A. G. Moore, M.E.I.C., is now in private practice as a consulting engineer (mechanical, electrical) in the Town of Mount Royal, Que. After graduating from the Nova Scotia Technical College with a B.Sc. in electrical engineering in 1925, he spent two years with Westinghouse Electrical Manufacturing Company, East Pittsburgh, Pa., on the students' test course. He returned to Canada in 1927 and spent one year with the Asbestos Corporation at Thetford Mines, Que. In the following year he joined the engineering staff of the Electric Service Corporation, Shawinigan Falls. In 1930 he entered the employ of the Montreal Light Heat and Power Company as engineer on the electric overhead and underground distribution and construction department. Eight years later he became resident engineer with the Compagnie Immobilière de Ste. Marguerite, Lake Masson, Que. When war broke out he joined the engineering staff of Defence Industries Limited as assistant to the senior electrical engineer on design and construction of war plants. He resigned this position in March of this year.

W. A. Rush, M.E.I.C., controller of radio, Department of Transport, Ottawa, has been awarded a medal by the Professional Institute of the Civil Service of Canada. The award is in recognition of work done in the application and development of radio and radar in furtherance of the conduct of war.

F. I. Ker, M.E.I.C., publisher of the *Hamilton Spectator*, was elected president of The Canadian Press. He was general chairman of the Canadian Publishers War Finance Committee 1940-45. He is a director of the Canadian Daily Newspapers Association and the American Newspaper Publishers Association and of the Southam Company. Born in Dunham, Que., he was educated at McGill, entered newspaper work in 1921, and became editor and managing director of the *Spectator* in 1930. He was a delegate to the Imperial Press Conference in 1930 and will attend the sixth Imperial Press Conference to be held in London this year.

G. H. Burbidge, M.E.I.C., acting district engineer for the Department of Public Works, Port Arthur, Ont., since 1942, has been appointed district engineer of the department. A graduate of McGill University in civil engineering, he has been connected with the department since 1921.

D. M. Vye, M.E.I.C., has been appointed to the New Brunswick Resources Development Board staff as development engineer. Mr. Vye served with the maintenance and construction section of the R.C.A.F. from July, 1942, until his discharge with the rank of squadron leader just prior to his recent appointment. His engineering career prior to the war was with the Erie Railroad Company, Cleveland, Ohio, and in engineering and construction work in Canada.

G. W. Rowe, M.E.I.C., has been appointed district engineer for the Department of Public Works, Winnipeg, Man. Mr. Rowe served with the R.C.A.F. during the war on construction work at Carberry and Newfoundland. Prior to the war he spent a year and a half at Churchill, Man., where he was port engineer.

J. W. Ussher, M.E.I.C., is at present employed by the Canadian Pacific Railway as supervisor of water treatment for western lines with headquarters at Winnipeg, Man. He was formerly assistant superintendent in charge of production, St. Maurice Chemicals Limited, Shawinigan Falls, Que.

W. A. Wheten, M.E.I.C., has accepted the position of irrigation engineer with the Government of Ceylon. Prior to serving in the R.C.A.F., he was associated with the Prairie Farm Rehabilitation Administration at Saskatoon. For the past two years he has been with the Department of National Defence at Ottawa on the inspection of explosives.

H. B. Dickens, M.E.I.C., supervising engineer of the Department of Public Works of Canada at Ottawa, has had two oil paintings accepted for exhibition in the spring show of the Art Association of Montreal.

Walter L. Rice, M.E.I.C., has been released from the R.C.A.F. with the rank of flight lieutenant and has returned to the City of Toronto, works department, water works section, as assistant engineer of water distribution. He has been on leave of absence for war service for five and one-half years, the latter four of which he served as waterworks and sanitation engineer officer for No. 3 Training Command, Montreal, and No. 1 Air Command, Trenton.

A. J. S. Taunton, M.E.I.C., was recently named deputy city engineer of the City of Winnipeg. On his release from the R.C.A.F. with the rank of group captain early in 1945 he was appointed welfare officer with the Department of Veterans Affairs at M.D. 10, Winnipeg, Man., and was the City of Winnipeg representative on the Civic Wage Survey Board.

J. G. Belle-Isle, M.E.I.C., now released from the R.C.A.F., has returned to his former position as plant engineer with the Bell Telephone Company of Canada at Montreal. He served four years with the R.C.A.F., most of which time was spent at Air Force Headquarters (Directorate of Intelligence) in the publication of four technical volumes.

W. H. S. Bird, M.E.I.C., has joined the engineering department of Trans-Canada Airlines at Winnipeg, Man. He was formerly in the office of technical administrator at Canadair Limited, Montreal, Que.

J. E. Clark, M.E.I.C., of the Bell Telephone Company of Canada, has been transferred from the outside plant and transmission division, chief engineer's office, eastern area, at Montreal, Que., to the Laurentian district as district plant engineer.

W. A. Dawson, M.E.I.C., who resigned his position as master mechanic of the DeHavilland Aircraft of Canada Limited on the termination of the Mosquito contract, is now associated with the F. F. Barber Machinery Company, Toronto, as manager of their branch office at Hamilton, Ont.

T. B. Harrison, M.E.I.C., is now employed as plant engineer with the Ontario and Minnesota Pulp and Paper Company at Fort Frances, Ont. He was formerly on the staff of the fuel department of Atlas Steels Limited, Welland, Ont.

Jean Paul Lecavalier, M.E.I.C., formerly on the engineering staff of the drainage bureau, Department of Agriculture of the Province of Quebec, at Montreal, is now in private practice at Montreal.

W. G. Reekie, M.E.I.C., is now employed by Bloedel, Stewart and Welch, Vancouver, B.C., as assistant engineer in charge of the design and construction of the sulphate pulp mill which is being erected at Port Alberni, B.C.

Lawrence H. Burpee, M.E.I.C., has joined the staff of Morrison-Knudsen Company Inc., Seattle, Washington. He was previously associated with the Foundation Company of Canada Limited, Montreal.

Gilbert Proulx, M.E.I.C., was recently promoted to the position of superintendent of the Saguenay Electric Company at Chicoutimi, Que. A graduate in civil engineering of the Ecole Polytechnique in 1941, he was employed for a time by Dominion Bridge Company Limited, Lachine, Que. In 1942 he joined the staff of the Saguenay Electric Company as assistant to the superintendent.

J. Stewart Ball, M.E.I.C., has been appointed refinery engineer of the Shell Oil Company of British Columbia Limited. He was formerly mechanical and maintenance engineer with the Shell Oil Company in Montreal.

M. L. Zirul, Jr.E.I.C., is at present connected with the Water Rights Branch at Nelson, B.C. For the past two years he was employed on structural design work with the Powell River Company, Powell River, B.C., prior to which he was associated with the British Columbia branch of the Dominion Water and Power Bureau.

W. M. Tkacz, Jr.E.I.C., was discharged from the Royal Canadian Navy in February last with the rank of lieutenant (E). He is now employed as time study engineer at Canadian Vickers Limited, Montreal.

Maurice Saint-Jacques, Jr.E.I.C., is now employed in Montreal, Que., as distribution engineer with the Quebec Hydro-Electric Commission. He was previously with Canadian General Electric Company Limited, Toronto.

G. L. Archambault, Jr.E.I.C., has severed his connection with the Aluminum Company of Canada Limited, where he has been employed since 1942. He has accepted the position of sales manager with Les Produits en Aluminium et Acier Inoxydable L'Hoir Inc., at Levis, Que.

W. C. Brown, S.E.I.C., recently released from the army with the rank of captain, has joined the engineering staff of Electronic Devices Company Limited, Toronto. He was employed by the army as design engineer on army radar equipment, associated in that capacity since 1942 with the radio section of the National Research Council and with Research Enterprises Limited.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Bertram P. Richardson, M.E.I.C., died suddenly at his residence in Montreal on March 11th.

Born at Lee, Kent County, England, on May 5th, 1872, he was educated at preparatory and public schools and served five years apprenticeship with Jos. Thompson & Sons Ltd., engineers and shipbuilders, London and Sunderland, England.

Early he travelled to India and to Australia where he joined the New South Wales Mounted Police. In Western Australia he participated in a 900-mile prospecting trek to the Coolgardie Goldfields. At Perth, Western Australia, in 1897, he joined the engineering department of the Western Australian Government Railway, remaining until 1900 when he returned to England. With General Baden-Powell's South African Constabulary in South Africa from 1900 to 1902 he was superintendent of military works for the Orange Free State. He was engaged then by the Kroonstad Breweries Limited as resident engineer and in 1905 was contractor in connection with a 90-mile railway being built by the Natal Government Railways from Bethlehem to Kroonstad. From 1906 to 1911 he was designer and construction engineer for the Consolidated Goldfields Limited, H. Ekstein and Company and The Premier Diamond Mines Ltd. in South Africa, was connected with La Compagnie Générale d'Electricité de Laurenco Marques, Portuguese East Africa, and was elected a member of the Transvaal Institute of Mechanical Engineers.

Coming to Canada in 1912 he was associated with J. A. Morrison, Montreal, and with Ross & Macdonald, Montreal, as resident engineers. In World War I Mr. Richardson was five years in France and Belgium with the railway construction corps of the Canadian Army. On his return in 1919 he became resident engineer for Lockwood, Greene and Company of Canada Limited, Montreal, and later associated himself with the department of buildings of the Protestant Board of School Commissioners in Montreal. In 1935 he established private practice as consulting engineer in Montreal.

Mr. Richardson joined the Institute as a member in 1921, and became a life member in 1939.

Altheod Tremblay, M.E.I.C.

Walter G. Hunt, M.E.I.C.

J. W. LeB. Ross, M.E.I.C.

Altheod Tremblay, M.E.I.C., a member of the Institute for over forty years, died at his home in Quebec, Que., on March 1st, 1946. Born in Montreal in 1877, he studied with the Marist Brothers and entered the employ of J. P. B. Casgrain, land surveyor, in 1891 as an assistant. In 1901 he was admitted as a member of the association of land surveyors of the Province of Quebec, and was employed as assistant engineer on the construction of the Soulanges Canal. On his return in 1903 from a surveying expedition in Western Canada he entered the construction department of the Canadian Pacific Railway as draughtsman. In 1909 he became a Dominion Land Surveyor, and on the inauguration of its school of surveying and forestry Laval University requested him to lecture there.

From 1919 to 1927 Mr. Tremblay carried on the surveying of Quebec City and its suburbs, and of the municipalities of Giffard, Ste. Anne de Beaupre and Sillery. He was connected with the construction of the waterworks at Quebec-West and Charlesbourg. Laval University conferred on him the degree of Master of Arts in 1923.

Mr. Tremblay joined the Institute as a Student in 1903, transferring to Associate Member in 1906 and to Member in 1940.

Walter G. Hunt, M.E.I.C., president and founder of the Walter G. Hunt Company Limited, general contractors, Montreal, died on April 6th in Montreal.

Born at Bury, Que., he was educated at McGill University where he graduated in 1917. For several years he was associated with the firm of Ross-Meagher Company, engineers and general contractors, Ottawa, as engineer and later as general superintendent. In 1926 he came to Montreal and two years later formed the firm of which he was president. Projects undertaken by the firm included the construction of the Sir Arthur Currie memorial gymnasium and armoury for McGill University, extensions to tank shops for the Canadian Pacific Railway and construction work at the St. Hubert and Dorval airports, near Montreal. Mr. Hunt was a director of the Stanstead and Sherbrooke Fire Insurance Company and a past-president of the Builders Exchange, Incorporated.

Joining the Institute as a Student in 1916, he transferred to Junior in 1919. He became an Associate Member in 1922 and a Member in 1932. He served on the executive committee of the Montreal Branch for several years and was councillor of the Institute in 1941-42-43.

Charles William Dingman, M.E.I.C., pioneer oil man and petroleum engineer, died suddenly on March 14th following a brief illness. Born in Toronto in 1888, he received his education at Picton, Ont., and at Western Canada College, Calgary.

He was associated with his uncle, the late A. W. Dingman, in the Calgary Petroleum Products Company at the time of the famous "Dingman Discovery" in 1914 which started the historic Turner Valley oil boom.

From 1920 to 1931 Mr. Dingman served with the federal government as inspector of gas wells. In 1932 he was associated with the old Turner Valley conservation board and was then in private practice as a petroleum engineer until 1935.

Named director of the petroleum and natural gas division of lands and mines that year, he received the appointment of deputy chairman of the petroleum and natural gas conservation board in 1938, later becoming chairman and remaining on the board until 1941. Since that year he has been chief petroleum engineer with the Home Oil Company.

Mr. Dingman became a Member of the Institute in 1945.

John W. LeB. Ross, M.E.I.C., died in Ottawa on April 1st in his eightieth year. Born in Ottawa, April 27th, 1866, he joined the Department of Railways and Canals in 1884, starting in a junior capacity on the staff employed in the improvement of the St. Lawrence Waterway, his activities consisting until 1891 of level and transit work. He was then promoted and in 1892 was appointed assistant engineer, remaining until 1893, when he accepted a position with the Ottawa, Arnprior and Parry Sound Railway serving consecutively as leveller, topographer, transitman and assistant engineeer.

Returning to the Department of Railways and Canals in 1897 he was overseer of the Williamsburg canals and resident engineer in connection with obstructions in other parts of the St. Lawrence Waterway, and in 1907 was appointed superintending engineer of the Sault Ste. Marie Canal, which position he held until his retirement in 1936.

Mr. Ross joined the Institute as an Associate Member in 1897, transferring to Member in 1901. He was made a life member in 1936.

Albert Raiguel Bingham, M.E.I.C., died at his residence in Massena, New York, on January 4th. He was born in Philadelphia, Pa., in 1878 and studied electrical engineering at the Drexel Institute in that city, graduating in 1900.

His early career was with J. M. Race, Housatonic, Mass., the Berkshire Street Railway, Pittsfield, Mass., the Hudson River Electric Power Corporation at Utica, N.Y., and the Hydro Plant, Spier Falls, N.Y.

He then spent four years with the Aluminum Company of America in their power plant at Massena, N.Y., and in 1913 became assistant superintendent for the Canadian Light and Power Company at their power plant at St. Timothée, Que., in charge of the power plant at Beauharnois Canal. He later became general superintendent of the plant, retiring in 1930.

Mr. Bingham joined the Institute as an Associate Member in 1921, becoming a Member in 1940.

Noel Faure Harrison, M.E.I.C., died on February 9th after a few days illness, in Bri Cualann, County Wicklow, Ireland. Born in Dromore, County Down, Ireland, on December 25th, 1884, he attended the Dublin Technical School, graduating in 1902. He spent two years in the office of Sir Thomas Drew, President of the Royal Hybernian Academy, studying architectural drawing and building construction, and three years with Messrs. Norman Robinson and Brunker, electrical engineers.

In Canada, in 1906, he was assistant to H. Ross, electrical contractor, Winnipeg, Man., and in 1907 and 1908 was draughtsman with J. R. Royce, consulting mechanical engineer, Toronto, Ont. He was later with J. P. Farrelly Excavating Machine Company, Toronto, as draughtsman, and in 1909 became assistant to the late Roderick J. Parke, consulting electrical engineer, Toronto.

With Canadian Northern Railway, Winnipeg, Man., he was assistant to the architect until 1919, when he entered the office of the chief engineer, Winnipeg River Power Company, Winnipeg, in 1920 associating himself with the Manitoba Power Company Limited, Winnipeg.

Mr. Harrison paid a visit to Ireland two years later, being interested in the development of peat gas power, and in 1924 returned to Ireland where he was engaged in building activities in connection with a housing scheme there, and remained to established private practice as a consulting engineer at Bray, County Wicklow.

Mr. Harrison joined the Institute as an Associate Member in 1922, becoming a Member in 1940.

Flight Lieutenant Thomas B. Akin, R.C.A.F., M.E.I.C., was killed in an airplane crash on May 16th, 1945, in Alberta. Born in Calgary, Alta., he resided at Windsor, N.S., and attended the Nova Scotia Technical College, graduating in 1932 with the degree of B.Sc. in civil engineering.

That year be came associated with the Minas Basin Pulp and Power Company Limited, Hantsport, N.S., and in 1935 became superintendent of Candian Keyes Fibre Co. Ltd., in the same city, being appointed manager in 1937.

In 1941, he joined the R.C.A.F. as pilot officer, being stationed at the School of Aeronautical Engineering in Montreal, later transferring to No. 15 S.F.T.S., at Claresholm, Alta. Since 1943 he had been at No. 2 F.I.S., at Pearce, Alta.

Joining the Institute as a Student in 1932, he transferred to Member in 1941.

Joseph Harold Melville Rombaugh, Jr.E.I.C., died at his home in Toronto on January 17th. Born at Smiths Falls, Ont., on July 28th, 1908, he graduated from Queens University, Kingston, Ont., in 1931 with a B.Sc. in civil engineering.

In 1931-32 he was assistant city engineer at Sudbury, Ont., and was in the tapping department of Fittings Limited, Oshawa, Ont., until he entered the employ of McColl-Frontenac Oil Company Limited at Montreal East, Que., in 1937. In that company he was draughtsman, engineer, clerk to the superintendent of construction and maintenance, and finally draughtsman for the marketing department at their Toronto office.

Mr. Rombaugh joined the Institute as a Student in 1928 and transferred to Junior in 1937.

News of the Branches

Because of the paper supply situation it has been necessary to reduce considerably the amount of space usually devoted to News of the Branches. We beg the indulgence of the branch news editors if they find that we have made liberal use of the blue pencil on their reports.—Editor.

Activities of the Twenty-seven Branches of the Institute and abstracts of papers presented

EDMONTON BRANCH

W. W. Preston, M.E.I.C. - *Secretary-Treasurer*

Technical features of **Mulberry**, the floating port designed by British engineers for the invasion of Normandy, were described by Col. V. C. Steer-Webster, O.B.E., in an address to a joint meeting of the Edmonton Branch E.I.C., the Association of Professional Engineers of Alberta, and the Canadian Institute of Mining and Metallurgy at their dinner on March 29th in the Macdonald Hotel. Col. Steer-Webster, who had headed the Mulberry project is now supervising the exhibition of models of Mulberry across Canada.

The speaker said that the war office began planning Mulberry when the allies left Dunkirk in 1940. He paid tribute to the Canadians for their attack at Dieppe, and emphasized the success of their efforts as preparation for the Normandy invasion.

The Colonel claimed there were no technical difficulties in building the port, but added that the design was governed by the shortage of materials, the scarcity of construction sites, the allowable sizes of shipping units (limited by narrow gauge railway, tunnel heights and bridge capacities) and the fact that 40 per cent of the manufacturing was to be done by women.

Col. Steer-Webster outlined the scope of the project and described the engineering features of various units comprising the port. Their flexibility in transit and during erection, and their protection from damage and how they stood up in service were also explained in the paper.

Chairman of the meeting was J. McMillan, president of the A.P.E.A. Head table guests included Hon. J. C. Bowen, Lieutenant-Governor of Alberta; Hon. N. E. Tanner, Minister of Lands and Mines; F. Mitchell, Deputy-Mayor of Edmonton, F. R. Burfield, chairman of the Edmonton Branch, E.I.C., E. O. Lilge, C.I.M.M., and Col. Steer-Webster who was introduced by Mr. Burfield.

At the conclusion of Col. Steer-Webster's address, which was heartily applauded, the members, numbering one hundred and fourteen, had the privilege of inspecting the Mulberry model at the Prince of Wales Armouries. The film "A Harbour Goes to France," was shown privately to the engineers.

HALIFAX BRANCH

J. D. Kline, M.E.I.C. - *Secretary-Treasurer*
S. W. Gray, M.E.I.C. - *Branch News Editor*

On April 15th, 1946, the regular monthly meeting of the Halifax Branch was held in the Nova Scotian Hotel. The attendance was 190, including some of the members of the Nova Scotia Technical College who were guests of the Branch.

Other guests at the head table included Air Vice-Marshal Morfee, Air Force; Brig. J. C. Stewart, Army; and Capt. Porteous, Navy; Prof. Hayes representing the Nova Scotia Institute of Science. The guest speaker of the evening was Dr. G. C. Laurence, chief of the technical physics division of the National Research Council's Chalk River Laboratory. He was introduced to the meeting by the chairman C. D. Martin.

Dr. Laurence delivered a very interesting and instructive address on **Atomic Energy,** reviewing the history of this research right up until the discovery of the atomic bomb.

Dr. Laurence, who was born in Charlottetown, P.E.I., and is a graduate of Dalhousie University, initiated the Canadian uranium fission research in Ottawa in 1940, and the interest with which his address was received is well born out by the above attendance, which was the largest attendance at a regular monthly meeting in the history of this Branch.

A vote of thanks to the speaker was moved by G. J. Currie and was seconded by Prof. J. V. Douglas of Dalhousie University.

HAMILTON BRANCH

L. C. Sentance, M.E.I.C. - *Secretary-Treasurer*
I. M. Macdonald, Jr.E.I.C. - *Branch News Editor*

The regular monthly meeting of the Hamilton Branch was held on Thursday, March 28th, 1946, at McMaster University, with Chairman A. R. Hannaford presiding.

Over 100 member of the Branch and members of the Association of Professional Engineers of the Province of Ontario gathered to hear the speaker of the evening, Dr. G. Ross Lord, president of the Professional Association of Ontario. Dr. Lord, introduced by W. J. W. Reed, is associate professor of mechanical engineering at the University of Toronto. His subject for the evening was **The Association of Professional Engineers—Its Accomplishments and Objectives.**

Some of the objectives of the organization listed by Dr. Lord included such things as job evaluation to set the standard of remuneration according to work requirements, educational standards, assistance to students and young engineers, and dealing with infractions of the Professional Engineers Act. Other activities are the licensing of foreign engineers, and the raising of salaries of low-paid engineers to the standard for their work.

The affairs of the Association are managed by an active council of 18 members, who appoint committees to report on routine and special matters. Matters of interest before the council at present are revisions to the Professional Engineers Act of Ontario, and plans for standard professional engineering requirements in all Canadian provinces.

At the conclusion of Dr. Lord's talk, Col. Tom Medland, public relations director of the Association, spoke briefly and outlined some unusual experiences encountered in his work.

A vote of thanks was tendered Dr. Lord by E. G. Wychoff, after which the meeting was adjourned for customary refreshments.

LETHBRIDGE BRANCH

T. O. Neumann, M.E.I.C. - *Secretary-Treasurer*
H. T. Miard, M.E.I.C. - - *Branch News Editor*

Mr. Don Livingstone of Lethbridge spoke on the **Bailey Bridge** at the monthly dinner meeting of the Lethbridge Branch held in the Marquis Hotel on Friday, February 22nd.

The speaker was introduced by Mr. G. S. Brown, who said Mr. Livingstone's father had been one of the most active members of the Branch. After graduating in mining engineering from the University of Alberta in 1939, Mr. Livingstone worked for a time with the Lethbridge Collieries. He was an officer in the reserve Field Park Company, and joined the army when the unit was mobilized, going overseas with the Sixth Field Park Squadron. For some time he was field engineer, and later adjutant, of the Fourth Division Engineers, with the rank of captain. Lately Mr. Livingstone has resumed his position as engineer with the Lethbridge Collieries.

Mr. Livingstone is an accomplished speaker, and his dry humour was appreciated by the audience as he gave a rapid, comprehensive, and clear description of the Bailey Bridge, and the procedure at a bridgehead during assault.

At the beginning of the Second World War, the British and Canadian Armies found their pontoon bridges too light, and their dry gap bridges either too light or too long in construction.

A structure capable of carrying a seventy-ton load and which could be erected in a few hours was urgently required. Professor D. C. Bailey, a structural engineer at the School of Military Engineering, designed the famous bridge which bears his name. His was probably the greatest single contribution to modern Army equipment. The bridge came into general use early in 1942.

The Bailey is a through type, the roadway being carried between two main girders which are composed of a series of interchangeable ten-foot panels.

The Bailey can be adapted to many uses: single spans up to 190 ft. for tanks, or 240 ft. for trucks; multiple spans resting on piers built of Bailey components or of piling, floating bridges on pontoons, draw bridges, lift bridges, structures on tidal waters, and tank rafts. It can be assembled away from the site if there is a comparatively straight wide road leading to the bridgehead.

For most efficient work on spans up to 120 ft. in length, one man per linear foot of bridge is required. This enables all operations to be carried on simultaneously—mine clearing, construction of approach roads, off-loading of parts, and bridge erection. Bridge sites were usually covered with the wreckage of previous structures, and the time necessary to remove the debris, or build an approach to an adjoining site, was greater than that required for actual bridge construction.

The fastest time in training for construction of a class 40 pontoon bridge, 285 ft. long, was two hours seventeen minutes. A class 40 single span, forty feet long, with twenty-foot ramps was constructed in fourteen and one-half minutes.

Mr. Livingstone believed the record time in action was the construction in seven hours fifteen minutes of two 120-ft. spans by the Fourth Division Engineers. These were built over canals in the Scheldt Estuary, with the enemy only 250 yards away.

A bridge crew can learn to assemble the bridge in two or three hours, they would become proficient in a week, but they might require months or years to reach maximum efficiency.

Mr. Livingstone illustrated a bridgehead on a diagram, and described the crossing in five phases.

A film depicting the erection of a Bailey Bridge was shown, and Mr. Livingstone added some comments.

Mr. Ritchie of Macleod expressed the meeting's pleasure and thanks.

❖ ❖ ❖

In honour of Mr. C. S. Donaldson, who is retiring as general manager of the Lethbridge Collieries, and Mrs. Donaldson, the Lethbridge Branch held a dinner meeting in the Marquis Hotel on Thursday, April 4th.

During the dinner, a trio—Mrs. George Brown, Mr. Brown and Mr. Henderson—furnished a delightful musical background. The sing-song, led by R. S. Lawrence, was devoted to favourites of Mr. and Mrs. Donaldson.

Miss Dawn Purkis sang two charming solos, accompanied by Miss Margaret Brown at the piano.

Chairman P. E. Kirkpatrick quoting from "The Faith of an Engineer" expressed the Branch's admiration of Mr. Donaldson's success in the mining field, his observance of the ethics of the profession, and the respect in which he is held by his fellow-members. In honour of the occasion, Mr. Kirkpatrick presented to Mr. Donaldson a gold lapel pin of the crest of The Engineering Institute of Canada. Mrs. Donaldson was presented with a large bouquet of spring flowers. Those present joined in singing "For He's a Jolly Good Fellow."

In replying, Mr. Donaldson said we all wonder at times if our efforts were worth while, and he assured the meeting that the kindness of his friends and his many associates on the occasion of his retirement, has proved to him that one's efforts were appreciated. He also introduced Mr. J. M. Davidson, his successor at the Lethbridge Collieries, and Mrs. Davidson.

The next part of the programme consisted of bright Scotch dances by Miss Jean Gauld and her pupils. Accompaniment on the piano was by Mrs. Dawson and on the bagpipes by "Scotty" Patterson, who also favoured with a solo.

Mr. Lawrence expressed the Branch's pleasure in having George Brown, Jr. home from the war safe and sound. Mr. Brown's fine baritone voice was enthusiastically received by the audience as he sang three selections.

C. Clendening introduced Mr. Ralph Thrall, who presented a paper on **Lime, Its Manufacture, and Some of Its Uses.**

Mr. Thrall explained there are two types of limestone: "high calcium" and "high magnesium" or dolomite. The quarry at Sentinel consists of high calcium limestone running 90 to 97 per cent of $CaCO_3$, and dolomite is considered an impurity. He confined his discussion to the treatment of the high calcium type.

Limestone occurs in every province of Canada, except possibly Saskatchewan, and in all but two states of the United States.

Limestone, besides its use in the manufacture of lime, is used for building stone. The local stone is not suitable due to the type of formation.

Sugar factories burn limestone with coke to produce quicklime and carbon dioxide. The molasses product still contains a large per cent of sugar. This is recovered by the "Steffenhouse" process of desugarization. Quicklime is added to the molasses producing a precipitate, which is filtered off. This is put into solution, and carbon dioxide is introduced, unites with the lime, and releases the sugar. Limestone required for beet sugar factories equals six per cent of the tonnage of the beet crop.

Glass manufacture requires lime, and the company at Redcliff orders limestone, as the natural gas fuel there enables them to produce lime economically.

Powdered limestone is used for dusting the walls of coal mines.

Lime is used in the ceramic industry, in cleaning coal by the sink and float process, in hog feeds, and in agriculture. The local soils do not require it, as they are partly decomposed limestone.

Mr. Thrall demonstrated the affinity of the pure lime or "quicklime" for water.

Hydrated lime is one of the main products of lime. This consists of the product obtained by adding just enough water to the lime to complete the chemical reaction. The chemical constituents are definitely known, while quickline may contain a varying per cent of combined water. The chemical industry and the building trades require large quantities.

Lime is also used in water-softening, in flotation processes for base metals, in gold processing, in paper mills, nickel manufacture, oil refineries, and with coke it is used to manufacture carbide.

Mr. Thrall said this district has two valuable assets for industry —lime and coal, but the location and transportation costs are drawbacks.

A. L. H. Somerville thanked the speaker.

MONTREAL BRANCH

E. M. Van Koughnet, M.E.I.C. - *Secretary-Treasurer*
Hyman Schwartz, S.E.I.C. - } *Branch News Editors*
Eli L. Ilovitch, S.E.I.C. - }

A Students' Night was held by the Montreal Branch on February 14th, 1946. Léo Scharry, S.E.I.C., was chairman of the meeting. The following students presented papers:

Roger P. Langlois, Fifth Year Ecole Polytechnique, on **Development of a Special Cathode-Ray Tube.** Mr. Langlois explained that for measurements of lengthy time-duration, such as for the study of slow electrical transient conditions, it was often desirable to increase the horizontal sweep of the luminous spot on the screen of a common cathode-ray tube. Such a sweep could be more than trippled by having the usual conical side wall of the tube made cylindrical and used as a circular screen for a suitably deflected cathode-ray beam. Slides were projected, showing the experimental set-up made at the electronics laboratory of the Ecole Polytechnique, under the direction of Professor J. C. Bernier.

Experiments permitted conclusions as to the proper shape of electrodes and magnetic fields to be used in order to deflect the beam without distortion. Realization of a practical tube based on these principles is being furthered at Polytechnique, and is expected to be of interesting use for various laboratory applications.

D. W. McLimont, Third Year McGill University, on **Wash Borings.** With the employment of simple apparatus and few men, wash boring affords a method of determining the nature of ground in depth. Boring proceeds as water pumped down a hollow steel drill rod escapes at a terminal cutting bit in the ground, washes soil up a steel casing around the drill, and voids it at the top.

A record is made of the type of material washed up at any particular depth as the bore hole descends. This information, together with geological data if available, is plotted and tabulated, and permits conclusions to be drawn regarding the composition, elevation and lie of soil strata, the existence of boulders, hardpan and bedrock.

Ground consisting of silt, clay, sandy clay, sand, fine gravel and loam may be explored by wash boring. The principal pieces of apparatus are: drill rod, casing, force pump, derrick, and winch. The operation may be carried out with a four or five-man crew.

The apparatus is mounted on a chassis with wheels or skids for boring on land; on a marine scow for subaqueous boring; or on sleds for under water borings made through ice.

Roger Simard, Fourth Year Ecole Polytechnique, on **Petroleum By-Products in the Plastic and Rubber Industries.**

This talk, which was of a general nature, was the survey of recent progress in the field of chemical synthesis starting from the cracked petroleum gases, the olefin hydrocarbons. After a brief outline of the cracking process, Mr. Simard explained, from a projected diagram, the various derivatives obtained from methane, ethylene, acetylene and butylene. From this he proceeded to describe the products obtained, mainly the phenolic and vinyl resins, Buna-N, neoprene and polystrene. As a practical application, there was described in detail the processing of Buna-S rubber as done at the Sarnia plant of the Polymer Corporation. This was accompanied by a projected diagram of the flow sheet drawn from data obligingly furnished by the rubber laboratory of the N.R.C. where Mr. Simard had worked the last two summers. A summary of the technical and economical possibilities of this new field of chemical synthesis was given in conclusion.

L. E. Neil Carr, Fourth Year McGill, gave an interesting talk on **Automatic Control in the Oil Refining Industry.**

❖ ❖ ❖

Leon A. Duchastel, retiring secretary-treasurer of the Montreal Branch was presented with a pair of silver candlesticks and two silver ash-trays at the regular meeting of the Branch, on March 11, 1946. The presentation was made by Dr. J. M. R. Fairbairn, on behalf of friends with whom Mr. Duchastel had worked on various committees. Thanking his friends for the gifts the former secretary-treasurer mentioned that he was glad of the opportunity to have worked with them.

Dr. W. E. Wickenden, was the speaker of the evening and his subject was **Engineers and Public Policy.** He covered a good deal of the world situation and its effect on engineers and laid some stress on the fact that nature's supply of raw materials might become exhausted before many years had passed. He also pointed out that the labour situation was such that some control had to be exercised to ensure that unreasonable demands were not made upon the ultimate consumer. Dr. Wickenden thought that engineers were in a position to help the world to solve its problems.

The meeting was very well attended and F. L. Lawton was in the chair.

❖ ❖ ❖

Mr. George P. Haynes, chief engineer, combustion division of Todd Shipyards Corp., New York, read a paper entitled **Fuel Oil Burning as Applied to Commercial Boilers for Industrial Service,** before the Montreal Branch on Thursday evening, March 28th, 1946.

The two outstanding types of petroleum are the paraffin base and the asphalt base; the latter is the one mostly used for fuel in industry. There are four general classes of oil atomizers for using this fuel. (a) The straight pressure or mechanical atomizer. (b) same as (a) but with a return flow system which provides for bleeding of oil from the discharge orifice to increase the capacity range. (c) Rotary-spinning cup atomizer and (d) the steam atomizer.

The straight pressure atomizer is the simplest to operate because it has only one moving part—the pump. It is ideal for a steady uniform load and variation of pressure will only allow a 2 to 1 range of operation for a given size sprayer plate. The addition of a " return flow system " allows the pressure to remain constant and the amount of bleed off to be varied. This gives very satisfactory atomizing conditions and allows an operating range of 6 to 1 with a given sprayer plate. The oil is delivered to the boiler at about 300 p.s.i.

The rotary spinning cup type is used where operating pressures are below 15 p.s.i. because it can atomize oil at a higher viscosity than either of the pressure types. While the pressure type burner needs oil at 150 SSU, the rotary cup type can handle oil at 375 SSU; this means that preheaters are not required. This burner has a wide capacity range and may be under fully automatic control with gas or electric ignition. One of the drawbacks is the likelihood of mechanical failure because each of the burners is individually motor driven.

The steam atomizer is used where sludges, and heavy tars are to be burned, the viscosity of which is usually above 375 SSU. Large port areas are needed to prevent clogging and similar difficulties. Supply pressure runs around 100 p.s.i. One of the chief drawbacks is a constant steam demand.

In the discussion period which followed, Mr. Haynes mentioned that he was not particularly worried about the supply of fuel oil being exhausted. It was also pointed out that recent tests in England have proved the straight pressure atomizer to be more efficient than the steam type atomizer.

A. L. Stewart thanked the speaker. W. L. Yack was chairman of the meeting.

OTTAWA BRANCH

C. G. Biesenthal, jr.e.i.c. - *Secretary-Treasurer*
R. C. Purser, m.e.i.c. - - - *Branch News Editor*

At an evening meeting on March 22 at the National Museum Lecture Hall, Col. J. P. Carriere, of Ottawa, presented an illustrated paper on **An Outline of Pre-Stressed Concrete Design.** This talk dealt with an outline of the basis for the design of prestressed concrete structural members based on researches and works carried out in Europe and included illustrations of its application.

❖ ❖ ❖

At a noon luncheon on April 5, the Ottawa Branch heard an address on **The Engineer and His Relation to Human Progress** by A. P. Young, O.B.E., of London, England. Mr. Young, a well known British engineer, inventor, industrial manager and educationalist, was in Canada on a tour under the auspices of the United Kingdom Information Office. During a major portion of his career, he has dealt with human relationships, with particular reference to the engineer's part in them.

Engineers should be interested not only in material improvements but also in the people that make use of them, declared Mr. Young. The engineering mind is called to a great task in our progress toward an industrial democracy. It will have to do its share in engendering in people an internal willingness to co-operate in all problems for the good of humanity. This should achieve far greater things than can possibly be achieved under the whip of external compulsion, which is the basis of dictatorship.

The idea of the brotherhood of man has been reverberating throughout the world for 2,000 years, said Mr. Young. Now it has become something more than an idealistic issue. The engineering mind, through its discovery of atomic power, has precipitated a crisis that demands instant attention. We shall have to go into international co-operation or most surely civilization will crash into the abyss. We shall live as one family or we shall not live at all.

Regarding those engineers who have helped to develop atomic power, the speaker remarked that they are now the blue-eyed boys of the engineering world but we must see to it that we do not all get black eyes from their engineering vigor.

Chairman J. H. Irvine presided.

PETERBOROUGH BRANCH

E. Whiteley, m.e.i.c. - *Secretary-Treasurer*
J. C. Allan, m.e.i.c. - *Branch News Editor*

On March 14th Mr. J. P. Sesia of the Faircraft Industries Limited, Longueuil, P.Q., addressed 95 members and visitors of the Peterborough Branch on **The Faircraft Factory Built House.**

Mr. Sesia introduced the subject with a description of four distinct systems used in the manufacture of prefabricated houses.

The first is a system of pre-cutting all pieces to size. These pieces are then shipped to the site, and the house is built. There is a substantial economy of material effected in that waste is reduced to a minimum. Against this must be set the difficulties which untrained workmen experience in sorting out the pieces and finding out just where they go. The success of this system is entirely dependent on the quality of the lumber.

The second method of prefabrication carries the process one step further, in that the wood members are cut in the factory and assembled into panels. These panels are then shipped to the site. When all these panels are bolted together the work proceeds in the conventional manner. Faircraft concluded that this system has greater economies than the first, because more work is done in the factory under efficient working conditions. Speed of erection at the site is far greater than by conventional methods. However, a survey indicated that when the cost of transportation is considered, the net saving in cost over the conventional site building methods was not very great.

Under the third system the house is built in two or three complete sections. Each section is fully wired, and the plumbing is installed. After shipment to the site, the several pieces are bolted together. This system approaches more nearly to the logical ideal in that the work on the site is far less than in either of the first two methods. Transportation costs are the only serious drawback. Usually one house requires three trucks or three flat cars.

The fourth system is used in the Faircraft House. It involves construction of the entire house at the factory. Instead of sectionalizing the house for shipment it is folded into a space small enough for one trailer truck or one flat car, and shipped in one package. Mr. Sesia considered that only the absence of a system of wide roads throughout the country had prevented the adoption of such a system years ago.

The speaker then described the Faircraft house and the methods of manufacture at Longueuil, P.Q.

With one exception, the house is built of conventional materials. The exception is the use of aluminum for the outside wall covering.

Following a description of walls, floors, ceilings, roofing, methods of manufacture and erection, the speaker concluded with some comments on the place of prefabrication in the present strained housing situation. The completion of a Faircraft house is a matter of days. The completion of a site built house is a matter of weeks or months. In the Faircraft factory, the complete manufacturing cycle of each house takes place inside of two weeks. It takes perhaps longer to dig the foundation than it does to build the house.

Mr. Sesia concluded with the statement that " We have created—if you will—a machine which is capable of producing more cubic feet of living space in less time and with greater economy than can be produced in any other way under existing conditions today."

QUEBEC BRANCH

Roger Desjardins, m.e.i.c. - *Secretary-Treasurer*

On February the 25th, the Quebec Branch heard an address by Lt. Col. E. D. Gray Donald entitled **Some Notes on Engineers and Engineering.**

To the engineer wanting success, the speaker said, fundamental professional knowledge of course is pre-requisite, but beyond that he must interest himself in economics, administration, accounting, law, merchandising, psychology, sociology, and a dozen other branches of knowledge—even, very occasionally of course, politics. Nearly every engineering problem is at the same time an economic problem. Construction work requires knowledge of organization, handling men, and some accounting.

Indispensable to success are balance, accuracy and clarity of thought and of verbal expression, and precision. To read well is important. Magazine articles have illustrated that few people read properly, and have given suggestions as to how reading can be improved. Most people read too slowly and carelessly, and assimilate little. Practice in reading well results in a saving of time, more understanding, and more pleasure from reading.

Speaking then about the "yes-man" and the "no-man", Mr. Gray Donald said that there is a happy medium between the two,—the man who will agree or disagree if he knows enough about the subject to be able to form an intelligent opinion. If he has no definite ideas, he will either keep quiet or ask time to think things over. If he has a better idea he says so, but makes sure that it is a better idea, and not just a different one.

The engineer must possess the ability to sell his ideas to others. An idea often does not find favour either because it is badly presented or it is no good. There is no room for passivity or negation in the engineering profession. Every engineer must be constructive, progressive and optimistic. The speaker said that whenever anything new comes up the passive attitude is to say 'Why', but the progressive fellows says 'Why not'.

Mr. Gray Donald concluded with an excellent summary of the qualities making for success. Good habits give balance; balance gives stability; stability gives strength; and strength gives the power to carry on under all circumstances, avoiding panic, discouragement, or faint-heartedness, but contributing strength and confidence.

Jean St-Jacques of the Quebec Power thanked the speaker on behalf of the audience.

Following the address Léo Roy, former secretary-treasurer of the Branch was offered a send-off on the occasion of his departure for Montreal where he has accepted an important situation with Hydro-Quebec.

❖ ❖ ❖

On April 4th, the Quebec Branch had the opportunity of hearing an address on **Radar.** The speaker was Mr. W. A. Laurie, public information representative of the Bell Telephone Company of Canada, and, in the chair, C. H. Boisvert, vice-chairman of the Branch. The speaker was introduced by Gilles Sarrault, professor of the Faculty of Sciences of Laval and thanked by U. Archambault of the Provincial Transportation Board.

Reviewing briefly the history of radio location, as radar is also called, Mr. Laurie pointed out that both British and American scientists participated in its discovery and application to war purposes.

A former radar technician in the R.C.A.F., Mr. Laurie was able to give a first-hand account of the development of radio detection and ranging, and using actual radar equipment he demonstrated how it works.

Mr. Laurie explained how very short radio waves, transmitted at high power, are reflected back from various objects. Picked up by a very sensitive receiver, the reflections reveal themselves on a fluorescent screen, showing up in various ways depending on the use to which the information is to be put.

Radar ground stations enabled the R.A.F. to win the Battle of Britain, Mr. Laurie said, and radar carried by British interceptors licked German night bombing. The results of fire-control radar so terrified the Italians that after the Battle of Cape Matapan their fleet never again came out of hiding. Radar was the means of tracking down the *Bismarck*. It licked the U-boat menace and the V-1 robomb blitz. It contributed to the success of Allied landings in North Africa, and France. It made airborne invasions possible. Radar might have saved Pearl Harbour if its warning had been heeded. In the Pacific, it enabled the *U.S.S. South Dakota* to bring down 32 enemy aircraft in one engagement. Aided by radar, the *South Dakota* and the *Washington* alone sank three Jap cruisers and one or two battleships in the Battle of Savo Island. Radar completely neutralized Jap air superiority in the India-Burma theatre, and kept open the supply lines of the British 14th Army. Close to three out of every four bombs dropped by heavy bombers on both German and Jap targets in the last year of war were guided by the radar bombsight.

In peacetime, radar can be used for airdrome traffic control, permitting safe landings even in fog, Mr. Laurie stated. It enables a ship to detect icebergs and other vessels in its path at night or in fog. It is already providing data for weather forecasts.

"Yet radar," the speaker concluded, "is still an infant."

SAGUENAY BRANCH

H. R. Fee, M.E.I.C. - - - - - *Secretary-Treasurer*

Mr. R. W. Herzer of Aluminum Company of Canada, Limited, Montreal, Que., addressed the Saguenay Branch of the Institute on 29th March 1946 on the subject **Canadian Technical Investigator Tours Western Europe After V-J Day.**

Mr. Herzer was one of a three-man technical investigating committee sent to Europe by the Aluminum Company of Canada, Limited, and his paper gave his impression of conditions in Europe as he saw them.

Most of the travelling was over fairly long distances and was done by air, but occasionally other methods of transport were used and these were found to be slow and unreliable, even in England. In Italy rail transport was particularly disrupted because of damage to bridges and railway stations, while in Germany a number of bridges had been destroyed by the retreating army, regardless of military significance. The canal system had also been badly sabotaged and was practically paralyzed. The chief method of transport was by road, and in this respect the speaker paid tribute to the "Bailey" bridges installed by the army Engineers. Even highway traffic was limited by the shortage of fuel, which had to be imported.

The speaker stated that business is in a complete state of turmoil. Some concerns have had their facilities completely destroyed, while others are shut down for want of raw materials, and still others are closed by military orders.

With respect to food, the speaker stated that the army rations were passable, and that throughout Europe extensive black markets existed, with prices unusually high, and therefore available only to a limited number. He expressed the opinion that England had made a greater sacrifice than any other country to relieve the situation in Europe.

Discussing physical damage, Mr. Herzer stated that England had not suffered as much as the continent, since the blitz was made during the period before the use of large bombs. In Italy the bombing had been particularly accurate and was aimed chiefly at railway stations. He stated that in general churches suffered most from bomb damage, with houses second and industry third, which was probably the reverse order of the efficiency of the fire control organization.

Mr. Herzer gave a very graphic picture of an approach to a bombed city, assuming that city to be Montreal. He described the extent of damage, the difficulties encountered in the movement of traffic and in securing accommodations, and told of the use made of the remaining buildings.

In closing, the speaker stated that the moral damage was more serious than the physical damage, and recommended that we, as Canadians, teach democracy by example in our support of world democratic organizations, and that in future our immigration policy should be based on the contribution the individual had made to the democratic way of living, rather than on background and financial standing.

The meeting was chaired by B. E. Bauman, and F. T. Boutilier moved a vote of thanks to the speaker.

ST. MAURICE VALLEY BRANCH

W. R. Mackay, M.E.I.C. - *Secretary-Treasurer*

The annual meeting of the St. Maurice Valley Branch was held in the Jacques Cartier Room of the Chateau de Blois in the form of a luncheon meeting at 1.30 p.m. on Saturday, April 13th. The guest speaker for the occasion was Dr. P. L. Pratley, prominent Montreal consulting engineer, who discussed the problems of the engineer on large bridge-building projects and how these problems vary widely under the various conditions encountered. Bridges may be privately or publicly owned and may be located so as to be under the jurisdiction of city, provincial or federal government or a combination of these. In some cases, they cross an international boundary, with resultant problems peculiar to this condition. Dr. Pratley used as examples a number of large bridges built during the past twenty years, with which he was personally familiar.

A. W. Peters expressed the thanks of the meeting to Dr. Pratley for his informative address.

J. A. Lalonde then spoke to the meeting about the current appeal to engineers for the Harry F. Bennett Educational Fund. It was stated that the drive in this Branch was organized and well under way.

H. K. Wyman, chairman, who presided at the meeting, then introduced the incoming chairman and executive to the meeting.

W. R. Mackay was appointed secretary-treasurer.

The attendance at the meeting was 81, which included several guests from Montreal and from the Chamber of Commerce.

SARNIA BRANCH

F. F. Dyer, M.E.I.C. - *Secretary-Treasurer*
C. E. Leon, M.E.I.C. - *Branch News Editor*

On Thursday, April 4th, the Sarnia Branch of the Engineering Institute held a dinner meeting at the Sarnia Golf Club. The speaker for the evening was Mr. T. J. Halme of the Industrial Electronics Department of Canadian General Electric Company, Toronto, his subject being **Industrial Electronics—Today and Tomorrow.** Mr. Halme graduated in electrical engineering from Queen's University, Kingston and upon graduation joined the Canadian General Electric Company in Peterborough where he took their industrial training course.

Industrial Engineers had no occasion to think about electronics until only a few years ago. At this time they awoke to the realization that electronics had become a valuable tool for doing things that formerly had never been imagined possible. However, electronics must be considered on merits only and not as a simple "cure-all" for every unsolved problem. In the application of electronics, Mr. Halme emphasized that they are as easy to apply as ordinary relays, transformers, and other electrical tools.

Mr. Halme reviewed some of the categories in which electronics are used today. By means of electronic measurement and inspection, an accuracy is possible that is 50 times greater than ever before. Electronic profile gauges give contour inspection to tolerances of one-ten-thousandth of an inch.

Time interval meters are used to time high speed camera shutters. It is possible to measure thickness continuously by passing X-rays through moving strips of materials and recording with a photo-tube the intensity with which these rays strike a fluorescent screen, thus giving accurate control on innumerable processes. Qualitative analysis such as ash content of coals is possible without the destruction of the analysed sample.

Mr. Halme described at some length an electronic motor control that varied the speed of the loading induction motor in the pendulum type textile testing machine.

In the field of light control, using photo-electric cells, Mr. Halme mentioned a few of the applications such as scanning devices to detect pinholes in rapidly moving tin sheets and foil; stroboscopes to detect faulty patterns on rapidly moving strips of material, and a new development in photo-tubes in which photo-electric beams can be transmitted over distances of 1,000 feet and more by the use of pulsating light.

In the field of electronic timing, the widest application is in controlled resistance welding. In the field of high frequency electronic heating, Mr. Halme pointed out that there were two distinct types of electronic heating—induction heating which is used for materials that are good electrical conductors, and where the area of heating must be closely confined, and di-electric heating, which is used for non-conductors and where heating is required throughout the entire mass.

In conclusion, Mr. Halme again stressed that electronics have made possible things that were impossible to accomplish a few years ago. The characteristics of electronics that make such things possible are fast operation, amplification, precise and quiet control. However, it is very necessary to realize that the future of electronics depends upon the active interest of engineers, their keeping abreast of electronic development and conceiving new ideas for applications. Electronics issue a challenge to the ingenuity of engineers in the future and it is to such men as ourselves that we must look for the further use of electronics.

VANCOUVER BRANCH

A. M. Eyre, S.E.I.C. - - *Secretary-Treasurer*
P. B. Stroyan, M.E.I.C. - *Branch News Editor*

On Thursday, March 21st, N. O. Paquette, M.E.I.C., addressed the Vancouver Branch on **Job Evaluation Methods.** Mr. Paquette, chief engineer of Stevenson and Kellogg Limited, industrial management engineers, was introduced by J. P. Fraser.

The speaker outlined the history of scientific job evaluation and the value of the subject to management for satisfactory labour relations.

The major steps in job evaluation were presented. First there is the collection of all data related to each job under various factors, such as complexity, education needed, initiative, etc Second, a point rating is assigned each factor for the different jobs in an organization. Third, the point rating is converted to dollars, and graphs are drawn to determine the relation of jobs and dollars. From the graphs so developed wage adjustments, new job ratings and wage trends may be determined.

The speaker stressed the by-products of job evaluation study, such as the thorough picture of activities and relationships of the various jobs in an organization. Promotion and training programmes may also be developed from scientific job evaluation study.

A spirited discussion followed the address. R. Walkem expressed the appreciation of those present for the informative and interesting presentation.

Appromixately fifty members and friends attended.

R. C. Pybus was Chairman of the meeting.

❖ ❖ ❖

Tuesday, April 16th, 1946 was the annual ladies' night at the Vancouver Branch. A special showing of the large-scale model of **Operation Mulberry** was presented at the Hudson's Bay Company for members and friends.

R. C. Pybus, acting as chairman of the meeting, introduced L. Austin Wright, general secretary of the Institute, who made a few opening remarks and turned the showing over to Colonel V. C. Steer-Webster of the British War Office.

Colonel Steer-Webster advised the gathering of the proper way to view the model and outlined the important features of the display. A fifteen minute film of the actual operation was presented at intervals throughout the evening. Many interesting questions and engineering problems were discussed by Colonel Steer-Webster.

Members of the Association of Professional Engineers of the Province of British Columbia were also invited to this special showing, which proved to be one of the most successful ladies' evenings in the history of the Institute.

A buffet supper was arranged by the Hudson's Bay Company.

NOTICE TO STUDENTS

Student members of the Institute who have left the university, whether definitely or only for the summer season, are requested to inform Headquarters of their new address, so that the *Journal* may be forwarded to them.

This is particularly important in the case of those who live in fraternities or boarding houses during the scholastic year. With present restrictions on the use of paper, it is imperative that no copies of the *Journal* go to waste.

Don't forget to inform us of your new address when returning to college in the Fall. Headquarters will change your mailing address as often as necessary provided you supply the information.

All changes should be recorded with the General Secretary, 2050 Mansfield St., Montreal 2.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

British Standard Specification for Lathe and Planer Tools (B.S. 1290—1946):

London, British Standards Institution, 1946, 2/-.

A new standard relating to the shapes of butt-welded lathe and planer tools prepared by collaboration between the Ministry of Supply and the Welded and Brazed High Speed Tool Trade Association. The standard establishes a standard series of 15 shank sections for lathe and planer tools together with a series of 31 diagrams illustrating the shapes of the tool points, and relates each shape of tool to the various shank sections in which it is customarily manufactured. Each tool shape is given a standard reference number for convenience in ordering.

Recommended Practices for Resistance Welding:

N.Y., American Welding Society, 1946. 47 pp., 50c.

This is a compilation of recommended practices for the spot and seam welding of low-carbon, stainless and hardenable steels, nickel, monel and inconel; the projection welding of low-carbon and stainless steels; flash-butt welding low and medium forging strength steels; and standard methods for testing resistance welds. Each recommended practice comprises a table of machine settings for current, voltage, time, pressure, and other factors, which will produce welds of specified strength in various thicknesses of materials. Included is a section of standard methods for testing resistance welds; with a complete description of the test specimens, equipment to be used, and procedure to be followed.

Scarce Materials; and When You Can Get Them:

N.Y., Journal of Commerce, 1946. 12 pp., 25c.

A new supply table indicating when the end of current shortages may be expected. Supplies of copper, sugar, rubber, lead tin, building materials, steel, paper, and many other materials are indicated. The factors influencing the supply situation in 21 basic raw materials are brought up to date. The probable end of acute scarcities, and the eventual date when supply and demand will be balanced is also spotlighted in the timetable.

Selection of Steel for Welding:

Samuel L. Hoyt. N.Y., American Welding Society, 1946. 10 pp., 50c.

This article explains why steel selected for welding should be chosen for "welding quality". It cites several typical examples of welded construction and explains the problem involved in the selection of steel for each. Also discussed are three-dimensional stress systems created by welded fabrication, as compared to stress conditions in riveted assemblies, and the need for "cohesive strength" in steels used for welded construction, to eliminate possibility of brittle failures.

Solid Phase Welding:

Augustus B. Kinzel. N.Y., American Welding Society, 1946. 22 pp., 50c.

An analysis of the principles and theory of pressure welding and solid phase bonding, this pamphlet covers the fundamental mechanism of bonding, including the theories of metallic cohesion, atomic bonding and film diffusion. The relative effect of temperature, time, and pressure in solid phase welding are also explained.

Wear Resistance Tests on Concrete Floors and Methods of Dust Prevention:

By Georg Wastlund and Anders Eriksson. Svenska Forskningsinstitutet for Cement och Betong vid Kungl Tekniska Hogskolan I Stockholm—Handlingar N: R 5 (e), 1945 (Swedish Cement and Concrete Research Institute—Proceedings) (in English).

This paper presents a description of tests made on concrete floor specimens of various types in order to determine their resistance to wear and to investigate the character of deterioration of concrete floor surfaces due to traffic. The results of these tests show that concrete floors provided with finish courses containing coarse aggregate up to about 9 mm. in size and an excess of pea gravel are definitely superior to concrete floors with a finish course containing fine sand only. The latter are common in Sweden at the present time. The investigation has helped to elucidate the causes of dusting of concrete floors, which if often very intense and detrimental in many respects. The surface skin of concrete floors is, as a rule, of poor quality, and as it is readily worn off, dust is liable to form. Dusting can be considerably reduced if the poor surface skin is removed by machine grinding, provided that the concrete below the skin is of first-rate quality. The paper concluded by proposing a detailed tentative specification for concrete floor finish which differs in essentials from current Swedish practice.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

METAL WORKING AND HEAT-TREATMENT, Vol. I

By F. Johnson. Paul Elek (Publishers) Ltd., Diamond House, 36-38 Hatton Garden, London, E.C.1. 204 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 17s. 6d.

This first volume of a series of four deals extensively with the characteristics and heat-treatment of carbon steels. It covers the influence of composition and treatment on structures and properties; describes practical operations such as forging, annealing, tempering, machining, etc.; devotes two chapters to hardenability; and discusses mechanical properties and their testing. There is a supplementary chapter on the heat-treatment of tool steel. Successive volumes are planned as follows: Vol. II, Alloy steels, cast iron and non-ferrous alloys; Vol. III, Surface-hardening; Vol. IV, Furnaces and pyrometry.

OPTICAL INSTRUMENTS IN ENGINEERING

By S. H. Hemsley. Paul Elek (Publishers) Ltd., Diamond House, 36-38 Hatton Garden, London, E.C.1, 1945. 80 pp., diagrs., tables, 8¾ x 5½ in., cloth, 7s. 6d.

This book outlines the construction and scope of some of the more important optical instruments now obtainable for workshop purposes, and briefly describes the principles upon which they work. No details of operation are given, but their general capabilities are surveyed to indicate ways in which they might be used in specific cases. The electron microscope is described in principle although not, strictly speaking, an optical instrument.

SCIENTIFIC SOCIETIES IN THE UNITED STATES:

By. R. S. Bates. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 246 pp., tables, 8¾ x 5½ in., cloth, $3.50.

The history and the influence of the scientific societies of the United States are the themes dealt with in this book. Beginning with the first small, short-lived organizations prior to the American Revolution, the author traces the development of this grouping together for scientific advancement down to the present-day multitude of national, state and local societies. These developments are effectively related to other aspects of the growth of the United States. A thirty-page bibliography provides further material on all phases of the subject.

PRELIMINARY NOTICE

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

April 30th, 1946.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the June meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thrity-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ANDERSON—SAMUEL CHARLES, 56 Leinster Ave., S., Hamilton, Ont. Born at Belfast, Ireland, Aug. 31st, 1896. Educ.: B.Sc., (Eng.), London Univ., England, 1922; with T. Lyons & Co., Ltd., London, as follows: 1922-23, in factory & drawing off., 1923-25, i/c plant at Coventry; with Anglo-Persian Oil Co., as follows: 1925-26, asst. engr. on pipe lines, 1926-28, personal asst. to field mgr.; 192932 Agricultural Genl. Engrg. Ltd., Aldwych House, London (dissolved in 1932), during period, factory representative in Canada, (Peacock Bros., Montreal); with Sawyer-Massey Ltd., Hamilton, Ont., as follows: 1941-45,chief dftsman., 1945 to date, sales engr.

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET, MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Particular emphasis is laid at this time on the need for this service to fill the dual role of providing a general picture of employment conditions for members in the armed forces, and of making available to them specific contacts both now and at the time of their release from the services. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEERS for junior engineering positions in production control department are required by a corporation in Southern Ontario. Candidates may be 1946 graduates. Preference to ex-service men. Apply to File No. 3344-V.

CHEMICAL ENGINEER or chemist, for junior position in patent department of a large chemical company in Quebec. Apply to File No. 3469-V.

CHEMICAL ENGINEER with some pulp and paper experience required for the technical department of a paper mill in Lake St. John area. Apply to File No. 3470-V.

CIVIL

JUNIOR ENGINEER, young graduate in civil with some experience in structural and municipal work, also overseas experience in the armed forces, age 35 or under, is required by a city in Ontario. Apply to File No. 3203-V.

CIVIL ENGINEER, young graduate preferred, with some experience on building layouts and piping work is required as draughtsman for an oil company in the Montreal area. Apply to File No. 3345-V.

CIVIL ENGINEERS with construction experience for field work on contracts with a firm of Montreal contractors. Salary open. Apply to File No. 3437-V.

CIVIL ENGINEER, as township engineer, responsible for construction and maintenance of roads, municipal drainage etc. Must be qualified O.L.S. Required for Central Ontario. Salary $250 per month. Local private practice allowed. Apply to File No. 3441-V.

CIVIL ENGINEER recent graduate, must be bilingual, required for work on general design, survey and construction of transmission lines in the Montreal area. Apply to File No. 3446-V.

CIVIL ENGINEER with experience on foundations, steel work and erection of plant. Preferably R.P.E. in B C. Required for construction work on B.C. coast. Salary according to qualifications. Apply to File No. 3448-V.

CIVIL ENGINEERS with construction experience, age 25 up, preference R.C.E. personnel, required by building contractors in Montreal, to take charge of jobs as superintendent or office engineer. Salary from $300 according to qualifications. Apply to File No. 3458-V.

ELECTRICAL

ELECTRICAL GRADUATE, with considerable experience in electronics and aircraft instruments and some sales ability, age 30 to 40, required for firm handling aircraft equipment in Montreal area. Salary open. Apply to File No. 3434-V.

ELECTRICAL DRAUGHTSMEN with experience in substation design, not necessary graduate engineers, required by a public utility in the Montreal area. Salary $200 to $225. Apply to File No. 3446-V.

MECHANICAL

YOUNG MECHANICAL ENGINEERS, recent graduates, preferably ex-service men, as assistants to plant engineer on mechanical supervision and maintenance of a cement plant in S.A. Knowledge of French useful. Apply to File No. 3218-W.

MECHANICAL ENGINEER, fluently bilingual, is required for the province of Quebec to represent a company engaged in the manufacture of bakers' machinery and candy making machinery, etc. Apply to File No. 3268-V.

SALES ENGINEER, high calibre, graduate mechanical with metallurgical knowledge, for large industrial organization in Quebec, preferably bilingual, salary according to experience. Apply to File No. 3433-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER, recent graduate, preferably bilingual, required for mechanical department in a paper mill in St. Maurice Valley, to be trained in a supervisory capacity. Apply to File No. 3452-V.

MECHANICAL ENGINEER with over ten years experience required for responsible position with an American mining corporation. Salary from $400 according to qualifications. Apply to File No. 3453-V.

ASSISTANT MECHANICAL SUPERINTENDENT to train for a senior position in a large paper mill in the St. Maurice Valley area. Must have paper or mining experience. Veteran preferred. Salary from $300 according to experience. Apply to File No. 3462-V.

MECHANICAL ENGINEER, age 35 to 45, preferably married, with good background of shop training and experience in the manufacture of farm machinery. Salary from $350 according to qualifications. Apply to File No. 3463-V.

MECHANICAL ENGINEERS with varying experience in tool engineering and machine shop practices. Positions involve supervision of tool designers and draughtsmen for design and ordering of jigs, fixtures, gauges, tools etc., for the production of precision equipment. Montreal area. Salary from $200 to $400 Apply to File No. 3464-V.

MECHANICAL ENGINEERS, recent graduates, for training as industrial engineers, required by a paper manufacturer in Eastern Ontario. Apply to File No. 3465-V.

MECHANICAL ENGINEER with experience in machine and tool design for design work on packaging machinery, required by a manufacturing concern in Western Ontario. Salary from $275. Apply to File No. 3466-V.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with considerable experience in plumbing, heating ventilating, age 30-45, required for a permanent job as a designer with a Montreal architectural firm. Salary from $300. Apply to File No. 3473-V.

METALLURGICAL

METALLURGICAL ENGINEER with some practical experience and desirous of entering the steel business is required to work for a large corporation in Eastern Canada. Apply to File No. 3314-V.

MISCELLANEOUS

ARCHITECTURAL DRAUGHTSMAN with enough experience to develop new types of windows, doors, trusses, steel sections etc., is required by a manufacturer in Montreal. Salary would be about $300. Apply to File No. 3212-V.

ENGINEER SALESMAN, preferably returned man under 40 with some road-building experience, is wanted by a firm engaged in the manufacture of emulsions. Apply to File No. 3250-V.

ARCHITECT is wanted to undertake responsibility along general lines, such as class of work which comes under jurisdiction of a provincial Dept. of Public Works. Desirable age not exceeding forty. Apply to File No. 3301-V.

INSTRUMENTS ENGINEER with five years experience in aircraft construction and installation design, of which at least 2 years should have been specialized as above, is required to act as design group leader for a company in the Montreal area. Apply to File No. 3316-V.

CIVIL AND ELECTRICAL ENGINEERS, age 30 to 40, 5 to 10 years experience, for estimating, design and general engineering for large public utility in Toronto area. Apply to File No. 3429-V.

CHIEF DRAUGHTSMAN to take charge of engineering department, draughting room and estimating for machinery manufacture in Sherbrooke. Apply to File No. 3430-V.

CHIEF DRAUGHTSMAN, over 25 years of age, with intimate knowledge of construction mechanical details, piping, to take charge of about 15 draughtsmen in an industrial plant. Salary dependent on qualifications. Apply to File No. 3435-V.

QUALIFIED DRAUGHTSMAN, thoroughly capable in design and layout of industrial piping, steam, water, air etc. Salary open. Apply to File No. 3435-V.

TWO CIVIL OR MECHANICAL ENGINEERS, recent graduates, preferably ex-service men, are required by a pulp and paper company in the Province of Quebec, to be trained as logging engineers and woods operations supervisors. Previous experience in the woods an asset but not essential. Salary $200 to $225 with board and lodgings. Apply to File No. 3442-V.

ENGINEERING DRAUGHTSMAN required by an industrial concern in Three Rivers for all round employment in a permanent position. Apply to File No. 3443-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

MECHANICAL AND ELECTRICAL SUPERINTENDENT with experience in maintenance of mine equipment and in design and construction. Replies should outline experience and salary desired. Apply to File No. 3453-V.

GENERAL PLANT SUPERINTENDENT, or manager in complete charge, to organize and operate a shipbuilding plant in the Maritimes, with knowledge of both hulls and engines, mainly for repairs and revisions. Salary from $5,000. Apply to File No. 3454-V.

GRADUATE ENGINEERS IN CIVIL, MECHANICAL, ELECTRICAL OR CHEMICAL, from recent graduates up with 2 to 5 years general experience (including overseas service) required for petroleum refinery engineering. Salary according to qualifications. Apply to File No. 3455-V.

ELECTRICAL OR MECHANICAL ENGINEERS interested in transportation, with experience in the transportation field or machine shop practice or automotive services, maintenance and operation. Salary according to qualifications. Apply to File No. 3456-V.

SALES ENGINEER of ability, preferably graduate mechanical, with some experience in marine engineering and sales, to develop sales and applications for a heavy outboard propelling unit for use on heavy inland water transport. Salary from $300 depending on qualifications. Apply to File No. 3457-V.

FORESTRY ENGINEER graduate 25 to 35, preferably bilingual Veteran, is required by a newsprint manufacturer in the St. Maurice Valley. Apply to File No. 3462-V.

SALES ENGINEER, preferably mechanical graduate, required by a firm dealing in heavy machinery for sales activities in Eastern Canada with headquarters in Montreal. Salary from $250 according to qualifications. Apply to File No. 3467-V.

MECHANICAL OR ELECTRICAL ENGINEER under 35, with at least 5 years practical experience, is required for a responsible position in the engineering department of an industrial firm in Toronto. Apply to File No. 3472-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CIVIL

CIVIL OR MECHANICAL ENGINEER, not necessarily a graduate, age 24-30, some experience in concrete and steel draughting, some sales ability, required to work with a consulting engineer and contractor in Montreal. Salary open. Apply to Box No. 3339-V.

SEVERAL CIVIL ENGINEERS, two with two or three years' experience in road construction and two recent graduates, are required for road building work in northern Quebec. Salary $2400. to $3000 a year. Apply to Box. No. 3351-V.

GRADUATE CIVIL ENGINEER, three or four years out of college, is required for surveying in bush in the Ottawa district, able to take charge of survey and do some plotting, make studies, etc. at office. Salary about $250. a month. Preference to veterans. Apply to Box. No. 3357-V.

CIVIL ENGINEER graduate with a good background of experience is required to act as superintendent or project manager for a large company in the Montreal area. Experience in heavy building construction essential. Age 40-50. Salary open. Apply to Box No. 3358-V.

TWO CIVIL ENGINEERS, preferably but not necessarily graduates, are required to act as structural steel draughtsmen or checkers for a company engaged in this sort of work in Alberta. All applications should indicate education, experience and salary expected. Apply to Box No. 3365-V.

CIVIL OR MECHANICAL ENGINEER with four or five years experience in a pulp and paper company is required by a company engaged in this work in eastern Ontario. Apply to Box No. 3367-V.

CIVIL OR MECHANICAL ENGINEER is required for design works by a paper company in the St. Maurice Valley. Some mining experience helpful. Salary $275. a month. Apply to Box No. 3381-V.

CIVIL ENGINEER, graduate age 30 to 40 years, is required for supervision of construction on 2½ million dollar project near Montreal. Salary $300 plus expenses. Apply to Box No. 3383-V.

CIVIL ENGINEER is required to act as assistant to city engineer, some knowledge of town services such as, water works, sewage, building inspection, parks, lighting an asset. Location Montreal. Salary open. Apply to Box No. 3385-V.

CIVIL ENGINEER with five to ten years experience in reinforced concrete design is required by a firm of consulting engineers in Montreal. Salary open. Apply to Box No. 3387-V.

TWO CIVIL ENGINEERS are required to act as senior and junior structural designer respectively with a steel company in southern Ontario. Salary open. Apply to Box No. 3389-V.

TWO CIVIL ENGINEERS, one experienced man to be in charge, the other to act as assistant, mostly for office work, are required for a building programme in Ontario, in connection with roads, trails, lookout towers, telephone line, buildings, etc. Preference to veterans. Salary up to $3,000 per year for senior and $2,000 per year for junior position. Apply to Box No. 3394-V.

RESIDENT ENGINEER graduate, preferably but not necessarily bilingual with several years' experience in building construction is required for a housing project in Montreal. Several civil engineers from recent graduates up are also required. Salary open. Apply to Box No. 3402-V.

CIVIL ENGINEER recent graduate is required by a pulp and paper company in the province of Quebec to understudy logging engineer on road-building, dam construction, etc. Candidates should be bilingual. Salary $200 a month. Apply to Box No. 3405-V.

SEVERAL CIVIL ENGINEERS with experience in the design of structural steel and reinforced concrete, or who are interested in testing and research work in connection with concrete and soils are required in the engineering department of a large organization in Toronto. Salary open. Apply to Box No. 3409-V.

CIVIL ENGINEER graduate with several years experience in construction work, preferably bilingual is required by a construction company in Montreal to take charge of a project as resident engineer in Quebec. Salary open. Apply to Box No. 3421-V.

CIVIL OR MECHANICAL ENGINEER graduate, with experience in construction and truck equipment, age 35 to 40, is required by an oil company to take charge of operations in Montreal area. Apply to Box No. 3427-V.

ELECTRICAL

ELECTRICAL ENGINEER with some experience with machinery and/or electrical installation work, with ability to get along with people, and interested in investing some capital, is required for executive work with a small company on the west coast for work in connection with the electrical machinery requirements and installation of lighting and power plants in the province. Salary open. Apply to Box No. 3352-V.

TWO ELECTRICAL ENGINEERS with a minimum of four years' experience with commercial radio equipment are required by a firm in Montreal. Applicants must have good personality and ability to meet public. Please do not apply unless qualified. Salary open. Apply to Box No. 3395-V.

ELECTRICAL ENGINEER with experience in marine electrification is required by a consulting firm in the Montreal area. Salary open. Apply in writing to Box No. 3398-V.

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters, English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to Box No. 3415-V.

ELECTRICAL ENGINEER 5 to 10 years experience on general electrical design wiring of buildings, industrial plants and sub-stations, preferably a graduate, is wanted by a firm of consulting engineers in Montreal. Salary $250-$400 a month. Apply to Box No. 3420-V.

ELECTRICAL ENGINEERS from recent graduates up, if possible with experience in maintenance and repair of A.C. and D.C. motors, or in power plant work, are required by a mining corporation in South America. Salary $275 up. Apply to Box No. 3425-V.

MECHANICAL

MECHANICAL ENGINEER, recent graduate, preferably ex-service man is required by a company in the Toronto area for work in salt processing, steam heating evaporators, power plant etc. Age 25-27. Salary $200. to $300. a month depending on qualifications. Apply to Box No. 3308-V.

MECHANICAL ENGINEER, age about 35-40 with experience in thermo-dynamics, mechanical and chemical work is required to be chief engineer of a company in the Toronto area. Preference to ex-service man. Salary about $400-$600. a month. Apply to Box No. 3308-V.

MECHANICAL ENGINEER, with 4 or 5 years industrial experience since graduation, with knowledge of and interest in steam as applied to industrial equipment, and preferably some experience in ventilation work and in pulp and paper mills, is required by a company in southern Ontario. Salary $3600. per year. Apply to Box No. 3333-V.

MECHANICAL ENGINEER, preferably graduate, with some experience in general lines of contractors' equipment including tractors, shovels, diesel engines, concrete machinery, etc., is required to act as manager of machinery department head office of a large machinery house in the maritimes. Salary excellent. Apply to Box. No. 3353-V

MECHANICAL ENGINEER, graduate, with some experience in the sale of marine engines, is required to head up the marine department of a large machinery house in the maritimes. Remuneration would depend entirely on the ability and efforts of successful candidate. Apply to Box No. 3355-V.

EIGHT MECHANICAL ENGINEERS or senior draughtsmen are required for design on a large plant extension project near Montreal. Salary $200. a month and good room and board available. Apply to Box No. 3360-V.

MECHANICAL ENGINEER, senior man is required for responsible position in a pulp and paper mill in the province of Quebec. Salary open according to qualifications. Apply to Box No. 3361-V.

MECHANICAL OR ELECTRICAL ENGINEER, preferably but not necessarily with some experience on design of tools and small parts is required by a company in the Montreal area. Salary: open. Apply to Box No. 3374-V.

TWO OR THREE MECHANICAL ENGINEERS, preferably ex-service men, graduates, with some knowledge of steam, piping layouts, design are required by a firm in the Niagara peninsula. Salary open. Apply to Box No. 3380-V.

MECHANICAL ENGINEER is required to act as assistant mechanical superintendent of a paper mill in the St. Maurice Valley. Salary $350 a month. Apply to Box No. 3381-V.

MECHANICAL ENGINEER, recent graduate, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to Box No. 3393-V.

THREE MECHANICAL ENGINEERS with one or two years experience in draughting and design are required for a paper company on the east coast. Work will involve draughting, design of new equipment and alterations to existing plant and equipment. Salary open. Apply to Box No. 3397-V.

MECHANICAL DRAUGHTSMAN is required by a paper company in Ontario. Must have industrial plant experience including conveyors, piping and machinery layouts. Salary $200-$225 a month. Apply to Box No. 3399-V.

MECHANICAL ENGINEER with paper mill experience is required to act as assistant mechanical superintendent of a large paper mill located in a city in western Quebec. Salary open. Apply to Box No. 3400-V.

JUNIOR MECHANICAL ENGINEER AND SENIOR MECHANICAL DRAUGHTSMAN, not necessarily graduates, but must have some experience of mechanical design problems. Preference will be given to ex-servicemen. Salary $1,800 to $2,700 depending on experience. Possibility of permanent employment located in Quebec City. Apply to Box No. 3401-V.

MECHANICAL ENGINEER, recent graduate, is required by a pulp and paper company in the province of Quebec, to learn woods operations with a view to mechanization. Candidates should be bilingual. Salary $200 a month. Apply to Box No. 3405-V.

CHIEF ENGINEER, age 35 to 40, preferably graduate mechanical, with experience in shop and production planning, running drafting office, etc., and ability to get along with people, is required by a factory in Sherbrooke ,Quebec. Salary $5,000 to $6,000 a year. Apply to Box No. 3410-V.

MECHANICAL ENGINEER with considerable practical experience is required for general plant maintenance of production equipment for large out of town metal processing plant. Salary open. Apply in writing to Box No. 3417-V.

MECHANICAL ENGINEER DRAUGHTSMAN with two or three years experience, is required for work with a paper company in the province of Quebec. Salary $250 to $275 a month. Apply to Box No. 3424-V.

METALLURGICAL

RECENT GRADUATES in metallurgical or chemical engineering are wanted for quantitative non-ferrous chemical analysis by a mining corporation in South America. Salary open. Apply to Box No. 3425-V.

MINING ENGINEERS

MINING ENGINEER, with good experience, is required by a company in Brazil, South America, engaged in the mining and smelting of lead. Successful candidate would have complete authority to operate mine: and in addition to salary would have house accommodation provided. Salary open. Apply to Box No. 3321-V.

MINING ENGINEERS, necessarily with some experience in mining work, capable of becoming shift bosses, are wanted for work with a corporation in South America engaged in the production of coal and copper. Salary $275 to $400 a month. Apply to Box No. 3425-V.

MINING ENGINEER graduate experienced and capable of doing underground survey work, estimating tonnage extraction, etc., is wanted by a company in South America. Salary open. Apply to Box No. 3425-V.

MISCELLANEOUS

SERVICE REPRESENTATIVE is required by a firm in Toronto to sell automotive, electrical and fuel system parts, and to train automotive mechanics. Position would be in Ontario and salary is open according to qualifications. Apply to Box No. 3295-V.

ARCHITECT, graduate, preferably, but with some reasonable experience, with good background and personality is required by a firm in Montreal. Interested in someone willing to start at the bottom with prospects of eventually becoming a partner in the firm. Apply to Box No. 3298-V.

DRAUGHTSMAN, preferably someone experienced in process piping work in food industries is required by a firm in the Montreal area engaged in consulting work. Apply to Box No. 3299-V.

SALES ENGINEER of proven ability is required by a Canadian manufacturer of high grade power apparatus specialties in demand by power companies, public utilities and manufacturers. Age 30 to 35 years. Apply in writing and state in detail education, experience, age, required salary and enclose photograph to Box No. 3303-V.

DESIGNING ENGINEER with four or five years experience in designing and detailing is required for work with consulting engineer in Vancouver. Salary is open according to qualifications. Apply to Box No. 3325-V.

TWO DRAUGHTSMEN with a minimum of three years draughting experience, are required by a company in Montreal. One must have mechanical experience to specialize in refrigeration design, the other structural or architectural experience to specialize in design layout of food service equipment. Apply to Box No. 3328-V

GRADUATE ENGINEER, age 25-35, preferably married wth five to 10 years experience in the design of complicated machines to be trained in the designing of shoe machinery. Starting wage will range from $60. to $75. a week for five-day week. Apply to Box No. 3330-V.

TWO ARCHITECTURAL DESIGNERS AND DRAUGHTSMEN, or architects with some experience in modern materials and design are required by a young progressive firm of architectural designers and engineers in Alberta. Salary will be commensurate with ability. Apply to Box No. 3331-V.

MECHANICAL, ELECTRICAL OR CIVIL ENGINEER, recent graduate who must have fluent knowledge of Spanish, preferably under 30, is required by a firm in the Montreal area for technical work in connection with production. Some travelling. Salary open according to qualifications. Apply to Box No. 3373-V.

DRAUGHTSMAN familiar with reinforced concrete and structural steel is required by a consulting firm in Montreal. Salary open. Apply to Box No. 3387-V.

DESIGN ENGINEER not necessarily a graduate but with mechanical or structural experience in the paper industry is required by a firm in the St. Maurice Valley of Quebec. Salary $250 to $300 a month. Apply to Box No 3388-V.

CHIEF INSTRUCTOR completely bilingual, veteran, not necessarily an engineer, is required by a pulp and paper company in the province of Quebec to instruct in labour relations, etc., and to understudy personnel manager. Salary $150 a month. Apply to Box No. 3405-V.

STEAM PLANT SUPERVISOR—Manufacturer with several plants in Ontario and Quebec requires an active man with technical training and field experience in efficient steam plant operation. Salary open. Apply to Box No. 3406-V.

GRADUATE ENGINEER with experience in structural design and detailing is required for work in bridge department of large transport company. Apply to Box No. 3407-V giving all particulars including salary expected.

ENGINEERING SALESMAN with pleasing personality, bilingual, 25 to 35 years old, not necessarily a graduate, but with some engineering background and if possible some knowledge of lubrication is required by a large company in Montreal. Salary open. Apply to Box No. 3422-V.

CHIEF DRAUGHTSMAN, experienced in all types of structural work, required to take charge of a draughting office for a central Ontario city. Apply to Box No. 3428-V giving all particulars including salary expected.

MAINTENANCE ENGINEER

Pulp and Paper Mill

•

Graduate Engineer, preferably mechanical, experienced in pulp and paper mill maintenance. Salary commensurate with ability and experience. Apply to personnel manager, The E. B. Eddy Company, Hull, Que.

PLANT ENGINEER

Modern boiler plant, hydro electric plant, refrigeration plants, electric, water, gas, sewer services, building construction, maintenance, repair, fire protection, numerous buildings. Eastern Ontario. Experienced graduate engineer. Salary $4,000-5,000. Reply listing qualifications.

SHOP SUPERINTENDENT

Supervise several shops engaged on jobbing work on precision instruments, machines and equipment. Graduate engineer experienced in tools, machine, pattern, sheet metal, cabinet shops, design, production. Eastern Ontario. Salary $3,600-4,200. Reply listing qualifications.

APPLY TO FILE No. 3468-V.

University of Toronto
REQUIRES
Engineer Instructors

Instructors of various grades up to and including lecturer are required by the Faculty of Applied Science and Engineering of the University of Toronto for duty starting in September, 1946. Applicants must be engineering, science or mathematics graduates. Salary will depend on experience and general qualifications. Apply to the Secretary of the Faculty of Applied Science and Engineering, Mining Building, University of Toronto.

Situations Wanted

SENIOR REINFORCED CONCRETE DESIGNER and civil engineer, R.P.E. (Ont.). experienced field and office, various countries, seeks first class opening. Apply to Box No. 107-W.

CIVIL ENGINEER, M.E.I.C., P.E.Q., age 39, married, B.Sc., U.N.B., widespread experience in construction with experience in plant maintenance both in civilian and Air Force capacities. Interested in responsible position involving plant maintenance. Apply to Box No. 225-W.

CIVIL ENGINEER, age 40, McGill '29, B.Sc., married, experienced surveyor and field engineer, two years on inspection of airfield construction, location immaterial, available on short notice. Apply to File No. 741-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., 20 years work on hydraulic plants as designer and superintendent of construction. Extensive experience in guniting, diamond drilling and pressure grouting. One month notice. Apply to Box No. 1527-W.

PLANT ENGINEER, graduate, M.E.I.C., age 42, qualified to take responsible charge of layout of plant and equipment, structural and mechanical design and organization of plant maintenance. Wide experience with chemical processes. Have successfully handled skilled and unskilled labour on construction, maintenance and plant operation. Prefer location in Ontario. Minimum salary $5000. per year. Apply to File No. 1621-W.

GRADUATE ENGINEER, B.Sc. (Mech) M.E.I.C., age 45, married. Three years experience in time and job study, factory methods and cost accounting. Fifteen years experience in construction and building maintenance; considerable experience in shop layouts and maintenance. Five years sales promotion and technical field work in plastics. Capable of handling personnel and planning. Seeks an executive position in industrial business or will assume complete administration of medium sized business in any part of Canada. Available on short notice. Apply to File No. 1642-W.

ELECTRICAL ENGINEER, M.E.I.C., R.P.E. (Ont). interested in mechanical design and production; experienced in hydro-electric station design, transformer and machine layouts and in development and design of radar equipment. Services available immediately. Location preferred: Toronto or Hamilton. Apply to Box No. 1693-W.

CHEMICAL ENGINEER, Jr.E.I.C., age 37, 12 years experience in pulp and paper industry, both technical and production, also three years research in paper containers during war. Bilingual; would like to return to paper industry. Available at a month's notice. Apply to Box No. 1768-W.

CIVIL ENGINEER, age 32, married, B.Sc. in Civil Engineering U.N.B. 1938, M.Sc. U.N.B. 1944. Two years service with R.C.E. Six years experience in Canada and in tropics on construction of roads, airfields, wharves, drainage works, etc. Speaks English, some French and Spanish. Presently employed but wishes to change for a position more directly in charge of construction. Available on thirty days notice. Apply to File No. 1860-W.

GRADUATE ENGINEER, B.Sc. (Civil) M.E.I.C., services available. Thorough knowledge of building construction and fifteen years' experience in sales engineering and promotional work in connection with building products; also considerable practical experience in construction work as estimator and in field work. Recently resident engineer on large industrial project. Good connections with architectural and contracting firms, particularly in Toronto area. Apply to Box No. 2440-W.

CHEMICAL ENGINEER, young university graduate, previously engaged in war industry, desires permanent position. Available immediately. Apply to Box No. 2464-W.

MECHANICAL ENGINEER, Jr.E.I.C., age 23, single degree from N.S. Tech. '44, 18 months' experience as engineer officer afloat in the Royal Canadian Navy, Experience included the administration and control of the entire propelling and other machinery, and the discipline of 30 men in that department. Would prefer work of a responsible nature in a small firm doing manufacturing or installations. Have just been released from the Navy and am available for immediate employment in Canada or elsewhere depending on living conditions. Apply to Box No. 2587-W.

MECHANICAL ENGINEER, Jr.E.I.C., single, age 27, graduate Royal Naval Engineering College (Practical Engineering Prize) wishes work of practical nature, mainly outdoor. Interested in operation or construction of steam, hydro or internal combustion machinery. Eight years in R.C.N., including operational, overseeing and instructing. Medical discharge. Seven months on shipyard staff. Prefer to remain near Pacific Coast but would consider temperate climate like New Zealand, South Africa, southern England. Apply to Box No. 2589-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., with 18 years' experience in Canada and abroad in tool design, product design, shop and industrial engineering, labour relations. Successful organizer. Available due to closing of war plant. Apply to Box No. 2592-W.

ELECTRICAL GRADUATE '46, N.S.T.C., S.E.I.C., 23, single, available upon graduation anywhere in Canada. Interested in electronics, communications, industrial promotion and management. Experience in one of Canada's largest radio manufacturer's test department and electrical draughting. Apply to Box No. 2607-W.

GRADUATE MECHANICAL-ELECTRICAL ENGINEER, 53 years old, with broad background in U.S. and Canada would like position in small or medium-sized organization as assistant to manager in operations but with freedom to do research and development touching any phase of the business. Apply to Box No. 2608-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng. (Ont.), available with one month notice or less. Age 44, married, three children. Six months mining engineering experience, three years mechanical experience in large implement factory, supervision since 1940 for Inspection Board of U.K. and Canada of a large staff on inspection of electrical apparatus and equipment. Seeks position with considerable administrative responsibility based on electrical production or maintenance. Able to go anywhere on continent. Apply to Box No. 2614-W.

INDUSTRIAL ENGINEER, graduate in civil engineering, B.A.Sc., M.E.I.C., single, age 30, bilingual. Experience in industrial engineering work; plant layout, time and motion study, wage incentive, work simplification, job evaluation, material handling, cost and production control, cost reduction research available. prefer Montreal, highest references from former employers. Apply to Box No. 2616-W.

GRADUATE MECHANICAL ENGINEER, Prof. Eng. (Ont.) Jr.E.I.C., married, age 31. Experience covers machine shop apprentice, engineering design, chemical plant design, field engineer on construction work, plant operation and superintendent in large plants employing modern plant management methods. Past 8 years have been with present employer. Now wishes to make change to smaller company with opportunity of securing position of responsibility. Apply to Box No. 2629-W.

MECHANICAL ENGINEER, Jr. E.I.C., graduate Queen's 1937, age 33, married. Four years with a mechanical control company at design, customer contact, administration and shop liason work. One year with a beverage company at design, development and installation of special machinery and conveyor equipment. Four years with a steel plate fabricator on design, estimating and field work. Desire position as assistant to plant engineer in an established Ontario firm. Available now. Apply to File No. 2641-W.

MECHANICAL ENGINEER, M.E.I.C., with chemical engineering experience, interested in responsible position with expanding organisation. Experience covers design, development, maintenance and construction of plant equipment. Would consider association with consulting engineer or act as foreign representative. Apply to File No. 2642-W.

GRADUATE CHEMICAL ENGINEER, McGill 1946, available immediately. Plant or sales work, single, healthy and ambitious, will travel anywhere. Apply to File No. 2661-W.

GRADUATE MECHANICAL ENGINEER, (Sask. '45) age 24, married, Jr. member of The Society of Naval Architects and Marine Engineers. Experience with moulded plywood, one year general mechanical engineering in processing plant. Good knowledge of yacht design. Require position with a firm connected with the boating industry, plywood, engines, hardware, plastics, etc. Prefer Vancouver location, available August 1st. Apply to File No. 2662-W.

ENGINEER now employed seeks better position; thoroughly bilingual; had many years experience teaching chemistry, mineralogy and geology and demonstrating in connected laboratories. Acted as mining engineer in mineralogy laboratory, writing reports on samples examined and conducting prospectors' classes; also had municipal engineering experience. Age 49; seeks position as executive, town manager, construction superintendent, sales engineer. Veteran of both wars. Apply to File No. 2663-W.

STRUCTURAL ENGINEER competent to analyse stresses and to make or review designs in concrete, steel or timber; would undertake small assignments (not requiring full time services). Office in Montreal. Apply to File No. 2672-W.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 29 | MONTREAL, JUNE 1946 | NUMBER 6

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

PUBLISHED MONTHLY BY

THE ENGINEERING INSTITUTE OF CANADA

2050 MANSFIELD STREET - MONTREAL

Price 50 cents a copy, $4.00 a year: in Canada, British Possessions, United States and Mexico. $5.50 a year in Foreign Countries. To Members and Affiliates, 25 cents a copy, $2.00 a year. —Entered at the Post Office, Montreal, as Second Class Matter.

CONTENTS

COVER PICTURE

The cover picture is the first in the series "Universities of Canada" which the *Journal* expects to print. The new buildings of the Université de Montréal which were completed in recent years rise on the northern slopes of Mount Royal. They house the faculties of law, medicine, arts, science, and the school of hygiene. The Ecole Polytechnique, which is the faculty of applied science of the Université de Montréal, houses in its own buildings on St. Denis Street.

TECHNICAL ASPECTS OF THE FUTURE OF ALUMINUM

P. M. HAENNI

Director of Research, Aluminium Laboratories Limited, Kingston, Ont.

Paper presented before the Montreal Branch of The Engineering Institute of Canada, January 11th, 1945

Introduction

In the course of the last six years the annual production of aluminum ingot in Canada expanded from a pre-war level of 70,000 tons to no less than 500,000 tons. This phenomenal growth, though stimulated by the war, was the outcome of forty years of experience and planning, which culminated in the completion of Shipshaw power development in 1943. To-day, Canada is the world's second largest producer of the metal; and the Arvida smelter is the biggest in existence.

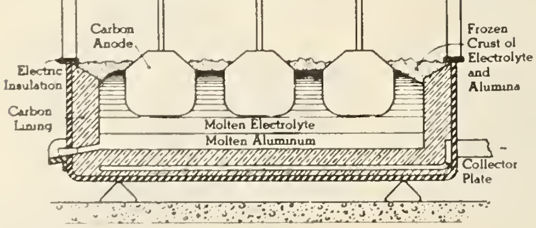
Before the war, only about 10,000 tons of ingot was consumed domestically, the majority of the output being used for heavy armament programmes abroad. Now, when the war is over; when the United States also is looking for outlets for its enormous production-facilities, and when other countries are becoming interested in setting up their own basic industries; it is reasonable to inquire whether any more than a small fraction of Canadian aluminum capacity can be utilized.

The aluminum industry has become a significant factor in Canadian economy, affecting both the employment of labour and the accumulation of foreign exchange. The question of its future is thus of more than ordinary interest.

Ingot Production

Aluminum, because of its great affinity for oxygen, is not found in a metallic state in nature; but combined with that and other elements, it is one of the most abundant and widely distributed ingredients of the earth's crust. It is found in innumerable forms, being present in precious stones such as ruby, sapphire, corundum, and topaz, as well as in mountainous masses of silicates and volcanic rocks, and in enormous alluvial deposits; it is found in natural waters, and occurs in numerous kinds of plant life. Practically all the aluminum produced commercially, however, is obtained from one single ore, an impure aluminum hydrate known as bauxite, the name of which is derived from the locale at Les Baux of a famous French deposit.

The extraction of metallic aluminum from bauxite involves two processes, the first being the chemical purification of the ore whereby anhydrous alumina (Al_2O_3) is obtained. The smelting operation proper consists in the electrolysis of alumina in molten cryolite, using carbon electrodes, the aluminum collecting on the cathodic bottom of the vessel: the electrolytic cell is shown diagrammatically in Fig. 1. The metal so obtained has a commercial purity ranging from 99.0 per cent upwards. To obtain still higher purities, the commercial product may be refined by further electrolysis, again using a solution of molten cryolite and fluorides: the molten purified aluminum is the cathode in this process, and a heavy aluminum-copper anode is employed. The purity of the aluminum so obtained compares with that of a typical commercial product in the manner shown in Table I.



HALL·HÉROULT

Electrolytic Cell

in which aluminum is produced

Fig. 1.

Table I

Typical Composition of Commercial Purity and Electrolytically Refined Aluminum

	Commercial %	Refined %
Al	99.6 +	99.99
Fe	.25	.003
Si	.15	.004
Ti	.010	.001
Cu	.005	.001
Mn	.002	.000
Na	.002	.000

+ By difference of Fe and Si

Although is has been found possible to produce alumina from clays and other common minerals, bauxite is likely to remain for a long time the most economical raw material for aluminum. And, although electrothermal methods such as carbo-thermal reduction are being investigated by various producers and are even being used commercially for the production of certain aluminum-silicon alloys, there is no immediate likelihood that the traditional smelting of alumina by electrolytic reduction will be abandoned: this is particularly true in Canada, where metal analysing up to 99.9 per cent purity can be produced directly. It is possible, however, that should the demand for metal of extreme purity reach sizeable proportions, new refining methods based on distillation of aluminum will attract the attention of the chemist. The precise influence of non-metallic impurities such as oxides, carbides, nitrates, phosphites, and sulfides, is not yet fully determined; and in the future considerable advantages may be found to accrue from their elimination.

Physical and Mechanical Properties

Of the several physical constants of aluminum that, in Table II, are compared with those of the other two structural metals, the following are the most significant:

The low density, which is responsible for the high strength-weight ratio of aluminum alloys and for their present and future importance in transportation and in moving parts from which dead load must be eliminated.

The low melting point, which permits of easy melting and founding.

The high thermal and electrical conductivities, by virtue of which aluminum is remarkably adapted for heat appliances and for electrical conductors.

The crystal structure, defined as face-centered cubic (the same type of structure possessed by copper and silver, and by iron at high temperatures): this structure accounts for ductility, formability, and for the conductivities mentioned above.

The low modulus of elasticity, which confers high resiliency but which renders necessary certain modifications in connection with the design of members subjected to flexural and compression stresses.

Table II

Physical Properties of Aluminum, Magnesium, and Iron

	Aluminum	Magnesium	Iron
Density (grams per cubic centimeter) at 20°C	2.70	1.74	7.87
Thermal Expansivity, 20° to 100°C	23.8×10^{-6}	25.8	11.9
Melting Point (°C)	660	651	1535
Boiling Point (°C)	1800	2130	2994
Thermal Conductivity (cal./cm.^{2}/cm./°C/sec.) 0 to 100°C	0.50	0.37	0.19
Latent Heat of Fusion (calories per gram)	93	88	65
Electrical Resistivity, Commercial Conductors, (microhms per cm.^{3}) at 20°C	2.83	4.46	9.8
Solidification Shrinkage (percentage)	6.6	4.3	
Electrode Potential (volts, at 25°C)	1.69	2.4	0.4
Crystal Structure	f.c.c.	c.p.h.	b.c.c.
Modulus of Elasticity (psi 10^6)	10	6.5	30

The non-metallic and non-sparking attributes, which render the metal suitable for certain special uses: and the high and sustained reflectivity of aluminum surfaces, rendering the metal of significant use in insulating media.

Aluminum and its alloy differ in many other physical and mechanical respects from steel (see Table III and Fig. 3), which until a few years ago stood as the only metal in the structural field. The ratio of shear strength to tensile strength, for instance, is different. Workability, hardness, impact-resistance, and fatigue-strength are important instances where aluminum does not compare favourably with certain steel, and of which particular account must be taken in structural design. That none of these is an insuperable obstacle to the use of the metal has, however, been very thoroughly established by its unexceptionable performance as the primary component of aircraft structures.

The designing engineer, by taking due account of these divergencies from the properties of familiar and long-used steel, will in his day-to-day work continue to make a most vital contribution to the future of aluminum in the many structural applications for which it is properly fitted.

Chemical Properties

Aluminum is chemically stable when placed in contact with any of a considerable range of commodities, particularly with organic compounds. It has, moreover, a high resistance to atmospheric corrosion, whether industrial, rural, or maritime. The pure metal, together with certain alloys, also withstands the attack of concentrated nitric acid and concentrated acetic acid: The high-purity metal is to a great extent resistant even to hydrochloric acid, as is shown in Fig. 2.

This chemical behaviour or aluminum is largely due to the presence of a continuous, compact, invisible oxide coating on its surface. This layer of oxide forms almost instantly upon exposure of the metal, and constitutes a barrier against further oxidation: it is difficult to remove. The film varies greatly in thickness, uniformity, hygroscopicity, and continuity, being influenced by factors among which may be cited temperature, metallurgical conditions, degree of polish and quantity of moisture present. It may be increased in thickness by chemical processes such as immersion in oxidizing solutions of dichromates or chlorates; or by the electro-chemical process of anodic oxidation in electrolytes such as sulphuric and chromic acids. The improvement in film thickness that is obtained by these processes presents a surface susceptible to the absorption of dyes: the metal may thus be commercially coloured by dyeing. In the future it may

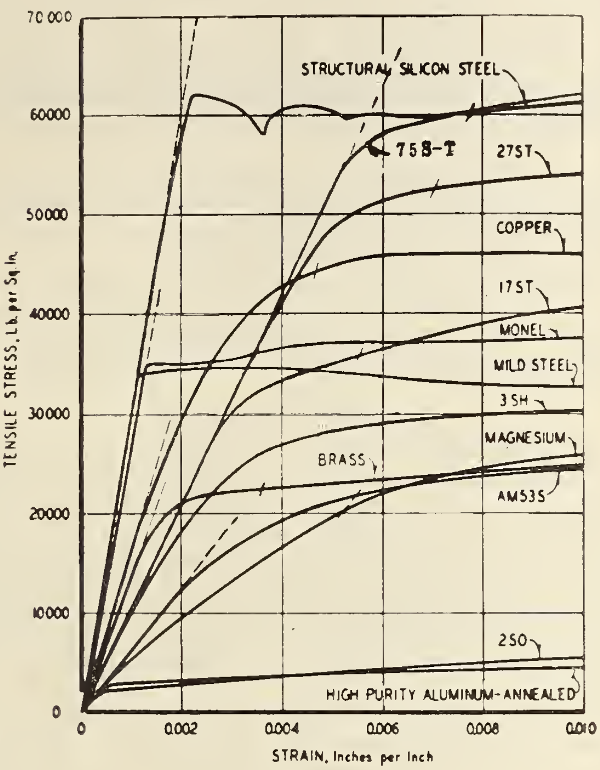


Fig. 3.

AC. 350 Aluminum		50,000	27,000	16	10.5
AC. 226-T26 Aluminum		41,000	33,000	6	10.5

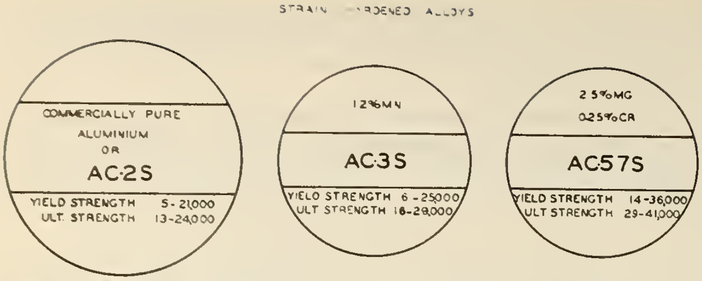

Fig. 4—Wrought alloys have the letter "S" as a suffix to differentiate them from casting alloys; the numbers indicating the various compositions, and the prefix letters "AC" that they are products of the Aluminum Company of Canada, Limited.

confidently be expected that there will be developed even more versatile oxide coatings, with improved appearance, greater hardness, better dye absorption and easier production chemically or by anodic means.

Aluminum is non-toxic, and is thus one of the few metals which can be used safely in contact with food. And, moreover, the fact that its compounds are colourless is of the greatest importance in chemical, architectural, and other applications.

Metallurgy

Pure aluminum is well known to be a soft material, with relatively low mechanical characteristics; but, upon alloying with small percentages of other metals in accordance with well established practice, tensile and other properties may be obtained which range well into the class of the better structural steels. Table III enumerates typical mechanical properties for certain wrought and cast alloys of steel and aluminum; and, in Fig. 3, are illustrated typical stress-strain curves for a variety of metals and alloys.

Aluminum alloys are divided into two general classes, namely, "non-heat-treatable" and "heat-treatable". Wrought alloys in the former category are termed "strain-hardened" or "common" alloys, and in the latter category, "strong alloys".

Strain-hardened alloys (Fig. 4), because of their excellent corrosion resistance and their formability, have a great variety of uses where high strength is not paramount. These alloys are available in a wide range of tempers, the harder tempers being produced by cold work.

The fact that aluminum alloys of certain chemical compositions, notably those containing copper and magnesium, are susceptible to heat-treatment whereby their mechanical properties are completely altered, has opened up applications in the structural field which otherwise would have been closed, and the simplicity of the essential treatment has greatly aided their adoption. The majority of heat-treatable aluminum alloys derive from the four main classes that are illustrated in Figs. 5, 6, 7, and 8.

AIRCRAFT ALLOY DEVELOPED FROM CLASSICAL DURALUMIN

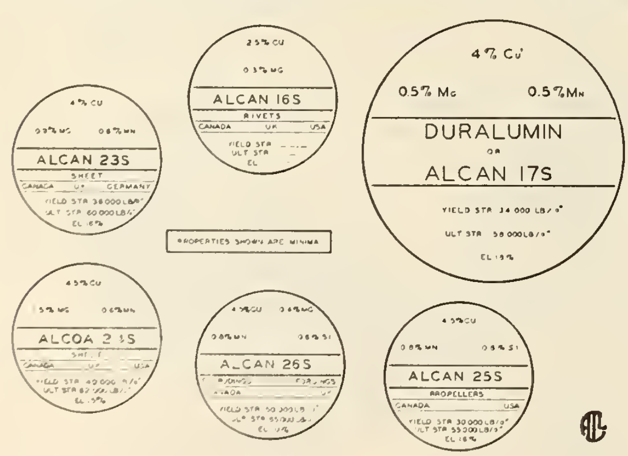

Fig. 5.

Has the last word been said in the production of new alloys?

The recent commercial development of wrought alloys giving tensile strength close to 100,000 lb. per sq. in. (in the extruded form), the recent appearance of self-hardening casting alloys, the potentialities offered by the production of alloys from high purity aluminum by the plating of still stronger alloy core with alloy coating, the production of alloys with controlled ingredients to produce a given effect such as a certain type of natural or anodic oxide film, a given type and degree of preferred orientation upon manufacturing, etc., all point to the fact that the future of aluminum will, to a considerable extent, be influenced by the development of new alloys and improved composite materials.

Fabrication

The versatility of aluminum and its alloys with regard to fabrication is indicated diagrammatically in Fig. 9. From that figure it will be noted that all the common methods of metal-founding, from simple sand-casting to

AIRCRAFT ALLOYS DEVELOPED FROM CLASSICAL ALCAN 160

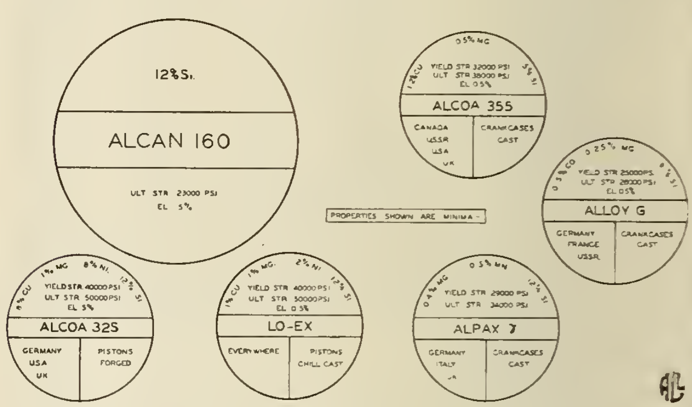

Fig. 6.

the more highly specialized centrifugal processes, are in ordinary commercial use.

With reference to the wrought alloys, it will be seen that these are currently being fabricated by hot and cold rolling, by drop forging, by pressing, and by upsetting. The latter techniques, involving the hot forming of solid metal, are exemplified in a notable manner by the extrusion process, whereby the metal is squeezed through an orifice in a manner similar to the pressing of toothpaste out of a collapsible tube. Aluminum alloys, which are among the most workable of metals, may also be readily spun on the lathe for cooking utensils or reflectors, drawn in the press into shells and containers, press or hammer formed into a great variety of shapes, and treated by stamping, coining, or embossing.

In addition to the finishes ordinarily used on metals, among which are listed mechanical finishes, electro-plated finishes, painting, and lacquering, it has already been pointed out that aluminum and its alloys may be treated by well-established methods in order to increase the thickness, and the chemical and mechanical resistance, of the natural oxide film; and that the processed film may furthermore be coloured by simple dyeing processes. There is no doubt that further improvements in surface-treatment, together with techniques involving dyeing, photography, plating, and highly reflective specular finishing, will play no small part in the future of aluminum.

The assembly of aluminum parts may be accomplished by all the usual methods of joining. Riveting, stapling, welding, brazing, and soldering are all now in commercial use to various extents; and there is considerable promise in bonding by means of newly-developed thermo-setting plastics and other adhesives. The several methods of

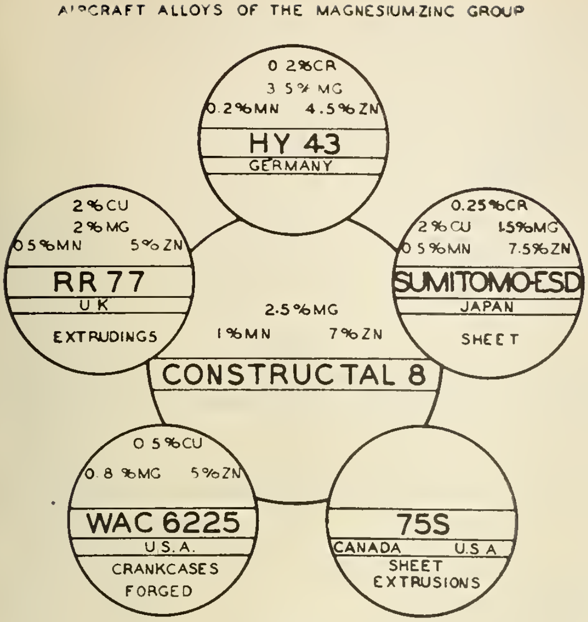

Fig. 7.

joining aluminum parts are becoming constantly more effective and more versatile as the processes are developed to greater degrees of perfection.

With regard to new manufacturing techniques, the main results to be looked for will be lower cost of fabrication, improved soundness and metallurgical structure, together with higher and more uniform mechanical properties. Improvements in the foundry will be essentially slow and evolutionary. In the manufacture of wrought alloys, the impossibility of producing large ingots of sound and homogeneous metal was, until recently, a cause of grave concern; but the development of the direct-chill or continuous casting process, in which the ingot is cooled directly by the impingement of water immediately upon solidification, has already opened a new field of rolled and forged products, of much larger size than was previously attainable. This process, in turn, will permit the production, by continuous rolling or extruding, of large-sized commodities, combined with the advantage of reduced cost of production.

In the field of powder metallurgy, the techniques for mass production of small aluminum alloy parts, with or without sintering, have been very thoroughly explored; and their commercial application is already to be noted in the increasing use of aluminum bearings.

Economics

The close of the nineteenth century was, generally speaking, a period of quantity production, while the present age will be recognized for its emphasis on quality; this applies to commodities in general and to metals in particular. Aluminum, which is substantially a twentieth-century product (its marked industrial development being a product of the first world war just as that of magnesium will be associated with the second world war), entered the metal market in the middle of this transition from quantity to quantity-plus-quality, and it has thus been forced to develop with respect to both of these parameters simultaneously.

Table IV

World Production of Metals as Compared with Aluminum
(On weight basis)

Years	Fe/Al	Cu/Al	Pb/Al	Zn/Al	Sn/Al
1900	4,200	20	33	25	4
1910	1,100	6	6	7	1
1920	500	2.3	1.6	2.1	0.36
1930	350	1.8	1.4	2	0.25
1940	135	2.2	1.5	1.4	0.14
1943	42	1	0.7	0.65	0.07

In the struggle for quantity, aluminum made notable progress during the war and its production on a volume basis became second only to that of steel; and on a weight basis almost to the same extent. This is shown in Table IV.

Achievements on the quality side are even more striking. Two examples may be cited. The new 75S-T alloy has a tensile strength of 76,000 lb. per sq. in., compared with the 13,000 lb. per sq. in., possessed by commercially-pure aluminum. Attention may also be drawn to the most effective combination of corrosion-resistance with high mechanical properties that has been obtained by the use of Alclad material, particularly in aircraft.

Developments such as those referred to have been due in a large measure to patient and systematic research. No fewer than fifteen research laboratories are at the present date devoted exclusively to the development and improvement of aluminum alloys and to methods for their fabrication; while in addition, more than two hundred laboratories are employing a large part of their facilities to the same ends.

Table V

Material and Power Required for the Production of

1 ton alumina		1 ton aluminum	
Bauxite	2.3 t.	Alumina	2.2 t.
Coal	0.2 t.		
Caustic Soda	0.15 t.	Electrode Carbon	0.8 t.
Lime	0.03 t.		
Water	6,000 gals.	Cryolite	0.08 t.
Steam	15,000 lbs.		
Power	180 KWH	Power	25,000 KWH

A question that has been asked in connection with increased production of aluminum is that of its effect upon the price of the metal. The answer to this is a matter of record: increased production has been accompanied by a lowering of the price. It may also be queried whether it will be possible to maintain the present high rate of production and whether lower prices can be achieved in the future. Table V lists the raw materials and power requirements for the production respectively of one ton of alumina and of one ton of aluminum; and Table VI shows the percentage partition of the cost of aluminum. From those figures it is obvious that production costs are primarily dependent on the costs of certain items, particularly bauxite and power. Labour and operating expenses also bear directly on the matter, and it seems clear that modern trends towards higher cost of labour will ultimately limit the extent to which increased production can be accompanied by a lower price.

Table VI

Cost Price of Aluminum in Percent

	%
Electrical Energy	20
Alumina	35
Electrodes	18
Cryolite	2
General Expenses & Operating	25

The future of a material can be predicted to some extent by the assessment of the degree of market-saturation that appears to have been reached in its case. Figures and curves of world production for aluminum, pig iron, petroleum, and copper, shows that actual saturation has not been reached for any of these products. Coal, iron, and copper are running almost parallel in production increase: petroleum shows a tendency to go on increasing quite rapidly, and, finally, aluminum shows a similar but even more marked tendency. In the latter connection it is of interest to note that, in countries such as Switzerland and Great Britain, production has not kept pace with that in other countries, especially in Canada, Germany, and the United States.

The most sensitive factor in the modification of curves of consumption and of saturation-levels is the price element, and the 25-per cent reduction in the price of aluminum during the last five years, combined with the development of notable improvements in mechanical properties and

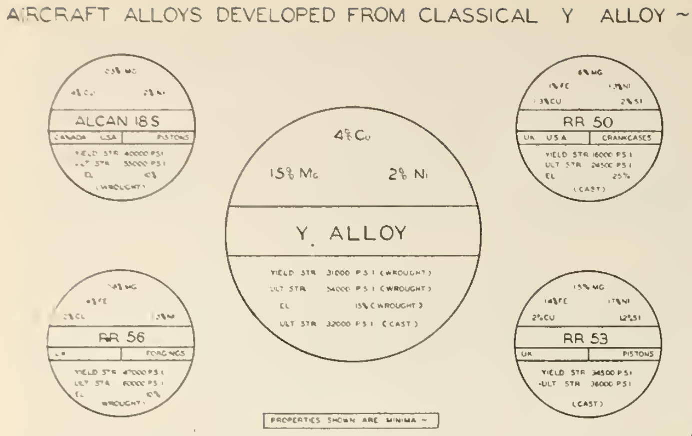

Fig. 8.

fabrication processes, will undoubtedly have a pronounced effect on the future consumption of this metal. In the past, aluminum was competitive in price with other non-ferrous metals such as copper, and to a much lesser degree with zinc, lead, and even tin: now aluminum is beginning to enter the price brackets of a number of special steels.

Table VII lists the percentages of total steel output when applied to the various fields of its application. In these various fields, aluminum will of course compete principally where lightness and resistance to corrosion are the main factors: two very important applications are those covered by transportation and by the food industry. This, it may be noted, does not represent a new departure, but simply a continuation of developments that were taking place prior to the war.

Table VII

Uses of Steel

	1937 %	1944 %
Agriculture	5.7	2.3
Aircraft		5.4
Automotive	18.9	
Construction	14.7	10.3
Containers	7.8	6.7

indicates that the transportation industry will absorb an even greater proportion of the aluminum output than was the case before the war.

Table IX

World Consumption of Aluminum Divided as to Uses

	1925 to 1935 %	Post-War %
Aircraft, automobile, bus, railway, marine industry	30	35
Food industry, cooking utensils	15	14
Heavy and small machinery	15	15
Electrical industry: conductors, busbars, motors	10	9
Chemical industry	3	3
Building and construction	5	7
Ferrous and non-ferrous metallurgy	7	6
Miscellaneous	15	11

Practical Applications

The intrinsic properties of aluminum, including its high strength-to-weight ratio, its resistance to corrosion, the film-forming properties of its surface, its high affinity for oxygen, its alloying properties, its reflectivity and its conductivity both electrical and thermal, have each resulted in a special field of application for the metal. The various uses are grouped under a number of headings in Table X.

Table X

Properties and Uses of Aluminum

High Strength — Weight Ratio		
Transportation	*Aircraft*	Land & sea planes, engines
	Automotive	Cars, buses, trucks, tank trucks, body, frame
	Railroad	Street cars, hopper cars, box cars, passenger cars, locomotive parts, trucks, containers
	Marine Construction	Super-structure, bulkheads, lifeboats, davits, masts, canoes, fittings
	Miscellaneous Vehicles	Bicycles, motorcycles, wheelbarrows, carriages
Machinery	*Reciprocating & Rotating Parts*	Connecting rods, textile industry, propellers
	Portable Tools	Pneumatic tools, spray gun impeller, fire engine parts
	Handling Equipment	Conveyers, pulleys, worm gears, foundry patterns
	Engines	Blocks, heads, crankcases housing, bases of diesel, aircraft, automotive, marine engines, outboard motors, steam turbines
	Home Appliances	Washing machines, vacuum cleaners, refrigerators
Metallic Construction	*Structural Work*	Cranes, booms, bridges
	Mining	Cages, skips, pit car loaders, mine cars
	Tanks	Storage tanks, containers, gas tanks
Corrosion Resistance		
Culinary	*Cooking Utensils*	Pots, pans, pressure cookers, covers, kettles
	Processing	Dairy, brewery, gelatine, fruit press
	Canning	General line can. Food processed can: fish, meat

	Packaging	Collapsible tubes, packing foil (butter, tea, fruit, cheese, meat, coffee, chocolates), bottle caps
	Transportation	Milk truck tank, milk can, beer barrel, drums
Chemical	*Processing Equipment*	Kettles, pans, coils, condensers, storage tanks, crystallizers, moulds, coolers, pipes
	Fatty acid	Condensers
Industrial	*Oil Refinery*	Towers, trays, heat exchangers, tanks, lines
	Rayon Industry	Spinning buckets, bobbins, ducts, tanks
	Varnish Industry	Kettles
	Sewage Disposal	Plates, gates, troughs, screens
	Transportation	Tanks, gas cylinders, drums cans
Architectural	*Structural Parts*	Windows, doors, grille, hand-rails, partitions
	Roofing	Flat, corrugated, shingles, sky-light
	Plumbing	Lavatory fittings, bath, pipes
	Hardware	Handles, fittings, curtain accessories, hinges, reflectors, lighting fixtures
	Ornamental Parts	Spandrels, name plates, fountains, panels
	Furniture	Chairs, beds, ovens, refrigerators, airplane, car, bus seats
Film Forming Properties		
Electrical		Condensers
Metallurgical		Zinc electro-deposition Nickel electro-deposition
Architectural		Calorized parts Anodized parts
High Affinity for Oxygen		
Deoxidizing		Steel
Alumino-Thermy		Welding, Reduction
Explosives		
Pyrotechnics		
Cement Admixtures		Aerocrete, Anti-shrinkage addition
Reflectivity		
Reflectors		Light: Ultra-violet rays Mirrors: Telescope Heat: Stove reflectors
Insulating Material		Alfol. Oven linings

Alloying Properties	
Ferrous Metals	Heat resisting alloys. Nitriding steel Permanent Magnets (Alnicol)
Non-ferrous Metals	Aluminum, Bronze, Zinc die castings, Zinc galvanizing baths
Thermal Conductivity	Pistons Cylinder Heads (liquid & air cooled) Bearings
Electrical Conductivity and Diamagnetic Properties	
Heat Appliances	Stoves (Gas and Electric) Heat Exchangers (Home & Industry) Heating Elements (Radiators) Home Equipment (Flat irons, ironers)
Conductors	ACSR and Alloy Conductor Underground Cable Telephone wire Busbars
Conductor Accessories	Squirrel Cage Rotors
Motor Parts	Housing: Motor frames
Machinery	Welding Casings: Motor boxes, Switch boxes, Trolley Bows
Radio	Cabinets, miscellaneous parts

Conclusion

In the present brief survey, only some of the aspects controlling the long-term future of aluminum have been considered. Its short-term future will be governed by the current backlog of consumer goods, as indeed will the immediate future of most other materials.

In the case of aluminum, the greatly increased capacity of the reduction plants, especially in Canada, the availability of enormous amounts of aluminum scrap in all parts of the world, and a much-improved knowledge of fabrication methods consequent on the huge expansion of the aircraft industry during the war, will all play their parts in promoting developments over the coming years. Together with the downward trend of prices that is to be anticipated, they will assure for aluminum and its alloys an increasingly permanent place in the economy of the world.

INDUSTRIAL EARTHQUAKE HAZARDS IN EASTERN CANADA

ERNEST A. HODGSON, M.E.I.C.
Chief, Seismological Division, Dominion Observatory, Ottawa, Canada

Paper presented to the Montreal Section of the American Institute of Electrical Engineers on February 28, 1945, and published here with their kind permission

An interesting pastime, which is not quite as futile as might at first sight appear, is that of developing empirical formulae to express what might be called physico-psychological relationships. For example, one might evaluate the general public interest in earthquakes in terms of the various contributing factors. Evidently, it varies directly as the intensity of the severe shock immediately preceding; directly as, and possibly as the square of, the damage cost in dollars; and inversely as, say, the cube of the number of months which have elapsed since the last major earthquake.

Anyone meditating for awhile on the problem could readily discover other factors and might be inclined to disagree with the powers adopted in the simple formula above. But, in any case, the curve of Canadian public interest in earthquakes resembles the chart of a patient suffering from undulant fever. There are sharp peaks of intense interest, with long intervals during which the curve lies close to the zero axis. Such a graph for Japan, or even California, would exhibit a greater number of peaks but they would not stand out so strikingly, for there would be fewer long periods of low values.

As a result of this continued interest, the architects, contractors and electrical engineers of such countries as Japan have been stimulated to recognize and evaluate industrial earthquake hazards and to provide reasonably effective measures to guard against them.

At this time, when Canadian public interest has been stimulated by the recent Cornwall earthquake, quite a number of letters have been received from executives of industrial concerns, vitally interested, by the way, in extensive electrical services, asking when and where another severe earthquake may be expected and what precautions should be taken in repairing or extending their premises.

For nearly forty years, the Seismological Division of the Dominion Observatory has been quietly but steadily accumulating and indexing all available data, instrumental and historical, on the subject of earthquakes in Canada. The present would seem to be an opportune time to undertake a short analysis of this material. As most of it refers to earthquakes in Ontario and Quebec, the discussion is limited to an evaluation of " Industrial Earthquake Hazards in Eastern Canada."

To define the area more precisely, let us restrict the study to those parts of Ontario and Quebec lying in the watershed of the St. Lawrence and relatively close to its streams. Moreover, since earthquakes do not recognize political boundaries, it is necessary to consider also those adjacent parts of the United States which may be included in the drainage limits above.

Historical and Seismological Sources

The subject involves a consideration of the earthquake history of this territory from the earliest historical times to the present. The last four or five decades of this period are well covered by seismological records and studies, but the data for earlier years may be obtained only from written records, practically all of which were compiled by those who were not trained observers and who had no instruments to assist them[3]. Even reports by men such as the late Sir William Dawson[2], Mgr. Laflamme[1], and others are little more than carefully edited compilations of accounts given by earlier lay observers, except for Dawson's reports on the earthquakes of 1860, 1864, and 1870. Even these shocks he did not personally investigate in the field, relying mostly on newspaper accounts for his data. For part of the historical record, old newspaper files in both Canada and the United States have been consulted by members of the Observatory staff.

The first seismograph definitely known to have been operated in Canada was an old-style, Ewing instrument set up in the Physics Department of McGill University, According to a paper by C. H. McLeod and H. C. Callendar (" Our Record of Canadian Earthquakes," *Papers from the Department of Physics, McGill University*, Montreal, 1897) the first earthquake recorded by this equipment was that of March 23, 1897. Regular recording does not seem to have been attempted. No data are available today. There is some mention in early records of a " seismometer " operated at McGill previous to 1897 by Dr. Smallwood. The type of instrument is not known and no instrumental data have been preserved.

In 1897, an early-type, two-component, horizontal Milne seismograph was set up at Toronto. (In 1898 a similar pair of instruments was installed at Victoria, though this does not affect our present problem; nor do those of other types set up at Saskatoon and at Halifax, respectively, in 1915.) Recording and reporting of earthquakes as registered at Toronto began at once and were maintained regularly. In 1922, two horizontal-component Milne-Shaw seismographs replaced the earlier Milne instruments, both at Toronto and at Victoria.

In 1905, at the inception of the Dominion Observatory, Ottawa, the late Dr. Otto Klotz was in charge of the geophysical studies. A Bosch photograph seismograph (two horizontal components) was installed there soon

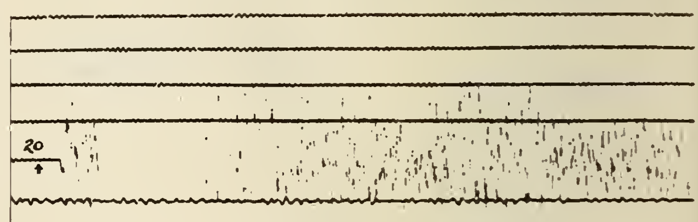

Fig. 1.—Seismograms of three major Canadian earthquakes. These seismograms show the relative amplitudes of the earlier registered phases of the earthquakes of 1925, 1935 and 1944 (St. Lawrence, Timiskaming and Cornwall). The records were all made on the same instrument (a Milne-Shaw seismograph). To compare relative intensities (at the foci), it is necessary to compensate for the reduction in amplitude due to distance from epicentre to station and for unequal scales used in the photographic reproduction. When these corrections are applied, it is found that the approximate relative intensities, at the foci, of the three shocks (St. Lawrence, Timiskaming, Cornwall) were, respectively, in the ratio—26:12:1. It is interesting to note that the ratio of estimated damage caused by these three quakes is—5:1:200.

afterwards. The first earthquake of any consequence to be recorded was the San Francisco shock of April 18, 1906. The Bosch was supplemented in March, 1912, by a Wiechert vertical (smoked-sheet) instrument. In 1922, two horizontal-component Milne-Shaws began operation; and in 1937 the Wiechert vertical was replaced by a modern photographic, short and long period, vertical Benioff. The present Ottawa instruments are the Milne-Shaw horizontals and the Benioff vertical, the Bosch horizontals having been moved to Halifax and the Wiechert vertical discontinued.

When the C.N.R. tunnel was being driven through Mount Royal, McGill University purchased and operated a single-component photographic Milne-Shaw seismograph. It was never used for regular seismological work, having been set up to determine the nature and magnitude of the disturbances caused by the tunnel. This instrument was purchased by the Dominion Observatory in 1925 and was installed, in 1927, at Seven Falls, Que. (about 7 miles north of Beaupré). At the same time, a Wood-Anderson, horizontal, torsion seismograph was installed at the same location and a similar Wood-Anderson was placed at Shawinigan Falls, Que. These two installations (vault, instruments, and services) were undertaken by the Shawinigan Water and Power Company and are still maintained by that organization. The work is under the direction of the Dominion Observatory and all seismograms are included in the records read and filed at Ottawa.

It thus appears that there has been a seismological service which would have recorded and noted any earthquakes of importance in the region with which we are concerned since 1897. The sensitivity of the equipment has been increased from time to time as has been noted. Since the installation of the Benioff vertical at Ottawa in June 1937, even relatively minor shocks, too small to be noted in the press, would be included in the reports. Installations of similar high class equipment at Burlington, Vt., Williamstown, Mass., Weston, Mass., and Harvard, Mass., permitted the formation of the North Eastern Seismological Association (NESA), which carries out special investigations leading to the detection and sometimes to the location by triangulation of the minor shocks in eastern Canada and New England. The records of this Association began to be published in June 1938 and are still being maintained.

The Record

The above-mentioned historical and seismological sources supply the basic data which must be used in any evaluation of earthquake hazards in eastern Canada. Let us select and examine, one by one, the reports of earthquakes of about magnitude V or greater on the Rossi-Forel scale[4] (the Cornwall earthquake would rank about VIII+). It may not be out of place to occasionally interject items reflecting what the reporters call "human interest" but, of necessity, most of the details must be limited to those which are later to be used in forming our conclusions. The total available earthquake records, within the above restrictions, are as follows:

1534—1536

There is mention in early records of an earthquake near Baie St. Paul, said to have occurred "between the two voyages of Jacques Cartier", which wrought noticeable changes in the topography. The name Les Eboulements was given by Cartier to a group of landslides caused by this earthquake,—a name still borne by a village in that vicinity. Tradition affirms that Isle-aux-Coudres, opposite the mouth of the river Gouffre (Baie St. Paul), was formed by these landslides, but this is not likely.

1663—Feb. 5

This was not one shock but a series of severe earthquakes, of which the first violent one occurred on Feb. 5. The epicentre was probably near Baie St. Paul, but the tremors were felt over a wide area. They are reported at length in the Jesuit Relations[1].

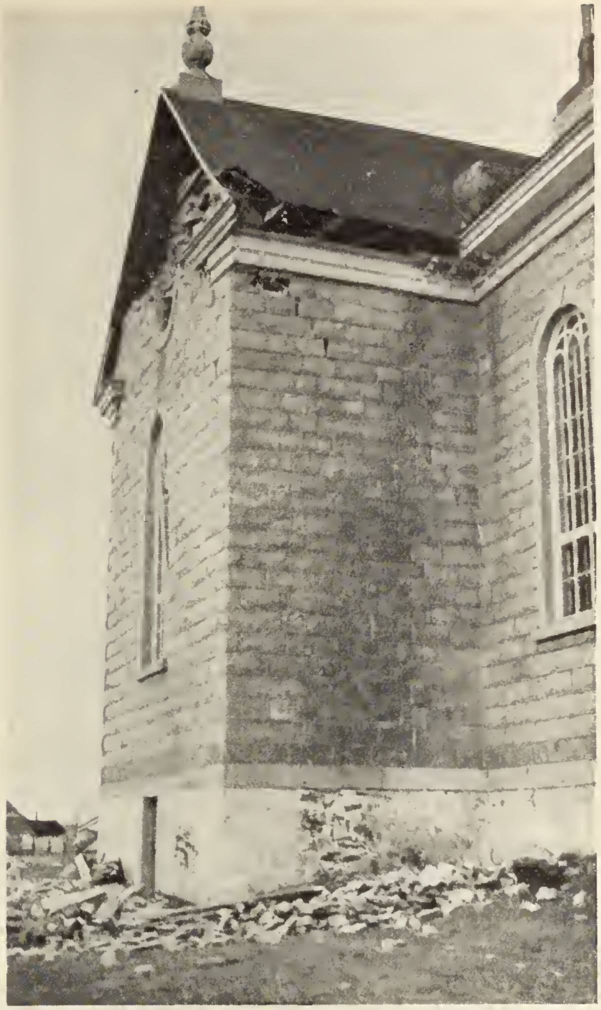

Fig. 2.—Rivière Ouelle church after the earthquake of February 28, 1925. This well constructed stone church stood on deep alluvium in the lowlands of Rivière Ouelle. It was jarred loose, stone from stone, so that it was necessary to tear it down and re-build.

We learn that: "An earthquake, extending over a region more than two hundred leagues in length and one hundred in breadth has shaken this whole country; mountains were swallowed up; forests were changed into great lakes; rivers disappeared; rocks were split and their fragments hurled to the tops of the tallest trees; etc." Mgr. Laflamme[3] comments: "Nous croyons qu'un bon nombre des faits rapportés à ce sujet par l'historien sont exagérés. L'épouvante est une mauvaise disposition d'esprit pour faire de bonnes observations scientifiques . . . Personne n'a été tué . . . Dans tous les cas, il est certain que les secousses ont été violentes et se sont répétées pendant plus de six mois, avec une intensité qui, *comme dans tous les tremblements de terre, a été diminuant jusqu'à la fin*." (The italics are our own.)

Several points are to be noted: Although a study of all accounts would lead to the conviction that the epicentre lay below Quebec[6], there are numerous stories[5] which show that landslides occurred at many places, notably in the valley of the St. Maurice. That river is said to have run white for three months, and other accounts say the St. Lawrence itself was "sulphurous" down to Tadoussac. A note in the Jesuit Relations says: "We noticed that in the more elevated places (which in that region are also invariably rocky) the motion was less than in the level country (which in that region is mostly deep alluvium)". (The brackets enclose our own interjected comments.) It is further to be noted that there were few structures which could have been damaged and that " personne n'a été tué ". Some heavy shocks were reported in 1664, 1665, and 1668, centered in the region of Baie St. Paul to Tadoussac. These were evidently aftershocks of the earthquake of 1663.

1732—Sept. 5

This earthquake seems to have had its epicentre near Montreal. Three hundred houses were damaged ③; many chimneys fell; people were hurt; one girl was killed; people slept in their gardens. " On fait des confessions générales de tous les côtés; les dames ont quitté leurs paniers (hoop skirts), les prêtres leur ont fait signer une promesse ".

(1755—Nov. 18)

Although it does not belong strictly in this category, mention should here be made of a very severe earthquake which occurred on this date. The epicentre was " on the Fundian fault ". Extensive damage was caused in Boston. The tremors were felt over a large area including the lower St. Lawrence region. Damage was confined to Boston and its vicinity.

(1777—April 14)

Another shock, not quite belonging in this list, is this earthquake reported from James Bay. It is said to have been severe, but details are lacking. It is entered in the records of the Hudson Bay Co. in London.

1784—Jan. 2 and Jan. 14

Mention is made in old records③ of severe shocks at Quebec on these dates, but details are lacking.

1791—Dec. 6

The epicentre of this severe earthquake again appears to have been near Baie St. Paul. It should be remembered that the early records are confined to reports of earthquakes in the lower St. Lawrence and up as far as Montreal, because these were the only sections of the country then regularly occupied by settlers. There may have been equally severe disturbances west of Montreal and Ottawa, (such as, for example, the Timiskaming shock of 1935), of which no mention is made, because of the then sparsely settled nature of the country, the absence of ready communication, and the fact that no written records seem to have been compiled in these upper reaches of the St. Lawrence watershed.

The earthquake of 1791 is reported by Abbé A. Mailloux in his " Histoire de l'Isle-aux-Coudres ", published in 1879. The account is quoted by Laflamme③. Among other observations the abbé says that shocks had been felt from time to time " for the past thirty years " in the vicinity of Isle-aux-Coudres. In the shock of 1791, chimneys were destroyed; people rushed from their houses; no one was killed; " une pauvre femme a perdu l'esprit par la peur et ayant été obligée de sortir nue de sa maison "; *the damage was worse in the stone houses than in the wooden ones;* one stone house was practically destroyed (The italics are ours.)

Some " vieillards " averred that severe earthquakes occurred in these regions every twenty-five years with a variation of one or two years, and that all arrived at the same time of the year within a month or two. Laflamme③ would correct this to " about every 40 years " but adds that such cyclic figures are *très incertaines.*

" L'abbé Gagnon prétendait avoir vu, à cette époque, une éruption volcanique dans les montagnes situées au nord-ouest de la Baie . . . Chose étrange . . . Or aucune d'elles n'avait vu la fumée ou les flammes volcaniques . . . Le digne abbé avait été le seul à faire cette observation . . . L'abbé aurait bien pu être victime d'une illusion d'optique ".

There is a belief, general among some of the residents of Baie St. Paul, that one of the mountains there is a relatively-recent volcano. Sir William Dawson② writes: " In a notice of the earthquake (of 1870 to be mentioned below) in *Sillimans Journal* (one of the oldest scientific journals in North America, now known as the *American Journal of Science*) for January, 1871, by Mr. A. C. Twining, the following statement occurs with reference to the intensity of the shocks at Baie St. Paul and Les Eboulements—' They are in general conformity to what has long been known to British geologists respecting the volcanic character of the region ' with some other remarks based on this strange statement, which has no foundation in fact ". (The entries in brackets are ours.)

While on this subject, mention may be made of the statements by sailors that, in the earthquake of 1663, there were great and strange lights in the sky and that showers of ashes fell on the decks of their vessels. These too must surely have been *des illusions d'optique.* Similar stories about strange lights and electrical phenomena, received at the time of the St. Lawrence earthquake of 1925, were investigated and found without any foundation in fact.

1796—Feb.

The exact date is not given② but the earthquake is reported to have been " violent ". Rocks fell from the cliffs at Niagara.

1816—Sept. 9

This was a moderately severe shock, apparently centered near Montreal②. Details are lacking. A second tremor, probably an aftershock since it was " less violent ", occurred on Sept. 16.

1831—May 7-8

A moderately severe shock was reported③ in *Le Canadien* as having occurred on this date with the epicentre near Baie St. Paul and Kamouraska. Chimneys were demolished and walls thrown down. Animals were terrified. Five aftershocks were felt.

1840—Sept. 10

Dawson② reports a violent shock at Hamilton on this date. Further details are lacking.

1842—Nov. 8-9

The same paper lists a severe earthquake at Montreal and Three Rivers with " agitation of the river ". Shocks are also reported at Montreal in 1844 and 1847 but exact dates and all details are lacking.

1860—Oct. 17

This earthquake was a major disturbance, probably comparable with that of 1925. The epicentre was near Rivière Ouelle. Aftershocks were reported from Les Eboulements. Dawson says: " It appears from published lists that the late earthquake is the last of at least twenty-nine that have visited Canada since its discovery by Europeans ". He argues that the focus must have been very deep as " the shock appears to have been nearly simultaneous throughout (eastern) Canada ". In reports from several different places, mention is made of the fact

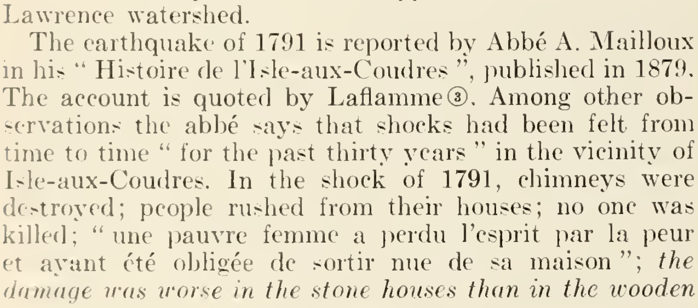

Fig. 3—Grain loading equipment on the banks of the St. Charles River at Quebec. This structure stands on deep, made ground. It is very top-heavy. At the time of the earthquake of 1925, the heavy superstructure of the distribution sheds (1,000 ft. long) swayed outward toward the river, but did not fall. The effect on the lower ends of the outer steel struts is shown in Figs. 4 and 5.

Fig. 4.—Base of steel strut supporting loading sheds at Quebec, shifted by the earthquake of February 28, 1925.

that the shocks were much more severe in low lying ground than on the rocky elevations, e.g. at Quebec and Montreal.

An anonymous correspondent, writing from Rivière Ouelle to a Quebec newspaper(7), states—" Jamais de mémoire de nos habitants, nous n'avons eu des coups aussi forts. Je suis demeuré devant mon horloge tout le temps pour m'assurer de sa durée, afin de pouvoir computer avec d'autres endroits la marche de ce grand et terrible phénomène ".

1864—April 20

This was a peculiar earthquake. No damage seems to have occurred at any point, but it was felt over a very great area in Quebec from Montreal to Rivière du Loup. Dawson(2) states: " Like other Canadian earthquakes it was felt almost simultaneously over a wide extent of country, indicating perhaps that its source was deep-seated, and the vibrations propagated almost vertically to the surface ". It was felt in Harvey Hill Mine at a depth of 180 ft.

(1864 ?)

In the *Saturday Evening Post,* May 25, 1929, Eugene Poole writes about an earthquake experienced in the Gatineau region north of Ottawa, which, though possibly rather weak to be included in this category, must be mentioned for a matter of considerable interest. He is writing a story of the life of the late Capt. Robert Dollar, founder of the famous line of steamships. He says: " He went on learning the woodman's trade and of those years he had stories to tell, but I have space for only one . . . he went with a gang of twelve men to haul provisions . . . it snowed all night . . . they were wakened by a slight earthquake . . . at first they were blinded by snow falling from the trees . . . then 'As it cleared we saw a grand, strange sight' . . . on the opposite mountainside they could follow the earth wave's course by the snow it shook from the trees . . . behind that long, sinuous, moving line the firs were green, in front they were white!"

1870—Oct. 20

This was probably the most severe earthquake Canada has experienced since 1663. Again, the epicentre was near Baie St. Paul. It is most interesting to read about this earthquake in old newspaper files at the Library of Parliament, Ottawa. On July 19, 1870, France declared war on Germany. The war news occupied the headlines and the front pages, then as now. But the earthquake of 1870 got front page and often headline space, as did the Cornwall earthquake of 1944 under similar news conditions.

The earthquake was felt from the Atlantic to western Ontario. It was reported from New York city. All movable objects were displaced at Baie St. Paul; stoves were overset; chimneys were demolished; some persons were injured; those who were outdoors were terrified by the " convulsions of the earth "; aftershocks continued to December 15 (when the notes were written); cracks opened in the earth at Baie St. Paul emitting water and sand; at Les Eboulements " les arbres d'un verger ont été renversés et complètement détruits " (evidently by a landslide).

Some important comments by Dawson must suffice for even this severe earthquake. He writes " In several places it is noticed that the shock was much more severe on sandy or loose ground than on solid rock "; and again " Other correspondents mention the opening of chasms in the ground from which streams of water and sand burst forth. This phenomenon arises from the landslips produced in the terraces of post-Pliocene clay, which in that part of the country rest against the steep sides of the Laurentian hills. These are ready to slide downward with any slight movement of the earth and to press the water out of the sandy layers associated with them, or give outlet to hidden springs and streams ". He adds also "A mass of rock 400 feet in length fell from the face of the cliff at Cape Trinity in the Saguenay "; and finally " The earthquake extended over 25 degrees of longitude from the Bay of Fundy westward and over at least 12 degrees of latitude from the north shore of the St. Lawrence southward. Its extension to the northward is not known ".

Shocks with approximately the same epicentre but relatively feeble and evidently aftershocks of the above earthquake were reported in 1871 and again in 1874.

1913—1914

Two earthquakes of about intensity V were investigated in the field by the late Dr. Klotz. The first, on April 28, 1913, was located near Iroquois, Ont.; the second, on February 10, 1914, had its epicentre near Labelle, Que. The accounts were printed in the *Publications of the Dominion Observatory*, the first in Vol. I., No. 1, the second in Vol. I, No. 5.

Other shocks of about intensity V or greater on the

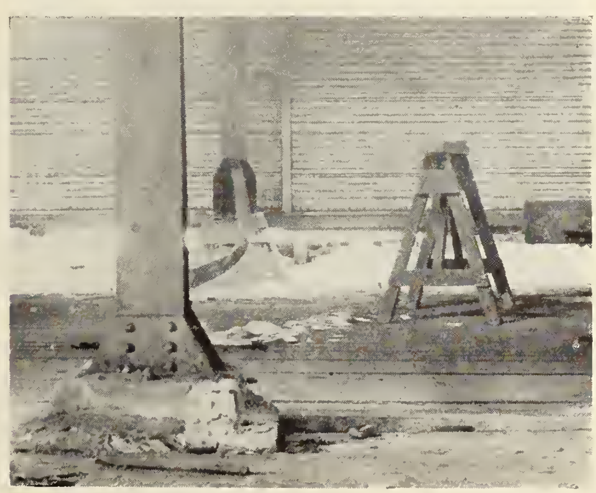

Fig. 5—Back brace at base of loading shed strut, bent by shift of the base of the strut, due to earthquake of 1925.

Rossi-Forel scale were reported from time to time in eastern Canada in the interval 1870-1925. Such reports deal with shocks in 1877, 1880, 1885, 1887, 1893, 1894, 1897, 1898, 1902, 1904, 1906, 1907, 1910, and 1924. The earthquake of 1897 (March 23) and that of 1904 (March 21) were each felt over about 300,000 square miles in eastern Canada and New England. But it was not until February 28, 1925, that the next really major shock occurred.

1925—Feb. 28

This earthquake was investigated in the field by the author, both immediately after the disturbance (when the ground was deeply covered with snow) and later in the spring and summer—six trips in all, each averaging about two weeks. To go into details is out of the question. To summarize the points of special interest to this investigation, we may note the following:

(a) The epicentre was found to be near the mouth of Rivière Ouelle, across the St. Lawrence from Baie St. Paul, Les Eboulements and Murray Bay.
(b) Damage in the epicentral region was decidedly greater on deep alluvium than on rock elevatons.
(c) On deep alluvium in the vicinity of the epicentre all chimneys were destroyed and all stone buildings were wrecked but frame buildings were very little damaged.
(d) Damage at Quebec city was confined to "lower town".
(e) Serious damage occurred at Three Rivers and at Shawinigan Falls, more than 200 miles in an airline to the west, though the seismograms furnish irrefutable evidence that there was only one epicentre.
(f) Aftershocks continued to be reported for several years. None was very severe. They diminished gradually in intensity and occurred at increasingly greater intervals.

Fig. 6.—Earth crack, Rivière Ouelle. This crack is shown some months after the earthquake of February 28, 1925. The crack is in deep alluvium. It runs parallel to Rivière Ouelle, some fifty yards back and beyond the slight flood escarpment. The width of the crack is indicated by a shoe.

1929—Aug. 12

An earthquake occurred on this date with its epicentre at Attica, N.Y., about 20 miles east of Buffalo. It was investigated in the field by U.S. observers (7), The intensity was assigned as between VIII and IX.

(1929—Nov. 18)

This earthquake, like that of 1755, does not properly come in this category, but should perhaps be mentioned since it presents another phase of our problem. The epicentre lay about 300 miles south of Newfoundland. The shock broke 12 of the 21 trans-Atlantic cables over an area some 200 miles long and almost as wide. But the point we need to note is that it caused a tidal wave, which, sweeping into the funnel-shaped Placentia bay on the south coast of Newfoundland, rose to a height of 30 ft. and inundated several villages, drowning 30 persons.

Now, the Gulf of St. Lawrence is also funnel-shaped and there have been several records (e.g. Nov. 5, 1884) of tidal waves which entered the Gulf and rose to considerable heights as they swept up the river. It is possible that a severe earthquake off the continental shelf just south of Newfoundland, or even in the St. Lawrence river itself, might cause a tidal wave which would seriously affect buildings on made ground close to the river, a type of structure to which reference will again be made.

It is interesting to note, in connection with this earthquake, with an epicentre nearly 900 miles from Ottawa, that it was detected by a lady living in Ottawa, who reported the tremors to the Observatory, by telephone, while they were still registering on the seismograph. This constitutes a record in our experience for personal (non-instrumental) detection of a major earthquake at a distance.

1935—Nov. 1

This earthquake was much more severe than the damage would indicate, although its epicentre was only about two miles from the town of Timiskaming, Que. It was felt over all eastern Canada, west to Duluth and south to Virginia. The focus was deep. The nearest towns of any size, besides Timiskaming, are Mattawa and North Bay, each about 40 miles distant. The shocks occurred so directly beneath Timiskaming that the chimneys were disintegrated but did not fall. No one was injured; several lakes, which had been quite clear, turned white at the time of the earthquake; there were so few man-made structures other than frame cabins in the general epicentral region, with the exception of Timiskaming itself, that it was difficult to determine the relative disturbance of adjacent points. Timiskaming is a "Company town" built and maintained by the rayon mills. The houses are well constructed and kept in good repair. In view of the intensity of the shock as shown by the seismograms, the town of Timiskaming is an excellent argument for simple honest workmanship, with good materials, on level solid ground, as an adequate precaution against earthquakes for the householder.

In spite of the relatively small damage at Timiskaming, many chimneys were thrown down at North Bay and Mattawa; some damage was done even at Ottawa (185 miles away in direct line); and about 200 ft. of a railway embankment, undermined by a stream at its base, slid out at Parent, Que., more than 200 miles distant from the epicentre.

1944—Sept. 5

There were other minor shocks in eastern Canada between the Timiskaming earthquake and the one at Corn-

Fig. 7.—Rotation effect on monument. This rotation in a monument in a graveyard beside Rivière Ouelle church was caused by the earthquake of 1925. This is typical of rotations in epicentral regions where the soil is deep. This one happened to be contra-clockwise. Most of the rotations on the south shore caused by this earthquake were in this sense, the ones on the north shore turning clockwise as a rule. (This rule was exactly reversed in the case of the Cornwall-Massena earthquake of 1944.) Practically every stone in every graveyard in the epicentral region was either rotated or overthrown.

wall but none was severe. Probably none could have been assigned a rating as high as V on the Rossi-Forel scale. The Cornwall quake was investigated in the field. A preliminary report is now in the hands of the printers and a complete analysis of data is being undertaken at the Dominion Observatory. This will, no doubt, be published at a later date.

The outstanding facts about the Cornwall earthquake which we should consider are as follows: Although the shock was certainly less severe than those of 1925 and 1935 the damage was very much greater. It is estimated as $1,000,000 at Cornwall and as much at Massena, N.Y. The author believes these figures are a bit high but is impressed by the convictions of those who are better qualified than himself to form an estimate and who are in a position to know more of the details. Whatever be the amount, we can all agree it was serious. Fortunately, no one was killed; only one or two are reported to have been injured, and these only slightly.

The second fact of importance is that the damage occurred in a very " spotty " pattern and the areas of greatest damage were definitely those places with a deep or sandy subsoil. Points in Cornwall itself, less than two miles apart but differing in the nature of the subsoil, showed differences in damage that have to be seen to be fully appreciated.

Analyzing the Evidence

So we come to the end of a very much abridged but reasonably adequate outline of the data on which must be based any estimate of industrial earthquake hazards in eastern Canada. It will, perhaps, simplify the analysis to consider the outstanding points of interest in a series of short topical paragraphs, after which it may be possible to present a brief outline of the conclusions deduced.

Is the Rossi-Forel scale④ a satisfactory measure of relative seismic intensity?

The answer is the classic " Yes, and no "; perhaps the author would prefer " no, and y-e-s ".

The earthquakes of 1663, 1732, 1791, 1860, 1870, 1925, and 1935 would each be classed as intensity IX or X according to the Rossi-Forel scale; but, evidently, they were not equally severe. If we were to compare the seismological records of a number of earthquakes in one of the lower grades, which would be given the same intensity factor under the rulings of the scale, we should probably find they would prove to differ greatly in intensity, since we would be considering the energy released at the focus. The deeper the focus, the less the epicentral energy for a given shock.

Moreover, the destruction, which is used largely in the scale as an index, depends on so very many factors: the nature of the ground; the amount of construction in the region; the design of the buildings; the quality, workmanship, and state of repair. The psychological factors are even more dependent on circumstances which are not constant from place to place or time to time, whether we speak of the psychology of those investigated or that of the investigator himself.

However, in working out the distribution of surface seismic energy in an epicentral region for a single given earthquake, the scale is useful as a means of reducing to a number the investigator's own evaluation of the relative conditions from point to point.

It is useful also as a rough index of energy, though the author would prefer to say *weak, medium, strong* and *very strong*. In any case, it should clearly be borne in mind that a Rossi-Forel scale assignment is far from a precise indication of seismic energy.

Are Canadian earthquakes caused by volcanic activity?

Absolutely not, although tradition to that effect is very strong in some places. They are believed to be caused by the readjustment of the earth, slowly recovering from the ice age conditions. Nearly a mile depth of ice was once piled on eastern Canada. Lying there for centuries, the upper layers of the earth's surface were forced down and adjustments took place at depth. After the ice melted, the ground began to rise. It is still rising slowly as is evidenced, around Hudson Bay and Labrador, by old wharves now some distance inland. It is said that the Atlantic coast is

Fig. 8.—The Parent, Que., slide, This slide occurred on the railway near Parent, Que., at the time of the Timiskaming earthquake of November 1. 1935. It is more than 200 miles away from the epicentre.

rising at the rate of about three inches a century. This imposes strains on the rocky strata in eastern Canada. When the strain exceeds the strength of the rock, the latter yields with a sudden release of great energy, and we have an earthquake. Such, at least, is the present accepted theory, which may be taken for what it is worth. In any event, there is no need to worry about a volcanic eruption complicating an earthquake in these regions.

Are aftershocks a menace?

When an investigation of the Timiskaming earthquake was being made, and again in the case of the Cornwall earthquake, the aftershocks were a source of considerable anxiety to many people. Some even went so far as to follow the example of the people of Montreal in the earthquake of 1732—they slept in their gardens. Several people near Kipawa contracted serious colds from sleeping in the open. The author was asked by the mayor of Timiskaming to issue a signed proclamation which was posted on the town hall bulletin board, to the effect that aftershocks were to be expected and would continue with irregularly diminishing strength at increasingly longer intervals for some months, none being likely to be comparable in intensity with the main shock. At Cornwall the mayor asked for a similar assurance, which was printed in the newspapers both in Cornwall and in Massena. We are told that the statements were most useful. At Timiskaming, many were preparing to leave their employment and going elsewhere to live. In the light of the evidence given in this paper, the reassuring statements were quite justified.

In the Cornwall notice, a rider was added, to the effect that broken chimneys should be taken down so that they might not fall during the aftershocks and injure someone. Also, the people were urged to carefully inspect the chimneys, in the walls as well as above the roof, and make complete repairs if any cracks were found. Finally, they were warned of the fire hazard, if stoves and furnaces were used before repairing the chimney. One case was noticed where smoke was rising from a chimney cut off at roof level on a frame house with wooden shingles.

This brings up a point to be remembered by householders and watchmen of large buildings. As soon as the tremors of a large earthquake cease, immediate steps should be taken to see that there is no danger of fire. It is remarkable that no fires were caused by any of the three earthquakes, 1925, 1935, or 1944, although in 1925, for example, many coal-oil lamps and stoves were upset in dry-as-tinder frame houses.

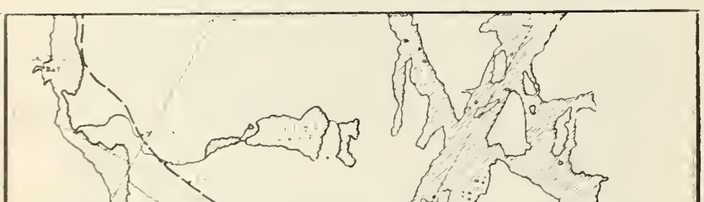

Fig. 9.—Map of the epicentral region of the Timiskaming earthquake of November 1, 1935. Note the positions of the mile posts on the railway from Kipawa to Dozois. At each post there were spare rails weighing over 900 lbs. each and resting on firm level supports. They shifted in toward a central point due to inertia, thus indicating the position of the epicentre.

Is any one part of the St. Lawrence watershed more likely to suffer a serious earthquake than another?

At first sight, after reading the records of the past, one is likely to nominate the lower St. Lawrence as more seismic than any other region. But we must consider the following facts.

(a) Nearly all our data, up to 1860 and 1870, are obtained from records written by the clergy. They deal with earthquakes in or near Quebec or Montreal, since it was in these places that the historians lived.

(b) Since seismological network services have been available—say since 1906, there have been only three major earthquakes. Our seismograms prove that there were no others, even in uninhabited sections. The one in 1925 was centered near Rivière Ouelle, it is true, but the 1935 quake occurred at Timiskaming on the upper Ottawa and that of 1944 at Cornwall on the upper St. Lawrence. The Timiskaming shock was strongly felt in the region of Montreal and also in Quebec. Is it not more than likely that some of the minor tremors recorded in Montreal and Quebec in those early years originated at epicentres west of Montreal and were caused by major disturbances? For example, consider the earthquakes of 1864, 1897 and 1904. These were felt "over 300,000 square miles," yet no epicentre was assigned. Had there been a seismograph network in service, the epicentre would have been located, probably west of Montreal.

(c) One of the outstanding lessons taught the seismologists by years of experience is that no place may be designated as certainly free from the danger of becoming an earthquake epicentre. Since 1925, major earthquakes have occurred at Timiskaming, Baffin Bay (four in all), and Montana (two), not one of which places would have been considered seismic in the light of all previous known seismic history. Going farther back, the earthquakes of New Madrid (Mississippi valley in southern Missouri and western Tennessee and Kentucky) in 1811 and Charleston in 1886 occurred in strictly "non-seismic" regions.

So, we conclude that, while the evidence available points to the lower St. Lawrence as our most seismic region, our sources of data are *very* heavily weighted in that direction. Indeed, the point raised in section (b) above, leads one to believe that this apparent distribution of seismicity is probably far from the truth. We might have an earthquake anywhere in the territory under consideration.

Will there be further major earthquakes in eastern Canada?

Practically speaking the answer is *certainly*.

When will the next major earthquake likely take place?

Let the reply be given in the words of Mark Twain. "I was gratified," he said, "to be able to answer promptly, and I did. I said that I did not know."

Let us note again the observation of Mgr. Laflamme in speaking of the possible cyclic occurrence of earthquakes as deduced by the "vieillards" in 1791. They averred that the major shocks recurred in close to twenty-five years. Laflamme says: "A ce propos, nous nous permettrons d'ajouter que depuis 1791, les paroxismes séismiques semblent se répéter plutôt tous les quarante ans ou à peu près. Si cette règle était vraie, nous devrions nous attendre à avoir des perturbations plus violentes que celles de tous les jours vers 1911. On peut cependant en douter, car ces répétitions périodiques, à dates précises, sont toujours très incertaines."

Why are the major earthquakes in Canada felt over such wide areas?

In speaking of several Canadian earthquakes Dr. Dawson[2] remarks that they must have occurred at a considerable depth " as they were reported almost simultaneously at widely separated places." It is doubtful whether his time data were even approximately accurate enough to permit such a deduction, which was probably suggested to his mind by earlier writings of the French seismologist, Alexis Perry, whom he quotes directly in his report on the earthquake of 1860.

Seismological records can now be used to determine, at least approximately, the depth of focus of major Canadian shocks. They are found to be at depths of ten miles and more. It is for this reason, coupled, of course, with their intrinsic intensity, that they are felt so widely.

This depth of focus is a contributing factor toward the earthquakes causing serious damage at distances of over 200 miles, as was the case in the 1925 earthquake, with serious damage at Shawinigan Falls, and in the 1935 shock which set off the embankment slide near Parent. It is a combination of strong, deep-seated disturbance with treacherous soil conditions, the latter being found at so many places in eastern Canada.

In no Canadian earthquake has there been any authenticated evidence of rock faulting at the surface. In every case, cracks in the ground have been caused by slippage of deep soil masses toward their unconfined boundaries, as is explained by Dr. Dawson, whose opinion is quoted in our report of the earthquake of 1870. The deep deposits of marine clays over much of the St. Lawrence lowlands present a hazard, even without the earthquakes. Earth slides are of two kinds [illegible]. In the first, very solid masses of clay, quite impervious to moisture but resting on sloping rock surfaces, are liable to slip toward their unconfined boundaries during a rainy season. Such a slide occurred at Poupore on the upper Lièvre river on October 11, 1903. A mass of clay, having a superficial area of about 100 acres, being roughly triangular, 600 yards long on the side next the river and having a depth inland of 800 yards, slipped bodily into and across the river. It carried with it a farmhouse with trees and a well for a distance of 150 ft. The well was not drained. In 1908 another slide on this same river caused the death of 33 people at Notre Dame de la Salette. There are many other cases which could be mentioned of this first type of slide.

In the second type, the clay is laminated — being composed of alternate layers of fine silt and coarser sand. This type of ground, when wet, flows like a liquid. A slide of this type occurred near Shawinigan Falls in the fall of 1924. A section of a farm 900 ft. long, 400 ft. wide and 40 ft. deep flowed out overnight into a ravine leading to the St. Maurice river. It was erroneously reported that this slide was caused by the earthquake of February 28, 1925. However, one can readily understand how much damage could be caused, were a strong, deep-seated earthquake to occur when the ground was very wet or even in the winter after a very wet fall. It would be interesting to know the weather condition in the fall of 1662, since there were so many slides associated with the 1663 earthquake.

Might an earthquake in Canada be catastrophic?

It might indeed, for the reasons we shall now outline, but the measures which ought to be taken to guard against the possibility require only relatively simple care and planning.

In 1932, John R. Freeman, an outstanding authority on insurance, completed a book " Earthquake Damage and Earthquake Insurance "(7). It is practically an encyclopedia of information on the subject indicated. Not only was the author extremely capable and painstaking but he had a unique opportunity to obtain authoritative information. On page 663 of this book he tabulates (in 1932) the total damage expressed as loss in dollars due to earthquakes (exclusive of fires caused thereby) in Canada and the United States during the preceding 100 years. He might as well have said since the time of the discovery of America. His total was $40,000,000. His book was published in 1932, as has already been twice remarked. On March 11, 1933, an earthquake occurred at Long Beach in which the damage was estimated as $50,000,000. The Cornwall earthquake damage (a grade VIII+ shock) is estimated at $2,000,000. Freeman's estimate of the damage caused by the St. Lawrence earthquake of 1925 is $100,000. The damage due to the Timiskaming earthquake would probably be less than $20,000.

Fig. 10.—Rock fall on edge of Lake Kipawa. This gives a good idea of the reason why epicentres are difficult to locate in wild country. It could not be determined whether this rock fell at the time of the earthquake; or, assuming that it did, whether [illegible] great or little energy was required to dislodge it.

To be sure, estimates are extremely elastic numbers, as is pointed out by the author in discussing the damage due to the Cornwall earthquake(6). But the fact remains that a serious earthquake occurring in eastern Canada today might cause incalculably greater damage than it could have caused fifty years and more ago.

So far as records show, only one person has lost his life as a direct result of Canadian earthquakes. In the account of the Montreal earthquake of September 5, 1732, we read: " one girl was killed ". But what would have been the case in Cornwall if the earthquake had occurred during school hours. That calamity, which did not occur simply because of the timing (12:38 a.m.), could have been avoided by a comparatively simple precaution which should be taken in the construction of all public buildings—leave no walls which cannot resist horizontal forces.

In the *Engineering News-Record* for September 21, 1944, an editorial reads: " The picture of roof parapet and cornice masonry piled across the entrance to the Cornwall, Ont., school, has a startling resemblance to those published following the Long Beach, Cal., quake in 1933 . . . . . *If design changes to make structures reasonably resistant to earthquakes were either extensive or expensive there would be more excuse for the existing situation.*" (The italics are our own.) The entire editorial is worth reading and should be read by all persons responsible for making reasonably adequate provision to meet earthquake hazards in eastern Canada.

Are Canadian earthquakes a menace to electrical installations?

So far as could be learned, with the exception of broken wiring which blew fuses and shut off lights and motors in a few cases, no marked damage has resulted to any hydroelectric generators, transformer stations, or running electrical machinery. At Timiskaming the lights of the town went out because a control relay was tripped. In Massena the aligning bolts of a very massive fly-wheel of a motor-generator set were sheared off and the shaft thrown out of alignment, but the equipment was not operating at the time and no damage resulted. This particular installation was on deep soil.

It seems reasonable to conclude that no earthquake damage would result to any equipment, such as a hydroelectric installation, in which the powerhouse, dam, etc., are of reinforced concrete and set on rock. However, there is a possibility that wing dams not based on rock and unreinforced earth dykes for restricting flooded areas might be damaged by such earthquakes as are to be expected in eastern Canada.

There is plenty of evidence that top-heavy structures built on deep alluvium or, worse still, on made ground built up behind pilings at the edge of a river are susceptible of serious damage even at quite considerable distances from an epicentre. Care should be taken to avoid these conditions wherever possible, in spite of greater expense or difficulty in locating and designing installations of this kind. Some thought should be given in such locations to the possibility of a tidal wave as has already been mentioned.

Elevated water tanks or heavy transformers should not be built with their supports tied into the walls of buildings. Steel frames with brick filler walls are also damaged very readily by earthquakes. A very good example of the steel frame, brick filler walls type of damage was found in the Palais station, Quebec city, and also in a large mill building in Shawinigan Falls, at the time of the St. Lawrence earthquake of 1925.

Fig. 11—Mushroomed chimney at Massena, N.Y. This chimney was damaged by the earthquake of September 5, 1944. When a building is very close to the epicentre of an earthquake of which the focus is deep, the chimneys are disintegrated by the almost-vertical shocks. The bricks are loosened but do not fall. It is an excellent sign that one is close to an epicentre.

Is there any danger of being "swallowed up" during an earthquake?

On any solid ground, on level alluvium, or on rock there is no danger whatever. On sloping ground, or ground having a deep depression (river, lake, or ravine) at one side, there is some possibility. In the Poupore slide of which mention is made elsewhere, several cattle were engulfed in cracks which opened and closed again. Such conditions are far from general, however. If one is on a deep clay bank it is well to get on to more solid ground as quickly as possible. In general there is no such danger in any Canadian earthquake.

What single factor is the most important in determining the distribution of destructiveness in an epicentral region?

By all means,—the nature of the terrain. Even in the most severe Canadian earthquakes of which we have any authentic information, the damage is very much greater on deep alluvium, on made ground, on fairly deep soil on a sloping base of rock or clay, or in places where there is a relief to one side of the point in question as in the case of a river, lake, or ravine.

In all the earthquakes studied, the damage to buildings on rocky terrain, even in the epicentral region, was practically nil. In buildings on deep soil, in the epicentral region, even relatively minor shocks are liable to cause damage to poorly constructed brick and stone buildings, chimneys, etc.

Conclusions

In view of the seismic history of the St. Lawrence watershed outlined above, it must be concluded that major earthquakes take place in that region at intervals which are quite irregular; but at least eight to ten have occurred in less than 300 years. The evidence, when carefully considered, must be interpreted as indicating that these disturbances are not confined to any particular part of the watershed.

The earthquakes are invariably deep-seated and are felt over wide areas. There have been no instances of surface displacement in exposed rock strata. Due to the fairly widespread regions of deep alluvium, with the variable contributing factor of moisture, landslides take place even when no earthquake occurs. In the case of severe shocks, slides are often set off at considerable distances from the epicentres and damage results to buildings erected on such unstable terrain. Buildings for industrial installations, schools, etc., should be erected on solid level ground or on rock wherever possible.

Top-heavy structures, on made ground close to a river, are particularly liable to damage and should be avoided. Care should be taken, in designing structures, to shun unanchored parapets and cornices, brick filler walls in steel framed buildings, earth dykes without reinforcement, wing dams not anchored to rock, uncoupled supports for bearings of long rotating shafts in high speed, heavy machinery.

There seems to be no need to adopt full seismic construction, as developed for example in Japan and California, *except for structures which must be erected on unstable terrain.* In such unavoidable conditions, it is estimated that adequate protection can be achieved at a cost of about ten per cent above normal approved construction for the type of building involved.

For the rest, honest workmanship, with good materials, using the designs approved in existant building regulations for the structures contemplated, would appear to meet all reasonable needs. However, schools and other public buildings should be more carefully designed, making full use of the lessons learned, for example in the Long Beach earthquake. To again quote, such precautions are not either "extensive or expensive".

It is hoped that the examination of seismic conditions as outlined in this paper may convince all responsible for extensive construction in the St. Lawrence watershed that industrial earthquake hazards do exist in eastern Canada, will present sufficient data to permit an estimate of their magnitude under any given set of conditions and will serve to assure all concerned that the reasonable precautions to be taken are both necessary and simple.

④ Rossi-Forel Scale of Earthquake Intensities:

I. Microseismic shock: Recorded by a single seismograph or seismographs of the same model, but not by several seismographs of different kinds: the shock felt by an experienced observer.
II. Extremely feeble shock: Recorded by several seismographs of different kinds: felt by a small number of persons at rest.
III. Very feeble shock: Felt by several persons at rest; strong enough for the direction or duration to be appreciable.
IV. Feeble shock: Felt by persons in motion; disturbance of movable objects, doors, windows; cracking of ceilings.
V. Shock of moderate intensity: Felt generally by everyone; disturbance of furniture, beds, etc.; ringing of bells.
VI. Fairly strong shock: General awakening of those asleep; general ringing of bells; oscillation of chandeliers; stopping of clocks; visible agitation of trees and shrubs; some startled persons leaving their dwellings.
VII. Strong shock: Overthrow of movable objects; fall of plaster; ringing of church bells; general panic without damage to buildings.
VIII. Very strong shock: Fall of chimneys; cracks in the walls of buildings.
IX. Extremely strong shock: Partial or total destruction of some buildings.
X. Shock of extreme intensity: Great disaster; disturbance of the strata; fissures in the ground; rock falls from mountains.

THE ENGINEER AND HIS RELATION TO HUMAN PROGRESS

A. P. YOUNG, O.B.E.
Chairman, Confederation of Management Associations of Great Britain

Address delivered before the Junior Section of the Montreal Branch of The Engineering Institute of Canada on April 8th, 1946

Before I begin to speak on the subject of my address, I think it is right that you should have a short pen picture of what I am, to supplement the words that I understand have been put on the notice cards inviting you to come to this meeting. Briefly, I have spent over forty years of my life in the electrical manufacturing industry and I was privileged during the whole of that period to work with one of the leading electrical manufacturing concerns in Great Britain and, indeed, in the whole world, the British Thompson-Houston Company. I started with that company when it employed only 260 people and finished my industrial career as such just over a year ago, when the number of employees had expanded to 30,000.

During the whole of that period, I expanded with it and perhaps took a hand in bringing about the expansion to which I have referred. The fact is that for the first twenty years of my industrial career I devoted my thoughts and energies to such design, to inventions, to a consideration of the physical forces and things that come within the sphere of the engineering world; and then when halfway through my career I was given the job, very suddenly, of controlling a factory, and I stepped forward from that point, nearly twenty-five years ago, along the path of industrial management, controlling factories that grew in size and complexity and I found that, quite inevitably, my thinking and energies were more and more absorbed by the human problems involved. The purely technical, mechanistic aspects of my responsibilities moved away from me to be dealt with by the appropriate members of the managerial departments, and finally I reached the stage in pondering these human intangible problems, as I had to, of concluding that if we are going to have a better world at all we have to rely more fully than ever before on education; we have got to view education as being the key that will open the door leading to that better world, and if we are going to use the key aright we shall have to view education in a much broader and deeper way than ever before, and forge new and improved educational implements and techniques to enable us to use the key in the right way. That is just a prelude to what I am going to say to you now.

The engineering era is something relatively new in human affairs. By that I mean that it is very young, roughly 200 years old, and it has evolved very much in step and in phase with the so-called scientific era; but I think it is right and wise that we should get our time perspective clearly, by appreciating the fact that 200 years, whilst it is a long time in relation to the individual, is but a speck on the time chart measuring human evolution on this planet.

Sir James Jeans, one of our greatest astronomers in Great Britain, put the life of the human family at at least

300,000 years, so that if we draw a line representing 300,000 years and put on that line a mark measuring the period of recorded history, roughly 6,000 years, and then a very fine line at the end for 200 years, we obtain a time perspective. I believe it is very helpful to do that in these troublous days because, from a proper time perspective, you have a better chance of developing the right attitude of mind toward the problems that are now welling up for solution.

It is always to me an encouraging, stimulating thought that our progenitors have been struggling and living, loving and hating, and doing all the things that have taken place on this planet for something like 300,000 years, battling with the tremendous forces of nature, concerned primarily with the fundamental struggle to secure food, shelter and clothing. It is an interesting reflection that even in the 20th Century we are again being brought face to face with those fundamental and primordial needs of mankind, especially the first one named, when at this very moment there is a food shortage pressing hard on the world. It was estimated by Sir John Orr many years ago that if we were going to feed the world's population in a right and proper way it would be necessary to nourish fully their bodies and minds and we would have to double the world's agricultural output, and that is roughly the position now.

Yet, during the whole of that time the human family went on and on and on, and I often ask myself why it did so. I submit that it did so for one reason only and that reason is that within the heart and within the soul of man there is something greater than the physical and mental attributes of man himself, that intangible something from God which we call the human spirit, that spirit which in Great Britain in those terrible months of 1940 flamed up to exalted heights such as we had never seen there before and which we are now struggling to recapture in the more prolonged battle to win the peace, the spirit that welled up and infused something into those people that you could not express on paper nor by means of an equation, but that intangible something which in the months of 1940 enabled us within that period to determine the defeat of Nazism.

We have reached a stage where the term "engineering" is now used to designate the activities of anyone who has applied scientific thinking and methods at any stage of the productive cycle, embracing as it does, research, design, planning, sales and distribution and one might even go so far as to say that the term is used to designate the scientific method and approach to any problem in any sphere of human endeavour. It is in this broad and deep sense that I am attempting to visualize the engineer and his relation to human progress, which necessarily involves his influence on and responsibility for human and social well-being.

As a result of the recent developments in the science of electronics and the new sea of wonder and bewilderment revealed by the atomic structure, the engineer now holds the key opening the door to an age of plenty that staggers the imagination. Whether we use the key aright depends not on the rate of scientific development or advancement in the realms of purely material forces and things but upon our ability to serve humanity, upon our ability to solve the predominant problems of human relationships, upon our skill in achieving a unity of purpose and outlook throughout the whole human family concerning economic and social values, upon the success we achieve through education in creating a co-operative world order in which individual nations and groups are prepared to sublimate their localized loyalties to a higher loyalty, which is the common good of humanity as a whole.

Brotherhood has been reverberating through the ages for nearly 2,000 years. It is the cornerstone of Christian faith and we are now face to face with this great issue, whether we like it or not. It is no longer an idealistic vision of a distant tomorrow. Very decisively we should implement this conception in all our plans, political, economic, educational or religious, through international co-operation, or most surely we shall crash into the abyss. There must be one world, one family, and we either learn to live together as one family or we cannot live at all.

Truly the engineering mind has precipitated this crisis in world affairs which has its roots in the ever rising curve of human productivity, the rate at which the individual aided by science, energy and machines is able to produce goods and services. The engineer is not to be blamed On the contrary it is up to all of us to see that he is proclaimed as a benefactor and, when I say all of us, I include the vast team of engineers who, because of their trained qualities of mind and the honesty of purpose that naturally arises from their calling and from their close association with nature's storehouse of materials and forces, they have an opportunity to exert a profound influence on this struggle which they must see with faith and confidence.

There are encouraging signs all to the good that the research teams in the realms of electronics are at last aroused to the dangerous use of some of their discoveries, such as the recent spectacular outcome of the use of atomic power in its relation to human life. It is indeed a pity that scientific workers everywhere did not concern themselves earlier, more critically, with the human element. Rousseau gave a clarion call nearly 200 years ago when he said "Science without morality is a curse". How has all this happened? And why the startling rapidity of the change? The power-driven machine, the proud handiwork of the engineer.

The stream of power-driven machines devised to serve human needs and ease the physical and mental burdens of living is ever widening. The machines themselves are with astonishing rapidity becoming more complex, more wonderful and capable of serving our needs in ways that were undreamed of thirty years ago. Within the lifetime of most of us here we have seen a procession of such machines which by themselves have initiated the greatest social revolution in world history, the internal combustion engine, radio, television, airplanes flown from Canada to Great Britain in just over five hours.

Two of the machines just mentioned are the most wonderful of all, the radio machine and the television machine. They virtually extend man's fundamental senses of speech, sight and hearing so that they can encompass the globe. The world is now compressed into a very small space by the onrushing scientific mind and the 2,000,000,000 humans are thus brought together in an economic, human and social sense, like unto the few hundred people living in a village community in England a century ago.

The cardinal problem overshadowing all of us now is to rebuild the whole house of human relationships to conform with the new conditions of living that have with startling suddenness been forced upon us by the scientific mind, intelligence motivating the thinking and acting of the engineer. One could say that a new kind of human engineering is needed, the engineering of the intangibles and imponderables, an engineering based on philosophy and religion, an engineering which builds lives on the principle of the law of Divine Love, the most practical and dynamic principle in human relationships, an engineering which gives practical expression in all forms of group life, plus group leadership, to the eternal truth that we are members one of another.

While the world in the human and social sense has been steadily compressed by the growing impact of scientific forces, the world of industry has been growing in stature, complexity and strength until it finally has become the dynamic centre of national life. What do I mean by the world of industry? I want to make myself perfectly clear. When I speak of the world of industry I am visualizing a world in which the bulk of the working people everywhere spend the bulk of their wakeful time doing four things.

In one division you have millions of people growing things, the worldwide agricultural industry. In another division you have millions of people mining things. In the third division you have millions of people making things, under the mechanized factory system of production. In the fourth division we have the workers who are moving things, transporting and distributing food and raw materials and the finished products to the community as a whole. Growing, mining, making, moving are the four divisions in the world of industry that I would like to picture for you and when you look at the world in that way it is important that you should not overlook what I feel are two fundamental considerations: first, that roughly 70 per cent of the world's working population at this moment are labouring in divisions 1 and 2, growing and mining the things needed to support life and maintain continuity, that constant, close-to-nature, primordial source of everything—70 per cent.

Secondly, that there is a law permeating everything down through the world, the law of interconnection and interdependence. By that I mean that as we advance into the future we must see to it that we obtain balanced progress on this divisional front. It would be fatal if we secured a big advance in one division at the expense of another division. Look back to 1929 and 1933, to the great economic crises that struck the world. Can anyone doubt now that they were due to our revision of that fundamental law? The people toiling on the soil did not get a square deal. The farmers in Canada—and I happen to know, because I have brothers who have been here for years—were selling their products below cost at that time and if we seek to repeat that process it will be the same. There is a law of interconnection and interdependence under which we must see to it that as we advance we must get balanced progress among these four fundamental big divisions within the world of industry. That is the first consideration.

The second consideration to which I would like to lead you is this: What is the purpose of this world of industry? In the way I have painted the picture I think I have very largely answered that question. There surely can be only one purpose—service; service to all those working within that world, which is the major part of the world's population, and service to the relatively few outside of that world of industry. Translating that into units, I would say that the purpose of the industrial people within the unit is to strive all the time to achieve optimum consumer service. Optimum consumer service means striving to see that the quality, cost and times are balanced. Any industrial organization that puts that objective first before the complete industrial scheme will, in my experience, achieve astonishing success.

Now if I am right so far, then I am right in my next statement. I must be right. Nothing can be of greater importance to each of us here, to the world as a whole, than to see to it that government or management of the world of industry is made as good as possible. How are we going to bring about better government or management of the world of industry? We have got to follow democratic principles. What do we mean by democracy? I think it is very important that we clearly understand what we mean by democracy. It is a much used word. I will try to clarify my own thinking and your thinking by giving you two very simple organization charts.

My first one is a picture of dictatorship and the second is a picture of democracy. The first one has a fuehrer at the top and there is a vertical line connecting the fuehrer to the state and under the state, the individual right at the bottom, the slave of the state. That is dictatorship: fuehrer, state, individual.

The second chart—democracy—is God at the top, a vertical line to the individual and another vertical line to the state, the servant of the individual, based on the tremendous conception of the inviolate link between the individual and his God.

Those two charts are tremendously important. I could not say anything more important than I am saying to you now and if I say nothing more I have probably given the best lecture I have ever given in my life, because we have fought the bloodiest war in history to determine, I hope for all time, that the government or management of groups of individuals, whether in the political, educational, economic or industrial sphere, shall be regulated by the second chart. That is democracy.

It was all beautifully thought out years ago by a great American philosopher, Mary Fuller, who saw that within the world of business or industry there would have to be evolved new leadership techniques, and she expressed the same thought that I am trying to convey to you in these important words: "The leadership we need is not by the whip of external compulsion but by the engendering of the will of others to do it ". That is democratic leadership. That is the second kind of leadership that we have to spread throughout every nook and corner of this world of industry if we are going to advance along the path given us by government or management in a truly democratic sense; and I say decisively that we are now at the crossroads, facing this tremendous issue.

All the problems in the world are very largely revolving around this cardinal problem of the steps we are taking and the rate at which we are advancing along the path of democratic government within the world of industry. In Great Britain we have been steadily moving along this path leading to some form of industrial democracy, for many years, and our rate of movement has been accelerated during the war period. We shall continue to step forward along that path and it may well be that in the years immediately ahead, Great Britain will evolve new techniques, new instruments and leadership within that world, showing others how they have to do the job themselves.

If you are going to apply democratic principles of government or management within this industrial world you have to build up an organization and the process of building up an organization is generally the same, no matter what kind of business it may be. You first have to split up the work into its main functions. You then select teams of people for giving leadership over those functions. You functionalize your business; and then the higher management has to do something which is always the most difficult of all. It has to create a psychological atmosphere in which the functional teams can work together and give this business the very best.

That is something that depends on the character and the mental and spiritual outlook of the higher management and if you are going to achieve the best results you must have at the centre of your organization a planning team. In other words you must plan the direction in which the organization is going to move and above all set out what should be its rate of movement toward clearly visualized goals. Planning, in the sense of which I am speaking, involves in my experience some form of budgetary control.

I referred earlier to the importance of education and I think if we are going to advance along this path heading toward some form of industrial democracy, we shall have to use the instrument of education more fully and effectively than ever before. The right kind of progress connotes the closest kind of co-operation between the world of industry, as I have pictured it for you, and the world of education. They have to be brought very close together. There should be communion of thought and spirit between those two worlds and I believe also that as industry grows in strength and stature and enlightenment, the world of industry itself will have to be evolved and developed through the managerial techniques as an education and spiritual force. I would say that one of the great purposes we should set before the management of this world of industry is not only to make good the things we have been striving to do for many generations, but to couple with that purpose or desire the other privilege and responsibility of making also good men.

The engineering mind, therefore, as I see the picture and the responsibility of engineering, is called to the great task of enlivening and enlightening the dominant field of group leadership and as management evolves along the path of enlightenment it will have to develop a spirit of co-operation as between individuals and groups. In a very real sense co-operation is the key to a better future. We either co-operate with one another as brothers, inspired with the ideal of giving service to all, or most surely we shall crash into the abyss.

This is very easy to talk about but it is the most difficult thing in the world to achieve because its success depends on the forces actuating the heart of the individual, the co-operative spirit radiated by the individual as a function of his attitude of mind, his philosophic outlook, and, above all, of the quality of the religion that motivates his daily life. I believe, therefore, that we can only make the right kind of progress a vital sphere of management within industry by decisively showing Christian principles and proving our earnestness by applying these principles in all our plans, programmes and policies. The managerial structure so dedicated will strive to provide the finest mechanistic devices in the form of the best factory buildings, the best machines, the best and most scientifically planned lay-out, the best working conditions, the highest wage levels commensurate with the highest productivity. The managerial structure must try earnestly to do all these things, conscious all the time that the most important thing within an industrial edifice is man himself with a free personal imagination, a free spirit.

In my long industrial experience I have always found it wise to set before the industrial people a target of achievement, a target that will inspire every member of the team to give of his best, so that as a band of brothers they may march forward toward a distant but clearly visualized goal. In this spirit I would like to conclude by giving you a target for a distant tomorrow, for the whole human family, at this great moment in history, as it strives eagerly to reach a better and happier future. Right at the centre is the bulls-eye and the bulls-eye is the home in which the family spirit of Christian fellowship should prevail.

In Great Britain we are now confronted with a great task of rehabilitating our homes in a physical sense; but also we must rehabilitate them in a psychological and spiritual sense. I believe the same kind of problem faces you here and, indeed, all people everywhere.

Around the bulls-eye of the home you draw a larger circle embracing the industrial family. Here we must strive through improved management to develop the family spirit so that the same kind of spirit that we have in our homes may permeate every nook and corner of the industrial structure where the bulk of the people spend the bulk of their wakeful time.

Around that larger circle I would draw a still larger one enclosing the national family wherein we must strive to have the same spirit of Christian fellowship; and bounding the target I have an outer circle indicating the world family.

Industrial management in the sense I am portraying it is becoming largely an educational and psychological process of group control. Industrial management in the future will have to combine with its technical skill the attributes of the teacher, preacher and artist and in saying this I point the way to revolution in our system of technical education which must come to ensure a proper blending of techniques with the humanities. Such management will be versed in the gospel of humanity and of humility, conscious all the time of its privilege and responsibility of trusteeship, conscious of and interested in what goes on within the human structure it controls but also conscious of and interested in what goes on in the world outside of its localized spheres of activity.

It will seek by all the means in its power to promote further education of itself and of the group it controls and, inevitably, such impulses within the managerial structure, the board of directors, managers, engineers, will surge right down the line to foreman and group leaders and express itself, in a growing measure, in all the processes of government, first within the local community and then in the national community. These interests grow and spread out to the widest spheres of world government. In a real sense we are being forced to train ourselves for world citizenship and industry, because it is a world-flung community service.

What a wonderful objective, leading the world through an enlightened managerial technique to that better future for which all people of goodwill are yearning with aching hearts! Right here is a challenge to the engineering profession, a call strong and impelling for service in rebuilding the house of human relationships which is mainly composed of its industrial planning. Success will depend on our sincere efforts to break down all barriers, economic, political, religious and educational, and to step forward with abiding faith along the path leading to a unity of all peoples is your privilege and responsibility. This prelude to co-operative endeavour has to start within the human heart and mind, and a start can only be made by an individual conscious of his inviolate link with God, his Creator, squarely facing those eternal questions, firm in the conviction that enduring progress is made only when we march along the path leading to greater achievements, and with an abiding purpose of dedicating ourselves to greater and better service.

The solution of this age-long problem leads us to the heart of the Christian faith. It means a continued striving, day by day, to live and act the Christian life. Of course you will say it is an ideal picture, a visionary picture, perhaps even an impossible picture; but surely we have reached the moment in human history when the truth of the pronouncement "Where there is no vision the people perish," is hammering on our inner consciousness with a great deal of insistence.

I believe in long-range planning. Planning services are the golden keys opening the future to all. Whether we open the door will depend on the quality of our vision at this moment. It must be set on the highest spiritual plane. Then as practical men we must eagerly strive to take a little step each day along the planned visionary path, realizing that we may never reach the idealistic target of tomorrow; but even so, a vision to guide, to inspire our daily thoughts and actions will be worth while a hundred times over, and will at least have kept us on the right track and we shall in the course of years have journeyed some distance along the path and in doing so shall have rendered some service to our brothers. But remember that the striving and the struggling, after all, are the things that really matter.

The overcoming of resistance, of obstacles and difficulties is necessary to healthy mental and spiritual growth and only in that way, by overcoming obstacles and resistances, are we vouchsafed the glorious opportunity of living our lives as builders in such a way that future generations may say that we builded well.

WARTIME PRODUCTION OF PRECISION OPTICS IN CANADA

D. C. R. MILLER, M.E.I.C

Development engineer, Fiberglas Canada Limited, Oshawa, Ont., formerly production superintendent of optical shops, Research Enterprises Limited, Toronto, Ont.

This is the third of four instalments of a paper describing the establishment, as a result of war exigencies, of a new industry in Canada. Previous instalments appeared in April and May issues—Ed.

Production Methods—Auxiliary Operations

A few optical parts such as filters and subsidiary optical systems—for example the rangefinder scale-viewing system shown in Fig. 4—are finished after polishing, and when inspected, are ready for assembly into instruments. But all lenses require centering and the majority of them are subsequently cemented into doublets, while these and most other optics are now required to be coated with anti-reflection films to improve transmission. Also the reflecting faces of many prisms and mirrors require silvering or aluminizing, certain prisms have to be cemented together into clusters, and graticules must be engraved. These auxiliary operations, performed on polished optics which are usually of considerable value, are therefore of vital importance and will next be dealt with in turn.

LENS CENTERING

All lenses after polishing are appreciably oversize in diameter, partly to permit edging out any chips which may occur during processing, partly to permit the removal of 'prism'. This condition, which has been mentioned earlier, is illustrated in exaggerated form in Fig. 23. Almost all lenses have some variance in edge thickness after polishing, and this must be corrected by centering.

Reference to Fig. 23 shows that after centering, the thickest part of the lens (with a convex lens) occurs exactly at the geometric centre—that is, optical and mechanical axes have been made to coincide. If a lens is located from one spherical surface and rotated, the image of a light reflected from the other surface will appear stationary when the optical axis of the lens coincides with its axis of rotation. This fact is utilized in most centering methods.

The centering machines have two essential mechanisms —a chuck for holding and rotating the lens and an abrasive wheel for edging it to the correct diameter. The chuck consists of a hollow tapered sleeve of diameter just less than that of the finished lens and bevelled to a narrow rim on the face which contacts the lens. This face must be very accurately trued at right angles to the axis of rotation, by means of a T-rest and hand tool, every time the chuck is removed from the machine. The lens is fastened to the chuck with high-adhesion cement, which is melted by means of a gas gun attached to the machine. After placing the lens against the face of the chuck, and before the cement has set, a hardwood stick is pressed against the exposed face of the lens, as close to the outside as possible, in such a way that the lens tends to slide automatically over the face of the chuck into the position of equal edge thickness. When the image of a light reflected from this face appears stationary, the cement is hardened by a stream of cold water and the lens is then ready for edging. This is done with a diamond or silicon carbide wheel, pivotted and weighted in such a way that it continues cutting until reaching an adjustable stop. The peripheral speeds and wheel types are the same as those described under planar grinding. The wheels must be very carefully trued to prevent vibration and chipping of the lens, and are usually provided with an oscillatory mechanism to prevent grooving of the cutting face. Actually, most of these machines are equipped with two or four chucks on a turret head, so that while one lens is being centered, the other is being edged. As the machine set-up time is considerable, the four-chuck type is the best, because it may be set up for two different lens sizes and quickly changed over from one to the other. A Jorgan machine of this type is shown in Fig. 24. After edging to the correct diameter, which is checked by means of go and no-go ring gauges, the chuck is indexed 180 deg. and the lens bevelled by means of a concave diamond lap or cast iron tool and medium abrasive. A flat brass plate is used for concave lenses, which are chucked with the convex side outwards as this provides the maximum support for the thinnest edge of the lens. Then the lens may be removed and re-chucked for bevelling the other side, or, if centering machine capacity is limited, this may be made a separate operation. After all abrasive is washed off by a stream of running water, the lens is placed in a rack and must be cleaned, by the methods described earlier, to remove the cement before inspection is possible.

Tolerance on edge diameters is usually ± .001 in. With diamond wheels this may readily be held: with silicon carbide wheels more trouble is experienced owing to wheel wear. The accuracy of centering required varies with the lens focal length and diameter. In most medium-power telescope systems, centering accuracy within .001 in. is sufficient.

Centering is an operation requiring intelligent and careful operators and skilled machine set-up. Lenses may be lost through inaccurate centering, inaccurate size, chips, scratches, and rings (marks from the chuck or centering stick). Losses with flint lenses are appreciably higher than with crowns, owing to their greater edge weakness. Lenses with excessive prism or large chips will not center out and must be discarded. It is seldom worthwhile to attempt to salvage centered lenses with surface damage, as the slightest amount of prism during reblocking and polishing would make them impossible to center out. Some firms do, however, salvage expensive lenses in this way.

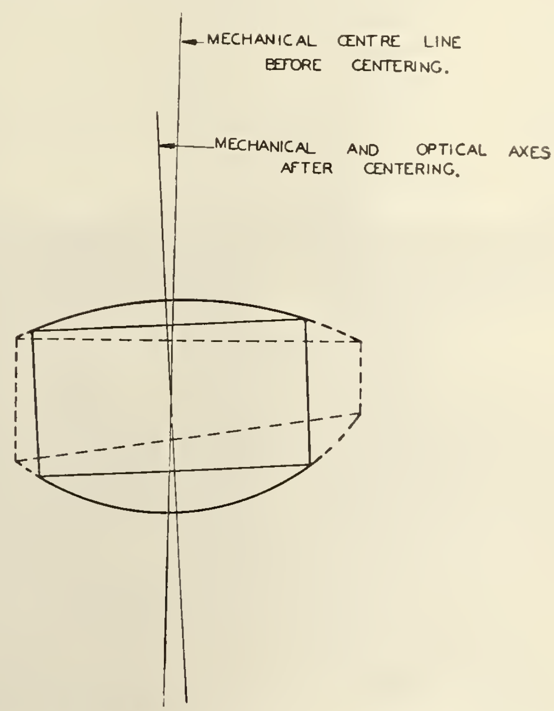

Fig. 23—Diagram illustrating the mechanism of lens centering.

Production rates for single components using diamond wheels vary from 25 per hour for $\frac{3}{4}$ in. diameter plano-convex lenses to 10 per hour for $2\frac{1}{4}$ in. diameter concave-convex lenses. For a given diameter, flint components take about ten per cent longer than crowns.

LENS AND PRISM CENTERING

Up until the last few years, Canada balsam was in universal use as an optical cement. This natural resin was available in liquid and solid form, and all stages of viscosity between, thus making it a versatile and useful cement. When applied as a liquid it was baked until the volatiles were removed, and by prolonged baking any desired degree of hardness was obtainable. Unfortunately, however, if the hardness of Canada balsam is made such as to withstand high temperatures, its low temperature properties are impaired, and 'flares'[1], 'balsam-starts'[1], or complete separations occur. 120 deg. F. may be considered the upper limit for a practicable Canada balsam and even at this temperature some softening and relative movement between parts tends to take place. The trend with military optical instruments has been to extend the temperature range requirements at both ends, so that some specifications now call for ability to withstand temperatures from —40 deg. F. to +160 deg. F. and these requirements can only be met by synthetic cements. Although Canada balsam was in full scale use up to the end of 1943, it may now be considered as obsolete, and cementing techniques for this material will therefore not be described here.

There are at present two main classes of synthetic cements in use—the high temperature thermoplastic type as represented by n-butyl methacrylate, and the thermosetting type as represented by the Pittsburgh Columbia resin CR-39, an allyl monomer, used by us under the designation PKR-15. Each of these types has certain advantages, but as we preferred the latter and used it exclusively from 1944 onwards, the following remarks will be confined to this type.

PKR-15 monomer is a thin, clear, colourless liquid. With the addition of a catalyst, polymerization takes place slowly at room temperature, and rapidly with heating, the liquid passing successively from a syrupy stage with increasing viscosity, then to a gel, and finally to a clear, hard and chemically very resistant solid. In preparing the material, it must be very carefully filtered after addition of the catalyst to remove all vestiges of dirt and undissolved matter. It is then heated until it partially polymerizes to the desired viscosity, transferred into small glass bottles, and stored at 32 deg. F. until ready for use. In this way it can be kept for several weeks. Enough cement is issued daily for the current day's needs and any surplus remaining is discarded.

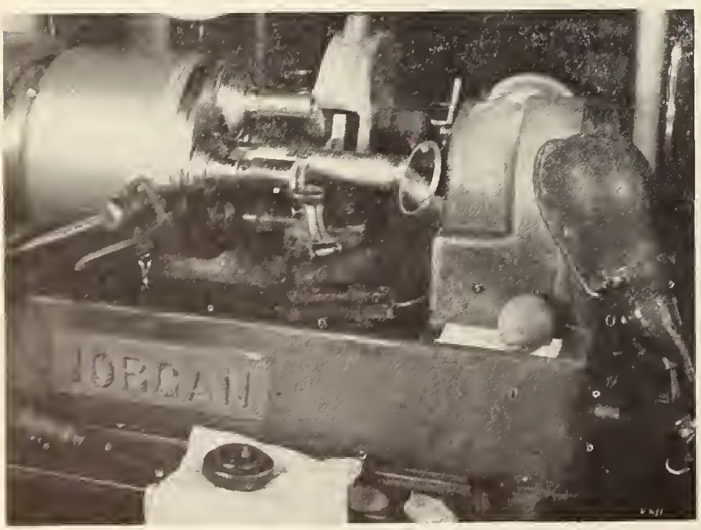

Fig. 24—Jorgan lens centering machine.

For lens work, the cement is used as a free-running syrup, viscosity 450-500 Saybolt seconds at 75 deg. F. For prism work, where the thinnest films are often necessary, and air bubbles harder to work out, the preferred viscosity is that of a thin watery syrup, say 350 Saybolt seconds at 75 deg. F.

Optics are prepared for cementing by first immersing in a warm 1-3 per cent soft soap solution, with added wetting agent; then they are wiped off with a soft linen or closely-woven cotton cloth, and finally brushed off with a camel-hair brush to remove every particle of lint and dust. These operations must be done under a strong light with very great care. Lenses, after centering, are cemented cold, using an eyedropper or glass rod to apply a drop of cement to the centre of the flint component. The crown is quickly placed on top and air bubbles worked out by sliding one piece over the other with a pencil eraser. After roughly registering the edges, any excess cement is wiped off. We tried several different methods and found that the simplest and best way of keeping the two components in alignment during baking is to lay the doublets in rows on edge with brass spacing rings between and roll them up into cylinders about 4 in. long, using thin cellophane sheet secured with scotch tape. In this form they are placed in small thermostatically controlled electric ovens and baked for 3 hours at 175 deg. F. to set the cement. This apparently crude method retains centering accuracy within .001 in., and has the additional advantage over other methods (such as V-blocks) that air is excluded from the edges of the lenses during baking—and with PKR cement this is important in reducing the number of edge separations or 'flares'. It is best to place the doublets in the oven cold, and bring them gradually up to temperature, and likewise to anneal the cement film by shutting off the heat and allowing them to cool slowly to room temperature in the oven.

To increase the speed of lens cementing, we built a machine operating on a conveyor-belt principle. The doublet components are first cleaned as previously described and placed in pairs on the conveyor belt. This passes through an electric oven and heats the doublets so that they emerge at a temperature of 210 deg. F. The cementing operator takes the doublets as they emerge and places the flint component, concave side uppermost, on a holding fixture[2]. After being positioned centrally on the holding device, a vacuum valve is opened and holds the lens firmly in position. A metered quantity of cement is next squirted into the concave face of the flint lens, the crown placed on top and bubbles worked out. The crown is then aligned with the flint in the same fixture. The two are held in this position for 30-40 seconds, at the end of which time the cement has hardened enough to permit handling, the vacuum is released, and the doublet automatically ejected onto a conveyor which takes it to the cleaning stage, for removal of excess cement. The doublet is kept hot by electric resistance heaters while in the fixture, which it is better to have in duplicate, so that while one lens is setting, another may be being cemented. After cleaning, the usual baking follows to complete polymerization of the cement.

Production rates with manual cementing methods vary from 17 per hour for doublets under 1 in. in diameter to 12 per hour for the sizes 2 in. and over. Use of the cementing machine reduces these rates by about 20 per cent in terms of man-hours. Rejections average between 5 and 10 per cent, mainly for edge flares and eccentricity. The latter may be checked optically, or more usually by the use of a ring gauge.

For cementing prisms much the same technique is used as for lenses. Most prism clusters require special holding and adjusting jigs to facilitate relative movement of the

[1] Types of partial separation.

[2] Details withheld from publication.

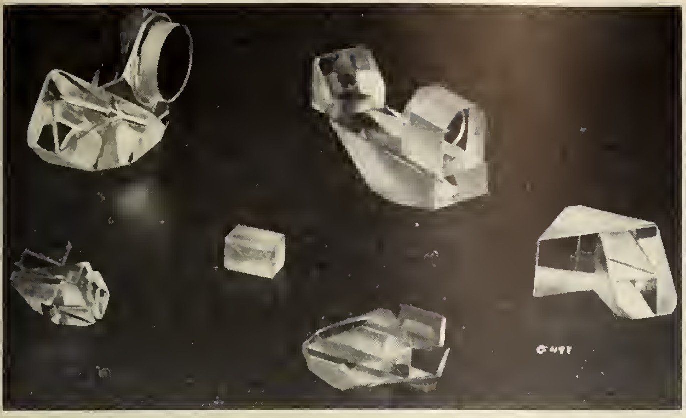

Fig. 25—A group of cemented prism clusters.

prisms during cementing and to maintain alignment during baking. Special optical fixtures may be necessary to adjust the prisms into their correct relative positions. Rangefinder centre prism clusters (Fig. 4, detail) are a good example of this class of work. The cementing of these clusters at production rates of 450-550 per month was probably one of the most difficult tasks of all those undertaken by Research Enterprises Limited. These clusters are built up in stages. After the first stage, certain faces of the combination must be hand-polished. Because of trouble with PKR cement during hand polishing it is found advantageous to cement these pieces with Canada balsam, then take apart and recement with PKR. Part of this cementing operation involves cementing a cover glass over the focal plane. Focal plane surfaces of this sort are cleaned off with a silk handkerchief and pure grain alcohol. The most scrupulous cleanliness must be observed, as the work is rejected for dirt visible only under a 7-power magnifier. Clusters of this sort require 4 to 5 man-hours of work in cementing. A typical selection of cemented clusters is shown in Fig. 25.

Edge flares are the biggest single cause of rejects in prism cluster cementing—partly because it is difficult to exclude air from the joints during baking, and even when this is done, as with a CO_2 atmosphere, there is still trouble. Temperature cycle control during baking appears to be important. The baking cycle ultimately used was similar to that for doublets, but the clusters were brought up to temperature more slowly, held there longer, and cooled off over a 5-hour period. Provision of the widest possible bevels at the edges of cemented joints is also advantageous. With all the various troubles encountered, a recovery of 50-75 per cent of the clusters cemented is considered satisfactory.

Work which requires de-cementing for any reason is best separated by thermal shock. There are several recommended methods, but we found the most satisfactory to be the blue flame from a Bunsen burner applied to the edge of the cemented joint, until the pieces 'pop' and can be separated with a razor blade. Any method used with this cement, owing to its inherent qualities, has to be drastic to effect separation and there are bound to be losses from breakage. With prisms, these may be as high as 20 per cent or more.

Another unfortunate feature of this cement is that it attacks the skin of the operators wherever it touches, and hands must be frequently washed, and contact with other parts of the body avoided, to prevent incapacitating dermatitis.

ANTI-REFLECTION FILMS

It is now some fifty years since the reduction in surface reflection by means of a thin transparent surface coating was first observed, but it is only within the last five years that the methods of applying such films and their durability have made them practicable for other than laboratory purposes. The use of anti-reflection coatings on almost all optical surfaces is now mandatory in military fire-control instruments.

With a plain polished glass component, from 4 to 7 per cent of the incident light is lost by reflection at each air-glass interface; but if these interfaces are coated with a transparent film of thickness equal to 1/4 of the wavelength of the incident light, interference occurs between light reflected from the glass-film and the film-air surfaces, so that the net amount of reflection is reduced to 0.6-2.0 per cent. In all but the simplest military instruments there are sufficient air-glass surfaces to effect an improvement of 40 per cent or more in light transmission if the optics are coated. In the more complicated instruments transmission may be more than doubled. Instruments with coated optics have higher brilliance and contrast of image which makes them more useful under the poor lighting conditions at dawn and dusk.

It can be shown that the anti-reflection effect is a maximum when the refractive index of the film is equal to the square root of the refractive index of the glass. Since most optical glasses have refractive indices lying between 1.5 and 1.7, this would necessitate a coating material of index between 1.2 and 1.3. In practice, materials of index closer to 1.4 are necessary for durability. For this reason such coatings are more effective on glasses of high refractive index. The presence of anti-reflection coatings is readily determined by the characteristic coloured reflection or 'bloom' when viewed at a low angle of incidence. The shade of colour in daylight varies from a yellow-red (450 milli-microns) to purple-blue (600 milli-microns), the former indicating a thin, and the latter a thick coating. Green, brown, or blue coatings are outside the acceptable thickness range. In judging the film thickness from the colour, the refractive index of the glass must be taken into account, as interference effects are stronger, and colours more intense, with the high-index glasses.

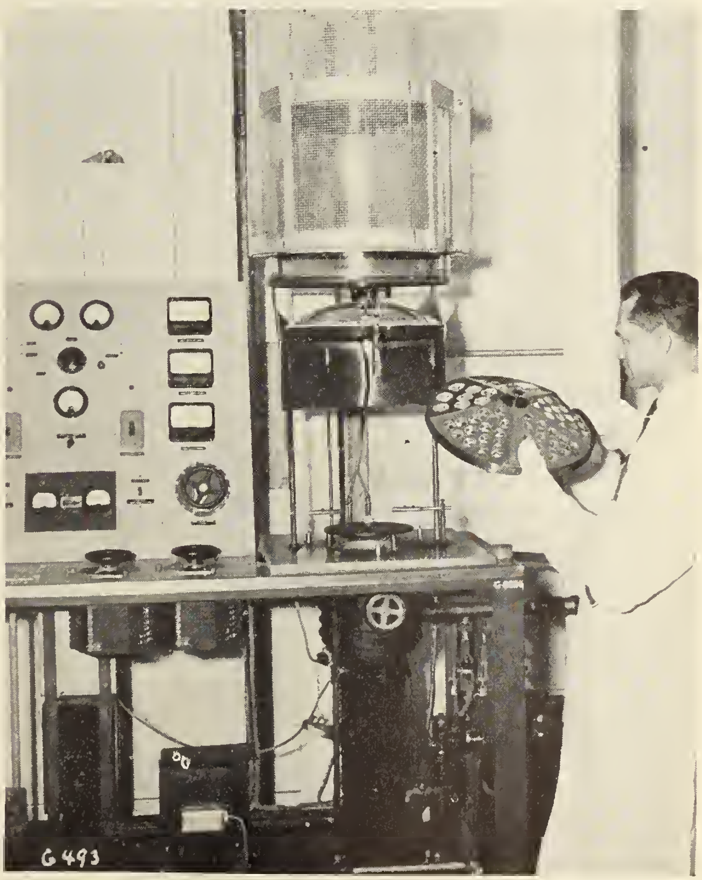

Fig. 26—General view of fluoriding equipment showing bell jar in raised position and work holding fixture.

Numerous different methods have been tried for applying anti-reflection films, including acid-etching of the glass surface to produce an artificial 'tarnish', and deposition by chemical means of various organic and inorganic materials. At present, however, the method in common use is a physical one in which the coating material, usually magnesium fluoride, is melted and evaporated in an extemely high vacuum and condenses uniformly over surfaces exposed to it, in a manner which permits close control of film thickness. Although this process was not employed on a large scale at Research Enterprises, since outside facilities already existed close at hand, a pilot unit was operated for emergency use, and it is believed that details of the methods are of sufficient interest to warrant inclusion here.

Evaporation of the magnesium fluoride is carried out in large pyrex glass bell-jars, about 3 ft. high and 18 in. dia. sealed onto a flat polished steel plate by means of a rubber gasket. The magnesium fluoride, in the form of a fine powder, is placed in a small porcelain crucible in the centre of the base plate, directly over the pump inlet opening. This crucible is heated by radiation from a heavy tungsten filament directly above it. The work to be coated is loaded into shallow recesses in a jig so designed as to give a spherical arrangement of the work about 18 in. above the fluoride source, with the surfaces to be coated facing downwards. The pumping system consists of an oil-distillation pump in series with a high capacity rotary vacuum pump. About 20 minutes is required for pumping down the bell-jar to an operating vacuum of 10^{-4} to 10^{-5} mm. of mercury. Down to 10^{-3} mm. the vacuum is measured by a Pirani gauge, and thereafter by an ionization gauge. When the necessary vacuum has been attained, the magnesium fluoride is melted and raised to a temperature of about 1500 deg C. During this period a baffle plate over the crucible prevents any coating. This plate is then swung aside by a powerful magnet from outside the jar and coating commences. Thickness of film is controlled by a disc of glass coated on the upper side to the correct colour and placed in the jig amongst the work in such a way that it may be observed from above. The coating is permitted to continue until the reflection from the lower surface of the test sample agrees in colour with its upper surface. This usually takes 5 to 6 minutes, so that the whole cycle occupies about 30 minutes.

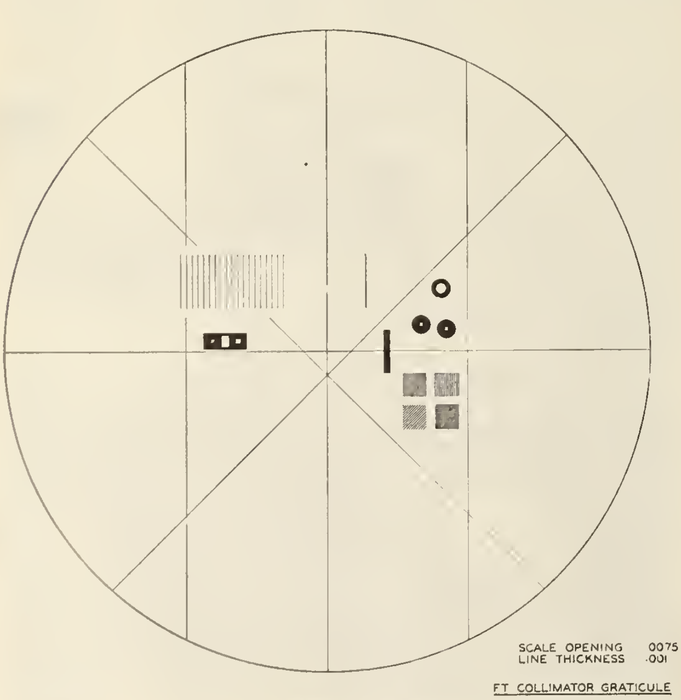

Fig. 27—A typical photographic gratucule for assembly equipment use.

The number of pieces which can be run at one loading of course depends on size and shape. With lenses in the usual range of sizes it varies from 30 to 100. Considerable time may be saved with windows and lenses by arranging the jig in pivotted flat segments which can be turned upside down by a magnet from the outside, so that one pumping cycle serves for both surfaces. The cost of applying fluoride coatings is inevitably high and not much less than chemical silvering. A general view of the fluoriding equipment, with the bell-jar in the raised position and showing a holding fixture for lenses, is given in Fig. 26.

The points to be carefully watched to ensure uniform, durable coatings are these: perfect cleanliness of the optics, baking of the optics during the coating cycle, a controlled quality of magnesium fluoride, use of the highest attainable vacuum, and avoidance of back-coating.

At one time, drastic chemical methods were used for cleaning preparatory to coating, but it now appears that the methods described under cementing give good results when carried out in a temperature-, humidity-, and dust-controlled atmosphere.

During the last two years it has been learnt that baking during fluoriding greatly improves the hardness and adhesion of the film. It is therefore standard practice at present to pre-heat the optics while pumping down to the right vacuum and continue the heating while coating proceeds. This is done by means of coiled radiant heaters inside a spherical aluminum reflector placed directly over the work and visible in Fig. 26. A temperature of not less than 250 deg. C. is thus maintained on the work throughout the cycle, care being taken to keep below the annealing range of the glass.

The magnesium fluoride must be chemically pure and free from absorbed moisture, otherwise it will splutter when melted and cause spatter-marks on the work. This trouble may be reduced by gradual heating of the crucible towards the end of the pumping cycle.

The holding fixture must be so designed that there are no openings round the work through which the fluoride vapour may pass and partially coat the back surfaces. Otherwise, adhesion on these surfaces will be poor after they are coated. Such back-coatings are also objectionable on the reflecting faces of prisms, especially if these are required later to be silvered.

After fluoriding, the optics are inspected for surface imperfections, correct colour and durability. Colour is checked by visual comparison with known samples. Durability is checked by giving each surface 20 double rubs with a special pumice-loaded rubber pencil eraser using a pressure of 2-2½ lb. Surfaces which will withstand this test require no special handling care.

Properly applied fluoride films are very difficult to remove if rejected for any reason. Of the numerous mechanical and chemical methods so far tried, the best appears to be soaking in hot concentrated phosphoric acid for periods of 15 minutes to 2 hours. Mixtures of boric and sulphuric acid are sometimes effective. Another method is alternate immersion for 5 minutes in saturated potassium hydroxide solution, followed by dipping for 30 seconds in concentrated nitric acid. This cycle is repeated 3 or 4 times as necessary. All these methods, particularly the last, are likely to etch the glass surfaces, because the fluoride film does not dissolve uniformly and before it is all off, large areas of bare glass may have been exposed to chemical attack. Mechanical removal by polishing is usually impracticable.

Lenses which require fluoriding are coated after centering, the cemented surfaces being of course left uncoated. The temperature of baking during fluoriding makes coating of doublets impossible with present cements.[1]

[1] Recent development of silicone optical cements may change this to advantage in the near future.

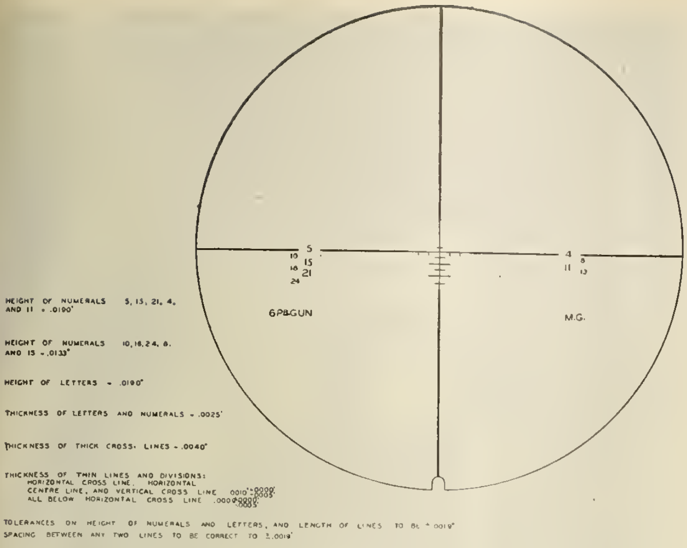

Fig. 28—A typical sighting telescope graticule produced either photographically or by ruling and etching.

Focal plane surfaces are left uncoated at present, because so far it has been found impossible to avoid the minute surface imperfections which are considered inacceptable for such use.

METALLIZED SURFACES

Metallizing of optical surfaces is usually necessary in order to provide front-surface mirrors (CA-2, Fig. 2) or semi-opaque films of very high density. There are two basic methods used, in both of which the metal is volatilized and condensed on the glass. In the process known as 'cathodic sputtering' the metal is bombarded with gaseous ions in a moderate vacuum (10^{-2} mm.). The other method involves evaporation of the metal in a very high vacuum and is the same in principle as that used for fluoriding[1]. The latter process only will be discussed here, as it has now virtually superseded the other, being both quicker and cheaper.

Aluminum is the metal most commonly used for front-surface mirrors because of its high reflectivity, second only to silver. Such coatings are highly durable in normal atmospheres, being protected by the formation of a very thin transparent film of oxide. The metal is first melted directly on the tungsten resistance coils by hanging over them short lengths of aluminum wire. When the aluminum melts it wets the tungsten wires to form a uniform film all over them, and in subsequent heating to higher temperatures, volatilizes and condenses on the glass. As the aluminum has poor adhesion to glass when applied directly, it is customary to apply first a coating of metallic chromium which has very high adhesion to glass. The chromium is placed in lump form in the centre of a closely wound coil of tungsten wire and sublimates to a vapour when heated to incandescence. Because of its softness, the aluminized surface is difficult to clean without marring and hence is easily rendered useless by fingermarks in handling during assembly. For this reason, it is sometimes protected by a coating of transparent material such as quartz or magnesium fluoride. If quartz is used, it is evaporated from a crucible of molybdenum, tantalum, or tungsten. All three coatings—chromium, aluminum and protecting film—are applied successively with but one pumping. The thickness of transparent film must be such that no interference results—a second order film, one half wave-length thick, with a light yellow colour in reflection is satisfactory, but all such films reduce reflectivity somewhat. For naval use, where mirrors may have to meet a salt spray or salt atmosphere test, organic coatings of cellulose nitrate or polyvinyl acetate are used, applied by spinning. These are of doubtful durability.

Aluminum mirrors rejected for any reason are difficult to strip because of the chemical resistance of the chromium coat. After removal of the aluminum with alkali, the chromium may be stripped using strong nitric or sulphuric acid, activated by the presence of powdered metallic zinc.

Rhodium or other precious metals are applied by electro-plating the tungsten heating wires. Rhodium mirrors have good handling qualities and durability, but about 13 per cent lower reflectivity than aluminum. No protecting coating is required, however. Semi-opaque rhodium films of extreme density are used on some of the larger rangefinders for sighting into the sun when adjusting the infinity range setting. Silver may be deposited in the same way as rhodium, but the method appears to have no advantages over the standard chemical means.

The presence of dust particles on the glass surface before metallizing results in small pinholes which, if numerous, are cause for rejection. Particular attention must therefore be paid to cleaning. The same trouble also results from minute grinding pits in the surface, so that a high quality of optical polish is necessary for the best results. For this reason, ordinary plate glass, unless specially selected, is seldom satisfactory for metallizing.

Metallic films of the highest reflectivity are obtained only by strictly controlled conditions of vacuum and glass cleaning and moderate rates of deposition.

CHEMICAL SILVERING

Mirrors and reflecting prism faces which require silvering are silvered by the standard Brashear or Rochelle Salts methods, which are sufficiently well-known to require no description here. The Bashear method gives deposits of slightly higher reflectivity, and use is sometimes made of this to balance the brilliance of two separate optical systems, viewed side by side. In some coincidence-type rangefinders for example, the left pentagonal prism is silvered by the Brashear, and the right by the Rochelle Salts method. After deposition of the silver a thin coating of copper is electro-plated on, followed by a suitable backing paint, which may be of asphaltic or bituminous base, or a standard mirror-backing lacquer. These may be applied either by brush or spray. Neither backing appears to be entirely satisfactory. The bituminous paint remains soft and elastic at normal temperatures, but is

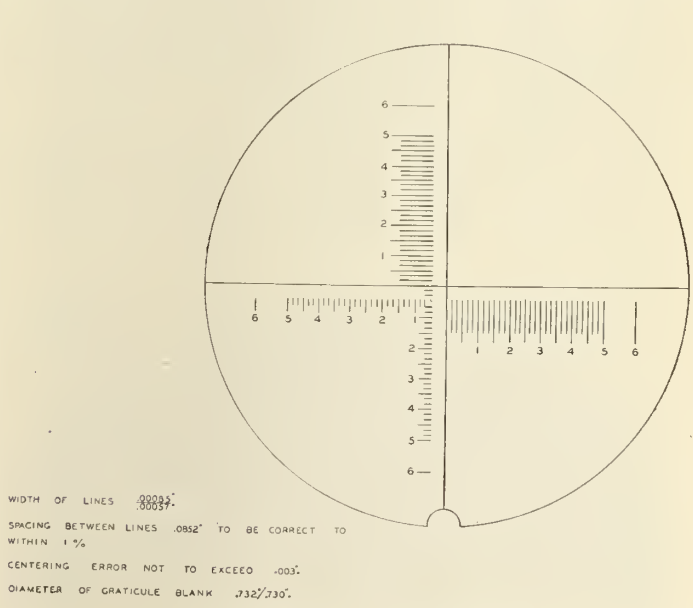

Fig. 29—An intricate design of very fine lines produced by ruling and etching.

[1] See S. Bateson—Vacuum Evaporated Films on Glass (Canadian Chemistry and Process Industries, August 1943.)

subject to handling damage during assembly. The lacquer type backing tends to transmit shrinkage stresses through to the silver on drying, so that there is danger of it peeling when subjected to frequent wide temperature variations. Where prisms are exposed to extreme weathering conditions, as in tank periscope prisms, thin lead foil may be cemented over the paint for additional protection.

There appears to be scope for further research to develop more durable silver backings.

ENGRAVING

Of all the auxiliary operations performed on polished optical components, that of engraving is probably the most difficult. To engrave fine lines and figures within a tolerance sometimes of ± .00015 in. in width and as little as half this amount in spacing, and with designs often of considerable intricacy, necessitates the utmost in skilled attention to detail and precision equipment. The already great difficulties are still further increased by the fact that the engraving has almost invariably to be carried out on focal plane surfaces, where the most minute surface defect, whether introduced during etching or during the necessarily large amount of handling, may be cause for rejection. The engraving itself, too, is viewed in the instrument under high magnification and must be correspondingly perfect. It is the maintenance of these high standards of engraving and surface quality which constitute the principal difficulty, once the necessary equipment is available and the techniques mastered.

There are two basic methods by which patterns of fine lines and figures may be applied to polished glass surfaces: photographically, whereby the design appears as an opaque raised coating adhering to the glass; and mechanically, whereby the design is ruled through a resist, acid-etched, and rendered opaque by filling. These are the two methods which we used successfully and which will now be described with a minimum of detail. Other methods are also used elsewhere, of which brief mention will be made later.

Photo-Embossing

Photo-embossing, by its very nature, is not a satisfactory method for production use: the figures and lines, sometimes as fine as .0005 in. wide, no matter how well applied, are too easily damaged during assembly, to say nothing of serviceability in the field. It is however a valuable method of producing the intricate designs sometimes needed in optical assembly equipment, and also where several different line widths are required. Two such examples are shown in Figs. 27 and 28, the first being an assembly collimator graticule for the coincidence-type rangefinder, the second the graticule in the sighting telescope, No. 33 Mk. 1 (Fig. 1, BB-9).

For photographic graticules we used the English bichromated glue method. With this method the graticule is first coated with an emulsion of engraving glue and potassium dichromate, and an image of the required design projected onto it from a photographic negative, using a very powerful light and an exposure of the order of several minutes. This renders the exposed portion of the emulsion relatively insoluble and the remainder is then washed off in running water, leaving the design as a darkened, raised pattern on the surface. A preliminary baking for 20 minutes at 100 deg. C. follows, to harden the design sufficiently to withstand handling, after which any stains are very carefully removed by swabbing with cotton-wool and alcohol. The pattern is next intensified and opacified by immersing in chemical solutions which impregnate it with lead ferricyanide. This in turn is converted into lead sulphide, a dark opaque pigment, by immersion in ammonium sulphide. The intensification treatment is repeated as many as three or four times until sufficient opacity is obtained. If carried to excess, however, no glue will be left to act as a binder, and the deposit will be powdery and easily removed. The design is then finally baked for ½ hour at 225 deg. C. to complete the hardening process.

Fig. 30—General view of Wilcox multiple engraving machine, showing tool arm at left, master and stylus at right.

In making the necessary photographic negative, a scale drawing must first be made 30 times or more full size, reduced to perhaps three times size after photographing. Extra illumination may be required round the outer portion of the drawing in order to give fine clear lines near the edge of the field. The very highest quality photographic objectives are necessary both for making the negative and for the projection lens, to obtain undistorted lines, clear definition, and even illumination all over the exposed surface of the graticule.

The photographic process is not simple, especially as the length of exposure and amount of intensification must constantly be varied to suit the changing characteristics of the animal glue, and these changes may in turn affect line width. With skill and experience, however, line widths may be held within .0002 in., with a minimum width of .0005 in. To protect very fine patterns, a cover-glass is sometimes cemented over them—the most difficult class of cementing work.

The preparation of the original negative is the most expensive item, but once this is available, large runs may be made at costs comparable with those of mechanical methods.

Mechanical Ruling and Etching

With the mechanical methods of engraving, the graticule is first coated with a wax resist, the design ruled through it, and the portions of the glass thus exposed etched to the requisite depth and filled with some opaque substance.

Simple straight line designs may be ruled singly or in multiple with a dividing machine having an accurate lead-screw. Intersecting lines may be ruled either by means of an additional traversing lead-screw or by rotating the graticules the required amount and using the main lead-screw.

Undoubtedly the best mechanical method of ruling is with a pantograph-type machine, as this is equally adaptable to the simplest and the most intricate designs, and for figures as well as lines. But unfortunately we very early found that there were no commercially-available multiple pantograph machines of sufficient accuracy to be able to repeat or re-rule a very fine line without appreciably increasing its width, and this requirement is fundamental in fine work involving ruling through a wax resist, especially for clearing the intersection points of lines, letters, or numerals. Other firms had solved this problem by designing their own machines, using either inelegant and cumbersome arrangements of wires and weights to support the moving arms, or buoying them in pans of viscous liquid—a machine of the latter type at the Eastman Kodak plant at Rochester being familiarly known there as The Two-Ocean Navy. Whatever method is used, some means has to be found to support the pantograph arms in all possible positions, in order to remove backlash or lost motion due to spring and bearing play. The machine which we built for this purpose was designed by Mr. R. Wilcox, who was also responsible for the lens cementing machine already described. This design is a considerable engineering achievement, and solves the problem so successfully and so unconventionally as to justify some description of its main features.

In the Wilcox multiple-pantograph, of which a general view appears in Fig. 30, the arms are supported by disc-type bearings resting on an accurately flat polished surface plate about 5 ft. square. The bearings devised for this purpose are discs of varying size, fed with dried and filtered compressed air at moderate pressure. The air acts as a lubricant and permits the bearings to slide over the surface plate virtually without friction, even though carrying an appreciable load. A sufficient number of these bearing pads are disposed along the pantograph arms to give them uniform support. The pivotal bearings of the arms themselves are made of large diameter spherical balls lapped into spherical seats, the amount of pressure at each pivot point being adjustable in such a way as to permit applying the least amount of pressure needed to maintain contact between the balls and their seats, reducing bearing friction to the minimum without backlash. The centre-to-centre distance between pivot points on the main arms is about 40 in. and these centres are accurately jig-bored to ± .0001 in. to ensure perfect operation in all positions. The arms themselves are of special light-weight construction.

This pantograph machine is designed for ruling 14 graticules simultaneously, with a reduction-ratio of 10:1 from the master pattern. The fourteen cutting points are carried in specially ground and polished steel slides of lozenge-section, running on small spherical balls in ground and polished cylindrical sleeves, split and spring-loaded, and interconnected so as to permit raising and lowering all tools at once between cuts. Very careful design is required here as the least play in the slides would spoil the accuracy of the machine, yet the amount of friction must be negligible in order that the pressure on each point may be individually adjusted to a fraction of a gram. This pressure is controlled by sensitive coil springs and must be adjusted by trial and error to suit the width of line and characteristics of the wax resist. The raising and lowering of the tools is effected pneumatically from a solenoid valve operated from a micro-switch in the stylus which follows the pattern in the master. When the stylus is released to transfer to a new figure or line, the tools are all automatically raised, and are dropped again to resume ruling when pressure is next applied. A dashpot mechanism ensures that the delicate cutting points will not be damaged when this occurs. The graticules are held face upwards in 3-jaw chucks specially designed to retain centering accuracy within .001 in. over a range from ¼ to 2 in. in dia. A front view, showing the tool arm, 14 cutting points, and chucks, is given in Fig. 31.

This machine is so accurate that it will rule the same pattern over and over again without increasing the line width by any more than .0001 in. Because of this characteristic, it may be used for ruling lines of different widths in the same graticule. The graticule in Fig. 28 was ruled by this means in very large numbers. The most convenient way of accomplishing this without changing the line width on the master is to raise the stylus to a fixed stop and rule first down one side of the groove, then the other, then drop the stylus and rule down the centre. The stylus point and groove are both V-shaped, so that by this means the line width may be increased several fold. At intersections, whether of lines or in figures, the best results are obtained by having horizontal and vertical portions of the design on two separate master plates, arranged so that one may be exactly superimposed on the other, and the two ruled successively. This ensures crossing the lines in the right sequence and proper removal of the resist at intersection areas.

Accuracy of line spacing and length is limited only by the accuracy of the master and as this is usually machined on a jig-borer, the ruling accuracy of the pantograph is perfect within the limits of measurement. Once in operation late in 1942, our problems of large-scale production of graticules were solved. With simple patterns an output of 4 loads per hour (56 pcs) may be obtained with one operator. The more intricate designs (Fig. 29) may require as much as 45 minutes per load, and to rule them is a difficult and exacting task.

The cutting tools used for ruling are of vital importance in affecting the results, and making them is by no means the least of the difficulties involved. There are two main problems: the correct hardening and tempering of the points, and grinding to the correct shape. The material best suited for this purpose is 1.1 per cent carbon steel drill rod, about .060 in. dia. hardened to 62-64 Rockwell C by heating for 5 min. at 1,490 deg. F., quenching in 10 per cent brine, and tempering at 400 deg. F. for 10 min. It is important that this be done before the point is ground, as otherwise proper hardness will not be secured at the extreme tip owing to decarburization on heating. The cutting point must then be ground to an approximate 60 deg. included angle, with a flat on the end equal in width to that of the line to be ruled. The average lines are about .0015 in. wide, ± .0003, and the finest .0007 in., ± .00015. To maintain these tolerances involves holding the width of flat on the point within .0001 in., and the flat itself must be polished and accurately at right angles to the axis of the tool. Considerable difficulty was experienced in making these tools until we designed a special grinding machine for that purpose. In this machine the point is held in the collet of a small jeweller's lathe, on the compound of which a grinding spindle is mounted. The rotor of this spindle is driven by a compressed air jet

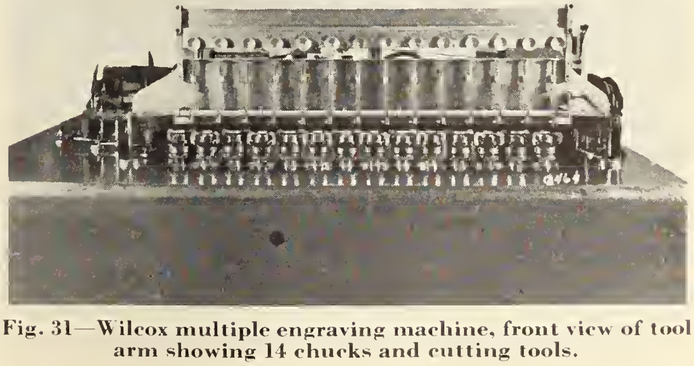

Fig. 31—Wilcox multiple engraving machine, front view of tool arm showing 14 chucks and cutting tools.

and the spindle runs in a compressed-air-lubricated bearing. The spindle revolves at 160-170,000 rpm., and a fine silicon carbide wheel is mounted directly on the end of the rotor shaft, in such a way that it can be used either for edge or face grinding. Grinding is done under a high-power microscope fitted with an eyepiece graticule with fine graduations for measuring the width of flat. With this equipment it is possible to hold the necessary tolerances without undue difficulty.

The life of properly made steel cutting points is two weeks or more of continuous use. For this reason we made no efforts to try natural or synthetic gem points, after finding no manufacturer able to supply them to the requisite tolerances.

The first operation in producing etched graticules is to coat them with a very thin film of a resist composed of an equal mixture of ceresin and carnauba waxes[1], carefully filtered to remove dirt. This mixture is melted in small thermostatically controlled electric melting pots and applied by spinning directly onto the rapidly revolving graticule surface. The temperature of the wax, speed of spinning, and amount applied must be so chosen as to give the right film thickness, as determined by trial and error from behaviour during ruling and etching. Too thin a coat results in the acid etching right through the resist; too thick a coat causes shallow rounded lines which may be impossible to fill. The resist is then baked for 20 minutes at 70 deg. C., to remove any possible porosity, after which the design is ruled as already described. Every graticule after ruling is inspected under a 15 power microscope for ruling defects and defects in the resist which are marked for later re-touching. One graticule in ten is checked under a measuring microscope for correct line width, spacing, and centering of design. The ruled surface of the graticule is then given an additional protecting coat of resist all round the pattern and wherever local retouching is required. This is applied by hand with a small brush. The graticules are next waxed onto small brass plates equipped with handles and these are stacked together with spacers between so that about 20 graticules may be etched at once.

Etching is carried out in a large, shallow, lead-lined tank with a fume-hood overhead. The tank is filled about 6 in. deep with water and the wax pot holding one pound of acid placed in the middle. The acid normally used is 60 per cent hydrofluoric, which is satisfactory for the easily etched barium light flint glass normally used for graticules. If commercial colourless plate or other crown glass is used, a stronger etching action is obtained by adding up to 40 per cent concentrated sulphuric acid and using after the mixture has cooled. The time of immersion varies from 3 to 5 seconds and is critical to less than ½ second. Too long an immersion will result in undercutting of the lines and etching pits from local failure of the resist. Too short a time causes shallow irregular lines which are impossible to fill. After lifting from the acid, the graticules are instantly plunged into the surrounding water and rinsed off. They are then heated off the brass plates and loaded onto racks for removal of the resist. This is accomplished with a minimum of handling in a small degreaser of the trichlorethylene vapour type, after which the graticules are ready for filling.

The filling of fine engraved lines was once one of the most troublesome of all the engraving operations. After experimenting with the materials most commonly used elsewhere—hard black waxes and very quick setting mixtures of metallic oxides and sodium silicate—we have found the best material to be a standard white baking enamel. This appears black in the instrument and is better than other filling agents on graticules which are edge-illuminated for night use. The paint is applied with a cotton wool swab, under a low-power microscope, allowed to harden for a few minutes, and the excess wiped off. The filling is then baked for about 1 hour at 350 deg. F. and any surface residue of paint rubbed off with cotton wool and alcohol. With very fine lines several fillings may be required. The enamel used must be carefully tested, to ensure that the white pigment has no abrasive characteristics which might cause scratches. After inspection under a strong light and powerful magnifier for surface and engraving defects, the graticules are then ready for use.

From consideration of the amount of handling and the many difficulties and variables involved, it should not appear surprising that recovery of engraved graticules seldom exceeds 75 per cent and on large runs of average designs lies between 65 and 75 per cent. The rejects are usually at least 50 per cent for surface defects, some portion of which may be assumed to have escaped inspection after polishing and to have been present at the outset. Production times for the complete engraving operation vary from 5 pieces per man-hour for the simplest cross-line designs to 1.3 for very elaborate ones.

Other Methods

Another important method of engraving combines the photographic and etching techniques in a photo-engraving process which is capable of producing useful results providing line widths are not excessively narrow. We did not use this process ourselves, but in the hands of a subcontractor it was instrumental in supplying us with graticules in quantity during the period in 1941 and 1942 before our mechanical etching equipment was designed and built.

In the method used, the etching resists are a layer of silver and light-sensitive varnish. The silver is first applied chemically, in as thick a coat as is practicable. The silvered surface is then covered with a light-sensitive varnish and an image of the proposed design projected onto it. The portion exposed to light is thus rendered insoluble, and the pattern itself is dissolved out with kerosene, leaving bare the silver below. This silver is then dissolved in nitric acid to expose the glass surface, and etching follows as with wax resists. After etching, the resists are removed—first the varnish with organic solvent, next the silver with nitric acid. Filling then takes place as usual. The films of resist which can be applied in this manner are barely strong enough to withstand the etching action, making this part of the operation perhaps even more delicate and critical than with a wax resist. Also, minute pin-holes in the resist are unavoidable, and must be hand retouched under a microscope before etching. Thus, although photo-engraving is a useful method for intricate designs of varying line widths, it has not proved practicable for widths below .0015 in., and rejects, principally for etching pits and shallow lines, tend to be somewhat higher than where wax resists are used.

Another method which appears promising is to apply a photographic stencil as above, and imprint the design on the clear area by sputtering or evaporating a coating of metallic chromium over the entire surface. The photographic mask is then removed, leaving the chromium pattern behind. Graticules made by this process are far more serviceable than the bichromated glue type, owing to the high tenacity of the chromium pattern, but it is not possible at this time to say whether the method can compete in cost with other methods, and further work is required before it may be regarded as commercially practicable.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

KOOTENAY BRANCH IS INAUGURATED

The twenty-seventh branch of the Institute became a reality on May 17th when the president presented a charter to the Kootenay Branch, with Headquarters at Trail, British Columbia. The occasion was marked by a dinner in the Tadanac Community Hall, presided over by S. C. Montgomery and attended by one hundred and seventy ladies and gentlemen.

The presence of nine councillors from other parts of Canada as far apart as Halifax and Victoria as well as that of Mr. Gaherty from the Montreal Branch, was an interesting and unusual feature. The presence of a great many non-members was a much appreciated compliment both to the branch and the Institute. The participation of Dr. C. A. H. Wright, vice-president of the Chemical Institute of Canada, added to the programme a graceful touch of inter-society goodwill.

In introducing the president, R. W. Diamond, vice-president and general manager of the Consolidated Mining and Smelting Company of Canada Limited, expressed the wish that the branch would serve a useful purpose by rounding out the representation of societies in the district. He referred to the excellent service already rendered by the Canadian Institute of Mining and Metallurgy and the Chemical Institute of Canada to their specialized groups and believed the Engineering Institute would be able to do a similar work for the group represented by its membership. He welcomed the president and all the other out-of-town guests and extended to them an invitation to return often.

Lorne A. Campbell, president and general manager of the Kootenay Light and Power Company, gave a condensed outline of the history of the power development on the Kootenay river, referring to personalities and events that highlighted that period. His long association with the work and his excellent memory provide the material for an exciting story of engineering achievement.

Letters and telegrams from officers of the Institute, the branches at Halifax, Saint John and Montreal, the Dominion Council, and the Associations of Professional Engineers of Saskatchewan and Nova Scotia, were read by the president, expressing congratulations and good wishes.

The new branch starts off under excellent circumstances. Already with a corporate membership of about thirty and a large body of potential members, it should become a useful agency in the neighbourhood. It is fortunate in the selection of its first officers, which of itself assures its success. Chairman, S. C. Montgomery. Executive, E. Mason, C. E. Marlatt, R. Pollard, J. P. Coates. Sec-Treasurer, J. V. Rogers.

A BRANCH FOR CORNWALL

At the May meeting of Council, held in Trail, British Columbia, an application for a charter was received from a group of members in Cornwall, Ontario, and was approved.

The application revealed that a canvass had been made and that in addition to the existing members, twenty others had expressed their wish to join if a branch were established. There are many industries in the area, most of them employing several engineers, so Cornwall should be a good field for service.

It is expected that the formal inauguration of what will be the twenty-eighth branch will take place in the fall.

POSITIVE APPROVAL

All the proposed amendments to the by-laws, submitted to the corporate membership in April, have been approved with sweeping majorities.

It is doubtful if a clearer result has ever been shown on any Institute by-law proposal. Three of the proposals carried with majorities of 96, 97 and 98 per cent, and the fourth, relating to increase in fees, carried with a majority of approximately 80 per cent. The total number of ballots cast was 2,371, which, too, is an unusually good showing.

It will be a great satisfaction to the committees that worked so long and diligently studying the situation, to know that the membership has supported them so handsomely. Special congratulations are due to the Membership Committee, the Finance Committee and the Board of Examiners, and due also are the thanks of the membership for their untiring efforts.

These amendments are among the most important ever advocated. They were a natural corollary to the expansion of the Institute and the activities of the profession. The generous approval of the proposals is a recognition of that fact. The Institute now is in a position to meet the challenge of its opportunities, and to continue on an expanded basis its service to the profession.

According to the by-laws, all amendments " shall take effect forthwith ". This will mean a great activity at Headquarters. The sorting out of overage Students and Juniors, of Members who meet the new qualifications for automatic election to Life Membership, the appointment of the new Admissions Committee, the preparation of material for study as a basis of its operation, and the reprinting of all by-laws, will present some complex problems, but it is expected that everything will be in full running order within a reasonable length of time.

It is hoped that the increased revenue which, of course, will not be available until next year, will quickly bring about many of the desired improvements, including an enlargement of branch activities. The new scale of fees will increase branch income by about fifty per cent, which will be very welcome to many branches.

All in all it looks as though the Institute had passed through the door of opportunity and was well on the way to new levels of accomplishment.

MARITIME PROFESSIONAL MEETING

Arrangements are progressing satisfactorily for the Maritime Professional Meeting which is to be held at The Pines, Digby, N.S., on September 5th, 6th and 7th 1946 under the joint auspices of the Institute and the provincial professional associations. A large attendance is expected from all branches of the Institute in the Maritimes as well as from other provinces.

Special 21-day railway tickets to Digby, at the rate of single fare plus one tenth, are available to members in Ontario and Quebec west of Montreal, upon application to local railway agents. Members in other locations can obtain tickets at the rate of single fare plus one-third upon presentation of an identification certificate which will be mailed to them in the course of the next few weeks.

A local committee has been formed made of representations of the Maritime branches and of the Associations under the chairmanship of Larry Mitchell of Halifax.

No president has undertaken, on behalf of the Institute, a single continuous itinerary the length of the one started by Mr. Hayes in Halifax on April 24th, which gets him back to his home almost eleven weeks later. He visits all branches from Toronto west, participating in forty meetings of one kind or another, including three council meetings. At the time of writing he is still on the road, but this brief account will tell something of where he has been and what he has done up to now.

Toronto

The presidential party left Montreal for Toronto on the evening of April 25th, and included, besides President and Mrs. Hayes, Councillor G. J. Currie of Halifax, the general secretary and the assistant general secretary.

The branch executive was host to the president and his party at dinner in Hart House on the 26th, and a successful branch meeting was held afterwards under the chairmanship of E. A. Cross.

Saturday, April 27th, a regional meeting of Council was held at the Royal York Hotel, convening at 10.00 a.m. and adjourning at 5.45 p.m. At the noon recess, members of Council were guests of the Toronto Branch executive for lunch at the Engineers' Club.

The council meeting was presided over by President Hayes and was attended by the two Ontario vice-presidents and by councillors from most of the Ontario branches. In addition, there were present several members of council from Montreal and Quebec, as well as many past-officers of the Institute in Ontario, and members of the executive of the Toronto Branch. Problems of special interest to members in Ontario were discussed at length and, in this respect, the meeting proved to be particularly useful.

Hamilton

On Monday morning, April 29th, the presidential party —minus the general secretary who had returned to Montreal—motored to Hamilton with Vice-President and Mrs. Sisson. Upon arrival they were greeted by Branch Chairman A. R. Hannaford and Branch Secretary L. C. Sentance, and taken over to the city hall where they met with the mayor and the board of control. A pleasant feature of the visit at the city hall was the signing of the visitors book.

The chairman of the branch, with the secretary and the Hamilton councillor, entertained the visitors at lunch at the Royal Connaught Hotel. In the afternoon the party went through the plant of Canadian Westinghouse, under the able guidance of Larry Sentance.

The branch meeting, under the chairmanship of A. R. Hannaford, was held in the refectory of McMaster University where dinner was served. In addition to several members of the branch, there were present engineers from the Grand Valley Group and the immediate past-chairman of the Winnipeg Branch, C. P. Haltalin.

Toronto Branch. Left to right: Vice-president C. E. Sisson, President J. B. Hayes, Chairman E. A. Cross.

At Niagara Falls. Mrs. and Mr. A. G. Herr, Miss Betty Inglis (now Mrs. P. A. Pasquet), Mr. Pasquet, Mrs. J. H. Ings, Mrs. W. D. Bracken, Mrs. Hayes, President J. B. Hayes, Mrs. Manock, P. E. Buss, W. D. Brownlee, and W. R. Manock.

Niagara Peninsula

The next morning, April 30th, the party motored through the blossoming peninsula to Niagara Falls where they arrived for lunch at the General Brock Hotel with the executive of the branch and their ladies. In the afternoon, the entire group were shown the beautiful sights of the district in a motor excursion which took them to the Queenston power plant, the Welland canal, Thorold where a short visit was made to the Spun Rock Wool plant of Councillor P. E. Buss, and finally to St. Catharines where a dinner meeting of the branch was held at the Leonard Hotel.

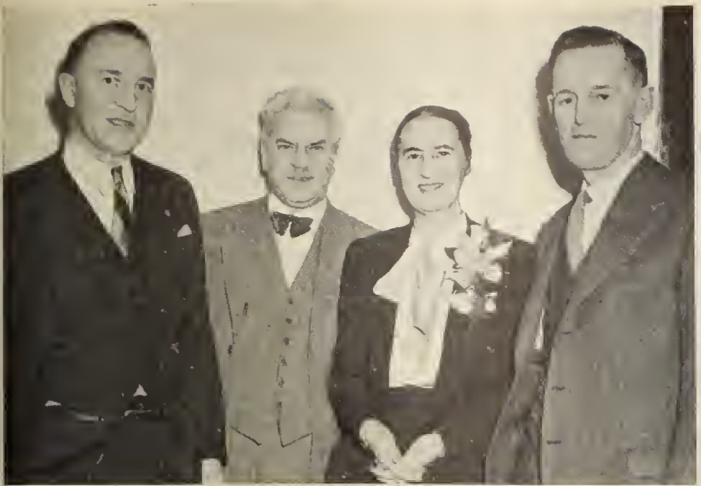
In the absence of Chairman Ings, the meeting was presided over by Vice-Chairman W. D. Brownlee and was very well attended. Among the guests at the head table were Past-President J. A. Grant, Vice-President W. R. Manock, Councillor J. R. Dunbar from Hamilton, and Councillor P. E. Buss.

After the meeting the president's party returned to Niagara Falls for the night and, the next morning, Mrs. Ings graciously drove them to Welland where they entrained for Windsor.

Border Cities

At the station in Windsor, the president and his party were met by the chairman and the vice-chairman of the branch, F. J. Ryder and A. D. Harris. In the afternoon, accompanied by members of the executive and their wives, they went through the Ford Motor Company plant under the guidance of the chief engineer, Branch Vice-Chairman Harris. The visitors marvelled at the achievements of engineering organization displayed everywhere in the plant and watched with great satisfaction the cars coming out of the production lines.

Preceded by a reception, a dinner meeting of the branch was held at the Prince Edward Hotel under the chairmanship of F. J. Ryder. Perpetuating a time-honoured custom in the branch, A. C. Pasini, chairman of the Detroit Section, and J. W. Armour, chairman of the Semi-Annual Meeting Committee of The American Society of Mechanical Engineers, were head table guests and addressed the meeting.



Border Cities Branch. Chairman F. J. Ryder, President and Mrs. Hayes, Councillor G. J. Currie.

London

On the morning of May 2nd, the presidential party left Windsor by train for London where they were guests of the branch executive for lunch at the Hotel London. In the afternoon the branch chairman, J. H. Johnson, chief engineer of the Borden Company, took the presidential party to near-by Belmont where they were privileged to inspect one of the most modern dairy and powdered-egg plants.

The branch meeting, with the ladies present, was held that night at the London Golf and Country Club and was preceded by a most enjoyable reception and dinner. Councillor J. A. Vance, who is chairman of the campaign for the Harry F. Bennett Educational Fund, was able to announce that the London Branch had already trebled its objective, with the canvassing incomplete.

Woodstock

The next morning, May 3rd, Councillor Vance drove the party to Woodstock where he entertained them at lunch with a group of members of the Institute and prominent local citizens. In the afternoon, a visit was made to the Truck Engineering Company where the guests were received by Mr. Verne King, president. After a short visit to the farm of Councillor Vance, President and Mrs. Hayes, with Councillor Currie, returned to London where they entrained for Windsor in the evening.

The presidential party stopped at Woodstock as guests of Councillor J. A. Vance. The party is shown here after inspection of the plant of Truck Engineering Company. Left to right: G. J. Currie, Mrs. Vance, Mrs. Hayes, President Hayes, Mr. Verne King of Truck Engineering Company and J. A. Vance.

The dinner meeting of the Border Cities Branch was honoured by the presence of American guests.

Through the United States to Winnipeg

Leaving Windsor on May 4th the party, with the general secretary now included (replacing Louis Trudel), journeyed through Detroit, Chicago and Minneapolis to Winnipeg, stopping over in each place for a short time.

At Winnipeg the branch executive entertained the group at dinner on the 8th, with the branch meeting being held at noon on the 9th—G. R. Fanset, branch chairman, presiding. Later in the day, Past-President Dean Fetherstonhaugh met the party at the university, and showed them over the engineering building.

Saskatoon

At Saskatoon the president arrived on Convocation Day, May 10th, and along with Mr. Currie was a head table guest at the alumni banquet. On the following day, a tour was made of the university grounds and the engineering building. At noon that day a meeting with members was held at the Bessborough Hotel with E. K. Phillips, vice-chairman, presiding. Vice-President Dean R. A. Spencer introduced the president, drawing much of his material from the fact that both he and the president and many others present were maritimers.

Edmonton

The growing city of Edmonton was reached on Sunday, May 12th, and that afternoon a delightful tea was given at her home by Mrs. J. W. Porteous, the wife of the newly elected chairman of the branch. On Monday noon, the executive met with the party at the university staff dining room after a tour of the engineering facilities. That afternoon the president, Mr. Currie, and the general secretary spoke to a group of ninety students—all of them returned men who had started their engineering courses in January.

That evening in the main dining room of the Hotel MacDonald a large number of members and their wives joined with the president for dinner, Past-Chairman F. R. Burfield presiding in the absence of Professor Porteous who was in Ottawa. At this point, Mr. G. A. Gaherty of Montreal, chairman of the Institute Committee on Prairie Water Problems, joined the presidential group for part of the tour. That night the president's party moved to Calgary.

Lethbridge

It was an unusual experience to pass right through Calgary without stopping, but the party left by motor for Lethbridge immediately after breakfast, and arrived there early in the afternoon of the 14th. A most delightful dinner meeting was held in the Marquis Hotel at which Chairman P. E. Kirkpatrick did the honors.

Robert Lawrence gave leadership in some of the lustiest community singing the Institute has ever heard at any branch. He would be a great asset at any branch meeting. Several members from Calgary were present as was also

At the regional Meeting of Council held at Trail, B.C. Seated, left to right: P. M. Sauder, Kenneth Reid, Miss M. McLaren, L. Austin Wright, President J. B. Hayes, S. C. Montgomery, G. J. Currie, J. P. Coates. Standing, left to right: C. S. Clendening, Ernest Mason, R. A. Spencer, A. H. W. Busby, C. W. Carry, R. Pollard, Ernest Smith, J. G. MacGregor, Stewart Young, J. V. Rogers

Mr. G. A. Gaherty of the Montreal Branch, and J. G. MacGregor, Calgary councillor, both of whom travelled with the party from Edmonton to Trail.

The Trail Area

The party, including Mr. Gaherty, spent four days in this area, detraining on the first day at South Slocan where they were guests of Mr. Lorne Campbell, vice-president and general manager of the West Kootenay Power and Light Co. Ltd. Here they visited the unique chain of power developments that so efficiently harnesses the Kootenay river, all of them being built over several years under the supervision of Mr. Campbell. Their story is one of the outstanding sagas in the history of Canadian engineering and industry.

At Trail an extensive programme was arranged whereby all visitors could see something of the country and a lot of the industry. Emphasis was placed on the plants and processes producing the four main products—lead, zinc, acid and chemicals, the latter largely in final form as a nitrous fertilizer, developed as a by-product of the gases formerly escaping through the stacks.

Three social events which rounded out the programme for the visitors were provided by Mr. Diamond. One was a luncheon at the plant, another a dinner at the Trail-Rossland golf club, and the third a reception at his home previous to the inaugural dinner. The latter was held in the garden under summer weather conditions, which were almost fantastic to the easterners. High on the banks of the Columbia river, surrounded by a luxurious growth of plants, flowers and trees, it was an ideal setting for such an event.

Council Meeting

On Saturday the 18th a regional meeting of Council was held in the Board Room of the Consolidated Mining & Smelting Company of Canada, Ltd., with the president in the chair. Every branch but two in Zone A was represented, and a most useful discussion was obtained on every subject. Representatives of the Association of Professional Engineers for both Alberta and Saskatchewan were also present. From every point of view this was one of the most successful regional meetings ever held any place.

Okanagan Valley

With the party augmented by the presence of Kenneth Reid, councillor from Victoria, a luncheon meeting was held in Kelowna on May 20th, attended by twenty-two engineers. The chair was occupied by F. W. Groves. The party then motored through the beautiful valley to Penticton to once again pick up the railway.

Vancouver

The next morning the group was greeted in Vancouver by the officers of the Vancouver Branch. That night there was a meeting with the executive of the branch and the following evening was spent with the branch at the pavilion in Stanley Park, with Ralph Pybus in the chair. At noon the same day the president's party were guests of the officers of the Association of Professional Engineers of British Columbia, under the chairmanship of the president Mr. Scott.

Victoria

At Victoria the branch meeting was held in the Empress Hotel on the evening of May 27, with chairman S. R. Weston presiding. For this function the ladies were in attendance, but another meeting for members only was held the following evening at the Oak Bay Municipal Hall, at which the affairs of the profession and the Institute were discussed at great length. A meeting with the executive was held at noon at the Union Club on the same day as the dinner.

Turning to the East

From Victoria the itinerary brought the party back to the mainland and to a prolonged return home. Unlike previous presidential tours, this one left many visits for the return journey, including attendance at the Semi-Annual Meeting of the American Society of Mechanical Engineers at Detroit on June 17th, a Council meeting in Montreal on the 22nd, and a visit to the Saguenay Branch. This portion of the trip comes too late to be included in this account, but will be described in the July issue.

RESULTS OF BALLOTS FOR AMENDMENTS TO BY-LAWS

We, the undersigned, having been appointed scrutineers to canvass the ballots for the proposed amendments to the by-laws, certify that the ballots have been duly counted with the following results:

Total number of ballots received	2371
Invalid ballots	28
Spoiled ballots	14

Ballot No. 1—(Proposed amendments to Sections 7, 9, 10 and 23):

Yes	2193	
No	103	
Did not vote	33	
Spoiled ballots	14	
Invalid ballots	28	
		2371

Ballot No. 2—(Proposed amendments to Section 45 and a New Section 50A):

Yes	2226	
No	40	
Did not vote	63	
Spoiled ballots	14	
Invalid ballots	28	
		2371

Ballot No. 3—(Proposed amendments to Sections 21, 22, 26 and 28):

Yes	1780	
No	479	
Did not vote	70	
Spoiled ballots	14	
Invalid ballots	28	
		2371

Ballot No. 4—(Proposed amendments to Section 66):

Yes	2204	
No	72	
Did not vote	53	
Spoiled ballots	14	
Invalid ballots	28	
		2371

Respectfully submitted,

Fraser S. Keith, M.E.I.C.,
L. C. Jacobs, M.E.I.C.,
Gerald N. Martin, M.E.I.C.,
Scrutineers.

SALARY SCHEDULES

Not long ago the Junior Section of the Toronto Branch recommended to Council that salary schedules as recommended by various organizations be published in the *Journal*, as a means of informing employers and employees alike of proper rates. Under Council's instructions the first schedule is reproduced herewith. It is that of the Association of Professional Engineers of the Province of Ontario.

It is only fair to point out that there is no schedule to which employers must adhere, nor is there any that has received the unanimous support of all employees. Actually, there is quite a variation in schedules which is probably confusing to all concerned. It should advance the interests of the profession if some one set of figures could be prepared that would be acceptable at least to all the employees.

It is not the purpose of the *Journal* to comment either favourably or otherwise on any schedule which is printed in this series. Some such comments were made in the October, 1944, issue and probably there is nothing to be gained now by repeating them, but, if the members wish to comment, the *Journal* will be interested in receiving communications from them.

MINIMUM ANNUAL COMPENSATION FOR THE EIGHT PROFESSIONAL GRADES IN AN ENGINEERING ORGANIZATION

As compiled and recommended by the Association of Professional Engineers of the Province of Ontario.

Professional Grades	*Annual Salary*		*Annual Increase*
I	From $2,400	to $2,850	$150
II	2,850	3,450	150
III	3,450	4,050	150
IV	4,050	5,050	250
V	5,050	6,250	300
VI	6,250	7,750	300
VII	8,000	9,500	300
VIII	9,700	and up	and up

Professional Grade I—To include all junior positions in which professional engineering work is done under supervision, with opportunity for the use of some independent judgment.

Professional Grade II—To include all positions involving the performance of professional engineering duties under general supervision, with limited latitude for independent, unreviewed actions and decisions; to perform engineering work of intermediate professional difficulty and responsibility, and to exercise independent judgment.

Requirements—Three years' successful experience in engineering work with demonstrated aptitude and capacity for increased responsibilities.

Professional Grade III—To include all positions involving the performance of professional engineering duties under general supervision, and with considerable latitude for independent, unreviewed actions and decisions; to perform engineering work of substantial professional difficulty and responsibility; to exercise independent judgment and, in certain cases, to supervise the work of others.

Requirements—Five years' successful experience in engineering work, with demonstrated aptitude and capacity for increased responsibilities, one year of which must have been in responsible charge of work.

Professional Grade IV—To include all positions involving the performance of professional engineering duties under general supervision, and with wide latitude for independent, unreviewed actions and decisions; to have responsible charge of a subdivision of a major engineering organization; to perform difficult professional engineering work requiring technical training, previous experience, recognized leadership, and the exercise of independent judgment.

Requirements—Eight years' successful experience in engineering work, with demonstrated aptitude and capacity for increased responsibilities, three years of which must have been in responsible charge of work.

Professional Grade V—To include all positions involving the performance of professional engineering duties under general supervision and with wide latitude for independent, unreviewed actions and decisions; to have responsible charge of a division of an engineering organization; to direct a staff on design or construction or to supervise an investigative survey or direct extensive studies of projects.

Requirements—Ten years' successful experience in engineering work, with demonstrated aptitude and capacity for increased responsibilities, four years of which must have been in responsible charge of work.

Professional Grade VI—To include all positions the duties of which involve the responsibility for a major division in a large engineering organization.

Requirements—Extensive successful experience in engineering work with demonstrated aptitude and capacity for increased responsibilities, six years of which must have been in responsible charge of work.

Professional Grade VII—To be the technical and administrative head of an extensive engineering organization, such as the principal assistant to the chief engineer.

Requirements—Extensive successful experience in engineering work, eight years of which must have been in responsible charge of important work, of which four years shall have been in an administrative capacity involving the direction of the work of a major technical organization.

Professional Grade VII—To have entire charge of and be responsible for all the functions of a major engineering organization.

Requirements—Extensive successful experience in engineering work; high order of executive and advisory service; evidence of success and demonstrated outstanding professional attainments.

BUILDING CANADA'S EXPORT TRADE

The wisdom of the policy outlined in the following letter, from an official of the Department of Trade and Commerce, should appeal to everyone. Engineers, who are so directly concerned with industrial prosperity, should miss no opportunity of enlightening the public on the motives which lay behind the educational campaign undertaken by the Department.

Department of Trade and Commerce

Ottawa, April 27, 1946.

The Editor,
The Engineering Journal.

Dear Sir:

You may have seen the first advertisement of a campaign that has been launched by the Foreign Trade Service of the Department. Since it is something new in our

Departmental advertising, we should like to explain the thinking that lay behind it and the other advertisements to follow.

Statistics of Canada's experience over a number of years support the view that Canadian prosperity during the critical years ahead, will depend in large measure upon the success of our efforts to market a good portion of our production in other countries. For this reason we think that the importance of foreign trade should be brought home to the public of Canada.

The time element enters, because if we wait until our production has satisfied domestic demand, many markets will be lost to us. It may be desirable, therefore, to forego some comforts, luxuries and replacements in the next couple of years, in order that we may export enough to establish our goods in the markets of the world.

In a recent speech at Montreal, the Hon. James A. MacKinnon, Minister of Trade and Commerce, referred to the importance of the time element when he said: "This is a testing time for Canadian business and the Canadian people. What is done in the immediate future—or equally important, what fails to be done—will fix the pattern of our commercial relations for a long time to come".

So in this campaign we want to achieve two things; to suggest the wisdom of doing without a few things for a while, should this be necessary, and to induce competent producers to set aside a share of their output for export. Accordingly, we are running two separate but allied advertising campaigns, one in newspapers and magazines, and one in business publications. In both we have tried to follow the most effective advertising practice, by making our material attractive and our message easy to understand. Our theme is: "One-third of your dollar"—the proportion of our national income conservatively estimated as earned, directly or indirectly, by foreign trade. We have done our utmost to avoid the stilted type of governmental announcement, because we want the widest readership possible.

As we believe this to be a national project of prime importance, any suggestions or comments you may care to make will be welcomed as a means of improving our campaign.

PROFESSIONAL ASSOCIATIONS

A REVIEW OF THE FOURTH REPORT OF THE FABIAN RESEARCH COMMITTEE

By E. P. Muntz, M.E.I.C.
Mem'er of Institute Committee on Professional Interests

A comprehensive special supplement under the title "Professional Associations" was published with the *New Statesman* in 1917. It might be reprinted as a text book worth reading by everyone interested in professional Associations and particularly by those who direct the course of professional organizations anywhere.

While written with specific application to the United Kingdom it should be of special interest in Canada at the present time, in view of the growth of the older organizations, the formation of new, and the discussion which has arisen regarding the advisability of an over-riding body in which all scientific organizations are represented. It is evident that the multiplicity of organizations in Canada had its counterpart in the United Kingdom thirty years ago. Practically every problem with which the engineering profession has been wrestling in Canada had appeared in the United Kingdom by 1917.

The special supplement contained the draft of the Fourth Report of the Fabian Research Committee investigating "The Control of Industry". It was compiled by Sidney and Beatrice Webb, with the section on professional artists by G. B. Shaw, and dealt directly with the question "What is to be learnt from the Professional Associations of Brainworkers as to sphere of control by Vocational Organizations?"

Practically every paragraph is replete with information. The following notes are largely extracts from the forty-eight 9" x 12" pages. They do not pretend to give more than a bare outline. The text must be read to be appreciated fully.

It is evident that some at least of those who "leaned to the left" thirty years ago might be considered now as leaning somewhat "to the right".

Introduction

Page 1 Some interesting general information is given including a definition of a profession. "A profession is a vocation founded upon specialized educational training, the purpose of which is to supply disinterested counsel and service to others for a direct and definite compensation wholly apart from the expectation of other business gain".

Classes of Professional Associations

Professional associations are divided into five classes; the Learned Professions, the Technicians of Industry, the Technicians of the Office, the Manipulators of Men, and the Professional Artists. The draft report analyses each class, deals with "The Success of Professional Organization; with its Shortcomings and Limitations", and states certain conclusions. This review deals primarily with "Professional Organization among the Technicians of Industry". Some short comments are added.

Technicians of Industry

There were no organizations of engineers, architects, surveyors, chemists, etc., earlier than the nineteenth centry. All started as scientific societies, and their ostensible purpose was, and still mainly is, the improvement of technical processes. These organizations are closely connected with the direction and management of industry and with Employers' Associations. Some members combine professional qualifications with ownership of instruments of production and with the employment of subordinate labour in pursuit of personal profit.

Page 4 "As we shall see, it is difficult to draw exact lines of division between Professional Associations and what are, in the same industry, essentially Employers' Associations on the one hand, and Trade Unions on the other".

Engineering

Page 20 "In the present century" (first seventeen years) "there seems to have been a rush of specialized organizations"—referred to in the draft as "Subject organizations".

Page 20 "The majority of Professional Associations of the Technicians in the Engineering Industry partake more of the character of Subject Organizations than of Trade Unions; though they are always attempting directly or indirectly, to secure a monopoly of work for their own members".

Page 20 "The Consulting Engineer paid by fees and working successively for innumerable customers, finds himself increasingly in competition, not only with the Contracting Engineer, who is himself a manufacturing employer, and who undertakes the production of commodities for profitable sale; but also with the Salaried Engineer who gives his whole time as a professional to an individual employer who is usually a public authority or Joint Stock Corporation ".

Page 20 " The leading feature of the Professional Organization of Engineers within the United Kingdom is thus the multiplicity of socities mostly distinguished from one another by specialization. . . . "

Page 21 " There may well be, in the engineering societies of today, with their frequently duplicated membership, a complete chain of individuals belonging to two or more organizations linking up the Institution of Civil Engineers, the premier organization of brainworkers, with the Amalgamated Society of Engineers, the premier organization of manual workers ".

Page 21

Architects

" In the case of the architects we have a profession which has gradually withdrawn itself from all pecuniary responsibility for the business enterprise of erecting buildings, and has taken up the position of supplying—either for a fee (or, in a minority of cases, for a salary)—nothing but advice and plans, which are carried out under the architect's supervision, either by a building contractor, or by the 'Works Department' of a corporate body, or a landed proprietor. The Architectural Profession, now about 12,000 strong in the United Kingdom, is distinguished from the engineering and some other vocations by its near approach to unity of professional organization, there being only one main society, the Royal Institute of British Architects, with allied local bodies, together with a smaller and newer second organization, the Society of Architects, aiming specially at statutory registration ".

Surveyors and Chemists

The professional associations in both groups are described.

The Success of Professional Organization; With Its Shortcomings and Limitations

Page 36 " We have presented in some detail the facts with regard to the principal Associations of Professionals in order to enable the formulation of general conclusions as to the causes and results of this remarkable revival of Vocational Organization in the nineteenth and twentieth centuries. Apart from Law and Medicine, this modern Vocational Organization is, as we have seen, entirely a creation of the past hundred years. What is remarkable is the rapidity and continuity of its growth, not merely in the aggregate membership of the various Professional Associations—which we put, in the United Kingdom of today, at more than a quarter of a million—but in the extension of organization to one class of brain-workers after another ".

The three separate motives for professional organizations are given as the creative impulse, the fellowship impulse, and the possessive impulse.

The conditions favouring the growth of vocational organizations among brainworkers are stated as chiefly more definite control by Government, such as through General Medical Act, various Public Health and Registration Acts, National Insurance Act, Pharmacy Act, etc.

Page 37 " This may be less true of engineering, but even in this profession the great Institutions of Engineers, like the leading professional organizations of accountants and actuaries, owe a large part of their strength to their increasingly frequent recognition by the State for public purposes. *In fact, the State, whether acting through Parliament, the National Departments or Local Government, as it has grown in the scope and complexity of its operation, has been steadily making more and more use of, and therefore extending the influence and the power of the Professional Organizations of brain-workers, as a corrective to that development of bureaucracy which the collective control and conduct of public affairs inevitably necessitates*". (Italics by reviewer).

A sub-section is devoted to each of the following: the Government of a Vocation, the Entry into the Profession, the Professional Training Required, Professional Remuneration, the Organization of the Service, Professional Ethics, the Militant Methods of Professional Associations, the Demand for Statutory Registration of Qualified Practitioners, Statutory and Voluntary Organization. All are discussed at some length.

Under Statutory and Voluntary Organization there are three divisions, the Unit of Organization, What is a Vocation, and The Government of Professional Organizations.

Conclusions

Page 45 " We may now sum up the conclusions to be drawn, so far as the brain-working occupations are concerned, from the history and experience in this country (United Kingdom) of the participation by Professional Associations in the control of their services ".

(a) *Modern Growth and Development:*

" . . . self-governing Associations of the brain-workers in an ever-increasing number of specialized professions sprang up in new forms in the course of the nineteenth century; and that, during the last few decades, these Associations have everywhere grown in membership and power, and have obtained a constantly increasing recognition as organs of control by the Government and public opinion ".

(b) *Impulses and Motives:*

Page 45 "Analysis of the Origin and Development of these Associations shows that there have been at work in their formation three main impulses . . . ", as noted above.

(c) *Conditions of Development:*

Page 46 " Changes in social and economic environment have resulted from increasing consciousness of a collective interest distinct from that of individuals, and the decay of belief in their efficacy to secure that freedom of competition among individuals ".

Page 46 " The organization of any one profession depends, in fact, on their being a sufficiently broad difference in capacity for the performance of the particular service, between its professional practitioners on the one hand, and either the ordinary cultivated man or a professional of another kind, on the other ".

(d) *The Unit of Organization:*

Page 46 " If we survey the growth in membership and increase in power of professional associations, we see everywhere a curious intermingling of statutory and voluntary organization.

" In so far as organization is left to voluntary association, experience shows that the members composing the unit of association must have essentially identical interests on all the main issues of policy. This identity may depend on the possession of a common technique and training, or on engagement by the same type of employer, or on a common method of remuneration, or on an identical organization of the service, several of these conditions being usually combined in each case. The fact that all these conditions have been, during the past hundred years, perpetually changing, and also shifting in relative importance, accounts for the characteristic impermanence of voluntary associations of brain-workers, to constant supersession of one association by another within the same profession; and the rising and falling in relative importance of the associations that endure. The result has so far been that the voluntary organization of each profession has tended, with every increase in the diversity of the service, to be perpetually breaking up into new units, corresponding with new group interests ".

Then following sub-sections (e) to (k), all with pertinent information under the titles, Demarcation Disputes, The Methods of Professional Associations, The Devices of Professional Associations, The Statutory Register, The Claim to Professional Self-Government, The Government of a Profession, Results of Professional Organization.

Page 47 (l) *The Sphere of Professional Organization:*

"A survey of the whole field makes it clear that there is a very real, and, as we venture to think, an ever-widening sphere for the Professional Organization of brain-workers in the Control of Industries and Services in the Modern State, although not exactly the sphere to which its most enthusiastic adherents have aspired.

"We suggest that where Professional Organization has shown itself to be of the greatest use to the community is where it has been inspired by the Creative Impulse, with which the Fellowship Impulse is often associated. It is in the main to the individual and collective activities of the existing body of practitioners — these activities being heightened, as we have seen, by Professional Association—that the community owes most of the continuous advance in the science and art of a profession; because these practitioners alone enjoy that combination of knowledge, training and daily opportunities for discovery upon which progress normally, although by no means invariably, depends.

Page 48 "Professional Organization is, moreover, indispensable as a defensive force. Experience demonstrates that it is required for protection, alike of the individual practitioner against the economic oppression and lay tyranny to which he may otherwise be subjected, and of the profession itself against conditions and restrictions which would withhold from it the necessary means of training and improvement, deny to its rank and file members an appropriate Standard of Life, and prevent the most efficient service ".

"What is required is some sort of composite authority, such as the Engineering Standards Committee, in which there can be represented, not only the knowledge and desires of the profession, but also the interests of the consumers or users of the particular service, the larger and more enduring interests of the State, and even the knowledge and desires of other professions which may be indirectly concerned. The first function of Professional Organization, whatever its form, in connection with the government of its service, is, in our view, to supply duly authorized representatives of the profession to such a composite authority as we have described.

"The second function of Professional Organization in connection with the government of its service, and, in our view, the most important of all, is one which has so far scarcely been claimed by Professional Associations. This is the function of independent authoritative criticism of the Government of the State, alike in its central and its local administration, and of responsible advice both to the Legislature and the Executive, on matters in which the profession has special competence. One of the gravest drawbacks of the bureaucratic administration which is involved in all enterprise on a large scale, and therefore especially in Government and in Consumers' Co-operative Societies, is the immunity from expert criticism which is now secured by official secretiveness and departmental discipline, and the practical monopoly of access to the mind of the Minister or governing committee possessed by the departmental chiefs. We know of no effective organ of criticism except that which might be afforded by Professional Organization.

(m) *The Unsolved Problem of Professional Organization:*

Page 48 "*The most intractable problem of Professional Organization, and one for which we can offer no complete solution, is how to discover, in each profession and in each branch of a profession, the most effective unit of organization, and the most appropriate method of formulating its general will, alike as an organ of expression and criticism, and as an instrument for supplying representatives to composite authorities.* (Italics by reviewer). The simple solution of asking all the registered or recognized practitioners to elect a Council representing the entire profession has two capital drawbacks. It submerges all the expert specialists, and all the newer and smaller sections, in the undistinguished mass of the rank and file pursuing the old routine. Moreover, even when provision is made, in one or other way, for enabling these minorities to have a share in any pronouncements of the Council, the result is blurred and ineffective—in the compromise between the different elements the specialization of knowledge and intensity of emotional experience, or just what is most valuable in Vocational Association, is inevitably lost. Finally, the characteristic impermanence of Professional Associations, which results naturally from the constant shiftings of a progressive technique and a changing social environment, makes it difficult, without an objectionable stereotyping of that which is in its nature variable, to base upon these Voluntary Associations any formally constituted Professional Council which is intended to be permanent. The only inference we can draw is that the constitution of any Professional Council, whether statutory or voluntary, must necessarily be complicated, ought to be elastic, and will need to be perpetually revised ".

Reviewer's Comments

The authors infer that there may be a place for an overriding council and point out some of the outstanding difficulties. Attempts over the past thirty years have shown that such councils do not enjoy wide and continuing support. There is no single successful example of such a council either in the United Kingdom or the United States.

An informal Presidents' Conference Committee has been found, in both countries, to be the best vehicle for developing co-operative or complimentary policies between a small or large number of organizations on matters of mutual interest.

A Parliamentary and Scientific Committee is functioning in London with some success. It appears worthy of study as a type of vehicle for assisting such " composite authorities " as our national and provincial governments in Canada.

Finally, these notes give some of the highlights only of this valuable and interesting document. They do not pretend to be a complete review. It is hoped that they are sufficiently complete to show that there is some very sound thinking concerning professional associations available in this supplement and that it is as applicable to conditions in Canada today as for conditions in the United Kingdom thirty years ago.

The *New Statesman* for 1917 is not now readily available. There are, at least, two copies in Canada, one is in the Parliamentary Library at Ottawa, and the other in the University of Toronto Library.

The Institute has been given a few photostat copies. Those who wish to read the complete text may borrow a copy through the Institute's library.

U.S. ENGINEERS PROGRAM OF CONTROL FOR GERMAN INDUSTRY ADOPTED BY ALLIED CONTROL COUNCIL

SIMILAR RECOMMENDATIONS FOR JAPAN IN PREPARATION

At the request of the U.S. Departments of War and State to formulate technological, non-political recommendations for the industrial disarmament of aggressor states, the National Engineers Committee of the Engineers Joint Council, representing five national engineering societies in the United States, is preparing a suggested program to eliminate the industrial war potential of Japan, it was recently announced by Col. Carlton S. Proctor, Chairman of the Committee for this study and report.

The Committee's report, embodying a suggested program based on engineering, industrial and economic factors, is expected to be completed in June. It follows a similar report for the permanent demilitarization of Germany submitted in September, 1945, and recently accepted and announced by the Allied Control Council in Berlin.

16 Committees of Specialists

Col. Proctor stated that sixteen working committees composed of American engineering and technological specialists in their respective fields, all of them highly placed in American industry, are cooperating in the preparation of the report and the recommendations which are now well along toward completion. The program will deal with the limitation of metal products, chemicals, power, mineral resources and other elements of war-making potential.

The study is under the direction of Col. Proctor, Dr. Harry S. Rogers, President of the Brooklyn Polytechnic Institute, and Sidney D. Kirkpatrick, editor of McGraw Hill Publications.

The Engineers Joint Council is a committee of the American Society of Civil Engineers, American Institute of Mining and Metallurgical Engineers, American Society of Mechanical Engineers, American Institute of Electrical Engineers and the American Institute of Chemical Engineers. These societies comprise a national membership of about 85,000. Malcolm Pirnie, Past President of the American Society of Civil Engineers, is Chairman of the Council and Robert M. Gates, Past President of the American Society of Mechanical Engineers, is Vice Chairman.

Study Follows Acceptance of German Plan

" The acceptance in principle and in its main essentials by the Allied Control Council of the National Engineers' program for the industrial disarmament of Germany, lends additional significance and importance to a similar plan for curbing the war potential of Japan," said Col. Proctor. " The German plan rigidly restricts or entirely prohibits German industry adaptable to war purposes, but curbs are selective in order to provide for the normal requirements of the country's peacetime economy and to avoid a disastrous economic vacuum.

" The plan now being developed to render Japan militarily impotent is based on the same principles. It is impossible to forecast as yet, until all the reports of the task committees are submitted and analyzed, the exact extent to which Japan should be industrially restricted or in precisely what respects. Her situation is somewhat different from that of Germany. But the program is expected to include complete prohibition of such war-making potential as warships, planes, munitions, certain heavy industries, and limiting others, but at the same time encouraging recovery of Japan's normal economy by not curtailing capacity in peaceful occupations. Data is now being gathered in this country and in Japan.

Non-Political Service by Engineers

" The engineering profession in the United States has welcomed the opportunity for public service in the industrial disarmament of aggressor states by making recommendations wholly non-political in their nature and based solely on the experience and jugment of top ranking men in engineering and industry. We have been informed that weight was attached to the program proposed by the Committee for Germany because of the non-political nature of its recommendations and their solid basis of technological, engineering and industrial experience. We venture to hope that the report as to Japan may be similarly received."

Colonel Proctor stated that the National Engineers program for Germany was submitted originally to Washington and to the United States Military Government for Germany. But its recommendations proved acceptable not only to the American group of the Control Council but also to Russia, Great Britain and France, and the plan promulgated by the Allied Control Council on March 28 giving effect to the Big Three decision at Potsdam last summer is backed by all four nations.

The Allied Control Council also has approved recently a law providing for continuing control of scientific research in Germany in order to prevent its utilization for purposes of aggression and to direct permitted research along peaceful lines.

The Committee based its recommendations for Germany on carefully gathered engineering data and economic and industrial statistics, but left the determinaton of the specific methods of control to the authorities charged with that function. It will follow the same principle in connection with Japan.

European Plan

Without anticipating the form or contents of the report on Japan, where conditions differ from those in Germany, the program for postwar Europe is significant. It had these objectives:

To so limit German basic industrial capacity as to make it impossible for her ever again support a major war effort.

To leave in Germany a minimum capacity in war-related activities, such as metalworking, chemicals, power, etc., to permit her to produce, for her own needs, enough to maintain a living standard not greater than the average of the rest of Europe (excluding Britain and Russia).

To physically remove from Germany presently installed factories and equipment above her minimum internal needs and transfer them as reparations to nations which suffered under Hitler so that these nations may build an industrial economy freed from traditional dependence upon Germany for heavy equipment.

To encourage Germany, by not limiting capacity in certain "peaceful" occupations such as agriculture, textiles, furniture and woodwork, building materials and construction (under license as to types of construction), to channel her working population into activities not dangerous to peace so as to rebuild a healthy internal economy.

In accordance with these objectives, the four-power Allied Control Council set forth in definite terms, by industries, how much capacity Germany may keep under the Potsdam agreement, and how much capacity is to be destroyed or used for the stimulation of greater industrialization of the rest of war-shattered Europe with the equipment and tools of German factories which had been built primarily for production of armaments or were easily adaptable to that purpose.

How Capacity is Curtailed

The Control Council's program leaves Germany a total industrial capacity with which to produce approximately 75 per cent of her 1936 industrial output (figured at 1936 prices), or perhaps between one-third and one-fourth her war production level.

However, the 75 per cent is not evenly distributed through the German economy. In the basic industrial fields essential to any war machine, the Council left only slightly more than half the 1936 capacity. For those industrial activities which cannot easily be distorted to a war effort, the plan leaves capacity sufficient to produce an estimated average of 95 per cent of the 1936 volume. Additionally, some industrial fields are not limited at all, thus providing potential expansion in "harmless" pursuits for workers forcibly displaced by curtailment of Germany's traditionally large heavy industry production.

14 Commodities Prohibited Entirely

Basic determination of the Control Council in response to its first assignment—to make Germany impotent to support a war effort—is the flat prohibition in the program of future German production of fourteen commodities which are vital to war. These are: Synthetic gasoline and oil, synthetic rubber, synthetic ammonia, ball and taper roller bearings, heavy machine tools of specified types (not yet defined), heavy tractors, primary aluminum, magnesium, beryllium, vanadium produced from Thomas Slags, radio-active materials, hydrogen peroxide above 50 per cent strength, specified war chemicals and gases, and radio transmitting equipment. In all these categories, the program would make Germany dependent upon licensed imports for her minimum peaceful economic needs.

In addition the Big Three decreed that Germany was to be prohibited from making arms, ammunition and implements of war of all kinds, and from producing either military or non-military types of aircraft or sea-going vessels.

A second category of industry comprises those types of production which must be provided for, to permit any kind of self-sustaining German economy beyond the discarded Morgenthau plan, but which, unless strictly limited could be diverted by another Hitler to support a future war effort. The key "controls" here are built around limitations on steel, chemicals, power and machine tools.

Steel Capacity

Germany's metallurgical and metal-working activities, under the program, will be geared to the limits of a steel production of 5,800,000 ingot tons annually from 7,500,000 tons of capacity. This compares with estimates of German war production as high as 28,000,000 tons of ingot.

Similarly, annual consumption of non-ferrous metals is also fixed as follows: Copper, 140,000 tons; zinc, 135,000 tons; lead, 120,000 tons; tin, 8,000 tons, and nickel, 1,750 tons.

Chemical Production

Production capacity for making basic chemicals (nitrogen, phosphate, calcium chloride, sulphuric acid, alkalis and chlorine) will be slashed to 40 per cent of the 1936 plant. However, 70 per cent of the 1936 capacity is to be retained for production of chemicals for building supplies, consumer goods items, plastics, industrial supplies and other miscellaneous chemical products. Germany's pharmaceutical industry will be maintained at 80 per cent of its 1936 production, and capacity will be kept to produce 36,000 tons of dyestuffs and 185,000 tons of synthetic fibers.

Machine Tools and Machinery

For machine tools, only 11.4 per cent of the 1938 capacity (enough to produce about 12,000 tools a year) will be allowed to remain in Germany, and the Council plans additional restrictions on types and sizes of tools which may be produced in plants that are kept.

Germany's vast stockpile of machine tools which were built for war and which have been estimated at 4,000,000 tons of metal, will largely be declared surplus and made available to other nations as reparations through other sections of the program limiting capacity to be retained in industries using machine tools and machinery.

Metallurgical Equipment

Thirty-one per cent of the 1938 capacity is to be retained in the heavy engineering industries making metallurgical equipment, heavy mining machinery, material handling plants, boilers, turbines, prime movers, heavy compressors, turbo blowers and pumps. In the fields of construction equipment, textile machinery, consumer goods equipment, engineering small tools, food processing equipment, woodworking machines and other similar machines and apparatus, 50 per cent of 1938 capacity will be kept. The same percentage will be kept of Germany's 1938 capacity to produce electrical equipment (industrial and domestic), except heavy power equipment which is to be cut back to 30 per cent of 1938, or to a total annual value of reichsmarks 40,000,000 (1936 value). Heavy electrical equipment is defined as generators of 6000 kw. and over, transformers of 1500 kva and over, and high tension switchgear.

Transportation

Similarly, in transport the program calls for strict limits. Capacity will be retained to produce 40,000 passenger cars, 40,000 trucks and buses, 4000 light road tractors, 10,000 light motorcycles. No new locomotives will be allowed but plant capacity is to be retained to rehabilitate existing stocks in order to produce a pool of 15,000 rail engines by 1949. Sufficient capacity is authorized for annual production of 30,000 freight cars, 1350 passenger coaches and 400 luggage vans.

The Council lumped broadly into a third category of industrial activity, those occupations which will have little or no limitation on either capacity or production, so that Germans displaced by deindustrialization policies in the heavy machinery and metal lines can find useful work helping to rebuild their nation.

In these industries, the Council's plan is, in effect, more a floor for production than a ceiling. For some of these fields, the Council has programmed a level of German production which actually is a goal; others are simply open-ended to permit the Germans to expand them within the limits of available resources and energy.

Coal Production

Coal production will be given positive assistance by the Council to maximize output, with a minimum goal set at 155,000,000 tons (hard coal equivalent) annually by 1949. This includes 45,000,000 tons, at least, for export. Potash production likewise will be given free reign to develop without limitation.

Textile Program

The program asserts that the Germans, to support the level of economy planned by the Council, will need to redevelop their textile industry so that it will be processing 665,000 tons annually of fiber by 1949. Also, 113,000,000 pairs of shoes will be required annually, an average of 1.7 pairs per capita.

Freedom of Construction

The Council has programmed no goal for the construction industry. Germans are to be left free to rebuild their country, subject only to a licensing system on structures, to the limit of available resources All existing capacity in the building materials industries will be kept in Germany to provide incentives in this field of activity. Capacity will be retained to produce 8,000,000 tons of cement annually.

Agricultural Machinery

To permit maximization of agriculture in the peacetime German economy, the program calls for retention of capacity for the annual production of 10,000 light agricultural tractors annually. Existing capacity, estimated at 80 per cent of the 1938 levels, is to be retained for production of other agricultural equipment subject only to restrictions on the type and power of equipment turned out.

Pulp and Paper

The program asserts the need in the German economy for processing 2,129,000 tons of paper pulp annually, and capacity for this purpose will be retained.

Rubber Production

The Council plans to leave in Germany capacity to process 20,000 tons of reclaimed and 30,000 tons of crude rubber annually.

Capacity will be retained to produce precision instruments of total value of reichsmarks 340,000,000 (1936 value), of which approximately one-third will be manufactured for export.

No limitation is placed on the following industries: Furniture and woodwork, flat glass, bottle and domestic glass, ceramics, bicycles, motorbicycles under 60cc. In these fields, the only limit on the Germans will be their own energies and available resources.

Total value of exportable production included in various segments of the Council's program is calculated to be three billion reichsmarks (1936 value) annually. The Council included in its plan a decision to limit approved imports to not more than this amount; this compares with German imports of 4.2 billion RM in 1936.

Two-Year Program

Putting the Control Council's industrial program into effect is expected to take about two years At Potsdam, the Big Three directed that the physical removals of surplus plant be completed within two years of the decision on Germany's peacetime level of industry.

Occupation forces at present are at work tagging every industrial facility in Germany which hasn't been wrecked by war, listing each for retention or as available for reparations. This task is expected to take another month or six weeks, after which it will be possible to determine how much reparation Germany is able to make from physical plant.

National Engineers Committee

For the program of disarmament of Japan, the Committee is Colonel Carlton S. Proctor, Chairman; Dr. Harry S. Rogers, Sidney D. Kirkpatrick, Dr. H. Foster Bain, Dr. R. E. Zimmerman, and Charles W. E. Clarke.

The National Engineers Committee (making the report for German industrial disarmament) consisted of: Robert E. McConnell, New York, chairman; Dr. Harry S. Rogers, vice-chairman, president of Brooklyn Polytechnic Institute; Thomas F. Barton, commercial vice-president, General Electric Company; Colonel Carlton S. Proctor, consulting engineer, New York; Dr. Edward R. Weidlein, director, Mellon Institute of Industrial Research, Pittsburgh, and Dr. Clyde E. Williams, director, Battelle Memorial Institute, Columbus, Ohio.

MEETING OF COUNCIL

A regional meeting of the Council of the Institute was held in the Board Room of the Consolidated Mining and Smelting Company of Canada, Limited, at Trail, British Columbia, on Saturday, May 18th, 1946, convening at ten o'clock a.m.

Present: President J. B. Hayes (Halifax) in the chair; Vice-President R. A. Spencer (Saskatoon); Councillors C. W. Carry (Edmonton), C. S. Clendening (Lethbridge), G. J. Currie (Halifax), J. G. MacGregor (Calgary), S. C. Montgomery (Trail), Kenneth Reid (Victoria), P. M. Sauder (Strathmore), representing the Association of Professional Engineers of Alberta, Stewart Young (Regina), representing the Association of Professional Engineers of Saskatchewan, and General-Secretary L. Austin Wright.

The following members of the Kootenay Branch were also present—J. V. Rogers, secretary-treasurer, A. H. W. Busby, J. P. Coates and Ernest Mason, of Trail, and R. Pollard and Ernest Smith of Nelson.

The president expressed his pleasure at seeing councillors from so many branches. This was perhaps the best western representation that had ever been gathered for a regional meeting of Council. He urged councillors and guests alike to participate in all discussions.

Mr. Montgomery, on behalf of the new Kootenay Branch, also welcomed the out-of-town visitors. He expressed the branch's appreciation of their assistance in inaugurating the organization.

Community Planning—The general secretary explained that this subject had been placed on the agenda for the purpose of gathering from the western branches any ideas that would help the Institute's committee to develop a programme. He stated that just before starting this western trip, he had spent half a day with R. L. Dobbin, chairman of the committee, in Peterborough. Mr. Dobbin had asked him to bring the subject up on every occasion in order to obtain ideas.

He referred to the proposal which was before Council many months ago to re-establish the Town Planning Institute or some other organization for the same purpose. He explained that there had been discussions with representatives of the Royal Architectural Institute of Canada as well as with groups of interested engineers, out of which certain tentative proposals had been submitted.

Mr. Stewart Young commented on the difficulty of getting engineers to take an active interest in the technical side of community planning. All engineers were interested in the subject generally, but very few were making it even a minor part of their professional activity. Contrasting with this he referred to the interest being taken by architects who, because they were largely self-employed, could divert their attention to the subject very quickly.

He described the work of the American Planning Association and was of the opinion that the work of this organization might be very helpful to Canadians and, as a matter of fact, it might be used as a substitute for a Canadian Planning Institute. He referred to the difficulties of financing and organizing a Canadian Institute. He agreed that there were phases of planning that were special to Canadian communities.

Mr. Young stated that the City of Regina had engaged a consultant to do some work for that city. This consultant, himself, was an architect but the local committee which was in control of the situation was made up largely of engineers. Mr. Young referred to the situation in Vancouver in which he said that city was very fortunate. It had done a great deal of planning and had, in the city organization, engineers who were competent to do the job.

Mr. Reid described the activities in Victoria which had resulted in the formation of a Town Planning Commission, made up largely of public-spirited citizens, including one engineer and a land surveyor.

Dean Spencer agreed with the previously expressed opinion that community planning was largely an engineers' job. He stated that there had been some demand at the University from engineers who wanted to know about the subject. He inquired as to whether or not it would be helpful to arrange a special course of lectures for municipal engineers in each province with the idea that the interest in the subject and the technical knowledge of it might be increased.

In the discussion which followed, the idea was evolved that instead of calling the engineers together to take a course at the universities, it might be better to call them together for a provincial meeting at which the subject could be discussed in great detail. It might be that out of such a conference a request would arise for special courses such as Dean Spencer had mentioned.

Mr. Young supported this idea but expressed his disappointment that extramural lectures already given at some universities had been associated with the Department of Architecture rather than with Civil Engineering.

The president described conditions in Halifax where a City Planning Board had been established under the chairmanship of an engineer. A basic plan for the city had been prepared and he was confident that the engineer was still the driving force in the organization.

Mr. Smith explained that in his work as district engineer, Department of Public Works of British Columbia, he had many contacts with community planning. He stated that he had no jurisdiction inside the limits of incorporated municipalities but that the plans for a great many subdivisions had been submitted to him for study and recommendation. He had found many instances where very bad planning prevailed. He was hopeful that the Institute would take an active part in the subject right across Canada as some strong organization's support was required in order to get the best results, both in enabling legislation and in construction.

Mr. Coates, as engineer for the City of Trail and the Municipality of Tadanac, explained the unusual problems that came to his attention. There had been some demand from the citizens for a replanning of the city and some efforts had been made along that line. However, the problems, because of the topography of the country and the nature of the soil, were perhaps the most difficult in Canada and, so far, a final and satisfactory plan had not been developed. As an indication of the difficulties he mentioned that some of the streets had grades as high as forty-five per cent. He thought that the Institute might provide leadership in many parts of Canada that would be very helpful to a large number of municipalities.

Mr. Carry supported the thought that a conference of interested engineers, on a provincial basis or on the basis of the four western provinces, might be helpful. He was confident that employers would be quite interested in seeing that their engineers participated in such a gathering.

At this point Mr. Young introduced a resolution giving certain instructions to the Institute's Committee on Community Planning. The resolution was seconded by Mr. Sauder, and was subjected to considerable discussion. Eventually, the president appointed a committee consisting of Messrs. Young, Spencer and Sauder, to reword the resolution for presentation at the afternoon session.

The meeting adjourned for lunch at twelve o'clock and reconvened at one forty-five p.m. with the president in the chair.

In response to the president's request, Mr. Stewart Young presented the following resolution for which the committee had been appointed:

> THAT the Committee on Community Planning be requested to investigate ways and means of holding provincial or other conferences of municipal engineers and other interested persons to organize through them refresher courses on community planning at Canadian universities, and other activities in this field.

Upon being presented to the meeting, the motion was carried unanimously.

At this point the president invited the vice-president, Dean Spencer, to take the chair, explaining that as this was a regional meeting in the western zone it was his wish, and he knew also the wish of the meeting, that the senior officer in the west should preside for at least a portion of the meeting.

Harry Bennett Educational Fund—The general secretary presented as a progress report some information which had been sent to him by the committee. This indicated that the campaign for funds was going well in several branches.

Dean Spencer inquired as to any decision that had been made as to the form in which assistance would be given to students. The general secretary stated that the terms of the Trust Deed controlling the fund were very broad and that it was possible for the money to be used for almost anything of an educational nature, but that at the commencement it was figured that loans to students would be the principal form of the activity.

In response to an inquiry from Mr. Montgomery, the general secretary stated that it was intended to have only the one drive for funds and that it would not be an annual event.

The Engineer in the Civil Service—The general secretary gave an outline of the work of the committee in relationship to the presentation of a brief before the Royal Commission. Dean Spencer inquired as to the best means by which this information could be circulated widely and it was agreed that every means should be adopted to bring the work of the committee to the attention of the membership. This was emphasized in view of the fact that all the members did not know of the many years of constructive effort in this cause that the Institute had expended and it was only fair to the organization that the members should have an appreciation of what had been done, particularly in view of the fact that it now appears that some improvement in salary conditions is about to be realised and of the committee's opinion that this result has been achieved, at least partially, because of the Institute's continued interest.

The general secretary also reported on an exchange of correspondence and interviews that had taken place in 1944 between the Institute and the Civil Service Commission of British Columbia, relating to a revision of the salaries of the Public Works Department of that province. The general secretary reported that up until the present time the committee had considered these contacts as confidential and therefore had given no publicity to them. Information was now being presented to this western meeting as it was thought the western branches should be informed of the Institute's participation in the recent revision of salaries for the province.

The general secretary emphasized that the Institute had stated to the Commission that the whole scale was too low, particularly for the more senior appointments, and was not able to agree with the ruling that the salary of the chief engineer had to be less than that of the deputy minister. The Institute had felt that the special training and experience required of a chief engineer should be appraised entirely apart from the salary paid to someone else for entirely different qualifications.

A very general discussion followed the secretary's statements, in which appreciation was expressed of the Institute's assistance to the Commission.

Committee on Professional Interests—Mr. Currie, as a member of the committee, reviewed the recent activities of the committee in relationship to a resolution and memorandum from the Toronto Branch. He outlined in some detail the steps taken some time ago by the committee to study the national situation involving the Institute's relationship with sister societies which had resulted in a statement from the committee which had been approved by Council.

He reported that after the Toronto resolution had been submitted by Council to the committee the situation had been studied again, and that the committee reported that it found no reason to change the policy which it had recommended previously. He stated that a reply along this line had been presented to the Toronto Branch at the April meeting of Council and that it had been accepted without adverse comment at that time. He emphasized the desirability which had been expressed at the Toronto meeting of giving a wide circulation to the reply of the committee. He thought that members with inadequate information might readily misunderstand the Institute's position and adversely criticize it for that reason, but at the same time he was confident that if they were fully informed they would agree with the policy.

Dean Spencer emphasized the difficulty of understanding the situation thoroughly inasmuch as there were many factors to be considered and he thought it was necessary to study all the material quite carefully before having the necessary basis for a decision. He urged councillors to participate in the discussion so that a proper dissemination of knowledge within this group might be possible.

Mr. Young inquired as to Appendix A of the minutes of the April meeting and stated that it was a very informative report and should be made available to all members. Mr. Currie replied that this was to be printed in the *Journal*.

Dean Spencer described the situation now existing in Saskatchewan whereby there was a common membership between the Association and the Institute with the same officers providing the executive of the branch and the council of the Association. He stated that the Council of the Association was unable to understand why a similar arrangement could not be developed across Canada thereby eliminating many of the points over which friction had developed.

Joint Committee on Legislation—The general secretary presented a progress report on the case of the Association of Architects of the Province of Quebec versus Brian R. Perry. He explained that the appeal was progressing and that it was possible it would be heard before the end of May. As the courts close at that time it would have to come up in the fall if they are not successful in getting it in the spring session. He explained the Institute's interest in the case and described how the joint committee on legislation was made up of three members of the Corporation of Professional Engineers of Quebec and three from the Institute. This committee was studying the appeal and providing joint co-operation between the two groups. The Institute was interested particularly because of its national character and the fact that the decision in this case would be of real concern to engineers in the other provinces. He stated that the joint committee was prepared to carry the appeal to the Privy Council, if necessary.

Dean Spencer referred to the service which Mr. Perry had rendered to the profession in fighting this case at great personal sacrifice to himself. It was agreed that this meeting should reaffirm the Institute's strong support of Mr. Perry and that it go on record as appreciating the self-sacrifice which he had made in the interests of all engineers.

At this point President Hayes reassumed the chairmanship of the meeting.

Engineering Education (Conference of Deans)—The general secretary referred to a conference of deans of engineering which was to take place in Toronto on May 28th, which had been arranged in association with the Universities Conference taking place at that time. He explained that certain organizations such as the Dominion Council, the Canadian Institute of Mining and Metallurgy, the Chemical Institute of Canada, and the Engineering Institute had each been invited to send a delegate to a meeting with the deans, to take place the day previous to the deans conference. The object of this meeting was to discuss engineering education so that the deans might have the opinions of the representatives before concluding their deliberations. In accordance with the decision of the April Council meeting, the president had asked Vice-President Sisson of Toronto to attend the session as the representative of the Institute.

Dean Spencer outlined the situation which the deans of engineering were discussing. He referred to the interest which was exhibited in many places on the subject of engineering education and at the same time he described some of the difficulties which prevented immediate changes in the courses in accordance with the many proposals which were being received. He referred to the work of the Society for the Promotion of Engineering Education and thought that an organization of this kind or a branch of the American organization might be useful in Canada. He referred to the report made by this society on engineering education and explained that it had been completed only after many years of study and consultation with thousands of practising engineers.

Dean Spencer mentioned that the feeling was developing among engineers that the courses should be changed to provide more humanities which would mean a reduction in the amount of teaching of technical subjects unless the course was lengthened. He thought the humanities were becoming of increased usefulness as engineers accelerated the development of moving from technical to administrative positions. He emphasized the difficulties which had to be faced in dropping any of the technical subjects and thought that a society formed specifically to study education would be able to make a real contribution to the solution of the problems. He believed that, as far as the present was concerned, the deans jointly would have to study the situation and to consult with non-teaching members of the profession as well. He did not think that at the moment a joint committee consisting of professional educationalists and engineers outside of that group should be established. The problem was primarily one for the educationalists who, of course, would have to keep in mind the requirements of the employer.

The president thanked Dean Spencer for his interesting and informative statement and agreed that at least for the moment there appeared to be no need for establishing a joint committee.

Sixtieth Anniversary, 1947—The president reminded Council that the next annual meeting of the Institute would mark the completion of sixty years of service. He stated that at the Toronto meeting it had been agreed that some special ceremony should be inaugurated to mark the occasion.

Mr. MacGregor thought that the anniversary might be used as a special means of publicity on behalf of the profession, making available in some form a lot of information on the work of the engineer so that the layman might have a better idea of the significance and the importance of engineering and the engineer.

The president thought that Mr. MacGregor's proposal was an excellent one and recommended that it be kept in mind by Headquarters and by the local committee.

The general secretary read an invitation from the Toronto branch that the 1947 annual meeting be held in that city. It was moved and seconded and carried unanimously that the invitation be accepted.

The general secretary stated that following the decision at the Toronto Council meeting he had interviewed the manager of the Royal York Hotel with regard to dates and found that the hotel was booked very solidly until 1948, but that he had been able to secure two dates reasonably close to the time usually set for the annual meeting. These were Friday and Saturday, April 18th and 19th. It was moved and seconded and agreed unanimously that these dates be approved by Council subject to their acceptance by the Toronto branch executive.

National Construction Council of Canada—A letter from the National Construction Council which dealt with the control of building materials was presented. It pointed out that the decision of the federal government to hand back to each municipality responsibility for distribution of these materials had resulted in some unfortunate developments. The letter pointed out that it had been suggested that the control should be transferred to some neutral organization and the National Construction Council asked the Council of the Institute to consider whether or not it thought the National Construction Council was a suitable medium for this service.

There was considerable discussion in which it was pointed out that the control of building construction was a provincial matter and not a federal one and that the National Construction Council, as presently organized, was not in a position to handle it. To build up a proper organization was a very complicated undertaking and the Council of the Institute believed it should be approached with considerable caution.

Eventually it was agreed that a special committee be appointed by the president to investigate the subject and to report back to Council.

A second letter from the National Construction Council was presented in which inquiry was made as to the desirability of establishing acceptable standards for building materials. The letter quoted a communication from the Canadian Standards Association and asked the Institute's opinion as to what action should be taken. This, too, was referred to the above mentioned committee.

Proposal from Chemical Institute of Canada—A letter from Dr. R. R. McLaughlin, president of the Chemical Institute of Canada, was presented. In this Dr. McLaughlin reported that the Canadian Manufacturers Association had arranged for its annual meeting in June a session on research. As a part of the programme it had been arranged by Dr. McLaughlin and the manager of the C.M.A. to have a series of speakers representing the professional technical organizations who would tell something of the aims and objects of each society, particularly in reference to its interest in research work. Dr. McLaughlin's letter was an inquiry to see if the Institute would join with the others in accepting the invitation. The president thought the proposal was an excellent one and that an opportunity to tell the members of the C.M.A. something about the Institute should not be neglected.

After further discussion it was agreed unanimously that the invitation be accepted and the general secretary was instructed to communicate with vice-president Armstrong in Montreal and with Louis Trudel at Headquarters in order that the details might be completed.

Sir John Kennedy Medal—The general secretary asked Council for instructions with regard to awarding the Sir John Kennedy Medal in 1946. He pointed out that the regulations intended that the medal should be presented not oftener than once every two years and that it had been presented in 1945. However, in view of the fact that on two or three occasions the medal had not been awarded he pointed out that the average period of time was well over two years. In the light of these circumstances he inquired as to whether or not Council would be agreeable to the award being made in 1946 for presentation at the sixtieth anniversary in 1947.

Messrs. Carry, Young, MacGregor, Montgomery and the president all expressed themselves as favouring a 1946 award and eventually it was moved and carried unanimously that this procedure be followed.

At the conclusion of the agenda there was a very general expression of appreciation of the kindnesses and hospitality of the officers of the Consolidated Mining and Smelting Company of Canada Limited. This was resolved in the form of a motion by Dean Spencer, seconded by Mr. Carry as follows, to be presented to Mr. R. W. Diamond, vice-president and general manager of the company.

" The president and officers of The Engineering Institute of Canada who have come to Trail for the inauguration of the Kootenay Branch and for a regional meeting of Council, are deeply appreciative of the many kindnesses afforded them by Mr. Diamond and his staff which have contributed so materially to the success of the meetings.

" Mr. Diamond's personal hospitality on so many occasions, in which he was so gracefully supported by Mrs. Diamond, provided the highlights of the meetings, marking the occasion so clearly in the minds of all that it will be long remembered.

" The Council of the Institute hopes that the activities of the new Kootenay Branch will be an additional expression of appreciation of the splendid support that has been received."

It was the unanimous opinion of the councillors that the minutes should record officially their appreciation of the kindnesses and hospitality of the members of the Kootenay Branch which had made their visit such a success, and accordingly the following minute was prepared.

The out-of-town members of the council attending the inaugural meeting of the Kootenay Branch and the regional meeting of Council in Trail wish to record their gratitude to the officers and members of the branch for their excellent hospitality and their many kindnesses. It is seldom that councillors have such splendid opportunities to see an industry and to know the local members of the profession. The well arranged programme and the many personal courtesies shown to the visitors by so many individuals have made this a happy and memorable occasion. It is the wish of all that the new branch may flourish and render a real service to the community. The personnel now associated with it is the guarantee of its success. The visiting members were proud to be associated with them in the inaugural ceremonies of the twenty-seventh branch of the Institute.

Mr. Rogers expressed the pleasure that it had given to the officers of the branch to have so many out of town visitors in Trail. On behalf of the branch he thanked them for the support which they had given to the first meeting of the new branch.

The Council rose at five forty p.m.

ELECTIONS AND TRANSFERS

A number of applications were considered and the following elections and transfers were effected:

Members

Borrowman, Murray Leroy, B.Sc. (Civil), Queen's, constrn. foreman, McColl-Frontenac Oil Co., Ltd., Winnipeg, Man.
Broadhurst, Eric Bertram, mtce. engr., lead smelting dept., Consolidated Mining & Smelting Co., Ltd., Trail, B.C.
Brown, Hugh Carey, B.Eng. (Elect.), McGill, sales engr., Canadian Westinghouse Co., Limited, Montreal, Que.
Burns, Stuart L., B.Sc. (Mech.), Queen's, Donald Inspection Limited, Montreal, Que.
Lambert, Arthur Alexander, B.A.Sc. (Civil), B.C., asst. to chief engr., West Kootenay Power & Light Co., Ltd., South Slocan, B.C.
Masse, Gaston W., B.Sc. (Elect.), McGill, genl. supt. and elect. engr., gas and elect. dept., City of Sherbrooke, Sherbrooke, Que.
Moline, Gustav Adolph Alexander, B.Sc. (Mech.), Univ. of Colorado, chief engr., Canadian Westinghouse Co., Limited, Hamilton, Ont.
Ross, Joseph Hope, B.A.Sc., Toronto; R.M.C., design and sales engr., McGruer, Fortier, Meyers Ltd., Montreal, Que.
Simpson, John Raymond, B.Sc. (Civil), Leeds Univ., England, recently with Dept. Public Works, British Guiana, as dist. engr., Victoria, B.C.
Slater, Arthur Evan Cross, B.Sc. (Elect.), Univ. of Manchester, elect. engr., Polymer Corporation Ltd., Sarnia, Ont.
Szymanski, Michal Bernard, Civil Engr., Univ. of Warsaw, Poland, stress engr., Fairchild Aviation, Montreal, Que.
Tessier, Joachim desRivieres, B.A.Sc., C.E., Ecole Poly., real estate and insurance broker, Quebec City, Que.
Tindale, William J., chief engr., West Kootenay Power & Light Co., Ltd., South Slocan, B.C.
Todd, William Lawrence, B.Eng. (Mech.), McGill, Cornwall, Ont.
Tomlinson, John Windows, B.Sc. (Elect.), Manitoba, chief engr., Manitoba Power Commission, Winnipeg, Man.
Williams, Sidney Elton (studies leading to B.Sc., Forestry, Toronto), res. mgr., St. Lawrence Paper Mills Co., Ltd., Three Rivers, Que.

Juniors

Bardsley, Leonard Walter, B.Eng. (Elect.), McGill, Hillcrest Works, Toronto Transportation Commission, Toronto, Ont.
Bjarnason, Johannes, B.Eng. (Mech.), McGill, technical director, Okra Ltd., Reykjavik, Iceland.
Comtois, Paul-Emile, B.Sc. (Mining), Laval, Lieut., R.C.E., Quebec City, Que.
Coote, Alexander Harcus, B.Eng. (Mech.), McGill, Lieut., (A/E), R.C.N.V.R., Pointe Claire, Que.
Elliott, Thomas Campbell, B.Sc. (Chem.), Alberta, instrument engr., Calgary Refinery, Imperial Oil Limited, Calgary, Alta.
McCaffrey, Keith Allan, B.Sc. (Mech.), Queen's, student, test course, Canadian General Electric Co., Ltd., Peterborough, Ont.
Soicher, Percy Arthur, B.Eng. (Mech.), McGill; M.Sc., Michigan, Lieut., R.C.E.M.E., Montreal, Que.
Young, Harold Randolph, B.Eng. (Civil), McGill, res. engr., C. D. Howe Co., c/o Commonwealth Construction Co., Winnipeg, Man.

Transferred from the class of Junior to that of Member

Lee, John Douglas, B.Sc., Queen's, M.Sc. (hydr. & san. engrg.), Iowa, asst. prof. civil engrg., Queen's University, Kingston, Ont.
Valiquette, Francis Pierre, B.A.Sc., C.E., Ecole Poly., town mgr. Bourlamaque, Que.

Transferred from the class of Student to that of Member

Ferguson, Robert Norman, B.Eng. (Mech.), McGill, asst. to chief engr., Canadian Celanese Limited, Drummondville, Que.
McGee, Leonard Davidson, B.Eng. (Elect.), McGill, mgr., sales and field instalns., Cresswell-Pomeroy Limited, Montreal, Que.
MacKenzie, John James, B.Sc. (Elect.), Manitoba, engr. dftsman., Schumacher MacKenzie Limited, Winnipeg, Man.
Neil, Charles Hamilton, B.Sc. (Mech.), Queen's, asst. steam supt., Consolidated Paper Corporation, Three Rivers, Que.

Transferred from the class of Student to that of Junior

McColl, Bruce John, B.Sc. (Mech.), Queen's, asst. to supervisor, design office, Canadair Limited, Montreal, Que.

Admitted as Students

Balderson, William Thomas, B.A.Sc., Toronto, dial equipt. engr., Northern Electric Co., Montreal, Que.
Browning, Philip Raymond, Manitoba, 176 Jemima Ave., Winnipeg, Man.
Butt, A. M., N.S. Tech. Coll., Halifax, N.S.
Cook, Lloyd Arnold, B.Sc. (Physics), Queen's, apprentice, Westinghouse Electric, Hamilton, Ont.
Davies, William Edward, McGill, 3747 de l'Oratoire Ave., Montreal, Que.
Daye, James Robert, N.B., Hampton Station, Kings Co., N.B.
Gray, Robert John, Alberta, 609 Belmont St., New Westminster, B.C.
Hicks, Robert Laing, B.A.Sc., Toronto, test student, Canadian General Electric, Peterborough, Ont.
Hope, Robert John Stephen, B.A.Sc., Toronto, dial equipt. engr. Northern Electric Co., Montreal, Que.
Houlding, John Draper, B.A., Western Ontario, engr., electronics divn., Westinghouse Co., Hamilton, Ont.
Innis, William Herbert, New Brunswick Nashwaaksis, N.B.
Klein, Samuel Harold, McGill, 362 Fairmount Ave. W., Montreal, Que.
Leger, Adrien Ralph, Laval, Gaspesian Sulphite Co., Ltd., Chandler, Que.
Ludwick, Alexander Peter, B.C., 1515 Renfrew St., Vancouver, B.C.
Moran, John Reid, B.C., 7 Lotus St., Victoria, B.C.
Murray, Donald, M., N.B., 329 St. John St., Fredericton, N.B.
Noble, D. W., Chaleur Inn, Dalhousie, N.B.
Perttula, F. A., Geraldton, Ont.
Pottruff, Walter Allen, B.Sc. (Elect.), Manitoba, 235 Kingsway Ave., Winnipeg, Man.
Ross, J. B., McGill, 23 Cote Ste. Catherine Road, Outremont, Que.
Scovil, John Henry, N.B., Beaverbrook Residence, Fredericton, N.B.
Smith, Ronald Stewart, Mt. Allison, Sackville, N.B.
Stewart, Murray Edgar, Alberta, 10955-79th Ave., Edmonton, Alta.
Swyers, Harry, Mt. Allison, Bonavista, Nfld.
Thibault, Robert, Laval, 293-18th St., Quebec, Que.
Yan, Cecil, Manitoba, 394 Mountain Ave., Winnipeg, Man.

Students at Queen's University

Campbell, J. G.	**Jones,** W. G.
Carrothers, W. D.	**McDonald,** C. A.
Francis, W. E.	**Runge,** J. F.

Students at University of Toronto

Davidson, R.	**Nicoloff,** P. C. F.
Fiander, L. O.	**Paterson,** R.
Lowrie, G. F.	**Seddon,** J. H.
Martin, J. H.	**Sentance,** A. P.
McMurdo, H. G.	**Temple,** P. B.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective:

ALBERTA

Junior to Member

McManus, Ralph Norman, B.Sc. (Civil), Alberta, lecturer in civil engrg., Univ. of Alberta, Edmonton, Alta.

Student to Junior

Campbell, Donald Kilgour, B.Sc. (Civil), Alberta, engrg. asst., City Engineer's office, Edmonton, Alta.
Kennett, Douglas Arthur, B.Sc. (Civil), Sask., jr. engr., P.F.R.A., Erskine, Alta.

SASKATCHEWAN

Member

Carss, Harold Wallace, B.Sc. (Civil), Sask., city engr., Swift Current, Sask.

Student to Junior

Boyle, William Eric, B.Sc. (Mech.), Sask., instructor, Regina College Univ. of Sask., Pense, Sask.
Sturdy, Ferris Durnin, B.Sc. (Mech.), Sask., instructor, Regina College, Univ. of Sask., Regina, Sask.

NEW BRUNSWICK

Junior

Holohan, E. J., Civil Aviation Dept., Dept. of Transport, Moncton, N.B.

NOVA SCOTIA

Member

Blackburn, Gerald Allen, B.Eng., N.S. Tech., Research and Development Branch, Regional Reconstruction Council, Dept. of Reconstruction, Halifax, N.S.

Student to Member

Dean, Maurice Ferguson, B.Eng. (Civil), N.S. Tech., Maritime Engineering Consultants Ltd., Halifax, N.S.

QUEBEC

Student to Member

Maclure, James Hubert Crocker, B.Eng. (Civil), McGill, engr., engine, pump and elect. dept., Canadian Fairbanks-Morse Co., Ltd., Montreal, Que.

Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form the basis of personal items in the *Journal*.

News of the Personal Activities of members of the Institute

C. S. Clendening, M.E.I.C., was recently appointed councillor of the Lethbridge Branch for the Institute to complete the current term as a result of the resignation of C. S. Donaldson.

Originally from Walkerton, Ont., Mr. Clendening studied at the University of Toronto Faculty of Applied Science and spent four years with the C.E.F. in World War I.

Previous to service overseas he was employed as transitman in connection with the Detroit tunnel and as recorder for the Geodetic Survey of Canada in 1909. He was concrete inspector for Smith, Kerry & Chase in Ontario and at their City of Winnipeg plant, and later office draughtsman and transitman for the Grand Trunk Pacific railway. In 1914 he was resident engineer for the Pacific Great Eastern Railway. Returning in 1919 as an engineer to the Grand Trunk Pacific Railway he remained two years, after which he went to Lethbridge as resident engineer for the Lethbridge Northern Irrigation District. He was located at Diamond City, Alta., as manager in 1932 and returned to Lethbridge as project manager in 1940 where he is still located.

Mr. Clendening joined the Institute as an Associate Member in 1921, becoming a member in 1940. He was councillor for the Lethbridge Branch in 1934 and 1935.

J. W. Porteous, M.E.I.C., is the newly-elected chairman of the Edmonton Branch of the Institute. Born at Galt, Ont., he graduated as a B.Sc. in electrical engineering at the University of Alberta in 1928 and, in 1932, received his M.Sc. He attended the Canadian Westinghouse Company student course in 1928 and the following year he was demonstrator at Syracuse University.

He returned to the University of Alberta, Edmonton, Alta., in 1930 as a lecturer in the electrical engineering department and was connected with the construction of the 1,000-watt transmitter for radio station CKUA. He is now associate professor at the university.

Mr. Porteous joined the Institute as a Student in 1929, transferring to Junior in 1934 and to Member in 1944.

W. D. Brownlee, M.E.I.C., of the Electro Metallurgical Company of Canada, Welland, Ont., is the newly elected chairman of the Niagara Peninsula Branch of the Institute.

Born at Collingwood, Ont., he received the degree of B.A.Sc. from the University of Toronto in 1931, and that year was associated with municipal engineering in Midland, Ont., entering the Ontario Department of Highways in 1932 as instrumentman. From 1933 to 1937 he was resident engineer and locating engineer for the Ontario Department of Northern Development on highway construction and location. With the Department of Highways he was resident engineer on highway construction in 1937 and 1938, and acting resident engineer with the Civil Aviation Branch of the Department of Transport of Canada in 1939 and 1940 on airport construction. He accepted his present position as engineer in 1940.

Mr. Brownlee joined the Institute as a Member in 1943.

L. O. Cass, M.E.I.C.

L. O. Cass, M.E.I.C., has been elected chairman of the Saint John Branch of the Institute.

Born in Springhill, N.B., he received a B.Sc. degree in civil engineering from the University of New Brunswick in 1939 and entered the Department of Highways of New Brunswick as office engineer and instrumentman.

The same year he transferred to the New Brunswick Hydro Commission as chief of party on transmission line location. He went to Montreal, where he was employed by T. Pringle & Son, consulting engineers, as draughtsman and field engineer and later to the Foundation Company of Canada as assistant to the group superintendent of construction at St. Paul l'Ermite, Que. Transferred to Shipshaw, Que., by the company, he was area engineer there in 1941 and 1942, when he joined E. G. M. Cape & Co. of Montreal as field engineer on the construction of the naval ordnance depot at Dartmount, N.S.

Mr. Cass has been with the National Harbours Board at Saint John, N.B., since 1944 when he became assistant engineer. Joining the Institute as a Student in 1939, he transferred to Member in 1944.

H. T. Miard, M.E.I.C., has been named secretary-treasurer of the Lethbridge Branch of the Institute.

Mr. Miard is from Coal Creek, B.C., attended schools in Fernie, B.C., and graduated in civil engineering from the University of British Columbia with a B.A.Sc. degree in 1933.

On graduation he was associated with the Big Bend Highway construction as rodman, levelman and instrumentman and, in 1937, was junior engineer on that project. In 1939 he was engineer in charge of the east section, Big Bend Highway. In ensuing years he was resident engineer for airdrome construction or development projects for the Civil Aviation Division of the Department of Transport of Canada in southern Alberta and southeast British Columbia, such as the development of the Lethbridge airport, the construction of the Pearce Relief airdrome, and the Claresholm S.F.T.S. airdrome. In 1942 he was named senior assistant engineer in the office of the district airway engineer of the Department of Transport and has been located since then in Lethbridge, Alberta.

Mr. Miard joined the Institute as a Member in 1942.

K. W. Salmon, Jr.E.I.C., recently named secretary-treasurer of the Saint John Branch of the Institute, is from Wolfville, N.S.

Graduating from the University of New Brunswick in electrical engineering with a B.Sc. degree in May 1941, he immediately enlisted in the Royal Canadian Navy as engineer officer, training on a turbine cruiser. He has been in charge of machinery in three Canadian naval ships and was employed in electrical overseeing of naval refits and in the training of engine room personnel.

He is with the New Brunswick Telephone Company Limited at Saint John. He joined the Institute early this year as a Junior.

Dr. F. W. Gray, M.E.I.C., retired from the Dominion Steel and Coal Corporation in June 1945, and is now residing in Victoria, B.C. He has served that corporation, its predecessors and affiliates from 1904 until his retirement, since 1927 as assistant general manager at Sydney, N.S.

Born in Yorkshire, he graduated in coal mining from Sheffield University, England, and after early experience in coal mines in Great Britain, he came to Canada in 1904 and has devoted the ensuing years to coal mining enterprises, principally in Nova Scotia. Unprecedented fire fighting and mine rescue appliances were introduced into eastern Canada by Dr. Gray at the commission of the Dominion Coal Company and his research has caused him to be called upon in western Canada areas on several occasions.

He has been awarded the Leonard Medal of the Engineering Institute, the Barlow Memorial Prize of the Canadian Institute of Mining and Metallurgy, the honorary degree of Doctor of Laws from Dalhousie University, and more recently the Julian Smith Medal of the Engineering Institute. A member and executive officer of numerous technical societies, he was councillor of the Institute for the Cape Breton Branch in 1942.

Dr. T. B. Williams, M.E.I.C., has been appointed commissioner for petroleum and natural gas in British Columbia with the Department of Lands at Victoria, B.C. He was previously petroleum engineer with the department, located at Dawson Creek, B.C.

Alex. Gray, M.E.I.C., has retired from the position of port manager at Saint John, N.B.

Coming to Canada from Scotland in 1905, he was appointed assistant engineer with the Dominion Coal Company and in 1906 entered the service of the Grand Trunk Railway as an engineer. In 1911 he joined the Public Works Department and was employed in connection with the storage of water on the Ottawa river and subsequently as engineer in charge of the Saint John harbour. In 1927 the Saint John Harbour Commission appointed him general manager and chief engineer and he continued as port manager under the National Harbours Board, established in 1936, until the Board regretfully accepted his recent resignation.

Mr. Gray was councillor of the Institute in 1919, 1920 and 1921.

Russell Yuill, M.E.I.C., succeeds Mr. Gray as port manager at Saint John. Mr. Yuill has lately been filling the position in an acting capacity, having been transferred from the National Harbours Board's head office engineering staff.

Born in Truro, N.S., and a graduate in engineering of Mount

Allison and McGill Universities, he has been employed in the Dominion public service since 1914, first in the Department of Mines and from 1915 to 1936 in the Department of Railways and Canals, when he was transferred to the staff of the National Harbours Board. Seconded to the Department of Munitions and Supply at the commencement of the war shipbuilding programme in 1940, he served as director and assistant director general of shipbuilding until 1944. He has been associated with the Saint Lawrence River development, with railway construction, and with construction and operation of Hudson Bay terminals and investigations of other projects in all parts of Canada. In 1945 he was appointed Federal Government representative on the Committee on Resources and Railways, Province of British Columbia.

During World War 1 he served overseas with the Royal Canadian Engineers.

E. H. Parmelee, Affiliate E.I.C., retired from his position as Eastern district manager at Montreal of the Ferranti Electric Limited, Toronto, Ont., after twenty-five years association with the company. He had previously represented Canada Wire & Cable Company in Winnipeg, and for several years was associated with both firms until his appointment in 1926 as manager of the Montreal office of Ferranti.

Noel N. Wright, M.E.I.C., succeeds Mr. Parmelee as acting manager of the eastern district for Ferranti Electric Limited. He has been associated with Ferranti since 1928, with an interval of about two and one-half years when he served with the navy as deputy-director of the signal division (wireless section) with the rank of lieutenant-commander. He returned from war duty on February 1st last.

Norman A. Eager, M.E.I.C., who was chairman of the Hamilton Branch of the Institute in 1945, was recently appointed general manager of the Burlington Steel Company Limited, Hamilton, Ont., and was also elected to the Board of Directors. He entered the firm as assistant sales manager in 1940 and in 1944 was appointed sales manager. He is a graduate of McGill and Cornell Universities, with B.Sc. and M.C.E. degrees.

J. A. Shaw, M.E.I.C., general electrical engineer of the Canadian Pacific Railway for 31 years, retired recently on pension. Supervision of the design and erection of the million dollar heating plant for the Toronto Terminals which includes Union Station and the Royal York Hotel, was one of Mr. Shaw's major achievements in the 42 years he has been with the C.P.R. Last year he directed the application of a fluorescent lighting system to a passenger coach, the first time this had been done in Canada, as part of a modernization programme.

A graduate in science from McGill University, he entered the Canadian Pacific as assistant electrical engineer at Angus Shops in 1904, was appointed to the same position for eastern lines three years later, became electrical engineer at Angus Shops in 1908, and since 1915 has held his present post. He is a past-president of the Canadian Railway Club of Montreal.

J. W. Hughes, M.E.I.C., of Toronto, will succeed Mr. Shaw. He directed installation of modern electric equipment on the C.P.R.'s bascule bridge at Sault Ste. Marie, in 1914 and supervised building of machinery for the diesel-electric tug and coal car in operation between Prescott and Ogdensburg. He started as engineer in the electrical department at Angus Shops in 1907 and has been electrical engineer for the eastern lines for 31 years. He is a past-president of both the Canadian Railway Club of Montreal and the Toronto Railway Club.

L. A. Duchastel, M.E.I.C., has received the appointment of employment supervisor for the personnel department of Shawinigan Water and Power Company. Mr. Duchastel, who recently resigned as secretary-treasurer of the Montreal Branch of the Institute after six years service, is a graduate of Ecole Polytechnique, Montreal. Joining the Shawinigan Water and Power Company in 1934, after seven years with the Shawinigan Engineering Company Limited, he was first in the department of development and later transferred to the power sales division of the commercial distribution department, where he became manager in 1943, remaining until his recent appointment.

J. P. Carrière, M.E.I.C., has been appointed city manager and engineer for the City of Hull, Que. On his retirement from the Canadian Army with the rank of colonel in 1945 he returned to the Department of Public Works of Canada, being appointed to the chief engineer's staff at Ottawa, Ont., where he was located at the time of his recent promotion.

J. K. Davidson, M.E.I.C., is now chief engineer of Orange Crush Limited and will be in charge of engineering connected with the company's proposed modernization of its plants across Canada. He had been development engineer with Mainguys Limited of Montreal, Que., since early 1945. During the war he was sent to Melbourne, Australia by the Electric Reduction Company of Buckingham, Que., to construct and manage an associated plant for the production of phosphorus and allied chemicals for munitions. Associated with the Electric Reduction from 1932, he has been assistant manager and chief engineer. He is a graduate of St. Andrew's University, Scotland.

John A. Mackenzie, M.E.I.C., has been transferred by the Canadian Pacific Railway from Toronto to Saint John, N.B. as district engineer. In Toronto he was assistant engineer on maintenance of way for eastern lines.

Wm. Rodger, M.E.I.C., recently elected a fellow of the Royal Society of Arts, discloses that the invitation to membership had been issued to him twenty-five years ago as a result of a paper he presented in 1915 before the Canadian Railway Club. Inadvertently mislaid and forgotten, the invitation came to light some months ago when a reply resulted in his election as a fellow. Mr. Rodger remarks that the secretary at that time was G. K. Menzies, now C.B.E., who is on the list of executives of the society. Mr. Rodger, a life member of the Institute, is chief draughtsman with the Nova Scotia Department of Mines.

W. G. Enouy, M.E.I.C., of the H. H. Robertson Co. Ltd., has been appointed sales manager and is located at the head office in Hamilton He was previously manager of the branch office in Montreal, Que.

G. H. Richards, M.E.I.C., city engineer of the city of Brantford, Ont., was unanimously elected president of the Grand Valley Group of Engineers at the annual dinner meeting in Brantford, on May 16th. Mr. Richards served the group last year in the capacity of secretary-treasurer.

I. S. Patterson, M.E.I.C., has been appointed manager of the new Winnipeg district office of the English Electric Company of Canada Limited of St. Catharines, Ont. Mr. Patterson is a graduate in electrical engineering from the Nova Scotia Technical College with fifteen years experience in the electrical manufacturing industry. He recently resigned his position as chief executive officer of the Wartime Bureau of Technical Personnel, Ottawa, after four years service with the Department of Labour.

J. A. Shaw, M.E.I.C.

J. W. Hughes, M.E.I.C.

I. S. Patterson, M.E.I.C.

J. M. Carrick, M.E.I.C., has been in consulting practice since September 1945 in Winnipeg, Man. He was formerly with the Canadian Pacific Railway at Winnipeg as designing engineer.

David Boyd, M.E.I.C., has received the appointment of works manager, general engineering division of the John Inglis Company Limited at Toronto. An engineering graduate of McGill University, he has a long and successful record on production of equipment such as manufactured by John Inglis Company. He has been active in development of welded pressure vessels and fabricated steel. He was awarded the Gzowski Medal of the Institute in 1936. During the war his services were requisitioned by the government, as general manager of Victory Aircraft Limited, Malton, Ont.

T. M. Moran, M.E.I.C., is now in Vancouver, B.C., having accepted the vice-presidency of the B.C. Power and B.C. Electric Railway Company Limited. Prior to his new appointment he was connected with The Aluminum Company of Canada Ltd., Dominion Rubber Company Limited, and latterly with Stevenson & Kellogg Limited, management engineers, as vice-president.

H. A. Cooch, M.E.I.C., vice-president in charge of sales and a director of the Canadian Westinghouse Company Limited, recently was elected president of the Hamilton Chamber of Commerce which is now in its one hundred and second year of continuous operation in the community.

Neville Beaton, M.E.I.C., became associated in April with the Brompton Pulp and Paper Company Limited as resident manager in charge of its Red Rock division, where he is responsible for the sulphate and groundwood mills and the associated woods operations. For the previous eighteen months he had been assistant to the vice-president in charge of Canadian operations for the Marathon Pulp and Paper Company Limited, Toronto, Ont.

V. W. G. Wilson, M.E.I.C., is now head of the engineering and design division, Dominion Road Machinery Company, Limited, Goderich, Ont. During the war he was employed by the army engineering design branch, Department of Munitions and Supply, on tank design. Before the war he was divisional superintendent in charge of sand foundry, Aluminum Company of Canada, Toronto, Ont. Mr. Wilson graduated from McGill University in 1926 with a B.Sc. degree and in 1926 received the degree of S.M. from the Massachusetts Institute of Technology.

O. F. Bush, M.E.I.C., is now in Talara, Peru, South America, associated with the International Petroleum Company on a construction project, and expects to be away from Canada for three years. He has served two years with the R.C.N.V.R., released as a lieutenant (E) in 1945.

C. W. Bickers, M.E.I.C., has severed his connection with the Ford Motor Company of Canada at Windsor, Ont., and is now plant engineer with Kaiser-Frazer Corporation, Willow Run, Mich.

R. H. Moore, M.E.I.C., has accepted employment with the Falconbridge Nickel Mines Limited at Falconbridge, Ont. He was formerly on the staff of Babcock, Wilcox and Goldie McCulloch Limited, Galt, Ont.

P. B. Hughes, M.E.I.C., who has been discharged from the R.C.N.V.R., with the rank of lieutenant commander (E), is now in Toronto. He is lecturer in the department of civil engineering, municipal and structural, at the University of Toronto.

M. A. Matheson, M.E.I.C., is now in Lima, Peru, having been appointed general sales manager for International Petroleum Company.

M. D. Stewart, M.E.I.C., until recently a lieutenant with the 5th Coy. R.C.E. at Valcartier, Que., has been appointed city engineer for Sudbury, Ont. Prior to his enlistment in 1941 he had been connected with Hugh C. MacLean Publications, Toronto.

J. J. Crawford, M.E.I.C., formerly assistant to the technical director of Howard Smith Paper Mills, is now in India as engineer in charge of pulp mills operated by the Orient Paper Mills, Limited. He is also engaged in the construction of a new plant which will double the capacity. Mr. Crawford's trip directly from Montreal to Karachi, India, in a Liberator bomber, involved 11,000 miles and was accomplished in approximately fifty-five hours, which the air force reported as a record.

Capt. A. C. Davidson, M.E.I.C., who has been overseas with the R.C.E., has now returned to Canada.

J. D. Chisholm, M.E.I.C., has accepted the position of works manager of the Cherrier Works of Canadian Arsenals Limited, Montreal. During the war he was with the shell filling division of Defense Industries Limited and at its termination was production manager of all shell filling plants operated by D.I.L. until his recent appointment.

R. W. Willis, M.E.I.C., has recently accepted the position of chief engineer, structural steel division, of John T. Hepburn Ltd., of Toronto, Ont. He was formerly structural designing engineer with the Standard Steel Construction Company at Port Robinson, Ont.

E. W. Henselwood, M.E.I.C., until recently with the Q.M.G. Branch, N.D.H.Q. at Ottawa with the rank of lieutenant colonel, is now employed by the Canadian General Electric Company at Toronto, Ont., as engineer in the generator section of the apparatus department.

G. O. Vogan, M.E.I.C., has accepted the position of hydraulic engineer with the Canadian and General Finance Company, Limited, Toronto, Ont. He was chief engineer with the Fred Mannix & Company Limited, general contractors, Calgary, Alta., since 1945, when he transferred from Wartime Merchant Shipping in Montreal where he was manager of the production division.

J. J. Samson, M.E.I.C., is now located at Coaticook, Que., where he will be in charge of municipal services. He has been maintenance and construction engineer for the Brown Corporation at LaTuque, Que.

R. P. Ring, M.E.I.C., who has recently been released with the rank of lieutenant (E) from the R.C.N.V.R. industrial relations department at Queen's University, Kingston, Ont., has accepted a position with Moore Business Forms Limited at Mount Dennis, Ont., to study plant methods and organize a manufacturing control department.

Howard Elgin Armstrong, M.E.I.C., who served overseas for two years with 8th Fd. Park Coy., R.C.E., is now working with the Department of Reconstruction.

E. J. Bartley, M.E.I.C., has left the Navy and returned to civilian employment in Cornwall, Ontario.

J. G. G. Belle-Isle, M.E.I.C., who served with the R.C.A.F. during the war, has returned to the Bell Telephone Co. of Canada in Montreal.

A. I. Bereskin, M.E.I.C., served overseas with the R.C.E. on construction work with the rank of captain and is now doing survey work with the Province of Saskatchewan.

W. A. Bickell, M.E.I.C., has retired from the R.C.E. after serving at the Directorate of Works & Construction at Ottawa, and is now in the contracting business in Vancouver.

Edgar Richard Bishop, M.E.I.C., has returned from the R.C.A.F. to the Canadian Westinghouse Co. Ltd., in Hamilton.

E. C. Hague, M.E.I.C., who spent more than five years overseas with the R.C. Signals is now re-established in civil life in Montreal.

R. T. Harland, M.E.I.C., who was with the R.C.A.F. section of the Cdn. Gov't Joint Staff in Washington, U.S.A., is now back in civil life in Winnipeg.

M. A. P. Harrigan, M.E.I.C., has left the Navy and is now employed in Montreal.

James Rowan Hartney, M.E.I.C., who served with the R.C.A.F. during the war, is now with the Imperial Oil Co. Ltd.

Ernest Allan Harvey, M.E.I.C., has retired from the R.C.A.F. and accepted a position at Canadair Ltd., Montreal.

J. Laird Hemphill, M.E.I.C., who served in the Royal Navy, is now with John Inglis Co. Ltd., in Toronto.

G. R. S. Henry, M.E.I.C., who served overseas with the R.C.E.M.E., has returned to the British American Oil Co. Ltd., in Montreal.

G. S. G. Henson, M.E.I.C., has retired from the R.C.A.F. and returned to the Winnipeg Electric Co.

Alfred Halsten, M.E.I.C., has been discharged from the R.C.N.V.R. and is now with the B.C. Electric Railway in Vancouver.

Philip B. Hughes, M.E.I.C., has been discharged from the R.C.N.V.R. and has accepted a position on the staff of the University of Toronto.

George Edward Humphries, M.E.I.C., who served overseas for several years with the R.C.E., has now gone into private practice in Ontario.

Brete Cassius Nowlan, M.E.I.C., who served overseas in the R.C. Sigs., has now returned to the Bell Telephone Co. in Montreal.

G. W. O'Neill, M.E.I.C., who served in Canada as a major in the R.C.E.M.E., has returned to the Manitoba Bridge & Iron Wks. Ltd.

B. L. Phomin, M.E.I.C., who was on works services in the R.C.E., is now with the Department of Public Works of Canada at Toronto.

J. M. Pope, M.E.I.C., has retired from the R.C.A.F. and is now at Baie Comeau, P.Q. with Ontario Paper Company.

Russell E. Potter, M.E.I.C., who was in the R.C.A.F., has returned to his position as chief engineer of the City of New Westminster, B.C.

D. O. D. Ramsdale, M.E.I.C., has retired from the R.C.N.V.R. and is now with the English Electric Co. at Kirkland Lake, Ont.

J. T. Rose, M.E.I.C., served in the works services of the R.C.A.F., and has returned to his former position in Winnipeg.

G. W. Rowe, M.E.I.C., has retired from the R.C.A.F., and is now with the Manitoba Department of Public Works at Winnipeg.

R. A. Rule, M.E.I.C., who served in the Directorate of Works and Construction as a major in the R.C.E., has now taken over the operation of A. E. Rule, Ltd., in Toronto.

B. H. Russell, M.E.I.C., formerly with the R.C.A.F., is now in the engineering department at Fairchild Aircraft Ltd., Longueuil, Que.

Richard Lear Bartlett, Affiliate E.I.C., has retired from the Army after four years overseas and is now with Heaps Engineering Co., in New Westminster, B.C.

C. B. Huyck, Affiliate E.I.C., who served in his second war as a major in the R.C.E.M.E., has set up in private business in Vancouver.

W. R. Binks, Jr.E.I.C., discharged from the technical branch of the R.C.A.F. in October last, has since been with the Ontario Department of Highways as an engineer assistant in the soils branch.

R. W. Franklin, Jr.E.I.C., has accepted a position with J. Gordon Turnbull, Inc., consulting engineers of Cleveland, Ohio, as structural engineer in connection with a factory being built in Lindsay, Ont. He had been with the Water Resources Branch of the Department of Mines and Natural Resources of Manitoba.

E. L. Miller, Jr.E.I.C., is in Pietermaritzburg, South Africa, with the Aluminum Company of South Africa. He was with the Demerara Bauxite Company in 1942 and with the Jamaica Bauxite Company in 1944.

W. A. McDougall, Jr.E.I.C., who was released from the Army in February, as a lieutenant, is in the employ of Canadian Bridge Company at Windsor, Ont.

C. H. Cook, Jr.E.I.C., has accepted a position with Canadian Domestic Engineering Company Limited in Montreal.

T. F. Holmes, Jr.E.I.C., recently released from the R.C.E.M.E. with the rank of second lieutenant, is located at the University of Toronto Ajax Division, where he is an instructor in engineering drawing.

Gérard Aubry, Jr.E.I.C., has retired from the R.C.A.F. with the rank of flight lieutenant to take up a temporary position with the Quebec Department of Mines pending post-graduate studies.

William Henry Warren Ball, Jr.E.I.C., has been discharged from the Army and is pursuing post-graduate studies.

James E. Beamish, Jr.E.I.C., who served overseas in the R.C.E., has accepted a position with the B.C. Department of Agriculture.

Major Guy Beaudet, Jr.E.I.C., who was overseas with 3 Bn. R.C.E., is now with the Central Housing and Mortgage Corporation in Montreal, as branch manager.

R. S. Bleackley, Jr.E.I.C., who was in Newfoundland with the R.C.N., is now with the Bell Telephone Co. Ltd., in Toronto.

Roy Thomas Bogle, Jr.E.I.C., has retired from the R.C.E.M.E. as a major and returned to the Canadian General Electric Co. in Peterborough.

V. F. Harrison, Jr.E.I.C., has been invalided out of the army and is now on the instructional staff at Queen's University.

G. J. Hendrikson, Jr.E.I.C., has left the R.C.N. and is now with the B.C. Electric Railway Co. in Vancouver.

Walter Andrew Hiller, Jr.E.I.C., who was with the R.C.E., has taken employment with Burns & Co. Ltd., in Calgary.

N. F. Hach, Jr.E.I.C., has left the R.C.A.F. and accepted a position with Alliance Paper Mills Ltd., Merriton, Ont.

J. S. Haughton, Jr.E.I.C., has retired from the R.C.A.F., and is now re-established with the Dominion Bridge Co. in Montreal.

Marcel Huot, Jr.E.I.C., who served as a navigation instructor in the R.C.A.F., is now with Dominion Bridge Co. in Montreal.

J. D. Near, Jr.E.I.C., who was overseas for three years with the R.C.E., is now in the Department of Works of the City of Toronto.

W. A. Nelson, Jr.E.I.C., who served overseas in the R.C.E.M.E., has returned to employment with the Bailey Meter Co. of Montreal.

H. W. Norton, Jr.E.I.C., who served in the R.C.A.F., has accepted a position with the Dominion Engineering Co. at Lachine. P.Q.

H. A. Norton, Jr.E.I.C., was in the R.C.N.V.R., afloat, and is now with Shawinigan Chemicals Ltd. at Shawinigan Falls.

J. R. Nutter, Jr.E.I.C., has retired from the R.C.N.V.R. and accepted employment with Canadian Pacific Railway.

D. E. Palmquist, Jr.E.I.C., who was in the R.C.N.V.R., has returned to Canadian Industries Ltd., at Windsor Ontario.

G. W. Painter, Jr.E.I.C., who served overseas for four years and attained the rank of Lt. Col. in the R.C.E.M.E., has returned to his former position with Canadian General Electric Co. Ltd. in Toronto.

A. H. Pangman, Jr.E.I.C., who was a captain in the R.C.A. overseas, is now with Charles E. Frosst & Co. of Montreal.

R. E. Phillips, Jr.E.I.C., who was in the R.C.N.V.R., has returned to the staff of the University of Alberta.

John Frederick Pink, Jr.E.I.C., who was overseas for three years on special work for the R.C.N.V.R., has accepted a position in the U.S.A.

J. C. Pratt, Jr.E.I.C., served in the Navy during the war and is now with Kipp-Kelly Ltd. in Winnipeg.

J. H. Rogers, Jr.E.I.C., has returned from the R.C.N.V.R. to the Hydro-Electric Power Commission of Ontario.

Lieut. J. O. Kelly, Jr.E.I.C., is now with the Inspection Board of Canada at Ottawa, seconded from the Canadian Army. He was previously at Chemical Warfare Laboratories in Ottawa.

Wm. J. Staples, Jr.E.I.C., who has been connected with the Aluminum Company of Canada Limited at Long Branch, Ont., and Arvida, Que., is now with the Demerara Bauxite Company at Mackenzie, British Guiana.

L. J. Russell, Jr.E.I.C., has been appointed field engineer by the Horton Steel Works Limited, Fort Erie, Ontario.

William Hall Ackhurst, S.E.I.C., who served overseas as a captain in the R.C.E.M.C., has now returned to his former employment with Canadian General Electric.

Paul Chenery Anderson, S.E.I.C., who spent four years overseas and attained the rank of major in the R.C.E.M.C., has returned to his former employment with Ferranti Electric at Toronto.

Robert Gordon Baird, S.E.I.C., has been discharged from the R.C.N., and has returned to his former employment.

Frederick Arthur Bell, S.E.I.C., has retired from the R.C.N.V.R. and accepted a position with the Manufacturers Life Insurance Co., in Toronto.

Morris Maskew Beresford, S.E.I.C., who was overseas in the R.C. Signals, is now with Northern Electric Co.

V. H. Berry, S.E.I.C., has been discharged from the R.C.N. and is taking a post-graduate course at McGill.

R. S. Allison, S.E.I.C., who recently graduated in civil engineering from Queen's University, Kingston, Ont., has been employed by the Canadian Pacific Railway as a transitman and is located at London, Ont.

R. R. Smith, S.E.I.C., has left the employ of H. G. Acres and Co., Niagara Falls, Ont., and is working with the W. G. Ure, M.E.I.C., city and construction engineer, at Woodstock, Ont.

Kurt Rothschild, S.E.I.C., has received the B.Sc. degree in electrical engineering from Queen's University, Kingston, Ont., and has entered the employ of Bedard and Girard Ltd., Montreal, Que.

A. Swystun, S.E.I.C., has graduated from the University of Saskatchewan and has accepted a position with the Consolidated Mining and Smelting Company at Trail, B.C.

J. W. Lee, S.E.I.C., is located at the Queenston Generating Station, with the meter and relay department of the Hydro Electric Power Commission of Ontario.

R. W. Hale, S.E.I.C., has been appointed the Vancouver manager of Lockerbie and Hole Limited, sanitary and heating engineers, who have opened an office in that city.

P. C. Levesque, S.E.I.C., has accepted the position of district electrical engineer with the New Brunswick Electric Power Commission.

J. H. Carson, S.E.I.C., recently entered the employ of the Bell Telephone Company of Canada at Toronto, Ont., as an engineering assistant.

R. Lloyd Parsons, S.E.I.C., has been appointed by the Parsons Construction Company Limited, Moncton, N.B., as secretary treasurer and construction engineer. Mr. Parsons received his engineering certificate from Mount Allison and his bacheor of engineering degree in civil engineering from Nova Scotia Technical College in 1944. Since graduation he has been with the firm as construction engineer.

A. B. Hopkins, S.E.I.C., has accepted a position at Kapuskasing, Ont., with the Spruce Falls Power and Paper Company.

R. A. Quance, S.E.I.C., has joined the staff of Canadian Synthetic Rubber Limited, Sarnia, Ont. He is in the instrument and electrical departments.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Glenn B. Ashcroft, M.E.I.C., died on April 25th, 1946, in Sacramento, California, where he had lived for the past fifteen years.

He was born at Munson, Ohio, in 1874 and was an alumnus of Baldwin University at Berea, Ohio, an of the Case School of Applied Science at Cleveland, Ohio, receiving there the degrees of B.S. and C.E. in 1900 and 1905 respectively. He spent more than forty years in engineering, architecture, contracting and manufacturing activities in Canada, the eastern and western United States, principally California where he has been identified with prominent engineering and architectural projects, and where he has made a study of local history, botany and geology, to the benefit of the museum at Sutter's Fort in Sacramento.

He was connected with the construction of the drydock at Baltimore, Md., and with railway surveys in Ohio, Indiana, Illinois, Michigan and Wisconsin. He was inspector of structural steel for bridges and buildings in Philadelphia, Buffalo. Montreal, San Francisco, and for structures erected by the Government of the Dominion of Canada, the Province of New Brunswick, and the Mexican Railways, and was connected with the steel inspection department of the Osborn Engineering Company of Cleveland, Ohio, at their Montreal office and was located in Montreal for some time as district representative for the DeLano Osborn Engineering Company of Toronto.

Mr. Ashcroft was contractor for the construction of stores, residences, hotels, plants in California and Pennsylvania, and was in charge of engineering design for warehouses, schools, plants, theatres, hotels, factories, garages and hospitals in California. He personally designed and supervised the construction of seven hotels and rooming houses in San Francisco and vicinity during the period of reconstruction after the earthquake and fire of 1906 and was chief enineer and secretary of a general contracting company which undertook the construction of twenty large structures after the same crisis. He has been general plant and sales manager for Clay Products at San Francisco, and director and vice-president of Fard's Federated Factors of that city, and was associated there with H. Meyers, Architect, for several years.

In 1930 he joined the California State Department of Public Works, division of architecture, as associate construction engineer, and at the time of his death was senior structural engineer.

Mr. Ashcroft became an Associate Member of the Institute in 1904 and a Life Member in 1940.

A. Irwin Cunningham, M.E.I.C., president of the Chaguaramas Terminals Company of Trinidad, B.W.I., died suddenly in Montreal on May 15th last.

Born in Westmount, Que., in 1893, and a graduate in civil engineering of McGill University, Montreal, in 1914, he served for four years with the Canadian Siege Artillery in World War I. On his return in 1919, he was employed by the St. Maurice Lumber Company at Three Rivers, Que., as field engineer, going in 1922 to the Parklap Construction Corporation as field engineer at the power house of the Sherman Island Hydro Electric Division at Glens Falls, N.Y., and in 1923 to the Moreau Manufacturing Corporation of Glens Falls as resident engineer.

Returning to the St. Maurice Lumber Company paper mill he was in charge of construction for the next three years and in 1928 became resident engineer for the New Brunswick International Paper Company at Dalhousie, N.B. He accepted the post of vice-president and general manager of Merritt-Chapman and Scott Limited, general contractors, Montreal, in 1930, and joined the Aluminum Company of Canada as construction superintendent at Arvida, Que., in 1935, transferring in 1936 to the Ontario Paper Company Limited at Baie Comeau, Que., as general superintendent of construction and later as managing engineer.

In 1937 he returned to the Aluminum Company of Canada Limited as construction manager and was appointed to the presidency of the Chaguaramas subsidiary in 1943.

Mr. Cunningham joined the Institute in 1914 as a Student, becoming an Associate Member in 1925 and a member in 1940.

C. H. McL. Burns, M.E.I.C., industrial engineer, died on May 20th, 1946, in Toronto.

Born at Amherst, N.S., in 1889, he attended schools in Truro, N.S., and studied engineering at Mount Allison University at Sackville, N.B. In 1911 he entered the employ of Canada Iron Corporation, Saint John, N.B., as assistant to the mechanical engineer and the following year become chief resident engineer with the Maritime Coal Railway and Power Company Limited of Nova Scotia.

He went to Philadelphia in 1920 as designing engineer with the Link-Belt Company and in 1924 was appointed engineer in charge of plant changes. Later connections were with the International Nickel Company of Canada at Copper Cliff, Ont., as designing engineer in 1928, with the Dodge Manufacturing Company Limited in Toronto as chief engineer in 1929, and he was inspector for the Ontario Power Service Corporation on the power development project at Abitibi Canyon, Ont., in 1931 and 1932. Mr. Burns then spent several years in private consulting practice and in 1935 joined Canada Foundries and Forgings Limited, Welland, Ont., as assistant manager in charge of operation and maintenance of drop forging and heavy forging plants.

In 1941 he was with Wartime Merchant Shipping Limited, Montreal, and the same year accepted the post of assistant to the manager of munitions, Ottis Fensom Elevator Company Limited, Hamilton, Ont. He entered the trades and industry branch of the Ontario Department of Planning and Development as director late in 1944.

Mr. Burns joined the Institute in 1920 as an Associate Member, transferring to Member in 1937. He was chairman of the Niagara Peninsula Branch in 1941.

L. M. Duclos, M.E.I.C., died in December 26th, 1945, at Woodstock, N.B., where he had been division engineer with the Canadian Pacific Railway.

Mr. Duclos was born at Ottawa, in 1890, and studied engineering at Acadia University. Entering the employ of the Canadian Pacific Railway in 1911, he was successively chainman, rodman, inspector, and transitman. Returning to the Canadian Pacific Railway after overseas service in World War I, he was senior instrumentman with the Grand Trunk Railway in Montreal, and in 1922 to 1925 was transitman at Ottawa. He was transferred to North Bay as assistant engineer in 1926 and to Sudbury, Ont., as division engineer in 1938. His appointment in the same capacity to Woodstock was in 1943.

He joined the Institute as a Junior in 1921, becoming an Associate Member in 1926 and a Member in 1940.

Rodolphe Emile Joron of Chicoutimi died in June 1945.

He was born at Valleyfield, Que., in 1888 and attended Ecole Polytechnique, Montreal, receiving a B.A.Sc. degree in civil engineering in 1909. He qualified as a mining engineer in 1911 and as a provincial land surveyor in 1914. He was assayer and surveyor for the Nova Scotia Mine at Cobalt, Ont., in 1909, and was with the Hollinger Mine at Porcupine in 1910. The following year he was engineer on the municipal development of West Crescent Heights, Westmount, Que., and from 1912 to 1914 he was employed in the engineering department of the Chicoutimi Pulp Company and associated companies, particularly connected with the location of the Roberval-Saguenay railway and municipal work. In 1914 and 1915 he was in charge of the construction of the water and sewer system and roads at Chandler, Que., when he joined the St. Lawrence Pulp and Paper Company as manager of their interests at Chandler. In 1916 he was responsible for location surveys for the Kenogami reservoir and the next year became associated with the interests of Mr. J. E. D. Dubuc, in charge of engineering. In 1922 he established his private practice in Chicoutimi as civil engineer and provincial land surveyor.

He became an Associate Member of the Institute in 1925, and a Member in 1940.

W. H. Ross, M.E.I.C., died on April 16th, 1946, at his home in Regina.

Born at Menstrie, Scotland, in 1881, Mr. Ross came to Canada at the turn of the century, followed correspondence courses in locomotive and stationary steam engineering, made varied engineering contacts in western Canada and registered in Saskatchewan as a professional engineer in 1931.

From 1915 to 1919 he was employed at Holy Cross Hospital Calgary, on building and installation of cold storage, heating and electrical systems. With the Burns Company Limited of Calgary in 1919 and 1920, he was chief engineer, and with Canadian Fairbanks Morse Company at Winnipeg, Man., he was sales engineer for the following eight years, with charge of diesel engine sales and installations. He also laid out and supervised plants and distribution systems at numerous points. Since 1928 Mr. Ross has been with the Dominion Electric Power Company, located at Regina and Estevan where he was general superintendent, responsible for power installation and distribution systems, diesel plants and transmission lines. When the organization was taken over by the Saskatchewan Power Commission in 1945, Mr. Ross became superintendent of diesel power plants for the Province.

He became an Associate Member of the Institute in 1938 and a Member in 1940.

Robert Charles Mold, Affiliate E.I.C., died on May 1st, 1946, at his home in Toronto, Ont.

Born in England in 1901, he was educated there and on his arrival in Canada was employed as draughtsman and junior fire protection engineer by the Grinnel Company from 1917 to 1923, when he became inspector for the sprinkler risk department of the Canadian Fire Underwriters Association.

With the H. G. Vogel Company (Canada) Limited in Toronto, from 1929 to 1936, he was district representative, contractor and superintendent of outside work involving installations in large buildings and mines, and later he was manager of their Montreal office. Entering the employ of the Associated Factory Mutual Fire Insurance Companies of Boston, Mass., in 1936 as an inspector, he was transferred to their Toronto office in 1937 as resident inspector. For the past eight years he has been the Canadian representative for the Blackstone Mutual Fire Insurance Company of Providence, R.I.

Mr. Mold became an affiliate of the Institute in 1936.

Lieut. James Finloy Ross, R.C.N.V.R., S.E.I.C., was killed in action in the Far East on July 30th, 1945.

Born at Mulgrave, N.S., in 1920, he enlisted in 1941 from Mount Allison University where he studied aeronautical engineering. Choosing the Fleet Air Arm, his training required exceptional exactitude. He trained at St. Vincent, England, and Grosse Isle, Michigan, and graduated at Pensacolo, Florida. After graduation he completed operational duties in European theatres, thence to North Africa, India, Ceylon, then the far east. Lieut Ross was twice mentioned in dispatches; in January 1945 he took part in the air blows which resulted in the destruction of Germany's greatest battleship, the *Armiral Von Tirpitz*. His second mention came posthumously in November 1945 for outstanding skill and courage in air operations against Japan.

Lieut Ross became a student member of the Institute in March, 1941.

News of the Branches

Becouse of the poper supply situotion it has been necessory to reduce considerobly the amount of spoce usuolly devoted to News of the Bronches. We beg the indulgence of the branch news editors if they find thot we hove mode liberol use of the blue pencil on their reports.—Editor.

Activities of the Twenty-seven Branches of the Institute and abstracts of papers presented

EDMONTON BRANCH

W. W. Preston, Jr.E.I.C. - *Secretary-Treasurer*

The highlights of the activities of the Edmonton Branch during its fiscal year, May 1st, 1945, to April 30th, 1946, were reported to the Branch annual meeting held in the Macdonald Hotel on April 24th. In the business session after dinner the different officers and committee chairmen gave the following reports: councillor's report by C. W. Carry, chairman's report by F. R. Burfield, secretary-treasurer's report by W. W. Preston, auditor's report by D. Ross, membership report by J. E. Cranswick, program report by J. W. Porteous, rehabilitation report by C. W. Carry, foundation soils report by R. M. Hardy, summary of correspondence re the Young Engineer including an outline of the Harry F. Bennett Educational Fund by the secretary, and finally the report of the nominating committee by the chairman.

The names of the officers elected appear at the front of the *Journal* except for the auditors, D. Ross and C. A. Stollery.

The retiring chairman thanked his executive for their cooperation and gave the chair to Professor J. W. Porteous, the chairman-elect.

The meeting then continued as a smoker at which refreshments were provided, an innovation at Branch gatherings. The attendance was higher than at recent annual meetings, there being 44 members present.

❖ ❖ ❖

During the western visit of the President J. B. Hayes, the Edmonton Branch held an informal general meeting, to which ladies were invited, on Monday, May 13th, 1946, in the Macdonald Hotel. The meeting, which opened with refreshments preceding dinner, was entertained with vocal solos by Miss Noreen Bristow accompanied by Mrs. Bessie Campbell-Bowen. A general sing-song was led by G. F. Mudgett.

The three visiting officials made short addresses. G. J. Currie brought greetings from Halifax.

President Hayes spoke of the alternating influence of employers on employees, and of labor on management. He deplored the current strikes and hoped that administrators will not seek revenge if opportunity arises. "Our urgent need", he said, "is to produce things we lack." He challenged the engineering profession to show the leadership during the recovery. Mr. Hayes also told of Halifax's experiences during the war.

General Secretary, Dr. L. Austin Wright, reviewed headquarter's activities.

Mr. E. Nelson expressed the thanks of the audience to the three distinguished guests. Attendance was 79 members and visitors.

Those sitting at the head table included the acting chairman, F. R. Burfield, and Mrs. Burfield; President Hayes and Mrs. Hayes; General Secretary Dr. L. Austin Wright; Councillor G. J. Currie; Mrs. J. W. Porteous, wife of the Branch Chairman; Hon. N. E. Tanner and Mrs. Tanner representing the Provincial Government; J. G. Dale, Registrar of the Association of Professional Engineers of Alberta, and Mrs. Dale; E. O. Lilge, vice-chairman of the Edmonton Branch C.I.M.M., and Mrs. Lilge; and G. A. Gaherty, president of the Calgary Power Company.

During the afternoon of May 12th the visitors went on a motor trip, inspected the meteorological offices at the Municipal Airport, and had tea at the home of Mrs. J. W. Porteous. Next day the Edmonton executive entertained the officials at luncheon in the University of Alberta cafeteria banquet room, while Mrs. Burfield entertained Mrs. Hayes and the wives of the executive members. After a tour of the University the visiting officials spoke to the class of freshmen engineers who registered in January, 1946, and will complete their course during the summer.

HAMILTON BRANCH

L. C. Sentance, M.E.I.C. . . . . *Secretary-Treasurer*
I. M. Macdonald, Jr.E.I.C. . . . . *Branch News Editor*

The annual joint meeting of the Hamilton Branch of the Engineering Institute and the Toronto Section of the American Institute of Electrical Engineers took place on Friday, April 26th, 1946, at the Westinghouse Auditorium, with about 175 persons in attendance. The meeting was conducted jointly by A. R. Hannaford, M.E.I.C., and Arthur Frampton of the A.I.E.E.

Dr. G. D. McCann, the speaker, was introduced by E. M. Coles as being associated with the Westinghouse Electric Corporation, Pittsburgh, in research work on lightning problems. He has collaborated in the development of such instruments as the automatic cathode-ray oscillograph, fulchronograph, electronic surge-duration recorder and a photographic surge recorder.

The speaker's subject **Lightning** and how lightning "detectives" are trapping split-second discharges to provide data for the construction of better protective devices on power systems. The results of lightning research in the field and laboratory have provided engineers with a better basis for designing power lines so that they will not be put out of service by lightning strokes.

Dr. McCann said that twenty years ago service was disrupted at least temporarily by nearly every one of the 50 lightning strokes that normally hit a 50 mile power line each year. Today, power lines of this length can be designed with lightning protection equipment that will not be put out of service more than once every five to ten years.

The address, which was illustrated with coloured slides, also dealt with the relation between lightning and other electrical conditions, global variations in thunderstorm activity, the mechanism and characteristics of lightning discharge, and the effect of this natural hazard on transmissions lines. Dr. McCann compared the performance of various types of applications on power lines and overhead ground wire systems, including some of the new designs now being used for wood pole lines.

An interesting discussion period followed the address, after which Arnold Brace of Toronto moved a vote of thanks to Dr. McCann.

❖ ❖ ❖

On Monday, April 29th, 1946, the Hamilton Branch had the privilege of entertaining the president of the Institute, J. B. Hayes, M.E.I.C., at a dinner meeting held at McMaster University. The president was accompanied by G. J. Currie, councillor for the Halifax Branch, and Louis Trudel, assistant general secretary of the Institute.

A. R. Hannaford, M.E.I.C., chairman of the Hamilton Branch, presided at the meeting and at the conclusion of dinner called on E. P. Muntz to introduce the president. Mr. Hayes spoke on **Holifox in Wortime,** and recounted many interesting personal experiences.

The Royal Navy, said Mr. Hayes, used Halifax as one of its important bases, and the harbor of the Maritime city was host to many famous British Ships—the *Warspite, Revenge, Ramilles, Valiant,* to mention a few. The president's company was closely connected with the war against magnetic mines, and many ships were fitted with degaussing equipment by his staff.

At the conclusion of the president's address, a vote of thanks was moved by Edward Stearns.

The chairman then called on Louis Trudel, who reported on Headquarters and Institute affairs in general. Membership, he mentioned has reached a new high of eight thousand. Three thousand of these are student and junior members. Following Mr. Trudel's remarks, G. J. Currie, Halifax councillor, spoke briefly and extended the best wishes of the Halifax Branch.

It was pointed out by the chairman that the meeting, attended by forty members and guests, had representatives from coast to coast—from Halifax, Montreal, Niagara Falls, Winnipeg and Vancouver.

LAKEHEAD BRANCH

A. J. Mickelson, m.e.i.c. - *Secretary-Treasurer*
R. B. Chandler, m.e.i.c. - *Branch News Editor*

The annual dinner meeting of the Branch was held at the Village Inn, Port Arthur, on May 28th. Mr. W. C. Byers presided and reviewed the year's activities. Reports of the committees were presented by the respective chairmen. An election was held and the officers for 1946-1947 were duly elected. The sister professions, medical, dental and legal were represented at the meeting. Mr. Byers introduced the new chairman, Mr. W. H. Small, who spoke briefly.

A sound film "The Building of the Golden Gate Bridge" was shown, which film was loaned to the Branch by the Bethlehem Steel Export Corporation.

Resolutions of appreciation were tendered the chairman and retiring officers for service during the year.

LETHBRIDGE BRANCH

H. T. Miard, m.e.i.c. - *Secretary-Treasurer*

G. E. Elkington, m.e.i.c., chief engineer and general manager of the East Kootenay Power Company at Fernie, B.C., spoke on **Power Supply in the Crow's Nest Pass Area,** at a dinner meeting of the Lethbridge Branch, held in the Marquis Hotel on Friday evening, May 3rd. C. Little introduced the speaker.

Mr. Elkington gave an interesting address, illustrating it on a large map of the area served by his company, and on a straight line electrical diagram, and with moving pictures.

The district is a very difficult one in which to develop power as the valleys, with the exception of that of the Kootenay River, are narrow, there is no pondage, and the streams are swift and turbulent, besides being "the best ice factories in the world." The mountain ranges run north and south, and although Aberfeldie is only 15 miles west of Fernie, the transmission lines between the two places are 52 miles long.

The Company has three generating plants—Aberfeldie near Wardner, Elko, the main plant, and Sentinel. Power is distributed as far west as Moyie, as far north as Kimberley and as far east as the fifth meridian. The Company generates a total of about 120 million kilowatt hours a year, most of which is used by industries.

Kimberley produces over a million and a half tons of ore annually. In the Coal Mines supplied by the Company, nearly three million tons are dug. The lumber mills market almost 40 million board feet. The Summit Lime Works, Machine Shops and Brewing Companies are also customers, as well as various cities and towns.

The future of his company depends on Canada's success in competing in world markets and the company's ability to meet larger power requirements. With an expanding market, the company will have to find more sites or depend on steam.

Mr. Elkington concluded his address by showing three reels of his own moving pictures. These showed various phases of power line construction and maintenance, and included many beautiful scenes in color of the East Kootenay Power Company office in Fernie, the various plants, the operator's attractive homes, lawns and gardens at the Elko and Aberfeldie stations, and many beautiful scenes of mountains, rivers and lakes in the East Kootenay which proved, as Mr. Campbell said in moving a vote of thanks, that although it is a difficult area in which to transmit power, it is a lovely place to live.

Chairman P. E. Kirkpatrick was in charge of the meeting. R. S. Lawrence led the community singing with A. L. H. Somerville at the piano, and A. Branch gave two humorous recitations.

❖ ❖ ❖

The Lethbridge Branch had the pleasure of entertaining President J. B. Hayes, Councillor G. J. Currie of Halifax, and General Secretary Dr. L. Austin Wright on the afternoon and evening of May 14th.

Following a cocktail party, twenty-eight members and guests attended a banquet in the Marquis Hotel. Brown's trio entertained with dinner music and R. S. Lawrence led the community singing.

The chairman introduced the president's party and also Councillor MacGregor and Mr. MacMillan of Calgary and Mr. Gaherty of Montreal. Councillor Clendening extended the Branch's official welcome to the visitors.

Councillor Currie brought best wishes from the Halifax Branch and from the Association of Professional Engineers of Nova Scotia.

Mr. Hayes said he had had a wonderful opportunity to see Canada. Speaking on the labour situation he said increased production is necessary to aid the world and advance our country. Engineers should by good leadership and by good fellowship with labour lead the world out of its present slough of despondency.

Mr. Hayes spoke of wartime Halifax. He described the large number of searchlights and anti-aircraft units stationed in the city, the harbour filled with large powerful battleships, the work of de-gaussing ships, and he gave a humorous account of his experiences as Chief Air Raid Warden.

Dr. L. A. Wright gave a brief report on Institute affairs. He complimented the Lethbridge Branch in the successful meetings it was having due to the inclusion of affiliates. He believed the good fellowship shown was an asset to the Institute.

Chairman P. E. Kirkpatrick expressed the appreciation and enjoyment the Branch had had in having the President, Mr. Currie and Dr. Wright as visitors. Councillor MacGregor of the Calgary Branch expressed his thanks for the entertainment and invited the Branch to attend the Calgary Branch's meeting with the President on June 3rd. Mr. J. M. Campbell expressed the Branch's appreciation of the talk given by Mr. Hayes and the report given by Dr. Wright, and complimented Dr. Wright on the fine work he is doing as the general secretary.

LONDON BRANCH

A. L. Furanna, m.e.i.c. - *Secretary-Treasurer*
J. C. Keppy, m.e.i.c. - - *Branch News Editors*
J. W. Kirk, jr.e.i.c. - - -

In recognition of the annual visit of the president of the Institute, the London Branch held a dinner for members and their wives on May 2nd.

Approximately fifty people sat down to dinner at the London Hunt Club, following which an informal business meeting was held.

Mr. J. H. Johnson, branch chairman welcomed those in attendance and then called on members of the branch to introduce the following guests: President and Mrs. J. B. Hayes, Assistant General Secretary, Mr. Louis Trudel, and Halifax Branch Councillor, Mr. G. J. Currie.

Mr. Trudel spoke at some length on matters concerning the Institute at large. He made mention of the continuing growth in membership and responsibilities, and the resulting heavy increase in expenditures to satisfactorily carry out the work of the Institute. To meet these new conditions the Executive have found it necessary to ask the membership for approval to increase annual fees.

Mr. Hayes gave a very interesting and enlightening account of the work of the Nova Scotia Light and Power Company during war years. In his free and easy manner, he related many inspiring experiences that he and his associates had been faced with in giving full co-operation to the armed forces and particularly the naval services.

Mr. G. J. Currie who is travelling with the president on his tour, brought greetings from the Halifax Branch.

Before the meeting closed an opportunity was given to each person present to personally thank the guests for visiting the branch.

The chairman of the London Branch, J. H. Johnson, took the presidential party over to Belmont, where they went through the plant of the Borden Company. Left to right: J. H. Johnson, President Hayes, G. J. Currie, L. Trudel.

MONTREAL BRANCH

E. M. Van Koughnet, m.e.i.c. - *Secretary-Treasurer*
Hyman Schwartz, s.e.i.c. } *Branch News Editors*
Eli L. Ilovitch, s.e.i.c.

The members of the Montreal Branch were given the rare opportunity Thursday evening, May 30th, of hearing at a special out-of-season meeting the eminent European engineer, Professor Gustave Magnel, head of the department of civil engineering of the University of Ghent and consultant to the Belgian Government, discuss recent **Developments In Reinforced Concrete,** and expound the principles and advantages of pre-stressed concrete.

The professor told the members who overcrowded the hall that shortages of building material especially steel made it imperative to find methods of using concrete more advantageously. A method known as prestressing of concrete has been evolved, which reduces greatly the amount of steel and concrete required, and also often reduces the cost of the structure.

As an example the speaker showed that it is possible to build a railroad bridge of 66 ft. span using a concrete slab 2 ft. 8 in. thick without any steel at all, as compared with the normal reinforced bridge which would require a slab of 3 ft. 7 in, thick and 11.4 sq. in. reinforcing steel per foot width of bridge. The principle involved here is that the concrete slab is entirely under compression by forces acting on the ends of the beam. Thus the tensile stresses on the underside of the slab caused by the bending moments of the dead and applied loads are more than compensated for. It is precisely the same forces that make it possible for a librarian to carry a stack of books horizontally (like a beam) from one shelf to another by pressing the books together. If she spreads her arms slightly the books separate and the whole "beam" collapses.

In a practical bridge it is not usually feasible to apply the necessary compressive stresses by external forces. And so thin (3/16 in. dia.) high tensile (200 tons per sq. in.) steel wires are threaded through the concrete, and after the concrete has set the wires are drawn tight with the aid of hydraulic jacks and finally locked into position. It is interesting to note that in a bridge 66 ft. long the wires are stretched 4 in. before locking to give the required tension and also to overcome the shrinkage and creep of the concrete and of the steel.

The distribution of the wires in the slab is important. About half the wires are made to run horizontally near the lower surface of the slab. The remaining wires are placed in such a manner that they are near the underside of the beam at the centre, i.e., the point of maximum bending moment, and at the neutral axis at the ends. This is done to prevent tensile stress on the upper side of the beam differing from ordinary reinforcing bars which bend upward to take care of shearing stresses.

It is not necessary that the concrete slab be free from vertical cracks. In fact the Canadian Army Engineers built a bridge in Belgium during the war which was constructed of concrete blocks about 1½ ft. long. Thus it is evident that shear stress need not be considered when designing with prestressed concrete.

During the discussion period that followed the lecture the Professor pointed out that the use of prestressed concrete slabs for continuous beams was not yet fully investigated and that consequently he could not recommend its use at the present time.

Prof. Magnel, in addition to slides, presented a film especially prepared for his students. This film reviewed the principles by animated diagrams and then showed how tests on prestressed concrete were conducted in his laboratory and what results were obtained.

J. F. Brett, the chairman, adjourned the three hour meeting after Brian Perry thanked the speaker on behalf of the members and of the Institute.

NIAGARA PENINSULA BRANCH

P. A. Pasquet, jr.e.i.c. - - *Secretary-Treasurer*
J. L. McDougall, m.e.i.c. - *Branch News Editor*

On April 30th President James B. Hayes visited the Niagara Peninsula Branch at a dinner meeting held in St. Catharines, Ont.

In the absence of J. H. Ings, chairman, W. D. Browlee, vice-chairman, conducted the meeting, welcoming many out-of-town guests.

Among those present at the head table were Dr. A. J. Grant, past president, Louis Trudel, assist. general secretary, accompanying the president, W. R. Manock, vice-president, G. J. Currie, councillor from Halifax, Paul Buss, councillor, and J. R. Dunbar, councillor of the Hamilton Branch.

Introducing the president, J. B. Hayes, to the branch members, P. Buss explained something of the president's duties as engineer in charge of public utilities at Halifax, both before and during the war years.

For his address the president dealt in greater detail with some of the many tasks confronted and accomplished by his staff in meeting emergencies at a wartime port—mentioning how several almost impossible demands were overcome through the combined efforts of his department and the civilian population.

W. R. Manock at the close of the address thanked the president after which L. Trudel outlined to the members some of the highlights at headquarters during the past year.

OTTAWA BRANCH

C. G. Biesenthal, jr.e.i.c. - *Secretary-Treasurer*
R. C. Purser, m.e.i.c. - - - *Branch News Editor*

S. W. Fairweather, vice-president of the Canadian National Railways in charge of research and development, addressed the Ottawa Branch at a noon luncheon on April 18 at the Chateau Laurier. He spoke on **The Canadian National's Contribution to the War Effort,** and said that, although the railways had many headaches, they met all problems with a high degree of efficiency and on the whole carried on quite successfully. It was a different story during the first Great War.

German opinion at the commencement of the recent World War was that one of the great weaknesses of Canada's war effort would be in the realm of transportation. This opinion was successfully challenged by Canada's railways for if the war demonstrated one thing it demonstrated that no other means of land transportation could have undertaken the work that they did and dealt with it so successfully.

Having been exposed to the blighting effects of the depression of the 30's, it was almost a miracle that they were able to maintain a resiliency which enabled them to expand rapidly where required without loss of efficiency at least to a point where they could carry on effectively.

Speaking more particularly of the Canadian National Railways, Mr. Fairweather said that within one week after the outbreak of war stock was being collected and allocated for the improvement and expansion of necessary services. It was fairly obvious, of course, that Halifax would be a port of great importance. Served as it was by a single line of the railway, with round houses inadequate and shop facilities in many places obsolete, it looked to be "a pretty tough job to take heavy traffic over that line".

In the west on account of the possibility of invasion by the Japanese, the railway had to hold itself in readiness to transport troops to Prince Rupert and into northern Alberta. United States military authorities in particular looked to the railway to meet this possibility.

"The war has amply demonstrated that the railways are a prime necessity", concluded Mr. Fairweather. "It is a thought that is very easy to let slip. This attitude of forgetfulness is due to the fact that the railways are a planned economy, intended for long time service."

J. H. Irvine, chairman of the Branch, presided. Commander C. P. Edwards, Deputy Minister of Transport, proposed the vote of thanks.

❖ ❖ ❖

At the last regular noon luncheon of the Ottawa Branch for the spring season, a sound film entitled: "No Keener Blade" was shown through the courtesy of the Canadian Liquid Air Company of Montreal. This picture was produced in technicolor and told the dramatic story of the use of oxygen in industry. It began with a re-enacting of the momentous scene in 1774 when Joseph Priestley discovered oxygen, its smooth-flowing sequences moving through early experiments with the gas in connection with the "burning" of steel to its present widespread use in industry.

The use of mass production methods were shown whereby many sheets were cut at the same time to the shape of a master pattern, the whole process being practically automatic and not requiring the constant attention of an attendant. Norman Cuke, of the Canadian Liquid Air Company, Montreal, introduced the film and explained some of the processes involved.

J. H. Irvine, chairman of the Ottawa Branch, presided. There was a good attendance.

SAGUENAY BRANCH

H. R. Fee, m.e.i.c. - *Secretary-Treasurer*

Mr. G. F. Todd, landscape architect of Montreal, addressed the Saguenay Branch on Thursday, April 25th, on **Parks for Use of the People.** Mr. Todd described the various types of parks, from playgrounds for small children to national park reserves, and by means of slides he described some of the parks in Eastern Canada.

A number of slides were shown of St. Helene's Island Park in Montreal, which has accommodated as many as 115,000 people in one day. Of particular interest were the beach which had been built with sand brought in on barges, and the fort originally constructed in 1815. This fort had been allowed to deteriorate, and considerable work was involved in its reconstruction. By means of information from various sources, including the Dominion Government Archives, it was possible to rebuild the fortifications approximately as they had been originally built, including the underground fortifications.

The speaker also described the Beaver Lake in Mount Royal Park, and showed slides of the beaver dam which was discovered during the excavation of the Lake. This dam was buried under five feet of silt, and the logs used in its construction were found to be in excellent condition, but deteriorated rapidly when exposed to the atmosphere.

A number of slides were shown of the Quebec Battlefield Park and St. Foy Park in Quebec, with an outline of the historical significance and points of interest, and the various monuments which had been erected.

Mr. Todd closed his talk with a description of a park just outside Saint John, N.B., which is used very extensively by the public.

B. E. Bauman was chairman of the meeting, and R. A. Lemieux moved a vote of thanks to the speaker.

❖ ❖ ❖

Mr. M. Laflamme, lighting service engineer of the Montreal branch of Canadian General Electric, addressed a joint meeting of the Engineering Institute and The Chemical Institute of Canada, on Ma · 28th on the subject **Magic of the Spectrum.**

Mr. Laflamme, with an elaborate supply of equipment, demonstrated his paper throughout, first showing how the "cold light" of the firefly could be produced chemically. He then explained the spectrum, including the ranges above and below the visible spectrum, and demonstrated the mixing of the primary lights of green, blue, and red to produce various colours. The effect of sodium vapour and mercury vapour lamps on the visible spectrum was illustrated, showing that objects will reflect only those colours which are contained in the light source.

The speaker then demonstrated the ultra-violet, or black light, showing its effect on various florescent materials, explaining the principles of the florescent lamps, as well as the sun lamp and germicidal lamps.

In the infra-red range the speaker demonstrated the drying lamp and the heat lamp.

Mr. Laflamme closed his talk with a demonstration of polarized light, indicating the practical applications, including the analysis of stress in metal shapes by means of replicas in plastic placed between polarizing screens.

WINNIPEG BRANCH

David Hunter - *Secretary-Treasurer*
V. W. Dick - - *Branch News Editor*

The presidential party arrived in Winnipeg on Wednesday, May 8th, on their Western trip, and were met on their arrival by members of the executive of the Winnipeg Branch. After lunch the president visited the University of Manitoba where he met the members of the Engineering Faculty, and made a tour of the laboratories and draughting rooms.

Wednesday evening, an executive dinner meeting was held at the Royal Alexandra Hotel with the presidential party as guests, at which the visitors brought to the executive the latest information on the Institute's programme and policies. Members of the Engineers' Wives Association entertained Mrs. Hayes while Mr. Hayes was occupied with his presidential duties.

Thursday noon, a general luncheon meeting was held at the Hudson's Bay Company to afford members of the Winnipeg Branch the opportunity to meet the president and to hear the latest developments in Institute affairs.

G. R. Fanset, branch chairman, presided, and others at the head table included President J. B. Hayes; G. J. Currie, councillor, Halifax Branch; Dr. L. Austin Wright, general secretary; Dr. E. P. Featherstonhaugh, past president; D. M. Stevens, councillor, Winnipeg Branch; H. L. Briggs, chairman, Electrical Section; E. M. Scott, chairman, Students' Section; T. L. Storey, vice-chairman; and C. P. Haltalin, past-chairman.

Dr. Featherstonhaugh introduced President Hayes, who spoke briefly on the present situation between labor and management with strikes and dissention, which was stopping production and upsetting the reconversion plans, and expressed the opinion that engineers fitted both ways into the situation, and could help bring both sides closer together, and lead them back into production.

The president then gave a very interesting account of war activities in Halifax which, due to the necessity of secrecy, were unknown to the rest of the country. Such activities included everything from blackout arrangements to degaussing of ships as protection against magnetic mines, over 1600 ships, from battleships to mine sweepers, being taken care of during the war period.

The chairman next introduced Mr. Currie, who conveyed the very best wishes of the Halifax Branch and the Association of Professional Engineers of Nova Scotia to the Winnipeg Branch. Mr. Currie spoke briefly and mentioned that the Halifax Branch had the pleasure of entertaining a large number of Institute members from all over Canada, who had been stationed in Halifax during the war.

D. M. Stevens then presented the Winnipeg Branch Student prizes, donated each year for the best thesis submitted by students of the University on civil and electrical subjects. Prizes were awarded to Ralph Morris, fourth year civil, for his thesis on "Railway Water Supply", and to D. M. Maxwell, fourth year Electrical, for his thesis on "The Amplidyne Generator".

The Chairman then introduced Dr. Wright, who gave a brief resume of the years activities at Headquarters, and outlined Council's immediate programme. Dr. Wright closed by inviting as many members as possible to attend the Annual General Meeting in Toronto, next February.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARD SPECIFICATION FOR BELL TRANSFORMERS (Excluding Transformers for Use in Mines). B.S. 832-1945:

London, British Standards Institution, 1945, 2/—.

This specification is a revision of B.S. 832-1939 and deals with bell ringing transformers having separate input and output windings for connection to low voltage circuits. It includes test requirements, maximum overall dimensions, standard capacities and output voltages, constructional details and requirements in connection with marking.

BRITISH STANDARD SPECIFICATION FOR CAST MANHOLE COVERS, ROAD GULLY GRATINGS AND FRAMES. B.S. 497-1945:

London, British Standards Institution, 1945, 3/6.

This revised and enlarged standard was prepared primarily for use in the post-war building programme and consequently was drawn up to facilitate mass production. The number and types of manhole covers, etc., have been reduced to a minimum, and adequate testing procedure has been provided in order to minimise the risk of accidents. Three grades of manhole covers and frames, and three types of gratings and frames have been provided. Manhole covers and frames:—(A) Heavy duty for use in carriageways. (B) Medium duty for use in footpaths, verges, carriage drives and cycle tracks. (C) Light duty for use in domestic premises or other places where they will not be required to carry wheeled traffic. Gully gratings and frames:—(A) Heavy duty for use in main roads. (B) Medium duty for use in roads on which there is no expectation of heavy vehicles or fast traffic. (C) Kerb type covers and frames for setting into footpaths and verges.

BRITISH STANDARD SPECIFICATION FOR WIRE ROPE SLINGS & SLING LEGS. B.S. 1290-1946.

London, British Standards Institution, 1946, 3/6.

This standard is alternative to and comparable with B.S. 781 for chain slings. The standard components for the slings are taken from B.S. 482 (hooks for cranes and slings), B.S. 302 (wire ropes for cranes), B.S. 462 (thimbles for wire ropes), and B.S. 781 (chain slings, rings and links). The illustrations of standard slings are to scale. To render the standard as nearly as possible self contained, extracts from B.S. 482 and B.S. 462 are reproduced at the end of the publication.

BUILDING AND ENGINEERING CAREER; 2d ed:

By C. C. Williams. N.Y., London, McGraw-Hill; Toronto, Embassy, 1946. 309 pp., illus., diagrs., charts, tables, 8¼ x 5½ in., cloth, $3.00 (in Canada).

An orientation text for engineering freshmen which gives him the engineering vocabulary and mode of thinking. The author discusses what engineering is and how to study it, gives something of its historical background and calls attention to modern achievements. Contents:—Part I—Vocations and Professions; The Profession of Engineering; Objectives of Engineering Education; How to study Engineering—General Procedure; How to study Engineering Suggestions. Part II—Machines and Structures; Heat and Electrical Energy; Transportation and Communications. Part III—Achievements in Chemical, Civil, Electrical, Mechanical and Mining Engineering and Metallurgy; Social and Economic effects of Engineering.

HOW TO EVALUATE SUPERVISORY JOBS:

Albert N. Gillett. Deep River, Conn., National Foremen's Institute, 1945. 141 pp., loose-leaf, charts, fabrikoid, 81½ x 11 in., $7.50.

An executive and supervisory appraisal manual divided into three parts. Part I—Job analysis, rating, and evaluation of supervision method; Part II—Detailed description of a definite plan by which management can determine the weak and strong points of the individual occupying the supervisory position; Part III—Blank forms which may be used by the reader for running his own tests. The manual contains a wealth of illustrative material.

(Continued on page 393)

AN URGENT REQUEST

Would members who do not file the *Journal* kindly return their May 1946 copy to headquarters.

On account of difficulties at the printers, fewer copies have been printed than had been ordered and the needs of several libraries have not been filled.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

May 31st, 1946

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the July meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BROCKENSHIRE—WILLIAM, of 44 Wyandotte St., East, Windsor, Ont. Born at Midland, Ont., March 29, 1914. Educ.: B.Eng. (Arch.), Detroit Institute of Tech 1939; 1935-36, (summers), layout, sash dept., Truscon Steel Co.; dftsman., Carter-Halls-Aldinger; with Constrn. Co., as follows: 1937-40, dftsman., 1940-42, estimator; 1942-45, Lieut., R.C.E.; and at present, estimator, Allan Construction Co., Ltd., Windsor, Ont.

References: G. G. Henderson, J. M. Wyllie, W. R. Mitchell.

BUCKLE—CHARLES WILFRID, 444 Lynas Road, Eburne, B.C. Born at Bilton, Yorks, Eng., May 12, 1888. Educ.: 1898-05, Arnold House Coll., Blackpool, Eng., (Cambridge Univ., Jr. Certificate); 1907-08, chainman & field dftsman., National Trans. Rly., Kenora, Ont.; with Can. Northern Pacific Rly, as follows: 1913-14, office engr. & asst. chief dftsman., 1914-17, asst. engr., constrn. Blue River to Albreda Summit, grading, tunnels, trestle bridges, etc., 1917, (6 mos.), asst. engr., hydraulic dredge fill, Vancouver; 1918-20, Lieut., Canadian Exp. Force, Canadian Engineers; 1921-32, private commercial business; 1933-37, asst. engr., Vancouver Civil Airport; with Dept. Public Works, as follows: 1937-42, asst. engr. i/c Fraser River survey, design & constrn of control works, bank protection, dykes, jetties, etc., 1942-45, engr. i/c, removal ripple rock Seymour Narrows, B.C., 1935, (6 mos.), engr. i/c, triangulation & Bathymetric surveys Kootenay Lake in connection with investigation Columbia River by Int. Joint Board (in progress), and at present, asst. engr., B.C. & Yukon District, New Westminster, B.C.

LIBRARY NOTES

(*Continued from page 391*)

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

A.S.T.M. STANDARDS including Tentatives, 1945 Supplement:

Part I—Metals. 397 pp.
Part II—Nonmetalic Materials—Constructional. 229 pp.
Part III—Nonmetalic Materials—General. 503 pp.

American Society for Testing Materials, Philadelphia 2, Pa., 1945-1946, illus., diagrs., charts, tables, 9⅝ x 6 in., cloth, $4 per Part ($2.50 to A.S.T.M. Members).

This supplement to the 1944 book of A.S.T.M. Standards brings it up to date by giving all the changes or additions accepted during the year 1945. Two hundred and fifteen standards are included, some sixty of which appear for the first time. The supplement appears, like the original work, in three volumes.

JOB EVALUATION METHODS:

By C. W. Lytle. Ronald Press Co., New York, 1946. 329 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $6.00.

The author presents an analytic approach to the subject. The procedure of job analysis and evaluation is separated into functional steps as indicated by the chapter headings, in order to compare and select methods and characteristics to fit any given set of conditions. The application of evaluation to office and supervisory positions is considered, and there is a special chapter on merit rating.

HACKH'S CHEMICAL DICTIONARY (American and British Usage), third edition completely revised:

Edited by J. Grant. Blackiston Company, Philadelphia and Toronto 1944; 1946 printing with changes and additions. 925 pp., illus., diagrs., charts, tables, 10 x 6½ in., cloth, $8.50.

This standard encyclopedic dictionary, based on recent chemical literature, covers not only the terms used in general chemistry, but also the collateral vocabularies of physics, astrophysics, mineralogy, pharmacy and medicine, and pertinent terms of agriculture, engineering and industry. It gives clear, brief statements of chemical theories, rules and laws, descriptions of elements, compounds, products, apparatus, etc., and notes and names of important scientists. Much new material has been added to the present edition, including terms relating to atomic disintegration.

MATERIALS HANDLING MANUAL (II)

Edited by M. M. Williamson and G. W. Williamson. Paul Elek (Publishers) Ltd., London, E.C.1, 1945. 488 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 30s.

This volume deals with aspects of handling applicable to all industries. The material is divided into four main divisions: continuous bulk movement, mainly horizontal, such as belt conveyors and aerial ropeways; continuous bulk movement, mainly vertical, as with elevators and pneumatic handling; continuous package handling, horizontal and vertical; intermittent movement, as earth moving, hoists and trucks. The book is intended as a guide for engineers and designers for modernizing plants or preparing new lay-outs, and is profusely illustrated with photographs, sketches and flowsheets.

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET, MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Particular emphasis is laid at this time on the need for this service to fill the dual role of providing a general picture of employment conditions for members in the armed forces, and of making available to them specific contacts both now and at the time of their release from the services. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER from recent graduate up required for special work on ventilation by an industrial organization with headquarters in Montreal. Salary from $200 according to qualifications. Apply to File No. 3500-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER with executive experience for position of Town Manager in progressive New Brunswick town. Good salary to right man. Apply in writing giving full details qualifications and experience. Apply to File No. 3481-V.

CIVIL ENGINEER DRAUGHTSMAN, age 25-35, for consulting engineer's office near Toronto. Applicant should have some knowledge of municipal sewerage and waterworks problems. Apply to File No. 3489-V.

ELECTRICAL

ELECTRICAL ENGINEER, graduate with some experience in electronics, age 25-35 is required by a company in Montreal at a salary of $250. Apply to File No. 3236-V.

ELECTRICAL ENGINEER with some mechanical experience, age 30-35, required for the gas division of a public utility in Western Canada, salary according to qualifications. Apply to File No. 3494-V.

ELECTRICAL ENGINEER with extensive experience as superintendent of entire electrical equipment for a townsite and paper mill in Western Ontario. Salary from $400-$500 according to experience. Apply to File No. 3497-V.

ELECTRICAL ENGINEER with experience in layouts and conduit details required for design work with a firm of consulting engineers in Southern Ontario. Salary open. Apply to File No. 3499-V.

MECHANICAL

GRADUATE MECHANICAL OR AERONAUTICAL ENGINEER with at least five years experience in aircraft, preferably in mfg., must have a fair knowledge of mechanical a c installation and be familiar with heat and ventilating installations, controls, de-icing, hydraulics and landing gear. Apply to File No. 3300-V.

MECHANICAL ENGINEER, recent graduate, for technical service and plant operation with a manufacturer in the Montreal area. Successful candidates will have two-year training course in U.S. Apply to File No. 3476-V.

MECHANICAL ENGINEER aged 30 to 35, capable of investigating maintenance and conveyors, motors and drives etc. This position includes studies toward improved plant maintenance and will also entail draughting, some routine keeping of records and allied engineering work. Salary $225 to start. Apply to File No. 3477-V.

MECHANICAL ENGINEER, recent graduate, for mechanical draughting work in paper mill in the Lake St. John area. Salary open. Apply to File No. 3478-V.

MECHANICAL ENGINEER for control work in the laboratory of a paper mill in the St. Maurice Valley with training for future supervisory work. Apply to File No. 3483-V.

MECHANICAL ENGINEERS from recent graduates up required by a structural steel company in the Montreal area. Salary according to qualifications. Apply to File No. 3485-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the reconversion of a paper mill in Western Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MISCELLANEOUS

STEAM PLANT SUPERINTENDENT with extensive experience is required to superintend the steam plant of a pulp and paper mill in Western Ontario. Salary would be $300 to $350. Apply to File No. 3227-V.

ENGINEER SALESMAN, fluently bilingual, not necessarily a graduate but with some good experience on truck mechanical work and some sales background, age 35-40, is required by an automobile manufacturer for work in the Montreal area. Preference will be given to ex-service men and R.C.E.M.E. and workshop experience would be useful. Salary $250 to $350. Apply to File No. 3266-V.

ENGINEERING ACCOUNTANT, young graduate age 25-35, with engineering background and taste for accounting, is required to act as assistant to the secretary treasurer of a manufacturing concern in Montreal. Apply to File No. 3272-V.

TWO INDUSTRIAL ENGINEERS, preferably with engineering background in mechanical, electrical or chemical engineering, age 35 up, bilingual with some practical experience is required by a company in Montreal engaged in industrial engineering, consulting work, plant layout, controls, inventories, production and admin. controls. Apply to File No. 3307-V.

TECHNICAL SALES ENGINEERS are required by an oil company in the Montreal area. Candidates must be bilingual and experience may range from recent graduate up. Salary will be $150-$250 depending on qualifications. Apply to File No. 3320-V.

STRUCTURAL STEEL DESIGNERS AND DETAILERS required by a construction company in Montreal. Salary open. Apply to File No. 3482-V.

GRADUATE ENGINEER with some construction experience, under 35, fluently bilingual, required for maintenance and construction work in a large wood working plant in Quebec, to be trained as chief engineer of plant. Apply to File No. 3484-V.

CIVIL OR MECHANICAL ENGINEER with experience in construction required by a Montreal firm to estimate value of work done and to inspect during construction concrete and steel bldgs. Salary open. Apply to File No. 3486-V.

CIVIL OR MECHANICAL ENGINEERS from recent graduates up required for various mills by a pulp and paper firm in Eastern Canada. Salary from $200 according to qualifications. Apply to File No. 3488-V.

STRUCTURAL STEEL ENGINEER with both field and office experience for employment in various parts of Canada as owner's representative on building construction. Salary according to experience. Apply to File No. 3490-V.

DESIGNING ENGINEER preferably with pulp and paper mill experience wanted for a paper mill in Newfoundland. Salary would be from $250-400 depending on qualifications. Apply to File No. 3491-V.

INDUSTRIAL MINERALOGIST, with Ph D. or M.Sc. in geology, mineralogy, chemistry or metallurgy and knowledge of commercial processing of industrial metals, laboratory investigations and publishing of results. Must have at least five years experience with special reference to industrial minerals. Starting salary from $275 in prov. mines dept. Apply to File No. 3492-V.

GEOLOGISTS, with Ph. D. in economic or mining geology and intimate knowledge of structural geology, diamond drilling and geophysical methods. Must have at least five years practical experience, ability to publish results of original investigations and use of aerial photographs. Starting salary from $275. in Prov. Mines Dept. Apply to File No. 3492-V.

MECHANICAL OR CIVIL ENGINEERS required as assistant engineer in Meat Packing firm with plants throughout Canada. Duties to consist of general industrial maintenance work, including building construction, steam, refrigeration and electrical installations. Positions available in Western Canada at salary of $195 to $240 depending on experience. Apply to File No. 3495-V.

SALES ENGINEERS required for junior positions in an Ontario firm manufacturing and installing building specialties in industrial plants. Salary according to qualifications with good prospects. Apply to File No. 3496-V.

MECHANICAL OR ELECTRICAL ENGINEER with at least three years experience in paper mill or steam plant operation, bilingual if possible, is required by an industrial firm near Montreal. Salary from $200 according to experience. Apply to File No. 3498-V.

STRUCTURAL STEEL DESIGNER for work with a firm of consulting engineers in Southern Ontario. Salary open. Apply to File No. 3499-V.

RESIDENT ENGINEER required for a road construction contractor in Quebec. Salary $225 with board. Apply to File No. 3501-V.

CHEMICAL OR MECHANICAL ENGINEER with construction experience in the chemical field, a knowledge of hydrocarbons and at least five years experience since graduation is required by a chemical firm in Western Ontario. Salary from $250. Apply to File No. 3502-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER with some pulp and paper experience required for the technical department of a paper mill in Lake St. John area. Apply to File No. 3470-V.

CIVIL

JUNIOR ENGINEER, young graduate in civil with some experience in structural and municipal work, also overseas experience in the armed forces, age 35 or under, is required by a city in Ontario. Apply to File No. 3203-V.

CIVIL OR MECHANICAL ENGINEER, not necessarily a graduate, age 24-30, some experience in concrete and steel draughting, some sales ability, required to work with a consulting engineer and contractor in Montreal. Salary open. Apply to Box No. 3339-V.

CIVIL ENGINEER, young graduate preferred, with some experience on building layouts and piping work is required as draughtsman for an oil company in the Montreal area. Apply to File No. 3345-V.

SEVERAL CIVIL ENGINEERS, two with two or three years' experience in road construction and two recent graduates, are required for road building work in northern Quebec. Salary $2400. to $3000 a year. Apply to Box. No. 3351-V.

TWO CIVIL ENGINEERS, preferably but not necessarily graduates, are required to act as structural steel draughtsmen or checkers for a company engaged in this sort of work in Alberta. All applications should indicate education, experience and salary expected. Apply to Box No. 3365-V.

CIVIL OR MECHANICAL ENGINEER with four or five years experience in a pulo and paper company is required by a company engaged in this work in eastern Ontario. Apply to Box No. 3367-V.

CIVIL ENGINEER is required to act as assistant to city engineer, some knowledge of town services such as, water works, sewage, building inspection, parks, lighting an asset. Location Montreal. Salary open. Apply to Box No. 3385-V.

CIVIL ENGINEER with five to ten years experience in reinforced concrete design is required by a firm of consulting engineers in Montreal. Salary open. Apply to Box No. 3387-V.

TWO CIVIL ENGINEERS are required to act as senior and junior structural designer respectively with a steel company in southern Ontario. Salary open. Apply to Box No. 3389-V.

TWO CIVIL ENGINEERS, one experienced man to be in charge, the other to act as assistant, mostly for office work, are required for a building programme in Ontario, in connection with roads, trails, lookout towers, telephone line, buildings, etc. Preference to veterans. Salary up to $3,000 per year for senior and $2,000 per year for junior position. Apply to Box No. 3394-V.

RESIDENT ENGINEER graduate, preferably but not necessarily bilingual with several years' experience in building construction is required for a housing project in Montreal. Several civil engineers from recent graduates up are also required. Salary open. Apply to Box No. 3402-V.

SEVERAL CIVIL ENGINEERS with experience in the design of structural steel and reinforced concrete, or who are interested in testing and research work in connection with concrete and soils are required in the engineering department of a large organization in Toronto. Salary open. Apply to Box No. 3409-V.

CIVIL ENGINEER graduate with several years experience in construction work, preferably bilingual is required by a construction company in Montreal to take charge of a project as resident engineer in Quebec. Salary open. Apply to Box No. 3421-V.

CIVIL ENGINEERS with construction experience for field work on contracts with a firm of Montreal contractors. Salary open. Apply to File No. 3437-V.

CIVIL ENGINEER, as township engineer, responsible for construction and maintenance of roads, municipal drainage etc. Must be qualified O.L.S. Required for Central Ontario. Salary $250 per month. Local private practice allowed. Apply to File No. 3441-V.

CIVIL ENGINEER recent graduate, must be bilingual, required for work on general design, survey and construction of transmission lines in the Montreal area. Apply to File No. 3446-V.

CIVIL ENGINEER with experience on foundations, steel work and erection of plant. Preferably R.P.E. in B C. Required for construction work on B.C. coast. Salary according to qualifications. Apply to File No. 3448-V.

CIVIL ENGINEERS with construction experience, age 25 up, preference R.C.E. personnel, required by building contractors in Montreal, to take charge of jobs as superintendent or office engineer. Salary from $300 according to qualifications. Apply to File No. 3458-V.

ELECTRICAL

ELECTRICAL ENGINEER with some experience with machinery and/or electrical installation work, with ability to get along with people, and interested in investing some capital, is required for executive work with a small company on the west coast for work in connection with the electrical machinery requirements and installation of lighting and power plants in the province. Salary open. Apply to Box No. 3352-V

TWO ELECTRICAL ENGINEERS with a minimum of four years' experience with commercial radio equipment are required by a firm in Montreal. Applicants must have good personality and ability to meet public. Please do not apply unless qualified. Salary open. Apply to Box No. 3395-V.

ELECTRICAL ENGINEER with experience in marine electrification is required by a consulting firm in the Montreal area. Salary open. Apply in writing to Box No. 3398-V.

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters, English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to Box No. 3415-V.

ELECTRICAL ENGINEER 5 to 10 years experience on general electrical design wiring of buildings, industrial plants and sub-stations, preferably a graduate, is wanted by a firm of consulting engineers in Montreal. Salary $250-$400 a month. Apply to Box No. 3420-V.

ELECTRICAL GRADUATE, with considerable experience in electronics and aircraft instruments and some sales ability, age 30 to 40, required for firm handling aircraft equipment in Montreal area. Salary open. Apply to File No. 3434-V.

ELECTRICAL DRAUGHTSMEN with experience in substation design, not necessary graduate engineers, required by a public utility in the Montreal area. Salary $200 to $225. Apply to File No. 3446-V.

MECHANICAL

MECHANICAL ENGINEER, age about 35-40 with experience in thermo-dynamics, mechanical and chemical work is required to be chief engineer of a company in the Toronto area. Preference to ex-service man. Salary about $400-$600. a month. Apply to Box No. 3308-V.

MECHANICAL ENGINEER, with 4 or 5 years industrial experience since graduation, with knowledge of and interest in steam as applied to industrial equipment, and preferably some experience in ventilation work and in pulp and paper mills, is required by a company in southern Ontario. Salary $3600. per year. Apply to Box No. 3333-V.

EIGHT MECHANICAL ENGINEERS or senior draughtsmen are required for design on a large plant extension project near Montreal. Salary $200. a month and good room and board available. Apply to Box No. 3360-V.

TWO OR THREE MECHANICAL ENGINEERS, preferably ex-service men, graduates, with some knowledge of steam, piping layouts, design are required by a firm in the Niagara peninsula. Salary open. Apply to Box No. 3380-V.

MECHANICAL ENGINEER, recent graduate, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to Box No. 3393-V.

THREE MECHANICAL ENGINEERS with one or two years experience in draughting and design are required for a paper company on the east coast. Work will involve draughting, design of new equipment and alterations to existing plant and equipment. Salary open. Apply to Box No. 3397-V.

MECHANICAL DRAUGHTSMAN is required by a paper company in Ontario. Must have industrial plant experience including conveyors, piping and machinery layouts. Salary $200-$225 a month. Apply to Box No. 3399-V.

MECHANICAL ENGINEER with paper mill experience is required to act as assistant mechanical superintendent of a large paper mill located in a city in western Quebec. Salary open. Apply to Box No. 3400-V.

JUNIOR MECHANICAL ENGINEER, not necessarily graduate, but must have some experience of mechanical design. Preference will be given to ex-servicemen. Salary $2,400 to $2,700 depending on experience. Possibility of permanent employment located in Quebec City. Apply to Box No. 3401-V.

CHIEF ENGINEER, age 35 to 40, preferably graduate mechanical, with experience in shop and production planning, running drafting office, etc., and ability to get along with people, is required by a factory in Sherbrooke ,Quebec. Salary $5,000 to $6,000 a year. Apply to Box No. 3410-V.

MECHANICAL ENGINEER with considerable practical experience is required for general plant maintenance of production equipment for large out of town metal processing plant. Salary open. Apply in writing to Box No. 3417-V.

MECHANICAL ENGINEER DRAUGHTSMAN with two or three years experience, is required for work with a paper company in the province of Quebec. Salary $250 to $275 a month. Apply to Box No. 3424-V.

SALES ENGINEER, high calibre, graduate mechanical with metallurgical knowledge, for large industrial organization in Quebec, preferably bilingual, salary according to experience. Apply to File No. 3433-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER, recent graduate, preferably bilingual, required for mechanical department in a paper mill in St. Maurice Valley, to be trained in a supervisory capacity. Apply to File No. 3452-V.

MECHANICAL ENGINEER with over ten years experience required for responsible position with an American mining corporation. Salary from $400 according to qualifications. Apply to File No. 3453-V.

ASSISTANT MECHANICAL SUPERINTENDENT to train for a senior position in a large paper mill in the St. Maurice Valley area. Must have paper or mining experience. Veteran preferred. Salary from $300 according to experience. Apply to File No. 3462-V.

MECHANICAL ENGINEER, age 35 to 45, preferably married, with good background of shop training and experience in the manufacture of farm machinery. Salary from $350 according to qualifications. Apply to File No. 3463-V.

MECHANICAL ENGINEERS, recent graduates, for training as industrial engineers, required by a paper manufacturer in Eastern Ontario. Apply to File No. 3465-V.

MECHANICAL ENGINEER with experience in machine and tool design for design work on packaging machinery, required by a manufacturing concern in Western Ontario. Salary from $275. Apply to File No. 3466-V.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with considerable experience in plumbing, heating ventilating, age 30-45, required for a permanent job as a designer with a Montreal architectural firm. Salary from $300. Apply to File No. 3473-V.

METALLURGICAL

METALLURGICAL ENGINEER with some practical experience and desirous of entering the steel business is required to work for a large corporation in Eastern Canada. Apply to File No. 3314-V.

MISCELLANEOUS

ARCHITECTURAL DRAUGHTSMAN with enough experience to develop new types of windows, doors, trusses, steel sections etc., is required by a manufacturer in Montreal. Salary would be about $300. Apply to File No. 3212-V.

ENGINEER SALESMAN, preferably returned man under 40 with some road-building experience, is wanted by a firm engaged in the manufacture of emulsions. Apply to File No. 3250-V.

ARCHITECT, graduate, preferably, but with some reasonable experience, with good background and personality is required by a firm in Montreal. Interested in someone willing to start at the bottom with prospects of eventually becoming a partner in the firm. Apply to Box No. 3298-V.

DRAUGHTSMAN, preferably someone experienced in process piping work in food industries is required by a firm in the Montreal area engaged in consulting work. Apply to Box No. 3299-V.

ARCHITECT is wanted to undertake responsibility along general lines, such as class of work which comes under jurisdiction of a provincial Dept. of Public Works. Desirable age not exceeding forty. Apply to File No. 3301-V.

SALES ENGINEER of proven ability is required by a Canadian manufacturer of high grade power apparatus specialties in demand by power companies, public utilities and manufacturers. Age 30 to 35 years. Apply in writing and state in detail education, experience, age, required salary and enclose photograph to Box No. 3303-V.

INSTRUMENTS ENGINEER with five years experience in aircraft construction and installation design, of which at least 2 years should have been specialized as above, is required to act as design group leader for a company in the Montreal area. Apply to File No. 3316-V.

TWO DRAUGHTSMEN with a minimum of three years draughting experience, are required by a company in Montreal. One must have mechanical experience to specialize in refrigeration design, the other structural or architectural experience to specialize in design layout of food service equipment. Apply to Box No. 3328-V.

CIVIL AND ELECTRICAL ENGINEERS, age 30 to 40, 5 to 10 years experience, for estimating, design and general engineering for large public utility in Toronto area. Apply to File No. 3429-V.

CHIEF DRAUGHTSMAN to take charge of engineering department, draughting room and estimating for machinery manufacture in Sherbrooke. Apply to File No. 3430-V.

TWO ARCHITECTURAL DESIGNERS AND DRAUGHTSMEN, or architects with some experience in modern materials and design are required by a young progressive firm of architectural designers and engineers in Alberta. Salary will be commensurate with ability. Apply to Box No. 3331-V.

MECHANICAL, ELECTRICAL OR CIVIL ENGINEER, recent graduate who must have fluent knowledge of Spanish, preferably under 30, is required by a firm in the Montreal area for technical work in connection with production. Some travelling. Salary open according to qualifications. Apply to Box No. 3373-V.

DRAUGHTSMAN familiar with reinforced concrete and structural steel is required by a consulting firm in Montreal. Salary open. Apply to Box No. 3387-V.

CHIEF INSTRUCTOR completely bilingual, veteran, not necessarily an engineer, is required by a pulp and paper company in the province of Quebec to instruct in labour relations, etc., and to understudy personnel manager. Salary $150 a month. Apply to Box No. 3405-V.

STEAM PLANT SUPERVISOR—Manufacturer with several plants in Ontario and Quebec requires an active man with technical training and field experience in efficient steam plant operation. Salary open. Apply to Box No. 3406-V.

GRADUATE ENGINEER with experience in structural design and detailing is required for work in bridge department of large transport company. Apply to Box No. 3407-V giving all particulars including salary expected.

ENGINEERING SALESMAN with pleasing personality, bilingual, 25 to 35 years old, not necessarily a graduate, but with some engineering background and if possible some knowledge of lubrication is required by a large company in Montreal. Salary open. Apply to Box No. 3422-V.

CHIEF DRAUGHTSMAN, experienced in all types of structural work, required to take charge of a draughting office for a central Ontario city. Apply to Box No. 3428-V giving all particulars including salary expected.

CHIEF DRAUGHTSMAN, over 25 years of age, with intimate knowledge of construction mechanical details, piping, to take charge of about 15 draughtsmen in an industrial plant. Salary dependent on qualifications. Apply to File No. 3435-V.

QUALIFIED DRAUGHTSMAN, thoroughly capable in design and layout of industrial piping, steam, water, air etc. Salary open. Apply to File No. 3435-V.

TWO CIVIL OR MECHANICAL ENGINEERS, recent graduates, preferably ex-service men, are required by a pulp and paper company in the Province of Quebec, to be trained as logging engineers and woods operations supervisors. Previous experience in the woods an asset but not essential. Salary $200 to $225 with board and lodgings. Apply to File No. 3442-V.

ENGINEERING DRAUGHTSMAN required by an industrial concern in Three Rivers for all round employment in a permanent position. Apply to File No. No. 3443-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

MECHANICAL AND ELECTRICAL SUPERINTENDENT with experience in maintenance of mine equipment and in design and construction. Replies should outline experience and salary desired. Apply to File No. 3453-V.

GENERAL PLANT SUPERINTENDENT, or manager in complete charge, to organize and operate a shipbuilding plant in the Maritimes, with knowledge of both hulls and engines, mainly for repairs and revisions. Salary from $5,000. Apply to File No. 3454-V.

GRADUATE ENGINEERS IN CIVIL, MECHANICAL, ELECTRICAL OR CHEMICAL, from recent graduates up with 2 to 5 years general experience (including overseas service) required for petroleum refinery engineering. Salary according to qualifications. Apply to File No. 3455-V.

ELECTRICAL OR MECHANICAL ENGINEERS interested in transportation, with experience in the transportation field or machine shop practice or automotive services, maintenance and operation. Salary according to qualifications. Apply to File No. 3456-V.

SALES ENGINEER of ability, preferably graduate mechanical, with some experience in marine engineering and sales, to develop sales and applications for a heavy outboard propelling unit for use on heavy inland water transport. Salary from $300 depending on qualifications. Apply to File No. 3457-V.

FORESTRY ENGINEER graduate 25 to 35, preferably bilingual Veteran, is required by a newsprint manufacturer in the St. Maurice Valley. Apply to File No. 3462-V.

SALES ENGINEER, preferably mechanical graduate, required by a firm dealing in heavy machinery for sales activities in Eastern Canada with headquarters in Montreal. Salary from $250 according to qualifications. Apply to File No. 3467-V.

MECHANICAL OR ELECTRICAL ENGINEER under 35, with at least 5 years practical experience, is required for a responsible position in the engineering department of an industrial firm in Toronto. Apply to File No. 3472-V.

Situations Wanted

CIVIL ENGINEER, M.E.I.C., P.E.Q., age 39, married, B.Sc., U.N.B., widespread experience in construction with experience in plant maintenance both in civilian and Air Force capacities. Interested in responsible position involving plant maintenance. Apply to Box No. 225-W.

CIVIL ENGINEER, age 40, McGill '29, B.Sc., married, experienced surveyor and field engineer, two years on inspection of airfield construction, location immaterial, available on short notice. Apply to File No. 741-W.

CIVIL & MINING ENGINEER M.E.I.C., R.P.E., age 45, married, seeks permanent position with large industrial concern as Maintenance and Construction or Townsite Engineer. Experienced on heavy construction, dams, shafts and tunnels, wharves, buildings, sewers, services, townsite development, general maintenance and administration. Apply to File No. 901-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., 20 years work on hydraulic plants as designer and superintendent of construction. Extensive experience in guniting, diamond drilling and pressure grouting. One month notice. Apply to Box No. 1527-W.

PLANT ENGINEER, graduate, M.E.I.C., age 42, qualified to take responsible charge of layout of plant and equipment, structural and mechanical design and organization of plant maintenance. Wide experience with chemical processes. Have successfully handled skilled and unskilled labour on construction, maintenance and plant operation. Prefer location in Ontario. Minimum salary $5000. per year. Apply to File No. 1621-W.

GRADUATE ENGINEER, B.Sc. (Mech) M.E.I.C., age 45, married. Three years experience in time and job study, factory methods and cost accounting. Fifteen years experience in construction and building maintenance; considerable experience in shop layouts and maintenance. Five years sales promotion and technical field work in plastics. Capable of handling personnel and planning. Seeks an executive position in industrial business or will assume complete administration of medium sized business in any part of Canada. Available on short notice. Apply to File No. 1642-W.

CHEMICAL ENGINEER, Jr.E.I.C., age 37, 12 years experience in pulp and paper industry, both technical and production, also three years research in paper containers during war. Bilingual; would like to return to paper industry. Available at a month's notice. Apply to Box No. 1768-W.

CIVIL ENGINEER, age 32, married, B.Sc. in Civil Engineering U.N.B. 1938, M.Sc. U.N.B. 1944. Two years service with R.C.E. Six years experience in Canada and in tropics on construction of roads, airfields, wharves, drainage works, etc. Speaks English, some French and Spanish. Presently employed but wishes to change for a position more directly in charge of construction. Available on thirty days notice. Apply to File No. 1860-W.

MANUFACTURING EXECUTIVE, mechanical engineering graduate with twenty years experience in manufacturing, engineering, production control, purchasing, storekeeping, incentive systems, budgets, cost and general accounting is now available. Apply to File No. 1871-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C. Practical experience includes eight years in tool engineering, production engineering and works planning and nine years in plant layout, general machine design and development work of patented mechanical projects. Successful record in responsible and executive positions. Good organizer. Desires either suitable position, or development work based on own patents, with large mechanical manufacutring concern or well-established firm of consulting engineers. Apply to File No. 2502-W.

CHEMICAL ENGINEER, S.E.I.C., B.A., B.A.Sc. '44, M. Eng. (McGill), age 26, single, two years experience, desires employment in Research or production control. Prefer Quebec and particularly Montreal area. Highest references from former employers. Apply to File No. 2671-W.

STRUCTURAL ENGINEER competent to analyse stresses and to make or review designs in concrete, steel or timber; would undertake small assignments (not requiring full time services). Office in Montreal. Apply to File No. 2672-W.

CIVIL ENGINEER, M.E.I.C., A.C.I.M., age 33, married, Major R.C.E. Civil experience includes two years building maintenance, three years frame construction, three years application and sales of mechanical equipment. Six years army service mostly on engineer works services. Desires permanent responsible position, plant engineering or light construction. Travel anywhere. Apply to File No. 2674-W.

PRESENT ACHIEVEMENTS AND FUTURE DEVELOPMENTS IN AIRCRAFT GAS TURBINE ENGINES

D. G. SAMARAS

In charge of Gas Dynamics, National Research Council of Canada, Ottawa, Ont.

A paper delivered at the Semi-Annual Meeting, Detroit, Mich., June 17-20, 1946, of The American Society of Mechanical Engineers, as a contribution of The Engineering Institute of Canada.

SUMMARY—In this paper, the present status of the aircraft gas turbine engine is treated and its future development predicted.

In scope, the paper covers a general investigation of the performance of the gas turbine engine, an examination of its basic components and probable methods of improving the compressor, combustor and turbine.

Matching of the different components, as well as the problem of regulation, are outlined.

Introduction

The first machine recorded in history as using a fluid reaction force for propulsion is attributed[1] to a Greek philosopher called Archytas ('Αρχύτας) who lived twenty-four centuries ago. His "flying dove" of wood was one of the wonders of antiquity, and it is described as having consisted of a wooden figure balanced by a weight that was suspended from a pulley. It is said to have soared in the air and to have been set in motion by a current of air "hidden and enclosed" in its interior, or by compressed air escaping from a valve.

Two centuries later another Greek called Heron (῞Ηρων) looking at an emptying barrel carried on a cart, observed that a force acting opposite to the flow of the water tended to set the cart in motion. He then built several machines based on this phenomenon and the most famous of them is his "aelophile".

While the date of the appearance of the first gas turbine is unknown, the machines Heron developed, on the basis of the reaction principle, formed the basis of our present day development of gas turbines.

Eighteen centuries later, the great English astronomer and physicist, Sir Isaac Newton, reduced this phenomenon to mathematical discipline.

Because of its military value in aircraft propulsion, many countries have developed and advanced important ideas on the aircraft gas turbine, but completely independent of one another because of the secret nature of such a project.

Most of such work done in Canada in the past few years was done in the Laboratories of the National Research Council[2].

Time does not permit a complete account of the Canadian contribution to this field. Suffice it to say that, in the early stages of the recent conflict, Canadian scientists with the National Research Council were called to the United Kingdom to report on the progress they had made in the development of the gas turbine and to co-ordinate their efforts with those of the corresponding British group.

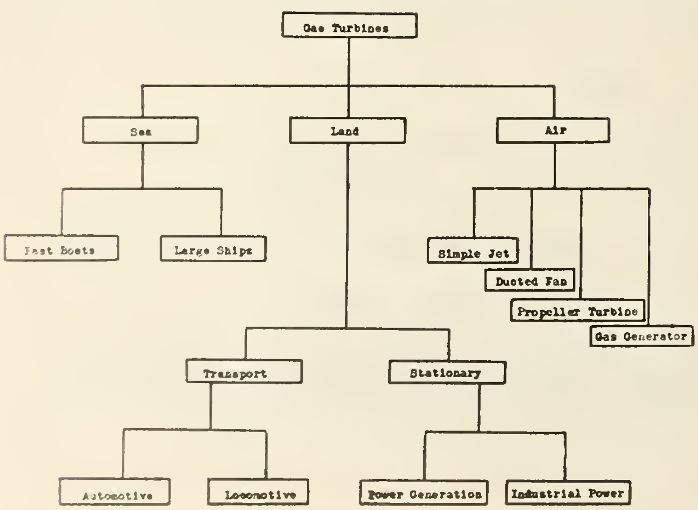

Fig. 1—Fields of application of gas turbines.

Fields of Application

The possible fields of application of gas turbine engines are shown in Fig. 1.

On land they can be used for stationary power generators or as a source of power to drive trains, trucks and automobiles.

On the sea they can be used first, in small boats such as speedboats, torpedo boats, etc., where high power units with small weight and compactness are desirable; and second, by large ships where weight and bulk are not a premium but where a low specific fuel consumption and long overhaul periods are the main desirable requirements.

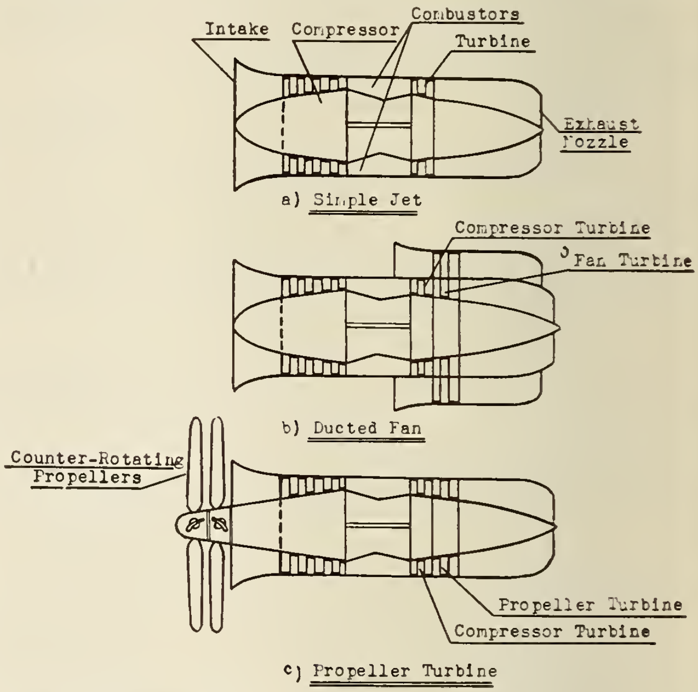

Fig. 2—Diagrammatic sketch of the three main types of gas turbines.

In the air, the following main types may be considered as fundamental:

(*a*) *The simple jet.*

A diagrammatic sketch of a simple jet is shown in Fig. 2a; it consists generally of one compressor, one or more turbines, and one or more combustors, the thrust being taken by the exhaust or propelling nozzle.

(*b*) *The ducted fan.*

A diagrammatic sketch of a ducted fan is shown in Fig. 2b; it consists generally of the main essential parts of the simple jet plus an augmentor fan driven as above or by an independent turbine.

(*c*) *The propeller turbine.*

A diagrammatic sketch of a propeller turbine is shown in Fig. 2c; it also consists of the main essential parts of the simple jet, but in addition has a propeller driven by the same as above or by an independent turbine.

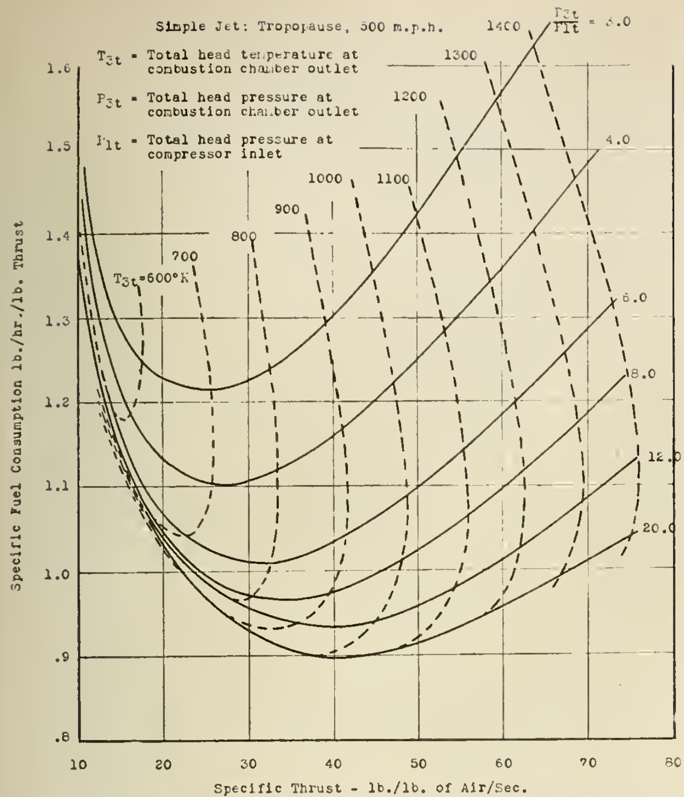

Fig. 3—Cycle performance of simple jet engines.

(*d*) *The gas generator.*

The gas generator consists of a two-stroke engine, one fan and a turbine utilizing the exhaust gases. Several combinations of this arrangement can be evolved.

The types of compressors used in the past were the centrifugal and the axial, although a diagonal type as in the Heinkel-Hirth-Oll simple jet engine may be used. No displacement compressors of the Roots or Lysholm type have been used in aircraft turbines.

To date, only axial flow single-stage or multi-stage turbines have been used.

Two main groups of combustors have been employed, the multi-chamber and the annular combustor. From many considerations, the latter is the more promising one.

It is probable that double-compound and even triple-compound units, combined with reheat and heat exchange, will be used in the future to achieve higher overall pressure ratio, thermal efficiency and ease in starting.

General Performance

Range of Suitability

For forward speeds of the order of 500 mph. and above, and high altitudes, the simple jet is superior to the propeller turbine, but as its specific fuel consumption is high, its range and endurance are rather limited.

The propeller turbine, because of its low specific fuel consumption, is suitable for all speeds up to 500 mph. Its advantages over the reciprocating engine increase with altitude and forward speed.

The ducted fan may have an intermediate place that has not yet been established.

The gas generator with its low specific fuel consumption may be used for extremely long ranges, but the recent advances in high temperature materials and blade cooling methods, tend to favour the propeller turbine.

The Simple Jet

Figure 3 shows the cycle performance of a series of simple jet engines of different design, pressure ratios, and combustion total head temperature at an altitude of 36,000 ft. and a forward speed of 500 mph.

From this it is easily seen that, as the present day pressure ratios are usually of the order of 4:1, the corresponding combustion total head temperature for maximum economy is of the order of 750 deg. K (890 deg. F), that is, more than 300 deg. C (540 deg. F) lower than the present day designs. It is also seen that this higher combustion temperature results in an increase in specific fuel consumption and the specific power output, the latter resulting in a smaller size engine.

From comparative performance calculations, it was found[3] that for a short range, high speed aircraft (fighters, racers) powered by simple jet engines, the optimum design pressure ratio was of the order of 4:1.

The Ducted Fan

Figure 4 shows the cycle performance of a series of ducted fan engines of various design, pressure ratios and combustion total head temperatures at an altitude of 36,000 ft. with a forward speed of 500 mph. and a by-pass ratio $\mu = 3$. From this it can be easily seen that as the present day pressure ratios are of the order of 4:1 for maximum economy, a corresponding combustion total head temperature of the order of 950 deg. K (1250 deg. F) is more than 150 deg. C (270 deg. F) lower than the present day practical limit. It can also be seen that such an increase in combustion temperature will result in an increase of specific fuel consumption and specific power output. Comparing Figs. 3 and 4, it will be noted that the latter curves are considerably flatter than the former. Therefore, it can be concluded that the greater specific fuel consumption resulting from an increase in temperature is less pronounced in a ducted fan engine.

Figure 5 shows the augmentation ratio of ducted fan engines as a function of the work fraction λ and the velocity ratio for a by-pass ratio $\mu = 3$.

After a lengthy investigation, it was found that the

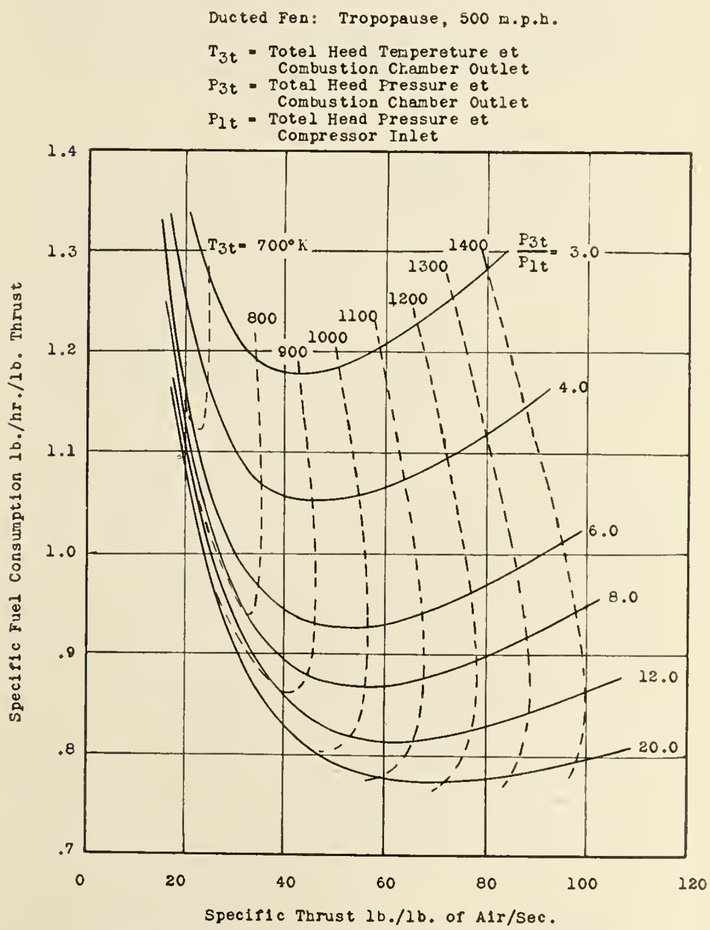

Fig. 4—Cycle performance of ducted fan engines.

mixing of the two jets resulted in little gain, although it was accompanied by a considerably lower performance at points far from the design point. From comparative performance calculations, it was found that for a short range, high speed aircraft powered by ducted fan engines, the optimum design pressure ratio was of the order of 4:1, and that for a longer range aircraft, an 8:1 design pressure ratio corresponded to the optimum.[4]

The Propeller Turbine

Figure 6 shows the cycle performances of a series of propeller turbine engines with various design pressure ratios and combustion total head temperatures at an altitude of 36,000 ft. and at a forward speed of 500 mph. From this it is seen that, for a given design pressure ratio, as the combustion temperature increases, the specific power output increases, the specific fuel consumption decreases and there is no minimum so that the curve runs asymptotically to the specific power output axis. From comparative performance calculations[5], it was found that for a long range high speed aircraft (bomber, transport) powered by propeller turbine engines, the optimum design pressure ratio was of the order of 8:1.

Figure 7 shows the envelope propeller efficiency for low weight and high efficiency multi-blade propellers for gas turbines as a function of the Mach number of the forward speed. It is well known that, owing to the absence of vibrations excited by reciprocating parts, thinner and more efficient blade profiles may be used, although there is some pessimism regarding the vibrations excited by the aerodynamic forces.

Comparative Performance

In all three modes of operation, the specific fuel consumption and specific output (both based on thrust) improved with increase in altitude and deteriorated with increase in forward speed, for forward speeds lower than the sonic velocity[6].

For maximum economy and output, the optimum combustion temperature increased while the design pressure ratio decreased with increase in forward speed.

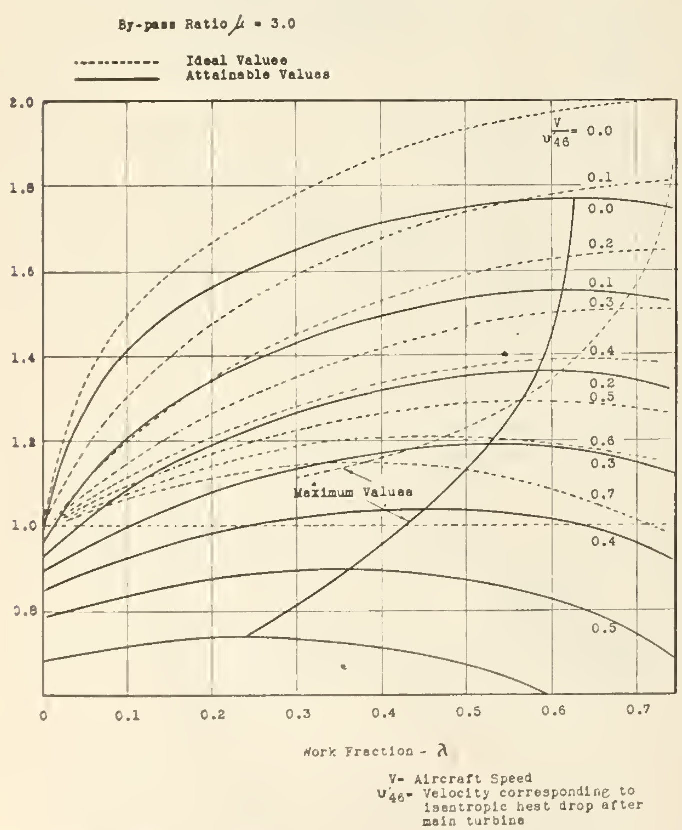

Fig. 5—Augmentation ratio of ducted fan engines.

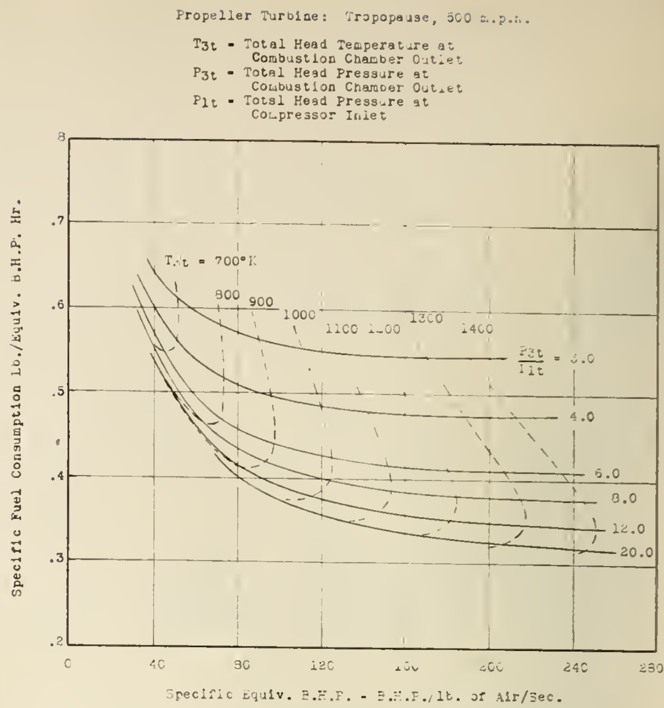

Fig. 6—Cycle performance of propeller turbine engines.

For a given pressure ratio, the optimum combustion temperature for maximum economy increased in the order of simple jet, ducted fan, propeller turbine.

Under static conditions and for a given combustion temperature, the optimum pressure ratio for maximum economy was lower for a propeller turbine than for a ducted fan and simple jet. This effect diminished with increasing forward speed. Finally for indicative reasons, Fig. 8 is presented, showing the comparative performances of a simple jet engine with centrifugal compressor and a propeller turbine with an axial flow compressor at an altitude of 36,000 ft. and a forward speed of 450 mph. From this, the superiority of the propeller turbine engine for ranges above 1000 miles is clearly indicated.

The Optimum Size of a Unit

No serious work has been done regarding the optimum size of a unit, which seems to vary with the different types of gas turbines. A pet rule in England was that the 50 lb. per sec. static mass flow represented the optimum size. While there was nothing to support this assumption, units designed or built elsewhere with considerably higher mass flows have not shown great variations in specific weight. However, the probability that the specific weight curve is flat near the optimum may be a criterion. The optimum size of a gas turbine power unit should be considered together with the aircraft in which it is to be installed. It should be remembered that this is not a problem of engine design alone.

Reheat and Heat Exchange

It is well known that reheating increases the optimum pressure ratio for output and economy. Heat exchange, however, decreases the optimum pressure ratio for economy.

For the present day design of propeller turbines, it should be noted that little is to be gained by employing pressure ratios in excess of 8:1 for no reheat and of 15:1 when reheat is used[7].

Figure 9 shows the comparative performance of propeller turbine engines cruising at an altitude of 30,000 ft. and a forward speed of 400 mph. From this it is seen that the chief advantage of reheat is that it gives an increase of specific output which varies for engines with no heat exchange, from 25 per cent for an 8:1 to approximately 55 per cent for a 15:1 design pressure ratio. In these cases, reheat has a negligible effect on the specific fuel consumption.

If heat exchange is used[7,8], it is necessary with normal pressure losses to employ a design thermal ratio of approximately $\xi = 0.25$, before better economy than that of the standard case is realized and at the same time there is a reduction in specific output. This is a consequence of the pressure losses in the heat exchanger and represents an initial penalty which has to be paid before heat exchange shows to advantage. If, for no reheat, the design thermal ratio is increased to $\xi = 0.5$, then in comparison

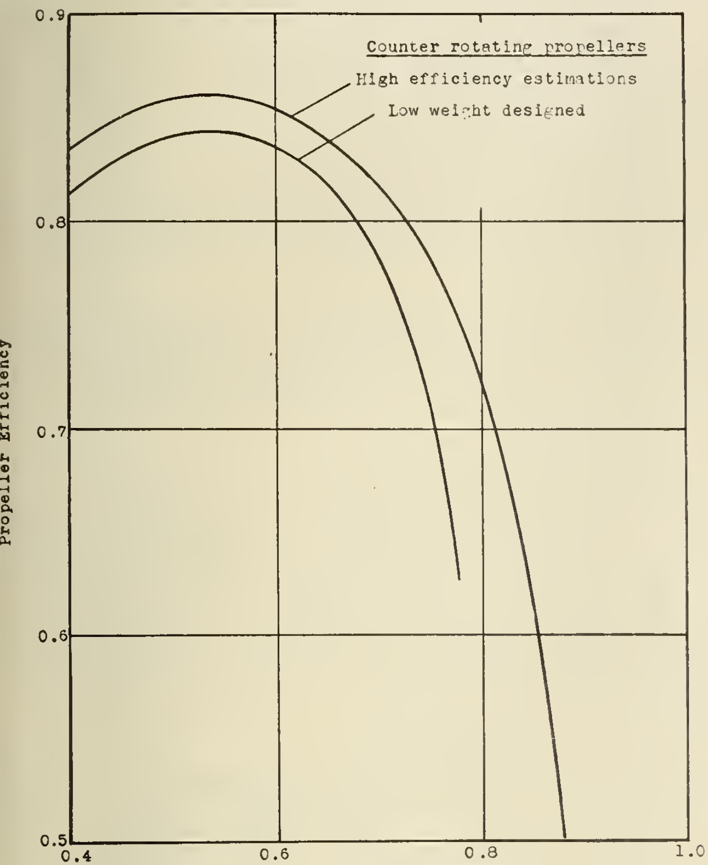

Fig. 7—Envelope curves of propeller efficiency.

with the standard case under cruising conditions, the specific fuel consumption is reduced by 13 per cent for a 4:1 and by 4 per cent for an 8:1 design pressure ratio engine. In these cases, the specific power output is reduced by 17 per cent and 11 per cent respectively.

When reheating is employed in conjunction with heat exchange, a greater temperature difference is available. This shows heat exchange to a greater advantage, for, at a design thermal ratio of $\xi = 0.5$ compared with the simple reheat case, the specific fuel consumption is now reduced by 11 per cent for the 8:1 design pressure ratio engine. It is worth noting that for this case the specific fuel consumption is down to 0.39 lb. per eq. B.H.P. hour.

From Fig. 9 it is also seen that raising the maximum allowable combustion temperature by 300 deg. C (540 deg. F) decreases the specific fuel consumption whilst increasing the specific power output by about 70 per cent relative to a similar engine operating at normal temperatures.

Owing to the much greater temperature differences available, heat exchange shows to more advantage when elevated temperatures are employed. In particular for a 4:1 design pressure ratio engine, a design thermal ratio of $\xi = 0.5$ reduces the specific fuel consumption by nearly 24 per cent for a specific output decrease of 13 per cent. Similar but less marked effects are observed with higher pressure ratio engines.

Finally, it is to be stressed that the pressure loss on the gas side of a heat exchanger is more critical than on the air side. For example, with a 4:1 design pressure ratio

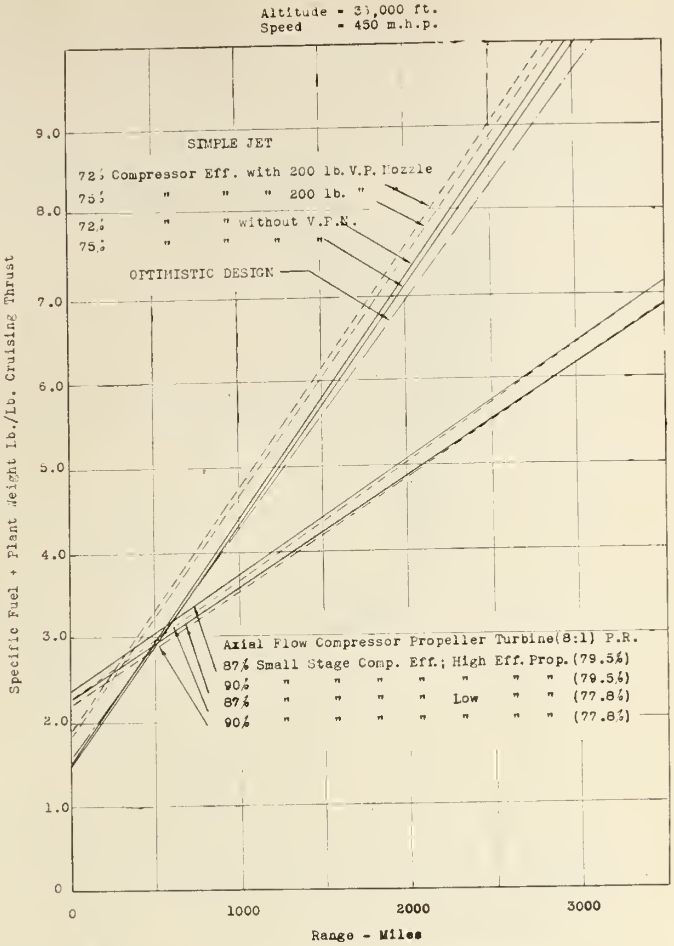

Fig. 8—Comparative performance of a simple jet and a propeller turbine.

engine, a pressure loss of one lb. per sq. in. on the gas side has twice the effect of an equal loss on the air side.

The Compressor

The Entry Duct

High efficiency of an entry duct for a high speed aircraft powered by gas turbines is very important. Systematic investigations on entry forms have been conducted in Göttingen by Dr. Küchemann and the results are published in a series of ZWB Reports entitled "der Einbau von Kühlern".

In an axial flow compressor, the entry spiders should be made of the best aerodynamic form to minimize vibrational effects and to keep the entry losses as low as possible.

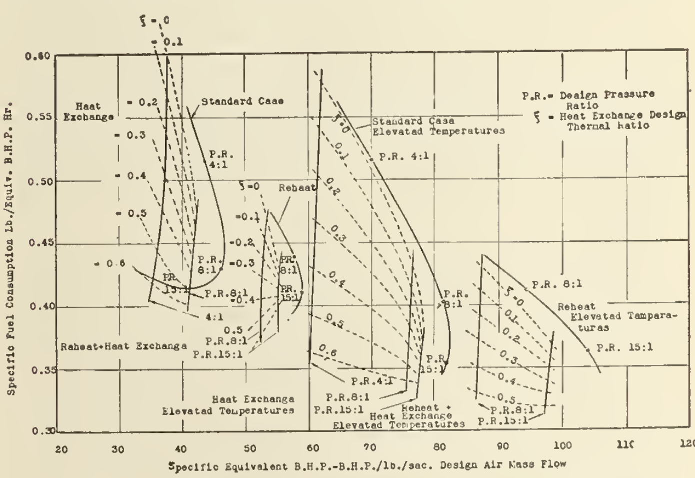

Fig. 9—Propeller turbine performance curves with reheat and heat exchange. Cruising 400 m.p.h. at 30,000 ft. Present day design.

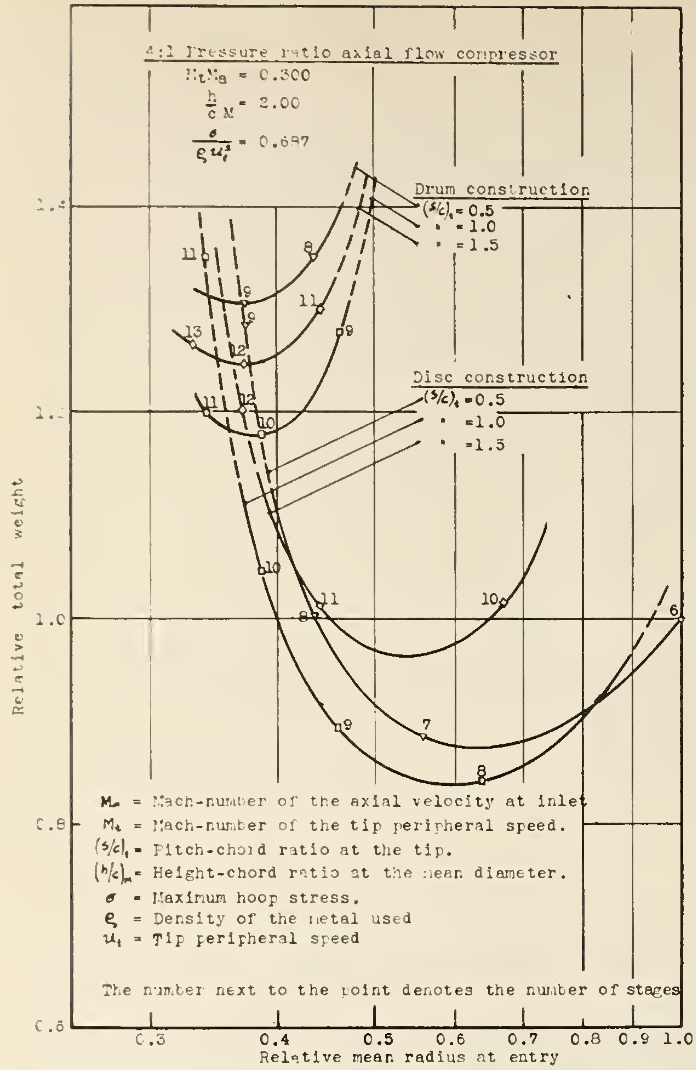

Fig. 10—Variation of weight with mean radius and pitch-chord ratio of multi-stage axial flow compressors.

It was found however that the wakes from the spiders have little effect on the performance of the compressor stages.

The number of spiders and the duct form should be such as to avoid icing troubles.

Axial vs Centrifugal Compressors

It is true that each type has its own advantages and disadvantages.

The axial has a considerably lower diameter than the centrifugal although it is considerably longer and slightly heavier.

It is well known that for a short range, very high speed aircraft powered by simple jet engines, the outside diameter of the nacelle is so critical that, for this reason alone, the axial should be adopted. Again, for long range, high speed aircraft powered by propeller turbine engines, the higher efficiency resulting in lower specific fuel consumption, gives the axial an overwhelming advantage over the centrifugal.

Before the war, the Germans developed the most efficient centrifugal compressor ever made, the so-called "D.V.L. supercharger", designed and tested by Prof. von der Nüll. Its adiabatic efficiency exceeded 80 per cent, but herein lies the greatest fallacy of the centrifugal enthusiasts: the maximum efficiencies were obtained at tip speeds of the order of 800 ft. per sec. To develop a satisfactory pressure ratio of 4:1, tip speeds of the order of 1500 ft. per sec. should be employed. Now, at these high tip speeds, the efficiencies are considerably lower, around 70 per cent and, in addition, the present day materials cannot withstand the high centrifugal and vibrational stresses. It is well known that centrifugal types have not been reliable for pressure ratios of 4:1 and above.

A systematic study of the characteristics of a large number of centrifugal compressors has shown that the optimum efficiencies cannot be realized at tip speeds higher than 1000 ft. per sec. and that the drop in efficiency with rotational speed is very steep.

The centrifugal compressor, however, has flatter characteristics than the axial and can operate in a wider range of mass-flows free from surging and choking.

Although the axial has steeper characteristics, several methods can be evolved that may widen its range of operation, such as using curved blades or other methods of design and control, i.e., compounding and variable propelling nozzles.

Another advantage of the axial compressor is freedom in designing any desirable pressure ratio.

Although no advanced design of an axial flow compressor is available today, it is definite that by using the research work from German and Swiss sources, a satisfactory design can be evolved.

Figure 8 shows a comparison of an axial and a centrifugal machine[9]. The centrifugal was the best that could be designed two years ago with rather optimistic assumptions. the axial was designed with the experience gained at that time, from the not too successful F.2 series.

Construction

Materials

The materials used today in the manufacture of axial flow compressors are mostly aluminium alloys, although in the case of high pressure ratio compressors, the last stages are made of steel. There is no reason whatsoever why the first two or three stages in a compressor should not be made of plastic materials, especially in the case where highly curved blades are used. For air-mass flows

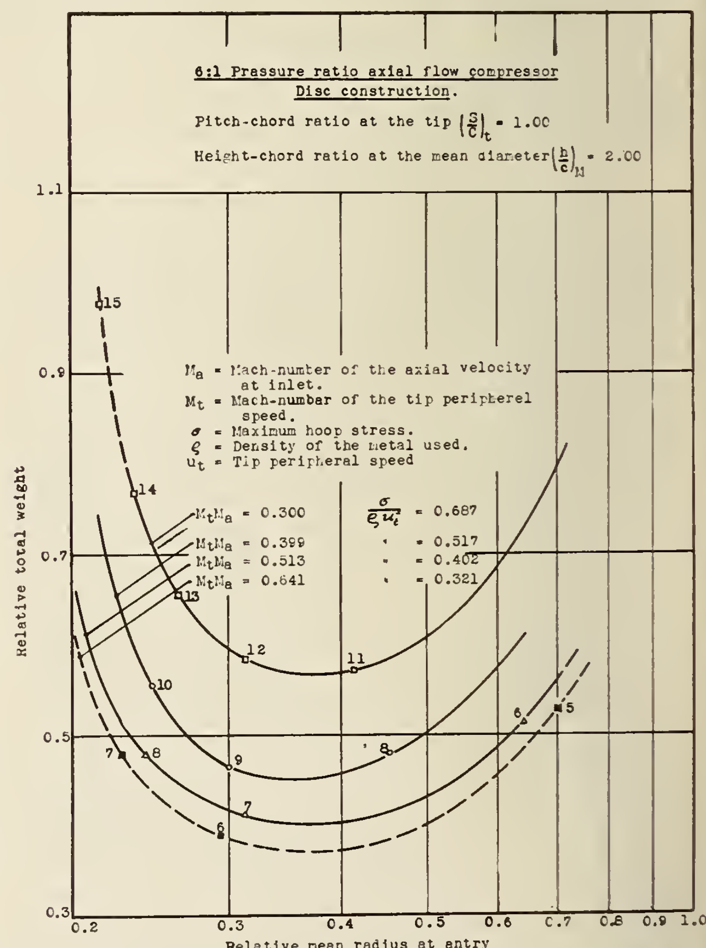

Fig. 11—Variation of weight with mean radius and Mach-number of multi-stage axial flow compressors.

of the order of 50 lb. per sec., the aluminium alloys give the lightest construction. For lower air-mass flows and pressure ratios, magnesium alloys are preferable.

Disc or Drum

It was found[10] that, in a drum construction, stress considerations prohibit the employment of the minimum number of stages possible.

For the same material and stress limitations, the disc type of construction results in a lighter compressor and a smaller number of stages. When the same tip speed is used, the disc construction compressor is nearly 30 per cent lighter than that of the drum construction. Figure 10 shows the results for a 4:1 pressure ratio compressor. The higher tip speeds which may be employed in disc construction enable a further reduction in weight and number of stages to be used. Figure 11 shows the results for a 6:1 pressure ratio compressor on a relative basis. It is seen that an increase of 45 per cent in tip speed results in a reduction of the weight and number of stages by 30 per cent.

Finally, it is to be noted that the disc construction gives greater freedom in choosing the outside diameter of the compressor.

Methods of Improving the Axial Flow Compressor

General

It has been shown that the most important disadvantages of the axial flow compressor are the relatively low pressure ratio per stage and the steep characteristics. The requirements of low weight and volume are covered by the requirement of high stage pressure ratio.

To determine the means of improving the axial flow compressor, elementary considerations are very helpful. For an axial flow machine, Euler's formula may be written as follows:

$$E = \frac{U.V_a}{g} (tg\alpha_1 - tg\alpha_2) \qquad (1)$$

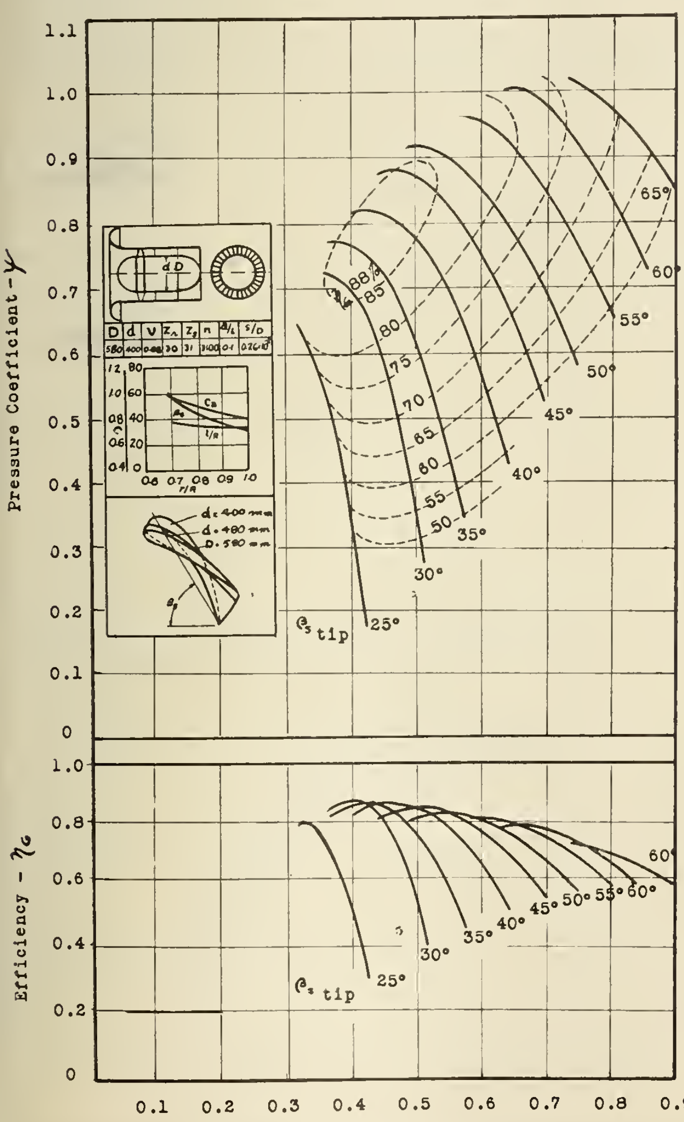

Fig. 12—Characteristics of a single stage axial flow compressor.

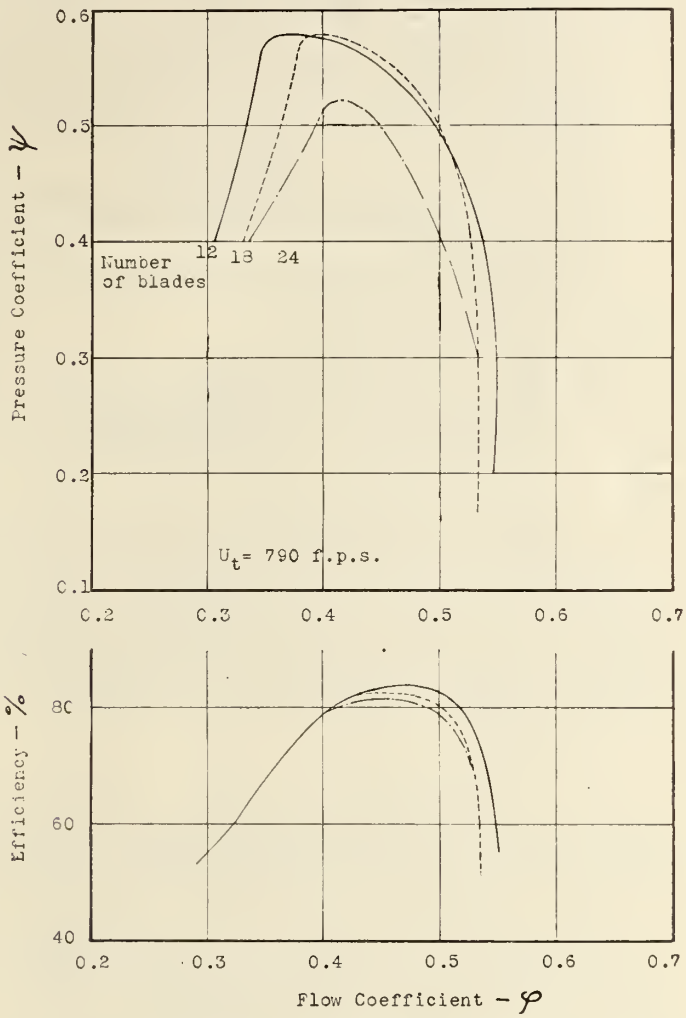

Fig. 13—Variation of the characteristics of single stage compressors with the Reynolds Number.

From the above may be observed that the work of compression per stage can be increased by one of the following methods:

(a) Increasing the peripheral velocity.

It was found that in the case of a drum construction compressor, rim speeds above 550 ft. per sec. were prohibitive. However, disc construction enables this value to be increased to 750 ft. per sec. where compressibility becomes the limiting factor.

(b) Increasing the axial velocity, compressibility is again the limiting factor.

(c) Increasing the deflection. This cannot be increased above certain limits because of the resulting separation of the flow and the subsequent stalling of the blades. There are three methods of increasing deflection:

- (i) Suction of the boundary layer at the blade roots by centrifugal action. Experimental investigation is required to show the order of the improvement.
- (ii) Using curved blades and utilizing the centri-

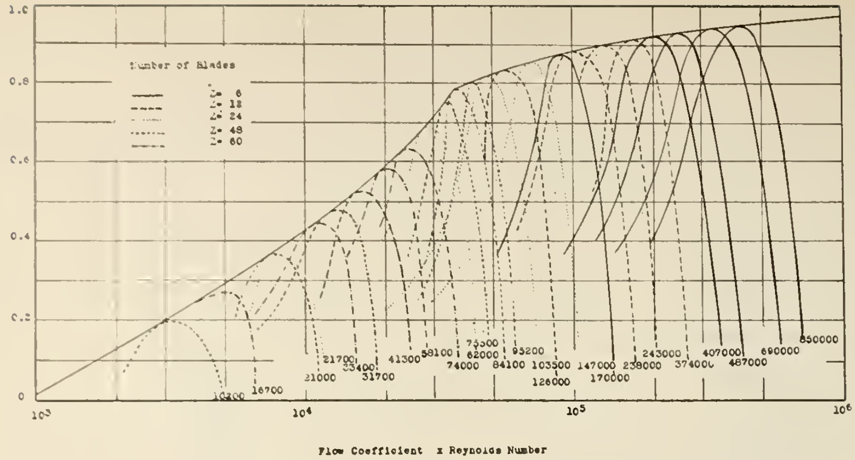

Fig. 14—Variation of the efficiency with flow coefficient for Reynolds Numbers from 8,000 to 850,000.

fugal force to compress the boundary layer and delay separation.

(iii) Using slotted airfoils.

(d) Using counter-rotating wheels. In the case of multi-stage compressors, mechanical difficulties are rather prohibitive. The characteristics of a counter-rotating compressor are slightly steeper with efficiencies of the same order.

All of the above methods refer to compressors with subsonic flow. However, some work has been done in using supersonic flows through the compressor and compressing the air by shock waves. Although some experimental work has been done by Prof. Weise in the D.V.L. and theoretical work by the author in the R.A.E., nothing spectacular has been achieved, because of the present insufficient knowledge of gas dynamics and lack of experimental facilities.

Increasing the Peripheral Velocity

As shown previously, the first method of improving the stage pressure ratio is by increasing the peripheral velocity. It was found that when the relative velocity approached that of sound, the influence of the compressibility was very important, and that before reaching the critical Mach-number, an increase of the lift coefficient was accompanied by an increase of the drag coefficient. Following a critical condition, the lift coefficient decreased while the drag coefficient increased rapidly.

If by the use of guide vanes before the rotor, a deflection is given the flow in the direction of rotation, then the peripheral velocity could be increased and even become larger than the sonic velocity without the relative reaching the sonic velocity. It can be seen that the same thing happens with the absolute velocity in the stator as with the relative velocity in the rotor. For instance, when $w_1 = c_2 < a$, a minimum value is attained when:

$$w_1^2 - w_2^2 = c_2^2 - c_1^2 \qquad (2)$$

Thus, equal division of the static pressure rise in the rotor and stator occurs which corresponds to symmetrical velocity triangles and 50 per cent reaction.

Aerodynamic Improvements

It was found that by using high camber blading, the lift and pressure coefficient could be increased.

Figure 12 shows the characteristics of a single stage axial flow compressor with high camber blading. With this wheel, 0.9 to 1.0 pressure coefficients were obtained for efficiencies ranging from 80 to 85 per cent. The outside diameter was D_o = 21.5 in. and the characteristic root parameter

$$\left(C_r \frac{C}{S}\right)_r = 2.22 \qquad (3)$$

Experiments on slotted blades have shown[11] an increased stage pressure ratio but accompanied by higher losses. It is important to know if, with such an arrangement, a decrease of the total length with the same overall efficiency will result.

Influence of Diameter Ratio

In order to keep a small outside compressor diameter for a given mass-flow area, a small diameter ratio $v = \frac{D_i}{D_o}$ should be used.

A uniform energy distribution along the blade height leads to unsurmountable difficulties, because at the inner diameter the peripheral velocity is small and high deflection should be adopted, a matter that is not always feasible, as it was seen before, at these high values of the lift coefficient, a separation of the flow may occur.

In the case of a multi-stage compressor where the throttling factor $\sigma = \frac{\varphi^2}{\psi}$ should not be below a certain value, it was found that its value might be increased by an increase of the diameter ratio.

There is a higher limit of the diameter ratio that should not be exceeded; for the dynamic compression work increases at the expense of the static, and a heavy construction as well as high losses result. Considerable work has been done regarding the optimum diameter ratio. It was found that by increasing the diameter ratio, the passive area (blades, wheel casing, disc surface) increased, losses

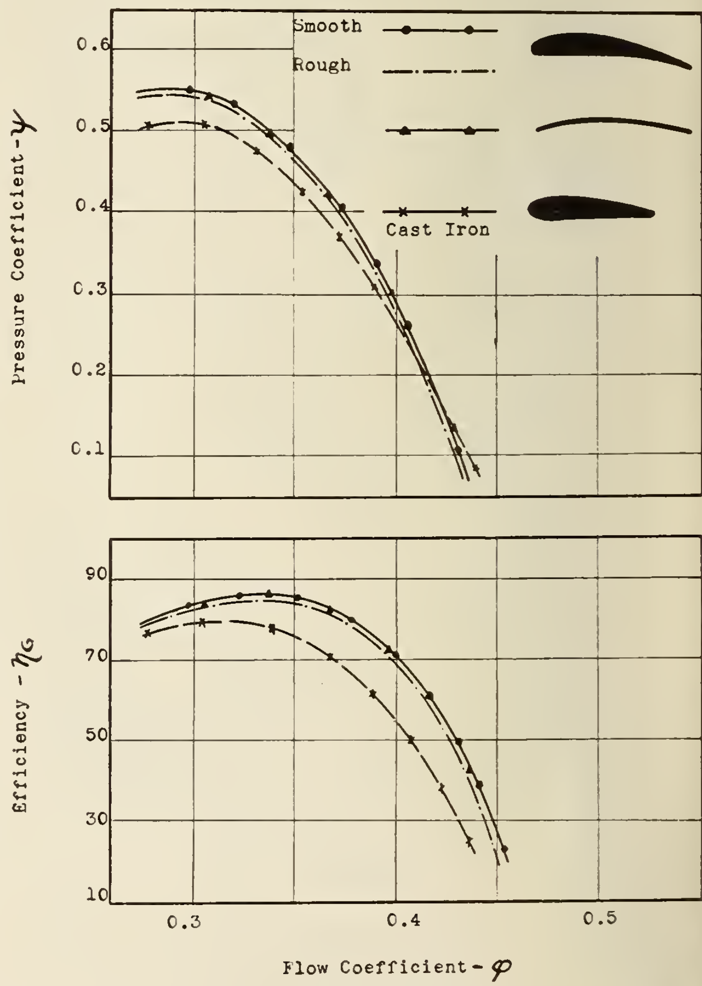

Fig. 15—Influence of the surface roughness on the characteristics of a single stage compressor.

increased and efficiency was reduced. For a diameter ratio between 0.70 and 0.85 there is very little variation in efficiency but above 0.85 the efficiency falls off rapidly.

Influence of the Reynolds Number

Considerable work has been done on the influence of the Reynolds number which is defined as

$$Re = \frac{U_t C}{\nu} \qquad (4)$$

Figure 13 shows the results[12] from three wheels consisting of 12, 18 and 24 blades with Re = 3, 4 and 6 x 10^5 respectively. It is seen that by decreasing the Reynolds number, lower efficiencies and narrower characteristics result.

Figure 14 shows the variation of efficiency with the Reynolds number for a great number of wheels, the $Re = 8.10^3$ to 8.5 x 10^5, the number of blades z = 6 to 60 and the blade chord C = 0.65 in. to 6.5 in.

The velocities were kept very low (260 ft. per sec.) in order to avoid the influence of compressibility.

From this, the great influence of the Reynolds number on the characteristics of the axial flow compressor is indicated.

The influence of the surface roughness has also been examined. Figure 15 shows the influence of roughness for a Re = 3.25 x 10^5.

Blading

General

The geometrical form and rotational speed of an axial flow compressor depend on the type, thickness, camber and diameter ratio of the blade adopted. It was found that any variation in the type of the blading would require important changes in the rotational speed, thickness and camber.

In the design of a single wheel, the direction of the air-flow is of great importance. By the use of guide vanes, we can introduce the air either in the direction of rotation or in the opposite direction or simply axially.

In the case where the relative velocity in the wheel is kept constant, a higher peripheral velocity can be employed if the absolute velocity is in the direction of rotation. In the opposite case where the absolute velocity is not in the direction of rotation, smaller diameter ratios and higher pressure coefficients can be used.

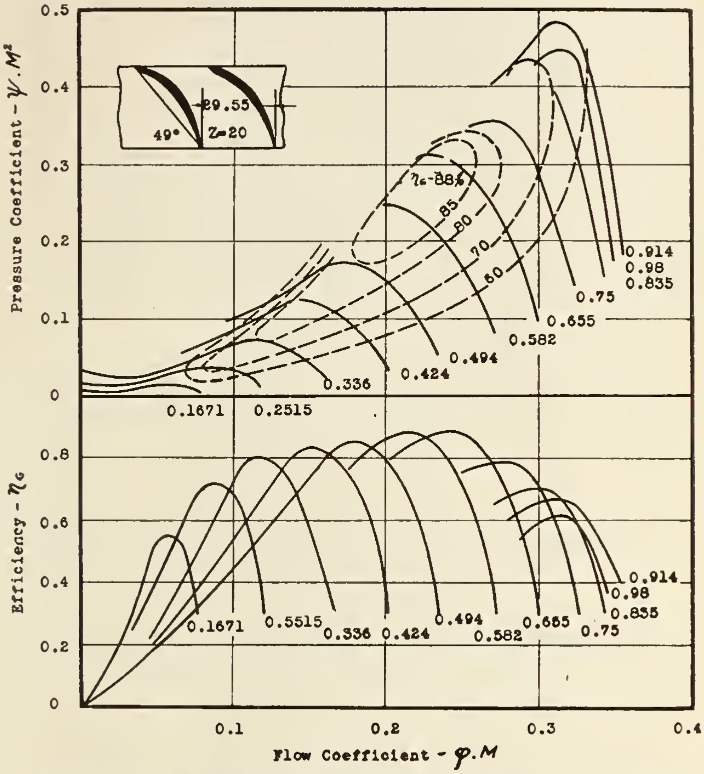

Fig. 17—The influence of the Mach-number on the characteristics of a 20-blade axial flow compressor with high camber blades and sharp leading edges.

In a multi-stage compressor with relative velocities opposed to the direction of rotation, the absolute velocity is, as an average, axial with small oscillations around the axis. In the other case, the absolute flow follows a helicoidal path and due to the large swirl velocities at the exit from the wheel, smaller axial thrust results.

The air outlet angle is a function of the stagger, camber and the pitch-chord ratio. The higher the stagger, the larger is the air outlet angle. Large air outlet angles, or staggers, give lower camber blades as the deflections, that can be used, are smaller.

By varying the air outlet angle, a variation of the rotational speed and the flow parameter occurs.

At the design point, the higher the air outlet angle the steeper are the characteristics and the higher the maximum pressure ratios. However, nothing is known about the starting characteristics.

A substantial increase in pressure ratio without any decrease in efficiency could be achieved on an axial flow compressor by decreasing the spacing distance of the blade rows. It was found that the present day practice of $^1/_3$ chord was too large.

Finally, it should be mentioned that the Coriolis forces and the centrifuge effect of the boundary layer have a great influence on the blading of high speed axial flow compressors.

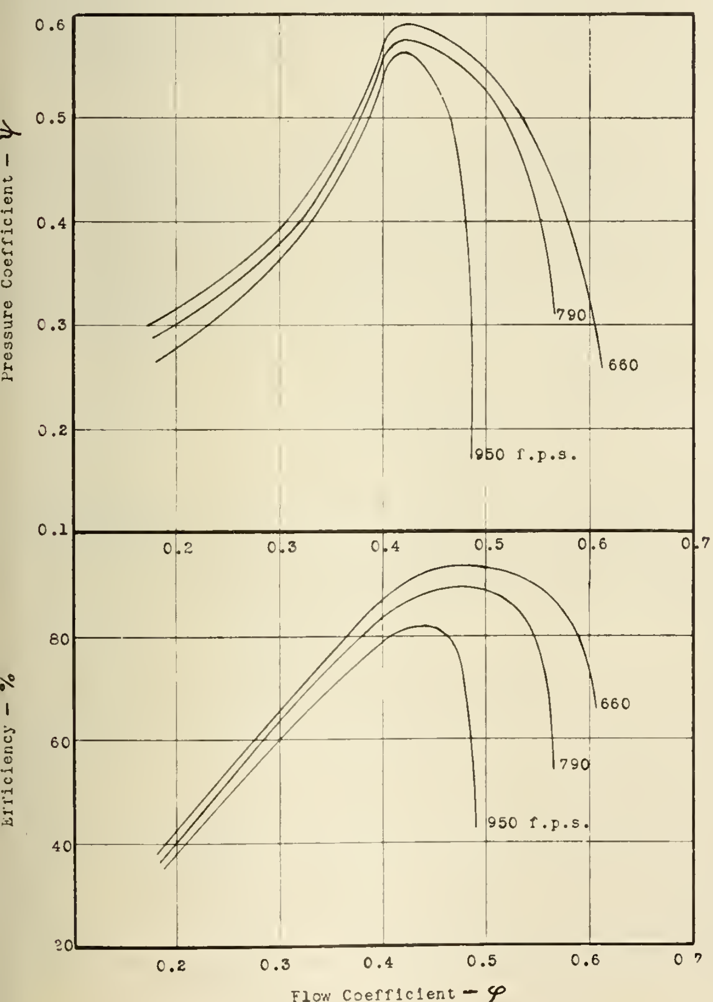

Fig. 16—Variation of the characteristics of a single stage compressor with the Mach-number.

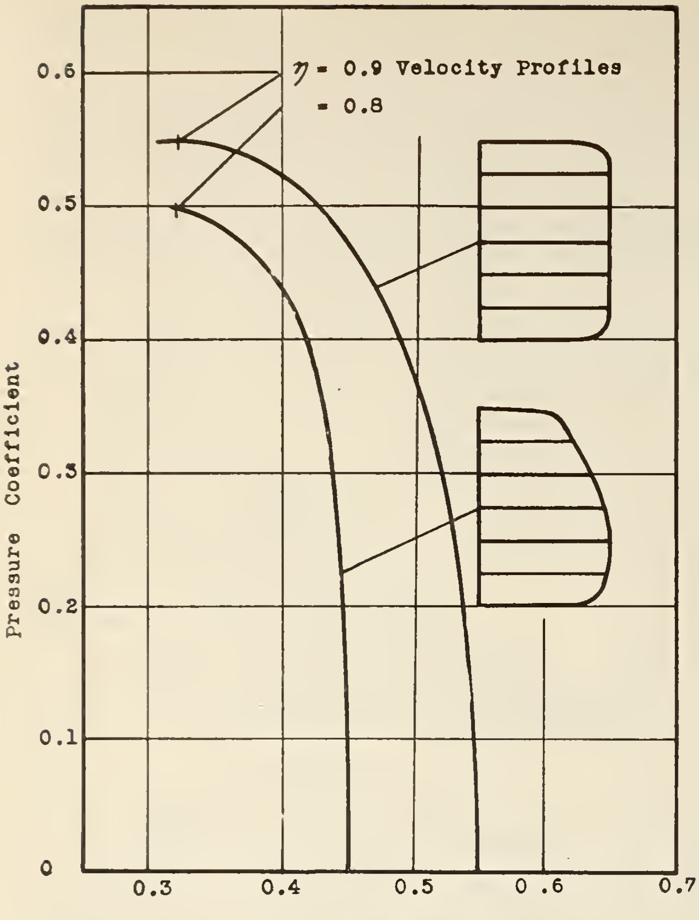

Fig. 18—Variation of the characteristics of a single stage axial flow compressor by different velocity distribution.

Influence of the Mach-Number

The Mach-number of the relative flow has a great influence on the characteristics of the axial flow compressors. Figure 16 shows the characteristics of a rotor wheel at different Mach-numbers. It is seen that the characteristics become steeper and the choking mass flow decreases with increasing Mach-number.

Tests on a series of high efficiency single-stage axial flow compressors were made with different numbers of blades and various types of blading. It was found that when the Mach-number (Mach-number of the tip speed) was low, the efficiencies fell off due to the decrease of the Reynolds number, also that when the Mach-number became greater than a critical value, the efficiency fell off again. In order to correlate the test results, the Glauert-Prandtl compressibility correction was employed. The critical Mach-numbers were between 0.70 and 0.75.

Figure 17 shows the characteristics of one of the above mentioned compressors having high speed airfoil sections of low thickness ratio and the maximum thickness of which is well in the rear. It was found that by further sharpening the leading edges, a slight change in the characteristics resulted, accompanied by a lower efficiency. This can be explained by the increased shock sensitivity.

Influence of Velocity Distribution

Investigations have shown that the inflow conditions in a compressor have a marked effect on the charaeteristics. Figure 18 shows the change of the charaeteristies due to asymmetrical velocity distribution.

It is not known whether in a multi-stage compressor, the influence of the inflow conditions is damped down or accentuated and how far these asymmetrical distributions, change the final characteristic lines of the compressor.

Incomplete evidence on a given type of blading has shown a damping effect, still this is not sufficient to draw general conclusions.

Methods of Design

The design of axial flow compressors is done either according to the hydraulic theory or according to the airfoil theory[13] with the necessary corrections in both cases.

The axial flow machines can be divided in three groups: high, average and low speed by the use of the specific rotational speed given as follows:

$$n_s = \frac{\sqrt{\pi}}{g} \cdot \frac{N\sqrt{Q}}{H^{3/4}} \quad \ldots\ldots\ldots\ldots\ldots\ldots (5)$$

In the case where the non-dimensional coefficients are used, the following is obtained:

$$n_s = \sqrt{\varphi} \,.\, \psi^{-3/4} \,.\, \sqrt{1-\nu^2} \quad \ldots\ldots\ldots (5^1)$$

According to present day experience, the following table is obtained:

TABLE I

Speed	High	Average	Low
Specific rotational speed	$n_s > 2$	$2 > n_s > 1$	$n_s < 1$
Design according to	Airfoil theory without corrections	Airfoil theory with corrections	Hydraulic theory with corrections for deviation
Type	Fans		Compressors

Considerable work has been published (Schilhansl, Betz, Ruden, Weinig, Ackeret, Howell, etc.) in the past, regarding the design of axial flow compressors by using cascade test results and applying the necessary corrections. Still this correlation is not satisfactory because it disregards the Coriolis forces and the centrifuge effect in the boundary layer.

ANALYSIS OF LOSSES

Many methods have been suggested to analyse the losses in an axial flow compressor. These can be divided into two main groups, those based on the hydraulic method of design and the others based on the airfoil theory.

The first analyse the losses in the same way as the steam turbine practice with the appropriate modifications.

The second analyse the losses into two-dimensional and three-dimensional flow taking into consideration the annulus loss.

As the matter is still in a fluid state, a combination of both may give the best answer.

TEST AND DEVELOPMENT

To obtain data for the design of axial flow multi-stage compressors, several testing methods have been suggested.

In the case of the internal combustion engine, developing a correlation of the results was as follows:

Bomb—single cylinder—multicylinder.

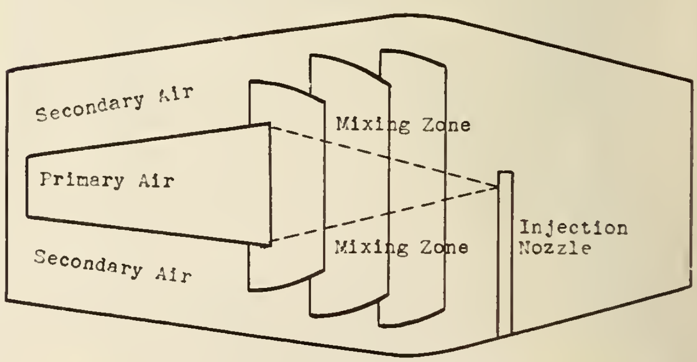

Fig. 19—Typical combustor subdivided in primary and secondary zone, and fuel injection system.

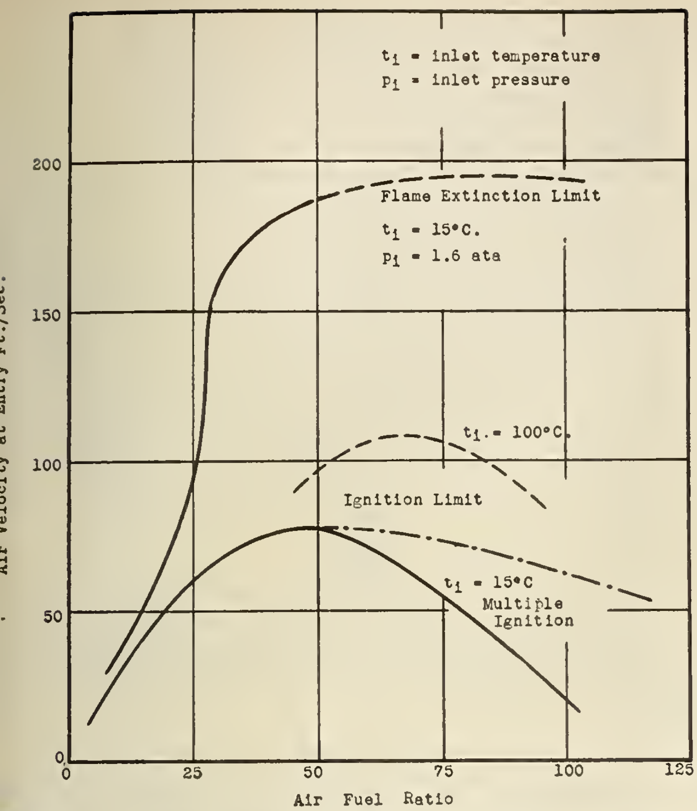

Fig. 20—Ignition and flame extinction limits of an experimental combustor.

It is logical to assume that the following is the rational correlation for axial flow compressors.

Single airfoils—Cascade tests—single stage (or two stage)—multi-stage compressor.

Combustors

General

The function of a combustor is to increase the temperature of the compressed air by burning the injected fuel.

The main requirements of a good combustor are: low total head pressure loss, high combustion efficiency, and minimum space. The last requirement places great limitations on the former two.

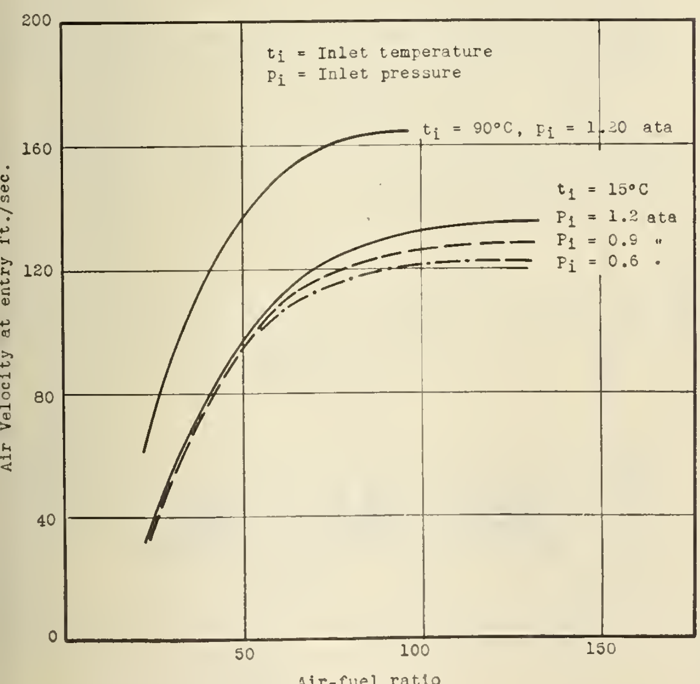

Fig. 21—Variation of the flame extinction limit with the temperature and pressure.

The effect of combustor volume on combustion may be expressed in terms of the *combustion intensity*, which is the heat released, per unit volume, unit time and unit pressure.

From the above it is easily seen that in order to keep the volume down, high intensities should be used. It was found that combustion intensities in gas turbines were rather high when compared with other applications.

Before going into details a description of a typical combustor is in order. Figure 19 shows one typical combustor which is sub-divided in the primary and secondary zone and the fuel injection system.

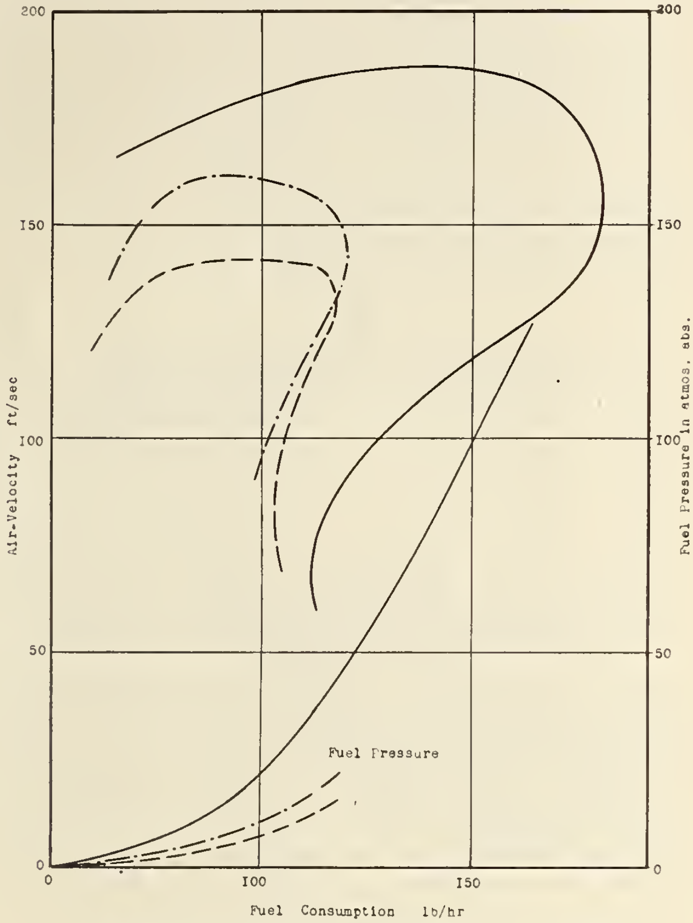

Fig. 22—Influence of the fuel pressure on the flame extinction limit.

As the permissible temperatures before the turbine are rather low, high air-fuel ratios have to be used; and in order to facilitate combustion, a division of the air is necessary in primary and secondary air. The air-fuel ratio in the primary zone is such as to secure temperatures of 1200 to 1400 deg. C (1700 to 2060 deg. F).

After burning in the primary zone, the combustion products are mixed with the secondary air in the secondary zone to reduce the temperatures to a permissible level. As combustion continues in the secondary zone, great care should be taken to avoid the deleterious effect of "flame chilling".

The secondary air keeps the walls of the combustor at a relatively low temperature.

Following more closely the physical and chemical processes that take place in a combustor, first, we have a high pressure liquid fuel that is injected into an air stream. Then atomization of the fuel occurs, the droplets fly relative to the air, but due to friction, heat conduction and radiation from the hot gases, evaporation on the surface of the droplets takes place. After a certain time of evaporation and mixing with the air, called ignition lag, ignition starts and finally more or less complete combustion results.

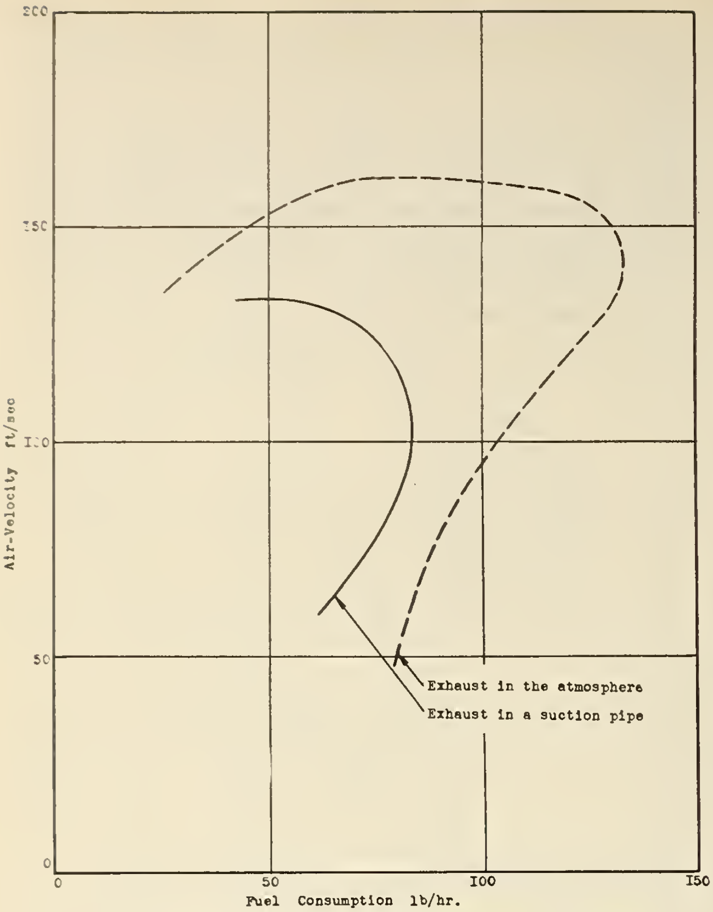

Fig. 23—Influence of the exhaust pressure on the flame extinction limit.

There are two ways in which fuel is injected into the combustor—upstream and downstream. Both have their advantages and disadvantages.

Atomization and evaporation depend on certain non-dimensional parameters such as *Re*, *N*, a parameter of surface tension, etc.

Several methods may be suggested to increase the combustion intensity but the two most important of these are:

(a) The use of catalytic combustion.

(b) Evaporation and injection of the fuel vapor in the hot stream.

For the mixing process in the secondary zone, large and small scale turbulence is required. This turbulence is created by the mixing action of two jets, by forced vorticity created by cascade rings or fans and the turbulence created by temperature gradients.

There are two limits that may be investigated in a combustor, namely, the upper or "flame extinction limit" and the lower or "ignition limit".

The flame extinction limit is defined as the limit at which combustion can still continue and the ignition limit as that at which combustion can still be started.

Figure 20 shows measurements made in an experimental combustor. It is seen that the ignition limit lies considerably lower than the flame extinction limit.

Both limits show a considerable drop in velocity in the neighborhood of the stoechiometric mixture. The more favourable variation of the upper limit is attributed to the higher temperatures present in the primary zone as compared to ignition during the starting process. It is also seen that, by increasing the temperature, the lower limit is improved.

Figure 21 shows the influence of pressure on the upper limit. It is seen that absolute pressure has little effect on the upper limit. From recent experiments, pressures of the order of 4 lb. per sq. in. abs. have shown only small variations from those of 8 lb. per sq. in. abs. The influence of pressure, then, may be attributed, in part, to the influence it has on the atomization.

The influence of temperature on the upper limit is considerably greater, because of its influence on the evaporation of the droplets.

Figure 21 also shows the flame extinction limit for air inlet temperatures of 15 deg. and 90 deg. C (59 deg. and 194 deg. F), at constant pressure.

In addition to temperature and pressure, the atomization of the fuel spray is also important. Figure 22 shows that as the fuel pressure is increased, a better atomization will result. Further, the flame extinction limit will be higher.

Back pressure of the combustor has definite influence on both the upper and the lower limits as it is shown in Fig. 23. This effect shows greater difficulties in high altitude operation. It was found[14] that the criterion for the upper limit is that of thermal equilibrium. Some stabilisation of the flame is achieved by the use of a baffle that creates recirculation and increases considerably the pressure loss.

Analysis of Losses

There are two principal groups of losses that occur in a combustor, namely, pressure losses and heat losses. The former are due mostly to aerodynamic and thermodynamic effects while the latter are due to chemical and physical conditions although there is a strong tie between them.

Pressure losses can be analysed in the following manner:

(a) Fundamental loss due to heat addition. This has been extensively investigated by the author and it has been found[15] that minimum loss occurs when the Mach-number is kept constant.

(b) Aerodynamic loss due to wall friction which is considerably small.

(c) Fundamental loss due to the mixing process in the secondary zone.

(d) Inductive loss due to frictional mixing and turbulence. This is by far the largest loss in a well designed combustor.

Heat losses can be analysed in the following manner:

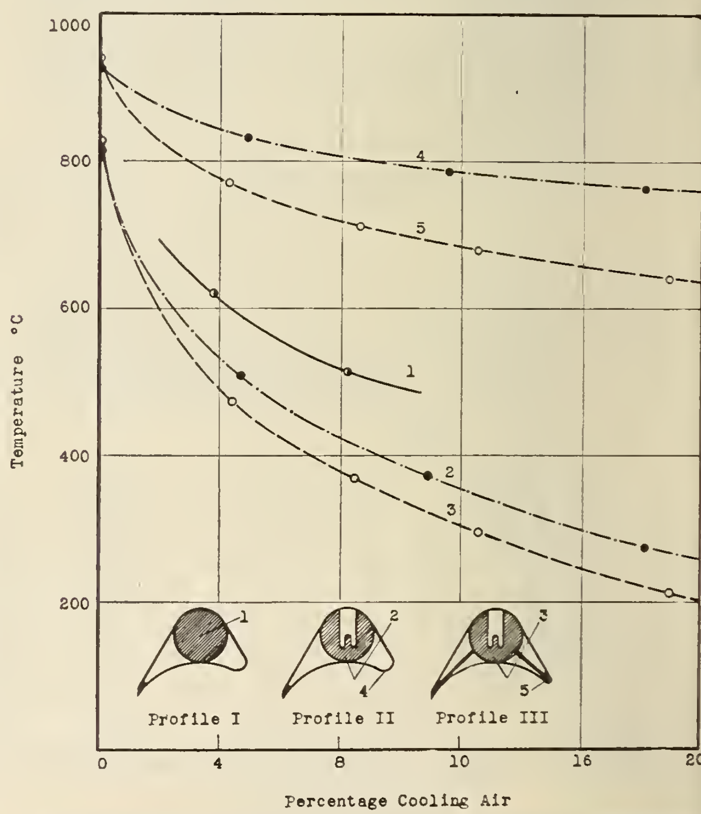

Fig. 24—Blade temperature as a function of the percentage cooling air.

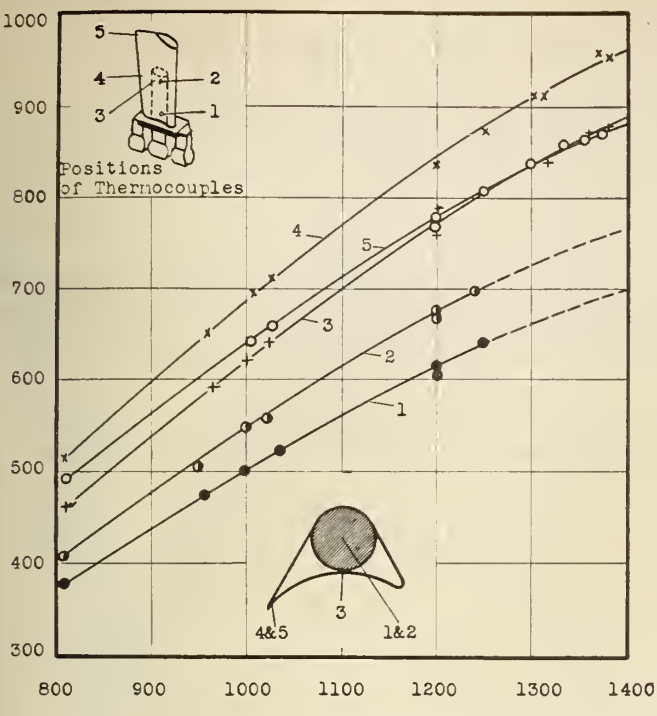

Fig. 25—Blade temperature as a function of the gas temperature.

a) Delayed combustion loss, mainly in the turbine and propelling nozzle.
b) Incomplete combustion loss.
c) Dissociation loss.
d) Radiation and convection loss.

The losses of (a) and (b) are a maximum at weak mixtures (cruising and idling). Also at low pressures (high altitude operation).

Pressure losses in the combustor greatly influence the starting time of the engine.

Although no attempt has been made to employ control in the combustor by moving parts, it seems very likely that the necessity of raising the upper and lower limits at variable conditions of altitude and speed would be successfully met by the use of movable parts as flaps, springs, etc.; in this way we can vary the primary air and keep the desirable air-fuel ratio and mass flow conditions in the primary zone. We could also vary the amount of the forced vorticity in the secondary zone.

A few unsuccessful attempts have been made to examine the similarity of conditions in combustors. The problem is not easy but its solution is urgently required.

Cold testing of efficient combustors of any form has no aerodynamical meaning.

REHEAT COMBUSTORS

Since inlet temperatures are higher and the temperature rise lower in reheat combustors, their design is much simpler than that of the main combustor.

TURBINES

GENERAL

To date very little experimental work has been done on gas turbines, their design being mostly based on steam turbine practice with few modifications. The turbine is thermally and mechanically the highest stressed component of a gas turbine engine.

The loadings are usually subdivided in the following groups:

(a) Temperature loading
(b) Centrifugal loading
(c) Gas bending loading
(d) Vibration loading

The severe temperature loadings create many bearing difficulties. However, this can be remedied by bleeding small amounts of air from the compressor to cool the turbine disc.

By appropriate design, e.g. using curved blades, the centrifugal and gas bending stresses can be decreased to a minimum.

Very little has been done regarding vibration. However, work that is now in progress should elucidate certain phenomena regarding vibration.

It is well known that the thermodynamic efficiency of a gas turbine improves by increasing the maximum temperature of the cycle. This increase in temperature cannot always be realized owing to the lack of materials able to withstand high temperatures, high stresses and the intense corrosive action of the gases.

Several high temperature materials have been developed or are in the process of development based on chromium and titanium. The composition of two of these, developed in the D.V.L., one for a range of 650 to 750 deg. C and the other for a 750 deg. to 800 deg. C, are as shown in Table II.

The strength characteristics of steel A are as follows:

U.T.S. = 220,000-250,000 p.s.i. at room temperature.
Creep strength 1% in 300 hours 74,000-81,000 p.s.i. at 600 deg. C (1110 deg. F).
Creep strength 1% in 300 hours 52,000-59,000 p.s.i. at 700 deg. C (1290 deg. F).
Creep strength 1% in 300 hours 27,000-30,000 p.s.i. at 800 deg. C (1470 deg. F).

No strength data are available for steel B; however, preliminary investigations indicated that the corrosion resistance was excellent and creep resistance good at temperatures from 750-800 deg. C (1380-1470 deg. F).

More recent advances inme tallurgy show that creep resisting alloys for temperatures as high as 870 deg. C (1600 deg. F) have been attained and the future promises even better materials.

The use of ceramics has not been sufficiently investigated; therefore conclusions as to their suitability should be withheld until more information is made available.

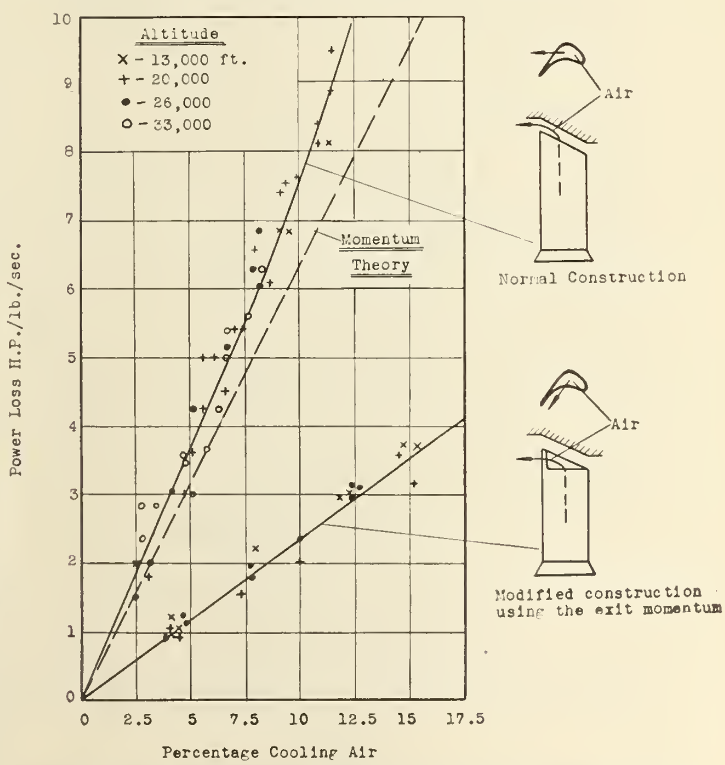

Fig. 26—Power loss as a function of the percentage cooling air.

Table II

Alloy	C	Si	Mn	Ni	Co	Cr	W	Mo	Ti	Fe	Range
A	0.1	0.5–0.8	1.0–1.5	30–34	25–30	13–15	40–45	5.5–6.0	1.0–1.3	Remainder	650–750 deg C
B	—	—	—	10–15	25–35	15–18	3.0	7.0	1.8–2.5	"	750–800 deg. C

Blade Cooling

There are two possibilities left for the use of high temperatures. First, by decreasing the stresses of the parts that are subjected to high temperatures and second by decreasing the blade temperature by cooling. Only the second possibility of cooling shall be dealt with. There are two principal methods of cooling, air cooling and liquid cooling. The latter may employ water, glycol or any other suitable liquid. With water cooling an open or closed cycle could be used. However, the use of other liquids would necessitate a closed cycle.

From the standpoint of weight only, air cooling can be successfully applied in aircraft gas turbines. Liquid cooling methods are best suited for land and sea turbines.

General thermodynamic considerations show that cooling results in a reduction of the expansion efficiency. Although due to the decrease of the boundary layer thickness, a decrease in the blade losses may result. It is left to further work on this matter to show which one of the two influences is prevailing.

Blade cooling is a problem of heat transfer where the flow of the cooling medium plays an important role.

As in a gas turbine rotor the blades rotate relative to the stator nozzles, the relative velocity should be taken into consideration when examining the rotor temperatures. Because of the expansion taking place in the nozzles, the static temperature is considerably lower than the total head temperature (before the turbine).

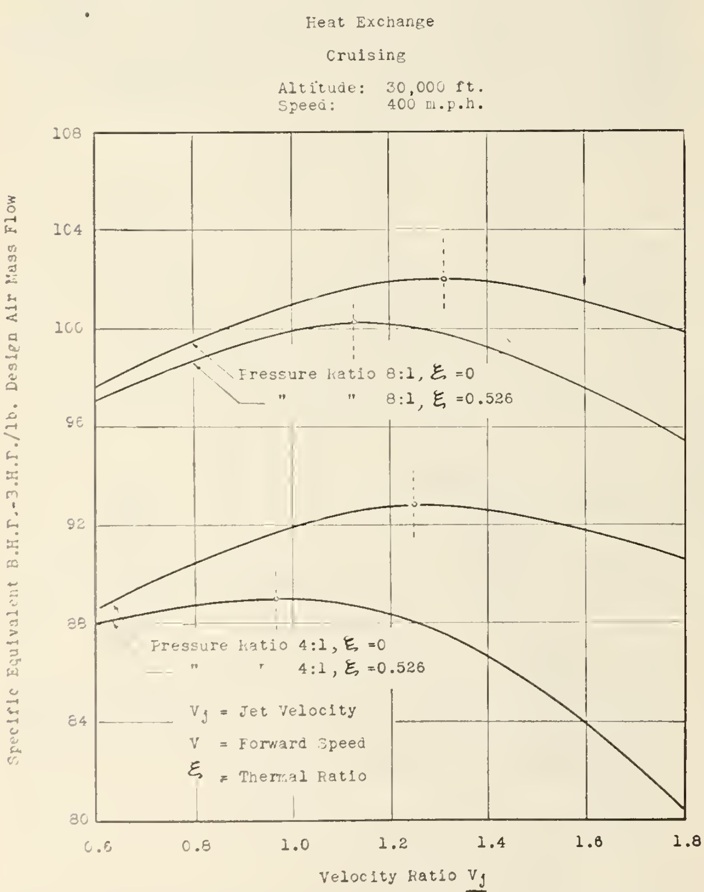

Fig. 27—Variation of the specific power output with the velocity ratio of propeller turbine engines with heat exchange.

The temperature reached by an uncooled blade is higher than the static temperature of the flowing gases because of the resulting temperature rise in the boundary layer.

This temperature rise is given as follows:

$$T = \theta \cdot \frac{w^2}{2gJK_p} \quad \text{(6)}$$

If air cooling is used, the higher the ratio of internal blade

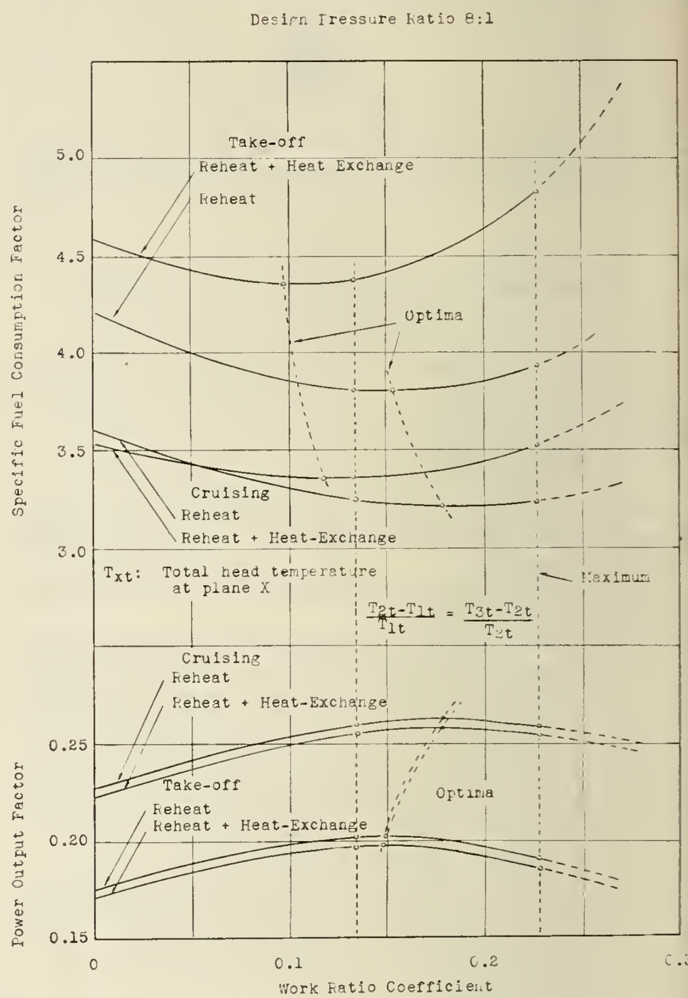

Fig. 28—Variation of the power output and specific fuel consumption with the work ratio of propeller turbine engines with reheat and heat exchange.

cooling surface to the external heat receiving surface, the lower the blade wall temperature will be. The film coefficient increases as the internal cooling air velocity increases.

Theoretical investigations have shown[16] that the radial heat flow at the root of the blade has a great influence on the cooling process.

Hollow blades usually consist of a more or less circular shaft capable of taking most of the stresses and of an outer thin wall shell. The blade is made of rather low heat resisting steel and the shell of thin highly heat-resisting alloy steel having a thickness of the order of 0.012 in. This results in a light construction which has a favourable effect on the turbine disc. The only disadvantage is that it has a low thermal capacity and this presents certain

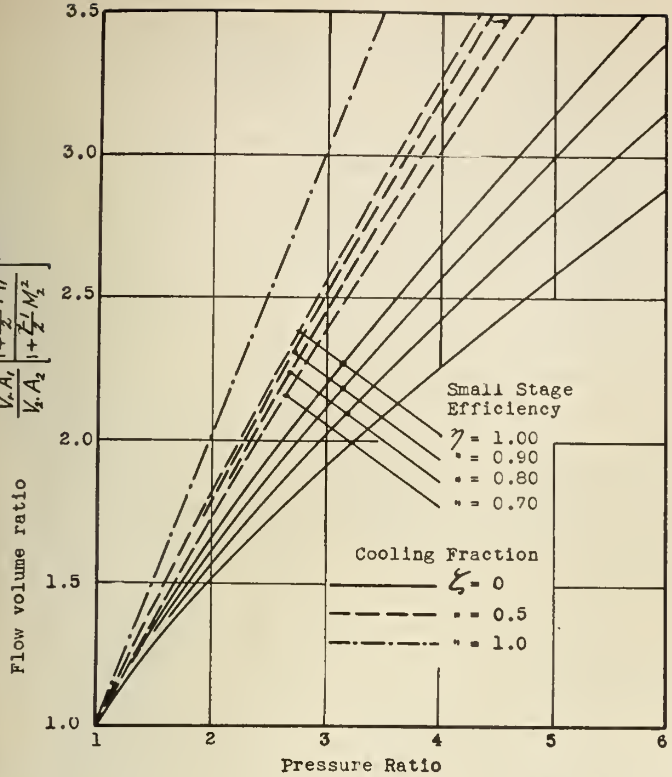

Fig. 29—Variation of the flow volume in a multi-stage axial flow compressor.

limitations in starting and load variation. Also that high local temperatures may result.

Figure 24 shows the results of temperature measurements of different points of the blade for three profiles as a function of the amount of the cooling air.

The stagnation air temperature is 950 deg. C (1740 deg. F) which corresponds to a total head temperature of the order of 1050 to 1100 deg. C (1920 to 2010 deg. F).

Each of the top curves shows the temperature of the leading edge at the mean diameter which more or less represents the maximum temperature of the blade.

The lower curves show the temperatures of the shaft in the neighbourhood of the root which represents the highest mechanically stressed parts of the blade.

It is easily seen that by increasing the internal area, the shaft temperature decreases. Even in the case of a simple cylindrical form the temperature of the blade shaft is considerably lower although the cooling area ratio is not larger than unity.

Figure 25 shows the temperatures at different points of profile I as a function of the gas temperature for 8 per cent cooling air. It is seen that the blade shaft temperatures corresponding to a gas temperature of 1100 deg. C (2010 deg. F) is below 600 deg. C (1110 deg. F) which proves that the use of low heat resisting materials for the blade shaft is feasible for the high gas temperatures.

In Fig. 24 it is seen that, in order to achieve satisfactory cooling, a considerable amount of cooling air is required. The energy required is shown in Fig. 26. As this energy wastage has a deleterious effect on the performance of the engine, methods should be devised to decrease it. One method is to permit air to escape in such a way as to utilise its exit momentum in the peripheral direction, giving part of its energy to the turbine and also improve the boundary layer conditions. In Fig. 26 it is seen that a considerable improvement results and the loss is reduced to $^1/_3$ of its original value.

These experiements show that it is possible to use higher temperatures without considerably lowering the overall efficiency of the engine by increasing the amount of cooling air.

In the case where a heat insulating material is used on the outer shell of the blade, e.g. ceramic of some sort, by keeping the same internal metal conditions and depending on the thickness of this material, higher temperatures can be employed of the order of 20 to 50 deg. C (36 to 90 deg. F).

Several methods of attaching such heat insulating materials can be suggested, spraying etc., but the thermal expansions should be examined in order to avoid scaling.

Number of Stages

Because of relatively low pressure drops in present day gas turbine engines, one or two stages are sufficient to handle the pressure ratios available. It was found that by a multi-stage construction, no essential advantages could be achieved. The attainable higher efficiencies by a multi-stage design are accompanied by a heavier machine, and waste of materials. In the case where blade cooling is used, the situation is further aggravated by the multiple amount of the cooling air necessary. Higher expansion ratios in the nozzles result in higher peripheral velocities and lower temperatures in the blades. This would suggest that another degree of reaction, usually less than 50 per cent, would be the best solution.

Nothing is known regarding the influence of the cooling air on the following stage. It can be seen that a deterioration of the efficiency may be expected but the order of it is unknown. When blade cooling is used, a single-stage turbine may be successfully employed for each compressor group. As the rim speed of a turbine should be kept lower than 1100 ft. per sec. the temperature drop in a turbine stage is of the order of 220 to 280 deg. C for turbine inlet total head temperatures of 1100 to 1800 deg. K. There is little variation in weight between the single and the two stage turbines, but the air cooling loss in the latter case is considerable, although the two stage turbine results in a smaller outside diameter and consequently smaller frontal area, but in most cases the turbine diameter is not a critical point as the frontal area of the engine is determined by other components.

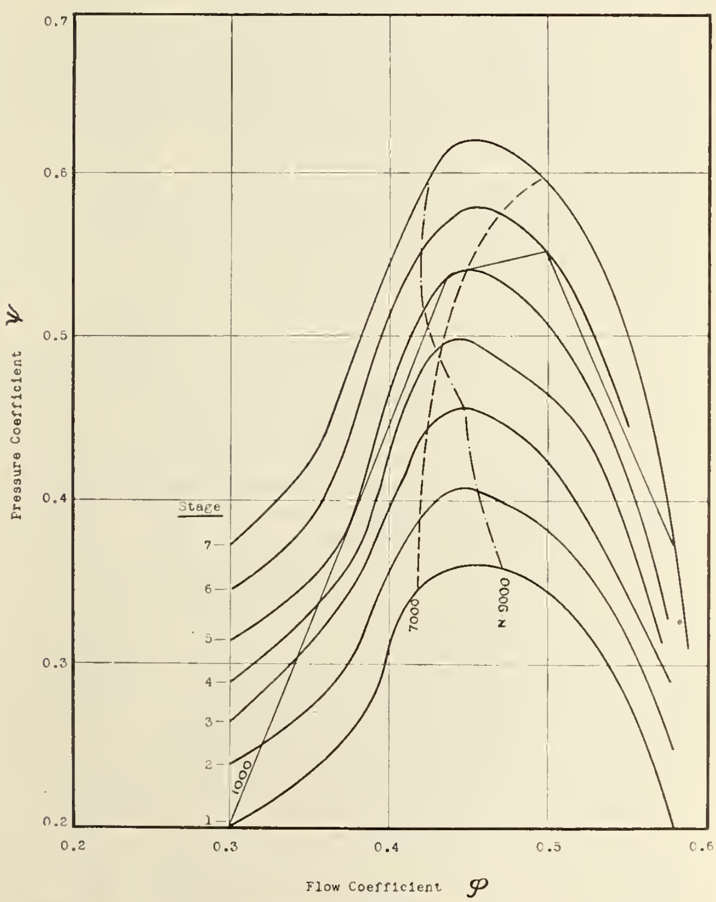

Fig. 30—Variation of the characteristics of a 7-stage axial flow compressor with the rotational speed.

Division of Power

With regard to the propeller turbine, the problem of division of power between the propelling nozzle and turbine and between the turbines of a compound unit is of great importance.

Division of Power Between Propeller and Propelling Nozzle

It was found[17] that optimum conditions result when the velocity ratio is given by the following formula:

$$\frac{V_j}{V} = \frac{\eta_j}{\eta_t \eta_p} \phi \qquad (7)$$

In the case where the above efficiencies are not constant, their variation is to be taken into consideration.

Figure 27 shows the variation of the specific power output as a function of the velocity ratio $\frac{V_j}{V}$. From this it is seen that the specific power output curves are very flat and there is a wide range of jet velocity forward speed ratio over which the engine can operate with negligible loss of power and efficiency. Also it may be inferred that there is a fair chance of a fixed propelling nozzle being used in a propeller turbine without appreciable loss of power and efficiency thus avoiding the additional complication and weight of a variable propelling nozzle. It was found that the optimum velocity ratio increases with the design pressure ratio, but falls off with increasing degree of heat exchange (thermal ratio).

Since, in practice, the exhaust system efficiency increases with jet velocity and the propeller weight decreases, the real optima occur at higher velocity ratios than those calculated above and the curves flatten more on the higher velocity ratio side.

Finally it is worth mentioning that at higher forward speeds, as the propeller efficiency falls-off, the jet becomes relatively more efficient, thus absorbing more power to maintain optimum conditions and therefore lightening the whole power plant installation.

Division of Power Between Turbines

Figure 28 shows the specific fuel consumption and specific power output of an 8:1 design pressure ratio double compound propeller turbine as a function of the work ratio coefficient (the ratio of the H.P. turbine temperature drop to its inlet temperature).

From these curves it is seen that the condition of equal temperature rise ratio in the high and low pressure compressors is not far removed from the optimum.

For optimum specific power output, the work ratio coefficient is higher than that of equal temperature rise ratios.

The optimum work ratio coefficient for maximum output is higher for cruising than for take-off conditions and it will be noted that there is but little variation between reheat alone and reheat with heat exchange.

Now, turning to the curves indicating the specific fuel consumption, the optimum work ratio coefficient is slightly higher than that yielding equal temperature rise ratio for each compressor but for the case of reheat and heat exchange the optimum coefficient is slightly lower.

Again, it is seen that for minimum specific fuel consumption, the optimum work ratio coefficient is higher at cruising than at take-off.

Finally it is to be noted that because of the flatness of the curves, little variation from the optimum values of specific fuel consumption and specific output will result with changes in the work ratio coefficient. This results in an appreciable measure of freedom in the design of the compressors and turbines of the double compound engine.

Matching of the Different Parts of the Power Plant

Owing to the steepness of the characteristics of the different parts of an aircraft gas turbine and especially the relatively high sensitivity of the efficiency, great care should be taken to ensure a satisfactory performance at cruising and starting conditions.

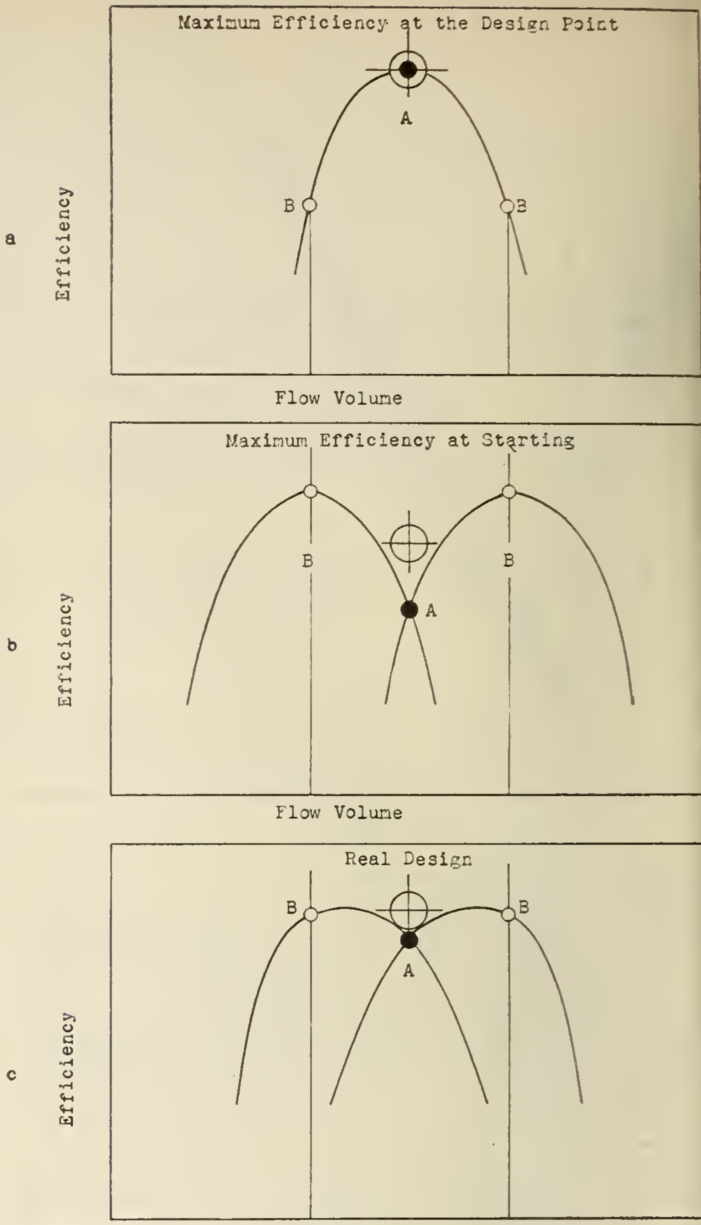

Fig. 31—Matching of the stages of an axial flow compressor.

Matching of the Stages of an Axial Flow Compressor

There are two main requirements that must be satisfied by a compressor; they are, high efficiency at the design point, and easy starting. Present day available data[18] show that the cooperation of the different stages of a compressor at different rpm. is not satisfactory. From fundamental theory, taking into consideration the continuity conditions, the following formula may be derived:

$$\frac{V_{a1} A_1}{V_{a2} A_2} = \left(\frac{1 + \frac{\gamma - 1}{2} M_1^2}{1 + \frac{\gamma - 1}{2} M_2^2} \right)^{\frac{1}{\gamma - 1}} \left(\frac{P_{2t}}{P_{1t}} \right) \left\{ 1 - \left(\frac{\gamma - 1}{\gamma} \right) \left(\frac{1 - \zeta}{\eta_\infty} \right) \right\} \qquad (8)$$

This has been plotted in Fig. 29. It is easily seen that at low rpm. the different stages are not working on the same design flow coefficient; because both the pressure ratio and the efficiency vary. Thus for high pressure ratio compressors, a dislocation of the stages at low rpm. cannot be avoided.

In the case where the compressor is designed for a high efficiency at the design point, a considerably lower efficiency will result at starting due to this dislocation.

Figure 30 shows the pressure and flow coefficients of a 7-stage compressor on which are drawn the constant rpm. lines. It is seen that at low rpm. the first stages surge and at high rpm. the last stages surge. It is also to be noticed that at high and low rpm. the mean stages take the most of the load and tend to keep the efficiencies high because as we progress through the stages of the compressor, the Reynolds number increases and the Mach number of the tip peripheral speed decreases, both resulting in an increase in efficiency. On the other hand, the diameter ratio $\frac{D_i}{D_o}$ and the relative gap increase, both resulting in a decrease in efficiency.

To make the above considerations clearer, let us plot in a schematic diagram the efficiency as a function of the flow volume coefficient ϕ.A. Assuming for simplicity that the efficiency curves are similar and disregarding the change in efficiency due to polytropic compression we examine the following cases:

(a) Maximum efficiency at the design point.

In this case all efficiency curves coincide and the overall efficiency at the design point coincides with the maximum efficiency. (Fig. 31a.)
At lower or higher rpm. owing to the variation of the flow volume of the different stages, a considerable drop in efficiency occurs. As it was seen above, this drop is larger with an increase of the pressure ratio.

(b) Maximum efficiency for starting.

In this case the distance between the maximum of the first and last stages is equal to the variation of the flow volume, (Fig. 31b) and the efficiency at the design point is considerably lower. This drop in efficiency is larger the greater the design pressure ratio.

(c) The real design case.

This case is a compromise between the above two (Fig. 31c). We design in such a way as to obtain a mean reduction of the optimum efficiency of the first and last stages at the design point and at starting rpm.

It is evident then that the intermediate cases will give better results and finally a more or less constant compressor efficiency, in the whole range of operation, will result.

From the above it may be inferred that it is advantageous for the first and last stages to have characteristics as flat as possible.

Many methods may be suggested to obtain flat characteristics on a stage but to our knowledge the most effective is that of using highly curved blades in which the centrifugal force compresses the boundary layer and a considerable delay in breakaway occurs.

In order to secure high efficiency at maximum rpm., several means for easy starting may be suggested such as movable stator and rotor blades, air bleeding, etc. These methods must always be used at pressure ratios higher than 3:1.

Matching of the Compressor, Turbine and the Propelling System

The results of good matching of the gas turbine components are seen in a diagram called the "equilibrium running" diagram. This diagram is found from the component characteristics of the compressors, turbines and exhaust systems.

The following may be mentioned as the main requirements of equilibrium running:

(a) Equal or proportional (in a reduction gear units) rotational speed of the connected rotating components.
(b) The energy absorbed by the compressor and propeller equals the energy produced by the turbine.
(c) The gas mass flow equals the air mass flow less any bleeding or leakage, plus the fuel added during combustion.
(d) Stability of running; that is, by an infinitely small variation of the running conditions of the one component, another stable running condition results.

The last condition is mostly secured when the running of the compressor is far away from surging regions.

In plotting the equilibrium running diagram, it was found profitable to use non-dimensional parameters. In Fig. 32 is shown the equilibrium running conditions of a simple jet using a variable propelling nozzle.

When a propeller turbine with fixed propelling nozzle is employed, similar characteristics can be obtained.

In compound engines, owing to the larger number of variables, more than one equilibrium running diagram is plotted. It was found that efficient running is assured when the high pressure compressor is coupled with the high pressure turbine.

Although a large amount of experimental data on compressor characteristics is available little or nothing of experimental material is available regarding turbines. Under these circumstances, theoretical characteristics have been used in the past, and discrepancies were recorded due to several unfulfilled assumptions made.

Now, with the introduction of blade cooling, the theoretical turbine characteristics are bound to differ even more from the actual, therefore experimental characteristics are urgently required.

Experimental characteristics for propelling nozzles are available although for counter-rotating propellers the situation is rather different.

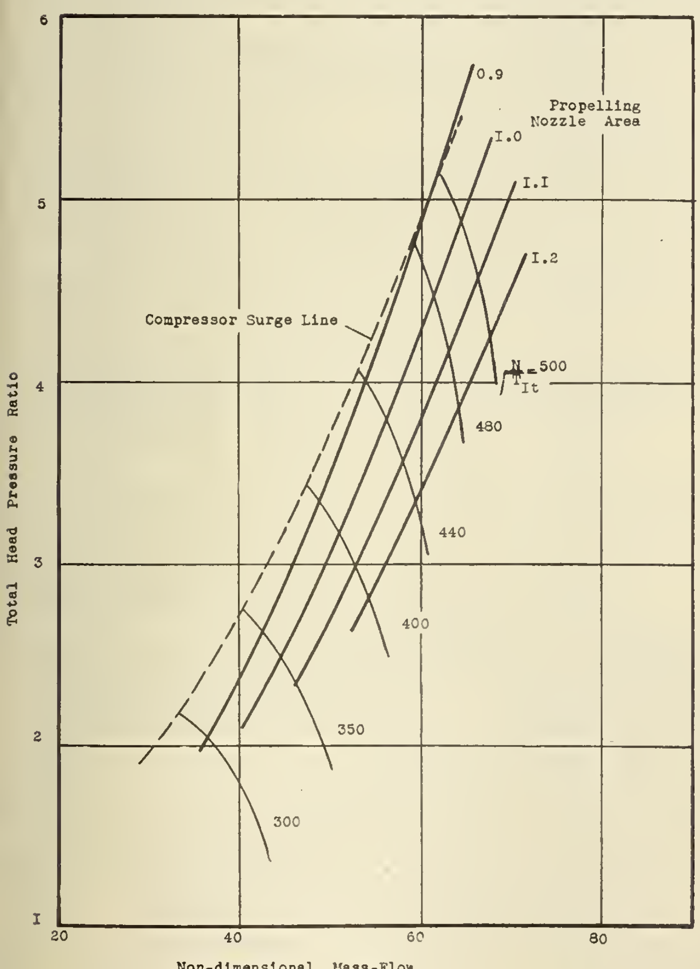

Fig. 32—Equilibrium running characteristics of a simple jet with variable propelling nozzle.

Regulation

After the matching of the different components and the plotting of the equilibrium running diagram the regulation of the unit is the next problem.

The components of an aircraft gas-turbine plant that may be controlled consist mainly of: the fuel supply, the rotational speed, the propelling nozzle area and the propeller pitch. Two methods of control have been proposed, namely, hydraulic and electronic, but is it too early to predict which should be adopted.

Non-Dimensional Plotting

Experience has shown that it is more convenient to plot compressor, turbine, propelling nozzle characteristics in a non-dimensional basis. This is usually done by the assumption of a mean specific heat.

Thus the pressure and temperature ratios in a unit will be functions of three non-dimensional parameters as follows:

$$\left.\begin{aligned} \frac{P_{II}}{P_I} &= f_1\left[\frac{W\sqrt{T}}{P}, \frac{N}{\sqrt{T}}, \frac{V}{\sqrt{T}}\right] \\ \frac{T_{II}}{T_I} &= f_2\left[\frac{W\sqrt{T}}{P}, \frac{N}{\sqrt{T}}, \frac{V}{\sqrt{T}}\right] \end{aligned}\right\} \quad \ldots\ldots(9)$$

In the simple jet engine, the fuel consumption and the thrust can also be expressed non-dimensionally.

Flight and bench test results of the whole power plant have been plotted non-dimensionally and correlated with each other; However, due to poor instrumentation, not sufficient agreement was found.

Conclusions

Although considerable progress has been made in the last five years towards the understanding of fundamental phenomena present in the gas turbine engines, much research is needed in order to obtain sufficient data to design efficient gas turbines.

A more or less clear picture regarding the ranges of utilization of the different types of gas turbine engines is available to-day[19].

The simple jet engine can be considered as the ideal fighter at high speeds approaching the sonic velocity. Above this speed, due to aerodynamic advantages resulting from smaller frontal areas, the rocket and the propulsive duct powered aircraft are the chosen competitors.

It has been proved that long range aircraft powered by simple jets for ocean crossing duties, are not justifiable in the near future.

The propeller turbine engine, most suitable for long range duties, is the most favoured type to-day and future advances in aerodynamics, metallurgy, gas dynamics, and heat transfer, will extend its use. The new impetus given by the methods of turbine blade cooling widens considerably the range of use for the propeller turbine. The gas generator is heavy and complicated, and the possibility of its application to very long range duties has been considerably decreased by the recent advances in materials, and the blade cooling that favours mostly the propeller turbine.

The ducted fan has some advantages, but it is rather difficult to foresee its range of application between the simple jet and the propeller turbine.

In the future, considerable decrease of bulk and weight for given power output is to be expected.

From the use of blade cooling and advances in fuels and combustion, smaller combustors will result.

A reduction in the number of stages in compressors is to be expected.

Finally, although higher specific output and more efficient engines may be expected, more complicated designs will result.

List of Symbols

The following symbols have been used:

- A = area
- a = local sonic velocity
- c = absolute velocity
- C = chord of the blade
- C_r = the circulation parameter
- E = Energy or work per unit mass flow
- g = gravitational constant
- H = the compression work per unit mass flow
- J = Joule's equivalent
- K_p = specific heat under constant pressure
- M = Mach number
- N = rotational speed
- n_s = specific rotational speed
- P = pressure
- Q = fluid volume rate
- Re = Reynolds number
- S = pitch of the blade
- T = Temperature
- U = peripheral velocity
- V = velocity
- w = relative velocity
- W = mass flow
- Z = number of blades
- α_1, α_2 = air inlet and outlet angles
- θ = constant
- ζ = cooling fraction
- γ = specific heat ratio
- η = efficiency
- η_∞ = small stage efficiency
- λ = work fraction, energy absorbed by the fan turbine expressed as a fraction of the total energy available in isentropic expansion after the compressor turbine.
- μ = by pass ratio, mass flow through the fan expressed as a fraction of the mass flow through the turbine.
- ν = kinematic viscosity
- ξ = thermal ratio
- σ = throttling factor
- υ = diameter ratio
- φ = flow coefficient, ratio of the mean axial to the mean peripheral velocity
- ϕ = factor correcting for reheat and heat exchange effects
- ψ = pressure coefficient

Subscripts

- $1,2$ = entry and exit
- a = axial
- t = total head (as second subscript)
- j,p,t = jet, propeller, turbine
- i,o = inside and outside diameter of the blading

VERTICAL LIFT BRIDGE ACROSS THE LACHINE CANAL

On Canadian National Railways Line between Victoria Bridge and New Central Passenger Station in Montreal

R. O. STEWART, M.E.I.C.
Engineer of Bridges, Canadian National Railways, Montreal.

General Description

The history and outline of the development on the Canadian National Railways Terminal project in Montreal were given in a descriptive article which appeared in the July, 1943, issue of *The Engineering Journal.* The structure described in the present article was completed when the 1943 article appeared, but it being a " structure over navigable waters ", wartime censorship prevented publication of construction details at the time.

The locating of the new C.N.R. passenger station at the south or Montreal end of the Mount Royal tunnel necessitated the construction of new main line tracks to connect this station with the existing tracks to the east and south over Victoria bridge and to the west by way of Turcot. The arrangement of these tracks is shown diagrammatically in Fig. 1.

In general these new tracks are carried on elevated structures, embankments and on various steel and concrete subway structures. From St. Antoine street to Ottawa street, the track structure is a reinforced concrete viaduct so constructed that the portion under the track deck consists of a series of two storey buildings between consecutive streets—which buildings have a total usable floor area of 350,000 sq. ft. and have, since construction, been continuously in use for C.N.R. offices, C.N. Express garage; a large area in one building is rented to the Post Office for the sorting and handling of overseas mail. From Ottawa street to Victoria bridge the tracks are carried on various embankments and reinforced concrete and steel structures, with complete elimination of all grade crossings with streets and other railway tracks. Referring to Fig. 1, the point at which these new tracks cross the Lachine canal on a vertical lift bridge will be seen. This structure is located near the City of Montreal Wellington street vehicular tunnel under the Lachine canal and also close to a C.N.R. single track swing bridge on the line providing railway service to the south or west end of Montreal harbor from the C.N.R. yards at Point St. Charles.

The Lachine canal vertical lift bridge was originally designed to carry four tracks. In 1929-30, the substructure for the new bridge was constructed for a four-track structure, provision being made for two separate two-track superstructures. All construction work in connection with Montreal terminals was suspended between the years 1930 and 1939. During this time there was considerable development on a new system of controlling and improving the operation of trains by means of completely interlocked switches and signals installed continuously along each railway track and operated from some conveniently located central point. This system is known as " Centralized Train Control "—or on the railways as " C.T.C." Early in 1940, it was decided to provide C.T.C. on all Montreal Terminal trackage. This reduced the requirements in regard to the number of new tracks to be built and it also greatly increased the capacity of existing tracks. There are four tracks on either side of the Lachine canal two-track bridge—these four tracks being fully interlocked and with all switches and turnouts power operated by the C.T.C. system. Provision has been made for the future construction of the second two-track superstructure on this bridge, if and when this may be found to be necessary. All traffic in and out of the new station has, however, been handled quite successfully over the two-track bridge since July 1943, which would indicate that the present construction has ample capacity, in so far as passenger traffic is concerned, for some considerable time to come.

Many inquiries have been made as to why the Canadian National Railways built a vertical lift bridge across the Lachine canal at this location when a swing bridge could have been built at less cost and would presumably have been equally satisfactory. This question is partly answered by the explanation in regard to a possible eventual four track bridge as given in the preceding paragraph. It must be kept in mind that the bridge was designed and the substructure built in 1930 and that the canal at this location has one 80-ft. navigation channel on either side of a 30-ft. centre island giving a total canal width of 190 ft. The overall width of a four-track swing bridge would be about 62 ft., which when swung for the passage of a ship, would considerably exceed the width of the centre island and thereby reduce the effective widths of the two navigation channels. Moreover the proximity of various important public works, of the City of Montreal vehicular tunnel and of the C.N.R. single track low level swing bridge precluded the economic possibility of increasing the width of the canal to restore the required 80-ft. width for the navigation channels.

The advisability of changing to a two-track swing bridge was investigated in 1939 but it was decided to proceed with the superstructure of the lift bridge on the grounds that the substructure was already in place and that there was also a probability that the other two tracks on this bridge would eventually be required for purposes other than to handle passenger traffic to the new station.

This bridge crosses the canal and one 20-foot roadway on each side at an angle of 45 deg. It is a two-track structure, each track being carried on five deck plate girder spans; one movable span

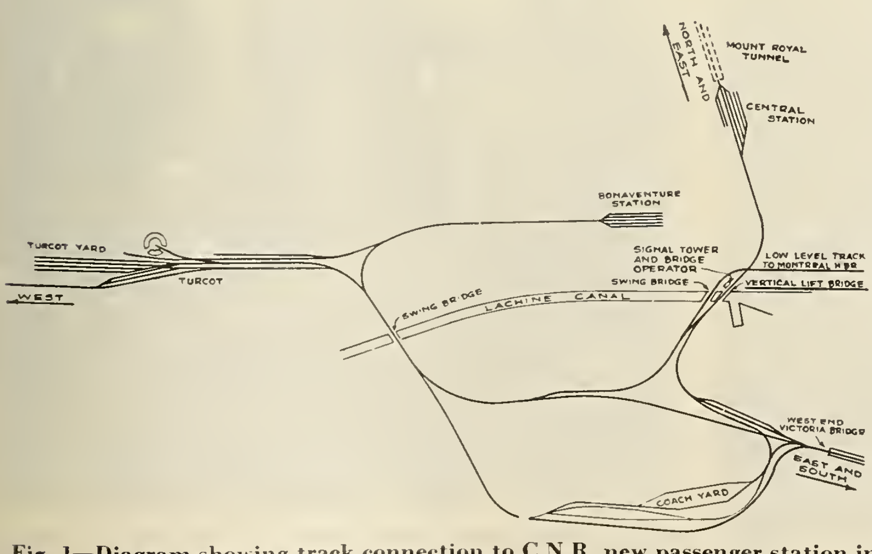

Fig. 1—Diagram showing track connection to C.N.R. new passenger station in Montreal, and location of lift bridge across the Lachine canal.

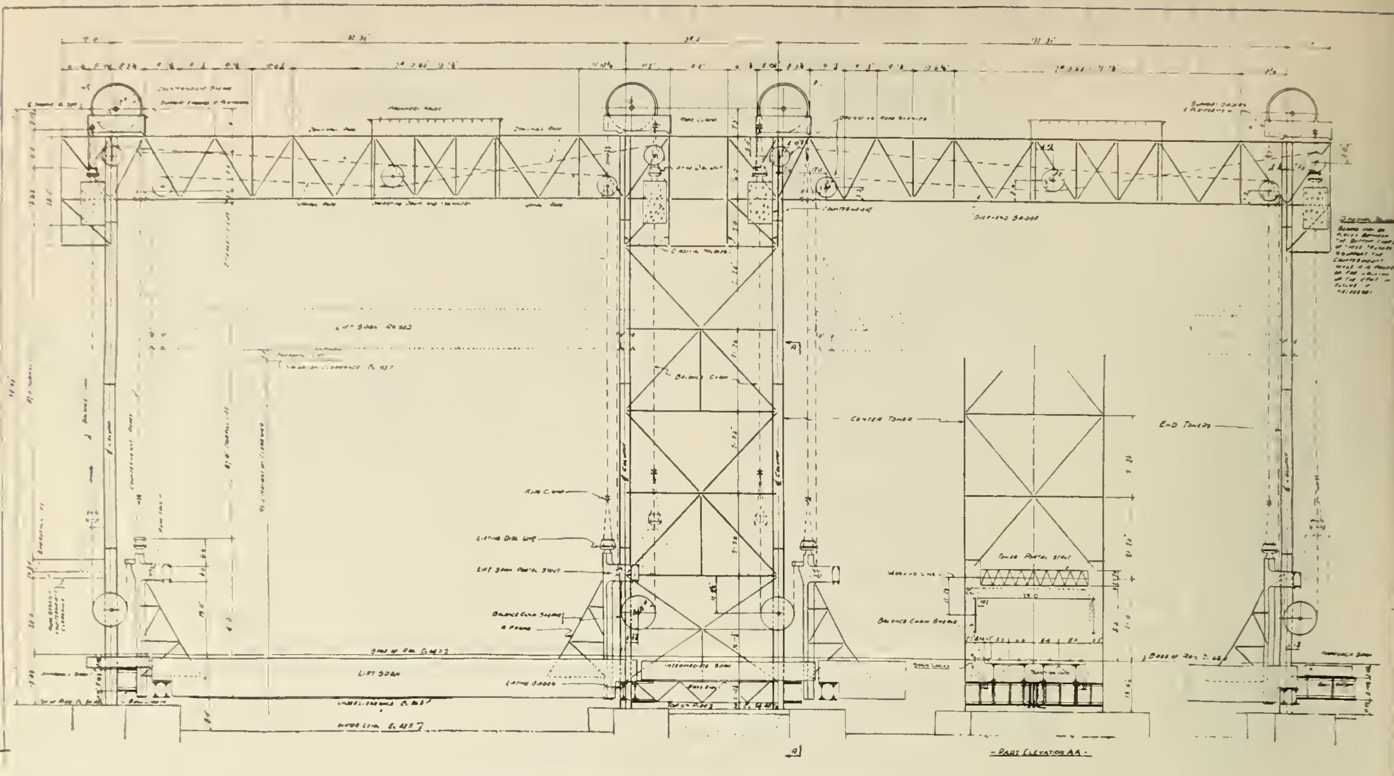

Fig. 2—Diagram showing general arrangement of bridge.

120 ft. long over each of the two navigation channels, one fixed span 36 ft. long over each roadway and one fixed span 39 ft. long over the island in the centre of the canal; the movable spans being so constructed and supported as to permit of either one or both spans being lifted vertically to a height of 95 ft. clear above the water level in the canal. The operating machinery and the counterweight sheaves are carried by an overhead fixed structure across the entire width of the canal. This structure is supported by a two-post rocker bent at each side of the canal and by a four-post tower on the centre island. The general arrangement as described above is shown in Fig. 2.

Substructure

The foundations for this structure were constructed in 1929-30 and consist of a reinforced concrete abutment at each end and four reinforced concrete piers—one on each side of the two navigation channels. Each pier consist of three 8 ft. 6 in. dia. reinforced concrete cylinders driven to rock and capped with a reinforced concrete beam which acts as the bridge seat.

Rock is from 70 to 72 ft. below ground level and it consists of limestone which invariably has, on the surface, some depth of shale or thin layers of stone sandwiched with layers of clay or other soft displaceable material. The material overlying the rock consists of alluvial clay with a very high water content and a layer of heavy gravel and boulders from 6 to 19 ft. deep immediately on top of the rock.

Of the twelve foundation cylinders the six in the centre of the canal were constructed first. Based on borings made by the Railway Company and on all other available data in regard to the soil formation it was considered by the Railway engineers and also by the contractor that these cylinders could be built by driving open cylindrical steel sheet piling cofferdams to rock; excavate these with an orange peel bucket; clean off the rock by diver; place the reinforcing steel and fill the cylinders with concrete, leaving the steel sheet piling in place. The construction of these six cylinders by this method was completed only after a great amount of difficulty and after considerable variations were made from the original concept. The old stone-filled timber crib construction in the centre of the canal was carefully removed to eliminate as far as possible all obstructions to the driving of the steel sheet piling. A centering pin, consisting of a 6 in. dia. steel pipe, was driven vertically in the exact centre of the location for each cylinder; a wooden template or form was then

Fig. 3—Steel sheet piling caisson with air lock. The pile of material in the foreground consists of shale and disintegrated stone removed from the surface of the solid lime stone rock.

lowered over the pin and the steel sheet piling was set up around this form and driven as far as possible, with the intention or hope that the steel piling cylinder would reach solid rock in the circular shape in which it was started. Unfortunately the steel sheet piling cofferdams did not retain their circular shapes to the bottom. In the case of three of the cylinders it was possible to excavate inside the open cofferdams, continue the driving of the steel sheet piling to rock, clean out the bottoms and fill with concrete in the manner originally intended. In the cases of two other cylinders, air locks had to be placed on the tops of the cofferdams; excavation proceeded with as far as possible; steel sheet piling cut off and the balance of the excavation taken out under air pressure and the cofferdams extended down to rock by means of bolted steel tunnel lining pans. There was considerable difficulty in sinking these two cylinders—chiefly due to the heavy leakage of air through the joints of the single wall steel piling cofferdam. Figure 3 shows one of the steel sheet piling cofferdams with air lock. The steel sheet piling in the remaining cofferdam was found to be so badly deformed that it was impossible to get it cleaned out below the surface of the gravel. It was, however, filled with concrete and later it was supplemented by eight 16-in. dia. steel bearing piles driven to rock and filled with concrete.

Fig. 4—Showing three wood stave pneumatic caissons being sunk on the shore of the canal. Photo also shows the tops of three completed steel sheet piling caissons on the right side of picture.

The experience with steel sheet piling cofferdams on the six cylinders in the centre of the canal was such that this method of construction was abandoned and the six shore cylinders were sunk by means of wood stave pneumatic cofferdams. These are shown in Fig. 4. The stone masonry canal walls were removed; the cofferdams set up, guyed and weighted by concrete lining; air locks installed; the excavation taken out to rock by manual labor and the cylinders filled with concrete without any unusual difficulties.

Each of the twelve cylinders is reinforced with twenty-four 2-in. dia. steel rods extending from the rock to substantially the top of the concrete capping beam. Each capping beam is 10 ft. wide by 8.5 ft. deep by 116 ft. long and is heavily reinforced top and bottom with 2-in. dia. steel rods. The 2¼-in. dia. anchor bolts for steel superstructures were set in place in the forms before the capping beams were poured. Six of these anchors were provided for each post.

To increase the stability of the substructure, the capping beams of the two centre island piers are trussed to each other by means of a series of heavy reinforced concrete diagonals and similarly the capping beams of the shore piers are trussed to the abutment footings. These reinforced concrete diagonals are located a sufficient distance below ground level to avoid damage from frost.

On the completion of the above work, the island in the centre of the canal was rebuilt, using two different types of construction. At the two ends of the island this construction consists of close-face timber cribs with concrete tops. Elsewhere it consists of a double row of timber piles along each face of the island and tied across the island with heavy steel rods. The island was filled with heavy rock. Timber and piles are creosoted to prevent deterioration during the three or four weeks when the canal is emptied each spring.

All construction work on the substructure was performed by the Foundation Company of Canada Limited.

Superstructure

The general arrangement of the superstructure of this bridge is shown in Figs. 2 and 5, or in the cover picture. The track girders are designed for E60 live load. Structural carbon steel with a minimum yield point of 35,000 and an ultimate tensile strength of 62,000 to 70,000 lb. per sq. in. was used throughout with a basic design unit stress of 20,000 lb. per sq. in. Canadian National Railways Standard Specifications for Fixed Span Steel Railway Bridges and CESA Specification A20 for Movable Bridges were used for design and fabrication

The movable spans over the two channels each consist of two single track deck plate girder spans 120 ft., 3 in. long with a 45 deg. skew at both ends, framed into and riveted to a transverse lifting girder and portal frame at each end of each span. With two separate girder spans rigidly connected to the same transverse girder, the deflection of any one span (due to live load on one span only) would result in torque stresses in the end transverse lifting

Fig. 5—Side elevation of bridge looking from the south.

Fig. 6—Centering pin on end of a movable span. This photo was taken with span partly raised. When span is lowered the lower end of pin enters snugly into a round hole in a heavy steel plate riveted to the adjoining fixed span.

girders and also secondary stresses in the connections between the main girders and the transverse girders. On investigation, these stresses were found to be prohibitive and to prevent their generation brace frames and top and bottom lateral bracing were provided between all four girders under the two tracks. The reason for this was, of course, to cause all girders to deflect vertically by nearly the same amount when the four-girder unit was loaded on one track only (with an eccentricity equal to half the distance between track centres). This eccentric loading produces a torque stress which can be considered as replaced by a couple acting horizontally in the planes of the top and bottom lateral bracing. This bracing was designed for the resultant stresses and the torque stresses in the end transverse girders were thereby eliminated. The deflections of all four girders have been measured with live load on one track only and they have been found to be approximately equal, thus substantiating the accuracy of the assumptions used in this particular feature of the design.

The span guide castings are attached to the ends of the lifting girders at both ends of the movable spans and at one end of each span a 7-in. dia. vertical steel pin is provided to transfer traction or braking stresses from the movable spans to the substructure. One of these pins is shown in Fig. 6. As a span is lowered, this pin enters a hole in a heavy steel plate connected to a shore span. In addition to taking care of traction and braking loads, this pin fixes the location of one end of the movable span, both laterally and longitudinally—the other end being fixed laterally by the span guides and left free to expand and contract longitudinally.

In the design of vertical lift bridges it is customary to leave a sufficient portion of the weight of the movable span uncounterweighted to ensure proper and positive seating when the span is lowered for railway or highway traffic. For reasons that will appear later, the movable spans in this bridge are, as nearly as possible, 100 per cent balanced by the counterweights. In order to insure positive seating, a motor-operated toggle type mechanism is provided at each corner of each movable span. These machines are automatically operated and apply seating loads of 25,000 lb. vertically on each corner of each span. These machines have proved to be very effective in providing positive seating of all four corners of each movable span and they also serve as very effective span locks.

Pneumatic buffers are attached to the undersides of all lifting girders to check or cushion the end of the downward vertical movement of the lifted spans. Similar buffers are attached to the overhead structure to check and cushion the end of the upward movement of the spans.

The pier members for the movable spans consist of the conventional discs and welded steel plate pedestals. The discs are suspended from and rise with the lifting girders. No expansion rollers were provided due to the fact that there is normally no dead load on these pier members and therefore only negligible friction between the discs and the pedestal bases to resist sliding due to changes in temperature. The surfaces between the discs and the pedestals are lubricated with dry graphite. No anchor bolts are provided.

Because of the 45-deg. skew the construction of the deck at the span breaks was complicated and steel deck construction was used at the ends of all spans (except the abutment ends) for sufficient lengths to square up the deck for timber ties. The track rails are carried on special tie plates on both timber and steel deck construction. The tie plates rest on ¼-in rubber pads and are firmly anchored to every deck tie and to the steel deck. The track rails are clip-anchored to every tie plate in a manner that prevents longitudinal creepage of the rails. This special anchorage of rails was provided in order to prevent creepage of rails which might displace the rail break castings.

At the end of both movable spans and at the adjacent ends of the fixed spans, rail breaks have been provided. These are chrome-molybdenum steel castings so designed that a slightly raised part lifts the locomotive and car wheels as they pass the rail gap thus eliminating noise and impact. See Fig. 7.

Fig. 7—Rail break assembly. Note the slightly raised casting that carries the treads of the wheels across the gap in the main running rail. The low flat unit to the left of the rail break is an enclosed mechanism for automatically making or breaking the track side of the electric traction circuit when span is raised or lowered.

Riveted to the transverse lifting girders at the ends of the movable spans are the portal frames which carry the overhead electric traction wires, the span ends of the counterweight cables and the uphaul ends of the operating cables. On top of these frames there are special trolley arrangements to pick up, from vertical trolley wires, the 110 volt electric power for the operation of the navigation lights on the movable spans.

The general construction features and dimensions of the fixed overhead structure are shown in Fig. 2 and various photographs. The purpose of this structure is to provide supports for the operating machinery and the counterweight sheaves. The only structural feature that deserves special mention is the provision of heavy transverse trusses between posts below track level, the purpose of these being to develop a transverse fixture of post bottoms by some means other than the anchor bolts with, of course, a consequent reduction in stress in the anchor bolts. It will be noted by looking at the cover picture that the height-to-width ratio of this structure is quite large and that the wind loads on the anchor bolts are therefore of major importance. The posts supporting the fixed overhead truss also serve to carry the guides for the movable spans and the counterweights.

The counterweight sheaves are 12 ft. in diameter and are located on top of the fixed overhead structure. These sheaves are of all welded construction, the machining being done subsequent to the completion of all welding and stress relieving operations. They are carried on 14-in. dia. axles which in turn are supported by SKF roller bearing units of large size. It is worthy of note that the design of these roller bearings takes into consideration the fact that the movable spans and therefore the bearings will stay in a fixed position for the period during which navigation in the canal will be closed each year and this condition requires special consideration in order to avoid the formation of flats on the rollers and grooves in the roller treads. The calculated load per bearing is 233,000 lb. and the rated static capacity of each bearing is 780,000 lb. thus establishing a brinelling safety factor of 3.35. Under operating

Fig. 9—Wheel to restrict the swing of counterbalancing chains. The weight of this wheel is carried by the chain. Wheel supports are carried on bridge post in such a way as to permit unrestricted vertical motion of wheel due to variegations in length of chain.

Fig. 8—Showing attachment of counterweight cables to end of a concrete counterweight. Steel framework to which cables are attached is actually part of a structural steel construction buried in the concrete counterweight. The mechanism in the left foreground is for adjusting the tension in the main operating cable.

conditions of 3 r.p.m. the minimum theoretical life of these bearings is 121,500 hours or 14 years of continuous operation; this figure being of value only to show that the design of the bearings was not controlled by operating conditions. Taking into account the fact that the bridge is not operated during winter months and only a relatively small number of times per day during the balance of the year, it is realized that a bearing life of 14 years of continuous operation should far outlast the life of the structure as a whole.

The use of roller bearings on the counterweight sheaves and of 100 per cent counterbalancing was determined entirely as a matter of economics. The added cost of these bearings together with that of the power operated seating mechanisms and of various other added detail parts being considerably less than the cost of larger motors and operating mechanisms that would otherwise have been required, together with the capitalized value of the increased electric power consumption. The use of roller bearings also greatly reduced the starting friction and thus made it much easier to comply with the comparatively fast operating times required by the Department of Transport.

The movable spans are suspended by twelve 1⅝-in. dia. plow steel stranded wire cables at each corner of each span. These cables pass over the counterweight sheaves and are connected at their ends to the spans and to the counterweights. The connections are made by means of rope sockets around the circumference of so-called lifting disc units and the cables are brought to plane surfaces by means of clamps. These connections are shown in Fig. 8. In order that the load be taken as equally as possible by

Fig. 10—Bridge operator's view of canal upstream from bridge. The swing span in the foreground carries the low level C.N.R. freight track serving the west or south end of Montreal Harbor.

all cables, they were prestressed at a load of 20,000 lb. and held at that load for a sufficient length of time to take the mechanical stretch out of the rope. The ropes were then measured (under 20,000 lb. load) and marked for cutting and socketing after which the load was released and the cables cut to length and end sockets attached.

Each counterweight consists of a structural steel frame, for the attachment of cables and guides, filled and housed in reinforced concrete. It is interesting to note that the concrete counterweights were constructed in their raised position, this of course being necessary as the spans could not be raised (and the counterweights lowered) till after the completion of the counterweights. Provisions were made in the bridge structure for the placing of steel beams on the bottom chords of the overhead structure to support the counterweights while being constructed and for jacking them up in future, if this should become necessary in order to change one or more cables. The counterweights are adjustable by the addition or removal of concrete blocks each weighing 100 lb. There are 95½ cu. yds. of concrete in each counterweight. The counterweights are so adjusted that the amperage on the operating motors is substantially the same to lower the span as it is to raise it and also that each span seats as nearly as possible simultaneously on all four corners. The first of these requirements means, of course, that the span is

Fig. 11—Bridge operator's view of canal downstream from bridge. The apparent restriction in length of view is due to a 90° bend in the canal.

100 per cent counterweight. It might be added that this adjustment is for calm weather when the timber deck and concrete counterweights are dry. Snow, sleet, rain and wind upset this balance but motor power, operating cables and braking capacity are such that the only effect of this disturbance in the counterbalancing is to vary the time required to lift or lower the span and to increase the current on the operating motors.

The weight of each set of counterweight cables is balanced by the weight of a steel link and pin chain, one end of which is attached to the counterweight and the other end to the movable span. These chains hang down just clear of the railway track clearance limits and in order to prevent any encroachment (due to swing of chains from wind or other causes) the lower part of the sag in each chain passes around a flanged wheel or sheave which is secured to a structural post. The weights of these sheaves are carried by the chains and the connections to the posts are such that the sheaves have a free vertical motion to take care of changes in lengths of chains — due to wear, temperature variations or other causes. The construction features of these sheaves are shown in Fig. 9.

Operating Machinery

As stated above, the operating machines are located on the overhead structure in weatherproof welded steel machinery houses; there being one machine for each of the two movable spans. Each operating machine consists of two 5-ft. dia. grooved drums (of all welded steel construction) actuated by a simple mechanism made up of a train of gears driven by two 80 hp. electric motors. All gears are totally enclosed and operate in oil. Each machine operates four cables (two to each drum). One end of each cable is attached to an end of a lifting frame at one end of a movable span and the other end of the cable (after being wound twice around the drum) is attached to the top of a counterweight. The cable drums on the operating machines are so located that the lengths of all four operating cables are substantially the same — the reason of this being, of course, to equalize the elongation of cables at all four corners. Manually operated devices for the adjustment of the operating cables are provided at all operating cable attachment points on spans and counterweights. It has been found that the bridge functions best when there is a slight amount of slack in the operating cables. To raise the span the operating machine and cables exert an upward pull on the movable bridge spans and to lower the span the upward pull is on the counterweights.

The two operating motors working together are capable of lifting or lowering a span in 82 seconds which, with an added 8 seconds to actuate the end seating machines, gives 90 seconds for the entire operation of either raising or lowering a span. In case of failure of one motor (or of any of the relays or controls for either motor) the other motor working alone would perform the above operations in about 135 seconds. The operating motors are reversible and each one is provided with a motor operated hydraulic brake which is automatically applied at all times except when there is electric power applied to the operating motors. An emergency motor operated hydraulic brake is also provided on each operating machine. These are controlled manually from the operating desk and their principal purpose is to control the speed of lifting or lowering a span when the counterbalancing is seriously upset by sleet or snow on the span deck or the counterweights. As an added precaution, these brakes are always kept applied when the span is in its down position and seated for the passage of railway traffic.

Access to the machinery houses is provided by ladders and stairs on one side of the centre tower and by footwalks in the overhead structure.

Cranes, hoists and trap doors are provided in the overhead machinery houses to facilitate the repairs, renewals and replacements of machinery.

Operation

Operation of the bridge is by remote control, the operating desk being located on the top floor of the C.T.C. tower on the north shore of the canal. From the desk in this room the operator has a clear view of the canal both upstream and downstream and also of both movable spans at all points between their extreme up and down positions as well as of both canal channels under the bridge. This is shown by Figs. 10 and 11 — these being photographs taken from the position at which the operator stands to lift or lower a span.

The operating desk is shown in Fig. 12 and consists in general of the following:—

- A voltmeter for the main A.C. operating power circuit.
- A voltmeter for the auxiliary D.C. circuit.
- An ammeter for each of the two motors in each of the two operating machines.
- An electrically operated dial type indicator to show the vertical position of each span.
- A reversible street car type controller for each span.
- A manual control for the electric emergency brake on each operating machine.
- Pilot lights to show various predetermined locations of the spans in their vertical movement.
- Pilot lights to show the positive seating for each of the four corners of each span.
- A button to operate an electric horn to warn employees on the track or working on the bridge that a span is to be moved.

The bridge operating desk is interlocked with C.T.C. and cannot be operated unless unlocked by the train interlocking system. The operating current for the motor and emergency brakes is 120 volt D. C. and this is supplied from storage batteries used in connection with the train control system. A Phanatron tube A.C./D.C. rectifier is provided for use as a standby in case of the failure of D.C. supply from the storage batteries. The motor actuating current is 550 volts, 3 phase, 60 cycles. The relays and contactors for all motors are located in the basement of the train control tower.

The operation of raising or lowering a movable span is performed by releasing the emergency brake and applying the current to the operating motors through the controller. Having performed these operations manually the balance of the operations can be controlled either manually or automatically (at the operator's pleasure), but in either case the sequence of these operations is as follows for raising a span—

Emergency brake released	1 sec.
End seating mechanisms released.......	7 "
Span accelerates	15 "
Span travels at full speed..............	39 "
Span decelerates to 1/3 speed..........	5 "
Span decelerates and stops at point 6 ft. below top buffers	5 "
Time interval of no motion............	4 "
Span accelerates and travels at 1/3 speed	5 "
Span decelerates and stops against top buffers	9 "
Total Time	90 seconds

The sequence of operations for lowering a span is just the reverse to the above. Both spans can, if desired, be raised or lowered simultaneously.

The normal vertical motion of a span is 87 ft., but allowance is made for three feet of emergency over-run.

Fig. 12—Operator's desk on top floor of C.T.C. tower.

The telephone gives the bridge operator direct communication with maintenance men working in either of the two machinery houses on top of the bridge structure.

The two rectangular boxes on the back corners of the desk house the span height indicators. Each of these indicators consists primarily of a relsyn motor—the companion motor being directly connected to the overhead span operating machinery.

The round meter standing up at the back of the desk shows voltage of D.C. current for operation of brakes.

The five meters (on this flat) at the back of the desk show voltage of A.C. current for operation of motors and amperage in each of the four main motors.

The two controllers at the front of the desk each operate one movable span. Other levers and buttons are for manual operation of subsidiary functions.

Limit switches at the end of this over-run cut off all operating power and automatically apply all brakes.

Electric power for the operation of the new Central Terminal Station is supplied by Hydro-Quebec from two sources of supply at 12,000 volts A.C. The main transformer room is in the basement of the new Central Station and from this point 4,000-volt, 3-phase, 60-cycle A.C. power is supplied from each of the initial power supplies, to the canal vertical lift bridge. The power cables are in ducts along the side of the high level tracks to a transformer room in the basement of the C.T.C. tower where the two 4,000-volt power supplies are separately converted to 550 volts for power purposes and to 110 volts for lighting purposes.

Miscellaneous

No auxiliary power is provided for the operation of this bridge as a general failure of electric power in the city of Montreal would stop not only the operation of this bridge but also the operation of all lock gates and most of the movable spans on the Lachine canal and thus paralyze canal traffic.

The superstructure was constructed by the Dominion Bridge Company and all electric equipment was supplied by the Canadian General Electric Company.

The "as constructed" quantities of materials in the superstructure of this bridge were as follows:—

Structural steel	4,276,519 lb.
Machinery	265,616 "
Wire cables	68,340 "
Balance chains	51,220 "
Counterweight sheaves	188,800 "
Concrete	382 cu. yds.
Timber deck	75 M.f.b.m.

WARTIME PRODUCTION OF PRECISION OPTICS IN CANADA

D. C. R. MILLER, M.E.I.C.

Development engineer, Fiberglas Canada Limited, Oshawa, Ont., formerly production superintendent of optical shops, Research Enterprises Limited, Toronto, Ont.

This is the last of four instalments of a paper describing the establishment, as the result of war exigencies, of a new industry in Canada. Previous instalments appeared in the April, May and June issues.

ABRASIVES

In many of the preceding descriptions of production methods for optics, mention has been made of abrasives of various kinds. Because of the great amount of confusion existing as to materials and grain sizes, some further elaboration of this subject appears advisable.

There are three main factors governing the selection and usefulness of abrasives: type of material and cost, grain size, and uniformity. These factors and their interacting effects will now be discussed in that order, ignoring at first the aspect of availability.

MATERIALS

The basic abrasive materials used at present in optical work are, in order of decreasing hardness: diamond dust, boron carbide, silicon carbide, aluminum oxide, and garnet.

Because of its high cost, diamond dust is never used loose, but embedded in steel, copper, or synthetic resin wheels in a manner which has already been sufficiently described.

Boron carbide is a recent synthetic material of hardness next to diamond. Its optical use so far appears to have been confined to roughing work and it remains to be seen to what extent it may later replace the much cheaper and more common abrasives.

Silicon carbide or carborundum is a very hard, fast-cutting abrasive used in bonded abrasive wheels and for roughing work. The hardness and sharpness of its crystals make it unsuitable for use in powder form for fine grinding, as it will not break down readily enough. It should not be confused with corundum.

Aluminum oxide is the best abrasive for medium and fine grinding. It is available in a number of natural and synthetic forms under many different names. The impure natural form is known as emery and less impure forms as corundum. The synthetic aluminum oxides are best-known as Aloxite or Alundum and these are the most satisfactory types for all but roughing use. Another synthetic variety, developed by the British Scientific Instrument Research Association and marketed as Sira, is slightly harder and coarser than the others, and although fast, is less useful because of the poorer finish obtained.

Abrasives made from garnet, an impure iron, magnesium and aluminum silicate, first became available in optical grades during 1943. Garnet is slightly softer than aluminum oxide, and we used it in large quantities as a substitute for the latter, especially in the fine grinding sizes. At first it was thought that the decreased hardness would be advantageous in producing finer finishes, but later experience showed that it breaks down too fast and before sufficient glass has been removed, making it slower and giving a finish which appears better than it really is. This behaviour and somewhat higher cost make it unlikely that it will continue in permanent use in the optical field.

GRAIN SIZES:

If confusion exists in regard to abrasive materials, then chaos is the only word to apply to conditions in regard to grain size: for there is as yet no nomenclature common to all manufacturers, with the result that each concern uses different numbers or letters — some based on mesh size, some on micron size, and some just arbitrary—to designate equivalent materials. In the coarse abrasives the use of mesh sizes is fairly general; in the medium and fine abrasives one must simply attempt to memorize what each manufacturer's terminology means. For that reason, micron sizes have been used throughout this article, a usage which one may hope will ultimately become general.

The desirable number of grain sizes of loose abrasives for production use appears to be eight, and to clarify the nomenclature used herein and co-relate it with general usage elsewhere, these sizes are listed with their equivalent mesh sizes and recommended materials in the table below:

Recommended Use	*Approx. Micron Size*	*Mesh Size*	*Recommended Material*
Rough Grinding	177	80	Silicon Carbide
	125	120	Silicon Carbide
	65	220	Silicon Carbide
Medium Grinding	31	500*	Aluminum Oxide
	22½	700*	Aluminum Oxide
Fine Grinding	18	850*	Aluminum Oxide
	12½	1200*	Aluminum Oxide
	9½	1600*	Aluminum Oxide

The mesh sizes marked with asterisks are approximate extrapolated values, since 400 mesh is about the finest screen size commercially used. For hand polishing use, abrasives down to 6 microns (2,600 mesh) are valuable in reducing polishing time. They are too fine for machine use.

UNIFORMITY

The average particle size is not in itself sufficient to determine the usefulness of an abrasive. The distribution of particle sizes about the mean, that is, the uniformity of grading of the material, is a most important factor. The presence of even a very few coarse particles in a fine abrasive will render it useless by causing scratches. On the other hand, the presence of any substantial proportion (say 20 per cent) of particles much finer than the average will mean that this fine material is rendered inactive by the coarser particles which separate the work and the grinding surfaces, and will result in slower and more wasteful grinding. The perfect abrasive should have all grains of equal size. It is this factor of uniformity which principally governs the choice between equivalent abrasives of different manufacture, and any future standardization should fully specify distribution in each grade.

AVAILABILITY

During the years 1942 and 1943 in particular, acute and sometimes critical shortages existed in Canada of loose abrasives in the medium and fine grades. During this time serious consideration was given to the feasibility of installing our own facilities for producing these materials. Had we done so, we would have used a ball mill, purchased coarse aluminum oxide, ground it and separated it by elutriation and sedimentation. Our consumption of abrasives towards the end of 1943 reached very high monthly figures: 8000 lb. of coarse, 7500 lb. of medium, and 2000 lb. of fine materials of all types. Investigation revealed, however, that a large capital expenditure and considerable experimental work would have been necessary to produce these quantities, and we therefore confined our efforts to salvaging for re-use abrasives which collected in the drainage sumps.

Salvage operations were begun late in 1942 after the necessary experimental work had developed suitable methods. The coarse grades are relatively easily reclaimed by first mixing to a slurry and straining to remove garbage, rough grading by sedimentation, followed by thorough drying and screening. Material finer than 220 mesh passes through the screens and is segregated by elutriation, down to an average particle size of 26 microns. The presence of fine ground glasses of specific gravities very close to that of the abrasives themselves makes separation of effective grades of fine abrasives a more difficult problem, solution of which was not attempted because of the expense involved. In total about 100,000 lb. of mixed material was reclaimed, of which less than 25 per cent was in the scarce medium sizes. The cost of the salvaged abrasives was substantially less than new material in the coarse grades, and about equal in the medium grades. Due to the inclusion of ground glass, however, these were perhaps 70 per cent as effective as new material. The operation was therefore a marginal one, and was abandoned in 1944 as supplies became increasingly available.

The Development and Use of Ceria

The main advantages in using ceria for glass polishing have already been mentioned under Lens Polishing. This is a development of sufficient importance to justify further description, as it has now virtually supplanted rouge everywhere in precision optical work.

Ceria appears to have been in use in France and Germany some time earlier than 1936, when Dévé[1] mentions it very briefly as *rose à polir*. Our attention was directed to it by our Austrian optical technician who had seen it used in Austrian and German plants, and had unavailingly advocated its trial in optical firms in England. As far as is known, ceria was used nowhere in the English-speaking countries until our own use of it in the summer of 1941. Early experimental work on methods of production was carried out by Mr. C. A. West in the Optical Department, and he was the first to establish the heat treatment required to produce an acceptable material. This heat treatment, as we have subsequently learnt, is a necessity with all metallic oxides used for polishing and depends on the little-known property of a change of crystalline structure at temperatures close to the fusion point. Early work employed a very pure grade of ceria made by igniting the double nitrate of ammonium and cerium, and is fully described by Mr. West in his interesting article on the subject[2]. Tests then indicated that heat treatment of the oxide at a temperature of 2050 deg. F. gave the best results, and established the usable range as between 2250 and 1900 deg. F., with increasing hardness as the temperature was raised. The softer grades are useful on extra dense flint glasses, which scratch very readily, while the harder ones give the shortest possible polishing time with the hard crown glasses. It was established by the preliminary work that polishing times with properly prepared ceria were from ½ to 2/3 those with rouge, and full-scale use was therefore decided upon.

Failure to obtain satisfactory grades of ceria from chemical manufacturers in Canada and the United States obliged us to undertake its production ourselves. As use of the double nitrate resulted in a material costing at least $25.00 per lb., the chemical laboratory under H. M. Davis developed a method, using crude cerium hydroxide as the raw material[3], which reduced costs some ten times, and was producing ceria in sufficient quantities for all our own requirements by early in 1942.

Ceria varies in colour from white or pale yellow for the purest grades to pink or dark brown for those commercially used. The colour gives no positive indication whatever as to efficacy, as the impurities may be other rare earth oxides with similar or even superior polishing properties. The fineness of the ceria varies with the method of preparation, and seems to have no bearing on polishing time. All that is necessary is removal of coarse aggregates by screening through a 150 mesh sieve.

Our results with ceria were communicated to Frankford Arsenal in Philadelphia and led before long to its wholesale adoption by the American optical industry. Samples were also supplied to British firms through the British Scientific Instruments Research Association and resulted eventually in an order for a very large quantity from the Ministry of Supply in England, for distribution throughout the United Kingdom. To meet this requirement, we raised our production rate to 4000 lb. per month, although our own use required barely one tenth of this amount.

The introduction of ceria into general use was the direct result of our efforts and was of considerable importance in speeding the output of military optical instruments in the allied countries.

Production Operating Conditions

Little or nothing has so far been said about conditions of temperature, dust and humidity control, yet these and similar factors have an important bearing on most of the operations already described.

Until the last twenty years or so, air-conditioning was virtually non-existent, so that it can hardly be said to be essential to the production of optics. Yet there are so many advantages in using air-conditioning that it was adopted at the outset in the main polishing shop, which was provided with full temperature and humidity control, together with electrostatic dust removal and monochromatic lighting.

Temperature control is especially helpful in machine and hand polishing, as otherwise blocking and polishing pitches must be constantly changed to suit varying indoor temperatures which can thus easily cause considerable loss of production. In the more delicate polishing work, temperature fluctuations can introduce distortions which may seriously affect surface accuracy. We found a constant temperature of 76-80 deg. F. gave the best results with our pitches.

Humidity control is less important than temperature control, but is an aid in all glass cleaning operations, especially those incidental to contact blocking, cementing and high vacuum evaporation. Glass cannot be effectively cleaned under widely fluctuating humidity conditions, apparently owing to imperfectly-understood effects connected with the inward and outward flow of water vapour and migration of alkali ions through what may be a colloidal silica film on the polished glass surface. Furthermore, extremely low relative humidities—below 25 per cent—are common in Canada in wintertime, and result in electrostatic charging of the glass during cleaning, causing attraction and retention of dust particles. Humidities over 60 per cent on the other hand, if the temperature is much over 72 deg. F., cause trouble with fogging which results from perspiration from the hands of operators. Humidity control is also valuable in polishing, as with low humidities the blocks dry up too fast. A constant relative humidity between 40 and 45 per cent gives good results throughout.

The value of dust control is sufficiently obvious to require but little elaboration. Cementing and polishing, especially of graticule surfaces, benefit most from dust control. In addition to removal of dust from the air, it is advantageous to have a linoleum floor as this also prevents breakage of test glasses and valuable optics if accidentally dropped. We never found it necessary to resort to special footwear and lint-free clothing. It is doubtful if the possible savings would be worth the trouble.

Avoidance of draughts is most important and seems to be a difficult problem in air-conditioned rooms with a high rate of air change. Draughts directly over polishing spindles not only cause scratches from dust, they also

introduce distortions through evaporative cooling, making production of precision surfaces impossible. The cooling effect may at the same time harden the pitch and further increase the tendency to scratching.

Special monochromatic lighting by Cooper-Hewitt mercury-vapour lights or other suitable means is very helpful in all polishing operations, as interference fringes are much more readily visible under such lighting.

Growth and Efficiency of Production

In the preceding passages an attempt has been made to outline what were the manufacturing problems involved, and what methods were adopted for their solution. In this final section it is proposed to trace the growth of production up to its peak and mention some of the less tangible, but equally real, factors affecting efficiency and volume of output.

production attainments

The original allotment of space for the grinding and polishing departments was made on what appeared at the time to be a very generous basis, and equipment was provided with capacity far in excess of any orders actually received in the early stages, even with one-shift operation. It was fortunate that this was so, because the trend of the war between 1941 and 1942 resulted in tremendously increased orders for many different kinds of optical instruments. In three separate programmes involving tank and anti-tank fire-control equipment the original requirements were increased as much as tenfold. Towards the middle of 1942 the first orders were also received for two different sizes of binoculars and before long these orders were so increased as to constitute the largest single item of manufacture. By the end of 1942 outside orders for optics, particularly for naval sighting telescopes and computing reflector sights, began to assume important proportions. Then in 1943 orders from the United States led to a four-fold increase in the short-base rangefinder programme and faced us with what was probably the hardest of all our problems, the production of these difficult optics in quantities unsurpassed in any of the allied countries. Not all these requirements were superimposed one on the other, yet the resultant was such that the peak of production was not reached until near the middle of 1944. It is rather hard to give any single figure which adequately presents the combined output of lenses, windows, graticules and prisms for the varying distribution of requirements for optics with varying degrees of intricacy, yet an attempt has been made to convey some idea of this in the graph in Fig. 32. This shows the manner in which production increased, in terms of the production rate at the end of the first year of operation, in March 1942. A glance at this output chart will show that production increased to its peak more rapidly from 1943 onwards, and that such recessions as did occur were invariably *pour mieux sauter*. The maximum production, representing approximately a nine-fold increase in slightly over three years, may be visualized as 95 per cent composed of a *monthly* output of optics for some 7,000 pairs of binoculars, 500 short-base rangefinders, 2,000 assorted sighting telescopes, panoramic sights, directors, etc., and the remaining 5 per cent of much smaller numbers of more intricate optics such as those for the larger base-length rangefinders. It is doubtful if this output was exceeded anywhere except by one or two of the larger United States firms.

During this period of growth we were short, at various times, of glass, machine capacity, operating supplies and labour—sometimes all at once. Glass shortages were mainly in the types most difficult to make: the extra dense flints, dense barium crowns, and first quality borosilicate crowns for use in prisms. Limitations in lens grinding capacity occurred at the end of 1942, before lens milling equipment was available to replace hand methods. In operating supplies there were shortages of blocking and polishing pitches, rosin, sealing wax, hydrofluoric acid, carnauba wax and ceria. The really critical shortage, however, was in the medium and fine abrasives during the years 1942 and 1943. These shortages frequently compelled us to use inferior materials, or materials not of the best grain size, and certainly resulted in some loss of production due to slower polishing times, increased amount of reprocess work, and increased rejects. The exact amount of lost production would be difficult to assess, but during certain times was probably not less than 20 or 25 per cent. Short-handedness was a chronic condition throughout and was equally severe with male and female workers, especially for night shift work.

Another limiting factor was the shortage of engraved graticules up to the end of 1942. As already mentioned, had it not been possible during this time to obtain photo-etched graticules from a subcontractor, a very serious condition would have developed. Even so, the succession of rapid expansions was continually taxing engraving capacity as well as our own capacity to produce the polished graticule blanks in large enough quantities. In spite of everything, however, in very few cases was instrument production limited by the supply of optics. The supply of subcontracted and machined metal parts was a much more frequent limitation.

expansion of capacity

Up to March 1942, increases in production of optics were obtained first by gradually building up personnel from the nucleus earlier mentioned, then by progressively increasing night-shift operation in all departments. Full-scale adoption of ceria for polishing at about this time came close to doubling polishing capacity. From that point until 1944, the steadily mounting requirements were met by successive expansions in the polishing shop, ultimately doubling the number of lens and planar polishing spindles. This additional equipment was mainly made to designs of our own which combined the best features of existing equipment and incorporated numerous improvements. With the increased binocular requirements, it was decided to set up a separate self-contained department for the production of binocular optics. Considerations of space made it necessary to locate this in a different building some distance away from the main shops. This department reached peak production in the first two months of 1944, but was reabsorbed into the main shops shortly thereafter, when increased production efficiency and contract terminations freed sufficient capacity to make this possible. We were glad to be able to do this, for the supervisory and administrative difficulties of running this separate optical department on a large scale at some distance

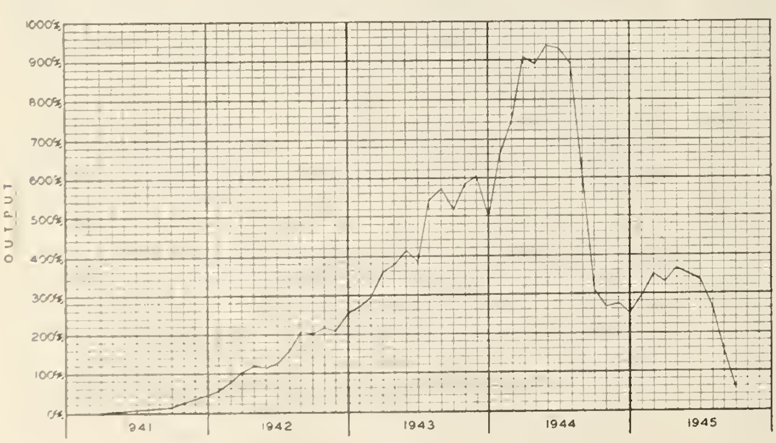

Fig. 32—Production chart.

away were very considerable. Early in 1943, the increased rangefinder requirements necessitated a large-scale rearrangement of the main polishing shop to provide additional planar polishing capacity. In the grinding shop, only one increase in floor-space was necessary, and the successive increases in production were met mainly by improvements in production methods, with milling superseding hand grinding both in lens and planar work, as the necessary equipment was designed and built, or purchased. Methods reached substantially their final form by the end of 1943, and from then on increases were the result of increased production efficiency.

PERSONNEL FACTORS

This growth of production capacity was of course parallelled by a growth in personnel. The number of employees in grinding, polishing, and auxiliary operations rose quite uniformly to a peak of 1,007 in January 1944. The maximum production was obtained some five months later, when the total number of employees in these departments had dropped to 840. This condition was the natural outcome of increased proficiency, application of improved methods, and incentive bonus.

There were two main personnel problems during this period of expansion: training of employees themselves, and the selection and training of supervisory personnel. As ours was an entirely new industry in Canada, we were placed in a different position from most other firms, in that we were able to hire almost no skilled labour. Such skilled labour as we did obtain was from the spectacle trade and although its techniques are different in many respects, the assistance thus furnished was not entirely negligible. For the most part it was simply a matter of selecting the employees who seemed best fitted for particular operations, and training them, while the main nucleus of already-trained personnel acquired skill and experience through practice on the particular groups of operations they had been taught. These employees then assumed supervisory positions and instructed others in their skills.

Contrary to the general impression, machine polishing is not an exceptionally difficult operation: an operator of good ability, with proper instruction, can polish the most difficult planar surface after 18 months' to two years' experience. With lens polishing, after one year's experience a good man should be able to handle most lens blocks. Girls can be trained to polish a particular size and kind of block within four or five months. The more difficult hand-polishing operations require several years of experience, but the simpler ones can be learnt within six months. Proficiency in centering and cementing takes normally at least as long to acquire, and the latter operation in particular is one requiring special capabilities which only one operator in two or three possesses. This, and the exacting nature of the work, result in high turn-over. In the grinding shop, there are few, if any, jobs that cannot be picked up within 18 months, and for the majority six months or less is sufficient. The times mentioned in all cases are those after which the individuals may work entirely on their own: it is of course to be understood that, almost invariably, additional experience results in increased proficiency and speed.

The effectiveness of the supervisory staff was greatly enhanced by a very complete, plant-wide, foreman's training plan, instituted during 1942, and operated continuously thereafter. This provided much-needed guidance on the psychological factors involved in handling people, and was supplemented by instruction on Company administrative procedures.

We found that, usually, groups of female employees worked best under male supervision. Other things apart, women seem averse to taking orders from their own sex.

The proportion of male to female employees averaged exactly 50 per cent during the period of highest output, but varied very considerably from operation to operation. In general, the skilled operations were left in the hands of men, and women used for semi-skilled or unskilled work of a repetitive nature. Thus, in the grinding shop, all the hand work of a difficult or arduous type was done by men, and women used for operating lens milling machines or on simple jobs like cleaning and bevelling. Women were found to be satisfactory for lens polishing only on the easiest work, involving a particular size and kind of block; even so, they are physiologically unsuited for this type of operation, involving, as it usually does, continuous standing and walking throughout the shift. As a result, labour turnover was far too high, when women were used on such work. In the binocular optics shop, nevertheless, female employees were 70 per cent of the total. In the operations of cleaning, centering, and cementing, women were used exclusively. Inspection, except prism inspection, was likewise all done by women. The critical man-power shortages in 1943 and 1944 also compelled us to use women for the simpler hand-polishing operations, in which they proved entirely satisfactory. The same can be said of their performance elsewhere: in most of the places where they were used under wartime conditions they could equally be used in peacetime.

Increased absenteeism and uncertain attendance were the greatest disadvantages with women, and much of this was owing to the wartime employment of women with domestic responsibilities who were unable to make proper arrangements for looking after their children.

During the periods of most critical labour shortage, we engaged a number of part-time women workers. As a group, these proved even less reliable than the others and we were glad when conditions made it possible to eliminate part-time work entirely.

The problem of military call-ups and deferments was a harassing one throughout. Especially during 1941 and 1942, the undefined government policy meant that men hired from an age group not then subject to call were called up four or five months later, just at the time when they were trained to the point of usefulness. In a period of rapidly-expanding production, this was particularly inconvenient. Yet the deferment policy in regard to fully trained men, especially those who would take a year or more to replace, was eminently reasonable, and appears to have been planned with more consideration for industrial problems than in the United States.

WORKING HOURS AND NIGHT-SHIFT PROBLEMS

For most of the first year of operation, under pressure of urgent need, working hours of 60 or more per week were adopted on both shifts. After a while this resulted in such manifest inefficiency that day-shift hours were dropped to 55½ (5½ 10-hour days) while night-shift hours remained at 60 (5 12-hour nights) mainly because this greatly facilitated overlapping of shifts, a matter of some importance with the high dilution of skill which then existed. The early start of the night-shift also made things easier for those of us who were obliged to maintain close contact with both shifts. This arrangement, furthermore, was approved by the majority of the night-shift workers themselves.

The polishing of lenses on two shifts introduced a peculiar problem. The length of polishing time of most blocks was such that at the end of the day-shift there were many blocks partially-finished still on the spindles. Normally, one might have expected the night-shift operators simply to have taken these over and finished them up. But unfortunately, all polishing is very much an individual matter of machine settings, and one where each operator has his own preferences. Unless operators on both shifts use identical techniques, different fine grinding curves are required for each, for quick polishing. As a result, after several fruitless attempts, we had to abandon trying to run the same work continuously through both shifts, and were obliged to segregate entirely the work done by each shift. While this caused some loss in efficiency, at least it separated responsibility for faulty work. In prism polishing the same result came about from a different cause: here, the shortage of skill obliged us to concentrate the difficult work on the day-shift, leaving the easier work to be done at night. In the binocular optics shop, however, the relative simplicity of the work made standardization of grinding tools and polishing techniques a much easier matter, and we were able to operate straight through both on lens and planar work very successfully.

Hoarding by each shift of scarce abrasives and other materials of variable quality was another constant source of trouble. This is best exemplified by an occurrence in which a day shift operator polished a group of lens blocks for two hours or more using a small jar of special ceria accidentally left out by the night-shift. It was only when polishing seemed abnormally slow that the foreman investigated and found he was trying to polish with cocoa, which is deceptively similar in appearance, but quite dissimilar in polishing properties.

Shortage of man-power and shortage of skilled supervision made the adoption of 3-shift operation impracticable, apart from other considerations.

During 1943 and 1944 the progressive installation of incentive bonus systems made the inefficiency of long working hours very apparent and permitted successive reductions without any diminution either of individual earnings or output. In fact, with the final working week of 46¼ hours on days and 5 9-hour nights, the output per operator per week was about 20 per cent higher than previously. Some portion of this improvement was of course due to increased proficiency with time, and to improved methods.

INSPECTION STANDARDS

There are few factors which so closely affect volume and cost of output of optics as inspection standards, and few less tangible. This is not true of gauged and measured dimensions such as sizes, diameters, and angles, which can be exactly specified on the blueprint and are either within tolerance or not; but it does apply to surface quality standards — scratches, pits, and degree of polish — and to similarly hard-to-define defects such as bubbles and striæ. When is a scratch not a scratch, but a ‘ score ’ or a ‘ sleek ’? When does a ‘ bubble ’ become a ‘ seed ’, and what constitutes ‘ objectionable ’ striæ? These problems of definition are further complicated by the fact that such defects may be permissible in greater degree at the outer edges of a surface than at the centre, and again by the fact that altogether different standards apply to optics depending on their function and position in the optical train, and even between parts of identical function and position in different instruments — as, for example, graticules, which in one instrument are viewed with a magnification of four times, and in another at fourteen times. It is hardly possible in an article of this scope to do more than indicate the existence of these problems. The solution of them was never more than partial, and was attempted in two ways: first, by specifying inspection conditions in such a way as to limit the visibility of many of these defects by defining the type of lighting used, and degree of magnification, if any, to be used in looking for them; second, by grouping together optics where the same standards applied — such as objective lenses, eye-lenses, and field lenses — and attempting to define, through discussion and mutual agreement, the surface and other standards applicable to each group. Other optics were treated according to their individual requirements.

Superimposed on these intrinsic difficulties was the equally difficult problem of co-ordinating such inspection standards between three, and sometimes four, different inspection groups, each operating under different control. First there was the Inspection Board of the United Kingdom and Canada, or the British Admiralty Technical Mission Inspection, either of which examined the optics in finished instruments, and whose standards had to be met. Secondly, there was our own Final Inspection Department, operated under our own, but separate, control and passing only optics considered fit for assembly. Third, there was floor inspection in the optical shops, which was found by experience to operate most satisfactorily under production authority. Lastly, in certain instruments supplied to the U.S. Government, there was U.S. Ordnance Inspection which inspected finished instruments after acceptance by the I.B.U.K. and was fully empowered to reject them for optical defects—and frequently did.

The summation of these difficulties may be better imagined than described. It resulted in an unending series of controversies in which the final authority—I.B.U.K. or U.S. Ordnance—invariably won. In many cases, we disagreed with the standards imposed, as undue importance seemed to be attached to ‘ beauty ’ defects — defects which, while visible to experienced inspectors under especially favourable conditions, would almost certainly be invisible to the user, and in any event had no bearing on performance. Scratches on objective lenses, small pits in field lenses, and minute pits in graticules are examples of this class of defect. Argument on these matters was equally prevalent between our own production and final inspection groups, but the decisions finally reached were always governed ultimately by what Ordnance Inspection would accept.

The importance of these standards was such that, in several cases, output and cost could be virtually halved or doubled by a change in surface quality requirements. There is therefore an urgent need for clearer definition of all the less tangible causes for rejection. Such standardization, if based on performance rather than appearance under close scrutiny, could very materially reduce costs. The standards which eventually crystallized certainly tended to become no less severe as the skill of the inspectors increased, and from comparison of work produced in Britain and the United States with our own, it may be stated that our standards appeared to be higher than either—that is, in general, needlessly high. Appreciation of this condition is a prerequisite to the discussion on operational losses which follows.

OPERATIONAL LOSSES AND PRODUCTION CONTROL

In any large-scale manufacturing operation, some form of production control is essential, in order to regulate the flow of work through the various operations, permit forecasting of raw material requirements, control the quantities in process, and schedule deliveries so as to meet assembly or shipping requirements. There are probably few industries where production control is attended by the same difficulties as in the manufacture of optics, where losses in successive operations may be so high that only two pieces out of three started, or in extreme cases one in six, are shipped out in finished instruments. Since losses are so much higher than, for example, in machined parts, an exact knowledge of losses at each operation for each piece is all the more necessary before any proper production control may be exercised.

Knowledge of losses is readily obtained from production records, which are so arranged as to record the number of permanent rejects occurring at each major stage of processing. The major stages differ from piece to piece, but are most simply broken down into grinding, polishing, fluoride-coating, centering, cementing, engraving, and assembly. The grinding and polishing stages may be further broken down if the volume is very large, but this adds to the complication.

It is not intended to give here any detailed figures on operational losses. To the non-specialist they would be of little interest; to the specialist they might either appear too low, and be questioned, or too high, and be derided. Such figures, in any event, have little meaning without the fullest knowledge of inspection standards. A few general remarks may, however, be of interest.

With lenses, the losses are roughly equally divided between grinding, polishing, and centering; with fluoride-coating, cementing and assembly losses all about equal and on a much smaller scale. All losses are higher in flint components, and higher with eye-lens flints than objective flints owing to steeper curves and higher surface standards. Field lenses of eyepieces, with standards second only to graticules, have the highest polishing and assembly losses. Grinding losses tend to be high for moulding flaws and similar defects, since the cost of the mouldings makes it worth while taking chances on whether or not such defects may be milled or ground out. With windows and filters having no extremely close tolerance on parallelism, losses are somewhat less than for lenses. With graticules, losses in polishing, engraving, and assembly are all higher than with lenses and on these parts it is not uncommon to have to start three or more for each finished piece assembled and shipped.

With prisms, grinding losses are slightly higher, and polishing losses somewhat lower, than for lenses. Cementing losses, especially on prisms with focal plane surfaces, may be substantially higher than for lenses. In spite of this, it is a significant fact that overall losses, even for intricate prisms, may be less than for simple lenses. This is an index of the importance to be attached to handling care: valuable prisms are only entrusted to skilled operators, whose careful handling produces this anomalous result.

We found that the most effective form of production control for all high-volume work was by means of large boards on which the cumulative total of pieces passed through each major operation for each part was represented in graph form by movable coloured markers sliding along horizontal cords. The cumulative figures plotted were not the actual number of pieces, but the number of instruments which could be assembled with this quantity, taking into consideration anticipated losses in all subsequent stages. This reduced everything to a common denominator, and enabled one to tell at a glance how close each part was to completion, which part was most behind and at what stage, and how deliveries to Finished Parts Stores stood in relation to instrument assembly requirements and to each other, while the difference in the position of the markers between successive operations indicated the amount of work in process or in stock between stages, in terms of finished instrument requirements. The daily and weekly reports necessary to compile this information required considerable bookkeeping and calculation, but in spite of this, the total numbers of clerical an other non-productive personnel such as chasers and truckers, were kept between six and seven per cent of total employees.

This method of production control was used to furnish the grinding and polishing shops with a monthly forecast showing the numbers, both gross and net, of each part required to pass through each major operation. Losses for this purpose were revised monthly, using, as a guide only, the average for each preceding four-month period. The glass-making department was also supplied each month with a schedule showing for each part the number required monthly during the four subsequent months, and the balance to be delivered to complete the contract. This planning work required considerable judgment and a detailed knowledge of manufacturing processes, since it was complicated by changes in methods, changes in losses (often due to changes in inspection standards), and changes to contracts.

The above information on operating losses is used in conjunction with time studies for any calculations involving processing capacity—particularly where polishing capacity is concerned. Here it is also necessary to know the amount of internal reprocess which occurs, as capacity must be provided for handling this as well as replacing permanent rejects. Our methods of routing the work in polishing and elsewhere were based on a minimum number of transfers back to the stock-room, as in this way both storage-space and handling is reduced to a minimum. In the polishing shop, therefore, we made a practice of issuing work to the floor and wherever possible leaving it in process until all sides had been polished, although with certain lenses it is more convenient to separate first and second sides. Our records, as a result, did not reveal the amount of internal re-processing in polishing, but for the purpose of polishing capacity calculations, a figure of 30 per cent appears to be adequate to cover both this and re-reprocess work. Control on re-processing appears to be best exercised by controlling the amount of work in process, which is readily done by means of the system described.

Conclusion

In the light of the manufacturing problems—technical and otherwise—which I have attempted to set out in this article, the results achieved may be assessed at their true worth, and are perhaps best left to speak for themselves.

The quantity production of a variety of optics of the types described is essentially a wartime problem, and one which I have endeavoured to outline in such a way as to supply to fellow-engineers an up-to-date and comprehensive picture which neither over- nor under-states the difficulties involved. If this purpose has been achieved, the facts and production data given here may also serve as a rough guide to whoever may be concerned in the unfortunate event of a recurrence of the same problem. This treatment of the subject may also aid in stripping away some of the prevalent misconceptions as to the extent of the difficulties; for the processing of optics has in recent years changed from an art to a science, and the methods now being used are almost as much subject to exact control as the production of machined metal parts, and, indeed, owe much to machine shop practice.

It seems unlikely that there will be any radical changes in polishing techniques for high-precision work, although the day is within sight when low-precision lenses may be made from moulding to polished lens on a single machine. Automatic polishing machines which generate the spherical surface in a manner similar to inclined cutter lens milling machines are already on the market. It is also to be expected that the considerable amount of work now being done on the surface chemistry and physics of polished glass surfaces will eventually bear fruit in improved quality and reduced manufacturing costs.

ACKNOWLEDGMENT

I should like to acknowledge with gratitude the assistance furnished in preparing this article by all members of the optical department staff, and particularly by Dr. D. C. Jones, under whose direction the work described was carried out, and to whom, more than any other single individual, should go credit for the results achieved.

COMMUNITY PLANNING IN THE RECONSTRUCTION PERIOD

RIGHT HONOURABLE C. D. HOWE, Hon.M.E.I.C.

An address delivered to a conference of provincial planning officials and technical experts, Ottawa, June 25th, 1946.

I should like, first of all, on behalf of the Government of Canada, to welcome you to this conference on Community Planning. In the years ahead we shall all be working together toward common goals in terms of the welfare of Canadian communities. The most effective ways and means of working together—spread as we are across a continent—will only be developed by a systematic pooling of our administrative and technical experience.

During our discussions here, and in our work after we get back to our own offices, I think we would do well to keep in mind how planning fits into the broader picture of the development of this country. I think you will agree with me that community planning has an important place in the achievement of high levels of employment and social security which we are pledged to maintain. We all want conditions of welfare worthy of the rich natural wealth that is ours as Canadians.

We are familiar with the techniques for developing our resources of forest, field and mine. We begin with surveys and analyses to find out the best ways of using the wealth we are given. The same is true when we come to the development of the resources embodied in our communities. The first need is for accurate topographic and population surveys, to find what we have; then we need fully studied and understood principles by which to proceed from the existing condition to the one that is wanted.

I think we may have lost track of what is the existing condition of our cities, towns and economic regions. Our development of industry and transport has been so rapid under the pressure of war that we have just begun to notice how that development has affected our communities—both urban and rural. We know from the census that, half a century ago, there were twice as many Canadians living outside the towns as in them; while now there are more living in towns than out. This shift to the towns was accelerated by the war. From 1940 to 1942 our larger cities grew three times as much as they had grown over the previous ten years. The rate at which goods were turned out in those cities probably doubled during the war; the army of industrial workers in the cities and towns increased by about 50 per cent.; while the productive capacity of the factories and works in our communities was correspondingly raised.

Now it may be said that this shift was abnormal, and should not be given too much weight in community planning. But there are three things about this change that I think planners must consider. First, many of the people who have moved to urban centres and acquired industrial skills want to stay there. Second, the problems in civic administration which wartime developments have rendered acute are in many cases continuing problems, not new ones; they may require more urgent and drastic treatment because they were intensified by the war, but they needed treatment anyway. Third, there is no denying that we now have an enlarged supply of modern and efficient plant and skills at our disposal in Canada, and that the intelligent course in the national interest is to make the best use of these community resources. To realize the highest possible standards of living, Canadians must employ what we have in the most efficient way—and the most efficient employment of our people and our resources is increasingly dependent on the efficiency and amenities of the communities where we live, and the routes connecting those communities.

One part of the problem of community development that is particularly urgent at present is the extension of local improvements, utilities and services. The war has made deferment of local improvements necessary to the point where a substantial back-log of work has to be done. I do not need to enlarge on the obvious fact that the layout of these surfaces, pipes and wires out-of-doors has a bearing on the overall efficiency of our industry and housing, just as surely as good design of their counterparts indoors affects efficiency. The reconstruction period, in which we are bound to undertake these improvements on a large scale, provides an opportunity that we may not be offered again to enhance the efficiency of this part of the national plant.

The job of improving the physical plant belonging to our own communities, and to the citizens in and around those communities, is one that we must do as Canadians for ourselves. Obviously the carrying out of community plans may be affected one way or the other by uncertainties in international trade and sentiment. But the decision as to whether we are to develop good communities is ours as Canadians—and ours alone. It is a decision which the citizens of every Canadian community must make on their own, and must act upon, without delay.

Modest outlay on community and regional surveys and plans, now, will make for better health and welfare for all time to come. Viewed in this light, planning is probably one of the least expensive kinds of social security. The security of every man's home and family against unnecessary dirt, noise, traffic and taxes is certainly a kind of social security that merits more attention than it has been given.

We are all morally pledged to maintain in this country high and stable levels of employment and income. To maintain those high levels, the various governments have in mind the undertaking of various kinds of developmental works, to be begun at the time at which they will be most effective in maintaining national objectives. Many of these developments—not only public buildings, but also utilities, harbour works, roads and facilities for pleasant touring and recreation—will materially affect the physical shape of our communities. I have not mentioned publicly-aided housing, because I understand that you will discuss that in relation to community planning in greater detail a little later; but the same statement may be made of all these public or publicly-aided developments: They cannot proceed in a healthy way, and be most effective in affording continuous employment and service, until the authorities of every populated area in Canada have studied the desirable physical shape of their community, and the desirable locations and directions of needed developments and improvements. Make no mistake about this.

The federal government is prepared to do what it can to maintain high and stable levels of employment. Among the many things the federal government has in mind to accomplish this aim, is to offer—as we have done in the proposals placed before the Dominion-Provincial Conference—inducements to the co-ordinated timing and placing of local developments. But the federal government cannot alone do the job.

Local government must fulfill its responsibility, in establishing needs and finding locations for the developments in the community or region it serves. In other words, to maintain employment and income levels, as well as to provide for the healthy building and rebuilding of the places where we live, we must have carefully prepared community plans. Also we must have competent personnel and clean-cut legislation at local levels to give our community plans adequate and continuing effect.

I would say that this conference already has made a beginning, in that we have met together, and come to know personally the men in other provinces and other groups whose efforts may be of use to us in our planning work—and who may from time to time be able to profit by whatever we may learn in this field. Personal acquaintanceship with our colleagues in Community Planning is, I am sure, to be only one of the achievements of this Conference. It is however important, especially in Canada, because when we know each other, these first-hand contacts lubricate the vehicles we shall set up to carry a continuous flow of ideas and experience between the working groups across the country.

The problems that arise in developing interest locally in the preparation of community plans, and in gaining endorsation for the execution of those plans, when they have been prepared, are yours to consider, at this conference and during the months and years ahead. I am confident that Canada will measure up to this situation as worthily as she has met and surmounted challenging situations in the past.

WARTIME PRODUCTION OF PRECISION OPTICS IN CANADA

A PROVINCIAL DIVISION FOR ONTARIO

Recently the corporate members in Ontario have been canvassed, under instructions of Council, to see if they desired a provincial division. Such a division has been provided for in the by-laws with the intention that any matters of importance, that were related specifically to branches in one province, could be handled entirely by the members in that province. In other words, it was to provide a full degree of autonomy for any province that felt it could use it to advantage.

In this instance, the Ontario councillors had recommended a division so they might have an organization to investigate and, if desirable, carry out certain proposals made by themselves. Council agreed unanimously to canvass the members, as is required by the by-law, and at the time of writing, almost enough replies have been received to give the necessary fifty per cent support.

It has come to the attention of Council that some members have thought the proposal looked like a sign of separatism, which they did not wish to support. This is far from the intention, and it is not expected the division will develop along that line. There have been provincial divisions before for specific objectives—one in Ontario and one in Quebec. Each was set up to provide a provincial body to assist in securing legislation to control the practice of engineering within the province. In Quebec it was the members of the provincial division that constituted the original membership of the Corporation of Professional Engineers of Quebec. Both divisions were dissolved when their objectives were accomplished.

If you have not returned the post card provided by Council, please do so now. It is not too late, and it is desirable that the proposal have the full support of all members. If your card is misplaced, a letter or other form, which indicates your support of the proposal, will be accepted.

COMMUNITY PLANNING ASSOCIATION OF CANADA

Under this title an organization was planned at Ottawa on June 26th. It was the outcome of a two-day conference held under the auspices of the Central Mortgage & Housing Corporation to which were invited representatives of all provincial governments and certain other organizations, to the number of forty.

The invitation stated " the object of this conference is to establish an organization that will foster, and be a channel for, the propagation of information on community planning as well as the routine and technique of ensuring unity of purpose by government at all levels, and other groups interested in this important work ".

The conference was opened by the Right Honourable C. D. Howe, Hon.M.E.I.C., Minister of Reconstruction, whose address appears elsewhere in this issue. He was followed by Stanley Lewis, who, in the dual capacity of mayor of the city and official delegate of the Federation of Mayors and Municipalities, welcomed the participants to Ottawa.

It is possible that the plans made at this conference will go a long way towards solving some of the many obstinate problems associated with community planning. It was the unanimous opinion of the delegates that an essential to success was a wider knowledge of the subject on the part of the general citizenry, and it was believed that best results could be obtained through a society devoted principally to such purposes. It will not be easy to set up a national organization of this kind, and much valuable time has been lost already, but every effort will be made now to get it under way with the minimum of additional delay.

The agenda for the first day dealt principally with provincial interests, each delegate describing the situation in his province, including a description of the legislation and an account of activities up to the present time. The concluding item was set up under three headings and was dealt with by the following technical organizations:

a) THE ENGINEER IN THE PLANNING TEAM—
(The Engineering Institute of Canada)

b) GOOD BUILDING IS MORE THAN GOOD BUILDINGS—
(The Royal Architectural Institute of Canada)

c) KEEPING IN TOUCH WITH OUR CLIENTS — THE CITIZENS—
(The Town Planning Institute)

In the evening the delegates were the dinner guests of the Corporation with D. B. Mansur, its president, in the chair.

The second day was devoted to a general discussion of the usefulness of a national association in the community planning field—an organization that could assist in developing the thinking on this important subject, and in the dissemination of information to the public. After several hours of discussion, it was agreed that such an organization could do a really useful work in both the local and national fields.

A committee under the chairmanship of A. E. K. Bunnell, M.E.I.C., was created to prepare a preliminary draft of a constitution. It presented its recommendations in the afternoon and they were accepted unanimously. The draft is to be submitted to the solicitors for final wording, with a copy going to every delegate for final approval before application is made for a charter.

An essential factor in the deliberations was the necessity of finding funds beyond those to be collected from members' fees. The meeting was informed that the Corporation would be prepared to assist materially, particularly over the first year or two and possibly longer if necessary.

The concluding action of the conference was the approval of a resolution that an interim board of directors be appointed to consist of three representatives each of the Royal Architectural Institute of Canada and The Engineering Institute of Canada, one each from the provincial governments, organized labour, the Canadian Welfare Council, and the Corporation.

It is essential that active support be given to the Association by existing organizations — particularly the Architectural Institute and the Engineering Institute. Already these two have taken a leading part in the project, having first discussed its possibilities over two years ago and having taken some preliminary steps leading up to the present development. The Engineering Institute can readily relate its own Committee on Community Planning to the Association, to the advantage of both.

INTERESTING PROPHECY

In a piece of literature issued recently by the Newcomen Society of England there appears the following:

" In Essex, England—famed for its salt marsh islands in the North Sea and for leafy Epping Forest, is a tombstone, dated A.D. 1440, bearing this amazing inscription of prophecy, cut in stone half a century before Columbus discovered America:

'When pictures look alive with movement free,
When ships, like fishes, swim beneath the sea,
When men, outstripping birds, shall scan the sky,
Then half the world, deep drenched in blood, shall lie.' "

COLLECTIVE BARGAINING RULINGS

At long last there are official pronouncements upon applications for certification made by professional groups in Ontario and Quebec. In the one case, it is employees of the Bell Telephone Company that are concerned, and, in the other, employees of the Toronto Hydro-Electric System. Both applications have been before the National Wartime Labour Relations Board for many months, and in the case of Toronto Hydro the application was made originally to the Ontario Labour Relations Board, where it was refused, because the Board felt it had no jurisdiction.

A knowledge of the many details involved in these precedent establishing cases gives one an appreciation of the difficulties that had to be surmounted. There was no pattern to follow, there were opposing interests of several types, and new types of employer groups were involved. The Board has taken a long time to reach its decisions. It is to be hoped that they are fair and equitable—and workable.

Following are the official releases from the Department of Labour. As examples of the use of words to conceal meanings, they are distinguished. Paragraph five of the first release is commended particularly from that point of view. Nevertheless, something new in the profession has occurred. Collective bargaining for engineers under the current labour legislation has been authorized. For the first time, Canadian engineers, within certain classifications, may now legally insist on collective bargaining with their employers.

Wisely used it can be of great benefit, but it can do an even greater injury if it is not administered carefully, cautiously and sensibly. Here are the releases:

Department of Labour—June 26th, 1946

"It was announced today by the Wartime Labour Relations Board (National) that it had ordered a representation vote of employees in the Department of the Vice-President (Engineering), the Engineering Department, Eastern Area, and in the Division Plant Engineering Groups of the Eastern Area Plant Department of the Bell Telephone Company of Canada, Montreal, P.Q.

The Board, in answering objections raised by the Company as to the status of professional employees under the Regulations, traced the development of the Board's policy in regard to such employees from April, 1944 down to February, 1945, when the policy was adopted that the Board was prepared, in proper cases, to certify bargaining representatives for units of employees engaged in professional capacity.

The Board stated that following the hearing of the case the parties had conferred in an endeavour to reach agreement upon the classifications of employees to be included in the bargaining unit, and had requested that, pending finality of such discussions, the application be held in abeyance.

While a substantial measure of agreement was reached, the Board found that the Company would desire to have an engineering plant unit exclusive of clerical employees, while the Federation of Professional Employees desired an Engineering craft unit comprising engineers and their technical assistants.

The Board stated, in determining the scope of the unit, that like considerations apply in general in determining an appropriate bargaining unit comprising or including occupational classification requiring professional skills as apply in determining an appropriate craft unit comprising or including occupational classifications requiring particular artisan skills. An appropriate unit should include the occupational classifications engaged in common employment in the same line of skilled work and in which there is by reason of training or experience and established practice the normal opportunity for promotion from the lowest to the highest occupational classifications comprising the professional or professional and technical group.

The Board drew attention to the particular organization structure of the Company and determined the appropriate bargaining unit as comprising employees performing the duties of engineering assistant, technical assistant, student engineer, assistant engineer and engineer below the rank of division plant engineer employed in the Engineering Divisions of the Company affected by the application. The Board excluded by title or classification a number of employees from the bargaining unit because possessing confidential or supervisory duties."

Department of Labour—June 25th, 1946

"It was announced today by the Wartime Labour Relations Board (National) that it had allowed the appeal of the Toronto Hydro-Electric System of Employee-Professional Engineers and Assistants from a decision of the Ontario Labour Relations Board dismissing the organization's application for certification.

The Ontario Board dismissed the application on the ground that it was uncertain as to the present attitude of the National Board toward the inclusion of professional employees in bargaining units in view of earlier declarations of policy and rulings.

The National Board stated, in reversing the decision of the Ontario Board, that it was prepared in proper cases to certify duly elected or appointed bargaining representatives of bargaining units constituted of employees employed in professional engineering or employed in training for professional engineering and to deal with the issue of whether a professional employee is employed in a confidential capacity on the facts of the particular case.

The National Board, therefore, granted certification of bargaining representatives for a bargaining unit consisting of all employees in the works of the Toronto Hydro-Electric System, Toronto, employed in the practice of professional engineering or employed in training for professional engineering, except those employed in a confidential capacity or having authority to employ and discharge."

MULBERRY EXHIBITION DISCONTINUED

Members everywhere will be disappointed to learn that the exhibition of the model of "the harbour that went to France" was discontinued before the completion of the itinerary. The change in plans deprived the citizens of Quebec, Saint John and Halifax of the privilege of seeing it.

The exhibition in Canada was a joint project with the Hudson's Bay Company, and was shown at many cities where branches of the Institute are located, such as Montreal, Ottawa, Toronto, Hamilton, Winnipeg, Regina, Edmonton, Vancouver and Victoria.

The Company felt that owing to the lateness in the season, and the remoteness of the war, the attendance was falling off to an extent that seemed to justify discontinuing the tour. Officers of the Institute were desirous of having it completed, and to this end cabled the Canadian Prime Minister then in London, and the Canadian High Commissioner. This exchange of messages, plus further discussions with Company officials in Canada did not influence the Company to the point that they would be willing to continue financing the tour.

With an entourage of from ten to twelve people to be financed, and all the costs of transportation, the liability was too great for the Institute to assume, and therefore reluctantly the tour was discontinued after the showing in Victoria.

This whole undertaking was a new experience for the

Institute. While the end of it was disappointing, the entire project was a great success. The objectives were to inform the Canadian people in some detail of at least one British undertaking that made a great contribution to winning the war, and to give them a picture of one phase of the engineers' work in the war. In short, the Institute's objects were to assist in circulating honest propaganda for the British people in general, and the engineers in particular. It is evident that these objectives were accomplished.

Although it was an unusual activity, there appears to be no reason based on this experience that should deter the Institute from undertaking equally unusual activities in the future. Members in all cities where the model was shown were interested and helpful. The Hudson's Bay Company was a generous and cooperative "partner", continuing to meet all costs under all conditions—many of them not foreseen in the original plans.

Previous to coming to Canada, the model was shown in the headquarters building of the Institution of Civil Engineers in London for three months. The attendance was reported as 300,000. In Canada the total attendance was 650,000. A record was made in Winnipeg where over 22,000 people saw it in a single day. The total at Montreal was 83,425, Ottawa 45,066, and Toronto 125,689. At all centres there was a special showing for the branch, at which Colonel Steer-Webtser gave a most interesting and informative talk.

To the British War Office, to the Hudson's Bay Company and to the personnel accompanying the exhibition, the Institute is greatly indebted.

THE PRESIDENT RETURNS FROM THE WEST

New Ground Broken

For the first time, an officer of the Institute met with the members in Kamloops and vicinity. A luncheon meeting was held on May 31st at which thirty-four engineers and wives attended. H. L. Hayne, chief location engineer, Department of Public Works of British Columbia, presided, and with him at the head table, besides the president and Mrs. Hayes, were Mrs. Hayne, Mr. and Mrs. M. L. Wade and Mr. G. J. Currie

The chairman introduced the guests, and Mr. Wade thanked the speakers, at the same time telling of his long association with the Institute and the services which it had rendered to him. He was of the opinion that branches could do more for non-resident members than was being done now. He thought if such members were kept well informed of branch activities many of them could arrange to attend at least some of the functions.

The chairman placed emphasis on the desirability of the Institute keeping closer to groups such as the one at Kamloops, where there were not enough members to justify establishing a branch, but where occasional meetings could be held, both of a social and of a professional nature. He hoped that succeeding presidents would be able to include Kamloops in their western itinerary.

From Kamloops the party motored over the Trans-Canada highway to Sicamous where they entrained the next morning for Calgary.

Calgary

Here the programme included a meeting with the executive, a trip to the oil fields of Turner Valley and a dinner meeting with the members of the branch and their ladies. At this latter function there were about a hundred present. Chairman H. H. Younger presided. The president was introduced by James McMillan and thanked by S. G. Coultis. The ladies entertained Mrs. Hayes at tea.

The two photos at the top are of the Kamloops dinner. Head table, left to right, Mrs. Hayne, the President, H. F. Hayne, chairman, and Mrs. Hayes. Lower left—the engineers of the Okanagan Valley greet the president at Kelowna. Lower right—the Banff local members entertain for the presidential party. Left to right, Mrs. Hayes, A. B. Geddes, Miss M. McLaren, the president, P. J. Jennings, Mrs. Geddes, G. J. Currie.

Regina

The two days at Regina were filled with pleasant events of importance. A large portion of the first day was given over to meetings with the executive of the branch and the Council of the Association—the personnel of these two bodies being identical. In the evening there was a dinner meeting with the members to the number of about sixty. Chairman Fred Estlin presided and had as his chief aid Jack Spratt, chairman of the Papers and Meetings Committee. The president presented the Duggan Medal to H. L. Lexier for his paper " Metallurgy and Machine Design ". Mr. Lexier had been unable to attend the annual meeting of the Institute in February.

An interesting feature of the whole trip was a visit to the barracks and criminology laboratories of the R.C.M.P. Incidentally, the laboratory is in direct charge of an engineer, Staff Sergeant Mallon, a graduate of Saskatchewan, who was the party's guide.

On the Saturday afternoon the ladies of the branch entertained Mrs. Hayes at tea in the hotel — a very pleasant affair.

Lakehead

It was a happy thought that prompted the members in Fort William and Port Arthur to hold the branch meeting at Kakabeka Falls—a beautiful spot not far from Fort William. There was an excellent turnout of members and their wives which indicated that the local people too appreciated an escape from the heat of the city.

The newly elected chairman, W. H. Small, was in charge, and following the tradition of the branch called on Joachim Antonisen to thank the speakers—Mr. Antonisen does this in a most pleasing colourful style that is indeed rare in these bustling days.

Other items of the programme included visits to the grain elevators, the ore terminal, and the plant of the Canadian Car and Foundry Co. Ltd., where buses were being turned out in quantities that should go a long way to solving the transportation problems of many cities. There was also a business meeting with the executive, and the ladies entertained Mrs. Hayes at luncheon.

Sault Ste. Marie

Once again the delightful weather permitted a branch to go out into the country for a meeting. This was held at the golf club with W. D. Adams in the chair. The attendance was substantially larger than usual—which, of course, is particularly encouraging to a small branch.

The party enjoyed a tour of the plant of the Algoma Steel Company, under the supervision of Chief Engineer Carl Stenbol.

Sarnia

From Sault Ste. Marie, by a devious route over highway, rail and water, the party moved to Detroit and Sarnia. A meeting with the new Sarnia Branch was held at the golf club on Friday, June 4th, with Chairman George Macpherson doing the honours. This was the first visit of a president to the branch, and the members with their wives turned out to the capacity of the club accommodation. A feature of the visit was a tour of the Polymer plant.

Detroit

The semi-annual meeting of the American Society of Mechanical Engineers was conducted in Detroit on June 17-18-19th. This was billed " with the Engineering Institute of Canada participating ", and so it was appropriate that the president of the Institute should be there. As usual the meeting was a great success. Unfortunately, the cyclone of the day previous had done a great deal of harm to transportation facilities, and authorities in the neighbourhood of Windsor did not encourage travelling. Doubtless this reduced the number of Canadians in attendance.

The Institute branch at Windsor organized a tour to the Canadian side, which included a trip through the plant of the Hiram Walker Distillery. It was well attended! There were plant trips on the American side as well, which with a technical programme of eighty-six papers, plus four luncheons and three dinners made up a series of rather full but profitable days.

It was a much appreciated manifestation of goodwill that the American Society of Mechanical Engineers should have so generously included the Canadians in the programme of this important meeting. By the terms of the co-operative agreement between these two societies, it should be possible to hold many joint functions and activities throughout the years, to the general advantage of all concerned.

Montreal

The president returned to Montreal on Friday, June 21st, and presided at the meeting of Council on the 22nd. On Sunday, in company of G. J. Currie, Louis Trudel, assistant general secretary, and Lt. Col. A. J. Kerry, rehabilitation officer, the president left by boat to visit the Saguenay branch at Arvida.

Saguenay

The boat trip down the St. Lawrence river was made in varied weather. The party, arriving at Bagotville on Tuesday night, June 25th, was met by members of the branch executive and driven to the Saguenay Inn at Arvida.

In the morning of June 26th, the president and his entourage visited the works of the Aluminum Company of Canada. At lunch, members of the executive and their wives entertained the visitors. Vice-president G. F. Layne of Quebec, a former councillor of the branch, and Mrs. Layne joined the group at this point.

In the afternoon, the party, including the ladies, visited the hydro-electric development at Shipshaw.

The branch meeting was held at the Arvida Inn that evening and, as usual, was attended by a large percentage of the members of the branch.

After the meeting the party was taken to the boat at Bagotville.

At Quebec the next evening, President Hayes and Councillor Currie boarded the train which took them back to Halifax after a tour which lasted more than two months.

"THE WAR SEEN FROM BRITAIN"

Recently Headquarters has received a forty page pamphlet issued by the British Ministry of Information. The full title is " The War Seen from Britain 1939-1945—Victory in spite of all Terror "—Chronology and Commentary. This pamphlet should be in everyone's possession, not only because it is an interesting story of the world's greatest events, but as a library reference for all time.

The pamphlet is a complete story of the war in a cleverly abridged form. Each page is divided into two parts, one side carrying a running narrative, alongside of which are notes which give the geographic information and dates. Together the two make up a short story in great detail.

As a piece of propaganda literature, it is one of the best that has come to Canada. The story is told dispassionately, but the very modesty of it impresses one with the great part played by the British people. It is a great credit to the British Ministry of Information and indicates clearly that the Englishmen have learned that the world should be kept properly informed.

The pamphlet is circulated in Canada through the United Kingdom Information Office, at 10 Albert Street, Ottawa, Ontario.

As Mr. George Walkem of Vancouver could not be in Montreal at the time of the Annual Meeting, the presentation of the Julian C. Smith Medal which had been awarded to him by Council had to be postponed. Fortunately he could be in Montreal on June 22nd the date of the Council Meeting at which the president presided. Accordingly, a luncheon was arranged at the University Club in his honour. The photograph shows the president making the presentation. Mr. Walkem's reply was delightful, with flashes of humour but over all a sincere acknowledgment of the honour done him. The citation appeared on page 196 of the February issue of the *Journal*.

R.C.E.M.E. CORPS ASSOCIATION

Headquarters has received notice of the creation of this Association, whose object is "to foster the development of R.C.E.M.E. Corps and to stimulate interest in training, design development, inspection, maintenance and repair techniques, procedures and facilities affecting army technical equipment".

The membership consists of all officers of active reserve units of the Corps, together with any inividual officers (active, reserve, regular or retired) who desire to belong. The first president is Colonel H. G. Thompson, D.F.C., B.A.SC., M.E.I.C., of Toronto, and the secretary is Lt.-Col. LeSueur Brodie, B.SC., M.E.I.C., also of Toronto. (76 Adelaide Street West).

Officers of the Association have stated that to maintain the many units of strength required for the reserve army it will be necessary to have the support of the engineering profession in general. It is with this in mind that the *Journal* brings to its readers' attention the existence of this new organization. The secretary will welcome enquiries from all who desire additional information or who are interested in becoming members.

It is highly important that the profession maintain its interest in the Royal Canadian Electrical Mechanical Engineers Corps. It is essential that the Corps become and remain an engineering corps. Such is the desire of those who are promoting the Association. Members of the Institute should not forget the many times that it became necessary during the war for Council to remind someone at Ottawa that an engineer corps should have engineers in it. Non-professional interests in high places can readily overlook such considerations, but an organization such as the Engineering Institute which is free from departmental restrictions and bias must not overlook them.

Every assistance should be given this Association. The best interests of the Corps and of the profession are their objectives.

WARTIME BUREAU OF TECHNICAL PERSONNEL

The future of the Bureau has been a subject of discussion for several months. It was realized that it was organized as a war agency and that the war was over. At the same time it was desired to preserve for peacetime use some of its facilities. Just how this could be accomplished has not been easy to determine.

Several months ago the Council of the Institute expressed the opinion that the Bureau should be dissolved, believing that all forms of compulsory procedures should be abolished now that the war is over, and not being able to see how the records could be maintained in useful form without compulsory measures. As a matter of fact the Minister of Labour issued an order to the effect that the Bureau would cease to exist as of August 1st, 1946, but representations made by several individuals and organizations have caused him to withhold action for the present.

In May, after a discussion in which the Institute representative again presented the Institute's opinion, the Advisory Board agreed unanimously to approach the Minister with the recommendation that in some manner or other certain Bureau records and services be continued. The latest word from the Deputy Minister is—

"The Minister has asked me to thank you for your letter of June 3rd regarding the continued operation of the Wartime Bureau of Technical Personnel.

I am sure you will be pleased to know that we have agreed in principle that its continuance is fully justified, and we are now exploring what form of administrative machinery is most appropriate.

This will no doubt mean that we will request your Advisory Board, which has done such excellent work, to take on a more permanent character".

THE ENGINEERING INSTITUTE OF CANADA

PRIZE AWARDS 1946

Twelve prizes known as "The Engineering Institute of Canada Prizes" are offered annually for competition among the registered students in the year prior to the graduating year in the engineering schools and applied science faculties of universities giving a degree course throughout Canada.

Each prize consists of twenty-five dollars in cash, and having in view that one of the objects of the Institute is to facilitate the acquirement and interchange of professional knowledge among its members, it has been the desire of the Institute that the method of award should be determined by the appropriate authority in each school or university so that the prize may be given to the student who, in the year prior to his graduating year, in any department of engineering has proved himself most deserving as disclosed by the examination results of the year in combination with his activities in the students' engineering organization, or in the local branch of a recognized engineering society.

The following are the prize awards for 1946:

Nova Scotia Technical College	James Pemberton Oakley
University of New Brunswick	Albert MacLean Stevens, S.E.I.C.
Laval University	Adrien Morin, S.E.I.C.
McGill University	Geoffrey Wakefield Ince, S.E.I.C.
Ecole Polytechnique	Jean-Paul Valade, S.E.I.C.
Queen's University	Robert Blair Glass
University of Manitoba	William Hollis Matthews, S.E.I.C.
University of Toronto	Keith Coleman Hendrick
University of Saskatchewan	Andrew Thomson Bingham
University of Alberta	John Anderson Randle
University of British Columbia	Edward T. Kirkpatrick
Royal Military College of Canada	No award, regular course discontinued during the war.

ENGINEERING EDUCATORS FORM UNIVERSITIES' CONFERENCE COMMITTEE

The following report has been written for the Journal by past-president, Dr. C. R. Young, Dean of the Faculty of Applied Science and Engineering of the University of Toronto. It will be a matter of modest satisfaction to members of the Institute to see that the preliminary conference of engineering educationalists which was a feature of the 1946 annual meeting of the Institute, has resulted in a permanent committee to deal with matters of importance to engineering education.

It is interesting to observe the proposals of the representatives of professional societies wherein recommendations were made with regard to uniformity of entrance standards, and the inclusion in the curricula of additional "non-scientific" courses. The replies to these proposals from the professional educationalists indicate how complex is the problem. There is no easy way in which courses can be standardized, or expanded to include other subjects. The minutes of this conference and the following report indicate this very clearly.

There has been a great deal of casual thinking about engineering education, which has resulted in all sorts of proposals. This report gives valuable information which should be helpful to the layman in his future thinking about such matters.—Ed.

Growing out of the conference of deans and teachers of engineering held in Montreal on February 9, as a concluding feature of the Annual Meeting of The Engineering Institute of Canada, another conference was arranged by the engineering educators to coincide with the Annual Meeting of the National Conference of Canadian Universities at Toronto on May 27-29.

Twenty representatives of the engineering schools offering work of university grade attended. Those present, and the institutions from which they came, were as follows: Dean A. F. Baird, University of New Brunswick; Dean Ignace Brouillet, Ecole Polytechnique; Reverend Father M. W. Burke-Gaffrey, University of St. Mary's College; Dean D. S. Ellis, Queen's University; Dean E. P. Fetherstonhaugh, University of Manitoba; Dean J. N. Finlayson, University of British Columbia; Professor A. E. Flynn, Nova Scotia Technical College; Reverend Father W. P. Fogarty, St. Francis Xavier University; Professor H. Gaudefroy, Ecole Polytechnique; Lt.-Colonel L. F. Grant, Queen's University and Royal Military College; Professor N. B. Hutcheon, University of Saskatchewan; Professor R. E. Jamieson, McGill University; Professor H. J. MacLeod, University of British Columbia; Dean H. W. McKiel, Mount Allison University; Professor L. M. Pidgeon University of Toronto; Professor J. W. Porteous, University of Alberta; Dean A. Pouliot, Laval University; Dean R. A. Spencer, University of Saskatchewan; Professor H. R. Theakston, Dalhousie University; Dean C. R. Young, University of Toronto.

On the morning of May 27, these representatives met as a group, with Professor J. W. Campbell, University of Alberta, Professor R. C. Dearle, University of Western Ontario, Professor H. R. Kingston, University of Western Ontario, and Professor M. Y. Williams, University of British Columbia, sitting in as assessors.

A spirited discussion of many matters relating to engineering education took place. The principal topics considered fell under the following heads:

(1) Extent of specialization
(2) Choice of course or option
(3) Cultural material in undergraduate courses
(4) Lengthening of undergraduate course by one year
(5) Formation of a Committee on Engineering Education of the National Conference of Canadian Universities.

From the discussion it appeared that specialization has gone as far as is desirable in the engineering schools of Canada. More generally than not, the first engineering year is common to all courses and the advantage of making this practice as widespread as possible was stressed. It was appreciated that the length of course for a first degree had an important bearing on the matter.

There was general agreement that too much emphasis is often placed by the student, and sometimes by the employer, on the particular course or option that the student has pursued in college. The important factor is the quality of the men who are graduated, rather than the particular courses they have taken.

Sympathetic though the group was to the inclusion of so-called "liberal" or "cultural" subjects in the unergraduate curriculum, it was agreed that the 20 or 25 per cent of the total time for a four-year course, as proposed by the SPEE Committee on Engineering Education After the War, could not be approached in Canada without impairment of the course from the scientific and technological point of view. The existing proportions reported varied from about 6 to 15 per cent. The importance of teaching scientific subjects in such a manner as to reveal their inherent cultural quality was noted.

Lengthening the course to five years, based on senior matriculation for entrance, did not appear practicable to the group at the present time. The importance of a post-graduate year was stressed.

There was general agreement that some organization of engineering education should be set up in Canada whereby means could be afforded for teachers of engineering to confer with each other on matters of mutual interest and to consider any measures that might further engineering education in this country.

After considering the possibility of the formation of a section of the American Society for Engineering Education (formerly the Society for the Promotion of Engineering Education), it was finally decided that the National Conference of Canadian Universities be requested to set up within the Conference a Committee on Applied Science and Engineering Education, representative of the engineering schools of the country.

Following the discussion of a paper on "Problems of Engineering Education" presented by Dean H. W. McKiel at a general session of the National Conference held on May 28, a resolution was passed by the Conference authorizing the establishment of the Committee that had been recommended by the deans and teachers of engineering. The Committee is to consist of one representative named by each of the member-institutions of the National Conference offering courses in applied science or engineering at the university level. The secretary of the Conference was instructed to obtain the names of the members of the new Committee selected as above and to conduct by mail an election of a chairman from nominations submitted to him by the members of the Committee.

On May 29, the group of deans and teachers of engineering present at the National Conference met in special session a group of seven representatives of Canadian professional engineering organizations. These seven, and the organizations represented, were: Professor J. Watson Bain, Chemical Institute of Canada; Dr. Alan E. Cameron, Dominion Council of Professional Engineers and the eight Provincial Associations; Mr. W. P. Dobson, Dominion Council of Professional Engineers; Mr. C. C. Huston, Canadian Institute of Mining & Metallurgy; Mr. C. S. Landon, Association of Professional Engineers of Manitoba; Mr. C. E. Sisson, Engineering Institute of Canada; Mr. M. Barry Watson, Dominion Council of Professional Engineers.

Dr. Cameron, acting as spokesman for the professional group, referred to the interest of the Dominion Council of Professional Engineers and its constituent Associations and Corporation in engineering education and felt that they could give constructive assistance to the universities. He expressed the thanks of his colleagues to Dean McKiel for organizing a meeting with the university representatives. He then presented to the meeting two recommendations which had been prepared by the professional group the day before. These were:

(1) That in order to maintain and possibly improve the graduates, entrance requirements to university engineering courses be set at the highest possible standard, and that these standards be as nearly as possible uniform across Canada;

(2) That in view of the complexity in industrial specialization, it is recommended that basic fundamental instruction be given in Canadian Universities, with as great emphasis as possible on the non-scientific courses, leaving industry to do the specialization instruction, in collaboration with the universities, even though this may necessitate the increase of certain courses to a minimum of five years beyond senior matriculation.

Discussion of Recommendation (1) revealed the difficulty of attaining uniformity of admission requirements across Canada. Many universities had to accept students from provinces, or from countries outside of Canada, where secondary school courses concluded at varying levels. High school standards are set provincially, and universities, especially those receiving government aid, must accept the product of the provincial system. In some provinces senior matriculation work is not given in the secondary schools, or in only a part of them, and the universities have had to offer such work in a pre-engineering year. It was agreed that any influence which the professional organizations could exert towards improving the calibre of students entering the universities and engineering colleges in every province would be welcomed by these institutions.

Referring to Recommendation (2), Dr. Cameron enquired as to whether the universities would consider arrangements with industrial and research laboratories, whereby work done in them under university staff supervision would be recognized and accorded academic credit. He suggested that adequate control might be secured by having the directors of some of the better industrial laboratories appointed as part-time staff members. Several of the academic representatives pointed out the need for the universities proceeding cautiously in any programme of this kind lest they be put in the position of having to accept for credit work that could not properly be regarded as of university standard. It would be particularly difficult to co-ordinate such credits with undergraduate courses. The value of training courses in the great industries, without academic credit, was generally admitted.

It was the consensus of opinion that a useful purpose had been served in calling the meeting. The professional representatives expressed the hope that similar meetings might be held from time to time and promised to give any assistance they could to the academic staffs of the engineering schools.

ADDRESSES WANTED

As it is planned to publish a membership list shortly, Headquarters would be glad to receive as quickly as possible, information regarding the addresses of the following members some of whom have been overseas. A list of students for whom we have no addresses will appear in the next number of the *Journal*.

MEMBERS WHO HAVE BEEN OVERSEAS

Members

Ewart, Geo. R.
Fry, Edmund Botterell

MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, June 22nd, 1946, convening at nine-thirty a.m.

Present: President J. B. Hayes (Halifax) in the chair; Vice-President W. R. Manock (Fort Erie, Ont.); Councillors A. Cunningham (Kenogami), G. J. Currie (Halifax), J. R. Dunbar (Hamilton), E. Lavigne (Quebec), W. L. Saunders (Ottawa), Paul Vincent (Quebec), R. S. Eadie, R. C. Flitton, C. C. Lindsay, C. A Peachey and J. B. Stirling of Montreal; Treasurer J. A. Lalonde, and E. P. Muntz, member of the Committee on Professional Interests; Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

There were also present by invitation Past-Presidents A. J. Grant of St. Catharines, and George A. Walkem of Vancouver, arrangements having been made to present to Past-President Walkem, at a special luncheon meeting at the University Club, the Julian C. Smith Medal awarded to him in 1945. This was the first opportunity for presenting the medal as Mr. Walkem had not been able to attend the annual meeting in February and was in Montreal in May when the president had been in Vancouver.

Canadian Construction Association—The general secretary reported that in response to Council's resolution regarding the government form of contract as related to foundation conditions, three replies had been received, one from the Deputy Minister of Transport, another from the Deputy Minister of Public Works, and one from the acting chief engineer of Public Works.

Mr. E. P. Murphy, Deputy Minister of Public Works, had replied that a similar resolution has been received from the Canadian Construction Association and that they had been advised by the Minister that determination of foundation conditions was " one of the ordinary risks of bidders and that the department was not in favour of complying with the request ".

The Deputy Minister of Transport, with his reply, submitted a copy of a letter written to the Canadian Construction Association by Mr. Lionel Chevrier, Minister of Transport, in which he stated " I would advise that your representations have been duly considered by our technical officers who are of the opinion that the practice presently followed should not be discontinued ".

In the discussions which followed it was agreed that these replies were decidedly unsatisfactory. It was pointed out that it was not fair to bidders, for the government to give information regarding foundation conditions in remote locations and then to disclaim responsibility for it. It was also pointed out that in many instances it would be wasteful for every contractor to make a separate investigation.

Eventually, it was agreed that the matter should be investigated further, and the president asked Messrs. J. B. Stirling, E. P. Muntz, J. A. Lalonde and R. E. Chadwick to act as a committee for this purpose.

Community Planning—The general secretary reported that the Central Mortgage and Housing Corporation had arranged for a conference to be held in Ottawa on June 25th and 26th, to discuss the possibility and advisability of establishing a community planning association. The notice indicated that each of the provinces would be represented as well as several societies, including the Royal Architectural Institute and the Engineering Institute. Mr. Wright reported further that the Institute's representatives would be R. L. Dobbin, of Peterborough, chairman of the Institute's Committee on Community Planning, N. B. MacRostie, consulting engineer, and Alan Hay, chief engineer of the Federal District Commission, both of Ottawa, and himself.

The general secretary pointed out that this conference tied in very nicely with the resolution passed at the May meeting of Council in which provincial conferences of engineers were suggested. He was of the opinion that following the national conference the provincial conferences would seem to be a natural development.

It was noted that in the list of provincial delegates there was no representation from the province of Quebec, and the hope was expressed that such a representative would be appointed in time to attend the conference.

A general discussion followed dealing principally with the fact that not many engineers were available for consultation on community planning. Many were interested in the subject but were employed full time usually by some government office. It was pointed out, also, that those consulting engineers who were interested in the field were so busy that it was almost impossible for them to take on additional assignments. Mr. Lalonde was of the opinion that engineers could be found in the province of Quebec who could handle further work of this kind.

Mr. Saunders expressed the opinion that it would be helpful if engineers would take a more prominent part in public discussions on community planning. As there are a great many badly conceived plans he thought the public should have the benefit of the engineer's critical opinion. As an example, he referred to one member of the Institute who publicly had taken a very strong stand against a plan which was being considered by his community.

The meeting agreed that the resolution with regard to provincial conferences of engineers on community planning should be pushed to the limit.

National Capital Planning Committee—The general secretary presented a letter from F. E. Bronson, M.E.I.C., of Ottawa, chairman of the Federal District Commission, stating that the government had established a National Capital Planning Committee which was to be responsible for the replanning of the city of Ottawa. He invited the Engineering Institute to have two official representatives on that committee. Council accepted the invitation and the names of five members were selected to be contacted by the general secretary in the order established by Council in the hope that two of the five would be able to act.

Harry Bennett Educational Fund—A report was presented from Mr. Heartz, a member of the committee, which indicated that the collection of the fund was proceeding in a reasonably satisfactory way. Several branches have not reported to the committee but those that have, in some instances, have far exceeded their quotas and in others are well on their way to meeting their quotas. Mr. Heartz' report pointed out that in those branches where canvassers had actually seen the members whose names were on their list, complete success had been attained, but that in other branches that had relied on telephone calls and circular letters, less favourable results had followed. The report stated that the committee was confident that the objective of $25,000.00 would be obtained.

At this point, following a custom established at the May meeting in Trail, the president asked Vice-President Manock to take the chair.

Committee on Professional Interests—Mr. Stirling, chairman of the committee, stated that there was no formal report to be made. The various matters before the committee had been studied further but no meetings had been held because of the absence of himself and other members of the committee from Montreal. He pointed out, however, that he had had several reports from western branches indicating that the president's visit had promoted closer relationships with the association in each province. The reports he had received following the president's visit had been very encouraging.

The general secretary reported that the returns from the canvass of the Ontario members regarding a provincial division showed that out of 1,360 notices sent out, 621 had been returned approving of the division. The by-laws require that a majority of fifty per cent of the corporate members in the province approve the proposal, which indicated that in this case 681 replies would have to be received. The general secretary reported that during the president's visits to the branches at the Lakehead, Sault St. Marie and Sarnia, there had been several inquiries with regard to the purpose of the provincial division. It seems that members do not wish to support the proposal if it indicated any tendency towards separatism. Mr. Saunders reported that similar doubts had been in the minds of several members of the Ottawa branch.

It was agreed that the *Engineering Journal* in its next issue, should carry a message which would indicate to members that in making the proposal there was no thought of separating the provinces.

Sixtieth Anniversary, 1947—At the May meeting of Council it had been decided, subject to approval by the Toronto Branch, that the 1947 annual meeting, which would mark the sixtieth anniversary of the Institute, would be held in Toronto on April 18th and 19th. A letter from the Toronto Branch indicated that these dates were not wholly acceptable as they coincided with the examinations at the university. The only other dates available at the hotel were May 8th and 9th. These were acceptable to the branch, and on the motion of Mr. Eadie, seconded by Mr. Currie, it was unanimously resolved that the dates of May 8th and 9th be approved for the adjourned annual meeting and that the formal meeting be held at Headquarters in January as usual.

Wartime Bureau of Technical Personnel—The general secretary read a report from L. C. Jacobs, one of the Institute's representatives of the Advisory Board of the Wartime Bureau of Technical Personnel. This dealt with a meeting of the Board held in Ottawa on May 21st. It pointed out that the main purpose of the meeting had been to recanvass the Minister of Labour with regard to continuing the work of the Bureau. The report pointed out that as the Council of the Institute had, by resolution, indicated its opinion that in the interests of economy the Bureau should be discontinued at an early date, Mr. Jacobs had continued to make the same representations. However, the majority were of the opinion that some efforts should be made to preserve the man-power register of the Bureau and to continue the employment service for technical personnel. Eventually, the meeting agreed unanimously to support a further report to the Minister recommending—

1. That provision be made for the maintenance and efficient use of the roster of scientific and technical personnel.
2. That in any employment service established for scientific and technical personnel, the direction shall be fully qualified scientifically and technically and the staff salary scales shall be commensurate with those of the prospective employees they are to serve.

The report also states, "We are not at the moment concerned as to the aegis under which the above two functions are carried on. We are concerned only with the essential objectives and the efficient use of government money expended in attaining them".

Mr. Jacobs' report and the minutes of the meeting of the Advisory Board were studied further and it was pointed out that it was difficult to see how the personnel records could be kept up to date without some compulsory legislation, but Council was agreeable to an effort being made, particularly in view of the unanimous support given to the proposal by the Advisory Board of the Bureau. Eventually, it was moved by Mr. Stirling, seconded by Mr. Eadie, and carried unanimously, that Mr. Jacobs' report be received and that Council agree with the action taken.

National Construction Council of Canada—Mr. Muntz, as chairman of a special committee appointed by the president, reported as follows:

"Your committee, appointed pursuant to Minute 4548, consisting of Past-President Dr. J. M. R. Fairbairn, Dr. P. L. Pratley, J. B. Stirling, with the writer as chairman, reports as follows:

Re Minutes 4546 and 4547

The committee feels that the N.C.C. is not a suitable body to handle construction controls. This opinion is predicated upon the following:

1. The N.C.C. has neither adequate funds nor suitable organization.
2. It is not an executive body.
3. It has no corporate membership.
4. It consists of representatives of national bodies in the construction field and these representatives have no power to commit the bodies they represent.
5. It is virtually a conference committee, the sphere of usefulness being limited probably to the extent each representative is able to mould the policy of his autonomous body along lines in co-operation with or complementary to others.
6. It should not act as a mouthpiece without prior approval of all the constituent bodies.

Re Minute 4549

Standards for building materials and standards in the building and construction fields in general fall within the scope of the Canadian Standards Association in which the Institute has representation on practically every committee as well as being represented on the executive by Dr. P. L. Pratley.

The C.S.A. has done splendid work in the specifications and approvals fields relating chiefly to quality of the more technical materials as well as some common building materials. Little has been done in Canada towards standardization of sizes and correlation of dimensions of products entering into construction.

This committee agrees with the N.C.C. that "some study should be given to the possibility of standardizing building materials", and recommends—

1. That the C.S.A. is the appropriate body to undertake such a study;
2. that the request to the C.S.A. should come from those primarily concerned with the manufacture of building products and their installation;
3. that the Institute should be ready to endorse such a request.

The committee also suggests that the constituent bodies forming the N.C.C. should express individually their views to the C.S.A. and that the N.C.C. might appropriately make this suggestion to its constituent bodies. It should not express a direct opinion on behalf of others."

On the motion of Mr. Stirling, seconded by Mr. Dunbar, it was unanimously resolved that this report be accepted.

Mulberry Exhibition—The general secretary reported that following the May meeting in Trail he had been in communication with the Hudson's Bay Company officials with regard to the possibility of having the Mulberry Exhibition in Halifax. After due consideration the company reported that they could not accept the recommendation and that arrangements had been made to have the models shipped back to England from Victoria.

An effort was then made to bring the matter to the attention of higher officials to see if the tour could not be completed as planned originally. These negotiations included an exchange of cablegrams with the Right Hon. W. L. Mackenzie King, who was then in England, and the Canadian High Commissioner, and further telephone conversations with the Hudson's Bay Company in Winnipeg, all of which resulted in the company maintaining its decision not to proceed any further with the exhibition.

The general secretary pointed out that it was unfortunate from the Institute's point of view that the company had thought the attendance did not warrant the continuation of the tour, but that as the company was handling the finances exclusively, there was nothing the Institute could do. Therefore, reluctantly, notice had been sent to the branches at Quebec, Saint John and Halifax that all arrangements would have to be cancelled.

At this point, President Hayes resumed the chairmanship of the meeting.

Maritime Professional Meeting—A request was presented from the Halifax Branch for a grant of $250.00 to assist in meeting the expenses of the Maritime Professional Meeting to be held in Digby, Nova Scotia, on September 5th, 6th and 7th, 1946, under the auspices of the Associations of Professional Engineers of Nova Scotia and New Brunswick and the maritime branches of the Institute.

The Finance Committee pointed out that some time ago a decision had been made by Council not to make advance grants for an annual meeting and the committee felt that in this instance the same practice should be followed, but in view of the presence at the Council meeting of the president and the councillor from the Halifax Branch it was decided to make no recommendation until Council could consider the whole subject.

It was pointed out that it is not customary for a branch to have to pay out money as part of the expenses of an annual or a professional meeting before revenue is received from the sale of tickets. Thus it has been found that the advance financing was not required. The general opinion of the meeting was that everything possible should be done to encourage the maritime members and although it had been arranged that the meeting would be a joint one between the Associations of Professional Engineers in Nova Scotia and New Brunswick and the Institute, it was felt that the Institute should indicate immediately its readiness to meet its share of any deficits.

Mr. Currie, councillor of the Halifax Branch, indicated that there had been some doubt in the minds of the committee members in Halifax with regard to this advance. It had been noticed in the minutes of the professional meeting of 1939 that such an advance had been made and therefore the committee thought they had been following the established procedure. The general secretary read portions of a letter from the secretary treasurer of the Halifax Branch in which comment was made on the joint sponsorship of the professional meeting. It was pointed out that the 1939 meeting had been exclusively an E.I.C. affair but that the committee thought it would be better in this instance to make it a joint meeting. The letter bore out Mr. Currie's observations with regard to the question of advance financing and of sponsorship, and, eventually, the general secretary was instructed to advise the secretary of the Halifax Branch that while an accountable advance would not be made, the Institute was fully prepared to meet its responsibilities. At the same time Council asked that its good wishes be transmitted to the branches, and several individuals indicated that they would endeavour to attend the meeting.

Amendments to the By-laws—On the motion of Mr. Dunbar, seconded by Mr. Flitton, it was unanimously resolved that the recommendations of the Finance Committee regarding the application of the new fees to applications for admission and for transfer be approved.

E.C.P.D. Booklet—A communication from the chairman of the Engineers' Council for Professional Development was presented which outlined a proposal to publish a special booklet to commemorate the fifteenth anniversary of the Council. The main purpose of the booklet was to inform industry of the work of E.C.P.D. to the end that a fund might be established, perhaps $250,000.00, which would enable E.C.P.D. to extend its work, particularly in the research field. A dummy of the booklet was circulated to the councillors from which it was seen that the thirty-five pages contained a great fund of vital information dealing with the profession and with the eight constituent organizations. It was the opinion of councillors that this was a most worthwhile object and that the Institute should agree to carry its share of the cost as recommended by the Finance Committee. It was planned to have an edition of 10,000 to cost about $3,000.00.

Quebec Agreement—A communication was presented informing Council that the Council of the Corporation of Professional Engineers of Quebec had appointed Messrs. Ernest Lavigne, G. H. Midgley and E. R. Chadwick as the Corporation's representatives on the joint committee provided for in Clause 9 of the agreement for the purpose of exploring the possibilities of simplification of existing arrangements for the collection of fees and the possibilities of reduction of total fees payable by those who hold membership in both the Institute and the Corporation. It was suggested that the Institute should appoint its three representatives on this committee.

Mr. Lalonde pointed out that at the March, 1945, meeting of Council three Institute representatives had been appointed to this committee. On the motion of Mr. Eadie, seconded by Mr. Dunbar, it was unanimously resolved that these three representatives, namely Messrs. J. B. Stirling, Andre Benoit and J. A. Lalonde, be reappointed as the Institute's representatives on the joint committee provided for in the agreement.

It was noted that Mr. Ernest Lavigne had been reappointed as the Corporation's representative on the Institute Council.

Joint Finance Committee in New Brunswick—The general secretary presented a letter from which it was noted that the Association of Professional Engineers of New Brunswick had appointed G. M. Brown, of Saint John, and E. B. Martin, of Moncton, as the Association's representatives on the joint finance committee provided for under the terms of the cooperative agreement. On the motion of Mr. Dunbar, seconded by Mr. Currie, it was unanimously agreed that the general secretary should write to the Saint John and Moncton branches requesting nominations to the joint finance committee and that the appointment of the Institute's representatives on this committee be left to the president.

Additional Councillor for Montreal Branch—A letter was presented from the secretary of the Montreal Branch pointing out that as the corporate membership of the branch is now over 1,200 the branch is entitled to an additional councillor, making a total of seven. The general secretary was instructed to inform the branch that it would be in order for them to submit to the chairman of the Nominating Committee the name of an additional nominee for councillor.

Admissions Committee—The general secretary outlined briefly the purposes of the new Admissions Committee, provision for which is made in the recent amendments to the by-laws. As a standing committee, the chairman must be a member of Council, and as most of the work will have to be done in collaboration with Headquarters, it was desirable that a Montreal councillor be selected. Some discussion followed as to the size of the committee and its membership, and it was finally unanimously agreed that an Admissions Committee of five be established; that Mr. C. A. Peachey be asked to accept the chairmanship of the committee, and that he be empowered to select the other four members, the committee to act until the next meeting of Council when the names could be submitted for formal approval.

Julian C. Smith Medal—Discussion took place as to the desirability of making additional awards of the Julian C. Smith Medal at the time of the Sixtieth Anniversary Meeting. The rules provide that not more than two awards shall be made each year, but that, by resolution of Council, additional awards may be made on special occasions. The opinion of Council appeared to be that the standard of the medal should not be lowered by making any large number of awards, and, on the motion of Mr. Lalonde, seconded by Mr. Eadie, it was unanimously agreed that no additional awards be made.

The general secretary was instructed to submit to the Julian C. Smith Medal Committee the nominations received for the 1946 award so that the final selection may be made.

Honorary Memberships—A suggestion that it might be appropriate to confer some honorary memberships at the Sixtieth Anniversary meeting received unanimous support, and, on the motion of Mr. Dunbar, seconded by Mr. Lalonde, it was unanimously resolved that a letter be sent to the branch secretaries informing them that Council is considering the possibility of conferring some honorary memberships at the time of the sixtieth anniversary meeting, and asking the branches to submit any suggestions they may have, the notice to the branches to include an outline of the qualifications for honorary membership.

Engineers' Council for Professional Development—It was unanimously agreed that Dr. C. R. Young be renominated as the Institute's representative on the Engineers' Council for Professional Development for a term of three years commencing in October, 1946.

President's Visit to the Branches—The president reported that he had now completed visits to all branches of the Institute west of and including Toronto. He had experienced the utmost in hospitality and in kindness at every centre. All branches were active and enthusiastic and the Institute was held in very high esteem. He referred also to the splendid reception which he had received at the semi-annual meeting of the American Society of Mechanical Engineers held in Detroit, June 17th to 19th. There were many references to the Institute from the officers and the speakers which indicated to him the high regard in which the Institute was held by its sister societies in the United States. He pointed out also the great responsibility that rests with the Council of the Institute in view of the fact that members everywhere look to Council for leadership and readily accept its decisions. He thought this placed Council in a unique position as leader for the profession.

Date of next Meeting—It was agreed that unless there was some urgent business requiring immediate attention no meeting of Council would be held during the month of July. It was suggested that instead of holding a meeting in August it might be possible to hold it in Digby, Nova Scotia, at the time of the maritime professional meeting. It was finally agreed that it be left with the president, in consultation with other officers of the Institute, to decide upon the date and place of the next meeting.

The Council rose at four forty-five p.m.

ELECTIONS AND TRANSFERS

A number of applications were considered and the following elections and transfers were effected.

Members

Andrews, Samuel Warren, Mech. Engr., (Cornell), president, H. G. Acres & Co., Niagara Falls, Ont.

Campbell, Donald William, B.Sc., (Mech.), (Queen's), sales engr., T. C. Chown Ltd., Montreal, Que.

Campbell, James Douglas, B.Sc., (Chem.), (Queen's), mgr., Chemical Lime Limited, Beachville, Ont.

Cooke, Donald Norry, B.A.Sc., (Elect.), (Toronto), genl. mgr. and Secretary, Soft Water Supply Ltd., London, Ont.

Critchley, John Churchill, B.Eng., (N.S. Tech. Coll.), Asst. elect. supt., Page-Hersey Tubes Ltd., Welland, Ont.

Davison, William Eric, B.Sc., (Elect.), (N.S. Tech.), asst. supt., sub-stn. divn., Shawinigan Water & Power Co., Montreal, Que.

Eggertson, Sigurdur Hjalti, B.Sc., (Elect.), (Manitoba), distribution engr., Winnipeg Electric Co., Winnipeg, Man.

Elford, Glenn Earl, B.A.Sc., (Toronto), engr., St. Clair Processing Corp., Ltd., Sarnia, Ont.

Gooch, Peter William, B.A.Sc., M.A.Sc., (Aero.), (Toronto), chief eng., Canadair Limited, Montreal, Que.

Grosvenor, Frank, B.A.Sc., (Toronto), asst. engr., Hydro-Electric Power Commission of Ontario, Toronto, Ont.

Hartwick, Elbert Frederick, B.Eng., (Chem.), (McGill), engr., The Aluminum Co. of Canada, Arvida, Que.

Hiscocks, Richard Duncan, B.A.Sc., (Toronto), asst. research engr., The National Research Council, Ottawa, Ont.

Lyons, Joseph Harvey Kent, B.Sc., (Elect.), (Manitoba); B.Eng., (Mech.), McGill, scheduling dept., Canadian General Electric Co., Peterboro, Ont.

McLachlan, Robert Angus, S.B. (Naval Arch. & Marine Engrg.), (Mass. Inst. Tech.), chief dftsman., Dominion Bridge Co., Ltd., Vancouver, B.C.

Nicholas, Gordon Alfred, B.Sc., (Civil), (Manitoba), engr., Cowin & Co., Ltd., Winnipeg, Man.

Shepherd, Herbert Lawrence, B.A.Sc., (Elect.), (Toronto), asst. to director of studies, Faculty of Applied Science & Engrg., Ajax, Univ. of Toronto, Ajax, Ont.

Simmons, Dwight Sylvester, B.Sc., (Mech.), (Queen's), asst. mgr., St. Clair Processing Corp. Ltd., Sarnia, Ont.

Smuck, Frederick Harold, B.Sc., (Mining), (Queen's), jr. engr., Hydro-Electric Power Commission of Ontario, Toronto, Ont.

Spigelman, Max, B.Sc., (Elect.), (Manitoba), street lighting engr., City of Winnipeg Hydro Electric System, Winnipeg, Man.

Thornber, William, B.A.Sc., (Mech.), (British Columbia), School of Graduate Studies, Univ. of Toronto (Canadian Lumberman's Association Timber Research Fellowship).

Tuck, Albert Edward, B.A.Sc., (Toronto), elect. test engr., Steel Co. of Canada Ltd., Hamilton, Ont.

Welch, Donald Herbert, B.A.Sc., (Chem.), (Toronto), asst. supervisor, Butadene plant, Polymer Corporation, Sarnia, Ont.

Juniors

Balshaw, Frank Ewart, Calgary Power Co., Ltd., Calgary, Alta. (Has passed the Institute's examinations.)

Beecher, Keith Davidson, B.Eng., (Elect.), (McGill), patent examiner, Canadian Patent office, Ottawa, Ont.

McLean, Donald D., B.Sc., (Elect.), (Queen's), radio engr., Canadian Marconi Co., Montreal, Que.

Ransom, George Edgar McKee, B.Eng., (McGill), asst. to master mtce. mechanic, Beauharnois Light, Heat & Power, Beauharnois, Que.

Walker, Harley Havelock, B.Eng., (Mech.), (N.S. Tech.), Lieut., R.C.E.M.E., (now discharged), Milton, Queen's County, N.S.

Wilson, Robert Galbraith, (N.S. Tech.), service engr., service dept., Canadian Westinghouse Co., Ltd., Hamilton, Ont.

Wurtele, Douglas Barnett, Graduate, (R.M.C.), Officer, Test & Development Unit, R.C.A.F., Ottawa, Ont.

Transferred from the class of Junior to that of Member

Bridgewater, Albert Williams, B.Sc.; B.Sc.; M.Sc., (Civil), (Saskatchewan), structl. designer and dftsman., office of chief engineer, Canadian Pacific Railway Co., Montreal, Que.

Hammond, Rowland Ernest, M.A.Sc., (Toronto), co-ordinator, radio communications divn., Dominion Electrohome Ind. Ltd., Kitchener, Ont.

Lingley, Harold Percy, B.Sc., (Civil), (N.B.), asst. engr., Public Works Dept., Canada, Saint John, N.B.

Noonan, Richard, B.Sc., (Elect.), (Manitoba), pres. & genl. mgr., Pioneer Electric Limited, Winnipeg, Man.

Rouc, John Edward, B.Eng., (Elect.), (N.S. Tech.), A Lieut. Cdr. (L), R.C.N.V.R., Halifax, N.S.

Schofield, Robert John Graham, B.Eng., (Chem.), (McGill), Pearl St., Somerville, N.J. (recently dyer and chemist, Canadian Cottons Ltd., Hamilton, Ont.).

Timms, Reginald Harold, B.A.Sc., (Civil), (Toronto), vice-pres. and asst. mgr., Timms Construction, Welland, Ont.

Transferred from the class of Student to that of Member

Brown, George Cameron, B.Eng., (Elect.), (McGill), designer, plant engrg., Bell Telephone Co. of Canada, Quebec City, Que.

Dessaulles, Jean, B.Sc., C.E., (Ecole Poly.), industrial power sales engr., C. & D. dept., Shawinigan Water & Power Co., Three Rivers, Que.

Gordon, John Abraham, B.Eng., (McGill), training course, Canadian General Electric Co., Peterboro, Ont.

Taylor, Harry, B.Sc., (Mech.), (Sask.), service engr., Aluminate Chemicals Ltd., Moncton, N.B.

Walker, Howard James, B.Sc., (Elect.), (McGill), distribution engr., Shawinigan Water & Power Co., Three Rivers, Que.

Transferred from the class of Student to that of Junior

Geake, Lloyd Woodrow, B.Sc., (Sask.), Lieut., R.C.E.M.E., (now discharged), 389 Douglas Ave., Toronto 12, Ont.

Peckover, Frederick Lionel, B.A.Sc., (Civil), (Toronto), jr. research engr., National Research Council, Ottawa, Ont.

Richards, James Leslie, B.Sc., (Elect.), (Queen's), Lieut., R.C.E.M.E., Billings Bridge, Ottawa, Ont.

Ward, John, B.A.Sc., (Toronto), jr.engr., Ontario Hydro-Electric Power Commission, Toronto, Ont.
Wilkins, Ernest Bertram, B.Sc., (Civil, (Alberta), Lieut., R.C.E., Lethbridge, Alta.
Wrong, James Stuart, B.Sc., (Civil), (Queen's), engr., F. E. Cummings, genl. contractor, Ottawa, Ont.

Admitted as Students

Borth, Laurence A., (Queen's), 81 Nelson St., Kingston, Ont.
Bradford, James Walter, B.A.Sc., (Civil), (Toronto), 17 Morton Rd., Toronto, Ont.
Baker, J. D. (Univ. of Toronto, Ajax), 35 Fairleigh Crescent, Toronto, Ont.
Carrol, John Murray, (Queen's), 118 Earl St., Kingston, Ont.
Clermont, Louis-Philippe, B.Eng., (Chem.), (McGill), Mgr., Pointe Claire Lumber Co., Ltd., Pointe Claire, Que.
Davis, Donald Frederick, (Toronto), Northern Electric Co., Montreal, Que.
Haflidson, R. S., Senator-Rouyn Limited, Noranda, Que.
Love, Andrew Eric Armour, (N.S. Tech.), 35 Whitney Ave., Sydney, N.S.
Neale, William A., B.Sc., (Mech.), Toronto, Link-Belt Ltd., Toronto 8, Ont.
Oliphant, William John, B.A.Sc., (Mech.), 22 Classic Ave., Toronto, Ont.
Ross-Ross, Philip Arthur, (McGill), 516 Sydney St., Cornwall, Ont.
Scott, Ivyl M., B.Sc., (Civil), (Alberta), 1140-7th St., Santa Monica Calif.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective:

Alberta

Member

Webster, Gordon William B.Sc., (Chem. Engrg.), Alberta, prod. engineer, Home Oil Co., Limited, Millarville, Alta.

Saskatchewan

Juniors

Edwards, John Bevan, B.Sc., (Mech.), Lieut., R.C.E.M., 120-8th St., E., Saskatoon, Sask.
Middleton, Jack Spencer Gordon, asst. city engr., City of Swift Current, Sask.
Treleaven, Leonard James, B.Eng., (Agri.), Sask., jr. hydraulic engr., P.F.R.A., Swift Current, Sask.
Watson, Howard Douglas, B.Sc., (Geo.), Sask., asst. engr., Mines Branch, Dept. of Natural Resources, Regina, Sask.

Students

Buhr, Donald Alan, (Saskatchewan), Langham, Sask.
Daniels, Ray Percy Levi, (Sask.), 96 First Ave., Yorkton, Sask.
Robb, Murray Doig, (Sask.), 42 - 20th St., Prince Albert, Sask.
Saldat, John Hans, B.Sc., (Mech), Sask., 327 Ave. "J", Saskatoon, Sask.

Student to Junior

Holmes, Loyde Thomas, B.Sc., (Civil), Sask., res. engr., Dept. of Highways, Regina, Sask.

Nova Scotia

Members

Devereaux, William Allan, B.Sc., (Mech.), Toronto, branch mgr., Bailey Meter Co., Ltd., Halifax, N.S.
Keddy, Harry MacKay, sales engr., Wm. Stairs Son & Morrow Ltd., Halifax, N.S.
Lahey, J. Walter, B.Sc., (Civil), N.S. Tech. Coll., Town Engineer, Dartmouth, N.S.
Paul, Roy Barry, B.A.Sc., Toronto, engr., Canadian Gypsum Co., Ltd., Halifax, N.S.

New Brunswick

Member

Isner, Bennett W., B.Eng., (Elect.), N.S. Tech. Coll., Canadian Gypsum Co., Ltd., Hillsboro, Albert County, N.B.

Junior to Member

Davis, Samuel, B.Sc., (Civil), N.B.; M.Sc., (Structl.), M.I.T., c/o H. F. Weigel, Saint John, N.B.

Student to Member

Levesque, Paul Carmel, B.Sc., (Elect.), N.B., district elect. engr., New Brunswick Electric Power Commission, Grand Falls, N.B.

Student to Junior

Colpitts, Rolfe Reynolds, B.Eng., (Mech.), N.S. Tech. Coll., Lieut., R.C.E.M.E., Sussex, N.B.

Affiliate to Member

Hargreaves, Welsford Thomas, resident engr., i/c constrn., Dartmouth Airport, Hillsboro, Albert County, N.B.

Quebec

Junior to Member

Hammon, Ernest Roy, B.Sc., Manitoba; Graduate, R.M.C.; S.M., (Civil), M.I.T., engr., H. E. McKeen & Co., Montreal, Que.

Personals

News of the Personal Activities of members of the Institute

E. D. Gray-Donald, M.E.I.C., was elected president of the Canadian Transit Association at its Forty-First Annual Meeting held at the Fort Garry Hotel in Winnipeg on June 13th. He is chief engineer, Quebec Power Company and Quebec Railway, Light & Power Company. Born in Amoy, China, in 1900, he was educated at George Watson's College, Edinburgh, Scotland, McGill University, Montreal, and Laval University, Quebec, obtaining the degree of B.Sc. (Elect.) at McGill in 1926, and that of M.Sc. at Laval, in 1934. He entered the service of the Quebec Power Company and Quebec Railway, Light and Power Company in 1926 as assistant engineer, and his subsequent appointments have been as follows: 1928—assistant superintendent, Power Division; 1930—superintendent, Power Division; 1937—assistant general superintendent; 1938—general superintendent; 1942—chief engineer.

H. S. Van Scoyoc, M.E.I.C., retired from the Canada Cement Company Limited at the end of June. He has been advertising manager for the firm for many years, having joined it in 1912 as inspecting engineer. He was later given charge of the consulting engineer service and promotional departments, while serving also as consulting engineer to the Toronto-Hamilton Highway Commission. In 1930 he was appointed manager of publicity and at his retirement he was advertising manager. He is prominent in advertising affairs, having been president of the Association of Canadian Advertisers, of the Montreal Publicity Association, of the Associated Advertising Clubs of the World and the Canadian Advertising and Sales Association.

Dr. Charles Camsell, M.E.I.C. has been awarded the founders' medal of the Royal Geographical Society for 1945 in recognition of his contribution to the geology and geography of the Canadian north and for his work in advancing geographical science in the Dominion.

Dr. R. S. L. Wilson, M.E.I.C., is retiring as dean of the faculty of applied science of the University of Alberta. He joined the university staff in 1919 as professor of civil and municipal engineering, receiving the appointment as dean in 1929. He is a graduate of McGill University, Montreal, and lectured there in mathematics and civil engineering from 1916 to 1919. He was on the council of the Institute from 1922 to 1924 and in 1929.

A. M. Hudson, M.E.I.C., has been appointed chief of the mechanical division of War Assets Corporation, with headquarters in Montreal.

Mr. Hudson is from Norfolk, England, and was articled in engineering. He came to Canada in 1910 to begin an extensive career in sales, engineering and construction work at Montreal, Toronto and elsewhere, including service with the Ontario Government. In 1940 he joined the Department of Munitions and Supply becoming chief of the gauges division and chief of the central inventory records division. In December 1944, Mr. Hudson joined War Assets Corporation as administrative engineer in the real estate division, and in July 1945 was transferred to the mechanical division. He served in World War I with the C.E.F., being demobilized as a captain after four years service.

LeSueur Brodie, M.E.I.C., has recently been promoted to the position of general sales supervisor for the Bell Telephone Company of Canada's western area with headquarters in Toronto. Mr. Brodie joined the army with the rank of captain in September, 1939, when "B" Corps signals, R.C.C.S. was being formed in Montreal. He re-enlisted in 1941 after a short time in civilian life, gaining his majority in September 1942. A lieutenant-colonel in 1943, he served overseas and in Canada as technical staff officer, grade 1, in charge of telecommunications with the Royal Canadian Electrical and Mechanical Engineers.

Mr. Brodie graduated from McGill University, Montreal, with a B.Sc. in engineering physics in 1926 and subsequently served in the Bell Telephone Company's engineering department until 1931, when he was transferred to Toronto as division sales engineer. In 1935 he became exchange rates engineer at Montreal, where he remained until his enlistment. During 1940 and 1941 he was manager at Brantford and, latterly, he has been Toronto Division sales manager.

(Fryer)

W. H. Small, M.E.I.C.

W. H. Small, M.E.I.C., has been elected chairman of the Lakehead Branch of the Institute. Born in Benzonia, Mich., he attended Michigan State College, graduating in 1908 with a B.Sc. degree in civil engineering. He was first employed as a manual training instructor by the school board at Port Huron, Mich., and in 1909 accepted a similar position in Louisville, Ky. He came to Canada in 1912 as draughtsman for Barnett-McQueen Construction Company, Fort William, Ont., and in 1914 worked with C. D. Howe as designing engineer. Back in the United States in 1916 he was draughtsman for the Webster Manufacturing Company at Tiffin, Ohio, until his return to Canada and to the Barnett McQueen company as chief draughtsman in 1917. He was promoted in 1934 to chief engineer and is now vice-president and chief engineer of the firm.

A. J. Girdwood, M.E.I.C., is the newly elected chairman of the Peterborough Branch of the Institute. He was born at North Bay, Ont., and studied engineering at the University of Toronto, receiving a B.A. Sc. degree in 1934. After following the Canadian General Electric Student Course in 1935 he entered that company at Peterborough, Ont., as designing engineer. He was appointed to his present position as senior engineer in 1945.

C. Brakenridge, M.E.I.C., has retired from the position of city engineer of Vancouver, B.C. Prior to his appointment in 1924, he had been for several years in private consulting practice in Vancouver after having served as assistant city engineer. He was chairman of the Vancouver Branch of the Institute in 1922, and represented the branch on the Council in 1923, 24, and 25.

A. R. Ketterson, M.E.I.C., engineer of bridges for the Canadian Pacific Railway since 1937 and an engineering department employee for thirty-nine years, retired recently. Born at Greenock, Scotland, in 1881, he received his education at Glasgow, finishing at the Royal Technical School there. He retired from a distinguished army career in 1919 with the rank of major. His first position with the C.P.R. was as bridge inspector in Montreal in 1907.

G. E. Shaw, M.E.I.C., will succeed Mr. Ketterson as engineer of bridges for C.P.R. at Montreal. He has been assistant engineer of bridges since 1941 and associated since 1925 with Canadian Pacific. He is from Windsor, Ont., and received his early education in the border city. He graduated from McGill University with the degree of Master of Science in civil engineering and joined the C.P.R. at Montreal in May 1925 as a draughtsman.

A. C. Northover, M.E.I.C., is employed as development engineer with the North Over Canada Product Promotion at Toronto. He had previously been designing engineer with the Marathon Pulp Mills of Canada at Toronto.

W. B. Scoular, M.E.I.C., has accepted a position with the Ontario Paper Company Limited at Thorold, Ont., having severed connection with the Powell River Company Limited in Vancouver, B.C., where he had been located since 1944.

Dr. Karel B. Rybka, M.E.I.C., has taken over the consulting practice of the late Walter J. Armstrong, M.E.I.C., in Toronto. He has been in charge of the Toronto office since 1934.

Albert Leduc, M.E.I.C., who after six years of service with the Canadian Army recently retired with the rank of lieutenant-colonel, has returned with the engineering division of the City of Montreal. He is responsible for the modernization of street lighting.

J. F. Cunningham, M.E.I.C., who has been with the Department of Public Works of Canada as senior inspector of dredges with headquarters at Selkirk, Man., has been transferred to Edmonton, Alta. Retaining his position as senior inspector of dredges, he is now in the Edmonton district engineer's office and will be concerned with development and maintenance of navigation on the MacKenzie River.

W. E. Locke, M.E.I.C., has been appointed assistant resident manager at the Ocean Falls plant of Pacific Mills Limited. A graduate in mechanical engineering of the University of British Columbia, he was formerly resident engineer for the firm.

R. S. Lawrence, M.E.I.C.

R. S. Lawrence, M.E.I.C., the newly elected chairman of the Lethbridge Branch, is from Sydenham, London, England. He studied at the Crystal Palace Engineering School and gained admission to the Institution of Civil Engineers, London, England. He travelled to Portuguese S.W. Africa in 1909 and was assistant engineer for the Benguella Railway Company and proceeded in 1911 to Venezuela, South America, where he was assistant engineer for the Bolivar Railway Company for a year. In Canada, from 1913 to 1915, he was surveyor and draughtsman for the City of Calgary, when he enlisted in the C.E.F., serving as a lieutenant until 1917. He entered the employ of the Canadian Pacific Railway as assistant engineer in the Department of Natural Resources at Lethbridge, Alta., in 1917 and remained with the firm in the Irrigation Office at Lethbridge until April this year. With the Alberta government, Department of Water Resources, Mr. Lawrence is now superintendent of the northern division of the St. Mary and Milk River Development.

A. R. Hailey, Jr.E.I.C., has been appointed secretary-treasurer of the Peterborough Branch of the Institute. Born at Vancouver, B.C., he attended the University of British Columbia, receiving a B.A. Sc. degree in 1941. The same year he entered the employ of Canadian General Elctric Company as testman at Peterborough, Ont., where he is still located.

F. G. Haven, M.E.I.C., has transferred from the Dominion Department of Public Works, Winnipeg, to the Dominion Department of Mines and Resources, engineering and construction service. He is located temporarily at Grimshaw, Alta., as inspecting engineer on the Dominion-Provincial section of the Grimshaw-Great Slave Lake highway project.

R. F. P. Bowman, M.E.I.C., who was with the railway troops, R.C.E. overseas has now returned to the Canadian Pacific Railway at Brandon, Man.

W. J. Bright, M.E.I.C., who was overseas with the R.C.E. for four and a half years and won the D.S.O. in Italy, has returned to his previous position with the Canadian Johns-Mansville Co. Ltd., as sales engineer for Western Canada.

H. P. Cadario, M.E.I.C., has returned from the army to the Hydro Electric Power Commission of Ontario at Toronto.

W. A. Capelle, M.E.I.C., who went overseas with the R.C.E. in 1940 and returned as a lieutenant-colonel in 1945, has resumed his position in the Department of Public Works of Canada at Winnipeg, Man.

J. R. Carson, M.E.I.C., who was overseas with the R.C.E., has accepted a position with the National Harbours Board at Halifax.

C. B. Charlewood, M.E.I.C., has been discharged from the army and can be reached through British Columbia House in London, England.

H. G. Conn, M.E.I.C., who served overseas as a lieutenant-colonel in the R.C.E.M.E., has returned to the staff of Queen's University, Kingston, Ont.

Charles Hershfield, M.E.I.C., has been discharged from the R.C.N.V.R. and appointed to the staff of the University of Toronto as a special lecturer.

E. S. Kent, M.E.I.C., who served in the R.C.E., has returned to his former position as chief engineer with Gouin & Co. Ltd., Winnipeg.

Edward Notman Kingsland, M.E.I.C., who served in the R.C.A.F., has returned to his position with Williams & Wilson Ltd., Montreal.

Hugh Lamb, M.E.I.C., who was overseas for three years with the R.C.A.F., is now engaged in the administration of the Veterans Land Act in Montreal.

John N. Langman, M.E.I.C., has been released from the R.C.A.F., and is now with the King Paving Co. Ltd., in Oakville, Ont.

J. P. Leroux, M.E.I.C., who was overseas in 3 Bn. R.C.E. has returned to his former position with the Dept. of Transport of Canada, (Civil Aviation Branch), Montreal.

ndrew Russell, M.E.I.C., has been demobilized from the navy nd returned to Imperial Oil Limited at Sarnia, Ont.

V. D. Schofield, M.E.I.C., who served overseas for four years in e R.C.E.M.E., has accepted a position with Slack Bros. in Vaterloo, Que.

V. I. Shuttleworth, M.E.I.C., has retired from the R.C.A.F., and ccepted a position with War Assets Corporation at Winnipeg.

I. C. Sherman, M.E.I.C., has retired from the R.C.E.M.E. with e rank of colonel after thirty-five years service, and has accept- d a position with the John Inglis Co. Ltd., in Vancouver, B.C.

. H. Skelton, M.E.I.C., who served in the R.C.A.F., on the Cana- ian Joint Staff at Washington, has accepted a position with e Quebec Hydro-Electric Commission in Montreal.

. K. Smith, M.E.I.C., has been discharged from the R.C.E. and is ow with Imperial Oil Co. Ltd., in Toronto.

. W. Smith, M.E.I.C., was released from the R.C.E. to take an ppointment on the staff at the University of New Brunswick.

. W. Snyder, M.E.I.C., who was overseas for five years with the .C.E., has returned to his former position with the Canadian Vestern Natural Gas, Light, Heat & Power Co. in Calgary.

Vm. C. Wilkinson, Jr.E.I.C., has resigned his position as vice- resident and chief engineer of the Wired Radio Company of anada Limited (affiliated with Canadian Line Materials Lim- ted), Toronto, Ont. He is taking up residence in Australia and arries with him a wide experience in the communication field, aving held the position of transmitter development engineer vith the Canadian Marconi Company in Montreal for four ears after his graduation from the University of New Bruns- vick in 1937. During the war years, he was research engineer vith the radio branch of the National Research Council in Ottawa.

. S. Cuthbertson, Jr.E.I.C., is in Canton, Ohio, with the Timken Roller Bearing Company. Since October last he has been following course of training and study preparatory to assuming charge of he tool engineering department of the company's Canadian plant t St. Thomas, Ont. He had previously been a junior engineer vith Northern Electric Company Limited in Montreal, Que.

. L. T. Ellis, Jr.E.I.C., is in the employ of the Carborundum Company of Niagara Falls, N.Y., as assistant to the engineer in harge of design and maintenance of air conditioning equipment. He had been with the R.C.A.F. in Toronto, since 1943, and was ssistant engineer with Weathermakers (Canada) Limited in Tor- nto prior to his enlistment.

. E. Kirkpatrick, Jr.E.I.C., has been discharged from the R.C.A. vith the rank of major, and is now with the Consolidated Paper Corp. at Grand'Mère, Que. He joined the artillery in 1940, going verseas, and later returned to Canada to work with the United Kingdom Inspection Board. Overseas again in 1943, he worked n rocket designs and saw service with a rocket battery.

W. D. Harkness, Jr.E.I.C., is in Jalesco, Mexico, as assistant woods nanager for Cia. Industrial de Atenquique. He was formerly with he Bathurst Power and Paper Company at Bathurst, N.B.

. C. Bryce, Jr.E.I.C., who was overseas for three years in the navy, as joined the Dominion Engineering Works at Lachine.

Basil Arthur Burgess, Jr.E.I.C., has retired from the R.C.N.V.R. and ccepted a position with the Bowen Machine Co. Ltd.

A. M. Cameron, Jr.E.I.C., on retirement from the R.C.N.V.R., has resumed his connection with International Nickel Co. Ltd., at Copper Cliff, Ont.

Alastair D. Cameron, Jr.E.I.C., who served overseas with the R.C.A. as a special technical officer, is now with Dominion Bridge Co., Lachine, Que.

M. C. Caron, Jr.E.I.C., who served in the R.C.N.V.R., as an elec- trical officer, is now with the Consolidated Paper Corporation at Grand'Mere, Que.

H. V. Cosson, Jr.E.I.C., has retired from the navy and is employed at Canada Creosoting Co. Ltd., North Vancouver, B.C.

F. S. Hutton, Jr.E.I.C., who served overseas with the R.C.E. rail- way troops, has returned to his former position with the Canadian National Railways, Stratford, Ont.

John L. Jomini, Jr.E.I.C., has retired from service in the R.C.A. and is re-established in civilian life in Shawinigan Falls, P.Q.

J. McLean Jordan, Jr.E.I.C., who served in the R.C.E. overseas, has been appointed county engineer for the United Counties of North- umberland and Durham, and is located at Cobourg, Ont.

B. F. Junkin, Jr.E.I.C., has been demobilized from the navy and has joined the Bell Telephone Co. in Montreal.

R. J. Kane, Jr.E.I.C., has retired from the navy and accepted a position with the Dominion Bridge Co. at Lachine.

H. A. Lancefield, Jr.E.I.C., who served in the R.C.A.F. is now with the Matthews Conveyor Co. Ltd., in Calgary.

Cornelius Rempel, S.E.I.C., has taken a position with the Manitoba Paper Company at Pine Falls, Man.

W. A. Bowman, S.E.I.C., who served overseas in the R.C.E. with a bridge company, R.C.A.S.C., is now working for C. D. Howe Co., in Port Arthur, Ont.

J. S. Wrong, S.E.I.C., is employed as engineer for F. E. Cummings, general contractor, Westboro, Ont. He had been associated with Proctor and Redfern, consulting engineers, Toronto.

J. A. Brown, S.E.I.C., has retired from the R.C.N.V.R. and accepted a position with the Spruce Falls Pulp and Paper Co. Ltd., Kapuskasing, Ont.

D. R. S. Browning, S.E.I.C., who was under training for the C.I.C. is now with Howard Smith Paper Mills in Cornwall, Ont.

J. M. Casault, S.E.I.C., has left the army and gone to the University of Alberta, Edmonton.

R. C. Cline, S.E.I.C., has been released from the R.C.E.M.E. to return to American Car Co., Niagara Falls, Ont.

Abbey Cohen, S.E.I.C., has been discharged from the R.C.E.M.E. and is at present with War Assets Corporation in Montreal.

R. R. Colpitts, S.E.I.C., has retired from the R.C.E.M.E. and ac- cepted a position with the Canadian International Paper Co. Ltd., in Dalhousie, N.B.

K. G. Cook, S.E.I.C., who was in the R.C.A., has accepted employ- ment with Cresswell Pomeroy Co. in Montreal.

A. F. Holloway, S.E.I.C., has been demobilized from the navy and is now a lecturer on the staff at Queen's University, Kingston, Ont.

Bruce F. Johnston, S.E.I.C., has returned from overseas service with the R.C.A.F. and is continuing his studies at McGill University, Montreal.

Edward Lewis Jones, S.E.I.C., who was overseas with the R.C.E. for over four years, is now with the Phillips Petroleum Co. in Bartles- ville, Oklahoma.

C. W. Kerry, S.E.I.C., who was overseas in the R.C.A., has returned to McGill University as a student.

L. L. Langille, S.E.I.C., who served in the R.C.N.V.R., is now with the Canadian National Railways in Montreal.

J. G. Longley, S.E.I.C., has been discharged from the R.C.A. and returned to his former position with Canadian General Electric Co. Ltd., in Toronto.

E. B. A. LeMoistre, S.E.I.C., has returned from overseas, where he joined the R.C.A.F. and is now back at McGill University, Montreal.

J. H. C. Mulherin, S.E.I.C., is now employed by the Montreal Engineering Company Limited, at Montreal.

A. D. Hamilton, S.E.I.C., is now with the Ontario Paper Company at Thorold, Ont. He was formerly with the Dominion Rubber Company Limited in Montreal, Que.

S. J. Simons, S.E.I.C., recently discharged from the R.C.E. with the rank of captain, has entered the employ of the Ontario Paper Company Limited, Thorold, Ont., in the central engineering division.

John Huxley Hargrove, S.E.I.C., served overseas for three years as a meteorological officer in the R.C.E. and has now returned to C. D. Howe Co. Ltd., in Port Arthur.

Marc Hurtubise, S.E.I.C., who attained the rank of captain overseas with the R.C.E.M.E., has now returned to the Dominion Bridge Co., Montreal.

Paul Selwyn Jagger, S.E.I.C., who was in the R.C.E.M.E., is now with the Barrett Co. in Montreal.

J. H. Nicholls, S.E.I.C., after service in the army has gone to South America. He is at Guayaquil in Ecuador.

J. R. O'Grady, S.E.I.C., who was under training for the R.C.E., re- turned to complete his course at Queen's University in 1946.

D. W. Patterson, S.E.I.C., has retired from the R.C.N.V.R., and accepted a position with the Aluminum Co. of Canada Ltd. in Toronto, Ont.

R. L. Payne, S.E.I.C., who served for a year and a half in the Merchant Navy, is attending McGill University.

J. N. Proulx, S.E.I.C., who served in the R.C.E.M.E., is now with the Department of Public Works, Quebec.

R. A. Ritchie, S.E.I.C., has been discharged from the R.C.E.M.E., and accepted a position with Canadian & Dominion Sugar Co. Ltd., in Montreal.

Ivan F. Ranolds, S.E.I.C., has been discharged from the R.C.A.F. and is now employed with the H.E.P.C. of Ontario.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here:

Simon Fraser McLeod, M.E.I.C., senior inspector of boilers in the Calgary district for the Provincial Government, died suddenly at his home in Calgary on Friday, May 17th, 1946.

Mr. McLeod was born in Westville, N.B., in 1889. He moved to Rossland B.C., in 1903, and later to Coleman and Lethbridge, Alta., where he entered the Department of Public Works of Alberta in 1928, was appointed provincial boiler inspector, and transferred to Red Deer, Alta. In 1938 he was appointed inspector of boilers for the Calgary District.

He was the holder of a first class steam engineer's certificate for Alberta. Prior to his connection with the Department of Public Works he was master mechanic and chief engineer for the McLeod River Coal Company, Mercoal, Alta., from 1924 to 1928, and was connected with the International Coal and Coke Company, Coleman, Alta., and the West Canadian Collieries, Blairmore, Alta., from 1909 to 1923.

He joined the Institute as an Associate Member in 1934, and became a member in 1940.

John Broy Cochrone, M.E.I.C., died at his residence in Ottawa on April 14th, 1946.

Born in Cacouna, Que., in 1860, he attended Royal Military College, Kingston, Ont., a member of the first graduating class, 1880. He joined the staff as an instructor with the rank of captain and later became assistant professor and finally professor of chemistry and physics. Transferred to Ottawa in 1914, he was in charge of the Military Surveys Division with the rank of major, and a year later was appointed assistant director of the geographical section, a part of the directorate of military operations and intelligence. He retired some fifteen years ago with the rank of lieutenant-colonel.

Mr. Cochrane joined the Institute in 1905 as a Member.

J. R. Roberts, M.E.I.C., died December 26th, 1945, in Toronto, Ont.

Born in Burlington, Vt., in 1890, he attended the University of Vermont, graduating in 1912 with a B.Sc. degree in civil engineering. He went to Montreal, Que., that year and was employed as instrumentman by Norman D. Barclay who had the contract with Canadian National Railways to survey the Town of Mount Royal, Que. In 1913 he was employed as superintendent for the Paterson Manufacturing Company Limited, Montreal, and the next year was appointed engineer in charge of their road department. He then served overseas for two years and on his return in 1919 he associated himself with the Barrett Company Limited in Montreal, and in 1920 was named chief engineer for the paving department of the Societé Samtor, Paris, France, the French branch of the Barrett Company. Transferred to Detroit and to Toronto, he was manager of the company's tarvia departments at those locations until 1931 when he became Ontario sales manager of Canadian Bitumuls Company Limited at Leaside, Ont. Mr. Roberts retained that position up to the time of his death.

He joined the Institute as a Junior in 1916, transferred to Associate Member in 1917, and to Member in 1940.

Joseph E. Hinchcliffe, M.E.I.C., of Belle River, Ont., died on March 10th, 1946, after a brief illness.

Born at MacLeod, Alta., in 1897, he attended McGill University, Montreal, receiving a B.Sc. degree in civil engineering in 1926. The same year he entered Canadian Bridge Company Limited, Walkerville, Ont., and was employed as detailer and checker until 1933. He was draughtsman and checker with Hamilton Bridge Company Limited at Hamilton, Ont., from 1934 to 1938, when he returned to Canadian Bridge Company. He later resided at Amherstburg, Ont., and Belle River, Ont. He was a veteran of World War I, serving with the 121st and 7th battalions.

Mr. Hinchcliffe joined the Institute as a Student in 1924, transferring to Junior in 1928. He became an Associate Member in 1934 and a Member in 1940.

E. A. Bemon, M.E.I.C., who was with the Chesterville Lardner Lake Gold Mining Company Limited at Kearns, Ont., died in Toronto on November 21st, 1945.

Mr. Beman was a graduate of the University of Saskatchewan with a B.E. degree in 1928 and was associated with the Department of Highways as a resident engineer in Regina, Sask., in 1931, and in Swift Current, Sask., in 1932. Two years later he became associated with the Kingfisher Gold Mines Limited at Wadhope, Man., and was subsequently with the Kenora Prospectors and Miners Ltd., at Machin, Ont., with the Elora Gold Mines Ltd., at Manitou Lake, Ont., and with the Wood Cadillac Mines at Kewagama, Que. He was employed by Pandora, Ltd., at Cadillac, Que., in 1941, and accepted his position as chief engineer with Chesterville Larder Lake Gold Mining Company in 1942.

He joined the Institute in 1931 as an Associate Member, becoming a Member in 1940.

Jocques P. Brillon, M.E.I.C., of the Quebec Streams Commission was one of a group drowned recently in the vicinity of Mingan, Que., while doing power survey work.

Born in Montreal in 1909, Mr. Brillon was educated at Loyola College and Ecole Polytechnique, Montreal, and at the Massachusetts Institute of Technology, Cambridge, Mass., receiving degrees of B.Sc., C.E., and M.Sc. in electrical engineering, the last in 1933. For two years he worked with Ricard and Royer, consulting engineers, Quebec, Que., and in 1937 joined the Aluminum Company of Canada, located at Arvida, Que.

He served in the R.C.A.F. as a flight lieutenant during the war, first concerned with aeronautical engineering, then stationed as chief engineer at the No. 9 B. & G. School at Mont Joli, Que., and later at No. 16 S.F.T.S., Hagersville, Ont. He later was posted at Headquarters, Ottawa.

Mr. Brillon became a Member of the Institute in 1945.

R. S. McCormick, M.E.I.C., of Sault Ste. Marie, Mich., died on March 18th, 1946.

Born in Quaker City, Guernsey County, Ohio, in 1873, he was educated at Saginaw and Ann Arbor, Mich., and commenced a career of fifty-five years in railroad work in Michigan and Ontario. He was assistant engineer with the Grand Trunk Railway, Battle Creek, Mich., in 1895-1897, and worked in the same capacity in Detroit, Mich., in 1897-99. He was locating engineer with the Algoma Central and Hudson Bay Railway at Sault Ste. Marie, Ont., from 1899 to 1903, and division engineer for the Saginaw district, Pere Marquette Railway in 1903-1905. In Fort William, Ont., in 1905 he was employed by the Grand Trunk Railway as location and construction engineer, and in 1909 accepted a similar position for the Algoma Central and Hudson Bay Railway at Sault Ste. Marie, Ont., becoming chief engineer in 1910. He retired from Algoma Central in June 1945 as general superintendent and chief engineer.

He joined the Institute in 1913 as a Member. Life membership was granted to him by Council on March 23rd this year, before his death was made known to the Institute.

V. H. McIntyre, M.E.I.C., of Toronto, Ont., died on April 28th, 1945.

Born at Toronto in 1900, Mr. McIntyre graduated from the University of Toronto with a B.A.Sc. in 1923. He was then employed for five years in the engineering department of McGregor-McIntyre Limited, Toronto, and after some months with the Ontario Hydro Electric Power Commission went to London, Ont., where he was in charge of sales and design for the London Structural Steel Company. He was president of V. H. McIntyre Limited from 1932, which firm designed, fabricated and erected timber structures.

Mr. McIntyre joined the Institute in 1942 as a Member.

George B. Hull, M.E.I.C., of Altadena, Cal., died on March 24th, 1946, in Mobile, Ala.

Born at Wallingford, Conn., in 1876, Mr. Hull was educated there and at Yale University, and the Armour Institute, Chicago, Ill. Joining the Alberta Railway and Irrigation Company at Lethbridge, Alta., in 1898, he went to Kamloops, B.C., in 1902 in connection with the Fruitlands Irrigation System, and to Calgary, Alta., in 1904 as division engineer with the Canadian Pacific Railway. From 1910 to 1920 he was with the Department of Public Works of Canada during which time he was responsible for the design and construction of wharves along the British Columbia coast to the Alaska boundary and as district engineer located at Prince Rupert, B.C., he was in charge of administration of the Harbors and Rivers Act. He spent two years in Iraq as district irrigation officer for the Euphrates Division at Baghdad, Mesopotamia, and in 1922 returned to Canada where he was division engineer for the Lethbridge Northern Irrigation District.

Subsequent years found him in the United States as assistant engineer for Leeds and Barnard, Consulting Engineers at Los Angeles, Cal., and with the Department of Water and Power in the same city, and from 1925 to 1936 he was vice-president and chief engineer with the Sinaloe Land Company, at Sinaloa, Mexico. In California in 1936 he was supervisor of the highway planning survey for the Division of Highways, Sacramento, and in 1937 was project engineer for the W.P.A. at Los Angeles.

Mr. Hull was in the United States Army corps of engineers in 1941 and 1942, after which he served the Department of Agriculture for some time at Los Angeles, as associate hydraulic engineer. Once more associated with the Sinaloe Land and Water Company in 1943, he was vice-president, located at the Los Angeles office. In 1944 he was appointed inspector of construction for the U.S. Navy at Seal Beach, Cal., and in 1945 general inspector, for the U.S. Navy at Inyokern.

Joining the Institute as an Associate Member in 1909, Mr. Hull became a Member in 1940.

News of the Branches

Activities of the Twenty-seven Branches of the Institute and abstracts of papers presented

LAKEHEAD BRANCH

A. J. Mickelson, M.E.I.C. - *Secretary-Treasurer*
R. B. Chandler, M.E.I.C. - *Branch News Editor*

W. H. Small was elected chairman of the Lakehead Branch of the Institute at the annual dinner meeting held Tuesday evening, May 28th, in the Village Inn, Port Arthur. Vice-President of the Barnett-McQueen Co. Ltd. of FortWilliam, Mr. Small succeeds W. C. Byers of Port Arthur.

S. E. Flook was named vice-chairman and A. J. Mickelson was re-elected secretary-treasurer. The following executive was chosen: W. E. McLennan, A. D. Norton, and S. T. McCavour of Fort William; O. J. Koreen, J. N. McNeil and J. M. Fleming for Port Arthur; R. W. Emery of Marathon; and S. C. Wilcox of Kenora.

Ex-officio officers are W. C. Byers, past-chairman; and R. B. Chandler, councillor.

Other professions represented at the dinner were Thunder Bay Dental Association, Dr. J. M. Spence; Thunder Bay Law Association, B. Shaffer; medical profession, Dr. J. N. Senn, a visitor in Fort William.

Sound films depicting construction of the Golden Gate bridge at San Francisco were shown through courtesy of the Bethlehem Steel Corporation.

OTTAWA BRANCH

C. G. Biesenthal, Jr.E.I.C. - - *Secretary-Treasurer*
R. C. Purser, M.E.I.C. - - - *Branch News Editor*

At an evening meeting on May 31st at the National Museum, Professor Magnel of the University of Ghent, Belgium, outstanding authority in the field of concrete design, gave a talk on **Pre-Stressed Concrete** before the Ottawa Branch. The talk was illustrated with slides and motion pictures.

Professor Magnel has been in the United States in a consulting capacity for a business concern and during his visit to Canada, on his return trip, the Engineering Institute invited him to talk to the branches on his itinerary.

The speaker was introduced by Col. J. P. Carrière, an acquaintance of Prof. Magnel's in Belgium.

PRESIDENTIAL VISIT TO EDMONTON

Head table, right to left: Hon. N. E. Tanner, Minister of Lands and Mines, Mrs. Hayes, F. R. Burfield, the president, and Mrs. J. W. Porteous.

Dean R. S. L. Wilson and the executive meet for luncheon with the president.

Above—the students are nearly all returned men.

Institute stalwarts and their wives.

CALGARY BRANCH GREETS PRESIDENT AND MRS. HAYES

Head table with Chairman H. R. Younger presiding.

THE PRESIDENT AT LETHBRIDGE

It was a very good meeting. Upper left picture, the head table, left to right: G. J. Currie, James McMillan, the president, P. E. Kirkpatrick, G. A. Gaherty.

PRESIDENT HAYES INAUGURATES THE KOOTENAY BRANCH

Head table at the inaugural dinner, left to right: Miss M. McLaren, G. A. Gaherty, Lorne Campbell, Mrs. Montgomery, G. J. Currie, Mrs. Diamond, the President, Chairman S. C. Montgomery, Mrs. Hayes and R. W. Diamond.

Mr. and Mrs. R. W. Diamond entertain in their garden.

R. W. Diamond entertains the visiting officials at the golf club. Left to right: R. R. McNaughton, W. S. Kirkpatrick, the president and Mr. Diamond.

At South Slocan the power developments were visited with Lorne Campbell as host.

PRESIDENT HAYES AT SARNIA

At left, the head table. Left to right: C. F. Davison, Mrs. Davison, Mrs. Macpherson, the president, Chairman G. L. Macpherson, Mrs. Dyer, F. F. Dyer.

PRESIDENT AND MRS. HAYES AT LAKEHEAD

Head table, right to left: W. C. Byers, Mrs. S. E. Flook, R. B. Chandler, Mrs. Small, Chairman W. H. Small, the president, Mrs. Hayes, G. J. Currie, Mrs. Byers.

PRESIDENTIAL VISIT TO SASKATOON

Upper left picture shows the head table with E. K. Phillips presiding and Vice-President R. A. Spencer at extreme right.

PRESIDENT'S VISIT TO THE SAGUENAY

Upper left: Yvon Cousineau, Norman McCaghey, the president, Chairman B. E. Bauman, Vice-President G. F. Layne. Upper right: G. J. Currie, Adam Cunningham, A. C. Johnston.

SAULT STE. MARIE BRANCH GREETS THE PRESIDENT

Upper left, head table, left to right: A. M. Wilson, the president, Chairman W. D. Adams, D. Holbrook. Upper right, left to right: Messrs. Holgate, Russell, Dalton, Kleburg, Pickering, Kelly, Rahilly. At left, right to left: Messrs. Fitzgibbon, Cowie, Watt, Holder, Brown, Brown, McQuarrie.

THE PRESIDENT AT WINNIPEG

The president speaks, with Tom Storey and Dr. Fetherstonhaugh on his right and Chairman George Fanset and the general secretary on his left.

As usual there was a large turn out at Winnipeg.

VANCOUVER BRANCH

A. M. Eyre, S.E.I.C. - - - *Secretary-Treasurer*
P. B. Stroyan, M.E.I.C. - - *Branch News Editor*

A special dinner meeting of the Vancouver Branch was held in the Sports Pavilion in beautiful Stanley Park on Wednesday evening, May 22nd, to honour Mr. J. B. Hayes, president of the Institute on the occasion of his tour of the branches. Mr. Hayes was accompanied by Mr. G. J. Currie, councillor for the Halifax Branch and Dr. L. Austin Wright, general secretary of the Institute.

R. C. Pybus, chairman of the Vancouver Branch, introduced the guests and expressed the pleasure of the membership at being honoured by this visit.

Mr. Hayes related some of the impressions gathered on his trip across the continent, and related experiences in a humorous and philosophical vein reminiscent of the late Stephen Leacock.

Mr. Currie carried greetings for the Halifax Branch and also produced a bottle of Atlantic sea-water which he proposed to empty into the Pacific Ocean. (It was not anticipated that the deleterious effect would prove particularly serious and therefore no action was taken to discourage this questionable practice).

Mr. Wright was somewhat handicapped by having to confine his remarks more or less to Institute affairs and in a few brief words brought the members up-to-date on matters pertaining to the welfare of the Institute. Several other distinguished guests accompanied the party and among those introduced to the meeting were Mr. J. A. McCrory, past vice-president of the Institute, Mr. Kenneth Reid, councillor for the Victoria Branch and Mr. J. M. Udell of Montreal.

The sixty members attending had the privilege, after the dinner, of meeting the guests, and thanks for the excellent arrangements were expressed to J. P. Fraser, vice-chairman of the Branch, and to Alan Eyre, secretary. Cigars were furnished by Mr. Pybus on the occasion of yet another addition to the long line of his descendants.

PRESIDENT AND MRS. HAYES VISIT VANCOUVER

Chairman Ralph Pybus and the president.

The executive meets with the president.

Left to right: Arthur Scott, Mrs. Hayes, " Dutch " MacPherson, Ralph Pybus and Norman Sherman.

Left to right: P. H. Stroyan, " Dutch " MacPherson, Gordon Stirrett, and the general secretary.

SASKATCHEWAN BRANCH

D. W. Houston, M.E.I.C. - - *Secretary-Treasurer*
Stewart Young, M.E.I.C. - - *Branch News Editor*

A special meeting of the Saskatchewan Branch, was held in the King's Hotel, Regina, on Friday evening, June 7, 1946, to meet President J. B. Hayes. Accompanying Mr. Hayes were General Secretary L. A. Wright and Councillor G. J. Currie, Halifax. The meeting was preceded by a dinner at which forty-five members were in attendance.

Prior to his address, President Hayes presented the Duggan Medal and Prize of the Institute ($100) to H. L. Lexier, Regina. Mr. Lexier, a graduate in mechanical engineering of the University of Minnesota, was awarded the medal for his paper on "Metallurgy and Machine Design."

The president, in his address, dealt with conditions in Halifax during the war, describing the difficulties which had to be overcome in adapting port facilities for wartime purposes. He gave his audience a word picture of some of the great battleships that steamed in and out of the harbour.

G. J. Currie conveyed greetings both from the Halifax Branch of the Institute and from the Association of Professional Engineers of Nova Scotia and extended a cordial invitation to attend the Maritime Professional Meeting to be held in Digby, N.S., next September.

Dr. L. A. Wright, gave an outline of activities of the Institute generally, and of the Council, dealing in particular with the Harry Bennett Educational Fund. After explaining the purpose of the fund he advised that substantial progress had been made towards the objective of $25,000, one branch more than trebling its quota.

On Saturday afternoon, Mrs. J. B. Hayes was guest of honour at a tea in the Isabella Room, Hotel Saskatchewan, attended by the wives of the members. Receiving with Mrs. Hayes were Mrs. F. E. Estlin, wife of the chairman of the Branch, Mrs. H. S. Carpenter and Mrs. L. A. Thornton. The tea table was centered with a bouquet of vari-coloured sweet peas and Mrs. D. A. R. McCannel, Mrs. J. W. D. Farrell, Mrs. H. Ross MacKenzie and Mrs. Stewart Young presided. Mrs. M. J. Spratt was in charge of the arrangements and, seeing to the pleasure of the guests were Mrs. A. P. Linton, Mrs. D. W. Houston and Mrs. J. G. Schaeffer. Mrs. G. L. MacKenzie, Mrs. A. H. Douglas, Mrs. R. W. Jickling and Mrs. H. L. Roblin served.

THE PRESIDENT AT REGINA

The president presents the Duggan Medal of the Institute to H. L. Lexier.

VICTORIA BRANCH GREETS PRESIDENT AND MRS. HAYES

Chairman S. R. Weston with Mrs. Hayes on his left and the president on his right, followed by Mrs. Weston, "Skip" Currie, and Mrs. R. C. Farrow.

East meets west. Councillor Reid of Victoria presents Councillor Currie of Halifax with some salt water from the Pacific in return for the same commodity brought by Mr. Currie from the Atlantic.

Mr. and Mrs. John Galbraith of Toronto are central figures in this shot.

Serious business.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

ARCH DESIGN SIMPLIFIED:
W. A. Fairhurst. London, Concrete Publications Ltd., 1945. 61 pp., illus., 9½ x 6¾ in., cloth, 12s.

A text-book on the rapid and economical design of arch bridges, including 33 tables and illustrative designs. The tables provided are based on economical arch curves and variation of cross section. A calculation chart has also been designed to enable the work to be carried out in a systematic way. The tables are based on arch curves set out to coincide with the pressure line for dead loading plus half the distributed live load (Ministry of Transport equivalent load standard), but with suitable precautions they may be used for arch curves set out for dead load only.

The book is divided into the following four parts: Part I—Arch Curve; Part II—Tables for Arch Design; Part III—Design of a Filled-Spandrel and an Open-Spandrel Arch; Part IV—Derivation of Formulae.

BUSINESS JOURNALISM; Its Function and Future:
Julien Elfenbein. New York and London, Harper, c1945. 341 pp., illus., 8½ x 6 in., cloth, $4.00.

This book was designed to serve as a text-book in schools of journalism, marketing, and business administration. It is divided into two parts.

In Book One the author defines the field of the Businesspapers giving the background of industry served, and shows the relation between the marketplace and the business press and also the relation between the trade associations and the business press. He outlines the development of the trade press and the flowering of the specialized press.

In Book Two the author deals with the organization of a Businesspaper publishing business and describes the functions of the publisher, the advertising sales manager, the circulation sales manager, the sales promotion manager, and the editor. In the concluding chapter the future of Business Journalism is developed.

The six appendices included consist of: I—American Businesspaper, before 1900; II—Agenda of Three Wartime Washington Conferences; III— Functions of Businesspaper Advertising; IV—Editorial Style Manual for Businesspapers; V—Outline of Exact Duty Specifications on a Large Businesspaper Editorial Staff; VI—Terminology: Technical Terms, Abbreviations, and Journalese.

HIGH VACUUM TECHNIQUE; Theory, Practice, Industrial Applications, and Properties of Materials; 2d ed. rev.:
J. Yarwood. New York, Wiley; London, Chapman & Hall, c1945 140 pp., illus., 9¼ x 6 in., cloth, $2.75.

This work introduces the latest developments in apparatus, describes important industrial processes, and attempts to bring together in one volume the diverse facts regarding the relevant properties and uses of materials encountered in all types of vacuum work. At the same time the standard technique is described to give logical sequence to the text so that the physics student can appreciate the theory and practice of the art.

A considerable enlargement in the second edition of this monograph has been undertaken in order to amplify those sections considered to be most directly useful to the technician, with special emphasis on the most recent work. The new sections included deal with the performances of vacuum pumps, the construction of vacuum systems, and extra methods of measuring low pressures, and pumping speed. In addition, those parts of the text discussing the oil-diffusion pump, gas-filled tubes, and the properties of materials have been increased in size and rearranged. Twenty-six new diagrams appear in this edition, and also a bibliography dealing exhaustively with the most important papers that have appeared in connection with the technique. Some corrections of the former text have been made.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

AMERICAN MACHINISTS' HANDBOOK and Dictionary of Shop Terms:
By F. H. Colvin and F. A. Stanley. 8th ed. rev. & enl. McGraw-Hill Book Co., New York and London, 1945. 1546 pp., diagrs., charts, tables, 7 x 4 in., cloth, $5.00.

This standard reference work for the machinist, toolmaker, and designer of machine parts provides a comprehensive collection of useful tables and data. The various phases of machine-shop work are covered thoroughly, including screw threads, gearing, measuring and fitting. Additional chapters are devoted to metals and other materials, knots and slings, shop trigonometry, and railroad shop data. There is a seventy-page illustrated dictionary of shop terms.

American Society for Testing Materials, 1944 Supplement to the BIBLIOGRAPHY and ABSTRACTS on ELECTRICAL CONTACTS:
Prepared by Committee B-4 on Electrical-Heating, Electrical-Resistance and Electric-Furnace Alloys, American Society for Testing Materials, Philadelphia, Pa., 1945. 30 pp., 9 x 6 in., paper.

The original "Bibliography and Abstracts on Electrical Contacts", published in 1944, covered the period from 1835 to 1942. This first supplement contains some eighty items within that period which had not previously been included, and carries on through 1943 into 1944. As before, an author and subject index are provided. A wide range of material is considered, and the abstracts are extensive enough for adequate determination of the particular value of the original articles.

Le BOIS, Matériau de la Construction Moderne:
By J. Campredon, preface by M. Leloup. Dunod, Paris, 1946. 153 pp., diagrs., charts, tables, 8¼ x 5¼ in., paper, 240 frs.

The author first deals with the structure and physical properties of wood. He then describes various methods of treatment of wood to increase its value as a structural material, such as impregnation, compression and lamination. The last section covers the new uses for which wood has been made available, such as built-up beams, and sections formed by the application of heat and pressure.

ELECTRIC CIRCUITS and MACHINES, an Introduction to Practical Electricity:
By E. C. Lister, McGraw-Hill Book Co., New York and London, 1945. 358 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $3.50.

(Continued on page 462)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

June 29th, 1946.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the August meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

DAMECOUR—CHARLES, 419 Belanger St., Montreal, Que. Born at Montreal, April 12th, 1921. Educ.: B.Eng., (Mech.), McGill, 1943; 1941, (6 mos.), tool designer, Canadian Vickers Limited; 1943 to date, Lieut., R.C.E.M.E.

References: R. H. Patten, R.B. Killam, J.A. Coote, A.E. Bowden.

DAVIS—JOHN CASWELL, of Winnipeg, Man. Born at Montreal, Que., August 19th, 1888. Educ.: B.Sc., McGill Univ., 1912; R.P.E., Manitoba; 1912-30, design and instaln. of automatic fire protection equipt., Grinnell Co. of Canada, Ltd.; 1931 to date, president and mgr., J. C. Davis Ltd., design and instln. automatic fire protection equipt., Winnipeg, Man.

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET, MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, to act as technical assistant in handling patent matters in industrial concern, operating or research experience in chemical manufacturing. Under 30 years. Salary \$190-\$240, depending on experience. Apply to File No. 3336-V.

CHEMICAL ENGINEER, recent graduate, with aptitude for sales work, is required by an industrial organization in Montreal. Apply to File No. 3537-V.

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada for mill control and pilot plant. Salary open. Apply to File No. 3549-V.

CIVIL

CIVIL ENGINEER for design work in an industrial plant in the Montreal area, with experience in building construction, probably permanent position, salary from \$200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEER with considerable experience is required by a Montreal firm for work in construction of radio stations. Salary from \$225. Apply File No. 3506-V.

CIVIL ENGINEER, recent graduate, required by a firm of consulting engineers in Montreal, to assist Engineer in charge of field work in Ont. Salary \$175 up. Apply File No. 3518-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS with experience as structural designers and draughtsmen are required by an engineering firm in Montreal. Salary from \$300—\$400 according to experience. Apply File No. 3520-V.

CIVIL ENGINEER to be town engineer of a town in Southern Ontario. Salary according to qualifications. Apply File No. 3527-V.

CIVIL ENGINEER to take charge of project engineering required by a firm of industrial engineers in Quebec. Should be bilingual and have experience in heavy construction. Salary according to capacity. Apply File No. 3531-V.

CIVIL ENGINEER with road construction experience required as assistant to county engineer in Central Ontario. Salary \$4000 plus travelling expenses. Apply File No. 3533-V.

CIVIL ENGINEER with paper mill experience for a pulp and paper company in the Lake St. John area. Salary from \$225. Apply to File No. 3548-V.

ELECTRICAL

ELECTRICAL ENGINEER, graduate, young man with at least one year of construction experience since graduation, bilingual, is required for work in connection with the erection of wood pole, steel tower transmission lines and sub-stations in various parts of the province of Quebec. Apply to File No. 3332-V.

ELECTRICAL DESIGNER for an industrial plant in the Montreal area, power and lighting layouts, from recent graduates up, probably permanent position, salary from \$200 according to qualifications. Apply File No. 3504-V.

ELECTRICAL ENGINEERS, preferably experienced for sales and service of motors, transformers, control equipment, etc., with an industrial firm in Montreal. Salary according to qualifications and ability. Apply File No. 3512-V.

ELECTRICAL DRAUGHTSMAN with considerable experience in industrial light, heat and power layouts is required by a consulting engineer in Montreal. Salary from \$200 according to experience. Apply File No. 3528-V.

MECHANICAL

MECHANICAL ENGINEER, graduate with 4 or 5 years' experience in heating and ventilating layouts is wanted by a consulting engineer in Montreal. Apply File No. 3243-V.

MECHANICAL DRAUGHTSMAN is required in Montreal by a firm engaged in the manufacture of conveyors, crushers, elevators, etc. Applicants should be 25-40. Salary according to experience. Apply File No. 3276-V.

MECHANICAL ENGINEER familiar with power plants and equipment, boilers and stoker operation to take charge of well established business in Ontario and Quebec. Give age, experience, married or single. Apply File No. 3515-V.

MECHANICAL ENGINEER with considerable industrial experience is required for the staff of a firm of consulting engineers in Montreal. Salary about \$250. Apply File No. 3525-V.

MECHANICAL ENGINEER, to assume charge of factory maintenance staff and help design new machines and develop new ideas in conjunction with research and methods departments, wanted by electrochemical and engineering firm in the Niagara Peninsula. Salary from \$250. Apply File No. 3538-V.

MECHANICAL DRAUGHTSMAN with over five years experience in piping layout and similar work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

MECHANICAL ENGINEER, age 35-40, with considerable experience in the design of heavy construction equipment, required by a machinery maker in central Ontario. Salary from \$350 according to experience. Apply to File No. 3541-V.

MECHANICAL ENGINEER with at least five years industrial experience, knowledge of plant layout, equipment design and cost estimating and preferably experience in chemical industry. Salary \$275-\$325. Apply File No. 3553-V.

MECHANICAL ENGINEER, recent graduate, for the engineering staff of a pulp manufacturer in Eastern Quebec. Apply to File No. 3547-V.

MECHANICAL ENGINEERS with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MISCELLANEOUS

PLANT ENGINEER either mechanical, civil or electrical graduate, basic experience of 2 to 3 years. To take charge of plant, equipment and machinery, age 25 to 30, preferably married, travelling may be necessary. Apply to File No. 3217-V.

INSTRUCTIONAL STAFF in physics and mathematics are required for a university in the Maritimes. Apply to File No. 3432-V.

DESIGN ENGINEER with several years experience in the pulp and paper industry, required for machine layout, piping, etc., by a paper company in the St. Maurice Valley. Possibility of permanent employment. Salary about \$300. Apply to File No. 3452-V.

FORESTRY ENGINEER graduate, 25 to 35 years, required by a large paper company in the Prov. of Quebec. Good opportunity for advancement. Salary open. Apply to File No. 3462-V.

RESIDENT ENGINEER with considerable construction experience and bilingual is required by a public utility for employment on the upper Ottawa River. Salary from \$350. Apply to File No. 3505-V.

PLANT ENGINEER with pulp and paper experience for development, construction and maintenance work with a paper mill in the Lake St. John area. Salary open. House available. Apply to File No. 3507-V.

GRADUATE ENGINEER with practical experience in plant layout and installation of equipment required for a mining and industrial plant. Veteran preferred. Salary from \$200-\$250. depending on experience. Apply to File No. 3510-V.

INSTRUCTORS for teaching duties beginning with the session 1946-47. Applicants should be engineering graduates from recognized universities. The grades required will be assistant professors, lecturers and demonstrators in civil and mech. engineering. Salaries will depend on experience and general qualifications. Apply to File No. 3516-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS with experience in mechanical and chemical process layouts are required by an engineering firm in Montreal. Salary from \$300-400 according to experience. Apply to File No. 3520-V.

COMBUSTION ENGINEER for sales and service with a coal distributing firm with headquarters in Montreal. Salary open. Apply to File No. 3522-V.

MECHANICAL OR MINING ENGINEER, age 30-40 with experience in industrial engineering, required by a large mining and processing firm for methods studies of equipment, labour and costs. Salary according to qualificatons. Apply to File No. 3524-V.

INDUSTRIAL ENGINEER, bilingual, with considerable experience, is required by a firm of industrial engineers in Quebec. Salary according to capacity. Apply to File No. 3531-V.

SALES ENGINEER, recent graduate, required by a Montreal firm for sale of machinery and supplies, tool steels, etc., in Western Canada. Experience not essential Salary plus commission. Apply to File No. 3534-V.

SENIOR DRAUGHTSMAN is required immediately by a Calgary and Turner Valley Oil Company. Work will be mainly geological draughting. Single man preferred. Salary dependant upon qualifications. Apply to File No. 3536-V.

CHEMIST OR RESEARCH ENGINEER, to take charge of Control Development and Research staff. Must have supervisory ability and be able to show results. Wanted by electrochemical and engineering firm in the Niagara Peninsula. Salary from \$200. Apply to File No. 3538-V.

DESIGN ENGINEER with several years experience in hydro-electric work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

JUNIOR ENGINEER OR DRAUGHTSMAN, preferably with experience in the design of heating and ventilating layouts, required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3545-V.

CIVIL OR MECHANICAL ENGINEER with experience in municipal engineering required as Assistant Supt. of Waterworks, Saskatchewan City. Salary dependent on experience and qualifications. Apply to File No. 3546-V.

CIVIL ENGINEERS, from recent graduates up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER with soms pulp and paper experience required for ths technical department of a paper mill in Lake St. John area. Apply to File No. 3470-V.

CIVIL

CIVIL OR MECHANICAL ENGINEER, not necessarily a graduate, age 24-30, some experience in concrete and steel draughting, some sales ability, required to work with a consulting engineer and contractor in Montreal. Salary open. Apply to Box No. 3339-V.

TWO CIVIL ENGINEERS, preferably but not necessarily graduates, are required to act as structural steel draughtsmen or checkers for a company engaged in this sort of work in Alberta. All applications should indicate education, experience and salary expected. Apply to Box No. 3365-V.

CIVIL ENGINEER with five to ten years experience in reinforced concrete design is required by a firm of consulting engineers in Montreal. Salary open. Apply to Box No. 3387-V.

TWO CIVIL ENGINEERS are requirsd to act as senior and junior structural designer respectively with a steel company in southern Ontario. Salary open. Apply to Box No. 3389-V.

TWO CIVIL ENGINEERS, one experienced man to be in charge, the other to act as assistant, mostly for office work, are required for a building programms in Ontario, in connection with roads, trails, lookout towers, telephone line, buildings, etc. Preference to veterans. Salary up to $3,000 per year for senior and $2,000 psr year for junior position. Apply to Box No. 3394-V.

CIVIL ENGINEER graduate with several years experience in construction work, preferably bilingual is required by a construction company in Montreal to take chargs of a project as resident engineer in Quebec. Salary open. Apply to Box No. 3421-V.

CIVIL ENGINEERS with construction experisnce for field work on contracts with a firm of Montreal contractors. Salary open. Apply to File No. 3437-V.

CIVIL ENGINEER recent graduate, must be bilingual, required for work on general design, survey and construction of transmission lines in the Montreal area. Apply to File No. 3446-V.

CIVIL ENGINEER with experience on foundations, steel work and erection of plant. Preferably R.P.E. in B C. Required for construction work on B.C. coast. Salary according to qualifications. Apply to File No. 3448-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER with executive experience for position of Town Manager in progressive New Brunswick town. Good salary to right man. Apply in writing giving full details qualifications and experience. Apply to File No. 3481-V.

CIVIL ENGINEER DRAUGHTSMAN, age 25-35, for consulting engineer's office near Toronto. Applicant should have some knowledge of municipal sewerage and waterworks problems. Apply to File No. 3489-V.

ELECTRICAL

ELECTRICAL ENGINEER, graduate with some experience in electronics, age 25-35 is required by a company in Montreal at a salary of $250. Apply to File No. 3236-V.

ELECTRICAL ENGINEER with some experience with machinery and/or electrical installation work, with ability to get along with people, and interested in investing some capital, is required for executive work with a small company on the west coast for work in connection with the electrical machinery requirements and installation of lighting and power plants in the province. Salary open. Apply to Box No. 3352-V

TWO ELECTRICAL ENGINEERS with a minimum of four years' experience with commercial radio equipment are required by a firm in Montreal. Applicants must have good personality and ability to meet public. Please do not apply unless qualified. Salary open. Apply to Box No. 3395-V

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters, English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to Box No. 3415-V.

ELECTRICAL ENGINEER 5 to 10 years experience on general electrical design wiring of buildings, industrial plants and sub-stations, preferably a graduate, is wanted by a firm of consulting engineers in Montreal. Salary $250-$400 a month. Apply to Box No. 3420-V.

ELECTRICAL DRAUGHTSMEN with experience in substation design, not necessary graduate engineers, required by a public utility in the Montreal area. Salary $200 to $225. Apply to File No. 3446-V.

ELECTRICAL ENGINEER with some mechanical experience, age 30-35, required for the gas division of a public utility in Western Canada, salary according to qualifications. Apply to File No. 3494-V.

ELECTRICAL ENGINEER with extensive experience as superintendent of entire electrical equipment for a townsite and paper mill in Western Ontario. Salary from $400-$500 according to experience. Apply to File No. 3497-V.

MECHANICAL

GRADUATE MECHANICAL OR AERONAUTICAL ENGINEER with at least five years experience in aircraft, preferably in mfg., must have a fair knowledge of mechanical a/c installation and be familiar with heat and ventilating installations, controls, de-icing, hydraulics and landing gear. Apply to File No. 3300-V.

MECHANICAL ENGINEER, age about 35-40 with experience in thermo-dynamics, mechanical and chemical work is required to be chief engineer of a company in the Toronto area. Preference to ex-service man. Salary about $400-$600. a month. Apply to Box No. 3308-V.

TWO OR THREE MECHANICAL ENGINEERS, preferably ex-service men, graduates, with some knowledge of steam, piping layouts, design are required by a firm in the Niagara peninsula. Salary open. Apply to Box No. 3380-V.

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancemsnt. Single man preferred. Salary open Apply to Box No. 3393-V.

MECHANICAL ENGINEER with paper mill experience is required to act as assistant mechanical superintendent of a large paper mill located in a city in western Quebec. Salary open. Apply to Box No. 3400-V.

JUNIOR MECHANICAL ENGINEER with some experience on mechanical design. Preference to ex-service men. Salary from $200 to $250. Location Quebec City. Apply to File No. 3401-V.

CHIEF ENGINEER, age 35 to 40, preferably graduate mechanical, with expsrisnce in shop and production planning, running drafting office, etc., and ability to get along with people, is required by a factory in Sherbrooke ,Quebec. Salary $5,000 to $6,000 a year. Apply to Box No. 3410-V.

MECHANICAL ENGINEER DRAUGHTSMAN with two or three ysars experisnce, is required for work with a paper company in the province of Quebec. Salary $250 to $275 a month. Apply to Box No. 3424-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER, age 35 to 45, preferably married, with good background of shop training and experience in the manufacture of farm machinery. Salary from $350 according to qualifications. Apply to File No. 3463-V.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with considerable experience in plumbing, heating ventilating, age 30-45, required for a permanent job as a designer with a Montreal architectural firm. Salary from $300. Apply to File No. 3473-V.

MECHANICAL ENGINEER, recent graduate, for technical service and plant operation with a manufacturer in the Montreal area. Successful candidates will have two-year training course in U.S. Apply to File No. 3476-V.

MECHANICAL ENGINEER aged 30 to 35, capable of investigating maintenance and conveyors, motors and drives etc. This position includes studies toward improved plant maintenance and will also entail draughting, some routine keeping of records and allied engineering work. Salary $225 to start. Apply to File No. 3477-V.

MECHANICAL ENGINEER, recent graduate, for mechanical draughting work in paper mill in the Lake St. John area. Salary open. Apply to File No. 3478-V.

MECHANICAL ENGINEERS from recent graduates up required by a structural steel company in the Montreal area. Salary according to qualifications. Apply to File No. 3485-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the reconversion of a paper mill in Western Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MISCELLANEOUS

STEAM PLANT SUPERINTENDENT with extensive experience is required to superintend the steam plant of a pulp and paper mill in Western Ontario. Salary would be $300 to $350. Apply to File No. 3227-V.

ENGINEER SALESMAN, fluently bilingual, not necessarily a graduate but with some good experience on truck mechanical work and some sales background, age 35-40, is required by an automobile manufacturer for work in the Montreal area. Preference will be given to ex-service men and R.C.E.M.E. and workshop experience would be useful. Salary $250 to $350. Apply to File No. 3266-V.

ENGINEERING ACCOUNTANT, young graduate age 25-35, with engineering background and taste for accounting, is required to act as assistant to the secretary treasur of a manufacturing concern in Montreal. Apply to File No. 3272-V.

SALES ENGINEER of proven ability is required by a Canadian manufacturer of high grade power apparatus specialties in demand by power companies, public utilities and manufacturers. Age 30 to 35 years. Apply in writing and state in detail education, experience, age, required salary and enclose photograph to Box No. 3303-V.

TWO INDUSTRIAL ENGINEERS, preferably with engineering background in mechanical, electrical or chemical engineering, age 35 up, bilingual with some practical experience is required by a company in Montreal engaged in industrial engineering, consulting work, plant layout, controls, inventories, production and admin. controls. Apply to File No. 3307-V.

INSTRUMENTS ENGINEER with five years experience in aircraft construction and installation design, of which at least 2 years should have been specialized as above, is required to act as design group leader for a company in the Montreal area. Apply to File No. 3316-V.

TECHNICAL SALES ENGINEERS are required by an oil company in the Montreal area. Candidates must be bilingual and experience may range from recent graduate up. Salary will be $150-$250 depending on qualifications. Apply to File No. 3320-V.

TWO DRAUGHTSMEN with a minimum of three years draughting experience, are required by a company in Montreal. One must have mechanical experience to specialize in refrigeration design, the other structural or architectural experience to specialize in design layout of food service equipment. Apply to Box No. 3328-V.

MECHANICAL, ELECTRICAL OR CIVIL ENGINEER, recent graduate who must have fluent knowledge of Spanish, preferably under 30, is required by a firm in the Montreal area for technical work in connection with production. Some travelling. Salary open according to qualifications. Apply to Box No. 3373-V.

DRAUGHTSMAN familiar with reinforced concrete and structural steel is required by a consulting firm in Montreal. Salary open. Apply to Box No. 3387-V.

STEAM PLANT SUPERVISOR—Manufacturer with several plants in Ontario and Quebec requires an active man with technical training and field experience in efficient steam plant operation. Salary open. Apply to Box No. 3406-V.

ENGINEERING SALESMAN with pleasing personality, bilingual, 25 to 35 years old, not necessarily a graduate, but with some engineering background and if possible some knowledge of lubrication is required by a large company in Montreal. Salary open. Apply to Box No. 3422-V.

CHIEF DRAUGHTSMAN, experienced in all types of structural work, required to take charge of a draughting office for a central Ontario city. Apply to Box No. 3428-V giving all particulars including salary expected.

CIVIL AND ELECTRICAL ENGINEERS, age 30 to 40. 5 to 10 years experience, for estimating, design and general engineering for large public utility in Toronto area Apply to File No. 3429-V.

CHIEF DRAUGHTSMAN to take charge of engineering department, draughting room and estimating for machinery manufacture in Sherbrooke. Apply to File No. 3430-V.

QUALIFIED DRAUGHTSMAN, thoroughly capable in design and layout of industrial piping, steam, water, air etc. Salary open. Apply to File No. 3435-V.

TWO CIVIL OR MECHANICAL ENGINEERS, recent graduates, preferably ex-service men, are required by a pulp and paper company in the Province of Quebec, to be trained as logging engineers and woods operations supervisors. Previous experience in the woods an asset but not essential. Salary $200 to $225 with board and lodgings. Apply to File No. 3442-V.

ENGINEERING DRAUGHTSMAN required by an industrial concern in Three Rivers for all round employment in a permanent position. Apply to File No. No. 3443-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

GENERAL PLANT SUPERINTENDENT, or manager in complete charge, to organize and operate a shipbuilding plant in the Maritimes, with knowledge of both hulls and engines, mainly for repairs and revisions. Salary from $5,000. Apply to File No. 3454-V.

GRADUATE ENGINEERS IN CIVIL, MECHANICAL, ELECTRICAL OR CHEMICAL, from recent graduates up with 2 to 5 years general experience (including overseas service) required for petroleum refinery engineering. Salary according to qualifications. Apply to File No. 3455-V.

ELECTRICAL OR MECHANICAL ENGINEERS interested in transportation, with experience in the transportation field or machine shop practice or automotive services, maintenance and operation. Salary according to qualifications. Apply to File No. 3456-V.

SALES ENGINEER of ability, preferably graduate mechanical, with some experience in marine engineering and sales, to develop sales and applications for a heavy outboard propelling unit for use on heavy inland water transport. Salary from $300 depending on qualifications. Apply to File No. 3457-V.

MECHANICAL OR ELECTRICAL ENGINEER under 35, with at least 5 years practical experience, is required for a responsible position in the engineering department of an industrial firm in Toronto. Apply to File No. 3472-V.

STRUCTURAL STEEL DESIGNERS AND DETAILERS required by a construction company in Montreal Salary open. Apply to File No. 3482-V.

CIVIL OR MECHANICAL ENGINEER with experience in construction required by a Montreal firm to estimate value of work done and to inspect during construction concrete and steel bldgs. Salary open. Apply to File No. 3486-V.

CIVIL OR MECHANICAL ENGINEERS from recent graduates up required for various mills by a pulp and paper firm in Eastern Canada. Salary from $200 according to qualifications. Apply to File No. 3488-V.

STRUCTURAL STEEL ENGINEER with both field and office experience for employment in various parts of Canada as owner's representative on building construction. Salary according to experience. Apply to File No. 3490-V.

DESIGNING ENGINEER preferably with pulp and paper mill experience wanted for a paper mill in Newfoundland. Salary would be from $250-400 depending on qualifications. Apply to File No. 3491-V.

INDUSTRIAL MINERALOGIST, with Ph D. or M.Sc. in geology, mineralogy, chemistry or metallurgy and knowledge of commercial processing of industrial metals, laboratory investigations and publishing of results. Must have at least five years experience with special reference to industrial minerals. Starting salary from $275 in prov. mines dept. Apply to File No. 3492-V.

GEOLOGISTS, with Ph. D. in economic or mining geology and intimate knowledge of structural geology, diamond drilling and geophysical methods. Must have at least five years practical experience, ability to publish results of original investigations and use of aerial photographs. Starting salary from $275. in Prov. Mines Dept. Apply to File No. 3492-V.

MECHANICAL OR CIVIL ENGINEERS required as assistant engineer in Meat Packing firm with plants throughout Canada. Duties to consist of general industrial maintenance work, including building construction, steam, refrigeration and electrical installations. Positions available in Western Canada at salary of $195 to $240 depending on experience. Apply to File No. 3495-V.

MECHANICAL OR ELECTRICAL ENGINEER with at least three years experience in paper mill or steam plant operation, bilingual if possible, is required by an industrial firm near Montreal. Salary from $200 according to experience. Apply to File No. 3498-V.

CHEMICAL OR MECHANICAL ENGINEER with construction experience in the chemical field, a knowledge of hydrocarbons and at least five years experience since graduation is required by a chemical firm in Western Ontario. Salary from $250. Apply to File No. 3502-V.

Situations Wanted

CIVIL ENGINEER, age 40, McGill '29, B.Sc., married, experienced surveyor and field engineer, two years on inspection of airfield construction, location immaterial, available on short notice. Apply to File No. 741-W.

CIVIL & MINING ENGINEER M.E.I.C., R.P.E., age 45, married, seeks permanent position with large industrial concern as Maintenance and Construction or Townsite Engineer. Experienced on heavy construction, dams, shafts and tunnels, wharves, buildings, sewers, services, townsite development, general maintenance and administration. Apply to File No. 901-W.

PLANT ENGINEER, graduate, M.E.I.C., age 42, qualified to take responsible charge of layout of plant and equipment, structural and mechanical design and organization of plant maintenance. Wide experience with chemical processes. Have successfully handled skilled and unskilled labour on construction, maintenance and plant operation. Prefer location in Ontario. Minimum salary $5000. per year. Apply to File No. 1621-W.

MANUFACTURING EXECUTIVE, mechanical engineering graduate with twenty years experience in manufacturing, engineering, production control, purchasing, storekeeping, incentive systems, budgets, cost and general accounting is now available. Apply to File No. 1871-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C. Practical experience includes eight years in tool engineering, production engineering and works planning and nine years in plant layout, general machine design and development work of patented mechanical projects. Successful record in responsible and executive positions. Good organizer. Desires either suitable position, or development work based on own patents, with large mechanical manufacutring concern or well established firm of consulting engineers. Apply to File No. 2502-W.

MECHANICAL ENGINEER, Jr. E.I.C., age 23, single, with degree from N.S. Tech. '44, 18 months' experience as engineer officer afloat in the Royal Canadian Navy. Experience included the administration and control of the entire propelling and other machinery, and the discipline of 30 men in that department. Would prefer work of a responsible nature in a small firm doing manufacturing or installations. Have just been released from the Navy and am available for immediate employment in Canada or elsewhere depending on living conditions. Apply to Box No. 2587-W.

MECHANICAL ENGINEER, Jr.E.I.C., single, age 27, graduate Royal Naval Engineering College (Practical Engineering Prize) wishes work of practical nature, mainly outdoor. Interested in operation or construction of steam, hydro or internal combustion machinery. Eight years in R.C.N., including operational, overseeing and instructing. Medical discharge. Seven months on shipyard staff. Prefer to remain near Pacific Coast but would consider temperate climate like New Zealand, South Africa, southern England. Apply to Box No. 2589-W.

ELECTRICAL GRADUATE '46, N.S.T.C., S.E.I.C., 23, single, available upon graduation anywhere in Canada. Interested in electronics, communications, industrial promotion and management. Experience in one of Canada's largest radio manufacturer's test department and electrical draughting. Apply to Box No. 2607-W.

GRADUATE MECHANICAL-ELECTRICAL ENGINEER, 53 years old, with broad background in U.S. and Canada would like position in small or medium-sized organization as assistant to manager in operations but with freedom to do research and development touching any phase of the business. Apply to Box No. 2608-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng. (Ont.), available with one month notice or less. Age 44, married, three children. Six months mining engineering experience, three years mechanical experience in large implement factory, supervision since 1940 for Inspection Board of U.K. and Canada of a large staff on inspection of electrical apparatus and equipment. Seeks position with considerable administrative responsibility based on electrical production or maintenance. Able to go anywhere on continent. Apply to Box No. 2614-W.

GRADUATE MECHANICAL ENGINEER, Prof. Eng. (Ont.) Jr.E.I.C., married, age 31. Experience covers machine shop apprentice, engineering design, chemical plant design, field engineer on construction work, plant operation and superintendent in large plants employing modern plant management methods. Past 8 years have been with present employer. Now wishes to make change to smaller company with opportunity of securing position of responsibility. Apply to Box No. 2629-W.

MECHANICAL ENGINEER, Jr. E.I.C., graduate Queen's 1937, age 33, married. Four years with a mechanical control company at design, customer contact, administration and shop liason work. One year with a beverage company at design, development and installation of special machinery and conveyor equipment. Four years with a steel plate fabricator on design, estimating and field work. Desire position as assistant to plant engineer in an established Ontario firm. Available now. Apply to File No. 2641-W.

GRADUATE CHEMICAL ENGINEER, McGill 1946, available immediately. Plant or sales work, single, healthy and ambitious, will travel anywhere. Apply to File No. 2661-W.

GRADUATE MECHANICAL ENGINEER, (Sask. '45) age 24, married, Jr. member of The Society of Naval Architects and Marine Engineers. Experience with moulded plywood, one year general mechanical engineering in processing plant. Good knowledge of yacht design. Require position with a firm connected with the boating industry, plywood, engines, hardware, plastics, etc. Prefer Vancouver location, available August 1st. Apply to File No. 2662-W.

ENGINEER now employed seeks better position; thoroughly bilingual; had many years experience teaching chemistry, mineralogy and geology and demonstrating in connected laboratories. Acted as mining engineer in mineralogy laboratory, writing reports on samples examined and conducting prospectors' classes; also had municipal engineering experience. Age 49; seeks position as executive, town manager, construction superintendent, sales engineer. Veteran of both wars. Apply to File No. 2663-W.

CHEMICAL ENGINEER, S.E.I.C., B.A., B.A.Sc. '44, M. Eng. (McGill), age 26, single, two years experience, desires employment in Research or production control Prefer Quebec and particularly Montreal area. Highest references from former employers. Apply to File No. 2671-W.

CIVIL ENGINEER, M.E.I.C., A.C.I.M., age 33, married, Major R.C.E. Civil experience includes two years building maintenance, three years frame construction, three years application and sales of mechanical equipment. Six years army service mostly on engineer works services. Desires permanent responsible position, plant engineering or light construction. Travel anywhere. Apply to File No. 2674-W.

ENGINEER, Prof. Eng. (Civil), M.E.I.C., thoroughly experienced in structural and mechanical design, estimating and sales work, will undertake worthwhile agency or representation for manufacturer in B.C. Apply to File No. 2687-W.

CHEMICAL ENGINEER, single, age 23, B.E., McGill '46, S.E.I.C. No significant industrial experience. Interested in a position in sales engineering, production or plant control. Services available immediately. Apply to File No. 2688-W.

GRADUATE MECHANICAL ENGINEER, (McGill '45) age 22, single, seeks employment with a Canadian, American or British firm operating in South America. Growing knowledge of Spanish. Experience in construction and aircraft industries, as well as in Royal Canadian Electrical and Mechanical Engineers. Available on one month's notice. Apply to File No. 2690-W.

AIRLINE ENGINEER with degree in Mechanical Engineering (McGill). Eight years' experience with major Canadian and foreign airlines. Has been concerned with practically all technical phases of a major airline operation, including engineering, maintenance, operations, statistics, operating costs, flight testing and training of flight personnel. Administrative experience, 500 hours' experience as flight crew on Trans-Atlantic operation. Age 33. Married, one dependent. Interested in responsible position with major airline or organization concerned with air transportation in general. Apply to File No. 2691-W.

ELECTRICAL—MECHANICAL ENGINEER, Jr.E.I.C., age 30, graduate of Naval Electrical Engineering Officers course at Nova Scotia Technical College, 1945. Graduate of Naval Electrical Artificer's course at University of Alberta, followed by 6 months of instructional work on same. One year at sea as Chief Electrical Artificer on frigate, in charge of all electrical equipment. Completed apprenticeship as machinist in railway repair shops. Interested in design work testing, research and calculations. Available on two weeks notice. Apply to File No. 2693-W.

ELECTRICAL ENGINEER, B.Sc., M.E.I.C., age 33, single, with experience in sales, purchasing, office management and production control. Very good connections with industrial plants in Ontario and Quebec. Available after July 20th. Location preference: Toronto, Montreal and Hamilton. Apply to File No. 2694-W.

SENIOR CIVIL ENGINEER, M.E.I.C., P.E.Q., with considerable experience in all building construction and specialization in reinforced concrete; seeks first class opening. Able to supervise work and qualified to take full charge of and execute contracts. Apply to File No. 2695-W.

ELECTRICAL ENGINEER, Queen's 1946, S.E.I.C., R.P.E., Ont., S.I. Radio E, veteran of R.C.N.V.R., age 24, completely bilingual, available immediately, will go anywhere. Apply to File No. 2696-W.

ELECTRICAL ENGINEER, honour graduate 1944, University of Toronto, desires position in electrical manufacture or construction. Two years' service as electrical lieutenant, Royal Canadian Navy. Experience in street-railway systems, radar, radio and ship electrics. Available now. Please contact File No. 2689-W.

NON FERROUS METALLURGIST AND GENERAL WORKS MANAGER seeks change. Experience: Fuel and electric melting furnaces, copper refining furnaces, splashing machines, water cooled moulds. Sheet-stripps-rod hot and cold rolling mills. Hydraulic extrusion presses, shapes tubes bars rods. Wire and bar drawing. Hot plating bi-metals. Tinning, ropery. Metal recovery. Processing copper, nickle, aluminium and all their alloys: Leaded and non-leaded brasses, aluminium-phosphor and guilden-bronzes. Phosphor copper and solution treatable copper-chromium alloys. Copper nickel and nickel brasses. Duralumin. Organiser, improver. Metallurgical, mechanical, chemical education. University degree. Apply to File No. 2701-W.

ELECTRONIC COMMUNICATIONS ENGINEER. B.Sc. (honours), M.I.E.E. (London), 14 years experience research, design and development, British, aged 36, at present employed in England at £840 gross, desires job in Canada at around equivalent salary. Has intimate knowledge of telephone and radio industries, own proved design methods for electronic equipment and theorectical and practical knowledge of pulse transmission system. Any location with reasonable living conditions for family of four. Details of career and references with Institute. Apply to File No. 2692-W.

LIBRARY NOTES

(*Continued from page 454*)

This text, prepared for a brief course offered in the specialized training program at Iowa State College during the years 1942-4, gives a general picture of the electrical field and covers the fundamentals with which the practical man must be familiar. The treatment is as non-mathematical as is practicable.

ELECTRICAL MEASURING INSTRUMENTS, Measurement and Surveys:

By E. S. Lincoln. Essential Books, 270 Madison Ave., New York, 1945. 284 pp., illus., diagrs., charts, tables, 8¼ x 5¼ in., cloth, $3.00

Part I of this practical text covers the operating principles of all types of industrial electric measuring instruments, including integrating and graphic instruments. Ranges, damping, sensitivity, accuracy, etc., are dealt with, and tables are given for quick reference in the selection of instruments. Part II covers instrument transformers and procedures for making electrical measurements. Details are given in Part III for making electrical surveys of an entire system from which proper operation of equipment and useful economics may be determined.

ELECTRONICS FOR ENGINEERS:

Edited by J. Markus and V. Zeluff. McGraw-Hill Book Co., New York and London, 1945. 390 pp., illus., diagrs., charts, tables, 11 x 8½ in., cloth, $6.00.

The articles, charts and graphs presented in this volume have been selected from those that have appeared in "Electronics" because constant demand has shown their permanent reference value. One hundred and forty-two articles have been edited and collected in 27 chapters by subject, making consultation easy. Designers and builders will find the data useful and convenient.

HANDBOOK OF NONFEROUS METALLURGY, Recovery of the Metals

Prepared by a Staff of Specialists, D. M. Liddell, Editor-in-chief. 2 ed. McGraw-Hill Book Co., New York and London, 1945. 721 pp., illus., diagrs., charts, tables, 9 x 5¾ in., cloth, $7.00.

The second volume of this standard two-volume reference work is devoted primarily to the reduction and refining of metals. Within its 700 pages the metallurgical processes by which the various nonferrous metals are effectively recovered from their ores are described in detail by specialists. Information on deposits, extraction methods, properties and uses is included. Footnotes and chapter bibliographies offer other valuable sources of information. This second edition has been revised to include recent improvements, and certain changes have brought the two volumes into closer conformity with their respective subtitles.

INGENIÖRS VETENSKAPS AKADEMIEN, Handlingar Nr. 184. On the Deflection Theory of Suspension Bridges:

By S. O. Asplund. Ingeniörs Vetenskaps Akademien, Stockholm, Sweden. 1943. 201 pp., illus., diagrs., charts, tables, 9¾ x 7 in., paper, apply.

This paper treats of the effect of vertical loads upon the main girders of suspension bridges, taking into account the distortions of the system. Solutions of the fundamental differential equation of the deflection theory have been carried out far enough to result in general expressions directly adaptable to influence line use. Applications to one span and three span bridges are worked out, and model tests are evaluated by comparison. There is a bibliography.

Introduction to INDUSTRIAL CHEMISTRY:

By W. T. Frier and A. C. Holler. McGraw-Hill Book Co., New York and London, 1945. 368 pp., illus., diagrs., charts, tables, 8 x 5¼ in., cloth, $3.00.

An elementary textbook, intended especially for industrial night schools and for students of limited scientific background. The aim is to enable the student better to understand the processes going on around him by using them as a substitute for laboratory experimentation.

MODERN PLASTICS ENCYCLOPEDIA, 1946:

Plastics Catalogue Corporation, 122 East 42nd St., New York. 1,389 pp. + 10 charts, illus., diagrs., charts, tables, 11¼ x 8 in., cloth, $6.00 ($7.00, Canada).

This standard compendium of information on plastics covers a wide field, beginning with a review of recent progress. Methods of identifying and testing plastics are described, the varieties are discussed at length, and their qualities are considered from a practical viewpoint. Other sections deal with engineering design; methods of molding, extruding and casting; fabricating, finishing and assembling; machinery and equipment; laminates, plywood, and vulcanized fiber coatings; synthetics and rubberlike plastics. There is a large amount of useful tabulated data including ten large folded charts in a special envelope.

LE PLAN DE FABRICATION AERONAUTIQUE:

By M.-P. Guibert, preface by J. Roos. Dunod, Paris, 1945. 126 pp., diagrs., charts, tables, 10 x 6½ in., paper, 255 frs.

A general plan for assembly line production of airplanes is established on a statistical and mathematical basis for the more efficient use of the facilities involved. The treatment is highly detailed, and much of the material is presented graphically by diagrams.

PLASTICS MOLD ENGINEERING, the Fundamentals of Plastics Mold Design and Construction

By J. H. DuBois and W. I. Pribble. American Technical Society, Chicago, 1946. 494 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $7.00.

The early chapters describe types of molds, tool-making equipment and methods, materials for mold making, and plastics product design. The succeeding chapters are devoted to detailed description of individual molds and specific molding processes. The book is profusely illustrated by sketches, photographs, and working drawings, and some forty pages of useful reference tables are provided.

SYMPOSIUM ON MAGNETIC PARTICLE TESTING, American Society for Testing Materials

Philadelphia District Meeting, January 22, 1945. 260 So. Broad St., Philadelphia, Pa., 1945. 122 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $1.25.

Eight papers by authorities and two tentative methods for testing are contained in this symposium. Topics covered by the articles include the equipment, specifications and procedure for magnetic particle inspection, the application of the method to the testing of aircraft parts, and the inspection of castings and forgings.

TELETRANSMISSIONS PAR ONDES PORTEUSES dans les Réseaux de Transport d'Energie à Haute Tension:

By A. Chevallier, preface by E. Mercier. Dunod, Paris, 1946. 111 pp., illus., diagrs., charts, tables, 10 x 6½ in., paper, 390 frs.

This book covers the theory and practice of teletransmission by carrier waves in high tension networks. Connections, methods of modulation, radiations from high tension lines, transmitting and receiving equipment, wave ranges and filters are some of the topics covered. Separate chapters are devoted to telephony, selective protection of high tension lines, and impulse frequency telemetering.

NOTICE

To facilitate reorganization, the Library will be closed until September 3rd, 1946.

AN URGENT REQUEST

Would members who do not file the *Journal* kindly return their June 1946 copy to headquarters.

On account of difficulties at the printers, fewer copies have been printed than had been ordered and the needs of several libraries have not been filled.

COVER PICTURE

A picture of The Pines hotel seen from the harbour at Digby, N.S. This will be headquarters for the Maritime Professional Meeting which will be held on September 5th, 6th and 7th under the joint auspices of the Associations of Professional Engineers of Nova Scotia and New Brunswick and The Engineering Institute of Canada.

PRE-COMPRESSED CONCRETE DESIGN

COLONEL J. P. CARRIÈRE, M.E.I.C.
City manager and engineer, City of Hull, Que.

Paper delivered before the Montreal Branch of The Engineering Institute of Canada on March 7th, 1946

Introduction

The purpose of this paper is to outline the basic theory of pre-compressed concrete design, some of its practical applications and some of the equipment employed in producing it.

Pre-compressed concrete represents a new technique in the use of steel and concrete, combined to form a new type of building material.

Before examining the relative values of the materials involved in pre-compressed concrete, let us review an elementary principle of mechanics.

Taking a simple example, let us consider a straight beam of rectangular cross-section and composed of homogeneous material, simply supported at each end and subjected to a concentrated load at the centre. (Fig. 1).

The stresses in the beam consist of:

(a) Compression at the top where fibres shorten;
(b) Tension at the bottom where fibres stretch.

These stresses are greatest at the extreme outer fibres (top and bottom), diminish in intensity as we get closer to the centre and are nil at the neutral axis.

This phenomenon takes place whatever the position or shape of the beam.

In the light of this observation, we may deduce that the ideal construction material is one which resists tensile and compressive stresses equally well.

Characteristics of Concrete and Steel

Concrete is simply artificial stone, but it is cheaper than natural stone, because it can be moulded to shape, doing away with the expensive processes of quarrying and cutting. Like stone, it resists compressive stresses well, but tensile stresses very badly.

Steel has been known since antiquity but was not being used as a construction material before 1880. It resists compressive and tensile stresses equally well. It is limited in its application as a construction material because of its:

(a) high cost;
(b) failure to resist corrosion;
(c) ease of deformation;
(d) and the fact that it is often not esthetic.

Characteristics of Reinforced Concrete

It is natural that, having available both steel and concrete, with opposite characteristics, engineers should have attempted to combine them, in order to obtain a material possessing the best qualities of both.

The first attempt resulted in what is known as reinforced concrete, which has long been used successfully, notwithstanding certain defects.

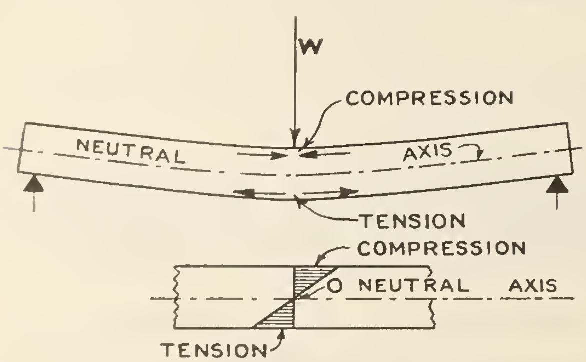

Fig. 1.

Reinforced concrete is essentially a grouping of materials wherein the concrete resists compressive stresses and the steel resists tensile stresses. It is not an intimate combination of elements, but simply a compromise which allows concrete to be used for members subjected, in part, to tension by the placing of steel bars in such concrete structural members where the tensile stresses actually occur. Only the steel resists these tensile stresses; the concrete simply follows the deformations in the steel. The tensile strength of concrete is always left out of stress calculations because of its slight importance and the uncertainty of its action.

The success of reinforced concrete has been due to the fact that it is relatively inexpensive, that it can replace timber and steel, and that it is fireproof.

The concrete in reinforced concrete must follow the deformation of the steel reinforcement to which it adheres. Since the limit of elasticity of concrete in tension is very much lower than that of steel, it usually works beyond its elastic limit and therefore cracks. Cracks in reinforced concrete are almost inevitable.

Cracking has been reduced considerably by various methods, but nevertheless, even in the best reinforced concrete structural members, these minute cracks tend to enlarge under the combined influence of variations in temperature, atmospheric agents and repeated loading and unloading. These cracks open the door, so to speak, to exterior agents, especially humidity which is extremely damaging to the steel reinforcing.

Ideal Building Material

Three qualities are desired of construction materials:

(a) Permanency;
(b) Tensile strength;
(c) Compressive strength.

Concrete possesses two of these qualities, permanency and compressive strength; pre-compressing is a process developed to give it the required third tensile strength.

For the last 15 years, M. Edouard Freyssinet, noted French engineer, has concentrated his efforts to the development of this new technique. His example has been followed by many other engineers and construction men, and many of the most recent developments are due to the efforts of Professor Georges Magnel of the University of Ghent, Belgium.

What is Pre-Compressed Concrete?

The pre-compressing of concrete consists of subjecting structural members, before the application of loads or simultaneously with the application of loads, to artificial and permanent compression stresses, exactly opposed to the tensile stresses resulting from the loads. Pre-compression and loads are so calculated as to be in equilibrium.

This results in the neutralization of tensile stresses within the concrete by transforming tension into "decompression".

A simple example will illustrate this technique.

It is required to build a slab bridge of 50 ft. span, and 10 ft. width abutting on solid rock of infinite depth; the live load to be 350 lb. per sq. ft. (Fig. 2).

With ordinary reinforced concrete we will require a slab 52 in. deep and an area of steel reinforcing of 45 sq. in. (say 3.8 tons of steel).

The maximum unit shear stress in the concrete will be 48 lb. per sq. in.

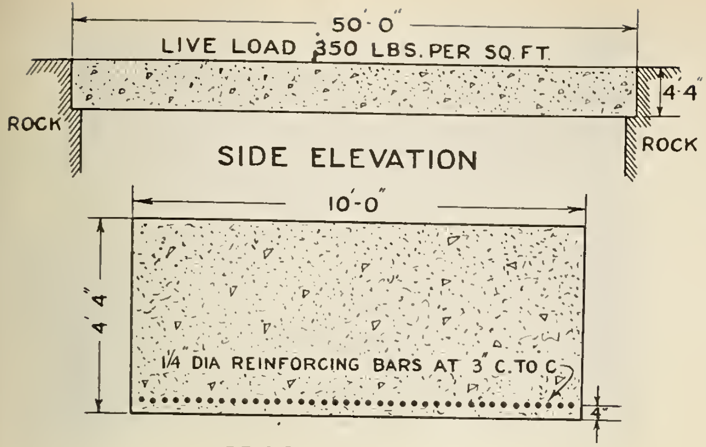

Fig. 2.

It is possible to make such a slab without reinforcing by compressing it between the abutments.

Let us examine a slab only 36 in. deep. (Fig. 3).

The dead load will be 450 lb. per sq. ft., live load 350 lb. per sq. ft.

Maximum bending moment due to the total load is 31,250,000 in.-lb. Maximum bending moment due to dead load only is 16,875,000 in.-lb.

Since the section modulus of the slab is 25,920 in.^{3}, the maximum unit working stress in the concrete, when the slab is fully loaded, is therefore 1,200 lb per sq. in., and when there is no live load 650 lb. per sq. in.

Now let us compress the slab against one abutment by means of suitable jacks resting on the rock of the other abutment, with a pressure of 200 tons per ft. of width so as to induce compressive stresses of 1,200 lb. per sq. in. at the bottom of the slab and of 650 lb. per sq. in. at the top.

When thus pre-stressed, the distribution of stresses in the slab will be: (Fig. 4).

Fully Loaded Slab

At top=1200+650=1850 lb. per sq. in. compression.
At bottom=1200—1200=0.

Unloaded Slab (Dead Load Only)

At top=650+650=1300 lb. per sq. in. compression.
At bottom=1200—650=550 lb. per sq. in. compression.
Max. unit shear stress=59 lb. per sq. in. opposed by an axial compression of

$$\frac{1200-650}{2} = 275 \text{ lb. per sq. in.}$$

Resulting in a net maximum tensile unit stress due to shear of 12 lb. per sq. in.

Thus, by reducing the thickness and removing all the steel reinforcement, we have a slab which will carry the same load with a maximum unit shear stress of 12 lb. per sq. in, and no tensile stresses at all.

This example has been used for the sole purpose of illustrating a theory. It is seldom, if ever, possible to compress structural members against natural rock abutments of the required strength.

Other means must be used to induce pre-compression in the concrete.

The most popular method employed at the moment consists in passing unbonded steel rods through the member and "tensioning" them against the ends. Let us apply this method to our slab.

If we attempt to use ordinary reinforcing steel working at 20,000 lb. per sq. in. to get our required pressure of 200 tons per ft. width of slab, we will require 20 sq. in. of steel per ft.

There is not enough room in the slab to place that much steel. Furthermore, the shrinkage and plastic flow of concrete cause an eventual loss of pre-compression which would neutralize that obtained with normal reinforcing steel.

We must use steel which can be subjected to working stresses of 80,000 lb. per sq. in.; with such steel we will require 5 sq. in. per ft., which can be placed in the slab quite easily.

This represents only 1/9 of the steel required for the reinforced concrete slab, and as this high tensile steel does not cost nine times the price of ordinary reinforcing steel, there is a saving in cost as well as in weight of steel.

We now have a slab in which all appreciable tensile stresses have been eliminated and in which concrete is subjected to compressive stresses only, the maximum unit stress in compression being 1,850 lb. per sq. in.

There is no reason why we may not design concrete structural members to resist even much greater compressive stresses.

We can eliminate the slight tensile stresses due to shear by placing pre-compressing steel rods vertically if we so desire.

With regard to the steel, it is to be noted that the stress variations due to loading and unloading are neglible.

In the present case, since we are subjecting the steel to a unit stress of 80,000 lb. per sq. in. for pre-compressing, the elongation will be=

$$\frac{80{,}000 \times 50 \times 12}{30{,}000{,}000} = 1.6 \text{ ins.}$$

When we apply the live load, the unit stress at the outer fibres of the bottom of the slab becomes zero which corresponds to an elongation of the steel of—

$$\frac{12 \times 1200 \times 50 \times 12}{5 \times 30{,}000{,}000} = .058 \text{ ins.}$$

which is equal to 3.6 per cent of the original elongation of 1.6 in. As a mater of fact, since the steel is placed a little inwards of the outer fibres, the unit stress and the elongation will be less than given above and we can say that the elongation of the steel, due to live load, is of the order of 3 per cent. This means that fatigue stresses are practically non-existent.

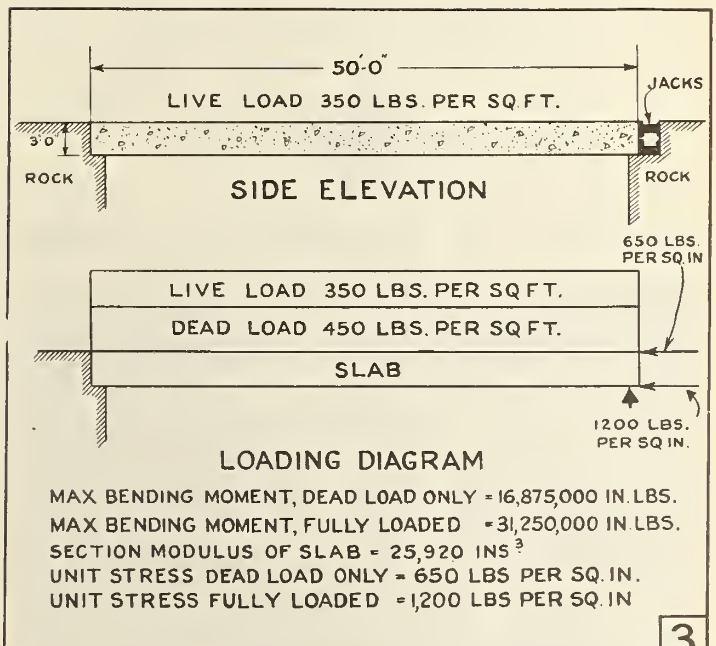

Fig. 3.

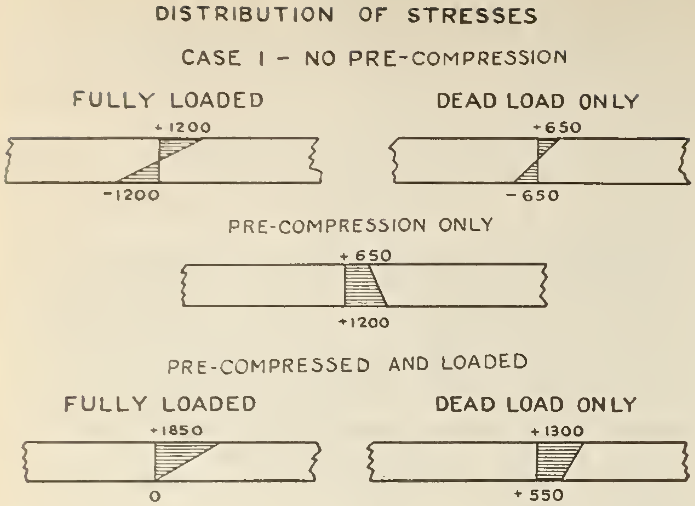

Fig. 4.

The Choice of Steel

The type of steel used for pre-compressed concrete in Europe is produced in the shape of drawn wire of a maximum diameter of 5 mm. (roughly ¼ in.), having an elastic limit of 100,000 lb. per sq. in. and a yield point of 134,000 to 145,000 lb. per sq. in. It contains 0.7 per cent of carbon and 0.8 to 1.2 per cent of manganese and it is drawn and tempered.

Its modulus of elasticity is the same as that of structural steel; a high working stress is allowed, (80,000 lb. per sq. in.), so that it will not lose more than 15 to 20 per cent of its tension due to shrinkage and plastic flow of concrete.

It will be noted that the allowable working stress is 80 per cent of that of the elastic limit, and an explanation is necessary to outline the reasons for such a discrepancy with the working stresses allowed in ordinary reinforcing steel.

In ordinary reinforced concrete, the reinforcing steel is not stressed to more than 50 per cent of its elastic limit, because:

(a) The variations in stresses in the steel during the life of the structure are considerable; for example, in our slab, the unit stresses vary from 650 lb. per sq. in. with dead load only, to 1200 lb. per sq. in. when live loads are applied. This represents an increase of 84 per cent. Repeated loadings bring in the question of fatigue.

(b) The reinforcing steel is subjected to maximum stresses only when the structure is loaded, that is at a time when the rupture of one of the bars, due to some fault, might cause complete failure.

(c) Concrete cannot follow the deformation of the steel in tension, especially in the case of repeated loadings, at higher working stresses than 50 per cent of elastic limit, and usually not even to that extent.

In pre-compressed concrete, these reasons do not apply.

(a) We have seen that the variation in stresses, due to loadings, is of the order of 3 per cent of the stresses under dead load; this eliminates the question of fatigue.

(b) The steel is subjected to maximum stresses during the pre-compressing period. From then on, under permanent loading, tension decreases due to the combined effects of shrinkage and plastic flow of concrete. This decrease is of the order of 15 to 20 per cent under normal circumstances.

Although not discussed in the example, by reasons of simplicity, this factor must be considered in designing pre-compressed concrete structures.

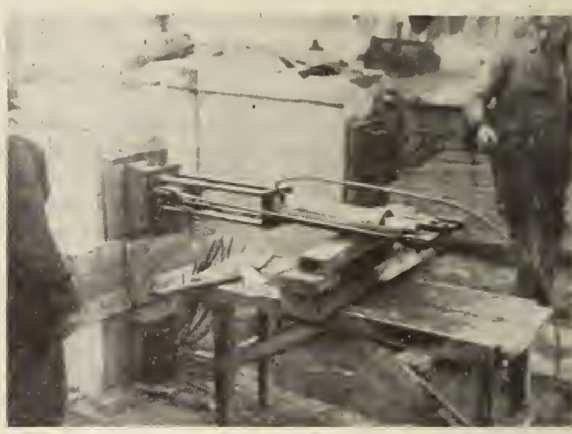

Fig. 6—Pre-stressing the wires for a beam made of pre-cast blocks by the Magnel method; work carried out by Royal Canadian Engineers for operation Pluto.

Rupture of faulty wires will, therefore, occur during the pre-compressing operations when they can be replaced without difficulty.

(c) Finally, the question of the concrete having to follow the deformations of the steel in tension does not present itself as the concrete remains in compression all the time.

Certain engineers, both in America and in Europe, feel that under the conditions of loading in most pre-compressed concrete structures, it is quite safe to stress the steel up to its elastic limit, which would lead to a greater economy of steel. Time will tell if such a practice is recommendable.

Experimental research is being carried out in the development of steels with higher elastic limits than that mentioned in this paper; their incorporation in pre-compressed concrete will no doubt also lead to new construction methods.

Losses of Pre-Compression

After pre-compressing, concrete shrinks. It is not intended to discuss the phenomenon in this paper beyond stating that the shrinkage of concrete will cause a reduction of tensile stresses in the steel.

Similarly, temperature stresses will cause deformation which, under certain circumstances, might be important.

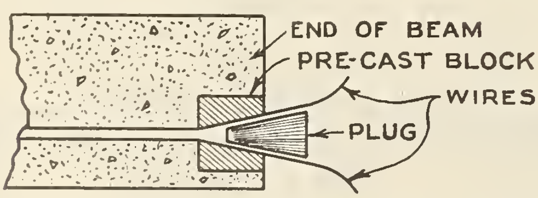

DIAGRAM OF FREYSSINET ANCHOR

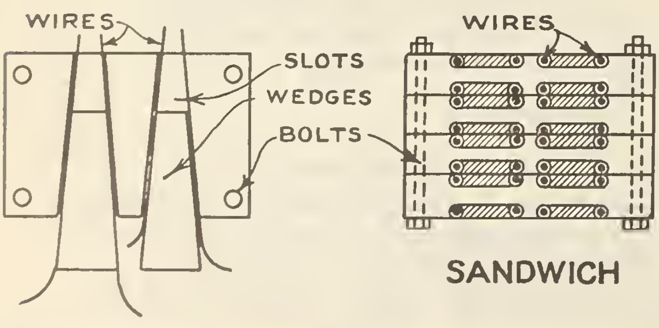

DIAGRAM OF MAGNEL ANCHOR

Fig. 5.

Fig. 7—One beam in place between abutments.

The values given above and in examples have been used to illustrate certain points, and are not intended as actual design calculations. Necessary allowances must be made in the design to overcome these expected losses of pre-compression.

Anchorage System

The steel used being hard and fragile, it is out of the question to use methods of anchoring which would necessitate notching the wires. This suggests that the wires must be locked in place by friction.

M. Freyssinet of France is using friction anchors of his own design which consist of setting precast concrete blocks in the ends of beams during the moulding operations; these precast blocks are provided with openings in the shape of truncated cones. The wires pass through these openings and rest against their walls; they are locked in place by means of pre-cast plugs driven into the opening which wedge the wires between the walls of the openings and the plugs. This type of anchorage system is being produced to take from 8 to 32 wires, (see Fig. 5).

Professor Magnel of Belgium has designed a method of anchorage also based on friction which he calls " sandwich type ". This consists of steel plates provided with wedge shaped slots on both faces into which wires are locked by means of steel keys. (See Fig. 5). Each plate can accommodate 8 wires and series of plates can be " sandwiched " over one another to accommodate multiples of 8 wires.

With the Freyssinet anchors, all the wires are stressed at the same time; the piston of a hydraulic jack rests against the pre-cast block through which the wires protrude; the wires are secured to a ring fixed to the body of the jack; when the required tension in the wires has been obtained the plug is driven in to lock the wires in place, by means of an auxiliary piston provided in the main piston of the jack.

With the Magnel anchors the wires are tensioned in a similar manner, except that they are pulled in pairs and that the wedges are driven in by hand with an ordinary hand hammer. (See Fig. 6).

In certain cases, the wires are held in place by bond with the concrete. The results of tests carried out with that type of anchorage, although not yet absolutely conclusive, suggest that wires of a diameter of 5 mm. will hold the concrete in pre-compression when bonded with the concrete.

Construction Method

When making monolithic structural members, forms are built as for normal, reinforced concrete, and the wires are placed in the forms in the shape of cables with the wires laid parallel. In order to prevent bond between concrete and the steel, bituminous paper is wound around the cables to provide a layer about ¼ in. thick, which is held in place by small wire bindings.

Professor Magnel uses flexible conduit commonly used in electrical installations as sheaths for the cables.

After the concrete has set sufficiently, the wires are tightened in place, then a cement paste is injected in the sheaths housing the cables to protect them against corrosion.

An interesting construction method was adopted by the Ministry of Transport of England in 1940. The Ministry wished to augment its reserve of emergency bridging materials and, because of the shortage of timber and steel, decided to construct a number of pre-compressed concrete beams in lengths of 15 to 50 ft. The shape found most economical consists of hollow rectangular beams for lengths up to 40 ft. and the others consist of H sections 12 in. wide.

It was also decided to bond the steel with the concrete and do away with end anchors completely. In order to effect this, wires were stretched between anchors 600 to 800 ft. apart, and three to four rows of beams were laid out. The wires were stretched between the anchors by means of jacks and the beams were cast around the stretched wires. After the concrete had set sufficiently, the pressure of the jacks was released, and the wires were cut flush with the ends of the beams which were subsequently stored until required.

In the type of structure such as the slab bridge used for an example, it is sometimes impossible to place the cables along the lower fibres of the slab upon its full length for many practical reasons.

To overcome this, the cables are raised at the end to assume parabolic curves in accordance with the requirements of the loading.

Pre-Compressing of Pre-Cast Blocks

Pre-compressed concrete beams can be made up of precast blocks in which holes have been left to receive the necessary cables.

A simple demonstration of the principle involved has probably been made unconsciously by most readers. When it is desired to shift books from one shelf of a bookcase to another, we usually handle more than one or two books at a time by applying pressure at each end of a number of them with our hands; as long as we maintain the necessary pressure the books form a beam of independent sections.

Pre-compressed concrete beams are made in just the same way with pre-cast blocks. A light coat of cement paste is usually applied between the blocks to overcome unevenness of the ends of blocks, but stability depends entirely on pre-compression induced by the pre-compressing cables.

Fig. 8—Pre-compressed concrete beams erected in Belgium to form a bridge between grain elevators.

Royal Canadian Engineers erected such beams during the construction of Pluto, the gasoline pipe lines from England to Germany. The beams were used to cross the Albert Canal, north of Brussels and are 65 ft. long, (see Figs. 6 and 7).

These beams consist of solid concrete end blocks roughly 3 ft. 4 in. long, 3 ft. 8 in. high, and 16 in. wide, and intermediate hollow blocks 1 ft. 8 in. long, and of the same height and width as the end blocks. The flanges of the intermediate blocks are 4¾ in. thick and the webs 2¾ in. thick.

There are 56 wires 5 mm. dia. in the beams; they were stretched in pairs to a tension of 80,000 lb. per sq. in. by means of hydraulic jacks and are locked in place at the ends by means of "sandwich type" anchors.

In this case, the beams were assembled on a level piece of ground and were swung into position by means of derricks as would have been done with steel beams or girders.

Figure 8 shows similar beams erected in the same manner by a Belgian engineering firm to form a bridge between grain elevators.

M. Freyssinet of Paris employed pre-cast blocks to build a highway bridge over the Marne River at Luzancy. This bridge has a single span, 180 ft. long. In this case, a temporary falsework timber beam was used to assemble the pre-cast blocks in place. The new bridge contains 17 tons of steel and replaces a demolished reinforced concrete bridge of the same capacity which contained 225 tons of reinforcing steel.

It will be noted that the blocks in such structures need not necessarily be of concrete. Prepared granite blocks, for example, would do just as well.

Pre-compressed concrete is being applied to many other types of construction, especially in Europe where steel and timber are scarce. It is being used for such things as telegraph poles, railway ties, high pressure pipes of various types, silos, grain elevators, dams, roofs, etc.

Conclusion

Much research and experimentation remains to be carried out into the use of pre-compressed concrete, but even at the present time, it can be used to great advantage in a variety of structures. Further development of this new technique depends on continued co-operation between engineers, manufacturers and builders. Given this co-operation, pre-compressed concrete is bound to become one of the great construction materials of the future.

DISCUSSION

P. L. Pratley, M.E.I.C.[1]

Any attempt to commit to writing, after an interval of several weeks, the ex-tempore comments offered in discussion of a technical paper, must of necessity be somewhat weak in "fidelity", but the writer is glad to accede to the request that such an attempt be made.

For the sake of brevity and clearness, the use of the first person may occasionally be allowed to creep into these notes.

The speaker of the evening was firstly congratulated on having on an earlier occasion expressed his preference for the term "pre-compressed" concrete, rather than "pre-stressed", as being more exact and more expressive, although the latter terminology has been widely adopted in the growing literature on this subject. The writer agreed most thoroughly with this preference and hoped that it can be adopted in Canada right from the outset. Colonel Carrière in his reply to the discussion expressed his concurrence and has actually altered his manuscript to accord with this proposal.

The writer next drew attention to the fact that the principle and process of pre-compression was not in itself new, as the reverse application, namely "pre-tension" was fairly common and well-established. The principle is simply one of prevention—the undesirable condition is foreseen and positively avoided. In the case of steelwork the objective is to prevent certain slender members from becoming struts, and it is accomplished by introducing an initial tension sufficient to ensure that in the normal course of service and experience, any compression stress that might be induced in the member will never overcome this initial tension, and the member will not therefore be called upon to suffer the undesirable stress for which it is not designed. The incidence of compression is by this means transformed into a diminution of tension. Common examples are bracing rods in tower and bridge structures, guy-ropes in radio towers, and, recently, stay-cables in "weak-sister" suspension bridges. In New York, for example, at the Whitestone bridge, heavily "pre-tensioned" diagonal ropes of 2⅞ in. dia. have been introduced in pairs, between the tower-tops and the stiffening trusses, to aid in reducing objectionable vibrations.

If introduced in an unloaded condition to the structure in its normal shape, these stay-cables would be stretched as the point of attachment to the girders sank, but would be slackened and therefore useless as the point of attachment rose on the crest of an undulation. Therefore, to maintain tension and usefulness at all times a high initial tension is supplied so that, at no time during even the maximum vibration, is the stay slack. Similar but less "hefty" pre-tensioned stay-cables have been installed in other United States suspension spans of the vertically-slender type.

Manifestly, with concrete, the desirable stress is compression and the stress to be prevented is tension, so that pre-compression instead of pre-tension is impressed upon the member, and its experience in service is confined to a diminution of the original compression on those fibres or that flange which would otherwise suffer tension and become valueless.

The methods by which these pre-compression stresses are introduced into certain selected portions of concrete beams or girders are various, and have grown up as personal preferences or as the results of circumstances, external conditions, or shortages of this or that material. Some interesting experiments are described in numerous papers delivered before the Institute of Civil Engineers and the Institution of Structural Engineers, in London and much valuable discussion has been provoked, especially in February 1941 when M. T. J. Guéritte addressed the first named body and presented further details and comments regarding tests on large beams, originally reported in early

[1] Consulting engineer, Montreal, Que.

1940 but not then published due to war restrictions. The claims for efficiency and economy were widely attacked by outstanding engineers, and references made to the apparently low factors of safety and the high permissible stresses, both in steel and concrete. The replies by M. Guéritte were illuminating and he brought out strongly and effectively the following points, which have been equally emphasized by Col. Carrière.

1. Pre-compressed concrete is not merely reinforced concrete, but a different structural concept.

2. The high stresses occur only in the preparatory and erection stages. All subsequent service involves reductions in critical stresses.

3. Principal combined unit stresses in tension and shear, calculable as produced in regions of heavy shear are definitely and surprisingly smaller than in ordinary reinforced concrete beams.

Dealing with these same matters, Colonel Carrière made it clear that reinforcing steel in the usual sense of the term is eliminated, so that the beam or girder is really a plain concrete member. Bond stress and modular ratio lose their importance and in many cases disappear. The full cross sectional area of the beam functions in compression under dead and live loadings.

Electrical methods of stretching the wires used for pre-compressing have generally given way to mechanical methods, and some ingenious devices have been developed for stretching the high tensile steel, whether rods or wires, so that the reaction from such stretching operates as the compressing agency on the lower flange of the concrete beam. I made reference to one method whereby the ends of wires were passed through $1\frac{3}{4}$ in. steel plates which were perforated with a series of tapered holes into which the wires were wedged under no more stress than could be supplied by hand tools. These plates were then pushed away from the ends of the beam by jacks whose outrun was sufficient to produce stress up to 170,000 lb. per sq. in. in the wires. (p. 527. Oct. 1941 *Journal* of the Inst. C.E.) This tension was accompanied by a corresponding compression in the concrete against which the jacks reacted, and the compression was distributed over the cross section in a manner dependent upon geometrical relations such as area, shape, and offset of load from neutral axis. In other systems the wires are pulled before wedging, as Colonel Carrière shows in his illustrations.

It was explained in M. Guéritte's papers, especially on p. 130. Apr. 1941 *Journal* of the Inst. C.E. that whereas 78,000 lb. per sq. in. was the initial unit stress used in 1936 for the beams tested and described by him, the practice in 1940-41 had risen to 154,000 lb. per sq. in. In the correspondence by Dr. Abeles p. 527. Oct. 1941 *Journal* Inst. C.E. the wires stressed initially to 170,600 are described as being of 0.069 in. dia., with ultimate tensile strength of 370,000 lb. per sq. in. and a limit of proportionality of 342,000. These properties indicate a very special type of wire not perhaps commercially obtainable in Canada yet.

Obviously care must be exercised during such pre-stretching operations; trained personnel are needed and much supervision. The load must be so applied that no bending moments arise, which are likely to induce tension in the *upper* flange or fibres of the beam, unless adequate provision has been made for this contingency. In the more ambitious cases, certain steel wires are inserted in these upper flanges and pre-stretched so that the concrete here is also pre-compressed. The designer has considerable freedom, once he is assured that mechanical equipment is available for controlling the "input" stresses, and by exercising his ingenuity he can provide for all temporary and permanent possibilities.

In transport and field handling, reverse bending moments are liable to occur, and he must either anticipate these conditions qualitatively and quantitatively, or the field forces must be instructed to follow carefully prescribed procedures, planned to control bending moments and eliminate reversals.

Early in 1940, the British Ministry of War Transport decided to build and stock a large number of pre-compressed concrete beams for emergency use in the repair of bombed structures. These were of various sections, some H, some I, some hollow box, and of spans from 15 to 50 ft. In these designs the wires were inserted near the bottom edge and kept in tension during the pouring of the concrete, being released after curing had been assured. On cutting the wires loose from the tightening devices, the bond stress would ensure joint action, and as the steel lost tension the concrete would pick up compression in the bottom flange, with some tension in the upper flange. By storing the beams as beams, the dead load tended to minimize this tension, and as soon as the beams were put into service the superimposed loads served to reverse or reduce the "input" stresses and leave every fibre in compression. Again, care had to be taken not to upturn the beams during transport or handling. Many of these beams survived the war and have since been used in railway practice as permanent structures, mostly for over-crossings. The beams are laid side by side and form a solid deck for ballast or slab. (See Nov. 1943, *Journal* Inst. C.E.)

Beams of this type can be cast in quantities in open yards or under cover. Wires, long enough for six or eight beams, are mounted and stretched at the right height above ground forms at a few feet interval. The concrete is poured around them in removable forms placed in sequence along each group of wires, and, after the concrete has set, the wires are cut just outside each beam-length. One of the more elaborate processes used for individual beams of special design or for experimental purposes is to build tubes into the concrete which is poured before any stretching of steel is attempted. Wires are then passed through the tubes, fastened to movable anchor assemblies of heavy plate or of built-up devices such as illustrated by Colonel Carrière, and then stretched by jacks to the required calculated amount. After stretching, the wires are securely fastened in the anchorages or the anchorages are themselves positively and immovably attached to the beams, so that the tension is permanently maintained in the steel and the corresponding compression permanently applied to the concrete. Welding, wedging, etc., are resorted to as means of attaching the ends of the wires to the anchors and precast cement blocks are frequently used to fill the space between anchor plates and beam ends, where the jacks were located during the stretching operation.

The effect of creep, shrinkage and deflection is inescapable, but research has made it possible to pre-calculate it fairly closely, and its magnitude is well illustrated in the records of tests and experiments described in the *Journal* of the Inst. C.E. for April 1941, Oct. 1941 and Feb. 1942.

As to the adoption of the pre-compressed beam or girder in Canadian construction, it must be borne in mind that competition with steel and reinforced concrete will be severe when materials are in normal supply again. If the cost of equipment and skilled labour could be distributed over a sufficiently large amount of work, then special conditions, such as restricted depths, speed of field work, reluctance to pour concrete at the site or under the temperature conditions, might offer opportunities for its adoption, but personally I am not over-optimistic regarding the prospects. Pre-cast, that is to say, shop-cast items such as standard beams and lintels, cross-beams for highway decks or poles for power lines might present the first field for the application of this principle in our neighborhood. Of course some particular bridge or building project might lend itself to pre-compressed concrete beam design, in the hands of a careful and competent engineer, as was undoubtedly the case in Europe under war or early-post-war conditions, and the experience of our R.C.E. units under expert engineer officers would then be a realizable asset. The knowledge of the art and their appreciation of the need of thorough organization should be a distinct advantage of which Canadian industry should be prepared to take note. The writer finally asked Colonel Carrière whether he had any more definite idea as to a possible Canadian field for this new and valuable material of construction, which he had so ably introduced to the membership both at the recent Annual Meeting and on this present occasion.

M. F. MacNaughton[2]

I enter this discussion of Colonel Carrière's paper with some hesitation, because I know comparatively little about pre-compressed concrete design, and I will limit my discussion to a presentation and interpretation of results of physical tests which we have recently carried out on some high carbon cold drawn steel wires which are being used in Canada as reinforcement in pre-compressed concrete.

About two years ago, Mr. E. P. Muntz, chairman of this meeting, asked us to arrange to carry out measurements of stress-strain relationships on some specimens of high carbon cold drawn wire when loaded beyond their elastic limits. About a year ago Mr. Muntz asked us to carry out a long time loading test on such a wire to determine cumulative creep when the wire was subjected to a continued load beyond its elastic limit. Some time was spent in designing and building the apparatus for this test, and, in the latter part of August, 1945, the test was started.

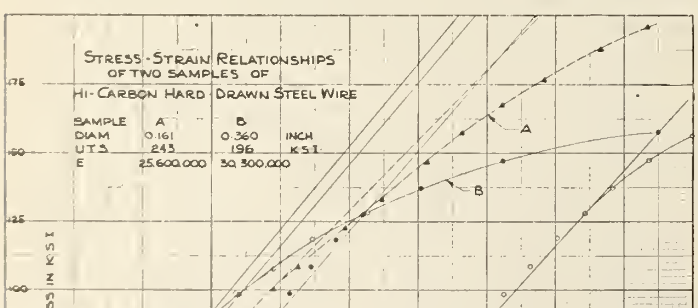
I note that Colonel Carrière states that European practice today utilizes steel with an elastic limit of 100,000 lb. per sq. in. and uses initial stresses of in the neighborhood of 80,000 lb. per sq. in. On the other hand, Dr. P. R. Pratley, in discussing the paper, quotes British authorities to the effect that working stresses of 155,000 lb. per sq. in. may be permissible.

These divergent views probably reflect conclusions based on the performance of steels of different properties and, possibly, composition. In adopting any conclusions to be applied to Canadian practice, the properties and characteristics of steels presently available in Canada, on a commercial scale, must, of course, be considered.

In support of this I present three graphs showing results of tests which we have made on Canadian steels.

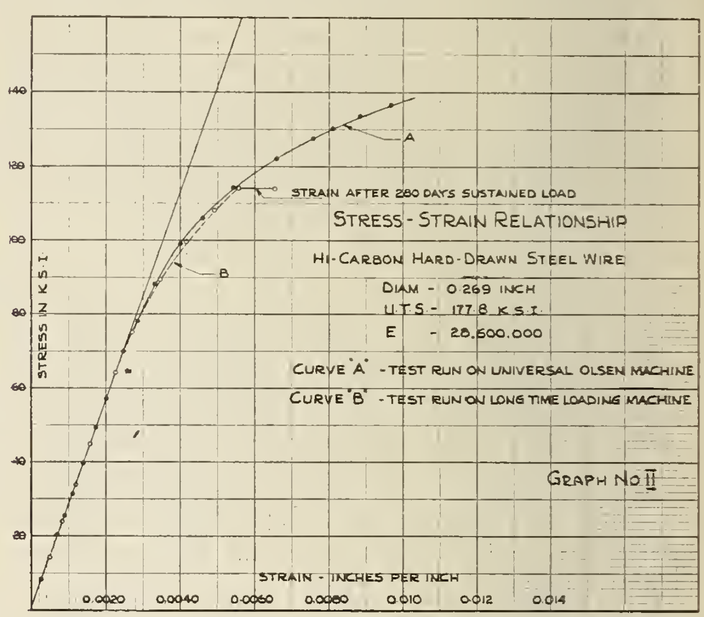
Graph I shows results of stress-strain tests on two samples of H.C.C.D. steel wire. Sample A had a diameter of 0.161 in., a U.T.S. of 243,000 lb. per sq. in., and an elastic limit of approximately 95,000 lb. per. sq. in. Sample B had a diameter of 0.360 in., a U.T.S. of 196,000 lb. per sq. in., and an elastic limit of approximately 78,000 lb. per sq. in. These two wires are entirely different as regards their physical characteristics, and cannot be classed as similar material.

[2] Consulting engineer, Milton Hersey Company Limited, Montreal.



Sample A, which has been drawn to a smaller diameter is higher in tensile strength and in elastic limit than Sample B. In both cases the elastic limit is about 40 per cent of the ultimate tensile strength. The values for E differ greatly, that for wire A being 25,600,000, while that for wire B is 30,300,000. This, of course, must be considered in designing pre-compressed concrete structures.

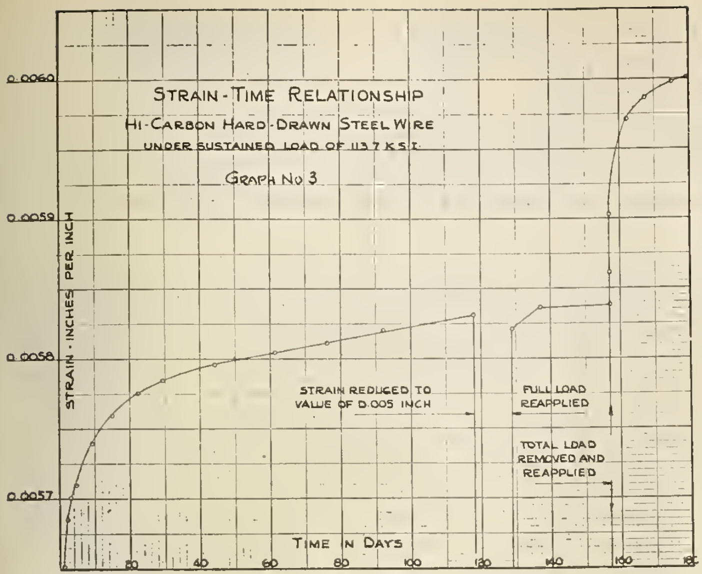
When the wires are stressed beyond their elastic limits, their behaviour is equally different. For example, consider their departures from proportionality at loadings equivalent to 75 per cent of their ultimate strengths, equal to 182,000 lb. per sq. in. for wire A and 147,000 lb. per sq. in. for wire B. At these loadings, the departure from proportionality, expressed as a percentage of the proportionality strain at the specified loading, is 17 per cent for wire A, and 48 per cent for wire B. It is apparent that wire A is not only stronger than wire B, but also, for proportional increments of loading above the elastic limit, is much more resistant to permanent deformation or "creep".



A simple stress-strain relationship was determined for wire A. Wire B, after five cycles of loading to 100,000 lb. per sq. in. and unloading, showed a permanent strain of 0.01 per cent of the original length. After further loading to 127,500 lb. per sq. in., followed by release of load, a permanent strain of 0.08 per cent was recorded, and the value for E had fallen to 29,000,000. After further loading to 157,000 lb. per sq. in. and release of load, a permanent strain of 0.385 per cent was recorded, and the value for E was 27,800,000. At the same time the elastic limit which originally was 78,000 lb. per sq. in., has been increased to approximately 115,000 lb. per sq. in. In arriving at this figure of 115,000 lb. per sq. in. it should be noted that the strain readings taken on reloading fall to the left of the descending stress-strain line, indicating some hysteresis effect in the steel itself, since this effect is not noted unless the steel is stressed beyond the elastic limit.

Thus it is apparent that these steels not only differ in their original properties, and behave in different manner when stressed beyond their elastic limits, but also suffer unequal changes in characteristics when stressed beyond their elastic limits.

Graph II shows the stress-strain relationship of a third sample of H.C.C.D. wire subjected to long time continued loading beyond the elastic limit. At 114,000 lb. per sq. in. loading, the proportional strain was .0040 in. per in. and



the immediate departure from proportionality was .0015 in. per in. After 280 days of sustained loading a further departure from proportionality, or creep, of .00108 in. per in. was observed making a total strain of .00658 in per in. During this period the immediate departure from proportionality was increased approximately 65 per cent by creep as a result of sustained load.

Graph III shows, on a very much magnified scale, the strain-time relationship of this phase of the test. After 118 days of sustained loading the lever arm was raised to a fixed position at .005 in per in. strain to protect the specimen from shock when full supervision was not possible. Full load was re-applied at 129 days. After 157 days the load was completely removed and re-applied.

It would seem that slight variations in stress, of the order which normally occur as a result of the fluctuations of live load in pre-compressed concrete structures, would have little effect on the rate of creep, provided the steel were not loaded too far beyond the elastic limit. Major increases or recessions in load would, however, greatly accelerate the rate of creep.

At the present time, after 280 days, this wire, stressed to approximately 65 per cent of its ultimate tensile strength, is increasing in length at the rate of slightly less than half a millionth in. per in. per day. For practical purposes, this rate of creep is probably not significant, though the fact that, with the exception of the effect produced by the unloading at 157 days, it has remained nearly constant since the fortieth day might suggest the desirability of continuing the test for a further period.

As has been pointed out by Colonel Carrière, maximum stresses in steel in pre-compressed concrete are developed at the time that the steel is pre-stressed, when the structure itself is not subject to excessive stress. From then on, as a result of shrinkage and plastic flow of the concrete, the stress in the steel gradually recedes. For this reason it may be quite proper, for initial stressing of the steel, to exceed the actual elastic limit. It may even be proper to design for working loads which exceed the elastic limit of the steel, provided that the effects of creep of the steel and change in elastic modulus, which occurs as a result of stressing beyond the elastic limit, are taken into account in the design. The designer might reduce or even eliminate these effects by adopting one of two expedients:

(1) He might select a more suitable steel for his purpose than the one immediately available. For example, wire A of Graph I would appear to be, by all counts, a more satisfactory material for reinforcement of pre-compressed concrete than wire B. Alternatively he might, if the material were available, select an alloy steel wire with a higher proportional limit than is provided by high carbon cold drawn steel wire.

(2) He might pre-stretch the wire, as received, to eliminate a large part of the creep resulting from continued long time loading. If the wire of Graph II had been pre-stretched at 122,000 lb. per sq. in. prior to testing, the greater part of the immediate departure from proportionality and a large part of the subsequent creep would not have taken place on subsequent loading to 114,000 lb. per sq. in. Had the wire been pre-stretched to 130,000 lb. per sq. in. prior to loading to 114,000 lb. per sq. in. the departure from proportionality and the creep at this loading would have been negligible.

Considering the information which has been developed in regard to these three wires, and the general dearth of information which is available in regard to this class of material, particularly when subjected to stresses beyond the elastic limit, it would seem prudent for the designer of pre-compressed concrete structures to obtain advance information regarding the essential properties of the reinforcing to be used and to check carefully the characteristics of each lot of material received to ensure that it conformed, within reasonable limits, to the design standard.

The Author:

At the outset, I wish to thank Dr. Pratley for supporting me when I expressed my preference for the term "pre-compressed" concrete against "pre-stressed" concrete. The support of such a distinguished engineer makes it much easier for the author to insist on this point which has its importance to students of the subject inasmuch as the term "pre-compressed" describes by itself the basis of the technique under discussion, whereas the term "pre-stressed" is vague and, in many cases, misleading.

As pointed out by Dr. Pratley, pre-stressing of building materials is not a new process, especially as regards "pre-tensioning" in steel structures; the important point is that we are faced with an accepted method of combining steel and concrete in our structures in a manner which is not entirely sound, either from the structural or economical point of view and that "pre-compressing" of concrete under given conditions offers an improved method of combining these materials to obtain greater efficiency and economy.

This is of capital interest to architects, engineers and builders, as well as to those useful members of society who provide the funds to erect our structures. The methods by which pre-compression of the concrete is obtained are only accessory to the principle involved. Certain methods have been applied with a measure of success; they are not perfect and present some undesirable aspects. Should we improve these methods or seek new ones? This is a question that the future will answer, the answer depending to a great extent on whether the originators of the present methods are left to improve their original ideas or whether engineers at large apply their inventive minds to research of other methods.

It is only natural that engineers who have applied the principle successfully by methods of their own design should aim at improving these methods rather than seek for new ones. As an example of this, I take the liberty of quoting Professor Magnel of the University of Ghent on the problem of creep in the steel, so ably presented by Mr. McNaughton.

After carrying out many experiments, Professor Magnel states:

"The greater part of the creep in hi-carbon hard drawn steel wire occurs in the early stages of loading over the elastic limit; therefore, such wire when intended for use in pre-compressed concrete should be pre-stressed in tension to a stress slightly higher than its elastic limit to eliminate the greater part of the creep before incorporating it in the concrete." (*Continued on page 482*)

THE APPLICATION OF THE GAS TURBINE TO RAILWAY LOCOMOTIVES

ARMIN K. LEUTHOLD, M.E.I.C.
Chief engineer, Brown, Boveri (Canada) Limited, Montreal, Que.

A paper presented before the Montreal Branch of The Engineering Institute of Canada on March 14th, 1946.

Although the steam locomotive is a very reliable, highly developed motive power unit, the railways and the locomotive manufacturers have for a long time been trying to find a more efficient traction machine. More than fifty years ago, the electric locomotive was created and it has been brought to a very high stage of development. Its applications in the various systems of transportation, such as main lines, mountainous country, subway systems, etc., have become so important and have been introduced all over the world to such an extent that one could not imagine doing without them.

In spite of this very extensive application of electric traction, there are, particularly in the heavy main line traction field, many lines left where electrification is not economical. Up to a few years ago, the steam locomotive reigned supreme on such lines. Then the Diesel electric locomotive appeared and has, within comparatively few years, achieved tremendous success. This applies especially to the United States where, because Diesel fuel oil is plentiful and comparatively cheap, more Diesel locomotives than any other kind of traction machines have been introduced by the railways. These locomotives are doing excellent work in switching, and main line passenger and freight service.

A still newer and simpler kind of motive power unit, the gas-turbine locomotive, has been created and, within a very short time, brought up to such perfection where it can be safely introduced on the railways.

The gas turbine which is incorporated in the first locomotive of this kind is one of the last links in a chain of developments that have been going on for many years. A first impulse was given to gas turbine development with the introduction of the Diesel engine supercharging groups which permitted to raise the Diesel engine output by 40 to 50 per cent and even more. As a result of further extensive research work on gas turbines, the Velox boiler then was originated, for which the combustion air is furnished by a gas-turbine driven air compressor. With over 130 gas-turbine compressor groups for Velox boilers and oil refineries and more than 2,000 gas-turbine driven superchargers for Diesel engines in operation, Brown Boveri & Company were able to gather valuable experience which led, in 1939, to the introduction of the first real gas-turbine as prime mover. A combustion chamber for the generation of the gas had to be created and this, together with better efficiencies of the turbine and the compressor, resulted in a gas-turbine group which could deliver considerable quantities of useful power at a reasonable efficiency.

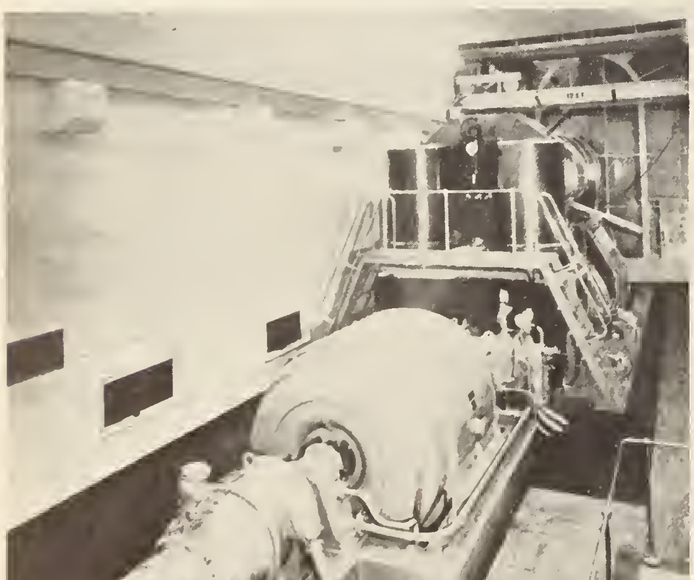


Fig. 1—First 4,000 kw. Gas-turbine Power Unit installed in bomb-proof standby power plant at Neûchatel, Switzerland.

First Gas-Turbine Power Unit

The 4,000 kw. gas-turbine power unit, which is illustrated in Fig. 1, may be looked upon as the forerunner of the gas-turbine unit as applied on the first gas-turbine locomotive. This first installation of its kind was a 4,000 kw. standby gas-turbine generator group installed in 1939 in a bomb-proof power plant of the City of Neuchâtel in Switzerland. The output of the gas turbine, in this case, is 16,000 kw. The air compressor utilizes about 12,000 kw., and 4,000 kw. are available for power production. This turbine group operates with a gas temperature at the turbine intake of about 1,020 deg. F. and the thermal efficiency of the turbine group, which is laid out in the simplest form possible, is 18 per cent at full load.

First Gas-Turbine Locomotive

In 1941, Brown Boveri & Company introduced, at the Swiss Federal Railway, the first gas-turbine locomotive ever built.

Figure 2 illustrates the principle of operation of this gas-turbine locomotive. On a common bedplate (G) are erected the gas turbine (B), the axial compressor (C), the reduction gear (E) with the power generator (F). The combustion chamber (A) is erected to the left of the gas-turbine, while the air pre-heater (D) is located above the gas-turbine set. The latter is connected to the compressor by an air pipe (8) with several expansion joints (9) which allow for different expansions of the air preheater and gas-turbine set.

The compressed air, which is pre-heated in an air heater, enters the combustion chamber partly as combustion air through the air nozzle ring (1) and partly as cooling air through the slits (2). The fuel enters through the injection nozzle (3). The cooling air enters into chamber (4) and reduces the combustion gas temperature to the admissible gas-turbine inlet temperature. This gas expands in the gas-turbine and passes afterwards through the air heater where finally it escapes through slits (6) in the locomotive roof to atmosphere.

The complete gas-turbine unit assembled on a common frame, ready for testing, is shown in Fig. 3. Various tests were carried out before the complete unit was fitted into the locomotive. The test data obtained were in very close agreement with the calculated values. The main particulars of this first gas-turbine locomotive are as follows. The guaranteed continuous output measured at the generator coupling is 2,200 hp. at a turbine speed of 5,200 rpm. and a generator speed of 812 rpm. The maximum speed of the locomotive is 65 mph. and the total length

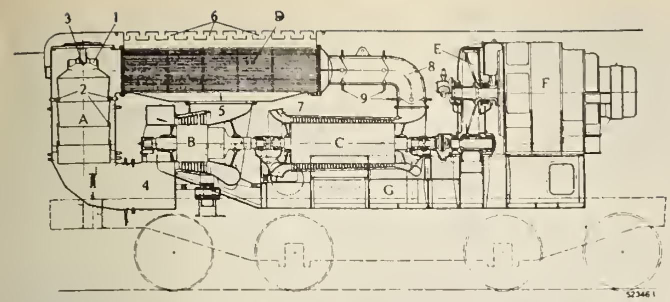

Fig. 2—Layout of the Gas-turbine Set of the Locomotive.

B. Gas-turbine **D. Air Heater** **G. Bedplate of Unit**
E. Gear

amounts to 53 ft. 10 in. The tractive effort at the wheel rim is at starting 29,000 lbs. at zero to 16 miles an hour; during one hour 17,000 lbs. at 30 miles an hour and continuous 11,000 at 45 miles an hour. The miximum service weight including fuel oil is 202,000 lb. The maximum axle load amounts to 35,200 lb.

In this simplest form of gas-turbine unit, a thermal efficiency between 14 to 18 per cent is obtained at half to full load of the unit, with a gas-turbine inlet temperature varying from 940 to 1,060 deg. F. The fuel consumption at full load is about one pound per horse-power hour at the wheel rim, i.e. it amounts to about 2,000 lb. of fuel per hour with 2,000 hp. at the wheel rim. On full-load operation, the gas-turbine develops approximately 8,200 hp., the compressor utilizes about 6,000 hp. and the remaining 2,200 hp. available at the generator coupling represents the useful power for traction and auxiliary purposes.

For various practical and technical reasons, the electrical transmission—as developed and successfully used in many cases with Diesel-electric units—was used with this first gas-turbine locomotive. Therefore, only the gas-turbine set was a new feature while the generator, motors, and switchgear could be adopted from the Diesel-electric locomotive without modification. Electric transmission was also preferred because such equipment had already proved very satisfactory for larger outputs, while hydraulic or mechanical transmission was not yet fully developed for larger outputs and therefore its application would have introduced uncertainties, which might have hampered the successful operation of this first gas-turbine locomotive. Furthermore, the gas-turbine which drives the generator through gearing can always be operated at the speed most suitable for the compressor and, therefore, the engine gives a relatively high efficiency at all speeds and loads. Furthermore no reverse turbine or corresponding reversing gear is necessary which would otherwise be required, in addition to the standard turbine, if mechanical transmission were used.

Regulation of the power developed by the gas-turbine locomotive with electrical transmission requires co-ordination of the power developed by the engine and that delivered by the motors or rather by the generator. This is effected by regulating the field of the generator by means of a servo-field regulator. This regulator is operated by an oil pressure governing system, which is illustrated in Fig. 4. The pump (9) supplies oil, under pressure, to the pressure lines common to all control devices and also during starting through the throttling orifice (31) to the bearing, while on normal operation the bearing lubrication is performed by the direct driven pump (8).

The driver, at either end of the cab, (A or B), can regulate simultaneously by the control wheel (14), the amount of fuel delivered by the pump (7) to the burner (12) of the combustion chamber via the oil pressure lines (18 and 19) by means of the servo-motor (20) and also the position of a speed governor sleeve (21) by means of the servo operated cam (22). By this operation, the speed varies with the oil pressure according to a definite law, the speed regulator, in turn, controlling through line (23) the servo-field regulator (24) and also the electrical output.

In case of a rising gradient where more power is required, the driver by rotating the handwheel (14) opens up the oil supply to line (18, 19) which means that the servo-motor allows more fuel to the combustion chamber and the cam sector (22) alters the position of the governor sleeve (21) so that the latter causes a speed increase of the set. The speed lags temporarily behind the value corresponding to the new governor setting due to the large inertia of the rotating masses of the turbine, compressor and generator, and therefore the servo-field regulator is influenced first by the speed governor in such a way as to remove load (as in the case of an overload) in spite of the fact that an increase in output is initiated. This operation therefore makes the excess of power, resulting from the increase in fuel quantity and from the reduction of the electrical load, available for accelerating the set which reduces considerably the temporary period of increased gas temperature and enables to attain in the shortest possible time the final speed at which the compressor supplies an air quantity corresponding to the increased fuel quantity. This action is further assisted by piston valve (26) coupled with the field regulator which causes, in the overload position, an additional increase in the supply of fuel oil by increasing the pressure in line (32). As soon as the speed of the set begins to exceed the new setting of the governor, the pressure begins to rise in the line (23) from the speed governor which causes the field regulator to be moved back again until equilibrium between the useful output of the gas-turbine and the load on the generator is established. When reducing the load, the same processes take place but in reverse sequence.

Lever (15) serves as a reversing switch for the motors and in the open position shuts off the governing oil supply from this driving stand when the other stand is used. The output and the speed which normally are fixed by the form of the cam sector (22) can be adjusted (if for any particular reason this should be desirable) by the screw knob (16) which establishes the relation between them and the fuel oil quantity. Lever (17) makes it possible to keep the light running speed high which might be desired in certain cases where a very short time to accelerate the set is required.

The control system also comprises a number of safety devices which prevent overspeeding of the set in case of a broken connection, protect the blading from harm

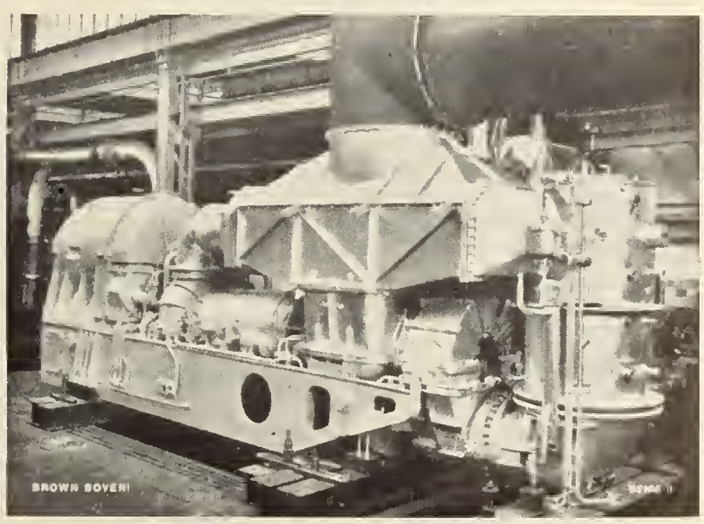

Fig. 3—Gas-turbine Generator Set on the test bed. The complete set is mounted on a common frame which also contains reservoirs for fuel oil and lubricating oil.

which would result from excessive temperature, shut-off the fuel should the governing oil pressure fall below a certain minimum or should the flame in the combustion chamber suddenly go out.

Operating Experience

On acceleration tests with a 321-ton train, the following data were obtained.

at a grade of .0% (level)	an acceleration of	0.500 mph per sec.
" " " " 1.2%	" " "	0.385 mph per sec.
" " " " 1.8%	" " "	0.276 mph per sec.
" " " " 2.6%	" " "	0.186 mph per sec.

While during the first year the number of test runs was relatively limited because of fuel shortage, this locomotive was operated during 1943-44 on a regular daily schedule over one of the longest secondary lines in Switzerland which is still not electrified. This line has a length of 47 miles and 21 stops, with light mixed passenger and freight traffic. The run includes switching operations at many stations, also numerous curves with resulting low average speed. It is far from ideal for a locomotive which is basically intended for long high-speed runs with few stops. During this period of service, the locomotive covered about 50,000 miles, far less than it could have travelled had oil fuel been freely available, but again much more than could have been hoped for, considering the severe wartime shortages in Switzerland. This run did not provide opportunities for trying out sustained operation at or near maximum speed but it did offer occasions for starting, acceleration, and stopping at much more frequent intervals than would occur under more nearly normal circumstances. It was therefore a much more severe test of the power plant and the control equipment than might be judged from the total milage alone. The number of control operations performed would normally be reached only in long-distance runs, aggregating at least 10 times the total milage covered.

This year of regular service confirmed the results of the earlier trial runs in regard to guaranteed performance. All requirements were fully met, no major disturbances of any kind occurred. Minor adjustments could always be completed during scheduled waiting periods, so that the availability record is excellent. The operating crews appreciate the simplicity of operation and the flexibility of the power plant. In view of this record, the locomotive has been definitely accepted by the Swiss Federal Railways and is now in service, together with other locomotives powered by internal-combustion machines.

In October, 1945, the Swiss Federal Railways loaned the locomotive, as shown in Fig. 5, to the French National Railways where it was operating daily on the line from Basle to Strasbourg, thus making one round trip of about 175 miles per day. On these runs, the fuel consumption measured over a long time was about 3 times less, namely 47.5 lb. per 1000 ton-miles, than it had been in Switzerland. This is entirely in accordance with the results of extensive operating cost studies. In North America, with heavier average loads on the turbine, higher speeds and fewer stops, the fuel consumption should drop to about 30 lb. per 1000 ton-miles. This is about double that which will be reached with the best traction Diesel engines. Depending now on the price ratio of Diesel and bunker oil, the fuel costs of the gas-turbine locomotive will be about the same or only slightly higher than that of a similar Diesel locomotive.

Economic Prospects of the Gas--Turbine Locomotive

Where traffic density is high, electrification generally receives first consideration especially in larger cities, otherwise either a steam, Diesel-electric or gas turbine-electric locomotive may be applied. It is therefore of interest to mention a few comparative figures for steam, Diesel-electric and gas turbine-electric locomotives. The data for steam and Diesel-electric units are taken from a paper presented before the American Society of Mechanical Engineers by Mr. E. E. Chapman, and giving an interesting comparison of steam and Diesel electric locomotives, in the light of modern American experience. To these figures, the corresponding data for a gas-turbine locomotive were added, based on careful estimates and operating figures available. The comparison is given in Table I.

In connection with Table I, the following remarks should be noted:

a) The cost of the gas-turbine locomotive is assumed on quantity production similar to steam and Diesel locomotives. It should be mentioned that these figures refer to pre-war conditions.

b) In the efficiency given for the steam locomotive, the steam turbo locomotive was not considered as this type has not been adopted to any extent. If supercharged four-cycle Diesel engines were considered, the Diesel efficiency would be higher than indicated.

Fig. 5—Passenger train driven by first gas-turbine locomotive at Gare de l'Est in Paris.

c) The equality of fuel cost for gas-turbine and Diesel locomotives applies to oil producing countries where the cost of bunker fuel oil is about one-half that of Diesel oil.

d) The lubricating cost of the gas-turbine is negligible, while for the Diesel engine, it amounts to a relatively high percentage of the fuel cost. The lubrication requirements of the wheel axles are not included, but they are, of course, the same as those of the other locomotives.

e) With the gas-turbine locomotive, no water is required for the gas-turbine power plant and, for the small starting auxiliary Diesel, an air-cooled auxiliary Diesel engine can be used.

g) Since the gas-turbine locomotive possesses no reciprocating parts, the time out for repairs and maintenance should be the smallest of the three.

h) The operating temperature range has been chosen at 850 to 1,100 deg. F. For this range of temperature, experience with a large number of exhaust gas-turbines on Velox boilers and combustion turbines for oil refining process has shown that there is practically no wear of the blading even after several years of operation. Also the greatest degree of security is ensured for the combustion chamber, due to the air cooling, which is supplied by the same compressor as the combustion air, and can therefore never fail whilst combustion is going on.

i) The gas-turbine locomotive can be applied for power braking whilst coasting downhill. If the fuel oil supply is reduced to such an extent that the flame just continues to burn, the motors are converted to generators by suitably exciting the fields and delivering their power to the main generator which, in this case, is operating as a motor driving the compressor and turbine. By opening, at the same time, the blow-off valve, which normally is actuated only by overspeed governor, the greater part of the air delivered by the compressor will escape to atmosphere, while enough air enters the combustion chamber to keep the burner alight with a small flame. In this manner, without requiring any additional apparatus, the motor power can be applied for braking.

TABLE I

Comparative Operating Figures for Various Types of Locomotives

Data	*Steam*	*Diesel*	*Gas-Turbine*
(a) Approx. cost per H.P. in U.S. $	35	87	75
(b) Efficiency at draw-bar %	6-8	26-28	15-16
(c) Fuel costs	100%	50-75%	50-75%
(d) Lubrication costs % of fuel costs	10%	20-30%	<1%
(e) Water costs % of fuel costs	10%	small	nil
(f) Milage per year	180,000	250,000	> 250,000
(g) Maintenance	lower	high	least
(h) Approx. life in years	30	15-20	25-30
(i) Power braking	none	full power	full power
(k) Starting effort	minimum	larger	larger

Gas-Turbine Locomotives of Large Capacities

Following the operating data obtained with the first gas-turbine locomotive and the wide experience gained with a large number of gas-turbines in operation on various applications Brown Boveri developed types of gas-turbine locomotives which are very suitable for heavy main-line service similar to that to be expected on American railroads. The prime mover for these locomotives is a gas-turbine group of 2500 hp. continuous rating, which in its main elements is similar to the first gas-turbine locomotive but incorporates several improvements in design resulting in a net output of 2500 hp. and a thermal efficiency of 20 per cent without going into the yet largely untried field of gas temperatures above 1100 deg. F.

This gas-turbine power unit of 2500 hp. can be used singly or in a wide variety of combinations. By coupling several of these units in various combinations and operating them by multiple unit control, larger units of an output of 5000 hp., 7500 hp. and 10,000 hp. can easily be obtained. Some of these units will now be considered more closely.

A 2500 hp. gas-turbine freight-locomotive designed for a maximum speed of 75 mph. is illustrated in Fig. 6. This locomotive is laid out as a truck-type unit such as has been built in great numbers in the United States for electric and Diesel-electric traction. The prime mover gas-turbine set is rated for an output of 2500 hp.

In accordance with the tractive effort and speed requirements of the American railroads, generators and traction motors larger than were used for the first gas-turbine locomotive are provided in this freight-locomotive. For the generator, a tandem group consisting of four armatures was chosen, resulting in each generator armature delivering electric energy to one traction motor only. The gear ratio of the motors is 71:27. The space above

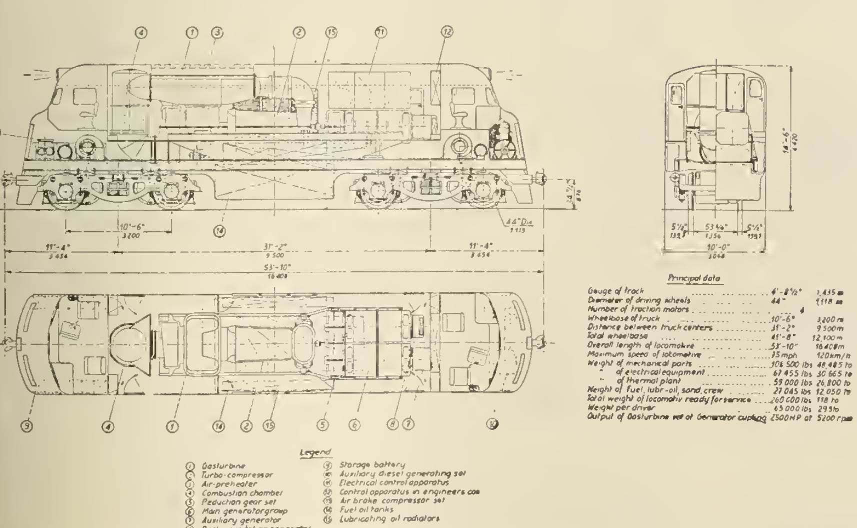

Fig. 6—Project of a 2500 hp. Gas-turbine-electric Freight-Locomotive.

the generator group is well suited for the mounting of the necessary control apparatus. The fuel oil capacity of this locomotive is, depending on the load conditions, sufficient for a run of approximately 500 to 600 miles. If a larger distance is to be covered without stopping for fuel, a fuel oil tender can be coupled to the locomotive.

A 2500 hp. gas-turbine passenger-locomotive, designed for a maximum speed of 112 mph. is illustrated in Fig. 7. For this locomotive, the same gas-turbine group as for the freight engine is used. This locomotive, which is also of the truck type, is designed, however, with 6 axles, of which 4 are equipped with traction motors. The generator and traction motors are the same as on the freight engine, the only difference being in the gear ratio of the motors which is 65 to 33 because this locomotive is to be used for a speed of up to 112 miles per hour. A steam boiler for train heating, of an approximate capacity of 3600 lb. of steam per hour, is located in the locomotive, and the necessary reservoirs for fuel oil and for feed water are provided. The combustion chamber of the gas-turbine and the steam boiler for train heating are fed by bunker C oil. The capacity of the reservoirs is sufficient for operation over approximately 500 to 600 miles.

A 5000 hp. gas-turbine passenger and freight locomotive, designed for a maximum speed of 112 mph., is illustrated in Fig. 8. In the cab of this locomotive are mounted two gas-turbine generator groups of design identical with that of the above mentioned locomotives. The running gear of this engine is built in such a way that two of the four trucks have 6 wheels and the other two have 4 wheels. The middle axle of the 6-wheel trucks are not fitted with driving motors. This type of engine is favoured because it permits the use of the same trucks, generator group and railway motors, as are intended to be used for the 2500 hp. freight and passenger locomotives.

As outlined above, the prime mover thermal plant and the electrical equipment are the same in all three types of locomotives, the difference between freight and passenger locomotives being mainly in the gear ratio of the traction motors. The 5000 hp. locomotive differs from the 2500 hp. unit only in so far as two complete power units are installed in one mechanical part. This standardization permits great freedom for the exchange of like parts between the locomotives and greatly reduces the amount of spare parts that should be kept and, furthermore, it speeds up repairs of damaged units.

When several of these units are operated in multiple, the following output ratings can be obtained: 5000 hp. with two 2500 hp. units; 7500 hp. with three 2500 hp. units; 10,000 hp. either with four 2500 hp. units or two 5000 hp. units. The control system of the locomotives is of the electro-pneumatic type and arranged in such a way that multiple unit operation of several units is possible.

Characteristics of the Gas-Turbine Locomotives

The tractive effort characteristics of the passenger and freight locomotives are shown in Fig. 9a and Fig 9b. It goes without saying that different gear ratios, generator, or motor sizes are selected if tractive effort and speed conditions other than indicated by the above curves are to be met.

The operating characteristics of the gas-turbine are given in Fig. 10 which shows the thermal efficiency, the speed of the gas-turbine, the temperature of the gases at the turbine intake and the air pressure after the compressor.

The influence of outside temperature on the gas-turbine output is illustrated in Fig. 11. These data show that, with decreasing ambient temperature, the output of the gas-turbine increases faster than the input of the compressor. The turbine can therefore deliver a higher ouptut to the generator at lower outside temperatures. In fact the gain is of such magnitude that the locomotive can, at 32 deg. F., if it is equipped with a heating-power generator, deliver its normal full output and a considerable amount of heating power for the same fuel consumption as it needs to deliver traction power only at about 70 deg. F. ambient temperature. This increase of power in winter time is furthermore very welcome because the train resistance increases also. Experience with steam locomotives which in winter time have to deliver large quantities of steam to the train for heating purposes, indicates that the useful traction output is often considerably lowered on account of these increased heating requirements.

Because the working medium of the turbine is air, its output is not only influenced by temperature changes of the surrounding air but also by the altitude at which it works. As a rule, higher altitudes mean lower air temperature so that, in most cases, a loss of power due to the lower air density at high altitudes is compensated by a gain in output due to the lower temperature. Each 1000 ft. increase in altitude decreases the output by approximately 3.5 per cent. Furthermore, each increase of 1000 ft. in altitude lowers the air temperature approximately 5.5 deg. F. which results in an increase of the useful output of 3.7 per cent; that is the loss of power by increasing altitude is compensated on account of the falling air temperature.

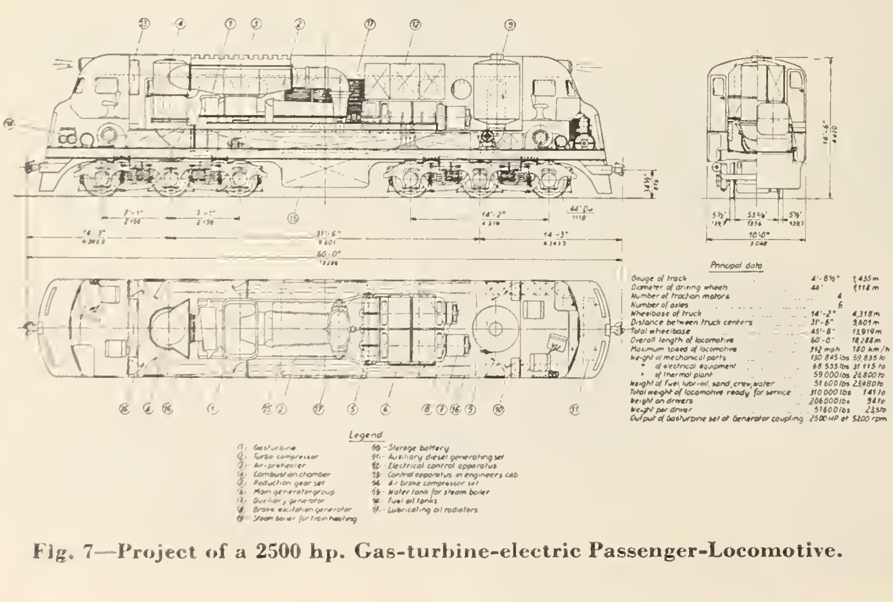

Fig. 7—Project of a 2500 hp. Gas-turbine-electric Passenger-Locomotive.

The fuel consumption and efficiency at various loads are shown in Fig. 12. The gas-turbine works at best efficiency if a certain speed is assigned to a certain output, i.e., with rising output, the speed is raised also until, at about 2500 hp., the maximum speed of 5200 rpm. is reached. The speed of the turbine is set by an electrical control apparatus that permits multiple unit operation of several units. For each speed point, the output of the turbine is kept constant, regardless of the speed of the locomotive, by means of a set of thermostats which regulate the excitation of the main generator in such a way that any increase in temperature above normal temperature tends to weaken it, that is to lower the generator output, and a drop somewhat below this temperature increases the generator field. With

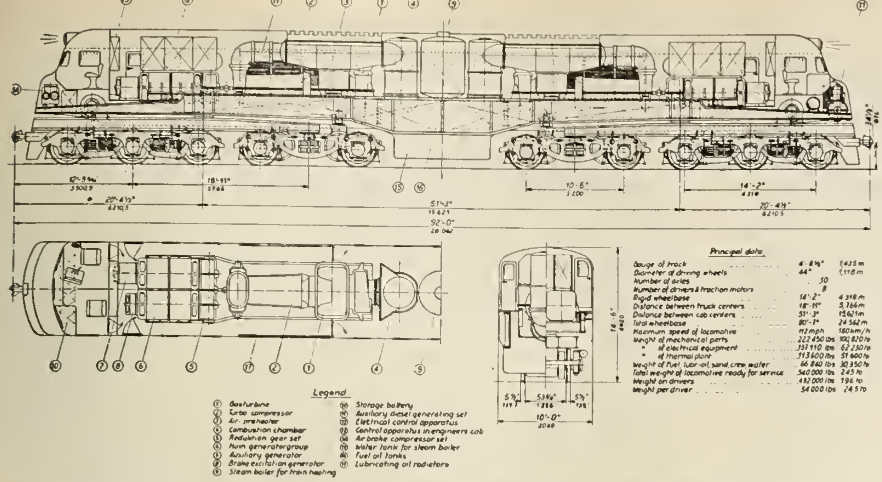

Fig. 8—Project of a 5000 hp. Gas-turbine-electric Passenger-Locomotive.

this arrangement, the gas-turbine always works at best efficiency.

In Fig. 13 is illustrated the thermal efficiency that would be obtained if the two separate power units of the 5,000 hp. locomotive, were operated in such a way that, up to 2,400 hp., only one unit carried the load. In order to obtain this high efficiency at low loads, it would be necessary to have each generator of the first unit supply power to two traction motors; when the second unit comes in to supply power above 2,400 hp. each generator will furnish current to only one traction motor.

Gas-Turbine Power Plant

The prime mover plant of the locomotive types considered above is designed very similarly to that of the first gas-turbine locomotive, i.e. it consists essentially of the gas-turbine, an air compressor directly coupled to it, an air preheater, a combustion chamber and the necessary auxiliary equipment such as fuel oil pumps, lubricating oil pumps, speed and fuel-oil regulators, gas-turbine shaft turning device and the necessary safety appliances that are essential for the protection of the unit against overspeed, too high temperature or lack of lubricating or control oil pressure.

Like an internal combustion engine, the gas-turbine must be started by means of some external power source. In order to accomplish this, a 200 hp. Diesel generator set is built into each locomotive. This Diesel generator set itself is started from the storage battery of the locomotive, which furnishes power to the generator, which then acts as a starting motor. The Diesel generator group starts the gas-turbine group and accelerates it up to a speed where sufficient air is furnished by the air compressor for the combustion of the fuel oil. When this speed has been reached, fuel oil is injected and electrically ignited. The turbine accelerates now very quickly up to its no-load speed, and the auxiliary Diesel generator can be stopped. The turbine is now ready to operate the locomotive. The starting time for the gas-turbine varies between 3 to 5 minutes.

The Diesel generator set is also used to feed one of the traction motors when it is desired to move the locomotive only a short distance at slow speed, such as moving it out of a shed, or to a train for coupling before the gas-turbine is started, or even for light switching work.

Sudden heavy overloads of the gas-turbine do not stop it, due to its great flywheel effect; they merely lower the speed of the machine until the output-regulating device has had time to adjust the fuel-oil supply and the excitation of the main generator.

The gas-turbine locomotive lends itself readily to electric braking; in fact, it is ideally suited for it. During braking, the motors furnish power to the generator, (instead of to resistors as would be necessary with other types of locomotives), which in turn drives the gas-turbine set. The air compressor absorbs all power that is delivered by the generator. The locomotive will be able to brake any train on a downhill grade at about the same speed as it can haul up the same grade.

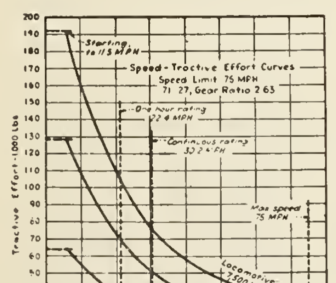
The gas-turbine is shut down by stopping the fuel-oil pump. In order to prevent the bending of the turbine shaft during the cooling period, a shaft-turning device is installed in the locomotive. A timing relay controls a shaft-turning motor of small output (fed from the storage battery) in such a way that the turbine shaft is turned ½ a revolution about every 30 minutes. This continues for a period of about 6 hours.

Lubricating-oil coolers are provided in the side walls of the locomotive. Unlike the lubricating requirements of a Diesel engine which may reach a high cost, the lubrication cost of the gas-turbine compressor unit is practically negligible. It will be necessary to renew the oil only after approximately 10,000 hours of operation. The gas-turbine and the compressor unit each contain only two bearings that must be lubricated. There are no crankshafts, no connecting rods, no pistons, no cylinder walls to lubricate, no cam-shafts with their bearings and no valves. In short, the gas-turbine is the simplest of all thermal motive-power units that are in use today.

The gas-turbine is normally operated with bunker C fuel oil. This oil does not lend itself to ignition at normal temperatures. The fuel oil therefore is heated up above a temperature of 175 to 200 deg. F. either by a fuel oil preheater, which is exposed to the exhaust gases of the turbine, or by a steam heater in the case where a boiler is installed on the locomotive. In the former case, the gas-turbine is started and operated for a few minutes with Diesel oil until the bunker oil has reached a temperature above 175 deg. F.

With regard to the electrical equipment, the following brief comments are of interest. In the 2500 hp. units, the direct-current generator group furnishes power to four forced-ventilated series-type traction motors. Overload relays and motor switches protect the motors and the generator from dangerous overloads. Field weakening of the traction motors is used in order to cover the full speed range of the locomotive without reaching unduly high voltages on the generator.

The generator group consists of four armatures, each delivering power to one traction motor. No series-parallel connection is used on the 2500 hp. unit, the motors being always connected to the same generator armatures over



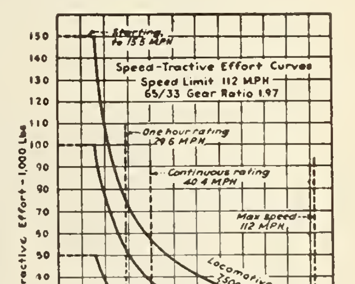


Fig. 9a—Tractive effort characteristics of Gas-turbine Locomotives of maximum speed 75 miles per hour.

Fig. 9b—Tractive effort characteristics of Gas-turbine Locomotives of maximum speed 112 miles per hour.

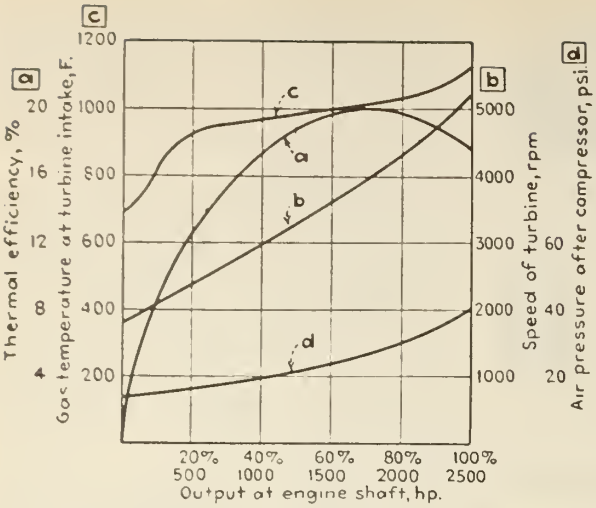

Fig. 10—Operating characteristics of 2500 hp. Gas-turbine Power Unit of Locomotive.

the entire speed range of the locomotive. The absence of such a series-parallel arrangement simplifies the design and assures smooth power control over the entire speed range. The generators are built as differential machines having both a self-exciter and a separately-excited winding. A starting winding is used to drive the gas-turbine set from the auxiliary Diesel generator set when starting. Output regulation is accomplished mainly by regulating the separately excited winding, which, in combination with the differential winding and the temperature-control device of the turbine, maintains a constant power output of the group for various locomotive speeds. For the operation of all auxiliary circuits, such as battery charging, traction-motor ventilating groups, fuel and lubricating-oil pumps, etc., an auxiliary generator of 75 kw. rating is directly coupled to the main generator. A voltage regulator is used to keep the voltage of the auxiliary generator constant for all speeds from no load to full load.

The traction motors, which are of the forced-ventilation type, can be either of the nose-suspended or entirely suspended rigidly mounted type. In the latter case, none of their weight rests on the driving axle. A flexible disk drive, as shown in Fig. 14, may be used to transmit the motor torque to the driving wheels. The motor torque is transmitted from the sleeve (1), which is attached to the rotor, over a carrier pawl (2) to the steel disc (4) and

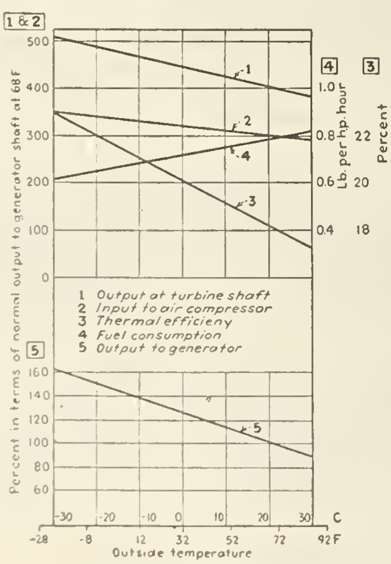

Fig. 11—Output, thermal efficiency, and fuel consumption of Gas-turbine Locomotive in relation to the outside temperature.

from there by another carrier pawl (5) to the torsion shaft (6). The other end of this torsion shaft is elastically connected over a second steel disc (9) and the two carrier pawls (7, 10) to the gear wheel shaft (11). By this means the disc drive can take up the relative movements between the motor, which is mounted in the spring supported truck frame and the gear wheels, the casing of which is rigidly attached to the driving wheel shaft. Such a drive has already been used in single-phase locomotives with pulsating motor torque and power up to 1000 hp. per axle, permitting the free vertical movement of the axle within the limits of the journal-box guides. Most important of all, this disc drive does not require any axle lubrication at all and does not influence the springing of the locomotive. The application of this very simple drive can be strongly recommended because it protects the motor from the heavy blows otherwise imposed upon it from the axle, and it reduces the unsprung dead weight to a minimum.

The mechanical parts designed for these locomotives are in accordance with the standard American locomotive-construction practice. The cab rests on a heavy under-frame which is either of welded or integral-cast construction. The 2500 hp. unit rests on two trucks of the 6-wheel type for the high-speed passenger locomotive. None of the

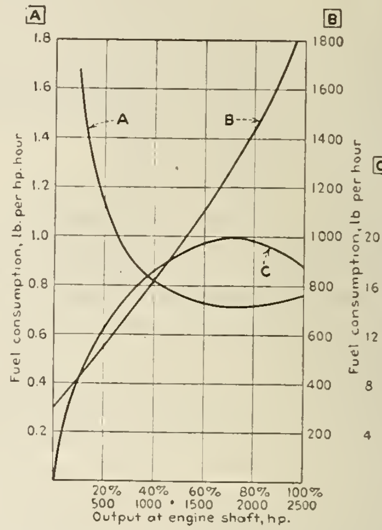

Fig. 12—Fuel consumption and thermal efficiency of 2500 hp. Gas-turbine Power Unit of Locomotive with approximately 1112 deg. F. gas temperature at turbine inlet.

trucks is articulated; that is, the tractive pull of the locomotives is transmitted through the cab underframe.

The 5000 hp. locomotive rests on four trucks, of which two have 4 wheels and the other two 6 wheels. The 6-wheel trucks and the motors installed in them are the same as those used in the 2500 hp. units. Only the springs will be different on account of the different axle load. Otherwise these trucks are interchangeable for the proposed locomotive types. The trucks are of the 4- and 6-wheel spring-bolster type having integral steel-casting frames. The axle boxes can be either of the antifriction or sleeve-bearing type. Two traction motors are mounted in each truck, the middle axle of the 6-wheel truck being an idler. Since the motors are of the forced-ventilation type, a flexible air connection is arranged between the truck and the cab underframe, on which the motor blowers are located.

Comparison of Weight and Length of Various Types of Locomotives

Table II gives the length of track occupied and the weight of various gas-turbine locomotives up to 10,000 hp.

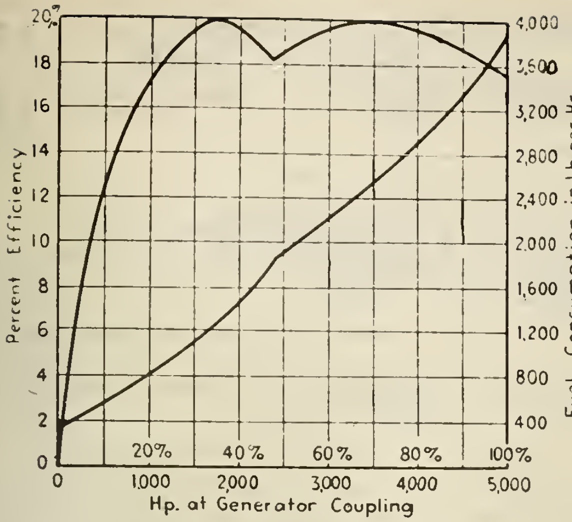

Fig. 13—Thermal efficiency and fuel consumption of 5000 hp. Gas-turbine Locomotive.

rating, built up by units of 2500 hp. and 5000 hp. rating.

When considering the fact that American railways are already operating a large number of steam locomotives of 6000 and 7000 hp., then it seems that gas-turbine locomotives of 10,000 hp. rating are not such fantastic units as one might think. The comparison of these different units shows that probably for a 10,000 hp. unit, a combination of two 5000 hp. units is preferable to a combination of four 2500 hp. units because the former unit is lighter, cheaper and also of smaller length.

A comparison between a 7500 hp. gas-turbine locomotive built up of three 2500 hp. units with a 5400 hp. Diesel-electric locomotive built up of four 1350 hp. units yields the following figures. The 7500 hp. gas-turbine locomotive weighs 382 tons whereas the 5400 hp. Diesel locomotive weighs 461.8 tons, i.e., the gas-turbine locomotive weighs only approximately 80 per cent of the Diesel locomotive but delivers 40 per cent more power. The Diesel locomotive has a slight advantage during starting because its tractive effort is about 110 tons whereas that of the gas-turbine is only 96 tons. This advantage, however, can only be utilized up to a speed of approximately 8.4 mph., while for all higher speeds the gas-turbine has a decided advantage due to the higher horsepower output.

TABLE II

Lengths and Weights of Combinations of Gas Turbine Locomotive Units

No. of Units Combined	Rating of each Unit hp.	Total Length ft.	Total Weight tons
1	2500	60	155
2	2500	111.5	305
3	2500	163	455
4	2500	214	605
1	5000	92	270
2	5000	184	540

Operating and Maintenance Costs

Brown Boveri has carried out extensive comparative studies of operating and maintenance costs for gas-turbine locomotive and Diesel-electric locomotives. The following performance data for the latter were taken from various recent papers in *Railway Age,* the *Railway Gazette*, etc., while, for the gas-turbine, the data have been closely estimated from available operating experience with the first gas-turbine locomotive and other gas-turbine power units. Many factors such as the following enter into the economics of locomotive operation: First cost, interest and depreciation of capital investment, maintenance of electrical, mechanical and thermal parts, fuel and lubricating oil costs and wages of crews.

FIRST COST. Estimates show that, in quantity production, it will be possible to build gas-turbine locomotives for a price about 80-85 per cent that of Diesel-electric locomotives of the same rating. This is justified if one realizes, as has been shown, that gas-turbine locomotives are considerably shorter and lighter than Diesel-electric locomotives built today, so that the mechanical parts will be cheaper; this applies particularly to locomotives of large output. The gas-turbine itself will be cheaper than Diesel engines of the same rating.

INTEREST AND DEPRECIATION OF CAPITAL. The rate of interest on the capital is assumed at 4 per cent for both types of locomotives. A life-time of 20 years for the gas-turbine and 15 years for the Diesel-electric locomotive are assumed, although our experience with rotating turbo-type machinery indicates that the life of the turbine locomotive, with its purely rotational movement of the prime mover, will very likely be much longer. As a matter of fact, both types as built today will very likely be out-dated long before the expiration of 20 years, due to improvements in design. The chances for such improvements are very pronounced for the gas-turbine locomotives, for instance where increasing temperatures of the gases result in higher efficiencies and more powerful locomotives for the same weights. These improvements are bound to come, when steels resisting higher operating temperatures are available.

MAINTENANCE OF EQUIPMENT. The maintenance data in Table III for the Diesel-electric locomotives were collected from various publications issued in the United States at different times. The figures in cents per mile (U.S. currency) for 2500 and 5000 hp. locomotives were based on these publications and for our estimates, in accordance with the horsepower ratings of the locomotives selected.

TABLE III

Maintenance Costs, cents per mile:

Locomotive hp.	2500		5000	
	Gas-turbine	Diesel	Gas-turbine	Diesel
Electrical equipment	2	2	3.3	3.3
Thermal equipment	3.21	5.6	6.0	11.1
Mechanical parts	3.4	3.4	5.45	5.45

The work which each locomotive, in our cost estimates, had to fulfil is about as follows:

a) For a 2500 hp. passenger locomotive, it is assumed that trains of 750 tons weight, the same for the Diesel and the gas-turbine locomotive, are operating over a certain profile of about 620 miles single length, making about

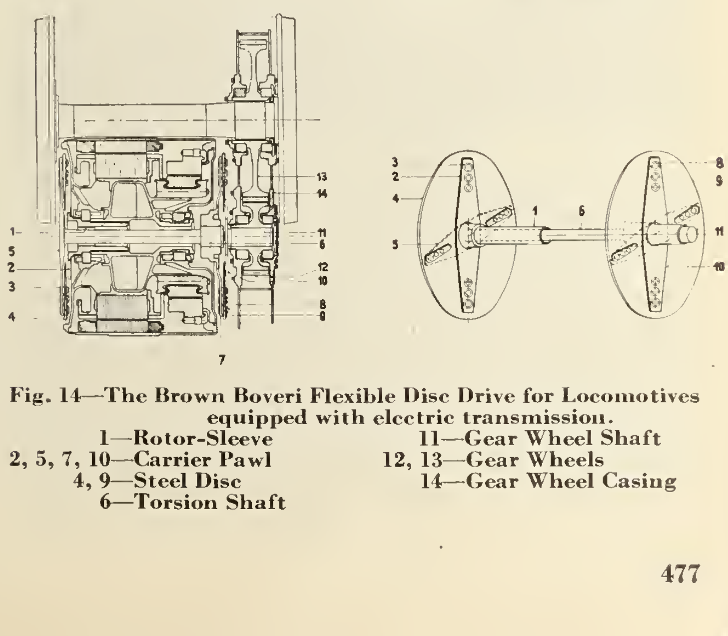

Fig. 14—The Brown Boveri Flexible Disc Drive for Locomotives equipped with electric transmission.

1—Rotor-Sleeve
2, 5, 7, 10—Carrier Pawl
4, 9—Steel Disc
6—Torsion Shaft
11—Gear Wheel Shaft
12, 13—Gear Wheels
14—Gear Wheel Casing

150 round-trips per year (time per round-trip about 24 hours) or about 187,000 miles per year.

b) For a 5000 hp. passenger locomotive, trains of 14 passenger cars are assumed, the total weight being 1470 tons. Each train operates over a certain profile of approximately 930 miles single length, each round-trip taking a time of about 36½ hours, making 120 round trips per year, and resulting in a total annual distance covered of about 239,000 miles. There is at present no maintenance data available on the thermal equipment of gas-turbine locomotives, however our extensive experience with thousands of steam turbines and many gas-turbines operating under somewhat different conditions, indicate that the above-given maintenance values are about what can be expected.

FUEL AND LUBRICATING OIL COSTS. For fuel costs, the average values of 4.5 cents per gallon (American) for Diesel oil and 2.7 cents per gallon for bunker oil were assumed. In order to obtain a fairly true picture of the fuel oil consumption for both types of locomotive, 15 per cent was added to the estimated quantity of fuel oil for the gas-turbine locomotive to allow for low speed orders, no-load periods before starting, running after the arrival of trains and unexpected stops during the run. For the Diesel-electric locomotives, a fuel oil consumption of 0.41 lb. per horsepower hour was assumed and 12 per cent of this figure for no-load periods. Diesel engine lubricating oil costs as published for the power range involved in our estimates amount to about 0.023 and 0.055 gallon (U.S.) per mile. The lubricating oil costs for the mechanical and electrical parts of Diesel-electric locomotives are of the order of 5 per cent of the fuel costs. The same cost is about to be accepted for the same equipment parts of the gas-turbine locomotives. The lubricating oil costs of the gas-turbine plant, as mentioned before, are practically negligible but are entered in our calculations as 0.5 per cent of the fuel oil costs.

ANNUAL SAVINGS. Based on these estimates, the total annual savings with a gas-turbine locomotive as compared with a Diesel-electric unit of the same power amount to:

a) approximately $10,000.00 per year for the 2500 hp. unit
b) approximately $20,000.00 per year for the 5000 hp. unit

These results are obtainable with gas-turbines of existing and tried designs working with an inlet gas temperature of about 1110 deg. F. Naturally the economic advantages of the gas-turbine locomotive will become even more attractive when the metallurgists can provide alloys for continuous operation with higher inlet temperatures to the gas-turbine. Such advances will have a very pronounced influence on the power developed by a given gas-turbine frame size, or in a given locomotive unit, or on the thermal efficiency of the power plant or both. The result will be lower first costs and fixed charges and, particularly, reduced fuel costs.

In connection with the above mentioned types of gas-turbine locomotives, it can be said that Brown Boveri has now under construction a new 4000 hp. gas-turbine power unit designed for use in locomotives. An efficiency of 22 per cent for this larger gas-turbine group is expected. The test results will be available later.

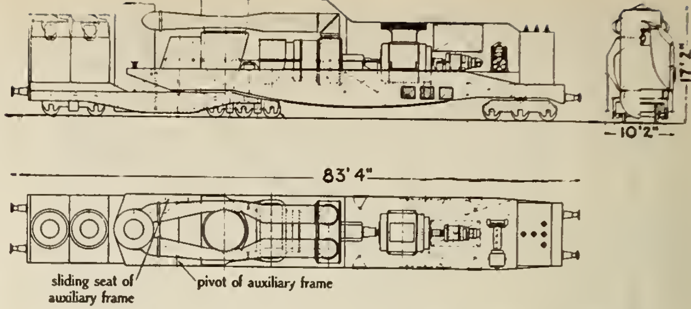

Fig. 15—Portable 4400 kw. Gas-turbine Power Plant.

Portable Gas-Turbine Power Plant

There exists another field of application of gas-turbines that might be very interesting to railroads. In Fig. 15 is illustrated the layout for a 4400 kw. portable power plant. Such a power plant can be very valuable during the development of new territories when electric power must be delivered within a short time or as standby plant. This power plant, which is mounted on three trucks, can be shifted to any side track. Within a very short time, it can deliver its full output. Because the prime mover is a gas-turbine, no water connections are necessary and fuel oil can be pumped into the reservoirs of the power plant from any standard tank car shifted to a track next to the gas-turbine plant. The only outside connection needed will be an electrical transmission line from the roof terminals to the tie-station. The total length of this installation is only 83 ft.

Future Prospects

It can be said that extensive tests are being carried out on a coal burning gas-turbine which, when it can be satisfactorily operated, will open a wide field especially in territories where coal is available at low cost.

Furthermore, it should be remembered that the trend is naturally towards higher temperatures as soon as suitable materials are available. This will make it possible to produce better, more powerful and more efficient machines. At some time, perhaps not too far distant, a continuous gas-inlet temperature of about 1380 deg. F. may be possible. The gas-turbine power plant on which these comments are based will then deliver 2500 hp. at 28 per cent thermal efficiency or 3800 hp. with 26.5 per cent thermal efficiency.

The gas-turbine power unit, recommended for the locomotives considered above, having outgrown the experimental stage, Brown Boveri therefore is in a position today to build locomotive power plants with firm guarantees on performance, output, and thermal efficiency.

From the above, and in conclusion, it can be stated that the gas-turbine locomotive shows sufficient merit today to warrant the serious consideration of forward-looking railroad engineers.

OPERATIONAL EXPERIENCE ON LORAN

A Navigational Aid Using Pulse Transmission

S. S. STEVENS

Director of Communications and Electronic Development, Trans-Canada Air Lines, Winnipeg, Man.

Introduction

The word Loran, which was derived from LOng RAnge Navigation, designates a navigation system developed during the war and whose principle of operation is the pulse transmission of signals.

There has been a great deal of discussion on long-distance radio navigational aids for flights, particularly over ocean areas such as the Atlantic, but the ideal system is still not at hand. However, to date, Loran has been the only system which has been extensively used, and operational results have been obtained over the past year from a commercial airline's viewpoint.

Trans-Canada Air Lines has used the Loran system of navigation for the past year and a half, mainly because it was the only system available that gave the desired results, and, in this period, has attempted to obtain data which might be of interest on both the Loran and Consol, or Sonne system as it is known. A review of the Consol or Sonne data was found to be inconclusive because, for the past year, the only Sonne stations in operation were the ones in Norway and Spain, and these were a considerable distance from the area over which we desired its use, and where they could be compared with Loran to establish some factual data. Because of this it was necessary to discount our Sonne observations and await the installation of Sonne stations so situated that they would be of practical value for flights over the North Atlantic.

This article is divided in two parts. The first contains a description of the Loran system in general and the second discusses Loran data as experienced by Trans-Canada Air Lines over a period of several months.

Principle of Operation

Hyperbolic navigation is achieved when synchronized signals, having a known velocity of propagation, are transmitted from at least three known points, and when the relative times of arrival of these signals are measured and interpreted by a navigator. The signals may be transmitted and received by any known means, but radio is at present the only mechanism which offers interesting accuracy at long ranges. A number of types of signals, ranging from continuous waves through modulated waves to pulses, may be used. In the more useful current applications, pulse transmission is preferred as ambiguity is minimized and the power supplied to the transmitters may be kept low. The apparent increase in the band width required for the system, because of the use of pulses, may be entirely illusory because by their use a number of methods of identifying signals become available. Thus a large number of pulse signals may be transmitted within a common radio frequency channel without excessive confusion, while continuous wave systems require the use of a separate radio frequency for each component in order to provide identification. At present the hyperbolic principle is used by only three operating systems. Of these three, the pulse method is exemplified by two, Gee and Loran, while the continuous wave technique is used in the Decca system.

Consider two fixed stations to transmit signals at the same instant. If a navigator receives these signals simultaneously, and if the velocity of propagation can be considered to be equal over the two paths, he knows that his position must be somewhere along the perpendicular bisector of the line connecting the transmitting stations. If one signal arrives before the other, a measurement of the time difference identifies some other line of position on which the navigator must be. These lines of position are approximately spherical hyperbolas but may usually be represented by plane hyperbolas drawn on a conformal conic projection if the distances involved are not too great; say, less than three or four hundred miles in the case of a system whose errors are expected to be several hundreds of yards.

In practice, in the pulse systems, the signals are not transmitted simultaneously but are separated by an arbitrary, constant, time difference. This is done partly to avoid uncertainty as to which signal is which, and partly so that the state of the receiving equipment may be altered as required to accommodate each signal individually. The signals are ordinarily repeated in an endless sequence so that the measurement to be made is actually one of relative phase rather than a time difference between single impulses, although the units generally used have the dimension of time.

The navigator in the aircraft obtains a fix by finding his lines of position relative to two or more pairs of stations. These readings may be made individually or simultaneously, or may be continuously indicated by semi-automatic equipment. In air navigation, a few of the available lines of position are usually precomputed and exhibited on special charts so that any line of position may be obtained by interpolation.

The number of distinguishable lines of position, in the pattern surrounding pair of stations, is equal to twice the time taken for a signal to travel from one ground station to the other divided by the smallest change in time difference which can be observed on the navigator's indicator. In Gee, there are typically a thousand resolvable lines for a single pair, while in Loran or Decca there may be as many as ten thousand. Since, at considerable distances from the ground stations, the lines of position are approximately radial with an origin at the centre of the base line, the positional accuracy of a hyperbolic system is about that which would be obtained with a direction finding system capable of resolving one fifth to one-fiftieth of a degree.

The labour involved in computing these lines of position is large, so large that several hundred thousand man-hours have already been spent in the construction of Loran charts and tables, but the results of the computations are permanently available as the lines are fixed with respect to the surface of the earth. Thus the time spent, per navigator, decreases with increasing use of the system and becomes small compared with the computing time required for celestial navigation; and the process of taking a fix is greatly speeded by the precomputation.

An important feature of hyperbolic navigation, as of some other radio aids, is that the act of navigation may be carried out in the future rather than in the past. A navigator may determine, from charts or otherwise, the indications which obtain at some distant point (such as his objective or one of a series of points on the route to his objective) and may preset his equipment to the constants applicable at that point. His aircraft may then be so steered as to follow a simple path until the predicted indications are obtained at the instant of arrival. Thus, at certain interesting times and places, the taking of a fix is made instantaneous instead of yielding the position occupied at some previous time.

The great advantage of hyperbolic navigation over radar beacon systems, which do or could offer equal or greater precision over the same ranges, lies in the fact that saturation of the ground facilities is impossible. The transmitters of a hyperbolic system are essentially a family of lighthouses whose keepers simply transmit intelligence according to prearranged standards. Thus there is no correlation between the activities of the navigators and those of the transmitter operators, and the behaviour of the system does not at all depend upon whether one or thousands of navigators are making use of the service it provides.

When Loran is used for navigation in advance or for obtaining occasional fixes to be used with dead reckoning methods, the most important feature of hyperbolic navigation is used to full advantage. Since the hyperbolic lines are fixed with respect to the earth, all courses derived from them are true courses and all speeds are grounds speeds. Thus the effects of drift are compensated automatically with the result that a pilot can navigate an aircraft with amazing ease and accuracy.

Standard Loran

Standard Loran such is is used over the North Atlantic is a hyperbolic system which was developed primarily for over-water navigation. It operates on one of several frequencies between 1700 and 2000 kilocycles and therefore enjoys propagation characteristics determined primarily by soil conductivity and ionospheric conditions. The transmitters currently in use radiate about 100 kilowatts and give a ground wave range over sea water of about 800 nautical miles in the daytime. The daytime range over land is seldom more than 250 miles even for high flying aircraft and is scarcely 100 miles at the surface of the earth. At night, the ground-wave range over sea water is reduced to about 600 miles by the increase in atmospheric noise, but sky-waves, which are almost completely absorbed by day, become effective and increase the reliable range to about 1400 miles. The transmission times of the sky-waves are somewhat variable, thus reducing the accuracy of the system, but the timing errors decrease with increasing distance and partially compensate for the increasing geometrical errors, so that navigation by sky-waves, appropriately enough, compares tolerably well with celestial navigation. Except in the case of over-land ground wave transmission, the signal strength, and therefore the usefulness of the system, does not vary at all with the altitude of the receiver. Even in the over-land case the signals increase rapidly with height so that there is little improvement to be had by going to altitudes greater than 300 ft.

Because of the medium frequency used, and the consequent necessity for conserving band width, the use of pulses whose length is of the order of fifty microseconds is unavoidable, and it is wise to operate as many stations as possible in a single radio frequency channel. The large pulse length makes necessary careful matching techniques in order to obtain reasonable precision. The method employed is to alter the gain of the receiver as required in order to produce pulses of equal amplitude on the oscilloscope no matter what distances or attenuating factors may be present in the two transmission paths. The pulses may then be accurately superimposed, provided that they are made sufficiently identical by all transmitters, and a measurement may be made with a precision of one per cent of the pulse length if the signal-to-noise ratio is sufficiently good.

If three Loran stations are used as a triplet, the average error at short distances is of the order of 300 yds. and increases smoothly throughout the ground-wave service area to a little more than one mile at 700. At night, sky waves may be used at distances between 300 and 1400 miles with average errors ranging from one and one-half to about eight miles. Occasionally, errors to 80 miles were noted, but these have always been traced to poor area coverage or maladjustment and operating of equipment.

The average errors of fix are frequently smaller than these estimates at long ranges, because pairs can often be found with crossing angles better than those obtainable from a triplet. Loran stations are often installed in a chain, along a coast line or between islands. The number may be anything greater than two, and each station may or may not operate as a member of two pairs with the stations on each side. In each pair, pulses are transmitted at a special recurrence rate, one of a family which have the ratios 400; 399; 398. Thus eight pairs may operate in a single radio frequency channel. The navigator's equipment can be adjusted to synchronism with any one of these rates; the pulses at the chosen rate then appear stationary so that their time difference can be measured, while the pulses from all other stations pass across the screen at speeds such that confusion is negligible. Stations intermediate between the ends of a chain ordinarily are " double "; that is, they act in all essentials as two independent stations at the same location, so that a chain consists of a number of separate pairs set accurately end to end.

The navigator can choose from among these the pairs he will use for determining a fix in the same way that he would choose stars for celestial navigation; that is, by taking those whose lines of position cross at the most favourable angle. In fact, he frequently uses three or four line fixes if he wishes to attain maximum precision, the reading of a single line of position at a time permitting great freedom of choice. This arrangement stems directly from the concept that Loran navigation is to be effective over a large area in comparison to that which could be served by a single pair or triplet. The system in the North Atlantic consists of a chain of four stations along the east coast of the United States, Nova Scotia and Newfoundland, a triplet between Newfoundland, Labrador and Greenland, and a triplet extending from Iceland through the

Loran equipment installed in T.C.A. planes operating on the trans-Atlantic route.

Faeroes to the Hebrides. These stations form a total of seven pairs, so that often a total of three, four or five lines of position are available to the navigator.

With Loran equipment, a fix is ordinarily taken in one to three minutes. Homing to a point can be accomplished by following one line of position until the correct compass heading has been determined and then switching to a second pair of stations to determine the progress along the first line.

The chief disadvantages of Loran are:

1. The impossibility of instantaneous fixing without dual installations.
2. The number of persons required to operate the ground installations.
3. The proper sites generally make it necessary to locate one or more of the ground stations in remote and uninhabited areas.
4. The frequency spectrum necessary.
5. The fact that the use of sky-wave transmission requires the application of corrections before the charts or tables can be entered.
6. The presence at night of long trains of pulses reflected from the ionosphere. In one of these trains only the first reflected impulse is useful for navigation, but from one to twenty useless pulses may follow it, thus greatly increasing the difficulty of identifying the correct one and interfering with the operation of other pairs in the same channel.
7. The fact that ionospheric transmission is not homogenous so that the shapes of the sky-wave pulses are often distorted, making them hard to match, while the time of transmission varies from hour to hour creating minor errors which cannot be eradicated.
8. The difference between the ground waves ranges over land and water.

The chief advantages of Loran are:

1. Accurate fixes can be obtained 700 to 1000 miles from the transmitting stations in daytime, and from 1400 to 1800 miles at night with a general accuracy better than that of celestial observations.
2. It is almost completely independent of weather. It works during the most adverse weather, in rough air, and under all conditions except that of severe precipitation static.
3. No transmissions are required from the aircraft.
4. Fixes can be obtained by a skilled operator in about one minute and no calculations are necessary.

Operational Data

Loran equipment, type AN/APN-4, as illustrated herewith, was installed on Lancaster aircraft operated on the Trans-Atlantic services by Trans-Canada Air Lines during August and September 1945.

Training of navigating officers in the use of this new facility was accomplished with the co-operation of the Royal Air Force Transport Command at Montreal, who made available an instructor and necessary training equipment. Assistance in this programme was also given by an instructor from the Communications Department of T.C.A.

All flight radio operators on the Trans-Atlantic service were given a somewhat briefer course of training in the theory and operation of Loran, the idea being that radio operators could assist the navigating officers in taking readings, and also lend a hand whenever any trouble was encountered with the adjustments or the equipment.

Two brief lectures in the theory of Loran were given to captains and interested first officers, for the purpose of making them acquainted with the possibilities of the new navigational aid.

Detailed notes on operation and adjustment of the equipment were prepared by the Communications Department of T.C.A., and distributed to all navigators and flight radio officers. A descriptive booklet on Loran prepared by the U.S. Coast Guard was also made available for study by all interested flight crew members.

Initial flight tests of aircraft equipped with Loran were accompanied by the Communications Department instructor, and the equipment was found to perform satisfactorily. The initial east and west crossings with Loran were also accompanied by the instructor, and results obtained were fully up to expectations.

In order to determine the reliability and accuracy of Loran as a navigational aid, a series of tests were commenced in mid-November, 1945, and continued until mid-March, a period of four months. A total of 74 reports have been received from the navigating officers covering the majority of crossings during this period.

Most of these crossings were effected between Prestwick, Scotland, and the following bases on this continent: Montreal, Que., Gander, Nfld., and Goose Bay, Labrador. Some crossings were made directly between the two terminal points, while others went by way of Reykjavik, Iceland; Lagens, Azores; and Bermuda Islands. The reports received contain data observed on both the eastbound and the westbound voyages. The following table gives a summary of the information gathered.

Total number of Loran reports received	74
Total number of Loran readings reported	980
Total number of Loran fixes obtained and reported in survey	417
Average Loran fix error from all reports (nautical miles)	10.2
Total number of flights reporting equipment troubles	11
Total number of flights reporting aurora or static seriously affecting Loran	23
Percentage of flights reporting aurora or static seriously affecting Loran	31.1%

Analysis of Reports Received

It is quite evident from the reports received that personalities enter into the results obtained. Some navigators make very extensive use of the facility, others merely use it occasionally. Some navigators obtain consistently good results with Loran, others only indifferent to poor results. It is also quite evident that many of the navigators place less faith in a Loran fix than they do on a D/R position, while others are entirely satisfied with the accuracy of Loran.

The period of this survey extended over a time when radio signals have been badly affected by aurora and sun spot activity. The period—winter—also covers a time when precipitation static resulting from cloud-flying has been at its worst. Given more favourable conditions, it would appear therefore that the accuracy and percentage of utilization of Loran would have been considerably better.

The percentage of flights reporting equipment troubles, while low, is still higher than could be desired. This is due partly, no doubt, as a result of unfamiliarity with the new installation. It is confidently expected that continued use and increasing familiarity with the equipment by servicing and operating personnel will soon reduce equipment malfunctioning to an almost negligible figure.

Of the total number of flights submitting reports, sixteen operated via the Azores. The portion of the route Azores-United Kingdom is notably poor for Loran, being in an area where Loran coverage is extremely weak.

Eleven flights operated via the Iceland-Greenland route, an area which is close to base line extensions and has near-parallel Loran lines.

Analysis of Large Fix Errors

An analysis has been made of all Loran fix errors reported in excess of twenty nautical miles, and some logical explanation has been sought for each recorded error. With 45 such errors reported out of a total of 417 Loran fixes obtained in the survey, this is a percentage of 10.8, which is, however, considerably reduced when allowances are made for the number of reported errors which were found to be incorrectly recorded. The figure 20 nautical miles was chosen arbitrarily, as being not too excessive an error for mid-ocean fixes, considering average working conditions on board the aircraft.

Flying almost entirely over water, it has been practically impossible for the flights to check Loran fixes with the terrain below except in a few isolated cases. In the few instances where visual checks were obtained the Loran fixes generally agreed fairly well with the actual position.

A good percentage of the Loran fixes were checked against Astro, and assuming reasonable accuracy of the latter, there can be no doubt as to the error of the Loran fix. However, many instances where Loran is compared with Astro, the comparison is, strictly speaking, not correct, as the Astro fix may have been an hour or more old, and the position estimated by the navigator on D/R.

On practically all occasions where Loran fixes are compared with strictly D/R positions, there is every reason to believe that the reported Loran error is not nearly so great as is indicated. In fact, in those cases where large errors—40-50 miles—are reported comparing Loran with D/R, it is quite likely that the Loran position is the more accurate of the two, particularly where the Loran fix was obtained in a good coverage area.

The conclusions to be drawn from these facts are that, of the 45 Loran fix errors reported in excess of 20 nautical miles probably not more than 25 were actual errors at all, while another 10 were actually errors resulting from miscounting or poor plotting, thus leaving only some 15 cases where Loran fixes likely erred to any great extent. This number, out of a reported total of 417 Loran fixes obtained during the survey, is a suitably low percentage. (Less than 4 per cent).

It is interesting to note that of the 45 large fix errors reported, 7 of them were daylight fixes obtained far beyond the normal day range of Loran coverage.

Conclusions

From an analysis of the foregoing reports, it would appear that Loran is giving generally satisfactory results, but, occasionally, large and sometimes unexplainable errors occur, greatly reducing the reliance which can be placed on Loran as a prime aid to navigation.

It is believed that as experience is gained, particularly in the use of sky waves, the overall accuracy of Loran fixes will increase somewhat. It would also appear that many of the larger errors now being reported would not be encountered, and the navigators would place greater faith in the results obtained by this system.

It is quite evident that greater care must be exercised by certain of the navigators in correctly matching pulses, and in ensuring correct counts. Several obvious cases of errors in plotting were also noted, which were incorrectly charged against Loran.

While it is recognized that it is not always possible to select the pair of stations which would give the best cut, it is apparent that in many cases fixes were based upon a more or less haphazard selection of stations. Greater care in selection of stations would, in many cases, result in higher accuracy of fixes. Greater use of a third pair of stations would also help towards this end.

A fair percentage of fixes reported with errors were obtained at extreme range, or in poor-cut areas for Loran. The fact that our flights must continually traverse such areas will tend to keep down the overall accuracy for Loran fixes. (It is presumed that navigating personnel are making due allowances for fixes obtained in such areas).

Difficulties arising from precipitation static and auroral effects were much greater than might be expected. While there is no perfect remedy for the latter, some experimentation by flight personnel with different antenna arrangements and lengths could very easily result in a reduction of precipitation static effects. A gradual increase in the availability of Loran under static conditions can also be expected as personnel gain more experience in reading signals through " grass ".

There is also every reason to believe that a marked decrease in static problems will result from the installation of wick-type static dischargers. During the period of this survey the aircraft were not equipped for static reduction, and hence were unduly handicapped by this trouble. The current programme for installation of static dischargers should materially improve the usefulness of Loran by making it available a greater percentage of time.

PRE-COMPRESSED CONCRETE DESIGN (*Continued from page 469*)

This reasoning is fully borne out by Mr. McNaughton's experiments when he states, referring to Graph II: " had the wire been pre-stretched to 130,000 lb. per sq. in. prior to loading to 114,000 lb. per sq. in., the departure from proportionality and the creep at this loading would have been negligible."

Although I have no wish to evade Dr. Pratley's question regarding a possible Canadian field for this material, I feel that it would be presumptuous on my part to be categorical on the subject; Dr. Pratley has already enumerated a number of articles which can be produced to advantage immediately. To this list may be added: water and fuel tanks and high pressure pipes which have been produced and are already in use in Canada and United States. I also feel that the application of this new technique in the construction of our short span highway and railway bridges would be of immediate benefit to all concerned. Although I must of necessity base my opinion on limited experience in the use of pre-compressed concrete, I suggest that the argument regarding cost of equipment and skilled labour is not entirely valid; the equipment used by European engineers for pre-compressing concrete is inexpensive and simple of operation; the normal skilled labour employed to produce reinforced concrete can be trained very quickly and simply to produce pre-compressed concrete. This, at least, was the experience of Royal Canadian Engineers.

One great advantage of pre-compressed concrete which may not be entirely appreciated is that it is " self-repairing." For example, in a pre-compressed concrete pipe filled with water, it is possible to raise the pressure of this water to a point above the designed capacity of the pipe until water escapes through minute cracks in the concrete caused by the abnormal pressure; upon reducing the pressure to normal, the cracks close and seal themselves automatically and the pipe is as good as new. Considering the damage done to our highways every year as a result of frost heaving and the cost of continued maintenance it involves, the economy which would derive from " self-repairing highways " is of such magnitude as to justify large scale experiments in this field immediately.

THE ARCHITECT, ENGINEER, AND LANDSCAPE ARCHITECT IN CITY AND REGIONAL PLANNING

RUSSELL VAN NEST BLACK
Planning Consultant, New Hope, Pa.

An address delivered before the New York Architectural League.

This is the renaissance of city and regional planning. Perhaps, though, " renaissance " isn't quite the word for never was there a time when so many people and cities evidenced as much interest in doing a real planning job as now. Why people and cities want to plan isn't so important as that, finally coming to want and demand planning, they be given bread and not stones; plans and not talk of plans. The opportunity that planners have dreamt of is here. Whether that opportunity goes up in a puff of smoke, depends much upon what the planners produce now. It depends upon what kind of plans they make.

The planning profession has been caught flat-footed. Never large and, as a whole, never overly competent, it is now quite unequal either in power or in numbers to do anywhere nearly all the planning that is now demanded in anything like the time that is required. Planning and planners are on the horns of a dilemma. Shall there be a few good plans or a lot of indifferent plans? Is it better to cover a little ground well or a lot of ground superficially?

In my opinion, superficiality is planning's worst enemy. Nothing in the past has held back planning so much as the fact that so many plans were mere surface scratchings. More of that kind of planning will do nothing to establish and perpetuate planning. Nothing will kill this new interest in planning so fast as a lot of empty and mistaken notions in the name of planning. We sometimes think that city administrators are a little dumb but they are not dumb enough to accept and keep on paying for a lot of false-front planning.

What then is the solution? The greatest threats to the survival of planning are insufficient manpower and insufficient brain power. Where are we to find the men and the brains to grasp firmly and to develop fully the present planning opportunity?

Planning — A Composite Profession

It is perhaps expected that I shall say, " from the men in this room—from the architects, the engineers, and the landscape architects, since I have been asked to speak for them." That may be but I think it depends upon *the* architect, *the* engineer, and *the* landscape architect—upon his background, training and experience and whether he has much knowledge and comprehension of this thing called planning, outside the small sector of it represented by his particular professional field. Architecture, engineering, and landscape architecture are *parts* of planning but no *one* is by any means the *whole* of planning. It follows that no engineer, architect or landscape architect is a planner per se, in the sense that we are here using the term " planner ", any more than a bricklayer is a builder.

By this time someone will have suspected that I disagree with the contention of some of my friends that planning is not a profession but, rather, a collaborative enterprise wherein the several professions join to produce plans. And the suspicion is well founded. I *am* convinced that planning comprises a true profession even though a composite one. For my own peace of mind I could not think otherwise. After more than twenty-five years spent almost exclusively in planning, I find so much still to be learned about it that I could no longer maintain the delusion of average intelligence if I were for one moment to admit that there isn't something special about the job.

Planning is a collaborative process in the sense of utilizing many kinds of skill and many kinds of knowledge. These various skills and kinds of knowledge may be brought to bear upon a particular problem by as many individuals. But points of view must be reconciled. The several individual contributions, technical and otherwise, must be synthesized into a single, organized and balanced concept. The process of synthesization is planning. The man who conducts or directs the process is a planner.

The " planner " on a particular project may be one man or a group of men. But for a group of men to achieve an organized concept of a city plan is as difficult as for a group of men to paint a picture. Not many cities and fewer city planning budgets are large enough to employ a balanced group of technical men. Usually, one man must assume all technical responsibility. To do so intelligently and successfully he must be more and less than an architect, an engineer, a landscape architect, a lawyer, a sociologist, and an economist. He must comprehend the fields of them all, must have considerable specific knowledge in each field, but need be master of none. The planner must be a jack of all trades and a master of his own business.

Until the word became threadbare, a lot of people liked to talk about " coordination ". Some of them seemed to have an idea that a street plan, a park plan, a public buildings plan, and a host of other plans and high-flown ideas could be thrown into a sort of mill called a coordinator, which, by some mysterious process, would produce a city plan. It would be less sanguine to expect to achieve an emulsion by the mere mixing of oil and water. A comprehensive plan is the outgrowth of a comprehensive concept that starts at the very begininng of the planning process and carries through to the effectuation of the plan.

This balanced concept of community needs and this synthesis of ideas is the only real contribution made as yet by this relatively new art and science called city planning. Given the opportunity, good engineers have always produced good transport and sewerage systems; good architects have produced fine civic centres; and good landscape architects have produced fine park systems. But rarely, have all these things been achieved and brought together in one integrated whole. Planning is the integrator. Far-sighted integration of urban development is the chief new thing that planning has to offer. It is, I maintain, a job in itself, sufficiently challenging to invite lifetimes of endeavor, sufficiently demanding to compromise a profession.

So, we have planning and planners on a pedestal. (I have heard it called an ivory tower). And the planners are not too happy about this lonely business of flag-pole sitting. A lot of people think that planners are not too bright. But they are bright enough to know that if they muff this opportunity, fail to do well the job now set before them, they can fold up their pedestal, their ivory tower, their flag-pole, or what-have-you and go home. They are bright enough to know that their greatest weakness is their small number and that the thing most needed to support their precarious position is strong reinforcement by more and better planners, by men of large technical capacity, judgment, and vision.

The Planner

Where are these reinforcements to come from and what have been the origins of this current crop of vainglorious towerites? Most of the older men came from architecture, engineering, and landscape architecture, with landscape architects predominating. A few have come from the field of economics, others from God knows where. Some, mostly the younger men, have had the benefit of specialized schooling but the great majority have learned their lessons on the job. Research in origins might be expected to produce some clue as to most likely sources of new recruits but seemingly does not. Early background training as between one profession and another appears to have had relatively little to do with the comparative success and the quality of production of individual planners. Even specialized schooling appears to have had less effect than might be expected. Graduates of planning schools are likely to get a fast start in the profession but unless they have those more-exacting qualities of a successful planner that cannot be taught in schools, these fast starters soon lose their advantage to men who do have these qualities. These qualities include a sponge-like capacity to soak up new knowledge, human sympathy and understanding, power of expression, and, most important of all, good judgment and a lot of hard practical common sense. Some of these qualities can be acquired in some degree, others can be improved and developed, but mostly they are things a man is born with. They are, therefore, outside the purposes of this discussion, which is more specifically concerned with the contributions that can now be made to planning by the professions of architecture, engineering and landscape architecture.

Although there are many elements in city planning other than the arrangement and design of physical objects, I am strongly of the opinion that a first requirement of a city planner is an appreciation of form and a knowledge of, and a capacity to design. Knowledge and ability in almost any kind of designing will help even if it is in things like building an efficient and beautiful machine. Naturally, the closer a man's design training and experience come to the work in hand, the better and quicker he will be at the job. The form of design coming closest to city planning requirements is probably that of landscape architecture in its larger aspects. Landscape architecture in its full meaning has to do with molding the land to multiple human use and purposes. It deals with large spatial relationships. It recognizes and deals with the third dimension and must comprehend and apply many of the more important engineering principles. It seeks to make all things beautiful. It must perforce make most of its products useful and practicable.

All this is directly applicable to city planning. If he has the other prerequisites for planning, it gives the landscape architect perhaps a little edge on other professionals in entering the planning field. However, having had *my* early training in landscape architecture, I am naturally somewhat prejudiced in the matter. I know quite well that engineers and architects claim equal, although perhaps different, advantages for their professions. Debate on the subject is likely to become quite acrimonious. I propose to avoid any such cat and dog fight tonight if possible. At any rate I shall not encourage it. Even the economists might join in, for there is considerable to be said for economics as an entry to planning.

The truth of the matter is that any well-grounded man from the professions of architecture, landscape architecture, or engineering has a good technical start in city planning and may make an important contribution. He is not, however, by the mere fact of being well versed and skilled in his profession, a city planner qualified to assume full responsibility for a comprehensive planning job. He has still to acquire the tools and the knowledge peculiar to the planning process. He must learn the mechanics of plan making and plan presentation. He must accustom himself to seeing the community, its life and its needs as a whole. He must learn to use statistics and to know which facts are important and which are not. He must learn a lot about municipal law, economics, and public finance. This is some of the special equipment a full-fledged planner should have, no matter what his professional origin. Some can be gotten in planning schools but most of it, normally, comes from long years of inquiring and acquisitive experience.

But there is great need and demand for planning now and no time for lengthy schooling or long-extended experience. Men most nearly equipped to plan must be worked into planning jobs. These men are most likely to be found among the architects, the engineers and the landscape architects. There is no question but that a man well founded in any of these professions can be immediately useful in a planning office under experienced direction. My concern is rather for getting more men equipped to assume responsible charge of planning operations. To do this satisfactorily, as I have already said, I believe that no matter how good a man is in his own profession, he must have considerable new knowledge. How is he to get it, in reasonable degree, in a short period of time?

He can get something by a lot of cramming in planning literature, but, most fruitful, it seems to me, would be intensive in-service schooling running for periods up to six weeks or more. There has been a lot of talk about setting up such schools but little has been done about it. There is no substitute for experience, and schools of themselves will produce no top-notch planners. But they should enable a person otherwise well equipped to find his way around in planning without too many missteps.

I have been instructed by program to say that a "technical talent formerly largely applied to project planning can be useful in overall planning". Of course it can be useful but I think it should be developed to the point where it can be more than merely useful. More needed than helpers are men who can take the initiative in planning to produce plans so good there can never again be question of overall planning as an essential function of government.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

THE ROYAL COMMISSION REPORTS

So far no one seems to have anything favourable to say about the report of the Royal Commission on Administrative Classifications in the Public Service, made public on the 15th of July. Newspapers, organizations and individuals all criticize it adversely, though not always for the same reasons. It would seem too that it would receive no better support from government officials when and if they care to make public their opinions.

The Institute's interest is related principally to the manner in which the recommendations would affect the professional worker. The Institute presented a brief to the Commission during its hearings, but there is no indication that the presentation offered any suggestions acceptable to the Commission. The three main recommendations were that the wages ceiling be raised to a specified figure, that the Civil Service Commission be enlarged to include a professional member, and that an interdepartment technical panel be established.

The report reveals that the ceiling recommended is far below that proposed by the Institute; there is no mention of a change in the number of commissioners, and the nearest thing to an interdepartment technical panel is the proposal to appoint a personnel officer in each department. These could become an interdepartmental panel, but certainly they would not be technical or professional—nor would they have the slightest competence to deal with the professional problems.

The report does not deal specifically with the situations in which the Institute is primarily interested. "We have not given particular consideration to the position of the junior ranks and of the scientific, technical and professional personnel ". There are general references to some need for treating the professional worker better, but nothing very helpful. Of more than passing interest is the following, " We recommend that the scales for the scientific, technical and professional classes in positions carrying a salary of $5,000.00 or more be the same as those proposed above for the administration grade, and we suggest that the existing salary situation respecting scientific, technical and professional personnel in positions carrying a salary below $5,000.00 be further reviewed.

The chief worry of the commissioners seems to have been the administrative worker. More attention is paid to the need of getting from the universities candidates whose general qualifications would indicate that they could become good administrators. There is no appreciation of the fact that an executive can be built from many classes, whereas an engineer or other professional worker must come from the group trained specifically for that work. If they are not attracted to the service, there is no other group that can do the work.

Structurally, the report leaves much to be desired. If an engineer made a similar report, it is not likely his client would think much of it. It criticizes and makes proposals without giving reasons. It is not enough to say " we recommend " without pointing out where and why the new arrangement would be better than the existing. This is not done. In other words, the report does not attempt to carry the reader with it. It is mostly statements without supporting evidence or argument, and, consequently, is not convincing.

Changes in C.S.C. Responsibilities

Perhaps the most far reaching proposal is that the Civil Service Commission should have its wings clipped, and that the pieces should be stuck on the wings of someone on the Treasury Board—yet to be appointed. Just how this would improve conditions is hard to discover—nor does the report attempt to explain. The proposal is—

" We recommend the continuance of the Civil Service Commission as an independent and separately constituted body. The Commission should be relieved, however, in the manner outlined below of certain of its present duties in order that it may be in a position to concentrate upon the highly important work of recruitment, which should be its primary function.

The duties of the Civil Service Commission should be as follows:

(a) The recruitment on a merit basis of personnel for all grades and classes.

(b) The review of recommendations by Deputy Ministers and Heads of Agencies for promotions of personnel in all grades other than the administrative, scientific, technical and professional grades.

(c) The transfer of personnel in all grades other than the administrative, scientific, technical and professional grades from departments where they are no longer needed to other departments where additional staff is required.

(d) General guidance to departments regarding programs of in-service training except in the case of the personnel covered by 4 (f) below."

And

4 (f) "We recommend the creation of a new Establishments and Personnel Division in the Treasury Board, under a Director General (or Deputy Minister) of Establishments and Personnel, who should have the rank of a senior Deputy Minister. The duties of the Director General should be as follows:—

(a) Responsibility to the Government, through the Treasury Board, for all matters concerning the organization and establishments (numbers and grades of positions required) of departments, and of the agencies listed in Appendix A.

(b) The submission, after consultation with the Advisory Committee referred to below, of recommendations to the Treasury Board regarding scales of pay and important regulations affecting the service as a whole.

(c) The review of recommendations by Deputy Ministers and Heads of Agencies (Appendix A) for promotions in the administrative and also in the scientific, technical and professional grades.

(d) Responsibility, after consultation with the Advisory Committee and, where necessary, with the approval of the Treasury Board, for the transfer between departments and agencies (Appendix A) of administrative and also of scientific, technical and professional personnel, to the full extent desirable for the proper training of such personnel and the best use of officials throughout the service.

(e) To be a member of, or to be represented on examination boards for the selection of applicants from outside the service for positions in the administrative, scientific, technical and professional grades.

(f) General responsibility for policy and guidance to departments regarding programmes of in-service training for the administrative, scientific, technical and professional grades.

(g) To act as chairman of the official side of the National Joint Council of the Public Service which is designed to provide an effective means of consultation with the staff.

(h) Responsibility for recommending policies concerning working conditions throughout the service including the improvement of morale and personnel welfare.

"Obviously the Director General will require an adequate staff of highly qualified assistants including such transfers from the Organization Branch of the Civil Service Commission as he may think desirable".

This appears to be a simple transfer of duties from the Civil Service Commission to the Treasury Board. What assurance is there that the work can be done any better by officers in a department already overburdened with its present duties than in the Civil Service Commission? In the opinion of many, the past performance of the Treasury Board does not justify any hope that an improvement would follow.

There are dangers to such a move. As the *Ottawa Journal* points out in commenting on the position of the Civil Service Association in voicing its opposition, "It is a position easily understood by all those who remember the bad old days when the doctrine prevailed 'to the victor belong the spoils', when merit was of little account in the Civil Service and politics and pull were everything." To put such power back into the hands of one department is indeed, as the Civil Service Association says "a decidedly retrograde step".

The only suggestion of a reason for this proposal is that, as the Civil Service Commission has to apply to the Governor-in-Council (which the report says means "approval by the Treasury Board") on matters of establishment, organization and money, it would be better to transfer these things entirely to the Board. "Financial control, without the direct and simultaneous duty to determine requirements and to provide the necessary means for effective operation, leads to delay, frustration and inefficiency". All departments of government, including special boards and agencies, have to apply to the government for their funds. Is this any reason why the work of such organizations should be taken over by the agency providing the funds? Would it be sensible to ask the Treasury Board to take over the work of the National Research Council just because the Council's requirements for funds are submitted to the Board? It doesn't seem so.

Misfits

It is interesting to read of the commissioners' concern over "misfits" and "redundant personnel". They point out correctly enough that for the former "there is a tendency to leave such officials in their posts and to prop them up in one way or another", and for the latter "there is always the danger that departmental organizations will be retained unaltered despite the fact that work has fallen off". "There is a tendency", and "there is the danger" are very mild observations to the mind of the "outsider" who is familiar with conditions in Ottawa.

Personnel Officers

The proposal that personnel officers be appointed to each department has some merit, but it would do nothing to solve the problems involved with professional workers. Surely 2,700 professional workers, whose engagement, promotion and continued service is so vitally important to many departments, are entitled to some personnel services from persons at their own level. The report offers nothing for this. The Institute believes that the intelligent handling of the professional worker is one of the greatest needs of the whole service.

The Old Story

Unfortunately, the report drags in the old fatuous argument that employment with the government has other compensations to offset a low salary. "Because of the special circumstances of public employment, the salaries in the case of the most senior ranks of the service have never been, and in our view need not be fully equivalent to the higher ranges in private employment. The senior civil servant has certain advantages which do not accrue to private individuals; he occupies a position of importance and usually of considerable interest; his appointment carries with it comparative security of tenure; upon retirement he becomes entitled to a relatively generous pension; provision is made for a pension for his widow; and above all, he has the satisfaction of rendering public service".

This is a hardy perennial that is produced on all occasions. The plain facts are that many employers today offer work that has more "importance, interest, security of tenure, and retirement income" than has the work of government. It is surprising to find a Royal Commission fooling itself with such hoary and disproved arguments. The laborer is still "worthy of his hire", and in cash.

New Ceilings for Deputy Ministers

There are recommendations for higher salaries for all deputy ministers. As this officer's salary provides the top for his department, it is important to get him high enough, but the report goes only part way, in that it suggests salaries in some instances as low as $10,000.00. Experience has shown already that highly competent professional assistance cannot be secured at remunerations below that level. Why not face that situation?

The Commission recommends salaries for deputies all the way from $17,500 to $10,000, without saying clearly which departments should get which. They recommend that the Deputy Minister of Finance, Dr. W. C. Clark, and the president of the National Research Council, Dr. C. J. Mackenzie, be given a special category carrying a salary of $17,500 "in recognition of highly meritorious services or of particularly onerous responsibilities". No one should quarrel with this recommendation.

The deputy-ministers in Agriculture, Justice and Trade and Commerce, are placed in the $15,000 class, but in Public Works, Transport, Veterans Affairs and National Revenue the proposal is for $12,000. What makes the deputy in Public Works worth $3,000 less than his opposite in Agriculture or in Mines and Resources, or in Revenue? Public Works is one of the really big spending departments. Surely the responsibilities and the need of outstanding qualities are at least as necessary here as elsewhere. To an outsider, it looks as though the wisest and fairest thing to do would be to pay all deputies the same, with some additional allowance for "highly meritorious services". Conversations with senior members of the Civil Service in Ottawa give strong support to this idea.

Senior Officers Far Down the Scale

The report recommends that, in a department where the deputy gets $15,000, there be one assistant at $10,000, and several at $8,000. Where the deputy gets $12,000, "we visualize one or more assistants at $8,000". For a deputy of the $10,000 size, "we think the next in rank should be paid $6,500 to $7,500".

To select a salary scale that gives the deputy fifty per cent more than his principal assistant, as in the first case, is unsound—particularly in government employment where the senior assistant may have to be a professional man and the deputy not—and also where the deputy may pass on to his assistant the principal burden of his office. A senior assistant worthy of the title should be able to reach a salary very close to that of his deputy. There are departments where competent men will not be secured or retained at lesser amounts.

In General

Perhaps one should not be too disturbed by the disparities of this report: if established custom prevails, it will not be implemented anyway. That seems to be one of the rules with regard to Royal Commissions. On the other hand, the proposals offer substantial improvements over existing conditions (except for the recommendation about curtailing the Civil Service Commission), and it would be better to have them adopted than to get nothing. Still, it is too bad that a more balanced report wasn't possible.

Is it too much to expect that the Government will take the report as a starting point and from it build up a really adequate policy of administration and remuneration? Without it the departments have little chance of attaining that degree of efficiency that is essential to economical operation.

REUNION IN PARIS

Last March, the president of the Institute was invited to attend a meeting of the Société des Ingénieurs Civils de France, in Paris, on June 21st and 22nd. The occasion was intended to mark the resuming of relations between the Société and the associations of engineers in other countries.

As President Hayes could not be present, Colonel D. C. Unwin Simson, M.E.I.C., military attaché at the Canadian embassy in Paris, was requested to represent the Institute and very ably filled the assignment, as will be seen from the following report.

Canadian Embassy

Paris, 12th July, 1946.

Acting on your cabled request I represented The Engineering Institute of Canada at the meeting of the Société des Ingénieurs Civils de France held on 21st June, 1946, at their H.Q., 19 rue Blanche, Paris.

The meeting was more a fraternal and social gathering than a technical one. Delegations were present from the U.S.A., Great Britain, Holland, Belgium, Rumania, Czecho-slovakia and Jugo-slavia. The United Kingdom delegation was by far the largest, representing different branches of the engineering profession.

The president and committee greeted us on arrival in the president's room and at 9.00 o'clock we entered the lecture hall with the president and mounted the stage. The hall was well filled with engineers and their families from all departments of France. The president introduced the different delegations to the audience and then drew attention to the fact that this was the first meeting in the hall since 1939.

Following the president's speech, replies were made by representatives of the foreign delegations. These mostly concentrated on welcoming the liberation of France, the overthrow of the Nazis, etc. When these were terminated the president proceeded to the presentation of prizes (Lauréats) awarded for the years 1940 to 1946 which had not been awarded during the occupation. Prizes were offered for the best papers written on engineering topics and adjudged by the committee of the Société as being most outstanding for the year in which they were submitted. Nearly all of them dealt with different phases of progress in the substitution of gasoline by new methods of internal combustion such as from compressed gas and gas generated from wood burning.

After the presentations were terminated a paper was read by Mr. Demaret, president of the Architects Associations of France and an honorary president of the Société des Ingénieurs Civils. In the paper he treated in turn of the war losses suffered in houses, bridges and all branches affecting the engineering profession in the different countries occupied during the war, evaluating the cost of the damage and the methods by which it was proposed to proceed with reconstruction. According to him Poland had suffered to the greatest extent.

The prime object of all studies in the reconstruction of big towns in France is the speeding up of transportation; for road transport by constructing by-pass roads around big towns and building overhead bridges to replace level crossings; for railways by reorganizing terminal stations in the cities and where possible building union stations. Before the war, trains on different railway lines entering the same town often had two separate stations and connections were made by a small local train. This procedure caused unnecessary inconvenience to travellers as well as considerable loss of time.

The meeting closed about 11.45 on Friday evening followed by a lunch at noon on Saturday, held at Claridges Hotel on the Champs-Elysées. After this, most of the delegates departed but for those that remained the president held an " at home " on Sunday afternoon.

I am endeavouring to obtain a copy of the paper read by Mr. Demaret and if successful will forward this to you as well as minutes of the meeting.

Colonel D. C. Unwin Simson, M.E.I.C.

BROAD THINKING ON COMMUNITY PLANNING

Like a breath of fresh air in an atmosphere not too sweet comes an address by Mr. Russell Van Nest Black, a recognized expert in the field of planning. It is a relief to see a frank open statement of the relationship between the groups concerned with an admission of their weaknesses both human and technical. Such fair mindedness, such honesty, such modesty should help a lot right now in Canada.

The address was delivered before a discussion group of the New York Architectural League, and is reproduced on page 483 of this issue with the kind permission of the author.

PRAISE FOR ENGINEERS

The Honorable E. C. Manning, Premier of Alberta, spoke to the Canadian Electrical Association at Banff in June, and concluded his address with some rather complimentary comments on engineers. With due modesty, the *Journal* presents herewith the paragraphs to which reference is made.

" In closing I would like to pay a tribute to those of you here who are members of the engineering profession. I do it in all sincerity because I believe that one of the causes of our great problems in the field of human relationships today is the fact that in political science, in the abstract sciences that have to do with human relationships, we have not made the progress that you gentlemen who are associated with the physical sciences, in the realms of engineering, have made in your profession.

" If we could apply to the abstract sciences, our political economy, and in our dealings with our fellowmen the same intelligence, the same ingenuity, the same perseverance that you men apply in your profession as engineers, we would get somewhere. You have gone so far ahead in your sphere of science, and political science is trailing so far behind, that today your achievements in the engineering world have placed in the hands of the human race powers of destruction so great that mankind, through his lack of development and progress in the abstract sciences, is unprepared to have in his possession."

INSTITUTE POLICY TOWARDS NEW COUNCIL OF ENGINEERS AND SCIENTISTS

The following report was recently presented to Council of the Institute by its Committee on Professional Interests. In view of the confusion existing in the minds of several persons on this subject, Council has directed that the report be published in the *Journal*. It is earnestly recommended that every member of the Institute study it carefully. —Ed.

A resolution from the Toronto Branch Executive regarding participation by The Engineering Institute of Canada in the C.C.P.E. & S. was discussed at considerable length at the March 23rd, 1946 meeting of council. It was referred to the Committee on Professional Interests for action.

The attention of the Toronto Branch Executive is respectfully drawn to the *Engineering Journal* for June 1945. On page 391 appears a report to the membership from the Committee on Professional Interests which includes a statement of the principal consideration which led the committee to its recommendation with regard to the new council. On page 400 appears the statement of principles and policy of the Institute on relations with sister societies, followed by the resolutions of council regarding participation in the C.C.P.E. & S.

Item E of the statement of policy (adopted May 19th, 1945) reads:

> " Council is prepared to consider as an experiment the formation of a committee representative of engineering bodies on which committee the members act only upon consent of the bodies they represent, and the chairman and the members change periodically, and the secretariat rotates annually among the headquarters of the constituent bodies ".

This is followed by the resolutions regarding participation in the C.C.P.E. & S., the first of which reads in part as follows:

> "As Clause E of the Committee's Statement of Principles and Policy proposed a Presidents' Conference Committee, and as this statement has received the unanimous approval of the individuals and organizations mentioned above, the committee recommends that Council consider the advisability of proposing such a committee to other interested and appropriate organizations ".

There was then discussion in favour of making arrangements for cooperation with other groups when there are special reasons for joint action.

> " Finally, on the motion of Mr. Eadie, seconded by Mr. Lalonde, it was agreed unanimously that a copy of these two resolutions be forwarded to the Canadian Council of Professional Engineers and Scientists, to the Dominion Council of Professional Engineers, to the provincial professional associations with which the Institute has cooperative agreements, and that the Institute's representatives at the forthcoming meeting of the committee of fourteen be authorized to use these resolutions as they see fit at that meeting, and, further, that the future steps to be taken in the matter be referred to the Committee on Professional Interests for study and recommendation ".

The following observations give additional weight to the Institute decision not to participate in an " omnibus " organization such as the C.C.P.E. & S.

(1) The state and multiplicity of professional organizations in Canada, with the exception of statutory bodies administering the licensing of engineeers, is now not very dissimilar from that in the United Kingdom thirty years ago. Attempts there to form a general council have not been successful. Our information is that support for such an organization is rapidly waning.

Experience in the United States is somewhat similar. Confusion there appears to be even greater than in Canada. Various attempts at the organization of all-embracing engineering bodies have been made. Those which have been brought into existence have enjoyed only brief periods of more or less general support. A satisfactory means of cooperation has been found, however, through what is called " The Joint Conference Committee " of purely engineering organizations.

(2) The president of the Institution of Electrical Engineers of Great Britain, Dr. P. Dunsheath, C.B.E., was the speaker at the Institute's Annual Dinner on February 8th, 1946. Early in his very fine and instructive address he mentioned that the presidents of the Institutions of Civil, Mechanical, and Electrical Engineers meet together from time to time and that through their discussions the policies and actions of these large autonomous bodies, with a combined membership of about 60,000, were influenced along the same or complementary lines when desirable. These informal meetings have been found to be the best way of meeting their cooperative requirements.

(3) In the international field, there is now an attempt to form an overriding body " The International Federation of Engineering and Scientific Societies ". This is receiving little encouragement and no support from stable professional bodies either in Europe, the United States, or Canada.

(4) As time goes on, there will be no doubt more and more specialized voluntary associations and an extension of statutory licensing in fields where the public is affected. Some individuals are already members of and contributors to four bodies, and this situation will become more aggravated as further specialization develops. The multiplication of contributions by the individual to an overriding body such as the C.C.P.E. & S. should be avoided unless such overriding body is absolutely essential.

The feeling is also developing that even nominal financial contributions by provincial licensing bodies, which are in effect indirect contributions by the individual, are " ultra vires ".

(5) The main functions which the C.C.P.E. & S. appear anxious to undertake seem to lie in two general classes.

1. Material welfare of the individual. The need for raising the remuneration of scientific workers of all kinds and for providing much greater compensation for our best research workers is emphasized. The hope is that the drain of technical personnel to the United States will be at least diminished.

An object of the C.C.P.E. & S. with an office in Ottawa is to act as " watchdog " regarding legislation, and there has even been talk of carrying on a " lobby ". It is hoped thereby that steps may be taken to mould proposed legislation to the interest of scientific workers.

2. Advisory. What amounts to a sufficiently powerful " pressure group " is apparently envisaged, so that governments may be forced to mould their research policies and coordinate all branches of science to place this country in the lead in all scientific developments.

How far progress may be accelerated by any organization towards the above and other projects under consideration is debatable. It is the opinion of this committee that just as much and probably more progress can be made on all practicable subjects by a President's Conference Committee without a new secretariat and therefore at vastly less cost.

(6) The Institute participated in the Committee of Fourteen. It is now cooperating with and is represented on the Canadian Chamber of Commerce, the National Construction Council, and other technical and non-technical bodies.

It is ready and willing to participate in a joint committee with other organizations on matters of common concern subject to the following: The Committee will not act as a mouthpiece. It will have no permanent secretariat. Each organization should bear the expense of its own representatives. The Committee will be used only to discover how the policies of the participating autonomous organizations may be coordinated. Each organization will normally speak for itself, although at times joint action for a specific project, as in the case of the Committee of Fourteen, would be in order.

It is considered that the effect is much greater when a number of known and respected autonomous organizations of large corporate membership exhibit the same policy, than when all are spoken for by a council having no corporate membership.

The council of The Engineering Institute of Canada will support a Presidents' Conference Committee of engineering bodies. It has in the past participated in such conference committees as well as in others including non-engineering bodies. There is nothing to hinder participation in a committee as covered in Item E and including other bodies for purposes of mutual benefit.

For the advisory functions which the C.C.P.E. & S. appear anxious to undertake, it should be noted that the National Research Council already has an advisory committee. It is understood that this committee represents a complete cross section of scientific activity.

We are informed also that the National Research Council has had a coordinating committee for twenty-five years for the purpose of integrating the activities of all research agencies and assisting them in their projects and programmes. There has been close association with universities, industry and governments. This coordinating committee is now tied in with the Research Division (of which Dr. C. J. Mackenzie is Director-General) of the Department of Reconstruction.

If something more is desired and appears practicable, then it is suggested that the Presidents' Conference Committee might see fit to discuss a definite proposal and subsequently be the means of coordinating representation to the Government on the form and substance of the scientific advisory set-up desired.

It is understood that there is a Parliamentary and Scientific Committee functioning in London with some success, and that a similar committee at Ottawa proposed by the Canadian Association of Scientific Workers is in progress of formation. It would seem that such a Committee, with the Government committees now established, would perform without cost to the profession the advisory functions which the C.C.P.E. & S. propose to undertake.

Conclusions

(1) The C.C.P.E. & S. is composed of representatives of many organizations covering a very wide field of professional endeavour. The interests of some will be contrary to the interests of others. If a clash of interests develops, either no action can be taken or one or more organizations must withdraw. The recent hearing of Bill 200, proposed by the Corporation of Professional Engineers of Quebec to the Quebec Legislature is an example. Opposition was offered by representatives of several provincial bodies whose national organizations are represented in the C.C.P.E. & S.

A Presidents' Conference Committee can expand or contract to include all those but only those interested in a specific subject. It seems that this provides the only effective vehicle for cooperation between organizations.

(2) Any overriding body composed of representatives of other organizations, but without corporate membership of its own, can only speak with authority after formal approval by the executives of the participating organizations. Otherwise it must encroach upon the autonomy of the participating organizations.

(3) Duplication of many activities of others have already been undertaken by the C.C.P.E. & S., and apparently many others are considered. Only a limited number of people are willing and able to do such society work. When there is duplication of effort by overriding organizations, additional strain is placed on many already overworked individuals. Their interests are divided and their capacity for effective accomplishment impaired.

(4) The cost of maintaining an organization such as the C.C.P.E. & S. in Ottawa will be an additional indirect burden on the individual members of each organization. It is neither practical nor desirable to secure large sums from sources outside the professions and such contributions would be very embarrassing to any organization seeking or receiving them.

(5) Experience in the United Kingdom and in the United States shows the inadvisability of "omnibus" organizations. The Committee on Professional Interests believes that a Presidents' Conference Committee is the best, if not the only, practical method of attaining the ends desired and that such a committee—

1. should not act as a mouthpiece.
2. should have no permanent secretariat.
3. should be used only to discover how policies regarding problems of common concern can be coordinated and therefore dealt with individually by those organizations participating in the discussions.

The Committee has again gone deeply into the matter and is still of the opinion that the "Statement of Principles and Policy of the Institute on Relations with Sister Societies" is sound, and that, in the best interests of the profession, the Institute is fully justified in refraining from participation in the C.C.P.E. & S. It is always ready and willing, however, to consider in detail the views of any members, group of members, or branch, so that it may be currently in a position to make the soundest possible recommendation to Council.

President of the Institute J. B. Hayes listens to description of exhibit at 1946 Semi-Annual Meeting of the American Society of Mechanical Engineers in Detroit. Left to right: J. W. Armour, chairman of the general committee for the meeting, D. Robert Yarnall, president, A.S.M.E., J. W. Parker, past-president, A.S.M.E., and J. B. Hayes, president, E.I.C.

MARITIME PROFESSIONAL MEETING

Final Programme

Wednesday, September 4th

3.00 p.m.—Regional Meeting of Council.

10.00 p.m.—Starter-offer—Members who will have arrived are invited to the Maritime Professional Engineers' Club Room. Music and refreshments will be provided.

Thursday, September 5th

8.00 a.m.—Early Birds Breakfast—Special entertainment will be provided.

8.30 a.m.—Registration.

10.00 a.m.—Professional Session.

Chairman, C. D. Martin, chairman of the Halifax Branch of the Institute.

Engineering Education, by H. W. McKiel, Dean of the Faculty of Applied Science, Mount Allison University, Sackville, N.B.

Chairman, T. H. Dickson, Member of the Executive of the Moncton Branch of the Institute.

Oil Exploration in the Maritime Provinces, by D. J. MacNeil, Professor of Geology, St. Francis-Xavier University, and Consulting Engineer, Antigonish, N.S.

1.00 p.m.—Luncheon—Addresses of Welcome by J. B. Hayes, O.B.E., president of the Institute, and His Worship the Mayor of Digby.

2.45 p.m.—Recreation—Golf, tennis, bathing. Prizes will be awarded the winners of the many games and contests planned by the Committee.

6.30 p.m.—Cocktail Party.

7.45 p.m.—Dinner.

10.00 p.m.—Grand Opening Ball. (Dress optional).

Friday, September 6th

10.00 a.m.—Professional Session.

Chairman, L. O. Cass, chairman of the Saint John Branch of the Institute.

Industrial Electronics, by T. J. Halme, Engineering Service Department, Canadian General Electric Co., Toronto, Ont.

Chairman, J. A. MacDonald, chairman of the Cape Breton Branch of the Institute.

The Utilization of Sydney Slags, by Norman A. Parlee, Director of Research and Development, Dominion Steel and Coal Corporation, Sydney, N.S.

1.00 p.m.—Luncheon—Address.

2.45 p.m.—Recreation—see Thursday.

6.30 p.m.—Cocktail Interlude.

7.45 p.m.—Engineers' Banquet De Luxe—Special speaker: Thomas H. Raddall, Canadian Author, Liverpool, N.S., on *Nova Scotia Humor*.

Special entertainment will be provided in the main dining room after the dinner.

Saturday, September 7th

"As You Like It".

For the ladies, a special programme is being arranged and will include teas, scenic tours, bridge, golfing and tennis.

Special Railway Rates

Special return tickets, at the cost of single fare plus one-third, are available under the Identification Certificate Plan of the Canadian Passenger Association, to members attending the meeting, and their families.

Special Identification Certificates, which must be presented to the local agent when buying tickets, can be secured from Institute Headquarters, 2050 Mansfield Street, or from P. A. Lovett, P.O. Box 263, Halifax, N.S.

Dress

Dress is optional at all functions.

Hotel Reservations

Reservations for hotel accommodation should be made with P. A. Lovett, P.O. Box 263, or 14 Prince St., Halifax.

Time

The times shown on the programme are Atlantic Standard.

USE OF SCIENTIFIC FILMS

The following paragraphs have been prepared by a group interested in promoting a wider use of films as an aid to science and to industry. For some time the Engineering Institute has been interested in such activities, and doubtless will find the new association of considerable aid. At the same time, it can be of assistance in establishing this association and expanding its usefulness. (Ed.)

Up to the present, no organized group has existed in Canada to stimulate the wider use of scientific films in industry, research and education. As compared with other countries, Canada has made little use of the motion picture as an industrial tool, or as an aid to science teaching in schools, or as a stimulus to discussion on such subjects as public health or the need of a national programme of scientific development. Accordingly, a small group interested in science and film have formed themselves into an Interim Committee to set up a Canadian Scientific Film Association (CSFA). The proposed Association corresponds to the Scientific Film Association founded in Britain four years ago, which is now providing extensive services to industrial firms and professional bodies, and counts among its members The Royal Society of Medicine, the London County Council, the Department of Scientific and Industrial Research, Imperial Chemical Industries and the Shell Oil Company.

The aims of the Canadian Scientific Film Association, as embodied in its draft constitution, are as follows:

(1) To promote and co-ordinate the use of the scientific film in Canada in order to achieve the widest possible understanding of scientific method and outlook.

(2) To study the needs of Canadian educators for scientific films; and to further the production of films needed to fill special Canadian educational requirements, or to make known the work of Canadian scientists.

(3) To review and appraise scientific films from all countries, and to establish an information service to make these findings known to all interested organizations in Canada.

(4) To appoint trained advisers, where so requested, to ensure the authenticity and accuracy of scientific films produced in Canada.

(5) To recommend the production of English and French language versions of outstanding scientific films originally produced in other languages.

(6) To make scientific films available throughout the country by employing the community film libraries associated with the National Film Society.

(7) To establish a central preview service of scientific films, so that prints of new productions may be seen by interested organizations; and to form a permanent library of films of outstanding scientific interest which will be available to members.

(8) To publish specialized catalogues of scientific films; and to issue a journal and other publications which will advance the use of the scientific film and will spread information about new film technology to research workers and to the professions.

(9) To encourage the wider appreciation by the public of science and its place in society by setting up local Scientific Film Societies and regional councils.

(10) To co-operate with UNESCO and with scientific film associations in other countries so as to further the international exchange of scientific information.

The membership of the Association will be drawn from national organizations of science and film; professional scientific and medical associations; universities and other educational groups; industrial concerns; Scientific Film Societies and private individuals.

The following letter from a member of the Engineering Institute will be read with interest by members everywhere. The letter is particularly pointed in Quebec because of the encouragement it gives to broad thinking and continued negotiations between the two groups.

There is nothing to be gained by further public utterances on the futile attempts made in the past to negotiate these differences, but the lesson to be learned from the experience in Pennsylvania should not be lost in Quebec.

PENNSYLVANIA SOCIETY OF PROFESSIONAL ENGINEERS
OFFICE OF THE HISTORIAN
524 COURT ST., READING, PA.

June 20th, 1946.

Mr. L. Austin Wright
Gen'l Secretary Eng. Inst. of Canada
2050 Mansfield St.
Montreal 2, Canada

Dear Mr. Wright:—

Your account of unfriendly "Legislation in Quebec" on the part of some of the Architects and their friends, on p. 314 of the May Journal, prompts me to enclose herewith a copy of the "Code of Ethics governing the Mutual Relationship between Architects and Engineers" entered into in May 1942 between the Pennsylvania Society of Professional Engineers (P.S.P.E.) and the Pennsylvania Association of Architects (P.A.A.),—which may suggest to responsible representatives of the two professions in Canada some way out of the unnecessary and undignified, if not ridiculous *impasse* they have come to in Quebec. I also enclose a copy of the "Architects' Law" as finally amended in 1939, by the State Legislature, which our P.S.P.E. *helped* the P.A.A. to get through the Legislature, thus healing a breach which for a while looked threatening.

Our P.S.P.E. was chartered in 1934, and has grown slowly but steadily. The sole qualification for membership is a license to practice engineering in Pennsylvania, granted by the State Board of Registration for Professional Engineers to persons who can show that they are qualified by education and experience in any branch of engineering, and are of good character and repute. Membership in our Society is not automatically consequent upon registration, as it is in the Canadian Provinces; — wherein the Canadians are, professionally, perhaps a step ahead of the registered engineers in the U.S. However, our State Societies, now numbering 25 or so, are constantly growing. The P.S.P.E. has now over 1200 members.

In May, 1935, the P.S.P.E. was barely a year old, but got very active when a bill was introduced in the Legislature by a few Architects that would have prohibited professional engineers from designing or supervising any building structures whatever, — even industrial buildings and power plants which are strictly engineering jobs. The P.S.P.E. sent out about 3200 postal-card requests to all the registered engineers in the State, to ask their legislative representatives to oppose this bill, and the prompt responses resulted in the killing of the bill in committee.

By the time the next biennial session of the State Legislature assembled in 1937, some members of both P.S.P.E. and P.A.A. got together in a spirit of cooperation and agreed to help sponsor a bill in the State Senate that would prohibit permits to be issued for governmental structures unless plans and specifications for same were signed by either a Registered Architect or a Registered Engineer. This bill failed of passage, but the incident marked the beginning of an era of better feeling between the professions.

At the next legislative session, in 1939, *P.S.P.E. actually helped the P.A.A.* to draft needed amendments to the Architects' Law of 1919, and get it passed through the Legislature. The amended law of 1939 made the Architect's legal status more definite than before, and further clarified the relations between Architects and Engineers where their functions might overlap. (See paragraph at bottom of p. 9, and top of p. 10, of the enclosed copy of the Architects' Law). Shortly thereafter, each Society formed its own committee of six members, to meet jointly with the committee of the other Society, for the purpose of establishing a *Joint Code of Ethics* to govern their mutual relationships. It took a couple of years, with quite a number of joint sessions, to devise the Code, but the result was good enough to be approved by the Boards and finally by the general membership of both Societies, in May, 1942.

You will notice that the Code does not attempt to specify the particular types of buildings to which Architects and Engineers are expected to restrict themselves respectively. Its appeal is primarily to cooperative reasonableness. A good friend of mine who was a member of the Engineers' 6-man committee for the whole period, told me that all hands were most cooperative and reasonable throughout; but he went on to remark that a single unreasonable person might have spoilt it all.

As the enclosed Code copy is a photostat "negative", it will be easy to get as many "positives" photostated from it, as you wish, in case you decide to distribute any of them amongst the Provincial Associations or Corporations of Registered Engineers, or of Registered Architects and their corresponding bodies, if you think any of them would be willing to accept enlightenment on how interprofessional quarrelling has been stopped in Pennsylvania, — for since its adoption, nothing has occurred to mar the harmony of the two professions in this State.

The New York State Society of Professional Engineers which is older than ours, dating from 1926-7, had a similar battle with the Architects that lasted from 1929 to 1932, when it was finally settled. Part of it was waged over the "Multiple Housing Law" of 1929, which excluded professional engineers as well as anyone else not a licensed architect, from designing apartments, hotels and covered by the Act. The full story of how all differences were finally adjusted can be found in the History of the N.Y. State Society, in the Society's 1941 Year Book, for years 1929 to 1932 inclusive. You may have this book in your Library, — if not, you ought to have it for the sake of this History by Arthur V. Sheridan, who has been President of the N.Y. State and the National Societies of Professional Engineers.

I was employed professionally in Canada for over 8 years, — 1918 to 1926, and enjoyed the experiences I had in Winnipeg and Vancouver, where my work lay. The engineers I knew in Western Canada were all reasonable men, and I hope that the architects in Quebec may prove equally so, if they have a chance to see how easily such disagreements have been settled south of the Border.

If what I am sending you, including this letter, can be helpful if passed around on both sides of the controversy, please use all of it in any way you see fit.

Very truly yours,

(Signed) W. NELSON SMITH, Life Member E.I.C.
Historian, Penna. Society of Prof. Engrs.

CODE OF ETHICS GOVERNING RELATIONSHIPS BETWEEN ARCHITECTS AND ENGINEERS IN PENNSYLVANIA

Reprinted from the February issue 1946 of the *Pennsylvania Professional Engineer*

1. Preamble:

The practice of Architecture and Engineering in the Commonwealth of Pennsylvania shall be conducted in a dignified and ethical manner. The following code of ethics has ,therefore, been adopted by the Pennsylvania Society of Professional Engineers and the Pennsylvania Association of Architects as a statement of conduct which is an ethical guide under ordinary conditions for business relations with the public and among members of both professions. All Architects and Engineers have an obligation to observe it as such.

2. Definitions:

(a) Primarily, the practice of Architecture and of Engineering shall be defined as set forth in the respective Licensing Laws of those professions and as issued by the Commonwealth of Pennsylvania.

(b) Each profession recognizes the other as an honored and learned profession of equal merit whose close cooperation is essential at all times for the benefit of the public welfare.

3. Field of the Architects:

(a) An Architect may ethically accept commissions for projects involving both architectural and engineering work, provided the primary problems of the project are in a field in which he has actively practiced.

(b) For structures supervised by Architects, which require engineering aid or assistance, Architects will employ Registered Professional Engineers to do such engineering and will pay a mutually agreed upon fee.

4. Field of the Engineers:

(a) An Engineer may ethically accept commissions for projects involving both architectural and engineering work, provided the primary problems of the project are in a field in which he has actively practiced.

(b) For structures supervised by Engineers and which require any architectural aid or assistance, the Engineer will employ a Registered Architect and will pay a mutually agreed upon fee.

5. Use of Seal:

The seal of the Registered Professional Engineer or Registered Architect to whom the commission is awarded shall be affixed to all drawings. In addition to his seal, the names and registration numbers of those Registered Professional Engineers and Registered Architects under whose direction any separate fields of work have been executed, shall appear in a special space on each drawing in connection with the title block.

6. Mutual Relationships:

(a) Architects and Engineers will cooperate to uphold the dignity and progress of each other's professions by exchanging general information and experience, and will foster instructions of students in their respective professions in every practicable way.

(b) In any case of dispute over questions of relationship between Architects and Engineers which cannot be resolved by discussion and which threatens the amicable relationship of the professions generally, or of individual members, the matter shall be referred to a Board of Arbitrators composed of one member of the Pennsylvania Association of Architects and one member of the Pennsylvania Society of Professional Engineers, who shall select a third disinterested party to sit with them and pass on the matter at issue and who shall have power by majority decision to determine it finally.

7. Public Responsibility:

(a) Architects and Engineers will interest themselves in public welfare on behalf of which they shall at all times apply their special knowledge, skill and training within the scope of their commissioned work.

(b) The professions oppose the practice of furnishing to the public free engineering and architectural services from manufacturers or their representatives on designing and planning work which comes within the fields of the Registered Professional Engineer and Registered Architect. But this shall not be construed as to prevent either profession from calling upon manufacturers of special equipment to furnish details of their product and the advantages of its application in specific cases.

8. Individual Obligations:

A. Each Architect and Engineer will familiarize himself with the Registration Laws of both professions and will not knowingly violate such laws.

B. Each Architect and Engineer pledges himself to respect the honest business interests of every colleague and accordingly:

(a) Will not injure falsely or maliciously, directly or indirectly, the professional reputation, prospects or business of another Architect or Engineer.

(b) Will not attempt to supplant another Architect or Engineer after definite steps have been taken towards his employment.

(c) Will not compete with another Architect or Engineer for employment on the basis of professional charges, by reducing his usual charges to underbid the other, after having been informed of the charges named by the other.

(d) No Architect or Engineer will review the work of another Architect or Engineer for the same client, except with the knowledge or consent of such Architect or Engineer, or unless the connection of such Architect or Engineer with the work has been terminated and he is fully compensated for the work already performed.

(e) Will not advertise in self-laudatory language or in any other manner derogatory of impartial truth, or of the dignity of the profession.

(f) Will not take advantage of a salaried position to compete unfairly with other Architects or Engineers.

PAPERS ON RADIOLOCATION

A Radiolocation Convention was held in London, England, last March, under the auspices of the Institution of Electrical Engineers and, as a result, a great deal of important information has become available for publication. The Institution has published the papers in a special number of Part III of its *Journal* with a series of eight supplements, all of which are being made available to members of the Institute.

Members who already subscribe to Part III of the *Journal* of the Institution of Electrical Engineers at half the normal rate will be able to obtain the Special Number without additional charge and may purchase the Supplements at a special price of 2s. 6d. per Supplement.

Others will be required to pay £1 for the Special Number and 5s. for each Supplement.

Members who wish to receive copies are requested to place their order with the Institute Librarian at 2050 Mansfield Street, Montreal, enclosing a remittance to cover the cost.

A list of the contents of the publications follows:

Part IIIA, No. 1—All Survey Papers and Lectures delivered at the Convention and abstracts of supporting papers.

The following are the Supplements which contain the supporting papers, and any discussions on the survey papers, within the headings indicated.

Part IIIA, No. 2 — Naval Gunnery Radar.
Radar Navigation.
Precision Radar.

Part IIIA, No. 3 — Propagation.
Aerials — I: Metre-wave.
Part IIIA, No. 4 — Aerials — II: Centimetre-wave.
Wave Guides.
Part IIIA, No. 5 — Cathode-ray Tubes.
Valves.
Part IIIA, No. 6 — Transmitters and Receivers.
Part IIIA, No. 7 — Circuit Techniques for Radiolocation.
Part IIIA, No. 8 — Radio Measurements and Test Gear — I: General.
Part IIIA, No. 9 — Radio Measurements and Test Gear — II: Centimetre-wave.

ADDRESSES WANTED

As it is planned to publish a membership list shortly, Headquarters would be glad to receive as quickly as possible, information regarding the addresses of the following Students, some of whom have been overseas. A list of the Members and Juniors for whom we have no addresses appeared in the July issue.

STUDENTS REPORTED OVERSEAS

Adams, John Lindley
Cheeseman, Edgar W.
Bruce, Gordon Wyndham
Fleming, John Patten
Mackenzie, Robert Kenneth
Mercer, George
Murphy, Daniel Francis
Murphy, Herbert John
Newman, Harvey Elliott
Snyder, Robt. Bertram
Taylor, Bruce S.
Welch, John Kenneth

OTHER STUDENTS

Bandiera, Leo Joseph
Bernardi, Aldo
Blaine, Donald Smith
Burrows, James Louis
Calder, John
Cameron, Curtis B.
Cann, John Alastair Ross
Carmichael, Douglas Alfred
Carter, Charles Douglas
Carter, Charles Junior
Chappell, Douglas Stewart
Chenevisse, Emile
Clark, Chester Graham
Clark, Frederick Hubert
Collingwood, John C.
Cook, James E.
Coppick, Sydney
Crowther, Edward James
Curtis, George Louis
Dickie, Harold Guthrie
Dolan, M. A.
Dunphy, Kenneth Rae
Dudych, Daniel
Fielding, Geo. Parker
Forbes, Cyril Robert
Galbraith, John D.
Garland, Hedley Robert
Godbout, Adolphe G.
Gordon, John Edward
Gregory, Arthur Herbert
Herbert, Albert Cecil
Horton, Graydon Thring
Howe, Lloyd G.
Hubley, John Stuart
Kennedy, Thos. Vernon
King, John Shirley Lowe
Kummen, Harold Thorvald
Kuzyk, Wm. John
Leavens, John Wright
Lowe, Howard Thomas
Leeper, Robert Patrick
Lichty, Lyall J.
MacDonald, Ignatius Lloyd
MacFadyen, Allan Burt
Macfarlane, Robt. Murray
MacInnes, Thomas Robert
Mackey, Keith Barker
Magee, E. D. B.
Maguire, Robert Adam
Martin, John Henry
Mason, H. L. K.
Maughan, Ronald George
McCallum, Francis
McKie, Wm. M.
McLaughlin, Robert Hugh Benson
Miller, Justin Ormond
Mowbray, John Frederick
Muirhead, Charles Randolph
Munro, Donald David
Oxley, Loren A.
Palmer, Kenneth Winfield
Peacock, Robert Fred
Pouliot, Jean
Prokopy, Peter J.
Reikie, W. Thorpe T.
Rhodes, Edward LeRoy
Robinson, A. H.
Scott, Ainsworth David H.
Sokoloski, Steve
Stewart, Walter D.
Tamblyn, Robert Teudar
Telford, Robt. Brown
Ternan, Jas. B.
Thompstone, Robt. Edward
Thomson, Thos. Moncrieff
Venables, Wm. Norman
Wales, Donn
Walker, Roger Hugh
Ward, John William
Welch, Kenneth
White, Hubert Edward
Wills, Nicholas James
Wilson, Hugh Wm.
Wilson, John Edwin
Yamanaka, Richard Hiroji

AFFILIATE: Goldenstein, Abraham

LIST OF MEMBERS

The compilation of the membership list is now under way, and it is expected that publication will be made before the end of the year. Many members have returned the post-card containing the information necessary, but 40% have not yet completed the form.

The form is reproduced herewith for their benefit as well as for those whose position or address has changed since they returned the card. Right now, before it is forgotten, the form should be completed and forwarded to Headquarters.

An accurate and complete list requires full cooperation —and requires it now.

Steel Construction
Federal, Provincial and Municipal Departments
Construction
Consulting Firms
Teaching
Undergraduates
General Manufacturing and Industrial
Communications
Transportation
Power
Pulp and Paper
Mining

....
Last name — Initials or Christian names as you desire them in the list
....
Position or nature of duties
....
Name of firm or employer
....
Business address — Street — City — Province
....
Home address — *(Underline the one to be used for Institute mail)*

INFORMATION FOR OFFICE RECORDS ONLY

....
Degrees — University — Year of Graduation
....
War service (Give dates, rank and decorations)
....
In which branch of engineering: (a) did you graduate? (b) Would you now classify yourself?
....
In which of the classifications on the list at the left are you interested?
....
If a registered professional engineer, state in which province.

Personals

It will be a matter of interest to all members of the Institute to see the list of their fellow members who share in the recent King's Honour Lists. There are seventy-one persons included in the published lists which we believe are complete.

It is a particular pleasure to find there the name of the president of the Institute, J. B. Hayes.

The Institute joins with the other citizens of Canada in congratulating the following members for the honour which they have so well deserved.

KING'S BIRTHDAY HONOURS LIST

ORDER OF COMPANION OF HONOUR

General the Hon. A. G. L. McNaughton, C.B., C.M.G., D.S.O.

APPOINTMENT TO IMPERIAL PRIVY COUNCIL

Right Honourable C. D. Howe

COMMANDERS OF THE MILITARY DIVISION OF THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (C.B.E.)

Brigadier Earl Ritchie Suttie, R.C.A., D.S.O., Montreal, Que.
Air Commodore Walter Alyn Orr, R.C.A.F., O.B.E., M.I.D., Ottawa, Ont.

OFFICERS OF THE MILITARY DIVISION OF THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (O.B.E.)

Engineer Captain Angus Downes Mathwin Curry, R.C.N., Jollimore P.O., Halifax Co., N.S.
Captain (E) Arthur Cecil Montague Davy, R.C.N., Esquimalt, B.C.
Captain (L) Ernest Geoffrey Cullwick,, R.C.N., (R), Ottawa Ont.
Colonel William Little Laurie, R.C.C.S., Kingston, Ont.
Colonel Norman Clarence Sherman, R.C.E.M.E., Kingston, Ont.
Colonel John Tuzo Wilson, R.C.E., Toronto, Ont.
Lieutenant-Colonel George Hylton Spencer, R.C.E., Toronto, Ont.
Group Captain Denton Massey, R.C.A.F., Toronto, Ont.

DOMINION DAY HONOURS LIST

COMPANIONS OF THE MOST DISTINGUISHED ORDER OF ST. MICHAEL AND ST. GEORGE (C.M.G.)

Lieutenant-Commander Charles Peter Edwards, O.B.E., Ottawa, Ont.
Dr. Augustin Frigon, Montreal, Que.
Emmett Patrick Murphy, Ottawa, Ont.
Joseph Emile St. Laurent, Ottawa, Ont.

HONOURARY COMPANION OF THE MOST DISTINGUISHED ORDER OF ST. MICHAEL AND ST. GEORGE

William L. Batt, Philadelphia, Pa.

COMMANDERS OF THE CIVIL DIVISION OF THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (C.B.E.)

Henry Blane Bowen, Montreal, Que.
Edward Launcelot Cousins, Toronto, Ont.
Frederick Coburn Jewett, Ottawa, Ont.
William A. Newman, M.B.E., Montreal, Que.
John Hamilton Parkin, Ottawa, Ont.
Walter Albert Rush, Ottawa, Ont.
James Morey Wardle, Rockcliffe, Ont.
John Armistead Wilson, Ottawa, Ont.

OFFICERS OF THE CIVIL DIVISION OF THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (O.B.E.)

Frederick Alport, Ottawa, Ont.
Hope V. Anderson, Ottawa, Ont.
Henry M. Armstrong, Fredericton, N.B.
Bristow Guy Ballard, Ottawa, Ont.
David Boyd, Toronto, Ont.
Donald Roy Cameron, Ottawa, Ont.
Albert Deschamps, Montreal, Que.
C. Leonard Dewar, Montreal, Que.
William Flockhard Drysdale, Montreal, Que.
J. Bertram Hayes, Halifax, N.S.
Llewellyn Corbett Jacobs, Montreal, Que.
Robert Edwards Jamieson, Montreal, Que.
Percy John Jennings, Banff, Alta.
Frederick Binns Kilbourn, Montreal, Que.
Ernest Lavigne, Quebec, Que.
Wilfrid S. Lawson, Ottawa, Ont.
Thomas Rodgie McLagan, Montreal, Que.
Frank Leslie Mitchell, Montreal, Que.
James Geoffrey Notman, Montreal, Que.
Russell Kenneth Odell, Ottawa, Ont.
Ernest Clint Perley, Ottawa, Ont.
Frederick Hatheway Peters, Ottawa, Ont.
Dr. Ronald C. Rose, Ottawa, Ont.
Lesslie Rielle Thomson, M.B.E., Ottawa, Ont.
Richard Laurence Weldon, Montreal, Que.

News of the Personal Activities of members of the Institute

COMPANIONS OF THE IMPERIAL SERVICE ORDER (I.S.O.)

Edward B. Jost, Ottawa, Ont.
Ivan E. Vallee, Quebec, Que.
Ernest Owen Way, Ottawa, Ont.

MEMBERS OF THE CIVIL DIVISION OF THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (M.B.E.)

William Henry Stephenson Bird, Winnipeg, Man.
Ernest W. Bowness, Calgary, Alta.
John Ellis Breeze, Ottawa, Ont.
Frederick Thomas Brown, Montreal, Que.
Alexander Stuart Donald, Fredericton, N.B.
Michael Dwyer, Moncton, N.B.
Alexander Gray, Saint John, N.B.
Richard Duncan Hiscocks, Toronto, Ont.
Frederick S. Jones, Montreal, Que.
Albert Lawrence Killaly, Peterborough, Ont.
Charles King Le Capelain, Ottawa, Ont.
Frederick Charles Mechin, Toronto, Ont.
Horace Owen Merriman, Ottawa, Ont.
John Bernard Phillips, Montreal, Que.
Alexander Watson, Montreal, Que.
Russell Yuill, Saint John, N.B.

MEDAL (CIVIL) OF THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (B.E.M.)

Arthur Magennis Hudson, Montreal, Que.
Norman Douglas Wilson, Toronto, Ont.

C. H. Boisvert, M.E.I.C., chief engineer of the Public Service Board of the Province of Quebec, is the newly elected chairman of the Quebec Branch of the Institute. Born at Montreal, he graduated from Ecole Polytechnique, Montreal, in 1925 with a B.A. Sc.

He followed the Shawinigan Water and Power Company student test course that year, going to the Quebec Public Service Commission in 1926 as an engineer. He became acting chief engineer of the Commission in 1931.

E. V. Gilbert, M.E.I.C., formerly assistant engineer in the Winnipeg office of the Department of Public Works of Canada, was appointed, last January, as senior assistant engineer. He is a graduate in civil engineering from McGill University, Montreal, and joined the Department in the Ottawa district office in 1938 after five years on engineering projects in the province of Quebec. He became assistant engineer at Winnipeg in 1939, going the next year to St. John's, Nfld., and later loaned to the British Admiralty Technical Mission as engineer of docks and dredging. In 1942 he was assigned to the works and buildings branch of the Canadian Naval Service and in 1943 was made district engineer for Newfoundland, where he remained until his appointment later in that year as chairman of the Board of Development at Ottawa. Mr. Gilbert returned to his duties in the Department at Winnipeg in January 1944.

W. H. M. Laughlin, M.E.I.C., who has been connected, since his graduation from the University of Toronto in 1927, with the Ontario division of Dominion Bridge Company Limited, latterly as chief engineer, has joined the Toronto consulting engineering firm of Proctor and Redfern. The firm will be known as Proctor, Redfern and Laughlin. Mr. Laughlin was chairman of the Toronto Branch of the Institute in 1943 and has represented that Branch on the Council since 1945.

Dr. J. J. Green, M.E.I.C., has been awarded a life honorary membership in the American Association of Airport Executives. His name appeared on the list of annual awards for 1945 made at the convention in May 1946 in recognition of outstanding contributions to the Association, its members and the civil airports they represent.

N. T. McKee, M.E.I.C., research engineer and vice-president of the Superheater Company, New York City, received the honorary degree of doctor of science in engineering at the commencement exercises of the University of Kentucky in June. He holds the B.M.E. and M.E. degrees from that university, and has served as vice-president of the Superheater Company, director of the Air Preheater Corp., director of the Superheater Co. Ltd. of Canada. From 1920 to 1922 he was director of Marine and Locomotive Superheater Ltd., in London, England.

Lyle G. Trorey, M.E.I.C., is chairman and chief engineer of the newly established firm, Aerographic Surveys Limited, Weybridge, Surrey, England. The firm will undertake aerial mapping commitments anywhere in the world, specializing in the preparation of topographic maps for engineering, forestry, geological and similar purposes, and supplying consulting services in these and related fields. Mr. Trorey is also senior partner of Trorey and Hunter, consulting civil and air survey engineers, Stratford, Ont., which firm is the Canadian agent for Aerographic.

F. O. Mills, M.E.I.C., mechanical engineer in the Department of Public Works district engineer's office at New Westminster, B.C., retired in April, 1946, after thirty-four years service with the Department. He went to New Westminster in 1925 as assistant engineer, after several years service in the Vancouver office.

E. E. Orlando, M.E.I.C., was appointed manager, central station sales, of the Canadian Westinghouse Company Limited in July. He will be located at the Hamilton headquarters building. A graduate of the Nova Scotia Technical College, he followed the Westinghouse student course and in 1928 commenced his duties in the engineering department. Appointed sales engineer in Montreal in 1934, he was promoted in 1944 to manager, apparatus division in that office, from which position he goes to his new assignment.

G. A. Vandervoort, M.E.I.C., who has been technical adviser with the British Columbia Power Commission, Victoria, B.C., since November, 1945, was recently appointed chief engineer for the Commission. He joined the Commission in 1945 after twenty-two years with the New Brunswick Electric Power Commission, finally as chief engineer.

A. Watson, M.E.I.C., formerly acting marine superintendent in the Department of Transport at Ottawa, has been appointed marine superintendent. He has been with the Department since 1931, and was previously connected with Canadian Vickers, Montreal, as chief engineer of the marine department.

S. B. Wass, M.E.I.C., has retired from the service of the Canadian National Railways and is residing at Uxbridge, Ont. He had been with Canadian National since 1918 where he served as division engineer at Moncton, N.B., and as terminal engineer for western lines at Fort William, Ont. As terminal engineer he was transferred to Montreal in 1927 and to Toronto in the same capacity in 1933. He was later divisional engineer at St. Thomas, Ont., and returned to the Toronto office in 1943.

W. L. Thompson, M.E.I.C., who recently returned to Canada after five years service overseas with the Canadian Army, has rejoined the Bailey Meter Company in the position of manager of the Toronto Office, which he held prior to enlistment. He saw service with the R.C.E.M.E. in England, France, and Belgium, in command of No. 1 Advance Base Workshop.

Group Captain C. A. Davidson, M.E.I.C., has received the appointment of director of construction engineering for the R.C.A.F., and will be stationed at Ottawa. He served with the Royal Canadian Engineers in World War I, and was commissioner of highways in Alberta for thirteen years. In the R.C.A.F. he had been stationed at Vancouver, Calgary and Winnipeg, and was latterly chief construction engineering officer for Maintenance Command at Uplands Air Station, Ontario.

H. B. Dickens, M.E.I.C., has resigned as supervising structural engineer for the Department of Public Works of Canada at Ottawa and opened a consulting office in that city, where he will specialize in modern reinforced concrete design. He was for a time reinforced concrete engineer for the City of Hamilton. He also had charge of the London office of the Dominion Structural Steel Company in 1929-30, and has been engaged in engineering in England, Wales, Turkey and Africa. He returned to Canada in 1940 as senior engineer for the United Kingdom Technical Mission and was advisor on design and construction for General Engineering Company at Toronto. He entered the Department in 1942.

Guy A. Lindsay, M.E.I.C., is employed as design engineer with the industrial electronics division of the Westinghouse Electric Company at Baltimore, Md. He was previously engineer in charge of the general engineering branch of the Department of Transport, located in Ottawa, Ont., and in 1940 was active on a committee appointed to represent Canada in the investigations for the early development of power resources in the international section of the St. Lawrence River.

A. O. Wolff, M.E.I.C., who has been district engineer for Canadian Pacific Railway at Saint John, N.B., since 1939, is now in the Toronto office of the company as assistant engineer, maintenance of way. He was chairman of the London Branch of the Institute in 1937 when stationed there as division engineer, and was councillor representing the Saint John Branch in 1942 and chairman of that Branch in 1943.

D. O. Turnbull, M.E.I.C., has been in private practice as a consulting engineer in Saint John, N.B., since January, 1945, specializing in the design and supervision of municipal and industrial engineering works. He had been with the R.C.A.F. since 1940 latterly as a squadron leader, stationed at Ottawa and Rothesay, N.B.

H. L. Shepherd, M.E.I.C., recently of the R.C.N.V.R., is now connected with the University of Toronto. He is assistant professor of general studies and assistant to the director of studies in the Faculty of Applied Science and Engineering at Ajax, Ont.

Paul Guénette, M.E.I.C., has entered the employ of the ammunition division of the Canadian Industries Limited at Brownsburg, Que., as an engineer in the methods department. He had been connected with the Dominion Rubber Company Limited in Montreal since 1944 as process development engineer, following service with the Regent Knitting Mills Co. Ltd., St. Jérôme, Que., as head of the planning department.

G. J. T. Gunn, M.E.I.C., is on the staff of R. A. Hanright, consulting engineer of Toronto, Ont., engaged at present as electrical engineer on the extension of the Bowater's Newfoundland Pulp and Paper Mills at Cornerbrook, Nfld. He was previously with the Robert A. Rankin Company at Montreal.

Jas. W. Houlden, M.E.I.C., has been transferred by Canadian Industries Limited to the Winnipeg office where he will handle western sales for the "Dominion" Ammunition of the company. He was formerly at the Montreal office as special assistant to the sales manager, having been transferred in 1945 from Brownsburg, Que., where he was ballistic engineer.

R. J. Mattson, M.E.I.C., has accepted the position of project officer with the Central Technical Power Board of the Department of Works, Mines and Power, of the Government of India at Simla. He was associated with the Canadian and General Finance Company at Toronto early this year, after five years service with the Aluminum Company of Canada Limited in Montreal.

J. B. Nelson, M.E.I.C., recently associated with E. Leonard & Sons Limited of London, Ont., is now with H. G. Acres, consulting engineers, Niagara Falls, Ont.

B. P. Rapley, M.E.I.C., is resident engineer for the Imperial Oil Company Limited in connection with the extension and modernization programme now being inaugurated at their Montreal East Refinery. He had been in Talara, Peru, since 1937, as chief engineer with the International Petroleum Company.

A. Raymond, M.E.I.C., is vice-president and general manager for the International Braid Company of Canada Limited at Ste. Rose de Laval, Que. He was previously with the Dominion Rubber Company as industrial engineer at the head office in Montreal. During the war, he was superintendent of Dominion Rubber small arms ammunition plant at Cap de la Madeleine, Que.

P. R. Sandwell, M.E.I.C., recently resigned his position as assistant chief engineer of the Ontario Paper Company Limited at Thorold, Ont., and has accepted an appointment as chief engineer with the Powell River Company Limited at Vancouver, B.C.

R. W. Wellwood, M.E.I.C., has accepted a position as wood technologist with the Department of Forestry of the University of British Columbia, Vancouver, B.C. He was previously employed in the same capacity by the Commonwealth Plywood Company Limited at Ste. Therese, Que.

T. W. Wilson, M.E.I.C., who received his discharge from the R.C.E. in March, is now employed by Canadian Bitumuls Co. Ltd., Leaside, Ont.

L. S. McGregor, M.E.I.C., has received the appointment of mechanical engineer, central region, with Canadian National Railways, and is located in Toronto. He had been appointed mechanical inspector in Montreal for Canadian National on his recent return from service overseas with the R.C.E.M.E.

H. F. Finnemore, M.E.I.C., was elected chairman of the Town of Mount Royal Protestant School Board at the first meeting of the board for the 1946-1947 school year.

R. C. Flitton, M.E.I.C., is retiring as chairman of the Town of Mount Royal Protestant School Board. He has been re-elected to the commission for a three-year term.

J. J. H. Miller, M.E.I.C., was named to the Town of Mount Royal Protestant School Board, at the first meeting of the current school year.

C. A. Boulton, M.E.I.C., is now in Regina, Sask., as district manager for the prairie provinces for Housing Enterprises of Canada Limited. He had recently been located in Halifax with the E. G. M. Cape Company Ltd.

E. E. Gregg, M.E.I.C., has recently ceased to practice as a consulting forester in Vancouver, B.C., and has joined the Western Plywood Company Limited of that city. His position is assistant general manager.

George Ford, M.E.I.C., has been admitted to the degree of Master of Science by the University of Alberta, where he has been sessional demonstrator in the department of civil engineering.

Maurice Laquerre, M.E.I.C., has associated himself with Lavoie and Delisle, consulting engineers at Chicoutimi, Que. He has been with the Aluminum Company at Arvida, Que., since 1942.

Donald Rhodes, M.E.I.C., who has been, since June 1946, district plant superintendent of the Bell Telephone Company's provincial district, has been transferred to a similar position in charge of the east district, Montreal.

G. C. Turner, M.E.I.C., is with the Curtiss-Wright Corporation at Columbus, Ohio, in the engineering department of the airplane division. He is working on stress analysis.

Elio D'Appolonia, M.E.I.C., was recently granted the degree of Master of Science by the University of Alberta, Edmonton. He is in the civil engineering department as an instructor.

R. N. McManus, M.E.I.C., was admitted to the degree of Master of Science by the University of Alberta, where he is a lecturer in civil engineering.

T. Hogg, M.E.I.C., has accepted an appointment with the B.C. Power Commission and is located at Victoria, B.C., having terminated his duties as administrator officer to the special commissioner for defence projects in northwest Canada.

H. R. M. Acheson, M.E.I.C., is now plant engineer with the Gaspesia Sulphite Company Limited at Chandler, Que. He was formerly supply engineer for the Canadian International Paper Company at Timiskaming, Que.

J. C. Dale, M.E.I.C., who served overseas with the R.C.A., has returned to his former position with Canadian Utilities Ltd. in Calgary, Alberta.

R. E. Daly, M.E.I.C., who served with the R.C.E.M.E., has returned to his former employment in Detroit, Mich.

Keith Dixon, M.E.I.C., who served in the artillery in both wars, attaining the rank of lieutenant colonel, has returned to his position with the Department of Transport at Prince Rupert, B.C.

A. B. Dove, M.E.I.C., has returned from overseas with the rank of lieutenant colonel in the R.C.E. and rejoined the Steel Co. of Canada Ltd., in Montreal.

E. J. Durnin, M.E.I.C., who served overseas with the R.C.E. for over four years, has returned to his former position with the Saskatchewan Power Commission at Regina.

J. B. Eldridge, M.E.I.C., who was overseas for four years with the R.C.E., has returned to the English Electric Co. of Canada Ltd., at St. Catharines, Ont.

R. A. Lombard, M.E.I.C., who was overseas for four years with the R.C.E., has accepted a position with the Boiler Inspection and Insurance Company of Canada in Montreal.

M. J. Lupton, M.E.I.C., who served overseas for several years with the R.C.E. on special technical work, is now with the Dominion Bridge Co. Ltd., at Winnipeg, Man.

L. D. McGee, M.E.I.C., who gained the rank of lieutenant colonel with the R.C.E.M.E. overseas, has accepted a position with the Industrial Development Bank, Montreal.

D. L. McGillivray, M.E.I.C., has retired from the R.C.N.V.R., and returned to his former position with Imperial Oil Ltd. at Sarnia, Ont.

H. R. McQueen, M.E.I.C., veteran of World Wars I and II, serving in the latter in the R.C.E.M.E., is now located and practicing in San Diego, California.

J. H. Mellor, M.E.I.C., who served overseas in the R.C.E.M.E., has returned to his former employers, Canadian Copper Refineries Ltd., Montreal, as chief engineer.

Guy McRae Minard, M.E.I.C., who served with the R.C.A.F. in Canada and overseas, is now assistant to the managing director, Spruce Falls Power and Paper Co. Ltd., Kapuskasing, Ont.

B. R. Spencer, M.E.I.C., who has been in the R.C.N. since 1924, is remaining in the post-war navy.

Harry Taylor, M.E.I.C., who served overseas in the R.C.E.M.E., has returned to his former position with the Canadian National Railways at Winnipeg, Man.

G. W. Thompson, M.E.I.C., who is a major in the R.C.E.M.E., is remaining in the post-war army.

F. L. Thompson, M.E.I.C., who was with the navy, has now returned to his former employers, Imperial Oil Ltd., and is stationed in Toronto.

K. H. Tremain, M.E.I.C., who rose to the rank of colonel in the R.C.A., is now manager of Mount Royal Importers Inc., in New York.

W. A. MacCallum, M.E.I.C., who was in the R.C.E.M.E., is now at the Fisheries Experimental Station at Halifax, N.S.

W. M. Berry, JR.E.I.C., Winnipeg, Man., a B.Sc. in civil engineering from the University of Manitoba in 1944, won the University Travelling Fellowship for $400.00.

T. A. J. Leach, JR.E.I.C. who served overseas in the R.C.E. as a survey officer is now at Saskatoon with the Department of Highways of Saskatchewan.

H. A. Leonard, JR.E.I.C., who served in the R.C.N. during the war, has decided to remain there and has been sent to England.

G. G. Leroux, JR.E.I.C., who served overseas in the R.C.A.F., is now with the Foundation Co. of Canada in Montreal.

G. Osberg, JR.E.I.C., has retired from the R.C.N.V.R. and accepted a position with the Bell Telephone Co. of Canada in Ottawa.

William Schofield, JR.E.I.C., has been released from the R.C.A.F. and returned to his former position with Alliance Paper Mills Ltd., at Merriton, Ont.

J. M. Scott, JR.E.I.C., who served overseas for over five years in the R.C.E., has accepted a position with the National Harbours Board at Montreal.

Reginald F. Shapcotte, JR.E.I.C., who served overseas with the R.C.E. on building construction, is now employed with the Department of Public Works, at Ottawa, Ont.

Richard Scott, JR.E.I.C., has temporarily relinquished his position as lecturer in electrical engineering at the University of Toronto and is at the Massachussets Institute of Technology, Cambridge, as instructor in electrical engineering while doing graduate work. He expects to remain about two years.

R. O. Lockwood, JR.E.I.C., has taken his discharge from the Canadian Army and has accepted a position as lubrication engineer with McColl-Frontenac Oil Company Limited at Calgary, Alta.

J. L. Simpson, JR.E.I.C., is manager of the new Manitoba branch of Insulating Industries Limited of Vancouver. He went to Winnipeg in May to build the company's plant there.

R. E. Davey, JR.E.I.C., is in the employ of Canada Oils Company Limited, Montreal He had recently been with the Rapid Transit Department of the Toronto Transportation Commission and from 1942 to 1945 he was engineer in charge of works and buildings for the Naval Service of the Department of National Defence, Shelburne, N.S.

J. N. McCarey, JR.E.I.C., has returned to the employ of Stephens-Adamson Manufacturing Co. of Canada Ltd., at Belleville, Ont., after being connected for some time with the Canadian International Paper Company at Hawkesbury, Ont.

J. E. Quist, JR.E.I.C., has severed connections with German and Milne, naval architects of Montreal, and has entered the service of Canadian Comstock Limited, Montreal, where he will be employed in electrical draughting. He was discharged from the R.C.N.V.R., in 1945 with the rank of lieutenant (elect).

P. W. Woodfield, JR.E.I.C., is now employed by A. V. Roe (Canada) Limited at Malton, Ont., as test engineer in the mechanical test section of the gas turbine division. He had been with Turbo Research Limited at Winnipeg since his discharge in 1945 from the R.C.A.F.

G. M. Webster, JR.E.I.C., is in Yellowknife, N.W.T., as resident engineer for the Doris Yellowknife Gold Mines Ltd. He is also doing consulting work in the area for the Tatham Company Limited. He was previously employed in the Nylon Division of Canadian Industries Limited in Kingston, Ont., as production supervisor and as assistant project engineer on the nylon plant expansion.

René Dansereau, JR.E.I.C., who served overseas with the R.C.A.F., is now re-established in Montreal.

G. P. Dewar, JR.E.I.C., who served overseas with the R.C.E. for four years, has accepted a position with Imperial Oil Co. Ltd., in Montreal.

J. R. Desmarais, JR.E.I.C., who was with the R.C.A.F. overseas, has accepted a position with the City of Montreal.

L. R. Douglas, JR.E.I.C., who was over four years overseas with the R.C.C.S., has returned to the Canadian General Electric Co. Ltd., Toronto, Ont.

L. F. Eull, JR.E.I.C., who served in the R.C.N., has returned to his former position with the P.F.R.A. at Regina.

C. B. Livingston, JR.E.I.C., who served overseas in the R.C.N.V.R., has accepted a position with the Canadian General Electric Co. Ltd., in Toronto, Ont.

J. G. M. Loomis, JR.E.I.C., was overseas with the R.C.A.F., has accepted employment with the Construction Equipment Co. in Montreal.

James G. MacLeod, JR.E.I.C., who served in the R.C.N.V.R., has accepted a position with the Canadian Refractories at Kilmar, P.Q.

D. P. MacVannel, JR.E.I.C., who served overseas in the Navy, is now with Otis Fensom Elevator Co. Ltd., at Hamilton, Ont.

G. F. McAulay, JR.E.I.C., who was with the R.C.A.F., has returned to his position with the City of Edmonton.

C. B. McMillan, Jr.E.I.C., who served in the R.C.A.F., has now returned to his former employment with the Canadian National Railways.

W. A. Marshall, Jr.E.I.C., who served in the R.C.E.M.E., has returned to the Dominion Structural Steel Co. Ltd., in Montreal.

D. R. Stanley, Jr.E.I.C., who served in the R.C.A.F., is now the Provincial Sanitary Engineer, Department of Health, Edmonton, Alberta.

J. P. Stanley, Jr.E.I.C., who was overseas with the R.C.A.F., has returned to his former position with Stevenson and Kellogg at Montreal.

W. R. Staples, Jr.E.I.C., who served in the R.C.N.V.R., is back on the staff of the University of Saskatchewan.

Charles G. Taylor, Jr.E.I.C., who served overseas in the R.C.E., is now with Beatty and Beatty in Pembroke, Ont.

R. H. Tivy, Jr.E.I.C., has been demobilized from the R.C.N.V.R. and has accepted a position with the Manitoba Power Commission in Winnipeg.

Graham R. Treggett, Jr.E.I.C., who was overseas with the R.C.A.F., has returned to his former position with the Coca Cola Co. of Canada Ltd in Montreal.

Leslie C. Turner, Jr.E.I.C., who served overseas with the R.C.N. Air Branch, has accepted a position with Molsons' Brewery in Montreal.

M. MacR. Uloth, Jr.E.I.C., who was in the Navy, has returned to his former post with the Canadian General Electric Co. Ltd., in Peterborough, Ont.

C. H. Vatcher, Jr.E.I.C., who served in the Navy, has now returned to his former employers, Canadian National Carbon Co. Ltd., in Vancouver, B.C.

D. L. Ryan, S.E.I.C., who served for a short period in the R.C.E., has taken a position with the Dominion Bridge Co., Lachine, Que.

Bernard K. Ryan, S.E.I.C., who served with the R.C.N.V.R., is now with the Canadian Tube and Steel Co. Ltd., in Montreal.

W. R. Sadler, S.E.I.C., who served overseas in the 1st Canadian Mechanical Equipt. Co. R.C.E., has accepted a position with the Alberta Transit-Mix Concrete Co. in Calgary.

Ralph Thomas Sansom, S.E.I.C., who was overseas for four years in the Sask. L.I. (M.G.), is now with Canadian National Railways at Moncton, N.B.

J. A. Savory, S.E.I.C., has been discharged from the navy and accepted a position with the Hydro Electric Power Commission of Ontario.

Léo Scharry, S.E.I.C., who served in the R.C.E.M.E., has recently graduated from Ecole Polytechnique of Montreal.

Stewart M. Schofield, S.E.I.C., who was overseas with 16th Fed. Co. R.C.E. is now with the B.C. Dept. of Public Works at Port Coquitlam, B.C.

W. B. Scott, S.E.I.C., who served in the R.C.E., is now with the Quebec North Shore Paper Co. Ltd., Baie Comeau, Que.

H. E. Seely, S.E.I.C., has been discharged from the army and is continuing his studies at the University of New Brunswick, Fredericton.

R. C. Sentance, S.E.I.C., who served overseas in the R.C.E.M.E., has accepted a position with B. Greening Wire Co. Ltd., Hamilton, Ont.

G. D. Zimmerman, S.E.I.C., will manage the newly established Montreal office of the Fischer and Porter Company of Hatboro, Penn. He is a graduate of the University of Toronto in chemical engineering, and was instrument engineer with the Canadian Synthetic Rubber Company Limited prior to his present appointment.

H. R. Wright, S.E.I.C., is employed as an electrical engineer by the Shawinigan Water and Power Company at Quebec.

Blake B. Denyes, S.E.I.C., is plant mechanical engineer for the Monarch Battery Mfg. Company Ltd., Kingston, Ont. He was formerly at Queen's University, Kingston, as demonstrator in the mechanical engineering department.

W. D. Martin, S.E.I.C., is with the Tomlinson Construction Company in Saskatoon, Sask. He had been with the Department of Mines and Resources at Banff, Alta., as assistant engineer.

L. Vergin, S.E.I.C., has completed the General Electric test course at Peterborough, Ont., and is employed as an electrical engineer by the Aluminum Company of Canada in Kingston, Ont.

J. M. Bennett, S.E.I.C., is in the employ of Canadian Blower and Forge Co. Ltd., at Kitchener, Ont.

K. L. Broe, S.E.I.C., is taking the Canadian General Electric Company's test course in Peterboro, Ont.

M. S. Greene, S.E.I.C., is employed by the Dominion Bridge Company Limited, Lachine, Que., as assistant to the sales development manager. For the past two years he was junior engineer with Engineering Service Company, Halifax, N.S.

L. E. Henne, S.E.I.C., is with the Northern Electric Company, telephone division, in Montreal as telephone equipment engineer.

R. A. Hemstock, S.E.I.C., is at Norman Wells, N.W.T., where he is employed as chief engineer for the Imperial Oil Company.

T. G. Higgins, S.E.I.C., has accepted a position with Canadair Limited in Montreal.

R. J. Kennedy, S.E.I.C., was discharged in March from the R.C.E., and has been lecturing in the civil engineering department of Queen's University, Kingston, Ont.

G. R. Lotts, S.E.I.C., has secured employment as plant engineer with the H. J. Heinz Company of Canada Ltd., at Leamington, Ont.

D. L. Mackinnon, S.E.I.C., has been appointed manager of the building department of the Foundation Company of Ontario Limited with hearquarters in Toronto, Ont. He was with the Foundation Company of Canada Limited prior to serving with the R.C.A.F.

A. N. Oldfield, S.E.I.C., is in Montreal in the employ of the Northern Electric Company, electronics division.

W. A. Potruff, S.E.I.C., joined the Hydro Electric Power Commission of Ontario on his discharge from the army in May. He is located at Toronto as a junior engineer.

H. L. Saunders, S.E.I.C., is in Guelph, Ont., where he is employed by the W. C. Wood Company, as production engineer.

T. E. Sullivan, S.E.I.C., is with the Bell Telephone Company in Montreal, being employed as engineering assistant in the plant department.

Jack H. Ward, S.E.I.C., has secured a position with the H. J. McFarland Construction Company of Picton, Ont. At present he is field superintendent over two paving undertakings in the vicinity.

Gordon T. Davis, S.E.I.C., who was in the R.C.N.V.R., is now employed with Canadian General Electric Co. Ltd. at Peterborough, Ont.

Jean Dessaules, S.E.I.C., who served overseas with the R.C.A.F., has returned to his former position with Shawinigan Water and Power Co. at Trois-Rivières, P.Q.

H. H. Dixon, S.E.I.C., who served in the R.C.A.F., is now employed in Santa Monica, California.

Ralph J. Doehler, S.E.I.C., who served overseas with the R.C.A.F., has accepted a position with the Montreal Welding Company.

A. T. Dougall, S.E.I.C., who served in the R.C.N., afloat for over four years, is now with the Standard Chemical Co. in Toronto, Ont.

Bernard H. Downman, S.E.I.C., who was in the R.C.N.V.R., is now with Fonboro Co. Ltd., in Montreal, Que.

J. M. Elliott, S.E.I.C., has returned from overseas service with the R.C.E.M.E., and is now with John Bertram and Sons Co. Ltd., Dundas, Ont.

W. R. Elsey, S.E.I.C., has retired from the R.C.E.M.E., and is now with Canadian General Electric Co. Ltd., in Winnipeg, Man.

Robert E. Evans, S.E.I.C., who served in the R.C.N., is now with Stadler Hurter Co. Ltd., Montreal, Que.

Douglas K. Macdougall, S.E.I.C., who served in the army, has now accepted employment with the New Brunswick Department of Public Works.

U. F. McCulloch, S.E.I.C., who was overseas with the R.C.A., has accepted a position with the Foundation Co. of Canada, Montreal, Que.

A. D. McKeller, S.E.I.C., has been discharged from the R.C.N.V.R., and has accepted a position with the Dominion Engineering Co. at Lachine, Que.

C. D. McKinney, S.E.I.C., who served in the navy, is now with the Shawinigan Water and Power Co., Montreal.

R. J. B. McNally, S.E.I.C., has been released from the R.C.E.M.E. to take up a position with the Canadian Synthetic Rubber Co., at Sarnia, Ont.

J. D. McPherson, S.E.I.C., who served overseas in the R.C.N.V.R., has joined the Foundation Co. of Canada in Montreal, Que.

R. B. McRae, S.E.I.C., who was with the R.C.E., has returned to his former position with Julius Kayser and Co. Ltd., Sherbrooke, P.Q.

Zavie Miller, S.E.I.C., has been demobilized from the R.C.E.M.E. and has accepted a position with the Northern Electric Co. Ltd. in Montreal.

K. R. Stehling, S.E.I.C., who served with the army overseas in the Canadian Repat. Depot, has returned to complete his studies at the University of Toronto, Ont.

M. I. Steiman, S.E.I.C., who served overseas in the R.C.E., has accepted a position with the Dominion Department of Public Works, Winnipeg, Man.

Martin, Swarek, S.E.I.C., who was with the R.C.C.S. overseas, is now with the City Hydro Commission, Winnipeg, Man.

Henry Todd, S.E.I.C., who served overseas with the R.C.E., has accepted employment with the Canadian Ohio Brass Co. at Niagara Falls, Ont.

W. R. Topham, S.E.I.C., who was in the R.C.A.F., has returned to his former position with Canadian Industries Ltd., in McMasterville, Que.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here:

Cecil Ewart, M.E.I.C., died on February 14th, 1946, at Victoria, B.C., at the age of seventy-four.

Born at Dinan, France, on January 27th, 1872, Mr. Ewart was educated at Victoria College, Jersey, Channel Islands, and came to Canada in 1896, where he was first engaged as chainman and later as instrumentman on the Kaslo and Slocan Railway.

From 1902 to 1904 he was resident engineer for the Great Northern Railway at Vancouver and from 1904 to 1909 in a similar capacity for the Grand Trunk Pacific in Alberta, during the period of construction through the Yellowhead Pass. In 1911 he was moved to Winnipeg where he became divisional engineer for Canadian National Railways.

Returning to British Columbia in 1914, he served as locating engineer during the following two years both with the Pacific Great Eastern Railway and with the Edmonton, Dunvegan and British Columbia Railway in northern Alberta.

He went overseas in 1916 with the 8th Battalion, Canadian Railway Troops, B.E.F., and served in France, winning the D.S.O. and returning to Canada in June 1919 with the rank of major.

Returning to the service of the Canadian National Railways, he was engaged successively as resident engineer at Fort William, Ont., as divisional engineer at Saskatoon, later (in 1928) being recalled to Winnipeg where he served for some years as industrial commissioner for the western region, C.N.R.

Throughout the last few years prior to his retirement in 1939, Mr. Ewart's health made it difficult for him to continue his duties and his many old friends in Winnipeg will recall with admiration his remarkable devotion to duty, his determination and cheerfulness in the face of ill health. At his retirement he moved to California, settling in 1941 in Victoria, B.C.

Mr. Ewart joined the Institute as an Associate Member in May 1907, becoming a Member in April 1911. In March 1938 he became a Life Member.

John E. Griffith, M.E.I.C., former deputy minister of railways for the British Columbia government, passed away at his home in Victoria on July 20th, 1946.

He came to Canada in 1881 from Port Dinorwick, Wales, where he was born in 1861 and articled in contracting engineering. In Winnipeg, Man., he was employed by the Canadian Pacific Railway as a draughtsman and as assistant to the chief engineer from 1881 to 1884. After spending a year in England he returned to the Canadian Pacific in 1886 as assistant engineer, becoming resident engineer on the Selkirk section the next year. Travelling to South America, he spent several years operating the Transandian Railway in Argentina.

He returned to Canada in 1909, entering the British Columbia Department of Public Works as assistant engineer, and was appointed in 1918 to the post of deputy minister of public works. The government of the province transferred him in 1925 to the position of chief engineer and deputy minister of railways.

Mr. Griffith became a Member of the Institute in 1912, and was elected to Life Membership in March 1945.

Walter James Armstrong, M.E.I.C., consulting engineer of Montreal and Toronto, died on July 10th, 1946, in Montreal after a brief illness.

Born at Fair Hill, Md., in 1885, he graduated as a mechanical engineer from Cornell University in 1909. He commenced his engineering career that year in New York City with Westinghouse, Church, Kerr and Company, becoming successively assistant engineer, assistant chief engineer in connection with hotels, stations and railroad shops, and finally engineer in charge of design and purchase of materials for heating, ventilation, plumbing and refrigeration for the Canadian Pacific Railway Station at Vancouver, B.C.

He entered the engineering department of Ross & Macdonald, Montreal architects, in 1913 as assistant chief engineer, later to be engineer in charge of the department. Here he was concerned with design and supervision of mechanical features for the construction of such projects as the Fort Garry Hotel in Winnipeg, Man., and The Macdonald, at Edmonton, Alta. He was in charge of preliminary plans, specifications and estimates for mechanical and electrical features for the Regina Hotel, the Halifax Ocean Terminals, the Toronto Union Station and the Mount Royal Hotel, Montreal, among the works of major interest. In 1931 he established a private consulting practice in Montreal with branch office in Toronto. He directed such projects as the Dominion Square building, and the Canadian Marconi Company plant in Montreal, the Royal York Hotel and the Bank of Montreal building in Toronto and Trinity College of the University of Toronto, the Bank of Nova Scotia at Saint John, N.B., and the T. Eaton Company stores in Montreal, Toronto, Calgary, Saskatoon and St. Catharines, Ont.

Mr. Armstrong joined the Institute as an Associate Member in 1916, becoming a Member in 1921.

Thurstan William Fairhurst, M.E.I.C., sales director of Ruston and Hornsby Limited, Lincoln, England, died suddenly on June 15th 1946, in Milwaukee, Wis. He had been making a tour of Canada and North America on behalf of his company.

He was born in 1889 at Chorlton-cum-Hardy, Cheshire, and, in 1904, started his apprenticeship in mechanical engineering at Manchester with Crossley Brothers, studying at the College of Technology, where he received a certificate in 1910. At the outbreak of World War I he joined the Royal Engineers in the ranks, was commissioned in the field, twice mentioned in dispatches and made responsible for the construction and operation of the desert pipe line from the Suez Canal to Palestine. He was demobilized in 1919 as a commander of two field companies. That year he joined the Vancouver Machinery Depot, Vancouver, B.C., as managing engineer of their sales department. He transferred in 1923 to the Marion Steam Shovel Company, Marion, Ohio, as managing engineer for the sales department, being engaged until 1927 in the establishment of the company's world sales organization and associated British manufacture of their products. He was then appointed overseas manager of the Nordberg Manufacturing Company, Milwaukee, Wis., and from 1933 to 1936 served as general sales manager for Crompton Parkinson Limited, Chelmsford, England.

He left the electrical industry in 1936 and returned to mechanical engineering, associated as sales director with Ruston and Hornsby Limited, Lincoln, England, and later became a director of the associated company, Davey Paxman and Company Limited, of Colchester, England.

Mr. Fairhurst became a Member of the Institute in 1940.

Alexander Thomson, M.E.I.C., Lethbridge civil engineer, passed away on July 15th 1946.

He was born in Edinburgh, Scotland, in 1891, educated at Leith Technical School, and spent four years apprenticeship in the city engineer's office at Perth, Scotland, becoming assistant engineer in 1912. He came to Canada in 1914, entering the Dominion Western Railway in Calgary, and transferring the same year to the Canadian Pacific Railway Department of Natural Resources, where he was a draughtsman in connection with irrigation and Dominion land survey work. With the Calgary South Western Railway in 1916 and 1917 he was draughtsman and transitman and transferred to the Canadian Pacific at Winnipeg in 1917 as a draughtsman. Later he joined the Dominion Parks Department as transitman on road location and construction and in 1919 and 1920 was draughtsman in connection with the topographical surveys for the Department of the Interior at Calgary, then given charge of plans for construction in the Lethbridge Northern Irrigation District and spending several years as hydrometric engineer for that department. For the past thirteen years he has been a member of the civic engineering staff at Lethbridge.

Joining the Institute as a Junior in 1922, he transferred to Associate Member in 1925 and became a Member in 1940.

ERRATUM

We sincerely regret the error whereby the name of the late **Joseph E. Hinchliffe,** M.E.I.C. appeared incorrectly spelled in this section of the July issue of The Journal,

News of the Branches

Activities of the Twenty-seven Branches of the Institute and abstracts of papers presented

NIAGARA PENINSULA BRANCH

P. A. Pasquet, jr. e.i.c. - *Secretary-Treasurer*
J. L. McDougall, m.e.i.c. - *Branch News Editor*

The Niagara Branch held its annual special dinner meeting on May 28th at the Queen Victoria Park Restaurant, Niagara Falls, Ont., with J. H. Ings presiding.

After refreshments and an enjoyable dinner, thanks due to the efforts of the personnel of the Niagara Parks Commission, the results of the incoming executive ballot were announced by P. E. Buss. W. D. Brownlee was elected chairman for the ensuing year.

Retiring chairman J. H. Ings voiced his appreciation. to the members of his executive for their assistance during his tenure of office. On behalf of the Branch members, Mr. Ings was presented with the gold membership pin of the Institute by W. R. Manock.

For this meeting the guest speaker was Colonel Herbert D. Vogel of the U.S. Army Corps of Engineers, who was introduced by C. G. Cline. The latter outlined briefly Colonel Vogel's career to date.

Colonel Vogel gave a very interesting talk, tracing the early history of the U.S. Corps of Engineers dating from George Washington, and mentioning such names as Colonel Richard Gridley, Colonel Rufus Putnam, Tronson du Coudray, Major du Portail, Captain L'Enfant, Roche-fontaine, Ville-franche.

A break in the history of the Corps occurred when in 1794 the designation was Corps of Artillerists and Engineers, whose duties dealt mainly with fortifications and assault. In 1802 the Corps of Engineers was established at the United States Military Academy. This latter corps, during the period of building in the United States, also undertook the building of roads, canals, lighthouses, and railroads. Among the notable works performed by the Corps were the Library of Congress, the Lincoln Memorial, Lee Bridge, the Washington Monument, and the Panama Canal. In December, 1941, all military construction work was placed in the hands of the Corps of Engineers.

Acommpanying Colonel Vogel were two of his associates, Colonel J. E. Deignan, and Major R. Kline, who were responsible to Colonel Vogel as base commander under General McArthur.

Both Colonel Deignan and Major Kline gave brief descriptions of their own first hand experiences through the fight in New Guinea and Philippine campaigns and of the landings on Iwo Jima; of the difficulties in building and maintaining communication lines; of roads and harbours constructed in spite of heavy rains and tropical heat, the latter causing much trouble in operation of mechanized equipment due to vapour locks in gasoline lines.

At the close of the talk a wide variety of questions was put to the speakers, whose information was most interesting.

H. W. LeBel thanked the speakers.

At the Niagara Falls meeting—left to right: C. G. Cline, W. R. Manock, P. A. Pasquet, Col. H. D. Vogel, W. D. Brownlee, J. H. Iings, Col. J. E. Deignan, P. E. Buss, Major R. Kline

QUEBEC BRANCH

Roger Desjardins, m.e.i.c. - *Secretary-Treasurer*

Le 29 avril, la section de Québec avait le plaisir d'entendre son vice-président, Monsieur C.-H. Boisvert, prononcer une conférence sur le sujet "Transport hier, aujourd'hui, demain". Voici un résumé du travail de Monsieur Boisvert.

Le seul moyen de transport au Canada, au début de la colonie, était la voie fluviale. Puis des agglomérations s'étant établies à l'intérieur, des routes furent construites pour les relier au St-Laurent et alimenter la voie fluviale.

Au début du 19ème siècle: développement de la route et transport de voyageurs par le chemin de la poste avec la diligence. Puis, ère du chemin de fer vers le milieu du siècle dernier et disparition de la diligence. La route sert de nouveau pour alimenter le chemin de fer, cette fois, plutôt que la voie fluviale. Puis vint le véhicule automobile, stimulant de la construction des routes durant les 35 dernières années.

Le premier autobus fut construit en 1829, en Angleterre, par Walter Hancock, et fonctionnait à la vapeur. Le développement de l'autobus prit naissance avec le perfectionnement du moteur à essence. G. Daimler fit breveter le moteur à essence en 1884 et vendit ses droits français et belges et son brevet en 1889 à Packard et Levasseur qui fabriquèrent leur premier moteur à essence en 1891.

En Amérique, le premier autobus régulier fit son apparition en 1907, sur la 5ème Avenue, à New-York. Jusqu'en 1920, il y eut très peu d'autobus.

Les automobiles enregistrés dans Québec, en 1910, étaient au nombre de 786; en 1920 — 41,562; en 1930 — 178,548; en 1940 — 225,152; en 1944 — 224,822. Ceci illustre le déplacement du chemin de fer par le véhicule automobile. Le développement des routes se fait à la même cadence. L'inauguration de la politique des bonnes routes se fit en 1912, dans Québec.

L'autobus est venu satisfaire cette partie de la population qui ne pouvait utiliser l'automobile privé. Il a favorisé le développement des banlieues des grandes villes.

Pauvres services d'autobus au début. Les services s'organisèrent vers 1920 et prirent essor avec la règlementation provinciale en 1926 par la Commission des Services Publics et des autres qui lui ont succédé. Actuellement, c'est la Régie Provinciale des Transports et Communications qui a juridiction complète sur les taux, horaires, services, permis, véhicules, assurances, etc. La consolidation des services et l'élimination de la concurrence ont apporté une amélioration considérable dans les services et a stabilisé l'industrie.

Les taux pour autobus dans la province de Québec varient de 2½ à 4 cents, par passager mille, et la moyenne est de 2.6 cents. Les taux sont réduits généralement de 40% environ, pour livrets de 10 ou 12 passages valides pour 7 à 10 jours.

L'autobus moderne est construit sur un châssis spécial, très fort, bas, avec moteur puissant et flexible et freins à air comprimé; ceci est très important car le véhicule pèse de 8,000 à 20,000 livres.

Le moteur à gazoline a un sérieux concurrent dans le moteur Diesel pour autobus et moteur électrique pour électrobus, qui est un tramway sans pneus.

L'autobus préféré pour service urbain est le 27 passagers et pour le service interurbain le 37 passagers. Pour l'autobus urbain, il n'y a pas de nécessité pour le grand confort, il doit être léger, court et facile de manœuvre à travers la circulation. Il doit avoir de l'espace pour les passagers debout. Pour l'autobus interurbain, le confort est primordial, chaque voyageur doit avoir son siège, il ne traverse pas de circulation intense et est beaucoup plus encombrant.

Dans la province de Québec, environ 25 millions de dollars sont investis dans les systèmes d'autobus, garage, termini et équipement. Les revenus annuels seraient d'environs 20 millions de dollars et le nombre de passagers de 140 millions environ, par année. En 1944, il y avait 1,469 autobus dans la province, en 1935, il n'y en avait que 505, donc une augmentation de 200% en regard de l'augmentation des autres véhicules qui n'a été que de 50%.

La capacité de l'autobus en 1925 était de 21 passagers; en 1927, 33 passagers; en 1935, 37 passagers. Le confort des autobus 1945-1946 est presqu'égal à celui des véhicules de promenade; certains coûtent près de $25,000.

A cause de la guerre et de la production restreinte, 400 autobus devraient être remplacés immédiatement dans la province de Québec, car ils sont devenus désuets et usés.

Les exploitants devront moderniser leurs véhicules et améliorer leurs services, s'ils désirent conserver une forte partie de la clientèle qu'ils se sont faite durant la guerre. Pour ce qui concerne les autobus de l'avenir, il est à prévoir qu'ils auront, pour les services interurbains, 8½ pieds de largeur généralement et 40 pieds de longueur, avec chambre de toilette dans les plus luxueux. Il est à prévoir que le système de propulsion sera, un jour, par turbo-générateur et l'énergie électrique produite sera transmise aux moteurs électriques sur les essieux. Vitesse prévue jusqu'à 100 milles à l'heure, sur routes modernes, avec pneus à l'épreuve des crevaisons. Freinage à l'électricité et conduite électrique ou hydraulique.

Les autobus seront climatisés et l'intérieur sera sous pression pour empêcher la poussière de pénétrer.

Les autobus de demain seront munis d'un haut-parleur pour le conducteur, d'un système radio-recepteur pour la distraction des voyageurs et de système de communication entre autobus et station de contrôle (à l'essai aux Etats-Unis).

❖ ❖ ❖

Le 29 mai 1946, la section de Québec avait l'insigne honneur de recevoir comme conférencier le Professeur G. Magnel, du département de Génie Civil de l'Université de Gand, Belgique. Le professeur Magnel traita du béton armé ordinaire et du béton pré-contraint.

Le professeur Magnel remercia tout d'abord la nation canadienne pour son magnifique effort de guerre et fit ressortir la grande contribution des Canadiens à la libération de la Belgique.

Le professeur Magnel expliqua, en premier lieu, la théorie du béton armé et exposa les désavantages de son utilisation dans sa forme actuelle. Le professeur illustra son exposé d'exemples concrets.

Par la suite, le professeur démontra les grands avantages de l'emploi du béton pré-contraint: économie dans le béton, élimination de l'armature, résistance supérieure, disparition des fissures, etc. L'armature dans les structures est remplacée par l'emploi de câbles d'acier auxquels on fait subir une élongation initiale en rapport avec les charges à supporter. Pour bien faire ressortir ses avancés, le professeur Magnel donna plusieurs exemples typiques où il démontra clairement les caractéristiques du béton pré-contraint quant à l'augmentation de la résistance avec des sections moins grandes que pour le béton armé ordinaire et l'élimination de l'armature. On y constate, en effet, une forte réduction de la section, une augmentation très substantielle de la résistance, et la disparition des efforts nuisibles causant les fissures.

Par des projections fixes, accompagnées d'explications appropriées, le professeur Magnel dévoila à l'assistance le résultat de ses nombreuses et fructueuses expériences sur le béton pré-contraint. De nombreux graphiques éclairèrent les auditeurs sur les caractéristiques de cette méthode nouvelle.

Le professeur Magnel fit dérouler par la suite un film bien au point illustrant le processus de différents essais dans ses laboratoires de l'Université de Gand, sur des poutres de béton ordinaire et de béton pré-contraint, en indiquant les charges maxima de rupture, de même que le travail de la poutre avec élimination graduelle de la charge. Ce film démontra de plus, clairement, les caractéristiques des poutres composées de blocs de béton de dimensions uniformes et pré-contraintes suivant le principe pour la poutre en béton monolithe.

Le professeur Magnel dévoila aussi que l'armée canadienne fut la première au monde à utiliser le béton pré-contraint. Un film nous démontra comment furent utilisées par l'armée canadienne deux poutres pré-contraintes composées de blocs de béton, pour construire une passerelle sur une partie du canal Terneuzen pour y faire passer les quatre lignes de la pipe-line qui apportait l'essence d'Ostende à Gand. Les travaux étaient exécutés par le corps de génie de l'armée canadienne au cours de ses opérations militaires, à Gand, en septembre 1944, sous la direction du Major Gaétan Côté, M.E.I.C., ingénieur civil de Sherbrooke et diplômé de l'école Polytechnique de Montréal, le professeur Magnel agissant comme consultant et aviseur.

Lors du passage des troupes canadiennes, l'éminent universitaire belge accueillit presque tous les jours des militaires canadiens à sa Faculté et à son laboratoire. Quelque 125 Canadiens ont fait des études à son laboratoire, travaillant comme les étudiants belges à fabriquer des poutres de béton pré-contraint. Le brigadier Georges Francoeur, M.E.I.C., ancien commandant de brigade dans le secteur de Gand, qui assistait à la conférence du professeur Magnel, a signalé l'amitié que celui-ci témoigna à nos militaires.

La Branche de Québec présente ses sincères remerciements au secrétariat-général de l'Institut qui lui a fourni l'avantage d'entendre cet éminent conférencier. La Branche souhaite un prochain retour du professeur Magnel.

BOOK REVIEW

ENGINEERING FOR DAMS

W. P. Creager, J. D. Justin and J. Hinds. New York, John Wiley & Sons; London, Chapman & Hall; 1945. 3 vols., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $15.00.

Reviewed by M. V. Sauer, M.E.I.C.*

This three-volume work by the well known authorities Creager, Justin & Hinds covers the design and construction of dams of all types to meet every condition of topography and of service. Each of the authors is a prominent practicing engineer of wide experience and they have embodied in this work a comprehensive study of the subject of dams in all its phases. Several well-known engineers have contributed chapters on special features of the subject.

Volume 1 covers investigation of dam sites, type of structure, foundation conditions, erosion below spillways, model studies, flood conditions and spillway capacities and design.

Volume 2 discusses the design of concrete dams of the gravity, arched and buttressed types.

Volume 3 covers the design of earth dams, including foundation conditions, soil tests and their utilization. There are other chapters in this volume on rock fill, steel and timber dams, as well as on head water control and various accessories.

A full exposition of the uses of the "flow net" and of the seepage line in the design of earth dams is given, and the value and location of core walls is analysed. Two instructive tables are included in the work, one showing the record floods and run off per square mile of many rivers throughout the United States, ranging from a drainage area of over 1,000,000 square miles, to small streams, and the other a tabulation of dam failures and their causes. There are bibliographies throughout the work.

Theoretical treatment of dam design is fully covered without losing sight of the practical side. The work is a valuable text for students as well as meeting the needs of engineers.

**Hydraulic Engineer & General Supt., Generating Stations, Electrical Dept., Quebec Hydro Electric Commission, Montreal.*

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Airport Planning:
Charles Froesch and Walther Prokosch. N.Y., Wiley; London, Chapman & Hall, c1946. 250 pp., illus., cloth.

Engineering Mechanics; 2d ed:
Seibert Fairman and Chester S. Cutshall. N.Y., Wiley; London, Chapman & Hall, c1946. 267 pp., illus., cloth.

Les Essais des Transformateurs Industriels Chez le Constructeur et Chez l'Exploitant; Suivi de La Marche En Parallèle des Transformateurs:
M. Lapine. Paris, Dunod, 1946. 139 pp., illus., paper.

Lincoln's Incentive System, 1st ed:
James F. Lincoln. N.Y., London, McGraw-Hill, 1946. 192 pp., illus., cloth.

Planning the Small Factory:

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

BRITISH STANDARD SPECIFICATION FOR FERROUS TRAPS FOR BATHS. B. S. 1291: 1946.

London, British Standards Institution, 1946, 2/-.

This specification is complementary to B. S. 1189—Cast Iron Baths for Domestic Purposes and provides cast iron traps for use with standard baths. The traps are of the "p" type and may be of ordinary or malleable cast iron. The non-ferrous fittings are identical to those covered by B. S. 1184. The external finish may be fine cast, galvanised or glass enamelled. There are two depths of seal, viz:—1½ in., and 3 in. Workmanship, dimensions, inspection and overflow openings are dealt with and illustrations show a cross section through the trap and overflow connection, together with details of the non-ferrous fittings taken from B. S. 1184.

HOW TO FIND A SHORT; and Other Automobile Wiring Troubles:

Jack Steele. N.Y., Norman W. Henley, 1946. 209 pp., illus., 7½ x 5¼ in., cloth, $2.00.

This book was written, not only for the technician, but for the car owner, and for this reason is both simple and direct. It includes wiring diagrams of practically all makes of late model cars with trouble-shooting chart, and contains answers to all light and wiring troubles common to the modern automobile. It shows how to trace down shorts; install heaters, fog lights, signal lights, etc; and explains, in simple language, windshield wipers, hydro-electric window raisers, power top controls, etc.

STORY OF THE HELICOPTER:

Devon Francis. N.Y., Coward-McCann; Toronto, Longmans, Green, c1946. 182 pp., illus., 8¼ x 5¾ in., cloth, $3.75.

In narrative and essay form this book tells in lay language of the helipcopter's possibilities, of hundreds of years of try-and-fail experiments in rotary wing flight, and of the engineering ingredients that finally made up-and-down flight feasible. The attitude of the author is that only a few persons out of the many have flown because flying has been too hard to learn and too expensive for what the layman could get out of it, and also because personal flying, as opposed to flying in commercial transport planes, has been too dangerous. If, ultimately, millions of persons are going to pilot flying machines, they must have a type of vehicle that does not require forward velocity for suspension by the air, and they must have a machine which is easily managed and safe. The author believes the helicopter is that machine.

WORLD OF NUMBERS:

Herbert McKay. Cambridge, University Pr.; N.Y. Toronto, Macmillan, 1946. 198 pp., illus., 7¾ x 5½ in., cloth, $2.75.

This book is written with the intention of illustrating how the average person, with a school-leaving knowledge of mathematics, may work things out and fit them into a reasoned mathematical picture of the conditions in which we live. Nearly all intelligent people take an interest in the universe, stars, moon, planets; their distances and movements, their constitution and conditions. It is obvious that our knowledge of things outside the earth and of the earth itself are almost entirely mathematical, or based on mathematics, hence this book illustrates the importance of this science.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

BASIC DESIGN OF SHIPS

By G. C. Manning. D. Van Nostrand Co., New York, 1945. 212 pp., diagrs., charts, tables, 9 x 5½ in., cloth, $3.75.

Emphasizing basic principles, the author presents his material under the following chapter headings: preliminary estimate of displacement; preliminary estimate of principal dimensions and coefficients; preliminary delineation of lines; preliminary general arrangement plans; weight and strength calculations; hull systems and fittings. The opening chapter covers the historical background and contains a statement of the scope of ship design.

DEVELOPMENT OF MATHEMATICS

By E. T. Bell. McGraw-Hill Book Co., New York and London, 1945. 637 pp., 9 x 5¾ in., cloth, $5.00.

Although this book covers the evolution of mathematics from about 4000 B.C. to the present day, it is not strictly a history. The author's intent is rather to indicate main trends over this period, presenting them only through typical major episodes in each. Chief principles, methods and theories are considered in both pure and applied mathematics. The author clearly shows by the judicious use of technicalities how seemingly unimportant phases have been developed into tremendously useful lines of endeavor. The book should prove an inspiration and a guide to the young mathematician in taking a larger view of his field.

DICTIONARY OF METALLOGRAPHY

By R. T. Rolfe. Chapman & Hall, Ltd., London, W.C.2, 1945. 243 pp., tables, 8¾ x 5½ in., cloth, 15s.

This dictionary covers definitions of the terms relating to the constitutions and structures of metals and alloys, and the relation of these to their physical properties. Particular attention has been given to atomic structure, constitution, micrography, macrography, processes to which metals and alloys are subjected in manufacture, heat treatments, and tests of finished products. Considering the amount and the nature of the information given, the book virtually constitutes a condensed encyclopedic treatment of the field of physical metallurgy.

DESIGN of REINFORCED CONCRETE STRUCTURES; 2d ed.

D. Peabody. John Wiley & Sons, New York; Chapman & Hall, London, 1946. 532 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $5.50.

Although this book is concerned, primarily, with the design of buildings, these fundamentals of structural design in reinforced concrete are applicable as well to other classes of structures. The several phases of structural theory are accompanied by illustrative problems which collectively form the essentials for the design of a complete building. This new edition includes "plastic theory", prestressed concrete, rigid frame design, and special conditions of beams and continuous frames. Matters of construction details and manipulation have not been considered within the scope of the book.

ELEMENTARY MECHANICS OF FLUIDS

By H. Rouse, John Wiley & Sons, New York; Chapman & Hall, London, 1946. 376 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $4.00.

The author considers the mechanics of fluids to be as fundamental a treatment of fluid behavior as the mechanics of solids is of the behavior of rigid and elastic bodies, and develops flow principles from the basic equations of mechanics in a logical, systematic order. He describes the practical application of these principles to problems encountered in various phases of engineering endeavor, with many illustrative examples. The numerous problems are designed to further the student's own power of analysis.

GLYCERIN, Its Industrial and Commercial Applications

By G. Leffingwell and M. Lesser, with foreword by W. J. Murphy. Chemical Publishing Co., Brooklyn, N.Y., 1945. 259 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $5.00.

This book is a comprehensive survey of the large number of industrial products which contain glycerin in smaller or larger percentages. Each chapter covers the use of glycerin in a particular branch of industry and contains a discussion of the properties of glycerin which render it useful for that industry. Numerous formulae for various preparations and an extensive bibliography are included.

HEATING, VENTILATING, AIR CONDITIONING GUIDE, 1946, Technical Data Section, Manufacturers' Catalog Data Section, Roll of Membership and Complete Indexes. Vol. 24.

American Society of Heating and Ventilating Engineers, 51 Madison Ave., New York. 1279 pp., plus 94 pp., illus., diagrs., charts, tables, 9¼ x 6 in., fabrikoid, $6.00.

This standard manual constitutes both a textbook and handbook on the design and specification of heating, ventilating and air conditioning systems. The technical section has been thoroughly revised, and much new material has been added, including a chapter on fluid flow. It provides all the data ordinarily needed by engineers and architects, cross-indexed for quick reference. The catalog section contains information on the products of over two hundred manufacturers, with a classified index.

MACHINE-TOOL WORK, Fundamental Principles

By W. P. Turner and H. F. Owen, 2 ed. McGraw-Hill Book Co., New York and London, 1945. 364 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $3.00.

The purpose of this text is to offer a systematic course of instruction in the fundamental principles of machine-tool work, not to produce first-class mechanics, but to provide a background for further study of industrial processes and practices. Although the fundamentals common to all are stressed, the various types of machine tools are dealt with separately. New chapters on shop safety and broaching have been added in this new edition, and the material on measurement, previously scattered through the book, has been collected in a single chapter.

MÉTROLOGIE GÉNÉRALE (Grandeurs et Unités).

M. Denis-Papin and J. Vallot. Dunod, Paris, 1946. 428 pp., plates L-XLVI, tables, diagrs., charts, 6 x 4 in., fabrikoid, 240 frs.

This comprehensive manual covers the field of measurement from a broad point of view. Early chapters are devoted to a discussion of measurement in general, the international system of weights and measures, and the symbols and equations of fundamental systems of measurement. Methods of measurement and units are described for the fields of geometry, geography, mechanics, angular measure, stresses, electricity and magnetism, heat and radiant energy, optics and time as well as for simple everyday use. Special industries, ancient and foreign units are covered. A detailed subject index provides a key to the wealth of information. A second volume will deal with measuring instruments and their use.

OFFICE LIBRARY of an INDUSTRIAL RELATIONS EXECUTIVE, 1946.

Prepared by H. Baker. 5th ed. (Bibliographical Series No. 77) Princeton University, Industrial Relations Section, Princeton, New Jersey, March, 1946. 36 pp., 9 x 6 in., paper, $0.50.

A considerable list of recommended books and pamphlets for the industrial relations executive is presented under the following general headings: general works; specific personnel problems and programs; trade unions and collective bargaining; labor legislation and administration; social insurance. A section of additional sources of information lists periodicals, research organizations, commercial and government informational services.
Eng. Journal—7180—Gal. 4—Gus

OUR OIL RESOURCES:

Edited by L. M. Fanning. McGraw-Hill Book Co., New York and London, 1945. 331 pp., illus., charts, tables, maps, 8½ x 5¼ in., cloth, $4.00.

Eighteen authorities within the field have contributed chapters to this symposium. It constitutes an exhaustive study of our oil resources in terms of geographical knowledge as well as of human resources—engineering and scientific learning, and private initiative and incentive. Topics covered include technological development in exploration, production and refining, the estimation of oil and gas reserves, conservation, oil from coal and shale, and the subject of American oil companies in foreign oil operations.

PETROLEUM PRODUCTION, Vol. 1, Mechanics of Production; Oil, Condensate, Natural Gas;

By P. J. Jones. Reinhold Publishing Corp., New York, 1946. 228 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.50.

Within the field of petroleum production this book limits itself to the consideration of a system of mechanics of producing oil and condensate prior to the breakthrough of displacing fluids into producing wells. Available information on the volumetric and phase behavior of fluids in reservoirs is presented in terms of barrels of oil and condensate and standard cubic feet of gas. Production is considered from uniform pay intervals corrected for the effect of permeability and volume ratios and interconnection.

PLANNING the SMALL FACTORY.

A. H. Huckle. (The) Mitre Press, London, 1946. 133 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, 15s.

This practical work presents a detailed description of the various elements which must be considered in a small concern of an engineering nature. Tables, charts, diagrams and working drawings are freely used to consolidate or illustrate the important subject matters. Management and costs are considered as well as design and production methods. A factory producing small machine and equipment parts with a personnel of 500 is the example under consideration in the book.

PRINCIPLES of PHYSICS, Vol. 2. Electricity and Magnetism. (Sears Physics Series).

F. W. Sears. Addison-Wesley Press, Cambridge 42, Mass., 1946. 434 pp., plus tables and Index, illus., diagrs., charts, tables, 9 x 6 in., cloth, $5.00.

A textbook of college grade, this volume deals with the elements of electricity and magnetism on the basis of a thorough preliminary

(Continued on page 504)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

August 15th, 1946.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the October meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BEST—GORDON LIVINGSTONE, of 588 Driveway, Ottawa, Ont. Born at Deal, Eng., Aug. 19th, 1909. Educ.: Diploma, R.M.C., 1931; 1937-38, Engr. Officer, R.A.F., 1938-40, Staff Officer, Directorate Repair and Mtce., Air Ministry, London, Eng., 1940-42, Chief Tech. Officer, Service Flying Training School, 1942-43, Sr. Aero. Engr. Officer, H.Q. No. 4, Training Command, Calgary, Alta., 1944, Deputy Chief Engr. Officer, H.Q., Allied Exp. Air Force, Eng., 1945 to date, Chief Engr. Officer (Aero. Engr.), H.Q. No. 45 (Transport) Group, R.A.F., Dorval, Que.

References: L. F. Grant, O. T. Macklen, C. A. Cook, R. G. Johnstone, A. Ferrier, E. W. Stedman.

BISHOP—JOSEPH WILLIAM, of Ottawa, Ont. Born at Grand Forks, B.C., Aug. 17, 1907. Educ.: B.A.Sc., B.C., 1929; R.P.E., Ontario; 1929-30, test dept., Canadian General Electric; with Allis-Chalmers Co., Ltd., as follows: 1930, hydraulic dept., 1930-34, sales engr.; 1934-39, mgr., air-conditioning divn., Canadian General Electric, Toronto; 1942 to date, R.C.E.M.E., with the rank of Colonel, Director of Mech. Engineering, Dept. of National Defence, Ottawa.

References: L. A. Wright, L. Trudel, N. C. Sherman, G. W. Beecroft, H. G. Thompson.

BLACK—SHAUN DUFF, of St. Catharines, Ont. Born at Fredericton, N.B., May 18th, 1921. Educ.: B.Sc. (Aero. Engrg.), Tri-State Coll., Indiana, 1941; 1936-37-38 (summers), opperated paving machine and other constrn. equipt., Canada Construction Co.; engrg. and dfting., Cub Aircraft Corp., Hamilton, Ont., "Theory of Flight and Navigation" Instructor and then Asst. to Chief Ground Instructor; 1942-43, Stanley Flying & Training School, R.C.A.F., Commonwealth Training School, Stanley, N.S.; 1943-45 (18 mos.), R.C.A.F. Aircrew, went through training, then graduated as Navigator; 1945 (3 mos.), engrg. and dfting., Noury Aircraft Ltd., Hamilton, Ont.; with English Electric Co. of Canada, Ltd., St. Catharines, Ont., as follows: 1945-46 (18 mos.), student engr., machine shop and elect. mtce., and at present, sales engr., application engrg., apparatus sales dept.

References: A. J. Bennet, G. Grant, C. B. Croasdale, G. Morrison, W. J. Lawson, J. B. Eldridge.

COVEY—DOUGLAS ELLIOT, of Three Rivers, Que. Born at Saskatoon, Sask., July 11, 1916. Educ.: B.Sc. (Chem. Engrg), .Sask., 1937; 1937-41, asst. mech. engr. on modernization of complete paper mill, then mech. engr., Wayagamack Divn., Consolidated Paper Corp Ltd.; 1942-45, R.C.E.M.E.; 1946 to date, asst. mech. engr. i/c dfting. office at paper mill, Wayagamack Divn., Consolidated Paper Corp Ltd., Three Rivers, Que.

DRUMMOND—GEORGE D., 576 Lansdowne Ave., Westmount. Born at Montreal, Jan. 29, 1886. Educ.: B.Sc. (Mining), McGill, 1907; 1907-12, mgr., blast furnaces, foundry, quarries, Midland Terminal R.R. & Docks, erection No. 2 blast furnace, Midland, instln. accessory equipt., asst. to genl. mgr., plants, Canada Iron Corp., Montreal; with Zenith Coal & Steel Products Ltd., (now Drummond & Co., Ltd.), as follows: 1913, founded company, 1914-17, director and eventually pres. and genl. mgr., Zenith Machine Co., Ltd., shell mfrs., 1914-15, handled for Drummond McCall Co., Ltd., sales of all Algoma Steel for war purposes, and sales Wm. Tod & Co., Youngstown, Ohio, of shell forgings, etc., to Canadian and Russian govts. respectively; 1939-40, prepared recommendation covering increase national iron and steel prod. to Canadian Govt., 1940-41, steel consultant to Dept. Munitions & Supply, 1941-42, general assignments, same Dept.; during period, 1940-41, collaborated with Dr. C. A. Robb as power consultant, Dept. Munitions & Supply; and at present, president, Drummond & Co., Ltd., Montreal.

FOR TRANSFER FROM STUDENT

SADLER—ROBERT F., 1245 St. Mark St., Montreal, Que. Born at Chatham, N.B., Aug. 13, 1915. Educ.: B.Sc. (Civil), N.B., 1936; 1936-39, instru'man., Dept. of Highways, N.B.; 1939-40, Sec. Troop and finally Battery Cmdr., 1 Cdn. Regt., R.C.A., 1 Cdn. Army; 1946 to date, asst. engr., Canadian National Railways, mtce. of way, St. Lawrence Divn. engrs., Montreal, Que. (St. 1935.)

References: E. O. Turner, G. Grant, W. J. Lawson, J. J. O'Sullivan, W. D. Kirk, A. F. Baird, D. Ross.

LIBRARY NOTES *(Continued from page 502)*

background of mathematics and general physics. Separate chapters are devoted to ferromagnetism, chemical and thermal RMF's, and the basic principles of electronics. Vol. I of the same series covers mechanics, heat and sound, while Vol. III deals with optics.

PULSED LINEAR NETWORKS:

By E. Frank, McGraw-Hill Book Co., New York and London, 1945. 267 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $3.00.

An introduction to electrical transients which puts particular emphasis upon the analysis and operation of linear networks across which rectangular voltage pulses are impressed. Mathematical analysis is confined entirely to differential equations, and the results are correlated closely with the physical phenomena they describe. Fundamentals of curcuit operation are stressed and explained in detail.

RADAR, What Radar is and How it Works

By O. E. Dunlap, Jr. Harper & Brothers, New York and London, 1946. 208 pp., illus., diagrs., 8¼ x 5¼ in., cloth, $2.50.

Written for the layman, this book traces the history of radar from the early reflected wave experiments of Hertz and Marconi, and presents a simple explanation of its basic features. The range and likely worth of various peacetime applications are considered, and a glossary and bibliography are appended.

RADIO AMATEUR'S HANDBOOK.

American Radio Relay League, West Hartford 7, Conn. 23rd ed., 1946. 468 pp., plus Catalog Section, 208 pp., illus., diagrs., charts, tables, 9½ x 6½ in., paper, $1.00 in U.S.A.; $1.50 abroad.

The first ten chapters of this comprehensive work constitute a textbook on principles, theory and design considerations. The second group of nine chapters presents examples of practical equipment with essential structural data and instructions for adjustment and use. This section has been considerably revised, particularly the chapters on very-high-frequency equipment. The final section contains the invaluable classified vacuum tube tables and other data, and a brief treatment of radio operating.

RAILROAD AVENUE, Great Stories and Legends of American Railroading:

By F. H. Hubbard. McGraw-Hill Book Co., Whittlesey House Division, New York and London, 1945. 374 pp., illus., maps, 9 x 6 in., cloth, $3.75.

The author of this new book on railroading and railroaders has collected his material with an eye for the entertaining. Among the stories and legends are authoritative versions of old favorites, as well as a variety of lesser-known and obscure items from the full history of the period. Songs and poems from and about railroad life are reproduced, and there is a vocabulary of "railroad lingo". The book is well illustrated by contemporary portraits, drawings and photographs.

RELAY ENGINEERING

By C. A. Packard. Struthers-Dunn, Philadelphia, Pa., 1945. 640 pp., illus., diagrs., charts, tables, 7 x 4½ in., fabrikoid, $3.00.

Following an introductory and historical opening chapter are some fifty pages devoted to definitions of terms and illustrations with code designations of some 100 magnetic structures manufactured by the Company issuing the manual. Succeeding chapters deal with description of relays and auxiliary equipment, applications and circuits, the selection of relays for specific tasks, installation and service work, and standards. A bibliography and an appendix of technical data are provided.

REPAIR-SHOP DIAGRAMS AND CONNECTING TABLES FOR LAP-WOUND INDUCTION MOTORS

By D. H. Braymer and A. C. Roe. 2 ed. McGraw-Hill Book Co., New York and London, 1946. 387 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, $5.00.

This practical, step-by-step guide for repair man and armature winders covers the laying out of coils for induction motor windings, and the connecting of the end of the groups of these coils in proper sequence of phase and pole groups. The information is also useful for reconnecting to satisfy changes in voltage or changes for operation with different phases, frequencies, or speeds. Each diagram is a practical shop drawing marked for the actual use of the winder when making the connections indicated.

SHEET PILING, COFFERDAMS and CAISSONS.

D. H. Lee. Concrete Publications Ltd., London, 1945. 191 pp., illus. diagrs., charts, tables, 9¾ x 6½ in., cloth, 10s.

The first two chapters of this book on deep foundation work cover sheet piling and the earth pressures involved. The design and construction of cofferdams are given in Part III, with the next three Parts devoted to the theory and practical application of cylinders and both open and pneumatic caissons. A brief note on box caissons as breakwaters is included. Construction details are effectively diagrammed, and examples have been selected to emphasize reasons for choosing certain types or methods.

SOCIETY FOR EXPERIMENTAL STRESS ANALYSIS:

Proceedings, Vol. 3, No. 1, edited by C. Lipson and W. H. Murray; published and distributed by Addison-Wesley Press, Kendall Square, Cambridge, Mass., 1945. 154 pp., illus., diagrs., charts, tables, 11¼ x 8½ in., cloth, $5.00.

Twelve articles are included in the current volume, dealing with strain gages, residual stresses, stress models, analysis of shafting and of rivet shear tests, stress analysis with brittle coatings, and stresses in aircraft components. The contents pages of the previous volumes are included at the back. The illustrations in all the volumes are a particularly good feature of the publication.

SURFACE ACTIVE AGENTS, Theoretical Aspects and Applications

By C. B. F. Young and K. W. Coons. Chemical Publishing Co., Brooklyn, N.Y., 1945. 381 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $6.00.

Part I deals with the theoretical aspects of surface tension, methods for the determination of surface tension, and the structure of wetting agents, inclusing a comprehensive 35-page list of wetting and other surface active agents. Part II presents useful information concerning the origin and effect of surface tension phenomena and their use in the following practical fields: emulsions, plating, cosmetics, leather, flotation, inks, textiles, cutting oils, foods, adhesives, lubrication, soldering, brazing and welding.

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET, MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

JUNIOR CHEMICAL ENGINEERS OR CHEMISTS, preferably bilingual, for various paper plants in Quebec. Salary from $200 according to experience. Apply to File No. 3555-V.

CHEMICAL ENGINEER required by an industrial organization with headquarters in Montreal as assistant to chief chemist and control supervisor in a pulp and paper plant. Initiative to deal with unexpected problems essential. Salary from $250 according to experience. Apply to File No. 3555-V.

CHEMICAL ENGINEER OR CHEMIST, from recent graduate up, is required by an industrial concern in Montreal for chemical control of products. Salary open. Bilingual preferred. Apply to File No. 3564-V.

CHEMICAL ENGINEER, recent graduate up, required by a petroleum refining company in Montreal for process and design work. Salary about $200. Apply to File No. 3575-V.

CHEMICAL ENGINEER, recent graduate, required for sales work by a company in the Montreal area. Salary according to qualifications. Apply to File No. 3587-V.

CHEMICAL ENGINEERS, age 22-35, recent graduates up, are required by a Montreal firm for development work, maintenance, design and construction in explosives field. Sales and technical service representation to paper and textile industries. Salaries according to qualifications. Apply to File No. 3588-V.

CIVIL

CIVIL ENGINEER to be superintendent of construction with a contractor in Montreal. Salary according to qualifications. Apply to File No. 3558-V.

CIVIL ENGINEER, recent graduate up, to be assistant to town engineer of a town in the Montreal area. Permanent position. Salary from $175 up. Apply to File No. 3569-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER with considerable building experience, as construction superintendent with a firm of building contractors in Central Ontario. Salary open. Apply to File No. 3582-V.

CIVIL ENGINEER required as town manager, preferably experienced, for a company town in Quebec. Must be bilingual. Accommodation is available. Salary about $350. Apply to File No. 3583-V.

CIVIL ENGINEER, senior designer, experienced in reinforced concrete and structural steel and general building construction, required to take charge of structural design staff for a firm of consulting engineers in Montreal. Salary $300-$400. Apply to File No. 3585-V.

CIVIL ENGINEER with 3 or more years' experience on design of industrial buildings, equipment, supports and foundation work, is required by a Montreal firm for structural design work in steel, timber and reinforced concrete. Salary $200 up. Apply to File No. 3588-V.

ELECTRICAL

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment. Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER required as superintendent for the power plant, distribution lines, etc., in Ontario town, age over 35. Salary open. Apply to File No. 3556-V.

ELECTRICAL ENGINEER with power plant experience, must be bilingual, to take complete charge of power plants and distribution system for a N.B. town. Salary according to experience. Apply to File No. 3561-V.

ELECTRICAL ENGINEER for a junior position in the design department of an industrial concern in the Montreal area. Salary open. Apply to File No. 3574-V.

MECHANICAL

MECHANICAL ENGINEER with at least five years' industrial experience, knowledge of plant layout, equipment design and cost estimating and preferably experience in chemical industry. Salary $275-$325. Apply to File No. 3553-V.

MECHANICAL ENGINEER with considerable experience in heating and ventilation, etc., required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3565-V.

MECHANICAL ENGINEERS with experience in heating and ventilating or the pulp and paper industry or with general mechanical layout and design work are required by a firm of consulting engineers in Montreal. Salary from $250-$350 according to experience. Apply to File No. 3568-V.

MECHANICAL ENGINEER, recent graduate, for junior position in the design department of a firm in Central Ontario making special heavy duty mobile equipment. Apply to File No. 3572-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEER with some electrical experience for the design department of an industrial concern in the Montreal area. Salary open. Apply to File No. 3574-V.

MECHANICAL ENGINEER with paper mill or mining experience required as assistant mechanical superintendent and understudy to mechanical superintendent in a paper mill in the St. Maurice Valley. Salary from $300 according to experience. Apply to File No. 3581-V.

MECHANICAL ENGINEERING DRAUGHTSMAN, fully experienced in kraft and sulphite mills processes and modern design, required by a pulp and paper firm on the West Coast. Salary open. Apply to File No. 3586-V.

METALLURGICAL

METALLURGIST, age 25-30, veteran, experience in Metallurgical Laboratory or Mine Assay office and Mining Mill practice decided advantage, required by a Montreal firm to be trained for Sales Representative. Salary depending on experience. Apply to File No. 3588-V.

MISCELLANEOUS

INDUSTRIAL ENGINEER, under 40, with not less than 5 years' experience in industrial methods engineering, required by a paper company in British Columbia. Salary open. Apply to File No. 3550-V.

CIVIL OR MECHANICAL ENGINEERS, preferably with pulp and paper experience, required for engineering and operating staff of a large Ontario corporation. Salary according to qualifications. Apply to File No. 3554-V.

CHEMICAL OR MECHANICAL ENGINEERS, age about 30, with at least five years' experience in the paper industry, required by an Ontario Company to train for executive positions. Salary open. Apply to File No. 3554-V.

STRUCTURAL ENGINEER with general building experience, aged 30 to 40 years, for estimating and design in office of general contractor, Vancouver. Permanent position for right man. Apply to File No. 3559-V.

CIVIL AND MECHANICAL ENGINEER, capable of detail work on compressor stations, piping layouts, surveying, etc., wanted by a gas producing and distributing utility in Southwestern Ontario. Preference to Service personnel. Good future for right man. Apply to File No. 3562-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

CIVIL OR MECHANICAL ENGINEER with construction experience required by an Ontario firm manufacturing and installing building specialties for industrial plants. Salary open. Apply to File No. 3567-V.

SALES ENGINEER with experience to organize the sales and service or marine engines in the Prov. of Quebec. Must be bilingual. Headquarters Montreal. Salary $250 to start. Apply to File No. 3576-V.

CIVIL AND MECHANICAL ENGINEERS AND DRAUGHTSMEN, preferably experienced in building design and plant layout, required for a pulp and paper mill in Southern Ontario. Salary open. Apply to File No. 3578-V.

ELECTRICAL OR MECHANICAL ENGINEERS, recent graduates, required for design work in the hydraulic side by a manufacturer in the Montreal area. Apply to File No. 3579-V.

MECHANICAL OR CIVIL ENGINEER, recent graduate, required by a power engineering Compnay. in the Montreal area. Salary according to qualifications. Apply to File No. 3587-V.

MECHANICAL AND ELECTRICAL DRAUGHTSMEN required by a Montreal firm. Must have working knowledge of equipment layout, architectural, piping and design. Salary from $200 up. Apply to File No. 3588-V.

MECHANICAL AND ELECTRICAL ENGINEERS, from recent graduates up, are required for mechanical and electrical maintenance, also design phases of project engineering work, by a Montreal firm. Salaries according to qualifications. Apply to File No. 3588-V.

GRADUATE ENGINEERS required as Development Engineer and Assistant to Sales Manager by a Montreal firm. Industrial, also sales and administrative experience necessary. Salary $200 up according to experience. Apply to File No. 3588-V.

INDUSTRIAL ENGINEER, 5 years' experience industrial manufacturing or process work, required by a Montreal firm for study and co-ordination of plant work. Salary $295 up according to qualifications. Apply to File No. 3588-V.

CHIEF DRAUGHTSMAN, under 35, 5-12 years' experience in drawing office, including year or more as squad boss, required by a Montreal firm. Salary $225 up. Apply to File No. 3588-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER with some pulp and paper experience required for the technical department of a paper mill in Lake St. John area. Apply to File No. 3470-V.

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada for mill control and pilot plant. Salary open. Apply to File No. 3549-V.

CIVIL

TWO CIVIL ENGINEERS are required to act as senior and junior structural designer respectively with a steel company in southern Ontario. Salary open. Apply to Box No. 3389-V.

TWO CIVIL ENGINEERS, one experienced man to be in charge, the other to act as assistant, mostly for office work, are required for a building programme in Ontario, in connection with roads, trails, lookout towers, telephone line, buildings, etc. Preference to veterans. Salary up to $3,000 per year for senior and $2,000 per year for junior position. Apply to Box No. 3394-V.

CIVIL ENGINEER recent graduate, must be bilingual, required for work on general design, survey and construction of transmission lines in the Montreal area. Apply to File No. 3446-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER with executive experience for position of Town Manager in progressive New Brunswick town. Good salary to right man. Apply in writing giving full details qualifications and experience. Apply to File No. 3481-V.

CIVIL ENGINEER DRAUGHTSMAN, age 25-35, for consulting engineer's office near Toronto. Applicant should have some knowledge of municipal sewerage and waterworks problems. Apply to File No. 3489-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area, with experience in building construction, probably permanent position, salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEER with considerable experience is required by a Montreal firm for work in construction of radio stations. Salary from $225. Apply File No. 3506-V.

CIVIL ENGINEER, recent graduate, required by a firm of consulting engineers in Montreal, to assist Engineer in charge of field work in Ont. Salary $175 up. Apply File No. 3518-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS with experience as structural designers and draughtsmen are required by an engineering firm in Montreal. Salary from $300—$400 according to experience. Apply File No. 3520-V.

CIVIL ENGINEER to take charge of project engineering required by a firm of industrial engineers in Quebec. Should be bilingual and have experience in heavy construction. Salary according to capacity. Apply File No. 3531-V

CIVIL ENGINEER with road construction experience required as assistant to county engineer in Central Ontario. Salary $4000 plus travelling expenses. Apply File No. 3533-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters, English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to Box No. 3415-V.

ELECTRICAL ENGINEERS, age 30 to 40. 5 to 10 years experience, for estimating design and general engineering for large public utility in Toronto area. Apply to File No. 3429-V.

ELECTRICAL DRAUGHTSMEN with experience in substation design, not necessary graduate engineers, required by a public utility in the Montreal area. Salary $200 to $225. Apply to File No. 3446-V.

ELECTRICAL ENGINEERS, preferably experienced for sales and service of motors, transformers, control equipment, etc., with an industrial firm in Montreal. Salary according to qualifications and ability. Apply File No. 3512-V.

ELECTRICAL DRAUGHTSMAN with considerable experience in industrial light, heat and power layouts is required by a consulting engineer in Montreal. Salary from $200 according to experience. Apply File No. 3528-V.

MECHANICAL

MECHANICAL ENGINEER, graduate with 4 or 5 years' experience in heating and ventilating layouts is wanted by a consulting engineer in Montreal. Apply File No. 3243-V.

MECHANICAL DRAUGHTSMAN is required in Montreal by a firm engaged in the manufacture of conveyors, crushers, elevators, etc. Applicants should be 25-40. Salary according to experience. Apply File No. 3276-V.

GRADUATE MECHANICAL OR AERONAUTICAL ENGINEER with at least five years experience in aircraft, preferably in mfg., must have a fair knowledge of mechanical a/c installation and be familiar with heat and ventilating installations, controls, de-icing, hydraulics and landing gear. Apply to File No. 3300-V.

MECHANICAL ENGINEERS, preferably ex-service men, graduates, with some knowledge of steam, piping layouts, design are required by a firm in the Niagara peninsula. Salary open. Apply to Box No. 3380-V.

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to Box No. 3393-V.

JUNIOR MECHANICAL ENGINEER with some experience on mechanical design. Preference to ex-service men. Salary from $200 to $250. Location Quebec City. Apply to File No. 3401-V.

MECHANICAL ENGINEER DRAUGHTSMAN with two or three years experience, is required for work with a paper company in the province of Quebec. Salary $250 to $275 a month. Apply to Box No. 3424-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER, age 35 to 45, preferably married, with good background of shop training and experience in the manufacture of farm machinery. Salary from $350 according to qualifications. Apply to File No. 3463-V.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with considerable experience in plumbing, heating, ventilating, age 30-45, required for a permanent job as a designer with a Montreal architectural firm. Salary from $300. Apply to File No. 3473-V.

MECHANICAL ENGINEER, recent graduate, for technical service and plant operation with a manufacturer in the Montreal area. Successful candidates will have two-year training course in U.S. Apply to File No. 3476-V.

MECHANICAL ENGINEER, recent graduate, for mechanical draughting work in paper mill in the Lake St. John area. Salary open. Apply to File No. 3478-V.

MECHANICAL ENGINEERS from recent graduates up required by a structural steel company in the Montreal area. Salary according to qualifications. Apply to File No. 3485-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the reconversion of a paper mill in Western Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MECHANICAL ENGINEER with considerable industrial experience is required for the staff of a firm of consulting engineers in Montreal. Salary about $250. Apply File No. 3525-V.

MECHANICAL ENGINEER, to assume charge of factory maintenance staff and help design new machines and develop new ideas in conjunction with research and methods departments, wanted by electrochemical and engineering firm in the Niagara Peninsula. Salary from $250. Apply File No. 3538-V.

MECHANICAL DRAUGHTSMAN with over five years experience in piping layout and similar work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

MECHANICAL ENGINEER with at least five years industrial experience, knowledge of plant layout, equipment design and cost estimating and preferably experience in chemical industry. Salary $275-$325. Apply File No. 3553-V.

MECHANICAL ENGINEER, recent graduate, for the engineering staff of a pulp manufacturer in Eastern Quebec. Apply to File No. 3547-V.

MECHANICAL ENGINEERS with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MISCELLANEOUS

STEAM PLANT SUPERINTENDENT with extensive experience is required to superintend the steam plant of a pulp and paper mill in Western Ontario. Salary would be $300 to $350. Apply to File No. 3227-V.

ENGINEER SALESMAN, fluently bilingual, not necessarily a graduate but with some good experience on truck mechanical work and some sales background, age 35-40, is required by an automobile manufacturer for work in the Montreal area. Preference will be given to ex-service men and R.C.E.M.E. and workshop experience would be useful. Salary $250 to $350. Apply to File No. 3266-V.

ENGINEERING ACCOUNTANT, young graduate age 25-35, with engineering background and taste for accounting, is required to act as assistant to the secretary treasurer of a manufacturing concern in Montreal. Apply to File No. 3272-V.

SALES ENGINEER of proven ability is required by a Canadian manufacturer of high grade power apparatus specialties in demand by power companies, public utilities and manufacturers. Age 30 to 35 years. Apply in writing and state in detail education, experience, age, required salary and enclose photograph to Box No. 3303-V.

TWO INDUSTRIAL ENGINEERS, preferably with engineering background in mechanical, electrical or chemical engineering, age 35 up, bilingual, with some practical experience, is required by a company in Montreal engaged in industrial engineering, consulting work, plant layout, controls, inventories, production and admin. controls. Apply to File No. 3307-V.

INSTRUMENTS ENGINEER with five years experience in aircraft construction and installation design, of which at least 2 years should have been specialized as above, is required to act as design group leader for a company in the Montreal area. Apply to File No. 3316-V.

TECHNICAL SALES ENGINEERS are required by an oil company in the Montreal area. Candidates must be bilingual and experience may range from recent graduate up. Salary will be $150-$250 depending on qualifications. Apply to File No. 3320-V.

TWO DRAUGHTSMEN with a minimum of three years draughting experience, are required by a company in Montreal. One must have mechanical experience to specialize in refrigeration design, the other structural or architectural experience to specialize in design layout of food service equipment. Apply to Box No. 3328-V.

CHIEF DRAUGHTSMAN, experienced in all types of structural work, required to take charge of a draughting office for a central Ontario city. Apply to Box No. 3428-V giving all particulars including salary expected.

CHIEF DRAUGHTSMAN to take charge ofengineering department, draughting room and estimating for machinery manufacture in Sherbrooke. Apply to File No. 3430-V.

QUALIFIED DRAUGHTSMAN, thoroughly capable in design and layout of industrial piping, steam, water, air etc. Salary open. Apply to File No. 3435-V.

ENGINEERING DRAUGHTSMAN required by an industrial concern in Three Rivers for all round employment in a permanent position. Apply to File No. No. 3443-V

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

GENERAL PLANT SUPERINTENDENT, or manager in complete charge, to organize and operate a shipbuilding plant in the Maritimes, with knowledge of both hulls and engines, mainly for repairs and revisions. Salary from $5,000. Apply to File No. 3454-V.

ELECTRICAL OR MECHANICAL ENGINEERS interested in transportation, with experience in the transportation field or machine shop practice or automotive services, maintenance and operation. Salary according to qualifications. Apply to File No. 3456-V.

FORESTRY ENGINEER graduate, 25 to 35 years, required by a large paper company in the Prov. of Quebec. Good opportunity for advancement. Salary open. Apply to File No. 3462-V.

MECHANICAL OR ELECTRICAL ENGINEER under 35, with at least 5 years practical experience, is required for a responsible position in the engineering department of an industrial firm in Toronto. Apply to File No. 3472-V.

STRUCTURAL STEEL DESIGNERS AND DETAILERS required by a construction company in Montreal. Salary open. Apply to File No. 3482-V.

CIVIL OR MECHANICAL ENGINEER with experience in construction required by a Montreal firm to estimate value of work done and to inspect during construction concrete and steel bldgs. Salary open. Apply to File No. 3486-V.

INDUSTRIAL MINERALOGIST, with Ph. D. or M.Sc. in geology, mineralogy, chemistry or metallurgy and knowledge of commercial processing of industrial metals, laboratory investigations and publishing of results. Must have at least five years experience with special reference to industrial minerals. Starting salary from $275 in prov. mines dept. Apply to File No. 3492-V.

GEOLOGISTS, with Ph. D. in economic or mining geology and intimate knowledge of structural geology, diamond drilling and geophysical methods. Must have at least five years practical experience, ability to publish results of original investigations and use of aerial photographs. Starting salary from $275. in Prov. Mines Dept. Apply to File No. 3492-V.

MECHANICAL OR CIVIL ENGINEERS required as assistant engineer in Meat Packing firm with plants throughout Canada. Duties to consist of general industrial maintenance work, including building construction, steam, refrigeration and electrical installations. Positions available in Western Canada at salary of $195 to $240 depending on experience. Apply to File No. 3495-V.

MECHANICAL OR ELECTRICAL ENGINEER with at least three years experience in paper mill or steam plant operation, bilingual if possible, is required by an industrial firm near Montreal. Salary from $200 according to experience. Apply to File No. 3498-V.

CHEMICAL OR MECHANICAL ENGINEER with construction experience in the chemical field, a knowledge of hydrocarbons and at least five years experience since graduation is required by a chemical firm in Western Ontario. Salary from $250. Apply to File No. 3502-V.

RESIDENT ENGINEER with considerable construction experience and bilingual is required by a public utility for employment on the upper Ottawa River. Salary from $350. Apply to File No. 3505-V.

PLANT ENGINEER with pulp and paper experience for development, construction and maintenance work with a paper mill in the Lake St. John area. Salary open. House available. Apply to File No. 3507-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS with experience in mechanical and chemical process layouts are required by an engineering firm in Montreal. Salary from $300-400 according to experience. Apply to File No. 3520-V.

COMBUSTION ENGINEER for sales and service with a coal distributing firm with headquarters in Montreal. Salary open. Apply to File No. 3522-V.

MECHANICAL OR MINING ENGINEER, age 30-40 with experience in industrial engineering, required by a large mining and processing firm for methods studies of equipment, labour and costs. Salary according to qualificatons. Apply to File No. 3524-V.

INDUSTRIAL ENGINEER, bilingual, with considerable experience, is required by a firm of industrial engineers in Quebec. Salary according to capacity. Apply to File No. 3531-V.

SENIOR DRAUGHTSMAN is required immediately by a Calgary and Turner Valley Oil Company. Work will be mainly geological draughting. Single man preferred. Salary dependent upon qualifications. Apply to File No. 3536-V.

CHEMIST OR RESEARCH ENGINEER, to take charge of Control Development and Research staff. Must have supervisory ability and be able to show results. Wanted by electrochemical and engineering firm in the Niagara Peninsula. Salary from $200. Apply to File No. 3538-V.

DESIGN ENGINEER with several years experience in hydro-electric work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

JUNIOR ENGINEER OR DRAUGHTSMAN, preferably with experience in the design of heating and ventilating layouts, required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3545-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

DIRECTOR

OF ENGINEERING

WANTED

BY LARGE U.S. COMPANY

Experienced executive of proved ability, aged 35 to 50, to take full responsibility for supervision of Engineering Department in a large American company operating in Canada as well as the U.S.

The man required will assume responsibility for design and development of plant additions, installation and repair of mechanical equipment, power contracts, equipment specifications, and technical advice to management. Excellent salary and other financial advantages.

We are interested in a thoroughly qualified man seeking a permanent and satisfactory position which offers unusual opportunity for advancement. He should be prepared to reside in the U.S.

Write for early personal interview, giving full details concerning experience, references, salary requirements, and enclose photograph. Replies will be treated in strict confidence. No contacts will be made with your present employer. Apply to File No. 3563-V.

THE PUBLIC SERVICE OF CANADA REQUIRES FOR THE
POST OFFICE DEPARTMENT

Two MECHANICAL ENGINEERS $4,200-$4,800 and $3,000-$3,600

One to design postal processes and layouts for new and proposed Post Office buildings and extensions to existing buildings at Ottawa, and the other to be responsible for the construction and maintenance of mechanical equipment in the Toronto Post Office.

Full particulars on posters in Post Offices, National Employment Service Offices or Offices of the Civil Service Commission throughout Canada. Application forms, obtainable thereat, should be filed immediately with the

CIVIL SERVICE COMMISSION OF CANADA
OTTAWA

WANTED

Twelve Graduate Engineers

Chemical or Mechanical

age 30, at least five years' experience in Paper Industry, to qualify as production engineers and junior executives, salary attractive, commensurate with experience and qualifications. Write for appointment stating experience and salary expected, to File No. 3554-V.

Situations Wanted

CIVIL & MINING ENGINEER M.E.I.C., R.P.E., age 45, married, seeks permanent position with large industrial concern as Maintenance and Construction or Townsite Engineer. Experienced on heavy construction, dams, shafts and tunnels, wharves, buildings, sewers, services, townsite development, general maintenance and administration. Apply to File No. 901-W.

PLANT ENGINEER, M.E.I.C., seeks position with industrial concern, preferably textile. Wide experience in charge of plant layout, all branches, design, selection and purchase of equipment, construction and maintenance. Apply to File No. 1662-W.

MANUFACTURING EXECUTIVE, mechanical engineering graduate with twenty years experience in manufacturing, engineering, production control, purchasing, storekeeping, incentive systems, budgets, cost and general accounting is now available. Apply to File No. 1871-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C. Practical experience includes eight years in tool engineering, production engineering and works planning and nine years in plant layout, general machine design and development work of patented mechanical projects. Successful record in responsible and executive positions. Good organizer. Desires either suitable position, or development work based on own patents, with large mechanical manufacutring concern or well-established firm of consulting engineers. Apply to File No. 2502-W.

MECHANICAL ENGINEER, Jr. E.I.C., age 23, single, with degree from N.S. Tech. '44, 18 months' experience as engineer officer afloat in the Royal Canadian Navy. Experience included the administration and control of the entire propelling and other machinery, and the discipline of 30 men in that department. Would prefer work of a responsible nature in a small firm doing manufacturing or installations. Have just been released from the Navy and am available for immediate employment in Canada or elsewhere depending on living conditions. Apply to Box No. 2587-W.

MECHANICAL ENGINEER, M.E.I.C. graduated N.S.T.C. 1940 age 30 years, married. Three years' experience in aircraft inspection, two years in R.C.A.F. as pilot. One year draughting, six months of which in pulp and paper. Desirous of getting more experience in pulp and paper industry. Apply to File No. 2617-W.

LECTRICAL ENGINEER, S.E.I.C., age 27, married, class of 1946, formerly a "Flight Engineer" in R.C.A.F., has approximately one and a half years' experience in mine and smelter electrical work. Position desired more along Mechanical line than Electrical. Will go anywhere, anytime. Apply to File No. 2631-W.

GRADUATE CHEMICAL ENGINEER, McGill 1946, available immediately. Plant or sales work, single, healthy and ambitious, will travel anywhere. Apply to File No. 2661-W.

GRADUATE MECHANICAL ENGINEER, (Sask. '45) age 24, married, Jr. member of The Society of Naval Architects and Marine Engineers. Experience with moulded plywood, one year general mechanical engineering in processing plant. Good knowledge of yacht design. Require position with a firm connected with the boating industry, plywood, engines, hardware, plastics, etc. Prefer Vancouver location, available August 1st. Apply to File No. 2662-W.

ENGINEER now employed seeks better position; thoroughly bilingual; had many years experience teaching chemistry, mineralogy and geology and demonstrating in connected laboratories. Acted as mining engineer in mineralogy laboratory, writing reports on samples examined and conducting prospectors' classes; also had municipal engineering experience. Age 49; seeks position as executive, town manager, construction superintendent, sales engineer. Veteran of both wars. Apply to File No. 2663-W.

CHEMICAL ENGINEER, S.E.I.C., B.A., B.A.Sc. '44, M. Eng. (McGill), age 26, single, two years experience, desires employment in Research or production control. Prefer Quebec and particularly Montreal area. Highest references from former employers. Apply to File No. 2671-W.

ENGINEER, Prof. Eng. (Civil), M.E.I.C., thoroughly experienced in structural and mechanical design, estimating and sales work, will undertake worthwhile agency or representation for manufacturer in B.C. Apply to File No. 2687-W.

CHEMICAL ENGINEER, single, age 23, B.E., McGill '46, S.E.I.C. No significant industrial experience. Interested in a position in sales engineering, production or plant control. Services available immediately. Apply to File No. 2688-W.

GRADUATE MECHANICAL ENGINEER, (McGill '45) age 22, single, seeks employment with a Canadian, American or British firm operating in South America. Growing knowledge of Spanish. Experience in construction and aircraft industries, as well as in Royal Canadian Electrical and Mechanical Engineers. Available on one month's notice. Apply to File No. 2690-W.

AIRLINE ENGINEER with degree in Mechanical Engineering (McGill). Eight years' experience with major Canadian and foreign airlines. Has been concerned with practically all technical phases of a major airline operation, including engineering, maintenance, operations, statistics, operating costs, flight testing and training of flight personnel. Administrative experience, 500 hours' experience as flight crew on Trans-Atlantic operation. Age 33. Married, one dependent. Interested in responsible position with major airline or organization concerned with air transportation in general. Apply to File No. 2691-W.

ELECTRICAL—MECHANICAL ENGINEER, Jr.E.I.C., age 30, graduate of Naval Electrical Engineering Officers course at Nova Scotia Technical College, 1945. Graduate of Naval Electrical Artificer's course at University of Alberta, followed by 6 months of instructional work on same. One year at sea as Chief Electrical Artificer on frigate, in charge of all electrical equipment. Completed apprenticeship as machinist in railway repair shops. Interested in design work testing, research and calculations. Available on two weeks notice. Apply to File No. 2693-W.

ELECTRICAL ENGINEER, B.Sc., M.E.I.C., age 33, single, with experience in sales, purchasing, office management and production control. Very good connections with industrial plants in Ontario and Quebec. Available after July 20th. Location preference: Toronto, Montreal and Hamilton. Apply to File No. 2694-W.

SENIOR CIVIL ENGINEER, M.E.I.C., P.E.Q., with considerable experience in all building construction and specialization in reinforced concrete; seeks first class opening. Able to supervise work and qualified to take full charge of and execute contracts. Apply to File No. 2695-W.

ELECTRICAL ENGINEER, Queen's 1946, S.E.I.C., R.P.E., Ont., S.I. Radio E, veteran of R.C.N.V.R., age 24, completely bilingual, available immediately, will go anywhere. Apply to File No. 2696-W.

MECHANICAL ENGINEER, Toronto '42, Jr. E.I.C., P. Eng., age 30. Four years' experience in tool repair, machine design, estimating, instructor in tool inspection, supervisor of production inspection, charge of engineering department handling design, draughting, purchasing and testing for modern manufacturing plant. Desires position as production engineer with firm of consulting engineers or as assistant production manager in progressive industry. Prefer Hamilton or Toronto. Apply to File No. 2711-W.

MECHANICAL ENGINEER, S.E.I.C., B.Sc., Queen's 1945, age 24, married, veteran, one year experience in design of heavy machinery and draughting, course in Time and Motion Study at McGill. Interested in Industrial, Production or Maintenance Engineering. Prefer Montreal area or Ontario. Available on one-month notice. Apply to File No. 2715-W.

CHEMICAL ENGINEER, S.E.I.C., B.Eng., McGill '46. Age 24, single, bilingual. Practical experience during summers. Desires employment in pulp and paper industry. Available Sept. 1st. Will travel anywhere. Apply to File No. 2717-W.

LIBRARY NOTES

(*Continued from page 504*)

TECHNOLOGY OF PLASTICS AND RESINS:

By J. P. Mason and J. F. Manning. D. Van Nostrand Co., New York, 1945. 493 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.50.

The first section of this comprehensive work discusses the resinous and plastic states, the types and mechanisms of polymerization, and the relationship between various physical properties and the structure of plastics and resins. In the second section, the methods of preparation and the properties and uses of the more important resins and plastics are discussed, including two natural products, rubber and cellulose. The third section describes fabrication techniques: compounding and mold designs, molding, casting, laminating and coating procedures.

WAVEFORM ANALYSIS, a Guide to the Interpretation of Periodic Waves, including Vibration Records:

By R. C. Manley. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 275 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $4.00.

Although this book is in the nature of a guide rather than a comprehensive treatise, it includes sufficient basic theory and methods of analysis for the student to acquire a groundwork of knowledge concerning the properties of complex waveforms. The envelope method of analysis is presented in detail, with subsequent discussion of other methods. Certain useful mathematical and technical data are given in appendices, and a brief glossary is included.

VAPOR ADSORPTION; Industrial Applications and Competing Processes:

By E. Ledoux, with foreword by D. F. Othmer. Chemical Publishing Co., Brooklyn, N.Y., 1945. 360 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $8.50.

This story of adsorption, the concentration or retention of molecules on surfaces, is divided into four parts. In part I the theories and calculations of static adsorption are discussed. Part II examines the thermal changes which occur when a vapor is added to air, particularly to the saturation point. Part III covers dynamic adsorption, with a current of air, for example, acting as a carrier for the vapor. The industrial applications of adsorption described in Part IV deal mainly with various aspects of air conditioning and drying processes, and with solvent recovery.

TELEVISION SIMPLIFIED:

By M. S. Kiver. D. Van Nostrand Co., New York, 1946. 375 pp., illus., diagrs., charts, 8¼ in. x 5½ in., cloth, $4.75.

A complete, practical description of modern television is presented in step-by-step fashion without involved theory or mathematics. The author proceeds from the analysis of circuits and the operating fundamentals of frequency modulation to the repairing of television sets and the explanation of an actual trouble-shooting system. The book is intended for radio workers, owners and service men and all who are interested in television and its opportunities.

PROPOSED RAPID TRANSIT SYSTEM FOR TORONTO

W. E. P. DUNCAN, M.E.I.C.
Chief Engineer, Toronto Transportation Commission

In January 1942, the Toronto Transportation Commission submitted to the mayor and Board of Control a proposal for the construction of a rapid transit system in Toronto as a partial solution to Toronto's growing traffic problem.

Development of Toronto

The latest authentic figures for the population of metropolitan Toronto show a population in 1943 of 925,000. The City of Toronto itself contains about three-quarters of this metropolitan population and occupies an area of 35 sq. mi.

It is not, however, the population of a city that governs the need for rapid transit service, but the location and character of its streets, and the concentration and congestion of its traffic and business activities. Present day traffic congestion has developed from the pouring into narrow streets, designed for horse-drawn traffic, the ever growing volume of passenger and commercial motor vehicles.

Except for the widening and extension of University Avenue, there has been no major improvement in the central downtown district for three decades. The increase in volume of traffic during this same period has been spectacular, and downtown traffic movements have increased almost five times. Traffic congestion on the arteries in and near the downtown district have reached such proportions as to throttle circulation in the rush-hour period.

The present rush-hour speed on Yonge Street, which is the principal north and south artery, averages about six miles per hour in the downtown section. The continuous traffic congestion on this street precludes satisfactory speeds or orderly movement for either street cars or motor cars, and each type of vehicle impedes the movement of the other.

The difficulty of handling traffic in Toronto may be illustrated by the fact that north of St. Clair Avenue there is a community of over 80,000 people who are served by only one continuous north and south street.

The Toronto Transportation Commission's proposal drew attention to the ever increasing difficulty of maintaining regularity of service and reasonable speed for transit vehicles operating through narrow streets congested with automotive traffic. It advocated separation of street car and automobile traffic on two major routes by the construction of:

(a) One north and south subway in the vicinity of Yonge Street, extending from Front St. to St. Clair Avenue.

(b) One east and west subway in the vicinity of Queen Street, extending from Trinity Park in the west to just east of Broadview Avenue in the east.

Concurrently with the investigation of the Toronto Transportation Commission on rapid transit, the Toronto City Planning Board was investigating the overall traffic problem of the metropolitan area. It concurred in the desirability of the construction of the proposed subway system.

The City Planning Board visualized, in addition to the rapid transit subways, a system of depressed limited expressways for motor traffic, and the provision of a centre mall or dividing strip between dual pavements in which to locate local transit tracks. The plan of the initial system of rapid transit subways provided for further extension of service from the subways to and along these expressways (see Fig. 1).

In 1943 the Commission created a Rapid Transit Department and retained Mr. Norman D. Wilson and DeLeuw, Cather and Company as consulting engineers, to make detailed investigations and to develop final plans for the construction of a rapid transit subway system.

The actual planning and designing is being carried out by the Commission's own staff of engineers.

The original proposals had been predicated on the operation of surface type street cars through subways which would, however, be designed to accommodate larger rapid transit cars as a later development.

Estimates of probable traffic in the Yonge Street and Queen Street subways were made, based on anticipated post-war conditions, prospective increases in population in the areas served, changes in traffic demands due to transfers from parallel routes, and traffic induced by the more rapid and more convenient service afforded by off-street operation. These estimates indicated a total one-way movement during the maximum periods of about 15,000 passengers per hour on the Yonge Street subway and from 8.000 to 9,000 passengers per hour on the Queen Street subway.

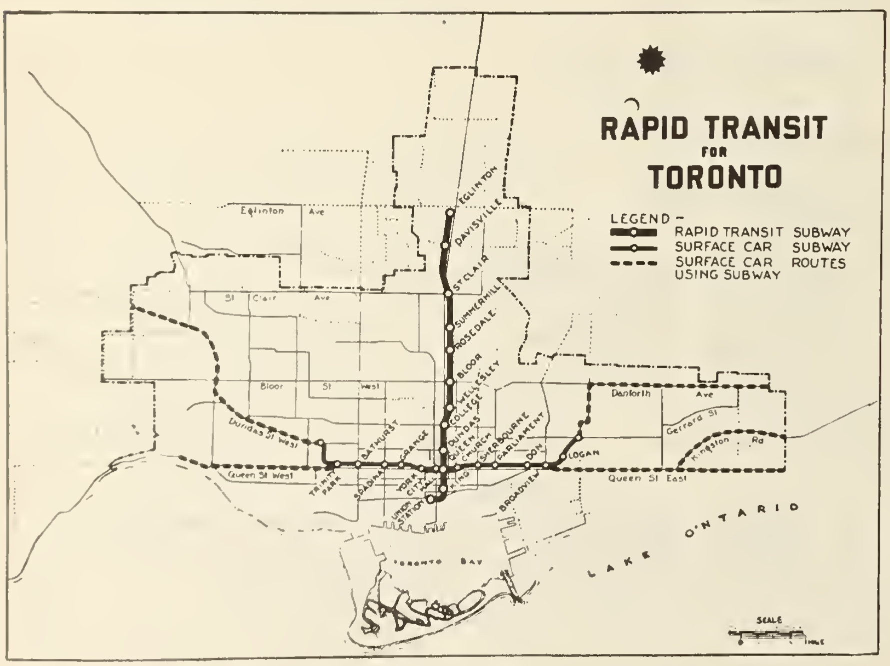

Fig. 1

Yonge Street Subway

It was evident that speeds in the Yonge Street subway, if operated by street cars, would provide but limited improvement in running time over the present surface street cars. It was further evident that the comfortable capacity of the subway with surface car operation would be taxed from the first day of its operation. It was decided therefore to consider the relative advantages of building the Yonge Street subway for immediate rapid transit operation. These studies showed:

1st That the Yonge Street subway could economically be extended north from St. Clair Avenue to a terminal at Eglinton Avenue.

2nd That the capacity for the subway,

by using modern rapid transit trains, would be three times the capacity of street car operation.

3rd That cars could be much wider than surface cars, providing more comfortable seating and a greater capacity. In addition, they could be constructed without steps and with a uniform clearance from the platform at all points of the car, thus minimizing accident hazards.

4th High level platforms could be located closer to the street surface, increasing the convenience to passengers and the loading and unloading of the cars with maximum speed because the platform and car floors would be at the same level.

5th Subways could be operated by trains of rapid transit cars, permitting minimum station stops, greater spacing of trains and higher speeds.

6th Service would be wholly free from street traffic delays and inclement weather conditions to which surface cars are subject.

In a joint report submitted by Mr. Wilson and DeLeuw, Cather & Company on April 1st 1944, the construction of a subway to provide full rapid transit operation on Yonge Street between Union Station on Front Street and Eglinton Avenue was recommended, and the Commission, after full consideration of all the factors, authorized development of plans for this subway, based on the provision of third rail rapid transit train operation.

The final route for this subway as now determined, is shown on Fig. 2, and is as follows:

> From Union Station in subway under Front Street and under Yonge Street to Carlton Street; then swinging eastward on to a private right-of-way about 150 ft. east of Yonge Street and continuing northward in subway to a point north of Davenport Road; then emerging to open-cut on private right-of-way through Rosedale; thence in subway under the C.P.R. at North Toronto Station; in open-cut to St. Clair Avenue; in subway from St. Clair Avenue to Heath Street, swinging across under Yonge Street to the west side, emerging in open-cut north of the old Belt Line Railway and continuing on the west side of Yonge Street to Berwick Avenue, with an underground terminal between Berwick Avenue and Eglinton Avenue.

In general the subway structure will be kept as close to the surface as possible, consistent with the provision of necessary coverage for water pipes and other utility services below the street level.

The total length of the Yonge Street subway is 4.56 miles, of which 3.20 miles will be in subway construction and 1.36 miles in open-cut.

The investments required by this rapid transit plan for structures and rights-of-way are estimated as follows:

Rapid transit structures.......	$19,835,000
Off-street rights-of-way.......	4,210,000
Fixed subway equipment......	4,805,000
Total...............	$28,850,000

This does not include the cost of the rapid transit cars, which will be approximately $5,000,000 additional, but which will replace an equivalent number of obsolete street cars.

SOILS

The soils to be encountered in Toronto are favourable to subway construction. The excavation generally will be through topsoil, sandy clay, tough blue clay, and sand and gravel. The Dundas shale, which underlies most of the city, is found approximately 25 to 30 ft. below the street surface along Front Street, and in this section the subway structure would be founded on this shale. Elsewhere the foundations will be in sand, sandy clay, or stiff blue clay. A series of test borings to a grade below the level of subway structures have been carried out and tests in undisturbed samples of subsoil have shown their satisfactory character. Investigations of existing records of building excavations along the line of the route have confirmed these findings.

Perforated steel pipes were installed at most of the test holes and observations are being made continually to determine ground water levels throughout the area.

METHOD OF CONSTRUCTION

The method of construction proposed is by cut and cover on the subway sections, and by open-cut on the remainder. It is proposed on the subway sections to drive heavy rolled steel sections along both sides of the line of excavation and install wood lagging to support lateral soil pressure. Steel beams will then be installed to span the subway excavation and on these there will be constructed a temporary wooden street surface to carry all normal traffic. Construction work will then proceed under this temporary street surface.

All utility pipes, cables, etc., will be suspended from the temporary steel structure during the construction period, except gas mains which will be removed from the excavation to the surface and relaid along the side of the street.

The support of buildings along the route of the subway will be included in the general contract which provides for the concrete structure only.

Subsequent contracts will include installation of mechanical equipment, electrical equipment, station finish, track and signal equipment, etc.

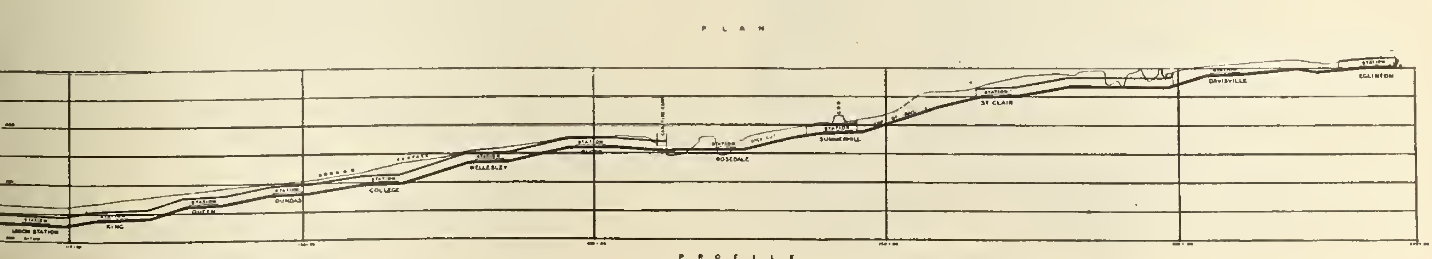

Fig. 2

PROTECTION AND RESTORATION OF UTILITY SERVICES

One of the major problems of subway construction is the maintenance of the tangled skein of utility pipes, conduits, tubes, cables, splicing chambers and man holes which lie beneath the surface of a modern street. Plans must include rigid provision for the protection, diversion or maintenance of these services during the construction period, and their relocation and restoration before completion of the job. Work in this connection has been facilitated in Toronto by the existence of a Public Utility Co-Ordinating Committee, consisting of representatives of the City Works Department, the Toronto Hydro-Electric System, the Toronto Transportation Commission, Consumers' Gas Company, Bell Telephone Company, C.P.R. Telegraph, and C.N.R. Telegraph, and other interested utilities. This committee has very complete records of all existing sub-surface utilities and acts as a clearing house for all changes or new installations. Their records have been invaluable to the subway designers.

ALIGNMENT AND GRADIENTS

In general the alignment has been laid out with long tangents and easy curves. The only curve of significant magnitude is the curve between Front Street and Yonge Street, which has a radius of 400 ft. The maximum gradient —for short distances only, south of St. Clair Avenue and south of Davisville Avenue—is 3.5 per cent.

If the alignment had been continued in subway under Yonge Street, the gradients would have been much more severe or the subway would have been much deeper at intermediate stations with consequent inconvenience and delay to passengers. The increased cost of such an alignment would have been in the neighbourhood of $6,000,000.

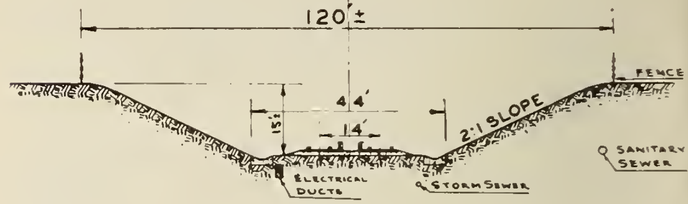
DESIGN OF STRUCTURE

For the covered subway structure a two track box section as shown in Fig. 3 has been adopted. Throughout the length of the subway structure, a constant width and ceiling thickness have been maintained for economy in formwork. The typical subway section between stations has an overall width of 32 ft. 6 in., an overall depth of 18 ft. 8 in., and inside width of 13 ft. 6 in. for each track, and a clearance over top of rail of 13 ft.

At typical station sections, as shown in Fig. 3, the subway structure is 52 ft. 4 in. wide, 19 ft. 3½ in. high, and has a transverse span of 25 ft. 5 in. between columns.

Where the depth of the subway permits, a mezzanine floor will be installed at the subway stations between the top of the subway structure and the street level. The minimum cover over the subway structure is 7 ft.

The open-cut sections (see Fig. 4) are designed with two to one slopes and a typical section will be 44 ft. wide between the bottom of the slopes. To carry cross streets over the open-cut, a fixed frame steel bridge was designed, the typical span being 48 ft. 11 in. and the minimum vertical clearance above the top of rail 13 ft.



YONGE STREET SUBWAY
TYPICAL CROSS SECTION IN OPEN CUT

Fig. 4

STATION DESIGN

Stations will be located at all main intersections, and there will be twelve stations on the Yonge Street subway. There will be mezzanine floors above the structure at Union Station, King Street, Albert and College Streets (see Fig. 5). The Dundas Station located at a high level has been designed with side platform control.

The Queen Street Station will be located at the intersection of the Yonge Street and Queen Street subways, the Queen subway passing underneath the Yonge subway at this point.

Plans for all the mezzanine stations include escalators as well as stairs for the convenience of passenger movement, and escalators will also be provided for passengers transferring between the Yonge Street subway and the Queen Street subway.

North of College Street, the subway will be on private right-of-way at high level, and stations will be located over the subway with entrances and passenger control doors at sidewalk level.

Station platforms will be 500 ft. long to provide for ultimate operation of trains of ten 45-ft. cars. Platforms at all stations except terminals will be located at the side of the stations and will be 12 ft. wide. Station platforms will be established on 0.3 per cent grades to provide drainage.

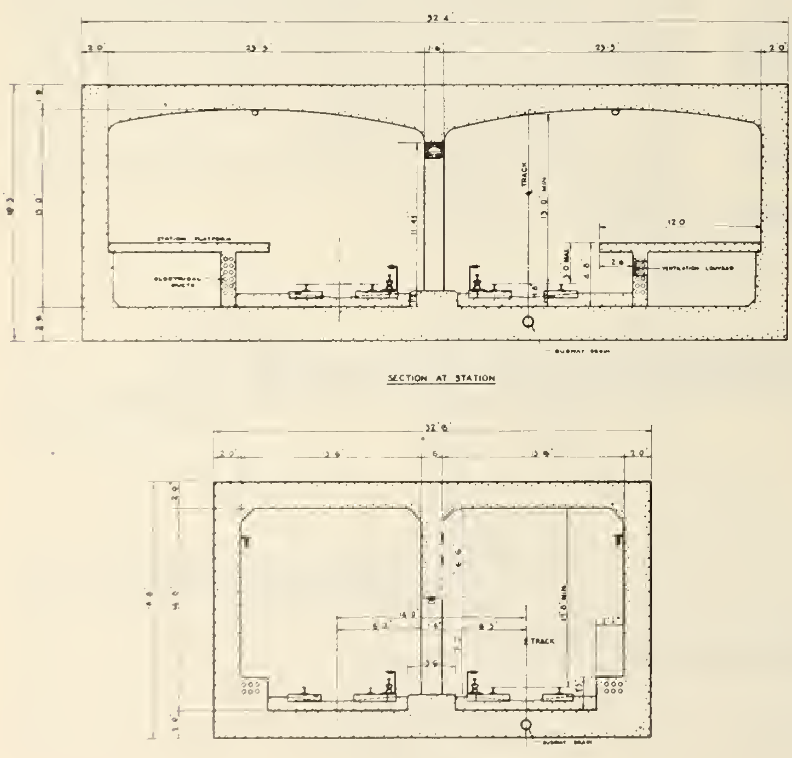


Fig. 3

VENTILATION

The ventilation system will be designed to provide sufficient air movement to dissipate the heat generated by train motors and also to provide ample fresh air. The movement of air is normally obtained from the piston action of each train movement through the tunnel. The pressure built up in front of a moving train forces air through vent shafts located at the point of transition from the tunnel to the station section. The vacuum created behind each moving train moves cool fresh air into the subway through these vent shafts located at both ends of each station and leading to gratings in the sidewalk.

DRAINAGE

Paved gutters will be provided to collect the run-off from the side slopes of the open-cut.

An intercepting sewer is planned along the easterly side of the right-of-way to collect the

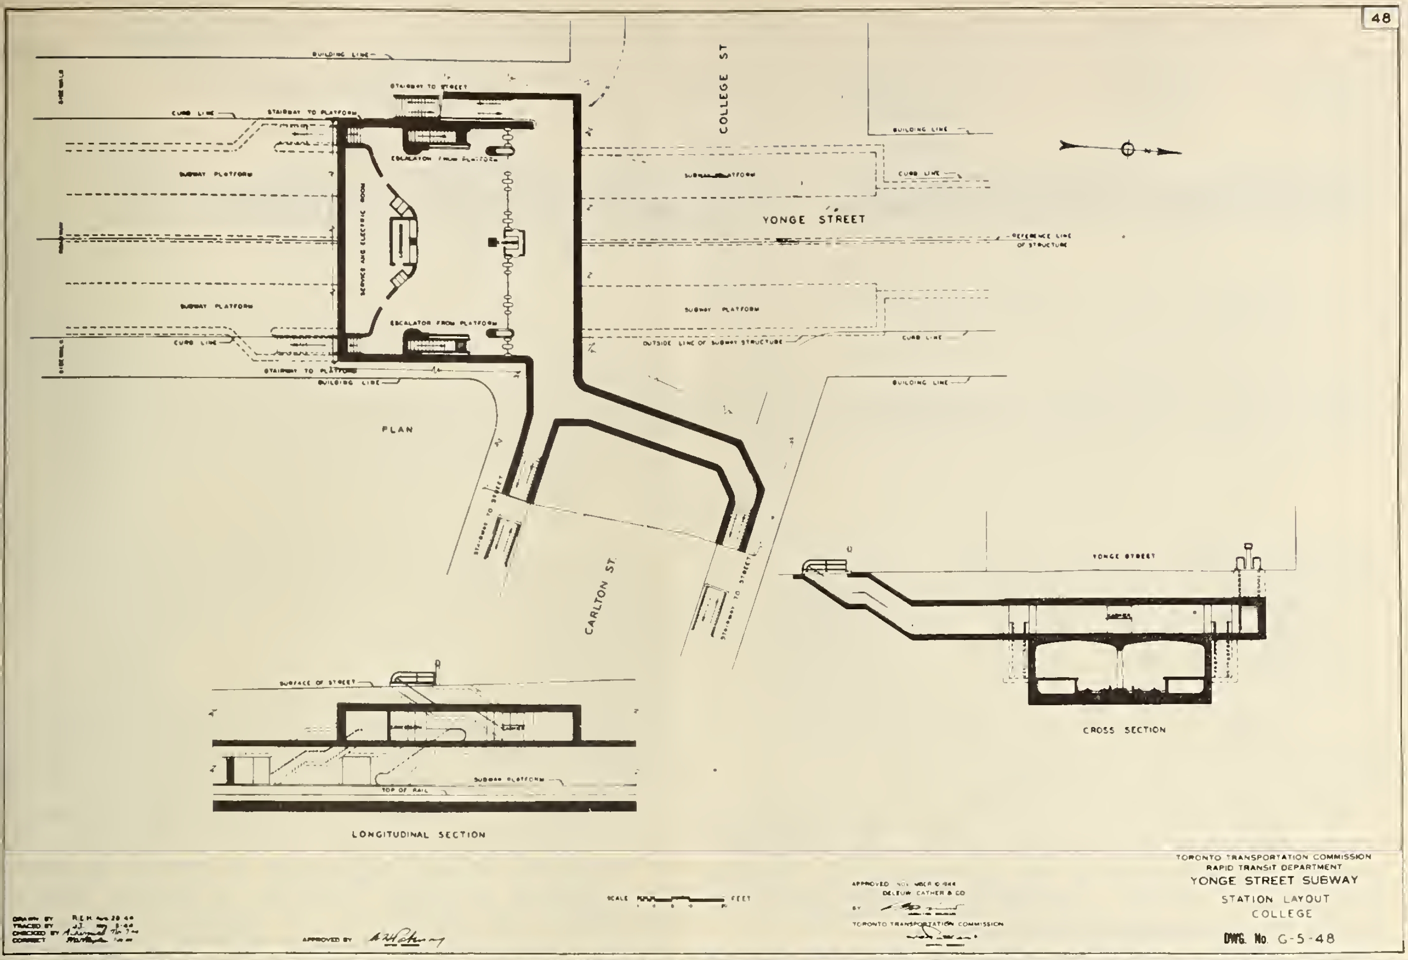

Fig. 5—College Station. Subway grades are established at the highest possible levels. Steep slopes on the streets, however, permit the construction of mezzanine stations to serve both platforms at Union Station, Albert, College and King Stations. The layout of College Station is somewhat typical of all four. Escalators are provided for upward movements of passengers from subway platforms to the mezzanine level. High level passageways connect the mezzanine to sidewalk entrances or to adjacent buildings as may be determined by local requirements.

effluent from the numerous east and west combined sanitary and storm sewers now discharging into a main sewer on Yonge Street.

ELECTRICAL EQUIPMENT

The power for operation of the train will be 600 volt D.C. and will be supplied from four modern automatic ignitron rectifier substations located at intervals of one and one-quarter miles along the route.

Power will be fed to the train by a positive contact rail about 20 in. outside and 6 in. above the running rails, and protected by an insulator guard.

The return circuit will be supplied by one of the running rails of the track.

Any additional power for operation of pumps, fans, escalators, lights, etc., will be 120 to 208 volts alternating current.

The 120 volts supplied by batteries will be installed at each station to supply power automatically to emergency light circuits during power interruptions.

A supervisory control system will be installed so that a dispatcher from a centrally located office will control all traction power and emergency fans, etc.

BLOCK SIGNALS

Trains operating in the subway will be protected by an automatic block signal system of the colour-light type. Obedience to the signal indications will be enforced by an automatic train-stop mechanism associated with each signal.

Interlocking equipment will be provided at train terminals and yard entrances.

OPERATION

The Yonge Street subway operation will be by the most modern subway equipment and the design of the car equipment is now being undertaken by the Commission's own engineers in conjunction with the manufacturers. It is hoped to develop a subway car which will have the same operating characteristics and passenger comfort as the new P.C.C. type of street cars.

Queen Street Route

On completion of the Yonge Street subway, it is proposed, as a second step, to construct a subway from east to west under or near Queen Street, as shown in Fig. 6. The plan contemplates subway construction under the street in the central section of the city with open-cut sections on private right-of-way to the east and west. The line will extend from Trinity Park in the west to Carlaw Avenue and Gerrard Street in the east, crossing the Don on a high level bridge.

Initially this route will be operated by surface street cars which will extend east, north-east, west and north-west beyond its portals.

Eventually, when traffic justifies, rapid transit equipment will be used in this subway also, and the subway structures are being designed with this end in view.

In the meantime, it is estimated that the maximum traffic on the Queen Street route, about 9,000 passengers per hour, can be satisfactorily carried by surface street cars, operating through the subway at speeds of about 15 miles per hour, including stops. The total length of the route between its connections to the surface system at each end is 4.54 miles.

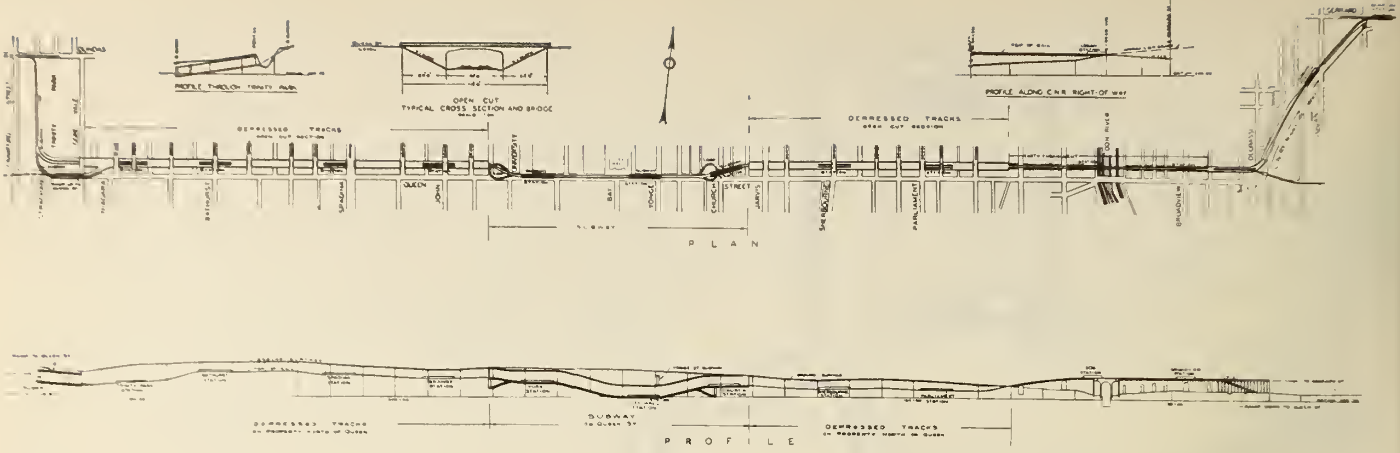

Fig. 6

The estimated cost of the work is as follows:

Structures	$11,800,000
Off-street rights-of-way	5,200,000
Fixed equipment	2,300,000
Total	$19,300,000

General

BENEFITS

The completion of the Yonge Street and the Queen Street rapid transit projects will provide a major improvement in transportation to the patrons of the Toronto Transportation System and will also confer widespread benefits on the community in general.

There will be substantial reduction in travel time as rapid transit operation will completely eliminate the many interferences to free movement of transit vehicles by vehicular and pedestrian traffic and traffic control signals on surface streets.

A definite improvement in comfort will result from the provision of enclosed stations for rapid transit passengers and this feature will be greatly appreciated, especially during the winter months and on rainy days.

For the convenience of those making local trips along the sections of Yonge and Queen Streets where the car tracks will be removed, supplementary local bus services will be operated.

The operation of the subway will be carried out as an integral part of the Toronto Transportation Commission system with free transfers between the rapid transit lines and the connecting street car and feeder bus routes. There will be no change in the present fares consequent upon the carrying out of these projects.

EMPLOYMENT ON SUBWAY CONSTRUCTION

It is estimated that approximately 40 per cent of the total cost of this project will be paid to labour; 45 per cent for materials, of which 50 per cent is labour; and 15 per cent for insurance, taxes, contractors' compensation and miscellaneous factors.

The total employment on the entire project is estimated at 7,250 man-years of skilled employment and 13,580 man-years of unskilled employment, a total of 20,830 man-years.

FINANCING

While the Commission believes in the basic principle that subway structures and rights-of-way should be provided by the City, because these are in the final analysis depressed or underground streets for the use of all citizens, the Commission is in a very sound financial position, and has, during war years, found itself with increasing revenues and without opportunity to expand its services in proportion to public demands. It believes that this situation should be reflected, as soon as possible, in improved transportation facilites, and it is prepared to assume 80 per cent of the cost of constructing the rapid transit lines.

The Commission has been advised that the Dominion Government would favourably consider the proposed subway as eligible for a timing grant of 20 per cent as part of the reconstruction proposals of the Government of Canada.

The whole project was submitted to the citizens of Toronto by referendum at the last municipal elections, and was approved by a ten to one majority, subject to the grant being obtained from the Dominion Government. The City's share is to be limited to the replacement and improvement of its own public utility services.

The Queen Street project will not be commenced until the Yonge Street subway is completed and in operation.

At the present time the Commission is proceeding with the development of contract plans and specifications for the Yonge Street subway. In order to encourage active bidding of competent contractors, the Yonge Street subway has been divided into five sections, and the plans and specifications have been completed for the first section. Plans for the second section are well under way and plans for other sections are proceeding concurrently.

The date of commencement of the work will depend on the labour and material situation, and the completion of the financial agreement with the Dominion Government.

MODERN METHODS OF CONDITIONING BOILER WATER EXTERNALLY

W. J. TOMLINSON, M.E.I.C.

Technical Director and Manager, Betz Laboratories Limited, Montreal, Que.

A paper delivered before the Saguenay Branch of The Engineering Institute of Canada on April 17th, 1945.

Classification of Softeners

Water softening equipment can be classified into two general types; base exchange softeners and chemical precipitation softeners. Both types have been in use for a good many years. However, in more recent years great strides have been taken in overcoming certain inherent difficulties with such softeners as originally designed and operated. In order to form a background for discussion on these various improvements, it is desirable to review the common type softeners and the chemistry of their operation.

The common type base exchange softener which has been in use for many years is the zeolite softener. The term "zeolite" is sometimes used loosely to cover practically all base exchange softeners. Generally, however, when used without further qualification, this term refers to the ordinary sodium zeolite unit. Although zeolite material may be natural or synthetic, it is all granular, being similar in structure to sand. The water to be softened is passed through the zeolite bed where its hardness is removed. A zeolite softener is illustrated in Fig. 1.

The chemical reaction of the softening is as follows:

$$\underset{\substack{\text{Sodium}\\\text{zeolite}\\\text{(granular)}}}{2\,NaZ} + \underset{\substack{\text{Calcium}\\\text{in solution}\\\text{(hardness)}}}{Ca^{++}} \longrightarrow \underset{\substack{\text{Calcium}\\\text{zeolite}\\\text{(granular)}}}{CaZ_2} + \underset{\substack{\text{Sodium}\\\text{in solution}}}{2Na^+}$$

(Same reaction for magnesium—Mg^{++})

Assuming that calcium represents the hardness in the water, it will be noted that this reacts with the sodium zeolite to form calcium zeolite and sodium in solution. When so much sodium has been removed from the zeolite bed that it is no longer capable of satisfactorily removing additional calcium from the water supply, it is necessary to regenerate the bed using a strong salt solution. When regenerating, the softener is taken off the line and the strong salt solution added in order to promote the re-conversion of the calcium zeolite back into sodium zeolite as shown by the following reaction:

$$\underset{\substack{\text{Calcium}\\\text{zeolite}\\\text{(granular)}}}{CaZ_2} + \underset{\text{Salt}}{2\,NaCl} \longrightarrow \underset{\substack{\text{Sodium}\\\text{zeolite}\\\text{(granular)}}}{2\,NaZ} + \underset{\substack{\text{Calcium}\\\text{chloride}\\\text{run to waste}}}{CaCl_2}$$

It will be noted that salt is consumed in the softening process. The regeneration reaction is not stoiciometric and a considerable excess of salt must be present in order to drive the reaction in the proper direction. After regeneration, the softener is rinsed until all the calcium chloride has been purged out and a test shows the rinse water to be soft. The unit is then placed back on the line for further softening of the water supply.

The type of chemical precipitation softener which has been in use for a good many years is the hot lime and soda softener. Discussion on cold process lime soda softening is being omitted here as it has a limited application for boiler water treatment. Better softening is obtained in the hot; and, inasmuch as the water must be preheated before sending it to the boiler, it is the usual practice to use a hot softener rather than cold for boiler water conditioning. There are, of course, certain exceptions to this, where, for example, the steam plant water might be drawn off from the plant process water supply following cold lime and soda softening.

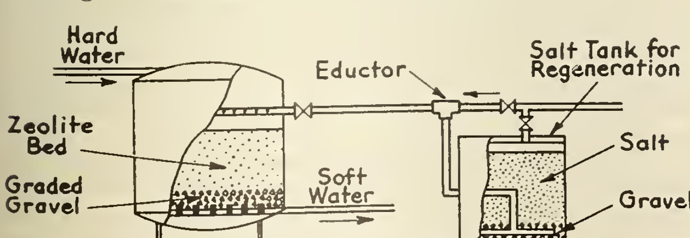

Fig. 1.—Zeolite softener.

Figure 2 illustrates a hot lime soda softener

It will be noted that the water is first heated and then treated with the proper chemicals which in this case would be lime and soda ash. It is then allowed to settle, normally for one hour, during which time the reaction goes to completion and the precipitated matter is allowed to settle out in the sedimentation section. The water then passes through filters in order to remove the suspended matter not retained in the sedimentation section. In the case of hot lime and soda softening, the filtering medium is usually anthracite coal. Sand used for this purpose would tend to increase the silica content of the water due to its solubility in a hot alkaline solution.

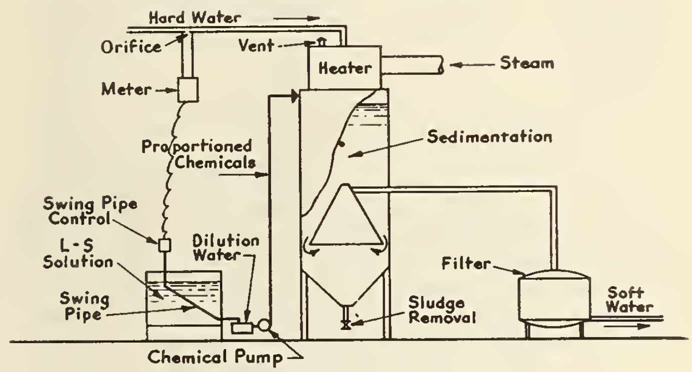

Fig. 2.—Hot lime soda softener.

It is important that the water be heated sufficiently as temperature plays a very important part not only in promoting the reaction but in improving the sedimentation. As such softeners are continuous in their operation, the chemical proportioner is a very important part of the unit. There are various types of chemical proportioners in use. It is necessary at intervals to remove the precipitated solids from the softener. This is accomplished by a desludging valve at the bottom of the sedimentation section. Last, but not least, the filter is important in order to provide a softened water free from precipitated matter.

The chemistry of lime and soda softening can be illustrated by the following reactions:—

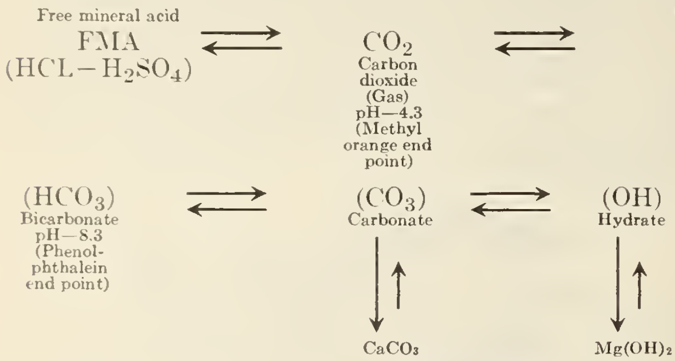
1. $$\underset{\substack{\text{Calcium}\\\text{bicarbonate}}}{Ca(HCO_3)_2} + \underset{\text{Lime}}{Ca(OH)_2} \longrightarrow \underset{\substack{\text{Calcium}\\\text{carbonate}}}{2CaCO_3\downarrow} + \underset{\text{Water}}{2H_2O}$$

2. $$\underset{\substack{\text{Calcium}\\\text{sulphate}}}{CaSO_4} + \underset{\substack{\text{Soda}\\\text{ash}}}{Na_2CO_3} \longrightarrow \underset{\substack{\text{Calcium}\\\text{carbonate}}}{CaCO_3\downarrow} + \underset{\substack{\text{Sodium}\\\text{sulphate}}}{Na_2SO_4}$$

3. $$\underset{\substack{\text{Magnesium}\\\text{bicarbonate}}}{Mg(HCO_3)_2} + \underset{\text{Lime}}{2Ca(OH)_2} \longrightarrow \underset{\substack{\text{Magnesium}\\\text{hydroxide}}}{Mg(OH)_2\downarrow} + \underset{\substack{\text{Calcium}\\\text{carbonate}}}{2CaCO_3\downarrow} + \underset{\text{Water}}{2H_2O}$$

The temporary hardness of the water supply can be represented by calcium bicarbonate. It will be noted that its reaction with lime results in complete precipitation not only of the calcium bicarbonate but also the lime, both being converted into calcium carbonate, the principal precipitate formed in a lime and soda softener. Accordingly, there is a reduction in total solids and alkalinity. The second reaction illustrates the softening with soda ash by precipitation of the permanent hardness. In this case it will be noted that although the hardness is precipitated as calcium carbonate, the original calcium sulphate has merely been replaced by sodium sulphate. Accordingly, there is no reduction in total solids. It should be noted in accordance with reaction (3) that magnesium calls for greater quantities of lime than an equivalent amount of calcium. Magnesium hydroxide is more insoluble than magnesium carbonate and accordingly magnesium precipitates as the hydroxide. In rare cases, reaction (2) is used to reduce the natural soda ash content of the water by addition of calcium sulphate. This has the effect of substituting sulphates for carbonates in the water supply, thereby reducing alkalinity.

A proper chemical balance in a lime soda softener is based upon the rather complicated considerations of acidity and alkalinity. The following illustrates some of the chemical equilibriums involved:



Precipitates in lime soda softener

If it were not for carbon dioxide, the alkalinity and acidity relationships would be relatively simple. In other words, we would have in a water either free mineral acids and neutral salt, or neutral salt and caustic. However, the presence of carbon dioxide sets up certain other intermediate products which buffer the *pH* value of the water at various values. It can be seen that present in the water we may have free mineral acid and carbon dioxide, carbon dioxide and bicarbonate, bicarbonate and carbonate, or carbonate and hydrate. We cannot have present at one time a combination of three of these forms of alkalinity or acidity. For example, if we have bicarbonate, carbonate, and hydrate present in a water, the bicarbonate would react with the hydrate in order to form the intermediate product of carbonate. The remaining constituent in addition to the carbonate would depend upon which was present in excess, either the bicarbonate or hydrate. These points can be refuted by pure physical chemistry, but the relationship is exacting enough upon which we can base a great deal of water conditioning and control work. It should be pointed out here that theoretically pure bicarbonate in water solution would give a *pH* value of 8.3 which corresponds to the phenolphthalein end point. Similarly pure carbon dioxide dissolved in water would give a *pH* value of 4.3 which corresponds to the methyl orange end point. These facts are very useful in control work for determining the extent of the alkalinity and in what form it is present. For example, it can be shown by mathematical proof based upon the considerations just outlined that the hydroxide content of the water is equal to twice the phenolphthalein titration minus the methyl orange titration. It can also be shown that the carbonate alkalinity is equal to the total alkalinity to the methyl orange end point less the hydrate alkalinity as calculated. Using this as a base, the quantities of lime and soda ash are controlled in order to keep the alkalinity of a softener principally in the form of carbonate with a slight excess of hydrate. By keeping the alkalinity in the form of carbonate, the solubility of calcium carbonate in the lime and soda softener is kept low. In actual practice, water from a lime and soda softener may run approximately 15 to 25 p.p.m. of hardness expressed as calcium carbonate as the precipitated calcium carbonate is soluble to this extent at the temperatures and pressures involved. By keeping a high carbonate content in the softened water there is a tendency to reduce the solubility of calcium carbonate, thereby producing a lower hardness in the finished water. A slight excess of hydrate is also carried in order to promote the precipitation of magnesium as magnesium hydroxide.

The application of heat will upset the original equilibrium in a water between the various forms of alkalinity and acidity. Heat will tend to drive carbon dioxide gas out of solution. In the case of natural waters of *pH* between 4.3 and 8.3, release of carbon dioxide will increase the *pH* value. The *pH* approaches the value of 8.3 for bicarbonate as the CO_3 is removed. In addition, bicarbonates tend to break up into sodium carbonate and carbon dioxide. This is another factor which tends to increase the *pH* value, although this latter reaction only takes place to a very limited extent at usual feedwater temperatures.

However, when the feed water reaches boiler temperature, not only do the bicarbonates decompose into sodium carbonate and carbon dioxide, but the sodium carbonate further decomposes into caustic soda and carbon dioxide as shown here:—

$$1.\ NaHCO_3 \rightleftarrows Na_2CO_3 + CO_2\uparrow + H_2O$$

$$2.\ Na_2CO_3 + H_2O \rightleftarrows 2\,NaOH + CO_2\uparrow$$

This latter reaction does not go to completion but it will account for a considerable amount of the carbon dioxide present in the steam. It is for this reason that all steam contains some carbon dioxide even though the free carbon dioxide may have been removed in the feed water heater.

Comparison of Lime-Soda and Zeolite

The comparison of these two general methods of water softening show that each has its particular advantages and disadvantages. In the first place, due to the solubility of calcium carbonate in a hot lime and soda softened water it is not possible to produce zero hardness. As previously stated, this hardness will probably run between 15 and 25 p.p.m. On the other hand, a zeolite softener will produce a water of much lower hardness. However, even with zeolite, a small quantity of residual hardness remains. Although the water may show zero hardness by the soap test, gravimetric determination will show the presence of anywhere up to 4 p.p.m. of hardness following the zeolite softener. On the other hand, one advantage the lime and soda unit has over the zeolite is that of reducing total solids of a water. As previously shown by the reactions for lime-soda softening, the lime reaction with calcium bicarbonate not only softens but also reduces total solids. In reducing the total solids, it also reduces alkalinity. It will be noted that, whereas the water originally contained bicarbonate, which is one of the forms of alkalinity, nothing remains soluble and accordingly alkalinity also has been reduced. The high alkalinity remaining in a water after zeolite softening has often been one of the principal objections to zeolite due to its effect upon foaming characteristics of the boiler water and caustic metal embrittlement, unless overcome by a high rate of blow down on the boilers. Of course, some waters have an initially low alkalinity and accordingly are quite suitable for sodium zeolite softening.

The reduction in alkalinity by lime also reduces the amount of fixed carbon dioxide which is available for release in the boiler. It is highly desirable to keep carbon dioxide in the steam at a minimum in order to reduce corrosive tendencies of the steam and condensate. With zeolite softening, all the bicarbonates present in the original water are unaffected in the softening reaction and accordingly are free to decompose in the boiler, releasing carbon dioxide.

Where economizers or closed heaters are used, lime and soda has the disadvantage of possibly forming deposits. This is due to the fact that such water is saturated with calcium carbonate and any increase in temperature tends to cause further precipitation. This can be overcome by acid treatment or certain surface active chemicals.

A comparison of chemical costs for softening must of course take into consideration the particular water in question. The consumption of salt cannot be figured stoiciometrically based upon hardness removal. Accordingly, although salt is a very cheap chemical, costs may not be low as relatively large quantities are required. For example, in actual practice it takes about 3½ lb. or salt to remove one pound of hardness expressed as calcium carbonate. On the other hand, with lime, whose price is comparable with that of salt, approximately 0.8 lb. is required for every pound of hardness removed. Of course, this becomes 1.6 lb. for the magnesium hardness. It is therefore apparent that removal of hardness with lime is considerably cheaper than with salt. However, in most cases, soda ash must also be used with the lime in order to remove the permanent hardness. It should take approximately 1.1 lb. of soda ash for every pound of hardness removed, although some excess of soda ash is also required. In comparison with the other two chemicals, soda ash is relatively expensive, being about two or three times more per pound than salt or lime. Of course, these relationships are entirely dependent upon market conditions, freight rates, and quantities purchased.

A comparison of internal treatment costs following either lime and soda softening or zeolite softening definitely favours the use of zeolite. As previously explained, a much lower hardness is obtainable with zeolite softening and accordingly only small quantities of internal treatment are required. As phosphates used in internal conditioning are considerably more expensive than salt, lime, or soda ash, the greater hardness of the lime-soda softened water will considerably increase the overall chemical costs when using lime and soda as compared with zeolite. Furthermore, in certain instances it is possible that the lime and soda softener will not produce as clean a boiler as the zeolite, due to the greater quantity of hardness passing through the softener.

An objectionable feature of zeolite softening is the need of a clear water supply. In other words, if any appreciable turbidity exists in the water supply, preliminary filtration should be provided. Such filtration would not be considered adequate without chemical coagulation. Accordingly this fact alone can increase the capital cost considerably in addition to chemical costs and maintenance. Turbid water will tend to foul up the zeolite beds and render them inefficient or unusable. Further disadvantages of the zeolite system are limiting factors of temperature and *pH* value. The ordinary zeolite should not be used where the water runs over 100 deg. F. Furthermore, the *pH* value should be somewhere between 6.5 and 8.0. In addition, recurring costs take place with zeolite due to the necessity of renewing the beds at intervals. Although the whole bed may not be renewed at once, for purposes of calculation it is well to figure the life at approximately five years.

Improvements in Base Exchange Softeners

However, many of the objections to the ordinary zeolite and lime and soda softeners have been overcome by present-day improvements. In the case of base exchange softeners, the use of carbonaceous zeolite has allowed higher water temperatures to be used and more latitude in the *pH* range of the water. However, there are still certain limitations which must not be exceeded.

One of the earliest means of overcoming high alkalinity following zeolite softening consisted of acid treatment. In other words, sulphuric acid is added to the softened water which reduces the alkalinity and releases carbon dioxide. It is the practice in such cases to aerate the water, following the addition of acid in order to drive off the liberated carbon dioxide. Unless this is done, the *pH* value of the water remains low, making it corrosive. Although such treatment reduces alkalinity it merely replaces it with sulphate and accordingly there is no essential change in total solids of the water. Of course, the addition of acid directly to the water can be based upon a stoiciometric relationship as a direct reaction takes place.

A further development has been the use of hydrogen zeolite. Hydrogen zeolite can be operated not only in the calcium sodium cycle but in addition it can be operated in a calcium sodium hydrogen cycle. In other words, calcium, magnesium, and sodium ions are all replaced by the hydrogen ion. This, of course, converts all the salts present into their respective acids. For example, all the chlorides in the water become hydrochloric acid, all the sulphates become sulphuric acid, and the bicarbonates become carbonic acid. This is shown as follows:—

$$\underset{\substack{\text{Hydrogen}\\ \text{zeolite}\\ \text{(granular)}}}{HZ} + \begin{matrix} Ca^{++} \\ Mg^{++} \\ Na^{+} \end{matrix} \longrightarrow \underset{\text{(Granular)}}{\begin{matrix} CaZ_2 \\ MgZ_2 \\ NaZ \end{matrix}} + \underset{\substack{\text{Acid}\\ \text{ion}}}{H^{+}}$$

Carbonic acid is carbon dioxide dissolved in water and accordingly all the original alkalinity is converted into carbon dioxide. The regeneration uses sulfuric acid as indicated:—

$$\underset{\text{(Granular)}}{\begin{matrix} CaZ_2 \\ MgZ_2 \\ NaZ \end{matrix}} + \underset{\substack{\text{Sulphuric}\\ \text{acid}}}{H_2SO_4} \longrightarrow \underset{\text{(Granular)}}{HZ} + \underset{\text{To waste}}{\begin{matrix} CaSO_4 \\ MgSO_4 \\ Na_2SO_4 \end{matrix}}$$

As with salt for straight zeolite softening, the amount of acid required is considerably more than would be required for a direct reaction. The amount of acid required will vary depending upon the characteristics of the water. This may range from 1.5 to 4.0 lb. of sulphuric acid for every pound of combined calcium, magnesium and sodium expressed as calcium carbonate. The chemical costs from the standpoint of alkalinity reduction are therefore greater than with straight acid treatment of zeolite water. In addition, the chemical costs for softening are higher as acid will cost approximately 2 cents a pound as compared with about 0.7 cents a pound for salt. On the other hand, the acid serves two purposes in one, that of softening and reducing alkalinity.

Of course, for boiler water use, it is not desirable to have free mineral acid in the water. Accordingly, the general practice calls for softening part of the water through a sodium zeolite softener and the remaining portion through hydrogen zeolite. The effluents from the two softeners are then mixed and the free mineral acid following the hydrogen zeolite is used to reduce the alkalinity of the sodium zeolite softened water, resulting in further liberation of carbon dioxide. As with regular acid treatment, the water can then be aerated for removal of carbon dioxide. Such a system has many desirable features. In the first place the hardness of the water is reduced to a very low value. The hardness after the hydrogen zeolite will even be lower than following the sodium zeolite as the calcium and magnesium are removed first before the sodium reacts. Accordingly, by the time the sodium is removed, very little calcium and magnesium will remain in the water. In the second place, alkalinity can be reduced to any value desired by merely regulating the proportion of hydrogen zeolite softened water to sodium zeolite softened water. In addition, alkalinity is removed without replacing it by some other constituent. This results in a material reduction in total solids. In most waters the reduction in total solids with such a system is very high as bicarbonates form a large portion of the total solids. Furthermore, due to the reduction of alkalinity to any degree desired with subsequent release of carbon dioxide, this system leaves a minimum of bicarbonate remaining in the water before passing to the boiler. This results in very small quantities of carbon dioxide being released in the boiler.

Theoretically, it would be possible to pass all of the water through the hydrogen zeolite, aerate it for removal of carbon dioxide, and then add caustic soda in order to establish suitable alkalinity free of any fixed carbon dioxide. This type of system would be more expensive to operate due to the relatively high cost of acid as compared with salt. In addition, caustic soda for re-establishing the alkalinity would further increase the costs. The advantage would lie in practically complete removal of carbon dioxide. Although the removal of carbon dioxide would theoretically be complete, in actual practice this would not be attainable as aeration of the water to liberate carbon dioxide cannot effect complete removal. Accordingly, as soon as caustic soda were added in order to re-establish the alkalinity, the reaction with the remaining carbon dioxide would form either bicarbonate or carbonate which could then decompose later in the boiler. Nevertheless, such a system would produce a steam with the lowest possible carbon dioxide content. Present studies and research on the problem of condensate line corrosion due to carbon dioxide is emphasizing the importance of this subject. At the present time many plants accept corrosive conditions due to carbon dioxide as being quite normal. A great deal of work is being done on the subject at the present time.

One possible method of operating hydrogen zeolite which is rather interesting is that of regenerating a softener with a mixture of salt and acid. The proportion of acid is controlled in order to give the desired alkalinity reduction. Such a system is actually in use at the present time, but experience with the method is lacking.

A further advancement with acid treatment or with hydrogen zeolite is the possible elimination of the aerator. When water containing carbon dioxide is passed through a feed water heater, removal of carbon dioxide takes place. However, the purpose of the aerator is merely to prevent corrosion of the piping and part of the feed water heater itself. By designing special feed water heaters for handling greater quantities of carbon dioxide and by providing a section in the heater capable of withstanding the corrosive condition, it is possible to eliminate the need of an aerator. No advantage in capital cost can be expected as the special heater would at least offset, if not more than offset, the cost of the aerator. However, by eliminating the aerator the system contains one less piece of equipment that must be maintained and operated. In addition, power requirements for the necessary air and additional pumping of the water is eliminated. One difficulty with elimination of the aerator is that the carbon dioxide is not released until the water is heated. Accordingly it is not feasible to store the water for use when the softeners are being regenerated unless some heat is to be lost in the stored water. However, this can be overcome by providing multiple zeolites such that remaining units can carry the load while one is being regenerated.

A further very interesting advancement in base exchange equipment is that of demineralization. Although demineralization has not found a practical use as yet in boiler water conditioning, it is a very interesting outgrowth of base exchange softeners worthy of some comment at this time. It has found use in other water conditioning problems. The first step in demineralization is to pass a water through a regular hydrogen zeolite softener in order to convert all the salts into their respective acids as previously described. This water is then passed through a second unit whose bed is capable of adsorbing the entire acid molecule, as indicated:—

$$\underset{\text{Acids present after HZ}}{\begin{matrix}HCL\\H_2SO_4\end{matrix}} + \underset{\text{(Granular)}}{\underset{\text{Demineralizing Bed}}{X}} \longrightarrow \underset{\text{(Granular)}}{\begin{matrix}X.HCL\\X.H_2SO_4\end{matrix}}$$

Carbonic acid is not adsorbed, but it is later removed by aeration. It will be noted that the reaction is not similar to the usual zeolite reaction. The entire molecule of hydrochloric acid or sulphuric acid is actually adsorbed on to the bed leaving nothing in the water in its place. It is then regenerated with soda ash which reacts with the adsorbed acid and leaves the bed in its original state with the respective salts of sodium chloride and sodium sulphate passing to waste. Regeneration is shown by this reaction:—

$$\underset{\text{(Granular)}}{\begin{matrix}2X.HCL\\X.H_2SO_4\end{matrix}} + \underset{\text{Soda ash}}{Na_2CO_3} \longrightarrow \underset{\text{(Granular)}}{X} + \underset{\text{To waste}}{\begin{matrix}2NaCL\\Na_2SO_4\end{matrix}} + \underset{\text{Water}}{H_2O} + \underset{\text{Carbon dioxide}}{CO_2}$$

It can be seen that the net result of the two processes in series, followed by aeration, is to produce a water free of all dissolved substances with the exception of silica. As yet nothing has been devised in the base exchange field for silica removal. This method can be used where distilled water is required as long as the silica does not interfere.

Improvements in Chemical Precipitation Softeners

As with base exchange, many advancements have been made in the field of chemical precipitation in order to overcome certain objections to the usual lime and soda softener. In the first place more accurate proportioners are now being produced in order to maintain better chemical balances consistently. It might be pointed out here that some of the older methods of mechanically proportioning chemicals were very ingenious, but it was difficult to keep the proportioners functioning properly at all times. The problem of course consisted of supplying lime and soda in direct proportion to the flow of raw water. As the flow of raw water varies with the square root of the pressure differential across an orifice, it was necessary to devise mechanical means of taking the square root out of the equation. As previously stated, some of the mechanical means of doing this were quite ingenious but still subject to maintenance problems. At the present time the tendency is toward electrical methods of proportioning and one of the popular types consists of a swing pipe in a chemical tank whose drop is directly proportional to the water flow.

One method of improving conditions with a hot lime and soda softener is to use boiler water recirculation. In other words, part of the continuous boiler blow down is returned to the softener. This not only affects the operation of the softener but also changes the conditions within the boiler. Many factors are affected by boiler water recirculation, but one of the principal uses is to allow higher alkalinity to be carried in a softener thereby producing a lower hardness without at the same time excessively increasing boiler water alkalinity. In the boiler itself the principal advantage of recirculation lies in its ability to lower the ratio of alkalinity and suspended solids to the other constituents in the water. Some of the boiler water alkalinity can be used up by replacing some of the lime and soda being added. Any boiler water recirculated has its suspended solids removed in the softener and subsequent filtration. In other words, as far as the boiler is concerned it is similar to taking water out of the boiler, removing its suspended solids and returning it to the boiler. Soluble constituents such as chlorides and sulphates remain the same. The reduction in suspended solids is highly desirable as this plays an important part in scale formation and carry over characteristics.

Many methods are now available for improving the sedimentation and accelerating reactions in the lime and soda softener. Boiler water recirculation, as just described, is one such method due to the suspended matter from the boiler returning to the softener. In this case the boiler water suspended matter acts as seeding points for the precipitation of calcium carbonate. This accelerates the build-up of particles of calcium carbonate in the softener which is necessary in order to allow the precipitates to properly settle. Another method gaining considerable favour is that of recirculating a portion of the sludge from the bottom of the softener back to the top of the softener. The previously precipitated calcium carbonate in this case acts as the seeding points for the freshly precipitating material. It should also be mentioned that automatic desludging is now available for relieving the concentrations of sludge at the bottom of the softener at regular intervals. Mechanical stirring somewhat in the nature of a coagulating paddle is also used to intimately mix the incoming chemicals with the water and accelerate precipitation.

It is also common practice to use a chemical coagulant in addition to the lime and soda in order to form a floc which settles very readily. In settling, the floc tends to enmesh the smaller particles of calcium carbonate thereby hastening their sedimentation as well. The two principal coagulants used for this purpose are sodium aluminate and magnesium oxide. These coagulants do not always work the same in all waters and a method of trial and error is probably best for determining which suits the individual case. The disadvantage of sodium aluminate lies in the fact that incorrect dosages might result in passage of soluble aluminum into the boiler. Other magnesium compounds can also be used for coagulation, but the use of the oxide prevents other ions from entering the system. For example, the use of magnesium sulphate will result in an increase in sulphate concentration in the system.

A great deal of attention has been paid to the problem of silica removal with the continually growing evidence of its importance in scale formation and also carry over. Although an ordinary lime and soda softener does effect some silica removal, it has been found possible to greatly increase the silica removal by the use of magnesium compounds, preferably magnesium oxide as just explained. The reaction for silica removal is not stoiciometric. Sludge recirculation is highly desirable along with the use of magnesium oxide where it is desired to reduce silica to a low value. The amount of magnesium oxide required depends on the amount of magnesium originally in the water and the degree of silica removal desired. Certain grades of magnesium oxide exhibit greater silica removal ability than others. Where magnesium might be present in excessive amount, silica might be used for magnesium reduction. However, the advisability of this is questionable in view of potential problems due to silica.

Improvements have also been made in filtration practices following lime and soda softeners as this can be the source of considerable difficulty if not properly handled. Any calcium carbonate carried through the filters will increase the sludge of the boiler and also require more phosphate due to the reaction of phosphate with calcium carbonate. Various means are now available for breaking up the sludge which accumulates at the top of the filter prior to backwashing. It is very important that proper backwashing remove the accumulated sludge in order that it does not build up to prohibitive quantities. One method consists of a rotating pipe containing jets of water which impinge upon and stir up the accumulated sludge bed in order to aid the backwashing.

The use of external phosphate has greatly extended the field for the hot process softener. This is essentially the same as a lime and soda softener except that phosphate is used as a precipitating agent instead of lime and soda. The reaction is as follows:

$$\underset{\substack{\text{Calcium}\\ \text{carbonate}\\ \text{(After L-S)}\\ \text{Ca (HCO}_3)_2\text{ if}\\ \text{no presoftening}}}{3CaCO_3} + \underset{\substack{\text{DSP}\\ \text{Di-sodium}\\ \text{phosphate}}}{2\,Na_2HPO_4} \longrightarrow$$

$$\underset{\substack{\text{Calcium}\\ \text{phosphate}}}{Ca_3(PO_4)_2\downarrow} + NaHCO_3 + Na_2CO_3$$

The pH value in the softener must be carried at about 9.5 in order to properly promote the phosphate softening reaction, and in many cases caustic soda is used along with the phosphate in order to establish the desired pH value. The caustic also precipitates the magnesium:—

$$\underset{\substack{\text{Magnesium}\\ \text{sulphate}}}{MgSO_4} + \underset{\substack{\text{Caustic}\\ \text{soda}}}{2NaOH} \longrightarrow \underset{\substack{\text{Magnesium}\\ \text{hydroxide}}}{Mg(OH)_2\downarrow} + \underset{\substack{\text{Sodium}\\ \text{sulphate}}}{Na_2SO_4}$$

A small excess of phosphate is carried in the softener. This cannot be held too high as otherwise the phosphate in the boiler water would be excessive due to the amount of concentration which takes place. In this connection the recirculation of boiler water is particularly advantageous with external phosphate softening as it allows a higher phosphate value to be maintained in the softener without at the same time creating an excessive phosphate value in the boiler.

The principal advantage of the phosphate over lime and soda lies in the very low hardness that can be maintained. It can be considered as zero hardness. In spite of this, however, external phosphate systems are definitely susceptible to forming economizer deposits as the water is completely saturated with calcium phosphate even though its solubility is extremely low. Accordingly, any rise in temperature tends to precipitate out a small amount of calcium phosphate. Over a period of time this can become excessive and cause difficulty in economizers and closed heaters. This problem can be overcome by feeding acid following the softener in order to take the edge off the saturated condition of the water. However, the use of acid tends to complicate the system and increases the amount of equipment which must be maintained and operated. Certain surface active chemicals can also be used for the purpose of preventing economizer deposits.

External phosphate has the disadvantage of using a comparatively expensive chemical, namely, phosphate, in order to remove hardness. Accordingly a straight external phosphate softener is not practical for use with a high hardness water. In such cases, however, it is possible to pass the water first through a hot lime and soda softener and then through an external phosphate unit. In this way the advantage of hardness reduction with relatively cheap chemicals together with the advantages of reduced total solids and alkalinity is effected in the lime and soda unit, yet no hardness remains after the phosphate softener. Different phosphates can be used, such as monosodium phosphate, disodium phosphate, or phosphoric acid. Where lime and soda is not used first, the phosphoric acid would have the advantage of releasing carbon dioxide which could be driven off in the heater of the softener provided provisions were made for this. Caustic soda added after the heater at the top of the softener could then re-establish the desired pH value. This of course would result in reduction of available carbon dioxide in the system. However, following lime and soda softening the use of phosphoric acid would not reduce the pH value sufficiently low to allow carbon dioxide to be

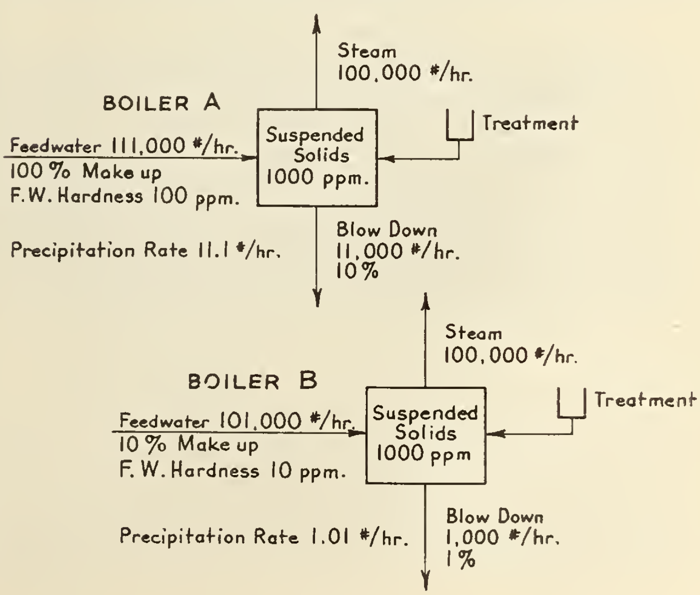


Fig. 3

driven off in any appreciable quantity. It therefore becomes a question of chemical cost and the necessary alkalinity or acidity required to maintain a *pH* value of 9.5 in the softener. Market conditions are such in Canada that disodium phosphate would be the cheapest means of providing phosphate. Monosodium phosphate is more expensive for equivalent phosphate content than the disodium phosphate, and phosphoric acid is still more expensive. Furthermore, special equipment is necessary in order to feed phosphoric acid due to its acidity. The same is true for monosodium phosphate.

The external phosphate system has one disadvantage similar to that of the zeolite. It produces a low hardness but considerable excess alkalinity is free to concentrate in the boiler. In such cases, alkalinity may become a factor determining blowdown. This can be overcome by acid treatment as previously described for preventing economizer deposits.

There is a growing tendency to incorporate a number of stages into one softener. For example, it is quite common for the softener to contain a special section for heating the condensate separately from the raw water. The condensate is then added to the system after the filters. A further development is to incorporate a third section inside the softener where the combined condensate and softened water are returned together for complete deaeration. The steam to such a unit can pass in series through the three heaters, namely, the deaerating heater, the heater for the raw water section, and the heater for the condensate. With the advent of combined lime and soda external phosphate softening, softeners are available which contain a section within the lime and soda softener for the phosphate softening. Some softeners have also been designed with sections for storing backwash water for the filter. Of course, such consolidation of units tend to save capital costs and space but in such cases capacities may suffer in order to place all the equipment into one unit. For example, where a separate unit is used for external phosphate it is more likely to be designed for the desired 45-minutes retention than if it is incorporated as part of the lime and soda unit. In such cases, retention might be cut down to 30 minutes in order to limit the size of the phosphate section.

Another trend tending to improve the results of hot external softeners is that of raising the pressure at which they operate. The conventional unit operates a little under 5 lb. pressure. By raising this pressure to approximately 50 lb., the corresponding increase in temperature greatly accelerates the reactions and they proceed further to completion. In other words, lower hardnesses can be produced in a lime and soda softener when operating at the higher temperatures. Due to the size of a lime and soda softener, however, such an increase in pressure may materially affect the capital cost.

Effect of Condensate

Throughout this discussion no mention has been made of the effect of condensate. This can prove to be quite important. For example, under certain conditions, straight internal treatment might be adequate provided there is about 50 per cent condensate, whereas straight internal treatment with a 100 per cent make up would not produce a clean boiler. At first thought this might not seem reasonable as it can be argued that the same chemical balance would be maintained in a boiler with 100 per cent make up as compared with 50 per cent make up provided additional treatment were added to the boiler and the blow down were increased in order to effect the same total solids. However, Fig. 3 indicates that this is not the case. It will be noted that under both systems (A) and (B) the boilers are producing the same amount of steam per hour. System (A) is operating with 100 per cent make up and a 10 per cent blow down rate resulting in 1000 p.p.m. of suspended solids in the boiler. System (B) produces the same amount of steam and uses the same quality make-up water but it has a much lower feed water hardness due to the use of 90 per cent condensate. By limiting the blow down to one per cent, Boiler (B) will carry the same amount of suspended solids. This is based upon the feed water hardness being precipitated as suspended solids part for part. In other words, one pound of feed water hardness becomes one pound of suspended solids in the boiler. This is approximately correct when precipitating with phosphate as 300 lb. of calcium carbonate is equivalent to 310 lb. of calcium phosphate. Although the chemical balance including the quantity of suspended solids is the same in Boiler (A) and Boiler (B), the fact remains that the hardness is being precipitated at the rate of 11.1 lb. per hour in System (A) whereas it is only 1.01 lb. per hour in System (B). Experience has shown that this rate of precipitation is very important, and undoubtedly Boiler (B) will be considerably cleaner than Boiler (A).

Choice of System and Determining Factors

From this discussion it can be seen that there are many factors affecting the choice of softening equipment. In addition there is always a question as to whether straight internal treatment should be used. In certain cases all three methods would produce satisfactory conditions. Accordingly, the economics of capital and operating costs is the determining factor. In other cases, straight internal treatment, for example, may not be capable of producing satisfactory conditions and therefore it must be ruled out as a possibility. Where high pressure boilers are to be used or even modern boilers at ordinary pressure, exacting water conditions are necessary. To just what extent a plant will go in installing a suitable system may depend on just how good the conditions must be maintained. For example, some plants prefer to accept the necessity of regular boiler cleaning rather than make the additional capital expenditure for a more complete system.

Many factors play their part in determining the final system to be used. One factor may be sufficient to make the decision. The principal items to be considered are hardness, alkalinity, total solids, silica content, temperature of water, *pH* value, turbidity, acceptable boiler outages, boiler pressure and design, and percentage condensate. In attempting to solve the equation where x represents the most desirable system, it can readily be seen that a very complicated equation is required due to the multitude of variables which must be considered. A true comparison can generally be made only by calculating through the chemical balances to be maintained under various systems in order to draw a comparison between the final water conditions, capital costs, and operating costs. There are hardly two jobs in existence in which the equation is identical and it is rare indeed when each individual plant is not a separate and distinct problem.

DISCUSSION ON

THE WINTER TEMPERATURE CYCLE OF THE ST. LAWRENCE WATERS

A Plea for More Data

A paper by J. G. G. Kerry, M.E.I.C., presented before the Sixtieth Annual General Professional Meeting of The Engineering Institute of Canada, on February 8th, 1946, and published in the January, 1946, issue of *The Engineering Journal*.

NOTE—Because of the length of several discussions and the restrictions on the use of paper, the Publication Committee has abridged the material substantially. Many statements and comments have been omitted entirely because, in the opinion of the committee, they were not related to the topic and, though interesting in themselves, did not advance the specific subject. Readers who desire to study any of the discussions in full may secure them by inquiring at Headquarters—(Ed.).

P. E. Church[1]

A study of the temperature cycle of Lake Michigan conducted by the Institute of Meteorology (University of Chicago) was carried out vigorously for three winters and two summers or from November 1941 to March 1944. Since that latter date observations still have continued but less frequently than before. Only a portion of the data have yet been published.

The three winters were of different character with respect to average air temperatures, average water temperature, and heat content of Lake Michigan. Table IV illustrates this.

Table IV

Milwaukee	Mean of Dec., Jan., Feb., Mar.		
	Winter, 1941–42	Winter, 1942–43	Winter, 1943–44
Ave. Temps	28.0°F.	22.6°F.	27.1°F.
Wind Vel., Ave. MPH	12.6	12.5	13.0
Total snow in inches	24.8	41.3	26.9
Mean Lake Temp. min. for winter, °F.	36.5	32.9	35.0*
Mean Lake Temp., Feb. 12-15.	37.5	34.5	36.3
*Rough extrapolation.			

For the sixty years, 1871-1930, the four months, December through March, average 25.4 deg. F. for Milwaukee. The winters of 1941-42 and 1943-44 were definitely warmer than normal and the winter 1942-43 definitely colder. Using a mean for the same months, but for the twenty-five years 1919-20 to 1943-44, as 26.9 deg. F., 1943-44 was close to average, 1941-42 was above normal and 1942-43 was much below normal. Only two winters in the past twenty-five years have been colder than 1942-43 and they were 1919-20 and 1935-6. Both of these winters had severe ice conditions, for navigation, between Milwaukee and Muskegon.

There appears to be a definite relation between the mean temperature of the air at Milwaukee for the four months, December through March when the lake is vertically isothermal and cooling is in progress, and the temperature of the lake.

A very rough formula, based on only three years of lake data, would be:

$$T_w = T_a + 9.0°$$

Where T_w is the mean temperature of the lake at its minimum, and T_a is the mean air temperature at Milwaukee for December through March.

or

$$T_w{}^1 = T_a + 10.5°$$

Where $T_w{}^1$ is the mean temperature of the lake between February 12 to 15th.

This implies that from mid to late March, when Lake Michigan has its minimum temperature, there would be no heat gain if the air temperature averaged 23.0 or lower for the four months. There are other variables, of course, and some of these have been mentioned by Mr. Kerry. In addition to those he mentioned, it would be well to consider the heat loss to the water by falling snow.

A rough estimate of the amount of snow which falls on Lake Michigan would be about 50 inches or, using a conversion figure of 10 inches of snow equals 1 of water, in the metric system the snow would equal 25 cm. of ice. Using $80/\text{cal}/^{cc}$ as the heat of fusion the lake would, during the winter, lose 1600 $\text{cal}/^{cm^2}$. In the St. Lawrence valley, where it is snowier than over Lake Michigan, the heat loss owing to falling snow would be correspondingly larger.

I am glad to note that Mr. Kerry has stressed the point that when temperatures become uniform in a "deep lake" further cooling is a slow process. This is because at temperatures below that of maximum density of fresh water (4 deg. C.) the whole lake will continually turn over if the wind is sufficient to cause stirring. When an ice cover prevents this mechanical stirring the water will stratify with the warmer water at the bottom. Conduction of heat from the bottom will bring a slight rise to bottom water.

In preparing a third report on Lake Michigan, I have computed, tentatively, the values of heat gain and loss by the processes of incoming radiation, evaporation, nocturnal radiation, and conduction. The losses were computed from formulae developed by Dr. R. Montgomery of the Woods Hole Oceanographic Laboratories and are in mimeograph form only. No attempt has been made to compute heat gain or loss from condensation, or precipitation. All figures are based on air temperature, relative humidity, cloudiness, and wind velocity at the Muskegon, Mich., airport. In Table V are some summary figures which may be of interest. Thus far they have been computed for December 1941-42 and January, February and March of 1942.

Table V

	Dec., 1941	Jan., 1942	Feb., 1942	Mar., 1942	Dec., 1942
Total incoming Cal/cm²/month	2,100	2,520	3,500	5,270	1,980
Total outgoing Cal/cm²/month	7,320	9,500	9,880	5,800	11,600
Incoming-outgoing Cal/cm²/month	−5,220	−6,980	−6,280	−530	−9,620
Heat loss or gain in lake cal/cm²/ for depth of 7,700 cm.	−8,000	−8,000	−8,500	−6,000	−17,000

While there is a large discrepancy between calculated and observed losses it must be remembered that losses were computed from atmospheric observations on the lee side of the lake and that currents are more active in the lake in winter.

[1] Associate Professor of Geography and Meteorology, Department of Geography, University of Washington, Seattle, Wash.

F. L. Lawton, M.E.I.C.[2]

While not necessarily subscribing to the hypothesis that the navigation season can be greatly extended, I think that much of the argument is of immediate interest in another field, namely the operation of the extensive hydro-electric developments in Canada, and particularly their storage reservoirs.

This problem is of such wide national interest that The Engineering Institute of Canada might well set up a committee to serve as a focal point for compilation of data, their analysis and dissemination to the profession.

No doubt a considerable volume of information, which could be utilized to advantage, exists in the files of the operators of large storage reservoirs associated with hydro-electric systems.

A wider field of application, and one of more immediate application than the extension of the navigation season on the St. Lawrence-Great Lakes waterway is the relatively accurate prediction of the probable date on which breakup will occur and new water enter the storage reservoirs and rivers feeding power developments.

The temporary loss of water from storage reservoirs due to the formation of frazil and anchor ice in the waterways leading to the power plants is another problem of major interest. How can it be minimized?

I submit, therefore, that The Engineering Institute of Canada would perform an outstanding service to widely diversified groups by forming a committee which would deal with the many problems entering into ice formation, breakup, etc.

E. Wendell Hewson[3]

The problem of which Mr. Kerry treats is important and of great complexity. Many more data must be available before a solution can be achieved. The following points should be kept in mind when considering its meteorological aspects.

1.) Insolation. The prevalence of cloud affects solar radiation, for an overcast sky cuts off about eighty per cent of the incoming solar energy. Even measured values at land stations around the lakes cannot be accepted without reservations, for the amount of cloud and fog is appreciably greater over the lakes than over the adjacent land. A fuller knowledge of cloud conditions over the lakes is needed.

A further point which should be considered is the reflection of the sun's rays by the water surface. This is small when the sun is near the zenith, but amounts to 30 to 40 per cent when the sun is low on the horizon, as it is in winter. The percentage is even greater when there are waves.

2.) Terrestrial or Back Radiation. The loss of heat by this process proceeds 24 hours a day. A ceiling of low cloud cuts off nearly all back radiation. The average cloud cover would have to be considered in conjunction with Prof. Richardson's formula; furthermore, it is doubtful if the constants are the same for the Great Lakes as for California.

In these latitudes, with clear skies in winter, the loss by back radiation is substantially greater than the gain by insolation.

3.) Convection. The losses by this process shown in Table III would seem to be too large. Molecular diffusion of heat in the atmosphere is negligible in comparison with the turbulent diffusion by eddies. In unsaturated air, eddies carry heat upward when the temperature decreases with height at a rate greater than 5½ deg. F. per 1,000 ft., and downward when it decreases with height at a rate less than this. There is no transfer when the decrease is 5½ deg. F. per 1,000 ft. Thus, when relatively cold air sweeps over the lakes from the north-west, heat is carried upward, but it is carried downward with warm air from the south. With saturated air the heat transfer is not substantially different. Bowen's ratio does not make adequate allowance for the turbulent transfer of heat, and computations based on it are subject to error. Other investigations lead one to believe that the heat loss or gain in this manner is very small in comparison with the loss by back radiation and evaporation.

James H. Brace, M.E.I.C.[4]

My experience from time to time with ice conditions in the St. Lawrence, particularly frazil, beginning at Sault Ste. Marie in 1903 and extending at intervals until the present time near Montreal harbour, makes me doubtful whether an open ship channel can be maintained throughout the year, but the subject is of such importance as to warrant a thorough investigation.

I am not enough of a physicist to pass judgment on the various theories that have been put forward as to the formation of ice under controlled conditions of flow in narrow channels, but I think the study should be carried on both from the point of view of observation and of theory. As Mr. Kerry says, this is too large a task to be undertaken by anybody except Government authority, and the work should be international. If Canada and the United States would get together more than they appear to do now on their observations and interpretations, this would be of great benefit to both countries.

Mr. Kerry has not said much about frazil, but I presume he believes that with a regulated river, no great amount will be formed. This is probably true with the exception of the Lachine section. In that section the plans in the 1926 Report would not help conditions in Montreal harbour and below. Conditions in this section should be thoroughly restudied both in connection with prevention of frazil and to make possible a more complete utilization of the power possibilities.

If the St. Lawrence Waterways are to be started in the near future, I would not like to see the work delayed to obtain data or make plans for construction in an attempt to provide an open channel, but care should be taken not to build structures that would seriously interfere with its future development, if later study warrants. In this connection, it may be well to consider whether an experimental section cannot be developed as an all year waterway, say, in the Detroit, St. Clair or St. Mary sections, to determine whether the whole scheme is practicable.

Edwin Rose[5]

Mr. Kerry has presented data on the growth of ice sheets, lake temperatures and the rate of cooling of lakes in the fall and winter months. He has also given an interesting treatment of the geophysical laws controlling the exchange of heat energy in the waters of lakes and rivers. He cites the need for more observational data, particularly for the Great Lakes region, to permit the intelligent and scientific utilization of the heat stored in the deep lakes to keep the outflowing river waters free from ice.

The Bureau of Reclamation has gathered some data on reservoir water temperatures in the western part of the United States. While most of this material was obtained in the southwest where the winter air temperatures are generally above freezing, it is believed the limited information available in the colder regions of the U.S. will be of interest.

Observations of water temperatures at various depths in the lake and also mean weekly air temperatures have been made at Grand Lake, Colorado, for the years 1940 and 1941. The winter air temperature conditions there are probably similar to the conditions encountered in the vicinity of the Great Lakes and the St. Lawrence. Due to the higher elevation at Grand Lake, the summer air temperatures may be somewhat lower than in the Great Lakes region.

[3] Air Services, Meteorological Division, Dept. of Transport, Toronto, Ont.

[4] President, Fraser-Brace Engineering Co. Ltd., Montreal.

[5] United States Bureau of Reclamation, Denver, Colo.

The figures show that the lake temperatures beyond a depth of about 100 ft. remain within a degree or two of the temperature of water at maximum density, about 39.4 deg. During the fall months, the upper portion of the lake cools until the temperatures throughout the entire depth are about 39 deg. This condition of uniform temperature occurred about December 1, after which time, until about April, the temperature remains about uniform except in the upper 10 ft. or so, where the temperatures decrease to the freezing point at the under side of the ice sheet, which usually forms in December.

These data indicate that the minimum water temperature at depths greater than about 50 ft. is not less than 37 deg. F., and for the most part remains about 39 deg. It is noted that the minimum temperature of Lake Michigan is about 36 deg. F. throughout. The effect of the wind velocity in the Great Lakes region in creating turbulence is probably a factor which tends to overcome the stratification tendency, thereby giving a slightly lower uniform temperature than would occur in an ice-covered lake such as Grand Lake.

The above record, although actually very limited in extent, does provide substantiation of the author's statement that the winter temperatures of deep lake waters are relatively warm.

Edward L. Cousins, M.E.I.C.[6]

We who have been concerned with Great Lakes transportation in conjunction with the St. Lawrence fully appreciate the fact that, in the past, it has been more or less taken as an accepted thing that river movements east from Montreal close some time during the last two weeks in November and as far as Great Lakes ports are concerned, cease around the 1st of December.

Mr. Kerry's suggestion for the collection of more data will, I think, be acceptable to the membership of the Engineering Institute, particularly those interested in navigation. This applies equally to the ports on the Great Lakes in the U.S.A.

The problem will require much study and it might be helpful to establish a committee including representatives from The Engineering Institute of Canada and the American Society of Civil Engineers. A problem of this nature might ultimately be referred to the International Joint Commission. As to Canadian representation on this committee, I would suggest that consideration be given by the Institute to the following: Department of Public Works, Department of Transport, Hamilton Harbour Commission, Toronto Harbour Commission, National Harbours Board, representatives from the Department of Physics of Toronto, McGill and Queen's Universities.

It is possible that the committee studying this matter may consider the availability of atomic energy as a source of heat.

S. R. Frost, M.E.I.C.[7]

There is a challenge to Canadian and American engineers in the suggestion that year-round navigation on the Great Lakes and St. Lawrence waterway may not be impossible.

The St. Lawrence and Great Lakes region contains some 50 per cent of the industrial development of the United States and 90 per cent of Canadian industry. This is largely due to transportation facilities provided by the great waterway which have permitted movements of bulk freight cargoes for rates as low as eight one-hundredths of one cent per ton mile.

That these navigation movements should cease abruptly in early December has to most of us seemed inevitable. It does seem possible that the use of these transportation facilities might be extended. At the present time, probably 90 per cent of Lake Ontario is open water and there is hardly any harbour that could not be kept open if required.

But the hazards of winter navigation are grim realities to those of us who have seen late ship arrivals in the upper lakes.

Most engineers will agree that Mr. Kerry has made a good case for the collection of more complete meteorological and geophysical data.

John Murphy, M.E.I.C.[8]

The coupling of Mr. Kerry's name with the ice question reminds me that, many years ago, I secured some patents in the United States and Canada regarding ice control. One of my licensees had some waterwheels made in Germany for a plant at Hull, Que., and they are still in successful operation. Shortly after these waterwheels had passed, successfully, through several winters, I met a Montreal engineer and I proceeded to tell him about my ice-fighting waterwheels. He interrupted me by saying:—"Walk down McGill Street to the harbour. There you will see hundreds of thousands of tons of ice. God put them there. Man cannot undo what the Creator does every winter. Now, don't talk like that any more. They'll put you in an asylum if they hear you!"

In the meantime, Dr. Barnes with his micro-thermometer let a flood of light in on the ice question. His work gave me courage to do things which proved the practicability of some of his contentions. My studies show to what a tremendous extent the agitation of the water in a stream is responsible for ice formation.

In a flowing river, measurements of the stream-flow at the period when the ice was forming indicated that 144,000,000 times more water went "down the river" than was turned into ice. Investigation also shows that frazil is, at times, so light that it will rise considerable distances in a flowing stream.

Another point not generally known about water is that its weight at different temperatures and at different depths is practically constant. Text books state that water at 32 deg. F. weighs 62.418 lb. per cu. ft., and at 39 deg. F. its point of maximum density, it only weighs .007 lb. more per cu. ft. At the Bubbler installations at power house racks or screens, there is not much work for the lifting air to do.

I would like to see Mr. Kerry put in charge of a committee to continue his study of the ice question.

A. E. K. Bunnell, M.E.I.C.[9]

Without question, great economic benefits would accrue to Canada and her neighbour to the south if all-year seagoing navigation could be obtained over the entire extent of the Great Lakes and St. Lawrence River waters.

Mr. Kerry has a clear-thinking analytical mind. His plea for more data should therefore be supported by the engineering profession in both countries.

I would accordingly urge that The Engineering Institute of Canada and the American Society of Civil Engineers should petition their respective governments to refer the matter to the International Joint Commission, and place adequate funds and staff at its disposal to carry out a full inquiry into the feasibility of the objectives envisioned by Mr. Kerry.

Prof. Robt. W. Angus, Hon.M.E.I.C.[10]

The author has not only given a brief and comprehensive review of the sheet ice problem as it affects the Great Lakes, but has presented much valuable data on lake temperatures and ice formation. Surely every member of the Institute will support Mr. Kerry's plea for more data. Further study of the problem should certainly be made.

While the paper deals almost exclusively with sheet ice and its effect on navigation in the St. Lawrence, it must be remembered that ice is also a serious problem in water power developments, and many of our Canadian plants have

[6] Consulting Engineer, Toronto Harbour Commission, Toronto, Ont.

suffered much from it. The power companies undoubtedly possess valuable information. Waterworks engineers are also concerned with this matter, particularly where the water is drawn from the Great Lakes, although their chief enemy is frazil ice, which has, at times, blocked up intakes in water 20 ft. or more deep. So far as the writer knows, little has been done to determine the conditions under which frazil ice forms in such quantities as to cause serious trouble, nor does there appear to be much information on how to get rid of the trouble.

As far as the St. Lawrence goes, it has been generally assumed that navigation on it must be suspended during the winter. The author has suggested some possible lines of attack on the tremendous problem of handling the river ice. It is difficult to see, however, how the "warm" waters of the lakes could be drawn off while the colder parts are left.

The construction of a new channel from Lake Huron to a point below Montreal, which would be free of ice during the entire year, would indeed be a difficult undertaking. Nearly thirty years ago the writer made a study for the Hydro-Electric Power Commission of Ontario in connection with the intake for the Queenston plant at Niagara. In this case, it was desired to draw a large volume of water from the shallow Niagara River for the plant. There are times when quantities of broken sheet ice come down the Niagara River, much of it coming close to the Canadian shore where the intake had to be placed.

A brief summary of work covered is given in the writer's paper "Intakes for Power Plants", presented to the American Society of Mechanical Engineers in 1924.[11]

In this case the intake had to be designed to keep floating ice out, but some of the things observed there may be of help.

It was observed that where ice was very thick, anything that slowed up the river water caused the ice to pile up and make greater difficulty in clearing it from the stream. The author's proposed channel would require to be made to carry a good proportion of the total flow and this would slow up the water in the main channel and cause further ice concentration. It would appear, therefore, that an effective channel might have to draw off so much water that the resulting flow in the river would be too low. The writer is not trying to show that the author's suggestion is impracticable, but rather that it offers difficulties only soluble through intensive study and very complete model tests.

The writer wishes to congratulate Mr. Kerry on his presentation of such an important matter in so clear, brief, and interesting a manner.

Alfred W. G. Wilson[12]

Most of my old observations had to do with surface currents and shore conditions rather than with river flow and ice movements. However, there is one point on which I can at least make a note. On page 28 (*Engineering Journal*, Jan. 1946), about the middle of the first paragraph, the American Meteorological Society for 1944 is quoted as stating—"Lake Ontario was frozen over during the winter of 1933-34; this is the first time on record that such a condition has been reported".

Popular opinion does not agree with this statement, for references to the lake freezing over will be found in the files of the local papers at both Port Hope and Cobourg; it seems to have occurred about every ten or fifteen years.

It is not likely that any planes made records before 1933. I think it probable that the lake was frozen over in 1918 and I have a recollection of seeing it frozen over in a year between 1885 and 1889.

Of course the width of the lake at the point of observation and the impossibility of accurate checking, as with a plane, casts doubt on the accuracy of the observations of myself or of the earlier "Oldest Inhabitants", still I could certainly see at least half way across, and the notable absence of rising vapour gave some indication of the conditions prevailing.

A heavy cloud of vapour almost always shows above the lakes during the winter months, especially when the wind velocity is low. This cloud condition would not completely disappear if the lake were completely frozen—it would, however, be reduced in density.

Any freezing that does occur is infrequent, and is only for a very short time and would really have no bearing on the river flow at the east end. The ice that might make trouble is the massive—sometimes very massive—blocks and even small bergs from the ice foot. At the east end of the lake the ice foot is higher than in the vicinity of Grafton to Toronto. The movements of these bergs in the spring is—when they get afloat at all—controlled completely by prevailing winds. It is extremely doubtful if any of these reach Montreal, or even past the first rapids below Prescott, where they would probably ground. It is thus suggested that it is the marginal river ice that has to be diverted and controlled, so far as the St. Lawrence is concerned. On Lake Huron the lake ice from the ice foot must reach the river, and the problem will be quite different.

An extension of such shore studies to all the lakes and to winter, and especially spring, conditions is one of the first steps needed to find out first what the ice actually does.

C. G. Andrus[13]

I wish to ask one question referring to the "Conclusions", on page 34 of the *Engineering Journal*, for January 1946, and it concerns subparagraph No. 3. The question centers on the word "never"; we wonder if Mr. Kerry meant to say "never in the freezing or in the winter months".

F. H. Peters, M.E.I.C.[14]

The severe conditions of cold in the Great Lakes and the St. Lawrence Waterway region cannot be changed by man but it is not beyond reasonable imagination that the consequent adverse conditions may be ameliorated. Mr. Kerry throws down the challenge when he says "Historically, the struggle against the forces of ice and snow has been active for a century past and one gain after another has been achieved by the (engineering) profession."

His paper leaves no doubt that there is a very wide field of research and study which must be fully covered before any definite opinions and conclusions can be reached.

Evaporation is possibly one of the most weighty factors which bear on the balanced water levels throughout the Great Lakes Waterways. This point is brought forward merely to illustrate how delicate is the balance between supply and discharge, and how essential it is that none of the governing factors be disturbed without full knowledge of the ultimate effect.

If the latent heat in the waters of the Great Lakes is used or drawn upon to a greater extent than by nature, might it not tend to change the ratio of evaporation to precipitation?

Some ten years past, certain studies were made of this balance between precipitation and evaporation, for the watersheds of the Great Lakes and the Ottawa River. For the forty-five year period 1890-1934, it was found that the average annual loss by evaporation was 66 per cent of the precipitation in the Great Lakes watershed, but only 45 per cent in the Ottawa watershed. This difference of some 20 per cent is probably due to the enormous areas of the Great Lakes.

If this average of 66 per cent loss by evaporation were reduced to even 60 per cent, it would without doubt increase the discharge and therefore raise the average water levels throughout the waterways. It would possibly raise Lake Ontario by about 8 in. which might be a benefit to

[11] Intakes for Power Plants, A.S.M.E. Trans., Vol. 46, 1924. Paper No. 1945, pp. 1131-64.

[13] Meteorologist, United States Department of Commerce, Weather Bureau, Cleveland, Ohio.

[14] Surveyor General and Chief, Hydrographic Service, Department of Mines and Resources, Ottawa, Ont.

navigation during low stages, but would not have been appreciated during the past few months by the land owners along the shores of Lake Ontario.

Major Richard Altman and Mr. Sherman Moore[15]

(The discussion on which these two collaborated expresses the privately-held opinions of both.)

The writers are in agreement with Mr. Kerry that a plea for more data on the winter temperature cycle of the St. Lawrence waters is long past due. A thorough knowledge of terrestrial heat absorption and radiation is essential to competent construction on and around the Great Lakes, and this cannot be obtained without a concentrated effort by the engineering profession as a whole. The United States Lake Survey Office has been observing and recording water-surface temperatures for many years as time and available facilities permit. At the present time, observations are being made only from the survey steamer. The amount of data collected probably is not sufficient for derivation of any set rules of ice formation.

The characteristics of snow blanketing and snow melt are under study by the United States Bureau of Reclamation, the Corps of Engineers, United States Army, and by other organizations in this country. The data are published as frequently as conclusions can be drawn from the observations made. In like manner, the United States Weather Bureau maintains a fairly dense pattern of observation stations. Weather conditions are meticulously observed and precise recordings have been maintained for a considerable period of time.

Similar activities are being carried on by the several agencies of the Canadian Government and undoubtedly these can be augmented by records compiled from the observations of individuals whose scientific approach to the problems can be assured. The efforts, then, on the part of the two governments, and of interested individuals, should act as a stimulus to the entire engineering profession.

To be complete, water temperature records, at various depths and covering a reasonably long period of time, must be analysed with proper regard to the possible influences of sun, wind, air temperature, snow, etc. Latent heat has a direct bearing on the period of time and the amount of ice that forms on the surface of lake waters; but it, in itself, is not conclusive because of changing air temperatures and changing conditions of roughness due to wind action.

Freezing of flowing water is less affected by the loss of latent heat than by movement of the mass. Flow conditions, therefore, must be considered along with other factors when considering Mr. Kerry's recommendation for transference of "hot" water from one location to another. The water may be kept free from icing by movement alone, but it will freeze over when velocity is low and depths are small.

Granting that sheet ice and float ice are the principal hazards to winter navigation in the Lower St. Lawrence, those conditions alone do not govern the desirability for winter navigation on the Great Lakes. The demands for winter shipping, when made, come from installations on shore that are affected by many conditions totally unrelated to the existence or non-existence of open navigable channels. Reaction of the boat operators to these demands is seldom, if ever, favourable because of the known tendency for mist and spray to form ice above the water line—at times it completely covers the ships superstructures to thicknesses in excess of 12 in. This added weight, combined with reduced operating efficiency, makes winter navigation risky to life and property. Consequently, before winter navigation on the Great Lakes becomes economical, the hazards cited must be eliminated or controlled. The Lake Carriers' Association and governmental bureaux of both countries have some data on these factors and perhaps would be interested in further pursuing the study.

Open channel connections that would flow free of ice are conceivable. From practical and economical considerations, however, it seems probable that the resulting detriments would greatly exceed the possible benefits. For instance, it is considered that an open channel without locks as proposed by Mr. Kerry at the Soo would require a width of about 600 ft. and a depth of about 30 ft. Such a channel, if uncontrolled, would for a time develop a flow sufficient to prevent icing because the drop between Lake Superior and Lake Huron is about 19 ft. It would also develop an outflow greater than the total mean supply of Lake Superior. This would reduce the lake level to such an extent as to render present shore installations useless and would eventually reduce the flow to less than enough to maintain navigation through the channel in any season. If the channel is constructed with locks there will not be a continuous flow, and the channel will freeze.

The watershed of Lake Erie is not sufficient alone to maintain the level of that lake. If the St. Clair River were diverted around Lake Erie, evaporation eventually would render the lake dry.

Detrimental results must be considered and outweighed by known benefits before any plan can be said to be effective. The writers, therefore, cannot concur in Mr. Kerry's recommendations. They are in firm agreement, however, with his plea for more data.

F. Graham Millar[16]

The Meyer evaporation formula was determined empirically from data observed at shore stations. No allowances were made for the frictional errors of anemometers, nor for the fact that wind velocity in the middle of a lake averages higher than at the most freely exposed shore station. Nor does it allow for the reduction in midlake of the difference in vapour pressure between the air and the water; this difference is reduced by the presence of additional vapour. On account of the formation of a vapour blanket, there is an area effect, so that larger bodies of water evaporate less per unit area than smaller ones. If suitable adjustments are made to the data, the Millar formula on page 10 of Mr. Kerry's paper gives results in fair agreement with Meyer's formula. The theoretical formula supposes the data to be measured over an infinite water surface, within the vapour blanket.

J. R. Freeman compared the evaporation by Meyer's formula with the deficit in water supply on the Great Lakes, obtained as the difference between the visible water supply and the outflow. There was fair agreement. Therefore Freeman adopted values of evaporation adjusted to give some weight to the determination by Meyer's formula on one hand, and the deficit in the water budget on the other.

H. C. Hickman did not make due allowance for the area effect when he applied the data on evaporation observed in pans and tanks to the Great Lakes. His figures are too large. The conclusion is that Freeman's estimates are better.

The constant in the Bowen ratio should be .501 instead of .46. This constant is the same as the psychrometric constant used in determining relative humidity from wet and dry bulb readings. The derivation of the constant is given in Humphreys' "Physics of the Air", pages 13 and 14. The constant found by Humphreys, when multiplied by 760 mm. normal pressure, is .501.

The pyrheliometric readings at Toronto exceed those for Chicago and Madison (Fig. 7) for June, July, and August. For other months, the agreement is excellent, but the peak rises to 1950 B.T.U./day sq. ft. for July. It is not known whether the difference is climatic or instrumental. Since radiation has economic importance in the design of heating installations for buildings, the subject is receiving increasing attention from the weather bureaux of the United States, Canada and other countries.

The components of the heat budget of lake waters due to evaporation, convection, and insolation, have been esti-

[15] War Department, U.S. Lake Survey Office, Army Map Service, Detroit, Mich.

[16] Air Services, Meteorological Division, Department of Transport, Toronto, Ont.

mated to the correct order by Mr. Kerry. The preceding considerations would effect refinements to the numerical values, but would not change them seriously. The one remaining factor, nocturnal radiation, has not been treated satisfactorily. Low clouds cut off nocturnal radiation almost entirely; high clouds have little effect. Therefore, the outgoing radiation is about equal to the radiation on a clear night, multiplied by the average percentage of sky free from low clouds.

Night data on cloudiness have only been collected by meteorological services in recent years since airlines began scheduled night operations. There is no quantitative information on this for the open lakes, though the cloudiness over the open lakes assuredly exceeds the amount over shore stations in fall and winter. The data for land stations could be applied to the St. Lawrence.

On the whole, Mr. Kerry seems to have reached a true conclusion, that a regimented St. Lawrence River could be kept virtually ice free. He is justified in calling for more data, as he has opened the door to a field of great theoretical interest and economic importance.

Charles G. Abbot[17]

I am glad to express my appreciation of Mr. Kerry's paper and my entire agreement with his basic conclusion that experimental data are very much needed in these fields. Mr. Kerry presents a valuable summary of important considerations regarding the formation and disposal of ice. One is particularly pleased by his suggestions that something helpful can be done about it. But though he points out hopeful ways of improvement, he also points out that we lack much of the data which are needed to justify the expenditure of large sums for engineering works. It is a gratification to me that my successor as Director of the Smithsonian Astrophysical Observatory, Mr. L. B. Aldrich, in cooperation with the Quartermaster Corps of the U.S. Army, has installed powerful and ingenious automatic apparatus for observing various wave-length intervals of sun and sky radiation, and proposes to make a long study at various points of the earth's surface in these lines. While these measurements are perhaps remote from Mr. Kerry's problems, it is hopeful that a great branch of public service like the U.S. War Department should see its way to cooperate in obtaining data of public value urgently needed.

Robert E. Kennedy[18]

The writer has been especially interested in the use of the energy equation as set forth in Richardson's paper and cited by the author.

The main handicap to this theory is the lack of data, but progress has been made since that paper was issued, notably in the measurement of atmospheric radiation. Prof. Richardson's equation for back radiation may well be superseded by Elsasser's Radiation Chart.[19]

The construction and use of this chart was made the subject of lectures 14 and 15 by J. R. Fulks, Weather Bureau, Washington, D.C. at a Regional Technical Conference at Oakland, Calif., 1941. The lectures were out of print when the writer inquired in 1943. They may be available now. At least they should be, for the writer found them helpful.

The author mentions the Bowen ratio. In English units of inches and degrees Fahrenheit it is:

$$R = 0.01 \frac{P}{29.92} \frac{(T_w - T_a)}{(E_w - E_a)}$$

This relationship is still the subject of controversy twenty years after it was first published. An excellent discussion of its validity by H. V. Sverdrup is available in a separate section of the Annals of the New York Academy of Sciences.[20]

H. C. Hickman[21]

The subject of Mr. Kerry's paper may appear to be academic, at the present time, but it becomes more and more important as the economic growth of the Great Lakes-St. Lawrence area continues. A complete revaluation of our water resources remains a vital necessity.

I propose to duscuss four inter-related subjects which have been considered in the preparation of Mr. Kerry's paper and in which I have a special interest, namely:

1. The lack of hydrological and meteorological data in the Great Lakes—St. Lawrence basin;
2. The inadequacy of present evaporation formulae;
3. The feasibility of warm water channels;
4. The importance of a new International Policy towards conservation of water resources.

Speaking only for the United States, the lack of hydrological and meteorological statistics, not only in the St. Lawrence basin, but throughout the nation, is a national disgrace. The necessity for scientific facts which can be used to solve an emergency problem seems to become apparent only when the problem arises. For instance, government agencies have been collecting rainfall data at various locations for over a hundred years. The locations have been selected by chance with no consideration for all problems involved and, as a result, the meteorological coverage for large areas is woefully inadequate.

Inadequacy of records extends to most other hydrologic fields. Discharge records on the tributary streams of the Great Lakes, for instance, are better in the Canadian wilderness than they are in the populated areas of the Border States. This condition is due primarily to the understanding of Canadian agencies regarding the problems involved, and the lack of foresight on the part of American political agencies. The fact still remains, however, regardless of conditions, that no one single stream in the Great Lakes-St. Lawrence system is adequately gaged. Very little, if anything, has ever been done on the investigation of ground water storage, snow surveys, lake currents, lake temperatures, land evaporation, and evaporation from open water surfaces. The only careful, long range investigation of hydrologic factors in the lake regions worthy of the name has been the work of the United States Lake Survey on discharge through the connecting channels of the Great Lakes and the records on lake levels. These records are necessary for the maintenance of channel and harbour depths for navigation. Whenever we plead for better data the answer is always "Why spend public money for purely academic research. We have water to waste in the Great Lakes area." Maybe so, but let me mention some of the results of such a policy.

In the Thumb District of Michigan, the farmers and many of the villages and towns are concerned because their wells have gone dry, despite the fact that rainfall, lake levels and snow-melt all appear to be above normal, while population and industrial demands have remained constant. Similarly the area around Wausseon, Ohio, in the Maumee River Valley, is experiencing a serious ground water shortage, so serious that farming and industrial operations may have to be suspended. Cities in Michigan are now required by law to treat their sewage wastes because our streams no longer are able to dissipate these wastes due to decreasing stream flow. We do not have an unlimited supply of water in the Great Lakes area, and unless we begin *now* to keep accurate scientific records on all factors of the hydrologic equation, we may in the very near future be faced with a problem we cannot solve.

[21] Formerly Captain, Corps of Engineers, War Department, Detroit District, Detroit, Mich.

We are dissipating our water resources at an alarming rate. We *must* collect the necessary scientific data so that we can intelligently face the future. We must devise a plan for conservation of water resources backed by reliable hydrological and meteorological statistics.

The remarks I have just made regarding lack of data are very well illustrated in Mr. Kerry's paper. Take just one item—the inadequacy of present evaporation formulae. Investigations into this factor of the hydrologic equation have been made and have been based on the fundamental equation of differences in vapour pressures or upon one of the popular solar radiation equations. All evaporation formulae have had their individual uses and each in itself contributes to the knowledge of hydrology. Records on evaporation, however, have not been kept for a long enough period to determine what formula is best suited to Great Lakes conditions. No formula that I investigated in my studies on water losses from the Great Lakes would give me accurate results through a temperature range in water temperatures from 33 deg.F to 85 deg.F. and through a range of air temperature from 10 deg. below zero to 95 deg. above. No one, in studying losses from large bodies of water, had ever considered evaporation as an important factor during winter months. They knew the lakes were not entirely frozen over during winter months but they assumed that at low temperatures air could not possibly carry much suspended water vapour.

But, during winter months, such evaporation does take place and at a rapid rate. There are two reasons: one—because whenever there is a difference between water and air temperatures, regardless of whether the air temperature is above or below that of the water, conditions are such that water vapour is given off from the body of water; and, two—vertical air currents over large bodies of water carry away vapour at a tremendous rate, the latter condition not being reflected in most evaporation formulae.

In reviewing Mr. Kerry's paper, I find that my monthly values of evaporation from Lake Huron, when used in his calculation for rate of heat loss in B.T.U. per sq. ft. per day from open water surfaces, give the best results. Mr. Kerry has used a purely scientific computation which any engineer can check. His results compare very well with computations made in other parts of the country under decidedly different conditions. None of the other evaporation formulae when applied to Great Lakes conditions give him a value which will even approximate the figures he used. I point this out, but do not attempt to criticize other formulae as such. All I say is that we know very little about certain factors of the hydrologic equation, and unless we start to collect records, and study them, there may come a day in the near future when we shall be in a tight spot.

To pass from the scientific portion of Mr. Kerry's paper to the practical, I feel that without the necessary data to approximate a preliminary design, one cannot even guess at what would be necessary to provide warm water outlets for winter navigation through the lakes. The scheme as presented seems within the realm of possibility from a scientific standpoint but I do not know whether it is practical from an economic standpoint.

The channels of the Great Lakes have been greatly improved during the last 50 years. I believe that water transportation in the Great Lakes area is here to stay, modified perhaps in the years to come. In any event, the final plans for the St. Lawrence Waterway should not be completed until the question of providing for warm water channels has been thoroughly investigated.

During the last five years we have been confronted with navigation and water supply problems of major importance. There has been a demand for deeper drafts in our navigable channels. Shall we deepen channels and build more vessels, or shall we increase the navigation season by building all-year channels? If we had the necessary scientific data, we could determine what the economical answer should be.

Similarly, certain industrial and metropolitan areas are at the peak of their productivity and growth because their water resources are being depleted. We must begin to study the problem from a scientific standpoint. This cannot be done on a small scale by local communities.

I should like to close my discussion with a request which will summarize Mr. Kerry's paper and the remarks I have just made, namely:

> That an International Hydrological and Meteorological Joint Commission be appointed by The Engineering Institute of Canada and the American Society of Civil Engineers for the purpose of—
>
> 1. Formulating long range plans for the conservation of water resources in the Great Lakes-St. Lawrence Basin;
> 2. Collecting and analyzing hydrologic and meteorologic data necessary to the successful operation of the above plan;
> 3. This commission should have the sanction of both the Canadian and American governments and further, public funds should be appropriated to carry on its work.

W. L. Bird, M.E.I.C.[22]

The outlet of the Kaministiquia Power Company lakes has been found to remain open during the most extreme sub-zero weather. Figure 10 indicates conditions at outlet of our Dog Lake storage dam where a 12 in. overflow over our spillway dam keeps channel open for 300 ft. above the dam, as well as below, even in extreme sub-zero (38 deg. below zero) weather. We thereby free our dam of ice pressure hazards.

At our reservoir control dam at Kakabeka Falls, we use an air bubbler system for the same purpose, which it does most effectively. At this point we closely conserve all water waste.

In the winter of 1936, we were faced with the advisability of lowering lake storage in anticipation of an advance of heavy spring freshets. On March 18, 1936, we increased the flow from Dog Lake dam from 1100 to 1800 cu. ft. per sec.

By March 31st, the river had opened clear to Dona, some 18 miles below the dam, and continued to open clear to Kakabeka Falls, some 35 miles below Dog Lake dam, before the tributary creeks and streams opened up.

During the period in question, the temperature frequently dropped below zero as late as April 8th.

An aerial observation was made confirming these conditions. The spring freshets did not commence until April 17, 1936.

Our Dog Lake dam discharge is by means of underflow gates which draws the warmer water from 20 ft. below lake level. Dog Lake is at elevation 1380, and is located about

[22] Vice-President and Manager, Kaministiquia Power Company Limited, Fort William, Ont.

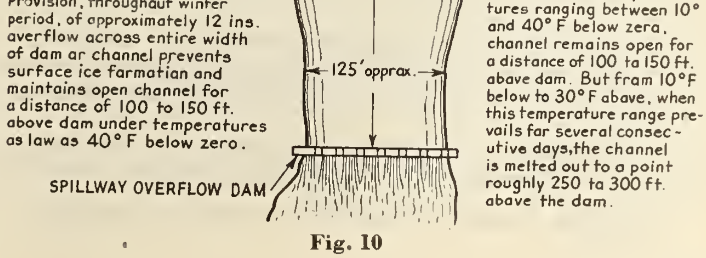

Fig. 10

50 miles northwest of Fort William on Lake Superior. Minimum temperatures are around 30 to 40 deg. F. below zero and have been as low as an extreme of 50 deg. below.

Based on our experience, I would say there are possibilities along the lines proposed by Mr. Kerry. While making these observations, I am not entering into the problem of economics or other difficulties involved under all our extremes of climate.

Frederick W. Cowie, M.E.I.C.[23]

Mr. Kerry's paper is a work showing much study. It mentions authorities such as T. C. Keefer, John Kennedy, and Dr. Barnes, whose names bring to mind much of success and of failure.

Thos. C. Keefer, as consultant on the construction of the Victoria Bridge in 1860, has never received the credit his country should have bestowed.

John Kennedy was a mechanical genius, of a family well known for invention and design.

Of scientists, Dr. Barnes was prominent in ice engineering. For many years he investigated our ice and frazil problems.

However, credit is due not only to Barnes, Kennedy and Keefer, but also to Dr. Robert Bell, the geologist, to Murphy of Ottawa, to Wilson of the Light Heat & Power, who, with Holgate, experimented and nearly won the battle of frazil.

At the time of the Montreal Flood Commission in 1886-87, Mr. Keefer sent me as observer to Lake St. Peter to find out how the ice took. The ice on the lake started to form on the shallows, and due to shipping and gales, was swept down to Nicolet and Pointe-du-Lac, where it grounded in side jams and, on December 1st, closed the gap.

The next event was the trial of three armoured tugs at Sorel. They could rip through 6-in. ice, buck 8-in., and, working together, break through 10-in. ice. But they had difficulty in keeping their condensers from choking from "snow ice" floating under the channel ice. This was frazil from Lachine Rapids.

Then the young observer was sent to Ottawa for consultation with Dr. Robert Bell, Geological Survey. Dr. Bell said he knew a lot about anchor ice. It formed under water on the rocks on a cloudy day and floated in sunshine. It did not form under a bridge or close to a shelving rock. It floated in rapids in lines of the swiftest water.

Then, in Montreal, there was a jam early in April 1887. Over the wharves, up to Beaver Hall Hill. What a flood! The jam was from Laprairie to above Longue Pointe. Experiments to break it were made with black powder, Giant powder, nitroglycerine, and 60 per cent dynamite. The last was the best. The first lot during good sleighing passed over the Laprairie road, the second was halted by the police opposite the City Hall. The iron shod runners grinding on the pavements caused a shower of sparks which did not look well under a loard marked "Dynamite—Dangerous". Go on? No! Go back? No! What could a poor man do?

But the dynamite was safely taken to a warming shanty on the ice, and the observer, unlucky as being the only bachelor, had to handle the job. It all had to be exploded before the break-up, which looked imminent. The next day, the ice bridge broke, but away over on the south side more than half a mile from the nearest shot.

From personal observations made at that time, and from personal observations of the work of the *Lady Grey*, the *Ernest Lapointe*, or the *N. B. McLean*, I am convinced that such ice breakers could have broken the 1887 undynamited ice-jam in a week.

In 1905 the Transportation Commission presented a splendid report and the result was the putting into operation of the Ice Breaking Service of the River St. Lawrence Ship Channel.

Now comes a question for Mr. Kerry: At the present time, when research is the vogue, do you suggest the use of atomic heat to warm the waters of our lakes or rivers, so that ice will not be the menace of winter navigation?

Can scientists produce split atoms which will, in any form possible, apply such intense heat without danger to fish life or any other life? Can Mr. Kerry answer that?

[23] Consulting Engineer, Montreal National Harbour Board, Montreal, Que.

J. K. Sexton, M.E.I.C.[24]

Mr. Kerry has dealt with ice control from the point of view of navigation. In the case of irrigation or hydro-electric work, it is frazil and slush that have to be controlled instead of sheet ice. When an ice cover forms on a reservoir or canal, it provides effective insulation to reduce heat losses, and, as a general rule, puts an end to the hydro-electric engineer's troubles. However, in the case of canals it is not always feasible to reduce velocity sufficiently to permit the formation of such an ice cover.

Over the past few years, the Montreal Engineering Company has been investigating both methods of heat conservation described by Mr. Kerry, namely:

1. Raising the temperature of reservoir discharge by withdrawing water from as great a depth as possible.
2. Lowering heat losses from open water surfaces in canals by reducing the ratio of surface area to discharge.

Using Negretti and Zambra deep sea thermometers, sub-surface water temperatures have been measured at several lakes in Alberta, Nova Scotia and Newfoundland to determine the temperatures available at various depths. This work has been carried on chiefly in winter time when it could be fitted into the routine of the operating staff. Hence, continuous records are not yet available. Wherever the ratio of inflow to reservoir volume was low, the sub-

[24] Montreal Engineering Company Limited, Montreal, Que.

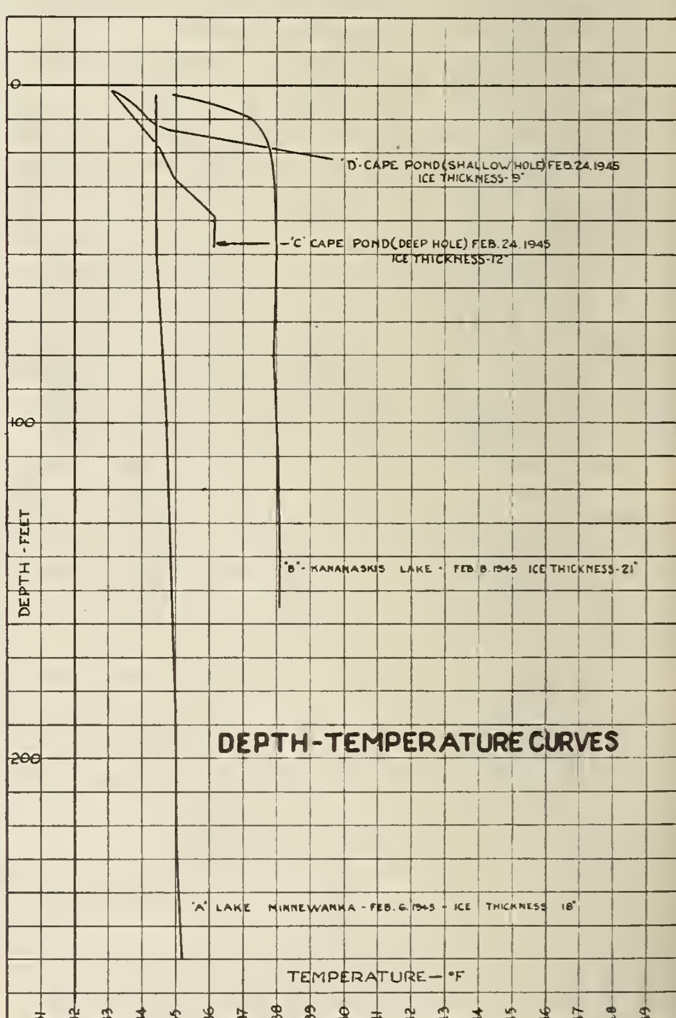

Fig. 11

surface temperatures were found to be well above 32 deg. F. after the formation of an ice cover. However, much variation was encountered in the depth temperature curves, even for lakes in the same locality. This is illustrated by the curves in Fig. 11. Curve A shows the temperatures of Lake Minnewanka near Banff, Alberta, on February 6th, 1945. Throughout a depth of 260 ft., the temperature was near 35 deg. F. Curve B shows conditions existing at Upper Kananaskis Lake, 48 miles to the south, two days later. The latter lake, although shallower, had a temperature of 38 deg. F. between depths of 25 and 165 ft. Curves C and D show conditions existing in the shallow Cape Pond in Newfoundland on February 24th, 1945, the former being measured near the centre of the lake and the latter in shallower water near the edge. These conditions are fairly typical of Newfoundland lakes.

Unlike the lakes of Newfoundland, those of Alberta appeared to have a fairly constant temperature gradient over their entire area.

The important thing from the hydro-electric point of view is that the evidence to date indicates that the deep, warm water can be drawn off throughout the winter at a temperature corresponding to its elevation. This is illustrated by the curves of Fig. 12 for the Ghost reservoir in Alberta on December 21st, 1944. Curve A was measured 200 ft. from the intake, and Curve B was measured at a further distance of some 2000 ft. in the Ghost arm of the reservoir. It will be noted that the temperature of the tailrace discharge corresponded closely with that of the elevation of the intake. This close relation was found to continue throughout the winter.

As for the heat losses from exposed water surfaces, we have accepted the figure of 95 BTU./°F. /sq. ft./day recommended by the Joint Board of Engineers in their

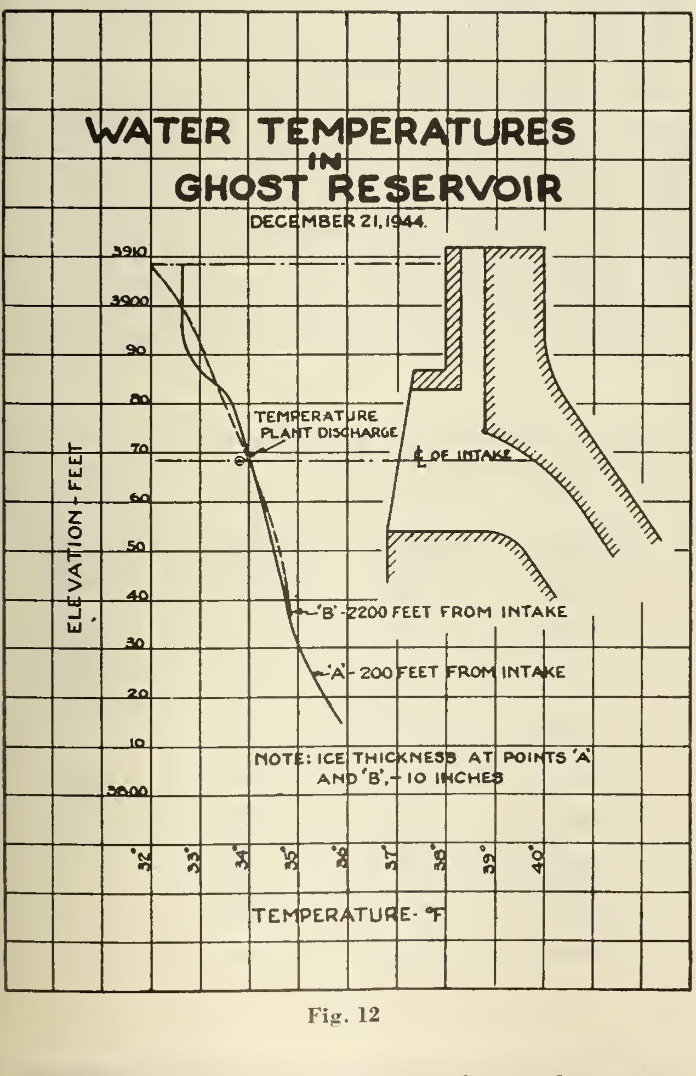

Fig. 12

1926 report. During the past two winters a number of attempts have been made to check this value on the LaManche Canal in Newfoundland but to date the results have shown a great deal of variation. Some of these may be eliminated as our technique improves. On the whole, the average values of the heat loss constant found have been lower than that of the Joint Board. This is probably due to the shelter from transverse winds that is provided by the comparatively high banks of the narrow canal. Results indicate that wind velocity may cause more variation in the heat loss than other factors.

The case of the LaManche Canal mentioned above offers an example of successful application of heat conservation theory. This canal, some 3 miles long, forms part of a chain of lakes and streams supplying water to the Rocky Pond and Tors Cove power developments. Water is discharged through the control structure at the outlet of Cape Pond. From there it flows down two miles of rapid, open river channel, before being diverted into the canal in question, where it continues at too high a velocity to permit the formation of an ice cover. On starting up operations in 1942, it was found that by the time the water reached the diversion dam in cold weather its temperature had dropped to 32 deg. F. and serious ice troubles developed in the canal. Using a heat loss constant of 95 Btu./°F./sq. ft./day it was calculated that the freezing point could be moved sufficiently far downstream to avoid this trouble if the area of exposed water surface between the control and diversion dams could be greatly reduced, and if the temperature of the discharge from Cape Pond could be prevented from falling much below 33 deg. F. To meet the first requirement, a deep, narrow canal with high velocity was substituted for the two miles of river bed between the two dams. An attempt to meet the second was made by placing a curtain wall in front of the stoplog openings at Cape Pond dam in order to draw off water from as great a depth as possible. Owing to the shallow depth prevailing at the outlet it has not always been possible to obtain discharge water at 33 deg. F., but apparently the temperatures obtained have been sufficient to improve operating conditions materially. The remedial measures have now been in effect since the fall of 1944 and no serious ice troubles have occurred since that time.

E. B. Strowger[25]

In his paper, Mr. Kerry has presented the analysis of a great mass of data which should encourage a comprehensive scientific study of the temperature cycles of the Great Lakes and of the possible beneficial use of the stored heat energy they contain.

Under the heading of "Sheet Ice", the author pleads for an extended survey on ice formation and ice movement on the Great Lakes, including a study of the possibility of designing and constructing detour channels and of creating barriers to keep the ice from the natural channels. In this connection it may be of interest to mention the operations of The Niagara Falls Power Company in combating ice troubles.

It is generally agreed that ice troubles in power plants occasioned by frazil and anchor ice will not exist provided the intake canal and the river above the intake have a sufficiently thick coating of ice. The problem of providing a means to get rid of the sheet ice as it is broken up would still remain, however. In the case of The Niagara Falls Power Company, sheet ice is taken care of by means of floating booms installed parallel to the flow of the river. The booms, which are chained to concrete piers, prevent the floating ice from entering the intakes of the power canals and power tunnel. The velocity of the water underneath the booms is kept low and for this purpose a channel has been dredged out from the main power canal to a point beyond the booms. When ice tends to clog the river channels

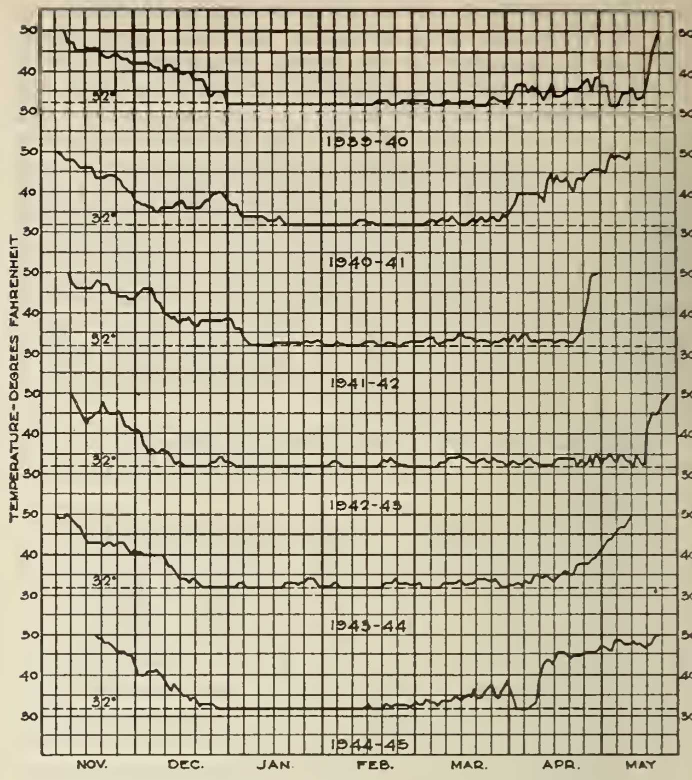
[25] Hydraulic Engineer, The Niagara Falls Power Company, Niagara Falls, N.Y.

near the boom structure, ice breaker tugs are put in operation. Any sheet ice which does get beneath the booms and into the power canal is removed at the gate house near the power plants by means of an ice skimmer and mechanically operated rakes, or is passed through the turbines which generally are operated in the winter time with racks withdrawn.

One problem connected with Niagara River operations is the formation of ice jams in the upper river. These have formed in the shallow water at the head of Goat Island, have extended upstream on the river shoals and have at times gradually encroached on the deeper channels. On several occasions the jams have reached the boom structure referred to above, and have caused serious power plant interruptions. This condition has not been experienced to any serious degree during the last four years because of the existence of relatively high lake stages and the building of the Niagara River submerged weir in 1942 in the Canadian channel of the Chippawa-Grass Island pool, a short distance upstream from the first cascade. The weir was built for the purpose of improving conditions for the generation of power because of the war emergency and at the same time for improving scenic conditions. While not enough time has elapsed since the construction of this weir to subject it to the most severe conditions which might prevail, so far it has been considered as very successful.

The weir has increased the levels in the Chippawa-Grass Island pool and thus has improved the conditions at the power plant intakes which draw water from this pool. It has also increased the discharge of the channel leading to the American Falls from approximately 9,400 to approximately 18,000 cu. ft. per sec. for a given total river flow and thereby acts to sluice more ice past the intake structures.

In order to be prepared to schedule river tug operations and the "pulling" of the steel racks, a record of the temperatures of the Niagara River water and of the levels of the river and of Lake Erie are kept. A series of winter temperature readings for the last twelve years are shown in Figure 13. During each of the winters of 1935-36 and 1937-38, there was a long period when the water temperatures were at or near 32 deg. F. During these two seasons there were severe ice jams in both the upper and lower sections of the river, the worst conditions existing in 1935-36 when the lake and river stage was extremely low. The effect of the ice jams resulting from the combination of low levels and the extended cold period upon power plant operations at Schoellkopf Station is shown in Figure 14 by the low levels existing at the Grass Island gauge for part of January and a major portion of February 1936, this



SURFACE TEMPERATURES OF NIAGARA RIVER WATER
TAKEN AT SCHOELLKOPF STATION OF
THE NIAGARA FALLS POWER Co.

Fig. 13

gauge indicating the head water level of this development. Similarly, the rise in level of H.E.P.C. gauge No. 12 shows the rise in tailwater level at the Queenston plant of the Hydro-Electric Power Commission occasioned by the ice jam in the lower river during this period.

Mr. Kerry points out that the studies of Mr. Church on the surface and subsurface temperatures of Lake Michigan indicate that the "water temperatures at depth coincided almost exactly with those on the surface". It should be noted that all of the curves derived from Mr. Church's observations except possibly one, shown in Figure 4, are based upon observations taken when the lake is at or near the temperature of maximum density of water; that is, 39.4 deg. F. It should perhaps be pointed out that, at this temperature, it is reasonable to expect a uniform tempera-

Table VI

Surface and Subsurface Temperature Measurements on Six Reservoirs in New York State

Reservoir or Pond	Trenton Falls	Caroga Lake	Inghams	Flat Rock	Pecks	Hinckley
Character	Small pond with large outflow	Small lake with small outflow	Small pond with large outflow	Small pond with large outflow	Large pond with small outflow	Large reservoir with large outflow
Date of Observation	1/29/29	2/15/29	2/6/29	2/9/29	3/16/29	1/30/29 and 3/19/29
Ice Cover	2¼″ to 4″	19″	27″	Not measured	18″	15″
Outflow—cfs	1200	0	446	—	0	—

CHART SHOWING EFFECT OF LONG LOW TEMPERATURE (WINTER OF 1935-6) AND LOW WATER STAGE ON FORMATION OF ICE JAMS IN NIAGARA RIVER

Fig. 14

ture gradient. Where the surface temperature of a large deep reservoir drops below that corresponding to maximum density and approaches the freezing point, the temperature increases rather rapidly with depth, the temperature near the bottom approaching 4 deg. C. (39.4 deg. F.).

During the winter of 1928-29, the Hydraulic Power Committee of the Empire State Gas & Electric Association, of which the writer was a member, made observations on the temperature gradients in six reservoirs in New York State using accurately calibrated deep sea thermometers of the inverting type.

The purpose of this work was to ascertain what the variations were and the conditions under which temperatures were extremely close to freezing or measurably above that point.

Tests made to ascertain the characteristics of the thermometers used showed them to have an accuracy within approximately 0.01 deg. C. The committee measured the sub-surface temperatures of six reservoirs varying in size from a small pond of 11 mcf capacity to a large reservoir having a capacity of approximately 3.5 bcf. Some of the results of the observations are shown by Table VI and by Figure 15.

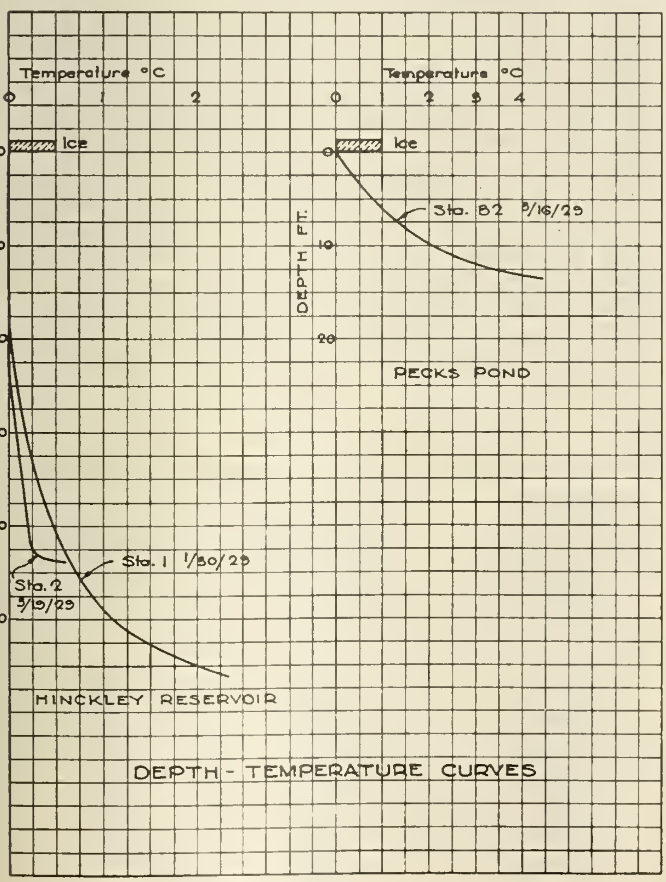

Fig. 15

The committee concluded that large bodies of water with small outflow and inflow assume maximum temperatures near the bottom of approximately 4 deg. C. As the ratio of inflow to capacity increases the maximum temperature falls as well as the temperature gradient from the undersurface of the ice to the bottom. Where the surface temperature is close to 0 deg. C., the temperature gradient increases from the underside of the ice to the bottom of the pond in a form approximating a parabolic curve with the vertex at the bottom of the pond.

The Author

The most important feature in the discussion on this paper is the unanimity of opinion of all contributors as to the desirability of further research into the annual temperature cycle of the waters of the Great Lakes and of the St. Lawrence River. The variations from year to year in the results obtained by Professor Church and by Mr. Millar indicate that dependable conclusions cannot be reached until a long series of observations has been made available. It is not to be expected that the results obtained by Professor Church on Lake Michigan will prove to be sure guides for estimating the temperatures of the other lakes during the winter months.

In view of the opinions expressed by so many members of mature experience, the Council of the Institute surely would be justified if it decided to draw the attention of proper authorities both at Ottawa and at Washington to the desirability of an extensive international study of the whole question of these water temperatures. The profession will not be in a position to make beneficial use of the stores of natural heat in the Great Lakes until engineers' observations have been co-ordinated with conclusions drawn from scientific study by geophysicists.

This question is perhaps more important to Canada than it is to the United States because in Canada the ice problem becomes increasingly more difficult to deal with as one goes northward from the border line, whereas it steadily diminishes in importance and finally disappears altogether as one goes southward. Any lessons learned on the St. Lawrence River can in the future find applications in such rivers as the Nelson, the Saskatchewan, the Peace and the MacKenzie. The MacKenzie River resembles the St. Lawrence in the great area of its tributary lakes and, no doubt, much can be done to increase the beneficial use of its waters by storage and by temperature control.

The comments of Dr. Abbot, who became internationally famous for his studies of solar radiation, show how much his work must have been hampered by official indifference to his aims and by lack of financial support. Steady pressure from a great organization like The Engineering Institute of Canada would help to secure proper official support for the needed studies of water temperatures.

The problem, however, has not been altogether overlooked. The contributions to this discussion of Dr. Hewson and Mr. Millar of the Dominion Meteorological Branch, of Messrs. Rose and Kennedy of the U.S. Reclamation Service, and of Mr. Moore and Major Altman and Capt. Hickman of the U.S. Lake Survey are evidence to the contrary, but there is no evidence that government, either in the United States or in Canada, has seriously attempted to find out how much conditions in the winter months on the major interior waterways of the continent can be improved.

It is interesting to compare the simultaneous records from the work of Professor Church and of Mr. Millar.

	1941–42	1942–43	1943–44
Av. winter temp. at Muskegon, Mich. (Church) four months, Dec. to Mar., incl.	28.0 F	22.6 F	27.1 F
Av. winter temp. at Kingston, Ont. (Dom. Metero. Observ.), four months	23.4	19.8	22.8
Lowest isothermal temp. of Lake Michigan (Church)	36.5	32.9	35.0(Est.)
Lowest surface temp. of Lake Ontario—in mid-lake (Millar).	36.0	34.5	34.5

It will be noted that Lake Ontario does not respond as quickly to major changes of air temperature as does Lake Michigan. Considering the differences in the methods of observation and of deduction, the results of the two series of observations are in very fair accord and they furnish data which may be used in estimating the possible temperatures that would be found in a canalized St. Lawrence River. It is fortunate that the records of both observers extend over the exceptionally cold winter of 1942-43.

If Professor Church's estimates of total heat content of Lake Michigan for that winter are plotted, they will be found to outline a smooth curve from which the rate of heat loss at ten day intervals can be determined. The same is true of Mr. Millar's records of the surface temperatures of Lake Ontario, although being surface temperatures, they are somewhat less regular in their rate of fall.

Assuming a canalized river of 64 ft. depth with an average current velocity of two miles per hour and a defined width sufficient to provide for the necessary discharge of the river, the results shown in Table VII can be calculated from the data taken in the winter of 1942-43.

Column 2 has been read off from a smooth curve drawn through a plotting of Mr. Millar's observations.

Column 3 has been calculated on the assumption that each sq. ft. of water surface is underlain by 4000 lb. of water which is true for a depth of 64 ft. The figures give the number of B.T.U.'s required to raise the temperature of 4000 lb. of water from 32 deg. F. to the temperature indicated in Column 2.

Column 4—The heat loss per sq. ft. per day used in calculating Column 4 has been read off from a smooth curve drawn through the points determined by Professor Church's figures. It has been assumed that the average time required by the waters to flow from Lake Ontario to Montreal will be four days. The assumption is in rough agreement with a steady current speed of two miles per hour.

Column 5 has been determined by subtracting the figures in Column 4 from those in Column 3.

Column 6 has been arrived at from the figures in Column 5 by reversing the calculating process used for Column 3.

Whether a rate of heat loss derived from Lake Michigan can properly be applied to the waters of the St. Lawrence River is a matter that can only be determined by further studies. Professor Church's rates of loss per sq. ft. per day, during the month of December, are at least in agreement with the severest losses recorded by the Joint Board of Engineers in their studies made in December of the years 1923-4 and 1924-5 on the St. Lawrence River.

Attention should be drawn to the effectiveness of internal motion in a water mass in preventing the formation of an ice crust over open water, whether such motion is caused by wind or by the flow of the river. The cause of such currents in the Great Lakes is at present receiving much attention.

It was suggested during the discussion of this paper at the Annual Meeting that the design of the channel of the St. Lawrence Waterway should be based on the principle of heat conservation. This requires the narrowest channel economically possible and a current velocity to be limited only by the demands of navigation.

It was with this principle in view that the current velocity of two miles per hour and the channel depth of 64 ft. used in the calculation of Table VII were adopted. In the St. Lawrence River, both the depth and current velocity could be controlled by the designing engineers.

Professor Angus has raised the question of ensuring the flow of "warm" water into the canalized river. This problem troubled the author until the records of the work of Professor Church came into his hands. It may be assumed for the present that the waters in the great pool of Lake Ontario are isothermal in winter, like the waters of Lake Michigan, and if the entrance into the river is moved far enough westward by the construction of guard embankments it will ultimately reach the isothermal area where nothing but "warm" waters are present. The section of Lake Ontario lying between the present west end of the river and Galloo Island is relatively shallow and will cool off rapidly. To reach the deep pool lying west of Galloo Island is a formidable undertaking but is necessary if the river is to be improved to the best advantage.

Mr. Brace has raised the question of testing, on a substantial scale, the theories of temperature control. Possibly if the temperatures of the deep pool of Lake Ontario were determined by the methods developed by Professor Church and if a series of carefully taken temperature measurements were made in the late fall on such waterways as the long reach of the Welland Canal or the headrace of the Beauharnois Power Company's development, satisfactory data as to the amount of heat available and as to the rate of heat loss could be secured for design purposes. These waterways are of such length that temperature changes in the water passing through them could be recorded and they are of uniform cross section and depth.

Mr. Brace also deprecates possible delay in this great enterprise arising out of changes of plan, but points out

Table VII

Date	Surface Temp., Lake Ontario F.	Heat Content under 1 Sq. Ft. of River Surface at Lake Ontario B.T.U.'s	Loss of Heat from 1 Sq. Ft. of River Surface During Four Days' Flow B.T.U.'s	Heat Content under 1 Sq. Ft. of River Surface on Arrival at Montreal B.T.U.'s	Isothermal Temperature of River at Montreal F.

that the official plans for the waterway east of Lake St. Louis must be revised owing to the growth of the city of Montreal. The author thinks that at this point the waterway should be within the present bed of the river at Lake St. Louis level as far east as Longueuil. The large quantities of embankment material needed could most readily be secured from the bed of Lake St. Louis by modern construction methods.

It is unfortunate that the contours of the rock underlying Lake St. Francis and Lake St. Louis have never been determined by geophysical surveys. The position of these contours might determine the location of the 64 ft. deep channels across the two lakes. The construction of such channels would involve the movement of immense quantities of material, but only a relatively small cash outlay if modern gold dredging methods were used.

The only other immediate modification of the official plans which seems advisable to the author is the deepening of the cut across the Galops Ridge to give a depth of 64 ft. The material from this cut could well be used to build a dividing embankment across the pool extending from Brockville to the Galops so that the working cross-section of the river at this point could be reduced to the area required by the heat conservation principle.

Assuming the construction of the proposed Barnhart Island dam, the St. Lawrence River from Galloo Island to the dam will be so deep that only moderate local excavations will be needed for a 64 ft. waterway, provided always that the cut across the Galops Ridge has been made to full depth. The conclusion to be drawn from the evidence now available indicates that the creation of an always open waterway between Lake Ontario and Montreal is simply a matter of proper authority becoming willing to undertake the necessary expense of construction.

The other plea in the original paper, namely the need for a scientific study of the drift ice on the Great Lakes, has evoked hardly any discussion, probably because the subject has suffered from almost complete neglect. The author has no doubt that scientific study will show that this difficulty can be greatly lessened but the problem is so great and it is so much affected by local conditions that it cannot be profitably discussed until comprehensive surveys of the life cycle of such drift ice have been made and studied.

Mr. Cowie's reminiscences of the work of the Montreal Flood Commission are interesting and point out a line of attack that may be wisely used as a precedent in future work. They are also a timely and kindly tribute to the memory of the great engineers who fathered the Institute in its boyhood days.

Forty years ago Mr. John Murphy taught the engineering world how to keep its metal structures free from ice adhesion and reduced that problem to one of operating expense. Mr. Murphy's contribution to this discussion might point the way to deal with the icing of ships during winter storms. The great freighters are constantly wasting much heat from their condensers that might be used in winter.

The application of first principles to overcome ice difficulties as developed by the Montreal Engineering Company is most interesting. This practice might be extended where natural conditions are favourable by one further step, namely to see that the stored reservoir waters are brought to the highest possible temperature in summer. Opportunities for such practice are rare except in the mountains, but there the Montreal Engineering Company has been active. This possibility can be illustrated by a fantastic example. Most Canadians are familiar with the locations of Lake Champlain and Lake George. Lake George has an area of 44 sq. mi. and its water level is about 30 ft. above Lake Champlain. The dividing ridge is in places less than three and one-half miles wide. The author has seen no record of soundings in Lake George but assumes that its topography is similar to that of Lake Champlain, narrow and of great depth. Mr. Rose's very accurate depth-temperature curves as contributed to this discussion show that there is little change in the temperature of the waters of such a lake below the 50-ft. depth level. The deeper waters remain at a temperature close to 39 deg. F. Topographical maps show that no serious physical divides exist between Lake George and the upper reaches of the Hudson River, a swift mountain stream. Following a practice employed in British Columbia, it would be a not difficult engineering feat to drain Lake George into Lake Champlain by a low level tunnel, which would draw off all its colder waters. These could be replaced by a diversion in summer of the flow of the upper Hudson River with temperatures well in excess of 60 deg. F., thus raising the temperature of the whole content of Lake George to a figure never recorded in any natural lake of like dimension and location. No material gain could develop from this practice unless and until the engineer-inventor of the future has developed a method of insulating large bodies of water from surface heat losses or of reducing the rate of surface loss very materially. If this should be accomplished, the practice would provide a simple means of raising the temperature of adjoining rivers in cold winters by perhaps two or three degrees F. Even without insulation, the warmer the waters of the reservoir are, the longer they will take to cool down.

Mr. Peters has questioned whether the creation of the open waterway would adversely affect the natural evaporation losses from Lake Ontario. The author thinks that this is unlikely but the question could wisely be studied by the trained meteorological staffs of the United States and Canada. The proposed change would result in the earlier freezing up of certain areas at the east end of Lake Ontario, thus reducing evaporation losses but would also increase to a nearly compensating extent the open water surface between Kingston and Montreal thus increasing evaporation. The total draught from the Great Lakes would not be affected by the proposed improvements as this will be under direct control at the Barnhart's Island dam.

Dr. Hewson's comment concerning the effect of the obliquity of the sun's rays should not be overlooked. This effect has been noted by many engineers who have worked on the more northern areas of Canada and adds greatly to the difficulty of removing ice obstruction from Canada's more northern waterways in spring.

Mr. Bird's experience on the Kaministiquia River suggests a possible means of keeping such harbours as Port Arthur open throughout the winter. Thunder Bay is relatively shallow but it is close to the very deep waters of the Isle Royale Channel where the continued presence of "warm" waters may be safely predicted. It is only a pumping problem and not too great a one at that to drive a great river of "warm" water into Thunder Bay with the aid of such guide embankments as a study with models would indicate to be necessary. The "warm" waters might be as much as 24 hours in circuit and certainly would not cool off completely in that time. The action of the pumped waters and their relatively high temperature would prevent the formation of ice cover over a selected area in the main harbour.

The comments of the trained geophysicists, Dr. Hewson, Mr. Millar and Mr. Kennedy are all very much to the point and indicate how wide a field the St. Lawrence problems offers to men of their experience and training.

The criticism offered by Mr. Andrus of the wording of the third tentative conclusion given in the paper is well founded and the conclusion would have been more accurately stated had his wording been used.

The vigorous discussion sent in by Captain Hickman covers a much wider field of hydrological study than has been dealt with in the paper. His views on water conservation merit very close attention. It will be gratifying to him to note that his recommendation for the appointment of an International Hydrological and Meteorological Commission has been endorsed by so many contributors to this discussion.

The author is pleased to note that Captain Hickman with his wide opportunities for observation, considers the open waterway to be a scientific possibility although he is uncertain concerning its economic value. The author, in preparing the paper, rigidly excluded all thought of economics from his field of consideration. The purpose of the paper was to expose the suggestions contained in it to a purely technical criticism by his brother engineers. The economic study of the project may properly begin, now that so many contributors to the discussion have recognized the value of the scientific facts upon which the outlines for the projected improvements are based. Whether the benefits to be secured by such a piece of construction justify the cost involved is a matter that lies outside the proper field of activity of the professional engineer.

The author has not studied the possible use of atomic energy as a source of heat as suggested by Mr. Cousins and Mr. Cowie nor the possible use of the internal heat of the earth. The author questions whether the use of such aids will be found to be necessary on the St. Lawrence waterway, but their possibilities should be known as providing reserves to be drawn upon under abnormal conditions.

The author is glad to note the approval given by Mr. Moore and Major Altman to the plea for the accumulation of more data on water temperatures and ice conditions, for the organization that they are associated with, the U.S. Lakes Survey, is the oldest and probably the most highly organized engineering bureau working on the problems of the Great Lakes. The control of the levels of the Great Lakes is one of the greatest of the international engineering problems, and judging from Captain Hickman's observations difficulties may become more acute in the future.

Messrs. Altman and Moore do not concur in certain recommendations appearing in the paper but their comments seem to be based on a misconception of the author's thoughts, for which the author is himself to blame. Those recommendations were a plea for study only and were made as brief as possible in order that attention should not be diverted from the underlying problem of the variations in water temperatures and the causes of them. However, it seems proper as the recommendations have been questioned that they should now be dealt with in somewhat more detail than in the original paper. The author has always considered the Grand Central Terminal in New York City as one of the finest pieces of engineering design in North America. He has been informed that this was because innumerable small "project squads" studied every suggested change in design to make sure that no meritorious improvement would be passed over. The vast group of possibilities that are to be found in the Great Lakes area merit an equally comprehensive study. The governments of the United States and Canada have not been over liberal in their attitude towards the improvement of the great national water assets which they control and it is perhaps regrettable that the principle of self-liquidation has not been introduced into the plans for such improvements. The vast traffic in the St. Mary and St. Clair Rivers would not be appreciably affected by a system of small tolls and desirable improvements could then be made without experiencing the delays that so often occur in securing the necessary appropriations of funds by political authority. It may be that the navigation interests themselves have been short-sighted in their attitude towards such a policy.

The paper under discussion was a war baby. It was commenced when the need of a first class internal waterway between Montreal and New York could be regarded as an international necessity, owing to U-Boat activity. For the same reasons the recommendations for improvement of ice conditions were thought of not as being commercially desirable but as essential to the continental safety. Keeping that forethought in mind, the recommendations themselves merit a brief discussion.

The author's study of the St. Mary River arose out of the frequent reports of float ice obstruction in Whitefish Bay in the spring and fall, which drew the author's attention to certain records secured by Mr. Millar in 1937. These showed that on December 5th the lake temperature at Whitefish Point was 39.8 deg. F. while less than 50 miles away, in the St. Mary River, it was recorded that the water temperature was 31.8 deg. F. This situation indicated the desirability of studying the possibilities of a closed channel from Whitefish Point to the Sault locks with sufficient current in it to make sure that the waters were always in turbulent flow, and that the time of transit was reduced to a reasonable minimum. An inspection of the charts published indicated a possible location that would follow the west and south shores of Whitefish Bay, but as this channel would be nearly fifty miles long its operation would involve a definite drop in level which in turn would affect the depth over the sills of the existing locks at Sault Ste. Marie. The author, having served on the location and construction of the Canadian Pacific Railway Company's branch into Sault Ste. Marie in 1886-87, had a fairly clear recollection of the topography of the lands lying between the Sault locks and the Georgian Bay, and thought that a possible canal location could be found rougly paralleling the railway line in that area. This impression he has confirmed by consulting the profile of the railway lines which were supplied to him by the courtesy of Mr. J. E. Armstrong, vice-president of the Institute and chief engineer of the Canadian Pacific Railway Company. A completed channel over this route to a point in the Georgian Bay opposite the Mississauga Channel would be well over 100 miles long and its slope could be counted on to absorb most and at times all of the fall between the two main lakes. One end of the channel would reach deep water in Lake Superior and the other deep water in Lake Huron. Presently available evidence indicates that such a channel would remain clear of ice throughout the year but to what extent control of its discharge would be necessary, the author has not yet studied. The author never contemplated free waste of the waters of Lake Superior which to his mind is the most valuable of storage basins, especially as the Ontario Hydro-Electric Power Commission has added some 5,000 cu. ft. per sec. to the water resources of the Great Lakes Basin by water diversion from the Hudson Bay watershed into Lake Superior. The recommendation in the paper is not a recommendation for action but for a study of an engineering possibility that might have a far-reaching effect. The rapid industrial development now taking place along the north shore of Lake Superior makes this possibility one of much interest to Canadians.

The study of the possibility of utilizing the inland waterway between Lake Michigan and Lake Huron arose from the report of ice obstruction in the north end of Lake Michigan and amongst the islands screening the entrance to the straits of Mackinac. The desirability of making this improvement would depend upon studies to be made following the methods of Professor Church to determine whether the natural temperature conditions in the waters approaching Little Traverse Bay are more favourable than those in the waters leading to the straits of Mackinac. A study of the charts indicates that the construction of a major channel from Little Traverse Bay in Lake Michigan to Cheboygan on Lake Huron would not be an unusually heavy piece of construction work. The author had contemplated the installation of a guard lock of very low lift and the creation of a safety current through the channel during the winter months by the use of large pumps. The power consumption would be low, as the head necessary to create a current through such a short channel with ample cross section would be very modest. This recommendation again is limited to the study of an engineering possibility which may be of value when the demand for the removal of ice obstruction from the main waterway becomes insistent.

The suggestion of a winter channel along the North Shore of Lake Erie arose from consideration of the shallowness of this lake and the certainty of abundant ice formation within its area. The most striking evidence as to the winter temperature of Lake Erie is to be found in the temperature curves submitted as part of this discussion by Mr. Strowger of the Niagara Falls Power Company.

The flow of the Niagara River probably is isothermal and the measurements taken by Mr. Strowger indicate a probable isothermal temperature in Lake Erie approaching 32 deg. F. for three months in each winter. A possible remedy lies in conveying the "warm" waters of Lake Huron into the Niagara River without letting them waste their heat content whilst flowing over the shallows of Lake Erie. There is abundant flow in the St. Clair River to maintain a satisfactory discharge through the proposed channel and at the same time to maintain the levels of Lake Erie, but the establishment of a control dam at the east end of Lake Erie would be necessary. All this planning is necessarily conjectural for at present we know little or nothing concerning the actual temperature cycles of the waters of either Lake Erie or Lake Huron. The few facts now available only serve to emphasize the need for more data.

The improvement of the St. Lawrence River below Kingston may perhaps be passed over here as it has been touched on lightly elsewhere in this discussion except that the author would like to state that he places great weight on the possible extension of the Lake St. Louis levels as far east as Longueuil. Such an extension will provide an ideal waterway, an economical site for a great hydro-electric power plant, a very notable site for a high level extension of Montreal Harbour and a very effective connection between the St. Lawrence waterway and the proposed Lake Champlain branch. It is believed that the cost of construction between Barnhart Island and Longueuil on this location will be less than that appearing in the official estimates.

The last recommendation for study, namely the Lake Champlain branch of the St. Lawrence Waterway, is in the author's opinion at once the knottiest and the most important of them all for it would furnish deep draught transportation on an all-year round basis from all the cities bordering on the Great Lakes and on the St. Lawrence River to the great population areas surrounding New York, Philadelphia and Baltimore, and to the tropical wealth of the West Indies and South America. From a Canadian standpoint it would furnish a safe winter route from the Maritimes to Central Canada. It may be noted that the sailing distance from Halifax or Saint John to Montreal does not greatly differ whether the route followed lies via New York and up the Hudson Valley or by the Gulf of the St. Lawrence.

The engineering problems involved in the construction of such a waterway through the Lake Champlain-Hudson River Valley would require a separate paper for their discussion. At present no data are available concerning the water temperatures of Lake Champlain. Possibly in parts the cycle of its water temperatures would be similar to those taken by Mr. Rose in Grand Lake, Colorado, and in parts similar to those observed by Professor Church in Lake Michigan. It seems probable that internal currents do not occur in this lake, a fact which would account for its freezing over nearly every winter.

The situation here appears to call for a much bolder engineering vision than has been granted to the Deep Waterways Commission. Briefly, as envisaged by the author, the waterway would consist of a canal of about 40 ft. depth extending from Laprairie on the St. Lawrence River to a point opposite the Pointe aux Roches lighthouse on Lake Champlain and possibly following the Alburgh Passage. Deepening and narrowing of the area of the lake extending from Port Henry to Whitehall would be necessary and a deep cut about 35 miles long through the ridge separating Lake Champlain and the Hudson River. The present regulated level of Lake Champlain is between Elev. 92.0 as a minimum and 95.0 as a maximum and the summit level of the existing Whitehall and Albany Canal is 140.00. The route of the Whitehall Canal might be followed to a point in the vicinity of Troy and the present Hudson River Waterway would require further improvement to a point about 25 miles south of Albany.

The natural flow of the Richelieu River and of the Upper Hudson River would provide ample water for lockage purposes but a much stronger flow than either of them could provide would be necessary to keep the canals at the north and south ends of the route free from ice during the winter months and to provide the agitation necessary to prevent the freezing over of the deep section of Lake Champlain. The author would favour a large diversion of flow from the St. Lawrence River into Lake Champlain from about December 1st to March 1st in every winter, a supply perhaps most economically effected by power pumps placed near Laprairie. The lift would be about 30 ft., the proposed regulated level of Lake St. Louis being 71.0. This diverted water, with a minimum temperature of perhaps 35 deg. F. combining with the great stores of natural heat impounded in the depths of Lake Champlain could be expected to keep the waterway clear of ice until tidewater is reached on the Hudson River.

The possibilities of the project outlined above justify the preparation of preliminary plans and estimates by a "project squad," so that the economic value of the project can come up for discussion. As stated by the Deep Waterways Commission in its report on the subject, the Lake Champlain section of the deep waterway will be of value only as providing a safe entrance to traffic originating in or seeking access to the industrial areas surrounding the Great Lakes and the St. Lawrence River.

It will be noted that several of the foregoing recommendations contemplate the construction of canals comparable in magnitude to such undertakings as the Welland Canal and the Panama Canal. This fact in itself is no valid objection to the study of them. The traffic that would use them is comparable to that in many existing canals of commercial importance, and it is possible that much of the traffic that now passes through the Panama Canal would find its way to its destinations in the Great Lakes area by water if the St. Lawrence and Lake Champlain Waterways were available.

The author is much pleased by the courteous attention that has been given to his essay by so many engineers and scientists of broad experience and knowledge and desires to express his thanks to them. It is to be sincerely hoped that the recommendations that these gentlemen have so freely made in favour of an intensive study of the water temperature problems will be generously dealt with by proper authority.

AIR CONDITIONING A WINDOWLESS TEXTILE MILL

G. LORNE WIGGS, M.E.I.C.,
Consulting Industrial Engineer, Montreal, Que.

This paper was presented at the 1946 Semi-Annual Meeting of the American Society of Heating and Ventilating Engineers, in Montreal, and was published in the July 1946 issue of the Journal of the Society, *Heating, Piping and Air Conditioning*. It is reproduced here with the kind permission of the editors.

SUMMARY—This paper sets out the considerations governing the decision to construct a mill without windows. It describes the construction details with particular reference to the insulation of walls and ceiling, the air conditioning system and certain provisions which were made to permit economical expansion when this is required.

The tremendous industrial expansion in Canada and the great engineering advances in both the textile machinery and textile mill construction fields in the United States during the war years have resulted in a new trend of textile mill design. Reflecting this recent trend is the new textile mill described in this paper.

The mill is located in the town of Ormstown, Que., situated approximately 40 miles southwest of Montreal. The mill was designed and constructed for producing spun rayon yarns, rayon and wool blends and worsted yarns on the latest type of machinery for handling long staple fibre. It will house a complete unit of 5000 spindles.

A perspective view of the new plant is shown in Fig. 1. It will be seen that the plant consists of a complete spinning mill, approximately 100 ft. by 300 ft., which is a single storey, completely windowless building, along the front of which are located the general offices, the men's and women's wash rooms, the first aid room, the cafeteria, the boiler room and the machine shop on the ground floor, with the executive offices on the second floor. A penthouse, running practically the length of the mill, houses all the air conditioning equipment. A covered loading platform with a railroad siding is also located along a portion of the front of the mill. An electrical substation and an artesian well and pump house are located at the back of the building. Probably the most striking thing about the plant is the small size of the chimney. The design was so made that by constructing additions at each end, the mill could readily be enlarged to increase the unit to one of 10,000 spindles. Further expansion could be made by building a second 10,000 spindle unit along the back of the present unit.

In designing a unit to produce the various yarns mentioned, the prime consideration was to design a building which would not only be an efficient operating unit but one in which the particular air conditions required for spinning each different yarn could be readily obtained at any time. Although the outdoor temperatures in this locality vary from a minimum of about —30 deg. F. in winter to a maximum of almost 100 deg. F. in summer and there is a very large concentrated internal sensible heat gain in the mill, the problem of designing the air conditioning system is not a particularly complex one. The difficulty lies in the determination of the best type of system to be used, in providing the proper air distribution so as to maintain a uniform temperature and humidity throughout the mill without objectionable draughts and in selecting equipment and controls to take care automatically of the widely differing conditions the system must encounter.

There was considerable difficulty in obtaining an authoritative statement of the exact air conditions which should be maintained in the mill for each different type of spinning. It was finally agreed, after consultation with the management and various authorities, that for spinning rayon yarns the air conditions to be maintained should be as follows:

Dry bulb temperature, 75 to 80 deg. F.

Relative humidity, 60 to 65 per cent.

In spinning rayon and wool blends and spinning worsted yarns on the so-called French spinning system, the air conditions required would be as follows:

Dry bulb temperature, 75 to 80 deg. F.

Relative humidity, 75 to 80 per cent.

Since the mill is initially to spin rayon yarns and since it will probably be some years before rayon and wool blends or worsted yarns will be spun, the management decided to have the plant designed and constructed for the spinning of rayon yarns only, but to design the walls so that, at a later date, when other yarns are to be spun, the additional insulation required in the walls to prevent condensation from occurring on these surfaces could be added. These considerations required a thorough study of many different possible types of wall and ceiling construction and of various insulating materials available, so as to produce an economical wall, especially when it is considered that at the time these studies were made many common building materials were extremely scarce in Canada and others were not available at all. The usual type of so called mill construction could not be adopted because of the shortage of lumber.

Reverting to the air conditions required in the mill when spinning rayon yarns, the following design conditions were adopted for the mill proper:

	Summer	Winter
Outside dry bulb temperature....	90° F.	—30° F.
Outside wet bulb temperature....	73° F.	....

	Summer	Winter
Inside dry bulb temperature......	75° F.	75° F.
Inside relative humidity.........	65%	65%
Inside wet bulb..................	66.6° F.	66.6° F.
Inside dew point.................	62.5° F.	62.5° F.

By reference to the graph, Fig. 4, Chapter 6 of the 1946 Heating, Ventilating and Air Conditioning Guide of the American Society of Heating and Ventilating Engineers, showing the permissible relative humidities for various transmission coefficients, it will be seen that, for an outside temperature of —30 deg. F., an inside temperature of 70 deg. F., and a relative humidity of 65 per cent, the wall, roof or glass heat transmission coefficient U must be less than 0.20. The same graph shows that for an outside temperature of —30 deg. F., an inside temperature of 70 deg. F. and an inside relative humidity of 80 per cent, the wall, roof or glass coefficient U must be less than 0.115. The coefficient U of single, double and triple thickness of glass being respectively 1.13, 0.45 and 0.281, it is obvious

Fig. 1.—Windowless textile mill.

that for either of the above winter conditions, even if triple thicknesses of glass are used in the windows, condensation will occur on the glass whenever the outside temperature drops below 0 deg. F. This, with the condensation which would occur on the window frames, would present a difficult problem when the relative humidity of the mill was maintained at 65 per cent and would be serious if the relative humidity were raised to 80 per cent. In addition, since the heat transmissions of glass windows or of glass bricks are all so much higher than those of well insulated walls, the omission of all windows materially reduces the cooling load in summer and heating load in winter and at the same time results in more uniform conditions in the mill. Because the omission of windows eliminates a difficult condensation problem and at the same time reduces the size of the air conditioning installation and the heating plant, it was decided to construct the mill proper without windows and with a minimum of exterior doors. However, in order to offset any possible objections that the plant employees might have to work in a completely windowless plant, windows were provided in the offices and services portion of the mill, where condensation is not a problem.

In order to allow for any possible lower temperatures at their inside surfaces, it was decided that the wall coefficient should initially be less than 0.15 and ultimately less than 0.10, while that of the roof should be less than 0.10.

After study, it was decided to construct the plant with concrete foundations and a single reinforced concrete floor, with a structural steel frame, with exterior walls constructed of white brick bonded with 8 in. terra cotta blocks and with precast light weight aggregate concrete roof slabs, supported on steel bar joists, thus giving a fire resistant construction.

The many different insulating materials commonly used were then investigated. A number of desirable insulating

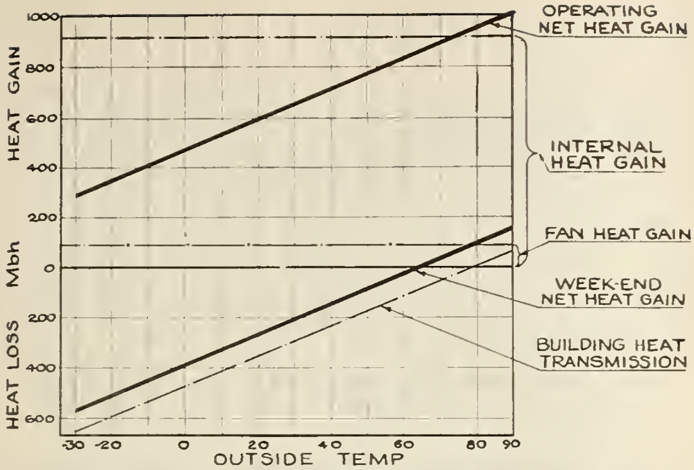

Fig. 2.—Variation of heat gains and losses of various outdoor temperatures.

materials were not available at the time. Finally it was decided to adopt for the exterior walls a slab insulating material made from shredded wood and cement, which has a conductivity k of 0.46 and which bears the approval of the Underwriters Laboratories. With a 2 in. thickness of this insulating material the value of U for the wall, neglecting the interior finish, is then approximately 0.14. When, at a later date an additional 2 in. thickness of insulation is added, the heat transmisson coefficient U will be less than 0.09.

The insulating board has a rather rough finish, so that in order to obtain a smooth interior finish, it was decided to give the board a coat of neat cement plaster. After this was thoroughly dry, the plaster was given two coats of emulsified asphalt cement, in order to provide a satisfactory vapor barrier. As an additional seal and in order to

Table I—Tabulation of Heat Gains and Heat Losses

	Summer		Winter			
	Working Day	Week-End	Working Day		Week-End	
	Heat Gain	Heat Gain	Heat Gain	Heat Loss	Heat Gain	Heat Loss
Picker Room:						
Heat Transmission, Solar Heat Gain and Infiltration	9,800	9,800		99,900		99,900

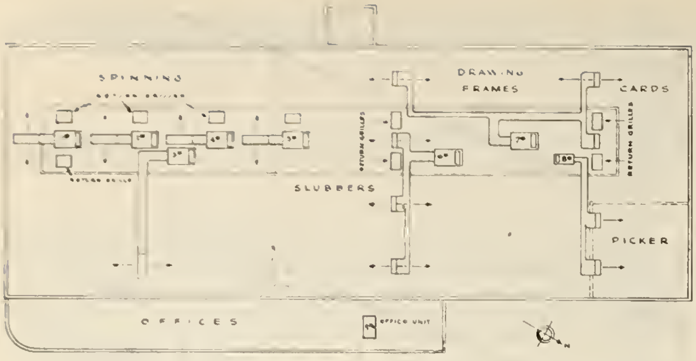

Fig. 3.—Plan of mill showing location of air conditioning unit.

prevent any possibility of the asphalt bleeding through the interior paint finish, the emulsified asphalt was given two coats of aluminum paint, which was finally painted with two coats of paint of a light green pastel shade.

The roof was insulated with wood fibre board insulation, 2 in. thick, which, with the light weight concrete roof slabs, gives U value for the roof of less than 0.10. The inside surface of the roof was sprayed with two coats of emulsified asphalt to provide the necessary vapour seal. Finally, a ceiling of gypsum board was attached to the bottom chords of the roof joists.

Incidentally, the roof of the mill was designed to be dead flat and the rain water leaders have been provided with removable standing waste pipes so that, in summer, the roof will be flooded with water approximately 2 in. deep.

The mill was designed so that its floor level would be at the level of a standard railway car floor which, due to the fact that the property is practically flat, meant that the mill floor is roughly 4 ft. 5 in. above grade. The plant floor, the walls below floor level and the foundation walls were all constructed of reinforced concrete, the floor being 4 in. thick and the concrete walls 12 in. thick. The amount of exposed concrete wall was reduced by backfilling against the wall on all sides of the plant to a height of 3 ft. 10 in. above the grade.

The wall and roof construction of the office and service section of the plant was modified slightly from that used in the mill proper, because the relative humidity to be maintained in this section of the plant is to be that commonly maintained in offices and the like.

The construction of the walls and the roof of the penthouse also are different from that of the plant, but were designed to have the same U value as those of the plant.

The mill proper is without windows of any kind and the only doors in the walls are those between the mill and the offices, one leading to the shipping platform and the regulation number of fire escape or panic doors. The panic doors were constructed similarly to standard refrigerator doors so as to minimize condensation on them and to prevent the doors from freezing in winter.

Fig. 4.—Spinning room before installation of machinery.

Having adopted the foregoing construction for the mill, calculations were then made to determine the various heat gains and heat losses of the mill for both summer and winter conditions.

Table I gives a list of the various heat gains and heat losses. It is notable that because of the large internal heat gains in the mill, particularly in the spinning room when it is in operation, even at -30 deg. F., the spinning room requires cooling during the working days. The variation in the heat gains and heat losses in the spinning room at various outdoor temperatures are shown in Fig. 2. This graph is not strictly accurate, but it serves to show the relation between the various heat gains and heat losses for any given outdoor temperature. It might be mentioned that, had the building been constructed with windows, the slope of the inclined lines would have been increased and both the maximum heat gain in summer and the maximum heat loss in winter would have been increased.

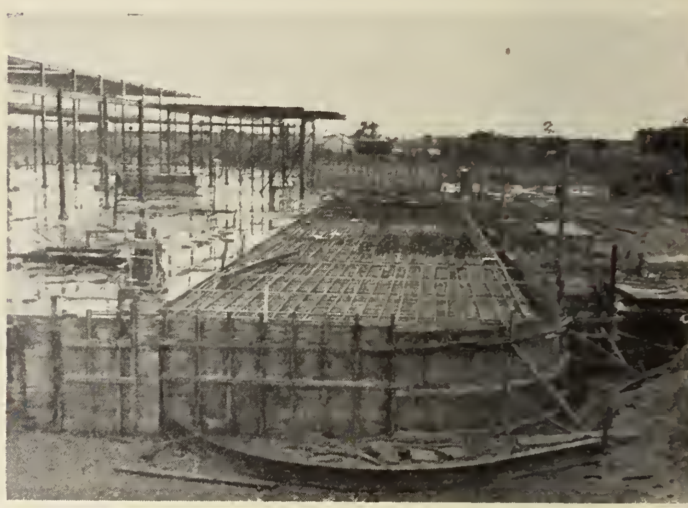

Fig. 5.—Radiant heating coils before concrete was poured.

With the tabulation of heat gains and heat losses, a study was made of the various types of air conditioning systems available, among these being the system having spray atomizers combined with mechanical ventilation. to provide both humidification in winter and evaporative cooling in summer and standard air conditioning systems, both central station type and unit type, to provide year round air conditioning. The unit air conditioning type was finally adopted, because of its flexibility, the ease of its installation and, particularly, because very little of the installation would be exposed in the mill. In order to expedite delivery and to keep costs to a minimum, eight standard unit conditioners were adopted for the mill proper, one being provided for the picker room, two for the carding and drawing room and five for the spinning room. A separate unit was provided for the offices and service areas. All the unit conditioners are factory assembled units, each including standard capillary cells, heaters, fan, pump, motors, etc. The unit conditioners are located as shown in Fig. 3. The outside air inlets to the units are located immediately above the units, while the entire penthouse acts as a return air plenum. The exhaust air is discharged outdoors through the wall of the penthouse. The conditioned air is supplied to the mill through conditioned air inlets of the type shown in Fig 4, which also shows the continuous lighting troughs and the pendant automatic sprinkler heads. Since the spinning frames

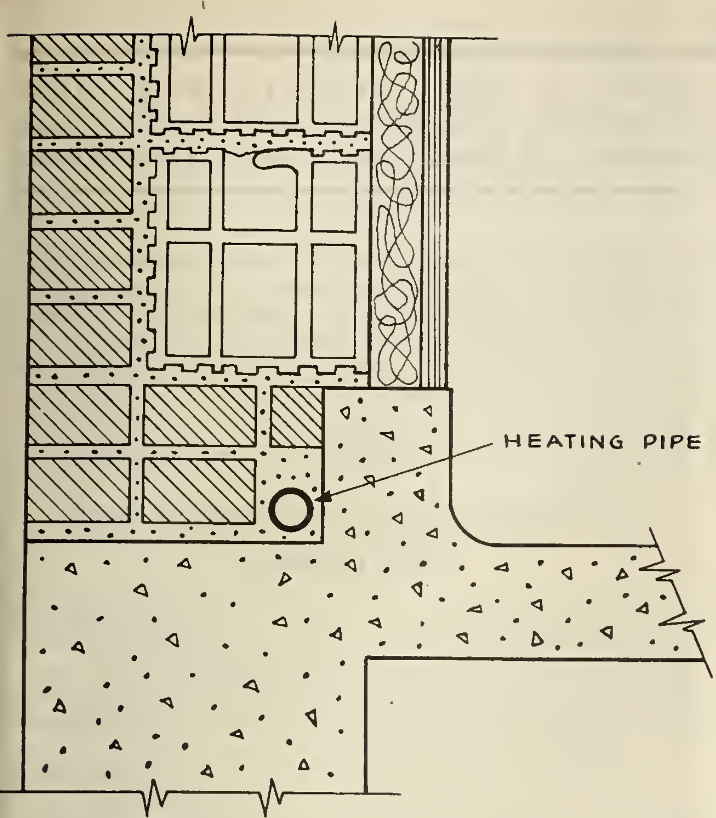

Fig. 6.—Detail of single heating coil in exterior wall.

will be driven by individual motors, there will be no overhead shafting or belts, with the result that the present clean cut appearance of the mill will be maintained even when the textile machinery is in place.

At the time that the mill was designed, all refrigerating equipment was "frozen" in Canada. However, prices were obtained on the required refrigerating installation, including evaporative condensers, but at the same time a study was made of the few deep wells in the vicinity and of the geology of the locality. The geological surveys and reports available indicated that the ground in the area, under an overburden of about 60 ft. of clay, had an underlying area of Nepean (Potsdam) sandstone formation of such a character and grain size that it could be expected to yield sufficient water at a reasonably low temperature to cool the plant.

Because of the uncertainty of obtaining refrigeration equipment, while a source of sufficient chilled water appeared to be available from a deep well, and because both the operating and maintenance costs of a deep well and of a deep well pump would be materially lower than that of a refrigerating unit, it was decided to sink a deep well

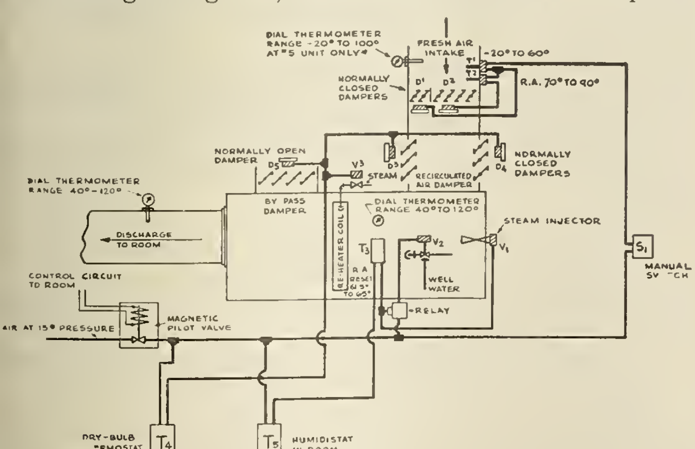

Fig. 7.—Schematic diagram control system for a typical factory air conditioning unit.

12 in. in diameter. The well was drilled to a depth of about 130 ft. of which about 65 ft. is through clay and 65 ft. is in bedrock. Later a pumping test of the well was made. After pumping continuously for 24 hours, the official 8-hour test showed a delivery averaging 686 Imp. gal. per. min. with a draw down of less that 20 ft. The temperature of the water was found to be 42½ deg. F. and, while its hardness was high, it was otherwise very satisfactory. As a matter of interest, the well drillers reported that they had run the test pump at various capacities to determine the ultimate capacity of the well, but they reached the limit of the capacity of the test pump at about 2075 Imp. gal. per min. without seriously increasing the draw down of the well.

Based on a well water temperature of 45 deg. F. the quantity of chilled water required for cooling the plant and offices amounts to a total of 266 Imp. gal. per min. As a result, the well has not only ample capacity to cool the present mill, but will also be sufficient for cooling the future additions.

The heating of the mill proper will be done by means of steam heating coils in the unit conditioners, while the heating of the offices and service areas will be provided by a low temperature radiant panel heating installation in the concrete floors of those areas. The partly fabricated floor coils are shown in Fig. 5. The radiant heating system utilizes forced hot water as a heating medium. In order to prevent the possible occurrence of condensation on the concrete floor of the mill proper, along its junction with the foundation walls, a single pipe coil was built into the junction of the exterior walls and the concrete foundations. The coil is connected to the radiant heating system. A detail showing just how this coil was built into the wall is shown in Fig. 6. The boiler plant consists of two oil-fired low pressure steam boilers, which provide steam for the heating of the plant and for heating the domestic hot water. Each boiler has a rated heating capacity of 4500 sq. ft. EDR when mechanically fired. When the textile machinery is in operation one boiler only will be used, even during the coldest weather, but both boilers will be required during the week-ends when subzero temperatures occur. It is due to the fact that the plant is windowless that such a small boiler capacity is required and that consequently the size of the chimney is so small in comparison to those usually found on mills of similar size. It is planned that, at a later date, electric heaters will be installed in the conditioned air supply ducts so as to take care of the weekend heating. In this way the steam boilers will be used during the plant operating periods only and the heating during the weekends will be done by electricity purchased as off peak power. Thus the present steam boilers will have sufficient capacity to take care of the heating of the future additions to the mill.

Because so little heating will be required in the mill, the fuel oil burning installation adopted utilizes oil burners approved to burn No. 4 fuel oil.

A schematic diagram of the control system for a typical factory air conditioning unit is shown in Fig. 7. This control system was designed to hold the dry bulb temperature and relative humidity constant the year round, and to control automatically the heating and humidification in winter, the evaporative cooling in spring and fall and the cooling by well water in summer.

Due to delays caused by difficulty in obtaining materials and by strikes both in the construction industry and, particularly, in the textile machinery manufacturing industry, this mill has not yet been put into production. It is, therefore, impossible at this time to give any data regarding its operation. After the mill has been in operation for some time, it is planned to make a survey of the performance of its air conditioning installation similar to surveys now being made by the author in a number of other textile mills and it is expected that the comparative data thus accumulated would form the basis of a subsequent paper.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

CONFERENCE OF COMMONWEALTH ENGINEERING INSTITUTIONS

During the month of September a conference unique in the history of engineering societies will be held in London, England. Representatives of engineering organizations from Australia, New Zealand, India, South Africa, Canada and the United Kingdom will gather there to discuss their many common problems and to explore the possibility of increasing their usefulness to the profession and to the public. The president and general secretary will represent the Engineering Institute.

The agenda covers a wide field dealing with joint publication of papers, a common information and abstracting service, and a common classification for publications, abstracts, filing and libraries.

The exchange of membership privileges will also be discussed. This will apply to publications, professional meetings, and all society activities. Uniformity of entrance standards, of training and of professional recognition will also be considered, and the possibility of joint membership will be investigated.

Professional recognition is another important item. What can the organization do to promote it? The possibility of an exchange of personnel such as research workers, teachers and students is also to be dealt with. Naturally collective bargaining will be on the programme.

An examination into the possibilities of the institutions giving encouragement to research, with provision of facilities for exchange of information, and the coordination of research projects, and travelling research fellowships are all to be discussed.

On the non-technical side the programme provides several social events and many visits to industries and to research establishments. The programme opens on September 14th and continues until the 28th.

AMERICAN SOCIETY FOR ENGINEERING EDUCATION

This is a new name for a society that has been in existence since 1893, the Society for the Promotion of Engineering Education. The organization and purpose of the original society have been expanded so as to include those of the Engineering College Research Association. The latter organization had been set up in 1942 in order to achieve objectives which could not be logically carried on under the Society for the Promotion of Engineering Education.

The American Society for Engineering Education now embodies the aims of the two former groups: the advancement of education in all that pertains to engineering and allied branches of science and technology, including the processes of teaching and learning, research, extension services, and public relations. The functions of the new Society are described as follows in its constitution: it "shall serve its members as a common agency of stimulation and guidance in: *(a)* the formulation of the general goals and responsibilities of engineering education for the service of individuals and the advancement of general welfare, *(b)* the adjustment of curricula and educational processes to changing conditions; *(c)* the development of effective teachers and administrators; *(d)* the improvement of instructional materials and methods, of personnel practices, and of administrative usages; *(e)* the enhancement of professional ideals and standards; *(f)* the fostering of research as a function collateral to teaching; *(g)* the coordination of institutional aims and programs, both among schools and colleges and in their joint relations with professional, educational, and public bodies; and *(h)* the cultivation of a fraternal spirit among teachers, administrators, investigators, practitioners, and industrialists.

At the regional meeting held at Digby, N.S., early this month, Council approved of the Institute continuing to give the new society the support it had given to its predecessor by retaining its institutional membership therein.

NON-TECHNICAL SUBJECTS ARE PREFERRED

Recently, the Junior Section of the Montreal Branch circularized its membership in order to determine the most popular subjects for meetings and discussion.

A list of about twenty subjects was submitted, including both technical and non-technical. It was a very wide and general list, and gave plenty of choice.

The results indicated emphatically that the members preferred non-technical subjects for their regular meetings. In the preferred list were such things as the following:

1) An outline of business management.
2) Effective speaking.
3) Psychology.
4) Town planning.
5) Canada's resources.
6) Appreciation of music.
7) The exporting business in Canada.
8) Selling psychology.

It is interesting and important to note this trend. Apparently, the young engineers realize the need of widening their knowledge. It is a good sign and it is to be hoped that the committee for the Junior Section will have no difficulty in lining up a series of good meetings along the lines so clearly indicated.

AN APPEAL TO CANADIAN ENGINEERS

Needed—Books, Journals and Equipment

University libraries in many parts of Europe have been partially or completely destroyed during the war years. With the new sessions commencing, these universities are without the necessary reading matter and equipment for their students.

The Association of Polish Engineers in Canada has set up a committee to handle the distribution of donations towards relieving the acute situation in Poland.

Contributions of the following types of material would be greatly appreciated by Polish university teachers and students:

1—Scientific and technical journals, proceedings, transactions and papers from 1925 to date.

2—Textbooks, handbooks, dictionaries, etc., in all branches of science and technology.

3—Drafting room equipment, compasses, triangles, slide rules, measuring instruments, and meter equipment.

All donations and inquiries should be addressed to M. Weinreb, M.E.I.C., Secretary, Committee forAssistance to Universities in Poland, Association of Polish Engineers in Canada, 671 Belmont Street, Montreal, Canada.

Because of its remoteness, not enough people know about the cenotaph recently unveiled by the Governor-General at Chilliwack, B.C.—a cenotaph conceived, designed and built by Canadian sappers in memory of all sappers. The Institute was officially represented at the unveiling by Past-President E. A. Cleveland of Vancouver.

The following account, based on material prepared by the committee, gives a somewhat sketchy outline of the project, sufficient to indicate the versatility and perseverance of the engineer, and his conquest over the perversity of inanimate objects. (Ed.).

* * * *

Cenotaphs to fallen warriors are generally located in prominent and naturally busy parts of a city or town, where the noise of traffic distracts the mind from the respect that such shrines deserve. The Sappers' Cenotaph, located some six miles out of Chilliwack, B.C., is set in such beautiful surroundings that on a fair day even the agnostic would surely feel the quiet sensation that is reverence.

To those privileged to know the history of this fine cenotaph it is not only a memorial to the dead, but a monument to the Corps, past, present, and to come. One must know something of the conception, production, and completion of the Sappers' Cenotaph to understand our pride in it.

At a meeting of the Officers Mess of "A6" Canadian Engineer Training Centre, in September 1944, a resolution was passed calling for a stone plaque to be erected to the memory of all members of "A6" who gave their lives in the service. Subsequently this idea was expanded by Lt.-Col. C. N. Mitchell, V.C., M.C., M.E.I.C., Officer Commanding, to envision a cenotaph to all sappers, designed, made, and erected by sappers.

Gradually the wheels started to turn. Soon after the New Year, Major W. F. Williams submitted his first sketch. On the twenty-fourth of January, an expedition located and decided on the quarry site, the face of a cliff on Harrison Lake, approximately 22 miles from the site selected for the cenotaph. The rock chosen was monzonite, aggregate of plagioclase, feldspar, and hornblende, resembling a grey granite. Under Lt. T. H. E. Copps, an experienced prospector and miner, a party started out to pitch a tent camp on Harrison Lake, and start the quarrying. A Cenotaph Committee was formed of Capt. R. B. Toombs, Capt. J. K. Korvin, Lt. W. G. Leithead, Lt. B. M. Middleton, S/Sgt. E. L. Crowe, Sgt. W. J. Sass, C.Q.M.S. J. Smalley, Sgt. A. E. Goring, Cpl. J. H. Forshaw, Cpl. R. B. Gamelseter, Spr. C. Mears, and Spr. J. F. Taylor, under the chairmanship of Major J. W. Davies. Subscriptions to cover such incidentals as trees, plants, grass seed, tools, etc., were asked for from all sappers in the Chilliwack area, and the response was speedy and gratifying.

The quarry party completed their most difficult job by the end of March 1945, although the weather had been such that a quarryman's comments would not look well in print. Now came the moving of the forty-two ton stone from the quarry to the park where the final cutting and finishing were to be done. It was decided to bring the massive block on a Bailey pontoon raft to Cannor Bay, a point on the Fraser near Chilliwack, and thence by low-loader overland to its destination. An obsolete Valentine tank was converted into a low-loader. The Bridging Wing constructed a five pontoon Bailey raft, while loading ramps were built at the quarry site and Cannor Bay.

Despite a heavy rain, the big stone started on its journey down the Harrison and Fraser rivers on the morning of May 16th, 1945, with Major T. A.V. Tremblay in charge. Within a few miles of the off-loading point, the raft grounded on a gravel bar in midstream. Using all available power and tricks of the trade, the raft was finally freed, but the force of the current threatened to swamp it. When the stone finally arrived at the off-loading point, some of the pontoons were half full of water.

Lt.-Col. C. N. Mitchell, V.C., M.E.I.C., Officer Commanding, "A6" C.E. Training Centre, Chilliwack, B.C. From a painting by Major J. W. Davies, 2nd i/c R.C.S.M.E., Chilliwack, B.C.

The big stone was unloaded in the centre of the Memorial Park on the 18th of May, 1945. By scrounging, improvising, and borrowing, a minimum of tools and equipment was assembled to start the stone cutting. S/Sgt. E. L. Crowe, Cpl. A. C. Bloomfield, Cpl. L. Thatcher, and Spr. J. P. Forster, all experienced stone masons, assumed the responsibility of carving the cenotaph. For the best part of a year, in fair weather and foul, they worked until the job was completed. All of these men could have claimed their discharge from the army long before the completion of their work, but the finishing of the cenotaph was a matter of personal pride to them. Twice the design had to be changed owing to faults in the stone. When it was found impossible to carry out the twelve-sided design of Major Williams, Capt. I. R. Morrison revised it to an eight-sided shaft. Again, further faults in the rock necessitated alterations, and Capt. W. G. Leithead, the last architect left in the unit, took on the job, and revised the design to the present cenotaph. Although the height of the shaft was not changed to any degree, the base was considerably reduced. By the end of February 1946, the steps were in place, the base stone and cap stone completed, and the main shaft approaching the final phase.

There still remained the modelling of the swords and grenades, the lettering, and the all-important job of raising the main shaft into position. Sgt. John Gastoski, a master craftsman in woodwork, carved a wooden sword model which was later cast in bronze and placed on the four cardinal faces of the cenotaph. Mrs. J. H. D. Barrett, widow of Major Barrett, R.C.E., who was killed in action soon after "D" day, modelled the grenade. The result was beyond expectations, carried out with strength and formality, yet with life in the waving flames. From the clay model, plaster casts had to be made for the bronze foundry. Major Davies, himself an artist but with little experience in modelling, took charge with Colonel Mitchell, Sgt. Gastoski and Spr. Rich assisting. Decked up in overalls and bespattered in clay and plaster, the workers looked like group "C" tradesmen.

On the four cardinal faces, inscriptions were cut and are as follows:

On the East Face—	In memory of the Officers and Men of the Royal Canadian Engineers who gave their lives in the War 1939-1945.
The South Face—	In memory of all Sappers of the Empire who have given their lives in the service of the Empire.
The West Face—	In memory of the Officers and Men of the Canadian Engineers who gave their lives in the War 1914-1918.
The North Face—	In memory of Canadian Sappers who gave their lives while serving with other Corps.

After careful calculation and consideration of all factors, an expert crew of riggers prepared the ground for the long anticipated event of erecting. On the 13th of April, 1946, the cenotaph was ready to be placed in its final position, a delicate operation indeed. By means of rollers, sheer legs, chain blocks, jacks, and block and tackle, the shaft was finally put in place, much to the relief of the whole organization. There remained only the completion of the paths and park, in which the engineers were aided greatly by the father of one of the sappers, a Mr. Booth, himself a well qualified landscape gardener. A park of two acres area surrounds the cenotaph.

* * * *

Thus was completed a unique enterprise which brings much credit to the small group that conceived it and built it. The *Journal* hopes that engineers all over the world will learn about it, and will share with the Canadians in the gratification that comes from knowing that a fitting memorial has been erected to the "members of their calling" who made the great sacrifice.

FACULTY CHANGES AT ALBERTA

R. S. L. Wilson, a former vice-president of the Institute, has just retired from the deanship of the Faculty of Applied Science at the University of Alberta, a position which he had occupied with distinction since 1929. He is succeeded by R. M. Hardy, who has been promoted from the status of Associate Professor of Civil Engineering to that of Professor of Civil Engineering and Acting Dean of the Faculty of Applied Science.

Dean Wilson was born in Lunenberg, N.S., in 1885 where he attended public and high schools. In 1902 he entered McGill University and graduated in 1911 after a five year interruption between freshman and sophomore years. During these five years and later summer vacations he was engaged in a variety of junior positions with the C.P.R. as clerk with the auditor of passenger receipts and various positions as surveyor's assistant on the construction of Angus Shops; maintenance of way, eastern division; construction of the Toronto Sudbury Branch; location of an electric railway in southern Ontario; construction of the Temiskaming and Northern Ontario railway; location surveys, Manitoulin and North Shore railway; and Grand Trunk Pacific branch lines.

After graduation he was engaged for a time with the Shawinigan Light Heat and Power Company on electrical transmission line construction and for one session as lecturer in mathematics and demonstrator in civil engineering at McGill University. This was followed by 3½ years on general construction work in Montreal and Saskatchewan. From 1915 to 1919 he was again lecturer and demonstrator at McGill University with summer periods at the Welland Ship Canal and as engineer with a construction company in Montreal.

In September 1919 he was appointed to the chair of civil and municipal engineering at the University of Alberta. In 1929 he was appointed dean of the Faculty of Applied Science.

While at the University of Alberta he was named as the

R. S. L. Wilson, M.E.I.C.

University representative among the incorporators of the Association of Professional Engineers of Alberta and served in an honorary capacity as registrar and secretary of the Association for some four or five years. Later he held the office of vice-president and president in successive years. He served two periods on the Council of The Engineering Institute of Canada: as councillor representing the Edmonton Branch from 1922-1924, and as vice-president of Zone A in 1933-34.

During his seventeen years service as Dean of Applied Science at the University of Alberta the registration in engineering more than tripled. During this period an extraordinarily large number of engineering students at Alberta came to regard him as a personal friend. His long experience and sympathetic personal characteristics were a great asset in dealing with the variety of special problems arising from the large number of returned men now proceeding through University courses in engineering. His retirement will be considered a real personal loss to many such men at the University of Alberta who have come to regard him as a friend and confidant.

The new head of the Faculty, Dean R. M. Hardy, was born at Winnipeg in 1906. He graduated as a B.Sc. in civil engineering from the University of Manitoba in 1929 and obtained a master's degree from McGill University in 1930. The same year he joined the staff of the University of Alberta as a lecturer in the Department of Civil Engineering. Later he was appointed assistant professor and in recent years became associate professor.

Dean Hardy spent a number of summers at the University of Michigan, studying structural engineering, and during the session 1939-40 he went to Harvard University where he studied soil mechanics, a field in which he has become recognized as an expert.

R. M. Hardy, M.E.I.C.

He has done consulting work for the past twenty years for industrial concerns both in eastern and western Canada, one of his most important assignments being with the Aluminum Company of Canada. He has also given extensive advice on structural and foundation problems in Alberta.

Dean Hardy has been a frequent contributor to The Engineering Journal and to other technical publications. He is president of the Alberta Land Surveyors Association and is a member of Council of the Association of Professional Engineers of Alberta. He has been active in the affairs of the Edmonton Branch of the Institute, having served at one time as secretary-treasurer.

The best wishes of the Institute go to Dean Wilson that he may long enjoy a well-earned period of retirement and to Dean Hardy that success may attend all his endeavours.

THE 1946 PROFESSIONAL MEETING AT DIGBY

An adequate account of the Maritime Professional Meeting held at Digby, N.S., September 5-6-7, would require a lot more space than the present paper supply situation will allow. The notes which follow should, however, be sufficient to convey to those who were not present the assurance that they have missed something, and to others they may bring back memories of a most pleasant time.

In the minds of the organizers, the Digby meeting was to be a continuation of the meeting held at Pictou, N.S., in 1939, and which had been interrupted suddenly at the half-way mark by the news of the invasion of Poland on September 1st. The delightful setting of the Pines Hotel, perfect summer weather, a programme where moments of relaxation alternated happily with the technical functions, those are so many factors that combined to make the 1946 Maritime Meeting a fitting celebration after seven years of hard work and restraint. Organized as a joint undertaking, this was the first maritime professional meeting since the Institute has entered into cooperative agreements with the Associations of Professional Engineers of Nova Scotia and New Brunswick. The results achieved are a good illustration of effective cooperation.

Officers of the three societies present were: President J. B. Hayes of the Institute and Mrs. Hayes, President J. L. Cavanagh of the Nova Scotia Association and Mrs. Cavanagh, R. M. Richardson, councillor of the New Brunswick Association representing President G. M. Brown, and Mrs. Richardson. In addition, there were several councillors and past officers of the three organizations, among whom should be mentioned: Past-presidents of the Institute A. J. Grant of St. Catharines, Ont., and H. W. McKiel of Sackville, N.B., both accompanied by their wives. The registration figure which was well over 300 includes mostly engineers from the Maritimes and their wives, but special mention should be made of the presence of members of the Institute such as W. H. Powell of Vancouver, B.C., who was accompanied by his daughter; Mr. and Mrs. R. F. P. Bowman from Brandon, Man.; Mr. and Mrs. E. A. Fulton of St. Louis, Missouri, and Miss Fulton. There were also several members and their wives from Ontario and Quebec.

Council Meeting

On September 4th, a regional meeting of the Council of the Institute was held in the afternoon, under the chairmanship of President Hayes. As it the custom at such meetings, past officers of the Institute in the Maritimes had been invited to attend as well as members of the branch executives. Officers of the provincial associations were also special guests and participated in the deliberations which lasted until shortly after 10 o'clock in the evening.

A large number of persons having already registered, the meeting was unofficially inaugurated that evening in the form of a get-together in the Maritime Professional Engineers club room. Under the inspiration of music provided by a talented accordionist, the ice was duly broken and, right from the start, a spirit of camaraderie was established which pervaded the entire meeting.

On Thursday morning the proceedings were launched at breakfast with what a writer of advertising copy would term an "eye-opener"; this was a bathing beauty contest "for men only" . . . to participate in. The event which terminated by a victory for "Arabella" MacNab set the note for the rest of the meeting.

President J. B. Hayes welcomes members at Digby. On his right, Chairman L. E. Mitchell, and on his left, Deputy Mayor Cardoza and Professor A. E. Flynn.

The Papers

At the first technical session, on Thursday, Dean H. W. McKiel of Mount Allison University presented a paper on Engineering Education in which he dealt with admission standards, selection of students and the need for broadening the scope of engineering courses. A lively discussion followed which indicated a great interest in the subject.

The second paper was by Dr. D. J. MacNeil, consulting geologist, of Antigonish, N.S., who told of the systematic search being currently made in the Maritimes to find oil in commercial quantities. He expressed the hope that those efforts would not be lessened and that sponsors of the survey would receive sufficient encouragement to spur them on to a successful conclusion

On Friday morning, Dr. Norman A. Parlee, director of research and development, Dominion Steel and Coal Corporation, Sydney, N.S., discussed the possible uses, for engineering and agricultural purposes, of the several hundred thousand tons of blast furnace and open hearth slag produced annually at Sydney.

The second speaker, that morning, was T. J. Halme of Canadian General Electric Company, Toronto. Mr. Halme, who spoke on Electronics in Industry, pointed out that electronics must not be expected to revolutionize present methods of operation, but that they will help existing methods, lower costs, improve quality and increase production.

The large attendance at all technical sessions is a tribute

(*Continued on page 548*)

The committee which planned and conducted the Digby meeting under the joint chairmanship of L. E. Mitchell and Mrs. G. J. Currie.

At the head table at the Friday dinner. Right to left, L. E. Mitchell, chairman, meeting committee; Past-President A. J. Grant; Premier Angus L. Macdonald; J. B. Stirling of Montreal, chairman at the dinner.

W. H. Noonan, Halifax; Charles Fowler, Halifax; J. B. Stirling, Montreal; A. A. Turnbull, Saint John.

Ira P. Macnab, Halifax; A. E. Cameron, Halifax; W. S. Wilson, Sydney.

Mrs. Gordon Naish, Mrs. E. C. O'Leary, Halifax, and S. Gordon Naish, secretary of the Cape Breton Branch.

J. H. Fraser of Sydney chats with W. H. Powell of Vancouver.

J. M. M. Lamb and Mrs. Lamb of Saint John, with Past-President A. J. Grant.

Lorne O. Cass, chairman of the Saint John Branch; Colonel J. A. Macdonald of Sydney, chairman of the Cape Breton Branch; J. L. Cavanagh, president of the Nova Scotia Association.

RULES GOVERNING AWARD OF INSTITUTE PRIZES

THE SIR JOHN KENNEDY MEDAL

A medal, called the "Sir John Kennedy Medal," was established in 1927, to be awarded under the following rules in commemoration of the great services rendered to the development of Canada, to engineering science and to the profession by the late Sir John Kennedy, past-president of The Engineering Institute of Canada.

(1) The medal shall be awarded by the council of the Institute, at intervals of not less than two years, but only when the occasion warrants, as a recognition of outstanding merit in the profession or of noteworthy contributions to the science of engineering or to the benefit of the Institute.

(2) As a guide in making the award, the council of the Institute shall take into consideration the life, activities and standing in the community and profession of the late Sir John Kennedy.

(3) Awards shall be limited to corporate members.

(4) At the beginning of the year of award, all members of Council shall be asked for their recommendations, supported by reasons, for the award of the medal, which must be submitted to council not later than May first. The council of the Institute shall then give consideration to the recommendations, but will not necessarily adopt any of them. If, in the opinion of the council, no corporate member of the Institute thus recommended is of sufficient merit or distinction, no award shall be made.

(5) The award shall be decided by letter ballot of the council in a form to be prescribed by the council. The ballot shall be mailed to each member of the council and shall state the date of the council meeting at which it is proposed to canvass the ballot, which shall not be less than twenty days after the issue of the ballot. Unless at least twenty-five votes are cast there shall be no award. There shall be no award if more than two negative votes are cast.

(6) Announcement of an award shall be made in *The Engineering Journal* and at the annual meeting, and, if possible, the presentation shall take place at that meeting.

THE JULIAN C. SMITH MEDAL

This medal was founded in 1939 by a group of senior members to perpetuate the name of the late past-president of the Institute. It is awarded for "achievement in the development of Canada." The inaugural awards—eleven in number—were made in 1940 and 1941, but subsequent awards are limited to not more than two each year.

The general secretary shall ask each past-president and each vice-president of the Institute for nominations, which shall be submitted to a committee of three consisting of the president and two members of Council appointed by him. This committee may select not more than two names from the nominations, which name or names shall be submitted by open letter ballot to all councillors not later than October first of each year. At least twenty days shall elapse before the ballot is closed. Unless at least twenty-five votes are cast there shall be no award. There shall be no award if more than two negative votes are cast.

It is possible that some special occasion—a centenary celebration or the like—may arise when it would evidently be desirable to award more than two Julian C. Smith medals. In such a case departure from the prescribed limit may be permitted, but only if authorized by a formal resolution of Council, stating the special reasons for the action.

DUGGAN MEDAL AND PRIZE

A prize of a medal and cash to a combined value of approximately one hundred dollars was established in 1935, to be given each year from the proceeds of a donation by Past-President G. H. Duggan, D.SC., LL.D., M.E.I.C., for the purpose of encouraging the development of the branches of engineering in which he practised.

The prize will be awarded for the best paper presented to the Institute in accordance with the following rules:

(1) Competition shall be open to all members of the Institute.

(2) The papers shall be presented to the Institute either at the regular meeting of a branch or at a professional meeting of the Institute, or directly to Headquarters. They shall not have been presented previously to any other body or meeting.

(3) Papers to be eligible for this competition shall deal with subjects concerning the use of metals for structural or mechanical purposes. Without limiting the generality of the foregoing, it is suggested that the following topics come within this category, viz.: the economic and theoretical elements of design, fabrication, machinery, transporting, erecting, the investigation of problems or failures, methods of overcoming difficulties, new methods of design or manufacturing, the recording of tests, and other features that add to engineering knowledge.

(4) Papers shall be the bona fide production of the author and proper credit shall be given for any assistance received from other parties, partners or reports. The relation of the author to the work shall be clearly stated. Papers shall be compiled and arranged with proper regard to literary value and shall constitute worthy contributions to the records of the engineering profession.

In judging the competition consideration will be given to the personal knowledge and appreciation of the problems and processes involved and the joint application of theoretical and practical considerations to the execution of the subject which are displayed on the part of the author.

(5) The papers shall be judged by a committee of three corporate members, eminent in the corresponding branch of the profession, appointed for the purpose by council as required.

(6) The award shall be made only when a paper of sufficient merit is presented. The prize year shall be from July 1st to June 30th and papers must be presented to Headquarters of the Institute by the 30th day of June.

(7) The prize shall be awarded at the annual meeting.

THE GZOWSKI MEDAL

A gold medal, called "The Gzowski Medal," is provided from the fund established in 1889 by Col. Sir Casimir Gzowski, A.D.C., K.C.M.G., late past-president of the Institute, and will be awarded according to the following rules for papers presented to the Institute:

(1) Competition for the medal shall be open only to those who belong to the Institute.

(2) The award of medals shall not be made oftener than once a year, the medal year shall be the year ended June last previous to the annual meeting at which the award is to be made.

(3) The papers entered for competition shall be judged by a committee of five, to be called the Gzowski Medal Committee, which shall be appointed by the council as soon after the annual meeting of the Institute as practicable. Members and Honorary Members only shall be eligible to act on this committee.

(4) Papers to be eligible for competition must be the bona fide production of those who contribute them, and must not have been previously made public, nor contributed to any other society in whole or in part.

(5) The medal shall be awarded for the best paper of the medal year, provided such paper shall be adjudged of sufficient merit as *a contribution to the literature of the profession* but not otherwise.

(6) In the event of the committee not considering a paper in any one year of sufficient merit, no award shall be made; but in the following year or years, it shall be in the power of the committee to award the accumulated medals to the authors of different papers which may be deemed of sufficient merit.

(7) The medal shall be suitably engraved by the Institute, and shall be handed to the successful authors at the annual meeting, or be given to them as soon afterwards as possible.

THE LEONARD MEDAL

A gold medal, called "The Leonard Medal," is provided from the annual proceeds of a fund established in 1917 by the late Lieut.-Col. R. W. Leonard, and will be awarded in accordance with the following rules for *papers on mining subjects* presented either to The Canadian Institute of Mining and Metallurgy or to The Engineering Institute of Canada.

(1) Competition for the medal shall be open to those who belong to The Canadian Institute of Mining and Metallurgy or to The Engineering Institute of Canada.

(2) Award shall be made not oftener than once a year, and the medal year shall be the year ended June last previous to the year in which the award is made.

(3) The medal shall be presented at annual meetings of The Engineering Institute of Canada.

(4) A committee of five shall judge the papers entered for competition, all of whom shall be members both of The Canadian Institute of Mining and Metallurgy and The Engineering Institute of Canada, this committee to be appointed by the council of The Engineering Institute of Canada.

(5) All papers presented shall be the work of the author or authors and must not have been previously made public, except as part of the literature of The Canadian Institute of Mining and Metallurgy or The Engineering Institute of Canada.

(6) Should the committee not consider the papers presented in any one year of sufficient merit, no award shall be made, but in the following year, or years, the committee shall have power to award the accumulated medals or to award a second prize in the nature of a silver medal, or a third prize of books to be selected by the committee.

(7) The medal shall be suitably engraved, containing the name of The Engineering Institute of Canada, and the words, "The Leonard Medal" together with the adopted design, and on the reverse side the name of the recipient, the date and any other inscription that may be decided upon by the committee.

THE PLUMMER MEDAL

A gold medal, called "The Plummer Medal," is provided from the annual proceeds of a fund established in 1917 by J. H Plummer, D.C.L., and will be awarded according to the following rules for *papers on chemical and metallurgical subjects* presented to the Institute.

(1) Competition for the medal shall be open to those who belong to The Engineering Institute of Canada, and to non-members if their papers have been contributed to the Institute and presented at an Institute or Branch meeting.

(2) Award shall be made not oftener than once a year, and the medal year shall be the year ended June last previous to the year in which the award is made.

(3) The medal shall be presented at annual meetings of The Engineering Institute of Canada.

(4) A committee of five shall judge the papers entered for competition, all of whom shall be members of The Engineering Institute of Canada, and shall be appointed by the council of the Institute.

(5) All papers presented shall be the work of the author or authors and must not have previously been made public, except as part of the literature of The Engineering Institute of Canada.

(6) Should the committee not consider the papers presented in any one year of sufficient merit, no award shall be made, but in the following year, or years, the committee shall have the power to award the accumulated medals or to award a second prize in the nature of a silver medal, or a third prize of books to be selected by the committee.

(7) The medal shall be suitably engraved, containing the name of The Engineering Institute of Canada, and the words, "The Plummer Medal," together with the adopted design, and on the reverse side the name of the recipient, the date and any other inscription that may be decided upon by the committee.

THE T. C. KEEFER MEDAL

This medal was established by Council in 1942 to perpetuate the name of the first president of the Institute.

It is awarded for papers presented to the Institute during the year on *civil engineering subjects*, "civil" being used in the limited sense to indicate structural, surveying and construction work generally.

THE R. A. ROSS MEDAL

This medal was established by Council in 1942 to perpetuate the name of a past president of the Institute distinguished for work in the electrical branch of engineering.

It is awarded for papers presented to the Institute during the year on *electrical engineering subjects.*

THE CANADIAN LUMBERMEN'S ASSOCIATION PRIZE

A prize of $100.00 will be awarded by the Canadian Lumbermen's Association for the best paper presented in any year on the use of lumber or timber in construction; or on the use of wood, including wood waste, in the manufacture of useful products; or on the development of methods of treating wood to make it more resistive to destruction from decay, insects, marine organisms or fire; or in such other related subjects in wood utilization as may later be designed.

The following rules shall govern in the competition:

(1) The competition shall be open to all members of the Institute and to any bona fide resident of Canada.

(2) An award shall be made only if, in the opinion of the examiners, a paper has been presented for publication in the *Journal* of the Engineering Institute of Canada and/or in *Timber of Canada* of sufficient merit to justify the award.

(3) The award shall not be made oftener than once a year, and the prize year shall be from July 1st to June 30th.

(4) The award shall be made at the Annual Meeting of the Engineering Institute of Canada.

(5) A committee of five shall judge the papers entered for competition, all of whom shall be members of the Engineering Institute of Canada.

(6) All papers presented shall be the work of the author or authors and must not have been previously made public except as part of the literature of the Engineering Institute of Canada, or of the Canadian Lumbermen's Association. Proper credit shall be given in the papers for any assistance obtained from other parties or from other reports.

(7) Should the Committee not consider the papers presented in any one year of sufficient merit to justify a prize, no award shall be made, but in the following year or years the Committee shall have power to award accumulated prizes if papers of sufficient merit to justify prizes are presented.

(8) In the case of two or more authors presenting a paper, the amount of the prize shall be divided equally among such authors.

(9) For the first year the award shall be made for the best paper on the structural application of timber and/or plywood as for example—

(1) Laminated structural wood members.

(2) Composite wood and plywood structural members.

(3) New ideas in the design of structural timber units.

Special consideration will be given to papers dealing with the application of low grade material to structural uses. (Approved by E.I.C. Council, June, 1944.)

PRIZES TO STUDENTS AND JUNIORS

(1) Five prizes may be awarded annually for the best papers presented by Students or Juniors of the Institute in the vice-presidential zones of the Institute, as follows:—

The H. N. Ruttan Prize,—
in Zone A—The four western provinces.

The John Galbraith Prize,—
in Zone B—The Province of Ontario.

The Phelps Johnson Prize,—
for an English Student or Junior in Zone C—The province of Quebec.

The Ernest Marceau Prize,—
for a French Student or Junior in Zone C—The province of Quebec.

The Martin Murphy Prize,—
in Zone D—The Maritime provinces.

(2) Awards shall only be made if, in the opinion of the examiners for a zone, a paper of sufficient merit has been presented to a branch in that particular zone.

(3) The winner of a prize shall be required to specify such technical books or instruments as he may desire to the total value of approximately twenty-five dollars when suitably bound and printed or engraved, as the case may be.

(4) The award of prizes shall be for the year ending June thirtieth. On that date, each branch secretary shall forward to the examiners for his particular zone all papers presented to his branch by Students and Juniors during the prize year, regardless of whether they have been read before the branch or not.

(5) The prizes shall be awarded only to those who are in good standing as Students or Juniors of the Institute of June thirtieth following the presentation of the paper.

(6) The papers must be the bona fide production of those contributing them and must not have been previously made public or contributed to any other society in whole or in part. It is to be understood, however, that a paper which has won or been considered for a branch prize is nevertheless eligible for the Institute Prize. No paper shall be considered for more than one of the five prizes.

(7) The examiners for each zone shall consist of the vice-president of that zone and two councillors resident in the zone, appointed by council. In the case of Zone C, two groups of examiners shall be appointed under the two vice-presidents, one for the English award and one for the French award. The awards shall be reported to the annual meeting of the Institute next following the prize year, and the prizes presented as soon thereafter as is reasonably possible.

PRIZES TO UNIVERSITY STUDENTS

In 1930 Council established eleven cash prizes of twenty-five dollars each for competition among students of Canadian engineering schools, in the year prior to the graduating year. Awards are now made annually to the following institutions:

University of Alberta
University of British Columbia
Ecole Polytechnique, Montreal
Laval University, Quebec
University of Manitoba
McGill University
University of New Brunswick
Nova Scotia Technical College
Queen's University
Royal Military College
University of Saskatchewan
University of Toronto.

It is the desire of council that the method of their award shall be determined by the appropriate authority in each school or university, so that a prize may be given to the student in any department of engineering who has proved himself most deserving, not only in connection with his college work, but also as judged by his activities in the student engineering organization, if any, or in the local branch of a recognized engineering society.

It is not necessary for the recipient to belong to the Institute, and in this respect the prizes are quite distinct from those offered to Students and Juniors of the Institute, or from the prizes which are offered by a number of our branches to the Students attached to them.

It is felt that the establishment of these prizes not only aids deserving students, but assists in developing their interest in engineering societies' work, and in the resulting acquirement and interchange of professional knowledge.

Personals

News of the Personal Activities of members of the Institute

Dr. R. D. Bennett, M.E.I.C., is the newly elected chairman of the Kingston Branch of the Institute. He was born in Montreal, and attended McGill University, receiving B.Eng. and M.Sc. degrees in 1932 and 1933. While serving as head demonstrator and graduate assistant in the chemical engineering department he obtained his Ph.D. at McGill in 1935, and that year joined the Canadian Industrial Alcohol Company Limited in Montreal as chief chemist. In 1937, he went to J. T. Donald and Company Limited, Montreal, as head of the organic department and the next year became connected with Canadian Industries Limited. With that firm he was located at Beloeil and Shawinigan Falls, Que., and was transferred in 1943 to Kingston, Ont. He is development superintendent in C.I.L.'s Nylon Division in that city.

J. E. Thom, M.E.I.C., the newly elected secretary-treasurer of the Kingston Branch of the Institute, is from Regina, Sask.

He attended the University of Toronto, graduating in 1932 with a B.A.Sc. He was then employed for six years by Imperial Oil Limited at the Regina Refinery, and in 1941 transferred to Defence Industries Limited. In the plant engineering department at Verdun, Que., he was successively engineer, supervisor, and superintendent. In 1945 he accepted his present position as resident engineer at the Kingston Works of Canadian Industries Limited.

R. H. Parsons, M.E.I.C., has recently retired as city engineer for Peterborough, Ont., after thirty-three years service in that office. The city council and fellow civic employees tendered a dinner in his honour and presented him with an engraved silver tray and an illuminated address citing his contributions to city improvement. Mr. Parsons studied engineering at the University of Michigan, and commenced his career with railroad work in the United States. He became engaged in municipal engineering work in Ottawa, Ont., where he was assistant to the city engineer from 1901 to 1913, with a two year interval in 1905 and 1906 as superintendent of the Warren Bituminous Paving Company at Toronto, Ottawa and Regina. He received his appointment in Peterborough in 1913. Mr. Parsons is a past president of the Canadian Institute on Sewage and Sanitation.

W. T. Dempsey, M.E.I.C., took office on September 1st as city engineer for Oshawa, Ont. He is from Griswold, Man., and graduated in civil engineering at the University of Saskatchewan in 1934. He has been employed in oil field development in South America and in construction engineering in Canada. In 1941 he was with the Chemical Construction Corporation at Niagara Falls, Ont. He served with the R.C.E. in the last war with the rank of lieutenant.

Captain (L) E. G. Cullwick, M.E.I.C., who was head of the department of electrical engineering at the University of Alberta and was granted leave of absence in 1942 to serve with the navy, has resigned from the university. He is located at Ottawa, Ont., at Naval Service Headquarters as director of electrical engineering.

E. D. Gray-Donald, M.E.I.C., chief engineer of the Quebec Power Company, has been promoted in the reserve army to the rank of lieutenant-colonel and appointed commander of the 4th Division, R.C.E.M.E.

George Bromley, M.E.I.C., consulting engineer of Montreal, Que., has become associated with J. A. Kearns, M.E.I.C., and the new firm will be known as Kearns and Bromley, Associate Consulting Engineers, Montreal.

D. E. Perriton, M.E.I.C., who has recently been appointed engineer in charge of mechanical sales for the eastern division of the Dominion Bridge Company Limited, Lachine, Que., has been with the company since 1922 following his graduation from McGill University in that year. He had occupied various positions in the engineering and contracting departments, before being transferred to the Ontario Division in 1930 where he assumed the managership of the McGregor McIntyre Iron Works Limited, a subsidiary of Dominion Bridge Company. In 1940 he became manager of the company's cartridge case plant at Toronto and continued in this position until his present appointment.

Brig. Gen. Sir Godfrey Rhodes, M.E.I.C., is in Crowborough, Sussex, England, where he has opened an office in collaboration with the firm of consulting engineers, Sir Alexander Gibb and Partners. He will be responsible for railway affairs for the firm. He had been in British East Africa for many years, connected with the Kenya and Uganda Railways and Harbours, at Nairobi, Kenya Colony, serving as chief engineer, as deputy general and chief engineer, and as general manager.

N. C. Sherman, M.E.I.C., who retired recently from the army with the rank of colonel, after thirty-five years service, is now established in Vancouver as an industrial consulting engineer. For the last few months, he was connected with the John Inglis Company as resident engineer at Vancouver.

E. R. Evans, M.E.I.C.
Photo by W. B. McAdams

E. R. Evans, M.E.I.C., has been elected chairman of the Moncton Branch of the Institute. Born at Hampton, N.B., he commenced his professional career in 1909 as engineer for the Montreal General Contracting Company on the deepening of the St. Lawrence river channel near Gananoque, Ont. He was next engaged on hydrographic surveys at Richibucto, N.B., and West Point, P.E.I., and later as engineer in charge of railway surveys for the Moncton-Buctouche Railway to Loggieville, N.B. He was commissioned a lieutenant in the Royal Canadian Artillery in 1915, won a captaincy and was awarded the Military Cross. After demobilization in 1919, he joined the Canadian National Railways and has been resident engineer on the construction of the transit sheds and new hotel and station at Halifax, the bridge across the St. John river at Fredericton, and the new locomotive shops at Moncton, N.B. He is at present assistant engineer at Moncton for C.N.R.

Norman Bell, M.E.I.C., formerly assistant superintendent of the Bayer Ore plant of the Aluminum Company of Canada at Arvida, Que., has gone to Pittsburgh, Pa. He is on the teaching staff of the chemical engineering department of the University of Pittsburgh.

C. A. Leighton, M.E.I.C., who has for many years been located in the United States in engineering work in Enfield and Boston, Mass., and New York, N.Y., and at Bermuda, B.W.I., and Caracas, Venezuela, has returned to Canada. He is associated with Marine Industries Limited, Montreal.

O. B. Mason, M.E.I.C., formerly of Chillicothe, Ohio, has accepted an appointment as assistant to the general manager of the Escanaba Paper Company of Escanaba, Mich.

G. H. W. McKee, M.E.I.C., who has been instructing in business administration at the University of Western Ontario, London, Ont., has become connected with Kelco Engineering Limited of that city as assistant to the president.

R. J. Merritt, M.E.I.C., is now manager of the Electric Steam Radiator Company of Canada Limited, Windsor, Ont. He was previously in the technical department of Defence Industries Limited and was located at the Cherrier Works at Montreal.

C. G. Mills, M.E.I.C., has taken a position with the engineering division of the B.C. Electric Railway Company at Vancouver, B.C. He was previously employed as an electrical engineer with the West Kootenay Power and Light Company at Trail, B.C.

L. Sterns, M.E.I.C., who was since 1944 in charge of construction for the Canadian International Paper Company, Gatineau, Que., has gone to the E. B. Eddy Company of Hull, Que., where he is construction engineer.

ERRATUM

In the Personals column of the August Journal, **Guy A. Lindsay,** M.E.I.C., was reported as being "employed as design engineer with the industrial electronics division of the Westinghouse Electric Company at Baltimore, Md." The item was meant to refer to **G. A. Lindsay,** M.E.I.C., who was formerly with the Northern Electric Company Limited, Montreal, as consulting engineer. Mr. Guy A. Lindsay of Ottawa is still in his position as engineer in charge of the general engineering branch of the Department of Transport and he is the one who, in 1940, was active on a committee appointed to represent Canada in the investigations for the early development of power resources in the international section of the St. Lawrence River.

We apologize to the gentlemen involved and to our readers.

W. I. Fisher, M.E.I.C., who served overseas with 2nd Battalion R.C.E., has returned to his former position with the Nova Scotia Department of Highways and Public Works.

J. S. Fowler, M.E.I.C., has been released from the R.C.N.V.R., and has returned to civil life and is now with the University of Saskatchewan.

John H. Fox, M.E.I.C., who served overseas in the R.C.E.M.E., with the rank of lieutenant colonel, has returned to his pre-war position with Minneapolis Honeywell Regulator Company Limited in Toronto.

F. F. Fulton, M.E.I.C., who was senior technical staff officer at Canadian Military Headquarters overseas, has returned to his pre-war appointment with the Northern Electric Company Limited, Montreal.

H. H. Minshall, M.E.I.C., who served overseas in the R.C.E., for several years, has returned to his pre-war position with Dominion Bridge Company in Vancouver.

W. J. Murray, M.E.I.C., who was on works services with the R.C.A., has rejoined the Hydro-Electric Power Commission of Ontario in Toronto.

Ralph R. Willis, M.E.I.C., who served overseas with the R.C.E., on works services, has returned to his pre-war position with the Ross Engineering Company of Canada Limited in Montreal.

F. C. Woods, M.E.I.C., who was overseas for over four years with the R.C.E., has returned to his former position with the City of Westmount, Que.

John A. Webster, M.E.I.C., who served in the Royal Canadian Signals, is now with the Shawinigan Water and Power Company in Montreal.

E. G. Woolsey, M.E.I.C., who was overseas with the R.C.E., has accepted a position with the Dominion Observatory, Ottawa, Ont.

J. H. Ferguson, Jr.E.I.C., who joined the R.C.A.F. in 1929, is remaining with them in the post war period.

R. A. Forrester, Jr.E.I.C., who was overseas for three years with the R.C.E., has accepted a position with the Hydro-Electric Power Commission of Ontario, in Toronto.

J. S. Francis, Jr.E.I.C., who served in both army and navy, is now employed with the Northern Electric Company Limited in Montreal.

C. Fraser, Jr.E.I.C., who served overseas for five years in the R.C.E., has returned to his former position with the Ontario Department of Highways at Port Arthur.

W. M. Fraser, Jr.E.I.C., has been released from the navy and is now connected with Fraser Airborne Products Limited.

R. H. Garrett, Jr.E.I.C., who served in Canada and overseas with the R.C.A.F., is now partner in Essex and Company in Vancouver, B.C.

L. W. Geake, Jr.E.I.C., who served overseas in the R.C.E.M.E., has accepted employment with Price Brothers and Company Limited, Kenogami, Que.

H. E. Gove, Jr.E.I.C., who was in the R.C.N.V.R., is now employed with the National Research Council at Chalk River, Ont.

E. R. Mitchell, Jr.E.I.C., who was in the R.C.E.M.E., is now with the Bailey Meter Company Limited in Montreal.

G. A. Morison, Jr.E.I.C., who served with the R.C.E., has accepted a position with the Canadian Pacific Railway in Montreal.

C. E. Morse, Jr.E.I.C., who served overseas in the R.C.A.F., is now with Dominion Glass Company Limited in Montreal.

W. Herbert C. Wallis, Jr.E.I.C., who served in the R.C.A.F., has accepted a position with Canadair Limited in Montreal.

Ronald S. Wilson, Jr.E.I.C., who was overseas with the R.C.N.V.R., is now with the National Harbours Board in Montreal.

W. C. Weir, Jr.E.I.C., who served in Canada and overseas with the R.C.A.F., has accepted a position with the Veterans Land Act administration and is in Ottawa, Ont.

R. C. Weller, Jr.E.I.C., who was in the R.C.E., is now employed with the Department of Mines and Resources at Ottawa, Ont.

John R. Wellington, Jr.E.I.C., who served overseas with the R.C.A., has now accepted employment with the Consolidated Mining and Smelting Company of Canada Limited at Trail, B.C.

J. P. Woods, Jr.E.I.C., who was overseas in the navy, is now with the Consolidated Paper Corporation at Grand'Mère, Que.

R. B. Wotherspoon, Jr.E.I.C., who served in the Royal Engineers for six years, has returned to his pre-war position with the Steel Company of Canada at Gananoque, Ont.

R. R. Snyder, Jr.E.I.C., has been discharged from the R.C.N.V.R. and is employed with Pacific Mills at Ocean Falls, B.C.

W. J. Milhausen, Jr.E.I.C., who served overseas in the R.C.E., is now with the Manitoba Department of Public Works in Winnipeg.

L. E. Gads, Jr.E.I.C., who was discharged in 1945 from the R.C.A.F., has returned to the department of civil engineering of the University of Alberta. He has been appointed assistant professor of civil engineering.

R. E. McClary, S.E.I.C., who received his B.Sc., (electrical) from the University of Alberta this year, is demonstrating in electrical engineering at the University.

G. Proudfoot, S.E.I.C., a B.Sc. in electrical engineering of the class of 1946 at the University of Alberta, is with the electrical engineering department of the University as a demonstrator.

A. D. Flay, S.E.I.C., who served overseas in the R.C.E.M.E., has returned to Queen's University to continue his studies in Arts.

J. E. Freeman, S.E.I.C., who served in the R.C.N.V.R., has accepted a position with New Brunswick International Paper Company Limited, Dalhousie, N.B.

V. A. Graham, S.E.I.C., who served in the R.C.N.V.R., is now with the Dominion Bridge Company at Lachine, Que.

A. H. Gerrish, S.E.I.C., who was in training for the army is now employed with the Montreal Engineering Company.

G. A. Verge, S.E.I.C., who served overseas with the Royal Canadian Signals, is now resident engineer, Department of Mines, Quebec.

Thomas E. Weber, S.E.I.C., who was in training for the Canadian Infantry Corps, has been released from the army and has taken employment with Mr. M. G. Smerchanski at Portage La Prairie, Man.

PROFESSIONAL MEETING AT DIGBY

(*Continued from page 543*)

to the authors and must have been very gratifying to the members of the committee who had arranged a well-balanced programme of papers combining local and general interest.

The Luncheons, Dance and Banquet

At the first luncheon, on Thursday, September 5th, under the chairmanship of L. E. Mitchell of Halifax, the official welcome from the town of Digby was extended by Deputy Mayor Victor G. Cardoza. After this, the president of the Institute, J. B. Hayes of Halifax, expressed his pleasure at presiding over a maritime meeting and made everyone feel quite at home.

The opening ball, which was held that evening provided a pleasant diversion. Long after the music had ceased, echoes were still ringing about the place and are said to have originated with serenaders going from one cottage to another.

The Friday luncheon was under the chairmanship of R. M. Richardson of the New Brunswick Association and was addressed by Dr. L. Austin Wright, general secretary, who described briefly the many services provided by the Institute for its members.

The banquet on Friday night was the closing function. Under the chairmanship of J. B. Stirling, a councillor of the Institute and a member of the New Brunswick Association, the meeting was honoured by the presence of Premier Angus L. Macdonald who spoke briefly. Thomas H. Raddall, the Canadian author who has so vividly described the strong characteristics of the Maritime people, was the guest speaker. Under the title "Nova Scotia Humour," his address was a collection of delightful anecdotes.

At the conclusion of the banquet, a show was given, in cabaret style, by a troupe of performers brought to Digby for the occasion.

Thanks are due to L. E. Mitchell and Mrs. G. J. Currie under whose joint chairmanship such a well-balanced programme was arranged, which, with the proverbial maritime hospitality, has resulted in one of the most successful meetings in the annals of the Institute. It was the wish of everyone present that it would not be necessary to wait another seven years before the next Maritime Professional Meeting.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here:

John Preston Forde, M.E.I.C., a life member of the Institute since 1938, died at his home in Victoria, B.C., on February 27, 1946.

He was born in Holywood, Ireland, in 1873, followed an engineering course at Dublin University, and came to Canada in 1891, establishing himself in British Columbia. He was first employed in field work and draughting for Burnet and Hope at Vancouver and in 1897 engaged in hydraulic and mining engineering in Lillooet, B.C. He entered railway work in 1901 as engineer in charge of the Kettle Valley Lines, Grand Forks, B.C., going the next year to the State of Washington as assistant engineer for the Great Northern Railway at Spokane. In 1904 he became district engineer for the Canadian Pacific Railway at Revelstoke, B.C., where he remained for seven years.

Mr. Forde then joined the staff of the Federal Department of Public Works and was successively located at Nelson, Victoria and New Westminster, B.C. He became engineer in charge of all Dominion works projects in British Columbia and the Yukon, including the Esquimalt drydock. He retired in 1938.

He had been a Member of the Institute since 1905.

Reginald March Calvin, M.E.I.C., sales manager of Canadian Vickers Limited, Montreal, died suddenly on August 12th, 1946, at Metis Beach, Que.

Born at Garden Island, Ont., in 1889, he was educated at Kingston schools and at Queen's University where he received a B.A. in 1911 and a B.Sc. in civil engineering in 1914. Following graduation he was on the engineering staff of Canadian Stewart Company on Toronto harbour improvements for some months, resigning to enlist in the Queen's University Engineers as a sapper, and was commissioned before going overseas in 1915. On his discharge in 1919 with the rank of major, he entered the Department of the Interior, employed on power investigation in the Dominion Water Power Branch at Ottawa. During the years 1921 to 1927 he was connected with the H. S. Taylor Company in Montreal and with Hanover Converters Limited at Hanover, Ont. In 1927 he joined the industrial engineering department of Canadian Vickers Limited, Montreal, and the firm appointed him sales manager in 1934.

Mr. Calvin joined the Institute in 1914 as a Student, becoming an Associate Member in 1919 and a Member in 1940. He served in recent years as a member of the Finance Committee.

James Anderson, M.E.I.C., of Malagash, N.S., died accidentally on May 8th, 1946.

He was born in 1904 in Motherwell, Scotland, was educated at Dalziel and Airdrie and served his apprenticeship as a mining engineer in Glasgow, Scotland, with the firm of William Dixon. He received a mining surveyor's certificate in 1926, and a mine manager's certificate three years later. In preparation for the latter he spent two years as assistant superintendent and engineer at the Cadzon Colliery, Hamilton, Scotland.

He came to Canada in 1930 and was employed as a surveyor in the Land Titles Office at Calgary, Alta., after which he was employed for two years by the Granby Consolidated Mining and Smelting Company at Anyox, B.C. He next proceeded to Ontario to mining engineering work at the Frood Mine, Sudbury, and at the Falconbridge Nickel Mine. In 1936 he entered the Malagash Salt Company in Nova Scotia, and was later appointed its manager, being actively engaged for the company at the time of his death. He joined the Institute as a Member in 1940.

BOOK REVIEW

AIRPORT PLANNING

Charles Froesch and Walther Prokosch. New York, Wiley; London. Chapman & Hall, 1946. 250 pp., Illus., 11¼ x 8½ in., cloth, $7.00.

Reviewed by J. A. Wilson, M.E.I.C.*

Adequate airports are as essential today to Air Transportation as are good roads to the modern automobile industry. Since the financial expenditures involved in providing such facilities are now so considerable and are constantly increasing, no airport project should be undertaken except after the most careful study and scrutiny to ascertain that all factors have been carefully weighed and that the expense can be justified from all angles. In this volume, the work of two experts, each with long experience in his own field, airport problems are clearly and concisely analysed from a fundamental and functional viewpoint.

The purposes of the book are: 1. To indicate the proper relationship of landing facilities to communities or regions they are to serve; 2. To analyse the characteristics of aircraft which affect the planning and design of those facilities; and, 3. To effect a proper balance between the airfield and buildings. Practical and detailed consideration is also given to airfield construction and lighting, building design, hangar design, and the establishment and operation of special services.

Each section is an admirable summary of up-to-date knowledge and practice which should be invaluable, not only to those in the aviation industry but to the constantly increasing number of executives, engineers, architects and contractors whose interest and attention will undoubtedly be attracted by the ever widening scope of modern aviation. The book is admirably illustrated by pictures, diagrams, maps and sketches throughout and each section contains a bibliography of reference works on its particular subject.

Stress is properly laid on the importance of planning ahead and allowing for expansion in planning. What may be adequate for today may be totally inadequate to take care of the traffic requirements a few years hence. This may result in the forced abandonment of expensive facilities created without sufficient vision to provide for future expansion. The expense involved in the creation of modern airport facilities is so great that no effort must be spared to plan for future expansion to take care of all anticipated growth. The authors show admirably how much error may be avoided and how sites, if properly planned, may be developed gradually, step by step, thus avoiding unnecessary preliminary expense while providing in the plan ample room for expansion, which may be required in future to meet increased traffic or to accomodate larger types of aircraft.

A word of warning is necessary, however. No amount of planning will provide a suitable airport site in some localities. The site must exist before it can be planned. Some localities are fortunate in having a choice of possible sites for development, others are fortunate if there are one or two possible airport sites available. In the case of at least one important Canadian city, no site which could be improved at reasonable cost has been found within a distance of twenty miles after twenty years of exhausted search! In another, the only possible site, and it is a fine one, is useless because it is blanketed by fog at many seasons of the year.

In Canada, the Civil Aviation staff has had the foresight to plan for expansion and few existing sites will have to be abandoned because of lack of vision in their planning. Many sites call urgently today for necessary expansion to meet new conditions, however. If Canada is to hold the great position she has made for herself in the aviation world, a great expansion of our airport programme is still necessary in all parts of the Dominion and no better guide to planning that expansion could be desired than this valuable work.

Formerly Director of Air Services, Department of Transport, Ottawa, Canada.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Atomic Energy in Cosmic and Human Life; Fifty Years of Radio-activity:

George Gamow. Cambridge, University Pr.; N.Y., Toronto, Macmillan, 1946. 161 pp., illus., cloth, $3.25 (in Canada).

Beams on Elastic Foundation; Theory with Applications in the Fields of Civil and Mechanical Engineering:

M. Hetényi. Ann Arbor, University of Michigan Pr.; London, Geoffrey Cumberlege, Oxford University Pr., 1946. 255 pp., illus., cloth, $4.50.

Civil Code of Lower Canada; with the Amendments Effected by Imperial Federal and Provincial Legislation, up to and including the First Session of the Twenty-Second Legislature of the Province of Quebec, 9 George VI, 1945; and also the Federal Bills of Exchange Act as Amended to Date:

E. Howard Cliff. Montreal, Wilson & Lafleur, 1945. 857 pp., fabrikoid, $7.00.

Le Cobalt:

Robert Perrault. Paris, Dunod, 1946. 151 pp., illus., paper, 390 Fr.

Design and Construction of Concrete Roads; 2d ed:

R. A. B. Smith and T. R. Grigson. London, Concrete Publications Ltd., c1946. 162 pp., illus., cloth, 8/6.

English-French and French-English Technical Dictionary; Metallurgy, Mining, Electricity, Chemistry, Mechanics, Sciences:

Francis Cusset. Brooklyn, N.Y., Chemical Publishing Co., Toronto, General Publishing Co., 1946. 590 pp., $7.00 (in Canada).

Modern Organic Finishes; Their Application to Industrial Products:

Rollin H. Wampler. Brooklyn, N.Y., Chemical Publishing Co., Toronto, General Publishing Co., 1946. 452 pp., illus., cloth, $11.90 (in Canada).

Simplified Punch and Diemaking:

James Walker and Carl C. Taylor. N.Y., London, Toronto, Macmillan, 1946. 235 pp., illus., cloth $5.50 (in Canada).

Statistically Indeterminate Structures:

L. C. Maugh. N.Y., Wiley; London, Chapman & Hall, c1946. 338 pp., illus., cloth, $5.00.

Steel Castings:

Eric. N. Simons. London, Paul Elek (Publishers), c1946. 208 pp., illus., cloth, 13/-.

Vertical Curves for Roads; a Textbook for Highway Engineers and Students:

F. G. Royal-Dawson. London, E. & F. N. Spon, 1946. 141 pp., illus., 15/-.

PAMPHLETS, ETC.

Community Planning, Why? When? and How?

C. A. Meadows. Toronto, Meadows, Critoph & Co.

Flexibility in Small Lot Production Broaching:

N.Y., Broaching Tool Institute, 1946. (Reprinted from Tool Engineer, July 1946).

Gr. Britain. Ministry of Towns and Country Planning:

Interim Report of the New Towns Committee, March 1946. Cmd. 6759.

. . . Second Interim Report of the New Towns Committee, April 1946. Cmd. 6794.

. . . New Towns Bill; Memorandum by the Minister of Town and Country Planning showing Application and Modification of Provisions of the Town and Country Planning Act, 1944. April 1946. Cmd. 6801.

. . . New Towns Bill; Memorandum by Secretary of State for Scotland, April 1946. Cmd. 6804.

Improving the Distribution of Water to Farmers by use of the Parshall Measuring Flume:

Ralph L. Parshall. U.S. Dept. of Agriculture. Soil Conservation Service. Bulletin 488, May 1945.

Reappraising the Quality Function:

J. M. Juran. N.Y., Wallace Clark & Co. (Reprinted from American Management Association. Production Series No. 164)

Research by the Aluminium Industry in Canada:

R. H. Rimmer. Kingston, Aluminium Laboratories Limited, 1946. (Lecture No. 18-46).

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

BASIS OF SHEET METAL DRAFTING:

W. H. Hedley. London, New York, Toronto; Longmans, Green, 1945. 118 pp., illus., 8¾ x 5¾ in., cloth, $1.80 (in Canada).

The purpose of this book is to give a firm foundation in the setting out of patterns which forms an important part in the technical education of those connected with sheet metal work. It is written primarily for the student who should find the application of calculations to the development of patterns interesting and valuable, even if only one or two calculations are made to serve as a check to patterns developed graphically. The book also covers a good deal of the work required for teaching plane and solid geometry in Junior Technical Schools.

BRITISH STANDARD SPECIFICATION FOR FLAMEPROOF ENCLOSURE OF ELECTRICAL APPARATUS FOR POWER AND LIGHTING PLANT; B. S. 229:1946:

London, British Standards Institution, 1946. 3/6.

This new illustrated edition of B. S. 229 defines the performance required and prescribes those features of design and construction considered to be essential to secure reliability in service.

It specifies the maximum permissible gap dimensions for a number of inflammable gases and vapours likely to introduce an explosion hazard if met in any industry.

The specification contains a tabulated summary classifying the gases and vapours covered into four groups:—1—Mining.—2—General industrial processes.—3—Gasworks and coke oven plants.—4—Excluded gases and vapours, acetylene, carbon-disulphide and hydrogen, for which the maximum experimental safe-gap is too small to admit any permissible gap for the class of apparatus to which flameproof enclosure is commonly applied.

BRITISH STANDARD SPECIFICATION FOR 'READY-TO-FIT' THERMAL INSULATING MATERIALS; B. S. 1304:

London, British Standards Institution, 1946. 2/-.

The first of a series of specifications for thermal insulating materials, embracing pre-formed, plastic, granular, and loose-filled types, B. S. 1304 covers thermal insulating materials for hot and cold water supply and central heating installations for dwellings with a water heater rated at not greater than 40,000 B.Th.U. per hour. It is intended for use in connection with small dwellings.

The fuel saving to be achieved by the installation of thermal insulation in such dwellings, is emphasized in an appendix. A list of suitable materials with information concerning thermal conductivity is also given.

CSA LIST OF APPROVED ELECTRICAL EQUIPMENT:

Ottawa, Canadian Standards Association, 1946.

CSA Approvals Division is renewing the periodic publication of its *List of Approved Electrical Equipment.* The completed List (January 1946) and the first Supplement (May 1946) have been issued. Supplements showing additions, revision, and cancellations will be issued every four months, and the complete List will be reprinted in January, 1948.

STANDARD CODE FOR ARC AND GAS WELDING IN BUILDING CONSTRUCTION.

New York, American Welding Society, 1946. 68 pp, $0.50.

This new edition, which replaces the 1941 (tentative) edition, embodies revisions based on experience in the recent applications of welding to structural fabrication and on further research investigation.

The section on design now provides for increased allowable weld unit stresses equal to those allowed for the steel being welded. Other sections on filler metal, workmanship, inspection and qualification of welding operators and procedures have also been revised.

TIRE WEAR AND COST ON SELECTED ROADWAY SURFACES:

R. A. Moyer and Glen L. Tesdall. Ames, Iowa Engineering Experiment Station, 1945. 127 pp., illus., 9 x 6 in., paper, request. (Bulletin 161).

The authors present the results of an extensive research study of the factors which determine tire wear and cost, and show the means by which tire life can be extended through proper tire care and maintenance. The results have been determined from 450,000 miles of carefully controlled driving on gravel, bituminous surfaces, and concrete pavements in Iowa, Kansas, Missouri and Wyoming.

WHAT PRICE SUPERVISION; How Management Can Build a Stronger Supervisory Force:

R. D. Bundy. New York, Deep River, Conn., Chicago, National Foremen's Institute, c1946. 46 pp., 6½ x 9½ in., fabrikoid, spiral-bound, $2.00.

In this book the author offers a definite programme, and presents specific suggestions for attaining the type of supervision necessary for the era ahead. Section I presents the various aspects of the supervisory problem: Pattern of management-foremen relations, Views on supervision, Outworn policy, Measure of leadership, Two problems—secure and develop, Philosophy of long standing, Case histories, Factual data on foremen's education, Education vs experience. In Section II the author offers a definite solution and covers: What is supervision, Well-balanced supervision, and The foreman who gets things done.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

ELECTRONICS in INDUSTRY:

By G. M. Chuto. McGraw-Hill Book Co., New York and London; Embassy, Toronto, 1946. 461 pp., illus., diagrs. charts, tables, 8½ x 5¼ in., cloth, $5.00.

To give a broad introduction to the use of electronic circuits and equipment is the purpose of this book. It outlines the industrial uses of tube circuits and gives detailed explanation of a large number of electronic equipments now serving in industrial plants. No previous knowledge of tubes is assumed, the early chapters being devoted to the necessary fundamentals, and since the book is intended for users of equipment already available, no design information is presented.

HEATING and VENTILATION of DWELLINGS (Post-War Building Studies No. 19):

By the Heating and Ventilation (Reconstruction) Committee of the Building Research Board of the Department of Scientific & Industrial Research, published for the Ministry of Works by His Majesty's Stationery Office, London, 1945. 228 pp., diagrs., maps, tables, 9½ x 6 in., paper, 2s.6d. (obtainable from British Information Services, 30 Rockefeller Plaza, New York, $0.75).

The major purposes of this report are as follows: to determine the average conditions of warmth and ventilation which are desirable, and the minimum provision for hot-water supply and cooking; to find the amount of heat theoretically needed in an average house to provide these basic facilities and show how this amount is affected by the construction of the house, etc., and to discuss the various factors relating to the choice of methods of heating. Special topics dealt with separately are: ventilation methods; clothes washing; the development, installation and operation of heating appliances; testing and standardization of appliances; and the use and distribution of fuel.

MOTEURS d'AVIONS, 2 Vols., Text and Planches:

By R. Marchal, preface by P. Dumanois. Dunod, Paris, 1946. Text, 643 pp., illus., diagrs., charts, tables, 11 x 7½ in., paper, (3200 frs., 2 vols.)

This comprehensive work on airplane engines first defines and identifies important parts and engine characteristics, and gives a brief historical sketch. A considerable part of the book is devoted to the thermodynamics of fluids and of engines and compressors. Another group of chapters covers the strength of materials and the kinematics of engine parts. Carburetion, ignition and lubrication are dealt with separately. Manufacturing practice and testing procedures are considered, and a chapter is devoted to unusual types of engines. Over a hundred plates and diagrams are contained in a supplementary volume.

TRAINS, TRACKS and TRAVEL:

By T. W. Van Metre. 7th ed. Simmons-Boardman Publishing Corp., New York, 1946. 423 pp., illus., diagrs., 9¼ x 6 in., cloth, $3.50.

This popular treatise, now in its seventh edition and twentieth year, has again been revised to keep abreast of the continuing developments in the railroad field. Intended originally for boys, the book has become broad enough in scope and thorough enough in treatment to be of general interest to all amateurs of railroading. Extensively illustrated, the pictures and text cover the historical, mechanical and operational phases of one of our greatest industries.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

September 15th, 1946.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the October meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least our years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

HOOD—JAMES R., 110 Marion St., Toronto 3, Ont. Born at Galt, Ont., Nov. 23rd, 1919. Educ.: B.Sc. (Chem.Engrg.), Queen's, 1942; R.P.E., Ontario. 1942-1945, meteorologist, British Commonwealth Air Training Plan; with Canada Packers Limited, Toronto, as follows: 1945-46 (13 mos.), routine analysis, chemical engrg. problems, preliminary layout new glue lab., design pilot plant for extraction of cholesterol, and at present, chemical engr. in mech. supvr.'s office on factory layout designs, designs and drawing of mech. and chem. equipt., mtce. engrg.

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET, MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER, Ph.D. or M.Sc. Specialized in physical chemistry, required by industrial organization in Montreal area as member of organic research team. Salary open. Apply to File No. 3596-V.

CHEMICAL ENGINEERS, recent graduates up, required as shift supervisors by an industrial chemical plant in the Montreal area. Salary from $200. Apply to File No. 3605-V.

CHEMICAL ENGINEER, under 30, required for the patent department of a large industrial organization in Montreal. Salary from $200. Apply to File No. 3609-V.

CIVIL

CIVIL ENGINEER with construction experience required as plant engineer by a textile firm with headquarters in Montreal. Salary open. Apply to File No. 3615-V.

ELECTRICAL

ELECTRICAL ENGINEERS, preferably with experience in line communications, required by a communications company in the Montreal area. Salary according to experience. Apply to File No. 3601-V.

ELECTRICAL ENGINEER DRAUGHTSMEN, preferably with pulp and paper experience, required by a paper company in Montreal. Salary open. Apply to File No. 3610-V.

ELECTRICAL ENGINEER with construction experience wanted as assistant to sales manager in a Montreal electrical supply and service company. Salary according to experience. Apply to File No. 3611-V.

ELECTRICAL ENGINEER for sales engineering, with previous experience, age 25-40, required by a Montreal firm handling pumps, valves, automatic controls, etc. Salary according to experience. Apply to File No. 3614-V.

MECHANICAL

MECHANICAL ENGINEER, preferably with mining experience, age 25-35, required by a manufacturer in Montreal to do estimating or design work on mining equipment and assist in sales. Salary according to experience. Apply to File No. 3589-V.

MECHANICAL ENGINEER as production engineer for a sea food canning company in Eastern Canada. Duties would include plant design, production improvement and plant maintenance. Bilingual and experienced man preferred. Salary from $200-$300. according to qualifications. Apply to File No. 3592-V.

MECHANICAL ENGINEER with extensive knowledge of machine shop practice and general industrial experience is required by a specialized industrial plant in the Montreal area. Veteran preferred. Salary according to experience. Apply to File No. 3595-V.

MECHANICAL ENGINEER with pulp and paper or construction experience required as resident engineer for a paper mill in Western Ontario. Salary open. Apply to File No. 3598-V.

MECHANICAL ENGINEER with five to ten years' industrial experience and familiar with the layout and construction of chemical plants, required by a manufacturer in the Montreal area for plant design and construction. Salary from $300. Apply to File No. 3605-V.

MECHANICAL ENGINEER with experience in the automotive business and the maintenance of all types of internal combustion engines required by an oil company in the Montreal area. Salary open. Apply to File No. 3608-V.

MECHANICAL ENGINEER with at least five years industrial experience required by a textile firm with headquarters in Montreal. Salary open. Apply to File No. 3615-V.

COMBUSTION ENGINEER, MECHANICAL, preferably with five years industrial experience, required by a textile firm with headquarters in Montreal. Salary from $300. Apply to File No. 3615-V.

MECHANICAL ENGINEER with at least five years' experience of aluminum processing, plant design and operation, etc., required for Aluminum production organization in Australia. Limited contract. Salary open. Apply to File No. 3620-V.

MISCELLANEOUS

ENGINEERING DRAUGHTSMAN with pulp and paper or construction experience required for a paper mill in Western Ontario. Salary open. Apply to File No. 3598-V.

ELECTRICAL, MECHANICAL OR COMBUSTION ENGINEER required by an industrial firm in Montreal for estimating and supervising the installation of heating plants. Age over 35. Salary from $300 according to experience. Apply to File No. 3602-V.

DESIGN ENGINEER, capable of assuming responsibilities of designing structures and equipment layouts of steam plants, hydro-electric developments, etc., required by an industrial corporation in Montreal. Salary from $350 according to experience. Apply to File No. 3603-V.

HYDRAULIC ENGINEER, familiar with hydraulic machinery design, installation, stream functions and runoff computations, etc., required by an industrial corporation in Montreal. Salary from $300 according to experience. Apply to File No. 3603-V.

MECHANICAL OR ELECTRICAL ENGINEER with considerable construction experience required as executive assistant to chief engineer of general contracting firm with headquarters in Montreal. Salary from $300 according to experience. Apply to File No. 3604-V.

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

RESIDENT ENGINEER with considerable construction experience, preferably bilingual, to take charge of the construction of a dam on the Upper Ottawa River. Salary from $300. Apply to File No. 3613-V.

CHIEF DRAUGHTSMAN with experience in design and controlling a design staff required for both structural and equipment work by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL OR MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

MACHINE DESIGNER with considerable experience required by a company in Southern Ontario. Experience on the designing of steel mill equipment or heavy machinery desirable but not essential. Salary according to qualifications. Apply to File No. 3617-V.

JUNIOR ELECTRICAL OR MECHANICAL ENGINEER, with transmission line experience, required for the engineering department of an industrial firm in Montreal. Salary from $225. Apply to File No. 3618-V.

ASSISTANT CHIEF DRAUGHTSMAN AND STRUCTURAL AND MECHANICAL DRAUGHTSMEN with experience, required for the engineering department of an industrial firm in Montreal. Salaries open. Apply to File No. 3618-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER with some pulp and paper experience required for the technical department of a paper mill in Lake St. John area. Apply to File No. 3470-V.

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada for mill control and pilot plant. Salary open. Apply to File No. 3549-V.

JUNIOR CHEMICAL ENGINEERS OR CHEMISTS, preferably bilingual, for various paper plants in Quebec. Salary from $200 according to experience. Apply to File No. 3555-V.

CHEMICAL ENGINEER required by an industrial organization with headquarters in Montreal as assistant to chief chemist and control supervisor in a pulp and paper plant. Initiative to deal with unexpected problems essential. Salary from $250 according to experience. Apply to File No. 3555-V.

CHEMICAL ENGINEER OR CHEMIST, from recent graduate up, is required by an industrial concern in Montreal for chemical control of products. Salary open. Bilingual preferred. Apply to File No. 3564-V.

CHEMICAL ENGINEER, recent graduate up, required by a petroleum refining company in Montreal for process and design work. Salary about $200. Apply to File No. 3575-V.

CHEMICAL ENGINEERS, age 22-35, recent graduates up, are required by a Montreal firm for development work, maintenance, design and construction in explosives field. Sales and technical service representation to paper and textile industries. Salaries according to qualifications. Apply to File No. 3588-V.

CIVIL

TWO CIVIL ENGINEERS, one experienced man to be in charge, the other to act as assistant, mostly for office work, are required for a building programme in Ontario, in connection with roads, trails, lookout towers, telephone line, buildings, etc. Preference to veterans. Salary up to $3,000 per year for senior and $2,000 per year for junior position. Apply to Box No. 3394-V.

CIVIL ENGINEER recent graduate, must be bilingual, required for work on general design, survey and construction of transmission lines in th Montreal area. Apply to File No. 3446-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER DRAUGHTSMAN, age 25-35, for consulting engineer's office near Toronto. Applicant should have some knowledge of municipal sewerage and waterworks problems. Apply to File No. 3489-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position, salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEER, recent graduate, required by a firm of consulting engineers in Montreal, to assist Engineer in charge of field work in Ont. Salary $175 up. Apply File No. 3518-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS with experience as structural designers and draughtsmen are required by an engineering firm in Montreal. Salary from $300—$400 according to experience. Apply File No. 3520-V.

CIVIL ENGINEER to take charge of project engineering required by a firm of industrial engineers in Quebec. Should be bilingual and have experience in heavy construction. Salary according to capacity. Apply File No. 3531-V

CIVIL ENGINEER to be superintendent of construction with a contractor in Montreal. Salary according to qualifications. Apply to File No. 3558-V.

CIVIL ENGINEER, recent graduate up, to be assistant to town engineer of a town in the Montreal area. Permanent position. Salary from $175 up. Apply to File No. 3569-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER with considerable building experience, as construction superintendent with a firm of building contractors in Central Ontario. Salary open. Apply to File No. 3582-V.

CIVIL ENGINEER with 3 or more years' experience on design of industrial buildings, equipment, supports and foundation work, is required by a Montreal firm for structural design work in steel, timber and reinforced concrete. Salary $200 up. Apply to File No. 3588-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters, English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to Box No. 3415-V.

ELECTRICAL ENGINEERS, age 30 to 40. 5 to 10 years experience, for estimating design and general engineering for large public utility in Toronto area. Apply to File No. 3429-V.

ELECTRICAL DRAUGHTSMEN with experience in substation design, not necessary graduate engineers, required by a public utility in the Montreal area. Salary $200 to $225. Apply to File No. 3446-V.

ELECTRICAL ENGINEERS, preferably experienced for sales and service of motors, transformers, control equipment, etc., with an industrial firm in Montreal. Salary according to qualifications and ability. Apply File No. 3512-V.

ELECTRICAL DRAUGHTSMAN with considerable experience in industrial light, heat and power layouts is required by a consulting engineer in Montreal. Salary from $200 according to experience. Apply File No. 3528-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment. Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEERS, from recent graduates up, preferably with pulp and paper experience, required by a power and paper corporation in Ontario. Salary open. Apply to File No. 3554-V.

ELECTRICAL ENGINEER with power plant experience, must be bilingual, to take complete charge of power plants and distribution system for a N.B. town. Salary according to experience. Apply to File No. 3561-V.

ELECTRICAL ENGINEER for a junior position in the design department of an industrial concern in the Montreal area. Salary open. Apply to File No. 3574-V.

MECHANICAL

MECHANICAL ENGINEER, graduate with 4 or 5 years' experience in heating and ventilating layouts is wanted by a consulting engineer in Montreal. Apply File No. 3243-V.

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to Box No. 3393-V.

JUNIOR MECHANICAL ENGINEER with some experience on mechanical design. Preference to ex-service men. Salary from $200 to $250. Location Quebec City Apply to File No. 3401-V.

STEAM PLANT SUPERVISOR—Manufacturer with several plants in Ontario and Quebec requires an active man with technical training and field experience in efficient steam plant operation. Apply to File No. 3406-V.

MECHANICAL ENGINEER DRAUGHTSMAN with two or three years experience, is required for work with a paper company in the province of Quebec. Salary $250 to $275 a month. Apply to Box No. 3424-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualificatione. Apply to File No. 3471-V.

MECHANICAL ENGINEER with considerable experience in plumbing, heating, ventilating, age 30-45, required for a permanent job as a designer with a Montreal architectural firm. Salary from $300. Apply to File No. 3473-V.

MECHANICAL ENGINEER, recent graduate, for technical service and plant operation with a manufacturer in the Montreal area. Successful candidates will have two-year training course in U.S. Apply to File No. 3476-V.

MECHANICAL ENGINEERS from recent graduates up required by a structural steel company in the Montreal area. Salary according to qualifications. Apply to File No. 3485-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the reconversion of a paper mill in Western Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MECHANICAL ENGINEER with considerable industrial experience is required for the staff of a firm of consulting engineers in Montreal. Salary about $250. Apply File No. 3525-V.

MECHANICAL ENGINEER, to assume charge of factory maintenance staff and help design new machines and develop new ideas in conjunction with research and methods departments, wanted by electrochemical and engineering firm in the Niagara Peninsula. Salary from $250. Apply File No. 3538-V.

MECHANICAL DRAUGHTSMAN with over five years experience in piping layout and similar work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

MECHANICAL ENGINEER, recent graduate, for the engineering staff of a pulp manufacturer in Eastern Quebec. Apply to File No. 3547-V.

MECHANICAL ENGINEERS with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER with at least five years' industrial experience, knowledge of plant layout, equipment design and cost estimating and preferably experience in chemical industry. Salary $275-$325. Apply to File No. 3553-V.

MECHANICAL ENGINEER with considerable experience in heating and ventilation, etc., required by a firm of consulting engineers in Montreal. Salary open Apply to File No. 3565-V.

MECHANICAL ENGINEERS with experience in heating and ventilating or the pulp and paper industry or with general mechanical layout and design work are required by a firm of consulting engineers in Montreal. Salary from $250-$350 according to experience. Apply to File No. 3568-V.

MECHANICAL ENGINEER, recent graduate, for junior position in the design department of a firm in Central Ontario making special heavy duty mobile equipment. Apply to File No. 3572-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEER with some electrical experience for the design department of an industrial concern in the Montreal area. Salary open. Apply to File No. 3574-V.

MECHANICAL ENGINEER with paper mill or mining experience required as assistant mechanical superintendent and understudy to mechanical superintendent in a paper mill in the St. Maurice Valley. Salary from $300 according to experience. Apply to File No. 3581-V.

MECHANICAL ENGINEERING DRAUGHTSMAN, fully experienced in kraft and sulphite mills processes and modern design, required by a pulp and paper firm on the West Coast. Salary open. Apply to File No. 3586-V.

METALLURGICAL

METALLURGIST, age 25-30, veteran, experience in Metallurgical Laboratory or Mine Assay office and Mining Mill practice decided advantage, required by a Montreal firm to be trained for Sales Representative. Salary depending on experience. Apply to File No. 3588-V.

MISCELLANEOUS

STEAM PLANT SUPERINTENDENT with extensive experience is required to superintend the steam plant of a pulp and paper mill in Western Ontario. Salary would be $300 to $350. Apply to File No. 3227-V.

ENGINEER SALESMAN, fluently bilingual, not necessarily a graduate but with some good experience on truck mechanical work and some sales background, age 35-40, is required by an automobile manufacturer for work in the Montreal area. Preference will be given to ex-service men and R.C.E.M.E. and workshop experience would be useful. Salary $250 to $350. Apply to File No. 3266-V.

ENGINEERING ACCOUNTANT, young graduate age 25-35, with engineering background and taste for accounting, is required to act as assistant to the secretary treasurer of a manufacturing concern in Montreal. Apply to File No. 3272-V.

TWO INDUSTRIAL ENGINEERS, preferably with engineering background in mechanical, electrical or chemical engineering, age 35 up, bilingual, with some practical experience, is required by a company in Montreal engaged in industrial engineering, consulting work, plant layout, controls, inventories, production and admin. controls. Apply to File No. 3307-V.

TECHNICAL SALES ENGINEERS are required by an oil company in the Montreal area. Candidates must be bilingual and experience may range from recent graduate up. Salary will be $150-$250 depending on qualifications. Apply to File No. 3320-V.

CHIEF DRAUGHTSMAN, experienced in all types of structural work, required to take charge of a draughting office for a central Ontario city. Apply to Box No. 3428-V giving all particulars including salary expected.

CHIEF DRAUGHTSMAN to take charge ofengineering department, draughting room and estimating for machinery manufacture in Sherbrooke. Apply to File No. 3430-V.

QUALIFIED DRAUGHTSMAN, thoroughly capable in design and layout of industrial piping, steam, water, air etc. Salary open. Apply to File No. 3435-V.

ENGINEERING DRAUGHTSMAN required by an industrial concern in Three Rivers for all round employment in a permanent position. Apply to File No. 3443-V

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

ELECTRICAL OR MECHANICAL ENGINEERS interested in transportation, with experience in the transportation field or machine shop practice or automotive services, maintenance and operation. Salary according to qualifications. Apply to File No. 3456-V.

FORESTRY ENGINEER graduate, 25 to 35 years, required by a large paper company in the Prov. of Quebec. Good opportunity for advancement. Salary open. Apply to File No. 3462-V.

MECHANICAL OR ELECTRICAL ENGINEER under 35, with at least 5 years practical experience, is required for a responsible position in the engineering department of an industrial firm in Toronto. Apply to File No. 3472-V.

STRUCTURAL STEEL DESIGNERS AND DETAILERS required by a construction company in Montreal. Salary open. Apply to File No. 3482-V.

CIVIL OR MECHANICAL ENGINEER with experience in construction required by a Montreal firm to estimate value of work done and to inspect during construction concrete and steel bldgs. Salary open. Apply to File No. 3486-V.

INDUSTRIAL MINERALOGIST, with Ph. D. or M.Sc. in geology, mineralogy, chemistry or metallurgy and knowledge of commercial processing of industrial metals, laboratory investigations and publishing of results. Must have at least five years experience with special reference to industrial minerals. Starting salary from $275 in prov. mines dept. Apply to File No. 3492-V.

GEOLOGISTS, with Ph. D. in economic or mining geology and intimate knowledge of structural geology, diamond drilling and geophysical methods. Must have at least five years practical experience, ability to publish results of original investigations and use of aerial photographs. Starting salary from $275. in Prov. Mines Dept. Apply to File No. 3492-V.

CHEMICAL OR MECHANICAL ENGINEER with construction experience in the chemical field, a knowledge of hydrocarbons and at least five years experience since graduation is required by a chemical firm in Western Ontario. Salary from $250. Apply to File No. 3502-V.

RESIDENT ENGINEER with considerable construction experience and bilingual is required by a public utility for employment on the upper Ottawa River. Salary from $350. Apply to File No. 3505-V.

PLANT ENGINEER with pulp and paper experience for development, construction and maintenance work with a paper mill in the Lake St. John area. Salary open. House available. Apply to File No. 3507-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS with experience in mechanical and chemical process layouts are required by an engineering firm in Montreal. Salary from $300-400 according to experience. Apply to File No. 3520-V.

MECHANICAL OR MINING ENGINEER, age 30-40 with experience in industrial engineering, required by a large mining and processing firm for methods studies of equipment, labour and costs. Salary according to qualificatons. Apply to File No. 3524-V.

INDUSTRIAL ENGINEER, bilingual, with considerable experience, is required by a firm of industrial engineers in Quebec. Salary according to capacity. Apply to File No. 3531-V.

SENIOR DRAUGHTSMAN is required immediately by a Calgary and Turner Valley Oil Company. Work will be mainly geological draughting. Single man preferred. Salary dependent upon qualifications. Apply to File No. 3536-V.

CHEMIST OR RESEARCH ENGINEER, to take charge of Control Development and Research staff. Must have supervisory ability and be able to show results. Wanted by electrochemical and engineering firm in the Niagara Peninsula. Salary from $200. Apply to File No. 3538-V.

DESIGN ENGINEER with several years experience in hydro-electric work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

JUNIOR ENGINEER OR DRAUGHTSMAN, preferably with experience in the design of heating and ventilating layouts, required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3545-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

INDUSTRIAL ENGINEER, under 40, with not less than 5 years' experience in industrial methods engineering, required by a paper company in British Columbia. Salary open. Apply to File No. 3550-V.

CIVIL OR MECHANICAL ENGINEERS, preferably with pulp and paper experience, required for engineering and operating staff of a large Ontario corporation. Salary according to qualifications. Apply to File No. 3554-V.

CIVIL SERVICE COMMISSION, OTTAWA

Situations Wanted

PLANT ENGINEER, M.E.I.C., seeks position with industrial concern, preferably textile. Wide experience in charge of plant layout, all branches, design, selection and purchase of equipment, construction and maintenance. Apply to File No. 1662-W.

SALES ENGINEER, Jr. E.I.C., P. Eng., Que., age 32, B. Eng. McGill in Mechanical, experience in sales, design and plant engineering. Married. Bilingual. Location immaterial. Veteran. Available on short notice. Apply to File No. 1692-W.

GRADUATE ENGINEER, B.Sc. (Civil), M.E.I.C., services available. Thorough knowledge of building construction and fifteen years' experience in sales engineering and promotional work in connection with building products; also considerable practical experience in construction work as estimator and in field work. Recently resident engineer on large industrial project. Good connections with architectural and contracting firms, particularly in Toronto area. Apply to File No. 2440-W.

MECHANICAL ENGINEER, M.E.I.C. graduated N.S.T.C. 1940 age 30 years, married. Three years' experience in aircraft inspection, two years in R.C.A.F. as pilot. One year draughting, six months of which in pulp and paper. Desirous of getting more experience in pulp and paper industry. Apply to File No. 2617-W.

ELECTRICAL ENGINEER, S.E.I.C., age 27, married, class of 1946, formerly a 'Flight Engineer" in R.C.A.F., has approximately one and a half years' experience in mine and smelter electrical work. Position desired more along Mechanical line than Electrical. Will go anywhere, anytime. Apply to File No. 2631-W.

ELECTRICAL ENGINEER, graduate McGill University 1944, age 25, single. Experience in industrial, radio communications and as Radar officer in R.C.E.M.E. Interested in a position leading to sales engineering or industrial management. Services available on one month notice or less. Apply to File No. 2649-W.

ENGINEER, Prof. Eng. (Civil), M.E.I.C., thoroughly experienced in structural and mechanical design, estimating and sales work, will undertake worthwhile agency or representation for manufacturer in B.C. Apply to File No. 2687-W.

GRADUATE CHEMICAL ENGINEER, S.E.I.C., B.A.Sc., Toronto, 1946, available immediately. Interested in position with Consultant or in Production. Location preference: Hamilton, Ont. Apply to File No. 2721-W.

GRADUATE ELECTRICAL, TORONTO, 1932. M.E.I.C., P. Eng. Seeks responsible Administrative or Industrial Engineering position with Manufacturer, Supplier or User of Electrical Equipment and or Electrical or General Management, Engineering Services, preferably outside the Province of Quebec. Fourteen years' experience in Radio and Aviation Industries, including: four years radio development and manufacture, one year supervision of instruction radio trade school, six years supervision of installation, operation and maintenance of radio aids to air navigation, one year supervision of airline communications, two years equipment and sales engineering, aeronautical and railroad radio equipment. This included executive and administrative responsibility. Apply to File No. 2725-W.

GRADUATE FOREST ENGINEER, Jr. E.I.C., single, age 28, with six years' bush experience, in timber, improvement and operational surveys, operational planning and layout, construction and supervision, requires position as assistant logging superintendent or assistant logging engineer. Available immediately for service anywhere in Canada or British possessions. Details of experience and references furnished on request. Apply to File No. 2726-W.

ELECTRONICS ENGINEER, B.Eng., Honors, McGill, 1943, Electrical Lieutenant, R.C.N., since graduation, desires position with electronics equipment or component manufacturer in purchase control, sales, specifications, or development. Experience: Naval electronics maintenance, fitting, inspection, test; last 18 months O I/C technical identification, documentation and procurement adviser for components; extensive knowledge of Standard and commercial specifications, and component characteristics of major U.S. and Canadian manufacturers. Quebec-Ontario location preferably. Apply to File No. 2727-W.

PLANT ENGINEER, B.Eng., M.E.I.C., R.P.E. (Ont.), age 35, married, with 11 years' experience in design, construction and maintenance of electrical and mechanical installations and buildings. Aggressive, resourceful and co-operative Successful record in responsible supervisory position. Apply to File No. 2728-W.

AIRLINE ENGINEER with degree in Mechanical Engineering (McGill). Eight years' experience with major Canadian and foreign airlines. Has been concerned with practically all technical phases of a major airline operation, including engineering, maintenance, operations, statistics, operating costs, flight testing and training of flight personnel. Administrative experience, 500 hours' experience as flight crew on Trans-Atlantic operation. Age 33. Married, one dependent. Interested in responsible position with major airline or organization concerned with air transportation in general. Apply to File No. 2691-W.

ELECTRICAL—MECHANICAL ENGINEER, Jr.E.I.C., age 30, graduate of Naval Electrical Engineering Officers course at Nova Scotia Technical College, 1945. Graduate of Naval Electrical Artificer's course at University of Alberta, followed by 6 months of instructional work on same. One year at sea as Chief Electrical Artificer on frigate, in charge of all electrical equipment. Completed apprenticeship as machinist in railway repair shops. Interested in design work testing, research and calculations. Available on two weeks notice. Apply to File No. 2693-W.

ELECTRICAL ENGINEER, B.Sc., M.E.I.C., age 33, single, with experience in sales, purchasing, office management and production control. Very good connections with industrial plants in Ontario and Quebec. Available after July 20th. Location preference: Toronto, Montreal and Hamilton. Apply to File No. 2694-W.

SENIOR CIVIL ENGINEER, M.E.I.C., P.E.Q., with considerable experience in all building construction and specialization in reinforced concrete; seeks first class opening. Able to supervise work and qualified to take full charge of and execute contracts. Apply to File No. 2695-W.

MECHANICAL ENGINEER, Toronto '42, Jr. E.I.C., P. Eng., age 30. Four years' experience in tool repair, machine design, estimating, instructor in tool inspection, supervisor of production inspection, charge of engineering department handling design, draughting, purchasing and testing for modern manufacturing plant. Desires position as production engineer with firm of consulting engineers or as assistant production manager in progressive industry. Prefer Hamilton or Toronto. Apply to File No. 2711-W.

MECHANICAL ENGINEER, S.E.I.C., B.Sc., Qneen's 1945, age 24, married, veteran, one year experience in design of heavy machinery and draughting, course in Time and Motion Study at McGill. Interested in Industrial, Production or Maintenance Engineering. Prefer Montreal area or Ontario. Available on one-month notice. Apply to File No. 2715-W.

CHEMICAL ENGINEER, S.E.I.C., B.Eng., McGill '46. Age 24, single, bilingual. Practical experience during summers. Desires employment in pulp and paper industry. Available Sept. 1st. Will travel anywhere. Apply to File No. 2717-W.

CONTENTS

COVER PICTURE

Canada with over 500 million forested acres is one of the world's richest timberlands. Chief product from these forests is the pulp and paper, with a gross value of more than 345 millions annually. Along the Gatineau River in Quebec, chief Canadian source of pulpwood, over 12½ million logs flow annually to the paper mills, near Hull, P.Q. The cover picture shows circular booms or "sasks" each consisting of approximately 25,000 logs being towed to the Mercier dam by tug-boat.

REPAIR OF WAR DAMAGED DWELLINGS IN THE LONDON AREA

BRIAN H. COLQUHOUN and WILLIAM O. MACLAREN, M.E.I.C.
Consulting Engineers, London, England

SUMMARY—Because of continuous air raids and the scarcity of materials and skilled labour, unorthodox methods had to be resorted to in carrying out emergency repair work to dwellings in the London area. This paper describes the organization and supervision of this work in one of London's boroughs, under a firm of consulting engineers.

Although nearly a year has passed since the end of the war in Europe, the work of repairing bomb damage, particularly in the London area, is still recognized by the government to be of major importance. At the present time, however, it is a vastly different proposition from that facing us some eighteen months ago. It is now an undertaking which can be comprehensively planned within known limits.

This article however, is more concerned with the extraordinarily difficult and unusual conditions brought about by continuous air raids, and with the necessarily unorthodox measures we took to control a housing situation for which there was no known precedent to guide us, and which taxed our resourcefulness and ingenuity to the full. We hope that it will prove the more interesting since it is to the best of our knowledge, the first paper to be published on the subject, and was first read, by invitation, before the Société des Ingénieurs Civils de France.

The information contained in this paper will be more fully appreciated if the situation in the latter half of 1944 is called to mind. London was experiencing the most severe continuous enemy air attacks. These round-the-clock raids allowed no daily respite, and the Londoner's morale suffered accordingly. A critical stage was reached by the last month of the year. The government were forced to the realization that if they were unable to repair dwelling houses more quickly than the enemy were able to destroy or damage them, serious difficulties would ensue from the ever-growing number of homeless and often completely destitute families in the densely populated areas. This could only be avoided by getting houses sufficiently repaired soon enough after the damage had been caused to ensure that the occupants could remain in them, and not demand re-housing by their already overwhelmed local authorities.

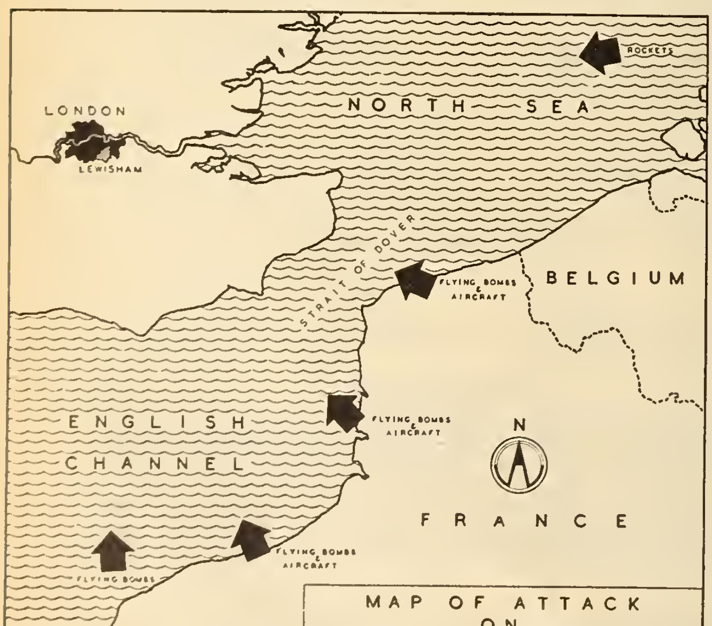

Fig. 1.

The position was, in fact, so acute that the government set up a special Emergency Committee headed by Sir Malcolm Eve, the chairman of the War Damage Commission, to undertake the task of organizing and controlling the whole of the repairs to war damaged houses in the country. Emergency measures had to be taken, and some 140,000 building operatives were employed in the London area alone on this work. In many instances the work was so vast that it was beyond the scope of the local authorities and their technical staffs, and special measures had to be taken to help in these cases. In the case of Lewisham, one of the largest boroughs of London, which had received almost the severest damage of all the London boroughs, we were asked by the Emergency Committee, headed by Sir Malcolm Eve, to accept an appointment as consulting engineers, to organize and supervise repairs to dwelling houses. Before discussing the methods used in undertaking this work, it is necessary to appreciate the position as it stood at that date, namely Christmas 1944.

Figure 1 shows the directions from which the enemy attacked the London area. The heavy attacks on London continued from the commencement of the Battle of Britain in the summer of 1940 to the spring of 1945, when the last rocket fell in Orpington on the outskirts of London. During that period, Britain was subjected to every form of aerial attack, ranging from high explosive bombs, oil and incendiary bombs, land mines and, in the latter stage, flying bombs and rockets. The brunt of these attacks was borne by London and the Home Counties, and the map shows the relation of the London area to the continental coast from whence most of the attacks were made. In the earlier stages, particularly in the period immediately following the fall of Dunkirk when the enemy was able to use the many airfields in France and Belgium, raids on Britain were made by piloted aircraft. The bombardment was continued with the greatest intensity until about the middle of 1941 when Germany attacked Russia, and although in the period after this time raiding became more sporadic, the attack was again intensified with the use of flying bombs, the first of which started on 12th June, 1944, six days after D day. The launching ramps were mainly sited in the Pas de Calais area, and despite concentrated attacks on this area by our aircraft and defence by anti-aircraft guns, fighter aircraft and other methods, thousands of these flying bombs reached London.

The final stages of the attack on the Greater London area by the use of rockets occurred between the last month of 1944 and April 1945. Most of these missiles were launched from the area round The Hague. The use of this highly destructive weapon caused great devastation in the London area, particularly in the densely populated districts, until the attacks ceased with the over-running of the sites by the Allies.

Extent of the Damage

Prior to the use of flying bombs and rockets, over 4,000,000 houses had been damaged in Great Britain, of which 200,000 had been totally destroyed or damaged beyond repair. During the flying bomb and rocket attacks the damage was proportionately much more serious. Each flying bomb damaged in varying degree an average of 900 houses per incident and each rocket an average of 1,100 houses per incident.

London's geographical position, her strategic importance, the concentration of administration, industry, and dense population all combined to make her the main target for attack. The immensity of the problem which faced us can better be appreciated when it is realized that, out of an approximate total of 2,150,000 houses in the London area, about 1,500,000 were damaged and 120,000 totally destroyed.

When it is also realized that out of a total number of 13,000,000 dwellings in Great Britain, almost 8,000,000 dwellings sustained some form of damage from aerial attack, it will be seen that the problem facing the country was one of considerable seriousness.

Since we were appointed as consulting engineers to organize and control the repair of war damage to dwelling houses in one of the London boroughs, namely the Borough of Lewisham, the details given in this paper indicating methods adopted to organize and control this work are of necessity descriptive of the methods which we ourselves used in the borough for which we were appointed, and are not necessarily indicative of the methods used in other sections of London.

The County of London is divided into 28 metropolitan boroughs, and Fig. 2 shows the position of the Borough of Lewisham in the Greater London area.

The Borough of Lewisham is situated in the south eastern part of London and occupies an area of approximately 10 sq. mi. It is the largest borough in population in the Greater London area, and is second only to the Borough of Wandsworth in area. Figure 3 shows only the Borough of Lewisham, and on this map is indicated the number and location of incidents created by various forms of aerial attack. As will be seen from this map, Lewisham suffered a total of 2,458 individual incidents, comprising 1,337 high explosive, approximately 986 incendiary bombs, 121 flying bombs and 14 rockets. When it is considered that the Borough of Lewisham is a very densely populated area and that each flying bomb or rocket damaged 900 to 1,100 houses on top of the damage suffered previously by high explosives and incendiaries, it will be realized that this Borough suffered very heavily. In fact, out of a total of 50,000 dwelling houses in the Borough, only 370 houses were undamaged by enemy action.

The problem which faced us on our arrival was quite simply to repair the largest number of houses in the shortest possible time, and for this purpose we were allocated some 5,300 building operatives working for 61 separate firms of small contractors. We were asked by the chairman of the War Damage Commission to aim at a target of repairing a total of 26,200 houses by the 1st April, 1945. On the date when we were appointed, 21st December, 1944, as consulting engineers to the Borough, London was still being subjected to extremely heavy attack in one form or another, and considering the urgency and immensity of the problem, steps had to be taken immediately to form an organization for this great task.

The first needs were for office accommodation for the organization to do this work, but the local authority had no accommodation available for this purpose. The first job then was to provide accommodation for our organization and this was done by the erection of eight temporary pre-fabricated huts and equipping them with partitions, lighting, heating and telephone service. Sufficient huts were erected and ready for use by the 1st of January, and in fact, control of the position in the borough was assumed upon that date.

We are still using these same temporary offices for accommodation for our site organization.

Shortly before the beginning of the war, steps had fortunately been taken to divide up the country into Civil Defence Regions of which the London area was one, and was again sub-divided into local Civil Defence Areas, each of these being responsible for the organization and protection of the civilian population during aerial attacks.

Figure 4 shows the way in which the borough, a Civil Defence Area, had been divided into eight further sub-areas. As boundaries between these areas are generally natural boundaries such as railways, streams or arterial roads, the sub-division as shown on this map lent itself very well to the organization required for our purpose. Our staff was, therefore, planned as indicated on Fig. 5.

Staff Organization

As will be seen from this illustration, the supervisory staff consists of an engineer-in-charge, together with a deputy engineer-in-charge and a total staff of 210 persons, 160 being highly experienced technical staff and 50 clerical staff.

It will further be seen that our organization was designed to include the careful supervision of basic problems such as material, labour and planning, and also specific detailed supervision for each area.

The general outline of the staff, therefore, under the engineer-in-charge and his deputy, is as shown on this chart. The Borough of Lewisham, as well as being divided into eight areas, is also divided into two sections by a railway line running from north to south with four areas on the west side and four areas on the east side.

For this purpose of co-ordination of supervision, two

MAP OF GREATER LONDON BOROUGHS

Fig. 2.

Fig. 3.

senior superintendents were appointed, one to control the out-door staff in the four areas on the west side and one to control the staff and work in the four eastern areas. Under the direct control of each senior superintendent are four area superintendents, one for each area, each of whom controls all the work being undertaken in his own area. The area superintendent works with the assistance of one senior technical assistant and a number of clerks of works and technical assistants, each of whom has one or more firms of contractors under his own direct control.

The physical work of repairing the dwelling houses in the borough is being undertaken at the present time by a total number of 125 firms of building contractors with a total labour force of approximately 6,500 building operatives.

Referring to the staff chart again (Fig. 5), it will be seen that it was also found advisable to set up other departments which, although working in close affinity with the supervising staff already described, are, in fact, separate sections, each of which is headed by a specialist. The necessity for setting up these separate sections will be made clear by a short description of each section.

The complaints section receives an average of 150 complaints and enquiries from householders, councillors, aldermen and others each week. These complaints and enquiries are immediately acknowledged and later distributed to the responsible senior technical assistant, and usually within 24 hours a fully detailed report is returned to the complaints section. This report is embodied in a reply sent directly by the head of the complaints section to the enquirer.

This department may be more correctly described as a public relations department, and some measure of its necessity may be indicated by the fact that, at the peak period, this department was dealing with about 100 enquiries per day.

The accounts and quantity surveyor's department is another self-contained unit under the immediate control of a chief resident quantity surveyor. This department is responsible for arranging financial details of all contracts and sub-contracts, for the measuring of all work undertaken by contractors on a measured basis, for the agreement of wages, salaries, overtime, claims and subsistance allowances, and also for the control of timekeepers and checkers whose work is to check the working times of the building operatives and to check the use of building materials supplied by the local authority.

The planning section is responsible for graphs and statistics giving an overall picture of the progress of the work, the material and labour positions, and future programmes. It also prepares all drawings required, particularly the great number covering the conversion of large houses into multiple family dwellings or flats. More recently it has also become responsible for the compilation of individual specifications for the repair of badly damaged houses, which will be covered in more detail later.

The labour manager deals with all questions regarding the employment and the working conditions of all the building operatives under our control, and is more particularly concerned with relations with the Ministry of Labour and National Service, and any government departments controlling labour conditions. The labour manager's job is a most difficult one, and he is responsible for the interpretation of various agreements between the industry and the employers, and one of his functions is to ensure that agreements reached between the industry and employers are fully recognized and operating smoothly. Building contractors are required to notify the labour manager before any man is discharged and the labour manager's permission must be sought and obtained before action of this kind is taken. Under the control of the labour manager is a welfare officer, whose main function is to ensure that the building operatives are properly housed, fed and entertained.

It has been stated before that the attacks by flying bombs and rockets were largely concentrated on London and Home Counties areas, and at the height of these attacks the government appealed to building operatives in other parts of the country to come to London as quickly as possible and volunteer to assist in the repair of dwelling houses. The response to this invitation was very considerable, but it meant that many thousands of building operatives had to leave their homes and families to come to boroughs, such as Lewisham to live under extremely difficult conditions. Just how difficult these conditions were will be realized when it is recollected that these thousands of volunteers had to be found accommodation in areas where more thousands were already homeless by reason of the bomb damage. The housing problem was temporarily solved by erecting huts and commandeering halls, hotels and big houses in many areas to accommodate both the building operatives and bombed-out families.

Because of this rather unique position, we have endeavoured to ensure that the living conditions for these men were clean and comfortable, that canteens were provided for adequate and proper feeding arrangements and that entertainment such as theatre shows, boxing matches, dances, cinemas, lectures and concerts were provided at frequent intervals. The attendance at shows of this nature has been extremely good and the increased production has more than justified the provision of these facilities.

Reference was made earlier in this paper to the target which had been set by the chairman of the War Damage Commission envisaging the repair of 26,200 houses within a period of three months. The problem which confronted us, therefore, meant that if we were to be successful in achieving this target figure it would be necessary to repair almost 2000 houses in every seven-day period. On the basis of available statistics covering the period immediately prior to our arrival in the borough the task appeared to be impossible, as the average rate at which houses were being repaired amounted to 220 houses per week. It was obvious therefore, that in order to achieve the target figure, every single man engaged on repairing war damage in the borough would have to give his very best, and that delays should be eliminated as far as possible.

In January 1945, we called a meeting of all contractors in the borough and this meeting was attended by approximately 500 persons, comprising the directors, foremen and agents of all the contracting firms for the borough. The current progress was indicated to them and the target figures were laid before them. Suggestions were considered and policy was formulated.

Classification of Damage

It is perhaps as well at this stage to analyze the type of damage being sustained by the dwellings in the area. Houses which had been entirely demolished by enemy action were classed as 'A' category houses; those which had been so badly damaged as to be beyond repair were classed 'B' category; houses which were so badly damaged that they were uninhabitable in their existing state were classed 'Cb'; houses which were very badly damaged and only contained perhaps one or two rooms that could be used were classed as 'Ca' houses, and those which were damaged but still largely inhabitable, whether the damage sustained was of a very minor or considerable nature, were classed as 'D' houses.

Figures 6 and 7 give some idea of the type of damage in the borough. Bearing in mind that a major consideration was to avoid an uncontrolled mass exodus of the population if at all possible, it was decided to concentrate on the repair of the 'D' damaged houses, at the same time repairing a small number of 'Ca' and 'Cb' houses, this latter work being done where people were living under conditions of acute hardship and where repairs were required by the medical officer of health.

Standards of Repair Work

The standard of repair work to dwelling houses in the London area falls into three categories, which are called for ease of reference:—

(a) First Aid
(b) Repairs to Comfort Standard.
(c) 99% completion.

The first aid work to dwelling houses consisted of ensuring that houses were made wind and weather tight and were repaired only sufficiently to ensure that continued occupation in the houses was possible. This first aid work was given the highest priority and every effort was made to carry out this first stage of repair within 24 hours after an incident had occurred, and in all cases this first aid work was completed to the affected houses within a maximum period of 48 hours after the incident.

The second category, that is the repair of dwelling houses to comfort standard, covered the second stage repair of making the house reasonably habitable for the occupants at that time. In other words, a miminum number of rooms were repaired to a reasonable standard of comfort comprising at least a kitchen, bathroom, one living room and one bedroom for a family of two or two

Fig. 4.

bedrooms for a couple with up to three children. Whereas the first stage, that is the first aid work, consisted at times of nailing sheets of ruberoid, hardboard or other temporary materials on window openings and possibly merely covering roofs with tarpaulins, the second stage consisted of proper repairs to windows, frames and sashes, the glazing with "recovered" glass and the permanent repair with tiles, slates or asbestos cement sheeting to roofs. An interesting point regarding the use of "recovered" or "R" glass as it was called, is that this was a substitute material manufactured from the vast quantities of broken glass which accumulated from the constant bombing of London, and although the material contained many imperfections and impurities, its use did much to alleviate the glass shortage at that time.

The third stage of repair on which we are engaged at present is the repair of the houses to 99 per cent completion, by repairing all rooms in the houses including decoration, and in the replacement of recovered sheet glass with polished clear sheet or plate glass.

The reason for not repairing houses to 100 per cent completion is to avoid having to negotiate the final details of compensation with the owner of each house. This we have insufficient time to do because of the large number of houses to be repaired, and by leaving the house almost, but not entirely completed, the onus has been left with the house-owner to make full details of his claim to the War Damage Commission, who are then responsible for settling the final claim with the owner.

In order properly to distribute the labour and supervisory personnel at our disposal, the firms of building contractors were placed in areas best suited for their own capabilities, and each contractor was given a proportion of the target figure to complete each week, commensurate with the type of his own organization, and more particularly in relation to the number of operatives employed by that firm.

First-Aid Repair

From January to April 1945, the building operatives and the firms of contractors under our control worked magnificently under appalling conditions, as rockets were falling, and attacks by a large number of flying bombs were still continuing. In fact, so much damage was being caused at this time when our programme was being launched that approximately 600 additional houses were receiving damage from enemy action each week due to new incidents as this work was progressing. In order to ensure, therefore, that the programme would not be completely dislocated by these new incidents, we created a 'first-aid squad' in each area, completely mobile and equipped with first-aid materials and light equipment. Although this mobile squad was normally engaged in repairing houses in the same way as other building operatives in the area, they were ready at a moment's notice to be sent to the scene of an incident within a matter of two hours after the incident occurred. From experience, we learned that it was quite useless sending building operatives to the scene of an incident earlier than two hours after the incident had occurred, this period being extremely necessary to allow the police, ambulances, fire brigades and heavy and light rescue squads to carry out their work of saving lives and preventing property being damaged by consequential fire.

Immediately the first-aid squad arrived, they were engaged in first removing or supporting dangerous structures and quickly repairing roofs, windows, and doors and restoring sanitary, cooking and heating services sufficiently only to ensure that the inhabitants could continue to live in their houses, not with complete comfort, but with shelter from the wind and weather and with improvised facilities to keep them going. All of this first-aid work was, of course, additional work to the programme which we had been set.

In connection with the immediate first-aid repair to buildings immediately following damage caused by enemy action, it is of interest to record that by encouraging householders to help themselves a great deal of bad temper and difficulty was avoided.

The procedure immediately following an incident, and in addition to the action already described, was to send one or two lorry loads of roofing felt, timber battens, nails and linen, asbestos board and hard board to the scene of each incident. On the side of each lorry was a sign inviting the householders to help themselves to materials and improve their own position by nailing up this material and so assist in making their own houses at least temporarily weather proof and inhabitable. The response given by the householders was extremely encouraging and this method proved itself to be highly successful.

Although all this first aid had to be carried on simultaneously with the main repair programme, we are very glad to say that because of the magnificent cooperation received from everybody under our control, we succeeded in achieving, and, in fact, passing with a considerable margin our target figure. In fact, on the 1st April, 1945, a total of 32,000 houses had been repaired up to a reasonable standard of comfort (Fig. 8).

Building Materials

This achievement, however, was not possible without considerable difficulties, one of the major ones being lack of materials. It will be noticed from the organization chart (Fig. 5) that a separate department had been set up to deal with building materials. This step was necessary for many reasons. The orthodox method of plastering partitions and ceilings for many years has been by the use of first fixing laths to give a key and by the application of two or three coats of plaster. Within the last 20 years, patent plasters have been developed to

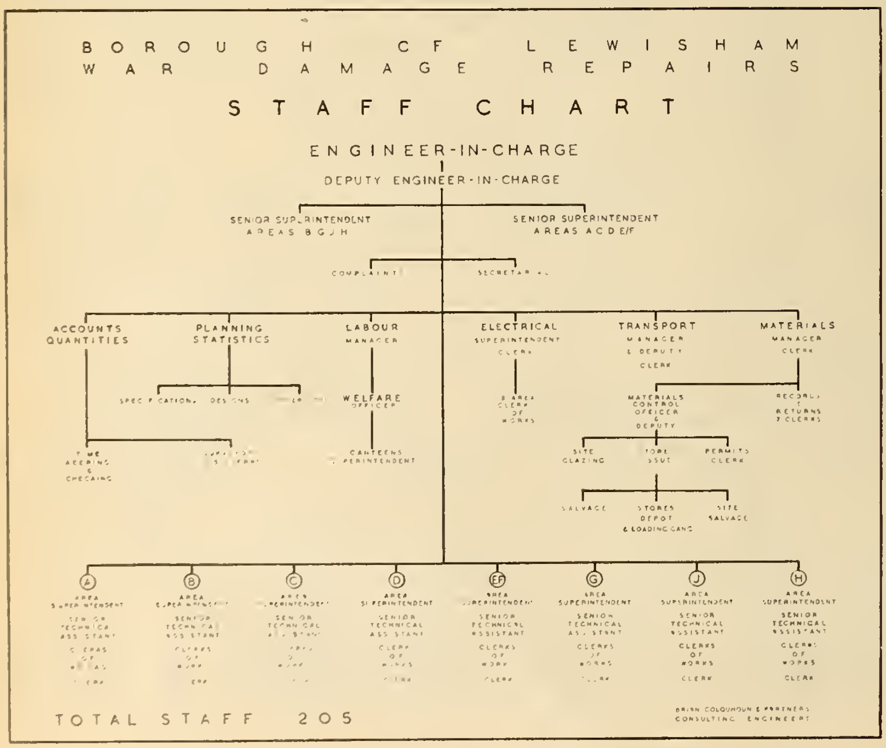

Fig. 5.

such an extent that many of the craftsmen had almost forgotten how to mix up the old fashioned type of lime plaster. One method that had come to the fore and had been used to a considerable extent during the past 15 years consisted of fixing sheets of plasterboard which only required a skim of patent plaster to finish either walls or ceilings. We mention this matter of plastering, particularly, because of the fact that in 1945 one of the biggest factories in the country producing patent plaster and plasterboard had been seriously damaged as a result of a severe explosion at a Royal Ordnance Factory bomb dump at Burton-on-Trent and was thereby rendered useless.

We were then faced with the immense problem of having to repair and surface ceilings and internal walls in houses and, at the same time, having to realize that the more orthodox and familiar materials with which the craftsmen were fully conversant in method of preparation and fixing, were, in fact, unobtainable.

Obviously then, the only method was to make the fullest possible use of substitute materials. Some supplies of plasterboard were fortunately received from America, and these were used to the fullest possible extent, but in order to eke out the meagre supplies, use had to be made of lime plaster which, as is well known, is difficult to work with, and must be very carefully mixed in order to obtain good results. Also, as lime plaster does not set quickly, an addition of a small quantity of cement was necessary in order to expedite the repair work.

Finally, in some cases, in the absence of other materials, use had to be made of wall board and laminated board, both of which materials are merely strengthened forms of cardboard and which were fixed to walls and ceilings to give some modicum of comfort until better materials were available.

One of the most difficult questions relating to shortage of materials was the extreme shortage of bricks. It will be realized that there are in England a very large number of brickworks which were, before the war, very well staffed with experienced craftsmen, versed in the industry of brick making. The need of the Armed Services and other forms of National Service in England was so great, however, that the labour force engaged on producing bricks was depleted to a very low level and consequently a very serious brick shortage ensued. One can appreciate, therefore, the difficulty which arose in the repair of brick houses under these conditions.

The main solution was in collecting loads of bricks from demolished and damaged houses and buildings, sending them to a central depot which was set up in the middle of the borough and was staffed with 50 women working under the control of one male foreman. These women received an average of 20 loads of bricks per day, stacked them by hand, and working with trowels cleaned all the old mortar off the bricks, then re-stacked them, and again loaded them for use in repairing the houses in the borough. In this way, we were able to re-use four million bricks within a period of three months.

Even as this paper is being written, there is still a very severe shortage of facing bricks in this country and we are still using very considerable quantities of salvaged bricks for the repair of our houses.

Timber in adequate supply is essential to the quick repair of door frames and doors, window frames and sashes, flooring, roofing and innumerable other items and is another material which presents considerable difficulty. When it is remembered that prior to the war 85 per cent of all our timber requirements were supplied from foreign countries, the immensity of the problem of supplying timber for our use and from our own sources during the war, will be realized.

We have had to resort to the use of considerable quantities of immature home grown timber and the use of this timber has not been at all satisfactory as insufficient time was available for proper seasoning for construction purposes. The greatest possible use has had to be made of salvaged timber, and demolished buildings were scoured for any available and useable timber which was sent to another depot we created in the borough for the purpose of cleaning and sawing it into useable sizes, shapes and lengths. Once again, female labour was used to withdraw nails and other foreign substances from this salvaged material with considerable success. Difficulty in relation to the supply of timber has meant that the strictest possible economy has had to be exercised in the use of timber. An example of the extent to which this was carried is that where normally perhaps 4 by 2 in. studding would be used in peace time, this had to be cut down to perhaps 3 by 1½ in. In fact, throughout the whole of the war period, every saving in the use of timber has had to be effected.

Fig. 6—Extent of damage caused by the incident of a flying bomb.

There is insufficient time to enumerate all the absences or shortages of building materials, but a very short list of the most aggravating items would cover such articles as all types of guttering and drain pipes, whether of cast iron, pressed steel or asbestos cement, all types of plumbing fixtures, roof slates, lead, zinc, glass and a multitude of other items normally used in building construction.

Two other specific items are well worthy of mention, the question of transport of materials and building operatives in a borough of this size, that is, of 6,500 acres in extent, is a matter of considerable importance. In the early stages, contractors were supplying their own conveyances and consequently a very great deal of petrol, time and money was being wasted by over-lapping and

Fig. 7—Another illustration of the type of damage caused in the bombing.

duplication. Some months ago, a system was set up in one of the eight areas of the borough whereby the leading building contractor in that area was made responsible for organizing the movement of all traffic in his own area and by ensuring that all motor vehicles in the area were put into one pool and used for given purposes, arrangements of full loads were possible and considerable economy thereby effected.

This transport pooling scheme was finally extended to all other areas in the borough and is now operating very efficiently and economically under the control of our central transport office. The consequential economy proved by this method amounts to £2,000 over a three months period.

Consideration had to be given also to the manufacture and replacement of pre-cast stone sills, lintels, steps, copings and items of that nature. In the past, prior to our arrival in the borough, each individual firm of contractors was in the habit of casting its own sections, and this was causing delays and, in some cases, the materials so made were of too low a quality to be used. A solution was found by importing into the borough a firm of contractors specializing in the manufacture and design of pre-cast concrete units. This firm co-operated with us very well, to the extent of setting up a special works in the centre of the borough and they are now obtaining orders from all contractors working under our control and after surveying the damaged buildings are preparing their own form work or shuttering, and casting sections for the use of all contractors in the borough.

Forms of Contract

It may be of interest to mention briefly the types of contracts which are in use. As will be appreciated, insufficient time was available to prepare individual contracts and specifications for each separate house in the borough before the work was commenced, and for this reason, a form of contract was devised by agreement between the industry and the government departments concerned of the type described in England as a prime cost form of contract. This type of contract is similar to the Canadian form of contract known as "cost plus".

We all agree that this form of contract is not a good one and has been very much abused by both contractors and operatives in many cases. Now that, fortunately, incidents have stopped, we have been able to consider other methods and in fact, as this paper is being written, we are changing our contracts from the "cost plus" system to contracts on a measured basis. The major difficulty in changing over the contracts to a measured basis is that every house must be surveyed, a specification drawn up, and the amount of required work measured and scheduled before any tenders can be obtained. When it is considered that there are still over 40,000 houses in the Borough of Lewisham which require further repair work, it will readily be seen that the amount of work involved in surveying, measuring and scheduling this work is a task of considerable magnitude. Because of its type, this new contract, now coming into use, is being confined only to contracts for the repair of heavily damaged houses. We are, however, considering a similar type of contract for the repair of the more lightly damaged houses. The method proposed is for each suitable contractor from whom we are accepting tenders for this type of work, to be given a master specification, which embodies the state of repair up to which the house must be brought when the contractor has finished work therein. The contractor is then requested to inspect each individual building and to quote a lump sum figure for carrying out the work required to repair the house and bring it from its existing state of damage up to the state embodied in the specification. This places a little more work and responsibility upon the shoulders of the contractors, and it relieves us as engineers of a very great amount of detail work, and this system, is in fact, permitting small jobbing builders to carry out their normal function as small building contractors.

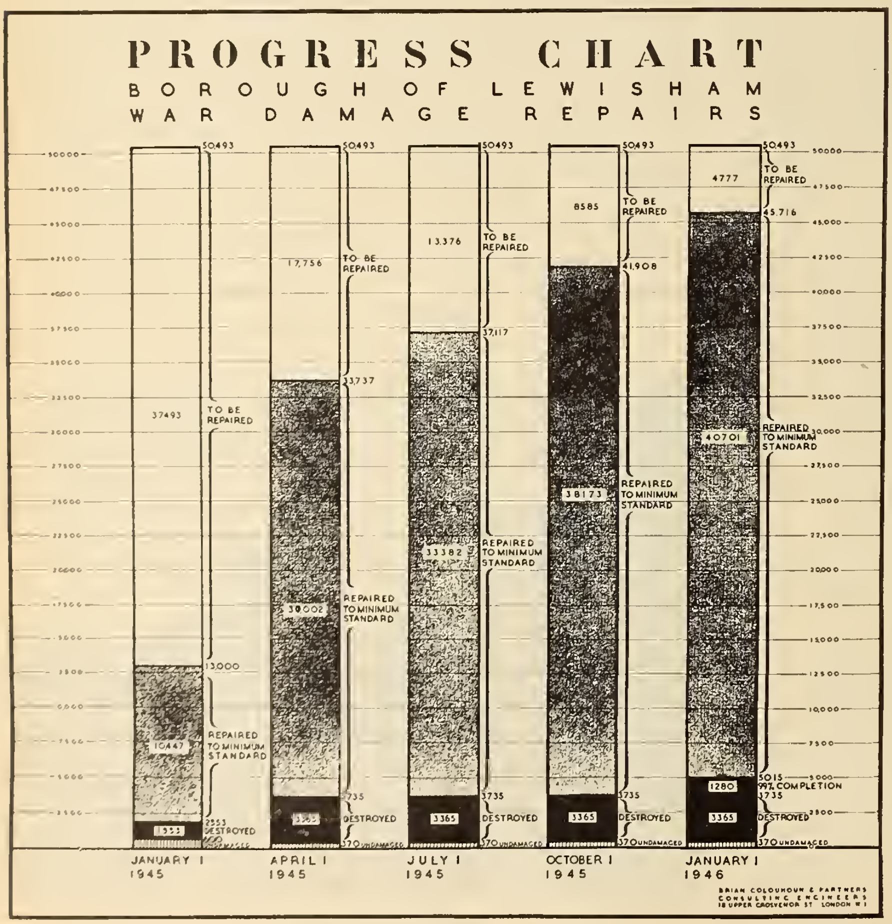

Fig. 8.

Progress of the Work

Before proceeding to the question of costs, it may be as well to examine Fig. 8, which gives an overall picture of progress achieved in the Borough.

The first column (Jan. 1st, 1945) shows the number of houses repaired in Lewisham during the period September 1939-January 1945 prior to our appointment as consulting engineers. The second column indicates the success of our methods in nearly tripling the previous total of houses repaired in three months. Due to our policy of concentrating on the lightly damaged properties the average time taken was 150 man-hours per house.

In the succeeding quarters the rise is not so spectacular, owing to the fact that we were undertaking the more heavily damaged properties. Man-hours per house gradually rose until the present average which is about 1500. In the last column it will be seen that we have started the 99 per cent repairs which will be gradually carried out on all the remaining houses in the Borough.

Costs

No information has yet been given of the way in which the cost of repairs to dwelling houses is being met in this coun-

PRESTRESSED REINFORCEMENT OF TIMBER TRUSSES

E. P. MUNTZ, M.E.I.C.
Consulting Engineer, Montreal

Precis

The information contained herein is of interest to present users and prospective purchasers of temporary war buildings containing timber trusses.

The reinforcement of a large number of Warren trusses is reviewed. The general conditions are given which lead up to the design of reinforcement, together with a description of the system adopted, the benefits derived therefrom, and costs.

Variations in drying shrinkage following erection are discussed in the appendix, giving reasons for the much better behaviour of trusses in some buildings than in others.

The effect of shrinkage on one class of joints is analysed. It is claimed that transverse bracing should be attached at centre of trusses (rather than at the sides) so that truss bolts may be tightened subsequent to erection without changing the transverse bracing.

The system of reinforcement adopted is based on the use of 0.30 in. dia. high strength steel truss wires (Fig. 7) and clamps developed by the author. The truss wires have been stressed in place against the trusses by hydraulic jacks, the load imposed being measured by the stretch in the wires.

Substantial relief is provided in end web members and in the bottom chords, and the cost is small. Camber of trusses is maintained. Deflections under live loads are reduced. The operation of hangar doors when supported by the trusses is assured.

Such reinforcing may be applied to a variety of trusses and to any bottom chord up to its dead load stress or to its capacity in compression.

Introduction

This article describes the principal causes of failure and methods used to restore the capacity of a great number of timber trusses.

The use of many buildings containing similar trusses will continue and the information contained herein is therefore of interest to present users as well as to prospective purchasers of buildings containing such trusses.

Timber has been one of our most generally used structural materials. Before the war, suitably seasoned timber meeting structural grading rules was generally available. With grading and inspection of seasoned timber at a high level, considerable test data on new methods of joining became available, leading to more precise designs as well as the design of structures not otherwise possible or economical in timber.

The very large war demand resulted in the use of considerable timber having a high moisture content as well as the use of some timber below structural grade. The limitations of such timber are great—much greater than provided for by some designers during the emergency. Seasoned structural grade timber probably will become available in increasing quantity but it will still be a long time before it is readily available in volume.

Many timber structures incorporating trusses of various spans were built during the war for industry and the armed services. The transverse shrinkage of the timber in some of these trusses has exceeded 5 per cent or over one inch in the width of a single truss. In buildings having ten trusses, the aggregate shrinkage is nearly a foot. Where transverse girts have been rigidly connected to the sides of trusses, the trusses on either side of the centre truss have been distorted, the bottom chords particularly being bowed towards the centre truss. The end trusses (back wall and door in hangars) have the greatest horizontal distortion. The lateral inward bowing of these end trusses is very noticeable, particularly when truss bolts have been tightened without extending the horizontal transverse girts between the trusses.

It follows that the transverse system should be connected at the centre of the trusses—not at the sides. Transverse shrinkage and swelling of the trusses would then take place freely without lateral distortions.

Joining

In general, the joining has been by split rings and bolts. There is no doubt that split rings are an excellent means for joining timber when reasonable deductions from maximum allowances are made for the spacing, end and edge distances, angle of load to grain, and grading of timber actually used.

These deductions have been too small in many cases in view of all the conditions, and failures have resulted. Many of these failures have been precipitated or aggravated by additional local stresses due to eccentric connections. (Figs. 1 and 2 show a widely used connection.) In general, posts or compression diagonals are single members in the centre. The chords are in two pieces on either side of the compression members and the tension members in two pieces on the outside of the chords. The vertical components of the tension and compression web members, of course, produce transverse bending, and the stress between the inside faces of chords and compression members frequently has been beyond the capacity of the timber. In some buildings about three years old, the measured distance between inside faces of lower chord members has been over one inch greater at the bottom than at the top of the member, and the full width of rings has been visible on both sides of the compression diagonals at the same time (Fig. 3). This has been due to shrinkage and to excessive compression between the top of inside faces of chord members and the compression web members.

This condition, of course, bends the timber tension diagonals and results in many secondary stresses causing various kinds of failure. Two of the most common are

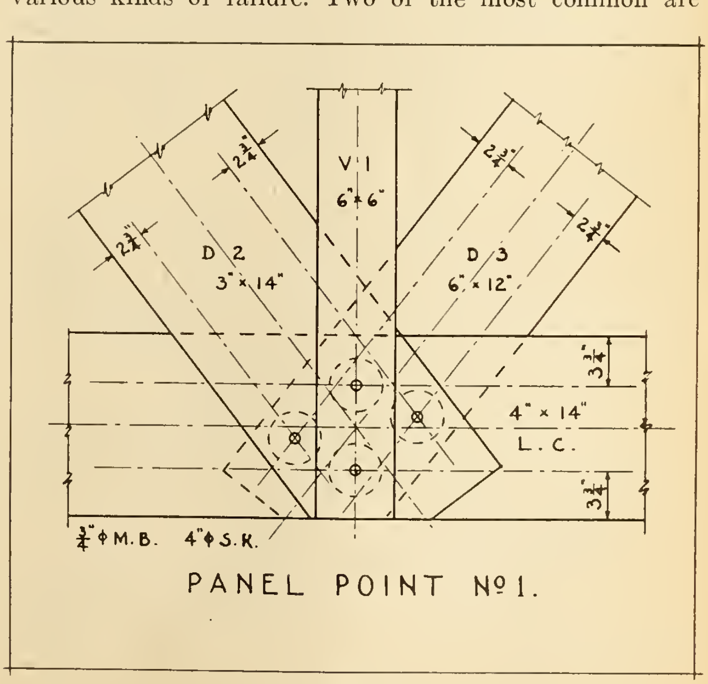

Fig. 1.

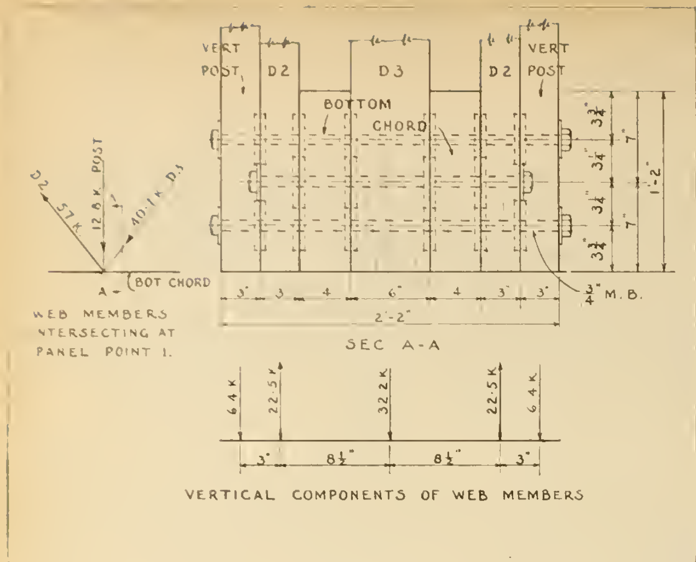

Fig. 2.

shown in Figs. 4 and 5, and these have occurred occasionally even when the distances from the ring connectors and bolts to the end of the member have been otherwise adequate.

Another condition which is of frequent occurrence is shown in Fig. 6. It is evident from the distribution of the rings as shown in the cross section (Fig. 2) that the tendency is to tear the chord members apart vertically.

In Fig. 1 the load in ¾ in. dia. bolts tightened to produce a body stress of 20,000 lb. per sq. in. (30,000 lb. per sq. in. at root of thread) would be 9,000 lb. each. Presume the bolts are so tightened when assembled before erection. The bearing stress of the 3 by 3 in. square washers on the timber would be 1000 lb. per sq. in. Presume also that large washers are provided to distribute the load uniformly from the bolts to the timber. The uniform compression between the chord members and the compression diagonals will then be 169 lb. per sq. in.

When the service loads are added, such a high bolt stress would provide for an over-all shrinkage of only 0.017 in. at the centre of the chord when the maximum compression between the chord and the compression diagonal is 300 lb. per sq. in. One inch shrinkage has been experienced at the bottom of the chord which corresponds to a minimum of 0.3 in. at the centre. The bolts would have to be retightened to this high stress over seventeen times and at the right time so as to keep the compression transverse to the grain at 300 lb. per sq. in. or lower. This, of course, is impractical not only in itself but because the transverse girts would have to be adjusted frequently.

If the faces are in contact but the bolts not stressed when the service loads are applied, the bolt stress due to the service loads will be 6100 lb. per sq. in. and the maximum compression 400 lb. per sq. in. Any shrinkage will produce greater maximum compression. It is thus evident that with a normal load due to hand tightening of 3500 lb. per bolt (or a bolt stress of 8000 lb. on the body) continual tightening is necessary.

Evidence of the large shrinkage experienced is the prevalence of hard wood washers up to 1¼ in. thick which it has been necessary to add under the steel washers on one side of the trusses because the bolt threads were too short. These washers have been made 4 in. square thus also reducing the bearing on the timber.

After the truss is in service, usually one bolt only at a time is tightened. Under dead load only, a single bolt and its washer bearings on the timber will be very much overloaded by the force necessary to overcome bending due to eccentric connections and friction of the timber on the rings. This has been calculated and is also shown in the field where many washers have been forced into the timber.

Where stresses due to eccentricity may be excessive unless bolts are continuously tightened as in Fig. 1, it is evident another design of joint is necessary.

If no arrangement of overlapping members can be formed within the range of material sizes available which will reduce the stresses to safe limits, then either steel or plywood gusset plates or other form of joint must be used. The author has used plywood gussets on several jobs.

Failures have occurred as shown in Figs. 4 and 5 at panel points 1 and 2 left and right. The trusses have sagged as much as 9 in. When the failures are at 1 and 2 L or R but not at both, the sag is of course not uniform but still may be several inches.

Undoubtedly similar joints and members which have not failed were near the point of failure or badly racked at time of failure elsewhere. Repair and reinforcement of a few individual panel points would therefore be followed probably by other failures. Such repairs seem to be something like putting new wine in old bottles and the cost would be continuing and heavy.

In some cases, no failures were apparent but the timber had shrunk leaving the bolts slack. These trusses had lost their original camber of nearly 3 in. and generally had a sag. When the chords were shored from the floor, bolts loosened, chords jacked to the original camber and bolts tightened, the trusses failed to hold the camber upon release of jacks and generally came down to the position before jacking.

Top chords in general are well supported laterally and have given little trouble, the new failures which have occurred being secondary to bad failures elsewhere.

Variations in drying shrinkage are discussed in the appendix.

Design Requirements for Reinforcement

These observations and many others lead to the conclusion that the reinforcement should meet the following design requirements:

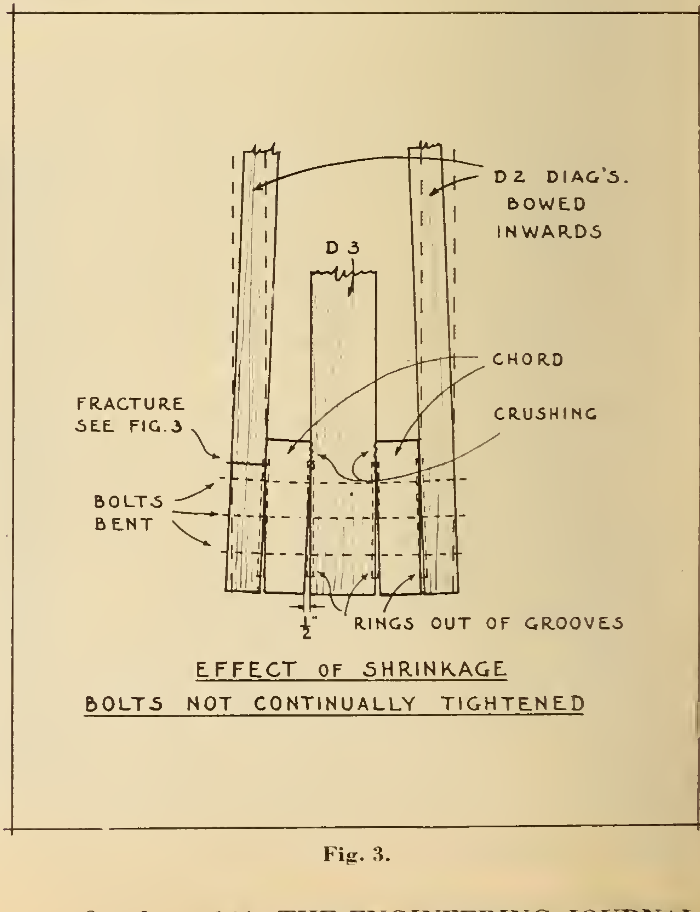

Fig. 3.

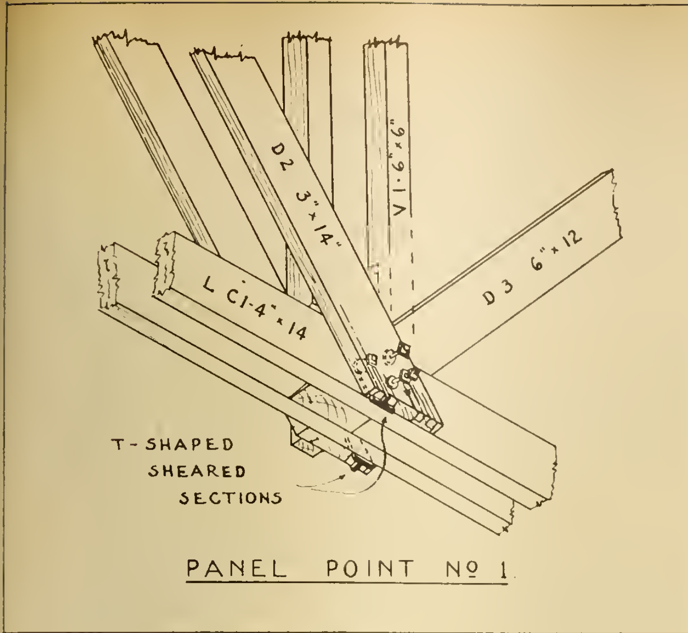

Fig. 4.

1. Provide general relief for web members in the first and second panels and for bottom chords.
2. Reduce stresses due to eccentric connections and slack bolts.
3. Permit sub-grade and partly failed members to remain in place to the extent that their deficiencies are supplemented by the reinforcement.
4. Maintain camber, particularly in door trusses, under normal service loads.

It is evident, of course, that any system of reinforcing to be economical must be flexible. The truss will take some proportion of the load as it deflects under full live load or even overload. If structural grade steel were used it would " hog " the load and would have to be designed to take the full load. Also, if structural grade steel were used, the reinforcement could not go through the trusses and would have to be placed on either side. Cost of end anchorages and bearings under the chords as well as of the main members would be prohibitive.

System of Reinforcement Adopted

The very economical system shown in Fig. 7 was then developed using truss rods of cold drawn high carbon steel wire stressed against the trusses. The increased stress in the wire is small for substantial deflections of the truss. For ½ in. deflection at points 1 and nearly one inch at points 2 the increase is less than 15 per cent.

This system has been applied to upwards of one thousand 112 ft. span Warren trusses. These trusses have seven 16 ft. panels with chords 10 ft. 3 in. centre to centre.

The system as applied to these trusses in single span buildings consists of eight truss wires running from end to end of top chord, four passing under and bearing up against panel points, 1 right and left and 2 right and left respectively. In plan two wires are on each side of each of the two timbers forming the chords. At the end bearings two wires are on each side of each of the two timbers forming the end posts.

Four and six wires have been used occasionally when the truss showed loss of camber and where ring spacing, etc., appeared inadequate even though no actual failure was evident. It was found that such trusses could be recambered without shoring or jacking from the floor.

In hangars the doors have been carried by the end trusses. The live load of the doors is approximately the same as the 40 lb. per sq. ft. live load used for intermediate trusses. The deflection at the centre upon closing the doors is approximately ½ in.

In double span buildings (two single trusses end to end), no anchorage is provided at the centre column. The wires bear on two 2¾ in. dia. standard steel pipe placed in snug holes through the double 5 by 22 in. columns. The pipes are filled with cement mortar.

The ends of the chords and tops of outside posts are bevelled to receive the ¾ by 10 by 18 in. steel bearing plates. The bearing blocks under the bottom chord consist of a 3 by 3 by ¼ in. angle with a 2 in. standard steel pipe in the bite of the angle, both 1 ft. 3 in. long. To the angle is attached two 3½ by 9 by ⅝ in. steel plates, one bearing against each 4 by 14 in. timber forming the bottom chord. The pipes in these blocks are also filled with cement mortar.

The wire was 0.30 in. dia. cold drawn high carbon steel having a breaking load of 12,600 lb. (178,000 lb. per sq. in.). It was stressed initially to 113,700 lb. per sq. in. to carry 7,200 lb. (102,000 lb. per sq. in.) after creep had become negligible.

The initial stress was determined from tests by M. F. Macnaughton. These tests were similar to others made for the author and described in Mr. Macnaughton's discussion of Col. Carrière's paper " Precompressed Concrete Design ". *(Engineering Journal,* August 1946).

Stressing by Hydraulic Jacks

Hydraulic jacks are used to prestress the wire. The jacks are Black Hawk Model EA-11 having a height of 11 in. and a hydraulic lift of 6½ in. These jacks act between the end bearing plates and a jack head engaging temporary clamps on two wires at a time. The permanent clamps against the bearing plates are left loose until the stressing is completed. When the load in the wires is transferred to the permanent clamps the excess length of wire required for jacking is cut off. The clamps and bearing plate do not project beyond the siding, the temporary opening in which is only 2 by 2 ft.

In single span buildings, the stressing is done from one end only. Actual measurements in the field show that the friction loss around the turns is practically negligible, particularly if the bearings at the turns are tapped with a hammer.

In two-span buildings the stressing is done from both ends.

An initial stretch of 1¼ in. in 20 ft. can be measured with practical accuracy without special equipment in the

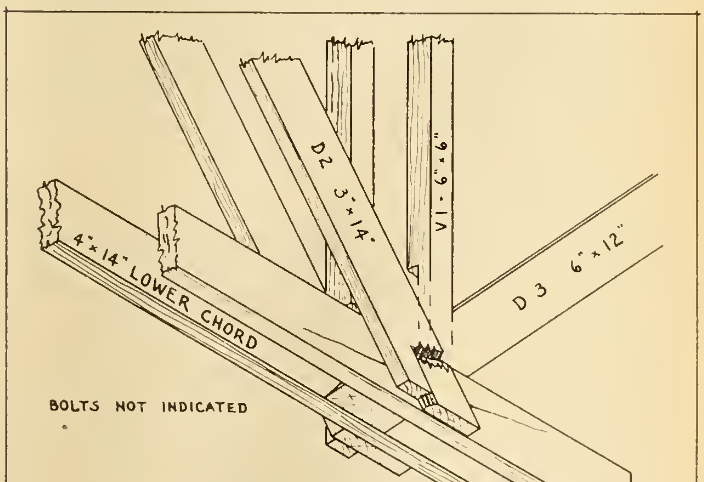

Fig. 5.

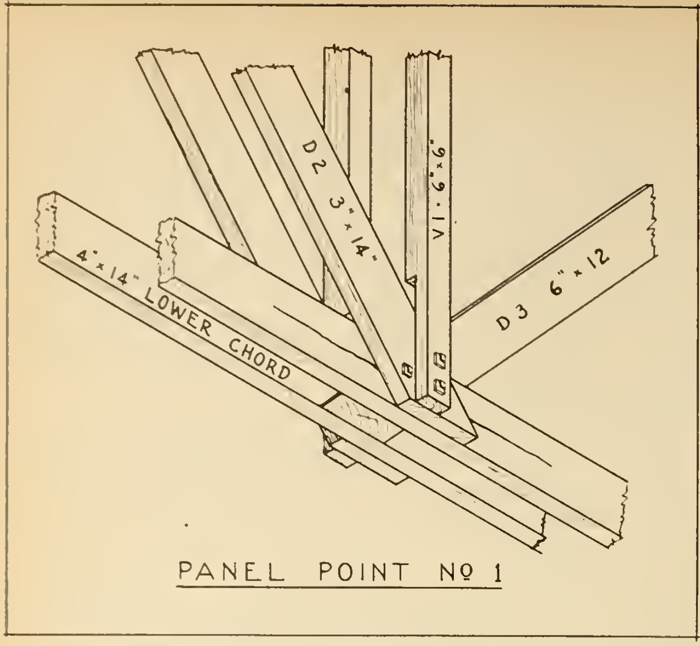

Fig. 6.

field. A 20 ft. length of unstressed wire is used as a gauge. One end of the gauge wire is secured to the wire to be stressed. The stretch in 20 ft. is measured by the difference between the other end of the gauge and a marker on the wire being stressed. The edge of a band of "electric" tape will provide a suitable marker. Of course the wire must not be nicked in any way. The hydraulic jacks can be equipped with gauges when procurable for measuring the load, thus making the procedure described above unnecessary except for periodic checking.

Clamps

The clamps were developed and patented by the author several years ago. They will securely grip the bare wire, and have been tested to loads 25 per cent in excess of the breaking load of the wire used. In breaking tests of the wire and clamps, the wire generally breaks clear of the clamps and always within 2 per cent of the breaking load of the bare wire.

Benefits of the System of Reinforcement

The shear stress in the 112 ft. span Warren trusses due to dead and live loads is reduced by 56 per cent in the panels adjoining the columns; by 32 per cent in the second panels, with no change in the third and mid-span panels where relief was not required.

Tensile stress in the timber bottom chord is reduced by 56 per cent in the panels adjoining columns; by 50 per cent in the second panels; and by 46 per cent in the third, and 42½ per cent at mid-span.

The bottom chord bearing blocks distribute the reaction from the wires evenly to the chords.

Timber web members may be left in place if the reduction in strength does not exceed the reduction in shear provided, i.e. the damage or deficiency may be 56 per cent in the first panel and 30 per cent in the second.

The camber in reinforced door trusses was reduced about one-half inch only when the doors were closed. The camber of two such trusses was checked monthly for six months without change.

The four design requirements or objectives noted earlier have thus been met.

The system can be applied to reinforce a variety of trusses.

Top Chords

In the original design the dead and live load compression in the centre panels of the top chord was 136,000 lb. The reduction in top chord compression at the centre due to upward bending by the prestressed truss wires is equal to the compression added by the horizontal reaction from the end bearing plates. Hence the stress at the centre is not increased.

The top chords as constructed were uniform throughout except at the ends. With the prestressed reinforcing, blocking has been added between the end posts and the ends of the main chord members. This blocking transmits the 51,000-lb. horizontal reaction from the end bearing plates. Thus the compression in end panels of the top chord is very much below the capacity. The top chords in general have given little trouble. They are well supported horizontally by the transverse roof sheeting directly nailed to them. Failures which have occurred are chiefly due to excessive sag caused by the failures elsewhere as noted above.

Additional Reinforcement Bottom Chords

Some bottom chords have split at the splices and elsewhere due to a variety of reasons. The loss in effective strength has been greater than the eight wires in the system described above could restore, that is, greater than 46 per cent at the splices. It has been found considerably more economical to supplement the reinforcing rather than renew the chords. Horizontal wires have been located immediately below or above and below the bottom chords. These wires have been stressed between bearing plates on the outside columns.

Such supplementary horizontal reinforcing can be applied equally well to reinforce the bottom chord of bow string or other types of trusses either steel or wood. A

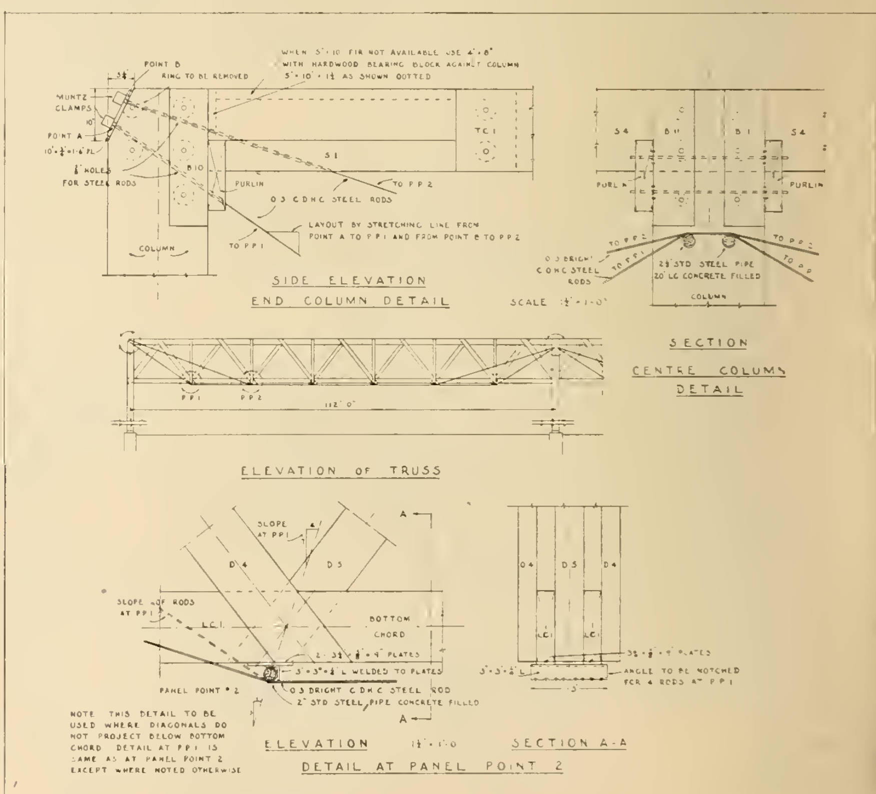

Fig. 7. (Patent applied for)

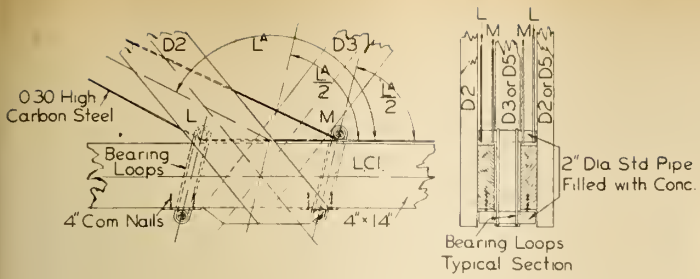

Fig. 8.

case has been studied recently in which it is proposed to reinforce the bottom chords on six 36 ft. trusses end to end with prestressed horizontal wires running from outside post to outside post or a total distance of about 216 ft.

Transverse Bracing

With the type of joint shown in Figs. 1 and 2 transverse bracing could not be attached at the centre of the truss at the panel points. It might be divided to engage on either side of the panel points in a new design using a different roof system. As noted earlier the shrinkage in the truss and tightening of truss bolts has been restrained by the transverse system and the trusses in many cases have been badly bowed. The restraint causing this bowing has been removed by cutting loose one end of the roof beams and rebolting after the truss has been tightened. The ends of these beams and the transverse girts at or near the bottom chord are carried by posts on the outside of the truss. The girts were cut in the centre and spliced. Wedges have been used in the cut between the splice plates so that the girts exert a slight thrust against the truss through the posts to which they are attached. These wedges can be driven at any time extending the girt whenever additional tightening of the trusses may be necessary.

Weight of Wire

The combined weight of 0.30 in. wire in eight rods for a single 112 ft. truss is about 240 lb. For 0.330 in. dia. if desired the weight is only 50 lb. more per single truss. The increment in total dead load for either is negligible.

Labour Costs

A foreman and six men can place the reinforcement excluding scaffold on two double trusses in three days, or 84 carpenter and rigger hours per truss. It has been found that the wire can be readily placed and accurately stressed by any good carpenter and rigger crew. One experienced man with a new crew, of course, helps materially to maintain reasonable labour cost.

Material Costs

The end bearing plates, bottom chord bearing blocks, centre column pipes, clamps and wire for one double truss cost approximately $135 f.o.b. Montreal. Cost of material for a single truss was less than $90.

It is evident from the above that the system has been found both economical and effective.

General Observations

When trusses have been recambered by jacking only and retightened, without supplementary web reinforcement, experience shows that the camber is lost quickly. No continuing relief is provided and doors suspended from such trusses require frequent adjustment.

Substantial, definite and continuing relief is provided, however, at relatively small cost, by the stressed wire system as described herein.

For trusses in bad condition, the cost of the system together with jacking, replacement of defective members and tightening is only about two-thirds of the cost without the system.

For trusses in relatively good condition where the sag is not more than 2 in., the stressed wire reinforcement has been applied and the trusses reconditioned and recambered without shores to the floor. Aircraft have actually been moved in and out under the trusses, while they were being reinforced and recambered.

Modified Arrangements

(a) Where the height of aircraft has required maintenance of clear headroom between floor and bottom chord between panel points, the arrangement shown in Fig. 8 has been used. The effective improvement for the same anchorage and wire is about 85 per cent of the values given for the standard arrangement as shown in Fig. 7.

(b) For an existing or new truss capable of taking reversal of stress, the principal elements of the reinforcement can be used to form a suspension system stressed to nearly the full working load against the truss. Fig. 9. The advantage of this system is of course that the prestressed suspension may be adjusted to give uniform vertical reactions at the panel points or to give reactions required by the condition of the existing truss.

Acknowledgements

Reinforcement of trusses by this system has been carried out in various locations during 1944 and 1945 extending from Moncton, N.B., to Kapuskasing, Ont., for the R.C.A.F. under the general direction of G/C F. H. Marani, O.B.E., S.O.C.E., No. 1 Air Command with F/L Allan Tubby and W.O.1 W. E. R. Patrick directly in

charge; in Toronto for DeHaviland Aircraft of Canada Limited for whom Mr. David Shepherd, M.E.I.C., was the consulting engineer, and elsewhere.

The work has been executed by the following contractors, A. F. Byers Construction Co. Ltd., Montreal, Hill-Clarke-Francis Limited, New Liskeard, Ont., Ambrose Wheeler, Moncton, N.B., and A. W. Robertson Limited, Toronto.

The special hardware including clamps, wire, bearing plates and bearing blocks was supplied by the A. F. Byers Construction Co. Ltd.

Appendix

Variations in Drying Shrinkage Following Erection

For timber of equal density with equal moisture content when erected, drying shrinkage will be slower at or near tide-water and will not reach the maximum experienced in dry hot areas in the interior.

Before the war, timber shipped from the west to east coast and Great Lakes ports by ship via the Panama Canal in summer was often checked due to too rapid drying shrinkage. The same was true of timber shipped by rail to eastern points in July and August unless air dry when leaving and protected from the sun in transit.

Presume timber *in an air dry condition* leaves the west coast by rail and is erected immediately upon arrival. At the east coast, tightening of bolted joints would be necessary only in a prolonged dry summer or dry interior heating conditions. One tightening might be made shortly after erection—six weeks to three months—and subsequent tightenings only when periodic changes in moisture content may have resulted in swelling, compression of washers into the timber and subsequent loosening of bolts. In drier areas of the interior, the early tightening will be much more frequent.

Also, the timber may go directly from mill to fabricating shop to job and may be erected in a comparatively short time. There will then be much more shrinkage subsequent to erection than if several months elapse between leaving the coast or the mill and erection.

The illustration given under the paragraph entitled Joining in the article is for the worst cases observed. It is clear that in many buildings where several months of dry weather may have elapsed between receipt of timber and erection, considerable drying shrinkage will have taken place before erection. The number of times which the joint shown in Fig. 1 must be tightened might be less, but the tightening must be practically continual until the shrinkage is overcome to keep the compression between chord members and centre diagonal down to 300 lb. per sq. in.

In many buildings, tightening has been carried on systematically, and apparently the trusses are in good condition. It is probable that few of all the buildings containing trusses with joints as shown in Fig. 1 have been subjected to a snow load of 40 lb. per sq. ft. In severely cold climates any snow remaining on flat roofs is probably light. In mild climates, any accumulation melts quickly when the roof is not insulated and the building is heated. In the latter case, any appreciable load is of short duration. The heaviest loads will occur from wet snow on well-insulated or unheated roofs or when ceilings are placed at lower chord level.

When snow is generally wet, i.e. at tidewater, drying shrinkage is neither rapid nor so great, and less damage will be done when tightening is intermittent.

When snow may be wet and shrinkage rapid and great as in southern Ontario, continual tightening of such joints as Fig. 1 is imperative.

In the midwest, snow loads have been light, probably due to high winds and light snow.

At the west coast, while snow might be heavy, drying shrinkage would be comparable to that at the east coast.

After the initial drying shrinkage has taken place and the bolts tightened, seasonal moisture changes may cause swelling and shrinkage which will loosen the bolts so that the compression across the grain will be excessive in the joint shown in Fig. 1.

Undoubtedly, early tightening after erection has been taken more seriously in some areas than in others, and, when snow loads have been light, has extended the useful occupancy of many buildings for the time being at least.

The system of reinforcement illustrated in Fig. 7 provides a substantial measure of relief as shown in the article.

When installed before drying shrinkage has taken place, the tightening of bolts would in general be reduced to reasonable intervals.

When installed after drying shrinkage has taken place, no further tightening of bolts should be required.

REPAIR OF WAR DAMAGE IN THE LONDON AREA

(*Continued from page 566*)

try. In 1939, a War Damage Fund was set up by the government. All property owners were required to contribute, monthly or annually, a sum of money proportionate to the value of their property. This money was retained by the Government and an assurance was given to all property owners that if any part of their property was damaged by enemy action the cost of repairing this property would be borne by the War Damage Fund. A small indication of the cost of repairing some of the damage caused to the London area is given by considering the cost already incurred in the borough under review in this paper.

The total cost of the repair work to dwelling houses which has been undertaken in the Borough of Lewisham from the 1st January 1945 to 31st December of the same year is approximately 3¼ million pounds, and in that period approximately 46,000 houses have been repaired to one stage or another. To date therefore, the average cost of repairing each house in the Borough is approximately £75. This by no means completes the work, since the majority of houses in the borough still require further work to bring them up to 99 per cent completion, and it is not yet possible to assess the final cost per house.

This applies to the whole of the London area. There is also the question of time to be assessed. At a conservative estimate it is considered that, even with the present high number of building operatives now engaged, there is still approximately two years' work to be done before all air raid damage to dwelling houses is completed.

This, of course, is not the whole problem as it excludes damage to churches, schools, office blocks, factory buildings, railway stations and buildings of other kinds yet to be repaired, and although a great deal of urgent work has already been done, it will be many years before the wounds which London has received will be healed again.

In conclusion, the authors would like to acknowledge the help given to them by various individuals in providing statistical information on which this paper is based and particularly to Mr. A. H. Shearing for his assistance in helping compile this paper.

SEARCHING FOR PETROLEUM IN THE MARITIMES

DONALD J. MacNEIL, M.E.I.C.
Consulting Geologist, Antigonish, N.S.

Paper delivered, on September 5th, 1946, at the Maritime Professional Meeting sponsored jointly by the Associations of Professional Engineers of Nova Scotia and New Brunswick, and The Engineering Institute of Canada, Digby, N.S.

Canada produces approximately 15 per cent of her requirements of crude oil, and even that small percentage is decreasing at a rapid rate. During the past two years there has been considerable activity in the Maritimes in regard to petroleum exploration. A very deep test was recently completed offshore near Prince Edward Island, and two tests were drilled in 1943 and 1944 in Inverness county, Nova Scotia. These efforts to find oil were not successful, although the company responsible for the Inverness tests has not abandoned the idea of finding oil in that part of the province. Currently, the Sun Oil Company is drilling a test near Amherst, N.S., with equipment that is designed to go deeper than 12,000 ft., and it is reasonable to assume that its success will introduce a period of intense geological investigation by other organizations interested in finding oil in this part of Canada. In addition to the above-mentioned projects, several oil companies are carrying out exploratory work through the medium of surface geological mapping, geophysical surveys, and core-hole drilling.

The term "wildcat", when applied to a test that is being drilled for oil, is often misinterpreted by the general public. Actually, any test that is located more than a mile from a productive well is a wildcat. Immediately following 1859, when the first successful oil well in North America was completed, the men who owned and operated the machines designed to drill these holes migrated from Pennsylvania westward and southwestward in the general direction of Kansas, Oklahoma and Texas. These wildcatters, moving slowly and relentlessly towards those areas that subsequently yielded so much petroleum, punched holes into the earth's crust all along the way. They were undaunted by disappointments, and were spurred to greater efforts when oil gushed over the derrick. It required a very special type of individual to follow the game in the early days; he was fired with a mixture of restlessness, curiosity and dogged determination. Economic and social conditions in North America were such that men with those characteristics were developed, and it may be safe to say that it is the absence of those circumstances in many parts of the world, and not entirely the lack of attractive geological conditions, that has retarded the discovery of petroleum in other countries where it has not yet been found.

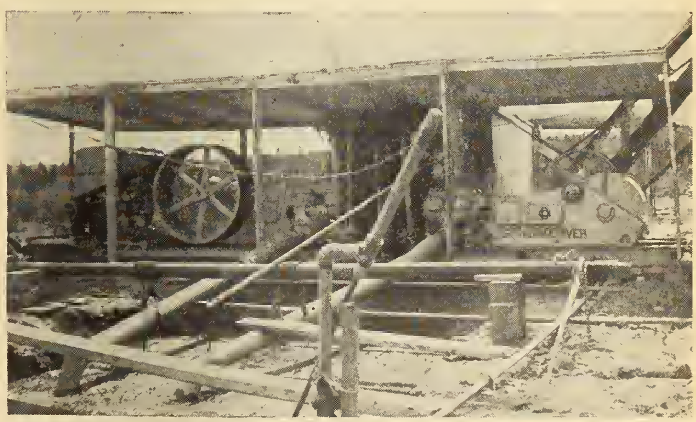
This paper deals with the mechanical and engineering side of oil exploration, rather than the geological phase. However, it perhaps would be well to refer briefly to the origin and natural accumulation of oil, just to refresh our memory on a bit of theory that many of us heard about at some time or other in the past.

The face of the earth is constantly changing. In some areas lavas from volcanoes are building hills and mountains; deep within the earth this same molten material is eating its way into portions of the earth's crust, cooling and solidifying before reaching the surface. There are, therefore, stresses and strains at work within the crust that produce displacements of the strata, wrinkling the beds into warps and folds, in some cases distorting them so much that they pile up into ridges and mountains. No sooner are these irregularities produced, in fact even while they are being formed, nature utilizing a variety of erosional agencies begins to level the high places, and the broken fragments are thus carried by the rivers to the sea, where they accumulate to form layers of shale and sandstone which, upon consolidation, become a part of the earth's crust. In the sea itself, where concentrates of calcium carbonate, calcium sulphate and sodium chloride become too great, they precipitate to the sea-floor, forming beds of limestone, gypsum and salt.

These sedimentary and chemical deposits, even after consolidation, are not completely solid. Microscopic voids are inevitable, and these are filled with sea water. Even as the deposits are pressed downward, and are consolidated as a result of the pressure exerted by superincumbent layers, this connate water is associated with the solid particles that make up the rock.

These processes have been going on for over a billion years; and ever since marine life first appeared upon this earth, plants and animals, many of them microscopic, have been trapped in the sand and the mud that form the sedimentary rocks. During some periods of the earth's history there were countless numbers of tiny organisms in certain seas, and as they died they formed a relatively high percentage of the accumulating sedimentary layers. The decomposition of these plants and animals may have yielded the hydrogen and produced the carbon necessary to form the hydrocarbons we call petroleum. These globules of oil traveled upward through the chains of water-filled voids in the sediments until they were stopped by an impervious roof, and if at that point the stratum happened to be tilted they migrated up-slope until the movement was interrupted by a reversal of dip. The continued generation of these globules, forcing their way upward in the direction taken by the earlier particles of oil, produced enormous pressures at the place of entrapment, often driving gas out of the oil into the highest parts of the folded reservoir rock. Thus in such a trap there would be, under pressure within the voids of the rock, gas, oil and water; with the gas and oil in the upper portion of the structure, and water down the flanks of the fold.

There are, therefore, in many places within the earth's crust, accumulations of oil and gas. It is difficult on first thought to imagine that enough petroleum could be trapped in the pores of a rock, or even in the cracks and fissures, to make the recovery of it worthwhile. However, many productive sandstones show porosities from 12 to 30 per



Pumping equipment used in connection with the Lion Oil Company's recent drilling operations near Mabou, N.S. The mud pit is in the foreground.

cent. There have been wells brought in with initial productions of 50,000 to 100,000 barrels of oil per day. One of the largest wells so far discovered, drilled in Mexico, yielded approximately 115,000,000 barrels in eight years. These, of course, are spectacular exceptions. If oil is discovered in Nova Scotia at the depths anticipated, a well that can yield 50 barrels of oil per day for eight years would not be unwelcome; but any reduction in that figure probably would make the project unprofitable.

The problem then is to find these buried oil-traps. It is obvious from the foregoing explanation that the search must be confined to sedimentary rocks. Oil prospectors must look for three things: first, strata in which oil could have been generated; second, rocks porous enough to serve as reservoirs for the petroleum; third, folding of the type that might have arrested the migration of the oil, thus forming a trap in which it could accumulate. In any area under investigation it is usual to find that during some period in the history of the region there was the right combination of geologic events to expose most of the sedimentary rock-section; consequently, under such circumstances, it is not difficult to determine whether or not there are source beds or reservoir rocks within the area. It is obvious also, if all the beds in the rock-section down through the earth's crust were acted upon simultaneously by forces capable of folding them, bends visible within the surface strata presumably would be present in the lower beds, down to and including the porous zones associated with the source rock. Conditions such as these have given rise to the discovery of many oil fields. However, there are areas where the surface beds do not reveal the type of folding that is present at depth; in fact, there are areas where rocks do not crop out on the surface at all, such as in the prairie regions of Canada and the United States.

Large quantities of oil have been discovered, and are still being found, in areas where the surface geology does not reveal clues as to geological conditions at depth; sometimes, in fact, by somebody digging his heel in the ground, or throwing a hat over his shoulder, and ordering the drill to be set up on the site thus selected. There are, however, scientific methods that can be applied successfully to exploration of that kind; these are now becoming more important in the search for oil, because many of the geologic features that can be interpreted by surface mapping have been tested. The seismograph, the gravimeter, the magnetometer, electrical resistivity apparatus, the electric log, the core-drill, soil analysis and the microscope all contribute to the success of the oil industry. It has been estimated [1] that out of every 100 wildcat tests drilled, 82 are now located on the basis of geological and geophysical work, the remaining 18 are located by unorthodox methods. Out of the locations selected scientifically, there is one successful well to 6½ failures; whereas of those located without the application of technological methods, there is one productive well to 17 that fail to produce.

As far as the geologist is concerned, the problem of finding oil in the Maritimes is somewhat different than it is in the well-known petroleum areas of North America. If the aforementioned theory on the origin of oil is correct, the rocks most favourable as source beds are those that were deposited in marine waters. In this part of Canada the sedimentary rock-section has a relatively thin zone of marine strata, in comparison to the great thickness of non-marine sediments. Although this restricts exploration to some extent, there are nevertheless large areas of the province covered or underlain by sediments that originated in marine and brackish waters. Furthermore, it has never been definitely shown that commercial quantities of oil could not have been generated in beds that were originally laid down in fresh-water basins.

The strata have been more tightly folded and more severely faulted in the Maritimes, particularly in New Brunswick and Nova Scotia, than they have been in many oil-producing areas. This fact does not preclude the presence of petroleum, it merely makes it more difficult to locate. The procedure for exploration may be confined to one of several methods, although in this part of North America it is generally felt that the results obtained by using one of the methods should be checked by a re-survey of the area utilizing some other procedure. In the parts of Nova Scotia where oil-bearing beds are thought to exist, it is safe to assume that the buried reservoir rocks were folded and faulted during the same period when strata now exposed at the surface were deformed. On the basis of that assumption, and as suggested earlier in this paper, it would be reasonable to suppose that the structural mapping of exposed bedrock in any such area would reveal structural conditions at depth. Unfortunately this procedure is complicated by the presence of salt, gypsum, and to some extent coal, in the stratigraphic section. It is obvious that the effects of stresses and strains upon massive beds will not be the same as upon the associated thinner, softer layers of the earth's crust. Beds of salt and gypsum act as zones of slippage, to such a degree that it is possible to find considerable folding and faulting above those relatively soft sections of rocks, while massive beds below them may be characterized by little or no faulting and very gentle folds. A somewhat analogous situation occurs where the surface rocks are so much younger than the buried oil-bearing strata that folds within the latter are obscured by the unfolded layers of the former.

Buried structures that cannot be delineated on the basis of surface exposures can be mapped in several ways. If, for instance, there is reason to believe that folds and faults within the deep crystalline rocks are reflected in the overlying petroleum-bearing zone, a magnetometer might be used to advantage. This instrument has a magnet, turning about a knife-edge, that will take a definite direction under the influence of the earth's magnetic field and the force of gravity. When the instrument is transferred to another location and set up exactly as before, the magnet will dip at a different angle. The difference between the readings taken at the two locations determines the difference in the strength of the magnetic field in the two places. There is a relationship between the depth of the crystalline rocks and the strength of the magnetic field, permitting the construction of a subsurface contour map depicting the elevation irregularities of the basement rocks. Certain types of subsurface faulting can also be detected with a magnetometer, provided the displacement has resulted in bringing two formations of different magnetic susceptibilities into juxtaposition.

Another geophysical method of subsurface mapping entails the use of the gravimeter. This instrument measures slight variations in the gravitational forces of the earth, which forces are affected by the distribution of rocks of varying density underlying the area. Buried geologic structures may also be mapped by a method that involves the discharging of explosives to create artificial earthquakes, the resultant waves being measured by seismographs placed a short distance away from the explosion. These waves travel at different speeds through the earth's crust, the rate of travel being dependent upon the degree of hardness or softness of the strata. For instance, in hard compact formations earthquake waves travel much more rapidly than they do in softer units of the earth's crust. An analysis of the waves, automatically picked up by a recording machine, affords a method for interpretation of

1. Alberta's Oil Industry. A Report of a Royal Commission published in 1940. Page 7.

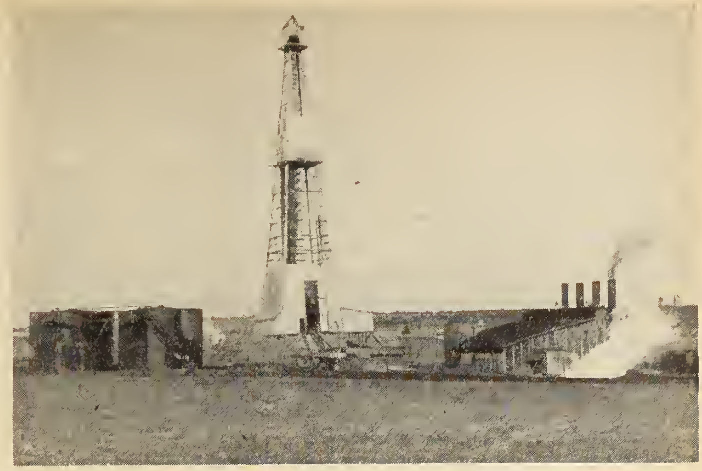
subsurface geologic structure. It will be noted that none of these geophysical methods reveals the presence or absence of petroleum, they are merely aids for determining the location and extent of buried folds that may be present within the investigated area.

When a geological structure assumed to be a favourable one for the entrapment of petroleum has been found, the next step is to bring the oil to the surface. Two methods of drilling are in general use; namely, the utilization of "cable" or "standard" tools, and the "rotary" method. Wells as deep as 3,500 ft. were drilled in China back in 220 B.C., in order to recover brine from buried salt deposits. The equipment used for that work was similar in many respects to the cable-tool rig that is often utilized today by drilling companies. The steel bit employed in this type of drilling is from 8 to 10 ft. long, with the cutting-end flattened into a fish-tail pattern. It is suspended by a cable to which an up and down motion is imparted by means of a walking-beam. It is periodically withdrawn from the hole, so that a bailer can be lowered to take up the rock cuttings.

Most oil wells now being drilled utilize what is known as the rotary system of drilling. This type of machinery varies in size and weight, depending upon the depth it is designed to reach. Rotary equipment is being used by the Sun Oil Company in its operations near Amherst, N.S. It consists of a 136-ft. steel derrick with a 30 by 30-ft. base, capable of carrying a load of over 500 tons. It rests on a heavy steel sub-structure, so that the derrick floor is about 12 ft. above the ground. On this floor there is a self-contained multiple-speed unitized draw-works complete with automatic cat-head and hydromatic brakes, its weight being about 25 tons. A steel rope, 1⅛ in. dia., wound on a drum operated by this machine, passes over a block on top of the derrick, and through a 5-sheave traveling block that weighs four tons, thus constituting a hoisting tackle for the drill-stem. Suspended to this line is a hollow square piece of steel about 40 ft. long. This unit, referred to as the "Kelly", fits through a square recess in a table that is set in the centre of the derrick floor, and which can be rotated by connections leading from the draw-works.

Each section of drill pipe is about 30 ft. long; the upper end is connected to the "Kelly", and a multi-toothed hollow bit is screwed on the bottom of the lowest section. As the hole gets deeper, new sections are inserted immediately below the "Kelly"; thus the whole stem can be rotated by turning the table. At the top of the "Kelly" there is a hydraulic rotary swivel which is connected to the pumps by means of a high-pressure hose. There are two pumps, one connected up as a spare, having a combined weight of 21,000 lb. The power plant consists of four Oilfield type boilers, each rated at 150 h.p. and 350 lb. water pressure. They are fired with fuel oil. In addition to the above-described units there is a cementing outfit, a mud-mixing plant, storage tanks for water and fuel, an electric generating plant, an electric and acetylene welding plant, a machine shop, a warehouse, and quarters for the technicians in charge of the job.

In starting a hole that may reach a total depth of two miles, a 20-in. bit is used for approximately the first 300 ft. A mud stream is forced down through the drill-stem; it issues from holes in the bit, and carries the cuttings upward along the outside of the pipe to a settling pit. Inserted in the mud line is a specially constructed unit that catches some of the rock fragments, where they may be examined by the geologist. It is usual practice to case the portion of the hole drilled with the 20-inch bit, using pipe that is 16 in. dia. A 12¼-in. hole may be drilled, and cased if necessary, from $\pm$ 300 ft. to $\pm$ 6,000 ft., and an 8⅝ in. hole from $\pm$ 6,000 ft. to the total depth.



Rotary equipment operated by the Sun Oil Company near Amherst, N.S.

The circulating mud-fluid plasters the walls of the hole, forming a thin coating that is usually firm enough to keep normal gas, oil or water pressures under control. If soft shales liable to cave are being drilled, a heavy mud is used; the extra weight is usually attained by adding barytes to the drilling fluid. The South American oil industry obtains approximately 100,000 tons of this mineral annually from Walton, N.S. Special preparations must be used in penetrating salt beds, gypsum, very porous sandstones and cavernous limestones.

The use of proper muds requires considerable skill and training. Dangerous and costly "blow-outs" and serious "cave-ins" can be avoided with well prepared muds. As a rule the pressures in gas, oil and water are approximately equal to the hydrostatic head to the depths at which they are encountered. As a precaution, in case the mud fails to hold the pressure under control, a special type of valve known as a blow-out preventer is connected to the surface casing; this is so located that it can be closed quickly if an emergency arises. There have been instances when pressures were so great that they overcame all safety measures, with the result that everything within a 50 ft. radius of the hole was hurled skyward, including the derrick, the draw-works and thousands of feet of drill-stem and casing. Blow-outs of this kind very quickly form huge craters, and often catch fire. To control them it is sometimes necessary to start another hole as close to the blow-out zone as possible, and by directional drilling intersect the well that is out of control. When the intersection has been effected, huge quantities of cement are pumped down the new hole until the escaping gas is choked off.

When the bit nears a zone in which oil is anticipated, the cuttings are examined with extra care, and if promising clues are detected a special type of formation tester is utilized to determine the productive value of the zone in question. If oil has been encountered, the column of mud is lowered by swabbing operations until the pressure in the oil sand is greater than that exerted by the drilling fluid, and the well starts to flow. Sometimes the pressures are so low that pumping equipment has to be installed to recover the oil. In the early days of drilling, before modern methods of bringing a well into production were devised, oil was occasionally encountered under pressures so great that it gushed over the derrick while frantic efforts were made to bring it under control.

The cost of drilling varies according to the lithological characteristics of the strata penetrated. In some areas it is possible to drill hundreds of feet without changing a bit; in other places the rock may be so hard that a bit will wear out during less than a foot of drilling. In Turner

EDUCATION FOR MANAGEMENT

L. URWICK, O.B.E., M.C., M.A., F.I.I.A.

Chairman, Committee on Management Education, Ministry of Education, London, England.

Reprinted from the TECHNICAL JOURNAL *February, 1946, of The Association of Teachers in Technical Institutions.*

The author is one of the outstanding experts in the field of management. He has written many articles on it and has been active on committees and in societies whose objects are the advancement of the science. The following article, which is reprinted with the permission of the Institute of Industrial Administration, is of importance to Canadians principally because of the information it gives about government recognition of the national importance of good industrial administration. It would be encouraging to see similar interest on the part of Canadian officials. (Ed.)

One of the outstanding features of the war period of 1914 to 1919 was the lesson that industrialists learned in regard to the high importance of management as a factor in production. A succeeding generation of industrialists between 1939 and 1945 were called upon to carry the responsibility for production for yet another major war with similar results. "The lessons of war" has become a temporary catchword in discussion of management problems. The lessons have indeed been valuable. In the first world war British experience taught the two major principles of the value of production control on a planned basis involving predetermined standards, and the importance of giving adequate attention to the human element. In the second world war both these principles were reaffirmed, but the lesson was carried much further. During the past five or six years, every aspect of management has been recognised as a factor bearing on the effectiveness with which war-like stores were being produced and made available.

A full appreciation of what management is and what it means to our national industrial system is still comparatively limited. Relatively few people have taken the trouble to study the subject deeply: fewer still are also equipped with the personal qualities and the opportunity to make such knowledge fully effective. But awareness of management and the part it can play in industry has been spreading more and more widely over the country in recent years. As a consequence, the work of the pioneers in this subject, and there have always been pioneers since the beginning of the Industrial Revolution, has begun to have a general influence.

To-day training for management has become a matter of widespread discussion. It should not be forgotten that behind this contemporary interest in educating managers for their profession there lies almost a hundred years of long and intense struggle, a struggle in which the few pleaded with the indifference of the many for recognition and acceptance of this need. Time after time technicians who had realised that something more than technical knowledge was required put the case to their fellows in the profession. A. J. Liversedge and J. Slater Lewis are two outstanding names.

Many of the Presidents or senior members of the Institutions—the Bramwells, the Dalbys, the Daileys, the Allinghams, the Donaldsons, and so on, have put the point. Coming closer to our own time, Sir Arthur Fleming,* as long ago as November, 1918, made a bold plea for the training of Works Managers. "Modern conditions are such that special training is required; modern management has a technique quite apart from the technology" of any particular industry.

The Contribution of Technical Colleges

It has taken more than a quarter of a century for these words to become part of the accepted thinking of a representative proportion of the industrial world as contrasted with a few pioneers. But during the intervening decades important and valuable developments were taking place. First-class work was put in up and down the country by some local education authorities and principals of senior technical colleges. Noting the signs of interest displayed in technical circles, they showed their initiative and sense of social purpose by trying to provide facilities in anticipation of any demand which might develop.

As early as 1903 the University of London was organising courses such as those on accountancy and business methods, which were in essence management courses. In 1918 the Manchester College of Technology founded a Department of Business Administration, which has remained to this day in the forefront of national effort in this field. Programmes of training in the technical colleges began to centre round the management aspects of the study courses for the various professional bodies bearing on industry, for instance, the Institute of Cost and Works Accountants, the Institution of Production Engineers, and the Institutions of Mechanical and Electrical Engineers.

A land-mark appeared in October, 1924, when the Institution of Mechanical Engineers decided to adopt in their membership examination scheme the subject, "The Economics of Engineering." A few years later the London County Council Education Committee took upon itself responsibility for providing at every appropriate senior technical institute adequate facilities for teaching the syllabus. Some years later for the Institution of Electrical Engineers a corresponding step was taken.

In 1927 a second land-mark was set up. The Institute of Industrial Administration elaborated its first examination scheme. The Regent Street Polytechnic established appropriate courses of study leading to the examinations of the Institute. A few years later impetus was given to the study of management on the commercial side by the reports of the Goodenough Committee on Salesmanship. In 1935 the Institute of Export started their own professional training scheme for those who wished to gain appropriate qualifications in this highly important branch of British business. 1936 provided yet another land-mark. The first Summer School for teachers of management was organised by the London County Council Education Committee. It was held at the South London Technical Institute and was, as in 1937, 1938 and 1939, ably assisted by members of the present I.I.A. Education Committee.

Throughout these years the Association of Technical Institutions played an active and invaluable part in the evolution of appropriate schemes of training. Without the ready co-operation offered by the Association to the technical bodies concerned, progress would not have been possible. At its summer meeting of 1933 the Association welcomed what was probably the first paper of its kind in this field, given by Mr. G. A. Robinson, under the title of "An Experiment in Management Education." Four years later Mr. Byng and Mr. Robinson gave a joint paper on "Management in Education and Industry." This showed the extent to which interest in the subject had developed and the noteworthy response which had been forthcoming from the technical colleges: no less than 49 colleges were providing Courses of Instruction in the Fundamentals of Industrial Administration.† Again in 1939, the Association turned its attention to the problem with a paper on the developments that had taken place in the United States.‡

The Response of Industry

Industry in its official capacity was less responsive. In

* Chairman, Education and Training Committee, British Management Council.

† The No. (1946) is 70.

‡ "Technical and Vocational Education in the U.S.A." G. A. Robinson.

the late 1920's some interest in the whole field of management was taken by the Education Committee of the Federation of British Industries. But the economic conditions of the thirties seem to have been unfavourable to initiative. It appears to have been almost another fifteen years before the subject was revived in the Federation's activities. The report of its Education Committee, dated May, 1944, carried the memorable sentence: " It is becoming increasingly felt that there is a science of management and business administration which it may be possible to teach academically and which should certainly be studied practically ". The leaders of industry in the United States had come to the conclusion that it was possible to teach business administration academically at least twenty years earlier.

Individual industrialists on the other hand took a more lively interest in the matter. Many gave time and effort to the activities of the British Association for Commercial and Industrial Education and to other bodies such as the Management Research Groups which were concerned with the promotion of education for industrial management. Others collaborated with various Technical Colleges. But, taking industry as a whole, it seemed that the old philosophy was still predominant. It was assumed that because a man acquired the title " Director," he became proficient in management automatically, or that if he had taken the trouble to gain qualifications in a purely technological field, he was educated adequately for the administrative responsibilities that come to him later in life.

It needed the second world war in thirty years to precipitate any major change in this outlook and to yield any general appreciation of the importance of management as a factor in industrial efficiency.

Management training during the war of 1939-1945 again owed much to the collaboration and help offered by the education authorities and the technical colleges. The first major problems that arose centred on the weakness of immediate supervision. When, on the basis of the work done previously by the Institute of Industrial Administration, the Ministry of Labour and National Service launched a scheme for a brief study course of training in works supervision, the technical colleges throughout the length and breadth of the country rose to the task. Several thousand foremen completed these courses. Large numbers are at present attending courses. Many await training. Their normal activities had been heavily curtailed by war conditions. Much of their teaching staff had been absorbed for other duties. Those left were preoccupied with the training requirements of the fighting services. Their buildings were largely occupied. But, in spite of all this, they were ready to meet the national need to provide facilities for foremen to learn in the little time permitted of the principles and practice of sound supervision. A similar response met the somewhat later demands for training in personnel management and for higher managers.

The Present Position

In one sense then we stand to-day at the climax of a century and a half of development. Within the past few months there have been three official developments, which in total mean that the case for deliberate instruction in Management has been accepted by the nation. There is a considerable degree of national concern that the appropriate activities should be initiated and the facilities provided which will make possible in future the deliberate training in Management of all who may assume responsibility for the control of others.

In the first place, there has been the " Newson-Smith " Report on " Training for Business Administration." This Committee was concerned with a limited aspect of the problem, namely, " to consider how far the absorption into industry and commerce of every man and woman released from war service would be facilitated by the provision of training in Business Administration and Salesmanship, and to make recommendations about suitable courses of training." But though restricted to those whose business careers have been postponed or interrupted by war service, the Committee could not have been appointed or a Ministry devoted public time and money to its work had there not been a national recognition of the need for training in management. In some quarters the Committee's Report was received with a certain disappointment, due to the general nature of the findings. Closer study of the Report suggests that the Committee's recommendation that a definite course of " basic training " should be provided was in fact public acceptance of training in management as an important contemporary need in business.

More important was the Report of the " Percy " Committee on Higher Technological Education. This Committee was concerned primarily with the field of technical training in its early stages. But inevitably, as its deliberations proceeded, members were impressed with the degree to which men and women of technical training turn over to administration in the later stages of their careers. They thus find themselves called upon to exercise a skill to which their technical education has made little contribution. The Committee therefore called attention to " the question of training in what may be conveniently called Management Studies." This is perhaps the most important official Report in the field of education of recent years. It records (Para. 71):—

> " We have been impressed by the statement made by several of our witnesses, that the highly trained technician is often ignorant of the principles of industrial organisation and management and that he often shows no inclination to accept administrative responsibility. Admittedly, there is much in this field that can be learnt only from experience; but there is a body of knowledge awareness of which may greatly facilitate the process of learning."

On this basis, the Committee made three recommendations. The first calls for a study of the subjects of Scientific Management, Industrial Psychology and the like; that is to say, the subjects that go to make up the content of the technique of management. This study should, in the first place, be in the nature of a general introduction included in the final year of the technological studies. The second envisages the institution of a national post-graduate centre for the study of Industrial Administration. The third suggests that there should be appropriate Refresher Courses in such studies.

The Nature of Management

These findings clearly contemplate that every man or woman who is going on to either the intermediate or the higher levels of management in industry or commerce should have full opportunity in their earlier careers, as well as later on, for attaining both the general level of knowledge and the specific understanding of the techniques of management required to discharge managerial responsibilities effectively.

Management is both a science—in that it rests on various applied sciences and can only advance its own technique by objective study—and also an art in that it is concerned essentially with the behaviour of individuals and calls for the exercise of a tact or judgment which is not as yet susceptible to precise measurement or within the field of exact knowledge. From this dual character derives the appropriate pattern of education and training. On the one side, there are the technological and economic disciplines that describe the total situation in which management is applied and which forms the basis of its techniques—fields such as Psychology, Economics, Law, Industrial History and Sociology. Issuing from these are what may be described as " tool " subjects, the applied sciences that have built up the methods common to management wherever applied, as, for instance, Accountancy, Cost Control, Statistical Method, Work Measurement and Incentives, Office Organisation and Method, and Engineering Principles. Thirdly, there is the modern technique of Administration itself, including the history of its evolution, the theory of Organisation and the principles of Command and Control. In addition, the Manager in business should have a working knowledge of its major functions and the management methods applicable to each. These major functions are production, distribution, finance, development and personnel. But before a man or woman becomes effective as a Manager, there must be added to this knowledge proper experience and practice in its application. In recent years the development of the Training Within Industry Programme for Supervisors has made an important contribution to this aspect of the problem. The further elaboration of such facilities is a matter for industry or for the professional bodies in management, such as the Institute of Industrial Administration.

The Education Authorities and the Colleges in their task of providing suitable facilities for management study have an equally practical issue to face. It springs from the multiplication of syllabuses in this particular field. The existing courses have been designed primarily in relation to the requirements of various professional bodies. It was therefore inevitable that before long there would be quite a number of similar subjects set by different organisations, in which broadly the same subject matter was being studied, but with differences of emphasis deriving from the special interests of the sponsoring Institutions. Such a position is quite understandable when looked at from the standpoint of the individual institution concerned with the standards of this or that profession within the management field. But from the point of view of a Technical College concerned to provide the broadest possible facilities for its local community it was bound to lead to a chaos of curricula, none of them commanding a sufficient number of students to justify special arrangements.

In 1939 it was found by the Education and Training Committee of the British Management Council that the Technical Colleges were being called upon to provide study courses in one or more "Management Subjects" for some 23 professional societies covering a total of over 100 syllabuses. In addition, in quite a number of colleges there were special requirements laid down by the industrial needs of the district. One might quote, for instance, colleges in Lancashire or South Yorkshire where the bias towards the Textile Industries necessarily led a college to tackle most of their management studies in that setting.§

Since the cessation of hostilities, the Education Committee of the Institute of Industrial Administration has done some valuable work in assimilating the syllabuses of a number of institutions. But those who are most concerned to secure co-ordination are most doubtful whether purely voluntary efforts among a variety of independent bodies, each with its own interests to serve, can attain a degree of unity which will enable the colleges to implement the "Percy" Committee recommendations. On the other hand, unless a solution is found for this problem, further progress in the development of management instruction may be jeopardised.

With this thought in mind, the Ministry of Education has recently set up a Committee to study the problem on a national basis. Its terms of reference are: "to advise the Minister on educational facilities required for management in industry and commerce, with particular reference to the steps to be taken in regard to the organisation of studies, bearing in mind the various requirements of professional organisations and the need for their co-ordination."

The Committee has not completed its deliberations. But it is to be hoped that it will be able to formulate a general programme of Management Study that will provide a common basis for the curricula of all the specialised interests that have a competence in this field, while at the same time providing adequately for the particular needs of the individual institutions.

If this can be achieved two major steps in the organisation of management education in this country will have been surmounted.

1. The nature of training for management *per se* as distinct from training for any one of the specialised functions contributing to the total task will have been isolated and defined.
2. The task of all persons and institutions responsible for the provision of educational facilities will have been clarified and simplified.

§ e.g., "Economics of the Cotton Industry." City and Guilds of London Institute.

SEARCHING FOR PETROLEUM IN THE MARITIMES

(*Continued from page 575*)

Valley, Alberta, where the average depth is probably around 6,000 ft. the cost is approximately $155,000 per hole. In the Maritimes, if drilling ever gets underway on a big scale, using current labour and material price indices, the cost of a 6,000-ft. hole will be in the neighbourhood of $75,000.

If oilfields are discovered in this part of Canada, as a result of the investigations now being made, the oil undoubtedly will be transferred to the refineries by tank car. Eventually, if production warrants it, pipelines will be constructed. At the present time about 75 per cent of the crude oil transported in the United States is carried by pipelines. These arteries criss-cross the country in a maze that totals 140,000 miles, representing an investment of over one billion dollars, and an annual payroll of fifty million dollars. These lines have almost 25,000,000 barrels of oil continuously in the pipes[2]. It is possible, in some of the larger systems, to ship several grades of oil through the same channels. For instance, in the Big Inch line, running from Longview, Texas, to New York, a number of orders may be shipped, one directly behind the other, each batch possessing different properties. If an occasion arises where it is necessary to rush one of the consignments that may have been put into the lines behind the other orders, instructions are phoned ahead to one of the several sidings along the line, and the pipe is cleared for the rush order by drawing the preceding batches into tanks long enough to permit the special consignment to flow through to its destination.

The discovery of commercial quantities of oil in the Maritimes would bring great benefits to this part of the Dominion. In time, if such an industry is developed, there will be a variety of engineering projects in connection with its expansion. It will give rise to additional orders for our steel mills; new industries having as their basis the exploitation of petroleum by-products will be introduced; business houses and factories needing gas and oil for fuel will be established near the petroleum-producing areas. It is to be hoped, therefore, that the efforts to find oil in the Maritimes will not be lessened, and that those who are sponsoring it will receive sufficient encouragement to spur them on to a successful conclusion.

RECENT ACTIVITIES IN COMMUNITY PLANNING

The first meeting of the Institute Committee on Community Planning was held in Peterborough on August 19th, with every member present, plus the general secretary. The Committee recognized the important part that the Institute has to play in the development of community planning in Canada. This interest is related both to the welfare of the citizens in general, and to the welfare of the profession in particular.

As preliminary steps in meeting these obligations, the Committee presented two proposals which were received by Council at its September meeting and unanimously approved. The first was that every branch of the Institute be urged to devote part of its programme for this year to a discussion of the subject. All branches have been told of this suggestion and the Committee is at present endeavoring to secure experts in the field who would be willing to speak before the branches.

The other recommendation was that the main portion of the 1947 annual meeting programme be devoted to the development of the subject of community planning. In the discussion on this item of the agenda, several members of Council expressed the opinion that there was perhaps at present no subject of greater importance to engineers and to the citizens in general and the suggestion was therefore passed on to the annual meeting committee with a strong recommendation that it be implemented.

The Committee has undertaken to secure immediately one or more world famous engineers who would come to the annual meeting to speak on the subject of community planning. The general secretary has undertaken to make inquiries along this line during his visit to England.

Another feature which the committee recommends for the annual meeting would be exhibits of models that would show planning projects from different parts of Canada and the United States, and perhaps South America as well. It is believed that such an exhibit would not only be of great interest to the engineers, but also would be of interest to the public, and therefore might bring many hundreds of people to the exhibition space at the time of the annual meeting. In this way the Institute could render a service that would go far beyond the interest of those attending the annual meeting.

Community Planning Association

In the July issue of the *Journal,* an account was published of the meeting held in Ottawa in June, the outcome of which was a proposal for establishing the Community Planning Association of Canada. The Institute was invited to participate in the formation of the new organization and to appoint three representatives to the interior board of directors. At its Digby meeting, Council approved of the Institute participating in the newly formed association and appointed the following representatives: R. L. Dobbin, manager of public utilities for Peterborough, and chairman of the Institute Committee on Community Planning; N. B. MacRostie, consulting engineer of Ottawa; and Dr. L. Austin Wright, general secretary of the Institute.

National Capital Planning Committee

At the same meeting, Council also appointed Institute representatives to the National Capital Planning Committee, an organization set up by the Federal Government to be responsible for the replanning of the city of Ottawa. They are: E. L. Cousins, consulting engineer of Toronto, and Dr. Arthur Surveyer, consulting engineer of Montreal.

ENGINEERS OF COMMONWEALTH MEET IN LONDON

The long awaited conference of representatives of Commonwealth engineering institutions has been completed. For two weeks the group met daily in London, concluding with a banquet at Grosvenor House, on Friday, September 27th. Representatives were there from India, South Africa, Australia, New Zealand and Canada, with the institutions of civil, mechanical and electrical engineers acting as hosts.

The agenda was made up of subjects most of which have been under discussion by engineers for many years. It was helpful to finally face these problems around a table and to reach unanimous decisions as to their solutions. Many resolutions were passed for submission to the councils of the various organizations—all leading toward closer cooperation between the institutions and the parts of the Commonwealth. These resolutions will be presented to the Council of the Institute shortly, after which it is expected they will be reported in the *Journal.*

The three "home" institutions shared the responsibilities and the honours equally. The meetings were held in rotation at the headquarters of the institutions, with the chairman and secretary changing in accordance with the location. The chairman in each instance was the president of the society.

It would be difficult to imagine a better organized programme, or better conducted meetings. It was this excellent preparation and direction that made it possible to cover so much ground in the limited period of time. There were several visits to points of historic or scientific interest, which provided breaks between the business session and added much to the pleasure and profit of the conference. These breaks included visits to the Battersea Power Station, the National Physical Laboratory, the G.P.O. Research Establishment, the new Waterloo Bridge, the Port of London, the Royal Observatory and a tour of the City of London, under the very capable guidance of the City Engineer, to see the amount of damage done during the war.

Such tours, though too brief to present a full picture, did give the visitors opportunities to appreciate what England experienced and accomplished during the war, and to see the plans that are being made to meet the future. It is heartening to see a nation with its eyes fixed so firmly on the future, in spite of the awfulness of the immediate past.

On every count the conference was a success, and out of it should come many things of benefit to the profession. It is possible, too, that the continued cooperation of the societies will uncover more subjects requiring attention, and will produce answers to many of the problems already before the profession.

The Engineering Institute's representatives were the president and the general secretary, who report that much more information about the conference will be presented to the membership in subsequent numbers of the *Journal.*

ENGINEERS' PLANS ENTERING CANADA DUTY FREE

In the budget speech presented at the last session of Parliament, announcement was made of amendments to the customs tariff whereby certain engineers' plans are now permitted to enter Canada duty-free. These plans are described as follows in Item 180e of Schedule A of the customs tariff.

> Engineers' plans, drawings or blueprints of machines and plant equipment, plant layouts, foundations for machinery and other plant equipment, structural supports and towers and similar outside structures, dams, spillways, and other hydro construction, wiring, piping, platforms, ladders, stairs, etc., not to include office or other buildings.,

Previous to the amendment, such plans were subject to the following rates of duty:

British preferential tariff, 12½ per cent; intermediate and general tariff, 22½ per cent.

As soon as the matter was brought to the attention of the Institute, a communication was sent to the Minister of Finance inquiring as to the reason for removing the restrictions. A delayed answer explained that the main object of the tariff item was " to help reduce the cost of equipping new plants in Canada ". Meanwhile, the legislation was introduced in the House of Commons and passed.

In the course of the discussion in the House, the Acting Minister of Finance made the following statement in answer to a question raised by Mr. John R. MacNicol:

> " I must say I am not as familiar with the subject as the hon. member for Davenport. I have looked into it, particularly since the discussion took place in the house and since I received the letter from Mr. Wright, the secretary of the Engineering Institute of Canada, relating to the matter. The purpose of including plans of this kind on the free list is to lower the cost of production in Canada by lowering the cost of the construction of industrial plants and the installation of machinery. It was thoroughly investigated by the tariff branch, and it is felt desirable to do this. Should it develop that it is injurious to the engineering profession in Canada it will, of course, be reconsidered, but the feeling is that it should be tested out first. In view of the investigations to which I have referred, it is felt that it is desirable to put plans of this kind on the free list, and that it will not be injurious to the profession in Canada."

Previously, in the Committee of Ways and Means, the Minister had answered the question as to whether the engineers had been consulted before introducing the legislation, by saying that the engineers did not need protection in this respect.

Further discussion with a high official of the Tariff Board yielded the information that the legislation was designed to take care of those cases where Canadian engineers are not regarded as qualified in special highly technical industrial processes. Referring to the text of the tariff item, it is difficult to see what highly specialized technique, beyond the skill of Canadian engineers, is required for the design of " Plant layouts, foundations for machinery and other plant equipment, structural supports and towers and similar outside structures, dams, spillways, and other hydro construction, wiring, piping, platforms, ladders, stairs, etc."

It would seem that the amendment makes it possible now for an American engineer to ship plans duty-free into Canada for everything except the shell of an industrial building. The following excerpt from a letter written to the Institute by a member confirms this belief: " I had an example this week where American engineers brought a set of plans into Canada completely drawn as far as the floor plans were concerned and with enough notations on the drawings so that any draughtsman could draw the building. In other words, this American company draw up a complete floor plan, including foundations, and all the Canadian architect is going to get out of the job is the shell of the building, for which I would think he could not expect to get anything but a very small fee. You will note that the Canadian engineer gets nothing."

The matter was discussed at the September meeting of Council and the general secretary was instructed to communicate with other national organizations who might be interested to join with the Institute in making further representations to the government authorities.

In his letter to the Institute, the Acting Minister of Finance says: " The representations you made will be reviewed after the Item has been in operation for a period of six months or so." Members who may become aware of specific instances where the new legislation has been detrimental to engineers will do a service to the profession by conveying the information to Institute Headquarters.

LIST OF NOMINEES FOR OFFICERS

The report of the Nominating Committee, as accepted by Council at the meeting held on June 22nd, 1946, is published herewith for the information of all corporate members as required by sections 19 and 40 of the by-laws:

President	L. F. Grant	Kingston
Vice-Presidents:		
* Zone "A" (Western Prov.)	G. S. Coultis	Calgary
* Zone " B " (Prov. of Ont.)	W. L. Saunders	Ottawa
* Zone " C " (Prov. of Que.)	R. S. Eadie	Montreal
	R. E. Heartz	Montreal
	A. W. Whitaker, Jr.	Montreal
Councillors:		
† Halifax Branch	L. E. Mitchell	Halifax
† Saint John Branch	C. D. McAllister	Saint John
† Saguenay Branch	W. J. Thomson	Arvida
† St. Maurice V. Br.	Viggo Jepsen	Grand'Mère
§ Montreal Branch	J. A. Beauchemin	Montreal
	K. G. Cameron	Montreal
	C. E. Gelinas	Montreal
† Kingston Branch	J. R. Carter	Kingston
† Ottawa Branch	J. H. Irvine	Ottawa
‡ Toronto Branch	C. F. Morrison	Toronto
† London Branch	V. A. McKillop	London
† Border Cities Br.	A. H. MacQuarrie	Windsor
† Lakehead Branch	S. T. McCavour	Fort William
† Saskatchewan Br.	N. B. Hutcheon	Saskatoon
† Edmonton Branch	F. R. Burfield	Edmonton
† Kootenay Branch	S. C. Montgomery	Trail
† Vancouver Branch	T. V. Berry	Vancouver

* One vice-president to be elected for two years.
† One councillor to be elected for two years.
§ One councillor to be elected for three years.
‡ Three councillors to be elected for three years each.

ERRATUM

Discussion on J. G. G. Kerry's Paper

A typographical error in the author's closing remarks to the above discussion has taken much weight from the argument. On page 553 of the September issue, in the left-hand column, seven lines from the bottom, it is stated that the difference in water level between Lake George and Lake Champlain is 30 ft. Actually the difference is 230 ft. We apologize to the author and to our readers.

GEORGE HERRICK DUGGAN

1862 - 1946

A deplorable highway accident has ended the career of a distinguished member of the Institute who was not only an engineer of outstanding achievement, but also a leading figure in the period of rapid industrial growth through which Canada has been passing during the last fifty years.

George Herrick Duggan was born in Toronto eighty-four years ago. He was educated at Upper Canada College and at the University of Toronto, where he completed a post-graduate course in 1884. His first professional employment was with the engineering department of the Canadian Pacific Railway, which he left in 1886 to take an appointment with the Dominion Bridge Company, the organization over whose activities he was later to preside so effectively. In 1891 he was appointed its chief engineer, holding that position for ten years until he went to Sydney as assistant to the president of the Dominion Iron and Steel Company and the Dominion Coal Company. He became second vice-president and general manager of the latter company in 1904.

G. H. Duggan, D.Sc., LL.D., Hon.M.E.I.C.

In 1910 he returned to the Dominion Bridge Company. At this time preliminary work on the Quebec Bridge had just been commenced. On the formation of the St. Lawrence Bridge Company Mr. Duggan was chosen as its chief engineer, so that for a considerable time he was mainly concerned with the progress of that great engineering work. At the same time he held the position of chief engineer of the Dominion Bridge Company.

In 1912 he was appointed general manager of the Dominion Bridge Company, becoming vice-president in 1917, and president in the following year. He retained that office till 1936, when, after eighteen years service, he resigned to accept the chairmanship of the board of directors.

He was active almost to the last. Besides holding the chairmanship of the board of the Bridge Company, he was president of the Dominion Engineering Works, the Robb Engineering Works, and a number of other allied organizations. He was a vice-president of the Royal Bank of Canada. His long list of directorships included such firms as the Shawinigan Water and Power Co., the Steel Company of Canada, the Dominion Steel and Coal Company, and many other important industrial and engineering enterprises.

Mr. Duggan did much to support and extend the activities of the Institute, which he joined in 1888, in the days of the Canadian Society of Civil Engineers. He served on the Institute council for nine years, was vice-president for five years and president in 1916. In 1931 he was awarded the Sir John Kennedy Medal. In 1937, having endowed the Institute's medal and prize now known by his name, he was elected an Honorary Member of the Institute. The American Society of Civil Engineers did him a similar honour in 1936. Four years later he was made an Honorary Life Member of the Canadian Standards Association, in recognition of his long service to that body.

His membership in the Institution of Civil Engineers (Great Britain) dates from 1912 and he served on the council of that body in 1918. He was a vice-president of the Canadian Institute of Mining and Metallurgy in 1906 and a past councillor of that Institute.

Mr. Duggan received the honorary degree of LL.D. from both McGill and Queens Universities. His contributions to engineering progress were recognized by his alma mater in 1920, when the University of Toronto conferred upon him the degree of D.Sc.

No sketch of the life of George Herrick Duggan would be complete without some account of his varied activities in pursuit of his main hobby, yacht sailing and designing. As a young graduate he began to work out the very original ideas which later led to the design and construction of the remarkable sloop 'Seawanhaka' which won and defended the well known international cup of that name from 1896 to 1901. His designs for cruising yachts were more conservative, but proved very successful. He owned and sailed several larger yachts in the great lakes, in the St. Lawrence, and in salt water. His skill, and his hospitality, were esteemed by the numerous friends who had the pleasure of cruising or racing in his company. Most of his associates and fellow club-members regarded 'The Skipper' as the ultimate authority on matters nautical.

He was instrumental in founding the Toronto Yacht Club, the Royal St. Lawrence Yacht Club, and the Royal Cape Breton Yacht Club. He was Captain of the Toronto Yacht Club 1883-4, Commodore of the Royal St. Lawrence Yacht Club 1889-90 (and Honorary Commodore since 1915), Commodore of the Royal Cape Breton Yacht Club 1905-10. In 1893 he received the bronze medal and certificate of the Royal Humane Society for saving life.

Besides the various yacht clubs in whose activities he took such great interest, he belonged to a large number of social and sporting clubs. He was a keen and skilful fisherman, and took every opportunity of angling for trout and salmon in the Laurentians and on the rivers of the lower St. Lawrence.

During the Great War, Mr. and Mrs. Duggan had the great sorrow of losing their two sons, both killed in action. Lieut. H. S. Duggan, R.E., died in October 1915, and his brother, Major K. L. Duggan, 5th C.M.R., was killed two years later. Mr. Duggan himself survived an almost fatal automobile accident near Montreal some ten years ago; a long period of convalescence followed.

It has often been said that the training and experience of an engineer give a man of suitable personality an excellent chance to achieve success as an executive in organizing or directing industrial and financial affairs. George

Herrick Duggan had the necessary characteristics, and with his business associates became prominent in the development of Canadian industry as we know it today. He had a thorough knowledge of the technical as well as of the financial aspects of engineering work and possessed a pioneering spirit which he retained throughout his life. Further, he was helped by the analytical quality of his mind, his farsightedness, his determination, and his courage.

In private life he was quiet in manner, genial, and hospitable to a high degree. Only those who knew him well were aware of his many acts of charity or of his benefactions to the societies and institutions in which he took an interest.

His death takes from us a man of proved worth, whose life's work did much to raise the status of the engineer in the eyes of the general public, but who never advertised himself or sought publicity.

DEAN SACKETT OF E.C.P.D. PASSES AWAY

Dr. Robert L. Sackett, for more than twenty years dean of engineering at Pennsylvania State College, died in New York City, on October 6th, 1946. His close association with the work of the Engineers' Council for Professional Development in recent years had made him known to many Institute officers who had learned to admire his sterling character and sound judgment. His death will be felt with a sense of personal loss within the Institute.

The following eulogy was written by Dr. Allan R. Cullimore, President of Newark College of Engineering, and a close friend of Dean Sackett:

To comment adequately upon the life, the achievement, and the interests of a man like Robert L. Sackett is an impossible task. Few men have been given the wealth and variety of interests which Dr. Sackett possessed, and the privilege is given to few of us to make contributions—very eminently constructive contributions—in so many fields and over such a wide range of human endeavor sustained over such a long period of time.

His first work, characterized as it was by a blending of engineering practice in a consulting capacity and teaching, led him from Earlam College to the Deanship at Pennsylvania State. During this time he was active not only in the educational field, but in the professional field as well, keeping his interest sustained in the fields of both civil and mechanical engineering. He was President of the Society for the Promotion of Engineering Education and received the Lamme Medal of that Society as the foremost teacher of engineering in the then current year, and of this medal and citation he was most proud. Honors were bestowed upon him by his Alma Mater and, fortunately, in the fields of both education and engineering, recognition was accorded to his work. He was a member of many learned societies and contributed substantially throughout the years to technical literature, particularly bearing upon the problems and orientation of the young engineer.

In many ways Dean Sackett's contribution since he left the active teaching profession has been on a broader front than ever. As time progressed, he remained active, serving on boards, committees, and commissions, not only of the engineering societies, but of the Engineers' Council for Professional Development, where he rendered unique services to the profession over many years. He was a marvel of energy to those who knew him best and who appreciated the tremendous range and weight of his responsibilities. I cannot recall having met a man in any field of human endeavour who was so genuinely, so actively, and so consistently constructive in so many varied fields, and I can recall no one who has through the years kept a finer sensitivity to those things which are worthwhile in our lives, and who could take a stand at the same time so firm and so flexible with respect to things of both the mind and the spirit.

It is, however, significant that the things by which Dr. Sackett has been best known, and the thing which will persist longest, is his interest and his thought with respect to the guidance of youth—particularly the young engineer. It is hard to pick out the projects with which he was especially familiar or with which he had uncommon interest for the simple reason that he was familiar with anything—one might almost say everything—which bore upon the relationship of the young man to his profession of engineering, and he was concerned intimately with all movements which served to make that relationship either more stable or more understandable.

His professional work as a consulting engineer in the first years of his professional life was characterized not only by his native good judgment, but by a very definite interest in those things which had to do with the human, the broader and the ethical values inherent in the relations of a consulting engineer with his clients.

In his professional teaching life—particularly in his Deanship at the Pennsylvania State College—this point of view developed, and he found in that situation a chance to practice and test many of his theories and points of view which afterwards became so helpful over such a wide field. And his help was not limited solely to the students in his own institution. For many young engineers, and I think we can truthfully say for *all* young engineers who came into contact with Dean Sackett, he was always a leader, always inspiring, and furnished, both by precept and example, a pattern which could be followed by the most eminent as well as the most humble.

It has been my privilege to work with him closely, even intimately, in the last dozen years, and to help him as I might with projects which had to do primarily with the choosing and the guiding of young engineers, and I have come to know and to appreciate what a unique and truly remarkable man he was. I have never seen fused into one personality so many of the attributes which are commonly thought to enter into and characterize a great man. Particularly in the later years, when Dr. Sackett was doing some of his best work—a work which he followed through to the end with the same thought and interest and the same vigor which characterized the earlier years—one always found him kindly and firm, *very firm* indeed, in his fundamental concepts concerning matters of morals and ethics. His was a firmness which was born of a deep sincerity of purpose, and with this firmness was a great tolerance, a great resiliency of thought, which made it possible for those of us who were somewhat younger to feel that in him we had always a contemporary—always one who stood at the same age level—although of greater stature, and I would submit that the feeling was shared by young and old alike.

Dr. Sackett never outgrew a fresh and ever renewing interest in the problems of youth, and in many ways he remained youthful in his thinking to the end. No man in the history of American professional education has had more influence on the lives of young men in his own profession than had Dean Sackett. Those of us who are left and who have lost a leader realize only too well how hard his place will be to fill, and while we do realize and feel very deeply a personal loss, greater and more vital even than this will be the loss to many of the younger men in the profession, those just coming in and those who will enter and who will not have the opportunity to profit as we have profited for so long by the activities and interests of a man who considered their interests and their enlightenment a matter of his first concern.

I have marvelled at the wealth and variety of his recreation. I have marvelled as I talked to him about things of professional interest and then watched him paint a picture. I have marvelled, too, at his youth evidenced in his thinking, and his youth evidenced in his recreation of sailing. Neither in his professional life nor in recreation did he have the slightest trace of fear. The startling thing to some of us in this day and this age is that he never complained. I think I never once heard him express a thought that even verged on the cynical.

It seemed to me that in the later years of his life when I came to know him so well, his philosophy was best expressed in the words of another great sailor (for sailing was the sport he loved so well), another hero, in the full sense of the word, for Dean Sackett was truly heroic in mold—a quotation which we shared and enjoyed together:

"There lies the port; the vessel puffs her sail:
There gloom the dark broad seas. My mariners,
Souls that have toil'd, and wrought, and thought with me—
That ever with a frolic welcome took
The thunder and the sunshine. . . . . . .
Some work of noble note, may yet be done,
Not unbecoming men that strove with Gods.
The lights begin to twinkle from the rocks:
The long day wanes: the slow moon climbs: the deep
Moans round with many voices. Come, my friends,
'Tis not too late to seek a newer world.
Push off, and sitting well in order smite
The sounding furrows; for my purpose holds
To sail beyond the sunset, and the paths
Of all the western stars, until I die."

PRESIDENTIAL VISIT TO QUEBEC AND EASTERN ONTARIO

Arrangements have been completed for President Hayes to visit in November the branches in Ontario and Quebec which were not included in his western itinerary last spring. The schedule of meetings is as follows:

Quebec	Monday, November 18th
St. Maurice Valley	Wednesday, November 20th
Montreal	Thursday, November 21st
Cornwall	Friday, November 22nd
Regional Meeting of Council	Saturday, November 23rd
Kingston	Monday, November 25th
Ottawa	Tuesday, November 26th
Peterborough	Wednesday, November 27th

Details of the functions which will be organized in each branch for the occasion are not available as yet. Notices will be sent in due course by the secretary-treasurer to all members in each branch concerned.

In Cornwall, Mr. Hayes will preside at the inauguration of the new branch, and it is hoped that he will be supported by a large representation of Institute officers. Any present or past officers who may wish to join the presidential party on any part or on the entire trip will be quite welcome but are asked to notify Headquarters.

The president will be accompanied by Mrs. Hayes, Councillor G. J. Currie of Halifax and by representatives from Headquarters.

CORNWALL BRANCH TO BE INAUGURATED

The first officers of the new Cornwall Branch of the Institute have been appointed, and their names appeared on the branch officers page of the September Journal. Short biographies of the chairman, D. Ross-Ross, and the secretary-treasurer, W. P. Nesbitt, will be found in the Personals column of this issue.

The official inauguration of the branch will take place at a dinner meeting to be held at the Cornwallis Hotel, Cornwall, at 6.30 p.m. on November 22nd. President J. B. Hayes will present the charter to the new branch, and it is expected that he will be accompanied by several vice-presidents and councillors. The officers of the new branch hope that there will be large delegations from neighbouring branches and send a pressing invitation to all members who may wish to come and celebrate the event with them.

The next day, Saturday November 23rd, a regional meeting of Council of the Institute will be held at the Cornwallis Hotel. All present and past officers of the Institute will be quite welcome to attend.

The territory of the Cornwall Branch includes the towns of Morrisburg, Alexandria, Cardinal, Maitland, Prescott. It is the twenty-eighth branch of the Institute, and the third to be inaugurated within the past year.

Dean Adrien Pouliot, M.E.I.C., of the Faculty of Science, Laval University, Quebec, was invited to give a lecture at the Sorbonne, Paris, October 10th, on the occasion of his visit to France. The meeting was under the auspices of the Association des Ingénieurs-Docteurs de France which took this opportunity of conferring upon Dean Pouliot their highest distinction, "la grande médaille d'honneur". From right to left: M. Le Lièvre, representing the Ministry of Information, Prince Louis de Broglie, General Georges Vanier, Canadian Ambassador, M. Varlon, president of the Association, Dean Pouliot and M. Jaxe.

New York Times photograph

As the result of experience in the Institute's employment service for the past six months, it is desired to put before the members a picture of how the service works and how they can make the best use of it.

Requests for the use of the service are received from both members and employers either by letter, by telephone or by a personal visit. The bulk of both are by letter. Once an application is received it is classified, both men and jobs being set up under the same basic file headings, i.e., a civil engineer with mining experience. Naturally a man or job may appear under several headings depending on the qualifications held or required. By classifying both men and jobs under the same simple number code it is an easy matter to find out what men fit a job and vice versa.

Once a job is classified three things happen. The first is that a check is made of all "open" men's files, which correspond to the qualifications desired. The records of these men are then sent or given to the prospective employer. Care is taken that a record is not sent to the man's present employer. These records are sent out with the request that they be treated as confidential and returned to the Institute as soon as the desired information is obtained from them. The second step is that a slip giving details of the opening is placed in a file on the Rehabilitation Officer's desk, where the information is available to any member who calls in to see him. The third step is that a short description of the opening, written up in this office, is placed in the Situations Vacant column of the *Journal*, provided it is still open and there has been no request to keep it confidential.

A member's request for assistance goes through the reverse process. If he comes in, he is given the addresses of firms where a suitable vacancy is believed to exist, together with the name of the particular person with whom he should deal. If he writes in, his record is sent out to all known suitable openings. His file is then opened and whenever a suitable vacancy appears his record automatically goes forward to the prospective employer. This file is kept open until it is learned that the member is satisfactorily employed.

The above are the mechanics of the job routine. In addition there are the replies to advertisements in the *Journal*. These are received in this office, checked quickly with particular reference to present employer and sent forward to the advertiser under covering letter. Whenever possible, the application leaves here the day it is received. On occasion, such as immediately after the issue of the *Journal*, the load is too heavy to keep up the pace. Applications to openings that no longer exist are checked in detail and whenever possible re-routed to a similar position.

On occasion it is asked why mimeographed form letters are used whenever possible and what has happened to the close personal touch of the past. The answer is that the membership of the Institute has increased considerably in the past few years and the available staff is loaded to the utmost. Overtime work is the rule rather than the exception. Hence every possible short cut is used, although we would greatly prefer to retain the older style. It is felt that speed of service is the target to be aimed at, so as to get members' names before possible employers without any delay. This also makes it virtually impossible to notify members of vacancies as they occur or to give more details than appear in the *Journal*.

A few statistics may be of interest at this point. There are at present some 2,800 men's files in existence, all of whom have made more than passing use of this service in the past eighteen years. There are, of course, very many more who have no files. At the begininng of last January there were 54 open job files. Since then 425 files have been opened and 332 files closed, leaving 147 files open as at the end of September. The maximum number of openings under any one file to date this year is 26. The maximum number of records sent out at any one time to a prospective employer is 78. The average is about 10. The maximum number of times any one man's record has been submitted to prospective employers is 41. The total number of placements known of to date this year is 158. It is believed that there are many more but it is very difficult to obtain records of placements. Over 700 men have been interviewed. The files of 98 men are at present on the open list. Correspondence on employment has been received from every continent, and many telephone requests for information.

In conclusion it is desired to ask for help from the members. The success of this service depends on cordial relations with prospective employers and a knowledge of where the jobs are. To maintain the former it is essential that records be up to date and all correspondence answered promptly. Complaints are frequently received that employers often do not even acknowledge letters written to them. It can be attested from personal experience that this situation is not one-sided. Members and possible jobs are scattered all over Canada, and occasionally outside of it. Would it be too much to ask members to bring the existence and operation of this service to the attention of possible employers whenever they hear of an opening which an engineer might fill?

A. J. Kerry, *Rehabilitation Officer.*

MEETING OF COUNCIL

A regional meeting of the Council of the Institute held at The Digby Pines, Digby, N.S., on Wednesday, September 4th, 1946, convening at three o'clock p.m.

Present: President J. B. Hayes (Halifax) in the chair; Councillors G. J. Currie (Halifax), A. E. Flynn (Halifax), S. W. Gray (Halifax—representing the Association of Professional Engineers of Nova Scotia), J. B. Stirling (Montreal), A. A. Turnbull (Saint John), Paul Vincent (Quebec), General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

There were also present by invitation—Past-Presidents A. J. Grant (St. Catharines) and H. W. McKiel (Sackville); Past-Councillors K. L. Dawson, F. W. W. Doane, J. R. Kaye and I. P. Macnab, of Halifax, J. R. Morrison and C. M. Smyth, of Sydney; T. H. Dickson (Moncton), and J. J. Traill (Toronto); J. L. Cavanagh, president, W. H. Chisholm, Howard Fellows, and D. S. Wickwire, councillors of the Association of Professional Engineers of Nova Scotia; R. M. Richardson, councillor, representing the president of the Association of Professional Engineers of New Brunswick; Marc Boyer, registrar of the Corporation of Professional Engineers of Quebec; G. A. Gaherty (Montreal), chairman of the Committee on Western Water Problems; Leo Roy (Montreal), formerly secretary of the Quebec Branch; Morley G. Taylor, of Maracaibo, Venezuela; S. G. Naish, secretary-treasurer, and J. H. Fraser, a member of the Cape Breton Branch; J. D. Kline, secretary-treasurer, and W. C. Risley, member of the executive of the Halifax Branch.

The president welcomed the councillors and guests and expressed his pleasure at presiding over a regional meeting of Council in the maritime provinces. He invited everyone to take part in the various discussions.

The president informed the meeting that the treasurer of the Institute, Mr. J. A. Lalonde and Mrs. Lalonde had suffered a serious motor car accident a few weeks ago. He reported that they were both recovering satisfactorily, but he suggested that the councillors might wish to send a message to them. It was agreed that a telegram expressing Council's wishes for a quick and complete recovery be sent by the general secretary.

Engineering Education: The general secretary presented a report from Vice-President C. E. Sisson on a conference held in Toronto on May 29th, between representatives of several engineering organizations and a group of deans and teachers of engineering. Mr. Sisson was the official representative of the Institute.

Professor Flynn, who was present at the conference, representing the Nova Scotia Technical College, reported in greater detail on the conference, and informed the meeting that arrangements had been made by the Universities Conference for the educators in the engineering field to meet regularly as an activity of the conference. Professor Flynn believed that this was a very satisfactory development, and thought it held great possibilities for the future.

Canadian Construction Association: In the absence of Mr. E. P. Muntz, chairman of the committee on this matter, the president asked Mr. Stirling, a member of the committee, to explain to the meeting the background of the Council's interest in this subject. Mr. Stirling explained that the Canadian Construction Association had approached the Government with the recommendation that the standard specification regarding foundation conditions should be altered so that it would be fair to contractors doing work for the various Government departments. The Association had asked the Institute and the Royal Architectural Institute of Canada to support it in its appeal and the Institute had communicated with several of the departments concerned, but in each instance had received what was considered to be an unsatisfactory reply. The matter had been considered further by a special committee appointed by Council, but the committee felt that it was not yet in possession of adequate information to make a final recommendation. Mr. Stirling explained that it was the committee's intention to propose that they join with the Royal Architectural Institute, the Canadian Construction Association and the National Construction Council in an interview with the deputy ministers and chief engineers of the departments concerned with a view to getting closer together on the subject.

Committee on Professional Interests: Mr. J. B. Stirling, chairman of the Committee, reported on many items of business which had been before the committee since the last meeting of Council, including the following:

(1) A proposal from the New Brunswick branches with regard to amending the co-operative agreement with the Association in that province. The committee recommended that, in view of Council's decision to refer to the Association all applicants who would be required to write an examination for admission, there was no further likelihood of confusion developing, as had occurred in at least one case in the past. Therefore the committee recommended that no effort be made to have the agreement amended.

(2) Memorandum from Toronto Branch re Institute policy. This memorandum made several recommendations with regard to the reorganization and the operation of Council. Mr. Stirling's report pointed out that a draft of a reply had been presented by him at the regional meeting of Council held in Toronto in April. The draft had been circulated to councillors with the April minutes, and as no criticism or discussions had been received, the committee considered that it was acceptable as a final answer to the Toronto executive. Accordingly, the committee recommended that Council authorize the presentation of this reply to the Toronto executive.

(3) Letter from a member criticizing a Journal editorial. Mr. Stirling reported that a letter had been received from a member strongly criticizing statements made in the Journal under the heading "Legislation in Quebec". As the committee accepted the responsibility for this editorial, he had again checked the facts and had replied to the member that from this point of view there was nothing to be withdrawn from the editorial. The committee had examined the subject very carefully and had made what they hoped was an acceptable and satisfactory answer.

(4) Relationship between the Engineering Institute and the Canadian Council of Professional Engineers and Scientists. Mr. Stirling reported on an exchange of letters between his committee and the president of the Canadian Council relative to the Institute's policy on cooperation.

(5) Cooperation with the American Society of Mechanical Engineers. The report drew attention to the successful joint meeting held last June, in Detroit, with The American Society of Mechanical Engineers. This was part of a programme developed under the recently completed co-operative agreement with that society.

(6) Changes in Committee. The report informed Council of the resignation of Mr. Norman Eager, of Hamilton, from the committee, and requested Council's approval of the appointment to the committee of Mr. L. A. Duchastel, of Montreal.

The report was received and approved unanimously.

Engineers' Council for Professional Development: It was unanimously agreed that Dean C. R. Young be renominated as the Institute's representative on the Executive Committee of the Engineers' Council for Professional Development (E.C.P.D.).

It was also unanimously agreed that Mr. E. V. Buchanan, of London, Ontario, be nominated as the Institute's representative on the E.C.P.D. Committee on Professional Recognition, to replace Mr. J. A. Vance, who has served on this committee for six years, and who is not eligible for reappointment.

The membership of the Institute's committee to study and report on the proposed Canons of Ethics, now under consideration by a special committee of E.C.P.D., was noted and approved as follows: A. E. Berry, E. A. Cross, O. Holden, N. MacNicol, W. S. Wilson.

Agreements with Provincial Associations: A letter had been received from the secretary of the Saint John Branch inquiring as to the method to be followed in handling the $5.00 increase in annual fees in the case of joint members under the co-operative agreement.

The Finance Committee recommends that the joint fee be increased $5.00 in those provinces where there is a co-operative agreement, and that the branches be rebated on the standard basis, the rebate to be deducted by the association before remitting the amount to Headquarters, or the full amount could be forwarded to Headquarters and the rebate returned to the branches. Following some discussion it was unanimously agreed that the general secretary should discuss this matter with the associations concerned.

International Technical Congress—Paris: The Finance Committee recommends that the Institute do not participate in this Congress.

The Committee's reasons for making this recommendation are as follows:—

(1) The Congress is being sponsored by a group of people who have stated that its purpose is to estab-

blish a new international engineering and scientific federation, sometimes referred to in the literature as "world union of engineers". In other words there is no official or constituted authority promoting the Congress.

(2) In view of the objective described in (1) the Committee judges the Congress in the same light as it judges the proposed international federation. The Committee is unable to see anything that can be accomplished by such a federation that is not already being accomplished by existing organizations.

(3) The proposed federation is not supported by the British Institutions of Civil, Electrical and Mechanical Engineers, or by the Founders Societies in the United States.

(4) The expense involved would be substantial and it was felt that the money could be used to better advantage in other activities.

(5) The Committee is informed that the promoters of the proposal are not prominent in the field of professional organization, and the literature which has come to the Institute gives ample support to this.

This recommendation was discussed at considerable length during which much additional information was disclosed. Council agreed unanimously to accept the Committee's recommendation not to participate in the Congress.

The suggestion was made that the Institute might have an observer at the meeting who could later inform the Institute of what had occurred. Several difficulties were mentioned that would be involved in such an idea and eventually it was left with the president and the general secretary while in London to keep informed of the situation through whatever means they thought most appropriate.

The meeting adjourned for dinner at five forty p.m.

The meeting reconvened at seven thirty p.m. with President Hayes in the chair.

A telegram from Mr. R. E. Heartz, chairman of the committee, was presented, in which the committee requested Council's permission to plan a survey of the economic status of the members of the Institute.

The general secretary explained that this telegram was the outcome of a meeting of the committee which had taken place in Montreal on Tuesday, September 3rd. The committee had studied a project now under way under the auspices of the Founder Societies of the United States, with the collaboration of the Federal Department of Labour. The questionnaire prepared by the societies was studied in detail, and the committee found that it offered new opportunities for gathering useful information about the profession. The questionnaire had been approved by the American Societies of Civil, Electrical, Mechanical, Mining and Chemical Engineers, and the Institute's committee found it unusually comprehensive and, at the same time, not complicated. The committee believes that a similar questionnaire, adjusted to meet Canadian conditions, would place in the hands of the Institute a volume of extremely important information which, in association with similar information gathered for the United States, would present a comprehensive picture of the economic conditions of the profession for North America.

For many months the committee had been kept closely informed by the American societies of what they were planning and preliminary drafts of the literature had been in the hands of the committee for many months.

In the discussion which followed there was some difference of opinion, some persons suggesting that the profession had already been subjected to too many questionnaires, and others believing that a really comprehensive survey would serve a useful purpose. Finally, on the motion of Mr. Currie, seconded by Mr. Vincent, it was agreed that the committee's recommendation be accepted, and that the plans in full detail be presented to a subsequent meeting.

The Engineer in the Civil Service: The general secretary reported briefly on the report of the Royal Commission on Administrative Classifications in the Public Service, pointing out that none of the recommendations made by the Institute's committee to the Commission had been incorporated in its report. It was explained that the Institute's criticism of the report was given in detail in the August number of the *Engineering Journal*. The committee was far from satisfied with the result and was proposing to continue its campaign for proper recognition of the engineers in the service.

Committee on Rehabilitation: A letter from Major-General Howard Kennedy was presented, in which he asked that Council accept his resignation as chairman of the Committee on Rehabilitation. This resignation was made necessary by the fact that he was now employed in Ontario and spent the major portion of his time in areas remote from the centres where it would be possible for him to be of assistance.

Reluctantly Council accepted the resignation, instructing the general secretary to thank Major-General Kennedy for the excellent service which had been rendered.

Annual Meeting 1948: A communication was presented from the Calgary Branch inviting Council to hold the 1948 annual meeting of the Institute at the Banff Springs Hotel in June of that year. Mr. Gaherty suggested that if Banff was to be considered for such a meeting it might be desirable to consult the American societies and see if a joint meeting with one or more of the societies could be arranged.

The meeting heartily approved of the suggestion of holding a professional meeting in Banff in 1948, and before finally accepting the invitation, on the motion of Mr. Turnbull, seconded by Mr. Currie, it was agreed that the general secretary be instructed to investigate the possibilities of securing hotel accommodation at that time, discussing the matter with the hotel company and the officers of the Calgary Branch.

Canadian Chamber of Commerce: It was unanimously agreed that Dr. Arthur Surveyer of Montreal be renominated as the Institute's representative on the National Board of Directors of the Canadian Chamber of Commerce.

National Construction Council: Correspondence was presented from the National Construction Council in which the Council asks the Institute's support in making representation to the Department of National Defence, with a view to speeding up the demolition of temporary buildings, in order to release much needed building materials.

Following considerable discussion it was felt that, in view of the recent release by the Department of Reconstruction and Supply, concerning salvage of materials and buildings, which appears to be under way on a large scale across Canada, no useful purpose would be served by sending further memoranda to the Department, as suggested by the National Construction Council.

Canadian Scientific Film Association: Mr. Wright described briefly the proposal for the establishment of the Canadian Scientific Film Association, the purpose of which is to co-ordinate the use and production of scientific films in Canada. A draft constitution, patterned after that of the British Scientific Film Association has been prepared by an interim committee, and it would appear that the Institute would benefit by becoming a member of the new association, which would undertake to route and schedule the distribution of appropriate films throughout its branches.

The general secretary further explained that the Institute had been invited to become a charter member. The inaugural meeting would be held in Ottawa on September 18th and he thought it was desirable to have a representative present at that meeting. Mr. Ralph C. Purser, of Ottawa, who had been approached to see if he would act as the Institute's representative, had suggested that it would be preferable to appoint someone from Headquarters but that he would be pleased to act as alternate.

On the motion of Professor Flynn, seconded by Mr. Currie, it was unanimously resolved that the Institute should become a member of the Canadian Scientific Film Association and that Mr. Trudel, the assistant general secretary, be appointed as the Institute's representative with Mr. R. C. Purser as alternate. Mr. Trudel was instructed to attend the inaugural meeting on September 18th.

Changes in Branch Territory: Mr. Trudel drew attention to the fact that, with the new list of members now in the course of preparation, a geographical list would also be issued. It had been suggested that the branch allocation of certain non-resident areas might very well be reviewed at this time. He referred particularly to the Northwest territories and certain mining areas in Northern Quebec, which, at the present time, are attached to the Ottawa Branch. Following some discussion, it was unanimously agreed that Headquarters be authorized to approach the various branches concerned and after consultation and agreement between the branches be given authority to reallocate certain districts as may be found more advantageous and satisfactory to the branches and members concerned.

Proposals for New Technical Committees: The general secretary reminded Council that during the course of the discussion following the paper presented at the annual meeting by J. G. G. Kerry on " The Winter Temperature Cycle of the St. Lawrence Waters — A Plea for more Data ", several speakers had recommended that the Institute take some action with regard to collecting the additional data which Mr. Kerry believes could be used to great advantage in properly studying the subject. These speakers had emphasized the importance both from the Canadian and the American point of view of an engineering study of this subject. Many of the discussors had recommended that the Institute endeavour to arrange co-operation in the study with the American Society of Civil Engineers, and perhaps also with the American and Canadian governments. Council agreed unanimously that the general secretary should discuss this matter with the American Society of Civil Engineers, to see if a joint study could be developed, reporting back to Council at a subsequent meeting.

The general secretary reported that recently a member of the Institute had brought to his attention a serious problem which was developing on the Great Lakes with regard to shore erosion. The member was of the opinion that a scientific study should be made in order to determine methods of combatting this great waste of the country's resources. The matter was submitted to Council to see if any action should be taken.

A very general discussion followed in which it was agreed that this was indeed a great problem not only related to the Great Lakes but also related to many other lakes and rivers. If it were possible for the Institute to study the subject, it should result in making a genuine contribution to the economic welfare of the country. Finally, it was agreed unanimously that the suggestion be submitted to the Toronto Branch Executive with the recommendation that they examine the situation in relationship to the Toronto area, making recommendations to Council as to action which might be taken both in that area and in more remote areas as well.

It was decided that the next meeting of Council would be held in Montreal towards the end of October.

ELECTIONS AND TRANSFERS

A number of applications were considered and the following elections and transfers were effected:

Members

Anderson, Samuel Charles, B.Sc. (London Univ.), sales engr., Sawyer-Massey, Hamilton, Ont.

Bleaken, Maynard Dollery, B.A.Sc. (Toronto), 74 Simpson Ave., Toronto, Ont.

Davidson, Philip, B.A.Sc. (Toronto), vice-pres. and chief engr., Robinson Engineering & Development Co., Calgary, Alta.

DeBlois, Howard Crawford, Grad. (R.M.C.); M.A. (Mech. Sciences), (Cambridge Univ.), engr., Canadian Industries Limited, Shawinigan Falls, Que.

Doherty, Thomas Beatty, B.Sc. (Chem. Engrg.), (Queen); S.M. (M.I.T.), process and development engr., Imperial Oil Limited, Sarnia, Ont.

Dunlop, William Hamilton, squad foreman i/c structl. contracts, Canadian Bridge Co., Windsor, Ont.

Eberts, Hermann Livingston, Graduate (R.M.C.); B.Sc. (Elect.), (McGill), sr. engr., Stevenson & Kellogg, Montreal, Que.

Harrison, William Edwin, B.Sc. (Mech.), (Queen's), chief instrument engr., i/c instrument dept., Imperial Oil Limited, Sarnia, Ont.

Laird, William Douglas, B.Sc. (Civil), (Manitoba), tech. information service, Dept. of Reconstruction, Westmount, Que.

Meyer, Karl Rudolf, B.Sc. (Engrg.), (Univ. of London, Eng.), mech. mgr., Stadler-Hurter & Co., Ltd., Montreal, Que.

Roden, Berkeley, B.Sc. (Aero. Engrg.), (Michigan), engr. on design, Canadair Limited, Montreal, Que.

Simpson, Robert E., B.Sc. (Queen's), (R.C.E.M.E.), White Motor Co., Montreal, Que.

Smith, Roy Hamilton, B.Sc. (Chem. Engrg.), (McGill), engrg. and development dept., Imperial Oil Limited, Sarnia, Ont.

Tarbox, John William, B.A.Sc. (British Columbia), jr., hydraulics dept., H.E.P.C. of Ontario, Toronto, Ont.

Watt, Andrew Gibb, chief draftsman, structl. dept., Saint John Drydock & Shipbuilding Co., Ltd., East Saint John, N.B.

Wyman, Russell Asquith, B.Sc. (General Course), (Manitoba), research engr., Aluminum Laboratories Limited, Arvida, Que.

Juniors

Cuke, Norman Hampden, B.Eng. (Metall.), (McGill), engr., development and engrg. dept., Canadian Liquid Air Co., Ltd., Montreal, Que.

Gregg, John William, B.Sc. (Petroleum Engrg.), (California), petroleum engr., Denton-Spencer Co., Ltd., Calgary, Alta.

MacDonald, Roderick Edward, B.Sc. (Acadia Univ.), student engr., Dominion Iron & Steel Co., Ltd., Sydney, N.S.

Rattenbury, David James, B.A.Sc. (Mech.) (British Columbia), chief dftsman., Canadian Sumner Iron Works, Vancouver, B.C.

Richer, Jean Herbert, B.Eng. (Mech.), (McGill), Lieut., R.C.N.V.R., Montreal, Que.

Sorensen, Eric Edgar, B.Sc. (Chem. Engrg.), (Queen's), late Lieut., R.C.E., 384 Earl St., Kingston, Ont.

Teskey, Robert Hugh, B.Sc. (Chem. Engrg.), (Alberta), chemical engr., Madison Natural Gas Co., Black Diamond, Alta.

Warren, Mark Prospere, B.Eng. (Met.), (McGill), late Lieut., R.C.E.M.E., 921 St. Joseph Blvd. E., Montreal, Que.

Wolever, Frank Day, B.Eng. (Mech.), (McGill), late Lieut., R.C.N. V.R., 536 Prince Albert Ave., Westmount, Que.

Yuill, Edward Stanfield, B.Sc. (Physics), (Mt. Allison); B.A.Sc. (Engrg. Physics), (Toronto), engr., control and development lab., cable and wire divn., Northern Electric, Montreal, Que.

Transferred from the class of Junior to that of Member

Angel, John Bartlett, B.Eng. (Met.), (McGill), managing-dir., United Nail & Foundry Co., Ltd., St. John's, Nfld.

Dutton, William Lawrason, B.A.Sc. (Civil), (Toronto), asst. to chief engr., Union Gas Co. of Canada, Ltd., Chatham, Ont.

Painter, Gilbert Walter, B.Eng. (Elect.), (McGill), transport. specialist, Canadian General Electric Co., Ltd., Toronto, Ont.

Sommerville, Donald Barton, B.A.Sc. (Toronto), vice-pres. and genl. mgr., St. Catharines Steel Products Co., Ltd., St. Catharines, Ont.

Transferred from the class of Student to that of Member

Duncan, Gaylen Rupert, B.Eng. (Elect.), (McGill), Electric Tamper & Equipt. Co. of Canada, Ltd., Toronto, Ont.

McRae, Robert Bruce, B.Sc. (Elect.), (Alberta), plant engr. and supvr. of purchases, Julius Kayser & Co., Ltd., Sherbrooke, Que.

Mikkelborg, Gordon Hodgson, B.Sc. (Mech.), (Sask.), development engr., Quebec North Shore Paper Co., Baie Comeau, Que.

Nathanson, Solomon, B.Eng. (Civil), (McGill); M.Sc. (Civil Engrg.), (M.I.T.), designer with Charles Mayer, designer of structl. steel and concrete, Brooklyn, N.Y.

Sansom, Ralph Thomas, B.Sc. (Elect.), (New Brunswick), asst. engr., signals dept., Canadian National Railways, Moncton, N.B.

Slater, Stewart, Major, R.C.E., Graduate, R.M.C.; B.Sc. (Civil), (Queen's), Royal Military College, Kingston, Ont.

Transferred from the class of Student to that of Junior

Hughes, Gerald Francis George, B.Sc. (Elect.), (New Brunswick), Canadian Government Trade Commissioner, Glasgow, Scotland.

Admitted as Students

Barker, Peter, B.A.Sc. (Toronto), 24 Willcocks St., Toronto, Ont.
Bratty, Lewis George, B.A.Sc. (Chem. Engrg.), (Toronto), 194 Connor Drive, Toronto, Ont.
Breen, Lloyd Stanley (Toronto), 72-11th St., New Toronto, Ont.
Brown, Donald Boyd (McGill), 548 Prince Arthur St. W., Montreal, Que.
Brown, Frederick Wallace (Toronto), Geo-Technical Development Co., Bourlamaque, Que.
Campbell, Douglas Keith McLellan (McGill), 332 South St., Halifax, N.S.
Evans, Charles (Toronto), 3000-15th St., Detroit, Mich.
Goddard, Rex Wendell, B.Sc. (Queen's), 105 Ronan Ave., Toronto, Ont.
Lake, Addison Arthur, B.A.Sc. (Mech.), (B.C.), 3821 Harvard Ave., Montreal, Que.
Mantha, Guy Kenneth (McGill), 5116 Cote St. Paul Road, Montreal, Que.
Marchionni, Dante Aldo (McGill), 8060 Lajeunesse St., Montreal, Que.
McEwen, James Eric, B.A.Sc. (Toronto), power plant test engr., Canadian Kodak, Toronto, Ont.
McKerron, Donald, B.A.Sc. (Met.), (Toronto), jr. engr., Dominion Steel & Coal Corp., Sydney, N.S.
McLean, John Allan (Toronto), 591 Gilmour St., Ottawa, Ont.
Nemetz, Alvin Sydney (B.C.), 6229 Angus Drive, Vancouver, B.C.
Orkin, Richard Cottingham, B.A.Sc. (Acadia), 137 Percival Ave., Montreal West, Que.
Oznst, Walter Bronek (Alberta), 10561-76th Ave., Edmonton, Alta.
Power, Donald James (N.S. Tech.), 136 Quinpool Road, Halifax, N.S.
Prifogle, John Stanley, B.A.Sc. (Mech.), (Toronto), 620 South West "A" St., Richmond, Indiana.
Proctor, Reuben Peter (N.S. Tech.), Armdale, N.S.
Spivak, Sidney Gerald, B.A.Sc. (Chem. Engrg.), (Toronto), engrg. dept., Electric Auto-Lite Co., Bay City, Mich.
van Beck, George John (Dalhousie), 27 Moran St., Halifax, N.S.
Wilson, James Franklin (McGill), 2737 McCallum Ave., Regina, Sask.
Wiseblatt, Lazare (McGill), 3408 Northcliffe Ave., Montreal, Que.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective:

Alberta

Members

Clarke, John Wesley, B.Sc. (London, Univ.) civil engr., Haddin & Miles Ltd., 801-13th Ave. W., Calgary, Alta.
Donaldson, William A., airway engr., Department of Transport, Edmonton, Alta.
Hind, Robin Cyril, B.Sc. (Elect.), (Alta.), apparatus sales engr., Canadian General Electric, Calgary, Alta.
Macnab, Thomas Morrow, B.Sc. (Mining), (Alberta), Ituna Works Mgr., Demerara Bauxite Co., Ituna, British Guiana, S.A.
Maggs, Percy James, B.Sc. (City & Guilds Coll., London), waterworks supvr., Calgary Power Co., Ltd., Wetaskiwin, Alta.
Ross, Herrick H., B.Sc. (Elect.), (Manitoba), elect. engr., Purity Flour Mills Ltd., East Calgary, Alta.

Junior

Mackenzie, Robert Bain Anderson, B.Sc. (Alberta), 11153 Saskatchewan Drive, Edmonton, Alta.

Junior to Member

Stanley, Donald Russell, B.Sc. (Alberta), prov. sanitary engr., Dept. of Health, Alberta Govt., Edmonton, Alta.

Student to Member

Kirkland, William Dalton, B.Sc. (Elect.), (Alberta), elect. engr., City Power Plant, Edmonton, Alta.

Saskatchewan

Member

Keith, Ralph Richard, B.Sc. (Mech.), (Sask.), asst. supt., Sask. Power Commission, Saskatoon, Sask.

Junior to Member

Bing-Wo, Reginald, B.Sc. (Civil), (Sask.), asst. hydraulic engr., P.F.R.A., Regina, Sask.

New Brunswick

Member

Spence, Earl Boyce, B.Sc. (Mech.), (N.S. Tech.), sr. engr., International Paper Co., Dalhousie, N.B.

Junior to Member

Mundee, Lawrence Sterling, B.Sc. (Elect.), (N.B.), Asst. equipt. engr., N.B. Telephone Co., Ltd., Saint John, N.B.

Quebec

Members

Bartlett, Oswald Willoughby, B.Sc. (London Univ.), design engr., Fraser-Brace Engrg. Co., Ltd., Montreal, Que.
Fear, William Davidson, B.A.Sc. (Toronto), asst. engr., E. A. Ryan, consultg. engr., Montreal, Que.
Halyard, Robert Henry, B.Eng. (Liverpool Univ.), engr., designer, Fraser-Brace Engrg. Co., Ltd., Montreal, Que.
Lundy, James Armstrong, B.A.Sc. (Toronto), sr. technician, Canadian Car & Foundry Co., Ltd., St. Laurent, Que.
Michaud, Joseph Marcel, B.Eng. (Mining), (McGill), mine engr., King Mine, Asbestos Corporation Ltd., Thetford Mines, Que.

Juniors

MacNaughton, John William, B.Eng. (Mech.), (McGill), asst. res. scientist, Canadian Armament Research & Development Establishment, Quebec, Que.
Paine, Frederick J., B.Eng. (Civil), (McGill), jr. designer, Dominion Bridge Co., Montreal, Que.
Sternfeld, Sol. I., B.Eng. (Chem.), (McGill), 5838 Durocher Ave., Outremont, Que.

Junior to Member

Demers, Georges, B.A.Sc., C.E. (Poly.), consultg. engr., 126 St. Peter St., Quebec City, Que.

Personals

News of the Personal Activities of members of the Institute

Donald Ross-Ross, M.E.I.C., is the chairman of the new Cornwall Branch of the Institute. Born in Montreal, he graduated from McGill University in 1917 with a B.Sc. in mechanical engineering. He served in the R.C.N. until 1919, when he went to Toronto, Ont., as instructor in steam power plant engineering for the Central Technical School. From 1920 to 1925 he was with the Dominion Rubber Company, Montreal, first in the planning department and later as assistant mechanical superintendent. He then joined the Cornwall division of Howard Smith Paper Mills Limited. He first served as combustion engineer, and was promoted to the position of assistant to the mill manager in 1927, production engineer in 1928, and chief industrial engineer in 1929. Two years later his title applied also to subsidiary companies, and gradually he assumed charge of purchasing and cost accounting. He was personnel supervisor for the company for several years.

William P. Nesbitt, M.E.I.C., has been appointed secretary-treasurer of the new Cornwall Branch. He was born in Merritton, Ont., and graduated from Queen's University, Kingston, Ont., in 1935 as a B.Sc. in mechanical engineering. He was first employed by Alliance Paper Mills, Merritton, and in 1936 went to the engineering department of Fraser Companies Limited, Edmundston, N.B. In 1938 he entered the Canadian International Paper Company's engineering department and was located at Hawkesbury, Ont., and Temiskaming, Que. He transferred to the Consolidated Paper Corporation, Grand'Mere, Que., in 1939, where he remained for two years as master mechanic, when he entered the employ of the Howard Smith Paper Mills in the Cornwall Division. He was appointed mechanical superintendent by his company in 1943.

T. G. Anglin, M.E.I.C., announces the formation of the T. G. Anglin Engineering Company Limited, Montreal, by the former associates of the late Walter J. Armstrong, M.E.I.C., consulting engineer of Montreal.

R. C. Flitton, M.E.I.C., has been appointed sales manager of Canadian Vickers Limited, Montreal, Que. He has been with the company since 1933, when he transferred from the William Hamilton Company Limited, Peterborough, Ont. He was first superintendent of industrial shops for the company and has latterly been chief estimator for the engineering division. He represents the Montreal Branch on the Council of the Institute.

C. M. Brant, M.E.I.C., has been appointed controller of radio (air) with the Civil Aviation Division of the Newfoundland Government. He is seconded to that government by the United Kingdom Ministry of Civil Aviation. He first went from the Air Ministry to Newfoundland in 1937 as technical superintendent for the transatlantic air base at Botwood. Transferring to the R.A.F. in 1942, he was first stationed at Gander, Nfld., as signals officer, and later at Bermuda, B.W.I., and Dorval, Que. He returned to Gander in May of this year and assumed his duties as controller.

John Allan Jones, M.E.I.C., has been named British Columbia regional supervisor for the Central Mortgage and Housing Corporation. A graduate of the University of British Columbia, he was general superintendent and assistant manager of the B.C. Bridge and Dredging Company, Vancouver, prior to joining the R.C.A.F. in 1939 as a flying officer. He attained the rank of group captain and was placed in charge of R.C.A.F. construction in Canada. Retired to the reserve in 1945, he became chief engineer for the Commonwealth Construction Company of Vancouver, later joining the Corporation as an engineer.

Dr. F. Noakes, M.E.I.C., is now associate pofessor of electrical engineering at the University of British Columbia. He had been employed since 1943 in the laboratories of the Hydro-Electric Power Commission of Ontario, Toronto, and lectured in electrical engineering at the University of Toronto from 1940 to 1943.

M. S. Mitchell, M.E.I.C., formerly of the department of civil engineering of the University of Alberta, is a partner in the Lethbridge firm of architects and engineers, Meech, Mitchell and Meech.. He was with the university during the academic sessions of 1943, 44 and 45, as sessional instructor.

T. M. Moran, M.E.I.C., vice-president of the B.C. Electric Railway Company Limited, is also carrying on work related to the gas division of British Columbia Motor Transportation Limited, and has been appointed vice-president for British Columbia of the Northwest Electric Light and Power Association.

Roger Lessard, M.E.I.C., is professor of mathematics at Ecole Polytechnique, Montreal. He graduated in 1941 from the Ecole, and has since been employed by the Milton Hersey Company Limited on storage dam construction at Dolbeau, Que., by Marine Industries Limited, Sorel, Que., by the Dominion Rubber Company at St. Jérome, Que., and by the Technical School of Hull, Que., as professor of mathematics and engineering.

Col. A. L. Mieville, M.E.I.C., is managing director of Bailimo Limited in London, England. He has been with the British Ministry of Supply Mission in Washington, D.C., for the past several years, and in 1940 was with the Ministry of Labor and National Service in London. In 1937 he was purchasing agent for Switchgear and Cowans Limited, Manchester, England.

C. V. F. Weir, M.E.I.C., is in Calgary, Alta., employed by the Calgary Transit System as assistant superintendent. On his release from the R.C.E. in 1945 with the rank of major, he returned as an electrical engineer to the City of Edmonton Power Plant where he had been employed in 1938 as a field engineer.

W. J. Orr, M.E.I.C., has accepted the position of mechanical engineer in the technical division of the Public Works Department of the City of Montreal. He was previously with Jas. A. Kearns, consulting engineer, Montreal.

Gordon MacL. Pitts, M.E.I.C., a representative of McGill University on the Council of the City of Montreal, was elected in September to serve as pro-mayor of the city for the ensuing three months. Mr. Pitts is a member of the board of governors of McGill, and a past-president of the McGill Graduates Society. He represented the Montreal Branch on the council of the Institute in 1942, 1943 and 1944.

D. B. Simpkin, M.E.I.C., is in Burlington, Ont., where he is employed as a designer by the Hamilton Bridge Company Ltd. Since his release from the R.C.E. in August 1945, he had been in Noranda, Que., with the Noranda Mines Limited.

Philip Simpson, M.E.I.C., was made an Associate Fellow of the Royal Aeronautical Society in May 1946. He is an aircraft standards engineer with Handley Page Limited in London, England. He went to England in 1932 and has since been associated with that company's aircraft standards and technical publications.

G. E. Smith, M.E.I.C., has been appointed engineer, right of way, Atlantic Region, for the C.N.R. at Moncton, N.B. He entered the employ of the railway as a draughtsman at Moncton in 1919, became third assistant engineer in 1937, and was acting division engineer at New Glasgow and Campbellton, N.B., in 1944. Returning to Moncton in 1945, he was assistant engineer until his recent appointment. He represented the Moncton Branch on the council of the Institute in 1940, 1941 and 1942.

Ernest Smith, M.E.I.C., who was district engineer at Nelson, B.C., for the British Columbia Department of Public Works, has been transferred to Victoria, B.C., in the same capacity. With the Department he has served at Prince Rupert, B.C., and at New Westminster, B.C., as assistant district engineer, and he went to Nelson as district engineer in 1941.

H. C. Spence, M.E.I.C., is in Calgary, Alta., where he has assumed the post of manager of the newly opened Calgary branch of the Central Mortgage and Housing Corporation. He served during the war with the administrative branch of the R.C.A.F. finally with the rank of Wing Commander. Prior to the war he was secretary of the Highway Traffic and Taxicab Office for the Municipal and Public Utility Board of the Province of Manitoba.

R. D. Sutherland, M.E.I.C., who was deputy adjutant general, with the rank of brigadier, with the Department of National Defence at Ottawa, Ont., for the past two years is now district manager for Rogers Majesic Limited in Montreal. From 1940 to 1942 he was Q.M.G., Atlantic Command, located at Halifax, N.S. In civil life prior to the war he was merchandise manager for the Canadian Westinghouse Company Limited, Montreal.

F. C. Wightman, M.E.I.C., of Amherst, N.B., has been appointed town manager for Sackville, N.B. He had been active as a municipal consultant in Amherst since his release in 1944 with the rank of major from the R.C.E. With the R.C.E. he was chief engineer officer at Camp Borden, Ont., and later O/C of No. 2 Works Company at Ottawa, Ont. Prior to war service he was for some years county engineer with the Department of Highways at Truro, N.S., and was town manager for Kentville, N.S. in 1937.

W. Raywood Smith, M.E.I.C., has resigned as county engineer for Middlesex County, Ont., his resignation to be effective at the end of this year. It is expected he will enter private practice. He has been county engineer since 1941 after some years service as assistant county engineer.

R. C. Gauthier, M.E.I.C., has joined the firm of Lalonde and Valois, Montreal, as a structural engineer. He had been assistant designer for the Dominion Bridge Company at Winnipeg, Man., since 1944.

A. R. Moffat, M.E.I.C., is a civil engineer in the surveys and engineering branch of the Department of Mines and Resources, Ottawa, Ont. He was previously at Arnprior, Ont., as assistant engineer on construction for the Ontario Hydro-Electric Power Commission.

M. R. Quintal, M.E.I.C., is in Quebec, where he is employed as an engineer in the soils division of the Department of Highways of the provincial government.

A. LeB. Ross, M.E.I.C., has accepted a position as works manager with Mueller Limited, Sarnia, Ont. He was formerly at Ajax, Ont., as plant engineer for Defence Industries Limited. He was with D.I.L. in Montreal in 1941, transferring to Oshawa, Ont., in 1942, and to Ajax in 1943.

J. B. Lalande, JR.E.I.C., who was with Canadian Westinghouse Limited in Hamilton, Ont., since his graduation in 1944 from Ecole Polytechnique, Montreal, has been transferred to the company's Montreal office.

Guy Savard, JR.E.I.C., is with the Société d'Oxygène et d'Acetylène d'Extrême-Orient, at Singapour. He left the Canadian Liquid Air Company, Montreal, in 1940, to enlist in the Royal Canadian Dragoons, and served overseas during the war.

F. E. Ayers, JR.E.I.C., is with the Canadian National Railways as instrumentman with the Port Arthur division.

W. K. Clawson, JR.E.I.C., has been appointed assistant engineer for Middlesex County, Ont. It is expected that he will succeed the resigning engineer at the beginning of 1947. On his recent release from the R.C.E., with the rank of major, he joined the Horton Steel Works Limited and was located at the Fort Erie Plant.

A. B. Extence, JR.E.I.C., who was discharged from the navy with the rank of lieutenant (E) late in 1945, has been at M.I.T., Cambridge, Mass., since last March, where he has been doing graduate studies.

F. S. Hutton, JR.E.I.C., has been transferred by Canadian National Railways from Stratford to London, Ont. He is assistant division engineer for the London division.

F. L. Peckover, JR.E.I.C., has been for the past two years with the National Research Council as a junior research engineer in the hydraulics laboratory of the division of mechanical engineering at Ottawa, Ont., and served as secretary of the N.R.C. Associate Committee on Soil and Snow Mechanics. He was recently granted leave of absence of one year in order to study in the field of soil mechanics and foundation engineering at the graduate school of engineering of Harvard University, Cambridge, Mass. He has been at the University since September.

G. W. Ross, JR.E.I.C., joined the Canadian General Electric Company on his release from the R.C.A.F. in 1945. First located in Toronto, he was later transferred to Ottawa as a lighting specialist, and is now in Sydney, N.S., as sales representative for the company.

G. J. Dunne, JR.E.I.C., has been employed since March last with Frank W. Horner Limited, Montreal. He is supervisor of the fine chemical department which is under development.

R. E. Gohier, JR.E.I.C., formerly a metallurgist with Sorel Industries Limited at Sorel, Que., is now with the gas distribution department of the Quebec Hydro-Electric Commission, and is located in Montreal.

G. W. Hudson, JR.E.I.C., who had been with the National Research Council, Ottawa, Ont., is now at Guelph, Ont., in the engineering department of the Hammond Manufacturing Company Limited.

F. A. Hunt, JR.E.I.C., was discharged from the army early this year and has returned to the Canadian National Railways in Toronto, Ont. He is an assistant engineer in the Toronto Terminals division office.

N. G. Wrightson, S.E.I.C., who served overseas in the R.C.A., has accepted employment with Darling Brothers Limited, Montreal.

W. F. Dawson, S.E.I.C., B.ENG., and former demonstrator in the Faculty of Engineering at McGill University, Montreal, is in Maracaibo, Venezuela, in the employ of the Caribbean Petroleum Company Limited.

K. G. Richardson, S.E.I.C., is in Toronto, Ont., where he is following the Junior Engineers' Training Course of the Hydro Electric Power Commission of Ontario.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here:

James Moscrip Rothwell, M.E.I.C., a member of the Vancouver Branch of the Institute, died suddenly on September 9th, 1946.

He was born in Walkerton, Ont., in 1896, and received his early education in Galt, Ont. Joining the Canadian Forces in 1916, he saw service overseas until the temination of the war. He was invalided home and spent almost a year in hospital before attending the University of British Columbia, from which institution he graduated in 1927 with the degree of B.A.Sc. in civil engineering.

After a few months spent with the Greater Vancouver Water District as field engineer, he joined the staff of the City of Vancouver engineering department as assistant in the surveys department. He remained on the municipal staff and at the time of his death he was assistant city surveyor.

Mr. Rothwell was a member of the Association of Professional Engineers of British Columbia and of the Association of Land Surveyors of British Columbia. He joined the Institute in 1927 as a Student, transferred to Associate Member in 1938 and to Member in 1940. He had been on the executive of the Vancouver Branch for the past two years.

Arthur Reginald Roberts, M.E.I.C., chairman of the department of mechanical engineering of McGill University, Montreal, died suddenly on September 6th, 1946.

Born in Montreal in 1883, Pofessor Roberts received a B.Sc. degree from McGill in 1903 and an M.Sc. in 1904. He secured employment that year as assistant chief draughtsman with the Dominion Coal Company, Montreal, and went the following year to the Montreal Rolling Mills Company.

He commenced his long connection with McGill University in 1908, joining the teaching staff as a lecturer in mechanical engineering. Within the next four years he became assistant professor and associate professor. He was appointed professor in 1928 and in 1943 chairman of the department of mechanical engineering.

Professor Roberts was a member of The American Society of Mechanical Engineers. He joined the Engineering Institute in 1904 as a Student, transferring to Associate Member in 1911, and to Member in 1940.

F. J. Heuperman, M.E.I.C.

Frederick Justinus Heuperman, M.E.I.C., of Calgary, Alta., died on August 16th, 1946.

He was born in 1887 in Amsterdam, Holland, and came to Canada in 1906. He became a Dominion Land Surveyor in 1911, and later the same year received his Alberta Land Surveyor's Certificate. From 1911 to 1914 he carried out extensive surveying projects in Northern Alberta and surveyed many timber limits. At one time he was in partnership with A. P. Patrick, one of the pioneer surveyors of the west.

Mr. Heuperman joined the engineering staff of the Canadian Western Natural Gas, Light, Heat and Power Company Limited in January 1914 as assistant engineer, and remained with the company. He was appointed general superintendent for the company in April this year.

He was a member of the Association of Professional Engineers of Alberta, and of the Alberta Land Surveyors Association. He joined the Engineering Institute as an Associate Member in 1925. becoming a member in 1940. Active in the Calgary Branch, he served as secretary for one year and has been a member of the branch executive on numerous occasions.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

J. F. Langston, M.E.I.C. - - - - *Secretary-Treasurer*
D. C. Jones. Jr.E.I.C. - - - - - *Branch News Editor*

The Calgary Branch held its first general meeting of the season on Thursday September 26th.

A report of progress on subscriptions to the Harry F. Bennett Educational Fund was read. A number of the new members were introduced to the meeting and welcomed by the chairman, H. R. Younger.

Through the courtesy of the Alberta Wheat Pool, three films were shown. The picture "Northwest Frontier" traced the development of Canada's northland, and the growth of its industries, transportation and communication systems.

The other films dealt with the salmon fishing industries in Alaska and in the Fraser river. The methods of fishing and processing fish in the canneries as well as the scientific study of the return of the fish to the spawning grounds were outlined. Of particular interest was a description of the measures taken to assist the fish in returning to the spawning grounds over rapids and falls.

The chairman thanked Mr. Davidson and Mr. Pettinger for presenting an entertaining and interesting programme.

HAMILTON BRANCH

L. C. Sentance, M.E.I.C. - - - - *Secretary-Treasurer*
I. M. Macdonald, Jr.E.I.C. - - - *Branch News Editor*

On Thursday, September 26th 1946, the Hamilton Branch of the Institute held the first meeting of the 1946-47 season at MacMaster University with Chairman A. R. Hannaford presiding.

E. G. Wyckoff introduced Brigadier D. H. Storms, C.B.E., M.C., the speaker of the evening. Brigadier Storms is general manager of Housing Enterprises of Canada Ltd., and dealt with that organization in his talk on **Housing in Canada, the Problems and Prospects.**

Housing Enterprises and other similar organizations are taking care of housing for medium salaried groups, but one third of the population of Canada in the low income brackets has no housing of decent standards, and some provision will have to be made for them. It will be necessary for federal, provincial and municipal authorities to combine in this effort.

Brigadier Storms said that it is evident that the problem of house building will be a major one for the next few years, despite all that is being done by government agencies and projects such as Housing Enterprises. He predicted continuing difficulty in obtaining materials in all branches of the building industry. While some delays are due to a shortage of labour, others are due to manufacturers not producing what they can in seeking higher prices or tax relief.

He suggested the cutting of red tape and establishing standard building codes across the Dominion. He said that in the project of which he is head it is necessary to have 24 separate legal agreements before work can proceed. Shortages are being partially alleviated by large-scale salvage operations. Many former army camps have been purchased and lumber, nails and plumbing reclaimed, along with other materials.

Brigadier Storms gave an outline of the various housing projects and the financial assistance given by the government, and explained that Housing Enterprises Ltd. is a private enterprise operated on a non-profit basis by the 42 life insurance companies in Canada with government assistance. It aims at providing low-rental housing units to which former servicemen are given priority, so that there is slight chance of the average civilian getting any of these units.

Abandonment of the old fashioned, conventional methods of construction of the horse and buggy days, and development of house building along the modern lines adopted in other industries was advocated by the speaker, who said research in radical methods of construction is being undertaken by his organization. Wider use of steel and precast concrete was included in some of these experiments. In this connection he invited inspection of the project under way in Hamilton at Lawrence Woods.

At the conclusion of his address, Brigadier Storms was tendered the thanks of the meeting by C. H. Hutton.

KINGSTON BRANCH

J. E. Thom, m.e.i.c. - *Secretary-Treasurer*

The annual meeting of the Kingston Branch was held on Wednesday, July 3rd, 1946, and included a showing of the film **Heat and Its Control** by Johns-Manville. This partly animated sound film was enjoyed very much by the attending members. The meeting then retired to the Faculty Players Lounge, Old Arts Building, Queen's University, for refreshments and the election of officers.

The following members have been elected for the year 1946-47; R. D. Bennett, chairman; C. E. Craig, vice-chairman. The Executive committee consists of: R. J. Kennedy, K. H. McKibbon, W. J. Piercy, and M. J. Saunders, J. E. Thom, of the construction department of Canadian Industries Limited, is secretary-treasurer.

LETHBRIDGE BRANCH

Thomas Miard, m.e.i.c. - - - - *Secretary-Treasurer*
E. A. Lawrence, s.e.i.c. - - - - *Branch News Editor*

Mr. Wm. Murday, chief installation engineer for Richard Sutcliffe Ltd., Horbury, England spoke on **Belt Conveyers in Britain** at the first dinner meeting of the fall season of the Lethbridge Branch of the Institute on Saturday evening, September 21. Chairman R. S. Lawrence presided.

Mr. Don Livingston introduced Mr. Murday who, previous to his present position, had been chief engineer for two large English collieries. He has had 26 years' experience with conveyors.

The speaker pointed out there was a great manpower shortage in Britain, and mechanization released men for other duties, thus increasing production.

In 1938, a self-acting incline in a hundred year old British colliery was replaced with a full belt conveyor system 2172 ft. long, releasing 42 men who had attended the incline. The conveyor carried 750 tons per seven-hour shift. The system was installed 1¼ miles from the bottom of the shaft. The belting was supplied in rolls seven feet in diameter which could not be handled in the mine. Each roll was hung under the cage, and allowed to revolve, the belting being carried from the foot of the shaft in mine cars.

In a colliery controlled by the Ministry of Mines the joints in the 30-inch six-ply belt had only 55 or 60 percent of the belt strength. Although vulcanizers are not flameproof, permission was obtained from His Majesty's Inspectorate to vulcanize the belts underground, increasing the joint strength to 90 per cent.

At a limestone quarry in North Wales, ships loading 1,000 tons came in with the tide, then retired to the bay with the ebb, to await the next tide. 150 to 200 tons were loaded per tide. During blackouts the work was dangerous for both shoremen and crew, and enemy action sank three ships. A conveyor system costing $170,000 was installed, with bunkers feeding a 42-inch conveyor running 1050 ft. along the jetty with a speed of 350 ft. per minute. A 1,000 ton cargo can now be loaded in a single tide.

In a large ammunition dump Mr. Murday's company installed conveyors which had to operate around bends up to 40 deg. At these angles, between the end of one belt and the start of the next, an independent frame was made on a suitable radius. The frames were fitted with tapered ball-bearing rollers. As a box came from the conveyor, the taper on the rollers guided it around the bend. When the next box left the conveyor, it pushed the first one along the rollers onto the next belt. Thirty miles of conveyor were installed in this storage area, replacing 14 locomotives. They have carried over six million tons of ammunition.

Mr. Murday mentioned several other installations, and in closing said there was a place for conveyors in every industry.

Answering questions, he stated the greatest single length of conveyor should be about 3,000 ft. On level runs the motor should be at the front, and on grades above 1 in 7 it should be at the top of the incline. The maximum grade is 1 in 3, as above that the material will fall by itself. Belts are troughed, and have self aligning rollers. Belt speeds vary from 120 to 500 ft. per minute. Direct starting can be used on belts travelling under 300 ft. per minute.

A. L. H. Somerville thanked the speaker.

Brown's trio presented enjoyable dinner music, and Mr. Morton Brown led the community singing, and sang three solos, accompanied by Mrs. G. Brown.

OTTAWA BRANCH

C. G. Biesenthal, jr.e.i.c. - - - *Secretary-Treasurer*
R. C. Purser, m.e.i.c. - - - - - *Branch News-Editor*

A special invitation was extended to members of the Ottawa Branch and their friends to attend a showing of scientific films at the National Research Laboratories auditorium on the evening of Wednesday, September 18. The showing, open to the public, constituted the closing item of a one-day inaugural meeting of the newly-formed Canadian Scientific Film Association.

The programme of films, which lasted about ninety minutes, was purposely selected for variety in subject matter and method of treatment and wide general appeal. Various aspects of scientific film production and technique were illustrated, and the possibilities of the use of films in relation to Canadian science and industry were illustrated. Subjects covered by the programme included: the tailless glider, the electron microscope, high speed photographic techniques, the human ear, vegetable insects, the search for oil in Western Canada, and the art of camouflage.

SAGUENAY BRANCH

J. E. Dyck, m.e.i.c. - - - - - *Secretary-Treasurer*

The Saguenay Branch was addressed by two speakers on September 24th, on subjects relating to architecture.

Mr. Gordon Webber, instructor in visual design, McGill University, spoke on the subject **How Student Architects View Arvida and District.** Each year, fourth and fifth year students of the McGill School of Architecture, as part of their regular course, visit a district to study and sketch such settings as houses, farms, factories, etc. This year, 20 students under the direction of Mr. Webber chose Arvida and district as a subject for their sketches and paintings.

Mr. Webber pointed out that the object of his students' work was to portray in their sketches the character of the district in an interesting and exciting manner. He mentioned too, that the tremendous industrial development of the Saguenay district had to be seen to be fully appreciated.

Mr. Spencer Sales, assistant professor of Architecture at McGill University, spoke on **Town Planning in Postwar England.** Mr. Sales, who just recently came to this country from England has had considerable experience in that country in connection with post war reconstruction of towns. He explained that since his interest lay in town planning, his visit to Arvida was prompted by a desire to see a new town in this country built almost entirely in the last ten years. His impressions of Arvida were very favourable and he felt that, with proper foresight in the future, Arvida could serve as a model town.

In England the problem was to decentralize large congested areas such as London. The plan there was to build satellite towns on the fringe of the large city, each town to cover 600 acres and accommodate 60,000 inhabitants. It was intended to bring diversified types of light industry to these towns. The speed of this work was still being retarded due to lack of building materials. In answer to a question as to what incentive people would have to move to these towns Mr. Sales pointed out that the prospect of a house in preference to a flat, as well as the advantage of living close to one's job, would serve as sufficient incentive. The use of prefabricated houses, however, was not contemplated and the speaker thought that standard methods of house construction would be employed. In conclusion Mr. Sales pointed out that rebuilding of towns in England could not be considered a short term undertaking and believed that a minimum period of 30 years would be required to complete the full project.

A. Cunningham thanked both speakers for their interesting talks.

SARNIA BRANCH

F. F. Dyer, M.E.I.C. - - - - - - - *Secretary-Treasurer*

A. E. K. Bunnell, consultant to the Provincial Department of Planning and Development, spoke to a dinner meeting of the Sarnia Branch of the Institute on October 3rd, 1946. His subject was **Community Planning.**

Mr. Bunnell stressed the part the engineer takes in community planning, from the first inception of the municipality through all stages of its development. He defined planning as, " thought before action ", and pointed out the necessity of planning to adequately provide for municipal services, such as water supply, sewers, and sewage disposal, schools, parks, traffic thoroughfares, etc.

The modern thought, by those who have studied the subject, is that municipalities should be limited in size, at a point where services can be made available at reasonable cost. Surrounding such a municipal area, should be a green belt of park, and agricultural land, restricted as to population density. Further growth in the area should take the form of satellite communities, with their own establishments, outside this green belt. This system would enable a municipality to know the extent to which it would be called on to provide future utilities. Studies made of community statistics show that after a certain stage has been reached, the cost per capita increases as the population of the municipality increases.

Mr. Bunnell briefly touched on the master plan for Sarnia, prepared by Mr. Wilson, and felt that a serious mistake had been made when the city failed to acquire the property necessary to develop the " Civic Centre " idea as set out in the plan. He also stated, in regard to the riverfront, that he knew of no municipality that had lost control of its waterfront, as Sarnia had done, that had not lived to regret it. Toronto, he said, had now acquired practically all of its waterfront, some 12 or more miles, at a cost of millions of dollars. Communities are all very much alike, and should seek something that will express their own individuality and develop it.

A plea was made for a wider interest in civic affairs by the individual citizen, and on the part of municipal councils; more thought to long range views both for community planning and financial planning.

The meeting was held in the Polymer Cafeteria, with a good representation of the engineering profession present. W. E. Dill acted as chairman.

TORONTO BRANCH

E. G. Tallman, M.E.I.C. - *Secretary-Treasurer*
E. R. Graydon, M.E.I.C. - *Branch News Editor*

The opening meeting of the 1946-47 season of the Toronto Branch was held on October 4th in the auditorium of the Royal Ontario Museum.

The meeting, conducted by Chairman Edgar Cross, was attended by some 400 members and their ladies, and gave promise of a most successful season to come. Colonel J. T. Wilson, a member of the Branch and Deputy Director of **Exercise Musk-Ox,** gave a fascinating account of the expedition through all its stages. Slides illustrated many of the points, and the National Film Board record film of the expedition " White Safari " was shown. Colour moving-pictures of the expedition brought this part of the meeting to a close.

During a brief period of discussion, the meeting heard a very humorous comparison between the equipment used on the Scott Antarctic expedition and that on the " Musk-Ox ". Professor Griffith Taylor, who made the comparison was a member of the Scott expedition.

A vote of thanks to Colonel Wilson for his excellent presentation was then moved by Professor C. F. Morrison, and the meeting was adjourned.

BOOK REVIEWS

X-RAYS IN PRACTICE

Wayne T. Sproull. New York, London, McGraw-Hill; Toronto, Embassy, 1946. 615 pp., illus., 9 x 5¾ in., cloth, $6.00

Reviewed by E. S. Kelsey, M.E.I.C*

This volume has been written to serve both as an up to date text book on the theory and application of X-Rays and as a convenient reference book on the subject.

The history, fundamentals and characteristics of X-rays and X-ray spectra provide an introduction to this comprehensive work. With emphasis on the practical aspects, the book proceeds with the generation, absorption, scattering and deffraction of X-rays, the measurement and recording of X-rays, and descriptions of X-ray equipment. Particular applications dealt with include industrial radiography, medical applications, crystallography, fluoroscopy, micro-radiography, and numerous minor uses.

Electronics Research Engineer, Northern Electric Company Ltd., Montreal.

Well selected questions and problems at the end of each chapter review the subject matter and assist the student in obtaining a proper grasp of it. The arrangement of material and thorough indexing should make it a convenient reference book for the practising engineer or physicist. Moreover, the numerous references to source material in foot notes throughout the volume, not only furnish an extensive bibliography, but also serve to make the book a most useful guide to the technical literature on X-rays in practice. The work is excellently illustrated with numerous figures and photographs, including many interesting radiographs.

One minor criticism is offered. In a work which so thoroughly caters to the needs of the practising physicist and engineer and which is so completely up to date in other respects (even the atomic bomb is included), it is disappointing to see continued adherence to the outmoded e.s. units. In all fields of applied electronics, the trend is towards complete superseding of the old theoretical e.s.u. and e.m.u. systems of units by the m.k.s. system which is both theoretical and practical.

LINCOLN'S INCENTIVE SYSTEM

J. F. Lincoln. New York and London, McGraw-Hill; Toronto, Embassy, 1946. 192 pp. illus., charts, 9 x 5¾ in., cloth, $2.00.

Reviewed by E. D. Kellogg*

Anyone who reads this book in order to obtain information on the setting of piece-work rates or the technical details of setting up wage incentive plans will be disappointed. The book does not cover the limited technical aspects of incentives which are usually so dear to the hearts of time study men and industrial engineers in general.

I can, however, highly recommend this publication to all those employed in the administrative and policy making levels of management. The book should be a "must" for union executives, and it would do no harm if it were read by some of our income tax administrators.

The first part of the book is devoted to a detailed analysis of the progress of the Lincoln Electric Company, Cleveland, Ohio, under incentive management. Coming as they do from a reputable well known organization, it would seem that the figures reported can be relied upon. Briefly, the Lincoln Electric Company has been able to consistently, over a period of years, reduce the cost of their product, improve the quality of their product, increase their production, decrease their selling prices, and last but not least, increase their wages to an extent which is well unbelievable.

Much of the book is devoted to the necessary steps to be taken by management before an incentive plan can be installed. A point which is often neglected on most works on incentives, but which is well emphasized in this book, is the necessity of developing in the workers their latent skills and abilities. This can be best done by supervisors and foremen with well developed leadership qualities. Management must be highly skilled in improving methods of operation and in the overall planning of the production operation. Then, when we have a competent management organization and a highly refined production standard, it is time to develop a piece-work or incentive system.

As far as the actual installation of incentive standards is concerned, practically no attention is paid to this in the book. The author states that time study men must, in his opinion, be entirely familiar with the job conditions and able themselves to perform any of the operations which they are studying. This is a good point and is often overlooked. In the Lincoln incentive operation, a piece-work rate, once established, is regarded as a contract between labour and management and is, therefore, never changed.

The well known dodge of changing methods or materials to a slight degree in order to cut a high rate piece-work is not tolerated under the Lincoln system. This is extremely important since it develops a high degree of confidence in the system by the workers. This attitude alone may account for a great deal for the success of the plan.

**Vice-President, Stevenson & Kellogg Ltd., Montreal.*

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

BRITISH STANDARD SPECIFICATION FOR NON-FERROUS PIPES AND PIPING INSTALLATIONS FOR AND IN CONNECTION WITH LAND BOILERS. B.S. 1306 Part 1:
London, British Standards Institution, 1946. 2/-.

This standard is similar and complementary to B.S. 806—Ferrous Pipes and Piping Installations for and in Connection with Land Boilers. B.S. 1306 Part 1 applies to the general and detailed construction of the copper pipework connecting a land steam boiler to engine turbine or industrial plant, and to all auxiliary pipework in connection therewith, together with individual pipes and fittings forming parts of such installations. It lays down limits of pressure and temperature for the use of copper piping installations and bronze castings used in connection with such installations.

B.S. 1306 will be completed at an early date by the issue of Part 2—Seamless Copper Tubes with Plain and Screwed Ends for Steam Services.

BRITISH STANDARD SPECIFICATION FOR SYNTHETIC RESIN (AMINOPLASTIC) MOULDING MATERIALS AND MOULDINGS. B.S. 1322:1946:
London, British Standards Institution, 1946. 2/-.

Corresponding to the British Standard Specification for Synthetic Resin Moulding Powders of the Phenol Formaldehyde Tube. B.S. 1322:1946 standardises the methods of test and provides the technical information necessary to frame purchasing specifications for aminoplastic moulding materials and mouldings.

The specification defines two types of materials according to their properties and further types will be included later enabling a purchaser to quote B.S. 1322 or to build a specification for a special type of aminoplastic material or moulding, by fixing a special standard of performance and prescribing the standard tests.

PORTLAND CEMENT CONCRETE PAVEMENTS:
Chicago, American Public Works Association, 1946. Loose leaf, $1.50.

This completely revised standard specification for Portland Cement Concrete Pavements is Part F1-44 of the Association's Standard Specification for Public Works Construction. It comprises the latest developments recognized as good standard practice.

The specification makes provision for the use of air-entraining cement in locations in which its use is warranted because of ice or snow conditions. Also, it includes provisions for varying the water cement ratio to meet the requirements of economical construction in either northern or southern areas and provides for the use of vibratory methods of compaction.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

APPLIED PHOTOGRAMMETRY:
R. C. Anderson, 4th ed. C. E. Hayes, P.O. Box 882, Chattanooga 1, Tenn.; apply Edwards Brothers, Ann Arbor, Mich., 1946. 517 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00.

As in the previous editions of this book the object is to present a clear, simple, but accurate method of calculating tilt of the aerial photograph. In this new edition has been incorporated the material contained in two other books by the same author, "Rigorous Analysis of the Scale Point and Tilt Formulas" and "Tilt of the Aerial Photograph by Graphical Resection". The theory and demonstrations of the basic idea, the dropped perpendicular analogy, have been extended, with further derivations, to increase the accuracy of the result. Numerical examples and sample calculations have been used freely, adding to the practical value of the book.

ATMOSPHERIC POLLUTION IN LEICESTER: Atmospheric Pollution Research, Technical Paper No. 1:
Great Britain. Dept. of Scientific and Industrial Research. London, His Majesty's Stationery Office, 1945. 164 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, 3/-. (Obtainable from British Information Services, 30 Rockfeller Plaza, New York, $.90).

As a part of the program of research on atmospheric pollution of large towns, some 200,000 readings of gauges, filters and other apparatus were taken over a three-year period. The apparatus used is described with methods for accurate determinations. The results are summarized and discussed, and the practical aspects are emphasized with suggestions on smoke abatement, sulphur control and town planning.

ATOMIC ENERGY in COSMIC and HUMAN LIFE; Fifty Years of Radioactivity:
By G. Gamow. University Press, Cambridge, England; Macmillan Company, New York and Toronto 1946. 161 pp., illus., diagrs., charts, tables, 8¼ x 5¼ in., cloth, $3.25 (in Canada).

In the first section the author takes up the question of what is atomic energy, and describes the modern alchemy by which atomic transformations are brought about. In the second section he describes the way in which these transformations are used and produced by and in the stars, with extremely high temperatures as the producing mechanism. The final section discusses the problem of how man can use atomic energy, utilizing the method of neutron-multiplication and bombardment as described.

AUTOBIOGRAPHY OF SCIENCE:
Edited by F. R. Moulton and J. J. Schifferes. Garden City, N.Y., Doubleday, Doran; Toronto, McClelland & Stewart, 1945. 666 pp., tables, 8½ x 5¼ in., cloth, $4.00.

From the earliest records to the twentieth century, the great triumphs of science in all fields, are recorded in this volume in the original words of those who achieved them. The introductory notes by the authors immediately preceding the separate items provide brief information about the lives, activities and achievements of the men whose writings are presented. This unusual collection will be of interest to those who like their information first-hand, allowing for the necessity of translation from foreign languages.

DIESEL-ELECTRIC LOCOMOTIVE:
C. F. Foell and M. E. Thompson. Diesel Publications, New York, 1946. 688 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $7.00, U.S.A.; $8.00, foreign.

The early chapters of this book cover the history, development, advantages and classification of Diesel-electric locomotives. The remainder of the book deals with the constructional, engineering, operational and maintenance aspects of the subject in considerable detail and with many illustrative charts and diagrams. Two chapters of general engineering fundamentals are included, and Diesel-hydraulic and Diesel-mechanical locomotives are given brief consideration.

ELECTRIC MOTORS AND GENERATORS and Related Drives:
E. S. Lincoln. New York, Essential Books; Toronto, Collins, 1945. 381 pp., illus., diagrs., charts, tables, 8¼ x 5½ in., cloth, $3.50.

This practical volume describes all kinds of direct and alternating current motors and generators, with instructions for installation and operation. Tables are provided showing complete standardization of motor manufacture and use. A final chapter covers a variety of related drives: belting, gears, chain drives, variable speed transmission, couplings, clutches, etc.

ELECTRON and NUCLEAR COUNTERS, Theory and Use:
S. A. Korff. D. Van Nostrand Co., New York, 1946. 212 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $3.00.

This book first discusses the internal mechanism of the discharge in electron and nuclear counters. It then presents the constructional and operational features which are desirable and the best means for securing them, with discussion of the errors and corrections encountered in using the devices. Finally, the various electronic circuits which are the essential auxiliaries to successful operation are considered in some detail. Selectively sensitive and other special counters are covered as well as the conventional Geiger type.

ELECTRON OPTICS AND THE ELECTRON MICROSCOPE:
By V. K. Zworykin, G. A. Morton, E. G. Ramberg, J. Hillier and A. W. Vance. John Wiley & Sons, New York; Chapman & Hall, London, 1945, 766 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $10.00.

Part I of this treatise offers a comprehensive description of the various types of electron microscopes, a non-mathematical discussion of electron optical theories on which they are based, and a practical guide for their effective operation. Part II contains a thorough coverage of the mathematical theory. Important topics considered include: the determination of potential distribution; electron trajectory tracing;

magnetic fields and electron motion; electron lenses, their aberrations and corrective measures; and image formation in the electron microscope. A list of references accompanies each chapter.

ENDLESS HORIZONS:

V. Bush, introduction by F. B. Jewett. Public Affairs Press, Washington, D.C., 1946. 182 pp., portrait, 9¼ x 6 in., cloth, $2.50.

Seventeen papers, ranging from the quietly humorous "The Inscrutable Past" to the practically suggestive "Science for World Service", demonstrates the versatility of Dr. Bush. The general tone of the whole group is forward-looking. In the varied fields under consideration, shortcomings are demonstrated, present achievements are assessed, and remedies and goals are proposed for the future.

ENGINEERING MECHANICS:

S. Fairman and C. S. Cutshall. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1946. 267 pp., diagrs., tables, 9¼ x 5¾ in., cloth, $3.00.

The object of this book is to provide a self-contained course in fundamental mechanics which can readily be covered in the usual time allotted to the subject. A knowledge of calculus and general physics is assumed, and no attempt is made to include material which may properly be deferred to advanced strength of materials. Special attention has been paid to arranging the subject matter in the most logical and effective order within the two main sections, statics and kinetics.

HEATING and VENTILATING for ARCHITECTS and BUILDERS:

By R. K. Cornell. Paul Elek Publishers Ltd., 37-38 Hatton Garden, London, R.C.1, 1946. 56 pp., illus., diagrs., charts, tables, 10 x 7¼ in., cloth, 7s.6d.

The first two chapters of this practical book present the fundamental principles and the calculation of heat losses and heat requirements. Chapter III contains the classification and comparison of heating and water supply systems, the application of such apparatus, and water treatment. In chapter IV will be found furnace control, the combustion of fuel, and running costs of systems. The final chapter deals with the types and operation of equipment for ventilating and air conditioning.

HEATING of STEEL:

M. H. Mawhinney, Reinhold Publishing Corp., New York, 1945. 265 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

The opening chapter discusses the oxidation, carburization and decarburization of steel when heated under various conditions. The succeeding six chapters deal with purposes for which steel is heated, and practical information concerning the heating methods, types of furnaces, and furnace tools which are important in obtaining the best results. Refractories and the relation between heat transfer and fuel economy are also covered.

INDUCTION HEATING:

H. B. Osborn, and others. American Society for Metals, Cleveland, Ohio, 1946. 172 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.00.

Five lectures presented at the 1946 National Metal Congress are combined in this book. They deal respectively with the principles and theory of high frequency heating; induction heating circuits and frequency generation; practical applications of the motor generator type of induction heating (up to 10,000 cycles); practical applications of high frequency induction heating (100,000 cycles and up); and a comparison of induction heating with other methods of heat treating.

MATERIALS-HANDLING EQUIPMENT, a Modern Manual:

M. W. Potts. Pitman Publishing Corp., New York and Chicago; Sir Isaac Pitman, Toronto, 1946. 172 pp., illus., 8¼ x 5½ in., cloth, $2.50.

This book is devoted to defining, describing and presenting the application of a number of standard types of materials-handling equipment. Earth-moving and other equipment used primarily by contractors and specialized units for certain industries have been omitted. Types covered are dealt with under the following section headings: conveyors, elevators, hand-operated equipment, hoisting machinery, trackless carriers, tractors and trailers, and miscellaneous equipment with general applications.

PLASTICS MOLD ENGINEERING, the Fundamentals of Plastics Mold Design and Construction:

J. H. DuBois and W. I. Pribble. Chicago, American Technical Society; Toronto, General Publishing, 1946. 494 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $9.75 (in Canada).

The early chapters describe types of molds, tool-making equipment and methods, materials for mold making, and plastics product design. The succeeding chapters are devoted to detailed description of individual molds and specific molding processes. The book is profusely illustrated by sketches, photographs, and working drawings, and some forty pages of useful reference tables are provided.

MODERN PLASTICS:

By H. Barron. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 680 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $7.50.

The introduction discusses raw materials and the polymerization process. The succeeding parts deal respectively with: thermosetting resins and their plastics; cellulose plastics; vinyl plastics; other leading plastics, including casein; some important aspects of plastics, such as the use of high-frequency heating and physical testing methods. Processes and plastics are closely associated, as: molding and phenolics; injection molding and cellulose acetate; extrusion and polyvinyl chloride; fibers and nylon, etc.

NEW CITIES FOR OLD:

L. Justement. McGraw-Hill Book Co., New York and London, 1946. 232 pp., illus., diagrs., charts, tables, 10¼ x 7 in., cloth, $5.50.

Part I presents a study of urban growth and decay as a basis for city planning within the limitations of a system of private enterprise. It poses certain problems and suggests possible solutions. In Part II the city of Washington, D.C., is utilized as an example to demonstrate the kind of city planning put forth in this book. In Part III, with the political background as a frame of reference for urban reconstruction, the author outlines his conception of a workable, integrated solution of the problem discussed in Part I, including the financial and legal aspects.

PRINCIPLES and PRACTICE of HEAT TREATMENT:

By J. Winning. 2 ed. Emmott & Co., Ltd., Manchester and London, England, 1945. 108 pp., illus., diagrs., charts, tables, 7¼ x 4¾ in., paper, 3s.6d.

The first four chapters of this small volume deal with general principles, furnaces and equipment, casehardening, and hardening machines. The book devotes separate chapters to carbon and alloy steels, stainless and rustless steels, and non-ferrous alloys. Material on the inspection of heat treated parts is included, and there is a discussion of how to plan a heat treating program for any particular job.

RUBBER IN ENGINEERING:

Prepared under the direction of the Controller of Chemical Research of the Ministry of Supply and the Directors of Scientific Research of the Ministry of Aircraft Production and the Admiralty on the Basis of Research carried out by the Imperial Chemical Industries, Ltd. Chemical Publishing Co., Brooklyn, New York, 1946. 267 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $5.50.

Part I, describing the rubber-like state, and Part II, discussing the general properties of rubber, furnish engineers with a general survey of the information available on the theoretical aspects of the subject. Part III provides useful information on the compatibility and incompatibility of rubber properties in their relation to practical use, covers the bonding of rubber to metal, and discusses other aspects of rubber technology. Part IV deals at some length with the principles of the design of rubber engineering compounds for shock absorption, vibration insulation, etc.

WATER SUPPLY AND PURIFICATION:

W. A. Hardenbergh. 2 ed. International Textbook Co., Scranton, Pa., 1945. 488 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $4.50.

The theories underlying the collection, transportation, delivery and treatment of water are presented, including the determination of quantity of water available, pipe line calculations, design of distribution systems, and purification processes. Actual problems are used for illustrative purposes to bridge the gap between theory and practice. This second edition includes material concerning developments in water supply problems resulting from the War.

SIMPLIFIED PUNCH and DIE MAKING:

By J. Walker and C. C. Taylor. Macmillan Co., New York, Toronto, 1946. 235 pp., illus., diagrs., tables, 8½ x 5½ in., cloth, $5.50.

Each step in the design, construction and operation of dies and punches is clearly and fully explained in this book for the use of those without previous experience. All important types of dies and punches used today are covered, with detailed information on specifications, materials, methods, etc. There is a glossary of shop terms.

STATICALLY INDETERMINATE STRUCTURES:

By L. C. Maugh. John Wiley & Sons, New York; Chapman & Hall, London, 1946. 338 pp., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $5.00.

Following the classification and description of statically indeterminate structures, this book explains and illustrates methods of analysis of these structures with emphasis on methods of successive approximation. These methods are based on fundamental principles of structural mechanics that are applicable to the design of most frame structures. Special problems dealt with in the last chapter are frames with semi-rigid connections, the calculation of stresses in space frames, and shearing stresses in thin-walled closed sections.

(Continued on page 600)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

October 15th, 1946.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the November meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BENTALL—CHARLES, of Vancouver, B.C. Born at Felsted, England, June 16th, 1882. Educ.: Tech. School, Chelmsford; R.P.E., B.C.; 1908-12, structl. engr., J. Coughlan & Sons; 1912, (6 mos.), member firm Wilson, Lake & Bentall; with Dominion Construction Co., Ltd., Vancouver, as follows: 1912-14, engr., 1914 to date, genl. mgr., continuously engaged in design and constrn. of large structures.

References: E. A. Cleveland, T. Berry, G. W. Allan, W. O. Scott, J. N. Finlayson.

BURGESS—JOHN ALEXANDER, of Trail, B.C. Born at Edmonton, April 13th, 1923. Educ.: B.A.Sc., (Mech.), B.C., 1946; 1942-45, (summers), helper or operator with Consolidated Mining & Smelting Co., in foundry, electric shop, and metall. plants; dftsman, indicator cards on triple expansion steam engines, preliminary analyses, etc., West Coast Shipbuilders Ltd., Vancouver; and at present, jr. mech. engr., assistant to mtce. engr., Consolidated Mining & Smelting Co., Trail, B.C.

References: J. V. Rogers, S. C. Montgomery, E. Mason, A. C. Ridgers, A. H. W. Busby.

CREIGHTON—HUGH HERBERT LOWRY, of Ste. Therese, Que. Born at Mannville, Alta., June 19, 1918. Educ.: B.Sc., (Elect. Engrg.), Alberta, 1941; 1941-42, test engr., Canadian General Electric; 1942-45, elect. engr., Aluminum Co. of Canada; 1945 to date, elect. engr., A. D. Ross & Co., Ltd., Ste. Therese, Que.

References: A. D. Ross, J. W. Stafford, B. R. Perry, J. Morse, J. R. Auld, G. Kearney.

FUGLER—RONALD WILLIAM, of Shawinigan Falls, Que. Born at Toronto, Ont., Sept. 17th, 1919. Educ.: B.A.Sc., (Chem. Engrg.), Toronto, 1941; 1941-42, shift supvr., ammonia nitrate divn., 1942-43, synthetic ammon divn., Welland Chemical Works, Niagara Falls; 1943-46, Officer I/C Machine Shop, Canadian Armoured Troop Work Shop, responsible for mtce. & inspecn. artillery equipt., etc., R.C.E.M.E.; at present, mech. supvr. & mtce. engr., fabrication divn., Canadian Resins & Chemicals Ltd., Shawinigan Falls, Que.

References: C. R. Young.

HEATHERINGTON—KENNETH, of Grand'Mere, Que. Born at Newcastle-on-Tyne, England, Oct. 10th, 1919. Educ.: B.Sc., Sir George Williams Coll., 1945; 1938-41, dftsman, detail, dftg., checking, preparing bills of material, calculations in connection with constrn. elect. transmission lines, Aluminm Laboratories Ltd.; 1941-46, dftsman., (engrg. dept.), detail and arrangement drawings for reciprocating steam engines and boilers, etc., (marine dept.), worked on design and layout of piping systems on ships, steam, water, oil and sanitary piping, steam heating layouts and all piping in connection with pumps and other auxiliary equipt., selection and ordering of material, estimating and genl. engineering work, Canadian Vickers Ltd.; and at present, dftsman., plant and machinery, layouts, design and genl. engrg., Consolidated Paper Corporation Ltd., Grand'Mere, Que.

References: R. A. H. Hayes, J. E. Thicke, G. Agar, R. C. Flitton, V. Jepsen, G. R. Goring.

HERMANOWICZ—TADEUZE, of Sorel, Que. Born at Naklo-Kielce, Poland, March 27th, 1910; Metallurgical Engr., 1937, Mining Academy, (Metallurgical Faculty of the Univ. of Jagiello, Cracow, Poland), equivalent of degree from a recognized Canadian university; Member, Assn. Polish Engrs. in Canada, and educational qualifications guaranteed by the Assn.; 1937-39, asst. supt., heat-treating of all types steel goods, Baildon Steel Works, Upper Silisia; 1939-40, special assign., French Navy, to put in operation prod. of 220 m/m shells and alloy steels, Etab. National de la Mazine, Loire, France; 1940-42, directing own drawing office, geo. charts, tech. drawings, etc., Aix-les-Bains, Savoie, France; 1942 to date, chief metallurgist and director of labs, i/c melting dept. (carbon, alloy, tool steels and cast iron), heat treating dept., metall. control and inspecn. including patterns, labs. (physical testing, chemistry and metallography), Sorel Industries Limited, Sorel, Que.

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET, MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER for junior position in control department of large pulp and paper mill in Western Ontario. Paper experience preferred. Salary open. Apply to File No. 3593-V.

CHEMICAL ENGINEERS OR CHEMISTS for analytical work in the laboratory of an industrial firm in Central Ontario. Salary from $175. Veteran preferred. Apply to Fil.e No. 3642-V.

CHEMICAL ENGINEER, preferably with sales experience, for sales and service with an industrial firm in Central Ontario. Salary open. Apply to File No. 3642-V.

CHEMICAL ENGINEERS AND RESEARCH CHEMISTS with considerable experience required by an industrial organization in the St. Maurice Valley. Salary open. Apply to File No. 3644-V.

CIVIL

TWO CIVIL ENGINEERS are required to act as senior and junior structural designers respectively with a steel company in Southern Ontario. Apply to File No. 3389-V.

ELECTRICAL

ELECTRICAL ENGINEER with experience in the design of electrical circuits required by an industrial organization with headquarters in Montreal. Salary open. Apply to File No. 3644-V.

ELECTRICAL ENGINEER with knowledge of power apparatus, preferably bilingual, required for sales work with a manufacturer in the Montreal area. Salary open. Apply to File No. 3646-V.

ELECTRICAL ENGINEERS with at least five years experience, mostly in aircraft design, required for the design staff of an industrial organization in Montreal. Salary from $275. Apply to File No. 3650-V.

MECHANICAL

YOUNG MECHANICAL ENGINEER, recent graduate up, single, to be assistant maintenance engineer in a cement plant in South America. Salary about $250 with keep. Apply to File No. 3621-V.

MECHANICAL ENGINEERS to be design squad leaders on heavy machinery design required by a company in Central Ontario. Salary open. Apply to File No. 3623-V.

MECHANICAL ENGINEER recent graduate, required by an industrial firm in south western Quebec, for the design and erection of complex textile machinery. Salary open. Permanent position. Apply to File No. 3625-V.

MECHANICAL DRAUGHTSMAN with experience in power house layouts required by an engineering firm in Toronto. Salary open. Apply to File No. 3630-V.

MECHANICAL ENGINEER, bilingual, with shop or automotive experience, required for equipment maintenance by a manufacturer in the Montreal area. Salary open. Apply to File No. 3631-V.

JUNIOR MECHANICAL ENGINEER with construction or machine shop experience, required by a Montreal firm handling heavy construction equipment. Salary open. Apply to File No. 3635-V.

MECHANICAL ENGINEER with experience in machine design required by a firm in the Maritimes engaged in ship repair and conversion and the manufacture of marine and heating equipment. Salary open. Apply to File No. 3638-V.

MECHANICAL DRAUGHTSMEN, graduates preferred, with experience in shop and field erection, required for design of coal and oil fired heating and steam systems by an industrial firm in Montreal. Salary open. Apply to File No. 3647-V.

MECHANICAL ENGINEER with knowledge of machine tools, age about 35, required in Montreal for work in connection with purchase, design, re-conversion and sale of machinery. Salary $300-$400. Apply to File No. 3648-V.

MECHANICAL SALES ENGINEER for office position with a firm in Montreal area manufacturing tools and machines, preferably bilingual and over 30. Salary open. Apply to File No. 3649-V.

METALLURGICAL

RESEARCH METALLURGIST, with at least five years post graduate experience, preferably in the field of ferrous physical metallurgy, needed in Toronto area. Salary $275-$325. Apply to File No. 3640-V.

MISCELLANEOUS

DESIGN ENGINEER with considerable experience required by a pulp and paper firm in the St. Maurice Valley. Salary open. Apply to File No. 3573-V.

ASSISTANT PROFESSORS AND INSTRUCTORS required for the staff of a technical college in New York State. Salary open. Apply to File No. 3600-V.

GRADUATE ENGINEER, bilingual, required for senior position on the Montreal sales staff of a firm manufacturing and installing mechanical equipment in buildings of all types. Veteran preferred. Salary open. Apply to File No. 3622-V.

JUNIOR ELECTRICAL OR MECHANICAL ENGINEER required as assistant to purchasing agent of a Montreal engineering firm. Salary open. Apply to File No. 3624-V.

SALES AND SERVICE ENGINEER with considerable experience in sales and heavy mechanical equipment required by a sales organization on the West Coast. Salary open. Apply to File No. 3626-V.

SALES OR OFFICE MANAGER required by a firm manufacturing pumps and special equipment in Central Ontario. Salary open. Apply to File No. 3627-V.

SALES ENGINEER with knowledge of structures and heavy machinery, preferably bilingual with sales experience in Quebec, under 40, to take charge of Montreal office of a firm manufacturing cranes, hoists and other heavy mechanical equipment. Salary open. Apply to File No. 3628-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply to File No. 3628-V by letter with full details. Salary open.

SALES ENGINEER with heavy construction experience and thorough knowledge of Quebec market, preferably bilingual, car owner, required by manufacturer of technical products. Salary open. Apply to File No. 3629-V.

MECHANICAL OR CHEMICAL ENGINEER for sales and sales engineering of industrial oils and greases, preferably bilingual and with experience in the paper or textile industries, required by an oil company in Montreal. Considerable travelling. Salary from $250. Apply to File No. 3632-V.

QUALIFIED ENGINEER required to represent for sales purposes in Northern Ontario a company engaged in the supply of coal. Knowledge of territory essential. Salary open. Apply to File No. 3634-V.

SALES ENGINEER to call on Industrial and Municipal engineers and executives across Canada. Returned man, under 40 with knowledge of mill pipe layout practice preferred. Position with future in nationally known firm, headquarters Toronto. Salary and expenses. Apply to File No. 3636-V.

AERONAUTICAL OR MECHANICAL ENGINEER, recent graduate up, required as owner's representative on aircraft design and manufacture in the Toronto area. Salary open. Apply to File No. 3637-V.

JUNIOR ENGINEERS, CIVIL, ELECTRICAL OR MECHANICAL, recent graduates up, required for the design staff of a large industrial organization in Montreal. Salary from $175 according to experience. Apply to File No. 3644-V.

ENGINEERING DRAUGHTSMEN with survey experience for the lands department of a public utility with headquarters in Montreal. Salary open. Apply to File No. 3644-V.

EXPERIENCED INSTRUMENT MAN for field work required by an engineering company with headquarters in Montreal. Salary open. Apply to File No. 3644-V

CONSTRUCTION ENGINEER with experience in steel erection required as maintenance engineer for wireless stations in the Maritimes. Salary from $200. Apply to File No. 3645-V.

JUNIOR ENGINEERS, recent graduates up, required by an organization in Montreal, for the inspection of buildings for fire hazards, etc. Bilingual preferred. Salary about $200. Apply to File No. 3651-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER with some pulp and paper experience required for the technical department of a paper mill in Lake St. John. area. Apply to File No. 3470-V.

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada for mill control and pilot plant. Salary open. Apply to File No. 3549-V.

JUNIOR CHEMICAL ENGINEERS OR CHEMISTS, preferably bilingual, for various paper plants in Quebec. Salary from $200 according to experience. Apply to File No. 3555-V.

CHEMICAL ENGINEER required by an industrial organization with headquarters in Montreal as assistant to chief chemist and control supervisor in a pulp and paper plant. Initiative to deal with unexpected problems essential. Salary from $250 according to experience. Apply to File No. 3555-V.

CHEMICAL ENGINEER, recent graduate up, required by a petroleum refining company in Montreal for process and design work. Salary about $200. Apply to File No. 3575-V.

CHEMICAL ENGINEERS, age 22-35, recent graduates up, are required by a Montreal firm for development work, maintenance, design and construction in explosives field. Sales and technical service representation to paper and textile industries. Salaries according to qualifications. Apply to File No. 3588-V.

CHEMICAL ENGINEER, Ph.D. or M.Sc. Specialized in physical chemistry, required by industrial organization in Montreal area as member of organic research team. Salary open. Apply to File No. 3596-V.

CHEMICAL ENGINEERS, recent graduates up, required as shift supervisors by an industrial chemical plant in the Montreal area. Salary from $200. Apply to File No. 3605-V.

CHEMICAL ENGINEER, under 30, required for the patent department of a large industrial organization in Montreal. Salary from $200. Apply to File No. 3609-V

CIVIL

TWO CIVIL ENGINEERS, one experienced man to be in charge, the other to act as assistant, mostly for office work, are required for a building programme in Ontario, in connection with roads, trails, lookout towers, telephone line, buildings, etc. Preference to veterans. Salary up to $3,000 per year for senior and $2,000 per year for junior position. Apply to File No. 3394-V.

CIVIL ENGINEER recent graduate, must be bilingual, required for work on general design, survey and construction of transmission lines in the Montreal area. Apply to File No. 3446-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position, salary from $200 up according to experience. Apply File No 3504-V.

CIVIL ENGINEER, recent graduate, required by a firm of consulting engineers in Montreal, to assist Engineer in charge of field work in Ont Salary $175 up. Apply File No. 3518-V

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS with experience as structural designers and draughtsmen are required by an engineering firm in Montreal. Salary from $300—$400 according to experience. Apply File No. 3520-V.

CIVIL ENGINEER to be superintendent of construction with a contractor in Montreal. Salary according to qualifications. Apply to File No. 3558-V.

CIVIL ENGINEER, recent graduate up, to be assistant to town engineer of a town in the Montreal area. Permanent position. Salary from $175 up. Apply to File No. 3569-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER with considerable building experience, as construction superintendent with a firm of building contractors in Central Ontario. Salary open. Apply to File No. 3582-V.

CIVIL ENGINEER with 3 or more years' experience on design of industrial buildings, equipment, supports and foundation work, is required by a Montreal firm for structural design work in steel, timber and reinforced concrete. Salary $200 up. Apply to File No. 3588-V.

CIVIL ENGINEER with construction experience required as plant engineer by a textile firm with headquarters in Montreal. Salary open. Apply to File No. 3615-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters. English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to File No. 3415-V.

ELECTRICAL ENGINEERS, age 30 to 40. 5 to 10 years experience, for estimating design and general engineering for large public utility in Toronto area. Apply to File No. 3429-V

ELECTRICAL DRAUGHTSMEN with experience in substation design, not necessary graduate engineers, required by a public utility in the Montreal area. Salary $200 to $225. Apply to File No. 3446-V.

ELECTRICAL DRAUGHTSMAN with considerable experience in industrial light, heat and power layouts is required by a consulting engineer in Montreal. Salary from $200 according to experience. Apply File No. 3528-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged, in the production of telephone, etc., equipment. Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER with power plant experience, must be bilingual, to take complete charge of power plants and distribution system for a N.B. town. Salary according to experience. Apply to File No. 3561-V.

ELECTRICAL ENGINEER for a junior position in the design department of an industrial concern in the Montreal area. Salary open. Apply to File No. 3574-V.

ELECTRICAL ENGINEER DRAUGHTSMEN, preferably with pulp and paper experience, required by a paper company in Montreal. Salary open. Apply to File No. 3610-V.

ELECTRICAL ENGINEER for sales engineering, with previous experience, age 25-40, required by a Montreal firm handling pumps, valves, automatic controls, etc. Salary according to experience. Apply to File No. 3614-V.

MECHANICAL

MECHANICAL ENGINEER, graduate with 4 or 5 years' experience in heating and ventilating layouts is wanted by a consulting engineer in Montreal. Apply File No. 3243-V.

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to File No. 3393-V.

JUNIOR MECHANICAL ENGINEER with some experience on mechanical design. Preference to ex-service men. Salary from $200 to $250. Location Quebec City Apply to File No. 3401-V.

STEAM PLANT SUPERVISOR—Manufacturer with several plants in Ontario and Quebec requires an active man with technical training and field experience in efficient steam plant operation. Apply to File No. 3406-V.

MECHANICAL ENGINEER DRAUGHTSMAN with two or three years experience, is required for work with a paper company in the province of Quebec. Salary $250 to $275 a month. Apply to File No. 3424-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with considerable experience in plumbing, heating, ventilating, age 30-45, required for a permanent job as a designer with a Montreal architectural firm. Salary from $300. Apply to File No. 3473-V.

MECHANICAL ENGINEER, recent graduate, for technical service and plant operation with a manufacturer in the Montreal area. Successful candidates will have two-year training course in U.S. Apply to File No. 3476-V.

MECHANICAL ENGINEERS from recent graduates up required by a structural steel company in the Montreal area. Salary according to qualifications. Apply to File No. 3485-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the reconversion of a paper mill in Western Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MECHANICAL ENGINEER with considerable industrial experience is required for the staff of a firm of consulting engineers in Montreal. Salary about $250 Apply File No. 3525-V.

MECHANICAL DRAUGHTSMAN with over five years experience in piping layout and similar work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

MECHANICAL ENGINEER, recent graduate, for the engineering staff of a pulp manufacturer in Eastern Quebec. Apply to File No. 3547-V.

MECHANICAL ENGINEERS with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER with at least five years' industrial experience, knowledge of plant layout, equipment design and cost estimating and preferably experience in chemical industry. Salary $275-$325. Apply to File No. 3553-V.

MECHANICAL ENGINEER with considerable experience in heating and ventilation, etc., required by a firm of consulting engineers in Montreal. Salary open Apply to File No. 3565-V.

MECHANICAL ENGINEERS with experience in heating and ventilating or the pulp and paper industry or with general mechanical layout and design work are required by a firm of consulting engineers in Montreal. Salary from $250-$350 according to experience. Apply to File No. 3568-V.

MECHANICAL ENGINEER, recent graduate, for junior position in the design department of a firm in Central Ontario making special heavy duty mobile equipment. Apply to File No. 3572-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEER with some electrical experience for the design department of an industrial concern in the Montreal area. Salary open. Apply to File No. 3574-V.

MECHANICAL ENGINEER with paper mill or mining experience required as assistant mechanical superintendent and understudy to mechanical superintendent in a paper mill in the St. Maurice Valley. Salary from $300 according to experience. Apply to File No. 3581-V.

MECHANICAL ENGINEERING DRAUGHTSMAN, fully experienced in kraft and sulphite mills processes and modern design, required by a pulp and paper firm on the West Coast. Salary open. Apply to File No. 3586-V.

MECHANICAL ENGINEER, preferably with mining experience, age 25-35, required by a manufacturer in Montreal to do estimating or design work on mining equipment and assist in sales. Salary according to experience. Apply to File No. 3589-V.

MECHANICAL ENGINEER as production engineer for a sea food canning company in Eastern Canada. Duties would include plant design, production improvement and plant maintenance. Bilingual and experienced man preferred. Salary from $200-$300. according to qualifications. Apply to File No. 3592-V.

MECHANICAL ENGINEER with extensive knowledge of machine shop practice and general industrial experience is required by a specialized industrial plant in the Montreal area. Veteran preferred. Salary according to experience. Apply to File No. 3595-V.

MECHANICAL ENGINEER with five to ten years' industrial experience and familiar with the layout and construction of chemical plants, required by a manufacturer in the Montreal area for plant design and construction. Salary from $300. Apply to File No. 3605-V.

MECHANICAL ENGINEER with experience in the automotive business and the maintenance of all types of internal combustion engines required by an oil company in the Montreal area. Salary open. Apply to File No. 3608-V.

MECHANICAL ENGINEER with at least five years industrial experience required by a textile firm with headquarters in Montreal. Salary open. Apply to File No. 3615-V.

COMBUSTION ENGINEER, MECHANICAL, preferably with five years industrial experience, required by a textile firm with headquarters in Montreal. Salary from $300. Apply to File No. 3615-V.

MECHANICAL ENGINEER with at least five years' experience of aluminum processing, plant design and operation, etc., required for Aluminum production organization in Australia. Limited contract. Salary open. Apply to File No. 3620-V

METALLURGICAL

METALLURGIST, age 25-30, veteran, experience in Metallurgical Laboratory or Mine Assay office and Mining Mill practice decided advantage, required by a Montreal firm to be trained for Sales Representative. Salary depending on experience. Apply to File No. 3588-V.

MISCELLANEOUS

STEAM PLANT SUPERINTENDENT with extensive experience is required to superintend the steam plant of a pulp and paper mill in Western Ontario. Salary would be $300 to $350. Apply to File No. 3227-V.

TWO INDUSTRIAL ENGINEERS, preferably with engineering background in mechanical, electrical or chemical engineering, age 35 up, bilingual, with some practical experience, is required by a company in Montreal engaged in industrial engineering, consulting work, plant layout, controls, inventories, production and admin. controls. Apply to File No. 3307-V.

CHIEF DRAUGHTSMAN, experienced in all types of structural work, required to take charge of a draughting office for a central Ontario city. Apply to File No. 3428-V giving all particulars including salary expected.

CHIEF DRAUGHTSMAN to take charge ofengineering department, draughting room and estimating for machinery manufacture in Sherbrooke. Apply to File No. 3430-V.

ENGINEERING DRAUGHTSMAN required by an industrial concern in Three Rivers for all round employment in a permanent position. Apply to File No. No.3443-V

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

ELECTRICAL OR MECHANICAL ENGINEERS interested in transportation, with experience in the transportation field or machine shop practice or automotive services, maintenance and operation. Salary according to qualifications. Apply to File No. 3456-V.

MECHANICAL OR ELECTRICAL ENGINEER under 35, with at least 5 years practical experience, is required for a responsible position in the engineering department of an industrial firm in Toronto. Apply to File No. 3472-V.

STRUCTURAL STEEL DESIGNERS AND DETAILERS required by a construction company in Montreal. Salary open. Apply to File No. 3482-V.

CIVIL OR MECHANICAL ENGINEER with experience in construction required by a Montreal firm to estimate value of work done and to inspect during construction concrete and steel bldgs. Salary open. Apply to File No. 3486-V.

CHEMICAL OR MECHANICAL ENGINEER with construction experience in the chemical field, a knowledge of hydrocarbons and at least five years experience since graduation is required by a chemical firm in Western Ontario. Salary from $250. Apply to File No. 3502-V.

RESIDENT ENGINEER with considerable construction experience and bilingual is required by a public utility for employment on the upper Ottawa River. Salary from $350. Apply to File No .3505-V.

PLANT ENGINEER with pulp and paper experience for development, construction and maintenance work with a paper mill in the Lake St. John area. Salary open. House available. Apply to File No. 3507-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS with experience in mechanical and chemical process layouts are required by an engineering firm in Montreal. Salary from $300-400 according to experience. Apply to File No. 3520-V.

MECHANICAL OR MINING ENGINEER, age 30-40 with experience in industrial engineering, required by a large mining and processing firm for methods studies of equipment, labour and costs. Salary according to qualificatons. Apply to File No. 3524-V.

DESIGN ENGINEER with several years experience in hydro-electric work is required by a firm of consulting engineers in Southern Ontario. Apply to File No. 3540-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

INDUSTRIAL ENGINEER, under 40, with not less than 5 years' experience in industrial methods engineering, required by a paper company in British Columbia. Salary open. Apply to File No. 3550-V.

CIVIL OR MECHANICAL ENGINEERS, preferably with pulp and paper experience, required for engineering and operating staff of a large Ontario corporation. Salary according to qualifications. Apply to File No. 3554-V.

CHEMICAL OR MECHANICAL ENGINEERS, age about 30, with at least five years' experience in the paper industry, required by an Ontario Company to train for executive positions. Salary open. Apply to File No. 3554-V.

CIVIL AND MECHANICAL ENGINEER, capable of detail work on compressor stations, piping layouts, surveying, etc., wanted by a gas producing and distributing utility in Southwestern Ontario. Preference to Service personnel. Good future for right man. Apply to File No. 3562-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

CIVIL OR MECHANICAL ENGINEER with construction experience required by an Ontario firm manufacturing and installing building specialties for industrial plants. Salary open. Apply to File No. 3567-V.

SALES ENGINEER with experience to organize the sales and service or marine engines in the Prov. of Quebec. Must be bilingual. Headquarters Montreal. Salary $250 to start. Apply to File No. 3576-V.

CIVIL AND MECHANICAL ENGINEERS AND DRAUGHTSMEN, preferably experienced in building design and plant layout, required for a pulp and paper mill in Southern Ontario. Salary open. Apply to File No. 3578-V.

ELECTRICAL OR MECHANICAL ENGINEERS, recent graduates, required for design work in the hydraulic side by a manufacturer in the Montreal area. Apply to File No. 3579-V.

MECHANICAL AND ELECTRICAL DRAUGHTSMEN required by a Montreal firm. Must have working knowledge of equipment layout, architectural, piping and design. Salary from $200 up. Apply to File No. 3588-V.

MECHANICAL AND ELECTRICAL ENGINEERS, from recent graduates up, are required for mechanical and electrical maintenance, also design phases of project engineering work, by a Montreal firm. Salaries according to qualifications. Apply to File No. 3588-V.

GRADUATE ENGINEERS required as Development Engineer and Assistant to Sales Manager by a Montreal firm. Industrial, also sales and administrative experience necessary. Salary $200 up according to experience. Apply to File No. 3588-V.

INDUSTRIAL ENGINEER, 5 years' experience industrial manufacturing or process work, required by a Montreal firm for study and co-ordination of plant work. Salary $295 up according to qualifications. Apply to File No. 3588-V.

CHIEF DRAUGHTSMAN, under 35, 5-12 years' experience in drawing office, Including year or more as squad boss, required by a Montreal firm. Salary $225 up. Apply to File No. 3588-V.

ELECTRICAL, MECHANICAL OR COMBUSTION ENGINEER required by an industrial firm in Montreal for estimating and supervising the installation of heating plants. Age over 35. Salary from $300 according to experience. Apply to File No. 3602-V.

DESIGN ENGINEER, capable of assuming responsibilities of designing structures and equipment layouts of steam plants, hydro-electric developments, etc., required by an industrial corporation in Montreal. Salary from $350 according to experience. Apply to File No. 3603-V.

HYDRAULIC ENGINEER, familiar with hydraulic machinery design, installation, stream functions and runoff computations, etc., required by an industrial corporation in Montreal. Salary from $300 according to experience. Apply to File No. 3603-V.

MECHANICAL OR ELECTRICAL ENGINEER with considerable construction experience required as executive assistant to chief engineer of general contracting firm with headquarters in Montreal. Salary from $300 according to experience. Apply to File No. 3604-V.

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

RESIDENT ENGINEER with considerable construction experience, preferably bilingual, to take charge of the construction of a dam on the Upper Ottawa River. Salary from $300. Apply to File No. 3613-V.

CHIEF DRAUGHTSMAN with experience in design and controlling a design staff required for both structural and equipment work by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL OR MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

MACHINE DESIGNER with considerable experience required by a company in Southern Ontario. Experience on the designing of steel mill equipment or heavy machinery desirable but not essential. Salary according to qualifications. Apply to File No. 3617-V.

JUNIOR ELECTRICAL OR MECHANICAL ENGINEER, with transmission line experience, required for the engineering department of an industrial firm in Montreal. Salary from $225. Apply to File No. 3618-V.

SALES ENGINEERS

Textile Machinery

Superior line. Must have wide engineering experience. Good salary. Reply in detail.

Construction and Allied Equipment

Good earnings and opportunity for an aggressive man. Wide engineering experience necessary. Reply in detail.

•

Apply to File No. 3639-V.

Situations Wanted

CHEMICAL ENGINEER, graduate in 1939, Jr.E.I.C., veteran, considerable experience in development and process control and quality control as well as some experience in production work, desires change. Employment since graduation, except for time in the services, has been with a large chemical manufacturing company. Montreal or Toronto areas preferred. Apply to File No. 798-W.

ELECTRICAL ENGINEER, Jr.E.I.C., age 26, B.Sc. (Man.) '42, E.M.E. Canadian Army for 4 years, in charge of workshop units engaged in the maintenance and repair of precision optical and mechanical instruments. Position of responsibility desired in research, power, traction or mechanical line. Ontario or western area preferred. Apply to File No. 1537-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng., age 28. Five years experience including plant layout and design; plant engineering and works and building maintenance; maintenance of trucks, tractors, cranes and small ships. Aircraft project and service engineer, design of modifications and failure investigation, power plant, engine, propeller, etc. Good organizer and ability to handle men. Engineering Officer, Royal Canadian Navy. Desires sales or plant engineering position in Montreal area. Available two weeks notice. Apply to File No. 1658-W.

SALES ENGINEER, Jr. E.I.C., P. Eng., Que., age 32, B. Eng. McGill in Mechanical, experience in sales, design and plant engineering. Married. Bilingual. Location immaterial. Veteran. Available on short notice. Apply to File No. 1692-W.

GRADUATE ENGINEER, B.Sc. (Civil), M.E.I.C., services available. Thorough knowledge of building construction and fifteen years' experience in sales engineering and promotional work in connection with building products; also considerable practical experience in construction work as estimator and in field work. Recently resident engineer on large industrial project. Good connections with architectural and contracting firms, particularly in Toronto area. Apply to File No 2440-W.

CHIEF DRAUGHTSMAN

Registered graduate engineer with five years draughting room and related engineering office experience, preferably in pulp and paper or process industries.

•

ASSISTANT ENGINEER

Registered graduate engineer experienced on estimates and specifications for industrial work.

•

MECHANICAL *and* STRUCTURAL DESIGNERS *and* DRAUGHTSMAN

Required at once for an operating pulp and paper mill in Port Arthur district.

ALL SALARIES OPEN

Applicants should include in first letter a summary of business experience and suitable references. Interviews will be arranged where possible. Apply to File No. 3653-V.

BRITISH COLUMBIA CIVIL SERVICE

WANTED

By Open Competition

COMBUSTION ENGINEER

Salary: $3,000 rising to $3,600 per annum.

Duties: To design and supervise heating and ventilation installations, etc., and boiler plants in connection with public buildings, under the direction of the Chief Architect.

Qualifications: Must be a member of the Association of Professional Engineers of British Columbia as a Mechanical Engineer specializing particularly in heating, ventilation and refrigeration, with a good record of successful experience.

Applicants must be British subjects, under 45 years of age. Preference is given ex-members of His Majesty's Forces.

Applications will be received immediately by the Chairman, Civil Service Commission, Parliament Buildings, Victoria, B.C.

ELECTRICAL ENGINEER, S.E.I.C., age 27, married, class of 1946, formerly a "Flight Engineer" in R.C.A.F., has approximately one and a half years' experience in mine and smelter electrical work. Position desired more along Mechanical line than Electrical. Will go anywhere, anytime. Apply to File No. 2631-W.

ELECTRICAL ENGINEER, Jr.E.I.C., graduate McGill University 1944, age 25, single. Experience in industrial, radio communications and as Radar officer in R.C.E.M.E. Interested in a position leading to sales engineering or industrial management. Services available on one month notice or less. Apply to File No. 2649-W.

MECHANICAL ENGINEER, S.E.I.C., B.Sc., Queen's 1945, age 24, married, veteran, one year experience in design of heavy machinery and draughting, course in Time and Motion Study at McGill. Interested in Industrial, Production or Maintenance Engineering. Prefer Montreal area or Ontario. Available on one-month notice. Apply to File No. 2715-W.

GRADUATE CHEMICAL ENGINEER, S.E.I.C., B.A.Sc., Toronto, 1946, available immediately. Interested in position with Consultant or in Production. Location preference: Hamilton, Ont. Apply to File No. 2721-W.

GRADUATE ELECTRICAL, TORONTO, 1932. M.E.I.C., P. Eng. Seeks responsible Administrative or Industrial Engineering position with Manufacturer, Supplier or User of Electrical Equipment and or Electrical or General Management, Engineering Services, preferably outside the Province of Quebec. Fourteen years' experience in Radio and Aviation Industries, including: four years radio development and manufacture, one year supervision of instruction radio trade school, six years supervision of installation, operation and maintenance of radio aids to air navigation, one year supervision of airline communications, two years equipment and sales engineering, aeronautical and railroad radio equipment. This included executive and administrative responsibility. Apply to File No. 2725-W.

GRADUATE FOREST ENGINEER, Jr. E.I.C., single, age 28, with six years' bush experience, in timber, improvement and operational surveys, operational planning and layout, construction and supervision, requires position as assistant logging superintendent or assistant logging engineer. Available immediately for service anywhere in Canada or British possessions. Details of experience and references furnished on request. Apply to File No. 2726-W.

PLANT ENGINEER, B.Eng., M.E.I.C., R.P.E. (Ont.), age 35, married, with 11 years' experience in design, construction and maintenance of electrical and mechanical installations and buildings. Aggressive, resourceful and co-operative Successful record in responsible supervisory position. Apply to File No. 2728-W.

COMMUNICATIONS ENGINEER. Engineering Physics (Hons.), Jr.E.I.C., Assoc. I.R.E., R.P.E. Ont., F.B.I.S., age 26. Summer employment with telephone manufacturer, Ontario Hydro, and as radio instructor. Three years with the Royal Navy as Radar Officer in complete charge of maintenance, installation and operation of radar equipment on board. One year field engineering with commercial FM radio equipment. Seeks position with opportunity for original work in electronic and allied fields. Available beginning 1947. Apply to File No. 2779-W.

CIVIL ENGINEER, age 39, M.E.I.C., R.P.E., etc., used to responsibility and control in Consultative, Public Authority and Governmental fields, seeks worthwhile professional or commercial opportunity in Southern Ontario. Apply to File No. 2790-W.

MECHANICAL ENGINEER, Sask., '46, with summer experience in highway surveying, time checking, a steel rolling mill, ship wiring, job planning and cost estimating, desires work, preferably in Vancouver area. Would prefer work including time and motion studies, cost control and estimating, and job evaluation. Available on short notice. Apply to File No. 2795-W.

LIBRARY NOTES (*Continued from page 595*)

Though not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

ENCYCLOPEDIA OF CHEMICAL REACTIONS, Vol. 1:

Compiled and edited by C. A. Jacobson. Reinhold Publishing Corp., New York, 1946. 804 pp., 9¼ x 6 in., cloth, $10.00.

Volume I of this important new chemical reference series presents over 3,000 entries giving reactions involving aluminum, antimony, arsenic, barium, beryllium, bismuth, boron and bromine. The standardized form of entry has the formula of the reactant at the top, the symbols or fomulas of the reagents, a descriptive paragraph of the conditions governing the reaction, one or more balanced equations expressing the progress of the reaction, and a reference to the original source of the information. Two sets of indexes list alphabetically all reagents used and all compounds produced.

ROLL NECK BEARINGS; Part I, Design, Construction and Operation:

By L. R. Underwood. Iron and Steel Industrial Research Council, London, 1943. 220 pp., illus., diagrs., charts, tables, 9¾ x 6 in., cloth, 10s. 6d.

This report, which was prepared for the Rolling Mill Research Sub-Committee and is published with the approval of the Iron and Steel Industrial Research Council of Great Britain, embodies the results of a study of the literature, of discussions with manufacturers of various types of roll neck bearings, and with some experiences of users. The types of bearings in use are surveyed, and the economic and technical factors that govern the selection for a given application are reviewed. The theory of lubrication as applied to these bearings, and bearing metals are considered. Later chapters deal with the design, construction, installation and operation of plain, synthetic resin, fluid film, roller and needle bearings. A useful bibliography is included.

THE ENGINEERING JOURNAL

VOLUME XXIX, No. 11 NOVEMBER, 1946

THE ENGINEERING INSTITUTE OF CANADA

LIST OF MEMBERS, 1946

Foreword

FOLLOWING the practice already established, and in order to conserve paper, the 1946 list of members of the Institute is published herewith as part of a regular issue of *The Engineering Journal*, in the place usually occupied by technical articles. The scarcity of paper has also made it necessary to depart from the usual standards, and print the list on whatever stock was available. The publication of a list of members is necessary for the conduct of the business of the Institute, and it is hoped that, in spite of its present physical characteristics, it may also prove useful and informative to the membership at large.

The names are listed both alphabetically and geographically. In the alphabetical list, the name is followed by the position held and business connection whenever available, the mailing address where it differs from the business address, and the year of election or transfer to the various grades of membership.

The abbreviations for the membership classifications are as follows:

Hon. M.—Honorary Member
M.—Member
A.M.—Associate Member (this classification was abandoned in 1940, when all Associate Members were transferred automatically to the grade of Member)
Jr.—Junior
S.—Student
Affil.—Affiliate

The geographical list which appears at the end contains the names of all resident members shown under the branch to which they belong. The non-residents are listed under the name of each country. In both cases, the classification is subdivided into localities and grades of membership.

The addresses given are, in most cases, those on record on September 15, 1946. Later returns, however, were incorporated wherever possible without causing delay and excessive increase in publication costs. Special attention was given to the listing of members being released from the armed forces, but up-to-date information regarding such members has not been received in many cases.

The alphabetical index is preceded by a list of officers and members of Council since the establishment of the Institute, showing the years in which office has been held. Honorary members are also listed separately at the beginning, in addition to being shown in the alphabetical and geographical lists.

Restrictions on Use of List

This list is issued for the personal use of members of The Engineering Institute of Canada in connection with Institute and professional affairs. Each member is requested not to permit his copy to be used as a basis for circularization or for other purposes not in the interest of the membership of the Institute.

LIST OF OFFICERS AND MEMBERS OF COUNCIL

Since the establishment of the Institute, showing the years during which office has been held.

NOTE: Names of deceased officers shown in light-face type.

ALPHABETICAL LIST OF MEMBERS

CORRECTED TO SEPTEMBER 15th, 1946

A

Abbott, Arthur C. Elec. Engr., Commercial & Distribution Dept., Shawinigan Water & Power Co., P.O. Box 6072, Montreal. (S.1923. A.M 1931. M.1940)

Abbott, Charles A. Little Priory, Shorne, Nr. Gravesend, England. (A.M.1903. M.1940)

Abbott, Harold F. Asst. Plant Supt., Beauharnois Light, Heat & Power Co., P.O. Box 100, Beauharnois, Que. (S.1926. A.M.1936. M.1940)

Abbott, W. H. Associated Textiles of Canada, Louiseville, Que. For mail: 1805 St. Luke St., Montreal. (A.M.1920. M.1940)

Abel, John K. 294 Overdale St., Winnipeg, Man. (S.1946)

Abell, John D. Mech. Engr., International Harvester Co. of Can. Ltd., Hamilton. For mail: 84 Proctor Blvd., Hamilton, Ont. (S.1940. Jr.1946)

Abells, H. B. Jr. Research Engr., National Research Council, Sussex St., Ottawa. (S.1944)

Aboud, Samuel J. Supervisor, Gauge Design & Dimensions Control, Electronics Division, Nortern Electric Co. Ltd., Montreal. For mail: 4940 Coronet Ave., Montreal 26. (M.1945)

Abraham, Earl M. Asst. on Geol. Survey, Dept of Mines of Ontario, Box 373, Larder Lake, Ont. For mail: Fraser House, Cobalt, Ont. (S.1944. Jr.1946)

Abramson, I. A. Survey Engr., Pioneer Timber Co. Ltd., Port McNeill, B.C. (Jr.1931)

Acheson, H. R. M. Plant Engr., Gaspesia Sulphite Co. Ltd., Chandler, Que. For mail: P.O. Box 160, Chandler, Que. (S.1926. Jr 1934. A.M.1939. M.1940)

Acker, S. E. 251 York St., Fredericton, N.B. (S.1943)

Ackerman, Paul 4584 Hampton Ave., Montreal 28. (A.M.1921. M.1940)

Ackhurst, W. H. Industrial Applications Engr., Canadian General Electric Co. Ltd., 214 King St, Toronto 15. (S.1938. Jr.1946)

Acres, H. D. Engrg. Dept., E. B. Eddy Co. Ltd., Ottawa, Ont. For mail: R.R. No. 1, Britannia Bay, Ont. (M.1944)

Adam, James Civil Engr. and Architect, 14 Metcalfe St., Ottawa, Ont. For mail: 263 MacLaren St, Ottawa. (A.M.1911. M.1940)

Adams, E. C. Design Engr., Defence Industries Ltd., 625 Dorchester St. W., Montreal. (M.1945)

Adams, G. C. Jr. Engr., Montreal Engineering Co. Ltd., 244 St. James St. W., Montreal (S.1943)

Adams, G. D. Metal Inspector, Imperial Oil Co. Ltd., Montreal. For mail, 5715 Sherbrooke St. W., Montreal. (S.1944)

Adams, G. R. Field Engr., Foundation Co. of Ontario, Marathon, Ont. (S.1925. A.M.1934. M.1940)

Adams, Jack Lieut., No. 6 Coy, R.C.E.M.E., Officers' Mess, Halifax, N.S. (S.1943)

Adams, J. D. Lieut., R.C.E., 5960 Monkland Ave., Montreal. (S.1939. Jr.1941)

Adams, J. L. Dftsmn. Design Office, Dominion Bridge Co., Vancouver. For mail: 1391 West 33rd Ave., Vancouver, B.C. (S.1940. Jr.1946)

Adams, Philip E. Chief Engr., Canadian Bridge Co. Ltd., Walkerville, Ont. (M.1927)

Adams, W. Douglas Piling Engr., Algoma Steel Corp. Ltd., Sault Ste. Marie, Ont. For mail: 144 Leo Ave., Sault Ste. Marie, Ont. (S.1908. Jr.1912. A.M.1922. M.1936)

Adamson, W. B. 215 Cummings St., Fort William, Ont. (S.1937. Jr.1946)

Addie, George K. Consulting Engr. & Land Surveyor, 148 St. Cyrille St., Quebec. (S.1887. A.M 1898. M.1935)

Addison, J. H. Tropical Oil Co., Apartados Nacional No. 335, Bogota, Colombia, South America. (S.1932. Jr.1935. M.1940)

Adlam, A.E. Chief Dftsmn (Structural), Rapid Transit, Toronto Transportation Commission, Toronto. For mail: 173 Sunnyside Ave., Toronto. (Jr 1940)

Adlington, W. E. Bennett (Hyde) Ltd., Boston Mills, Hyde, Cheshire, England. (Jr.1928)

Aeberli, J. Adolf Engr., Hydro-Electric Power Commission, Toronto. For mail: 257 Kingswood Road, Toronto. (M.1921)

Affleck, Garnet Dist Engr., Dept. of Public Works of Manitoba, Winnipeg. For mail: 674 Fisher St., Winnipeg, Man. (S.1909. Jr.1912. A.M.1920. M.1940)

Agar, George Exec. Engr., Canadian Vickers Ltd., Montreal. For mail: 64 Nelson St., Montreal West 28. (A.M.1924. M.1940)

Agnew, Ellis A. Vice-Pres, Livingston Stoker Co. Ltd., Hamilton. For mail: 117 Charlton Ave. W., Hamilton, Ont. (M.1941)

Agnew, T. Charles Chief Engr., Minneapolis-Honeywell Regulator Co., Toronto 12. For mail: 52 Lyngrove Ave., Toronto 9. (S.1928. A M.1936. M.1940)

Ahearn, Wm. J. Sales Engr., Superheater Co. Ltd. For mail: 538 MacLaren St., Ottawa. (S.1935. Jr.1940)

Ahern, A. W. Mgr., Northeastern Paper Products Ltd., 10 Blvd. des Capucins, Quebec. (S 1920. A.M.1926. M.1940)

Ahern, P. C. Maritime Engineering Consultants, 75 Upper Water St., Halifax. For mail: P.O. Box 981, Halifax, N.S. (M.1946)

Ain, Joseph 227 Villeneuve St. W., Montreal. (Jr.1941)

Ainlay, A. Radio Design Dept., Canadian Westinghouse Co. Ltd., Hamilton, Ont. For mail: 153 John St. South, Hamilton, Ont. (Jr.1944)

Ainsworth, Vivian Arthur Divn. Supt., Maritime Electric Co. Ltd., 139 Grafton St., Charlottetown, P.E.I. (M.1942)

Aird, André co-owner, Modern Engrg. Industries & Laurentide Engrg. Industries Ltd., 7032-7034 Côte-des-Neiges, Montreal. (S.1936. Jr.1942)

Aitken, J. A. Divn. Engr., (Nfld.) Imperial Oil Ltd., 228 Water St., St. John's, Nfld. (M.1943)

Aitkens, J. C. Designing Engr., Ford Motor Co. of Canada Ltd., Windsor. For mail: 769 Hall Ave., Windsor, Ont. (S.1928. Jr.1934. A.M.1937. M.1940)
