ should happen to be less than this, deflections and bending stresses will be proportionately reduced. No lesser value should however be used in computation.

As engineers we are not interested in knowing how great a pressure will certainly cause failure of an ideal shape; we wish rather to know how great a pressure will certainly *not* create dangerous stresses in an actual practicable shape: and these two pressures bear no definite relation to one another. Hence the computation of the first mentioned one, such as $p_u$ is of very doubtful value in design. The author therefore recommends only those of his equations which are used to find stresses when $\Delta = 0.01\,r$ to $0.02\,r$, but he has included such equations as (35) and (38) for comparison with similar equations which may have been presented by others. These and all other equations based on buckling should not be taken too seriously.

The assumption of four nodes and only four, for computing stresses, is based upon common observation of a physical fact. It is easily observable that a slightly deformed tube with reasonable shell thickness does, actually, develop exactly four nodes, two of the quarters approaching each other whilst the other two recede from each other.

There remains now only to point an easy way to tell when a design is a proper one, the stresses in which may correctly be computed with the foregoing equations.

It is evident that failure will take place with four beams so long as $p_e \gg p_c$.* While it is tedious to get a perfect value for $p_e$ with equation (27), it is, nevertheless, easy to arrive at a value $p_e'$ which is nearly right and always slightly greater than $p_e$.

This is accomplished by making $C = 1$ in equation (27) and solving for $p$ as follows:

$$p_e' = \frac{q}{2} - \sqrt{\frac{q^2}{4} - v} \quad \text{.......................(39)}$$

in which

$$q = \frac{E}{4\,a}(12\,X + ab^3) + b\left(\frac{3\,EI}{2\,rS}\frac{\Delta}{r} + f_e\right)$$

and
$$v = \frac{Ebf_e}{4\,a}(12\,X + ab^3)$$

*The more exact value $p_u$ may be used instead of $p_e$, but this refinement is not likely to influence the design. The correction is appreciable only for values of $a\sqrt{b}$ near 0.77 and up to about 1.0.

We are therefore sure that the stress equations may properly be used when $p_e' \gg p_c$.

Solving equation (39) for $a$ with $\Delta/r = 0.01$, we have

$$a = \frac{12\,X}{\frac{p}{E}\left[\frac{.06\,Ebe/r}{bf - p} + 4\right] - b^3} \quad \text{............(40)}$$

This equation is useful in determining very nearly a correct value of $a$ when the other features of the design are assumed.

The calculation of $p_c$ will be greatly facilitated by Table I. Having calculated $a\sqrt{b}$ observe the zone in which the result lies, using the proper column for $b$. The appropriate values of $\Sigma$ and $\Theta$ are found on the same line and are substituted in the simple equation (36)

$$p_c = Eb\left(\frac{\Sigma}{a^4} + \Theta b^2\right)$$

The value of $n$ shown on the same line, is to indicate the number of beams which will be in existence at the time of failure, if of course the ribs are strong enough to develop them.

The critical values of $a\sqrt{b}$ where $\Sigma$ and $\Theta$ change are found by making $p$ simultaneous in two equations having successive values of $\Sigma$ and $\Theta$. Inasmuch as both $\Sigma$ and $a\sqrt{b}$ vary to some extent with the actual value of $b$, such variation is indicated in the table.

If more exact values of $\Sigma$ are required for intermediate values of $b$ not listed they may easily be obtained by remembering that the percentage increase varies as $b^2$. Corrections of less than one per cent are not indicated.

An economical design can only be made with the aid of judgment. A reasonable design must first be tentatively assumed by recourse to such simple formulae as are available, after which the true stresses may be computed and if not suitable a new trial made.

If the ribs are chosen with too heavy a section, the calculated value of $a$ will be unduly large, and $p_e$ will be greater than $p_c$. If the rib is too small, the proper relation $p_e \gg p_c$ will prevail, but the difference between them will be too great for economy.

It will be found that if a design is laid out with good engineering judgment, the elastic limit will always be reached before the integrity of the four beams is disturbed; but in order to be sure that no more than four beams can be in evidence, it is better in all cases to check up to see that $p_e' \gg p_c$; if it should be, the values of $a$ and $X$ must be reduced, for the same stress and thickness of plate.

The writer is not interested in the values of $p_u$, as before stated, but it may be pointed out that the proper values of $\Sigma$ and $\Theta$ to be used are very nearly within the same ranges of values of $a\sqrt{b}$ as given in the table and furthermore, it would be always necessary to figure the value of $p_u$ with four beams to be sure that this is not less than the value figured for the proper range of $a\sqrt{b}$.

If the value of $a\sqrt{b}$ should be only a little smaller than a transition value where $\Sigma$ and $\Theta$ suddenly change, it is better in such cases to figure $p_u$ with two successive values of $\Sigma$ and $\Theta$, as well as the value for four beams, to see which of the three is the least, because the minimum value naturally controls. It is possible to make charts to determine the definite values of $\Sigma$ and $\Theta$ in this case as the table does for $p_c$ but this refinement is hardly worth applying to the use of an equation which is at best of very doubtful practical value.

No great importance is attached to a meticulous precision of values of $p_c$, a quantity which is practically useful only as a means of determining when a rib is too rigid for the plate thickness and spacing used with it. With this point of view in mind, $p_e'$ might usefully be compared with authentic values of $p_c$ obtained by other writers.

It should be understood that the author is not attempting to compete with others in the academic determination of the ultimate strength of perfect tubes: his efforts in that direction are intended only to present a simple formula such as (27) for purposes of practical design, when there is a clause, written in the specifications, that "no two diameters measured in any transverse plane shall differ by more than one per cent."

A close observer will immediately discover that the writer's simple conception of beam action does not completely take care of all the forces in evidence such, for example, as certain longitudinal tension due to relatively greater compression at the mid-point than at a rib and also due to the lengthening of the node loci by tangential slipping at the nodes but it is believed that any such refinements would have a negligible effect upon equation (27) and that such effect as they do have is not in the direction of error on the unsafe side.

In conclusion, the author hopes his critics will weed out any errors which he may have overlooked. It may be well to call attention to the fact that a designer who becomes familiar with the principles of the paper will be able to produce a practical design with formula (40) alone, but until then he should employ the other formulae whose importance has been mentioned in the course of the development.

Due acknowledgment is made to Jeffrey B. Macphail, A.M.E.I.C., for his assistance in editing this paper for publication. Those who saw the manuscript dated September 1932 will agree that he has clarified it considerably.

## APPENDIX

A numerical example will be interesting and helpful for understanding the application of the formulae. A single one will suffice, as will be seen when the law of similitude for these designs is stated.

The first point to be settled is the value of $d$, the length of plate which is assumed to be acting integrally with the ribs in resisting girth deformation.

When equal leg angles are used for ribs, and when the thickness of the plate is not less than that of the angle, a convenient empirical rule for which there is at least some theoretical justification is to take enough plate to increase the section modulus of the angle by 33 per cent. This corresponds roughly to an increase of 75 per cent in the moment of inertia of the angle. Exactness of the latter is not necessary, because the value of $a$ in equation (40) is not at all sensitive to changes in this element. If an angle with unequal legs is to be used, the value of $d$ should be calculated with the equal leg angle required by the rule, and this value would then be used for the unequal angle chosen.

This rule arises from the consideration that for reasonable working stresses with $\Delta/r = 0.01$ and rib spacing of $d$ inches, the structure is not weakened by assuming momentarily that the rivets uniting the angle and plate are removed, thus relieving the angle of compressive stress and putting it all in the plate.

In other words, the bending stress $f'$ in the unattached angle is less than the maximum combined stress $f$ when the angle acts integrally with $d$ inches of plate, even when the compressive stress $f_c$ is reduced by including the angle area with that of the plate.

Nothing is claimed for this rule except that it is safe for use. A smaller value of $d$ is certainly not necessary, and a reasonably larger value does not result in any appreciable economy. In some unusual case it might lead to a value of $d$ greater than $l$ but in that event one would of course take $d = l$.

The permissible percentage increases in the section modulus and moment of inertia of an angle due to the presence of the plate may of course be calculated in any particular case from the consideration of equal stress with and without the rivets, and it will be found that these increases may sometimes exceed 33 and 75 per cent respectively.

A good empirical rule for trial values is

$$S/S_a = 1.33 + 0.25\,(16 - k/t_a)\sqrt{b - 0.006}$$
$$I/I_a = (S/S_a)^2$$

where $S_a$ = section modulus of angle $k \times k$ inches in size and of thickness $t_a$ inches, and $I_a$ is the moment of inertia of the angle.

For an actual example, assume the following data:—

$\Delta/r = 0.01$ $\quad p = 15$ pounds per square inch
$r = 60$ inches $\quad t = 7/16$ inches
$E = 30 \times 10^6$ pounds per square inch
$f$ = maximum combined stress = 15,000 pounds per square inch
Rib = 6 inches × 6 inches × 7/16 inches angle
$f_e$ = elastic limit = 30,000 pounds per square inch.

In this case a value of 40″ was taken for $d$, increasing the section modulus of the angle from 4.07 to 5.435 and the moment of inertia from 17.68 to 31.53. These values, while not precisely according to the rule given, are sufficiently close to make no practical difference in the design.

Applying equation (40) we find that $a = 3.50$ and $l = 210$ inches. Applying equation (39) we find that $p_e' = 24.84$ pounds per square inch. We find also that $a\sqrt{b} = 0.299$ which gives, from Table I, the values $\Sigma = 0.00404$ and $\Theta = 2$. Applying equation (36) we find that $p_c = 29.1$, which is greater than $p_e'$ as it should be. Other values which arise from the appropriate equations are $\Delta = 0.60$ inches, $\delta = 0.18$ inches and $\delta' = 0.0016$ inches.

TABLE I

| Range of $a\sqrt{b}$ according to $b$ | | | 10,000 $\Sigma$ for $b < .005$ | Percentage increase in $\Sigma$ according to $b$ | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| $b \not> .01$ | $b = .015$ | $b = .025$ | | $b = .005$ | $b = .01$ | $b = .015$ | $b = .02$ | $b = .025$ | $\Theta$ | $n$ |
| ∞ to 1.954 | ∞ to 1.954 | ∞ to 1.954 | 62910 | | | | | | 1/4 | 4 |
| 1.954 to .778 | 1.954 to .778 | 1.954 to .778 | 2386.7 | | | | | | 2/3 | 6 |
| .778 to .404 | .778 to .404 | .778 to .405 | 240.83 | | | | 1.01 | 1.46 | 5/4 | 8 |
| .404 to .241 | .404 to .242 | .405 to .243 | 40.377 | | | 1.34 | 2.38 | 3.72 | 2 | 10 |
| .241 to .157 | .242 to .158 | .243 to .160 | 9.4168 | | 1.26 | 2.84 | 5.04 | 7.87 | 35/12 | 12 |
| .157 to .109 | .158 to .110 | .160 to .112 | 2.7451 | | 2.36 | 5.32 | 9.47 | 14.77 | 4 | 14 |
| .109 to .080 | .110 to .081 | .112 to .083 | .94168 | 1.02 | 4.08 | 9.18 | 16.31 | 25.49 | 21/4 | 16 |

Checking the stress by equation (27) we find that $f = 12{,}945 + 2{,}057 = 15{,}002$ pounds per square inch. This result is given with useless precision to show that it is slightly greater than the working stress assumed, but this difference is never of importance unless $a$ is greater than about 10 with plate thicknesses usual for large tubes. When $a < 10$ and when angles are used for ribs, with thicknesses about the same as that of the plate, equation (27) need not be used except as a check on the accuracy of numerical calculation.

Furthermore, equations (36) and (39) need not be used unless the leg of the angle is more than 14 or 15 times its thickness, and this ratio should be 10 to 15 times in the interest of economy.

These statements may be summarized by saying that equation (40) is alone sufficient for an experienced designer.

A useful law of similitude is found to exist, quite exactly enough for practical purposes. If an accurate scale drawing be made, without dimensions, the relation between stress and pressure can be found. For example, in the numerical example given above, if all the dimensions be reduced by one third, say, the tube would still support the same pressure with approximately the same stresses. The design would be as follows:

$r =$ 40 inches $t =$ 0.292 inches

$a =$ 140 inches

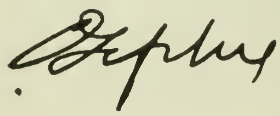
Ribs = 4 inches × 4 inches × 0.292 inch angles.

# Message From The President

During the past year it has been my privilege to visit the Branches of The Institute from coast to coast of the Dominion. Everywhere I found an admirable loyalty to The Institute and the objects for which it stands. On the part of our members there is a keen determination to help in every possible way in combating our present economic difficulties; the more fortunate of our members have helped generously both in money and effort in a general endeavour to ensure the welfare of those of their confreres who have found themselves in need. Thus the spirit of co-operation which has developed in the profession has shown its resourcefulness and solidarity.

The course of events during the latter part of 1933 gives many reasons for believing that we have passed through the worst of the emergency and that conditions are now improving slowly but surely. It is my hope and expectation that in the year now before us, this improvement will gather impetus, and continue with increasing rapidity.

With the expression of my gratitude for the unwavering support given to The Institute throughout this trying period, I extend to all our members my best wishes for a happy and prosperous New Year.



# The Forty-Eighth Annual General and General Professional Meeting

The Annual General Meeting for 1934 will be convened at Headquarters, 2050 Mansfield Street, Montreal, on Thursday, January 25th, 1934, at eight o'clock p.m.

After the transaction of formal business, the meeting will be adjourned to reconvene at the *Windsor Hotel, Montreal,* at ten o'clock a.m. on Thursday, February 8th, 1934, continuing with the professional sessions on the following day.

## Programme of Meeting at Montreal

(*Subject to Minor Changes*)

### Thursday, February 8th

9.00 a.m. *Registration.*

10.00 a.m. *Annual General Meeting* (Windsor Hall).
Reception and discussion of reports from Council, Committees and Branches.
Discussion of Council's proposals for amendment of By-laws.

12.45 p.m. *Formal Luncheon* (Rose Room).
Members $1.00.
Complimentary to visiting Ladies.
Welcome by the Chairman of the Montreal Branch, Dr. A. Frigon, M.E.I.C., and by His Worship the Mayor of Montreal.

2.15 p.m. *Annual General Meeting* (continued).
Scrutineers' report and election of officers.
Retiring President's address.
Induction of new President.

7.30 p.m. *Annual Dinner of The Institute* (Rose Room).
The President in the chair.
It is expected that the Prime Minister, the Right Hon. R. B. Bennett, K.C., P.C., LL.D., will address the members and ladies present.

9.30 p.m. *Reception and Dance* (Windsor Hall).
Tickets for Dinner and Dance, $2.50 per person.
Tickets for Dance only, $1.50 per person.
(Alexander's Orchestra.)

### Friday, February 9th

9.30 a.m. *Professional Sessions for the Presentation and Discussion of Papers.*

Oak Room. *Chairman*—P. B. Motley, M.E.I.C.

(1) *The Broadway Bridge, Saskatoon, Sask.*—by Dean C. J. Mackenzie, M.C.E., M.E.I.C., Dean of Engineering, University of Saskatchewan, Saskatoon, Sask.
(A reinforced concrete bridge over the South Saskatchewan River.)

(2) *Survey Work for the Lake St. Louis Bridge, Lachine*—by C. F. Draper, A.M.Inst.C.E., Lake St. Louis Bridge Corporation, Montreal.
(A steel highway bridge over the St. Lawrence, near Montreal.)

Prince of Wales Salon. *Chairman*—Dr. A. Frigon, M.E.I.C.

(1) *Stresses in Stiffened Circular Tubes under External Pressure*—by R. D. Johnson, M.Am.Soc.C.E., consulting engineer, New York, N.Y.
(To be presented by title only.)

(2) *Reflecting Telescope for the David Dunlap Observatory*—by R. K. Young, Ph.D., Department of Astronomy, University of Toronto.
(The largest telescope in the British Empire.)

(3) *Air Conditioning*—by G. B. Elliott, B.Sc., A.M.E.I.C.

12.45 to
1.45 p.m. *Buffet Luncheon* (Rose Room).
Tickets $1.00.

2.15 p.m. *Professional Sessions* (continued).

Oak Room. *Chairman*—P. B. Motley, M.E.I.C.

(1) *Substructure of the Lake St. Louis Bridge*—by J. A. Lalonde, B.A.Sc., A.M.E.I.C., Chief Engineer, A. Janin and Company Limited, Montreal.

(2) *Superstructure of the Lake St. Louis Bridge*—by W. Chase Thomson, M.E.I.C., Lake St. Louis Bridge Corporation, Montreal.

Prince of Wales Salon. *Chairman*—Dean E. Brown, M.E.I.C.

(1) *The Utilization of Magnesian Carbonates*—by F. E. Lathe, Director, Division of Research Information, National Research Council, Ottawa, Ont.
(For use in refractory materials and plastic cements.)

(2) *Department of National Defence Relief Camps and Projects*—by Major G. R. Turner, M.C., D.C.M., A.M.E.I.C., Assistant Director of Engineer Services, Department of National Defence, Ottawa.

8.00 p.m. *Smoker* (Windsor Hall) Music, and a Boxing Tournament.
Tickets $1.00.

The Ladies Committee is arranging for the entertainment of visiting ladies and a Ladies Programme will be issued.

### Hotel Arrangements

Members are recommended to make their reservations well in advance.

The management of the Windsor Hotel will give the following special rates (European Plan) to members attending the meeting:

Single rooms with private bath—$3.00, 3.50, 4.00, 4.50, 5.00 per day.

Double rooms with private bath—$5.00, 6.00, 7.00, 8.00 per day.

### Railway Rates

Both railways offer special return rates for groups of ten or more as follows:

(*a*) Organized parties having a minimum of ten up to fourteen persons: single fare and one half. Time limit sixteen days.

(*b*) Organized parties of fifteen or over: single fare and one quarter. Time limit sixteen days.

(*c*) Rate *good on coaches only*, a minimum of fifteen persons: single fare and one tenth. Time limit seven days.

All these fares require travelling together on the same train and date, with individual return on any train within the time limit.

THE
# ENGINEERING JOURNAL
THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOLUME XVII JANUARY 1934 No. 1

## The Forty-Eighth Annual Meeting of The Institute

The forthcoming Annual General and General Professional Meeting, to be held at the Windsor hotel in Montreal on February 8th and 9th, 1934, is being organized under the auspices of the Montreal Branch of The Institute, and, like the Ottawa meeting of last year, will last for two days. These, however, will be days of activity, for a very full programme has been arranged, an outline of which is given on another page.

The business sessions will be largely occupied by discussion on the far-reaching changes in the by-laws which have been proposed by Council. The most important features in these proposals are the establishment of one class of corporate member instead of the two classes now existing; the merging of the class of Student in that of Junior, and a reduction in the scale of annual fees. It is hoped that the arguments for and against these and the other proposals of Council will be thoroughly brought out in debate during the meeting, so that members may vote upon them subsequently in the letter ballot with full understanding as to their scope and probable results. It may be added that no Annual General Meeting of recent years has been called upon to consider matters of more vital importance to the welfare of The Institute.

At the professional sessions papers of a wide range of technical interest will be presented and discussed. The social features of the meeting will fully maintain the reputation which the Montreal gatherings have always had in that respect. They include a dance, and a smoking concert at which the principal feature will be a boxing tournament under the sanction of the A.A.U.

It is hoped that many visiting members from other branches will take advantage of the moderate rates offered by the railways and head for Montreal and the Forty-Eighth Annual Meeting.

## The E-I-C Engineering Catalogue 1933-1934

The many appreciative letters received regarding the first issue of the E-I-C Engineering Catalogue have fully justified the decision of the Council to continue the publication of this valuable reference book and indeed to enlarge it. The volume now in the press will be generally similar to that issued a year ago, but its contents will be materially extended both as regards the Products Data pages and the Indices.

A better understanding of the service that The Institute is rendering in publishing the Catalogue has resulted in a larger number of manufacturers including technical information regarding their products and greater attention has been given to the nature of the information they supply.

The Products Index, or list of engineering products which last year included some eighteen hundred items, will have twenty-four hundred different entries, and the Directory will contain some thirty-five hundred names in place of twenty-four hundred. It may be noted that: the Directory contains not only the manufacturers' names and addresses but also the names of their local representatives and the names of other firms they represent, if any. The names of Canadian representatives of British and foreign manufacturers also form a feature of the Directory.

The distribution of the new issue will also be extended. As was the case last year, copies will be distributed to all members of The Institute who fill in and return the inquiry cards which will be sent out in the course of a few days and the remainder of the issue of five thousand copies will be carefully distributed to those officers of important firms or organizations who can best make use of its lists and the technical information which it contains.

The new E-I-C Catalogue, like that of last year, is bound in a serviceable semi-flexible fabrikoid cover, and will fit either standard bookcases or filing cabinets, the overall size being 11⅜ inches by 8⅜ inches.

## Independent Springing in Motor Cars

The gradual process of development of the automobile during the past thirty years into a machine whose reliability is so remarkable, in spite of the unavoidable complexity of its structure, forms one of the most interesting stories in the records of mechanical engineering. During this period the general scheme of car design has undergone few radical changes, and the marked advances in riding comfort, reliability, performance and economy have largely been due to refinements in design and to the development of existing components based on the results of experience, together with improvement in the materials available, and the adoption of a number of accessories such as fuel pumps, shock absorbers, oil filters, and the like.

From time to time, however, an entirely new development leads to departure from some old and well tried arrangement, and important innovations are perfected involving change in some main feature of the car or its structure. Such ideas as the fluid flywheel, or complete stream lining of the body, seem likely to belong to this class. Another movement of this kind, which is now in progress, involves the adoption of independent springing for the wheels, a matter to which hitherto considerably greater attention has been paid in Europe than on this side of the Atlantic. Requiring, as it does, the complete abandonment of the conventional axle construction, it is a change which is being entered upon with caution, and only after thorough trial. Even in Europe there seem to be some differences of opinion with regard to this new development, although it has made great strides in Germany, where at the last Berlin Motor Show it was found on thirty per cent of all of the cars exhibited, and several British cars exhibited it at Olympia. Three important French automobile firms have adopted this system of construction, and it has been used successfully for many years by a prominent Italian builder. It is interesting to note that several of the biggest manufacturers in the United States and Canada have incorporated independent springing for the front wheels in their newest models.

The possibilities of independent springing have recently been discussed by a German engineer,* who points out that the undoubted improvement in riding qualities resulting from separate wheel suspension is mainly due to the reduction in the ratio of unsprung to sprung weight which it makes possible.

The proportion of any road shock which is transmitted by the springs to the frame and spring-supported mass of the car is increased by adding to the unsprung mass, and is diminished by adding to the sprung mass. Thus the introduction of front wheel brakes, while making for safety, did not improve riding qualities, but had rather the reverse effect, particularly on light cars. Road shocks are less noticeable in heavy cars, since they have a low ratio of unsprung to sprung weight. The smaller this ratio the less is the proportion of shock transmitted to the frame.

Thus there seems no question that the adoption of independently sprung wheels will be of particular advantage to the lighter cars, in which the unsprung weight bears so high a relation to the weight of the car as a whole. Further, a reduction in unsprung weight and the resulting improvement in springing, not only gives better riding but affords a more constant wheel grip than is possible with rigid axles. The tires show much less tendency to leave the road, which makes for more reliable steering in the case of the front wheels, and in the case of the back wheels avoids the disadvantages resulting from their tendency to spin whenever they lose contact with the road. Obviously, when the rear tires touch the road again severe friction develops between the tire and the road surface, resulting in strains on the transmission, and heavy wear on the tires.

Against these advantages must be set a number of difficulties which have to be overcome in obtaining a satisfactory solution of the springing problem, particularly in relation to the rear wheels. It is necessary to provide against the danger of a broken spring. The structure carrying the wheel must be adequately braced against all forces due to the application of the brakes or the reaction of the driving torque, and modifications are required in the steering gear, since the usual one-piece tie rod can no longer be employed. In the case of the rear wheels the abandonment of the conventional axle design involves additional universal joints, and increases the difficulty of satisfactory lubrication and maintenance, and it may be noted that such universal joints, if arranged in the driving shafts of the rear wheels, have to carry loads considerably greater than that transmitted by the universal joint in the propeller shaft of the car as usually designed.

It is true that some of the designs proposed for independently sprung wheels are more complicated and expensive in construction than the old conventional arrangements, but it seems that experience with this new development has now been such that simplification will result in schemes in which the costs of production and maintenance are quite reasonable, and which will make the undoubted advantages of independent springing available on a mass-production basis.

Both in Europe and America there is now a definite trend towards reduction in the weight of passenger cars. The introduction of a satisfactory system of independently sprung wheels will make it possible to insure in the light car of the future comfortable riding qualities which have hitherto only been available in automobiles of the heavier and more expensive makes.

*R. F. Colell, The Possibilities of the Independently Sprung Wheel, Engineering, December 8th, 1933, p. 619.

## Meeting of Council

A meeting of Council was held at the Royal York hotel, Toronto, on December 8th, 1933, at seven thirty p.m., with President O. O. Lefebvre, M.E.I.C., in the chair, and five other members of Council present.

The Council noted with appreciation the formation of a joint committee in Vancouver, composed of members of the Vancouver Branch of The Institute and local members of the American Society of Civil Engineers, to deal with local arrangements for the forthcoming Western Professional Meeting of The Institute, which is to be held in Vancouver at the same time as the Western Convention of the American Society of Civil Engineers in June or July of next year.

The report of the Finance Committee was received, and it was noted that the financial statement to November 30th, 1933, had been examined and approved. Eleven resignations were accepted, a number of requests for reinstatement were received, and sixteen members were placed on the Non-Active List.

The report of the Board of Examiners regarding the examinations of The Institute held on November 7th, 1933, was received, from which it was noted that three of the candidates examined had passed.

The report of the Past-Presidents' Prize Committee was received and approved.

A letter was presented from the chairman of The Institute's Committee on Engineering Education, expressing the opinion of the committee that in all cities where engineering faculties exist, the local branch of The Institute should form a small committee to keep in touch with questions of engineering education in that city. This was approved, and the Secretary was directed to communicate with the branches concerned.

The Council gave consideration to a memorandum presented by Mr. Newell in which attention was drawn to the desirability of providing for adequate preliminary engineering study of any projects to be carried out under the auspices of or with the assistance of the Dominion government. It was pointed out that such study was not only necessary from the economic point of view, but was particularly desirable as a means for affording employment to the young engineering graduates who at the present time have no opportunity of utilizing the training which they have received, and whose technical acquirements are not being put to profitable use under present conditions. A small committee was formed, under the chairmanship of Mr. Newell, to make recommendations to Council as to the further steps to be taken.

The newly elected officers of the Border Cities Branch were duly noted.

Mr. F. A. Combe, M.E.I.C., was named to represent The Institute on a committee being organized by the Canadian Engineering Standards Association to consider the preparation of a Safety Code for Mechanical Refrigeration.

A number of applications for admission and for transfer were considered, and the following elections and transfers were effected:

| *Elections* | | *Transfers* | |
|---|---|---|---|
| Assoc. Members | 4 | Assoc. Member to Member | 2 |
| Juniors | 3 | Junior to Assoc. Member | 1 |
| Students admitted | 7 | Student to Junior | 1 |

The Council rose at nine fifty p.m.

## Results of November Examinations of The Institute

The report of the Board of Examiners, presented at the meeting of Council held on December 8th, 1933, certified that the following candidates, having passed the examinations of The Institute, have satisfied the examiners as regards their educational qualifications for the class of membership named:

Schedule C—*For admission to Associate Membership:*
G. O. Nancarrow............Hamilton, Ont.

Schedule B—*For admission as Junior:*
W. L. Rice..................Toronto, Ont.
J. A. Sevigny, S.E.I.C....Three Rivers, Que.

## OBITUARIES

### Ormond Higman, M.E.I.C.

Deep regret is expressed in placing on record the death of Ormond Higman, M.E.I.C., which occurred at Ottawa, Ont., on November 9th, 1933.

Born at Duloe, Cornwall, England, on March 1st, 1850, Mr. Higman received his early education at a private grammar school at Menheniot, Cornwall, and at the High School, Plymouth, Devonshire. In 1867-1869 he took a course in chemistry at the Metropolitan School of Chemistry, London.

Coming to Canada in 1870, Mr. Higman entered the employ of the Montreal Telegraph Company at Ottawa as an operator, and in 1873 was promoted to the position of electrician and inspector of the Ottawa district, which office he retained for eighteen years. In September 1892, Mr. Higman was invited by the Minister of Inland Revenue to draft bills and regulations for a system of electrical inspection throughout Canada, and in July 1894, was appointed chief electrical engineer of the Inland Revenue Department, which position he held until 1921, when he became Director of the Electrical Standards Laboratories, Department of Trade and Commerce, Ottawa.

In 1893 Mr. Higman represented the Canadian government at the Electrical Congress in Chicago, and again at St. Louis in 1904. In February 1903, he was commissioned by Sir William Mulock, then Postmaster General, to investigate and report upon the working of the pneumatic tube system for the despatch of mail matter in the United States, and in July of the same year was appointed by the Minister of the Interior as electrical expert to the Commission to investigate the Ruthenberg process of electric smelting of magnetite ores at Lockport, N.Y.

In July 1905, Mr. Higman became chief of the Gas Inspection Service of the Department of Inland Revenue, this in addition to his other duties, and in 1906 was a member of the International Electrical Commission on Electrical Units and Standards.

Mr. Higman joined The Institute (then the Canadian Society of Civil Engineers) as an Associate Member on October 12th, 1893, and transferred to full Membership on May 2nd, 1907. He was placed on the life membership list in April 1926.

### Joseph Dufferin Peters, A.M.E.I.C.

It is with much regret that we record the death of Joseph Dufferin Peters, A.M.E.I.C., which occurred at Moose Jaw, Sask., on November 27th, 1933.

Mr. Peters was born in Perth county, Ontario, on April 8th, 1884, and received his early education at the Collegiate Institute, Stratford, Ont.

For two years Mr. Peters was plant operator and electrician with Barkey Bros., at Tillsonburg, Ont., and was subsequently with the London Electric Company, London, Ont. Later Mr. Peters was engaged on the installation and operation of a steam electric plant for the Moore Milling and Electric Company at Qu'Appelle, Sask., and in 1908 was appointed superintendent of the power plant of the city of Moose Jaw, Sask., which position he retained until 1930 when the plant was sold to the National Light and Power Company Ltd., of which organization he became general manager.

Mr. Peters became an Associate Member of The Institute on February 25th, 1919, and took a keen interest in Institute affairs, being vice-chairman of the Saskatchewan Branch in 1932.

## PERSONALS

Cecil H. Gunn, A.M.E.I.C., of the firm of John Gunn and Sons, Winnipeg, was re-elected as alderman for Ward One in Winnipeg at the election held recently. Mr. Gunn was the only candidate in any ward to be elected on the first count.

H. W. Furlong, A.M.E.I.C., is now a member of the staff of Sir Alexander Gibb and Partners, London, England. Mr. Furlong was formerly with Stone and Webster Engineering Corporation, Boston, Mass.

Elijah Cowan, S.E.I.C., who was connected with the draughting department of the International Paper Company, New York, N.Y., is now with the Lake St. John Pulp and Paper Company and is located at Dolbeau, Que.

C. H. Champion, A.M.E.I.C., has joined the staff of Howard Smith Paper Mills Limited, Cornwall, Ont. Mr. Champion was for a time in the mechanical department of Price Brothers and Company Limited, at Kenogami, Que.

F. Jno. Bell, M.E.I.C., has been appointed Canadian representative for Messrs. Braithwaite and Company Engineers Limited, London, England, with works at West Bromwich, and Newport, Wales. Mr. Bell, who is widely known in engineering and industrial circles throughout Canada, represents a number of other British engineering

F. JNO. BELL, M.E.I.C.

firms, including the well-known steam turbine builders, C. A. Parsons and Company, Ltd. He was president and general manager of the Canada Wire and Cable Company, Toronto, and subsequently held the same offices in the Leaside Munitions Company, Leaside, Ontario. Mr. Bell later became vice-president of the St. Catharines Steel and Metal Company, at St. Catharines, Ontario, and was for some years manager for the late E. A. Wallberg, M.E.I.C.

## ELECTIONS AND TRANSFERS

At the meeting of Council held on December 8th, 1933, the following elections and transfers were effected:

*Associate Members*

CADE, John Edwin, asst. chief engr., Fraser Bros. Limited, Edmundston, N.B.

McLENNAN, Allan John, B.Sc., M.Sc., (Mass. Inst. Tech.), plant elect'n., Shell Company of Canada, Pointe aux Trembles, Que.

FARROW, Richard Charles, Coldhayes, Liss, Hants, England.

*NANCARROW, Gilbert Owen, chief operating engr. of power plant, Hamilton Works, International Harvester Company, Hamilton, Ont.

*Juniors*

HATFIELD, Gordon Wallace, B.Sc., (McGill Univ.), asst. chemist, Atlantic Sugar Refineries Limited, Saint John, N.B.

PANGMAN, Arthur Henry, B.Sc., (McGill Univ.), control chemist, C. E. Frosst & Co., Montreal, Que.

*RICE, Walter Leslie, instr'man., water supply section, Dept. of Works, City Hall, Toronto, Ont.

*Transferred from the class of Associate Member to that of Member*

HEARTZ, Richard Edgar, B.Sc., (McGill Univ.), asst. engr., Power Engineering Company, Montreal, Que.

TRIMINGHAM, James Harvey, B.Sc., M.Sc., (McGill Univ.), chief engr., Power Corporation of Canada, Montreal, Que.

*Transferred from the class of Junior to that of Associate Member*

DESBARATS, George H., B.Sc., (McGill Univ.), supt. of Paugan power house of Gatineau Power Company, Low, Que.

*Transferred from the class of Student to that of Junior*

*SEVIGNY, Joseph Alfred, dftsman., St. Lawrence Paper Mills Co. Ltd., Three Rivers, Que.

*Students Admitted*

BENOIT, André Persilliers, (McGill Univ.), 481 Prince Arthur West, Montreal.

BROWN, Alan Coatsworth, (Univ. of Man.), 234 Sherburn St., Winnipeg, Man.

CLARKE, Stephen Herbert, (Faraday House Electl. Engrg. College), 1492 Bishop St., Montreal, Que.

DAIGNAULT, Lawrence George, (McGill Univ.), 2067 Church Ave., Montreal, Que.

DOBSON, Richard Nesbitt, (McGill Univ.), 6645 Molson St., Montreal, Que.

HAYES, Herman R., (Univ. of Alta.), 11129-90th Ave., Edmonton, Alta.

JOHNSON, James Richard, (McGill Univ.), P.O. Box 151, Revelstoke, B.C.

*Has passed The Institute's examinations.

## Unemployment Relief Committee Montreal Branch

The Unemployment Relief Committee of the Montreal Branch wishes to express through these columns its appreciation for an anonymous subscription of $20.00 to the Unemployment Relief Fund.

## BOOK REVIEWS

### Electrical Engineering Practice

*By J. W. Meares and R. E. Neale, Chapman and Hall Limited, London, England, 1933. 5½ by 8¾ inches, 920 pp. Figs., tables, 30s. net. Cloth.*

Reviewed by Professor H. J. MacLeod, M.E.I.C.*

This book is the third and last volume of the fourth edition of a work described by the authors as "A practical treatise for electrical, civil and mechanical engineers with many tables and illustrations." The first and second volumes received exceptionally high praise from many well-known engineering journals and this third volume maintains the same high standard. Every chapter shows that the authors combine a wealth of practical experience with sound theoretical knowledge, and their treatment of the subject successfully bridges the gap between the many excellent handbooks of data and the highly technical books written for specialists in various branches of electrical engineering.

This volume deals with electric motors and their control and with the many applications of electrical energy in industrial operations and processes, in hoisting, in mining, in agriculture, in traction and in ships. Chapters on specifications, depreciation and maintenance, testing and law are also included.

The treatment of each subject proceeds in easy manner from the elementary principles involved right through to practical applications. American as well as European practice has been considered, though naturally European, and especially British, practice predominates. This, however, does not prevent the book from being of value to engineers in this country.

Electric motors and their control are treated very fully. The principles of operation, the characteristics and suitable applications of the many different types of motors are set forth in a clear and interesting manner. The control and protection of the various types also receive extended treatment. These chapters are followed by a consideration of current practice and motor applications in the various lines of industry mentioned above.

The book is well printed and the subject matter is presented in a style that is admirably clear and critical. The three volumes of Electrical Engineering Practice would form a valuable addition to any engineering library.

*Professor of Electrical Engineering, University of Alberta, Edmonton, Alta.

### The Fuel Value of Wood

A report just issued by the Forest Products Laboratories, Ottawa, on the "Heating Value of Wood Fuels," gives a brief comparison of the fuel value of various species of wood, and also the relative heating value of wood and anthracite coal. The tests on which the article is based were made in a domestic hot-water heating installation by the Fuel Research Laboratories in co-operation with the Forests Products Laboratories.

The air-dry cordwoods used in these tests had a calorific value varying from 32 million B.t.u. per air-dry cord in the case of rock elm, down to 15.5 million for balsam fir or black cottonwood. In the former case approximately 1¼ cords was found to equal 2,000 pounds of anthracite—with the latter wood nearly 2½ cords would be required. In the particular domestic heating installation used for the tests it was found that about 2.3 pounds of well-dried hard maple containing about 20 per cent moisture gave a heating effect equivalent to that of one pound of good anthracite coal (12,900 B.t.u. per pound). In view of the wide use of wood as a domestic fuel, the report is intended for those using wood in domestic heating installations.

Copies of the report may be obtained from the superintendent of the Forest Products Laboratories, Ottawa.

## RECENT ADDITIONS TO THE LIBRARY

**Reports, Etc.**

*City of New York, Board of Water Supply:* Annual Report 1932.
*Canada: Forest Products Laboratories:* Heating Value of Wood Fuels.
*American Society for Testing Materials:* Standards 1933.
*The Institution of Mining and Metallurgy:* List of Members, 1933.
*Institution of Electrical Engineers:* List of Members, 1933.
*Canada: Dept. of the Interior, Forest Service:* Circular No. 38, The Effect of Kiln Temperatures and Air Seasoning on Ambrosia Insects (Pinworms).

## BULLETINS

*Speed Reducers*—A 4-page pamphlet received from the Hamilton Gear and Machine Company, Toronto, gives details regarding the new integral motorized speed reducers and increasers built as one self-contained unit. These are made in a full range of sizes in both worm gear and helical gear forms, of single or multiple reduction, to give almost any desired final speed.

*Tractors*—The Cleveland Tractor Company, Cleveland, Ohio, have published an 8-page booklet describing the new Diesel crawler tractor developing 85 h.p. This is a 6-cylinder solid injection engine of 5-inch bore and 6-inch stroke, with 19,000 pounds pull at 1.7 miles per hour.

*Concrete Roads*—"Concrete Road Design," a 60-page booklet published by the Portland Cement Association, presents a logical basis for the design of concrete slab for the predominating wheel loads, appropriate safety factors for each class of road, a simple method for determining the life expectancy of the slab in years, and relative efficiency and economy of various slab designs. Copies of this are available on application to the Association at 33 West Grand Avenue, Chicago, Ill.

*Hypo-Chlorination*—A 60-page booklet received from The Associated Chemical Company of Canada, Limited, Toronto, explains the term "hypo-chlorination," its various applications in the treatment of raw water and examples of its use in different municipalities. A number of tables on the strength of solutions necessary and the weight required to treat different volumes of water are given.

*Compressors*—A 26-page booklet issued by the Worthington Pump and Machinery Corporation, Harrison, N.J., gives details regarding the company's feather valve, horizontal duplex motor-driven compressors.

# Light-Weight, High-Speed Passenger Trains

*By E. E. Adams**

*A paper presented before the Railroad Division at the Annual Meeting, New York, N.Y., December 4th to 8th, 1933, of The American Society of Mechanical Engineers and published in "Mechanical Engineering," December, 1933. Slightly abridged.*

The public is probably generally aware of the fact that the passenger business of the railroads has been declining steadily in recent years because of the competition of the motor bus, the private automobile, and, recently, the airplane. In order to show the extent of this decline, compared with the increase in automobiles registered in the United States, the following figures are quoted.†

| Year | Passenger Miles | Automobiles Registered |
|---|---|---|
| 1911 | 32,371,444,793 | 619,500 |
| 1916 | 34,585,952,026 | 3,297,996 |
| 1920 | 46,848,667,987 | 8,225,859 |
| 1925 | 35,950,222,811 | 17,496,420 |
| 1930 | 26,814,824,535 | 23,059,262 |
| 1931 | 21,894,420,536 | 22,347,800 |
| 1932 | 16,974,591,000 | 20,903,422 |

Coincident with this decline in passenger business, the railroads have spent enormous sums of money for the replacement of light wooden equipment with heavy steel equipment which has very radically improved the safety and comfort of railroad travel. A modern ten-car passenger train, consisting of locomotive, head-end car, de luxe coach, diner, six Pullman sleepers, and observation car weighs approximately 2,000,000 pounds. An average of 100 passengers per train is considered a very satisfactory volume of business, which means a dead weight of 20,000 pounds per passenger. An ordinary 30-passenger bus weighs around 20,000 pounds, or about 667 pounds per passenger. An average five-passenger automobile weighs about 4,000 pounds, or 800 pounds per passenger. The result is that in recent years, with a few exceptions, the passenger business of the railways has been unprofitable when all costs are properly prorated.

There is a strong demand on the part of the public for increased speed, and with the present heavy class of equipment, such increase can only be made by shortening trains or increasing the power of locomotives, thereby materially increasing operating cost; and the possibilities of increased speed even under these conditions are very limited.

The obvious solution appears to be the development of light-weight, high-speed trains which can be operated at a minimum of expense, and such a development has recently been undertaken by the Union Pacific Railroad Company with the Pullman Car and Manufacturing Corporation as the builder. A three-car train is nearing completion, consisting of a forward car containing the power plant, a 33-foot mail apartment, and a small baggage room; a second car, which is a coach, seating 60 passengers; and a rear car, which is a coach, seating 56 passengers, with a buffet in the rear for serving light meals to passengers at their seats. See Figs. 1 and 2.

### Light Weight

A study was made of all available materials, including the aluminum alloys, stainless steel, and other steel alloys with physical properties intermediate between ordinary steel and stainless steel. It was finally decided to use aluminum alloys for the entire car structure, except for the bolsters, articulation castings, and truck frames, for which purpose there was used a special alloy cast steel having high tensile strength, high yield point, and great ductility. The net result is an estimated weight of 160,000 pounds for the three-car train.

The development of aluminum alloys has been the object of some very progressive research work as applied to new methods of car construction, the most interesting being the use of extruded metal shapes to take the place of the ordinary rolled shapes and pressings. These shapes are produced by merely forcing the hot metal through a die forming the cylinder head of the press. The producers of aluminum have co-operated with the car-builders and have been able to produce all of the desired shapes as outlined by the car designer with a relatively small outlay for dies, and such shapes are so accurate in dimensions that the designer is able to interlock various extruded-metal sections or shapes to produce cars of a minimum weight, maximum strength, and minimum deflection with simple shop fabrication.

Figure 3 is a cross-section of the light-weight train showing the various extruded sections which were used throughout the structure.

Aluminum plates can also be readily formed for the curved surfaces used in connection with streamlining. Aluminum can be readily riveted and spot-welded without injury to the material. It is believed that a great deal of development work will be done in connection with the use of high alloy steels, with the result that there will be strong competition between different materials in connection with producing the eventual light-weight passenger-carrying equipment.

### Streamlining

An exhaustive study was made of streamlining with the idea of reducing as much as possible the wind resistance to secure the obvious economy in power requirements. Advantage was taken of work done along these lines in connection with aircraft development. This, however, did not take into account the effect of ground resistance. It was concluded that an actual wind-tunnel test for each model or modification of it was necessary. Wooden models of the train, with detachable fronts and rears, were built, and front ends and rear ends of various shapes were constructed, all of which were subjected to wind-tunnel tests. Based upon the results obtained in these wind-tunnel tests, the final form of the train was determined, and a fairly accurate estimate was made of the power required for the speed desired.

The streamline models indicated a smooth canopy closing up the gap between sections, which is, of course, absolutely essential; but the accomplishment of this was a difficult task, taking into account the relative movement between car sections on curves. An aluminum shield which is the prolongation of the car contour, extends from the rear end of the forward section toward the front end of the following one. The extent of this projection is contingent on the minimum radius of curve to be negotiated. Closing up this gap between the hood projection and the following car section is a rubber sheet rigidly attached to the following car section, assuming the contour of the car and free to move at its forward edge. Spring actuated arms, mounted on the drum portion of the articulation with rollers bearing on the inner side of the projecting hood, keep this rubber stretched to close up the gap between the hood and the following car section.

### Structural Design

In order to secure the greatest strength with the least amount of material, a train of tubular cross-section was adopted, with the outer surfaces of aluminum sheets and frame-work built up of extruded aluminum-alloy sections. All of the metal in the framing is co-ordinated to act as a unit, whether for draught or buff, as it is impossible to deflect or stress any member without having adjacent members bear their proportion of the stress. This is at variance with the ordinary form of car design where draught or buffing shocks are taken by longitudinal underframe members. The underframe transmits certain loads to the side frame and the roof, but due to its design, only part of its area can be

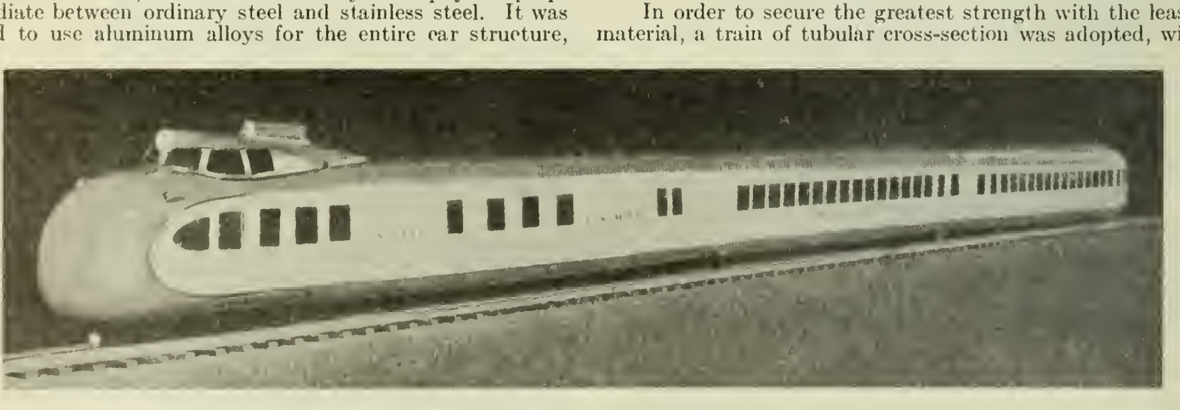


Fig. 1—High-Speed, Light-Weight Passenger Train under Construction.

*Vice-President, Pullman Incorporated, Chicago, Ill.

†From "Railroad Facts," published by the Western Railways' Committee on Public Relations.

utilized for load carrying; in other words, in the conventional type of car construction, much of the material or section does not take its proper part in bearing its share of stress.

Assuming the cross-section of the car to be a tube, there was naturally obtained a very large moment of inertia, which means closely controlled deflections, compensating for the high deflections otherwise produced by the low modulus of elasticity of aluminum.

The basic principle that has been developed in connection with these structures is that gusset connections should be avoided; all longitudinal members should extend the entire length of the car section, and transverse members should be in one piece for at least one-half of the cross-section.

As will be noticed from the cross-section, Fig. 4, below the roof is a duct running the entire length of the car, which is used as an air duct, also for lamps for indirect lighting. This duct acts as an effective compression member. The underframe portion of the cross-section is an I-beam built up of extruded metal and truss bracing. This, due to its shape and connections, forms an effective tension member that co-ordinates with the compression member in the roof.

Incidentally, the tubular design, which lends itself to economy in material requirements, also conformed to the best shape as developed in connection with streamlining, reducing very materially the retarding effect of side or quartering winds. It has been determined that a quartering wind confronting the train from either side, not a straight headwind, actually offers the greatest resistance because of the larger surface area presented to the forces present in the air current.

The net result of the light-weight and proper streamlined shape was rather graphically expressed by a well-known aeronautical engineer who supervised the wind-tunnel tests and who said that the new train "has possibilities of power economy not possessed by any other known vehicle."

"The new train will require 500 h.p. to propel it 90 m.p.h. with a load of 120 passengers and 25,000 pounds of mail and baggage. The ten-car conventional train which it replaces, carrying the same load at the same speed, requires 3,400 h.p.; a three-car conventional train requires 1,700 h.p.; six buses, similarly loaded, same speed, 1,500 h.p.; thirty automobiles, 3,600 h.p.; a river steamboat, 211,000 h.p.; and fifteen transport airplanes, 5,000 h.p."

Whenever light-weight equipment has been proposed, the usual reaction of an experienced railroad man is the hazard encountered at grade crossings when colliding with automobiles, trucks, etc., which, unfortunately, is of frequent occurrence. In order to protect against damage under such conditions, the front end or nose of this train was given most careful consideration. About half of the total weight of the train, or 80,000 pounds, is carried on the front truck, which necessarily requires a very massive support for the engine at the floor line. This floor-line construction forms the centre of the curved front end, and all of the structural members converge to form a strong parabolic arch, which should resist without damage the shock of any collision possible at highway crossings.

### Articulation

Articulation of body units of the train has been adopted as best suiting the requirements for high speed and smooth riding. It eliminates the objectionable overhang of non-articulated cars, also the necessity for couplers and draught gears and complicated vestibule arrangement. It also prevents, except to a limited degree, the independent oscillation of each individual car, thus tending toward a gliding motion of the entire train. It also permits the carrying of three cars on four trucks rather than six trucks, thus reducing track resistance as well as inspection and maintenance, and, incidentally, construction cost and weight.

Articulation is effected by attaching an extension casting to each adjoining end sill, these castings terminating in centre plates which rest one on top of the other, these two centre plates in turn resting on the truck centre plate. A heavy locking king-pin secures all three plates together. All centre plates are lined with "oilite" bronze to reduce friction. Side bearings are spaced each side of centre plates and are of special design, incorporating the use of rubber in shear, to deaden oscillation and contribute their share toward smooth riding.

### Trucks

All trucks are of the four-wheel type.

The front or power truck has 36-inch rolled-steel wheels and roller-bearing journals spaced outside of the wheels, due to space necessary for the two 300-h.p. ventilated motors of suspended type and geared to each axle. The armature shafts are also on roller bearings, the armature being wound for a safe maximum speed of 110 m.p.h. The remaining three trucks have 33-inch rolled-steel wheels, and all axles are provided with inside type roller bearings, the inside type being used to reduce air resistance. All roller bearings are liberally oversized for the weight and speed requirements of this train.

To minimize air resistance still further, all trucks are shrouded, wind-tunnel experiments on scale models having developed that the total air resistance of the train was thus capable of being reduced about 20 per cent from the truck shrouding alone. An intensive study was made of the basic requirements for a truck suitable for service of this type.

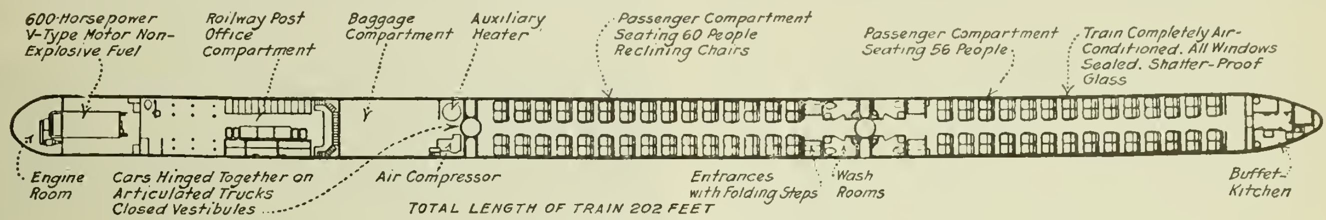

Fig. 2—Plan of High-Speed Train.

Few data were available concerning the stresses and deflections in trucks set up under operating conditions. By the use of extensometers and deflectometers, the builders of the train have studied truck action to obtain a true basis for correct design, resulting in low uniform deflections in connection with low uniform stresses for all parts of the structure. This insures, under dynamic conditions, the same safety as is indicated by the usual calculations covering static loading. Localization of stress must be avoided in all successful light-weight structures and material used only where it serves a purpose. There are instances where the static stresses have been quite low at all points, but under impact, the stresses at certain points exceeded the elastic limit of the material.

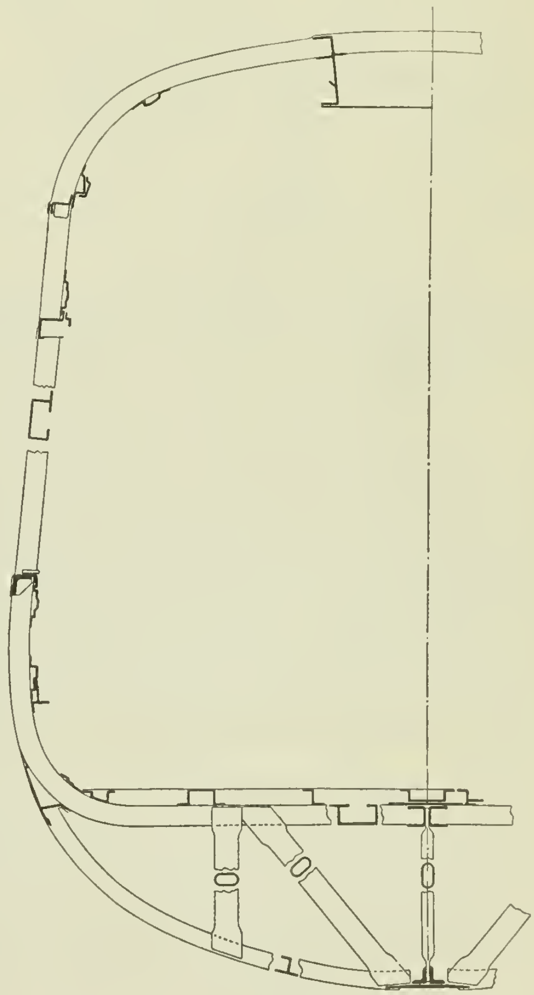

Fig. 3—Framing Showing Various Extruded Sections.

The trucks on this train are of cast steel; frames and transom being cast in one piece. An alloy cast steel was used, having a minimum yield point of 50,000 pounds per square inch and extreme ductility.

The advent of light-weight cars, with high-speed trains, high accelerations and decelerations, insistence by the public on elimination of noise, comparison with the automobile and the cushioning effect produced by its rubber tires, have resulted in a steadily growing sentiment that there should be something done along these lines by the designer of rail equipment.

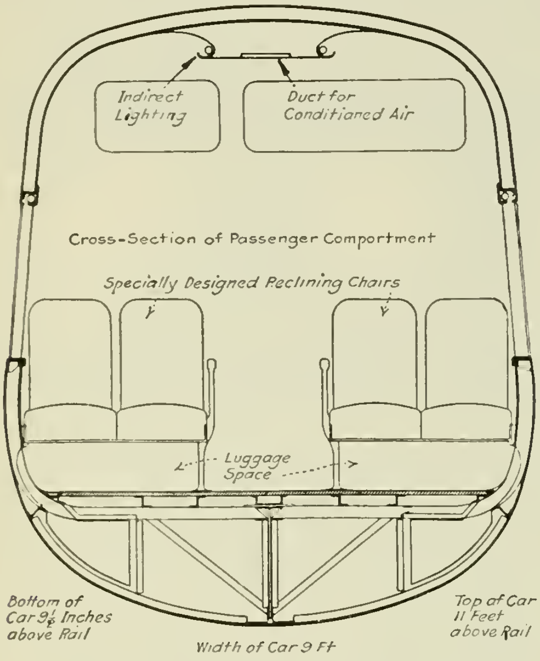

**Fig. 4—Cross Section of the Train.**

To meet this ever-increasing demand there have been several applications of rubber to both new and old trucks. New types of rubber compounds have been developed to meet the requirements of shear and compression loading, with proper movement under the imposed loads, and having relatively long life.

The trucks other than the power truck have inside journal bearings, and in lieu of the usual pedestals, the side frame has cutouts approximating the opening in the pedestal; but there is no metallic contact between the frame and any part of the journal box. The car weight is transmitted to the axle by means of rubber "doughnuts"* placed on each side of the axle. The sides of the journal box are extended either side of the axle, and between these extensions on the side frame are the rubber doughnuts, applied with sufficient compression so that the rubber has ample capacity in shear to perform its part in supporting the load, acting through the truck. In addition, there are coil springs working in parallel with the rubber so that for the usual static loading the doughnuts are lightly stressed. The compression load curve of the coil springs is much flatter than that of the rubber, so that the major portion of all impacts or live loads are carried by the rubber, the action of which is obvious. The rubber doughnuts are not only useful for vertical impact but, within a limited range, provide universal resistance, cushioning flange pressures and fore-and-aft forces, due to deceleration and acceleration.

All coil springs are mounted on rubber pads especially designed to soften shocks and "kill" metallic contact.

Rubber bushings are applied at each end of the truck bolster, the movable end bearing against hardened steel wear plates on the truck side frame, these to supplement the swing hangers in order to render them self-centring and provide a cushion effect.

Rubber is also used in connection with the chafing plates between the bolster and the transoms at the extremities of the bolster, thereby cushioning the traction and braking forces.

## Power Plant

The power plant for this train consists of a distillate-burning engine, developed especially for this service. It is of the twelve-cylinder "V" type, with cylinders 7½ inches in diameter and 8½-inch stroke, rated at 600 h.p. at 1,200 r.p.m. The entire engine frame, including the crankcase and cylinder water jackets, is of welded wrought-steel construction. The crankshaft, 5½ inches in diameter, which is dynamically and statically balanced, is made of chrome-nickel-molybdenum steel, having an elastic limit of 130,000 pounds per square inch, with a Brinell hardness of 300. No cast iron is used in the construction of this engine, except for the cylinder sleeves, which are made of a special grade of cast iron suitable for this purpose.

The distillate fuel is handled by special-type carbureters of the multiple-jet fixed-air-ratio type, which have been developed over a period of eighteen years, and are especially adapted to handling this heavy fuel. There is a separate carbureter having ten jets, attached directly to each cylinder head, and atomization of the fuel is accomplished without the application of heat. The fuel is supplied to the carbureter by electrically driven turbine pumps with gravity return to the fuel tank, and as floats and needle valves are not used, no surplus fuel is carried in the engine room. Fuel capacity is sufficient for a 1,200-mile run.

To facilitate streamlining further, the cooling radiators are located under the ceiling of the engine room, and cooling is effected by having a closed engine room under forced draught. This also supercharges the engine to some slight extent.

The motorman, with all of his controls and necessary instruments, is located in an elevated cab separated from the main engine room. From his elevated position he will have an increased visual range, and be removed from the noise of the power plant. His main operating controls consist of a throttle, a controller, and a brake valve. The brake valve is equipped with a "deadman's" control, requiring a motorman to keep either a hand or a foot on this control while the train is running, and if, for any reason, hand or foot is removed from this control, there is an immediate automatic closing of the throttle and application of brakes. The direct-connected generator is connected to the front end of the engine by means of a flexible coupling and is capable of developing approximately 425 kw., and the current, through remote control, is led directly to the two 300-h.p. traction motors on the front truck.

In addition to the main generator, there is an engine-driven auxiliary generator having a capacity of 25 kw. at 76 volts, which supplies current for battery charging, one of the two air compressors, air conditioning, and lighting. An additional 8-kw. engine-generator set at 76 volts is carried in the baggage compartment for service when the main power plant is shut down.

## Air Brakes

The air brakes for this train presented an important problem. In order to avoid rearranging the signaling system and also to avoid any additional operating hazard, it was necessary to be able to stop this train from 100 m.p.h. within the same distance that a conventional steam train could be stopped from the ordinary speeds at which they operate.

Heretofore, uniform braking retardation has not been possible, due to the fact that the coefficient of friction between brake shoe and wheels varies with the speed through a wide range, this coefficient decreasing rapidly at the higher speeds. In order to provide a uniform rate of retardation, it is necessary to control brake-shoe pressure automatically in proportion to the speed. In the new brake this is done by controlling cylinder pressure automatically by a very simple but effective device recently developed and thoroughly tried out, known as a "decelerometer." This instrument consists essentially of a movable weight of about 100 pounds, sensitively mounted on ball-bearing rollers, arranged to move in the line of motion of the train, and suitably restrained by a calibrated spring. This weight, acting through suitable leverage and a pneumatic valve, controls the brake-cylinder pressure accurately in proportion to its inertia, and, therefore, in proportion to the retardation of the train. Recent tests with this device on a gas-electric motor car developed a straight-line retardation graph from 76 m.p.h. to rest. Thus, by taking advantage of a simple natural law, it becomes possible to regulate brake-shoe pressure automatically in proportion to retardation and secure the maximum results in quick stopping.

If high rates of deceleration are used, it would be obvious that this device would control such deceleration up to a point at which the vehicle comes to rest, and by so doing, the sudden change from the high deceleration rate to a state of rest would result in a noticeable jolt at the end of the stop. In order to eliminate this, the decelerometer is provided with an ingenious valve device which changes the rate of deceleration to a low value just previous to the stopping of the vehicle. This results in a sudden final reduction in cylinder pressure to prolong the smoothness of deceleration to the end of the stop.

The air brake used on this train is a complete departure from conventional practice, both in its circuit and in the design of the various valves and parts used. The pneumatic feature is based on a two-pipe circuit consisting of a supervisory line and a control line. The supervisory line distributes the air to the reservoirs under each car and charges to the maximum pressure at all times. In conventional brakes it is not possible to charge the reservoirs during brake application. The purpose of the control line is to apply and release the brakes by admitting air to the pneumatic relay valve under each car, this valve controlling communication between each brake cylinder and its adjacent reservoir, and from the cylinder to the atmosphere. This control line passes from the engineer's brake valve through the decelerometer valve to the relay valve. This briefly describes the pneumatic operation. Parallel to this pneumatic circuit lies an electric circuit actuated by contact points on the engineer's brake valve, which operates a magnetic control feature on each pneumatic relay valve. This not only synchronizes but accelerates all brake applications and releases.

*Developed by C. F. Hirshfeld director President's Conference Committee on Research, American Electric Railway Association.

The use of a straight-air brake system demands adequate protection against operating failures in case of pipe rupture or other unforeseen causes. To overcome this the relay valve units are constructed so as to insure proper operation upon the depletion of pressure from both the supervisory and control lines. If the electric circuits should fail from broken lines or other cause, the pneumatic elements in the system will function in the usual manner to supply adequate braking power.

All brake cylinders are of aluminum and are mounted on the trucks, two cylinders per truck, and each cylinder acts on one pair of wheels only.

Air Conditioning and Ventilating

There is a duct on each side of the train below the floor line, and also a central ceiling duct, all of which are connected between cars by flexible bellows. Heat is obtained by passing air through the radiators of the engine. This air is forced by blowers through the floors ducts, a radiator outlet being located at each seat. Air is exhausted through a corresponding opening in the ceiling duct so that a definite circulation is obtained at each seat unit. An oil-fired hot-air furnace is installed in the baggage compartment and is capable of heating the train under all conditions should there be a failure of the heat from the engine radiator. It also provides heat for the cars at terminals or in the yards when the engine may not be operating.

A compressor is installed in the baggage room for cooling the air when desirable. For cooling, the circulation is reversed, cold air being discharged from the ceiling duct and exhausted through the floor ducts. In connection with both heating and cooling, approximately 25 per cent of fresh air is introduced in order to obtain frequent air changes and to keep a pressure in the car at all times for the exclusion of dust and cinders. The windows of safety plate glass are sealed in rubber and are set as nearly flush with the outside as practicable in order to minimize wind resistance. Two inches of a special fireproof insulation material is installed completely around the shell of the car and in the ends. This will give an unusual amount of insulation against heat and cold and also has special sound-deadening qualities.

Lighting and Seating

Careful study was made of lighting. Indirect lighting, from a trough on each side of the ceiling duct, was adopted. The light from this trough is reflected on each side against a properly curved ceiling cove in order to distribute it evenly at the reading position. The lights are so arranged that three intensities of light can be obtained, the lowest intensity being for night lighting while passengers are sleeping.

Seats were specially designed for this equipment, the object being to secure the maximum of comfort together with style and attractiveness. The space beneath the seats was kept clear to permit storage of baggage. The seat backs are adjustable with four positions. Seats are equipped with devices for the quick installation of an individual tray at the proper location for serving meals from the buffet.

Other Features

The side doors when closed are flush with the exterior, and are interlocked with steps which fold up and down as doors are closed or opened, a flush trap-door inside of the car completing this assembly.

Electric signals afford communication between train crew and motorman. A powerful headlight of special construction is streamlined into the roof of the motorman's cab, and this headlight is provided with a 10-inch vertical light beam in addition to the horizontal beam, for the purpose of added safety.

It will be noted that the fundamental objective was to produce a high-speed train which would have a low operating cost, and in addition, give the passengers safety, quietness, smooth riding, comfortable temperature, and fresh air, all of which, it is hoped and believed, will help in attracting passenger business back to the rails from other means of transportation.

## Meter Companies Merge

Negotiations have just been completed merging in Canada Neptune Meter Company Limited, and National Meter Company of Canada, Limited. The new company will be known as Neptune-National Meters Limited, with head office and factory at the plant of the former Neptune Meter Company Limited, located at 345 Sorauren Avenue, Toronto.

The manufacture of the two lines of meters will shortly be consolidated and carried on at the large and modern former Neptune plant.

The Sully Brass Foundry Company Limited, Toronto, which is owned by Neptune will become a subsidiary of Neptune-National Meters Limited.

---

*The Swiss Electric Company of Canada Limited* announce the incorporation of a new company having an exclusive arrangement to distribute in Canada the products of Messrs. Brown Boveri and Company Limited, Baden, Switzerland, the Micafil A.-G., and other companies.

The headquarters of the Swiss Electric Company of Canada Limited will be temporarily in the offices of Messrs. Griswold and Company Limited, the former distributors of Messrs. Brown Boveri and Company Limited products.

After April 1st, 1934, it is intended to establish separate offices, which will be staffed with application and service engineers for the conduct of Canadian business.

# BRANCH NEWS

## Calgary Branch

*J. Dow, M.E.I.C., Secretary-Treasurer.*
*H. W. Tooker, A.M.E.I.C., Branch News Editor.*

Through the co-operation of the three prairie Branches of The Engineering Institute of Canada—Lethbridge, Calgary and Edmonton—each Branch in turn was privileged to see the Dominion government's official motion picture record of the "Arctic Patrol" and "The Fire Fighters of the Skies." These two most interesting and instructive records, the former a four-reel picture and the latter a two-reel picture, were shown to over eighty members and friends, many ladies being present, of the Calgary Branch on Thursday evening November 23rd, 1933.

The pictures of the "Arctic Patrol," as its name implies, depicted scenes of the 1929 patrol of the Canadian government vessel *Beothic* in Arctic waters, and, being an actual record of the vessel's supply voyage, gave an accurate picture account of conditions in the north.

The Branch was also very fortunate in having as its guest speaker the Venerable Archdeacon C. Swanson, who was for a number of years a missionary in the Yukon, and who recounted in a humorous fashion many of the difficulties under which the Indians live and the obstacles which had to be overcome to carry on the work of the Church.

The second picture, "The Fire Fighters of the Skies," depicted the Dominion government's method of patroling the immense forest areas by aeroplane and, in the event of forest fires, how the equipment for fighting them was brought into action by larger aeroplanes and the method of combating the fire.

After a hearty vote of thanks given the speaker by B. L. Thorne, M.E.I.C., the meeting adjourned at 10 o'clock p.m.

Methods of Handling Earth Fill Material

On Thursday evening, October 26th, 1933, Mr. J. K. MacKenzie of the Caterpillar Tractor Company gave an address on "Methods of Handling Earth Fill Material, with Special Reference to Levee Construction on the Mississippi River," to a large number of members and their friends.

Mr. MacKenzie showed, by means of motion pictures, how dirt was moved by caterpillar equipment to build the levees of the Mississippi river, and protect the cotton fields and farming areas. During the first eight months forty-two million yards of earth was moved.

A comparison of the recent developments of Diesel engines for tractor work over the old type of gasoline engines was made by the speaker, who stated that Diesel fuel costs about one half that of gasoline fuel, and the Diesel only uses approximately 56 per cent of what the gasoline engine uses. The fuel operating costs for five gasoline units was approximately $50 per day, while Diesel fuel for five units was $12.50 per day.

The meeting adjourned at 10 o'clock p.m.

Industrial Electric Tubes

"Industrial Electric Tubes" was the subject of a most interesting and instructive address presented to the members of the Calgary Branch and a large number of visitors on the evening of November 9th, 1933, by Mr. P. F. Peel of the Canadian General Electric Company. The address was illustrated by lantern slides and motion pictures.

Stating that all matter is composed of elements, the speaker went on to describe the electron theory. Progressing from the lightest to the heaviest elements, the number of electrons and protons comprising the different atoms increase with mathematical regularity. This makes possible the phenomena of electric current in metals and their absence in the lighter elements which gives us our electrical insulators.

Proceeding, the speaker dealt fully with the development of the various kinds of tubes such as the vacuum-filled gap and the gas-filled gap types.

The essentials of an electron tube are that it consists of the gap enclosed in an air-tight container by means of which no particular medium used can be regulated. That side of the gap connected to the positive potential is the anode; the opposite side being connected to the negative is the cathode.

The effect of heat greatly increases the activity of electrons in metal, which if applied to the cathode increases its electron emitting ability many hundreds of times, incidentally using a low anode voltage. This gives rise to the hot cathode type of tube which can be heated in any way desired. Cathodes are made of metals capable of withstanding high temperatures, such as tungsten. The cold cathode type made from some of the radio active metals such as selenium react to light in the same way that other types react to heat and so the photo-electric type of tube is possible.

The speaker then went on to name the various types of tubes and their uses: kenatron—high vacuum tube; pliatron—kenetron with grid or electric static control; magnitron—kenatron with magnetic control; phonatron—gas filled tube; thyratron—phonatron with grid or electrostatic control.

Pliatrons are the oldest and most generally known type of three-element tubes, the majority of radio tubes belonging to this class.

The thyratron type of tube is the one doing so much to revolutionize industry and has many unique applications.

Radio active metals constitute our heaviest and therefore our most unstable elements; their activity being greatly affected by light and heat. Tubes using these metals as cathodes are known as cold cathodes and are becoming extremely important in commercial applications. Some uses of the various types of tubes are: pliatrons—applied to certain types of self-levelling passenger elevators; thyratrons—furnishing field current for synchronous machines; controlling lighting load in conjunction with saturable reactors; application to wire drawing machines to maintain an even tension on the wire; regulating the quantity of material passing over a conveyor; burglar alarms; photo-electric tubes—counting pedestrians or vehicles or objects passing a given point; regulating the depth of material on a conveyor; controlling the density of syrup or other liquid food products; paper breaks in pulp mills can instantly be made known; doors can be made to open automatically by the approach of an individual; burglar alarms will promptly announce the presence of an unauthorized person.

Following the lecture an interesting discussion took place after which a hearty vote of thanks was given the speaker by P. Turner Bone, M.E.I.C. The meeting adjourned at 10.30 o'clock p.m.

## Hamilton Branch

*Alex. Love, A.M.E.I.C., Secretary-Treasurer.*
*V. S. Thompson, A.M.E.I.C., Branch News Editor.*

Tuesday, November 7th, 1933, was a red letter day for the Hamilton Branch when Dr. O. O. Lefebvre, M.E.I.C., The Institute's genial President, paid his official visit to the Branch. The Niagara Peninsula Branch joined with the Hamilton Branch on this auspicious occasion and many members and friends came from other points such as Toronto, Brantford and Galt.

The President arrived at 9 a.m. and was entertained by local members. He was taken to different places of interest and was also enabled to view the beautiful city of Hamilton from every vantage point.

The first official gathering was at 3.30 p.m. when a large party met at the offices of the Dominion Foundries and Steel Ltd. and were shown moving pictures of the manufacture of a car axle from the raw material to the finished article. The party was conducted through the plant by Mr. Frank Sherman and witnessed the tapping and subsequent charging of an electric furnace. Next the process of rolling 78-inch steel plates was seen. It is interesting to note that this is the widest steel plate rolled in Canada. The party also saw the tapping of an open-hearth furnace and pouring the molten metal into ingot moulds.

A smaller party visited the textile mill of Porritt's and Spencer and were shown the latest developments in the textile industry.

The city engineer, W. L. McFaul, M.E.I.C., conducted another party over the recently installed city filtration plant and pointed out its many interesting engineering features.

At an informal dinner in the Wentworth Arms at 6.30 p.m. (with an attendance of seventy-two) E. P. Muntz, M.E.I.C., who occupied the chair, welcomed to the Hamilton Branch Dr. Lefebvre, the President of The Institute. Dr. Lefebvre warmly thanked the members for the very kind welcome he had received. Mr. Muntz also introduced to the gathering Vice-President A. H. Harkness, M.E.I.C., of Toronto, A. B. Crealock, A.M.E.I.C., chairman of the Toronto Branch, W. R. Manock, A.M.E.I.C., chairman of the Niagara Peninsula Branch, and Mr. Crawford, president of the Babcock-Wilcox and Goldie-McCulloch Engineering Society, Galt.

At 8.00 p.m. members and friends to the number of 115 assembled in the Science Hall at McMaster University where Mr Muntz again presided. W. G. Milne, A.M.E.I.C., showed a reel of moving pictures of the total eclipse of the sun. These pictures were taken by Mr. Milne at Actonvale, Que., August 1932, when he accompanied the Hamilton party headed by the late Dr. Marsh.

Dr. Lefebvre next addressed the gathering and, commenting on the moving pictures, said they were of peculiar interest to him as they had been taken in his native county not many miles from his home town. He told the audience that he considered his election to the office of President as a very great honour indeed, because The Institute as a whole had selected one of the five per cent of the membership who were French-Canadians. It showed that The Institute did not consider race or creed in selecting men for high office.

The President told of the financial worries at Headquarters and how affairs were being managed. He told of the Plenary Meeting of Council last month and indicated what was likely to develop as the outcome of their deliberations. The Institute was to him something really worth while and he considered what he had paid in fees a sound investment, and he had derived manifold benefits as the results of this investment. He closed his interesting talk with an appeal to the older engineers to do everything they possibly can for the unemployed engineers, particularly those who have just recently graduated.

F. W. Paulin, M.E.I.C., the local Councillor of The Institute, voiced the sentiments of all present when he thanked the President for his interesting and inspiring talk.

At the close of the meeting coffee and sandwiches were served and a social half-hour was spent. This was the first meeting of the Branch in McMaster University and the facilities and accomodation provided by the University authorities were much appreciated by all present.

### Joint Meeting with Ontario Section, American Society of Mechanical Engineers

The Hamilton Branch, Engineering Institute of Canada, held a joint meeting with the Ontario Section, American Society of Mechanical Engineers, in the Science hall, McMaster University, on the evening of Tuesday December 12th, 1933. R. K. Palmer, M.E.I.C., past-chairman of the Branch, occupied the chair, and on behalf of the Branch extended a welcome to the members of the Ontario Section, A.S.M.E. Mr. Palmer also welcomed a large number of members and visiting friends from the Canadian Westinghouse Company, and spoke of their kindness in securing such an outstanding man as speaker of the evening.

On the invitation of Mr. Palmer, Mr. Ellis, chairman of the Ontario Section, A.S.M.E., assumed the chair and expressed the appreciation of the A.S.M.E. members at being invited to this meeting.

Mr. G. F. Mudgett, illuminating engineer of the Canadian Westinghouse Company and also chairman of the Toronto Chapter, Society of Illuminating Engineers, introduced the speaker of the evening. He spoke of his wide experience in the field of illumination, not only on streets and buildings, but in tunnels and under the sea. During the war Mr. Hibben was called on to devise special lighting equipment for use under water in salvaging a sunken submarine. He had also co-operated with Mr. Beebe in his deep water exploration.

The speaker, Mr. S. G. Hibben, manager of the Commercial Engineering Department, Westinghouse Lamp Company, Bloomfield, N.J., then addressed the meeting. He pointed out the great advantage and necessity of illuminants—in that 87 per cent of the knowledge obtained by the brain came through the optic sense. He also showed how rapid has been the development of the electric light in the past forty years. In that time the efficiency of lights expressed in light units per watt has increased from 1.4 to 26.0 which is about the limit with metallic filament lamps. By the ionization of various rare gases such as argon, neon, xenon, various illuminants of much higher efficiency have been produced.

He explained the problem of life and efficiency of lamps that confronts the manufacturer and by an interesting demonstration explained how a decision is arrived at.

The speaker predicted a wider use of colour in future lighting and showed the various colours derived from neon, argon, xenon, mercury and sodium, and showed slides of how concealed lighting is effectively used in stores, offices and the home.

Tables and charts showing the relation of mortality rates to hours of sunshine demonstrated clearly that the mortality from certain diseases was inversely proportional to the intensity of the sun's rays. The effect of the sun's health-giving rays can be closely approximated by ultra violet ray lamps, which are now used extensively in therapeutic work. A moving picture film showed the destruction of minute living organisms in a drop of water subjected to the rays of the ozone lamp which uses mercury vapour as the medium.

Sodium vapour lamps are being used more and more in street lighting and slides were shown which demonstrated their effectiveness.

At the close of the lecture G. A. Moes, A.M.E.I.C., moved a vote of thanks to the speaker and this was enthusiastically endorsed by those present.

Mr. Palmer pointed out that this lecture was ample demonstration of the value of The Institute to its members, particularly young engineers, when they could thus obtain first hand information from experts on important subjects not within the normal range of the practising engineer's activities.

The meeting adjourned at 10 o'clock p.m. but a great many remained to further inspect the equipment on view, and coffee and sandwiches were served.

This meeting fully demonstrated the advantage the Branch enjoys in being privileged to meet in McMaster University.

## Lethbridge Branch

*E. A. Lawrence, S.E.I.C., Secretary-Treasurer.*
*Wm. Meldrum, A.M.E.I.C., Branch News Editor.*

Dr. Wallace, president of the University of Alberta, gave a most inspiring address at a meeting of the Lethbridge Branch of The Institute held on Wednesday, November 8th, 1933, at the Marquis hotel, at 6.30 o'clock p.m.

Orchestral music was rendered during the dinner and the customary community singing was ably led by Bob Lawrence.

The meeting was open to the public and close to one hundred people were present when G. N. Houston, M.E.I.C., introduced the speaker. Dr. Wallace's subject was "Building a World."

### Building a World

In opening his address, Dr. Wallace stated that in the beginning life was composed of plant life; this developed into what were termed reptiles and later into mammals. All this took place before the advent of man, the knowledge of this coming to us through the work of geologists and archaeologists. From the time of man forward, we are able to get such knowledge from his writings, the knowledge therefore being more complete. In all this space of time, man has played a very small part and occupied a very short time.

During his short time on earth, man has accomplished much. He has learned to make use of his possessions. In the early ages, he made implements with which to kill his prey, that he might live; he made weapons to protect himself; he built rude huts for shelter. As he learned to make better use of his minerals and resources, he studied architecture and science. That he increased his knowledge in these lines is shown by the arts, paintings and fine buildings to be found in Crete and Egypt and later in Spain and southern France.

In the field of engineering, we have advanced notably. So in the field of science. Our astronomers and astrologers can tell us the distance stars are from us, the speed at which they are travelling from us, their weight, composition, etc. In regard to space and time, for instance, the Japanese statistics show that in about thirty-five years their birth and death rate will be almost equal and stationary. But they also know that at the end of that period they will have ten million more people to put to work. They know and admit that they are not a colonizing nation and therefore the only way they can keep their population working is by the expansion of industrialization. To do this, they must have raw materials. If Japan were sure that other countries would supply her with the raw materials to manufacture into goods that the world needed, she would be satisfied. But the world has not promised this to Japan in the past nor is it likely to do so in the future. Therefore, the only way Japan can be sure of having the necessary supply of raw materials is to possess them and possession means war such as Japan is engaged in at the present time.

China has no knowledge of her population because she is too backward at present. In the future, she will likely forge ahead and look for raw materials just as Japan is doing now.

Thus we have advanced in our scientific and engineering fields. But as a human race we have failed to learn how to live together. We have failed miserably on this point. We make peace pacts, pledges, sign agreements, etc., and then turn around and break them.

A great mistake we have all made is that we fail to see the problems of the world through the eyes of others. Our interests are too self-centred.

E. E. Eisenhauer, A.M.E.I.C., who moved the vote of thanks, expressed the appreciation of the audience for the very interesting and pleasant address given by one of Canada's outstanding speakers.

The Lethbridge Branch, Engineering Institute of Canada, held a meeting in the Marquis hotel on Saturday, November 25th, 1933, at which the wives and lady friends of the members were the guests of the evening. The chairman, J. Haimes, A.M.E.I.C., extended a welcome to all those present.

During the dinner, a fine selection of music was provided by the "Studio Trio," after which Bob Lawrence very ably led the community singing. Two very pleasing vocal selections were sung by Miss Janet McIlvena followed by two violin solos by Mr. Allan Murray, both artists being accompanied at the piano by Mr. Ralph Johnson.

The feature of the evening was the showing of two moving pictures, "Fire Fighters of the Skies" and "The Arctic Patrol." The projector was operated through the courtesy of Mr. Cyril Watson, the thanks of the Branch being tendered him by Mr. Haimes.

Following the pictures, those present repaired to the mezzanine floor in the Marquis where they became the guests of Mr. and Mrs. J. Haimes. Bridge was played until midnight when coffee and sandwiches were served.

## London Branch

*W. R. Smith, A.M.E.I.C., Secretary-Treasurer.*
*Jno. R. Rostron, A.M.E.I.C., Branch News Editor.*

A special dinner meeting was held on November 8th, 1933, in the Hotel London at which the speaker was the president of The Institute, O. O. Lefebvre, D.SC., M.E.I.C.

Some eighteen members were present to welcome the president and the meeting was presided over by the chairman of the Branch, V. A. McKillop, A.M.E.I.C.

Mr. McKillop, in introducing the speaker, said that he had already visited twenty of the twenty-five Branches throughout Canada and his object in so doing was to personally acquaint the members with what was happening to the profession, and consequently The Institute.

Mr. Lefebvre explained how the depression had affected financial standing of members of the engineering profession at large with the result that the revenue of The Institute was very much reduced.

Expenses had been very much curtailed. For example in the administrative costs the salaries of the staff were reduced 19 per cent last year and 5 per cent on top of that this year, although their work had increased. Services and publications had been limited, notably the Year Book and Transactions.

Reference was made to the desirability of obtaining uniform legislation throughout the provinces and to one fee covering admission to the Provincial Associations and The Engineering Institute.

As the speaker has visited and will visit all the Branches, it is not necessary to give a full resume of his talk, but suffice to say the difficulties under which The Institute was labouring were fully realized and a lengthy discussion took place on this and upon the standing of both The Institute and the Association.

The dinner was enlivened by musical selections by Mr. Archie McCulloch at the piano. The president's visit was much appreciated and he was accorded a warm welcome.

### The Engineering Profession

The regular November meeting was held in the board room of the Public Utilities Commission on Wednesday, November 29th, 1933, the chairman of the Branch, V. A. McKillop, A.M.E.I.C., presiding.

The speaker was A. B. Lamb, A.M.E.I.C., of Ottawa, president of the Association of Professional Engineers of Ontario.

Mr. Lamb opened his talk by a description of the meetings of the Ottawa Branch and went on to compare the lack of prominence of the engineering profession with those of law, medicine and theology.

The engineers did not appear in the public eye as a professional body as much as they should and the speaker advanced reasons for this. The remedy was organization, which he averred was slowly but surely progressing. He reviewed the present organization beginning with the British North America Act and subsequently the formation of the Canadian Society of Civil Engineers (now The Engineering Institute of Canada) and the Provincial Associations of Professional Engineers. He reviewed the legislation of these Associations of which eight out of the nine are protected by Acts of Provincial Parliaments, some strong and one notably weak, that of Ontario. He pointed out some of the weak spots in the latter and voiced the disappointment which was felt at the failure of the attempt in 1931-32 to get a revised Statute through the House. However, committees had been working ever since to iron out the difficult problems and before long a new Bill would be drafted which, it was thought, would sufficiently satisfy the objectors, chiefly chemical and mining.

An interesting discussion took place, after the speaker's remarks, concerning legislation, the status of the engineer, etc. The whole field of engineering was reviewed and it was felt that progress was being made in restricting the activities of unqualified practitioners. Colonel I. Leonard, M.E.I.C., past-president of the Association of Professional Engineers of Ontario, was present and gave a short resume of the policy of the Association with regard to legislation. Referring to loss of professional interest of the engineer he remarked that 80 per cent of the mining, mechanical and electrical engineering graduates in the United States joined large firms and worked up to business managers and executive positions, leaving only 20 per cent on the technical or engineering end.

E. V. Buchanan, M.E.I.C., pointed out that many engineers holding government and municipal positions were more or less debarred from taking part in public life.

A vote of thanks to the speaker was proposed by E. V. Buchanan, M.E.I.C., and seconded by J. A. Vance, A.M.E.I.C.

---

# FORTY-EIGHTH ANNUAL MEETING

## Windsor Hotel, Montreal
## February 8th and 9th, 1934

*Courtesy Canadian Pacific Railway Company.*

**Dominion Square, Montreal.**

## Annual General Meeting
## Annual Dinner
## Reception and Dance
## Technical Sessions

**Programme of Meeting Appears on Page 27**

## Moncton Branch

*V. C. Blackett, A.M.E.I.C., Secretary-Treasurer.*

The regular monthly meeting was held in the City Hall on December 12th. Professor H. W. McKiel, M.E.I.C., chairman of the Branch, presided. A very interesting paper on the field control of concrete in the construction of the new pier and quay wall at West Saint John was read by J. Harold McKinney, A.M.E.I.C., assistant engineer, Saint John Harbour Commission. During the discussion that followed, F. O. Condon, M.E.I.C., expressed the opinion that a central mixing plant would have been more economical than several scattered units. The mix would be more uniform and fewer inspectors required. Mr. McKinney admitted the contention but stated that the matter had been left to the discretion of the contractors. C. S. G. Rogers, A.M.E.I.C., asked if there had been any difficulty in bonding the 18-inch facing of No. 1 concrete to the inner No. 2 concrete, and if any cracks had developed. The reply was in the negative. H. J. Crudge, A.M.E.I.C., enquired as to the time of mixing. Mr. McMcKinney stated that one and one-half minutes had been insisted upon and added that tests had shown that a longer time would have resulted in greater strength. A vote of thanks was extended the speaker on motion of F. O. Condon, M.E.I.C., seconded by E. R. Evans, A.M.E.I.C.

## Ottawa Branch

*F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.*

How a fully developed town came into being in the wilderness connected only with the older settled parts of the country by a single line of railway, but with all the usual amenities of present day urban development, was described at an evening meeting of the local Branch on Thursday, October 26th, 1933. A. K. Grimmer, M.E.I.C., manager of the Town Department, Temiskaming, Quebec, was the speaker, his subject covering the "Development and Operation of Temiskaming as a Company-Owned Industrial Town." Group Captain E. W. Stedman, M.E.I.C., chairman of the Branch, presided.

### Development and Operation of Temiskaming

The speaker traced the course of the town from the time of the selection of the site less than sixteen years ago down to the present day.

The part played in reaching this objective by the application of the principles of town planning and of engineering and through intensive study of processes and elaborate research was aptly brought out by the speaker. The site selected was tributary to large areas of pulpwood which could be water-borne to the plant, and was also well located for obtaining water supplies and ample power cheaply developed from the Kipawa Lake area.

In the design and layout of the town itself, which was to furnish places of residence for the company employees, a model industrial community was aimed at, one which would attract and hold the best class of labour.

The controlling considerations in the selection of the townsite, after the industrial plant had been provided for, were briefly: geological structure, topographical conformation, proximity to potable water supply, exposure to sun and prevailing wind, proximity to plant, available building material, and natural beauty.

A decision was reached to meet the varying needs of the population by a general classification of the residences into officials', mechanics', helpers', and labour houses. Up to the present, however, no officials' type of houses have been built, officials meantime occupying other types. The general plan adopted for mechanics' houses was a six-roomed building with three bed rooms, bath, living room, dining room and kitchen, each having an approximate ground floor area of 625 square feet. Mechanics' helpers were similar, but with ground floor area kept down to 500 to 550 square feet. In the labour type the ground floor area was tentatively fixed at 450 to 500 square feet but in this classification more variation in type has been necessary on account of the variable sizes of families and the modern conveniences expected by the tenant.

The houses have practically every convenience expected in even large cities—the population varies from 2,200 to 3,200 persons.

School accommodation, allocation for churches, with one already built, a hospital, a motion picture hall, an athletic field, ski-jump, tennis courts, dressing rooms and equipment for a large out-door hockey rink, a concrete-lined wading pool for children, a nine-hole golf course, motor boat landing and a diving stage are just a few of the features of this interesting town. The planting of trees, shrubs and vines, competitions to foster the improvement of home surroundings, the construction by the town itself of an extensive rock garden and other measures have tended to transform the locality to one of beauty and interest to the citizen.

The address was accompanied by lantern slides and followed by a motion picture illustrative of the subject, after which the meeting was opened to discussion, in which a number of the members took part.

### International Highway, Mexico City-Laredo

The local Branch at their noon luncheon at the Chateau Laurier on November 2nd, 1933, had the pleasure of listening to an address by F. Jaime Gaxiola, newly appointed trade commissioner from Mexico to Canada. Mr. Gaxiola, an engineer by profession, graduated from the Polytechnic College of Engineering at Oakland, California, and in 1931 was appointed as engineer of the National Commission of Highways in the Location Section of the Pan-American Highway between Mexico City and Guadalajara City. He spoke on the subject "International Highway, Mexico City-Laredo (American Border)."

Group-Captain E. W. Stedman, M.E.I.C., chairman of the Branch, presided at the luncheon, and in addition head table guests included: Augustin Munoz Cabrera, consul-general for Argentina; Luis Sotto, acting consul-general for Cuba; Honourable H. A. Stewart; J. B. Hunter; Major J. G. Parmelee; Colonel A. E. Dubuc, M.E.I.C.; Dr. R. W. Boyle, M.E.I.C.; F. C. Askwith, A.M.E.I.C.: Alan K. Hay, A.M.E.I.C.; J. A. Ewart; H. W. Cheney; J. Sears, and C. McL. Pitts, A.M.E.I.C.

Mr. Gaxiola traced the course of railway and highway development in Mexico during the past generation, emphasizing the difficulties that had to be surmounted due to the topography of the country.

On account of the rapid increase in motor traffic in 1924, the National Commission of Highways was founded, which has now evolved into the Department of National Highways. The policy of this Department is to join several regions of the republic to the several existing railroad lines.

In 1926, a year and a half after the establishment of the department, the first modern highway was inaugurated joining the important city of Puebla (the capital city of the State of Puebla) with Mexico City. Since that time many other highways have been opened up. Some of these reach altitudes of 10,000 feet above sea level in their course across the country.

The Pan-American highway that will join Mexico and the United States on the western section is at present under construction and should be completed in the near future. Details of the location and the construction of this road were given by the speaker including the following items: length 770 miles, of which two-thirds are paved and the other third to be finished by the middle of next year; width of completed road, 30 feet: fenced on both sides as a protection for cattle; construction started from both ends; longest bridge, 1,500 feet long built of reinforced concrete; work done by contract; average cost $1,300 per mile. Further, the maximum allowable grade was 6 per cent for very short lengths and 5 per cent for longer stretches, the maximum curve allowed was 28 degrees with tangents of at least 100 metres between curves, no reverse curves being allowed. The highway is to form part of a Pan-American system which will ultimately connect with Argentina.

After the address a few minutes were devoted to discussion.

### The Treasury and Public Works Expenditure

Watson Sellar, Comptroller of the Treasury, addressed the noon luncheon on Thursday, November 16th, 1933, upon the subject of "The Treasury and Public Works Expenditure." Mr. Sellar has had extensive experience in the Federal Department of Finance. In 1930 he was appointed Assistant Deputy Minister of that Department and in 1932 was named to the newly created post of Comptroller of the Treasury.

Group-Captain E. W. Stedman, M.E.I.C., chairman of the local Branch, presided at the luncheon, and in addition head table guests were: Hon. E. N. Rhodes, W. C. Clark, Maj.-Gen. A. G. L. McNaughton, M.E.I.C., Capt. F. Anderson, M.E.I.C., W. T. Lucas, M.P., J. H. Campbell, C. H. Payne, B. J. Roberts, J. B. Harkin, L. L. Bolton, M.E.I.C., Noel J. Ogilvie, M.E.I.C., and E. Viens, M.E.I.C.

The address dealt with the procedure followed in government expenditures in Canada in so far as the control of these expenditures was concerned under the Consolidated Revenue and Audit Act. This act was originally copied from the English statutes and in this connection the speaker traced the history of the legislation, particularly in the Old Country, which led up to it.

The Consolidated Revenue and Audit Act, affirmed the speaker, was admittedly out of date by 1931, difficult to apply and expensive to administer. A revision was made and a new act came into effect on April 1st, 1932. This act entailed a number of changes one of which was that an official, to be known as the Comptroller of the Treasury, was made responsible for all payments. This involves a supervision over 3,500,000 transactions each year.

The speaker did not claim that an ideal system had been evolved in the short space of twenty months since this change came into effect, but every effort was made toward the ideal. If the Comptroller makes a payment when it is prohibited by law or Executive direction he assumes the responsibility, but if the transaction is permissible by law but objectionable on the ground of cost, waste or inefficiency, the originating Department must shoulder the blame.

On account of the variety of the work the accounting system must be simple yet comprehensive. While the speaker admitted the procedure is still more or less experimental he expressed the belief that the only way to build a sound control is to pivot the record on one document. Generally this is the contract order.

The Comptroller's office also, it may be expressed, act as "scouts" on behalf of the Minister of Finance who is responsible for the public credit. In performing this service this office must perforce delve into transactions which departments think is their own business.

The speaker then referred to the material diminution in works programmes which has been brought about during the past few years. This has coincided with a changed view point of the public towards public works. "There still are, of course," Mr. Sellar said, "those who dub all such undertakings as 'patronage.' To them, cost to construct, or financial return to the government are of no concern. The greater number of people, however, note that the tendency is to encourage public bodies to undertake activities which, not so long ago, were within the exclusive sphere of private enterprise. We feel that, when the public invades the field of commerce, we must, at least in part, accept the rules of commerce. The more important is that the undertaking should carry its own load, and not add it to the back of the general taxpayer."

At the present time there is a tendency on the part of civil servants to urge that works should be carried out either because they will provide employment or because the cost is less than it would have been a few years ago. The speaker was not impressed by such arguments, declaring that the need for the work should be the first consideration.

Elements of Town Planning

"Congestion is the cancer of modern life and development," stated Noulan Cauchon, A.M.E.I.C., in a noon luncheon address on November 30th, 1933, before the Ottawa Branch of The Engineering Institute at the Chateau Laurier. Mr. Cauchon was speaking upon the subject—"Elements of Town Planning."

Group Captain E. W. Stedman, M.E.I.C., chairman of the local Branch, presided, and in addition head table guests included: Hon. H. A. Stewart, Hon. A. Duranleau, C. A. Magrath, M.E.I.C., Professor F. E. Lloyd, Tom Moore, John M. Kitchen, F. L. Poulin, G. J. Desbarats, M.E.I.C., H. L. Seymour, Alan K. Hay, A.M.E.I.C., C. D. Wight, A.M.E.I.C., C. McL. Pitts, A.M.E.I.C., Caleb Medcalf, and Wing-Commander W. R. Kenny, A.M.E.I.C.

Mr. Cauchon in his address traced the development of town planning principles from the spectacular work of rulers of bygone days who wished to glorify their land, and, incidentally, themselves, down to the present day. Modern town planning, particularly British planning, he characterized as "The technique of social science of providing conditions of human welfare, resting upon biological requirements for the maintenance and enhancement of human life." Into this science there is focused the sciences of engineering and architecture, methods of efficiency and, in fact, the whole range of human knowledge in so far as it relates to the production and maintenance of well being and amenity.

Mr. Cauchon dealt with the question of movement of population along highways, differentiating between the requirements for their width, their length, and, also, their height. This latter dimension he explained relates to the height of buildings fronting upon such highways with the consequent inward and outward flow of human population and goods. To these three dimensions—the first one fixed, the second and third ones variable and cumulative—Mr. Cauchon added a fourth dimension, which is time.

Time combined with space which he translated as speed is also a variable and cumulative quantity limited only by certain mechanical and psychological considerations.

The speaker characterized the traffic problem as one in dynamics, the play of forces considered free from volition, and stated that the present usual checkerboard plan of sub-division with its cross intersections is a continuous example of interference and shock of forces. This plan was specifically denounced by Sir Raymond Unwin, the great British authority on town planning, in all his recent addresses in Montreal and Toronto. It has been worked out, for instance, that there are sixteen minimum collision points at a cross intersection. As a remedy to this situation, Mr. Cauchon brought forward his plan whereby streets would intersect each other in three way junctions at angles of 120 degrees. He maintained that the latter method of planning permits approximately three times the speed and gives five times the safety of traffic which moves through the present generally accepted checkerboard layout which is also choked by peak loads.

A further development of the three way junction idea was the addition of the principle of "Interceptor" which is a through traffic route permitting access and exit only at certain long intervals and affording continuous high speed. He showed that this principle is analogous to that of the storm sewer, the intercepting sewer, and the intercepting water main. At this point Mr. Cauchon made extended references to traffic conditions in Ottawa, explaining how the application of this principle would relieve local congestion and bring about badly needed improvements in and around the city.

The speaker devoted a short time to the development of the idea of art in town planning. He considered that art should not be understood merely as a decorative thing, but as an expression in the works and actions of every day life.

## Peterborough Branch

*H. R. Sills, Jr.E.I.C., Secretary.*
*W. T. Fanjoy, Jr.E.I.C., Branch News Editor.*

Annual Meeting November 28th

The note of optimism struck by J. E. Hammel, internationally-known mining man, was one of the outstanding features of the annual dinner of the Peterborough Branch, held at the Empress hotel Tuesday evening, November 28th, 1933.

Known in mining circles from Newfoundland to the Yukon and from the Arctic Circle to away south of the international boundary, Mr. Hammel declared that he thought the north country was going to be the making of Canada and did not see any reason why Canada with all her mineral wealth should be feeling the depression.

One of the most fascinating and romantic characters that has appeared locally for some time, Mr. Hammel, was introduced to the gathering by Lieut.-Colonel C. H. Ackerman as a man whose only satisfaction in life was to make some worthy contribution to the people of Canada.

The dinner at which V. R. Foster, A.M.E.I.C., chairman of the Branch, presided in the capacity of toast master, was outstanding not alone for the delightfully informal and extremely individualistic talk with which Mr. Hammel delighted the gathering but also by reason of the fact that Dr. Oliver O. Lefebvre, M.E.I.C., president of The Institute, was present with an inspiring message for the members of the Branch.

As a complimentary gesture to Dr. Lefebvre, Andrew H. DuChene of the local staff of the Canadian General Electric Company tendered a message of welcome to the guest in French.

Mr. DuChene stated that as the only French-Canadian member of the Peterborough Branch he had been commissioned to convey to Dr. Lefebvre in French the welcome of the Branch. As far as matter was concerned he could add little to that which had been so ably expressed by the chairman, but his purpose was to convey the gratitude of the Branch for the honour the President had done them in coming to address them at their annual dinner.

Dr. Lefebvre appeared delighted at the warmth of the welcome accorded him, and during the course of the evening replied to the message extended by his compatriot in French.

A. B. Gates, A.M.E.I.C., in proposing a toast to The Institute and its Branches referred to the cohesion of the various branches of The Institute and the force which held them together across a far-flung country.

The toast was responded to by the president, Dr. Lefebvre, and also by A. H. Harkness, M.E.I.C., vice-president of The Institute, and R. J. Durley, M.E.I.C., secretary of The Institute.

Upon assuming office, Dr. Lefebvre stated, he had set out with the purpose of paying a personal visit to each of the branches of The Institute in Canada. "This Branch," he said, "is the twenty-third I have visited."

The Institute, the speaker declared, was in good health notwithstanding the fact that it had felt the depression in the last few years. There was no profession, he believed, so intimately connected with human activity as the engineering profession. The engineer was active in every line of human endeavour, and as human activity decreased the engineer was the one who was the first to experience the reaction. As a result, he stated, many members of the profession had seen their incomes greatly reduced, while others had seen their incomes completely dissipated through unemployment.

The Institute had suffered in depleted revenues, and it had been found necesshry to reduce expenditures in several directions. While retrenchments had been made, Dr. Lefebvre emphatically declared that no effort would be spared to keep up the high standard of The Engineering Journal, nor to decrease the service which The Journal was rendering to members of the profession.

Speaking of the engineering profession as being in the forefront of public opinion, the speaker remarked that everyone recognizes the part the engineer plays in the development of the country. It had been stated however, he added, that engineers were responsible for over-production and over-development along certain lines. That was not so. The engineer had merely been called upon to draw up plans to produce certain results, and he had done his work well. Had the opinion of the engineer been referred to, Dr. Lefebvre was of the opinion that in many cases the engineer would have advised against certain things.

Dr. Lefebvre referred to the difficulty that was being experienced by young men who were graduating from the universities at the present time with engineering degrees, and with no outlet for their ambitions. These young men, he said, were finding it impossible to get jobs and were being driven into the ranks of the unemployed. He appealed to the older members of the profession to show sympathy to those unfortunate young men and to encourage them, and to instil into them the hope of better days ahead.

Dr. Lefebvre, who was the guest of Ross L. Dobbin, M.E.I.C., councillor of the Branch, during his brief stay in the city, was presented by Mr. Dobbin with an alarm clock, through the courtesy of J. H. Vernor, manager of the Western Clock Company. Earlier in the day Mr. Lefebvre had paid a visit to the Westclox plant.

Addressing his listeners in a free and easy, informal manner, Mr. Hammel regaled them with stories of the trail and the mining camps.

"Mines are not found, they are made," he said. "There is nothing to this mining game but horse sense, commonsense and guts—mostly guts."

Mr. Hammel paid tribute to the work of the engineer in the development of the North country, and spoke of the constructive help that was given to the mining men by the Provincial and Federal Ministers of Mines.

Offering encouragement to the youth of to-day, Mr. Hammel stated, "The main thing is to keep going, don't be afraid of not getting jobs. All you need is lots of pep and punch." That he said was advice he gave to a group of senior students at the University of Toronto in an address before them recently. It was the younger men the country had to depend on, the speaker thought, and he believed that all kinds of opportunities presented themselves in the northlands for men of resourcefulness and nerve, and that the north country was going to be the making of Canada.

## Quebec Branch

*Jules Joyal, A.M.E.I.C., Secretary Treasurer.*

Lundi le 4 décembre 1933, à 11 heures a.m., les membres de la section de Québec de l'Institut des Ingénieurs du Canada et quelques-uns de leurs amis ont eu le plaisir d'assister à une démonstration de quelques-unes des nombreuses applications pratiques de l'invention moderne qu'on appelle "Œil Électrique."

Cette démonstration eut lieu au Manège Militaire de Québec où le club Kiwanis local avait organisé une Kermesse au profit des enfants pauvres et l'Œil Électrique y était sans aucun doute la principale attraction.

Cette réunion fut tenue par suite d'une gracieuse invitation faite à notre président, Hector Cimon, M.E.I.C., par Monsieur A. D. Masson, gérant de la Canadian Electronics Limited, Montréal, qui était en charge de cette attraction.

Tous ceux qui ont pu répondre à cette invitation, une soixantaine environ, furent simplement émerveillés en face des possibilités de ce nouveau produit du génie humain.

Monsieur Masson fut le premier à nous adresser la parole et après nous avoir remercié d'avoir répondu en aussi grand nombre à son invitation, il nous cita une foule de cas où cet œil électrique peut être appliqué et nous en expliqua le fonctionnement; pour ne mentionner que quelques cas, cette invention peut être utilisée pour enregistrer le nombre de personnes entrant dans une salle, faire la sélection pour l'emballage des marchandises, protéger le caissier d'une banque contre toute attaque par des bandits, protéger la propriété contre les voleurs, ouvrir ou fermer les portes, etc., etc., l'œil électrique au moyen d'un relais met en mouvement le mécanisme approprié aux opérations qu'on lui destine.

Un autre représentant de Canadian Electronics Limited, Monsieur Ouimet, nous donna ensuite certains détails techniques au sujet de cet œil électrique qui peut se comparer à l'œil humain et lui est même supérieur à certains points de vue, par exemple il est beaucoup plus rapide et ne se fatigue pas.

Un Kiwanien de Québec, Monsieur Lucien Brousseau, nous donna ensuite la démonstration pratique en faisant fonctionner les divers appareils installés et nous invita à faire de la publicité au cours de la journée pour que tous ceux qui ne s'étaient pas encore rendus au Manège ne manquent pas d'aller admirer cette nouvelle découverte présentée pour la première fois au public de Québec et que nous n'aurons peut-être pas l'occasion de revoir prochainement.

Notre président, Monsieur Cimon, se fit l'interprète de l'assistance pour remercier Monsieur Masson de son beau geste envers les ingénieurs de Québec et avant de quitter la salle tous purent examiner à loisir les divers mécanismes qui avaient servi à cette démonstration.

## Saint John Branch

*Sidney Hogg, A.M.E.I.C., Secretary-Treasurer.*
*C. Gordon Clark, S.E.I.C., Branch News Editor.*

### Visit to H.M.S. Norfolk

During the summer about forty members of the Saint John Branch of The Institute paid an informal visit to H.M.S. Norfolk, a 10,000-ton treaty-class cruiser, the flagship of the West Indies squadron that came to Saint John to use the dry dock facilities there. The officers of the engine-room staff conducted parties to points of interest about the ship and afterwards entertained in the ward room.

### President's Visit

On Monday, October 23rd, 1933, at 7.30 o'clock p.m., the Saint John Branch held its first meeting of the season in the form of a dinner to meet Dr. O. O. Lefebvre, M.E.I.C., the president of The Institute. There were about forty members present, including several from outside Branches.

After toasts to the King and The Institute, G. A. Vandervoort, A.M.E.I.C., chairman of the Branch, introduced Dr. Lefebvre. In his address Dr. Lefebvre emphasized two points: the membership of The Institute and its relations with the provincial professional associations. Pointing out that membership has decreased, the speaker showed where necessary economies in the operation of The Institute were to be made. The Journal, however, must be retained and improved where possible. The Saint John Branch was cited as a Branch whose membership had continued to increase. A brief description was given of the growth of the professional associations and their relation to The Institute. Fuller co-operation was asked for, and the architects cited as an example of how effective this could be. The President in conclusion spoke of the apparent indifference of members to ballots sent out on various questions.

## Saskatchewan Branch

*S. Young, A.M.E.I.C., Secretary-Treasurer.*

The regular monthly meeting of the Branch was held in the Hotel Champlain, Regina, on Friday evening, November 24th, 1933, P. C. Perry, A.M.E.I.C., occupying the chair.

After disposing of several matters of business, the chairman called on J. N. DeStein, M.E.I.C., for a short address on the reproduction of plans.

### The Reproduction of Plans

After pointing out the necessity in certain cases for the making of plans in duplicate, triplicate, quadruplicate, etc., Mr. DeStein stated that, having the original plan, reproductions can now be made directly on sensitized linen or paper. The process was invented about twenty years ago and, though at first not entirely satisfactory due to the tendency of the linen or paper to deteriorate, the process has now reached a stage where plan reproductions can be made at considerable saving in cost.

The meeting then proceeded to the main topic of interest by the chairman introducing L. A. Thornton, M.E.I.C., whose subject was "Proposed Power Developments on the Saskatchewan River." In introducing the speaker, Mr. Perry recalled the fact that Mr. Thornton had been the first chairman of the Saskatchewan Branch of The Institute.

### Proposed Power Developments on the Saskatchewan River

In introducing his subject, Mr. Thornton drew attention to the fact that there is at the present time no immediate proposal to develop power on the Saskatchewan river, but that for the purpose of his address he would discuss one or two proposals which had been made during the last three or four years.

Dominion statistics show that Saskatchewan has the lowest water power development in Canada, there being only one such development, namely, that recently constructed on the Churchill river for the supply of power to the Flin Flon and Sherritt Gordon mines. The chief reason why hydro development had not been seriously considered was that potential sites of hydro power were situated a considerable distance from the load centres, and that the sites in question did not possess the same obvious natural advantages as were attached to water power sites in other parts of the Dominion. The Saskatchewan river was the only available source within reasonable reach of the population. It was classed as a navigable stream and there were no locations where a natural head of water could be developed.

The flow in this river had been recorded by the Dominion Water Powers Branch for many years and indicated the low minimum flow in the winter season of less than 4,000 cubic feet per second; that for 30 per cent of the year the flow would be less than 6,000 cubic feet per second; for 50 per cent of the year less than 14,000 cubic feet per second; and for the balance of the year ranging from 14,000 to 50,000 cubic feet per second. The river for all practical purposes might be taken to be entirely lacking in natural storage facilities and the only available storage would be the pondage which would be created by the erection of a dam at the power site, the use of which would be effective to some adjustment of hourly variations in load, but would be of little use for longer periods of regulation.

He referred to the report of Sullivan, Kipp and Chace, consulting engineers, made to the Power Resources Commission of Saskatchewan in 1928, in which the engineers discussed a site immediately below the forks of the north and south branches of the river. They adopted a dam height of 50 feet, not only because the river banks at that location were comparatively low and limited the height, but because the river bottom provided only a clay foundation, a condition which raised in their mind the doubt as to the practicability of providing a higher head. They estimated a maximum development of 50,000 h.p., which would be limited in output in the low flow months of the winter to 12,000 h.p., which latter fact would necessitate the continuous operation of steam plants during the winter, and their conclusion was that until such time as the load of the province during the seven summer months would absorb large quantities of power which could be developed at the site discussed, and very much in excess of the present day demand, consideration of such development should be deferred.

H. G. Acres and Company had been employed by the Saskatchewan Power Commission to make further investigation and report, and had reported in 1931 upon a site at Fort a la Corne, where the formation of the river made a dam of 125 feet in height possible, which with the minimum flows reported would promise a continuous supply throughout the year of 42,000 h.p. Foundation conditions were described as favourable. The Acres report recommended an ultimate development of 125,000 h.p., and it claimed that the economics of the situation warranted the project; that present steam costs and ultimate steam costs could be bettered by the cost of the hydro development. The total ultimate cost of the project, including transmission lines to the cities of Prince Albert, Saskatoon, Moose Jaw and Regina, would be $19,000,000, and the immediate cost about $15,000,000.

On account of the situation in the province as regards hydro possibilities, briefly referred to at the beginning of the address, the main interest in power development for many years has been in the erection of steam plants. The steam plants had reached a stage of high efficiency, possibly higher than in any other part of the Dominion when all factors were considered. These plants were still in first-rate condition and the investment must be carried, and, therefore, any hydro development, to compete must be in a position to deliver the power to the centres of load at distribution voltage at a cost comparable with the operating costs of the steam plants, exclusive of the investment costs, and it had been urged that, with the changed conditions of finance, for the present at least, the steam operating costs would be lower than possible costs of a present hydro development, as suggested by the Acres report.

The speaker discussed at some length the method adopted by the reports in question in reaching an estimate of the future loads available when the development was proceeded with. He pointed out that in the first place the principal interest in hydro development lay in the provision for future loads of much larger dimension than present day loads; that under normal conditions a healthy growth in the load might confidently be expected and must be provided for, either in this way or further extension of steam plants; that at the present time, however, the steam plants were adequate to supply all the present load and for some little time to come; and that at the present time also there was no growth in the load, and that until there was some promise of a return to normal conditions experience did not warrant reaching a definite conclusion as to the immediate future.

In the discussion following Mr. Thornton's address, those taking part were E. W. Bull, H. S. Carpenter, M.E.I.C., Arthur Townsend, E. H. Roberts, P. R. Genders, A.M.E.I.C., D. A. R. McCannel, M.E.I.C., L. W. Llewellyn, Jr.E.I.C., S. R. Muirhead, A.M.E.I.C., A. B. Coward and J. N. deStein.

A hearty vote of thanks moved by D. A. R. McCannell, seconded by J. McD. Patton, A.M.E.I.C., was voted to both speakers.

## Toronto Branch

*W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.*
*O. Holden, A.M.E.I.C., Branch News Editor.*

On November 16th, 1933, a well-attended dinner meeting was held by the Toronto Branch at the Royal York hotel. The guest of honour was O. Lefebvre, D.Sc., M.E.I.C., President of The Engineering Institute of Canada. Dr. Lefebvre was introduced by the chairman, Archie B. Crealock, A.M.E.I.C.

Following his introductory remarks, Dr. Lefebvre referred to the financial problems of The Institute. He pointed out that The Institute had effected economies in a number of directions, including reductions in the salaries of the staff. These he felt, however, had been cut to the lowest possible level to which they could in justice be brought. Expenses for such items as the transactions and membership list were dealt with. The transactions, Dr. Lefebvre felt, were unnecessary, particularly at the present time, in view of the fact that all papers meriting publication were published in The Journal.

Dr. Lefebvre referred to the recent three-day Plenary Meeting of Council, indicating its importance, and pointing out that without the generous contribution of the branches from their own funds toward the expenses it is doubtful if it would have been possible to hold such a meeting.

The relationship of The Institute to the provincial associations of professional engineers was dealt with. There was, he felt, no need for friction or overlapping of the interests of these associations with those of The Institute, their aims and objects being entirely separate. The Institute had fostered the provincial associations with the object that these associations might fulfil a function which, by virtue of The Institute charter and the British North America Act, were beyond the scope of the parent body.

All members of The Institute were exhorted to encourage the younger members of the profession to become members and to take an active part in Institute affairs. He pointed out, however, that no matter how desirous we may be to increase the membership, this should not be done by lowering the standards of entrance. Dr. Lefebvre's address was rendered particularly entertaining by the ready wit and good humour of the speaker.

Eric P. Muntz, M.E.I.C., spoke briefly on behalf of the Hamilton Branch of The Institute.

A. H. Harkness, M.E.I.C., moved a vote of thanks, to which a hearty response was made by all present.

## Winnipeg Branch

*E. W. M. James, A.M.E.I.C., Secretary-Treasurer.*
*E. V. Caton, M.E.I.C., Branch News Editor.*

At the local Branch meeting of The Institute held on Thursday, November 2nd, 1933, Professor J. N. Finlayson, M.E.I.C., gave a very interesting paper on the "St. Lawrence Waterway Project."

### St. Lawrence Waterway Project

Professor Finlayson defined the St. Lawrence waterway project as a scheme to connect the oceans of the world with the Great Lakes of North America by means of a ship canal of a depth sufficient to allow of the unrestricted passage of vessels drawing 27 feet of water, and thus create a North American Mediterranean which will be to this continent everything that that inland sea is to Europe, Asia, and Africa. It also includes the simultaneous development of five million horse power of hydro-electric power, four-fifths of which will belong to Canada and one-fifth to the United States.

The most powerful support for the project comes from the United States located on or near to the St. Lawrence watershed between the Appalachian and the Rocky Mountains. Sixteen of these states including Montana in the west and Kansas in the south organized the Great Lakes-St. Lawrence Tidewater Association, which has issued a vast amount of literature favourable to the project. These states contain forty-five millions of people, about 40 per cent of the population of the Union, and produce 75 per cent of the wheat, 65 per cent of the corn, 100 per cent of the flax, 85 per cent of the iron, 3 per cent of the copper, 74 per cent of the zinc and 46 per cent of the lead in the United States.

The province of Quebec and a portion of New York state are opposed to the scheme. The strongest case against the proposed waterway is made by The Institute of Economics of the Brookings Institute, Washington, D.C. In 1929, the Institute published a work, edited by Doctor Harold G. Moulton, and containing articles by Doctor D. A. MacGibbon, formerly Professor of Economics at the University of Alberta, now a member of the Grain Commission of Canada, residing in Winnipeg. These authors have pointed out that Canada's interest in the proposed waterway is in many respects different from that of the United States. In the latter country, the principal arguments advanced in favour of the scheme are that it is necessary for the purpose of relieving railway congestion, that it will reduce transportation costs, and that it will lead to the development of vast water power resources. The Canadian transportation situation is, however, that there is no congestion of traffic; instead the existing transportation agencies do not have sufficient volume of traffic. The need is for additional tonnage for the railways rather than for the relief or any congestion present or potential. The Canadian public, through its various governments, has already invested in Canadian railways nearly a billion dollars in the form of subsidies, loans, lands and guarantees. Thus for the Canadian government to incur enormous expenditures for the construction of a waterway, designed to divert some of the traffic from the existing railways, including those that are owned and operated by the government itself, is unsound national policy.

Many boards, committees and commissions have reported on methods of obtaining the necessary improvements on the river. The International Joint Committee, a body created by the Boundary Waters Treaty of 1909, made a thorough examination of the project. Its report, often referred to as the Wooten-Bowden Report, was filed on December 19th, 1921. It found that the physical conditions of the St. Lawrence are favourable for improvements for navigation, which will be permanent and will have low upkeep costs, but that the simultaneous development of power is not a sound economic procedure, as the market to take the output is not in existence and cannot be expected to spring into being at once. Alternate plans for improving navigation and developing part of the power in the international rapids section were presented. In the spring of 1924, the Joint Engineering Board was appointed, composed of three Canadian and three United States engineers. Its report was published in November, 1926. It recommended the deep waterway for navigation purposes and presented plans for power houses with an ultimate installed capacity of about 2,700,000 horse power. The engineers differed on the question of power development of the international section of the river. The United States members favoured a single stage development with one dam at the foot of Barnhart Island near Cornwall. The Canadian members recommended a two stage development with dams at Ogden Island near Morrisburg and at Long Sault Island near Cornwall. The former plan called for a dam 75 feet in height which would be the means of flooding over 29,000 acres of land and several villages. The latter scheme would have one dam over 50 feet high near Cornwall and another 27 feet high near Morrisburg. There would be less flooding of land, not more than 6,000 acres. Another scheme (Scheme C) has been favoured by the Hydro-Electric Commission of Ontario. The upper dam would be erected at Crysler Island below Ogden Island. Nearly one million horse power would be obtainable two or three years sooner than by either Scheme A or Scheme B.

As regards costs, these have been carefully considered by the engineers who have reported on the project. Mr. Lesslie R. Thomson, M.E.I.C., a consulting engineer, residing in Montreal, prepared a paper for The Engineering Institute of Canada on the subject, in which he tabulated and analyzed the cost of the project. If the navigation enterprise alone is considered, the estimated cost is about $355,000,000, which sum includes the cost of the new Welland canal, $120,000,000, and that of deepening the channels between the upper lakes and of a new lock at Sault Ste. Marie, $60,000,000. If a power enterprise should be considered by itself, the cost of developing five million horse power will be $545,000,000. If a combined navigation and power development is undertaken the total cost would be $840,000,000, constituting a saving of $60,000,000. These figures do not include interest charges during construction and thus the ultimate cost may be said to be a billion dollars.

There has been much speculation as to the equitable division of costs between the two nations concerned. If Canada were to offer to pay for all the work to be done on her side of the international boundary line, her share would amount to nearly three-fourths of the whole, or about $700,000,000. This would place too great a burden on the Canadian taxpayer, and considering the greater advantages which the United States would derive from the enterprise, would be unfair to Canada. Any other division of the costs will require international negotiations. Many United States citizens have recorded protests against the expenditure of public money on an enterprise, or any portion of an enterprise, in a foreign country, urging the advisability of the alternate route to the sea via the Hudson. A few Canadians have questioned the sanity of a policy which allows the United States to become a paying partner in what they consider to be a purely national project. The phrase "The thin edge of the wedge" resounds throughout the country. On the other hand, many responsible representative citizens of both nations have expressed their belief in the ultimate evolution of a satisfactory basis of division of costs.

Owing to the general interest of the subject the meeting was thrown open to the public and a special invitation was given to the engineering body of the University of Manitoba to attend. An exceptionally large attendance resulted and an active and interesting discussion took place at the close of the paper.

MODERN CONSTRUCTION

A large gathering attended the local Branch meeting of The Institute on Thursday night, November 16th, 1933. The subject was "Modern Construction" and the speaker Mr. A. Stevenson, local branch manager of the Otis-Fensom Elevator Co. Ltd. To illustrate the subject two films were run showing the construction of the Empire State building and the new George Washington suspension bridge over the Hudson river.

The first film showed the process of fabricating the lower column section for the Empire State building and the erection of the steel proceeding floor by floor to the top.

Some interesting facts relative to the Empire State building were given by the speaker, such as:—

Total weight of structural steel in framework—60,000 tons.
Total weight of building—303,000 tons.
Height equivalent to 102 storeys.
Observation gallery 1,048 feet above Fifth avenue.
Tower observation gallery, accommodating fifty persons, 1,212 feet above Fifth avenue.
Building contains 67 elevators.
Total cost of building—$60,000,000.
Total revenue obtained the first year from persons visiting the observation tower $1,000,000 at $1 per person.
There were only five casualties during the construction of the building.

The next film shown was that of the construction of the George Washington suspension bridge. This structure is a highway bridge over the Hudson river and the total length of the bridge proper is one mile.

The picture showed first the construction of the anchorages, the two suspension towers and the temporary scaffolding. It then illustrated in detail the method of spinning the four suspension cables. These are 3 feet overall in diameter and each contains about 100,000 individual wires. The finished cable was closely wound with a layer of wire and then given a protective coating.

Other interesting facts relative to the construction of this bridge are:—

Total cost—$75,000,000.
Field construction plant—$1,500,000.
Scaffolding—$600,000.

At the close of the meeting an interesting discussion took place and a vote of thanks was finally tendered by J. W. Porter, M.E.I.C.

## British Standard Specifications

(ISSUED DURING SEPTEMBER AND OCTOBER, 1933)

*B.S.S. No.*

503—1933. *Creosote for Fuel in Furnaces.*
Specifies requirements for the specific gravity, viscosity, fluidity, water content, ash content and calorific value of creosote for use as a fuel in oil burning installations. Detailed appendices are included in which the methods of carrying out the various tests specified are fully described.

504—1933. *Drawn Lead Traps.*
This specification secures without additional cost hygienic and efficiently designed traps for use with baths, lavatory basins, bidets, sinks, etc.

505—1933. *Road Traffic Control (Electric) Light Signals.*
Prepared at the request of the Ministry of Transport and covers the optical requirements, the signal construction, the control requirements, the controller construction and the requisite tests, and in addition the elimination of surges, radio interference and regulations governing the use of Post Office plant are also included.

506—1933. *Methyl Alcohol (Methanol).*
507—1933. *Ethyl Alcohol.*
508—1933. *Normal Butyl Alcohol (Butanol).*
509—1933. *Acetone.*
The above four specifications form the first of a series of British Standards for solvents.

510—1933. *Single-Coat Asphalt (Cold Process).*
511—1933. *Two-Coat Asphalt (Cold Process).*
The above two specifications provide for the process of asphalt road surfacing in which the use of heat is either greatly reduced or entirely eliminated. Each comprises three sections: definitions, materials, and construction and workmanship. In a series of appendices are described tests demanded by the specifications.

*Prices:—2s. 2d. each, post free.*

British Standards Institution,
Publications Dept.,
28, Victoria Street,
London, S.W. 1.

## Additional Sewage Plant Recommended for Toronto

Construction of a large new sewage disposal plant has been recommended to the city council of Toronto, Ont., in a report prepared jointly by the firm of Metcalf and Eddy, Boston, and Gore, Nasmith and Storrie of Toronto. The entire project covered by the report would cost about $26,000,000.

The report recommends that the development be laid out to take care of the sewage from the area known as the Greater Toronto Sewerage District, that a population of 877,000 in 1948 and one of 1,564,000 by 1970 be planned for, that all flows up to two and one-half times the average daily flow be conveyed to the treatment plant, that complete treatment be given to all flows up to one and one-half times the average and the surplus be treated by sedimentation only. Elimination of the existing Eastern avenue sewage-treatment plant is called for, also provision for pumping the sewage coming to that plant to a new sewage-treatment plant at the mouth of Highland creek in Scarborough township, close to Lake Ontario, from which an outfall conduit will lead into Lake Ontario. The new pumping station adjoining the site of the Eastern avenue plant is estimated to cost $859,000, an outfall sewer from the pumping station to the proposed Highland creek plant to cost $9,374,000; the plant itself $9,435,000 and the outlet conduit $760,000. Intercepting sewers within the city would cost $5,411,000 and those to serve the outlying district $3,745,000.

The treatment process would consist of preliminary sedimentation, activated-sludge treatment of the settled sewage and digestion and mechanical dewatering of the sludge. The new plant would be 11 miles east of the existing plant. Its discharge would be carried into the lake a distance of 4,480 feet for discharge through a diffusing system about 34 feet deep. It is estimated that six years would be required to build the plant and put it in shape for operation.

## Reversed Refrigeration

Reversed refrigeration, or the process of heating a house in winter by means of the same equipment that cools it in summer, is an idea which is being carefully investigated by the Canadian Westinghouse Company. In summer, air conditioning equipment absorbs heat from inside the house, pumps it to the outside and discards it.

In winter the cycle is reversed; heat is picked up from the outdoors and brought inside to warm the house, coils inside the house which formerly absorbed heat become radiators, while outside coils instead of throwing off heat, absorb warmth from the outside air. The explanation lies in the fact that the atmosphere is only relatively cold; even zero F. is some 460 degrees above absolute zero. In reversed refrigeration, no heat is generated (except mechanical losses), but is merely pumped from the tremendous outdoor reservoir to the inside of the house. An experimental installation has heated an ordinary frame house satisfactorily in winter.

Vapour from the evaporator is compressed, thereby raising its temperature. Flowing through the condenser the gas becomes a liquid, liberating heat. Reaching the expansion valve, the pressure of the liquid refrigerant is so reduced that it boils and in vapourizing makes the evaporator colder than the outside air. Heat flows from the warmer outside air to the refrigerant and the vapour is again drawn off by the compressor to repeat the cycle.

Since heat is not generated but merely transferred from outside inside the house, an efficiency of 300-500 per cent is obtained—i.e., the electric current consumed in pumping produces three to five times as much house heat as if the same electricity were directly converted into heat.

There are, however, many problems yet to be solved before reversed refrigeration equipment can be made commercially possible.

---

*Canadian Hoists and Conveyors Ltd., Montreal,* have introduced a new design of conveying belt and idlers. The outstanding feature of this new system is that it employs a flat belt on the edge of which rubber curbs are vulcanized, thus doing away with the troughing formerly necessary to permit a conveyor belt to carry its load. It is claimed that breaks in the belt fabric are eliminated, and that the belt carries a larger load than a troughed belt of equal width. The improved return idlers are likewise worthy of note as they are perfectly balanced aluminum tubes fitted with anti-friction roller bearings. The "Curbelt" can be adapted to existing troughed conveyors by fitting the troughed belts with curbs and converting the troughed idlers by mounting the inclined rolls on horizontal shafts. Bulletin No. CHC-750, describing the "Curbelt" and the "Superoll" will be sent on request to the company at New Birks Building, Montreal.

*Canadian Industries Limited* announce that due to the increased use of high explosives in Canada, especially in mining circles, the price of all types has been reduced by 25 cents per hundred pounds. This reduction has been made possible as a result of a greater volume of sales in the various divisions of C-I-L since last May, an improvement which, in the case of explosives, has brought the rate of production nearer normal.

# Preliminary Notice

**of Applications for Admission and for Transfer**

December 26th, 1933

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described in February, 1934.

R. J. Durley, Secretary.

* The professional requirements are as follows—

**A Member** shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

**An Associate Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

**The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.**

**FOR ADMISSION**

BRAUNS—OTTO L. J., of 112 Andrews St., Sault Ste Marie, Ont., Born at Halmstad, Sweden, Oct. 22nd, 1903; Educ., 1924-28, Royal Institute of Technology, Civil Engr. (Chem.), 1928; 1923-24, ap'tice, Rydo Bruks Sulphite Mill, Sweden; 1928-29, lab. asst., dept. ind. chem., McGill Univ., Montreal; 1929-31, research engr., Abitibi Power and Paper Co. Ltd., Iroquois Falls, and 1931 to date, asst. chief chemist at Sault Ste Marie Divn. in charge of routine mill control work and research projects.

EAGER—NORMAN H. A., of 4312 Montrose Ave., Westmount, Que., Born at Montreal, July 18th, 1900; Educ., B.Sc., McGill Univ., 1922, and M.C.E., Cornell Univ., 1923; 1923-24, res. engr., Illinois State Highway; 1925-26, supt. of constrn., Church Ross Co.; 1924-25, designing engr., Canadian Vickers, Ltd.; 1926-30, designing engr., Power Engrg. Co., and 1930 to date, industrial engr., dept. of development, Shawinigan Water and Power Company, Montreal, Que. (*Jr. 1925.*)

References: E. Brown, D. W. Ross, J. A. McCrory, C. K. McLeod, G. J. Dodd.

KURTZ—HAROLD JOHN, of Sudbury, Ont., Born at Burlington, Ont., Aug. 3rd, 1900; Educ., B.Sc. (Civil), Queen's Univ., 1926; 1926, instr'man., Welland Ship Canal; 1926-28, chainman, N.Y. Central R.R., Rochester; 1928-29, office engr., Tropical Oil Co., Barranca-Bermeja, Colombia, S.A.; 1929, i/c location and constrn., railroad for Timber Products Co., Trenton, Ont.; 1930-32, water and sanitary sewers, City of Sudbury; 1932-33, town engr., Thorold, Ont.; Aug. 1933 to date, supt., Ontario Refining Co., Copper Cliff, Ont. (*St. 1926, Jr. 1928.*)

References: P. E. Buss, W. D. Bracken, J. J. MacKay, F. W. Paulin, W. P. Wilgar.

PHILLIPS—JOHN BERNARD, of 1433 Bishop St., Montreal, Que., Born at Montreal, Aug. 19th, 1899; Educ., B.Sc. (Chem.), 1927, M.Sc. (Chem.), 1928, Ph.D. (Chem.), 1930, McGill Univ.; 1930-31, research assistantship, Mass. Inst. Tech.; 1931 to date, lecturer in chemical engrg., McGill University, Montreal, Que. (*Jr. 1927.*)

References: C. M. McKergow, R. DeL. French, J. R. Donald, A. R. Roberts, C. K. McLeod, C. V. Christie, A. Stansfield.

TOYE—ARTHUR MACFARLANE, of 205 Indian Rd., Toronto, Ont., Born at Toronto, June 26th, 1900; Educ., B.A.Sc., Univ. of Toronto, 1925; 1925-26, dftsman., Chapman & Oxley; 1926-31, estimator and asst. supt., John V. Gray Constrn. Co. Ltd.; Nov. 1931 to date, designing engr., Dept. of Highways of Ontario. (*Jr. 1926.*)

References: J. M. Oxley, A. B. Crealock, F. S. Milligan, A. A. Smith, A. Hay.

WINSLOW—KENELM MOLSON, of Toronto, Ont., Born at Stratford, Ont., Jan. 20th, 1898; Educ., B.Sc., McGill Univ., 1921; 1916, machinist, Canadian-Ingersoll Rand, Sherbrooke, Que.; 1917-18, Lieut., Can. Engrs., 14 mos. in France in charge of design, constrn. and operation of various water supply systems; With C.P.R. as follows: 1921-22, dftsman., mech. dept., Winnipeg; 1922-23, machinist, Angus shops, Montreal; 1923-24, mech. dept., Montreal, engaged on locomotive road tests; With Canadian Ingersoll-Rand Co. as follows 1924-25, asst. to mgr., compressor dept., Montreal; 1926-27, mgr., hoist and crusher dept., Montreal; 1928-29, district engr., Toronto; 1930-33, production engr., Sherbrooke; at present, sales engr., Dominion Engineering Works, Ltd., Montreal. (*Jr. 1922.*)

References: G. R. Pratt, H. E. Mott, E. P. Fetherstonhaugh, A. G. Riddell, J. G. Hall, A. A. Bowman, J. B. D'Aeth, S. R. Newton.

FOR TRANSFER FROM THE CLASS OF STUDENT

BOUCHER—RAYMOND, of Montreal, Que., Born at Stanbridge, Que., July 21st, 1906; Educ., B.A.Sc., in C.E., Ecole Polytechnique, Montreal, 1933; 1928-31 (summers), surveying, etc., with Quebec Streams Commission; at present pursuing studies leading to M.Sc., at Mass. Inst. Tech., Cambridge, Mass. (*St. 1932.*)

References: O. O. Lefebvre, A. Frigon, A. Boyer, A. Duperron, J. A. Lalonde.

HUNT—EDWARD VICTOR, of 240 Rushton Road, Toronto, Ont., Born at Durban, Natal, British South Africa, Feb. 11th, 1906; Educ., B.Sc. (E.E.), Univ. of Man., 1931; 1926-27-28 (summers), with Manitoba Power Company; July 1931 to date, with Canadian General Electric Company on transformer design, and 1930-31 and 1933 (Jan.-Aug.), test course. (*St. 1928.*)

References: C. E. Sisson, W. M. Cruthers, E. V. Caton, E. P. Fetherstonhaugh, N. M. Hall.

MOORE—WILLIAM HERBERT, of 466 Grosvenor Ave., Westmount, Que., Born at Belfast, Ireland, Sept. 10th, 1906; Educ., B.Sc., 1927, M.Eng., 1932, McGill Univ., 1927-28, demonstrator, elec. engrg. dept., and 1929-30, demonstrator, physics dept., McGill Univ., Montreal; Summers, 1924, checking, etc., Bell Telephone Co.; 1925, dfting., Northern Electric Co.; 1926, Lieut., R.C.C.S., Camp Borden; 1926, radio research, National Research Council of Canada; 1927, research asst. on ultra short radio waves for National Research Council in labs. of R.C.C.S., Ottawa; 1928, ship radio operator, Schooner "Morso," of Dominion Explosives Ltd., Toronto; 1928-29, engr. in charge of erection and operation of short wave radio station for Dominion Explosives Ltd., at Tavane, N.W.T.; 1930 to date, elec'l. (radio) engr., engrg. dept., Canadian Marconi Co. Ltd., Montreal, transmitter development and research. (*St. 1926.*)

References: C. V. Christie, W. A. Steel, J. H. Thompson, G. A. Wallace, E. W. Farmer.

PATRIQUEN—FRANK ANDREW, of 19 Horsfield St., Saint John, N.B., Born at Apohaqui, N.B., Aug. 2nd, 1906; Educ., B.Sc. (E.E.), 1930, B.Sc. (C.E.), 1931, Univ. of N.B.; 1931 to date, Junior engr., Saint John Harbour Commissioners, 2 yrs. office work, 6 mos. field work. (*St. 1930.*)

Refereuces: A. Gray, V. S. Chesnut, J. H. McKinney, D. G. Ross, J. Stephens.

## American Concrete Institute Convenes in Toronto in February

The American Concrete Institute, a body with an international membership, will hold its 30th Annual Convention at the Royal York Hotel, Toronto, February 20th-22nd next.

Elements of the convention programme were discussed at a luncheon meeting in Toronto, November 8th, at which the American Concrete Institute, the Toronto Branch of The Engineering Institute of Canada, the Toronto Chapter of the Ontario Association of Architects, and the Toronto Building and Construction Association were all represented.

The American Concrete Institute is wholly devoted to service as a clearing house for technical information on concrete design, construction and manufacture. Its membership includes designing, consulting, construction and testing engineers, architects, constructors, makers of concrete products, and research workers in its field of interest. The convention this winter in Toronto is a recognition of a highly valued membership in Canada.

The Toronto convention will include six technical sessions in the three day period and to any or all of these meetings interested engineers will be welcome, whether or not they are members of the organization.

S. C. Hollister, professor of Structural Engineering at Purdue University, is president of the American Concrete Institute and R. B. Young, M.E.I.C., testing engineer of the Hydro-Electric Power Commission of Ontario, is a member of its Board of Direction. Mr. Young is also chairman of the Programme Committee of the organization and has been made chairman of the Toronto Convention Committee which has local organization work, preparatory for the meetings, in charge. The headquarters of the Institute are at Detroit, Michigan, in charge of Harvey Whipple, Secretary and Treasurer.

## Winnipeg Plans Interceptors and Sewage Treatment Plant

A sewage-treatment works is planned by the city of Winnipeg, Man., in order to relieve unemployment during the coming year. To this end, the city has retained W. S. Lea, M.E.I.C., consulting engineer of Montreal, to prepare plans for a large intercepting sewer and to advise in connection with the first installment of the treatment works. In February of last year, Mr. Lea submitted a report covering the needs of the city and of its six adjacent municipalities in regard to sewage treatment works for 260,000 people initially and 500,000 ultimately. At present crude sewage is discharged through fifty or more outlets scattered along a 20-mile stretch of the Red and Assiniboine rivers. Mr. Lea recommended the construction of an interceptor 7 miles long, designed for future extension upstream to permit of concentration of sewage from about 70 per cent of the population at a down-river site where ultimately the settleable solids would be removed from all the sewage delivered there, and about half of it subjected to some oxidizing treatment if and when the condition of the river so requires. The estimated cost of the ultimate project to the city is $1,000,000.

## Surety Bonds

The present form of fidelity coverage, which protect the employer and his shareholder's capital from impairment by pecuniary losses through dishonest employees absconding, or otherwise misusing funds entrusted in the employer's care, are varied and fairly well standardized.

The word "surety" covers a wide class of risks, of which the fidelity bond is one class. There are other surety bonds of all kinds to be had; bid and contract bonds, court, lien, immigration, lost securities and other miscellaneous bonds.

The "bid bond" in itself does not appear to be a great risk although it serves the purpose of a marked cheque, which in the usual course the contractor would deposit, it goes a little further and provides that the surety will underwrite the contract bond if the contractor has his bid accepted, so that the surety then, must take all precaution against the contractor under-estimating the contract and must employ qualified underwriters, who can analyse and immediately grant the bond upon consideration of the contractor's financial condition, his reputation, the number of contracts which he has on hand, and other considerations.

The "contract bond" usually guarantees that the surety will protect the obligee, or municipality, if it is for their benefit, or other private interests from any and all pecuniary loss resulting from the failure of the contractor to observe the terms of his contract, subject to certain conditions. In some cases, upon default it has been necessary for the surety company to become subrogated to the rights of the contractor and proceed with the performance of the contract to completion.

Contracting concerns, who in the usual course of business a few years ago deposited marked cheques as a guarantee that if the bid was accepted they would comply with the contract, are now realizing the benefit of "bid and contract bonds" which enable them to use the capital otherwise held up or covered with the marked cheque in furthering their business.

These forms of protection may be purchased in Canadian companies at premiums proportionate to the amount of protection desired and commensurate with the risk involved.

---

*Canadian General Electric Company Ltd.* announces a new indicating lamp which can be used for signal-light indication or, in combination with control switches, to tell whether a circuit breaker is open, closed or tripped automatically. This offers the advantages of long lamp-life, low-wattage consumption and good visible indication.

The indicating lamp unit consists of a resistor of the vitreous-enamel type, a receptacle and escutcheon constructed of insulating material, a 24-volt lamp, a colour cap made of a special translucent compound, which may be clear, red, yellow, or green. The escutcheon, mounted in the panel hole from the front and the receptacle body, mounted from the rear, are threaded to make a compact unit when assembled. The resistor element slides over the receptacle body from the rear, and the complete device provides for soldered connections, or if not desired binding screws are included.

## EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

*All correspondence should be addressed to*

**The Employment Service Bureau, The Engineering Institute of Canada**
**2050 Mansfield Street, Montreal**

### Situations Wanted

ELECTRICAL AND RADIO ENGINEER, B.Sc., '28. Experience in the design and testing of broadcast radio receivers, including latest superheterodyne practice, and capable of constructing apparatus for testing same Also familiar with telephone and telephone repeater engineering. Thorough experience in design, and construction and inspection of municipal power conduits. Apply to Box No. 12-W.

MECHANICAL ENGINEER, Canadian, with technical training and executive experience in both Canadian and American industries, particularly plant layout, equipment, planning and production control methods, is open for employment with company desirous of improving manufacturing methods, lowering costs and preparing for business expansion. Apply to Box No. 35-W.

MECHANICAL ENGINEER, A.M.E.I.C. Married. Experience in machine shops, erection and maintenance of industrial plant mechanical and structural design. Reads German, French, Dutch and Spanish. Seeks any suitable position. Apply to Box No. 84-W.

YOUNG ENGINEER, B.A., B.SC., A.M.E.I.C., R.P.E., Ont. Competent draughtsman and surveyor. Eight years experience including design, superintendence and layout of pulp and paper mills, hydro-electric projects and general construction. Limited experience in mechanical design and industrial plant maintenance. Apply to Box No. 150-W.

PURCHASING ENGINEER, graduate mechanical engineer, Canadian, married, 34 years of age, with 13 years' experience in the industrial field, including design, construction and operation, 8 years of which had to do with the development of specifications and ordering of equipment and materials for plant extensions and maintenance; one year engaged on sale of surplus construction equipment. Full details upon request. Apply to Box No. 161-W.

CIVIL ENGINEER, age 44, open for employment anywhere, experience covers about 20 years' active work, including 7 years on municipal engineering, 2 years as Town Manager, 3 years on railway construction, 3 years on the staff of a provincial highway department, 2 years as contractor's superintendent on pavement construction. Apply to Box No. 216-W.

REINFORCED CONCRETE ENGINEER, B.SC., P.E.Q., eight years experience in construction design of industrial buildings, office buildings, apartment houses, etc. Age 30. Married. Apply to Box No. 257-W

MECHANICAL ENGINEER, B.Sc., McGill '19, A.M.E.I.C. Married. Twelve years experience including oil refinery power plant, structural and reinforced concrete design, factory maintenance, steam generation and distribution problems, heating and ventilating. Available at once. Location immaterial. Apply to Box No. 265-W.

ELECTRICAL ENGINEER, B.SC., '28, Canadian. Age 25. Experience includes two summers with power company; thirteen months test course with C.G.E. Co.; telephone engineering, and the past thirty months with a large power company in operation and maintenance engineering. Location immaterial and available immediately. Apply to Box No. 266-W.

DESIGNING DRAUGHTSMAN, experience in layout of steam power house equipment and piping. Wide experience in mechanical drive and details of machinery, gearing, and hoists. Accustomed to layout of small mill buildings of steel and timber, structural design and details. Good references. Present location Montreal. Apply to Box No. 329-W.

PLANE-TABLE TOPOGRAPHER, B.SC., in C.E. Thoroughly experienced in modern field mapping methods including ground control for aerial surveys. Fast and efficient in surveys for construction, hydro-electric and geological investigations. Apply to Box No. 431-W.

ELECTRICAL ENGINEER, B.SC., A.M.E.I.C., AM.A.I.E.E., age 30, single. Eight years experience H.E. and steam power plants, substations, etc., shop layouts, steel and concrete design. Location immaterial. Available immediately. Apply to Box No. 435-W.

CIVIL ENGINEER, B.A.SC., and C.E., A.M.E.I.C., age 30, married. Experience over the last ten years covers construction on hydro-electric and railway work as instrumentman and resident engineer. Also office work on teaching and design, investigations and hydraulic works, reinforced concrete, bridge foundations and caissons. Location immaterial. Available at once. Apply to Box No. 447-W.

SALES ENGINEER, M.A.SC. Univ. of Toronto, wishes to represent firm selling building products or other engineering commodities, as their representative in Western Canada. Located in Winnipeg. Apply to Box No. 467-W.

### Situations Wanted

CIVIL ENGINEER, B.SC., A.M.E.I.C., with six years experience in paper mill and hydro-electric work, desires position in western Canada. Capable of handling reinforced concrete and steel design, paper mill equipment and piping layout, estimates, field surveys, or acting as resident engineer on construction. Now on west coast and available at once. Apply to Box No. 482-W.

MECHANICAL ENGINEER, B.SC. Age 28, married. Four and a half years on industrial plant maintenance and construction, including shop production work and pulp and paper mill control. Also two and a half years on structural steel and reinforced concrete design. Available at once. Apply to Box No. 521-W.

CIVIL ENGINEER, Canadian, married, twenty-five years' technical and executive experience, specialized knowledge of industrial housing problems and the administration of industrial towns, also town planning and municipal engineering, desires new connection. Available on reasonable notice. Personal interview sought. Apply to Box No. 544-W.

ELECTRICAL AND MECHANICAL ENGINEER, B.SC., A.M.E.I.C. Experience includes C.G.E. Students Test Course and six years in engrg. dept. of same company on design of electrical equipment. Four summers as instrumentman on surveying and highway construction. Recently completed course in mechanical engineering. Available at once. Location preferred Ontario, Quebec, or Maritimes. Apply to Box No. 564-W.

#### Employment Service Bureau

This bureau is maintained by The Engineering Institute of Canada for the benefit of members and organizations employing technically trained men.

An enquiry addressed to 2050 Mansfield Street, Montreal, will bring full information concerning the services offered Details can also be obtained from Branch secretaries who are located in the larger centres throughout Canada.

Brief announcements of men available and positions vacant will be published without charge in The Engineering Journal and the Bulletin. Replies addressed in care of the required box number will be forwarded to the advertiser without delay.

An additional service also offered those who are unemployed or wish to change their positions, is the opportunity of placing their names and records on file at 2050 Mansfield Street for consideration by employers wishing to employ engineers. This is of great assistance as many employers will not advertise or wish to locate a suitable man on short notice. If desired the information contained in these records can be kept confidential.

Forms for registration purposes may be obtained from The Institute Headquarters or Branch secretaries.

CIVIL ENGINEER, age 25, single, graduate. Creditable record on responsible hydro and railroad work in both Eastern and Western Canada. Apply to Box No. 567-W.

MECHANICAL ENGINEER, A.M.E.I.C., with twenty years experience on mechanical and structural design, desires connection. Available at once. Apply to Box No. 571-W.

MECHANICAL ENGINEER, B.A.SC., '30, desires position to gain experience, and which offers opportunity for advancement. Experience in pulp and paper mill and one year in mechanical department of large electrical company. Location immaterial. Available immediately Apply to Box No. 577-W.

DOMINION LAND SURVEYOR, and graduate engineer with extensive experience on legal, topographic and plane-table surveys and field and office use of aero-photographs, desires employment either in Canada or abroad. Available at once. Apply to Box No. 589-W.

MECHANICAL ENGINEER, Canadian, technically trained; eighteen years experience as foreman, superintendent and engineer in manufacturing, repair work of all kinds, maintenance and special machinery building. Location immaterial. Available at once. Apply to Box No. 601-W.

### Situations Wanted

CHEMICAL ENGINEER, S.E.I.C., B.SC., University of Alberta, '30. Age 31. Single. Six seasons' practical laboratory experience, three as chief chemist and three as assistant chemist in cement plant; one year's p.g. work in physical chemistry; three years' experience teaching. Desires position in any industry with chemical control. Available immediately. Apply to Box No. 609-W.

DESIGNING ENGINEER AND ESTIMATOR, grad. Univ. of Toronto in C.E., A.M.E.I.C., twenty years experience in structural steel, construction and municipal work. Available at once. Apply to Box No. 613-W.

CIVIL ENGINEER, A.M.E.I.C., R.P.E., Ontario; three years construction engineer on industrial plants; fourteen years in charge of construction of hydraulic power developments, tower lines, sub-stations, etc.; four years as executive in charge of construction and development of harbours, including railways, docks, warehouses, hydraulic dredging, land reclamation, etc. Apply to Box No. 647-W.

MECHANICAL ENGINEER, A.M.E.I.C., Canadian, technically trained; six years drawing office. Office experience, including general design and plant layout. Also two years general shop work, including machine, pattern and foundry experience, desires position with industrial firm in capacity of production engineer or estimator. Available on short notice. Apply to Box No. 676-W.

ELECTRICAL AND CIVIL ENGINEER, B.SC., Elec., '29, B.SC., Civil '33. Age 27. JR.E.I.C. Undergraduate experience in surveying and concrete foundations; also four months with Canadian General Electric Co. Thirty-three months in engineering office of a large electrical manufacturing company since graduation. Good experience in layouts, switching diagrams, specifications and pricing. Best of references. Available immediately. Apply to Box No. 693-W.

MECHANICAL ENGINEER, B.SC., '27, JR.E.I.C. Four years maintenance of high speed Diesel engines units, 200 to 1,300 h.p. Also maintenance of D.C. and A.C. electrical systems and machinery. Draughting experience. Westinghouse apprenticeship course. Practical mechanical and electrical engineer with a special study of high speed Diesel engine design, application and operation. Location in western or eastern Canada immaterial. Apply to Box No. 703-W.

COMBUSTION ENGINEER, R.P.E., Manitoba, A.M.E.I.C. Wide experience with all classes of fuels. Expert designer and draughtsman on modern steam power plants. Experienced in publicity work. Well known throughout the west. Location, Winnipeg or the west. Available at once. Apply to Box No. 713-W.

ELECTRICAL ENGINEER, B.SC., University of N.B., '31. Experience includes three months field work with Saint John Harbour Reconstruction. Apply to Box No. 722-W.

MECHANICAL ENGINEER, age 41, married. Eleven years designing experience with project of outstanding magnitude. Machinery layouts, checking, estimating and inspecting. Twelve years previous engineering, including draughting, machine shop and two years chemical laboratory. Highest references. Apply to Box No. 723-W.

YOUNG CIVIL ENGINEER, B.SC. (Univ. of N.B. '31), with experience as rodman and checker on railroad construction, is open for a position. Apply to Box No. 728-W.

DESIGNING ENGINEER, M.SC. (McGill Univ.), D.L.S., A.M.E.I.C., P.E.Q. Experience in design and construction of water power plants, transmission lines, field investigations of storage, hydraulic calculations and reports. Also paper mill construction, railways, highways, and in design and construction of bridges and buildings. Available at once. Apply to Box No. 729-W.

MECHANICAL ENGINEER, S.E.I.C., B.A.SC., Univ. of B.C. '30. Single, age 24. Sixteen months with the Allis-Chalmers Mfg. Co. as student engineer. Experience includes foundry production, erection and operation of steam turbines, erection of hydraulic machinery, and testing texropes and centrifugal pumps. Location immaterial. Available at once. Apply to Box No. 735-W.

CIVIL ENGINEER, M.SC., A.M.E.I.C., R.P.E. (Ont.), ten years experience in municipal and highway engineering. Read, write and talk French. Married. Served in France. Will go anywhere at any time. Experienced journalist. Apply to Box No. 737-W

ELECTRICAL AND RADIO ENGINEER, B.SC. '31, S.E.I.C. Age 25. Nine months experience on installation of power and lighting equipment. Eight months on extensive survey layouts. Two summers installing telephone equipment. Specialized in radio servicing and merchandising. Available at once. Location immaterial. Apply to Box No. 740-W.

CIVIL ENGINEER, graduate '29. Married One year building construction, one year hydro-electric construction in South America, fourteen months resident engineer on road construction Working knowledge of Spanish. Apply to Box No. 744-W.

SALES ENGINEER, B.SC., McGill, 1923, A.M.E.I.C. Age 33. Married Extensive experience in building construction. Thoroughly familiar with steel building products; last five years in charge of structural and reinforcing steel sales for company in New York state. Available at once. Located in Canada. Apply to Box No. 749-W.

DESIGNING ENGINEER, graduate Univ. Toronto '26. Thoroughly experienced in the design of a broad range of structures, desires responsible position. Apply to Box No. 761-W

## Situations Wanted

ELECTRICAL ENGINEER, B.Sc. (McGill Univ. '29). S.E.I.C. Married Experience in pulp and paper mill mechanical maintenance, estimates and costs and machine shop practice. Desires position with industrial or manufacturing concern. Location immaterial. Available on short notice. References. Apply to Box No. 770-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. Queen's Univ '29. Age 25. Married. Three years experience as construction supt. and estimator for contracting firm. Experience includes general building, bridges, sewer work, concrete, boiler settings, sand blasting of bridges and spray painting. Available at once. Apply to Box No. 776-W.

CIVIL ENGINEER, B.Sc., '25, JR.E.I.C., P.E.Q., married. Desires position, preferably with construction firm. Experience includes railway, monument and mill building construction. Available immediately. Apply to Box No. 780-W.

DRAUGHTSMAN, experience in civil engineering, forestry engineering, land surveying and house construction. Good references. Apply to Box No. 781-W.

ELECTRICAL AND SALES ENGINEER, S.E.I.C., grad. '28. Experience includes one year test course, one year switchboard design and two years switchboard and switching equipment sales with large electrical manufacturing company. Three summers Pilot Officer with R.C.A.F. Available at once. Apply to Box No. 788-W.

ELECTRICAL ENGINEER. Specializing in power and illumination reports, estimates, appraisals, contracts and rates, plans and specifications for buildings. Available on interesting terms. Apply to Box No. 795-W.

CIVIL ENGINEER, S.E.I.C., graduate '30, age 23, single. Experience includes mining surveys, assistant on highway location and construction, and assistant on large construction work. Steel and concrete layout and design. Apply to Box No. 809-W.

CIVIL ENGINEER, college graduate, age 27, single. Experience includes surveying, draughting concrete construction and design, street paving both asphalt and concrete. Available at once; will consider anything and go anywhere. Apply to Box No. 816-W.

CIVIL ENGINEER, B.E. (Sask. Univ. '32), S.E.I.C. Single. Experience in city street improvements; sewer and water extensions. Good draughtsman. References. Available at once. Location immaterial. Apply to Box No. 818-W.

CIVIL ENGINEER, S.E.I.C., B.Sc (Queen's '32), age 21. Three summers surveying in northern Quebec. Interested in hydraulics and reinforced concrete. Available at once. Location immaterial. Apply to Box No. 822-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with fifteen years experience mostly in pulp and paper mill work, reinforced concrete and structural steel design, field surveys, layout of mechanical equipment, piping. Available at once. Apply to Box No. 825-W.

ELECTRICAL ENGINEER. S.E.I.C., grad. '29, age 24, married; experience includes one year Students Test Course, sixteen months in distribution transformer design and eight months as assistant foreman in charge of industrial control and switchgear tests. Location immaterial. Available at once. Apply to Box No. 828-W.

CIVIL ENGINEER, B.A.Sc., D.L.S., O.L.S., A.M.E.I.C., age 46, married. Twelve years experience in charge of legal field surveys. Owns own surveying equipment. Eight years on technical, administrative, and editorial office work. Experienced in writing. Desires position on survey work, assisting in or in charge of preparation of house organ, on staff of technical or semi-technical magazine, or on publicity, editorial or administrative office work. Available at once. Will consider any salary, and any location. Apply to Box No. 831-W.

CIVIL ENGINEER, M.Sc., R.P.E. (Sask.). Age 27. Experience in location and drainage surveys, highways and paving, bridge design and construction city and municipal developments, power and telephone construction work. Available on short notice. Apply to Box No. 839-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. '32 (Univ. of N.B.) Age 25, married. Two years experience in power line construction and maintenance; one year of highway construction; one summer surveying for power plant site, location and spur railway line construction. Available at once. Location immaterial. Apply to Box No. 840-W.

CIVIL ENGINEER, B.Sc. '15, A.M.E.I.C., married, extensive experience in responsible position on railway construction, also highways, bridges and water supplies. Position desired as engineer or superintendent. Available at once. Apply to Box No. 841-W.

CIVIL ENGINEER, B.Sc. (Alta. '31), S.E.I.C., age 21. Experience, three summers on railroad maintenance, and seven months on highway location as instrumentman. Willing to do anything, anywhere, but would prefer connection with designing or construction firm on structural works. Available immediately. Apply to Box No. 846-W.

MECHANICAL ENGINEER, graduate, '23, A.M.E.I.C., P.E.Q., age 32, married. (English and French.) Two years shop, foundry and draughting experience; one year mechanical supt. on construction; six years designing draughtsman in consulting engineers' offices (mechanica lequipment of buildings, heating, sanitation, ventilation, power plant equipment, etc.). Present location Montreal. Available immediately. Montreal or Toronto preferred Apply to Box No. 766-W.

## Situations Wanted

MECHANICAL ENGINEER, JR.E.I.C., technical graduate, bilingual, age 30. Two years as designing heating draughtsman with one of the largest firms of its kind on this continent handling heating materials; three years designing draughtsman in consulting engineers' office, mechanical equipment of buildings, heating, ventilation, sanitation, power plant equipment, writing of specifications, etc. Present location Montreal. Available at once. Apply to Box No. 850-W.

BRIDGE AND STRUCTURAL ENGINEER, A.M.E.I.C., McGill. Twenty-five years' experience on bridge and structural staffs. Until recently employed. Familiar with all late designs, construction, and practices in all Canadian fabricating plants. Desirous of employment in any responsible position, sales, fabrication or construction. Apply to Box No. 851-W.

STRUCTURAL ENGINEER, B.A.Sc., A.M.E.I.C. Twenty-two years experience in design of bridges and all types of buildings in structural steel and reinforced concrete. Three years experience in railway construction and land surveying. Apply to Box No. 856-W.

MECHANICAL ENGINEER, B.Sc. '32, S.E.I.C. Good draughtsman. Undergraduate experience:—One year moulding shop practice; two years pipe fitting and sheet metal work; one year draughting and tracing on paper mill layout; six months machine shop practice; and eight months fuel investigation and power heating plant testing. Desires position offering experience in steam power plants or heating and ventilating design. Will go anywhere. Apply to Box No. 858-W.

MECHANICAL ENGINEER, age 31, graduate Sheffield (England) 1921; apprenticeship with firm manufacturing steam turbine generators and auxiliaries and subsequent experience in design, erection, operation and inspection of same. Marine experience B.O.T. certificate thoroughly conversant with Canadian plants and equipment. Available on short notice. Any location. Box No. 860-W.

CHEMICAL ENGINEER, B.Sc. (McGill '21), A.M.E.I.C., age 36, married; three years since graduation with pulp and paper mills; eight years in shops, estimating and sales divisions of well-known gas engineering and construction companies in the United States. Excellent references. Available on short notice. Apply to Box No. 866-W.

CONSTRUCTION ENGINEER (Toronto Univ. of '07). Experience includes hydro-electric, municipal and railroad work. Available immediately. Location immaterial. Apply to Box No. 886-W.

ELECTRICAL ENGINEER, graduate 1929, S.E.I.C. Single. Experience includes two years with electrical manufacturing concern and one on highway construction work. Available at once. Will go anywhere. Apply to Box No. 887-W.

CIVIL ENGINEER, B.Sc., Montreal 1930, age 26, single, French and English, desires position technical or non-technical in engineering, industrial or commercial fields, sales or promotion work. Experience includes three years in municipal engineering on paving, sewage, waterworks, filter plant equipment, layout of buildings, etc. Available immediately. Apply to Box No. 891-W.

ELECTRICAL ENGINEER, grad. Univ. of N.B. '31. Experienced in surveying and draughting, requires position. Available at once Will go anywhere. Apply to Box No. 893-W.

CIVIL ENGINEER, B.A.Sc., JR.E.I.C., age 29, single. Experience includes two years in pulp mill as draughtsman and designer on additions, maintenance and plant layout. Three and a half years in the Toronto Buildings Department checking steel, reinforced concrete, and architectural plans. Available at once. Location immaterial. At present in Toronto. Apply to Box No. 899-W.

ENGINEER, JR.E.I.C., specializing in reconnaissance and preliminary surveys in connection with hydro-electric and storage projects Expert on location and construction of transmission lines, railways and highways. Capable of taking charge. Location immaterial. Apply to Box No. 901-W.

MECHANICAL ENGINEER, Canadian, age 25, B.Sc. (Queen's '32). Since graduation on supervision of large building construction. Undergraduate experience in electrical, plumbing and heating, and locomotive trades. Available at once. Apply to Box No. 903-W.

DESIGNING ENGINEER, A.M.E.I.C. Permanent and executive position preferred but not essential. Fifteen years experience in designing power plants, engine and fan rooms, kitchens and laundries. Thoroughly familiar with plumbing and ventilating work, pneumatic tubes, and refrigeration, also heating, electrical work, and specifications. Apply to Box No. 913-W.

YOUNG CIVIL ENGINEER, JR.E.I.C. Six years as instrumentman on subway work. Two years as time-keeper cost clerk on building construction. Four years as job engineer on buildings, tunnels, dams, power houses. Location immaterial. Available at once. Apply to Box No. 916-W.

INDUSTRIAL ENGINEER, B.Sc. in M.E., age 25, married, is open for a position of a permanent nature with an industrial concern. Experience includes three years in various divisions of a paper mill and two years in an electrical company. Apply to Box No. 917-W

ENGINEER, B.Sc., A.M.E.I.C., R.P.E. (N.B.), age 35, married. Seven years' mining experience as sampler, assayer, surveyor, field work, and foreman in charge of underground development; two years as assistant engineer on highway construction and maintenance Available on short notice. Apply to Box No. 932-W.

## Situations Wanted

CIVIL ENGINEER, B.Sc., '25, McGill Univ., JR.E.I.C., P.E.Q., age 32, married. Experience as rodman and instrumentman on track maintenance. Seven and one-half years with Canadian paper company, as assistant office engineer handling all classes of engineering problems in connection with woods operations, i.e., road buildings, piers, booms, timber bridges, depots, dams, etc. Apply to Box No. 933-W.

ELECTRICAL ENGINEER, Dipl. of Eng., B.Sc. (Dalhousie Univ.), S.B. and S.M. in E.E. (Mass. Inst. of Tech.), Canadian. Married. Seven and a half years' experience in design, construction and operation of hydro, steam and industrial plants. For past sixteen months field office electrical engineer on 510,000 h.p. hydro-electric project. Available at once. Apply to Box No. 936-W.

CIVIL ENGINEER, B.Sc., O.P.E. Experience includes several years on municipal work-design and construction of sewers, steel and concrete bridges, watermains and pavements. Available at once. Apply to Box No. 950-W.

ELECTRICAL ENGINEER, twenty years experience, desires position, either temporary or permanent. Experienced in design, construction, and operation of power and industrial plants, and supt. of construction. Apply to Box No. 974-W.

INDUSTRIAL ENGINEER, B.Sc., in C.E. (McGill Univ. '30), graduate student in industrial engineering '33 session, age 27, single, available for a position of temporary or permanent nature with industrial concern. Has theoretical knowledge of latest methods of market analysis, production control, management and cost accounting. Also experience in the design and construction of industrial buildings. Location immaterial. Apply to Box No. 981-W.

CIVIL ENGINEER, B.Sc. (Univ. of Sask. '33), S.E.I.C., age 28, single. Experience in testing hydro-electric equipment, draughting, surveying, city street, improvements, technical photography. Available at once. Location immaterial. Apply to Box No. 986-W.

ELECTRICAL ENGINEER, B.A.Sc., '27, JR.E.I.C., A.A.I.E.E. Married. Age 31. One and a half years G. E. Test Course, Schenectady; four and a half years motor and generator design including induction motors, D.C. and A.C. motors and generators. Willing to do anything, design or sales preferred. Available at once. Present location Toronto. Apply to Box No. 993-W.

MECHANICAL ENGINEER, S.E.I.C., B.Sc., Queen's University '33. Age 24, desires position on power plant and power distribution problems, factory maintenance, heating and ventilation or refrigeration design. Willing to work for living expenses in order to gain experience. Apply to Box No. 999-W.

ENGINEER SUPERINTENDENT, age 44. Engineering and business training, executive ability, tactful, energetic. Had charge of several large projects. Intimate knowledge of costs and prices, reports and estimates. Available immediately. Any location. Apply to Box No. 1021-W.

CIVIL ENGINEER, B.Sc. (Queen's 14), A.M.E.I.C., Dominion Land Surveyor, 5 months' special course at the University of London, England, in municipal hygiene and reinforced concrete construction. Experience covers legal and topographic surveys, plane tabling and stadia surveying, railway and highway construction, drainage and excavation work. Available at once. Apply Box No. 1035-W.

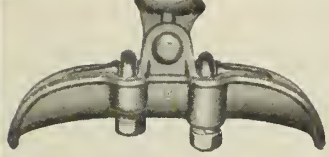
ELECTRICAL ENGINEER AND GEOPHYSICIST. Age 36. Married. Seven years experience in geophysical exploration using seismic, magnetic and electrical methods. Two years experience with the Western Electric Company of Chicago, working on equipment and magnetic materials research. Experienced in radio and telephone work, also specializing in precise electrical measurements, resistance determinations, ground potentials and similar problems of ground current distribution. Apply to Box No. 1063-W.

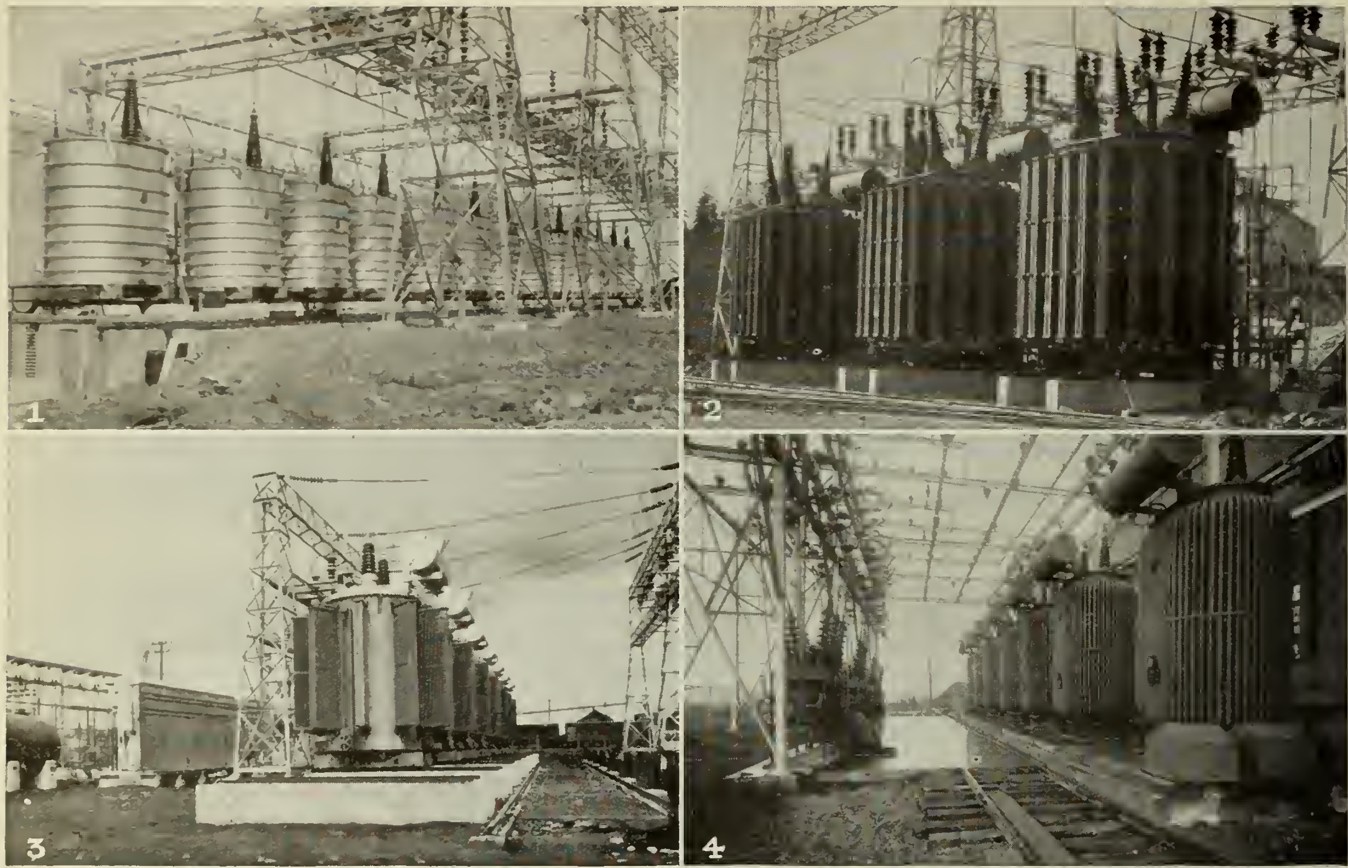
ELECTRICAL ENGINEER, B.A.Sc. Univ. Toronto '28. Experience includes Can. Gen. Elec. Co. Test Course. Also more than two years in the engineering dept. of the same company. Available on short notice. Preferred location central or eastern Canada. Apply to Box No. 1075-W.

ELECTRICAL ENGINEER, B.Sc. Married. Eight years electrical experience, including operation, maintenance and construction work, electrical design work on large power development, mechanical ability, experienced photographer, employed in electrical capacity at present. Available on reasonable notice. Apply to Box No. 1076-W.

GRADUATE IN MECHANICAL ENGINEERING, 1927, desires opportunity in Diesel engine field, preferably in design and devolopment work. Skilled draughtsman and clever in design. Familiar with basic theories of the Diesel engine and in touch with recent developments and applications. Anxious to obtain a foothold with up-to-date company. No objection to shopwork or other duties as a start but would prefer shopwork and assembly if possible. Apply to Box No. 1081-W.

INDUSTRIAL ENGINEER, B.A.Sc. in Chem. Eng. (Tor. '31), S.M. in Indust. Eng. (Mass. Inst. of Tech. '32), S.E.I.C. Age 25 years. Northern Electric Training Course. Construction and sales experience. Rookefeller Research Associate at McGill University in industrial engineering for past year and to date. Desire work in production or financial departments of a manufacturing plant. Apply to Box No. 1098-W.





(1) *Thirteen G-E 15,700 kv-a., 220,000 grd.Y-13,200 volt, 25 cycle single-phase transformers, Chats Falls Station, H.E.P.C. of Ontario.*

(2) *Three G-E 22,500 kv-a., 110,000 Y-12,000 volt, 60 cycle three-phase transformers, Alexander Development, H.E.P.C. of Ontario.*

(3) *Seven G-E 5,000 kv-a., 110,000 Y-26,400 volt, 25 cycle single-phase transformers, Port Colborne Substation, H.E.P.C. of Ontario.*

(4) *Seven G-E 2,500 kv-a., 60,000-2400 volts, 60 cycle single-phase transformers, Bay Street Substation, B.C. Electric Railway Co., Victoria, B.C.*

# Years of Dependable Service from General Electric Power Transformers

General Electric power transformers have earned for themselves an enviable reputation for reliability, high efficiency, and good appearance in the hundreds of installations from Halifax to Vancouver. G-E power transformers have been built in sizes from 200 kv-a. to 36,000 kv-a. and in voltage ratings up to 230,000 volts. When you buy G-E power transformers you can rely on equipment incorporating the latest design evolved from years of G-E transformer manufacturing experience.

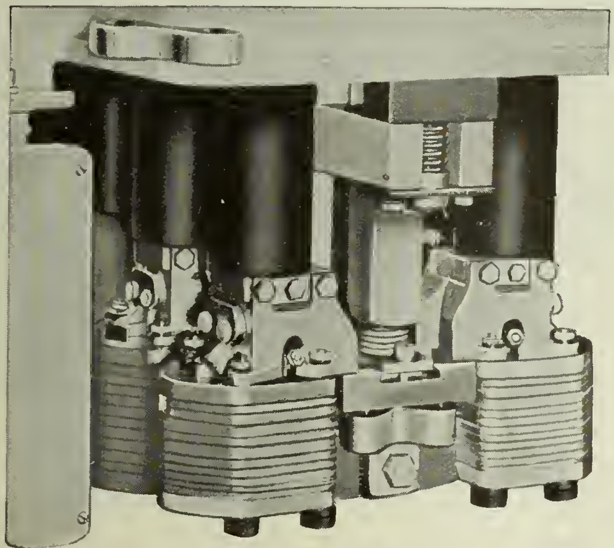
# Modernizing your old



## Circuit Breakers with De-ion Grids

*1200 Ampere, 15,000 volt, 3 P.S.T. electrically operated Type BK Oil Circuit Breaker with De-ion Grids*

WHEN you modernize your old circuit breakers with "De-ion Grids" you save the cost of making changes in the mechanical structure of the breakers. You also save considerably in the time required for the change-over. In addition, you very materially increase the rupturing capacity.

All that is required is the simple substitution of "De-ion Grids" and contacts for the older types of contacts. It is such unparalleled advantages as these that have made "De-ion Grids" the outstanding contribution in circuit interruption. But these advantages in their application to old breakers—important as they are—tell only part of the story. In operation, the performance of "De-ion Grids" is equally outstanding. In new breakers or in old ones "De-ion Grids" reduce arc voltages, lower the arc energy liberated in the breaker structure, and always extinguish the arc in the grid with a large factor of safety, resulting in lower tank pressures, and making possible new reclosing duty cycles. You can avail yourself of these vital economies by installing new "De-ion Grid" breakers or modernizing, at small cost, your old Westinghouse oil circuit breakers with "De-ion Grids."

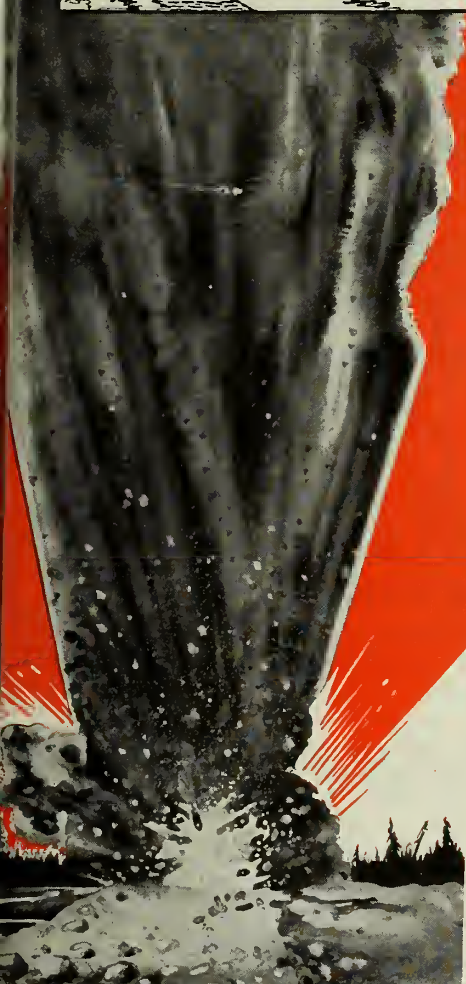
# *The Romance of Power Development in Canada*

## AT THE SITE OF A GRIST MILL

erected about the year 1800 at
the mouth of the St. Louis River



FOR centuries the de Beauharnois family was prominent in the life of Old and New France. It furnished Canada during the ancient regime with a governor and an intendant. About the year 1800 the Seigneur, to provide a more even flow in the stream at all seasons, built a small feeder canal from Lake St. Francis to the nearby headwaters of the St. Louis. These fundamental diversion rights are still in existence and are now held by the Beauharnois Power Corporation.

To-day power is being generated at this point at the rate of 200,000 h.p. with an ultimate capacity of 2,000,000 h.p., and a canal 27 feet in depth provides deep water navigation facilities in the entire wholly-Canadian section of the St. Lawrence, save for the stretch arounc the Lachine Rapids at Montreal.

During the early stages of development of thi: site, 1,000,000 pounds of C-I-L dynamite were used in preparation for this huge develop- ment. Engineering skill and modern machinery and C-I-L dynamite are thus aiding in the development of low cost power to meet the growing needs of industry.

# Low Head Water Tube Boilers

Low head water tube boilers are built by Foster Wheeler for capacities from 72 to 500 hp. for any commercial steam pressure.

Recommendations will be made without charge for power or heating installations, incorporating boilers of water tube or fire tube type, especially designed for maximum operating efficiency consistent with restricted space conditions. Foster Wheeler engineers are also experienced in the design of modern marine steam generating equipment.

# He takes chances...

# ...but never on the QUALITY of his equipment..

*JENKINS VALVES of various types are widely used in all classes of industry throughout the country. Their record shows that quality costs less in the end.*

Fig. 404—Iron Body, Bronze mounted, Rising Spindle Gate Valve, suitable for oil, water, gas, air and steam service.

THE parachute jumper takes no chances on the quality of his equipment. To do so would be to invite disaster.

It pays to exercise equal care in the selection of valves.

For seventy years engineers have chosen Jenkins Valves for their dependable quality "from the inside out".

Today the Jenkins "Diamond" on a valve is recognized all over the world as a guarantee of long service, trouble-free operation and low maintenance costs.

# For the EXTREMELY HEAVY JOBS

If your requirements for the heavy jobs of switch and bus work on voltages of 220 kv. or more demand unusual rigidity, choose this new O-B switch and bus insulator.

It is designed especially to provide minimum deflection in a stack of insulators placed in either upright or underhung position. It has the same characteristics of longevity and the same electrical factor of safety for which all O-B porcelain is so well known.

For the extremely heavy jobs where deflection is to be held to a minimum and strength is an important factor, this new O-B switch and bus insulator proves a satisfying choice. (No. 30575 with 5-in. bolt circle; No. 30577 with 7-in. bolt circle.)

# ENGINEERING JOURNAL

## THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

**Published monthly at 2050 Mansfield Street, Montreal, by The Engineering Institute of Canada, Incorporated in 1887 as The Canadian Society of Civil Engineers.**

Entered at the Post Office, Montreal, as Second Class Matter.

Volume XVII | Montreal, February, 1934 | Number 2

# Department of National Defence Relief Camps and Projects

*Major G. R. Turner, M.C., D.C.M., A.M.E.I.C.,*

*General Staff, Department of National Defence, Ottawa, Ont.*

**Paper to be presented at the General Professional Meeting of The Engineering Institute of Canada, Montreal, Que., February 9th, 1934.**

**SUMMARY.—Dealing with the relief work organized by the Dominion government in camps for the benefit of single, homeless, unemployed men, the paper gives details of the scheme, which in the first twelve months of its operation has afforded over 2,000,000 man-days of relief work at a cost of about $1.00 per man-day. A number of the supervisory and administrative positions in the camps are filled by unemployed professional men. As far as possible, the projects undertaken are such as can be carried out mainly by unskilled labour.**

The unemployment relief scheme administered by the Department of National Defence for the care of single homeless men owes its success, in no small measure, to the generous and hearty co-operation of The Engineering Institute of Canada; consequently the members, as a whole, of The Institute may be interested in the main features of this scheme. It is with a view to presenting this information to the membership at large that this paper has been prepared.

No one realizes better than the engineering profession the extent to which unemployment had spread in practically all branches of industry in Canada by the autumn of 1932, when it was estimated that there were between sixty and seventy thousand single homeless unemployed in Canada in need of relief. Many of these were dependent for accommodation and sustenance either on "hostels" financed through contributions from various sources, or on the generosity of the individual householder. Enforced idleness, scanty clothing, inadequate food and no immediate prospects of improved conditions combined to make the outlook of these unfortunate young Canadians most appalling. In addition to the problem of the care of many thousands of single homeless Canadians, the situation was further complicated by the large numbers of persons who had recently come to the country and who had not been absorbed. It is estimated that the number of men in this category amounted to nearly one hundred thousand. Unemployed under such conditions soon become unemployable, of no value to themselves and a menace to the state, in that they are potential recruits for organizations that thrive on misery and distress, fail to lend assistance, and do everything possible to increase human discontent so that the established order may be overthrown.

In October, 1932, it was proposed that the Department of National Defence utilize its Dominion-wide organization to administer and control a scheme for the relief of the single unemployed homeless men, this scheme to comprise the execution of various works that could be economically carried out to the general advantage of Canada. The works to be undertaken would anticipate by some years the ordinary programmes, so that by proceeding with them in the present no men are deprived of work at remunerative rates of wages which they might otherwise have had either now or in the near future. This Department possesses facilities for feeding, equipping and clothing large numbers of men, and these factors, combined with the fact that it has its own engineering, medical and administrative services, indicated that it was, from a general standpoint, a logical Federal Department to administer a scheme in which the direct feeding, clothing, etc. of the relief personnel are important features.

Apart from the economic value to the country of the works to be executed, the scheme propounded by the Department of National Defence aimed at improving the mental and physical condition of the single homeless unemployed by freeing them from the demoralizing effects of enforced idleness and providing them with wholesome food, adequate clothing, comfortable accommodation and, most important, with useful work to do. Further, the proposed scheme offered opportunities to certain classes of tradesmen to work at their trades and so maintain their efficiency, and also offered opportunities to unskilled labour to learn the rudiments of some useful trade.

The government gave favourable consideration to the scheme and on October 8th, 1932, an Order-in-Council authorized the Ministers of National Defence and Labour to arrange (during the period October 8th, 1932-March, 31st, 1933) for the care of a maximum of two thousand single homeless men in need of relief. The work specified was the clearing of twenty-four landing fields on the trans-Canada airway, repairs to the citadel walls at Halifax and Quebec, both of which are important national historical memorials; and the general improvement of air stations at certain other points.

From this modest beginning, the scheme has steadily expanded, with the result that the latest Order-in-Council (October, 1933) provides during the period November 1st, 1933-March 31st, 1934,[1] for the care of up to thirty-five thousand single homeless men on works such as clearing and grading of landing fields, forestry work, highway construction, dredging, and other work of a primitive nature not requiring any large expenditure on machinery or materials of construction. Projects are located in every province of Canada except Prince Edward Island where, to date, the problem of the single homeless man has not been serious. Work projects that require skilled labour have necessarily had to be kept at a minimum; to date the cost on this account and for machinery and materials purchased has been approximately 12 per cent of the total expenditure.

**Fig. 1—Frame and Canvas Camp Buildings, Kimberley-Wasa Highway, B.C.**

Proposals for works to be executed under this scheme emanate from various sources and, if they fall within the category of "works for the general advantage of Canada," they are considered by the Department of National Defence in conjunction with the Federal Department of Labour. No project is authorized, however, unless the preliminary estimates indicate that it can be executed economically, and the unemployment situation in the locality warrants its inception.

When a project is authorized, the responsibility for its execution is placed upon the Officer Commanding the Military District concerned or upon the official in charge of certain groups of projects which are under the direct control of National Defence Headquarters. These independent groups have been established in areas, such as Northern Ontario, remote from the Military District Headquarters in order to reduce the expense of administration and control.

Although the staffs of the Military Districts are utilized for the general administration of the projects, the projects themselves are, in practically all cases, directly in charge of civilian personnel. The technical supervisory personnel are graded as engineers, assistant engineers, foremen, sub-foremen and gang bosses, depending on the size and importance of the project. Appointments as engineers, assistant engineers, foremen and sub-foremen are, for the most part, filled by nominees of The Engineering Institute of Canada (and the provincial Associations of Professional Engineers working in conjunction with The Institute). They are normally married men selected by the various relief committees of The Institute or Provincial Associations on the basis of comparative need of relief, that is, provided technical qualifications and experience in handling men are equal. The positions of gang bosses are normally filled by capable practical men who have entered the camps as labourers. Promotion to grades up to and including foreman is given to practical men of marked ability if opportunity offers, but the positions of engineer and assistant engineer are reserved for qualified professional engineers. Up to December 15th, 1933, seventy-three members of The Institute (and seventy-one other qualified professional engineers) in need of relief have been cared for under this scheme, and it is hoped that thereby they may be assisted to maintain their professional efficiency until conditions permit their re-absorption in the economic life of the country in remunerative employment.

In the case of the larger projects, doctors, nominated by the Canadian Medical Association from members of the medical profession who are in need of relief, are engaged. In the case of smaller projects or where medical personnel in need of relief are not available, local practitioners are engaged at contract rates.

The remainder of the supervisory personnel—accountants, storemen, clerks, cooks and assistant cooks, and the relief labourers are selected in consultation with the local offices of the Employment Service of Canada or, in localities where such offices do not exist, in consultation with the municipal authorities concerned. The junior supervisory personnel are selected mainly from the ranks of married men in need of relief; the relief labourers are selected from the single homeless unemployed.

Personnel selected for the relief projects are given free transportation from the point of selection to the project. They are given free outward transportation, for a distance not exceeding the inward journey, if they definitely secure other employment, or on conclusion of the project.

**Fig. 2—Dining Hut, Long Branch, Ont.**

**Fig. 3—Hut Construction, Dundurn, Sask.**

Accommodation is provided in existing buildings if such are conveniently located, in tents for summer projects, or in frame huts which, as a general rule, are of the "sectional" type. During the winter of 1932-1933 mobile camps were established in railway boarding cars in a few cases, pending the erection of frame camp buildings. Canvas roofs have been used in a number of instances where the camps are required for only comparatively short periods in one place.

Fig. 4—Clearing, Lac Seul, Ont.

The food supplied is based on the standard army ration, which consists of:

| | | | |
|---|---|---|---|
| Bread | 1 pound | Butter | 2 ounces |
| Beef | 1 " | Cheese | 1 " |
| Potatoes | 1 " | Milk (evaporated) | 1 " |
| Fresh vegetables | 6 ounces | Split peas | ½ " |
| Bacon | 3 " | Salt | ½ " |
| Sugar | 3 " | Pepper | 1/36 " |
| Beans | 2 " | Coffee | ⅓ " |
| Jam | 2 " | Tea | ¼ " |

per man per day. This ration may be varied at the discretion of the official responsible for the project, provided that the medical officers are satisfied that it is not thereby unbalanced, and provided that the cost does not exceed that of the standard army ration. Contracts for food supplies are arranged by the Director of Contracts (Purchasing Agent) of the Department of National Defence. In addition to this ration, the relief personnel are given a free issue of ⅓ ounce per man per day of smoking tobacco, or the equivalent in chewing tobacco or snuff.

No man is selected for a relief project unless he is found to be medically fit for ordinary manual labour and free from communicable disease, the necessary medical examination being carried out at public expense. Personnel selected are given medical attention and hospital treatment, where necessary, free of cost, and their allowances are continued while undergoing medical treatment or while in hospital. Cases requiring simple hospital treatment are cared for in the project hospital hut, but serious cases are treated, under contract, in the nearest civic or municipal hospital. The medical personnel employed are responsible for the sanitation of the camps in accordance with provincial regulations.

Personnel taken on the strength of a project are given a free issue of such articles of clothing as they actually require up to a maximum authorized scale. The articles issued include boots, trousers, sweaters, shirts, underwear, caps, mackinaws or overcoats, rubber boots, mitts, etc. In addition, necessary articles such as towels, razors, razor blades, kit bag, etc. are provided. When a man leaves a project he is permitted to retain essential requirements but is required to hand in all other clothing issued. For example, a man leaving in summer is not allowed to take away a mackinaw or overcoat, whereas in winter he would be allowed to do so provided he had joined the project without a garment of this nature.

Facilities for outdoor sports are provided as far as local conditions permit the preparation of grounds for softball, soccer, etc. Sports equipment has been provided, in a number of cases, through the generosity of organizations and individuals, who have also furnished materials for indoor games, reading material, gramophones, radios, etc.

Education is not neglected and, through the cooperation of the Frontier College, the relief personnel who so desire are given the advantage of general education classes in elementary subjects.

In addition to the free transportation, accommodation, subsistence, tobacco, clothing, medical care and recreational and educational facilities indicated above, relief personnel receive the following cash allowances:

| | |
|---|---|
| Engineers and superintendents | $100.00 per month |
| Assistant engineers | 80.00 " |
| Medical officers | 70.00 " |
| Assistant medical officers | 60.00 " |
| Foremen | 60.00 " |
| Accountants | 50.00 " |
| Cooks | $40.00 to $50.00 per month |
| Sub-foremen | $40.00 per month |
| Storemen | 30.00 " |
| Assistant cooks | $20.00 to $30.00 per month |
| Gang bosses | $20.00 per month |
| Clerks and timekeepers | 20.00 " |
| Labourers | 20 cents per day for each day, or portion of day, actually worked. |

Fig. 5—Landing Field Site, Megantic, Que.

Fig. 6—Highway Construction near Tadanac, B.C.

No military discipline or drill is instituted in relief camps and the regulations which the personnel are required to observe are no more than are normally followed in the operation of an ordinary well-conducted construction camp. In only a few instances are the projects in direct charge of military personnel, and in the majority of camps the supervisory personnel are entirely civilian. Personnel are free to leave whenever they choose and, if they are not prepared to comply with the regulations prescribed, are discharged. They are not subjected to any punishment unless their actions require their arrest and conviction under the ordinary process of law.

**Fig. 7—Cribwork, Big Bend Highway, North of Revelstoke, B.C.**

The first project was opened on November 1st, 1932, and by October 31st, 1933, on a total of one hundred and one projects, 2,064,337 man-days of relief had been afforded. As many of these projects are newly opened, it is as yet too early to say conclusively that the total cost will be within the objective of $1 per man-day. The average cost, estimated on the basis of full establishment, for some eighty-seven projects which have been in operation for over three months is now down to 98 cents per man-day. Detailed analysis of the work performed on all projects shows an average labour efficiency of 56 per cent. It is also as yet too early to give precise figures of cost and created values with confidence, but it is clear that when created capital values are taken into account on a conservative basis, the net cost is substantially lower than the cost which would have been incurred had the men in question been cared for through direct relief.

### Criticisms of the Plan

The opposition of the radical elements in the country to this scheme is not difficult to understand, as no other attitude on their part could be expected. Certain sections of organized labour contend that the scheme is setting a bad example to private enterprise, municipalities, etc., and is fostering a general lowering of the standards of living. The attitude of the moderate members of the trades and labour unions appears to be that, while they appreciate the value of the scheme in that it takes men off the streets and gives them work which improves their health and morale, they feel that the work should be limited to projects requiring only unskilled labour or, if skilled labour is involved, that such should be paid at prevailing rates.

In considering the above objections, it should be remembered that this scheme aims at a measure of relief for "the single homeless unemployed." It seems illogical to contend that such personnel should receive prevailing rates of wages in preference to the large number of married men with families who are now unemployed. It is not the province or purpose of this article to discuss whether or not the government should embark on a Dominion-wide public works programme at prevailing rates of wages, but, if such a course were adopted, it is obvious that the unemployed with dependents would be absorbed before "single homeless men" with no dependents. Unless, therefore, a reconstruction scheme of such magnitude as to absorb *all* unemployed in the country were adopted, it is quite clear that the single homeless employed would remain in the same state as before the introduction of the existing scheme, as, invariably, this class is the first to be let out of employment and the last to be re-absorbed.

The scheme does not aim at lowering standards of wages—in fact, *the remuneration given is not classed as wages at all.* It is merely an allowance so as to permit the men to purchase the few small necessities which they require, and to avoid having to issue these articles on ration. It is recognized that "wages," as such, should be in conformity with the fair wage schedules, but the personnel cared for under this scheme are offered accommodation, food, clothing, medical care and a small allowance in return for their work *until such time as they can be absorbed in industry.* No restriction is placed in the way of a man who wishes to leave to accept a job or position—in fact men who secure work outside are given free transportation from the project in order to accept it. Further, every endeavour is made to place competent personnel in jobs, and men who desire to engage in harvesting or other seasonal work are given an assurance that they will be taken back on the project, if they so desire, when this temporary employment is finished.

The criticism that the works executed under this scheme should be confined to "primitive" work requiring only unskilled labour implies that the works requiring skilled labour are carried out exclusively by relief personnel, the skilled tradesmen among whom are "forced" to work at their trades under penalty of dismissal. Nothing is further from the truth. Skilled tradesmen among the relief personnel are encouraged to work at their trades, if opportunities offer, in the interest of retaining their manual efficiency, but if a carpenter or a plumber prefers working outside with a pick and shovel to working at his trade, he is allowed to do so. It is an established fact, however, that the majority of skilled tradesmen among the relief personnel infinitely prefer to work at their trades in order that they may retain their efficiency, and many young men who have had no opportunity to learn a trade welcome a job as a carpenter's helper, etc. in order that they may qualify as "handymen" when industry revives. Moreover, if there are insufficient relief personnel on a project who are capable of, or agreeable to, performing the "skilled" work

**Fig. 8—Making Concrete Blocks, Air Station, Trenton, Ont.**

required, married skilled tradesmen in the vicinity are engaged, on a rotation basis, at prevailing rates.

The argument that only "primitive" work should be undertaken would carry weight if there were sufficient of such work to absorb all the single homeless unemployed. However, this is not the case, and it has been necessary, in order to care for more of this class, to institute projects on which a certain amount of skilled work is required. It must be remembered also that projects involving skilled

**Fig. 9— Repairing Citadel Walls, Quebec, Que.**

labour, such as building construction, restoration of fortification walls, etc. require a large amount of complementary unskilled labour in the normal course of events. Moreover, the restriction of projects to the "primitive" type would mean that skilled tradesmen among relief personnel who wish to work at their trades would be denied this opportunity. The employment on "primitive" work of skilled tradesmen who wish to work at their trades is not only wasteful but is destructive of morale, and the main purpose of this scheme is to restore the morale of those who have been experiencing the demoralizing effects of idleness, living in hostels, feeding at soup kitchens and depending on the generosity of individuals for an occasional coin.

An argument has been advanced that the morale of this personnel would be enhanced and they would feel more independent if they were given an hourly rate, bought their own clothing, tobacco, etc. and had deductions made for board, medical care, etc. The answer is that under such a scheme, the cost per man per day to the government would necessarily be much higher than now if the man were to be assured a net $5.00 at the end of each month. In the matter of clothing, alone, the facilities of the Department of National Defence for purchasing and distributing in large quantities ensure that the required articles are supplied at only a fraction of the cost that the man would be obliged to pay if he purchased elsewhere. Surely, if the eventual result to the relief personnel is the same, the method which imposes the lighter load on the taxpayers should be adopted, apart from any question of the simplicity of the present method, and the fact that it enables the organization of the Department of National Defence to function in its normal method of supply and distribution of food, clothing, etc. without incurring heavy overhead costs.

### Comparisons with the United States Plan

The Civilian Conservation Corps of the United States is recruited primarily from single unemployed men, under twenty-five years of age, with dependents. Single unemployed over twenty-five years of age with dependents and single *homeless* unemployed of any age are not catered for. Each man in the Conservation Corps receives $5.00 per month for personal use and $25.00 is paid to his dependents. As far as the man cared for is concerned, the financial remuneration is practically the same in the United States and Canada.

The schemes differ in organization. In the United States nearly six thousand army personnel are employed full time on the scheme. In the same proportion, Canada would utilize three hundred to four hundred military personnel on full time, whereas less than a dozen are employed on this basis. Of course a number of military personnel are employed part time on the organization and administration of the work, in addition to their normal duties, but relief personnel are used practically entirely for camp staffs and superintendence of works.

Under the American scheme the relief personnel are enrolled for certain definite periods, while, under the Canadian scheme, a man is free to leave whenever he chooses.

The most important difference is in the matter of discipline. In the Civilian Conservation Corps discipline is enforced through the Summary Court-Martial scheme in operation in the United States Army. In the Canadian relief scheme, no powers of compulsion have been taken and the appeal is to the man's intelligence, not to his fear of punishment.

### Conclusion

Having due regard to the fact that the scheme described is for the purpose of affording a measure of relief to single homeless unemployed, it is claimed that, for the purpose intended, the scheme described is serving its purpose with fairness to the relief personnel eligible and with economy to the taxpayer. It is not contended that it is a solution of the unemployment problem, neither is it contended that it is properly applicable to single or married unemployed with dependents. Above all, it is desired to emphasize that it is not an attack on organized labour nor on the standards of living of those who live by manual labour. Single homeless men who are provided with wholesome food, good accommodation, adequate clothing, medical care, recreational facilities, tobacco and a net cash allowance of $5.00 per

**Fig. 10—Grading Landing Field, Salmo, B.C.**

month, with no worries or responsibilities, in return for a moderate amount of work, are probably better off than many married men on direct relief in these times of depression. The best answer to criticism of the plan is to visit the camps and see the men themselves. In only one camp—Long Branch—have professional agitators been able to make any impression, and it is established that a large number of the men who left that camp now regret that they allowed themselves to be influenced by the radical element.

In conclusion, it must be stated that the Departments of Labour and National Defence have been materially assisted in this scheme through the co-operation of other Federal Departments and of various provincial governments. As indicated earlier in this paper, The Engineering Institute of Canada has taken an active part in making this scheme a success through its nomination of competent engineers for supervisory positions, and the fact that The Institute has thus been in a position to assist its unemployed members, and other unemployed engineers, in need of relief should ensure that its value is enhanced in the eyes of the engineering profession generally.

Finally, it is satisfactory to record that there has been a steady flow of men from the camps back to industry, and it is confidently hoped that with the developing opportunities for regular employment this will continue and increase. The purpose has been to ensure that the efficiency—mental, physical and at their trades—of the men entrusted to the Departments' care is improved, so that they may be returned to the economic life of the country well able to resume their usual work.

# The Relation of Economics to Engineering

*Eric G. Adams, S.E.I.C.,*
*Montreal.*

**Note: The Past-Presidents' Prize for 1933 was awarded to this essay, which is now published by direction of Council.**

(*Parts I and II now published, will be followed by Parts III and IV in an early issue*)

### Introduction

Civilization has now reached the stage where the different streams of knowledge, followed by the different sciences, are coalescing, and the artificial barriers raised by calling the sciences by different names are breaking down. Frequently it is when this coalescence of two subjects occurs, when some connecting channel between them is opened suddenly, that most striking advances in knowledge take place. Engineering and economics appear to be approaching such a stage now. Throughout their development the relations between the two sciences have been close and interwoven, and in the future it appears that the two will be more interrelated than ever. Since this study is concerned mostly, however, with the relations before this coalescence occurs, it is expedient to define the two sciences in their separate state.

Engineering may be defined as the science of controlling the forces and utilizing the materials of nature for the benefit of man. This is a broad definition, according to which the engineer may be regarded not only as applying the discoveries of science, but also as a creator producing that which has not previously existed. The conception is purely materialistic, and the engineer is regarded as applying his skill and learning to the solution of material problems in which the data are more or less concrete.

Economics, on the other hand, inclines more to the abstract, and is closely allied to the older political economy in its methods and aims, if not in all of its findings. It is the science dealing with the wants of man and their fulfilment; it is particularly concerned with the production, distribution and consumption of wealth, and the manner in which these activities affect the welfare of the community. Thus the economist, in his work, must attempt to understand human beings and be capable of dealing with the complexity of human relations. Much of his data are indefinite in nature, and he is forced to adopt somewhat of an abstract or philosophical attitude in his activities.

Throughout this paper a sociological point of view has been maintained. That is, the results of neither science have been regarded as ends in themselves, but all have been related to their effects upon social progress as a whole.

Since the background of this paper rests on the historical development of the two sciences, the whole first part of the paper is devoted to presenting this background in summary form. This history of their development establishes a *de facto* relation between them. Both are sciences and function primarily to further material progress, but both have secondary effects in making cultural advance possible. From the existing relations the discussion proceeds to outline what they should be. Present conditions, it is considered, indicate the need for a planned economy, and in such a system both engineering and economics have a place of importance. Equal status and stage of development is necessary, as well as closer co-operation in methods and closer coordination of results. The last part of the paper deals with the problem of changing the relations from what they are to what they should be. In general this can be accomplished by the two sciences assisting each other in method, and by the broader education of both engineers and economists.

Although a planned economy is recommended, with control in the hands of specially trained 'economic-engineers,' it is not Technocracy. The required changes in the industrial system can be brought about without scrapping the whole system and setting out on a programme of pure experiment and untried theories. Only when the seemingly logical modifications required in our present system have been tried and found wanting is such a course justified. In this paper, therefore, the attempt is made to see the logical modifications and to point out methods of accomplishing them through the closer relation of engineering and economics.

## Part I—Historical

### A. Development of Engineering

To the ancients, the term engineering referred exclusively to operations connected with building military works and engines of war, and this conception was broadened little until the eighteenth century. In order to know the gradual development of the science to its present broad outlines, therefore, it is necessary to trace briefly the growth of pure and applied science up to this time.

*Technology in Ancient Times*

Pure science did not always lead the way for applied science as it does now. For many centuries practice was in advance of theory, and it was not until substantial achievements in analysis had been made that pure science began to exert a creative influence upon applied science. A considerable amount of practical experience had to be accumulated before it was possible to build up a theoretical science.

As might be expected, technical advance was extremely slow during the period of initial accumulation of experience. Little interest was taken generally in technology, for under the aristocratic organization of society slave labour was abundant and labour-saving devices were, therefore unnecessary. Because the power units available even during the Egyptian times were so small, comprising as they did only man power, the development of any sort of complex mechanism was obstructed. Pulleys, levers, wheels and their combinations were known, and their knowledge of these the Egyptians passed on to the Greeks and Romans, but in Egyptian times their applications were almost exclusively in devices worked by man power.

The technology of the Greeks included a slow accumulation of improvements on the practical side—the available power was increased by the development of better harness and methods of using animals—but the more significant advance was in theory. Archimedes (287-212 B.C.) formulated the fundamental conceptions of hydrostatics and studied the quantitative laws of the lever, thus taking the first real step in the exact science of mechanics.

At this time the primary object of philosophy was regarded as the discovery of the eternal truths of nature, and the task of theoretical science was defined as the construction of hypotheses which would present the phenomena of nature as manifestations of these eternal truths. This general concept of the task of science was responsible for attention being directed towards logical demonstrations that involved pure reasoning, rather than towards experimental study of the phenomena.

The contributions of the Romans were largely in the field of military engineering and were eminently practical. They developed no new mechanical principles, but they made use of those they had acquired from earlier civilizations in constructing efficient engines of war, roads and waterworks. Otherwise they are important chiefly for passing along intact to future generations the technology they received.

*Broadening Scope in the Middle Ages*

During this long period, although the mechanical sciences still were allied nominally to philosophy and rested upon supposed axioms or upon primary metaphysical concepts, a growing body of doubt and controversy was evident. Out of the large volume of discussion which these controversies provoked, there arose new concepts of the problems of technology. By stages the conviction grew that true knowledge of the nature of things could be obtained only through systematic observation and experiment.

In applied science, the substitution of water and wind power for human and animal power probably first took place in the milling industry. The simplest application of water power to grinding dates back to the fifth century, but it was not until the twelfth century that gearing was applied to work the mills at higher speeds. The general mechanism of the geared mill was also adapted to the use of other forms of power, notably hand power and horse power, about the same time. The use of wind as a source of power is not established prior to the thirteenth century. The earliest known applications of water power outside the field of grinding grain are to be found in the textile industry. References to fulling mills driven by water power appear in the second half of the twelfth century, and references to mills for crushing woad and tan bark about the same time suggest a form of mill that might be applied to any light task of stamping, crushing, or fulling. Water-powered saw mills were the next step, dating from the fourteenth century. The development of the turret windmill in Italy towards the close of the fifteenth century was the last significant addition to the list of prime movers until the invention of the steam engine. Thus, by the fifteenth century, the extension of generalized power to tasks other than turning millstones was well started, and the initial efforts had met with modest success.

*Transition from Mediaeval to Early Modern Period*

The foundation of the theories of modern statics dates back to the thirteenth century, but the study of dynamics made little progress until the time of Leonardo da Vinci (1452-1519). His creative imagination was responsible for clearing away the old metaphysical impediments to the effective study of motion, and the problems of dynamics which he defined were later solved through the efforts of Galileo and Huygens. Before da Vinci's day engineering was concerned with military activities that were being extended by the development of gunpowder and artillery, but which were largely a direct continuation of a tradition reaching back into antiquity. Fifteenth century drawing and writing on mechanical subjects was confined to the military engineers and architects, with the former most in evidence. Leonardo da Vinci's career, however, marks a change in the established conception of the scope of engineering. Although he gave some attention to fortress construction and artillery, his interest was predominantly in the application of mechanism to industry. His work also created new bonds between pure and applied science, and he influenced greatly the trend towards more imaginative thinking which at last pushed theory ahead of practice.

The number of patents registered in the seventeenth century was large, and many of the inventions contained principles later to prove of great value. The swing to imaginative thinking, however, led to the conception of much apparatus long before there was any possibility of making it.

Although the mediaeval period must be credited with nearly all the preliminary work in the development of low-powered prime movers, the sixteenth and seventeenth centuries were marked by a substantial development of the range and character of the uses of power. The strictly new power problems of these centuries were concerned largely with pumps and pumping. Eventually a solution was found, and the new source of power was ultimately embodied in the steam engine.

The ending of the ancient period in the development of the mechanical and physical sciences was marked by the publication of Newton's "Philosophiae Naturalis Principia Mathematica" in 1686. In this notable work, besides modifying the principles of dynamics and statics as previously stated, Newton brought together the closely related sciences of physics, astronomy and mechanics in one comprehensive whole, and generalized the concept of gravitation.

*The Industrial Revolution*

For the next century and a half England took the lead in technical advancement. While continental scientists confined themselves chiefly to pure science, Englishmen busied themselves with the application of knowledge already available, and through patient experimentation they brought to bear upon the problems of industry the discoveries of their more brilliant continental contemporaries.

By the early eighteenth century the iron industry was in difficulties because the supplies of charcoal were giving out. In 1720 Wood applied coal to iron smelting furnaces successfully, however, and gave the industry new life. In the cotton textile industry weaving was enabled to outstrip spinning by Kay's invention (1733) of the flying shuttle. A great incentive was then given to invention by the government offering prizes for the best improvements to methods of spinning. The relation of spinning to weaving was soon reversed by a series of inventions applied to the former—notably Hargreaves' spinning jenny in 1764, Arkwright's water-powered spinning frame in 1769, and Compton's mule in 1779. Water power was replaced by steam power towards the end of the century, first in spinning, and later in weaving.

In 1760 Potten connected the valve and piston action of a steam pump and made it automatic. Profiting by the pioneer work of Newcomen and others, Watt, in 1769, patented the separate condenser and so produced a new type of engine. He then made his engine double-acting, which removed the obstacle to rotary motion, and the resulting prime mover revolutionized one industry after another. The final stage in the development of the steam engine, the high pressure engine, was made possible by the improvements in iron making in the last quarter of the century.

Beginning with the Grange brothers' successful operation of a reverberatory furnace in 1760, methods of refining and working iron developed rapidly. This opened up new uses for iron and steel, and soon led to the building of industrial machinery of iron. The most important of the early machine tools were lathes and boring machines. The lathe was strikingly developed, particularly for wood working, prior to 1774, but it was not until this date that a method for boring metal cylinders adequately was patented by Wilkinson. This is regarded as the first decisive step in the new methods of working in metals. The developing technique of the metal trades opened up new possibilities in quantity production and in the manufacture of interchangeable-part mechanisms, which laid the foundations of modern mass production.

With the development of the high-pressure steam engine, Trevithick and others began to experiment with its application to transport. It was not until the successful Rainhill tests of Stephenson's 'Rocket' in 1830, however, that the steam railway was definitely established on a practical basis. An age of feverish railway building began, until by 1848 nearly five thousand miles of railway line had been laid in Great Britain.

The great inventions of this period changed the relation of handwork to mechanical assistance. The accuracy of the work no longer depended upon the skill of the workman, but on the accuracy of his tools. Under the former method the tool was an aid to the worker's skill, and the amount of skill that had been transferred was small. In the new machines the transfer of skill and thought could be so great that the worker became merely an attendant guiding the machine. This transfer of skill was not based on the division of labour, although it made possible an extension of the principle. The result was, however, that the factory system of industry was facilitated, and rapidly displaced the domestic system in England.

*Beginnings of Modern Engineering*

As a result of the industrial revolution, various branches of engineering began to take on more of their present characteristics. Before this, however, there grew up a class of engineers who concerned themselves with works which were neither exclusively military in purpose (though some were akin, such as the making of roads), nor executed by soldiers. These men by way of distinction came to be known as civil engineers. In England, there was a great extension of roads and canals in the latter part of the eighteenth century, largely due to the agrarian revolution which concentrated the ownership of land in the hands of a decreasing number of proprietors and revived the enclosure system. This movement greatly increased the number and widened the scope of the new class of civil engineers.

It was not long before specialization took place in the wide range of activities covered by civil engineering, and this resulted in the separation of different branches of the science. The first of these were mechanical engineering and mining engineering; both became important as separate branches about the same time.

In the latter branch, the most marked development came first in the field of coal mining. The manufacture of iron and iron products, and the operation of steam powered mills and factories, necessitated abundant and inexpensive fuel. To meet these needs greater attention was devoted to methods of mining coal. Before the close of the eighteenth century the introduction of steam pumping had made it possible to sink deeper shafts, but the expansion of coal production became noteworthy only in the decade 1810-19. In that period wooden props were introduced, the steam boring machine was invented, Sir Humphrey Davy's safety lamp was brought into use, and in 1820 mechanical haulage underground began to be substituted for human labour. Thus by the end of the first quarter of the nineteenth century the separate science of mining engineering had been definitely established.

Mechanical engineering was important by 1820, and received a great stimulus from the early railway development. Because the industrial revolution came first in England, she had the equipment, experience and skill to supply the rest of the world when they wanted machines. During the middle of the nineteenth century, therefore, mechanical engineering received its greatest impetus in England. Its scope and power were greatly increased by the discoveries of Bessemer (1856), Siemens brothers (1866), and Snelus (1879) which created the modern steel industry; and by a series of inventions such as Nasmyth's steam hammer in 1838, de Laval's impulse turbine in 1882, and Parsons' reaction turbine in 1884.

Since the middle of the century, the industrial record in England has largely been one of expansion in size and output, and of specialization in the processes of manufacture. But it is in the United States that mechanical engineering has progressed most in developing the technique of interchangeable-part manufacture and mass production. The group of machine tools has become more and more automatic until manufacturing is possible wherein highly complex operations are carried on with only the simplest labour of attendance by humans.

Another branch of mechanical engineering which has attained prominence, particularly in the United States, during the first quarter of the twentieth century, is that specializing in internal combustion engines. Otto first introduced his four-cycle gas engine in 1876, and Daimler brought out his high-speed gasoline engine in 1883, but it was not until the century had turned that the ultimately most important field, the automobile, received much attention. Heavy oil engines began to assume characteristic form about 1885, but the special problems were not adequately solved until Diesel produced his first engine in 1895. Since that time the development of this engine has been steady, although its use is somewhat restricted to special circumstances.

*Newer Branches of Engineering*

About 1890 the field of mechanical engineering was restricted by the separation of the important branch of electrical engineering. By this time the importance which steam had attained since the industrial revolution began to be decreased through greater use of electric power.

The early history of electricity centres around the various types of accumulators. The next period is marked by the invention of the dynamo and motor, and before 1880 the primary accomplishments in lighting, power production, and traction were practically realized. The development of the incandescent light by Edison in 1879, however, was the outstanding achievement, as it involved the creation of the central electric station with its complementary distribution system. With the subsequent development of high tension transmission of alternating current it became possible to make increasing use of centralization in electrical production. Hydro-power from remote sections could now be used, and the economies of steam production in large central stations obtained. The degree of stability attained by interconnecting large systems further reacted to the benefit of industry. The abundant supplies of power which these developments released effected the transition from the Machine Age into the Power Age, and the nature of electric power facilitates a decentralization of industry in direct opposition to the concentration which steam power necessitates.

Communication engineering has grown up as a particularized branch of electrical engineering. Pithball, spark, electrolytic, and electro-magnetic telegraphs were all developed almost coincidentally with the discoveries in electricity upon which they were based. As early as 1844 a company was organized in America to link New York, Baltimore and Washington by telegraph. From this time the use of the telegraph spread rapidly as a means of land communication, and in 1850 the first submarine cable was laid, connecting Dover and Calais. Improvements were continually applied, so that land wires and submarine cables connected most of the civilized world by the end of the century.

Bell's invention of the telephone in 1876 opened up another important channel of communication. At first speech was transmitted only locally, but gradually the local systems, many of which sprung up when the Bell patents lapsed, were linked regionally and then by long distance circuits, so that interconnection is now possible between more than 99 per cent of all telephones in the United States. Since the war great strides have been taken in extending the range of telephone communication, particularly in the international sphere by radio.

The groundwork for wireless telegraphy and telephony was laid by Maxwell's electromagnetic theory and Hertz's analysis of electrical oscillatory disturbances. In 1901 Marconi established wireless communication between England and Newfoundland. Since then development of wireless has been continuous and rapid, until now wireless communications comprise every variety of traffic that can be handled by aid of wires, and some that cannot. Communication by speech or signal to near or distant points on land, sea or in the air, direction finding for ships or planes, and the broadcasting of information and programmes are samples of the services this development offers.

The present status of chemical engineering has been attained by a slow growth from the time of Faraday to the commercial development of electricity, and a rapid growth since then. Consequent upon the advances in technology which have definitely ended the shortage of man power, more attention has been paid to the problem of conserving natural resources, until today there is little hesitancy in attempting to synthesize any organic compound for which there is a demand, or to produce to order some special material. Thus chemical and metallurgical engineering have become increasingly important to the other branches of engineering and industry in general.

*Present Status and Future Outlook*

The transition to the Power Age which has been accomplished during the past two decades has far-reaching effects which are yet only partially realized. It means, first, that the great era of machine invention is past, being replaced by a time in which technological effort is directed towards obtaining more extensive and effective use of existing machines. In both the United States and England statistics of patented inventions now show a uniform tendency towards a decreasing rate of increase, and in some important branches an absolute decrease. It means, secondly, that the recurring shortages of man power which limited production in the past are now eliminated. The net result is that the problems of production, which have always received predominant attention in the past, have been solved (for the time being at least), and will require less attention in future. To retain the status of importance enjoyed when production considerations were uppermost, therefore, engineering must broaden its scope in order to be able to offer the same valuable assistance in solving the problems of distribution.

### B. The Development of Economics

Although economic science as such only dates back to about the sixteenth century, it is instructive to follow the development of economic thought from early times in order to understand the origin of the science. A certain unity in economic thought and continuity in its development exist to connect the present with ancient times.

*Earliest Beginnings*

Economic ideas of any definiteness were given their earliest expression in rules of conduct or moral codes formulated by priests and lawgivers. The underlying philosophy was broad and simple, and economic concepts were presented with ethics and religion as one whole. The tardy development among the ancients was principally due to the fact that economic phenomena were not important to peoples living relatively static and simple lives with the dominant classes supported by a servile population.

The Oriental civilizations (including the Egyptian and Hebrew) did little to develop economic ideas. In all there was a dominant priestly class which formulated and handed down traditions that minutely regulated everyday life, even in its economic phases. Their philosophy was characterized by lack of both individualism and materialism, and a disapprobation of industry other than agriculture, that made an industrial civilization impossible. Happiness for them was obtained by abolishing discontent through decreasing wants, rather than through satisfying them materially. Static ideals predominated, and material progress was effectively blocked by the caste system.

Although the Greeks continued to look down upon all industry except agriculture, they were more rational in their thinking. Instead of forbidding the accrual of interest on money in conformity with some divine edict, they argued about it. They were more concerned with the individual than the Hebrews or Hindus, and recognized to some extent the value of material wealth as an agency in furthering human happiness. The first use of the word 'economics' was by Xenophon in the title of a book on household economics, which was as far as the subject had progressed to this time.

Typically lacking in speculative originality, the Romans did little directly to advance theoretical economics. Indirectly they did exert a profound influence on future thought, however, by their development of a jurisprudence whose practical spirit furthered individualism through its doctrines concerning property, contract, interest, and so forth.

*Expansion of Scope During the Middle Ages*

In the Middle Ages (from the fall of the Roman Empire, 476, to about 1500) a very slow transition took place which resulted in the replacement of independent household economy by national economy. During this period commerce and handicrafts gradually encroached on the dominating position of agriculture, and slavery was slowly abandoned for serfdom and free labour. The Church became dissociated from politics and industry.

With the development of inter-town and inter-regional trade, and the gradual lapsing of merchant and craft guild restrictions, the relations of business men became more intricate and more impersonal. Expanding markets soon indicated the advantages of division of labour and of regional industrial specialization, which led to the replacement of the guild system of industry by the domestic system. The discovery of new lands (such as America) further broadened commercial interests, until common policies were found advantageous not only locally and regionally, but also nationally. It was out of the discussion of questions of public policy created by this realization of common interest and opposition of interest in diverse fields that the science of political economy attained a status of importance.

*Early Progress of Political Economy*

Viewing with envy the acquisition by Spain of wealth in the form of gold and silver from mines in America, other countries, notably France, Italy and England, sought to obtain the same results from the expansion of export trade. This was facilitated by the development of currency, banking, credit and shipping, and to this end public policies were determined which were intensely nationalistic in character. From these accepted policies the principles of the Mercantilists took form as economic theory in the early part of the seventeenth century.

War was common then, and a considerable degree of self-sufficiency was a practical necessity. Consequently the Mercantilists laid down the principles of a national political economy, not a cosmopolitan one. They identified the interests of the nation with the interests of its merchants, and underestimated the relative importance of agriculture and industry. The result was a body of government regulation of commerce and industry directed towards securing a large net profit in the form of treasure for the state as a trader.

About the middle of the eighteenth century, reaction against the naive confusion of economic welfare and money profits of the Mercantilists crystallized in the doctrines of the Physiocrats in France. They measured the welfare of the community, not by the profits of trade, but by the excess of the community's annual product over its cost. This meant that the soil was regarded as the real source of wealth since it alone yields a net product. They were distinctly abstract in their reasoning, and although their principles were partly fallacious, yet they saw the processes of economic life more as an interrelated whole than did the Mercantilists.

The publication in 1776 of Adam Smith's "An Inquiry into the Nature and Causes of the Wealth of Nations" opened a new era in economic thought and earned for its author the title 'father of political economy.' Smith shared some of the Physiocratic prejudices, but expanded the theory of wealth to give industry its legitimate place, believing that wealth could be increased only by making labour more effective. To do this he believed in a system of free competition and laissez-faire. Smith was much superior to the Physiocrats in building up his theories from observation of facts and history, but perhaps his greatest contribution was the simple and comprehensive picture he presented of the whole economic life of a nation.

*The Classicists and the National School*

As a result of the teachings of Adam Smith, and the character of the economic problems which arose out of the Napoleonic wars, and the swiftly changing industrial structure in England, the next group of economists were led to think of political economy as a natural, purely expository science. These Classicists employed the deductive method in their reasoning, starting from general data conceded to be beyond dispute and proceeding to deduce countless propositions, as in geometry. This school included such men as Malthus, Ricardo, Say and Mill, and was influential until the middle of the nineteenth century.

Sharply contrasted with the Classicists was the National or Historical School of which List is usually regarded as the chief exponent. They believed economic life to be something peculiar to a given nation at a given time, and therefore, the conception of universal natural laws of the Classicists was replaced by a restricted national historical view of political economy. The inductive method—i.e., basing general propositions upon certain definite observed facts—was employed, but the National School carried its ideas much further than the meagre empirical data of the times warranted.

The deductive method is essentially abstract, and the chief criticism of the Classicists is that they were led astray by their own abstractions. Having invented the 'economic man,' they formed their deductions as though such a person really existed. The National School, on the other hand, was grossly handicapped in the use of the inductive method because of the difficulty of observing facts connected with the social sciences. These facts are so diversified and intricate that observation can only be performed through the collective labour of thousands, and the necessary technique was not then available. The criticisms of the Classical and National Schools, therefore, are not directed towards their basic methods, but rather to the way in which they employed these methods.

*Further Broadening of Economics*

With the decline of the National School, economics was finally broadened beyond the political field, and its scope no longer was limited by preoccupation solely with national commercial policy. Among the subjects to which an increased amount of attention was given by the newer generation of economists were the mechanism of supply and demand, and interest and profits. Two schools are important in this group for their return to the deductive method, and for carrying it to extreme logical consequences.

The first of these, the Mathematical School, was led by Jevons, Walras, and Marshall, to name a few of the better known mathematical economists. They considered the relations which arise among men in any given circumstance as relations of equilibrium, much as in mechanics. Elaborate mathematical formulations of the conditions of equilibrium were devised, the great advantage of these being that it is then possible to depict the variety, complexity, and interdependence of all the factors which determine prices, costs, supply, demand, or distribution shares.

The second of the later deductive schools, the Psychological School, devoted its attention almost exclusively to the theory of value. They regarded value exclusively as the expression of human desires, assuming the economic behaviour of men to be governed from the standpoint of maximizing pleasure and minimizing pain. As a result of looking at the problem of distribution in this way, emphasis was given to important relations existing between one distribution share and another, relations which must be considered when analysing the repercussions of many economic proposals.

*Growth of 'Radical' Economics*

Utopian ideas concerning an ideal society were originally to be found only among the philosophers. Plato's "Republic" and More's "Utopia" are well-known illustrations of this fact. With the publication by Marx and Engels of the "Communist Manifesto" in 1848, however, the subject took on a decidedly political and economic tinge. During the next seventy years there grew up a body of economics which was radical in the sense that it repudiated the orthodox theories based upon the private ownership of capital or tools of production. The radical economists of this period, however, men such as Marx, Lassalle, Liebknecht, and Bukharin, for instance, were really more interested in the political aspects of the subject than in the truly economic questions. It remained, therefore, for men like Veblen, Cole, Laski, in the past two decades, to develop this branch of economics to a position of outstanding importance. The overthrow of capitalism in Russia, and the drastic changes since made in communist practice there, directed the attention of the rest of the world to both the good and the bad in the new system. As a result, some of the good points are considered adaptable in a modified system of capitalism, and are now being tried in the form of economic planning in different degrees in several countries.

*Present status and Future Outlook*

At the same time as there has grown up a number of distinct branches of study in economics, such as transportation, public finance, banking, population, their interrelation has been recognized in the growth of the central body of economic principles. The fact that each separate branch now has its special literature and engages the attention of a corps of specialists indicates that the advantages of division of labour are at last being recognized in economics, and augurs well for its future development.

The most important characteristic of the newer work in economics is its greater realism. The continued accumulation of records by governments and other bodies provides a widening range of economic experience for study and analysis, and so facilitates the realistic approach. Abstract conceptions have not lost their usefulness, but these conceptions are drawn, as much as possible, from the world of affairs. Thus economics, in its abstract reasoning, is coming to follow a procedure employed with great success in the physical and natural sciences. This procedure involves four stages:

(*a*) Observing facts without any preconceived notion;
(*b*) Formulating hypotheses to fit the observed facts;
(*c*) Deducing individual propositions from the general hypothesis;
(*d*) Verifying the deductions by experiment or specially conducted observation.

Despite the changes and contradictions which have characterized the development of economics, there still remains a general picture of communal economic life, sufficiently ordered to make analysis possible, but imperfect enough to make such analysis imperative. With the swing of attention from the problems of production to those of distribution the scope for practical economics is broadened immensely.

## Part II—What Are The Relations?

### A. Interrelated and Interdependent Development

In many ways both engineering and economics have been dependent upon each other in different stages of their development. At first the points of interdependence were somewhat haphazard, though none the less important. As the two sciences developed, however, they became more closely connected and mutually dependent. Always economics lagged somewhat behind engineering, with the result that the latter was often impeded in its development. In what follows, sample interrelations are indicated at different stages in the development of the two sciences.

*Connection in Early Times*

A conspicuous reason for the meagre technical advance made up to the time of the Greeks was the restricted nature of the markets, which provided no incentive to enlarge either the output or scope of the few hand industries then in existence. Economics embraced only domestic matters, trade was little more than barter with one's neighbours, so there were but few technical problems to challenge the best minds of the age.

A little later, the Romans, by their developments in military engineering, were enabled to gain political control over distant lands by conquest. The limited amount of trade which sprang up in the wake of the armies led to the cultivation of more distant markets, and so broadened the scope of economics slightly.

The slow development of technology which took place during the Middle Ages was closely linked with gradual changes in economic life, and this is well illustrated by tracing the developments within the milling industry.

About the fifth century water power began to be used in grinding. The mills were small, however, grinding was slow, and there were no professional millers. During the next five centuries almost no technical improvements were made in milling, although some centralization took place in the administration of the great estates and larger mills were built to be used by the tenants of the estates. Eventually some of the feudal lords claimed exclusive rights over milling, and both limited the number of mills that might be set up and forced all tenants to grind at the lord's mill. As a result of this concentration of milling, and the renaissance of town life in the eleventh century, a demand was created for larger mills which would work faster. Consequently, we find technology supplying the demand by the development of geared mills which greatly speeded up the work of grinding and first appeared about the twelfth century. In this instance, then, an economic development prepared the way for an advance in technology.

*Mutual Dependence in Early Modern Period*

Economics and other branches of learning are deeply indebted to technology for freeing them from the crushing burden of superstition and dogma which practically stopped all advances in knowledge during the Middle Ages. In technology the adoption of the experimental method resulted in mechanical developments which restored to man a sense of self-confidence that had long been lacking. Thus, science both cleared the way and set the example for pushing ahead in other fields.

Also, in a practical way, the first real step in broadening the scope of economics was dependent upon mechanical science. The invention of gun-powder and the consequent advances in military engineering facilitated territorial expansions of the great powers, and this forceful widening of markets fostered the formulation of common policies which grew into the science of political economy.

Inventions were plentiful in the sixteenth and seventeenth centuries, but their application to industry was restricted by several economic factors. In the first place, opportunities for the profitable use of the inventions were limited until some economic expansion took place and economic life became more complex. Secondly, lack of the necessary capital to promote the application of the conceived mechanical ideas proved a great obstacle. The same difficulty was encountered in applying more power to industry. The capital involved was large relative to the amount of power generated, so that, although power-using devices were known, their use was impossible in all but a few instances. Although some fortunes were large even in these times, they consisted largely of land, serfs and commodities, rather than easily transported capital. To provide the requisite mobility and concentration of capital the stock company was evolved, appearing first in Holland and then in England in the seventeenth century.

The effect of the agrarian revolution (which was purely economic) in England upon the development of civil engineering has been noted previously. The efficient system of roads, canals and harbours which resulted made the industrial revolution possible in England before other countries.

*Effects of Industrial Revolution*

While the industrial revolution was primarily technological, the economic consequences were most important. As a result of it England was transformed from a country with peasant occupations and local markets into an industrial nation with world-wide connections. To make the most of her new opportunities in world trade (gained by the removal of French competition resulting from the French Revolution) England made every effort to increase her industrial production, with the astounding advances in technology which we have seen. Conversely, the wide market which England commanded made economical production possible, and the immense wealth in metals and raw materials which poured into England from her colonies greatly facilitated industrial expansion.

England had an industrial revolution before the railway era partly because the extensive system of canals and roads gave ready access to the sea, which was nowhere far distant. In the other great industrial countries (Germany and the United States), however, the industrial revolution began only with the introduction of the railway. The chief obstacle to earlier industrial development in these countries was the inadequacy and difficulty of land transport. The civil engineer made the industrial revolution possible in England, and he and the mechanical engineer together did so in the other countries.

*Economic Effects of Modern Technical Developments*

The effect of communication on trade is somewhat analogous to that of transportation on industry. The advances made in methods of communication by technicians, consequently, are responsible for marked expansions in trade and widening of markets. By the telegraph, telephone and wireless, people all over the civilized world are now as closely connected as they were in neighbouring communities in ancient times. This virtual bringing together of vast numbers of people has had very complex effects on both economic and social life. While it has forced a broadened scope on economics, it has also raised problems in human relations on individual and national scales which are not yet adequately solved.

The industrialization based upon the use of steam power resulted in concentration of population in large centres. This also created many problems of a social and economic character—problems which were intensified as the concentration of population increased, and which have only been solved in part by subsequent technical advances (such as mechanization of agriculture, building of skyscrapers, development of motor, urban and fast suburban transport, etc.). The great expansion in use of electric power which has come with the twentieth century, however, has opened the way for decentralization in industry again. While little tendency to move in this direction has been shown, the possibilities are there. When economic developments permit, we may see the colossal centralized factories catering only to branches of production supplying the fundamental and universal needs of all men, and the adoption of small, individual, dispersed industries for making the infinite number of products of variable nature. Thus, industry may now be on the road to a better status, possessing the advantages of power machinery without the disadvantages of congestion.

The ability of chemical engineering to supplement natural resources, particularly those which are irreplaceable in nature or replaceable at a very slow rate, mitigates many otherwise insurmountable economic problems. In some instances not only mere substitutes have been produced, but actual equivalents, and sometimes items superior to those provided by nature. As a result of this growing interest in synthetic materials, competition today is not only between concerns, but also between dissimilar products, and research has come to serve industry as a weapon of both attack and defence.

It is evident from this brief survey that the relations of economics and engineering became extremely involved from about the time of the industrial revolution onwards. The two sciences have grown more and more closely together, so that it is impossible to say where a certain step in the development of one is responsible for a given step in the other. Cause and effect can no longer be separated with any degree of definiteness, and the interrelations can only be realized, not analysed.

*Economics has lagged behind Technology*

Furthermore, it is evident that the development of technology has consistently been in advance of economics. The deductive method (pure logic), for instance, was used in connection with technology in the time of the Greeks, but it was not widely adopted in economics until the early nineteenth century by the Classicists. Similarly, the experimental method was used in the mechanical sciences about 400 years before it found a place in economics (roughly 1500 as compared to 1900). Theory pushed ahead of practice in technology during the sixteenth century, but this did not happen in economics until the time of the Physiocrats about 1750.

The work of Newton and Adam Smith in their respective sciences is roughly comparable. Both were responsible for summing up the work that had been done before them, and for presenting a comprehensive view of the whole, preparatory to launching their sciences on greater periods of development. Both published remarkable books (Newton, his "Principia Mathematica" in 1686, and Smith, his "Wealth of Nations" in 1776), which are now credited with marking the close of the ancient period of development of the two sciences and the opening of the modern period. It is of some significance, therefore, that this point in the development of technology took place ninety years before it did in economics.

The evidences of this lead of technology over economics are plentiful even in this day. Whether the lead in time is as long as it was previously is unimportant; the fact remains that technology has consistently been in the lead. Many of the ills of the business and industrial world at the present time can be traced to the unbalance which exists between technological and economic advance. Production has outstripped distribution; the substitution of mechanical power for human labour has progressed faster than the knowledge of how best to utilize the added leisure; and the development of tools for furthering material welfare has progressed faster than the technique for controlling them.

*Lag Detrimental to Development of Technology*

Reference to the previous section shows several instances where technology was held back until economics took another forward step. Lack of common policies among business men resulted in narrow markets, which greatly limited the advantages and uses of many technical devices. Furthermore, restricted markets and trade produced little surplus capital, which was necessary to promote many of the mechanical inventions. From the time of the industrial revolution to the present, the use of machines has been frequently restricted simply because economic life has not been organized adequately to provide for the human labour thus displaced.

Another drag upon technological progress has resulted from the widespread swing to economic nationalism which has characterized the post-war period. Not only does this indicate lack of advancement in economic thinking, it indicates retrogression to the ideas of the National School which flourished in the latter half of the last century. As a result, restrictions are placed upon the distribution of products to distant markets, and the dissemination of technical information and processes among different nations. This in turn limits both the scale of technological advance and the importance of such results as are obtained.

The past twenty-five years have been characterized by the creation of vast industrial enterprises, which, if properly controlled, should result in tremendous material advances for mankind. Present conditions, however, are ample evidence of the fact that only a small part of the possible benefits (and a large part of the possible disadvantages) of this development have been obtained. One of the chief difficulties is that this mass production trend has produced problems of mass financing, mass management, and mass control, which are purely economic. But economics, in its backward state of development, has not been able to offer adequate solutions to these problems.

In the past, the problems of the world were problems of scarcity as well as of distribution. Today the first of these is practically eliminated, thanks to advances in technology, but the problem of distribution is more pressing than ever. It is no longer a problem of not being able to create the goods to reach a higher economic level, it is the problem of the distribution of plenty. The engineer has apparently done his work well, perhaps too well in view of the burden placed upon an inadequately developed system of distribution, the economist's special responsibility.

B. Connected Function in Furthering Material Welfare

Engineering and economics function primarily in the material sphere, both in theory and practice. They are scientific tools, functioning dependently, but past results have not been altogether satisfactory.

*Both Are Sciences*

Although both engineering and economics have frequently been called sciences, it is instructive to investigate the propriety of this designation. A science may be defined as a connected and systematized body of knowledge, possessing generality of form, but also sufficient homogeneity to enable isolation from other bodies of knowledge. The orderliness, generality and homogeneity of the basic phenomena underlying each branch of engineering are common knowledge and do not need demonstration here. The same, however, cannot be said for economics.

To be distinguished by the name, science, in the first place, economic phenomena must be connected within themselves and possess enough similarity to permit of separation from other phenomena. Such isolation is necessary so that, in analysing the phenomena, it is possible to deal separately with their different aspects and the different elements of which they are composed. Although there exist some doubts as to its complete separation from social philosophy in general, economics may safely be said to constitute a distinct, though not necessarily entirely independent, department of sociological speculation. It is possible, at least up to a certain point, to isolate the study of the phenomena of wealth from the study of other phenomena of society.

To be classed as a science, economics must also embrace an ordered body of data. Although economics has not passed through as rigid a classificatory stage as sciences of the type of zoology or botany, which deal with material objects falling into a natural system, a certain amount of collecting and systematizing economic phenomena has taken place, particularly in recent times. The existence of some measure of regularity and predictability in economic phenomena as applied to the individual is evident in the conduct of individual daily affairs. Everyday business is conducted on the assumption that men generally, if not individually, behave in similar fashion when placed in the same circumstances. Since individual affairs show some sort of order, the economic life of the community as a whole cannot be sheer confusion. It must, therefore, have some semblance of an ordered pattern which shows itself in laws or tendencies which can be discovered by observation and analysis. Thus, by maintaining that economics is a science, it is meant that it is possible to discover general laws of economic phenomena, to co-ordinate these laws, and to explain particular economic facts by means of them.

*Scientific Conception of Both Now Closer*

Until recently, the concept of science as applied to economics was broader and less rigid than when applied to engineering. The natural laws underlying engineering practice were regarded as absolute, while those regarding economic phenomena were looked upon more as tendencies than as laws. Now, however, the so-called natural laws are coming to be regarded as nothing more than good probabilities, while the economic tendencies are acquiring added definiteness and are also becoming good probabilities.

A further similarity between the two sciences is apparent as a result of the greater attention to causality which classification as a science now entails. Mere descriptive systematization can no longer constitute a science. Economics and the social sciences have always dealt predominantly with cause and effect, and now the natural sciences, during the later stages of their development, are concerned not alone with how the phenomena take place, but also with why they occur.

The detection of causal connection needs the assistance of some apparatus of reasoning, inductive or deductive, or a combination of both. Mere reflective observation cannot possibly give the requisite insight. In developing and using the necessary reasoning technique, engineering can assist economics materially, as will be outlined in a subsequent section.

*Both Equally Concerned with Material Progress*

The total wealth that any people can create is governed primarily by two factors: the natural resources of the country, and the tools of production, mental and physical, available for developing the resources. Highly developed tools of production make possible a high average level of material existence, but the realization of this average depends upon the social and industrial organization for the distribution of the created wealth.

By definition, then, both engineering and economics are fundamentally concerned with the material welfare of man. For, in supplying human wants, the function of engineering, briefly stated, has been to look after the methods of production, and that of economics, to organize production and distribution to supply these wants effectively. Thus, engineering is concerned with the tools for transforming man's environment to make life more liveable, while economics is concerned with the effective use of the tools, and with their results.

The above applies particularly to the practical field, but in the theoretical field the functions of the two sciences are not less important to the furthering of material progress. Researches in the domain of pure science frequently yield results that can be turned to great practical advantage. So generally important have these findings become, that many of the great industrial corporations have found it to their advantage to establish research departments in which the scientists are often allowed to work along lines that, in the beginning, show no relation to practical industry.

In the field of economics much the same condition is evident. The value of economic theories is rightly measured by their bearing on practical questions, but investigations which at the outset appear purely theoretical often disclose findings important from a practical standpoint. While the ultimate aim of economic investigation is to guide human conduct, the immediate object often is merely to obtain knowledge of positive facts. Such knowledge cannot be accurate and thorough if the theoretical enquiries are worked out piecemeal, as they arise in connection with particular practical issues, instead of being pursued systematically.

Broadly speaking, therefore, we may regard both engineering and economics as tools for furthering material progress. Engineering is virtually a tool for providing possibilities of material advance, while economics is a tool for making the best use of these possibilities. Since both conform to the requirements for classification as sciences, they are truly scientific tools. The relation between the two sciences is implicit in their classification in the above sense. Each is complementary to the other, and one cannot be said to be more important than the other.

*Actually Engineering Subordinated*

In view of the above, the gradual separation of responsibility and authority in the two sciences is significant.

When machines first appeared in industry, there was no clearly marked division between the industrial experts (engineers) and the business managers (economists). Not infrequently the designers of industrial processes and equipment both managed the shop and looked after the selling and financial end of the business. As the industrial system developed, becoming more involved, more specialized and of wider scope, the functions of the technological experts and the business managers grew apart. This division of function left the engineers to look after the productive end of business, while the economists decided on commercial grounds what the engineers could do, and how far they could go in doing it. As industry became still more mechanized and more complex, the work of the engineers became increasingly difficult and important, but the decision of the business managers continued to be final. In other words, more and more responsibility was placed on the engineers at the same time as their authority decreased in favour of the business managers.

This gradual separation of responsibility and authority has not been helpful to sound material progress (as will be shown in more detail later), particularly in view of the fact that the decisions of the business managers were made purely on commercial and not on social grounds.

### C. Secondary Effects on Cultural Development

The connection between engineering and economics in the material sphere is primary, but there is a secondary connection of the two sciences in relation to cultural life that is not so obvious. This arises from the fact that most cultural development, while not caused by advances in engineering and economics, is at least made possible by them.

*Necessity of Leisure and Wealth*

Cultural life, whether concerned with creative work in the arts or with the appreciation of such work, depends to a large extent upon the supply of leisure and wealth available to society. Creative work cannot be hurried, but must be allowed to pursue its course at ease. In the days when men had to spend all their time in procuring a living there was no opportunity for doing creative work in the arts. Leisure is necessary, preferably for a gifted part of the people all of the time, in order to create the means for enjoyment on the cultural side of life. Similarly, leisure must be available for all of the people some of the time, both to develop and to make use of the ability to enjoy these creations.

The function of wealth is complementary to that of leisure in facilitating cultural development. To make possible the maintenance of part of the population engaged in unproductive creative work all the time, and of the whole population in leisure part of the time, society must possess a surplus of material wealth above the requirements for daily sustenance. The greater this surplus wealth, the greater can be the cultural development, and provided it is properly distributed, the more widespread can be its enjoyment.

*Functions of Engineering and Economics*

The part of both sciences in bringing about the necessary material development is obvious. Through technical advances in industry and agriculture the creation of both wealth and leisure is made possible, and through the proper operation of economics its realization is effected. On the extent that effective co-ordination of the two is worked out, therefore, depend the lengths to which cultural development can go.

# The Reflecting Telescope for the David Dunlap Observatory

*R. K. Young, Ph.D.,*
*Department of Astronomy, University of Toronto, Toronto, Ont.*

**Paper to be presented at the General Professional Meeting of The Engineering Institute of Canada, Montreal, Que. February 8th and 9th, 1934.**

**SUMMARY.—After explaining the principles on which reflecting telescopes are based, the author mentions the preliminary considerations which led to the placing of the contract for this large telescope. The general arrangement of the instrument and the various parts of its mounting and accessories are described, including the tube, the declination axis, the polar axis and driving gear and the driving clock. A brief description of the building and dome follows.**

---

The principle of the telescope was discovered about the year 1608. The first famous telescope of Galileo was one and five-eighths inches in diameter and about twenty inches long. At that time the making of a telescope would not have been considered an engineering problem. The principles of the telescope are the same now as then but the increase in size from an inch or so to several feet makes all the difference. There is probably no instrument which necessitates the combination of technical and engineering skill to such an extent if the final product is to be satisfactory. A description of the 74-inch telescope of the David Dunlap Observatory, Toronto, will be of interest to members of The Institute.

The principles upon which a reflecting telescope is based are illustrated in Figs. 2*a* and 2*b*. In *a* the Newtonian form is shown, so-called after Sir Isaac Newton, its inventor. The light from a distant source is imagined coming from the right in a sensibly parallel beam which strikes the mirror *A*. The front surface of *A* is made hollow, being a paraboloid of revolution. This type of surface reflects the rays of all colours to the same point *D*, called the prime focus. In the Newtonian type of telescope, a plane mirror is placed at *B* in the path of the converging beam and inclined at 45 degrees to the axis, so that the beam is bent through a right angle and the focus is near *C*, where it may be examined with a magnifying glass or eyepiece.

In *b* we have the Cassegrain form of the telescope. The light which is reflected from the silvered glass mirror *A* in this case falls on a convex mirror *B* before it reaches the focus, and if the convex mirror is a portion of an hyperboloid of revolution, all the rays will be reflected back to a point near *C*. It is necessary in this case to have a hole in the centre of the mirror *A* to allow the light to reach the focus *C*.

These schemes look so simple that it is not at first apparent why it should be a difficult problem to make a telescope several feet in diameter. In the first place, however, the mirror *A* must be truly parabolic in shape with departures of the order of one-millionth of an inch. It must be very rigid to resist flexure and consequently heavy. The best material from which to make a mirror yet discovered is glass. In the instrument now described the mirror will consist of a solid disc about thirteen inches thick weighing about 5,000 pounds and made of pyrex. The advantages of pyrex are that it has a small temperature coefficient of thermal expansion and is a stable glass. The disc has been cast at the Corning Glass Works, Corning, N.Y., and is now in England at the optical shops of Sir Howard Grubb, Parsons and Company, at Newcastle-on-Tyne, where it will be ground and finished.

In the second place the telescope must be capable of being pointed towards any object without loss of time and must be driven by some mechanism to follow the object continuously as it moves across the sky. It must not only keep the object in the field of view but must hold the image stationary. A drift of the image of a thousandth of an inch during the course of an exposure when the telescope is being used for photography would seriously affect the definition of the picture. The engineering difficulties confronting the telescope maker in thus keeping the tube so accurately pointed are about equivalent to keeping a gun pointed on a target an inch in diameter at a range of twenty miles while the target is moving at the rate of five feet per second.

The mechanical parts which support the mirrors are usually spoken of as the "mounting." The whole instrument must be sheltered by a building which can be opened to permit a view in any direction and provide means of convenient access for the observer to any part of the telescope.

The positions of objects in the sky are located with reference to imaginary circles drawn among the stars very similar to the circles of longitude and latitude on the surface of the earth. They are however given different names when drawn in the sky. Those which correspond to the circles of latitude on the earth are termed declination circles and that declination circle corresponding to the equator on the earth is termed the celestial equator. The angular distance of a star north or south of the celestial equator is called *declination*. The circles corresponding to longitude circles on the earth are termed right ascension circles and the corresponding angular co-ordinate is called *right ascension*. Right ascension is numbered from the zero right ascension circle and increases toward the east. Thus the position of any star in the sky is designated by its declination and right ascension in a manner very similar to the location of points in the earth's surface by latitude and longitude. Due to the rotation of the earth the sky appears to rotate about an axis, so that there are two points in the sky at which the earth's axis produced cuts the celestial sphere, and about which the stars seem to revolve. Of course, in the northern hemisphere only the north celestial pole can be seen and indeed its elevation above our horizon will be equal to the observer's latitude. Due to the rotation of the earth also the right ascension circles drawn among the stars come in turn to the meridian and that right ascension circle which coincides with the meridian is called the *sidereal time*. If any star on its right ascension circle is not on the meridian it is said to have an *hour angle* measured east or west in time from the meridian, the sky apparently rotating 15 degrees per hour.

The technique of telescope making has evolved gradually. Experience has had to point the way for advances and, as in other lines of engineering production, the changes are suggested by the weaknesses of former models. There are comparatively few firms that have sufficiently large machinery to handle the massive castings which support the optical parts, and, when we combine with this the fact that the number of firms which have had experience in telescope building is very small also, we see that the project could be tendered for by a very restricted few. In 1927, when Mrs. D. A. Dunlap expressed her willingness to provide the means to construct a large telescope, tentative specifications were drawn up and in June of 1928 sent to four firms, the Carl Zeiss Company of Germany, the Sir Howard Grubb, Parsons and Company of England, the Warner and Swasey Company of Cleveland, and J. W. Fecker of Pittsburgh. The preliminary specifications stipulated the general form of the mounting but left considerable latitude in detail. The Warner and Swasey Company did not submit any tender and the design of the Carl Zeiss firm was not attractive as it was of a very radical nature. There was not much difference in the designs of the other two firms but after due consideration it was decided to accept the tender of the Sir Howard Grubb, Parsons and Company, England. This was a very fortunate choice because the decrease of the pound sterling

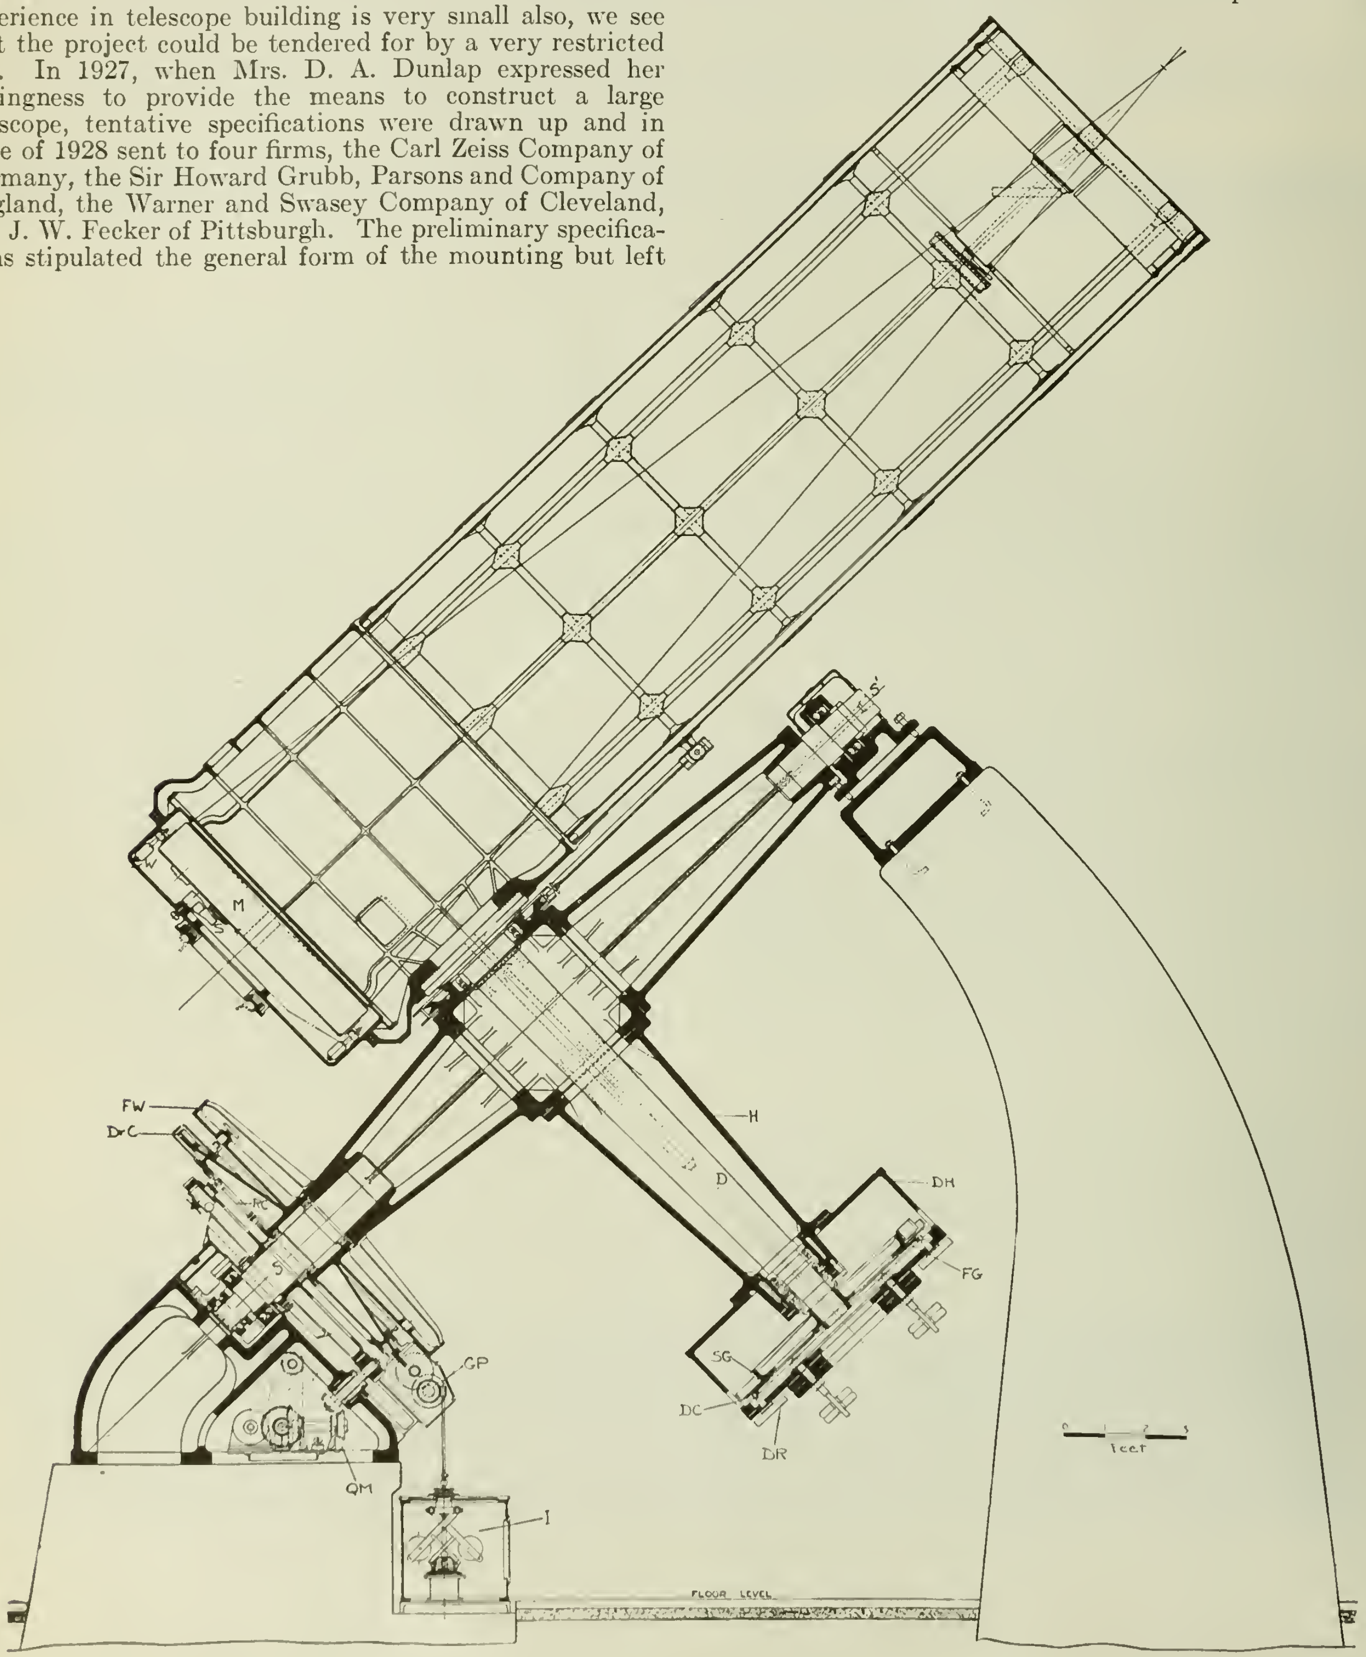

Fig. 1—General Arrangement of 74-inch Reflecting Telescope.

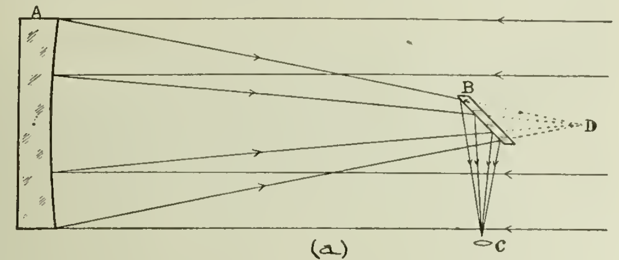
and the inflation of the American dollar later made the cost of the telescope very much less than it would have been had the contract been let in the United States.

The general form of the mounting is shown in Fig. 1 and a photograph as it appeared in the workshops prior to shipment is shown in Fig. 3. The essential features of any mounting are the tube which supports the optical parts and two axes of rotation at right angles to each other. The



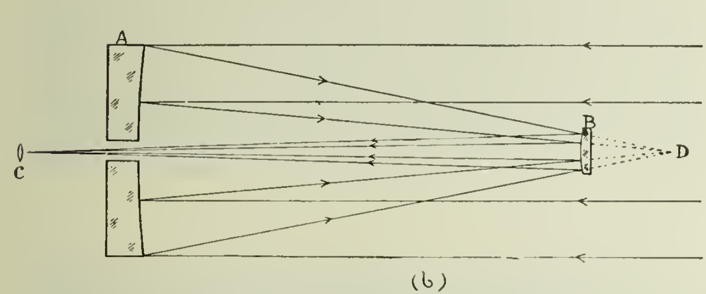


Fig. 2—Principle of the Reflecting Telescope.

*polar axis* (*SS'* in Fig. 1) must point to the celestial pole and the *declination axis D* to which the tube is attached provides another degree of freedom so that the tube may be pointed to any part of the sky. The polar axis is rotated by clockwork *I* in such a way that the telescope will continue to follow an object as it moves from east to west across the sky in its diurnal rotation. This is the equatorial form of mounting.

There are many forms of the equatorial mounting, which differ in the way the tube is attached to the declination axis, the latter attached to the polar axis, and the way in which the polar axis is supported. The kind of mounting selected for the 74-inch telescope is usually called the English type. As can be seen from Fig. 1, the polar axis is supported at both ends by two piers and the tube is carried on one end of the declination axis. In very heavy telescopes the polar axis is sometimes built in the shape of a large O and the declination axis supported by bearings at each end of the short diameter. This design is adopted in the mounting for the 100-inch telescope at Mount Wilson, California. In other telescopes the declination axis is attached to the polar axis beyond the two bearings of the latter. The 40-inch telescope of the Yerkes Observatory, Chicago, is an example of this type of mounting. In other telescopes again the polar axis is built in the form of a massive fork with two prongs and the tube of the telescope is mounted between the arms of the fork as in the 60-inch telescope of the Mount Wilson Observatory. Each type has its peculiar advantages in regard to strength, accessibility, and freedom of motion. The form adopted for Toronto has been very successful in the 72-inch telescope at Victoria, B.C.

When the contract was awarded in 1930 the main outlines only of the instrument were specified and Sir Howard Grubb, Parsons and Company began work on the detailed drawings. It seemed advisable toward the spring of 1930 for the author to spend some time in England going over the plans of the instrument with the manufacturer, and F. Jno. Bell, M.E.I.C., the Canadian representative of the firm, arranged to have the author visit Newcastle while the essential features were being drafted. This enabled much more rapid progress to be made than would have been possible if all the details had to be settled by correspondence.

On the author's arrival in England early in July 1930 the drawings were found well underway. Fortunately the firm had recently completed the 36-inch reflecting telescope for the Edinburgh Observatory and were engaged on a 40-inch telescope for the Stockholm Observatory. As there are many parts very similar in all telescopes, it was easy, from the parts of the 40-inch, many of which were in the workshop, to form a picture of the proposed new telescope. The completed drawings of the Edinburgh telescope were also a great help. In addition, the author had had a long experience with the 72-inch reflecting telescope at Victoria, B.C., and since the proposed mounting was very similar to this, conferences with Mr. Young, the manager of the optical works, enabled rapid progress to be made on the final design. When the author left towards the end of August no work on the actual construction had been done but the plans were so far advanced that construction was started in the fall.

### The Tube

The tube of the telescope which immediately supports all the optical parts is made in three sections. These three sections are called the mirror cell, the centre piece, and the skeleton, and are shown in Fig. 1. There are several features that the tube must possess. It must be as light as possible but must carry the 5,000-pound mirror at the bottom and the small mirrors at the top with a minimum amount of flexure. It must permit a free circulation of air so that light rays, in their passage through the tube to the

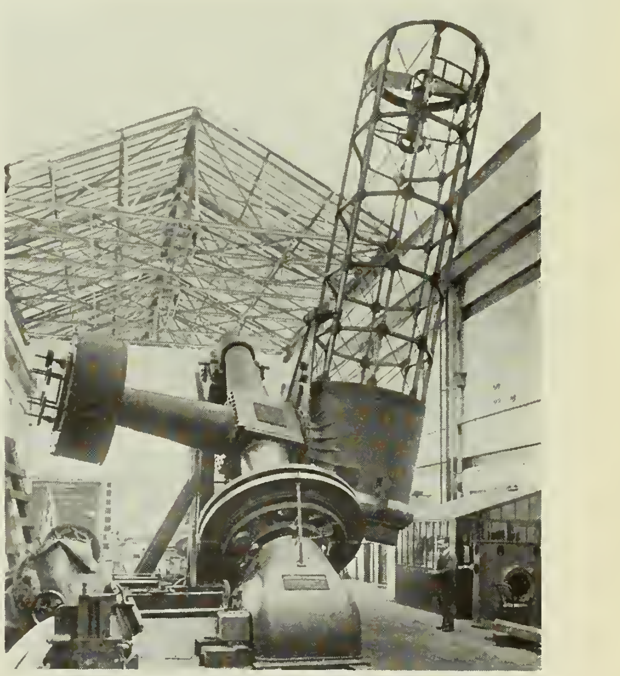

Fig. 3—Telescope with Tube Nearly Vertical.

main mirror and back, travel in a homogeneous medium. It must be capable of adjustment for alignment so that the optic axis is truly at right angles to the face to which the declination axis is attached. In order to reduce vibration to a minimum it should be mounted as close to the polar axis as possible.

The mirror cell consists of a steel-ribbed casting, weighing about 2,100 pounds. The mirror is supported on the bottom by a system of discs 7 inches in diameter in three sets of three each. These supports are shown in Fig. 1 at *S*. Each disc is mounted on a universal joint and the web-work which supports each set of three discs can be moved in or out to set the mirror with its face perpendicular to the optic axis. The disposition of the various discs is such that each carries its share of weight. Very careful attention was also given to the edge support. It is

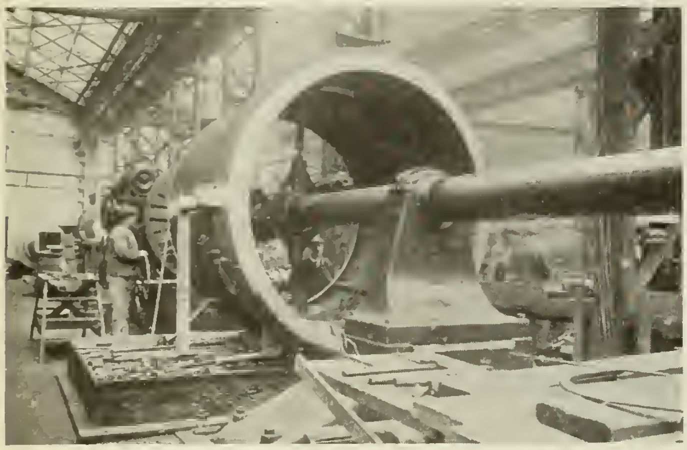

**Fig. 4—Truing Faces of Centre Piece of Tube.**

surrounded by arcs of a strong steel rim which fits into a groove in the disc. Heavy weights shown at *W* are attached to this rim by universal joints and are also attached by brackets attached to the interior wall of the mirror cell. When the tube is vertical there is no thrust on the edge of the mirror but as the tube assumes a horizontal position the weights act as levers with the brackets on the mirror cell acting as fulcrums and support the resolved component of the weight of the mirror so that in all positions the mirror is, as it were, floated. This might seem an elaborate system of support but the mirror is so sensitive to any distortional stresses that there is danger of the disc being warped if the stresses are not as uniform as possible in all parts. The mirror cell is bolted by a flange to the central casting.

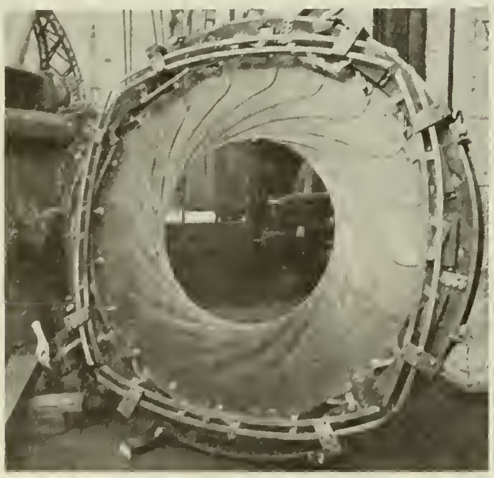

**Fig. 5—Iris Diaphragm at Half Aperture.**

The centre piece of the tube is also of steel and is heavily ribbed, weighing 4½ tons. A boss is cast on one side where it bolts to the declination axis. Instead of making a perfectly flat contact between the flange on the declination axis and the centre piece, they touch along a rim only. The purpose of this precaution is to reduce the rate of flow of heat from the tube to the declination axis and thence to the rest of the massive parts of the telescope. This flow of heat has a tendency to take place in the early evening when the telescope is first put into use and the result seems to be that the part of the tube next the polar axis becomes a little cooler or warmer than the outer parts. There is then a temperature gradient across the disc and this produces a slight cylindrical warping and consequent astigmatism in the reflecting surface. It is necessary that the face of the boss and the two faces, where the mirror cell is bolted on at the lower end and the tube at the upper, be at right angles. The operation of truing these up may be seen in Fig. 4.

Immediately above the mirror and attached to the centre piece is an iris diaphragm similar in construction to that used in ordinary cameras. It is operated by a graduated hand-wheel on the outside of the tube and may be used to stop down the telescope and serves also as a protection to the mirror when closed. It is shown at half aperture in Fig. 5.

The skeleton part of the tube, which is bolted to the upper flange of the centre piece, is made of duralumin I-beams, cross-braced by rods also of duralumin threaded right and left hand at the ends into T-anchors. By means of these brace rods, which can be seen in Fig. 3, the tube may be made to twist slightly or to shift in any direction without twisting. The rods are tightened to a point where each is under tension in any position of the tube. Careful

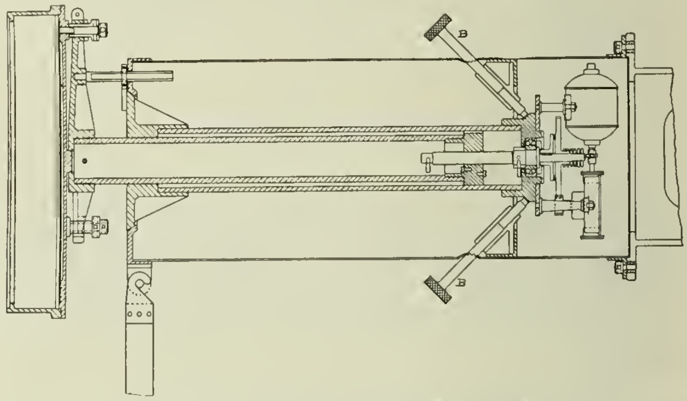

**Fig. 6—Cassegrain Mirror Mounting.**

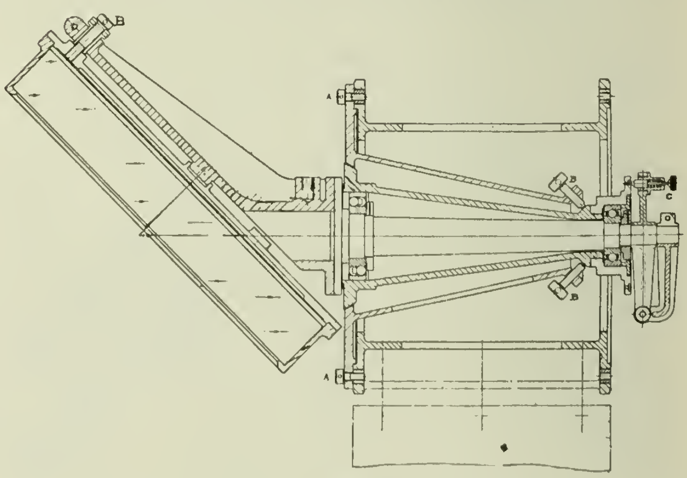

**Fig. 7—Newtonian Mirror Mounting.**

tests when completed have shown that, under the extreme position of flexure, the outer end does not sag more than one-sixteenth of an inch. The skeleton part of the tube supports at its upper end the secondary mirrors which may be of the Newtonian or Cassegrain form. The 74-inch telescope is designed to be convertible to either form. Figure 3 shows the Cassegrain mirror in place and in Fig. 1 the position the Newtonian mirror occupies is shown by dotted lines. Sectional elevations of these two attachments are shown in Figs. 6 and 7. Very convenient arrangement is provided in both these mirrors for bringing them into alignment with the axis of the tube by means of the screws *BB*. By shifting the dowel pin *C* (Fig. 7) in the Newtonian form the mirror can be rotated and the rays of light brought to the side of the tube in any one of four positions. This is almost essential because, in working at

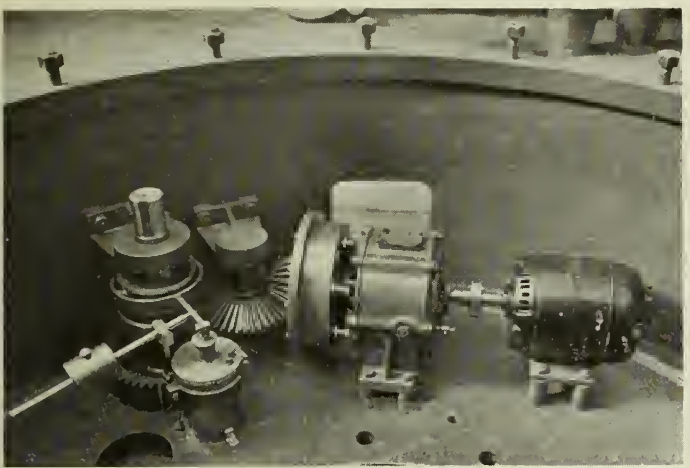

Fig. 8—Declination Quick Motion Gear.

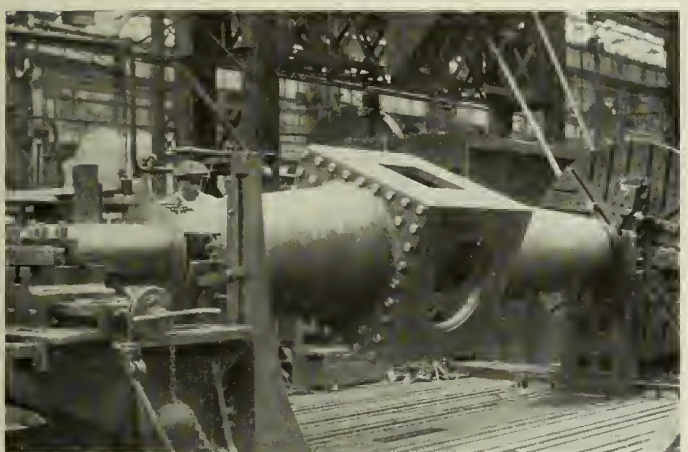

Fig. 9—Truing Polar Axis.

the upper end, it is convenient to bring the focus to that side of the tube which is the easiest to reach. By loosening the screws *AA* the Newtonian may be removed and the Cassegrain fastens to the same flange. When the Cassegrain mirror is in place the observer is situated at the base of the tube for observation. In a large telescope of the reflecting type the changes in temperature, causing expansion and contraction in the tube and mirror, alter the position of focus. Changes in the focus may be made by altering the position of the Cassegrain mirror and in the 74-inch telescope this is done by a small motor mounted in the tube which attaches the mirror in position. The observer has only to touch a button at the lower end of the tube and the focus is adjusted in or out as desired.

### The Declination Axis and Housing

The declination axis, to which the tube of the telescope is attached, consists of a steel forging 13 feet long with a flange at the inner end 3½ feet in diameter. Its weight is about 3½ tons. A hole has been trepanned through its centre to permit the electric wiring to pass to the tube and to the outer end. It is supported at the inner end by a radial ball-bearing 17 inches inside diameter, and at its outer end is carried by a radial bearing and double thrust bearing fitting into a tubular steel casting (*H* in Fig. 1) which is called the *declination sleeve.* All the bearings have been specially made with considerably less clearance than in commercial bearings. A spur gear (*SG* in Fig. 1) is keyed to the outer end of the declination axis which serves to turn the tube quickly in declination. The power for this motion is supplied by a motor inside the *declination housing DH.* A photograph of this motor and gearing is shown in Fig. 8. It can be clamped or unclamped by a magnetic clutch, the controls for which are mounted on the pier of the telescope. Bolted to the large spur gear is a graduated circle *DC* (Fig. 1) which by an index enables the observer to read the declination at which the tube is set. This *declination circle* is divided to single degrees, but in order to read the declination more accurately a fine spur gear *FG* bolted to the graduated circle drives two small drums *DR*, and these are graduated to a least reading of five minutes. Small electric lights illuminate the declination circle and drums so that the reading may be conveniently seen from the operator's position beside the pier. The declination housing is made intentionally heavy so that its weight counterbalances the weight of the tube. Additional weights are attached to the housing to adjust the balance. It can be seen from Fig. 1 that no extra weight has been attached to the declination axis proper, thus reducing flexure to a minimum and facilitating a free motion in declination. When the telescope has been brought to the correct declination setting, within a minute of arc, the quick motion gear is disengaged and the observer, on looking through the telescope, will see the star, but usually not in the centre of the field of view. It is necessary to have some fine adjustment whereby the tube may be moved by very small amounts. The mechanism which effects this is called the *declination slow motion.* It is shown in Fig. 1 and in Fig.

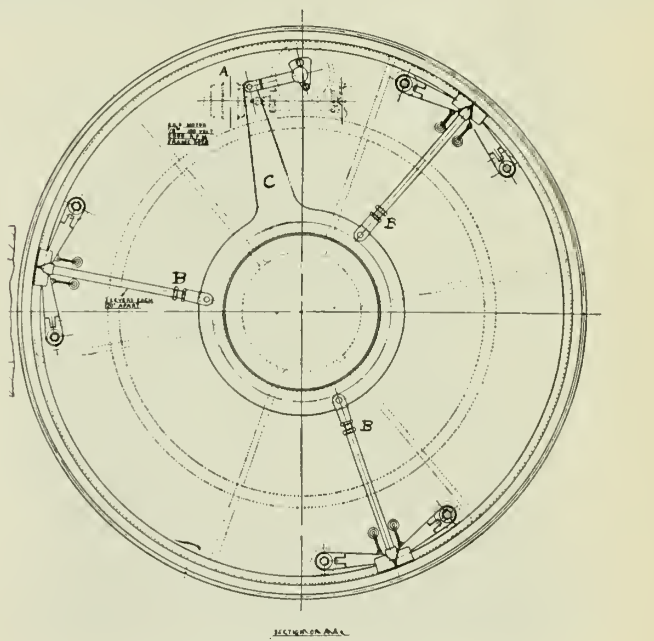

Fig. 10—Right Ascension Slow Motion Clamp.

3 between the polar axis and the tube. A fabricated steel arm about seven feet long is mounted on a V-ring which can be clamped or unclamped to the polar axis. The outer end of the arm carries a nut mounted on a link motion which can be moved in either direction along a screw attached to a bracket fastened on the tube. A motor operates a two-speed gear to turn this screw for giving the slow motion in declination. The motor is operated by two

separate switches. For the faster motion a dog-clutch, operated by a solenoid in parallel with the motor, connects the gear to the slow motion screw and moves the tube fifteen minutes of arc in one minute of time. For the slower motion an electro-magnet brings a differential gear into action and the tube moves thirty seconds of arc in one minute of time. The circuit which actuates the magnetic clutch in the declination housing for quick motion is inter-

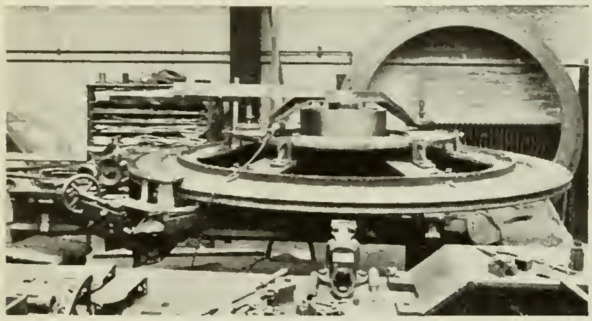

**Fig. 11—Cutting Teeth in Driving Circle.**

locked with the clamping motor on the V-ring so that it is impossible to have the two clamps engaged at the same time.

### The Polar Axis and Driving Gear

The polar axis, which carries the declination axis and housing, is best seen in Fig. 9 where it is shown on a lathe. It consists of three sections, a central hollow steel cubical casting to which is bolted two tapered hollow steel castings. Forged steel pivots are shrunk into the ends of the steel castings. Figure 9 shows the operation of truing the polar axis. It is 22 feet long and weighs $9\frac{1}{2}$ tons. Having been trued up it was never taken apart but henceforth treated as a unit. It runs in self-aligning ball bearings with a ball thrust bearing at the lower end. The housing at the upper end provides means of adjustment in elevation and azimuth to bring the axis $SS'$ in line with the celestial pole. Keyed to the lower end of the polar axis is a large spur gear $S$ which engages with the quick motion motor $QM$ in Fig. 1 for moving the telescope in right ascension. This motor is engaged with the gear by a magnetic clutch. When the clutch is engaged and the motor started, the telescope rotates in right ascension, and in order to bring the telescope quickly to rest when the motor is released, the clutch continues to engage for a few seconds and acts as a drag. This is a very convenient arrangement in preventing the overrunning of the telescope beyond the desired reading. The *driving circle* (*Dr. C* in Fig. 1) for moving the telescope to follow the motion of the stars is mounted on the lower pivot immediately above the quick motion spur gear. It turns freely on ball-bearings but can be clamped to the axis through the spur gear. The clamping arrangement is shown in section at *RC* in Fig. 1 and a plan is shown in Fig. 10. A small motor (*A* in Fig. 10) rotates the arm *C* and the toggle arms *B*, which are mounted eccentrically, push out wedges into a V-groove on the inner edge of the driving circle. The driving circle itself is a steel casting, and a bronze rim, in which the teeth are cut, has been shrunk onto its outer edge. The pitch diameter is 8 feet cut into nine hundred and sixty teeth. The operation of cutting the teeth in this wheel is shown in Fig. 11, in which it will be observed that a finely divided silver circle is mounted directly over the worm wheel. The positions of the teeth are governed by the divisions on this circle so that the driving circle is a copy of this tested circle. This procedure eliminates the danger of periodic errors. The teeth were carefully hobbed and ground and the worm finally run in with rouge to ensure a perfectly smooth fit. Mounted above the driving circle at *FW* in Fig. 1 is a free wheel called the *sidereal circle*. It is mounted on the boss of the driving circle and can be easily rotated by any one of six hand-wheels attached to it and fitted with pinions gearing into a wheel attached to the driving circle. The metal rim of this wheel is 3 inches wide and graduated on both edges to one minute of time divisions. The lower set of divisions read against indexes fixed to the guard of the driving circle and therefore mark sidereal time, while the upper set of divisions are read by indexes which are attached to the polar axis and therefore read right ascension. On starting work at the beginning of the night the clock is started and the sidereal circle moved by means of the hand wheels till the lower graduations read the correct sidereal time. As the sidereal circle is attached to the driving circle the lower scale will continue to read the sidereal time. In order to set the telescope on any star it is necessary only to engage the quick motion and turn the telescope about the polar axis until the upper scale reads the right ascension of the object. The driving circle is then clamped to the polar axis and the quick motion clamp freed. The quick motion clamp in right ascension and the clamp for the

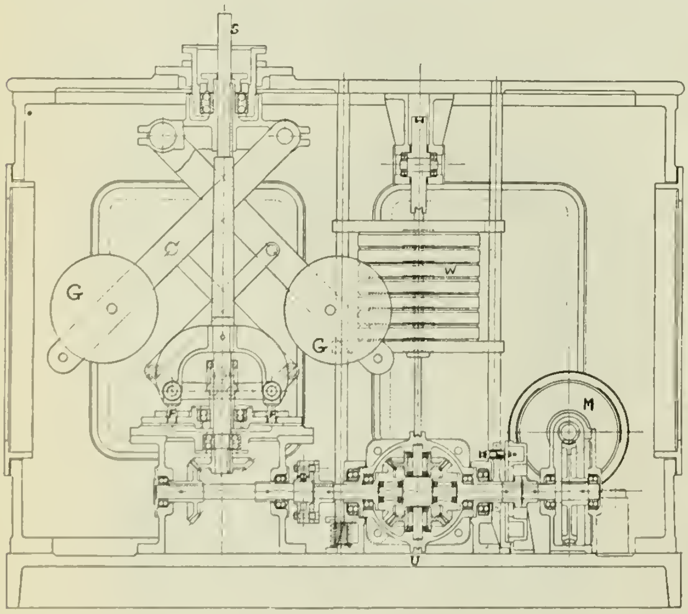

**Fig. 12—Driving Clock.**

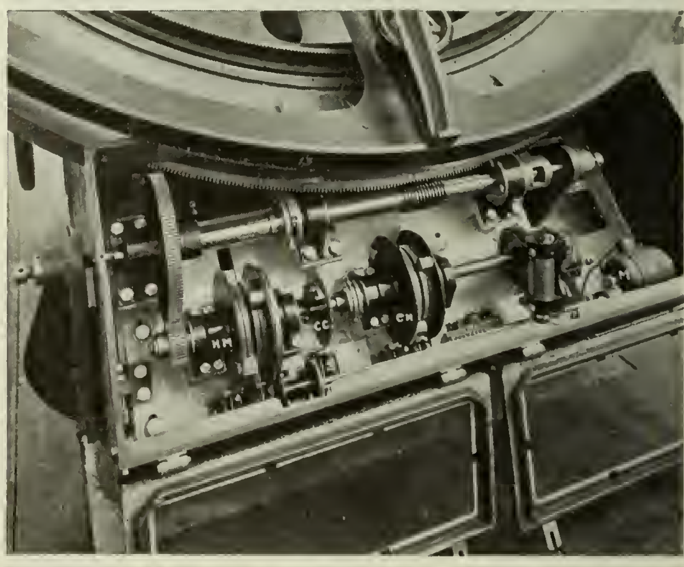

**Fig. 13—Gear Plate and Driving Worm.**

driving circle are actuated by an interlocked circuit so that it is impossible to have both on at the same time.

### The Driving Clock

The position of the driving clock is shown at *I* in Fig. 1 and a cross-section through the vertical spindle is given in Fig. 12. The cross-arm governor *G* is driven by the weight *W*. The motor *M* turns at the right speed to keep the weight floating on its vertical guides. Ordinarily if the motor is turning at the correct rate the position of *W* will be stationary and the outer housing of the differential gear *U* will be at rest. But if the motor turns too fast or slow the weight rises or falls and the outer housing turns, without affecting, however, the torque applied to the governing spindle. In order to keep the weight *W* suspended and to govern the motor, the weight is attached to a lever arm, not shown in the drawing, which actuates a resistance in series with the motor slowing the latter down if the weight gets high and speeding it up if the weight falls low. As the governors speed up, the link motion spreads and brings into play two friction pins at *FF* and the speed is checked. The moment that these engage can be regulated by turning the heavy weights *GG* which are mounted eccentrically. A clock of this type runs very accurately but not with the precision necessary to keep the image of the star perfectly stationary. Therefore, instead of gearing the spindle *S* directly to the driving worm, it communicates to a gear plate shown in Fig. 12, and at *GP* in Fig. 1, the function of which is to correct for any small irregularities in the clock drive and at the same time provide means of slow motion of the telescope in right ascension if it is desired to shift the position of the star in the field of view. The spindle of the driving clock *S* connects with the worm and worm wheel of the gear plate shown at *D* in Fig. 13. If the clock is driving at exactly the right rate this shaft turns one revolution in twenty-four seconds. Mounted on this shaft at *CC* is a thin disc in the circumference of which are cut twenty-four V-shaped notches, and into these notches beats the armature of a solenoid which is connected to the seconds beat of a sidereal master clock. Provided the disc *CC* runs at the correct rate the armature accurately strikes the depressions but if the wheel runs too fast or slow the armature shifts the wheel slightly and it is connected with the differential *HM* to keep the worm drive in synchronism with the notched wheel *CC*. For a slow

**Fig. 14—View of Site from Southeast showing Piers.**

motion the differential *HM* may be rotated by the motor *M* and for a still finer motion the differential *GM* can be locked or released by a dog-clutch. The motion imparted by the motor *M* is never sufficient to completely overcome the normal rate of drive so that the driving screw is always engaged with the driving circle and hence all difficulties of backlash avoided.

The complete mounting as described above was received in Toronto on October 15th, 1933.

### The Building and Dome

The building to house the telescope, though out of the line of ordinary construction, did not require so long to complete. The contract for it was let in November 1931, and it was received on July 31st, 1933. In the meantime the piers to support the telescope and the foundations of the building had been built.

**Fig. 15—Building with Dome Partially Erected.**

Figure 14 shows the cement piers in place and the nature of the surrounding country. The site chosen is a hill about 800 feet above sea level and 100 feet above the surrounding

**Fig. 16—Observing Platform.**

country, 12 miles north of the city limits of Toronto. The piers consist of reinforced concrete and extend 25 feet underground to a foundation of hard clay which extends farther down for more than 150 feet. On the east side of the pier a pit 6 by 10 feet extends to the bottom of the foundations. An elevator is mounted in this pit for removing the mirror and mirror cell. The mirror can be readily taken off for the purpose of resilvering.

Figure 15 shows the circular building and dome as it stood at the end of September. Since then the telescope has been put in place and the dome covered. As the construction of the building and dome presents a number of unusual features a brief description will be of interest. The entire building is of steel construction. The circular base and dome have double walls, and open louvres at the base of the building admit air which circulates to the top and exits through baffle plates at the top of the dome. The inside and outside of the dome is covered with "agasote," a kind of hard paper product, and the outside is further protected by a sheeting of copper. By this means the interior is kept cool during the day and in the evening when observations are started the whole building soon assumes the temperature of the outside air and the definition is not interfered with by heated air currents which would undoubtedly be the case if any quantity of heat were stored in the walls.

The dome, which weighs about eighty tons, rests on twenty-four rollers 27 inches in diameter mounted on self-aligning ball bearings and running on a circular track. Lateral rollers keep the dome in position as it is rotated. The rotation is effected by means of an endless steel cable passing around an annular channel ring fixed to the base of the dome and over two tangent pulleys to a winding gear. The dome is 61 feet in diameter and has an opening at one side, 15 feet wide, extending from the bottom to 7 feet beyond the zenith. Two parallel shutters run on rails at the top and bottom of the dome and are operated by wire ropes connected to a motor-driven gear which opens or closes the two shutters simultaneously. To protect the telescope from wind blowing in at the open shutter, two wind screens, motor operated and consisting of heavy sail cloth, can be used to cover the part of the opening not in use. One runs from the top of the opening downward and the other from the bottom upward and are guided in tracks fixed to the inside of the shutter opening. A novel feature of the dome, and one which should make it more convenient to operate than any previous models, is the method of access to the upper end of the tube. Two parallel segmental platforms are fixed to the inside of the dome, the lower one at the base of the opening and the upper one at a 16-foot higher level. Rails are mounted on these platforms and a circular arc bridge connects the two platforms. The bridge is shown in Fig. 16. The entire bridge can be moved laterally on the rails of the platforms and a small observing carriage travels up the curved arch. The small observing platform can be swung around on a pivot to enable the observer to place himself in a convenient position with respect to the eyepiece of the telescope.

No effort has been spared by the manufacturers to make the entire mechanism, mounting and dome in the best way possible. The workmanship is of the highest quality throughout and when finally completed the telescope will be the largest in the British Empire.

The magnitude of the telescope will make it a powerful instrument of research, and the major part of the programme of the observatory will be devoted to investigations into the motions and distribution of the stars. One evening per week however will be devoted to viewing the heavens when the public will be invited to visit the observatory and look at the planets, the moon and other objects in the sky.

---

Note: The illustrations, with the exception of Figs. 14 and 15, which are from photographs taken from the roof of the administration building of the observatory, are from photographs and drawings kindly supplied by the Sir Howard Grubb, Parsons and Company.

# Report of Council for the Year 1933

Observers of the course of events during 1933 appear to agree on one point, namely, that last spring saw the lowest level of the country's industry and commerce. Since then there has been a definite though comparatively small improvement in many branches of manufacturing activity and general business, extending over practically the whole of Canada. Unfortunately this has not as yet affected to any marked degree the industries in which engineering work is involved, nor has there been any appreciable increase in the employment of engineers. The construction industry in particular is still at a very low ebb, although there are some prospects of better conditions in 1934.

Thus 1933 has been a most difficult year for members of The Institute, and many have found it impossible to meet their annual fees. Your Council has thought it necessary to refrain from applying in full the provisions of the by-laws regarding arrears of fees, and has established a Non-Active List, on joining which, a member, while retaining a nominal connection with The Institute, ceases to incur further indebtness, and can on request resume active membership at any time without formal reinstatement. A considerable proportion of the drop in membership reported for this year is due to the establishment of this list, which is intended more particularly for those members who are unemployed.

The Institute's income, both from members' fees and from advertising in The Institute publications, has shown a marked decrease, and your Council has been faced with the necessity of adjusting expenditure to a falling revenue whose amount could not be predicted. As a result of this situation, although rigid economy has been practised and expenditures have been kept within the budget, the year's operations show a deficit. It is, however, a matter for some satisfaction that under these conditions the shrinkage in our active membership has not been greater, and that it has been possible to carry on the most essential services of The Institute to its members with but little disturbance.

The financial situation of The Institute, as shown by the report of the Finance committee, demands careful consideration, since it indicates that The Institute's reserves have had to be drawn upon. Your Council considers it essential to prevent the continuance of this condition, and is taking such measures as are possible to further limit expenditure and to promote the revenue from advertising. But to meet the difficulty, it is essential that all members who can possibly do so continue to support The Institute by regular payment of their annual fees. It will be appreciated that your Council's action in extending credit, and carrying a large number of members on the Non-Active List has been immediately reflected in decreased revenue from members' fees.

Your Council would also direct particular attention to the report of the Membership committee, which rightly stresses the necessity for increased activity as regards building up the membership, both on the part of branch executive committees and the membership of The Institute at large. At this time there are hundreds of our present members whose circumstances are such as to have compelled them to discontinue, temporarily at all events, their support of The Institute. On the other hand there are in all of our branch districts many qualified engineers who would be able to take part in The Institute's work with benefit to themselves and to The Institute, and have not yet done so. These possible members can only be brought in if present members who know them will render a service to The Institute by placing their names in the hands of their branch officers for the necessary action.

To aid the efforts of the branch membership committees, your Council has thought it advisable to make a temporary reduction of the entrance fee to $5.00 for all classes of Institute membership, a measure which will be submitted to the membership for confirmation at the Annual General Meeting.

From the report of The Institute's Committee on Unemployment,* it will be noted that while unemployment has been widespread among our membership, comparatively few cases of dire need have been reported, occurring principally in the larger centres, and these have been dealt with by voluntary contributions from the members of the branches chiefly affected. The number of our members now seeking employment shows a regrettable increase over 1932, but the situation has been greatly helped by the action of the Department of National Defence in making available for members of The Institute and of the Associations of Professional Engineers a considerable number of supervisory positions in connection with the Department's Relief Work Camps. In this connection The Institute is greatly indebted to the Minister of National Defence, the Minister of Labour, and to Major-General A. G. L. McNaughton, C.M.G., D.S.O., M.E.I.C., Chief of General Staff, who has carried out the Department's very effective programme.

The proposals of the Committee on Development and the discussions upon these formed the basis of the debates at the Sixth Plenary Meeting of Council which was held in October last. As a result of this meeting your Council has drafted a set of by-laws proposing such changes as seem desirable at this time, and these will be submitted for discussion at the Annual General Meeting. Council recognizes with gratitude that the contributions so freely granted from the funds of the various branches made it possible to hold the Plenary Meeting.

Should the proposed changes in the by-laws meet with approval and become effective, it is hoped that they will react favourably on The Institute's relations with the various Associations of Professional Engineers. The movement for the co-ordination of the activities of these several bodies is being dealt with by a Committee of Eight (the successor to the original Committee of Four), which is composed of representatives of the eight Provincial Associations, and is understood to be making definite progress in its task.

While it happens that every member of this committee is a corporate member of The Institute, the committee does not include any official representative of The Institute as a body. It will be remembered that in 1931 The Institute was requested to withdraw from the committee then functioning, in order to meet the views of one of the professional associations and secure the co-operation of that association in the committee's work. Your Council, however, still feels that the co-ordination movement is one in which The Institute has a very real concern, and remains willing to assist that movement in any possible way.

This attitude was clearly expressed in a resolution passed unanimously at the recent Plenary Meeting, to the effect that The Institute should "co-operate in every way possible with the Provincial Associations of Professional Engineers, particularly in endeavouring to secure a generally

*Printed in The Journal for December 1933, pp. 528-30.

acceptable system of registration of engineers in all parts of the Dominion."

Your Council has followed with interest the work of the National Construction Council of Canada, a body on which The Institute is represented by two of its members, and notes with pleasure that that Council has formulated what appears to be the most promising construction recovery scheme that has yet been put forward. The National Construction Council estimates that a general revival of construction activity on the part of private interests would make it possible to find direct and indirect employment for nearly half a million men, and that Council is accordingly endeavouring to obtain the assistance of the Dominion Government in making credits available at low interest rates for private construction.

The E-I-C Engineering Catalogue, the first issue of which appeared early in 1933, met with an encouraging reception, not only from the membership of The Institute, but also from the considerable number of industrialists and manufacturers to whom it was made available. The second and enlarged issue of that Catalogue is now in the press, and will be found of increased service to our members, besides bringing The Institute and its activities into closer relations with industry. It is intended to publish this Catalogue annually.

Your Council has noted with great appreciation the results of the President's visits to the twenty-five branches of The Institute, in developing a better understanding of The Institute's problems as a whole by our membership, and in familiarizing the members of each branch with the activities and points of view of the others. Journeys of this kind are most effective in promoting unity of sentiment and definiteness of aim in our widespread membership.

The Forty-Seventh Annual General and General Professional Meeting took place in Ottawa on the 7th and 8th of February, 1933, and fully maintained the reputation of the Ottawa Branch as organizers and hosts. The business sessions were of unusual interest, as they dealt with the proposals of the Committee on Development. After lengthy discussion, it was decided that the proposals for the amendment of by-laws to be submitted to the membership for acceptance should be discussed and prepared at a Plenary Meeting of Council to be held in Montreal as soon as possible. Active discussion on the unemployment situation as regards Institute members was also a feature of the meeting. At the Annual Dinner The Institute was honoured by the presence of the Governor-General and the Countess of Bessborough, and His Excellency delivered a felicitous address to the members and ladies present.

On July 13th, 14th and 15th, 1933, The Institute held a Maritime General Professional Meeting at White Point Beach, Queen's County, Nova Scotia, under the auspices of the Halifax Branch and with the active co-operation and support of the Nova Scotia Association of Professional Engineers. The Halifax members, on whom most of the organization work fell, are to be congratulated upon the success of the gathering. The officers of the Mersey Paper Company and those of the Nova Scotia Power Commission gave generous support throughout the meeting, which was noteworthy as being the first occasion on which a General Meeting of an association of professional engineers has been held conjointly with a Professional Meeting of The Institute.

### Roll of the Institute

During the year 1933, one hundred and twenty-eight candidates were elected to various grades in The Institute. These were classified as follows:—Three Members, twenty-two Associate Members, five Juniors, ninety-six Students, and two Affiliates. The elections during the year 1932 totalled two hundred and three candidates.

Transfers from one grade to another were as follows:— Associate Member to Member, seven; Junior to Associate Member, fifteen; Student to Associate Member, two; Student to Junior, nine; a total of thirty-three.

The names of those elected or transferred are published in The Journal each month immediately following the election.

### Removals from the Roll

There have been removed from the roll during the year 1933, for non-payment of dues and by resignation, twenty-nine Members, seventy-two Associate Members, twenty-nine Juniors, eighty Students, and eight Affiliates, a total of two hundred and eighteen.

Thirty-six reinstatements were effected and eleven Life Memberships were granted.

Two hundred and twenty-four names were placed on the Non-Active List; and one hundred and thirteen names on the 1932 Non-Active List were carried forward, making a total of three hundred and thirty-seven names on the Non-Active List.

### Deceased Members

During the year 1933 the deaths of thirty-three of The Institute's members have been reported as follows:—

#### Members

Browne, James Edward
Bucke, William A.
Butler, Matthew Joseph, C.M.G.
Caddy, Arthur E.
Davis, Allan Ross
Doucet, A. Emile
Grant, Alex. MacDonald
Hannaford, Robert Maitland
Higman, Ormond
Leahy, Maurice J.
Lindsay, William Bethune, C.B., C.M.G., D.S.O.
Mackenzie, Allan Campbell
Mullen, Charles Augustine
Selig, Alonzo Clarence
Warren, Philip Ridsdale, O.B.E.
Wilson, Robert M.

#### Associate Members

Armstrong, William Dun
Cameron, Charles Scott
Mackay, John Murray
Melling, H. T.
Peters, Joseph Dufferin
Robertson, John Donald
Scott, Henry Maurice
Spence, William Archibald
Spreckley, John Alfred
Sutherland, Angus Lynn
Wallace, David Gemmell
Waring, George Hart
Webb, Stanley Chipman
Weicker, Julius John
Yandall, Byron Angus

#### Junior

Marlatt, Victor Egerton

#### Student

MacMurray, John A.

### Total Membership

The membership of The Institute as at January 1st, 1933, totals four thousand and seventy. The corresponding number for 1932 was, four thousand, three hundred and sixty-nine. These figures do not include those members who have been placed on the Non-Active List.

| | 1932 | 1933 |
|---|---|---|
| Honorary Members | 9 | 9 |
| Members | 1,012 | 965 |
| Associate Members | 2,059 | 1,894 |
| Juniors | 401 | 346 |
| Students | 842 | 820 |
| Affiliates | 46 | 36 |
| | 4,369 | 4,070 |

Respectfully submitted on behalf of the Council,

O. O. Lefebvre, m.e.i.c., *President.*
R. J. Durley, m.e.i.c., *Secretary.*

### Finance Committee

The President and Council:—

Your committee respectfully submits herewith the auditors' report for the year 1933, which indicates that a deficit of over $3,700.00 has been incurred. Such an impairment of the assets of The Institute naturally leads to great anxiety on the part of your committee, and has warranted an exhaustive investigation as to its causes and even more so as to its future prevention.

At the beginning of the year it was realized that the revenues of The Institute would be very much reduced and accordingly a balanced budget was prepared based on a revenue and expenditure of $60,500.00 for the year 1933, as against $72,500.00 for the year 1932. This budget included provision for a Plenary Meeting of the Council, and for the usual activities to a large degree, but drastic economies were introduced by eliminating the publication of the E.I.C. News, reduction of library service, and for the third time a reduction in the salaries of the staff was put into effect. While expenditures have definitely been kept within the budget allowances, the revenues, especially from Members' fees and from Journal advertising, dropped off to an even greater extent than anticipated. During the first nine months of the year, however, there was every indication that losses from these sources would be counteracted from other sources; unfortunately, however, this anticipation did not materialize.

The following table gives a statement of the principal amounts in the budget and the actual amounts of the corresponding items of the revenues and expenditures of The Institute for the year 1933, also, for comparative purposes, the figures for the year 1932.

| | *1932* | *Budget for 1933* | *Actual Amount for 1933* | *Per cent of 1932* |
|---|---|---|---|---|
| Arrears of fees | $ 2,927.72 | $ 1,250.00 | $ 1,658.86 | 56 |
| Current fees including *Journal* subscriptions | 34,151.94 | 31,000.00 | 29,178.08 | 85 |
| *Journal* advertising | 18,930.84 | 12,000.00 | 10,863.65 | 63 |
| Catalogue advertising | 10,752.61 | 12,500.00 | 12,176.87 | 112 |
| Total revenue | 72,528.79 | 60,500.00 | 56,320.12 | 74 |
| *Journal* expense including salaries | 20,385.30 | 16,650.00 | 16,549.79 | 81 |
| Catalogue expense including salaries | 11,272.47 | 12,150.00 | 12,923.09 | 115 |
| Office expense including salaries | 16,416.95 | 15,550.00 | 13,924.94 | 85 |
| Total expenditure | 72,453.22 | 60,500.00 | 60,115.85 | 83 |

A diagram is also attached hereto giving in graphic form the major items of The Institute's revenues and total expenditures over the past ten years. It will be noted that revenues have dropped from over $80,000.00 to $56,000.00, (or if it had not been for the Catalogue, to $43,000.00), that is to say the revenue for 1933 was, on a comparable basis, only a little over one-half that of 1929 or 1930. The revenue from fees was well maintained

(*Continued on page 77*)

## STATEMENT OF ASSETS AND LIABILITIES AS AT 31st DECEMBER, 1933

### Assets

| | | |
|---|---|---|
| **Current:** | | |
| Cash on hand and in Savings Account | | $ 113.41 |
| Accounts receivable | $13,685.55 | |
| *Less:* Reserve for bad debts | 804.43 | |
| | | 12,881.12 |
| Arrears of fees—Estimated | | 2,500.00 |
| | | 15,494.53 |
| **Special Funds**—Per Statement attached: | | |
| Investments | 10,964.93 | |
| Cash in Savings Bank | 316.71 | |
| Due by Current Funds | 1,314.98 | |
| | | 12,596.62 |
| **Investments**—At cost: | | |
| $100 Dominion of Canada 4½%, 1946 | 96.50 | |
| $200 Dominion of Canada 4½%, 1958 | 180.00 | |
| $4,000 Dominion of Canada 4½%, 1959 | 4,090.71 | |
| $500 Province of Saskatchewan 5%, 1959 | 502.50 | |
| $1,000 Montreal Tramways 5% 1941 | 950.30 | |
| $2,000 Montreal Tramways 5%, 1955 | 2,199.00 | |
| $500 Title Guarantee and Trust Corp. Certificate | 500.00 | |
| 2 Shares Canada Permanent Mortgage Corp | 215.00 | |
| 40 shares Montreal Light, Heat & Power Cons. N.P.V. | 324.50 | |
| | | 9,058.51 |
| **Advances to Branches** | | 400.00 |
| **Deposit**—Postmaster | | 100.00 |
| Advance Travelling Expenses of staff | | 150.00 |
| **Prepaid Expenses:** | | |
| Stationery | 520.46 | |
| Stamps | 75.00 | |
| Unexpired insurance | 160.00 | |
| | | 755.46 |
| **Gold Medal** | | 45.00 |
| **Library** | | 1,787.81 |
| **Furniture**—Balance as at 1st January, 1933 | 4,886.39 | |
| Additions during the year | 32.62 | |
| | | 4,919.01 |
| **Land and Buildings** | | 89,041.64 |
| | | $134,348.58 |

### Liabilities

| | | | |
|---|---|---|---|
| **Current:** | | | |
| Bank Overdraft—Secured | | | $ 9,687.66 |
| Accounts Payable | | | 1,391.68 |
| Estimated cost of completing Catalogue | | | 7,400.00 |
| Rebates due to Branches | | | 589.22 |
| Amount due to Past Presidents' Fund | | | 1,314.98 |
| | | | 20,383.54 |
| **Special Funds:** | | | |
| Leonard Medal | | $ 613.25 | |
| Plummer Medal | | 606.85 | |
| Fund in aid of Members' families | | 2,045.44 | |
| Past Presidents and Prize Fund | | 5,308.53 | |
| War Memorial Fund | | 4,022.55 | |
| | | | 12,596.62 |
| **Surplus:** | | | |
| Balance as at 1st January, 1933 | | 105,764.15 | |
| *Deduct:* | | | |
| Excess of Expenditure over Revenue for the year ending 31st December, 1933 | $3,732.73 | | |
| 1932 Catalogue expenses paid in 1933 | 663.00 | | |
| | | $ 4,395.73 | |
| | | | $101,368.42 |
| | | | $134,348.58 |

Montreal, 16th January, 1934.

Audited and verified, subject to our report of this date.

*Chartered Accountants.*

## STATEMENT OF REVENUE AND EXPENDITURE FOR THE YEAR ENDING 31st DECEMBER, 1933

### Revenue

| | | |
|---|---|---|
| **Membership Fees:** | | |
| Arrears | $ 1,658.86 | |
| Current | 22,766.43 | |
| Advance | 309.44 | |
| Entrance | 807.00 | |
| | | $25,541.73 |
| **Publications:** | | |
| *Journal* subscriptions and sales | 6,411.65 | |
| *Journal* advertising | 10,863.65 | |
| *E-I-C News* advertising | 30.50 | |
| Catalogue advertising—Estimated | 12,176.87 | |
| | | 29,482.67 |
| **Income from Investments** | | 548.77 |
| **Refund of Expenses of Hall** | | 667.50 |
| **Sundry Revenue** | | 79.45 |
| **Excess of Expenditure over Revenue** For the year ending 31st December, 1933 | | 3,732.73 |
| | | $60,052.85 |

### Expenditure

| | | | |
|---|---|---|---|
| **Building Expenses:** | | | |
| Taxes—Property and Water | | $ 2,078.04 | |
| Fuel | | 484.15 | |
| Insurance | | 124.00 | |
| Light | | 278.62 | |
| Caretaker's wages and service | | 907.50 | |
| Repairs and expenses | | 1,079.65 | |
| | | | $4,951.96 |
| **Publications:** | | | |
| *Journal*—Salaries | $ 4,872.46 | | |
| Expenses | 11,677.33 | | |
| | | 16,549.79 | |
| *E-I-C News* Expense | | 112.97 | |
| Catalogue—Salaries | 4,345.20 | | |
| Expenses | 8,577.89 | | |
| | | 12,923.09 | |
| Sundry printing | | 215.45 | |
| | | | 29,801.30 |
| **Office Expenses:** | | | |
| Salaries—Secretary and staff | | 10,782.85 | |
| Postage and telegrams | | 1,252.56 | |
| Office supplies and stationery | | 981.08 | |
| Legal and audit fees | | 275.00 | |
| Telephone | | 321.60 | |
| Messenger and express | | 87.31 | |
| Miscellaneous | | 224.54 | |
| | | | 13,924.94 |
| **General Expenses:** | | | |
| Annual and Professional Meetings | | 1,915.85 | |
| Plenary Meeting of Council | $1,933.16 | | |
| *Less:* Collected from Branches | 805.95 | | |
| | | 1,127.21 | |
| Meetings of Council | | 210.31 | |
| Travelling—Secretary | | 122.16 | |
| Branch stationery | | 185.24 | |
| Students' Prizes | | 33.76 | |
| *E-I-C* Prizes | | 287.50 | |
| Library—Salaries | $595.10 | | |
| Expenses | 774.10 | | |
| | | 1,369.20 | |
| Interest, discount and exchange | | 124.71 | |
| Examination—Cost less amount collected | | 75.00 | |
| Papers' Committee | | 30.45 | |
| Committee on Development | | 170.59 | |
| Committee on Unemployment | | 146.55 | |
| National Construction Council | | 150.00 | |
| | | | 5,948.53 |
| **Rebates to Branches** | | | 5,426.12 |
| | | | $60,052.85 |

## SPECIAL FUNDS

| | | | Represented by: | | |
|---|---|---|---|---|---|
| ***Leonard Medal Fund:*** | | | | | |
| Balance as at 1st January, 1933 | $ 615.44 | | $500 Title Guarantee and Trust 6% 1933 Certificate | $ 500.00 | |
| *Add:* Bond interest | 30.00 | | Cash in Savings Bank | 113.25 | |
| Bank interest | 2.81 | | | | |
| | 648.25 | | | | |
| *Less:* Cost of Medal | 35.00 | | | | |
| | | $ 613.25 | | | $ 613.25 |
| ***Plummer Medal Fund:*** | | | | | |
| Balance as at 1st January, 1933 | 577.09 | | $500 Dominion of Canada 4½% 1959 Bonds | 500.00 | |
| *Add:* Bond interest | 27.50 | | Cash in Savings Bank | 106.85 | |
| Bank interest | 2.26 | | | | |

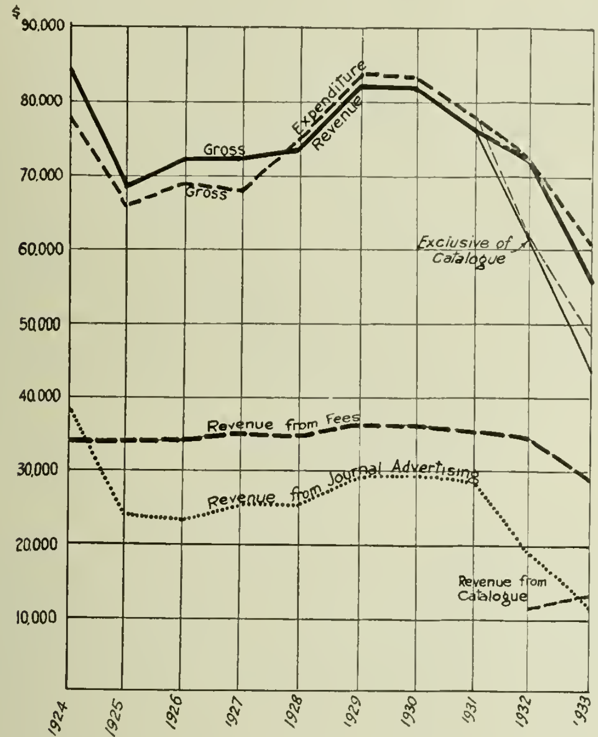
| *Less:* Interest on loan from Past Presidents' Fund | 6.25 | | | | |
| | | 4,022.55 | | | 4,022.55 |
| | | $12,596.62 | | | $12,596.62 |

### Finance Committee

(*Continued from page 75*)

until this last year. The Journal advertising revenue was well maintained until 1931, but dropped off to about one-third of normal in 1933.



The question naturally arises as to whether there are any of The Institute's activities which in themselves are a direct loss and which might have been dispensed with if it could have been foreseen at an earlier date that the revenues were going to be less than anticipated. It will be seen from the Financial Statement that the expenditure on The Journal has exceeded its receipts by over $5,000.00 (in this connection it must be borne in mind that the item "Journal subscriptions" is in reality a part of the membership fee) and that Annual and Professional Meetings and the Plenary Meeting are responsible for over $3,000.00 of expenditure. These are all essential activities of The Institute and probably there has been no time when it was more important that a Plenary Meeting of the Council should be held. The only way to have avoided the deficit (with the foresight of only $56,000.00 revenue) would have been to have made drastic inroads into the general activities of The Institute or to have reduced the staff or to have made still further reductions in salaries.

What of the future? In view of the change of management which takes place early in the year, it is only natural that a retiring Finance committee hesitates to take any drastic steps, and nearly one-third of the year has passed before a new Finance committee can take office and be in full operation. In view of the present conditions, however, your committee has already instituted some economies, but on the whole is of the opinion that a balanced budget can be presented and adhered to for the year 1934, and that subsequently it will be possible to build up a substantial surplus year by year.

In the past the revenues of The Institute fluctuated within quite narrow limits and it was comparatively simple to prepare a reasonable budget, but nevertheless, as the diagram indicates, it was apparently impossible to avoid deficits even in those years when revenues were comparatively stable. It would appear advisable in future that every budget contain a reasonable sum for "unknown contingencies."

In connection with the serious drop of revenue from fees it is to be noted that this is far greater than the actual drop in membership, and is a natural reaction of the times. Nevertheless, the problem as to the treatment of members who have not paid their fees is one of great difficulty. The best solution would appear to be a half way course between extreme leniency and a strict compliance with By-law requirements. It is hoped that the members will themselves do their part towards reducing the difficulty of this problem.

Your committee would like to take this opportunity of expressing appreciation of the action of the Branches in so generously defraying part of the cost of the Plenary Meeting of the Council, and one of the bright spots of the year has been the fact that the President has made a personal visit to every Branch of The Institute without expense to The Institute.

Respectfully submitted,

J. L. Busfield, m.e.i.c., *Chairman.*

### Nominating Committee, 1934

Appointments to the Nominating Committee for the year 1934 have been made by the various Branches, and the Chairman has been appointed by Council, as shown on the following list, which is now presented for announcement at the Annual Meeting in accordance with the By-laws:—

*Chairman:* H. W. B. Swabey, m.e.i.c.

| *Branch* | *Representative* |
|---|---|
| Cape Breton | R. R. Moffatt, a.m.e.i.c. |
| Halifax | J. B. Hayes, a.m.e.i.c. |
| Saint John | G. G. Murdoch, m.e.i.c. |
| Moncton | G. E. Smith, a.m.e.i.c. |
| Saguenay | N. F. McCaghey, a.m.e.i.c. |
| Quebec | P. Methe, a.m.e.i.c. |
| St. Maurice Valley | J. H. Fregeau, a.m.e.i.c. |
| Montreal | F. S. B. Heward, a.m.e.i.c. |
| Kingston | W. Casey, m.e.i.c. |
| Ottawa | F. H. Peters, m.e.i.c. |
| Peterborough | A. L. Killaly, a.m.e.i.c. |
| Toronto | J. J. Spence, a.m.e.i.c. |
| Hamilton | J. R. Dunbar, a.m.e.i.c. |
| London | F. C. Ball, a.m.e.i.c. |
| Niagara Peninsula | C. G. Moon, a.m.e.i.c. |
| Sault Ste Marie | C. Stenbol, m.e.i.c. |
| Lakehead | H. G. O'Leary, a.m.e.i.c. |
| Border Cities | W. J. Fletcher, a.m.e.i.c. |
| Winnipeg | T. C. Main, a.m.e.i.c. |
| Saskatchewan | L. A. Thornton, m.e.i.c. |
| Lethbridge | R. Livingstone, m.e.i.c. |
| Edmonton | R. J. Gibb, m.e.i.c. |
| Calgary | B. L. Thorne, m.e.i.c. |
| Vancouver | T. E. Price, a.m.e.i.c. |
| Victoria | H. F. Bourne, a.m.e.i.c. |

### Past-Presidents' Prize Committee

The President and Council:—

At a meeting held on May 26th, 1933, the Council of The Engineering Institute of Canada appointed the following—F. M. Gaudet, m.e.i.c., C. M. Goodrich, m.e.i.c., R. A. C. Henry, m.e.i.c., S. G. Porter, m.e.i.c., and Lesslie R. Thomson, m.e.i.c. (chairman) as members of the Past-Presidents' Prize Committee for the year 1933.

Immediately upon its constitution the committee laid out and agreed upon a method of work that would facilitate the task to be performed. This understanding included:—the giving to each essay of a pseudonym under which it would be marked, an agreement among all members of the committee that each would do his reading and judging without any consultation whatever with any other member of the committee, the knowledge of the key to the pseudonym to remain solely with Mr. Durley, the Secretary of The Institute, and several other points, all of which are available in the files of The Institute.

The closing date for reception of essays has normally been June 30th, but the Council extended the date this year until July 31st, 1933. As a result nine (9) essays were received and given to the committee for review.

As a result of its work your Committee is unanimous in putting the essay "Holborn" first in order of relative standing, and the committee recommends unanimously that in view of the merit and quality of the "Holborn" essay the Council of The Institute award the Past-Presidents' Prize for the year 1933 to the writer of the essay so identified.

Your committee also recommends unanimously that honourable mention be accorded to the writer of the essay identified "Oxford."

Respectfully submitted,

LESSLIE R. THOMSON, M.E.I.C., *Chairman.*

"Holborn"—Eric G. Adams, S.E.I.C., Cockfield Brown and Co. Ltd., Canada Cement Building, Montreal.

"Oxford"—C. G. Cline, A.M.E.I.C., Niagara Falls, Ont.

R. J. DURLEY, M.E.I.C., *Secretary.*

### Gzowski Medal Committee

To the President and Council:—

Your committee, having examined carefully all of the papers eligible for the Prize Year 1932-33, have decided to recommend that the Gzowski Medal be awarded to M. Eaton, A.M.E.I.C., for his paper on "Automatic Operation of Electric Boilers."

Respectfully submitted,

C. J. MACKENZIE, M.E.I.C., *Chairman.*

### Plummer Medal Committee

The President and Council:—

In the unanimous opinion of the committee, the award for this medal goes to A. G. Fleming, M.E.I.C., for his paper on "The Development of Special Portland Cements in Canada," which appeared in the May and June, 1933, issues of The Engineering Journal.

Respectfully submitted,

HAROLD J. ROAST, M.E.I.C., *Chairman.*

### Leonard Medal Committee

The President and Council:—

Your committee having studied all of the papers eligible for consideration for the award of the Leonard Medal for the prize year 1932-33, begs to recommend that the gold medal be awarded to:

C. H. Hitchcock for his paper on "Diamond Drilling Practice" published in the C.I.M.M. Bulletin, June 1933.

Respectfully submitted,

L. H. COLE, M.E.I.C., *Chairman.*

### Students' and Juniors' Prizes

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of The Institute were submitted to Council at its meeting on January 16th, 1934, and the following awards were made:—

*H. N. Ruttan Prize* (Western Provinces)—No award.

*John Galbraith Prize* (Province of Ontario)—To C. W. Crossland, S.E.I.C., for his paper on "The Rationalization of Load Factors for Aeroplane Wings."

*Phelps Johnson Prize* (Province of Quebec, English)—to L. A. Duchastel, Jr.E.I.C., for his paper on "The Rapide Blanc Development."

*Ernest Marceau Prize* (Province of Quebec, French)—To R. Boucher, S.E.I.C., for his paper on "Projet d'aménagement hydro-électrique."

*Martin Murphy Prize* (Maritime Provinces)—No papers received.

### Membership Committee

The President and Council:—

At the meeting of Council in February 1933 the question of membership in general came up for discussion and it was felt that increased attention should be given in all our Branches to encouraging eligible men to apply for membership or for transfer. Council realized that many engineers were finding it difficult to get along on reduced income, and that a considerable number were actually without employment. This situation has resulted in some resignations and many applications to be put on the Non-Active List. Yet the opinion was freely expressed that for these very reasons it was all the more necessary that real efforts be made to increase our membership, especially in view of the belief that there are many capable and qualified engineers in various centres who are not members of The Engineering Institute and would be quite willing to send in applications if suitably approached.

Council therefore appointed the following committee to encourage membership activities in all our Branches:—

A. Frigon, M.E.I.C.
F. S. B. Heward, A.M.E.I.C.
C. K. McLeod, A.M.E.I.C.
D. C. Tennant, M.E.I.C., *Chairman.*

In April last, a circular letter was sent out to all Branches drawing attention to the need for action as regards membership, and outlining the course which the committee proposed to take. Branches that had not appointed a sub-committee on membership were requested to select at least one member who would be willing to co-operate with The Institute's committee in all matters relating to membership within the branch territory.

Following this, in June, a circular was sent to all corporate members of The Institute, accompanied by a form which each member was invited to fill in with the names and qualifications of any engineers known to him who might be prospective members, or who, if members of The Institute, seemed eligible for transfer.

In response to this 274 names had been sent in to Headquarters up to October 16th. These have been checked and classified, as per the attached sheet, from which it appears that of the names sent in 203 had no previous connection with The Institute; 11 were already active members; 13 had previously applied for membership, but had not been admitted, and 47 had been members previously but had resigned or been removed from the list. Your committee feels that the list of 203 names is by no means representative of the number of eligible engineers in the country who do not belong to The Engineering Institute. After classification, the replies were sent back, on August 22nd, to the branches concerned, with a request that each branch authority, after investigation, should approach those it considered desirable as prospective candidates. We are now awaiting the results of this action.

In your committee's opinion the close attention of Council should be given to the present situation as regards membership. Very few applications for admission are being received. This situation is partly explainable by the existing economic situation, but is no doubt aggravated by the uncertainty as to changes which may be made in the conditions and qualifications for membership. It is in some cases difficult to approach prospective candidates unless the proposed changes in the constitution of The Institute are settled, and your committee would urge that a decision on these matters be arrived at at the earliest possible date, and, further, that whether the proposals of the Committee on Development are accepted by the membership or not, no further drastic changes in the conditions of membership should be proposed for at least five years.

Your committee would draw attention to the desirability of entering into closer relationship, if possible, with the undergraduate body in the engineering schools, before whom the advantages of joining The Institute should be definitely presented during their college course. The body of engineering students at the universities should form our principal recruiting ground, and it is recommended that the deans of the various schools be approached with a request (*a*) to arrange for the prominent display of announcements regarding The Institute and membership therein, (*b*) to permit at each college some one member of the university staff to be available to give information regarding The Institute and furnish forms of application for admission when requested, and (*c*) to arrange each year for the advantages of Institute membership to be explained in short addresses to the student body, preferably by recent engineering graduates.

Your committee considers that the recent action of Council in provisionally reducing the entrance fee for all classes of membership to five dollars will be of considerable assistance, particularly as this involves the temporary abolition of transfer fees, except from the class of Student to that of Junior.

Your committee does not agree with the opinion of those few members who consider that in view of unfavourable economic conditions no effort whatever should be made to attract members to The Institute. On the contrary, it is felt that a determined effort should now be made at all events to maintain The Institute's membership at its present figure of approximately 4,000. This figure does *not* include the members (over 300 in number) who have been placed on the Non-active List. Even in normal times our membership was subject to losses from deaths, resignations and removals for arrears, approximating 300 per annum.

Existing conditions are shown by the following figures covering the nine months January 1st to September 30th, 1933. The total membership on September 30th, 1933, was 4,059, *not* including 323 members then on the Non-active List. This shows a reduction of 310 since January 1st, made up as follows:—

| | | |
|---|---|---|
| Removals from List | 146 | |
| Resignations | 59 | |
| Deaths | 23 | |
| Placed on Non-Active List (Jan. 1st to Sept. 30th) | 201 | |
| | | 429 |
| Admissions (including 85 Students) | 107 | |
| Reinstatements | 12 | |
| | | 119 |
| Net loss | | 310 |

It is felt that these statistics clearly show the necessity for increased activity as regards new members.

Respectfully submitted,

D. C. Tennant, M.E.I.C., *Chairman.*

*Committee:*

A. Frigon, M.E.I.C.
F. S. B. Heward, A.M.E.I.C.
C. K. McLeod, A.M.E.I.C.
D. C. Tennant, M.E.I.C., *Chairman.*

Note by the Chairman:—

The above report was presented at the Plenary Meeting of Council on November 1st, 1933. It may be observed that the annual reports of the branches, received since then, make no mention of the results of the efforts of their membership committees, a fact which seems regrettable. Your committee had hoped that before the end of the year applications for admission would have been received through the branches from a considerable proportion of the 213 prospects whose names were originally sent in by individual members, checked over by headquarters, and returned to the branches for further action. Since September 1st, 1933, however, only twenty-five applications for admission have been received at headquarters, and some of these are apparently due to headquarters' efforts to assist the applicants in obtaining employment.

The action taken by Council in October in reducing the entrance fee to $5.00 for all classes of membership for a limited time has no doubt been helpful, but it is impossible as yet to say to what extent. Your committee would ask Council to bring the urgency of the situation again to the attention of all the branches, pointing out the necessity of placing the membership work of each branch in the hands of active and enthusiastic members.

D. C. Tennant, M.E.I.C., *Chairman,*
Membership Committee.

## Papers Committee

The President and Council:—

The personnel of the Papers committee remained the same this year as previously. Zone representatives formed contacts with members of Branch executives in charge of programme in their respective zones, and in a number of instances arranged exchanges of speakers between neighbouring branches. A number of requests from branches for assistance in arranging for speakers were dealt with.

Assistance and suggestions were requested and received from members of the committee in connection with the programme for the technical sessions of the Annual General Meeting.

Communications received from some of the smaller branches indicate increasing difficulties in developing satisfactory programmes for meetings, due to various causes, chief among which is the reduction in engineering and construction activity, and the consequent lack of papers on current projects. Assistance of considerable value could be given to branches if the committee was in a position to advise branches of impending visits to their locality of members who would be willing and in a position to address branch meetings. There is a field here in which the committee may act with advantage to branches by collecting and transmitting information of this type to those points at which it would be useful. Suggestions that assistance of this kind be given have been received from a number of branches. The committee would welcome the receipt of information from members that would assist it in complying with these requests.

Respectfully submitted,

J. J. Traill, M.E.I.C., *Chairman.*

## Publication Committee

The President and Council:—

Your Publication committee reports that, in view of the fact that a volume of Transactions will not be published this year, no papers have been submitted to it and, therefore, no meetings have been held.

Respectfully submitted,

Hector Cimon, M.E.I.C., *Chairman.*

## Library and House Committee

The President and Council:—

During the year every effort has been made to carry on the work of the library and information service although with reduced staff. The following particulars will indicate the extent to which our members have taken advantage of The Institute's facilities in this connection:—

| | |
|---|---|
| Requests for information | 661 |
| Requests for text books, periodicals, reprints, etc | 495 |
| Technical books borrowed | 103 |
| Bibliographies compiled | 36 |
| Accessions to library | 642 |
| Requests for photoprints | 33 |
| Total pages of photoprints | 173 |

The following books were presented to the library by Professor R. W. Angus, M.E.I.C.:—

Elements of Engineering Thermodynamics, by J. A. Moyer, J. P. Calderwood and A. A. Potter. Wiley.
Evaporating, Condensing and Cooling Apparatus, by E. Hausbrand. Van Nostrand.
Heat Transmission, by W. H. McAdams. McGraw-Hill.
Air Conditioning, by J. A. Moyer and R. U. Fittz. McGraw-Hill.

The following book was presented to the library by Professor T. R. Loudon, M.E.I.C.:—

Unemployment and Relief in Ontario, 1929-1932. A Survey and Report by H. M. Cassidy, B.A., Ph.D., under the Auspices of the Unemployment Research Committee of Ontario. J. M. Dent and Sons Ltd.

Nineteen recently-issued technical works have been sent in by publishers for review in The Engineering Journal. Very few technical books have been purchased, the library appropriation having been barely sufficient to cover the technical periodicals necessary to maintain the completeness of our files.

It will be noted that the enquiries for information show about 30 per cent increase over last year.

Certain work necessary for the repair and maintenance of the headquarters building has been carried out during the year. This has included the renewal of the grates and sundry equipment in connection with the heating installation, repairs to the roof and outside iron work, flashing, etc., and the renewal of some of the exterior woodwork. The necessary repairs, pointing, etc., of the exterior brickwork and masonry have also been executed. The expenditure in connection with the above was approximately $500.

Respectfully submitted,
D. C. Tennant, M.E.I.C., *Chairman.*

## Report of the E.I.C. Members of the Main Committee of the Canadian Engineering Standards Association

The President and Council:—

The Institute nominees on the Main Committee of the Canadian Engineering Standards Association are now as follows:—

P. L. Pratley, M.E.I.C., retires March, 1934.

Dean C. M. Mackenzie, M.E.I.C., retires March, 1935.

J. Morrow Oxley, M.E.I.C., retires March, 1936.

Three new committees have been formed during the year, dealing with Oil Circuit Breakers, Enamelled Magnet Wire, and a safety code covering the construction, installation and operation of Oil Burners.

The prevailing industrial conditions have seriously affected the income of the Association. There have been fifteen resignations from sustaining membership, and eight sustaining members felt compelled to reduce their subscription. It is gratifying, however, to report that this was offset to a certain extent by the addition of eleven new sustaining members during the year. Sustaining memberships at present number sixty-three, and the total amount received from membership fees will be $5,250, which is a decrease of $545 from 1932.

The headquarters of the Association have been moved to Room 3064, National Research Building, Ottawa, where quarters have been provided by the National Research Council, and this saving in rent, together with the cut in staff salaries which has been continued, enabled the Association to carry on for the year.

The Secretary had the privilege of addressing the annual meeting of the Electrical Contractors' Association in Kingston and had an opportunity of explaining the situation with regard to the Canadian Electrical Code, particularly the question of approval of electrical apparatus. The Secretary also attended the annual meetings of The Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy, the Dominion Fire Prevention Association, the Chambers of Commerce, and the Canadian Manufacturers Association.

An effort is being made to carry out the resolutions which were made at the Imperial Conference in 1932, and at the present time a comparison between British and Canadian specifications is being made and a special Joint Panel on Structural Steel has been organized to prepare Canadian specifications for steel with the object of securing greater uniformity in different parts of the Empire.

The publication of the C.E.S.A. Bulletin has been continued and results have amply justified its publication. No Year Book, however, has been published for 1932 owing to the lack of necessary funds.

### Work in Progress

#### A — Civil Engineering and Construction

*Building Materials.*—The Panel on Brick Sizes has prepared a preliminary report based on the results of the questionnaire which was circulated throughout the Dominion. This report will shortly be presented to the Committee on Building Materials. The replies to the questionnaire indicated a majority opinion in favour of standardization and the Panel will recommend that one size of brick be used for all purposes, but it is expected that the size will be somewhat larger than the size recommended in 1927.

In connection with building codes, several members of the Association are acting on a special committee in connection with the building code for the City of Toronto, and it is understood that recognition will be given to existing C.E.S.A. standard specifications.

Referring to standard contract forms which have been jointly adopted by the Canadian Construction Association and the Royal Architectural Institute of Canada, the results of the discussion by the Sectional Committee of Civil Engineering and Construction indicated considerable difference of opinion. This matter was finally discussed at a meeting of the Main Committee of the Association, held in Ottawa in May, 1933, and as a result it has been decided that the Association will not take any action in endorsing this contract form at present, the belief being that this is somewhat outside the field of the Association's work, particularly on account of the legal questions involved. It is possible that this may be reconsidered at some future time, however.

#### B — Mechanical Engineering

*Screw products.*—The standard for Binder Head Screws has been issued as B 35–1933; after considerable negotiations agreement was obtained on one design of screw and four different sizes, two of them making provision for alternative diameters of head. It is believed that this standard will effect a great improvement in the situation which has hitherto existed and that this standard will be almost universally used.

The standard for Machine, Carriage and Plough Bolts is still held up waiting for up-to-date information, as there has recently been a change in the manufacturing situation.

Panels have now been organized to deal with standards for Wood Screws and Small Rivets, but a start will not be made until up-to-date data has been obtained.

*Safety Code for Passenger and Freight Elevators.*—The committee held their first meeting during the year, and a draft code was sent out for comment. A summary of the comments received has been prepared and sent out to the members of the committee and it is hoped to have a second meeting shortly. Present indications are that this code will be very acceptable to the different authorities throughout the Dominion.

*Safety Code for Mechanical Refrigeration.*—A committee is now being organized to prepare this safety code, and it is planned to study particularly questions involving health in the use of this equipment. The co-operation of provincial governments, and insurance, manufacturing and public health organizations is being solicited.

*Oil Burners.*—A committee has been organized to prepare Dominion regulations on which tests can be made. The laboratories of the National Research Council are now equipped to make these tests and the laboratory staff is co-operating in the preparation of these regulations. It is proposed at the present time to cover only two types—atmospheric or gravity feed type, and the automatic or power-operated type. A draft covering definitions and construction of oil burners of the atmospheric type has been prepared and is now out for comment.

C — Electrical Work

*Canadian Electrical Code.*—During the year a provincial code committee has been organized in the province of Prince Edward Island, so that nine of these committees are now in operation. The third edition of the Code is still under consideration and every effort will be made to have it issued during 1934, as there seems to be a general demand for this new edition.

In connection with Part II of the Code, the specifications for Portable Electric Displays and Incandescent Lamp Signs and Electric Floor Surfacing and Cleaning Machines have been issued, and specifications for Electric Clocks and Electric Fixtures are now in the press. Specifications for Service-entrance and Branch Circuit Breakers, Fractional Horsepower Motors, and Electric Portable Lighting Devices will shortly be in the press. The draft specification for Enclosed Switches has been revised and discussed at a meeting of the Panel on Specifications, and a complete revised draft has been sent out for comment. Meetings of the Panel on Specifications have been held to discuss the specifications for Capacitors (Electrical Condensers), Transformers for Luminous-tube Signs and Oil-burner Ignition Equipment, Industrial Control Equipment, Electric Heating Pads, Insulated Conductors for Power-operated Radio Devices, Cable for Luminous-tube Signs and Oil-burner Ignition Equipment, Outlet Boxes, Soldering Lugs, and Motor-operated Blowers and Stokers, and revised editions of these draft specifications have been sent out for comment. Specifications for Cord Sets and for Gasoline Measuring and Discharge Devices have been prepared and sent out for comment and will shortly be discussed at a meeting of the Panel. A draft specification for Oil Circuit Breakers has also been prepared and sent out for comment and this will be considered also by a special committee on Oil Circuit Breakers.

In connection with both Parts I and II of the Code, the Association has inaugurated a system of bulletins to electrical manufacturers, in which information is given on proposed changes in Code rules or in laboratory requirements. Five of these bulletins have been issued to date.

With reference to Part III of the Code, the only progress which has been made is in connection with the work of Sub-panel No. 3 on Inductive Co-ordination, but the draft covering Principles and Definitions in connection with Radio Interference has not yet been finally approved. In connection with the work of Sub-panel No. 1, Overhead Systems, a special report from the railway group has been sent out for comment, and it is hoped to incorporate this report in the general report from the Sub-panel, but it has proved exceedingly difficult to make rapid progress in this work.

*Watthour Meters.*—The revised specification for a.c. watthour meters and the new specification for demand meters is now before the committee for letter ballot, but there are still some points on which approval has not been obtained. It is believed that these specifications will not conflict with regulations of the National Research Council covering approval of type.

*Enamelled Magnet Wire.*—A committee has been organized to discuss specifications for enamelled magnet wire, and one meeting has been held at which a draft specification was presented. This is now out for comment.

*Insulated Power Cable.*—The draft covering paper-insulated lead-covered cable is before the committee for comment, this specification having been prepared by a special panel of the committee.

G — Ferrous Metals

*Heavy Steel Shaft Forgings.*—The first meeting of this committee has now been held and a draft specification has been prepared and sent out to the members of the committee for comment.

As previously recorded, a special Joint Panel of the Committees on Steel Highway Bridges, Steel Railway Bridges, and Steel Structures for Buildings, has been organized to prepare material specifications, and an endeavour will be made to recognize up-to-date practice and to secure as much uniformity as possible with present Empire standards.

Co-operation and Publicity

A very close contact has been maintained with the electrical committees of the British Standards Institution, in connection with the work on approval specifications under Part II of the Canadian Electrical Code. Draft copies of the different specifications have been sent for comment and the comments which have been received have been very helpful. Drafts have also been submitted to the Underwriters' Laboratories at Chicago, and to the National Electrical Manufacturers Association at New York, and comments from these sources have also been very helpful.

The technical press and newspapers have been very generous in giving publicity to the work of the Association, particularly to the announcement of new publications.

The sale of publications has been most encouraging and there is every evidence that the interest in the work of the Association is increasing.

Regular exchange of publications with the different national standardizing bodies has been continued. This applies particularly to the British Standards Institution, the Standards Association of Australia, and the South African Branch of the British Standards Institution. It is announced that the South African Branch of the B.S.I. is considering the establishment of a South African Standards Institution.

Respectfully submitted,

P. L. Pratley, m.e.i.c., *Chairman.*

## Committee on Biographies

The President and Council:—

The Committee on Biographies submitted a policy and method of procedure to the Plenary Meeting of Council in September 1931 which was designed to produce consistent and effective results in the future; the policy was approved but qualified with reference to the matter of financial expense. During 1933 the financial restriction made it possible to publish only one biography—that of the late E. H. Keating.

It is observed that a sister society on the same continent has for many years printed in their Transactions very carefully prepared memoirs of deceased members; consulting one annual volume pulled at random from the shelf it was found to contain sixty-two memoirs occupying one hundred and thirty-four pages of rather small type. Engineers are perhaps traditionally rather careless of the amenities of life but your committee is inclined to feel that many Canadian engineers would be appreciative if their Journal gave a little more attention to those who made their mark in the engineering world but are now no longer with us. Your committee hopes that in future annual budgets of The Institute the work of preparing and printing suitable biographies will receive its quota and thus be given some status as one of the activities which The Institute intends to maintain on some permanent and suitable basis.

Respectfully submitted,

F. H. Peters, M.E.I.C., *Chairman.*

### Honour Roll and War Trophies Committees

The President and Council:—

During 1933 efforts have been continued looking to the completion of the checking and confirmation of the names, approximately one thousand in number, to be inscribed on the bronze tablet or Honour Roll recording the names of those who served. Final particulars are still lacking regarding a very few cases, details regarding which have been very difficult to verify, but it is hoped that it will soon be possible to place the contract for the large tablet.

Respectfully submitted,

C. J. Armstrong, M.E.I.C., *Chairman.*

### Board of Examiners and Education

The President and Council:—

The results of the examinations held during 1933 for admission to The Institute are as follows:—

| *Description* | *No. of Candidates* | *No. of Papers Written* | *No. of Papers Passed* | *Failed* | *No. of Candidates Completely Passed* |
|---|---|---|---|---|---|
| Examined under Schedule "A" (Student) | 1 | 5 | 2 | 3 | 0 |
| Examined under Schedule "B" (Junior) | 5 | 10 | 6 | 4 | 2 |
| Examined under Schedule "C" (Associate Member)— | | | | | |
| Electrical Engineering | 1 | 2 | 2 | .. | 1 |
| Mechanical Engineering | 1 | 2 | 2 | .. | 1 |
| Structural Engineering | 1 | 2 | 2 | .. | 1 |
| Totals | 9 | 21 | 14 | 7 | 5 |

It is to be noted that under Schedule "C" for Associate Membership all of the candidates presented papers that passed the standards set by The Institute.

In Schedules "A" and "B" classes for Students and Juniors the papers indicate a failure on the part of the candidates in the fundamental ground work necessary for a training in the subjects written. The number of text books prescribed by The Institute for study under the different subjects is unusually large and we would suggest to the Council the advisability of confining the necessary studies to be made by the candidates to a smaller number of text books.

For the last two years your Board has had under consideration the question of admitting graduates from the Royal Military College without further examination and the majority of the Board has advised that the Royal Military College should be recognized as a "School of Engineering recognized by the Council" as mentioned in Section 8 of The Institute By-laws. We understand that this recommendation has been accepted by the Council.

Respectfully submitted,

William Gore, M.E.I.C., *Chairman.*

### Unemployment Committee

The President and Council:—

As the report of this committee as submitted to the Plenary Meeting of Council was printed in full in the December issue of The Engineering Journal, it is not thought necessary to reproduce it. It may be noted, however, that since that time the appointments of ten more engineers to the Supervisory Staffs of the Department of National Defence Unemployment Relief Projects have been authorized, six of these being in connection with the new camps in New Brunswick. This brings the total of Engineer Relief appointments to 143. Attention is drawn to the paper by Major G. R. Turner, M.C., D.C.M., A.M.E.I.C., entitled "Unemployment Relief Projects," which appears in the February issue of The Journal, and describes the work of the Department of National Defence, in connection with these camps.

Respectfully submitted,

D. C. Tennant, M.E.I.C., *Chairman.*

### Employment Service Bureau

The President and Council:—

During the past year it has again been found exceedingly difficult to locate vacancies or opportunities for employment for our members. Very few enquiries have been received from employers for engineers.

Many of those registered with our Employment Service Bureau comprise civil and electrical engineers, while the demand has been chiefly for those with sales, mechanical, chemical and mining experience. It has therefore been necessary for a large proportion of our unemployed members to attempt to obtain employment in other fields, which unfortunately seems to have proved exceedingly difficult.

Again, many of the positions of which we received notification were difficult to fill, as employers were often exacting and generally some unusual qualifications or experience were required.

The number of members now registered with our Employment Service Bureau is 378; of this number, however, some sixty or seventy are known to be in temporary positions.

While it has only been possible to fill a relatively small number of positions during the past year, it is encouraging to find that a larger proportion of the positions filled have been of a permanent nature than during the past two or three years.

From our correspondence with the Branch Unemployment Committees and individual members it would still appear that a considerable number of members have not thought it desirable to register with our Employment Service Bureau. This is very regrettable, as on a number of occasions we have found it necessary to advise employers that we did not have anyone registered with the necessary experience.

The Institute has again been able to supply a limited amount of work to members of The Institute, in connection with the E-I-C Catalogue and mailing of circulars.

The following figures show the extent of the Bureau's work for 1933:—

| | *1933* | *1932* |
|---|---|---|
| Number of registrations during year—Members | 138 | 166 |
| Number of registrations during year—Non-Members | 46 | 18 |
| Number of members advertising for positions | 102 | 132 |
| Replies received from employers | 21 | 34 |
| Vacant positions registered | 92 | 117 |
| Vacancies advertised | 4 | 18 |
| Replies received to advertised vacancies | 16 | 162 |
| Men notified of vacancies | 147 | 143 |
| Men's records forwarded to prospective employers | 210 | 219 |
| Placements — temporary and permanent — definitely known | 50 | 58 |

The above figures do not include the placements on the Supervisory Staffs of the Department of National Defence Unemployment Relief Projects, in which the Employment Service Bureau worked in conjunction with the Branch Unemployment Committees.

Respectfully submitted,

R. J. Durley, M.E.I.C., *Secretary.*

---

# Branch Reports

## Border Cities Branch

The President and Council:—

The work of the Border Cities Branch has been carried on during 1933 by the following committees:

| | |
|---|---|
| Papers and Entertainment | E. M. Krebser, A.M.E.I.C., Chairman. |
| | H. J. Coulter, Jr.E.I.C. |
| | W. A. Dawson, A.M.E.I.C. |
| | T. H. Jenkins, A.M.E.I.C. |
| Reception | H. J. A. Chambers, A.M.E.I.C. |
| Membership | W. A. Dawson, A.M.E.I.C., Chairman. |
| | D. T. Alexander, M.E.I.C. |
| | C. F. Davison, A.M.E.I.C. |
| | T. H. Jenkins, A.M.E.I.C. |
| Publicity | R. C. Leslie, A.M.E.I.C. |
| Representative on the Directorate of the Border Chamber of Commerce | C. G. R. Armstrong, A.M.E.I.C. |
| Institute Nominating Committee | W. J. Fletcher, A.M.E.I.C. |
| Unemployment Committee | A. E. West, M.E.I.C., Chairman. |
| | A. J. M. Bowman, A.M.E.I.C. |
| | J. E. Porter, A.M.E.I.C. |

Meetings

The Executive committee met eight times during the year to deal with the various questions which arose. The Unemployment committee met three times to deal with the problems which related to unemployment.

Including the Annual Meeting, eight regular meetings have been held, and one special meeting held to visit the site of the Livingstone Channel project.

The following is a list of the meetings held together with a note on the subject, speaker, and attendance.

Jan. 13.—**Life and Conditions in Soviet Russia** by John Banks, erection engineer for the Palmer-Bee Co., Detroit. Attendance, 26.

Feb. 10.—**Station CKOK** by W. J. Carter, chief engineer of Station CKOK. A tour of the station was also made. Attendance, 21.

Mar. 7.—**Technocracy** by C. M. Goodrich, M.E.I.C., chief engineer of the Canadian Bridge Co., Walkerville. Attendance, 33.

April 21.—**Conditions and Developments in the Near East and the Orient** by Colonel John W. Warden, O.B.E., D.S.O. Attendance, 18.

May 19.—**The Livingstone Channel Project** by Messrs. G. A. Dixon and K. Heagy of the U.S. Engineers Office, Great Lakes District. Attendance, 26.

May 27.—**Visit to the Livingstone Channel Project.**

Oct. 13.—**Safety Engineering and Personnel Management** by G. A. Kuechenmeister, of the Dominion Forge and Stamping Co., Walkerville. Attendance, 18.

Nov. 9.—**Institute Affairs.** Visit of Dr. O. O. Lefebvre, M.E.I.C., President of The Engineering Institute of Canada. Attendance, 22.

Dec. 1.—**Annual Meeting,** Election of Officers, and Joint Meeting with The Association of Professional Engineers of Ontario. Speaker, A. B. Lambe, A.M.E.I.C., President of the Association of Professional Engineers of Ontario. Attendance, 26.

Average attendance per meeting, 26.

Average attendances for other years:—

| *1928* | *1929* | *1930* | *1932* |
|---|---|---|---|
| 38 | 34 | 28 | 25 |

Membership

Status of membership, December 31st, 1933:—

| | *Resident* | *Non-Resident* | *Total* |
|---|---|---|---|
| Members | 15 | 2 | 17 |
| Associates | 25 | 9 | 34 |
| Juniors | 2 | 3 | 5 |
| Students | 7 | 4 | 11 |
| Affiliates | 1 | .. | 1 |
| Total | 50 | 18 | 68 |

A comparison of our status of membership for other years is shown in the following table:—

| | *1930* | *1931* | *1932* | *1933* |
|---|---|---|---|---|
| Members | 23 | 24 | 21 | 17 |
| Associates | 50 | 53 | 42 | 34 |
| Juniors | 12 | 12 | 8 | 5 |
| Students | 16 | 15 | 11 | 11 |
| Affiliates | 1 | 1 | 1 | 1 |
| | 103 | 105 | 83 | 68 |

Financial Statement
(For the year ending December 31st, 1933)

| *Receipts* | | |
|---|---|---|
| Cash on hand—January 1st, 1933 | $177.97 | |
| Rebates to December, 1933 | 124.20 | |
| Rebates for December, 1933 | 10.35 | |
| Branch News | 2.87 | |
| Dinner receipts | 70.20 | |
| Unemployment Committee Fund | 6.00 | |
| | | $391.59 |

| *Expenditures* | | |
|---|---|---|
| Printing | $ 47.52 | |
| Stamps and telegrams | 9.09 | |
| Speaker's expenses | 22.10 | |
| Dinners | 95.05 | |
| Telephone | 2.40 | |
| Miscellaneous | 16.35 | |
| Unemployment Committee Fund | 35.00 | |
| Advance to Plenary Meeting Fund | 15.60 | |
| Balance in bank | 138.13 | |
| Accounts receivable | 10.35 | |
| | | $391.59 |

Respectfully submitted,

R. C. Leslie, A.M.E.I.C., *Chairman.*

T. H. Jenkins, A.M.E.I.C., *Secretary-Treasurer.*

## Calgary Branch

The President and Council:—

On behalf of the Executive committee, Calgary Branch, we beg to submit the following report of our activities for the calendar year 1933:—

Membership

| | *Dec. 31st, 1933* | | |
|---|---|---|---|
| | *Resident* | *Non-Resident* | *Total* |
| Members | 16 | 7 | 23 |
| Associate Members | 45 | 11 | 56 |
| Juniors | 9 | 2 | 11 |
| Students | 1 | 3 | 4 |
| Branch Affiliates | 14 | 1 | 15 |
| | 85 | 24 | 109 |

During the year our Branch and The Institute have lost three valuable members through the passing on of J. A. Spreckley, A.M.E.I.C., Major C. C. Richards, and W. D. Armstrong, A.M.E.I.C.

The Executive met twelve times during the year to discuss and dispose of the various items transacted.

Owing to various reasons our executive decided to postpone the annual ball, and instead a supper dance and bridge was held for members, and a limited number of friends, in the Renfrew Club. This proved a very successful function, and requests have been made for similar entertainment in the near future.

A joint dinner is being arranged, and sponsored by our Branch, with the Association of Professional Engineers of Alberta and the Canadian Institute of Mining and Metallurgy, at the Renfrew Club, February 10th, 1934.

Students and Juniors of the Calgary Branch, Students now in Alberta University, and others residing in the Branch district who have graduated from any university within the last two years, have been invited to compete for a prize of twenty dollars ($20.00) given by the Branch. The rules governing the award of the prize are as follows:

1. The award shall only be made if, in the opinion of the examiners, a paper of sufficient merit has been presented.
2. The papers must be the bona-fide productions of those contributing them and must not have been previously made public or contributed to any other Society in whole or in part.
3. Notice of intention to compete and the subject of the paper must be in the hands of the Secretary not later than December 1st.
4. The papers submitted will be judged by a special committee appointed by the Branch executive.

The same papers presented by Students and Junior members of The Institute will be eligible to compete for The Institute prize.

Fourteen general meetings were held during the year, with fair attendance at each. The following are the dates and subjects presented:—

Jan. 12.—**The Manufacture of Steel** by L. R. Brereton, A.M.E.I.C., metallurgist for the Dominion Bridge Co. Attendance, 25.
Jan. 26.—**The Manufacture of Portland Cement** by the late W. D. Armstrong, A.M.E.I.C. Attendance, 35.
Feb. 9.—**Forestry** by Mr. H. G. Reynolds. Attendance, 40.
Feb. 23.—**Getting Out a Modern Newspaper** by Mr. C. A. Hayden. Attendance, 25.
Mar. 11.—Annual Meeting and Election of Officers. Attendance, 15.
April 17.—Dinner at Renfrew Club to welcome the President of The Institute, Dr. O. O. Lefebvre, M.E.I.C. Attendance, 37.
April 28.—**Protection of Inductive Windings Against Lightning** by A. B. Cooper, M.E.I.C. Attendance, 58.
Sept. 2.—**Annual Field Day and Golf Tournament.**
Oct. 12.—**Television** by Mr. Alick Mitchell. Attendance, 130.
Oct. 26.—**Methods of Handling Earth Fill Material With Special Reference to Levee Construction on the Mississippi River** by Mr. J. K. Mackenzie. Attendance, 52.
Nov. 9.—**Industrial Electron Tubes** by Mr. P. F. Peel. Attendance, 84.
Nov. 23.—**Arctic Patrol** (four reels) and **Forest Fighters of the Skies** (two reels) with reminiscences of the Yukon, by the Ven. Archdeacon Swanson. Attendance, 108.
Dec. 1.—Dance and Bridge, Renfrew Club. Attendance, 72.
Dec. 14.—**Reminiscences of Experiences in Africa South of the Equator** with films of wild life in Africa, **A Trip Through Egypt, and Big Game in India** by P. J. Jennings, M.E.I.C. Attendance, 67.

FINANCIAL STATEMENT
(Year ending December 31st, 1933)

| | | |
|---|---|---|
| *Receipts* | | |
| Value of bonds | $989.66 | |
| Dues collected from Affiliates | 33.00 | |
| Interest and savings | 135.87 | |
| Rebates | 171.36 | |
| | | $1,329.89 |
| *Liabilities* | | |
| Net value of assets—Bonds | $989.66 | |
| Cash in bank | 111.38 | |
| Expenditures, net | 228.85 | |
| | | $1,329.89 |

Respectfully submitted,
H. J. McLean, *Chairman.*
John Dow, *Secretary-Treasurer.*

## Cape Breton Branch

The President and Council:—

The annual report of the Cape Breton Branch is as under:—

During the year the Branch held six meetings as follows:—

1932
Dec. 15.—Annual Meeting at which a paper on **The Significance of the Washability Curves in Coal Washing** was read by Mr. J. L. Bowlby.

1933
Jan. 12.—**The Mystery of Oak Island, N.S.** by M. R. Chappel, Affil.E.I.C.
Feb. 23.—**The Development of the Modern Motor Car** by Mr. T. H. Morris.
Mar. 25.—Joint Meeting at which Professor G. V. Douglas, A.M.E.I.C., lectured on **Shackleton's Antarctic Expeditions.**
May 30.—**Some Recent Developments in the Telephone Business** by Mr. J. I. Marshall.
Oct. 26.—Luncheon Meeting addressed by President O. O. Lefebvre, M.E.I.C., who spoke on **Institute Affairs.**

The average attendance at the above meetings (not including that of March 25th, which was public) was 23, and a lively discussion always followed the reading of the paper.

The Branch has suffered a slight loss in membership but it is hoped that this will be recovered during the next year.

We are pleased to announce that we have secured speakers for each month of the winter season.

FINANCIAL STATEMENT

| | | |
|---|---|---|
| *Receipts* | | |
| Balance brought forward | $227.65 | |
| Rebates | 77.70 | |
| Tickets to meeting | 5.50 | |
| | | $310.85 |
| *Expenditures* | | |
| Printing | $ 2.00 | |
| Meetings | 13.45 | |

## Edmonton Branch

The President and Council:—

On behalf of the Executive committee of the Edmonton Branch we beg to submit the following report for the year 1933.

MEMBERSHIP

| | Dec. 31, 1932 Resident | Non-Resident |
|---|---|---|
| Members | 13 | 2 |
| Associate Members | 26 | 7 |
| Junior Members | 4 | .. |
| Student Members | 27 | .. |
| | 70 | 9 |

| | Dec. 31, 1933 Resident | Non-Resident |
|---|---|---|
| Members | 11 | 2 |
| Associate Members | 23 | 6 |
| Junior Members | 3 | .. |
| Student Members | 33 | .. |
| | 70 | 8 |

MEETINGS

The following meetings of the Branch were held during the year:—

Jan. 16.—**Fractures** by Professor I. F. Morrison, Professor of Applied Mechanics, University of Alberta. Attendance, 24.
Feb. 12.—**System Load Apportionment and Supply** by H. J. McLean, A.M.E.I.C., production superintendent of the Calgary Power Co. Attendance, 52.
April 4.—**The Present World Depression and the Way Out** by Dr. Einer Jensen, of the Department of Political Economy, University of Alberta. Attendance, 26.
April 8.—Dr. O. O. Lefebvre, M.E.I.C., addressed the meeting on the affairs of The Institute. Attendance, 27.
Oct. 25.—**David Thompson** by Professor N. C. Pitcher, Professor of Mining Engineering at the University of Alberta. Attendance, 24.
Nov. 21.—The programme consisted of the following items:—
**Northern Culture**—a short address by Dr. R. C. Wallace President of the University of Alberta.
**The Arctic Patrol**—a four reel film.
**Forest Fighters of the Skies**—a two reel film. Attendance, 40.

Four meetings of the Executive committee were held to deal with special questions which arose.

FINANCIAL STATEMENT

| | | |
|---|---|---|
| *Receipts* | | |
| Balance on hand, January 1st, 1933 | $271.26 | |
| Rebates from Headquarters | 90.15 | |
| Rebates due from Headquarters, December 30th | 11.40 | |
| | | $372.81 |

*Expenditures*

| Honorarium to Secretary-Treasurer | 50.00 | |
| Miscellaneous—telegrams and exchange | 1.95 | |
| Balance on hand, December 31st, 1933 | 197.55 | |
| | | $372.81 |

Special Unemployment Relief Fund

| | |
|---|---|
| Receipts | $ 20.00 |
| Expenditures | 20.00 |

Respectfully submitted,
Robert M. Dingwall, a.m.e.i.c., *Chairman.*
R. M. Hardy, s.e.i.c., *Secretary-Treasurer.*

## Halifax Branch

The President and Council:—

On behalf of the Chairman and Executive committee, the following report on the activities of the Branch for the past year—1933—is submitted.

Including the Annual Meeting there have been seven regular meetings and eight meetings of the Executive. The following is a summary of the meetings held:

January.—Annual Banquet held in conjunction with the Nova Scotia Association of Professional Engineers.

February.—Report on Plenary Meeting of Council by Professor F. R. Faulkner, m.e.i.c. Paper on **The Salvaging and Repairs to S.S. "Prince David"** by Mr. D. Scouler, general superintendent of the Halifax Shipyards. Attendance, 30.

March.—Meeting was addressed by Dr. F. H. Sexton on the subject of **Technocracy.** Dr. Sexton's address was followed by a very interesting discussion. Attendance, 32.

July.—Summer meeting in co-operation with the Nova Scotia Association of Professional Engineers was held at White Point Beach on Thursday, Friday and Saturday, July 13th, 14th and 15th. Attendance, 120.

October.—General business meeting of the Branch and to meet the President of The Institute, Dr. O. O. Lefebvre, m.e.i.c. Attendance, 35.

November.—Annual Students Meeting at the Nova Scotia Technical College. Meeting took the form of open forum, principal speakers being the chairman, H. S. Johnston, m.e.i.c., Howard Fellows, a.m.e.i.c., and W. A. Winfield, m.e.i.c., on the subject of the **Future of the 'Engineer-in-Training.'** Attendance, 105.

December.—Annual Meeting of the Branch which was held at the Halifax Hotel on Thursday, December 21st, and as well as the general business of the Branch, a very interesting paper was delivered A. F. Dyer, a.m.e.i.c., on **The Stabilization of the Construction Industry with view to Alleviation of Unemployment.**

The attendance at meetings was equal to that of last year and it is interesting to note that more members are taking part in the discussions.

The Maritime Professional Meeting of The Institute held at White Point Beach, N.S., in July deserves further reference. This gave an effective demonstration of the way in which the educative and technical work of The Institute can be carried on in conjunction with the official duties of a Professional Association. Representatives of all four Maritime Branches of The Institute were present as well as members of the Associations of Professional Engineers of Nova Scotia and New Brunswick.

The committee in charge of the meeting worked out a programme of technical sessions, visits and entertainment which proved particularly enjoyable.

The professional papers presented included "Use of the Back Pressure Turbine in a Modern News Print Mill" by J. H. Mowbray Jones, a.m.e.i.c., chief engineer, Mersey Paper Company; "Supervisory Control and Automatic Protection as Applicable to Hydro-Electric Developments in the Maritimes" by Howard Fellows, a.m.e.i.c., assistant chief engineer, Nova Scotia Power Commission; "Modern Practice in the Construction of Portland Cement Concrete Road Surfaces" by K. MacKenzie, Nova Scotia Department of Highways; and "Use of High-Ash Pulverized Coal in Steam Boilers with Special Reference to Results Obtained at Seaboard Plant, Glace Bay, N.S." by K. H. Marsh, m.e.i.c., chief engineer, Dominion Steel and Coal Corporation.

Visits included one to power developments on the Mersey river and the newsprint mill of the Mersey Paper Company.

The finances of the Branch are in good shape—even in face of increased expenditures made necessary by the Summer Meeting at Liverpool and also the contribution to the Plenary Meeting at Montreal. The financial statement is as follows:

*Receipts*

| | | |
|---|---|---|
| Cash on hand, January 1st, 1933 | $391.77 | |
| Rebates | 267.90 | |
| Branch News | 4.63 | |
| Bank interest | 11.44 | |
| | | $675.74 |

*Expenditures*

| | | |
|---|---|---|
| Meetings | $127.90 | |
| Secretary's office | 88.87 | |
| Mailing list | 30.00 | |
| | | $246.77 |
| Cash on hand | | 428.97 |
| | | $675.74 |

Respectfully submitted,
H. S. Johnston, m.e.i.c., *Chairman.*
R. R. Murray, a.m.e.i.c., *Secretary-Treasurer.*

## Hamilton Branch

The President and Council:—

The Executive committee of the Hamilton Branch, Engineering Institute of Canada, submits the following report for the calendar year 1933.

The Branch year formerly closed on May 31st but in September, 1933, the Branch by-laws were amended to make the Branch year correspond with the calendar year, so the report of 1933 includes half of the 1932-33 session and a short linking session from June 1st to December 31st, 1933.

Thus two Executive committees held office during the year, and the latter committee has been re-elected to office for the year 1934.

The following meetings and visits were held:—

Feb. 1.—Special Business Meeting and Professional Meeting.
**The Value of Photography to Engineering** by a Committee: A. R. Hannaford, a.m.e.i.c., Chairman; W. Hollingworth, m.e.i.c., J. A. M. Galilee, affil.e.i.c., J. G. Morrow, W. A. T. Gilmour, jr.e.i.c., T. S. Glover, a.m.e.i.c., E. T. Sterne, C. H. Cunningham. Attendance, 65.

Mar. 15.—Joint Meeting with Hamilton Chapter, Ontario Association of Architects.
**The Empire State Building and the George Washington Bridge,** motion pictures showing construction of these structures, shown and explained by John Parkin, Otis-Fensom Elevator Co., Hamilton. Attendance, 100.

April 21.—Joint Meeting with Toronto Section, A.I.E.E.
**Recent Progress in Research** by Thos. Spooner, assistant director of Westinghouse Research Laboratories. Attendance, 200.

May 10.—Annual Meeting and Professional Meeting.
**Some Problems of a Chemical Engineer** by Professor C. E. Burke. Attendance, 60.

July 25.—Visit to Plant of Regal Brewing Co., Hamilton. Attendance, 40.

Sept. 12.—Joint Meeting with Hamilton Section, Canadian Chemical Assn.
**Radium** by J. D. Leitch, b.sc., Department of Public Health, Toronto. Attendance, 150.

Sept. 26.—Visit to City of Hamilton Filtration Plant. Attendance, 15.

Oct. 10.—Joint Meeting with Babcock-Wilcox & Goldie-McCulloch Engineering Society at Galt.
**Some Aspects of Scientific Management** by Professor E. A. Allcut, m.e.i.c., Toronto. Attendance, 50.

Nov. 7.—Joint Meeting with Niagara Peninsula Branch E.I.C.
Visit to Plant of Dominion Foundries and Steel Ltd. Attendance, 50.
Visit to Textile Mill of Porritts and Spencer. Attendance, 12.
Visit to City of Hamilton Filtration Plant. Attendance, 10.
Dinner at Wentworth Arms. Attendance, 72.
Professional Meeting—Address by Dr. O. O. Lefebvre, m.e.i.c., President of The Engineering Institute of Canada.
Moving pictures of total eclipse of sun (1932) by W. G. Milne, a.m.e.i.c. Attendance, 115.

Dec. 12.—Joint Meeting with Ontario Section, A.S.M.E.
**Modern Lighting Research** by S. G. Hibben, manager, Commercial Engineering Department, Westinghouse Lamp Co., Bloomfield, N.J. Attendance, 100.

This year has seen the presentation of the first of the committee papers—**The Value of Photography to Engineering** by Mr. Hannaford and his committee. This paper evoked a lot of local interest and has also appeared in the November issue of The Journal.

It is expected that the second committee paper on **The Status of the Engineer in Industry** by J. B. Carswell, m.e.i.c., and his committee will be given early in 1934.

During the year the Branch has been afforded the privilege of holding its meetings in the Science Hall, McMaster University, a privilege which has been greatly appreciated by the members.

Membership

| | Dec. 31st, 1932 Resident | Non-Resident | Total |

A. Love, a.m.e.i.c., *Secretary-Treasurer.*

## Kingston Branch

The President and Council:—

During the year 1932-33 the Kingston Branch met six times, as follows:—

1932

Oct. 18.—Annual Meeting and Dinner.

Dec. 13.—Dinner and special meeting to discuss the report of the Committee on Development.

1933

Jan. 12.—A paper on **Welding in Structural Engineering** was presented by Mr. Frank P. McKibben, President of the American Welding Society.

Feb. 9.—In conjunction with the Engineering Society of Queen's University a meeting was held at which an address on **Writing for Engineers** was read by Mr. G. C. Monture, editor of the Mines Branch, Ottawa.

Feb 17.—Following a dinner at the Badminton Club, Squadron Leader G. E. Wait, R.C.A.F., gave a most interesting talk on **Aviation To-day.**

April 1.—The final paper of the season was on the **Development of Diesel Engines** by Lieut.-Col. F. J. Schmidlin, r.c.e., m.e.i.c.

Employment

Kingston has been less affected by the difficult times of the last three years than larger places. On the other hand many recent graduates have failed to find satisfactory places, or indeed any places at all, while a few of the more experienced members have also been out of work. The situation was greatly helped by the inauguration of the projects under the Department of National Defence, about twelve members obtaining employment thereon. On the opening of these projects, your Executive was asked to nominate a certain number of candidates for positions and all but three or four of those who had registered as unemployed were placed. In this connection it is felt that attention should be drawn to the services rendered to the profession by Major-General A. G. L. McNaughton, c.m.g., d.s.o., m.e.i.c., Chief of the General Staff who has had the direction of these projects and who made it a definite policy to employ only members of the E.I.C. or of the Professional Associations in the higher positions.

Municipal Affairs

The representative of the Branch on the International Bridge Committee of the Chamber of Commerce attended most of the meetings. M. E. Crouch, a.m.e.i.c., one of our Branch members rendered such valuable services to the Committee that he was asked to become a member.

The proposal of the city of Kingston to proceed with the construction of sewage works suggests the advisability of our forming a small committee to confer with the proper officials and give such assistance as we may.

Membership

E. J. Schmidlin, m.e.i.c., *Chairman.*
L. F. Grant, m.e.i.c., *Secretary-Treasurer.*

## Lakehead Branch

No report received.

## Lethbridge Branch

The President and Council:—

The following is a report of the operations of the Lethbridge Branch during the past year.

Since January 1st, 1933, eight regular meetings have been held with an average attendance of 47; also six Executive meetings with an average attendance of 7.

The usual procedure has been followed in connection with our regular meetings, i.e., dinner meetings with short musical programmes interspersed with community singing followed by the address.

The Programme committee have been very active this year and as a result some outstanding speakers have addressed the branch on various topics of interest.

Through the efforts of an active Entertainment committee the musical section of our meetings has been excellent.

We have found it necessary through a decreasing membership to reduce the number of our meetings. As our meetings do not follow a set programme for the year as heretofore, it was found advisable to do away with Branch Affiliates until such time as the Branch can afford to follow a set schedule of meetings once again. The Affiliates have access to our meetings however as guests.

The list of speakers and subjects chosen follows:

Jan. 7.—F. H. Ballou, efficiency engineer, B.C. Sugar Refinery Co. Ltd., Raymond, Alberta. Subject: **Operation of a Beet Sugar Refinery.**

Jan. 21.—R. F. P. Bowman, Jr.e.i.c., road master, Canadian Pacific Railway. Subject: **Aligning Railroad Curves.**

Feb. 4.—Joint meeting of the Professional Engineers of Alberta with the Lethbridge Branch of The Engineering Institute of Canada. Dr. H. J. Macleod, M.E.I.C., Professor of Electrical Engineering, University of Alberta. Subject: **The Conquest of Distance.**

Feb. 18.—H. W. Meech, architect, Lethbridge, Alberta. Subject: **Architecture,** illustrated with lantern slides. This meeting was open to the ladies.

Mar. 4.—Annual Meeting. W. D. Armstrong, A.M.E.I.C., Superintendent of the Canada Cement Co. Subject: **Cement.**

April 18.—Dr. O. O. Lefebvre, M.E.I.C., President of The Engineering Institute of Canada. Subject: **Institute Affairs.**

Nov. 8.—Dr. R. C. Wallace, President of the University of Alberta. Subject: **Building a World.** This meeting was open to the ladies and guests of the members.

Nov. 25.—Ladies Night. Musical programme with two motion pictures, **Fire Fighters of the Skies** and **The Arctic Patrol of 1929.** Bridge was played for the balance of the evening.

The Annual Meeting of the Branch was held on March 4th, 1933, when the officers were chosen for the season 1933-1934.

At December 31st, 1933, the membership of the Branch was as follows:—

| | *Resident* | *Non-Resident* | *Total* |
|---|---|---|---|
| Members | 4 | 0 | 4 |
| Associate Members | 14 | 2 | 16 |
| Juniors | 1 | 1 | 2 |
| Students | 4 | 3 | 7 |
| Affiliates | 0 | 0 | 0 |
| | 23 | 6 | 29 |

FINANCIAL STATEMENT
(As at December 31st, 1933)

| | | |

Nil

We have examined the books, vouchers, papers and the foregoing statement prepared by the Secretary Treasurer and find the same to be a true and correct account of the standing of the Branch.

C. S. DONALDSON, A.M.E.I.C. }
P. M. SAUDER, M.E.I.C. } Auditors.

Respectfully submitted,
J. HAIMES, A.M.E.I.C., *Chairman.*
E. A. LAWRENCE, S.E.I.C., *Secretary-Treasurer.*

## London Branch

The President and Council:—

During the past year nine meetings were held as follows:—

Jan. 17.—Annual Meeting. Dr. Sherwood Fox, speaker.

Feb. 15.—**Shop Talk.** Speakers W. C. Miller, M.E.I.C., A. O. Wolf, M.E.I.C., S. W. Archibald, A.M.E.I.C.,

Mar. 15.—Talk on **Tax Reduction** by Major Gordon Ingram of the Associated Chambers of Commerce.

April 19.—Films showing construction of the George Washington Bridge and the Empire State Building. Courtesy of the Otis-Fensom Elevator Company.

May 17.—Address on **Town Planning and Landscaping** by Gordon Culham, B.S.A.

June 24.—Annual outing and picnic at country home of the Secretary.

Oct. 18.—Address by J. M. Breen, A.M.E.I.C., of the Canada Cement Company, assisted by L. M. McDonald, plant superintendent.

Nov. 18.—Dinner meeting addressed by O. O. Lefebvre, D.Sc., M.E.I.C., President of The Institute.

Nov. 29.—Address by A. B. Lambe, A.M.E.I.C., President of the Association of Professional Engineers of Ontario.

Owing to the last two meetings being limited to members, the average attendance was reduced to 26.

In addition to the above, six executive meetings were held.

## Moncton Branch

The President and Council:—

On behalf of the Executive committee we beg to submit the fourteenth annual report of Moncton Branch.

The Executive committee held four meetings. There were seven meetings of the Branch held, one of which was a dinner meeting. All technical meetings were open to the public.

Jan. 24.—A paper on **Detection of Internal Defects in Steel Rails** was read by H. B. Titus, A.M.E.I.C.

Feb. 23.—**The Mining Industry of New Brunswick** was the subject of an address by W. J. Wright, PH.D., F.R.C.S.

Feb. 27.—E. G. Evans, M.E.I.C., read a paper on **The Sphere of Influence of the Engineer.**

May 16.—Nominations made for Branch officers for 1933-1934.

May 31.—The Annual Meeting of the Branch was held on this date.

Oct. 27.—The Branch entertained Dr. O. O. Lefebvre, M.E.I.C., President of The Institute, at a shore dinner at Cocagne, N.B.

Nov. 16.—**Psychological Tests as Used in Industries** was the subject of an address by Professor C. A. Krug, M.A.

Dec. 5.—J. Harold McKinney, A.M.E.I.C., addressed the Branch on **Field Control of Concrete, Saint John Harbour Commissioners Docks,** at West Saint John, N.B.

MEMBERSHIP

Our membership at present consists of seventy-eight members, as follows:—

| | *Resident* | *Non-Resident* |
|---|---|---|
| Members | 6 | 1 |
| Associate Members | 19 | 4 |
| Juniors | 1 | 2 |
| Students | 38 | 5 |

## Montreal Branch

The President and Council:—

We have the privilege of submitting a report of the activities of the Montreal Branch during the past year. We feel that notwithstanding the strenuous times, which we have some reason to expect are now nearing an end, this Branch has concluded what might be considered quite a successful year.

In keeping with the exigencies of the times, we have curtailed our activities in certain directions, but not to a degree, we hope, that has occasioned any halt or backward step in the progress that has for years past marked our operations. Our efforts in the operation of the Branch have been prompted by circumstances towards policies from which it was felt the most good would be derived by all.

Early in the year the Executive gave most serious consideration to such important questions as finance, unemployment, membership, technical meetings, social functions, and the general conduct of Branch activities.

Our financial statement is submitted at the end of this report, and you will note that while a deficit of $76.57 has been incurred in the year's operations, we are, nevertheless, in a sound position. The item of $222.00 which was responsible for the deficit was subscribed towards the expenses of the Plenary Meeting only after very serious consideration and consultation with the resident members of Council.

The subject of unemployment amongst our members was considered of prime importance and occupied the attention of the General committee and of a special committee to a large extent. In order to be assured of a direction from the membership, one of the regular Thursday evening meetings was devoted to a general discussion of it and numerous suggestions were made which were acted upon.

Feeling that existing conditions might re-act adversely for us, it was decided wise to institute at the outset a Membership committee, the purpose of which would be to endeavour to make up for any losses sustained through resignations or deaths, and also to co-operate with Headquarters in inducing members to retain their membership.

Your Executive realized at the beginning of its term that it would be extremely difficult to secure for presentation at the regular weekly meetings any considerable number of papers on works of an outstanding nature, because of general lack of such projects, and furthermore, it felt that lectures of a popular nature would perhaps be more agreeable. With this in mind it endeavoured to secure addresses to be delivered by well known and competent speakers on matters that are very much in the public mind and which would contribute to the general, rather than technical knowledge. This policy we feel has been successful, measured in terms of the large numbers attending our meetings. It was also decided after some study not to hold any social functions, as had been the custom in previous years. It was considered that they would not be justified under present conditions and owing to the holding of the Annual and Professional Meeting in Montreal in 1934 it was believed that this would afford a reasonable compromise in facilitating the renewal of social acquaintance among the members.

Meetings were held on twenty-seven evenings, and the average attendance was 105, which is a slight increase over previous years.

Jan. 5.—Annual Meeting.
Jan. 12.—**Recent Progress in Oxy-Acetylene Welding and Cutting Processes** by D. S. Lloyd, A.M.E.I.C.
Jan. 26.—**Unemployment Problem.**
Feb. 2.—**Power Plants in South America** by J. V. Angus, A.M.E.I.C.
Feb. 9.—**Television: Its Fundamental, Physical and Psychological Principles** by Dr. J. O. Perrine.
Feb. 16.—**Mapping From Aerial Photographs** by A. E. Simpson, B.Sc.
Feb. 23.—**Special Cements** by A. G. Fleming, M.E.I.C.
Mar. 2.—**Fluid Flywheels** by W. T. Reid, F.R.Ae.S., A.M.I.Mech.E.
Mar. 9.—**Wellington Street Subway** by L. J. Leroux, A.M.E.I.C.
Mar. 16.—Junior Meeting:—
**Petroleum Asphalt Paving Material** by Mr. H. R. Holland.
**Etude comparative de chauffage d'une résidence** by Mr. Jean Bastien.
Mar. 23.—**Nipawin Bridge** by Major A. R. Ketterson, A.M.E.I.C.
Mar. 30.—**Electrical Aspects and General Characteristics of Chute-a-Caron Development** by Mr. McNeely DuBose.
April 6.—**Montreal's Traffic Actuated Traffic Control System** by R. B. Dodd, Jr.
April 13.—**Engineering Features of The Location of Hydro-Electric Developments on Upper St. Maurice** by C. R. Lindsey, A.M.E.I.C.
April 20.—**Suspension Bridges** by Mr. Clement E. Chase.
April 27.—**Construction of Hydro-Electric Power Plant at Masson, Que.** by H. V. Serson, A.M.E.I.C.
Oct. 5.—Open Meeting.
Oct. 12.—**International Radio Conference** by Lieut.-Col. A. W. Steel, M.C., A.M.E.I.C.
Oct. 19.—**Refining of Oil** by Mr. F. S. Clulow.
Oct. 26.—**The Sperry Method of Non-Destructive Testing** by J. A. Drain, Jr.
Nov. 2.—**Recent Developments in Switching Equipment** by Mr. L. B. Chubbuck.
Nov. 9.—**Relation of Accounting to The Engineer** by Hon. Gordon W. Scott.
Nov. 16.—**Municipal Law as Applied to Municipal Engineering** by Mr. J. W. Weldon, K.C.
Nov. 23.—Junior Meeting:—
**Aeronautical Research** by Mr. Charles Paton.
**Exploitation d'une carrière** by Mr. J. Benoit, S.E.I.C.
Nov. 30.—**Construction Methods Toronto Water Works Intake** by R. E. Chadwick, M.E.I.C.
Dec. 7.—**Our Friends the Electrons** by Dr. A. S. Eve.
Dec. 14.—**Photography as an Engineering Implement** by Mr. P. J. Croft.

Following our usual custom, out-of-town speakers were tendered a dinner on three different occasions previous to the meeting, and we feel that this is a very important adjunct, as it gives the members and the speaker an opportunity of becoming better acquainted, and of exchanging views more freely on engineering matters.

The customary annual excursion to a distant development was dispensed with and in its stead was arranged, during the summer, a combined visit to the new Caughnawaga bridge and the extensive project of the Beauharnois Power Company. This happy combination was eminently popular as it attracted a very large turnout and our grateful thanks are due to the Janin Construction Company, the Dominion Bridge Company, and the Beauharnois Power Company for enabling us to enjoy the privileges we did at little, if any, cost to ourselves.

The Junior Section, which was organized in 1932, has just completed its first year. This Section comprises the younger members of The Institute, and one of its prime objects is to promote the art of expression in public by members of the engineering profession. They held twelve meetings in all during the past year, and attendance at any of their meetings would disclose a well organized group of promising men, conducting their affairs in a very efficient way, and keen in acquiring and disseminating knowledge of value in the line of their proposed future endeavours. The formation of this section should prove very valuable in securing for The Institute, loyal and interested supporters, thus helping to offset a fear amongst some that the attractions of, and benefits derived from other organizations, did not augur well for it in the future.

The Radio and Wire Communication Section, also organized last year, gives promise of becoming a great asset owing to the developments that appear to be in prospect in this particular line, and the interest and attention that the meetings which it sponsored have aroused. It is worthy also of note that through the agency of associations with the Institution of Electrical Engineers, reciprocal privileges are afforded the members of both Societies in the interchange of knowledge on this increasingly important branch of science.

Your committee, and the Branch as a whole, have co-operated with the Special committee of The Institute in studying the subject of future development and have made recommendations officially as to desirable changes in the constitution of corporate membership—it having been resolved that this should be composed of one grade only.

Suggestions were also made as to modifications in the qualifications for membership. In common with the other branches, this Branch contributed towards the expenses of holding a Plenary Meeting of Council at which this very important subject, amongst others, was given serious study.

A change in the Branch By-laws respecting Affiliate Membership was authorized whereby the dues were reduced, it being the feeling that this would tend to attract more men, having associations with our profession, to The Institute.

There has been held throughout the year a total of twelve meetings of the Executive committee, at which the average attendance has been eleven. In addition to the regular weekly meetings of the Branch and the meetings of the Junior Section, there have been three special Branch meetings called for the purpose of transacting business of a special nature.

MEMBERSHIP

The active list of the members of the Branch remains about equal to what it was in the previous year, as will be noted from a comparison of the figures quoted hereinafter. In addition to the numbers stated there is a number of former members to whom privileges of extension have been accorded in consideration of present conditions and who have been placed upon the non-active list. These would increase the totals by 61 corporate and 18 non-corporate members.

| | *1932* | *1933* |
|---|---|---|
| Corporate members | 720 | 712 |
| Non-Corporate members | 326 | 342 |
| | 1,046 | 1,054 |

We record with deep regret the loss of the following esteemed members who passed away during the course of the year:—

Robert Maitland Hannaford, M.E.I.C.
Allan Campbell MacKenzie, M.E.I.C.
Charles Augustine Mullen, M.E.I.C.
Robert M. Wilson, M.E.I.C.
Henry Maurice Scott, A.M.E.I.C.
David Gemmell Wallace, A.M.E.I.C.

To their families we extend our heartfelt sympathy.

UNEMPLOYMENT

The past year has been a difficult one for those engaged in engineering pursuits, and although it would now appear as if there is every reason to anticipate better conditions, the need for continuation of our effort to assist those in need is as evident as before.

Owing to the limitations of funds made available through the response by the members at large in a special appeal, it was early realized that assistance could only be given to those in actual need. From a report of the committee published in The Journal, December 1933, it will be observed that the fund created in the fall of 1932 has been exhausted, and it was unanimously decided at a meeting of the Branch that the fund be recreated through a further appeal to the members for their generous assistance.

Support of the Technical Service Bureau was withdrawn during the latter part of the year as it then appeared that we could no longer afford to extend our benevolence beyond the ranks of our own members.

Our thanks are due to Mr. Holliday and his aides for the valuable assistance afforded through the Registration Bureau of Office Workers in investigating cases and dispensing the relief which this fund permits.

This committee has co-operated with the main committee of The Institute in compiling statistics on this matter, and has also been successful through the combined efforts in facilitating the temporary or permanent placing of a number of our members.

## Niagara Peninsula Branch

The President and Council:—

The Executive committee of the Niagara Peninsula Branch presents herein the report for the year 1933.

The Executive held four regular meetings and one electoral meeting with an average attendance of 13.

The meetings are listed as follows:—

Feb. 1.—Dinner meeting, Hotel General Brock, Niagara Falls; speaker, G. W. Lapp, Lapp Insulator Company, LeRoy, N.Y.; topic, **My Trip to Russia.**

Feb. 22.—Annual dinner dance, Welland House, St. Catharines, Ont.

April 22.—Inspection trip, Ontario Paper Company, Thorold. Especially to see electrical installation for boilers. Dinner at Trinity United Church with talk after by W. L. Eliason, electrical engineer, assisted by E. J. Calnan, steam control engineer, of the Ontario Paper Company, giving details of the electrical and steam features of the boilers.

May 18.—Annual meeting at Welland House, St. Catharines. Speaker, Dr. O. O. Lefebvre, M.E.I.C., President of The Engineering Institute of Canada.

Nov. 7.—Joint meeting with Hamilton Branch. Inspection trip in afternoon to the city of Hamilton filtration plant; Dominion Foundries and Steel Company; Porrits and Spencer textile plant. Dinner at the Wentworth Arms hotel. Meeting at McMaster University Science Hall, with moving pictures of the eclipse of the sun, 1932, taken and shown by W. G. Milne, A.M.E.I.C., followed by an address by Dr. O. O. Lefebvre, M.E.I.C., President of The Institute.

Dec. 14.—Dinner meeting at Fox Head Inn, Niagara Falls, Ont.; speaker, Mr. H. Spencer Clark; topic, **An Engineer Looks on Russia.**

## Ottawa Branch

The President and Council:—

On behalf of the Managing committee of the Ottawa Branch we beg to submit the following report for the calendar year 1933.

During the year the Managing committee held seven meetings. In addition the Branch held sixteen luncheons, two evening meetings and a dinner dance.

One of the chief activities of the Branch during the year was the holding of the 47th Annual General and Professional Meeting of The Institute in Ottawa in February, at which 423 members registered attendance. This meeting has been fully reported in The Engineering Journal.

It is with deep regret that we report the loss through death of two members, A. M. Grant, M.E.I.C., and Ormond Higman, M.E.I.C., who was a Life Member.

PROCEEDINGS AND PUBLICITY

During the year sixteen luncheon meetings, two evening meetings and a get-together dinner dance were held at the Chateau Laurier. The dates of meetings and speakers are as follows:

Jan. 12.—Annual Meeting, Standish Hall, Hull.
Jan. 12.—Luncheon address, Frank P. McKibben, B.Sc., Black Gap, Pennsylvania, **A Roman Bridge in an American City.**
Jan. 26.—Luncheon address, Dr. Hugh Bostock, M.Sc., Ph.D., Geological Survey, Ottawa, **Mining Industry in the Yukon Territory.**
Feb. 16.—Evening meeting, Gordon McL. Pitts, M.Sc., A.M.E.I.C., Montreal, P.Q., **Transportation in Canada.**
Feb. 23.—Luncheon address, Gordon McIntyre, B.Sc., Sarnia, Ontario, **The General Theoretical Aspects of Lubrication.**
Mar. 9.—Luncheon address, Lieut.-Col. H. J. Lamb, D.S.O., M.E.I.C., Toronto, Ont., **Development of the Great Lakes Waterways System and Harbours Thereon in Canada.**
Mar. 23.—Luncheon address, Dean Eve, C.B.E., D.Sc., McGill University, Montreal, P.Q., **Highs and Lows.**
April 6.—Luncheon address, John Murphy, M.E.I.C., Department of Railways and Canals, Ottawa, **Frazil—from 1883 to 1933.**
April 20.—Luncheon address, H. E. M. Kensit, M.E.I.C., Ottawa, **Water Powers of the World.**
May 11.—Luncheon address, L'abbé Alexandre Vachon, Laval University, Quebec, **Forerunners of Modern Chemistry.**
May 25.—Luncheon address, Frederic R. Speed, Ethyl Gasoline Corp., Detroit, Michigan, **Trends in Gasoline Engine Design and Fuel Design for Optimum Performance.**
May 30.—Luncheon address, J. H. Martin, English explorer, **Seal Fishing in the White Sea, Northern Russia.**
Oct. 5.—Luncheon address, Dr. Olivier O. Lefebvre, M.E.I.C., President of The Engineering Institute of Canada, **Engineering Institute Affairs.**
Oct. 19.—Luncheon address, B. F. Haanel, B.Sc., M.E.I.C., Mines Department, Ottawa, **Fuel Research an Aid to the Solution of Canada's Fuel Problems.**
Oct. 26.—Evening meeting, A. K. Grimmer, M.E.I.C., Town Engineer, Temiskaming, P.Q., **The Development and Operation of Temiskaming, P.Q., as a Company-Owned Industrial Town.**
Nov. 2.—Luncheon address, F. Jaime Gaxiola, B.Sc., Mexican Trade Commissioner, **International Highway, Mexico City, Laredo (American Border).**
Nov. 16.—Luncheon address, Watson Sellar, Comptroller of the Treasury, Department of Finance, Ottawa, **The Treasury and Public Works Expenditure.**
Nov. 30.—Luncheon address, Nouland Cauchon, A.M.E.I.C., Chairman, Ottawa Town Planning Commission, **Elements of Town Planning.**
Dec. 14.—Luncheon address, Alan K. Hay, B.Sc., A.M.E.I.C., Ottawa Suburban Roads Commission, **Progress in Highway Transportation.**
Dec. 15.—Dinner Dance, Chateau Laurier, Ottawa.

The average attendance at these meetings was 82.

### Dinner Dance

With a view to bringing the members of Ottawa Branch of The Engineering Institute into closer touch with one another, an informal dinner dance was held at the Chateau Laurier on December 15th and was attended by 172 members and ladies. During the course of the evening, in addition to the usual dancing, ship's games were provided and this innovation was greatly enjoyed by all. The purpose of the evening to bring the members into closer contact was successfully achieved.

### Membership

Owing to deaths, resignations and members removed from the roll, the membership shows a decrease of ten during the year.

The following table shows in detail the comparative figures of the Branch membership for the year 1932 and 1933:

| | *1932* | *1933* |
|---|---|---|
| Honorary Members | 1 | 1 |
| Members | 88 | 80 |
| Associate Members | 174 | 173 |
| Affiliates of Institute | 4 | 3 |
| Juniors | 13 | 16 |
| Students | 28 | 33 |
| Branch Affiliates | 37 | 36 |
| Resident Members | 345 | 342 |
| District Members | 70 | 63 |
| | 415 | 405 |

### Finances

The attached financial statements show that the Branch had a deficit of $313.43 in expenditure over revenue.

The Branch closed the year with a balance of $579.87 in the bank, $5.97 cash on hand and $1,000 in Victory Bonds; a total balance of $1,585.84. In addition the Branch has assets of $51.60 in rebates due from The Institute; $6.62 due from Branch News in The Engineering Journal, and $21.00 in equipment, etc., making a total of $1,665.06.

### Officers for 1934

The Annual Meeting of the Branch will be held on the 11th of January, when the officers and members of the Managing committee for 1934 will be elected.

### Financial Statement

## Peterborough Branch

The President and Council:—

On behalf of the Executive committee of the Peterborough Branch, we have the honour to submit the following report covering the activities of the Branch during the year 1933.

### Meetings and Papers

Jan. 10.—**Erecting Steel Buildings and Strengthening Steel Bridges by Welding** by Mr. Frank P. McKibben, consulting engineer.
Jan. 26.—**The Manufacture of Specialty Rubber Goods in Various Forms** by Mr. O. B. Crowell, chief chemist of the Viceroy Manufacturing Co., Toronto.
Feb. 9.—**Aluminum—Its Production and Utilization** by Mr. Paul S. White, of the Aluminum VI Co. Ltd.
Feb. 23.—**Recent Developments in the Bakelite Industry** by Mr. H. P. Mills, of the Bakelite Corp. of Canada.
Mar. 9.—**Developments in the Great Bear Lake Area** by Major Bernhard Day, consulting engineer for the Bear Exploration and Radium Co. Ltd.
Mar. 23.—**Developments in Topographical Mapping** by J. W. Pierce, D.L.S., O.F.S., M.T.S., M.E.I.C., Peterborough.
April 6.—Students Papers:
1. **Determinism in Natural Science** by J. L. McKeever, S.E.I.C., Canadian General Electric Co.

2. **Building the Backbone of the Nation** by E. J. Davies, Jr.E.I.C., Peterborough Technical School.
3. **A National and International Problem** by W. F. Auld, Jr.E.I.C., Canadian General Electric Co.

April 27.—**Story of Lubrication** by Mr. A. G. Scott of the Imperial Oil Co., Toronto.

May 11.—Annual Meeting, Reports of Committees, Election of Officers.

Oct. 7.—Annual Outing, Trip to Deloro Smelting and Refining Co. plant at Deloro, Ont.

Nov. 9.—**Diesel Engines** by Lieut.-Col. E. J. Schmidlin, M.E.I.C., Royal Military College, Kingston.

Nov. 28.—Annual Dinner, Empress Hotel, Peterborough.

Dec. 14.—**Highways** by W. L. Saunders, A.M.E.I.C., resident engineer, Ontario Department of Highways.

The average attendance at the branch meetings was 34.
Number of Executive meetings held during the year, 7.
Special sub-committees were appointed as follows:—

| | |
|---|---|
| Meetings and Papers | A. B. Gates, A.M.E.I.C. |
| | B. Ottewell, A.M.E.I.C. |
| | E. J. Davies, Jr.E.I.C. |
| Branch News Editor | W. T. Fanjoy, Jr.E.I.C. |

| | 110 | 113 | 101 |

It is with deepest regret that we report the death of one of the founders of our Branch, A. E. Doucet, M.E.I.C., who died on July 16th, 1933.

Report of Activities

During the year 1933, the Branch Executive committee held five regular meetings with an average attendance of seven.

In addition the Branch held meetings as follows:—

Jan. 16.—Luncheon-meeting at Chateau Frontenac. Speaker: Mr. J. E. Gregoire, K.C., Professor of Political Economy at Laval University. Subject: **L'or et son rôle économique.** Attendance, 24.

Feb. 27.—Evening meeting at Chateau Frontenac. Speaker: Lieut.-Col. H. L. Trotter, M.E.I.C., consulting engineer, Montreal. Subject: **The Chats Falls Development, Ottawa River.** Attendance, 25.

Mar. 6.—Luncheon meeting at Chateau Frontenac. Speaker: Augustin Frigon, D.Sc., M.E.I.C., Director of the Montreal Polytechnical School and Director of Technical Education for the Province of Quebec. Subject: **L'ingénieur dans l'industrie.** Attendance, 44.

April 24.—Evening meeting at Palais Montcalm. Speakers: J. U. Archambault, A.M.E.I.C., Quebec Public Service Commission: **Du contrôle des services publics et l'ingénieur;** G. D. Moon, Jr.E.I.C., Bell Telephone Company of Canada: **General Economics on Telephone Business;** Ludger Gagnon, P.E.Q., City of Quebec: **La construction du réservoir des champs de bataille.** Attendance, 42.

May 13.—A visit to the new 30,000,000-gallon reservoir on Battlefields Park. Attendance, 36.

May 25.—**Annual Meeting** and election of officers at Palais Montcalm.

Oct. 13.—Luncheon-meeting at Chateau Frontenac. Dr. O. O. Lefebvre, M.E.I.C., President of The Engineering Institute of Canada, visiting our Branch addressed the members on Institute matters. Attendance, 41.

Dec. 4.—Special meeting at Quebec Drill Hall to visit a display of a modern invention called **Electric Eye.** Attendance, 55.

## Saguenay Branch

The President and Council:—

On behalf of the Executive committee of the Saguenay Branch of The Engineering Institute of Canada, we beg to submit the following report for the calendar year 1933.

### Membership

Our membership this year shows a net loss of one. We are endeavouring to increase our membership and hope to add at least three to the grade of Associate Member.

The following table gives a comparison of our membership as at December 21st for the past four years:—

| | *1930* | *1931* | *1932* | *1933* |
|---|---|---|---|---|
| Members | 6 | 5 | 4 | 3 |
| Associate Members | 25 | 19 | 16 | 18 |
| Junior Members | 7 | 4 | 4 | 3 |
| Student Members | 11 | 7 | 5 | 5 |
| Affiliates | .. | .. | 1 | .. |
| | 49 | 35 | 30 | 29 |

### Branch Meetings

During the year Branch meetings were held as follows:—

June 3.—Meeting was held at St. Joseph d'Alma, preceding which dinner was served. The meeting was addressed by Dr. O. O. Lefebvre, M.E.I.C., who spoke on **Institute Development and Problems.** There were 40 members and guests present.

Aug. 24.—The Annual General Meeting and luncheon was held at Arvida. 16 members were present.

Oct. 12.—A meeting was held at Arvida, addressed by H. B. Pelletier, A.M.E.I.C., on **The Chicoutimi Harbour Development.** 30 members and guests were present.

Nov. 2.—A meeting was held at Arvida, addressed by J. T. Farmer, M.E.I.C., on **The Economics of Steam and Hydro-Electric Generation of Power, with special reference to Process Steam.** 45 members and guests were present.

## Saint John Branch

The President and Council:—

On behalf of the Branch Executive committee we have the honour to submit the annual report of the Saint John Branch for the calendar year ending December 31st, 1933.

### Executive Committee

Eleven meetings of the Branch Executive committee were held during the year.

### Standing Committees

The Standing committees of the Branch are as follows:—

| *Committee* | *Chairman* |
|---|---|
| Programmes and Meetings | J. D. Garey, A.M.E.I.C. |
| Entertainment | J. T. Turnbull, A.M.E.I.C. |
| Employment | J. A. W. Waring, A.M.E.I.C. |
| Membership | Branch Executive |
| Salaries | C. C. Kirby, M.E.I.C. |
| Publicity and Branch News | Chas. M. Hare, S.E.I.C. |
| Natural Resources and Engineering Industries | F. P. Vaughan, M.E.I.C. |
| Auditors | D. A. Duffy, A.M.E.I.C.<br>V. S. Chestnut, A.M.E.I.C. |
| Town Planning | J. P. Mooney, A.M.E.I.C. |

### Branch Meetings

During the year six Branch meetings were held as follows:—

Jan. 26.—Joint dinner of The Institute and the Association of Professional Engineers of New Brunswick. Following the meeting M. A. Ravenor, M.E.I.C., read a paper on **Foundations in Clay** illustrated by lantern slides of construction in Georgetown, British Guiana.

Mar. 23.—**Town Planning as Applied to Saint John** was the subject of an address delivered by J. N. Flood, A.M.E.I.C. This address was broadcast by the local radio broadcasting station.

May 4.—Annual Dinner and meeting held at Riverside Golf and Country Club. The present officers of the branch were elected at this meeting.

Aug. 30.—Visit to H.M.S. *Norfolk*, treaty cruiser and flagship of the West Indies Squadron.

Oct. 23.—Dinner tendered Dr. O. O. Lefebvre, M.E.I.C., President of The Institute.

The Maritime Professional Meeting of the E.I.C. and General Meeting of the Association of Professional Engineers held at White Point Beach, N.S., on July 13th, 1933, was sponsored by the Halifax Branch and supported by this Branch, several members attending.

### Membership

The following is a statement of membership as at December 31st, 1933:—

| | *Resident* | *Non-Resident* | *Total* |
|---|---|---|---|
| Members | 10 | 6 | 16 |
| Associate Members | 22 | 12 | 34 |
| Juniors | .. | 5 | 5 |
| Students | 16 | 13 | 29 |
| Affiliates | 1 | .. | 1 |
| | 49 | 36 | 85 |

There are ten members on the non-active list.

### Financial Statement

(Year ending December 31st, 1933)

*Assets*

| | | |
|---|---|---|
| Cash in bank, December 31st, 1933 | $301.96 | |

| Honorarium to Secretary | 25.00 | |
| | $149.84 | |
| Surplus, December 31st, 1933 | 327.46 | |
| | | $477.30 |

Respectfully submitted,
G. A. Vandervoort, A.M.E.I.C., *Chairman.*
S. Hogg, A.M.E.I.C., *Secretary-Treasurer.*

## St. Maurice Valley Branch

The President and Council:—

On behalf of the Executive committee, I beg to submit the following report of the activities of the St. Maurice Valley Branch during the year 1933.

Five general meetings were held; on February 3rd, October 7th, November 4th, when the President of The Institute, Dr. O. O. Lefebvre, M.E.I.C., addressed the meeting, December 4th and December 18th. The Executive committee met twice during the year (on January 25th and April 13th, 1933) to deal with the various questions which arose.

At one of the general meetings a dinner was tendered to Dr. Olivier Lefebvre, M.E.I.C., President of The Engineering Institute, which was attended also by Dr. A. R. Décary, M.E.I.C., Past-President, A. B. Normandin, M.E.I.C., Vice-President, and 40 members of the Branch.

### Financial Statement

*Receipts*

| | | |

J. ALBERT HAMEL, A.M.E.I.C., *Secretary-Treasurer.*

## Saskatchewan Branch

The President and Council:—

On behalf of the Executive we submit the following report of the activities of the Saskatchewan Branch for the year 1933.

MEMBERSHIP

The membership of the Branch shows a decrease of twenty-one from last year, the present membership being:—

| | *Resident* | *Non-Resident* | *Total* |
|---|---|---|---|
| Members | 4 | 8 | 12 |
| Associate Members | 28 | 26 | 54 |
| Juniors | 2 | 6 | 8 |
| Students | 3 | 16 | 19 |
| Branch Affiliates | 2 | .. | 2 |
| | 39 | 56 | 95 |

EXECUTIVE COMMITTEE

The Executive committee was elected on March 24th, 1933, and held seven meetings during the year.

COMMITTEES

The standing committees are:—
Papers and Library........S. R. Muirhead, A.M.E.I.C. (Convenor).
Nominating..............H. J. A. Bird, A.M.E.I.C. (Convenor).
Unemployment...........H. R. MacKenzie, A.M.E.I.C. (Convenor).
Membership..............J. J. White, A.M.E.I.C. (Convenor).

MEETINGS

There were one special and six regular meetings of the Branch. The regular meetings in all cases were preceded by a dinner at which the average attendance was thirty-five, a decrease of one from last year. The general interest in the meetings has been good.

We regret to record the loss, by death, of two of our members, C. S. Cameron, A.M.E.I.C., Regina, and J. D. Peters, A.M.E.I.C., Moose Jaw. Mr. Peters was chairman of the Branch last year.

The programme for the year was as follows:—

Jan. 20.—Ladies Night. Address by R. N. Blackburn, M.E.I.C., entitled **A Winter's Wanderings.**

Feb. 17.—Regular meeting held jointly with the Association of Professional Engineers. Address by C. J. Mackenzie, M.E.I.C., Dean of Engineering, University of Saskatchewan, on **The New Saskatoon Bridge.**

Mar. 24.—Sixteenth Annual Meeting. General discussion of Institute affairs.

April 20.—Special meeting. Address by Dr. O. O. Lefebvre, M.E.I.C., on **The Present Status of The Engineering Institute of Canada.**

Oct. 20.—Regular meeting. Address by E. A. Duschak, A.M.E.I.C., on **Developments in Petroleum Refining.**

Nov. 24.—Regular meeting. Address by L. A. Thornton, M.E.I.C., on **Proposed Power Developments on the Saskatchewan River.**

Dec. 15.—Regular meeting. Address by E. B. Webster, A.M.E.I.C., on **The Mineral Possibilities of Northern Saskatchewan.**

FINANCIAL STATEMENT

Respectfully submitted,
P. C. PERRY, A.M.E.I.C., *Chairman.*
STEWART YOUNG, A.M.E.I.C., *Secretary-Treasurer.*

## Sault Ste. Marie Branch

The President and Council:—

Nine dinner meetings were held during 1933, one at the Country Club, one at the local mill of the Abitibi Power and Paper Company, and seven at the Windsor hotel.

Regular meetings of the Branch were held during the year, and we were especially honoured by a visit from the President of The Institute, Dr. O. O. Lefebvre, M.E.I.C., in June, when a special meeting was arranged at the Country Club.

Attendance at both dinners and meetings was better than during 1932, averaging 26 at dinners and 31 at meetings.

The meetings with the speakers were as follows:—

Feb. 24.—**Monetary Matters** by Jas. Baxter, Royal Bank of Canada.

Mar. 23.—**The Engineering Features of a Sulphite Mill** by C. B. Davies, Abitibi Power and Paper Co. Ltd.

April 28.—**Some Aspects of Forest Protection in Ontario** by Nigel Kensit, Ontario Forestry Department.

May 26.—**Preservation and Use of Canadian Timber** by B. M. Winegar, Canada Creosoting Co. Ltd.

June 14—Visit of President, Dr. O. O. Lefebvre, M.E.I.C.

Sept. 27.—**Development of Great Lakes Waterway System** by Colonel H. J. Lamb, D.S.O., M.E.I.C.

Oct. 27.—**Sisal Industry in Kenya Colony** by C. W. Holman, Sault Technical School.

Nov. 24.—**Examination and Testing of Forging Steels for the Automotive Industry** by W. R. Werther, Algoma Steel Corporation.

Dec. 20.—Annual Meeting. **Northern Ontario Iron Ores** by J. D. Jones, M.E.I.C., Algoma Steel Corporation.

A meeting of the Branch at North Bay was contemplated early last summer but had to be dropped for the time being. Something in this direction may be attempted next year and would be well worth considering.

There were a number of resignations and suspensions during the year but the loss of membership from this has been more than compensated for by members of other branches who have been transferred to this district due to the continued activity in the mining area. There have also been a number of new applications for membership.

The Committee on Unemployment thoroughly canvassed the membership of the Sault Ste. Marie district by letter with regard to unemployment.

Opportunity for employment was offered by The Engineering Institute on construction work being carried out by the Dominion government. Three members of this district availed themselves of the opportunity.

The committee now reports that there is no hardship being experienced by any member of The Institute in this district.

All phases considered 1933 can well be regarded as a very successful year for this Branch, and with increased activity apparent in the industrial field there is every reason for the utmost confidence in its continued success.

FINANCIAL STATEMENT

## Toronto Branch

The President and Council:—

The Executive committee of the Toronto Branch respectfully submits the following report on the affairs of the Branch for the year 1933:—

The Annual Meeting was held on March 30th, 1933, and the members of the Executive committee for 1933-34 were elected.

The chairmen of the Standing committees of the Branch are as follows:—

Papers.......Archie B. Crealock, A.M.E.I.C.
Finance.......W. E. Ross, A.M.E.I.C.
Publicity.......A. U. Sanderson, A.M.E.I.C.
Meetings.......W. E. Bonn, A.M.E.I.C.
Membership.......R. E. Smythe, A.M.E.I.C.
Student Relations.......J. Roy Cockburn, M.E.I.C.
Branch Editor.......O. Holden, A.M.E.I.C.

The Executive committee of the Branch has held twelve meetings for the transactions of Branch business during the past year.

Nine regular meetings of the Branch were held, with an average attendance of about sixty-five at each meeting. Two of the meetings were luncheon meetings. The meetings were as follows:—

Jan. 9.—**Erecting Steel Buildings and Strengthening Bridges by Welding** by Mr. Frank P. McKibben, consulting engineer, Black Gap, Pa.

Jan. 26.—**Flow of Water and other Fluids in Pipes** by Professor R. W. Angus, M.E.I.C., Professor of Mechanical Engineering, University of Toronto.

Mar. 16.—**The Construction of the Trans-Canada Highway as an Unemployment Relief Measure** by Jas. Sinton, A.M.E.I.C., chief engineer of the Department of Northern Development, Province of Ontario.

Mar. 30.—Annual Meeting of the Branch.

April 12.—**Tests of Worm Gear Speed Reducers for Power Capacity and Lubrication Data** by Chester B. Hamilton, Jr., M.E.I.C., president and mechanical engineer of the Hamilton Gear and Machine Co.

Oct. 19.—**The Financing of our Highways System** by The Hon. Leopold Macaulay, Minister of Highways, Province of Ontario.

Nov. 2.—**The Chemistry of Portland Cement and its Significance to the Engineer in the Quality of Concrete** by Mr. W. J. D. Reed-Lewis, consulting engineer.

Nov. 16.—**Engineering Institute Affairs** by Dr. O. O. Lefebvre, M.E.I.C., President of The Engineering Institute of Canada.

Dec. 7.—**The Law of Contracts and Bonds of Particular Application to Engineers and Architects** by Mr. H. D. Anger, of Elliott, Hume, McKague, and Anger, barristers. This was a joint meeting with the Toronto Chapter of the Ontario Association of Architects.

During September the Employment committee of the Branch conducted a survey of the condition of unemployment among the membership and the results of the survey were forwarded to Headquarters of The Institute. Further assistance has been given to some members of the Branch from the "Toronto Branch E.I.C. Loan Fund." About one thousand dollars was raised over a year ago for this fund and it is expected that this amount will be sufficient for the present winter, unless very unexpected demands are made upon it.

The Branch is deeply grateful to the Technical Service Council under the direction of Lieut.-Colonel R. E. Smythe, A.M.E.I.C., who has also acted as chairman of the Toronto Branch Unemployment Committee, for the assistance which has been given to members of The Institute in aiding them to find employment. Had it not been for this assistance, the seriousness of the unemployment situation, which we expected following the survey, would have been much greater than it is and it would have been necessary to raise further money for the Loan Fund.

The Toronto Branch has representatives on the Regional Committee of the National Construction Council. A committee has also recently been formed to act in an advisory capacity to the Commissioner of Buildings of the City of Toronto. This committee consists of two members of The Engineering Institute of Canada, two members of the Ontario Association of Architects, and one member of the Contractors Association.

The membership of the Branch on December 31st, 1933, is made up as follows:—

| | *Resident* | *Non-Resident* | *Total* |
|---|---|---|---|
| Members | 108 | 1 | 109 |
| Associate Members | 219 | 15 | 234 |
| Juniors | 56 | 2 | 58 |
| Students | 73 | 21 | 94 |
| Affiliates | 3 | 1 | 4 |
| Branch Affiliates | 2 | .. | 2 |
| Total 1933 | 461 | 40 | 501 |
| Total 1932 | 490 | 38 | 528 |
| | −29 | +2 | −27 |

It is with regret that we record the death of the following members of the Branch during the past year: W. A. Bucke, M.E.I.C., A. R. Davis, M.E.I.C., and W. A. Spence, A.M.E.I.C.

W. S. Wilson, A.M.E.I.C., *Secretary-Treasurer.*

## Vancouver Branch

The President and Council:—

We beg to submit the following report of the activities of the Vancouver Branch of The Institute during the year 1933.

Meetings

Ten general meetings of the Branch, including one joint meeting each with the Vancouver Section, A.I.E.E., and the Military Institute of Vancouver, were held as follows:—

Feb. 1.—His Honour Judge Howay on **The Royal Engineers and Their Work in British Columbia.** Joint meeting with the Military Institute of Vancouver.

Feb. 11.—Inspection trip to the new Carrall Street gas plant of the British Columbia Electric Power and Gas Co. Ltd.

Feb. 20.—Mr. John Kirkhope on **The New Carrall Street Gas Plant.**

Mar. 4.—Inspection trip to Imperial Oil Refinery at Ioco, B.C.

Mar. 13.—Mr. A. D. Grant on **The Oil Industry.**

April 3.—Professor E. G. Cullwick, Jr.E.I.C., on **Electronic Valves.** Joint Meeting with Vancouver Section A.I.E.E.

April 13.—Dr. O. O. Lefebvre, M.E.I.C., President of The Institute, on **Institute Affairs.**

May 15.—Professor A. H. Finlay on **Erection of Sydney Harbour Bridge.**

Oct. 10.—W. H. Powell, M.E.I.C., on **First Narrows Pressure Tunnel.**

Nov. 8.—Annual Meeting.

The average attendance at meetings was 45.

Executive Meetings

Seven Executive meetings were held during the year to transact the routine business of the Branch and discuss matters of policy.

An informal dinner meeting of the Executive with Dr. O. O. Lefebvre, M.E.I.C., President of The Institute, as the guest of honour, was held in Hotel Georgia on April 13th prior to the General Meeting.

During the past year the Executive committee has carried on an extensive campaign for a policy of development aimed to bring The Institute into closer relations with the provincial associations of professional engineers. Co-operation with the Quebec Branch in particular has resulted in placing clearly before the other executive committees and members of Council the arguments in favour of higher standards of admission than those proposed in the 1932 Report of the Committee on Development. Also we have urged the adoption by Council of a definite plan of development on lines parallel to the membership structure of the provincial associations, which we believe will go far towards harmonizing Institute relations with them and bring the confederation objective into the realm of practical politics. Widespread criticism of the Development Committee's recommendations has caused Council to reconsider the whole question. A. S. Wootton, M.E.I.C., Councillor for Vancouver Branch, represented the Branch at the Plenary Meeting of Council in Montreal on October 30th and 31st. The results of the Council's deliberations on this question were announced in the December Journal.

A contribution of $39.00 was made by the Executive toward the expenses of the Plenary Meeting. This sum is being deducted from moneys due the Branch.

As in 1932, the President and Registrar of the Association of Professional Engineers were appointed honorary members of the Branch Executive, an arrangement which has been very helpful to the Branch and is recommended to the incoming Executive.

The Branch has also been fortunate in being able to carry out arrangements with the local branch of the American Institute of Electrical Engineers similar to those of 1932.

### Visit of President Lefebvre

The Branch was honoured during April by a visit from Dr. O. O. Lefebvre, M.E.I.C., President of The Institute. During the three days he was in Vancouver Dr. Lefebvre spent much time discussing Institute matters, particularly Institute development.

Through the co-operation of the Association of Professional Engineers of British Columbia, Dr. Lefebvre was given a number of opportunities to become familiar with the trend of professional thought here on the subject of closer relations of The Institute with the provincial associations in general.

### Walter Moberly Memorial Prize

The prize for 1933 was awarded to James Wilson MacRae for the best essay submitted by any student in the senior year of the Faculty of Applied Science of the University of British Columbia.

### Membership

| | *Resident* | *Non-Resident* | *Total* | *Suspended List* |
|---|---|---|---|---|
| Members | 45 | 9 | 54 | 1 |
| Associate Members | 53 | 24 | 77 | 4 |
| Juniors | 8 | 4 | 12 | 1 |
| Students | 32 | 6 | 38 | 6 |
| Affiliates | 3 | .. | 3 | .. |
| Branch Affiliates | 1 | .. | 1 | .. |
| | 142 | 43 | 185 | 12 |

A member may go on the suspended list for a limited period, providing he is not in arrears, and may be reinstated to membership on request. While on the suspended list he receives no publications of The Institute but the Branches may, at their own expense, continue to send notices to members on the list and thus keep them in touch with Branch activities. This policy has been pursued by the Vancouver Branch.

At the request of Headquarters the Branch agreed to put on a drive for new members and Dr. E. E. Brydone-Jack, M.E.I.C., was made chairman of the Committee. Recently Dr. Brydone-Jack asked to be relieved of this duty as he was leaving the city, and no action has been taken.

### Elections

For financial reasons the Executive decided to hold the elections by secret ballot at the Annual Meeting subject to the approval of the meeting, nominations signed by two corporate members in good standing and received at the meeting, being accepted on a basis of equality with those of the Nominating committee.

### Financial Statement

The attached financial statement shows a balance on hand of $44.41 as at November 4th, 1933.

*Receipts*

| | | | |
|---|---|---|---|
| Bank balance, December, 1932 | | $ 67.27 | |
| Rebates from Headquarters (Sept. 1932 to April 1933, incl.) | | 224.76 | |
| Branch News | | 9.14 | |
| Bank interest | | .86 | |
| | | | $302.03 |

*Disbursements*

| | | | |
|---|---|---|---|
| *Office expenses:* | | | |
| Rent | $ 75.00 | | |
| Petty cash | 30.60 | | |
| Telegraphs | 3.90 | | |
| Florist (wreath) | 3.00 | | |
| Stenographer | 15.00 | | |
| | | $127.50 | |
| *Meetings:* | | | |
| Notices | 34.12 | | |
| Auditorium rental | 30.00 | | |
| Dinner meeting—April 13th | 16.00 | | |
| | | 80.12 | |
| Honorarium to Secretary (W. O. Scott) | | 50.00 | |
| Balance in bank, November 4th, 1933 | 43.01 | | |
| Cash in hand | 1.40 | | |
| | | 44.41 | |
| | | | $302.03 |

### Walter Moberly Memorial Fund

*Receipts*

| | | |
|---|---|---|
| Bank balance of December, 1932 | $ 87.07 | |
| City of Vancouver Bond interest | 25.00 | |
| Dominion of Canada Bond interest | 5.00 | |
| Bank interest (May, 1933) | 1.34 | |
| | | $118.41 |

*Disbursements*

| | | |
|---|---|---|
| Bank charges | $ 1.00 | |
| Bursar, University of British Columbia | 25.00 | |
| Bank balance, November 4th, 1933 | 92.41 | |
| | | $118.41 |

### Bonds Held in Trust

| | |
|---|---|
| City of Vancouver No. 663—5%—1963 | $500.00 |
| Dominion of Canada No. T.A 065189—5%—1943 | 100.00 |
| | $600.00 |

Audited and certified correct:

Respectfully submitted,
P. H. Buchan, A.M.E.I.C., *Chairman.*
A. E. Gordon, Jr.E.I.C., *Secretary-Treasurer.*

## Victoria Branch

The President and Council:—

The undersigned have the honour to submit the following report on the activities of the Victoria Branch of The Engineering Institute of Canada during the year 1933.

### Membership

An increase of five is reported during the year: two members, six associate members, and one student member were added: one member and one student left Vancouver Island, and two students and one affiliate resigned.

Two senior members were granted life membership. Some success met the efforts of the Branch towards new membership, two applications having been forwarded to Montreal with several applications pending.

At the close of the year the membership of the Branch was as follows:—

| | *Resident* | *Non-Resident* |
|---|---|---|
| Members | 19 | 2 |
| Associate Members | 24* | 9* |
| Junior Members | 2 | .. |
| Students | 7 | 3 |
| Branch Affiliate | 1 | .. |
| | 53 | 14 |

*Includes five Associate Members (three resident and two non-resident) on suspended list on account of inability to pay membership dues.

### Meetings

Seven meetings of the Executive committee were held, the average attendance being seven members, which is considered to be an exceptionally high average and evidence of the interest taken in Institute affairs.

Five general meetings were held, including one social meeting and the Annual General Meeting, the average attendance of 21, or 40 per cent of the resident membership, being considered fairly satisfactory when it is remembered that the official duties of many members require their frequent absence from the city. Reports of technical papers have been duly published in The Journal under the heading of Branch News.

We have adopted the custom of holding our general meetings at a down-town hotel at 7.45 p.m., the meetings being preceded by an inexpensive dinner at 6.15 p.m.; this gives members an opportunity of meeting socially and, it is felt, ensures a better attendance.

### Visit of President

In April, 1933, the Branch was honoured by a visit from Dr. O. O. Lefebvre, M.E.I.C., President of The Institute, who remained two days in the city. The Branch Executive met Dr. Lefebvre on the evening of the first day and views were exchanged on many matters affecting The Institute. On the following evening 27 members met the President at an informal dinner, following which Dr. Lefebvre addressed the Branch. It is felt that Dr. Lefebvre's visit has assisted materially in the promotion of the interests and objects of The Institute.

### Development Committee Report

Members of the Victoria Branch evinced great interest in the Interim Report of The Institute's Committee on Development: every detail of the report was discussed in committee and, finally, by the Branch as a whole. The opinion of the Branch was then put into concise form and sent to all concerned, including secretaries of all Branches.

### Unemployment

The Executive committee of the Branch as a whole continued to act as a committee on unemployment; it is gratifying to be able to report that the situation is certainly no worse than at this time last year and that no cases of destitution are known to the committee.

Through co-operation of officials of the Department of National Defence, all members known to have been unemployed were given an opportunity of employment during the summer on relief projects and six members accepted; three of these members are still so employed. Two members also found employment other than the foregoing; in one case the work was of a permanent nature.

FINANCIAL STATEMENT

The financial statement, attached hereto, shows an improved financial condition at the end of the year, notwithstanding the fact that no branch dues were levied.

ANNUAL GENERAL MEETING 1933

This meeting was held on December 8th, 1933 and the Branch officers for the year 1934 elected.

It is interesting to note that the father of Mr. W. Clarke Gamble, M.E.I.C., who was this year elected a member of Executive committee was the first chairman of the Victoria Branch, which was formed twenty-two years ago.

CONCLUSION

We wish to take this opportunity of expressing our thanks and appreciation of the courtesy and assistance which we have received at all times from Headquarter's staff.

FINANCIAL STATEMENT

*Receipts*

| | | |
|---|---|---|
| Balance in hand, December 6th, 1932 | | $ 71.65 |
| One Branch Affiliate's dues | $ 3.00 | |
| Rebates and Branch News | 138.95 | |
| | | $141.95 |
| | | $213.60 |

*Disbursements*

| | | |
|---|---|---|
| Stationery and repairs to typewriter | $ 3.83 | |
| Stenographer | 19.98 | |
| Mimeographing, addressing and mailing | 23.62 | |
| Cost of five meetings | 27.70 | |
| Telegrams | 8.83 | |
| Telephones | .20 | |
| Wreath and flowers | 6.00 | |
| Preparation and mailing recommendations of Victoria Branch in connection with Development Committee Report | 9.75 | |
| Exchange on cheques | .30 | |
| Present for Secretary of Branch | 10.50 | |
| | | $110.71 |
| Balance in hand, December 1st, 1933 | | 102.89 |
| | | $213.60 |

Audited and found correct:
H. W. GAHAN, A.M.E.I.C., Auditor.

Respectfully submitted,
H. L. SWAN, M.E.I.C., *Chairman.*
I. C. BARLTROP, A.M.E.I.C., *Secretary-Treasurer.*

## Winnipeg Branch

The President and Council:—

The following report of the Winnipeg Branch for the year ending December 31st, 1933, is respectfully submitted.

The Branch membership is as tabulated below:—

| | *Resident* | *Non-Resident* | *Total* |
|---|---|---|---|
| Members | 39 | 5 | 44 |
| Associate Members | 95 | 24 | 119 |
| Juniors | 9 | 4 | 13 |
| Students | 47 | 9 | 56 |
| Affiliates | 2 | 0 | 2 |
| Branch Affiliates | 3 | 0 | 3 |
| | 195 | 42 | 237 |

This tabulation includes members of all classes under suspension.

The membership of the Branch has to our great regret been reduced by death of V. E. Marlatt, Jr.E.I.C.

The Executive committee has held 13 meetings during the year.

There were 13 regular meetings of the Branch during the year, as tabulated below:—

Jan. 5.—D. A. Ross, M.E.I.C., **The Winnipeg Auditorium.** Attendance, 52.

Feb. 2.—Arch. Blackie, **Some Modern Portland Cements.** Attendance, 66.

Feb. 16.—Dr. T. Glenn Hamilton, **Psychical Research—A Belated Branch of Science.** Attendance, 95.

Mar. 2.—J. P. Fraser, A.M.E.I.C., **Operation of the Welland Ship Canal.** Attendance, 40.

Mar. 16.—Professor E. E. Macdonald, A.M.E.I.C., **Granular Materials in Deep Bins.** Attendance, 39.

April 11.—Dean E. P. Fetherstonhaugh, M.E.I.C., **The Photo-Electric Cell.** Attendance, 42.

April 21.—A. B. Cooper, M.E.I.C., **The Ferranti Surge Absorber.** Attendance, 47.

Oct. 5.—Major Geo. Northwood, **Self Liquidating Public Works.** Attendance, 31.

Oct. 19.—Major H. L. Strange, **The Course of the Depression and Recovery—Some Facts; Some Fallacies.** Attendance, 42.

Nov. 2.—Professor J. N. Finlayson, M.E.I.C., **The St. Lawrence Waterway.** Attendance, 128.

Nov. 16.—A. Steventon, **Modern Construction.** Attendance, 165.

Dec. 7.—Wm. D. Hurst, S.E.I.C., **Modern Water Purification.** Attendance, 43.

Dec. 21.—H. C. Beresford, **Great Bear Lake.** Attendance, 52.

It will be seen from this that attendance at Branch meetings has improved greatly, this year's average being 65 while that for last year was 46.

On April 21 the Branch had the good fortune to receive a visit from the President of The Institute Dr. O. O. Lefebvre, M.E.I.C., who addressed the members on Institute affairs. The following day the members met Dr. Lefebvre at luncheon at the Fort Garry hotel, at which time the President made some further remarks on Institute affairs and gave a most interesting address on the activities of the Quebec Streams Commission.

The Joint Committee on Unemployment of the Winnipeg Branch and the Association of Professional Engineers of the Province of Manitoba has, under the able chairmanship of Professor J. N. Finlayson, M.E.I.C., covered much ground and has explored all possible sources of prospective employment for members in need of such, and has had some success in placing men.

The finances of the Branch are not in as strong a condition as could be desired.

FINANCIAL STATEMENT

*Receipts*

| | | |
|---|---|---|
| Rebates due, December, 1932 | $ 6.00 | |
| Rebates for 1933 | 232.14 | |
| Branch News | 16.38 | |
| Dues, Branch Affiliates | 15.00 | |
| Bond interest | 27.50 | |
| | | $297.02 |

*Expenditures*

| | | |
|---|---|---|
| Honorarium to Secretary | $ 75.00 | |
| Deficit, Annual Dance | 24.13 | |
| Students prizes | 80.00 | |
| Joint Committee expenses | 89.32 | |
| Refreshments, Branch meetings | 12.77 | |
| Janitor's services | 28.00 | |
| Printing and postage | 179.91 | |
| Telegraphs | 6.25 | |
| Safety deposit fees | 6.00 | |
| Grant, National Construction Council | 4.00 | |
| | | $505.38 |
| Grant re Plenary Meeting | | 39.70 |
| | | $545.08 |

Thus the bank balance has been reduced by $248.06.

Respectfully submitted,
G. H. HERRIOT, M.E.I.C., *Chairman.*
E. W. M. JAMES, A.M.E.I.C., *Secretary-Treasurer.*

# COMMITTEE of MONTREAL BRANCH

IN CHARGE OF ARRANGEMENTS FOR

## THE ANNUAL GENERAL PROFESSIONAL MEETING

### Montreal, February 8th and 9th, 1934

E. A. Ryan, M.E.I.C., Chairman,
Annual Meeting Committee.

F. S. B. Heward, A.M.E.I.C.,
Chairman,
Entertainment Committee.

Dr. A. Frigon, M.E.I.C.,
Chairman, Montreal Branch.
Vice-Chairman,
Annual Meeting Committee.

J. A. McCrory, M.E.I.C.,
Chairman,
Publicity Committee.

H. W. Lea, Jr.E.I.C.,
Chairman,
Registration Committee.

C. K. McLeod, A.M.E.I.C.,
Secretary Treasurer,
Montreal Branch.
Chairman, Committee in Charge of
Hotel Arrangements.

F. V. Dowd, A.M.E.I.C.,
Chairman,
Papers Committee.

VOLUME XVII FEBRUARY 1934 No. 2

## A New Canadian Observatory

Much of the recent progress in astronomical knowledge has related to the stars and nebulae, and is the result of patient observation with greatly improved equipment. This has furnished astronomers with a mass of information on such matters as the stars' temperatures, motions, distances and constitutions, all based on the study of the messages which the astronomer deciphers from the light sent to him from the skies. In fact, astronomy has become closely connected with atomic physics and the astronomer and the physicist are working hand in hand. For such investigations the astronomer needs instruments of a capacity and precision undreamt of in the days of Newton and Huygens. Of these, the most important is, of course, the telescope with its photographic and spectroscopic accessories.

The design and construction of a great telescope is now an undertaking which requires the highest skill of the mechanical and electrical engineer, and presents manufacturing and optical problems which very few engineering works are able to solve successfully. As Dr. Young points out in his paper, printed elsewhere in this issue of The Journal, it is necessary to design an instrument which can be moved slowly and with extreme accuracy, although weighing many tons, so as to follow exactly the motion of a celestial object. Further, if the image of the object is to have the necessary clearness of definition, the deformations of the telescope structure and the mirror it carries must be kept within very minute limits, whether such distortions are due to temperature changes or to the weight of the parts of the instrument itself.

The paper describes the way in which these objects have been attained in the construction of the new 74-inch telescope for the David Dunlap Observatory of the University of Toronto. The provision of this instrument and the building which houses it was due to the efforts of Professor C. A. Chant, head of the Department of Astronomy of that University, who for the past twenty-five years has urged the establishment of a research observatory there. In numerous public lectures, in The Journal of the Royal Astronomical Society of Canada, and in the courses in astronomy within the university, the need of an observatory was constantly stressed.

During his life, the late David A. Dunlap took a keen interest in astronomy and in the meetings of the Astronomical Society. When, therefore, some time after his death, Dr. Chant approached Mrs. Dunlap with the proposal that she erect an observatory as a memorial to her husband, the project was very sympathetically received, and as a result plans were made for the observatory, the account of which we are now privileged to publish.

Some of the largest telescopes of the world are listed below:

1. The 100-inch reflector at the Mount Wilson Observatory, California.
2. The 72-inch reflector at the Dominion Astrophysical Observatory, Victoria, B.C.
3. The 69-inch reflector at the Perkins Observatory, Delaware, Ohio.
4. The 60-inch reflector at Harvard College Observatory, Boston.
5. The 60-inch reflector at the Mount Wilson Observatory, California.

The telescope for the new David Dunlap Observatory will have an aperture of 74 inches. It will therefore be the second largest in the world, and its construction gives Canada two reflecting telescopes of the first rank.

The new telescope will be devoted almost entirely to astronomical research. The advantage which it will possess over smaller instruments is due to its great light-gathering power. Taking the light-gathering power of the unaided eye as a unit, that of various sized telescopes may be expressed in terms of this unit. A 2-inch telescope would possess 64 times the light-gathering power of the eye, a 10-inch telescope 1,600 times and a 74-inch telescope 87,616 times. Possibly another and more striking way to illustrate the effectiveness of the large telescope is by a comparison of the number of stars which can be seen in telescopes of various sizes. There are about 4,000 stars visible to the naked eye in the whole celestial sphere on a clear moonless night. A 2-inch telescope will show about 300,000 and with the 74-inch telescope it will probably be possible to photograph over 500 million. Thus the ability of the large telescope to photograph faint stars enables it to reach far out into the depths of space.

When a spectrograph is attached to the telescope the spectra of the stars can be photographed and it is possible to determine their constitution, temperature, distance and speed of motion in the line of sight. To photograph the spectrum of a star at the limit of naked eye visibility requires about two hours with a telescope of 15-inch aperture; with the 74-inch this exposure time can be reduced to ten or fifteen minutes. Thus a great deal more work can be done in a given time with the larger instrument. The actual difference in practice is greater than these numbers indicate, owing to the danger of the long exposures being ruined by clouds and other troubles.

But there is another advantage of the large telescope over the small, and that is the clarity with which it shows detail on any surface. The layman thinks of this as magnifying power; a better term is resolution. In order that detail may be seen on an object it is necessary that the images of two nearby points of the object be seen as two separate images in the telescope. The smaller the angular separation of two points which can be seen apart, the greater the detail which can be made out. This ability to distinguish contiguous points is called resolving power and it varies directly with the aperture of the telescope.

In order that the full resolving power of a telescope be developed it is necessary that the beam of light from the source pass through a perfectly uniform medium and ordinarily even when the sky is clear the atmosphere of the earth is very far from this condition. In looking at the stars through a small telescope of 2-inch aperture the uniform beam of light needs to be two inches in diameter only, but in a 74-inch telescope there must be a uniform beam 74 inches in diameter. The former condition is met with on very many more nights per year than the latter. It therefore happens that the casual visitor to an observatory may be disappointed with the clarity with which he sees the moon or planet through the large telescope, often not better than through a much smaller instrument. The fault does not lie with the telescope but with the atmosphere. When the latter is steady, or, as an astronomer would say, when the "seeing" is good, the full aperture can be utilized to advantage and much more detail seen. The observer must seize these opportunities to do his best work.

The new telescope will be used on every available clear night from sunset to sunrise in photographing the stars or obtaining their spectra. An observatory however would not be fulfilling its complete purpose if used entirely for research. Part of the time must be devoted to those interested in seeing the wonders of the skies and it is planned to set aside one evening per week when the observatory will be open to the public and the telescope available to them. From such a visit some idea may be gained of the patience and skill which the observer needs in order to keep a star image on the slit of his spectroscope, or obtain a clear photographic record in spite of adverse atmospheric conditions and the necessity for prolonged exposure.

## OBITUARIES

### Charles Johnstone Armstrong, C.B., C.M.G., V.D., M.E.I.C.

The membership of The Institute will learn with deep regret of the death at Montreal on January 23rd, 1934, of Major-General Charles Johnstone Armstrong, C.B., C.M.G., V.D., M.E.I.C.

Born at Montreal on August 27th, 1872, General Armstrong graduated from the Royal Military College, Kingston, in 1893.

Following graduation he was until 1899 assistant engineer and later resident engineer on the construction and maintenance of the Atlantic and Lake Superior Railway, and in 1899-1900 served in South Africa with the Royal Canadian Regiment. In 1900-1901 General Armstrong was on the staff of the director of Imperial Military Railways in South Africa, and in 1902-1907 he was divisional engineer in charge of the construction of the Central South African Railways at Harrismith and Krugersdorp. In 1908-1910 he was district engineer in charge of maintenance and new works of the Orange River Colony Railways.

Returning to Canada in 1911, Major-General Armstrong became assistant representative for Sir John Jackson (Canada) Limited, engineers and contractors. During the Great War he held many important posts; he proceeded to England with the 1st Divisional Engineers, C.E.F., and in 1914-1915 commanded the Royal Canadian Engineers, 1st Canadian Division, in England and France. In 1915-1916 he commanded the Royal Canadian Engineers, Canadian Corps, in France, and was engineer-in-chief for Canadian engineer defences in France from February to November 1918. From that time until March 1919, he was chief engineer, VII Army Corps, France. He was mentioned three times in despatches, and besides receiving the 1914-1915 Star, British War Medal and the Victory Medal, was made a Companion of the Bath (C.B.), a Companion of the Order of St. Michael and St. George (C.M.G.). He received the Auxiliary Forces Long Service Decoration (V.D.) and his foreign decorations include the Belgian Ordre de la Couronne and the Portuguese Military Order of Avis (Grand Officer).

C. J. ARMSTRONG, C.B., C.M.G., V.D., M.E.I.C.

Following his return to Canada, Major-General Armstrong was appointed District Officer Commanding Military District No. 4, Montreal, in October 1919, and commanded that district until 1926 when he was appointed to command Military District No. 1, at London, Ont., which appointment he held until 1933, when he retired and made his home at Carillon, Que.

In January, 1933, Major-General Armstrong was promoted to the rank which he held at the time of his death.

He joined The Institute as a Student in 1894 and was transferred to Associate Membership in 1902, becoming a Member in 1912. General Armstrong always took an active part in the affairs of The Institute and was for a number of years chairman of the Honour Roll and War Trophies Committee.

### Hiram Fergusson Donkin, M.E.I.C.

With the death of Hiram Fergusson Donkin, M.E.I.C., at Halifax, N.S., on January 8th, 1934, The Institute loses one of its oldest members.

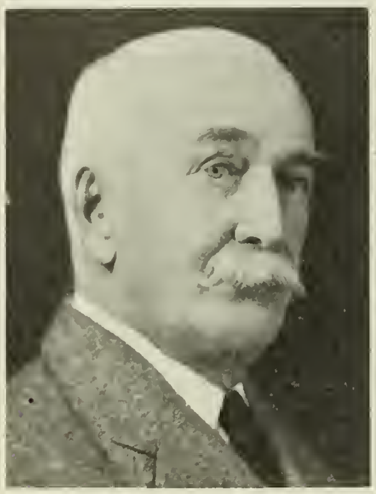
Born at River Philip, N.S., on March 2nd, 1845, Mr. Donkin became a rodman on the Pictou Branch Railway in 1863. From 1867 to 1874 he was assistant engineer with the Intercolonial Railway, and from 1874 to 1876 served in the same capacity with the Kent Southern Railway. During the years 1876-1879, Mr. Donkin was divisional engineer with the Eastern Extension Railway, and in 1879 joined the staff of the Canadian Pacific Railway as divisional engineer. From 1882 to 1883 he was in charge of construction of the Manitoba and Northwestern Railway and from 1883 to 1885 he was contractor with the Canadian Pacific Railway. In the year 1885-1886 Mr. Donkin was in charge of a preliminary survey for the Cape Breton Railway, and in July 1886 was appointed resident chief engineer of that railway. Later on, Mr. Donkin was for some years chief engineer of the Dominion Coal Company, and subsequently was appointed Deputy Commissioner of Public Works and Mines at Halifax, N.S.

Mr. Donkin was one of the original members of the Canadian Society of Civil Engineers, having joined as a Member on June 9th, 1887, the year of its foundation.

### Cyrus Witter Archibald, A.M.E.I.C.

Regret is expressed in recording the death of Cyrus Witter Archibald, A.M.E.I.C., which occurred at Truro, N.S., on January 3rd, 1934.

Mr. Archibald was born at Truro, N.S. on April 27th, 1857, and in 1879 was employed on the Canadian Pacific Railway with the company's engineers on construction at the Lake of the Woods. From 1880 to 1885 he was in the Engineers Department of the Intercolonial Railway, being engaged on surveys and construction work, and from 1885 to 1887 fulfilled the same duties on the Pictou and Oxford branches. In 1887 Mr. Archibald was appointed resident engineer on the Oxford and New Glasgow Railway, which office he held until 1890. During the following year (1891) he was engaged on engineering work of various kinds in New Brunswick and Nova Scotia for the Intercolonial Railway, and from 1891 to 1912 he was roadmaster for the same railway. In 1912 he was appointed resident engineer at New Glasgow, and in the following year became roadmaster on the Halifax division, which position he held until 1931, when he retired.



CYRUS WITTER ARCHIBALD, A.M.E.I.C.

He joined The Institute (then the Canadian Society of Civil Engineers) as a Student on May 17th, 1888, and became an Associate Member on November 21st, 1901. Mr. Archibald became a Life Member on April 11th, 1930.

Mr. Archibald belonged to a well known Nova Scotia family and was held in high esteem by his many friends, especially in railroad circles, having been connected with railway work since the pioneer days in his native province.

### George Edward Wilson Cruttwell, M.E.I.C.

Deep regret is expressed in recording the death in London, England, on November 10th, 1933, of George Edward Wilson Cruttwell, M.E.I.C.

Mr. Cruttwell was born at Frome, Somerset, England, on December 5th, 1857, and received his education at Clifton College and the Applied Science Department of King's College, London. From 1876 to 1879 he was an articled pupil to the late R. P. Brereton, and was employed as assistant resident engineer on Neath harbour improvement works. In November 1879 Mr. Cruttwell entered the service of Mr. (afterwards Sir) John Wolfe Barry, and Mr. H. M. Brunel under whom he acted as resident engineer on St. Paul's station and bridge, and in 1886 he was appointed resident engineer on the construction of the Tower bridge. Since its completion until the time of his death, he has been consulting engineer for the bridge. Following the completion of the Tower bridge, Mr. Cruttwell was in private practice for some years. He held the position of consulting engineer to the Orange Free State Railways until the Boer War and in this capacity was responsible for the new locomotives and rolling stock, large quantities of which were ordered between 1897 and 1900. In 1900 Mr. Cruttwell prepared a scheme for widening London bridge without adding to the weight on the foundations, which was carried out under his supervision without interference with the traffic, and in the same year he obtained the premium of One Thousand Pounds from the New South Wales government for a design, submitted in competition, for Sydney Harbour bridge. In 1901 Mr. Cruttwell joined the firm of Sir John Wolfe Barry and Partners, and during the last thirty years has been connected with a large number of important works covering a very extended range of engineering practice, including dock and harbour works at Barry, Grangemouth, Middlesbrough, Immingham, Newport (Mon.), Grimsby and elsewhere.

In November, 1911, Mr. Cruttwell visited Vancouver in connection with the Second Narrows bridge scheme for which his firm was at that time acting as consulting engineers in conjunction with Messrs. Cleveland and Cameron.

During the Great War Mr. Cruttwell devoted most of his time to work for the Department of Explosives Supply. In 1925 he was appointed honorary consulting engineer to the War Graves Commission, which position he held until the time of his death.

Mr. Cruttwell was a member of the Institution of Civil Engineers and of the Institution of Mechanical Engineers.

He became a Member of The Institute (then the Canadian Society of Civil Engineers) on April 13th, 1912.

### Ernest Harrison McBeath, S.E.I.C.

It is with deep regret that we record the passing, at his home in Moncton, N.B., of Ernest Harrison McBeath, S.E.I.C. Death occurred on December 3rd, 1933, following a long period of illness, the result of an injury received in athletics.

ERNEST HARRISON McBEATH, S.E.I.C.

Mr. McBeath was born at Moncton, N.B., on March 23rd, 1910. He received his elementary education in the Victoria School, afterwards attending Aberdeen High School, in the entrance examinations to which he won the Governor General's medal for Westmorland county. He entered Mount Allison University, Sackville, and graduated with a diploma in engineering. At Mount Allison, Mr. McBeath was president of the Engineering Society. He spent one year at McGill as a student of engineering. Later, failing health compelled him to discontinue his studies.

Mr. McBeath joined The Institute as a Student Member on January 20th, 1931.

## PERSONALS

Charles Connell, A.M.E.I.C., Technical Instructor in the Motive Power Department of the Canadian National Railways, has been transferred from Montreal to Toronto. Mr. Connell, who has been with the Canadian National Railways for many years, was for some time located at Ottawa.

A. R. Currey, Jr.E.I.C., has become connected with Industrial Utilities Limited, Montreal. Mr. Currey obtained the degree of B.A. at Queen's University in 1925, and later studied mechanical engineering at the same institution. In 1927 he entered the engineering department of the Bell Telephone Company, at Montreal, and remained with the same company until the present time, having been appointed general vehicles supervisor in 1931.

M. V. Sauer, M.E.I.C., has been appointed assistant chief engineer of the Beauharnois Light, Heat and Power Company.

Mr. Sauer is a graduate of the University of Toronto of the class of 1901, and took a post graduate course in 1902, receiving a fellowship in 1903.

Following graduation, Mr. Sauer was with the Ontario Power Company at Niagara Falls, first as draughtsman and the next year as assistant to the mechanical engineer. In 1905 he was appointed chief designer of the Niagara Falls Power Company, Niagara Falls, N.Y., and the following year was construction engineer for the Iroquois Construction Company, Buffalo, N.Y. In 1907 he again became associated with the Ontario Power Company as chief designer, then as mechanical assistant to the engineer-in-charge, and subsequently, in 1912, as mechanical engineer in full charge of design, field and inspection department. He later became connected with the Hydro-Electric Power Commission of Ontario, and occupied a prominent position in connection with the design and construction of the Queenston-Chippawa power development. In 1923 Mr. Sauer became hydraulic engineer for Canadian Vickers Limited, with headquarters at Montreal, and in 1925 he was transferred to Toronto, and was chief engineer of the hydraulic department of the then recently incorporated Vickers and Combustion Engineering Ltd., which was a consolidation of the Canadian Vickers Limited, and the Combustion Engineering Corporation Ltd. In 1926, he was appointed vice-president of William Hamilton Limited, at Peterborough, Ont., and was later with the Winnipeg Electric Company, Winnipeg, Man. In 1929 he joined the staff of the Beauharnois Construction Company as hydraulic engineer.

## Addresses Wanted

Mail addressed to the following members has been returned to us by the post office authorities, and any information as to their present addresses will be appreciated:—

*Members*

| | |
|---|---|
| C. W. Dill | C. H. Larson |
| H. Kay | J. C. Tache |

*Associate Members*

| | |
|---|---|
| A. O. Beauchemin | J. C. Mitchell |
| T. R. Cooil | T. M. Montague |
| N. T. Ellis | T. B. Patterson |
| D. H. Fleming | H. E. Thornton |
| W. J. Fraser | L. B. Tillson |
| J. A. Henderson | A. A. Webster |
| F. W. S. Kennedy | J. B. Wilkinson |
| A. J. McFadgen | |

*Juniors*

| | |
|---|---|
| J. E. Archer | J. M. Ehmann |
| T. E. Dwyer | J. E. Kellett |

*Students*

## RECENT ADDITIONS TO THE LIBRARY

**Proceedings, Transactions, etc.**

American Institute of Electrical Engineers: Quarterly Transactions, September-December, 1933.

Institution of Mechanical Engineers: Proceedings, Volume 124, 1933.

American Society of Mechanical Engineers: Chicago Meeting of Railroad Division, June 26th, 1933; "Contribution of Research to Railway Progress."

**Reports, etc.**

*Quebec Bureau of Mines:*
Annual Report 1932—Part A—Mining Operations and Statistics.

*American Society for Testing Materials:*
Tentative Standards 1933.

*American Institute of Mining and Metallurgical Engineers:*
Year Book 1934.

*Governor of the Panama Canal:*
Annual Report 1933.

*American Society of Mechanical Engineers:*
Research Publication—"Fluid Meters."

*Canada, Department of Labour:*
Report for the year ending March 31st, 1933.

**Technical Books, etc., Received**

Practical Designing in Reinforced Concrete, Part II, by M. T. Cantell. (*E. and F. W. Spon Ltd.*)

Evaporating, Condensing and Cooling Apparatus, by E. Hausbrand. (*Van Nostrand*). Presented by Professor R. W. Angus, M.E.I.C.

Air Conditioning, by Moyer and Fittz. (*McGraw-Hill*). Presented by Professor R. W. Angus, M.E.I.C.

Heat Transmission, by W. H. McAdams. (*McGraw-Hill*). Presented by Professor R. W. Angus, M.E.I.C.

Elements of Engineering Thermodynamics, by Moyer, Calderwood and Potter. (*Wiley*). Presented by Professor R. W. Angus, M.E.I.C.

Canadian Almanac 1934. (*Copp Clark Co. Ltd.*)

George Washington Bridge across the Hudson River at New York, N.Y. (Reprinted from Transactions of the American Society of Civil Engineers, Vol. 97, 1933) (Port of New York Authority.)

## BULLETINS

*Air preheaters.*—An 8-page folder has been received from the Superheater Company, New York, illustrating the various applications of the Ljungstrom air preheater in the public utility and steam power plant fields, and to those interested in industrial heat recovery.

*Concrete*—The Portland Cement Association, Chicago, have issued a 24-page booklet describing monolithic concrete sewers with photographs and design details of types of construction used in eleven leading cities.

*Centrifugal Pumps*—A 4-page folder issued by the Worthington Pump and Machinery Corporation, Harrison, N.J., describes two-stage monobloc centrifugal pump, of high efficiency and low power requirements for services requiring relatively small capacity and medium discharge head.

*Metal treatment*—a 24-page brochure received from The Follsaid Syndicate Limited, of whom the Canadian representative is R. Prefontaine, Montreal, describes the various processes for the treatment of metals of ordinary commercial quality to render them resistant to oxidation at high temperatures, to acid attack, and to give them surface hardness, also the Follsaid agglomeration process for the agglomeration of "fines" flue dust, burned pyrites residues, etc., and the Follsaid volatilization process for the treatment of ores.

*Refuse Collectors*—A 6-page folder received from the Duke Equipment Company, Montreal, describes the various models of truck collector bodies sold by this company. The body mechanism is hydraulically operated, and provides for waist-high loading, thus producing increased speed of collection and disposal.

*Steel Framing*—In their recently issued 20-page booklet the Stran-Steel Corporation, Detroit, Mich., review the use of steel framing for five types of steel house construction. Other possible uses such as roofs, signboards etc., are given. Tables showing dimensions and weights and load possibilities are included, also details of various types of connectors.

*Steel Houses*—In a 28-page booklet issued by the Stran-Steel Corporation, Detroit, Mich., views of actual interiors and exteriors of steel house construction are given.

## CORRESPONDENCE

To The Editor, January 9, 1934
Engineering Journal

In view of the continued serious scarcity of employment among engineers and draughtsmen, we would venture to suggest that an appeal be made to employers to discontinue the loaning of men from one firm to another. By this means it happens that a man who has been unemployed for two or more years is done out of a temporary job, which, however small, would have been of immense financial assistance to him. From a glance at the "Situations Wanted" columns of The Engineering Journal or any list of experienced men available, it is obvious that only in exceptional circumstances can there exist a necessity for borrowing a man at present employed.

Yours very truly,
J. W. March, a.m.e i.c.

The Editor, December 18th, 1933
The Engineering Journal,

Dear Sir,

I read with interest, on page 527 of The Engineering Journal for December, an excerpt from the S.A.E. Journal by C. F. Kettering. Mr. Kettering's statements are enlightening. In this same connection, the opinions of one of the rank and file, who has been fortunate enough to have had responsible charge of the activities of several hundred engineers representing many countries, might not be out of place.

If Mr. Kettering's findings don't coincide with those of the writer, the answer must necessarily lie in the selection and handling of material at hand. The statements are answered in the order in which they are made:

"Engineers as a Class are Too Conceited."

With the possible exception of the recent graduate or a young man, nothing can be further from the truth. We usually find the experienced engineer criticized for being too shy and retiring. Few of them care to make speeches because of this very failing. The conceited man is usually willing to talk on any or all subjects at any time.

"They Think They Known a Lot."

In my own experience, the engineer is the world's greatest pessimist. Engineers lack the confidence of the know-it-all in their own ability. They don't talk very much about what they have done until the work is completed, tested and gives satisfactory service. By experience, the engineer has found that statements which have no basis in fact are liable to be wrong and they will at all times question such statements—not because they think they are right or know a lot, but because they wish to get down to facts before accepting the statement.

"They Don't Mix With Enough Kinds of People."

This is unfortunately only too true. During working hours the engineer has little opportunity for social contact. During his own time a large portion of this must be spent in study if he is to maintain efficiency in his life's work. Engineering methods and processes are in a continual state of flux. The engineer must stay up-to-date or pass out of the picture. When given the opportunity, the engineer is friendly and a good mixer.

"They Lack Imagination."

We must assume Mr. Kettering, in making this statement, feels he has a corner on this valuable process. Why is it, then, that his company with its unlimited financial resources are content to lag five or ten years behind and then copy the developments of European manufacturers of custom built motor cars? I might ask what is wrong with his imagination. However, this is beside the point. All that we have to state is this—every building, bridge or piece of engineering work—machine or what have you, first must take form in the imagination of the engineer before it can be placed on paper.

"They Are Not Emotional Enough."

This is a statement with which it is somewhat difficult to deal. I believe that the average engineer feels emotion just as much as any other individual. However, due to his training and experience, he usually views things as they are and tries to hide his emotions. In other words, he does not capitalize this function as, for instance, is done by the moving picture actor or actress.

"Few of Them Have Broad Mental Perspective."

This statement is probably further from the truth than any of the preceding ones. Let us take, for instance, the typical engineer's work—one who happens to be in charge of machine design and production. In the first place, he must always bear in mind the saleability of the product. He must view the product from the eyes of both the ultimate customer and the salesman. At the same time, he must give due and proper consideration to the economics of the problem with a view to giving the customer a cheap practical product which the sales department will have no difficulty in presenting to the customer and one which can also be manufactured to compete with present machines at a profit to the engineer's employer. Furthermore, he must bear in mind that the product as produced is well within the capabilities of the different branches of manufacture of the company with whom he is employed. In the design and production of the machine he frequently has to deal with eccentricities of his management and different department heads. If this does not constitute a broad perspective within his own field, we are sadly mistaken.

On the other hand, the average engineer has many pursuits outside his own line of endeavour. He usually gives some of his spare time to the study of the various branches of art, theology and politics.

The next two statements must be classified as one:

"Too Many of Them Are Satisfied With Things As They Are."
"They Are Not Dissatisfied Enough."

From my own experience I would say that the average engineer is about the most dissatisfied person in the world. As already stated, they usually are true pessimists. The only individual who can possibly outclass them on a score of dissatisfaction is the Tommy Atkins of the British Regular Army. Dissatisfaction on the part of the engineer frequently causes his dismissal. This, however, is the wrong attitude to take for, as a matter of fact, it is one of the cardinal attributes of the profession, for it is only by dissatisfaction with conditions as they exist that upward progress can be made. Practically every new invention in every field is brought about by the dissatisfaction of the inventor with the methods existing. It is this dissatisfaction, and not the desire for gain which prompts new inventions.

"They Are Inclined to Put Formulae Ahead of Facts."

This statement is absolutely absurd. Mr. Kettering must be out of touch with engineering practice. One would assume from the statement that formulae consist of a conglomeration of hypothetical numbers and signs which bear little or no relation to the subject in hand. In other words, he differentiates between formulae and facts. Formulae, as used by engineers today, are mathematical statements of the relationship of facts which have been proved over and over again by experiment. With the fundamental facts, it is possible to derive a formula with which to work. Formulae are used in order to simplify the work of the engineer. The engineer no longer designs by the cut-and-try method. It would be impossible today to build machinery by this process, inasmuch as we build so much that the cost of producing on this basis would be absolutely prohibitive. He has found that it is much more economical to experiment and find the relationship of the different functions of design and from these basic experiments derive formulae with which it is possible to design machines never before built, with an exactitude which is nothing short of astounding.

For instance, we have the large electrical manufacturers who go out and take contracts for the manufacture of water-wheel generators or steam turbine generators, the capacity of which may be 100 per cent in excess of anything previously built. Before the order is placed they will guarantee all the characteristics of these units. The designs of these machines will be carried out accordingly by formulae and when the tests are made of the final completed unit the results are surprisingly accurate. Inasmuch as this type of machine costs hundreds of thousands of dollars and may weigh several hundred tons, one wonders how long it would take to manufacture these units and what would be the cost if they were produced on the trial-and-error method as suggested by Mr. Kettering's statement.

I might point out that the establishment of formulae from facts established by fundamental experiment would produce infinitely greater results than $7,000,000 of cut-and-try experimentation.

"Most Engineers Lack the Ability to Transfer Their Thoughts in Simple Language to the General Public."

To a certain extent this statement bears some truth. The language of engineering is as different from the ordinary language as is German from English. There exists in engineering, conditions for which it has been found necessary to coin absolutely new words. For this very reason, we have in several good modern dictionaries a glossary of engineering terms. This is usually quite a large section of the work. It is very often quite difficult to explain some of the more complex engineering theories in a manner which can be well understood by the general public. Probably the outstanding engineer of the past generation who was best able to convey his thoughts simply was Charles P. Steinmetz, and he was better able to write his thoughts than to speak them.

In closing, I would like to say that the further up the ladder of success anyone climbs, usually the less able they are to understand the less successful members of their profession, inasmuch as one is apt to lose contact with those more lowly placed. It is only by getting down on the same footing as man to man that one is able to find out the hidden points of a man's character. The man placed on the lower rungs of the ladder is apt to look with some awe at those standing on the topmost rungs. They feel that this man's position must be justified by great ability or learning. This is particularly true in the engineering field. They are, therefore, quite slow in offering suggestions to one whom they feel must know considerably more than they do. Many men will carry out work which they feel is wrong because they have been given strict and uncompromising orders relative to the method of procedure.

There are many types of men in high places who do not give the underling an opportunity to express himself or to voice his opinions. This method can never bring out the best that is in a man.

I am,
Very truly yours,
Boyd Candlish, a.m.e.i.c.

170 Rankin Blvd.,
Sandwich, Ontario.

## Thirty-Fifth Annual Meeting C.I.M. and M.

The Canadian Institute of Mining and Metallurgy will hold its Thirty-Fifth Annual General Meeting on April 3rd to 5th, 1934, in the City of Quebec. Both the General Section and the Industrial Minerals Section will hold sessions, and the technical programme will include the following:—

*Geological*

The Geology of British Columbia Goldfields, by Victor Dolmage.
The Geology of the Vipond Mine, by E. Y. Dougherty.
The Geology of the Beattie Mine, by J. J. O'Neill.
The Geology of the Horne Mine, Noranda, by Peter Price.

*Industrial Minerals*

Recent Developments in the Sodium Sulphate Industry, by L. H. Cole, M.E.I.C.
Mining Methods at the King Mine (an account of the block-caving recently introduced by the Asbestos Corporation), by J. G. Ross.
A Non-Wasting Industrial Mineral, by A. W. G. Wilson.

*Milling and Metallurgy*

Ore Treatment at Falconbridge, by Gill and Mott.
The Trail Leaching Process and Treatment of Fume Produced from Lead Blast Furnace Slag, by Hannay and Bryden.
The Flin Flon Mill, Smelter and Zinc Plant, by The Staff, Hudson Bay Mining and Smelting Co. Ltd.

*Mining*

Sub-level Stoping, by A. Hasselbring.
Guniting at the McIntyre, by D. E. Keeley.
The History, Development and Practice of the Hudson Bay Mine, by The Staff, Hudson Bay Mining and Smelting Co. Ltd.
Power Development for Flin Flon, by The Staff, Hudson Bay Mining and Smelting Co. Ltd.

*Prospecting*

The Organization and Service of a Provincial Prospectors' Association.
The Use of Government Maps and Reports.
The Equipment of a Prospecting Party.
A satisfactory "Grubstaking" agreement.
A Fair Deal for a Prospect.

*General*

The Companies Information Act and Security Frauds Act, Quebec, by W. Amyot.
The Tax Return of a Mining Company, by E. D. Fox.
Blue Sky Laws, by W. E. Segsworth.
Mine Taxation, by The President (Balmer Neilly).

## A.S.T.M. Standards 1933

The American Society for Testing Materials recently issued its triennial Book of Standards containing all of the standard specifications, methods of test, recommended practices and definitions formally adopted by the Society.

The book is published in two parts. Part I, Metals, contains one hundred and four standards on ferrous metals, seventy on non-ferrous, and eleven involving metallography and general testing methods. New specifications adopted in 1933, and revisions are included. Part II, Non-Metallic Materials, contains two hundred and eighty-five standards and methods of test.

In both parts of the book, the specifications for a particular class of material are given first, followed directly by test methods, definitions, etc. A complete subject index is included, together with two tables of contents, one listing the standards under the materials covered, the other listing them in the numeric sequence of their designations.

Copies of either part of the book, in cloth binding, may be obtained for $7.50—both parts $14.00.

---

At an "Open Night" and demonstrations given in the Toronto Training Shop of *Dominion Oxygen Company Limited*, Toronto, on January 26th and 27th, 1934, demonstrations were given on bronze welding, pipe welding, aircraft welding, aluminum welding, automatic cutting, hard surfacing, and flame machining. In addition demonstrations were given on metal spraying, weld and welding rod testing, and the results of weld testing, and an illustrated lecture was presented on "Testing Welders and Welding Materials."

*The Bristol Company*, Waterbury, Conn., announces that in order to better serve the Canadian market, a separate company, the Bristol Company of Canada Limited, has been incorporated. Factory and general headquarters will be located at 64 Princess street, Toronto, Ont., where Bristol recording, indicating and control instruments will be made. Mr. J. S. Mayberry, graduate engineer of the University of Toronto, and for ten years with the parent company, has been appointed manager.

# BRANCH NEWS

## Calgary Branch

*J. Dow, M.E.I.C., Secretary-Treasurer.*
*H. W. Tooker, A.M.E.I.C., Branch News Editor*

Arranged for by the Executive Committee, the principal convenors being H. J. McLean, A.M.E.I.C., R. S. Trowsdale, A.M.E.I.C., and G. P. F. Boese, A.M.E.I.C., the members of the Calgary Branch were entertained at a bridge party and dance held at the Renfrew Club on Friday evening December 1st, 1933, which proved to be a most successful affair, and the opinion was voiced by some of the members that a similar event should be held at some future date.

### Reminiscences of Experiences in Africa

The members and their friends of the Calgary Branch of The Institute were entertained at a general meeting on Thursday evening, December 14th, 1933, in the Board of Trade rooms by three short travelogue motion picture reels, following an interesting address by P. J. Jennings, M.E.I.C., superintendent of Banff National Park.

Mr. Jennings spoke on "Reminiscences of Experiences in Africa, South of the Equator," citing many of the hardships that were cheerfully borne by the British soldier during the Boer War.

The pictures "Land of the Nile," "Wild Life on the Veldt" and "Giants of the Jungle" dealt with the daily life of the natives in Egypt, the various kinds of wild animals seen on the veldt and their unceasing watchfulness to protect themselves from unseen dangers, and the elephant which can be trained to perform many useful works.

Following a hearty vote of thanks given the speaker, by M. H. Marshall, M.E.I.C., the meeting adjourned at 10 o'clock p.m.

## Niagara Peninsula Branch

*P. A. Dewey, A.M.E.I.C., Secretary-Treasurer.*

On December 14th, 1933, the Branch held a dinner meeting at the Fox-Head Inn, Niagara Falls, which was addressed by Mr. H. Spencer Clark upon the subject of the "Russian Experiment in Collective Economy." Some forty-five members and guests attended.

Mr. Clark was introduced by Walter Jackson, M.E.I.C., with whom he had been associated during the construction of the Queenston-Chippawa power plant. His trip to Russia in 1931 took him to some of the larger cities, such as Moscow and Leningrad, as well as the surrounding country districts.

### Russian Experiment in Collective Economy

The eventual outcome about Russia, Mr. Clark warned his audience, is probably not determinable at the present stage of affairs, but he had formed the impression that the experiment would eventually succeed to this extent, that a nationality would emerge which would be in advance of anything that could have been achieved under the Tsarist regime.

The name "Russia" is not recognized. It is now "The Union of Socialist Soviet Republics" and comprises a territory larger than North America. The population consists of about 52 per cent pure Russian, 22 per cent Ukrainian and a balance of various racial strains, with one hundred and eighty or more dialects. It is numerically increasing, due largely to two factors, a noted decrease in infant mortality, and a return to the country of exiles or people who have been working in foreign parts, both of which are significant indications of a measure of success.

For sixteen years the U.S.S.R. have had a stable system of government, with policies which have been, on the whole, more consistent than those enjoyed in many other countries, and there is no indication that any counter-revolution is at all possible, or even probable. There is no proof that the government is at present working for, or abetting, any movement for a world revolution; in fact all signs point towards a willingness to recognize the so-called capitalistic nations and to live in peace and amity with them. Therefore no longer does there seem to be any valid reason for refusing to acknowledge this government which will, sooner or later, have such a powerful influence upon world conditions.

Scientific and technical abilities in the U.S.S.R. are receiving a full measure of recognition and, in general, command higher salaries than some of their political superiors. Before the five year plan was announced the details were studied for a period of three years by a commission of 33,000 experts under the leadership of Kubyshev. The plan failed in some respects, notably transportation, but in others the objects were achieved in less than the five years.

Planned economy is the aim of the government, but the machine is not yet functioning smoothly. Most of the energy has been concentrated upon the "heavy industries" in order to provide the necessary power, tools and agricultural implements for the planned productions. Food and clothing have been given a second place temporarily and, in consequence, these articles appear to be less plentiful than at the beginning of the five year plan.

Electrification and aeronautics are well advanced, while, in the cities, education, medical services and social services are much in evidence. Ten thousand new libraries and fifteen hundred scientific institutes convey an indication of their progress.

Mr. Clark visited some of the agricultural districts, five hundred miles south of Moscow, and his lantern slides were quite instructive as to the condition of this basic industry. About 80 per cent of the farmers have joined together in the collective movement and receive government aid by way of scientific earth tests, instructions as to rotation of crops, improved seed and credits for the purchase of farm implements and machinery. Their working and living conditions are comparatively good and the farms are yielding some 50 per cent surplus which goes to the cities. Five hundred grain elevators have been built during the past six years. On the opposite side of the picture are the freehold, or individualistic peasant farmers who, from a fear of losing a new-found liberty, are cultivating their fields as did their forefathers with hoe or wooden plough using hand sickles to garner the grain and hand-flails for threshing. Their land shows every sign of being worked-out, their living conditions are miserable and their yield shows a surplus of but 11 per cent.

In the cities, ration tickets are still employed and consequently much time is wasted in line-ups; many shops, however, carry modern goods which can be purchased by those who have money.

Incentives appear to be somewhat lacking, particularly to the older generation. Propaganda is used freely to raise the spirit of the people, pictures are broadcast showing the faces of men who have done any particularly brilliant piece of work, statues are erected to living heroes and extra holidays are doled out to those who are deemed worthy.

It is of course too early yet to say whether such incentives as these will continue to satisfy ambition and keep the worker fully efficient.

Political prisoners are still treated harshly, but civil misdeeds are punished by banishment to a penal colony where the prisoners live in ordinary surroundings, are taught trades and an endeavour is made at final reform. The restrictions are very slight and inmates have been known to marry and settle in the colony permanently. They are paid nothing at the commencement of their term, but wages are given during the later stages until, at release, they are receiving the common wage.

In conclusion, Mr. Clark remarked that, in his opinion, Russia has now turned the hardest corner and will forge ahead.

A. W. F. McQueen, A.M.E.I.C., in moving a vote of thanks, expressed appreciation of the speaker's address and the interesting lantern slides with which it had been illustrated.

Chairman W. R. Manock, A.M.E.I.C., thanked Mr. Clark on behalf of the Branch and at 10.30 the meeting adjourned.

## Ottawa Branch

*F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.*

On Thursday, December 14th, 1933, Alan K. Hay, A.M.E.I.C., highway engineer of the Ottawa Suburban Roads Commission, gave an address on the subject of "Progress in Highway Transportation." Group-Captain E. W. Stedman, M.E.I.C., chairman of the Ottawa Branch, presided, and in addition head table guests included: F. A. Heney, B. Rothwell, J. B. Hunter, Dr. Charles Camsell, M.E.I.C., A. H. Fitzimmons, Bower Henry, H. K. Carruthers, A. Stuart, F. C. Askwith, A.M.E.I.C., E. A. Stephens, F. V. Seibert, M.E.I.C., W. F. M. Bryce, A.M.E.I.C., Colonel A. E. Dubuc, M.E.I.C., F. G. Smith, A.M.E.I.C., and C. McL. Pitts, A.M.E.I.C.

### Progress in Highway Transportation

Mr. Hay traced the development of highway construction from the early days to the present, placing particular stress upon the present-day requirements to meet the ever-extending automobile traffic.

In the design, construction and maintenance of a road the engineer, according to Mr. Hay, must deal with three main problems. There are: wear and tear due to the passage of vehicles; the forces of nature; and obsolescence. Information has been obtained in recent years covering the first two problems, but the third problem, obsolescence, has caused far more concern to highway engineers. It is difficult sometimes to forecast future traffic conditions and the future trend in motor car and motor truck design. The speaker stated that in this country and the United States there are many examples of road improvements which have not given service over their expected tenure of life but which have been rebuilt in a comparatively short time, not because they were worn out but because of changes in traffic and other requirements.

There is an unceasing contest between the motor vehicle designer and the highway builder somewhat analogous to the constant race between gun power and armour plating in naval circles. In the contest between the motor vehicle designer and the highway builder the designer is usually in the lead, that is, the average car or truck has usually reached a higher stage of development than the average road. In this country there are comparatively few stretches of highway adequate to accommodate the latest model car when driven continuously at high speed over a course of some distance. Such stretches of road should have first class alignment, easy grades, long radius curves scientifically banked, wide shoulders, shallow side ditches or none at all, and non-skid surfaces.

Probably considerations of cost will prevent any large portion of highway mileage ever reaching this degree of perfection but at any rate it is an ideal toward which we may aim.

One trouble, however, with setting a standard, is that such a standard is constantly changing. A road which seemed the height of perfection a few years ago might look quite antiquated today.

The speaker made special reference to the development of the motor truck. The truck has been taking an ever-increasing part in the movement of freight and baggage goods and has had its effect upon road construction.

Mr. Hay described some of the more popular types of surface construction giving the advantages and disadvantages of each. He also touched upon the work the road engineer is called upon to do in connection with the building of bridges, culverts, retaining walls, etc. This he characterized as one of the most interesting phases of the highway engineer's activities.

He closed his address with a reference to the highway engineer's necessity for maintaining amicable relationships with the public. This involves endless contact with not only the users of the road but the owners of property frontage, a large number of whom have special little problems of drainage, private entrances, or the fixing of grades. Each of these problems must be given its share of attention having regard to the fact that each owner is a tax payer and also to the fact that the interest of all must be protected.

### Dinner Dance

A dinner dance was held by the local Branch of The Engineering Institute at the Chateau Laurier on December 15th, 1933 at which about one hundred and seventy-five members and their friends were present. This dance was in the nature of a get-together party, the programme consisting of an informal dinner with games and dancing following.

The guests were received by Group-Captain and Mrs. E. W. Stedman and Mr. and Mrs. G. J. Desbarats.

The games were those usually held on board a liner at sea and consisted of horse racing, ship's run, etc. Each person, at the commencement of the evening's programme, was given a fixed sum of fake money and prizes were awarded to those who accumulated the most wealth.

This unique form of entertainment was a pronounced success and everyone present stated that the evening was a most enjoyable one.

## Peterborough Branch

*H. R. Sills, Jr.E.I.C., Secretary.*
*W. T. Fanjoy, Jr.E.I.C., Branch News Editor.*

The last meeting during 1933 of Peterborough Branch took place Thursday evening, December 14th, with Mr. W. L. Saunders, A.M.E.I.C., resident engineer, Ontario Department of Highways, as the speaker.

### Highways

Mr. Saunders gave his paper the general title of "Highways," and dealt particularly with the cost of highways. He stated that the average taxes assessed on an Ontario farmer with a $5,000.00 farm for highways was $8.45 annually. The motorist with a $1,000.00 car pays $40.00 in the same length of time.

Contrary to the popular idea the speaker said that there is more money spent on highways than is taken in. It should be remembered that a huge debt for highways was incurred before the road taxes were instituted. This debt is still drawing interest.

Contrasting Ontario conditions with Great Britain it is found that the license for a Ford car in the latter country costs $112.00.

The speaker was of the opinion that our roads cost us very much less to build and maintain than a similar road in Great Britain and this despite the fact that we have more severe frost and drainage conditions to contend with.

The standard Ontario highway is 20 feet wide of concrete. This is usually laid by contractors and the average rate is 1,000 to 1,200 feet per day. Mr. Saunders said that the world's record for laying this type of highway is held by Ontario when the firm of Clinton & Goderich laid 2,162 feet of 20-foot highway in one day some four years ago.

The average costs on road maintenance per mile in Ontario for all types of roads is $397.00 per year. In Ontario there are about 3,600 miles of highway and on some highways the traffic is as much as 4,500 vehicles per day. The highest type of highway has a maintenance cost per mile year of $441.00. Great Britain's cost on her second class roads with very much lessened frost and drainage conditions is $1,500.00 to $1,600.00 per mile year. Our costs are also less than those in the United States. One of the reasons for this is that no regular road maintenance gangs are maintained. Regular patrol men pick up casual labour along the roads to do the work as required. At the present time, the use of mechanical road equipment is limited so as to benefit hand labour. Grading and paving of course requires the use of machinery.

Mr. Saunders also touched on the work that is being done with regard to widening the shoulders of roads and eliminating ditches. Where feasible the shoulders are being graded down to the ground level at a definite slope, thereby eliminating ditches.

### What Mechanical Tests Are Worthwhile

"Proficiency is the art of designing something which will do the job satisfactorily and not cost too much."

This definition was given by F. A. Nagler, M.A., S.M.E., Chief Engineer of the Canadian Allis-Chalmers Company, Limited, of Toronto, speaking before the Branch, Thursday evening, January 11th, 1934.

To make something which is 100 per cent perfect or which will take care of every possible contingency will in most cases cost too much. In this connection the speaker declared that nothing can replace full scale tests. In a great many cases troubles are encountered in the full scale model that never appear in a reduced model. In many cases of course reduced scale testing must be resorted to but these tests are nearly always checked on the full scale model after it is completed.

There is a wide variation in design. For instance pumps can be designed for a continuous duty of five hundred thousand hours which is equivalent to over fifty years of continuous running. On the other hand ordinary automobiles have a life at full load of only a few hours. Actual tests were made on five cars in the price class of $1,500.00 to $2,000.00, with a brake on the rear wheels to give full load. At full throttle the first car to fail ran one hour, seventeen minutes and the last five hours.

The speaker went on to outline unusual conditions in materials. For instance in transporting helium gas thick walled steel spheres are used with the gas at 1,200 pounds pressure. The spheres are 8 feet in diameter with 2-inch walls. They were tested with water pressure and while under pressure were hammered by six men for two hours with sledges, then six air-hammers were substituted which in three days delivered 20,000 blows. They were finally blown up with heavy water pressure. A section would finally stretch a little and form a pimple. This would relieve the stress at this point and a pimple would form somewhere else on the surface. Finally the sphere had added to its diameter by one foot by stretching all over. The final break was like an orange peel.

The speed of application of a blow is very important. A pipe with internal pressure fails by tearing down one side. Other shapes made from the same material may actually shatter. In general heavy walls shatter and thin walls tear. A rifle bullet was fired at a cylinder of oxygen under 1,200 pounds pressure. Instead of tearing or shattering the heat of impact ignited the steel of the cylinder and the oxygen in the cylinder supported the combustion. Rifle bullets with speeds up to 3,000 or 4,000 feet per second merely spatter against Krupp armour plate but special bullets with a speed of 5,000 feet per second caused hemispheres to drop out of the plate.

New tests are constantly being added to the list of standard tests for steel. At one time tensile strength and elongation was considered sufficient but microphotographs, impact tests, fatigue, reversal of stress, notch effect, etc., are now considered necessary.

In connection with notch effect it has been found that the average strength of a section will be reduced as much as seven or eight times by a notch or sharp corner. Fillets must be used and in some cases particularly punches, these fillets should be polished lengthwise.

## Saskatchewan Branch

*S. Young, A.M.E.I.C., Secretary-Treasurer.*

The regular monthly meeting of the Branch was held in the Hotel Champlain, Regina, being preceded by a dinner at which thirty-two were in attendance. The chair was occupied by P. C. Perry, A.M.E.I.C.

### The Mineral Possibilities of Northern Saskatchewan

After introducing several guests and attending to several items of business, the chairman introduced the speaker of the evening, E. B. Webster, A.M.E.I.C., mining engineer, Department of Natural Resources, Saskatchewan, his subject being "The Mineral Possibilities of Northern Saskatchewan." Pointing out that the capital invested in mineral development in Canada is very largely "outside" capital Mr. Webster proceeded to enlarge on his subject by stating that mineral development in the Saskatchewan-Manitoba area, north of The Pas, has resulted in the establishment of a town, Flin Flon, Manitoba, equal in size and population to several of the smaller cities in southern Saskatchewan. He stated further that, while copper producing mines in other areas had been obliged under existing economic conditions to curtail output to as low as 40 per cent, the mines at Flin Flon have actually increased their output by 50 per cent. He stated further that while Saskatchewan is not listed as a metal producing province, it could and should be so listed if a proper separation of the ore mined in this area were made. If royalties were earned from production a separation of the amount of metals produced in Saskatchewan would be necessary and Saskatchewan would be listed in a small way as a producer of zinc, copper and gold.

The growth in mineral production in Canada has been enormous, the present production being in the ratio:

| | |
|---|---|
| Non-metals | 23.1 per cent |
| Fuels | 29.4 per cent |
| Metals | 47.5 per cent |

Of these one would expect to find metals only in northern Saskatchewan, more especially in the territory west from Flin Flon to Lac La Ronge then north and west to Lake Athabasca and the northernly boundary of the province, latitude 60 degrees N, the latter area extending well into the North West Territory. Here the geological formation, pre cambrian, is the same as in the Flin Flon area.

Northern Saskatchewan has not as yet been properly mapped. Consequently it is impossible to make a proper estimate of the areas favourable to prospecting. There are however several known favourable areas as follows:—

1. The Amisk-Athapapuskow area extending from the eastern boundary of the province west for 35 miles and being about 25 miles in width from north to south.
2. An area from 2 to 10 miles in width extending from the north-east corner of Deschambault Lake north to the Churchill river and beyond, probably fifty miles in length.
3. An area along the west side of Lac La Ronge.
4. The territory surrounding Lake Athabasca and north to the northern boundary of the province.

In concluding his paper Mr. Webster drew attention to the fact that while much of the formation in northern Saskatchewan is considered to be unfavourable it is similar in structure to formation elsewhere in Canada of proved value.

## Sault Ste. Marie Branch

*G. H. E. Dennison, A.M.E.I.C., Secretary-Treasurer.*

The annual meeting of the Sault Ste. Marie Branch was held on Wednesday, December 20th, 1933, at the Windsor hotel at Sault Ste. Marie. The meeting was addressed by J. D. Jones, M.E.I.C., general manager of the Algoma Steel Corporation, whose topic was "Northern Ontario Iron Ores."

### Northern Ontario Iron Ores

In opening, Mr. Jones referred to previous papers read before the Sault Ste. Marie and Peterborough Branches dealing with Canadian iron ores and stated that in this paper he would confine himself to ores of northern Ontario. These deposits are the largest known reserves in Canada and on account of their character and location are sure to be considered in any new developments that may occur. The known and proved deposits are in three locations, namely, the Atikokan ores at the Canadian head of the Great Lakes, the Siderite ores at Michipicoten and the Magnetites of Algoma and Moose Mountain in Sudbury district. Worthy of separate consideration are the iron ores raised in the Sudbury nickel belt incidental to the mining of nickel and copper. All are within easy transportation distance of the Great Lakes and although requiring beneficiation, when beneficiated offer an ideal charge for blast furnaces, superior in every way to the raw ores of the Misabi or Michigan rouges.

There is nothing in our siderite or magnetite ores which presents a metallurgical problem to be contended with in the manufacture of iron or steel and in fact the use of these ores in combination, eliminates many of the daily problems with which steel makers have to contend. The problem, then, is one of preparation. As mined these ores are low in metallic values averaging about 35 per cent for both ores. It is necessary to raise this to at least 50 per cent for economical blast furnace use. In the case of siderite this is done by calcining either by a rotary tube or the use of the Greenawalt or Dwight-Lloyd method. The magnetite ores require fine grinding, magnetite separation and sintering. Both processes have been and are being successfully carried out in Sweden, Eastern Pennsylvania, New Jersey and elsewhere.

On account of the extremely high grade product obtained at Moose Mountain (64 per cent iron) it occurred to the author that it might be possible to extend the beneficiation process to the preparation of sponge iron. This is a very pure product used in the manufacture of very high grade steels.

---

Construction Work in Montreal

**Riviere St. Pierre Collector Sewer, Montreal.**

Mr. Jones enlarged on the possibilities of combining these two processes and drew an interesting picture of the unique advantages which could be enjoyed by a steel plant able to derive a wide range of steels from a common source of supply with a consequent saving in inventories.

At the conclusion of Mr. Jones' address, Mr. Jno. A. McPhail, president of the Great Lakes Power Company and one of the receivers for the Algoma Steel Corporation, addressed the meeting, followed by Mr. J. W. Curran. Both dealt with different aspects of the development of the iron ores adjacent to this district and both were confident of early activities in this direction.

K. G. Ross, M.E.I.C., concluded his year of office with the December meeting and at its conclusion retired in favour of E. M. MacQuarrie, A.M.E.I.C., who will occupy that post for 1934. His executive committee consists of H. F. Bennett, A.M.E.I.C., S. B. Clement, M.E.I.C., A. A. Rose, A.M.E.I.C., C. J. Russell, A.M.E.I.C., A. E. Pickering, M.E.I.C., and G. H. E. Dennison, A.M.E.I.C., secretary-treasurer.

## Toronto Branch

*W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.*
*O. Holden, A.M.E.I.C., Branch News Editor.*

On the evening of December 7th, 1933, Mr. H. D. Anger, of the legal firm of Elliott, Hume, McKague and Anger, addressed a joint meeting of the Ontario Association of Architects, Toronto Chapter, and The Engineering Institute of Canada, Toronto Branch, on the subject of "The Law of Contracts and Bonds of Particular Application to Engineers and Architects." The meeting, which was open to guests of the members, was convened in the Debates Room at Hart House, following an informal dinner in the North Common Room.

The speaker pointed out the advisability, in fact the necessity, of engineers and architects having some knowledge of the essentials of contract law, since their work brought them continually in contact with the preparation or interpretation of such documents. A brief outline of what constitutes or is the essence of a contract was given. This may be summarized as follows:

1. An offer and acceptance either verbally, by letter or telegram.
2. Capacity of parties—i.e. they must be competent, and in case of corporations must be within their powers.
3. Consideration—There must be a consideration, but the amount is not considered unless fraud or deceit is shown.
4. Form of Contract—Contracts for more than a year or for the sale of land, among others, must be in writing. Contracts with corporations must be under the seal of the corporation, and in the case of a municipality must be under seal and also be confirmed by by-law, this latter point being of particular interest to engineers acting as consultants on municipal works.

The speaker then dealt with building contracts, and pointed out the distinction as to a contract being one and indivisible or made up of several items to be separately paid for on completion. If of the former type the contractor could not recover any payment until he performs the whole work.

In dealing with sub-contracts, it was pointed out that the sub-contractor cannot sue the owner, nor can the owner sue him, but by virtue of the Mechanics Lien Act a sub-contractor may put a lien on the owner's property, as can the other parties.

The question of extras to a contract was discussed, and attention was called to the fact that any necessary formalities relating to a contract relate also to extras or alterations. If the contract makes no provisions for extras, these form a new contract.

A most interesting portion of the address dealt with the much discussed question of penalties. The speaker pointed out that the courts would not enforce a time penalty whether it was called liquidated damages or not, merely because it was named in the contract. They would, however, allow actual damages. If, however, the evidence shows that the amount named in contract represents estimated actual damages, the courts will enforce it. Such amount, however, must bear a reasonable relation to the time loss or expense to owner, and to the amount of the contract. The enforcement of a penalty does not require the provision for payment of a bonus.

In connection with contract bonds, it was shown that any material variation in the contract without consent of the surety relieves the latter.

A most interesting discussion followed, and the vote of thanks of the members was most heartily given for a very instructive and illuminating address.

## Winnipeg Branch

*E. W. M. James, A.M.E.I.C., Secretary-Treasurer.*
*E. V. Caton, M.E.I.C., Branch News Editor.*

On Thursday evening, December 7th, 1933, at the meeting of the Winnipeg Branch of The Engineering Institute, presided over by Professor G. H. Herriot, M.E.I.C., chairman, a paper was read on "Modern Water Purification" by W. D. Hurst, S.E.I.C., assistant engineer of the City Engineering Department, Winnipeg.

### Modern Water Purification

Mr. Hurst stated that in recent years a higher standard of drinking water has been demanded. The public now demands a water that is not only sterile, but attractive, clear, colourless, odourless and free from excessive quantities of soluble mineral substances. These substances last named are receiving more and more attention as the public becomes aware of the tremendous waste of soaps that occur with a supply of hard water.

Water-borne disease may readily be transmitted through water systems, especially typhoid fever and dysentery. The germs usually find their way into wells drawing from limestone or other porous formations and into lakes or rivers forming a watershed, usually thickly populated and poorly patrolled.

The methods of purification were explained and the type of treatment required by various waters was discussed.

Preliminary sedimentation is now receiving less and less attention although in special cases it may be of service. It can be demonstrated that water which contains particles finer than silt will not become clear by sedimentation even when the particles are relatively heavy and the water perfectly still, unless considerable time is given. For this reason the process may be uneconomical.

The work of Sir Alexander Houston on the treatment of the Thames river water by storage in the Chelsea reservoir was discussed rather fully.

The history of filtration was briefly traced, mention being made of Simpson, Frankland and Hyatt's work in perfecting the general process.

Discussion of proper sand and grading took place and Mr. Hurst emphasized the value of the "effective size and uniformity coefficient" in selecting a proper filtering medium. The effective size averaged about 0.45 mm. but lately sands having a size of 0.5 and 0.6 were becoming common. The uniformity coefficient should run from 1.5 to 1.7.

The paper closed with discussion of softening and filter loadings.

At the conclusion of the address the meeting was thrown open for discussion and a lengthy one followed, during which Mr. A. Blackie, F.I.C., city chemist, gave a short discussion on the chemical requirements of pure water and recognized water standards.

A hearty vote of thanks was proposed to the speaker which was unanimously carried.

On Thursday evening, December 21st, 1933, at the regular meeting of the Winnipeg Branch of The Engineering Institute of Canada, presided over by Professor G. H. Herriot, M.E.I.C., chairman, Mr. H. G. Beresford, D. and M.L.S., gave an address on the "Great Bear Lake Country."

### Great Bear Lake Country

Mr. Beresford, due to his experience in this country during the last two years, where he has been engaged in surveying various properties, is a highly qualified speaker.

This lecture was a joint meeting of the Winnipeg Branch of The Engineering Institute of Canada and the Winnipeg branch of the Canadian Institute of Mining and Metallurgy, and was illustrated by slides made from photographs taken by Mr. Beresford during his residence in the district.

The speaker pointed out that Great Bear lake, the largest lake within the Dominion and having an area of between 12,000 and 13,000 square miles, lies astride of the Arctic circle about 100 miles east of the Mackenzie river. It drains into the latter by the Bear river some 90 miles in length. It was at Echo bay on the east shore of this lake that in 1930 Gilbert LaBine made his wonderful discovery of pitchblende carrying high grade uranium and silver.

Great Bear lake is most easily reached by hydroplane except during freeze-up and break-up. The journey by air from the end of steel at Waterways, Alberta, is usually accomplished in about eight hours, though record trips of six and three-quarter and five and three-quarter hours have been made. Freight has to be shipped in by steamer and barge from Waterways to Fort Fitzgerald on the Slave river, thence across a 16-mile portage to Fort Smith, thence by steamer, gasboat and barge to Fort Norman at the confluence of the Bear and Mackenzie rivers.

Fuel is getting scarce, but deposits of coal have been found on both the western and southern shores of Great Bear lake, and these will be developed in the very near future.

Power at the operating mines is developed from Diesel type engines using fuel oil from the wells at Fort Norman some 300 miles away. The climate is arctic from October to May; the summer is short, though warm and pleasant. Continual daylight occurs from June till August and conversely there are only about three hours of daylight in December and January.

Prospecting is rather difficult as the occurrences of mineralized zones or lodes are hard to find. Nevertheless, numerous discoveries of considerable importance have recently been made and some of them are being developed.

The Dominion government is trying to assist transportation by the construction of a portage around the rapids on the Bear river and it is confidently expected that 1934 will see both reduced freight rates and easier access by the Mackenzie river route.

A very active discussion took place at the end of the meeting, and Mr. Beresford was congratulated on his very interesting address.

# Preliminary Notice

## of Applications for Admission and for Transfer

January 23rd, 1934

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described in March, 1934.

R. J. Durley, Secretary.

---

* The professional requirements are as follows—

**A Member** shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

**An Associate Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

**The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.**

### FOR ADMISSION

AUSTIN—FRANK DOUGLAS, of 1510 Bathurst St., Toronto, Ont., Born at Brockville, Ont., Sept. 14th, 1890; Educ., B.A.Sc., Univ. of Toronto, 1915; 1925-30, Michigan Land Surveyor; 1910-13 (summers), drainage work, surveying and estimating topog'r.; 1914-19, overseas service, Signal Despatch Rider; 1919-24, asst. engr. with the following: Town of Sault Ste Marie, Algoma Steel Corpn., Dept. Rlys. and Canals, Durant Motors, Leaside; 1924-26, chief of party, surveying and mapping, chief right of way, for R. L. Kerr, Mich.L.S., Vernor, Wilhelm, & Molby; 1926-28, dftsman., Macomb Co. Rd. Commn.; 1928-29, asst. engr., C.N.R. Elec. Rlys., Toronto; 1929-32, computer, C.N.R., Valuation Dept., Toronto; 1932 (Oct.-Dec.), asst. valuation engr., General Steel Wares, Toronto. Not employed at present.

NAISH—SIDNEY GORDON, of Sydney, N.S., Born at Halifax, N.S., Aug. 21st, 1900; Educ., B.Sc., Durham, Univ., 1923; Premium pupil with Sir W. G. Armstrong Whitworth & Co. Ltd., Newcastle-on-Tyne, England. 1919-20, practical work at Walker shipyard of above co., and 1921-24, at Elswick works; 1924-26, asst. production engr., for same company; 1926-29, asst. plant engr., designing, directing and reporting on installn. of telephone plant equipment, Bell Telephone Co. of Canada, Montreal; 1930, practical work at Cleveland Worm & Gear Co. Ltd., Cleveland, Ohio; 1931 to date, eastern district manager, Peacock Bros. Ltd., making recommendations for coal mine mechanization projects, and layouts of power plant equipment. Also in charge of installn. and servicing of above equipment in N.S. and N.B. (*Jr. 1927.*)

References: K. H. Marsh, T. L. McCall, W. H. Slinn, W. S. Wilson, T. E. Naish, A. M. Mackenzie, F. T. Peacock, S. C. Mifflen.

RAPLEY—BLAKE PARKER, of Sarnia, Ont., Born at Strathroy, Ont., Nov. 12th, 1899; Educ., B.Sc., Queen's Univ., 1923; 1923 (summer), mechanic, Canadian Carborundum Co., Shawinigan Falls, Que.; 1923-24, dftsman, 1923-25, checking materials, 1925-26, asst. storekpr. i/c mill stores, Nfld. Power and Paper Co.; 1926-31, dftsman, Imperial Oil Refineries, Limited; and from Aug. 1931 to date, asst. mech'l. supt., with same company at Sarnia, Ont. (*S. 1922, Jr. 1927*)

References: R. L. Weldon, T. Montgomery, G. Noble, D. A. Evans, L. M. Arkley, L. T. Rutledge.

SAMPSON—CYRUS DEXTER, of Westville, N.S., Born at Halifax, N.S., Jan. 1st, 1897; Educ., 1919-20, Acadia Univ.; 1918, Khaki Univ., Epsom, England; 1919, private tutor; 1919 (Feb.-May), course in surveying, N.S.T.C.; 1920-23, home study, civil engrg.; 1924-32, home study, mining engrg.; 1914-19, overseas, C.E.F. (3 Decorations); 1919 (May-Sept.), instr'man., etc., P. H. Board, N.S.; 1920-22, dftsman., instr'man and asst. engr., P. H. Board, N.S.; 1923 (Feb.-Apr.), dftsman., engrg. dept., 1923-25, surveyor and dftsman., mining engrg. dept., Dominion Coal Company, Glace Bay, N.S.; 1925 to date, International Coal Co. Ltd., Westville, N.S., engr. in charge of all work of engrg. nature including surveys, dfting, design, estimating, gas analysis, tunnelling, system of mining, etc. (Provincial Land Surveyor of N.S. by examination.) (*Jr 1923.*)

References: A. L. Hay, S. C. Mifflen, T. L. McCall, J. R. Morrison.

SPOTTON—JOHN GREER, of Guelph, Ont., Born at Harriston, Ont., Feb. 24th, 1900; Educ., B.A.Sc., Univ. of Toronto, 1922; 1918, machine shop, Harriston Furniture Co. Ltd., Harriston; 1919 (5 mos.), machine shop, Gilson Mfg. Co., Guelph, Ont.; 1920 (5 mos.), transformer dept., Canadian Westinghouse Co., Hamilton, Ont.; 1921 (5 mos.), station mtce., H.E.P.C. of Ontario; 1922-31, owner and manager, Spotton Engineering Company, Guelph, Ont. Sales representation, responsibility for service and repair for a number of radio and elect'l. mfgrs. for a territory in central Ontario. Also a number of special radio and sound equipment installations, and special refrigeration installns.; 1932, managing a factory in Guelph for Guelph Excelsior Products, manufacturing from pulpwood-excelsior, excelsior, pads and wrappers, etc.; Jan. 1933 to date, sales engr., Delaney & Pettit Ltd., Toronto and Montreal; (Involves industrial glue, machine labelling and fabric and paper sizing). (*S. 1920, Jr. 1924.*)

References: H. S. Nicklin, A. H. Heatley, J. F. Plow, L. E. Jones.

### FOR TRANSFER FROM THE CLASS OF STUDENT

CLIMO—PERCY LLOYD, of Cobourg, Ont., Born at Cobourg, Ont., Oct. 17th, 1906; Educ., B.Sc., Queen's Univ., 1932; 1928-29 (summers), special ap'tice, machine shop practice, John Bertram & Sons Co. Ltd., Dundas, Ont.; 1930 (summer), surveying and airport constrn., R.C.A.F. Training Station; 1932 (summer), field engr. and timekpr., bldg. constrn., Gardner Constrn. Co., Welland; 1933, occasional employment supervising sewer constrn., Town of Cobourg. (*S. 1928.*)

References: L. M. Arkley, L. T. Rutledge, D. S. Ellis, H. G. Bertram, W. D. Bracken.

KENT—GEORGE EDWARD, of Sarnia, Ont., Born at Truro, N.S., Sept. 25th, 1905; Educ., B.Sc. (Mech.), N.S.T.C., 1928; 1926 (summer), student with Canadian Ingersoll Rand Co., Sherbrooke, Que.; 1927 (summer), compressor operator, Maritime Tel. and Tel. Co., Halifax, N.S.; 1928-29, engr. dial system divn. of gen. traffic dept., Bell Telephone Co. of Canada; With Imperial Oil Refineries Limited, Sarnia, Ont., as follows: 1929-30, engr., dfting dept., on design of oil refinery equipment; 1930-32, asst. mech'l. supt., and from July 1932 to date, asst. to refinery supt. at plant No. 2, assisting in the operation of plant 2 refinery and looking after all repairs. (*S. 1926.*)

References: T. Montgomery, C. B. Leaver, J. W. MacDonald, W. A. Winfield, W. P. Copp, F. R. Faulkner.

LAING—ADDISON KERR, of Ottawa, Ont., Born at Hamilton, Ont., Feb. 20th, 1905; Educ., B.Sc. (Civil), McGill Univ., 1930; Summers: 1927, i/c car loading, Canada Crushed Stone Corpn., Hagersville, Ont.; 1928, computer and asst. instr'man., topog'l. survey, Dept. of Mines, Ottawa; 1929, gen. dfting., Dominion Bridge Co., Lachine; 1930 to date, hydrographer, Grade I, Can. Hydrographic Service, Dept. of Marine, Ottawa. (*S. 1926.*)

References: F. Anderson, H. W. Jones, M. A. MacKinnon, C. A. Price, J. V. Butterworth, R. DeL. French, W. Hollingworth.

NICKERSON—ALLAN DOUGLAS, of Halifax, N.S., Born at Shag Harbour, N.S., Sept. 13th, 1906; Educ., B.Sc., (E.E.), N.S.T.C., 1929; 1928 (summer), rodman, survey party, N.S. Power Commn.; 1929-31, asst. engr. (equipment and transmission), and 1931 to date, transmission engr. (under supervision of equipment engr.), responsible for layout and specifications for both toll and local telephone plant, also for inductive relations work, including co-ordinated design of signal and supply systems, Maritime Telegraph and Telephone Co. Ltd., Halifax, N.S. (*S. 1929.*)

References: W. A. Winfield, F. R. Faulkner, C. M. Crooks, F. A. Bowman, H. Fellows.

WEIR—RONALD ALBERT STANLEY, of 4868 Cote des Neiges Road, Montreal, Que., Born at Montreal, Aug. 2nd, 1901; Educ., 1924-25, Fac. of App. Sci., McGill Univ., completing 1st and 2nd years; Automotive Course at Montreal Technical School; 1929, six weeks instruction in aerial mapping at Ottawa; 1921 (summer), gen. bldg. constrn., Newport, Vt.; 1922 (summer), timekpr. and subforeman on road constrn., for St. George Constrn. Co.; 1923-24 (summers), care and operation of marine engine and yacht; 1925-26, with Duke-Price Power Company, Lake St. John, 6 mos. gen. electl. installn. work in power house; switchboard; station auxiliary; lighting, etc.; also 6 mos. on transmission line, Isle Maligne-Port Alfred; 1926-32, with the Shawinigan Water and Power Company and subsidiary companies, in field engrg. dept., prelim. investigations and final surveys of rivers; storage reservoirs; power house and dam sites; railways, highways; transmission lines; telephone lines; estimates and constrn., organization and management of field parties; 1930-32, in charge of all aerial mapping work for Shawinigan companies; at present, asst. industrial lubricating engr., Imperial Oil Limited, Montreal, Que. (*S. 1924.*)

## A.S.T.M. Tentative Standards

The book of A.S.T.M. Standards issued annually has just been received for 1933. This contains two hundred and twenty-three standards which are issued by the Society for trial before final adoption. These are classified under the head of: A—Ferrous Metals, B—Non-Ferrous Metals, C—Cement, Lime, Gypsum, Refractories, Concrete and Masonry Materials, D—Miscellaneous Materials, E—General Testing Methods.

This book is available to other than members of the Society at a cost of $7.00, in paper binding, or $8.00 in cloth. Individual tentative standards are available separately.

## Annual Meeting, Association of Professional Engineers of the Province of B.C.

At the annual meeting of the Association of Professional Engineers of the Province of British Columbia, held recently in Vancouver, the retiring President, Mr. J. D. Galloway, Provincial Mineralogist, in his address drew attention to the satisfactory progress which the Association had been able to make in spite of a year of uncertainty and depression. Although unemployment at the present time exists in nearly all branches of the profession in British Columbia, the mining engineers had been the least affected; and the Association's propaganda and educational activities had been carried on under these adverse conditions with comparatively little interruption. The speaker drew attention to the benefits arising from the Dominion Government Relief Camps for single unemployed men, and the efficient manner in which the Vancouver Engineers Relief Committee had raised and distributed a fund for unemployed professional engineers.

The following officers were elected for 1934: President, A. S. Gentles, M.E.I.C.; Vice-President, G. S. Eldridge; Councillors, Sidney Anderson, C. V. Brennan, L. A. Campbell and H. F. G. Letson.

At the annual dinner the principal speaker was the Hon. George S. Pearson, Minister of Mines and Labour, who stated that the fundamental policy of the provincial government was based on the need of more employment and a fairer spread of the employment available. It was proposed to investigate possible means for the stimulation of industry in the province, and take action accordingly.

---

The Topographical and Air Survey Bureau of the Department of the Interior, Ottawa, has issued a new topographical map of the Sudbury district. The map has a scale of 2 miles to one inch, and shows an area of about 1,650 square miles, including Sudbury, Copper-Cliff, Coniston, Capreol, Chelmsford and Cartier. Copies may be obtained at the nominal price of twenty-five cents.

# EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

*All correspondence should be addressed to*

**The Employment Service Bureau, The Engineering Institute of Canada**
**2050 Mansfield Street, Montreal**

## Situations Wanted

ELECTRICAL ENGINEER. Age 33. Canadian University graduate. Ten years experience in design and construction of power and substations network calculations-illumination design and industrial layouts. Seven years as design engineer. Available for position at home or abroad. Apply to Box No. 7-W.

ELECTRICAL AND RADIO ENGINEER, B.Sc., '28. Experience in the design and testing of broadcast radio receivers, including latest superheterodyne practice, and capable of constructing apparatus for testing same. Also familiar with telephone and telephone repeater engineering. Thorough experience in design, and construction and inspection of municipal power conduits. Apply to Box No. 12-W.

MECHANICAL ENGINEER, Canadian, with technical training and executive experience in both Canadian and American industries, particularly plant layout, equipment, planning and production control methods, is open for employment with company desirous of improving manufacturing methods, lowering costs and preparing for business expansion. Apply to Box No. 35-W.

MECHANICAL ENGINEER, A.M.E.I.C. Married. Experience in machine shops, erection and maintenance of industrial plant mechanical and structural design. Reads German, French, Dutch and Spanish. Seeks any suitable position. Apply to Box No. 84-W.

YOUNG ENGINEER, B.A., B.Sc., A.M.E.I.C., R.P.E., Ont. Competent draughtsman and surveyor. Eight years experience including design, superintendence and layout of pulp and paper mills, hydro-electric projects and general construction. Limited experience in mechanical design and industrial plant maintenance. Apply to Box No. 150-W.

PURCHASING ENGINEER, graduate mechanical engineer, Canadian, married, 34 years of age, with 13 years' experience in the industrial field, including design, construction and operation, 8 years of which had to do with the development of specifications and ordering of equipment and materials for plant extensions and maintenance; one year engaged on sale of surplus construction equipment. Full details upon request. Apply to Box No. 161-W.

CIVIL ENGINEER, age 44, open for employment anywhere, experience covers about 20 years' active work, including 7 years on municipal engineering, 2 years as Town Manager, 3 years on railway construction, 3 years on the staff of a provincial highway department, 2 years as contractor's superintendent on pavement construction. Apply to Box No. 216-W.

REINFORCED CONCRETE ENGINEER, B.Sc., P.E.Q., eight years experience in construction design of industrial buildings, office buildings, apartment houses, etc. Age 30. Married. Apply to Box No. 257-W.

MECHANICAL ENGINEER, B.Sc., McGill '19, A.M.E.I.C. Married. Twelve years experience including oil refinery power plant, structural and reinforced concrete design, factory maintenance, steam generation and distribution problems, heating and ventilating. Available at once. Location immaterial. Apply to Box No. 265-W.

ELECTRICAL ENGINEER, B.Sc., '28, Canadian. Age 25. Experience includes two summers with power company; thirteen months test course with C.G.E. Co.; telephone engineering, and the past thirty months with a large power company in operation and maintenance engineering. Location immaterial and available immediately. Apply to Box No. 266-W.

MECHANICAL ENGINEER, age 28, nine years all round experience, Grad. Inst. of Mech. Engs. England, S.E.I.C. Technical and practical training with first class English firm of general engineers; shop, foundry and drawing office experience in steam and Diesel engines, asphalt, concrete machinery, boilers, power plants, road rollers, etc. Experience in heating and ventilation design and equipment; 18 months designing draughtsman with Montreal consulting engineers. 2½ years sales experience, steam and hot water heating systems, power plant equipment, machinery, oil-burning apparatus. Canadian 4th class Marine Engineers Certificate; C.N.S. experience. Available at short notice. Apply to Box No. 270-W.

DESIGNING DRAUGHTSMAN, experience in layout of steam power house equipment and piping. Wide experience in mechanical drive and details of machinery, gearing, and hoists. Accustomed to layout of small mill buildings of steel and timber, structural design and details. Good references. Present location Montreal. Apply to Box No. 329-W.

PLANE-TABLE TOPOGRAPHER, B.Sc., in C.E. Thoroughly experienced in modern field mapping methods including ground control for aerial surveys. Fast and efficient in surveys for construction, hydro-electric and geological investigations. Apply to Box No. 431-W.

ELECTRICAL ENGINEER, B.Sc., A.M.E.I.C., AM.A.I.E.E., age 30, single. Eight years experience H.E. and steam power plants, substations, etc., shop layouts, steel and concrete design. Location immaterial. Available immediately. Apply to Box No. 435-W.

## Situations Wanted

CIVIL ENGINEER, B.A.Sc., and C.E., A.M.E.I.C., age 30, married. Experience over the last ten years covers construction on hydro-electric and railway work as instrumentman and resident engineer. Also office work on teaching and design, investigations and hydraulic works, reinforced concrete, bridge foundations and caissons. Location immaterial. Available at once. Apply to Box No. 447-W.

SALES ENGINEER, M.A.Sc. Univ. of Toronto, wishes to represent firm selling building products or other engineering commodities, as their representative in Western Canada. Located in Winnipeg. Apply to Box No. 467-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with six years experience in paper mill and hydro-electric work, desires position in western Canada. Capable of handling reinforced concrete and steel design, paper mill equipment and piping layout, estimates, field surveys, or acting as resident engineer on construction. Now on west coast and available at once. Apply to Box No. 482-W.

MECHANICAL ENGINEER, B.Sc. Age 28, married. Four and a half years on industrial plant maintenance and construction, including shop production work and pulp and paper mill control. Also two and a half years on structural steel and reinforced concrete design. Available at once. Apply to Box No. 521-W.

CIVIL ENGINEER, Canadian, married, twenty-five years' technical and executive experience, specialized knowledge of industrial housing problems and the administration of industrial towns, also town planning and municipal engineering, desires new connection. Available on reasonable notice. Personal interview sought. Apply to Box No. 544-W.

ELECTRICAL AND MECHANICAL ENGINEER, B.Sc., A.M.E.I.C. Experience includes C.G.E. Students Test Course and six years in engrg. dept. of same company on design of electrical equipment. Four summers as instrumentman on surveying and highway construction. Recently completed course in mechanical engineering. Available at once. Location preferred Ontario, Quebec, or Maritimes. Apply to Box No. 564-W.

CIVIL ENGINEER, age 25, single, graduate. Creditable record on responsible hydro and railroad work in both Eastern and Western Canada. Apply to Box No. 567-W.

MECHANICAL ENGINEER, A.M.E.I.C., with twenty years experience on mechanical and structural design, desires connection. Available at once. Apply to Box No. 571-W.

MECHANICAL ENGINEER, B.A.Sc., '30, desires position to gain experience, and which offers opportunity for advancement. Experience in pulp and paper mill and one year in mechanical department of large electrical company. Location immaterial. Available immediately Apply to Box No. 577-W.

DOMINION LAND SURVEYOR, and graduate engineer with extensive experience on legal, topographic and plane-table surveys and field and office use of aero-photographs, desires employment either in Canada or abroad. Available at once. Apply to Box No. 589-W.

MECHANICAL ENGINEER, Canadian, technically trained; eighteen years experience as foreman, superintendent and engineer in manufacturing, repair work of all kinds, maintenance and special machinery building. Location immaterial. Available at once. Apply to Box No. 601-W.

CHEMICAL ENGINEER, S.E.I.C., B.Sc., University of Alberta, '30. Age 31. Single. Six seasons' practical laboratory experience, three as chief chemist and three as assistant chemist in cement plant; one year's p.g. work in physical chemistry; three years' experience teaching. Desires position in any industry with chemical control. Available immediately. Apply to Box No. 609-W.

DESIGNING ENGINEER AND ESTIMATOR, grad. Univ. of Toronto in C.E., A.M.E.I.C., twenty years experience in structural steel, construction and municipal work. Available at once. Apply to Box No. 613-W.

CIVIL ENGINEER, A.M.E.I.C., R.P.E., Ontario; three years construction engineer on industrial plants; fourteen years in charge of construction of hydraulic power developments, tower lines, sub-stations, etc.; four years as executive in charge of construction and development of harbours, including railways, docks, warehouses, hydraulic dredging, land reclamation, etc. Apply to Box No. 647-W.

## Situations Wanted

MECHANICAL ENGINEER, A.M.E.I.C., Canadian, technically trained; six years drawing office. Office experience, including general design and plant layout. Also two years general shop work, including machine, pattern and foundry experience, desires position with industrial firm in capacity of production engineer or estimator. Available on short notice. Apply to Box No. 676-W.

ELECTRICAL AND CIVIL ENGINEER, B.Sc., Elec., '29, B.Sc., Civil '33. Age 27. Jr.E.I.C. Undergraduate experience in surveying and concrete foundations; also four months with Canadian General Electric Co. Thirty-three months in engineering office of a large electrical manufacturing company since graduation. Good experience in layouts, switching diagrams, specifications and pricing. Best of references. Available immediately. Apply to Box No. 693-W.

MECHANICAL ENGINEER, B.Sc., '27, Jr.E.I.C. Four years maintenance of high speed Diesel engines units, 200 to 1,300 h.p. Also maintenance of D.C. and A.C. electrical systems and machinery. Draughting experience. Westinghouse apprenticeship course. Practical mechanical and electrical engineer with a special study of high speed Diesel engine design, application and operation. Location in western or eastern Canada immaterial. Apply to Box No. 703-W.

COMBUSTION ENGINEER, R.P.E., Manitoba, A.M.E.I.C. Wide experience with all classes of fuels. Expert designer and draughtsman on modern steam power plants. Experienced in publicity work. Well known throughout the west. Location, Winnipeg or the west. Available at once. Apply to Box No. 713-W.

ELECTRICAL ENGINEER, B.Sc., University of N.B., '31. Experiences includes three months field work with Saint John Harbour Reconstruction. Apply to Box No. 722-W.

MECHANICAL ENGINEER, age 41, married. Eleven years designing experience with project of outstanding magnitude. Machinery layouts, checking, estimating and inspecting. Twelve years previous engineering, including draughting, machine shop and two years chemical laboratory. Highest references. Apply to Box No. 723-W.

CIVIL ENGINEER, B.Sc. (Alta. '31), S.E.I.C. Experience includes three seasons in charge of survey party. Transitman on railway maintenance, and concrete bridge designing Nature of work and location immaterial. Apply to Box No. 724-W.

YOUNG CIVIL ENGINEER, B.Sc. (Univ. of N.B. '31), with experience as rodman and checker on railroad construction, is open for a position. Apply to Box No. 728-W.

DESIGNING ENGINEER, M.Sc. (McGill Univ.), D.L.S., A.M.E.I.C., P.E.Q. Experience in design and construction of water power plants, transmission lines, field investigations of storage, hydraulic calculations and reports. Also paper mill construction, railways, highways, and in design and construction of bridges and buildings. Available at once. Apply to Box No. 729-W.

MECHANICAL ENGINEER, S.E.I.C., B.A.Sc., Univ. of B.C. '30. Single, age 24. Sixteen months with the Allis-Chalmers Mfg. Co. as student engineer. Experience includes foundry production, erection and operation of steam turbines, erection of hydraulic machinery, and testing texropes and centrifugal pumps. Location immaterial. Available at once. Apply to Box No. 735-W.

CIVIL ENGINEER, M.Sc., A.M.E.I.C., R.P.E. (Ont.), ten years experience in municipal and highway engineering. Read, write and talk French. Married. Served in France. Will go anywhere at any time. Experienced journalist. Apply to Box No. 737-W.

ELECTRICAL AND RADIO ENGINEER, B.Sc. '31, S.E.I.C. Age 25. Nine months experience on installation of power and lighting equipment. Eight months on extensive survey layouts. Two summers installing telephone equipment. Specialized in radio servicing and merchandising. Available at once. Location immaterial. Apply to Box No. 740-W.

CIVIL ENGINEER, graduate '29. Married One year building construction, one year hydro-electric construction in South America, fourteen months resident engineer on road construction Working knowledge of Spanish. Apply to Box No. 744-W.

SALES ENGINEER, B.Sc., McGill, 1923, A.M.E.I.C. Age 33. Married. Extensive experience in building construction. Thoroughly familiar with steel building products; last five years in charge of structural and reinforcing steel sales for company in New York state. Available at once. Located in Canada. Apply to Box No. 749-W.

DESIGNING ENGINEER, graduate Univ. Toronto '26. Thoroughly experienced in the design of a broad range of structures. desires responsible position. Apply to Box No. 761-W

MECHANICAL ENGINEER, graduate, '23, A.M.E.I.C., P.E.Q., age 32, married. (English and French.) Two years shop, foundry and draughting experience; one year mechanical supt. on construction; six years designing draughtsman in consulting engineers' offices (mechanical equipment of buildings, heating, sanitation, ventilation, power plant equipment, etc.). Present location Montreal. Available immediately. Montreal or Toronto preferred. Apply to Box No. 766-W.

ELECTRICAL ENGINEER, B.Sc. (McGill Univ. '29), S.E.I.C. Married. Experience in pulp and paper mill mechanical maintenance, estimates and costs and machine shop practice. Desires position with industrial or manufacturing concern. Location immaterial. Available on short notice. References. Apply to Box No. 770-W.

## Situations Wanted

CIVIL ENGINEER, S.E.I.C., B.Sc. Queen's Univ '29. Age 25. Married. Three years experience as construction supt. and estimator for contracting firm. Experience includes general building, bridges, sewer work, concrete, boiler settings, sand blasting of bridges and spray painting. Available at once. Apply to Box No. 776-W.

CIVIL ENGINEER, B.Sc., '25, Jr.E.I.C., P.E.Q., married. Desires position, preferably with construction firm. Experience includes railway, monument and mill building construction. Available immediately. Apply to Box No. 780-W.

DRAUGHTSMAN, experience in civil engineering, forestry engineering, land surveying and house construction. Good references. Apply to Box No. 781-W.

ELECTRICAL AND SALES ENGINEER, S.E.I.C., grad. '28. Experience includes one year test course, one year switchboard design and two years switchboard and switching equipment sales with large electrical manufacturing company. Three summers Pilot Officer with R.C.A.F. Available at once. Apply to Box No. 788-W.

ELECTRICAL ENGINEER. Specializing in power and illumination reports, estimates, appraisals, contracts and rates, plans and specifications for buildings. Available on interesting terms. Apply to Box No. 795-W.

CIVIL ENGINEER, S.E.I.C., graduate '30, age 23, single. Experience includes mining surveys, assistant on highway location and construction, and assistant on large construction work. Steel and concrete layout and design. Apply to Box No. 809-W.

CIVIL ENGINEER, college graduate, age 27, single. Experience includes surveying, draughting concrete construction and design, street paving both asphalt and concrete. Available at once; will consider anything and go anywhere. Apply to Box No. 816-W.

CIVIL ENGINEER, B.E. (Sask. Univ. '32), S.E.I.C. Single. Experience in city street improvements; sewer and water extensions. Good draughtsman. References. Available at once. Location immaterial. Apply to Box No. 818-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. (Queen's '32), age 21. Three summers surveying in northern Quebec. Interested in hydraulics and reinforced concrete. Available at once. Location immaterial. Apply to Box No. 822-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with fifteen years experience mostly in pulp and paper mill work, reinforced concrete and structural steel design, field surveys, layout of mechanical equipment, piping. Available at once. Apply to Box No. 825-W.

ELECTRICAL ENGINEER, S.E.I.C., grad. '29, age 24, married; experience includes one year Students Test Course, sixteen months in distribution transformer design and eight months as assistant foreman in charge of industrial control and switchgear tests. Location immaterial. Available at once. Apply to Box No. 828-W.

CIVIL ENGINEER, B.A.Sc., D.L.S., O.L.S., A.M.E.I.C., age 46, married. Twelve years experience in charge of legal field surveys. Owns own surveying equipment. Eight years on technical, administrative, and editorial office work. Experienced in writing. Desires position on survey work, assisting in or in charge of preparation of house organ, on staff of technical or semi-technical magazine, or on publicity, editorial or administrative office work. Available at once. Will consider any salary, and any location. Apply to Box No. 831-W.

CIVIL ENGINEER, M.Sc., R.P.E. (Sask.). Age 27. Experience in location and drainage surveys, highways and paving, bridge design and construction city and municipal developments, power and telephone construction work. Available on short notice. Apply to Box No. 839-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. '32 (Univ. of N.B.). Age 25, married. Two years experience in power line construction and maintenance; one year of highway construction; one summer surveying for power plant site, location and spur railway line construction. Available at once. Location immaterial. Apply to Box No. 840-W.

CIVIL ENGINEER, B.Sc. '15, A.M.E.I.C., married, extensive experience in responsible position on railway construction, also highways, bridges and water supplies. Position desired as engineer or superintendent. Available at once. Apply to Box No. 841-W.

CIVIL ENGINEER, B.Sc. (Alta. '31), S.E.I.C., age 24. Experience, three summers on railroad maintenance, and seven months on highway location as instrumentman. Willing to do anything, anywhere, but would prefer connection with designing or construction firm on structural works. Available immediately. Apply to Box No. 846-W.

MECHANICAL ENGINEER, Jr.E.I.C., technical graduate, bilingual, age 30. Two years as designing heating draughtsman with one of the largest firms of its kind on this continent handling heating materials; three years designing draughtsman in consulting engineers' office, mechanical equipment of buildings, heating, ventilation, sanitation, power plant equipment, writing of specifications, etc. Present location Montreal. Available at once. Apply to Box Nn. 850-W.

BRIDGE AND STRUCTURAL ENGINEER, A.M.E.I.C., McGill. Twenty-five years' experience on bridge and structural staffs. Until recently employed. Familiar with all late designs, construction, and practices in all Canadian fabricating plants. Desirous of employment in any responsible position, sales, fabrication or construction. Apply to Box No. 851-W.

STRUCTURAL ENGINEER, B.A.Sc., A.M.E.I.C. Twenty-two years experience in design of bridges and all types of buildings in structural steel and reinforced concrete. Three years experience in railway construction and land surveying. Apply to Box No. 856-W.

MECHANICAL ENGINEER, B.Sc. '32, S.E.I.C. Good draughtsman. Undergraduate experience:—One year moulding shop practice; two years pipe fitting and sheet metal work; one year draughting and tracing on paper mill layout; six months machine shop practice; and eight months fuel investigation and power heating plant testing. Desires position offering experience in steam power plants or heating and ventilating design. Will go anywhere. Apply to Box No. 858-W.

MECHANICAL ENGINEER, age 31, graduate Sheffield (England) 1921; apprenticeship with firm manufacturing steam turbine generators and auxiliaries and subsequent experience in design, erection, operation and inspection of same. Marine experience B.O.T. certificate thoroughly conversant with Canadian plants and equipment. Available on short notice. Any location. Box No. 860-W.

CHEMICAL ENGINEER, B.Sc. (McGill '21), A.M.E.I.C., age 36, married; three years since graduation with pulp and paper mills; eight years in shops, estimating and sales divisions of well-known gas engineering and construction companies in the United States. Excellent references. Available on short notice. Apply to Box No. 866-W.

CONSTRUCTION ENGINEER (Toronto Univ. of '07). Experience includes hydro-electric, municipal and railroad work. Available immediately. Location immaterial. Apply to Box No. 886-W.

ELECTRICAL ENGINEER, graduate 1929, S.E.I.C. Single. Experience includes two years with electrical manufacturing concern and one on highway construction work. Available at once. Will go anywhere. Apply to Box No. 887-W.

CIVIL ENGINEER, B.Sc., Montreal 1930, age 26, single, French and English, desires position technical or non-technical in engineering, industrial or commercial fields, sales or promotion work. Experience includes three years in municipal engineering on paving, sewage, waterworks, filter plant equipment, layout of buildings, etc. Available immediately. Apply to Box No. 891-W.

ELECTRICAL ENGINEER, grad. Univ. of N.B. '31. Experienced in surveying and draughting, requires position. Available at once. Will go anywhere. Apply to Box No. 893-W.

CIVIL ENGINEER, B.A.Sc., Jr.E.I.C., age 29, single. Experience includes two years in pulp mill as draughtsman and designer on additions, maintenance and plant layout. Three and a half years in the Toronto Buildings Department checking steel, reinforced concrete, and architectural plans. Available at once. Location immaterial. At present in Toronto. Apply to Box No. 899-W.

ENGINEER, Jr.E.I.C., specializing in reconnaissance and preliminary surveys in connection with hydro-electric and storage projects Expert on location and construction of transmission lines, railways and highways. Capable of taking charge. Location immaterial. Apply to Box No. 901-W.

MECHANICAL ENGINEER, Canadian, age 25, B.Sc. (Queen's '32). Since graduation on supervision of large building construction. Undergraduate experience in electrical, plumbing and heating, and locomotive trades. Available at once. Apply to Box No. 903-W.

DESIGNING ENGINEER, A.M.E.I.C. Permanent and executive position preferred but not essential. Fifteen years experience in designing power plants, engine and fan rooms, kitchens and laundries. Thoroughly familiar with plumbing and ventilating work, pneumatic tubes, and refrigeration, also heating, electrical work, and specifications. Apply to Box No. 913-W.

YOUNG CIVIL ENGINEER, Jr.E.I.C. Six years as instrumentman on subway work. Two years as timekeeper cost clerk on building construction. Four years as job engineer on buildings, tunnels, dams, power houses. Location immaterial. Available at once. Apply to Box No. 916-W.

INDUSTRIAL ENGINEER, B.Sc. in M.E., age 25, married, is open for a position of a permanent nature with an industrial concern. Experience includes three years in various divisions of a paper mill and two years in an electrical company. Apply to Box No. 917-W.

ENGINEER, B.Sc., A.M.E.I.C., R.P.E. (N.B.), age 35, married. Seven years' mining experience as sampler, assayer, surveyor, field work, and foreman in charge of underground development; two years as assistant engineer on highway construction and maintenance Available on short notice. Apply to Box No. 932-W.

CIVIL ENGINEER, B.Sc., '25, McGill Univ., Jr.E.I.C., P.E.Q., age 32, married. Experience as rodman and instrumentman on track maintenance. Seven and one-half years with Canadian paper company, as assistant office engineer handling all classes of engineering problems in connection with woods operations, i.e., road buildings, piers, booms, timber bridges, depots, dams, etc. Apply to Box No. 933-W.

ELECTRICAL ENGINEER, Dipl. of Eng., B.Sc. (Dalhousie Univ.), S.B. and S.M. in E.E. (Mass. Inst. of Tech.), Canadian. Married. Seven and a half years' experience in design, construction and operation of hydro, steam and industrial plants. For past sixteen months field office electrical engineer on 510,000 h.p. hydro-electric project. Available at once. Apply to Box No. 936-W.

CIVIL ENGINEER, B.Sc., O.P.E. Experience includes several years on municipal work-design and construction of sewers, steel and concrete bridges, watermains and pavements. Available at once. Apply to Box No. 950-W

ELECTRICAL ENGINEER, twenty years experience, desires position, either temporary or permanent. Experienced in design, construction, and operation of power and industrial plants, and supt. of construction. Apply to Box No. 974-W.

INDUSTRIAL ENGINEER, B.Sc., in C.E. (McGill Univ. '30), graduate student in industrial engineering '33 session, age 27, single, available for a position of temporary or permanent nature with industrial concern. Has theoretical knowledge of latest methods of market analysis, production control, management and cost accounting. Also experience in the design and construction of industrial buildings. Location immaterial. Apply to Box No. 981-W.

CIVIL ENGINEER, B.Sc. (Univ. of Sask. '33), S.E.I.C., age 28, single. Experience in testing hydro-electric equipment, draughting, surveying, city street, improvements, technical photography. Available at once. Location immaterial. Apply to Box No. 986-W.

ELECTRICAL ENGINEER, B.A.Sc., '27, Jr.E.I.C., A.A.I.E.E. Married. Age 31. One and a half years G. E. Test Course, Schenectady; four and a half years motor and generator design including induction motors, D.C. and A.C. motors and generators. Willing to do anything, design or sales preferred. Available at once. Present location Toronto. Apply to Box No. 993-W.

MECHANICAL ENGINEER, S.E.I.C., B.Sc., Queen's University '33. Age 24, desires position on power plant and power distribution problems, factory maintenance, heating and ventilation or refrigeration design. Willing to work for living expenses in order to gain experience. Apply to Box No. 999-W.

ENGINEER SUPERINTENDENT, age 44. Engineering and business training, executive ability, tactful, energetic. Had charge of several large projects. Intimate knowledge of costs and prices, reports and estimates. Available immediately. Any location. Apply to Box No. 1021-W.

CIVIL ENGINEER, B.Sc. (Queen's 14), A.M.E.I.C., Dominion Land Surveyor, 5 months' special course at the University of London, England, in municipal hygiene and reinforced concrete construction. Experience covers legal and topographic surveys, plane tabling and stadia surveying, railway and highway construction, drainage and excavation work. Available at once. Apply Box No. 1035-W.

ELECTRICAL ENGINEER AND GEOPHYSICIST. Age 36. Married. Seven years experience in geophysical exploration using seismic, magnetic and electrical methods. Two years experience with the Western Electric Company of Chicago, working on equipment and magnetic materials research. Experienced in radio and telephone work, also specializing in precise electrical measurements, resistance determinations, ground potentials and similar problems of ground current distribution. Apply to Box No. 1063-W.

ELECTRICAL ENGINEER, B.A.Sc. Univ. Toronto '28. Experience includes Can. Gen. Elec. Co. Test Course. Also more than two years in the engineering dept. of the same company. Available on short notice. Preferred location central or eastern Canada. Apply to Box No. 1075-W.

ELECTRICAL ENGINEER, B.Sc. Married. Eight years electrical experience, including operation, maintenance and construction work, electrical design work on large power development, mechanical ability, experienced photographer, employed in electrical capacity at present. Available on reasonable notice. Apply to Box No. 1076-W.

GRADUATE IN MECHANICAL ENGINEERING, 1927, desires opportunity in Diesel engine field, preferably in design and development work. Skilled draughtsman and clever in design. Familiar with basic theories of the Diesel engine and in touch with recent developments and applications. Anxious to obtain a foothold with up-to-date company. No objection to shopwork or other duties as a start but would prefer shopwork and assembly if possible. Apply to Box No. 1081-W.

INDUSTRIAL ENGINEER, B.A.Sc. in Chem. Eng. (Tor. '31), S.B in Indust. Eng. (Mass. Inst. of Tech. '32), S.E.I.C. Age 25 years. Northern Electric Training Course. Construction and sales experience Rockefeller Research Associate at McGill University in industrial engineering for past year and to date. Desire work in production or financial departments of a manufacturing plant. Apply to Box No. 1098-W.

CIVIL ENGINEER, age 27, graduate 1930, single. Experience includes detailing, designing and estimating structural steel, plate work and pressure vessels; also hydrographic surveying. Available at once. Apply to Box No. 1111-W.

CIVIL ENGINEER, B.Sc. Sask. '30. S.E.I.C. Age 24 years. Experience in municipal engineering, including sewer and water construction, sidewalk construction, paving, storm sewer design, draughting, precise levelling, and reinforced concrete bridge construction. Unmarried. Available at once. Will go anywhere. Apply to Box No. 1115-W.

## Wanted to Purchase

Second-hand or used Land Surveying Compass with tripod. Must be in good condition. Describe fully and state price wanted. Apply to Box P-15.

BUY COGHLIN SPRINGS
FOR QUALITY AND SATISFACTION
With sixty-five years Canadian reputation and experience, you can safely specify COGHLIN'S for all your spring requirements.

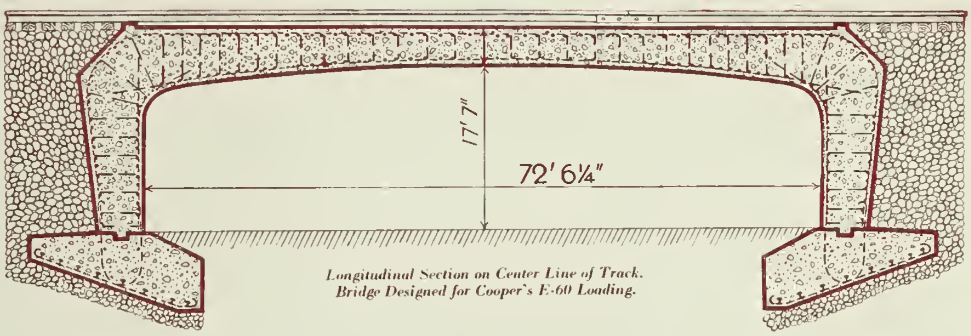
## INDEX TO ADVERTISERS

# World's Longest Span Rigid Frame

## CONCRETE RAILWAY BRIDGE

*at Vaudreuil, Que.*



*Longitudinal Section on Center Line of Track.*
*Bridge Designed for Cooper's E-60 Loading.*

Owner, Dept. of Highways, Quebec.
Hon. Joseph E. Perrault, Minister.
Lieut.-Col. J. L. Boulanger, Deputy Minister.
A. Paradis, Chief Engineer.

C. B. Brown, Jr., Chief Engineer, Canadian National Railways.
C. P. Disney, Bridge Engineer, Canadian National Railways.

Laflamme & Laflamme, Montreal, Contractor.

Rigid frame concrete bridges offer remarkable economies for grade crossing elimination jobs. Thin crown sections: reduced embankment or excavation: longer spans: more headroom: no intermediate columns: no structural projections: low first cost: are a few of their many advantages.

Canadian National Railways double-track bridge at Vaudreuil over the new Montreal - Hull - Ottawa Highway is a typical application of the rigid-frame principle. No ballast or ties are used, the rails being fastened to the concrete deck with a cushion block of oak beneath them.

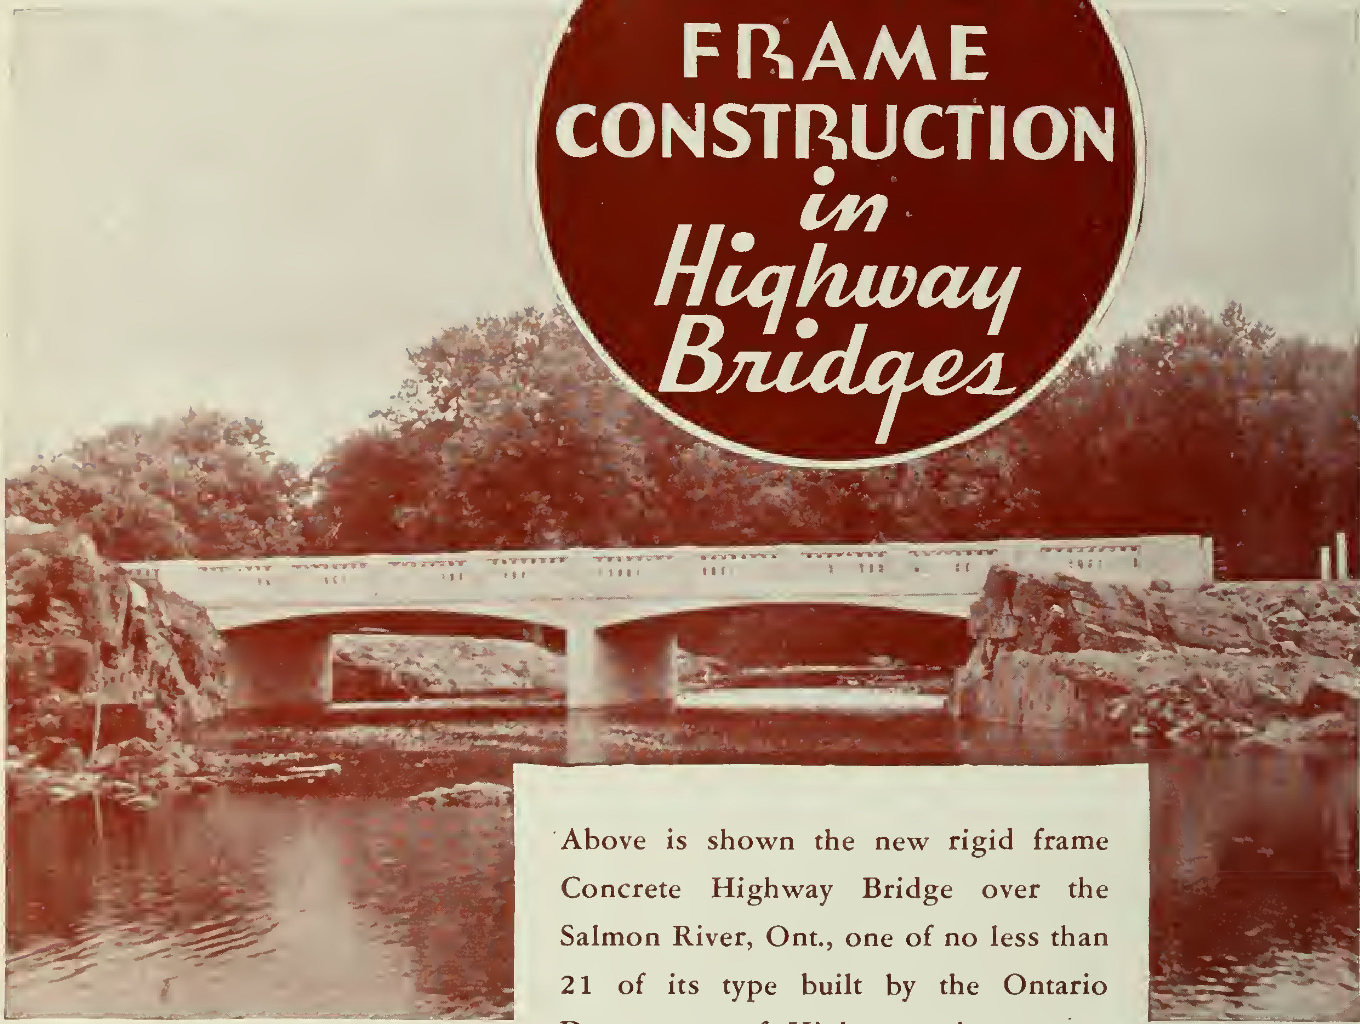
# RIGID FRAME CONSTRUCTION *in* Highway Bridges



*Salmon River Bridge:*
*Leopold McCauley, Minister of Public Works and Highways, Ontario.*
*R. M. Smith, Deputy Minister of Highways.*
*A. A. Smith, Chief Engineer, Dept. of Highways.*
*Arthur Sedgwick, Engineer of Bridges, Dept. of Highways.*
*Angus & Taylor Ltd., North Bay, Contractors.*

Above is shown the new rigid frame Concrete Highway Bridge over the Salmon River, Ont., one of no less than 21 of its type built by the Ontario Department of Highways since 1931. This modern type of construction offers unusual economies such as: reduced embankment or excavation, thin crown sections, longer spans, no intermediate columns or structural projections and many other advantages. Write our Service Department for full information.

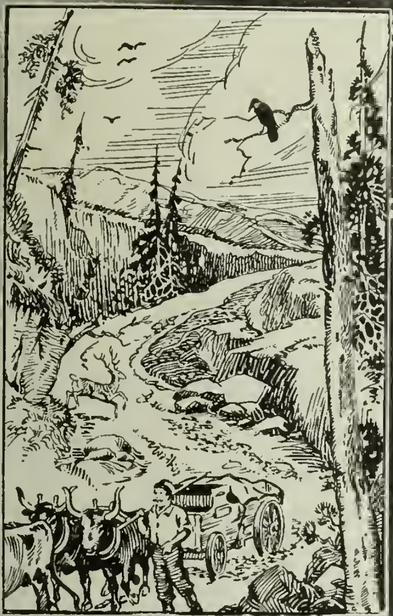
# The Romance of Road Building in Canada



THE early crude roads not only served the needs of the settlers, but also those of the British, French and American armies during the numerous campaigns.

The first important highway in Canada extended along the north shore of the St. Lawrence from Quebec to Montreal, being gradually completed with the growth of the French settlements. In 1794, the first governor of Upper Canada, Colonel John Graves Simcoe, completed one of the great arteries of traffic known as Grovernor's Road, Yonge Street, Toronto, to Lake Simcoe. The work was done by the Queen's Rangers. In 1817 Toronto was joined to Montreal and in 1827 a through road was available between Halifax and Amherstburg. The cost of construction of these roads was high, and travel by stage coach was tedious and costly. Today, over 378,094 miles of all types of roads are in use throughout Canada. Explosives played a large part in this construction work and NOW a new, economical and efficient method of building highways across swamps and marshy ground can be carried out by the use of C-I-L Explosives.

## Survey Work for the Lake St. Louis Bridge

*C. F. Draper,*
*Lake St. Louis Bridge Corporation, Montreal.*

**Paper presented at the General Professional Meeting of The Engineering Institute of Canada, Montreal, Que. February 8th and 9th, 1934.**

SUMMARY.—The paper first discusses the preliminary soundings, borings and current measurements for the 4500-foot highway bridge, which is now approaching completion, over the St. Lawrence river near Lachine, Que. The author then deals with the survey work including levelling, triangulation, and direct check measurements for the location of the centre lines of the fourteen piers.

Preliminary surveys to determine the location and levels for the new highway bridge to cross the St. Lawrence river in the neighbourhood of Ville LaSalle and Caughnawaga were made during the summer of 1931.

After the contracts were placed, the work of checking the preliminary triangulation was put in hand and carried out early in 1933.

The bridge is situated about eight miles from Montreal at the outlet of Lake St. Louis, and will provide direct access to provincial route No. 4, one of the main roads from the province of Quebec into New York state.

Starting from the north or LaSalle end, it consists of an embankment with a graded surface of 4.7 per cent about 440 feet long. This connects with a reinforced concrete

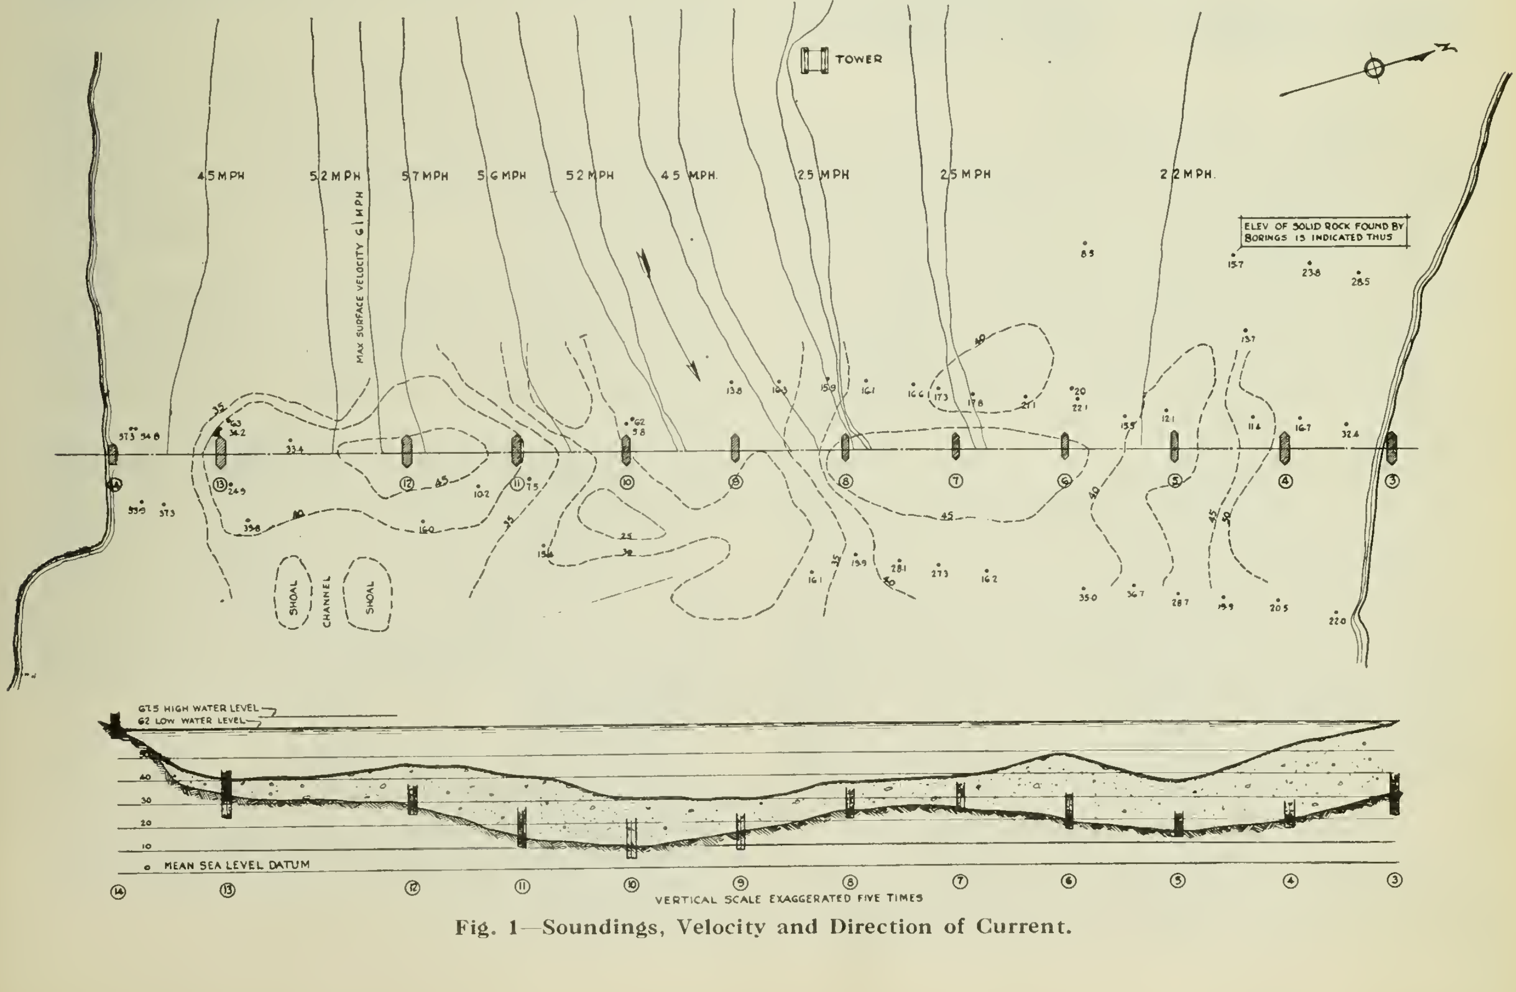

Fig. 1—Soundings, Velocity and Direction of Current.

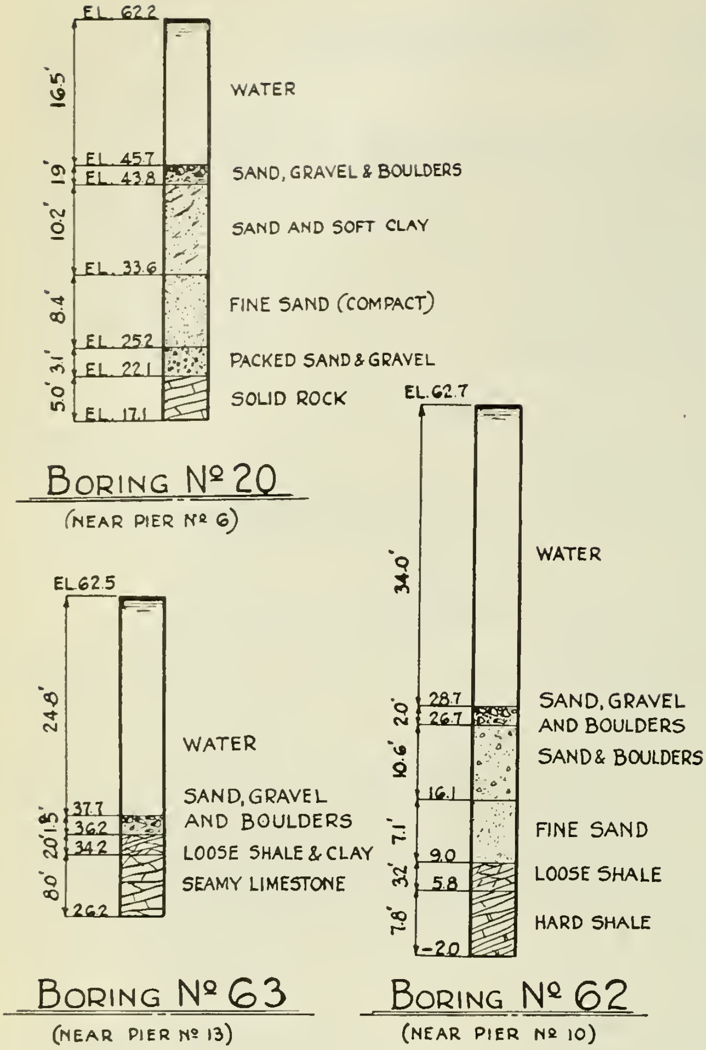

Fig. 2—Borings.

viaduct 300 feet in length, with level grade, containing six spans of 50 feet ending at pier No. 1 of the river crossing.

The total length of the river crossing measured between the faces of the extreme piers, Nos. 1 and 14, is 2,918.3 feet.

From pier 14 the highway is carried southward on a reinforced concrete viaduct containing twenty-five spans of 50 feet each, the grade falling 2.5 per cent.

The total length between faces of the ballast walls of the north and south abutments is 4,469 feet 4 inches.

An embankment about 1,300 feet in length falling on a 2.5 per cent grade, connects with the highway on the south shore.

The second pier of the river crossing was located originally on the south side of LaSalle boulevard, and close to it. For construction reasons this pier was eliminated, and a single span 172 feet long of a deck truss type with curved lower chord to provide clearance over the highway was substituted for the two shorter spans between piers 1 and 3. The next span, that between piers 3 and 4, is of a special length, 231 feet between pier centres, to conform with the requirements of the proposed St. Lawrence Deep Waterway channel.

With the exception of these two spans and that of the 400-foot river channel span, the remaining nine spans are each 235 feet between pier centres.

### Soundings, Borings and Current Measurements

Soundings were taken during the summer of 1931 and these, together with information obtained from the Department of Railways and Canals, covered an area of about 700 feet downstream from the bridge and upstream as far as the Canadian Pacific Railway bridge. Taking a section on the centre line, these show a maximum depth of water of about 32 feet with the water level at 62 above mean sea level datum. This depth occurs between piers 9 and 10 and is the deepest portion of the river for the area considered, with the exception of several pockets about 5 feet deeper, adjoining the two 400-foot spans of the railway bridge. The remainder of the latter crossing is however in shallower water than is found lower down, while some 400 feet longer than the new highway bridge crossing.

The sectional area of the waterway on the centre line is 54,500 square feet at low water, the width being 2,700 feet, giving an average depth of 20.2 feet.

Results of the measurements giving velocity and direction of current, soundings, and borings are given on the accompanying plans (Figs. 1 and 2).

The material in the river bed overlying the rock consists of clay, sand, gravel and boulders, in varying combinations, and the depth of the overlying material varies from 13 and 14 feet between piers 7 and 9, to 28 feet at pier 6 and 31 feet at pier 3. From pier 13 to the south shore the rock rises rapidly and is outcropping at pier 14. The smaller boulders were found to be largely of material foreign to the bed rock, having been carried by water or ice, and occurred at varying levels, whereas the larger boulders were almost entirely of eroded black shale, which was the material on which the piers have been founded, with, to a limited extent, intrusions of a hard grey limestone.

This shale, which is badly broken up and eroded on the surface, shows regular bedding where cut into, and gives a dip which is of irregular amount, but generally changes from a westward dip for the northern half of the river to a dip eastward for the southern half. The erosion of such a deposit, therefore, results in the breaking off of successive steps, and giving fall to the channel, while presenting rock of a very broken character when first encountered in excavation.

The central profile shows that this rock is roughly level as far south as pier 8, with an elevation of 25 over datum, and has a fairly regular depression from piers 3 and 7 towards pier 5, where it was met with 11 feet deeper. From pier 8 to the south shore there is a depression, culminating at pier 10, where the lowest rock was found at elevation 8.4, the foundation of this pier being carried down 4 feet further.

From pier 11 the rock rises abruptly to pier 12 whence it gradually rises southward. The depth of sinking at pier 10, while it is the deepest of the piers, was exceeded in the case of pier 6, which was 33 feet, and piers 3 and 4, where the foundations were carried through 41 feet and 35 feet respectively.

The borings were partly wash-borings and partly taken with diamond drill. They were taken over a band of from 30 to 80 feet in width, and were supplemented later with some additional borings taken on the actual pier sites.

The direction and velocity of the surface currents in the river were measured in December 1932 and in November 1933 at intervals across the channel. They show the velocity to vary from a minimum along the north shore, where it is approximately 2.2 miles per hour, to a maximum of 6.1 miles per hour in the channel span, water level being 63.5 over datum.

### Triangulation

The general outline of the triangulation is given on the accompanying diagram (Fig. 3). The figure used in the survey is roughly of quadrilateral form, with its longer east and west sides slightly tapering towards the south, and the distance between these sides of about two thirds of the longer dimension.

The bridge centre line crosses this figure longitudinally and subdivides it in an approximate ratio of three to two.

The resulting figure between the two bridges has a width of 1,400 feet, which is about 40 per cent of its longest side, the base line.

This figure was admirably suited for transference of points measured along the base line, on to the new bridge centre line.

The original circumscribing figure contained nine sides, the longest of which was the original base line. The tower station near the centre of the river and closer to the railway bridge was used as a check on the outer figure. A new base line was substituted for the original, since it was impossible to measure the latter directly with sufficient accuracy. This virtually added two sides to an already crowded polygon, but was a necessary complication. Once, however, the figure was calculated and adjusted, little use was made of it, beyond the new base line with its pier substations. The tower station was used to check a few of the adjoining piers.

The angles were read throughout by a single observer to eliminate as far as possible variation in personal error. Each angle with its explement* was read three times in one direction, the telescope reversed and the same readings taken in the opposite direction. Each angle was therefore read twelve times and the average was then recorded.

The angles so adjusted were again checked for closure around each station. They were further adjusted in each quadrilateral into which the triangulation figure was divisible, by the angle equation, and were finally adjusted by the quadrilateral side equation:—

$$\frac{\sin 1 \ . \ \sin 3 \ . \ \sin 5 \ . \ \sin 7}{\sin 2 \ . \ \sin 4 \ . \ \sin 6 \ . \ \sin 8} = 1$$

in which the figures in order of sequence represent the eight angles at the apices of the quadrilateral.

*The explement of an angle is equal to 360 degrees minus the angle.

From the angles so adjusted the latitude and departure of each point was calculated, and a working plan made for use in the field, with only the essential angles shown thereon.

### Tape Measurements

The tapes used for precise measurements, 500 feet and 300 feet long, were first of all checked with those used in the Dominion Bridge Company's shops, where the steel work was being fabricated. All measurements were corrected for a temperature of 70 degrees. Checks of the suspended-tape measurements were made, and for this purpose two small steel supports were made as shown in the accompanying illustration (Fig. 4). These provided a convenient method of fixing a point plumb over the plugs at either end, also a smooth pulley, with dead weights for measuring the pull. A small correction for friction was made by taking the mean reading between those given by releasing the weight after slightly increasing and relieving it.

For the measuring point, a small adjustable brass plate was fitted at the top of the stand, with a line engraved on its centre, the plate being adjusted plumb over the hub by transit, and fixed by two butterfly nuts when correct.

For the purpose of checking the suspended-tape measurements, two steel plugs were set in the level concrete floor of the Dominion Bridge Company's machine shop. These were 235 feet apart, and the steel standards described above were placed with their measuring points plumbed by transit directly over the plugs. The 300-foot tape was used, with pulley weights varying by five pounds each from 20 pounds up to 40 pounds and from 40 pounds back to 20 pounds, the sags being measured and the temperatures noted. The corrections for sag agreed very closely with the catenary calculated from the known weight of the tape and the tensions applied.

It may be pointed out that the greatest difficulty in carrying out such measurements in the field lies in obtaining suitable climatic conditions, namely, absence of wind and uniformity of temperature. This applies particularly in

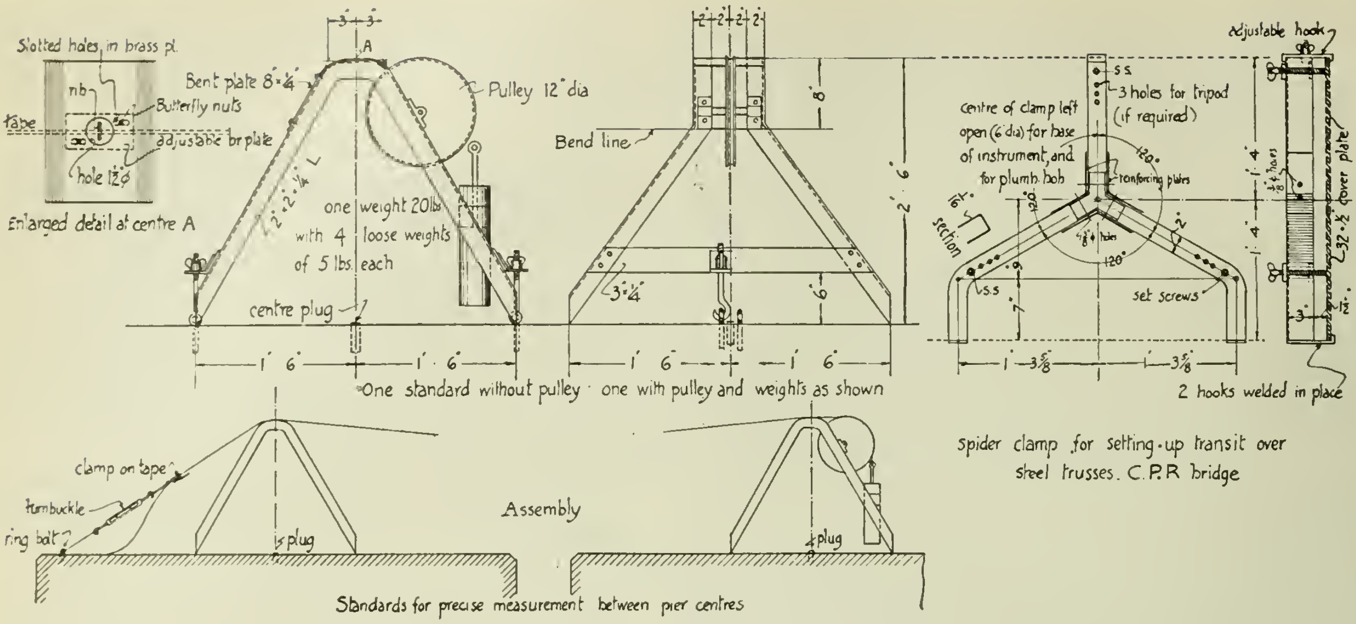

Fig. 4—Steel Supports for Checking Suspended-Tape Measurements.

the case of a wide and exposed river such as the St. Lawrence at Lake St. Louis, where a windless day is a rarity. Generally, the early morning is the most favourable time for this work, as well as for taking long sights, and is usually preferable to the evening. In the morning the atmospheric conditions have remained equable over a long period. This is particularly noticeable in sighting over a long stretch of steel work or even of railway track. The reason is that during the night the temperature of the steel has approached a condition of equilibrium which is not greatly disturbed even by an early sun, whereas in the evening the heat absorbed by the steel structure during the day, particularly if the sun has been strong, begins to radiate into the surrounding atmosphere as soon as the sun approaches setting, with consequent quivering of the air which renders accurate sights impossible.

During the progress of the work on the sub-structure, and after its completion, suspended-tape check measurements were made as described above from pier to pier across the river, and the centre lines for the pier members of the steel trusses laid out therefrom.

For the measurement of the base, a line was chosen on the deck of the west track of the railway bridge, giving a space clear of all obstructions from rail or deck fastenings. A metal plug was set in the masonry of the abutment ballast wall at either end of the line C1A-R5A (Fig. 3). Small zinc plates engraved with two fine lines at right angles, were placed on centre, and nailed to the first anchored bridge tie on the fixed end of the corresponding span. The 500-foot tape was used, and the zinc plates set at a distance apart not exceeding the length of the tape. These plates were subsequently used to lay out the adjoining pier intersections.

The base line C1A-R5A was measured on April 28th, 1933, a cloudy day being chosen, and a period between trains. Measurements were taken to the zinc plates, and the total length obtained by aggregating the separate distances, whatever they happened to be. The temperature, at intervals, of the tape was also recorded, and the necessary corrections made. By this method time was saved, and the measurements were reversed and taken a second time. Pulls of 30 pounds and 40 pounds were used for each measurement, and the length finally corrected to the standard used throughout.

A shorter side C3-C20 on the south shore was also measured by levelling stakes every 20 feet and checked in well with the rest of the work.

### Locations of Piers

The triangulation figure gave with the established shore stations a system whereby the piers could have been located entirely from these shore stations.

Owing to the accessibility of the railway bridge, however, through the courtesy of the Canadian Pacific Railway Company, it was used almost entirely for the location of the new piers, with the added advantage that from the base line on that bridge, not only could the centres of the piers be established, but also the pier centre lines themselves. Full advantage was taken of this, as well as for the location of the breakwaters or deflectors, which were placed in position by floating equipment, as nearly as possible symmetrical with the pier centre lines.

These deflectors were located also, as well as the construction trestle, by means of a 50-foot offset line which was laid out for this purpose, with hubs and targets at either end.

The intersections of each pier were marked on the base line and the pier centre lines transferred across the width of the railway bridge to its east face where targets were placed, three to each pier. The two side targets were placed for the side lines which were used on the construction trestle to control the sinking of the caissons.

Where the trusses of the railway bridge permitted, from the intersection of pier 5 southward, the pier intersections were also transferred to the cover plate of the top chords, and a special clamp made for setting up the tripod of the transit, as shown in Fig. 3. In this way the work could be carried out with a minimum of inconvenience from passing trains.

After the checking of the triangulation, work was commenced on the viaduct on the south shore and on pier 14, which was constructed from the shore by the same gang. The setting out of this 1,250-foot viaduct presented nothing out of the ordinary. The centre line of each pier was extended to a hub 100 feet on each side of the centre line. After the completion of pier 14, a target was placed on its summit, on the centre line, and used subsequently for the viaduct on one side and the river piers on the other.

### Levelling, etc.

For the levels, the government bench marks were used until a check was made across by levelling over the railway bridge, also by connecting the levels from an instrument placed at the tower station.

A small correction was made to the reduced levels of the bench marks on the south side of the river which were not favourably situated, or in good condition for accuracy. All levels were co-ordinated with the bench mark placed at the north end of the railway bridge, which was in good condition.

It may be pointed out that in setting the lines for the location of the pier members of the steel spans on their bridge seats, the span lengths centre to centre of bearings were corrected to a temperature of 40 degrees. The latter would be approximately the mean temperature, and give the mean position of the expansion end of the span.

By making this correction the cycloidal pintles set in the upper and lower expansion members which control the rollers will lie one vertically over the other at the mean temperature. The amount of this correction is about 9/16 inch for the 235-foot spans. It may be noted that if this correction had been made throughout, the entire bridge would have been about 10½ inches shorter.

It is of interest to consider what degree of precision is necessary in work of this kind. Actually an error of 8 inches was found in the length of the river crossing as determined by the preliminary survey. This is about one in four thousand. Had even this amount been known in time, it might have been taken care of by judicious distribution. The difficulty lies in the fact that the error would probably not have been discovered until it had either been concentrated in one span, or until a stage had been reached in the erection of steel when it would have been equally unfortunate.

An error of one sixth of the above, however, or one in twenty five thousand, would have been reasonable and of little moment from the nature of this particular structure.

To reduce errors in measurements to such a proportion absolute precision should therefore be aimed at. That it was possible to reduce the total of errors to considerably less even than the above, to less than one in one hundred and fifty thousand, was due to the enthusiastic co-operation on the part of the entire engineering staff in an attempt to obtain as nearly absolute precision as possible.

# The Substructure and Approaches of the Lake St. Louis Bridge

*J. A. Lalonde, A.M.E.I.C.,*
*Chief Engineer, A. Janin and Company Limited, Montreal, Que.*

**Paper presented at the General Professional Meeting of The Engineering Institute of Canada, Montreal, Que. February 9th, 1934.**

SUMMARY.—Twelve of the piers for the Lake St. Louis bridge across the St. Lawrence stand in a strong current and in depths of water up to 32 feet. The paper discusses the construction methods adopted, some of the pneumatic caissons having been placed from a specially designed sectional trestle, and others from powerful floating equipment. Notes are given on the construction of the approach viaducts.

The Lake St. Louis bridge, now approaching completion, will carry the traffic of a main highway across the St. Lawrence river at a point near Lachine, west of Montreal. The bridge is about 4,500 feet long from abutment to abutment. The north shore approach consists of a 440-foot earth fill and a 300-foot concrete viaduct, and the south of a 1,300-foot earth fill and a 1,250-foot concrete viaduct.

The steel superstructure is supported by thirteen piers, eleven of which have been carried to bedrock by the pneumatic method. The north shore pier was built in an open sheeted cofferdam, and that on the south shore in a puddle cofferdam.

The following interesting features characterized the construction of the substructure of this bridge:—

1. The development of a practical and economical combination steel-tube and timber trestle for construction in swift water.
2. The use of welded steel caissons.
3. The methods employed for building and guiding caissons and forming breakwaters.
4. Accurate methods of sinking.
5. The use of a specially designed deflector in combination with a powerful shear-leg boat designed for handling and sinking pneumatic caissons.

### General River Conditions

The river conditions had to be studied very carefully before any final method of construction could be adopted. The St. Lawrence river, at the bridge site, is 2,800 feet wide. At low water, its depth varies up to a maximum of 30 feet. It has a current velocity of 2 miles per hour near the north shore, increasing to a maximum of 6 miles per hour at pier No. 10, and 3 miles per hour at the south shore. At high water, the velocity reaches a maximum of 8 miles per hour in the channel. A rate of 4 miles per hour has actually been measured near the north shore during construction last spring.

The river is not navigable, with the exception of a narrow and tortuous channel near the south shore, and contains many shoals and rocky reefs. The extreme low water (elevation 61.3) which prevailed during the greater part of the summer and fall of 1933 increased the difficulties of navigation to such an extent that it became risky.

The behaviour of the river between December 1932 and May 1933 was observed closely. This section of the river is open all winter, but considerable field and frazil ice floats down; the maximum proportion of ice to water surface last winter was approximately 90 per cent with an average of 50 per cent of rapidly moving ice.

The spring break-up took place on April 4th, 1933, the river being entirely clear of ice by April 15th, with the water at elevation 66. This definitely fixed the average working season between April 15th and December 1st.

The bridge site is subject at times to strong westerly winds from Lake St. Louis, creating such conditions that during many days construction operations are difficult, if not impossible.

Test borings taken from 200 to 300 feet upstream and downstream from the final site of the bridge were made in

Fig. 1—General View Downstream of Bridge under Construction.

1931, to determine the best location. These borings were remote from the pier sites and the elevations of the base of each pier as shown on the contract plans had been interpolated between these borings. The nearest other available information regarding river bottom conditions was at the C.P.R. bridge located 1,500 feet upstream; the bottom there being practically bare rock and generally about 3 feet below low water, with a maximum of 35 feet of water at the channel.

### Construction Methods

The contract for the substructure was awarded on November 14th, 1932, to be completed on November 1st, 1934. Guided by the studies of the river conditions and the available borings, the general contractor decided that the most advantageous way to construct the river piers was to find an economical system of getting at as many piers as possible from the land, by using a system of trestle especially fitted to these river conditions; the number of piers to be built this way to be determined by soundings, current velocity readings and borings made at the pier site, just as soon as the river would permit. There was then enough information on hand to allow of making the final plans and ordering the necessary materials up to pier No. 6.

A trestle design was studied, and a system of trestle, side cribs and breakwater developed, permitting: (*a*) pile spuds to be driven in swift running water regardless of river conditions, (*b*) minimum stream obstruction, (*c*) adaptability for use on other work, (*d*) considerable economy by speedy construction and dismantling.

This combination steel tube and timber trestle was developed by Mr. Englander. the general contractor's resident engineer in charge of the river work, to whom the writer is greatly indebted for assistance in the preparation of this paper.

The trestle was designed of sufficient strength and size to support a 35-ton crane. The bents were 20 feet centre to centre, braced to act as four-legged towers, the corner posts being square tubes made of ⅛-inch plate, and electrically welded at the junction, with welded gusset plates to receive the lateral and sway bracing. These tubes and frames were fabricated at the Dominion Bridge Company's shops, and assembled at the bridge site with bolted field connections. A typical tower ready to be placed in position is shown in Fig. 2.

Soundings were made at the bent locations and 12-inch by 12-inch square timber spuds, steel shod and of proper length, were prepared in advance of placing the bents.

The four corner spuds were first placed in the tubes, with the points projecting the proper distance below the bottoms of the tubes and held in place by dowels through the tops of the tubes. The tower was then lifted from the trestle by the crane and swung into line with the trestle; ¾-inch wire rope cables were then attached to the bottom struts of the tower and carried through two sets of three-part blocks to a small scow equipped with two 15-ton hand winches. This scow was located about 100 to 150 feet up-

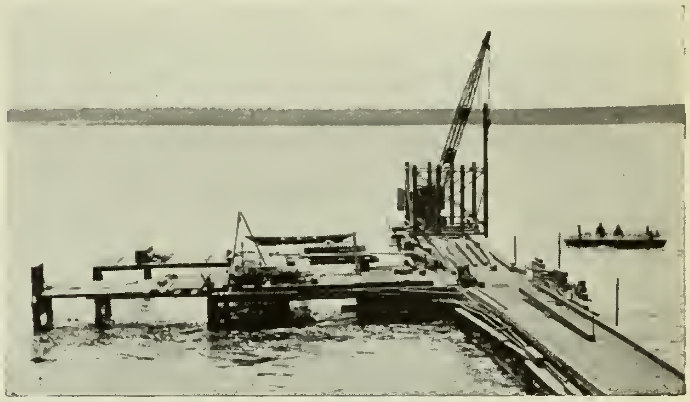

Fig. 2—Trestle under Construction.

stream from the tower to be placed, and by means of lines from one of the winches, leading to upstream anchors, could be warped into position. The cables attached to the tower resisted the current action and permitted the tower to be placed in its correct up and downstream position.

The tower was then lowered to rest on the four spuds. The winches were tightened up to withstand current action, and the crane boomed out until proper distance between towers was obtained. With the tower in position, the intermediate spuds were placed in the tubes, driven to refusal and dowelled. Then the corner spuds were driven home. Although the penetration at times was as little as nine inches, the steel tubes prevented the current from swaying the spuds and also provided lateral and sway bracing far below water level without any additional labour, and without any underwater work.

Spuds were then cut off, capped, and the stringers and deck placed. The caps and stringers were 12 inches by 16 inches, and 10 inches by 16 inches, drift bolted. The deck was 3-inch plank.

All lumber was of standard length, which speeded up the work considerably.

The final operation was to attach anchor cables to the top of the tower. These consisted of two ¾-inch wire rope cables tied to two one-ton pre-cast concrete blocks, which had been previously placed about 50 to 75 feet upstream from the trestle. This completed 40 lineal feet of trestle and the crane was now ready to move ahead for the next tower.

The work was arranged so that materials required for a 40-foot section of trestle were directly behind the crane and ready for distribution. The tower bents were assembled and bolted at the land end and rolled out on 6-inch rollers on top of the guard rails of the trestle, as shown in Fig. 2.

Figure 3 shows the arrangement and construction of the trestle at a pier, and Fig. 4 shows a typical caisson in position.

### Caisson Cribs

To create a dead water basin at the caisson site, the tower directly on the centre line of, and upstream from the caisson was designed to act as a combination breakwater and trestle tower. This was accomplished by providing steel channel grooves for 4-inch wooden stop logs on the north and south sides of the frames.

To deflect the current, the upstream and downstream corner tubes were fitted with half sections of steel sheet piling to permit driving steel sheeting across the upstream and downstream sides of the towers. The side stop logs were first placed, as they would not obstruct the current, spuds were cut off, capped and deck placed as in the case of the standard bents. Clearance was allowed in the deck to permit the driving of the steel sheeting when ready to deflect the current.

The next operation was to place the tower bents which functioned as side guides for the caisson, supported working platforms, and acted as buttresses to the main trestle; the upstream towers on the north and south sides also functioning as part of the breakwater. Three towers were placed on each side of the caisson berth; the north consisting of two 15- by 20-foot towers with four spud bents, the downstream one of one 12- by 12-foot tower with two spud bents. Those on the south were similar to the north downstream tower. All frames in the guide towers were fitted with 5-inch channel grooves for wood stop logs as has been previously described. These towers were carefully located and a clearance of three feet on each side of the caisson allowed. The north platform was 20 feet wide, enabling the crane to erect caisson, steel shafting and locks. On the south side it was 12 feet wide providing a working platform and support for the concrete tower.

After the stop logs were in place, the cribs were filled from 10 to 15 feet deep with rip-rap providing lateral stability for the cribs while sinking and guiding the caisson.

With the side cribs in place and rip-rapped, the gap in the upstream breakwater was closed with steel sheet piling, and when required, sheeting placed at the downstream end of tower, and a rip-rap fill made.

This combination of breakwater, trestle and working platform created an effective dead water basin; in fact, the downstream eddy caused a slight upstream current in the basin. The closure between the breakwater and two adjoining side cribs was made with steel sheeting.

It was not found necessary to carry all of the stop logs to the water surface as the upstream logs deflected the current sufficiently.

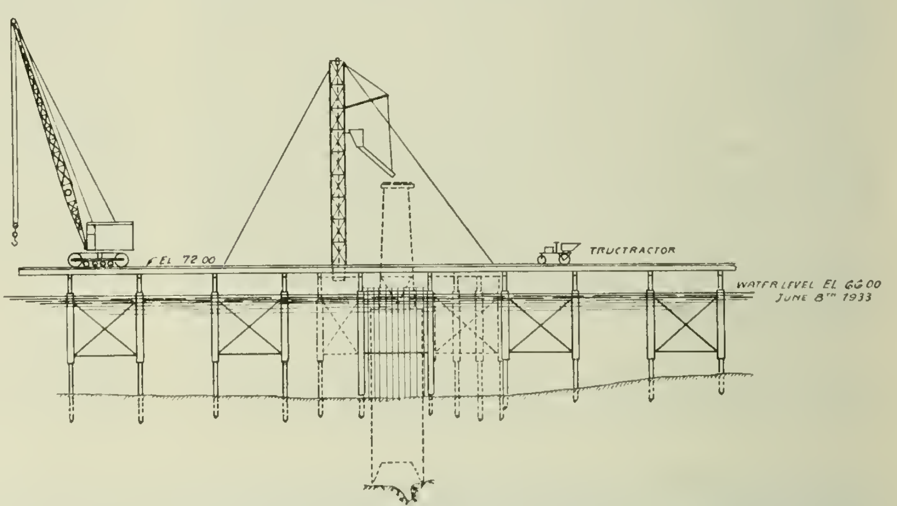
To resist the pressure of the sheeting against the tower, the lower horizontal waler was reinforced with a channel and the top one stiffened by an 8-inch by 8-inch timber.

The caisson area was now ready for accurate soundings and inspection to determine the character of the river bottom and prepare it to receive the caisson.

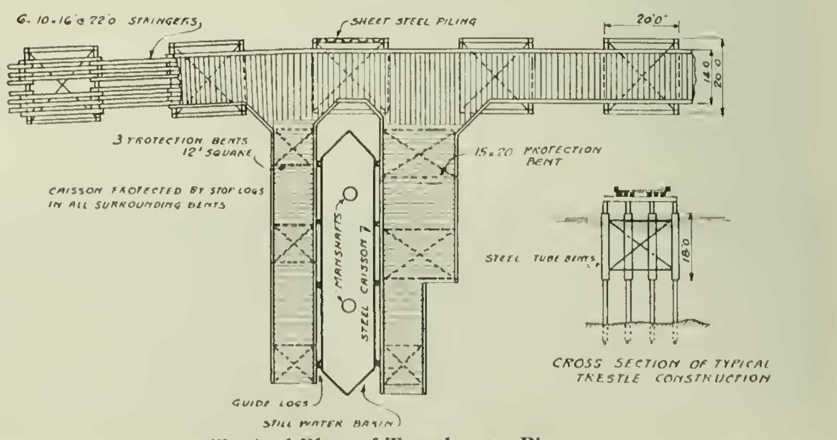
In this manner the trestle and berths were built without difficulty to pier No. 6, during the high water period, in a current varying from 3 to 5 miles per hour, and in water from 12 to 26 feet deep.

The elevation of the trestle deck was fixed at 72.0 to provide clearance for maximum high water.

The trestle construction commenced as soon as river conditions permitted and the major portion of ice had passed the bridge site. The first tower was placed on April 19th, and the trestle built, including side cribs, etc., to pier No. 6, a total length of 1,200 feet, by June 1st, averaging 60 feet per day taking into consideration the fact that during three weeks the crane did not erect trestle but handled material for caisson build-up, erected gantry frame used for lowering, placed shafting, and air locks.



Typical Elevation of Trestle at a Pier.



Typical Plan of Trestle at a Pier.
Fig. 3.

In computing the stability of the towers against the current, the formula used for current pressure was

$$P = K \frac{wv^2}{2g}$$

where $w$ = 62.5 pounds per cubic foot, $v$ is the velocity in feet per second. $K$ was taken as 1.5 for a square tower. The current pressure was considered as acting on the upstream faces of all columns in each tower. Actually, the current is deflected by the upstream column, and when the columns are

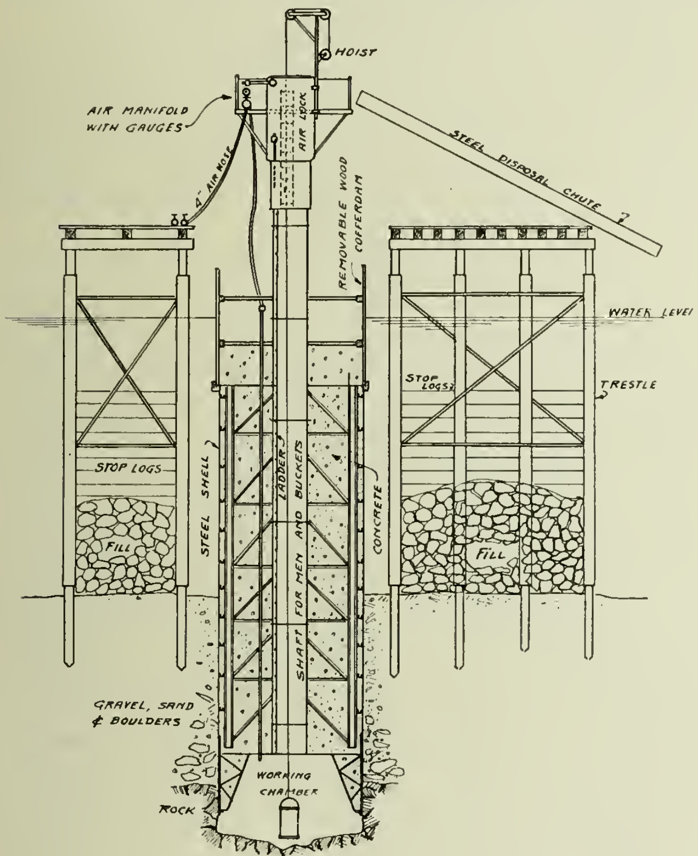


**Fig. 4—Typical Caisson for Piers.**

in line with the current the factor $K$ taken as 1.5 is probably larger than necessary. At two miles per hour, figured from the above formula, the current pressure is 12.9 pounds per square foot; at 3 m.p.h. 28.8; at 4 m.p.h., 51.5; and at 5 miles per hour, 80.4, the pressure increasing as the square of the current velocity.

This current pressure was assumed as acting one third of the depth below the surface of the water, the moment arm increasing with the depth of the water. Resisting the current is the moment of the weight less the buoyancy of the tower, the piling, the steel sheet piling and stop logs if used, the weight of the stringers, caps and decking. To this may be added excess weight from dead loads, such as rip-rap fill, or upstream anchorages.

It was found that the trestle in itself was stable at the current velocities and river depths encountered, but as a factor of safety, and a precaution against storms, anchorages of one ton block were placed upstream from each tower.

### Construction Equipment for Trestle and Cribs

The equipment used for the trestle and crib construction was one 60-foot boom North-West crane, one No. 7 McKiernan Terry air-operated hammer, one 14- by 30-foot scow (built on the job), equipped with two 15-ton hand winches, three tructractors and three lorries, an unusually small amount of equipment for such work.

The area available for the contractor's use on the north shore was very small, therefore it was decided to so co-ordinate the work and deliveries of materials, that little storage would be necessary. All materials being truck delivered, a stiff-leg derrick was erected on the north shore and so placed that it could unload directly from trucks on the highway to lorries on the trestle. These lorries were hauled by three three-wheeled tructractors along the trestle. Schedules of deliveries were drawn up weekly, sent to the vendors and revised as progress demanded. Thus, through this bottle neck, 120 tons of steel for the towers, 580,000 board feet of lumber, 14,000 cubic yards of concrete, steel for the caissons, air locks, shafting, and reinforcing were delivered with practically no storage of materials, and at no time was the job either blocked or held up because of supply of materials.

The tructractors, being very flexible, entirely eliminated the need for industrial track, handling all materials for trestle construction, caisson build-up, shafting, locks and concrete, and accelerated construction a great deal.

### Caisson Design

*Caisson No. 3*

This caisson was designed of reinforced concrete with a steel cutting edge. This cutting edge (Fig. 5) was made up of a 24-inch by ¾-inch outside plate, one 8-inch by 6-inch by 1-inch angle, and a 12-inch at 25-pound channel, the inner flange of the channel bent to conform to the slope of the inner working chamber wall, and riveted to a 22-inch by ⅜-inch continuous plate. Reinforcing, threaded and fitted with two nuts, passed through the channel to provide anchorage for the steel edge. The 2-inch wood sheeting forming the outside was fastened to the outer plate with countersunk bolts. As this sheeting was to remain in place, 6-inch nails at 2-foot centres were driven to provide a bond between the caisson concrete and sheeting, thus eliminating any tendency to displacement due to skin friction while sinking. Horizontal walers at 4-foot centres, and tie rods, held the sheeting in place while concrete was poured, and were removed as the caisson was sunk. The character of the sub-soil justified the heavy cutting edge used. The deck of the working chamber was sloped longitudinally upwards towards each shaft and thence downwards to the centre. This precaution was taken to insure complete filling of working chamber concrete against the deck. Directly above the roof, jet nozzles

**Fig. 5—Cutting Edge, Caisson No. 3.**

pointing upwards were placed at 5-foot centres with the outer ends flush with the outside of the sheeting. These nozzles, connected to a header and riser, were placed on each side of the caisson, and formed the jetting system used to reduce the skin friction. It was arranged to have each side operate independently. As the caisson concrete stopped at elevation 60, 4 to 5 feet below the water level, a light cofferdam, braced by flanged pipe, was provided to permit the building of the pier shaft in the dry.

*Caissons 4 to 13*

The borings indicated the probability of difficult sinking through gravel, boulders and shale, and therefore all cutting edges were proportioned to withstand severe conditions. The only riveted steel was in the cutting edge. The skin plates, deck, channels and angles were all electrically welded. The working chamber roof was 6 feet above the cutting edge; hooks were welded to the deck for electric light wires, and U-bolts placed at various points for snatch blocks to pull snags, boulders, etc., from under the cutting edge. To permit the connection to the working chamber of air lines, vents, whistle and other pipes, pipe couplings of proper size were welded to the top side of the deck plates, and nipples were screwed into these couplings from below for any piping required inside. This arrangement left all openings flush with the roof when nipples were removed and all pipes could be used as vents when sealing the working chamber. The manshafts were 42 inches in diameter, the bottom sections were welded to the deck with the underside flush so as to permit bottom doors to be placed without difficulty when raising the locks. Two shafts were provided for each caisson, and located at the centre of area of the material to be removed.

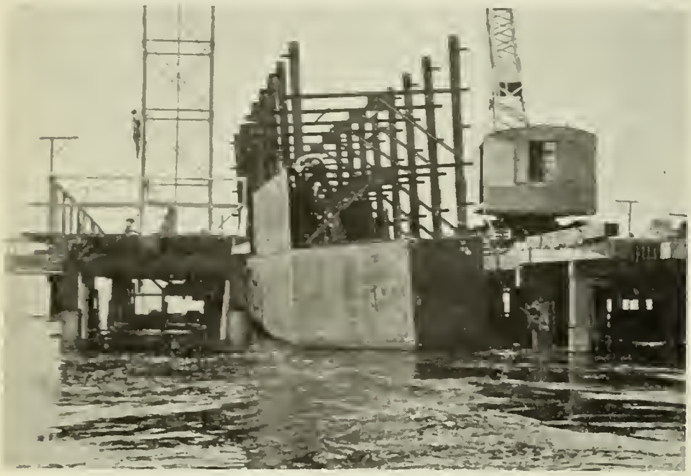

Fig. 6—Erecting Caisson Steel.

The skin plates and bracing above the deck level were designed to withstand the water head imposed under sinking conditions at the different caissons. All skin plates and bracing were electrically welded at junction points. (Fig. 6.)

As the outside shell was specified to be built entirely of steel to elevation 60, due to the uncertainty as to the actual elevation of rock and the corresponding final cutting edge elevation, the caisson steel was built up to within 4 or 5 feet of the designed height, assuming contract rock elevations to be correct, and flanged steel panels provided to complete the steel skin to elevation 60. A wooden cofferdam was provided to withstand the water head above the top of the steel caisson.

For each caisson, flotation and sinking diagrams were made to determine the height to which the caisson plates should be carried, the cofferdam requirements and the concreting schedule.

### Preparation of River Bottom

At pier No. 3, located at the water's edge, the site of the caisson was first dredged to a depth of 4 feet so as to remove all snags and boulders, and then backfilled to elevation 65 with sand, the water being then at elevation 64.

At the other pier sites, careful soundings were taken to determine the general profile of the bottom and where necessary the high points were either clammed off or sand bag walls built up to the high level to enable the caisson to land plumb and in position. Where the river bottom was found to be practically level, no preliminary preparations were made. As soon as sufficient concrete weight was on the caisson, air was applied; the sand hogs placed bags under the cutting edge and removed the high points under the side walls.

### Erection and Lowering of Caissons

The caisson steel for piers 4, 5 and 6 was fabricated at the Lachine shops of the Dominion Bridge Company Limited. Trucks and trailers transported it to the job in sections that could be handled by the job derrick, which transferred it to lorries on the trestle, and by means of the tructractors it was hauled to the caisson site. The crane assembled the steel at each pier site on ten 12-inch by 12-inch timbers spanning across the caisson berth. The first build-up was about 14 feet; all field welding being done with four General Electric welding machines. The "high air" for riveting the cutting edge was supplied by the air plant north of Lasalle boulevard.

The method employed to lower the caissons is shown in Fig. 7 and was as follows:—

Twelve-inch H-beams 60 feet long were placed on the side platforms parallel to the caisson. Five 12-inch by 12-inch posts, capped longitudinally by 12-inch by 12-inch timber and braced to the platforn s, provided support for ten I-beams (15 inches at 42 pounds) placed at right angles to the timbers and spanning over the caisson. These I-beams were paired, bolted together with wooden clamps and separated a sufficient distance to allow eyebar straps to pass between the flanges. A pin across the tops of the I-beams held the straps in place. Two triple blocks with shackles and becket reeved with 1¼-inch manilla rope were attached to these straps and to a similar arrangement which held an 8-inch H-beam under the cutting edge of the caisson, this H-beam being securely blocked under the 12-inch channel of the cutting edge. The lead from each top block led to a 15-ton hand winch. Five winches were used on each side. The caisson was then raised until clear of the timbers, which were removed, and the caisson lowered until floating. The load on each winch was about 6 tons, the maximum weight to be handled being 60 tons on ten winches.

This operation took from one to two hours. After the caisson floated the lowering frame was removed to be re-

Fig. 7—Lowering Caisson.

used on the next caisson. Generally, the lowering was started in the afternoon and the night crew had removed all lowering apparatus by the following morning, permitting the erection crew to start on the second build-up on the morning shift.

In some cases, after lowering, and before the third build-up, it was necessary to concrete to increase the stability.

### Landing Caissons on River Bottom

A 60-foot tubular frame steel concrete tower and hoist, air operated, was erected on the 12-foot platform opposite the centre of the caisson; the platform, cut away under the tower, permitted the bucket to drop below platform level, and concrete to be dumped directly into the tower bucket.

The concrete was delivered ready mixed to the job on Lasalle boulevard, chuted to a ten-yard hopper at the trestle level, then transported to the concrete tower by the tructractors, which were equipped with a one-yard automatic dumping bucket. Three trucks were used, handling an average of 30 cubic yards an hour. This output required the use of ten to twelve four-yard trucks, the haul from the Montreal plant being 6 miles.

From the tower the concrete was chuted directly into a central hopper on the caisson, and chutes distributed the concrete where desired, so as to keep the caisson floating level. (See Fig. 8.)

Before sinking, five 12-inch by 12-inch vertical greased guides were placed along each side of the caisson for lateral support, and the up and downstream position was controlled by tackles.

Great care was taken to land the cutting edge on the river bottom in its proper position. With the caisson thus properly "landed," it was fitted up for air; and as air was put on, enough weight of concrete was placed to overcome the air pressure. As soon as the water in the working chamber was lowered to a workable depth, the gang was sent in, to place the clapper valves, high air manifolds, and level the high and low spots preparatory to actual sinking. These precautions in landing have been justified, as the caissons were narrow and very little tolerance had been allowed in the design between caisson and shaft sizes.

Rod soundings were made in the working chamber under air, to determine the existence of obstructions and when it was evident that the bottom was clear, sufficient concrete was added for sinking.

### Air Plant

The air plant erected on a leased property north of Lasalle boulevard consisted of one 831-cubic foot and one 1,196-cubic foot low pressure compressor, one of these being intended as emergency equipment. A 600-cubic foot high pressure compressor supplied the high air requirements. These machines were all electrically driven, with two independent sources of electrical energy. Cooling water for the compressors was supplied by a motor-driven pump located at the river, which raised the water to a gravity tank in the compressor room. The water main on Lasalle boulevard was also tapped for an emergency supply. The high and low air compressors were arranged to pass the air through after-coolers before entering the three receivers in the compressor house, and the valves arranged so that the high air could pass into the low air receivers in emergencies. The low air was carried through two 6-inch lines from the compressor house to the foot of the river bank and from there through two 4-inch lines along the trestle to the caissons. The high air line was a 4-inch pipe and during the sinking of pier No. 3, which was done in cold weather, the air was passed through a pre-heater, to prevent freezing at the exhausts of jack hammers, tugger hoists, paving busters and other air tools.

**Fig. 8—Caisson No. 4 under Air.**

At each caisson the two low air lines were manifolded to enable the use of either line in case of breakage of pipes. A 4-inch air hose tapped the main line and led to a manifold placed on each lock platform. These manifolds supplied air to two 4-inch air hose, one leading to the main caisson supply pipe, and the other to a 4-inch connection under the bottom door of the lock. Gauges on this manifold, watched by the locktender's helper, controlled the pressure in the working chamber. Telephone connections were provided from the working chamber to the outside on the lock platform, and also from the trestle directly to the compressor room and field office. In this manner, complete control of air requirements was possible.

Two locks of the Moran type were used on each caisson. These locks were fitted with jib-boom derricks and the material buckets hoisted with "Little Tugger" air hoists. The buckets were tipped into steel chutes which dumped the muck where desired. When mucking sticky material, water supplied to the chutes prevented any stoppage due to piling up of material.

This method of equipping caissons for river work is a distinct departure from the standard practice. Usually, the dirt buckets are handled by derrick boats and the materials deposited with a boom either on scows or directly into the river, and the derrick boats are also used to raise locks, build-up and concrete caissons, etc. On this work, the locks were raised and shafting extended by means of the crane, using the usual bottom door at the deck of the working chamber and removing one lock at a time; the gang mucking through the other lock in the meanwhile.

### Sinking Caissons to Final Positions

A record chart of sinking caisson No. 3 is shown in Fig. 9. This particular caisson proved to be one of the most difficult to sink. As noted on the chart, the caisson was carried down through 30 feet of boulders and rock, and skin friction as high as 800 pounds per square foot was developed. The boulders were mostly under half cubic yard size, being too large to be placed directly in the 30-inch diameter muck bucket.

To make sure that the caisson would not become boulder bound, the cutting edge was blocked up before each drop by 12-inch by 12-inch timbers, mudded up, boulders removed; then the blocks were "shot." A slight movement would follow removal of the blocking. The caisson was then "blown" by reducing the air pressure until sinking movement started. When the caisson failed to move after blowing, the water jets were started, air raised about 5 pounds above theoretical requirements, shut off and reduced to 5 pounds above atmosphere. In all cases movement started after this procedure and the full drop was made.

During the blowing operations the gang was taken out of the caissons. As said before very little tolerance in

Table I

| Pier No. | Size of Caissons | Water Level During Construction | Elevation of River Bottom | Depth of River | Average Elevation-Bottom of Piers | Depth Sunk Below River Bed | Total Height of Piers |
|---|---|---|---|---|---|---|---|
| 1 | 32′ 1½×13′ 1½ | .... | .... | .... | 89.0 | .... | 30.9 |
| 3 | 20×74 | 63.0 | 64.4 | .... | 21.1 | 43.3 | 72.9 |

| 14 | 42′3×14′11 | 63.5 | 63.5 | .... | 60.0 | 3.5 | 59.9 |

Note:—Pier No. 1—On shore. Piers Nos. 3 to 13—Pneumatic caissons. Pier No. 14—Open cofferdam.

location had been allowed for the caissons, and extreme precautions were required to hold all caissons plumb and in position. The caisson's cutting edge, as a rule, was carried down a few feet into the rock and excavation continued until a satisfactory rock bottom was reached. Ten-foot by 10-foot test pits were excavated 4 feet deep into the rock and 5- to 6-foot holes drilled to make certain that no mud seams or cavities existed below the level of the excavation. Figure 10 is from a photograph showing actual conditions in the working chamber.

Figure 11 shows a cross section of the river with the depths to which the various caissons were sunk and the nature of the material encountered. Particulars are given in Table I.

Considering the narrow widths of the caissons and the depths sunk, the final locations were remarkably good. This was due to the precautions taken in landing on the river bottom, the daily checking of caisson locations, the side guides and cribs and, most of all, to the expertness of the pressure foremen on the job.

After the bed rock had been cleaned off, test pits and drill holes made, the bottom was inspected and passed by the engineers of the Lake St. Louis Bridge Corporation.

The rock generally lay in strata dipping upstream. In some of the caissons, alternate layers of shale and limestone were found. In pier 6, for instance, the bed rock consisted of a 4-foot layer of hard limestone underlain by shale. Due to a crevice running diagonally across the caisson and extending to the shale, it was necessary to clean out the loose material. The limestone being very blocky, a great deal of air was required due to losses through the crevices. The bottom of the excavation was 9 feet 6 inches below the cutting edge. In caisson No. 5, a 4-foot layer of hardpan was encountered in the river bottom, necessitating the use of air tools and mudding up under the cutting edge as soon as sinking operations started. Before each drop, due to insufficient cover outside the caisson, a blow would occur, flooding the caison to the cutting edge.

In the case of pier No. 10, after the deflector and side cribs had been installed (as described later in the paper), a test boring was taken 23 feet upstream from the nose of the caisson. This boring struck rock at elevation 3.7, about 18 feet lower than expected. The boring further disclosed that the river bottom was covered with about 2 feet of gravel and boulders with 27 feet of sand extending to rock. Considerable indication of scour was noted around the south side of the deflector, and there was also the possibility that the gravel and boulder surface did not extend over the whole area, as there had been little difficulty in driving the piles for the side cribs to a penetration of 8 to 13 feet. Pier No. 10 as designed, was 14 feet wide by 60 feet long at the base, with a height from rock of 72 feet and 80 feet from the bottom. The above boring made the height from rock 90 feet giving this pier a slenderness ratio of nearly 7. The river bottom around the pier might scour to a greater depth, therefore aggravating the situation, the velocity of the current at this point being at least 6 miles an hour. Regarding these conditions, it was finally

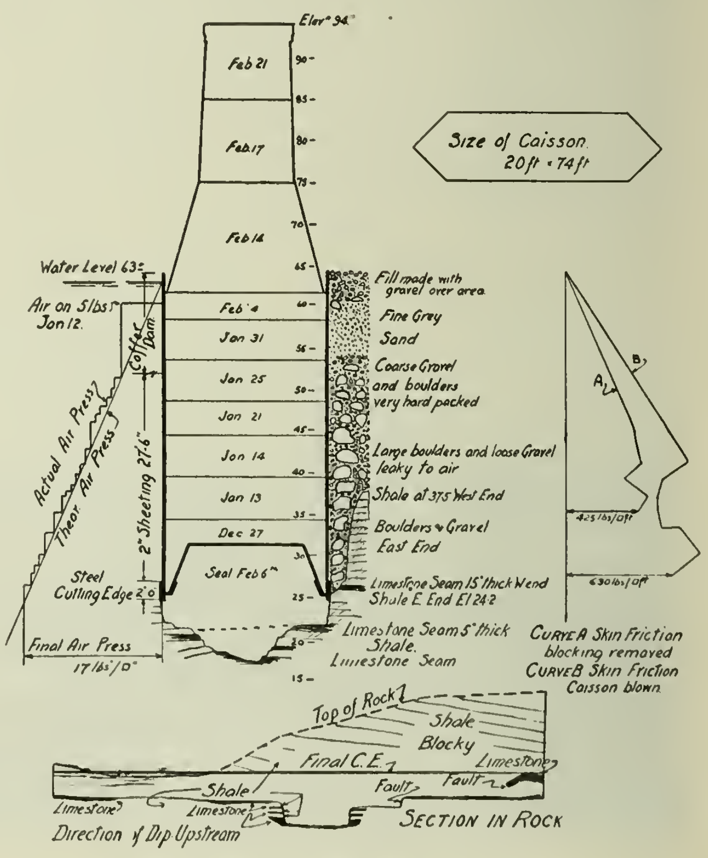

Fig. 9—Record Chart, Caisson Pier No. 3.

decided to increase the size of this caisson to 18 feet by 72 feet at the base to a height of 46 feet above the cutting edge, and from this point build a cofferdam, stepping the concrete to 14 feet by 60 feet using ⅛-inch liner plates up to elevation 60.0. The distance between side cribs permitted this increase without change of location.

Pier No. 2 was located near the edge of a high bank underlain by a 14-foot bed of blue clay, part of which was soft and plastic. As a street exists just to the north of this pier there was also a possibility of endangering, either during construction or later, the water, sewer and gas mains. There was also the possibility that the pier might be disturbed or moved laterally after its completion. It was therefore decided to abandon this pier and construct the steel span from No. 3 to No. 1. Pier No. 3 being carried to rock did not require any increase in size, whilst pier No. 1 was enlarged sufficiently to carry the increased load.

**Fig. 10—Working Chamber of Caisson No. 3.**

### Sealing the Working Chamber

A 19-inch diameter by 2-foot high tube, fitted at the bottom with a ½-inch rubber gasket and supported by timber, was placed on the bottom door of the lock. Above this tube, a conical wooden hopper, lined with sheet iron, was built within the lock. Ladder rungs were provided to enable the sand hogs to pass through the hopper to the main shaft. This hopper was made removable to be re-used in other locks. The concrete was chuted to the hopper, 2 cubic yards constituting a batch; top door closed, air applied, and the mass allowed to drop to the working chamber where it was shovelled into place by sand hogs. This operation continued until the concrete reached to within 3 feet of the deck, care being taken that it was level and well packed under the cutting edges. Concreting was then stopped until lights, fittings, valves and nipples were removed, and all men out of the working chamber, and then continued, using a ¾-inch gravel concrete with a 7- to 8-inch slump (adding cement to maintain the cement water ratio), until it rose in the shafts 20 to 30 feet above the deck. The gate valves controlling the air lines leading to the locks were then opened and those leading to the working chamber closed. All of the pipes leading into the working chamber were fitted on the open air end with stop cocks and, as the concreting continued, were opened from time to time until any accumulated water in the working chamber was forced out, the water spouting from the pipes until they were plugged by concrete reaching the working chamber roof level. When the concrete reached 10 to 20 feet above the deck, the air on one shaft was raised 10 pounds above the theoretical and lowered on the other shaft, inducing a flow from shaft to shaft and filling any cavity that may have existed under the working chamber roof. The concreting in the shafts was continued for a height of 30 feet above the deck, thus creating a pressure head equivalent to the weight of a 30-foot column of concrete on the semi-fluid mass in the caisson. To insure absolute contact between the working chamber concrete mass and the deck, neat cement grout under 100 pounds pressure was applied to each vent pipe with the remaining pipes open to atmospheric pressure. In most cases, no grout was forced into the chamber. Fifty bags of cement was the maximum used on any one caisson in this grouting operation. In the caisson of pier No. 5, the shafts were filled to about 44 feet above the cutting edge, creating a pressure of 30 pounds per square inch on the plastic mass in the working chamber. In addition 34 pounds per square inch of pressure were maintained on the locks and 100 pounds applied to the neat cement in the grouting machine, the grout being applied immediately after the sealing. Thus there was approximately 164 pounds pressure acting on a confined fluid mass in the working chamber. All vent pipes were opened and no grout could be forced in the chamber. Properly placed and properly grouted, it is believed that this method of sealing the working chamber is preferable to the old benching method.

### Pier Shafts

The shafts and caissons for piers 3 and 4 were designed for a future lift span intended to replace the present span should the St. Lawrence waterways project become an actuality. All piers were built with standard ice breaker noses. The up and downstream noses and corners are protected from ice damage by ¾-inch steel plates anchored securely into the concrete pier mass.

Each pier shaft was concreted in three lifts, using the steel concrete tower erected alongside on the working platform. The bearing areas of the bridge seats were left ¼ inch high and afterwards bush hammered to the proper level surface.

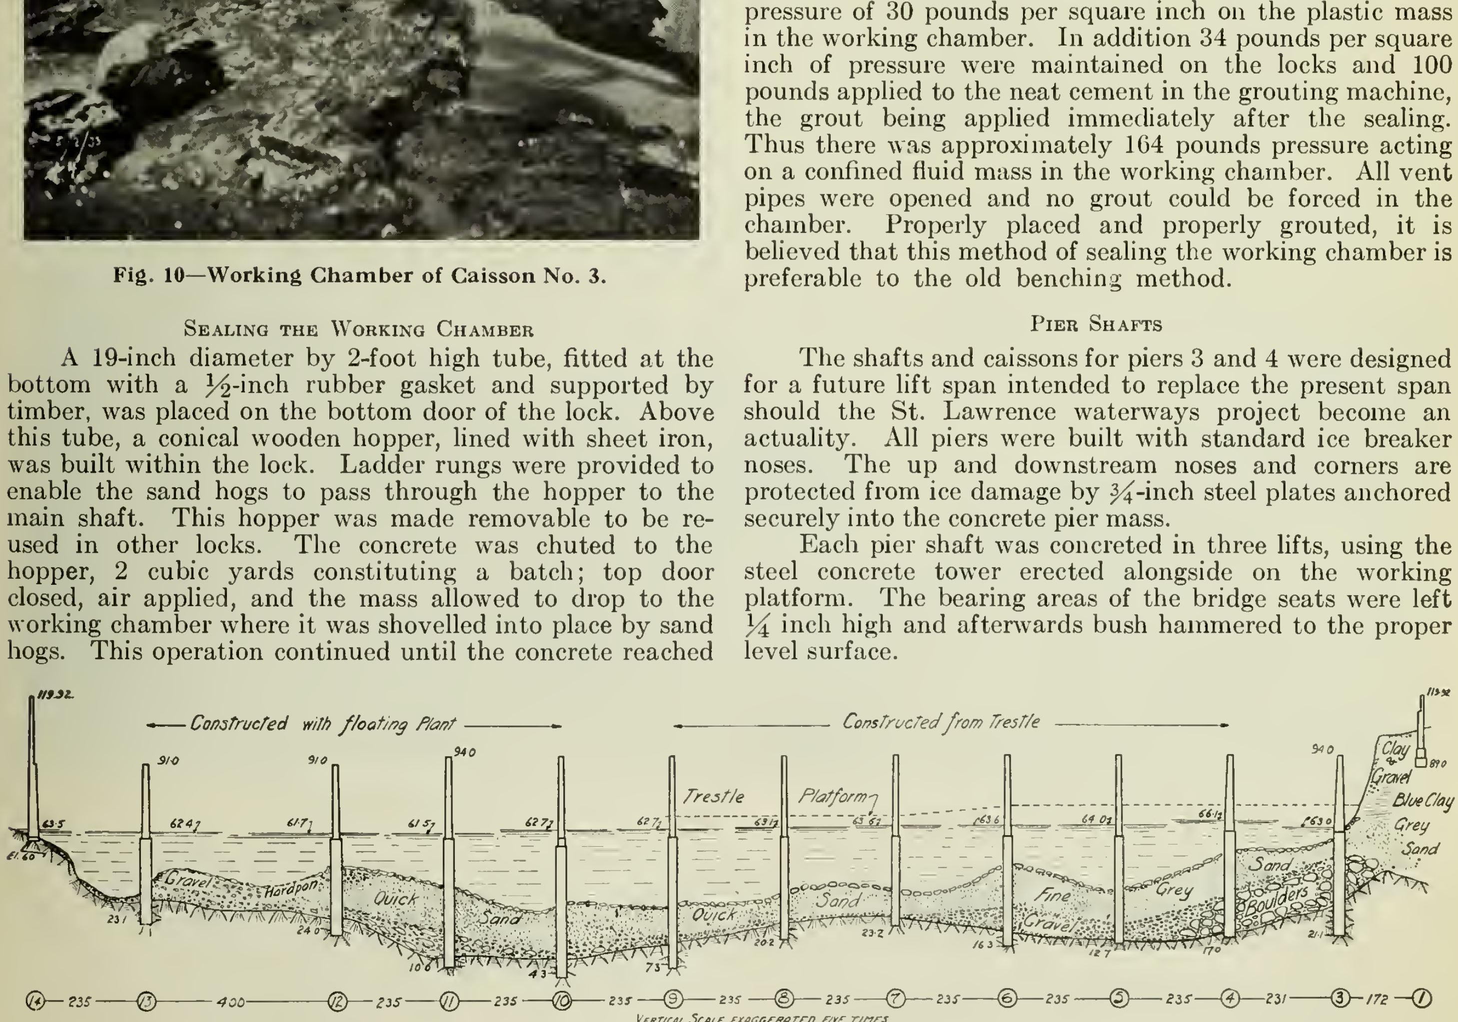

**Fig. 11—Cross Section of River.**

### Concrete for Piers

The coarse aggregate was crushed stone graded in size from ¼ inch to 1½ inch having a fineness modulus of 8.1; and ¼ inch to ¾ inch having a fineness modulus of 7.6. The coarse aggregate of the concrete used for the sealing of the working chamber was ¾-inch washed gravel. The fine aggregate was either washed pit sand having a fineness modulus of 2.8 or Lake of Two Mountains sand having a fineness modulus of 2.6.

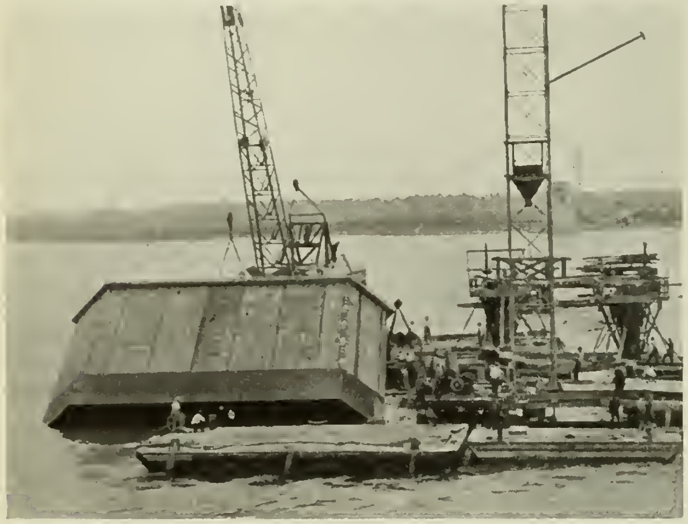

Fig. 12 *Masson* lifting Caisson No. 9 at Pier Site.

Cylinder tests were made on approximately every 100 cubic yards of concrete poured. Cylinders were made from concrete taken at trucks, in the hoppers, and in the forms. Tests were made at seven and twenty-eight days, and averages for the different classes of concrete were as in Table II.

Table II

| | 7 days | 28 days | 3 months | Average Slump |
|---|---|---|---|---|
| 2,000 pounds | 1,950 pounds | 2,600 pounds | .... | 4 inches |
| 2,500 " | 2,380 " | 3,030 " | .... | 4 " |
| 2,000 " (¾-inch gravel) | 1,956 " | 2,564 " | 3,036 pounds | 7 and 8 inches |

### Progress of Work

Before the spring of 1933, a sub-contract had been let for the construction in the river of piers No. 7 to 13 inclusive. Early in March, a schedule of progress had been submitted by the sub-contractor and approved by the general contractor, in which provision was made for the completion during the month of December 1933 of piers No. 7, 8, 9 and 10, the three remaining piers, Nos. 11, 12 and 13, to be completed by September 1st, 1934. The steel tube combination trestle and breakwater had been developed by the general contractor as a consequence of his decision not to use his own floating equipment, which was at the same time the object of sub-letting piers No. 7 to 13 to the sub-contractor, who, on the contrary, was anxious to use on that work the large floating equipment which he had available.

During the month of May, the sub-contractor began preparations to start work; his first move being the construction of a wharf, 1,500 feet downstream from the bridge site, to accommodate his floating equipment and receive materials. At that time, the general contractor's work had reached the point where the success of the steel tube combination trestle had become evident and progress was becoming so rapid that an opportunity was seen to advance considerably the date of completion of the entire river work if the use of the trestle could be extended further than originally intended, so that three of the four piers which were to be completed during the first season could be completed by that method early in the summer, allowing the sub-contractor to concentrate the work of his fleet on the four remaining piers three of which were to be completed only the following year. Accordingly, the general contractor submitted this plan to the sub-contractor who, in the meantime, had succeeded in bringing his floating equipment to the site somewhat earlier than originally expected. It appeared to both the general contractor and the sub-contractor that a very substantial saving in time might be effected by a virtual pooling of the two plants and organizations and by extending the trestle and concentrating the floating plant on the south side of the river. A combination along these lines was agreed upon with exceedingly satisfactory results and, with the exception of minor details on the approaches, the entire substructure was completed before the end of November 1933 or exactly twelve months ahead of schedule.

This agreement was completed before the end of May, and as a consequence, all work beyond pier No. 6 was continued up to pier No. 9, by means of the steel tube combination trestle and breakwater in the same manner as the general contractor had proceeded up to then, but with the difference that from then on the general contractor's plant and organization passed under the supervision of the sub-contractor, who then abandoned the wharf downstream, and used the trestle as his dock, to anchor his fleet and receive his material. Between piers No. 6 and 9, the floor construction of this trestle was made lighter, since it had only to carry the tructractors and the lorries. The deck was also lowered by 3 feet, the water level at the time of construction having gone down that much. The trestle was erected with a derrick boat. The caissons for piers No. 7, 8 and 9 were built on the banks of the Lachine canal at the Dominion Bridge Company's docks, and floated on their sides to the pier sites and righted and placed in their berths by a 25-ton derrick boat. (Fig. 12.) These three caissons being only 14 feet wide were too unstable to be floated in an upright position.

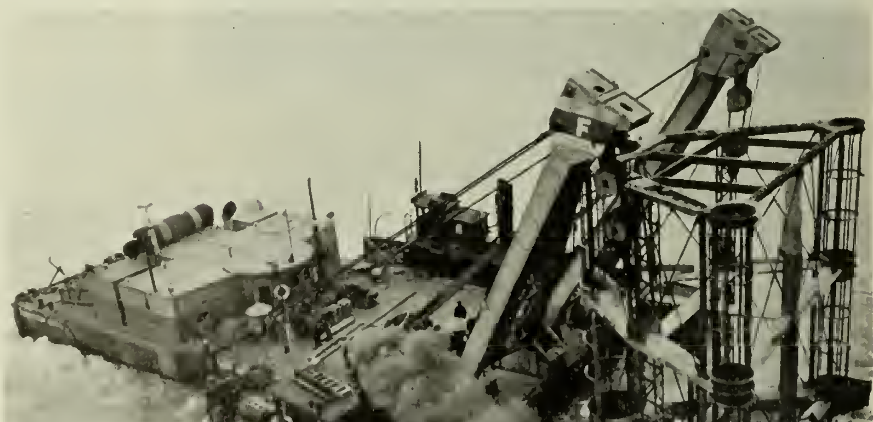

Fig. 13—*Scarboro* and Deflector.

### Floating Equipment and Deflectors

Piers Nos. 10 to 13 inclusive were constructed by the sub-contractor exclusively with floating equipment, the most important piece of which was the 250-ton work-boat *Foundation Scarboro,* especially designed for the handling and sinking of pneumatic caissons, and fitted with powerful shear legs for this purpose. This boat is equipped to furnish 2,000 c.f.m. of low pressure air and 750 c.f.m. of high pressure air.

**Section Showing Cross Beam.**

**Fig. 14—Viaduct—Light Structural Steel Kane Truss.**

Primary power is derived from twin Diesel electric generators complying with the usual requirements of two independent sources of power, both high and low pressure air are furnished from electrically driven compressors to give complete duplication back to the source of primary power. High and low pressure air for tools and divers are furnished from separate systems. Water, electric light and power are furnished from the ship's pumps and generators. The vessel is manoeuvred from two anchor winches which have a capacity of 18,000 pounds pull on a single line, and able to handle anchors for a 7,000-ton ship. Lateral lines and stern anchors, when required, are handled from two warping winches each having two drums and one warping head. The bo t is equipped with a decompression lock, and all requirements for handling pressure workers. On this particular work, the *Scarboro* placed the "deflector" (as shown in Fig. 13), which ultimately formed the anchorage for the caissons and furnished air for sinking; the current deflector forms part of the *Scarboro* equipment, the shear legs on the vessel being designed so that a deflector of the maximum width practical for navigating through the St. Lawrence canal could be held between the legs, and the ship navigated in inland waters with the deflector in place. The purpose of this deflector is to form an anchorage and to break the current. It is arranged in triangular form to adapt itself to fairly uneven surfaces with all three legs bearing. The triangular form also lends itself to efficient streamlining. Means are provided for forming a foundation for the legs of the deflector so that the whole structure may be held level within the degree of accuracy required. After the deflector is set in position, heavy steel and concrete sheet piles are placed along the two upstream sides of the triangle and tied into the structural framework, thus adding to the weight and relieving the device to a great extent of its tendency to slide on the bottom. When thus sheeted the deflector forms a very substantial and solid anchorage and does not require additional support, although as a matter of precaution in the swifter water anchor lines were run from the nose, exerting a more or less uniform pull due to the sag in the anchor cables. The downstream legs are also arranged for spuds if required. A deflector in position for pier No. 12 may be seen in Fig. 1.

From these 150-ton current deflectors, lines were led to tandem steel pontoons anchored with 4-ton ship anchors and seen in Fig. 1 near pier No. 12. Each pair of pontoons was equipped with a double drum hoist and boiler, thus affording means to adjust its position with block and tackle. This arrangement of anchors provides for the strain of any given line to be distributed to at least two anchors, and permits of the proper distribution of load between any pair of anchors compensating for any dragging. Other various items of floating plant were conveniently moored to these pontoons. Side cribs consisting of tower bents similar to those used for the trestle construction were constructed at each of these piers, and were found absolutely necessary for the guiding of the caissons. Caissons 10 to 13 were launched similarly to 7, 8, and 9, lashed alongside a scow and floated to the job in an upright position.

The combination of the two methods above described enabled the contractors to obtain the greatest possible economy, eliminated much hazard, and speeded work to such an extent that all river piers were completed, and the river cleared by November 1st, 1933. This was very fortunate, considering the zero weather which was experienced early in November and the premature winter which followed.

### Safety Precautions

Every known precaution was taken to prevent accidents and sickness, and it is gratifying to state that the entire job was carried through without a single major accident. There were no permanent disabilities and no real case of bends resulting from the air operations. The time of decompression established by good practice was followed and recorded on an automatic gauge attached to the lock.

**Fig. 15—South Viaduct, Deck under Construction.**

A well equipped first-aid room in charge of competent day and night nurses, and under the supervision of a physician, attended to all injuries, and the fine work of this staff contributed very largely to the low casualty record of this job.

The sand hog houses were located next to the compressor plant and were built around the hospital lock, with clothes lockers along the walls. They were heated, provided with showers and tubs, and in charge of an experienced sand hog whose duties were to provide the regulation coffee, keep the place clean, and decompress such men as required treatment in the hospital lock.

### Approach Viaducts and Embankments

The work on the south shore consisted of a large earth fill (137,000 cubic yards), an abutment wall and a concrete viaduct 1,250 feet long.

The south abutment and viaduct and river pier No. 14 are built on an island, Isle Maligne, with water about four feet deep separating it from the mainland. The approach fill extends from the present provincial highway No. 3 across a shallow creek to the abutment on this island, a 7-foot by 8-foot concrete culvert being built to take care of the water from this creek.

The distinguishing feature of the viaduct was the use of a system of light structural steel for reinforcing and form supports and special viaduct form work. The viaduct is supported on 24 piers varying in height from 24 to 54 feet above the rock on which they are founded. The deck is carried on two longitudinal concrete girders 7 feet 6 inches deep with nine cross girders, 2 feet 6 inches deep, the sidewalk being carried on cantilever brackets. The system of light structural steel members utilized (Fig. 14) is strong enough to carry the forms and green concrete, and then becomes a permanent reinforcement for the concrete itself. This design was detailed and the material furnished by the Dominion Bridge Company. The steel trusses were entirely shop welded. Stirrups were used on the floorbeams to resist shear. Vertical and longitudinal reinforcing rods and angle braces were used on the main girders. They were intended as surface reinforcing rather than for strength.

The steel trusses and floorbeams were shipped by rail from the Lachine shops to the Adirondack siding on the south side of the river. They were then trucked to the site and erected with a caterpillar crane; the twenty-five spans were put in place ready for concrete in ten working days. All field connections were bolted. The forms for the bottom of the main girders were built on double 2-inch by 12-inch cross stringers, hung close to the bottoms of the girders by means of specially designed U-shaped hangers with removable bolts. The stringers were 36 feet long extending under the complete width of the slab. Scaffold planks were laid on these to provide a safe working platform for erecting and stripping forms, and finishing the surface of the concrete. After the platform was prepared, the forms for the beam sides and bottoms were placed and suspended from the steel work. Metal forms were used for the curved bottoms of the brackets. This method eliminated completely the usual falsework to the ground level, this feature alone being an economy of time and expense. Figure 15 shows the south viaduct under construction by this method.

In each span of the deck there are 111 cubic yards of concrete, 5,247 square feet of forms, 12.0 tons of structural steel and 4.75 tons of reinforcing steel. Expansion joints were provided every 50 feet under each main beam. At each expansion joint there is a sliding bearing plate, a copper strip in the concrete, and asphalt expansion material across the deck. Cast iron drain scuppers are placed at intervals of 25 feet, dowels set for the stone balustrade, and conduit pipe for the lighting of the bridge. The balustrade is artificial stone of four members, sill, balusters, rail and posts.

Excavation was started June 13th. Concreting of the columns started July 14th and was completed on September 1st. The pouring of the twenty-five spans of the deck started on September 13th and finished on October 19th, from five to six spans being poured each week.

The concrete plant consisted of a one cubic yard paving mixer on caterpillar tractor, a tubular frame steel tower 90 feet high and a three-compartment material bin, fed by a clam shell bucket, each size of aggregates being weighed on a separate scale. In concreting, all the footings were poured first, then the mixer travelled back pouring columns and finally travelled back for the third time

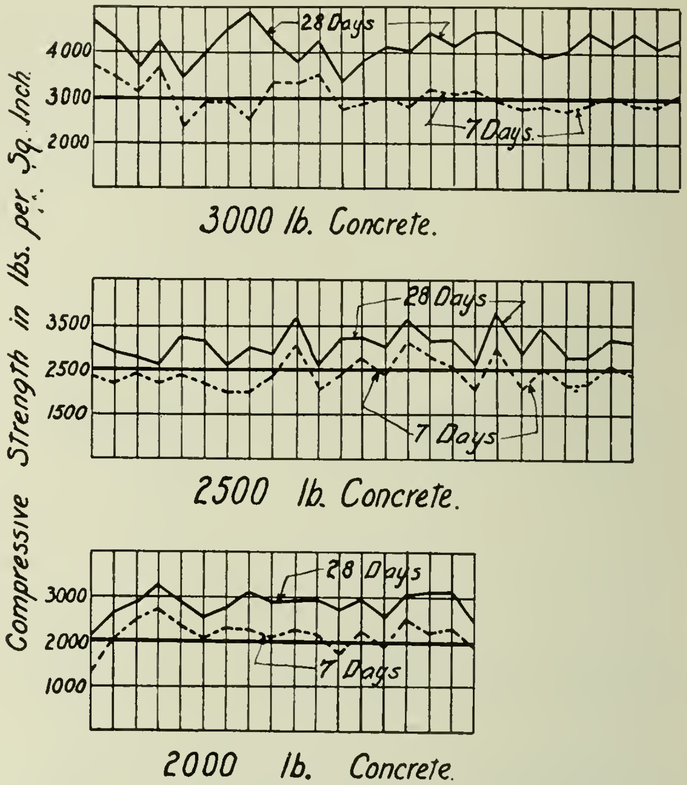

**Fig. 16—Concrete Tests, South Viaduct.**

pouring the deck. A 35-ton caterpillar crane with 65-foot boom was used for handling form material, steel, and aggregates to the bin.

The aggregates used were classified as follows:—

Coarse: Crushed stone ¼ to 1½ inch; fineness modulus 7.9
Crushed stone ¼ to ¾ inch; fineness modulus 6.9.
Fine: Washed pit sand having a fineness modulus of 2.8.

Figure 16 shows the results of compression tests made on the different classes of this concrete.

River pier No. 14 at the south edge of the river was also built from this plant. A timber cofferdam was built for the excavation of the footing of this pier, which was carried into solid rock.

The north viaduct is similar in design to the south viaduct, but is only 300 feet long, with columns having a maximum height of but 16 feet.

The bridge is built for the Lake St. Louis Bridge Corporation under the supervision of Dr. O. O. Lefebvre, M.E.I.C., chief engineer, with Jules A. Beauchemin, A.M.E.I.C., as resident engineer. A. Janin & Company Limited of Montreal are the contractors for the substructure and approaches, with Harry Englander as their resident engineer in charge of river work, and C. J. E. Maxwell as general superintendent. The Foundation Company of Canada Limited were the sub-contractors for the river piers No. 7 to 13 inclusive, the work being in charge of R. Holland, vice-president, and W. U. Smick as their superintendent. The Dominion Bridge Company are the contractors for the superstructure.

# The Steel Superstructure for the Lake St. Louis Bridge

*Structural Engineer,*
*Lake St. Louis Bridge Corporation, Montreal, Que.*

**Paper presented at the General Professional Meeting of The Engineering Institute of Canada, Montreal, Que., February 8th and 9th, 1934.**

SUMMARY.—The steel spans for the new highway bridge over the St. Lawrence river near Lachine have a total length of nearly three thousand feet, and include a number of simple deck spans, with a continuous tied arch over the present navigation channel. Provision has been made for the replacement of one of the deck spans by a lift span when the projected St. Lawrence Waterway is completed. The paper discusses the design and erection of the steel superstructure, with particular reference to the problems connected with the continuous tied arch.

## General Description

The steel superstructure for the Lake St. Louis bridge is mostly of deck type, but modified to conform to the navigation requirements of the Federal government. It supports a roadway 27 feet wide between kerbs, thus providing for three lines of traffic; and a 4-foot sidewalk, on the upstream side. The roadway is level throughout, with crown at elevation 129.0. The total length of the steel spans is 2,918 feet. Tenders for the superstructure were requested on two alternative designs, A and B, differing in the treatment of spans 11, 12 and 13 at the south end. General elevations of the two designs are shown in Figs. 2 and 3.

In design A, spans 11 and 13 are of simple deck type; but span 12, though simple, is of through type, in order to provide the required overhead clearance at the navigation channel. In design B, which was adopted, spans 11 to 13 inclusive are continuous over four supports, with vertical reactions only, the thrust of the arch ribs being resisted by the bottom tie at the floor level. Furthermore, the top chords of the arch are continuous with those of the anchor spans; thus, in consequence, the structure is called a "continuous tied arch," and may be considered to represent a new type of design.

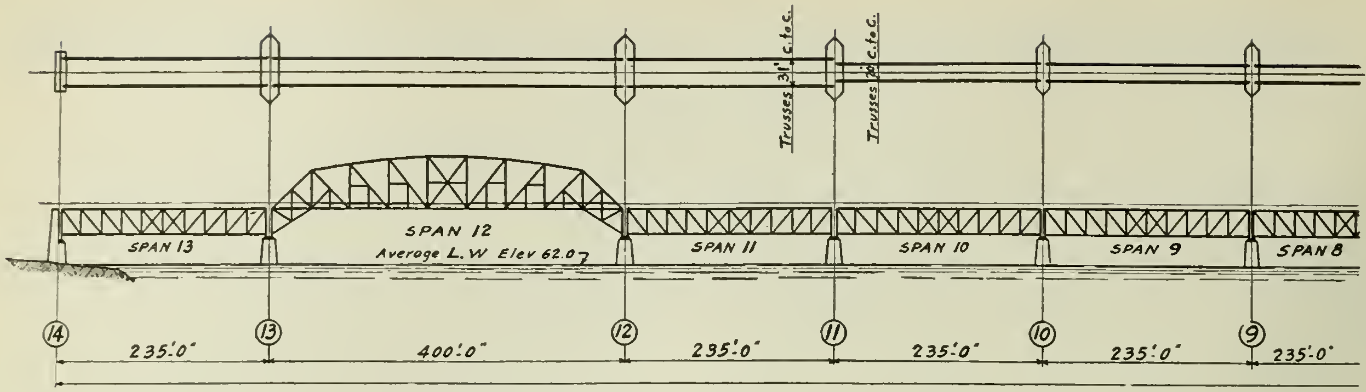
Tenders with estimated weights and unit prices were received on both designs; in which tenders the estimated weight for the three continuous spans in design B was considerably less than that for the corresponding simple spans in design A; but, owing to higher unit prices for the former, the resulting total estimated cost for B was about $5,000 greater than that for A. However, the Lake St. Louis Bridge Corporation was of the opinion that design B, owing to its superior æsthetic value, was well worth the additional cost, and adopted it accordingly.

Hitherto, too little attention has been given to æsthetics when designing steel bridges, particularly in countries of this western hemisphere. In consequence, many persons are convinced that a steel bridge must necessarily be an ugly structure. But no bridge need be ugly, and some may be made beautiful, simply by careful attention to general lines and proportions, and without additional expense. In the present instance, the final lines and proportions for the continuous tied arch were adopted only after much thought and many trials.

In other parts of the steel superstructure, care was exercised to avoid sudden breaks in general outline, particularly in the revised span 2, which was required to conform to somewhat unusual conditions. It is hoped that the resulting bridge will be found pleasing to the eye, as well as satisfactory in other respects. Unfortunately, it is too early to see the completed structure; but a good idea of it may be obtained from the artist's drawing, shown in Fig. 1.

An unusual feature in the design as built, is the use of splayed trusses for spans 5 and 10, in order to facilitate continuous cantilever erection from the north shore to the channel, which method of construction was considered highly desirable on account of the swift current and floating ice. Now the trusses for spans 2, 3 and 4 are spaced 31 feet centre to centre, to provide sufficient clear width for the roadway to pass through the future lift span which may eventually replace the present span 3, as well as to pass through the counterweight towers on the adjacent spans 2 and 4. The trusses for spans 6 to 9 inclusive are spaced 20 feet centre to centre, for economy; and the trusses for the continuous tied arch, or spans 11, 12 and 13, are 31 feet centre to centre, to provide the necessary clear width for the roadway which passes through these trusses, also to

**Fig. 1—Sketch Showing Bridge when Completed.**



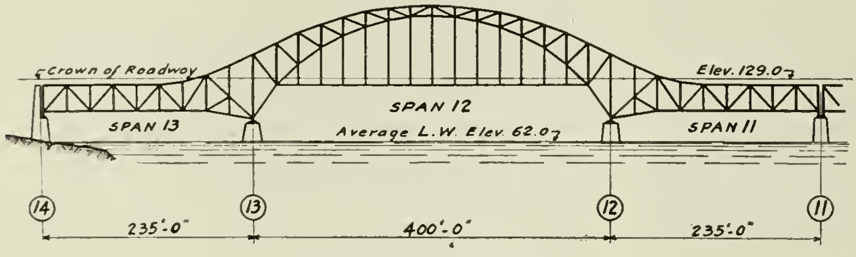


**Fig. 3—Adopted Design B.**

give adequate lateral stability for the 400-foot channel span. In consequence, spans 5 and 10 have been designed with trusses inclined to one another horizontally, to conform at each end to the truss spacing of the adjacent span. In addition to their usefulness during erection, these splayed spans also obviate unsightly breaks in the alignment of the trusses, which would otherwise occur at piers 5 and 11. Moreover, the slight bends in the alignment are scarcely perceptible, even to one familiar with the design, and could not be detected by others unless viewed from the water immediately below the splayed spans.

### Future Lift Span

One of the requirements of the Federal government was that provision should be made for installing a lift span when required, on the line of the projected St. Lawrence Waterway, which is close to the north shore of the river at this point, or between piers 3 and 4. Owing to the uncertainty when the lift span will be required (if ever) and the great cost of this type of structure, the Corporation decided to substitute, as a temporary measure, an ordinary deck span; but to construct the piers and the two adjacent spans so that they will be capable of carrying the future lift span and counterweight towers.

Before the designs for spans 2 and 4 could be completed, it was necessary to develop a design for the future lift span and towers in sufficient detail to determine their weight and the applied wind loads, and thus to obtain the reactions at the front and rear legs of the towers, for dead load, live load, impact and wind. An elevation of this design, including that of the revised span 2 is given in Fig. 4. The span is of through type and provides, when down, a minimum clearance above high water of 50 feet, which will be sufficient to accommodate much of the traffic. With the span up, the clearance will be 120 feet above the highest water in Lake St. Louis (elev. 74.1), as required. The clear distance between piers at the coping is 220 feet. The dead weight of the span will be supported by counterweights inside of the towers, and connected with the ends of the trusses by cables passing over sheaves at the top of the towers. The bridge will be raised or lowered by uphaul and downhaul ropes, operated by winding engines in the machinery house, placed at the top chords and at the centre of the span. The operator's cabin will be immediately below and suspended from the floor of the machinery house. Safety gates for highway traffic will be provided on the adjacent approach spans, located about 75 feet from the ends of the lift span, and interlocked with the bridge mechanism so that the span cannot be raised until the gates are closed.

### Span No. 2

The outline of revised span 2 calls for some explanation. Both of the general designs A and B, upon which tenders were submitted, included a pier (No. 2) located at the edge of the river bank and about 82 feet from pier 1. With this length of span it was practicable to use comparatively shallow girders over Lasalle road, thus providing ample headroom. Later on, it was decided to eliminate pier 2, owing to the unsatisfactory nature of foundation materials, interference with the roadway while excavating and the possibility of considerable lateral thrust on the pier in the event of land slides. The problem then was to provide a structure, spanning the distance between piers 1 and 3 (more than double the length of the original span 1) and without encroaching on the standard clearance of 14 feet over Lasalle road. A design was first submitted, in which the top chords of the trusses were placed above the roadway, in order to obtain sufficient depth for this longer span. Æsthetic considerations were chiefly responsible for the rejection of this design by the Corporation.

In the design as built, the top chords are set as high as possible, without interfering with the space reserved under the sidewalk slab for future telephone or telegraph conduits, and a minimum practicable depth of 13 feet centre to centre of chords is used from pier 1 to the outer edge of the roadway, from which point the bottom chords are curved downwards to a suitable height above the bridge seats on pier 3. The panels are of varying lengths, being longer where the trusses are deeper. The trusses are spaced 31 feet centre to centre, to accommodate the north tower for the future lift span; and the second panel-point in the top chords (counting from pier 3), which will support the back legs, is located so that the inclination of these members will be the same as for corresponding parts on span 4. Although the top chords are higher than those on other sections of the bridge, the break in alignment, due thereto, is scarcely noticeable, due to the proximity of the floor system. At present the height from the roadway to the under side of the steelwork is only 12 feet; but the full clearance of 14 feet will be provided by lowering the roadway. In order to maintain consecutive numbering throughout, this section of the structure is called span 2. The saving due to the elimination of pier 2 was more than sufficient to offset the increased cost of the single span over the two shorter spans of the original design.

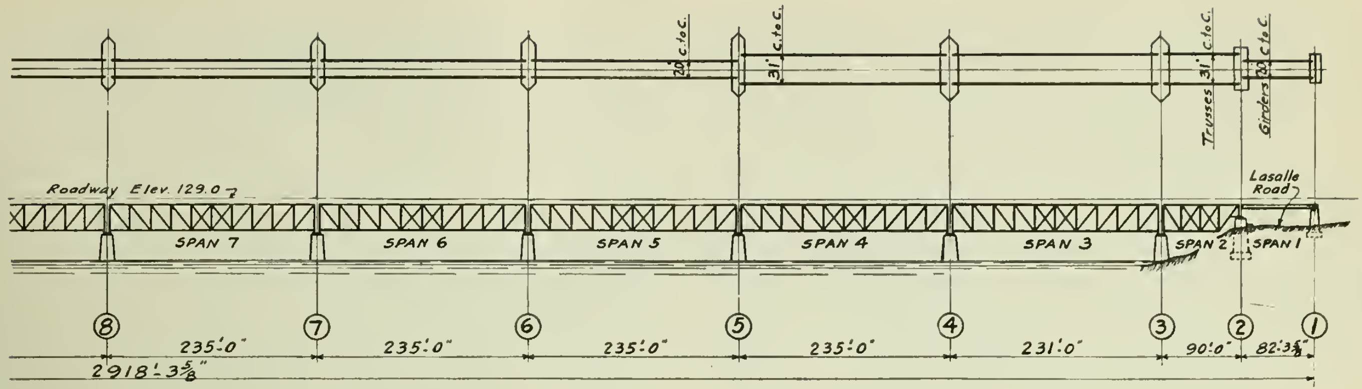

Fig. 2—Design A.

### Span No. 4

Span 4 is designed to support the south tower for the future lift span, and thus the trusses are spaced 31 feet centres, as are those of span 2.

### Spans 6 to 9

Spans 6 to 9 inclusive are of ordinary deck type, with trusses spaced 20 feet centre to centre. The floorbeams are supported on the top chords of the trusses, overhanging upstream and downstream to carry the roadway and sidewalk.

### Splayed Spans 5 and 10

Spans 5 and 10 are similar to spans 6 to 9, but the trusses are spaced 31 feet centre to centre at one end and 20 feet at the other, to align with those of adjacent spans and thus facilitate cantilever erection, as stated previously. Resulting from this unusual spacing of the trusses, the floorbeams are all different from one another; moreover, the dead loads on the heavy or upstream truss, which carries the sidewalk, increase from the wide to the narrow end, whilst the dead loads on the downstream truss decrease; thus involving much tedious labour in working out this part of the design. The resulting sections for the truss members of the splayed spans are only slightly different from those of spans 6 to 9; in consequence, it was found convenient to include on the same shop drawings all similar members for six spans, 6 to 9 inclusive, noting differences where they occurred.

### Continuous Tied Arch

The distinguishing feature of the bridge is the continuous tied arch, comprising spans 11, 12 and 13. In the development of its general design, as well as in detailing, many interesting problems have arisen and have been successfully solved; thus an entire paper should be devoted to its description. It is understood that such a paper will be presented to The Institute at a later date. In consequence, only a few points will be touched upon at this time.

The tied arch is more generally used either as a complete bridge in itself, supported on abutments, or as a suspended span, supported on the ends of the cantilever arms of two anchor spans. In the latter case, top-chord members are provided, for erection purposes, in the panel immediately landward of the points of support for the arch. After erection these members are cut at one end and provided with a sliding joint, to break the continuity; they thus become idle members, but are left in place to conform to æsthetic requirements.

The continuous tied arch resembles the simple tied arch, supported on the cantilevered arms of anchor spans; but the top chords at the ends of the arch are not cut after erection, and thus continue to be effective members of the structure, resulting in economy of materials and greater rigidity. In this design, an articulated joint at the point where the bottom tie meets the arch rib becomes unnecessary, which is a great advantage in view of the complicated details at this point, where provision must also be made for transverse bending moments of considerable magnitude due to wind loads. For calculation of stresses, the arch is assumed to be hinged at the crown, although the joint at this point is actually riveted. The lower chord

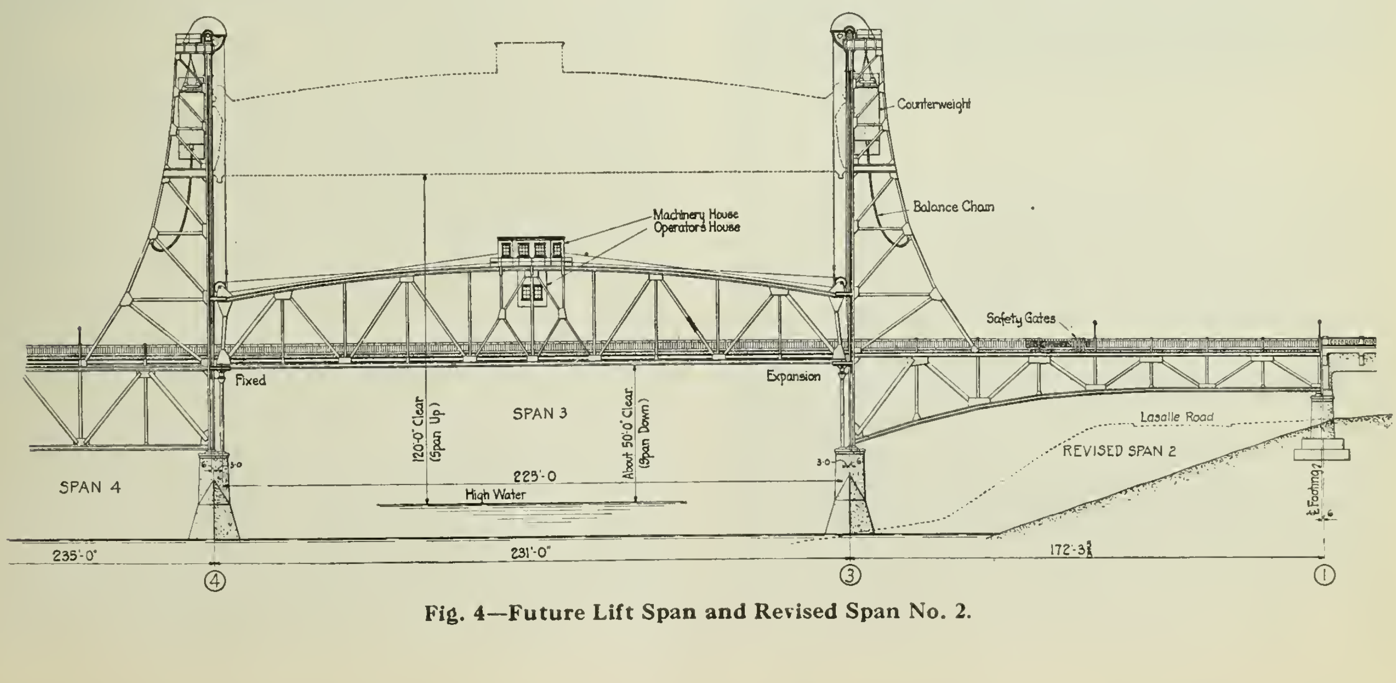

Fig. 4—Future Lift Span and Revised Span No. 2.

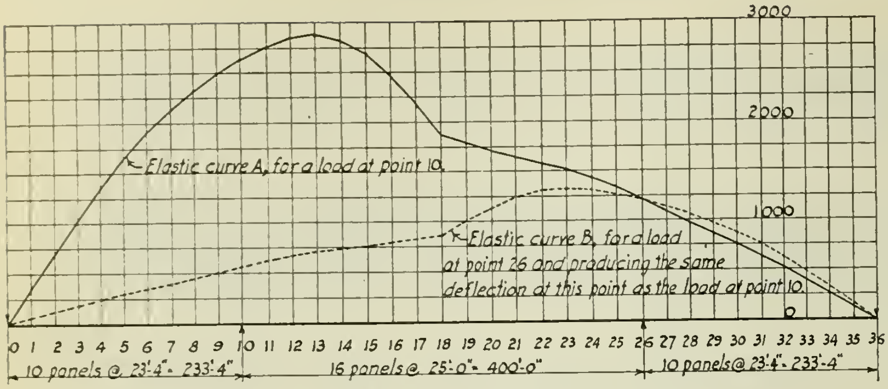

Fig. 5—Elastic Curves for Loads at Points 10 and 26.

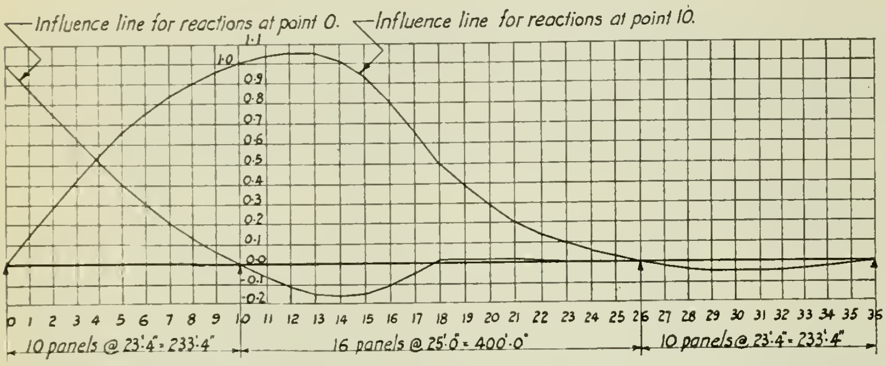

Fig. 6—Influence Lines for Reactions at Points 0 and 10 (I Variable).

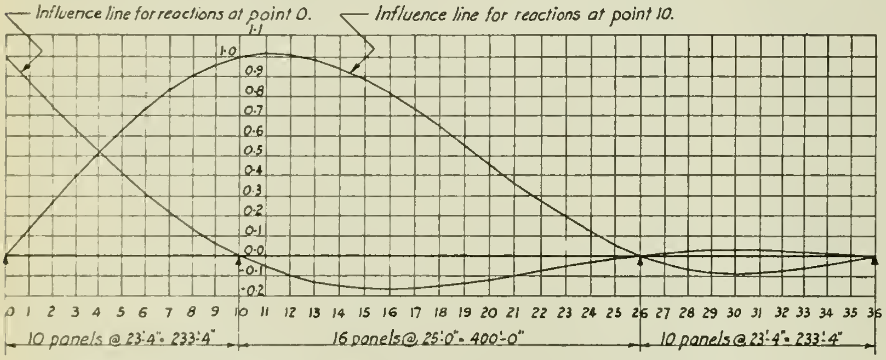

Fig. 7—Influence Lines for Reactions at Points 0 and 10 (I Constant).

of the arch rib in the two panels adjacent to the centre line, which is of the lightest practicable section, is designed as an idle member, thus removing one redundancy and greatly facilitating the stress calculations. By assuming a hinge at the top, and by making the lower rib at the centre of the span incapable of transmitting stress, the effective depth of the arch is increased, resulting in a considerable saving in the bottom tie, which is probably sufficient to compensate for the lack of continuity at the crown.

For the calculation of reactions, the structure has been treated as a girder of variable moment of inertia, continuous over four supports. The influence lines for the reactions have been obtained by the elastic-curve method, which is clearly demonstrated by D. B. Steinman, in the section dealing with continuous bridges in "Movable and Long-Span Bridges" by Hool and Kinne. Due to the unusual framing of this continuous girder and the consequent great and sudden changes in its moment of inertia, the curves are decidedly irregular and somewhat surprising. In Fig. 5, the elastic curve *A* represents the deflections of the girder when supported at its extreme ends only and subject to a concentrated load of any intensity at one of the inner piers (panel point 10). These deflections were obtained by a Williot diagram, using sectional areas of members derived from earlier designs. Elastic curve *B* is for a load at the other inner pier (panel point 26), giving the same deflection at that point as the load at panel point 10. Elastic curves *A* and *B* are similar but opposite to one another.

The reaction at point 10, for a load at any point on the girder is proportional to the intercept at that point between elastic curves *A* and *B*. In Fig. 6, these intercepts are reduced in scale and plotted with reference to a horizontal line, with the ordinate at point 10 made equal to unity. Thus the reaction at point 10 for a load of unity at any point on the girder is equal to the ordinate at that point, and the line circumscribing the ordinates for all points considered is the influence line for reactions at point 10, due to a load of unity at every point on the girder. Since the end spans are alike, this one influence line serves to obtain the reactions at both of the inner piers. Having obtained the unit reactions at the two inner piers, as above, the reactions at the two end piers were easily computed by moments, from which the influence line for reactions at point 0 was constructed.

For comparison, the influence lines for reactions for a continuous girder, having the same panel lengths and spans, but with constant moment of inertia, are given in Fig. 7.

## Floor Design

The roadway has a clear width of 27 feet, and is designed with a curved surface, being two inches higher at the crown than at the kerbs. The roadway slab is of reinforced concrete, having a uniform thickness of 6½ inches; and it is supported by longitudinal stringers, about 3 feet centre to centre, the stringers being set so that the top flange of each conforms to the bottom surface of the slab. The wearing surface for the roadway is of asphalt, 2½ inches thick. The roadway kerbs are 9 inches high and are protected by a 5 by 3½ by ⅜-inch angle. These protection angles are anchored to the concrete by bent clips welded to the angles. Thus anchor bolts, which are very troublesome to maintain in their proper position during the placing of concrete, are eliminated.

Except on the continuous tied arch, the sidewalk slab, which is on the upstream side, is 4 feet 3 inches wide, measured from kerb to outer edge, and 4 inches thick. It is supported on and is integral with the kerb, and is also supported upon a longitudinal stringer near its outer edge. On the continuous channel structure, between panel points U5 (north and south) the sidewalk is 3 feet wider, in order to maintain the same clear width outside of the trusses as on the purely deck part of the structure; and an additional supporting stringer is provided, immediately outside of the adjacent truss. Around the truss members which extend through the slab, rectangular openings are provided, with a minimum clearance of two inches between concrete and steel work. The outer edge of the sidewalk, throughout, is one inch higher than the kerb; thus the splayed connecting sections, between panel points U3 and U5 (Fig. 14) which are 46 feet 8 inches long, are slightly warped. This alternative was considered preferable to an irregularity in the vertical alignment of the handrailing. Under the sidewalk slab, throughout, a clear space, not less than 30 inches wide and 9 inches high, is reserved for future telegraph and telephone ducts. On spans 2 and 4, provision is made for widening the sidewalk, when required, to provide the necessary width outside of the towers for the lift span.

Principally for permanence rather than for present strength, the concrete in the slabs is required to have an ultimate crushing strength of 3,000 pounds per square inch at age of twenty-eight days. It is also required to conform to the Canadian Engineering Standards Association specification for reinforced concrete.

Fig. 8—First Stage of Cantilever Erection.

### Drainage

For drainage of the roadway and sidewalk, cast-iron scuppers are provided on both sides of the bridge, at the middle point of every panel. At the kerb, the scupper castings have a rectangular opening 8 inches wide and 3 inches high, and they are tapered to a 3-inch circular section at the outlet; they are supported on and rigidly connected to the top flange of the outer roadway stringers, thus insuring correct position and alignment with the kerbs, also preventing displacement during the placing of the concrete. At the outlet of the scupper castings, a 3-inch standard galvanized pipe is provided, to conduct the drainage clear of the steelwork. On span 2, which crosses Lasalle road, the drain pipes empty into an open trough of structural steel, on each side of the bridge, which discharges into the river, thus protecting the roadway, as well as the river bank.

### Lighting

Provision has been made for lighting standards, in line with the handrailings, and spaced alternately. upstream and downstream, four panels apart, or 100 feet on the channel span and about 93 feet elsewhere. The lower section of the standards is of structural steel, to facilitate connections with the floorbeams and with the handrailings; it is 10 inches square inside to accommodate a transformer, and will be provided with an ornamental cast-iron door, bearing the arms of the province of Quebec. The upper section of the standards will be of cast iron, with ornamental capital and globe holder, similar to those used in modern city street lighting. On the tied arch, where the trusses extend above the roadway, the lamps on the downstream side will be supported by cast-iron brackets, connected to the steelwork and located, transversely, two feet from the centre line of the near truss. The light centre for all lamps, whether supported on standards or brackets, will be 16 feet above the kerb or sidewalk.

Low voltage lamps of 400 c.p. will be used with reflectors. They will be operated on the series system, and with reduced current provided by a transformer at the base of each standard. The main current will be supplied by a two-conductor insulated and weatherproofed cable, on each side of the bridge. That on the upstream side will be supported on the bottom flange of the outer sidewalk stringer, and clamped thereto. On the downstream side, the cable will be carried on the bottom flange of the outer roadway stringer. On the steel portion of the bridge there will be thirty-two lights; but the total number, including those on the concrete viaducts and on the approach roadways, will be about seventy. The complete lighting system will extend over a distance of about 6,000 feet.

### Erection, Spans 2 to 11 Inclusive

Erection was begun at the north end on September 6th, 1933. Span 2, which is principally over land, and span 3, which is over shallow water, were erected on falsework. From pier 4, however, the structure has been erected by cantilevering from pier to pier, using the last-finished span as an anchor arm for the span under construction. Thus, during the erection of span 4, span 3 was the anchor arm, and the order of procedure was as follows: First, thrust blocks were placed over pier 4, and in line with the bottom chords, to transmit the thrust at this point between the two adjacent spans; and temporary ties were provided to connect the top chords. From these starting points, cantilever erection was carried forward to the fourth panel point at the bottom chord, and to the third panel point at the top chord. For handling materials and for placing them in the structure, stiff-leg derricks, provided with bull wheel and hoisting engine, were used. Figure 8 represents this first stage of cantilever erection using temporary ties to connect the top chords of anchor arm and cantilever, and shows the type of derrick used.

Owing to the uneconomical length of span (as a cantilever) in proportion to its depth, it would have been impracticable to proceed in this manner to a landing on pier 5, because the chord stresses, near the supported end, would have been excessive, requiring greatly increased sections. It was therefore necessary to increase the effective depth of the trusses over pier 4; to accomplish which, a

Fig. 9—Saddle Fully Erected.

Fig. 10—Second Stage of Cantilever Erection with Saddle Functioning.

temporary saddle, shown in Figs. 9 and 10, has been used. This saddle structure consists essentially of portal-braced verticals, supported on the top chords at the first panel points of the anchor arm and of the span being erected; together with a horizontal tie at the top, and inclined ties, connected to the top chords of the two adjacent spans by temporary pins at the third panel points. The saddle functions only after the removal of the temporary ties at the top chords of the adjacent spans, before mentioned.

**Fig. 11—Span 13 Supported on Pier 14 and on the First Temporary Pier.**

In Fig. 9, the completely-erected saddle is shown; and the top-chord ties are being removed. In this operation, the toggle-joint principle was employed, in which a downward force, applied by block-and-tackle at pin-connected joints in the top horizontal ties, shortens the distance between the pins at the top of the posts, thus eliminating the tension in the temporary top-chord ties and permitting of their removal. The bend in the top horizontal ties, produced by the block-and-tackle, can readily be seen in the illustration.

With the saddle in place, and subjected to stresses produced by that portion of the overhanging structure already erected, the second stage of cantilever erection began, and was proceeded with in the same manner as for the first stage, until pier 5 had been reached. Here the span was jacked up sufficiently to slacken the tension bars of the saddle, and thus to permit of its removal. This saddle structure was designed and fabricated for use in the erection of the South Shore bridge, and has since been used on several other bridges. The second stage of cantilever erection is illustrated by Fig. 10, in which the bottom chords of the overhanging arm have just reached the forward pier.

The procedure, described above for the erection of span 4, applies equally to spans 5 to 11 inclusive.

In all spans erected by the cantilever method, field riveting of main joints has followed closely behind the erector.

### Erection of Span No. 13

It may be explained in this place that the contract with the Dominion Bridge Company called for completion of erection by March 1st, 1935; but, owing to the rapid progress made in the construction of the piers (which were completed during the month of October, 1933), it was found practicable to finish the entire bridge a full year ahead of the specified date. Accordingly, arrangements were made with the contractor for the steel superstructure to complete his part of the work early in the year 1934.

In order to conform to the advanced date for completion, it was necessary that span 13, the south anchor arm for the continuous tied arch, should be erected during 1933, and sufficiently early to avoid risks from floating ice. Judging by previous records, no danger from this source could have been expected earlier than the middle of December; but, to be on the safe side, the contractor planned to finish this part of the erection not later than December 1st, which was a wise precaution; for the available records, covering the past ninety years and more, contain no precedent for the severe winter conditions throughout the month of November 1933.

Erection of span 13 began on October 2nd, which was the earliest practicable date, due to the time required for the completion of the final stress sheets for the continuous structure; their checking and approval by the Corporation's engineers; together with the detailing and fabrication of this span.

The first operation was the construction of a tower alongside of the bridge site and close to pier 14, with a platform on top, level with the bridge floor, on which was erected a stiff-leg derrick. This tower and derrick served to deliver bridge materials, to erect a temporary pier in the river at panel point L2 (see Fig. 14), and to erect the first two panels of the span.

The temporary pier at panel point L2 was of substantial construction, well braced in all directions, the posts being heavy steel-encased timbers, previously used in a working platform by the contractor for the substructure. The construction of the upper part of this pier is clearly shown in Fig. 11.

The first two panels of the span were then erected, resting on the temporary pier at L2 and on the bridge seats of pier 14. To prevent uplift during subsequent operations, the structure was securely anchored at pier 14 by substantial bolts, previously built into the concrete. From the temporary pier at L2, cantilever erection was carried forward far enough to facilitate the construction of another temporary pier, for the support of the structure at panel point L6. This second temporary pier was similar to that at L2, but located in much deeper and much swifter water. On reaching this second temporary pier, the structure was jacked up sufficiently to remove its load from the earlier support provided at L2, which then became inactive. Cantilever erection now proceeded to pier 13, reaching that point on November 21st, 1933. On the following day, riveting of the span was completed; it was jacked up on pier 13, and securely blocked. There was then no load on either of the temporary piers, the span being supported entirely on permanent piers 13 and 14.

In the erection of span 13, the hazard was greater than for other sections of the superstructure, due to the necessity of using falsework in swift and deep water, the risks from floating ice and the lateness of the season. Notwithstanding these obstacles and the loss of time on days when it was impossible to work, the structure was completed well in advance of the date contemplated by the contractor, and without fatality or serious accident of any kind.

The erection conducted from the north shore has been equally without accident to date. As a precautionary measure, the contractor has maintained a man in a boat, constantly on the lookout, in case any one should lose his footing and fall from the bridge.

### Erection of Span No. 12

The erection of span 12 will begin as early in the year 1934 as practicable, considering weather conditions. Each half of the span will be erected as a cantilever, with spans 11 and 13 as anchor arms; and the work will proceed simultaneously from piers 12 and 13 towards the centre of the span. The first two panels at the ends, in which the heaviest members are found, and where the height of the top chords above the roadway is not too great, will be erected by stiff-leg derricks, supported on the floor of the bridge, as before. For the remainder of the erection, a different type of derrick will be used, designed to travel on the top chords of the arch ribs; one such derrick will be provided for each cantilever arm. Materials will be delivered by runways at the roadway level, and will be hoisted into place by the derricks overhead.

During cantilever erection, it is highly desirable to omit all superfluous weight. In this instance, parts so omitted will include the idle members of the middle chords, near the crown of the arch (referred to previously), six lines of roadway stringers, two lines of sidewalk stringers, all sidewalk brackets and both lines of handrailing.

Closure will first be made at panel point L18 in the bottom tie. In order to do so, the free ends of the anchor arms will be lowered sufficiently to counteract deflections under cantilever conditions, and to raise the ends of the cantilevered arms slightly above their geometrical position, as shown in Fig. 12. The south half of the structure, which is provided with roller bearings at pier 13, will then be jacked towards the other half until they meet. At this stage, the two sections of the bottom tie will be in contact, whereas there will be a small gap at the crown of the arch, as shown in Fig. 13. In this position, the joint in the bottom tie will be securely bolted. The anchor arms will now be jacked up sufficiently at piers 11 and 14 to bring the adjacent ends of the arch ribs into firm contact at U18, as shown in Fig. 14. Having securely bolted the joint at this point, the anchor arms will be raised further, by hydraulic jacks, until the reactions at L0, as indicated by the gauges, agree with the calculated amounts. After which field riveting will be completed.

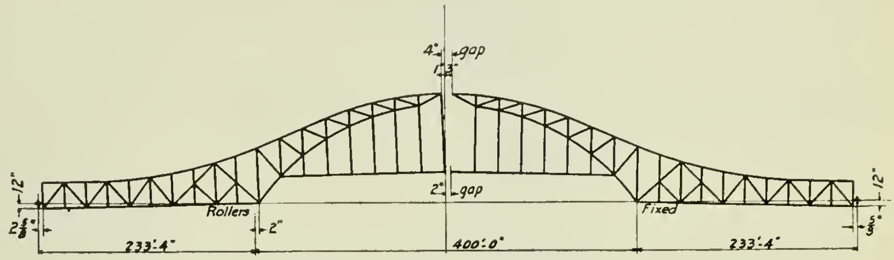

Fig. 12—Closure. First Position.

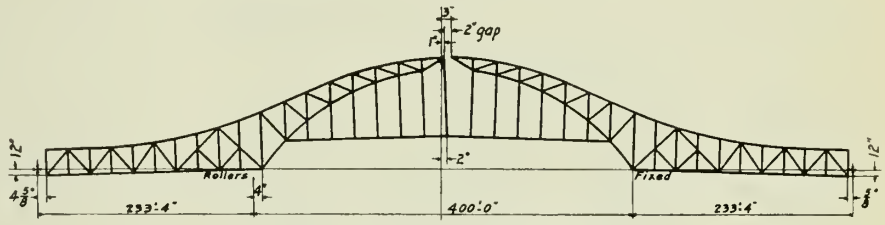

Fig. 13—Closure. Second Position.

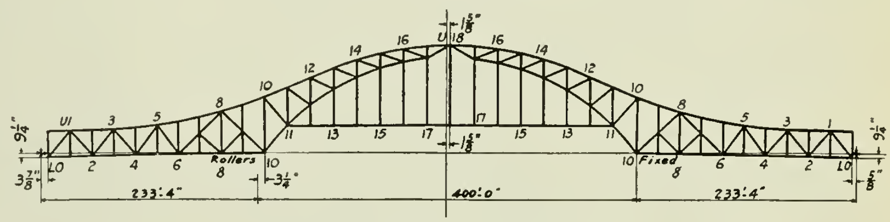

Fig. 14—Closure. Third Position.

### Plans and Specifications

The general plans and specifications for the steel superstructure were prepared under the direction of the chief engineer for the Corporation, Dr. O. O. Lefebvre, M.E.I.C. The general specifications include, modifying where necessary, those of the Department of Public Works for the province of Quebec; and the Standard Specification for Steel Highway Bridges, A6-1929, published by the Canadian Engineering Standards Association.

The details of the design (including the stress sheets) have been worked out by the contractor for the superstructure, in consultation with and subject to the approval of the corporation's engineer.

The specified live loads are as follows:—

For proportioning the reinforced concrete slab for the roadway, its supporting stringers and the floorbeams, also for truss members deriving their entire load from a single floorbeam, 120 pounds per square foot; or two 20-ton motor trucks, plus 30 per cent impact.

For sidewalk slabs, stringers and brackets, 120 pounds per square foot.

For main trusses, 100 pounds per square foot over the entire width of the roadway, for spans of 100 feet or less (reduced to 80 pounds per square foot, for spans of 200 feet and over, as per Canadian Engineering Standards Association specification), or two 20-ton motor trucks plus 30 per cent impact; together with a uniform load on the sidewalk, equal in intensity to 50 per cent of that on the roadway.

The specified material for the bridge is structural carbon steel for bridges, complying with the requirements of the Canadian Engineering Standards Association specification; and it is worthy of note that every pound of this steel has been rolled in Canadian mills.

### Concluding Remarks

The contractor for the steel superstructure, the Dominion Bridge Company Limited, has carried on his part of the work in the most satisfactory manner; and the contractor's engineers have given every attention to details, both great and small, in order that the completed structure may represent the best in modern practice.

The author desires to thank every one who has assisted him in the preparation of this paper, especially the Dominion Bridge Company, for drawings and photographs; and Mr. H. Lavoie, C.E., the author's assistant, for his valuable help in arranging the drawings for publication.

THE
ENGINEERING JOURNAL
THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOLUME XVII MARCH 1934 No. 3

## The Construction Industry's Problems

Just twelve months ago the organization and aims of the National Construction Council were brought to the attention of the readers of The Journal. The formation of that Council was the result of joint action by the Canadian Construction Association, the Royal Architectural Institute of Canada, The Engineering Institute of Canada, and a number of other organizations vitally interested in the welfare of the construction industry, its object being the revival of that industry in Canada.

One of the outstanding features of the discussions which took place at the Annual General Meeting of The Institute on February 8th was the presentation of an interesting summary of the year's activities of the National Construction Council, in a report submitted by J. B. Carswell, M.E.I.C., one of The Institute's representatives upon that Council.

At the commencement of its activities, the Council established three working committees, the Research committee, under the chairmanship of W. L. Somerville, architect, Toronto, the Publicity committee, under the chairmanship of H. P. Frid, general contractor, Hamilton, and the Survey committee, under the chairmanship of Mr. Carswell.

The first named of these committees has been occupied in gathering data for the Council on the distribution of construction costs and other allied matters, and it is also engaged in investigating housing conditions in Canada.

The duty of the Publicity committee has been to put the needs of the construction industry before the Canadian public, and as a result, the idea of a planned construction programme as a proper economic step in Canada has been effectively presented to the public and to legislative authorities.

On its formation the Survey committee immediately commenced an enquiry into the present conditions and possibilities of the construction industry throughout Canada, for which purpose twenty regional committees have been established, on which architects, engineers, contractors, manufacturers and labour are represented. As a result of their work, a survey of all deferred construction since January 1st, 1930, has been completed, and indicates that the value of such construction approaches the startling figure of $500,000,000. A large proportion of this total represents undertakings which would have been carried out by private enterprise if conditions had been more favourable, the remainder consisting of much needed Federal, provincial and municipal works which have been deferred for very obvious reasons during the period of depression.

During the past year the Survey committee has been in constant touch with the Federal government, and has been able to comply with a request from the Prime Minister to furnish a list of proposed Federal, provincial and municipal works which might be proceeded with at the present time. This list was in the Prime Minister's hands shortly before the recent conference of provincial prime ministers, and it included undertakings to the amount of some $50,000,000. Shortly after the conclusion of that conference, the Council was permitted by Mr. Bennett to announce that a moderate programme of widespread public works would be instituted during the present session of Parliament. It is believed that this satisfactory result is due in great measure to the work of the National Construction Council in which the representatives of The Engineering Institute of Canada, Messrs. J. B. Carswell, M.E.I.C., and A. H. Harkness, M.E.I.C., have been privileged to take an active part.

As regards provincial and municipal schemes, Mr. Carswell pointed out that these will present a more serious problem. It is obvious also that the restoration of confidence to private enterprise has still to be dealt with. The great bulk of suspended construction work lies in this field rather than in the field of public expenditure, and private initiative is still hindered by such obstacles as the moratorium situation in Ontario and other provinces and by the high interest rates demanded for commercial loans.

In its recommendations, the National Construction Council has consistently urged that if a revival of the construction industry is to take place, any construction work backed by public authorities, whether Federal, provincial or municipal, must be carried out on a competitive basis, employing qualified architects and engineers in private practice and with regular contractors employing labour remunerated at standard rates. In other words, the wages paid must be fully earned by competent workers, none of the expenditure must be on a charitable or relief basis, and the public must receive full value for the outlay.

Emphasis has also been laid on the necessity for the proper control of the financial features of the scheme, the Council having suggested that a board or commission should be formed, under the auspices of the Dominion government, for the purpose of passing on the merits or necessity of proposed construction projects, and assisting them in arranging for banking services or direct financing. The activities of this commission would be directed primarily to the fostering of construction by private enterprise.

Following Mr. Carswell's report, the construction situation received further consideration during the technical sessions of the Annual Professional Meeting, when W. D. Black, M.E.I.C., spoke on "Construction, the Joint in the Armour of Depression."

In this address, originally prepared for the Canadian Construction Association, Mr. Black took a point of view somewhat different from that of Mr. Carswell's presentation, and dealt more particularly with the problem of stabilising the industry. His chart, showing the gross value of building contracts awarded in Canada in recent years, indicated that starting from a figure of $150,000,000 in 1906, the estimated value of building contracts awarded yearly grew to $463,000,000 in 1912. During the war years a considerable shrinkage took place, and the value of contracts awarded remained at less than $100,000,000 per annum. At the close of the war, however, an upward movement began again, and in 1926 (now generally regarded as a normal year) the total was $372,000,000. The activity of the industry reached its peak in 1929, with a value of $576,000,000. This was followed by a rapid decline, until in 1933 the total was less than $100,000,000. Thus the history of the industry during the past thirty years simply records a series of violent fluctuations without any appreciable period of stable activity. As the speaker pointed out, the effect of this is that at the close of each period of stagnation a large amount of delayed construction has accumulated, such accumulation being estimated by Dr. Marvin, economist of the Royal Bank of Canada, to be now proceeding at the rate of $100,000,000 to $150,000,000 per annum, with the result that unless effective steps are taken the industry will be subject to another period of feverish production followed by credit contraction and unemployment as before.

In Mr. Black's view, this situation, which affects directly or indirectly some eight hundred thousand men, can only be controlled by some authoritative body possessing power over the financial agencies through which credit is extended, as well as over the construction industry itself.

In advocating the establishment of such a board or commission he arrives at a conclusion which is practically the same as that of the National Construction Council, although the Council perhaps lays more stress on the financial duties of the proposed board than on its planning activities. In any case, such an authority, after considering the results of such a survey as the Council has made, would first have to determine the level of activity or mean line which would be justified as a uniform standard, and secondly would be confronted by the problem of the raising of construction activity to this determined level.

Thus the board would evidently have to be equipped for planning as well as for control, and should be empowered to deal with such economic factors as working hours and other factors affecting employment in the industry. It would seem quite possible for a board possessing powers such as those outlined above to smooth out the peaks and valleys of the total construction curve, by deferring public works construction in times of commercial activity and proceeding with such work during periods of depression.

The figures available indicate that if all public works expenditure had been cut to the bone during the early years of the peak period, until in 1929 such works had virtually disappeared, total construction would then only have exceeded a mean economic line by $80,000,000. In this event, during the period considered, the operation of a system of prosperity reserves for all public works construction would have resulted in the operation of the construction industry within economically justified bounds.

The publicity already given to these proposals has called forth a good deal of comment in all parts of the country. The majority of the critics agreed that some scheme of stabilization for the construction industry is inevitable. The opposition has come principally from those who consider that the ups and downs in business are caused largely by governmental and political interference with private initiative and that the ideal condition is one of laissez-faire. Those who hold this view seem to oppose any form of planned economy and have apparently no practicable remedy to offer for the present condition of affairs. Such ideas are in marked contrast to those which are now being tried in the United States, where the code control of industry is being followed up by an effort to develop a comprehensive scheme of industrial planning.

The proposals sketched by the National Construction Council's committees and by Mr. Black have awakened general attention and may well form the first step in the adoption of a definite plan of campaign to develop industry in Canada.

In presenting the subject for discussion at the Annual Meeting, The Institute's representatives on the National Construction Council and Mr. Black have earned the thanks of their fellow members. The interest aroused should encourage all those who like to see The Institute taking its rightful part in considering the economic problems of the day, particularly those which are of vital concern to all members of the engineering profession.

## Western Professional Meeting 1934

Arrangements are now being completed for the 1934 Western Professional Meeting of The Institute, which has been authorized by Council and will take place in Vancouver under the auspices of the Vancouver and Victoria branches of The Institute during the week of July 8th.

This meeting is of particular interest because it will be held at the same time and place as the Western Summer Convention of the American Society of Civil Engineers. Representatives of the two organizations are collaborating so as to make these two simultaneous meetings outstanding in all respects.

It is intended that the first technical session shall be held jointly by the two societies, the ensuing business and technical sessions taking place independently, while members of both societies will join in the various social functions.

The Headquarters of both societies will be at the Hotel Vancouver, and a local committee under the chairmanship of E. A. Cleveland, M.E.I.C., M.Am.Soc.C.E., and composed of members of both organizations, is at work on the details of the programmes, particulars of which will be published as soon as available.

## Meetings of Council

A meeting of Council was held at Headquarters on January 16th, 1934, at eight o'clock p.m., with President O. O. Lefebvre, M.E.I.C., in the chair, and four other members of Council present.

The annual report of the Finance committee was submitted for approval and Council discussed the financial situation and approved the auditors' report for presentation at the Annual Meeting.

After discussion of the case of members in arrears for 1933, it was thought desirable in their case to suspend for the present the operation of the provisions of Section 37 of the By-laws and the Secretary was directed to send a circular letter to a number of Members, Associate Members and Juniors who have not replied to communications, informing them that they are being placed on the non-active list in order to avoid the accumulation of further indebtedness on their part.

Discussion took place as to the desirability of discontinuing the payment for branch news for The Journal, this being recommended by the Finance committee as a measure of economy. After consideration this course was approved by Council.

The Report of Council for the year 1933 and the reports of the various Institute committees were approved for presentation to the Annual Meeting.

The membership of the Nominating committee for the year 1934 was noted, and the reports of the various medal and prize committees were accepted for presentation to the Annual Meeting.

A suggestion was submitted by F. S. B. Heward, A.M.E.I.C., that The Institute might possibly be of assistance in the movement which is being promoted by the Canadian Chamber of Commerce in connection with the formation of provincial committees to discuss and make recommendations as to the present economic situation. The Secretary was directed to write to the Secretary of the Canadian Chamber of Commerce indicating Council's willingness to render such assistance in this movement as may be within its power.

The Secretary presented letters from the Winnipeg and Saskatchewan branches with reference to local organizations of graduate engineers which have been formed in Manitoba and Saskatchewan for mutual aid in obtaining employment and discussion of the industrial problems of the day. It was thought that The Institute might perhaps be of assistance to these young engineers, and a reply from the Secretary was approved suggesting that the associations in question might with advantage to themselves function as Junior Sections of Institute branches.

Council gave sympathetic consideration to a request from the Saskatchewan Branch asking for support in making representations to the government of the province of Saskatchewan in connection with a classification scheme for provincial civil servants which has recently been proposed, in connection with which there has been some criticism as regards engineering appointments. The Council appointed a committee under the chairmanship of Fraser S. Keith, M.E.I.C., to study and report upon the matter.

Six resignations were accepted, a number of members were placed on the non-active list, and certain special cases were dealt with.

A number of applications for admission and for transfer were considered, and the following elections and transfers were effected:

| *Elections* | | *Transfer* | |
|---|---|---|---|
| Member | 1 | Student to Junior | 1 |
| Associate Members | 2 | | |
| Students admitted | 5 | | |

The Council rose at eleven forty p.m.

A meeting of Council was held at the Windsor hotel, Montreal, on Friday, February 9th, 1934, at five o'clock p.m., with President F. P. Shearwood in the chair, and sixteen other members of Council present.

R. J. Durley, M.E.I.C., was re-appointed Secretary of The Institute, and J. B. Challies, M.E.I.C., was re-appointed Treasurer.

The Finance committee was re-appointed for the year 1934 under the chairmanship of P. L. Pratley, M.E.I.C., the membership being as follows:

P. L. Pratley, M.E.I.C., *Chairman*
J. L. Busfield, M.E.I.C.
J. B. Challies, M.E.I.C.
A. Duperron, M.E.I.C.
F. Newell, M.E.I.C.

The chairmen of the following committees were appointed, with a request to submit the names of the remaining members of their committees to the next meeting of Council:

Library and House Committee.....A. Cousineau, A.M.E.I.C.
Papers Committee.....C. S. L. Hertzberg, M.E.I.C.

The following committees were re-appointed for the year 1934:

Publication Committee..... H. Cimon, M.E.I.C., *Chairman*
J. A. Duchastel, M.E.I.C.
A. A. MacDiarmid, M.E.I.C.
P. L. Pratley, M.E.I.C.
H. L. Trotter, M.E.I.C.

Legislation Committee.....F. Newell, M.E.I.C., *Chairman.*
C. A. Bowman, M.E.I.C.
A. S. Gentles, M.E.I.C.

Following the discussion at the Annual General Meeting of Council's proposals for the amendment of the By-laws, it was noted that an amendment to Section 1 of the proposals had been moved. Accordingly, in regard to the pro and con committees required by the by-laws to state the arguments for and against this amendment Past-President Lefebvre, as chairman of the Annual General Meeting at which the proposals were discussed, appointed Messrs. J. L. Busfield, M.E.I.C., and W. C. Adams, M.E.I.C., to state the case for Council's proposals, and Messrs. Gordon M. Pitts, A.M.E.I.C., and R. F. Legget, A.M.E.I.C., for the contrary arguments.

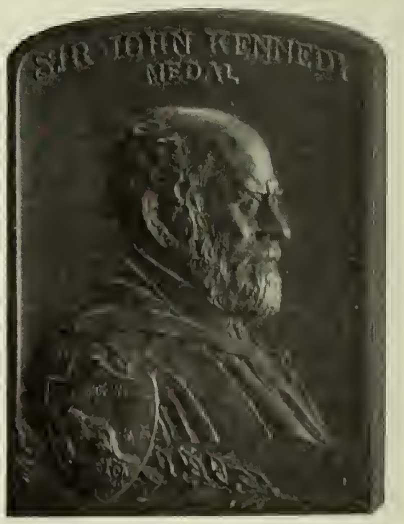
Correspondence with Vancouver and New York was presented regarding the Western Professional Meeting 1934 outlining a general plan for the meeting, which was approved by Council subject to later modification in detail if found necessary. It was decided that the meeting should be held during the week of July 8th, and this period being satisfactory to the American Society of Civil Engineers it was understood that The Institute and the Society will each conduct its own functions, while certain arrangements common to both will be in the hands of a local General committee composed of members of both bodies. Certain joint technical sessions will be held but other technical and business sessions will be held separately. Social functions will be held jointly.

The Secretary was directed to express Council's appreciation of the success attending the efforts of the Montreal Branch committees in connection with the Annual General and General Professional Meeting which had just concluded.

The Secretary was also directed to address letters of thanks to the Rt. Hon. R. B. Bennett, Sir William Clark, and to the Canadian Marconi Company for the broadcasting facilities they afforded, also to write to H. P. Eddy, M.E.I.C., President, American Society of Civil Engineers, expressing the pleasure given by his attendance at the Annual Meeting.

Six Students were admitted.

The Council rose at six fifteen p.m.



**Sir John Kennedy Medal**

## Annual Fees

Members are reminded that a reduction of One Dollar is allowed on their annual fees if paid on or before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to members residing in all parts of the country.

# Frederick Perry Shearwood, M.E.I.C.

## President of The Engineering Institute of Canada

Election to the office of President of The Engineering Institute of Canada, the highest honour in The Institute's gift, is generally considered as a fitting recognition of professional eminence and of long and active work in the interests of The Institute. The membership has made no departure from this principle in choosing Frederick Perry Shearwood, M.E.I.C., as President for 1934.

Born in 1866 in London, England, he received his education by private tuition in England, and in 1884 proceeded to Brazil, where he entered the service of the São Paulo Railway. After three years of railway work, he came to Canada and became connected with the firm with which the greater portion of his professional career has since been spent.

Starting in a junior position in the Engineering Department of the Dominion Bridge Company, Montreal, Mr. Shearwood rose rapidly, holding successively the appointments of designing engineer and assistant chief engineer, until in 1921 he became chief engineer, the position which he now holds.

A list of the important structures for whose design or erection Mr. Shearwood has been wholly or largely responsible, would be a list of the principal work carried out during the last thirty years by that organization. Apart from the design of many of the structures they have built, his company, as a contracting firm, has had in many cases to develop such erection methods as were required to meet special needs. In work of this kind Mr. Shearwood has always been greatly interested, and structural engineers will appreciate the engineering skill and experience required to devise and apply such methods in the case of structures like the Interprovincial bridge at Ottawa, the Montreal Harbour bridge, or large roof structures like that of the Maple Leaf Arena, Toronto. It may in fact be said that examples of the results of Mr. Shearwood's engineering ability may be seen right across the continent, starting fron the ferry landing-stages on the Straits of Canso and terminating at the bridge over the Fraser river at New Westminster, B.C. In all of these undertakings his part in connection with the erection or design, or both, has been a principal one, and his reputation as a bridge engineer is based on this Dominion-wide experience.

FREDERICK PERRY SHEARWOOD, M.E.I.C.

An enthusiastic yachtsman and yacht designer, Mr. Shearwood was for ten years associated with his then chief, G. H. Duggan, M.E.I.C., in building and racing the boats which brought the Seawanhaka cup to Canada and for a long period during the nineties successfully defended that trophy against American challengers. The many successes of boats whose designs came from Mr. Shearwood's board have proved that his skill as an amateur yacht designer equals his ability to handle a racing boat under sail.

Throughout his career he has been an active member of The Institute, joining the Canadian Society of Civil Engineers as an Associate Member on April 8th, 1892, and transferring to Member on November 17th 1904. He was elected to Council in 1909 and again in 1921 and the two succeeding years. In 1923, when the late Walter J. Francis, M.E.I.C., was called upon to assume the office of President, Mr. Shearwood was a Vice-President of The Institute, which office he held until 1925. He has been active in committee work, having been chairman of the Finance Committee for three years from 1923 to 1925. In 1926 he undertook the responsible duties of Treasurer of The Institute, in succession to the late Sir Alexander Bertram, M.E.I.C., and retired from that office in 1930.

Mr. Shearwood is a member of the American Society of Civil Engineers, an Associate Member of the American Railroad Engineering Association, and a member of the Corporation of Professional Engineers of the Province of Quebec. He has also served on various committees of the Canadian Engineering Standards Association including those for Structural Steel, Railway and Highway Bridges and Buildings.

The selection of Mr. Shearwood as The Institute's President for 1934 will give real pleasure to all who have been associated with him, either in professional work, in the service of The Institute, or in any other activity.

# Address of the Retiring President

*O. Lefebvre, D.Sc., M.E.I.C.*

**Delivered before the Forty-Eighth Annual General Meeting of The Engineering Institute of Canada, Montreal, Que., February 8th, 1934.**

During my term as President of The Institute, which will terminate with the conclusion of the present brief address, it has been my privilege to pay a visit to all of the twenty-five branches of The Institute. This has given me the opportunity of acquiring a broader conception of the affairs of The Institute and the different problems inherent to local conditions.

There is no need to mention that I was received royally on all occasions, except that I should take this opportunity to express my appreciation and my gratitude for the welcome accorded to me.

My visits brought me into contact with a large portion of our membership,—men of character and ability who have played a great part in the development of the country, and are determined to help in every possible way to bring an end to the present financial and industrial depression.

There are in Canada, eleven schools of engineering recognized by Council. From these engineering schools or faculties of applied science, graduates numbering three hundred or so are given degrees every year, and these young men should join our Institute. Why do they not all do it? It is perhaps due to our lack of interest in them. It seems to me that the members of those branches located at the seat of a university, or engineering school, should make special efforts to awaken the interest of these young graduates. I do not want to imply that no efforts have been made in that direction. I know what good work is done by some of the teachers and some of our members outside of the teaching profession, but the effort from the outside members is not sufficiently organized and is too spasmodic to give efficient results.

The Institute is awarding to each engineering school, each year, a prize of $25.00 which is remitted to the most deserving student. The presentation of that prize should be made an outstanding event and a prominent member of The Institute should make the presentation. Advantage could be taken of this occasion to impress upon the students the advantages of membership in our Institute.

Some of our branches have established contact with the students. Meetings are held to which the students are invited. Sometimes they are held in the university. This should be more generally practised. After all, the students of to-day will be the engineers of to-morrow, and all of them should be induced to become members of The Institute.

Another remark which I want to make concerning the profession is a warning against the tendency to sectionalize engineering. Engineering covers a very wide field and necessarily lends itself to specialization. We should be careful, however, to resist that tendency to divide the profession into its different branches, each with its own organization, and holding its own meetings.

Glancing at one of our publications, one finds more than a dozen different classes of engineers. Not so very long ago, the engineering profession recognized two classes, namely: the military engineer and the civil engineer. There is a tendency to distinguish between the latter and the mechanical engineer, the electrical engineer, the hydraulic engineer, the structural engineer, the municipal engineer, the highway engineer, the railway engineer, the mining engineer, and others,—even the sales engineer, the promotion engineer. This practice should be discouraged in every possible way. Let us designate ourselves as civil engineers specialized in such and such a branch.

The policy followed by the Montreal Branch of The Institute is to be recommended to other branches. That Branch has a civil section, a mechanical section, a railway section, a municipal section, and so on, but all these divisions form part of one single body.

Another feature which I have noted has been occasional misunderstanding as to the relations between The Engineering Institute and the Provincial Corporations of Professional Engineers. Many of our members do not yet realize that the two bodies are complementary to each other, and that their activities are essentially different.

The Engineering Institute was organized principally to facilitate the interchange of engineering knowledge and experience between its members. The Institute has rendered great service to the profession, both to the individual members and to the group. However, The Institute could not exercise the legal control of the practice of the profession. This control is a matter of provincial jurisdiction. Hence the reason for the organization of the Provincial Corporations. These provincial bodies can perform what The Engineering Institute cannot perform. It is fair to say that their existence has been brought about mainly by the initiative of The Institute. In 1918, a committee of The Institute drafted a model act which The Institute submitted to its members in the different provinces, with the advice that legislation be obtained along the lines recommended. Legislation was passed in eight of the nine provinces,—the only exception being Prince Edward Island where no act was presented to the legislature for reasons that are obvious.

The model legislation requested was not acceptable to all of the legislatures, but nevertheless the acts are quite satisfactory, except in one or two cases. Under the acts that are satisfactory, the practice of the engineering profession is legally controlled to the benefit of the public and of the members of the profession.

The Institute has gone a step further and has taken the initiative to bring about uniformity in legislation between the different provincial acts and uniformity in the requirements for admission to the Provincial Associations. As a result, a committee representative of the eight Provincial Associations, namely, the "Committee of Eight," is at work and is making good progress.

When we have reached the goal of uniformity in provincial legislation and uniformity in requirements for admission, it will be a simple matter to bring about a complete co-operation between The Institute and the Provincial Associations,—the associations exercising the legal control of the practice of engineering, and The Institute devoting all its time, activities and resources to facilitating the interchange of engineering knowledge and professional experience amongst its members. Such a complete co-operation between the two bodies will result in great benefit to the profession as a whole and to its individual members in particular.

# The Forty-Eighth Annual General and General Professional Meeting

**Convened at Headquarters, Montreal, January 25th, 1934, and adjourned to the Windsor Hotel, Montreal, on February 8th, 1934**

The Forty-Eighth Annual General Meeting of The Engineering Institute of Canada was held at Headquarters on Thursday, January twenty-fifth, nineteen hundred and thirty-four, at eight fifteen o'clock p.m., with President O. O. Lefebvre, M.E.I.C., in the chair.

The Secretary having read the notice convening the meeting, the minutes of the Forty-Seventh Annual General Meeting were submitted, and on the motion of J. T. Farmer, M.E.I.C., seconded by E. C. Kirkpatrick, M.E.I.C., were taken as read and confirmed.

Appointment of Scrutineers

On the motion of G. B. Mitchell, M.E.I.C., seconded by H. W. B. Swabey, M.E.I.C., Messrs. deGaspe Beaubien, M.E.I.C., and J. M. Fairbairn, A.M.E.I.C., were appointed scrutineers to canvass the Officers' Ballot and report the result.

There being no other formal business, it was resolved, on the motion of H. Milliken, M.E.I.C., seconded by G. Kearney, M.E.I.C., that the meeting do adjourn to reconvene at the Windsor hotel, Montreal, at ten o'clock a.m., on the eighth day of February, nineteen hundred and thirty-four.

## Adjourned General and General Professional Meeting at the Windsor Hotel, Montreal

The adjourned meeting was called to order by President O. O. Lefebvre, M.E.I.C., at ten a.m. on Thursday, February 8th, 1934. After messages of regret had been submitted from members and guests unable to be present, the Secretary announced the membership of the Nominating Committee appointed to nominate the officers of The Institute for 1935 as follows:

Nominating Committee 1934

*Chairman:* H. W. B. Swabey, M.E.I.C.

| *Branch* | *Representative* |
|---|---|
| Cape Breton | R. R. Moffatt, A.M.E.I.C. |
| Halifax | J. B. Hayes, A.M.E.I.C. |
| Saint John | G. G. Murdoch, M.E.I.C. |
| Moncton | G. E. Smith, A.M.E.I.C. |
| Saguenay | N. F. McCaghey, A.M.E.I.C. |
| Quebec | P. Methe, A.M.E.I.C. |
| St. Maurice Valley | J. H. Fregeau, A.M.E.I.C. |
| Montreal | F. S. B. Heward, A.M.E.I.C. |
| Kingston | W. Casey, M.E.I.C. |
| Ottawa | F. H. Peters, M.E.I.C. |
| Peterborough | A. L. Killaly, A.M.E.I.C. |
| Toronto | J. J. Spence, A.M.E.I.C. |
| Hamilton | J. R. Dunbar, A.M.E.I.C. |
| London | F. C. Ball, A.M.E.I.C. |
| Niagara Peninsula | C. G. Moon, A.M.E.I.C. |
| Sault Ste. Marie | C. Stenbol, M.E.I.C. |
| Lakehead | H. G. O'Leary, A.M.E.I.C. |
| Border Cities | W. J. Fletcher, A.M.E.I.C. |
| Winnipeg | T. C. Main, A.M.E.I.C. |
| Saskatchewan | L. A. Thornton, M.E.I.C. |
| Lethbridge | R. Livingstone, M.E.I.C. |
| Edmonton | R. J. Gibb, M.E.I.C. |
| Calgary | B. L. Thorne, M.E.I.C. |
| Vancouver | T. E. Price, A.M.E.I.C. |
| Victoria | H. F. Bourne, A.M.E.I.C. |

Awards of Medals and Prizes

Before asking the Secretary to announce the winners of the various prizes and medals of The Institute, the President stated that the formal presentation of these would take place at the Annual Dinner of The Institute. The following awards were then announced:

The Sir John Kennedy Medal to Alexander Joseph Grant, M.E.I.C., Engineer in Charge, Welland Ship Canal, St. Catharines, Ont., Past-President of The Institute.

The Past-Presidents' Prize to Eric G. Adams, S.E.I.C., Cockfield Brown & Co., Montreal, Que., for paper on "The Relations of Economics to Engineering."

The Gzowski Medal to Milton Eaton, A.M.E.I.C., Electrical Engineer, Shawinigan Chemicals Ltd., Shawinigan Falls, Que., for his paper "Automatic Operation of Electric Boilers."

The Plummer Medal to A. G. Fleming, M.E.I.C., Chief Chemist, Canada Cement Company, Montreal, for his paper "The Development of Special Portland Cements in Canada."

The Leonard Medal to C. H. Hitchcock, Vice-President, Smith and Travers Limited, Sudbury, Ont., for his paper "Diamond Drilling Practice."

*Students' and Juniors' Prizes*

The John Galbraith Prize (Province of Ontario) to C. W. Crossland, S.E.I.C., now with Hawker Aircrafts Limited, England, for his paper "The Rationalization of Load Factors for Aeroplane Wings."

The Phelps Johnson Prize (Province of Quebec—English) to L. A. Duchastel, Jr.E.I.C., Designer, Power Engineering Company, Montreal, for his paper "The Rapide Blanc Development."

The Ernest Marceau Prize (Province of Quebec—French) to Raymond Boucher, S.E.I.C., now at the Massachusetts Institute of Technology, Cambridge, Mass., for his paper "Projet d'aménagement hydro-électrique."

Report of Council and Report of Finance Committee

The Report of Council for 1933 was read by the Secretary, and on the motion of H. B. Stuart, A.M.E.I.C., seconded by W. H. Wardwell, M.E.I.C., the report was approved. The report of the Finance Committee was presented by the committee's chairman, Mr. Busfield, who pointed out that although the expenditures had been kept within the budget, the year's operations of The Institute had resulted in a deficit, a result principally due to the unforeseen drop in members' fees. General C. H. Mitchell, M.E.I.C., was of the opinion that the Finance Committee's report was more favourable than might have been expected, having regard to the difficult circumstances obtaining during the past year, and moved the adoption of the report. In seconding General Mitchell's motion, J. H. Hunter, M.E.I.C., supported General Mitchell's views. F. W. Paulin, M.E.I.C., drew attention to the desirability of according lenient treatment to members in arrears, and Mr. Busfield, in reply, explained the procedure adopted by Council, in which the utmost consideration was given to the circumstances of individual cases wherever members have stated their circumstances, and after further discussion the report was unanimously adopted.

Reports of Committees

After presentation by the Secretary, on the motion of W. McG. Gardner, A.M.E.I.C., seconded by J. B. Macphail, A.M.E.I.C., the reports of the following committees were taken as read and adopted:—Past-Presidents' Prize Committee, Gzowski Medal Committee, Plummer Medal Committee, Leonard Medal Committee, Students' and Juniors' Prizes, Membership Committee, Papers Committee, Publication Committee, Library and House Committee, Report of E.I.C. Members of the Main Committee of the Canadian Engineering Standards Association, Committee on Biographies, Honour Roll and War Trophies Committee, Board of Examiners and Education, Unemployment Committee and Employment Service Bureau.

### Reports of Branches

On the motion of L. F. Grant, M.E.I.C., seconded by H. A. Lumsden, M.E.I.C., it was resolved that the reports of the branches be taken as read and accepted.

### National Construction Council of Canada

J. B. Carswell, M.E.I.C., one of The Institute's representatives on the National Construction Council of Canada, presented a report on that Council's activities, which outlined the origin and proceedings of the Council, with particular reference to the study it had made of the economic situation as affecting the construction industry. Its recommendations, sent early in the year to Mr. Bennett and to the Provincial Prime Ministers in Canada, had suggested a reasonable construction programme to be carried out under normal working conditions in an effort to reduce relief. Since that time the Council had formed twenty regional committees all over Canada and had completed a survey of all construction deferred since January 1st, 1930, amounting to some 500 million dollars, much of this consisting of Federal, provincial and municipal work. A list selected from this had recently been placed in the Prime Minister's hands, and an assurance had been received from Mr. Bennett that a certain amount of long-deferred and much needed public works construction will be undertaken this year. The question of municipal undertakings still presented a very serious problem, to the solution of which attention was now being given. Mr. Carswell pointed out that for the first time the construction industry had a coherent voice, and congratulated The Engineering Institute as having given much needed and active support in the work of this organization. It was moved by F. W. Paulin, M.E.I.C., seconded by C. M. McKergow, M.E.I.C., and carried unanimously, that a hearty vote of thanks be accorded to J. B. Carswell, M.E.I.C., and A. H. Harkness, M.E.I.C., the members representing The Institute on the National Construction Council of Canada.

### Reduction in Entrance Fees

The President drew attention to the action taken by the Council of The Institute on October 6th, 1933, in taking upon itself to order a reduction of the entrance fee for all classes of membership to $5.00, this to hold good until June 30th, 1934. The Council now asked the members present at the Annual General Meeting to approve this action, which had been undertaken with a view of facilitating the recruitment of new members. It was perhaps too soon to say whether this reduction, which had now been effective for four months, had produced any definite effect. The action of the Council in changing the entrance fee was unanimously approved, on the motion of deG. Beaubien, M.E.I.C., seconded by J. H. Hunter, M.E.I.C.

### Council's Proposals for the Amendments to By-laws

The Secretary presented a letter from the Executive Committee of the Vancouver Branch pledging its support to the draft of by-laws as now proposed by Council provided that no move was made to substitute the term "Associate" for "Affiliate" in the wording of these by-laws. That Branch Executive committee was of opinion that the draft of by-laws should be accepted as they stand. A letter was also read from the Secretary of the Moncton Branch stating that that Branch strongly opposed any change being made in the present grading of Institute members, and urged that the time had come when admission to corporate membership in The Institute should be limited to those who are graduates in engineering of some recognized university, or who possess the equivalent of this.

The President pointed out that the draft by-laws now submitted by the Council for discussion were the result of work which had extended over two years, culminating in the consideration and approval of the proposals in detail at the Plenary Meeting of Council held on October 31st and November 1st and 2nd last.

The discussion was opened by Mr. Busfield, formerly chairman of the Committee on Development, who briefly described the considerations and activities which had led to the present proposals. The most important of these were the adoption of one class of corporate membership in place of two, and the modification of membership qualifications to give a measure of recognition to membership in a provincial association. He urged the adoption of the present proposals by the membership on ballot, and felt that if this were done there would be a secure foundation on which to build up The Institute during the next few years.

Professor H. E. T. Haultain, M.E.I.C., inquired what were the conditions of urgency which had called for the considerable effort and expenditure undertaken in connection with these proposed changes in the by-laws, and asked how the proposed changes met this condition of urgency. Mr. Busfield in reply indicated that the activities of the Committee on Development had been set on foot as a result of criticisms from members of The Institute that it was not fulfilling its functions in the best possible way. Many members were dissatisfied with what they considered apathy and lack of activity within The Institute. The course that had been taken was not started so much as a measure of urgency as in order to hasten the process of development of The Institute, which it was felt was proceeding at too slow a pace.

R. F. Legget, A.M.E.I.C., observed that while the proposals now before the meeting had met with the unanimous approval of the Plenary Meeting of Council, he did not think the Council in this respect was truly representative of all branches of The Institute members, particularly the younger members of The Institute, who were especially concerned in the path which The Institute was going to take. Mr. Legget had discussed the proposed changes with a number of members of The Institute under the age of thirty-five, and he believed that the majority of these younger men would be definitely opposed to the changes suggested. This position was based on disagreement with the motive underlying the activities of the committee, as they did not consider that the objects of The Institute would be best served by changing the requirements for admission so as to secure a larger but less highly qualified membership. He criticized the new by-laws as containing no definition of what an engineer is, and felt that the changes in the objects of The Institute in Section 1 were such as to place first the functions of The Institute as a clearing house for technical knowledge, whereas it should be fundamentally a professional body. He felt also that a mistake was being made in abandoning the existing code of ethics and replacing it by a clause which was so general as not to meet the case. He, and those who thought with him, believed that the proposed by-laws made no progress whatever towards approaching the professional associations with a view of the fundamental co-ordination of the profession. He hoped to see eventually a scheme similar to that which was working so admirably in the case of the sister profession of architecture in Canada.

Mr. Legget felt that the present status of the professional engineer in Canada was unsatisfactory. The opinion of him held by the general public could be judged, for instance, by articles appearing in the leading papers of Canada, an example of which he gave, in which the work and status of the engineer were systematically belittled. He felt that The Engineering Institute of Canada should be organized as a definite professional body, and should be so constituted as to be able to take action in cases of this kind. He hoped that the opinions he had expressed, which were, he thought, largely the views of the younger men, could be given consideration.

The meeting adjourned at twelve fifty p.m.

In resuming the discussion at two fifty-five p.m., the Secretary, in reply to a question of Gordon M. Pitts, A.M.E.I.C., pointed out that there was no need for a motion for the adoption of the proposed changes in the by-laws, as, in accordance with Section 75 of the present by-laws, these were before the Annual General Meeting for discussion and thereafter must go to a ballot.

Mr. Pitts expressed appreciation of Mr. Legget's contribution to the discussion, which indicated that he had given serious and thorough study to the proposals. Such action on the part of the younger members was badly needed by The Institute. Mr. Pitts drew attention to the first section of Council's proposals, and particularly to the object which was stated as "to enhance the usefulness of the profession to the public." He felt that one of the most important functions of The Institute would be to convince the public that engineers are an asset to the community, and he believed that The Institute as now constituted was not in a position to do that to the fullest degree. Mr. Pitts read a letter which he had addressed to the Council under date of October 4th, 1933, in which he had advocated the consolidation of the engineering profession throughout Canada into one representative organization, somewhat along the lines of the present organization of the profession of architecture, the Dominion organization forming a liaison between the legally constituted provincial bodies and the engineers of the Dominion. The reply he had received indicated that Council had been considering this question for nine years, but that practically nothing had been accomplished. Under these circumstances he urged that action on the proposed amendments to the by-laws be deferred until a full and proper study had been made by all parties concerned as to the possibility of a broader organization of the profession in Canada.

During the discussion which followed, Major L. F. Grant, M.E.I.C., pointed out that the condition desired by Mr. Pitts must be the result of action by the eight provincial associations themselves, and he drew the attention of Mr. Pitts to the fact that the Council of The Institute had for years been doing all in its power to further the movement of co-ordination.

D. G. Elliott, S.E.I.C., was in agreement with Mr. Legget in opposing the present proposals of the Council, as he felt that they lacked the factors which had given the Institution of Civil Engineers in Britain and the American Society of Civil Engineers in the United States the general respect of the community. These were, high qualifications for membership, a high code of ethics, and rigorous enforcement of that code. He was of the opinion that if a change were necessary, which was debatable, consideration should rather be given to a move towards the raising of the standard of membership, making it something to be prized. He felt that instead of doing this The Institute was proposing to open the doors still wider in the hope of increasing its membership.

Dr. L. F. Goodwin, M.E.I.C., in commenting on Mr. Elliot's remarks, felt that the Plenary Meeting of Council, at which more than thirty members were present from all over the Dominion, representing branches with widely divergent views, was really more representative of the membership at large than the present Annual General Meeting. Dr. Goodwin pointed out that in addition to the consideration of opinions expressed by the members of Council present at that meeting, a mass of written communications from branches and members had been considered, embodying all kinds of suggestions. He felt that Mr. Legget's position was difficult to understand, as on the one hand he criticized the standard of admission to The Institute as not being sufficiently high, while on the other he wished at once to co-ordinate The Institute's activities with those of the provincial associations of professional engineers. Apparently Mr. Legget was not aware that this was the difficulty, as the requirements of the professional associations were by no means uniform, and some, at least, had a distinctly lower standard than The Institute. He felt that many of the points brought forward by Mr. Legget had been carefully considered and the Council had tried to recognize the different points of view. Dr. Goodwin believed that if the by-laws as proposed were adopted on ballot the solution of the larger problem of co-ordination with the professional bodies would be facilitated, particularly if the full co-operation of the younger members of the profession could be secured.

J. H. Hunter, M.E.I.C., compared the present requirements for corporate membership with those embodied in the Council's proposals, and believed that those proposals prescribed qualifications which should be acceptable to every member of The Institute. He was of opinion that the adoption of the new by-laws would do exactly what they were intended for—put The Institute on a sound foundation.

F. W. Paulin, M.E.I.C., drew attention to the difficulty experienced, particularly in some of the outlying branches of The Institute, in obtaining the co-operation of these various branches with the sections of foreign engineering societies which had been established in Canada, and also with the mining engineers. He thought that the representatives of these organizations should be asked to a committee meeting to see what could be done to provide a common ground for the members of every branch of engineering to discuss their problems.

Professor Haultain, as an old member of The Institute, recalled that he had been chairman of the committee whose work resulted in the change from the Canadian Society of Civil Engineers to The Engineering Institute of Canada. This important change was, however, made on the advice of a committee all of whose members had taken an active part in the work. He felt that in the case of Mr. Busfield's Committee on Development, which had included a galaxy of past-presidents, this policy had not been followed, and the actual work of the committee had been done by a very small proportion of its members. In any case, the Committee on Development was soon superseded by another, and finally it was decided to have a Plenary Meeting of Council, at which but little time seemed to have been given to the detailed consideration of the proposals now put forward by the Council. Professor Haultain was not in agreement with a number of the changes which were now proposed, particularly the alteration in the objects of The Institute, and the change in the allocation of vice-presidents. He urged that the code of ethics should not be abandoned. Such a code was of great educational value, and the clause now proposed by Council was a poor substitute for a complete code. As regards the change in the classes of membership, Professor Haultain criticized the proposed requirements for corporate membership, which he regarded as unsatisfactory, since it was impossible to assign a precise meaning to some of the phrases used. The standing of The Institute to-day was not due to any by-laws but to the men like Sir John Kennedy, Phelps Johnson, G. H. Duggan, R. A. Ross, J. M. R. Fairbairn and Julian Smith, who in the past had contributed so much to the prestige and influence of the profession, and had unhesitatingly given their time and ability to build up The Institute. He had looked in vain for the presence of these distinguished men at the last Annual Meeting, when the report of their committee was presented by Mr. Busfield.

Mr. Paulin desired to correct a wrong impression he seemed to have given to Professor Haultain, namely, that at the Plenary Meeting of Council but little time was given to the discussion of the new by-laws. Nearly all of the time of that meeting was taken up in a full, broad discussion of every item concerning these by-laws, and then a comparatively short time was spent in going over the different clauses in order to conform with the views that had been presented in the general discussion.

S. R. Banks, Jr.E.I.C., desired to express his agreement with Mr. Legget's criticisms of the proposed by-laws, the adoption of which he believed would be a retrograde step. The prestige of a society depended on the standing of its individual members and the requirements exacted of them. He felt that the qualifications now proposed were of a lower standard and believed that the status of The Institute under the proposed by-laws would compare very unfavourably with that of older institutions with more rigid requirements for membership. Many of the clauses in the proposed by-laws were vague and depended on the discretion of the Council. He believed that if the proposed by-laws were accepted the result would be equivalent to an invitation to foreign societies to come in and start branches in Canada.

John M. Fairbairn, A.M.E.I.C., considered that the proposed changes brought up the question as to whether The Engineering Institute was to be a purely professional body or whether it was to be largely a commercial one. Was The Institute to be a broad-minded organization covering the whole field of engineering, or would some of the best known engineers who are engaged in competitive industry have to withdraw from The Institute?

A. B. Lambe, A.M.E.I.C., drew attention to the difficulties which had been encountered by the professional associations in obtaining satisfactory legislation and remarked that while the present situation was by no means satisfactory, particularly as regards the relations between The Institute and the professional bodies, it was the best possible under present conditions, and for the time being it would be necessary to carry on with the two sets of organizations. Mr. Lambe outlined the discussions which had taken place between The Institute's committee and those of the professional associations, and explained that a committee representing the professional associations was at work, and as soon as some initial difficulties had been overcome, would endeavour to compose the difficulties among the associations.

Mr. Carswell felt that the discussion had so far been somewhat unsatisfactory as being unlikely to lead to any definite result. He questioned whether an Annual General Meeting, at which slightly over two per cent of the total membership were present, could be regarded as being very representative, and he thought that the discussion could with advantage be closed at this point. In this he was supported by Dr. Goodwin.

After further discussion, in which Messrs. Pitts, Busfield, Lambe, Hunter and General Mitchell took part, Mr. Gordon Pitts presented a motion that the decision on the by-laws now proposed by Council be delayed for the time being. This motion was ruled out of order by the President, as the course to be followed in connection with Council's proposals was definitely laid down in the by-laws, the motions with which the Annual General Meeting was empowered to deal being those for amendments to the proposed by-laws as submitted by Council. The motion of Mr. Pitts did not fall within this category.

Mr. Legget drew attention to the provisions of the present by-laws to which the chairman had referred, and moved, as an amendment to Section 1 of the Council's proposals, that the words of Section 1 of the existing by-laws be substituted for those of Section 1 of the new by-laws as now proposed by Council. H. M. Scott, M.E.I.C., having seconded this amendment, the President announced that in accordance with the by-laws it would go out to ballot with Council's proposals, and that he would appoint the necessary committee to state the arguments for and against, as required by Section 75 of the by-laws.

The President then declared the discussion closed, and delivered his retiring address, which appears in another column of this issue of The Journal.

The Secretary was then asked to read the report of the scrutineers appointed to canvass the Officers' Ballot for 1934, and the officers named therein were declared duly elected as follows:

| | |
|---|---|
| President | F. P. Shearwood |
| Vice-Presidents: | |
| Zone B | E. G. Cameron |
| Zone C | A. B. Normandin |
| Zone D | A. Gray |
| Councillors: | |
| Cape Breton Branch | C. M. Smyth |
| Moncton Branch | H. J. Crudge |
| Saguenay Branch | G. F. Layne |
| Quebec Branch | H. Cimon |
| Montreal Branch | C. B. Brown |
| | A. Cousineau |
| Ottawa Branch | C. M. Pitts |
| Peterborough Branch | R. L. Dobbin |
| Toronto Branch | J. R. Cockburn |
| Hamilton Branch | F. W. Paulin |
| Niagara Peninsula Branch | W. Jackson |
| Sault Ste. Marie | A. E. Pickering |
| Winnipeg Branch | F. G. Goodspeed |
| Lethbridge Branch | C. S. Clendening |
| Calgary Branch | F. M. Steel |
| Victoria Branch | H. L. Swan |

On the motion of A. B. Normandin, M.E.I.C., seconded by A. B. Crealock, A.M.E.I.C., it was unanimously resolved that a vote of thanks be tendered to the scrutineers for their services and that the ballot papers be destroyed.

Dr. Lefebvre then asked Past-President C. H. Mitchell, M.E.I.C., and Past Vice-President J. H. Hunter, M.E.I.C., to conduct the newly elected President to the chair, and after a brief expression of appreciation from President Shearwood of the honour done him, the following votes of thanks were unanimously passed.

On the motion of W. H. Wardwell, M.E.I.C., seconded by W. C. Adams, M.E.I.C., it was unanimously resolved that the hearty thanks of The Institute be accorded to the retiring President and the retiring members of Council in appreciation of their services during the past year.

On the motion of E. W. Stedman, M.E.I.C., seconded by F. W. Paulin, M.E.I.C., it was unanimously resolved that the thanks of The Institute be conveyed to the Montreal Branch in recognition of their hospitality and activity in connection with the holding of the Forty-Eighth Annual General and General Professional Meeting.

Following announcements by the Secretary, the meeting adjourned at five oc'ock p.m.

### Social Functions

At the luncheon held on Thursday, February 7th, the Chairman of the Montreal Branch, Dr. A. Frigon, M.E.I.C., took the chair, and the members and ladies present were addressed by the Hon. Fernand Rinfret, M.P., Mayor of Montreal, who extended the city's welcome. He was followed by Sir William Clark, K.C.S.I., K.C.M.G., High Commissioner for the United Kingdom, who spoke of recent economic changes in Britain, tracing the history of events there since the war. He discussed the effect of the various measures taken for recovery, referring particularly to the conversion loan, the effect of the introduction of tariffs and the undoubted recovery in basic industries.

The Annual Dinner of The Institute took place in the evening of the same day, President F. P. Shearwood, M.E.I.C., in the chair. The function was honoured by the presence of the Prime Minister, The Right Hon. R. B. Bennett, K.C., P.C., LL.D., who presented the prizes and medals of The Institute and delivered an inspiring address. Mr. Bennett pointed out that the engineering profession was essentially one of wide vision, and that to the engineer material things seemed of less importance than the realization of hope and belief. He concluded with a message of encouragement to the younger men.

Following the dinner a reception and dance took place which was largely attended, the members and guests being received by the President and Mrs. Shearwood, the chairman of the Montreal Branch, Dr. Frigon, and Mrs. Frigon, and the chairman of the Annual Meeting Committee, Mr. E. A. Ryan, and Mrs. Ryan.

On Friday the 9th, the ladies were entertained at tea at the Cercle Universitaire and in the evening a ladies' bridge at the Windsor hotel proved very popular. On the same evening the smoker held in the Windsor Hall was a great success, the attractions provided including some very acceptable musical numbers by the McGill University Glee Club and a boxing tournament held under the sanction of the Amateur Athletic Union of Canada. The nine bouts were refereed by the bantam and welter-weight champions of Canada, and the excellent display was greatly appreciated.

Technical Sessions

The professional sessions were held on Friday, February 9th, the papers presented and discussed in the morning being the following:

In the York Room, under the chairmanship of P. B. Motley, M.E.I.C.:

"The Broadway Bridge, Saskatoon, Sask.," by Dean C. J. MacKenzie, M.C.E., M.E.I.C.

"Survey Work for the Lake St. Louis Bridge, Lachine," by C. F. Draper, A.M.Inst.C.E.

In the Prince of Wales Salon, under the chairmanship of Dr. A. Frigon, M.E.I.C.,

"Stresses in Stiffened Circular Tubes under External Pressure," by R. D. Johnson, M.Am.Soc.C.E.

"The Reflecting Telescope for the David Dunlap Observatory," by R. K. Young, Ph.D.

"The Utilization of Magnesian Carbonates," by F. E. Lathe.

In the afternoon papers were presented and discussed as follows:

In the York Room, under the chairmanship of P. B. Motley, M.E.I.C.,

"Substructure and Approaches of the Lake St. Louis Bridge," by J. A. Lalonde, A.M.E.I.C.

"Superstructure of the Lake St. Louis Bridge," by W. Chase Thomson, M.E.I.C.

In the Prince of Wales Salon, under the chairmanship of Dean Ernest Brown, M.E.I.C.,

"Department of National Defence Relief Camps and Projects," by Major G. R. Turner, M.C., D.C.M., A.M.E.I.C.

"Construction, the Joint in the Armour of Depression," by W. D. Black, M.E.I.C.

The Committee of the Montreal Branch, which was responsible for the detailed arrangements, is to be heartily congratulated on the success of the meeting, the organization of which was carried out under E. A. Ryan, M.E.I.C., as chairman of the Montreal Branch committee, with Dr. A. Frigon, M.E.I.C., as vice-chairman. H. W. Lea, Jr.E.I.C., was responsible for the registration, F. V. Dowd, A.M.E.I.C., for the papers and meetings, F. S. B. Heward, A.M.E.I.C., for the entertainment and smoker, and J. A. McCrory, M.E.I.C., for the publicity. Mrs. E. A. Ryan was chairman of the Ladies' Committee.

---

## Address of the Right Hon. R. B. Bennett, K.C., P.C., LL.D.,

*Prime Minister of Canada*

**Delivered at the Annual Dinner of The Engineering Institute of Canada, Montreal, February 8th, 1934**

After a few words of congratulation to the newly elected President of The Institute, Mr. F. P. Shearwood, M.E.I.C., the Prime Minister continued as follows:—

Ladies and Gentlemen, I did not come here to make a speech, but rather to do honour to myself by being permitted to associate with a group of men who play such a great part in our modern civilization.

I suppose there are few countries in the world where greater opportunities have been offered for the development of engineering in the greatest and widest sense than in Canada. Take our highways winding over mountain and stream; the splendid steel structures that cross our great rivers; our mines and the winning of minerals; irrigation systems, canals and railways; I wonder if you ever pause to think where our civilization would be if it were not for the engineers. If one reads the history of the past, we realize how large a part they play.

Here in Canada, where we have such a variety of natural resources, where there are such great difficulties to overcome, the engineer has indeed found the widest scope for his activities.

I believe, Sir, that the bridge I see every morning that spans the river between Ottawa and Quebec is one of the first you built in this country. I was looking at it the other day, and realized the sense of pride men must have as their creative genius, first of all conceives, and then works out the designs for such a work, until finally every detail takes shape and form and a bridge is the result.

Then there are the irrigation canals. We have extensive irrigation works in the western country and twenty-three or four or five years ago, I was actively engaged in work which had to do with irrigation canals. I well remember my duty was to complete the water agreements and the then President of the Canadian Pacific was having some difficulty with those in "the benighted east" as we in the west would say, as to the extent of responsibility involved in the water agreements. Lord Shaughnessy, then Sir Thomas Shaughnessy, asked "What are our obligations under this contract?" I said, "Your obligations are to deliver water in the canals to be available for the farmers if there is water in the Bow river. That is all we ask."

Lord Shaughnessy remarked "As we are under contract to deliver mail across this continent, and we frequently have disasters in the mountains, I cannot think that our obligation is any greater in the one instance than in the other, and there is no reason why we should not rely on our engineers as much in one case as the other" and they did.

We have spanned streams, we have built irrigation works, sewers, water works; gas, electric light and power have been developed and they are truly a monument of progress in this country. We have, indeed, experienced with all the world a great setback, and passed through a period of great depression, but as you look about in city and town and country, you realize that the engineer has been abroad in the land. Though a depression is upon us, in the month of November last, I think, we consumed more kilowatts of electric energy than in any month in the history of this Dominion, and so, you see, the engineer of water power, electric plants and matters of that kind has still work to do.

But I did not come here for the purpose of reminding you of the great contribution you have made to the welfare of the Dominion. That, of course, some of you younger men would readily admit. It might be a little difficult to get the older men to consent to such an admission, but remembering my own youth and the willingness with which I would undertake to give an explanation of a legal difficulty more easily than the more experienced men, I feel quite certain that the younger men will admit that they have made a great contribution to the life of this country. I can only hope that the steady resistant courage that enabled the Welland canal to be completed and resulted tonight in the presentation to Mr. Grant of the Sir John Kennedy Medal which is indicative of the high regard in which he is held by his confreres, will encourage the youth of this country as they go forward with their enterprises, so that when they have attained a similar age they will have been the recipients of similar honours.

I do not know that I could usefully do more tonight, after having paid tribute to your worth, than to express my sense of obligation on behalf of the nation to those who belong to the engineering profession, for I conceive it to be not only a high honour but a great privilege and pleasure to bear my tribute of respect and esteem and regard to the great profession to which you belong in all its various branches. I do so, not only on my own behalf, but gladly on behalf of the nation and the government of which I happen to be the head, for I am quite certain that the contributions which engineering has made to the Dominion of Canada in every branch of its activity, have done more to bring about the material progress and advancement than any other single factor to which I could refer.

When I say that, I explain at once my reason for being here and my excuse for not indulging in any lengthy observations. To make any address would be like painting the lily. Has not one young man won a prize because he talked about "Economics and Engineering"? I think that during the last three years I must have listened to more economic advice than any man in this room. Take for example the development of electric energy on the St. Lawrence. If the advice was not tendered by individuals, at least I received it through the columns of the newspapers.

So, not being desirous of indicating my own unfamiliarity with problems with which you are so familiar, I would just like to say these words of encouragement: Few professions have offered the same opportunity as yours for wide vision, for no great engineer can be a small man. It is impossible. He can't be; he might like to be a small politician, but he couldn't be if he wanted to; it is impossible. It is quite impossible, for he deals with problems that are not small, he struggles with the forces of nature in their wildest forms; he looks at a great chasm and sees a dam, water power, towns, communities, factories. He sees in his mind's eye, all those things which go with the orderly development of great industry. He sees a great railway or a great terminal or a great system of water works, a great canal or a great irrigation system, bringing fertility to the dry and sterile land through which water is being led. How could he be small? To-day, if you want to get a large view of anything, you go to the engineer. He always has it. It can't be otherwise. I am sure none of the wives of the engineers present have ever found their husbands niggardly with their monthly allowance. (Laughter.)

Young men, with such examples as you have before you in this country, I hope you are shaping your course along the line of their example. When I was a youth I remember reading Samuel Smiles' "Lives of the Engineers." It is a little old fashioned now, but I suppose most of you have read it. I remember the impression it made on my mind as I read of Telford, the great engineer. The electrical engineer hadn't then come into being. We hadn't heard of him and the consultant and the specialist. People had to take chances in those days and they became their own consultants and their own engineers and their own initiators.

But you boys feel very pessimistic these days. You say there isn't much doing. "What is the hope for us? We haven't got anything to do. We have education. Didn't we listen to Dean Brown for the last four years? We know all there is to know about these abstruse and difficult things. What are we going to do to-day?"

Well, my friends, the other night I picked up the 1830 Quarterly Review—an article written only one hundred and four years ago—and they had exactly the same difficulties in those days that we have now, only they thought they were worse. We know they are worse in our day because you radio and electrical engineers have created a situation where it is possible to have all the troubles of all the world on our doorstep every morning. It is the price we pay for your achievements.

But I come with a message of hope to you younger men. This country is only on the threshold of its development. It may be true that we have been over-ambitious in some directions and that ten and a half million of people have, perhaps, accomplished more than ten and a half million people should have accomplished so quickly, but we are on the threshold of great development. All the world shows signs of progress. The insecurity of the past is leaving us; the uncertainty is giving place to certainty. In every nation, whether the United States or France or Germany or Great Britain, or Canada or Japan, employment is greater, production is increasing and men are looking with more hopefulness upon the future.

Even though you may sometimes recall the phrase "hope deferred makes the heart sick"—I think those are the words—nevertheless, have a strong and abiding faith in your country, with pride in what has been accomplished, with certainty as to your equipment which has been secured for you by the sacrifices of those who have gone before. Have an intelligent appreciation of what the future holds for Canada, be of good hope, be of high courage, for you will find your niche and your place and your work to do. Of that I feel confident.

If at times you are depressed, as I sometimes am myself, study the history of the great engineers of the past in our country and in other countries, learn of the difficulties they overcame, the struggles they had, their willingness to endure sacrifices that they might vindicate sometimes a principle, at other times a struggle for livelihood —you will take courage and despair no longer. The clouds break, the future is brighter.

I would not say that if it were confined to my own country, but in all the world it is so. Who shall say that in a young country such as this, after passing through the struggle we have, and enduring what we have, we may not produce better men, because they have not too easily attained prosperity.

You engineers know something of stress and strain. Sometimes you have to make costly experiments in order to satisfy yourselves as to the correctness of what you are doing. Well, you young men are being tried in the laboratory of experience. The work may be hard, the compensation may be small, but don't shorten your vision because of that.

When I talk to my friend, the President, here, I realize that here is a man to whom material things were much less important than the realization of hopes and visions and understanding. If, in this material age, you sometimes wonder whether there is room for aught but material thoughts, I would like to say to you younger men, what helped me when I was your age, for unless a man's reach exceeds his grasp what's a Heaven for? So hope beyond what you may attain; believe what you may not see and, reach, reach, reach, reach far beyond your grasp. That is all I have to say to you.

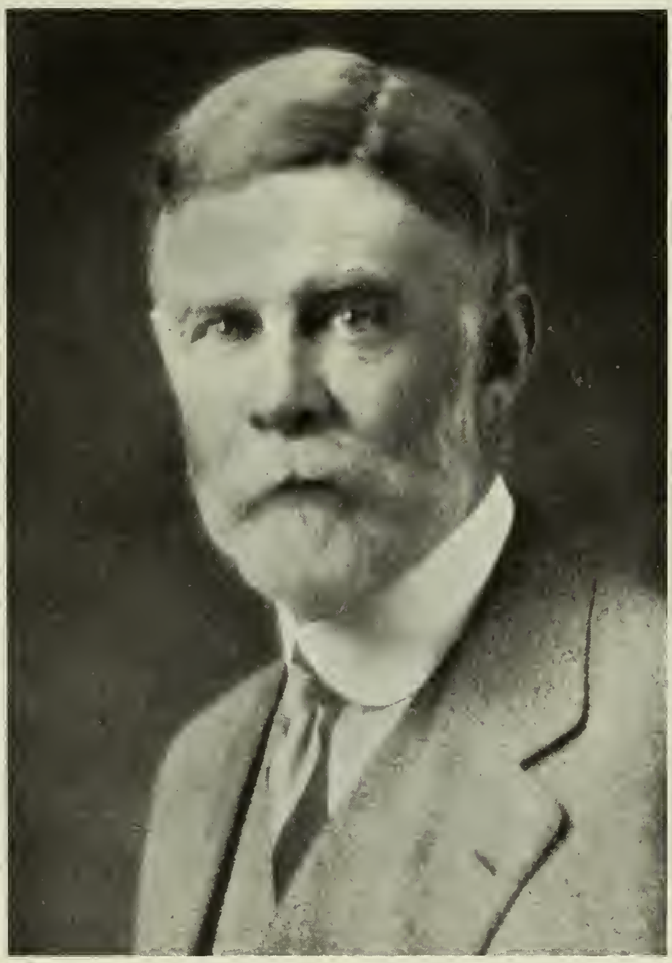
It is worth coming here tonight to see your faces, to shake you by the hand and for the moment to see men who have done things, who have wrestled with the forces of nature and won from her her treasures. It is not easy to overcome her; Nature is hard to beat. Wrestling with her, overcoming her, struggling with her, you attain victory and success. I came here tonight to get inspiration from the thought of what you have done, that I may take up the burden of my responsibilities the better for having seen you. (Prolonged applause.)

# The Sir John Kennedy Medal Awarded to Alexander Joseph Grant, M.E.I.C.

In order that The Engineering Institute of Canada might give fitting recognition from time to time to engineers of outstanding merit in the profession, and to those who have made noteworthy contributions to the science of engineering or to the benefit of The Institute, the Sir John Kennedy Medal was established in 1928. The rules governing its award provide that in making its decision as to this medal, the Council of The Institute shall take into consideration the life, activities and standing in the community and profession of the late Sir John Kennedy. It is one of the greatest honours in the gift of The Institute.

At its Plenary Meeting on October 30th, 1933, the Council unanimously named Past-President A. J. Grant, M.E.I.C., as a recipient of this distinction, and accordingly the medal was presented to him at the Annual Dinner of The Institute on February 8th.

Two previous awards of this gold medal have been made, the first, in 1929, to the late Lieut.-Colonel R. W. Leonard, M.E.I.C., Past-President of The Institute, and the second to Past-President G. H. Duggan, M.E.I.C., in 1930.



A. J. GRANT, M.E.I.C.

Mr. Grant, who now becomes the third Sir John Kennedy medallist, was born in Scotland on May 10th, 1863, at Dufftown, Banffshire, and came to Canada in 1872. He was educated at the University of Ottawa and St. Mary's College, Montreal.

His professional career began in 1880 on a survey party under H. D. Lumsden, for the Canadian Pacific Railway, west of Winnipeg. In 1883 he worked on the Baie des Chaleurs Railway, and in July 1886 he entered the outside service of the Department of Railways and Canals by joining the engineering staff of the Cape Breton Railway, under Hiram Donkin, M.E.I.C., where he was assistant engineer on the construction of the railway from 1887 to 1891. In the latter year he was transferred to the engineering staff of the Soulanges canal under Thomas Monro, remaining as an assistant engineer until the completion of the canal in January 1903, when he was appointed to the position of engineer in charge of the Port Colborne improvements. Here he remained until April 1906, when he was promoted by the department to the position of superintending engineer of the Trent canal.

During his tenure of this appointment, the construction of the Ontario-Rice Lake Division of the waterways was carried out, and the surveys and plans made for the Severn River Division of the canal. The works for improving the navigation of the Severn river were begun under his supervision, but, owing to war conditions, were suspended in 1916-17.

Since January 1st, 1919, Mr. Grant has been engineer in charge of the construction of the Welland Ship canal.

Mr. Grant joined The Institute before its change of name, having been elected an Associate Member on October 8th, 1891, and a Member on November 21st, 1901. Throughout his connection with The Institute he has been an unfailing supporter of its work and aims, and he took an active part in the formation of the Niagara Peninsula Branch in 1919. He served on Council as Vice-President in 1928-1929, and was elected President in 1930, a year which was particularly appropriate, since it saw the official opening to traffic of the important waterway whose construction he had directed for more than ten years.

This great work, with its terminal harbours and flight locks, is an outstanding engineering achievement, and its sound design and substantial construction forms an enduring evidence of Mr. Grant's professional capacity, ripe experience, and ability as an engineer and administrator.

# Award of Medals and Prizes

PAST-PRESIDENTS' PRIZE

The Past-Presidents' Prize for the year 1932-1933 has been awarded to Eric G. Adams, S.E.I.C., Montreal, the subject, "The Relation of Economics to Engineering" having been prescribed by Council for this competition. The committee also accorded honourable mention to the paper contributed by C. G. Cline, A.M.E.I.C., Niagara Falls, Ont.

Mr. Adams is a graduate of McGill University, having obtained the degree of B.Sc. in 1929. He is at the present time with Messrs. Cockfield, Brown and Company, Montreal. This is the second time that Mr. Adams has been the recipient of one of The Institute's prizes, having been awarded the Phelps Johnson Prize for Students and Juniors in the province of Quebec for the year 1930-1931, for his paper entitled "Some Economic Problems Confronting the Wider Application of Railroad Electrification in America."

Eric G. Adams, S.E.I.C.

M. Eaton, A.M.E.I.C.

A. G. Fleming, M.E.I.C.

C. G. Cline, A.M.E.I.C.

C. H. Hitchcock

Mr. Cline is senior assistant engineer with the Water Power and Hydrometric Bureau, Department of the Interior, Ontario Power Plant, Niagara Falls, Ont. He graduated from the University of Toronto in 1911 with the degree of B.A.Sc.

GZOWSKI MEDAL

The Gzowski Medal Committee has awarded that medal for the year 1932-1933 to M. Eaton, A.M.E.I.C., for his paper entitled "Automatic Operation of Electric Boilers." Mr. Eaton graduated from McGill University in 1921, with the degree of B.Sc., and following graduation was on the engineering staff of the Shawinigan Engineering Co. Ltd. In 1922 he was appointed electrical engineer for the Canadian Electro Products Company Ltd., and at the present time he is connected with Shawinigan Chemicals Limited, at Shawinigan Falls, Que.

PLUMMER MEDAL

The Plummer Medal for the year ending June 1933 was awarded to A. G. Fleming, M.E.I.C., for his paper on "The Development of Special Portland Cements in Canada."

Mr. Fleming graduated from Queen's University in 1904, with the degree of B.A. and later attended the School of Mines of the same university. In 1907 he joined the staff of the International Cement Company (later the Canada Cement Company) at Hull, as operating chemist, and in 1913 received the appointment which he now holds, that of chief chemist of the Canada Cement Company, Montreal.

LEONARD MEDAL

C. H. Hitchcock, vice-president, Smith and Travers Limited, Sudbury, Ont., is the recipient of the Leonard Medal for this year, the award being for his paper on "Diamond Drilling Practice" which was published in the June, 1933, issue of the Bulletin of the Canadian Institute of Mining and Metallurgy. Leonard medallists must be members either of The Engineering Institute of Canada or of the Canadian Institute of Mining and Metallurgy.

STUDENTS' AND JUNIORS PRIZES

Three of these prizes were awarded this year as follows:

The John Galbraith Prize (province of Ontario) to C. W. Crossland, S.E.I.C., of the Hawker Aircraft Limited, England, for his paper on "The Rationalization of Load Factors for Aeroplane Wings."

C. W. Crossland, S.E.I.C.

L. A. Duchastel, Jr.E.I.C.

R. Boucher, S.E.I.C.

The Phelps Johnson Prize (Province of Quebec, English) to L. A. Duchastel, Jr.E.I.C., designer, with the Power Engineering Company, Montreal, for his paper on "The Rapide Blanc Development."

The Ernest Marceau Prize (Province of Quebec, French) to R. Boucher, S.E.I.C., Massachusetts Institute of Technology, Cambridge, Mass., for his paper entitled "Projet d'Aménagement Hydro-Electrique."

---

## ELECTIONS AND TRANSFERS

At the meeting of Council held on January 16th, 1934, the following elections and transfers were effected:

*Member*

MAILHIOT, Adhemar, Civil, Mining and Chem. Engr., (Ecole Polytechnique), professor of mining, geology and metallurgy, Ecole Polytechnique, Montreal, Que.

*Associate Members*

BRIDGE, John Franklin, B.A.Sc., (Univ. of Toronto), elect'l. engr., Canadian Industries, Limited, Sandwich, Ont.

GOODWIN, Edward Arthur, (St. Helens Tech. Sch.), chief engr., Silent Glow Oil Burner Corpn. Ltd. (Canada), Montreal, Que.

*Transferred from the class of Student to that of Junior*

BLACK, Frank Leslie, B.Sc., (N.S. Tech. Coll.), asst. professor, engrg. dept., Mount Allison University, Sackville, N.B.

*Students Admitted*

HARDING, Sidney Howard, (Univ. of N.B.), Apohaqui, N.B.

HOUGHTON, Walter Craig, (Grad., R.M.C.), (Queen's Univ.), 223 Albert St., Kingston, Ont.

HUNT, William Murray, B.Sc., (N.S.Tech.Coll.), North Sydney, N.S.

MACDONALD, Colin, (Univ. of Toronto), North House, Univ. of Toronto, Toronto, Ont.

SHORT, H. Douglass, B.Sc., (Queen's Univ.), 3032 Maplewood Ave., Montreal, Que.

At the meeting of Council held on February 9th, 1934, the following Students were admitted:

BLAINE, Donald Smith, (Grad. R.M.C.), (Queen's Univ.), Kingston, Ont.

GRAHAM, Charles Allison, (McGill Univ.), Chesterville, Ont.

KESTER, William Hudson, (Univ. of Wisconsin), 162 Windermere Road, Walkerville, Ont.

McCANN, Edward Howard, (McGill Univ.), 2064 Mansfield St., Montreal, Que.

TASSE, Yvon Roma, (Ecole Polytechnique), 4683 Christophe Colomb, Montreal, Que.

TREMBLAY, Charles, B.A.Sc., C.E., (Ecole Polytechnique), junior engr., Lake St. Louis Bridge, Montreal, Que.

## ANNUAL REPORT

*Received too late to publish with Branch Reports in February, 1934 issue of The Journal*

### Lakehead Branch

The President and Council:—

On behalf of the Executive committee, the following Annual Report of the Lakehead Branch of The Engineering Institute of Canada is submitted.

MEMBERSHIP

On January 1st, 1933, there were 41 Corporate Members and 12 Non-Corporate Members. On December 31st, 1933, there were 34 Corporate Members and 10 Non-Corporate Members.

MEETINGS

Two meetings were held during the past year. The first meeting was held in the Officers' Mess, Port Arthur Armoury, on April 24th. Dr. O. O. Lefebvre, M.E.I.C., President of The Institute, was the guest of honour. The meeting was preceded by a dinner, after which the meeting was called to order by the Branch Chairman, J. Antonisen, M.E.I.C. Dr. Lefebvre addressed the meeting on Institute affairs. After discussing the affairs Dr. Lefebvre answered all questions that were asked by the members present. A hearty vote of thanks was tendered the President.

The second meeting was held in the same place and was addressed by G. H. Burbidge, M.E.I.C., who gave a resume of his attendance at the Plenary Meeting. Then P. E. Doncaster, M.E.I.C., addressed the meeting on the subject of The International Joint Commission re International Waters along the Boundary. Mr. Doncaster had just returned from a meeting of the above body at Winnipeg and St. Paul, Minn.

Both addresses were greatly enjoyed and a vote of thanks was tendered both gentlemen.

H. G. O'Leary, A.M.E.I.C., was appointed the Lakehead Branch Representative on the Nominating Committee.

FINANCIAL STATEMENT

| | | |
|---|---|---|
| *Revenue* | | |
| Balance in Bank, December 31st, 1932 | $447.17 | |
| Rebate of Fees | 61.50 | |
| Rebate of Fees, 1932, deposited January 1933 | 3.90 | |
| Bank Interest | 10.59 | |
| Refund, Travelling Expenses to Plenary Meeting | 145.80 | |
| Rebates due from Headquarters | 6.00 | |
| | | $674.96 |
| *Expenditure* | | |
| Telegrams | $ 3.18 | |
| Entertainment | 66.15 | |
| Dues, Secretary-Treasurer | 40.15 | |
| Advance, Travelling Expenses to Plenary Meeting | 145.80 | |
| Branch Share, Plenary Meeting | 4.20 | |
| Accounts Receivable, Rebates due from Headquarters | 6.00 | |
| Balance in Bank, December 31st, 1933 | 409.48 | |
| | | $674.96 |

Respectfully submitted,
J. ANTONISEN, M.E.I.C., *Chairman.*
GEO. P. BROPHY, A.M.E.I.C., *Secretary-Treasurer.*

## Publications of Other Engineering Societies

From time to time announcements have appeared in The Engineering Journal regarding the exchange arrangements which exist between The Engineering Institute of Canada and the founder engineering societies of the United States, whereby members of The Institute may secure the publications of the American societies at special rates which in most instances are the same as charged to their own members. A list of these publications with the amounts charged is given below, and subscriptions may either be sent direct to New York or through Headquarters of The Institute.

| | *Rate to E.I.C. Members* | *Rate to Non-Members* |
|---|---|---|
| AMERICAN SOCIETY OF CIVIL ENGINEERS | | |
| Proceedings, single copies | $ 0.50 | $ 1.00 |
| Per year | 4.00 | 8.00* |
| Civil Engineering, single copies | .50 | .50 |
| Per year | 4.00 | 5.00 |
| (Plus $.75 to cover Canadian postage.) | | |
| Transactions, per year | 6.00 | 12.00† |
| Year Book | 1.00 | 2.00 |
| (Other publications 50 per cent reduction on catalogue price to E.I.C. members). | | |
| * *If subscription is received before January 1st, otherwise $10.00.* | | |
| † *If subscription is received before February 1st, otherwise $16.00.* | | |
| AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS | | |
| Electrical Engineering, single copies | $ 0.75 | $ 1.50 |
| Per year | 6.00* | 12.00* |
| (*Plus postage $1.00.) | | |
| Transactions—annual, bound | 6.00* | 12.00* |
| (*Plus postage $1.00.) | | |
| (The single copy price for Electrical Engineering includes postage charge.) | | |
| THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS | | |
| Mechanical Engineering, single copies | $ 0.50 | $ 0.60 |
| Per year | 4.00* | 5.00 |
| (*Additional Postage to Canada $.75, Outside United States and Canada, $1.50.) | | |
| Transactions, bound, published annually, about May 15 (price of current volume) | 10.00 | 20.00 |
| (Other publications, same rate to E.I.C. members as to A.S.M.E. members.) | | |
| AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS | | |
| Mining and Metallurgy, single copies | $ 0.50 | ....... |
| Per year | 3.00* | ...... |
| (*Plus $1.00 for foreign postage.) | | |
| Metals Technology, single copies | 1.00 | ...... |
| Per year | 7.00* | ....... |
| (*Plus $.50 for foreign postage.) | | |
| Transactions, per volume | 5.00* | ...... |
| (*Plus $.60 for foreign postage.) | | |
| Technical publications: Supplied at $.01 per page, with a minimum charge of $.25 for single copies, or at a subscription rate per year of | 7.00* | ...... |
| (*Plus $1.00 for foreign postage.) | | |

# OBITUARIES

### Narcisse Belleau Gauvreau, M.E.I.C.

It is with regret that we place on record the death on December 29th, 1933, at North Vancouver, B.C., of Narcisse Belleau Gauvreau, M.E.I.C.

Mr. Gauvreau was born at Isle Verte, Que., in 1855. He studied mathematics at Laval University, and was an articled apprentice to Mr. C. Baillarge, city engineer of Quebec, and Mr. Bignell, Provincial Land Surveyor of Quebec. From 1871 to 1875 he was leveller and transitman on Dominion government surveys for the Canadian Pacific Railway, and in 1876-1879 was employed on railway location and the construction of the North Shore Railway. From 1880 to 1885 Mr. Gauvreau was engaged on Dominion government Canadian Pacific Railway work in British Columbia, and has since that time resided in British Columbia.

Mr. Gauvreau was one of the oldest members of The Institute, having joined the Canadian Society of Civil Engineers on November 11th, 1887. He became a life member on March 25th, 1925.

### Pierre Michel Helbronner, M.E.I.C.

Regret is expressed in placing on record the death at Montreal on January 23rd, 1934, of Pierre Michel Helbronner, M.E.I.C.

Born at Montreal on October 22nd, 1876, Mr. Helbronner studied architecture in the offices of Taylor and Gordon, and in 1896-1897 took an architectural course at McGill University. In 1899 he joined the staff of T. Pringle and Son Limited, and in 1907 became a member of the firm, which association was retained until the time of his death.

Mr. Helbronner served with the French Army from 1914 to 1919, receiving three decorations, and being cited in British despatches. From 1917 until the armistice he was attached to Sir Douglas Haig's headquarters staff as interpreter, and was the author of a technical bilingual dictionary used by the British Ministry of War.

Under the pen name of Jacques Savane, Mr. Helbronner enjoyed a considerable reputation in France and in Montreal as a poet and writer, and for his poetry gained a mention and then a first prize in the annual poetic competitions of Les Annales, Paris, in 1906 and 1907 respectively.

He was president in Montreal of the Société Française de Secours Mutuels, vice-president of the Union Nationale Française, vice-president of the Vétérans des Armées de Terre et de Mer, and of the Soldats de la Grande Guerre, also vice-president of the Société Alsacienne-Lorraine and of the Association des Sphynx, and member of the Ville-Marie section of the Association des Vétérans de la Grande Guerre. Mr. Helbronner was a member of the Association of Architects of the Province of Quebec, a founder-member of the Royal Architectural Institute of Canada, a member of the Société des Architectes de France, and a licentiate in architecture of the Royal Institute of British Architects of London.

Mr. Helbronner joined The Institute as a Member on August 12th, 1921.

### James Benjamin Philipps, A.M.E.I.C.

Regret is expressed in recording the death at Winnipeg, Man., on January 11th, 1934, of James Benjamin Philipps, A.M.E.I.C.

Mr. Phillips was born in South Wales on June 24th, 1874, and from 1897 to 1901 was employed as chainman and instrumentman on Dominion Land Surveys. In 1901-1903 he was with the Public Works Department of Manitoba as instrumentman on bridge and drainage works, and later was with the Canadian Northwest Irrigation Company. In January, 1904, Mr. Phillips joined the staff of the Grand Trunk Pacific Railway and later in the same year was assistant engineer on the construction of the main line of the Canadian Northern Railway. In January, 1905, he was assistant engineer with the National Transcontinental Railway, and in 1906 was connected with the Grand Trunk Pacific Railway as resident engineer on construction at Saskatoon. Later he became resident engineer for the Transcontinental Railway at St. Boniface, Man., and was subsequently in the construction department of the Canadian Pacific Railway Company. In 1924 Mr. Philipps went to Winnipeg as division engineer with the Canadian National Railways.

He became an Associate Member of The Institute on February 7th, 1907.

### Cyril Henry Ernest Rounthwaite, A.M.E.I.C.

It is with very deep regret that we place on record the sudden death at Sault Ste. Marie, Ont., on February 5th, 1934, of Cyril Henry Ernest Rounthwaite, A.M.E.I.C.

Born at Hartford, Cheshire, England, on February 27th, 1876, Mr. Rounthwaite came to this country as a child and was educated here, graduating from the School of Practical Science, University of Toronto, in 1900.

For three years he was assistant superintendent with the Canadian Electro-chemical Company, Sault Ste. Marie, and in 1904-1909 was draughtsman with the Grand Trunk Pacific Railway at Fort William. In 1910 Mr. Rounthwaite was located at Winnipeg as draughtsman for the chief engineer of the same railway, and in the same year returned to Sault Ste. Marie as chief draughtsman and later as office engineer of the Algoma Central Railway, which positions he held up to the time of his death.

Joining The Institute (then the Canadian Society of Civil Engineers) as an Associate Member on September 21st, 1914, Mr. Rounthwaite always took a very active part in its affairs, being a charter member of the Sault Ste. Marie Branch. From 1922 to 1927 he represented that Branch on the Council of The Institute and in 1930 was Chairman of the Branch.

## PERSONALS

A. L. Farnsworth, A.M.E.I.C., is, for a time with the Northern Foundry and Machine Co., at Sault Ste. Marie. Mr. Farnsworth was formerly with the engineering staff of Abitibi Power and Paper Co. at Sault Ste. Marie.

J. L. Rannie, M.E.I.C., chief of the triangulation division of the Geodetic Survey, Department of the Interior, Ottawa, was elected president of the Dominion Land Surveyors Association for 1934, at the Association's annual meeting held at Ottawa recently.

J. A. Reid, M.E.I.C., formerly consulting mining engineer and geologist of Toronto, Ont., is now associated with the Panama Corporation (Canada) Limited, at Panama, R. de P.

John Hole, M.E.I.C., architect and engineer, has opened an office in the Harbour Commissioners Building, Toronto, Ontario.

At the Forty-third Annual Meeting of the Province of Quebec Association of Architects held recently, L. A. Amos, M.E.I.C., of L. A. and P. C. Amos, Montreal, was elected President, and G. McL. Pitts, A.M.E.I.C., of Maxwell and Pitts, Montreal, became Vice-President.

W. F. Auld, Jr.E.I.C., is now on the staff of the Lincoln Electric Company of Canada Limited, at Toronto, Ont. Mr. Auld, who graduated from the University of Toronto in 1927 with the degree of B.A.Sc., was for a time in the Induction Motor Engineering Department of the Canadian General Electric Company at Peterborough, Ont.

Among the officers elected at the Sixteenth Annual Meeting of the Canadian Construction Association held at Toronto recently were F. G. Rutley, A.M.E.I.C., vice-president, The Foundation Company of Canada, Limited, Montreal, who became a Vice-President, and W. L. R. Stewart, A.M.E.I.C., managing director, Stewart Construction Company Limited, Sherbrooke, Que., who was re-elected eastern Vice-President.

Alan K. Hay, A.M.E.I.C., Engineer of the Ottawa Suburban Roads Commission, has been elected Chairman of the Ottawa Branch of The Institute for the year 1934. Mr. Hay graduated from McGill University in 1914 with the degree of B.Sc., and following graduation was until 1916 assistant engineer on the city engineer's staff of Ottawa. In 1917 he was inspector in the gauge-testing laboratory of the Imperial Ministry of Munitions, and in 1918 and 1919 served with the Canadian Engineers, having the rank of lieutenant. Later Mr. Hay became resident engineer for the Department of Public Highways and subsequently received his present appointment.

H. M. White, A.M.E.I.C., was recently elected President of the Association of Professional Engineers of the Province of Manitoba for 1934. Mr. White, who has served on the Executive of the Winnipeg Branch and has been a Member of the Association Council for the last three years, graduated from the Faculty of Applied Science of the University of Toronto in 1910 and in the fall of the same year joined the Engineering Staff of the Dominion Bridge Company Limited, Montreal. In 1919 he was transferred to Winnipeg as designing engineer, appointed engineer in 1923 and for the last several years has been chief engineer of the Western Division, Dominion Bridge Company Limited, which includes plants in Winnipeg, Calgary and Edmonton.

#### S. J. Hungerford, M.E.I.C., Appointed President of C.N.R.

S. J. Hungerford, M.E.I.C., acting president of the Canadian National Railways since July 1932, was recently appointed President by the Board of Trustees recently named to administer the railway's affairs.

Mr. Hungerford's first railway work was as machinist apprentice with the Southeastern Railway and Canadian Pacific Railway at Farnham, Que., in 1886-1891; from then until 1910 he was with the Canadian Pacific Railway in various capacities at a number of points throughout the system, and at that time he joined the engineering staff of the Canadian Northern Railway as superintendent of rolling stock with headquarters at Winnipeg. Following the organization of the Canadian National Railways, Mr. Hungerford was appointed, in November 1917, general manager of the eastern lines, and in the following year became vice-president and general manager. In 1923 he assumed the office of vice-president in charge of operation and maintenance.

#### Harrison P. Eddy, M.E.I.C., President of the American Society of Civil Engineers

Harrison P. Eddy, M.E.I.C., partner in the firm of Metcalf and Eddy, Boston, Mass., has been elected President of the American Society of Civil Engineers for the year 1934.

Born at Millbury, Mass., on April 29th, 1870, Mr. Eddy graduated from the Worcester Polytechnic Institute in 1891 with the degree of B.S. in chemistry. Subsequently he was until 1892 superintendent of the Sewage Treatment Works of Worcester, Mass., and during the years 1892-1907 was superintendent of the Worcester Sewer Department.

Beginning in 1907 there followed a life-long partnership with the late Leonard Metcalf, M.Am.Soc.C.E., under the firm name of Metcalf and Eddy, by which it is still officially known. A list of the large and important works on which the firm has served during its twenty-six years existence would sound like the roster of most of the important sanitation and water supply projects in America. The firm's practice has not only extended widely but has gone deeply into many allied fields, including water works, sewerage and drainage systems, water, sewage and industrial wastes treatment plants and municipal refuse incinerators.

As an outcome of his intimate acquaintance with these technical questions, Mr. Eddy has been retained on many

Harrison P. Eddy, M.E.I.C.

important court cases and his services have been in demand on many engineer commissions, including the Engineering Board of Review of Chicago, working on the lake-lowering controversy and the programme of remedial measures. Still another commission on which he served had to do with the general plan, design, construction and operation of the sewage treatment plant of the North Toronto District, and on the sewage disposal problem of the entire city of Toronto. Among the projects on which he is now engaged are the sewerage problems for the District of Columbia in the east and for the city of Portland, Ore., in the west. At the present time he is a member of the Technical Board of Review which is advising the Public Works Administration in Washington with respect to applications for Federal aid in carrying out those of its projects which are unusual and of a controversial nature.

In spite of his otherwise busy life Mr. Eddy has found time to devote to technical writing, and is widely known as the co-author of a standard work on American Sewerage Practice and on Sewerage and Sewage Disposal. Many technical papers and reports also have appeared under his name. The quality of this work is attested by the award of the Desmond FitzGerald Medal from the Boston Society of Civil Engineers, and that of the Rudolph Hering Medal and the Norman Medal from the American Society of Civil Engineers, the latter the highest literary distinction in the profession.

### Committee on Low Water Level in St. Lawrence River

A committee of engineers to inquire into the cause of the low water level that has existed in the St. Lawrence river channel from Montreal downstream in recent years, and to report upon action necessary in order to correct the situation, has been appointed by the Canadian government. The low level during the late fall in 1933 seriously hampered navigation in Montreal harbour.

The committee composed entirely of engineers in the federal government service is as follows: N. B. McLean, M.E.I.C., chief engineer of the St. Lawrence Ship Channel division of the Department of Marine, Ottawa (chairman); A. Laflèche, A.M.E.I.C., assistant chief engineer of the division; F. Anderson, M.E.I.C., director, hydrographic survey; K. M. Cameron, M.E.I.C., chief engineer, Department of Public Works, Ottawa; J. L. Dansereau, A.M.E.I.C., district engineer, Montreal; J. T. Johnston, M.E.I.C., director, Dominion Water Power and Hydrometric Bureau, Ottawa, and D. W. McLachlan, M.E.I.C., chief engineer, St. Lawrence Waterways and Hudson Bay Terminals, Department of Railways and Canals, Ottawa.

## BOOK REVIEWS

### Air Conditioning

*By J. A. Moyer and R. U. Fitz, McGraw-Hill Book Company Inc., New York, 1933. 6 by 9¼ inches, 390 pp. Figs., tables. $4.00. Cloth.*

Reviewed by G. Lorne Wiggs, A.M.E.I.C.*

In this book the authors have covered clearly and comprehensively the broad subject of air conditioning for industrial processes and human comfort. The work is replete with design data, charts, illustrations and examples of design calculations.

The first portion of the book is devoted to the underlying principles of air conditioning and ventilation. As the authors point out in the preface, a great deal of the data from the research work of the American Society of Heating and Ventilating Engineers and from other sources has been drawn on and included in this portion of their book.

The subject of air filters and dust removal has been well treated in a chapter devoted to that subject.

A large portion of the book covers the use of refrigeration in connection with air conditioning. This includes not only the properties of refrigerants and the different types of refrigerating equipment, including the new steam-jet type, but it also covers air-cooling by means of ice and such adsorption substances as silica-gel, activated alumina and calcium chloride.

Temperature and humidity control equipment is clearly described, while the design of temperature and humidity control systems is well covered.

The illustrative design calculations of an air conditioning system for twelve floors and the basement of a bank and office building are given. The calculations for a theatre, having a seating capacity of three thousand people, are shown in the same way, while an example of the air conditioning of a restaurant seating about seven hundred people is also included.

The details of the application of air conditioning to food factories and textile mills are given. The different methods of air conditioning railway passenger cars are also described.

Finally, the author deals with the subjects of air conditioning for residences and residence heating with refrigeration equipment.

The book is recommended to those interested in air conditioning and especially to those engineers engaged in the design of air conditioning systems.

*Consulting engineer, Montreal.*

## Practical Designing in Reinforced Concrete

*By M. T. Cantell, E. and F. N. Spon Ltd., London, England, 1933. Part II. 5½ by 8¾ inches, figs., tables, photos. 12/6 net. Cloth.*
Reviewed by VERNON R. DAVIES, A.M.E.I.C.*

This is the second volume to appear of what is to be a three-volume work on reinforced concrete designing. The book is printed in very excellent type on high grade paper. It is well printed and illustrated, containing two hundred and nineteen figures, of which only fifty are photographs. The book is arranged in headings and sub-headings without any chapter or section numbers. The index is not as comprehensive as one would wish.

A short notice of Part I states it to be a description of reinforced concrete and its suitability for various kinds of structures, together with examples worked out in detail for all types of beams, floors and columns. Part II appears to be a further development of some of the topics treated in Part I, together with some new items, such as retaining walls, safety vaults, roofs, water tanks, bins, silos, conduits, underground reservoirs, foundations and combined footings.

In the preface it is stated that Part III will contain articles in earthquake resistance, tall chimneys, dams, arches, bridges, conduits and domes.

In the preface the author points out that advanced mathematics are avoided, and graphical solutions are included in many examples to assist in elucidation and simplification of the problems.

One may raise the objection that the treatment of the various topics is rather too elementary. In many of the subjects treated a more generalized treatment could quite easily have been given without the use of advanced mathematics. It may be noted that fifteen examples are worked out for continuous beams, but in every one a constant moment of inertia has been assumed throughout all the spans. This is not usually the case in practice. In another example, when discussing a hollow circular column, the author states that, as the load is within the middle third of the diameter, there will be no tension at the section. For the particular ratio of outer and inner radii in his examples, he is right, but he should have informed his readers that for a solid circular section the kern diameter is one quarter of the outer diameter and for a thin cylindrical shell the kern diameter is one half of the outer diameter. He might also have stated that the kern radius is equal to one third the outer radius only when the ratio of outer and inner radii is equal to 3 and that the middle third rule is for solid rectangles and squares only.

The author has evidently kept in mind the needs of the beginner, as for example, when he devotes half a page to the discussion of elementary hydrostatic principles. His discussion of the wind stresses in tall buildings is empirical, but probably quite adequate for most ordinary situations. A larger number of charts or tables might with advantage have been provided in the book as aids in calculations.

The book can be recommended as a collection of examples for the use of beginners in the study of reinforced concrete structures.

*Structural and hydraulic engineer, Montreal.*

## BULLETINS*

*Steel Scaffolding*—A 16-page booklet received from the Steel Scaffolding Company Limited, London, England, illustrates the use of, and details of construction of tubular steel scaffolding which is recommended as having greater strength, safety, durability, efficiency, and is cheaper than anything of its kind on the market.

*Centrifugal Pumps*—The Worthington Pump and Machinery Corporation, Harrison, N.J., have issued a 4-page folder describing the Worthington Type U.B., two-stage volute centrifugal pumps, and including details of specifications and a list of parts.

*Compressors*—An 8-page bulletin published by the Worthington Pump and Machinery Corporation, Harrison, N.J., describes and illustrates the Worthington single horizontal, single stage, steam and motor driven compressors. Diagrams show the details of construction and advantageous features of the units, also specifications of the various sizes made are included.

*Couplings*—A 2-page leaflet issued by the Dominion Engineering Company, Ltd., Montreal, illustrates Dominion gearflex couplings, small series, shaft sizes 1, 1½ and 2 inches.

*Rotary Pumps*—Roots-Connersville Blower Corporation, Connersville, Ind., have issued a 4-page folder on their cycloidal rotary pumps which are built on the two-impeller principle, with two or three lobe impellers depending on the type of service to which they are to be applied. They are principally for heavy duty service.

*Sheet Piling*—A 2-page leaflet received from the Canadian Sheet Piling Company Ltd., Montreal, illustrates the use of steel sheet piling in the reconstruction of the Fish Quay, Torquay, England.

*Pavements*—The Portland Cement Association have issued a 20-page booklet containing particulars based on a survey of concrete resurface projects. It includes table giving recommended thickness and design for varying conditions of traffic and support.

*Cementation*—A 122-page book received from the François Cementation Company Ltd., Bentley Works, Doncaster, England, gives particulars and examples of work carried on by this company in the injection of a liquid mixture of cement, sometimes spoken of as grouting, into cavities, fissures, etc., thereby strengthening and consolidating the strata of structures so treated. A number of special features are claimed for this process such as, the mixture being moved directly by a pump piston and not through the use of compressed air; the pressure of injection is recorded on hydraulic pressure gauges and is kept under strict observation, the position of the cement tanks and pumps may be hundreds of feet away from the point of application.

** Copies of the bulletins listed above are usually available upon request to the companies concerned.*

## A.S.T.M. Regional Meeting in Washington, D.C.

A symposium on the Outdoor Weathering of Metals and Metallic Coatings will be the technical feature of the 1934 A.S.T.M. Regional Meeting, to be held on March 7th, in Washington, D.C.

The A.S.T.M. committees are sponsoring a number of important test programmes, involving atmospheric corrosion, liquid corrosion, galvanic and electrolytic corrosion, etc., and their standardization work on specifications and test methods has met definite needs on the part of industry.

This problem of outdoor weathering is one of the most difficult ones with which technical men and engineers must contend.

## Business Training for Engineers at McGill University

The Corporation of McGill University at a recent meeting received a memorandum from Dean E. Brown, M.E.I.C., of the Faculty of Engineering, who discussed the problem faced by his faculty in correlating the studies of engineering students with the more practical aspects of their work with which they are faced after graduation. He explained that engineering law and general economics had been a regular part of the engineering course for many years, but that recently an attempt had been made to extend the general training.

A course of lectures on the general history of science is now included in the first year curriculum, which is designed mainly to show that all the sciences are interrelated and interdependent. In the second year a similar course, called "Engineering Reports," is given, this being mainly a general training in English; and public speaking and a general course on economic aspects of engineering have been included in the third year, but are optional. In the fourth year, the most recent innovation is an optional course of weekly lectures by practising engineers and business men, which, as will be noted from the following programme, is diverse, and the results are being followed with great interest: October 16th-23rd—Engineering and the Social Sciences, Professor L. C. Marsh, The Social Research Council; October 30th—Engineering and Banking, Major S. C. Norsworthy, Bank of Montreal; November 6th, 13th—Engineering and Insurance, George B. Foster, K.C., Travelers Insurance Company; November 20th-27th—Engineering and Labour, Mr. Tom Moore, Trades and Labour Congress of Canada; December 4th-11th—Engineering and Trade, Mr. W. H. Munro, M.E.I.C., Ottawa Light, Heat and Power Company; January 25th-February 1st—Engineering and Safety, Mr. W. G. H. Cam, M.E.I.C., Canada Cement Company; February 8th,—Engineering and the Federal Departments, Mr. J. B. Challies, M.E.I.C., Shawinigan Water and Power Company; February 15th—Engineering and Public Health, Mr. T. J. Lafreniere, M.E.I.C., Provincial Board of Health; February 22nd-March 1st—Engineering and Architecture, Professor Ramsay Traquair, School of Architecture, McGill University; March 8th-15th—Engineering and Economics, Mr. S. W. Fairweather, Bureau of Economics, Canadian National Railways; March 22nd-29th—Engineering and the Professional Societies, Mr. R. J. Durley, M.E.I.C., Engineering Institute of Canada.

In January, 1934, the *Dominion Engineering Company Limited* presented the first issue of The Dominion Engineer, which is to be published each month. It is to contain articles of general interest regarding mechanical equipment for various purposes, and articles of a technical nature indicating modern engineering trends, and will also include items concerning the products and shop facilities of both the company and its associates. The first issue is a 12-page booklet, which contains a number of excellent illustrations, and short informative articles.

*The Hamilton Gear and Machine Company* of Toronto is now represented in British Columbia by the B.C. Conveying Machinery Company, 422 Shelly Building, Vancouver.

# BRANCH NEWS

## Border Cities Branch

*C. F. Davison, A.M.E.I.C., Secretary-Treasurer.*

"The Diesel and High Speed Engines" was the subject of an address given by Boyd Candlish, A.M.E.I.C., to the members of the Border Cities Branch and their friends at a dinner meeting held in the Prince Edward hotel, on Friday evening, January 12th, 1934.

### The Diesel and High Speed Engines

Comparing the European and American types of automobiles the speaker pointed out that the relatively high fuel mileage obtained from the former was due probably to the higher cost of fuel and taxes which had led to the development of cars equipped with motors of lesser horsepower and higher thermal efficiency. The American type of car was sold on a basis of rapid acceleration and was equipped with an engine capable of driving the car at speeds far in excess of the legal limit. The load factor of the English car is 35 to 40 per cent, while that of the American is but 15 to 25 per cent.

Modern motor car engines are of high mechanical efficiency. The rolling friction of the car itself is small, the greater portion of the power generated being used to overcome wind resistance and to operate the accessories such as the generator and fan. At high speeds the fan may consume from 5 to 15 h.p. and this at a time when the air pressure on the radiator is such that a fan is scarcely required. However, in so far as the engines themselves were concerned, the increase in overall efficiency must be obtained by increasing the thermal efficiency.

Higher thermal efficiencies may be obtained by using higher compression ratios. This ratio, however, is limited in the case of the gasoline to 8:1, while the Diesel engine operates on ratios exceeding 10:1. By means of diagrams, it was shown that compared to the maximum possible efficiency for any one compression ratio, the average American motor car engine does not give the best efficiency for the compression ratios now in use. For highest efficiency, engines should be designed for specific fuels. In the case of the gasoline engine the thermal efficiency drops rapidly as the load decreases.

Mr. Candlish predicted that a properly stream-lined car with a well-designed engine would operate at a speed of 50 miles per hour on a full consumption of 35 to 40 miles per gallon. At a speed of 30 miles per hour, 70 miles per gallon of fuel should be obtained.

Passing to Diesel engines, Mr. Candlish noted that in order to have a yardstick with which to measure performance it was necessary to discuss the advantages and disadvantages of internal combustion engines in general. If the Diesel engine had no other advantage than that of operating on a cheaper fuel, it would soon lose this advantage were it to displace the gasoline engine. The comparative prices of fuel were largely due to supply and demand, and if Diesel engines were applied to automobiles, fuel oil would soon be at a premium and a tax on fuel oil would replace the present tax on gasoline.

The Diesel engine has however several inherent advantages. Since the air and gas are not compressed together, a higher compression ratio may be obtained without danger of pre-ignition. It will develop a high efficiency over a wide range of load and speed. Further, it is subject to less trouble from carbon and will run for longer periods without overhaul.

The time elapsing between ignition and the complete combustion of the charge, termed the "delay period," was shorter in the case of the Diesel than the gasoline engine which enables it to operate satisfactorily at any speed from 300 to 3,000 r.p.m. The maximum speed is governed by the dynamic loading due to heavy rotating parts rather than by thermal considerations. The disadvantages of the Diesel engine lay in the difficulties of design to overcome stresses at higher temperatures and in its greater weight per h.p. developed. The limit for engines of 1,500 feet per minute piston speed is about 15 h.p. per cylinder.

The speaker sketched the development of the Diesel engine and compared the various types and their application. The supremacy of the gasoline engine for eight passenger automobiles is not likely to be challenged but the Diesel will probably be more widely adopted for heavy bus and truck service.

The Diesel engine is rapidly supplanting steam power in railway locomotives for light and fast service. The overall efficiency of about 35 per cent for the Diesel as against 6 per cent for the steam locomotive is the deciding factor. The Diesel also finds application in marine service, though its use will be limited to boats of less than 8,000 tons displacement as where great power is required the number of cylinders and hence the number of units required becomes excessive. Diesel engines are used in aircraft. The lesser weight of fuel required with the more efficient Diesel engine more than offsets its heavier weight for long distance service.

Mr. Candlish also referred to the hydrogen engine now being developed and indicated that this engine was of great interest to Canadians. Off-peak electric power at low rates may be used for the electrolysis of water. The oxygen may be sold for industrial purposes while the hydrogen may be used to develop power at a cost equivalent to gasoline at 3 cents per gallon. The off-peak electric power available in eastern Canada would produce hydrogen equivalent in power to that of about one billion gallons of gasoline per year.

The speaker closed his address with a brief reference to the latest type of gasoline engine in which the fuel is injected into the cylinder in a manner similar to Diesel practice.

A lively discussion followed the presentation of the paper, and Mr. Candlish displayed his thorough knowledge of the subject in replying to many questions.

A hearty vote of thanks was proposed by J. E. Porter, A.M.E.I.C., and seconded by W. H. Baltzell, M.E.I.C.

## Calgary Branch

*J. Dow, M.E.I.C., Secretary-Treasurer.*
*H. W. Tooker, A.M.E.I.C., Branch News Editor.*

Thursday evening, January 11th, 1934, was the occasion of a most interesting address on the "Big Bend Highway" given to the members of the Calgary Branch of The Institute and their friends by J. M. Wardle, M.E.I.C., chief engineer of the Dominion National Parks Branch.

### Big Bend Highway

During the course of his introductory remarks, Mr. Wardle mentioned that he was a member of the Ottawa Branch, and took this opportunity of extending the greetings of that Branch to the members of the Calgary Branch.

Before presenting the three reels of motion pictures depicting the roughness of the country through which the highway travels, the nature of the construction, the many difficulties to be overcome, the methods employed in constructing this portion of the trans-Canada highway, and the different types of powered machinery used, Mr. Wardle explained that the Big Bend highway was that portion of the trans-Canada highway from Golden to Revelstoke, and followed the Columbia river between these two points around the Big Bend or most northerly point of that river, and was the last link of the highway to be completed, as it is already completed westerly as far as Golden and easterly from Vancouver as far as Revelstoke. He also explained how this portion of the highway, when completed, would be of great importance to tourist traffic, as it will open up an altogether new section of the country, mentioning the fact that tourists seldom care to make the return journey by exactly the same road by which they come.

The speaker went on to say that the Dominion government is constructing the eastern leg of the highway from Donald to the top of the Bend or most northerly point known as Boat Encampment, a distance of 78 miles, of which 60 miles was already constructed and 45 miles surfaced. The British Columbia government is constructing the western leg from Revelstoke to the top of the Bend, a distance of 100 miles, 40 miles of which is already completed, making that portion of the trans-Canada highway known as the Big Bend highway 178 miles long, and although efforts had been made to keep the maximum grade down to 6 per cent, the steepest grade was 8½ per cent.

Besides the motion pictures depicting the many details of this particular piece of work and the many labour-saving devices used in its construction, Mr. Wardle showed by means of lantern slides the details and type of bridge construction and the many difficulties to be overcome in this connection.

Following Mr. Wardle's address, a very interesting discussion took place, after which a hearty vote of thanks was given the speaker by R. S. Trowsdale, A.M.E.I.C.

The meeting adjourned at 10 o'clock p.m.

## Edmonton Branch

*R. M. Hardy, S.E.I.C., Secretary-Treasurer.*

The third dinner and meeting for the season 1933-34 was held in the Corona hotel on January 9th, 1934. R. M. Dingwall, A.M.E.I.C., the Branch chairman, presided.

### Television and the Sending of Pictures by Wire

Mr. A. M. Mitchell, Comptroller of the Alberta Government Telephones, presented a paper entitled: "Television and the Sending of Pictures by Wire."

Mr. Mitchell first dealt with the transmission of pictures by wire. He pointed out that there are four distinct steps in the process. First, the picture must be "scanned" and transferred into a series of light impulses. Second, the light must be converted into electrical energy. Third, these electrical impulses must be transmitted over the wires and received at the other end. Fourth, the electrical energy received must be converted into light again and allowed to act on a photographic plate to reproduce the original picture.

Mr. Mitchell with the help of a very excellent set of slides described in detail the technical features of each of these stages and illustrated the apparatus in current use.

Then turning to the subject of television, Mr. Mitchell stated that the problem here was essentially the same as that of sending pictures by wire. There are several practical difficulties, however, which complicate the problem of television over that of sending the picture by wire. The problems of static and of synchronizing the equipment at the sending and receiving ends present the most serious difficulties.

Mr. Mitchell went on to say that while there were several systems of television in the experimental stages he would confine his remarks to the system developed by the Bell Telephone Company of New York.

The speaker then explained the principles and apparatus used in this system illustrating his remarks with numerous slides. At the transmitting end the object to be photographed is seated before a scanning disc behind which is a powerful source of light. The scanning disc is covered with a spirally arranged set of small holes, so placed that when the disc revolves, in a period of a fraction of a second, a powerful ray of light has illuminated every point of the object to be "televised." As these light rays illuminate the object they are reflected and picked up by a set of photo-electric cells which generate an electric current varying in intensity with the intensity of the light picked up. The photo-electric cells constitute a "light microphone." These electrical impulses are then amplified and transmitted by an ordinary radio transmitter.

At the receiving end the problem is to pick up these electrical impulses and convert them back to light impulses and direct these so that they produce an image of the original object. This is accomplished as follows: the signals are picked up and amplified and then allowed to act on a neon gas lamp. The neon gas glows with an intensity varying with the intensity of current flowing through it. The light from the neon lamp illuminates a small screen (about 2 inches by 2½ inches), through a scanning disc exactly the same as that used at the sending end. If the two scanning discs are in synchronism the transmitted light rays from holes of the scanning disc at the sending end will pass through the corresponding holes of the disc at the receiving end, and an image of the "televised" object will be seen on the small screen.

In practice three transmitters are used; one for transmitting the picture, one for the speech or music accompanying it and one for the synchronizing signal of the sending and receiving apparatus.

A short discussion followed the presentation of the paper. During the discussion it was brought out that some experimenters have replaced the scanning discs with cathode ray tubes, and others with banks of neon gas tubes. It was also pointed out that television transmitters require a very wide wave band.

## Hamilton Branch

*Alex. Love, A.M.E.I.C., Secretary-Treasurer.*
*V. S. Thompson, A.M.E.I.C., Branch News Editor.*

The Hamilton Branch, Engineering Institute of Canada, met in the Science Hall, McMaster University, on the evening of Tuesday, January 9th, 1934. The annual business meeting of the Branch preceded an address by Mr. R. A. Cline, equipment engineer of the Bell Telephone Company, Toronto, on "the Teletypewriter."

H. B. Stuart, A.M.E.I.C., chairman of the Branch, presided over a gathering of members and friends numbering 50, and after hearing reports from the various committees, and election of Branch Nominating committee, he introduced new members to the Branch. The Executive having been re-elected, there were no formalities of handing over, so the business session was very brief.

W. J. W. Reid, A.M.E.I.C., then introduced the speaker of the evening.

### The Teletypewriter

Mr. Cline first of all showed on the screen diagrams of the mechanical and electrical intricacies of the teletypewriter. Referring to the practice of leasing private telephone wires, he said that these are used in combination with both key and sounder types of transmitters as well as with the more modern teletypewriter. It is possible to use such lines for ordinary telephone conversations at the same time by means of filters at each end. This entails extra equipment at the telephone stations to overcome the distortion consequent on dual use, but even this is far less expensive than multiplication of lines. There are two common types of teletypewriter, namely those which print on a page similar to the ordinary typewriter, and those printing on a strip or tape, the latter of course, being similar in principle to the broker's "ticker."

For long distance transmission it is frequently necessary to eliminate intermediate stations and by a selector calling system, the operator can dial any station or series of stations.

The speaker outlined the chief applications of the teletypewriter under the following headings:—

(1) Press dispatches.
(2) Commercial orders, messages, etc.
(3) Police orders and information.
(4) Weather reports for airports.
(5) Any case where verbal instructions from distant points would be dangerous if misunderstood.

In connection with the fourth item, the latest development is the transmission of complete weather maps which are typed with special symbols on previously printed forms, giving pilots far more comprehensive information than any descriptive matter.

It is obvious that any matter typed on previously printed forms must be exactly spaced, and so in these cases the form is ratchet fed in the manner of a moving picture film. A development of the press service is a teletypewriter combined with the linotype machine so that news dispatches are set up in type as they come in over the wire.

At the close of the lecture, Mr. Cline gave an interesting demonstration on a complete sending and receiving unit which had been set up in the lecture room. These machines had the covers removed so that the moving parts could be clearly seen. The speaker answered a great many questions which were asked by the interested spectators.

Mr. Stuart, on behalf of the Hamilton Branch, thanked Mr. Cline for the very interesting paper and demonstration, after which the meeting adjourned to a neighbouring room where refreshments were served.

### The Ontario Research Foundation

The February meeting of the Hamilton Branch happened to fall on a very cold night, which possibly accounted for a smaller attendance than usual (45), but those who braved the elements were amply repaid for their efforts.

H. B. Stuart, A.M.E.I.C., the chairman of the Branch, in his opening remarks gave his impressions of the Annual Meeting of The Institute in Montreal. He said it was the busiest two days' convention that he had ever attended—the business being of a very serious nature and the technical papers being most interesting, not only for the papers themselves but for the many points raised in the discussion. He also brought a message of greeting from the retiring President, Dr. O. O. Lefebvre, M.E.I.C., who had visited the Branch last November.

F. W. Paulin, M.E.I.C., in a short talk, told of the excellent work done by two of our local members, J. B. Carswell, M.E.I.C., and W. D. Black, M.E.I.C., and how their addresses at the Annual Meeting had aroused much favourable comment. He also told of the tribute paid to the engineering profession by the Premier, Rt. Hon. R. B. Bennett. Mr. Paulin claimed that The Institute would thrive and prosper if members of the engineering profession continued to take the interest in current conditions that they are showing at the present time.

In connection with the subject of the evening's address Mr. Stuart read a resolution passed in 1919 by the local Branch, urging the Federal government to establish a Research Institute.

Mr. J. G. Morrow, metallurgist of the Steel Company of Canada, in introducing the speaker of the evening, referred to his long happy association with Dr. Ellis. He mentioned the fact that the Research Bureau in Ottawa had unfortunately spent a lot of money on a beautiful building and now in these times found itself restricted in its usefulness by shortage of funds. The Ontario Research Foundation was not in the same position, fortunately, and was doing a very useful work. "No one doubts the value of research in lowering the costs of production," he said in conclusion.

The speaker of the evening was Dr. O. W. Ellis, Director of Metallurgical Research, Ontario Research Foundation: Chairman of the Ontario Section, American Society of Mechanical Engineers, and former Professor of Metallurgy at the University of Toronto.

He first explained how the Foundation was started under the direction of Hon. Howard Ferguson, the original intention being that the government donation of $1,000,000 should be duplicated by contributions from industry. Actually the latter subscribed about $2,500,000, so the government increased its share to the same amount, making an endowment of $5,000,000. The speaker stressed the fact that since its inception the Foundation has paid its way without additional cost to the public. Among the diverse subjects investigated by the Foundation for the benefit of the province at large are the lignite and iron ore deposits. It has been established that the latter will probably never be of any practical use, at least for low temperature processes of reduction.

Considerable work has been done for agriculture, important results having been obtained in the elimination of contagious abortion among cattle. The speaker gave a detailed account of an inquiry into a disease causing death among geese. Investigation showed that the cause was a small parasite which attached itself to the digestive canal. These parasites, or flukes, were living in the bodies of snails and tadpoles which had been eaten by the geese. In the geese they produced organisms which bore to the original the same proportion as an elephant to a man. The organisms were prevented from thriving, or even existing in pond water by adding a solution of copper sulphate to the water.

Dr. Ellis caused some amusement by describing a possible cure for baldness which had developed from an investigation which required the injection of diphtheria antitoxin into rabbits. It is found that the shaved portion around the injection grew hair very rapidly, but the speaker's appearance showed that the cure was still in the laboratory stage.

The speaker described the work done in the textile department in testing certain fabrics used in automobile upholstery. He also devoted some time to the work of his own particular department, metallurgy. Numerous slides were shown of micro-photographs demonstrating how the structure of steel varies with the cooling rate. He also told of an investigation into change of structure in drop forgings.

W. J. W. Reid, A.M.E.I.C., proposed a vote of thanks which was enthusiastically endorsed by those present.

H. W. Powell, chairman of the Hamilton Chemical Association, brought a message of goodwill from his association and invited the engineers to attend an interesting meeting on the 21st.

Refreshments were served in the laboratory at the close of the meeting.

## Lethbridge Branch

*E. A. Lawrence, S.E.I.C., Secretary-Treasurer.*
*A. Meldrum, A.M.E.I.C., Branch News Editor.*

The Lethbridge Branch, Engineering Institute of Canada, held a meeting in the Marquis hotel on Saturday, February 17th, 1934. The meeting took the form of a ladies' night, at which the wives and lady friends of the members, also several visitors from the Crows Nest Pass, were present. During the dinner, the "Studio Trio," consisting of Gordon Henderson, 'cellist, Allan Murray, violinist, and K. A. Maclure, pianist, rendered a fine selection of music.

Following the dinner, J. Haimes, A.M.E.I.C., chairman, on behalf of the Branch welcomed the ladies and visitors. G. S. Brown, who was in charge of the musical programme, led the community singing. Mr. Wm. Meldrum delighted the audience with two outstanding vocal selections accompanied by Alan Meldrum. Mrs. Wm. Meldrum's beautiful contralto voice was heard to advantage in two lovely numbers accompanied by Mr. Meldrum.

After a brief intermission, the gathering re-assembled in the dining-room where a six-reel film showing the process of the manufacture of cloth from cotton was projected on the screen. The picture was a presentation of the Dominion Textile Company Limited. It compared the present procedure of spinning and weaving to the old methods. Modern factories contain about 40,000 spindles in one room, in the neighbourhood of 1,000 being in the care of one spinner. Under the old system, one spindle was in the care of one spinner. Modern factories employ as many as 7,000 workers.

After going through various cleaning, spinning, and weaving processes, the cotton emerges in the form of grey cloth which is sent to a finishing plant to be used in the manufacture of oil cloth, auto tops, slickers, rubber boots, etc.

If the cloth is to be coloured for dress material, etc., it is bleached, washed and dried. The design, drawn by a staff of artists, is etched onto a zinc plate and transferred to a copper roller. The material passes over several of these rollers, each of which produces its particular colour design.

At the conclusion of the showing of the film, Mr. Haimes tendered the thanks of the Branch to Mr. Cyril Watson for operating the projector. Those present then repaired to the mezzanine floor of the hotel where bridge was enjoyed, following which refreshments were served.

## London Branch

*H. A. McKay, A.M.E.I.C., Secretary-Treasurer.*
*J. R. Rostron, A.M.E.I.C., Branch News Editor.*

The annual dinner meeting of the Branch was held on January 17th, 1934, at the Highland Golf Club.

The chairman of the Branch, V. A. McKillop, A.M.E.I.C., presided, and the speaker of the evening was Brig.-General J. M. Ross, C.M.G., D.S.O., V.D.

About 35 members and guests were present at the dinner, which was much enjoyed, community singing being indulged in at intervals.

After the dinner, the Chairman welcomed the guests and then called upon Major W. M. Veitch, A.M.E.I.C., M.I.C.E., to introduce the speaker. In the course of his remarks Major Veitch gave an outline of the military career of General Ross up to the time of his recent appointment to the command of Military District No. 1 with headquarters in London, Ontario. Following this he referred to the illness of the now late Major-General Armstrong who was the immediate predecessor of General Ross in the same command, and said how sorry all those present were to hear of his sickness. He made a motion, which was adopted, that a message of sympathy coupled with sincere wishes for his speedy recovery be sent to him. General Armstrong had been at the last annual meeting and had then announced, to the regret of the members, his projected retirement.

General Ross opened by stating that he did not claim to be a speaker nor to be able to make a speech and did not intend to try it. He did not know under what delusion Mr. McKillop was labouring when he finally persuaded him to give the boys a talk. Therefore all that he was going to do was to tell a few stories of his personal experiences under fire in the Boer War and the Great War. The General then proceeded to relate several exciting incidents in his military career, which were heard with much interest.

Subsequent to the General's talk the chairman invited all the non-members to retire to the lounge and smoking room where cards and music were provided.

The business of the evening was then proceeded with, the first items being the reading of the Secretary's and Auditor's reports, both of which were passed and adopted.

The election of officers for the ensuing year then took place.

Music, which was much enjoyed, was provided by Murray Dillon at the piano and an orchestra composed of several of his friends. After the business was transacted the members joined the guests and a very enjoyable evening was spent by all.

## Moncton Branch

*V. C. Blackett, A.M.E.I.C., Secretary-Treasurer.*

A special meeting of the Branch was held on January 29th, 1934, for the purpose of discussing proposed amendments to Institute By-laws and making recommendations to the forthcoming Annual Meeting. Professor H. W. McKiel, M.E.I.C., chairman of the Branch, presided.

Only sections dealing with membership grades and qualifications were dealt with. The general feeling of the meeting was against merging the present corporate membership grades. Several speakers argued that engineers who had attained a certain degree of eminence in the profession were entitled to the distinction which the present grade of member conferred. Furthermore the higher fees paid by members was worthy of consideration and much needed revenue would be lost if the proposed amendment was adopted.

Taking up the matter of qualifications for membership and combining the views of the meeting on grades and qualifications, the following resolution was moved by J. G. Mackinnon, A.M.E.I.C.:—

> "That this Branch do strongly oppose any change being made in the present grading of Institute Members; further, that in the opinion of this Branch the time has come when admission to corporate membership in The Institute should be limited to those applicants who are graduates in engineering of some University recognized by the Council of The Institute, or who possess an education equivalent to that required for university graduation."

In speaking to the motion, Mr. Mackinnon declared conditions in the profession had changed. Rule of thumb methods had given way to exact scientific investigation. The young engineer of today had little hope of success unless he was university trained. Engineering prestige would tremendously increase with insistence on college graduation. The speaker expressed the hope that he would live to see the day when he would be regarded by the public as a man who had a profession and not merely as one holding a job.

In answer to an objection as to the effect on relations between The Institute and the provincial associations should the resolution be adopted, the chairman explained that similar provisions had already been adopted by the Nova Scotia and Quebec Associations. The New Brunswick Association had approved the principle but had not as yet demanded university qualifications as prerequisite for membership.

Mr. Mackinnon's resolution was put and carried unanimously.

## Niagara Peninsula Branch

*P. A. Dewey, A.M.E.I.C., Secretary-Treasurer.*

A. W. F. McQueen, A.M.E.I.C., was the speaker at a dinner meeting held on January 19th, 1934, at Niagara Falls. The subject was "India," and Mr. McQueen described a trip to the native State of Bhopal, made together with H. G. Acres, M.E.I.C., for the purpose of investigating hydro-electric possibilities.

The State of Bhopal, said Mr. McQueen, lies almost in the geographical centre of India, with an area of 6,900 square miles and a population of three-quarters of a million. Some seventy per cent of this population are agriculturalists who are still using the primitive methods of their forefathers. Holdings are small, taxes are heavy, and consequently the farmers are extremely poor.

In Bhopal State the average farm-holding is about 5 acres. The main crops are wheat, millet, cotton and oil seeds. With the present low world prices, 5 acres of land sown to wheat will return to the farmer the money equivalent of about $16.00. Land taxation, which is the principal source of governmental revenue in India, will probably absorb some $5.50 of this amount, thus leaving the farmer with a net return of approximately $10.50 for his season's work.

Nawab Mahomed Hamidulla Khan, the present ruler of Bhopal, is a comparatively young man, imbued with the spirit of modern progress and believes that a fuller development of the resources of his state, both human and natural, may be materially aided by a programme of industrialization.

That there is a market for certain classes of cheaper goods cannot be denied. At present considerable quantities of cheap cotton piece goods and such articles as rubber shoes are being imported, mainly from Japan. A good pair of Japanese tennis shoes can be purchased in Bhopal for only 70 cents and this type of shoe is used extensively by the natives.

The first element in a programme of industrialization is, of course, the provision of a supply of cheap power. With this end in view five hydro-electric sites were examined by Mr. Acres and Mr. McQueen. The annual monsoon rainfall in the state varies from 29 to 60 inches and most of the streams are somewhat flashy, but storage areas are available and some of these sites are undoubtedly capable of economic development. The dams would be constructed of stone masonry which is cheaper than concrete under the local conditions of material and labour.

Labour is cheap and consequently competes strongly with any attempt at bringing in modern machinery. Masons are paid 41 cents, carpenters 36½ cents, labourers 14 cents and women 9 cents a day.

Mr. McQueen's address was illustrated with moving pictures showing native scenes in and around Bhopal; elephants fording streams accompanied by automobiles, native women carrying water from the wells for the purpose of making water-bound macadam roads and farmers ploughing their worked-out soil with oxen and wooden ploughs.

An interesting discussion followed the address and then W. R. Manock, A.M.E.I.C., chairman, conveyed the sincere thanks of the Branch to the speaker for a very pleasant evening.

## Ottawa Branch

*F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.*

Major D. L. McKeand of the Department of the Interior, spoke at the noon luncheon of January 11th, 1934, at the Chateau Laurier on the subject of "The Eastern Arctic Patrol—1933." Major McKeand is the Assistant Director of the Northwest Territories and Yukon Branch and was commissioned under the Great Seal of Canada as representative of the government in the Northern Archipelago, having made several inspection trips during the past few years.

Group Captain E. W. Stedman, M.E.I.C., chairman of the local Branch, presided at the luncheon, and in addition head table guests included: Honourable Thomas G. Murphy, H. H. Rowatt, Ralph Parsons, Doctor Harold McGill, Doctor George S. Williamson, J. Lorne Turner, R. A. Gibson, Lieut.-Col. W. A. Steel, A.M.E.I.C., Doctor R. W. Boyle, M.E.I.C., Noulan Cauchon, A.M.E.I.C., C. McL. Pitts, A.M.E.I.C., J. L. Rannie, M.E.I.C., L. Sherwood, M.E.I.C., K. M. Cameron, M.E.I.C., and R. J. Fraser.

### Eastern Arctic Patrol—1933

Major McKeand, at the commencement of his address, stated that interest in the northern islands of Canada and in the Northwest Territories generally has increased greatly of late years. Not a small portion of this interest, he stated, has been occasioned by the prominence given to this section of Canada in the Saturday evening radio broadcasts by the Canadian Radio Commission to those resident in these outlying points.

The Department of the Interior annually sends an expedition into the eastern portion of the Arctic islands for the purpose of maintaining Royal Canadian Mounted Police posts, looking after the health and well-being of the natives, undertaking certain scientific investigations, and in general patrolling the area and maintaining the sovereignty of the Canadian government. In this work a number of the other departments of the Federal service co-operate in so far as they are concerned.

Major McKeand described in detail the course of the itinerary of the 1933 patrol. The ship was the "Nascopie" belonging to the Hudson Bay Company. It sailed from Montreal on July 8th and returned to St. Johns, Newfoundland, on September 27th, having covered over 12,000 miles, the longest trip ever undertaken on these annual patrols. The ship, in the course of this patrol, visited points in Hudson and James Bays, including Charlton Island only some 500 miles north of Toronto. The northmost point of the patrol was Robertson Bay, Greenland, situated 50 geographical miles south of Etah, and approximately 724 nautical miles from the North Pole.

In commenting upon the information secured by the Department of the Interior, Major McKeand stated that the administrative survey revealed, generally speaking, that the health of the population has been good. The fur catch, however, for the past season was rather poor and this with the low price of pelts has caused some hardship.

Fortunately, seal and walrus, on which the Eskimos largely depend for food for themselves and their dogs and also to some extent for clothing, were fairly abundant. Walrus were caught much further south in Hudson Bay than usual.

To assist in preventing undue hardship, the Department of the Interior distributed 10,500 pounds of dried buffalo meat, part of the product of the annual slaughter of surplus animals at Buffalo National Park, Wainright, Alberta. As an experiment, five hundred green buffalo hides from the same source were distributed to those looking after Eskimo relief at the various posts. They were for issue to those natives who had an inadequate supply of caribou skins or other bedding.

This year the scientific features of the expedition were more prominent than ever before. Geological examinations were made in areas of the south shore of Hudson Strait and near Cape Smith on the east side of Hudson Bay. A representative of the Department of Marine inspected the stations of the meteorological service at seven different points and new stations were installed at Coral Harbour, at Southampton Island, and at Clyde river, Baffin Island. Much valuable information was obtained regarding topography and climate and a number of special observations were made during the voyage, particularly regarding optical phenomena. A parasitological survey was inaugurated, a pioneer effort on this continent, and a new branch of scientific investigation from the world's standpoint.

Major McKeand paid a high tribute to Doctor M. O. Malte who conducted botanical research which was, unfortunately, terminated at Charlton Island by his lamented illness and subsequent death. The work which Doctor Malte had done on this and previous occasions in the north will undoubtedly prove of great value for further botanical studies in the future.

### Annual Branch Meeting

The twenty-fourth Annual Meeting of the Ottawa Branch of The Engineering Institute of Canada was held at Standish Hall, Hull, on the evening of January 11th, 1934. About eighty members were present, the retiring Chairman, Group-Captain E. W. Stedman, M.E.I.C., presiding. In the unavoidable absence of F. C. C. Lynch, A.M.E.I.C., secretary, Mr. R. K. Odell acted as secretary.

The chairman, in presenting his address, reviewed the activities of the Branch for the past year. Although Ottawa was feeling the effect of reductions in staff of the various government departments and also of reductions in pay for the remaining personnel, there has been no serious loss in membership, the attendance at Branch activities has been good, and the financial position has been satisfactory. The slight reduction in membership, a total of 405 compared with 415 a year ago, should be more than made up with the turn of conditions for the better. It was to be feared that some who had dropped out of The Institute did not realize the importance of having a Dominion-wide organization of engineers in an age when extensive organization has become the basis of all professions. One instance alone of the value of such an organization was the work done for unemployed engineers throughout the Dominion.

The chairman also expressed the feeling that the younger members of The Institute could participate more actively in the Branch proceedings and suggested that some steps should be taken to encourage them in the contribution of papers.

With regard to finances, two abnormal expenditures were incurred during the year, namely, the expenses of the Annual Meeting of The Institute which was held at Ottawa in February, and the contribution to the special Plenary Meeting of the Council at Montreal in November.

Sixteen luncheon meetings and two evening meetings were held by the Branch with an average attendance slightly greater than that of the previous year. Social functions consisted of a dinner dance at the Chateau Laurier on December 15th which some 175 members and friends attended.

The Aeronautic Section, affiliated with the Branch, had a very active year, one gratifying feature of which was the increase in the number of Branch members taking an active interest in it. This Section, with J. H. Parkin, M.E.I.C., as chairman, and Alan Ferrier, A.M.E.I.C., as secretary, held eight meetings in all during the year. At these meetings professional papers were read and technical demonstrations given, relating to the science of aeronautics.

One of the very important activities of the Branch was the work of the Special Committee on Unemployment. Under the chairmanship of G. J. Desbarats, M.E.I.C., this committee has done exceptional service in connection with the Relief Camps of the Departments of Labour and National Defence. Although opportunities for appointments in the Ottawa District were not great, Mr. Desbarats utilized them to the utmost, doing everything possible at all times to put the right man in the right place.

During the year, The Institute, and particularly the Ottawa Branch, suffered severe loss in the passing of two of its members, A. M. Grant, M.E.I.C., who died on January 19th, 1933, and Mr. O. Higman, a life member, who died on November 8th.

Mention was also made by the Chairman of the kind and gracious support and publicity received during the year from the three local newspapers, the *Ottawa Citizen*, the *Ottawa Journal* and *Le Droit*.

Following the Chairman's address, reports were presented from the Secretary-Treasurer, and from regular committees with chairmen as follows:

| | |
|---|---|
| Proceedings | E. Viens, M.E.I.C. |
| Membership | W. F. M. Bryce, A.M.E.I.C. |
| Employment | G. J. Desbarats, M.E.I.C. |
| Advertising | J. G. MacPhail, M.E.I.C. |
| Rooms and Library, Branch By-laws and Reception | W. S. Kidd, A.M.E.I.C. |
| Aeronautic Section | Dr. J. H. Parkin, M.E.I.C. |
| Dinner Dance | Group Captain E. W. Stedman, M.E.I.C. |

The financial statement, according to the Secretary-Treasurer, showed that the assets of the Branch were $1,665.06, a decrease of $285.01 from last year. The Branch also passed a motion to continue the policy of donating prizes to the Ottawa and Hull Technical Schools for competition among the students.

## Quebec Branch

*Jules Joyal, A.M.E.I.C., Secretary-Treasurer.*

On January 15th, 1934, a well-attended luncheon meeting was held by the Quebec Branch at the Chateau Frontenac. The speaker, Lieutenant-Colonel J. B. Dunbar, A.M.E.I.C., District Engineer Officer, Department of National Defence, delivered a brief but very interesting paper on "Road Making by Hand Methods Using an Asphaltic Emulsion."

Mr. Dunbar was introduced by the chairman, Hector Cimon, M.E.I.C., and J. A. Duchastel, M.E.I.C., moved a vote of thanks, to which a hearty response was made by all present.

### Road Making by Hand Methods, Using an Asphaltic Emulsion

About a year ago, the Canadian government decided to open at Valcartier, Que., a concentration camp for about 1,700 single, unemployed, homeless men. This decision was in accordance with the general policy of establishing such camps at various places in Canada and having them administered by the Department of National Defence.

One requirement at Valcartier was the construction of dust-proof roadways within the camp limits, and in accordance with the policy decided upon for all works, the use of machinery was to be kept to a minimum and hand labour employed to the greatest extent. Another governing factor was that all costs, including material used in all works, must not exceed the sum of $1.00 per head per day.

The Terolas, which is an emulsion of asphalt produced in Canada by Colas Road Ltd., was used as a binder for the aggregate available on the spot which is sand.

Each batch of mixture was made up of three wheel-barrow loads of material excavated from the shoulders mixed by hand with 43 pounds of Terolas and approximately 30 pounds of water: the result was 6¾ cubic feet to one batch or four batches per cubic yard.

After mixing was completed, the material was wheeled, shoveled on to the sub-grade and spread by hand rakes to approximately ½ inch more than the final thickness of 3 inches and to the correct camber of ¼ inch per foot; then the wooden screeds were brought into use followed as closely as possible by a small roller weighing 400 pounds which was drawn to and fro by ropes from both sides of the road. Immediately following the small roller, a larger roller weighing 4 tons which was pushed and pulled by from twenty-seven to fifty-four men, was used to give final finish to the base-course.

One cubic yard of the above mixture supplied material for 10 square yards of the base-course of roadway.

In applying the armour coat, Terolas was sprayed on the base-course surface at a rate of ¼ gallon per square yard and covered immediately with ¾-inch crushed gravel in sufficient quantity to fill any slight depression and to provide a one stone thickness. This course was well rolled and broom dragged to obtain a smooth surface; then more Terolas was applied at the rate of ¼ gallon per square yard and covered with ⅜-inch crushed gravel at approximately 20 pounds per square yard; then this was rolled.

Owing to the limiting factors already mentioned and to improvised plant, progress was slow but the average rate of construction was 555.5 square yards of finished road per day costing $0.3937 per square yard.

The above described method of road construction was used during the summer 1933 on about 1,600 lineal yards of 20-foot pavement and 1,400 lineal yards of 16-foot pavement.

## Saint John Branch

*Sidney Hogg, A.M.E.I.C., Secretary-Treasurer.*
*Charles M. Hare, S.E.I.C., Branch News Editor.*

Continuing the policy of fostering closer co-operation between The Engineering Institute of Canada and the Provincial Association, the Saint John Branch sponsored a dinner meeting held in the Admiral Beatty hotel on January 25th, 1934. At 7 p.m., sixty members of the Provincial Association and The Engineering Institute of Canada, along with several distinguished guests, sat down to dinner, presided over by G. A. Vandervoort, A.M.E.I.C., chairman of the Saint John Branch.

Following the toast to the King, G. C. Torrens, A.M.E.I.C., proposed a toast to the Association of Professional Engineers, and spoke of the value of organization both to the engineers themselves and to the public. J. D. Garey, A.M.E.I.C., responded briefly, characterizing engineers as men of action rather than words.

Mr. Vandervoort proposed the toast to The Engineering Institute of Canada and stated that in the future, engineers must play a more prominent part in the economic and financial life of the country. Engineers had taken the guesswork out of production and were, in fact, blamed to quite an extent for the present conditions, because of the developments of mechanism. This charge was unfair. It is distribution that is at fault. If the engineer was going to protect the good he had done he would have to take a hand in removing the guesswork from distribution.

"Through the ages the different civilizations have been benefited by the creative builders who to day would be called engineers," said W. J. Johnston, A.M.E.I.C., responding, and he next referred to advances in transportation and communications made by engineers.

John N. Flood, A.M.E.I.C., proposed the "toast to our guests," welcoming those present who were not engineers.

Replying to this, Brigadier J. L. R. Parsons, officer commanding District No. 7, during the course of his remarks gave some facts about the relief camps in the province. There were now 500 men in the camp in Sunbury county, the morale of the men in the camps was excellent and all seemed content with the treatment they were receiving. The life they were leading and the mild discipline imposed on them were good for them both morally and physically. Nine graduate engineers are at present employed as foremen and squad bosses in the relief camps of New Brunswick.

Responding to the same toast, D. B. Rogers spoke appreciatively of the important contribution which engineering had made to the newspaper profession, particularly in the development of mechanical equipment and lines of communication.

On completion of the toast list, moving pictures of the latest type of snow-ploughing apparatus were shown through the courtesy of J. T. Turnbull, A.M.E.I.C., district highway engineer, who explained the films. Snow removal work in New Brunswick, Mr. Turnbull observed, was as yet very limited. He briefly outlined the technique of snow removal.

### The Task of Economics

Professor B. S. Kierstead, B.A., guest speaker, spoke on "The Task of Economics." Acceptance of the inevitable, sitting back and taking things as they come, he contended, would only mean more frequent and more serious depressions in the future. The world might withstand another depression, or perhaps several more, but sooner or later collapse of the present social system would come unless something was done to forestall it, he asserted. "It is said of the British that they 'muddle through'," Professor Kierstead observed. Great Britain never muddled through. She got where she is by hard clear thinking and courageous action. Great Britain has never muddled through any major crisis and will not muddle through this crisis.

The first job of the economist was the job of convincing people that the economist knew what he was talking about. Economic or social order had run afoul, and haphazard policy, attempted in ignorance of real economic knowledge, would not prove a successful remedy.

It may be true, he said, that we are emerging from the depression. but this is not due to our efforts but to the natural swing of the business cycle.

The speaker went on to say that the problems of the world were becoming more difficult and without clear thinking and definite action, depressions would be more frequent and more severe in the future. In former times depression was famine. Engineers had learned to make things so well that to day there was no longer any problem of famine, but a problem of distribution. Depressions today are as normal as good times, and they are a normal period recurring every eight or ten years.

There was one point on which practically all economists agreed, the causes of depression, which could be placed under three heads, political causes, industrial causes and financial causes. The disagreement concerned the respective importance of the causes, and which should be tackled first. In his opinion this was to do the job which was most expedient first, then go on to the others.

Professor Kierstead then referred to the different factors in moulding public opinion, expressing the belief that the press in many instances had failed to live up to its responsibility as a moulder of public opinion on economic matters. As an example of misdirected guidance he referred to the attitude of a large section of the United States press in insisting on the exaction of the last dollar of war debts, despite the obvious effect of such a policy in promoting stagnation and disruption.

In contrast he mentioned the part which many Canadian newspapers had played in conscientiously preparing the public for acceptance of the idea of a central bank for Canada—a very essential and practical step toward the solution of a definite Canadian problem.

The press can and does exert a predominating influence, he said, but in order to be effective it must be backed up by an enlightened and intelligent public opinion.

A vote of thanks to the speaker was moved by Captain W. H. Blake, A.M.E.I.C., and seconded by G. G. Murdoch, M.E.I.C.

## Sault Ste. Marie Branch

*G. H. E. Dennison, A.M.E.I.C., Secretary-Treasurer.*

"Theory and Application of the Use of Orifices for Industrial Flow Measurements" was the subject of an address before the Sault Ste. Marie Branch by Mr. O. Brauns on January 26th, 1934, following the regular monthly dinner at the Windsor hotel.

After touching briefly on other methods of flow measurement, Mr. Brauns took up in detail the orifice method. He developed the fundamental formulae involved and proceeded with the theory of orifice design, discussing the influencing factors. Following a mathematical discussion of the various orifice discharge coefficients Mr. Brauns described their practical application in the orifice constant $c$, a function of the diameter ratio $d/D$.

The quantity of fluid passing through an orifice is directly proportional to the square root of the pressure differential caused by the orifice and Mr. Brauns indicated by drawings and exhibits how this pressure differential is obtained and recorded in typical installations.

The immense importance of accurate flow measurements was stressed by Mr. Brauns in closing his address. First from the standpoint of process requirements where quantities must be definitely known or where a continuous record of flow will indicate certain results achieved and second in distributing charges correctly for steam water or fluid to various plant equipment or processes. Steam flow measurements has been one of the most important uses of orifice type meters where a complete record of the amount of steam generated in each unit of a plant is essential to an intelligent understanding of the efficiencies being obtained and where, for accounting purposes, the distribution of this steam should be definitely known. In one local plant some thirty steam flow meters are in use to measure and record the use each day of over one thousand dollars worth of steam.

The meeting was presided over by E. M. MacQuarrie, A.M.E.I.C., chairman of the Branch, and the balance of the business carried over from the annual meeting was disposed of. The financial report for 1933 was read and adopted on motion of Messrs. H. F. Bennett, A.M.E.I.C., and L. R. Brown, A.M.E.I.C. A report by C. H. E. Rounthwaite, A.M.E.I.C., chairman of the Committee on Legislation and Remuneration, was adopted on motion of Messrs. A. H. Russell, A.M.E.I.C., and Carl Stenbol, M.E.I.C.

## Toronto Branch

*W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.*
*O. Holden, A.M.E.I.C., Branch News Editor.*

On November 2nd, 1933, a very interesting paper entitled "The Relation of Certain Chemical and Physical Characteristics of Cements to the Qualities of Concrete" was presented at the regular meeting of the Toronto Branch by Mr. W. J. D. Reed-Lewis, consulting engineer on Portland cement and formerly superintending engineer of the Super Cement Company, Detroit, Michigan.

Mr. Reed-Lewis opened his remarks with a brief summary of the essential raw materials used in the manufacture of cement, and a description of various methods of manufacture and types of cement plants.

The speaker then gave a technical description of the chemical reactions which occur during the manufacture and hydration of cement, and the effect that compounds formed by these reactions have upon the ultimate character of the concrete. As some compounds impart undesirable properties to the concrete, attention must be given to the chemical composition of the cement, so that these undesirable properties may be controlled. Methods of computing from the chemical composition of the cement, the potential constitution in terms of kiln materials in the clinker, and the ultimate hydrous compounds in the cement were outlined by the speaker.

Cements high in tri-calcium silicate impart to the concrete high strengths at early ages, but excessive volume changes due to high setting temperatures may result. Concretes made from cements high in di-calcium silicate gain strength slowly, but they are more resistant to disintegration as there is less free lime present. Since 1900 there had been a general trend toward cements having high percentages of tri-calcium silicate, but in recent years more attention has been given to obtaining a balanced proportion of the two silicates, so that advantages of each may be realized.

The rate of hydration of cement is largely dependent upon the fineness of the particles. Pulverizing stimulates the reaction with water, but the limit to which cement particles may advantageously be reduced in size depends upon the chemical composition.

Existing specifications limit the residue on a No. 200 mesh sieve (nominal diameter 74 microns), but as particles larger than 40 microns are practically inert and the bulk of the active particles are smaller than 30 microns, any study of cement grinding must consider sub-sieve sizes.

Tests made by separating cements into sub-sieve sizes and recombining them into cements of synthetic fineness have disclosed many interesting features. It has been found that the rate of hydration bears a definite relation to the particle size. Particles of 75 microns diameter are only 18 per cent hydrated after twenty-eight days, while particles of 7 microns diameter are 62 per cent hydrated in twenty-four hours.

A yardstick of the fineness of cements ground in the mill may be obtained by a summation of the products obtained by multiplying the percentage of each size fraction by the reciprocal of its mean effective diameter. This has been termed the coefficient of effective fineness, or "C.E.F." Tests show that there is a straight line relation between the C.E.F. and the degree to which the cement is hydrated at various ages, and hence to the compressive strength of concrete.

The speaker concluded his remarks by referring to the methods used for controlling the grinding to give a desired grading of effective sizes in the manufacture of cements.

The meeting was adjourned after a discussion of the paper and a vote of thanks extended to the speaker on behalf of those present.

### Planning Towards Economic Recovery

On Thursday evening, January 18th, 1934, members of the Toronto Branch convened in the Debates room at Hart House, following an informal dinner in the Common room. The meeting was addressed by Professor Gilbert E. Jackson, B.A. (Cambridge), Professor of Political Economy, University of Toronto. The speaker, who was introduced by Professor T. R. Loudon, M.E.I.C., gave a most interesting and instructive address on the subject of "Planning Towards Economic Recovery." He also extended to members of The Institute a cordial invitation to co-operate with the Canadian Political Science Association in the study of economic problems. The meeting was very ably presided over by Archie B. Crealock, A.M.E.I.C.

In introducing his subject, Professor Jackson pointed out that in planning for economic recovery, Canadians had to choose one of two alternative methods. One was the method adopted by the United States, and the other that pursued by Great Britain.

It is a well-known fact that by lavish government expenditures, prosperity can be created. The world-wide prosperity of the war period was perhaps the most recent large-scale example of this principle. Such expenditures called for heavy budgetary deficits requiring the floating of large government loans, possibly at unfavourable interest rates. The fear of uncontrolled inflation made it difficult to obtain money except on short-term securities.

This method, however, had the disadvantage of greatly increasing the governmental obligations, and was bound eventually to react somewhat unpleasantly through higher tax levies. It was likened to the administration of a highly potent stimulant, which, although it may carry the patient over a serious crisis, might result in an uncomfortable aftermath. Owing to the delay in taking action in the United States (March 4th, 1933), conditions there had become so acute that of the two methods available, the one adopted was perhaps the most suitable under the existing circumstances.

In Great Britain, a more gradual, but nevertheless equally effective, method had been adopted much earlier in the depression period (September, 1931), at which time she was forced to relinquish the gold standard. Great Britain's policy was to first form a national government which, by drastic economy and increased taxation, succeeded in balancing the budget. The burden of interest on government bonds was materially lessened by refunding the war loans through the issuance of low-interest-bearing bonds.

This low interest rate on government securities, coupled with an easy credit policy, led to an abundance of money in the hands of private investors seeking investment in industry and in public works. This "easy-money" condition was well known through many precedents to gradually bring about a healthy form of prosperity. By virtue of getting an early start, Great Britain was enabled to employ this method with advantage, and the results to date, while not as spectacular as those obtained over a relatively short period in the United States, offer ample proof of its effectiveness. It had the added advantage of not leaving an aftermath of huge public debts as a burden to posterity.

After setting forth the characteristics of the two recovery processes, the speaker pointed out that either might serve equally well in the case of Canada, and that it behooved Canadians to decide which they would choose. To take no positive steps of either kind toward recovery would be to prolong unnecessarily the suffering due to the existing industrial stagnation.

In conclusion, the speaker drew attention to the fact that the durable goods industries had suffered more than others in the depression. Since this is the branch of industry in which engineers are chiefly employed, it was to their interest to co-operate as far as possible in the study of economic problems.

In reply to an inquiry as to how much Canada would have to spend to carry out a programme similar to that to be presently undertaken by the United States, Professor Jackson estimated that, in proportion to the population, Canada would have to undertake some $850,000,000 of new expenditures to parallel the $10,000,000,000 appropriation of the United States.

Following a further brief discussion, Professor T. R. Loudon strongly recommended that arrangements be made for a joint meeting of the Canadian Political Science Association and The Engineering Institute of Canada, to be attended by members resident in Toronto and in the adjacent districts. The Chairman then called for a vote on Professor Loudon's recommendation. The meeting was unanimously in favour of such a meeting, and it was understood that the Branch executive would make the necessary arrangements.

A. U. Sanderson, A.M.E.I.C., moved a vote of thanks to the speaker of the evening, to which a hearty response was made by all present.

## Winnipeg Branch

*E. W. M. James, A.M.E.I.C., Secretary-Treasurer.*
*E. V. Caton, M.E.I.C., Branch News Editor.*

On Thursday evening, January 4th, 1934,at the regular meeting of the Winnipeg Branch of The Engineering Institute of Canada, presided over by Professor G. H. Herriot, M.E.I.C., chairman, Mr. R. D. Colquette, Associate Editor of *The Country Guide*, gave an address on "Iron Debts and Rubber Dollars."

### Iron Debts and Rubber Dollars

The speaker stated that advances in the development of the machinery of production had outstripped the development of machinery for the exchange of goods after they had been produced. A time lag was natural since production precedes distribution and the lag had been accentuated by the terrific rate at which production had been increased during the last half century. The credit for the rapid improvement in productive processes, he said, must go chiefly to the engineering professions and they had a right to ask why millions of workers were deprived of the opportunity of supplying themselves not only with the improvements of modern science, but also with the sheer necessities of existence. The trouble lay, he claimed, not in the fields of production, transportation or distribution of goods, but in the realm of finance. The present depression had been precipitated by the stock market crash. It would probably not have lasted more than 18 months if it had not been accompanied by a fall of about one-third in the price level of all commodities and a much greater fall in the price received for primary products.

The speaker traced the history of price levels showing that after the Napoleonic war they fluctuated downward until 1850 when new supplies of gold from California and Australia increased the world's monetary gold stocks with the resulting rise in price levels which continued until 1873. A similar rise began in the middle 90's when, after the trend of prices had been downward for nearly 25 years, monetary gold stocks were increased by the introduction of the cyanide process in the Rand and the opening of the new gold field in the Yukon.

The fall in prices since 1929, said the speaker, was chiefly the result of the return of industrial countries to the gold standard. When France returned in 1928 the scramble for gold began. Monetary gold stocks were barely sufficient to maintain pre-war price levels. Since the price of gold was fixed in gold standard countries it could not rise and the effect of the increased demand for gold had to be reflected in the fall of commodity prices. He supported the idea of inflating back the price level of the 20's and outlined two proposals for stabilizing prices at that level. One proposal advanced by Keynes would divorce the currency from gold reserves and maintain prices by altering the price of gold. The other proposal advanced by Fisher, would maintain a fixed purchasing power for the dollar by altering the amount of gold it contained. Stable prices, he said, would not be a panacea for all our economic ills except in the sense that a panacea was one of several different remedies all of which would have to be applied.

A very active discussion took place at the end of the meeting and a hearty vote of thanks was tendered to the speaker for his interesting address.

## The Nickel Industry in 1933

Robert C. Stanley, president of The International Nickel Company of Canada Limited, in a year-end analysis of the nickel market for 1933 discloses the profound changes which the depression has wrought in the industrial attitude towards better materials, better performance and lower ultimate costs.

World consumption of nickel in all forms for the first ten months of 1933 was 77,609,280 pounds as compared with slightly more than 49,500,000 pounds in the same period of 1932 and with the 112,481,600 pounds of the corresponding part of the peak year, 1929.

Although commanding increasing importance as an alloying element in combination with ferrous and other non-ferrous metals, the variety of uses for pure nickel continues to widen. Pure nickel for coinage is growing in popularity, and in radio tube manufacture, the consumption was approximately twice that of last year. These include grid glow tubes, photo-sensitive tubes, various types of rectifiers and ubes for use in control of spot welding machinery. In the chlorinationt process of oil refining a leading company has replaced its old equipment of lead-coated steel with tanks of pure nickel. Pure nickel tubing offered to industry has also helped to maintain a market.

Nickel-clad steel plate consisting of a solid layer of pure rolled nickel permanently bonded to a heavier layer of steel provides high resistance to corrosion with great structural strength and relatively low cost. Introduced in 1931, one of its most recent applications is in steam locomotive fireboxes where both corrosion and stress are factors.

Of the non-ferrous nickel alloys, monel metal has retained its position as a leading white metal alloy. Seamless and welded monel metal tubing have been used to replace piping of older and softer materials. In the breweries it is finding a number of uses, such as for filter screens, pump rods, continuous coolers and the like. The household field continued to provide an important outlet for this alloy. A spectacular use of monel metal during the year was for both shafts and propellers of Gar Wood's "Miss America X." In the marine field, new shipbuilding programmes are requiring considerable tonnage of this alloy for valve trim, pump rods and liners, turbine blades, propellers and propeller shafting, galley sinks and dresser tops. It has been adopted for important structural parts of seaplanes, which are exposed to the action of salt water.

The successful experience with monel metal forgings in the Panama canal for such parts as gate and valve equipment has led to its adoption for similar parts for Madden dam and Boulder dam. It has been possible to furnish this material in large shafts with a minimum breaking strength of 90,000 pounds per square inch, a minimum yield point of 70,000 pounds per square inch, elongation in two inches of 20 per cent to 30 per cent, and a reduction in area of 20 per cent to 50 per cent.

Inconel (80 per cent nickel) introduced two years ago as Inco Chrome Nickel, primarily for dairy equipment, has already found important applications in a dozen other fields. It is available in sheets, rods, seamless tubes, wires and other forms required by industry.

Its most recent form of commercial production is as Inconel-clad steel which, like nickel clad steel, is the permanent bonding of a tough layer of tarnish and corrosion resisting white metal with the cheaper strength of steel.

With monel metal and pure nickel, Inconel enjoys a wide use in chemical, textile dyeing, food process plants, and in brewing, wine making and distilling.

Solid nickel silvers (5 per cent to 30 per cent nickel) are available in many castings for architectural trim, plumbing fixtures and certain classes of food handling equipment. A wide range in colour, hardness and melting point can be obtained by appropriate changes in the composition of the alloy. Also extruded sections of complicated shapes are now being produced.

Nickel brass and bronze (½ per cent to 8 per cent nickel) due to engineering requirements for higher physical properties in readily castable bronzes have led to the introduction of nickel to obtain the desired results.

A copper-nickel-tin bronze, containing approximately 8 per cent nickel, has been developed. It is responsive to heat treatment and, remaining tough, develops an elastic limit of some 55,000 pounds per square inch.

Nickel in bearing metals (½ per cent to 2 per cent nickel) as the copper-lead bearing alloys frequently contain a small amount of nickel properly to disperse the lead. A bearing metal consisting of cadmium hardened by the addition of approximately 2 per cent of nickel has been devised recently.

In cupro-nickel alloys (15 per cent to 50 per cent nickel) tests and service behaviour continue to favour tubes of 20 per cent to 30 per cent nickel content for condensers and heat exchangers handling corrosive substances.

With nickel in ferrous alloys, nickel alloy steels (¼ per cent to 12 per cent nickel) developments during the year indicate the important markets for these steels are ship-building and the attention given to revolutionary changes in the design of passenger trains.

There has been an increase in the tonnage of heat resisting alloys produced this year over that of 1932. This is due both to installation of new equipment and to replacement of inferior alloys.

It has also been established experimentally that nickel within the range of ¼ per cent to 1 per cent is a powerful agent for conferring toughness at temperatures slightly below freezing point of the metal, particularly with steels containing more than 0.25 per cent carbon.

In stainless steels (7 per cent to 35 per cent nickel) the outstanding feature was the growing recognition of its structural qualities for such uses as aircraft frames and wing construction.

Also much of the experimentation with light-weight, high-speed trains is in terms of stainless steel construction; and naval architects are now turning to this alloy for masts, funnels and superstructures of new ships.

The largest application of the year was in the brewery business, for barrels, fermentation tanks and other equipment..

In the classification of nickel cast irons (½ per cent to 5 per cent nickel) the outstanding application has been a nickel-chromium-molybdenum composition grain roll for hot rolling of metals. This possesses greater strength, more uniform structure, and greater wear resistance than compositions formerly used; it also resists the cracking tendency due to the high temperatures of service. Also, every automobile body builder in the United States is now using heat treated nickel-chromium cast iron dies.

Another development has been the extended production of a nickel-chromium type of malleable cast iron. This material has a strength approximately 75 per cent to 80 per cent greater than that of regular malleable iron, and in addition has a higher degree of hardness, which ensures considerably better resistance to wear and abrasion.

Alloy cast iron up to 3 per cent nickel is being used extensively for the brake drums of heavy duty trucks and buses. A foundry making castings for two car builders has increased the nickel content from 0.1 per cent to 0.15 per cent in its Mayari mix for cylinder block and cylinder head castings.

The greatest development in nickel cast irons however, is through the expanding applications for three special compositions—Ni-Resist for resistance to corrosion and to heat particularly in the chemical industry, marine, railroad, automotive and airplane fields for pumps, valves, sleeves, pistons, etc. Ni-Hard for resistance to wear and abrasion particularly for chilled rolls for both hot and cold rolling of sheet metals; for mining and the processing of cement, ore, coal and limestone. In the ceramic, glass and abrasive industries it is used for Muller tires, dies, grinding pans, screens and so forth. Ni-Tensyliron to meet the demand for greater strength. This, the most recent of the three special nickel alloy cast irons to be developed, is being used by foundries to provide products which can successfully compete with other materials to which simple cast iron had been losing business. A manufacturing advantage is that this alloy can be efficiently produced from a regular malleable iron base mixture.

## The Commissioning of the King George V Graving Dock, Southampton

The King George V Graving Dock at Southampton, which was formally opened by H.M. the King on July 26th, 1933, was utilized for the first time recently, when the White Star liner *Majestic* of 56,598 tons, was taken in for overhaul. The vessel was towed towards the gate by six tugs and was then drawn to its final position by winches, the operation occupying about an hour. After closing the gates pumping out was begun, the equipment for this purpose consisting of four 54-inch centrifugal pumps, which will empty the content of 250,000 tons in about four hours. A full description of the dock appeared in our issue of June 30th, 1933, but it may be recalled that it has an effective length of 1,200 feet, is 135 feet wide at the entrance and 165 feet wide at cope level. The depths over the sill and over the keel blocks are 47 feet and 45 feet, respectively, at high water ordinary neap tides. The gate is of the sliding caisson type, and weighs 4,600 tons, including the water ballast; it is operated by a system of main and auxiliary motors with push-button control gear. The pumps are also electrically driven and are housed in a chamber 40 feet below ground level. They are operated by a single attendant from a control desk in the motor room, which is provided with a diagram of the pipe layout to show which pumps are working and which valves are open or closed.—*Engineering.*

# Preliminary Notice

## of Applications for Admission and for Transfer

February 22nd, 1934

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described in April, 1934.

R. J. Durley, Secretary.

* The professional requirements are as follows—

**A Member** shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

**An Associate Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

**The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.**

FOR ADMISSION

DuCHENE—ANDREW HUBERT, of 271 Sherbrooke Street, Peterborough, Ont., Born at Quebec, Que., Dec. 29th, 1907; Educ., B.Sc. (E.E.), Univ. of N.B., 1930; 1930 to date, asst. foreman on tests, Canadian General Electric Co. Ltd., Peterborough, Ont.

## New Brunswick Coal Output

During 1933 the coal production of the province of New Brunswick increased 59 per cent, and that province experienced the largest coal output in its history, according to figures submitted by W. E. McMullen, Inspector of Mines, in his annual report to the Minister of Lands and Mines.

The amount of coal produced in the Minto-Chipman area was 269,499 tons, or 100,000 tons greater than in 1932. Two causes contributed to this encouraging result, the report states.

First, the coal can be produced at lower cost than coals of the same grade coming from without the province, and secondly because all the principal operators have adopted methods for eliminating waste, screening and grading which give the customer a good article and retain his business. About 51 per cent of the coal production goes to the Canadian National and Canadian Pacific railways, 5 per cent is used in the New Brunswick Power Commission's plant at Grand Lake, and the balance of 44 per cent is principally used by industrials and institutional buildings.

Employment at the mines has been well maintained so that the six Minto companies alone have had an average of eight hundred and ninety-seven men throughout the year, and the mines of the Minto and Chipman region collectively now employ steadily about one thousand men.

## Planning a Better Country

For the first time in our national history, planning for physical, economic and social improvement is being made a prime object of study. An active and serious effort is being made to effect some degree of discipline in our heretofore uncoordinated programmes of developing and exploiting the land and natural resources of nation, region and state.

In several instances the potentialities of great regional areas, such as the Tennessee Valley, are under intensive study by specially designated authorities. More than half of the states have appointed planning boards to take the inventory of natural wealth, trends of industry and agriculture and population. The mere intention of introducing intelligent order in our national future is of itself an achievement of such great significance that it cannot be allowed to pass unnoticed. But the results of such studies, the proper balancing and coordinating of our manifold development activities, are capable of bringing more national happiness than any other programme in a generation. The task of appraising the present for the benefit of the future is the greatest challenge the expert planner has ever had presented to him.

—*Engineering News-Record.*

---

The Dominion Water Power and Hydrometric Bureau of the Department of the Interior of Canada has issued the annual review of hydro-electric and water-power development throughout the Dominion during the year 1933 which gives a brief description of those undertakings which were begun or which reached the developed stage during that period and of extensions and replacements in existing plants.

This discloses that while no new large water-power undertakings were begun in 1933, installations were completed and brought into operation amounting to 270,210 horse-power, so that the total of water-power developments installed in Canada at the end of 1933 amounts to 7,332,070 horse-power. The most notable and encouraging feature of the year has been the recovery in power demand and it is anticipated that the total production for the year will not be much short of 1930, the highest year of record.

## EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

*All correspondence should be addressed to*

**The Employment Service Bureau, The Engineering Institute of Canada**
**2050 Mansfield Street, Montreal**

## Situation Vacant

SALES ENGINEER. Well known firm wishes to make connection with a sales engineer familiar with air compressor and Diesel engine market. Please state former experience. Apply to Box No. 1002-V.

## Situations Wanted

MECHANICAL ENGINEER, Canadian, with technical training and executive experience in both Canadian and American industries, particularly plant layout, equipment, planning and production control methods, is open for employment with company desirous of improving manufacturing methods, lowering costs and preparing for business expansion. Apply to Box No. 35-W.

MECHANICAL ENGINEER, A.M.E.I.C. Married. Experience in machine shops, erection and maintenance of industrial plant mechanical and structural design. Reads German, French, Dutch and Spanish. Seeks any suitable position. Apply to Box No. 84-W.

YOUNG ENGINEER, B.A., B.Sc., A.M.E.I.C., R.P.E., Ont. Competent draughtsman and surveyor. Eight years experience including design, superintendence and layout of pulp and paper mills, hydro-electric projects and general construction. Limited experience in mechanical design and industrial plant maintenance. Apply to Box No. 150-W.

PURCHASING ENGINEER, graduate mechanical engineer, Canadian, married, 34 years of age, with 13 years' experience in the industrial field, including design, construction and operation, 8 years of which had to do with the development of specifications and ordering of equipment and materials for plant extensions and maintenance; one year engaged on sale of surplus construction equipment. Full details upon request. Apply to Box No. 161-W.

CIVIL ENGINEER, age 44, open for employment anywhere, experience covers about 20 years' active work, including 7 years on municipal engineering, 2 years as Town Manager, 3 years on railway construction, 3 years on the staff of a provincial highway department, 2 years as contractor's superintendent on pavement construction. Apply to Box No. 216-W.

REINFORCED CONCRETE ENGINEER, B.Sc., P.E.Q., eight years experience in construction design of industrial buildings, office buildings, apartment houses, etc. Age 30. Married. Apply to Box No. 257-W

MECHANICAL ENGINEER, B.Sc., McGill '19, A.M.E.I.C. Married. Twelve years experience including oil refinery power plant, structural and reinforced concrete design, factory maintenance, steam generation and distribution problems, heating and ventilating. Available at once. Location immaterial. Apply to Box No. 265-W.

ELECTRICAL ENGINEER, B.Sc., '28, Canadian. Age 25. Experience includes two summers with power company; thirteen months test course with C.G.E. Co.; telephone engineering, and the past thirty months with a large power company in operation and maintenance engineering. Location immaterial and available immediately. Apply to Box No. 266-W.

MECHANICAL ENGINEER, age 28, nine years all round experience, Grad. Inst. of Mech. Engs. England, E.E.I.C. Technical and practical training with first class English firm of general engineers; shop, foundry and drawing office experience in steam and Diesel engines, asphalt, concrete machinery, boilers, power plants, road rollers, etc. Experience in heating and ventilation design and equipment; 18 months designing draughtsman with Montreal consulting engineers. 2½ years sales experience, steam and hot water heating systems, power plant equipment, machinery, oil-burning apparatus. Canadian 4th class Marine Engineers Certificate; C.N.S. experience. Available at short notice. Apply to Box No. 270-W.

DESIGNING DRAUGHTSMAN, experience in layout of steam power house equipment and piping. Wide experience in mechanical drive and details of machinery, gearing, and hoists. Accustomed to layout of small mill buildings of steel and timber, structural design and details. Good references. Present location Montreal. Apply to Box No. 329-W.

PLANE-TABLE TOPOGRAPHER, B.Sc., in C.E. Thoroughly experienced in modern field mapping methods including ground control for aerial surveys. Fast and efficient in surveys for construction, hydro-electric and geological investigations. Apply to Box No. 431-W.

ELECTRICAL ENGINEER, B.Sc., A.M.E.I.C., Am.A.I.E.E., age 30, single. Eight years experience H.E. and steam power plants, substations, etc., shop layouts, steel and concrete design. Location immaterial. Available immediately. Apply to Box No. 435-W.

CIVIL ENGINEER, B.A.Sc., and C.E., A.M.E.I.C., age 30, married. Experience over the last ten years covers construction on hydro-electric and railway work as instrumentman and resident engineer. Also office work on teaching and design, investigations and hydraulic works, reinforced concrete, bridge foundations and caissons. Location immaterial. Available at once. Apply to Box No. 447-W.

## Situations Wanted

SALES ENGINEER, M.A.Sc. Univ. of Toronto, wishes to represent firm selling building products or other engineering commodities, as their representative in Western Canada. Located in Winnipeg. Apply to Box No. 467-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with six years experience in paper mill and hydro-electric work, desires position in western Canada. Capable of handling reinforced concrete and steel design, paper mill equipment and piping layout, estimates, field surveys, or acting as resident engineer on construction. Now on west coast and available at once. Apply to Box No. 482-W.

MECHANICAL ENGINEER, B.Sc. Age 28, married. Four and a half years on industrial plant maintenance and construction, including shop production work and pulp and paper mill control. Also two and a half years on structural steel and reinforced concrete design. Available at once. Apply to Box No. 521-W.

CIVIL ENGINEER, Canadian, married, twenty-five years' technical and executive experience, specialized knowledge of industrial housing problems and the administration of industrial towns, also town planning and municipal engineering, desires new connection. Available on reasonable notice. Personal interview sought. Apply to Box No. 544-W.

### Employment Service Bureau

This bureau is maintained by The Engineering Institute of Canada for the benefit of members and organizations employing technically trained men.

An enquiry addressed to 2050 Mansfield Street, Montreal, will bring full information concerning the services offered. Details can also be obtained from Branch secretaries who are located in the larger centres throughout Canada.

Brief announcements of men available and positions vacant will be published without charge in The Engineering Journal and the Bulletin. Replies addressed in care of the required box number will be forwarded to the advertiser without delay.

An additional service also offered those who are unemployed or wish to change their positions, is the opportunity of placing their names and records on file at 2050 Mansfield Street for consideration by employers wishing to employ engineers. This is of great assistance as many employers will not advertise or wish to locate a suitable man on short notice. If desired the information contained in these records can be kept confidential.

Forms for registration purposes may be obtained from The Institute Headquarters or Branch secretaries.

ELECTRICAL AND MECHANICAL ENGINEER, B.Sc., A.M.E.I.C. Experience includes C.G.E. Students Test Course and six years in engrg. dept. of same company on design of electrical equipment. Four summers as instrumentman on surveying and highway construction. Recently completed course in mechanical engineering. Available at once. Location preferred Ontario, Quebec, or Maritimes. Apply to Box No. 564-W.

CIVIL ENGINEER, age 25, single, graduate. Creditable record on responsible hydro and railroad work in both Eastern and Western Canada. Apply to Box No. 567-W.

MECHANICAL ENGINEER, A.M.E.I.C., with twenty years experience on mechanical and structural design, desires connection. Available at once. Apply to Box No. 571-W.

MECHANICAL ENGINEER, B.A.Sc., '30, desires position to gain experience, and which offers opportunity for advancement. Experience in pulp and paper mill and one year in mechanical department of large electrical company. Location immaterial. Available immediately. Apply to Box No. 577-W.

DOMINION LAND SURVEYOR, and graduate engineer with extensive experience on legal, topographic and plane-table surveys and field and office use of aero-photographs, desires employment either in Canada or abroad. Available at once. Apply to Box No. 589-W.

MECHANICAL ENGINEER, Canadian, technically trained; eighteen years experience as foreman, superintendent and engineer in manufacturing, repair work of all kinds, maintenance and special machinery building. Location immaterial. Available at once. Apply to Box No. 601-W.

CHEMICAL ENGINEER, S.E.I.C., B.Sc., University of Alberta, '30. Age 31. Single. Six seasons' practical laboratory experience, three as chief chemist and three as assistant chemist in cement plant; one year's p.g. work in physical chemistry; three years' experience teaching. Desires position in any industry with chemical control. Available immediately. Apply to Box No. 609-W.

## Situations Wanted

DESIGNING ENGINEER AND ESTIMATOR, grad. Univ. of Toronto in C.E., A.M.E.I.C., twenty years experience in structural steel, construction and municipal work. Available at once. Apply to Box No. 613-W.

CIVIL ENGINEER, A.M.E.I.C., R.P.E., Ontario; three years construction engineer on industrial plants; fourteen years in charge of construction of hydraulic power developments, tower lines, sub-stations, etc.; four years as executive in charge of construction and development of harbours, including railways, docks, warehouses, hydraulic dredging, land reclamation, etc. Apply to Box No 647-W

MECHANICAL ENGINEER, A.M.E.I.C., Canadian, technically trained; six years drawing office. Office experience, including general design and plant layout. Also two years general shop work, including machine, pattern and foundry experience, desires position with industrial firm in capacity of production engineer or estimator. Available on short notice. Apply to Box No. 676-W.

ELECTRICAL AND CIVIL ENGINEER, B.Sc., Elec., '29, B.Sc., Civil '33. Age 27. Jr.E.I.C. Undergraduate experience in surveying and concrete foundations; also four months with Canadian General Electric Co. Thirty-three months in engineering office of a large electrical manufacturing company since graduation. Good experience in layouts, switching diagrams, specifications and pricing. Best of references. Available immediately. Apply to Box No. 693-W.

MECHANICAL ENGINEER, B.Sc., '27, Jr.E.I.C. Four years maintenance of high speed Diesel engines units, 200 to 1,300 h.p. Also maintenance of D.C. and A.C. electrical systems and machinery. Draughting experience. Westinghouse apprenticeship course. Practical mechanical and electrical engineer with a special study of high speed Diesel engine design, application and operation. Location in western or eastern Canada immaterial. Apply to Box No. 703-W.

COMBUSTION ENGINEER, R.P.E., Manitoba, A.M.E.I.C. Wide experience with all classes of fuels. Expert designer and draughtsman on modern steam power plants. Experienced in publicity work. Well known throughout the west. Location, Winnipeg or the west. Available at once. Apply to Box No. 713-W.

ELECTRICAL ENGINEER, B.Sc., University of N.B., '31. Experience includes three months field work with Saint John Harbour Reconstruction. Apply to Box No. 722-W.

MECHANICAL ENGINEER, age 41, married. Eleven years designing experience with project of outstanding magnitude. Machinery layouts, checking, estimating and inspecting. Twelve years previous engineering, including draughting, machine shop and two years chemical laboratory. Highest references. Apply to Box No. 723-W.

CIVIL ENGINEER, B.Sc. (Alta. '31), S.E.I.C. Experience includes three seasons in charge of survey party. Transitman on railway maintenance, and concrete bridge designing Nature of work and location immaterial. Apply to Box No. 724-W.

YOUNG CIVIL ENGINEER, B.Sc. (Univ. of N.B. '31), with experience as rodman and checker on railroad construction, is open for a position. Apply to Box No. 728-W.

DESIGNING ENGINEER, M.Sc. (McGill Univ.), D.L.S., A.M.E.I.C., P.E.Q. Experience in design and construction of water power plants, transmission lines, field investigations of storage, hydraulic calculations and reports. Also paper mill construction, railways, highways, and in design and construction of bridges and buildings. Available at once. Apply to Box No. 729-W.

MECHANICAL ENGINEER, S.E.I.C., B.A.Sc., Univ. of B.C. '30. Single, age 24. Sixteen months with the Allis-Chalmers Mfg. Co. as student engineer. Experience includes foundry production, erection and operation of steam turbines, erection of hydraulic machinery, and testing texropes and centrifugal pumps. Location immaterial. Available at once. Apply to Box No. 735-W.

CIVIL ENGINEER, M.Sc., A.M.E.I.C., R.P.E. (Ont.), ten years experience in municipal and highway engineering. Read, write and talk French. Married. Served in France. Will go anywhere at any time. Experienced journalist. Apply to Box No. 737-W.

ELECTRICAL AND RADIO ENGINEER, B.Sc. '31, E.E.I.C. Age 25. Nine months experience on installation of power and lighting equipment. Eight months on extensive survey layouts. Two summers installing telephone equipment. Specialized in radio servicing and merchandising. Available at once. Location immaterial. Apply to Box No. 740-W.

CIVIL ENGINEER, graduate '29. Married. One year building construction, one year hydro-electric construction in South America, fourteen months resident engineer on road construction. Working knowledge of Spanish. Apply to Box No. 744-W.

SALES ENGINEER, B.Sc., McGill, 1923, A.M.E.I.C. Age 33. Married. Extensive experience in building construction. Thoroughly familiar with steel building products; last five years in charge of structural and reinforcing steel sales for company in New York state. Available at once. Located in Canada. Apply to Box No. 749-W.

DESIGNING ENGINEER, graduate Univ. Toronto '26. Thoroughly experienced in the design of a broad range of structures, desires responsible position. Apply to Box No. 761-W

## Situations Wanted

CIVIL ENGINEER, S.E.I.C., B.Sc. Queen's Univ '29. Age 25. Married. Three years experience as construction supt. and estimator for contracting firm. Experience includes general building, bridges, sewer work, concrete, boiler settings, sand blasting of bridges and spray painting. Available at once. Apply to Box No 776-W.

CIVIL ENGINEER, B.Sc., '25, Jr.E.I.C., P.E.Q., married. Desires position, preferably with construction firm. Experience includes railway, monument and mill building construction. Available immediately. Apply to Box No. 780-W.

DRAUGHTSMAN, experience in civil engineering, forestry engineering, land surveying and house construction. Good references. Apply to Box No. 781-W.

ELECTRICAL AND SALES ENGINEER, S.E.I.C., grad. '28. Experience includes one year test course, one year switchboard design and two years switchboard and switching equipment sales with large electrical manufacturing company. Three summers Pilot Officer with R.C.A.F. Available at once. Apply to Box No. 788-W.

ELECTRICAL ENGINEER. Specializing in power and illumination reports, estimates, appraisals, contracts and rates, plans and specifications for buildings. Available on interesting terms. Apply to Box No. 795-W.

CIVIL ENGINEER, S.E.I.C., graduate '30, age 23, single. Experience includes mining surveys, assistant on highway location and construction, and assistant on large construction work. Steel and concrete layout and design. Apply to Box No. 809-W.

CIVIL ENGINEER, college graduate, age 27, single. Experience includes surveying, draughting concrete construction and design, street paving both asphalt and concrete. Available at once; will consider anything and go anywhere. Apply to Box No. 816-W.

CIVIL ENGINEER, B.E. (Sask. Univ. '32), S.E.I.C. Single. Experience in city street improvements; sewer and water extensions. Good draughtsman. References. Available at once. Location immaterial. Apply to Box No. 818-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. (Queen's '32), age 21. Three summers surveying in northern Quebec. Interested in hydraulics and reinforced concrete. Available at once. Location immaterial. Apply to Box No. 822-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with fifteen years experience mostly in pulp and paper mill work, reinforced concrete and structural steel design, field surveys, layout of mechanical equipment, piping. Available at once. Apply to Box No. 825-W.

ELECTRICAL ENGINEER, S.E.I.C., grad. '29, age 24, married; experience includes one year Students Test Course, sixteen months in distribution transformer design and eight months as assistant foreman in charge of industrial control and switchgear tests. Location immaterial. Available at once. Apply to Box No. 828-W.

CIVIL ENGINEER, B.A.Sc., D.L.S., O.L.S., A.M.E.I.C., age 46, married. Twelve years experience in charge of legal field surveys. Owns own surveying equipment. Eight years on technical, administrative, and editorial office work. Experienced in writing. Desires position on survey work, assisting in or in charge of preparation of house organ, on staff of technical or semi-technical magazine, or on publicity, editorial or administrative office work. Available at once. Will consider any salary, and any location. Apply to Box No. 831-W.

CIVIL ENGINEER, M.Sc., R.P.E. (Sask.). Age 27. Experience in location and drainage surveys, highways and paving, bridge design and construction city and municipal developments, power and telephone construction work. Available on short notice. Apply to Box No. 839-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. '32 (Univ. of N.B.). Age 25, married. Two years experience in power line construction and maintenance; one year of highway construction; one summer surveying for power plant site, location and spur railway line construction. Available at once. Location immaterial. Apply to Box No. 840-W.

CIVIL ENGINEER, B.Sc. '15, A.M.E.I.C., married, extensive experience in responsible position on railway construction, also highways, bridges and water supplies. Position desired as engineer or superintendent. Available at once. Apply to Box No. 841-W.

CIVIL ENGINEER, B.Sc. (Alta. '31), S.E.I.C., age 24. Experience, three summers on railroad maintenance, and seven months on highway location as instrumentman. Willing to do anything, anywhere, but would prefer connection with designing or construction firm on structural works. Available immediately. Apply to Box No. 846-W.

MECHANICAL ENGINEER, Jr.E.I.C., technical graduate, bilingual, age 30. Two years as designing heating draughtsman with one of the largest firms of its kind on this continent handling heating materials; three years designing draughtsman in consulting engineers' office, mechanical equipment of buildings, heating, ventilation, sanitation, power plant equipment, writing of specifications, etc. Present location Montreal. Available at once. Apply to Box No. 850-W.

BRIDGE AND STRUCTURAL ENGINEER, A.M.E.I.C., McGill. Twenty-five years' experience on bridge and structural staffs. Until recently employed. Familiar with all late designs, construction, and practices in all Canadian fabricating plants. Desirous of employment in any responsible position, sales, fabrication or construction. Apply to Box No. 851-W.

STRUCTURAL ENGINEER, B.A.Sc., A.M.E.I.C. Twenty-two years experience in design of bridges and all types of buildings in structural steel and reinforced concrete Three years experience in railway construction and land surveying. Apply to Box No. 856-W.

MECHANICAL ENGINEER, B.Sc. '32, S.E.I.C. Good draughtsman. Undergraduate experience:—One year moulding shop practice; two years pipe fitting and sheet metal work; one year draughting and tracing on paper mill layout; six months machine shop practice; and eight months fuel investigation and power heating plant testing. Desires position offering experience in steam power plants or heating and ventilating design. Will go anywhere. Apply to Box No. 858-W.

MECHANICAL ENGINEER, age 31, graduate Sheffield (England) 1921; apprenticeship with firm manufacturing steam turbine generators and auxiliaries and subsequent experience in design, erection, operation and inspection of same. Marine experience B.O.T. certificate thoroughly conversant with Canadian plants and equipment. Available on short notice. Any location. Box No. 860-W.

CHEMICAL ENGINEER, B.Sc. (McGill '21), A.M.E.I.C., age 36, married; three years since graduation with pulp and paper mills; eight years in shops, estimating and sales divisions of well-known gas engineering and construction companies in the United States. Excellent references. Available on short notice. Apply to Box No. 866-W.

CONSTRUCTION ENGINEER (Toronto Univ. of '07). Experience includes hydro-electric, municipal and railroad work. Available immediately. Location immaterial. Apply to Box No. 886-W.

ELECTRICAL ENGINEER, graduate 1929, S.E.I.C. Single. Experience includes two years with electrical manufacturing concern and one on highway construction work. Available at once. Will go anywhere. Apply to Box No. 887-W.

CIVIL ENGINEER, B.Sc., Montreal 1930, age 26, single, French and English, desires position technical or non-technical in engineering, industrial or commercial fields, sales or promotion work. Experience includes three years in municipal engineering on paving, sewage, waterworks, filter plant equipment, layout of buildings, etc. Available immediately. Apply to Box No. 891-W.

ELECTRICAL ENGINEER, grad. Univ. of N.B. '31. Experienced in surveying and draughting, requires position. Available at once. Will go anywhere. Apply to Box No. 893-W.

CIVIL ENGINEER, B.A.Sc., Jr.E.I.C., age 29, single. Experience includes two years in pulp mill as draughtsman and designer on additions, maintenance and plant layout. Three and a half years in the Toronto Buildings Department checking steel, reinforced concrete, and architectural plans. Available at once. Location immaterial. At present in Toronto. Apply to Box No. 899-W.

ENGINEER, Jr.E.I.C., specializing in reconnaissance and preliminary surveys in connection with hydro-electric and storage projects Expert on location and construction of transmission lines, railways and highways. Capable of taking charge. Location immaterial. Apply to Box No. 901-W.

DESIGNING ENGINEER, A.M.E.I.C. Permanent and executive position preferred but not essential. Fifteen years experience in designing power plants, engine and fan rooms, kitchens and laundries. Thoroughly familiar with plumbing and ventilating work, pneumatic tubes, and refrigeration, also heating, electrical work, and specifications. Apply to Box No. 913-W.

INDUSTRIAL ENGINEER, B.Sc. in M.E., age 25, married, is open for a position of a permanent nature with an industrial concern. Experience includes three years in various divisions of a paper mill and two years in an electrical company. Apply to Box No. 917-W.

ENGINEER, B.Sc., A.M.E.I.C., R.P.E. (N.B.), age 35, married. Seven years' mining experience as sampler, assayer, surveyor, field work, and foreman in charge of underground development; two years as assistant engineer on highway construction and maintenance Available on short notice. Apply to Box No. 932-W.

CIVIL ENGINEER, B.Sc., '25, McGill Univ., Jr.E.I.C., P.E.Q., age 32, married. Experience as rodman and instrumentman on track maintenance. Seven and one-half years with Canadian paper company, as assistant office engineer handling all classes of engineering problems in connection with woods operations, i.e., road buildings, piers, booms, timber bridges, depots, dams, etc. Apply to Box No. 933-W.

ELECTRICAL ENGINEER, Dipl. of Eng., B.Sc. (Dalhousie Univ.), S.B. and S.M. in E.E. (Mass. Inst. of Tech.), Canadian. Married. Seven and a half years' experience in design, construction and operation of hydro, steam and industrial plants. For past sixteen months field office electrical engineer on 510,000 h.p. hydro-electric project. Available at once. Apply to Box No. 936-W.

CIVIL ENGINEER, B.Sc., O.P.E. Experience includes several years on municipal work-design and construction of sewers, steel and concrete bridges, watermains and pavements. Available at once. Apply to Box No 950-W.

ELECTRICAL ENGINEER, twenty years experience, desires position, either temporary or permanent. Experienced in design, construction, and operation of power and industrial plants, and supt. of construction Apply to Box No. 974-W.

CIVIL ENGINEER, B.Sc. (Univ. of Sask. '33), S.E.I.C., age 28, single. Experience in testing hydro-electric equipment, draughting, surveying, city street, improvements, technical photography. Available at once. Location immaterial. Apply to Box No. 986-W.

ENGINEER SUPERINTENDENT, age 44. Engineering and business training, executive ability, tactful, energetic. Had charge of several large projects. Intimate knowledge of costs and prices, reports and estimates Available immediately. Any location. Apply to Box No. 1021-W.

CIVIL ENGINEER, B.Sc. (Queen's 14), A.M.E.I.C., Dominion Land Surveyor, 5 months' special course at the University of London, England, in municipal hygiene and reinforced concrete construction. Experience covers legal and topographic surveys, plane tabling and stadia surveying, railway and highway construction, drainage and excavation work. Available at once Apply Box No. 1035-W

ELECTRICAL ENGINEER AND GEOPHYSICIST Age 36. Married. Seven years experience in geophysical exploration using seismic, magnetic and electrical methods. Two years experience with the Western Electric Company of Chicago, working on equipment and magnetic materials research. Experienced in radio and telephone work, also specializing in precise electrical measurements, resistance determinations, ground potentials and similar problems of ground current distribution. Apply to Box No. 1063-W.

ELECTRICAL ENGINEER, B.A.Sc. Univ. Toronto '28. Experience includes Can. Gen. Elec. Co. Test Course. Also more than two years in the engineering dept. of the same company. Available on short notice. Preferred location central or eastern Canada. Apply to Box No. 1075-W.

ELECTRICAL ENGINEER, B.Sc. Married. Eight years electrical experience, including operation, maintenance and construction work, electrical design work on large power development, mechanical ability, experienced photographer, employed in electrical capacity at present. Available on reasonable notice. Apply to Box No. 1076-W.

INDUSTRIAL ENGINEER, B.A.Sc. in Chem. Eng. (Tor. '31), S.B in Indust. Eng. (Mass. Inst. of Tech. '32), S.E.I.C. Age 25 years. Northern Electric Training Course. Construction and sales experience Rockefeller Research Associate at McGill University in industrial engineering for past year and to date. Desire work in production or financial departments of a manufacturing plant. Apply to Box No. 1098-W.

CIVIL ENGINEER, age 27, graduate 1930, single. Experience includes detailing, designing and estimating structural steel, plate work and pressure vessels; also hydrographic surveying. Available at once. Apply to Box No. 1111-W.

ELECTRICAL ENGINEER, S.E.I.C., single, age 24 years. Four consecutive years at Univ. of N.B. in electrical engineering. Summer experience in bridge and road construction and auto repairing, desires position in industrial or power plant. Any locality. References on request. Apply to Box. No. 1114-W.

CIVIL ENGINEER, B.Sc. Sask. '30. S.E.I.C. Age 24 years. Experience in municipal engineering, including sewer and water construction, sidewalk construction, paving, storm sewer design, draughting, precise levelling, and reinforced concrete bridge construction. Unmarried. Available at once. Will go anywhere. Apply to Box No. 1115-W.

ELECTRICAL ENGINEER, B.Sc.E.E. (Univ. of N.B. '31) C.G.E. Test Course included industrial control, induction motors and transformers; the transformer test included desk work for two months on computing losses, efficiencies, etc. Available at once. Apply to Box. No. 1119-W.

## Wanted to Purchase

Second-hand or used Land Surveying Compass with tripod. Must be in good condition. Describe fully and state price wanted. Apply to Box P-15.

Second-hand Transit in good condition. Must be reasonable price. Apply to Box P-18.

## For Sale

TRANSIT THEODELITE—horizontal and full vertical 5" circles, reading to 20 secs. Fully equipped for stellar and solar observations. Three screw-Reading glass at each vernier—3 eye pieces—strident buble-Prism attachment for eye piece at large vertical angles. Light weight all non wearing parts aluminum. Apply to Box No. 18-S.

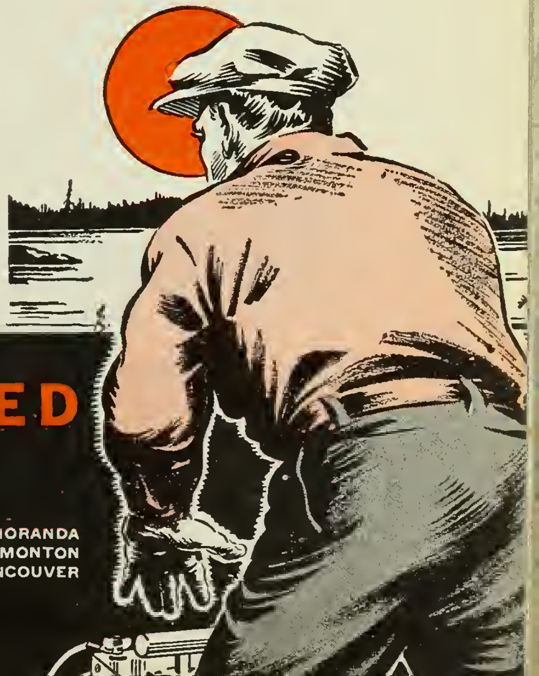
## THE WELLAND CANAL

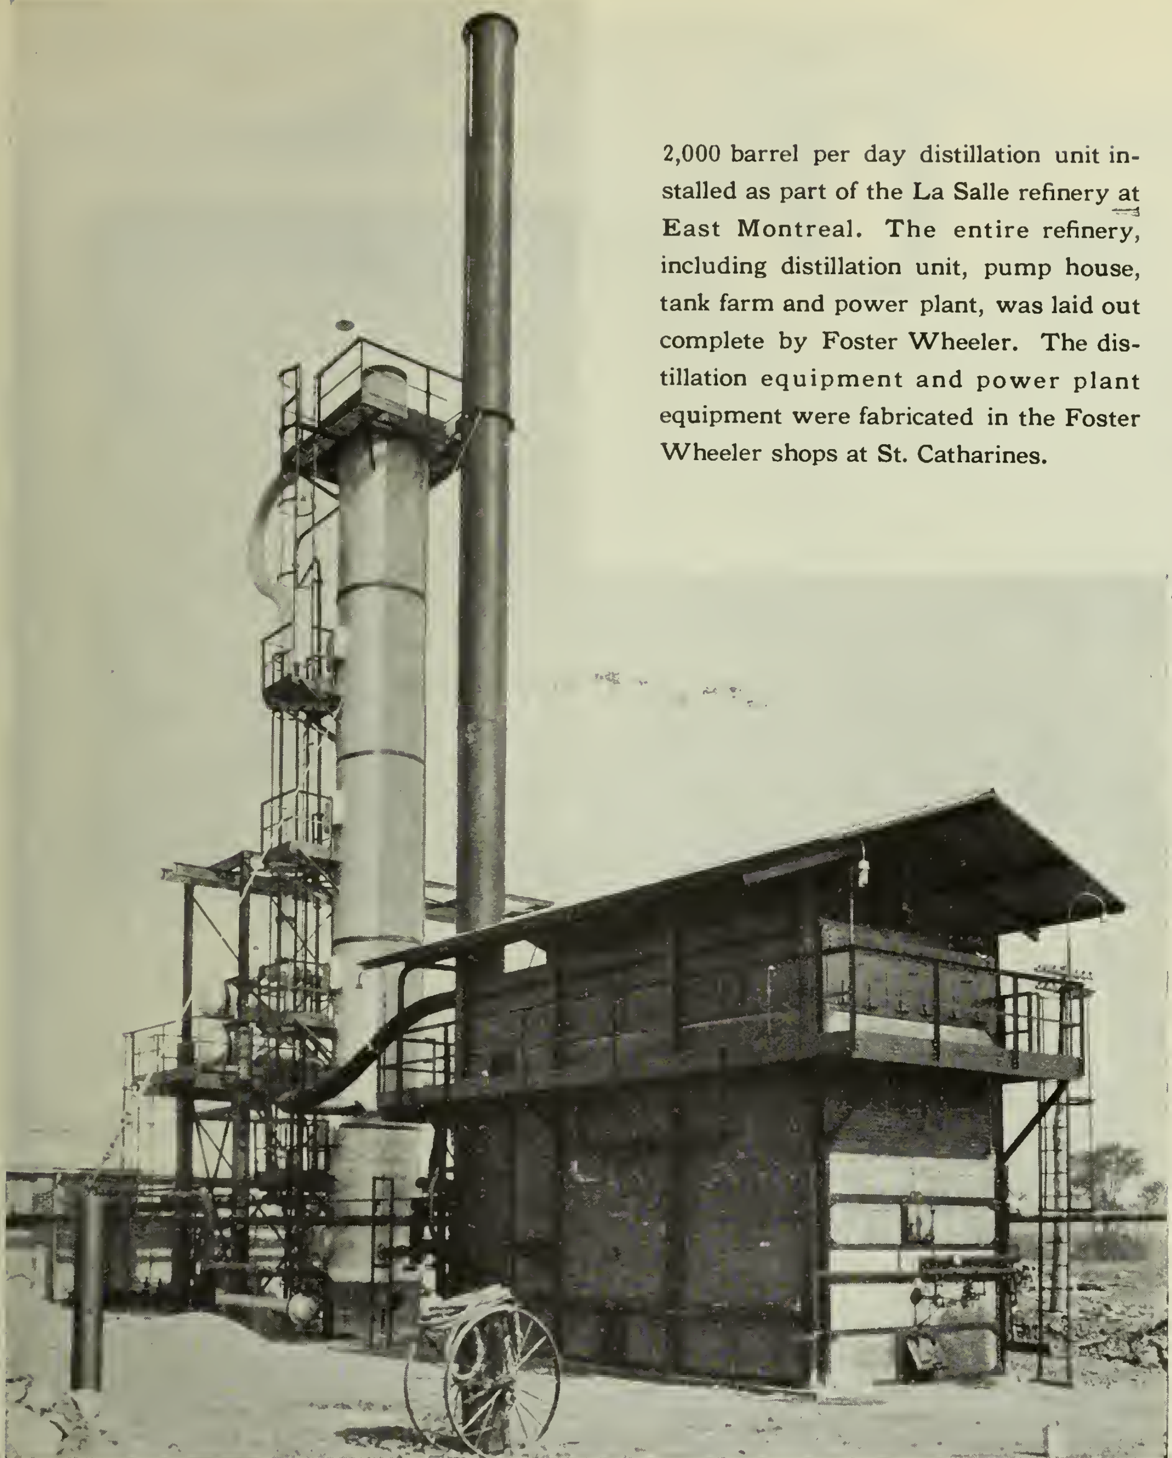
FROM the days of the earliest settlements on the St. Lawrence down to the present time, the Canadian people have looked forward to the day when ocean ships would be able to sail up the St. Lawrence to the Great Lakes. To this end, a private company was formed over a century ago and started the first Welland Canal, which was later taken over by the government of Upper Canada and enlarged between 1841 and 1850. A second canal was started and its completion coincided with the completion of the St. Lawrence canals, between Montreal and Lake Ontario, when boats 140 feet long, with 26 foot beam and 9 foot draught could for the first time ascend the river from Montreal to Lake Erie. Again the canal was enlarged to a depth of 14 feet with twenty-six locks.

The present Canal was started in 1913 and finished eighteen years later. It has a minimum depth of 25 to 27½ feet with only eight locks in a fall of 327 feet between the lakes. All the locks and their entrance piers, bridge piers and the docks at Port Weller and th docks at Port Colborne are built to a depth c 30 feet so that the canal at some future dat can be deepened by simply dredging the cana prism and harbour entrances.

In the undertaking of large projects such a this one, where enormous quantities of roc have to be removed, C-I-L Explosives play very vital part in the handling of the jo quickly and economically,



2,000 barrel per day distillation unit installed as part of the La Salle refinery at East Montreal. The entire refinery, including distillation unit, pump house, tank farm and power plant, was laid out complete by Foster Wheeler. The distillation equipment and power plant equipment were fabricated in the Foster Wheeler shops at St. Catharines.



# FOSTER WHEELER

# Refinery Equipment

Foster Wheeler designs and builds a wide variety of refinery equipment, including distillation units, heaters, power plants, cooling towers and gasoline recovery plants. This equipment may be supplied as separate units, or furnished as a complete, operating refinery built and designed under unit responsibility by Foster Wheeler.

# Mineralization in the Great Bear Lake District

*D. F. Kidd,*
*Geological Survey, Department of Mines, Ottawa, Ontario.*

**Paper presented before the Ottawa Branch of The Engineering Institute of Canada, February 22nd, 1934, and published with the permission of the Director, Geological Survey, Department of Mines.**

**SUMMARY.—The author sketches briefly the history of the district and the local conditions as regards transportation, fuel and power. He discusses the more important of the mineral occurrences of silver or pitchblende which are now known in the locality and gives statistics as to the world's production of radium as affecting the possibilities of radium supply from the Great Bear Lake district.**

Great Bear lake lies 900 miles north-northwest of Edmonton and is in the District of Mackenzie, N.W.T. The mineral deposits of silver and pitchblende (an uncommon radium-bearing uranium mineral) are on the east shore of the lake. Deposits have been found in two areas, at Echo bay 30 miles south of the Arctic circle, and at Camsell river 35 miles further south at the southeast corner of the lake.

The railhead is at Waterways, Alberta, 305 miles by rail north of Edmonton. From here there is a boat route to Echo bay by way of Resolution, Simpson and Norman, a distance of 1,380 miles, and a more direct aircraft route, by way of Rae on the north arm of Great Slave lake, with a length of 750 miles. There are two obstructions to navigation on the boat route, a 16-mile portage over a motor road between Fitzgerald and Fort Smith on the Slave river, and 4 miles of fast shallow water on the Bear river. Small scows can be tracked through this second obstruction and some progress has been made in building a road round it.

The freight rate by the boat route from Waterways to Echo bay is 10 cents per pound. By aircraft the rate on casual express varies from 63¾ cents per pound at some seasons to 75 cents per pound. On contract freight the rates are probably lower.

The seasons for the two kinds of transport are shown in Table I. The table represents average conditions, individual seasons varying considerably. The reason for the long interruption to aircraft communication during freeze-up and break-up periods is apparent.

There are low rather regular shores round most of Great Bear lake but along the east side is the western edge of a much dissected upland which forms along the shore very rugged hills up to 1,100 feet in height. The topography is reminiscent of parts of the north shore of Lake Superior.

TABLE I

SEASONS ON MACKENZIE TRANSPORT ROUTES

| Type of Transport | Good at McMurray | Good at Echo bay | Good McMurray to Echo bay |
|---|---|---|---|
| For aircraft on skis | Dec. 1-15th to April 15th | Nov. 15th to May 15th | Dec. 1-15th to April 15th |
| For aircraft on floats | May 1st to Oct. 10th | June 15th to Sept. 20th | June 15th to Sept. 20th |
| For boat transport | May 15th to Oct. 15th | July 20th to Oct. 1st | July 20th to Oct. 1st |

The country is close to the edge of the Barren Lands or northern plains. Though some of the timber is gnarled and twisted, where it occurs in groves good logs for cabin construction can be secured. Firewood is already scarce at some places. Good grade lignite coal outcrops at one place on the west shore of the lake and could be used for fuel. Fuel oil and gasoline, produced from the oil well 40 miles below Norman on the Mackenzie river, are used in the district.

There are possible water-power sites at Whiteagle Falls on Camsell river, and on the Sloan river. At Camsell river it has been reported that more than 10,000 h.p. could be developed.*

There is at present one settlement at Cameron bay in the inner part of Echo bay, another abandoned one at Hunter bay on the Arctic circle, and several mining camps.

The presence of copper deposits in far northwest Canada has been known since early in the 16th century, and they were first visited by Hearne in 1771 during one of the most remarkable single-handed journeys of exploration ever made in Canada. Copper deposits at Hunter bay on Great Bear lake were first staked in 1922. Real attention focused on the area with the advent of aircraft transportation. In 1929 the two prominent prospecting companies using aircraft, Northern Aerial Minerals Exploration (N.A.M.E.) and Dominion Explorers, having met with but little success in the region tributary to Hudson bay, worked their way west as far as the Coppermine river and Great Bear lake. In the same year Gilbert LaBine of the Eldorado Gold Mines, a small Manitoba concern, also arrived at Great Bear lake to prospect for copper. Returning the following year he made in May 1930 at Echo bay a find of pitchblende, and in the following year rich silver mineralization at the original discovery and at Dowdell point 6 miles to the south. These discoveries started a staking rush in August 1931 and this lasted intermittently till the autumn of 1932. Since 1932 discoveries have mostly been extensions of earlier finds.

Figure 1† is a view looking west across LaBine Point. The Eldorado mine buildings are seen in the centre of the photograph.

There are two kinds of deposits of present interest in the district: (1) pitchblende and silver deposits, often with secondary values in copper, lead and gold, and (2) silver deposits. The rocks consist of two sedimentary and volcanic groups intruded by large bodies of granite and

Fig. 2—View Looking South Along East Side of Great Bear Lake.

associated rocks, and later by smaller bodies, dykes and sills, of basic rocks. The mineral deposits are related in source to some of the intrusives, and as they occur round the borders of the granite masses these may be the source.

The silver and pitchblende are in zones of fracturing and crushing in the rocks; zones which in some cases are thousands of feet in length. The pitchblende is in narrow seams up to an inch wide of extremely high grade material, and as much larger lenses with quartz, this also being rich ore though of lower grade than the seams. The seams are colloform slabs which can readily be hand-cobbed from the gangue rock. The silver is present as the native metal and in several other silver minerals. It occurs irregularly distributed in the same kind of zones as the pitchblende, at some places associated with it.

The more important occurrences are: Eldorado Gold Mines, LaBine Point, silver and pitchblende; Echo bay

Fig. 3—Sledge Travel, Great Bear Lake, June 15th, 1932.

claims of Consolidated Mining and Smelting Company, 1¼ miles northeast of LaBine Point, silver and pitchblende; Bonanza claims of Eldorado Gold Mnes, Dowdell Point, silver; M Group claims of Bear Exploration and Radium, Contact lake, silver and pitchblende; and at Camsell river, Whiteagle Mines, silver.

Figure 2 is a view from an altitude of 5,000 feet looking south along the east side of Great Bear lake and across Echo bay. LaBine Point is in middle distance and Dowdell Point in the background. Crosses indicate the location of mineral deposits: on LaBine Point the Eldorado mine, on Dowdell Point the Bonanza deposits, in left foreground the Echo bay claims deposit of Consolidated Smelters.

At the Eldorado Mine at LaBine Point there are three mineralized zones which trend east-northeast and converge in that direction. Pitchblende occurs in all three zones and has been mined at the surface from two of them. Only the middle zone carries silver, and this chiefly in its northeast part where very rich silver mineralization has been found.

Mining from surface pits was started in 1931 and a shipment of pitchblende was made that year. In 1932 a further shipment of pitchblende and one of silver ore was made. Also a small mining plant with a Diesel operated compressor was shipped in and an adit started to cut the middle zone. This has been accomplished and the zone has been drifted along for several hundred feet. As there is disseminated silver mineralization as well as the high grade type the company in 1933 shipped in a concentrating mill which is reported to be now in operation.

On the Echo bay group of claims to the northeast a great deal of surface trenching and short hole diamond drilling has been done. Six shear zones with lengths of hundreds of feet have been traced in an area 600 feet wide and 2,000 feet long along their strike. Rich silver mineralization has been found at some places in nearly all the zones and in 1933 pitchblende as well was found in one of them. No underground work has as yet been done.

On the Bonanza claims at Dowdell Point spectacular silver mineralization has been found at two distinct localities ½ mile apart. The only development is a little surface stripping. This has exposed at each place some splashes of very rich silver ore.

*Information from Dominion Water-power and Hydrometric Bureau.

†Figures 1 and 2 are published by courtesy of the R.C.A.F.

On the M Group claims at Contact lake silver and low grade pitchblende were found in 1931 and 1932. They occur in a single fracture zone extending up a hillside. An adit has been driven several hundred feet along this zone, a small gasoline driven compressor being used. Silver is said to have been found at a number of places in the tunnel. The pitchblende is of less importance.

At the site of the Whiteagle property on Rainy lake, an expansion of Camsell river, a silver find was made in 1932. High grade silver mineralization occurs in one pit sunk in a fracture zone which extends down a hill to the lake. An adit started last summer from the lake shore has explored the zone for several hundred feet and much more silver is said to have been found.

The mineralization at all the properties at Great Bear lake is characterized by its high grade but irregular distribution. This is a quite usual feature in high grade ores. It however makes it very difficult to estimate even approximately tonnages and grades of unmined ore. It is probably true that similar conditions existed at Cobalt, Ontario, and that few companies there ever had large ore reserves in sight.

These high grade deposits may be likened to a plum pudding in which the high grade patches are the plums. The analogy is not exact as there may be low silver values (it is reasonable to expect them in most cases) between the bodies of high grade. These low grade portions may even be mined at a profit in themselves. It is for the purpose of concentrating this type of mineralization to a product sufficiently rich to ship that Eldorado has built a mill and B.E.A.R. and Whiteagle are planning to do so. It appears to be the policy of Consolidated Smelters to do extensive exploration by surface work and diamond drilling before making any considerable investment in mining or milling equipment.

It is apparent that it is and always will be very difficult to estimate the worth of properties in this field. The presence of one small bit of rich mineralization, or of indications of it, may encourage the spending of large sums in an honest endeavour to find more. In most cases it is

**Fig. 4—Cabin, Lindsley Bay.**

almost impossible to say the money should not be spent, though efforts may to some extent be graded in degree of hopefulness. In the Echo bay area probably all ground not in the bounding granite bodies is worth careful surface prospecting for silver, that is, surface examination by experienced silver prospectors, but not extensive trenching of shear zones, though this may be warranted on some ground. Whether underground exploration is justified if indications of silver mineralization are found on the surface depends on the factors of the individual cases. Diamond drilling to determine values in these deposits is of doubtful worth though it will of course locate mineralized zones.

Deposits of the type described are attractive to the less scrupulous promoter. It is rarely possible to say there is no hope in an enterprise. They can point to the analogy with Cobalt, the fourth greatest silver camp in the world, an analogy which has been stressed more than is warranted from the geological conditions at the two places, and there is the attraction of a distant field and of a little known substance, radium, with a very high nominal value.

The production from Great Bear lake is as yet small, but then it is a young camp being developed under new and

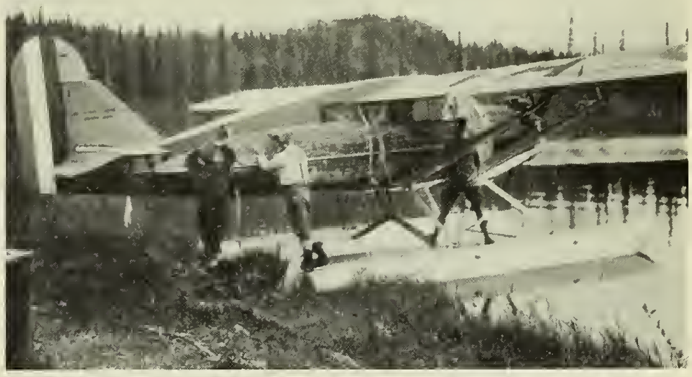

**Fig. 5—Combining Advantages of Canoe and Aircraft Transportation.**

rather difficult conditions. Also with the high grade product shipped there is a considerable production from a small tonnage. For example in 1932 Eldorado Gold Mines shipped 10.6 tons of silver ore averaging 3623.2 ozs. to the ton.

The author has been accused of lack of enthusiasm because he has confined himself to the realm of facts and avoided that of possibilities. There is without question a large amount of silver exposed in the surface workings of some of the properties and some of it is very rich material. It is not possible to estimate by eye the approximate grade of exposed material as could often be done at Cobalt, so till the companies engaged in mining in the area do systematic sampling at fixed distances, not at good places, no real idea of the size of possible ore bodies can be known.

The radium production from the Great Bear lake field may well prove less important in gross final commercial value than the silver production, though its real value from the standpoint of human welfare may be much greater. At the present time, as far as known to the writer, the Eldorado property alone has notable amounts of pitchblende though others have some.*

The radium industry of the world is at present a Belgian monopoly. The major part of the supply comes from a mine at Shinkolobwe in the southeast part of the Belgian Congo. The company operating this property is a subsidiary of the Union Minière de Haut Katanga, the large copper mining company in which the Belgian government has a substantial interest. The world's radium supply has always been nearly a monopoly as is shown in Table II. First it was Czechoslovakia producing radium from the same ore from which it was first isolated by the Curies, then the United States producing from low grade ores in the western states, and now the Belgian Congo which with its high grade ores put the United States out of the business very rapidly.

The price of radium has ranged widely since it first appeared in commercial markets (see Table III).

The present price of \$50-\$70 a milligram, depending on type of container and size of lot, was established in 1923. The Belgian company has always been secretive about grade of ore mined, extent of reserves, and particularly production costs, so it is not known whether the quoted

*Since going to press discoveries of pitchblende have been reported from Beaverlodge lake, 90 miles south of Echo bay.

price represents only a fair return on their invested capital or whether it is designed to be just low enough to throttle American competition. It is generally believed that the recent marked falling off in Belgian production has been due to accumulation of unsold stocks. The company have an elaborate sales and service organization, are renting radium, and are reported to be selling it on the instalment plan.

It is therefore extremely difficult to evaluate the factors in the marketing of radium. The world's new radium business is not large. The production figures (from Table II) and an average price of say $60,000 per gram give for 1931 $2,650,000 for the 44 grams and for 1932 only $600,000 for 10 grams.

# The Relations of Economics to Engineering

## (Parts III and IV)

*Eric G. Adams, S.E.I.C.,*
*Montreal.*

**Note: The Past-Presidents' Prize for 1933 was awarded to this essay which is published by direction of Council.**

*Parts I and II which appeared in the February 1934 issue of The Journal gave a brief historical review of the development of engineering and the development of economics, and proceeded to discuss the interrelated development of these branches of knowledge, their connected functions in furthering material welfare and their secondary effects on cultural progress.*

### Part III—What Should be the Relations?

#### A. Connection in Modified Industrial System

The proper relations can only be determined in the light of their place in the best system for improving man's life. Existing conditions indicate that the traditional organization of the industrial system is inadequate, and some revision is necessary if progress is to be continued in the future. This necessitates some important changes in the character of traditional economics, but embraces many of the teachings of the modern economists who belong to the radical school in some modified form.

*Nature of Modern Industry*

During the past century, as industry has become mechanized, always in the direction of larger quantity production, the industrial system has taken on the character of an inclusive organization of interlocking mechanical processes. These processes and sub-processes are so balanced among themselves that the due working of any part is conditioned on the due working of the rest of the system. This interdependent and interlocking mechanical system is not bounded by national barriers, but, as regards material welfare, all civilized peoples are drawn together into a single going concern. There still remain a few industries which have not been drawn into the system of mechanical processes and quantity production, but the great underlying industries which form the back-bone of the system are the ones that shape the main conditions of material life and set the pace for the rest.

Besides growing more complex and interlocking, the industrial system has developed in another way that is not yet generally realized. This is the change from the Machine Age to the Power Age, with the result that today our industrial economy is based upon the expenditure of power resources and not of man-hours. In the Machine Age, although a transfer of skill from the worker to the machine was effected, the worker was still important, other power resources were limited, and time spent by the worker was the important element in material advance. Now, chiefly due to the vast stores of power made available by the electrical industry since 1910, power for industry is virtually unlimited. Because of this and the great developments in automatic machinery, the worker is less important, man-hours no longer are the determining element in production, but their place is taken by power. Thus economic relationships in industry have been reversed by the transition.

*Need for Economic Planning*

It is upon these two factors—the interlocking nature of the industrial system, and the reversed economic relationships in the system caused by the transition from the

Machine Age to the Power Age—that the need for changes rests. It is because of them that economic planning is needed, involving an organized control over such aspects of economic life as production, the distribution of purchasing power, and the fixing of prices.

On account of the delicately balanced nature of the present industrial system, a minor fault in any part can easily throw the whole system out of balance. When that happens, as is so apparent today, material progress is effectively interrupted. Since an economic force is likely to be destructive to the extent that it is uncontrolled, it appears that a primary need of the present system is some measure of control to check diverse interests. Control in the industrial field in turn postulates economic planning on a national scale at least. (The common term 'economic planning' is used, although the planning must also be technological in nature.)

*Scope of Planning*

Economic planning is not a hard and fast, completely pre-determined scheme. Rather it is a method or technique of attacking problems which develops in practice. The large objectives of planning may be defined, however, and these must be accepted, to be translated into more detailed goals and standards for action day by day, not by a central board only, but with the aid of agencies throughout society. Many suggestions for planning have been published during the past year, and out of these the general objectives of planning may be constructed.

Based as it is on mass production, the industrial system must have mass consumption to drain off its products continually, i.e., production and consumption must be balanced. Otherwise unit costs mount due to the accumulation of overhead charges, or the distribution system breaks down.

To balance production and consumption means that output must be balanced with purchasing power plus desire to buy. Since the purchasing of the products of industry is done predominantly by the wage earning classes, this means that the flow of funds going into wages and investment must be controlled. Furthermore, desire to buy as applied to the wage earning classes is to some extent a function of the feeling of security in employment. It is significant, therefore, that in modern life, as the worker decreases in importance as a producer, he increases in importance as a consumer.

When the implications of this changed status of the workers are clearly understood, it is evident that the world is not suffering from technological unemployment, but rather from unemployed technology. If the purchasing power of consumers is maintained, and the hours of labour adjusted to spread leisure equitably, each new technical advance can result in a rise in the social standards of all. An increase in the amount of leisure available, however, throws a heavy responsibility upon education to fit man to make the best use of the newly acquired leisure, and to teach man how to enjoy the new opportunities afforded by the underlying material advance. From this standpoint, therefore, technical progress must be balanced against educational progress in the use of leisure.

It is apparent that the extent to which the industrial system as it has now developed can be useful in obtaining a better life for man depends upon the effectiveness with which the system is controlled and its working planned. Doubtless an economic plan may exist and still fall short of the full implications of organized planning; but if it falls very far short it will break down and destroy the element of control.

*Connected Functions in Planning*

The complexity of the industrial system gives ample scope for both engineering and economics, and, in order to keep the system running, a close connection between the two sciences must be maintained. The organizing habits and technique of engineering, which have proved so useful in the material field, should also prove helpful in the social field. Recognition of the disparity between the marvellous efficiency of industrial technique and the halting, destructive behaviour of economic life as a whole, lends weight to this view. There is no question but that scientific management and management engineering have worked wonders internally for individual industries. To apply the same technique to planning for all industries seems logical, provided certain necessary modifications are included. There is an important difference in the functions of planning in the two fields. In the past, management engineers have planned exclusively for separate industries internally, but the general economic plan entails planning for all industries together, externally in relation to separate industries. In this wider field the assistance of the economist is needed. The engineer can think in terms of fulfilling material human wants, but it requires the economist's point of view to gauge these wants.

Economic planning, furthermore, includes more than scientific management on a broader scale to take in all industries. It includes also the formulation and application of some fundamental economic reforms in the organization of society. While these reforms can be adequately designed by economists, the co-operation of the engineers is required to carry them out. Thus, not only does engineering need the help of economics in running its part of a planned economy, but economics also needs engineering assistance in carrying out its own functions.

Finally, both sciences need to attain wider dispersion of the particular knowledge of each in the field of the other. In other words, the engineer needs to become more economic-minded, and the economist more engineering-minded.

### B. Equal Status and Stage of Development

When engineering and economics do not go hand in hand, social progress is retarded. This can happen in several ways, some of the most important of which are discussed below.

*Separation of Responsibility and Authority Disadvantageous*

One of the primary laws underlying efficient administration in any field is that responsibility and authority must always go together. As shown in an earlier section, responsibility and authority have continually become more divorced as the modern industrial system developed. This situation has produced two notable disadvantages to society at large.

In the first place, a lack of efficiency in the advancement of material welfare has resulted. Since the engineers have not had the authority to make needed changes in the manner or tools of material advancement, this advancement has sometimes had to be halted until the requisite authority was obtained. Furthermore, lack of authority has detracted from the urge of technologists to create.

The second serious disadvantage has been to facilitate uncoordinated developments which often have ill effects, in the beginning at least. Frequently some new development has brought a distinctly harmful conflict of the new and the old in the industrial system. Examples of this were abundant during the Industrial Revolution—the hand weavers destroying newly installed power looms, sawyers congregating to break up the first water-powered mill. The change from the Machine Age to the Power Age during recent times also gives ample evidence of this conflict. As more power is applied to industry and human labour replaced, instead of all society benefiting by the additional leisure, it is faced with the miseries of unemployment, and the delicately balanced industrial system is thrown out of balance by the loss of purchasing power formerly accruing to the now unemployed workers.

Thus the lack of closer correlation between engineering and economics, which would bring together again responsibility and authority, retards the attainment of new levels of life and standards of living, and often creates unhappiness for part of society during transition stages.

*Effects of Overbalance of Engineering*

The retarding effect on material progress caused by a lag in the development of economics behind engineering has been noted previously. There are also several ill effects caused by engineering pushing ahead of economics. The waste which an uncoordinated technological advance can create is appalling. Not only does it cause waste of time, abilities and resources, since the greatest use cannot be made of the development until the world is economically ready for it, but it may bring about waste and hardship through cut-throat competition, both direct and indirect. The increasing amount by which production continued to outstrip distribution since the war had its share in bringing about the business troubles of today. The intense competition engendered by ever-expanding production caused nations to make a feverish search for new markets at the same time as they raised tariff barriers at home to safeguard their domestic markets. The results are now apparent to all—international trade has been strangled with drastic consequences to all industries. Furthermore, as competition became more intense, the consumer, instead of benefiting by lower prices, often had to pay more to live. The protection and subsidies which governments were forced to hand out to industries overburdened with overhead charges, and the ever-increasing amounts which industrialists were forced to spend in intensive advertising to overcome both direct and indirect competition, resulted in increased costs to the consumer, either in the form of taxes or in higher prices for goods.

The reason for ill effects resulting from too fast development of engineering is lack of adequate knowledge of how to make the best use of it. In other words, economic development must not be outdone by engineering, or disastrous results may occur. The engineer works in good faith to increase the usefulness and efficiency of industry, but without the requisite economic co-operation his results may be the opposite of his desires. He is prone to regard industry merely as a technical problem, whereas it is fundamentally an economic problem as well. It is not enough to work towards the creation of the maximum of goods; these must be created with a minimum of inconvenience and human suffering in such a way as to promote the best distribution of wealth. Cheap production is not an ultimate good, it is so only if it leads to right distribution and does not violate the demand of the workers for tolerable conditions of labour.

*Effects of Overbalance of Economics*

The effects of economic development outstripping technology, while not as unfortunate as those of the reverse situation, are not altogether beneficial. An overbalance of economic development may be taken as existing when ability to distribute and consume wealth exceeds the ability to produce it. A situation partaking of this nature was to be found in Russia after the revolution, before the great technical developments under the five year plan took place. In such a situation the standard of living generally is low, and the hardships which result cannot but be considered disadvantageous to society at large.

Although such a condition can exist in separate areas, it cannot take place generally for some time to come, due to the lag in the present development of economics relative to engineering. It must not be denied, however, that it is a future possibility.

C. Closer Co-operation and Co-ordination

The discussion in the preceding sections has been concerned largely with the need for keeping engineering and economic developments in balance. It remains for the present section, therefore, to consider the benefits of closer co-operation in method and closer co-ordination of results.

*Assistance of Economic Methods to Engineering*

Probably the most important contribution which economics can make to the methods of engineering is to teach facility in dealing with indefinite concepts. Economics, dealing directly as it does with human wants and desires, has fostered within itself a manner of thinking that is elastic and adaptable to the vagaries of changeable human conduct. (Of course, it has also fostered certain other less desirable qualities which will be discussed later.) Engineers, on the other hand, being accustomed to deal predominantly with material objects and the resources of nature, acquire set habits of thought which make them incapable of dealing directly with human wants. What they need to acquire is a certain amount, not too much or the value of accurate thinking will be lost, of elasticity in thinking. Then they will not be required to take a subordinate position to those who are now better able to gauge and plan for the fulfilment of human desires.

An example of how the methods of thinking differ between the two sciences, and their results, is found in the traditional attitudes of the production and sales departments of many companies. The production department, prone to think rigidly, continually strives for more standardization, firmly believing that the resulting reductions in unit costs are the ultimate good to be achieved. The sales department, sensing the desire of consumers for variety and the competitive advantage of being able to offer wider choice than competitors, habitually demands less standardization and more variety. The two views are diametrically opposed, but the solution is obvious. To go the whole way with either method of thought is unsound, a compromise must be effected. Since the consumer has to be satisfied some variety is necessary, but at the same time, in order to supply him at a reasonable price, there must be some standardization. Where to draw the line in either direction, is, of course, a difficult question. The illustration, nevertheless, serves to point to the advisability of both engineering and economics adopting some of the other's method of thinking.

*Assistance of Engineering Methods to Economics*

The same rigid, concrete habits of thought which were found to need modification in the direction of more elasticity by learning from economics, at the same time can teach improved methods of thinking to economics. The latter can learn from engineering to attain precision in thought and so eliminate errors due to slovenly and inaccurate thinking processes. If engineering needs to acquire some of the elasticity of economic thinking, the latter in turn needs to acquire some of the clarity of engineering thinking. If this is acquired, some of the guesswork may be eliminated from economics. The fact that an engineer may be severely criticized if his estimate is 5 per cent out, while it is common to see economic forecasts which are 100 per cent in error, indicates that the latter science needs to acquire some of the accurate habits of thinking of the former.

Economics also needs to learn from engineering how to make use of group effort and get the most out of co-operative thinking. Technology became powerful when it became cumulative and kept records,—when it began to pursue knowledge systematically by observation, hypothesis, experiment, and verification. To do this adequately it was necessary to employ the principle of division of labour. Scientific fragments were broken up into smaller and smaller fragments. Group effort, not individual genius, became increasingly important, and progress came more and more to depend upon the organized co-operation of ordinary men. Economics is beginning to remove the hazards of chance from progress by keeping detailed cumulative records, but it still has to learn the great importance of group effort. Specialization in different branches of economics has taken place, but such specialization is usually determined by some brilliant individual who has a special interest, and it is not the result of systematized division of labour of the ordinary men working in the science.

*Benefits of Co-ordination of Results*

Closely akin to the need for balanced development of the two sciences is that for close co-ordination of results.

That no engineering solution is complete until the economic aspects have been considered is a truism that is too frequently overlooked; and the same truism holds good if reversed.

As stated before, the principal function of both engineering and economics is to provide better living and more happiness for man. This means that both should cater to the collective wants of man, instead of to the individual. Throughout the history of social progress the conflict between collective and individual wants has been apparent. No better illustration could be provided than the experience of the past few years, which indicates how serious can be the consequences when individual wants are increasingly better supplied to the disadvantage of the satisfaction of collective wants.

Both sciences neglected to give adequate consideration to collective wants during the years of prosperity ending in 1929. This neglect was more or less wilful in the field of economics (business management), for a policy of 'every man for himself and the devil take the hindmost' seemed to dominate industry. In the field of technology the neglect was not wilful, and was not as pernicious in its effects. Being under the control of the business managers the engineers were not in a position to cater to collective wants to the disadvantage of individual interests, even if they so desired. It must be admitted, however, that most of them were too blinded by the great achievements made in technology to see what their effects on social progress might be. Nevertheless, all through history, wherever moves on their own volition were possible, engineers have usually tried to satisfy collective wants. That they have not been subject to the necessary guidance of economics to attain this end in the best manner possible poses the need for closer co-ordination.

Provided that aims in the field of economics, therefore, can be limited primarily to the satisfaction of collective wants, closer co-ordination between the two sciences will have beneficial results. The control of environment which engineering makes possible, if properly directed, results in a larger amount of leisure for mankind and greater aggregate wealth. These in turn make possible greater development of art and culture, and give the opportunity for more universal education of the people.

Thus closer co-ordination between the results of engineering and economics can increase both the means for enjoyment and the ability to enjoy. In this way only is the primary function of both sciences fulfilled—to provide better living and more happiness for man.

## Part IV—How Can These Relations Be Brought About?

### A. Mutual Assistance in Methodology

In many ways the methods of one science may be used advantageously in the conduct of the other. This is not so much the case of engineering assisting economics, or vice versa, directly, as it is of one borrowing from the methods of the other the better to carry out its own functions. Since engineering has been developed to a greater degree than economics, it is natural that it should be able to offer the most valuable assistance in the interchange. In fact, this is true to such an extent, that economics can offer little more than an example of broadness in methods of thought (which has been fully discussed in a previous section,) while engineering has several tools of thought and technique which have proved their worth and are possibly adaptable for use in developing economics.

*Use of Deductive Method*

Systematization in a theoretical science is a sign of approaching maturity, a period typified by the construction of hypotheses rather than by mere recognition of facts, and this means deductive reasoning. There is no need to review in detail the value of the deductive method to technology. Its role is still far from played out, for while some students struggle to relate phenomena to the general laws, others work unceasingly to discover divergencies in those laws.

In economics the deductive method has been known for some time, but its early use was forced before the requisite systematization of phenomena was accomplished, with the result that the deductive method fell into more or less disrepute. More recently, however, economics, having passed through the classificatory stage, and following the example of technology, has begun again to use this method, and this time the results have been more fortunate. A few isolated thinkers using the deductive method are reported to have brought the knowledge of cyclical business fluctuations to a point from which the fateful events of the last few years can be explained in general terms, and a partial solution, within the next few years, of the problem of depressions may not be impossible.

The great difficulty is that the deductive method is still misused and its results misinterpreted by many persons recognized as authorities. If the data that economic laws postulate are present, then the consequences they predict necessarily follow. In other words, if a given situation conforms to a certain pattern, then definite other features must also be present, for their presence is deducible from the original data, (pattern). It is here that many are led to err.

There is no known method of predicting what will be the given data at any particular time. Given the data in a particular situation, economics can draw inevitable conclusions as to their implications, and if the data remain unchanged these implications will certainly be realized. Of course, if other things do not remain unchanged, the consequences predicted do not necessarily follow. The trouble is that in practice the original data almost never remain unchanged, so employment of the straight deductive method without any other assistance is practically useless. In the physical sciences this 'other assistance' is found in mathematics, which enables the investigator to handle problems in which some variables are present in the basic data.

*Use of Mathematics*

Since quantitative exactitude was regarded as an object of all scientific inquiry, it was natural that economists should early attempt to apply mathematical analysis to their science. The work of Jevons and some of his followers in this field was of considerable merit, for they avoided distortion of their results by over-simplification of the data, and improved the precision of their thinking. Others who came later, however, carried their ideas of the quantitative nature of economics to extremes, and brought the use of mathematics in this science into disrepute. The modern Quantitativists (mentioned later) provide a good example of how mathematics should not be used.

The point that these extremists missed is that the social phenomena with which economics deals are related to human valuation and desire, and the closer the connection with the vagaries of human wants the less the chance of reducing them to a quantitative basis. Nevertheless, while it may be impossible to restrict human desires to a numerical basis, it is not impossible to determine the probability of any desire being within given limits. Thus a whole new field of economic inquiry is opened up, if the economists will make use of the technique for dealing with probabilities which has been developed so highly by the engineers.

At the same time there is another important use to which the tool of mathematics can be put in economics. As pointed out in the previous section, the use of the purely deductive method alone is not very effective simply because it is impossible to cope with situations in which the basic data include variables, and such situations are the most common in practice. Since mathematics is such an admirable tool for handling complexities which are otherwise beyond the reach of human minds, the obvious procedure is for economics to learn from engineering how to use mathematics to aid the deductive method in dealing with the multitude of problems where 'other things are not equal.'

With the growing realization that economics must deal with the motivation of groups, and not individuals, the use of mathematics to handle increasing complexities becomes still more important. Thus, if economics can attain the same facility in using this valuable tool as engineering has, the present lag in the development of this science may be quickly overcome.

It must be concluded, therefore, that, although economics does involve some conceptions of a quantitative nature which require to be analysed in a mathematical spirit, most of these should be treated as probabilities rather than as definite quantities, and the chief use of mathematics in the future will probably be to facilitate dealing with otherwise unmanageable complexities and variables.

One other special branch of mathematics, however, is becoming of increasing importance to economics. This is mathematical statistics which is treated in the following section.

*Use of Statistical Method*

During the past ten years there has been repeated and flagrant misuse of statistics in economics which has aroused doubts regarding the efficacy of this tool. Under the name of Institutionalism or Quantitative Economics, observations have been made of various phenomena over considerable periods of time and in various places. The correlation of trends subject to influences of the most diverse character has been scrutinized for quantitative laws, and the results expected to have significance. Important as some of these investigations may have been at the moment at which they were made, and perhaps for a short time afterward, there was no justification in claiming for their results the status of the so-called statistical laws of the natural sciences. The theory of probability on which modern mathematical statistics is based affords no justification for averaging where conditions are obviously not such as to warrant the belief that homogeneous causes of different kinds are operating.

There are two reasons for the small esteem in which statistics is generally held in economics. The first arises from the nature of the use to which statistics has been put. The ordinary use has been to supply the records of observation as the basis for inductive reasoning. Since, in this role, statistics is applicable only in the early stages of studying any phenomena, and acts merely as an aid in forming hypotheses, it is natural that the value tends to be minimized.

The second reason is evident in the manner in which statistics has been used. Reasoning from statistics inductively, in addition to the inherent danger in all empirical reasoning, is subject to difficulties and dangers inherent in itself. The criticism that statistics can be made to prove anything is all too true unless extreme care in handling it is exercised. To use statistics in the proper manner, therefore, is a difficult matter requiring considerable skill and honesty in thought.

These obstacles in the way of more effective use of statistics in economics can be removed by borrowing from the methods of engineering. Proper handling of the tool through the adoption of scientific precision and honesty of thought, which make misuse improbable, is the first lesson to be learned.

The other is to employ statistics in the second part of the scientific method, i.e., the deductive part. The steps in the so-called scientific method, whose use resulted in such notable advances in technology, are: observation, hypothesis, deduction, and experiment. We have already seen how statistics has been used in the inductive half of this method when applied to economics. Its place in the deductive half should be to substitute for experiment. Since verification by direct experiment is usually impossible in economics and the social sciences, its place should be taken by the comprehensive collection and use of statistics. In this way deductive reasoning will be supplemented and its results checked by submitting them to the test of experience—accumulated statistical data.

B. Broader Education in Both Sciences

Education is a subject which cannot be covered adequately in a limited space, but it is such an important element in bringing the relations of economics to engineering closer to what they should be that a brief outline of the high lights is imperative.

*More Economics for Engineers in University Courses*

Briefly stated, the discussion in previous sections indicates that engineers should be taught to think more freely and often about social problems, while economists should learn habits of precision in thinking. To begin with the engineers, the first training of this nature should be given in the universities where their preliminary professional education is completed.

Engineering curricula now generally include a good grounding in the subjects of mathematics, physics and chemistry, the borderland of the natural sciences. The borderland on the other side of engineering, that embracing the social sciences, however, is virtually neglected. It is in this field, and particularly the branch concerned with economics, that instruction must be provided. When the engineer's training develops a connection with economists of the same order as the connection now developed with pure sciences, then will the requisite vision be fostered which will prevent industrial developments, that are a relative good if properly timed, from becoming a relative evil.

The scope of instruction in the economic borderland of engineering should not be merely to review the history of economic thought and tenets. Rather the work should embrace studying and investigating the economic and social uses of power, machines, transportation, communication and such technical developments. The object of these investigations should be to place this economic side of engineering on the same basis of rigorous examination and reasoning as now characterizes the scientific side. Thus, instruction should be restricted to the solution of problems as practical as possible. Probably the best method would be to use a system of class discussion based on the case method, supplemented by outside reading of standard economic texts for general information only.

*Function of Professional Engineering Societies*

The other great agent of education for engineers is the professional societies. The engineering school and university departments serve to give the young engineer his preliminary training, but it is the professional societies to which he must turn in later life to carry on his education and keep his thirst for knowledge stimulated. In broadening the engineer in his appreciation for the social results of his work, therefore, it is the duty of the engineering societies to carry on the work begun in the universities.

While the economic training received in a university engineering course (as outlined above) is designed chiefly to stimulate the right kind of thinking, the work of the professional society in this field may well be directed towards solving current problems of importance. The study of the relation between production and consumption and its place in the business depression now being conducted by a committee of the American Engineering Council is a good example of this type of work. Besides committee work, however, the important function of the engineering societies should be to foster discussions including more of the economic aspects of engineering problems. Generally the papers presented at society meetings, and the discussion which follows their presentation, are purely technical in nature. If the scope of these papers and discussions could be broadened to include more of the economic aspects, therefore, a distinct service would be performed. In addition to developing a broader state of mind in the engineers, this activity may reasonably be expected to lead to significant advances in the science of economics itself.

*More Engineering for Economists in University Courses*

Similarly, in the field of economics, something of the precision of engineering methods and a direct borrowing of engineering technique can be taught to young economists while taking their university training. At the present time, mathematics and the other natural sciences are looked upon as uninteresting and unnecessary in the training of an economist. A certain amount of such training, however, is just what an economist needs to develop in him the right methods of thinking. To make some work in these subjects a compulsory adjunct to courses in economics would be to assure a sounder development for that science in the future.

*Function of Professional Economic Societies*

Just as discussion of the economic aspects of engineering problems in the professional engineering societies is relied upon to continue the broad development begun in preliminary training, so should discussion of the engineering aspects of economic problems in professional economic societies aid in furthering the development of mature economists. All too frequently the papers delivered before such societies suggest some economic development for which the requisite technical foundation is altogether lacking or impossible of accomplishment. By turning more attention to the practical side of some of the proposals, therefore, more valuable results may be expected.

One of the portentous signs of recent times is that some outstanding economists are now turning from studies which are essentially indeterminate and controversial, and are concentrating their attention instead on specific problems which offer the possibilities of definite solutions. In such problems much of the data are readily available and politics do not ordinarily upset all calculations; e.g., the optimum size of an industry or particular company, the market for a certain product, or the proper location for a specialty plant. Consideration of such problems, primarily from the economic standpoint but at the same time not neglecting the technical aspects, indicates an important step in the direction of obtaining the needed co-ordination of economics and engineering.

*Joint Professional Society Meetings*

A final way in which the individuals can obtain some of the education which each science can give to the other is for the members of each science to come together in friendly discussion more frequently. The traditional attitude of the engineer regarding the economist as an idle theorist, and the economist regarding the engineer as a high type of plumber or machinist, must be abandoned. Each must view the other with the respect which a proper knowledge of the functions each performs engenders. On this basis, joint meetings of branches of the professional societies of the two sciences to discuss both the economic and engineering aspects of current problems would be most beneficial. (The joint meeting of the American Institute of Electrical Engineers and the Econometric Society in Chicago on June 30th 1933, is evidence that this need is beginning to be realized.) The best way to see the other person's point of view is to listen to it presented intelligently, and this is exactly what would take place in joint discussions of the proposed nature. Furthermore, the practical results of such joint meetings to discuss problems of current importance might well be considerable.

*Control by Men Versed in Both Sciences*

For controlling and outlining the general plans in a planned economy (as described in a previous section) it is evident that men with exceptional abilities and special training are needed. Past experience shows that the planning must be done by others than politicians, for most of the examples of 'government in business have not been encouraging. Clearly, however, neither engineers nor economists, even when broadened as just suggested, would be competent to control this system. Moreover, to have the central planning board made up of some engineers and some economists would likely result in friction, with one or the other faction eventually coming out on top, which might not be to the best advantage of society at large.

Since the central planning body originates broad, not detailed plans, its personnel needs to have broad views. What is required is a body of men possessing a good general knowledge of both engineering and economics, but not circumscribed by the narrow views of either profession or encumbered with all the detailed knowledge necessary for endeavour in either field alone. Successful planning requires men trained to discover the facts and lead where they indicate, at the same time possessing the foresight to make their leadership conform to the requirements of the greatest good to society in the long run. While the engineers have the requisite training to equip them to perform the first function, they lack the second; and with the economists the reverse is true. But with men trained generally in both sciences, all the requirements are present. For lack of a better term, these combination engineers and economists might be called 'economic-engineers.'

In operation, a planned industrial system makes use of a continually increasing amount of detail in its plans as they are broken down for application by smaller and smaller units of society. Thus, as the parts of the plan become more definite, men with more specialized and detailed knowledge are needed to carry them out. It is obviously impossible for an engineer to fit himself for carrying on both his and the economist's functions in any of the more specialized parts of the plan, and the same applies to the economist. The broad training recommended for all engineers and economists, therefore, is designed chiefly to enable each to gain some appreciation of the other's viewpoint and problems. So at the same time as more specialization is needed in each field by reason of the increasing complexities of life, some broadening to cover related fields is needed to give the proper perspective from which to view the individual's contribution to the plan as a whole.

With the control in the hands of 'economic-engineers,' the special ability and training of engineers and economists being available to solve the problems in their respective fields, and both engineers and economists having been trained to respect and appreciate each other's functions so as not to work at cross-purposes, the chances appear bright of running successfully an industrial system organized along the proposed lines. And under such a system many of the present difficulties confronting both material and cultural progress would be effectively removed.

# The Development of Radio

*J. H. Thompson, A.M.E.I.C.,*
*Chief Engineer, Canadian Marconi Company, Montreal, Que.*

**Paper presented before the Montreal Branch of The Engineering Institute of Canada, January 11th, 1934.**

The historical aspects of radio are so numerous and cover so much ground that it is quite impossible to do justice to its development in a single lecture. Fleming's first book on wireless was published in 1910, and contained a very full record of radio development at that time. This book contains about 1,000 pages of small print. Development since 1910 printed in detail would require many volumes of the same size as this first volume of Fleming's. It is therefore the intention to confine this paper more particularly to the early periods of the development, since this is probably the most important and the most spectacular. The developments after 1920 will be touched upon only when necessary to emphasize the importance of some of the early developments.

In 1855 Clerk Maxwell read a paper on "Faraday's Lines of Force." He established certain fundamental relations between electric and magnetic qualities, and found the equations to be of the same type as those which express wave motion through a continuous medium, and therefore, their effects must be propagated in space with the same velocity as light. As a corollary, therefore, he proved that light was merely a form of electro-magnetic waves, identical physically with electric waves. This masterly mathematical treatise resulted in the foundation of the electro-dynamic theory of light. Many scientists, however, were reluctant to accept this new theory and abandon the old one of action at a distance, but universal acceptance of the electro-dynamic theory resulted after the work of Hertz became known.

The Hertz apparatus for radiating and receiving electric waves was remarkably simple. His transmitter or, as he called it, "exciter," consisted of two metal plates connected by rods to two metal spheres separated by about half an inch. The rods were connected to the terminals of the secondary winding of an induction coil. When the coil was energized a spark or train of sparks jumped across the gap between the two spheres. The receiver or, as Hertz called it, the "resonator," consisted of a piece of wire bent into a circle, the ends of the wire terminating in two small metal balls, thus forming a circular loop with a small gap in it; the length of this gap could be adjusted by a micrometer screw. The resonator was set up at a short distance from the exciter, and when a spark jumped across the space between the balls of the exciter, a spark was also seen to pass across the small gap in the resonator. With this apparatus Hertz carried out a large number of investigations. He reproduced electro-magnetically, and in rapid succession, all the phenomena of light, and thus completely demonstrated that light was a form of electric wave. He perceived that his experiments confirmed Clerk-Maxwell's theory. He pointed out that when sparks passed rapidly at the exciter, rectilinear oscillations were radiated into the surrounding space. The resonator was brought into all kinds of different positions in relation to the exciter, and the results accurately measured and tabulated. Hertz found that the law of radiation was the same as the corresponding law in optics. In further experiments he proved that the velocity of electric waves is the same as that of light, differing only in length of wave and penetrative power. He found that they could be reflected and even polarized, that they are propagated in straight lines, but that they cannot pass through metal screens, the presence of which causes electrical shadow effects. Hertz was the first to produce a generator of electric waves, as well as to demonstrate their physical properties. As Sir Oliver Lodge has stated, "he effected an achievement that will hand his name down to posterity as the founder of a new epoch in experimental physics." Hertz's discoveries were studied in the laboratories of many different parts of the world, and improved methods of generating and detecting electric waves were soon effected.

The resonator as used by Hertz, while serving admirably the purpose of his experiments, was an extremely inefficient detector. Many forms of detectors have been devised; amongst others Lodge invented one consisting of a metallic needle resting on a plate. The most sensitive detector, however, was of the microphonic type, in the special form invented by Professor Branly and afterwards greatly modified by Marconi.

Branly made a series of investigations into the variations of conductivity of a large number of materials under different electrical influences. He found that substances which responded best to the phenomenon of sudden increase of conductivity were iron, copper, brass, aluminum, zinc and similar metals. He discovered that the conductive effect on copper filings, caused by a near-by electrical discharge, persists for a comparatively long period, but disappears rapidly if subjected to a mechanical shock. He obtained this result therefore by tapping the tube in which the filings are contained. This principle was adopted in the original Marconi system.

Sir Oliver Lodge closely followed and verified Hertz's experiments and conclusions. At the British Association meeting in 1894, he demonstrated the efficiency of a coherer* of the Branly type as a detector of electrical waves up to a distance of 150 yards. He stated that signalling was easily carried on from a distance through walls and other obstacles. Curiously enough, no attempt was then made to carry out such experiments in the open spaces of the country or to apply anything but the feeblest power to test how far disturbances could really be detected. Lodge here stopped upon the threshold of a very important discovery. His explanation of his failure to proceed, he states in an article in 1923, was due to the fact that he was too busy with teaching work to take up telegraphic or other developments, nor, he says, did he have the foresight to perceive what turned out to be of extraordinary importance.

It is about this period that Marconi comes into prominence. In 1894 he was experimenting with an induction coil as a Hertzian emitter. He found that the space indoors was not sufficient to enable him to carry out his experiments

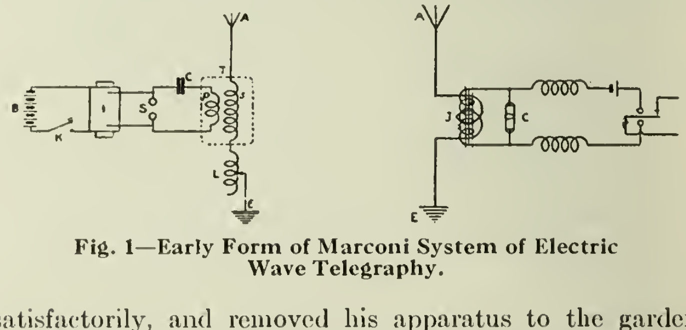

**Fig. 1—Early Form of Marconi System of Electric Wave Telegraphy.**

satisfactorily, and removed his apparatus to the garden where tests could be carried out at greater distances. He now made a most important discovery. Instead of using the two rods of a Hertzian oscillator, he connected one

*Cohesion is based on the following: S. A. Varley in England made the first practical application of the principle of cohesion in utilizing fine charcoal powder as a leak for lightning discharge, the powder being a non-conductor of electricity until caused to cohere by the action of a lightning flash. Following this, Onesti, an Italian professor, discovered that copper filings piled up between two metal plates were normally non-conductors of electricity, but became conductive when subjected to a high voltage spark discharge.

terminal of the secondary of the induction coil to a metal cylinder, or capacity, elevated to the top of a pole, and the other to a metal plate laid on the ground. An elevated aerial was thus produced which discharged across the spark gap to the earth. At the receiving end a similar capacity was erected on the top of a pole and connected to earth through a Branly coherer. He found that the Branly coherer was neither sufficiently sensitive nor reliable in its action, so some time was spent in endeavouring to improve this instrument. After a series of investigations as to the best metals for the filings a mixture of nickel and silver, in the proportion of 95 per cent nickel and 5 per cent silver, was chosen, and these filings were carefully sifted to a certain degree of fineness. The space in the tube between the two silver plugs was about one-third to one-half filled with filings and the glass tube was then exhausted of air and sealed. As a means of restoring the coherer to a non-inductive state immediately after coherence he used a tapper designed on the principle of an electric bell, the coherer tube taking the place of the bell gong.

At the same time Marconi carried out systematic experiments to ascertain in what way the height to which he elevated his capacity affected the distance at which his detector would respond. In 1895 he employed metal cubes about one foot square, which were erected on poles two metres high, and found that with similar arrangements at both ends, he could receive signals at 30 metres distance. On doubling the height to four metres, the distance of reception was increased to one hundred metres; again doubling the height to eight metres the range was increased to four hundred metres. He then increased the size of the cubes to about three feet three inches square, and with this new aerial was able to record Morse signals at a distance of about one and a half miles. He then tried placing the discharge balls of the transmitter in the focal line of a cylindrical parabolic reflector, and at the same time placed the receiving detector in the focus of a similar reflector. Thus the idea of directive radio was very early conceived. Nothing further was done at that time for practical reasons, principally because short waves were not then found to be of practical value, and the longer waves introduced high costs and physical difficulties in erection of such antennae.

In 1896 Marconi brought his invention to the notice of Sir William Preece, of the General Post Office, who had himself developed a system of wireless telegraphy by the conductive-inductive method. Sir William arranged that every facility should be granted to Marconi to demonstrate his invention, and it was successfully operated between the General Post Office and the Thames Embankment. Later experiments were carried out on Salisbury plain, when reception over a distance of eight miles was demonstrated.

Figure 1 shows an early form of Marconi system of electric wave telegraphy. *B* is a battery supplying current to an induction coil *I* with a key *K* in the primary circuit of the coil. When the coil is in action the condenser *C* is charged and then discharged with oscillations across the spark gap *S*. This creates oscillations in the aerial *A* and radiates trains of electric waves. The receiving aerial picks these up, which then act on the coherer *C* (right hand) and this permits the local battery to send a current through the coherer and the relay and operates a Morse inker. This method of reception is now antiquated and no longer used.

Sir William Preece in a lecture at the Royal Institution in 1897 made the following remarks about the Marconi experiments: "He has not discovered any new rays, his recorder is based on Branly's coherer. Columbus did not invent the egg but he showed how to make it stand on its end, and Marconi has produced from known means a new electric eye, more delicate than any known instrument, and a new system of telegraphy that will reach places hitherto inaccessible . . . Enough has been said to show that for shipping and lighthouse purposes it will be a great and valuable acquisition."

There was at once world wide interest in scientific centres. In 1897 apparatus was installed on two Italian warships and communication established up to a distance of 12 miles. Marconi's next step was the erection of a station at Alum Bay in the Isle of Wight, and another at Bournemouth. For this communication elevated aerials at a height of about 120 feet, and a 10-inch spark induction coil were used. The first paid wireless messages were sent over this circuit. In 1898 at the request of Lloyds, apparatus was installed at Ballycastle and Rathlin island, in the north of Ireland, which was successfully operated by Lloyds lighthouse keepers. In July 1898 the results of the Kingston regatta were reported from sea from the steamer *Flying Huntress*, and over seven hundred messages were sent and received. This was the first instance where a ship had been equipped for commercial purposes. In August 1898 communication was established between the royal yacht *Osborne* and Osborne House, Isle of Wight. During the next few months certain improvements were made, particularly the introduction of high frequency transformers between the aerial and the transmitting equipment. In March 1899 messages were transmitted across the English channel between South Foreland lighthouse, near Dover, and Wimereux, near Boulogne. Correspondence arrived from all parts of the world, some asking for information, some giving advice, and many from cranks and madmen who attributed the illnesses from which they suffered to the passing of the wireless waves through their bodies.

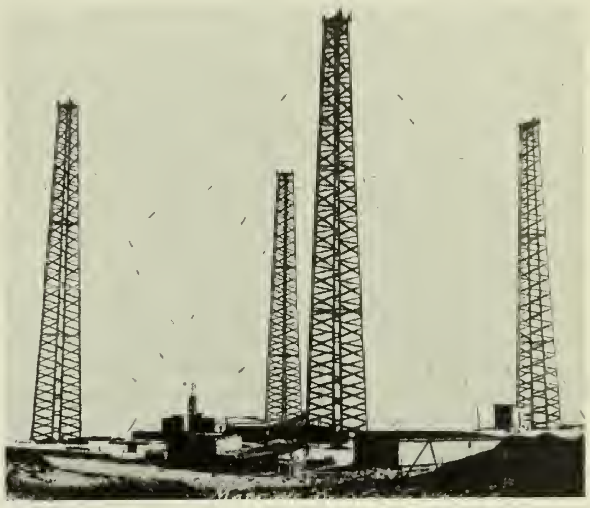

**Fig. 2—Wooden Towers used at early Trans-Atlantic Station, Glace Bay, N.S.**

Communication was next established between Chelmsford and Wimereux, a distance of 85 miles. During the same year the International Yacht Races in the United States were reported by wireless ship to shore. In the autumn of the same year two British cruisers used wireless up to a range of 85 miles during manoeuvres. From this arose the first sale of commercial equipment to the British Admiralty, who made their first purchase of thirty-two installations.

Tuned circuits were now developed both for transmitter and receiver. This was developed as far as working two or three transmitters on one aerial, and two or three receivers on one receiving aerial, provided they were tuned to wave lengths substantially different. A demonstration of wireless multiplex telegraphy was given in 1900 and 1901 when messages were sent from St. Catherine's, in the Isle of Wight, to the Lizard, a distance of 156 miles.

Attempts were now made to reach longer distances, and to do this experimental work it would be necessary to have higher masts and more power. It was thought inadvisable to use metallic masts, and limitations in height of wooden masts were somewhat severe in those days. For increase of power it was also necessary to depart from a physical laboratory type of apparatus, and instead there were developed suitable transmitters more nearly associated with the power development of that time. Also special alternators and transformers would be required.

This design work was undertaken by Dr. J. A. Fleming and apparatus of about 25 kw. input designed and the aerial erected upon a 200-foot circular wooden mast at Poldhu. It was decided to attempt to span the Atlantic with this equipment and when this installation was finished early in 1901, a similar one was started on the American side at South Wellfleet, Cape Cod. Some delay was caused by the complete collapse of the masts both in Cornwall and Massachusetts, but repairs were made and tests conducted between Poldhu and the west coast of Ireland, a distance of 225 miles. These results were such that signals were anticipated at ten times this distance.

Marconi now decided that the first test would be between Poldhu and Newfoundland, that is, transmitting at Poldhu and receiving in Newfoundland. He kept this proposed test secret for the obvious reason that there would be adverse publicity if he failed. On December 11th, 1901, the test was started by sending the letter "S" from 3.00 p.m. to 6.00 p.m. In Newfoundland, where he received every assistance from the Newfoundland government, he had arranged to use a balloon attached to his aerial in order to obtain height, but this broke away on the first ascent and was lost. On the next day, the 12th, a kite was successfully used and hoisted the aerial to a height of 400 feet. As this kite was rising and falling in the wind throughout the experiments, thus varying the electrical capacity of the aerial, it was impossible to use tuned apparatus. Marconi therefore resorted to more simple and less efficient receiving apparatus which was simply a highly sensitive self-restoring coherer connected in series with a telephone and the aerial. With this apparatus, on December 12th, 1901, he and his two assistants heard faint "S" signals. Wireless signals were thus transmitted across the Atlantic for the first time.

This achievement caused a great sensation, and subsequent results dispelled any doubts. In Newfoundland further tests were brought to an abrupt conclusion by the action of certain cable companies who claimed a monopoly of all telegraph communications in Newfoundland. However the Canadian government at once invited Marconi to Canada where he received the utmost encouragement and was offered a substantial subsidy of approximately $80,000.00 to build a station on the Canadian coast. In February 1902 his contract was ratified by the Canadian House of Commons and the Canadian government by this far-sighted and public spirited action were very largely responsible for bringing about the remarkable development in wireless communication which took place within the next two years. It was at the Canadian station erected at Glace Bay that most of the experimental work originated that led to a regular transatlantic service, and it was from this station that the first transatlantic messages were successfully transmitted. This was the beginning of long distance transoceanic communication.

In 1902 tests were carried out to see how far the Poldhu station could be detected on a ship. Receiving equipment was installed on the S.S. *Philadelphia* of the American Line and very important results were obtained. Readable messages were recorded on tape up to a distance of 1,551 miles, and beyond this the letter "S" was recorded up to 2,099 miles. The most important scientific discovery was made on this voyage, namely, that on the wavelengths then used, wireless signals travelled much farther at night than during the day. Signals failed at 700 miles during daylight, while at night they were quite strong at 1,550 miles.

Following this there was, of course, activity in all the large countries of the world. Communication was still in a more or less experimental stage. Improvements were necessary in both transmitting and receiving equipment and, also, in the aerial systems. The latter were both extensive and costly; they were also subject to the vagaries of nature, particularly during the winter time when ice would form on the aerial causing it to break. At this period, development in transmitters proceeded very slowly, but a great deal of attention was paid to the development of receiving systems, and particularly detectors. This work upon the receiving side and upon detectors was probably given more wide-spread attention than the transmitters because the need for improvement was obvious, and the cost of carrying out development was relatively inexpensive. Roughly speaking, detecting devices can be classed into: (1) spark detectors, (2) contact detectors, (3) thermal detectors, (4) magnetic detectors, (5) electrolytic detectors, (6) electrodynamic detectors, and (7) rectifying detectors. Of these groups, perhaps the most important in the development of radio were the contact detectors, of which the coherer is typical, magnetic detectors and rectifying detectors.

### Rectifying Detectors

It has been found that a small surface contact between certain conductors as, for instance, between silicon and copper, and carbon and steel, possesses the power of rectifying high frequency currents. G. W. Pickard found that a copper or steel point pressed against a piece of silicon acted as an oscillation detector when shunted by a telephone. He also found that a brass point in contact with fused zinc oxide or red oxide of zinc acted as a detector of high frequency currents. This was called the "Perikon" detector. In 1906 General H. H. C. Dunwoody used a steel point in contact with carborundum and the carborundum detector was in general use until the development of the radio valve. It is still used today to some extent as a cheap form of detector. A piece of wire in series with a crystal and a pair of headphones will give very good reproduction on present day broadcasting stations, so long as they are not too far from the broadcasting station.

The next important step in detection was the development of the Fleming valve. The Fleming development here was the harnessing of the phenomenon long known as the "Edison effect." Fleming in 1904 found that the electron stream which flows from a hot cathode to a metal anode was unilateral, and therefore it could be used as a detector of high frequency oscillations. This was the beginning of the radio valve or tube as it is known today and

Fig. 3—Ship's wireless cabin in the Experimental Days.

the principle is still in use in the so-called diode detectors and, of course, in all present day rectifier tubes for receiving sets and transmitting sets. Between 1904 and 1907 much study was given to this valve, and its behaviour observed under varied conditions of filament temperature and voltage, and degree of vacuum, etc. In 1907, due to DeForest, an epoch-making development took place and a third element known as the grid was introduced into the Fleming valve between the filament and the anode. The function of the grid was to control the electron stream between the cathode and the anode, and it was so sensitive in this regard that the electron stream would vary in magnitude with every change of potential of the grid relative to the filament even if the changes were at the rate of several million cycles a second. This discovery was the real beginning of radio as it is today. Between 1907 and the present day, much time and money has been spent upon improving the radio valve, and many hundreds of workers have been engaged upon it,

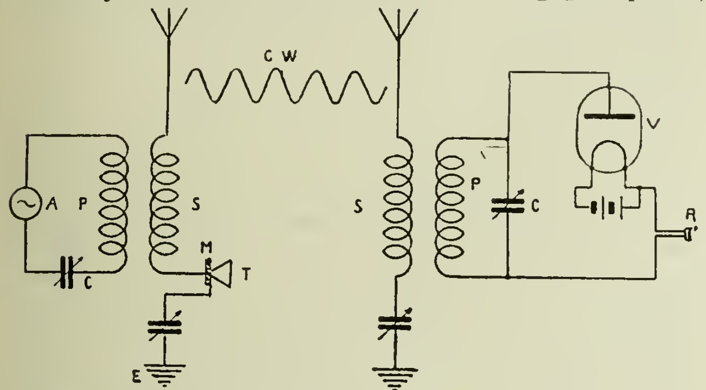

**Fig. 4—Apparatus for conducting Wireless Telephony.**

with the result that the present day valves are very complex in their structure and in their multi-purpose operation. Additional grids have been inserted and various anti-capacity structures embodied in valve design. Valves are now used for the detection of the most feeble impulses and, in the larger sizes, for the generation of very powerful high frequency impulses. This development is still going on.

### Transmitter Development

The first transmitters as used on transatlantic and ship-to-shore communication were the so-called spark transmitters. These comprised condenser and inductance which formed an oscillating circuit, a source of high tension and a spark gap for the purpose of agitating and interrupting the electric energy stored in the high frequency circuit. This energy in the oscillating circuit was transferred to the antenna where part of it was radiated into space. A train of oscillations during the periods of interruption by the spark were highly damped which caused a considerable spread on each side of the fundamental wavelength. This is what is now known as broad tuning, as distinct from sharp tuning subsequently obtained when high frequency oscillations were generated and radiated without decrement in amplitude, in what is now called continuous wave. Spark transmitters were used for a number of years, the radiated power being increased and the aerial systems made more efficient as the technical requirements became more understood. It was, however, realized that radiation on continuous waves would be infinitely better, but the means for obtaining alternating currents of the order of half a million cycles per second were not then known, nor was it known by what method radiated waves of that character could be detected.

The next outstanding step was the development of the continuous wave transmitter which was known as the Poulsen arc. This was a successful development by Poulsen of the singing arc described by Duddell. The arc was very highly developed, and some installations were put in about the end of the war which were capable of transmitting about 1,000 kw. into the aerial. These installations were operated on frequencies of the order of 20 kc. The first telephony of any commercial importance was made by Poulsen and his arc transmitter, when speech communication was established in 1909 in Denmark over a distance of 170 miles. About the same time as the introduction of the arc, much attention was being given to the development of high frequency alternators, and several types were successfully built and operated, some still being in operation today. The most notable of these were those of Goldschmidt in Germany and Alexanderson in the United States which generated a capacity of several hundred kilowatts, and operated on frequencies of the order of 15 or 20 kc.

The most outstanding development in transmitters has been the application of the valve which was developed during the War period intensively, and far beyond the initial stage of the construction of the DeForest valve, but nevertheless, on the same principle. It is probable that development would have been much slower under ordinary peace circumstances than under the research inspired by the War and its needs. The first outstanding demonstration of the value of the valve in public service was made by the American Telegraph and Telephone Co. when they telephoned across the Atlantic using a transmitter which employed a very large number of small valves operating in parallel. This demonstration was followed by some years of research on this problem which culminated in the opening of the New York-London circuit for commercial telephony in 1927, and, in the meantime, valves of very much greater power had been developed. These were of quite different design to the small receiving valves with glass envelopes. In these large valves a copper anode forming part of the envelope and water cooled, was used to carry away the heat from the valve. This was the so-called water cooled tube. They are now made with power ranging from 5 kw. up to several hundred kilowatts. Shortly after the Armistice, many of the wireless organizations again turned their efforts to peaceful occupations and development now centered largely around the valve, perfecting its use in transmitters and receivers. One of the first long distance circuits to be used on commercial radio telegraph with a valve transmitter was a circuit between Great Britain and Canada. The transmitting set in Glace Bay used about forty-eight 500-watt valves in parallel, with the opening of the valve circuit on continuous wave. The spark transmitter was abandoned on this circuit.

Figure 4 illustrates the nature of the apparatus for conducting wireless telephony. On the left-hand side is the transmitter by which continuous electric waves are thrown off from the aerial. These are altered in amplitude or height by speaking to the microphone *T*. At the receiving station (on the right) the aerial picks up these waves, and

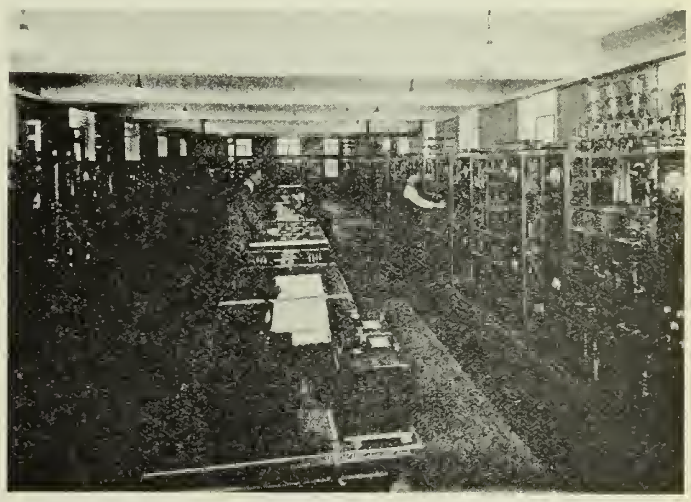

**Fig. 5—Transmitting Room in Modern Trans-Altantic Station.**

they are rectified by a thermionic valve *V* and heard as speech sounds in the telephone receiver *R*.

The next occurrence of importance was the discovery in about 1924 that short waves, that is, waves between 20 and 100 metres, were not as useless for long distance communication as had been supposed. There seemed to be a sudden burst of activity in transmission and reception on these shorter waves. Investigation on a large scale and over long distance did not seem to have been carried out until tests were made by Marconi from Poldhu with a transmitter of the call sign 2YT. During these tests signals were received very clearly in Montreal on a single valve receiver with little or no aerial. This demonstrated at that time that short waves of the order of between 20 and 30 metres could be received quite well during daylight hours but were inaudible during darkness. It was also noted that wavelengths of between 60 and 100 metres could be received quite loudly during darkness but not during the day.

From these tests arose the development of the beam circuit between England and Canada. Theoretically, the transmission was supposed to be directive, that is, more or less concentrated in a small sector. The receiving aerial system was also made so that it would theoretically only be responsive to a small sector in a given direction. This, at that time, was regarded by many as something in the nature of a huge and costly experiment. It was admitted that there might be concentration of radiation in the neighbourhood of the transmitter. It was also thought that it was possible that such concentration would be lost by dissipation and diffusion as the distance from the transmitter increased. Fortunately, however, the installation behaved more or less according to theory, and there was at once concentrated development in many countries in the matter of improving and installing means for short wave directive transmission and reception. At this time the essential difference between long wave and short wave was the relatively small cost of short wave equipment and its relative high speed operation and freedom from static as compared with long wave operation.

Shortly after the conclusion of the test periods on these circuits, another important occurrence in nature became painfully apparent, namely, fading. During certain conditions of the upper atmosphere subsequently associated with sun spots and magnetic storms, there are times when short wave signals will disappear for hours. Theories have been developed for the general behaviour of short waves which involve certain hypothesis concerning the so-called Heaviside layer. This trouble is still experienced but its vagaries are now better understood.

As transmitters are today, it may be generally said that on short wave, transmissions are carried out with valve transmitters, while on long wave long distance transmitters, some of the older means such as alternators and arcs are still being used chiefly as a matter of economy in capital costs. On the receiving side, the introduction of valves brought about a very radical change in design of receivers. One of the most important was the development of the reaction receiver, and another the heterodyne receiver. In the former the output of the valve was fed back upon itself, resulting in a marked amplification due to the cumulative effect. The latter consisted of the use of the output of a local oscillator to beat with the incoming high frequency continuous wave, the difference between the frequency of the incoming wave and the local oscillator being a frequency within audible range. This combination gives a musical note. This was an outstanding development in the detection of continuous wave. In selectivity and sensitivity, another outstanding development was the superheterodyne receiver which in simple terms is the use of a beat oscillator which produces supersonic beats between the incoming signal and the oscillator, this supersonic beat being amplified to a very high degree through what is called an intermediate amplifier and then rectified by a valve rectifier followed by a low frequency amplifier working into a loud speaker. It is the most widely used type of receiver today and owes its popularity to extremely sharp selectivity.

# An Explanation of Modern Sinking Funds

*J. B. Macphail, A.M.E.I.C.,*
*Power Engineering Company Limited, Montreal*

Modern issues of public utility and industrial bonds generally contain clauses providing for the periodic retirement of portions of the issue, but no convenient method has hitherto been available to enable a person with little mathematical training to determine the cumulative effect of these provisions; that is, to determine what proportion of the issue will be retired by maturity or at some earlier date, for this is the really important part of the matter.

The purpose of this paper is to show the quantitative result of a large class of these retirement clauses, covering nearly all modern Canadian issues, where some percentage of issued or outstanding bonds is to be retired annually, together, sometimes, with whatever can be purchased with interest from coupons of bonds previously retired. No tables are known to be available for this purpose, and neither the words of these clauses nor their expressions in mathematical form appear in some text books where one would expect to find them. Perhaps, also, the subject has been thought too difficult to be apprehended by any but the initiate but, as will be seen later, it can be set forth in very simple terms.

There are other methods of retirement now in operation, but they affect only a few issues and are all special cases. A complete treatment of these methods would be out of place here, because they are all different and require individual treatment by one expert in the necessary calculations. They are often interesting, and to take only two examples, there are the Southern Canada Power Company bonds where instead of retirement there is a provision that 15 per cent of gross revenue must be set aside annually for maintenance, renewals, and permanent additions; and for bond retirement only to the extent of any unexpended balance on these accounts: and bonds of Dominion Telegraph Securities where a fraction, just over five per cent of the issue, was held back and deposited with the trustee so that it would accumulate at compound interest to retire the whole issue.

A sinking fund was once considered to be a sum accumulated by periodic payments from current income, which, with the assistance of compound interest, was to retire a debt due at a future date, but the meaning has been extended to cover various methods of periodic retirement of portions of a debt. A complete discussion of what should be done in this respect is also out of place here: it is proposed only to show the future effect of what has been done, and not to consider the adequacy of those results when attained.

Three simple formulae will cover nearly all cases which occur in practice. Their derivation need not be given, because it is necessary only to proceed along the usual algebraic lines of working out the operation of the fund in symbolic form for the first three years, observing that the results in each case can after some transformation be made to form a geometrical series and taking the sum of the series. The results only are given, with examples of their use. They could perhaps have been put in the form of a set of tables, but the necessary multiplication is so simple that anyone can use them in their present form.

Three symbols or abbreviations, common to all cases, are introduced for simplicity and require a little preliminary explanation.

Let $M$ be the amount of the bond issue at time zero. It may often be taken as $100 because the formulae will then give retirements in percentages.

Let $n$ be the number of years, taken to the year end, for which the sinking fund is supposed to have been in operation. If an issue is dated January 1st, 1930, the various transactions which occur on January 1st, 1935, are considered to belong to the end of the fifth year, and the formulae for five years give conditions just after completing these operations. Bond texts and financial reference books are sometimes not quite precise in their sinking fund descriptions, and in that event an extract from the trust deed must be obtained from the trustee. If a sinking fund is described as beginning in 1932, for example, it might commence with a payment at the first of the year, or at the end of the year with amounts drawn from 1932 earnings. But if it is to begin on some given date there is no ambiguity, for zero time is then the same date in the preceding year.

Let $R$ be the amount of bonds redeemed at the end of $n$ years, including redemptions made on the last day of the year.

Coupon rates or retirement rates given in percentages are here expressed as decimals. A 5 per cent coupon is called 0.05 and a 1 per cent retirement rate is written 0.01.

Case 1.—Sinking fund as a percentage ($= t$) of bonds outstanding at the end of each year with no interest on bonds redeemed.

If $Z = (1 - (1 - t)^n)$ then $R = M \times Z$......(1)

and $Z$ is found in Table I for various years and rates.

*Example:*—What percentage of an issue will be retired at the end of the fortieth year if 1 per cent of bonds outstanding at the end of each year are annually retired? From Table I on the line of $n = 40$ in the column $t = 0.01$ find $Z = 0.331$.

So $R = \$100 \times 0.331 = 33.1$ per cent.

Case 2.—Sinking fund as a percentage ($= s$) of bonds originally issued plus interest (at coupon rate $= c$) on bonds previously redeemed.

If $Y = ((1+ c)^n - 1)/c$ then $R = M \times s \times Y$....(2)

and $Y$ is found in Table II for various years and coupon rates.

*Example:*—What percentage of a 5 per cent issue will be retired at the end of the thirtieth year with a sinking fund of one half of one per cent of bonds originally issued plus interest on bonds previously redeemed? From Table II on the line of $n = 30$ in the column $c = 0.05$ is found $Y = 66.44$.

So $R = \$100 \times 0.005 \times 66.44 = 33.22$ per cent.

Case 3.—Sinking fund as a percentage ($= t$) of bonds outstanding at the end of each year plus interest (at coupon rate $= c$) on bonds previously redeemed.

If $Y = ((1 + u)^n - 1)/u$ then $R = M \times t \times Y$....(3)

and $Y$ is found in Table II for various years and for the composite rate $u = c - t$.

Table I

Values of $Z$

| Years | Values of $t$ | | |
|---|---|---|---|
| $n$ | 0.01 | 0.015 | 0.02 |
| 5 | 0.049 | 0.073 | 0.096 |
| 10 | .096 | .140 | .183 |
| 15 | .140 | .203 | .261 |
| 20 | .182 | .261 | .332 |
| 25 | .222 | .315 | .397 |
| 30 | .260 | .365 | .455 |
| 35 | .297 | .411 | .507 |
| 40 | .331 | .454 | .555 |
| 45 | .364 | .493 | .597 |
| 50 | .395 | .530 | .636 |

*Example.*—Assume an issue of \$1,000,000 of 5 per cent bonds. How much of it will be retired at the end of the thirtieth year if there is an annual sinking fund of one half of one per cent of bonds outstanding at the end of each year plus interest on bonds previously redeemed? Since $u = c - t = 0.05 - 0.005 = 0.045$, there is found in Table II on the line $n = 30$ in the column $u = 0.045$ a value of $Y = 61.01$.

So $R = \$1,000,000 \times 0.005 \times 61.01 = \$305,050$

A few further remarks will complete this elementary presentation. Table I has been newly computed, because it is believed, after enquiry, not to have been published before. Table II will be recognized as an ordinary annuity table given in many text and reference books which, however, are not often found in the hands of the public; and even if they were, many people would have to engage an actuary to find the proper page. Hence it is repeated here, and especially so because its application to the present use is not entirely self-evident.

Great exactness is not possible in these calculations, because fractional bonds are not available and the prices at which purchases can be made are not known in advance: nor is it necessary, because for practical purposes a small variation in the amount ultimately retired is of little importance. The compounding of interest semi-annually may be neglected on these grounds.

Table II can also be used when there is an increase in retirement rate a few years after the sinking fund begins, on the assumption that the investment will not until then have attained its full earning power. For example in Canada Cement Company 5½ per cent bonds due in 1947, application of formula (2) on a basis of \$100 issued shows that the 2 per cent rate in the first five year period will retire \$11.16, and that the 3 per cent rate in the second period of thirteen years will retire \$54.87, to which must be added compound interest of (not the compound amount of) \$11.27 or a total of 77.3 per cent retirement by maturity.

Table II may also be replaced by an ordinary compound interest table at the expense of a little additional calculation. A full discussion of all possible uses would not be in keeping with the ideal of simplification which has, it is hoped, been attained in these explanations.

Table II

Values of $Y$

| Years | Values of $c$ or $u$ | | | | | | |
|---|---|---|---|---|---|---|---|
| $n$ | 0.030 | 0.035 | 0.040 | 0.045 | 0.050 | 0.055 | 0.060 |
| 2 | 2.03 | 2.04 | 2.04 | 2.04 | 2.05 | 2.06 | 2.06 |
| 4 | 4.18 | 4.21 | 4.25 | 4.28 | 4.31 | 4.34 | 4.37 |
| 6 | 6.47 | 6.55 | 6.63 | 6.72 | 6.80 | 6.89 | 6.98 |
| 8 | 8.89 | 9.05 | 9.21 | 9.38 | 9.55 | 9.72 | 9.90 |
| 10 | 11.46 | 11.73 | 12.01 | 12.29 | 12.58 | 12.88 | 13.18 |
| 12 | 14.19 | 14.60 | 15.03 | 15.46 | 15.92 | 16.39 | 16.87 |
| 14 | 17.09 | 17.68 | 18.29 | 18.93 | 19.60 | 20.29 | 21.02 |
| 15 | 18.60 | 19.30 | 20.02 | 20.78 | 21.58 | 22.41 | 23.28 |
| 16 | 20.16 | 20.97 | 21.82 | 22.72 | 23.66 | 24.64 | 25.67 |
| 18 | 23.41 | 24.50 | 25.65 | 26.86 | 28.13 | 29.48 | 30.91 |
| 20 | 26.87 | 28.28 | 29.78 | 31.37 | 33.07 | 34.87 | 36.79 |
| 22 | 30.54 | 32.33 | 34.25 | 36.30 | 38 51 | 40.86 | 43.39 |
| 24 | 34.43 | 36.67 | 39.08 | 41.69 | 44.50 | 47.54 | 50.82 |
| 25 | 36.46 | 38.95 | 41.65 | 44.57 | 47.73 | 51.15 | 54.86 |
| 26 | 38.55 | 41.31 | 44.31 | 47.57 | 51.11 | 54.97 | 59.16 |
| 28 | 42.93 | 46.29 | 49.97 | 53.99 | 58.40 | 63.23 | 68.53 |
| 30 | 47.58 | 51.62 | 56.08 | 61.01 | 66.44 | 72.44 | 79.06 |

# DEPARTMENT OF NATIONAL DEFENCE RELIEF CAMPS AND PROJECTS

*Major G. R. Turner, M.C., D.C.M., A.M.E.I.C.* [1]

## DISCUSSION

Mr. Tom Moore[2]

Mr. Moore observed that he appreciated having received an advance copy of the author's paper as there was much contained therein of value in enabling one to understand the extent of the work being carried on and the purpose of the same

He was particularly interested in the chapter on page 4 respecting criticisms of the plan. In this it was stated that it seemed illogical to contend that such personnel should receive prevailing rates of wages in preference to the large number of married men with families who were now unemployed. This statement corroborated the protest that work should not be done by these single men which could and should legitimately be done under proper wage conditions in such manner that either unemployed married or single men would have equal opportunity of employment.

To have taken hordes of single men into Kingston and Barriefield to construct permanent buildings while married men, skilled at their respective trades were compelled to walk the streets seeking employment was, in the eyes of organized labour at least, an injustice.

Further on, referring to preference of men to work at their trade for the 20 cents per day the article said "Many young men who have had no opportunity to learn a trade welcome a job as carpenter's helper, etc., in order that they may qualify as handymen when industry revives." This was one evil which labour had struggled to eradicate over many years and in co-operation with employers had, in Ontario and some other sections of Canada, checked the growth of handymen by the inauguration of qualified apprenticeship plans. It was only aggravating an already acute situation for mechanics to know that with any slight revival of trade they would be met by competition from "handymen" willing to work at less than proper wages and who had been encouraged to become such by those administering these camps.

In direct contrast to this was the statement on page 2 that appointments as engineers and other administrative posts were filled by (the engineers' trade union) The Engineering Institute of Canada, and in the case of the medical by (their trade union) the Canadian Medical Association.

Further, a different scale of payment was established for these which, when board was included, was in many instances not much below that paid by industry generally.

What justification was there for trained mechanics being accorded less consideration both in respect to their manner of hiring and also the rates of pay given to them?

One thing further: Mr. Moore was not sure that the statement on page 5 regarding the conservation corps of the United States being paid only $5.00 per month for personal use was exactly correct. He did know the regulations provided that men willing to allow part of their wages to be paid direct to some dependents were to be given preference for employment.

Mr. Moore in closing observed that he trusted that his criticisms would be accepted in the same friendly spirit in which they had been made, as his only purpose was to endeavour to make Labour's protests better understood.

Major G. R. Turner, m.c., d.c.m., a.m.e.i.c.[3]

The author remarked that Mr. Tom Moore had made several observations which were of interest as indicating his reaction to the scheme.

These observations, which had been made in a friendly spirit, could not be interpreted as indicating any hostility to the scheme generally, but as emphasizing certain features which organized labour considered undesirable. In view of this and of the cordial relations which existed between Mr. Moore and the officers of the Department of National Defence charged with the responsibility of this scheme, it was desired to make it quite clear that his observations were accepted in the spirit in which they were given, and further, that comments on his observations were given in a similar spirit, the object being merely to invite attention to the factors which appeared to justify those features to which Mr. Moore took exception.

Mr. Moore considered that the statement that "it seems illogical to contend that single homeless unemployed should receive prevailing rates of wages in preference to married unemployed with families" corroborated Labour's protest that work, such as the building construction at Kingston and Barriefield, should *not* be done by these single men which could and should legitimately be done under proper wage conditions and in such a manner as to give either unemployed married or single men opportunities of employment. The answer to this criticism was that these buildings anticipated the ordinary programme of the Department by a number of years and, in consequence, no skilled mechanic was being deprived, either now or in the near future, of any work through the construction of these buildings as a relief project for single homeless men. In fact, the lack of skilled relief personnel on the projects at Kingston, Barriefield, Trenton, etc., had afforded opportunities of employment to certain married men in those vicinities which they would not have had if these relief projects had not been instituted.

Mr. Moore condemned the principle of affording opportunities to young men to work as carpenters', etc., helpers, and so be handymen when industry revives. He stated that organized labour had struggled for years to inaugurate qualified apprenticeship plans and to eradicate the evil of the "handyman" who was willing to work for less than proper wages, and so offered serious competition to skilled mechanics. Perhaps the intention of the clause "in order that they may qualify as handymen when industry revives" might be more satisfactorily expressed in the words "in order that they may qualify for more remunerative jobs than that of unskilled labourers when industry revives." Fair wage schedules of the Dominion and various provincial Departments of Labour made provision for higher rates of wages for "helpers" for various trades and for "skilled labourers" than were prescribed for "unskilled labourers." There was no intention whatsoever of producing a number of "handymen" to replace or compete with skilled tradesmen when industry revived; the object was merely to give these young men who, through no fault of their own had been unable to learn a trade, opportunities of learning the rudiments of a trade or trades, becoming "handymen" with tools, and so be able to be classified as "tradesmen's helpers" or "skilled labourers" when they left the projects for normal employment. No man could learn a trade unless he obtained practical experience in that trade and surely it was not unreasonable to give these young

(1) Paper presented before the Annual General Professional Meeting of The Engineering Institute of Canada, and published in the February 1934 issue of The Journal.

(2) President, The Trades and Labour Congress of Canada, Ottawa, Ont.

(3) General Staff, Department of National Defence, Ottawa, Ont.

men every opportunity to acquire knowledge and experience and fit themselves for something more remunerative than jobs as unskilled labourers. The primary purpose of this relief scheme was to increase the morale of the personnel afforded relief, and this could not be done by denying ambitious personnel any opportunities that might be presented of acquiring knowledge and experience of a trade.

Mr. Moore had remarked that, in direct contrast to the treatment accorded the skilled mechanics, was the filling of the technical appointments by The Engineering Institute of Canada, which he designated as the "engineers' trade union." However, the paper specifically indicated that these appointments were filled for the most part by "*nominees*" of The Engineering Institute, and it could not be too strongly emphasized that The Engineering Institute had *not* restricted its nominations to its own members. It had given consideration to qualified unemployed engineers in need of relief whether they were members of The Institute, members of the Provincial Professional Engineers Associations or non-members of either. This appeared to be a feature of The Institute's activities that should be generally commended and that should considerably enhance its value and prestige among the members of the engineering profession as a whole.

Mr. Moore asked what justification existed for trained mechanics being accorded less consideration than engineers, doctors and others on the supervisory staffs both in respect of method of hiring and rates of pay, stating that the rates given the supervisory staff were, when board, etc., were included, not much below that paid by industry generally. Mr. Moore had apparently overlooked the fact that positions on the supervisory staff were normally filled by married men with dependents, whereas the relief labourers were single and homeless. Further, even $100.00 per month (the maximum rate of allowance) did not seem excessive for a graduate of any of our universities who had expended a considerable amount on his education and no one of either the engineering or medical professions would agree that the rates of $40.00 to $100.00 per month (and only a few received the $100.00 rate) were too high compared with those paid by industry generally, even under present conditions.

Finally, Mr. Moore questioned the accuracy of the statement that personnel of the Civilian Conservation Corps in the United States received only $5.00 per month for personal use. To quote from a paper presented by Professor Nelson C. Brown of the New York State College of Forestry at the recent convention of the Canadian Pulp and Paper Association in Montreal, Professor Brown then stated that each enrollee assigned $25.00 from his $30.00 monthly pay direct to his dependents, and also remarked that distress had been definitely relieved in homes by the contribution of $25.00 per month out of the monthly wage of $30.00. Also an article by Mr. Robert Fechner, Director of Emergency Conservation Work, published in the New York Times of February 4th, 1934, stated that the men received $30.00 per month, of which about five-sixths was sent directly home by the War Department to the families of the enrolled men.

G. McL. Pitts, A.M.E.I.C.[4]

Mr. Pitts suggested that the scheme should act as a "relief valve" during normal business periods, as well as in times of great stress such as the present. If The Engineering Institute of Canada were to associate more closely with this scheme it would do a great deal for the community and would at the same time greatly increase its prestige. He wished to know if it would not be possible to use this type of project for the maintenance of highways and airports particularly in the winter.

Major G. R. Turner

The author replied that these projects were merely to care for the men until they were assimilated into industry by normal employment demands. Out of one hundred and twenty-three projects, thirty-five were landingfield projects, as part of the trans-Canada airways. At present in Alberta and British Columbia projects were instituted for highway construction and Ontario had relief projects for highway construction under provincial arrangements. "Snow removal" projects had not been considered.

W. McG. Gardner, A.M.E.I.C.[5]

Mr. Gardner wished to know if there were any more projects in view in the near future.

Major G. R. Turner

Major Turner answered that the main difficulty was in selecting suitable projects that could be executed economically during the winter due to our climatic conditions.

Dr. A. Stansfield, M.E.I.C.[6]

Dr. Stansfield wished to know why there were so many more camps in British Columbia than elsewhere.

Major G. R. Turner

Major Turner replied that it was due primarily to climatic conditions, and secondly to the fact that a large number of transient unemployed normally migrate to British Columbia from the Prairie Provinces after the harvest season.

Major LeRoy F. Grant, M.E.I.C.[7]

Major Grant stated that from personal observation he had noted that both the morale and the spirits of the men in these camps were raised, that the men were satisfied and indeed pleased, with the community life. He also remarked that those in charge declared that they received full value in work from the men, this considering all the expenses such as food, clothing, wages, etc.

G. J. Desbarats, M.E.I.C.[8]

Mr. Desbarats drew attention to the benefits which should accrue to The Institute, due to the assistance which had been given in forwarding this relief scheme. He stated that The Engineering Institute of Canada had been the means of placing many married men on the supervisory staff, at low pay, but enough to keep them going and to carry them along until they could get back into their rightful places in the world. The action of the government in giving preference to engineers for these positions had been of great value.

# THE UTILIZATION OF MAGNESIAN CARBONATES

*F. E. Lathe*[1]

## DISCUSSION

W. G. Worcester, M.E.I.C.[2]

Professor Worcester observed that the author's paper had proved so interesting that he wished to express his appreciation of the value of such work, the first of its kind in Canada, to the refractory and metallurgical industries of the Dominion.

He had studied the paper from the view point of a ceramic engineer, and felt that the author and his co-workers were to be congratulated on their attack on the problem and the successful outcome, in that they were pioneering with an unsatisfactory and unproved raw material. Further, they had carried the work to a point where laboratory results had been reproducible under commercial conditions, so that today industrial plants were operating successfully and economically on the new Canadian refractories. Thus the position of the Dominion had been altered from that of an unsafe dependency upon importations of magnesian refractories to one of independence.

Professor Geo. A. Guess[3]

Professor Guess stated that the first impression one was apt to obtain in reading the paper was perhaps the benefit which this industry in Quebec had derived from research. The author was naturally excused for stressing this, but from the metallurgists' point of view the interesting thing was that he had developed two new and valuable refractories.

The first was a prepared material ready for patching a basic furnace or for producing a monolithic basic bottom in a new furnace. The second was a refractory brick with great resistance to sudden temperature changes. The author had stated that the addition of chromite reduced the shrinkage in burning. Since it also reduced the spalling one would expect the coefficient of expansion to be lower. Magnesite brick had a high coefficient of expansion and a high heat conductivity. Therefore, it would be interesting to know what these values were for the new basic brick.

Mr. F. E. Lathe[4]

The author in reply to Professor Guess observed that the coefficient of expansion and thermal conductivity of this compound had not been determined, but presumably they were between those of magnesite and chromite. The increase in spalling resistance had been brought about by properly proportioning the grain sizes of the two constituents; it was quite independent of shrinkage.

The shrinkage in burning was quite a different question. Chromite and magnesian clinker, when burned alone, each had a large shrinkage, yet when properly combined the shrinkage could be practically eliminated.

A. Stansfield, D.Sc., M.E.I.C.[5]

Dr. Stansfield remarked that some of the early attempts to utilize the Canadian magnesian carbonates for furnace linings, by sintering in admixture with iron ore, had been made in his laboratory about 1917 by Mr. J. R. Donald, M.E.I.C., and others, and also several pounds of electrically fused magnesia from the Grenville deposit had been produced. It was extremely satisfactory to recognize the work that had been done since 1925 by the staff of the National Research Council and their co-workers, and to realize what an advance had been made, not only in the utilization of the Canadian carbonates, but also in the wider field of basic refractories.

The deposits in the township of Grenville might be described as "magnesitic dolomites." They were supposed to be unsuitable for use in open-hearth furnaces in place of Austrian magnesites because they contained too much lime and were deficient in iron. During the war this material had been sintered with the addition of iron ore, making a refractory that could be used in furnaces, but it had not been as good as the Austrian clinker and so could not retain the market when the latter was once more available. The industrial researches described by the author had not merely overcome the original handicap of the Canadian material, but had produced a basic lining that was superior to the best natural magnesian clinker.

When lining an open-hearth with Austrian clinker, the refractory, in rather coarse grains, was mixed with about one third of its weight of basic slag and shovelled into the furnace. The slag melted and cemented together the almost infusible grains of magnesite and in time, as the slag dissolved magnesia from the adjacent grains of refractory, the slag itself became less fusible, so that the whole lining remained solid at the high temperature of the open-hearth furnace. As, however, the spaces between the grains were of considerable size and as the mixing of the refractory with the slag must be far from perfect, a long time must elapse before the added slag became sufficiently refractory, and there might be places in the lining where some of the slag remained molten and could be washed out by the molten steel or slag of the furnace charge, leaving cavities that would lead to a serious breaking up of the lining. The new basic refractory had been so constituted that there was no need to add any slag when making the hearth. The necessary fluxing material had been intimately and evenly mixed by machinery and each minute grain of periclase was surrounded by the necessary minimum amount of bond, so that the operation of bonding or setting was more rapid and there could be no pockets of fusible slag to cause the destruction of the lining. As no slag was used to fill the cavities between the larger grains of clinker, the product was carefully graded so that there was enough of the smaller sizes to fill these spaces completely, forming, after setting, a truly monolithic lining.

Magnesite bricks were extremely valuable for use in the construction of furnaces that had to stand very high temperatures, and would be more generally used if it were not that they spalled very seriously when exposed to sudden changes of temperature. The new bricks described by the author, which were composed of finely crushed Canadian magnesitic dolomite clinker mixed with coarsely crushed chromite, scarcely spalled at all under the most severe conditions; they should last much longer than the older type of brick and could be used in many places for which the older brick were unsuitable.

This industrial research illustrated the value to industry and to the Canadian people of scientific training and of original thought that was not bound down too closely by the existing methods of reaching a desired end. It also illustrated the necessity for team work. It was seldom that any one man, no matter how capable, could completely solve any of the industrial problems that con-

(5) Professor of Metallurgy, McGill University, Montreal.

tinually presented themselves, but a combination of men who had been trained in scientific research and industrial workers who were familiar with the technical requirements and the limitations of large-scale operation could usually achieve success. Lastly, in this time of industrial depression, when the National Research Council had been considered by many as a luxury that should be dispensed with, it was satisfactory to realize that its action in this particular had been fully justified.

F. D. Adams, Ph.D., D.Sc., Hon.M.E.I.C.[6]

Dr. Adams stated that he had been a member of the National Research Council when they decided to undertake this work. In his opinion, the Canadian railways had benefited by a large sum annually due to the utilization of these deposits; there had been an increase in coal consumption; exports of magnesian products had increased and imports had decreased. He believed that the results of the research would practically establish some new industries.

L. F. Goodwin, Ph.D., M.E.I.C.[7]

Dr. Goodwin suggested that figures relating to tonnage and value be included in the author's paragraph pertaining to the commercial development of this industry, also that they include some figures on imports and exports of magnesian products. He would be interested to know what the effect was on Austrian magnesite imports, where the various chromite products could be obtained, and how it happened that the excellent flooring had been developed so recently when the results of investigations had been known for so long.

Mr. F. E. Lathe

The author observed that he was not at liberty to give tonnage figures and they would have to be obtained from Canadian Refractories Limited. He could only state that sales had been greatly increased in spite of the severe depression in the steel industry; an active sales campaign had been partly responsible for this. Austrian magnesite brick were still being imported, as the new brick were not yet being manufactured in Canada. The brick used in this country were being brought in from England, where they had been manufactured under the instructions of one of the Canadian research men. At the present stage they were producing variety rather than large tonnage, but it was hoped that American manufacture would soon be arranged, making possible large-scale applications of the new brick in Canada.

Replying to Dr. Goodwin's question in regard to plastic magnesia, he stated that a difficulty in the application of the Canadian material lay in the fact that there was much dolomite in the rock, and ordinary calcination decomposed this, forming free lime, which was very detrimental to the quality of the product. This difficulty had been overcome by carefully controlled calcination, followed by the addition of magnesium sulphate to neutralize any small amount of free lime formed, with the result that there was no free lime in the product. Foreign plastics contained little lime, but this was usually all in the free condition, so that they were inferior in this respect. A second difficulty in the use of any plastic magnesia was that it was very hygroscopic, and imported plastics often contained much magnesium hydrate. The Canadian plastic was being marketed in containers practically moisture proof. In general it might be said that any condition resulting in the formation of magnesium hydroxide was detrimental, whether this was due to the absorption of moisture from the air, the use of too weak magnesium chloride solution, or to any other cause.

H. J. Roast, M.E.I.C.[8]

Mr. Roast mentioned Dr. Donald's work on plastic magnesia and stated that a cathedral in Montreal had a Canadian flooring which, although not perfect, was still giving service after many years. He inquired whether the magnesium sulphate used in the neutralization of lime was added in the solid or liquid condition.

Mr. F. E. Lathe

The author stated that in practice the calcined plastic was analyzed and the calculated amount of magnesium sulphate was added to it in solid form, before grinding. It could, if necessary, be added to the magnesium chloride solution at the time of making up the flooring mixture, in which case it would be in liquid form, but this method was not recommended, as it was more difficult to determine the proper amount of magnesium sulphate to be added.

# Recent Progress in Light Sources

*Samuel G. Hibben,*
*Director of Applied Lighting, Westinghouse Lamp Company, Bloomfield, N.J.*

**Paper presented before the Hamilton Branch of The Engineering Institute of Canada, December 12th, 1933.**

*(Abridged)*

Useful kinds of artificial lamps and portable lighting devices have existed for three thousand years. Farther back than that it was a matter of the fagot or the bonfire if anything at all. The incandescent metal filament lamp has been in existence for only about thirty years. The first incandescent lamp for exterior decorations at the World's Fair in Chicago appeared about forty years ago. (See Fig. 1.) The filamentless or gaseous conductor lamps are some three years old, so modern illuminants have not been freely used for any considerable time.

The following table of efficiencies in lumens* per watt of consumption illustrates the progress made in lighting.

| Date available | Type of source | Amount of light per unit of energy used |
|---|---|---|
| 1879 | Early filament lamp | 1.4 |
| 1893 | Carbonized filament lamp | 3.3 |
| 1905 | Metalized filament (carbon) | 4.0 |
| 1906 | Tantalum metal filament | 4.8 |
| 1907 | Squirted tungsten filament | 7.9 |
| 1911 | Drawn tungsten wire | 10.0 |
| 1913 | Inert gas-filled lamp | 12.6 |
| 1926 | Mazda (inside frosted) lamp | 13.2 |
| | Best Mazda (projector type) | 25.0 |
| | High pressure mercury | 40.0 |
| | Sodium vapour lamps | 50.0 |
| | Solar disc (at 6,000 degrees C.) | 80.0 |

This brings to the fore the question of lamp life and efficiency in so far as it affects the pocket book, because it is the desire of everyone to obtain the most light for the least money. Many times one has heard expressed that

*A lumen is the measure of the quantity of light which will produce the illumination of one foot-candle on an area of one square foot at a distance of one foot from a light source. A uniform source of one candlepower emits $4\pi$ lumens.

"lamps do not last as long as they used to do." In many instances they do not, and in many services they should not! If one wants an inefficient, long-life lamp, he can have it, but if a modern, efficient medium-lived is required it also is available. If one wants a very high efficiency short-life lamp, he may have that too.

Consider for example a series of 60-watt lamps, all consuming the same amount of power, but differing only in the matter of life and efficiency.

Fig. 1—Replica of "Stopper" Lamp.

The first lamp will, barring mechanical breakage, have a life of one thousand years. That is its "rated" life, but it does not emit light. The next will live eighteen thousand hours, producing a little light, but with a shorter life. Next there is one that will burn five thousand hours, still somewhat brighter, but not bright enough. Then the one thousand-hour lamp which is the lamp of commerce today. This gives a good bright light of reasonably white colour, with a fair average life. Still, it may not be the best design because if one were willing to sacrifice a little life and use the seven hundred and fifty-hour lamp it would be possible to obtain still more light. A fifty-hour lamp may sometimes be satisfactory if it is going to be used for a short time a week, as a cellar light, or for occasional fine work like sewing or engraving. To take photographs or if a great deal of light was wanted with little need for life, a five-hour lamp should be burned. It emits 1,870 lumens, compared to 740 lumens from the one thousand-hour lamps.

Thus there are the two extremes,—five hours, to many years. The range of filament lamps is interesting, since an increase in efficiency results in a shorter lived lamp but with a tremendous gain in usable light. The cheapest lamp is that which produces its light the cheapest; not the one which merely lasts a long time.

These various lives have gone in extreme directions. For instance the long life lamp we would use for an infra-red or heater lamp, with possibly a life of many years if continually burned, but designed to produce heat and not visible radiation. Its uses seem destined to multiply rapidly.

At the other extreme is the lamp whose light is emitted for less than 1/100 of a second. It is the common photo-flash lamp in which there is a certain amount of oxygen and aluminum foil so that it burns almost instantly emitting more than four millions of lumens in a fraction of a second. Pictures can be taken without such a discomforting flash if a specially coloured bulb is added. Such a lamp is used to take pictures of animals, sports events or courtroom scenes, or wherever glare is to be minimized, without sacrificing the actinic value so necessary to good photographic results.

The photoflood lamp of approximately one hour's life, for taking motion pictures, is a very efficient photography and emergency service lamp. Another recent addition is the long tubular lamp of filament type used in the Century of Progress street lamps in Chicago. A considerable sale is now being found for lamps with two filaments of different candle-powers within the same bulb named the "three-light" lamps. These have a double contact base so that one may have a 200-watt lamp or a 300-watt lamp, or by burning both filaments a 500-watt lamp, thus giving greater flexibility in illuminating stores and shops. (Fig. 2.)

Sealing of the lead-in wires or connections to a lamp bulb in the form of a sphere so as to resist crushing, and developing a self-sealing tight connection so the lamps can be used under water provides a submarine or diving lamp useful beneath the surface of the ocean. It took about three years to discover how not to make such lamps. Attempts were made to seal wires inside a pipe with suitable materials to resist high pressure, but that proved exactly the wrong way to do it. The only way to effect tight joints, is to wrap the wires loosely with rubber tape and let the pressure of the water seal it. About 100 or 300 feet down, the pressure of the water is so great that the rubber tape is moulded into a solid block and sealed. Dr. Beebe, who has gone down 1,000 feet in the ocean for the observation of fish and marine phenomena, uses divers' lamps of this kind as lures.

It is quite possible to obtain light without going through the medium of heat, and without heating up a metal as is done in a tungsten filament lamp. Whether light is considered as a series of waves of projection, or as quanta, like shots, the ordinary atom of the molecule in the element has been thought of as consisting of a nucleus of a positive charge of electrical energy or "proton" and a series of rotating "planets" of negative charges around the centre as in the solar system. The orbits have various radii, these negative

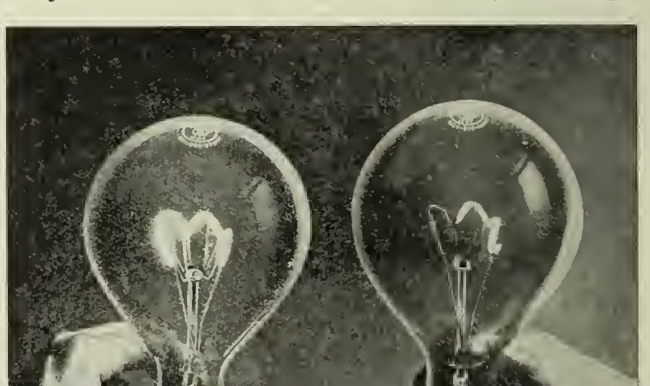

Fig. 2—Three-Light Lamps.

charges balancing the positive charges. What is being attempted is to dislodge these negative charges out of their orbits, for the purpose of man's lighting need—out of their respective paths around the nucleus. If the radius of a negative charge moving around its nucleus is changed, and then allowed to fall back to its old orbit, there will be a giving up or freeing of the energy put into it, and that freed energy may appear as luminous energy or visible radiation. When it is stated that a certain atom is "ionized" it simply means that a charge or electron is dislocated out of a certain path of revolution.

Most scientific research starts with observing Nature's wonders. In the higher latitudes, on nights in winter, of sudden temperature changes, ionization of the gases of the atmosphere may be found and those gases become luminous under the influence of the earth's polar electrical field. This is called the aurora borealis. Crypton, xenon, argon, nitrogen are possible illuminants. Everyone is familiar

Fig. 3—"Black Bulb" Ultra-Violet lamp.

with the glass tubing used with neon gas. Neon is ionized by bombarding the gas atoms with a stream of electrons in the tube, and there results the orange yellow glow. Each gas has its especial spectrum or composite colour.

Most of the tubing in outdoor signs contains neon (orange) or mercury (blue) or helium (cream). They consume on the order of 10 watts per foot of tube, and require high voltage to start. Very little light is obtained from these tubes, say 3 or 4 lumens per watt, compared to 20 from filament lamps, so the ordinary sign tubing is not so good as an illuminant *per se*. One can increase the pressure of the gas as is being done now in metallic vapour lamps, and get 30 or 40 lumens per watt. Heat the electrode or cathode and thus increase the storm or flow of electrons from such, and thus increase the output of light.

Included in the hot cathode type of vapour lamps are neon, mercury, zinc, sodium and several others. Some of these are in the form of a bulb rather than in the form of a tube. The mercury lamp of a hot cathode type of vapour unit in a bulb gives a blue spectrum. There is a limited current flow, and by putting the electrodes within a bulb instead of a tube more convenient shapes for reflectors may be achieved.

Mercury vapour may show ultra-violet or short wave radiation, too short to be seen by the human eye. Ultra-violet radiation has many uses among which is that of increasing the lime and phosphorus content of the blood and so improving the condition of the bones, teeth, finger-nails. As a body treatment it will tan the skin and aid in curing certain diseases chiefly of the outer surfaces. It will also develop ozone in the air, to purify or sterilize.

Extremely short waves, from special lamp types, will produce tan or sunburn in two or three minutes. Short wave ultraviolet can speed up the tanning of leather, aid in the detection of oils in sewage, the testing of pigments as against sun-fading and the fastness of dyes—useful in a hundred different ways.

In the production of this "black light" the hot cathode type of lamps can be used in producing mercury spectra. Practically the only "light" escaping will be of the short wave length invisible to the human eye but visible if photographed. (See Fig. 3.)

In 1933 an interesting sodium vapour lamp installation was made at Port Jervis, N.Y., where some 3,000 feet of concrete highway is illuminated using ornamental steel standards spaced 125 feet apart along the outer edge of the roadway, 6 feet from the paving line. (See Fig. 4.) This is a two-lane 30-foot width highway extending from the edge of the business district into the suburbs and constituting part of a main artery for east and west traffic. Mounted on the top of each standard at a height of approximately 14 feet is a Westinghouse sodium vapour lamp bulb nominally rated at 4,000 lumens, enclosed in a heat-insulating vacuum cylinder or flask, and in turn surrounded by a glass bowl refractor. The ornamental steel pole and lighting fixture includes a special light density opalescent outer globe, some 18 inches in diameter.

Within the base of each post is mounted a transformer operating on the 6.6 ampere series primary circuit and delivering to each sodium lamp, through the four-wire secondaries up the posts, the two voltages required for lamp operation. The series circuit for this group of sodium lamps is part of a straight a.c. system now feeding other series filament lamps in the city, and from a standard automatic tub transformer. A clock switch throws in the lamps at dusk and they burn until dawn, approximately fourteen hours.

As lighting science progresses it is opening out into so many enlarging fields that there is no end in sight in the development of illuminants and lighting research.

Fig. 4—Highway Lighting with Sodium Vapour Lamps.

THE
# ENGINEERING JOURNAL
THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOLUME XVII APRIL 1934 No. 4

## Municipalities and Engineering Services

Some time ago the Council drew the attention of The Institute's members to the course taken by certain municipalities in advertising for tenders for the professional engineering services required for the design of their waterworks, sewage treatment plants or other public works. It was pointed out that this practice is not only open to serious objection from the engineers' point of view, but also is not in the best interests of the city, as leading to a form of competitive underbidding which makes it unlikely that the city will obtain services of the highest character. A city father with a troublesome appendix would hardly ask for competitive bids from surgeons for the necessary operation, nor would he receive them if he did so, but apparently he has no hesitation in regarding an engineer's professional skill and experience as an ordinary article of commerce to be purchased at the lowest price obtainable. The efforts of engineering societies to discourage this kind of thing, and the publicity given to such cases have not yet resulted in entirely preventing their repetition.

Quite recently there have been instances where the practice has taken a somewhat different form. Early this year, for example, a city in Ontario needed a city engineer, and advertised the vacancy, requiring applicants to state the salary they require. This action is not only expressly forbidden by Section 253 of the Ontario Municipal Act, R.S.O. 1927, and its amendments, but is evidently unethical, for it is, in fact, another form of competitive underbidding.

Cases of this kind have been considered by the Council of The Institute, and in Council's opinion members of The Institute should refrain from replying to advertisements of this character, or, indeed, to any enquiry made under conditions which render it doubtful whether the best man available will receive the appointment.

## Institute Members and The Journal

Among the engineering societies of the world there are few whose main body of membership is distributed over so wide an area and engaged in such widely diversified branches of engineering as is the case with The Engineering Institute of Canada. In an organization of this kind there is special need for some means of regular communication with all the members, in the form of a periodical which will keep them informed of each other's professional and social activities, will further their mutual interests and will serve as a medium for the interchange of professional knowledge.

In fact, such a magazine must be more than a mere record of the proceedings of Council, or a collection of the technical papers presented at meetings. It should in addition be available as a kind of forum for the membership, affording space for notes and correspondence giving members' views on technical problems or questions of the day. It should reflect the ideas of the thoughtful engineer, and encourage their presentation to the membership for discussion.

Since it was established in 1918, The Engineering Journal has won for itself a definite place in the growing array of technical periodicals. It differs from most of these in being owned by those who contribute the bulk of its contents. It has amply justified the enthusiasm of its founders and has knit together the twenty-five Branches of The Institute in a way which would have otherwise been impossible. Its technical articles have recorded the varied engineering activities of The Institute's members. In the Branch News will be found the story of the proceedings of our Branches. Its Personal items are consulted by members all over the country for tidings of old friends and acquaintances from whom they have long been separated.

But there is always room for improvement in a magazine of this kind, and the Editor would like to point out two features, which, with the active help of the membership, it would be possible to include, which in his opinion would add materially to the interest of The Journal, and which, most important of all, could be made effective without any additional drain upon the funds of The Institute.

For some reason or other, many of our members seem reluctant to see themselves in print. Apart from the larger works which furnish subjects for important professional papers, there are many engineering projects of lesser scope which present features of technical interest, particularly to the younger members. Why are these not described in brief, pithy articles by those who are familiar with them? Why do members hesitate to tell others of the dodges they have had to evolve or the gadgets they have had to devise to get over some difficulty or to make good some mechanical or electrical defect? No doubt many engineers feel that the problems arising in their daily work are of so ordinary a kind that they cannot be of interest to others. This may be true in a few cases, but in many instances such information would prove most helpful to those engaged in similar lines of work. Will our members, particularly the younger ones, take note of this and render a service to The Institute and to themselves by contributing material of this kind?

The correspondence columns form one of the most interesting features in the monthly magazines of several of our sister societies. Some of the letters they contain comment upon the subject matter of papers previously published, others give the writers' views on some topic of the day. All form part of a body of discussion which is readable and informative, and affords to those who take part in it admirable practice in the art of expressing oneself clearly and tersely. Why do we not have more material of this kind in The Journal? Surely it is not because the average member does not think, or cannot put his thoughts into words. Taking a few topics at random, has he no ideas on such subjects as slum clearance, fishways, the depreciation of electrical machinery, the post-graduate education of engineers, or traffic regulation in cities? No apology is needed for bringing these matters to the notice of our readers.* The Journal depends for its contents upon our members, who have it in their power to supply or withhold the material we need to make our chief publication worthy of The Institute and fully representative of its membership.

The Journal's Board of Management and the Editor invite all members who can do so to co-operate by sending in contributions likely to be of interest to their fellow members, whether in the form of professional papers, notes, letters or memoranda. They are asked to contribute to our correspondence columns, and to submit discussion and comment on papers previously published or on topics of engineering interest. If they will do this, The Journal will continue to gain in interest and popularity and will become increasingly effective as the organ of The Engineering Institute of Canada.

## Address of Sir William Clark, K.C.S.I., K.C.M.G., High Commissioner for the United Kingdom

**At the luncheon held on Thursday, February 8th, 1934, during the Annual General and General Professional Meeting of The Engineering Institute of Canada, held on February 8th and 9th, 1934, in Montreal.**

It is a great pleasure to be the guest of this Institute which represents so comprehensively the distinguished and honourable profession of the engineer. I use those adjectives advisedly, gentlemen, for yours is the outstanding profession of this age. You and your predecessors, the inventors, the scientists, the engineers of previous generations have been the architects of this modern civilization of ours, and have brought about wonderful changes within the last century. It is hard to realize that if a man of the Augustan age had been transported across eighteen centuries to the Napoleonic era, he would have felt much more at home than a man of the Napoleonic era if transported across one century to our own times.

Through those eighteen centuries, for example, the world had to be content with the horse for locomotion. When Napoleon drove across Europe in the travelling carriage, he probably passed over worse roads than those along which the Romans marched and which made their great Empire possible.

You and your predecessors have brought the world into one close unit. You are the magicians. As a layman, I have no idea how you do it, or why it is that the bridges you are going to talk about this afternoon, stand up. I don't know how your complex machines work. When I am taken through some vast plant, and am half deafened with the noise, I realize that the only thing to do is to cease to ask for information and merely to realize what very great men you are.

But, gentlemen, recently, I am sorry to say, some doubts have been expressed. It has been suggested that your influence in the world has not been wholly beneficent, but instead of being a benefit your work may actually have become a detriment to the prosperity of the world. It has been said that the extent of your activities, the extent of the mechanization for which you are responsible, has caused at one and the same time, over-production and unemployment, and, indeed, as some people argue, has precipitated the crisis through which we have all been passing. If that were true, it would be a very serious business for the world because it would mean that humanity would have to forswear further progress in the lightening of its burdens.

But, as a matter of fact, it is not, I believe, a tenable theory. I think you will agree with me that it is one of those *a priori* theories, which look plausible at first sight, similar to that of the people who tell you that unemployment is merely the result of over-population. What is true is this: that the rapidity with which new processes have been developed, new inventions and new industries have been created, has created disturbances which have contributed to the derangement of our economic equilibrium, but that is a different thing from arguing that progress itself can be an evil.

A very obvious example is the course of events in the nitrate industry. A beneficent providence decreed that near the Pacific coast of South America should be found vast deposits of nitrate of soda which were subsequently carried both to our own country and all over the world, creating wealth and aiding transportation, commerce and production. The same Providence also decreed that there should be nitrogen in the air, free to all, and now as the result of the work of busy engineers, the same nitrate is made much more cheaply from the air. The result has been the bankruptcy of a great industry, great losses to shipping and the impoverishment of one of the most prosperous of the South American nations. Nevertheless, a balance of advantage to the world undoubtedly remains.

The reason why the theory started that over-mechanization produced the slump is, I think, that in certain industries undoubtedly there has been—and certainly on this continent—over-expansion of plants, due partly, no doubt, to uneconomic, anarchic competitiveness on the part of the people in charge of those industries, and partly to what may be called an over-development of the machine mentality.

Such over-development no doubt contributed to the general disturbance, but was not one of the primary causes. I was reading the other day a book written by a friend of mine, a distinguished economist, whose books I sometimes buy, not merely because he is a friend, and still less because he is a distinguished economist, but because his books, unlike those of most other distinguished economists, are intelligible and therefore flattering to my limited understanding. He demonstrated very clearly, by the use of statistics, that even in 1929 there was not actually in the United States a larger expansion of industry in general than the income of the time justified, but there was over-expansion in certain industries which certainly contributed to the general derangement of financial equilibrium.

So far as Great Britain is concerned, it has been an advantage to us that since the War there has been little over-expansion of that kind. I don't say that we have been wiser than the people on this side of the Atlantic, but circumstances have been different. Between 1925 and 1929, we did not have a boom. We went back to the gold standard in 1925 and that meant a period of deflation. We did not participate in the advantages of other countries during that time and were not tempted to launch into heavy fixed capital commitments. That has proved an advantage during the slump, because our plants have had a smaller proportion of idle capacity. It has meant that our industrial concerns have been able to conserve their resources, and to use them for expansion and improvement, now that better times are in view.

The turn of the tide in Great Britain came with our departure from the gold standard in September 1931.

That relieved the monetary tension. It took some time to have its effect. The bank rate was at first maintained at a high point to protect our gold reserves, but from about February or March, 1932, the Bank of England reduced the bank rate and started buying securities in the open market; and thus paved the way for the great conversion operation of the summer. The success of that operation was of immense importance; not only to us, in the saving of interest on our large national loans, but also for the rest of the world. We have established low rates for long-time borrowing by good borrowers in London, and for that matter, elsewhere.

We have to confess that the national extravagance in our expenditure helped to precipitate the crisis but, none the less, the intrinsic financial situation in England was, in effect, sound. Our great banks had tucked away hidden reserves and profits made in better times and they entered the depression in so strong a position that there has never been any whisper during the depression of any trouble in that direction. You in Canada know what an immense difference it makes when banks are in that happy state—what an immense difference it makes to have the support of a sound and strong banking system!

This fundamentally sound situation shows itself in another way in the recovery recently of the capital market. It shows that there are still savings laid away and that investors have recovered confidence. In the last year, just finished, we have been able to lend a hundred and thirty million sterling. It has been mostly utilized at home and much of it in industry, which shows that industry is on the upgrade. Not much went overseas—but some thirty million of it went to the British Empire.

As to the improvement in national finances in Great Britain, the revenue returns for the first nine months are very encouraging. Our system is rather a peculiar one. The income tax comes in in the last three months of the financial year so we always run a deficit for the first nine months, covered by borrowing on treasury bills. Last year the deficit was over two hundred million sterling at the end of the year and this year it is only one hundred million. That is partly due to an increase of twelve millions in revenue, but the larger improvement was on the expenditure side with a saving of fifty-five million. It was a tremendous saving, due mostly to the saving on interest in the various conversions which have taken place, and also in the low rate of treasury borrowing.

We are full of hope about getting our taxes a little lower. Hope is the only thing that isn't taxed in England at the present time and we are looking forward with a reasonable modicum of it to the budget speech. Even the Chancellor of the Exchequer has permitted himself some optimism in a recent speech.

The other great advantage we have had, apart from the advantage of going off the gold standard, was the adoption of a tariff. Whatever view any of you may take on the fiscal issue, I think you will agree that a tariff when first put on is bound to be a very useful stimulant. Let me give an illustration from dynamics. Suppose somebody has taken in succession—a rash thing to do—five cocktails. I think you will agree that he gets a better, more effective kick, between zero and the first cocktail, than between the fourth and fifth.

That is a fair parallel as between our fiscal policy and that of other nations. During the slump, everybody has had to go on raising tariffs, whereas we have started, mostly, from no tariff at all. The great advantage to us has been that whereas every country which like England depends on foreign trade has naturally lost a lot of trade abroad, we have been able to compensate by getting a lot of additional trade at home—additional because tariffs have gone on for the first time. Also, it has helped us greatly in negotiations. We have been able to enter into the Ottawa agreements—there is no time to talk of them today. We have also been able to make arrangements with foreign countries which have helped our trade in certain lines, especially as regards coal, and also, a little retaliation has been practicable when it has seemed necessary. We were rather helpless under our free trade system; when other countries did things we didn't like, or treated us unfairly, or showed discrimination, we couldn't do anything about it, but the position is different now.

Now for a few indications of the actual improvement which has taken place. The best index of course, is the trend of unemployment. Unemployment figures in the course of this year, since last June, have fallen by some 679,000 and the numbers of men taken into employment have increased by 742,000. The latter figure includes new entrants into industry, as well as men in employment before. Our figures are actual figures and not estimates; they are based on the registration of men in industry for insurance purposes.

In some of our industries, employment has been steadily maintained right through the winter season, and in the heavier industries, particularly, the improvement continues. Indeed, the basic industries are showing a very remarkable recovery. The average monthly production of steel in 1933 has gone up by 33 per cent compared with 1932 and that has been due very largely to the increased demand for capital equipment which is in itself a good sign, for that demand is what falls off most in times of depression. Railways have been re-equipping themselves, building has been increasing, also ship-building. Our motor industry has made remarkable progress; in the first nine months of the year its production increased by 23 per cent as compared with the same nine months of the year before.

And the engineers—I don't want to make your mouths water—the engineering industry have got their order books full enough to be happy for about the next six months.

Our export trade, of course, has not been so good. That is a different picture, but even there some improvement is shown; it has increased by some two million pounds over 1932, which in fact represents a considerably larger increase in the volume of trade because there has been a further fall in prices.

Especially there has been a satisfactory increase in exports under such headings as the non-ferrous metals, woollens, iron, steel, motors, and in the increased import of raw materials—wool, cotton, timber, hides, and iron ore—is a good omen for the future.

All this gives an encouraging picture. But there is still unhappily a nigger in the woodpile, and that is in the foreign trade. We have increased our share of the world trade, but, unfortunately, the volume of the world trade is lower again in 1933 as compared with what it was for 1932.

That may not worry those people who think any nation can pull itself up by its own shoe strings—an experiment in engineering which I fancy none of you would think very feasible. But despite all those indications of improvement to which I have referred the fact remains that in Great Britain we have still two million two hundred thousand men unemployed and you will find a similar phenomenon in other countries. Clearly the cause of the trouble is the failure to attain the recovery of international trade, and I am afraid one must add, with the present situation of the world and the unhappy state of political insecurity in Europe and the Far East, the prospects of its restoration are not, at the moment, as good as one would wish. We must admit that, but I don't want to dwell on that dark side. I would rather ask you to note the progress that has been made. We see how great it has been as we look back on the whirlpools and the rapids through which we have passed in the last two years. I would ask you rather to cling to the thought that the lowest point of the depression was reached and passed about a year ago.

There are a lot of people who disbelieve in the influence of the trade cycle, partly because they think we oughtn't to go on allowing trade cycles to influence human affairs and there is a great deal to be said for that no doubt, but it is a comforting thought for the moment that while the cycle has brought us down, it unquestionably took an upward turn about February or March of last year and is now carrying us up. I have given you indications of this in my own country. You business men know of similar indications in Canada, and there is evidence from other countries, from Australia, especially, and from South Africa, and of course one is glad to see it in many foreign countries as well.

Especially, I would ask you to recall—I am speaking now, I need hardly say, not for Great Britain alone, but for all our peoples—that whatever mistakes any of us may have committed—and there have been plenty of them—none of our people have at any time made bad worse by giving away to panic. They have borne their afflictions with a patient stoicism which has been above all praise and they have earned the right to emerge from their troubles by maintaining their courage unimpaired through all these difficult and dangerous times. (Applause.)

## Meeting of Council

A meeting of Council was held at Headquarters on Tuesday, March 20th, 1934, at eight o'clock p.m., with President F. P. Shearwood in the chair, and eight other members of Council present.

A committee under the chairmanship of Mr. R. E. C. Chadwick, M.E.I.C., was appointed to co-operate with the National Committee on Sound Public Finance which has been established under the auspices of the Canadian Chamber of Commerce.

The committee under the chairmanship of Mr. Fraser S. Keith, M.E.I.C., which was appointed to study the proposed Civil Service classification scheme of the Government of Saskatchewan, reported that a memorandum had been prepared on behalf of the Council of The Institute, and together with supporting representations from the Saskatchewan Branch of The Institute, had been submitted to the Saskatchewan Public Service Commission.

The following committees were appointed for the year 1934:

*Gzowski Medal Committee*

R. W. Angus, M.E.I.C., *Chairman*
F. C. Dyer, M.E.I.C.
F. R. Ewart, M.E.I.C.
W. P. Near, M.E.I.C.
R. B. Young, M.E.I.C.

*Board of Examiners and Education*

A. F. Dyer, A.M.E.I.C., *Chairman*
W. P. Copp, M.E.I.C.
F. R. Faulkner, M.E.I.C.
H. S. Johnston, M.E.I.C.
J. Stephens, M.E.I.C.
E. O. Turner, A.M.E.I.C.

*Membership Committee*

D. C. Tennant, M.E.I.C., *Chairman*
A. Frigon, M.E.I.C.
F. S. B. Heward, A.M.E.I.C.
C. K. McLeod, A.M.E.I.C.

*Unemployment Committee*

D. C. Tennant, M.E.I.C., *Chairman*
A. Duperron, M.E.I.C.
R. J. Durley, M.E.I.C.

*Students' and Juniors' Prizes*

| | | |
|---|---|---|
| H. N. Ruttan Prize | R. S. L. Wilson, *Chairman* | Edmonton |
| | F. M. Steel | Calgary |
| | H. L. Swan | Victoria |
| John Galbraith Prize | E. G. Cameron, *Chairman* | St. Catharines |
| | R. L. Dobbin | Peterborough |
| | J. J. Traill | Toronto |
| Phelps Johnson Prize | Ernest Brown, *Chairman* | Montreal |
| | C. B. Brown | Montreal |
| | F. Newell | Montreal |
| Ernest Marceau Prize | A. B. Normandin, *Chairman* | Quebec |
| | H. Cimon | Quebec |
| | B. Grandmont | Three Rivers |
| Martin Murphy Prize | A. Gray, *Chairman* | Saint John |
| | H. J. Crudge | Moncton |
| | A. F. Dyer | Halifax |

On the recommendation of Mr. Challies, and after consultation with Mr. Keith, it was decided to establish a Committee on Relations with National Societies, its chief function being to promote friendly relations with sister Engineering Societies. It was decided to request Mr. John Murphy, M.E.I.C., of Ottawa, to act as chairman of this committee, and nominate its membership for the approval of Council.

A draft programme for the Western Professional Meeting of The Institute, to be held conjointly with the Summer Convention of the American Society of Civil Engineers in Vancouver in July, was submitted by the local joint committee making the arrangements for the meeting, and was tentatively approved by the Council, subject to the adjustment of minor details.

A letter from the Hon. W. A. Gordon, Minister of Labour, to Dr. Lefebvre as President of The Institute, thanking The Institute for its effective co-operation with General McNaughton and the Department of National Defence in their efforts to handle the problem of relief camps set up under the Department, was noted with appreciation.

Seven resignations were accepted, a number of members were reinstated, seven members were placed on the Non-Active List, and three Life Memberships were granted.

A number of applications for admission and for transfer were considered, and the following elections and transfers were effected:

| *Elections* | | *Transfers* | |
|---|---|---|---|
| Members | 3 | Junior to Assoc. Member | 8 |
| Assoc. Members | 5 | Junior to Affiliate | 1 |
| Juniors | 1 | Student to Assoc. Member | 2 |
| Students admitted | 8 | Student to Junior | 1 |

The Council rose at ten forty-five p.m.

## OBITUARIES

### The Right Hon. the Earl of Aberdeen, P.C., LL.D., Hon.M.E.I.C.

Deep regret is expressed in recording the death at his home, the House of Cromar, Tarland, Aberdeenshire, on March 7th, 1934, of The Right Hon. the Earl of Aberdeen, P.C., LL.D., Hon.M.E.I.C.

The Marquis of Aberdeen, who was born in 1847, succeeded to the earldom in 1870, being the seventh holder of the title, which was created in 1682. In 1880 the Earl was appointed Lord Lieutenant of Aberdeenshire, and in 1881 became High Commissioner of the General Assembly of the Church of Scotland. During the Gladstonian administration of 1886 he held the office of Lord Lieutenant of Ireland. The next position of high prominence to which his lordship was called was that of Governor General of Canada, which office he held from 1893 to 1898, his regime opening two years after the death of Sir John A. Macdonald, first Prime Minister of the Dominion. In 1905 Lord Aberdeen entered upon a second term as Lord Lieutenant of Ireland, a term which extended to the unusually long period of ten years. On leaving Ireland, Lord Aberdeen was created a Marquis. In a few months the Marquis again assumed the position of High Commissioner of the Church of Scotland, and his second period as such marked the close of his long years of public service.

On January 4th, 1894, when he was Governor General of Canada, the Marquis of Aberdeen, having graciously consented, was elected an Honorary Member of The Institute (then the Canadian Society of Civil Engineers).

### William Henry Wardwell, M.E.I.C.

The membership of The Institute will learn with regret of the death at Montreal on March 15th, 1934, of Major William Henry Wardwell, M.E.I.C.

Major Wardwell was born at Buffalo, N.Y. on June 8th, 1875, and graduated from Cornell University in 1897. In 1898 and 1899 he was engaged on design and as head of the testing department of the J. J. Case Company, at Racine, Wis., and in the following year he was superintendent of the Wisconsin Wheel Works at Racine. In 1901 Major Wardwell came to Canada as chief engineer and superintendent of construction for the Shawinigan Carbide Company, in complete charge of the construction and equipment of the plant. From 1904 to 1907 he was general manager of the Continental Heat and Light Company, and subsequently until 1911 occupied the same position with the Shawinigan Carbide Company. In 1912-1913 Major Wardwell was a partner in the firm of Reynolds Wardwell Company, Montreal, and in the latter year entered private practice in Montreal as a consulting engineer specializing in fireproof design and construction. On the entry of the United States into the war Major Wardwell offered his services to the American authorities, and he was given a special commission, being in charge of airplane assembly. For the service which he rendered to the United States his country offered him the rank of colonel, which he refused.

Returning to private life at the end of the war, Major Wardwell established himself in Montreal's commercial life, particularly in the field of architectural engineering. One of his best known feats of engineering was undertaken some years ago, when he planned the moving of the Morgan Trust building from its original site to some distance up the street.

Major Wardwell was a member of the United Services Club, the Canadian Club and the Thistle Curling Club. An influential member of the American Legion, he was a past commander of the Montreal Post.

He become a Member of The Institute on March 25th, 1919.

### W. J. V. Bennett

Regret is expressed in recording the death by drowning on March 1st, 1934, of W. J. V. Bennett, vice-president of the Bennett and White Construction Company, Calgary, an Affiliate of the Calgary Branch of The Institute.

Mr. Bennett, who was held in high esteem by those who knew him, settled in Calgary in 1910, when he started in the construction business with his brother. In 1920 he joined the firm as it is known now, and had been active in it since that time.

The accident which caused Mr. Bennett's death was the breaking of a gang plank above a flume. Mr. Bennett fell into the flume and was carried down beneath the ice.

## PERSONALS

H. Ross MacKenzie, A.M.E.I.C., chief engineer of the Department of Highways, Province of Saskatchewan, Regina, Sask., was elected president of the Association of Professional Engineers of Saskatchewan, at the annual meeting of that Association held in Regina on February 22nd, 1934.

Karel R. Rybka, A.M.E.I.C., has entered private practice in Montreal as a consulting engineer for the mechanical and electrical equipment of buildings. After graduation from the University of Prague in 1923, Mr. Rybka was engaged for several years on various engineering work in Prague. Coming to Canada in 1928, he joined the staff of Ross and Macdonald, architects, in Montreal. Mr. Rybka is the author of the book "Amerikanische Heizungs und Lueftungspraxis" and of other papers on engineering subjects.

Colonel W. G. Tyrrell, D.S.O., M.E.I.C., has accepted the appointment of Assistant Director of Transportation at the War Office, England. Colonel Tyrrell's duties involve technical and engineering matters regarding transportation services (railways, inland water transport and docks), agreements with home railway companies, questions involving transportation policy and intelligence, technical instruction and training of railway troops and the administration of the Transportation Branch of the Supplementary Reserve. Colonel Tyrrell was promoted to his present rank on January 1st, 1933, with seniority June 3rd, 1923.

R. M. Calvin, A.M.E.I.C., has been appointed sales manager of Canadian Vickers Limited, according to a recent announcement. Mr. Calvin has been acting sales manager since June 1933. His connection with this company dates back to 1927, when he joined the sales staff of the industrial engineering department. He is a graduate of Queen's University, from which he received the degree of B.A. in 1911 and B.Sc. in 1914. Following graduation, Mr. Calvin was on the engineering staff of the Canadian Stewart Company on the Toronto harbour improvements, resigning in November 1914 to enlist for overseas. He served with the Canadian Engineers from that date until he was discharged with the rank of Major in March 1919. In 1919 Mr. Calvin joined the staff of the Dominion Water Power Branch of the Department of the Interior at Ottawa, and was engaged on power investigation. During the years 1921 to 1927 he was connected with the H. S. Taylor Company, in Montreal, and the Dominion Rubber Company.

H. G. Thompson, A.M.E.I.C., has recently joined the sales force of Canadian Vickers Limited, and will specialize in the boiler field.

Following his return from overseas, where he served with the R.N.A.S., Mr. Thompson completed his course at the University of Toronto, from which he graduated in 1922 with the degree of B.A.Sc., and from November of

H. G. Thompson, A.M.E.I.C.

the same year until May 1923 was engaged on engineering design, estimating and sale of heating and ventilating equipment with the Canadian Sirocco Company, Limited, Montreal. From June to November 1923, he was supply engineer for pulp mill equipment with the Riordon Company Limited at Temiskaming, Que., and from that time until 1925 was connected with the Combustion Engineering Corporation Limited, as engineer on erection, service and sale of boilers, mechanical stokers, etc., and later as assistant to the Montreal manager. In October 1925 Mr.

Thompson joined the staff of Affiliated Engineering Companies Limited, and in 1930 became associated with F. S. B. Heward and Company Limited, Montreal. During the past two years Mr. Thompson has been on the staff of The Institute as Editor of Indices of the E.I.C. Engineering Catalogue.

### J. E. Armstrong, A.M.E.I.C., President of the American Railway Engineering Association

J. E. Armstrong, A.M.E.I.C., assistant chief engineer of the Canadian Pacific Railway Company, Montreal, has been elected President of the American Railway Engineering Association. With election to this office, Mr. Armstrong in addition automatically becomes chairman of the engineering division of the American Railway Association.

Born in Peoria, Ill., Mr. Armstrong graduated from Cornell University in 1908, and was subsequently until 1912 assistant on the engineer corps of the Cleveland and Pittsburgh Division of the Pennsylvania Company at Cleveland, Ohio. In 1912 he became assistant engineer with the Canadian Pacific Railway, and in 1928 received the appointment which he now holds.

Mr. Armstrong has been engaged on many important works including the Quebec joint terminals, the waterfront development at Saint John, railway revision during the war, and the construction of the Toronto viaduct from 1924 to 1930.

In 1927 Mr. Armstrong was a director in the American Railway Engineering Association, and in the following year became second vice-president.

## ELECTIONS AND TRANSFERS

At the meeting of Council held on February 23rd, 1934, the following elections and transfers were effected:

*Members*

CARRIE, G. Milroy, B.A.Sc., (Univ. of Toronto), general manager, Canadian Refractories Limited, Montreal, Que.

DUNCAN, George Marr, designing engr., Department of Public Works of British Columbia, Victoria, B.C.

*Associate Members*

BRAUNS, Otto L. J., C.E., (Royal Inst. Tech., Stockholm), asst. chief chemist, Abitibi Power and Paper Co., Sault Ste Marie, Ont.

HARKNETT, Stewart George, (A.M.Inst.E.E.), manager, elect'l. dept., Mumford and Medland, Winnipeg, Man.

WILSON, William Fairbairn, (Univ. of St. Andrews), in charge of appraisal and valuation, Winnipeg Electric Company, Winnipeg, Man.

*Transferred from the class of Junior to that of Associate Member*

CURREY, Allan Robert, B.Sc. (Queen's Univ.), president and chief engineer, Industrial Utilities Ltd., Montreal, Que.

EAGER, Norman H. A., B.Sc. (McGill Univ.), M.C.E. (Cornell Univ.), industrial engr., Shawinigan Water and Power Company, Montreal, Que.

KURTZ, Harold John, B.Sc., (Queen's Univ.), 402 Bartram Ave., Sudbury, Ont.

PHILLIPS, John Bernard, B.Sc., M.Sc., Ph.D., (McGill Univ.), lecturer, chemical engrg., McGill University, Montreal, Que.

TOYE, Arthur MacFarlane, B.A.Sc., (Univ. of Toronto), designing engr., Dept. Highways Ontario, Toronto, Ont.

WIGHTMAN, John, B.Sc., (McGill Univ.), field engr., Cons. Mining and Smelting Co., Amos, Que.

WINSLOW, Kenelm Molson, B.Sc. (McGill Univ.), sales engr., Dominion Engineering Works, Montreal, Que.

*Transferred from the class of Student to that of Associate Member*

MOORE, William Herbert, B.Sc., M.Eng., (McGill Univ.), engr., Canadian Marconi Co. Ltd., Montreal, Que.

*Transferred from the class of Student to that of Junior*

BOUCHER, Raymond, B.A.Sc., C.E., (Ecole Polytech., Montreal), 19 Clinton St., Cambridge, Mass.

HUNT, Edward Victor, B.Sc., (Univ. of Man.), Davenport Works, Canadian General Electric Co. Ltd., Toronto, Ont.

*Students Admitted*

ROBINSON, William Morecroft, (McMaster Univ.), 23 Market St., Dundas, Ont.

ROYER, Jacques, (McGill Univ.), 1990 Rachel St. East, Montreal, Que.

SCOBIE, A. Gordon, (McMaster Univ.), 472 King William St., Hamilton, Ont.

TAYLOR, James Lawrence, (Queen's Univ.), Barriefield, Ont.

TUCKER, Robert Norman, (McMaster Univ.), 123 Chestnut Ave., Hamilton, Ont.

At the meeting of Council held on March 20th, 1934, the following elections and transfers were effected:

*Members*

GOHIER, Joseph Arthur Ernest, B.Sc., (McGill Univ.), consltg. engr., 10 St. James St. East, Montreal, Que.

LEE, Leonard Alldwyn Cole, B.A.Sc., (Univ. of Toronto), chief concrete engr., bldg. dept., City Hall, Toronto, Ont.

SANCTON, George Edward, (Finsbury Tech. Coll.), pres. and gen. mgr., Fraser & Chalmers of Canada Ltd., Montreal, Que.

*Associate Members*

AUSTIN, Frank Douglas, B.A.Sc., (Univ. of Toronto), 1510 Bathurst St., Toronto, Ont.

BENETT, Charles Morgan, B.Sc., (McGill Univ.), inspection engr., Charles Warnock and Co., Montreal, Que.

DYER, Walter Gerald, B.Sc., (Univ. of Sask.), transitman, C.P.R., Regina, Sask.

McLEOD, Simon Fraser, inspector of boilers and machinery, Govt. of Alberta, Lethbridge, Alta.

MOXON, George Burnham, (Assoc. Member, Inst. C.E. (Great Britain)), 359 Victoria Ave., Westmount, Que.

*Junior*

MIALL, Edward Jr., (Grad., R.M.C.), (Univ. of Toronto), sub-foreman, Unemployment Relief Project No. 40, Petewawa, Ont.

*Transferred from the class of Junior to that of Associate Member*

COULTER, Hugh John, B.A.Sc., (Univ. of Toronto), foreman, meter shop, Detroit City Gas Co., Detroit, Mich.

GOBY, Thomas, B.Sc., (Tri-State Engrg. Coll.), sales engr., Armco Culvert Mfg. Assn., W. Q. O'Neall Co., Crawfordsville, Indiana.

GRAY-DONALD, Erceldoune Donald, B.Sc., (McGill Univ.), supt., power divn., Quebec Power Company, Quebec, Que.

KERRY, Armine John, Capt., R.C.E., (Grad., R.M.C.), B.Sc., (McGill Univ.), works officer, Mil. Dist. No. 5, Quebec, Que.

NAISH, Sidney Gordon, B.Sc., (Durham Univ.), eastern district mgr., Peacock Bros. Ltd., Sydney, N.S.

RAPLEY, Blake Parker, B.Sc., (Queen's Univ.), asst. mech'l. supt., Imperial Oil Refineries Ltd., Sarnia, Ont.

SAMPSON, Cyrus Dexter, (Acadia Univ.), engr., Intercolonial Coal Co. Ltd., Westville, N.S.

SPOTTON, John Greer, B.A.Sc., (Univ. of Toronto), sales engr., Delaney and Pettit Ltd., Toronto, Ont.

*Transferred from the class of Junior to that of Affiliate*

BROSSEAU, Joseph Charles, (Montreal Tech. School), engr., City Hall, Verdun, Que.

*Transferred from the class of Student to that of Associate Member*

LAING, Addison Kerr, B.Sc., (McGill Univ.), hydrographic engr., Hydrographic Service, Dept. of Marine, Ottawa, Ont.

WEIR, Ronald Albert Stanley, (McGill Univ.), asst. industrial lubricating engr., Imperial Oil Limited, Montreal, Que.

*Transferred from the class of Student to that of Junior*

PATRIQUEN, Frank Andrew, B.Sc. (E.E. and C.E.), (Univ. of N.B.), junior engr., Saint John Harbour Commission, Saint John, N.B.

*Students Admitted*

DESCOTEAUX, Paul R., (Ecole Polytechnique), 1660 St. Andre St., Montreal, Que.

FLETCHER, Thomas Henry, (Univ. of N.B.), 278 Westmoreland St., Fredericton, N.B.

FLEURY, Maurice, (Ecole Polytechnique), 40 Spring Grove, Outremont, Que.

HYDE, Arthur Edwin, (McMaster Univ.), 101 Newlands Ave., Hamilton, Ont.

LEFEBVRE, Jean, (Ecole Polytechnique), 11 Laviolette Ave., Outremont, Que.

MASON, George Anthony Ritchie, (Univ. of Alta.), 3023-3rd St. West, Calgary, Alta.

VINCENT, Paul, (Ecole Polytechnique), 837 Hartland Ave., Outremont, Que.

## BOOK REVIEW

### Materials of Aircraft Construction

*By F. T. Hill, F.R.Ae.S., M.I.Ae.E., Sir Isaac Pitman and Sons Ltd., London, 1933. Cloth, 5½ by 8¾ inches, 363 pp., figs., tables, 20/.*

Reviewed by E.W.S.

This book is described by the author in his preface as being primarily for students of aircraft engineering. It has, however, a much wider application, because of its definite value to the aircraft designer.

The first chapter deals with mechanical testing, and whilst purposely omitting an unnecessary repetition of the description of testing machines and methods which are usually to be found in similar text books, it deals at some length with the vagueness of the meaning and value of several mechanical properties which are generally called for in material specifications and indicates the reasons for employing the proof stress in British specifications for aircraft materials.

When dealing with steel and iron in the second chapter, the author enters at once into a very incomplete discussion of the iron-carbon equilibrium diagram without any previous explanation of this type of diagram. It is doubtful whether this part of the book would be grasped by a man who had not had previous training in metallurgical subjects, and to one so trained it would provide no new or useful information.

The greater part of the book is devoted to a description and discussion of the various materials called for by the British Standards Institute specifications for aircraft materials, and the British Air Ministry D.T.D. specifications, the former specifications being those in common use, and the latter specifications being those for materials which have a more limited application at the present time. It gives very little information not already included and published in these specifications, but as a classification and a guide to the use of these specifications the book can serve a very useful purpose without, however, satisfactorily providing the more detailed information upon the reasons for the existence of many special materials, which a deep study of the subject requires, but which would necessarily make the book much larger and more expensive.

The last chapter, which has been borrowed with permission from another publication, provides an interesting discussion upon the designer's selection of materials.

## Recent Additions to the Library

### Proceedings, Transactions, etc.

American Society of Mechanical Engineers: Transactions, Vol. 55, 1933.

Australasian Institute of Mining and Metallurgy Inc.: Proceedings, March 1933, "Sintering and Smelting Mixed Lead Carbonate-Lead Sulphide Concentrates at Mount Isa, Queensland," by F. A. Forward, M.E.I.C.

### Reports, etc.

*Canada, National Research Council:*
16th Annual Report, 1932-33.

*Canada, Dom. Water Power and Hydrometric Bureau:*
Supplement to Water Resources Paper No. 55, Directory of Central Electric Stations in Canada—Nov. 1, 1932.

*Carnegie Institute of Technology:*
Colleges of Engineering and Industries, Catalogue 1933-1934.

*Canada, Civil Service Commission:*
Annual Report for the year 1933.

*Canada,* Report of the Minister of Public Works on the Works Under His Control, for the year ended March 31st, 1933.

*Air Ministry, Aeronautical Research Committee, Great Britain*
Reports and Memoranda:
- No. 1561—Flow Near a Wing which starts suddenly from Rest and then stalls.
- No. 1559—Use of Networks to Introduce Turbulence into a Wind Tunnel.
- No. 1560—Heat Transmission through Circular, Square and Rectangular Pipes.
- No. 1563—A Survey of the Air Currents in the Bay of Gibraltar in 1929-1930.
- No. 1558—Tests of a Roots Type Aircraft Engine Supercharger.
- No. 1304—Torsional Resonance Characteristics of a Twelve-Cylinder Vee Aero Engine.

### Technical Books, etc., Received

Materials of Aircraft Construction, by F. T. Hill. (*Sir Isaac Pitman and Sons.*)

Carnegie Steel Company, supplement to Pocket Companion, abridged edition CB Sections.

Joint Sewerage Works for Twelve Municipalities in New Jersey, by Alexander Potter. (*Sewage Works Journal, January, 1934.*)

American Sewerage Practice, Vol. II, by Metcalf and Eddy. (*McGraw-Hill Book Company.*)

Society of Automotive Engineers, Handbook, 1933.

## BULLETINS

*Air Compressors*—A 4-page folder received from the Worthington Pump and Machinery Corporation, Harrison, N.J., describes the Worthington air compressor units type VA-2, for garages, repair shops and service stations. This equipment is made in 8 sizes, requiring motors of ¾ to 7½ h.p., and having a displacement of 4¼ to 34 cubic feet per minute at 150 pounds.

*Pumps*—Worthington Pump and Machinery Corporation, Harrison, N.J., have issued a 4-page leaflet describing the vertical triplex single-acting type Worthington power pumps, equipped with Worthington Multi-V-Drive. Particulars of specifications of pump, motors and drive, together with a list of capacities and sizes manufactured are included.

*Water Tube Boilers*—Canadian Vickers Limited, Montreal, have published Bulletin LH 10, describing their low head water tube boilers, together with particulars of three classes.

*Electric Steam Generator*—An 8-page booklet received from E. Leonard and Sons, Ltd., London, Ont., describes the Penzold electric steam generator mentioning the unusual features and special advantages of this system, among which is claimed high efficiency and dry steam, no generation of gas through arcing and long life of electrodes. Operation may be manual or automatic, and from 10 to 125 per cent of rating.

*Sodium Silicate*—A 16-page booklet received from the Sodium Silicate Manufacturers' Institute, Philadelphia, Pa., contains details regarding sodium silicate cured concrete pavements in the United States, together with particulars of specifications.

*Metal Doors*—Richards-Wilcox Canadian Company Limited, London, Ont., have issued an 8-page illustrated booklet with types of and use of metal doors manufactured by that company.

*Instruments*—A circular received from The Brown Instrument Company Philadelphia, Pa., gives brief particulars of various types of instruments manufactured by the company. This includes pyrometers, flow meters, gauges, tachometers, etc.

### Engineering Centenaries in 1934

Among those who have contributed notably to the progress of engineering, few occupy a more honoured place than Thomas Telford, the shepherd's son, who rose to the head of the engineering profession. Telford's roads, canals, bridges and docks contributed largely to the improvement of the transport facilities of the country, and his standing among his fellows led to his being made the first president of the Institution of Civil Engineers. He died in Abingdon-street, Westminster, September 2nd, 1834, and was buried in the nave of Westminster Abbey. Only six years ago a monument was erected to him at Westerkirk, Dumfriesshire, where he was born. The year of Telford's death also saw the passing away of three notable Frenchmen, Marie Joseph Jacquard (1752-1834), famous for his loom; General Henri Joseph Paixhans (1783-1834), distinguished for his work on artillery, and Jean Nicolas Peter Hachette (1769-1834) the mathematician, whose work on the descriptive geometry of Monge was of great utility to engineers. Of the many men who, born in 1834, achieved distinction as inventors or engineers, only a few can be mentioned. Samuel Pierpont Langley, one of the great pioneers of aviation, was born on August 22nd. 1834; Gottlieb Daimler, the first to make a light high-speed spirit engine fit for land transport, was born on March 17th, 1834, while Johann Bauschinger whose work on the testing of materials led Dr. Unwin to speak of him as a "prince of observers," was born on June 11th, 1834. The same year saw the birth also of Loftus Perkins, a pioneer of the use of high-pressure steam at sea; Joseph Vavasseur, the inventor of the copper band on projectiles and the hydraulic recoil for gun mountings; of Gustav Hermann Wedding, whose writings on metallurgy led to his being awarded the Bessemer Medal of the Iron and Steel Institute; and also of Sir William Preece and James Mansergh, both of whom had the honour of being elected to the chair once occupied by Telford.

—*Engineering.*

---

The Dominion Water Power and Hydrometric Bureau of the Department of the Interior of Canada has issued its annual review of the water power resources of Canada, developed and undeveloped as at February 1st, 1934. This bulletin comprises nine pages in mimeographed form and deals also with current progress in development, the utilization of water power in the principal industries, and the past and future growth of water power development.

Copies of the bulletin may be obtained, free of charge, on application to the Director of the Dominion Water Power and Hydrometric Bureau, Ottawa, Ont.

### Erratum

#### Practical Designing in Reinforced Concrete

In the book review by Vernon R. Davies, A.M.E.I.C., on "Practical Designing in Reinforced Concrete" which appeared on page 153 of the March, 1934, issue of The Journal the following sentence "He might also have stated that the kern radius is equal to one third the outer radius only when the ratio of outer and inner radii is equal to 3" should read as follows: "He might also have stated that the kern radius is equal to one third the outer radius only when the ratio of outer and inner radii is equal to $\sqrt{3}$."

# The United States Public Works Administration

### An address delivered before the Winnipeg Branch of The Engineering Institute of Canada, February 1st, 1934

*by William Nelson Carey,*
*Federal Engineer, Public Works Administration for Minnesota*

On March 4th, 1933, when Franklin Delano Roosevelt was inaugurated President, the United States of America was struggling along under the industrial and social handicap of twelve million unemployed workers. Thirty million other citizens used up their savings and mortgaged their homes and farms to keep their unemployed relatives and friends from starvation or from becoming public charges.

In the face of vehement and oft repeated assurances by press and politician to the effect that prosperity was "just around the corner," 1933 produced a more dismal outlook than ever. Public confidence was gone. In spite of our brass lunged calamity howlers and our quieter, communist, borers from within, the seaworthiness of our ship of state worried the majority but little. What was needed was a new pilot with new ideas. The world now knows how fully President Roosevelt has met those specifications. Our National Industrial Recovery Act, passed last June by a specially convened session of Congress, was the development of many old thoughts into a new idea of colossal proportions. I shall speak on but one phase of that Act, Public Works, and hope to show you, that for the United States at least, the public works path affords us solid footing in our climb toward national industrial recovery.

The National Industrial Recovery Act of June, 1933, is in two principal sections, Title One and Title Two. Title One is the part of the Act whose function it is to co-ordinate and stabilize business, to overcome cutthroat competition and unfair business practices and to stabilize labour in business and industry. It provides for the adoption of codes of fair business practice in the several branches of business and industry. Through shortened hours the number of employees has been increased greatly.

The provisions of Title One of the Act, the NRA, were designed to march abreast of those of Title Two, the Public Works Section, or PWA. While the effect of the NRA is to increase purchasing power through shortened hours, and spread work and other methods, the real impetus toward increased purchasing power is set up through the financing of public works in large volume. In the Federal government itself rested the only useable source of extended credit. The President and Congress created a fund of $3,300,000,000 to be used to finance public works. Never before has there been so vast a sum appropriated in peace time by any government in the history of the world.

The PWA, Public Works Administration, early set the tests which projects must pass before they might be accepted for financing. Acceptable projects must be for public works which are actually needed. Projects must be sound from an engineering or architectural viewpoint, they must be legally permissible and socially desirable, and the financing scheme proposed must be sound. For such projects PWA has made loans and grants to states, cities, counties and other governmental subdivisions. For certain limited types of acceptable projects such as public markets, toll bridges or vehicular tunnels, hospitals and dry docks, private, non-profitmaking corporations may secure loans but not grants. All Federal agencies such as the Corps of Army Engineers, the U.S.B.P.R., the Navy Department and others have received outright appropriations for the full cost of their projects.

Non-federal PWA projects; those of governmental subdivisions, as states, counties, cities, towns, school boards and villages, receive either a loan including grant, or a grant only, depending upon the financial situation of the respective municipalities. A grant or gift by the Federal government, amounting to thirty per cent of the aggregate construction cost of the project, plus field supervision cost, is made to municipalities for all approved projects. If the municipality has funds available which, together with the grant, will pay for the project, it may apply for and receive a grant only. If the municipality needs to borrow the money to cover the full cost of the project, it may apply for and receive both loan and grant. The grant is in the same amount in either case. Any government subdivision, through its proper officers, may make application for a PWA loan and grant or grant only to cover any public works project. An application must be made along prescribed lines set out by regulations. It must be submitted to the State Engineer, PWA, in quadruplicate. The general items which must be covered by the applicant in his application follow:

(1) Names: of applicant, his attorney, his engineer or architect. Population figures.

(2) Amount of loan requested, the security offered, with particulars. The amount of grant requested, if grant only is needed.

(3) A description of the project with, at least, skeleton specifications and drawings sufficient to give a thorough understanding of the project. An engineering or architectural report. A rather detailed cost estimate together with a showing as to need of the project and its social desirability.

(4) A detailed estimated revenue and expense statement covering the project.

(5) A complete financial statement covering the municipality making the application; showing property valuation, debt, defaults, tax rate, tax returns, current expenses and general industrial conditions.

(6) A legal memorandum covering the powers of the applicant as they relate to the project. This is an extremely detailed statement covering some thirty-seven items.

A PWA office has been set up in each state. It consists of a State Advisory Board, a State Engineer and a force of engineers, architects, lawyers, clerks and stenographers. The advisory boards each consist of three public spirited citizens who devote part time to PWA duties. The function of the State Advisory Board is largely to weigh the social aspects of each project and to conduct public hearings on controversial projects. The State Engineer, PWA, is the executive and administrative head of the State PWA office. The engineers, architects, financial clerks and attorneys are provided for the purpose of examining the applications, plans, specifications, contracts, etc., received and to draft a full report along prescribed lines for each project. After an application has been examined in the State Office, the State Engineer approves or disapproves it. An outline of each report is then submitted to the State Advisory Board for its approval or disapproval. Our Minnesota Board meets once a week for this purpose. After action by the State Engineer and State Board is taken, the application and State Engineer's report, in triplicate, is forwarded to the Central PWA Office at Washington.

The Examining Section of the Central Office is divided into three divisions: engineering, finance and legal. When applications and reports from State Engineers are received at Washington, a copy of the application and report goes to each division for examination. The engineering, financial and legal features of a particular project can then be reviewed simultaneously. The head of each of these divisions approves or disapproves the project. If all approve, the application then goes to the Special Board of Public Works, PWA, for final action. Secretary of Interior Harold Ickes, the Administrator of PWA, is chairman of the Board. The Special Board of Public Works is composed of four Cabinet Members and three other officials, one of whom is the Deputy Administrator. The Deputy Administrator, Colonel H. M. Waite, is in active charge of the Central PWA Office which has a force of about two thousand persons at present. If the examination of a project in the Central Office reveals special conditions, it is routed through a Special Board of Review on its way to the final Board of Public Works. If an application is rejected by the Central Office, the applicant is advised of the reasons and is given an opportunity for a hearing before the Special Board of Review. Every possible effort is made both in the State Offices and in the Central Office to determine all of the facts on every project and to weed out all which appear unsound.

When final favourable action has been taken by the Administrator on any particular application, the State Engineer of the state of origin of the application, is notified by wire that an allotment of funds in a certain amount has been made for the project. The State Engineer in turn notifies the applicant who usually takes prompt steps to get the project into construction as soon as possible. The telegraphic allotment advice is followed from Washington in a few weeks with a formal contract between the Federal government and the borrower municipality or other agency, which contract sets up the conditions under which Federal funds will be advanced to the borrower. A copy of the contract goes to the State Engineer. When the borrower executes the contract and conforms to the regulations set up, he then may proceed with his work with assurance that Federal funds will be forthcoming when needed. If the approved application is for a grant only, the applicant may start work upon signature of his contract with the PWA, and the federal grant of thirty per cent of the construction cost will be forthcoming as soon as the work is well along.

If the approved application is for a loan and grant, the bonds or other securities of the borrower are purchased by the Federal Government and the cash needed to carry out the work is placed in an escrow account in a Federal Reserve bank to the credit of the borrower. It can be used by the borrower as the project progresses, only as his need is certified by the PWA auditors, field inspectors and the State engineer. All bonds accepted by the PWA are taken at par, and carry an interest rate of four per cent. The National Industrial Recovery Act provides that all bonds or other securities accepted by PWA shall be "reasonably secured." An impression existed in some quarters at the outset of PWA operations that the words "reasonably secured" would be interpreted to mean that any excuse for a bond would be snapped up by PWA in an effort to start public work quickly. This error of thought was promptly corrected by the Administrator, who has demanded securities of unquestionable soundness in all cases, and who has disabused all of any thought that the loans obtained would not have to be paid back in full.

When the important matter of funds has been attended to for a given project, the State Engineer, PWA, has more work to do. He must see that all proceedings of the governing body of the borrower community are taken properly; proceedings to authorize the construction, to obtain rights of way if needed, to appoint a consulting engineer or architect if one is not regularly employed by the borrower, to order contract plans and specifications, or to do any other official act in connection with the project. The State Engineer also must examine and approve the detailed plans and specifications to the end that the construction to follow will be both structurally and economically sound, that true competition can be had in the bidding, and that the engineer or architect responsible is authorized legally to render professional service on public work. He must see that the project is advertised widely, that bids are tabulated properly, and that the lowest responsible bidder gets the contract if he is qualified. The State Engineer must obtain and examine the qualifications of the successful contractor as to his regular place of business, his plant, his experience and his financial stability. The contract with the builder must contain all required provisions for compliance with PWA regulations as well as being in proper legal form to cover public work, and the State Engineer must see that this is done. He must also know that workmens' compensation insurance is carried and that a performance bond in proper form and for the full amount of the contract is put into effect before work starts. When the State Engineer has satisfied himself that all these things and others not named have been attended to correctly, he gives the borrower a final O.K. to start construction. It is possible for the borrower to have most of these details out of the way between the time he submits his application and the date the contract for funds has been executed. If this is done, construction may start immediately upon completion of contract for funds. Most of these duties and requirements apply only to non-federal projects as these projects are the only ones for which the State Engineer, PWA, has responsibility.

Once a PWA contract gets under way it is inspected by PWA engineering or architectural inspectors at sufficiently frequent intervals or continuously as may be required to enforce adherence to the construction contract. Auditors of the PWA keep constant check on labour and material expense. Trained PWA special agents, many of them engineers, have roving commissions to check all reported violations of contracts or other improper or unfair practices. These special agents report directly to a separate Division of Investigation, the Chief of which reports directly to the Administrator. Every precaution has been taken to exclude rigorously all graft or corruption from PWA projects.

All PWA contracts contain definite provisions to provide for compliance with PWA regulations. The outstanding regulations are those which limit the hours of work by an individual to thirty hours per week, those which set up a minimum wage scale and provide for payment of labour in full in cash, and those which require the procurement of labour through the U.S. Department of Labour Re-employment Service. A thirty-hour week was set up to put more men on the same job. A minimum wage scale was provided to insure wages for the short week which would permit men to live in decency and comfort. The Central Office, in co-operation with the U.S. Department of Labour and representatives of organized labour, set fifty cents an hour for unskilled labour and one dollar twenty cents an hour for skilled labour as minimum wages for all the states in the northern one-third of the United States. Some State Engineers, in co-operation with officials of organized labour, contractors, engineers, architects and municipal officials, set up intermediate scales based on the basic minima given. We took such action in Minnesota beginning with our first construction job which started last September. The Minnesota PWA labour classification and wage scale has been made part of every Minnesota non-federal PWA contract to date and will continue to be so included. PWA recognizes the right of labour to collective bargaining agreements with contractors. It protects both union labour and non-union labour. There is no PWA prohibition to higher wages than those set in the minimum scales. The Minnesota scale sets up eight groups of labour classification. Unskilled labour at fifty cents per hour minimum falls in group one. Group two covers the slightly higher classifications and provides a minimum of sixty cents per hour. The several following groups provide successively higher minima, in ten cent increments, until group eight is reached with a minimum of one dollar and twenty cents per hour for skilled labour. Our scale has proved entirely satisfactory to date.

Labour on PWA projects, as provided for in the contract provisions, must be secured either through union locals or from the local agency of the U.S. Department of Labour Re-employment Service. In Minnesota practically all the PWA labour is secured through the Re-employment Service. If a contractor is a "closed shop" contractor, that is, has agreements in force with organized labour, he is expected to place requisition for his labour on a given PWA project at the local union headquarters. If the union labour agencies do not furnish the labour requisitioned within forty-eight hours of the demand made for it, then the "closed shop" contractor may secure his labour from the Federal Re-employment Service.

"Open shop" contractors place their requisitions for labour on the Re-employment Service in the first instance. No contractor may hire directly the labour required on his contract. He may discharge men as he chooses but he must procure them in the manner outlined. He may carry his own supervisory and administrative employees from job to job but no others. Agencies of the Federal Re-employment Service are set up in each county. The men appointed on County Re-employment Boards serve without pay, with the possible exception of a paid secretary. Unemployed workers of each county are required to register at their Re-employment Agency Office. Labour on PWA jobs in each county must be obtained, if it is available, from the Re-employment Office labour lists of that county. In this manner labour is put to work on jobs close to home and labour migration to any material extent is prevented. Because of the large numbers of unemployed, there has been no difficulty experienced to date in Minnesota, and so far as I know, in any other state, in obtaining high class labour of any kind through the Re-employment Service. Hand in hand with the local labour use requirement is a requirement that local materials be used, other things being equal. The theory back of the local labour and local material requirements is that it is only fair to employ the men and use the material, so far as possible, of the community which is paying directly about seventy per cent of the cost of a given non-federal PWA project.

When the three-billion dollar appropriation was made available last fall, non-federal projects in large numbers were not available to place in construction quickly. Many large and small all-federal projects were ready. Non-federal projects did not begin to receive allotments in volume until November and December. The latest official figure, received on January 27th, shows the total of non-federal allotments to that date to be $870,028,704. This sum has been provided for the construction of 2,118 non-federal projects by States, municipalities and other political subdivisions and public agencies. As the entire PWA appropriation, to all practical purposes, now has been allotted, it follows that, approximately $2,230,000,000 was allotted to all-federal projects. It should be remembered that an all-federal allotment of $400,000,000 was made for Federal roads and another $400,000,000 was paid out to the Civil Works Administration to finance its activities. Individual non-federal allotments have been comparatively small, running from a few hundred dollars in extreme cases to several million. Minnesota's smallest PWA non-federal allotment was $900 to finance a village well, and our largest allotment was $18,000,000 to finance a joint trunk sewer and sewage disposal plant for Minneapolis and St. Paul.

The entire PWA organization had to be brought into being almost over night. All the necessary regulations and safeguards had to be built up in their entirety. The requisite machinery for handling non-federal applications for loans and grants was found to be not only of extraordinary size but complicated as well. It is only natural that the time expected to be consumed from the organization of PWA to the construction of public work projects in volume was underestimated. The result was that, when winter came upon us, widespread non-federal PWA construction had not been attained. There was still a large unemployment list and the buying power expected to result from PWA jobs had scarcely begun to register. It appeared evident that the full force of PWA construction would not be felt before next spring. Something had to be done before spring to take men in large numbers from relief rolls and place them on pay rolls. On November 7th, 1933, the Civil Works Administration, or CWA, was created for that purpose and an allotment of $400,000,000 from PWA funds was made to the CWA.

A basic principle governing PWA projects is that detailed plans and specifications shall be made to cover each project, that it be advertised for competitive bidding and that a contract be let to the lowest responsible bidder. To obtain speed and to put a large volume of hand labour at work with a minimum of delay, the CWA abandoned this basic PWA requirement and proceeded to put thousands of CWA projects under way by day labour. CWA was decentralized and final approval of its projects was left to a CWA Administrator appointed in each state. The objective of CWA, as announced on November 15th, was to put four million persons to work before December 15th. Approximately half of this number was to be taken from men then on public relief rolls. CWA accomplished its objective. All public works projects of the character usually constructed or carried on either by the public authority or with public aid to serve the interests of the general public were made eligible as CWA projects. The limitations were that the projects should be socially and economically desirable, that they could be undertaken quickly and that not more than fifteen per cent of the total cost of a project could be expended for materials. The hours of labour were limited to the thirty hour week and the PWA minimum wage scale also was adopted. Neither PWA nor CWA permits persons under sixteen years of age to be employed. CWA is still in operation but is expected to be discontinued or at least postponed by May 1st, next. It was provided as a stop-gap to fill the inevitable lag which occurred in getting PWA construction under way in volume.

There can be no question that the PWA drive to transfer men from the relief rolls to pay rolls is obtaining results. A report of a survey by the Dodge Corporation, industrial statisticians, made public January 14th, 1934, revealed a strikingly larger volume of construction during December, 1933, than in any month since October, 1931. Private construction as well as public construction shared in the increase, in confirmation of the theory of stimulation of industries through PWA upon which theory the whole programme was undertaken. There is a spirit of optimism and of confidence abroad in the land which has not been felt in years. A definite step has been taken in the war on the depression and the public feels the advantage which lies with a vigorous offensive attack. We have a new, national pilot, a new deal and our course is set on new landmarks. Again our industrial ship is moving under a full head of steam, our crew is well organized and has complete faith in its leader. With the existing unprecedented spirit of co-operation in industry, with new jobs for millions and with optimism and confidence prevailing, we firmly believe that our ship of state is well on its way out of the Sargasso sea of depression toward the home port of Prosperity.

---

*The Canadian General Electric Company* announces a new line of capacitors for power factor correction. A substantial reduction in size, rating for rating, is one of the advantages of these devices, which are treated and filled with Pyranol, whose insulating and dielectric properties permit an unusually small capacitor for a given rating, and which is non-inflammable and non-explosive. The line also includes new box-type units and small rack-type capacitors, both for indoor service.

# BRANCH NEWS

## Border Cities Branch

*C. F. Davison, A.M.E.I.C., Secretary-Treasurer.*
*F. J. Ryder, S.E.I.C., Branch News Editor.*

At the regular monthly meeting of the Border Cities Branch held on Friday, March 9th, 1934, Mr. Ernest Wilby, A.A.I.A., Professor of Architecture at the University of Michigan, was guest-speaker. Mr. Wilby gave an intensely interesting discourse on "A Trip Through the Past."

A Trip Through the Past

Stating that architecture is the oldest profession, while engineering is the youngest profession, and that architecture has passed down to this generation with no schisms since earliest times, Mr. Wilby briefly outlined the problems that have beset architects throughout their history.

Architects of the past he stated knew of and used only compression and the law of gravity. Since the introduction of tension into structures architects have encountered considerable difficulty. They have found it impossible to "make tension beautiful." Creating beautiful structures utilizing tension members remains a challenge to the coming generations of architects.

Egyptian architecture, Mr. Wilby pointed out, was remarkable for its massiveness and the degree of accuracy achieved in construction.

The Greeks, in the speaker's opinion, reached the highest point in intellectual development. This was because they were interested in the solution of problems rather than in their commercial utility. Knowledge has increased in quantity very considerably since their time but the intelligence of the Greeks has never been equalled.

Their architecture indicated a mastery of accuracy and design. The Ionic temple in Athens is considered as a landmark in architecture and the Parthenon as it existed is considered to be the most perfect building ever built.

The speaker likened the Romans to present day Canadians and Americans. The Romans were exceptionally practical. Evidence of this was the Coliseum, the aqueducts, and the Pantheon. They also appreciated the need for the beautiful. Being unable to build beautiful structures themselves they employed the Greeks to build them for them. They discovered natural cement and its use permitted the building of large arches, aqueducts, and durable roads.

Mr. Wilby then dwelt on structures of more recent times. In England are many examples of Gothic architecture which in almost every case runs on the narrow side of safety structurally.

In the discussion following the address it was brought out that the most enduring and beautiful structures are those composed of materials natural to the site and that such structures gain beauty from the surrounding landscape. It was also pointed out that one of the main reasons for the deterioration of most ancient large structures is the fact that following generations have made use of them as quarries.

Mr. Wilby illustrated his talk with postcard views, projected through a stereopticon of his own manufacture, which were of interest to all.

Following the address a hearty vote of thanks was extended to Mr. Wilby by the chairman.

## Calgary Branch

*J. Dow, M.E.I.C., Secretary-Treasurer.*

Engine No. 8,000

At a general meeting held at the Board of Trade rooms on Thursday evening, January 25th, 1934, a large attendance of the members of the Calgary Branch and their friends were privileged to hear an address by Mr. T. F. Donald, mechanical engineer of the Canadian Pacific Railway, on Locomotive No. 8,000.

Mr. Donald's address was illustrated by motion pictures showing in animated form the principle of steam generation which is a radical departure from the ordinary locomotive, marine or stationary boiler. The films also depicted interesting scenes taken during the construction of the locomotive and also of its assembly.

The principal feature of engine No. 8,000 is a system known on this continent as the Elesco multi-pressure system, which consists of three distinct separate units:

(*a*) The closed circuit, with maximum pressure of 1,700 pounds per square inch.
(*b*) The high pressure boiler, with 850 pounds pressure.
(*c*) The low pressure boiler, with 250 pounds pressure.

The closed circuit is really a water tube boiler forming fire box and combustion chamber and is composed of a number of small diameter forged nickel steel drums. This is filled with distilled water and the unit is then sealed. Steam generated in the circuit is not used in the cylinders, it does not leave the circuit, consequently there is no loss of water. The steam separates from the water in the top drums, flows into the top of the sixteen multi-tube coils, called heat transfer elements, and almost entirely submerged in the high pressure boiler water. During its flow the steam loses its heat to the lower temperature water in the high pressure boiler, turning it into steam at 850 pounds. As it loses its heat it condenses, and as condensate flows back to the bottom drums of the fire box ring where it is again turned into steam. There is no fixed pressure for the closed circuit, it varies depending upon the demands of the locomotive. Under normal conditions it ranges from 1,300 to 1,500 pounds and for peak loads to 1,600 pounds. Safety valves are set at 1,700 pounds.

The high pressure boiler is a seamless forged nickel steel drum, protected from contact with the flames by lagging and fire resisting steel plates. The high pressure feedwater is taken to the low pressure boiler at 250 pounds and delivered to the high pressure boiler by a high pressure pump.

The low pressure boiler is similar to the barrel part of an ordinary locomotive and located ahead of the combustion chamber. Steam is generated in the low pressure boiler at 250 pounds by the heat in the fire box gases after they leave the fire box. The steam from the high and low pressure boilers passes through superheaters located in the fire tubes of the low pressure boiler before entering the cylinders.

Two stages of expansion are necessary to derive all benefits of the 850 pounds pressure, first in a high-pressure cylinder and then in low pressure cylinders.

After the 850 pounds steam pressure performs its work in the high pressure cylinder, it is exhausted at a pressure of 250 pounds into mixing chambers located in the low pressure cylinder steam pipes, where it intermingles with the 250 pounds pressure superheated steam from the low pressure boiler, this intimate mixture reheats the high pressure exhaust steam so that there is a superheated mixture fed into the low pressure cylinders, where it is expanded to nearly atmospheric pressure in the performance of its work and then exhausted through the stack.

This engine has a tractive effort of 83,300 pounds and has developed 97,400 pounds on one occasion. It can haul a train of 10,000 tons, about one hundred and fifty loaded grain cars, on level track.

Following Mr. Donald's address a most interesting discussion took place, after which a hearty vote of thanks was given the speaker by F. N. Rhodes, A.M.E.I.C.

The meeting adjourned at 10.00 o'clock p.m.

A very pleasant evening was enjoyed by all those present at a joint annual dinner of the Calgary Branch of The Engineering Institute of Canada, the Association of Professional Engineers of Alberta, and the Institute of Mining and Metallurgy, held at the Renfrew Club on Saturday evening, February 10th, 1934. Eighty-four members and their friends attended.

P. T. Bone, M.E.I.C., presided at the dinner. Recitations and songs were given by Messrs. D. Carswell and G. H. Patrick, A.M.E.I.C., assisted at the piano by Mr. Lloyd Roberts.

The speakers were Mr. J. D. Baker of Edmonton, President of the Association of Professional Engineers, who recounted the work that had been accomplished by that body during the past year, also stressing the point that engineers as a whole should take more interest in international affairs. Mr. Baker said that he was very pleased indeed to be able to announce the appointment to Life Membership in the Association of P. T. Bone, M.E.I.C., and J. S. Tempest, M.E.I.C. H. J. McLean, A.M.E.I.C., chairman of the Calgary Branch of The Institute, next spoke in a lighter vein, and was followed by the Venerable Archdeacon Swanson, the speaker of the evening, who addressed the gathering, choosing as his subject "People I have Met" and in a reminiscent style enlarged greatly on his subject to the amusement of all present.

## Halifax Branch

*R. R. Murray, A.M.E.I.C., Secretary-Treasurer.*
*C. Scrymgeour, A.M.E.I.C., Branch News Editor.*

The regular monthly meeting of the Halifax Branch was held on Thursday, March 15th, 1934, at the Halifax hotel, with forty of the members present, and the chairman of the Branch, R. L. Dunsmore, A.M.E.I.C., presiding.

The first part of the meeting, following the regular dinner, was taken up for general discussion by the members of the proposed alterations to the By-laws affecting The Engineering Institute of Canada, and among those who took part in the discussion were past-chairmen A. F. Dyer, M.E.I.C., H. S. Johnson, M.E.I.C., Professor W. P. Copp, M.E.I.C., and others.

At the conclusion of the discussion, Mr. W. B. Burchall, advertising publicity manager of the Canadian Airways, Limited, was introduced to the members of The Institute by the chairman, following which Mr. Burchall gave a highly instructive and interesting address on the contribution of the aeroplane to Canadian industrial development, the address being accompanied by a particularly fine series of slides illustrating the class of work which the Canadian Airways had done since its inauguration in Canada.

## Hamilton Branch

*A. Love, A.M.E.I.C., Secretary-Treasurer.*
*V. S. Thompson, A.M.E.I.C., Branch News Editor.*

The March activities of the Hamilton Branch got off to an early start with a joint meeting with the Toronto Branch on the first day of the month. The meeting was held in Hart House, Toronto University, and Hamilton Branch was well represented by a delegation of twenty-two including three from the Babcock-Wilcox and Goldie McCulloch Engineering Society, Galt.

Archie B. Crealock, A.M.E.I.C., the genial chairman of the Toronto Branch, presided at the dinner which was served in the graduates' dining hall, and at which there were about sixty present. Among the guests were a few outstanding in Institute affairs—Brig.-Gen. C. H. Mitchell, M.E.I.C., Dean of the Faculty of Applied Science, Toronto University and Past President of The Institute, A. H. Harkness, M.E.I.C., Past Vice-President, and F. W. Paulin, M.E.I.C., Councillor.

Dean Mitchell very kindly conducted a party over Hart House and pointed out the many notable features of this attractive building.

It was not intended that this should be a reunion of Glasgow University graduates, but there were four present, including the speaker of the evening.

The professional meeting was held in the Debates room and was very well attended. Mr. Crealock opened the proceedings and then turned over the meeting to Mr. Stuart, who explained that the paper to be presented by Mr. Carswell had been prepared by a committee composed of J. B. Carswell, M.E.I.C. (Chairman), E. P. Muntz, M.E.I.C. and H. B. Stuart, A.M.E.I.C.

### The Status of the Engineer in Industry

Mr. Carswell then spoke on "the Status of the Engineer in Industry." It was early noticed that the speaker preferred to stick to the truth, even if it did hurt, and told the engineers in no uncertain terms that the status of the engineer in industry was by no means what it might be; that while industry was going merrily along the engineer was there doing his part, but when industry declined to the vanishing point, it did not necessarily follow that the engineer should disappear also, as it would seem at present. With his long valuable training, the engineer should be able to do some constructive work and take his place with those who are striving to open up lines of activity, where there is at present nothing but stagnation. The speaker's criticism extended to engineering meetings; his advice while of a general nature was directed mainly towards the younger engineers.

As was to be expected the talk started an interesting discussion which was free and frank, and brought out many suggestions both good and otherwise. It is to be hoped that some good will follow the presentation of this paper and the ensuing discussion, but it is certain that the general feeling of the meeting was that joint meetings and interchange of visits are most desirable, and no doubt the future will see more of them.

### Visit to Plant of Sovereign Potteries, Limited

At the invitation of Mr. Paulin and the management of Sovereign Potteries, Ltd., the members of the Branch and their ladies were enabled to visit this interesting new industry on Saturday, March 17th, 1934. About one hundred and fifty guests took advantage of the opportunity of inspecting the processes in the manufacture of dinnerware for the first time in Canada.

The visitors were shown first the new clay which is brought from several different sources, but mainly from Saskatchewan and Georgia.

The clays are mixed and washed, any iron present being removed with magnets. It is then squeezed into flat slabs to remove excess water, and stored for approximately one week.

All moulds used in the plant are of plaster of paris and are made on the premises.

The visitors were particularly interested in the cups, which are spun for a few seconds only. The handles are made in separate moulds and stuck on by hand. The handles of jugs and pitchers however are cast integral with the body of the piece.

Up to this stage the clay is still moist and is allowed to stand for a day or two before piling into saggars or earthenware containers for bisque firing. The first firing takes six days, during which the ware is subjected to its maximum heat for about two days. About 60,000 pieces can be heated at one firing in one bisque furnace.

The ware, now classified as bisque, is dipped in a glazing fluid and dried by means of fans. As soon as it is dry it is piled again in saggars, but this time it is necessary to separate each piece from its neighbour as the glazing coat is easily broken or fused. The saggars are then returned to another furnace for the second firing which produces the glazed surface.

The temperature of the furnaces is regulated by means of pyrometric samples known as seger cones which give warning through mica inspection windows when the desired heat has been attained. After removal from the second furnace the ware is finished except in the case of decorated ware which is varnished and to which transfers are applied. This necessitates one more heat treatment to evaporate the varnish and bake the coloured design on to the surface. Many attractive samples of decorated ware were on display and the visitors were much impressed by the variety of designs.

Before departing, coffee was served and each lady was presented with a cup and saucer with The Institute crest as a souvenir of a very interesting and instructive afternoon.

## London Branch

*H. A. McKay, A.M.E.I.C., Secretary-Treasurer.*
*Jno. R. Rostron, A.M.E.I.C., Branch News Editor.*

The regular February meeting of the Branch was held on the 21st, at the Physics building, University of Western Ontario.

Mr. Garnet A. Woonton of the University staff was the speaker, and his subject "The Oscillograph and Its Uses."

The chairman of the Branch, Frank C. Ball, A.M.E.I.C., presided and in introducing the speaker said that the branch was greatly indebted to Mr. Woonton and to members of the University staff who were not only giving their time, but had gone to great trouble in arranging the apparatus for a practical demonstration.

### The Oscillograph and Its Uses

Mr. Woonton opened by giving some of the formulae and graphs which were usually employed to express the frequency and magnitude of sound waves.

The oscillograph situated at one side of the room was actuated from a microphone at the other side and connected by electric wires. A small screen was installed in front of the oscillograph on which moving delineations of the sound waves were thrown. Demonstration was first given by actuating tuning forks of different sizes, the various sounds being depicted on the screen by an illuminated line travelling from one side to the other and showing by different shapes and waves and intervals the character, magnitude and frequency of the sounds transmitted. Later, other sounds were demonstrated such as those of the human voice and various musical instruments, each giving a characteristic graph.

The use of the instrument was not confined to sound waves however, for demonstrations were given showing graphs produced by different kinds of electric currents, alternating and direct, and with various cycles.

Many questions were answered by Mr. Woonton and his assistants. Replying to one question Mr. Woonton said that the oscillations of moving bodies could be registered by the oscillograph provided the oscillations of the bodies were converted into electric currents.

E. V. Buchanan, M.E.I.C., manager of the London Public Utilities Commission, in moving a vote of thanks to the speaker, referred to the uses to which the oscillograph had been put in his own experience.

About fifty members and guests were present.

## Ottawa Branch

*F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.*

### Public Health in Quebec

At the noon luncheon on January 25th, 1934, the guest speaker was Theo. J. Lafreniere, D.Sc., M.E.I.C., chief engineer of the Bureau of Health, Province of Quebec. He spoke on "Public Health in Quebec." Dr. Lafreniere occupies the chair of Sanitary Engineering, Ecole Polytechnique de Montréal, and served for several years on the Finance Committee and Board of Examiners of The Engineering Institute of Canada.

Alan K. Hay, A.M.E.I.C., newly elected chairman of the local Branch, presided and in addition the head table guests included: Hon. Alfred Duranleau, Hon. Murray MacLaren, Dr. O. O. Lefebvre, M.E.I.C., Amedee Buteau, Dr. E. R. Faribault, Col. A. E. Dubuc, M.E.I.C., Dr. Eug. Poitevin, G. J. Desbarats, M.E.I.C., J. V. Beauchemin, Jean D. Chene, A.M.E.I.C., C. A. Menard, J. E. St. Laurent, M.E.I.C., A. Lafleche, A.M.E.I.C., R. Blais. With the exception of the chairman and two of the guests, those at the head table were all graduates of the Ecole Polytechnique de Montréal.

Professor Lafreniere, in commencing his address, traced the history of public health engineering in Quebec from the middle of the seventeenth century down to the present day. In 1706, for instance, the inspection of meat and bread was established and in the same year the chief of police of the colony, visiting Montreal, found the streets in such a deplorable state that he ordered their reconstruction and required sewers on St. Pierre Street.

From the time of the cession of Canada to England in 1763 up to about sixty years ago, public health matters remained stationary, the measures of the French regime being maintained. In 1870, the Municipal Code was passed, giving to every municipality the powers to make regulations concerning health matters. When the smallpox epidemic occurred in 1885, the legislative authorities passed a special act creating a commission which later became the permanent board of health of the province. The present activities of this organization concern themselves with water supply, sewerage, milk supply, housing, and nuisances.

With regard to water supply, a survey in 1931 revealed the fact that water for domestic use is obtained from rivers for 84 per cent of the population, from lakes for 6 per cent of the population and from springs and wells for 10 per cent of the population. Numerous typhoid fever epidemics have been caused in the past through the general use of rivers as a source of supply and accordingly the main concern of the sanitary engineering division has been to obtain the improvement of these supplies. Filtration plants were established in the larger cities and towns and chlorination plants in those municipalities that could not for the present afford the cost of the more expensive works. It is interesting to note that the typhoid death rate decreased from 25.5 in 1910-1914 to 6.8 in 1932.

The speaker also dealt with questions of sewerage, milk pasteurization, housing, and nuisances. The pasteurization of milk is compulsory in the city of Montreal and vicinity only, although there are forty-three plants in areas beyond this in the province. Approximately 45 per cent of the population of the province is served with pasteurized milk. The consumption based on the pasteurized milk is one-third of a quart per head per day.

The main activities of the Engineering Division of the Bureau of Health concern themselves with the above mentioned features, but other features are touched upon. The examination and control of swimming pools; bathing beaches are becoming a special problem; tourist camps are under the jurisdiction of a special department; ventilation of schools and public buildings is controlled by general by-laws; permits are required to harvest natural ice, etc.

In conclusion, stated the speaker, the Quebec Public Health Act contains the necessary powers to control the environment for the benefit of the public.

The Great Bear Lake District

"The Great Bear Lake District" was described by D. F. Kidd, Ph.D., of the Geological Survey of Canada, at a noon luncheon address on February 22nd, 1934, before the local Branch at the Chateau Laurier. Dr. Kidd spoke largely from personal experience, having conducted geological surveys and explorations in this and other localities of the Northwest Territories in recent years. His address was illustrated by lantern slides and by motion pictures taken by himself.

A. K. Hay, A.M.E.I.C., chairman of the Ottawa Branch, presided and in addition head table guests included: Hon. T. G. Murphy, Grote Stirling, M.E.I.C., H. H. Rowatt, Dr. Charles Camsell, M.E.I.C., G. J. Desbarats, M.E.I.C., F. H. Peters, M.E.I.C., Group Captain E. W. Stedman, M.E.I.C., John McLeish, M.E.I.C., W. B. Timm, A. L. Cumming, R. J. Traill and A. M. Narraway.

Along the east shore of Great Bear lake, where the mineralization occurs, "a much dissected upland comes to the edge of the lake and forms very rugged hills up to 1,100 feet high. The topography is reminiscent of parts of the north shore of Lake Superior," stated Dr. Kidd.

Possible waterpower sites are at Whiteagle falls on Camsell river, where it has been reported 10,000 h.p. can be developed, and on the Sloan river. At present there is one settlement at Cameron bay, another abandoned settlement at Hunter bay, and several mining camps.

At Hunter bay copper deposits were first staked in 1922 but real attention was focussed on the Great Bear lake area with the advent of aircraft transportation and the historic find of pitchblende at Echo bay in May, 1930.

Dr. Kidd briefly outlined the geological features of the district, explaining that the deposits were of two kinds: first, pitchblende and silver, often with secondary values in copper, lead and gold; and secondly, silver.

He also detailed the various kinds of mineralization at the different properties and gave an account of production methods to date.

In commenting upon the radium possibilities, Dr. Kidd expressed the opinion that "radium production from the Great Bear lake field may well prove less important in gross final commercial value than the silver production, though its real importance from the standpoint of human welfare may be much greater."

The radium industry of the world is at present practically a Belgian monopoly, the major portion coming from a mine in southeastern Belgian Congo. The Belgian company has always been secretive about the grade of ore mined, the extent of their reserves, and particularly about production costs. It is therefore extremely difficult to evaluate the factors in the marketing of radium.

This paper appears in full on page 167 of the April issue of The Journal.

## Peterborough Branch

*H. R. Sills, Jr.E.I.C., Secretary.*
*W. T. Fanjoy, Jr.E.I.C., Branch News Editor.*

The Electric Eye

The fascinating story of the electric eye, the device which has also made possible the "photography" of sound, for the talking movies, the opening of the World Fair gates by light from a distant star and countless other miracles, was unfolded to the Peterborough Branch, Thursday night, February 8th, 1934. The speaker was A. G. Turnbull of Toronto, a representative of the Canadian General Electric Company.

In 1873, an operator stationed in a trans-Atlantic cable station on the coast of Ireland noticed that the operation of his equipment was affected by the amount of light which happened to fall on certain selenium or selenium-coated electrical conductors which formed a part of his apparatus; with that observation the birth of the electric eye many years later was heralded.

The electric eye, using the term broadly, is simple in principle. It is a device which causes variations in the flow of an electric current in concurrence with variations of the intensity of light allowed to fall on the device; in other words it is a mechanism which translates light into electrical energy.

Mr. Turnbull had a number of practical demonstrations to offer using a varied assortment of equipment.

Stating that the electric eye has recently proved extremely useful as a device to count automobiles passing a given point on a highway, people passing in and out of a theatre or packages passing out of a machine, the speaker offered another practical demonstration. He placed an electrical counting machine in the lap of one of his auditors and through the operation of photoelectric equipment caused the device to register.

One company is manufacturing electric eye equipment which will cause garage doors to open when car headlights are turned on them. Another company is specializing on electric eye equipment to be used for burglar alarm purposes.

Mr. Turnbull divided light sensitive devices into three classes. "Phototubes" are the devices operating by the photoelectrical emission of electrons from the cathode. The pioneer of the devices, the "selenium" or "copper anode tube" operates by the resistance of a conductor due to the action of the light. "Photovoltage cells" are those which generate an electromotive force when exposed to light.

Practically all photoelectric relays of the industrial type utilize photo tubes as light sensitive devices. These tubes produce currents of the order of a few microamperes which current is amplified by ordinary conventional radio type vacuum tubes to operate relays, the contacts of which can be used to accomplish whatever work is required. While the speed of response of the tube is very fast the relays being mechanical devices, limit the application of the device to applications where the light is "on" and "off" for a period of at least 1/15 second each. For high speed counting, etc., the mechanical relays are replaced by "thyratrons" which are three element mercury vapour tubes. These outfits have a speed of response up to 1/100,000th of a second.

Mr. Turnbull was very careful to point out that while the photoelectric eye has a particular field of its own, the fact that it is a relatively new and novel device carries with it the danger that it may be applied indiscriminately. Each application must be carefully checked to see if some other device is not more suitable particularly from cost and suitability angles. An example of a legitimate application is the use of the eye as a limit switch where the articles to actuate the limit are too small or too light to actuate a conventional mechanical limit switch, for instance, sheets of paper on a conveyor.

## Quebec Branch

*Jules Joyal, A.M.E.I.C., Secretary-Treasurer.*

At a meeting of the Quebec Branch held at Montcalm Palace on February 12th, 1934, Marc Boyer, S.E.I.C., delivered a very interesting paper on the "Valuation of Non-metallic Mineral Deposits," of which an abstract will appear in an early issue of The Journal.

At the same meeting two other short papers were delivered by Messrs. Maurice Royer and E. Gray-Donald, Jr.E.I.C., a summary of which will appear in the Branch News section of the next issue.

Hector Cimon, M.E.I.C., chairman of the Branch, introduced the speakers; a vote of thanks was moved by J. Joyal, A.M.E.I.C., seconded by J. Ruddick, M.E.I.C.

## Saskatchewan Branch

*S. Young, A.M.E.I.C., Secretary-Treasurer.*

The monthly meeting of Saskatchewan Branch, was held in the dining room of the Champlain hotel, at 6.15 p.m., on Friday, January 19th, 1934, some forty members and visitors being in attendance.

An interesting letter was received from W. T. Thompson, M.E.I.C., now residing at Cranberry Portage, Manitoba. Mr. Thompson expressed interest in Mr. Webster's paper delivered at the last meeting on "Mineral Resources in Northern Saskatchewan," and expressed the desire that a synopsis be published in The Journal. He also referred to an address, given previously by L. A. Thornton, M.E.I.C., dealing with Water Power Development at La Colle Falls, stating that he remembered this location especially well and referring to an exciting voyage made in a flat boat down the Saskatchewan from Prince Albert to the Pas in 1911.

Disarmament

The chairman, P. C. Perry, A.M.E.I.C., then introduced the speaker of the evening, Mr. F. C. Curtis, B.C.L., who addressed the meeting on "Disarmament." The history of disarmament, Mr. Curtis placed into three periods: from the close of the war to the opening of the disarmament conference in 1932; the conference itself and up to the crisis when Germany threatened to withdraw; and the crisis itself: the withdrawal of Germany from the League of Nations. He declared that the building of armaments was one of the chief causes of war, despite preparedness propaganda. An active military preparation means the growth in the state of a military spirit, which sooner or later grows to assume national importance in the nation's life. Outlining the various moves towards international peace, Mr. Curtis declared that disarmament outdistanced anything else in the international field, in that it was on it that Germany withdrew from the League of Nations. With four great nations, Russia, Japan, Germany and United States outside the League of Nations, and Italy only lukewarm, it holds little promise of security for France. Despite this the position is now better than it was twelve months ago. In concluding, he touched on the various steps which marked the disarmament conference and on the growth of Hitlerism. During the discussion period, the speaker stated that war propaganda of armament firms was a great factor in promoting international discontent and that it was necessary for public opinion to combat this.

H. S. Carpenter, M.E.I.C., moved a vote of thanks and congratulated the Papers and Library Committee on their selection of papers, and expressed the view that subjects of great interest outside of actual technical matters were, he thought, to be desired, and hoped that more papers of this nature would be provided. Those taking part in the discussion: Mr. Carpenter, Colonel A. C. Garner, M.E.I.C., Colonel A. P. Linton, A.M.E.I.C., Mr. P. C. Perry and J. N. deStein, M.E.I.C.

## Sault Ste. Marie Branch

*G. H. E. Dennison, A.M.E.I.C., Secretary-Treasurer.*

The regular monthly meeting of the Sault Ste. Marie Branch was held on Friday evening, February 23rd, 1934, following the regular dinner at the Windsor hotel. E. M. MacQuarrie, A.M.E.I.C., chairman of the Branch, was in the chair.

On opening the meeting reference was made to the sudden death since our last meeting of Mr. C. H. E. Rounthwaite, A.M.E.I.C. R. S. McCormick, M.E.I.C., spoke of the many fine attributes of Mr. Rounthwaite and moved an expression of regret at his passing, seconded by A. H. Russell, A.M.E.I.C.

J. LeB. Ross, M.E.I.C., then introduced the speaker of the evening, Captain James McCannel of the C.P.R. steamer *Assinaboia*, flagship of the C.P.R. lake fleet, who addressed the meeting on "A Short History of Great Lakes Shipping since 1812."

### A Short History of Great Lakes Shipping Since 1812

One of the ships of which Captain McCannel spoke was the *Chicora* built to run blockades during the American Civil War. A steamer which also carried sail, she was one of the fastest ships of the day and made several spectacular runs. After the war, she was brought to the Great Lakes by Milroy Bros. of Toronto, in 1864. She carried troops to the head of the lakes in 1870 and after sixty years active service on the Great Lakes became a tow barge where she is still employed under the name *Warrenko.*

Touching on the opening of Lake Superior to through lakes shipping and the construction of canals at Sault Ste. Marie, the views of some of the marine authorities of the day were quoted. Derision greeted the suggestion that the first locks built be constructed for ships up to 300 feet in length, and it was the considered opinion that a 200-foot lock would provide ample capacity for all time.

One of the early ships which contributed to Great Lakes mercantile history was the *Kaloolah*, a paddle steamer built at Buffalo in 1853. In 1857 she was renamed the *Collingwood* and chartered to carry the Hynd and Gladman expedition to Fort William for a survey of that area. She locked through the Sault canal, the first upbound Canadian vessel to do so, and paid a toll of $7.50.

The propeller ship *Rescue* built at Buffalo in 1855 was fitted out by a group of Toronto business men to carry mails to Grand Portage, the first step in the delivery of mail to the Red river. For this service $1,200 was paid and the first mail consisted of three letters and a newspaper, but laid the foundation of trade with the northwest. In 1866 during the Fenian Raids, the *Rescue* was converted into a gun boat.

In 1895 the Canadian canal at Sault Ste. Marie was opened by the steamer *Majestic*, a freight and passenger steamer built at Collingwood the same year. For many years the Canadian canal some 600 feet in length was the largest at the Sault though now eclipsed by the new American canals. In conclusion Captain McCannel spoke of the *Lyman C. Davis*, last of the Great Lakes fleet of sailing vessels now laying at its moorings in Toronto harbour where it is planned to burn her for the amusement of holiday crowds. He deplored such an event and urged that the ship be preserved and turned to some useful purpose such as a cadet training ship.

Captain McCannel received a sincere vote of thanks from the meeting for his excellent paper on motion of Messrs. J. H. Jenkins and A. H. Russell.

## Vancouver Branch

*A. I. E. Gordon, Jr.E.I.C., Secretary-Treasurer.*

### Utilization of Electrical Energy at the Plant of the Consolidated Mining and Smelting Company

On Monday, January 8th, 1934, a joint meeting of the Vancouver Section of the American Institute of Electrical Engineers and the Vancouver Branch of The Engineering Institute of Canada was held in the auditorium of the Medical-Dental building, when Mr. A. G. Dickenson, electrical engineer of the Consolidated Mining and Smelting Company at Trail, B.C., spoke on the above subject to an audience of ninety-two.

Mr. Dickenson confined his discussion to the Trail smelter and did not take account of the extensive use of electrical power at the Sullivan mine. At Trail, there is the main smelter and refinery at Tadanac, which covers 160 acres and employs 2,800 men, and the fertilizer plant at Warfield, a mile away, which covers 60 acres and employs 400 men. Both plants operate eight hours every day in the year and consume over 87,400 kw. With the plants in full operation this becomes 110,000 kw. Seventy-five per cent. of this power is converted to d.c. for use in refining and other metallurgical operations. There are 2,100 motors of various types totaling 51,000 h.p. Power is generated by the West Kootenay Power Company, a subsidiary of the Consolidated Company, at Bennington Falls and elsewhere.

The lecture was illustrated by numerous slides and after describing the arrangement of the plants on the ground, the speaker went into detailed description of the distribution system, the main sub-stations, and the principal types of electrical machines and equipment used in the various processes.

### Nistri Photo-grammetric Method of Air Survey

A general meeting of the Vancouver Branch, held in the auditorium of the Medical-Dental building on February 12th, 1934, was addressed by Brigadier-General Sir Charles Delmé-Radcliffe on "The Nistri Photo-grammetric Method of Air Survey."

The distinguished guest, while in charge of British forces on the Italian front during the War, became acquainted with the Italian inventor of the process and assisted in carrying it to its present degree of perfection. The system depends on the optical enlargement of aeroplane photographs by projection on a moving screen in such a manner that rays of light intersecting along one contour line show that line in sharp relief, the rest of the picture remaining a blurred background. This may be repeated and the contours drawn for any interval. The enlargement may be to any desired scale. The speaker showed slides illustrating the complicated machine, the "cartograph," which accomplishes this purpose.

Field work takes a minimum of time and an half hour's flying will provide two hundred hours of office work. A minimum of ground control is required. The time required to survey and construct a contour map of a given area is ⅓ to 1/10 that required by ordinary topographical methods and can be done at ⅓ to 1/10 the cost.

An accuracy of less than 0.5 foot error is claimed for the contours and the topographical detail is much superior to that obtained by other methods.

After considerable discussion a vote of thanks was moved by H. B. Muckleston, M.E.I.C., and the meeting adjourned.

Discussion lasting over an hour was a tribute to the very high standard of this paper.

A vote of thanks was moved by P. H. Buchan, A.M.E.I.C., chairman of the Vancouver Branch, and the meeting adjourned at 11.00 p.m.

## Winnipeg Branch

*E. W. M. James, A.M.E.I.C., Secretary-Treasurer.*
*E. V. Caton, M.E.I.C., Branch News Editor.*

The regular meeting of the Winnipeg Branch of The Engineering Institute of Canada held on February 1st, 1934, was a joint meeting of the Winnipeg Branch of The Engineering Institute of Canada, the Association of Professional Engineers of the Province of Manitoba, and the Association of Manitoba Land Surveyors.

The speaker at this meeting was Mr. William Nelson Carey, Federal Engineer, Public Works Administration for Minnesota. Mr. Carey is also a member of the American Society of Civil Engineers, and President of the Minnesota Federation of Architectural and Engineering Societies.

Owing to the great interest of Winnipeg citizens, both engineers and laymen, in the gigantic economic experiment being made by our neighbours south of the International boundary, and it being realized that Canada will be affected whether President Roosevelt's efforts end in success or failure, and the probability that Canada will shortly follow her big neighbour's example to the extent of a moderate programme of public works to relieve unemployment and stimulate business, the Technical Associations decided to invite Mr. Carey to describe what is being attempted and what has already been accomplished, in the hope that we in Canada would be able to profit by America's experience and avoid their mistakes.

Some four hundred members and visitors were present.

The chairman, Professor G. H. Herriot, M.E.I.C., briefly addressed the meeting, and for the benefit of the visitors explained the aims and objects of The Engineering Institute of Canada, emphasizing the objects of the Association as outlined in Section 1 of the By-laws. He then called on Major A. J. Taunton, A.M.E.I.C., to introduce the speaker.

The speaker took as the title of his subject "The U.S. Public Works Administration," and his address reproduced elsewhere in this issue.

After the address an active discussion took place in which many of the visitors took part.

The meeting closed with a hearty vote of thanks being tendered to Mr. Carey by Mr. D. A. Ross.

### Supper Dance

The joint supper dance of the Winnipeg Branch of The Engineering Institute of Canada and of the Association of Professional Engineers of the Province of Manitoba was held in the main dining room of the Royal Alexandra hotel on the evening of Friday, February 9th, 1934.

The room was converted for the occasion into a stage representing the evolution of surveying and engineering.

The window recesses concealed by large silhouettes depicted the progress of engineering from the initial mechanical stage to the finished product, which proved a most effective background and accentuated the occasion for which the dance was planned.

At one corner of the room a curtained wall showed off to advantage a giant thermometer on which letters of varied hues marked the dances on the programme in their rightful succession.

Tables of varying size were adorned with gold, pink and white tulips with their attendant green spike-like foliage.

The dance was featured by many pretty gowns which radiated in and out of the spot lights that were thrown from time to time on the dance floor. Noise makers and favours added merriment to the event.

# Preliminary Notice

## of Applications for Admission and for Transfer

March 26th, 1934

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described in May, 1934.

R. J. Durley, Secretary.

* The professional requirements are as follows:—

A **Member** shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An **Associate Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A **Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

### FOR ADMISSION

ALEXANDER—STANLEY GEORGE, of 460 Sherbrooke St., Peterborough, Ont., Born at Paisley, Scotland, March 27th, 1893; Educ., 1922, Ont. Stationary Engr's. Cert. 1st Class; Maths. Course, Chicago Tech. Coll.; I.C.S. steam engrg., 1918, chemistry, 1925; 1909-13, ap'tice machinist, International Marine Signal Co., Ottawa, Ont. (later General Engrg. Works, Ottawa); 1913-15, operating engr., Ottawa Constrn. Co.; 1915-18, Overseas, C.E.F.; 1918-20, steam plant foreman, Dept. of Engineer Services, Ottawa; 1920-23, chief operating engr. (summers), Govt. Peat Fuel Committee, Ottawa and Alfred, Ont., (winters) in charge of shift at central heating plant, Dept. of Public Works, Ottawa; 1923-26, steam plant foreman, Douglas Packing Co. Ltd., Cobourg, Ont.; 1926-31, asst. mech. supt., General Foods Corpn., Cobourg, Ont.; 1931 to date, chief operating engr. of steam power plants, Canadian General Electric Co., Peterborough, Ont.

BREBNER—HECTOR STEPHEN, of 1431 St. Mark St., Montreal, Que., Born at Haddenham, Bucks, England, Feb. 4th, 1904; Educ., 1922-24, 2 year day course in engrg. science at Glasgow Univ.; Montreal Technical School—certificates in struct'l. design, 1930, electrotechnics II, 1932, and reinforced concrete design, 1933; 1924-27, 3 yr. pupilage with Nott Brodie & Co. Ltd., Bristol, England (gen. experience on railroad and reinforced concrete bridge constrn. Also trench excavation and piling work); 1927-28, with same firm as asst. engr., responsible for lines and levels on reinforced concrete sluiceway in Bristol Docks; 1929 (Feb.-Aug.), junior dftsman and tracer, Lake St. John Power & Paper Co., Montreal; Sept. 1929 to Aug. 1931 and from May 1932 to date, dftsman., Canadian Industries Limited, Montreal.

References: L. de B. McCrady, H. C. Karn, W. B. Fraser, V. R. Davies, I. R. Tait, A. B. McEwen, G. R. Stephen.

FRANCOEUR—GEORGES ULRIC, of 2447 Maplewood St., Montreal, Que., Born at Sorel, Que., April 29th, 1893; Educ., 1908-10, private technical course, dfting, surveying, etc.; 1920, returned soldier refresher course on civil engrg., McGill Univ.; 1910-14, dftsman, Sorel shipyard, and land surveying in field; 1914-19, overseas. Experience in map reading, sextants, range finders, compass, protractors and map reading for aviation purposes; 1921-23, dftsman., Dominion Engrg. Works, Lachine, Que.; 1923-25, dredging, surveying and concrete works, Atlas Constrn. Co., Montreal Waterworks; 1925-26, supt., Simplex Radio Co., Montreal; 1927, ship designer, Sorel Shipyard; 1928-31, junior engr., and 1931 to date, asst. engr., River St. Lawrence Ship Channel, Dept. of Marine, Montreal, Que.

References: N. B. McLean, A. E. Dubuc, H. A. Terreault, C. J. Desbaillets, A. Lafleche, O. C. E. Fournier.

GAUDEFROY—HENRI, of 4590 Hutchison St., Montreal, Que., Born at Montreal, June 18th, 1909; Educ., B.A.Sc., C.E., Ecole Polytechnique, Montreal, 1933; at present pursuing studies at Mass. Inst. Tech. leading to the degree of B.S. in Elec'l. Engrg.

References: A. Frigon, A. Boyer, T. J. Lafreniere, J. A. Lalonde, A. Duperron.

GRANT—ERIC, of 3645 Jeanne Mance St., Montreal, Que., Born at London, England, Feb. 14th, 1902; Educ., Prelim. Oxford and Cambridge Local Exams.; Montreal Technical School—certs. struct'l. design, 1932, reinforced concrete design, 1933; 1917-18 (18 mos.), ap'ticeship, with C. J. Maggs, M.I.M.E. supt. engr., Sprostons Ltd., British Guiana; 1919-20, machinist helper, Imperial Oil Refineries, Imperoyal, N.S.; 1920, boiler makers helper, Halifax Shipyards, Ltd.; 1921-22, field asst. to Govt. Surveyors, Lands and Mines Dept., British Guiana; 1922-23, ap'tice engr., Colonial Transport Dept., British Guiana; 1924-27, pupil and engr's. asst. to M. A. Ravenor, M.Inst.C.E., British Guiana. Georgetown city improvement schemes, sewer and water main schemes, etc.; also lab. work in connection with report on silt discharge of the Demarara River; 1928 to date, engr., on field work for Montreal Light Heat & Power Cons., Montreal. Laying out lines and grades for gas mains; preparation of profiles, design of gas main connection, reinforced concrete beams, reinforced concrete manholes, etc. Drafting, surveying and levelling.

References: J. J. Humphreys, W. J. Yorgan, D. O. Wing, H. Milliken, E. J. Turley, V. R. Davies.

HANSEN—DARREL ADRIAN, of Edmonton, Alta., Born at Hartley, Iowa, U.S.A., July 17th, 1900; Educ., B.Sc. (E.E.), Univ. of Alta., 1928; 1923-28, rodman and instr'man. on rly. location and constrn.; 1928 to date, with Calgary Power Company, and at present asst. to divn. engr., Northern Division. Work includes: supervision of transmission line constrn., location topographic surveys, material and cost estimates, switching structures and distribution systems, collecting, computing and plotting hydrometric and hydrographic data, etc.

References: R. S. L. Wilson, H. J. MacLeod, G. H. Thompson, H. B. LeBourveau, B. Russell.

LAND—HERBERT LOUIS, of Ottawa, Ont., Born at Bralanda, Sweden, June 5th, 1902; Educ., D.L.S. 1930; 1920-25, misc. surveys, British Columbia; 1925-28, asst. on land and misc. surveys in B.C., Alta., Sask. and Man.; 1929 (season), asst. topog. and aerial control survey, N.B. and P.E.I.; 1930 (season), asst. D.L.S. Peace River (subdivision); 1928-31 (winters) in office of Topog'l. Surveys Br., Dept. of Interior, dfting., map compilation, laying out projections, computing triangulation surveys, plotting aerial photographs; From June 1931 to date, on staff of River St. Lawrence Ship Channel, Dept. of Marine. Asst. to engr. in charge of contract dredging, part time in full charge. In full charge of survey parties on Lake St. Peter, winters of 1933 and 1934.

MAUDE—JOHN HENRY, of 613 St. Joseph St., Lachine, Que., Born at Manchester, England, Feb. 18th, 1896; Educ., 1912-21, Coll. of Technology, Manchester. 1915, senior course diploma, mech'l. engrg., Manchester Coll. of Tech., and 1921, Assoc. Manchester Coll. of Technology; 1911-17, engr. ap'tice, Sir W. G. Armstrong Whitworth, Manchester, 3 yrs., works, 3 yrs., dfting office; 1917-20, dftsman., gen. engrg. office of same company; and from 1921-24, designer, gen. engrg. dept.; 1922-29, part time evening lecturer, mech'l. engrg., Newton Heath Technical School, and Openshaw Technical School, Manchester; 1924-29, leading designer, gen. engrg. dept., Messrs. Vickers Armstrong, Manchester. Hydraulic and electric cranes, hydraulic presses and machinery, testing plants, steelworks, boiler shop and shipyard machy.; 1929-32, lecturer, evening classes, mech'l. design, Dominion Bridge Company; 1929 to date, mech'l. engr., Dominion Bridge Company, Lachine. Cranes, swing bridge machy., bascule bridge machy., plant work, etc. Hydraulic regulating gates and operating machy.

### FOR TRANSFER FROM THE CLASS OF JUNIOR

SAUVAGE—ROBERT, of Quebec, Que., Born at Montreal, Nov. 27th, 1902; Educ., B.A.Sc., C.E., Ecole Polytechnique, Montreal, 1924; 1920-23, summer work with Quebec Streams Commission; 1924 to date, bridge designing, Dept. of Public Works, Quebec, Que. *(Jr. 1925.)*
References: I. A. Vallee, A. B. Normandin, O. Desjardins, H. Cimon, J. Joyal, J. G. O'Donnell, C. Milot, T. M. Dechene.

WILLIAMS—EDWARD CLIFFORD, 233 Indian Road, Toronto, Ont., Born at Hawera, New Zealand, July 3rd, 1900; Educ., 1924-25, Canterbury College, Christchurch, N.Z.; Cert., Gordon Inst. of Technology, Geelong, N.Z.; Final Pass Cert. (1930), in elect'l. engrg. practice, City and Guilds of London (England) Institute, Dept. of Technology; 1922-23, worked as lineman and lines foreman; 1926 (Feb.-July), mtce. electn., Ford Motor Co., Geelong, N.Z.; 1926-27, foreman in charge of installn. of plant for Co-op. Phosphate Co., Geelong, N.Z.; 1927 (Aug.-Dec.), mtce. of direct current plant for B. J. Neilson, Melbourne, Australia; 1927-29, electrn. in charge of mtce. and conversion from single to three phase of plant for Bosella Preserving and Mfg. Co., Melbourne, Australia; 1929 to date, with Can. Gen. Electric Co. Ltd., as follows: 1929-30, test course, Peterborough; 1930-31, jr. asst. switchboard engr., Peterborough; 1931 to date, industrial heating specialist, Head Office, Toronto, full charge of industrial heating dept., involving supervn. of all appn. work and all commercial policies for complete line of industrial heating equipment, including resistor heated furnaces of all types, immersion type, steam generators, bldg. heating equipments and appns. of industrial heating units of all kinds. *(Jr. 1930.)*
References: D. L. McLaren, W. E. Ross, L. C. Prittie, L. D. W. Magie, W. M. Cruthers.

### FOR TRANSFER FROM THE CLASS OF STUDENT

AITKINS—JOHN CURREY, of Boissevain, Man., Born at Boissevain, Man., Oct. 11th, 1905; Educ., B.Sc. (C.E.), Univ. of Man., 1929; Passed Prelim. D.L.S. Exams., 1927; 1924-25-26 (summers), rodman and field dftsman., Topog'l. Surveys of Canada; 1927 (summers), articled pupil to D.L.S.; 1928 (summer), instr'man. in charge of party, prelim. survey, Slave Falls power development; 1929-31, office on constrn. of same project for City of Winnipeg Hydro-Electric System; 1931, instr'man., on constrn. of concrete pavement, Manitoba Good Roads Board; Oct. 1933 to date, inspecting engr., (Dom. Water Power and Hydrometric Bureau) Lac Seul Unemployment Relief Project. *(S. 1928.)*
References: J. N. Finlayson, J. W. Sanger, G. H. Herriot, J. A. MacGillivray, G. G. McEwen, B. B. Hogarth.

FRANKLIN—ROBERT LAWRENCE, of Woolwich, England., Born at Riceville, Ont., Aug. 2nd, 1908; Educ., B.Sc., Queen's Univ., 1930. At present attending the 9th Ordnance Mechanical Engineer's Course, Military College of Science, Woolwich, England; Summer 1928 and 1929 and 2 mos. in 1900, student training course, Massey Harris Co. Ltd., Toronto; 1930 (4 mos.), at Sturgeon Falls, and 1931 (4 mos.), at Iroquois Falls, mech'l. engr. in research organization, Abitibi Power and Paper Co. Ltd.; 1932 (June-Dec.), handled two bldg. contracts at Hearst, Ont.; 1900 (Feb.-June), sub-foreman, Govt. Relief Camp, Rockcliffe, Ont.; June 1933 to date, Ordnance Mechanical Engineer (4th Class), Royal Canadian Ordnance Corps. *(S. 1928.)*
References: N. C. Sherman, L. T. Rutledge, E. W. Stedman, G. R. Turner, L. M. Arkley, A. E. MacRae.

FULTON—FRASER F., of Montreal, Que., Born at Saint John, N.B., June 28th, 1905; Educ., B.Sc. (E.E.), McGill Univ., 1928; 1922-23 and summers 1924-25-26, outside plant unit cost work, N.B. Tel. Co.; 1927 (summer), rly. sales engr., 1928-31, asst. to rly sales mgr.,—equipment engr. on carrier current and telegraph apparatus, and 1931 to date, installn. estimating engr.—constrn. engrg. on fire, police and traffic signal systems, street lighting systems and power cable, for the Northern Electric Co. Ltd., Montreal, Que. *(S. 1923.)*
References: H. J. Vennes, N. L. Morgan, W. C. M. Cropper, T. Eardley-Wilmot, W. H. Jarand, B. C. Nowlan, H. R. Cleveland.

HARDY—ROBERT McDONALD, of Edmonton, Alta., Born at Winnipeg, Man., Sept. 25th, 1906; Educ., B.Sc. (Civil), Univ. of Man., 1929. M.Sc., McGill Univ., 1930; 1927 (5 mos.), dftsman., Dominion Bridge Co., Winnipeg; 1928-29-30 (summers), reinforced concrete designer, Truscon Steel Co., Winnipeg; 1931 (4 mos.), struct'l. designer, City of Edmonton; 1932, misc. surveying; 1930 to date, lecturer, dept of civil engrg., University of Alberta, Edmonton, Alta. *(S. 1928.)*
References: R. S. L. Wilson, J. N. Finlayson, E. Brown, A. Campbell, H. L. Seymour, A. Ritchie.

McCORMICK—ARCHIBALD THOMAS, of Winnipeg, Man., Born at Maryfield, Sask., Jan. 13th, 1904; Educ., B.Sc. (E.E.), Univ. of Man., 1930; 1927 (summer), timekpr. and cost clerk, City of Winnipeg Engrg. Dept.; 1928-29 (summers), subforeman and inspr., with same dept.; 1930-34, installn. and service engr., research products dept., Northern Electric Co., Winnipeg, at present special products engr., in charge of service territory for theatre sound systems. *(S. 1928.)*
References: E. P. Fetherstonhaugh, A. L. Cavanagh, J. D. Peart, G. H. Herriot, J. N. Finlayson.

McCRONE—DONALD GORDON, of 78 Iona Ave., Ottawa, Ont., Born at Toronto, May 5th, 1904; Educ., B.A.Sc., Univ. of Toronto, 1917; 1924-25 (summers), constrn. office, T. Eaton Co.; 1926 (summer), Standard Constrn. and Paving Co.; 1927-28, asst. engr., Prov. of Ontario, Dept. of Health, sanitary engrg. divn.; 1928, asst. engr., Chapman & Oxley; 1928-29, asst. engr., Dom. of Canada, Dept. of Health, sanitary engrg. divn.; 1929-31, asst. engr., Chapman & Oxley; 1931, municipality of Forest Hill; 1931 to date, with E. B. Eddy Co., as filtration plant supt., and from 1932 to date, also in charge of sulphite control and chemical laboratories. *(Jr. 1929.)*
References: J. M. Oxley, R. A. Crysler, E. A. Cross, W. S. Kidd, G. H. Ferguson.

STEWART—JOHN R., of Montreal, Que., Born at Beebe, Que., Sept. 3rd, 1905; Educ., B.Sc. (Mech.), McGill Univ., 1927; 1926 (summer), pump dept., Ingersoll Rand Co., Sherbrooke, Que.; 1927-29, constrn. work, mixing room foreman, in charge of sulphite pits, screening, mixing, coloring and delivery of stock to paper machines, Anglo Canadian Pulp and Paper Co., Limoilou, Que.; 1929 to date, service engr., in charge of service dept., and development of processes in gas welding and cutting, electric welding, etc., Canadian Liquid Air Co. Ltd., Montreal, Que. *(S. 1925.)*
References: C. M. McKergow, E. Brown, A. Stansfield, A. R. Roberts, G. Sproule.

WOOD—ROBERT, of Quebec, Que., Born at Kilmarnock, Scotland, May 12th, 1902; Educ., B.Sc. (E.E.), McGill Univ., 1924; 1920-23, dftsman., with Northern Electric Co., Ross & MacDonald and McDougall, Pease & Friedman; 1924-25, student engr., Shawinigan Water and Power Co.; 1925-27, asst. chief engr., Quebec Power Co. and Quebec Rly. Light & Power Co.; 1927-29, supt., power divn., Quebec Power Co.; 1929 to date, executive asst., Quebec Power Co., and Quebec Rly. Light and Power Co., acting as gen. mgr's. asst., particularly in analysing engrg. and economic problems affecting all divisions of the company, and in general supervising and coordinating the work of the various divnl. supts., power, gas, tramways, suburban rly., etc. *(S. 1921.)*

## July Journals Required

Copies of the July, 1933, issue of The Engineering Journal are required for binding, and it would be appreciated if members having no further use for this issue would forward copies available to Headquarters at 2050 Mansfield Street, Montreal. An allowance of 25 cents to cover the cost of postage etc., will be made on each copy received.

The Annual Report of the Department of Public Works of New Brunswick states that road expenditures were curtailed during 1933 and expenditures for maintenance work were 18 per cent lower than in 1932 and 62 per cent under the peak year of 1930. Expenditures on permanent work were 69 per cent lower than the previous year and 90 per cent lower than during 1930.

Expenditures for 1933 were classified as follows:—

| | |
|---|---|
| Ordinary roads | $ 233,753 |
| Municipal roads | 55,143 |
| Patrol | 254,732 |
| Permanent—main trunk | 248,799 |
| Permanent—secondary and branch | 343,883 |
| Total | $1,136,310 |

A comparatively small amount of permanent highway construction was carried on during the past year; only work found to be absolutely necessary being done. Greater attention has been given to the secondary trunk highway system, and some of these roads are being gradually brought up to almost as high a standard as the main trunk highways. All main trunk highways and a large mileage of secondary trunk highways are being regularly maintained by heavy power maintainers. Horse patrol graders are used on roads where the traffic is not heavy enough to warrant the use of power machines. Very little winter maintenance work is done on highways other than the snowing of covered bridges and bushing ice roads. It is further stated that New Brunswick has a total road mileage of 11,822 and some 1,761 road signs have been placed along the roads.

## Canada and Exchange Fluctuations

The recent spectacular changes in the exchange relationships of the pound sterling, the United States of America dollar and the Canadian dollar have effects of far-reaching importance to Canadian interests. Canadian borrowers, including the Dominion and provincial governments, municipalities and corporations, benefit by the elimination of the premium on obligations payable in United States funds. Many of the outstanding bond issues provide for payment in sterling at the option of the holder, at the rate of $4.86 to the pound, so that the premium on English exchange, if maintained, will represent a considerable charge. With sterling quoted at over $5.11 to the Canadian dollar, Canadian holders of Canadian bonds payable in sterling will find their payments subject to the Dominion government tax of 5 per cent on interest payable in a currency at a premium exceeding 5 per cent.

The premium on sterling will assist sales of Canadian products in the United Kingdom and other Empire markets, but constitutes a handicap on sales of British products in the Dominion. On the other hand the discount on the United States dollar will facilitate imports into Canada from the United States and handicap Canadian producers in respect of exports to that country. The present exchange premium provides an opportunity for British interests to transfer funds to Canada for investment in Canadian securities, or for development of Canadian branch plants or for other purposes.

While retail trade throughout Canada has continued in the doldrums, there are many indications of gradual improvement in the general economic situation in the Dominion. The value of construction contracts awarded in October was nearly double the amount for September, and was the largest for any month in the last two years. The Canadian Bank of Commerce, in its monthly commercial letter, has referred to this "surprising improvement in one of the major branches of our economy," and points out that it was due to a better demand for housing accommodation and an extension of commercial facilities, rather than to an expansion of public works.

It is reported that the *New Brunswick Electric Power Commission* now operates 235 miles of high voltage transmission line and 695 miles of distributing lines in villages and rural districts. The commission is distributing electricity directly to 5,213 customers in villages and rural sections and in addition power generated by the commission is distributed through other agencies to 17,395 customers. These figures are contained in the fourteenth annual report of the New Brunswick Electrical Power Commission.

## Situation Vacant

ENGINEER, required by a progressive Canadian company for sales and service work. Should be a graduate in chemical or mechanical engineering and have experience in combustion work or the operation of metallurgical or reheating furnaces. Apply to Box No. 984-V.

## Situations Wanted

MECHANICAL ENGINEER, Canadian, with technical training and executive experience in both Canadian and American industries, particularly plant layout, equipment, planning and production control methods, is open for employment with company desirous of improving manufacturing methods, lowering costs and preparing for business expansion. Apply to Box No. 35-W.

MECHANICAL ENGINEER, A.M.E.I.C. Married. Experience in machine shops, erection and maintenance of industrial plant mechanical and structural design. Reads German, French, Dutch and Spanish. Seeks any suitable position. Apply to Box No. 84-W.

PURCHASING ENGINEER, graduate mechanical engineer, Canadian, married, 34 years of age, with 13 years' experience in the industrial field, including design, construction and operation, 8 years of which had to do with the development of specifications and ordering of equipment and materials for plant extensions and maintenance; one year engaged on sale of surplus construction equipment. Full details upon request. Apply to Box No. 161-W.

CIVIL ENGINEER, age 44, open for employment anywhere, experience covers about 20 years' active work, including 7 years on municipal engineering, 2 years as Town Manager, 3 years on railway construction, 3 years on the staff of a provincial highway department, 2 years as contractor's superintendent on pavement construction. Apply to Box No. 216 W.

REINFORCED CONCRETE ENGINEER, B.SC., P.E.Q., eight years experience in construction design of industrial buildings, office buildings, apartment houses, etc. Age 30. Married. Apply to Box No. 257 W.

ELECTRICAL ENGINEER, B.SC., '28, Canadian. Age 25. Experience includes two summers with power company; thirteen months test course with C.G.E. Co.; telephone engineering, and the past thirty months with a large power company in operation and maintenance engineering. Location immaterial and available immediately. Apply to Box No. 266-W.

MECHANICAL ENGINEER, age 28, nine years all round experience, Grad. Inst. of Mech. Engs. England, S.E.I.C. Technical and practical training with first class English firm of general engineers; shop, foundry and drawing office experience in steam and Diesel engines, asphalt, concrete machinery, boilers, power plants, road rollers, etc. Experience in heating and ventilation design and equipment; 18 months designing draughtsman with Montreal consulting engineers. 2½ years sales experience, steam and hot water heating systems, power plant equipment, machinery, oil-burning apparatus. Canadian 4th class Marine Engineers Certificate; C.N.S. experience. Available at short notice. Apply to Box No. 270-W.

DESIGNING DRAUGHTSMAN, experience in layout of steam power house equipment and piping. Wide experience in mechanical drive and details of machinery, gearing, and hoists. Accustomed to layout of small mill buildings of steel and timber, structural design and details. Good references. Present location Montreal. Apply to Box No. 329-W.

PLANE-TABLE TOPOGRAPHER, B.SC., in C.E. Thoroughly experienced in modern field mapping methods including ground control for aerial surveys. Fast and efficient in surveys for construction, hydro-electric and geological investigations. Apply to Box No. 431-W.

ELECTRICAL ENGINEER, B.SC., A.M.E.I.C., AM.A.I.E.E., age 30, single. Eight years experience H.E. and steam power plants, substations, etc., shop layouts, steel and concrete design. Location immaterial. Available immediately. Apply to Box No. 435-W.

CIVIL ENGINEER, B.A.SC., and C.E., A.M.E.I.C., age 30, married. Experience over the last ten years covers construction on hydro-electric and railway work as instrumentman and resident engineer. Also office work on teaching and design, investigations and hydraulic works, reinforced concrete, bridge foundations and caissons. Location immaterial. Available at once. Apply to Box No. 447-W.

SALES ENGINEER, M.A.SC. Univ. of Toronto, wishes to represent firm selling building products or other engineering commodities, as their representative in Western Canada. Located in Winnipeg. Apply to Box No. 467-W.

CIVIL ENGINEER, B.SC., A.M.E.I.C., with six years experience in paper mill and hydro-electric work, desires position in western Canada. Capable of handling reinforced concrete and steel design, paper mill equipment and piping layout, estimates, field surveys, or acting as resident engineer on construction. Now on west coast and available at once. Apply to Box No. 482-W.

MECHANICAL ENGINEER, B.SC. Age 28, married. Four and a half years on industrial plant maintenance and construction, including shop production work and pulp and paper mill control. Also two and a half years on structural steel and reinforced concrete design. Available at once. Apply to Box No. 521-W.

CIVIL ENGINEER, Canadian, married, twenty-five years' technical and executive experience, specialized knowledge of industrial housing problems and the administration of industrial towns, also town planning and municipal engineering, desires new connection. Available on reasonable notice. Personal interview sought. Apply to Box No. 544-W.

ELECTRICAL AND MECHANICAL ENGINEER, B.SC., A.M.E.I.C. Experience includes C.G.E. Students Test Course and six years in engrg. dept. of same company on design of electrical equipment. Four summers as instrumentman on surveying and highway construction. Recently completed course in mechanical engineering. Available at once. Location preferred Ontario, Quebec, or Maritimes. Apply to Box No. 564-W.

### Have You Registered?

Readers of these columns will notice with interest the appearance of two situations vacant advertisements during the last two months. It is true these positions demand rather unusual requirements but it is pleasing that our registration files at last show a shortage in some lines of engineering. Members are again reminded however that the qualifications of those registered are first submitted for any vacancies before positions are advertised, and if suitable men are available the positions are filled immediately.

Some employers still think there is an unlimited number of engineers idle, but recently two firms who had chosen men, waited too long—their men had found positions elsewhere.

CIVIL ENGINEER, age 25, single, graduate. Creditable record on responsible hydro and railroad work in both Eastern and Western Canada. Apply to Box No. 567-W.

MECHANICAL ENGINEER, A.M.E.I.C., with twenty years experience on mechanical and structural design, desires connection. Available at once. Apply to Box No. 571-W.

MECHANICAL ENGINEER, B.A.SC., '30, desires position to gain experience, and which offers opportunity for advancement. Experience in pulp and paper mill and one year in mechanical department of large electrical company. Location immaterial. Available immediately. Apply to Box No. 577-W.

DOMINION LAND SURVEYOR, and graduate engineer with extensive experience on legal, topographic and plane-table surveys and field and office use of aerophotographs, desires employment either in Canada or abroad. Available at once. Apply to Box No. 589-W.

MECHANICAL ENGINEER, Canadian, technically trained; eighteen years experience as foreman, superintendent and engineer in manufacturing, repair work of all kinds, maintenance and special machinery building. Location immaterial. Available at once. Apply to Box No. 601-W.

CHEMICAL ENGINEER, S.E.I.C., B.SC., University of Alberta, '30. Age 31. Single. Six seasons' practical laboratory experience, three as chief chemist and three as assistant chemist in cement plant; one year's p.g. work in physical chemistry; three years' experience teaching. Desires position in any industry with chemical control. Available immediately. Apply to Box No. 609-W.

## Situations Wanted

DESIGNING ENGINEER AND ESTIMATOR, grad. Univ. of Toronto in C.E., A.M.E.I.C., twenty years experience in structural steel, construction and municipal work. Available at once. Apply to Box No. 613-W.

CIVIL ENGINEER, A.M.E.I.C., R.P.E., Ontario; three years construction engineer on industrial plants; fourteen years in charge of construction of hydraulic power developments, tower lines, sub-stations, etc.; four years as executive in charge of construction and development of harbours, including railways, docks, warehouses, hydraulic dredging, land reclamation, etc. Apply to Box No. 647-W.

MECHANICAL ENGINEER, A.M.E.I.C., Canadian, technically trained; six years drawing office. Office experience, including general design and plant layout. Also two years general shop work, including machine, pattern and foundry experience, desires position with industrial firm in capacity of production engineer or estimator. Available on short notice. Apply to Box No. 676-W.

DIESEL ENGINEER. Erection and industrial engineer, A.M.E.I.C., technically trained mechanical engineer with English and Canadian experience in erection and operation of steam and Diesel equipment in power house and mines, pumping, rock drilling, air compressors. Experienced in industrial and steel works operations including rolling mills, quarries, sales. Open for position on maintenance, operation or sales engineer. Location immaterial. Apply to Box No. 682-W.

ELECTRICAL AND CIVIL ENGINEER, B.SC., Elec., '29, B.SC., Civil '33. Age 27. JR.E.I.C. Undergraduate experience in surveying and concrete foundations; also four months with Canadian General Electric Co. Thirty-three months in engineering office of a large electrical manufacturing company since graduation. Good experience in layouts, switching diagrams, specifications and pricing. Best of references. Available immediately. Apply to Box No. 693-W.

MECHANICAL ENGINEER, B.SC., '27, JR.E.I.C. Four years maintenance of high speed Diesel engines units, 200 to 1,300 h.p. Also maintenance of D.C. and A.C. electrical systems and machinery. Draughting experience. Westinghouse apprenticeship course. Practical mechanical and electrical engineer with a special study of high speed Diesel engine design, application and operation. Location in western or eastern Canada immaterial. Apply to Box No. 703-W.

COMBUSTION ENGINEER, R.P.E., Manitoba, A.M.E.I.C. Wide experience with all classes of fuels. Expert designer and draughtsman on modern steam power plants. Experienced in publicity work. Well known throughout the west. Location, Winnipeg or the west. Available at once. Apply to Box No. 713-W.

ELECTRICAL ENGINEER, B.SC., University of N.B., '31. Experience includes three months field work with Saint John Harbour Reconstruction. Apply to Box No. 722-W.

MECHANICAL ENGINEER, age 41, married. Eleven years designing experience with project of outstanding magnitude. Machinery layouts, checking, estimating and inspecting. Twelve years previous engineering, including draughting, machine shop and two years chemical laboratory. Highest references. Apply to Box No. 723-W.

CIVIL ENGINEER, B.SC. (Alta. '31), S.E.I.C. Experience includes three seasons in charge of survey party. Transitman on railway maintenance, and concrete bridge designing. Nature of work and location immaterial. Apply to Box No. 724-W.

YOUNG CIVIL ENGINEER, B.SC. (Univ. of N.B. '31), with experience as rodman and checker on railroad construction, is open for a position. Apply to Box No. 728-W.

DESIGNING ENGINEER, M.SC. (McGill Univ.), D.L.S., A.M.E.I.C., P.E.Q. Experience in design and construction of water power plants, transmission lines, field investigations of storage, hydraulic calculations and reports. Also paper mill construction, railways, highways, and in design and construction of bridges and buildings. Available at once. Apply to Box No. 729-W.

MECHANICAL ENGINEER, S.E.I.C., B.A.SC., Univ. of B.C. '30. Single, age 24. Sixteen months with the Allis-Chalmers Mfg. Co. as student engineer. Experience includes foundry production, erection and operation of steam turbines, erection of hydraulic machinery, and testing texropes and centrifugal pumps. Location immaterial. Available at once. Apply to Box No. 735-W.

CIVIL ENGINEER, M.SC., A.M.E.I.C., R.P.E. (Ont.), ten years experience in municipal and highway engineering. Read, write and talk French. Married. Served in France. Will go anywhere at any time. Experienced journalist. Apply to Box No. 737-W.

ELECTRICAL AND RADIO ENGINEER, B.SC. '31, S.E.I.C. Age 25. Nine months experience on installation of power and lighting equipment. Eight months on extensive survey layouts. Two summers installing telephone equipment. Specialized in radio servicing and merchandising. Available at once. Location immaterial. Apply to Box No. 740-W.

CIVIL ENGINEER, graduate '29. Married. One year building construction, one year hydro-electric construction in South America, fourteen months resident engineer on road construction. Working knowledge of Spanish. Apply to Box No. 744-W.

## Situations Wanted

SALES ENGINEER, B.Sc., McGill, 1923, A.M.E.I.C. Age 33. Married. Extensive experience in building construction. Thoroughly familiar with steel building products; last five years in charge of structural and reinforcing steel sales for company in New York state. Available at once. Located in Canada. Apply to Box No. 749-W.

DESIGNING ENGINEER, graduate Univ. Toronto '26. Thoroughly experienced in the design of a broad range of structures, desires responsible position. Apply to Box No. 761-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. Queen's Univ. '29. Age 25. Married. Three years experience as construction supt. and estimator for contracting firm. Experience includes general building, bridges, sewer work, concrete, boiler settings, sand blasting of bridges and spray painting. Available at once. Apply to Box No. 776-W.

CIVIL ENGINEER, B.Sc., '25, Jr.E.I.C., P.E.Q., married. Desires position, preferably with construction firm. Experience includes railway, monument and mill building construction. Available immediately. Apply to Box No. 780-W.

DRAUGHTSMAN, experience in civil engineering, forestry engineering, land surveying and house construction. Good references. Apply to Box No. 781-W.

ELECTRICAL AND SALES ENGINEER, S.E.I.C., grad. '28. Experience includes one year test course, one year switchboard design and two years switchboard and switching equipment sales with large electrical manufacturing company. Three summers Pilot Officer with R.C.A.F. Available at once. Apply to Box No. 788-W.

ELECTRICAL ENGINEER. Specializing in power and illumination reports, estimates, appraisals, contracts and rates, plans and specifications for buildings. Available on interesting terms. Apply to Box No. 795-W.

CIVIL ENGINEER, S.E.I.C., graduate '30, age 23, single. Experience includes mining surveys, assistant on highway location and construction, and assistant on large construction work. Steel and concrete layout and design. Apply to Box No. 809-W.

CIVIL ENGINEER, college graduate, age 27, single. Experience includes surveying, draughting concrete construction and design, street paving both asphalt and concrete. Available at once; will consider anything and go anywhere. Apply to Box No. 816-W.

CIVIL ENGINEER, B.E. (Sask. Univ. '32), S.E.I.C. Single. Experience in city street improvement; sewer and water extensions. Good draughtsman. References. Available at once. Location immaterial. Apply to Box No. 818-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. (Queen's '32), age 21. Three summers surveying in northern Quebec. Interested in hydraulics and reinforced concrete. Available at once. Location immaterial. Apply to Box No. 822-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with fifteen years experience mostly in pulp and paper mill work, reinforced concrete and structural steel design, field surveys, layout of mechanical equipment, piping. Available at once. Apply to Box No. 825-W.

ELECTRICAL ENGINEER, S.E.I.C., grad. '29, age 24, married; experience includes one year Students Test Course, sixteen months in distribution transformer design and eight months as assistant foreman in charge of industrial control and switchgear tests. Location immaterial. Available at once. Apply to Box No. 828-W.

CIVIL ENGINEER, B.A.Sc., D.L.S., O.L.S., A.M.E.I.C., age 46, married. Twelve years experience in charge of legal field surveys. Owns own surveying equipment. Eight years on technical, administrative, and editorial office work. Experienced in writing. Desires position on survey work, assisting in or in charge of preparation of house organ, on staff of technical or semi-technical magazine, or on publicity, editorial or administrative office work. Available at once. Will consider any salary, and any location. Apply to Box No. 831-W.

CIVIL ENGINEER, M.Sc., R.P.E. (Sask.). Age 27. Experience in location and drainage surveys, highways and paving, bridge design and construction city and municipal developments, power and telephone construction work. Available on short notice. Apply to Box No. 839-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. '32 (Univ. of N.B.). Age 25, married. Two years experience in power line construction and maintenance; one year of highway construction, one summer surveying for power plant site, location and spur railway line construction. Available at once. Location immaterial. Apply to Box No. 840-W.

CIVIL ENGINEER, B.Sc. '15, A.M.E.I.C., married, extensive experience in responsible position on railway construction, also highways, bridges and water supplies. Position desired as engineer or superintendent. Available at once. Apply to Box No. 841-W.

CIVIL ENGINEER, B.Sc. (Alta '31), S.E.I.C., age 24. Experience, three summers on railroad maintenance, and seven months on highway location as instrumentman. Willing to do anything, anywhere, but would prefer connection with designing or construction firm on structural works. Available immediately. Apply to Box No. 845-W.

## Situations Wanted

MECHANICAL ENGINEER, Jr.E.I.C., technical graduate, bilingual, age 30. Two years as designing heating draughtsman with one of the largest firms of its kind on this continent handling heating materials; three years designing draughtsman in consulting engineers' office, mechanical equipment of buildings, heating, ventilation, sanitation, power plant equipment, writing of specifications, etc. Present location Montreal. Available at once. Apply to Box No. 850-W.

BRIDGE AND STRUCTURAL ENGINEER, A.M.E.I.C., McGill. Twenty-five years' experience on bridge and structural staffs. Until recently employed. Familiar with all late designs, construction, and practices in all Canadian fabricating plants. Desirous of employment in any responsible position, sales, fabrication or construction. Apply to Box No. 851-W.

STRUCTURAL ENGINEER, B.A.Sc., A.M.E.I.C. Twenty-two years experience in design of bridges and all types of buildings in structural steel and reinforced concrete. Three years experience in railway construction and land surveying. Apply to Box No. 856-W.

MECHANICAL ENGINEER, B.Sc. '32, S.E.I.C. Good draughtsman. Undergraduate experience:—One year moulding shop practice; two years pipe fitting and sheet metal work; one year draughting and tracing on paper mill layout; six months machine shop practice; and eight months fuel investigation and power heating plant testing. Desires position offering experience in steam power plants or heating and ventilating design. Will go anywhere. Apply to Box No. 858-W.

MECHANICAL ENGINEER, age 31, graduate Sheffield (England) 1921; apprenticeship with firm manufacturing steam turbine generators and auxiliaries and subsequent experience in design, erection, operation and inspection of same. Marine experience B.O.T. certificate thoroughly conversant with Canadian plants and equipment. Available on short notice. Any location. Box No. 860-W.

CHEMICAL ENGINEER, B.Sc. (McGill '21), A.M.E.I.C., age 36, married; three years since graduation with pulp and paper mills; eight years in shops, estimating and sales divisions of well-known gas engineering and construction companies in the United States. Excellent references. Available on short notice. Apply to Box No. 866-W.

CONSTRUCTION ENGINEER (Toronto Univ. of '07). Experience includes hydro-electric, municipal and railroad work. Available immediately. Location immaterial. Apply to Box No. 886-W.

ELECTRICAL ENGINEER, graduate 1929, S.E.I.C. Single. Experience includes two years with electrical manufacturing concern and one on highway construction work. Available at once. Will go anywhere. Apply to Box No. 887-W.

CIVIL ENGINEER, B.Sc., Montreal 1930, age 26, single, French and English, desires position technical or non-technical in engineering, industrial or commercial fields, sales or promotion work. Experience includes three years in municipal engineering on paving, sewage, waterworks, filter plant equipment, layout of buildings, etc. Available immediately. Apply to Box No. 891-W.

ELECTRICAL ENGINEER, grad. Univ. of N.B. '31. Experienced in surveying and draughting, requires position. Available at once. Will go anywhere. Apply to Box No. 893-W.

CIVIL ENGINEER, B.A.Sc., Jr.E.I.C., age 29, single. Experience includes two years in pulp mill as draughtsman and designer on additions, maintenance and plant layout. Three and a half years in the Toronto Buildings Department checking steel, reinforced concrete, and architectural plans. Available at once. Location immaterial. At present in Toronto. Apply to Box No. 899-W.

DESIGNING ENGINEER, A.M.E.I.C. Permanent and executive position preferred but not essential. Fifteen years experience in designing power plants, engine and fan rooms, kitchens and laundries. Thoroughly familiar with plumbing and ventilating work, pneumatic tubes, and refrigeration, also heating, electrical work, and specifications. Apply to Box No. 913-W.

ENGINEER, B.Sc., A.M.E.I.C., R.P.E. (N.B.), age 35, married. Seven years' mining experience as sampler, assayer, surveyor, field work, and foreman in charge of underground development: two years as assistant engineer on highway construction and maintenance. Available on short notice. Apply to Box No. 932-W.

CIVIL ENGINEER, B.Sc., '25, McGill Univ., Jr.E.I.C., P.E.Q., age 32, married. Experience as rodman and instrumentman on track maintenance. Seven and one-half years with Canadian paper company, as assistant office engineer handling all classes of engineering problems in connection with woods operations, i.e., road buildings, piers, booms, timber bridges, depots, dams, etc. Apply to Box No. 933-W.

ELECTRICAL ENGINEER, Dipl. of Eng., B.Sc. (Dalhousie Univ.), S.B. and S.M. in E.E. (Mass. Inst. of Tech.), Canadian. Married. Seven and a half years' experience in design, construction and operation of hydro, steam and industrial plants. For past sixteen months field office electrical engineer on 510,000 h.p. hydro-electric project. Available at once. Apply to Box No. 936-W.

CIVIL ENGINEER, B.Sc., O.P.E. Experience includes several years on municipal work-design and construction of sewers, steel and concrete bridges, watermains and pavements. Available at once. Apply to Box No. 953-W.

## Situations Wanted

ELECTRICAL ENGINEER, twenty years experience, desires position, either temporary or permanent. Experienced in design, construction, and operation of power and industrial plants, and supt. of construction. Apply to Box No. 974-W.

CIVIL ENGINEER, B.Sc. (Univ. of Sask. '33), S.E.I.C., age 28, single. Experience in testing hydro-electric equipment, draughting, surveying, city street, improvements, technical photography. Available at once. Location immaterial. Apply to Box No. 986-W.

ENGINEER SUPERINTENDENT, age 44. Engineering and business training, executive ability, tactful, energetic. Had charge of several large projects. Intimate knowledge of costs and prices, reports and estimates. Available immediately. Any location. Apply to Box No. 1021-W.

CIVIL ENGINEER, B.Sc. (Queen's 14), A.M.E.I.C., Dominion Land Surveyor, 5 months' special course at the University of London, England, in municipal hygiene and reinforced concrete construction. Experience covers legal and topographic surveys, plane tabling and stadia surveying, railway and highway construction, drainage and excavation work. Available at once. Apply Box No. 1035-W.

ELECTRICAL ENGINEER AND GEOPHYSICIST. Age 36. Married. Seven years experience in geophysical exploration using seismic, magnetic and electrical methods. Two years experience with the Western Electric Company of Chicago, working on equipment and magnetic materials research. Experienced in radio and telephone work, also specializing in precise electrical measurements, resistance determinations, ground potentials and similar problems of ground current distribution. Apply to Box No. 1063-W.

ELECTRICAL ENGINEER, B.A.Sc. Univ. Toronto '28. Experience includes Can. Gen. Elec. Co. Test Course. Also more than two years in the engineering dept. of the same company. Available on short notice. Preferred location central or eastern Canada. Apply to Box No. 1075-W.

ELECTRICAL ENGINEER, B.Sc. Married. Eight years electrical experience, including operation, maintenance and construction work, electrical design work on large power development, mechanical ability, experienced photographer, employed in electrical capacity at present. Available on reasonable notice. Apply to Box No. 1076-W.

INDUSTRIAL ENGINEER, B.A.Sc. in Chem. Eng. (Tor. '31), S.B. in Indust. Eng. (Mass. Inst. of Tech. '32), S.E.I.C. Age 25 years. Northern Electric Training Course. Construction and sales experience. Rockefeller Research Associate at McGill University in industrial engineering for past year and to date. Desire work in production or financial departments of a manufacturing plant. Apply to Box No. 1098-W.

CIVIL ENGINEER, age 27, graduate 1930, single. Experience includes detailing, designing and estimating structural steel, plate work and pressure vessels; also hydrographic surveying. Available at once. Apply to Box No. 1111-W.

ELECTRICAL ENGINEER, S.E.I.C., single, age 24 years. Four consecutive years at Univ. of N.B. in electrical engineering. Summer experience in bridge and road construction and auto repairing, desires position in industrial or power plant. Any locality. References on request. Apply to Box No. 1114-W.

CIVIL ENGINEER, B.Sc. Sask. '30, S.E.I.C. Age 24 years. Experience in municipal engineering, including sewer and water construction, sidewalk construction, paving, storm sewer design, draughting, precise levelling, and reinforced concrete bridge construction. Unmarried. Available at once. Will go anywhere. Apply to Box No. 1115-W.

ELECTRICAL ENGINEER, B.Sc.E.E. (Univ. of N.B. '31). C.G.E. Test Course included industrial control, induction motors and transformers; the transformer test included desk work for two months on computing losses, efficiencies, etc. Available at once. Apply to Box No. 1119-W.

MECHANICAL ENGINEER, B.A.Sc. (Univ. of B.C.), M.S. (Univ. of Pittsburgh). Canadian. Age 26. Single. One year graduate student course, W.E. and M. Co., East Pittsburgh. Three and a half years engineering research in mechanics with the same company. Location immaterial. Available at once. Apply to Box No. 1123-W.

GEODETIC AND TOPOGRAPHICAL ENGINEER, D.L.S., M.E.I.C. Experience in all kinds of geodetic and topographical surveys, especially photo-topography, well versed in all kinds of air photo surveys; Canadian and U.S. patent method of determining position and elevations of points from air photographs. Available at once anywhere in Canada or the United States. Apply to Box No. 1127-B.

PETROLEUM CHEMIST, B.Sc. in Chem. Eng. Age 25, Single. One and a half years experience as assistant chemist. Capable of taking charge in small refinery. Wishes position anywhere in Canada. Apply to Box No. 1130-W.

ELECTRICAL ENGINEER, B.Sc., Queen's '33. Single, age 23. Anxious to gain experience. Present experience installing small private hydro-electric plant. Location immaterial. Available at once. Apply to Box No. 1137-W.

## INDEX TO ADVERTISERS

# PROFESSIONAL CARDS

*Firms advertising in The Journal are considered as absolutely reputable.*

# There is a

# Barrett ASPHALT SHINGLE

# for every Steep Roof requirement

**BARRETT—the greatest name in roofing since 1854—sets new standards for beauty, protection, durability and economy. There is a style and type of asphalt shingle to blend into the colour setting which you desire.**

MASSIVE HEAVY TAB SHINGLE

THE GIANT SHINGLE

**A three-in-one strip shingle, double-coated by hand, that lends itself to high type construction. Weighs 340 lbs. per square. Made in five solid colours — Red, Green, Blue-Black, Spanish Red, Emerald Green; and three blends—Red Tone, Green Tone and Variegated.**

**The extra weight and thickness of this shingle produce the heavy shadow line desired by architects. Carries the Underwriters' Laboratory label of Approval, Class "C."**

**A three-in-one shingle, built on the heaviest weight felt. Weighs 240 lbs. per square. The following five solid colours are available: Red, Green, Blue-Black, Spanish Red, Emerald Green and three blended colours; Red Tone, Green Tone; and Variegated.**

**The "Giant" is being recommended and used more and more with complete satisfaction to the owner and architect. Carries the Underwriters' Laboratory label of Approval, Class "C."**

There are many other Barrett Shingles of different designs, weights and colours to suit your particular job.

You can specify and use Barrett's Shingles with confidence, because Barrett's name has stood for quality materials and workmanship since 1854.

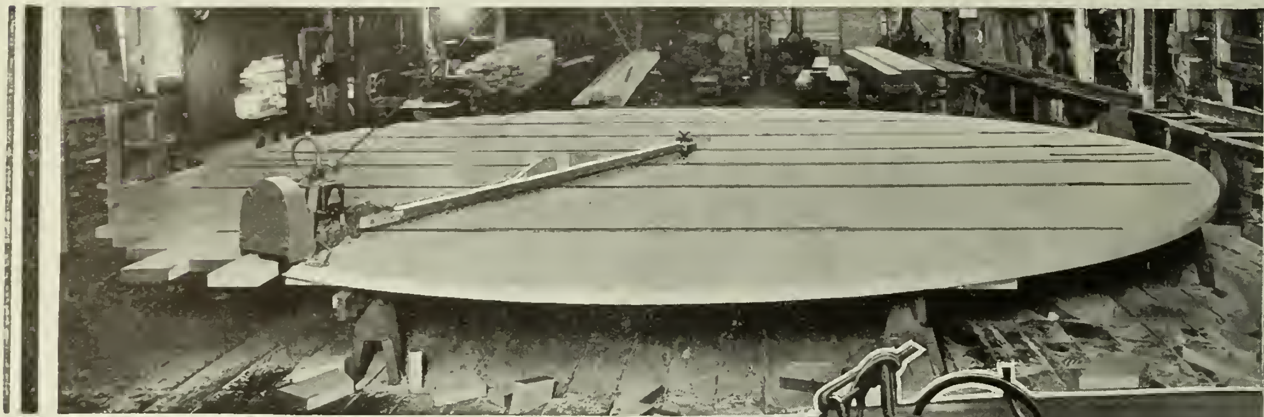
# Buyers of *Canadian* WOOD TANKS

## Profit by this New Construction Method



Above — Note the perfectly matched ends.

Right—This method of bevelling assures absolute precision of dimensions.

AN absolutely flush edge all 'round the tank bottom is cut in one simple, economical operation by the electrically-driven circular saw illustrated above. A special planer then bevels this edge, top and bottom, so that tank staves fit perfectly and stand erect while the tank is being set up. These new methods are our own and covered by patents. They cut manufacturing costs—and the saving is passed along to the buyer.

You get a tank which is quick and easy to erect —which is absolutely water-tight and which gives longer, more satisfactory service.

*For water, oil, chemical or any other liquid storage, place your order for a Canadian Wood Tank.*

# ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Published monthly at 2050 Mansfield Street, Montreal, by The Engineering Institute of Canada, Incorporated in 1887 as The Canadian Society of Civil Engineers.

Entered at the Post Office, Montreal, as Second Class Matter.

Volume XVII | Montreal, May 1934 | Number 5

# The Law of Contracts and Bonds of Particular Application to Engineers and Architects

*H. D. Anger, Barrister,*
*Elliott, Hume, McKague and Anger, Toronto, Ont.*

**Paper presented before the Toronto Branch of The Engineering Institute of Canada, December 7th, 1933.**

*Editor's Note:*

*The following address was given by Mr. H. D. Anger at a joint meeting of the Toronto Branch of The Engineering Institute of Canada and the Ontario Association of Architects.*

*While Mr. Anger's remarks had particular reference to the laws of Ontario, it is felt that his address contains advice and information of great value to all engineers and architects wherever situated in Canada, and we are greatly indebted to Mr. Anger for his permission to publish it.*

*We are informed that the basic principles outlined in the address have general application throughout Canada, but that members should bear in mind that the laws of the other provinces differ in some respects from those of Ontario, the most marked divergencies existing in the Province of Quebec where the Civil Code prevails. For this reason, and on account of the complexity of the legal problems which may arise in an apparently simple case, members will appreciate the advisability of consulting one's solicitor and following his advice in all matters of importance involving contractual relations.*

The paper covers the following topics:

## Introduction

Several centuries ago one of the greatest jurists of our race, Blackstone, enunciated the great truth that no man can properly discharge the duties he owes to the public, to his family and to himself, without in some degree possessing a knowledge of the laws by which all are bound and the obligations resting on each as an individual; and, the late Pierpont Morgan gave Blackstone an emphatic endorsement by telling a meeting of bankers that the greatest risk in business is legal risk. I believe it was he also who said that keen business men were increasingly determined to give their sons a course in law as necessary equipment for business life.

When one realizes that almost every daily act in business has a legal consequence, it is obvious that Pierpont Morgan was right, and that it is essential that the doer of the act should know its consequence.

During my various activities I have to a considerable degree been brought in contact with the layman's attitude towards the study of law—and the general keynote is preconceived discouragement. There is really little reason for such discouragement. As in golf the hazards are more mental than real. While the study of law in all its branches is necessarily complex, yet, those branches which relate most closely to business transactions are not inherently complex. They are in fact mere rules of business conduct formulated by business men.

I become very impatient with the man who says "a little knowledge is a dangerous thing." A little knowledge at the right time would have saved many a litigant from a bad loss. It is to be borne in mind that it is not necessary to have such a knowledge of business law as to be your own lawyer. That is an impossible and illogical goal—as illogical as to expect a managing-director to be able to design and supervise the construction of the building and equipment. You do not need to shoot par golf to play a consistently good game, nor do you need to have a deep knowledge of law to play a consistently good business game. It is sufficient if your grasp of the fundamentals of business law warns you when to consult your legal adviser before loss has occurred instead of after.

I am constantly being asked by laymen what is meant by "common law" or "case law" and how it is applied. Possibly a brief note will be of interest to you also. Centuries ago in England the rules and customs of merchants which were found to be common to most localities were consolidated as the "common law" of the realm. In order to avoid unsettling variation it was the duty of a judge to conform to or follow the decision in an earlier case involving similar circumstances. In the course of centuries decisions on almost every conceivable set of circumstances were made and recorded in the law reports. Common law is therefore the law of precedent. The decided cases fall into classes, each class establishing a general rule or principle of law. If you and I were to have a legal dispute tomorrow it would certainly fall into one of these classes and the governing principle is usually readily discernible.

At the creation of Upper Canada the common law of England was established as our civil law, except as it should thereafter be altered by Dominion or provincial legislation. Common law comprises doubtless some seventy-five per cent of our civil law.

It is true, of course, that in applying the law of precedent, injustice seems sometimes to be meted out to some individual, and you hear judges remark that they reluctantly decide as they do. Those judges are not to be cursed —they are to be commended. In following precedent they are on firm and logical ground, for if they did not follow precedent law would be a very indefinite thing, so elastic that it could not be said to be known; lawyers could not adequately advise their clients and clients would be in a quandary, for the question would not be "what is the law" but "what is the judge likely to think?"—in short each judge would be a law unto himself.

Now unquestionably there is often great difficulty in deciding what law clearly governs a certain set of facts. One principle of law seems to govern and the pendulum swings one way. Another principle is seen to be also applicable and the pendulum swings back. Lawyers disagree, judges disagree, courts disagree, one judgment overruling another and so on. But this cannot be avoided in modern complex life, with new inventions and what-not more or less revolutionizing customs from time to time. We rely upon our legislatures to revise law from time to time to meet these new conditions. Furthermore, rarely is there a case where all the right is on one side—the problem is to ascertain the overriding right.

Yet with all these difficulties I repeat that the study of business law is not so complex as it seems to the layman. The broad general principles are an open book and the *reasoning* behind each decision is usually quite clear. If you study the reasoning the memory usually receives a reasonably indelible impression. I seriously suggest therefore that you do not stop at listening to talks on law, but that you purchase and study trite texts on various branches of business law. It will be well worth your while.

## A. Contracts in General

The law of contract is the root and foundation of almost all branches of business law. Acquisition of a decent knowledge of the law of contract therefore is of inestimable value and incidentally renders the study of other branches of business law much easier. For instance, topics that are really subdivisions or off-shoots of the law of contract are agency, employment, suretyship, insurance, negotiable paper, real estate, sale of goods, mortgages, and leases.

### I Formation of Contracts

A contract may be conveniently defined as any agreement intended to be enforceable at law. Some agreements have no such intention—such as to subscribe to a charity, intended as and being a moral obligation only.

To make a contract there must be at least two persons, but there may be any additional number.

To make a contract binding and enforceable, five things, and, in certain cases a sixth, are required:

(1) An offer by one person and its acceptance by another.
(2) Consideration (that is, money or money's worth), or a document under seal.
(3) The parties must be legally capable of contracting.
(4) There must be mutuality of mind.
(5) The purpose must be lawful, and
(6) Certain contracts must be in writing.

I will discuss these requisites in that order.

(1) *Offer and Acceptance*

The making of a contract takes many forms, but no matter what the course, it must be reducible to an offer by one party and its acceptance by the other. Having regard to business dealings as a whole, I suppose comparatively few contracts take the form of a formal document. The greatest number are made verbally, or by correspondence or telegraph, and, with certain qualifications which I shall mention, they are just as binding and enforceable as when the terms are set forth in a formal document signed by both parties.

Still another form of contract is where either the offer or the acceptance is not actually expressed but takes place by conduct. For instance, if I place an order for machinery I am in effect offering to pay the price if you fill my order, and you accept my offer by merely forwarding the machinery to me without saying anything. In such a case there is a contract the moment you send the goods. Again, I may offer to sell you something, sending the article to you for your approval—if you use it you have accepted my offer and must pay the price.

Now any offer must be accepted definitely and without qualification of any sort. The slightest change in terms destroys acceptance. To illustrate, if I offer to sell you something for $50 and you reply that you will pay $40 or that you will pay $50 by instalments or if I guarantee the thing, you have obviously not accepted my offer, but have made a counter offer to me which I may accept or refuse at my option. If I accept, there is then a contract.

As to time for acceptance, a verbal offer which does not give time for acceptance ceases when the parties separate. A written offer, with no time limit for acceptance, must be accepted within a reasonable time and before the offer is revoked. What is a reasonable time depends upon the special circumstances of each transaction.

Once an offer has been refused it cannot afterwards be accepted unless the offer is repeated. A counter-offer is in effect a rejection of the offer. A mere enquiry whether the offeror will change his terms is not necessarily a refusal.

Once an offer has been accepted, it cannot be revoked, but it may be revoked at any time before its acceptance unless the offer is under seal in which case a reasonable time must be given for its acceptance. Similarly, an acceptance once given cannot be revoked.

The use of an agent to transmit offer and acceptance, however, introduces some important factors. The great principle of acceptance is that it must be given to the offeror or to his agent authorized to receive acceptance. If there be such an acceptance there is a contract the moment it is given, regardless of the circumstances. Let us follow this thought.

If I post a letter to you containing an offer, I have thereby appointed the post-office my agent. There is a contract the moment you *post* your letter of acceptance. The post-office is my long arm reaching out for your acceptance, and there is a contract the moment you post your acceptance in the outstretched hand. Similarly, any other agent I utilize is my outstretched hand, such as the telegraph office, or a messenger.

When we realize that principle of agency it is understandable that there is a contract even though a long delay takes place in the post-office or telegraph-office before I personally receive your acceptance, or even if I do not receive it at all. If I appoint an agent I take the risk of him serving me well. (The telegraph office is however authorized only to transmit the actual message delivered to it. Neither party is bound by a mistake in transmission.)

Now what happens if you do not use my agent? While it is true, generally speaking, that, if I do not specifically require you to use my agent, there is a contract if your acceptance sent in another manner *actually reaches* me in time, yet the risk is reversed. By using your own means of communication you take the risk of your acceptance not reaching me, or reaching me too late, either because of unreasonable delay or because I have meanwhile cancelled my offer.

Because of the principle of authorized agency, we see that if I mail you an offer I can revoke it if my revocation reaches you before you have mailed your acceptance; but, if you did not use the post-office to forward your acceptance to me, I can revoke my offer before your acceptance actually *reaches* me—this I could do by telegram, telephone, messenger, etc.

Similarly, if you hand your acceptance to my agent, there is that instant a contract, and you cannot revoke it, even if you by some quicker agency can get your so-called revocation to me before your acceptance actually reaches me. This would not sound like common sense were it not for the obvious principle that a dealing with my authorized agent is a dealing with me.

Of course, if you do not use my agent to transmit your acceptance but use your own agent you can revoke your acceptance if by some quicker means you can get your revocation to me before I receive your acceptance.

The only remaining thing concerning offer and acceptance that it is practical to say is that the death, insanity, or bankruptcy of the offeror before the offer is accepted causes the offer to lapse.

(2) *Consideration*

Every contract that is not under seal requires "consideration" to make it binding. Consideration is some value given or received as an inducement to enter into the contract. Mere motive is not sufficient. Consideration need not be money, and it may have very little actual value. It could be briefly defined as some benefit received by one party, or some detriment, responsibility, or forbearance undertaken or suffered by the other.

If you undertake to do something for nothing it is not a contract and you cannot be compelled to perform it. (I must say however that if you actually perform it and do so negligently, you will be liable for damages for loss caused by your negligence.)

Consideration need not be adequate however. The courts will not make bargains for people. If you agree to do something in return for a trifle, you are nevertheless bound by your agreement. For example a man promised to do something in return for delivery to him of a certain promissory note which was outlawed by the Statute of Limitations—nevertheless, it was a piece of paper, something he wanted, and he was held bound by his contract.

There are two technical rules respecting consideration I must draw to your attention. The first rule is that a promise to do something that you are already legally bound to do, such as to perform an existing contract, is not consideration for a return promise and the latter need not be bound. For example, if you hire men to do something, and they go on strike and you agree to increase their pay if they perform their original contract, you need not pay the increase. The second rule is that consideration to be good must be something done at the time of contracting, or to be done in future. Past consideration is no consideration, such as agreeing to do something because of past benefits received. There are only two exceptions to the rule against past consideration—one is that a promise to pay a statute-barred debt is binding, and the other is that a minor's written promise, made after attaining majority, to pay debts contracted during minority, is binding.

Contracts under seal are binding without consideration. The seal imports consideration. The law presumes that when parties enter into a contract in such solemn form they do so with a full knowledge of its contents and that consideration actually existed. If fraud or undue influence is practised to obtain a contract under seal, the Court will set it aside, and in such case absence of consideration is corroborative evidence of the fraud or influence.

(3) *Capacity to Contract*

Certain persons are protected by law and are made incapable, either wholly or partly, of binding themselves by contract. Such persons are infants or minors, persons of unsound mind, intoxicated persons and Indians. (To which list at one time there were added married women, much to their disgust.) Other persons have but limited capacity to contract—such as corporations and alien enemies.

*Infants:* In Canada every male or female person under the age of 21 years is an infant or minor. The contract of an infant for the supply of *necessaries* is always binding. What are necessaries depends upon the infant's station in life. Board, lodging, clothing, medical attention and education are ordinary necessaries to all. Furthermore, things that would be luxuries to the children of a labourer would be reasonable necessaries for the children of rich men of high social position (such as engineers and architects are known to be). All contracts of an infant that are not necessaries are voidable, that is may be repudiated, by him after he attains majority. Certain contracts must be repudiated within a reasonable time after majority, else they become binding upon the infant. Where the infant acquires an interest in permanent property involving obligations, or where he makes a contract involving continuous benefits and liabilities, and actually takes some profit, he must repudiate within a reasonable time or be bound. For instance, if he leaves property he must pay rent until he repudiates and must vacate when he repudiates; an infant who holds himself out as a partner is liable for the firm's debts as any other partner until he repudiates the partnership; and an infant who buys shares in a company is liable for the unpaid portion unless he repudiates the purchase at his majority.

If, after attaining majority, an infant ratifies in writing a contract made during minority, the contract is binding.

An infant can have a contract set aside and recover back money paid. Where a contract is not enforceable against an infant, he cannot compel its performance by the other party; but, if the infant is willing to carry out the contract, he can sue the other party for damages for breach of contract.

*Persons of unsound mind:* A person of unsound mind is always liable for necessaries delivered. Any other contract is binding upon him unless it be proved that at the time the contract was made he was so insane he did not know what he was doing and that the other party knew it. If these two facts be proved, the contract is voidable by the lunatic or his legal representative at his option.

*Intoxicated persons:* The contract of an intoxicated person for necessaries delivered is binding. Any other contract is binding unless it be proved that at the time the contract was made he was so intoxicated he did not know what he was doing and that the other party knew it. If these facts be proved it is voidable at his option.

*Indians:* Indians living on reservations and not enfranchised are wards of the Crown, and are protected from fraud by being placed in a position similar to that of infants. They cannot bind themselves even for necessaries. An Indian can sue the other party for damages for breach of contract however. An enfranchised Indian has the same rights and liabilities as any other British subject.

*Corporations:* An incorporated company is an artificial person created by law. Its powers to contract are limited by its charter and by-laws; and, any contract not falling within their powers is said to be "ultra vires" or beyond their powers and therefore void.

The consent of its members to a contract is evidenced by the corporate seal impressed on the contract. Some of its contracts do not need the corporate seal; e.g., in matters of minor importance such as the hiring of employees, effecting repairs, obtaining office supplies; and, a trading company can contract without seal in matters relating to the objects for which it was created, such as the supply of the things it sells.

Apart from the above classes of exceptions no contract is enforceable against a company if it does not bear the corporate seal. This fact is of vital importance to an engineer or architect, for a contract with you for your professional services is not enforceable by you if it does not bear the corporate seal. As I shall show later however, if you actually wholly execute your part of the contract, you can recover your remuneration, for the company is not permitted to retain the benefit without paying for it.

*Municipal corporations:* The Ontario Municipal Act provides that the powers of a municipal council must be exercised by by-law. This provision has been interpreted conclusively by our courts, confirmed by the Privy Council, as absolutely requiring a contract to be authorized by by-law of the council, else there is no corporate act. Absence of a by-law therefore is fatal to the contract. It makes no difference that the other party to the contract has wholly performed his part of it, he cannot recover a cent if there was no by-law. It makes no difference that the municipality passes a by-law authorizing the construction of the undertaking. You cannot creep in under that tent—*your* employment must be by by-law.

Of course the ordinary law respecting the corporate seal applies to a municipal corporation, and we need not repeat it.

Having regard to the vicissitudes of municipal politics and to the fact that frequently most of your work other than supervision is completed before the construction by-law is passed, you can plainly see the danger you are in if, when your professional services are retained by a municipality, you do not take the precaution of having your contract under corporate seal and that contract authorized by by-law of council.

The Ontario Unemployment Relief Act, 1933, chap. 65, provides as follows:—

Section 9. Every municipality in addition to all power and authority now vested in it shall have and shall be deemed to have had for the purpose of taking advantage of and the benefit of any Act of the Dominion of Canada or province of Ontario or any order or regulation made thereunder or any agreement made in pursuance thereof or of carrying out and performing any agreement entered into for that purpose between the government of the province of Ontario and the municipality, full power and authority to undertake, carry out and complete any work and to provide direct relief, and to vote, appropriate, receive and pay all sums of money required to defray the cost or the municipality's proportion of the cost thereof or any part of the cost of the same, and, with the approval of the Ontario Municipal Board, to issue debentures of the corporation to pay the said sums or any part thereof, and to levy and collect the said cost or the municipality's proportion of the cost or any part thereof by means of taxation against the rateable property in the municipality or in the case of a work undertaken under The Local Improvement Act in the manner provided by that Act.

Does this imply that a municipal council may act under this statute without passing a by-law that would be required under the Municipal Act? I would think not. I think this statute only adds to the things a municipality may do without affecting the manner of doing it.

*Public Utilities:* While under the Ontario Public Utilities Act a Public Utility Commission is a body corporate and therefore the ordinary law respecting the corporate seal comes into operation, yet such a commission is not a municipality and hence the provision of the Municipal Act respecting the necessity of a by-law of employment does not apply.

Perhaps I had better qualify that statement by saying the by-law provision does not seem to apply. It has been held both in the trial court and the Appellate Division in Ontario that that provision of the Municipal Act does not apply to a Public Utility Commission, but the point will arise for final determination in the Supreme Court of Canada in its sittings of next February. I shall be considerably surprised if the Supreme Court of Canada holds the contrary view.

A unique but well settled point of law deals with responsibility of payment under a contract made by a Public Utility Commission. Under the Public Utilities Act, upon the election of the commissioners, all the powers, rights, authorities and privileges of the municipality respecting the particular utility are vested in and are to be exercised by the commission and not by the council of the municipality. Ownership however remains in the municipality, the commission having merely the control and management. Therefore while the commission is the proper body to make a contract relating to its objects, the commissioners have no personal liability under it. The commission has been held to be but the statutory agent of the municipality in the exercise of its powers, and therefore in case of suit under the contract the municipality is the proper defendant and not the commission. Similarly the commission is not liable for damages for tort, such as negligence, the municipality being the proper defendant.

*Alien Enemies:* An ordinary alien has all the contractual capacity of a British subject. An alien enemy is on a different footing. After hostilities have commenced, all contracts thereafter made with him, even negotiable paper, are illegal and void unless the Crown grants a special enabling license. A contract existing before hostilities commenced is suspended during hostilities—it cannot be enforced meanwhile by the alien enemy, but may be enforced after declaration of peace.

(4) *Mutuality of Mind*

The consent of both parties to the contract must be voluntary and intentional. The consent of one of the parties may have been procured by mistake, misrepresentation, fraud, duress or undue influence. Under such circumstances it would be unjust to recognize the contract.

*Mistake:* By mistake is not meant mistake in expression—that involves mere interpretation and the courts will hear an explanation. Nor is there meant a bad bargain or incorrect estimate—the party suffering has only himself to blame and cannot escape from his contract. Mistake that will invalidate a contract can only occur in three ways: (*a*) by the fraud or carelessness of a third party, (*b*) by the dishonesty of one of the parties, or (*c*) by mutual mistake as to the identity of the thing contracted for or the identity of each other. Let us illustrate briefly.

(*a*) Where a blind man or one of feeble sight, or one who cannot read, is told fraudulently by a third party that a document is other than what it is, and consequently he signs it, the contract is void for mistake. Again, where a third party is careless, as where a telegraph office incorrectly transmits an offer and it is accepted in its incorrect state, the contract is void for mistake.

(*b*) Where one party knows that the other considers him somebody else and dishonestly allows the contract to proceed, the contract is void for mistake.

(*c*) Where the thing contracted for has ceased to exist at the time the contract is made, it is void for mistake; e.g., where a cargo of grain was bought while the ship was at sea and the grain had become overheated so that the captain had had to dump it; again, where a cargo of a ship was bought, and there were two ships of the same name, one party meaning one ship and the other party the other ship, there was genuine mutual mistake which voided the contract.

*Misrepresentation:* Misrepresentation is the innocent assertion by one party of facts which are not true but which he does not know are untrue. If such misrepresentation actually induces the other party to enter into the contract he can refuse to perform it or he can sue to have it set aside. If he wishes to sue for cancellation he must act quickly after he discovers the untruth else he may lose his rights, for, if property further changes hands so that the parties cannot be restored to their original position the contract will not be set aside.

*Fraud:* Fraud is the wilful assertion of facts that are untrue, and which the asserter either knows are untrue or does not care whether they are true or not, made to a person to induce him to enter into a contract and actually so inducing him. In such a case the victim of the fraud has several options: (*a*) he can affirm the contract and demand its performance strictly according to its terms or damages for non-fulfilment; or (*b*) he can repudiate the contract and sue to have it set aside, but here again he must act quickly else he may lose his rights, such as where property further changes hands so that the parties cannot be put back into their original positions; or (*c*) he can sue for punitive damages for deceit.

*Duress:* Duress is the infliction or threat of violence or imprisonment. It renders a contract obtained by its means voidable at the option of the victim if it was practised upon the victim or his wife, parent, or child, by the other contracting party or by someone acting with his knowledge.

*Undue Influence:* Undue influence is the improper and unconscientious use of a power or influence possessed by one party over another by reason of their relationship. Undue influence is *presumed* (*a*) where one party is uneducated, inexperienced or ignorant and the other party is educated and experienced, (*b*) where one party is in immediate want and sacrifices a future advantage, and (*c*) where a gift is made by child to parent, ward to guardian, beneficiary to trustee, client to solicitor, patient to doctor, or by any person to his spiritual adviser—in all such cases the other party must prove the transaction was fair and reasonable.

Where there is no such inequality of relationship, undue influence is not presumed but must be proved to have been exercised. If it is proved the courts give relief. The principle applies wherever confidence is reposed and betrayed.

With respect to a wife, it is held that things done or contracted to be done by her for her husband's benefit are done under his undue influence if she had affection for or fear of her husband and if she had no independent legal advice. By independent legal advice is meant advice by some solicitor other than her husband's solicitor or the solicitor of the other party.

The effect of undue influence is that the transaction is voidable. If the undue influence ceases the transaction may be confirmed or ratified by some act.

(5) *Legality of Purpose*

The object of the contract must be legal else the court will not enforce it. For instance, if you rent a building to a man for the purpose of carrying on an illegal trade neither you nor he can enforce the lease.

In a discussion such as this little purpose can be served by dwelling on the various classes of illegal contracts. Something may usefully be said however respecting contracts that attempt to restrain trade. You often encounter contracts in which one party covenants not to compete against another, such covenants usually arising when a person is employed and the employer wishes to be safeguarded after termination of the employment, or where the good will of a business is sold. Such covenants are valid and enforceable if they are reasonable, that is if the forbidden territory is restricted, or if there is a time limit, or if a certain line of business only is affected. What is reasonable depends upon the special circumstances of the case. For instance, a covenant not to engage in a certain business anywhere would need strong evidence of reasonableness to support it.

(6) *Necessity of Writing*

Every contract may be verbal unless it is required by some statute to be in writing. The Ontario Statute of Frauds requires seven classes of contracts to be in writing, signed by the party to be sued or by his authorized agent, else no action may be brought upon such contracts. These classes are:

(*a*) no executor or administrator may be sued upon a verbal promise to pay out of his own pocket a debt owing by the estate;

(*b*) no guarantor may be sued upon a verbal promise to discharge the debt or liability of another;

(*c*) no person may be sued upon a verbal promise to pay or do something if a certain marriage takes place;

(*d*) no person may be sued upon a verbal agreement to sell real estate;

(*e*) no person may be sued upon a verbal agreement that is not to be or cannot be performed within the space of a year from its date;

(*f*) no vendor may be sued upon a verbal agreement to pay a real estate commission. The written signed agreement to pay commission must be separate from the sale agreement also;

(*g*) no person may be sued upon a verbal agreement to buy or sell goods having a value of $40 or over, unless the buyer pays something down or receives and accepts the goods.

The statute simply forbids action until the written evidence is obtained. It may be obtained later and action then be commenced.

The writing required need not be formal but may consist of a series of papers or correspondence. It must be sufficient to identify the parties and the terms. It need not be signed by both parties but merely by the one to be sued.

Once a contract has been reduced to writing, whether in a formal document or in an exchange of correspondence, etc., the written terms govern. Neither party can set up verbal terms not disclosed therein. If the contract does not fall into one of the foregoing classes dealt with by the Statute of Frauds, it is open to either party however to give evidence of verbal terms which complete an obviously incomplete writing, or of additional verbal terms *that do not contradict* the written terms; but no verbal terms may be proved in the case of a contract covered by the Statute of Frauds.

So much for formation of a contract. A few remarks on performance and breach may be useful.

### II. Performance of Contracts

The parties to a contract may at any stage mutually agree to cancel it, so that neither will have any further rights or liabilities under it. They may also at any stage mutually agree to alter its terms—by so doing they are making a new contract into which the former merges.

Performance of a contract may become impossible. In such a case the general rule is that performance is not excused. If a party enters into a contract unconditionally he takes the risk of being unable to perform it, even though circumstances beyond his control make performance by him impossible. For instance, if a contractor undertakes to complete by a certain date, in the absence of special clauses he must pay damages if he fails to complete then, though the failure was caused by weather conditions, strikes or phenomena.

There are several exceptions to the general rule, however. If the impossibility of performance is due to a change in the law or if the subject matter of the contract is destroyed, performance is excused. Again, a man who contracts to render personal services is excused from performance if he is unable to act because of incapacitating illness. Furthermore, the bankruptcy of either party releases him from debts and liabilities that can rank against his bankrupt estate.

III. Breach of Contract

A breach of contract may occur in various ways—by refusal to perform, by making it impossible to perform, or by simple failure to perform.

Where one party before performance by him is due refuses to perform the contract or a vital part of it, the other party may at once treat the contract as at an end, and, without awaiting the time fixed for performance, sue for damages for breach and is also absolved from further performance on his own part. If he elects so to do, the other party is not entitled to an opportunity to change his mind. If he elects to wait for the time fixed for performance before making any claim for breach of contract, he remains liable to perform his own part and the party in default is meanwhile entitled to change his mind and perform his contract.

Where one party to a contract by some act makes performance of the contract impossible, the other party is similarly at once exonerated from performance of his own part and may at once sue for damages.

Where one party during performance refuses to continue, or makes further performance impossible, the other party need perform no further and may at once sue for damages, only needing to show he was always able and willing to perform.

Where the refusal or creation of impossibility is not of a vital part of the contract, does not go to the root and essence of it, the other party cannot treat the whole contract as broken but can only claim damages caused by breach of the particular term.

Where there is neither refusal nor impossibility but simply failure to perform, whether the entire contract may be treated as repudiated depends on the nature of the contract and its terms. If the broken terms are not vital, the other party must perform his part of the contract and claim afterwards for damages caused by the other's partial breach.

Cases involving instalment contracts show to some extent the working of the rule. Where goods were to be supplied at the rate of 150 tons per month, and the seller merely supplied 21 tons the first month, it was held to be sufficient default to relieve the buyer from further performance.

Where a buyer failed to pay for one instalment because he erroneously thought he could withhold payment because of a defective prior instalment, it was held insufficient default to discharge the seller from further performance.

It is difficult to lay down a comprehensive rule because the question whether a breach is vital depends on the particular circumstances of each case. It may be said however that if the breach by one party is of such a nature as to reasonably lead to the inference that similar breaches will be committed with respect to subsequent deliveries, the whole contract is discharged at the option of the party not in default.

A further point respecting breach of contract should here be noted. Where one party has repudiated the contract or disabled himself from performing it, the other party can not only sue for damage, but if he has performed his part wholly or in part, he can sue for the value of what he has done, called a "quantum meruit."

Lastly, if damages are not an adequate remedy and performance is possible, the court will compel the defaulting party to perform the contract according to its terms—this remedy being known as specific performance.

Where, however, the court cannot supervise the carrying out of its order, such as in construction contracts, specific performance will not be granted. Nor will a contract for personal services be specifically enforced.

An injunction order restraining a party from committing a contemplated breach of contract is equivalent to an order for specific performance of the contract, and will not be granted where specific performance would not be granted. An injunction is sometimes granted as the first step in an action for specific performance; e.g., to prevent imminent disposition of property.

B. Building Contracts

Owing to the natural difficulties of an owner in entering into a building or engineering contract, a building contract has certain special features as to which brief comment may be useful.

(1) *Tender:* An invitation to tender is a mere attempt to ascertain whether a satisfactory offer can be obtained—it is an offer to negotiate, an offer to receive offers. While it is usual to advertise that the employer does not bind himself to accept the lowest tender, such is not necessary. The employer can at any moment revoke the invitation to tender and cannot be made responsible for any expenses incurred by tenderers.

A person making a tender can withdraw it at any time before acceptance, but if he does not do so it remains in force until it is accepted or until a reasonable time has elapsed. A tender being an offer, its unconditional acceptance creates a contract. If however the acceptance provides that the particular stipulations are to be settled in a formal document, there is as yet no contract binding either party. Bear in mind that in the case of a municipality the acceptance must be under seal and authorized by by-law. A tender is an offer notwithstanding that it is labelled an "estimate."

If a tenderer pays a secret commission to the engineer, architect or other agent of the employer to induce the agent to influence the employer to accept the tender, the acceptance of the tender is not binding, and the employer has the option of repudiating the contract or of confirming it and recovering the commission from the agent and recovering damages from the tenderer. Such bribery is also an indictable offence on the part of both briber and bribed.

(2) *Alterations:* Building contracts usually carry provisions empowering the employer or his architect or engineer to vary the work in some specified manner. In the absence of such a provision the contractor is entitled to refuse to submit to alterations. If there is a provision however and it is exercised, wherever the original contract can be clearly traced in the substituted work, the terms of the contract as to price, approval, etc., will be binding. If the alterations are so sweeping that the original contract is practically lost, it is deemed to have been abrogated and a new contract created to do the substituted work for a reasonable price, that is on a "quantum meruit" basis.

(3) *Entire Contracts:* An entire contract means one where one party must entirely complete his contract in order to have the right to fulfilment by the other party.

There are three ordinary varieties of entire contracts: (*a*) a contract to construct the whole building or works for a lump sum price; (*b*) a contract to construct the whole building or works for a specified price made up of separate payments for separate parts of the work; and (*c*) a contract to construct the whole building or works for a price to be ascertained upon a fixed basis, such as by a schedule of prices or on a cost plus percentage basis.

If the contract is entire and the contractor throws up the work, without any fault on the part of the employer, he has no right of action against the employer either under the contract or on a "quantum meruit" for the value of the work actually done, and he is also liable in damages for breach of contract. If he did work outside the contract he can recover for the value of it.

In a lump sum contract nothing can be recovered whatever unless and until the work is fully completed. Where the contract is for a whole price to be ascertained in a specified manner it is a lump sum contract.

If a contractor undertakes to construct the whole building or works in accordance with a specification which is divided into separate parts to each of which a price is fixed or to be ascertained in a specified manner, the contract is nevertheless entire, and no right to payment for any part arises unless and until the whole is completed. But, if the contract provides for a certain payment for a certain part as and when completed, the contract is not entire but severable and a right to payment arises on completion of a part. Each part is for all practical purposes a separate contract entire in itself.

In all cases where a piece of work is contracted to be done, and, by inadvertence or otherwise, no price is fixed for such piece, the contractor is entitled to a reasonable price. The same rule operates if the whole contract does not mention price.

If the contract is to *complete a whole work* the contractor must do everything that is indispensably necessary, and it makes no difference that such indispensable necessary works are not described in the specifications, or not shown in the drawings, or are calculated wrongly, or their cost or extent underestimated in specifications or omitted or underestimated in quantities, and this whether the specifications or quantities have been made part of the contract or not. The fact that quantities, etc., are made part of the contract does not cut down the obligation of the contractor to furnish a complete work.

But, if the contract is merely to do so much work as is described in the specifications or quantities, he cannot be compelled to do more.

In the case of an entire contract, the preparatory work such as clearing away existing works, excavating, transporting materials, etc., is part of the contract work. If unforeseen difficulties arise, such as rock being encountered instead of clay, the preparatory work is still part of the contract work.

A well-prepared fair contract would provide for the engineer or architect in his status as arbitrator allowing extra remuneration in all such cases.

(4) *Time for Completion:* Where the contract does not set a particular time for completion, a reasonable time is implied and will be allowed. What is reasonable time depends on the nature of the work, the orders which the contractor has on hand, the proper use of customary appliances and the time a reasonably diligent contractor would take.

If a particular time for completion is specified, failure to complete within such time ordinarily will not be such a breach as to release the employer, but he is entitled to damages. If, however, time has effectually been made of the essence of the contract (and this is not usual in building contracts), and completion to time expressly made a condition precedent to payment, failure to complete within such time releases the employer.

The mere insertion of words that time is of the essence is ineffective if they are inconsistent with other terms. Time cannot be of the essence if there is a clause providing for a penalty or liquidated damages for delay, nor where there is a bonus for speed.

Where time is effectually of the essence, the contractor can recover nothing if he does not complete in time.

Where time was not of the essence, or where it was but was waived by the employer, the employer still has the right to fix a reasonable time for completion and to dismiss the contractor if he does not complete within such time.

The contractor has till midnight of the last day to complete.

(5) *Excuses for Non-Completion:* It sometimes happens that performance of a building contract is or becomes impossible. In such cases the ordinary rules of contract law apply—the contractor is not excused from performance and must pay damages. It is the duty of the contractor to fully inform himself of the particulars and practicability of the work before tendering. For instance, it is no excuse for non-performance to say that the soil has a latent defect making construction impossible. If, however, the impossibility to do the work is due to failure of the employer to fulfil a condition precedent, express or implied, the contractor has no liability.

The contractor may be absolutely prevented or delayed by the employer from commencing or continuing his work. The degree of prevention determines whether he is entitled to treat the contract as repudiated by the employer or is bound to continue and recover damages sustained. For instance, such delay by the employer as to turn a summer contract into a winter one may be such as to abrogate the terms of the contract and entitle him to recover on a "quantum meruit." Again, if the employer does not provide the site by the time fixed in the contract, or at once if no time is fixed, the contractor is entitled to throw up the work and sue for damages; or, he may wait for the site and continue with his work, recovering damages caused by the delay.

Where a time limit is fixed for completion, and does not provide for relief on account of strikes, the contractor will be liable for the delay so caused.

Where no time limit is fixed, the occurrence of a strike may excuse an unreasonable time and make it a reasonable time under the circumstances. If the contract provides for strikes, but a strike lasts so long that the object of the contract is frustrated, it puts an end to the contract.

The occurrence of bad weather or storms is no excuse, as weather changes must have been contemplated by both parties when the contract was made.

Where the employer, by the terms of the contract, employs sub-contractors, or independent contractors, or specialists, he becomes liable to the contractor for delay caused by them—but not so if the contractor employs them.

If an engineer or architect in the exercise of his quasi-judicial duties delays or prevents the contractor from proceeding, such as in deciding whether work or materials are as specified and in determining questions between employer and contractor, the contractor has no remedy. But, if the delay or prevention is caused by architect or engineer in his capacity as the *agent* of the employer, the latter is liable for their defaults.

(6) *Alterations:* As it is a rule of law that wherever a statute requires a contract to be under seal it can only be varied by a document under seal, and bearing in mind

the Ontario Municipal Act requiring contracts to be also authorized by by-law, the danger of dealing loosely with municipal councils is obvious. You should do everything possible to have your retainer fully protected as to formalities. The proper way is to have a contract under corporate seal and to have a by-law passed referring to that contract and authorizing it. This contract should provide for the manner of ordering alterations in or extensions to work, so that you do not have to go back to council for another contract and another by-law.

I realize that in dealing with municipal councils it is often not expedient to press for the formalities of contract to which you are entitled for your protection. This state of affairs should not exist. It is for instance taken for granted that you must give a real estate agent a written commission agreement else he will not work for you—that is because real estate agents have well trained the public to do the proper thing. Why should not municipalities be trained so that they cannot employ an engineer or architect except in the way they know to be proper and required by the Municipal Act under which they have their being? I seriously suggest that your Institute or Association adopt measures of practice that would take this embarrassment from the individual members.

When you find yourself in a position such that extensions to the work are ordered, and you have not the protective formalities covering the same, there is one way you can protect yourself. You no doubt are acquainted with the rule of law that if a debtor in making a payment does not apply the same to any particular debt the creditor may apply it as he sees fit. If a payment is voted to you and merely applied "on account" or some such language, you are entitled to apply it to extras or extensions that you have completed, leaving the sum due to you under your formal original contract safely collectible at law. Such an application cannot be made to unfinished work, however, as there is no "debt" for it till it is finished, except in so far as the agreement provides for payment by stages of progress.

The contractor is in the same position with the employer respecting extras, alterations, or extensions as you are. Hence the contract should contain provisions for alterations or extras by the engineer or architect, and it usually does in practice. Apart from statutory requirements as to formalities, a contractor for a lump sum cannot obtain payment for extras or variations unless he can show the employer expressly or impliedly ordered them, or that the architect or engineer did so acting within his authority, or that the employer ratified unauthorized orders of the architect or engineer, or that the employer accepted the work personally or by his authorized agent.

(7) *Breach of Contract:* If the employer does not fulfil a condition precedent to the contractor's liability to commence, the contractor can throw up the contract and sue for damages or, if he proceeds with the work he may according to the circumstances be relieved from stipulations as to time and still recover damages.

If breach by the employer occurs during the work, it depends on the particular circumstances whether the breach goes to the root of the contract. If it does the contractor can abandon the work and sue for damages at once. If it does not he must complete the work and then sue. As a general rule the longer the work is in progress and the nearer to completion, the less likely is a breach to be considered as going to the root of the contract.

Notice by the employer to the contractor not to do any more work is total breach and entitles the contractor to treat the contract as rescinded so that he need do nothing further and may at once sue.

Total abandonment by the contractor entitles the employer to treat the contract as rescinded. Breach by the contractor of particular stipulations has the same effect as a similar breach by the employer. But, where the contract provides for progress or time limits under penalty of forfeiture of the contract, breach of such a stipulation may entitle the employer to exercise his powers of forfeiture.

(8) *Penalty Clauses:* In order to secure punctual performance of contracts, it is usual to insert a clause that if the work is not completed by a certain time the contractor shall pay a certain sum or sums to the employer. The amount may be a penalty or it may be liquidated damages.

If it is in effect the payment of a penalty, the sum does not bind either party and all that the employer can recover is actual damage sustained. If the intention of the parties is clear that the sum or sums represents the estimated damage, then the sum is collectible as liquidated damages. These rules operate no matter what language is used.

To make effective a provision that the stipulated sum or sums shall be liquidated damages, it is essential that a day be fixed from which they are to run, for, if there is no such date, or it has ceased to be operative by the acts of the parties without a fresh date being stipulated, all right to recover the sum as liquidated damages is at an end. It is for this reason that you insert in contracts a clause that the architect or engineer may extend the time for completion, to fix a substituted date from which liquidated damages are to run.

The employer, by causing a delay in completion, through failing to supply site, drawings or required materials, or through ordering extras, etc., may make the date fixed for completion inapplicable and forfeit the right to recover liquidated damages. The burden lies on the contractor to prove such effect.

Where there was power to deduct the liquidated damages and they are not deducted, or where the engineer or architect in issuing his final certificate does not take them into account, the right to recover is gone.

Where the right to liquidated damages is gone and the contractor completes within a reasonable time, the employer has no right to even unliquidated damages.

(9) *Forfeiture:* It is usual to provide that on the happening of certain events the employer may take possession of the work so far as it has been performed and to complete it himself or by some other contractor. The employer may also be empowered to take possession of the property of the contractor, such as materials, plant and money due (for which he must usually account).

If there is no such power provided in the contract or the power is wrongfully exercised, the act of forfeiture by the employer is a breach going to the root of the contract, giving the contractor a right to sue either for damages for breach or for the value of work actually done and materials supplied.

If the forfeiture depends on the certificate of the engineer or architect, which certificate is by the contract final and conclusive, and the certificate is given under a mistaken view of the circumstances, but honestly and in good faith, the forfeiture is not wrongful on that account.

As a general rule the court will not restrain the employer from even wrongfully exercising forfeiture, as the contractor can be compensated in damages. The employer on proper grounds may however obtain an injunction restraining the contractor from proceeding with the work.

The usual provisions for forfeiture are for not commencing the work, not regularly proceeding with the work for some fixed number of days, not proceeding to the satisfaction of the employer or his engineer or architect, not proceeding with such despatch as will in the opinion of the engineer or architect enable completion by the time stipulated, not proceeding in the manner required by or not obeying directions of the architect or engineer, not performing the work as specified, not observing stipulations, not completing as stipulated, leaving the works in an unfinished state, failing after proper notice to rectify defects, removing materials, and not maintaining the works.

The forfeiture must be put into effect within a reasonable time, after the act complained of, else delay will constitute a waiver, except where there is a continuing or fresh breach.

(10) *Sub-Contracts:* As a sub-contractor is not a party to the contract between employer and contractor, he cannot sue the employer under it. If a particular article he has undertaken to prepare or supply has not been affixed to the freehold, he remains its owner until he has delivered it, and, on the contractor's bankruptcy, he can refuse to deliver it until he is paid for it. Where the sub-contractor is liable to compensate the contractor for inferior work or defects, and the contractor is under similar liability to the employer, the latter can take an assignment of the contractor's right to compensation.

Acceptance by the employer of work done by a sub-contractor in no way makes him liable to the sub-contractor. If the latter claims an "extra" ordered by the employer he must show the original contract does not include it and must prove a distinct contract for the extra between the employer and himself.

It is because of the rule that there is no contractual status between employer and sub-contractor that unless the contract between employer and contractor provides to the contrary, the bankruptcy of the contractor entitles his trustee-in-bankruptcy to whatever is due by the employer, and the latter must pay the same, and the engineer or architect must certify accordingly, without deduction of what the contractor may owe to the sub-contractor.

Unless the contract provides otherwise, the contractor has the right to sublet portions of the work to sub-contractors and be paid for their work. He is also liable to the employer for defects in their work as if he had performed it himself, the sub-contractors being of course liable to him for the same.

If by the breach of the contractor the principal contract is forfeited, the sub-contractors can sue the contractor for damages. Conversely, if the sub-contractor causes the forfeiture or payment of liquidated damages, he may be liable to the contractor for damages accordingly, provided he was aware of such terms of the principal contract.

(11) *Independent Contractors:* An independent contractor is one who contracts to do something, employing his own means to do it, and is in the performance of his contract entirely independent of any control or interference by the other party. The test to distinguish whether he is a contractor or a servant is whether the employer retains the power not only of directing what work is to be done but also of controlling the manner of doing it—if a man can be overlooked and directed he is a servant, not a contractor.

The chief importance of the distinction lies in the question of liability for negligence. The rule is that if the work contemplated by the contract is of such a nature that it can be lawfully done without causing injury to others unless there is negligence, and the employer has employed a competent contractor to do the work and parted with all control over its execution, the contractor is solely responsible for injuries caused by execution of the work or by the negligence of his workmen. It makes no difference that the employer lends men to the contractor if such workmen are under the control and superintendence of the contractor.

If the employer retains control over the execution of the work or if he actually interferes with the contractor or his servants and actually directs the manner of doing the work, he places himself in the position of master and is liable to third parties for any injuries sustained by them or their property.

Where the work to be done is a statutory duty of the employer or where though the work is lawful it is inherently dangerous, it is the duty of the employer to see personally that proper precautions are taken to prevent damage, and he cannot divest himself of this responsibility by employing a contractor, no matter how competent, and stipulating that he take due care.

The logic of this distinction is clear. There is an obvious difference between committing work to a contractor to execute which cannot have injurious consequences if properly done, and handing over work from which injurious consequences will arise unless preventive measures are taken.

The employer can to a certain extent safeguard himself by taking indemnity from the contractor but this has no effect on the rights of third persons and he still remains liable to them.

Where the employer remains liable for injuries this does not absolve the contractor. Both are liable and both may be sued jointly, and, being joint tort-feasors, neither can obtain contribution from the other.

A contractor in his relations to his sub-contractors is in the same position respecting liability for negligence as is the employer in his relation to the contractor.

## C. Engineers and Architects

### I. Status

The general object for which an engineer or architect is employed is to prepare plans and drawings of the buildings or works in contemplation and to supervise their construction, and, depending on the terms of his contract, he is generally speaking in such respects the agent of the employer.

His authority as agent does not empower him to warrant that the plans or drawings are correct, or that the work can be carried out according to them, or that temporary constructional works are practicable, or that conditions will be varied or waived.

If there are omissions in the plans, drawings or specifications, he has no authority to order such omissions as extras. If the scheme is impracticable, he cannot order as extra work what is necessary to enable the works to be constructed.

Generally he has to supply detailed or working drawings as the work progresses. This duty however is only to be exercised for the purpose of directing the contractor as to the exact manner in which the work described generally in the plans and drawings is to be done.

Where he is authorized to secure tenders, he is entitled to use the customary means to obtain them. If tenders are submitted but not accepted, he may obtain others within the time limited, or if no time limited, then within reasonable time. An authority to receive tenders does not empower him to enter into a contract with a contractor, even if the tender is within the price the employer is prepared to pay.

It depends upon the terms of his contract whether he can dismiss the contractor, or designate persons as sub-contractors or to manufacture or supply special articles; or to order extras, or to vary or dispense with any conditions in the contract.

The contract of employment of an engineer or architect is a personal one and therefore there is an implied condition that the contract shall continue only so long as he remains alive and in sufficiently good health to perform his duties. For this reason his death, insanity, or continued disablement dissolves the contract, and neither party can bring an action for breach.

In the case of temporary illness, the omission to perform the required services does not entitle the employer to rescind the contract, except where constant personal supervision has been stipulated.

The employment of an engineer or architect, being a personal contract, may be terminated by the employer at any moment, with or without good cause. The only remedy against the employer is an action for damages, as the court will neither decree specific performance of a personal contract nor grant an injunction restraining the employer from engaging another engineer or architect.

Where the main contract provides that the engineer or architect named is alone to give decisions in a quasi-judicial capacity, the employer has no right to prevent him from so doing, even if he dismisses him from his service, and he cannot revoke the agreement to abide by his decisions. But, where the contract designates the person to render these decisions as "the architect or engineer for the time being," or other similar words, the employer can appoint another to so act.

In case the employer dismisses the engineer or architect and should prevent him from going on the site to measure and certify, the court will grant a mandatory order compelling the employer to so permit him for the purposes of valuation.

II. Duties

(1) *General:* Although at common law an engineer or architect does not require to possess a diploma or qualifying certificate, he is bound to possess a reasonable amount of skill in the profession he exercises, and to use a reasonable amount of care and diligence in performing work he undertakes, including the preparation of plans and specifications. He represents himself as understanding the subject and as qualified to act in the business he undertakes. The employer buys both skill and judgment. He ought not to undertake work if he knows it cannot succeed and he ought to know whether it will or not.

As to the amount of skill required he need not exercise an extraordinary degree of skill. He is not responsible if others of far greater experience or ability might have used a greater degree of skill, or even if he might have used a greater degree. The question always is whether there was such a want of competent care and skill, leading to a bad result, as to amount to negligence.

(2) *As Quasi-arbitrator:* In most contracts the engineer or architect, in addition to his duties as agent of the employer, has to perform functions of a quasi-judicial nature, such as deciding between the parties whether work or materials are as specified in the contract, valuing as between the parties, determining questions that arise between them, and certifying. In such matters as valuer and certifier he is in a position similar to an arbitrator or an average adjuster and is not liable to his employer either for want of skill, ignorance of law, or negligence.

(3) *As Arbitrator:* Many contracts provide for settlement of disputes between the parties by arbitration, and an arbitrator is designated who may be the engineer or architect. There is a distinction between valuing for the parties, or certifying for payments, and arbitration. Where by the terms of the contract valuing and certifying is left to the sole skill and judgment of the engineer or architect, in performing such duties he is not an arbitrator, and, in the absence of fraud his decision is not open to review of either a court or an arbitrator. The valuation and certificate are given to prevent a dispute arising. The arbitrator's functions do not arise until a dispute has arisen. Where a valuation or certificate are not by the contract made conclusive between the parties, they would be open to review on an arbitration.

It may happen, where the engineer or architect is also made the arbitrator that a dispute may arise in which the evidence will cover or overlap something he had formerly dealt with to some extent in his quasi-judicial capacity as valuer and certifier. In such a case he must act as impartially as he can and all he can do is to be honest. It has been held that the honest exercise of his functions of superintending and controlling the work does not disqualify him as arbitrator, nor will extremely strong prior expressions of opinion disqualify him, except where they show he is not open to argument. The parties have agreed on a tribunal which they know cannot be wholly impartial because of the twofold capacity and they must abide by their agreement. If an arbitrator misconducts himself however, or the court is satisfied he cannot deal fairly with the dispute, or if he is really adjudicating on his own neglect, the court may remove him.

(4) *Delegation of Duties:* As the employment of an engineer or architect is a personal contract, he cannot delegate his duties entirely. But he need not personally go into all details and may make use of others in the performance of his duties. He cannot be expected to be constantly on the site, supervising construction of every part of the works. So he can employ others such as resident engineers, etc. He is responsible for the acts and defaults of all subordinates however, and he is not entitled to rely solely on their judgment.

(5) *Liability to Employer:* If an engineer or architect acts without due care and skill he forfeits all remuneration for services rendered that are useless, and in addition is liable for all damages sustained by the employer by reason of the negligence.

The question of whether reasonable and proper care has been exercised is one of fact and the test is whether other persons in the profession and having experience and skill would have acted in the same way. It is evidence of unskilfulness and ignorance to act contrary to established principles.

It is a duty to ascertain and comply with the requirements of all public and local statutes affecting the works. The knowledge of law expected of an engineer or architect is not a minute and accurate knowledge but a knowledge of the general rules of law applicable to the profession.

Failure to submit plans to the proper authorities, or to give notices required by law, or to examine the site, and the circumstances affecting it such as nature of soil and strata, condition of buildings thereon and existence of easements and building restrictions, with the result that his plans are defective or impracticable, renders him liable for all loss thereby occasioned to the employer.

Liability in respect to plans may be due to their being defective or incomplete or through not being supplied in proper time to the contractor. The design may be defective or incomplete, as being not in accordance with the art and science of architecture, or as being opposed to sound principles of building or engineering, or as not being in accordance with the instructions of the employer, or as contravening statutes or by-laws, or as disregarding restrictions imposed on the land.

The mere approval by the employer does not exonerate the architect or engineer if the work is structurally defective or does not carry out his instructions.

An engineer or architect does not, in recommending acceptance of a tender, warrant the solvency or competency of the contractor, but it is his duty to disclose to the employer all knowledge he possesses respecting the contractor and he should make reasonable enquiries.

Supervision must be thorough, and it is not sufficient to pay only occasional visits and set right what defects he notices. His duty is to give such an amount of supervision as will enable him to give an honest certificate whether or not the work has been done in accordance with the contract. While his supervision may in matters of detail be partly entrusted to subordinates he is liable for their negligence.

No engineer or architect or any other agent may receive a secret commission. If he does he forfeits his contract and all remuneration under it, and the employer can also recover the commission.

(6) *Liability to Contractor:* As there is no contractual relationship between engineer or architect and contractor, there can be no liability to the contractor for negligence or want of skill, and he cannot be sued by the contractor in any respect so long as he acts honestly and within the scope of his authority as agent of the employer. He does not in any way warrant that his employer is solvent and can pay, or that he will act reasonably, or that he will observe the terms of the contract.

If, however, he actually exceeds his authority and causes the contractor to provide work or materials for which the employer is not liable, he is liable to the contractor for damages for breach of warranty of authority, whether he honestly believed he had authority or not. If the assertion of authority was fraudulent, that is was made knowing it was untrue, or carelessly, not caring whether it was true or not, he is liable for punitive damages for deceit.

If, however, the contractor knew or could have known the limits of the engineer's or architect's authority, as for instance the terms of the building contract, there is no liability for breach of warranty of authority.

The amount of damages for breach of warranty of authority is the sum required to put the contractor in the same position as if the work had been authorized, that is its cost plus a reasonable profit.

The architect or engineer does not warrant that the plans, drawings or specifications are practicable. The contractor must satisfy himself in that connection.

Similarly there is no warranty to the contractor that the quantities are correct, whether they have been prepared by a quantity surveyor or by the engineer or architect himself.

(7) *Remuneration*

(*a*) *When Work Completed:* We have seen that under the Ontario law where the contract of the engineer or architect is with a municipality and the formalities of seal and by-law were not complied with, no sum whatever can be recovered from the municipality. In all other cases, where the work has been completed, whether the contract was in writing or oral, the engineer or architect recovers the remuneration stipulated by the contract. If no remuneration was set by the contract, or if by the contract the employer was to fix the amount, reasonable remuneration must be paid.

Similarly, where the contract fixes the remuneration for the stipulated work, but extras, variations, or extensions have been ordered by the employer, without the basis of remuneration of the same having been agreed upon, a reasonable remuneration must be paid.

(*b*) *When Work not Completed:* Where the engineer or architect has partly performed the services for which he was employed, and the employment is terminated by the employer, the engineer or architect is entitled to sue either for damages or on a "quantum meruit" for the value of what he has done. If he was so negligent however that the employer derived no benefit from his services, or part of them, no remuneration for them, or the part affected by his negligence, can be recovered.

Where the non-completion was due to the death or insanity of the engineer or architect while the contract in so far as it concerns future work is at an end, the personal representative is entitled to recover instalments that have fallen due; and, unless the contract stipulated that payment was only to be made on completion, he can recover the value of completed work.

In the event of bankruptcy of the engineer or architect during the progress of the work, all moneys due to him under his contract pass to his trustee-in-bankruptcy to whom also pass his rights of action for breach of contract and wrongful dismissal. If he was employed on a salary however, the salary does not pass to the trustee. It may be comforting to know that after bankruptcy the trustee cannot compel an engineer or architect to work.

(*c*) *Amount of Remuneration:* When the contract is completed and it sets forth the remuneration it governs of course, and in the event of non-payment the engineer or architect can sue for that sum.

When the contract does not stipulate the remuneration, or when work is done beyond the stipulated work, or when the contract is terminated by the employer wrongfully, various questions arise.

While engineers and architects have an official tariff, when the contract does not stipulate the remuneration for the work or part of it, there is no implied contract that the remuneration shall be on the tariff basis—the rule being that what is reasonable remuneration must be paid. The position of the tariff in the courts is that while it is not binding on the court the court may consider it for its guidance in deciding what is a reasonable remuneration.

Where the contract is wrongfully terminated by the employer, the engineer or architect sues for damages or on a "quantum meruit," generally putting forth both claims in the alternative so that the trial judge may bite that side of the apple which appeals to him most.

The general rule of damages is that such sum is to be awarded as would put the parties in the same position as if no breach had occurred. Disbursements which the engineer or architect would have had to pay out during uncompleted work are generally deducted from the sums he would have received, as those disbursements are salvaged.

As respects a "quantum meruit" claim, the value of the work performed is in practice generally ascertained by consulting the official professional tariff. This as you know gives two main ways of arriving at the value—first on a percentage of cost basis and secondly on a per diem allowance plus disbursements basis. One way of arriving at what is reasonable remuneration is to allow the entire contractual percentage less that portion which by the tariff is applicable to the incompleted part of the work.

It is to be noted that where the contract was wrongfully terminated by the employer the engineer or architect is no longer bound by the remuneration stipulated in the contract, whether it be on a percentage basis or otherwise, and is entitled to put his entire claim on a "quantum meruit" basis.

(8) *Lien:* An engineer or architect has a lien on the plans and drawings prepared by him and need not deliver them up till he is paid.

Under the Mechanics and Wage Earners Lien Act in Ontario he is also entitled to register a lien against the lands upon which the building and works are erected, the lien covering his entire services to the owner.

This lien must be registered not later than thirty days after the last day's service by him. It may be filed during the progress of the work or even when the contract is made. (I only personally know of one case where a lien was filed as soon as the contract was made, and, if I may be pardoned for the expression, "hell is popping yet.")

The lien is enforced without writ merely by delivering and filing in the Supreme Court of Ontario, a statement of claim in the statutory form, and registering a certificate of action, both of which must be done within sixty days after the lien was registered or within ninety days after the last day's service, whichever is the last. An action so commenced by any lien claimant keeps alive all other liens, and the other claimants need do nothing. An appointment to try the action of all lien holders is taken out with the Assistant Master, whose judgment covers not only personal judgment for the money due against the employer but gives right of sale of the lands and premises to the lienholders whose liens he finds valid. Wage-earners have priority over other lien holders. The lien of an engineer or architect is classed with those of contractors.

An owner who did not make a personal contract with a lien claimant is liable only for a percentage, the percentage being up to 20 per cent according to the contract price.

The lien takes priority over all judgments, executions, assignments, attachments, garnishments and receiving orders issued or made against the employer and owner.

### D. Surety Bonds

#### I. In General

These bonds fall into two classes—indemnity bonds and guarantee bonds. While the student of law must be acquainted with the various technical distinguishing characteristics attached to each such class of bonds, most of those points are too academic for our general purpose. I shall therefore restrict my remarks to a few points of practical utility.

In every indemnity and guarantee there are at least three parties—a principal debtor who contracts with his creditor to do something, such creditor, and a surety.

In an indemnity the surety's promise to the creditor is unconditional—he undertakes to pay the creditor's loss or damage.

In a guarantee the surety's promise is conditional—he undertakes with the creditor to do something if the debtor fails to do so.

Apart from this great distinguishing feature the general rules of law are equally applicable to both an indemnity and a guarantee.

Perhaps the chief kinds of bonds with which you as engineers or architects come in contact in your professions are indemnity bonds against loss or damage, performance bonds or bonds guaranteeing performance by the contractor of his contract with your employer, bonds guaranteeing the finances of the contractor, and bonds guaranteeing payment to the contractor.

The bonds in common use to-day are very carefully drawn to provide against many of the legal points that have arisen in the past. Some of the terms are very cogent, indeed, and, with the greatest respect, I suggest that in your practice you should take the precaution of perusing those terms in each of your retainers where a bond is in operation. You will find your legal duties and obligations to your employer and your general interest in advising your employer are considerably affected by those terms.

I concluded that a discussion of the law of bonds most practical for your purposes concerns the rights and liabilities of the surety, that is, what will cost your employer the loss of the security of a bond.

#### II. Position of Surety

(1) *Before issue of bond:* A surety is a favoured debtor. While he is not, as an insurer is, entitled to "uberrima fides" or the utmost good faith, there must not be any fraud or fraudulent non-disclosure of material facts. Thus, proof of fraud to secure his bond will release him from liability under the bond. This fraud may consist in either (*a*) false representations by the creditor to induce him and actually inducing him to issue the bond, or similar false representations made by the debtor with the creditor's knowledge, or (*b*) fraudulent concealment of material facts.

Fraudulent concealment may consist in not disclosing facts in answer to the surety's questions, or facts which the creditor should voluntarily disclose. A creditor must disclose any facts which make his position with the debtor different from what the surety would naturally expect. While a creditor need not tell all about a debtor's credit which affects the risk, nevertheless very little need be wrongfully said, or left unsaid when it ought to have been said, to invalidate the bond contract. For instance, the creditor should disclose to the surety any private contract he has with the debtor which affects the surety's liability and it is often necessary to disclose a contract between the creditor and a third party. In general however, the surety must inquire and it is, for instance, no defence for him to say the debtor had been guilty of previous defaults and that the creditor ought to have mentioned the fact.

(2) *After issue of bond:* A surety being a favoured debtor is entitled to the strictest adherence to his contract set forth in his bond, and, as the contract between creditor and debtor is made a part thereof, he is also entitled to the strictest adherence to its terms.

This is why I say you should study and closely follow all stipulations in the bond and see that your employer does so. Again, since any material alteration in the contract between the contractor and your employer without the surety's consent relieves the surety from all liability under the bond, and since building contracts are so naturally liable to be altered, you can see the very real obligation you have. The reason the surety is discharged by any material alteration in the contract between employer and contractor is that it is no longer the contract he guaranteed.

Thus, an increase in the amount of work to be done, or an extension of time for completing the work, will discharge a surety if he did not consent to such alteration. Decreasing the amount of work will not, however, release the surety as he is not prejudiced.

A payment made by the employer to the contractor before payment is due will release the surety, if made without his consent.

As a surety upon payment or other requisite performance of his bond liability is entitled to the benefit of any securities of the debtor held by the creditor, whether those securities were held before issue of the bond or were obtained by the creditor afterwards, loss or impairment of those securities to the prejudice of the surety releases him.

Any active omission by the creditor to do something he was bound to do for the protection of the surety will release the latter either wholly or partly according to the circumstances. Any unreasonable delay by the creditor in informing the surety of the debtor's default so that meanwhile assets of the debtor change hands and become lost to the surety, or anything that occurs that increases the surety's loss, releases the surety either wholly or partly according to the circumstances. It is to be noted however that this rule does not apply to a Crown department. Under our law the King can do no wrong. Here "the King" includes his Ministers and his employees. Hence, under the bureaucratic form of government we have to-day a member of a Crown department can be as negligent as he pleases to the prejudice of a surety without the surety having any adequate redress.

A surety has also the right to investigate all the circumstances and can set up any defence that could have been set up by the debtor. Hence, any act of the employer that releases the contractor wholly or partly from his liability similarly releases the surety.

#### Conclusion

In conclusion may I say that while I am fully aware that this discussion has been sketchy it would really be impossible on an occasion like this, where the time is necessarily limited, to cover all the ground or any of it in detail. I therefore close with an expression of my thanks for your courteous and attentive hearing.

# The Development and Operation of a Company-Owned Industrial Town

*A. K. Grimmer, M.E.I.C.,*
*Manager, Town Department, Canadian International Paper Company, Temiskaming, Que.*

**Paper presented before the Ottawa Branch of The Engineering Institute of Canada, October 26th, 1933.**

SUMMARY.—The paper outlines briefly the development of a company-owned industrial town, dealing with site, layout, housing, water supply, fire protection and requirements for schools, hospitals, stores and recreation.

Less than sixteen years ago the townsite on which Temiskaming is located was a section of forest at the southern end of Lake Temiskaming in the province of Quebec.

The selection of this site by the Riordon Pulp and Paper Company for expansion of its sulphite pulp industry was not haphazard, and was decided upon only after a detailed survey of its natural advantages.

The decision of the company to expand at Temiskaming was made on the recommendation of its Technical Director, Mr. C. B. Thorne, M.E.I.C.

The immediate objective in this expansion was to meet the demand for a viscose pulp which would satisfy the requirements of the rapidly growing rayon industry.

The fact that this unit, now owned by the Canadian International Paper Company, supplies over fifty per cent of the world's consumption of viscose pulp indicates that the objective has been attained.

This paper, however, is not intended to deal with the industrial development, but only with its adjunct, the town, which provides accommodation for the employees.

When an industrial company faces the problem of expansion, there are two main requirements, viz.:

1. An ample supply of raw material with a visible market of sufficient duration to absorb the capital cost of the plant.
2. The best site for cheapest and continuous manufacture of its product.

Definite proportional numerical values must be assigned to the various essentials that control the cost of production. Each industry will place its own values on every item affecting its own cost of production and marketing. Generally, without including special industrial features, the most important factors to be thus valued are the following: Cost of raw materials, labour supply, fuel, power, living conditions, transportation, water supply, climate, cost of maintenance supplies, taxes and legal requirements, plant site, and cost of construction.

It is apparent that different values will be attributed to each item by different industries; but, when determined, these values will provide a scale for comparison of locations. The numerical total will show the most advantageous locality.

The site selected for Temiskaming was tributary to extensive areas of pulpwood which could be water-borne to the plant. Here also ample power could be developed cheaply from the Kipawa lake area. This water also, being clear and low in alkalinity, was especially adapted for boiler use and for the manufacture of viscose pulp. The Canadian Pacific Railway offered good transportation facilities for moving supplies and product, and the site was naturally suited for the location of plant and town. Climatic conditions were normal for the industry, and the laws and taxes in force could not unduly affect the cost of production. There was, however, neither labour supply nor accommodation for employees.

This shortage was entirely offset by the natural advantages, and the company undertook to provide these essentials. Hence the origin of the town of Temiskaming.

Realizing that contented employees are the cheapest type of labour, it was decided that the completed town should be a model industrial community which would attract and hold the best class of men.

When this decision was made, a department known as the Town Department was formed and the author placed in charge of organizing and executing the undertaking. Similar developments in Canada, in the United States, and in Europe, were examined with a view to benefiting by the experiences of all.

In the preparation of the final plans leading consultants were retained with a view of producing an economical and modern scheme.

Naturally, that portion of the location selected which was most adaptable for the construction of the industrial plant was taken for that purpose. This, however, left several alternative sites available for the townsite, the relative merits of which all had to be considered and appraised.

The controlling considerations, which also apply in other cases, were briefly as follows:—

(*a*) Geological structure.
(*b*) Topographical conformation.
(*c*) Proximity to potable water supply.
(*d*) Exposure to sun and prevailing wind.
(*e*) Proximity to plant.
(*f*) Available building material.
(*g*) Natural beauty.

To supplement what could be observed from surface exposures, test pits were sunk in various locations to determine the general sub-surface conditions. From these accurate estimates were formed of the suitability of the sites for the erection of buildings and of the construction costs based on the materials encountered.

Topographical surveys were then made of all areas that could reasonably be considered, and the plans studied as to their respective merits for the proposed townsite.

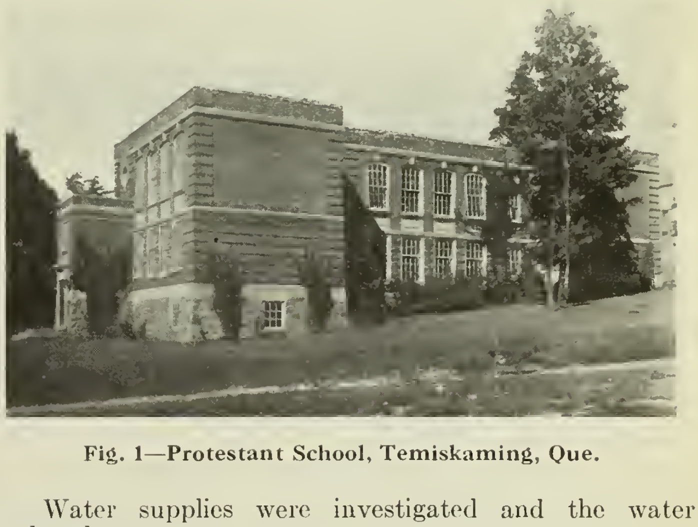

**Fig. 1—Protestant School, Temiskaming, Que.**

Water supplies were investigated and the water analyzed.

The proximity of the town to the plant afforded a field for much thought and study. Here the experience of other industrials was of great benefit. Investigation indicated that employees who have an option in this do not like to live too close to their work. When their work is over they do not wish the plant to be a constant reminder. It was also found that the auto and autobus had increased the employee's latitude and had permitted his living some distance away where he could rent or buy for himself a house where the land was cheaper, and, by securing more land and cultivating a kitchen garden, could reduce his living expense. Consideration was given to exposure to sun and to the nuisance from smoke and gas.

It was quickly apparent that building material costs would be about equal in all possible locations.

Each section had its particular scenic value and natural beauty spots, which in valuation were practically equal, except that in the one finally selected Lake Temiskaming offered a waterfront for the town.

After a careful study of these points a site was selected to the northwest of the plant. This was a heavily wooded series of steep slopes and narrow inclined plateaus. The underlying geological formation was granite, which was exposed in many places, but was generally covered with glacial drift, containing fifty to sixty per cent of boulders varying from man-size to many yards in content.

Admittedly, this was far from a cheap site upon which to build a town. However, the additional annual charges for the above-normal costs were relatively minor matters compared to the other manufacturing advantages of the whole location.

With the definite decision made as to site, a careful topographical survey was completed. On account of the abrupt changes in the slope and the narrowness of many of the plateaus, accuracy was of prime importance in order that full advantage could be taken of the natural topography to secure economical locations for both building lots and streets. On the completed plan the townsite was laid out and later definitely located on the ground and marked with permanent concrete monuments.

It is well here to point out that on account of the number of boulders the engineering work was difficult and intricate, as practically all the streets had to have curved boundaries in order to conform to the principal topographical features. The town plan, therefore, is not symmetrical; nevertheless its development through construction has produced a convenient, interesting, and attractive layout.

From the natural steepness of the slopes it was evident that a six per cent grade would have to be considered the minimum controlling grade for the principal arteries, and that secondary street grades up to fourteen per cent would be necessary.

So far as could be reasonably foreseen, the population of the town would never exceed ten thousand. It was therefore decided to limit the width of primary streets to 60 feet, to make secondary streets 50 feet wide, and purely residential streets 40 feet wide. The general slope, too, had considerable bearing on this decision.

The blocks in the town plan are necessarily irregular in shape; but in each case an attempt has been made to follow the principle outlined in Fig. 2, which shows a typical block layout plan. It will be seen that a lane has been provided immediately adjoining the rear of the houses with outlets to the streets at appropriate places. The space between the lanes has been divided into kitchen-garden plots, each duly numbered to correspond to the house to which it belongs. Further, an enclosed children's playground is incorporated in the plan in such a position that the housewife may keep an eye on the son and heir while attending her daily duties.

It is believed that this layout is original; and, though lanes as commonly known are decried and often avoided, this arrangement holds many advantages for the particular case in question, and would doubtless be adaptable to other situations. Among its good points are the convenience for wood, coal, and other deliveries, the reduced cost of garbage collection, and the ease of its disposal by the householder.

The point may be raised that there would be difficulty in preparing a description of the property if a sale were to be made. When this general plan was devised, it was proposed that only the lot on which the house was located would be sold, but that the purchaser would also acquire the right to cultivate a specific garden plot. On his failure to do so, or to take proper care of it, it could be turned over to some one who would appreciate the advantage.

The streets along which the buildings have been erected have been graded and gravelled. Concrete sidewalks have been laid on at least one side of the street, while cinder walks have been provided on the other. A concrete curb and gutter is laid on all the principal streets and on many with excessive grades to prevent erosion.

The water supply comes from the Kipawa lake watershed and is taken from the 8- and 13-foot diameter wood stave pipe lines which convey water for power purposes from the dam at Lumsden's Mills to the power house situated on Lake Temiskaming. Kipawa lake is situated in a practically unsettled area, but is liable to occasional pollution from lumbering operations. Consequently, the supply is passed through pressure filters, and, as an added precaution, is chlorinated.

The water enters the pumping station under a static head of 20 pounds per square inch from the pipe lines, and, passing through pressure filters, is chlorinated, and is then pumped into the distribution system by a motor-driven centrifugal pump having a capacity of 600 g.p.m. against a head of 240 feet.

For emergency service and fire protection a gasoline engine directly connected to another pump of equal capacity has been installed as a stand-by unit.

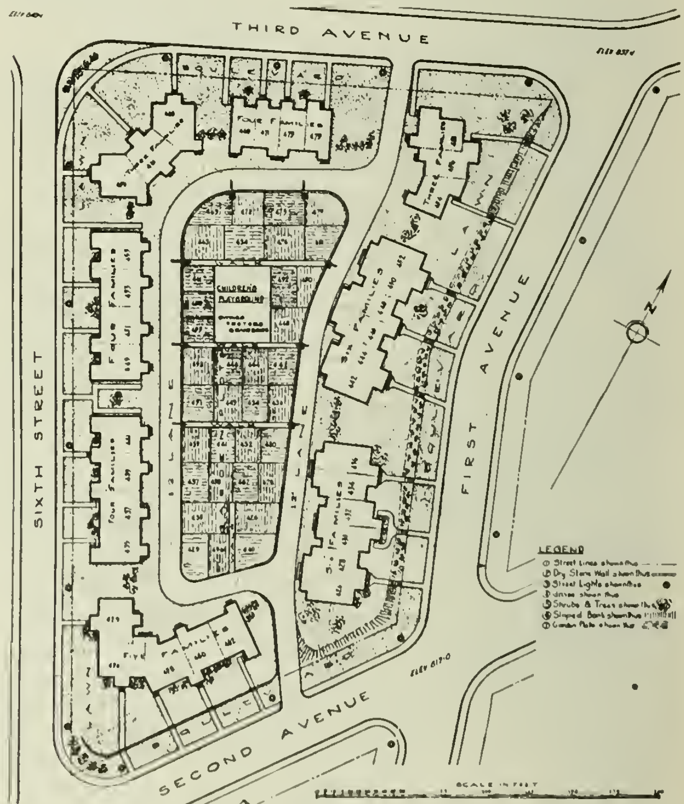

Fig. 2—Typical Block Layout.

The motor-driven unit is equipped with no load and overload cutouts. Consequently, the station requires no attendants or operators other than to provide regular oiling and inspection. This plant has been operating continuously for fourteen years under these conditions.

Daily water samples are forwarded to the Superior Board of Health of Ontario for analysis—a service furnished free of charge by the provincial government.

The distribution system is entirely cast iron pipe 10 inches to 6 inches in diameter and a liberal installation of valves provides excellent control in emergency.

Owing to the location of the town on a steep hillside where prospective consumption might be taken anywhere between elevation 625 and 900, the pumping station was located at approximately elevation 740, and reducing valves installed to regulate the pressure below elevation 700. By-passes are installed at each reducing valve for use in case of emergency. These valves, however, have operated automatically and satisfactorily even during bad fires.

Fig. 3—Group of Mechanics' Houses.

One-inch galvanized iron pipe was used for all ordinary water services and as yet no service has been renewed after fourteen years' use.

Owing to climatic conditions, all water mains have a minimum of 5 to 6 feet of cover, and, due to the heavy cost of excavation, were laid in the same trench as the sewers, which naturally contribute some frost protection. The services have at least 6 feet of cover except where there is a good sod covering when it has been found possible to reduce this to 5 feet of cover.

An ever-present fire hazard exists in the adjoining forest and therefore, as auxiliary protection, the town of Temiskaming has supplemented the company's water system by the purchase of three bush fire pumps and four thousand feet of 1½-inch cotton hose. This equipment can be speedily transported to a fire originating in the immediate vicinity of the town; but neither it, nor any other equipment, can control a fire which originates miles away and reaches the intensity that wiped out Haileybury some years ago. Against such fires man and equipment are impotent, and only rain or change of wind will extinguish them or prevent a catastrophe.

Owing to the high cost of excavation, a combined domestic and storm sewage system was decided upon and installed. This is laid entirely in vitrified terra cotta pipe varying in diameter from 10 to 36 inches. At points where the run-off would be excessive for the diameter of the pipe, overflow outlets have been placed to relieve the mains and prevent back-flooding of cellars. All ordinary services are 6 inches in diameter. So far no difficulty has been experienced with sewers laid on grades up to fifteen per cent.

Although no long distance phone connection is available, an automatic telephone system has been installed for inter-departmental service and for the convenience of the people. A hundred-line unit has been placed in a fireproof building and arranged for extension when and as required.

The construction of houses, schools, and commercial buildings has been the largest single item of expenditure.

Housing presented the problem of providing for people of many nationalities and stations in life, and involved consideration of climatic conditions and the relatively high cost of construction.

In approaching this problem the first step was a decision upon a classification for housing that would best meet the local needs. Four general classes were settled upon, viz. officials,' mechanics,' mechanics' helpers, and labour houses.

No officials' houses have as yet been built, and each will be designed as a separate unit. Officials in the meantime have occupied machanics' houses, and will continue to do so until funds can be allocated for their construction without sacrificing more pressing needs.

The general plan adopted for mechanics' houses was a building with six rooms, three bed-rooms, bath, living room, dining-room, and kitchen, each having an approximate ground floor area of 625 square feet. Typical layouts for this type are illustrated in Fig. 4. An examination of this plan will show that a very small percentage of area is absorbed by halls and stairs. It consequently is an economical house to build for the accommodation it provides.

Mechanics' helpers' houses were similar in general plan, but the ground floor area was kept within the limits of 500 to 550 square feet. Figure 5 illustrates one of the most representative and economical types in this class.

Labour houses have the ground floor area tentatively fixed at 450 to 500 square feet; but in this classification more variation in type has been necessary than in either of the others, due to the variable size of families and to the modern conveniences expected by the tenant. Figure 7 shows a typical and economical arrangement for a small house of this type. This plan is particularly adaptable to change of grade or to fit unusual conformation of ground, as its separate units can be moved about to meet these conditions.

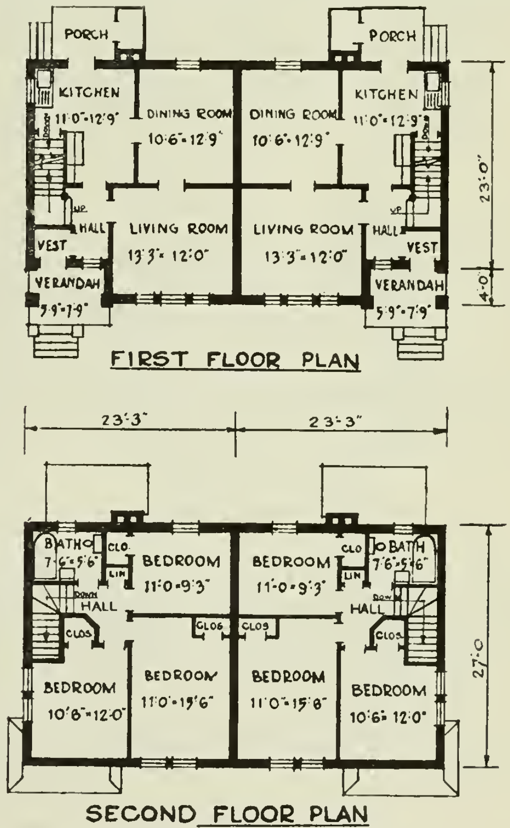

Fig. 4—Typical Houses for Mechanics.

The first consideration in all housing design is to provide proper accommodation for the family. Definite standards as to size of room, light, ventilation, and heating were established and maintained.

Each house has water and sewer service, a combined kitchen sink and wash-tub, toilet, and other plumbing fixtures in keeping with the standard of living expected by the tenant. Each house is fully wired for electric light, and at least eighty per cent of all cooking is done by electricity. This utility is furnished at a low rate for light, cooking, and hot water heaters, and is one of several appreciated features tending to lessen the labour turnover.

Mechanics' and mechanics' helpers' houses are all heated with hot air furnaces and the construction is such that it is possible to keep the heating bill very low in spite of the climatic conditions. It may be of interest here to state that the average fuel consumption for a mechanics' house is approximately five cords of sixteen-inch hardwood and five tons of anthracite coal per year. It was also found that four inches of cork insulation placed on the ceiling above the bedrooms reduced the heating bill nearly twenty per cent, as well as having other advantages referred to later.

All houses have permanent foundations constructed of rubble masonry made from the boulders found in the excavation. The superstructure is what is commonly called balloon frame, and is brick veneered, or stuccoed. Several types of roofing have been tried, but roofs of asphalt shingles, slate surfaced, have proved the most economical and satisfactory. Even these, in the author's opinion, leave much to be desired both in appearance and durability.

Careful study has been given to the grouping of houses, which, generally, are either semi-detached or in rows. Some very interesting facades have been worked out to take care of the steep grades; but the effect striven for has been harmony without monotony along every street.

As previously noted, full advantage was taken of the topography to obtain reasonable street grades; consequently, due to the winding and curved streets, the block plan is irregular. Nevertheless, the gradually changing vistas enhance materially the appearance of the town.

The snow on the roofs and the icicles formed at the eaves have been a real problem, and at times a menace to

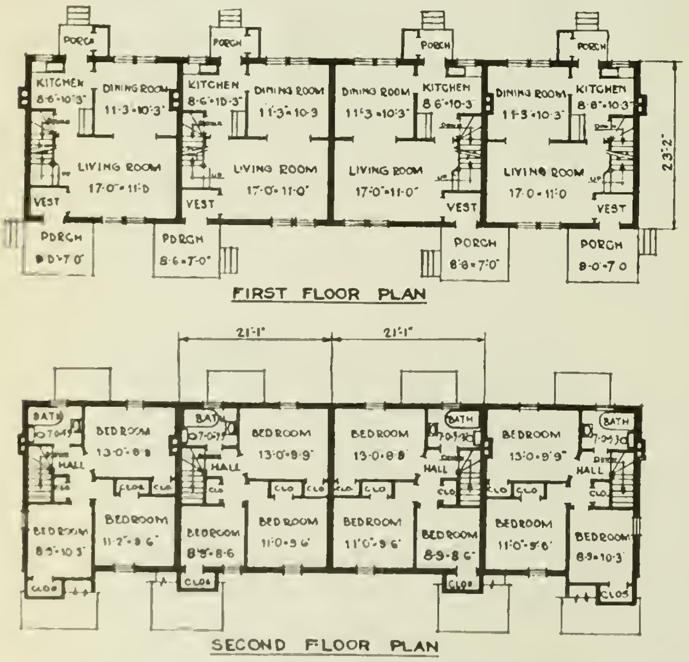

Fig. 5—Typical Houses for Mechanics' Helpers.

the safety of persons. The snow melting on the upper roof due to interior heat runs down on the projecting unheated eave and freezes, gradually accumulating a great weight of ice.

Experience indicates that each eave projection should be boxed in and so arranged that the air in the exterior partition may circulate in this eave, and that all ceilings should be insulated with 4 inches of ground cork. The projection of the eave should not be less than 18 inches. When this has been done, the icicle nuisance has been overcome.

Next to housing, education is doubtless the most important requisite for a contented people. Realizing this, and also the value of educated employees, the company has continued a policy of providing absolutely free education to the children of all residents of the town irrespective of whether or not they had company affiliations—this without request to the provincial government for assistance.

Two fully modern, solid brick schools have been erected and equipped to give education up to and including matriculation. Domestic science and manual training have been provided for in another building, and the company is now about to offer this vocational training to the adult population.

The supervision of the schools is left to the Advisory School Boards appointed by the company. It may be of interest to state that the present school attendance is four hundred and the annual cost to the company for each pupil is approximately $90.00.

A hospital is a very important consideration for any isolated community. This has been provided and equipped so that any major operation is undertaken. Its location is ideal, on the hillside facing Lake Temiskaming. It overlooks the lower town and mill, and offers a beautiful and interesting outlook for the convalescent. This institution, with its doctors and nurses, has given valuable aid in emergencies and doubtless saved many lives which otherwise would have been lost due to the distance from other hospitals.

When the town was first established, it was difficult to interest business men with capital to invest in necessary stocks and supplies to establish themselves in the community; so this obligation also fell upon the company. However, as private individuals could be found who would undertake these enterprises, they have been turned over to them to conduct, the company merely retaining such portions of the business as would permit them to keep the cost of living at a satisfactory level.

Naturally, their whole interest was to maintain this at the lowest point consistent with the health and comfort of the people.

Situated as Temiskaming is in a wilderness with geological conditions prohibitive of the private production of dairy and farm products so essential to the people, the company purchased the only suitable area and established a dairy farm to meet this need. Otherwise, a milk supply would not have been available within a radius of 40 miles, and that only by rail, as there is no highway connection.

As amusements are essential to contentment, an athletic field for baseball and football was provided. Here, too, an endeavour has been made to avoid paternalism by encouraging and supporting an organization known as the Temiskaming Athletic Association, which controls and supervises all sport in town. This association is a board of directors formed by representatives of all the sporting clubs. Grants are made to this board, who in turn allocate the money to the individual clubs. Through the united effort of this association, the town council, and the company, the town possesses four splendid tennis courts, ski jump, motor boat landing, diving stage, a nine-hole golf course, dressing-rooms and equipment for a large out-door hockey rink, and a splendid concrete-lined wading pool for children.

A moving picture hall with a seating capacity of three hundred was one of the first buildings completed. Recently this was equipped with the most modern type of sound reproduction apparatus.

In addition to the above amusements, the natural location provides canoeing, motor boating, swimming, fishing, and hunting. Game and fish abound in the surrounding country and lakes.

It unfortunately appears that nature objects to clearing a space in the forest for a townsite, as it has been impossible to save the many beautiful and stately trees that were carefully protected during the progress of construction. Experience here indicates that when adjoining trees are removed from those which it is desired to save the specimens gradually succumb. Whether this be due to added exposure in winter, or to the higher rate of evaporation from the soil, or to both, it is not possible to state. However, young trees of similar varieties may be planted and will continue to prosper.

After the removal of the original forest the townsite presented a desolate aspect much intensified by innumerable boulders of all shapes and sizes. These were utilized for all forms of construction and broken up for concrete aggregate, for which they are naturally suited. Consequently, today one finds that the lots are practically cleared of all except those which have been deliberately left for landscape purposes.

Coincident with the inauguration of the above policy, through a definite plan, trees, shrubs, and vines have been planted, and by sponsored competitions attempts have been made to interest each householder in improving his own home. From a small beginning these competitions have been the means of producing gardens and home surroundings which ten years ago would have been deemed impossible.

Today the centre of the town may be viewed as one garden; but investigation shows that it is made up of the individual gardens of the various householders, so harmoniously blended, however, that it is impossible to realize that the whole is the product of individual effort.

The officials of the company feel that the resulting appreciation of the beautiful has done much to stabilize labour. It has, at least, developed loyalty and pride in the town, so that people who located here less than ten years ago now speak of it as "home," and that is the essence of contentment.

In keeping with this policy, the town of Temiskaming undertook as an unemployment measure the construction of an extensive rock garden, a feature to which the natural situation of the town easily lends itself. As a result, the town possesses now a very fine example of this type of landscaping, and has a splendid collection of rock garden plants that is gradually attracting attention to the community as a whole.

The town council has established and continuously supported a public library.

In 1928 the citizens raised funds to erect a memorial to Mr. Thorne and this monument now stands at the

Fig. 6—Group of Mechanics' Helpers' Houses.

entrance to Thorne avenue. A further indication of his interest in the citizens is shown by Mr. Thorne in his presentation to the town in 1930 of an antique marble fountain and well-head brought from Florence, Italy.

A description of the boarding houses, hotel, cafeteria, etc., provided and operated for the accommodation of the single employees would unduly extend this paper but the same detailed study has been given to this as to every other phase of the development.

On the original plan definite sites were allocated to all principal religious denominations for churches; and, though temporary accommodation has been provided for services, each denomination is expected to raise funds for its own permanent structure. The Roman Catholic congregation has already succeeded in this, and has erected a beautiful rubble masonry structure from the boulders broken on the site. The architect in executing this plan used Laprairie red brick for corners, returns, and reveals, thus avoiding the expense of cut stone, and adding warmth to the completed structure.

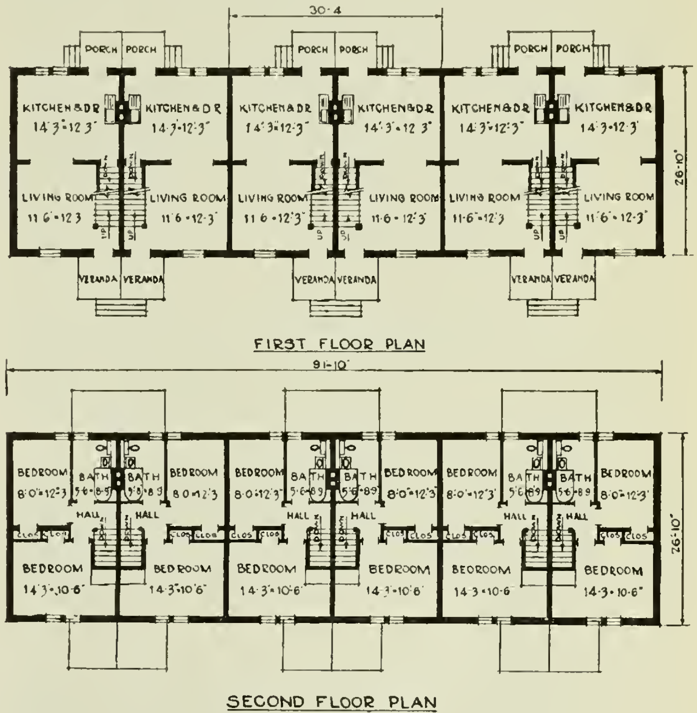

Fig. 7—Typical Houses for Labour.

This paper would be quite incomplete without some reference to the general policy governing the operation of this company-owned town.

There is no doubt that the original intention of establishing a model industrial town has in a very large measure been fulfilled. Obviously such an undertaking as this can be assumed only by a large and financially powerful organization with sufficient output to absorb the operating costs.

Another point of interest is that the company has only rented and never sold any of its houses. Much can be argued for and against this decision. However, after fifteen years of experience it is felt that the best of employees would not have it otherwise. During the past depression they have had no worries of accumulating payments, enjoyed a below normal rental, and have had no investment to tie them to the locality if opportunity offered betterment.

The company has at all times endeavoured to avoid paternalism. Its local regulations are based on the belief that the interest of the whole community supersedes that of the isolated individual.

Rents have not attempted to cover interest and upkeep of houses. This deficit is absorbed in the cost of production. Utility rates are fixed as nearly as possible to the average cost of operation.

The whole project is operated by a department called the Town Department, whose responsibility finally consists of maintaining a contented community and seeing that the cost of living is as low as is consistent with maintaining a healthy and satisfied people.

So stands Temiskaming today, an isolated but fully modern town, which provides modern living conditions for a population which varies with the activities of the mill from twenty-two hundred to thirty-two hundred persons.

# THE BROADWAY BRIDGE, SASKATOON

*C. J. Mackenzie, M.E.I.C.*[1]

## DISCUSSION

R. DeL. French, M.E.I.C.[2]

Professor French stated that he had had the privilege of presenting this paper in the unavoidable absence of its author, Dean Mackenzie, a privilege perhaps the more appreciated as his engineering interests lay along lines quite different from the subject of the paper. The following comments were therefore offered from the point of view of one familiar only in a general way with the subject.

The author was to be congratulated upon a satisfactory solution of a difficult architectural problem. His success but emphasized the old truth that a pleasing effect could be secured in any structure and with any material if one adhered to the well-established principles of functional design.

Careful engineering planning and supervision were evidenced by the high quality and reasonable cost of the work, both the more notable because the bridge had been built within a not too adequate time limit and under the twin handicaps of a severe northern Saskatchewan winter and the use of unskilled relief labour.

The careful measurement of temperatures at various points in the structure merited commendation. Not only must these be interesting in themselves to all concerned with the design of similar structures, but they served to stress how easy it was to seize the opportunity to amass engineering data of real value. He ventured to guess that these temperature measurements added very little to the cost of the bridge.

If engineers generally would follow the lead of the author, it would shortly be found unnecessary to make so many assumptions as to the fundamentals upon which far too many designs were now perforce based. Because these assumptions had led to safe designs was not in itself any indication that better ones could not be formed. With economy the watch word, as it was today and as it was likely to be for years to come, a critical examination of "standard" assumptions seemed indicated; if these were to be modified, it should be in the light of actual measurements so far as possible.

A. W. Haddow, A.M.E.I.C.[3]

In commenting on the excellent engineering structure which had been produced, Mr. Haddow remarked that he had had the opportunity of visiting this work during construction and the photograph Fig. 2 showed clearly the pleasing appearance of this structure.

The bridge had been built under winter conditions, utilizing relief labour. This sentence conveyed a volume of meaning to the engineers who had had to carry on work under similar conditions.

The information contained in the paper, particularly that dealing with the temperatures of setting concrete and pier rotation and arch deflection, had been very thoroughly taken and recorded.

C. D. Howe, M.E.I.C.[4]

Mr. Howe observed that the author's paper described the most creditable undertaking chargeable to unemployment relief that had come to his attention in western Canada. A needed municipal improvement had been built at a surprisingly low cost. Methods used provided for the maximum employment of labour, while excellent supervision made possible a high standard of efficiency that obtained full value for wages paid.

The results obtained bore out his observation that construction costs were more frequently raised than lowered by the installation of an elaborate construction plant. The tendency among successful contractors in the competitive field was to keep plant expense to a minimum consistent with required speed of progress, and cost results usually justified this procedure.

He had had some experience with pouring concrete under winter conditions in Saskatoon, and believed that more difficult conditions were seldom found anywhere.

The rather extensive system for obtaining temperature readings in the concrete mass as pouring took place had been fully justified as a means of eliminating risk in obtaining concrete of required strength before progress of setting of the concrete could be arrested by extreme cold weather. This system had enabled the author to obtain temperature ranges in the finished structure that would form a valuable addition to the designing data available for future work of this class.

Having in mind the fact that local conditions had made necessary a minimum gradient of four per cent for the roadway, the architectural effect of the design bore out the soundness of the reasoning that led to its adoption. Engineering features had been analyzed in careful detail and by the most advanced methods. The testing laboratory had been used to supply accurate data on which to base engineering analysis.

The author's paper should help to justify a relief programme based on construction of needed public works. It was to be hoped that the necessity for efficient engineering planning and supervision could be brought home to those in responsible charge.

H. A. Lumsden, M.E.I.C.[5]

Mr. Lumsden remarked that the difficulties encountered in the design of the bridge due to the difficult

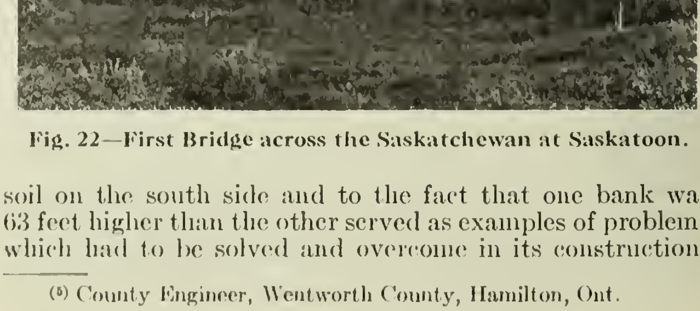

Fig. 22—First Bridge across the Saskatchewan at Saskatoon.

soil on the south side and to the fact that one bank was 63 feet higher than the other served as examples of problems which had to be solved and overcome in its construction.

[1] Paper presented before the Annual General Professional Meeting of The Institute, and published in the January, 1934, issue of The Journal

[2] Professor of Highway and Municipal Engineering, McGill University, Montreal.

[3] City Engineer, Edmonton, Alta.

[4] Managing partner, C. D. Howe and Company, Port Arthur, Ont.

[5] County Engineer, Wentworth County, Hamilton, Ont.

What a boon this work must have been to the city was realized when one heard that $324,000 had been paid out in wages. The cost of $10.20 per cubic yard for the concrete work was most reasonable and the fact that fifteen hundred and ninety-three men had been employed for varying periods during the work should be noted.

He particularly wished to comment on the manner in which the paper had been prepared as it had given an unusual amount of information, without going too much into detail, and proved intensely interesting throughout. As a paper it was a model which could well act as a guide when a record of other large works were being compiled.

As illustrating the contrast between the present time and forty-four years ago he wished to show a few views made from photographs taken by his father, the late H. D. Lumsden, M.E.I.C., who in 1890 was supervising engineer of both the Qu'Appelle Long Lake and Saskatchewan Railway, Regina to Prince Albert and the Calgary and Edmonton Railway. Figure 22 was a view from the north-east of the first bridge across the Saskatchewan at Saskatoon built in 1890 which stood on the site of the present Canadian National Railways bridge. It consisted of a series of timber Howe trusses resting on piers. In the background could be seen the station and beyond a white line which was in reality a pile of buffalo bones some 6 or 7 feet in height. These bones which stand on the site where Saskatoon stands to-day were awaiting shipment by train and he understood were later to have been converted into charcoal and used in the sugar refining industry.

Professor I. F. Morrison[6]

Professor Morrison observed that in the design of a reinforced concrete arch bridge, one must face the selection of a temperature range and the division of that range into two parts by the selection of some mean temperature at which the arch ring was to be closed. A number of records were available of observations on structures exposed to relatively moderate temperatures, but these were not comparable to those which obtained throughout the northern part of this continent. The official records for the mean air temperature were available at many localities and it seemed logical to use for design purposes those records which gave the mean daily temperature at the station. Cold spells lasted usually from three to six days; that shown in Fig. 16, December 6th to 12th, being quite typical. He would suggest that the maximum and minimum design temperatures be selected as a percentage of the mean air temperatures for hot and cold spells at the locality taken over a period of from three to six days. There were, of course, local variations, but it was difficult to take these into account.

The coldest part of the author's records occurred between December 5th and 12th, 1932. The six-day mean for this period was $-16.3$ degrees F. and the corresponding lowest temperature reached at the crown of the arch at a depth of 19 inches had been $-12$ degrees F., which was 74 per cent of the six-day mean. The lowest temperature reached in Edmonton during the last five years had been $-52$ degrees F. with a four-day mean of $-35$ degrees F. In the arch ring, judging from the records of the crown 19 inch thermometer, there appeared to be a lag of from two to two and a half days. In Fig. 16, the influence of the rise in temperature on December 8th and 9th was shown in the curve for crown 19 inch, and had this not occurred, the arch ring temperature would have probably gone to around $-17$ degrees F. This rise of mean air temperature was characteristic, however, of cold spells, and for that reason the basis of a three- to six-day mean air temperature had been suggested above.

[6] Professor of Applied Mechanics, University of Alberta, Edmonton, Alta.

The percentage of the mean air temperature range to be taken in design depended on a number of factors, the chief of which was the thickness of the arch ring. He would suggest, as a general guide, that the percentage could be taken as $\left(\dfrac{100}{1+\dfrac{D}{300}}\right)$ in which $D$ was the thickness in inches of the arch ring at the crown for open spandrel structures and as $\left(\dfrac{80}{1+\dfrac{D}{300}}\right)$ for filled spandrel structures.

The minimum four-day mean for Edmonton was $-35$ degrees F. and the maximum $+76.5$ degrees F., giving a range of 111.5 degrees F. The range used in the design of the Wellington Ravine bridge* had been 110 degrees F. The arch ring was 24 inches thick at the crown, which would give a range of 102 degrees according to the above suggested formula, so that the range used in design was perhaps too high by 8 degrees. However, since this bridge ran east and west, and was exposed on one side to the sun, which had been estimated to give a rise in average arch-ring temperature of roughly 10 degrees F.,† the range would then be 112 degrees F., which was close to the 110 degrees F. actually used.

After the range had been decided upon it remained to divide it into two portions, depending upon the temperature at which the arch ring was to be closed. This matter seemed to the writer of sufficient importance to warrant careful consideration. At this stage in the computations, the dead and live load stresses had been determined. Since the effect of a drop in temperature caused bending moments of such character as to produce a tension stress at the intrados at the crown and at the extrados at the abutment—obviously a rise in temperature would produce the opposite effect—it was an easy matter to select the proportionate amount of fall and rise in temperature which would combine with the dead load stresses—or whatever dead plus percentage of live load stresses seemed advisable—to the best advantage. In this way the mean temperature could be determined and it so turned out in many cases that the larger proportion should be a fall in temperature.

Many specifications called for an equal amount each way.‡ The Wellington Ravine bridge had been designed for a rise of 40 degrees F. and a drop of 70 degrees F. and the mean temperature of closing was 40 degrees F. The author had stated that the temperature range used in the design of the Broadway bridge was 120 degrees F. but did not indicate how this was divided and further on put the extreme range of temperature at Saskatoon as "from 110 to minus 60 degrees F. . . .over a long period." This statement appeared remarkable as it was contrary to what occurred in Edmonton where these extremes were never reached, and where the highest and lowest temperatures were of short duration. Exposure to sun could raise the temperature considerably above the air temperature, but, in so far as an arch ring was concerned, it could at best strike only two faces.

A detailed study of the records for the years 1900 to 1931 showed that the maximum and minimum air temperatures for Edmonton were $+98$ and $-52$ degrees and for Saskatoon $+103$ and $-55$ degrees F. The maximum and minimum four-day means for this period for Edmonton were $+76.5$ and $-35.0$ degrees F. and for Saskatoon $+74.3$ and $-35.4$. These data did not appear to sustain the author's statement quoted above. The night tempera-

* See Canadian Engineer, Nov. 28, 1933, page 9.

† See Handbuch für Eisenbetonbau (Vol. XI, page 143).

‡ For example see Hool, Reinforced Concrete Construction, Vol. III, page 38.

tures were always much lower than the day, which gave a mean value lower than the maximum daily air temperature.

There were several methods of securing the assumed mean temperature of the arch ring, but there was not space for details. Among these methods, the pouring of all but one or two small sections of the arch and closing the ring at the proper temperature, with the use of jacks, in case it was desirable to remove the centring at an earlier date, was perhaps the obvious and most common. Another possibility was the construction of the arch as a three-hinged arch and its conversion into the hingeless type at a later date. This permitted the completion of the bridge without delay and it might be opened to traffic at controlled reduced loads. After shrinkage, and settlement of the abutments, had taken place, the ring could be converted at a definite temperature.

Another matter of importance in connection with the computation of temperature stresses was the selection of a suitable modulus of elasticity. A value of $2 \times 10^6$ pounds per square inch was often used and for a reinforced concrete structure was probably too low for two reasons: (*a*) the modulus of elasticity of concrete as determined from test cylinders, such as described in Bulletin 5, Structural Materials Research Laboratory, Lewis Institute, was too low. This was due to the fact that the gauge points were too close to the ends of the cylinder and that the assumed uniform distribution of stress near the ends of the cylinder was not fulfilled in the test; the effect of which was to give a reduced modulus of elasticity; (*b*) the modulus of elasticity used should be for the combination of steel and concrete and not for concrete alone. Tests on reinforced concrete columns indicated that a modulus of $4 \times 10^6$ pounds per square inch, and possibly greater, should be used.

In this matter, the movement of abutments must also be considered. A decrease in temperature tended to pull the abutment forward and any slight movement would tend to decrease the temperature stresses rapidly. On the other hand, when the temperature rose again, the arch might not be able to effect the same displacement of the abutment back to its original position; as in the case of a railroad bridge with a fill at each end which became compacted while the abutments were pulled forward. Such action was equivalent to a change downward in the mean temperature of closing of the arch ring. It was impossible to discuss all possibilities but there was likely to be some movement of the abutments and the effect of this was always to decrease the stresses which tended to cause it. Since it was usually impossible to estimate such movement it must of necessity be left out of account but might be looked upon in a general sense as a justification for the use of a lower modulus of elasticity which might well be chosen to suit different foundation conditions.

The use of hinged rockers was not common on this continent though extensively used in Europe. He could not agree with the detail as shown in the paper, Fig. 8. In his opinion the rods should not extend through from the rocker to the beam or to the abutment. The expansion of the 45-foot floating span amounted to .447 inches based on computations depending on the data for expansion given on page 14. This would cause a rotation of the rocker of 1 degree —04′ and further computation showed that this would stress the one-inch steel bars far beyond the yield point of mild steel. The consequent effect would be strain hardening of the steel and after several movements back and forth fracture would likely occur. There was always the tendency on the part of a designer to anchor down such joints but all that was necessary was to prevent slipping. Numerous details for such rockers would be found in Gehler's Balkenbrücken.

Professor Morrison further stated that he had used hinges of this type in the design of the three-hinged arch in the 109th Street subway at Edmonton. There, however, the angular movement was small and no difficulty had been experienced, although a slight rise and fall of the crown from summer to winter had been observed.

C. M. Morssen, m.e.i.c.[7]

Mr. Morssen stated that the natural and other difficulties which this undertaking had to overcome were of great interest. The bridge was a relief job, and there had been only one month available between the time the bridge had been authorized and the letting of the contract in December 1931. In addition the contractor had been allowed the choice of only one foreman, one superintendent and the accountant, all other labour had been taken from relief organizations and each labourer had been limited to earnings of $25.00 in one month.

The undertaking constituted a further proof that important engineering structures in reinforced concrete might be carried to a successful end in any place with local unskilled labour.

Over 9,000 cubic yards of concrete had been poured under sub-freezing conditions with perfect results. He had always been of the opinion, that when reasonable precautions were taken, very good concrete might be made in winter and its quality might in certain cases be superior to concrete made during the hot summer season. The heated materials and the heat generated during the process of the setting, maintained the inner temperature of the concrete above the outside, and as heat accelerated setting, the concrete would start to set from the inside to the outside, which was an advantage.

When concrete was setting it was eliminating certain impurities of the cement which accumulated on the surface as a buttery non-resistant substance known as laitance which had to be carefully removed. He had always noticed that in winter the amount of laitance so eliminated was far greater than in summer and it would be interesting to know, if during the pouring of the concrete in Saskatoon, laitance had to be taken care of and how it had been done.

According to the quantities given in the paper there were about 12,000 cubic yards of concrete above the springing lines of the arches and about 1,000 tons of steel had been used for reinforcing. Assuming that most of the steel had been used above the springing line, there would be about 96 per cent of concrete and 4 per cent of steel reinforcing. Similar proportions were generally maintained in all reinforced concrete structures and it was a good policy to supervise carefully the making and the placing of the concrete as the most important part of the whole structure.

Mr. Morssen had often noticed the contrary. The reinforcing steel was carefully bent and the spacing was checked to within 1/16 of an inch and special spacing bars and chairs had been used to keep the steel in place but the making and placing of the concrete had been left to the foreman and his gang.

Certainly the engineering organization on the Broadway bridge should be favourably commented upon for the adequate measures which had been taken to supervise the concrete. One practical technician with three assistants, all engineers of experience, had analysed the pit run of materials from hour to hour and the consistency had been regularly checked by the slump test. Testing cylinders had been made from the buggies every two hours and the quality of concrete had been well maintained above that specified. The average compressive strength of the test cylinders had been 2,460 pounds against the specified one of 2,250 pounds per square inch.

[7] 353 St. Nicholas Street, Montreal.

The arrangements made to measure the interior temperatures of the concrete and keep records must be commented upon. This had been done not only during construction but for a long period after. The conclusions arrived at and described were both surprising and interesting.

It was well known that the internal stresses developed in structures through temperature and humidity changes were very important and already several different devices had been used by prominent engineers to measure these.

When in Europe last year he had the opportunity of seeing instruments which were imbedded in the concrete and were used to measure over long periods the interior temperature and stresses which developed inside the concrete.

The most interesting had been the sound extensometer invented by Mr. André Coyne, chief engineer of bridges and roads in Paris and now in charge of the construction of an important circular dam at La Haute Dordogne, France, and already successfully used on several important dams and other structures.

This sound extensometer was based on the following principles:

If, between two points of a structure, a light sonorous cord was stretched, any variation in lengths between the two points of attachment would vary the vibrating frequency of the cord and change its sound which could be listened to and used for measurements.

The Coyne extensometer was manufactured by the Etablissements Henry-Lepaute, Paris, France, and was made as follows:

A light steel cord was stretched in a water tight metal tube provided with two bands whose distance represented the basis of measurements, generally 8 inches. The tube itself was elastic and was covered with a tarred jute in such a manner as to solely protect the cord without introducing any parasitic strain. An electric magnet placed in the tube at about the middle of the cord served to produce its vibration. The excitation of the magnet was produced by means of a condenser discharge. Listening was made possible by means of a lamp amplifier and loud speaker. (See Fig. 23.)

A number of such extensometers might be imbedded in different places of a structure and then connected to a central listening station for measurements and recording.

The same apparatus could also be utilized for measuring the temperature of the interior of the structure by measuring the electrical resistance of the listening coil.

By the use of his extensometer Mr. Coyne in collaboration with Mr. Pfaff, engineer of Public Works of the French government, had already made interesting measurements on concrete dams and the results had been presented by him at the International Convention on dams held in Stockholm in 1933.

The introduction of the sound extensometer might even lead to the construction of one which, once imbedded in the concrete, would sound an alarm when the interior stresses reached a dangerous limit. That could be accomplished by a synchronized motor and electric clock which would excite the electro magnet at certain regular intervals and the sound of the cord so produced might then, when its pitch reached a certain limit, sound an alarm. Such extensometers should be useful for large dams and retaining walls.

The measuring over long periods of interior stresses of a structure due to temperature and humidity changes was still in its infancy, but as the knowledge of these stresses were of interest to the engineer it was being studied. The dispositions which had been adopted for the measuring of temperatures in the Broadway bridge were an excellent start in that direction in Canada.

E. M. Proctor, M.E.I.C.[8]

Mr. Proctor observed that in general, papers which described the construction of bridges dealt with the problems met in construction and erection, together with the design. This paper went further and gave to the bridge engineer not only the ideas of the designer and the constructor, but observations made on the bridge after its construction.

The designer had handled the problem, which was not an easy one, in a very pleasing manner. The arrangement of the different length arches with their varying rises to fit the 4 per cent grade was one that entailed a considerable amount of additional work, but the aim of the designer had been attained and a beautiful structure completed.

In his opinion the portion of the paper which dealt with the movement of the bridge and with temperature data collected was the most interesting. In an exposed situation, the extreme variations of temperature and consequent movements in the spans, particularly in a reinforced concrete structure of this nature, were very important and the data would be of material assistance to other designers.

[8] President, James, Proctor and Redfern, Ltd., Toronto, Ont.

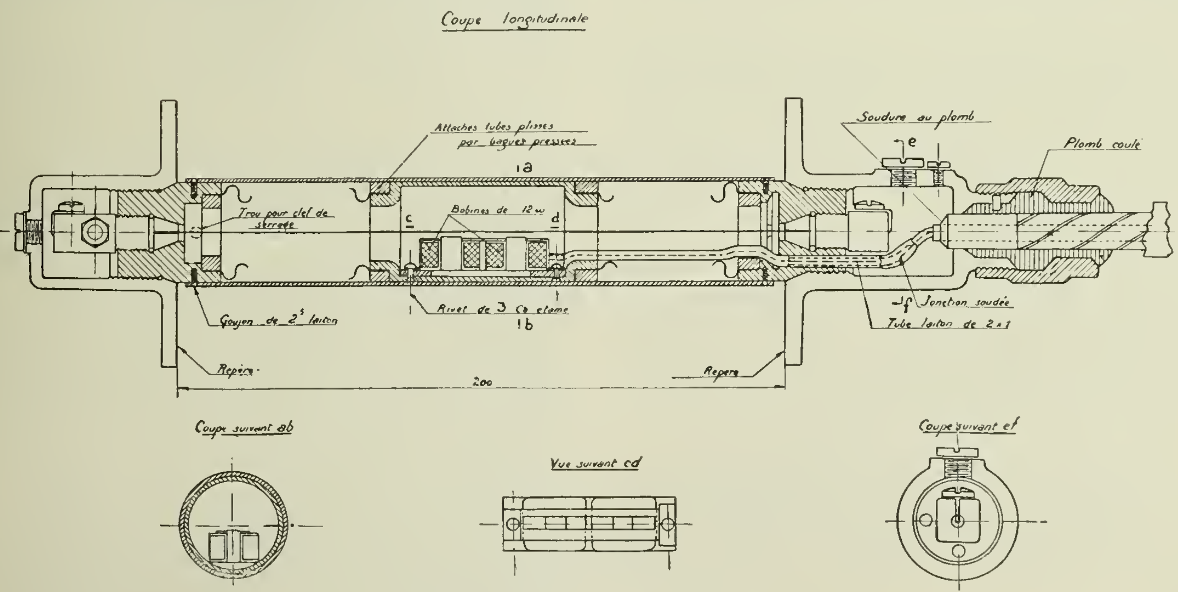

**Fig. 23—Sound Extensometer.**
By courtesy of L'Expérience et la Détermination des Contraintes.

If work of this kind could be carried out successfully, there seemed to be no limit to the construction of reinforced concrete structures even in the severest climates. In the province of Ontario there were still some engineering staffs who prohibited reinforced concrete construction during the winter, their idea being that the work was too hazardous to undertake. Surely with this outstanding example such arguments were conclusively answered.

The only criticism he wished to offer, and this was not one of the designing engineer, was in reference to the live loads used. In his opinion, four lines of 20-ton trucks, or two lines of 50-ton street cars with two lines of trucks together with impact, seemed altogether too high a loading, and one that would rarely, if ever, be encountered. In Ontario the operation of 10-ton trucks on highways was prohibited by law, and with this fact in mind, it seemed unreasonable that bridges had to be designed to take loads of such a severe character. If such a condition of loading ever did develop, it was hard to figure that four lines of 20-ton trucks would be moving across the bridge with sufficient speed to create any impact. It would, therefore, seem that if 20-ton truck loading were used in the design, that at least the impact requirements might be eliminated. However, these were the specifications that were set for the bridge designer and he must follow them. Of course the question of local members that derived their size from one vehicle was another problem.

The designer had to some extent allowed for the severity of the loading specifications by using high stresses in steel and concrete, which he believed quite permissible.

The solution of the problem of the approaches where the ground was of a precarious nature and difficulty had been encountered due to high banks sliding had been well thought out and was quite satisfactory. This was a point in bridge engineering which had not always been properly taken care of, and there were numerous examples throughout the country of sliding banks destroying an otherwise satisfactory structure.

He thought that a more pleasing effect could be obtained, from the viewpoint of the traveller over a bridge, by adopting an open type of handrail so that the scenes up and down the river could be enjoyed. This generally meant the adoption of a combination ornamental steel and concrete handrail similar to that used on the Hamilton high level bridge. More people saw a bridge from the deck than from any other angle, and it was as important to please from this viewpoint as from a side view.

E. Viens, M.E.I.C.[9]

Mr. Viens remarked that considering the short time allowed for construction, the time of the year, the severe weather, and other difficulties encountered, it had to be admitted that those in charge not only showed great engineering skill but much ingenuity, and were to be complimented, particularly as to the manner in which the concrete had been handled.

The phase of the paper which he wished to discuss was in connection with the waterproofing of 6,795 square yards of concrete at a cost of $8,154. This was a subject to which he had given considerable thought both in laboratory investigation, in the field, and also in committee work. There were two methods in common use, namely,—

(a) By use of integral compounds.
(b) By surface waterproofing.

The latter (b) might be done in different ways; by the membrane method, by the application of cement mortar renderings, by the application of various bituminous paints and proprietary applications. He would confine his remarks to three of the above, namely integral compounds, cement mortar renderings, and the membrane method.

*Integral Compounds*—The Standard Specification for Concrete and Reinforced Concrete of the Canadian Engineering Standards Association, clause 47, read—"No integral compound can be recommended." As one of the committee of the above specification, he had opposed the use of integral compounds and his opposition had been based on many tests of various compounds. But granted that such compounds had some beneficial effects, which, to his knowledge, they had not, they would not overcome the troubles encountered on the average construction. Generally the leaks were at construction joints, fill-planes, or at points where segregation had taken place. No integral compound would overcome bad construction methods, and, if water passed through the concrete at other points than through construction joints, fill-planes, or where bad segregation had taken place, it was generally because too little cement had been used. Cement would render concrete waterproof at less cost than integral compounds, and, at the same time, would give added strength and durability.

As an illustration of this when the Confederation building at Ottawa had been built, the specification called for a mixture based on definite proportions of 1:2½:5 for the walls of the foundation, but had also called for an integral waterproof compound. The contractor had been asked to submit a sample of the waterproofing compound to be used, and, at his suggestion, to state the cost per pound. By actual test with the aggregates to be used, it had been determined that one and one-third sacks of cement could be used per cubic yard of concrete for the cost of the waterproofing compound. It had then been agreed between the contractor and the Department that the waterproofing compound would be left out and that the contractor would use cement for its value. A 3,000-pound concrete had been secured and the foundation had been built in sections, each section being completed in one operation to avoid any leaky fill-planes, and no sign of moisture had ever appeared through that concrete in spite of the fact that the trenches around the walls of the building, before being filled, on one occasion had been full of water for a period of two weeks. One could go on multiplying instances of 100 per cent waterproof concrete.

*Application of Cement Renderings*—In 1920, the laboratory of the Department of Public Works had developed a method of waterproofing concrete foundations from the inside of the building. The method was as follows: First, the concrete was brushed clean of any loose material, then the surface was wetted either with a hose or a brush to near saturation. Dry neat cement was then dashed on the wet concrete and immediately after the cement had turned dark in colour, owing to the moisture from the wall penetrating it, a cement mortar was pressed into the neat cement paste sticking to the wall, thus making a perfect bond between the old concrete and the mortar by giving every grain of sand of the mortar a chance to embed itself in the neat cement film or paste adhering to the wall. This method had been used in numerous government buildings with satisfaction, and had also been applied to the pump chamber of the Esquimalt dry dock, a chamber which was under water during certain operations, and had shown no leaks or signs of moisture since it had been made waterproof in this manner.

*Membrane Method*—This was the method that had been used on the Broadway bridge, Saskatoon, to waterproof 6,795 square yards.

The standard Specification for Concrete and Reinforced Concrete of the Canadian Engineering Standards Association, clause 48, read—"Where added protection is desired for basements, pits, etc., membrane waterproofing *may* be

[9] Director, Testing Laboratories, Department of Public Works, Ottawa, Ont.

used." Much discussion had taken place in committee about the value of this method of waterproofing, and, of the two methods given in the C.E.S.A. specification, he believed that the membrane method was the better of the two, but he wondered if it was as satisfactory as it would have been to make in the first place a water-tight concrete, which, to his mind, could be made. No-one had ever seen a concrete structure which leaked through its entire area. As a rule it was only a patch here and there that gave trouble. The leaky spots or patches were due to construction defects or to defective concrete. Were not concrete waterproof in itself, then the entire surface would leak, and if the greater part of the concrete was waterproof, why not the whole? The cost of membraning would go a long way towards overcoming these defects in concrete structures. Much more cement could be used per cubic yard and part of the cost of membraning could be applied to better methods of the application of concrete.

Construction joints could generally be made waterproof either with strips of copper sheeting or some other mode. Fill-plane joints could generally be avoided if a whole section of concrete was carried right up to the top in one operation, but should the operation have to be stopped before a section was completed a waterproof joint could be made as described in the C.E.S.A. specification, clause 44.

Segregation of the materials of concrete which was often the cause of leaky concrete could easily be prevented by the use of properly designed concrete and proper methods of placing it.

Some of the difficulties of membrane waterproofing were: proper adhesion of the membrane to the concrete; the application of the membrane on damp or wet concrete, which, at certain times of the year, was very inconvenient, and its application in cold weather. Some had also questioned the permanency of such membrane. Some of the dangers of membrane waterproofing were: that it might be punctured when other materials were applied against it, or that it might be caused to break by the movement of materials placed upon it, and if the adhesion of the membrane to the material to which it was applied was not what it should be, water would find its way between the membrane and that material and would cause trouble somewhere.

Membrane waterproofing might have to be resorted to in certain cases and especially in repair works, but his plea in this discussion was that concrete in itself, properly designed and of a given strength, say 3,000 pounds or over, when properly laid and matured, was water-tight, and that in such cases there was no need to resort to any other way of waterproofing.

C. J. Mackenzie, M.E.I.C.[10]

The author observed that he was pleased with the interest and discussion which his paper had evoked and appreciated the favourable comments and the valuable criticism offered.

Professor I. F. Morrison had raised some interesting points in connection with design theories and the interpretation of temperature data. In calculating stresses in arch rings it was assumed that there would be a temperature rise of 30 degrees F. above and a fall of 90 degrees F. below the normal air temperature of 68 degrees. Allowances were also made for the effect of deck articulation on temperature stresses. These assumptions were undoubtedly on the safe side and in the light of recent studies and observations the author would modify them for future designs, as he did not feel the same confidence as Professor Morrison seemed to in the reliability of the general elastic theory as applied to shrinkage and temperature stresses in reinforced concrete arches. Realizing that the matter was controversial, he rather inclined to the view of Whitney,*

(*a*) that plastic flow of concrete eliminated to a large degree initial bending stresses;

(*b*) that, due to plastic flow, high setting temperatures had little effect on concrete stresses and that temperature stresses in such cases could be safely computed for an equal rise and fall equal to one-half the maximum range regardless of the temperature during construction. As a consequence he felt that the centre of the arch rib should follow the dead load pressure line as nearly as possible; it was also felt that the use of jacks, temporary hinges and such devices had no value commensurate with their expense, except in particularly long or flat arches, or where the piers were liable to excessive horizontal movement.

In discussing temperature data Professor Morrison had submitted two interesting formulae for use in determining arch temperature ranges from air temperatures. The criticism the author would make of these formulae was that no account was taken of the very real effect of the transmission of heat from the piers. As stated in the original paper, the thickness of a member was by no means the only important factor. During 1932 temperature tests were made on the 40-inch crown of one of the 150-foot arches on the 25th Street bridge, Saskatoon, and concurrent tests were also made on a block of concrete 36 inches by 36 inches supported on a wooden frame above the ground and thus practically isolated thermally. The coldest period of that winter lasted from January 24th to February 2nd and the average five-day temperature was approximately −20 degrees F.; the temperatures in both block and arch ring reached their minima on February 2nd. The following table showed the variations in temperature for the last twenty-four hours of the cold spell.

| Time | | Outside Temp. | 40″ Arch Ring 3″ depth | 40″ Arch Ring 20″ depth | Isolated 36″ Block 3″ depth | Isolated 36″ Block 9″ depth | Isolated 36″ Block 18″ depth |
|---|---|---|---|---|---|---|---|
| February 1 | 20 p.m. | −25 | −12 | −8 | −16 | −13 | −11 |
| February 2 | 2 a.m. | −35 | | | −26 | −24 | −24 |
| | 9 a.m. | −21 | −18 | −10 | −28 | −29 | −26 |
| | 11.30 a.m. | −20 | −13 | −9 | −25 | −28 | −27 |
| | 14.30 p.m. | −9 | −10 | −6 | −13 | −16 | −21 |
| | 20.00 p.m. | −8 | −8 | −4 | −11 | −13 | −15 |
| | Midnight | −5 | −7 | −5 | −8 | −10 | −12 |

It would be seen that the centre temperature of the isolated blocks became lower than the five-day mean and was actually only two degrees higher than the mean of the coldest day of the five. If these tests could be taken as indications it seemed to the author that the temperature of an isolated block of 36 inches would have a yearly variation approximately equal to the difference between the means of the days of extreme temperatures, and if the block was subjected to the direct rays of the sun the block temperature range would probably exceed that of the air means. It was for the above reason that he had given a probable maximum range for isolated blocks. It was also evident from the above table and also from data in the original paper, that for arch crowns of approximately the same size which were in contact with river piers, the yearly range would be from 20 to 25 degrees less than the range of daily air means and it was felt that a general formula which did not take into consideration the height and length of span and the thermal environment of pier must be open to question.

With regard to the rocker design as shown in Fig. 8 of the paper, the economy and desirability of anchorage in the stringer and base appealed strongly to the author. To calculate the actual stresses in the reinforcement due to bending, assumptions which were uncertain must be

[10] Dean of Engineering, University of Saskatchewan, Saskatoon, Sask.

* See Journal American Concrete Institute, March 1932, page 515.

made as to radius of curvature. When it was considered that these bars would have very heavy direct compression stresses and that excess stresses would probably be compression in nature and that in addition a complete alternation only occurred once a year, it was difficult to feel that the possibilities of fatigue failure were alarming. Again if failure of steel did occur it seemed to the author that the situation would be little worse than if the bars had never been so anchored. The rockers could be easily inspected and it would be interesting to observe their action over the years.

In answer to Mr. Morssen, no trouble was experienced with laitance; during the winter the piers only were poured and as the pouring was done continuously night and day and a very dry mix used, little if any excess liquid gathered on the surface. The author was very interested in Mr. Morssen's description of apparatus used in Europe for making readings of expansion and temperature and agreed with him that such valuable work was only in its infancy in Canada and that the infant would well repay nourishment and attention.

Mr. Proctor very properly questioned the possibility of a bridge of this nature ever having to carry a load of two continuous lines of 50-ton street cars flanked by two lines of 20-ton trucks. On the floor system over arch spans, due to panel spacing, one vehicle in each lane only was used and over the girder spans two vehicles following each other. The arch rings were designed for a uniform load without impact allowance, which was less than the average weight of trucks and cars. The author felt that for arches the maximum possible loading would probably be due, not to vehicles but to people: a situation which might occur at "openings" or other ceremonials. The heaviest load which this bridge had had to carry to date was on August 1933 when the Traveller's Parade was held in connection with the Saskatoon Exhibition. On the high end of the bridge ten fairly full street cars were parked end to end, and on the shortest span during a stoppage in traffic flow, observers estimated that there was a load, made up of vehicles and people, of about 45 pounds per square foot. In Saskatoon there are at present several trucks with a gross weight of about 15 tons.

With Mr. Vien's comments on waterproofing, the author found himself in substantial agreement, and realized that well made concrete was practically water-tight. However it was well known that laboratory uniformity could not be obtained on a large job and it was found that, particularly on the road slab where there was heavy reinforcement, even with constant supervision of mixing and tamping, patches did occur that were not water-tight. As many cases were known where seepage through the street railway trackways on bridges had caused serious trouble, it was thought wise to add waterproofing as an extra precaution. For the same reason the retaining wall on the north approach was protected with membrane waterproofing. A park surrounded this portion and while copper strips were used at expansion joints and precautions taken to obtain a waterproof concrete, nevertheless it was felt that any seepage would be aesthetically objectionable and the cost of extra protection seemed warranted.

## THE LAKE ST. LOUIS BRIDGE

*Authors: C. F. Draper, J. A. Lalonde, A.M.E.I.C., and W. Chase Thomson, M.E.I.C.*[1]

## DISCUSSION

H. B. Stuart, A.M.E.I.C.[2]

Mr. Stuart observed that it was refreshing to learn of an engineer who applied geodetic refinements to measurements required for construction purposes. The ratio of precision obtained by so doing and the comparative ease of giving sights by the use of the targets so ingeniously set beforehand must have contributed materially to the smooth, speedy and efficient prosecution of the work.

Mr. Draper had not stated the type of theodolite used, but it would appear that readings had been taken on both sides of but one vernier and that each angle had been repeated twice in both the forward and reversed positions of the telescope. Assuming the usual type of instrument with opposite verniers on the horizontal circle he preferred to read both verniers in order to reduce possible errors of centring of the circle, of opposition of the verniers and of graduation. It must be admitted, however, that with the method used by the author, there had been no necessity for the observer to move from his position at the eye end of the telescope which was a distinct advantage when set-up on unstable ground or in a cramped position. Again he liked to repeat all angles whose values lie between 0 degrees and 30 degrees at least twice as often as those whose values lie between 30 degrees and 45 degrees, because, by so doing, one had a more precise value of those angles whose sines changed most rapidly.

He could not but envy the author his peace and comfort of mind upon having obtained a closed figure adjusted to a ratio of precision of less than one in one hundred and fifty thousand.

During the levelling operations were the rod graduations checked against a calibrated steel tape?

C. F. Draper[3]

In reply to Mr. Stuart, the author stated that the angles for the triangulation were mostly read with a Wild instrument and later a Zeiss theodolite No. 2 was used for checking the survey and for the setting out work. In both these modern instruments the necessity of reading the verniers at the two horizontal circle reading points was obviated by the angle scales being optically superimposed one over the other, and the microscopic vernier which could be read without the observer changing his position, giving directly the reading of the mean of these two readings, a great advance in accuracy, convenience and speed.

With such an instrument in the hands of a careful observer, with a base line carefully measured, there was no reason why the results obtained should not readily be repeated.

There was really no necessity to check the levelling rod graduations directly with steel tapes inasmuch as all the levelling was done with the rod, and the finer work necessary in the levelling of the bridge seats was done from the nearest complete pier.

Where the south viaduct connects with the steel superstructure, the difference in elevation of the concrete deck of the viaduct and of the bridge seat of pier 14 was checked by steel tape. This was, of course, an indirect check between the rod and tape measurements.

Should there have been any minute differences in elevation as between the approaches and the river crossing, they would have been taken care of by the concrete slab and asphalt wearing surface.

The author knew of no worthier object for the application of methods of precision than in the case of a large bridge. Such a structure, moreover, should be an incentive

to the younger engineers to practise exactitude throughout the work in all the measurements that were significant.

He thought it would be admitted by those of experience that the slight additional trouble and even if it should be so, expense, would be more than compensated for by the satisfactory nature of the results.

He had always been of the opinion that the precise methods used in the bridge shops should be matched in the field.

Major A. R. Ketterson, A.M.E.I.C.[4]

Major Ketterson referred to the preliminary investigation described by Mr. Lalonde, and observed that the author had stated that test borings were made along a line from 200 to 300 feet upstream and downstream from the site finally selected in order to determine the best location for the bridge, and that the elevation of the base of the various piers was obtained by interpolation between these borings.

Since the river bottom and the rock line at the C.P.R. bridge, which was about 1,500 feet upstream, was at a much higher elevation than at the site selected, it was presumed that the reason for placing the highway bridge in a location where the water was so much deeper and where there was so much over-burden between river bed and rock line had been primarily controlled by the location for the approaches to the bridge.

The type of construction trestle which had been developed by Mr. Englander—the resident engineer in charge of the river work— was very ingenious. Its use must have proved of great advantage, not only in expediting the work, but in the economy of its construction and in maintenance throughout the progress of the contract.

Major Ketterson stated that one of the features which occurred to him in connection with these piers was the narrow caissons and the very small step between the side of the caisson and the pier shaft. The size of this step allowed very little leeway for caissons which had to be sunk through the depth of overlying material, which existed at the majority of the piers, and provided very little allowance for a slight drift, either longitudinally or laterally. This fact called for great care in landing the caisson in the first place and also keeping it in a proper position during sinking. While the precautions taken by providing such efficient and stable deflectors to secure still water facilitated the work of landing the caisson in its proper position on the river bed, the actual sinking, owing to the narrow width, called for unusual care throughout the whole process, and it reflected great credit on the contractor's organization that so many piers had been sunk through a considerable depth of overburden to rock without their getting out of line to any appreciable extent.

In connection with pier No. 10, the author had stated that the size of the caisson originally intended for this pier was 14 feet wide by 60 feet long. However, when it was discovered that the rock was 18 feet lower than expected, thus making the height of the pier from the rock 90 feet instead of 72 feet, it was decided to increase the size of the caisson to 18 feet by 72 feet for a height of 46 feet above the cutting edge. This appeared to be a most advisable change, especially the widening from 14 feet to 18 feet.

Instead of simply placing steel protection strips on the nose and shoulder of the cutwaters, it would have been advisable, in his opinion, to completely iron-clad the upstream cutwater to a height above high water level. By making the steel protection continuous around the nose and shoulder the hazard of having the protection torn off by ice was very much diminished.

B. O. Boissonnault, S.E.I.C.[5]

Mr. Boissonnault remarked that he would like to secure the opinion of others as to the efficiency of grouting according to methods now generally used. In his opinion the pipes usually become clogged during the concreting operations which renders them useless for grouting.

R. E. Chadwick, M.E.I.C.[6]

Mr. Chadwick observed that to attain the object in view the number of pipes available were more than sufficient and the objection was more theoretical than practical. He also stated that in his opinion the proper way to concrete was to drop the concrete down through the air lock, thereby creating impact forces which would most effectively puddle the concrete and pack the working chamber. He had had no experience at any time with the settlement of piers due to pockets having been left in the ceiling of the working chamber.

C. F. Draper

Mr. Draper stated that in any analysis of this question, consideration must be given to the strength of the pier at the plane of the roof of the working chamber.

The concrete in the area outside the roof, which was considerable, was placed in the open air without any interference. Having in view the above as well as the large preponderance of strength in the pier at this plane compared with its bearing capacity at the foundation, it was difficult to see how a pier could fail with a pocket covering even the entire roof.

It was undoubtedly a satisfaction to know that the voids in a pier where they were not intended were reduced to a minimum. He would, however, support Mr. Chadwick's contention for a continuous pour through the shafts instead of stopping below the roof of the working chamber as was sometimes done.

By the latter method a further laitance plane was added for a doubtful certainty of a better seal at the roof.

He would like to see the roof pitched slightly or otherwise modified from the usual horizontal plane, to more surely remove air pockets, also the form of the walls designed to give a more positive bearing and better bond with the concrete mass in the working chamber.

J. A. Lalonde, A.M.E.I.C.[7]

The author, in reply to Mr. Boissonnault, pointed out that if the pipes were plugged during concreting operations, it clearly showed that the concrete had not only filled the working chamber completely, but had also started to fill the pipes.

The large number of pipes used, 9 to 13, of various sizes, and distributed equally over the area of the roof, offered a large factor of safety so that no pockets of air were left on the roof of the working chamber, and grouting was done as an extra factor of safety.

He further stated that the danger point was around the cutting edge and if special precautions were taken to place and pack the concrete in that area, the ceiling of the working chamber should give no trouble.

Brig.-General C. H. Mitchell, C.B., C.M.G., M.E.I.C.[8]

General Mitchell enquired if any trouble had ever been encountered in sinking the caisson past large boulders.

J. A. Lalonde, A.M.E.I.C.

The author stated that some trouble had been encountered with boulders but nothing which would really interfere with the work.

In some cases where boulders were met on the surface, it was necessary to prepare the bottom by building up with sand bags rather than attempt to remove the high spots.

(6) President, The Foundation Company of Canada, Limited, Montreal.

(7) Chief engineer, A. Janin and Company Limited, Montreal.

(8) Dean of the Faculty of Applied Science, University of Toronto, Toronto, Ont.

S. Blumenthal, A.M.E.I.C.[9]

Mr. Blumenthal enquired if the Canadian Pacific Railway bridge afforded the new bridge any considerable protection from field ice, and whether this had been taken into account when designing the new bridge.

C. F. Draper.

Mr. Draper observed that the question of ice pressure was a very interesting one, or should be, to bridge engineers in Canada, and he had made general observations on this subject for some years and particularly during the last fourteen months. In the case under discussion, the Canadian Pacific Railway bridge did act as a bulwark to the new bridge against field ice and the ice field was now solid to a point about 1,000 feet from the north shore, that is, it covered the area of low velocity.

R. E. Chadwick, M.E.I.C.

Mr. Chadwick remarked that he had had considerable experience with bridge piers that had failed due to ice pressure, and this was usually preceded by scouring; but he had never seen a failure when piers were sunk below the surface of and keyed into the rock.

P. B. Motley, M.E.I.C.[10]

The chairman, after remarking on the interesting subject matter of the paper and the method of presentation, observed that the bases of failure always showed that no provision had been made for shear or sliding.

D. C. Tennant, M.E.I.C.[11]

Referring to the paper by Mr. Chase Thomson, Mr. Tennant stated that his first impression of the artist's drawing of this bridge had been from an aesthetic point of view and it was easily the most satisfying of all the St. Lawrence river bridges. This had been a move in the right direction and had been emphasized by the author. In order to accomplish this and at the same time avoid difficulty and expense in the erection of the steelwork it was necessary to introduce splayed trusses both at the main arch

Fig. 15—Welded Pier Members.

and at span 3 where the future lift span was contemplated. This splaying had introduced differences in various members in the trusses, bracing and floor system which would otherwise have been duplicates and this had entailed some additional expense, but the situation had been very skilfully treated so that aesthetic considerations were preserved and the average observer would not find anything to mar the beauty of the structure. However, it would seem that the smoothness of the profile in the side view might have been further enhanced by the introduction of adequate vertical curves in the roadway grade at each end where the horizontal grade on the main central portion of the bridge met the incline on the concrete approaches.

The substitution of one special truss span instead of the two originally intended at the north end had been a specially happy solution and well executed, moreover a saving had apparently been effected by this change though

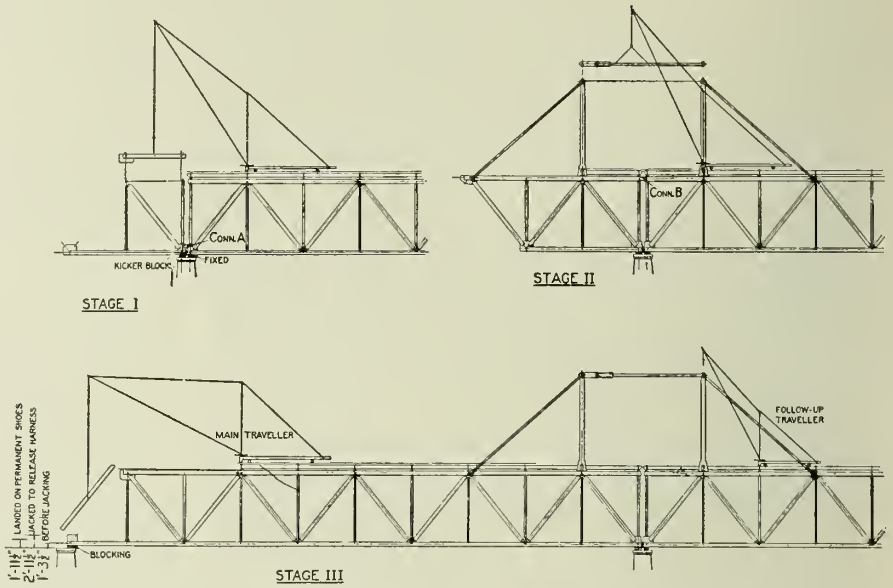

Fig. 16—Typical Erection Procedure.

the amount was not indicated. It would be interesting also to know in what respects the specifications of the province of Quebec and the Canadian Engineering Standards Association had been modified for this bridge. Details of these modifications might serve as a guide on similar structures in future.

From the paper by Mr. Draper it might be assumed that cycloidal pintles were used in the roller nests in the pier members on the regular spans, but this seemed to be the only reference in any of the papers to the pier members. Further, the papers did not include drawings showing stresses or loads or the make up of the more important members. However, it would be interesting to note in what respects the main sections had been modified to ensure all material being obtainable from Canadian rolling mills.

On the Kane trusses that reinforced the concrete approach spans all joints had been welded and it would be of interest to record the practice, procedure, and results in the welded connections which had been used in the pier members, handrailing and perhaps other details on the main steel spans themselves. The purpose of the erection traveller and cantilever erection harness for the main spans had been clearly explained. Welded connections had been used in a most ingenious manner in the construction of the traveller itself, resulting in a considerable saving in weight which had been important on this bridge where the live load was small and the duplication considerable.

Mr. Thomson had stated that a further paper might be expected dealing with the design and construction of the main arch and its flanking spans and in his opinion this should prove a valuable record. It was hoped that some account might also be made available outlining the preliminary steps in the Lake St. Louis bridge project, such as the considerations governing its location, choice of materials, cost, and proposed tolls; also the contribution it was expected to make towards the solution of the traffic problem on Montreal island and the alterations or additions

[9] Assistant engineer, Bridge Department, Canadian Pacific Railway Company, Montreal.

[10] Engineer of bridges, Canadian Pacific Railway Company, Montreal.

[11] Designing engineer, Dominion Bridge Company, Montreal.

to existing approach arteries that might be necessary to ensure the best results. These were considerations that were of the utmost interest to all engineers.

W. Chase Thomson, M.E.I.C.[12]

The author in reply to Mr. Tennant observed that the brief references to many important features were due to the limited time given for the preparation of the paper; also to the necessity of making it as short as practicable.

Although not shown on the general plans of the bridge, vertical curvature of the profile, at points of change in grade, had been provided for in the detail drawings, and the concrete structures had been built accordingly. The floor on the steel superstructure was level throughout.

The net saving due to the elimination of pier 2 and the substitution of a single span to replace the two shorter spans had been small, but the exact amount was not yet available.

The specifications of the Department of Public Works for the Province of Quebec included the Canadian Engineering Standard Association Standard Specification for Steel Highway Bridges. The only departures from these specifications had been the adoption of two motor-trucks abreast on the roadway, instead of three; and a change in the height of the hand-railing from 4 feet to 3 feet 9 inches to align with the parapet railings on the concrete portions of the bridge.

The pier members were generally of flat-slab construction and were provided with disc bearings. For spans 2 and 4, the bearings on piers 3 and 4 were fixed and had been designed to carry the heavy concentrations of the future lift span. With their integral discs the bottom slabs for these members were about 9½ inches thick and about 54 inches square. Rolled-steel slabs of such dimensions could not be obtained in Canada; in consequence, cast-steel slabs had been used in their place. These castings were of excellent quality, and might be depended upon to perform their function satisfactorily.

For expansion bearings, the rollers were 6¼ inches in diameter. They were effectually restrained from skewing by substantial pintles, secured to the upper and lower bearing plates and engaging with slots at the extreme ends of one roller in each set.

The fixed bearings had the same total height as the expansion bearings to permit the construction of bridge seats at a uniform elevation.

The bottom members of these bearings were of cellular construction, and all joints had been made with continuous welding on both sides. The machine finishing of these bearings had been done after welding.

The large bearings at piers 12 and 13 for the continuous tied arch were similar to those for the other spans, but of much heavier construction. Instead of disc bearings for these members, pin bearings had been provided, to permit of the necessary rotation during erection. At pier 13, the expansion rollers were 8 inches in diameter, and two rollers in a set were provided with pintle guides.

O. O. Lefebvre, D.Sc., M.E.I.C.[13]

Dr. Lefebvre remarked that the conditions met with in constructing the bridge were as expected except in one pier and this had expedited the work considerably.

The difference between the cost of work as estimated and the final estimates was expected to be very little. In the case of the river work there was an increase which amounted to about $55,000 or $60,000.

[12] Lake St. Louis Bridge Corporation, Montreal.

[13] Chief engineer, Quebec Streams Commission, Montreal.

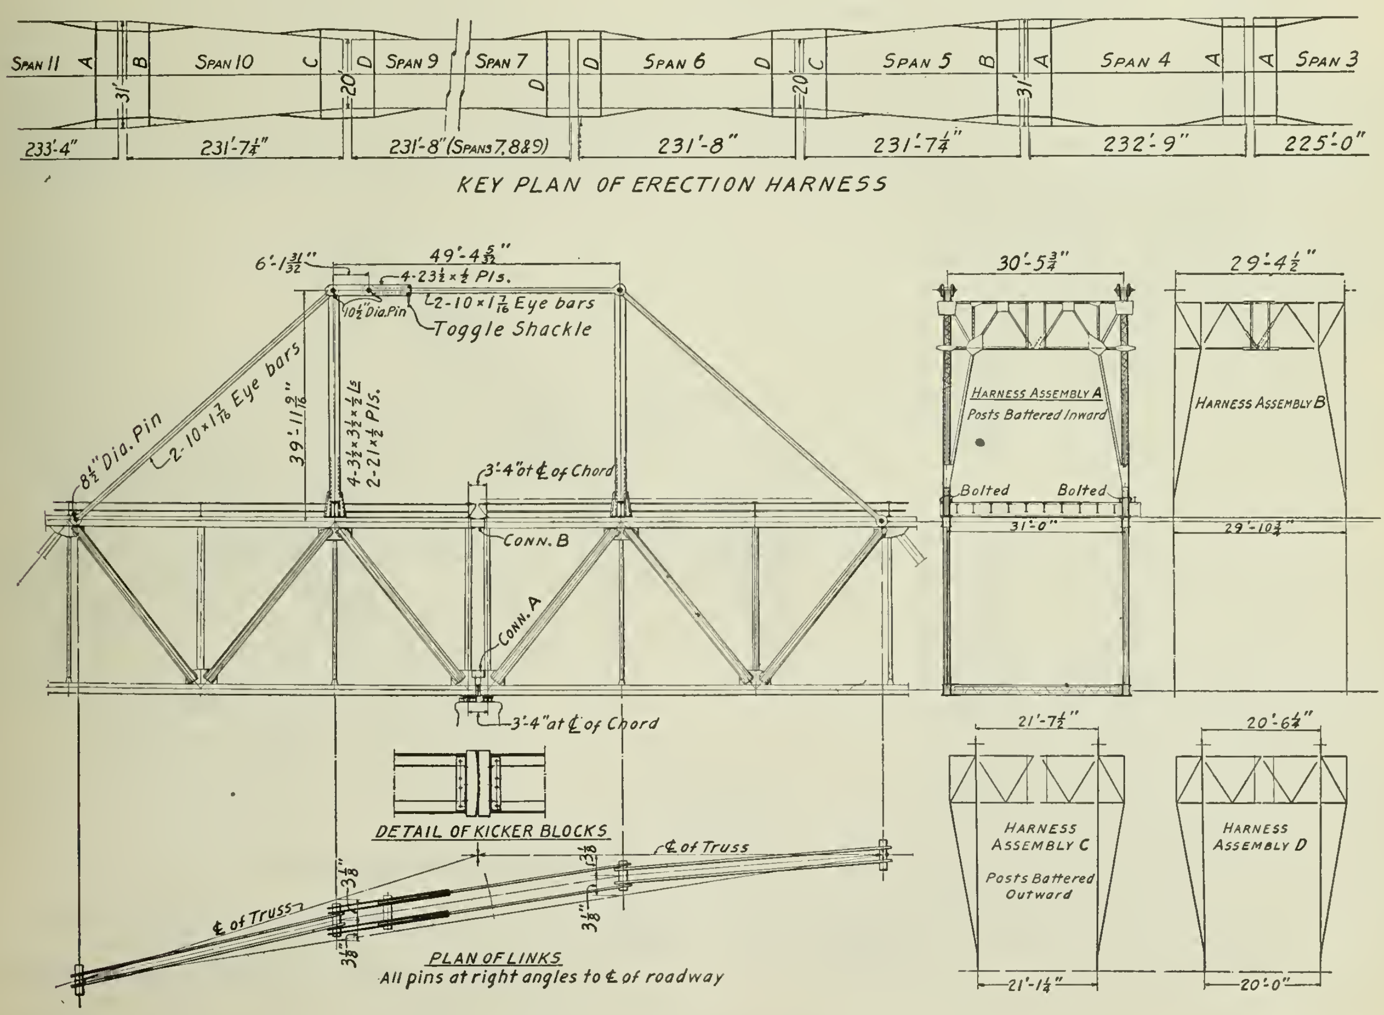

**Fig. 17—Design of Erection Harness and Key Plan.**

In reply to the possible question as to why the bridge was narrowed in some sections, he stated that the roadway was 27 feet wide from end to end of bridge, but where provision was made for navigation, the only solution was a through truss and at this point the sidewalks were constructed on the outside of the truss.

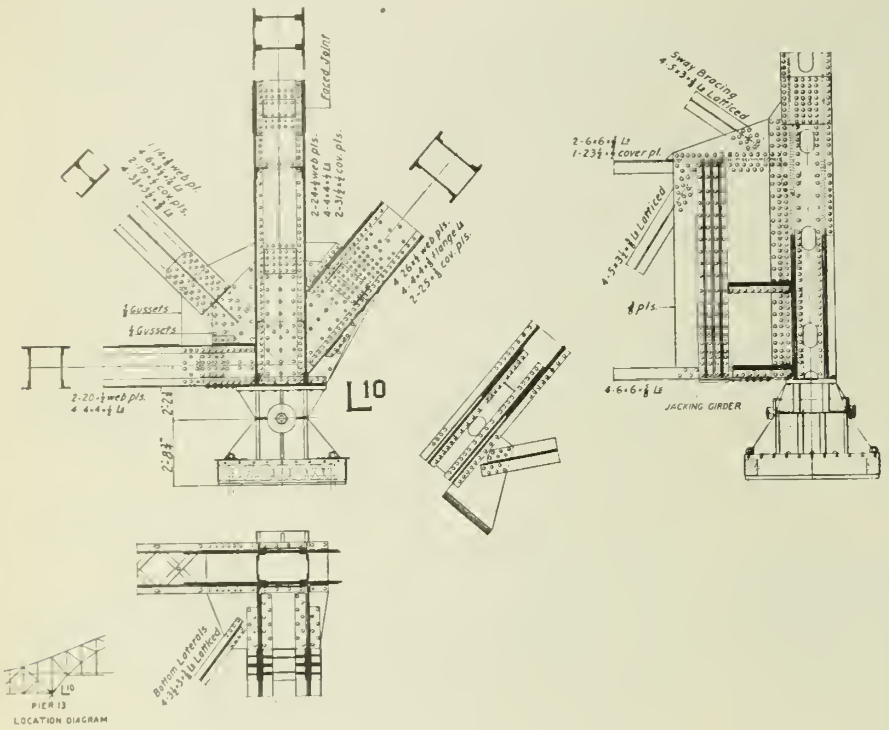

Fig. 18—Continuous Tied Arch—Details at L10.

Further, if the St. Lawrence Waterway was constructed, a through truss would have to replace the present fixed span at the north end.

With regard to probable tolls it was his hope that these would be made sufficiently high at the start to prevent a deficit. The annual revenue necessary was approximately $225,000 and it was preferable to fix comparatively high tolls at the beginning and then lower them if possible rather than be faced with the necessity of increasing them.

The Lake St. Louis Bridge Corporation had arranged with the provincial highway department for the necessary improvements at the south end and with Ville La Salle at the north end of the bridge.

A. S. Wall, M.E.I.C.[14]

Mr. Wall observed that the pier members for the bridge were made of steel plate, the parts having been joined together by the electric arc method of welding, covered electrodes being used throughout, to form the conventional type or shape generally associated with a steel casting.

The problems, or difficulties, associated with this method of construction, were intensified by the use of steel parts from 1½ to 2½ inches thick, together with fillet welds as the connecting medium. The fillets themselves had relatively small cross sections compared with those of the plates which they connected and the operation of welding tended toward a concentration or summation of residual stresses in the weaker parts. (Fig. 15.)

Probably the most interesting point in this particular class of construction concerned the development work necessary to weld such thicknesses successfully and the train of responsibility considered necessary to control the product.

Before attempting to weld together such heavy parts, a great deal of experimental work had been done over a period of years by the engineering staff and more particularly by the metallurgist and the welding engineer co-operating with the shop personnel. Development work had been done on rod coatings, joint type, welding procedure, etc., in order to establish the proper technique for this class of work. The quality of weld wanted was that required by the American Society of Mechanical Engineers Code for the manufacture of pressure vessels which requires the special qualification of the operators.

The construction of these pier members had been under the direct control of the welding engineer.

The train of responsibility, which could not be too highly stressed, commenced with the chief engineer, then the departmental engineers, shop inspection and operating staff to the operator. Nothing had been left to the operator alone or to any other single individual.

The result, in his estimation, had been a better pier member than could be obtained otherwise; supplied to the customer at no greater cost than the conventional cast steel type.

D. B. Armstrong, A.M.E.I.C.[15]

Mr. Armstrong stated that spans 4 to 11 inclusive had been erected by cantilevering from pier to pier without the use of falsework.

Under the circumstances this had been considered the safest and most economical method to follow, having many distinct advantages over the more common falsework method.

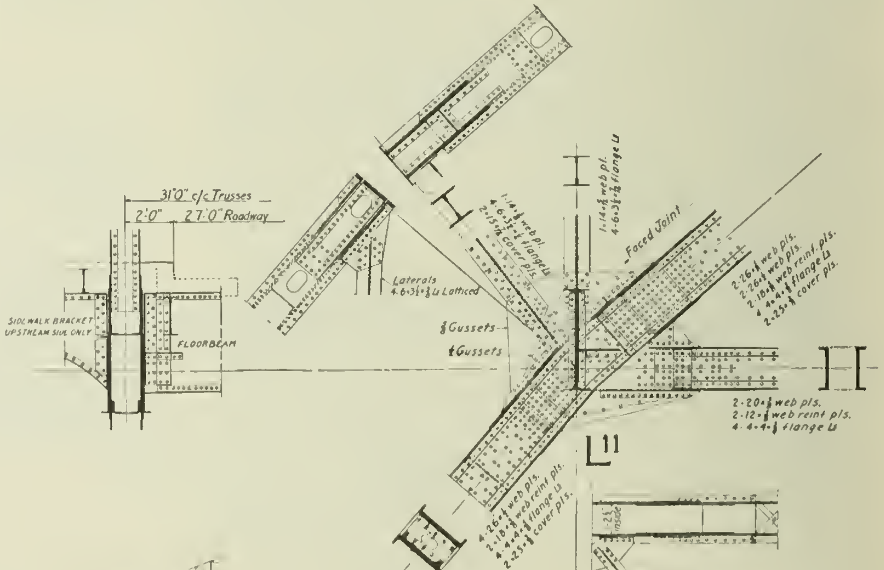

Fig. 19—Continuous Tied Arch—Details at L11.

The use of falsework always involved several unavoid-

(14) Dominion Bridge Company Ltd., Montreal.

(15) Erection engineer, Dominion Bridge Company Ltd., Montreal.

able risks, such as the uncertain and variable condition of the river bottom, hazards from floating ice, swift water and river craft. By keeping all work clear of the water these hazards were eliminated.

Once the first span had been cantilevered, the operations became more or less routine, resulting in increasing efficiency and lower costs as the erectors became familiar with the method.

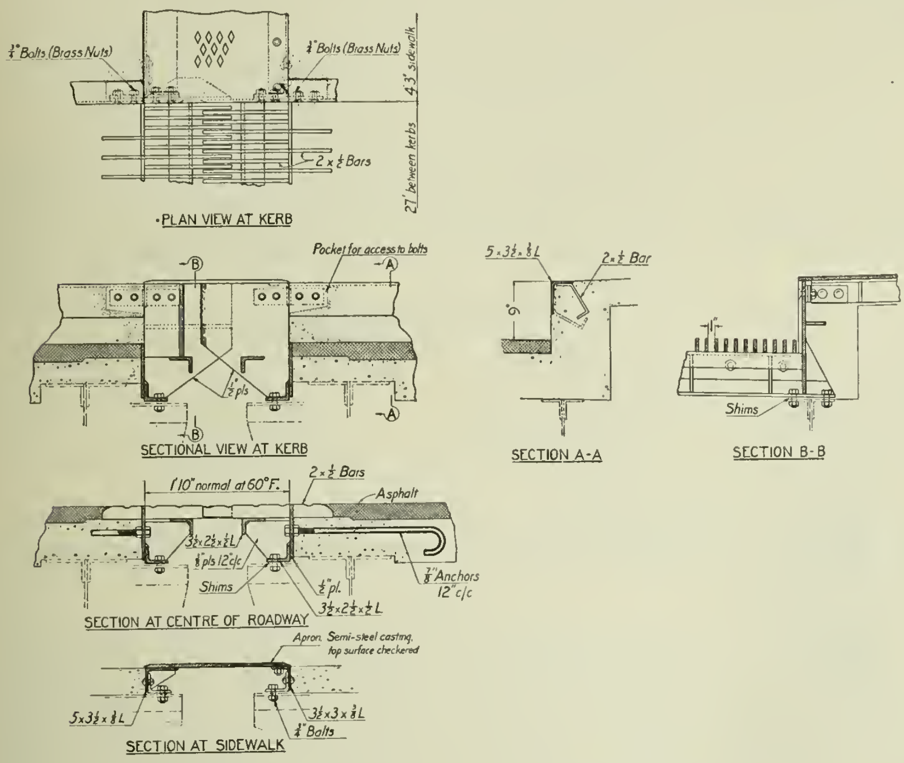

**Fig. 20—Typical Expansion Joint for Roadway and Sidewalk.**

Where several spans were to be erected, the cost of special cantilevering equipment was small compared to the cost of material and labour in setting, removing and continually altering falsework to suit succeeding spans.

The erection procedure could be laid out in the office during the designing stage and any modifications to the steelwork could be incorporated at that time at little additional cost.

Relatively short spans were usually cantilevered by inserting thrust blocks between the end bottom chords and by having the end top chords of adjacent spans fabricated in single pieces, continuous over the piers. When the cantilevered span had been landed and jacked up at its forward end, the connecting top chords were severed and the thrust blocks removed.

However, for spans as long as those of the Caughnawaga bridge (235 feet) the chords at and adjacent to the piers were usually too weak to take care of the erection stresses. To remedy this condition, without adding superfluous material to the finished structure, a temporary saddle or harness had been utilized, its effect being to increase the truss depth over the pier and to keep the maximum erection stresses within safe limits.

The accompanying diagrams (Figs. 16 and 17) showed the harness used on the Caughnawaga spans. Its development had been somewhat complicated by the fact that the bridge trusses, which started off at 31 feet centres at the north end, splay inwards to 20 feet in span 5, and then outwards again to 31 feet in span 10 (as indicated in the key plan, Fig. 17).

The general form of the harness as shown in elevation and the different arrangements of the bents, to suit the varying widths were shown in section in Fig. 17.

The eyebars (which had first been used in a similar manner on the Montreal Harbour bridge, and later for the combined railway and highway bridge at Nipawin, Sask.) were of medium heat treated steel having a yield of 50,000 and an ultimate strength of 80,000 pounds per square inch.

Being bored for 10½-inch pins it had been necessary to bush their lower ends for 8½-inch pins, this being the largest size that could be conveniently used in the Caughnawaga chords.

The posts were of box section, terminating in bases which straddled the floorbeams and bore through the top chord cover plates on the gusset plates of the trusses. Connections to the top of the floorbeam were also provided, for lateral stability before the bracing was assembled. The posts were battered 3⅛ inches in their height (as shown in section) to accommodate the splayed spans, their height having been determined by the length of eyebars available.

An attempt had been made to indicate the arrangement of the eyebar chain, as assembled to erect a splay span. In plan (Fig. 17) the inclined eyebars lay parallel to the line which bisected the angle contained between the centre line of truss and a line joining the end pins of the chain.

Thus the eyebars had an offset of 3⅛ inches in their length, which produced slight but negligible bending stresses in them. To maintain equal lengths of the inner and outer eyebar chains it had been necessary that all pins be set normal to the bridge axis.

The sections (Fig. 17) showed the four ways in which the bents were assembled to accommodate the various widths between trusses.

Assembly "A" was for the parallel trusses at 31 feet centres.

By telescoping the bracing and engaging a second set of holes on the centre plate, arrangement "B" was obtained. By revolving the posts through 180 degrees and inverting the bracing, arrangements "C" and "D" were arrived at. The key diagram (Fig. 17) indicated the points at which the various assemblies had been used.

Another slight complication had arisen on span 3 due to the fact that the panel lengths were somewhat shorter than those of the 235-foot spans. This made it necessary to shorten the horizontal distance between the chord pins and the bent, which had been compensated for by the insertion of stools under the posts.

The procedure followed in erecting a typical span was shown in Fig. 16.

Stage I. The end bottom chords with thrust blocks attached, were landed on their shoes and connected to the anchor span gussets by temporary plates (connection A). The jacking struts, laterals, truss members and end sway bracing were then erected as shown.

Stage II. The top chords were then connected to those of the anchor span (connection B) after which connection A had been removed.

The main erection traveller then proceeded to erect the span and harness as shown. The horizontal eyebar chain having been placed, the load had been transferred from connection B to the harness by means of the toggle provided.

Stage III. The main traveller then passed through and the follow-up traveller filled in the sway bracing in the bents. The end bottom chords were blocked on the pier as soon as erected. When the end diagonals and jacking struts were in place and securely bolted, the forward end of the span had been jacked up an amount of 20 inches to allow the harness to be disconnected. The permanent shoes were then set and the end of the span lowered onto them. The harness had been dismantled by the follow-up traveller which then proceeded to place all remaining floor steel and fences, which had been omitted to decrease the weight of the cantilever.

## Western Professional Meeting of The Institute

### To be Held in Vancouver, B.C.,

*with*

## The Annual Convention of The American Society of Civil Engineers

It is always a pleasure when members of The Institute are able to welcome members of sister engineering societies from the United States at a meeting on Canadian soil. Such an opportunity will occur in July of this year when the American Society of Civil Engineers will hold its Sixty-fourth Annual Convention in Vancouver on the same days and at the same place as the 1934 Western Professional Meeting of The Institute The headquarters of both organizations will be in the Hotel Vancouver, and the meetings will be held from the 11th to 14th of July.

On three previous occasions the Society has held its annual convention in Canada; in Montreal in 1881, in Quebec in 1897 and in Ottawa in 1913, and in 1925 the fall meeting took place in Montreal. The Society's members are, therefore, no strangers to Canada. This year's convention, however, will be especially noteworthy as the first to be held in Western Canada, and the first to be held jointly with a professional meeting of The Engineering Institute of Canada. This is an innovation which it is hoped will often be repeated.

The detail arrangements for the meeting and convention are being worked out by an active local committee, consisting of members of both organizations, and it will be noted from the tentative programme, as printed on another page, that while the professional and purely business sessions will be held separately, members of both societies will join in a series of attractive social events and visits of inspection.

An important feature of the gathering will be a joint discussion on a matter which is of international engineering interest, namely, the utilization of the resources of the Columbia River Valley. This question is just now under consideration in connection with certain development schemes which are proposed as public works by the United States government. Authoritative papers will be presented on both the Canadian and American aspects of this matter.

Members of The Institute will devote a whole day to professional sessions, at which papers on a number of important engineering developments in the Canadian west will be presented and discussed. While these sessions are being held, members of the American Society will be attending the meetings of their several technical divisions.

The local committee handling the joint arrangements is as follows:

*Chairman:* E. A. Cleveland, M.E.I.C., M.Am.Soc.C.E.
*Secretary:* J. C. Oliver, Jun.Am.Soc.C.E.

| | |
|---|---|
| I. C. Barltrop, A.M.E.I.C. | H. B. Muckleston, M.E.I.C. M.Am.Soc.C.E. |
| C. E. Blee, M.Am.Soc.C.E. | W. H. Powell, M.E.I.C. |
| C. Brakenridge, M.E.I.C. | J. Robertson, A.M.E.I.C. |
| P. H. Buchan, A.M.E.I.C. | W. O. Scott, A.M.E.I.C. |
| E. E. Carpenter, M.E.I.C., M.Am.Soc.C.E. | H. L. Swan, M.E.I.C. |
| A. H. Finlay, Assoc.M.Am.Soc.C.E. | G. A. Walkem, M.E.I.C. |
| A. E. Foreman, M.E.I.C. | C. E. Webb, A.M.E.I.C. |
| J. R. Grant, M.E.I.C., M.Am.Soc.C.E. | A. S. Wootton, M.E.I.C. |
| Frank Lee, M.E.I.C., M.Am.Soc.C.E. | G. R. Wright, A.M.E.I.C. |
| H. N. Macpherson, A.M.E.I.C. | |

*Ladies:* Mrs. E. E. Carpenter

It is not too early to make plans for visiting Vancouver during the week of July 8th, and it is understood that very favourable rates will be offered to travellers from the east by both Canadian railways. A considerable attendance of members of the American Society is expected, not only from the western states, but also from points further east, and it is hoped that a number of the eastern visitors will be able to accept the invitations which have been extended by The Institute Branches at Winnipeg, Calgary and Victoria, to stay over for a day or two in each of these centres, and take the opportunity of inspecting engineering works as well as Canadian scenery.

The Institute meeting will be under the auspices of the Vancouver and Victoria Branches. Members who were able to attend the Western Professional Meeting of The Institute in Vancouver in 1928 will recall the Western welcome which they received. There is every assurance that the forthcoming gathering will fully maintain the reputation of British Columbia in this respect.

## The By-laws and The Ballot

From the ballot figures given on another page it will be noted that the recent vote on the amendments to the by-laws has failed to show a majority sufficient to approve Council's proposals.

The amendments on which the vote was taken were based on the original work of the Committee on Development, modified as a result of extensive discussion by correspondence, at branch meetings, by branch executive committees, at a Plenary Meeting of Council held specially for that purpose, and finally at an Annual General Meeting of The Institute. Thus consideration of this matter has continued over a period of nearly three years. The many letters and communications received from individual members, as well as branches, during this time, showed that the proposals aroused widespread interest. It is, therefore, surprising, and somewhat disappointing, to find that a more decisive verdict has not been rendered, and that the vote was so small. In fact, only 818 ballots in all were cast by a voting corporate membership of some 2,600.

It is possible, however, that these unexpected features were not due to lack of interest in The Institute but to a general feeling of indecision caused by the difficulty of weighing the advantages and disadvantages of so large a number of issues of such varying degrees of importance. No doubt there was also a feeling on the part of some members that the present was not an opportune time for experiment, particularly as regards the one or two proposals of major importance. The result of the vote certainly indicates a reluctance to make any considerable changes in the constitution of The Institute at the present moment.

The question which naturally suggests itself now, is how to utilize, for the best interests of The Institute, the large amount of valuable work which has been done by the committees and by Council in connection with this matter of development. This is the problem which Council now has to consider and which will form one of the principal topics on the agenda at the next meeting of that body. Before that date councillors will have time for consideration and for consultation with their branch constituents regarding the best means for promoting the end which all have in view, namely, the fullest possible development of the activities of The Institute.

## Civil Service Classification in the Province of Saskatchewan

In the fall of 1933 the Saskatchewan Public Service Commission issued the first classification of the Provincial Civil Service as provided for under the Public Service Act of 1930.

A study of this classification by the executive committee of the Saskatchewan Branch of The Institute indicated that its provisions did not give adequate recognition to the engineering profession, either as regards classification or remuneration, and it was felt necessary to bring this circumstance to the attention of the Public Service Commission, and to ask the assistance of the Council of The Institute. The co-operation of the Saskatchewan Association of Professional Engineers was also sought.

The Council of The Institute, at its meeting on January 16th, 1934, appointed a special committee under Mr. Fraser S. Keith, M.E.I.C., and this committee was able to supply valuable information which has proved of great assistance in dealing with the matter. Consultation was also arranged between Mr. D. A. R. McCannel, M.E.I.C., councillor for the Saskatchewan Branch, Past-President S. G. Porter, M.E.I.C., and the officers of the Branch and of the Association of Professional Engineers.

On March 16th the representatives of these bodies were accorded an interview with the Saskatchewan Public Service Commission, and took the opportunity of filing two memoranda, one on behalf of the Council of The Engineering Institute of Canada, presented by Mr. McCannel, and the second jointly from the Saskatchewan Branch of The Institute and the Saskatchewan Association of Professional Engineers, presented by Mr. P. C. Perry, A.M.E.I.C., chairman of the Branch, and Mr. G. D. Archibald, president of the Association.

The memorandum from the Council of The Engineering Institute outlined the principles which it was felt should govern basic requirements in the classification of professional employees in the Civil Service, and pointed out that the remuneration proposed was in many cases less than that assigned elsewhere to positions of similar classification. It was also urged that in the classification suggested, the importance of certain positions did not seem to have been adequately recognized, and that in these cases higher grades of classification than those proposed would be advisable.

The brief presented by the Saskatchewan Branch and the Association of Professional Engineers submitted a suggested schedule based on that of the Royal Commission on Technical and Professional Services, and dealt in detail with a number of outstanding cases where the remuneration proposed was not in keeping with that generally recognized as being adequate for the responsibilities involved. It was also noted that the proposed classification differentiated between employees in revenue producing and non-revenue producing departments.

The representatives were able to discuss in detail with the Commission several of the points which they raised, and believe that their application will result in an appreciation on the part of the Commission of the necessity for fuller recognition of the engineering profession in the future. Owing to present economic conditions it is possible that the desired results may be somewhat delayed in general application, but it is hoped that early improvement may follow in some of the more urgent cases.

## The Forthcoming Construction Programme

The work of the National Construction Council in promoting the adoption of a national construction programme by the Dominion government is at last bearing fruit.

The Institute is, of course, one of the principal constituent bodies of that Council, and our representatives have taken a leading part in its activities. Engineers, like architects, have been vitally affected by the present depressed condition of the construction industry, and The Institute's Council has accordingly been an active supporter of the proposals for a government programme of public works. Further, The Institute's officers and representatives upon the Council have been able to direct the government's attention to the desirability of utilizing wherever possible the services of unemployed engineers, particularly those in private practice and young graduates, in connection with the preparation of the plans and estimates for the proposed works.

Since December of last year, when the Prime Minister announced that a construction programme of some kind would be brought down in the spring of the year, all interested in the industry have been waiting patiently for an official announcement as to its character and extent.

As a result of enquiries made in Ottawa, it may be said on good authority that the staff of the Public Works Department, both as regards engineering and building construction, have been busy for some months on details connected with this programme. On April 13th Hansard contained the following statement from Mr. Bennett: "The special public works undertakings that will be dealt with in a bill are works along the line of the suggestions that were made by the construction association and other industrial groups throughout the country during the last few months, with which I dare say the hon. gentleman is familiar."

We do not yet know the date on which this government bill will be introduced; possibly its contents will be public property before this issue of The Journal reaches its readers. There is no doubt, however, that if, as Mr. Bennett states, the suggestions of the National Construction Council have been followed, the programme will be wide-spread in character and of uniform proportions throughout the various provinces.

Such action by the Dominion government will create an excellent impression in construction circles, indicating as it will do the faith of the government in the future prospects of the country. It is to be hoped that the government's action will be followed by similar effort on the part of private individuals and corporations.

It is somewhat unfortunate that during the past few weeks figures have been quoted in the press and elsewhere which appear to indicate a sharp advance in the volume of construction in Canada. The figures which have been used for the purpose of these statistics, however, include the cost of many of the relief measures which are being carried out by cities and municipalities all over the country under the Relief Act and with assistance from the provincial and Dominion governments. This class of work is practically useless as a stimulant to regular construction forces, for it is carried on under relief conditions and not on the real economic basis which it is understood will underlie the construction programme of the Dominion government.

If relief figures are disregarded, it will be found that the value of effective construction work during the first three months of 1934 was not very different from that of last year, and as yet is less than 10 per cent of the rated capacity of the industry. In other words, the pressing need for the rehabilitation of the construction industry is as urgent as ever and the contemplated action of the Dominion government will be heartily welcomed as a remedy for this stagnation.

## Ballot on Amendments to By-laws, 1934

The scrutineers appointed by Council canvassed this ballot on April 17th and their report was submitted to Council and accepted at its meeting on April 24th.

They certify the following results:

Vote (A), amendment to Section 1 of the By-laws as proposed by Council—

In favour of Council's proposal—483
Against —316
Total valid ballots cast —799

Affirmative votes required under Section 75 of the By-laws (⅔ of 799), 533.

Council's proposal therefore fails to carry (lacking 50 votes), and the present Section 1 remains unchanged.

Vote (B), adoption of Sections 2 to 65 as proposed by Council—

In favour of Council's proposals—505
Against —289
Total valid ballots cast —794

Affirmative votes required (⅔ of 794), 529.

Council's proposals therefore fail to carry (lacking 24 votes), and the present Sections 2 to 75 remain unchanged.

## The Past-Presidents' Prize 1933-1934

The subject prescribed by Council for this competition for the prize year July 1st, 1933, to June 30th, 1934, is

**"The Engineering Features of City Management."**

The rules governing the award of the prize are as follows:

The prize shall consist of a cash donation of the amount of one hundred dollars, or the winner may select books or instruments of no more than that value when suitably bound and printed, or engraved as the case may be.

The prize shall be awarded for the best contribution submitted to the Council of The Institute by a member of The Institute of any grade on a subject to be selected and announced by the Council at the beginning of the prize year, which shall be July first to June thirtieth.

The papers entered for the competition shall be judged by a committee of five, to be called the Past-Presidents' Prize Committee, which shall be appointed by the Council as soon after the Annual Meeting of The Institute as practicable. Members and Honorary Members only shall be eligible to act on this committee.

It shall be within the discretion of the committee to refuse an award if they consider no paper of sufficient merit.

All papers eligible for the competition must be the bona fide work of the contributors and must not have been made public before submission to The Institute.

All papers to be entered for the competition must be received **not later than June 30th, 1934,** by the General Secretary of The Institute, either direct from the author or through a local Branch.

## Students' and Juniors' Prizes

Students and Juniors of The Institute are reminded that five prizes each of the value of twenty-five dollars, may be awarded to Students and Juniors of The Institute for the prize year 1933-1934 as follows:

The H. N. Ruttan Prize in the four Western Provinces.

The John Galbraith Prize in the Province of Ontario.

The Phelps Johnson Prize for an English Student or Junior in the Province of Quebec.

The Ernest Marceau Prize for a French Student or Junior in the Province of Quebec.

The Martin Murphy Prize in the Maritime Provinces.

Papers in competition for these prizes must be received by Branch Secretaries before June 30th, 1934. Further information as to the requirements and rules may be obtained from the General Secretary.

# OBITUARIES

## William States Lee, M.E.I.C.

The membership of The Institute will learn with regret of the death of William States Lee, M.E.I.C., which occurred at his home in Charlotte, North Carolina, on March 26th, 1934.

Mr. Lee was born at Lancaster, South Carolina, on January 28th, 1872, and was educated at the South Carolina Military Academy, from which he graduated in June 1894.

In 1896-1897, Mr. Lee was employed as instrumentman and later as resident engineer on the construction of the Carolina Midland Railway, Barnwell, S.C., and from March to November 1897 he was resident engineer for the Anderson Water, Light and Power Company at Anderson, S.C. From that time until March 1898, Mr. Lee was with the Pickens Railway Company at Pickens, S.C., in the same capacity. He was later in the same year assistant engineer on the staff of the United States Engineering Department on coast defence in South Carolina, and from then until January 1900 was resident engineer with the Columbus Power Company at Columbus, Ga. In January

W. S. LEE, M.E.I.C.

1900 Mr. Lee was appointed chief engineer of the same company. In October of that year he became vice-president and chief engineer of the Catawba Power Company, Charlotte, N.C. This company was a subsidiary of the Southern Power Company, and in 1905 Mr. Lee became chief engineer of the latter company. Later he received the appointment of vice-president and chief engineer, which position he held for about fifteen years. At the time of his death, Mr. Lee was vice-president and chief engineer of the Duke Power Company at Charlotte, N.C.

# WESTERN PROFESSIONAL MEETING

OF

# The Engineering Institute of Canada

## VANCOUVER—JULY 11th to 14th, 1934

THE AMERICAN SOCIETY OF CIVIL ENGINEERS is holding its ANNUAL CONVENTION at the same time and place as The Institute meeting. In the following programme, events marked * are joint functions in which delegates from both organizations will take part. The Headquarters of both bodies will be at the Hotel Vancouver.

(*Programme subject to minor changes*)

**Wednesday, July 11th**

9.00 a.m. *Registration* (separate for each Society).

*10.00 a.m. *Joint meeting*, called to order by the Chairman of the Local Joint Committee—E. A. Cleveland, M.E.I.C., M.Am.Soc.C.E.

Welcome to all delegates by His Worship the Mayor of Vancouver.

*10.10 a.m. Welcome to Am. Soc. C.E. delegates by the President of The Engineering Institute of Canada, F. P. Shearwood, M.E.I.C., M.Am.Soc.C.E.

Reply, and annual address, by the President of the American Society of Civil Engineers, Harrison P. Eddy, M.Am.Soc.C.E., M.E.I.C.

*12.30 p.m. *Luncheon.*

*Chairman:* The Chairman of the Vancouver Branch of The Engineering Institute of Canada.

*Speaker:* A. S. Gentles, M.E.I.C., President of The Association of Professional Engineers of British Columbia.

*Subject: The Growth and Work of the Association of Professional Engineers in British Columbia.*

* 2.30 p.m. *Joint Technical Session* (both Societies.)
*Chairman:* The President of The American Society of Civil Engineers.

*Subject: The Development of the Columbia River Drainage Basin.*

Presentation and Discussion of the following papers:

(*a*) *Power and Navigation Features of the Columbia River below Snake River, with particulor reference to the Bonneville Project*, by Major C. F. Williams, District Engineer of the U.S. Engineer Office, Portland, Ore.

(*b*) *Reclamation Features of the Columbia River Drainage Basin, with particular reference to the Columbia Basin Project and the Grand Coulee Development*, by Frank A. Banks, Assoc.M.Am.Soc.C.E., Construction Engineer of the U.S. Bureau of Reclamation, Almira, Wash.

(*c*) *The Canadian Aspects of the Columbia River Drainage Basin*, by J. C. MacDonald, M.C., M.E.I.C., Comptroller of Water Rights, Province of British Columbia.

* 3.00 p.m. For the ladies a motor trip will be arranged around Stanley Park Marine Drive and to the grounds of the University of British Columbia at Point Grey, followed by tea.

* 7.00 p.m. *Dinner.*

*Chairman:* The President of the American Society of Civil Engineers.

*Speaker:* His Honour Judge F. W. Howay.

*Subject: The Work of the Royal Engineers in British Columbia.*

**Thursday, July 12th**

The Engineering Institute and the Technical Divisions of the Am.Soc.C.E. will hold separate professional sessions for the presentation and discussion of papers.

For The Institute these will be as follows:

9.00 a.m. *First Technical Session, E.I.C.*

(*a*) *Town Planning Aspects of Vancouver and Fraser River Harbours*, by W. G. Swan, D.S.O., M.E.I.C., Consulting Engineer, Vancouver.

(*b*) *The English Bay Interceptor*, by G. M. Gilbert, Engineer of the Vancouver and District Sewerage Board.

2.00 p.m. *Second Technical Session, E.I.C.*

(*a*) *The Highway System of British Columbia*, by Patrick Philip, M.E.I.C., Chief Engineer, Department of Public Works, Province of British Columbia.

(*b*) *The Ghost Development ond Hydraulic Fill Dom*, by G. A. Gaherty, A.M.E.I.C., President, Calgary Power Company, and T. H. Hogg, D.Eng., M.E.I.C., Chief Hydraulic Engineer, H.E.P.C. of Ontario.

Ladies are left free during morning and afternoon sessions.

* 7.30 p.m. *Informal Dinner and Dance* (Grouse Mountain Chalet).

**Friday, July 13th**

* 9.00 a.m. *All day excursion by steamer*, through Gulf of Georgia and Malaspina straits to Powell River (seventy-two miles). Inspection of pulp and news print mill (650 tons per day capacity) and hydro-electric plant of the Powell River Company. Arrive Vancouver about 9.00 p.m.

**Saturday, July 14th**

Morning No formal functions arranged.
Golf can be arranged for those who desire it.

* 2.00 p.m. *Motor drive* on north side of Vancouver harbour through the catchment area controlled by the Greater Vancouver Water District.

*Tea* at Seymour Canyon and Falls.

Drive to Capilano Canyon and Whytecliff; thence back to Vancouver.

NOTES:—Unless otherwise stated, ladies are expected to participate in all functions and inspection trips.

Members are recommended to make their Hotel reservations well in advance.

Both railways offer special return rates for groups of ten or more. For details see later announcement.

Among Mr. Lee's other connections were the following: president of the W. S. Lee Engineering Corporation; president and chief engineer of the Piedmont and Northern Railway Company; vice-president and chief engineer and director, Duke Power Company, Wateree Power Company, Western Carolina Power Company, Catawba Manufacturing and Electric Power Company; director, American Cyanamid Company; and vice-chairman and trustee of the Duke Endowment. Mr. Lee also engaged in practice as a consulting engineer with offices in New York City and Charlotte, N.C.

Mr. Lee's interest in Canadian work was originally due to his association with the late James B. Duke in the activities of the Duke-Price Power Company, and he was in charge of the construction of that company's development at Isle Maligne on the Saguenay river. This Canadian connection was followed by his engagement in connection with the power development of the Beauharnois Light Heat and Power Company on the St. Lawrence river at Beauharnois, Que.

Mr. Lee acted for many years as consulting engineer for the Hydro-Electric Power Commission of Ontario, and served in the same capacity for a number of Canadian organizations. He was a vice-president and chief engineer of the Quebec Development Company.

Mr. Lee, who was recognized as one of the pioneers in high-tension hydro-electric power development, was president of the American Institute of Electrical Engineers in 1930-1931.

He joined The Engineering Institute of Canada as a Member on May 19th, 1914.

### John Athalmer Aylmer, M.E.I.C.

General regret, we are sure, will be felt at the announcement of the death at Peterborough, Ont., on April 11th, 1934, of John Athalmer Aylmer, M.E.I.C., one of the senior members of The Institute.

Born at Quebec on August 28th, 1847, he received his early education at St. Francis College, Richmond, Que., serving his apprenticeship under the late J. G. Lippell, C.E., chief engineer of the lower St. Lawrence canals. From 1872 to 1879 he was engaged as an assistant engineer on the construction of Lachine canal enlargements, and was subsequently employed until 1881 in the same capacity on the construction of the Ste. Annes canal on the Ottawa river. Following this for some years he was resident engineer on the Trent canal system, his work embracing surveys and plans and estimates for some two hundred miles of canal, lake and river navigation. Mr. Aylmer was later connected for a time with the firm of Manning and McDonald of Toronto, and finally became a member of the firm of Brown, Love and Aylmer, located at Peterborough, Ont. Mr. Aylmer retired from active practice about fifteen years ago.

Widely recognized throughout Ontario and Quebec as an outstanding member of the profession, Mr. Aylmer completed many important public works contracts, including sections of the Trent canal and other large enterprises.

Mr. Aylmer joined the Canadian Society of Civil Engineers on its formation, having become a Member on January 20th, 1887. He was made a Life Member on April 2nd, 1929.

### Samuel Martin Green, M.E.I.C.

It is with regret that we place on record the death at Springfield, Mass., on March 2nd, 1934, of Samuel Martin Green, M.E.I.C.

Born at Benton Harbor, Mich., on April 13th, 1864, Mr. Green graduated from the Worcester Polytechnic Institute in 1885.

Following graduation he was until 1899 connected with the F. E. Reed Company of Worcester, Mass., the Deane Steam Pump Company of Holyoke, Mass., the John T. Noye Company of Buffalo, N.Y., and the Merrick Thread Company at Holyoke, Mass., and from that time until 1907 was chief mechanical engineer of the American Thread Company, being in charge of the mechanical equipment, power plants and buildings of all the American plants of that company. In 1897 the Samuel M. Green Company was incorporated, and Mr. Green became president and treasurer, which connection he retained until the time of his death. Mr. Green held many important commissions throughout the eastern and southern states, Canada, Finland, Norway, Germany, Australia, Sweden, Japan and India, his overseas work being largely the designing of chemical plants. During the world war Mr. Green was in charge of the erection of a record size chlorine soda plant as a unit of the poison gas plant at the government arsenal at Edgewood, Md.

He was associated with many societies, being a member of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the Engineering Society of Western Massachusetts and the American Geographical Society.

Mr. Green became a Member of The Institute on October 14th, 1911.

### George Arthur Johnson, M.E.I.C.

Regret is expressed in recording the death of George Arthur Johnson, M.E.I.C., in New York, on April 1st, 1934.

Colonel Johnson was born at Auburn, Maine, on May 26th, 1874.

In 1895-97 he was engaged on investigating methods of water purification at Louisville, Ky.; in 1898-99 at Cincinnati, Ohio, and York, Pa.; in 1899 at Norfolk, Va., and Washington, D.C. In 1900 Colonel Johnson was associate director of a special city department at St. Louis, Mo., studying water problems, and in 1901 was engaged on the study of water filtration at Philadelphia, Pa. In 1902 he was in charge of the operation of filtration works at Little Falls, N.J., and in 1903 was field director in charge of a sanitary survey of the Hudson river watershed for New York City. In 1904-1905 he became engineer in charge of studies on the purification of water supply and sewage at Columbus, Ohio, and in the following year was abroad on professional work. In 1907-1910 Colonel Johnson was principal assistant engineer, and later a member, of the firm of Hering and Fuller, and in 1911 became senior partner of the firm of Johnson and Fuller, consulting engineers. In 1918 Colonel Johnson was in the Quartermaster Corps National Army of the U.S.A., in the construction division in the maintenance and repair branch, at Washington, D.C. At the time of his death he was engaged in consulting engineering as the George A. Johnson Company at New York, N.Y.

Colonel Johnson became a Member of The Institute on April 20th, 1915.

### Harry Brooke Aylmer, A.M.E.I.C.

Harry Brooke Aylmer, A.M.E.I.C., died at Melbourne, Que., in July 1933.

Mr. Aylmer was born at Melbourne, Que., on November 12th, 1854, and from 1872 to 1877 was employed as an assistant on the Geological Survey of Canada. In 1879 he was engaged as assistant on township surveys in the province of Quebec, and in 1880 was occupied on the same work in the province of Manitoba, being in charge of party. In 1881 Mr. Aylmer was assistant engineer in the location of the Canada Atlantic Railway, and the following year was on its construction. In 1882-1883 he was an assistant to Mr. Wm. Crawford, C.E., on general engineering work in Manitoba, and following this was until 1885 on the location, and construction of the mountain division of the Canadian Pacific Railway as assistant engineer. In 1887 Mr. Aylmer was with the Algoma Eastern Railway Company at Little Current, Ontario, and in 1913 he returned to Melbourne, Que., where he remained until the time of his death.

Mr. Aylmer joined The Institute (then the Canadian Society of Civil Engineers) as an Associate Member on June 25th, 1887.

## PERSONALS

Leonard H. Birkett, A.M.E.I.C., is now sales manager of the Combustion Engineering Corporation Limited, Montreal. During the year 1914-1915, Mr. Birkett was engaged on a special apprenticeship course with the Canadian Pacific Railway, and from June 1915 to April 1919 he was overseas with the Canadian Expeditionary Force in

LEONARD H. BIRKETT, A.M.E.I.C.

the infantry and with the Canadian Engineers, holding a commission. Returning to Canada in 1919, he was attached to the mechanical department of the Canadian Pacific Railway until April 1921, when he joined the staff of The Superheater Company Limited, Montreal, as sales engineer in charge of industrial sales and engineering.

Lieut.-Colonel R. E. Smythe, A.M.E.I.C., Director, Technical Service Council, Toronto, Ont., has been elected chairman of the Toronto Branch of The Institute.

G. P. F. Boese, A.M.E.I.C., has been appointed chairman of the Calgary Branch of The Institute. Mr. Boese is assistant engineer, Department of Natural Resources, Canadian Pacific Railway Company, Calgary, Alta.

D. Ross Eastwood, A.M.E.I.C., is now assistant engineer on the staff of Canadian Celanese Limited at Drummondville, Que.

J. B. Clark Keith, A.M.E.I.C., chief engineer, the Essex Border Utilities Commission, Windsor, Ont., was elected chairman of the Canadian Section of the American Water Works Association at the fourteenth annual meeting of the Association held in Toronto, recently.

H. A. Thompson, A.M.E.I.C., is now connected with the E. B. Eddy Company at Hull, Que. Mr. Thompson was for some time assistant engineer with the Lethbridge Northern Irrigation District, Lethbridge, Alta.

A. B. Anglin, S.E.I.C., who graduated from Queen's University in 1933 with the degree of B.Sc., is now on the refinery staff of the British American Oil Company at Toronto, Ont.

F. C. C. Lynch, A.M.E.I.C., has been appointed director of the Bureau of Economic Geology under the division of the geological survey in the Mines Department, Ottawa. Mr. Lynch entered the service of the Dominion government in April 1906, when he became technical clerk, Railway Lands Branch, Department of the Interior. In April 1911 he was appointed assistant superintendent and in April 1912 superintendent of the same Branch, which office he held until 1917, when he joined the Natural Resources Intelligence Branch as superintendent. Mr. Lynch subsequently became Director of that Branch, which office he has held up to the time of his present appointment. Mr. Lynch is most active in the affairs of The Institute, having been the Secretary-Treasurer of the Ottawa Branch for a number of years.

### Technical Books, etc.

Bethlehem Rolled Steel Wheels, Steel Axles and Locomotive Forgings,
Bethlehem Tool Steels,
Mayori Pig Iron,
Bethlehem Rolled Steel Circular Products,
Bethlehem Structural Shapes.
(Five publications listed above published and presented by the *Bethlehem Steel Company.*)

## BULLETINS

*Car Washers*—A 4-page folder received from the Worthington Pump and Machinery Corp., Harrison, N.J., illustrates and describes car washer units for modern garages, wash racks and service stations. The units are made in four sizes.

*Waggon Drill*—The Worthington Pump and Machinery Corp., Harrison, N.J., have issued a 4-page folder which gives particulars regarding an improved type waggon drill. The new machine incorporates an adjustable drill steel centralizer and a levelling device, permitting the adjustment of the drill tower to the vertical position when the rig is set on uneven ground. The drilling engine can be readily demounted from its detachable feed slide.

*Industrial Research*—Forty-five prominent manufacturing organizations contributed the data that is contained in the 30-page report issued by the Policyholders Service Bureau, Metropolitan Life Insurance Company. The material deals with the organization and administration of an industrial research department, the question of cost estimates, the methods of budgeting in use, and other sections consider standardized research procedure, cost keeping and control, and the review and reconsideration of research projects. Copies may be secured from the Policyholders Service Bureau, Metropolitan Life Insurance Company, 180 Wellington Street, Ottawa, Ont.

# BOOK REVIEWS

## Arc Welded Steel Frame Structures

*By Gilbert D. Fish, McGraw-Hill Book Company, Inc., New York, 1933. 6 by 9¼ inches, 401 pages. Figs., tables, photos. $5.00. Cloth.*

Reviewed by C. M. Goodrich, M.E.I.C.*

The author, in the preface, has clearly outlined the aims of the volume in the following sentence: "The book is intended for engineers, architects, contractors, inspectors and students who are now, or may become, concerned with welded structures. The guiding motive is to assist all groups to combine economy with safety." He further states that his subject is welded structures rather than welding processes, and he devotes the opening chapter to a brief review, with photographs, of steel structures which have been erected or reinforced by the welding process. The closing chapter is a critical comment on the experience gained by the author from those structures with which he was connected.

In the early chapters, the author deals with elementary matters of welding and stress analysis, and reprints the American Welding Society's code for fusion welding and gas cutting, as well as his own specification for the reinforcement of bridges. These chapters are introductory to those which treat of detail design, strength calculations and economical layout for welded joints.

The author discusses at length all the usual types of connections met in the fabrication of steel structures. He has compiled a number of tables of the allowable loads, etc., for the different types of welds in accordance with his design data.

There is an important chapter dealing with detail drawings and the author stresses the importance of having clear drawings of the weld details showing the field welding separately from that to be carried out in the shop, as if both details are on the one set of drawings there is a tendency to cause confusion.

The method of estimating used by the author is clearly set out, together with various factors in the design of the connections which affect the welding cost, such as the position of the welds, their accessibility, and the speeds of deposition for the various types and classes of welds.

The author's calculations are based on the use of bare electrodes and although he states that he believes covered electrodes will supersede the bare, it is to be regretted that he does not include any comparative data on the results obtained from the use of covered as against bare electrodes.

Inspection, welders qualifications, and contractors' equipment is dealt with and the book should prove a useful guide to those who are interested in the application of welding for the erection or strengthening of steel structures.

*Canadian Bridge Company Limited, Walkerville, Ont.*

## The Technical Man Sells his Services

*By Edward Hurst, S.B., McGraw-Hill Book Company Inc., New York, 1933. 5½ by 8 inches, 239 pp., $2.00. Cloth.*

The purpose of this book is to assist technical men to find positions by outlining the analytical methods of the problem. The author without theorizing shows the reader how by selling his services instead of asking for a job, he can convert the employer's "no" into a "yes." The author, an engineer engaged in manufacturing, has for eight years as an avocation been assisting engineering students to obtain positions, and this book sums up his experience. He illustrates by a series of examples the application of successful methods in securing employment. Among the occupations covered in these cases are those of mechanical, chemical, electrical, sales, construction and production engineers, the machine designer, architect and cost accountant. Any technical graduate, recent or otherwise, who is in search of employment may consider this book well worth reading.

## Triangulation in Southeastern Ontario and Montreal Area

### Being Geodetic Survey Publication No. 55

*By J. E. R. Ross. 152 pages. Noel J. Ogilvie, Director, Ottawa. The King's Printer, 1934. Price $1.00.*

Reviewed by Professor J. Weir, A.M.E.I.C.*

This publication completes a series of seven reports—of which numbers 29 to 35, inclusive, have appeared in recent years—containing the results of all triangulation established by the Geodetic Survey of Canada in eastern Canada. The area, of which this series treats, is that of the older and more settled portion of Canada, extending easterly from Lakes Huron and Erie in Ontario to the St. Lawrence river, thence along the river valley through Quebec, and finally throughout the Maritime provinces to the southwestern portion of Newfoundland.

The Index Map of Publications included in the report shows the areas covered in these numbers; and also those areas west of Lake Superior to Prince Rupert on the Pacific coast, and those in Northern Ontario and Quebec, for which results are unpublished but may be had by applying to the Director.

This particular report No. 55 presents the final results, on the North American datum, of the triangulation executed by the Geodetic Survey in that area bordering on the St. Lawrence river from about 30 miles east of Montreal, Quebec, westerly to about 25 miles west of Belleville, Ontario, with portions of the Ottawa and Gatineau river valleys. A notable feature is the addition of the control in Montreal City and District area. The main scheme has an axial length of about 250 miles and an average width of 50 miles. The field work of this scheme was prosecuted during the years 1907-1913, the first important accomplishment of this Survey after its inception in 1905, and the results were first given in G.S.C. Publication No. 2, by W. M. Tobey, which is not now extant.

In each report, Mr. Ross has given a description of the triangulation methods of the Survey. The methods of adjustment are well illustrated, and the precision of the final results attained must impress even the most casual. On replacement of the geometrical figures of the triangulation scheme by a single line, the ratio of the error to the length is 1 part in 519,000, or 1 foot in 98 miles. (See page 29.)

The triangulation of the Geodetic Survey of Canada, in harmony with that of Mexico and the United States, is based on a common standard, the "North American datum," and calculations are based throughout on the Clarke Spheroid (1866). As a result, there are avoided the complications of overlap along the International Boundaries, and advantages of mutual co-operation ensue.

The results of the Montreal area triangulation form a major feature of the report. The city engineers of Montreal, long feeling the need of an accurate base map for civic planning, enlisted the services of the Geodetic Survey in 1919 for the extension of a rigid net of triangulation control from the primary net of the surrounding area. The resulting work places this area foremost in Canada in density of triangulation control.

The net adopted, based on the line Mount Royal-St. Hilaire, has twelve main stations on commanding points, from which control points were established by intersections from three or four of the main stations. The positions of many church spires, flagpoles, etc., were thus fixed, and for convenience, positions of bolts on the streets were also determined.

With about 45 primary control marks thus made available, the city staff has put in hundreds of intermediate points and computed their co-ordinates. Eight hundred permanent monuments will constitute the complete work. Precise levels also make these bench marks available for vertical control.

A very convenient system of rectangular co-ordinates allows all points in Montreal to have their departures and latitudes given from the one origin, the primary station Royal. The axes are parallel and at right angles to the direction of St. Lawrence Main, in azimuth 302°55′27″.2.

A complete list of descriptions and marking of all stations in the book renders positive identification on the ground possible, and a seven-page index completes the report of a monumental work well done.

*Assistant Professor of Geodesy, McGill University, Montreal.*

# CORRESPONDENCE

The Editor, Fort William, Ont., April 21st, 1934
The Engineering Journal

Dear Sir:

I know it is voicing the appreciation of many other readers of The Journal as well as my own in acknowledging the pleasure experienced and speculative thought induced through reading Mr. Eric G. Adams' essay on "The Relations of Economics to Engineering." In the light of present day conditions the subject is topical, entertaining and instructive for any engineer who gives more than passing thought and interest to a situation in which we all, engineers especially, are enveloped. One cannot conceive any subject which could be of more interest and productive of more ultimate value to the younger engineers to-day than would an open well-directed discussion of Mr. Adams' paper by every Branch across the Dominion.

It is the writer's opinion that the future of engineering as a profession, rather than a trade, rests basically on an appreciation by engineers of the fact that a broad knowledge of economics and the application of its principles to engineering works and enterprises is essential to the attainment of the higher status. However, Mr. Adams has enunciated this much better and more clearly than I can.

In the endeavour, Mr. Editor, to act on your plea for more active help from the membership towards broadening interest in The Journal, I submit the following for consideration, and, I trust, comments from other members:

That each Branch appoint or elect a Journal correspondent, not the Secretary. That his duty be to submit local items of interest to engineers regularly, and not less than two more extended resumés, short articles or comments, during his year of office, on some subject or work in his area in which the membership might be interested. He should preferably, be of the younger group, and his services in digging out his material should be recognized by remitting the annual dues.

As professional ethics has been to the fore recently one is prompted to enquire what attitude The Institute would take on the proposition that it is not good business and it is unethical for any engineer on his own account, or at the behest of his employer or client, to take advantage of distress conditions to hire common and skilled labour at distress wages. Undoubtedly a subject more properly discussed within than without the profession. A little moral backing on the part of The Institute in respect to this would no doubt be welcomed by some of the members.

P. E. Doncaster, M.E.I.C.

# BRANCH NEWS

## Calgary Branch

*J. Dow, M.E.I.C., Secretary-Treasurer.*
*H. W. Tooker, A.M.E.I.C., Branch News Editor.*

The competition open to Junior and Student members of the Calgary Branch, carrying with it a substantial cash prize, for the best paper on an engineering subject, personally presented, was held at the Board of Trade rooms during the evenings of March 1st and 2nd, 1934.

The papers, in order of presentation, were as follows:

Thursday, March 1st:

(1) The Application of Heavisides Operational Calculus to Engineering Problems, by I. A. Abramson, Jr.E.I.C.

(2) Construction and Principles of Operation of the New Sewage Disposal Plant at Bonnybrook, by J. S. Neil, S.E.I.C.

Friday, March 2nd:

(3) Railway Construction in the Peace River Block, by J. L. Pidoux, S.E.I.C.

(4) Recent Development in Radio Receiver Design, by D. C. Fleming, S.E.I.C.

Judging of the contest was conducted by a committee of which J. H. Ross, A.M.E.I.C., was the chairman. The committee based their award on the following points: completeness, 50 marks; originality, 10 marks; appropriateness, 10 marks; and for the manner of presentation, including language, delivery and logical sequence, 30 marks.

Mr. D. C. Fleming was the successful competitor, with a total of 77 marks, Mr. J. L. Pidoux was second, Mr. J. S. Neil third, and Mr. I. A. Abramson fourth.

ANNUAL MEETING

The annual meeting of the Calgary Branch of The Institute was held in the Board of Trade rooms on March 10th, 1934, at 2 o'clock p.m., there being present the chairman, H. J. McLean, A.M.E.I.C., and sixteen members.

Following the reading of the minutes of the last annual meeting, scrutineers of the ballot on the election of officers for the year 1934-1935 were appointed.

G. P. F. Boese, A.M.E.I.C., in reporting the activities of the Programme committee commented on the necessity of the members attending the meetings, thus encouraging those who have prepared lectures.

Mention was made of the departure from usual procedure in having the large number of nineteen general meetings illustrated by moving pictures, which greatly enhanced the popularity and interest of the papers.

The hope was expressed that members would endeavour to have their friends who are eligible and attending the meetings to associate themselves with The Institute.

A. Griffin, M.E.I.C., in presenting the report of the Prize committee, emphasized the good results of the Students' contest and the gratifying interest taken by members as well as the public.

Colonel F. M. Steel, M.E.I.C., reported on the Unemployment committee which has been exceptionally active during the year and in cooperation with the Professional Engineers of Alberta endeavoured to put unemployed engineers in touch with employers. The committee also kept in close touch with the National Defence Relief Schemes and employment was found for several. A word of warning was given against exploitation by employers, particularly on the so-called temporary jobs, so that there will not be a general devaluation in engineering services.

Reports were also made by the committees on Policy, Receptions and Attendance and Membership.

The report of the Secretary showed a gain of one member during the year and regretted the loss of three valuable members in the passing on of Major C. C. Richards, W. D. Armstrong and W. J. I. Bennett. The Executive met fifteen times and there were nineteen general meetings, with a gratifying increase in the attendance.

The Treasurer's report showed total disbursements of $395.16 and assets amounting to $1,000.38.

Mr. McLean, the chairman, gave the report of the activities of the Branch and stated that the two salient points necessary to bring members in close touch with each other were playing together and working together. He suggested that less technical data should be encouraged in lectures and more general information given, thus stimulating the general education.

Past-President S. G. Porter, M.E.I.C., gave a resume of the annual meeting of The Institute in Montreal which he had attended, and observed that in his address the Premier, Mr. R. B. Bennett, was particularly encouraging to the young engineer.

Mr. Boese, in accepting the chairmanship of the Branch, thanked the members for their confidence in electing him, and paid tribute to Mr. H. J. McLean.

## Hamilton Branch

*Alex. Love, A.M.E.I.C., Secretary-Treasurer.*
*V. S. Thompson, A.M.E.I.C., Branch News Editor.*
*Reported by J. A. M. Galilee, Affil.E.I.C.*

The regular get-together meeting of the Toronto Section, American Institute of Electrical Engineers, and Hamilton Branch, Engineering Institute of Canada, was held in the Westinghouse auditorium, Hamilton, on April 6th, 1934. H. B. Stuart, A.M.E.I.C., chairman, welcomed the visitors to Hamilton and turned the meeting over to G. D. Floyd, chairman of the Toronto Section, A.I.E.E.

*By courtesy of Canadian Airways Ltd.*

**Stanley Park and Harbour Entrance at Vancouver, B.C., the location of the forthcoming Western Professional Meeting of The Engineering Institute of Canada.** *(See announcement page 239.)*

Mr. Floyd introduced Dr. Joseph Slepian, speaker of the evening, consulting engineer in the Research Laboratories of the Westinghouse Electric and Manufacturing Company at East Pittsburgh.

Circuit Interruption

Dr. Slepian's subject was "Circuit Interruption," and its relation to much research work that has been done recently in studying arc phenomena and allied subjects.

He showed that the original attempts to break contacts have been based on the false assumption that the arcs thus formed were: (1) flames and must be "extinguished" or "quenched," that (2) they can be cut, such as a rope, and (3) they can be drawn out much in the same manner as molasses candy to such a point that they separate to a mere insubstantiality. It was in a study of the fundamental reasons of the formation of arcs that Dr. Slepian evolved his De-ion principle of circuit interruption.

The speaker then explained the mechanism of the extinction of an arc in an A.C. circuit and its re-ignition, dealing with both the short and the long A.C. arc.

Dr. Slepian pointed out that in the original introduction of the De-ion principle in connection with circuit interruption, it was thought possible to be able to eliminate the use of oil in all circuit breakers.

The "De-ion Grid" is essentially a stack of plates built up of multiple units. Each unit consists of several insulating plates and one magnetic iron plate. There is a long, narrow slot in all the plates and when assembled together these slots form a groove in the complete stack. It is in this groove or slot that the contacts move vertically and the arcs are drawn, generating (in the iron circuit) magnetomotive forces which act on the magnetic field around the arc. This drives the entire length of the arc rapidly into intimate contact with the oil body in the slot and towards the closed end of the slot. The fresh un-ionized gas generated in this way is forced through the entire length of the arc stream. This gas acts as a de-ionizing agent and is most effective in causing interruption after the current zero of the alternating wave is reached. The longer the arc persists the more units are brought into action to interrupt it. This gives a reserve rupturing ability. The number and size of the units is made to suit the various applications. The grids and contacts are located in the oil at the bottom of the bushings. A very simple high pressure contact is used.

It was shown that with oil soaked fibre or fullerboard plates as used in the De-ion grid, the volts ruptured per inch length of gap was about ten times more than would be ruptured if a refractory material such as porcelain were used. The un-ionized oil gas given off by the fibre helps to rupture the arc. The material, being filled with oil, does not deteriorate.

Pictures were shown of various control equipment on test with and without de-ionizing plates and the comparative lack of flame and other manifestations of that nature all pointed to the correct application of the de-ionization principle.

Dr. Slepian's extremely lucid explanation of difficult problems fascinated the large audience which numbered over 200. Following the address, a considerable discussion took place, which gave Dr. Slepian a further opportunity of demonstrating his facile manner of explaining electrical phenomena.

A vote of thanks to the speaker was proposed by A. E. Davison, of the Toronto Section, A.I.E.E., and seconded by Mr. Paulin, M.E.I.C. Thanks were given to the Canadian Westinghouse Company for their hospitality. Refreshments were served at the conclusion.

## London Branch

*H. A. McKay, A.M.E.I.C., Secretary-Treasurer.*
*Jno. R. Rostron, A.M.E.I.C., Branch News Editor.*

The regular monthly meeting of the Branch was held in the City Hall auditorium on March 21st, 1934.

Frank C. Ball, A.M.E.I.C., chairman of the Branch, presided and the speaker of the evening was Mr. Charles G. Hunter, who was introduced by D. M. Bright, A.M.E.I.C.

Modern Principles of Air Conditioning

Mr. Hunter spoke on "Modern Principles of Air Conditioning" and gave "Ionization," the underlying principle of air conditioning, as a vital factor of interest not only to the architect or builder but also to the physician, the physicist, the chemist and all concerned with the normal health of individuals.

He described the atoms which are present in the atmosphere—so small that 50,000,000 are required to make up one linear inch of space. The atoms themselves contain a positive charge of electricity and each is surrounded by electrons containing a negative charge.

He stated that scientists maintain they will be able to lengthen the average span of human life from five to seven years and will be able to cure many ailments such as high blood pressure and arthritis simply by correcting their metabolisms. The secret lies in ionization which is the process of breaking up the atom and separating the electrons or negative charges by cosmic rays, electrical discharges and other scientific means and so producing "ions." Mr. Hunter stated that these "ions" raise the vitality of human beings in a proportion to the amount administered.

In nature preserving its balance "ions" become apparent after thunder storms when a heavy negative charge is brought to earth with rain and lightning, he pointed out, and stated that the cool exhilarating feeling that follows such a storm is in reality the building up of the vitality.

Only recently has man been able to measure "ionization" definitely. It is inhaled into the body chiefly as a sort of energy and this is when the principles of air conditioning come in. As a result science has invented an apparatus to increase it by mechanical means.

Until a few years ago medical authorities were unable to reproduce synthetic secretions similar to those of the ductless glands. They are now beginning to understand that this is a purely electro-chemical process in which "ions" play a great part.

With civilization came many maladies that the medical world was unable to correct It has been found that the ductless glands were not functioning properly under average conditions. Also that people living a simple life walking about in their bare feet were not afflicted with the sicknesses of their more civilized brethren.

The speaker asserted that a temperature of 60 to 70 degrees and a humidity of between 30 and 45 units was best for people.

A chart prepared by the Harvard School of Public Health showed that patients who had been given an "ionization" treatment responded remarkably. Also the response was 50 per cent greater when the patient was grounded to a suitable conductor. Deaths were the highest when "ionization" was at an ebb while the death rate was at its lowest when the atmosphere was most heavily charged with "ions."

He predicted that there would be great changes in architecture and that homes, offices and factories would be built so that each floor was a "ground" to enable the residents to receive the most benefit from the conditioned atmosphere.

A hearty vote of thanks and appreciation was made to the speaker by J. A. Vance, A.M.E.I.C., of Woodstock, and seconded by Major S. W. Archibald, A.M.E.I.C., and unanimously carried by those present, numbering about 40.

## Moncton Branch

*V. C. Blackett, A.M.E.I.C., Secretary-Treasurer.*

"The Contribution of the Aeroplane to Canadian Industrial Development" was the subject of a very interesting address delivered before the Branch, on March 14th, 1934, by Mr. W. B. Burchall, advertising manager, Canadian Airways, Ltd., Montreal. J. G. Mackinnon, A.M.E.I.C., vice-chairman of the Branch, presided. The meeting was open to the public and the attendance was unusually large. Special invitations to be present were sent to members of the Moncton Flying Club and to pupils of the Aberdeen High School.

Mr. Burchall described the part played by aviation in mining, fishing, the fur trade, forestry and engineering. Of particular interest is the service rendered in northern areas. Transport of men and materials, which a few years ago tested human endurance to the limit, is now carried on in comfort and safety. Many of the inhabitants have never seen a train or an automobile, but to them the aeroplane is a common sight. In fact, in the extreme north it is the only means of mechanical transport. Mr. Burchall's remarks were illustrated with numerous slides.

At the conclusion of the address, the chairman called on Mr. W. S. Dalziel, who spoke a few words of appreciation on behalf on the Moncton Flying Club.

A vote of thanks was tendered Mr. Burchall, moved by T. H. Dickson, A.M.E.I.C., seconded by G. E. Smith, A.M.E.I.C.

Sackville Meeting

On March 20th a very instructive address on "Engineering Estimates" was delivered by H. J. Crudge, A.M.E.I.C., before a combined meeting of Moncton Branch and the Engineering Society of Mount Allison. The meeting was held in the Eurhetorian hall of Mount Allison University at Sackville. C. Baggs, president of the Engineering Society, presided.

Estimating, declared Mr. Crudge, is more an art than a science. There are no formulae that can be applied repeatedly except, of course, those that pertain to computation of volumes or quantities of materials. There is never any guarantee that because certain conditions existed on a previous project, they will also be exactly the same on a later one. Webster defines an estimate as "an opinion, as to the value of, formed from imperfect data." The term "imperfect data" is very appropriate, and an estimate is at most times a guess tempered with experience.

Projects, however, cost money and those who provide the funds expect to be told in advance the amount thereof. Demands for accuracy are often most unreasonable, but these the engineer must do his best to satisfy. Handbooks should be used with caution. A lively imagination backed by experience is an invaluable asset.

Take, for example, a concrete job. It is not enough to calculate the concrete and excavation quantities, arbitrarily assign unit costs and let it go at that. Instead, every possible contingency involving the spending of money must be considered. The engineer may first enquire as to the excavation. Is it of a sandy nature or is it clay? Will water be encountered? If so, it must be removed and then there is the question of the cost of, say, a gasoline pump, suction hose, flume, gas, oil and pump attendant, and possibly rubber boots for workmen, Perhaps the excavated material must be removed from the site, another item of expense. With regard to the concrete, there will be the cost of freight on cement, sand and gravel, truckage from railway siding to site, water supply, storage of cement, possible heating of materials in cold weather, etc. These are but a few of the cost items to be considered, but enough to show that the engineer must visualize every operation from start to finish of a project and use judgment in estimating the probable cost of each.

In conclusion, Mr. Crudge spoke briefly on the various types of bids, lump sum, cost plus percentage and cost plus a fixed fee.

A vote of thanks to the speaker was moved by J. K. Kerr, seconded by Robert Pike.

## Ottawa Branch

*F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.*

"The Northwest State Railways of India" was the subject of a noon luncheon address at the Chateau Laurier before the local Branch on March 8th, 1934. Colonel E. J. C. Schmidlin, Director of Engineer Services of the Department of National Defence, a graduate of the Royal Military College who spent several years of his career in the Mechanical Engineering Department of the above-mentioned railways, was the speaker.

Colonel Schmidlin was introduced by Alan K. Hay, A.M.E.I.C., chairman of the local Branch. Additional head table guests, all of whom were also graduates of the same institution, were: Brigadier C. F. Constantine, Brigadier A. C. Caldwell, Major-General H. A. Panet, Major Walter Blue, A.M.E.I.C., F. H. Peters, M.E.I.C., Colonel N. O. Carr, Colonel W. F. Hadley, A.M.E.I.C., Colonel H. E. Boak, Major E. L. M. Burns and Major K. M. Holloway.

Northwest State Railways of India

The railways of India, stated the speaker, have a total track mileage of about 42,000 miles. Some 74 per cent are state-owned, while nearly 50 per cent are state-managed. In the Punjab area, lying along the northwest frontier of India, the Northwestern Railway, with its 7,100 miles of track, is state-owned and operated, comprising a system not only of commercial importance but also of great stategic importance from a military standpoint. It forms a network over the whole Punjab with spurs reaching into Baluchistan to the very border of Afghanistan and also up to the summit of the famous Khyber Pass.

In the Punjab proper, the country is flat or gently rolling, the railway grades being easy. In the northwestern part and in Baluchistan, foothills and mountain spurs have had to be contended with so that the grades are as steep as 3 per cent in places and curves as sharp as 8 per cent. Much tunnelling has also been necessary. In some of these outlying parts, a 2 foot 6 inch gauge has been used, the greater part of the railway, however, being the standard Indian gauge, 5 feet 6 inches. The roadbed is first class throughout, the rail used being of a type familiar in this country, but held down with screw spikes on wooden ties.

Many of the great bridges of the Northwestern Railway were originally built forty years or more ago, with native labour constituting 80 to 90 per cent of the working force and under the most severe climatic conditions, and the greatest credit was due to the engineers of that day. It was the deeds of these men that inspired in Rudyard Kipling his great admiration for the engineering profession and provided him with material for some of his finest poems and stories.

Except in dimensions and in certain modifications required by climatic conditions, the rolling stock on Indian railways largely follows English practice. Passenger classification is used, as in England, with a corresponding range in fares. There are four classes: first, second, intermediate and third. Accommodation, on long-distance trains at least, is very good. The third class traffic is heavy on most lines, the total number of passengers carried on all Indian railways being over 600 millions per year. As the native does not mind being crowded, it has been possible to keep fares for third class well below one cent per mile.

Up to the present, the lack of roads has kept the problem of competition from motor-vehicles in the background. Its possible arrival has not been forgotten, however, and the Railway Board has been studying the problem in Europe and America, with a view to preventing in India the conflict of interests which has been so serious in the western countries.

## Peterborough Branch

*H. R. Sills, Jr.E.I.C., Secretary.*
*W. T. Fanjoy, Jr.E.I.C., Branch News Editor.*

Contribution of the Aeroplane to Canadian Industrial Development

William B. Burchall, advertising manager of Canadian Airways, Limited, addressed the Peterborough Branch at their regular meeting, Thursday evening, April 12th, 1934.

Mr. Burchall received his technical education at Manchester Technical College and his first connection with aviation was with the Sopwith Aviation Company, Kingston-on-Thames, England, from 1915-1919. He joined the staff of Western Canada Airways (now Canadian Airways, Limited) in 1927.

In discussing the contribution of the aeroplane to Canadian industrial development, Mr. Burchall stated that it was to the mining industry that aerial transport had made its greatest contribution. Less than ten years ago the first air route was established for the regular conveyance of passengers, mails and freight. This was to serve the gold fields at Rouyn. Later, in 1926, services were instituted at Red Lake, Ont., and these are still in operation. In the intervening years, over 393,000 pounds of mail, 13,153 passengers and 3,576,182 pounds of freight have been carried by Canadian Airways in the Red lake mining area.

Distance from rail head no longer precludes exploitation, for mining activity is prevalent almost to the shores of the Arctic ocean. In the newer productive mining areas the aeroplane alone provides speedy mail and passenger service.

Not only to mining, but to other primary industries—the fur trade, fishing, forestry, engineering—the aeroplane has rendered valuable assistance.

Air freighting of fresh fish from the lakes of northern Manitoba and Saskatchewan is a new development. The fish are caught in the winter time and have to be transported into the United States without being frozen. Over 60,000 pounds of fresh fish have been transported by air from the Lake of the Woods area during the present winter.

The aerial survey is being used by well informed civil engineers to solve many varied problems connected with town planning, preliminary surveys for the construction of hydro-electric projects, railroad and transmission line location.

## Quebec Branch

*Jules Joyal, A.M.E.I.C., Secretary-Treasurer.*

On Monday evening, March 12th, 1934, the Quebec Branch had the privilege of being addressed by Mr. H. P. Burrell, vice-president and general manager of Franki Compressed Pile Company of Canada, Limited.

J. M. H. Cimon, M.E.I.C., chairman of the Branch, presided, and introduced the speaker.

The Evolution of the Cast-in-Place Concrete Pile

The speaker first said that piles are used to provide proper foundations, and he traced their use to the time of the Egyptians. The piles used at that time consisted merely of sand filling a hole dug in clay or similar soil; however these served their purpose and were capable of transmitting considerable loads to firmer ground. As sand piles were unable to resist horizontal forces, the timber pile was introduced, and later, due to the short life of timber above the ground water level, the concrete pile was introduced.

The first engineer to use a concrete pile was Mr. Hennebique, a Frenchman, who in 1897 used a pile of concrete reinforced with steel and moulded before being driven into the ground. This precast pile had the advantage of being rot and fireproof, but it had certain disadvantages, and to overcome these a number of cast-in-place piles were developed.

The first concrete pile used in America was driven in 1905 by Mr. A. A. Raymond, his pile being the first cast-in-place pile.

Various types of concrete cast-in-place piles were described and commented upon by Mr. Burrell, viz. the Raymond, the Simplex pile, the Pedestal, the Thornley and the Vibro piles. All these piles are really variants of the timber pile, and as a contrast, the last pile described by Mr. Burrell, the Franki pile, was a radical departure. This pile, of Belgian origin, was introduced into North America about two years ago.

The present method of driving Franki piles consists of placing a charge of concrete in a steel tube of great strength; this charge is then compacted by a drop hammer which falls inside the tube pushing the concrete against the tube walls until the two form a single unit, then the hammer drives the concrete plug, which is still unset, into the ground and the plug pulls the tube with it. When a firm stratum is reached, the tube is anchored to the driver by means of cables and the concrete plug is driven out while small charges of concrete are added as driving proceeds.

By this means an enlarged base is formed at the bottom of the pile and when the concrete is so dense that the driving force tends to lift the tube out of the ground, the bulb may be considered as finished.

A charge of concrete is then placed in the tube, the hammer rested on it, the tube slightly withdrawn and the hammer is used to drive the concrete as already described and so on. The weight of the hammer is 3 tons and drops up to 30 feet are not unusual.

On extremely soft ground where no firm bottom can be reached, a different type of pile has been evolved which consists of forming an artificial stratum of conglomerate for the pile to rest on. The tube is sunk in the ordinary way to 20 or 30 feet; the tube is then anchored and the plug driven out, large stones or other material of similar nature coated with cement grout are put in the tube and driven out by means of a hammer; thus a mass of coarse material of perhaps 5 or 6 cubic yards is driven out.

Louis Beaudry, A.M.E.I.C., moved a hearty vote of thanks to the speaker.

## Saint John Branch

*S. Hogg, A.M.E.I.C., Secretary-Treasurer.*
*C. M. Hare, S.E.I.C., Branch News Editor.*

On Tuesday evening, March 13th, 1934, in the Admiral Beatty hotel the Saint John Branch of The Engineering Institute of Canada, with the chairman, G. A. Vandervoort, A.M.E.I.C., in the chair, heard Mr. W. B. Burchall of the Canadian Airways Ltd. give a very interesting address on "The Contribution of the Aeroplane to Canadian Industrial Development."

About forty members and guests were present. The lecture was illustrated with approximately one hundred slides, depicting the activities of Canadian Airways in the north and elsewhere.

THE CONTRIBUTION OF THE AEROPLANE TO CANADIAN INDUSTRIAL DEVELOPMENT

In a foreword Mr. Burchall explained the way in which the usefulness of heavier than air machines had expanded. The aeroplane, at first regarded as a military scout, developed rapidly during the war. With the coming of peace, this increased knowledge of the different types was put to good use in the field of exploration, survey and transport.

In the immediate post-war period, before the specialized types of to-day had developed, the aeroplane was used largely in new services which did not compete with ground services then in existence. With the gradual specialization of types, services became more diverse, and the speaker classed them as services exclusive to aircraft, such as, aerial sketching, vertical and oblique photography, dusting, and forestry patrol; and others competing directly with land services, such as transportation of mails, passenger and express.

The slides were then shown while the speaker described details of aircraft work.

At the conclusion of the address Mr. Burchall answered members' questions. A vote of thanks was moved, seconded, and tendered to the speaker by the chairman. On motion the meeting adjourned at 10.30 p.m.

## Saskatchewan Branch

*S. Young, A.M.E.I.C., Secretary-Treasurer.*

SEVENTEENTH ANNUAL MEETING

The seventeenth annual meeting of the Saskatchewan Branch was held in the Hotel Champlain, Regina, Friday evening, March 16th, 1934, being preceded by a dinner at which thirty-eight members and guests were in attendance.

Immediately following the dinner, P. C. Perry, A.M.E.I.C., chairman, welcomed the guests, after which several items of business received attention.

The chairman then introduced the speaker of the evening, S. E. Slipper, chief geologist, Canadian Western Natural Gas, Light, Heat and Power Co., Calgary, Alberta, the subject of his address being "Gas and Oil Possibilities in Saskatchewan."

Mr. Slipper briefly outlined the possibilities of gas and oil as falling under four heads, namely, sufficient source, sufficient metamorphosis, sufficient porosity and sufficient structure.

Petroleum is dissimilar in origin to coal, resulting from marine deposits of which it may be said that southern and western Saskatchewan is plentifully supplied.

After explaining the effect of static and dynamic metamorphism, Mr. Slipper proceeded to explain the effects of these forces on the formation of petroleum. Static metamorphism results ultimately in methane gas and carbon at a depth of approximately 20,000 feet. Consequently the formation of petroleum in Alberta and Saskatchewan must have resulted from dynamic metamorphism caused by lateral pressure from the building up of the Rocky Mountains. Tracing the various types of petroleum in Alberta eastward towards Saskatchewan one must conclude that only heavy oil and dry gases will be found in Saskatchewan.

The speaker then described the several types of structure of sufficient porosity (reservoir), including in these sands, sandstones and dolomitic limestones.

If there is insufficient structure, he stated, the reservoir capacity is of little or no commercial value.

Mr. Slipper concluded his address by stating that Saskatchewan is not as well off in petroleum possibilities as Alberta. On the other hand there are possibilities which he classified as follows:—

| | Saskatchewan | | | |
|---|---|---|---|---|
| | S.W. | N.W. | Central | S.E. |
| Sufficient source | G. | G. | G. | G. |
| Sufficient metamorphosis | M. | M. | P. | P. |
| Sufficient porosity | M. | M. | M. | M. |
| Sufficient structure | M. | M. | M. | F. |

Note: G—good. M—fair. P—poor.

During the discussion, in which several members and guests took part, he explained the several geophysical methods of discovery.

A hearty vote of thanks was tendered the speaker on motion of D. A. R. McCannell, M.E.I.C., and C. J. McGavin, A.M.E.I.C.

The scrutineers then reported the newly elected officers for the ensuing year.

## Toronto Branch

*W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.*
*O. Holden, A.M.E.I.C., Branch News Editor.*

On February 1st, 1934, the Toronto Branch of The Engineering Institute of Canada met in the Debates room of Hart House, following an informal luncheon.

VALUATION AND DEPRECIATION

The meeting was presided over by A. B. Crealock, A.M.E.I.C., chairman of the Toronto Branch, who introduced the speaker, Mr. W. G. Moulton-Redwood. Mr. Moulton-Redwood presented a most interesting and instructive paper on the subject of "Valuation and Depreciation." Following a few introductory remarks, the speaker emphasized the necessity of co-operation between the engineer and accountant to show fair values. He then showed an interesting curve of "Average price trend," extending from the year 1912 to 1932, also a valuation form used in his own practice for collecting the engineering and accounting data. Mr. Moulton-Redwood pointed out that the aim of the work is to "convince all interested parties of the fairness and impartiality of the work." The speaker described depreciation as being a combination of wear and tear, and inadequacy or obsolescence. He outlined his method of arriving at depreciation based on original costs, which he stated was a method generally followed. Mr. Moulton-Redwood outlined the various methods of setting up depreciation for accounting purposes, and showed a table used in his practice to obtain uniformity in the collecting of data.

The subject was discussed by various members present, and a number of interesting points were brought out. Following the discussion, a hearty vote of thanks was tendered the speaker.

## Victoria Branch

*I. C. Barltrop, A.M.E.I.C., Secretary-Treasurer.*
*Kenneth Reid, Jr.E.I.C., Branch News Editor.*

The Victoria Branch of The Institute held its third annual bridge party on Saturday evening, April 7th, 1934, and through the kindness of Mr. and Mrs. F. C. Green their commodious home on Foul Bay road was again offered for the occasion. Ten tables of bridge were placed in the living room, the players comprising members of the Victoria Branch, their wives and friends.

Auction bridge was played from 8.30 to 11.30 followed by a buffet supper served in the adjacent dining room, tea and coffee being poured by Mrs. I. C. Barltrop and Mrs. Owen Smith. The table and living room decorations consisted of bowls of tulips and other flowers. The prizes for the evening were graciously presented to the respective winners by Mrs. Green.

An exceedingly enjoyable evening was concluded with a hearty vote of thanks being extended to Mr. and Mrs. Green for their kind hospitality by Major H. L. Swan, M.E.I.C., on behalf of the guests, this being the third consecutive occasion that such had been enjoyed by the Branch.

## Winnipeg Branch

*E. W. M. James, A.M.E.I.C., Secretary-Treasurer.*
*E. V. Caton, M.E.I.C., Branch News Editor.*

At the regular meeting of the Winnipeg Branch of The Engineering Institute of Canada, held on Thursday evening, March 1st, 1934 in Theatre "A," University building, A. J. Taunton, A.M.E.I.C., in the chair, a paper was given by Mr. J. W. Tomlinson on "Electric Soil Heating."

Mr. Tomlinson was particularly well qualified to speak on this matter, as in addition to being a graduate electrical engineer, he has had actual commercial experience in market gardening and marketing of farm produce. He dealt with actual results obtained from experiments carried on at the Manitoba Agricultural College, and under commercial conditions (of which he was in charge) which was sponsored by the Winnipeg Electric Company.

The speaker stated that electric soil heating is the application of electricity to horticulture. It is the use of electricity to supply heat directly to the soil to promote quicker and more uniform plant growth in hotbeds, on greenhouse benches and even in the open field. The heat is supplied by means of a low temperature soil heating cable which is buried in the soil. The amount of heat supplied is regulated to requirements by hand or preferably by an electric thermostat.

The use of electricity in this way was first introduced in Norway in 1927 and has spread from there to Sweden and to most other northern European countries and thence to the United States and Canada.

Only partial records are available but they indicate that upwards of one million kilowatt hours of electricity were used for electric soil heating in the United States in 1932. By the end of May, 1933, two thousand soil heating thermostats and three hundred and thirty thousand feet of soil heating cable were sold; and the power consumption was four times that for 1932. Climatic conditions and low power rates make Canada an exceptionally suitable field for electric soil heating.

The logical method of introducing this new agricultural tool to the grower is to operate typical installations in the territory where it is to be sold. In 1932 numerous installations were started in the market gardening districts around Montreal, the Shawinigan Power Company being the chief sponsor. In Ontario the Hydro-Electric Power Commission has taken an active interest in several installations. In Manitoba the Winnipeg Electric Company is sponsoring test installations, and in British Columbia the B.C. Electric Company has undertaken to prove its practical value. The fact that the power companies have been behind most of the experimental installations leads to the conclusion that electric soil heating must constitute a desirable load. Some of its desirable features are: 1, 100 per cent power factor; 2, high load factor; 3, 70 to 75 per cent night load; 4, peak consumption during early spring months; 5, mostly connected to underloaded rural distribution feeders.

The advantages to the grower are equally outstanding, the principal one being a clean, reliable and readily controlled source of heat which can be applied directly to the soil.

The meeting closed with a hearty vote of thanks being tendered to Mr. Tomlinson.

# Preliminary Notice

### of Applications for Admission and for Transfer

April 27th, 1934

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described in June, 1934.

R. J. Durley, Secretary.

---

* The professional requirements are as follows:—

**A Member** shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

**An Associate Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

#### FOR ADMISSION

BECK—HUMPHREY CAMPBELL, of Sandringham, Norfolk, England, Born at Wyton, Huntingdonshire, England, Dec. 20th, 1905; Educ., Diploma in Electrical Engineering Sciences, Swiss Federal Technical University, Zurich, 1928; 1926 (3 mos.), workshop experience at Ateliers de Construction Mécaniques de Vevey, Switzerland; 1927 (2 mos.), workshop experience, and 1928-32, mercury arc rectifier dept., Brown Boveri & Co., Baden, Switzerland. Execution of various contracts in Great Britain and Canada. Design of stations and ordering of apparatus. Completing works and putting in operation; 1932-34, res. engr. in Canada for same company (Compressors, steam turbines, rectifiers. Inspection, sales, mtce.). Now returning to company's head office in Baden, Switzerland.

References: K. B. Thornton, F. T. Kaelin, F. S. Keith, N. H. A. Eager, J. H. Thompson, L. E. Krebser.

CORNER—EDWARD PONSONBY, of Montreal, Que., Born at Georgetown, Demerara, British Guiana, Mar. 6th, 1888; Educ., Glasgow Technical College, 1906-11; (formerly Assoc. Member, Inst. M.E. (Gr. Britain); 1906-12, apprenticeship, 3 years general shops, 2 years 2 mos. drawing office, Glasgow, Scotland (John McNeil & Co., and A. & A. W. McAnie); 1914-17, erection and operation, including design of several large chemical plants for manufacture of pyroligneous products, acetone, formaldehyde, ether-alcohol distillation, etc., Blair, Campbell & McLean, Govan, Scotland; 1917, chief engr., electrolytic zinc extraction plant at Swansea, Wales, for British Metals Extraction Corpn., completed new power installn., Babcock boilers, Williams & Robinson engines, coal-conveyor equipment, etc.; 1917-19, drawing office, Fawcett Preston & Co., Liverpool, England; 1919-30, technical representative for British West Indies on behalf of Fawcett Preston & Co.; 1930 to date, representative, Province of Quebec, Hamilton Gear and Machine Co., Toronto, Ont.

References: C. B. Hamilton, Jr., C. D. Woolward, K. G. Cameron, W. Griesbach, W. B. McLean, R. W. Farmer, R. J. Mattson.

GILBERT—GORDON MACDONALD, of Vancouver, B.C., Born at Ottawa, Ont., June 2nd, 1899; B.Sc. (C.E.), Univ. of Man., 1926. Member of B.C. Assn. of Prof. Engrs. by exam.; since graduation in 1926, continuously employed by the Vancouver and District Joint Sewerage and Drainage Board, as asst. to the chief engineer; Resident engr. on different constrn. jobs, at present acting engr. and supt. of the Board.

References: E. A. Cleveland, W. H. Powell, J. R. Grant, R. Rowe, W. O. Scott.

GILCHRIST—JOHN, of 6 Weredale Park, Westmount, Que., Born at Glasgow, Scotland, July 31st, 1907; Educ., B.Sc. (E.E.), Univ. of N.B., 1932; 1922-24, ap'tice, machine and fitting shops, Barr & Stroud, Glasgow, Scotland; 1926-29, control survey, International Paper Co., field and office work, Quebec, N.B. and Nfld.; 1930 (summer), summer course in signalling and communication, R.C.C.S., Camp Borden, Ont.; 1931 (summer), boiler survey re location of stokers, E. S. Stephenson & Co., Saint John, and concrete inspection, Saint John Harbour Commission; 1932 (summer), instrument work on road constrn., City of Saint John, N.B.; Oct. 1933 to date, designer and dftsman., General Steel Wares, Montreal, Que.

STIRLING—JOHN BERTRAM, of Montreal, Que., Born at Dundas, Ont., Nov. 29th, 1888; Educ., B.Sc., Queen's Univ., 1911; R.P.E. of N.B.; 1911-16, asst. engr. with Willis Chipman (Chipman & Power), Toronto and Winnipeg; 1917, overseas, C.E.F.; for the past 16 years to date, field engr. and supervising engr. on many contracts with E. G. M. Cape and Company, and for the past 6 years a partner of this firm. In responsible charge of many large works throughout Canada.

References: E. G. M. Cape, J. M. R. Fairbairn, A. Gray, D. C. Tennant, G. R. MacLeod, C. J. Desbaillets.

TAYLOR—ANDREW, of 346 Union Ave., Winnipeg, Man., Born at Edinburgh, Scotland, Nov. 2nd, 1907; Educ., B.Sc. (C.E.), Univ. of Man., 1931; D.L.S. 1932; M.L.S. 1933; 1929-30 (summers), asst. on survey in Peace River, Dept. of Interior; 1931 to date, field asst. and at present plan calculator and examiner, Surveys Branch, Dept. of Mines and Natural Resources, Manitoba Govt.

References: S. E. McColl, G. H. Herriot, D. N. Sharpe, J. N. Finlayson, A. E. Macdonald.

### FOR TRANSFER FROM THE CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

EVANS—EDWIN RONALD, of Lewisville, N.B., Born at Hampton, N.B., Aug. 1st, 1891; Educ., 1907-08, School of Applied Science, Mount Allison Univ.; Diploma in Municipal, Railroad and Civil Engrg., I.C.S.; Diploma in Struct'l Engrg., Wilson Engineering Corporation, Cambridge, Mass.; R.P.E. of N.B. 1920; 1909 (Aug.-Dec.), in charge and instr'man., Montreal Gen. Contracting Co., deepening All Candn. Channel, St. Lawrence River, Kingston to Brockville; 1910-11, as above with one asst.; 1912 (Jan.-Apr.), engr. in charge of party and instr'man., Hydrographic surveys, proposed car ferry wharves, etc., between N.B. and P.E.I.; 1912-15, engr. in charge party, rly. surveys, Buctouche to Loggieville, N.B., Prelim. and location, Design and erection trestle M. & B. Ry., Engr. in charge realignment surveys, plans, etc., Engr. in charge mtce. of way and supt.; 1915-19, overseas. C.F.A., Capt.; 1919 to 1933, with Can. Nat. Rlys., as follows: 1919-25, asst. engr. in charge constrn. (field supervision) Moncton yard and engine facilities (except bldg.), Moncton and Island yard rearrangement, Buctouche River rly. bridge, substructure of concrete abutments and piers; 1925-30, asst. engr. in charge field constrn., Bridgewater engine and boiler houses, Halifax Ocean Terminal transit sheds (later part), Halifax Ocean Terminal immigration facilities, C.N.R. Hotel and station foundations, Halifax. Res. Engr. for rly. on superstructure being erected by contractor; 1930-31, acting harbour engr., Moncton, in charge of reconstrn. of ferry terminal work at Cape Tormentine and Port Borden incl. wharf constrn. and installn. of fuel oil storage system at Port Borden; 1931-32, res. engr., constrn. of Saint John Rly. Station; 1932-33, res. engr., reconstrn. of Pier No. 4, Saint John River Bridge, Fredericton, N.B.; at present, private practice, civil and structural engr., Lewisville, N.B.

References: F. H. Fay, C. B. Brown, H. T. Hazen, H. J. Crudge, C. S. G. Rogers, A. S. Gunn, E. G. Evans.

GAHERTY—GEOFFREY ABBOTT, of Montreal, Que., Born at Dickenson's Landing, Ont., April 3rd, 1889; Educ., B.Eng., Dalhousie Univ., 1909; 1909-12, asst. engr., 1913-14, designing engr., Western Canada Power Co. Ltd.; 1914-19, overseas, C.E.F., Capt.; 1919-20, surveys and mill designs for Keeley Silver Mines, Ltd.; 1920 to date, with Montreal Engineering Co. Ltd., from 1922, chief engr. of this company, and from 1923, chief engr. of Calgary Power Co. Ltd., and at present President of both companies. (*A.M. 1921.*)

### FOR TRANSFER FROM THE CLASS OF JUNIOR

O'HALLORAN—JAMES, of Quebec, Que., Born at Montreal, May 27th, 1900; Educ., B.Sc., McGill Univ., 1921; 1917 (summer), dftsman for J. B. McRae, M.E.I.C., Ottawa; 1918 (summer), survey party, Dept. of Mines; 1920 (summer), asst. engr., Abitibi Power & Paper Co. Ltd., Iroquois Falls; 1921-24, asst. engr., with same company; 1924-27, asst. engr., Price Bros. & Co. Ltd., Kenogami, Que.; 1927 to date, engr. in charge of all mtce. and constrn. work, Anglo-Canadian Pulp & Paper Mills Ltd., Quebec, Que. (*S. 1919, Jr. 1922.*)

References: A. A. MacDiarmid, C. M. McKergow, E. Brown, C. N. Shanly, F. S. B. Heward.

SEXTON—JACK KENNETH, of Seebe, Alta., Born at London, England, Oct. 4th, 1904; Educ., B.Sc. (C.E.), Univ. of Sask., 1928; R.P.E. Alta.; 1925-26 (summers), chainman; 1927 (summer), instr'man in charge of municipal surveying party, Phillips, Stewart & Lee, Saskatoon, Sask.; 1928-31, with Calgary Power Company Ltd., asst. engr. on dam repair work; field engr. during constrn. of Ghost water power project; asst. to production supt., supervising mtce. and improvement, constrn., investigating proposed power schemes, testing hydraulic turbines, hydraulic studies of hydro-electric production for maximum efficiency, etc.; 1931-33, full time member of Faculty of Applied Science, Univ. of Alberta, demonstrating and instructing in civil engrg. subjects; at present employed at hydro-electric plant at Seebe, Alta., for Calgary Power Company. (*S. 1927, Jr. 1929.*)

References: R. S. L. Wilson, H. J. McLean, C. J. Mackenzie, G. H. Thompson, H. R. Webb, B. Russell, G. A. Gaherty.

WAY—WILLIAM RUSSELL, of 4564 Draper Ave., Montreal, Que., Born at North Bay, Ont., May 29th, 1896; Educ., B.Sc. (E.E.), McGill Univ., 1918; 1914-17 (summer work), rodman, C.P.R., underground surveying, Hollinger Gold Mines, dftsman., Nor. Electric Co.; 1918 to date, with the Shawinigan Water & Power Company, Montreal, as follows: 1918-23, asst. engr.; 1923-28, chief system operator; 1928-30, system operating engr.; 1930 to date, asst. supt. of operation. (*S. 1916, Jr. 1919*).

References: G. R. Hale, A. S. Runciman, F. S. Keith, J. A. McCrory, J. Morse, C. V. Christie, E. Brown.

### FOR TRANSFER FROM THE CLASS OF STUDENT

COWAN—ELIJAH, of Dolbeau, Que., Born at Middlesborough, Yorks, England, March 6th, 1900; Educ., B.A.Sc., Univ. of Toronto, 1923; 1923-25, dftsman., St. Lawrence Paper Mills; 1925-26, dftsman., Price Bros. & Co. Ltd.; 1926-27. designer on second extension, St. Lawrence Paper Mills; 1927-33, with International Paper Co., New York, 4 years, designing engr., 2 years asst. engr., mfg. dept.; at present, control man, Lake St. John Power & Paper Co. Ltd., Dolbeau, Que. (*S. 1921.*)

References: R. L. Weldon, A. A. MacDiarmid, G. F. Layne, F. O. White, J. F. Plow.

HALTALIN—CLIFFORD PAUL, of 636 Toronto St., Winnipeg, Man., Born at Winnipeg, Dec. 28th, 1906; Educ., B.Sc. (E.E.), Univ. of Man., 1929; 1927 (summer), refrigeration layouts, etc., Tully Ice Machine Co., Winnipeg; 1928 (summer), dfting mill layout for Flin Flon Mines with General Engineering Co. of New York, consltg. engrs. for Hudson Bay Mining & Smelting Co., Winnipeg; 1929 to date, with Winnipeg Electric Co., Winnipeg, Man., 1929-32, substation design, transmission line and water power calculations, 1932-34, design, layout and installn. of electric pumping equipment and electric boilers, and at present, asst. engr. in charge of dfting office. (*S. 1928.*)

References: E. V. Caton, L. M. Hovey, E. P. Fetherstonhaugh, J. N. Finlayson, T. H. Kirby.

LORD—GEORGE ROSS, of Toronto, Ont., Born at Peterborough, Ont., Feb. 2nd, 1906; Educ., B.A.Sc., Univ. of Toronto, 1929. M.Sc., Mass. Inst. Tech., 1933; 1933-34, German engrg. universities; 1927 (summer), Peterborough Utilities Commn.; 1928 (summer), General Motors of Canada Ltd., Oshawa, and from Apr. 1929 to June 1930, with same company in charge of cost control, tools and gauges for inspection dept.; 1930-31, instructor, hydraulic lab., Univ. of Toronto; 1931-32, with Technical Service Council, Toronto; 1932-33 (15 mos.), Freeman Traveller from the American Soc. of Civil Engrs., study of hydraulic methods in Europe; Jan. 1934 to date, lecturer in mech'l. engrg., Univ. of Toronto, Toronto, Ont. (*S. 1927.*)

References: R. W. Angus, C. H. Mitchell, R. E. Smythe, R. L. Dobbin, W. S. Wilson.

## Ways to Kill a Society

1. Don't come to the meetings.
2. But if you do come, come late.
3. If the weather doesn't suit you, don't think of coming.
4. If you do attend a meeting, find fault with the work of the officers and other members.
5. Never accept an office, as it is easier to criticize than to do things.
6. Nevertheless, get sore if you are not appointed on a committee, but if you are, do not attend committee meetings.
7. If asked by the chairman to give your opinion regarding some important matter, tell him you have nothing to say. After the meeting tell everyone how things ought to be done.
8. Do nothing more than is absolutely necessary; but when other members roll up their sleeves and willingly, unselfishly use their ability to help matters along, howl that the association is run by a clique.
9. Hold back your dues as long as possible or don't pay at all.
10. Don't bother about getting new members. Let the secretary do it.
11. When a banquet is given, tell everybody money is being wasted on blowouts which make a big noise and accomplish nothing.
12. When no banquets are given say the association is dead and needs a can tied to it.
13. Don't ask for a banquet ticket until all are sold.
14. Then swear you've been cheated out of yours.
15. If you do get a ticket, don't pay for it.
16. If asked to sit at the speaker's table, modestly refuse.
17. If you are not asked, resign from the association.
18. If you don't receive a bill for your dues, don't pay.
19. If you receive a bill after you've paid, resign from the association.
20. Don't tell the association how it can help you; but if it doesn't help you, resign.
21. If you receive service without joining, don't think of joining.
22. If the association doesn't correct abuses in your neighbour's business, howl that nothing is done.
23. If it calls attention to abuses in your own, resign from the association.
24. Keep your eye open for something wrong and when you find it, resign.
25. At every opportunity threaten to resign and then get your friends to resign.
26. When you attend a meeting, vote to do something and then go home and do the opposite.
27. Agree to everything said at the meeting and disagree with it outside.
28. When asked for information, don't give it.
29. Cuss the association for the incompleteness of its information.
30. Get all the association gives you but don't give it anything except h—.
31. **When everything else fails, cuss the Secretary.**

—*Brooklyn Engineers' Club Bulletin and Cleveland Engineering.*

## Motor Car Silencing

It will be remembered that in 1932 the subject of noise came before Section G (Engineering) of the British Association, and that as a result of discussion arising out of Dr. G. W. Kaye's paper on the subject a committee was appointed to consider the practicability of reducing noise resulting from engineering developments. This was followed up by a paper in 1933 by Mr. R. S. Capon which dealt mainly with the reduction of noises in and arising from aeroplanes. Since the Leicester meeting the committee's attention has been directed to the question of reducing street noises due to motor traffic.

Although matters are still in a somewhat early stage, we are able to state that at the Aberdeen meeting considerable prominence will be given to this question. The programme is likely to find place for two or three papers on the subject, one dealing with motor-car and motor-cycle silencing, one with the measurement of noise, and a third with objectionable horns. In addition, the committee hope to be able to arrange for a practical demonstration during one of the afternoons, at which, if plans can be carried out, a motor-car of the sports type and a motor-bicycle will be run over a course unsilenced and then fitted with silencers of different design.

It is a fact that though efforts have been made to check motor noise, so far the results have remained disappointing, and it evidently requires the development of a strong public feeling on the matter before it will be taken in hand properly by the authorities. The organization of the demonstration will be in the hands of Professor T. R. Cave-Brown-Cave, C.B.E., University College, Southampton.—*Engineering.*

---

It has been noted that the *Canadian Ohio Brass Co. Ltd., Montreal,* moved their offices on May 1st to 1107 Dominion Square Building, 1010 St. Catherine St. West. They were formerly located in the Canada Cement Building. Their telephone number at the new address is Harbour 2343.

# EMPLOYMENT SERVICE BUREAU

**The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.**

*All correspondence should be addressed to*

**The Employment Service Bureau, The Engineering Institute of Canada**
**2050 Mansfield Street, Montreal**

## Situation Vacant

ENGINEER, required by a progressive Canadian company for sales and service work. Should be a graduate in chemical or mechanical engineering and have experience in combustion work or the operation of metallurgical or reheating furnaces. Apply to Box No. 984-V.

CIVIL ENGINEER. An established general contractor and engineer in Quebec would like to get in touch with a young engineer (civil preferably), having business and construction ability and a knowledge of French and estimating; of saving habits and pleasing personality, willing to undertake any work and able to partially finance himself to begin with and later, if satisfactory, to take an interest in the company. Apply to Box No. 1005-V.

## Situations Wanted

MECHANICAL ENGINEER, Canadian, with technical training and executive experience in both Cansdian and American industries, particularly plant layout, equipment, planning and production control methods, is open for employment with company desirous of improving manufacturing methods, lowering costs and preparing for business expansion. Apply to Box No. 35-W.

MECHANICAL ENGINEER, A.M.E.I.C. Married. Experience in machine shops, erection and maintenance of industrial plant mechanical and structural design. Reads German, French, Dutch and Spanish. Seeks any suitable position. Apply to Box No. 84-W.

PURCHASING ENGINEER, graduate mechanical engineer, Canadian, married, 34 years of age, with 13 years' experience in the industrial field, including design, construction and operation, 8 years of which had to do with the development of specifications and ordering of equipment and materials for plant extensions and maintenance; one year engaged on saie of surplus construction equipment. Full details upon request. Apply to Box No. 161-W.

CIVIL ENGINEER, age 44, open for employment anywhere, experience covers about 20 years' active work, including 7 years on municipal engineering, 2 years as Town Manager, 3 years on railway construction, 3 years on the staff of a provincial highway department, 2 years as contractor's superintendent on pavement construction. Apply to Box No. 216 W.

REINFORCED CONCRETE ENGINEER, B.Sc., P.E.Q., eight years experience in construction design of industrial buildings, office buildings, apartment houses, etc. Age 30. Married. Apply to Box No. 257 W.

ELECTRICAL ENGINEER, B.Sc., '28, Canadian. Age 25. Experience includes two summers with power company; thirteen months test course with C.G.E. Co ; telephone engineering, and the past thirty months with a large power company in operation and maintenance engineering. Location immaterial and available immediately. Apply to Box No. 266-W.

MECHANICAL ENGINEER, age 28, nine years allround experience, Grad. Inst. of Mech. Engs. England, S.E.I.C. Technical and practical training with first class English firm of general engineers; shop, foundry and drawing office experience in steam and Diesel engines, asphalt, concrete machinery, boilers, power plants, road rollers, etc. Experience in heating and ventilation design and equipment; 18 months designing draughtsman with Montreal consulting engineers. 2½ years sales experience, steam and hot water heating systems, power plant equipment, machinery, oil-burning apparatus. Canadian 4th class Marine Engineers Certificate; C.N.S. experience. Available at short notice. Apply to Box No. 270-W.

DESIGNING DRAUGHTSMAN, experience in layout of steam power house equipment and piping. Wide experience in mechanical drive and details of machinery, gearing, and hoists. Accustomed to layout of small mill buildings of steel and timber, structural design and details. Good references. Present location Montreal. Apply to Box No. 329-W.

PLANE-TABLE TOPOGRAPHER, B.Sc., in C.E. Thoroughly experienced in modern field mapping methods including ground control for aerial surveys. Fast and efficient in surveys for construction, hydro-electric and geological investigations. Apply to Box No. 431-W.

ELECTRICAL ENGINEER, B.Sc., A.M.E.I.C., Am.A.I.E.E., age 30, single. Eight years experience H.E. and steam power plants, substations, etc., shop layouts, steel and concrete design. Location immaterial. Available immediately. Apply to Box No. 435-W.

CIVIL ENGINEER, B.A.Sc., and C.E., A.M.E.I.C., age 30, married. Experience over the last ten years covers construction on hydro-electric and railway work as instrumentman and resident engineer. Also office work on teaching and design, investigations and hydraulic works, reinforced concrete, bridge foundations and caissons. Location immaterial. Available at once. Apply to Box No. 447-W.

SALES ENGINEER, M.A.Sc. Univ. of Toronto, wishes to represent firm selling building products or other engineering commodities, as their representative in Western Canada. Located in Winnipeg. Apply to Box No. 467-W.

## Situations Wanted

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with six years experience in paper mill and hydro-electric work, desires position in western Canada. Capable of handling reinforced concrete snd steel design, paper mill equipment and piping layout, estimates, field surveys, or acting as resident engineer on construction. Now on west coast and available at once. Apply to Box No. 482-W.

MECHANICAL ENGINEER, B.Sc. Age 28, married. Four and a half years on industrial plant maintenance and construction, including shop production work and pulp and paper mill control. Also two and a half years on structural steel and reinforced concrete design. Available at once. Apply to Box No. 521-W.

CIVIL ENGINEER. Canadian, married, twenty-five years' technical and executive experience, specialized knowledge of industrial housing problems and the administration of industrial towns, also town planning and municipal engineering, desires new connection. Available on reasonable notice. Personal interview sought. Apply to Box No. 544-W.

ELECTRICAL AND MECHANICAL ENGINEER, B.Sc., A.M.E.I.C. Experience includes C.G.E. Students' Test Course and six years in engineering dept. of same company on design of electrical equipment. Four summers as instrumentman on surveying and highway construction. Several years experience in accounting previous to attending university. Desires position with industrial concern where the combination of technical and business experience will be of value. Apply to Box No. 564-W.

### Revision of Employment Registration File

If you have recently received a letter from The Institute Employment Service Bureau enquiring whether you are employed, it will be of assistance if you will reply without delay.

Letters have been sent to those registered and from whom no communication has been received for some time. From replies already in, it would appear that a number of members have recently secured work. However, where this is of a temporary nature the names are retained on the active file as available for permanent positions. This leaves any temporary jobs that may come to our attention for those whose needs are found to be the most pressing.

CIVIL ENGINEER, age 25, single, graduate. Creditable record on responsible hydro and railroad work in both Eastern and Western Canada. Apply to Box No. 567-W.

MECHANICAL ENGINEER, A.M.E.I.C., with twenty years experience on mechanical and structural design, desires connection. Available at once. Apply to Box No. 571-W.

MECHANICAL ENGINEER, B.A.Sc., '30, desires position to gain experience, and which offers opportunity for advancement. Experience in pulp and paper mill and one year in mechanical department of large electrical company. Location immaterial. Available immediately. Apply to Box No. 577-W.

DOMINION LAND SURVEYOR, and graduate engineer with extensive experience on legal, topographic and plane-table surveys and field and office use of aerophotographs, desires employment either in Canada or abroad. Available at once. Apply to Box No. 589-W.

MECHANICAL ENGINEER, Canadian, technically trsined; eighteen years experience as foreman, superintendent and engineer in manufacturing, repair work of all kinds, maintenance and special machinery building. Location immaterial. Available at once. Apply to Box No. 601-W.

CHEMICAL ENGINEER, S.E.I.C., B.Sc., University of Alberta, '30. Age 31. Single. Six seasons' practical laboratory experience, three as chief chemist and three as assistant chemist in cement plant; one year's p.g. work in physical chemistry; three years' experience teaching. Desires position in any industry with chemical control. Availsble immediately. Apply to Box No. 609-W.

DESIGNING ENGINEER AND ESTIMATOR, grad. Univ. of Toronto in C.E., A.M.E.I.C., twenty years experience in structural steel, construction and municipal work. Available at once. Apply to Box No. 613-W.

## Situations Wanted

CIVIL ENGINEER, A.M.E.I.C., R.P.E., Ontario; three years construction engineer on industrial plants; fourteen years in charge of construction of hydraulic power developments, tower lines, sub-stations, etc.; four years as executive in charge of construction and development of harbours, including railways, docks, warehouses, hydraulic dredging, land reclamation, etc. Apply to Box No. 647-W.

MECHANICAL ENGINEER, A.M.E.I.C., Canadian, technically trained; six years drawing office. Office experience, including general design and plant layout. Also two years general shop work, including machine, pattern and foundry experience, desires position with industrial firm in capacity of production engineer or estimator. Available on short notice. Apply to Box No. 676-W.

DIESEL ENGINEER. Erection and industrial engineer, A.M.E.I.C., technically trained mechanical engineer with English and Canadian experience in erection and operation of steam and Diesel equipment in power house and mines, pumping, rock drilling, air compressors. Experienced in industrial and steel works operations including rolling mills, quarries, sales. Open for position on maintenance, operation or sales engineer. Location immaterial. Apply to Box No. 682-W.

ELECTRICAL AND CIVIL ENGINEER, B.Sc., Elec., 29, B.Sc., Civil '33. Age 27. Jr.E.I.C. Undergraduate experience in surveying and concrete foundations; also four months with Canadian General Electric Co. Thirty-three months in engineering office of a large electrical manufacturing company since graduation. Good experience in layouts, switching diagrams, specifications and pricing. Best of references. Available immediately. Apply to Box No. 693-W.

MECHANICAL ENGINEER, B.Sc., '27, Jr.E.I.C. Four years maintenance of high speed Diesel engines units, 200 to 1,300 h.p. Also maintenance of D.C. and A.C. electrical systems and machinery. Draughting experience. Westinghouse apprenticeship course. Practical mechanical and electrical engineer with a special study of high speed Diesel engine design, application and operation. Location in western or eastern Canada immaterial. Apply to Box No. 703-W.

COMBUSTION ENGINEER, R.P.E., Manitoba, A.M.E.I.C. Wide experience with all classes of fuels. Expert designer and draughtsman on modern steam power plants. Experienced in publicity work. Well known throughout the west. Location, Winnipeg or the west. Available at once. Apply to Box No. 713-W.

ELECTRICAL ENGINEER, B.Sc., University of N.B., '31. Experience includes three months field work with Saint John Harbour Reconstruction. Apply to Box No. 722-W.

MECHANICAL ENGINEER, age 41, married. Eleven years designing experience with project of outstanding magnitude. Machinery layouts, checking, estimating and inspecting. Twelve years previous engineering, including draughting, machine shop and two years chemical laboratory. Highest references. Apply to Box No. 723-W.

CIVIL ENGINEER, B.Sc. (Alta. '31), S.E.I.C. Experience includes three seasons in charge of survey party. Transitman on railway maintenance, and concrete bridge designing Nature of work and location immaterial. Apply to Box No. 724-W.

YOUNG CIVIL ENGINEER, B.Sc. (Univ. of N.B. '31), with experience as rodman and checker on railroad construction, is open for a position. Apply to Box No. 728-W.

DESIGNING ENGINEER, M.Sc. (McGill Univ.), D.L.S., A.M.E.I.C., P.E.Q. Experience in design and construction of water power plants, transmission lines, field investigations of storage, hydraulic calculations and reports. Also paper mill construction, railways, highways, and in design and construction of bridges and buildings. Available at once. Apply to Box No. 729-W.

MECHANICAL ENGINEER, S.E.I.C., B.A.Sc., Univ. of B.C. '30. Single, age 24. Sixteen months with the Allis-Chalmers Mfg. Co. as student engineer. Experience includes foundry production, erection and operation of steam turbines, erection of hydraulic machinery, and testing texropes and centrifugal pumps. Location immaterial. Available at once. Apply to Box No. 735-W.

CIVIL ENGINEER, M.Sc., A.M.E.I.C., R.P.E. (Ont.), ten years experience in municipal and highway engineering Read, write and talk French. Married. Served in France. Will go anywhere at any time. Experienced journalist. Apply to Box No. 737-W.

RADIO AND ELECTRICAL ENGINEER, B.Sc. '31, S.E.I.C. Age 27. Experience in installation of power and lighting equipment. Temporary operator in radio station; studio experience with part time announcing. Two summers in switchboard and installation department of telephone company, eight months on extensive survey layouts. Interested in sales work of electrical or radio equipment. Available on short notice. Location immaterial. Apply to Box No. 740-W.

CIVIL ENGINEER, graduate '29. Married. One year building construction, one year hydro-electric construction in South America, fourteen months resident engineer on road construction. Working knowledge of Spanish. Apply to Box No. 744-W.

SALES ENGINEER, B.Sc., McGill, 1923, A.M.E.I.C. Age 33. Married. Extensive experience in building construction. Thoroughly familiar with steel building products; last five years in charge of structural and reinforcing steel sales for company in New York state. Available at once. Located in Canada. Apply to Box No. 749-W.

## Situations Wanted

DESIGNING ENGINEER, graduate Univ. Toronto '26. Thoroughly experienced in the design of a broad range of structures, desires responsible position. Apply to Box No. 761-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. Queen's Univ. '29. Age 25. Married. Three years experience as construction eupt. and estimator for contracting firm. Experience includes general building, bridges, sewer work, concrete, boiler settings, eand blasting of bridges and spray painting. Available at once. Apply to Box No. 776-W.

CIVIL ENGINEER, B.Sc., '25, Jr.E.I.C., P.E.Q., married. Desires position, preferably with construction firm. Experience includes railway, monument and mill building construction. Available immediately. Apply to Box No. 780-W.

DRAUGHTSMAN, experience in civil engineering, forestry engineering, land surveying and house construction. Good references. Apply to Box No. 781-W.

ELECTRICAL AND SALES ENGINEER, S.E.I.C., grad. '28. Experience includes one year test course, one year switchboard design and two years switchboard and switching equipment sales with large electrical manufacturing company. Three summers Pilot Officer with R.C.A.F. Available at once. Apply to Box No. 788-W.

ELECTRICAL ENGINEER. Specializing in power and illumination reports, estimates, appraisals, contracts and rates, plans and specifications for buildings. Available on interesting terme. Apply to Box No. 795-W.

CIVIL ENGINEER, S.E.I.C., graduate '30, age 23, single. Experience includes mining surveys, assistant on highway location and construction, and assistant on large construction work. Steel and concrete layout and design. Apply to Box No. 809-W.

CIVIL ENGINEER, college graduate, age 27, single. Experience includes surveying, draughting concrete construction and design, street paving both asphalt and concrete. Available at once; will consider anything and go anywhere. Apply to Box No. 816-W.

CIVIL ENGINEER, B.E. (Sask. Univ. '32), S.E.I.C. Single. Experience in city street improvement; sewer and water extensions. Good draughtsman. References. Available at once. Location immaterial. Apply to Box No. 818-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. (Queen's '32), age 21. Three summers surveying in northern Quebec. Interested in hydraulics and reinforced concrete. Available at once. Location immaterial. Apply to Box No. 822-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., with fifteen years experience mostly in pulp and paper millwork, reinforced concrete and structural steel design, field surveys, layout of mechanical equipment, piping. Available at once. Apply to Box No. 825-W.

ELECTRICAL ENGINEER, E.E.I.C., grad. '29, age 24, married; experience includes one year Students Test Course, sixteen months in distribution transformer design and eight months as assistant foreman in charge of industrial control and switchgear tests. Location immaterial. Available at once. Apply to Box No. 828-W.

CIVIL ENGINEER, B.A.Sc., D.L.S., O.L.S., A.M.E.I.C., age 46, married. Twelve years experience in charge of legal field surveys. Owns own surveying equipment. Eight years on technical, administrative, and editorial office work. Experienced in writing. Desires position on survey work, assisting in or in charge of preparation of house organ, on staff of technical or semi-technical magazine, or on publicity, editorial or administrative office work. Available at once. Will consider any salary, and any location. Apply to Box No. 831-W.

CIVIL ENGINEER, M.Sc., R.P.E. (Sask.). Age 27. Experience in location and drainage surveys, highways and paving, bridge design and construction city and municipal developments, power and telephone construction work. Available on short notice. Apply to Box No. 839-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. '32 (Univ. of N.B.). Age 25, married. Two years experience in power line construction and maintenance; one year of highway construction; one summer surveying for power plant site, location and spur railway line construction. Available at once. Location immaterial. Apply to Box No. 840-W.

CIVIL ENGINEER, B.Sc. '15, A.M.E.I.C., married, extensive experience in responsible position on railway construction, also highways, bridges and water supplies. Position desired as engineer or superintendent. Available at once. Apply to Box No. 841-W.

CIVIL ENGINEER, B.Sc. (Altn. '31), S.E.I.C., age 24. Experience, three summers on railroad maintenance, and seven months on highway location as instrumentman. Willing to do anything, anywhere, but would prefer connection with designing or construction firm on structural works. Available immediately. Apply to Box No. 846-W.

MECHANICAL ENGINEER, Jr.E.I.C., technical graduate, bilingual, age 30. Two years as designing heating draughtsman with one of the largest firms of its kind on this continent handling heating materials; three years designing draughtsman in consulting engineers' office, mechanical equipment of buildings, heating, ventilation, sanitation, power plant equipment, writing of specifications, etc. Present location Montreal. Available at once. Apply to Box No. 850-W.

BRIDGE AND STRUCTURAL ENGINEER, A.M.E.I.C., McGill. Twenty-five yeare' experience on bridge and structural staffs. Until recently employed. Familiar with all late designs, construction, and practices in all Canadian fabricating plants. Desirous of employment in any responsible position, sales, fabrication or construction. Apply to Box No. 851-W.

STRUCTURAL ENGINEER, B.A.Sc., A.M.E.I.C. Twenty-two years experience in design of bridges and all types of buildings in structural steel and reinforced concrete. Three years experience in railway construction and land surveying. Apply to Box No. 856-W.

MECHANICAL ENGINEER, B.Sc. '32, E.E.I.C. Good draughtsman. Undergraduate experience:—One year moulding shop practice; two years pipe fitting and sheet metal work; one year draughting and tracing on paper mill layout; six months machine shop practice; and eight months fuel investigation and power heating plant testing. Desires position offering experience in steam power plants or heating and ventilating design. Will go anywhere. Apply to Box No. 858-W.

MECHANICAL ENGINEER, age 31, graduate Sheffield (England) 1921; apprenticeship with firm manufacturing steam turbine generators and auxiliaries and subsequent experience in design, erection, operation and inspection of same. Marine experience B.O.T. certificate thoroughly conversant with Canadian plants and equipment. Available on short notice. Any location. Box No. 860-W.

CHEMICAL ENGINEER, B.Sc. (McGill '21), A.M.E.I.C., age 36, married; three years since graduation with pulp and paper mills; eight years in shops, estimating and sales divisions of well-known gas engineering and construction companies in the United States. Excellent references. Available on short notice. Apply to Box No. 866-W.

CONSTRUCTION ENGINEER (Toronto Univ. of '07). Experience includes hydro-electric, municipal and railroad work. Available immediately. Location immaterial. Apply to Box No. 886-W.

ELECTRICAL ENGINEER, graduate 1929, S.E.I.C. Single. Experience includes two years with electrical manufacturing concern and one on highway construction work. Available at once. Will go anywhere. Apply to Box No. 887-W.

CIVIL ENGINEER, B.Sc., Montreal 1930, age 26, single, French and English, desires position technical or non-technical in engineering, industrial or commercial fields, sales or promotion work. Experience includes three years in municipal engineering on paving, sewage, waterworks, filter plant equipment, layout of buildings, etc. Available immediately. Apply to Box No. 891-W.

ELECTRICAL ENGINEER, grad. Univ. of N.B. '31. Experienced in surveying and draughting, requires position. Available at once. Will go anywhere. Apply to Box No. 893-W.

CIVIL ENGINEER, B.A.Sc., Jr.E.I.C., age 29, single. Experience includes two years in pulp mill as draughtsman and designer on additions, maintenance and plant layout. Three and a half years in the Toronto Buildings Department checking steel, reinforced concrete, and architectural plans. Available at once. Location immaterial. At present in Toronto. Apply to Box No. 899-W.

DESIGNING ENGINEER, A.M.E.I.C. Permanent and executive position preferred but not essential. Fifteen years experience in designing power plants, engine and fan rooms, kitchens and laundries. Thoroughly familiar with plumbing and ventilating work, pneumatic tubes, and refrigeration, also heating, electrical work, and specifications. Apply to Box No. 913-W.

ENGINEER, B.Sc., A.M.E.I.C., R.P.E. (N.B.), age 35, married. Seven years' mining experience as sampler, assayer, surveyor, field work, and foreman in charge of underground development: two years as assistant engineer on highway construction and maintenance. Available on short notice. Apply to Box No. 932-W.

CIVIL ENGINEER, B.Sc., '25, McGill Univ., Jr.E.I.C., P.E.Q., age 32, married. Experience as rodman and instrumentman on track maintenance. Seven and one-half years with Canadian paper company, as assistant office engineer handling all classes of engineering problems in connection with woods operations, i.e., road buildings, piers, booms, timber bridges, depots, dams, etc. Apply to Box No. 933-W.

ELECTRICAL ENGINEER, Dipl. of Eng., B.Sc. (Dalhousie Univ.), S.B. and S.M. in E.E. (Mass. Inst. of Tech.), Canadian. Married. Seven and a half years' experience in design, construction and operation of hydro, steam and industrial plants. For past sixteen months field office electrical engineer on 510,000 h.p. hydro-electric project. Available at once. Apply to Box No. 936-W.

CIVIL ENGINEER, B.Sc., O.P.E. Experience includes several years on municipal work-design and construction of sewers, steel and concrete bridges, watermains and pavements. Available at once. Apply to Box No. 950-W.

ELECTRICAL ENGINEER, twenty years experience, desires position, either temporary or permanent. Experienced in design, construction, and operation of power and industrial plants, and supt. of construction. Apply to Box No. 974-W.

CIVIL ENGINEER, B.Sc. (Univ. of Sask. '33), S.E.I.C., age 28, single. Experience in testing hydro-electric equipment, draughting, surveying, city street, improvements, technical photography. Available at once. Location immaterial. Apply to Box No. 986-W.

ENGINEER SUPERINTENDENT, age 44. Engineering and business training, executive ability, tactful, energetic. Had charge of several large projects. Intimate knowledge of costs and prices, reports and estimates. Available immediately. Any location. Apply to Box No. 1021-W.

CIVIL ENGINEER, B.Sc. (Queen's 14), A.M.E.I.C., Dominion Land Surveyor, 5 months' special course at the University of London, England, in municipal hygiene and reinforced concrete construction. Experience covers legal and topographic surveys, plane tabling and stadia surveying, railway and highway construction, drainage and excavation work. Available at once. Apply Box No. 1035-W.

ELECTRICAL ENGINEER AND GEOPHYSICIST. Age 36. Married. Seven years experience in geophysical exploration using seismic, magnetic and electrical methods. Two years experience with the Western Electric Company of Chicago, working on equipment and magnetic materials research. Experienced in radio and telephone work, also specializing in precise electrical measurements, resistance determinations, ground potentials and similar problems of ground current distribution. Apply to Box No. 1063-W.

ELECTRICAL ENGINEER, B.A.Sc. Univ. Toronto '28. Experience includes Can. Gen. Elec. Co. Test Course. Also more than two years in the engineering dept. of the same company. Available on short notice. Preferred location central or eastern Canada. Apply to Box No. 1075-W.

ELECTRICAL ENGINEER, B.Sc. Married. Eight years electrical experience, including operation, maintenance and construction work, electrical design work on large power development, mechanical ability, experienced photographer, employed in electrical capacity at present. Available on reasonable notice. Apply to Box No. 1076-W.

INDUSTRIAL ENGINEER, B.A.Sc. in Chem. Eng. (Tor. '31), E.B. in Indust. Eng. (Mass. Inst. of Tech. '32), S.E.I.C. Age 25 years. Northern Electric Training Course. Construction and sales experience. Rockefeller Research Associate at McGill University in industrial engineering for past year and to date. Desire work in production or financial departments of a manufacturing plant. Apply to Box No. 1098-W.

CIVIL ENGINEER, age 27, graduate 1930, single. Experieuce includes detailing, designing and estimating structural steel, plate work and pressure vessels; also hydrographic surveying. Available at once. Apply to Box No. 1111-W.

ELECTRICAL ENGINEER, S.E.I.C., single, age 24 years. Four consecutive yeare at Univ. of N.B. in electrical engineering. Summer experience in bridge and road construction and auto repairing, desires position in industrial or power plant. Any locality. References on request. Apply to Box No. 1114-W.

CIVIL ENGINEER, B.Sc. Sask. '30. S.E.I.C. Age 24 years. Experience in municipal engineering, including sewer and water construction, sidewalk construction, paving, storm sewer design, draughting, precise levelling, and reinforced concrete bridge construction. Unmarried. Available at once. Will go anywhere. Apply to Box No. 1115-W.

ELECTRICAL ENGINEER, B.Sc.E.E. (Univ. of N.B. '31). C.G.E. Test Course included industrial control, induction motors and transformers; the transformer test included desk work for two months on computing losses, efficiencies, etc. Available at once. Apply to Box No. 1119-W.

MECHANICAL ENGINEER, B.A.Sc. (Univ. of B.C.), M.S. (Univ. of Pittsburgh). Canadian. Age 26. Single. One year graduate student course, W.E. and M. Co., East Pittsburgh. Three and a half years engineering research in mechanics with the same company. Location immaterial. Available at once. Apply to Box No. 1123-W.

GEODETIC AND TOPOGRAPHICAL ENGINEER, D.L.S., M.E.I.C. Experience in all kinds of geodetic and topographical surveys, especially photo-topography, well versed in all kinds of air photo surveys; Canadian and U.S. patent method of determining position and elevations of points from air photographs. Available at once anywhere in Canada or the United States Apply to Box No. 1127-W.

PETROLEUM CHEMIST, B.Sc. in Chem. Eng. Age 25, Single. One and a half years experience as assistant chemist. Capable of taking charge in small refinery. Wishes position anywhere in Canada. Apply to Box No. 1130-W.

ELECTRICAL ENGINEER B.Sc., Queen's '33. Single, age 23. Anxious to gain experience. Present experience installing small private hydro-electric plant. Location immaterial. Available at once. Apply to Box No. 1137-W.

## For Sale

Complete equipment for radio servicing. Used for five months. Burton-Rogers '32. Price $75.00. Analyzer and tube tester in one case. Adaptors for new tubes. New 610 Readrite analyzer and tube tester with case for tools, all in one. Oscillator with output meter. Approved by A.T. & T. Co. Complete set of tools. Apply to Box S-20.

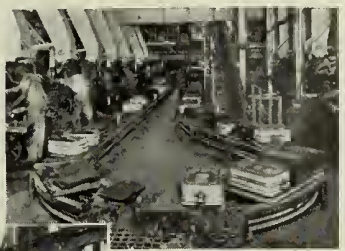
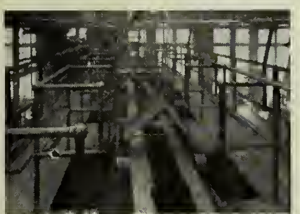
# Foundry Equipment by JEFFREY includes:



Floor Type Mold Conveyors

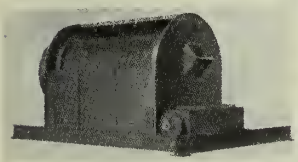
Pendant Type Mold Conveyors (below)

Scraper Conveyors



Belt Conveyors

Flask Fillers (overhead bin type)

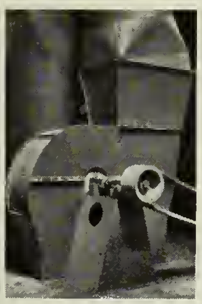


Screens

Aerators

Leak-proof Apron Conveyors (below)

Flask Fillers (Portable wall type)



Fans

Pulverizers and Crushers

*Also*

- Sand Reclaiming and Conditioning Equipment
- Portable Loaders
- Bucket Elevators
- Bins and Hoppers
- Chains, Wheels, and Buckets
- Transmission Equipment
- Bottom Dump Buckets
- Foundry Flask Knock-outs

Any one of these Jeffrey Units pictured here will cut your Foundry costs materially. Mechanical handling saves floor space, molders' time and flasks required, and effect many other economies. The extent of these savings is vitally affected by the type of equipment selected.

Large or small foundries . . . complete systems or small installations . . . Jeffrey has the proper equipment for your problem, backed by experience covering a long line of highly successful installations.

## INDEX TO ADVERTISERS

# PROFESSIONAL CARDS

# Use Street Lighting to Prevent Accidents

OF the 1,111 fatal accidents in Canada in 1932, 47 per cent. were during the dark hours that carry only 20 per cent. of the 24-hour traffic. In other words, the night hazard is 400 per cent. of the day hazard.

An official survey indicates that about 35 per cent. of all night traffic accidents are directly attributable to insufficient illumination. Correct lighting might have prevented hundreds of deaths. Property losses would have been reduced by thousands of dollars.

Canadian General Electric lighting specialists are qualified to recommend intensities, spacing and luminaires that will meet your safety requirements. Write the C.G.E. office nearest you or Canadian General Electric Co., Limited, 212 King Street West, Toronto, for the services of a specialist.

# ANNOUNCEMENT

In the belief that the interests of the public and the building industry will be served best by securing as wide an application as possible of the scientific principles involved in Modern Heating Methods, the following cooperative agreement has been entered into for that purpose.

JOINT STATEMENT C. A. DUNHAM CO., LIMITED
AND DARLING BROTHERS LIMITED REGARDING PATENTED
SYSTEMS OF STEAM HEATING

THROUGH MANY YEARS THESE COMPANIES, WORKING IN ASSOCIATION WITH THE C. A. DUNHAM COMPANY, CHICAGO, ILLINOIS, AND WARREN WEBSTER & COMPANY, CAMDEN, NEW JERSEY, HAVE MADE SIGNIFICANT CONTRIBUTIONS TO THE PROGRESS OF THE ART OF STEAM HEATING. ▪ ▪ IN RECENT YEARS THE MAJOR PROBLEM UPON WHICH BOTH COMPANIES AND THEIR AFFILIATES HAVE CENTERED THEIR ATTENTION HAS BEEN THAT OF PROVIDING A SYSTEM SO CONTROLLED THAT THE CORRECT AMOUNT OF STEAM MAY BE CIRCULATED UNDER VARYING WEATHER CONDITIONS TO OFFSET THE VARIABLE HEAT LOSS FROM A BUILDING. ▪ ▪ DEVELOPMENT TO THIS END HAS RESULTED IN A NUMBER OF CANADIAN PATENTS UPON METHODS AND APPARATUS WHICH ACCOMPLISH THE ABOVE DESIRED RESULTS. ▪ ▪ WE ANNOUNCE THAT THESE COMPANIES HAVE ENTERED INTO A CROSS-LICENSING AGREEMENT COVERING PATENTS RELATING TO HEATING SYSTEMS. ▪ ▪ EACH COMPANY WILL CONTINUE TO SPECIALIZE ON ITS RESPECTIVE SYSTEM, NAMELY—THE DUNHAM DIFFERENTIAL SYSTEM AND THE WEBSTER MODERATOR SYSTEM AS MANUFACTURED AND SOLD IN CANADA.

# The Romance of the Construction Industry in Canada

## Over deep ravines . . . spanning rivers . . . and adding to man's progress, bridges will ever be built.

*Lake St. Louis Bridge.*
*Photograph courtesy of A. Janin & Co. Ltd., Montreal, Que.*

Since the world began bridges, in some form or another, have decided the progress of man. In many cases the fate of wars have been decided by them.

In Canada we have one of the outstanding bridges of the world, namely, the Quebec Bridge, situated nine miles west of the city of Quebec. This bridge has a clear span of 1800 feet between piers. One of the recent bridges to be completed here is the new Lake St. Louis Bridge, spanning the St. Lawrence River about eight miles from the city of Montreal at the outlet of Lake St. Louis. This bridge provides direct access to provincial route No. 4, one of the main roads from the Province of Quebec into New York State.

C-I-L Explosives play their part in all construction activities. C-I-L Explosive Technicians are always glad to help you solve any problem that confronts you on blasting operations.

# EFFICIENCY
# RELIABILITY
# GENERAL UTILITY
*of*
# TYPE "E" STOKERS
UP TO 700 NOMINAL H.P.

# 650,000 sq. ft. prove it!

In hundreds of leading industrial plants in Canada under 650,000 sq. ft. heating surface Type "E" stokers have proved their ability to operate with maximum efficiency and low upkeep with all types of coals.

## FEATURES

### Sliding Retort Bottom

Carries main ram and pushers. Feeds and agitates fuel in retort. No pusher rods to warp or buekle.

### Hollow Air-Cooled Firebars

Preheat a portion of the air for eombustion. Assure low maintenanee. Alternate bars have lateral, adjustable motion. Replaeement requires no dismantling of grate surfaee. Non-sifting.

### Proper Coal Distribution

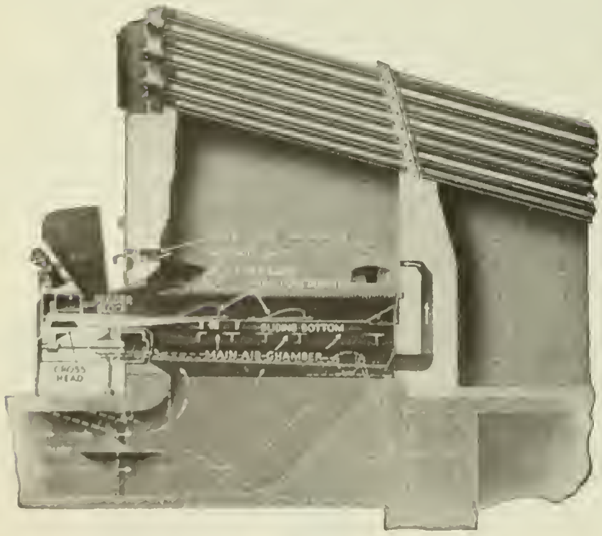
Assured by large throat opening to the retort, full stroke at all ratings and sliding bottom with auxiliary pushers. Lateral motion of firebars gives positive, gradual movement of the coal toward the dump grates.

### Complete Air Control

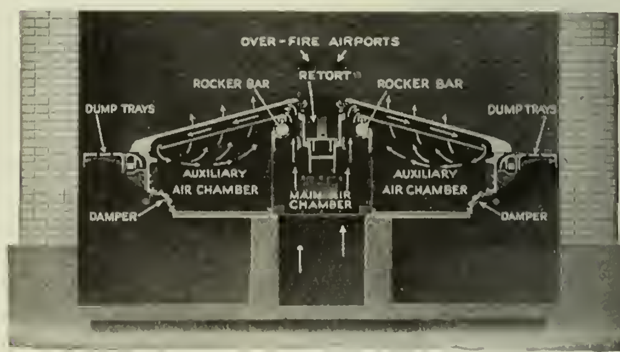
Furnished for entire grate area including dump grates. 100 per eent foreed draft surfaee divided into three pressure zones parallel to the retort. Separate control of air supply to grate surfaee, dump grates and over the fire. Air pressure is eompensated to the thiekness of the fuel bed, the greatest pressure being applied to the thiekest portion over the retort.

The foregoing, together with its integral steam operating cylinder drive, its smokeless operation, low maintenance cost and easy operation, are fully described in bulletins which will be sent gladly on request.

*Rear view showing retort, grate bars, dump grates and auxiliary windbox.*



*Longitudinal section showing air distribution. Air duct may enter from front or rear.*



*Cross-section showing air distribution. Air may be admitted to dump grates as required.*

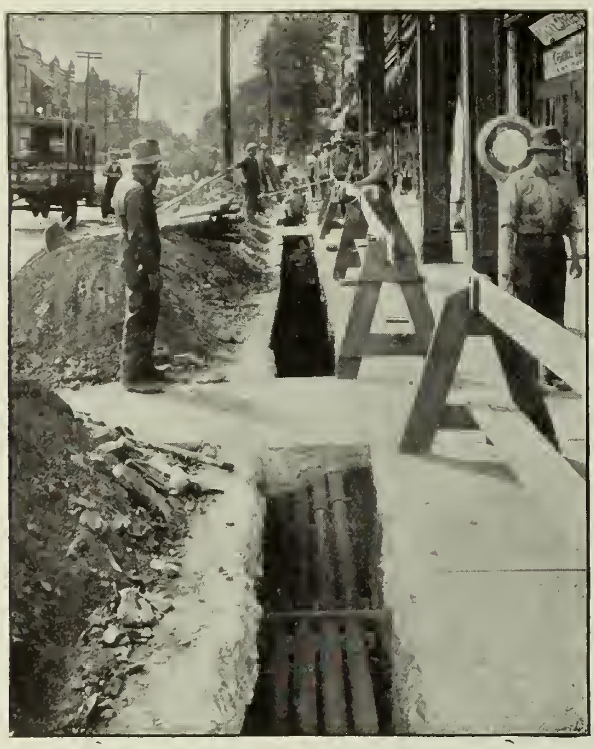
FIBRE MADE IN CORNWALL CANADA CONDUIT

## FIBRE CONDUIT, BENDS AND FITTINGS FOR UNDERGROUND ELECTRICAL DISTRIBUTION

Cornwall Fibre Conduit is used extensively by Power Companies, Telephone Companies and other Public Utilities for Underground distribution of the services. It is also installed in Power Houses at the time of construction for cables leading from the generators to the switchboards and generators to the transformers and switching stations. The high insulating qualities of Cornwall Fibre Conduit with its non-abrasive bore and special sleeve joint are among the many features which have made Cornwall Fibre Conduit a standard with most Public Utilities.

A few of the advantages gained in establishing a conduit construction programme are:—

All Electrical Services rendered immune from wind, lightning or sleet storms in the underground area. Improved appearance of the streets from which the poles have been removed. Decreased fire hazards. Provision can be made for expansion of the services to meet changing requirements.



A 16 duct run of Cornwall Fibre Conduit being installed on Park Avenue, Montreal, in August, 1933.

THE TAPERED SLEEVE JOINT

All Cornwall Fibre Conduit is finished with the superior tapered Sleeve Joint. Some of the advantages obtained by its use are:—

1. Its flexibility makes it possible to deviate from straight runs or pass minor obstructions in the trench and still maintain strong tight joints.
2. Rapidly installed as there are no male or female ends.
3. Less waste, as slightly damaged ends are protected by the coupling with no reduction in the tightness of the joints.

Manufactured in five foot lengths (one coupling supplied with each length of pipe) in the following sizes:

Inside Diameter

2½″ 3″ 3½″ 4″ 4½″

Standard Bends 45° and 90° (one coupling supplied with each bend).

| Inside Diameter | 2½″ | 3″ | 3½″ | 4″ | 4½″ |
|---|---|---|---|---|---|
| Radius | 24″-36″ | 36″ | 36″ | 36″ | 36″ |

Quotations furnished on special bends with radius other than standard above listed.

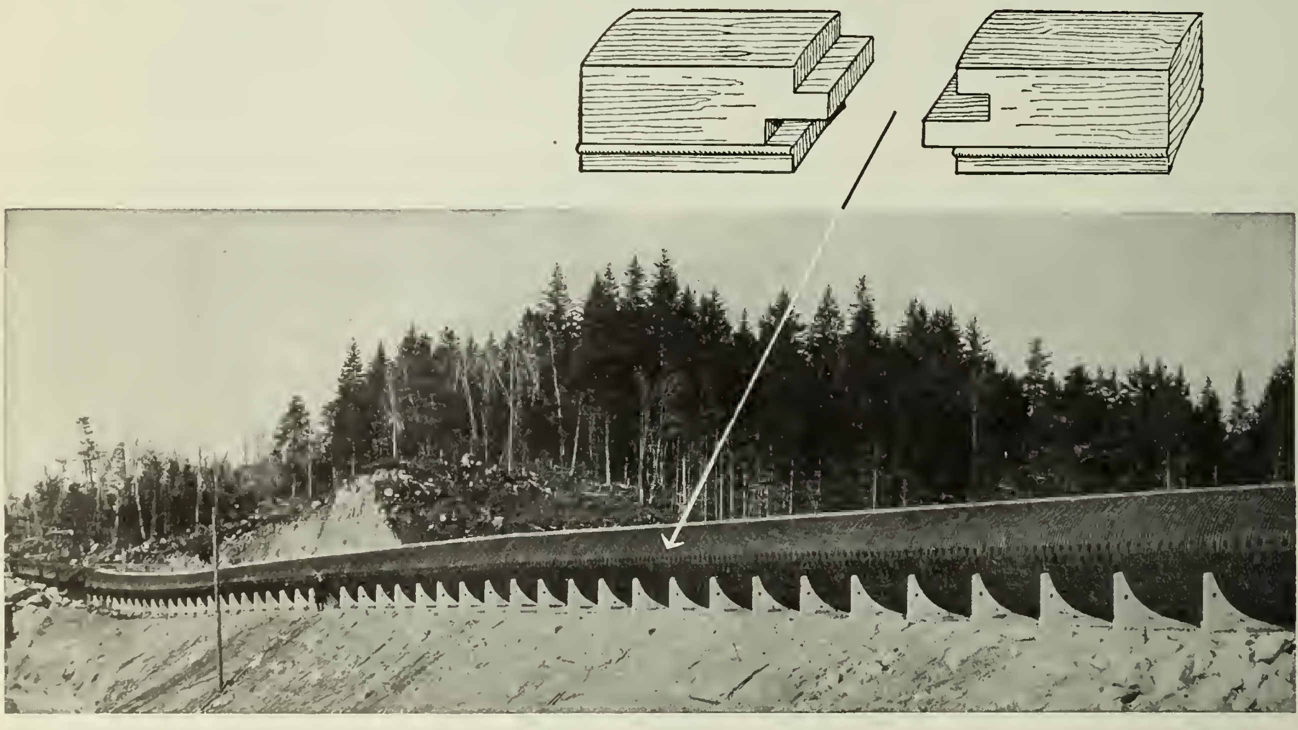
# New *Canadian* Wood Pipe BUTT JOINT



## MOST RIGID AND ECONOMICAL JOINT EVER MADE

The New "Canadian" Butt Joint gives the buyer of Canadian Wood Pipe the greatest improvement in the history of Wood Pipe manufacture. It is supplied without extra cost. Made entirely of wood, the CANADIAN BUTT JOINT will not rust or corrode. It is absolutely rigid, watertight and frost-proof.

This new joint slides easily into exact position thus speeding up erection. There are no steel tongues to handle or become lost and nothing to work loose. The joint remains perfectly tight during the entire life of the pipe.

The patented double-tongue-and-groove construction has twice the strength of the old-type joint, and in tests withstood more pressure than any other part of the pipe. It was designed in our own plant after a long period of experiment and testing. We have worked out a very simple and economical method of manufacture—and these economies are passed along to the buyer.

To get the many advantages of the Canadian Butt Joint—which is available to you at no extra cost—specify Canadian Wood Pipe.

# First Narrows Pressure Tunnel, Vancouver, B.C.

*W. H. Powell, M.E.I.C.,*

*Engineer, Greater Vancouver Water District, Vancouver.*

**Taken from a paper presented before the Vancouver Branch of The Engineering Institute of Canada, January 15th, 1934.**

**SUMMARY.—The following article consists of extracts from a paper presented before the Vancouver Branch of The Engineering Institute of Canada on January 15th, 1934. The author describes the construction of a tunnel carrying the water supply of the city under the entrance to Vancouver Harbour. The tunnel itself is 3,100 feet long, lined with steel-cylinder-reinforced concrete piping, having a clear waterway 7 feet 6 inches in diameter. The vertical shafts on the north and south shores are nearly 400 feet deep, and are similarly lined. Cost and progress figures are given.**

In 1886 a charter was granted the Vancouver Water Works Company to supply the new city of Vancouver with water.

The original supply was brought from an intake on Capilano river by a pipe line which crossed the First Narrows of Burrard Inlet as a 12-inch submerged pipe with flexible lead joints.[1] Even the early submerged pipes were not entirely dependable, and in 1893, two years after the city had taken over the system from the Vancouver Water Works, Colonel T. H. Tracy, city engineer, was instructed to report on the feasibility of a tunnel to carry pipe lines. In the same year a proposal for a suspension bridge to carry the water mains across the Narrows was made to the city council. However, neither the report nor the suspension bridge proposal was acceptable, and by 1924[2] the water supply system had been expanded so that there were three 18-inch and two 12-inch pipes at the First Narrows on the Capilano system and six 18-inch pipes in the Second Narrows on the Seymour system, supplying a population of over 200,000. Between 1904 and 1924 the submerged mains suffered seventeen breaks of which fourteen were caused by ships.

During this period there was a growing realization that the whole question of water supply to Vancouver and its surrounding cities and municipalities should be placed on a proper basis and at the session of the Legislature late in 1924 an act was passed which provided for the formation of the Greater Vancouver Water District. The Vancouver city council however did not then accept the legislation.

In 1925, after another serious interruption, Mayor Taylor arranged a conference with the Honourable T. D. Pattullo, and as a result, acceptable amendments to the act creating the Greater Vancouver Water District were granted. The question was then referred to the electors of the city, Point Grey, and South Vancouver, and the District was officially inaugurated.

In 1926, Dr. R. W. Brock, M.E.I.C., Dean of Engineering in the University of British Columbia, was asked to report upon the geological structure likely to be encountered if a tunnel were driven under Burrard Inlet. From Dr. Brock's report the following conclusions have been taken:—

1st. The present topography does not accurately express bedrock topography.

2nd. Only borings can determine the depth to bedrock and that only for the point where the bore hole has been put down.

3rd. As a general principle a fiord deepens seaward, but when it has been occupied and modified by glacial action, bedrock is not apt to maintain a uniform grade and will be gouged into basins. The amount of gouging depends upon the relative softness and other favourable physical features of the local rock and upon the pressure of the ice. The latter depends upon the volume and velocity of the ice.

4th. In Burrard Inlet there are only two points where there are any indications of rock having resistance superior to the general average, viz. north-east of Barnet and at Prospect Point.

5th. At Prospect Point the harder rocks may have retarded gouging and bedrock may be at a less depth than might otherwise be expected.

6th. Considering solely the geological factors the best tunnel site would be at Prospect Point, about 40 yards south-east of the lighthouse.

- (*a*) Because it is as far as possible from the Seymour glacier without coming into the area affected by the Capilano.
- (*b*) Because only part of the ice passed through the channel.
- (*c*) Because the rock is hardest at this point and would offer greatest resistance to ice action.

---

[2]See Paper by Mr. E. A. Cleveland, M.E.I.C., published Journal of the American Water Works Association, Vol. 24, June 1932.

7th. A second location, much less favourable than the above site, but better than any other, is at Second Narrows, as far west of the North Arm as possible without coming into the area affected by the Seymour glacier.

The late Mr. J. Waldo Smith, consulting engineer to the New York Board of Water Supply, was consulted and he advised:

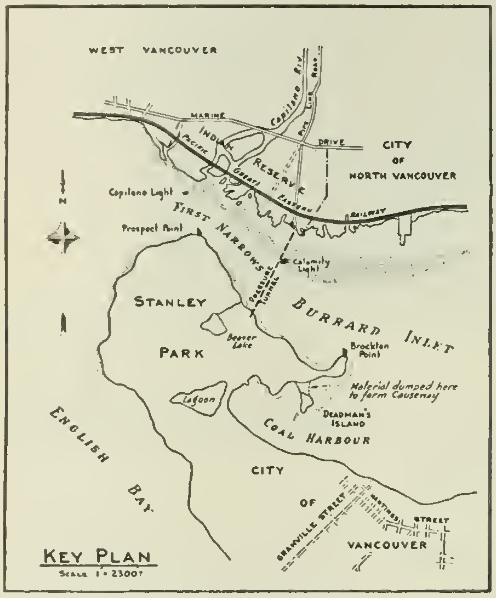

**Fig. 1—Key Plan.**

1st. Keep the water supply system independent of bridges or tunnels for other purposes.

2nd. Explore by drilling the foreshore regions at both First and Second Narrows, endeavouring to find bedrock at a depth not exceeding 115 feet.

### Start of Drilling Operations

Acting on the report of Dr. Brock, and with the knowledge of the results of previous drilling, the chief commissioner of the Board recommended that a contract be awarded for two drill holes at First Narrows and two drill holes at Second Narrows. It was expected that when this work was completed sufficient data would have been obtained to determine where other drilling and experimental work should be undertaken. Figure 2 shows the location of the proposed long and short tunnels and that of the pressure tunnel as constructed.

Because the work that the city had done on investigating the city's future water supply had been confined largely to the Seymour creek area, which could be developed at comparatively small cost to supply five times the then population of Vancouver, the first drilling was attempted at the Second Narrows, near the mouth of Seymour creek.

The first hole sunk there was on the north shore and gave results which discouraged further investigation, so that attention was transferred to the First Narrows. The first hole in that area, No. 1 (see Fig. 2), was drilled from the Water District's wharf, and holes were then sunk on the north shore. No. 2 went 161 feet through sand and gravels before striking rock. No. 8, near high water mark, was sunk 173 feet to rock, and No. 9, near low water mark, followed, reaching rock at a depth of 146 feet. This hole was finished on July 20th, 1927, more than twelve months after the contract was let.

### Geology

While this work was proceeding, Dr. Schofield, Professor of Geology at the University of British Columbia, was consulted and submitted a detailed report on the geology in the vicinity of the proposed tunnel.

He stated that the bedrock strata of Stanley Park are mainly of tertiary age and consist of conglomerates, sandstones, sandy shales and shales. These strata are cut by dykes of basalt. In the proposed pressure tunnel the rocks belong to the upper part of the Burrard formation.

The ridge-like form from Siwash Rock to Prospect Point is due to the presence of a hard rib of basalt which intrudes as a dyke the soft sandstone and shale which makes up the bedrock of Stanley Park. This ridge is separated from the north shore by the First Narrows of Burrard Inlet.

The sandstones and shales found in the drill cores from holes Nos. 1, 2 and 8 rest conformably on a thick stratum of conglomerate which in turn rests on an irregular floor of granite which belongs to the Coast Range batholith of Jurassic age. The depth of this granite beneath the First Narrows has not been determined, but it is more than 1,000 feet.

Resting on the bedrock strata in the vicinity of the north shore occur gravel and sands brought down by the Capilano river.

Dr. Schofield recommended that if possible the tunnel be driven in a bed of sandstone.

As the drilling previously described did not disclose bedrock within the required depth, viz. 115 feet, a second machine was set up and a hole (No. 1A) put down near Marine drive and another (No. 10) just north of the Pacific Great Eastern Railway—both on the line of the pipe line road. No. 1A did not reach bedrock and was sunk to a depth of 218 feet at a cost of $2,604 before it was abandoned. The other (No. 10) struck rock at 313 feet and was carried 175 feet into the rock. The time required to drill this hole was over three months.

Drilling was then started on a series of holes located on a line parallel to the Inlet and in the area between high and low water mark. West of the pipe line road, no positive results were obtained; towards the east slightly higher rock surfaces were found and at hole No. 17 the rock was reached at elevation −16.3 feet.

From the result of this drilling, in the spring of 1928, it was decided to go back to the outcrop near the confluence of Brothers creek and the Capilano. This decision was based on the facts that the tunnel would not be unduly long (6,800 feet); that the water had to be carried that distance in any case; that the north shaft, although deeper, would be much cheaper than one through the sands and gravels near the sea; and that there would be no interference with the proposed development of the harbour entrance.

In accordance with this scheme a line from proposed shaft to proposed shaft was surveyed, but before undertaking complete drilling along it an electrical process of determining bedrock depth was experimented with. This proved unsatisfactory under the conditions encountered and again the drilling machines for wash boring and diamond drilling were put to work. Seven holes were put down, at about 1,000 feet apart, the greatest depth to bedrock being 283 feet and the greatest total depth 714 feet. This part of the programme was completed in February, 1929.

With this change in tunnel location, Dr. V. Dolmage, consulting geologist, reported on the geology of the new route, and came to the following conclusions:—

Diamond drilling and the surrounding geology show that the tunnel will penetrate only two geological formations, a basalt dyke and a series of early tertiary (Eocene) sediments. The dyke is only about fifty feet wide and though the tunnel will cross it at an acute angle it is quite probable that only a very small proportion of the whole tunnel will be in the dyke.

The dyke consists of fine grained normal basalt and is therefore hard and strong though extensively jointed.

The tertiary sediments are part of a formation known as the Burrard formation which is made up of a basal conglomerate two hundred feet or more thick overlain by 1,350 feet of interbedded lenses of sandstone and shale, the latter constituting only about one quarter of the total volume. The beds strike east and west and dip about fifteen degrees to the south and have been folded and faulted to only a slight degree.

The northern part of the tunnel will pass through the conglomerate for several hundred feet and the remainder will be in the lower sandstone and shale beds.

The main portion of the tunnel will thus be in sandstone and shale lenses. The shales are comparable with the conglomerate in strength and hardness but are more compact and impervious. The sandstones occupy much the greater portion of the tunnel site and are perhaps the least competent rocks of the formation. The beds are fairly porous and would conduct a considerable amount

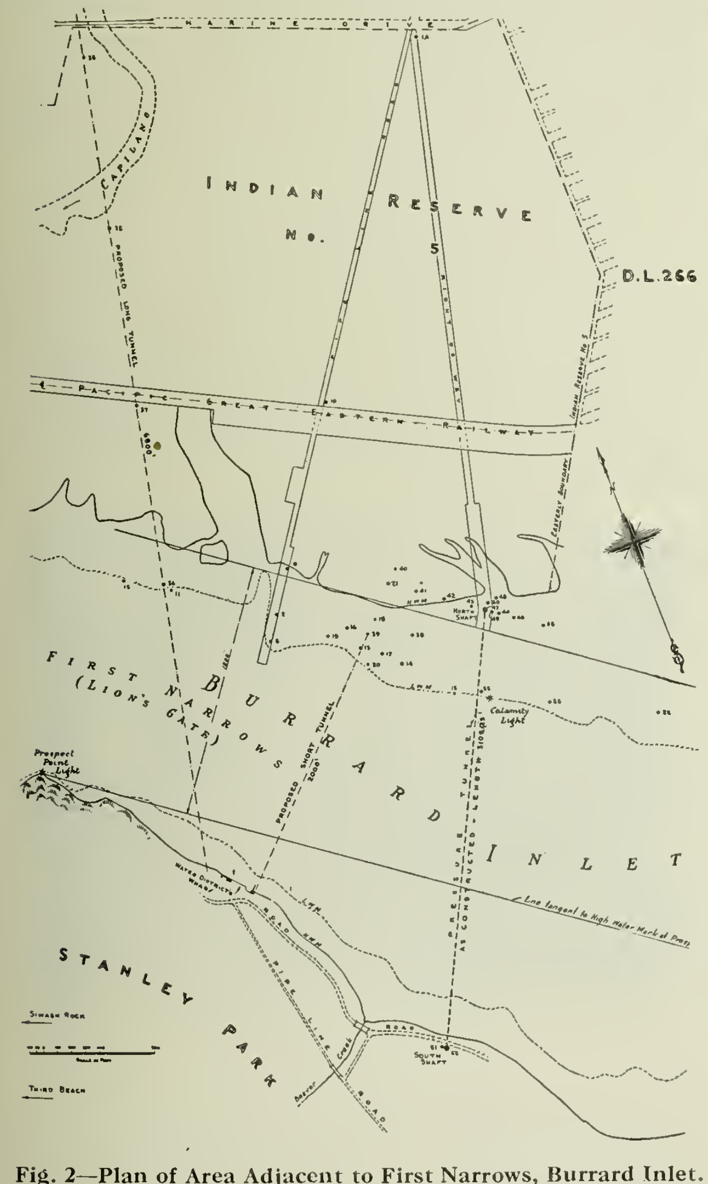

Fig. 2—Plan of Area Adjacent to First Narrows, Burrard Inlet.

of water, but, owing to their lenticular form and to their being interlayered with lenses of impervious shale, there is little danger of their conducting large quantities of water over great distances.

Like the other members of the formation, the sandstones are unusually free from joint cracks or other openings.

It is concluded from the above observations that a tunnel can be driven under the First Narrows with no extraordinary difficulties.

In December, 1929, before determination was finally made as to the general designs to be adopted for the tunnel, at Mr. Smith's request Mr. James Sanborn of New York examined the site of the proposed work. On account of the unreliability of the rock which the cores from the drill holes disclosed, Mr. Sanborn was of the opinion, concurred in by Mr. Smith, that in order to ensure safety the tunnel should be lined throughout with a continuous steel cylinder to form a water stop. The extra cost for this construction

Fig. 3—Drilling Hole No. 53, Calamity Light in Background.

with a tunnel 6,800 feet long was sufficient reason for again directing attention to the short tunnel route. After further drilling, shaft locations which seemed most suitable for the success of the undertaking were selected in the neighbourhood of hole No. 39 and hole No. 1, giving a length of tunnel of just over 2,000 feet.

Preliminary plans were made for this site and the Vancouver Harbour Commissioners approved of the site subject to the qualification that if the requirements of navigation twenty or twenty-five years hence demanded it, the north shaft should be moved farther north. Following the Federal election just at that time the Harbour Commissioners were changed and the new Board did not approve of the site.

As a consequence new drilling explorations were begun in a wide area on the north shore and at the fifth hole drilled, No. 48, bedrock was reached at a depth of 103 feet below ground level, elevation −14.0, and at hole No. 47 at a depth of 101 feet, elevation − 10.5. (See Fig. 3.) Further drillings disclosed no higher bedrock. As the location of a shaft near hole No. 47 was acceptable to the Harbour Board and bedrock was within the depth that could be reached by pneumatic methods the site was adopted for the location of the north shaft.

The selection of this location for the north shaft altered the earlier decision as to the site of the south shaft. A new position about 100 yards east of Beaver creek in Stanley Park was selected and a drill hole put down, which disclosed in the last 200 feet from 80 to 100 feet of sandstones so soft that for 32 feet no core was recovered and much of the balance was coarse and very poorly cemented. The drill hole was sunk a further 100 feet, but little change from the material of the upper portion was found. It was decided to draw the specifications so that the final decision as to the depth of the shafts could be made when the excavation had reached the 400-foot mark. The total cost of drilling at the First Narrows up to this time was over $75,000.

For the drilling operations, two plants were employed, one was steam driven and was better for deep work while the other was gasoline driven and more practical for shallow holes.

Different diameters of drill casing were used depending upon the depth anticipated:

6, 4 and 2 inches for a hole 150 feet deep.

8, 6, 4 and 2 inches for a hole 350 feet deep.

Each diameter was driven to what was considered an economical depth. When bedrock was reached it was chopped into for five or eight feet and then drilling was started using a shot drill, a calyx bit or a diamond bit. Core recovery for some lifts was almost 100 per cent, at others less than 20 per cent, and one length of sandstone for 32 feet gave no core at all.

The cores disintegrated very rapidly when left exposed but when housed in a dry place have not deteriorated and give a good section of the strata passed through.

For tabulation of depths of holes, costs, etc., see Appendix I.

### Tenders and Award

Tenders for the whole tunnel work were received on June 25th, 1931 from four contractors. (See Appendix II.)

Two of the contractors accompanied their tender by a letter containing the following: "Which is submitted upon the express condition that we shall not be required to enter into any contract that does not contain mutually satisfactory provisions.

"1. Relief in the event of impossibility of performance within the reasonable intendment of said contract.

"2. Payment of progress estimates.

"3. Arbitration."

The solicitor for the district ruled that the tenders were qualified and therefore informal and that only two tenders were in accordance with the specifications. The Board accordingly on July 6th awarded the contract to the Northern Construction Company and J. W. Stewart, Limited.

In the meantime the B.C. Electric high tension power line to West Vancouver was tapped and a transformer station erected and provision made for supplying 1,000 h.p. A cable was laid across the Narrows capable of carrying 500 h.p. The cost of this power installation was $6,541.12, less $427.06 salvage and whatever value there may be in 2,500 feet of cable. Electricity was supplied to the contractors at regular rates, i.e., $1.00 per month per h.p. of maximum demand plus 1 cent net per kw.h.

### Design Requirements

*Hydraulic*—The tunnel and shafts were designed to provide a conduit to carry the total supply of the Capilano system, estimated to average throughout the year about 200 million Imperial gallons per day, or say 360 cubic feet per second. Taking into consideration the top water elevation of a future reservoir above Capilano canyon and the terminal pressures and topography, the water delivery requirements resolved themselves into three cases, in which, using a Hazen-Williams co-efficient of 120, the calculated losses from valve chamber to valve chamber were as follows:

| Case | C.F.S. | Calculated Loss of Head |
|---|---|---|
| I | 280 | 5 feet |
| II | 390 | 11 feet |
| III | 570 | 22 feet |

The smoothness of the finished conduit suggests that a Hazen-Williams co-efficient of 140-150 may be expected and a considerably less loss of head than calculated may be found in practice.

*Structural*—The steel interlining for the south shaft above elevation −65 and for the north shaft above elevation −17.5 was designed for an unbalanced upward and bursting pressure of 312 pounds per square inch; for the remainder of both shafts the same bursting pressure and no consideration of upward pressure, and for the tunnel an unbalanced bursting pressure of 260 pounds per square inch. Where the rock was poor in the tunnel the use of a steel pipe one inch thick or its equivalent was required and the unbalanced bursting pressure was considered as 300 pounds per square inch. With these unbalanced bursting pressures, steel stresses, making no allowance for the supporting rock, are from 24,000 to 14,000 pounds per square inch.

### Surveys and Alignments

The surveys for the tunnel were extremely simple. As, on the surface, the centre of the south shaft was visible from the centre of the north shaft, the prolongation of the axis of the tunnel was easy. Sufficient concrete monuments were placed on this axis or its extension to ensure visibility from one to another.

The top of each monument carried a brass bar perpendicular to the axis and about 12 inches long, upon which the line was marked with a fine punch. Bars were used in preference to small plates, to facilitate the establishment of an offset if required. These bars were protected by a cover, easily removable, and lightly bolted to the monument. The measurement of the distance between shafts was done by triangulation, the nearest tenth being sufficient accuracy for that purpose.

The line for the tunnel was first established underground by stretching a string on the line of two No. 8 music wires about 9 feet apart hanging from the edge of a plank which had been placed on line across the top of the shaft. This line was used until the station at the bottom of the shaft was completed and the face was about 80 feet from the shaft. A scale was then set on the back wall of the station and another on the tunnel roof about 40 feet from the shaft, the distance between these scales being about 65 feet.

Accurate line was afterwards transferred from the monuments to these scales by transit sighting on the wires.

In this manner the line was actually carried down the north shaft once, and the south shaft six times, for tunnel purposes, and once each for setting the quarter bends. In the case of the south shaft the average of all six sets was used for the prolongation of the line into the tunnel.

Scales were set from the finally accepted position every 300 feet but never within 100 feet of the face. From these scales plugs with spads were set at about every 50 feet with one always within 80 feet of the face. Elevations, carried

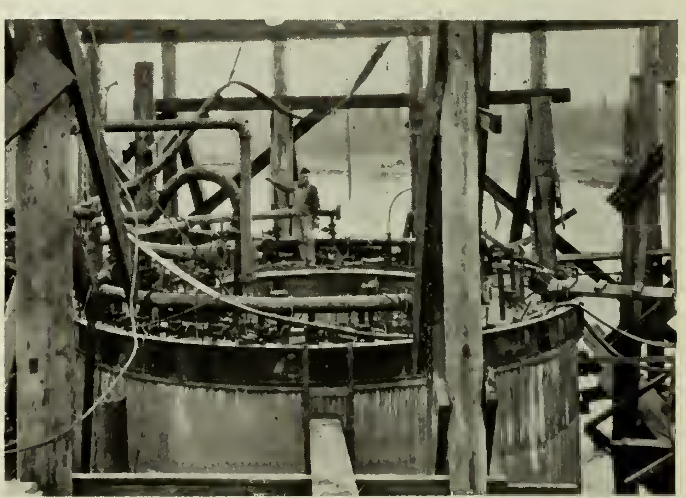

Fig. 4—Jetting Caisson.

down the shaft by an ordinary surveyor's tape, were taken on these plugs, and plummet lamp chains were adjusted to proper lengths for the two plugs nearest the face, by the use of which the miners set their centre on the face before drilling each round. In the final tie-in the levels checked exactly and the line within one inch.

### Commencement of Work

Excavation began on August 25th at the site of the south shaft in Stanley Park, the first 65 feet of the shaft, or to elevation 54.5, being in hard pan. To elevation 84.3 the side walls were timbered. This elevation determined the lower limit of the shaft cap and connecting castings, and below this it was decided to abandon the timbering and concrete a shell around the shaft in lifts of 5, 10, or 15 feet, depending upon the stability of the material. For this purpose about 610 cubic yards of concrete were used, the inside diameter being 16 feet for 45 feet, 12 feet 10 inches for 109 feet, and 9 feet 8 inches from there to the bottom.

Until the excavation of the shaft was completed and the tunnel driven some distance all the water was removed by baling. Then a centrifugal three-stage pump to lift 200 gallons per minute was installed and a triangular weir built to measure the water pumped, which was paid for at the rate of one cent per million foot pounds. (For progress on south shaft see Appendix IV.)

North Shore Preparation and Caisson Sinking*

At the same time that work was started on the south shore a dredge was put to work on the north shore and a channel dredged from the low water mark to the shaft site. At the shaft site an excavation was made to remove a layer of boulders 18 feet thick starting just below the surface. (See Fig. 4.) This excavation was made 30 feet deep and was refilled with pea gravel and a little heavy gravel and sand to a point about high water level, making an island. The caisson, 24 feet outside diameter, 14 feet inside, and the first lift 34.5 feet, was then built on this island within the supporting structure. Dredging from the inside of the caisson then started, using a 1½-yard clam shell or a 2½-yard orange peel bucket. Alternate building and dredging continued until the cutting-edge of the caisson had gone to elevation −5 and seemingly would go no farther. On examination by the diver large granite boulders, some of them containing three or four cubic yards, were discovered under the cutting edge. Some difficulty was experienced with sloughing exhibited on the surface by the sinking of pile work around the caisson. When elevation −10.5 was reached another lift of 8 feet was added to the caisson.

(For progress at north shaft see Appendix III.)

When the caisson reached the clay and soft shale bedrock a jet arrangement was made. A three-stage centrifugal pump capable of delivering 2,000 g.p.m. at 165 pounds per square inch pressure was installed and the caisson was jetted and sunk to elevation −27.5. The bottom was then cleaned up and five feet of concrete containing calcium-chloride was placed and left to set for four days when the pumps were reversed and the caisson emptied.

A seal was disclosed with only a few wet spots. A sump, 6 feet in diameter, was sunk 3 feet into the seal and about 1½ gallons per minute of water was collected. Grout holes were drilled, pipes sealed in and valves installed and grouting done. The hole was widened out to 10 feet in diameter and sunk below the original bottom for five feet. Underpinning was developed on two opposite quadrants and then the other two for about 8.5 feet from the centre of shaft. A welded steel watertight tube 14 feet long ⅜-inch steel and 9 feet 8 inches in diameter was placed central for the shaft position and concrete backing behind it placed and tamped. The seepage water was panned and the whole grouted. The caisson inclined 20½ inches per 100 feet towards the north and west from the perpendicular. The completed waterway was built so that its centre of gravity passed through the centre of gravity of the caisson in place.

After the caisson work was finished the shaft was sunk similarly to the south shaft using 335 cubic yards of concrete instead of the specified timber. Greater difficulty was experienced on this shaft than in the south on account of the presence of poor shales.

Tunnel Drifting

Tunnel drifting was not spectacular. The machines were ordinary jack hammers. Twenty-six holes per round were drilled and loaded with 100 to 175 sticks of powder and an advance of from 7 to 8 feet per round was made. The extra powder used broke the muck up very finely and facilitated handling. It disturbed material in place somewhat so that more trimming was necessary at some places to bring down loose or shattered rock. Through the sandstone little or no timbering was needed but in the shales a good deal was required, and when passing across the sandstone to shale contacts, which dipped southerly about 10 to 12 degrees, the progress was very slow and extreme care was necessary. A total of 876 feet

Fig. 5—Tunnel, showing Invert, Permanent Rails, Timbered Section and Gunite on Sidewalls.

of tunnel was timbered. About 14,000 square feet of tunnel wall, where the shales would disintegrate very rapidly, were covered with a coating of gunite ¼ to ½ inch thick. It protected the surface excellently. Payment was made for this gunite by arrangement as it did not coincide with the 2-inch thickness and timber sets required by the specification. A tunnel length of 3,069 feet was excavated from the centre line of the south shaft. A 35 h.p. storage battery motor was used to haul the muck, which was loaded into the muck car by hand labour.

There was no water in the shales, not much in the sandstone and only a small quantity even in the conglomerates. No running water whatever was encountered, and the maximum quantity pumped at any time was less than 60 gallons per minute.

On account of the grade of the tunnel falling from south to north all the water was pumped back to the south shaft sump and from there periodically to the surface. The water was quite salty and over any extended period would have had quite a rusting effect on unprotected steel pipe and equipment.

A construction station 85 by 9 by 9 feet was excavated north of the shaft for the tunnel pipe-placing equipment. This station was later thoroughly concreted and after the quarter bend was placed was filled up with concrete, the timber not having been withdrawn.

For details of progress in driving the tunnel see Appendix V.

On completion of the drift, men were immediately put at trimming and also concreting the invert, in which permanent 30-pound rails at 24-inch gauge, were laid to a precise grade. This took from May 27th to August 6th.

Tunnel and Shaft Lining

The specifications provided for a lining of steel pipe or steel-cylinder-reinforced concrete pipe equivalent in strength to the corresponding steel pipe. Different thicknesses of steel pipe were proposed dependent upon the nature of the rock. A steel plate ⅝ inch thick was taken as the base for tunnel lining and 11/16 inch thick for the shafts.

*See Engineering News-Record, July 6th, 1933, "Difficult Caisson Sinking for Vancouver Water Tunnel," by W. Smaill, M.E.I.C.

On account of the longitudinal stress due to upward pressure, in the upper 160 feet in the south shaft and 107 feet in the north shaft, riveted steel pipe $1\frac{1}{8}$ inch or $1\frac{1}{8}$ inch and 1-1/16 inch respectively, no alternative, was used. Below that the steel-cylinder-reinforced concrete pipe known as Bonna pipe was employed. Very little material change was made in the shafts, but in the tunnel the specifications anticipated only about 100 feet of heavy pipe whereas 1,530 were used. The sandstone was considered to have sufficient strength to be amply protected by the thinner pipe lining but the shale was deemed uncertain. Timber was used through the shale beds and the impossibility of withdrawing that timber when lining operations were proceeding was early foreseen.

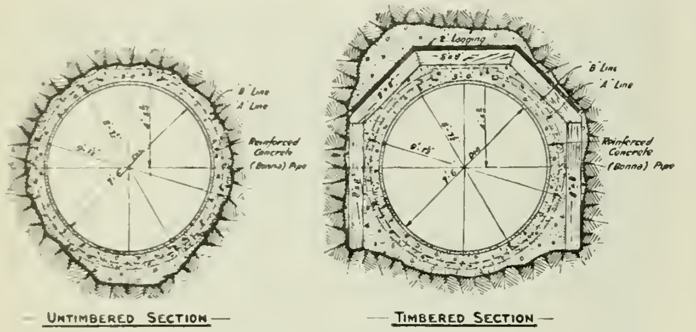

Fig. 6—Tunnel Sections.

For this reason the decision was made to use the heavy pipe specified equivalent to one-inch steel plate through the shale areas and to leave the timber in place and to grout as thoroughly as possible after the lining was placed. This heavy pipe has a steel stress of less than 10,000 pounds per square inch from the whole unbalanced pressure and has not more than 14,000 pounds per square inch where ample provision is made for surge or water hammer.

Primarily the steel-cylinder-reinforced concrete pipe consisted of a steel cylinder 5/32 inches thick on which were wound two or three tiers of $\frac{5}{8}$-inch steel reinforcing rods separated by $\frac{3}{8}$-inch steel rods longitudinally placed 8 inches apart and lined centrifugally with concrete. The outside concrete was not placed as it would have increased the weight of each section about 5 to 6 tons.

The theoretical shop length of a tunnel pipe section was 14 feet and of a shaft pipe 12 feet. The actual length was from $\frac{1}{4}$ to $\frac{3}{8}$ inch shorter.

Appendix VI contains information regarding the reinforced concrete steel cylinder pipe used for the lining of the tunnel.

The operating procedure in the shop during the manufacture of the pipe under the Bonna process included:—

(1) Shearing of the plate to required size.
(2) Rolling and flanging of the plate to required diameter.
(3) Fitting of the plates into a course.
(4) Assembly of the courses into a section and tack welding longitudinal and circumferential seams.
(5) Welding of the section.
(6) Testing of the welds.
(7) Placing spiral and longitudinal reinforcing done by wrapping machine.
(8) Placing grout pipes.
(9) Rolling and placing the interior reinforcing steel.
(10) Setting and adjusting the spinning rings.
(11) Spinning of the interior concrete lining.
  (a) Mix
  (b) Pour
  (c) Spin
  (d) Finish
(12) Curing of the concrete lining.
(13) Shipping by barge or truck.

### Material Tests and Inspection

Tests were taken throughout on all materials and workmanship, and steel and cement were inspected at the mills or at the manufacturer's plant.

A piece of concrete was removed from one pipe to determine whether the mix used appeared balanced and also if there was good bonding with the steel. This piece was cut and polished and showed a very dense concrete with just about the right proportion of sand to gravel, there being a slight excess of sand in order to allow a smooth finish to be given to the inside of the pipe. This concrete was tested for density and gave a weight per cubic foot of 157 pounds as against 150 pounds for the rodded concrete set without spinning.

The spun concrete being denser than the concrete test cylinders broken it is expected that the strength of the lining will be from 10 to 15 per cent greater than the strength of the cylinders made from the same batch.

All weld test specimens from the automatic welding machine broke in the material except those two noted below. Six circumferential and six longitudinal tests were made and of the ten deemed satisfactory the average breaking stress was 58,197 pounds per square inch. Full penetration of seams was insisted upon.

Bend and fracture tests were made, in addition to the tension tests, and all were found satisfactory.

Torpedo gravel, coarse and fine sands were used as aggregates for the concrete lining.

For a typical test of concrete aggregates which were not stored under cover and were subject to variations in climatic conditions see Appendix VII.

Throughout the work 3-inch by 6-inch test cylinders were taken from one of the batches of every pipe. These cylinders were not tested, only cured in damp sand, water spray or vapour to make curing conditions comparable to those of the section itself, and held for check tests of the larger cylinders in case of failure or doubt.

Every tenth pipe was selected for the regular test, in which two 6-inch by 12-inch standard test cylinders were taken and one tested at seven and one at twenty-eight days curing, alternately. This schedule was adhered to as closely as possible.

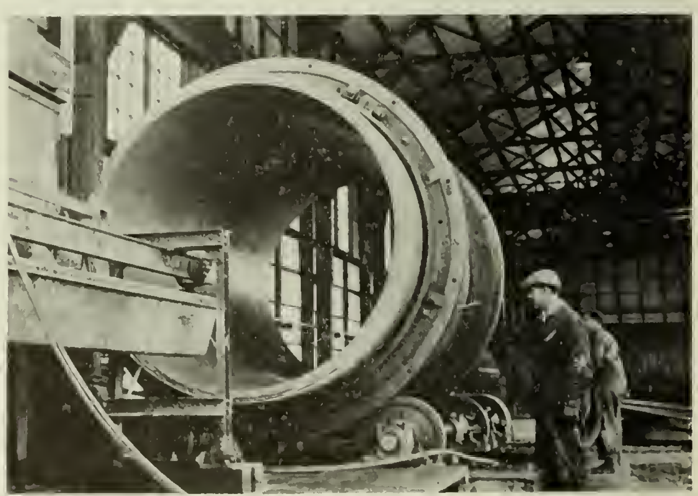

Fig. 7—Fabrication of Steel Cylinder Reinforced Concrete Pipe.

Results of tests showed a very dense concrete of low absorption.

Check tests were made on all cement, shipped from the tested bins at Bamberton, B.C., at the fabrication plant or at the warehouse before shipping to the plant.

### Hydrostatic Tests of Pipe

Two sections of tunnel type pipe were set up and welded together in the shop. The joint of the two sections was filled up by the finishing method used in the tunnel. A steel cylinder was then placed inside and bolted together, and the end rings welded to the inner and outer cylinders to make a watertight compartment about one inch in width between the cylinder and the section. Hydrostatic pressure was then applied at 195 pounds per square inch.

Several sweats showed in the welded seams, which served to show that under test conditions the cylinder and its surrounding spirals expanded away from the centrifugated concrete lining, that the water penetrated here

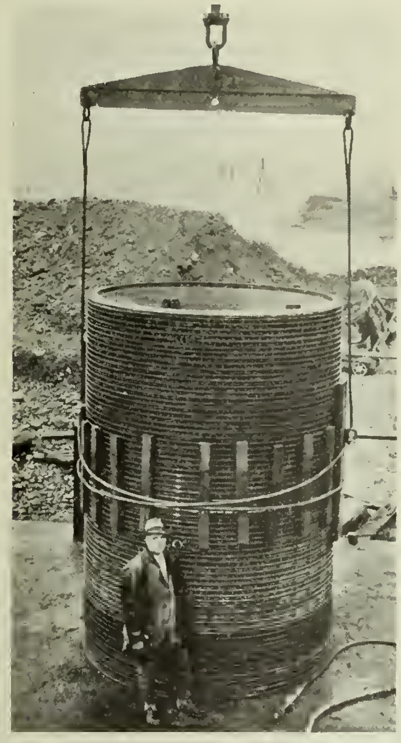

Fig. 8—Section of Tunnel Pipe Ready for Lowering.

and exerted its full pressure upon the 5/32-inch plate, which without its concrete backing deformed, and pores which could not be detected under the gasoline test showed a water percolation.

However, it was decided that the test was in no way fair to the type of pipe as tests already made had demonstrated the strength of the pipe. Further similar tests were therefore dispensed with.

### Laying The Tunnel Pipe

The pipes for the tunnel and the north shaft were moved from the fabrication plant to the shaft by barge, four lengths or more being shipped per trip. The eighteen lengths required for the south shaft were hauled by truck to Stanley Park.

When a tunnel pipe arrived at the north shaft it was spidered inside at three or four places with 4- by 6-inch struts and four 4- by 6-inch longitudinal timbers and lowered down the shaft by means of a stiff-leg derrick. At the bottom it was, for the first time since centrifugation was completed, lowered on to its side and a cantilever car picked it up and carried it to its place of installation in the tunnel.

Adjacent to the south shaft, between the first three pipes placed and the roof and side of the tunnel, there was ample room for workmen to move around. These three pipes were jacked into position and the concrete backing placed outside them in one operation.

The fourth and subsequent pipes were brought up to an approximate position. A centring spider in the last set pipe took the far end of the pipe and with motion in three planes available from the cantilever car and with the steadying effect of the centring spider, the pipe was quickly adjusted for line and grade, and blocked so that motion was impossible. Here the value of the concrete invert and the permanent set rails was apparent. A sandbag bulkhead was built and the first two yards of concrete of the section blown in from the bottom. It was found, by experiment, that gravity would not carry the backfilling concrete completely into the reinforcing bars on the bottom of the pipe, but the upward motion and the blast of air through the mixture when placed from the bottom excellently surrounded the reinforcing steel. The blower pipe was then transferred to the top of the section and the placing continued until the top of the reinforcing steel was covered to a depth of 3 inches. Time was then allowed for a slight set of the concrete and the slump of the mixture was changed from 10 or 11 inches to 5 inches and the balance was placed so as to fill the spaces as completely as possible between the pipe and the rock excavation.

Fifteen pipes were placed before the welding was started and then oxy-acetylene welding was tried, unsuccessfully. The joint could not be dried and consequently it was impossible to make other than a porous weld. The method was then changed and the weld was made immediately the pipe was placed in position and before the backing was placed. No great difficulty was then experienced. The welders later used more heat and it was then discovered that the expansion of the steel was breaking the bond between the steel and the concrete. The use of oxy-acetylene was then stopped and electric welding substituted. Not much trouble was found from that time, but much greater care had to be taken in the preparation of the joint for welding.

When the welding was finished the concrete backing was placed and it was sufficiently wet so that if there was any porosity in the weld a moisture showed, Finally a caulker was detailed to stand by every joint as the concrete was being placed and to caulk until dry or re-weld the porous spots. In all joints done after the procedure was changed very little difficulty was experienced with leaks but when the welding alone was completed there was scarcely a joint 100 per cent dry against all moisture. The backing concrete was placed by means of a Webb gun.

Fig. 9—Lowering Tunnel Pipe at Bottom of Shaft.

The concrete was mixed at the north shaft and brought to the gun in cars holding two batches each of 12 cubic feet. The bulkhead was left in place at least four hours, and no concrete was blown against that previously placed until the latter was six or eight hours old.

The greatest care was exercised in preparing the sandstone rock before the pipe was placed, and it is thought that in general the contact of backing to bedrock is very tight except of course at the top of the section.

Considerable study was given to the selection of the proper mix for the backing. Ten or twelve mixes with different cement content, water content and different admixtures were tested. Two experimental sections were used and remembering that the steel reinforcing was placed thirteen ⅝-inch rods to the linear foot on the inside tier and two tiers over that with 9 and 4 rods respectively, the fineness of the material used can be realized.

For a typical mix of concrete backing see Appendix IX.

**Fig. 10—Bulkhead in Place and Concrete Setting.**

In placing pipe and lining the men worked eighteen shifts per week and placed from twelve to a maximum of fifteen pipes per week.

In the tunnel lining the cycle of operation and the time occupied may be summarized as follows:

| | | |
|---|---|---|
| 1. | Clearing up, removing muck, drumming rock, air blasting the sides of the excavation and the invert | 4 hours |
| 2. | Bringing in and setting pipe, placing bulkhead | 1 hour |
| 3. | Welding joint | 2½ hours |
| 4. | Bringing in gun and adjusting blower | 1 hour |
| 5. | Blowing lower part of space | ½ hour |
| 6. | Changing over to upper section | ¼ hour |
| 7. | Blowing upper part of space | 2 hours |
| 8. | Time for setting | 2 hours |
| 9. | Complete blowing of top spaces | 1 hour |
| 10. | Awaiting setting of concrete backing before withdrawing sand bag bulkhead or blowing further concrete up against green concrete | 6 to 8 hours |

(Some of these operations run parallel with others)

Later the joint spaces in the inner lining of the Bonna pipe were concrete finished and the grout hole plugs set and also concrete finished.

### Quarter Bends

The quarter bends at the feet of the shafts were specials. The shaft part consisted of a cylinder 8 feet 8 inches diameter of one-inch steel, which went 4 feet below the floor of the tunnel in the south shaft and about 6 feet below the floor in the north shaft forming a permanent sump, and a taper 8 feet 8 inches to 7 feet 10 inches about 10 feet long. The taper was field connected to the cylinder by a double riveted butt joint, the joints in the strap being field welded. Special flanges were provided to connect the quarter bend to the tunnel and shaft pipes respectively. The quarter bends were built in two pieces, bolted together, riveted and caulked and then set to place and finally welded to the already set tunnel pipe. A grout hole was left in the centre of the bottom, through which, when the quarter bend was set, grout was poured up to the plate, to a depth of about 3 inches, the bottom of the sump having previously been concreted up to that level.

On account of the bad rock conditions at the junction of the north shaft and the tunnel, reinforcing rods were placed around the quarter bends, designed to stiffen the whole structure. The outside backing was then placed. There was plenty of space around for tamping the concrete.

The reinforcing for the inside of the quarter bend was set, saddled and tack welded or tied so as to be in its correct position in the inner lining. This reinforcing consisted of No. 10 galvanized wire mesh tied to hoops at 18-inch centres. Over the mesh was then placed the form shaped to develop the final waterway. The lining, consisting of a rather thick grout, fifteen sacks cement to the yard, was poured, the form being vibrated as much as possible during the process.

For test purposes, prior to placing this grout lining, a form was made and poured. On stripping four days after pouring, it was found that the shrinkage was very slight.

### Shaft Pipes

From the top of the quarter bends to elevation −66.66 south and elevation −20.83 north the shafts were lined with steel-cylinder-reinforced concrete pipes similar to those used in the tunnel, but of strength equivalent to varying thicknesses of steel pipe. (See Appendix VI.) The selection of the location of the pipe of different strengths was made originally from the borings and was somewhat amended as the excavation disclosed the true character of the rock passed through. Altogether the shaft reinforcing steel amounted to 21¾ tons more than was specified.

On an average about one length of pipe was set per day. The welding was done before concrete was poured

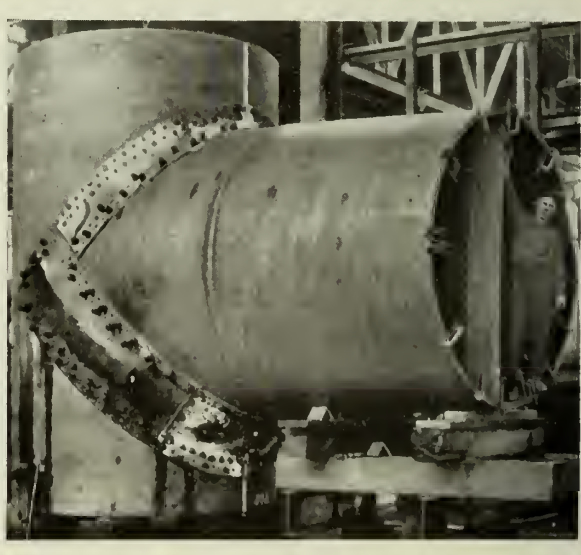

**Fig. 11—Quarter Bend being Assembled.**

but the water coming down inside the shaft lining prevented inspecting and caulking until after the upper steel pipe was set.

Grout holes were left near the top of the shaft pipes and these were grouted, as explained under the section on grouting.

The outside backing was similar to that placed behind the Bonna pipe in the tunnel.

### Steel Pipe Interlining

Above elevation −66.66 on the south shaft and above elevation −20.83 on the north, steel pipe interlining was used in order that the upward thrust due to pressure should be transferred into the concrete counter-weight, the heavy circular backing of the upper shaft section. The pipe used was 161.66 feet 1⅛ inch thick in the first case and 48.83 feet 1⅛ inch and 58.50 feet 1-1/16 inch thick in the latter. Each course of pipe was made from one plate, with a butt

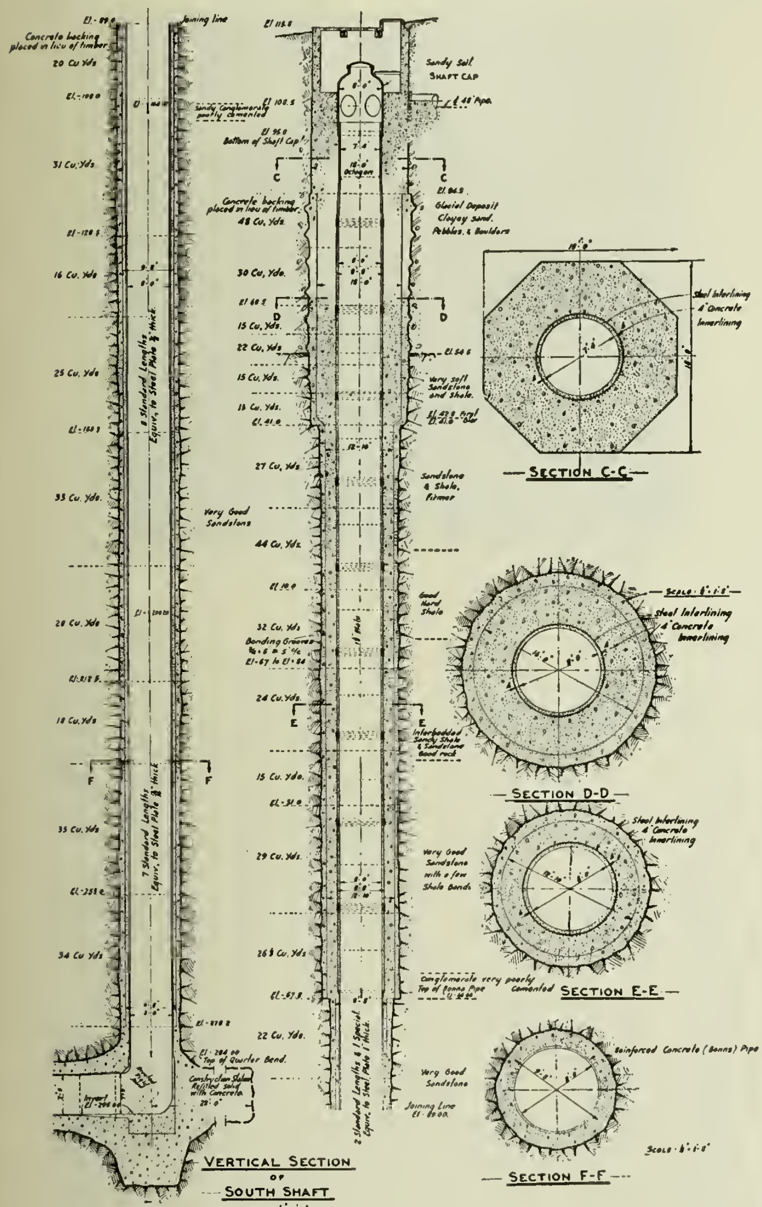

Fig. 12— Sections of South Shaft.

welded longitudinal joint. Two courses joined in the shop by a butt welded circular joint formed a section 16 feet long. The field connections were riveted butt joints, the straps being welded where joined. The seams as well as all rivet heads were caulked inside and out. The sections were shop erected and fitted, the rivet holes being drilled ⅛ inch undersize so as to provide for field reaming. The steel pipes were backed with a 2,500-pound concrete, maximum aggregate 1½ inches to 2 inches. To lower a pipe section down the shaft, set, fit, ream, rivet, caulk, weld and place concrete backing, erect staging and make ready to receive next length took seventy-two hours. In each shaft the whole of the steel interlining was placed and then the concrete interlining was carried up to within 8 feet of the shaft cap joint. The last portion of inner lining was placed after the shaft cap had been erected.

Grout holes were left and later grouted in the south shaft but in the north all the steel interlining being within the caisson no grouting was needed.

The inner lining was a cement, sand and bird's eye gravel mixture—twelve sacks cement to the yard. It had a 8-9 inch slump. It was 4 inches thick and reinforced with wire mesh No. 10 gauge, tied to hoops which were welded to the steel pipe. It was placed in 8- or 16-foot lifts and as soon as the forms were removed was rubbed and polished to a finish corresponding to that of the centrifugated pipe.

### Shaft Caps, Valves and Connecting Pipe Lines

The only outward indication of shaft or tunnel is the shaft cap at each end. The caps are made of cast steel 2½ inches thick, with four 48-inch outlets on each, to which are attached the 48-inch outlet pipes which go to the valve chamber. The flanges of the outlets are standard heavy pressure 48-inch flanges. The top of each shaft cap has a 48-inch removable head attached to the main body by studs. The connection to the steel interlining is a triple riveted lap joint.

Bolted to the shaft cap are steel castings consisting of straight pipe extension pieces, ⅛ bends and ¼ bends. Between the steel castings and the valves 48-inch welded steel pipe ¾ inch thick was used. Chrome-nickel bolts, studs and nuts were used throughout for these connections. All castings and pipes were coated inside and outside with Hermastic pipe coating.

Only two valves are at present installed, the other pipes being closed by bolted-on heads. The valves are of cast steel 48 inches in diameter, designed for 210 and tested to 425 pounds per square inch. Each weighs 21,000 pounds.

The north connecting pipe is 60 inches and the south pipe is 70 inches. At some future date the 70-inch pipe will be paralleled by an 84-inch and the 60-inch by three

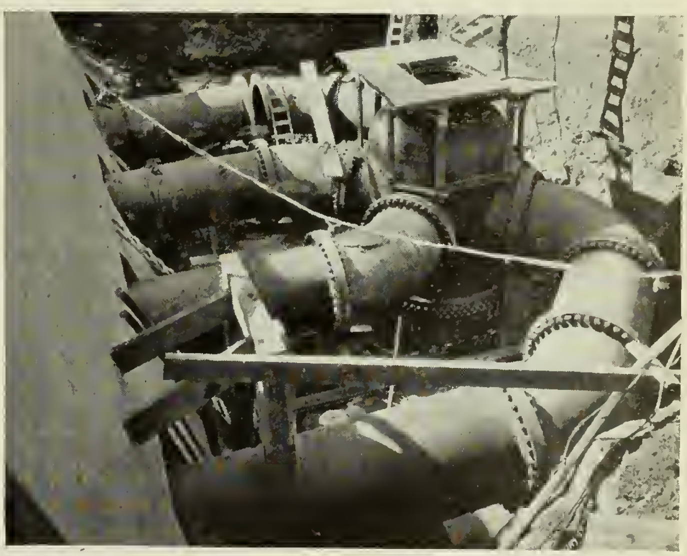

Fig. 13—Pipes Between South Shaft Cap and Valve Chamber.

60-inch or two 72-inch pipes. The tunnel and these pipe systems will carry the total yield of the Capilano system, estimated at over 200 million gallons per day.

### Grouting and Finishing

In each length of tunnel pipe there were placed on the top centre line two grout holes, one about 18 inches from the end and the other near the centre. Also two grout holes were placed in selected pipes about 18 inches from the end, one on each side of the pipe, and about 45 degrees from the bottom. These were only used where water conditions demanded it.

In the Bonna shaft pipe two grout holes were placed, one about 8 inches and the other 10 inches from the top.

In the steel pipe in the south shaft in order that the concrete backing might be brought to the proper length for support for the riveters the grout pipes were placed relatively in the same position but about 3 feet below the top of the pipe.

When the tunnel pipe laying had proceeded to station 20 + 00 grouting was started at station 11 + 74. This point was selected because it was in the shales and the grouting holes showed no water leaking into the tunnel. By starting here the grouting would form a plug so that residual water would not be forced into the otherwise dry areas.

Nipples and valves were placed on 10 or 12 holes and grouted to refusal at a pressure of 100 pounds per square inch. Theoretically the roof aperture should be open enough for the grout to flow from one hole to the next and further if the intervening valves are closed. This did not prove entirely true and very often it was nearly impossible to force any grout into the adjoining hole at the given pressure and the machine had to be connected with each individual aperture. This operation was carried right back to the quarter bend at the south shaft.

The total amount of grout used was 21.5 cubic yards. The maximum for any hole was 16 cubic feet and in some cases the quantity taken was scarcely measurable.

Returning over the same area, using a pump and a pressure of 200 pounds per square inch, another 3.50 cubic yards of grout was used and practically the whole of the leakage water was cut off.
