PERMANENTLY FROZEN GROUND AND FOUNDATION DESIGN

Paper presented before the Edmonton Branch of The Engineering Institute of Canada on March 13th, 1945

SUMMARY—Part I of this paper deals with the theory of frost action in soils and presents results of tests recently run on samples of permanently frozen ground from Alaska and the Yukon area of Northern Canada. Part II deals with problems encountered with the foundations of structures and aircraft runways in the area of permanently frozen ground in these northern regions.

Part I

R. M. HARDY, M.E.I.C.

Associate Professor of Civil Engineering, University of Alberta, Edmonton

Permanently frozen ground is ground that is not thawed out by seasonal changes in temperature. The word "permafrost" is coming into general usage in the literature to mean permanently frozen ground, and so will be used for the remainder of this paper. A layer of ground near the surface may be subject to thawing and refreezing due to seasonal changes in temperature. This is called the "active layer".

Permafrost occurs quite generally on this continent where the mean annual temperature is less than about 30°F. Figure 1 (an adaptation from a map prepared by the U.S. Geological Survey) shows the areas in North America where permafrost may occur. It has been estimated that about one-fifth of the land surface of the world is underlaid by permafrost. Its thickness varies from a few feet to as much as 1,200 ft. It may also occur in bands, that is, there may be alternating layers of frozen and unfrozen ground. Occasionally it is also found in a columnar structure.

The great mass of the permafrost is a relic of the last ice age, that is, of the Pleistocene age, which started perhaps a million years ago. However permafrost can be readily caused to form locally in areas where it does not ordinarily occur. For example, there is a record of a depth of 28 ft. of earth above bed rock becoming permanently frozen in an area where the mean annual temperature was above freezing. This occurred under a pile of boulders accumulated during mining operations. Another case is known of a depth of 25 ft. of permafrost forming under a building approximately in the latitude of Edmonton. This occurred under a cold storage room in the basement of the structure.

Theory of Frost Action

For soil to freeze implies that there be water in the voids between the soil particles. In freezing this water turns to ice. In sandy soils with little or no content of silt or clay material, the water in the voids simply turns to ice on freezing. The only change in volume of such a soil mass on freezing or thawing is that resulting from the change in state of the water in the voids. It will, of course, expand on freezing and contract on thawing. The volume change accompanying this change of state for water is 9 per cent. For a saturated sand it will amount to about 5 per cent of the volume of frozen soil. However, for soils with a silt or clay content, a different phenomenon takes place during freezing. Ice lenses may grow in the material. These consist of horizontal layers of solid ice varying in thickness from hair lines to a foot or more, and in length from about an inch to many feet. They are usually interspersed at quite regular intervals throughout the mass of the frozen soil. Under favourable conditions of freezing, the growth of ice lenses may produce an increase in volume of as much as 200 per cent in the frozen soil. This increase will produce a corresponding "heave" of any structure, highway or runway resting on the material. Moreover, such frozen soil on thawing has a moisture content greater than it had before freezing by the amount of water in the ice lenses. Consequently, while the material may have been reasonably stable before freezing, after thawing, it may be just so much soft muck, quite incapable of supporting any type of building foundation, or any kind of highway or runway pavement, including concrete.

Frost action in soils was made the subject of extensive researches in Sweden from 1925-1935. On this continent Dr. Stephen Taber①, a geologist at the University of North Carolina, conducted the pioneer research on the mechanics of frost action in an "open" system. Benklemen and Olmstead②, of the Michigan State Highway Department, have presented an alternative hypothesis applying to conditions with a fluctuating frost line where the surface is prevented by adjacent frozen ground from settling as the ground thaws from below. It may apply to comparatively small pockets of material very susceptible to frost heave, surrounded by highly impervious soil. However, Taber's is the accepted theory in Europe

Fig. 1—Permafrost regions of the North American Continent.

Fig. 2—Ice lens produced in the laboratory.

as well as on this continent and there is no question but that his hypothesis explains the formation of the vast areas of permafrost.

According to Taber, ice crystals begin to form in the centre of the voids of a saturated soil. These crystals grow principally in the direction of heat transfer and eventually press against the thin absorbed water films surrounding the soil particles. The absorbed water has a lower freezing point than that in the main body of the voids. There follows, however, a transfer of molecules from the films to the growing crystals. To maintain pressure equilibrium, water is pulled to the films from the unfrozen soil below. If the growing crystals are within the range of capillary rise in the soil from a source of water, such as the ground water table, the system is an "open" system. The ice layer continues to grow or segregate as long as the frost line stays at that level and at a rate determined by the permeability of the soil.

Dr. A. Casagrande③ has also made a contribution to the subject of frost action in soils that is of considerable interest in the interpretation of some of the test results presented here. He has stated that, "Under natural freezing conditions and with sufficient water supply, one should expect considerable ice segregation in non-uniform soils containing more than 3 per cent of grains smaller than 0.02 mm., and in very uniform soils containing more than 10 per cent smaller than 0.02 mm. No ice segregation was observed in soils containing less than 1 per cent of grains smaller than 0.02 mm. even if the ground water level was as high as the frost line."

There are thus several conditions that must exist simultaneously for ice segregation to take place in a freezing soil. First, there must be a source of water. If the ground water table is above the frost line it naturally can supply the necessary water. But what is equally important is the fact that if the ground water table is lower than the height of capillary saturation below the frost line, it may serve as the source of the water necessary for ice segregation. A second requirement is that there must be the minimum percentage of soil particles less than 0.02 mm. as stated by Casagrande. A third condition is that the permeability of the soil must be such as to permit relatively rapid flow of water through the soil to the frost line. Finally a fourth requirement is that the rate of penetration of the frost into the ground must be relatively slow. These last two conditions are interrelated, since the range of permeabilities for which serious ice segregation will take place depends upon that rate of penetration.

In general, clays are so impervious that they are seldom susceptible to serious frost action. At the other extreme clean gravels and sands are not susceptible to frost action because of their lack of fine particles. The soils which give the most trouble are the silts and sandy silts with their relatively fine texture and high permeability permitting ice segregation to proceed at a relatively rapid rate.

Figure 2 shows ice segregation secured in the laboratory in a silt soil. It requires careful temperature control and a stationary frost line for several hours to secure ice lenses of any appreciable thickness. Figure 3 shows an ice lens about two feet thick formed under natural conditions.

Results of Classification Tests

Samples of permafrost from two sites where the underground was being thawed out by heat from buildings were submitted to the Department of Civil Engineering of the University of Alberta in the spring of 1944 for routine tests. Cylindrical samples were cut from the frozen underground. Those from site "A" were 3 in. dia. and up to 10 in. long. Those from site "B" were 6 in. dia. and 12 in. long. They were delivered to the laboratory packed in ice and sawdust.

Fig. 3—Ice lens about 2 ft. thick, formed under natural conditions.

Table I
Classification tests of Permafrost samples.

All Moisture Contents are Based on Dry Weight of Soil

Table I shows the results of tests for specific gravity of the soil particles, moisture contents and limit tests. It is of interest to note the extremely high moisture contents of the silt materials as compared with the sands. A moisture content of 200 per cent in these silts represents an increase in volume of the material from its loosest state of 175 per cent. It will also be noted that no ice lenses were observed in the materials having the comparatively low moisture contents.

Figure 4 shows the results of the grain size determinations for the samples. It is of interest to note that the curves for samples 2 to 8, in which no ice lenses were observed, have practically no particles as fine as 0.02 mm., while the curves for samples 1, 9, 10 and 11, in which ice lenses were observed, have a percentage of particles finer than 0.02 mm. considerably in excess of the 3 to 10 per cent mentioned by Casagrande. The curve for sample 9 is of particular interest. It is from a gravel bed upon which a concrete floor slab was placed. It had ice lenses in it up to 3/8 in. thick. Considerable cracking and settlement of this slab occurred as the bed was thawed out from the heat of the building. Many people refuse to accept Taber's hypothesis and Casagrande's observations because they claim that they have seen many ice lenses in gravels. It will be noted, however, that this sample had 10 per cent particles finer than 0.02 mm. To an inexperienced observer, this gravel would appear simply as a " dirty " material. It would not readily be appreciated that the percentage of fine particles is so large. If one wishes to avoid heaving in a backfill of gravel, he should beware of a " dirty " gravel.

Results of Consolidation Tests

In addition to the tests, the results of which are shown in Table I and Fig. 4, consolidation ④ tests were run on some of the samples. These were run on 2⅝ in. dia. test pieces either ¾ or 1¼ in. thick. The samples were cut to fit the consolidation rings at temperatures below freezing, using a hacksaw and " shaving " the sample to size. Quite satisfactory samples were secured by this process.

Several loading cycles up to a maximum of 10 tons per sq. ft. were run on each sample at a temperature below freezing. The tests indicated that even at temperatures of only —0.5 deg. C. no thawing or appreciable deformation resulted from these loads. This result could have been deduced beforehand from the physical properties of ice, but we were specifically asked to run the test in this way.

The consolidation tests, after being set up in freezing temperatures, were moved into ordinary room temperatures and thawing was allowed to take place in such a manner that no soil particles could be lost from the samples but that the excess water could flow off. The thawing took place with a small load on the sample. After complete thawing the usual type of consolidation test was run on the sample. Figure 5 shows the " pressure-void ratio " curves from the consolidation tests.

Curves for Samples 1, 2 and 4 are from the sand material, and for Samples 10 and 11 are from the silt material. The sand samples, while they were in a comparatively loose state for a sand, did not loose excessive volume on thawing, and were comparatively incompressible and stable if confined after being thawed out. The silt samples, on the other hand, lost considerable volume in thawing, and were highly compressible after thawing. Curve for Sample A is added as a comparison. It is from a test on a material in which 2½ ft. of settlement has been recorded in a 50-ft. depth of compressible soil carrying a load of approximately 3,000 lb. per sq. ft. over an area 75 by 150 ft.

Conclusions From Results of Tests

In terms of behaviour of foundations the tests indicate that a foundation on the frozen sand would not be appreciably affected if the sand thaws. However, in the case of the silts, the settlement of a foundation, for all practical purposes, would be equal

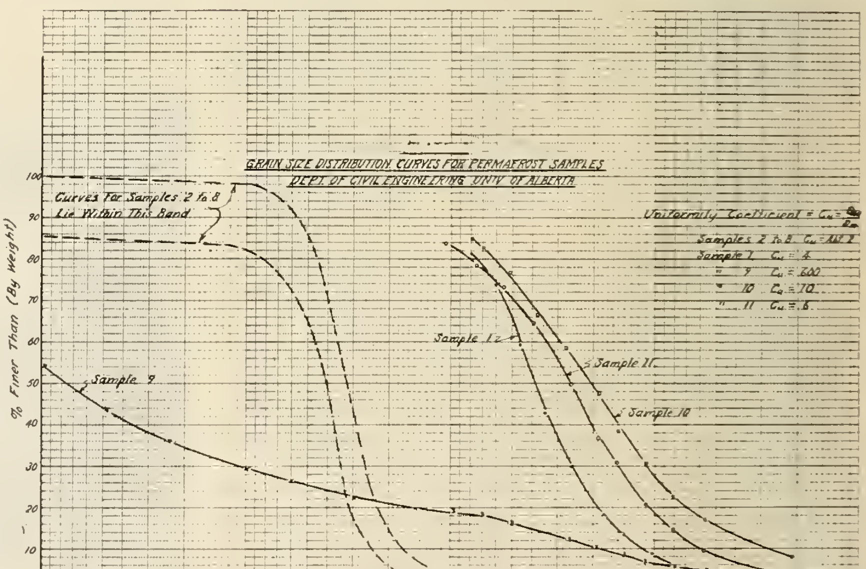

Fig. 4—Grain size distribution curves for permafrost samples.

to the thickness of the underground thawed out, if conditions were such that the soil could flow from under the load. This would be the case under posts or spread footings. Under a large loaded area, such as under a hangar or runway, the minimum settlement to be expected would be as indicated by the reduction of volume in thawing in the consolidation tests. Further settlement could then be expected consistent with the high compressibility of the soil as indicated by the results from the standard part of the consolidation tests.

It is of considerable practical interest to note that a soil survey at sites subject to frost action and a few simple soil tests will enable dangerous soil types to be identified, will permit an intelligent analysis of the action of a foundation at the site, and will facilitate the selection of the proper type of foundation.

Introduction

Within recent years the barren cold north, as it is known to most of us, has taken on great developments in the field of mining and in the growth of communities, roads and airfields. To-day in the north can be found some of the largest airfields on the North American Continent—airfields which can accommodate the largest bombers. These airfields have been further linked together by a highway which serves as an artery over which supplies for maintenance and repairs are carried. Nature's crude oil flows through the famous Canol line to Whitehorse to be refined as fuel for airplanes and other services.

These developments of the north are the outcome of the ingenuity and perseverance of those men who built in the north. Mother Nature placed every conceivable obstacle in their path—cold weather, floods, frozen ground, insects and many others. The most serious of these to the engineer was the frozen ground.

It has been pointed out in Part I that the greater portion of the northern region is underlaid by this permanently frozen ground. The potentialities of this ground as a destructive agent to structures depends mainly on the number of ice lenses present. When thawed, certain soils cannot sustain a load; if the soil refreezes after being thawed, heaving results.

Roads, railroads, bridges, buildings and airports have all suffered due to the behaviour and destructive characteristics of this frozen ground. The severity of the damage to structures already built has been mainly due to lack of adequate preliminary investigation, study and research in this particular field of foundation design.

Structure in permafrost regions simply cannot be built on the same basis as those in temperate climates with the expectation that they will not suffer damage due to the freezing and melting of the ground.

The state of affairs to date has been that most engineers from Canada and the United States have disregarded the characteristics of the frozen ground and built according to practice in regions of temperate climate. The outcome of such construction is evident all along the Alaska Highway and at various airports built in the Northwest Territories, the Yukon and Alaska.

The purpose of this paper is to present some of the failures which have occurred, some revised foundation designs for structures, roads and runways, and the results of a load settlement test carried out in a permafrost region.

Failures

Failures which occur in frozen ground are mainly due to two fundamental causes.

1. The thawing of the frozen ground which supports the structure.

2. Heaving, which results from the growth of ice lenses in the soil.

Examples of each types of failure are numerous, and consideration will be given to a few of the more interesting cases.

Repeater Station

The first building failure which was encountered was at a repeater station located near the intersection of the Alaska Highway and the Alaskan border. At this site the permafrost extended from 2 to 42 ft. below the surface, as indicated by the log of a well boring. The building was located on a glacial deposit and, as indicated in Part I (Table I, Sample No. 9), the texture of the soil varied from clay to coarse gravel and contained a high moisture content, as a result of the growth of ice lenses.

The foundation for the furnace consisted of a 24-in. gravel backfill placed on the permafrost, after the 18 in. of active layer had been removed. A 4-in. plain concrete slab formed the base for the furnace. After four to five months of operation the heat had penetrated to a depth of 51 in. under the centre of the furnace resulting in a settlement of 7 in.

In the original design it appears that no particular consideration had been given to the texture of the frozen ground, nor to the study of its properties. The failure was a direct result of the thawing of the permafrost. In the new foundation design, this problem of the thawing of the frozen ground was considered. As a result the floor was elevated to give a free air space under the building. The purpose of this was to cause a minimum of disturbance to the natural thermal regime of the frozen ground.

Raising the building necessitated the use of posts, and this led to the possible danger of the posts being heaved due to the growth of ice lenses in the active layer. To offset this hazard the posts were securely anchored into the permafrost at a depth below which the permafrost horizon would not recede. Further, the posts had sufficient penetration to develop tangential adfreezing forces along its surface capable of withstanding the upheaval forces in the active layer. To help minimize these upheaval forces the surface of the post in the active layer was made smooth and then covered with a collar made up of grease and tar-paper. This collar allowed the ground heaved by the growth of ice lenses to slide along the surface of the post. If no collar had been used the freezing ground would have adhered to the post near the ground surface. Then, with increased penetration of the frost line and the formation of more ice lenses, the post would have been heaved along with the expanding soil.

To offer the greatest possible resistance to the heat transfer by conduction from the slab to the ground, insulation was placed between the joists. To reduce radiation, a fibre board having a surface with a low emissivity was used as sheeting on the underside of the joists. The free circulation of air under the floor helped to carry away transmitted heat by natural convection. Such precautions are essential to the preservation of the permafrost horizon and the stability of the structure.

Boiler House

In the Norman Wells area, the depth of permafrost varies from 60 to 130 ft. and is overlaid by an active layer which averages 18 in. in thickness. The frozen ground at a particular site where a boiler house was erected was a fine silty soil with a high moisture content.

The active layer was not removed during construction of the foundations, but was added to by a mat of brush and moss followed by 3 ft. of poor gravel fill. This supported a 10-in. concrete slab which formed the base for the boilers. After six months of operation a maximum settlement of 2.69 ft. was recorded.

The settlement resulted from the thawing of the permafrost by the heat transmitted from the firebox. The plasticity of the soil when thawed was so high that it flowed when subjected to load.

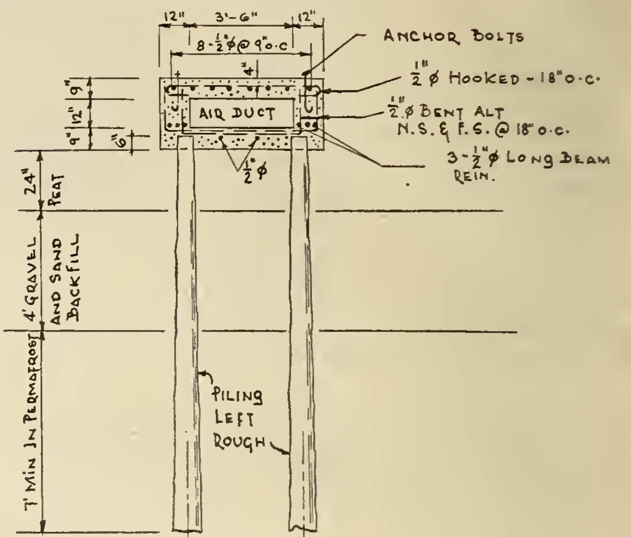

Fig. 6—Proposed foundation details for boiler units.

Figure 6 shows the new foundation design. The purpose of the duct is to have forced convection and thereby the removal of the greatest portion of the heat transmitted from the firebox. To further resist the heat transfer, the floor of the duct is given a shiny surface to reduce radiation. Heat transfer due to conduction is resisted by the concrete slabs, 24 in. of peat and 4 ft. of gravel backfill.

The depth to which the piles are sunk into the frozen ground depends on the desired life span of the structure and the rate of heat transfer. It should be understood that, once the permafrost horizon recedes to the base of the piles, settlement will result, if the soil is unable to sustain the load.

Warehouse

Figure 7 shows the 4 in. of shimming required to make the floor of a warehouse level. The supporting posts are resting on woodpads bearing directly on the permafrost. During construction the active layer was removed and not replaced, leaving the permafrost horizon exposed. The coming of warm spring weather caused a melting of the permafrost and subsequent settlement.

Utility Line

An example of a failure mainly due to heaving is shown in Fig. 8. The utility line in this particular case carried the steam, water and sewer lines for the community. The supporting posts of the box rested on the permafrost or, at the most, penetrated it only a few inches. During the winter the posts were heaved with the expanding active layer. In the spring settling

Fig. 7—Shimming under warehouse floor.

occurred, leaving the utility line with the twisted alignment shown in the photograph.

This heaving of posts is also common with telephone, power lines, and buildings supported on piles. In these cases the piles or poles are not anchored to a sufficient depth in the permafrost, nor have they protection against upheaval forces in the active layer.

General Schemes for Building Foundations

For frozen ground, four general schemes of construction are possible, and the choice of any one or any combination thereof will depend on the nature, use and life span of the building along with a study of the soil properties at the chosen site.

Experience shows that buildings or other structures resting on a clean gravel or sandy stratum of 20 ft. or more in thickness are not damaged by settling or heaving action of the soil. The reason for this is that the growth of ice lenses is not possible in such stratum. It also appears that such a thickness of stratum offers sufficient resistance to heat transfer under small buildings and assures the stability of the foundation for the normal life span (20 years) of the structure.

The problem of by-passing a silty stratum to a thick layer of sand or gravel requires no more precaution than the existence of proper protection of the piles in the active layer.

The main foundation problems arise where there is the existence of (1) alternate layers of sand and silt, (2) a thick stratum of fine grained soil.

Practically without exception, wherever there is a fine textured soil, the moisture content is high, due to the ice lenses which have formed. These soils when thawed are very plastic and possess little to no load bearing capacity.

These brief statements should emphasize the fact that foundation design should be preceded by (1) a determination of the soil profile to a depth equal to the width of the building, but at least to 20 ft. (2) a study of the soil properties at all changes in stratum. (3) study of the rate of heat transfer under a heated slab.

In order to determine the type of foundation to be used it is essential that the data obtained from the first two be considered. Very little attention has been given to the last item, rate of heat transfer, which is the controlling factor in determining the life span of the structure built on silty frozen ground.

The problem, though complex in character, is to determine the transient state of heat flow beneath the slab, maintained at a constant or variable temperature. The designer must be able to state within reasonable limits at what depth below the surface the permafrost horizon will be at any given time. The time element is necessary to establish the probable settlement, length of pile, or life span of the structure.

Returning to a consideration of the four main schemes of building foundations,—

Scheme 1 is a suitable solution for small buildings with an average life span of 20 years. These buildings remain stable as long as the permafrost horizon does not recede below the base of the piles. Figure 9 shows a typical section of such a foundation. Insulation is normally placed between the joists to reduce the heat transfer. The space beneath the buildings has no fluctuation of air temperature, but is fairly constant. Gradually the heat will penetrate further into the

Fig. 8—Alignment of utility line after one cycle of freezing and thawing.

frozen ground, melting it, and over a period of years the permafrost horizon will recede to the level of the base of the piles. The length of time required for this to occur is not certain. Experience indicates however that for small dwellings, piles set at least 10 ft. into the permafrost assure stability for the desired life span of the building.

Scheme 2. This design, illustrated in Fig. 10, is

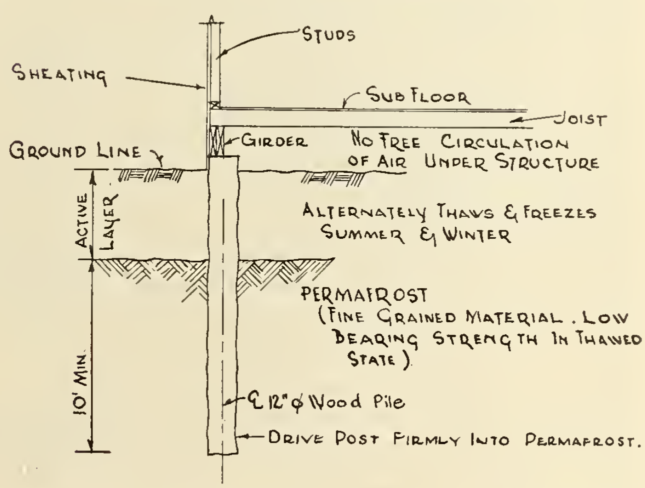

Fig. 9—Wood pile construction Type A. No free circulation of air under structure.

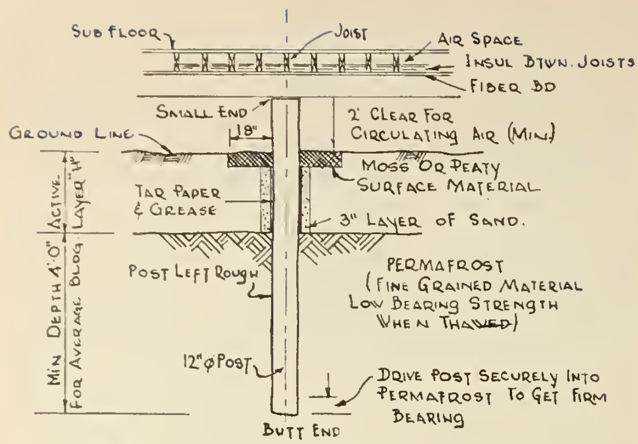

Fig. 10—Wood pile construction Type B. Free circulation of air permitted under building.

satisfactory for foundations of warehouses, boiler and power houses, barracks and such medium sized structures. The air space under the floor allows a free circulation of air and thereby tends to maintain the permafrost horizon near its natural level. In this design, as in Scheme 1, the heat transfer is resisted by insulation placed between the joists, and by having the underside of the floor sheeted with a fibre board which has a shiny surface.

Piles are set approximately twice the depth of the active layer into the permafrost. This develops sufficient bond to resist the upheaval forces which occur during freezing. In the active layer the piles are further protected from heaving by the use of a collar.

Steam Thawing

It can be readily recognized that it is impossible to drive piles into the frozen ground. This difficulty is overcome by steam thawing the ground to roughly the desired hole diameter for the driving of the pile. The process of thawing the ground is much the same as that used in the cold-water thawing of placer mining operations. The thawing is done with a ½ or ¾ in. dia. steam-point having steam pressure at 30 lb. per sq. in. This steam-point is then gradually driven to the desired depth. The length of time the steam-point is left in the ground depends on the texture of the soil. For sandy or silty soils, the time should be ½ to 1½ hours and increased to 3 hours for clay soils. The difference is mainly due to the fact that in sandy soils the heat is dissipated by the circulating and filtering action of the water in the void spaces. In the more impermeable soils, like the clays, the heat transfer and thawing is mainly a function of conduction, which is a much slower process. The piles are then driven butt down to refusal. These piles are checked for additional driving two or three days after initial placing.

Temperature measurements taken in the field show that the ground begins to refreeze very quickly. Figure 11 shows Fahrenheit isopleths of the thawed ground 3½ days after completion of steam-thawing. Records indicate that within ten days of the start of operations the temperatures along the face of the piles have dropped below freezing. For this reason it is recommended that no load be placed on the piles for a period of two weeks to a month. This gives the necessary time for the piles to become securely bonded with the permafrost. The Russians recommend that this operation of pile driving be carried out in the fall and that the piles be allowed to stand all winter before construction of the structure is started.

The load which each pile can carry depends on the adfreezing strength of the frozen ground to the wood pile, that is, the resistance which can be developed between the frozen ground and the pile. A value of 5 tons per sq. ft. of surface area is average for clay soils, 7 tons per sq. ft. for silts and sands, 3 for gravel and 5 for ice.

Scheme 3 can be well adapted to the design of foundations for water tanks and similar structures. As shown by Fig. 12, a backfill of clean sand is built up to a height of 3 to 4 ft. above the surrounding terrain. This fill is placed on the frozen ground during the early spring at a time when the seasonal frost has penetrated to its greatest depth. The thought in this design is to maintain the frozen ground by having the permafrost rise as high as possible into the sandy backfill. To reduce the transmission of heat, the necessary insulation and air space under the floor is provided.

Scheme 4 requires the thawing of the permafrost and the maintaining of it in a thawed state. This type of construction is suitable in cases where the frozen ground possesses reasonable bearing properties, and where there is a soil which will not undergo too great a consolidation due to the dead load and overburden when thawed.

An impervious wall is built around the building and anchored into the permafrost. The function of this wall is to prevent the movement of ground water into the thawed area under the dwelling. The ground water is subjected to a hydrostatic pressure when the active layer begins to freeze, and should this water find an avenue of escape through the thawed area under the building, it will move up through the soil and flood

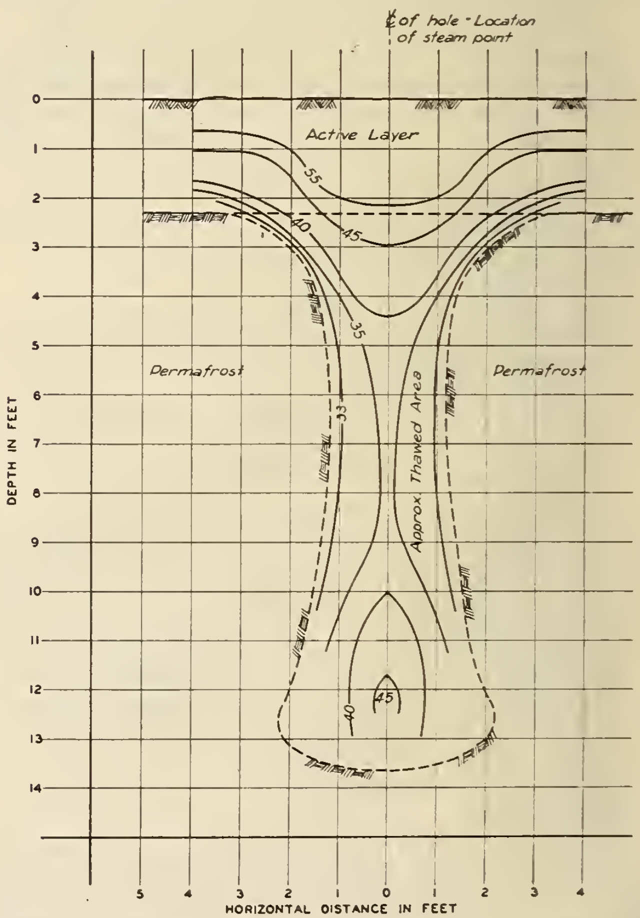

Fig. 11—Fahrenheit isopleths of thawed ground 3½ days after completion of steam jetting.

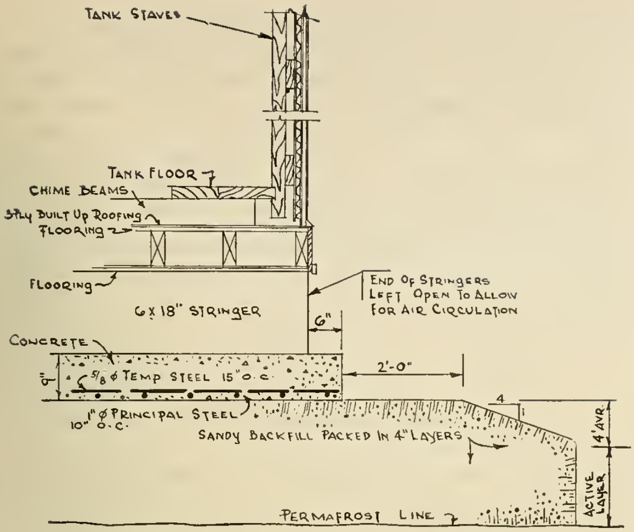

Fig. 12—Earth foundation for water tank.

the structure. Manifestations of this phenomenon have been recorded in Siberia.

Hangar and Load-Settlement Test

It can be readily understood from the preceding discussion that great importance should be attached to the study of the soil profile, its properties and the rate of heat transfer before a foundation is designed for any structure. This statement forcefully expressed itself in the case of a particular hangar built in Alaska.

The hangar was constructed on the site of an old borrow pit which was filled with sand and gravel to an average depth of 5 ft. No borings were made of this site and it must have been expected that the sandy backfill would properly distribute the footing load and be of sufficient depth to offer adequate resistance to the transfer of heat.

To determine the behaviour of the permafrost horizon, records of a dozen probing holes were kept. That is, the depth of the permafrost horizon below the finish floor was determined by driving a ¾-in. diameter rod to refusal. A record of nine months readings clearly indicated that the permafrost was receding at a rapid rate. To further investigate the problem, a boring was sunk to a depth of 40 ft. to determine the soil profile. The results of the boring showed that a clean layer of sand was underlaid by layers of silt and peat. These strata are typical of river deposits and their moisture contents indicate the existence of ice lenses. Figure 13 shows the soil profile along with moisture contents varying from 21.7 to 129.4 per cent based on dry weight of sample.

To obtain a measure of the settlement that might occur if the permafrost thawed, a pit 8 by 8 ft. was dug to permafrost, and a platform having an 18 by 18 in. bearing pad was erected on the permafrost horizon.

A 2500-lb. sq. ft. footing pressure was obtained by stacking lead weights on the platform. After this preliminary set-up, the ground was thawed to a depth of 40 ft. by four steam-points and a record of the settlement kept by taking level readings with reference to a fixed datum. The test was carried on for a period of 40 days, and in that short length of time a total settlement of 3 ft. was recorded.

To date, the hangar floor has undergone no settlement due to the thawing of the frozen sand. Figure 13 also shows the present level of the permafrost horizon and the amount of thawing which has occurred from the day the building was occupied. The conclusions which can be drawn from this figure are as follows: If the soil strata are continuous throughout the hangar area and should the permafrost horizon continue to recede at its present rate, the remaining life of the hangar is only another one to one and a half years. There remain approximately 5 ft. of good frozen sandy material before the silt is encountered. That settlement is inevitable is quite obvious when one considers only the high moisture content of the silt, 85.7 to 103.4 per cent, and the behaviour of the loaded platform.

Highways and Runways

Construction

The construction of highways and runways in permafrost regions along lines similar to those used in temperate climate regions, has resulted in failure of part or all of a runway or roadway resting on frozen ground.

As in standard practice, the surface insulation of moss and peat is removed along with the active layer. The result of such construction is the melting of the permafrost and the subsequent formation of a quagmire in fine grained soils. The backfill is then placed in lifts of approximately two feet to make the road passable. The placing of the backfill in such high lifts produces isolated pockets of a very plastic soil. These pockets in turn are conductive to the growth of frost mounds during the winter.

To cause a minimum disturbance to the natural thermal regime of the permafrost, careful consideration should be given to the soil profile before any insulating surface is removed. Should stripping be necessary, it should precede the backfilling only by a few hundred feet.

It is advantageous to build the roadway or runway in the early spring, that is, at the time when the permafrost horizon and frost line coincide. In the case

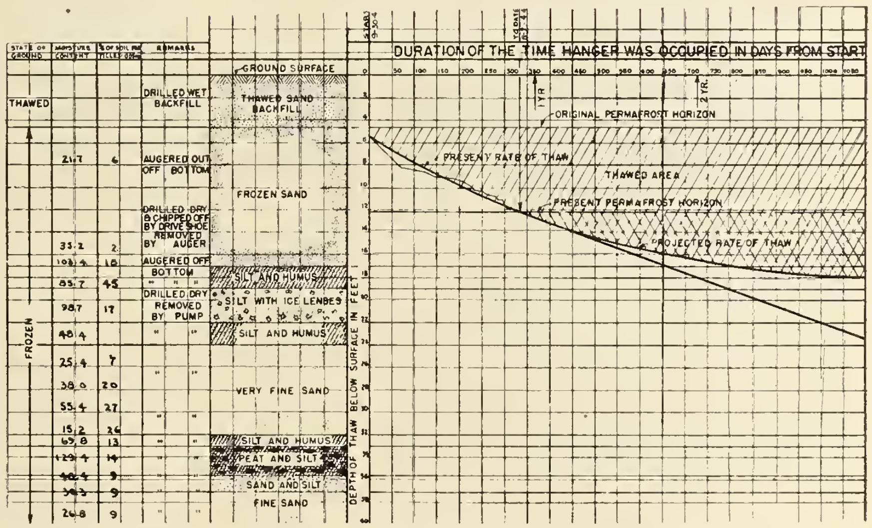

Fig. 13—Variation of permafrost under hangar floor.

of a roadway no insulation is removed, but a mat of brush and moss 50 to 75 ft. in width is added to the road. On this mat a clean gravel fill is then placed. The principle of such construction is to preserve a high level of the permafrost horizon and, if possible, have it rise up into a fill not susceptible to frost action. This type of construction has been tried and has proved successful in certain areas of the north. In other cases it may require several years to stabilize a road. This is done by periodically adding fill until it is found that the depth of summer thaw does not extend below the base of the brush insulation.

SHOULDERS

Other sources of trouble in roadways are the damming of water above the high rise of the frozen ground under the centre of the roadway, and the deep thawing of the permafrost on southern slopes. Such action, in either case, tends to increase the moisture content of the shoulders with subsequent slides resulting.

This difficulty can be avoided by the construction of a wide berm or mat along each side of the roadway. This causes the permafrost horizon to vary uniformly in depth under the full width of the roadway, and thereby insures the stability of the shoulders. A deep trench is cut well up on the high side of the road where the ground water can come to the surface and be removed by a system of drainage ditches and culverts.

CULVERTS

Roads suffer the greatest damage in the winter time due to the failure of the culverts to remain open. Once the culverts become blocked, the water, in due time, builds up as ice and " glaciates " the surface of the road making it impassable. At times the difficulty can be avoided by providing an adequate number of large culverts with good slope for drainage.

Another scheme is to provide winter maintenance as, for example, steam-thawing. Another method widely used is to build a small shed at each end of the culvert and place an oil-burner in each shed. In this manner the ice is melted and the temperature of the water is raised sufficiently to allow it to flow through the culvert. On the low side the water is again heated so that it flows well away from the opening before freezing again.

Each site has its own peculiarities and the scheme selected will require trial and readjustment before a satisfactory solution is obtained.

DEPTH OF BACKFILL

The statements made regarding the construction of highways apply equally well to runways, with the exception that the brush insulation is omitted.

The main problem in highway and particularly runway design is to determine the depth of backfill necessary to produce a stable section. Though the procedure has been to use the California Bearing Ratio Method, the results in permafrost regions have not been satisfactory. It is the author's opinion that the air temperature variation and depth of summer thaw are the predominant factors in establishing this required depth of backfill at any given site.

The depth of summer thaw and its duration can be computed from the following mathematical expression:—

$$T = T_m + \frac{a}{2}\, e - x\sqrt{\frac{\pi}{kp}}\, \cos\left[\frac{2\pi t}{p} - x\sqrt{\frac{\pi}{kp}}\right]$$

a = yearly range in temperature at the ground surface in °C.
k = the thermal diffusivity per square meter per day.
x = depth below the earth's surface in meters.
T = temperature in °C.
T_m = mean yearly soil temperature °C.
e = base of natural system of logs.
t = time in days.
p = period of temperature variation in days.

This equation states that the ground temperature at different depths can be computed on the assumption that the temperature fluctuation in the earth's surface is a harmonic function of time.

It is not certain to what degree of accuracy this method of design applies to runways and roadways in arctic and sub-arctic regions. This, however, could be determined if experiments were conducted on constructed runways in permafrost regions. This approach to runway design is based solely on the physical properties of the soil and the air temperature. Further, the solution depicts the conditions as they exist in the field.

Conclusion

Further development of the north will require a better working knowledge of frozen ground. This can only be accomplished through research and study, coupled with experimental work in the field. Russia has made great progress in the study and development of the permafrost regions both from an agricultural and an engineering point of view. To-day, the United States is taking measures to become acquainted with and to study her problems in Alaska. This should serve as a note of warning to Canada. If the Canadian north is to play the part hoped for it in our post-war world of air commerce and travel, the problems of frozen ground within the boundaries of Canada are of vital importance to us all.

A NEW HIGH-EFFICIENCY LINEAR AMPLIFIER

SIDNEY T. FISHER, M.E.I.C.
F. T. Fisher's Sons Ltd., Consulting Engineers, Montreal

SUMMARY—This paper describes a new high-efficiency amplifier circuit with a quantitative analysis of its operation. This circuit operates by dividing the wave in several sections, amplifying each section separately and recombining the sections in the output to produce a larger wave of the original form. The circuit has special application to controlled-carrier system and relatively high efficiencies are obtained, the comparison with conventional arrangements being most favourable at low modulation levels.

Introduction

The problem of a high-efficiency linear amplifier is one with which radio engineers have been concerned for 25 years. Power amplifiers for either unmodulated or frequency-modulated carrier waves operate with such high efficiency, of the order of 75 per cent, that no considerable improvement is necessary. A power amplifier for a carrier wave modulated in amplitude by a speech wave still presents an outstanding problem and it is the purpose of this paper to develop a general line of attack on the problem.

Several solutions have previously been offered. The most wide-spread arrangement in use today is the class C radio amplifier modulated at high level by a class B audio amplifier. Other more complex arrangements in less common use are the Chireix "outphasing" modulation method, and the Doherty high-efficiency circuit.

The Linear-Amplifier Problem

When a wave containing amplitude modulation is to be amplified, the amplification must be closely linear. A conventional class B amplifier is linear, and when operated continuously at its maximum capacity, such an amplifier will have an efficiency of the order of 66 per cent. An amplitude-modulated wave has a value on peaks of modulation of twice the carrier value, so that a class B linear amplifier transmitting such a wave must have a maximum capacity twice that of the carrier wave unmodulated. Since over any considerable period of time a voice-modulated wave has a very low average value, we are not far wrong in considering the efficiency of the circuit for the carrier wave alone as its actual performance The efficiency of the class B amplifier is about proportional to the root-mean-square value of the wave being transmitted by it, so that we have in conventional linear amplifiers intended for transmitting a carrier wave amplitude-modulated by a speech wave, and where the modulation may reach 100 per cent, an average efficiency of only about 33 per cent. This means that, for every watt delivered to the antenna, about two watts of power is dissipated as heat at the anodes of the output tubes.

Two disadvantages are immediately apparent: first, the cost and difficulty of providing this relatively large amount of direct-current power at high voltage are considerable; and second, unduly large power-amplifier tubes must be employed in order safely to dispose of this amount of heat.

Aside from the question of efficiency of the power amplifier for the conventional transmission method, another factor should be considered. In an amplitude-modulated system, three major components are contained in the output wave; the carrier wave and two wideband waves. The two sidebands are equal in power, and together contain one half of the power contained in the carrier wave, for continuous maximum modulation. In other words, a radio transmitter with an unmodulated carrier of 100 watts, at maximum modulation transmits 150 watts, of which 25 watts is contained in the lower sideband, and 25 watts in the upper sideband. Telephonic speech may be assumed to have an average value of about 20 per cent of the maximum value over any considerable period of time. The total power in the two sidebands is therefore, for average telephonic speech, not one half the power in the unmodulated carrier, but is given by the following expression:

$$\frac{\text{Sideband power for telephonic speech}}{\text{Unmodulated carrier power}}=\frac{1}{2}\times\frac{1}{5^2}=\frac{1}{50}.$$

This means then that, for the 100-watt unmodulated carrier, the average sideband power over some period would be about 2 watts.

Since the intelligence is wholly contained in the sidebands and not in the carrier, the real efficiency of such a system is seen to be surprisingly low. Suppressed-carrier and controlled-carrier systems have been suggested and put to use in a wide variety of applications but have heretofore suffered from a rather fundamental disadvantage. If, for example, the amplitude of the carrier wave in a radio transmitter is adjusted by a circuit operating from the envelope of the audio modulating wave, so that for all values of the modulating wave the percentage modulation is kept close to 100 per cent, then in the conventional class B linear amplifier, which is required to raise this wave to a high power level, the efficiency will not be 33 per cent. Actually, it will be very much less, because the average value of such a wave will be much less over a period of time than the average value of the wave in a conventional system, which is very close to the unmodulated carrier wave. If we again assume the average value of the telephonic speech wave is about 20 per cent of the peak value, then in such a system we will have a carrier wave which has an average value of 20 per cent of the maximum carrier which the system will transmit, and this wave will therefore have 1/25 of the power of the maximum carrier rating.

Taking the case of the transmitter with 100-watt unmodulated carrier, the control of the carrier wave to maintain substantially complete modulation for all values of the audio modulating wave will not affect the peak rating which the power-amplifier stage must have, and we incur the serious disadvantage that this output stage will operate at an average power level of about 1/25 of its peak power rating. The over-all efficiency will therefore be very low (of the order of a few per cent) and the apparent advantage obtained by a controlled-carrier system has largely been offset by the low efficiency of the linear power amplifier which must be employed.

In the high-efficiency circuit of Doherty, linear amplification is obtained at an efficiency of around 60 per

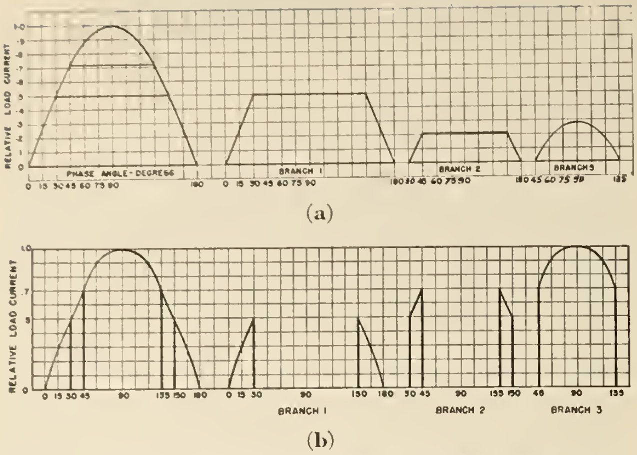

Fig. 1—Division of sinusoidal wave into sections, each of which can be amplified with higher efficiency than the original wave.

cent, which is very nearly twice the efficiency of the conventional class B modulated-wave amplifier. This efficiency of 60 per cent is the same order of efficiency as is achieved by a class C carrier amplifier modulated at high level by a class B audio amplifier, and the choice between the two systems lies in the practical details of components, ease of adjustment, and first cost, which for any individual application may be quite different for the two approaches to the problem. We have previously noted that, based on average speech, the sideband power is only about 2 per cent of the unmodulated carrier power, so that if we take the ratio of sideband power to direct-current input to the power-amplifier stage (which is actually a true statement of the utility of the conversion which we obtain in the power-amplifier stage of a radio transmitter) then it is seen that the true efficiency lies between 1 and 2 per cent, and we are back to the same order of efficiency as is obtained in a controlled-carrier system using a conventional class B linear amplifier. A controlled-carrier system using a Doherty or Chireix amplifier will have better efficiency than this, although the efficiency will still be in the region below 10 per cent, and for many applications where tuning over a frequency band is required, the complexity of these circuits is prohibitive.

Proposed Circuit

On consideration of these facts, it is realized that this problem, one of the most important in all radio engineering because of the large use of radio transmitters for aircraft and other mobile uses where weight, size, tube cost, and power requirements are serious considerations, requires a completely new attack. It is believed that the proposal which follows is a basically correct approach to the problem.

The anode dissipation in a vacuum tube goes to a low value when either the anode current is reduced to a low value without exceeding the allowable anode voltage, or the anode voltage is reduced to a low value without exceeding the maximum anode current. It will be obvious that the wave form which fulfills both these conditions will be transmitted with maximum efficiency, and that this wave form is a square-topped wave. In such a wave, the energy is completely contained in rectangular pulses which rise instantaneously from zero to the maximum value, and drop to zero from this maximum value instantaneously. The energy is therefore transmitted wholly during the time at which the maximum allowable anode current is being transmitted, and under this condition the ratio of voltage drop across the load to voltage drop across the tube is a maximum. If signalling systems were called upon to transmit only such wave forms, of constant amplitude, we would then have linear power amplifiers which would operate with an efficiency of the order of 90 per cent, using conventional tubes. It appears that a successful approach to the actual problem can be developed from this simple statement.

The solution to the problem resolves itself into changing the actual signal wave to the form in which it can be transmitted with the highest efficiency; that is, having it approach square-topped wave as nearly as possible. Figure 1 shows two ways in which this can be done. The wave can be divided into a number of sections, horizontally (Fig. 1 (a)) or vertically (Fig. 1 (b)), that is on either an amplitude basis or a time basis. The method to be proposed therefore consists of the following steps: (1) Subdivision of the wave into components that approximate the optimum, rectangular wave form; (2) Amplification of these components separately in vacuum-tube amplifiers; (3) Recombination of the separate components in the output circuit of the amplifiers so as to reproduce the original wave at a higher power. That is to say, high-efficiency amplification is achieved by dividing the wave on an amplitude basis into several sections, in practical cases, about three; transmitting each of the sections through a power amplifier whose peak allowable current is that of the section being transmitted, and then combining the three sections at the output by connecting the three amplifier branches to a common load circuit so that the original wave form is again obtained. This arrangement results in some circuit complexity, but increases by a large factor the plate-circuit efficiency of the amplifier. It also reduces the required tube complement, with a corresponding reduction in weight and size of the associated apparatus, since the increase in efficiency chiefly manifests itself in a reduction of the amount of power dissipated on the anodes of the power amplifiers.

Circuit Operation

An approximate way of regarding the system proposed is to think of it as a series of class C amplifiers,

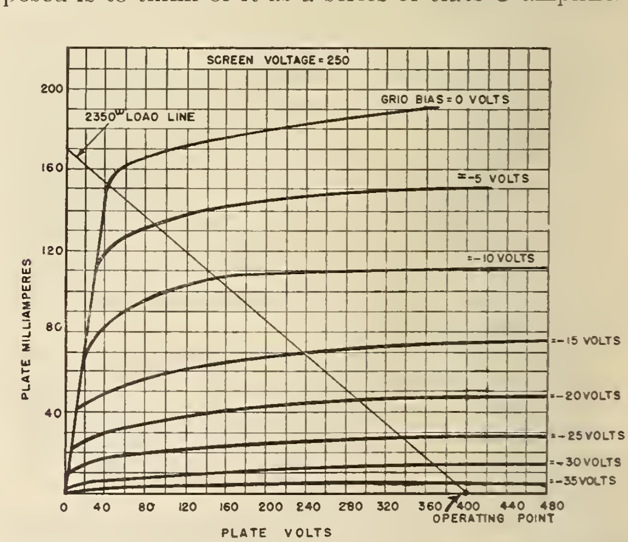

Fig. 2 — Plate-current — plate-voltage characteristic of typical small beam tetrode, showing low-voltage drop across tube at high values of plate current.

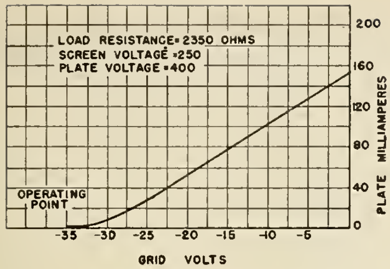

Fig. 3—Grid-voltage—plate-current characteristic of the tube of Fig. 2

whose inputs are driven by different sections of the wave, the sections being selected by a combination of grid bias and grid drive in an arrangement which can be termed an "amplitude filter." Each branch then amplifies the section of the wave which it receives with higher efficiency and higher output than with which it could handle the whole wave, and the sections of the group are combined in the output circuit so that a linear relation is obtained between input and output.

A reference to Fig. 2 demonstrates in a qualitative way the major point involved. This illustration shows the plate characteristic, and Fig. 3 shows the grid-voltage—plate-current characteristic of a typical small transmitting tube. When the tube is operated as a class B amplifier into the rated load impedance, the plate current rises along the load line to a maximum value which is determined by the allowable anode heating and the allowable cathode current. It will be noted for the tube whose characteristics are given, that when the grid is driven to zero voltage, the maximum operating point for this tube, 10 per cent of the plate voltage appears across the tube, and 90 per cent across the load. That is to say, at this point the tube is transmitting power at an instantaneous efficiency of 90 per cent. However, when the tube transmits a sine wave or a modulated signal wave, only a small part of the energy is transmitted at, or near, this high-efficiency point, and most of the energy content of the wave is transmitted at much lower efficiencies; a sine wave being transmitted with about 60 per cent, and modulated wave with about 35 per cent over-all efficiency. It will be apparent that this tube would transmit a square-topped wave with an efficiency of 90 per cent, so that for a given plate dissipation the tube would have a power output for the square-topped wave about four times greater than for the sine wave, and about six and one-half times greater than for the carrier wave 100 per cent modulated by a signal.

This leads to the present proposal of dividing the sine wave or modulated wave into a series of pulses, each of which has a form more nearly approaching the required rectangular form, amplifying these pulses through separate power amplifiers whose peak allowable currents are the same as the maximum value of

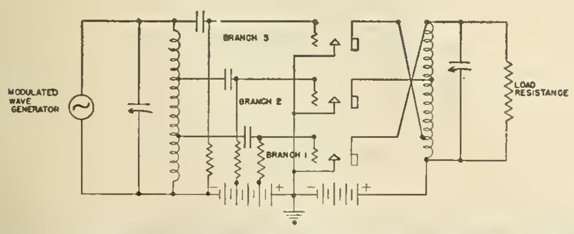

Fig. 4 — Schematic circuit of a three-branch linear amplifier, with the grid drive and grid bias individually adjusted for each branch.

the pulses in a common load circuit to form the original wave form.

In practice this rather roundabout method has been found to work out with surprising ease. Figure 4 shows an outline circuit of a three-branch modulated-wave linear amplifier. Each of the three branches has its grid drive and grid bias individually adjusted so that the branches transmit current in sequence and not simultaneously. Branch 1 is biased at cutoff, so that it operates as a conventional class B amplifier. It receives the lowest grid drive. Branch 2 is biased beyond cutoff, and it has a greater grid drive. Branch 3 is biased to about twice cutoff, and it has the highest grid drive. These three branches are connected to the load through a common plate coil, and their load im-

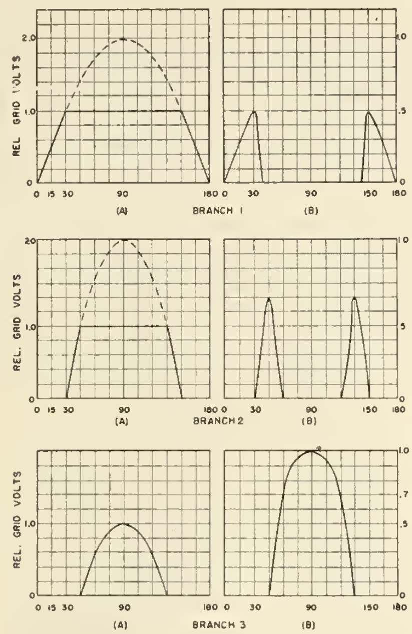

Fig. 5—Division of input wave through a three-branch amplifier.

pedances are adjusted about in inverse proportion to the grid drive. Branch 1 has the highest load impedance, branch 2 an intermediate load impedance, and branch 3 a load impedance about one half that of branch 1.

The operation of this circuit can now be described with reference to Figs. 5 and 6. As the wave commences, branch 1 immediately starts to draw plate current, since it is biased to class B operation. As the wave advances it reaches a point, shown as a relative grid voltage of 1.0 and a relative load current of 0.5, where the peak allowable current of branch 1 tube is reached. At this point, the grid commences to draw current and biases itself back due to the direct voltage set up across the grid leak. At the same time the plate current of branch 1 decreases abruptly because at this point in the wave branch 2 has started to draw plate current and is delivering power to the load from a higher voltage source than does branch 1. Similarly as the wave advances, branch 3 draws plate current and branch 2 at this point has its plate current abruptly reduced. The same process takes place in a reverse order when the wave has passed its maximum value and decreases again to zero. It will be seen that each tube operates linearly over a range of amplitude for which it delivers power, and nonlinearly outside this range. The three groups of pulses are delivered in sequence to the load resistance, and the way in which they combine is shown in Fig. 6. It might be mentioned that the illustrations shown are copies of oscillograms obtained in an experimental amplifier.

It will be noticed that the recombined wave has, for a three-branch arrangement, an appreciable content of the ninth harmonic. Other distortion products are almost entirely lacking. In any radio-frequency application it is, of course, rather easy to reduce the ninth harmonic by any factor desired; and where this circuit is used for audio frequencies, the harmonic content can be reduced about as desired by the application of negative feedback.

Efficiencies Obtained in New Circuit

It will be apparent that the efficiency of this circuit is high, even for low values of the wave being transmitted, since the instantaneous efficiency rises to about 90 per cent as the maximum current in each branch is reached. This is shown in Fig 7 which is a plot of per-cent instantaneous efficiency against per-cent peak load current for the transmission of a sine wave. For the conventional class B amplifier the efficiency is assumed to be proportional to the peak load current,

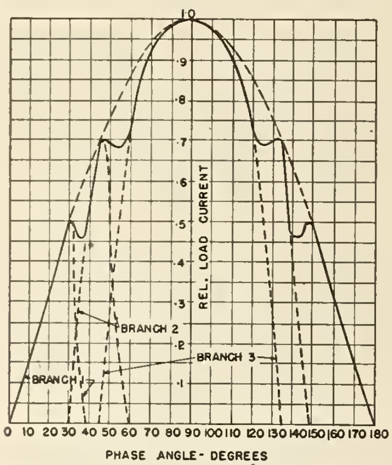

Fig. 6—Recombination of the wave sections of Fig. 5 in the output circuit of a three-branch amplifier.

rising to a value of about 90 per cent at 100 per cent of the allowable current. The plot shows how this efficiency curve varies as circuits of varying numbers of branches are used. In each case for which the data is given on this figure, the power ratio in successive branches is 2 to 1; that is, a 3-decibel separation. For a three-branch circuit, for example, the case illustrated by the previous wave-form curves, the instantaneous efficiency rises to 90 per cent at 50 per cent of the maximum load current, and the efficiency does not depart far from this value right up to the maximum power from the over-all circuit. For waves of low amplitude, the efficiency of this circuit is therefore quite good, and in fact is the same for waves of half the maximum amplitude as the efficiency of a conventional class B amplifier for waves of maximum amplitude. If as many as ten branches are used, then the efficiency of the circuit for waves of 4.4 per cent of the maximum amplitude is the same as the efficiency of the conventional circuit for waves of the maximum amplitude, and for waves of amplitude higher than 4.4 per cent, the efficiency steadily improves to a value in excess of 80 per cent for waves of the maximum amplitude.

Figure 7, which was obtained experimentally, is further explained by Fig. 8, which shows the efficiency obtained in amplifiers of different numbers of branches in which 3-decibel separation exists between the

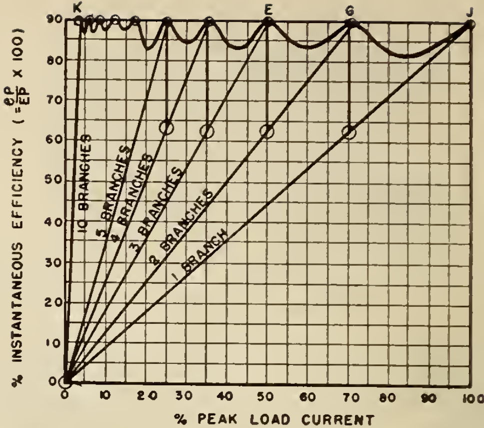

Fig. 7—Per-cent instantaneous efficiency plotted against per-cent peak load current, for the transmission of a sine wave through amplifiers of different numbers of branches.

branches. The efficiencies are shown both for a sine wave of constant amplitude, and for a signal-modulated carrier wave with 100 per cent modulation, and were derived experimentally using the tube whose characteristics are shown in Figs. 2 and 3. Based on this data, it appears that, for normal applications involving speech modulation, an arrangement of about three or four branches gives the practical compromise between efficiency and circuit complexity in the case of either type of wave. It is likely that for amplification of audio frequencies the greater complexity of the circuit, because of the impossibility of tuning the load, would dictate a smaller number of branches, either two or three. In the audio-frequency case, the " amplitude-filter " arrangement is not so readily obtained by the adjustment of grid drive and grid bias of the power amplifiers, and for such applications it will occasionally be necessary to have separate signal-shaping driver stages, each power-amplifier stage operating as a conventional class B amplifier. Such a circuit for a push-pull three branch audio-frequency amplifier is shown in Fig. 9. In this case the division of the signal into sections is accomplished by small driver tubes which accomplish their function by individual adjustments of the grid drive, grid bias, and plate load.

Application to Controlled-Carrier Systems

It is apparent that the linear-amplifier system described, whose efficiency remains relatively high for low amplitudes of the transmitted wave, has special advantages to offer as a power amplifier for a signal-modulated wave in which the carrier is either controlled so as to keep the per cent modulation substan-

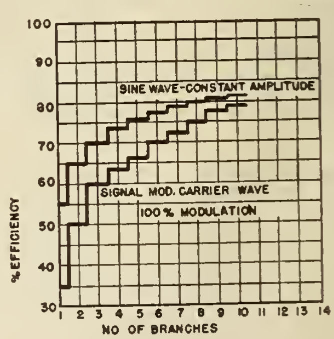

Fig. 8—Per-cent efficiency of transmission of a sine wave and of a carrier wave 100 per cent modulated by a sine wave, through amplifiers of different numbers of branches. In each case, succeeding branches have a 3-decibel difference in output power.

tially constant and high, or in which the carrier is suppressed. Since suppressed-carrier systems are of rather a special nature and require special receivers, consideration of a controlled-carrier system is of more interest in the present application. In a controlled-carrier system, in general it is not necessary to use special receiver, and the transmission is essentially no different from constant-carrier systems.

The usual way in which a controlled-carrier system operates is to derive from the audio-frequency modulating wave a unidirectional pulse which has the form of the envelope of the audio-frequency wave. Thus in Fig. 10, the input wave A is rectified and filtered to provide the unidirectional pulse B. This pulse is then added to the original wave to form the unidirectional wave C. It is this wave which is introduced into the system ahead of the modulated-wave amplifier. This wave is applied to the modulated amplifier in such a way, that when no speech current exists, carrier is transmitted at only a very low level, say 5 per cent of the maximum capacity of the system. When speech current is applied, the carrier is increased proportionately to this current so that the output wave consists of a voice-modulated carrier wave whose modulation is substantially complete for all amplitudes of the voice wave. Such a wave is shown as D in Fig. 10. Since average voice modulation is only about 20 per cent, it is seen that the range of amplitudes of the output wave will vary, not in a ratio of 2 to 1 as in the conventional transmitter, but in a ratio of, say, 30 to 1, with the average amplitude about one fifth of the peak amplitude instead of about one half the peak amplitude as is the case in a conventional system. It will be recognized that these factors are responsible for the low efficiency of conventional linear amplifiers in controlled-carrier systems, and that the ability of the circuit outlined in the previous paragraphs to sustain its efficiency at low amplitude will be of great value for this type of transmission For example, to consider again a transmitter with an unmodulated output of 100 watts, if this carrier is so controlled that it drops to, say, 5 watts in the absence of modulation, it will rise to a total value of 150 watts, averaged over an audio-frequency cycle, for 100 per cent modulation. Considering average modulation as 20 per cent, the average power content of the carrier plus the sidebands will be somewhat more than 6 watts. This value would be 6 watts if the carrier were completely suppressed during silent periods, but the constant carrier output of 5 watts combined with the modulation gives an average carrier plus sideband output of about 10 watts. This output power will be generated in a three-branch amplifier with an efficiency of around 30 per cent. This can be determined by applying the data of Fig. 7 to the wave form D of Fig. 10. That is to say, the direct-current input to this output stage will be about 33 watts for telephonic speech. This compares with the case of the conventional class B amplifier operating on a controlled-carrier system where under similar conditions, the direct-current input is of the order of 200-watts, or of the class C carrier-amplifier modulated by the class B audio amplifier using a constant carrier where the direct-current input is about 300 watts.

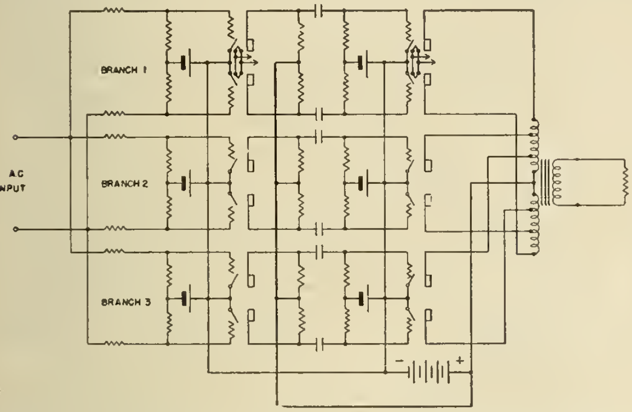

Fig. 9 — Schematic circuit of a three-branch audio-frequency amplifier, with separate "signal-shaping" stages.

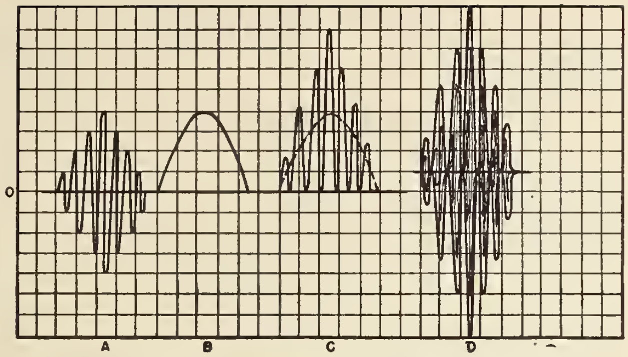

Fig. 10—Wave forms obtained in the operation of a controlled-carrier modulator.

Conclusions

On a basis of direct-current power input, this arrangement therefore appears to have an advantage of at least 5 to 1 over circuits now in use, and in some cases this improvement might be 10 to 1. It is possible that these advantages will not in all cases be obtained in practical apparatus due to the greater circuit complexity, but substantially the improvement to be expected should be obtained. A further point is that with this circuit the total power dissipation of the output stage is now considerably reduced. For instance, in the example cited above, the power to be dissipated by the anodes of the power-amplifier tubes for average telephonic speech is about 23 watts. The power to be dissipated by the anodes of the power amplifier in a controlled-carrier system, using a conventional class B power stage is about 190 watts, and in an output stage in which a class C amplifier is plate modulated by a class B audio amplifier, it is about the same. The anode dissipation in the system described is therefore only about 15 per cent of that obtained in conventional systems, and the tube complement employed is of correspondingly smaller capacity.

Practical Variations of Basic Circuit

A large number of variations of this basic idea is obviously possible. Only the " vertical " division of the wave has been considered. " Horizontal " division is also possible, in which all branches may transmit current simultaneously; this would involve a bridge or hybrid-coil arrangement in the output, so that the branches could supply current simultaneously to the load, without mutual coupling. Both series and shunt plate-supply arrangements should be considered. In place of the " signal-shaping " arrangement employing adjustments of grid drive and grid bias to set up the sections of the wave, the plate current of one

branch can be utilized to "trigger" the grid bias of the succeeding branch. By using a divided direct-current power supply, the branches can be arranged in parallel or in series to deliver power to a single load impedance, instead of the divided load described. The adaptations of this circuit to a modulated amplifier and to an oscillator are straightforward.

Special tubes, having a higher ratio of plate current to plate dissipation than those currently used, will have particular value in this circuit. New forms of tubes, employing multiple grids or multiple anodes, with heat interchange between the anodes, appear to have useful possibilities.

The foregoing material gives a qualitative description of the operation of the new circuit as a linear amplifier.

Mr. E. S. Kelsey, M.E.I.C., Electronics Research Engineer, Northern Electric Company Limited, at Montreal, has made a theoretical analysis *(Journal of the Institute of Radio Engineers*, January, 1946) of the circuit for the cases of a triangular wave and a sinusoidal wave, in each case of constant amplitude. This study in these cases supports the experimental results noted above, but the case of a voice-modulated carrier wave, either with or without the complications of carrier-control or carrier-suppression, requires more basic experimental data before it can be treated theoretically in a satisfactory manner. Mr. Kelsey intends to carry out and report on this further study.

The optimum ratios of the peak voltage output of each branch to the maximum load voltage were worked out for circuits with up to five branches, and using these optimum values ("voltage factors") the efficiency of theoretical 1000 watt-output amplifiers, for the cases of a triangular and a sine-wave, were calculated. Tables I and II show these conclusions. In arriving at these results it has been assumed that in every case the ratio of voltage across the load to supply voltage ("voltage-utilization factor") reaches a maximum of 0.9.

These theoretical results are somewhat more favourable than those reported above, from the initial experimental work. For instance, in the case of the sinusoidal wave, the efficiency of the 5-branch amplifier is 83.8 per cent as against 70.6 per cent for a conventional amplifier.

Acknowledgment

The author is indebted to Mr. C. B. Fisher, M.E.I.C., of Montreal, who worked over the proposal in its early stages and first put it into a sound theoretical and practical form. Wing Commander K. R. Patrick, O.B.E., of the R.C.A.F. was of assistance on the experimental side.

GAS TURBINE FUNDAMENTALS

DALE D. STREID
Aircraft Gas Turbine Engineering Division, General Electric Company, Lynn, Mass., U.S.A.

A paper presented before the Montreal Branch of The Engineering Institute of Canada, on December 6th, 1945.

The gas turbine is a prime mover embodying a compressor, a combustion chamber, and a turbine as illustrated in Fig. 1. Any combination of these elements working together is considered a gas turbine; however, the use of these components in conjunction with an Otto cycle engine, a Diesel engine, a steam power plant, or other common forms of prime movers is not considered as a gas turbine power plant. Other components besides the compressor, combustion chamber, and turbine may be added to these and the resulting power plant is still considered a gas turbine. Such components are regenerators, compressor interstage coolers, turbine interstage combustion chambers, and split compressors or split turbines. The addition of these other components merely improves the performance or mechanical operation of the gas turbine and does not change its fundamental principles.

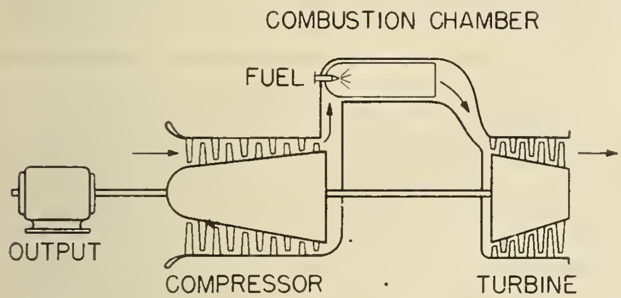

Fig. 1—Schematic diagram of simple cycle gas turbine.

The gas turbine as illustrated in Fig. 1 operates on the familiar Joule (or Brayton) cycle which consists of adiabatic compression, constant pressure burning, and adiabatic expansion. The adiabatic compression is normally accomplished in a compressor which may be either of the axial flow type or the centrifugal type or a combination of the two. The constant pressure burning is normally accomplished in a combustion chamber, although heating of the air may be done by indirect means such as a heat exchanger. The adiabatic expansion is normally accomplished by means of a turbine although other methods of removing the energy from the gas may also be used. The cycle of operation of the gas turbine is illustrated on the diagram shown in Fig. 2. The air enters the compressor at (1) and is compressed adiabatically to (2). It then enters the combustion chamber and is heated at constant pressure to (3). In this state it enters the turbine and is expanded adiabatically to (4).. Obviously, this is a simplified explanation since the compression is not 100 per cent efficient adiabatic compression, the heating does not occur without a slight pressure loss, and the expansion in the turbine is not 100 per cent efficient adiabatic expansion. However, the cycle is very well illustrated by this example of ideal conditions.

For the purpose of this paper, gas turbines are considered as being in two classes; the static gas turbine, and the dynamic gas turbine. The static gas turbine is the one used for the familiar applications such as stationary power plant, marine power plant, locomotive power plant, etc. The dynamic gas turbine is the one used for aircraft applications in which the performance is greatly affected by the forward speed of the gas turbine. The fundamentals of the static gas turbine are thoroughly discussed in the literature; some of the most recent publications are given in References 3, 4, 5, and 10. The simple theory and some performance data of the static gas turbine are being repeated in this paper merely to provide a background and foundation for the theory and performance of the dynamic gas turbine. The simplest form of the static gas turbine is the simple cycle gas turbine shown in Fig. 1.

The performance of gas turbines depends on the properties of air and gasses at pressures and temperatures which vary over a wide range. Therefore, to be strictly correct, the calculations of the performance of the gas turbines must take account of the variations of available energy, enthalpy, specific heat, and other properties with temperature and pressure, as well as with moisture content and composition. Since this is a very laborious process, and since the properties of air and hot gas have only recently been accurately established (See Ref. 6 and 7), simplifying assumptions are usually made. The simplest assumption, which may be called the first approximation, is that of an Ideal Air Cycle using normal air throughout and perfect gas laws. The second approximation, and the one used in this paper, is to assume normal air for the compressor, average properties for the air in the combustion chamber, and average properties for the hot gasses in the turbine. In addition, it is assumed that the air in the compressor, the air in the combustion chamber, and the hot gas in the turbine obey the perfect gas laws.

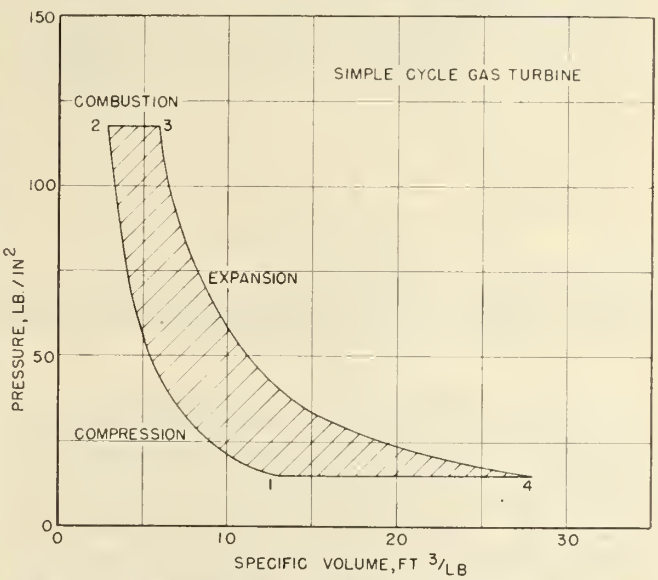

Fig. 2—Pressure-volume diagram of simple cycle gas turbine. These curves are based on assumed efficiencies.

Based on these assumptions, the compression in the compressor results in a temperature rise of

$$\triangle T_c = \frac{XT_1}{\eta_c}$$

where X is obtained from the familiar expression:

$$X = \left[\left(\frac{p_2}{p_1}\right)^{\frac{k-1}{k}} - 1\right]$$

The power required for this cycle is given by the following:

$$P_c = \frac{778}{550} C_{pc} \triangle T_c w_a$$

The temperature rise in the combustion chamber is given by:

$$\triangle T_b = \frac{w_f}{w_a} \quad \frac{Q_L \eta_b}{C_{pb}}$$

and the pressure loss through the combustion chamber is given by

$$\triangle p_b = p_2 - p_3 = C_b p_2$$

The temperature drop through the turbine is given by

$$\triangle T_u = \eta_u \varphi T_3$$

where φ is a function for expansion similar to the X function for compression

$$\varphi = \frac{\left[\left(\frac{p_3}{p_4}\right)^{\frac{k-1}{k}} - 1\right]}{\left(\frac{p_3}{p_4}\right)^{\frac{k-1}{k}}}$$

The power developed by the turbine is given by the following equation:

$$P_u = \frac{778}{550} \triangle T_u C_{pu} w_g$$

(See appendix A for nomenclature).

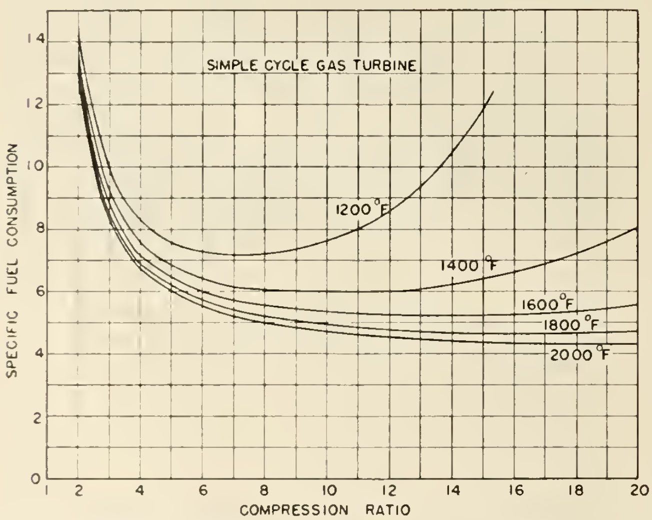

Fig. 3—Effect of compression ratio and turbine inlet temperature on specific fuel consumption of a simple cycle gas turbine. These curves are based on assumed efficiencies.

In analyzing the gas turbine throughout this paper, the weight flow of hot gas from the combustion chamber and through the turbine is assumed to be equal to the weight flow of air entering the compressor. Actually the hot gas flow from the combustion chamber and through the turbine is greater than the air flow into the compressor by the amount of fuel burned. These two flows are being made equal with the assumption that the difference represents the mechanical loss. Thus, it is not necessary to use a mechanical or coupling efficiency to take account of the heat radiation losses, the bearing losses, the windage losses, etc. of the turbine, the combustion chamber, the compressor, and the power output.

The performance of all of the gas turbine cycles throughout this entire paper is based on the standard efficiencies shown in Table I. These efficiencies are used in all curves and discussions of this paper except when it is specifically indicated that one or more of them is changed or being considered variable.

The efficiencies shown in Table I are assumed values which are not necessarily obtained at present. However, in the author's opinion, these values represent a possibility for the future, with the development of the art proceeding as it is to-day. Since these efficiencies are being used for illustration of the fundamentals of gas turbines and not for actual performance representation, the performance data presented in this paper are not for any real gas turbine, either in existence or of a proposed design.

Table I—Standard Efficiencies for Gas Turbine Calculations

Compressor Efficiency	η_c	.85
Turbine Efficiency	η_u	.83
Turbine & Jet Efficiency	η_{uj}	.90
Jet Efficiency	η_j	.98
Combustion Chamber Pressure Loss	C_b	.03
Heat Exchanger Effectiveness	η_h	.50
Combustion Efficiency	η_b	.98
Ram Efficiency	η_r	.85
Regenerator Pressure Loss	C_h	.05
Intercooler Pressure Loss	C_h	.03

It is realized that these efficiencies are both higher and lower than those used by other authors in gas turbine papers. (See Ref. 3, 4, 5, and 10). For example, Ref. 5 uses .80 for both compressor and turbine efficiencies. These values may be representative of present practice, considering the effects of dirt, carbon, deterioration of the vital parts, etc., but it is expected that improvements will be made leading to the realization of the assumed efficiencies given in Table I. The heat exchanger effectiveness and pressure loss are controversial subjects, and an effectiveness of .75 might easily be obtained with a pressure loss of .08 instead of the values given in Table I.

All of the curves and discussion of this paper are based on constant values for the properties of the air and hot gas as shown in Table II. The properties of air are for "Normal Air" described in Reference 1. The conditions of the air at altitude are taken from Reference 2. The properties of the air in the combustion chamber are average values for air at about 900 deg. F. The properties for the hot gas in the turbine are average values at about 1500 deg. F. (See Ref. 6 and 7). Experience has shown that the use of these constant values in gas turbine calculations gives performance which is very nearly the same as that obtained by the rigorous method employing actual properties, enthalpies, etc. This is true for only one set of conditions, but it is reasonably well true for other reasonably similar conditions.

The basic parameter of performance to be used in this paper as the ordinate for most of the curves is Specific Fuel Consumption. The Specific Fuel Consumption is the ratio of the fuel flow in pounds per hour to the output in horse power.

$$w_{fp} = \frac{\text{lb (fuel)}}{\text{hp. hr.}}$$

There is a definite relation between the Thermal Efficiency normally used for analysis of power plants and the Specific Fuel Consumption as follows:

$$\text{Thermal Efficiency} = \frac{3600 \times 550}{w_{fp} \times 778 \times Q_L}$$

Table II—Constant Values for Gas Turbine Calculations

Compression

$C_{pc} = .243$ Btu/lb °F.

$k = 1.3947 = C_p/C_v$

$\frac{k-1}{k} = .283$

$R_c = 53.4$

Combustion

$C_{pb} = .26$ Btu/lb °F.

$Q_L = 18{,}550$ Btu/lb

Turbine

$C_{pu} = .276$ Btu/lb °F.

$k = 1.33 = C_p/C_v$

$\frac{k-1}{k} = .248$

$R_u = 53.6$

Inlet Air

$T_{am} = 518.4$ °F.

$P_{am} = 14.7$ lb/in^2

Very elementary considerations of the simple cycle gas turbine show that a considerable amount of heat energy is being wasted in the exhaust from the turbine. If this heat energy could be used in place of fuel to help to heat the compressor discharge air, an improvement in Specific Fuel Consumption can be obtained. By means of a heat exchanger called a regenerator, some of the waste heat can be so utilized. The performance of regenerators is normally considered in terms of their effectiveness as a heat exchanger. Effectiveness is the ratio of the temperature rise (or drop) of the fluid being heated (or cooled) to the inlet temperature difference between the fluid being heated (or cooled) and the heating (or cooling) fluid.

Figure 4 is a schematic diagram of a regenerative cycle static gas turbine. The regenerative cycle is obtained by adding a regenerator to the simple cycle. This is recognized as one of the most useful gas turbine cycles and will probably have many applications. Figure 5 shows the effect of regenerator effectiveness on the Specific Fuel Consumption of a regenerative cycle gas turbine. The curve with no regeneration is for the simple cycle gas turbine. Figure 5 clearly illustrates that, for any given regenerator effectiveness, there is a certain optimum pressure ratio at which minimum Specific Fuel Consumption is obtained. This figure also shows that considerable gains in Specific Fuel Consumption can be realized by using a regenerator. Furthermore, it shows that the optimum compression ratio for a regenerative cycle is considerably lower than for a simple cycle.

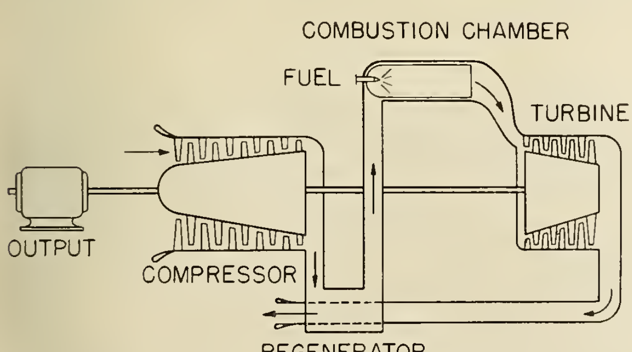

Fig. 4—Schematic diagram of a regenerative cycle gas turbine.

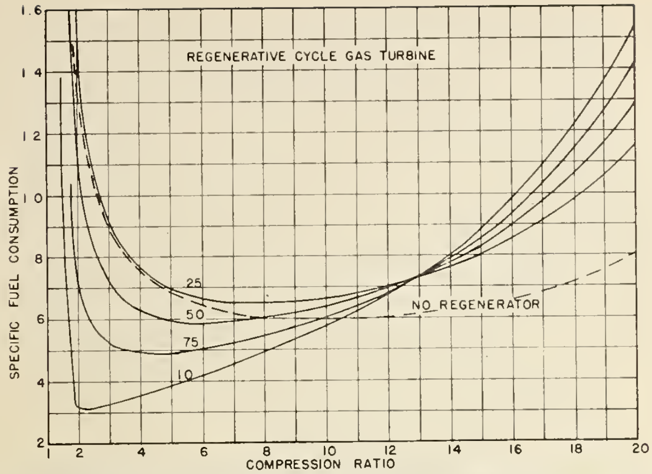

Fig. 5—Effect of regenerator effectiveness and compression ratio on the specific fuel consumption of a regenerative cycle gas turbine. These curves are based on assumed efficiencies. $T_3 = 1400$°F.

By rather elementary considerations of the gas turbine cycle, it is apparent that improved performance can be obtained by intercooling between compressor stages and by reheating between turbine stages. In the limit these additions result in a cycle with isothermal compression, constant pressure combustion, isothermal expansion, and regeneration to conserve waste heat. A cycle with intercooling between compressor stages, with reheating between turbine stages, and with a regenerator is called a complete cycle and is illustrated in Fig. 6. The Specific Fuel Consumption of a complete cycle compared to the Specific Fuel Consumption of a regenerative cycle and of a simple cycle is shown on Fig. 7 for various pressure ratios. Unfortunately, it is not possible to realize the good performance which could be obtained by isothermal compression and isothermal expansion. Furthermore, the pressure drops through intercoolers, combustion chambers, and regenerators detract considerably from the performance which could be obtained if these pressure drops were negligible. Even so, a very definite gain is shown for the complete cycle over the regenerative cycle, by

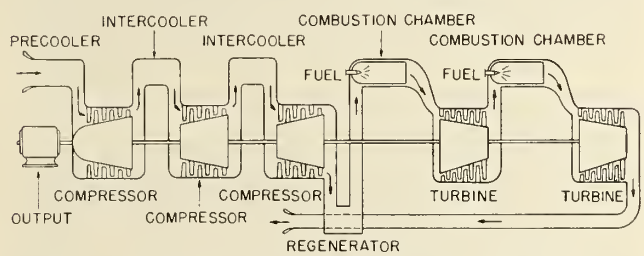

Fig. 6—Schematic diagram of a complete cycle gas turbine.

about as much as the regenerative cycle is better than the simple cycle. Thus, it appears that as the gas turbine becomes more complex, its performance is improved, although this improvement is obtained only at the expense of a greater amount of capital equipment and a considerable increase in the maintenance costs. However, in large power plants, the improvement in Specific Fuel Consumption may be sufficient to warrant the increased capital investment and increased maintenance cost.

When the gas turbine is used for propulsion of aircraft or for other purposes in which the forward velocity is high, two new effects must be considered. These are the effect of the ramming intake and the effect of the jet discharge. When these two effects become appreciable

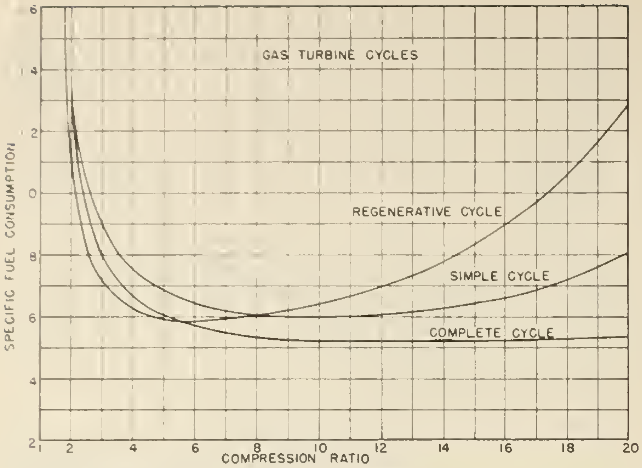

Fig. 7—Effect of compression ratio on the specific fuel consumption of a complete cycle gas turbine. These curves are based on assumed efficiencies. $T_3 = 1400°F$.

and affect performance, the gas turbine is called a dynamic gas turbine to differentiate it from the static gas turbines discussed above in which the ramming intake and the jet discharge are not important factors. For all practical purposes, the dynamic gas turbine can be considered the gas turbine for aircraft propulsion.

The ramming intake increases both the temperature and the pressure at the compressor inlet. The temperature rise is the full temperature rise equivalent to the forward speed of the gas turbine and is given by:

$$\triangle T_r = \frac{V^2}{2gJC_{pc}}$$

The pressure rise is not as efficient as the temperature rise and only a portion of the pressure rise theoretically available can be obtained. In aircraft literature, the ram efficiency is defined as follows:

$$p_1 - p_{am} = \eta_r \, q_c$$

Where the theoretical rise q_c is obtained from:

$$\left[(q_c/p_{am} + 1)^{\frac{k-1}{k}} - 1) \right] \quad T_{am} = \triangle T_r$$

The performance of the dynamic gas turbine is adversely affected by the ram temperature rise; however, the performance is improved by the ram pressure rise. Since the temperature rise is automatic, the only controllable factor is the ram efficiency which has a very important effect on the performance as will be illustrated.

The available energy at the turbine inlet can be used both for turbine power and for jet power, providing the forward speed of the gas turbine is high enough so that some power can be developed by the jet thrust. Therefore, a combined turbine and jet efficiency, η_{uj}, is used for determining the proportion of the available energy at the turbine inlet which is realized in the turbine and in the jet. Thus, the temperature drop through the turbine and jet is:

$$\triangle T_u + \triangle T_j = \eta_{uj} \, \varphi T_3$$

where

$$\varphi = \frac{\left[\left(\dfrac{p_3}{p_{am}} \right)^{\frac{k-1}{k}} - 1 \right]}{\left(\dfrac{p_3}{p_{am}} \right)^{\frac{k-1}{k}}}$$

This definition of combined turbine and jet efficiency results in an apparent turbine efficiency of η_{uj} when no energy is being used in the jet which is somewhat unrealistic. However, when reasonable jet velocities are used, as is necessary in a real gas turbine design, this combined turbine and jet efficiency is a reasonable approximation.

The power developed by the turbine is the same as given above for the static gas turbine.

The jet velocity is obtained from the relation

$$v_j = \sqrt{2gJ \, C_{pu} \, \eta_j \, \triangle T_j}$$

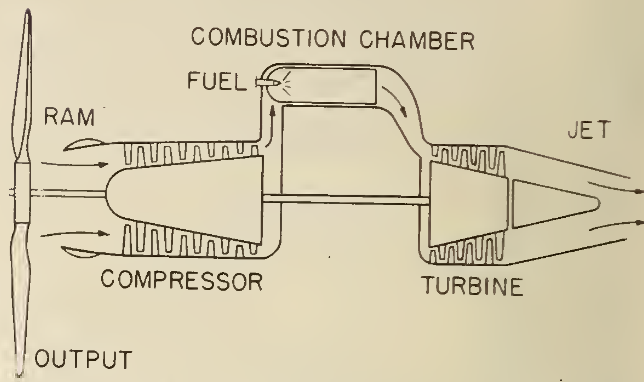

Fig. 8—Schematic diagram of a propeller drive gas turbine.

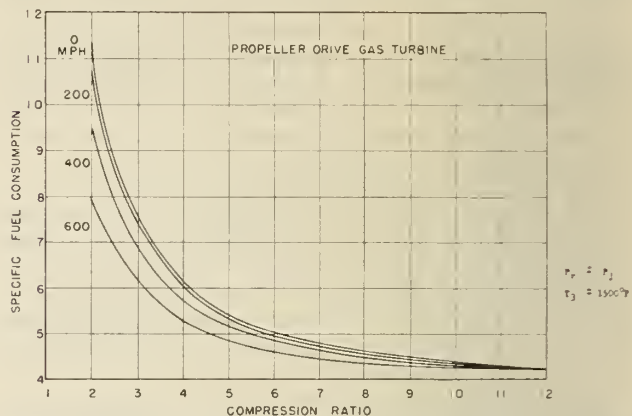

Fig. 9—Effect of forward speed and compression ratio on the specific fuel consumption of a propeller drive gas turbine. These curves are based on assumed efficiencies.

The dynamic gas turbine is moving with sufficient speed so that the power required to take the air on board and accelerate it to the speed of the gas turbine must be considered. Likewise, the power developed by the jet due to its rear-ward velocity from the gas turbine becomes appreciable. This can be considered the elementary theory of jet propulsion and is based on Newton's second law of motion which says that thrust is equal to the time rate of change of momentum. On this theory, the ram power is:

$$P_r = \frac{V^2 \, w_a}{550g}$$

Likewise, the jet power is

$$P_j = \frac{V v_j \, w_g}{550g}$$

Figure 8 is a schematic diagram of a dynamic gas turbine for propeller drive. The air enters the ramming intake and is compressed and heated by ram as described above due to the forward speed of the gas turbine. It then passes through the compressor, the combustion chamber, and the turbine. From the turbine, it is discharged through a jet nozzle to the rear. Output power developed is delivered to a propeller. Obviously, this gas turbine must be charged with the power lost due to ram and must be given credit for the power developed by the jet. Thus, the power output is the shaft power plus the propulsive jet power minus the ram power. In all considerations of the propeller drive gas turbine, the power output is based on the shaft power and does not include a propeller efficiency. In a real application, the useful output is obtained by multiplying the shaft power by the propeller efficiency, adding the jet power, and subtracting the ram power.

The performance of a propeller drive gas turbine is shown in Fig. 9. This shows the effect of forward speed and compression ratio on the Specific Fuel Consumption of a propeller drive gas turbine. This curve was made by assuming that the jet power is equal to the ram power, which, of course, is an assumption. Theoretically, the turbine energy can be divided between the propeller and the jet in any desired proportion. The effect of division of energy between the propeller and the jet on the Specific Fuel Consumption of a propeller drive gas turbine is shown in Fig. 10. This shows that the optimum performance is obtained at a certain energy distribution between the propeller and the jet depending on the forward speed. Further analysis of this has shown that this optimum point of Specific Fuel Consumption occurs where the jet power is equal to the ram power. Thus, the curves of Fig. 9 are for the optimum distribution of energy between the propeller and the jet. Since it is impractical to design a turbine without some leaving loss (or energy in the exhaust) these curves are only of theoretical interest below about 15 per cent energy in the jet.

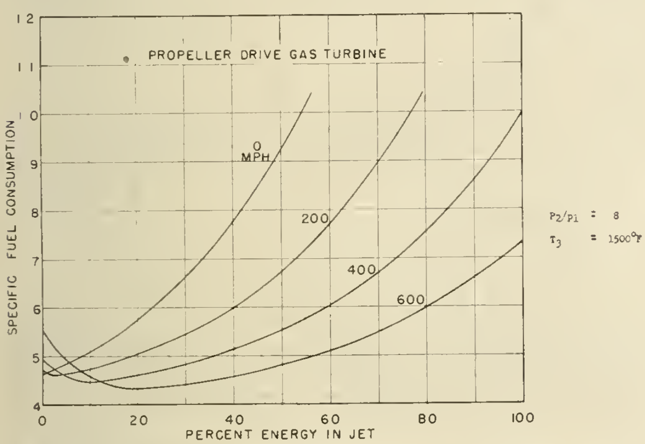

Fig. 10—Effect on the specific fuel consumption of the division of energy between the propeller and the jet of a propeller drive gas turbine. Efficiencies assumed.

Since the propeller drive gas turbine is particularly for aircraft application, it might be expected that altitude will have some effect on performance. The output of a given gas turbine is materially affected by the reduction in density at high altitudes. This, however, is a mechanical consideration and is beyond the scope of this paper. There is also a thermodynamic effect due to the reduction in temperature with increasing altitude. This effect is illustrated in Fig. 11 which shows the effect of altitude on the Specific Fuel Consumption. This entire effect is due to inlet temperature change and it is not due to pressure change. This shows that optimum performance of a propeller drive gas turbine can always be obtained at the highest altitude or at the lowest air temperature obtainable.

In the limit of zero shaft power when all of the energy is used in the jet discharge, the propeller drive gas turbine becomes a pure jet propulsion gas turbine. Figure 12 is a schematic diagram of a jet propulsion gas turbine. In this cycle the air is compressed in a ramming intake. It then passes through a compressor, a combustion chamber, and a turbine. At the exhaust from the turbine it is discharged rearward through a

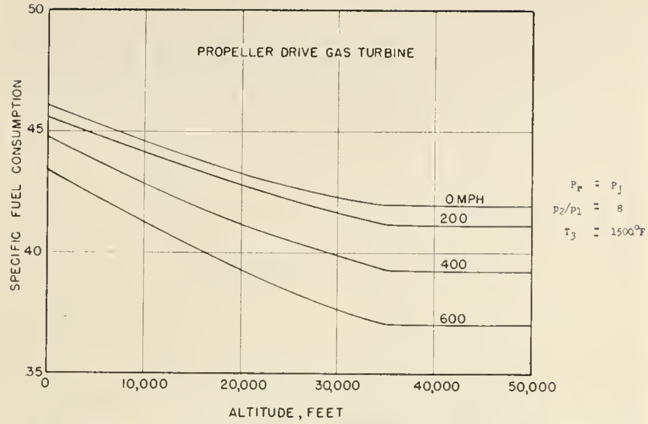

Fig. 11—Effect of altitude on the specific fuel consumption of a propeller drive gas turbine. These curves are based on assumed efficiencies.

jet nozzle. The power of the turbine is just sufficient to drive the compressor. Although this is a special case of the propeller drive gas turbine, it is a very important gas turbine cycle and so will be discussed and illustrated in some detail. Figure 13 shows the effect of compression ratio and forward speed on the Specific Fuel Consumption. Shown on the same figure is the curve for a propeller drive gas turbine at 400 mph for which the Specific Fuel Consumption has been increased by dividing by the propeller efficiency in order to put it on a comparable basis. The propeller efficiency is assumed to be .86, which is a reasonable propeller efficiency at sea level and 400 mph. (according to Reference 11). The Specific Fuel Consumption of the jet propulsion gas turbine is based on propulsive power, whereas the Specific Fuel Consumption of the propeller drive gas turbine must be divided by the propeller efficiency to be based on propulsive power which brings the actual performance of the two gas turbines much closer. At very high speeds, the propeller efficiency falls off with speed increase, and the jet propulsion gas turbine gets better with speed increase. Thus, there is some forward speed above which the Specific Fuel Consumption based on net propulsive power of the jet propulsion gas turbine is better than of the propeller drive gas turbine, or of other forms of power plants having comparable performance which may be used with a propeller.

Figure 14 shows the effect of turbine and compressor efficiency on the Specific Fuel Consumption of a jet propulsion gas turbine. Various curves are shown for various ram efficiencies. This shows very clearly the importance of obtaining the highest possible ram efficiency if good Specific Fuel Consumption is to be obtained. This curve was made up by assuming that the ratio of the compressor efficiency to the turbine and jet efficiency was constant at the standard value of .945. The same curves are approximately true for other ratios of compressor and turbine efficiency. The

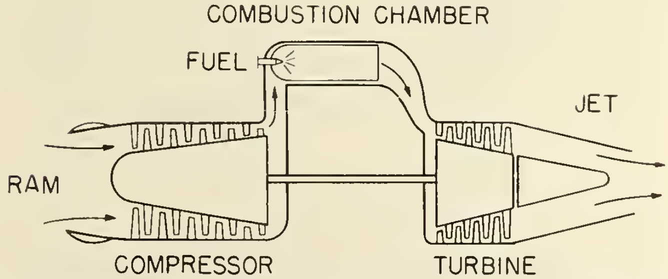

Fig. 12—Schematic diagram of a jet propulsion gas turbine.

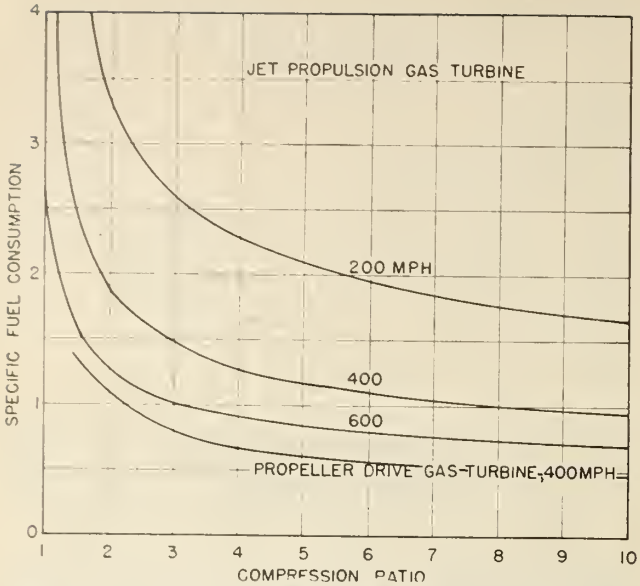

Fig. 13—Effect of compression ratio and forward speed on the specific fuel consumption of a jet propulsion gas turbine. These curves are based on assumed efficiencies. Propeller efficiency = .86 T_3 = 1500°F.

output of a jet propulsion gas turbine falls off with increasing altitude because of reduced density. However, the temperature effect is not as pronounced for the jet propulsion gas turbine as it is for the propeller drive gas turbine as was shown in Fig. 11.

In dealing with jet propulsion, it is obvious that there is no power output when the gas turbine is tested in a test cell, because the gas turbine is not in motion. Therefore, another parameter is used with jet propulsion, and is called Specific Fuel Consumption based on thrust. This is defined as the fuel flow in pounds per hour divided by the net thrust developed by the gas turbine in pounds.

$$w_{fn} = \frac{\text{lb (fuel)}}{\text{lb (net thrust) hr.}}$$

By using this Specific Fuel Consumption based on thrust, it is possible to obtain data in test cells and make extrapolations to actual operating conditions. Figure 15 illustrates the Specific Fuel Consumption based on thrust as a function of compression ratio for various forward speeds. This is the only curve for jet propulsion on which zero miles per hour forward speed is plotted. Thus, tests can be run in a cell with the gas turbine static and the curve for zero miles per hour can be obtained. Extrapolations to actual operating conditions are much easier on this basis for thrust, than are extrapolations of power.

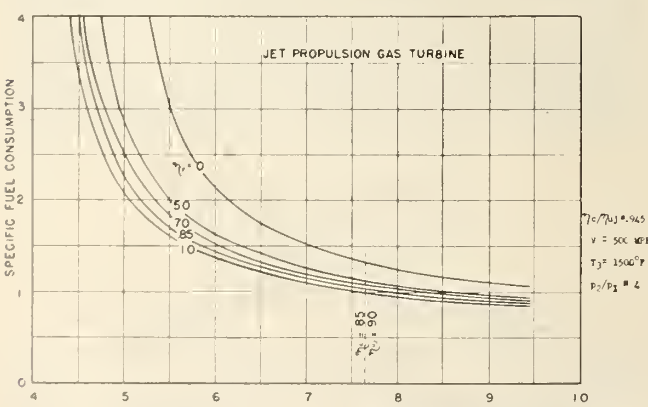

Fig. 14—Effect of compressor, turbine, and ram efficiency on the specific fuel consumption of a jet propulsion gas turbine. Based on assumed efficieneics.

As shown on Fig. 3 the performance of a static gas turbine is improved by using higher turbine inlet temperatures. The same is true also for a propeller drive gas turbine. This, however, is not true for jet propulsion gas turbines because the higher turbine inlet temperatures result in higher jet velocities and lower propulsive efficiencies. Figure 16 illustrates the effect of turbine inlet temperature on the Specific Fuel Consumption of a jet propulsion gas turbine for various forward speeds. This shows that for any given forward speed, there is an optimum turbine inlet temperature for minimum Specific Fuel Consumption. This turbine inlet temperature occurs at relatively low temperatures compared to the practical operating temperatures for gas turbines. For example, at 400 mph the minimum Specific Fuel Consumption occurs at about 1100 deg. F, and at 600 mph the minimum Specific Fuel Consumption occurs at approximately 1200 deg. F. turbine inlet temperature. Fortunately, the curves are fairly flat for

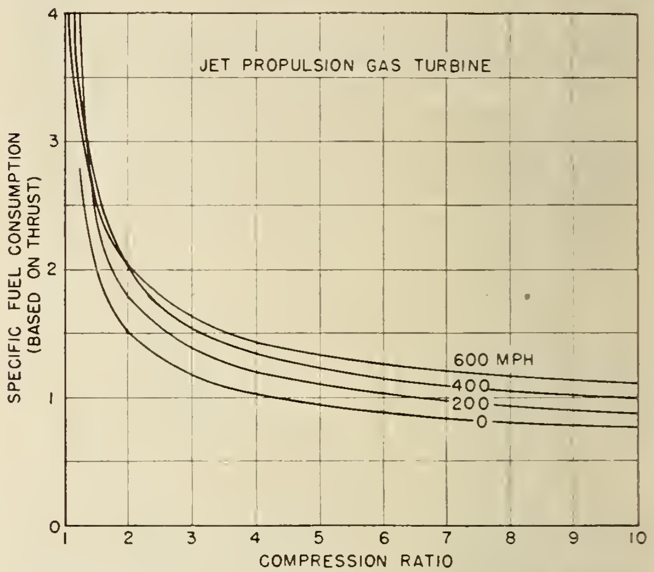

Fig. 15—Effect of compression ratio and forward speed on the specific fuel consumption based on thrust of a jet propulsion gas turbine. These curves are based on assumed efficiencies. T_3 = 1500°F.

higher temperatures, so the choice of turbine inlet temperature is not critical and depends on other factors.

In order to establish a basis for evaluation of the numerical values of Specific Fuel Consumption presented in this paper, the performance of other well known prime movers can be transformed into a comparable Specific Fuel Consumption. The Otto cycle aviation engine has a Specific Fuel Consumption ranging from .43 to .50 lb. (fuel) /hp hr. and averaging about .45. The best that has been realized to date with these engines is about .40 for ideal operating conditions of a new engine. These figures are not comparable to the performance of a jet propulsion gas turbine because they are based on test stand shaft power output. To be comparable, they must be converted to a propulsive power basis which means that the propeller efficiency and the cooling air drag power must be taken into account. This would increase these figures about 15 per cent to an average of about .52 lb. (fuel)/hp (propulsive) hr. The modern central station steam generating plant has a minimum heat rate of about 10,000 Btu (fuel)/KW hr. which corresponds to a Specific Fuel Consumption of .40 lb. (fuel)/hp hr. The combined mercury vapor and steam plant has attained as low as 9158 Btu (fuel)/KW hr. which is a Specific Fuel Consumption of .37 lb. (fuel)/hp hr. (See Reference 8). The modern

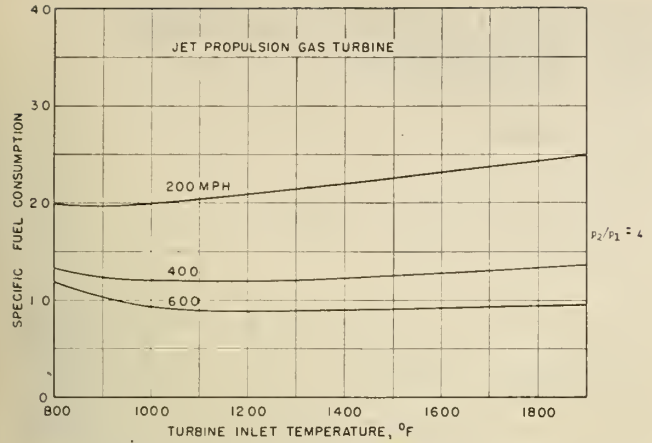

Fig. 16—Effect of turbine inlet temperature and forward speed on the specific fuel consumption of a jet propulsion gas turbine. Based on assumed efficiencies.

Diesel engine obtains as high as 35 per cent thermal efficiency which corresponds to a Specific Fuel Consumption of .39 lb (fuel)/hp hr. (See Reference 9). By comparing these figures with the curves presented in this paper, it is seen that the gas turbine is rapidly approaching the state of development where it will be competitive with these other types of prime movers. However, the gas turbine is shooting at moving targets which always seem to move ahead when the gas turbine seems to be getting close.

As shown in the early part of this paper, the addition of regenerators, intercoolers, etc., to the simple cycle improves the performance of the simple cycle gas turbine. (See Figs. 3, 5, and 7). In like manner, the performance of the propeller drive gas turbine can be improved by these additional components. Also, the jet propulsion gas turbine can be improved somewhat by these additional elements, although not as much as the propeller drive gas turbine. Thus, the dynamic gas turbine for aircraft propulsion offers interesting possibilities for the present and near future. It must be remembered that the performance data presented in this paper are based on assumed efficiencies, hence the performance data are not for any existing or proposed gas turbines.

The author wishes to acknowledge the help given him by his colleagues in the General Electric Company which has made possible the preparation of this paper. Messrs. R. A. Novak, J. E. Foisy, and C. E. Danforth are thanked especially for the preparation of the curves used in this paper.

THE WINTER TEMPERATURE CYCLE OF THE ST. LAWRENCE WATERS

A Plea for More Data

J. G. G. KERRY, M.E.I.C.

Paper to be presented at the Sixtieth Annual General Meeting of The Engineering Institute of Canada, at Montreal, on February 8th, 1946.

The boundaries of the Dominion of Canada are such that all its area lies within a section of the earth's surface that annually gives off more heat to outside space than it receives from the sun and from other celestial radiation. This fact means that the Canadian climate would steadily grow colder were it not for the counter balance supplied by air movements of very great magnitude from more favoured sections of the earth.

The staff of the Scripps Oceanographic Institute in their book, "The Oceans"⑬, make the following estimate of the daily gains and losses of heat energy at various latitudes, the quantities given being in B.T.U.'s per sq. ft. per day:

Latitude	Heat Gains	Heat Losses	Net Loss or Gain
30	1578	1504	+ 74
40	1419	1446	− 27
50	1233	1371	−138

In view of these geophysical facts it is natural that all questions concerning the formation of ice and snow should be of great interest to every construction engineer practicing in Canada, for he must deal with these obstructions sooner or later. It was fitting that the first paper read to the Canadian Society of Civil Engineers dealt with the formation of frasil ice.

This present paper contains a brief review of certain sections of the available data upon which the practice of what the late Dr. Barnes called "Ice Engineering" is based—the history of the engineer's struggle in Canada against these major obstructions is briefly related, present-day knowledge or rather lack of knowledge of the life history of float ice on the Great Lakes is considered, the winter temperature cycle of the waters of the Great Lakes, both surface and sub-surface, is discussed and the causes that make these waters lose or gain heat energy are analyzed. The writer's conclusions are that data on these major problems are woefully lacking, for no major scientific study appears to have been made at any time covering the formation and dissipation of sheet ice on the Great Lakes, only one scientific study of the depth temperatures of their waters has been published and on only one of the Great Lakes have the temperatures of the surface waters been systematically recorded over a period of years. Finally, no estimates have been made of the heat energy contained in the waters of the Great Lakes at various dates throughout the year nor has any study been made of the possibility of beneficially utilizing this heat energy. It is hoped that the publication of this paper will lead to greater activity on the part of proper authority in the collection and publication of the needed data.

History

Historically, the struggle against the forces of ice and snow has been active for a century past and one gain after another has been achieved by the profession. Along the St. Lawrence waterway, perhaps the first notable step was the construction of the old revetment wall in front of Montreal by the Royal Engineers in the early 1840's when, for the first time, the moving ice sheet met up with a piece of construction that it could not overthrow. The writer has seen ice piled up sixty-odd feet deep on the old low level wharves in Montreal where the spring shove had crashed against the masonry of the now buried revetment wall.

A second step was the construction of the Victoria Bridge in the late 1850's by the engineers of the Grand Trunk Railway. Even to-day it is a pleasure to watch the moving ice sheet shattering itself to pieces against the highly developed cutwaters of the old bridge.

The Montreal Flood Commission (1889) made extensive surveys of the ice conditions around Montreal but the complete success of the simple remedy that the Commission recommended for the protection of the city has caused other remedies that the Commission was considering to be overlooked.

The high level piers and the Guard Pier in Montreal were to some extent the outcome of the Flood Commission's work, as Mr. John Kennedy, M.E.I.C., the chief engineer of the Montreal Harbour Commissioners, was also a member of the Flood Commission. After the completion of the Guard Pier about 1895, vessels could, for the first time, be safely wintered in Montreal harbour.

Mr. Kennedy also introduced in the 1880's the practice of taking daily observations of the water temperatures in the harbour with an especially protected thermometer. Sailing vessels were not unusual visitors to Montreal in those days and Mr. Kennedy depended upon his records of water temperatures when he had to decide when to issue warnings to the vessels in port that it was time for them to take final leave for the season or be frozen in. It was also at Mr. Kennedy's direction and at the expense of the Montreal Harbour Commission that Dr. T. Howard Barnes, M.E.I.C., commenced his long series of experiments on water temperatures and ice formation, definitely confirming to the profession the fact that running water never falls sensibly below 32 deg. F. in temperature during the winter months and that a very slight rise in the temperature of the mass destroys all the adhesive qualities of frasil ice.

Dr. Barnes' report resulted, amongst other consequences, in the patents taken out by Mr. John Murphy, M.E.I.C., Superintendent of the Ottawa Electric Company, who, in the operations of his company's plant at the Chaudière Falls on the Ottawa River, had then to deal with one of the most difficult ice situations in Canada. The successful result of Mr. Murphy's use of heat as a correcting agency is fully described in his paper presented to the Canadian Electrical Association in September, 1907. So far as the writer knows, no other engineer has as yet made use of heat on a similar major scale in the battle against ice.

The first extensive study of ice conditions along the entire St. Lawrence waterway appeared in the report of the U.S. Deep Waterways Commission which was presented in 1897.

No further studies of the ice problem appear to have been made until the growth of the demand for hydro-electric power resulted in the preparation of the Bowden-Wooten Report on the St. Lawrence Deep Waterway which was presented in 1921. This was followed by the Report of the Joint Board of Engineers which was completed in 1926. The Joint Board made extensive studies of the temperature conditions in the St. Lawrence river during the early weeks of winter.

During the last ten years the Dominion Meteorological Service has made an extended series of observations upon the surface temperatures of the Great Lakes, which study is still being carried on.

During all this time apparently but little attention has been given to two main problems affecting the design and use of the waterway, namely—

1. The control of float ice and the possibility of its exclusion from the major navigable channels.
2. The control of the temperatures of the water in the rivers issuing from the Great Lakes.

Sheet Ice

So far as the writer knows, no extended survey of ice formation and ice movement has ever been made on the Great Lakes and the subject is too vast to be undertaken by other than a government department or a privately endowed scientific institute.

Modern science has placed at the disposal of the profession the equipment and machinery with which such a survey could now be easily and not expensively carried out. It should cover with scientific accuracy:

1. The locations and date of the major formations of sheet ice.
2. The causes that make such ice break away from its moorings and the paths, if any, along which it normally drifts.

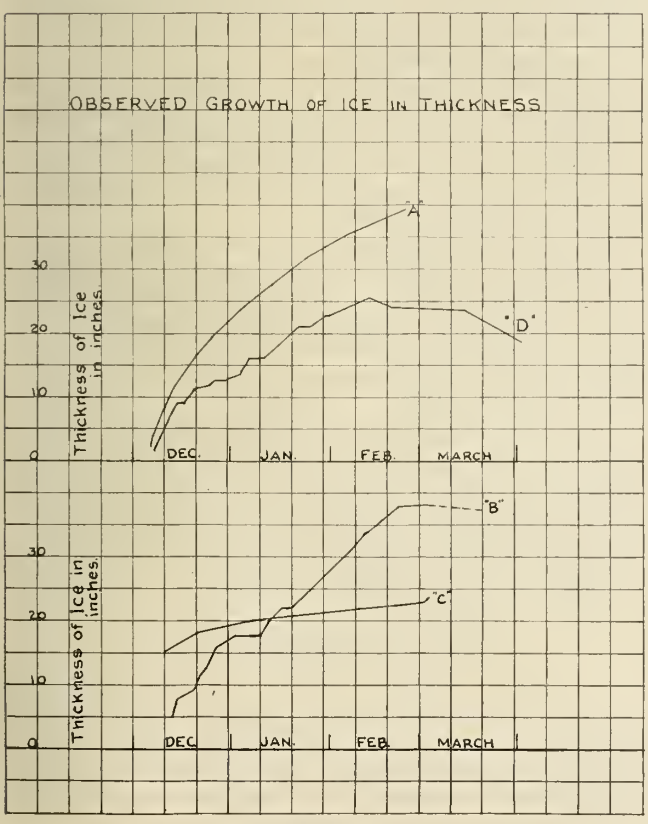

Figure 1.

3. The possibility of designing and constructing detour channels so placed that drift ice will not normally enter into them.
4. The possibility of confining sheet ice to its area of formation and of creating barriers that will close the natural channels through which drift ice frequently passes and from which it finds its way into the regular channels of navigation.

The Montreal Flood Commission gave some thought to the control and permanent anchoring of what is known as "bordage" ice in the province of Quebec—Mr. T. C. Keefer, M.E.I.C., the first engineer of the Montreal Ship Channel and the chairman of the Montreal Flood Commission, was convinced that the control of "bordage" was a reasonable engineering undertaking and he is on record as stating that if the surface of the St. Lawrence River between Montreal and tidewater could be kept as clear of float ice as it actually is between Lake St. Louis and the Lachine Rapids, no difficulty would be experienced in maintaining winter navigation over the section of the waterway between Montreal and tidewater.

The rate at which ice forms along the waterway and the thickness to which it grows are reasonably well known and these facts are illustrated by the curves appearing in Fig. 1. The origins of the curves shown are as follows:

Curve A is a theoretical curve calculated by Dr. Barnes' formula① governing the growth of ice in thickness, and the calculation is based on an assumed air temperature of 14 deg. F.

Curve B is the result of a series of measurements made by the Greater Winnipeg Water District under the direction of the late Mr. W. G. Chace, M.E.I.C., in 1913-14 on Shoal Lake, Manitoba. An area 50 ft. by 100 ft. was kept clear of snow and the ice thickness was measured daily. The average temperature at Shoal Lake during December was 20.1 F., during January 8.2 F. and during February minus 7.2 F.

Curve C is the result of a series of measurements also made by the Greater Winnipeg Water District under the direction of Mr. W. L. Scott in 1942-43 at the same place. The surface of the ice was not swept and measurements were taken weekly. The average temperatures were about minus 7.8 F. for January and plus 6.4 F. for February.

Curve D is the result of measurement taken by Dr. Barnes at Valleyfield, Que., in 1910-1911 and the surface of the ice was not swept. The average winter temperatures in Valleyfield were about 11 deg. F. in January and 12 deg. F. in February, 1911.

The following facts may be noted from Fig. 1:

1. The insulating effect of snow cover as shown by the divergence of Curves B and C and of Curves A and D.
2. The parallelism between Curves A and B although the air temperatures for Curve B during January and February were very much lower than those assumed in the calculations for Curve A. The conclusion may be drawn that the rate of the natural outdoor growth of ice is very appreciably slower than is the same growth under laboratory conditions.
3. The rapidity of the formation of the first few inches of ice. Dr. Barnes' estimate of the time required to form an ice sheet 1 in. thick with an air temperature of 14 deg. F. is very slightly over two hours.

No study as yet appears to have been made for the design of piers and booms to prevent sheet ice from breaking away from its place of formation as contemplated by the Montreal Flood Commission nor has the possibility of using ice as a controller of ice been given attention. There are few engineering structures that can be formed more simply and more quickly than a heavy field of ice; suitable site and air temperatures with an efficient pumping equipment is all that is required for overflooding and very rapid thickening. Yet a heavy snow-covered sheet of ice can serve as an excellent insulator as the curves in Fig. 1 show; it can be made use of as a formidable barrier with which to block and prevent the movement of other ice; and as it is floating it can be moved at will with suitable equipment to any location where it can be of service. Data are not now available concerning the strength of a great ice sheet or of its ability to resist the action of winds and waves. Considered solely as a heat problem it appears likely that ice will not form in quantity on the Great Lakes at any point where the waters have a depth of 200 ft. or over. On the other hand, thicknesses exceeding the thirty-eight inches measured by W. G. Chace at Shoal Lake will rarely be exceeded where the ice is undisturbed, Shoal Lake being both very shallow and very exposed. The formation of surface ice seems to depend mainly upon the depth of the waters and upon the activity of the winds. In general, ice does not form over deep waters but will do so on occasions more or less frequent if by some change in the winds the activity of the internal currents within the waters is checked.

Present-day knowledge of the actual ice conditions far out on the Great Lakes can be described as being decidedly vague and is summarized in the following quotations from a bulletin issued by the American Meteorological Society in 1944: "Do the Great Lakes freeze entirely across ? Aviators flying from Ontonagon, Upper Michigan, to Ile Royale have reported solid ice all the way and on to Canada, but it is believed that there is always some open water in eastern Lake Superior—Lake Michigan often freezes across the north and where there are islands. Railroad car ferry captains report Lake Michigan as frozen over between Milwaukee and Muskegon only once in 25 years of sailing and then for only one day. . . . There appears to be no information that Lake Huron has frozen across except at the south end of the lake. The narrow eastern end of Lake Erie freezes across, probably every winter, and this is true around and to the westward of the islands. . . . Lake Ontario was frozen entirely across during the winter of 1933-1934; this is the first time on record that such a condition has been reported." This is surely vague information after more than one hundred years of active navigation.

One definite fact has been contributed by the year 1945—in the first part of January several new merchant vessels left Duluth and made their way without difficulty to Sault Ste. Marie. These vessels were assisted by ice breakers when leaving Duluth and while passing through the St. Mary River, weather conditions at Sault Ste. Marie were very severe, the thermometer registering about 15 deg. F. below.

The progress in the art of communication made during the late war, especially for aviation service, makes it now possible to keep the Great Lakes carriers warned of nearly all the more serious dangers that beset navigation, such as winds, storms, fog, sleet, and approaching vessels, leaving float ice as perhaps the most serious problem calling for further study. How serious this problem is may be judged from the following extracts from an address given in 1943 to the Royal Meteorological Society of Canada by C. G. Andrus of the United States Weather Bureau:[14]

"The season opens when the ice floes are cleared

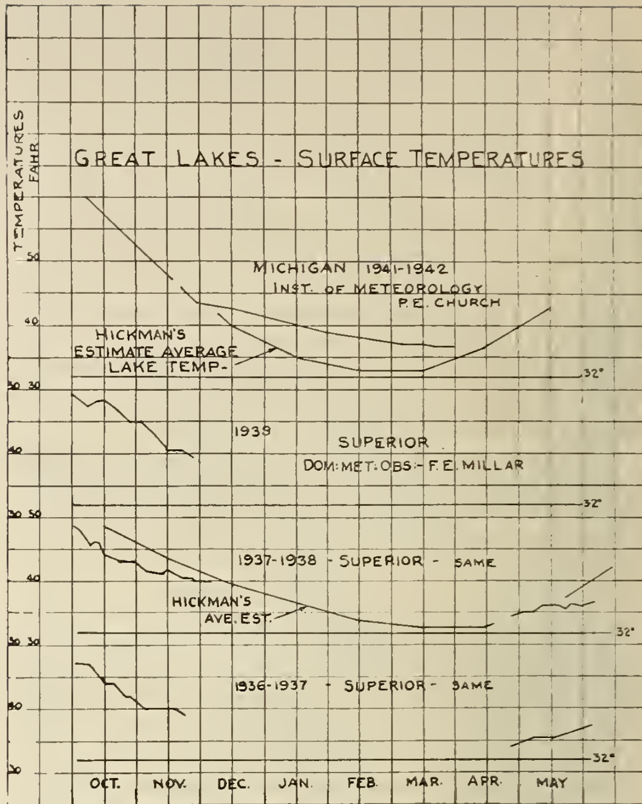

Figure 2.

from the lanes of navigation in the Spring; it closes when iced cargoes and iced harbours combine with the icing of ships to retard movements. In season every ship races continuously up and down the lakes as freely as sea and weather permit. . . . Ice may be classed as derelict material quite beyond human control—floating in great masses, it drifts and packs with the wind and its fields break up and recombine into windrows as wind and current dictate. . . ."

It would now appear to be opportune for proper authority to adopt the policy of the Montreal Flood Commission and to find out by scientific observation just how far this menace can be brought under control. It need not be accepted as an Act of God against which there is no hope of defence.

In those sections of the Great Lakes that are shallow and where the cooling off of the mass will be complete at relatively early dates, surface ice of appreciable thickness will form and those engineering studies may prove most productive of results that are directed to confining the ice to these formation areas or at or near to their place of origin.

In the major gathering areas of float ice such as Whitefish Bay and the southern end of Lake Huron the best promise of relief would appear to be in the construction of detour channels in which the entire discharge of the feeding lake could be confined during the winter months. Until the subject has been scientifically studied no more can be said.

Sub-surface Temperatures

The studies made by Mr. P. E. Church[15] for the Institute of Meteorology (University of Chicago) in the winter of 1941-1942 show that the surface waters of Lake Michigan remained at a temperature above freezing point all through that winter and that the water temperatures at depth coincided almost exactly with

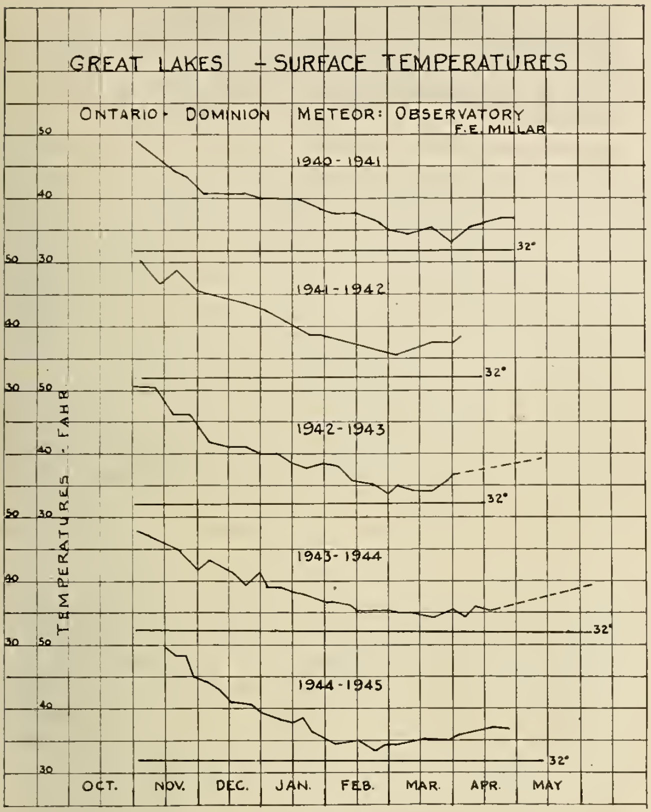

Figure 3.

those on the surface. Figure 2 shows the surface temperatures observed by Mr. Church about the centre of the lake and their change with date. Figure 4 shows a series of depth temperature observations also taken by Mr. Church at about the same place. The measurements were made from the car ferry of the Grand Trunk Western Railway operating between Milwaukee and Muskegon and were taken with recording depth-temperature apparatus that had been developed at the Wood's Hole Oceanographic Institute (Wood's Hole, Cape Cod—Massachusetts Institute of Technology). In Fig. 5 are shown water temperature curves as observed(3) in Lake Mendota, Madison, Wisconsin. Madison lies about 80 miles due west of Milwaukee on Lake Michigan. The temperatures shown are averages and are the result of sixteen years of observation by Dean Birge and Associates. The noteworthy factors are the uniform temperature existing throughout the lake at all depths during the month of November and the temperature gradients that developed just before the freeze-up came. The slow rise in temperature throughout the lake that commenced when the freeze-up took place and that continued all winter should also be noted. In Fig. 4 are shown the results of temperature observations made on Lake Vattern, Sweden,(4) in 1910 in which the practically uniform distribution of temperature is shown to continue well into the spring months. Lake Vattern is situated at Lat. 58 deg.; it is about twice the size of Lake Champlain and of an equal depth. The average annual temperature is about 2 deg. F. lower than that of Madison. Ice forms on this lake.

Mr. Desmond Fitzgerald(5) in certain papers read to the American Society of Civil Engineers in the 1880's and 1890's, was the first to advance the theory that lake waters cool down gradually in the fall until the whole body of the waters has a temperature of 39.4 deg. F., and he argued that when in that condition the waters are very likely to be agitated throughout their depth by winds, there being no differences in weight among the water particles to check movement within the mass. On further cooling, the waters show temperatures steadily if slowly increasing from top to bottom. On Lake Michigan, Mr. Church's observations(2) show almost uniform temperatures as early as December 7th, when the water temperatures were about 43 deg. F., and this condition of almost uniform temperature continues down to Mr. Church's latest observations taken on March 30th when the water temperatures were about 36 deg. F.

The fact that the waters of the Great Lakes do not show any tendency to cool off first at the surface during the winter months is thought to be due to the constant activity of the winds in creating and maintaining internal currents. Wind is the normal air condition over the Great Lakes in winter and calms are definitely a rarity. Meteorogical opinion considers that intensity of any storm is in general considerably more severe when it is sweeping over a lake surface than as it is measured on the adjoining lands.

This condition of open water in spite of low air temperatures does not completely hold on Lake Champlain where on the "broad lake" the dates of the annual freeze-out run as follows:

Freeze-up dates on the "broad" section ot Lake Champlain:

1925	January 20th	1930	January 30th
6	February 9th	1	February 11th
7	March 4th	2	Not closed
8	March 11th	3	Not closed
9	February 6th	4	January 20th
		5	January 20th

the dates being from a bulletin issued by the U.S. Weather Bureau in 1935 and containing a continuous record from the year 1816.

The "broad" lake has depths as great as 400 ft. but the lake is relatively narrow and is protected from wind both on the east and on the west by mountain ranges.

One fact stands out clearly on the entire record of sub-surface temperatures, namely, that no observations have shown in winter sub-surface water temperatures that are lower than the corresponding surface temperatures. In other words, surface lake temperatures are a sure indication of the minimum temperatures that will be found in the river outflowing from the lake, provided that the supply of the river is drawn from a

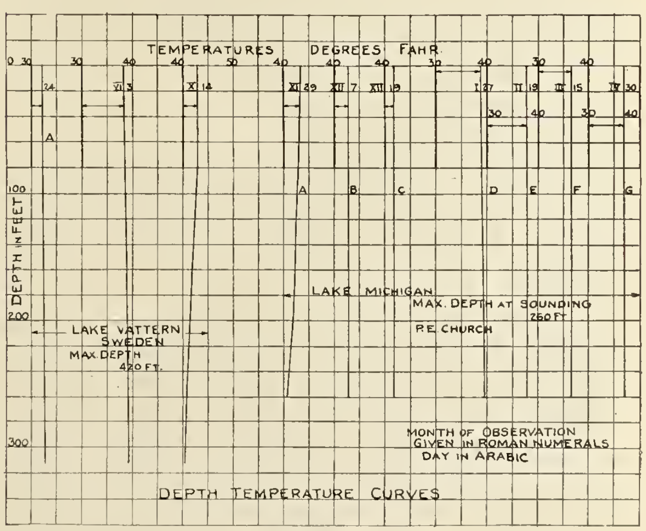

Figure 4.

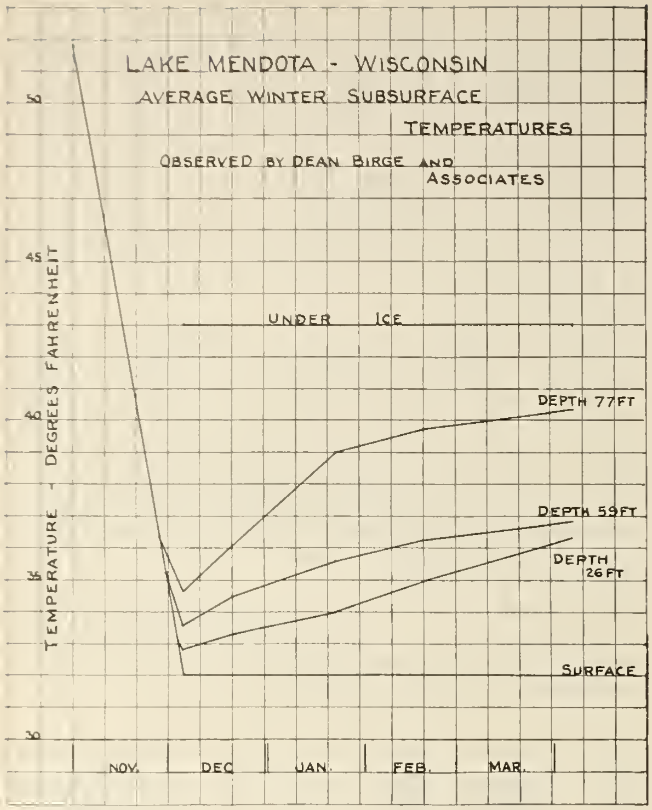

Figure 5.

deep section of the lake. Shallow shore waters always cool off quickly and early.

Surface Temperatures

For ten years past the staff of the Dominion Meteorological Survey under the immediate direction of Mr. F. S. Millar has been recording the surface temperature of the Great Lakes, placing time-temperature recording instruments on various vessels making commercial runs and particularly on the car ferry operated by the Canadian National Railways between Cobourg and Charlotte. A partial summary of results is given on Figs. 2 and 3, which show lake surface temperatures:

(a) Five winters' lake temperatures on the run across Lake Ontario from Cobourg to Charlotte.

(b) Three sets of observations of lake temperatures on Lake Superior in the late fall on the run between Port Arthur and Whitefish Point and two sets in the early spring.

(c) One winter's temperatures on the run across Lake Michigan from Milwaukee to Muskegon as observed by Mr. Church.

It is not certain that the temperature equalization discovered by Mr. Church extends to the bottom of very deep lakes such as Ontario and Superior. On Fig. 6 are shown a series of deep lake water observations⑤ recorded by Mr. Fitzgerald, particulars of which are as follows:

Curve A shows a series of observations made on Lake Superior for the U.S. Lake Survey in August, 1871. The readings were taken at various places and on various dates. Curves B, C and D show a sequence of observations made in 1848-49 by Messrs. Fischer, Ooster and Brunner in Lake Thun, Switzerland. Lake Thun very rarely freezes over but it will be noted in Curve D that temperature equalization has descended to a depth of 500 ft. The month and day of the observations are shown by Roman and Arabic numerals, respectively. Curves E and F show observations made by F. A. Forel in 1879 on the Lake of Geneva which never freezes over. Curve F shows that the temperatures have equalized to a depth of 900 ft.

The Swiss Lakes are much smaller and much better protected from wind by the surrounding mountains than are the Great Lakes of North America. For purposes of comparison, average surface temperature curves for Lake Superior and for Lake Michigan-Huron are also shown on Fig. 6. The data for these average curves are taken from a paper prepared by Lieut. Hickman⑥ of U.S. Lake Survey and presented to the American Society of Civil Engineers in 1939.

From the preceding discussion there emerges the engineering problem of regimenting the outlets of the various Great Lakes so that the outflowing rivers will draw their supply from deep and "warm" waters in the parent lake.

Rate of Cooling-off

The rate at which open water under Canadian winter conditions will give up its heat is difficult to determine, because the geophysical forces which are in action are very sensitive to atmospheric conditions and their effects quantitatively change rapidly and materially with variations in wind, cloud and haze. This makes observational records of little value unless they are continuously maintained. The geophysisist's approach to this problem is discussed briefly later on in this paper.

Such records as are available of direct observation of the rate of cooling-off are in fair agreement if it is assumed that the difference in temperature between the air and the water surface is a measure of the rate of loss. This assumption is not tenable for any long period of time, for there are great geophysical forces at work which are practically independent of changes in the temperature of the air.

The scientifically accurate measurements of Dean Birge and Associates in Lake Mendota③ show that that lake during the month of November has a uniform temperature at all depths and is cooling-off rapidly. The average depth of Lake Mendota is 40 ft. and the average fall of the water temperature during November was from 52.5 to 39 deg. F. The average air temperature is 36 deg. F. The average heat loss per sq. ft. of surface per day was therefore about 1125 B.T.U. or roughly 115 B.T.U. per sq. ft. per day per degree of

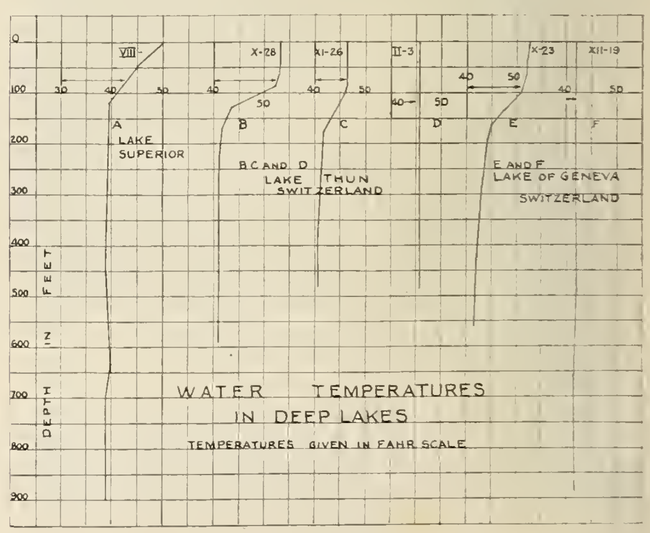

Figure 6.

temperature difference between air and water.

Calculations using the geophysical formulae discussed further on in this paper indicate an average heat loss of about 1175 B.T.U. per sq. ft. per day as likely under average weather conditions at Lake Mendota in November.

The Joint Board of Engineers in their 1926 Report to the International Waterways Commission lists twelve series of measurements made in the early part of December on the St. Lawrence River below Kingston, each experiment extending over ten or eleven days. The results range from a constant of loss per sq. ft. of surface per degree difference of temperature of 83.0 to one of 121.7 and the Joint Board recommends the use of a constant of 95 B.T.U. A plotting of the published results suggests that possibly the governing equation is not a straight line but should flatten off as the amount of the temperature difference increases.

Strictly speaking, the above constant should be applied only to conditions as they are found in the early part of December in any year on the St. Lawrence River.

It may be noted in passing that the curves of average air temperature during the winter months as taken at Madison, Wis., and at Kingston, Ont., are in close agreement, and that the two sets of observations of heat loss are in reasonable agreement with each other and with geophysical theory.

The measurements taken by Mr. P. Church(2) gave the results shown in Table I, calculations being based on an average depth of 300 ft. for Lake Michigan, and the waters in both shore areas being excluded from the calculation. The air temperatures are not definitely known and those used in the calculations are based on the records of nearby land stations as given by Mr. Church slightly modified by reference to the long-time records of Madison, Wis.

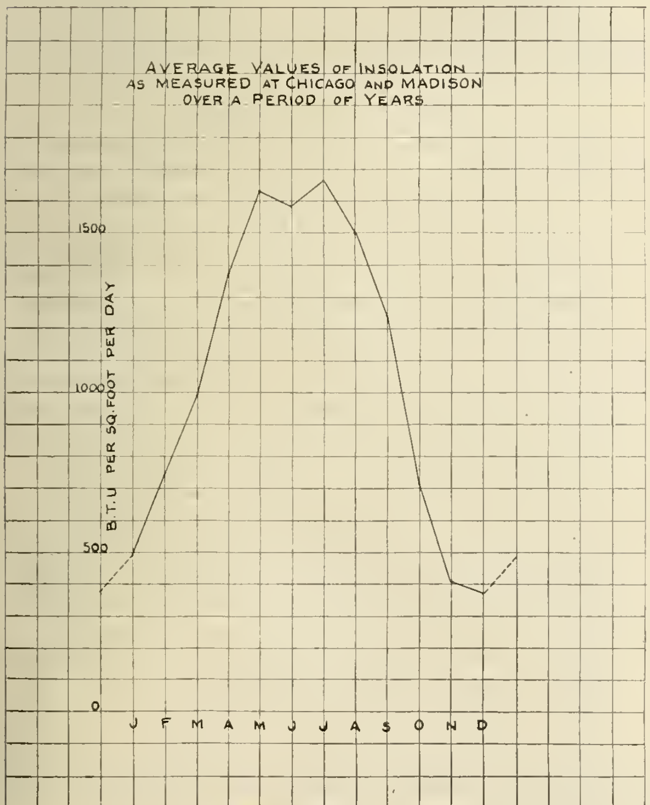

Figure 7.

TABLE I

Heat losses from the surface of Lake Michigan in the winter of 1941-1942 calculated from observations taken by P. E. Church:

Dates	Temp. Drop (°C)	Daily Av. Drop (°C)	Daily Av. Drop (°F)	Loss of Heat on B.T.U. Per Sq. Ft. Per Day
Dec. 15 to Mar. 21	3.18	0.035	0.063	1181
Dec. 7 to Dec. 19	0.55	0.046	0.083	1556
Dec. 19 to Jan. 27	1.94	0.05	0.09	1698
Jan. 27 to Mar. 4	0.94	0.026	0.047	881
Mar. 4 to Mar. 21	0.23	0.013	0.023	431
Mar. 15 to Mar. 21	0.05	0.009	0.016	300

It will be noted that the loss constant falls off sharply as the winter progresses and this is in good agreement with geophysical theory. It is clear that, if the waters of a Great Lake such as Ontario remain consistently at a temperature well above freezing point, the maintenance of an open outflowing river is simply a matter of heat conservation. As Mr. John Kennedy knew sixty years ago, and as Dr. Barnes has pointed out again and again, water will not form ice until it is cooled down to freezing point. To keep the water in a river warm, its channels must be as narrow and as deep as can be secured. The St. Lawrence River would flow comfortably in a channel about 1500 ft. wide and 64 ft. deep with a regulated velocity of about two miles per hour.

What this means may be illustrated by reference to the report of the Joint Board of Engineers from which the figures in columns 1, 2 and 3 of Table II are taken.

TABLE II

Comparison of actual heat records in the St. Lawrence River with obtainable values in a regimented river:

Location of Lower Station	Av. Water Temp. at Kingston	Av. Water Temp. at Lower Stn.	Temp. Diff. between Air and Water	Dist. in Miles to Kingston	Calculated Temp. in a Regimented River (Lake at 44°)
Kingston	40.5		12.0 (av.)	25 (up to lake)	43.8
Brockville	40.5	37.2	16.4	40	43.4
North Channel	41.6	38.7	8.9	64	43.6
Cardinal	38.9	33.8	11.4	67	43.45
Massena Point	39.0	33.6	11.0	103	43.25

In the calculations a loss rate of 100 B.T.U. per degree temperature difference per day was adopted and a stream velocity of two miles per hour. The drop in temperature between the deep lake and Kingston is not surprising for the river flows over vast areas of relatively shallow lake water. It is, however, something of a natural tragedy that of 12 deg. of sensible heat available in the deep lake against freezing, practically one-third of this amount should be lost by the time the waters reach Kingston, the distance to which is less than one-tenth of the distance from the deep lake to tidewater.

It is possible that the assumed figure of 44 deg. F. for the lake temperature is a little too high for the years 1924 and 1925 when the observations by the Joint Board of Engineers were made. The assumption, however, agrees with Mr. Millar's observations in later years.

In 1925 Dr. Barnes has recorded that the water temperature at the Victoria Bridge, Montreal, was 32 deg. F. on December 10th; making the same assumptions as above it would appear that the temperature loss between Lake Ontario and the Victoria Bridge should not exceed 1.5 deg. F. in the first week in December, provided that the waters were brought down in a regimented river flowing at a speed of about two miles per hour. The waters could be made to reach Montreal harbour with a temperature well above 40 deg. F. in early December.

It should be noted that the temperature of Lake Ontario grows steadily lower as the winter proceeds and that it reaches its minimum in March. Fortunately, as Mr. Church's observations show, and as theory confirms, the rate of heat loss per sq. ft. of surface also grows less and less as the winter proceeds and as the sun gains in altitude until at some date in March the waters cease to lose heat and commence to grow warmer. The simultaneous falling off of heat supply in the lake and of heat demand from the flowing river is a most important fact for March lake water, if fed into the river in January, would not be warm enough to provide against the heat losses of the river in January. The writer having examined with some care the charts and topographical maps covering the area under discussion, has not detected any abnormal construction problems that would have to be dealt with in regimenting the St. Lawrence River to the measure required nor any for which precedent cannot be instanced.

Geophysical Laws

The study of the laws that control the heat cycles in the Great Lakes lies within the field of geophysics and has received a fair amount of attention, particularly by the staff of the Scripps Oceanographic Institute in California, which some fifteen-odd years ago took up the problem of determining the rate of water evaporation from the surfaces of the many storage reservoirs scattered about in the State of California. Water evaporation in California and ice formation on the Great Lakes seem at first sight to have little relation to one another, but the forces that are active are the same in both cases and so are the controlling laws. The California study is well summarized by Prof. Burt Richardson in a paper presented to the American Society of Civil Engineers in 1930.[7]

Briefly and disregarding minor causes, Professor Richardson limits the forces that act to raise the temperature of a sheet of open water to solar radiation and considers that only night radiation, evaporation and convection need be taken into account amongst the forces that act to reduce water temperatures.

The heat contribution of solar radiation, technically called insolation, at any point on the earth's surface can be calculated from the known constant of radiation for the sun, taking into account the sun's altitude at the time of observation and the losses of radiant heat that occur during the passage of the rays through the atmosphere. These losses are large and they are found, like nearly all geophysical factors, to vary largely and quickly with changes in the atmospheric conditions. Generally these losses aggregate to more than fifty per cent of the heat that would otherwise reach the earth's surface, so that in general it is more satisfactory to depend upon past records of the measurement of this factor rather than on scientific calculation. The United States Weather Bureau has several stations that regularly record the heat received on a flat surface from the sun and the Dominion Meteorological Service maintains one such station in Toronto. Figure 7 shows the annual variations of insolation, the unit being B.T.U. per sq. ft. per day and the quantities are the means of observations made at Madison, Wis., and at Chicago, Ill. Insolation measurements are regularly reported in the *Monthly Weather Review* published by the U.S. Weather Bureau. The curve as shown on Fig. 7 is from the averages of two stations over many years and would be very much more irregular if only one year's observation at a single station had been used.

Measurements taken by Dean Birge and Associates at Madison show that practically all the radiant heat

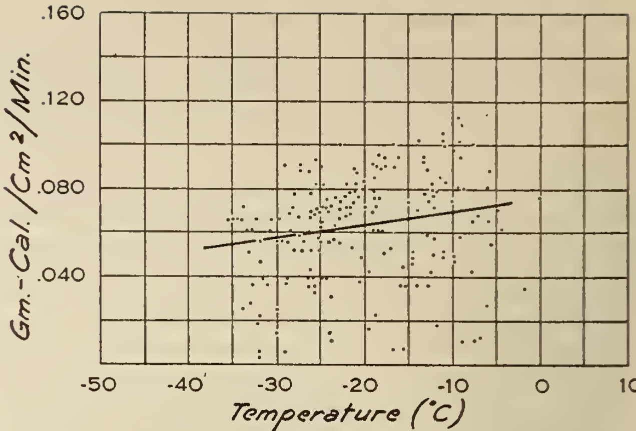

Fig. 8—Observed Values of Outgoing Radiation during Clear Weather at Fargo, N. Dakota, 1936-1938.

from the sun is absorbed in the upper ten feet of any pond. Subsequent distribution of such heat is principally the work of internal currents and is most active when the waters approach uniformity in density and temperature as they do in smaller ponds twice every year.

Back or night radiation is the radiation of heat from the surface of the earth into space. Because night radiation is a relatively long wave radiation it is very subject to atmospheric conditions, as will be seen from Fig. 8, which shows the results of a series of measurements of night radiation made at Fargo, North Dakota[8] for the U. S. Weather Bureau in 1937 and 1938. By use of the theory of least squares, a governing equation of

$$Q = 0.076 + 0.0006\, t$$

was obtained, where t is the air temperature in centigrade units and Q is in gram-calories per sq. centimeter per minute.

In theory the loss of heat by radiation varies as the fourth power of the absolute temperature of the radiating surface and Professor Richardson gives a formula for the calculation of this factor:

$$Q = c\, a\, T_w^4 - b\, a\, T_a^4$$

in which c and b are constants obtained from observations in California, T_w and T_a are the absolute temperatures of water and air, and a is the constant of black body radiation. Professor Richardson's formula has been used in the few calculations included in this paper. The equation is in centigrade units. The Dakota observations were not made from an open water surface.

In general the Dakota observations indicate that night radiation in the winter months is dominated by atmospheric conditions and is only slightly affected by temperature. Its value during the winter months seems to lie between 400 and 500 B.T.U. per sq. ft. per day and it may be considered to be approximately equal in amount to solar radiation during the months of November, December and January. In other words, the loss of heat from an open water surface during those critical months comes almost entirely from the factor of evaporation and from the closely connected factor of convection.

Probably the best known formula for the calculation of evaporation is the Meyer formula[9]:

$$E = 30\,(V - v)\,(0.5 + 0.05w)$$

in which E is the evaporation in inches per month, V and v are the vapour pressures at the surface of the water and in the air passing over it and w is the wind in miles per hour.

Mr. F. E. Millar of the Dominion Meteorological Observatory has more recently advanced the following formula for the determination of evaporation losses, viz:

$$E = \frac{1}{K_o^2} \quad \frac{(e_w - e_a)\ u}{\log_e \frac{Z}{Z_o} \log_e \frac{Z}{Z'_o}}$$

in which

K_o = von Karman's constant = 0.38

E = No. of grams of water evaporated per sec. per sq. centimeter

e_a = No. of grams of water in the air per cubic centimeter at a height Z

e_w = No. of grams of water in saturated air of the same temperature as the open water

u = Speed of the wind in centimeters per sec. at the height Z

If the wind speed and specific humidity, i.e., u and e in the above formula, are observed at various heights and plotted against the logarithms of the heights of observation, it is an experimental fact that the plotted observations will lie on almost straight lines intersecting the axis at heights of Z_o and Z_1^o, respectively.

Practically these formulae have been but little used, reliance being placed on direct observations of evaporation made from special test pans. However, it should be noted that both formulae are governed by the factor $(e_w - e_a)$ denoting the difference of vapour pressure between air and water. In Fig. 9 a curve is drawn showing the relation between vapour pressure and temperature, the data being taken from the Meteorological Tables published by the Smithsonian Institute. It will be noted that vapour pressure does not vary directly with temperature and that therefore evaporation losses and the heat losses from open water that accompany them do not vary directly with temperature changes. Actually a drop of air temperature from 30 to 20 deg. F. will affect evaporation losses about five times as much as a corresponding drop from 0 deg. F. to 10 deg. below.

The actual losses due to evaporation from the surfaces of the Great Lakes are still a matter of controversy and the following figures are taken from two well-known estimates prepared respectively by Dr. J. R. Freeman⑩ and by Lieut. H. C. Hickman of the U.S. Lakes Survey⑥, the figures given being the evaporation losses in inches per month for Lake Huron.

	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.
Freeman.......	3.4	3.2	3.0	2.5	1.8	1.0
Hickman.......	5.6	4.9	4.3	3.4	2.7	2.3

Considering the high standard of the two estimates the need of further series of observations is obvious, for evaporation will be the controlling factor in the net winter heat losses from the surface of the St. Lawrence waterway. In the rough calculations that follow, Lieut. Hickman's estimates have been adopted as being based on the most recent series of observational data. The conversion constant from water to water vapour is 970 B.T.U. per lb. of water evaporated.

The effect of wind upon the rate of evaporation still remains to some extent a matter of scientific dispute. Mr. Millar's experiments⑪ made on a wind tunnel at the Dominion Meteorological Observatory show a direct variation in the rate of evaporation with variations in the difference of vapour pressure and also a direct variation with increase in wind velocity subject, however, to a correcting factor which itself varies with changes in the wind velocity. Lieut. Hickman's curves⑥ show an increase of about 25 per cent in the rate of evaporation at the usual air and water temperatures existing around Kingston during the months of December and January when the wind velocities are increased from five to ten miles per hour.

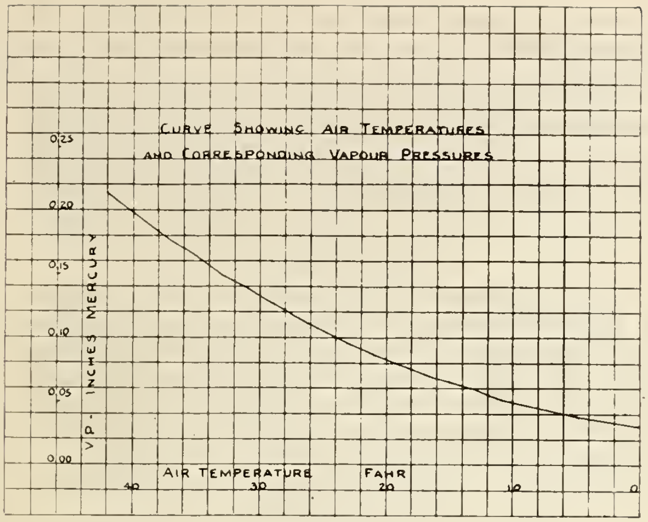

Figure 9.

Comparing the open river with the open lake it may be found by observation that evaporation from the open river will be greater in the winter months because the differences between the effective air and water temperatures will be found to be greater on the river than on the lake and also that the evaporation will be less from the open river because of a decreased effective wind velocity. Only a systematic meteorological survey can supply the necessary data to determine these points.

TABLE III

Calculated Rate (mean) of Heat Loss in B.T.U. per sq. ft. per day as determined from the data listed above:

	December	January	February	March
Night radiation...	619	568	464	247
Evaporation......	648	585	507	355
Convection.......	485	535	392	66
Sub-total......	1752	1688	1363	668
Solar radiation....	376	486	730	990
Net loss.......	1376	1202	633	—

Convection or the carrying away of heat by the air passing over an open water surface takes place at the same time as evaporation and it has been shown mathematically by Dr. Bowen that the heat loss due to convection is directly proportional to the heat loss due to evaporation (at least under California conditions), the connecting formula, known as Bowen's Ratio, being

$$R = 0.46 \times \frac{P}{760} \times \frac{(T_w - T_a)}{(E_w - E_a)}$$

The formula is in metric units, P being the height of the barometer, T_w and T_a the temperatures of water and air and E_w and E_a the water content of the air in contact with the water and of the air passing above it in grams per cu. cm. It is not known whether Bowen's ratio will hold accurately under the weather conditions existing in the Great Lakes basin and in the St. Lawrence valley but it has been used in preparing certain figures that appear later in this paper.

For the purpose of roughly checking by theory the figures in Table I obtained by calculation from Mr. Church's recorded observations, the writer has used the long-time average air temperatures of Wisconsin as published by the Wisconsin Academy of Sciences, Arts and Letters, Mr. Church's observations of water temperatures and Lieut. Hickman's estimates of water evaporation from Lakes Huron and Michigan. The figures (Table III) are intended to be used only as an illustration.

If these figures are compared with those shown in Table I, they will be seen to indicate a close agreement if it be recollected that all the factors entering into the calculation are tremendously variable not only from one year to the next but in some cases from one minute to the next, all depending upon atmospheric conditions.

Conclusions

It is obvious that the profession has need of masses of observational data to be taken in the Great Lakes basin and in the St. Lawrence valley in order to determine dependable average values for insolation, night radiation, evaporation and convection. So large a statistical task lies properly in the field of the great governmental bureaux of the United States and Canada.

Tentatively at least the following conclusions may be drawn from the foregoing discussion:

1. The Great Lakes are great natural accumulators of heat energy.
2. The temperature of the mass of their waters is never as low as freezing point.
3. The temperature of the deeper waters is never lower than that of the surface waters concerning which a considerable mass of statistical data has already been secured.
4. The rate of cooling off of the waters under St. Lawrence Valley conditions has been in some measure determined.

There remains for the profession the two main problems of:

1. Designing outlets to the lakes so that only the "warm" waters of the lakes will be drawn into the outflowing rivers.
2. To regiment the channels of the outflowing rivers so that the loss of heat from their surfaces will be reduced to a minimum.

To the writer the following local problems appear to be worthy of professional study and consideration if the heat energy contained in the waters of the Great Lakes is to be put to beneficial use, viz.:

The location of the principal ice-forming areas in the Great Lakes.

The devising of ways and means to confine sheet ice to its place of formation and to limit as far as possible the movement of float ice when drifting under the influence of current and wind.

The designing of detour channels around the principal gathering areas of drift ice such as Whitefish Bay and the south end of Lake Huron.

The design of outlet rivers that will flow free of ice throughout the winter:

1. From Lake Superior to Lake Huron—Such a river might be either with or without locks.
2. From Lake Michigan to Lake Huron. The winter closing of the Straits of Mackinac and the opening of a suitable channel via Little Traverse Bay and Cheyboyagan is a possibility.
3. From Lake Huron at some point north of Sarnia to a point on the Welland Canal below the guard lock. Lake Erie from the standpoint of winter navigation calls for thorough study. The lake is relatively very shallow and therefore liable to freeze over early, but, in general, climatic conditions in its immediate area are much milder than they are around the larger lakes. It is not a case for offhand conclusions. An isolated channel along the north shore of the lake and carrying most of the flow of the St. Clair River offers one solution to this problem. Such a channel could empty into the Welland Canal below the guard lock and possibly the level of main reach of the Welland Canal could be lowered.
4. From Lake Ontario to a point near Longueuil including the possible extension of the Lake St. Louis level to Longueuil and the construction of a power development of the first order at or near Longueuil.
5. From Montreal to tidewater following the plans suggested long ago by Mr. T. C. Keefer.
6. The extension of the Lake Champlain level from a point on the St. Lawrence River near Laprairie to a point on the Hudson River near Albany. The two main problems in this area are the providing of a sufficient water flow to keep the connecting channels free from ice during the winter months and the control of the surface ice on Lake Champlain.

It may be noted that river channels designed on a principle of heat conservancy will probably always be deeper than would be required to float the largest of present-day vessels.

Considering the ultimate possibilities for improvement of the St. Lawrence and Great Lakes waterway and comparing them with present-day plans, the writer is reminded of the comment made by Mr. T. C. Keefer some seventy-odd years ago: "Canada always builds her canals to designs that are obsolete before construction has commenced."

Acknowledgments

The author would like to place on record his appreciation of the assistance he has received in the preparation of this paper from many correspondents. Thanks are due particularly to the late Mr. George T. Seabury and his colleagues of the Hydraulics Division of the American Society of Civil Engineers for bibliographical data; to Dr. C. G. Abbot, Secretary of the Smithsonian Institute, for references to the work of Dean Birge and his associates; to the officials of the U.S. Weather Bureau for advice concerning the work of Mr. Church; and to Mr. John Patterson, O.B.E., Director of the Dominion Meteorological Observatory for making available the assistance of Mr. Millar and the records compiled under the direction of that gentleman.

IT CAN'T HAPPEN HERE—OR CAN IT?

It will be encouraging to professional employees of governments everywhere to know that in Great Britain an appreciation of professional services has been proclaimed recently. The *Journal* regrets that the following observations are not based on a Canadian plan, but hopes that the good example of the Old Country will be of some inspiration to Canadian officials.

In September 1945, the Chancellor of the Exchequer presented to Parliament a report wherein he explained that the Government had decided to adopt the recommendations of a special committee which had been appointed to study the "Reorganisation and Recruitment" of the Scientific Civil Service.

The quickest way to describe the proposals is to quote from the report of the Chancellor and from the committee under the chairmanship of Sir Alan Barlow. This committee, by the way, was made up of scientists and laymen, civil servants and industrial leaders, five in all.

Clause 5 of the committee's report puts a finger on the vital spot—in a single short paragraph sums up the whole situation. It reads:—

> "All the evidence before us points to one main conclusion, that the Government failed in peacetime to attract into and retain in its service a proper proportion of the best scientists produced by the Universities. Although Government Departments, like similar departments in industry, do not require more than a certain percentage of first-class men among their scientists, the present situation, in which in general the Universities and industry obtain as compared with the Government an unduly high proportion of the best scientific talent available, is one which must be remedied. The fault seems to us to lie partly in the standards of remuneration and the prospects of promotion offered, but at least as much in general conditions of service and the relations between Government Research organizations and the scientific world outside."

From clause 9 we quote a single significant sentence:—

> "One point, on which those whom we have consulted have been practically unanimous, is the necessity of providing rapid advancement for outstanding men."

The opening paragraph of the Chancellor's report sounds the note for the entire recommendation. It is a nicely restrained acknowledgment of past performances and of hopes for future services. What a thrill it would be to Canadians to see such a statement from the Minister of Finance, instead of the mincing words and non-committal statements of evasion that have been handed out for years by all officials associated with the sad conditions in the civil service of Canada. This is what the Chancellor says:—

> "1. The Government have decided that the Scientific Civil Service is to be reorganised. They are deeply conscious of the contribution made by science towards the winning of the war, a contribution which may have altered the whole course of the war and has certainly shortened its duration. They are equally conscious of the contribution which science can make during peace to the efficiency of production, to higher standards of living, to improved health, and to the means of defence. They are resolved that the conditions of service for scientists working for the Government shall be such as to attract into the Civil Service scientifically qualified men and women of high calibre, and to enable them after entry to make the best use of their abilities, in order that scientists in the Government Service may play their full part in the development of the nation's resources and the promotion of the nation's wellbeing."

From clause 8 these lines are taken:—

> "The salaries of the most highly qualified members of the Scientific Service are to be brought into relationship with those of the Administrative Class;"
>
> "The Committee recommended that the outstanding scientist should have a reasonable expectation of reaching the Principal Scientific Officer grade in the early thirties," (£800 — 1100 about 10 yrs. after graduation).

Clause 9 is a sign of enlightenment—it puts merit above red tape:—

> "Special provision will be made for recruiting above the normal minimum salary University graduates with research qualifications. In exceptional cases, scientists will be recruited direct to grades above the basic, where they possess special qualifications or experience which a Department requires."

Clause 11 describes some of the top salaries. All proposed salaries are shown in the later tabulation, but this clause is quoted herewith for emphasis:—

> "At the present time the highest scientific posts in the Civil Service, excepting the post of Secretary to the Department of Scientific and Industrial Research, carry a salary of £2,000 per annum. This was agreed during the war for the Heads of some of the Research Institutions. In future there will be at the highest levels salaries of £2,250 and £2,500, and in the whole Civil Service two or three posts will be graded at £3,000. The grading of the highest posts has still to be worked out in detail between the Treasury and Departments."

In the appendix, present scales and new scales are shown. For simplicity, the *Journal* quotes only the new figures as they are of greatest interest here. A note accompanies the appendix which to many will indicate that the committee, or the Government, in spite of the modern improvements proposed, is still influenced by the thinking of the horse and buggy days. "In accordance with normal civil service practice, scales for women are somewhat lower."

Here is the new scale using the figures for London. There is in addition a war bonus of £60 on all salaries up to £1,500.

" SCIENTIFIC OFFICERS (men)

Scientific Officer (two to four years, probationary). - - -	z £275-£500 (×£25—£400 on confirmation of appointment).
Senior Scientific Officer - - -	£550-£750 (×£25)
Principal Scientific Officer -	£800-£1,000 (×£30)
Senior Principal Scientific Officer - - - - - - - - - - -	£1,200-£1,400 (×£50)
Deputy Chief Scientific Officer	£1,600-£1,800 (×£50)
Chief Scientific Officer - - -	£2,000
Various posts at - - - - - -	£2,250 and £2,500
Two or three posts - - - - -	£3,000

z Higher starting points for graduates with post-graduate experience in research.

Another encouraging sign is that the Government proposes to set up a Panel, " to maintain a uniform standard for promotions and special advancements in the Scientific Service." The responsibilities of the Panel include, " keeping under review the well-being and efficiency of the Government Scientific Service."

Members of the Institute will be interested in the proposal that, " workers in Government Service (be) encouraged both to publish works of their own and to discuss their work with persons outside the Service engaged on similar problems."

Is it too much to hope that some such enlightenment will come to the Department of Finance and its Treasury Board within the not too distant future. It all seems very simple. It does not take supermen to see simple truths. Any other conclusions than those quoted would indicate shortsightedness, thoughtlessness, and a lack of understanding of economics and personnel considerations.

Can it happen here?

THE GENERAL SECRETARY VISITS THE WESTERN BRANCHES

This year the pleasant custom of the president visiting the western branches could not be maintained. It came as no surprise to anyone that a dean of engineering would not be able to leave his academic duties in the month of November. The unusual inrush of students who want to be engineers has presented such a problem that the heads of engineering faculties will be tied to their offices for a long time to come.

Reluctantly, Dr. Fetherstonhaugh abandoned his plans for the tour, although he was able to visit the branches at Regina and Lakehead, and preside over the regional meeting of Council at Regina. These two branches were just overnight from Winnipeg, and required the minimum absence from the university. The branches farther west were disappointed but readily understood the situation.

The general secretary made the complete circuit, visiting every branch from Sault Ste. Marie to Victoria as well as Saskatoon, Nelson and Trail. Councillor James Vance of Woodstock was present at the Soo, Winnipeg and Regina, being the farthest travelled branch representative at the council meeting. The general secretary visited twelve branches, participated in twenty-one meetings, spoke to the students at four universities, and arranged for the establishment of a new branch — all in four weeks less one day.

The general secretary reports that in most centres there are continuing indications of a general expansion in Institute activities and usefulness. Some branches, notably Calgary and Vancouver, report a greatly increased membership, with new members adding from 20 to 25 per cent to the total, and still more in sight.

At the universities there is developing a demand for a closer type of affiliation. Consideration will have to be given by Council to the possibility and advisability of establishing student sections entirely within the university, rather than continue the present plan of tying the student members to the junior section of the local branch. There are clear signs that the students look with favour on such an arrangement. All in all, it has been an encouraging experience to visit with these undergraduates, and to see the new opportunities that present themselves for service to the future engineers.

An outstanding feature of the trip was a four-day stay at Trail, B.C. Last year the then president, de Gaspé Beaubien, accompanied by R. E. Heartz and the general secretary, made the Institute's first visit to this area. There was a strong demand for the establishment of a branch, and during the ensuing year considerable ground work was done towards this end. During the secretary's visit this year, the members decided unanimously to petition Council for a charter in the name of the Kootenay Branch. There are a large number of engineers in the East and West Kootenays, and it should be easily possible for the Institute to do good work there. The Consolidated Mining & Smelting Company, Ltd., and its various companies, including the Kootenay Power Company, employ great numbers of engineers in all fields. Already there is an excellent nucleus of a branch, and new applications are coming in at an encouraging rate.

At the regional meeting of Council there was a good attendance, with six branches being represented by eight councillors. There were eight guests. The president handled a rather bulky agenda with excellent despatch, without in any way restricting the discussion. Mr. Vance's presence made it possible to discuss, in full detail, the proposed education fund in memory of Harry Bennett. It will be helpful to the committee, of which Mr. Vance is chairman, to have the ideas and the general support of the western councillors.

At Winnipeg, on the return journey, it was everyone's good fortune to have vice-president J. E. Armstrong of Montreal at the meeting. He also joined the president and general secretary on the visit to the Lakehead Branch the following day.

The visits to the universities gave the general secretary a first hand opportunity to see and understand the problems facing the engineering faculties, and to appreciate the bold steps that have been taken to surmount them.

All in all, the trip was a splendid success, although the president was missed greatly. The opinions, information and inspiration gathered all along the line will be helpful to Council and to Headquarters. Such contacts are essential to the life of an organization as widespread as the Institute, and it is to be hoped that they can be increased in number from year to year.

INSTITUTE'S REHABILITATION SERVICE SUBJECT OF BROADCAST

The following talk was given by Major Royd Beamish, in the series "Repat Reporter", over the Canadian Broadcasting Corporation's Trans-Canada network, at 7.45 p.m. EST, (Eastern network) 11.00 p.m. CDT (Western network) on Tuesday, December 4th, 1945.

There are thousands of rehabilitation plans operating in Canada today. They range all the way from small, almost personal plans to programmes that spread across all Canada. The employer with two or three men coming back from the armed forces has his plan. Virtually every large company has one, too. And some of them are most elaborate and detailed. They're all of tremendous help to the men and women who are coming out of the services.

But tonight I'd like to tell you about a rehabilitation program that strikes me as being particularly noteworthy. It has two or three notable features. In the first place, the plan wasn't drawn up by employers in several scattered localities, but by a national organization. Secondly, it deals with a group of ex-servicemen who are going to need a lot of top-drawer technical guidance. And thirdly, it's been operating long enough now to show pretty conclusively that it really works.

I'm referring to The Engineering Institute of Canada and its rehabilitation scheme. The Institute embraces all branches of engineering—civil, electrical, mining, mechanical and all the rest. It has over 7,000 members and probably 2,000 of them were on active service during the war. They were practically all technical experts — building bridges for the Royal Canadian Engineers, keeping tanks and electrical equipment operating for Reme, directing the work of survey regiments with the artillery, handling problems of design and modification of equipment with the Ordnance Corps. There were engineers in every branch of the service—navy, army and air force. And their contribution to victory was virtually immeasurable.

Well, now those engineers are coming back, back to Canada and back to civil life. And they have a lot of problems to contend with on the way. Problems peculiarly their own.

A good many of them were employed before the war and their old jobs are waiting for them now. Well, that's fine for the engineers whose service life was spent in the same type of work they did before the war. But military engineering doesn't cover the same sort of problems you meet in civil life. And so some engineers feel they've gone rusty and need refresher courses before they go back to work. Particularly the lads just out of college when they enlisted. And then there are a lot of undergraduate engineers. They'll either have to finish their university training or go into some other business or profession.

The Engineering Institute of Canada anticipated those problems a long time ago. And the members discussed the best way to meet them. This spring they put the plan into operation.

First thing they did was to appoint a Rehabilitation Committee. It has thirty members, with at least one living in each of the main industrial centres of Canada. Major-General Howard Kennedy was made chairman and Major Donald McCallum of Montreal, was appointed full-time director of rehabilitation and personnel services. Major McCallum went overseas with the Sherbrooke Fusiliers and was later posted to the Three Rivers Tank Regiment in Italy. He saw plenty of action with his new outfit before he was wounded at Lake Trasimeno in June of last year. It's Major McCallum who is applying the Institute plan, working, of course, under the strategic direction of the committee.

Step two in the rehabilitation scheme was to prepare a questionnaire and send it to all Institute members in the armed forces. The Institute was able to reach 1,200 of its members, and most of them sent back replies.

It was really those completed questionnaires that worked out the rest of the plan. The answers of Institute members in England, Italy, and Northwest Europe formed the basis of all subsequent operations. For instance, a large percentage of replies asked questions about university training privileges and things like that. To answer them, the Institute prepared a booklet called " The Engineers' Return to Civil Life " and sent it out to all members in the forces. We'll deal with it in a moment.

The second major demand was for some means of contact between engineers in the three services and the employment situation at home. To meet this demand, the Institute published an " Employment Page " in its monthly *Journal* and pre-printed the page, sending a copy to every member in advance of publication.

In addition, the Rehabilitation Committee has kept an eye on all government rehabilitation measures and made recommendations where they saw fit. I was particularly interested to see that they endorsed the petition of several university veterans' groups urging an increase in maintenance allowances, particularly for married veterans. That's the same petition we discussed a couple of weeks ago, you may remember.

But now I'd like to get back to this Engineering Institute booklet. I've seen a lot of booklets and pamphlets dealing with the demobilization theme, but this one has a number of unique points. It starts out, like all the rest, by listing all the various government benefits a veteran can get on discharge. But then it goes a lot further.

Under the heading of university training, for instance, the booklet lists all the standard information. And then it goes on to discuss the problem as it applies to engineers. I'd like to quote a couple of its more pertinent paragraphs. This one seems particularly sound: " It is natural that engineers who've been absent from their civilian occupations for a long time should feel they've forgotten a great deal. But it should be remembered that training in engineering is a fairly general background, designed to teach men how to think rather than what to think. This sort of thing is not easily forgotten and if you realize that even after a refresher course you'll still have to learn the particular line of your eventual employer, the loss of time and earnings may offset the value of any such course."

Later on, the booklet sums it up this way: " It is not, in general, considered advisable to undertake refresher and brush-up courses because: (a) men who are entering a new field will have to learn on the job anyway; (b) men who are returning to their previous line of work will find that they have forgotten far less than they think they have. And their experience will enable them to pick up new methods quickly. And (c) the universities will be unable to accommodate all the engineers who want to take such courses. Their capacity will be stretched to the limit by undergraduate personnel."

Even in dealing with undergraduates, the Engineering Institute takes a practical view. For men whose university training was begun before joining up, the booklet says, usually it will be worth while to return to university and get their degrees. But men who are thinking of starting an engineering course for the first time are cautioned. Here's what the book says: "Although the degree is very useful, a great deal of earning time will be consumed in getting it. Employment conditions are good now compared to what they may be four or five years hence." In other words, it may be more worth while for such men to find work in engineering fields that do not require an engineering degree.

Even in the matter of post-graduate courses for specialized degrees the Institute keeps both feet solidly on the ground. Its word to the wise is this: " Generally, highly specialized post-graduate courses are not recommended to men who are planning to enter manufacturing or industrial fields. Usually employers do not want specialists. They want men with the general background provided by the original engineering degree, who can learn their methods."

Well, now, that may sound like carrying realism to extremes. And if the Institute didn't have another alternative to offer after talking down college training, perhaps it would be. But the Engineering Institute *has* another plan. And it's been working out remarkably well.

I mentioned it a few minutes ago when I told of the " Employment Page " in the *Engineering Journal*. Any firm seeking to employ an engineer is permitted to announce its vacancies through the *Journal*. And the announcements are very specific as well as amazingly diversified. A pre-print copy is sent to every Institute member in the services, and the Engineering Institute reports that this has resulted in more than a hundred pre-discharge applications being received every month.

In addition, between 80 and 100 engineer servicemen are being interviewed every month, with a view to placement in jobs. Each man reporting for interview and guidance is given at least six likely firms to contact. Somewhere between fifteen to twenty confirmed placements result every month, but as many are not reported, the Institute believes the real total would be nearer forty or fifty.

This may not sound like a very large number, but when you realize that these men are specialists and that their salaries range anywhere from $200 to $500 a month when they are placed, it becomes more significant. The interviews usually produce the actual jobs but the avenue opened up by the announcement of job vacancies is a most important preliminary. In its November " Employment Page " for instance, the Institute lists a total of sixty-five employment possibilities. Those sixty-five announcements represent at least 75 jobs, because several of them call for two or even three men to fill them. And they're not just vague " leads " to employment either.

They tell the sort of experience required for the job, the type of work it will entail and the salary that can be expected. For instance, one advertisement for a civil engineer is worded like this: " Civil engineer, 25 to 35 years old, with some experience in construction and good personality, is required to act as specialist in piling for a company in Montreal. Work would be mostly design but would also involve dealing with engineers and contractors. Preference will be given to a returned man and salary would be about $300 a month.

And there are fascinating vacancies like this one: " Mechanical engineer is required to act as assistant engineer to the superintending engineer of a pulp and paper company in Calcutta, India. The work will be in connection with all the practical maintenance of the plant and a salary of between $4,000 and $6,000 a year is offered, under a three-year contract, including free housing accommodation and full passage expenses."

All told, this sheet lists vacancies for three chemical engineers, 15 civil engineers, six electrical and 21 mechanical engineers and twenty " miscellaneous " vacancies. Members receiving it are told that the sheet offers them three things. It can be considered, first of all, as an indication of present employment conditions in Canada. Service members can reply to any of the announcements that interest them with a view to establishing contact for the future and those whose discharge is imminent can make direct applications for the positions advertised.

That's the schemes. And it has the added merit that it works out in practice as well as in theory. As an example of co-operation between employees, employers, and veterans, I think this engineering program is outstanding. And one thing it shows above everything else, I believe, is the tremendous advantage that lies in having a national organization like this. It would almost suggest that Dominion-wide organizations in other trades and professions could accomplish similar things in their own fields. I wonder how many such organizations do have a plan like this one?

The employment angle of the engineering rehabilitation program is the one that catches your eye most compellingly. But I think the committee deserves a lot of credit for setting out the educational aspects so lucidly in their little handbook.

One engineer I spoke to told me that, before he received the booklet, he'd made up his mind to take a refresher course at university because it seemed the logical thing to do. Then, when he saw what the Institute committee felt about it, and read their caution against further study unless it were really necessary, he began sizing up the employment situation. Here's how he put it.

" The Institute executive is made up of practical engineers. And when they made their suggestions about education, they knew what they were talking about. That booklet kept me from wasting a lot of time lining up a course I didn't need. I used that time to make some business contacts, and I was on the job two months after I got my discharge.

With at least 20 new placements being made every month and perhaps 30 or more in actual fact, and with a good percentage of our serving engineers returning to their pre-war jobs, it really looks as though the Engineering Institute has an excellent answer to what might easily have been a very touchy problem in job placement. And if telling how they've gone about it helps some other group to develop something along the same lines, I think the engineers will be just as pleased as the veterans themselves would be.

CANADIANS LEARN ABOUT GERMAN RESEARCH

Shortly before V-E Day a small number of Canadian scientific and technical experts left for the continent of Europe and followed close on the heels of the invasion troops on their march into Germany. Their purpose was to obtain quick first-hand information that would be of value in the war against Japan. Others left before V-J Day with the same object in view, some 42 going over altogether. They were recruited both from the government services and from industry and represented a wide range of activities. Technical processes, particularly those dealing with new or novel features, received a wide share of their attention. With the sudden advent of V-J Day, however, their tour immediately turned into an industrial rather than a military investigation.

Their work of investigation was conducted in co-operation with other scientific and technical men from the United Kingdom and from the United States. They did not all remain together but travelled singly or in teams made up of two, three or more members whose interests centred upon the same things, though it was found that they could carry on more efficiently if the teams were not too large. On the investigational tour they visited industrial plants, military establishments, scientific laboratories, research institutions, shipyards, devastated areas, and other points of interest throughout Germany, the Netherlands, Luxembourg, Belgium, and France.

The tour on the average lasted for approximately three months. Many have now returned to Canada though at this writing a few of them still remain overseas or are en route home. On Friday, 14th December, at the Chateau Laurier, Ottawa, under the auspices of the Department of Reconstruction there was held a press conference followed by a dinner, at which 27 of these investigators were present. The conference took the form of questions by the press and answers by the experts. Everything was " on the record " except that questions relating to international politics were ruled out and highly technical questions were reserved to be dealt with more properly at subsequent trade-press conferences.

In the interim between the conference and the dinner and also at the dinner itself opportunity was furnished for a more informal get-together between members of the press and those investigators in whose work they might be most interested. The Engineering Institute of Canada was represented by R. C. Purser, M.E.I.C.

V. W. Scully, deputy minister of Reconstruction occupied the chair at the conference, jointly with Col. T. F. Flahiff, assistant director general Industrial Reconversion branch, who organized the visit of the Canadians to the German plants.

From the conference and from conversations afterward with members of the group, it was evident that by and large the investigators felt that Canadian industry and technology is in advance of German thinking. Dr. C. J. Mackenzie, director of the National Research Council, crystallized this thought with the remark that as a result of the investigations " we don't feel terribly unhappy about our own position." Canadians, he said, need have no inferiority complex over their achievements.

Dr. Edwin R. Rowzee, research director of Polymer Corporation Limited, Sarnia, said that the processes in Germany for the production of synthetic rubber were quite similar to those in use in United States and Canada. " Nothing we saw led us to believe that they were any better than we are here," he said. Actual tests made on tires fabricated from German rubber brought over to this country demonstrated their inferiority. " They failed miserably after a few thousand miles of running," he said. Referring to the breakdown of German motor transportatoin during the first winter campaign in Russia, Dr. Rowzee stated that this was not due so much to tire failure as to tube failure. The tubes would split due to low temperatures and manufacturing processes had to be revised to meet these conditions.

He also referred to a research laboratory maintained by the Germans and devoted to synthetic rubber that was better than " anything on the North American continent ". A pilot plant in this connection was capable of the production of 600 tons of rubber per month. In his words it was " a most outstanding setup " and " it was quite evident," he said, " that the expenditure per unit of population on such research is much heavier there than here."

Dr. W. H. Cook, director of the applied biology division, National Research Council, spoke about a new rapid butter-making machine capable of continuous operation in which the cream went in one end and the butter came out the other. Another butter making method used by the Germans is also new and rapid. He also mentioned some ersatz foods such as synthetic butter and synthetic egg powder said to be better than the real thing, though he remarked that such foods would have little interest to Canadians who are able to get the real thing.

Dr. William Boyd Campbell, director of technical research of the Pulp and Paper Research Institute of Canada, Montreal, told the conference that the Germans of necessity were forced to do some things differently from what is done, for instance, in this country. However they " did nothing that we in Canada would not and could not have done under similar circumstances." They converted a large number of sulphite plants to the use of beechwood. This was for making fibre which took the place of cotton, unobtainable in Germany. They also made great use of waste liquors, turning from alcohol to food yeasts when they changed to long-fibred wood.

S. H. Chambers, chemist of Montreal Cottons Limited, Valleyfield, P.Q., whose interests related to textile dyeing, said that the Germans " did lots of good work bleaching fibres without loss of strength, also finishing them to make them acceptable." Referring to the great I.G. Farben-industrie he said he found them far in advance of Canada in some things, such as one or two series of dyes that they had perfected. They had also produced a spun rayon which to the uninitiated eye was no different from wool. It was shrink-proof and water-proof. But " they could not make better rayon stockings than Canada."

Dr. A. C. Burton, University of Western Ontario, remarked that his findings in Germany convinced him more than ever that " science flourishes on the soil of freedom." Some scientists may have been able to carry on more or less freely but most of them were hampered by the Nazi setup. Industry paid more than research and consequently trouble was experienced in getting good research men. Heads of scientific institutions had even been drafted to serve as privates in the Germany army. " They never seemed to be able to wed up brains and money in Germany," he said.

Basic research did not flourish and projects which promised to take more than six months were often ordered abandoned. In spite of this some important discoveries were made but again there was no uniformly rapid application of research in industry. Toward the latter part of the war there appeared to be a change on the part of the Nazi party but by that time it was too late.

Speaking generally, the experts said that they had little difficulty in getting information from German scientists and technicians. Sometimes the latter were reluctant to give original drawings of new machine developments but were quite willing to give copies.

At the dinner given by the Department of Reconstruction to the experts and press representatives, Mr. Scully spoke on behalf of Reconstruction Minister C. D. Howe, who was unable to be present, welcoming the guests and congratulating the experts on the job they did in the German Reich.

Percy J. Philip, president of the Parliamentary Press Gallery, spoke on behalf of the press, commenting upon the difficulty experienced by reporters in their efforts to find out the truth about what has been going on in Germany.

CORRESPONDENCE

"Sin and Salvation" Moment Distribution Method

Vancouver, B.C.,
November 26th, 1945.

Dear Editor:

The Hardy Cross Moment Distribution method of analyzing structures with continuity through the joints or over the supports, as in a building frame or multiple-span girder bridge, has now been tested for about fifteen years.

It is the outstanding new aid for simplifying otherwise complex structural problems.

Simplicity is the key to accuracy and thus I would like to present a new variation of moment distribution for the consideration of practical Canadian engineers. This method can be called the Carryover Distribution Method or the *CDM*. Basically it consists of setting up fixed-end moment conditions and also an unbalanced moment table and then using Carryover Distribution Factors (*CDF*) which are products of ordinary Distribution Factors (*DF*) and standard Carryover Factors (*CF*).

For example, if the end B of BA takes 0.50 of the unbalanced joint moment and the carryover to the end A is 0.5 we can say that $CDF = (0.5)\ 0.5 = 0.25 = (DF)\ (CF)$.

In the simple example of Fig. 1, this "shortcut" *CDM* is worked out. This method is increasingly timesaving as the complexity of the structure increases as for example in multistory unsymmetrical building frames or secondary stress determinations for heavy complicated railroad bridges.

In order to aid those who have not used this method I will describe the first few steps. After determining the values I, L, $K = I/L$, *DF*, *CF*, and *CDF* then enter the fixed-end moments (*FEM*) in the table. In the Unbalanced Moment Table (*UMT*) record these *FEM's* and determine the set of *UM's*. We observe that joint B has the largest *UM*, thus we release this joint *first*, carrying over +450 to each of the joints A and C. It is then found that joint C has the next largest outstanding $UM = -750$; release this joint *next*.

This procedure of releasing joints of largest outstanding *UM* at each successive step is a real "timesaver". Continue entering Carried-Over Moments (*COM*) until the desired degree of accuracy is obtained. In the Summation (Σ) we determine *FEM*+*COM* and, using the *UM* table, we find the final *UM's*. These are

distributed in *one* operation of distribution so that we can calculate the final moments which can be graphically represented as shown in Fig. 1.

If this method of using *CDF's* and if moments of largest successive unbalance are distributed in the balancing process for a really complex problem, the saving of designer's time is really remarkable.

In closing I would like to mention that the Moment Distribution Method of Hardy Cross, University of Illinois, is a brilliant example of the use of what is known as the "Fault and Reform" method of structural analysis. The "faults" in this method are the artificial joint-clamping moments or sidesway prevention forces and the "reforms" are the joint balancing moments or sidesway correction forces. A more humorous way of describing this method is that of "Sin and Salvation" where salvation rectifies all the structural designer's sins in the process.

Yours truly,

(*Signed*) C. W. Deans, M.Sc., M.E.I.C.

Would Regulate Supply of Engineers

Department of Transport,
Ottawa, Ont.,
December 2, 1945.

The Secretary,
Engineering Institute of Canada,
Montreal, Quebec.

Sir:—

Much has been written and spoken about the low rates of pay for engineers, but very little, in a practical way, has been done to ameliorate this condition.

During the war years while there was a shortage of engineers, salaries were much improved, but during periods of depression new graduates accept positions at low salaries and find it difficult to improve their economic condition.

The economic law of supply and demand works the same with engineers as with agricultural or manufactured goods. It therefore appears logical that some control should be exerted over the supply of engineers.

This proposed control would be voluntary, exerted by universities in co-operation with the Engineering Institute. A commission could be set up which would estimate the probable demand of engineers for a ten-year period, revised from year to year.

A table could be set up indicating the number of graduates from each university that would be able to find satisfactory employment in the various engineering fields. Using this information, the university authorities would be able to direct students into likely branches or discourage them from entering fields already at the saturation level.

The enormous size of classes in engineering for this year will only mean a glut on the market four years from now. So far as I am aware, no effort has been made to guide students into fields where there is likely to be a fair chance of success, they just go willy nilly wherever their fancy takes them.

Sincerely,

(Signed) C. K. Hurst, M.E.I.C.

IT'S BEING TALKED ABOUT

The *Journal* is not the only publication that finds fault with the government policy of "penny wise and pound foolish," in relation to remuneration of professional workers in the Civil Service. The following short article is quoted from "Backstage at Ottawa" in *Maclean's* magazine of December 1st, 1945.

The *Journal* has been given to understand that the salary situation at the Research Council referred to in *Maclean's* has been rectified just recently.

"Reconversion is waking the Government to something any Deputy Minister could have told them years ago—that you can't hire a good man for peanuts. Unless something is done very fast to raise salaries in key Civil Service jobs, and to raise the myopic sights of the Treasury Board and the Civil Service Commission, the Government's elaborate reconstruction plans will break down hopelessly for lack of competent personnel.

In the Public Works Department, the Treasury Board authorized the employment of 32 new men as reconstruction planners, at salaries the Treasury Board thought pretty generous. Up to now, Public Works has been able to hire only seven, and has 25 jobs still open. The men they want aren't interested in the money they offer.

In the Department of Natural Resources, keystone of the federal conservation and development programme, 48 experienced and highly skilled technicians have quit within the past few months. They've gone to private industry for salaries often double what the Government was paying them—and even at that they're mostly getting less than $4,500. In the Civil Service many of them had been getting between $2,000 and $2,500.

For the National Research Council there are no late figures, but the turnover there is popularly reported to be worse than anywhere else. The peculiar irony is that the Research Council has a fairly generous schedule of salaries, but isn't allowed to live up to it—men qualified for senior jobs, and actually doing senior jobs, are kept at junior rank and pay. They're moving into commercial and industrial laboratories in droves, for double and triple the money but for work of much less value.

One department lately interviewed an Army officer of fairly senior rank. They offered him $2,100 to start. The officer, who has a wife and two children, said he couldn't live on that, and the Civil Service official looked hurt: "That's what we pay beginners," he said. Finally, after much cogitation, the department decided to offer him the Grade Four salary of $3,600. But meanwhile he'd taken a job in industry at $8,000."

SIXTIETH ANNUAL GENERAL

MONTREAL - MOUNT

THURSDAY, FRIDAY and SATURDAY,

R. C. FLITTON
General Chairman

H. F. FINNEMORE
Vice-Chairman

THURSDAY, FEBRUARY 7th

9.00 a.m. (all day)—Registration. There will be a registration fee of two dollars per person for Members, Affiliates, and guests, and one dollar for Juniors. No registration fee for ladies and Student members.

9.30 a.m.—Annual General Business Meeting of the Institute. Address of the retiring president, Dr. E. P. Fetherstonhaugh.

12.30 p.m.—Luncheon — Speaker: H. M. Scott, M.E.I.C., Manager, Toronto Branch, Atlas Construction Company. **The Engineers' Civic Responsibility in Community Planning.**

2.30 p.m.—Professional Session (Ball Room). **Design, Installation Characteristics and Performance of Rolls-Royce Nene and Derwent Gas Turbines (with special reference to jet propulsion),** by J. D. Pearson, Chief Technical Services Engineer, North American Technical Office, Rolls-Royce Limited, Montreal.

2.30 p.m.—Professional Session (Convention Room). **Evaluation of Light Metal Alloys,** by J. A. Van den Broek, M.E.I.C., Professor of Engineering Mechanics, University of Michigan, Ann Arbor, Mich., U.S.A.

8.30 p.m.—Montreal Branch Annual Smoker—Out-of-town members who are not familiar with the outstanding character of Montreal Branch Smokers will be well advised not to miss this event.

FRIDAY, FEBRUARY 8th

9.30 a.m.—Professional Session (Ball Room). **The Winter Temperature Cycle of the St. Lawrence Waters—A Plea for More Data (Is Winter Navigation Possible on the St. Lawrence and the Great Lakes?)** by J. G. G. Kerry, M.E.I.C., Consulting Engineer, Port Hope, Ont.

9.30 a.m.—Professional Session (Convention Room). **The Future of Radio Communications in Canada,** by A. B. Hunt, M.E.I.C., Manager, Elec-

C. A. LAVERTY
Chairman of the Entertainment Committee

L. A. DUCHASTEL
Secretary

J. J. H. MILLER
Chairman, Finance Committee

E. E. ORLANDO
Chairman of General Arrangements

AND PROFESSIONAL MEETING

ROYAL HOTEL

EBRUARY 7th, 8th and 9th, 1946

tronics Division, Northern Electric Company, Limited, Montreal.

12.30 p.m.—Luncheon — Speaker: Harry S. Rogers, President, Polytechnic Institute of Brooklyn, New York, U.S.A., and President, Society for the Promotion of Engineering Education.

What the War has done to Engineering Education

2.30 p.m.—Professional Session (Convention Room). **Pre-stressed Concrete,** by T. C. Creaghan, M.E.I.C., President, Creaghan and Archibald, Engineers and Contractors, Montreal, and by V. S. Murray, Engineer of Bridges, Department of Highways of Ontario, Toronto.

2.30 p.m.—Professional Session (Ball Room). **British Engineers' Contribution to the Allied Cause,** by P. Dunsheath, C.B.E., President, The Institution of Electrical Engineers (Great Britain), London, England.

7.00 p.m.—Annual Banquet (Normandie Roof). ***Dress—Dinner jackets or business suits.***

Speaker: Dr. P. Dunsheath, C.B.E., President, The Institution of Electrical Engineers (Great Britain), London, England. **The Engineer Family in the Commonwealth.** Presentation of prizes and medals of the Institute. Induction of the new president and presentation of new officers.

10.00 p.m.—Reception and Dance.

SATURDAY, FEBRUARY 9th

9.15 a.m.—VISIT to C.N.R. Rectifier Room (Central Station) and Control Tower at Lachine Canal.

9.15 a.m.—VISIT to C.P.R. Angus Shops to witness locomotive, wood and steel freight and passenger car repairing. Casting of car wheels. Blacksmith shop.

LADIES' PROGRAMME

Ladies are invited to all functions on the general programme. In addition, special entertainment is being arranged for them.

A bridge party at the Women's University Club is being arranged for Thursday night, February 7th.

MRS. R. E. HEARTZ
Ladies' Convenor

H. B. HOWE
Vice-Chairman of the Entertainment Committee

C. A. PEACHEY
Chairman of the Papers and Meetings Committee

J. M. CAPE
Chairman of Transportation and Plant Visits Committee

A. BENOIT
Chairman of Hotel Arrangements Committee

W. SHARPLES
Chairman of the Publicity Committee

COMMUNITY PLANNING COMMITTEE

Ross L. Dobbin, of Peterborough, has accepted the chairmanship of the Institute's Committee on Community Planning. He is a member of the City Planning Commission of Peterborough, and for five years was chairman of the Wartime Housing Committee of his city. These qualifications, along with his professional experience as General Manager of the Peterborough Utilities Commission and his broad knowledge of Canadian affairs, place him in an excellent position to do justice to the assignment.

Mr. Dobbin is a graduate of Toronto—1910, B.A.Sc., 1911, and joined the Institute as a Student in 1910. He has been chairman of the branch, councillor and vice-president for Ontario. He has rendered excellent and frequent service to the Institute through membership on various committees. He joined the Association of Professional Engineers of Ontario in 1922 and was on its council for 1927-28.

In 1931 he was made president of the American Water Works Association, a unique distinction for a Canadian. He was also president of the Association of Municipal Electric Utilities in 1930.

He was a member of the Senate of the University of Toronto for 1927 to 1932.

Mr. Dobbin has many other interests related to his profession and to good citizenship. For years he has been active in the Canadian and American Gas Association, and the Canadian and American Public Health Associations, the Illuminating Engineers Society, the New England Water Works Association, and Rotary International.

Members may feel confident that the Institute's interest in the important topic of community planning is in good hands.

MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, December 15th, 1945, convening at nine-thirty a.m.

Present: President E. P. Fetherstonhaugh in the chair; Past-President deGaspé Beaubien; Vice-Presidents J. E. Armstrong and E. V. Gage. Councillors A. Cunningham (Kenogami), W. L. Saunders (Ottawa), H. R. Sills (Peterborough), H. E. Brandon, W. H. M. Laughlin and W. S. Wilson, of Toronto; R. S. Eadie, R. C. Flitton, J. A. Lalonde, and C. C. Lindsay, of Montreal; Treasurer R. E. Chadwick; R. E. Heartz, chairman of the Committee on Employment Conditions and member of the Harry Bennett Memorial Committee; J. B. Stirling, chairman of the Committee on Professional Interests; General Secretary L. Austin Wright, Assistant General Secretary Louis Trudel, Secretary Emeritus R. J. Durley, and Major D. C. MacCallum, Rehabilitation Officer.

Harry Bennett Memorial Fund—The president called on Mr. Heartz, as a member of the Harry Bennett Memorial Committee, to present the report of the committee, explaining to Council that Mr. Heartz had just returned from a trip to London, Ontario, where he had discussed this matter with the other members of the committee, namely, James A. Vance, chairman, and E. V. Buchanan.

Mr. Heartz presented the committee's recommendations for the rules of governance for the Harry Bennett Memorial Fund. Each clause was examined separately, and was followed by a broad discussion. Mr. Wilson believed that the minimum number of restrictions should be required. The experience of various funds with which he had been associated was that the fewer restrictions there were, the better it was for everyone. At the same time, their loss experience had been very low.

It was thought also that the rules should specify the number of members of the Board which would constitute a quorum. It was thought, also, that the reference to a "high school" should be broadened to "school". It was agreed, finally, that the requirement that a student securing a loan should furnish life insurance as collateral be eliminated.

Finally, on the motion of Mr. Beaubien, seconded by Mr. Lindsay, the rules, as amended, were accepted unanimously.

There was further discussion as to the objective of the committee and Mr. Heartz stated that the committee had in mind $20,000.00 to $25,000.00. Mr. Gage and Mr. Laughlin were of the opinion that the amount should be higher but eventually, on the motion of Mr. Eadie, seconded by Mr. Lindsay, it was agreed unanimously that in the publicity material associated with the campaign for funds the ultimate figure be limited to $25,000.00.

Mr. Heartz pointed out that with the acceptance of this report the terms of reference of the committee were fulfilled. It was moved by Mr. Eadie, and seconded by Mr. Beaubien, that the present committee be continued, with power to add to its numbers.

In response to an inquiry, Mr. Heartz explained the procedure which the committee proposed to take to collect the funds. This was approved by Council and upon the motion of Mr. Armstrong, seconded by Mr. Eadie, it was unanimously agreed that the committee be authorized to proceed on the basis outlined by Mr. Heartz.

The president thanked Mr. Heartz for the interest he had taken and for the excellent report he had presented on behalf of the committee.

Rehabilitation of Members in the Armed Forces: Major MacCallum presented an interim report on the work of his rehabilitation service. He drew attention to the fact that conditions had changed somewhat and that to-day there were more members looking for employment than there were openings. At the same time there were several openings still not filled as persons with the proper qualifications have not applied. He thought this change, to some extent, would be seasonal, but the main reason was that opportunities were definitely dropping off.

Major MacCallum reported that the committee, under Major-General Howard Kennedy, recommended sending out letters to five thousand potential employers, telling them of the Institute's service and of the availability of certain members who had returned from overseas service. He thought that in this way several additional openings could be discovered. Council approved of the proposal.

Mr. Eadie described the experiences at his company's plant to illustrate how the opportunities for employment were falling off, and Mr. Stirling referred to figures released by the Dominion Bureau of Statistics which showed that although contracts awarded for the first eleven months of the year were up 37 per cent, as compared to last year, employment in the construction industry was only up 3.4 per cent, this situation being due to the shortage of materials.

Major MacCallum inquired of Council as to instructions for continuing the service to non-members of the Institute. Mr. Armstrong pointed out that the service affected members in two ways, one as employers, and one as employees. He thought that in every instance a member employee should be given the first opportunity, but if no member is available with the qualifications for the opening it should be offered to a non-member who had the qualifications rather than deny to the employer member the opportunity to interview a prospect. This interpretation was approved by Council.

Major MacCallum pointed out that up to the first of December at least forty non-members who had been interviewed by him had applied for membership in the Institute. Major MacCallum's report was accepted, it being pointed out that the complete report will appear in the February *Journal* as part of the annual report of Council.

Amendments to the By-Laws: The proposed changes to Sections 21, 22, 26, 28 and 66, as recommended by the Finance Committee, were presented by Mr. Armstrong and considered section by section. Following discussion, each section was approved unanimously with the exception of Section 21, in which case Mr. Sills voted against the proposed amendment.

The general secretary then presented proposed changes to Sections 7, 9, 10, 23, 45 and a new Section 50A, submitted by the Membership Committee with a view to implementing the recommendations of that committee and the Board of Examiners, all of which had been discussed and commented upon by the various branches. Following discussion, and with slight amendment to Section 7, the proposed changes were unanimously approved and the general secretary was instructed to proceed with the proposals in accordance with the by-laws.

Annual Meeting, 1946: Mr. Flitton, chairman of the annual meeting committee, reported that all arrangements were proceeding satisfactorily. Since the last meeting of Council there had been some doubt as to whether hotel accommodation would be available, but the committee had now been assured that a certain number of rooms would be available at the Mount Royal Hotel, where the meeting was being held, and also at two or three other centrally located hotels. Speakers had been secured for the banquet and for the two luncheons and some excellent technical papers were being prepared. Arrangements were proceeding for the students' conference, which would be an important feature of the meeting. This was noted as a progress report.

Community Planning: The general secretary outlined the action taken by the president since the last meeting of Council relative to amendments to the National Housing Act of 1944. The Institute's attention had been called to an amendment to the Act whereby the compulsive requirement that an official plan be approved by the Minister before government funds were available was modified so that money could be given at the Minister's discretion without an official plan.

This clause in the original Act was mandatory and the money could not be loaned unless the plan had been approved. To make the official plan an optional requirement might mean the end of all community planning. It was from this aspect that the Institute was concerned.

The president, Vice-President Armstrong and the general secretary discussed the amendment in Winnipeg on December 6th and it was agreed that a message should be sent to the Minister of Finance asking that the mandatory clause be reinstated, also requesting that an engineer with community planning experience be appointed to the Central Mortgage Housing Corporation.

The matter was discussed at some length and eventually, on a motion by Mr. Beaubien, seconded by Mr. Flitton, and carried unanimously, the president's action was approved and he was authorized to take whatever further action should be required before the next meeting of Council.

Planning for Ottawa Federal District: The general secretary reviewed the situation with regard to the planning of the city of Ottawa as a national memorial. He reminded Council that it had been agreed that further action would be delayed until certain authorities in Ottawa had been consulted in order to be certain that the Institute's position was a sound one.

He reported that he had heard through one of the members that a National Committee, to be in overall charge of the work, was to be established, upon which various interested groups would be represented. He had been informed that the Royal Architectural Institute of Canada had already been invited to name its representative but that no word had come to the Engineering Institute. This was accepted as a progress report. (The week following the Council meeting the general secretary visited Ottawa and had several interviews that have a bearing on this subject. He had lunch with Mr. F. E. Bronson, chairman of the Federal District Commission, and was assured by him that when the final plans were agreed upon the arrangements would be entirely to the satisfaction of the Engineering Institute. Mr. Bronson admitted that his proposal had not yet been accepted, but he anticipated that it would be completed and ready for announcement within a very short time. This material will be presented in greater detail at the next meeting of Council.)

Montreal Branch By-laws: A draft revision of the by-laws of the Montreal Branch were submitted for the approval of Council. The general secretary reported that he had read the draft and it appeared to be in order but that one or two points might be improved with some editing. On the motion of Mr. Eadie, seconded by Mr. Lalonde, it was unanimously resolved that the branch by-laws as submitted be approved subject to such editorial revision as may be agreed upon.

Engineering Education: The general secretary reported that the question of the Institute establishing a Committee on Engineering Education had been discussed at the regional meeting in Regina in November. Certain proposals were made at that time which he had since had the opportunity of discussing with several deans of engineering in various parts of Canada. One of these proposals was that Dr. Fetherstonhaugh, as president of the Institute, should invite all the deans of engineering to a conference about the time of the annual meeting of the Institute. Mr. Wright stated that approval was given to this proposal by each of the deans with whom he had spoken. They were of the opinion that they should meet soon in order to discuss many things of common interest, including the courses themselves. Each dean had made a long study of these matters but felt there would be considerable advantage to getting the ideas of the other deans as well. Accordingly, on the motion of Mr. Brandon, seconded by Mr. Flitton, it was unanimously agreed that the president be authorized to write to the deans along the lines suggested.

Suggestions were made that certain other individuals or representatives of groups might meet with the deans, but Mr. Eadie suggested that it was highly desirable that the deans should be left alone throughout their conference as they could readily invite the participation of anyone they desired to have with them. Council agreed with this.

Increase of Fees: At the Finance Committee meeting consideration was given to arrangements which might be made with the provincial associations with which the Institute has agreements with regard to the proposed increase of fees in those provinces. It was agreed that the matter of an increase in fees for the entire Institute was wholly a matter for the Institute to decide but that, subsequent to this decision to increase the fees, negotiations should be carried on with the associations in order to agree upon a basis that would apply to joint members.

It was suggested that a conference might be called between representatives of the five provincial associations and the Institute's Committee on Professional Interests and the Finance Committee to discuss this subject. It was also agreed that it would be desirable to have such a conference before the annual meeting so that the deliberations of the conference could be reported at the annual meeting of the Council.

On the recommendation of the Finance Committee it was unanimously resolved that the Committee on Professional Interests be empowered to negotiate with the provincial associations to the end that such a conference be arranged.

Toronto Branch Junior Section: Consideration had been given by the Finance Committee to a letter from the chairman of the Junior Section of the Toronto Branch requesting Council to donate a sum of $50.00 to the section as the first prize in the papers competition on Students' Night. Also, a letter had been received from Mr. Dibblee, chairman of the Students' Committee on the Toronto executive, in which he recommended that Council make the grant. Mr. Laughlin, as councillor from the Toronto Branch, supported the proposal very strongly.

At the meeting of the Finance Committee attention had been called to the position in which the Institute might find itself in relation to other junior sections if this grant were made. Following a long discussion it had been agreed to recommend to Council that the money be made available as the first prize for the best paper presented at the Toronto Branch Students' Night on January 24th, 1946. This recommendation was approved unanimously by Council.

Committee on Professional Interests: Mr. Stirling, chairman of the Committee on Professional Interests, reported that in November, at the time of the annual meeting of the American Society of Mechanical Engineers, three Institute representatives (R. S. Eadie, G. Lorne Wiggs and Louis Trudel) had met with a similar group from the A.S.M.E. to discuss certain suggested changes in the co-operative agreement between the two societies. These changes had developed in the course of interviews that Mr. Stirling had had in Toronto with representatives of the Ontario Section of the A.S.M.E.

Mr. Eadie reported on the actual meeting and stated that there was very little discussion as to the suggested changes, but that considerable time was spent in determining methods and procedures by which the two organizations could expand their programme of co-operation. He was assured by the A.S.M.E. representatives that the revised agreement would be accepted by their Board of Management at the December meeting. Mr. Stirling now asked the Council of the Institute to approve the revised agreement. Accordingly, it was moved by Mr. Eadie, seconded by Mr. Cunningham, and approved unanimously that the revised agreement be approved.

Mr. Eadie reported that the A.S.M.E. was holding its mid-year meeting in Detroit in the month of June. Past-President Parker (A.S.M.E.) had suggested that this should be a joint meeting with the Institute similar to the one held in Toronto in 1943.

Mr. Eadie also reported that there had been some definite suggestions as to means by which Institute members could carry out activities in Association with the research committees of the A.S.M.E.

Council approved of the suggestions of further co-operation, including the joint meeting.

Establishment and Operation of Branch Sections: The general secretary presented a set of suggested rules governing the establishment and operation of branch sections submitted by the executive of the Winnipeg Branch. He reported that the branch was anxious to establish a Students' Section, and he had informed them that in accordance with the Institute by-laws it would be in order for them to establish such a section, without authority from Council, if the branch executive approved.

Following some discussion, it was unanimously agreed that Council approves of the principle of establishing student sections, and the general secretary was requested to study the rules submitted and make suggestions to the Winnipeg Branch before they are presented to Council for final approval.

New Branch at Trail, B.C.: The general secretary presented a petition signed by fourteen members and one junior of the Institute, requesting the establishment of a new branch to be known as the Kootenay Branch, with headquarters at Trail, B.C., such branch to include the district extending from the Okanagan Valley on the west to the British Columbia border in the east and including the districts known as the West and East Kootenays and the Okanagan Valley. Additional signatures were being secured from members residing outside of the immediate Trail area and these will be forwarded to Headquarters as soon as received.

This area at present forms part of the Vancouver Branch district and the possibility of establishing such a branch had been discussed with the officers of the Vancouver Branch, who had been decidedly of the opinion that there was room for a new branch in that area.

On the motion of Mr. Lindsay, seconded by Mr. Lalonde, it was unanimously resolved that the application for a new branch with headquarters at Trail be accepted and approved.

Conference of British Engineering Societies: The general secretary read a letter signed by the secretaries of the Institutions of Civil, Mechanical and Electrical Engineers (of Great Britain), asking if the Institute would be prepared to participate in a conference of officers of similar societies of Australia, New Zealand, South Africa and India, the representatives to be guests of the three British Institutions. The matter had been discussed with President Fetherstonhaugh, Vice-President Armstrong and President-Elect Hayes, all of whom were very much in favour of it. On the motion of

Mr. Brandon, seconded by Mr. Chadwick, it was unanimously agreed that the Institute should participate in such a conference.

Application through Associations: A letter was presented from the registrar of the Association of Professional Engineers of New Brunswick regarding the recent admission to the Association of a candidate whose application for membership in the Institute had, a short time previously, been declined. Application was now being made for membership in the Institute under the terms of the co-operative agreement. The secretary was directed to discuss the matter further with the Association and report to a later meeting of Council.

ELECTIONS AND TRANSFERS

A number of applications were considered, and the following elections and transfers were effected.

Members

Adams, Edward Campbell, B.Eng., (Elect.), (Nova Scotia Tech. Coll.), design engr., special projects dept., Defence Industries Limited, Montreal, Que.

Barnes, James C., B.A.Sc., M.A.Sc., (Univ. of Toronto), asst. research engr., National Research Council, Ottawa, Ont.

Cochrane, Peter William Fitzgerald, (Aero. Engr., R.C.A.F.), B.Eng., (Mech.), (McGill Univ.), 310 York St., London, Ont.

Croft, Philip James, (London Polytechnic Inst.), elect. engrg. dept., Canada Wire and Cable Co. Ltd., Toronto, Ont.

Daly, Robert Emmet, (Capt., R.C.E.M.E.), B.Eng., (Chem.), (McGill Univ.), prod. engr., Dept. Munitions & Supply, Montreal, Que.

Denton, Herschel Eugene, B.Sc., (Mech.), (New Mex. Coll. A. & M. Arts), consultg. engr., Denton & Spencer, Calgary, Alta.

Donald, Robert Johnston, B.A.Sc., M.A.Sc., (Univ. of British Columbia), asst. chief chemist, Imperial Oil Limited, Sarnia, Ont.

Dyke, Frederick Ian Latham, (Elect. Lt., R.C.N.V.R.), B.Sc., (Elect.), (Queen's Univ.), Calgary, Alta.

Goring, Gilman Rogers, B.Eng., (Mech.), (McGill Univ.), asst. divn. engr., Consolidated Paper Corp., Grand'Mere, Que.

Hanrahan, Frank Edward, (Elect. Lt., R.C.N.V.R.), B. Eng., (Elect.), (N.S. Tech. Coll.), 81 Spadina Ave., Ottawa, Ont.

Hemphill, James Laird, (Ltd. Cmdr. (E), R.C.N.V.R.), B.A.Sc., (Univ. of Toronto), Canadian Joint Staff, Washington, D.C.

Hillary, Bertrand Bristow, M.A., Ph.D., (Univ. of Toronto), mtce. & process engr., Dow Chemical of Canada Ltd., Sarnia, Ont.

Hubble, Charles William, (Works Liaison Officer, R.A.F.), B.Sc., (Civil), (Univ. of Sask.), 17 High St., Cricklade, Wilts., England.

Lundie, William Earl, B.Eng., (Civil), (Univ. of Saskatchewan), mech. supt., British American Oil Co., Ltd., Clarkson, Ont.

McGeachy, Robert Andrew, B.Sc., (Civil Engrg.), (Univ. of Michigan), engr., mech. dept., Imperial Oil Limited, Sarnia, Ont.

McNellis, Ralph Stewart, B.A.Sc., (Mech.), (Univ. of Toronto), contract estimator & project engr., John Inglis Co., Ltd., Toronto, Ont.

Phelps, Charles Stewart, B.A.Sc., (Eng.), (Univ. of Toronto), elect. engr., St. Clair Processing Corp., Sarnia ,Ont.

Pirnie, Malcolm, M.C.E., (Harvard Univ.), Hon. D. Eng., (Rensselaer Poly. Inst.), consultg. engr., 25 West 43rd St., New York 18, N.Y.

Pollard, Roy, (Accrington Tech., England), water rights engr., Dept. of Lands & Forests, Prov. of British Columbia, Nelson, B.C.

Raymond, Jean Maurice, S.B., (Chem.), (Mass. Inst. Tech.), president, Raymond Hardware Ltd., Montreal, Que.

Russell, Andrew, (Cmdr. (E), R.C.N.R.), (Rutherford Tech. Coll., Newcastle, Eng.), Chief Engr., H.M.C. Dockyard, Halifax, N.S.

Russell, Bruce Hamilton, (W/C., R.C.A.F.), B.A.Sc., (Mech.), (Univ. of Toronto), Mount Hope, Ont.

Smith, Osborne Kingdon, (Works Off., R.C.E.), B.A.Sc., (Univ. of Toronto), M.D. No. 1, London, Ont.

Thompson, Howard Bell, B.A.Sc., (Univ. of Toronto), mech. & elect. engr., Imperial Oil Limited, Sarnia, Ont.

Walsh, Frederick Francis, B.A.Sc., (Mech.), (Univ. of Toronto), tech. supervisor, steam & power plant, St. Clair Processing Corp., Sarnia, Ont.

Watt, William C., (Glasgow Tech. School), district chief engr., Dept. of Munitions & Supply, Toronto, Ont.

Juniors

Blayney, James Porter, B.A.Sc., (Mech.), (Univ. of Toronto), jr. engr., engrg. dept., Dow Chemical of Canada, Ltd., Sarnia, Ont.

Boggs, William Brenton, Jr., (Engr., Aero., R.C.A.F.), B.Eng., (Mech.), (McGill Univ.), awaiting discharge, Noranda, Que.

Caron, Maurice Charles (Lt. Elect., R.C.N.V.R.), B.Eng., (Elect.), (McGill Univ.), 83 St. Cyrille Blvd., Quebec, Que.

Casson, Harold Vincent, (Lt. (E), R.C.N.V.R.), B.A.Sc., (Elect.), (Univ. of British Columbia), Seaview Road, Cadboro Bay, B.C.

Craig, William Hardy, B.A.Sc., (Mech.), (Univ. of Toronto), construction supvr., Dow Chemical of Canada Ltd., Sarnia, Ont.

Delage, Jean Baptiste, (Lieut., R.C.S.), B.Sc., (Mining), (Laval Univ.), M.D. No. 4, Montreal, Que.

Livingstone, James George, B.A.Sc., (Univ. of Toronto), engr., Imperial Oil Limited, Sarnia, Ont.

Macdonald, Allan George, (Sub. Lt. Elect., R.C.N.V.R.), R.R. No. 1, Victoria, B.C.

McDiarmaid, Robert Batson, B.Sc., (Elect. Engrg.), (Univ. of Alberta), resident elect. engr., Dept. of Transport, Edmonton, Alta.

McLeod, Cedric William, (Lieut. R.C.E.M.E.), B.Eng., (Mech.), (N.S. Tech. Coll.), (Workshop Officer, 2 H.A.A. Regt., Cdn. Army Overseas).

McRae, William Robertson, B.Sc., (Chem. Engrg.), (Washington State Coll.), mgr. dir., Western Clay & Chem. Supply Co., Ltd., Calgary, Alta.

Rose, Harold Thomas, B. Eng., (N.S. Tech. Coll.), designing dftsman., H. G. Acres & Co., Niagara Falls, Ont.

Tiedje, John Louis, B.A.Sc., M.A.Sc., (Univ. of British Columbia), chem. engr., tech. research dept., Imperial Oil Limited, Sarnia, Ont.

Transferred from the class of Junior to that of Member

Gorowski, Charles S., B.Eng., (Elect.), (Univ. of Manitoba), asst. mgr., sub-contract dept., de Havilland Aircraft, Toronto, Ont.

Transferred from the class of Student to that of Member

Kingsland, Edward N., (F/O., R.C.A.F.), B. Eng., (McGill Univ.), 544 Lansdowne Ave., Westmount, Que.

Vail, Gilbert Frank, (Elect. Lieut., R.C.N.V.R.), B.Eng., (Elect.), (N.S. Tech. Coll.), teacher. Electronic Industrial Control, Nova Scotia Technical College, Halifax, N.S.

Transferred from the class of Student to that of Junior

Auger, Roland Albert Auger, B.A.Sc., C.E., (Ecole Poly.), asst. to mtce. and utilities engrs., Shell Oil Refineries, Montreal East, Que.

Beaudry, Roger Joseph, B.Sc., (Queen's Univ.), on staff Sound Maintenance & Research, National Film Board, Ottawa, Ont.

Dinsmore, Clarence Sherman, B.Sc., (Univ. of Toronto), secretary-treas., and mgr., Grenville Castings Limited, Merrickville, Ont.

Galli, Joseph N., B.Sc., (Civil), (Univ. of Manitoba), H. E. McKeen & Co., Ltd., Montreal, Que.

Kirkwood, John Gordon, B.Sc., (Civil Engrg.), (Univ. of Michigan), welding design engrg. dept., The Canadian Bridge Co., Ltd., Walkerville, Ont.

Livingston, Charles Burton, (Elect. Lt. Cmdr., R.C.N.V.R.), B.A.Sc. (Univ. of Toronto), 160 Glen Road, Toronto, Ont.

MacLeod, Frederick James Gordon, (Constructor Lt., R.C.N.V.R.), B. Eng., (Civil) (McGill Univ.),N.S. H.Q., Ottawa, Ont.

Mitchell, E. Roe, (Capt., R.C.E.M.E.), B.Sc., (Mech.), (Queen's Univ.), 580 McLeod St., Ottawa, Ont.

Pink, John Frederick, (Lieut. Elect., R.C.N.V.R.), B.Sc., (Elect.), (Univ. of Manitoba), engrg., design & drafting, E. I. DuPont de Nemours Co., Wilmington, Del.

Poirier, Leo Joseph, B.Eng., (Civil), (N.S. Tech. Coll.), detailer & designer, Truscon Steel Co. of Canada, Montreal, Que.

Admitted as Students

Hershman, Henry Phillip, B.Eng. (Mech.), (McGill Univ.), jr. engr., United Shipyards Ltd., Montreal, Que.

Lassman, Salomon H., B.Sc., (Elect. Engrg.), (Univ. of New Brunswick), layout dftsman, amphibious vehicles, Dept. of Munitions & Supply.

Mackay, William Donald, dftsman., Canadian National Railways, Prince Rupert, B.C.

McDonald, Rheo Michael, (Univ. of New Brunswick), Fredericton, N.B.

Murray, William A., (St. Francis Xavier Univ.), Box 401, Pictou, N.S.

Pimenoff, Vladimir John, B.Eng., (McGill Univ.), Dept. of National Defence.

Taylor, Leonard Harold, B.A.Sc., (Univ. of British Columbia), 2456-W. 6th Ave., Vancouver, B.C.
Watson, William Scott, B.Sc., (Elect. Engrg.), (Univ. of Manitoba), test engr., English Electric Co. of Can., St. Catharines, Ont.

Students at University of Manitoba

Alexander, Gordon Alan, 27 Digby Ave., Winnipeg, Man.
Anderson, Kristjan Gunnar, Box 218, Univ. of Manitoba, Fort Garry, Man.

Shannon, Harold Cecil, 10214—124th St., Edmonton, Alta.
Wetterberg, Donald Carleton, 10803 Whyte Ave., Edmonton, Alta.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective.

Alberta

Member

Keith, Leslie Stephens, (Univ. of British Columbia), sr. asst. airways engr., Dept. of Transport, White Horse, Y.T.

New Brunswick

Junior to Member

Ball, Elmer Langdon, B.Eng., (N.S. Tech. Coll.), Dept. of Public Works of Canada, Saint John, N.B.

Nova Scotia

Members

Fournier, Robert Noel, B.Sc., (Engrg. Physics), (Univ. of Saskatchewan), industrial heating section, Canadian General Electric Co., Toronto, Ont.
Thorne, Edward Lefferte Jr., B.Sc., (Civil Engrg.), (N.S. Tech. Coll.), 18 Bloomingdale Terrace, Halifax, N.S.

Quebec

Members

Farquharson, Andrew Gray, B.Sc., (Queen's Univ.), mgr., refining dept., McColl-Frontenac Oil Co. Ltd., Montreal, Que.
Tremblay, Charles, B.A.Sc., C.E., (Ecole Poly.), engr., Quebec Electricity Board, Montreal, Que.

Junior to Member

Benoit, Andre Persillier, B.Eng., (Civil), (McGill Univ.), sales engr., mech. divn., Dominion Rubber Co., Montreal, Que.

Student to Member

Lamb, Hugh, B. Eng., (Civil), (McGill Univ.), (overseas with R.C.A.F.), 1061 Richard Ave., Verdun, Que.
Marcotte, Benoit, B.A.Sc., (Ecole Poly.), Sullivan, Abitibi, Que.
Thibaudeau, Guy, B.A.Sc., C.E. (Ecole Poly.), civil engr., Dept. of Mines, Province of Quebec, Quebec, Que.

AN URGENT REQUEST

Would members who do not file the *Journal* kindly return their December 1945 copy to headquarters.

On account of difficulties at the printers, fewer copies have been printed than had been ordered and the needs of several libraries have not been filled.

Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items, such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form a basis of personal items in the *Journal*.

News of the Personal Activities of members of the Institute

C. C. Parker, M.E.I.C., has recently entered a consulting practice in Hamilton, Ont., specializing in a structural service to architects and consulting service to municipalities on bridges, grade separation and similar structures.

C. C. Parker, M.E.I.C.

Mr. Parker graduated in civil engineering from the University of Toronto in 1929, following which he spent several years with the Manitoba Bridge and Iron Works Limited in Winnipeg, on the detail and design of steel and reinforced concrete construction. Returning to Toronto in 1931, he spent a year with James, Proctor and Redfern, notably on the design of the high level bridge into Hamilton. Then followed a year in structural research, at the University of Toronto, with a research bursary. Mr. Parker then spent seven years with the Department of Highways of Ontario on the design and field supervision of bridges.

With the beginning of the war and cessation of highway activity, he secured leave of absence to work with the Hamilton Bridge Company Limited as a structural designer. He participated in the design of a number of industrial plants, lock gates, hammerhead cranes, railway bridges and other structures directly and indirectly connected with the war effort, and located throughout Ontario, Quebec and the Maritimes.

A. M. Paull, M.E.I.C., is being released from the R.C.A.F. and is returning to his former position as office engineer with the Department of Public Works, Edmonton, Alta. Mr. Paull served for four years with the Works & Buildings branch of the Air Force, with the rank of squadron leader.

V. S. Thompson, M.E.I.C., who has served overseas as a lieutenant-colonel in the Royal Canadian Engineers, has been engaged by the Department of Reconstruction as chief of the design division, and has taken up his permanent residence in Ottawa.

G. W. F. Ridout-Evans, M.E.I.C., has accepted an appointment with the Department of Reconstruction at Ottawa, Ont. Major Ridout-Evans was mentioned in despatches and won the Military Cross while serving overseas in the Royal Engineers from 1915 to 1919. For the past four years he has been in the Small Arms Ammunition Division of the Inspection Board of United Kingdom and Canada.

L. S. McGregor, M.E.I.C.

L. S. McGregor, M.E.I.C., who recently returned to the Canadian National Railways, after over five years service overseas, has been appointed mechanical inspector in Montreal.

Mr. McGregor joined the Canadian National Railways as office boy in 1926 and became a machinist apprentice two years later. He went to McGill University in 1931 and graduated with the degree of B.Eng. (Mech.) in 1936.

He continued his apprenticeship in the Canadian National Railways shops in the summer months while attending college and completed it in 1937, when he became a machinist. Later in the same year, Mr. McGregor was promoted to assistant foreman, and, in 1939, inspector and transferring to the department of research and development, assistant engineer. Enlisting as a lieutenant with the R.C.E.M.E.'s he attained the rank of lieutenant-colonel and was assistant director of the unit overseas.

A. D. Hogg, M.E.I.C., who until recently was lecturer in mechanical engineering in the Department of Applied Science, University of Alberta, is now employed as assistant research engineer for the Hydro-Electric Power Commission of Ontario in Toronto.

Dr. Otto Holden, M.E.I.C., chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario, was elected president of the Engineering Alumni Association of the University of Toronto at the 12th triennial reunion, last November.

S. McEachern, M.E.I.C., has recently joined the staff of Ross Engineering of Canada Limited at Montreal as plant manager. He was previously associated with Westeel Products Limited at Montreal.

D. R. McGregor, M.E.I.C., has been discharged with the rank of lieutenant from the R.C.N.V.R. and has returned to his former position in the engineering department of the Canadian General Electric Company in Peterborough, Ont.

D. W. Laird, M.E.I.C., has returned to the staff of the C. D. Howe Company Limited, Port Arthur, Ont., where he was formerly employed as designing engineer prior to his enlistment in the Royal Canadian Engineers. Mr. Laird has been serving as a lieutenant with No. 6 E.S. & W. Company, stationed in Halifax, N.S.

J. P. Leroux, M.E.I.C., has recently been discharged from the Canadian Army after three and a half years' service with the R.C.E. in Canada and abroad. Lieutenant Leroux returned from overseas in July, 1945, where he served in North West Europe with the 3rd Bn. R.C.E. He has now resumed his position with the Department of Transport, Civil Aviation Division, as resident engineer at Montreal. He is presently engaged in soil mechanics investigations for the Montreal (Dorval) Airport in the Soil Mechanics Laboratory at McGill University.

F. R. Barnsley, M.E.I.C., of Canadian General Electric Company has recently been transferred from Peterborough, Ont. to Vancouver, B.C., where he is manager of the supply division.

Dr. Charles Camsell, M.E.I.C., Canadian deputy minister of mines and resources, and a past-president of the Institute, has been awarded the R. B. Bennett Empire Prize of 100 guineas for his paper " Canada's New North ". The paper was read to the Royal Society of Arts last April by Captain W. M. Gilchrist.

R. W. Diamond, M.E.I.C., whose association with the Consolidated Mining and Smelting Company of Canada began in June, 1917, has recently become vice-president and general manager, and a member of the board of directors of that company. Mr. Diamond, who graduated from the University of Toronto in 1913 with the degree of B.A.Sc. in Mining and Metallurgical Engineering, was closely associated with the development of successful processes for the concentration of Rossland and Sullivan mine ores, and with the design, construction and operation of the group of plants built by the company for the production of chemicals and chemical fertilizer at Trail, B.C.

In assuming his new responsibilities, Mr. Diamond fills the vacancy created by the death of S. G. Blaylock, M.E.I.C.,

G. P. Duncan, M.E.I.C., has been released from the R.C.A.F., in which he served as a flying officer, and is at present working as instrument man with the City of Edmonton, Alta.

F. G. Ewens, M.E.I.C., has returned to the University of Toronto as assistant professor of mechanical engineering in the Faculty of Applied Science and Engineering, after five years in Montreal at the head office engineering departments of Canadian Industries Limited and Defence Industries Limited.

W. M. Veitch, M.E.I.C., has returned to his position as city engineer of London, Ontario. He served as district engineer officer of M.D. No. 1, London, with the rank of lieutenant-colonel. Colonel Veitch was twice decorated with the Military Cross while serving overseas with the Canadian Engineers from 1914 to 1919.

Eric E. Wheatley, M.E.I.C., formerly with the Consolidated Paper Corporation Limited, at Grand'Mere, Quebec, has accepted the appointment of professor of mechanical engineering at the University of New Brunswick, Fredericton.

R. H. Ansley, JR.E.I.C., who for nearly four years served as a lieutenant with the Royal Canadian Engineers in Italy, Belgium, Holland and Germany, has recently been released from the Canadian Army and has been employed with the City of Winnipeg Hydro-Electric System at Slave Falls where additional units are being constructed.

Stewart Barkwell, JR.E.I.C., has returned to civilian life and is now employed in design engineering at the Davenport Works of the Canadian General Electric Company Limited, Toronto, Ont. Mr. Barkwell joined the Test Department of this company upon graduation from the University of Manitoba in 1940. He recently obtained his release from the army with the rank of second lieutenant.

Flying Officer R. L. Blackett, JR.E.I.C., has retired from the R.C.A.F. and has accepted a position as junior engineer with the Tropical Oil Company, Barrancabermeja, Colombia, South America.

Raymond LeBel, JR.E.I.C., has recently returned from overseas and, upon being discharged, has resumed his connection with J. M. Eugene Guay, Inc., consulting engineers, Montreal. He served as a lieutenant with the Royal Canadian Engineers in Canada and overseas for the past four years.

Maurice Magnan, JR.E.I.C., has joined the Eagle Pencil Company of Canada Limited, Drummondville, Que. Since his graduation from the Ecole Polytechnique in 1943, he had been employed with the Imperial Oil Company, Sarnia, Ont.

E. N. Parker, JR.E.I.C., has been discharged from the R.C.N.V.R. with the rank of lieutenant (E), and has returned to the Dominion Bridge Company Limited, at Lachine, Que., where he was employed as a mechanical engineer prior to his enlistment.

R. G. Rowan, JR.E.I.C., was released by the Royal Canadian Air Force in September, 1945 and has returned to his former position with the Bell Telephone Company of Canada as an assistant engineer on the staff of the Laurentian District Engineer. He served as a flight lieutenant with number 10 B.R. Squadron in Newfoundland.

E. P. Stephenson, JR.E.I.C., who has served as captain and major with the R.C.E.M.E. on the technical staff at N.D.H.Q. and overseas, has now returned to his former position with the Canadian General Electric Co. Limited at Peterborough, Ontario.

W. M. Brenan, S.E.I.C., is now employed with D. O. Turnbull, consulting engineer, Saint John, N.B. Mr. Brenan has recently been discharged from the Royal Canadian Air Force, with which he has served overseas since 1942. Prior to enlistment he was with Dominion Bridge Company Limited.

C. Brown, S.E.I.C., has resumed his civilian occupation with the Bell Telephone Company at Quebec City, Que. After joining the Royal Canadian Air Force in January, 1942, Mr. Brown served overseas for three years, returning recently to retire with the rank of squadron leader.

W. M. McKie, S.E.I.C., has returned to the Canadian General Electric Company Limited, after overseas service as a flight lieutenant in the Royal Canadian Air Force. Mr. McKie has joined the Switchgear Section, Central Station Division, Apparatus Department, of the company.

Lorne Page, S.E.I.C., is at present doing post-graduate work in physics in the Graduate School at Cornell University in Ithaca, New York.

I. F. Ronalds, S.E.I.C., has recently been discharged with the rank of flight lieutenant from the Royal Canadian Air Force, in which he has been serving since 1942. He graduated from the University of New Brunswick in 1941 and is now employed with the Ontario Hydro-Electric Power Commission at Toronto.

H. G. Roy, S.E.I.C., is now with Commonwealth Plywood Company Limited at Ste. Therese, Quebec.

R. E. Stone, S.E.I.C., has been released from the Royal Canadian Corps of Signals, with which he was serving as a lieutenant, and is now attending the University of Western Ontario, where he is working towards his master's degree in electronics and communications.

A. E. Street, S.E.I.C., is now employed as assistant engineer in the Bridge Engineer's Department of the Canadian National Railway Company in Winnipeg. Mr. Street has recently returned from overseas, where he served as a lieutenant in the Royal Canadian Engineers.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

S. G. Blaylock, M.E.I.C.

SELWYN GWILLYM BLAYLOCK

"A time like this demands strong minds, great hearts, true faith and ready hands."

So often in studying the history of a section of Canada we find the life story of a man. There are not many places where this is truer than in the Kootenay, British Columbia. The story of Trail and Kimberley and the Consolidated Mining and Smelting Company of Canada Limited is essentially the story of S. G. Blaylock, who died in Trail on November 18th, 1945, at the age of sixty-six, after forty-six years service with one company.

Mr. Blaylock rose within the ranks of the company from assayer to president, and at the time of his death was chairman of the board, having relinquished the presidency but a few months earlier.

He was also vice-president and director of Coast Copper Company Limited, a director of Electrolytic Zinc Process Company, Montana, Buena Vista Mining Company, and the Bank of Montreal.

Mr. Blaylock was born in Paspebiac, Quebec, and attended Bishops College School at Lennoxville. In 1899 he was graduated from McGill in metallurgy.

One of Canada's greatest industries grew up in an obscure part of British Columbia. There were difficulties of finance, power, transportation and refining that beset the industry in its early days, and nothing but the dogged perseverance, the resourcefulness, and the intelligence of its guiding genius could have made it the giant it is today. He would not be beaten—and fortunately so for Canada.

The company's war record is unique. The quantities of metals and chemicals that were produced are staggering. The whole programme was shaped to the needs of the Allies and in his drive to get high production in the materials so precious and so essential to success, Mr. Blaylock spared himself least of any.

In the course of his life he received many honours and recognitions. He was an honorary member of the American Institute of Mining and Metallurgical Engineers, and the Canadian Institute of Mining and Metallurgy, and was president of the latter organization in 1934-35. Twice he was given honorary degrees, and at the time of his death was a member of the Board of Governors of McGill University.

Mr. Blaylock will be sadly missed in many places. It is difficult to imagine Trail without him, but actually Trail will never be without him while the plants of the company continue to operate. Verily it has been said "An institution is but the lengthened shadow of a man". Emerson might well have been writing about this company and this man.

Major Francis Lorn Campbell Bond, D.S.O., M.E.I.C., a prominent figure in railroad circles for many years, died in Montreal, Que., on December 9th, 1945. Born in Montreal on February 21st, 1877, he graduated as a B.Sc. from McGill University in 1898.

Shortly after graduation he entered the service of the Grand Trunk Railway and became assistant engineer in charge of double track in 1901. He worked on the construction of the New York subway in 1902. In the following year he was named resident engineer for the eastern division of the Grand Trunk Railway. Ten years later he was appointed division engineer. He enlisted with the Canadian Army in 1916 and became a major in the battalion of railway troops in France. He was mentioned in dispatches twice and in 1918 he won the Distinguished Service Order.

Returning to Canada after demobilization, Major Bond was appointed chief engineer of the Grand Trunk Railway System and, following amalgamation of the lines comprising the Canadian National Railways, he was appointed regional chief engineer, central region, with headquarters at Toronto. In 1924 he became general superintendent, Montreal district, and twelve years later he was appointed general manager, central region, to which was added the position of vice-president in 1940.

In 1942 he retired after 45 years of service with the railway. Before his retirement he also held the position of managing director of the Montreal Stockyards and Montreal Fruit and Produce Terminal Limited.

Major Bond joined the Institute as a Student in 1898, transferring to Associate Member in 1902 and to Member in 1919.

Chauncey Marsh Goodrich, M.E.I.C., consulting engineer for the Canadian Bridge Company, died on December 9th, 1945, in Windsor, Ont. Born on April 8th, 1875, in Burlington, Vermont, he graduated with honours in 1896 from the University of Vermont with an A.B. degree. During the following year he did post-graduate work in Berlin and Leipzig. In 1898 he received his A.M. degree with honours from Harvard University. Two years later he returned to the University of Vermont and received a B.S. in civil engineering in 1901, and a C.E. in 1903.

After teaching for a term at Williston Seminary, Easthampton, Mass., he worked for a time with the B. & O. Railways. In 1901 he became associated with the Canadian Bridge Company at Walkerville, Ont., as draughtsman. Four years later he became assistant engineer, and in 1909 designing engineer. He was appointed chief engineer in 1927 and at the time of his death he held the position of consulting engineer.

Mr. Goodrich was given leave of absence from the Company from 1917 until 1919 when he served in World War I in the United States Army as officer in charge of technical engineering, design and procurement division. He was head of Board of Contract Review for the division and engineer member Superior Board of Contract Review. He was contracting officer for Board on Engineer Troops and for the Director-General of military railways. He wrote and signed the agreement with France covering the sale of 500 locomotives and 20,000 freight cars. He changed the 1864 equipment which the army had already bought to carry the camions and such loads as the 8" and 9" Howitzer trains.

Mr. Goodrich spent about four years abroad representing Canadian Bridge Company and United States Steel Products, travelling east to Ceylon and west to Australia.

He developed limit design methods in 1909 for transmission towers for the Hydro-Electric Power Commission of Ontario ten years before the method was announced abroad. Several of his patents were assigned to the United States. In all he had about 27 patents.

Mr. Goodrich joined the Institute as an Associate Member in 1907, transferring to Member in 1916.

Captain James Huntington Cranbrook, M.E.I.C., died on September 29th, 1945, in Henderson Memorial Hospital, Henderson, Texas. Born in London, England, on October 4th, 1890, he received his preliminary education at Faribault, Minn., then studied civil engineering at the University of Minnesota.

Captain Cranbrook was associated for several years with companies in the railway and highway fields in both Canada and the United States. In 1936 he joined the United States Steel Corporation. He left the employ of the Company in 1941 to join the Royal Canadian Engineers at Halifax, N.S., as a lieutenant. He supervised the construction of various works under the Department of National Defence, including the Naval Arsenal at Bedford and a number of important Coast Defence Works.

When the United States came into the war in December, 1941, he transferred to the American forces with the rank of captain, his promotion to that rank in the R.C.E. having come through shortly before. In the American forces he served with the air force engineers, first with a construction battalion and later in the organization and installation of air field defences. He retired from military service at the end of 1943 on account of impaired health. During 1944 and 1945 he carried on his engineering work in various locations until a few months ago.

Captain Cranbrook joined the Institute as a Member in 1941.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

EDMONTON BRANCH

W. W. Preston, Jr.E.I.C. - *Secretary-Treasurer*

The November general meeting of the Edmonton Branch was held during the general secretary's annual western visit, in the Macdonald Hotel at 6.30 p.m. on November 20th in the form of a dinner meeting. Dr. L. A. Wright showed the sound film "A Harbour Goes to France", and explained that the Institute had wanted to bring the harbour model to Canada so that the profession would realize the outstanding contribution that the British engineers had made to victory in Europe. In the final part of the meeting Dr. Wright discussed Institute activities.

The meeting was conducted by the chairman, F. R. Burfield, who introduced Dr. Wright. A hearty vote of thanks to him was moved by B. W. Pitfield. The attendance was 64.

❖ ❖ ❖

Speaking on **Rural Electrification in Alberta** before the Edmonton Branch in the Macdonald Hotel on December 10th, Mr. F. T. Gale, electrical engineer with the Calgary Power Co., foresaw that electricity on the farm will bring a greater advance than did the introduction of the tractor. An extension of electrical power to rural districts, Mr. Gale stated, should raise the level of farm work and increase farm produce.

The situation in Alberta is unique, the speaker claimed. Statistics show that the number of farms electrified in Canada is only 20 per cent. In contrast Denmark has 98 per cent, Sweden 75 per cent, U.S.A. 40 per cent. Canada is behind because the expenses for greater distances between farms is paid for by fewer people. For the same reason there is a marked difference in the percentage across Canada. Ontario has 40 per cent of its farms electrified but Alberta only ½ per cent. The West has a problem of its own.

Three inseparable factors, namely engineering, economics and social conditions must be considered if Alberta is to supply electric power to as many people as possible as cheaply as possible. Associated with the engineering, economic and social factors there are three others; patience, because the programme will require twelve to fifteen years (2/3 of a man-year being required to electrify one farm); hard work, because both the manufacturer and farmer must be made to understand the problem; and finally co-operation, because manufacturers must adapt their products to the farmers' needs and agricultural departments must be prepared to train the farmers to make maximum use of their equipment.

The speaker expected little trouble solving the engineering problems, but hoped we would make our power lines adequate for future extensions, and thus avoid a weakness of United States systems.

He outlined the economic aspect of the problem. The report on a survey of eighteen typical areas in Alberta made under the direction of Professor A. Stewart, University of Alberta, gave the average cost of electrification per farm as $600.00. For further study the Calgary Power Company developed the Olds district which came closest to the average of the typical districts served by the Company. The Canadian Utilities conducted a similar investigation. The results obtained in the Olds area came very close to the estimates and included a contribution from the farmer amounting to $100.00 and a monthly charge of $5.00 covering depreciation, power losses, operating costs and rent of equipment on the farm. Mr. Gale emphasized that the scheme was not practical unless the farmer used electrical appliances in addition to electric lighting.

The distribution of Alberta's population was shown graphically to be related to the colour of the soil and precipitation. The areas of expected population could be estimated without much concern about the frost-free time.

After his address Mr. Gale showed a coloured film entitled " Farm Life in Wartime ", which showed how electrical appliances increased food production on farms in the United States.

The chairman of the meeting was Professor J. W. Porteous. G. H. Milligan introduced Mr. Gale, and E. Nelson proposed a much applauded vote of thanks to the speaker. The meeting adjourned at 9.35 p.m. The dinner attendance was 36.

HALIFAX BRANCH

S. W. Gray, M.E.I.C. - *Secretary-Treasurer*
C. D. Martin, M.E.I.C. - *Branch News Editor*

On October 22nd, 1945, the first dinner meeting for this season was held at the Nova Scotian Hotel.

The attendance was 94, including several senior students of the Nova Scotia Technical College who were guests of the Branch.

We were very fortunate in having as the guest speaker, Mr. Huet Massue, statistical engineer with the Shawinigan Water and Power Company. Mr. Massue has made an intensive study of the Tennessee Valley Authority developments, and he is exceptionally well qualified to give the very instructive illustrated address which he delivered to a most receptive audience.

At the end of his talk a vote of thanks was extended to Mr. Massue.

L. E. Mitchell, chairman, presided at this meeting. It is interesting to note that F. H. Palmer, Canadian Foreign Trade Commissioner, was in the city at the time, and was able to be present.

❖ ❖ ❖

The regular monthly dinner meeting of the Halifax Branch was held at the Nova Scotian Hotel, November 22nd, 1945. The attendance, including guests, was 112.

Besides several members of the senior class at the Nova Scotia Technical College, the following were also guests of the Branch.

A. M. Butler,	Mayor of Halifax,
C. A. Fowler,	President of the Nova Scotia Association of Architects,
C. L. Beazley,	Municipal Commissioner for Nova Scotia,
R. D. Hurst,	Secretary of the Regional Reconstruction Council,
A. M. MacKay,	Chairman of the Regional Reconstruction Council,
Ira Macnab,	Chairman of the Civic Planning Committee,
G. L. Dickson,	Moncton, N.B. Regional Vice-President of the E.I.C.

The speaker of the evening was J. L. Gray, Director of Housing Research of the Research and Development Branch, Department of Reconstruction, Ottawa. Mr. Gray and the above guests were introduced by chairman L. E. Mitchell, who also welcomed members of the Association of Architects.

The subject of Mr. Gray's talk was **Research in Connection with Canada's Housing Programme.** He covered the various aspects of housing from the point of view of the elements, and also told of the amount of research being done, and the amount of information available at Ottawa.

Following Mr. Gray's talk a discussion period took place, and judging from this it was quite evident that this subject had aroused considerable interest.

At the end of the meeting C. Scrymgeour moved a vote of thanks to Mr. Gray. This motion was seconded by J. L. Wichwire.

HAMILTON BRANCH

W. E. Brown, M.E.I.C. - *Secretary-Treasurer*
L. C. Sentance, M.E.I.C. - *Branch News Editor*

McMaster University was the scene of the regular monthly meeting of the Hamilton Branch held on October 15th, 1945. Approximately 65 members and guest were present.

N. Eager, branch chairman, opened the meeting; H. J. A. Chambers introduced the speaker of the evening, Mr. J. Nichols, design engineer with the Hamilton Bridge Company who chose as his subject **Steel Nesting Barges.**

Mr. Nichols began with a historical outline of the project of manufacturing steel nesting barges in Canada. By means of lantern slides, the various types of barges which could be fabricated from the basic components were illustrated.

By means of further lantern slides and moving pictures, Mr. Nichols traced the manufacture of the components in the Hamilton Bridge Company plant from raw material to final trial run on the Hamilton Bay.

The mass production of nesting barges involved a very substantial tooling programme. Elaborate but sturdy welding jigs and fixtures were made in quantity. In all cases the fixtures were arranged for maximum accessibility, and minimum clamping time — hydraulic and air clamping arrangements were used throughout.

Both hand welding and automatic welding were used. On long regular seams, several installations of automatic submerged melt welding equipment proved very economical.

All parts were required to be completely interchangeable, and a shop assembly to check such interchangeability was necessary. After completion of this check, barges were dismantled and loaded on flat cars. The nesting feature made it possible to load a complete barge on a single flat car.

In a test performed at a Hamilton marine railway, a crew of ten men with no previous experience unloaded, completely assembled and launched a barge in eight hours.

At the conclusion of a question period, Mr. Nichols was thanked by Norman Eager.

❖ ❖ ❖

On Thursday, November 15th, eighty members of the Hamilton Branch and their guests met at McMaster University to hear a most timely dissertation on **Urban Transportation Problems.** H. A. Cooch introduced the speaker of the evening, Mr. Charles E. DeLeuw, consulting engineer and senior partner of the firm of DeLeuw, Cotter & Company, of Chicago, Illinois.

Mr. DeLeuw was eminently qualified to present his topic, having spent the major portion of his professional career on traffic and transportation problems of various kinds, including work in Baltimore, Chicago, Montreal, Los Angeles, St. Louis and Washington, D.C. He has been engaged recently as consultant on the Toronto Subway Project.

While transportation problems have existed for many years, and have received some thought and some remedial action, efforts in general, usually tending to widening of thoroughfares, proved almost completely unsatisfactory. The building of regional highways in past years has done much to help rural areas, but has imposed a tremendous load on the urban streets.

In recent years it has been recognized by transit operators that there are other equally deserving users of the public streets. Fact finding surveys in which the Public Roads Administration of the United States had been a prime mover have been far reaching in scope, and have resulted in great improvements towards safe and expeditious travel. These problems were being solved by grade separation, improved street plannings and rapid transit. The tendency today was towards construction of parkways, or depressed express routes, for fast automobile traffic, unhampered by side streets, stop lights, left turns. In conjunction with such automobile facilities, rapid transit rail traffic may be accommodated between lanes. While this type of express way greatly relieved over-crowding of existing grade level streets, its cost, in the neighbourhood of $3,500,000 per mile, rendered it prohibitive to smaller communities. However, Mr. DeLeuw stated that such express ways had been found practical and very successful for cities of 200,000 and greater population. One of the most successful projects was New York's Parkway System, now comprising almost 100 miles of expressway.

For larger cities, grade separation becomes a necessity, and subways must be used to segregate rail or rapid transit from street level auto and pedestrian traffic. Mr. DeLeuw discussed the Montreal and Toronto Subway projects with which his firm had been connected. A series of slides served to illustrate proposed installations, and furnished data on actual subway and expressway systems in American cities.

At the close of this talk, Mr. DeLeuw answered many questions put by an interested assembly. The modern trend in relation to civic transportation was stated to be toward curb loading, where feasible. The use of motor busses or trackless trolleys was dependent upon local configuration, traffic volume and distances involved.

The operation of a good transit system is one of the easiest ways of minimizing a bad traffic situation. Good transit service encourages the use of the public transportation, private automobiles are left at home and traffic and parking problems reduced.

Mr. DeLeuw considered his views on the parking problem were somewhat radical. In his estimation there was no part in the modern scheme for parking in busy sections. Eventually, he felt, communities such as Hamilton would be forced to provide off-street parking facilities.

At the conclusion of the discussion, Mr. DeLeuw was thanked on behalf of the branch by Chairman Norman Eager.

KINGSTON BRANCH

J. Douglas Lee, Jr.E.I.C. - *Secretary Treasurer*
T. L. Brock, M.E.I.C. - - *Branch News Editor*

A meeting of the Kingston Branch was held in the Old Arts Building, Queen's University, on Friday, November 23rd. The principal speaker was Mr. John L. Long, president of the Association of Professional Engineers of Ontario, who discussed the relation of the engineer to present-day and future social and business problems, and the importance of professional aim on responsibilities to the Engineer. A second speaker was Lieut.-Col. T. M. Medland, personnel consultant and "trouble shooter" for the Association of Professional Engineers of Ontario. Col. Medland told of some of the problems which come before him where he is able to help further the professional standing of the individual engineer, particularly in regard to salaries. A spirited discussion followed the two addresses. Mr. Lang was introduced by Dean Ellis, and the speakers were thanked by J. D. Lee. J. D. Calvin, vice-president of the Branch, acted as chairman. Following the meeting, refreshments were served.

LETHBRIDGE BRANCH

T. O. Neumann, M.E.I.C. - *Secretary-Treasurer*
A. G. Donaldson, M.E.I.C. - *Branch News Editor*

Dinner music, songs and an address on Manchuria featured the annual joint meeting of the Association of Professional Engineers of Alberta and the Lethbridge Branch of the Institute held in the Marquis Hotel on Friday, November 30th, at 6.30.

Head table guests were J. G. Dale of Edmonton, registrar of the Association, A. L. H. Somerville, councillor of the Association and past-chairman of the Lethbridge Branch of the E.I.C., Mr. C. G. Anderson of Claresholm, the guest speaker, J. McMillan of Calgary, president of the Association, P. E. Kirkpatrick, chairman of the Lethbridge Branch of the E.I.C., A. G. Donaldson who introduced the speaker, C. W. Carry of Edmonton, councillor of the Association, L. C. Stevens of Edmonton, vice-president of the Association, and D. A. Hansen of Calgary, councillor of the Association. President McMillan was in the chair.

Other prominent visitors were Messrs. Ben Russel, P. M. Sauder, and Dr. Clarke, councillor.

Dinner music played by Mr. and Mrs. G. Brown and Mr. Henderson added much to the enjoyment of the evening. Mr. Bob Laurence led a hearty sing-song, and excellent solos by Mr. Tom Pizzey and Mr. Ted Laurence were warmly applauded. Mrs. Brown accompanied both soloists.

A one-minute silence was observed in memory of "Bill" Meldrum.

Mr. Donaldson, in introducing the speaker, said Mr. Anderson was a graduate in agriculture of the University of Alberta, and had been a supervisor of forestry and grazing. In 1930 while studying Canadian drought problems, he became interested in Manchuria where similar problems existed. During the war Mr. Anderson served with the R.C.A.F., and had been adjutant on many western stations.

Mr. Anderson had maintained his interest in Manchuria to the present time. His address was followed with great interest as he presented a complete picture of that country, its effect on past and present history, and its potential place in the future, and in the next war.

Until Admiral Perry's visit in 1853, Japan had been an insignificant country. After that time through the influence of the powerful families and the Blue Dragon Society the country embarked on a programme designed to make her a world power. At home she had unlimited cheap labour and abundant electrical power, but many raw materials were lacking. Her agriculture suffered from a deficiency of soil nitrogen.

Japan's army was patterned after the German system, her navy after Britain's, and her industry was copied from the United States. Observers sent to work in America returned and built identical factories, and turned out identical items, without regard for patents or rights.

To obtain raw materials, and allegedly to obtain room for her population, Japan invaded Korea and later Manchuria. At that time Manchuria was similar to Canada, with potential agricultural plains, grazing lands and forests, and the same varieties of climate. Russia had done considerable railroad development, building the Chinese Eastern across central Manchuria, and the South Manchurian to the Laotung peninsula from Harbin. At the southern terminus Port Arthur was built giving Russia an all-year port on the Yellow Sea. Russian development had been arranged with China.

In 1904, seeing a threat in Port Arthur, Japan made her first " Pearl Harbor " attack, and in an undeclared war seized the port and part of Manchuria. By the Treaty of New Hampshire in 1905 Japan was forced by the other great powers to relinquish Manchuria, except for a 99-year lease on the Laotung Peninsula, and the South Manchurian Railroad and its right-of-way. Along this strip the largest coal mine in the world was developed at Fushan near Mukden. A mountain of iron provided another raw material, and oil strata were also found. The S.M.R. began a colonization programme and brought in Chinese farmers, and built up a large agricultural industry. Many grains grown in Canada were produced there, and also the all-important soya bean. The industrial residue of the bean was rich in nitrogen, and was taken to Japan to enrich the soil. Darien was developed as a naval base in preference to Port Arthur.

The industrial centre of Manchuria around Fushan and Mukden was bombed by the Allies because of its importance to Japan's war effort. Realizing the value of Manchuria, and its strategic importance, Russia bided her time and seized the country at the end of the war, and is rumoured to have moved some of the key industries to Siberia.

The advanced development of Siberia and its self-contained resources were described. Pointing out that Siberia was only 32 miles from the closest Alaskan Island, the speaker said he hoped that Canada would not be the Belgium of the next war, when and if it comes.

J. M. Campbell expressed the thanks of those present to Mr. Anderson.

MONTREAL BRANCH

L. A. Duchastel, M.E.I.C. - *Secretary-Treasurer*
Hyman Schwartz, S.E.I.C. - } *Branch News Editors*
Eli Ilovitch, S.E.I.C. - }

A partial lifting of the wartime restrictions made it possible for F/L R. W. Wilton of the R.C.A.F. to explain **Pulse Techniques,** the principles and application of the fundamental circuits used in radar and other electronic timing devices, at a joint meeting which was held on Thursday evening November 15th under the auspices of the Montreal branches of the E.I.C. and Institute of Radio Engineers.

In opening his address the speaker mentioned briefly the difficulties of obtaining and maintaining a perfect sine wave through various stages in a radio circuit. He then discussed the necessity for the theoretical square waves and the reasons why such waves are impossible. However by means of circuits having many stages, known as triggering circuits, it is possible to get wave forms which show up as pips (pyramids) on an oscilliscope screen. The distance between pipe which may be from a quarter to three inches represents the time interval which may be anything from one down to $5x10^{-7}$ seconds according to the setting of the apparatus.

F/L Wilton made the rather complicated subject very clear by the use of a carefully prepared set of slides and specially built demonstration equipment.

❖ ❖ ❖

A glimpse of what the general public may expect in the near future from the aeroplane operators was given to the members of this branch at a meeting held on Thursday evening November 22nd, by Mr. Jack Dyment, supervisor and engineer of the T.C.A., Canada's national airline, who spoke on the **Trends of Development of Airline Aircraft.** He told the meeting that the great shortage of aircraft, especially of the heavy four-engined class, could be only partially overcome by converting bombers, and that new machines now on order will be essentially those of prewar design. However they will include many improvements and electronic devices that have been developed during the war.

He then went on to describe some new blind landing devices, based on radar, making it possible for an aircraft to land and take-off without the slightest help from the pilot.

Mr. Dyment devoted the second half of his talk to a discussion of what the airline operators would like incorporated in new designs in order to give better passenger convenience, simplify maintenance and generally to reduce costs, but with increases in safety and speed. He then explained the importance of good landing fields which are provided by local governments.

In concluding his address the speaker predicted that gas turbine jet engines would be in general use within the next ten years but that rocket propulsion was still something for the distant future.

❖ ❖ ❖

On Thursday evening November 29th, Mr. Eric C. Molke gave an interesting lecture on the **Application of the Cylinder Shell for Concrete Roofs,** which is

Group of Students and their lady-friends at the first Annual Dance of the Junior Section, Montreal Branch, in the Ritz-Carlton Hotel, Montreal, November 23rd, 1945.

used in various structures requiring large expanses of clear areas such as aircraft hangars, hockey arenas, auditoriums and manufacturing plants.

With the aid of an excellent set of slides Mr. Molke explained the types and essential features of shells for roofs which are mounted on columns as compared to shells for sewers and tunnels which may be considered to have continuous support. He then went on to show the direction and concentration of the stresses in these shells and how the steel reinforcing is distributed.

The speaker then described in considerable detail the methods developed for building concrete hangars on an economical " mass production " scale. This was illustrated by a coloured film taken during the construction of several large projects in the United States.

In concluding his address Mr. Molke pointed out the advantages of such concrete structures and especially their resistance to fire.

A discussion which was presided over by S. R. Banks followed the meeting.

❖ ❖ ❖

The **Fundamentals of Gas Turbines** was explained to the members of the Montreal branches of the A.I.E.E. and of the E.I.C. by Mr. Dale D. Streid of the General Electric Company, Lynn, Mass., at a joint meeting held on December 6th.

In discussing the basic features of the turbine jet, the speaker showed that the engine could be considered to contain three sections viz. the compressor, the burner, and the turbine which drives the compressor, and in some designs a propeller through suitable gear reducers. He then pointed out that the engine contains only one major moving part which rotates at high speed. It is the simplicity of the engine and the absence of oscillating parts that give this type of engine great smoothness and the highest H.P. per pound weight.

A description of the heat equations and entropy curves used in the design and test of these engines was given by the speaker. Although the engine consumes twice the weight of fuel compared to a standard engine it is still economical since it burns kerosene and is only a third as heavy. And further it is the only system yet devised to give aircraft speeds over 600 m.p.h. at altitudes over 40 thousand feet.

After the lecture a thirty-minute coloured film entitled " Report on Jet Propulsion ", was presented which showed the Bell Aircomets (P-59) in flight. These machines are the first jet-propelled planes built in the United States and were used for experimental and training purposes. Performance data on these machines are still restricted.

Following the film there was a lively discussion which might have gone on until midnight had not the late hour compelled the chairman, Mr. Dyment, to adjourn the meeting.

PETERBOROUGH BRANCH

E. Whiteley, m.e.i.c. - *Secretary-Treasurer*
J. C. Allan, m.e.i.c. - *Branch News Editor*

A paper on the **Manufacture of Heavy Aircraft** was presented by Mr. David Boyd, general manager, Victory Aircraft Limited before the November 20th meeting of the Branch. In his introduction, Mr. Boyd gave a brief description of the Lancaster Bomber, which was the subject of the paper, and which dropped more tonnage of destruction on Germany than any other type of aircraft. The Lancaster is an all-metal midwing heavy bomber of the following dimensions and performance:

Span	102′ 0″
Length	69′ 6″
Gross Weight	63,000 lbs.
Empty Weight	36,000 lbs.
Rated Bomb Load	18,000 lbs.
Cruising Speed	200 m.p.h.
Max. Speed	300 m.p.h.
Extreme Range	3,000 miles

The Canadian " Lancaster " programme was conceived in the dark days of August 1941 when the Germans were rolling eastward across Russia, but it was not until January 1942 that the official instructions to proceed with 300 bombers were issued to the National Steel Car Corporation.

Mr. Boyd outlined the procedure followed for the project as a whole beginning with photographic negatives of drawings which arrived from England in February, 1942. Because of the bombing of England and submarine activity, the aircraft was to be fully Canadian. However all of the 23 major components had to be completely interchangeable with British Lancasters wherever produced.

The extent of the problem may be better realized when it is known that over 30,000 drawings were involved, and there are 31,000 different fabricated parts not including bolts, nuts, rivets or free issue equipment.

Methods peculiarly adapted to aircraft manufacture were stressed. These included prototype fabrication, lofting and the use of rubber presses. The engineering and associated work involved over 2,000,000 man hours quite exclusive of tool and jig building. Sixteen thousand, five hundred and ninety-two tools were made, including those made obsolete, due to modifications. The largest tool was 30 ft. wide, 100 ft. long, and 5 ft. high. It incorporated two radial drills, and 18 drills that had a diameter of 1½ in.

There were 276 Canadian modifications and 1,303 English modifications which together represented a drawing change every 12 minutes of every working day.

Delays incidental to the differences between British and Canadian Standards for screw threads, etc., and methods of preparing material specifications were described, as were delays over secret "proprietory materials".

Mr. Boyd urged that steps be taken to make certain that data on British standards and materials be readily available in Canada at all times. The advantages of much wider standardization between Britain and America were also discussed.

The paper was illustrated throughout by lantern slides.

A lively question and discussion period followed the presentation of the paper. W. T. Fanjoy expressed the thanks of the meeting to Mr. Boyd.

SAGUENAY BRANCH

H. R. Fee, M.E.I.C. - *Secretary-Treasurer*

On November 21st Mr. D. J. O. Barry, of the Aluminum Company of Canada, Limited, Shipshaw, Que., addressed the Saguenay Branch on the subject **Sailplanes; Their Construction and Operation.**

Mr. Barry pointed out that in soaring an elevation higher than that of the starting point was attained, while in gliding the altitude decreased from the starting point. He stated that gliders are primary trainers and are inexpensive and inefficient machines, consisting merely of a truss carrying controls and a supporting surface. Sailplanes are expensive but efficient aircraft and are classified as secondary, intermediate, and high performance, in order of efficiency.

By means of slides the speaker traced the development of modern gliding in Germany subsequent to World War I, and then on the North American continent, particularly in Canada.

Another series of slides depicted the various steps involved in the construction of a sailplane, and a short motion picture was shown picturing gliders in action at Elmira, New York.

Mr. Barry had assembled, and displayed in the lecture room, his own type H-17 sailplane, which was inspected with interest. This sailplane was built by the speaker and two partners, Squadron Leader A. A. Reid, and Capt. Alex Ross.

A vote of thanks on behalf of the Branch was moved by B. L. Davis.

SAINT JOHN BRANCH

E. L. Ball, Jr.E.I.C. - *Secretary-Treasurer*
I. O. Cass, M.E.I.C. - *Branch News Editor*

On Tuesday, October 30th, a dinner meeting was held at the Admiral Beatty Hotel at 6.30 p.m. Mr. Huet Massue, statistical engineer, Shawinigan Water and Power Company, Montreal, was guest speaker (while on tour of the Maritimes). The subject of his address was **A Factual Analysis of the Tennessee Valley Authority.** J. M. Lamb, chairman, presided at the meeting.

A vote of thanks was extended to the speaker by G. G. Murdock, and seconded by R. M. Richardson who expressed his appreciation of Mr. Massue's illustrated lecture on the relative merits of private and public enterprise. The films shown were: "Curves of Colour" and "History of X-Ray". The total attendance was 51.

❖ ❖ ❖

A dinner meeting at which H. W. Hole, manager of the New Brunswick Gas and Oil Fields Limited was the guest speaker, was held on Friday, November 16th, at the Admiral Beatty Hotel. The subject of the address was **The Formation and Development of Stoney Creek Oil and Gas Field, Albert County, New Brunswick.**

Mr. Hole spoke of the value of oil and its products to the engineer, giving details of gas and oil exploration in New Brunswick. He told how the Albert County field was formed, giving interesting analogies to other gas and oil fields in North America. He also dealt with the exploration and operation of the Stoney Creek field and told of modern methods of geological survey now being used there. The address was illustrated by slides.

Major W. B. Akerley, vice-chairman, presided in the absence of Chairman J. M. Lamb. R. M. Richardson and A. A. Turnbull moved and seconded a vote of thanks to the speaker.

Three moving pictures were shown at the meeting: "Getting out the Coal", "Highway North", "10,000 Feet Deep". The attendance was 58.

❖ ❖ ❖

At a dinner meeting on December 6th at the Admiral Beatty Hotel, John Flood presented a paper which was written by an eminent British engineer and issued under the Port of London authority. The paper, illustrated by slides, dealt with the history and development, types of cargo, loading equipment, and other features of the immense port facilities which make London the commercial centre of the world. The meeting was presided over by Chairman J. M. Lamb.

The total attendance was 59. The Saint John Branch has enjoyed a marked increase in attendance over preceding years due largely to an increase of Branch Affiliates.

QUEBEC BRANCH

Leo Roy, M.E.I.C. - *Secretary-Treasurer*

On November 19th, 1945, in the Amphitheatre of the Faculty of Science, Laval University, Mr. Marcel Laflamme, lighting expert of the Canadian General Electric, gave a talk before an audience of 115. The subject was **What's New in Light Sources.**

The meeting was under the chairmanship of J. O. Martineau. The speaker was presented by J. U. Jacques.

Mr. Laflamme talked on fluorescent lamps, including " circline " Slimline Germicide and the most recent development on cold cathode and instant start lamps. Numerous questions were answered by the speaker who was thanked by G. Sarault.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

CANADA YEAR BOOK 1945:

Dominion Bureau of Statistics. Ottawa, King's Printer, 1945. $2.00.

The present edition continues the policy of giving such space as can be spared to feature articles of special importance. Such articles give additional meaning and substance to the purely statistical and analytical material that constitutes the basic chapter material.

Among the special articles appearing in the present edition are: Physical Geography of the Canadian Eastern Arctic, Canada's Growth in External Status and Canada's Part in the Relief and Rehabilitation of the Occupied Territories, Canadian Oil Production, Changes in Canadian Manufacturing Production from Peace to War, International Air Conferences, The Wartime Role of the Steam Railways in Canada, Canada's Northern Airfields, the Democratic Functioning of the Press, and the Activities of the Wartime Prices and Trade Board in Controlling Prices, Rents and Supplies.

In addition to the Special Articles, the regular chapter material has undergone thorough-going revision to reflect latest developments.

Although the statistical lag is necessarily such that for most chapters the record still lies in the period before V-E Day, yet the reader is kept abreast of developments by up-to-date textual analyses and discussions. Where statistics of current operations have been compiled even on a preliminary basis, such as in the case of Family Allowances, these are included.

A five-year review of manufacturing developments for war needs serves as general background for the Manufactures Chapter and places in proper perspective the industrial achievements and contributions of the Dominion to Victory.

The External Trade Chapter has been very considerably reorganized. The extended general review at the opening of the Chapter draws attention to the influences that will affect post-war world trade and Canada's relation to them.—Statistics of External Commodity Trade—the series of detailed tabulations of principal imports and exports that, because of wartime restrictions, could not be published from 1942 to 1944, is now reinstated from the point where they were previously dropped.

The Chapter on Internal Trade contains several new features. The wartime controls affecting distribution and trade are explained. In Part II a section on the Consumption of Foods is given. The final results of the Census of Merchandising and Service Establishments as derived from the Census of 1941 are given in this Chapter.

The chapters dealing with primary resources have been brought up-to-date and attention is directed to all major trends.

A new section explaining the Manpower and Selective Service organization is introduced into the Labour Chapter.

It has been found possible to include more than the usual number of maps and charts in this volume.

By a special concession, a limited number of paper-bound copies have been set aside for ministers of religion, bona fide students and school teachers, who may obtain such copies at the nominal price of $1.00 each. Application with remittance for special copies must be forwarded to the Dominion Statistician, Dominion Bureau of Statistics, Ottawa.

The Canada Year Book (Cloth-Bound Edition) is held for sale by the King's Printer, Ottawa, at $2.00 a copy.

Remittance should be made by money order, postal note or accepted cheque payable to the Receiver General of Canada.

CONTRACTORS' PUMP MANUAL:

Wash., Associated General Contractors of America, Inc., 1945. 39 pp., illus. $0.50.

This manual was designed to supply information on portable pumps and guidance to pump users in the construction, mining, industrial and other fields. Based on the experience of manufacturers regarding the characteristics of the several types of portable pumps, the manual discusses the selection of the proper kind and size of pump for the particular water-moving job at hand, and the correct operation of the pump, together with its maintenance and repair. Four types of pumps are presented—self-priming centrifugal; diaphragms; well-point; road pumps. In each case the pumps are described and their particular advantages and limitations outlined. A pump selection table is included to serve as a guide in the choice of the kind of pump which can be most advantageously applied to the job to be done.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

ACIERS à OUTILS

By A. Michel. Dunod, Paris, 1944. 246 pp., illus., diagrs., charts, tables, 9½ x 6 in., paper, 245 frs.

This treatise on tool steels describes the different types, covering constitution, structure, properties, heat treatment, etc., In addition to the steels and steel alloys whose principal constitutent is iron, the book also deals briefly with stellite, the iron-cobalt-tungsten alloy (50% iron) and the metal carbides. The final chapter discusses temperature measurement.

ADVANCING FRONTS in CHEMISTRY, Vol. 1—High Polymers.

Edited by S. B. Twiss. Reinhold Publishing Corp., New York, 1945. 196 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $4.00.

A group of ten lectures is presented giving a logical development of the recent chemistry of high polymers. The first two chapters contain elementary information on the relation between structure and properties. Chapter 3 covers applications of catalysis to important hydocarbon reactions. Chapters 4 and 5 give a review of evidence for the free radical mechanism of addition polymerization. Chapters 6 and 7 discuss the importance of chain length and size distribution. Chapters 8, 9 and 10 deal with further aspects of the nature and properties of chain polymers, with special treatment of textile fibers.

CHEMICAL CONSTITUTENTS of PETROLEUM.

By A. N. Sachanen. Reinhold Publishing Corp., New York, 1945. 451 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth $8.50.

This volume gives a detailed description of the latest developments in methods for separating the many constituents of petroleum, covering both theory and practice. A considerable part of the book is devoted to individual hydrocarbons and compounds as well as to the methods of separation and identification. The separate chapters deal with petroleum gases and natural gasoline, physical and chemical methods of determining hydrocarbons in distillates, hydrocarbons of straight-run and synthetic distillates, petroleum wax, oxygen compounds, sulphur and nitrogen compounds, resins and asphaltic products, and classification of crude oils. Several hundred literature references are provided for further study.

COLLECTED PAPERS on METALLURGICAL ANALYSIS by the SPECTROGRAPH.

Edited by D. M. Smith. British Non-Ferrous Metals Research Association, Euston Street, London, N.W.1, 1945. 162 pp., illus., diagrs., charts, tables, 10 x 6 in., cloth, 21s.

The thirteen papers included in this collection are grouped under the following headings: processing and calibration of the photographic plate; analysis of aluminum and aluminum alloys; analysis of lead and lead alloys; analysis of zinc alloys; analysis of copper alloys; analysis of platinum. The text material is supplemented extensively by tables and diagrams.

ELECTROLYTIC CAPACITOR.

By A. M. Georgiev. Murray Hill Books, Technical Division, New York and Toronto, 1945. 191 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $3.00.

The author's primary objective is to describe the design, construction, manufacture, function and testing of dry and wet electrolytic capacitors, to explain the operating characteristics of various types, and to indicate both their useful applications and their limitations. He discusses briefly electrolytic capacitors versus non-electrolytic, and gives some consideration to causes and detection of defects and methods of emergency repairs. A glossary, a bibliograpny and a list of patents are appended.

HANDBOOK of NONFERROUS METALLURGY, Principles and Processes.

Prepared by a Staff of Specialists; D. M. Liddell, Editor-in-chief. 2 edit. McGraw-Hill Book Co., New York and London, 1945. 656 pp., illus., diagrs., charts, tables, 9 x 5¾ in., cloth, $6.50.

Volume I of this comprehensive two-volume handbook deals mainly with general principles and processes. Separate chapters, written by authorities in the field, deal with those operations, apparatus and methods fundamental to all branches of nonferrous metallurgy. Sample chapter headings are: crushing and grinding; classification; filtration; roasting and sintering; metallurgical fuels; refractories; power plant and accessories; and the electric furnace. There are also chapters on plant layout, materials of metallurgical construction, and applied electrochemistry.

MACHINISTS' AND DRAFTSMEN'S HANDBOOK

By A. M. Wagener and H. R. Arthur. D. Van Nostrand Co., New York, 1945. 662 pp., illus., diagrs., charts, tables. 8 x 5¼ in., fabrikoid, $4.50.

The beginning chapters of this reference work deal chiefly with geometrical and trigonometrical constructions and calculations. Basic information on drills, threads, spur gearing, milling, speeds and feeds, and cutting tools is next presented. A considerable amount of tabulated information on the composition, heat treatment, etc., of important metals and alloys is followed by substantial chapters discussing mechanics, logarithms and the strength of materials. Tables of weights and measures are included.

MANUAL of FIREMANSHIP, a Survey of the Science of Firefighting, Part 6A, Practical Firemanship—I.

His Majesty's Stationery Office, London, 1945. 249 pp., illus., diagrs., tables, 8¼ x 5½ in., paper, (obtainable from British Information Services, 30 Rockefeller Plaza, New York, $0.75).

Practical methods of dealing with fires in ordinary city buildings are described in this recent volume of a series on firefighting. Methods of entry, use of equipment, methods of rescue, ventilation at fires and salvage procedure are covered. Useful knots and slings are described, and there is a special chapter devoted to the proper organization and handling of men and equipment for efficient fire control.

NETWORK ANALYSIS and FEEDBACK AMPLIFIER DESIGN.

By H. W. Bode. D. Van Nostrand Co., New York, 1945. 551 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50.

Originally written as an informal mimeographed text exclusively on the design of feedback amplifiers, this book now includes an extensive preliminary development of electrical network theory as well. It now also covers non-feedback amplifiers and miscellaneous transmission problems arising in wide band systems generally. On the other hand, transmission line and filter theory are omitted. Design information for amplifiers used as repeaters in long distance telephone systems is particularly exact.

PRINCIPLES of INDUSTRIAL PROCESS CONTROL

By D. P. Eckman. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 237 pp., diagrs., charts, tables, 8½ x 5¼ in., cloth, $3.50.

The purpose of this book is to treat, in a logical manner, the important laws of operation of industrial automatic control systems and to provide a practical background of theory. It presents a comprehensive treatment of measuring characteristics of controllers, controller characteristics, the effect of process load changes, the effect of valve characteristics, and correlated or multiple control systems. The principles that apply to the operation of a process when under automatic control are emphasized.

NOTICE

Bank, Customs, Foreign Exchange, and Postage Charges are not included in the prices listed. Members are therefore requested to await receipt of invoice before forwarding remittance in payment of publications ordered through the Institute Library.

(*Continued on page 62*)

PRELIMINARY NOTICE

for Applications for Admission and for Transfer

December 29th, 1945.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the February meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examination of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations or Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiner that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall nor remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BARDSLEY—LEONARD WALTER. Capt., E.M.E., Canadian Army Overseas. Born at Saint John, N.B., July 28th, 1920. Educ.: B.Eng., (Elect.) McGill Univ., 1943; 1938-39, (summers), engr.'s asst., engaged on Ford plant constrn., Saint John, N.B., with Carter, Hall, Aldinger Constrn. Co.; 1941 (summer), chemist, Port Royal Pulp & Paper Co., Saint John; 1944-45, with Cdn. Army Overseas, as Capt. E.M.E., (Telecom.); at present working on elect. traction with English Electric Co., Bradford, Yorkshire, Eng., having been granted a six months leave of absence by the Army, 15 Linden Ave., Bradford, Yorkshire, England.

LIBRARY NOTES

(*Continued from page 60*)

SHORT DICTIONARY OF ARCHITECTURE

By D. Ware and B. Beatty. Philosophical Library, 15 East 40th St., New York, 1945. 109 pp., diagrs., 6¼ x 5¼ in., cloth, $2.75.

Both the terms used in classical architecture and the common building terms in current use are included in this dictionary. A great many clear and easily understood drawings illustrate such definitions as need it. The dictionary also includes a number of terms from fields allied to the two main ones. A brief bibliography is appended.

SPUN RAYON WARP SIZING Special Summary Report on Weaving Efficiency of Warp Sizing Materials, a research project of the Textile Research Institute

Conducted at the North Carolina State College School of Textiles and the Research Laboratories of the Textile Foundation at the National Bureau of Standards, Washington, D.C.; issued by the Textile Research Institute, Inc., 10 East 40th St., New York, May 1, 1945. 91 pp., illus., diagrs., charts, tables, 10½ x 8 in., paper, $1.50.

Part I of this research report is designed to throw light on certain problems peculiar to the sizing of staple rayon warp yarns, including possible laboratory test methods. Part II deals with the weaving, efficiency and film properties of warp sizing materials.

TRANSMISSION LINES, ANTENNAS AND WAVE GUIDES

By R. W. P. King, H. R. Mimno and A. H. Wing. McGraw-Hill Book Co., New York and London, 1945. 347 pp., diagrs., charts, tables, 9 x 5¾ in., cloth, $3.50.

This book presents, with some additions, the material given in the lectures on transmission lines, antennas, wave guides and wave propagation that constitute part of a course in pre-radar training given to officers in the armed forces. Transmission lines are presented exclusively from the high-frequency point of view; antennas are presented from the viewpoint of electromagnetic theory; and wave guides from the viewpoint of generalized transmission circuits. There is a brief treatment of wave propagation

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET,
MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Particular emphasis is laid at this time on the need for this service to fill the dual role of providing a general picture of employment conditions for members in the armed forces, and of making available to them specific contacts both now and at the time of their release from the services. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

NOTICE

SERVICE PERSONNEL: The completed rehabilitation questionnaires have indicated a need for the employment service to be made available to all members of the E.I.C. in the Armed Forces. It is suggested that all those who are interested—

1. **Consider these positions as indicative of present conditions.**
2. **Reply to interesting advertisements to establish contact for the future.**

Apply for any of these positions when discharge is imminent.

CIVILIAN TECHNICAL PERSONNEL should not reply to any of the advertisements for situations vacant unless—

1. **They are registered with the Wartime Bureau of Technical Personnel.**
2. **Their services are available.**

A person's services are considered available only if he—

(a) is unemployed;
(b) is engaged in work other than of an engineering or scientific nature;
(c) has given notice as of a definite date; or
(d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

Situations Vacant

AUTOMOTIVE

SERVICE ENGINEER is wanted to promote specialized automotive service in Quebec and the Maritimes. Work will involve a study of existing methods, and demonstration and introduction of new ideas and improvements in shops, garages, service stations and clinics. Candidates must have good practical experience in servicing electrical, carburetion, fuel brake and shock absorber systems of automobiles, must be bilingual, and must have the personality and tact necessary to advise and convince experienced automotive service men. Future prospects depend entirely on successful applicant, and starting salary will be about $250 per month. Apply to Box No. 3077-V.

CHEMICAL

CHEMICAL ENGINEER, young graduate, necessarily with some pulp and paper mill experience is required to take over control of the testing laboratories and to take charge of various engineering problems in a mill in the Eastern Townships of Quebec. Salary would be about $250 a month. Apply to Box No. 3211-V.

CHEMICAL ENGINEER, age about 34, graduate, preferably with some experience in the sale of chemical products is required by a company in Toronto for work in connection with problems of distribution, merchandising and selling. Salary would be about $300 a month plus share in profits. Apply to Box No. 3215-V

CIVIL

RESIDENT ENGINEER, not necessarily a graduate, with considerable construction experience, is required to represent a firm of architects on a large contract in Nova Scotia. Salary would be from $300 a month according to experience. Apply to Box No. 3189-V.

CIVIL ENGINEER, preferably discharged service man with considerable experience in construction, maintenance and servicing of buildings and real estate generally, is required to act as the manager of a company of this nature in a small town on the lower St. Lawrence. The successful candidate would be expected, in addition, to supervise the maintenance staff, rentals, sale of properties, town services, etc. Apply to Box No. 3198-V.

CIVIL ENGINEER from recent graduate up, about 25, preferably a veteran, is required for design and estimating in connection with steel plate work. This position would be in Toronto, and salary would be from $150 to $250. Apply to Box No. 3207-V.

SEVERAL CIVIL ENGINEERS, not necessarily graduates but with from at least three years up to very extensive experience in construction, are required by a company in Montreal to estimate several big new developments. Salary would range from $200 to $450 a month depending on experience. Apply to Box No. 3209-V.

ELECTRICAL

ELECTRICAL ENGINEER, preferably unmarried discharged service man with two or three years' experience in plant layout, is required by a firm of contractors in Montreal for work in eastern Ontario in connection with the installation of services and equipment in a large new plant. Salary about $250 a month. Apply to Box No. 6187-V.

ELECTRICAL ENGINEER with fair knowledge of draughting is required by a firm in Montreal for work on design, assembly and testing of special instruments for industrial process control equipment. Candidates may be recent graduates and starting salary would be about $175 a month. Apply to Box No. 3201-V'

MECHANICAL

SEVERAL MECHANICAL ENGINEERS, preferably unmarried discharged service men with two or three years' experience in plant layout work, are required by a firm of contractors in Montreal for work in eastern Ontario in connection with the installation of services and equipment in a large new plant. Salary about $250 a month. Apply to Box No. 3187-V.

MECHANICAL ENGINEER preferably about 32 years old with about five years straight engineering experience and about five years general experience in factory or plant management, etc., and with suitable personality for selling and contacting is required by a firm in Montreal. Salary would be from $250 a month depending on experience. Apply to Box No. 3191-V.

MECHANICAL ENGINEER, age 25-35 with some experience, preferably bilingual, is required by a manufacturer in the Eastern Townships of Quebec, to work under the supervision of the plant manager with responsibility for executing production schedules, manufacturing operations, and for quality and cost control work. Apply to Box No. 3192-V.

MECHANICAL OR AERONAUTICAL ENGINEER with two or three years' experience is required by a firm in the Montreal area to act as stress analyst. Salary would be about $250 a month. Apply to Box No. 3202-V.

MECHANICAL ENGINEER with five to ten years' experience, preferably in pulp and paper work, is required to act as chief draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to Box No. 3204-V.

MECHANICAL ENGINEER, young graduate, preferably ex-service man with draughting ability, is required for general mechanical work by a paper mill in eastern Quebec. Apply to Box No. 3205-V.

MECHANICAL ENGINEER from recent graduate up, about 25, preferably a veteran, is required for design and estimating in connection with steel plate work. This position would be in Toronto and salary would be from $150 to $250 a month depending on qualifications. Apply to Box No. 3207-V.

MECHANICAL ENGINEER is required as draughtsman for layouts and general mechanical engineering by a paper company in the Lake St. John area. Salary would be $225 to $250 a month depending on experience. Apply to Box No. 3208-V.

MECHANICAL ENGINEER is required by a firm engaged in the manufacture of building materials in Montreal to act as junior engineer and to start on draughting and layout work of new equipment. Candidates need not be graduate engineers but preference will be given to ex-service men. Salary will be about $175 a month. Apply to Box No. 3213-V.

METALLURGICAL

METALLURGICAL ENGINEER with B.Eng., or B.Sc., in chemical or metallurgical engineering and at least one year's experience in non-ferrous metallurgical chemical analysis is required by a company in Montreal. Preference will be given to ex-service man and salary would be about $250 a month. Apply to Box No. 3200-V.

MISCELLANEOUS

DRAUGHTSMAN with about ten years' experience in structural and steel plate work, preferably, but not necessarily a graduate engineer, is required by a large company in Montreal. Apply to Box No. 3193-V.

ARCHITECTURAL DRAUGHTSMAN with enough experience to develop new types of windows, doors, trusses, steel sections, etc., is required by a manufacturer in Montreal. Salary would be about $300 a month. Apply to Box No. 3212-V.

PLANT ENGINEER, either mechanical, civil or electrical graduate with two or three years' general experience, age 25-30, is required by a firm engaged in the manufacture of building materials to take charge of maintenance of a plant complete with equipment and machinery. Candidates may expect to do some travelling and may have headquarters in either Quebec, Ontario or Manitoba. Salary would be from $200 a month up according to experience. Apply to Box No. 3217-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER, 20-25 years is required to act as sales engineer for a chemical company in the Toronto district. Preference will be given to ex-service man. Salary $150. to $250., depending on qualifications. Apply to Box No. 3134-V.

CIVIL

TWO CIVIL ENGINEERS are required to act as a structural steel engineer and a structural steel designer. The former would be required to prepare cost estimates, do some designing and selling of structural steel work, give technical direction to the structural steel draughting, contact contractors, customers and other persons in the steel business. The structural steel designer under supervision of the structural steel engineer would be required to do detailed designing, including the layout and detailing of structural steel work. These positions would be in Toronto at salaries according to qualifications. Apply to Box No. 3060-V.

CIVIL ENGINEER is required by the building department of a large Ontario city to examine buildings for general safety and code requirements pursuant to the issuance of building permits. Preference will be given to qualified applicants who have been honourably discharged from the Armed Forces. Apply to Box No. 2943-V.

CIVIL ENGINEER, bilingual, ex-service man is wanted to act as instrument-man for survey work in the province of Quebec in connection with the Veterans Land Act. Salary about $200. a month. Apply to Box No. 3129-V.

CIVIL ENGINEER, age 30-35 with some experience is required to install bush roads for woods operations and to make surveys and profiles in northern Ontario. Apply to Box No. 3130-V.

CIVIL ENGINEER, age 27-35, with experience in reinforced concrete and steel is required to act as structural designer for a large company in Montreal. Salary would be about $250. a month. Apply to Box No. 3140-V.

CIVIL ENGINEER with experience in the design of hydro-electric power stations is required to act as designer on reinforced concrete structures in Winnipeg. Apply to Box No. 3155-V.

CIVIL ENGINEER recent graduate is required to act as lecturer and assistant in the engineering faculty of a university in Ontario. Work will involve lecturing to third and fourth year students on highway and railway course, also elementary surveying and assisting in laboratory. Preference will be given to returned service man. Apply to Box No. 3163-V.

ELECTRICAL

ELECTRICAL ENGINEER, graduate under 35 years of age, bilingual, is required to be trained as assistant to the supervising engineer of the electrical commission of a large city in the province of Quebec. Salary during training period will vary with qualifications between $2500. and $3000. a year. Apply to Box No. 2963-V.

ELECTRICAL ENGINEER with five years' aeronautical experience is required to be in charge of the electrical work in connection with modifications to aircraft. This position will be in the Montreal area and would be worth about $275. a month. Apply to Box No 3107-V.

ELECTRICAL ENGINEER with experience around mills or smelters, English-speaking, with a working knowledge of French, age 32-36, is required by a firm engaged in the manufacture of abrasives and refractories in the province of Quebec. Apply to Box No. 3122-V.

MECHANICAL

CHIEF MECHANICAL ENGINEER is required by a firm engaged in the manufacture of cranes, crushers, conveyors, pumps, etc., in the Toronto area. Work will consist of organizing and directing the activities of the engineering department, which would include draughting, development and design of mechanical products and the supervision of a chief draughtsman, development engineers, project engineers and designers. Apply to Box No. 3040-V.

MECHANICAL ENGINEER with experience in machine design and preferably a returned service man is required by a firm of manufacturers of insulating materials located in eastern Quebec. Apply to Box No. 3058-V.

MECHANICAL ENGINEER, having some familiarity with pulp and paper machinery and suitable personality is required to act as sales engineer for a small manufacturing company in northern New Brunswick. This is a permanent position with a good future for the right man. Candidates should be between 30 and 35 years old and can expect a salary of between $200 and $300 a month depending on experience. Apply to Box 3088-V.

MECHANICAL ENGINEER is required for investigation of maintenance and operation problems in connection with pumps, compressors, boilers, etc., for a firm of alkali manufacturers in southern Ontario. Candidates should be between 26 and 30 years of age. Apply to Box No. 3094-V.

MECHANICAL ENGINEER is required to act as superintending engineer for a pulp and paper company in Calcutta, India. The position demands, firstly, a man who has had some considerable experience in both pulp and paper mill work, particularly in the sulphate pulp mill industry. The company is embarking on an extensive programme covering the installation of various new equipment. The work will involve general maintenance of the entire plant, boiler house and steam turbo power generators. Three year contract including free housing accommodation, full passage expenses and a suggested salary of about $12,000. per annum. Apply to Box No. 3112-V.

MECHANICAL ENGINEER is required to act as assistant engineer to the superintending engineer of a pulp and paper company in Calcutta, India. The work will be in connection with all the practical maintenance of the plant and a salary of between $4,000. and $6,000. per year, under a three year contract, including free housing accommodation and full passage expenses, is offered. Apply to Box No. 3112-V.

MECHANICAL ENGINEER with experience in crude oil burning is required by a small company in Montreal for work in connection with the installation of oil-burners and heating equipment. Age not important but must have good experience. Salary about $250. a month. Apply to Box 3137-V.

MECHANICAL ENGINEER with good local contacts, age 25-30 is required to act as sales engineer for a small firm of manufacturers in the Montreal area. Preference will be given to returned service man who has conversational knowledge of French. Apply to Box No. 3141-V

MECHANICAL ENGINEER, recent graduate, preferably returned service man is required by a well-known company in Montreal for draughting and design work on structural and mechanical problems. Apply to Box No. 3146-V.

MECHANICAL ENGINEER experienced plant and production superintendent is required for a machine shop and grey iron foundry in the Ottawa district, to take full charge of operations and planning. Salary $300. to $375. a month depending on experience. Apply to Box No. 3159-V.

MECHANICAL DRAUGHTSMAN is required by a firm of manufacturing chemists in the Montreal area for temporary work in connection with design and layout of plant equipment of a new plant. Candidates need not be graduate engineers but should have some experience with industrial equipment. Apply to Box No. 3169-V.

MECHANICAL ENGINEER is required to act as designing engineer for a newsprint manufacturer in the St. Maurice Valley. Candidates should have some paper mill experience in mechanical and structural work. This position will last about one year but there will be good prospects for the right man. Preference will be given to an ex-service man and salary will be about $275 a month. Apply to Box No. 3173-V

MECHANICAL ENGINEER, recent graduate, is urgently required for the position of foreman in the mechanical department of a newsprint manufacturer in the St. Maurice Valley. Salary will be between $150 and $225 a month depending on qualifications. Preference will be given to ex-service men. Apply to Box No. 3174-V.

MECHANICAL ENGINEER with approximately ten years experience divided between design and machine shop is required to act as principal assistant to a mechanical engineer in a corporation in Toronto. Candidates should have general all around experience and particularly some manufacturing experience with heavy machinery. Salary would be from $300 a month according to qualifications. Apply to Box No. 3175-V.

SEVERAL MECHANICAL ENGINEERS, preferably recent graduates and discharged service men, are required by an engineering company in Montreal for draughting, testing and research work. Salary would be $185 to $220, depending on experience. Apply to Box No. 3183-V.

MECHANICAL ENGINEER is required to act as chief design engineer for a paper company in southern Ontario. Candidates should have had five or six years' experience preferably in pulp and paper mill work. Salary would be about $325 a month. Apply to Box No. 3184-V.

METALLURGICAL

METALLURGICAL ENGINEER, age 25-30 years is required to act as sales engineer for a chemical company in northern Quebec and Ontario. Preference will be given to an ex-service man. Candidates should have a conversational knowledge of the French language and should expect to do considerable travelling. Salary $160. to $250. a month depending on qualifications. Apply to Box No. 3134-V.

MISCELLANEOUS

ARCHITECT OR ARCHITECTURAL DRAUGHTSMAN with about three years' experience is required by a consulting engineer in the Montreal area. Salary would be about $250 a month. Apply to Box No. 3165-V.

TWO ENGINEERS, civil or mechanical graduates, age 22 to 30, preferably with conversational knowledge of French language are required, one for the sales staff and one for the engineering department of a firm in the Montreal area engaged in the manufacture of refractories. Preference will be given to discharged service men and the work will be in connection with boiler and furnace installations, etc. Salary $175 to $200 a month. Apply to Box No. 3166-V

ELECTRICAL, MECHANICAL OR CIVIL ENGINEERS are urgently required for appointments in the British Colonial Service. These positions will be in Malaya and Hong Kong, particularly. Consideration will ge given to applicants who have been discharged from the armed forces with no other experience and to applicants with varying degrees of experience, especially in railroad engineering. Application may be made to the office of High Commissioner for the United Kingdom, Earnscliffe, Ottawa, or to one of the university liaison officers at the university from which the candidate graduated.

DRAUGHTSMAN, under 35 years of age, not necessarily a graduate engineer, but accustomed to plotting from field surveys, with some experience in structural steel and reinforced concrete draughting, preferably a discharged overseas veteran, is required for a position in Montreal. Salary will be about $150 a month. Apply to Box No. 3180-V.

Situations Wanted

SENIOR REINFORCED CONCRETE DESIGNER and civil engineer. P.E. Ont., experienced field and office, various countries, seeks first class opening. Apply to Box No. 107-W.

CIVIL ENGINEER, M.E.I.C., P.E.Q., age 39, married, B.Sc. U.N.B., widespread experience in construction with experience in plant maintenance both in civilian and Air Force capacities. Interested in responsible position involving plant maintenance. Apply to Box No. 225-W.

GRADUATE ENGINEER, B.A., B.Sc., Montreal University (1935). Age 34, married, bilingual. Interested in development of new machinery, industrial promotion and management; resides in Montreal but willing to travel. Two years on construction and design of hydraulic machinery for food processing. Associated for the past seven years with large electro-metallurgical plant as supervisor on production and on various assignments such as time studies, technical and job-instructor training of personnel, manrating. Apply to Box No. 1818-W.

CIVIL ENGINEER, 30, married, nine years experience in general construction, sewer and water work. Interested in position with consultant or municipal engineer, or company doing structural design. Located in western Canada Available on short notice. Apply to Box No. 2459-W.

GRADUATE MECHANICAL ENGINEER, U. of Sask., S.E.I.C., 26, single, at present with R.C.E.M.E. Wishes to make contacts for position leading to sales engineer .Apply to Box No. 2557-W.

GRADUATE CIVIL ENGINEER, age 25, with three years' experience in surveying, building construction, and highway construction. Prefer western Canada. Recently discharged from army. Available immediately. Apply to Box No. 2560-W

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., available on one month's notice or less. Age 39 years. Experience as plant engineer of 400,000 KVA. hydro-electric generating station, operating engineer of 800,000 KVA. transformer and switching station and A.C. and D.C. conversion station handling approximately 90% of the output of the above station. Also one year's experience as electrical maintenance engineer of large industrial plant. Some experience in electrical construction and in cost and manufacturing methods engineering. Would prefer position in Ontario or the Maritimes. Apply to Box No. 2562-W.

GRADUATE CIVIL ENGINEER, age 24, presently in Vancouver, Experienced in layout of townsite and construction of buildings, ground service, and central steam-heating system. Familiar with soils investigation. Has 1½ years' experience as junior engineer on highway location, design and estimate. Apply to Box No. 2570-W.

MECHANICAL ENGINEER, M.E.I.C., age 36, married, B. Eng., N.S.T.C., Major, R.C.E., soon to be discharged. Experience: 7 years steel plant in rolling mills, machine shop, coke ovens, engineering department; 6 years in army, 4 years on construction and maintenance of fortifications, buildings, 2 years in complete charge, 1½ years overseas as technical officer. Experienced in handling men. Desires administrative position of responsibility in expanding and progressive industry. Location, preferably Ontario. Apply to Box No. 2571-W

MECHANICAL ENGINEER, Jr.E.I.C., McGill graduate, age 27, single. Five years' design and executive experience in manufacturing plants. Now available for position with progressive organization. Highest references from former employers. Apply to Box No. 2586-W.

CIVIL ENGINEER, graduate of UNB in 1941, age 27, with experience as instrumentman on highway construction, assistant engineer on town concrete street paving and concrete inspection, and one year as aircraft inspector for Department of National Defence. Expects early discharge from R.C.A.F. after nineteen months service overseas with bomber command as aeronautical engineer, and desires to make contacts for employment, preferably in Ontario. Apply to Box No. 2585-W.

MECHANICAL ENGINEER, Jr.E.I.C., age 23, single, with degree from N.S. Tech. '44, 18 months' experience as engineer officer afloat in the Royal Canadian Navy. Experience included the administration and control of the entire propelling and other machinery, and the discipline of 30 men in that department. Would prefer work of a responsible nature in a small firm doing manufacturing or installations. Have just been released from the Navy and am available for immediate employment in Canada or elsewhere depending on living conditions. Apply to Box No. 2587-W.

CIVIL ENGINEER, M.Sc., in hydraulics, and sanitary engineering, experienced in design and operation of waterworks distribution systems; has administrative ability; age 30, M.E.I.C. Wishes to obtain position in municipal, sanitary or water supply department. Apply to Box No. 2589-W.

GRADUATE ELECTRICAL ENGINEER, UBC '41, P.E. Ont., Associate A.I.E.E. Age 32, married, one child. Six years school teaching, five months thawing assistant engineer; first class honors degree, C.G.E. Test Course. Major, Technical Staff, R.C.E.M.E., four years active service. Radar trained. Active part in build-up of Canadian Army Telecommunications maintenance and repair organization and production of technical literature. Accustomed to planning, forecasting, general organizing and supervision. Not a specialist. Available in B.C. after discharge February '46. Apply to Box No. 2588-W.

WANTED City Engineer

The Corporation of the City of Vancouver, B.C., invites applications for the position of CITY ENGINEER at a salary of $7,200.00 per annum, rising by annual increments of $240.00 to $8,400.00 per annum.

Applicants must be qualified civil engineers, registered to practise professional engineering in British Columbia, with extensive experience in the design, construction, maintenance and operation of municipal engineering works and the development of town planning, transit and civic improvement schemes. Proven administrative and executive ability must be possessed by applicant.

Applications, stating age, full particulars of experience and qualifications and date when duties could be assumed, accompanied by copies of three recent testimonials, should be endorsed "City Engineer" and addressed to the City Clerk, City Hall, Vancouver, B.C., not later than 21st January, 1946.

Civil and Hydraulic Engineer

Required, with comprehensive background of experience and good executive ability to supervise the designing of reinforced concrete and structural steel structures, hydraulic structures and equipment. Give complete resumé education, experience and state salary required. Location Toronto. Apply to Box No. 3196-V.

Specification Writer

Required by Toronto engineering firm; must be university graduate, experienced and able to write clear and technically sound specifications suitable for contract work. Give full particulars education, experience, references and salary required. Apply to Box No. 3195-V.

Development Engineer

Large paper company has opportunity at Main Office for BILINGUAL Mechanical engineer, age 26-33. Work involves development of mechanical equipment for woodlands operations and standardization of maintenance methods for large numbers of trucks, tractors, gasoline and diesel engines. Some draughting experience necessary. Must be able to get along well with men. Veteran of R.C.E.M.E. or R.C.E. preferred. Salary $300 monthly. Do not apply unless your services are available under regulation P.C. 2796, Part 3, administered by the Wartime Bureau of Technical Personnel. Apply to Box No. 3024-V.

ENGINEERS WANTED

An engineering firm located in Toronto requires the following men experienced in design of hydro-electric developments:

Squad Chief, Checker and five Draughtsmen on reinforced concrete design.

Squad Chief, Checker and three Draughtsmen on structural steel design.

Squad Chief, Checker and three Draughtsmen on mechanical design.

Applicants should state age, education, experience and salary expected.

Do not apply unless your services are available under regulations P.C. 2796, part 3, administered by the Wartime Bureau of Technical. Apply to Box No. 3194-V.

Industrial News

Industrial development—new products—changes in personnel—special events—trade literature

CANADIAN LICENSEES

G. W. Wigle, president of Hamilton Bridge Co. Ltd., recently announced that the company has been licensed by the Sanford-Day Iron Works Inc., Knoxville, Tenn., to manufacture and sell "Sanford-Day" automatic drop-bottom cars, drop-bottom trailers, patented types of wheels and axles and patented methods of opening and closing the doors of these cars and trailers. All of this equipment is designed and adapted for use in the production of minerals in underground and stripping mining operations and for other industrial uses.

GROUND BEARINGS

Completely reconditioned ball bearings, fully guaranteed to give the same service as new bearings and a saving of 30% in bearing costs, are now available in Canada. Although new in Canada, the process of reconditioning worn ball bearings has been in use in the United States for almost a third of a century. Ground bearings are simply worn bearings on which the raceways have been wet-ground, oversize balls installed and new retainers fitted.

Ahlberg Bearings Canada Limited, affiliated with the Ahlberg Bearing Company of Chicago, has set up temporary offices in Montreal where orders are now being filled. A large, modern plant at 4000 Namur Street, Montreal, is now under construction and will be in operation by March. The factory will be equipped with the latest machinery, capable of handling all types and sizes of ball bearings from 1-inch bore up.

C.G.E. TRANSFER

T. J. Halme has been transferred to the industrial control section, industrial division, apparatus department, Canadian General Electric Co. Ltd. He will specialize in industrial electronics, applications and products.

Mr. Halme has served with the contract service department at Toronto and Winnipeg district offices and most recently with the engineering service department at head office.

T. J. Halme

L. E. Messinger

APPOINTED PRESIDENT

L. E. Messinger, well-known throughout the electrical industry, has recently been appointed president of the Selenium Corporation of Canada. He is also president of Canadian Line Materials Limited, as well as several other companies.

LINK-BELT PROMOTIONS

A. W. Williams, for many years sales engineer, Link-Belt Limited, Toronto, has been appointed district manager at Montreal. He has been with the company since 1916.

P. G. Welford, formerly sales engineer at Toronto, has been appointed sales manager at Toronto. He joined the company in 1929.

NATIONAL DISTRIBUTORS

The appointment of Rogers Majestic Limited, Toronto, as Canadian and Newfoundland representatives for the Amperex Electronic Corporation, Brooklyn, N.Y., has recently been announced by S. G. Paterson, manager of the telecommunications division of Rogers Majestic.

C.G.E. APPOINTMENTS

W. H. Prevey has been appointed application engineer, supply department, Canadian General Electric Co. Ltd.

Mr. Prevey will provide engineering information and will make application studies on utility and industrial electric distribution systems. He joined the company in 1936 and after completing the test and engineering course, was transferred to the distribution equipment division of the supply department at head office. During the war, he was associated with aircraft instruments and equipment and was on loan for a time to the Aircraft Production Branch, Department of Munitions and Supply.

W. E. Weaver has been appointed manager of the Royce Avenue Works, C.G.E., Toronto.

Since 1936, Mr. Weaver has been manager of the industrial division, supply department. Prior to this time, he was associated with industrial heating and carboloy and later with fractional horsepower motors and arc welding.

MARITIME DISTRIBUTORS

Moffats Limited have announced the appointment of Electrics Limited, Halifax, N.S., as distributor for the Maritime provinces. With warehouses in St. John and Moncton, they will distribute the complete Moffat line including: Crosley radios, Crosley shelvador refrigerators, Moffat ranges and appliances.

NEW WAREHOUSE

A new oxygen and acetylene warehouse located at 11013-105th Avenue, Edmonton, Alta., has been announced by Dominion Oxygen Co. Ltd., a unit of Union Carbide & Carbon Corporation.

Dominion Oxygen, which at present serves Canadian industries from oxygen-producing plants at Sault Ste. Marie, Welland, Toronto, Montreal, and Quebec, recently announced plans for the erection of an oxy-producing plant and sales office at Vancouver, B.C. An affiliate company, Prest-O-Lite Company of Canada Limited, has acetylene-generating or charging plants located at Shawinigan Falls, Merritton, Montreal, and Winnipeg.

SALES REPRESENTATIVE

Williams & Wilson Limited, with offices in Montreal, Toronto and Windsor, have been appointed exclusive sales representative throughout Canada, east of Manitoba, for the F. J. Stokes Machine Company of Philadelphia, Pa.

C.G.E. PROMOTION

A. E. Byrne has been appointed manager of the newly-formed chemical division, supply department, Canadian General Electric Co. Ltd. Since 1940, he has been in charge of glyptals, plastics and insulating materials.

Mr. Byrne, who joined the company in 1937, recently served as secretary of the Plastics Advisory Committee, Department of Munitions & Supply, and is a past chairman of the Canadian Section of the Society of the Plastics Industry.

Sir John Kennedy Medal		For outstanding merit or noteworthy contribution to science of engineering, or to benefit of the Institute.
Julian C. Smith Medal		For achievement in the development of Canada.
Duggan Medal and Prize	Medal and cash to value of $100.	For paper on constructional engineering involving the use of metals for structural or mechanical purposes.
Gzowski Medal	Gold medal	For a paper contributing to the literature of the profession of civil engineering.
Plummer Medal	Gold medal	For a paper on chemical and metallurgical subjects.
Leonard Medal	Gold medal	For a paper on a mining subject, open to members of the Canadian Institute of Mining and Metallurgy as well as The Engineering Institute.
T. C. Keefer Medal	Medal	For a paper on civil engineering subjects.
R. A. Ross Medal	Medal	For a paper on electrical engineering subjects.
Canadian Lumbermen's Association Prize	$100.00	For a paper on the use of lumber or timber in construction or related subjects in wood utilization.
Students and Juniors	Books to the value of $25 (5 prizes).	For papers on any subject presented by Student or Junior members.
University Students	$25 in cash (12 prizes)	For the third year student in each college, making the best showing in college work and activities in student or local branch of engineering society.

THE FUTURE OF RADIO COMMUNICATIONS IN CANADA

A. B. HUNT, M.E.I.C.
Manager, Electronics Division, Northern Electric Company Ltd., Montreal

Paper presented at the Sixtieth Annual General and Professional Meeting of The Engineering Institute of Canada, at Montreal, on February 8th, 1946.

INTRODUCTION

War, with all its horror and devastation, was brought upon us by the aggressor nations who had for many years directed their development and research towards the advancement of the science of war. A great deal of credit is due our scientists, physicists and engineers who, in spite of the tremendous lag in our scientific thinking for war, were able, not only to overcome this handicap, but to surpass in practically every technical field the development of our enemies during the short space of time that we were engaged in war.

During this period, the combined resources of all allied countries were pooled with one incentive: to outwit the brains of our common enemies. With this wealth of knowledge working for one purpose, there is no doubt that many years of normal research and development were crowded into the space of a few years of war. Radio and radar research took on one of the leading roles during this race for supremacy.

We now find ourselves loosed from the demands of our fighting services, and with the slackening of security restrictions on many of the war developments, we can well afford to review these scientific advances and consider their practical application to the service of mankind in a world free from war. It will be many years before we realize the full commercial value of many of these scientific discoveries, and it is hoped that with the continued co-operation of private, industrial, national, and even international research, these advances will be only the starting point of many great developments which can be produced during times of peace. Even though we can see only dimly into the future, there are many applications which have already become apparent, and many others which are a challenge to research engineers to produce something for the usefulness of mankind instead of for the production of deadly weapons for the destruction of human life and property.

War developments in radio communications have brought about outstanding improvements in the existing art and technique which have expanded the useful radio frequency spectrum very close to that of visible light and the spectacular accomplishments of research in the radar field will have far-reaching effect on the future of many types of radio communications and aids to navigation.

The technical ramifications of all branches of radio and radar research during these years, or even recent months, are so ponderous that it is impossible to comprehend their full effect on future development and the broadening scope of this form of communication on the economy of the nation. It is therefore proposed to deal only with the broad aspect of the many improvements and changes which we may expect in the radio field and the general effect they will have on the various civilian services which will look to radio more than ever before as a means of communication.

It is also proposed to deal briefly with a few types of navigation aids which have been developed through our expanded knowledge of radio and radar techniques. These devices, although not strictly coming under the subject of this paper, are so closely allied that it is impossible to deal adequately with the broad field of radio communication without referring to the spectacular advances in radio aids to navigation which were the forerunner of many communication developments.

CANADIAN RADIO TECHNICAL PLANNING BOARD

A review of the reports of the Canadian Radio Technical Planning Board, which is composed of many outstanding engineers in Canada, gives us some idea of the expanded field of application of radio. The express purpose of this board is to formulate sound engineering principles and to organize technical facts which will assist in the development, in accordance with the public interest, of the Canadian radio industry and radio services of the nation, and to advise Government, industry and the people of its findings and recommendations.

The Engineering Institute is a sponsoring member of this Board and has representation on all of its panels and working committees.

The reports of the Board show requirements for services unthought of before the war, not that the need did not exist previously but, due to the lack of useful frequency space according to our pre-war knowledge, their demands had to give place to those involving the protection of human life and property and those of common service to the greatest proportion of the population. Even the demands of these services were far from adequately fulfilled in the days before the war.

The greatly expanded frequency spectrum, as we know it today, will still be inadequate to supply the complete demands of all services. The exhaustive studies now being made by the Planning Board in regard to frequency assignment should, however, aid materially in the orderly allocation of new frequencies so as to reduce to a minimum confusion and interference between services in the future.

RADIO-TELEGRAPH AND TELETYPE

The development of radio communications[7] started with Marconi's low-frequency trans-Atlantic experiments in 1901. The low-frequency or long-wave range below 100 kilocycles was intensely developed during the first two decades of the present century. The large expansion in communication did not occur, however, until it was discovered during the 1920's that long-distance transmission could be carried on by short waves, that is, by frequencies in the range 3 to 30 megacycles.

Commercial radio communication by Morse code has been standard since Marconi's early developments. The dot-dash system has never been entirely superseded by voice and, in fact, its use has been greatly expanded during the war years by the development of a new system of high-speed automatic code transmission and reception.

The frequency shift[1] method of transmitting telegraph signals is analogous to frequency modulation broadcasting except that it does not introduce the undesirable characteristic of increasing band width. Instead of keying a carrier on and off to designate the mark and space of the telegraph signals, the transmitter maintains radiation at full power, but the carrier is shifted back and forth between two distinct frequencies to designate mark and space. The same beneficial reduction in signal-to-noise ratio is derived in transmitting telegraphy in this manner as is derived from frequency modulation.

The development of high-speed automatic senders and tape recording equipment for both telegraph and teletype paralleled the frequency shift transmission development. Due to these outstanding improvements, towards the end of the war Press Wireless was able to maintain telegraph communication between Europe and the United States with 400-watt mobile transmitters, and handled press traffic at a rate of 500 words per minute.

These developments are entirely commercial and may be used extensively in Canada in future years. One may question the need for these high-speed circuits in many parts of Canada where traffic volumes are relatively low. They can be justified, however, in many cases, particularly in the auroral zones, where transmission may be blacked out for hours at a time with an occasional break-through at which time a larger volume of stored-up traffic may be cleared.

Trans-oceanic Telephony

The first trans-Atlantic radio telephone circuit② for public service was established in 1927. It used a low-frequency carrier of 60 kc. The following year a short-wave telephone circuit was established and by the beginning of 1939 there were in service throughout the world about 170 important long-distance short-wave telephone circuits, of which five were in regular use between this continent and Europe.

Recent developments by the Bell Telephone Laboratories in the short-wave field for trans-oceanic service have introduced single-sideband transmission and the multiple-unit steerable antenna known as "MUSA". The single-sideband transmission has doubled the frequency channel utilization factor as the transmission band width is cut in half and there is a very marked improvement in the signal-to-noise ratio. The MUSA reduces selective fading by combining signals arriving over different paths or by eliminating all signals except those arriving over one path.

With cessation of hostilities, there was an immediate commercial demand for this equipment. Many countries of continental Europe have already purchased this system to establish direct radio telephone circuits with this side of the Atlantic. Some of these equipments have already been delivered and will be in operation within the next few months.

It is impossible to predict the part Canada will play in the expansion of trans-oceanic radio communication, but it is just another one of the many broadening radio fields which are opening up unlimited opportunities for Canadian engineers.

Point-to-point Communications and Relay Systems

Prior to the war, radio as used by the telephone companies was restricted to a few special applications where it was found to be definitely impractical to use land lines or submarine cables. This limitation was principally due to the lack of available frequencies; in fact, it can be generally stated that radio frequency channels would not be assigned for any type of service where alternative wire circuit could be made available.

One of the largest pre-war radio-telephone networks was operated by the British Columbia Telephone Company for point-to-point communications and ship-to-shore radio service which tied in directly through their long distance toll switchboard in Vancouver to regular telephone subscribers.

A radio circuit from Saint John, N.B., to Digby, N.S., operated jointly by the New Brunswick Telephone Company and the Maritime Telegraph and Telephone Company was put into service in July 1941 across the Bay of Fundy, a distance of approximately 40 miles. This was a typical application for radio as it saved approximately 130 miles of wire line by transmitting by radio from Saint John to Digby and continuing from there by wire for approximately 150 miles to Halifax, as compared with a 280-mile wire circuit from Saint John to Halifax via Moncton and Truro. This radio circuit meets standard long-distance toll requirements and forms part of the trans-Canada telephone circuit. Telephone carrier was applied to this radio circuit in March 1945, increasing its capacity from one to three channels.

During the war, the Canadian Government installed several extensive radio telephone relay systems to supplement telephone communication systems for coastal defence on both the Atlantic and Pacific coasts. The first of these systems, engineered during 1942 for protection along the Gulf of St. Lawrence, utilized standard 1,000-watt 40-50 megacycle FM broadcast transmitters which were chosen because of their availability to meet the urgent requirements of the fighting services. This

Fig. 1—1000-watt FM broadcasting transmitter used during the war emergency for communication across the St. Lawrence river. High quality wide-band transmission characteristics of FM permitted use of telephone carrier to increase capacity of single radio channel to include two telephone voice circuits and four telegraph circuits.

Fig. 2—Experimental antenna station, Lachine, Que., used to check characteristics of VHF antenna structures for telephone relay station used on East Coast defence system.

installation, the first of its kind in Canada, required extensive development work, principally in regard to the design and construction of antennas, to withstand the severe weather conditions encountered at high altitudes along the coast where some of the equipment had to be located.

Towers were designed to withstand wind velocities of 150 miles per hour with structures loaded with three inches of ice. This ruled out conventional antenna designs using insulators and regular co-axial transmission line feeds. It was necessary to establish a large experimental antenna station a few miles west of Montreal where designs were engineered and their transmission characteristics thoroughly checked during the winter of 1942-1943 so that they could be installed without delay in the spring as soon as roads could be built into the inaccessible sites on the rugged south shore of the St. Lawrence. One of the sites was approximately 30 miles from the nearest highway and over 4,000 feet above sea level.

This circuit consisted of two terminal stations and one intermediate relay station and was originally designed to operate as an isolated radio link, but was later tied in with wire line to the telephone exchange at Halifax and, at that time, telephone carrier was superimposed on the radio circuit to give a total of two voice and four telegraph circuits. This addition of carrier was possible due to the high quality wideband FM radio transmitter that had been originally used for this installation.

The second large radio telephone network installed by the Government was on the West Coast. This installation also used commercial FM broadcast equipment in the same frequency range but of somewhat lower power output. Climatic conditions being much less severe on the West Coast, more or less conventional antenna systems were employed, although many difficult and almost insurmountable problems were encountered due to the inaccessible and rugged nature of the country.

Due to the rapid advancement of the art, higher frequencies in the neighbourhood of 100 megacycles were used for the next large system engineered and installed for war purposes during the fall of 1943 and the spring of 1944. This installation was located on the East Coast, supplying much needed communication to Newfoundland. Weather conditions were again a severe problem to cope with, but design work was greatly simplified due to the smaller antennas required for these higher frequencies; 250-watt transmitters were also found adequate for the system. Voice frequency carrier was not employed on these circuits but instead, four separate radio channels were installed. This compared favourably from a cost standpoint with the first installation referred to, due to smaller antenna structures and lower power of the transmitters used at these high frequencies.

The reliability of very high frequency systems of this type has been thoroughly established during their wartime operation and, provided frequency assignments can be made available, there is little doubt that extensive use will be found for radio to replace or supplement existing wire lines. Relay systems at these or higher frequencies will soon become an integral part of many long distance telephone circuits. They will also find extensive use in extending telephone service to rural communities where normal land lines are too expensive to install or maintain.

Pulse Modulation

In considering the future plans for radio telephony, this paper would be very incomplete if it did not include a reference to pulse modulation. The merits of this method of transmission applicable to multi-channel telephony were first considered in 1937, but the advancement of radar or pulse technique during recent years can be given full credit for bringing this system into actual operating use during the last year of the war.

The method consists essentially of transmitting intelligency by pulses of constant amplitude and duration, the instantaneous amplitude of the voice being translated into a variation of time intervals of successive pulses, the rate of this variation corresponding to the instantaneous frequency of the signal.

The AN/TRC-6 eight-channel microwave radio system(3), designed by the Bell Telephone Laboratories and used during the last year of the war by the American forces, makes use of "pulse modulation". In such a system, the radio transmitter emits short spurts or

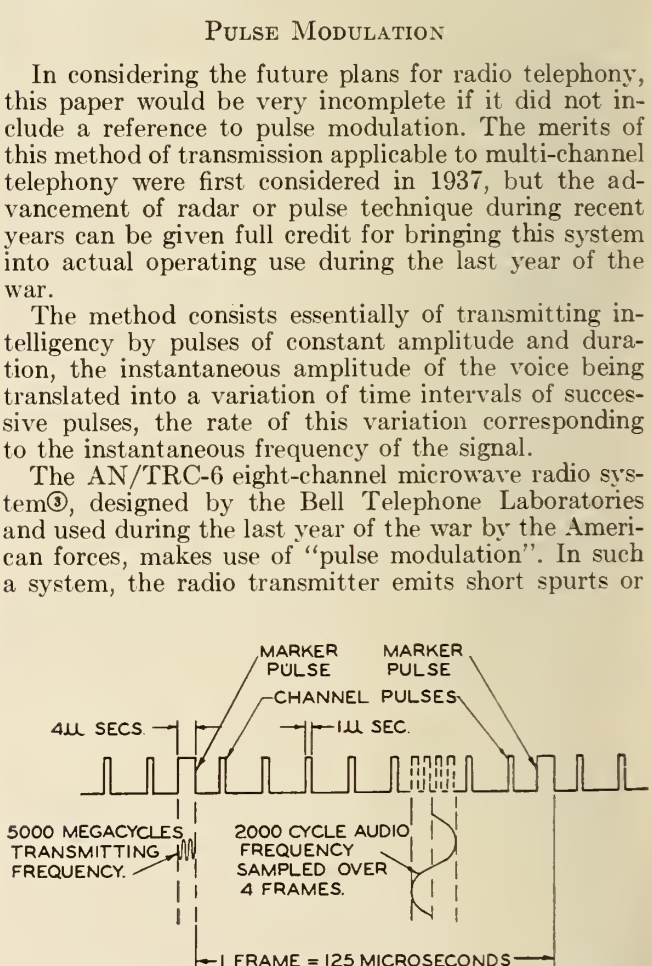

Fig. 3—Diagrammatic sketch of pulse transmission of AN/TRC-6 microwave relay transmitter with audio modulation on channel No. 6.

pulses of radio-frequency power, individual bursts lasting for intervals of time as short as about one-millionth of a second. These short microwave pulses are substantially constant in both amplitude and frequency. Eight one-microsecond pulses, one for each channel, are transmitted in sequence 8,000 times a second, that is, each audio channel is sampled or scanned approximately every 125 microseconds.

The intelligence of each channel is conveyed by varying the time position of the one-microsecond channel pulses. The phrase "pulse-position-modulation" (PPM) has been applied to this method. Eight channels share the operating time of the radio transmitter and receiver, each using them in turn. Such a sharing process utilizes a multiplexing principle that, at least for telegraph, dates back to 1853, and for many years has been known as "time division". Pulse transmission therefore not only provides for position modulating the pulses but also permits multiplexing the channels by time division. Simultaneous two-way communication is provided by using different radio frequencies for the two directions of transmission. Directional separation is thus obtained by frequency separation or "frequency division", while channel separation is obtained by time division. No detectable distortion of the re-created signals in the final receiver is inherent in this method of transmission, nor is the system limited to only eight channels.

Fig. 4—Searchlight antenna used with AN/TRC-6 microwave pulse modulated radio relay system.

Because of the line-of-sight path over which the system operates, the distance between sets is limited by the curvature of the earth, but by using intermediate sets as radio relays, communication may readily be extended to hundreds and even thousands of miles.

A highly directive and sharply focused microwave beam with a frequency of nearly five billion cycles per second is used to carry the intelligence of the eight messages. The antenna beam pattern is comparable in sharpness to that of a searchlight, and the five-billion-cycle radio frequency of the relay system corresponds to a wavelength that is less than one-half the length of an ordinary lead pencil.

This very high radio frequency gives communication channels virtually free from static and most man-made interference. As a result of the sharply beamed transmission, the correspondingly highly directive reception and the absence of static and other external noise sources, a small amount of transmitter power is adequate for communication over optical paths of considerable distance. A peak power of two watts serves for jumps as great as 100 miles. Because of the sharp beam pattern of the transmitting and receiving antenna systems, because transmission must be over an unobstructed optical path, and because of the method of modulation employed, a substantial number of sets using the same frequencies may be operated in close proximity at a single location.

The practical application of this system of radio communication has been thoroughly established by war usage. A trial installation for commercial telephony is now under way between Los Angeles and Cataline Island. A similar trial installation is contemplated for Canada. It seems probable that AN/TRC-6 equipment is the forerunner of future line-of-sight microwave relay systems operating in the billion-cycle range which will provide stabilized broad-band communication facilities of high quality and dependability. These advantages are enhanced by sharply beamed transmission and reception, pulse transmission, and time division multiplex. Such systems can be transportable or fixed as required. The passage of time and the results of additional development which can be expected to follow at a rapid tempo will contribute towards establishing their economic status and advantageous fields of application.

Aircraft Radio

Prior to the war, practically all commercial air lines carried complete two-way radio communication facilities for the transmission of information and instructions between the pilot in the air, and the ground control at various airports. The pilot was also guided in his flight path by low frequency radio range beacons, and was given warning of his approach to specific ground features by radio marker beacons.

Radio is undoubtedly one of the major factors contributing to the successful use of aircraft during the war. The radio communication equipment, with no reference to the multiplicity of radar, installed in every Canadian-built Lancaster bomber included three radio transmitters and three radio receivers, one of the latter being used as a radio compass. Two TA-12 transmitters, each with four pre-set station frequencies, were used for long distance communication between the plane and ground. The companion RA-10 receiver was used for long distance reception from the ground. A combined transmitter-receiver, TR-1196, known as a command set, was used for short distance communication within the squadron. The MN-26 Compass, which also forms part of the navigation radio equipment is a high quality radio receiver with a rotatable loop antenna which, when directed towards a specific radio station to which the receiver is tuned, gives the pilot or navigator a direct azimuth reading of the radio station relative to the direction in which the plane is heading. In addition to these radio transmitters and receivers, there are numerous remote indicators and controls, as well as a complete intercommunication system within the plane having eleven outlets or station boxes where the crew can receive information that comes over the radio, or they can be used to pass instructions between members of the crew.

Returning again to commercial air transport, it will be realized that aircraft in flight are totally dependent upon radio for transmission of essential flight information relating to *en route* and terminal weather conditions and trends, changes in routing and the nature of other traffic on the airway. A safe and efficient operation cannot be conducted unless this information is continually available. The tremendous expansion in air transport operations now being planned will be accompanied by a commensurate increase in the complexity of the airways traffic control problem. To assure safety in flight, it is therefore reasonable to assume that within the next few years, all aircraft, scheduled and unscheduled, will be required by government edict to carry two-way radio communication facilities.

Fig. 6—Radio control pedestal designed for TCA for the DC-4M DeLuxe airliners being built by Canadair in Montreal.

There is no doubt that the advancement in radio will keep pace with the fast-moving air industry. This will bring into use many new radio devices and will necessitate a large expansion in the number of radio frequency channels for airways services. Fortunately, the accelerated war development has already made this a reality. Existing services will be greatly expanded and augmented in the post-war years. New and broader frequency assignments have already been given to the aeronautical services in the high frequency spectrum. In addition to communication frequencies, provision is also being made for airway and airport traffic control, distance and collision indicators and meteorological observations by radio which are already accepted aids to air navigation. It is feasible to expect that pilots will be directed in specific traffic lanes and their flight safely controlled by radio or radar beams just as railways are today controlled by the block system. Instrument landing, which is already installed at some airports, will permit pilots to land in absolute safety where visibility above the landing strip, due to weather, may be only a matter of feet instead of hundreds of feet.

The science of radar has already made possible the development of accurate instruments for the reading of distance. The distance indicator④ developed by the National Research Council is an airborne equipment which shows the pilot of an aircraft his distance from one or more selected ground points. This information is presented continuously on a meter on the cockpit panel calibrated in two ranges, 0-100 miles and 0-25 miles. The long range scale is intended for airways navigation and the short range scale for airport control and approach procedures. The conservative working range of the system is 100 miles at an altitude of 4,000 ft.

The complementary ground equipment is installed at selected points, which may be sites of the present range stations, or at airports, depending upon the particular application. Monitoring equipment is provided in the airport control towers to ensure a continuous check on the performance of the ground stations.

One of the most promising peacetime applications for radar appears to be in the meteorological field for the detection and observation of storm areas. Extensive experimental work⑤ has been carried on during the past year using radar equipment, known to the army as M.E.W. It has been conclusively established that this same equipment which used to scan the sky for enemy aircraft, can also see snow, rain and even heavily saturated clouds. The location of these storm areas and the direction of movement can be readily determined from the electronic picture on the cathode ray screen of the radar equipment, and the necessary information can thus be given to the pilots through the usual meteorological service.

Fig. 5—Wireless operator's table, Lancaster bomber, showing TA-12 transmitters with associated antenna loading units, MR9 remote control for R-10 receiver, MN-28 remote control for MN-26 compass receiver, and 3616-B transmitter control.

Marine Radio

Ships having sailed the seas as long as history can relate are not as vitally dependent on radio for communication as aircraft, but nevertheless no modern ship today is without radio and, in fact, by recent government legislation, certain classes of vessels sailing in specified zones in Canadian waters must now be equipped with this modern means of communication.

The use of very high frequencies which has extended the horizon of many communication services will have only limited application for marine communication. Due to the "line of sight" characteristics of frequencies above 30 megacycles, their use will probably be restricted to direction finding and to coastal vessels and inland shipping on small lakes where land stations can be installed on high ground near the water's edge and thus the height of the station will offset to some extent the curvature of the earth. For example, if the shore station is 1,000 feet above the water level, the line of sight path will extend out from shore approximately 40 miles, whereas with two stations located on separate boats, at sea level the tops of 50 ft. masts would drop out of line of sight when the boats are approximately 18 miles apart. These distances are of very little value to commercial shipping so that generally speaking their communication frequencies will probably remain in the old pre-war channels below 30 megacycles, where we can rely on obtaining one or more reflections from the Heaviside layer to greatly extend the useful range of the transmitted signal.

Although we do not expect any spectacular changes in marine radio communication, there appear to be many improvements in navigational aids as well as a direct application for the use of radar. The distance indicator, referred to under Aeronautical Aids to Navigation, has a direct application for ships approaching harbour or another vessel equipped to give a return signal. It may also be used to obtain distance readings from lighthouses or buoys. These return signals will be identified so the captain will have no difficulty in recognizing the correct landmark.

Type 268 naval radar equipment[4] was designed by the National Research Council to be used in small ships of the Motor Torpedo Boat or Fairmile class for the detection of surface targets.

The equipment consists of a single rack or cabinet which contains the transmitting and receiving apparatus, a motor-driven continuously rotating antenna, mounted on the mast, and two remote indicator units or displays. The equipment is usually mounted in a small cabin within the ship, and a single operator ob-

Fig. 8—Microwave search antenna used with 268 naval radar equipment.

tains range and bearing information from the main display unit mounted in the main rack or cabinet. Of the two remote display units, one is usually mounted on the bridge, and the second mounted within the chart room.

The main purpose of the equipment during the war was to detect the target and direct the ship's course onto it, for attack. It was also found useful in navigating small vessels during darkness or fog, particularly when in a group with other ships or when close to shore.

Equipment of this type will have a broad application as a peacetime navigational aid. With the rugged shore lines of some approaching narrows clearly traced on the electronic screen in front of the captain, he can with complete safety, even in a dense fog, guide his vessel past the perilous rocks and continue on his course without delay.

Train Radio

The broadening of the radio frequency frontier towards the visible spectrum has made possible the development of mobile train radio service. Following extensive field studies, the Federal Communications Commission in the United States has, within the last few months, allocated the band 158-162 mc. for railroad use, in end-to-end, train-to-train, and wayside-to-train service; and on a non-interference basis, for yard and terminal communication. The bands 44-72 mc. and 186-216 mc. are also available on a sharing basis with television, for yard and terminal radio systems. This action by F.C.C. is significant and of vital importance, and cannot be overlooked in considering the potentialities of VHF train radio. It is to be expected that Canada will consider similar action in assigning frequencies for this type of service.

The opening up of the VHF band for this service has resulted in many advantages; they can be briefly summarized as follows:

(1) The first and most important consideration is the desirable propagation characteristic of 160 megacycle radiation. Due to the absence of ionispheric reflections, it is possible to control the range as

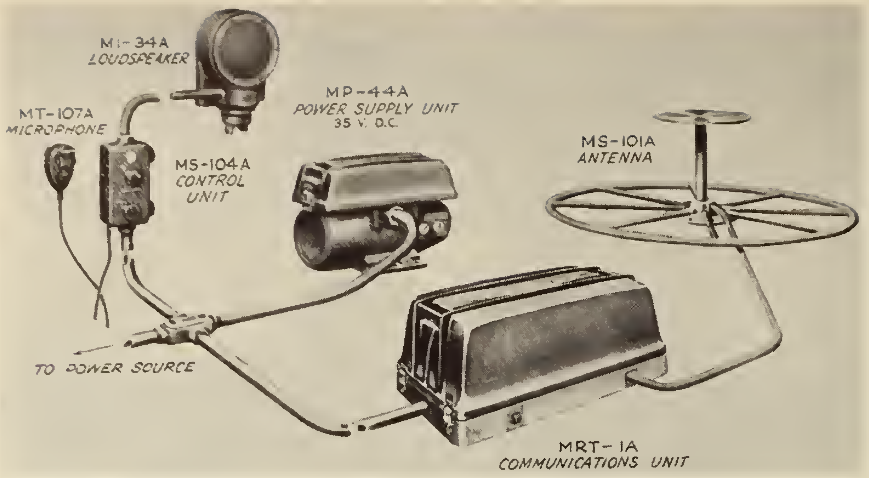

Fig. 9—160-megacycle mobile train radio equipment.

the requirements of railroad application might dictate. Then, too, the earth and objects upon it act as more and more efficient reflectors as we proceed upward in the spectrum to 160 megacycles. This results in perfectly usable signal levels entirely beyond the line of sight and , on the basis of recent tests, it appears that solid communication on 160 megacycles can be maintained in long tunnels.

(2) The short wavelengths employed, slightly less than two meters, permit the erection of small but highly efficient antennas having directional or non-directional characteristics as desired. This makes it possible to erect antennas on locomotives and cabooses well within the railroad's clearance pattern. This is one of the major reasons why tests at lower frequencies in the past have been somewhat unsatisfactory.

(3) A third and most important feature concerns electrical interference. It was originally feared that the electrical noise level in huge Diesel-electric locomotives and in industrial areas would be severe. Recent operating tests have indicated that at frequencies of 160 megacycles, noise from sparking commutators, high tension lines and other such sources was almost non-existent. It is safe to say that atmospheric noise is almost entirely absent and that any man-made noise encountered is of the impulse type and easily rendered innocuous by the use of radio noise limiters.

(4) Due essentially to the three preceding factors, it is not necessary to employ high power to provide a consistent noise-free communication circuit. Low power can do an excellent job. This means smaller equipment operating at lower temperatures, lower power input, lower tube cost and lower overall cost. It also makes practicable the employment of pack sets and handy talkies.

(5) 160 megacycles also represent a "happy combination" of things. The frequency is high enough to secure the advantages of controlled range, small antennas, low noise level and lower power, yet the frequency is low enough to permit routine manufacturing and maintenance techniques and use of standard components. This means that thoroughly reliable equipment is available today.

The MRT-1A communication unit is one of the latest post-war designs of a combined mobile transmitter-receiver for railway use. The case is of moulded, reinforced aluminum construction with a rubber gasket between upper and lower halves to give a water-and-air-tight housing. The overall dimensions are 27 in. long. 14 in. wide and 10 in. high, and the complete unit weighs 55 lb. This equipment operates in the 108-162 mc. range, the lower end of the band being available for aviation radio. It is frequency modulated and has a transmitter output of approximately 12 watts.

The associated antenna is of novel design; relatively short in any event due to the high frequency, but made still shorter to meet the space limitations of the railroads by the top loading disc, and carries its own ground plane in the form of a cartwheel.

Police, Fire and Forestry Radio

Police, fire and forestry as emergency services for the protection of life and property have been able to obtain a limited use of radio in the past. The commercial development of frequency modulation (FM) in the 30-40 megacycle band for mobile service during 1939 greatly expanded the usefulness of mobile communication and especially for large networks required by the provincial police.

The following proposed Provincial Police system illustrates the advantages that can be obtained from FM. All main fixed stations would operate on the same frequency so that they could communicate with adjacent stations and any car within their range.

The transmitters in the mobile units would be on a second frequency used to communicate back to the main stations, which would have a second receiver tuned to the mobile transmitting frequency. This dual frequency arrangement permits the main stations to have priority for inter-station and station-to-car communication without interference from the mobile units. On the other hand, a mobile unit would be always free to call its main station on the second frequency and, depending upon the urgency of the case, the main station could decide whether or not to interrupt the conversation in progress in order to communicate with the car which has put in the call.

This arrangement provides for two-way communication from main station to car and car to main station. If three-way communication is required, that is, the addition of car-to-car communication, a second crystal can be added to the mobile transmitter using the main station frequency. This, however, would make it possible for the cars so equipped to interfere with trunk calls.

A large number of main stations operating on the same frequency, thus giving great flexibility with a minimum of equipment, is only possible because of the capture effect of FM. It has been found entirely feasible to operate stations not immediately adjacent simultaneously without creating any disturbance to the cars listening to their own stations. If the same case were applied to amplitude modulation (AM) the weaker signal would be heard mixed up with the desired station and would set up a heterodyne squeal or spoil the wanted signals entirely. In engineering terms, using FM, the ratio between desired and undesired signals has to be only 2 to 1 for rejection of the weaker station on the same frequency, whereas in AM, the stronger signal must be at least 20 times louder in order to blanket out the interference.

This engineering fact has proven to be the solution to the problem of congestion that exists on police frequencies due to the large number of cities, towns and even provinces desiring to operate radio facilities on the limited number of frequency channels available.

This characteristic will also be of considerable advantage to forestry radio as it will permit large networks to operate on the same frequency and give great flexibility in the movement of equipment from one location to another as it is needed to take care of emergencies.

Up until the present time, radio for fire departments has usually been used in co-operation with the municipal police systems. With the development of pack sets and walkie-talkies, there is little doubt that this service will be extended to supply communication at the actual scene of the fire. With this equipment, the various fire-fighting crews will be able to keep in touch with each other and at the same time they can be directed in their operations by the chief or some other officer who can see the progress of the fire from a place of advantage. It will also be of invaluable assistance in directing help to firemen who are in danger of being trapped or cut off from exit.

General Mobile Radio

General mobile radio includes a broad field and, although not a standardized term, is intended to designate all services designed to extend communications to motor vehicles in the cities and on the highways. Telephone service to these moving vehicles, of course, can be given only by radio. The service, up until the present time, has been extremely restricted, due to the limitations of usable frequency channels. The broadening of the frequency spectrum in recent years has therefore stimulated a great deal of interest on the part of prospective users who realize the tremendous advantages which are likely to accrue from this type of service.

This vehicular telephone service is of two types. First, urban service for vehicles operating primarily in cities and towns and, secondly, highway service for vehicles operating on or in the vicinity of the principal inter-city highways. Urban service, particularly in the large cities, should be available for use by all operators of motor vehicles, including public utilities, doctors' cars, ambulances, surface traction lines, taxicabs, busses and all types of delivery trucks. This service should be available also to tugs, ferry boats, barges and other vessels. Highway service should be provided to inter-city transports, busses, highway maintenance vehicles, utilities and others, including vessels operating in nearby waterways. The facilities also may be used for communication with railway trains and possibly aircraft.

Such service may be provided either on a common carrier basis by the telephone companies, or through a plurality of private services. Private service may be justified for certain large operating companies who can utilize at a reasonable capacity the frequency channels assigned to them, and can also justify the economy of establishing separate central office fixed station transmitting and receiving equipment. On the other hand, there are many advantages in the establishment of a co-ordinated common carrier system of public mobile communication, serving a wide variety of needs. Such a system will permit highly efficient use of radio channels with resulting conservation of frequencies and economy of operation. Through interconnection with the general telephone exchange and toll system, the communication needs of the smaller user will be served as effectively as those of the larger user. Centralized operation and co-ordination will also minimize interference possibilities.

One of the most important new applications for mobile radio service is for communication to line maintenance and emergency service trucks of all types. This service will eliminate a great deal of waiting time on the part of service trucks which are now held at headquarters for emergency calls. When radio-equipped, these trucks may be employed on regular routine maintenance and yet will be available for immediate dispatch to the source of trouble in the same familiar way that we now see a police car directed to the source of a civilian disturbance.

The Bell Telephone Company of Canada already have installed, on an experimental basis, common carrier mobile radio service in both Montreal and Toronto. The final installations at these locations will include one or more high-power fixed-station transmitters and a network of fixed receivers located at a number of points throughout the city to receive the weaker return signal from the low-power mobile transmitters. The fixed station equipment will be connected through the regular telephone trunk lines to the exchange switchboards. Any telephone subscriber may therefore originate a call through the exchange and be connected by radio to any radio-equipped vehicle. Selective ringing is used so that even though the radio circuit will be a party line for a number of mobile subscribers, only the designated subscriber will receive the ringing call. The radio-equipped vehicle may originate a call to any other telephone subscriber through the exchange operator.

Power Line Carrier

Power line carrier, operating in the low frequency band below 200 kc.. has been used extensively by the electric power companies for communication between power stations and to service trucks equipped with portable radio equipment working in close proximity to the power lines.

This system has many of the inherent advantages of both wired lines and space radio. The radio waves, being guided by the wire lines, give reliable transmission up to approximately 150 miles with relatively low power in the order of 50 watts. At the same time, having the characteristics of radio, the signal will carry through space for a limited distance in the event of line damage.

In recent years the use of these radio communication systems has been extended for relay control and telemetering. This is accomplished by dividing a portion of the audio frequency channel into a number of narrow band channels for the transmission of a single frequency tone or pulse. By interrupting the continuous tone or by varying the length of the pulse, relays or meters can be operated at remote locations.

This system is very economical in the use of radio frequency channels and as it is practically instantaneous in response as a means of control, it gives considerable promise for widespread use in the future.

Radio Broadcasting

Standard broadcasting is one of the oldest and, as its name implies, one of the most standardized forms of radio communication. Little technical change can therefore be expected, but on the other hand, many Canadian stations have recently been authorized by the Government to increase their power output rating to the limits permitted under the terms of the Havana Agreement. This has brought about a large expansion

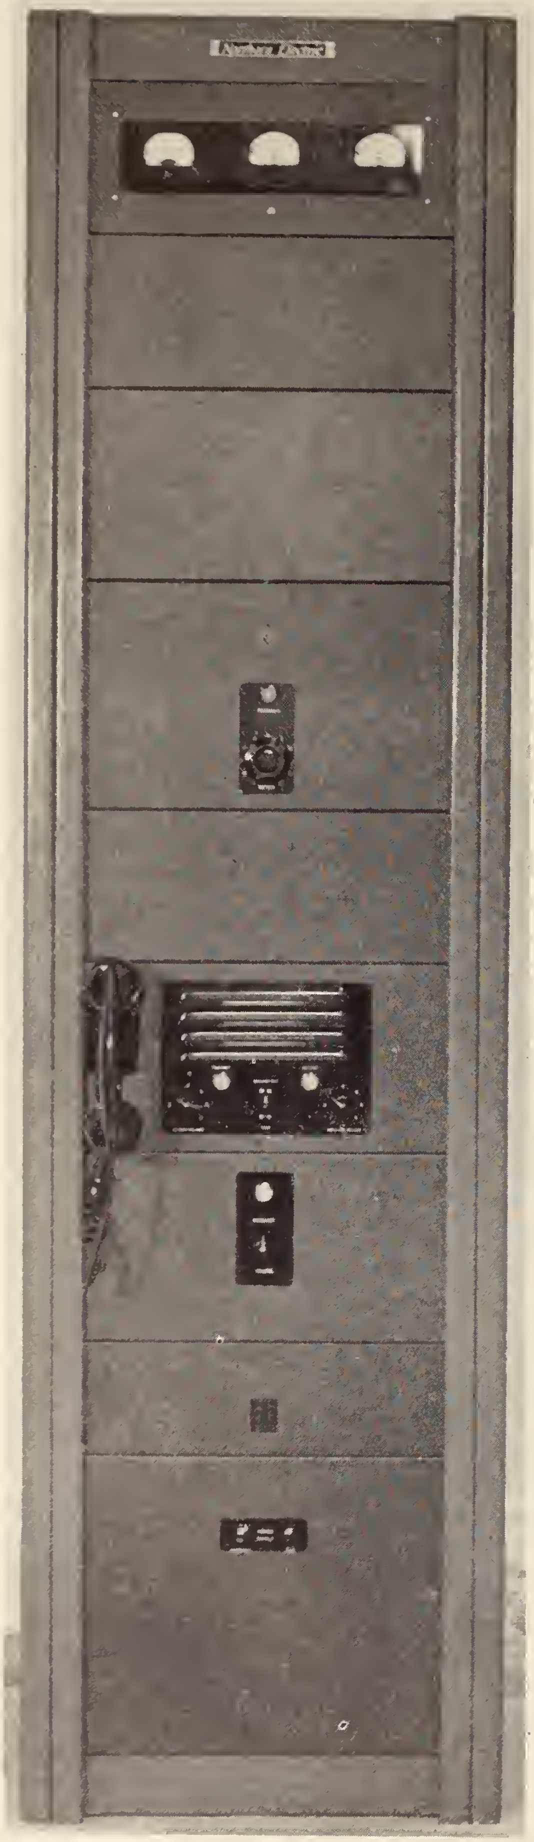

Fig. 10—Power line carrier terminal.

in the construction of new high power stations from coast to coast. This has been accompanied by extensive use of two, three and even four tower antenna directional arrays required to prevent excessive interference with co-channel and adjacent channel stations.

Considerable publicity has been given to the advantages of frequency modulation as compared with amplitude modulation for broadcast purposes. These advantages include the possibility of better signal-to-noise ratio, absence of fading due to the use of very high frequencies, lack of interference due to the capture effect, and improved quality due to the wider frequency band available. FM, however, is not likely to entirely supersede AM, as the standard broadcast has the advantage, in rural areas, of greater coverage as it is not limited to line-of-sight transmission. The field for FM broadcasting appears to be in cities and larger towns, whereas AM can be expected to remain in favour for high power stations giving combined urban and rural coverage.

In the United States, frequency modulation had made a beginning before the war with approximately half a million FM receivers in use as compared with about sixty million AM receivers. This was one of the objections brought forward against changing the frequency allocation from the 42-50 mc. band up to the 88-108 mc. band. A limited amount of experimentation is being done in Canada on the old frequency band due to the availability of equipment for these frequencies, but for practical purposes this country is in the fortunate position of not being faced with any conversion programme or obsolescence due to the adaptation of the 100 mc. band for FM.

The Department of Transport is actively engaged in planning for FM broadcasting and it is expected that the regulations governing its use and the engineering standards to be followed will be forthcoming early this year. A conservative estimate of the ultimate number of FM broadcast stations in Canada would be in the order of 200 as compared with about 2,000 in the United States. There are at the present time approximately 100 applications for Canadian stations so that there is little doubt that a broad expansion will be forthcoming in this field of radio communication. This will expand Canadian production facilities for both transmitting equipment and radio receiving sets for the home. The latter will undoubtedly appear on the market as combined AM and FM receivers before the end of this year.

Canada's future position in the field of international broadcasting has been very firmly established by the inauguration of the Canadian Broadcasting Corporation's International Shortwave Service[6] about a year ago at Sackville, New Brunswick. This installation is an outstanding tribute to Canadian engineers and especially those directly associated with the design and construction of the system. By the application of the latest developments in the art of radio communication, Canada is able to supply a service which is technically second to none, as compared to similar services originating from this side of the Atlantic. These services are gradually being extended and we can be assured that "Canada's Voice" will have an ever broadening influence in world affairs.

Facsimile and Television

It has been stated that television is the ultimate in communication. A very brief analysis of the technical facts reveals only too clearly the magnitude of the transmission problems of sight as compared to audio intelligence, which up until recent years has been the common concept of communication.

Frequency band width has become almost a commodity to the communication engineer. He assigns about 100 cycles to a printing telegraph machine that prints 60 words per minute. A 3,000-cycle band width is considered a reasonable engineering standard for commercial telephony. The range of the normal human ear is about 15,000 cycles and perfect transmission of music requires that band width. For the transmission of high quality colour television, the standards have been established at the astronomical figure of 20,000,000 cycles although for commercial black and white transmission, the limit will not exceed 6,000,000 cycles.

Stating this in another way, twenty printing telegraph channels with adequate separation cost in frequencies about as much as an ordinary telephone channel, but for one television channel we must pay the price, in frequencies, of 1,000 telephone or 20,000 printing telegraph channels.

The necessity for this broad communication band can be realized when it is understood that the television camera dissects each picture into approximately 175,000 separate pieces, accurately arranged in horizontal rows with hundreds of pieces to each row. They are then transmitted one piece at a time, row by row, to the receiving set. There they are laid down in the same order, so swiftly that the eye sees a complete picture all at once. To show clear images and unblurred action, television must reproduce 30 complete pictures every second, giving a total of 5,250,000 separate dots or picture elements. With colour television, the number of picture elements to be transmitted each second must be approximately three times this number.

In the United States at the end of 1944 there were nine active television stations and over 80 applications for new stations. At the end of 1945, the number of applications had increased to 125. During November of last year, F. M. Folson, Executive Vice-President in charge of television for RCA, predicted sales of 300 to 400 thousand television receivers during 1946 and 600 to 700 thousand during 1947. This compares with a total of approximately 7,000 receivers in use in the United States prior to the war.

The Canadian picture, of course, is not quite so optimistic. Studio programmes using live talent will be extremely expensive and can probably be supported in only a few of our large cities. It has been stated that a television programme requires ten technicians for every one used on a radio broadcast programme. The importation of programme material will necessitate the installation of co-axial cables or radio relay circuits from the American network centres. It will probably be several years before these facilities will be available. A further problem confronting Canada is the need of specially designed equipment for our 25-cycle power areas and the difficulty of synchronizing telecasts between the 25 and 60 cycle districts.

These many problems, however, are only a challenge to our Canadian engineering talent and Canadian industrial enterprise. From a review of our past achievements, there is no reason to doubt that these obstacles will be overcome and that the future of television in Canada is assured.

Conclusion

I realize only too well as I approach the conclusion of this article that I have attempted a difficult if not impossible task in trying to deal with the broad field of radio communication within the limits of a single paper. Any one of the phases of this art gives adequate scope for a complete study in itself. I am conscious of many omissions, but hope that I have covered most of the highlights and have left no doubt in your minds as to the broad expansion that lies ahead of us in the field of radio communication.

This expansion, however, cannot be realized immediately and we, as engineers, should guard against the stimulation of undue optimism on the part of the public for the early release of new products and services. If these are not thoroughly engineered and field-tested before being offered for commercial use, it is bound to have a serious reaction on the whole radio industry and may jeopardize its growth for many years to come. We all realize that even during the war when the lives of hundreds of thousands were at stake, progress in new developments was subject to many limitations. Advancement had to be made one step at a time. With commercial and economical considerations now playing an important role in civilian developments, progress is bound to be relatively slow. It is interesting to note that Major Armstrong's original developments on FM broadcasting date back to 1933, but it was not until six years later that they were applied commercially to mobile radio and we are only beginning to realize the benefits of FM broadcasting itself.

We can reasonably expect, as a direct result of war research, that there will be a greatly accelerated period of development in commercial radio communication during the next five or ten years. Radio communication throughout most of the VHF band from 30 to 300 mc. is already becoming a commercial reality. This expansion will soon give service to many types of users who were previously without means of communication. Many new radio aids to navigation are already past the experimental stage and within the next few years will be a major contribution towards safer and more efficient operation of both aircraft and marine transportation. In the ultra-high frequency and microwave ranges, research has produced many new equipments for war use but only a very limited number of them have been applied even experimentally to commercial communication. This latter stage, unlike the developments covering equipment used below 300 mc., involves entirely new components and techniques. Consequently, commercial developments are only in their infancy, and it will undoubtedly be many years before we realize the full advantages which can be gained by the use of these extremely high frequencies.

THE SOLUTION OF THREE-TERM SIMULTANEOUS LINEAR EQUATIONS BY THE USE OF SUBMATRICES

I. F. MORRISON, M.E.I.C.

Professor of Applied Mechanics, University of Alberta, Edmonton, Alta.

Introduction

In the analysis of indeterminate structures one often encounters large sets of simultaneous equations. If influence lines are to be plotted, it is advantageous to solve these equations in general form. The loading terms can then be varied according to the successive positions of the unit load. Also they can be written in algebraic form from which the equations of the influence lines can be immediately set down. This paper deals with a method of solution based on the division of the matrix of the coefficients of the set of equations into submatrices. It is particularly adapted to sets of three-term equations because some of the submatrices are null and, therefore, do not appear in the process of solution. A common source of equations of this sort is the three-moment equation.[1] A formal solution has been worked out and a simple step by step process by means of which the reciprocal matrix is to be obtained is set forth. It is illustrated by application to a simple numerical case.

§*1.*

A set of three-term simultaneous linear equations with n unknowns may be briefly indicated by

$$a_{ij}x_i = z_i \qquad i-1.......n. \qquad a_{ij}=a_{ji}$$

$$j-1.......n. \qquad a_{ii} \neq 0$$

$$\text{at least one } z_i \neq 0$$

The summation of the terms on the left is implied and there are not more than three terms in any one equation.

The formal solution of these equations is

$$x_i = b_{ij}z_i, \text{ in which } b_{ij} \text{ is such that,}$$

$$b_{ij}.a_{ij} = I_n \qquad I_n \text{ is the unit matrix of order } n.$$

It has been shown in a recent paper[2] that some advantage may be gained in the solution of large sets of linear equations by considering the matrix of the coefficients to be partitioned into four submatrices in terms of which the reciprocal of the main matrix can be found. This method will here be extended and applied to a set of three-term equations.

For purposes of illustration, a set of three-term equations containing six unknowns will be chosen and, instead of four submatrices, the set will be partitioned into nine submatrices as shown in the scheme below, thereby extending the process given in Duncan's paper.

$$\left(\begin{array}{cc|cc|cc}
a_{11} & a_{12} & & & & \\
a_{21} & a_{22} & a_{23} & & & \\
\hline
 & a_{32} & a_{33} & a_{34} & & \\
 & & a_{43} & a_{44} & a_{45} & \\
\hline
 & & & a_{54} & a_{55} & a_{56} \\
 & & & & a_{65} & a_{66}
\end{array}\right) \qquad \begin{array}{l} a_{ij} = a_{ji} \\ \\ a_{ii} \neq 0 \end{array}$$

Let:

$$A = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \qquad B = \begin{pmatrix} 0 & 0 \\ a_{23} & 0 \end{pmatrix}$$

$$C = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} \qquad D = \begin{pmatrix} 0 & a_{32} \\ 0 & 0 \end{pmatrix}$$

$$E = \begin{pmatrix} a_{32} & a_{34} \\ a_{43} & a_{44} \end{pmatrix} \qquad F = \begin{pmatrix} 0 & 0 \\ a_{45} & 0 \end{pmatrix}$$

$$G = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} \qquad H = \begin{pmatrix} 0 & a_{54} \\ 0 & 0 \end{pmatrix}$$

$$I = \begin{pmatrix} a_{55} & a_{56} \\ a_{65} & a_{66} \end{pmatrix}$$

We may now rewrite the set of equations as

$$\begin{aligned} Ax + By + Cz &= l \\ Dx + Ey + Fz &= m \\ Gx + Hy + Iz &= n \end{aligned} \qquad 1.1$$

In these equations, $C = G = 0$ and A, E and I are not singular because $a_{ii} \neq 0$.

Solving the first and third, we have

$$\begin{aligned} x &= A^{-1}\,l - A^{-1}\,By \\ z &= I^{-1}\,n - I^{-1}\,Hy \end{aligned} \qquad 1.2$$

Substituting in the second equation of 1.1,

$$Ey = m - DA^{-1}l + DA^{-1}\,By - FI^{-1}\,n + FI^{-1}\,Hy$$

from which

$$y = U^{-1}\,(m - DA^{-1}l - FI^{-1}\,n),$$

in which

$$U \equiv (E - DA^{-1}\,B - FI^{-1}\,H). \qquad 1.3$$

We now replace y in equations 1.2 and write out the formal solutions which give

$$\begin{aligned} x &= (A^{-1} + A^{-1}\,BU^{-1}\,DA^{-1})\,l \\ &\quad - A^{-1}\,BU^{-1}\,m + A^{-1}\,BU^{-1}\,FI^{-1}\,n \\ y &= \;- U^{-1}\,DA^{-1}\,l + U^{-1}\,m - U^{-1}\,FI^{-1}\,n \\ z &= + I^{-1}\,HU^{-1}\,DA^{-1}\,l - I^{-1}\,HU^{-1}\,m \\ &\quad + (I^{-1} + I^{-1}\,HU^{-1}\,FI^{-1})\,n \end{aligned}$$

The reciprocal matrix is therefore

$$\begin{pmatrix} (A^{-1}+A^{-1}BU^{-1}DA^{-1}) & -A^{-1}BU^{-1} & +A^{-1}BU^{-1}FI^{-1} \\ -U^{-1}\,DA^{-1} & +U^{-1} & -U^{-1}FI^{-1} \\ +I^{-1}\,HU^{-1}\,DA^{-1} & -I^{-1}HU^{-1} & +(I^{-1}+I^{-1}HU^{-1}FI^{-1}) \end{pmatrix}$$

[1]See "A Note on a New Form of the Three-moment Equation", by I. F. Morrison, *Engineering Journal*, March 1944, p. 143.

[2]Some devices for the solution of Large Sets of Simultaneous Linear Equations by Prof. W. J. Duncan, *Phil. Mag.* Vol. 35 page 660.

It will be noted here that A, I and U must be non-singular in order to have reciprocals.

N.B. To multiply two matrices A and B, multiply the terms of each row i of A by those of each column j of B taken in pairs, starting at the left of the row and the top of the column, and add the results. This gives the ij term in the product.

§2.

In order to develop the process further, we proceed to develop U in detail.

We have:

$$(1)\quad DA^{-1} = \frac{1}{a}\begin{pmatrix} -a_{12}\,a_{23} & +a_{11}\,a_{23} \\ 0 & 0 \end{pmatrix}$$

$$(2)\quad A^{-1}B = \frac{1}{a}\begin{pmatrix} -a_{12}\,a_{23} & 0 \\ +a_{11}\,a_{23} & 0 \end{pmatrix}$$

$$DA^{-1}B = \frac{1}{a}\begin{pmatrix} +a_{11}\,a^2_{23} & 0 \\ 0 & 0 \end{pmatrix} \qquad 2.1$$

and also

$$(3)\quad FI^{-1} = \frac{1}{i}\begin{pmatrix} 0 & 0 \\ +a_{45}\,a_{66} & -\,a_{45}\,a_{56} \end{pmatrix}$$

$$(4)\quad I^{-1}H = \frac{1}{i}\begin{pmatrix} 0 & +\,a_{45}\,a_{66} \\ 0 & -\,a_{45}\,a_{56} \end{pmatrix}$$

$$FI^{-1}H = \frac{1}{i}\begin{pmatrix} 0 & 0 \\ 0 & +\,a^2_{45}a_{66} \end{pmatrix},$$

in which a and i are the determinants of A and I respectively. From equations 2.1 and 1.3 we have.

$$(5)\qquad U = \begin{pmatrix} \left(a_{33}-\dfrac{a_{11}a^2_{23}}{a}\right) & a_{34} \\ a_{34} & \left(a_{44}-\dfrac{a_{66}a^2_{45}}{i}\right) \end{pmatrix}$$

which obviously is non-singular provided

$$a_{33} \neq \frac{a_{11}\,a^2_{23}}{a},\ \text{or}\ a_{44} \neq \frac{a_{66}\,a^2_{45}}{i}\ \text{and}\ a_{34} \neq 0.$$

The remaining steps now can be worked out.

(6)	U^{-1}	from	(5)
(7)	$A^{-1}BU^{-1}$	from	(2) x (6)
(8)	$I^{-1}HU^{-1}$	from	(4) x (6)
(9)	$A^{-1}BU^{-1}DA^{-1}$	from	(7) x (1)
(10)	$A^{-1}BU^{-1}FI^{-1}$	from	(7) x (3)
(11)	$I^{-1}HU^{-1}DA^{-1}$	from	(8) x (1)
(12)	$I^{-1}HU^{-1}FI^{-1}$	from	(8) x (3)
(13)	$U^{-1}DA^{-1}$	from	(6) x (1)
(14)	$U^{-1}FI^{-1}$	from	(6) x (3)
(15)	A^{-1} + (9)		
(16)	I^{-1} + (12)		

In skeleton form the reciprocal matrix is:

$$b_{ij} = \begin{vmatrix} (15) & -\ (7) & (10) \\ -\ (13) & (6) & -\ (14) \\ (11) & -\ (8) & (16) \end{vmatrix}$$

§3.

Illustrative Example.

As an illustration of the above process let the matrix be set down as the coefficients of the moments at the supports of a seven span continuous girder of constant I.

$$a_{ij} = \begin{pmatrix} +20 & +4 & & & & \\ +4 & +18 & +5 & & & \\ & +5 & +22 & +6 & & \\ & & +6 & +26 & +7 & \\ & & & +7 & +20 & +3 \\ & & & & +3 & +14 \end{pmatrix}$$

In this case:

$$A = \begin{pmatrix} +20 & +4 \\ +4 & +18 \end{pmatrix} \quad B = \begin{pmatrix} 0 & 0 \\ +5 & 0 \end{pmatrix} \quad a = +344$$

$$D = \begin{pmatrix} 0 & +5 \\ 0 & 0 \end{pmatrix} \quad E = \begin{pmatrix} +22 & +6 \\ +6 & +26 \end{pmatrix} \quad F = \begin{pmatrix} 0 & 0 \\ +7 & 0 \end{pmatrix}$$

$$H = \begin{pmatrix} 0 & +7 \\ 0 & 0 \end{pmatrix} \quad I = \begin{pmatrix} +20 & +3 \\ +3 & +14 \end{pmatrix} \quad i = +271$$

$$A^{-1} = \frac{1}{344}\begin{pmatrix} 18 & -4 \\ -4 & 20 \end{pmatrix}$$

$$I^{-1} = \frac{1}{271}\begin{pmatrix} +14 & -3 \\ -3 & +20 \end{pmatrix}$$

$$(1)\quad DA^{-1} = \frac{1}{344}\begin{pmatrix} -20 & +100 \\ 0 & 0 \end{pmatrix}$$

$$(2)\quad A^{-1}B = \frac{1}{344}\begin{pmatrix} -20 & 0 \\ +100 & 0 \end{pmatrix}$$

$$(3)\quad FI^{-1} = \frac{1}{271}\begin{pmatrix} 0 & 0 \\ +98 & -21 \end{pmatrix}$$

$$(4)\quad I^{-1}H = \frac{1}{271}\begin{pmatrix} 0 & +98 \\ 0 & -21 \end{pmatrix}$$

$$(5)\quad U = \begin{pmatrix} +20.547 & +6 \\ +6 & +23.468 \end{pmatrix}$$

$$(6)\quad U^{-1} = \frac{1}{446.20}\begin{pmatrix} +23.468 & -6 \\ -6 & +20.547 \end{pmatrix}$$

$$(7)\quad A^{-1}BU^{-1} = \frac{1}{153{,}493}\begin{pmatrix} -469.36 & +120 \\ +2346.8 & -600 \end{pmatrix}$$

$$(8)\quad I^{-1}HU^{-1} = \frac{1}{120{,}920}\begin{pmatrix} -588 & +2013.6 \\ +126 & -431.5 \end{pmatrix}$$

$$(9)\quad A^{-1}BU^{-1}DA^{-1} = \frac{1}{153{,}493}\begin{pmatrix} +9{,}387 & -46{,}936 \\ -46{,}936 & +234{,}680 \end{pmatrix}\cdot\frac{1}{344}$$

$$(10)\quad A^{-1}BU^{1-}FI^{-1} = \frac{1}{153{,}493}\begin{pmatrix} +11{,}760 & -2{,}520 \\ -58{,}800 & +12{,}600 \end{pmatrix}\cdot\frac{1}{271}$$

(11) $I^{-1} HU^{-1} DA^{-1} =$

$$\frac{1}{120{,}920}\begin{vmatrix} +11{,}760 & -58{,}800 \\ -2{,}520 & +12{,}600 \end{vmatrix} \cdot \frac{1}{344}$$

(12) $I^{-1} HU^{-1} FI^{-1} =$

$$\frac{1}{120{,}920}\begin{vmatrix} 197{,}333 & -42{,}287 \\ -\ 42{,}287 & 9{,}062 \end{vmatrix} \cdot \frac{1}{271}$$

(13) $U^{-1} DA^{-1} =$

$$\frac{1}{153{,}493}\begin{vmatrix} -469.36 & +2{,}346.8 \\ +120 & -600 \end{vmatrix}$$

(14) $U^{-1} FI^{-1} =$

$$\frac{1}{120{,}920}\begin{vmatrix} -588 & +126 \\ +2013.6 & -431.5 \end{vmatrix}$$

(15) $A^{-1} + (9) =$

$$\frac{1}{344}\begin{vmatrix} +18.06116 & -4.30579 \\ -4.30579 & +21.52893 \end{vmatrix}$$

(16) $I^{-1} + (12) =$

$$\frac{1}{271}\begin{vmatrix} +15.63193 & -3.34971 \\ -3.34971 & +20.07494 \end{vmatrix}$$

The reciprocal matrix may now be written down by inspection. It is, after the necessary reduction to decimal fractions:—

$$b_{ij} = \begin{vmatrix} +\ .05250 & -\ .01252 & +\ .00306 & -\ .00078 & +\ .00028 & -\ .00001 \\ -\ .01252 & +\ .06258 & -\ .01529 & +\ .00391 & -\ .00141 & +\ .00030 \\ +\ .00306 & -\ .01529 & +\ .05260 & -\ .01345 & +\ .00486 & -\ .00104 \\ -\ .00078 & +\ .00391 & -\ .01345 & +\ .04605 & -\ .01665 & +\ .00357 \\ +\ .00028 & -\ .00141 & +\ .00486 & -\ .01665 & +\ .05768 & -\ .01236 \\ -\ .00001 & +\ .00030 & -\ .00104 & +\ .00357 & -\ .01236 & +\ .07408 \end{vmatrix}$$

§4.

Remarks.

In order to check the final result, the original matrix may be multiplied by the reciprocal matrix. It would seem sufficient, in addition to the obvious symmetry of the reciprocal matrix, to multiply each row by the corresponding column. The result should, of course, in each case be +1.

If n be odd, for the number of unknowns, the method may still be applied. In this case it is best to partition the matrix into nine submatrices such that $E = a_{33}$, the last row and the last column having been omitted. Thus, the symmetry is maintained and moreover U^{-1} reduces to a scalar multiplier, which, since it appears in all forms of the reciprocal matrix, may be factored. In fact U becomes,

$$U = (a_{33} - \frac{a^2_{23}\, a_{11}}{a} - \frac{a^2_{34} a_{55}}{i})$$

The reciprocal matrix is symmetric as will be seen from the numerical example. Thus, (13) is the transverse of (7), (11) of (10), and (14) of (8). Recognition of this fact reduces the amount of computation by three items, and the skeleton of the reciprocal matrix can be written.

$$\begin{vmatrix} (15) & -\ (7) & (10) \\ -\ (7) & (6) & -\ (8) \\ (10) & -\ (8) & (16) \end{vmatrix}$$

Some advantage by the way of a final check, however, may be had by leaving items (13), (11) and (14) in. The proof of these relationships is simple but will not be given here.

The process outlined above can be applied to the case for n equal nine except that the submatrices will then be of higher order and the working out will require more numerical computation.

APPENDIX NOTE ON MATRICES

Definition

A matrix is a system of mn quantities arranged in a rectangular array of m rows and n columns. It is not a determinant. If $m = n$, then the matrix is said to be a square matrix of rank n. A typical element is indicated by

$$a_{ij} \quad i\ .\ .\ 1 \text{ to } m.$$
$$\qquad j\ .\ .\ 1 \text{ to } n.$$

Properties:

Two matrices, A and B or a_{ij} and b_{ij} are equal if, and only if, all of the corresponding elements are equal i.e. $a_{ij} = b_{ij}$.

A zero matrix has all of its elements equal to zero.

The unit matrix is a square matrix such that $a_{ij} = 1$ $i = j$ and $a_{ij} = 0$ $i \neq j$.

The determinant of a matrix is formed from a square matrix and is written $|a_{ij}|$, or a, to distinguish it from the matrix. A matrix is said to be singular or non-singular according as the determinant does or does not vanish.

The coefactor A_{ij} of the element a_{ij} in the determinant $|a_{ij}|$ is used to form the adjoint of the matrix A.

$A_{ij} = (-1)^{i+j} M_{ij}$, in which M_{ij} is the minor of the ij term of the determinant.

$$\text{Thus: Adj. } A = \begin{vmatrix} A_{11} & A_{21} \ .\ . \\ A_{12} & A_{22} \ .\ . \end{vmatrix}$$

The transposed order should be carefully noted. The inverse A^{-1} of a square matrix is obtained by dividing Adj. A by $|a_{ij}|$.

$$\text{Thus: } A^{-1} = \frac{\text{Adj. } A}{|a_{ij}|}$$

$$\text{If } A = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} \text{ then } A^{-1} = \frac{1}{a}\begin{vmatrix} +a_{22} & -\ a_{21} \\ -a_{12} & +\ a_{11} \end{vmatrix}$$

Algebra of matrices

1. The sum of two matrices is defined as a matrix formed by adding each of the corresponding elements.

$$\text{Thus: } \begin{vmatrix} a_{11}\, a_{12} \\ a_{21}\, a_{22} \end{vmatrix} \pm \begin{vmatrix} b_{11}\, b_{12} \\ b_{21}\, b_{22} \end{vmatrix} = \begin{vmatrix} a_{11} \pm b_{11} & a_{12} \pm b_{12} \\ a_{21} \pm b_{21} & a_{22} + b_{22} \end{vmatrix}$$

In general $A_{ij} \pm b_{ij} = C_{ij}$ by the same rule.

2. The product of two matrices is defined as the matrix obtained by multiplying the elements of each row of the first matrix by the elements of each column of the second matrix and adding. This is entered in the product matrix in the position corresponding to the intersection of the row and the column used.

Thus: $\begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \cdot \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix}$

$$= \begin{pmatrix} a_{11}\, b_{11} + a_{12}\, b_{21} & a_{11}\, b_{12} + a_{12}\, b_{22} \\ a_{21}\, b_{11} + a_{22}\, b_{21} & a_{21}\, b_{12} + a_{22}\, b_{22} \end{pmatrix}$$

In general $a_{ij} \cdot b_{ij} = c_i$

This may also be written: $c_{ik} = \sum_{j=1}^{n} a_{ij} \cdot b_{jk}$ which is in better form.

3. The associative and distributive laws of ordinary scaler algebra hold for matrix algebra. But, the order of the factors in multiplication is important because $A.B \neq B.A$. i.e. the commutative law does not hold.

4. Division by a non-singular matrix A is defined as multiplication by A^{-1}.

Thus: $B/A = A^{-1} \cdot B$

The product $A^{-1} \cdot A = A \cdot A^{-1} = I$, in which I is the unit matrix.

However, $(A.B)^{-1} = B^{-1} \cdot A^{-1}$

The order is important.

N.B. The I used in the paper is not the unit matrix. As the unit matrix does not occur in the paper there should be no confusion. The above note is merely intended to assist those not already familar with matrix algebra in reading the paper.

IRRIGATION

G. P. F. BOESE, M.E.I.C.

Chief Engineer, Department of Natural Resources, Canadian Pacific Railway Company, Calgary, Alta.

1. Irrigation is so comprehensive a subject that it can be only briefly outlined in a general way in a short article. It is a subject on which a great many volumes have been published and which may be found in public and private libraries almost everywhere. It is older than civilization and as up-to-date as modern science can make it. Fundamentally the principles of irrigation are the same the world over, but irrigation practice and methods vary widely, depending on climate, soil, crops, markets, standards of living, costs and other economic considerations, and in the older areas by traditions handed down from ancient times.

2. Some idea of the extent of irrigation development in different parts of the world may be seen from the following figures, which stand for millions of acres actually served by irrigation works;

India, 53; China, 50; United States, 27; Russia, 8; Egypt, 7½; Japan, 7½; France, 6; Mexico, 4; Italy, 4; Chile, 3; Java, 2½; Spain, 2; Siam, 2.

The figures for India were obtained in 1942; for the United States in 1939; for China (estimated) in 1923, and for the other countries in 1926. Not included are a number of countries where irrigation is carried on to a considerable extent but on a smaller scale. The areas that can eventually be irrigated are considerably greater than the above figures.

In the United States, California leads with about 5¼ million acres, Colorado is next with about 3½ million, followed in order of size of area irrigated by Montana, Wyoming, Utah, Oregon and Texas, with from 2 to 1 million acres. Arizona, Washington, Nebraska and New Mexico have less than 1 million but over 500,000 acres under irrigation.

In Canada, about 500,000 acres are under irrigation in Alberta and there are a number of small projects in British Columbia and Saskatchewan. In Australia, irrigation development has made considerable progress since about 1924.

Irrigation in the United States and Canada is practically all confined to Western States and Provinces.

3. The amount of water needed to produce maximum crops of all kinds has been determined in practically all areas where irrigation is practised, but warmth and sunshine are also needed and the soil must contain sufficient chemical plant food and decayed organic matter or humus. Where the normal rainfall is insufficient, irrigation must be resorted to if abundant crops are to be produced.

4. Various other considerations besides climatic and soil conditions have bearing on the feasibility of irrigation development. Water must be available in quantity and accessibility; the cost of the project should be within economic limits; markets and transportation facilities should be accessible, and water users should have the ability to pay some proportion of capital costs as well as maintenance charges.

5. The amount of water to be supplied by irrigation is determined by experiment and from studies of the meteorological records of the locality, which will indicate to what extent precipitation is deficient and to what extent temperature, sunshine and evaporation will affect crop growth. The quantity of water required is variable for different crops, but an irrigation system is designed for the average crop requirements of some particular area and also to supply domestic and stock water needs. Irrigation water is not supplied for human consumption, although indirectly, through wells and after treatment, such use is frequently made of it.

6. Water for irrigation is supplied by gravity, pumping or sprinkler systems and by various primitive devices coming down from antiquity. By gravity, which is by far the most general method used, the water is carried in open ditches, pipes, flumes and chutes by the force of gravity. Pumping is resorted to where water can be economically lifted to points higher than the source of supply, and from the higher levels it is carried by gravity to the land to be irrigated. Sprinkler systems are principally used to water orchards, lawns, gardens and golf courses, the water being carried under pressure in pipes. The sprinkler method occupies only a comparatively small place in the general field of irrigation. Various other contrivances are used for lifting water

to higher levels such as the vertical water wheel, operated by the current of the stream itself, and the hydraulic ram, which is automatic and uses a comparatively large quantity of water under a low head to raise a small quantity to a considerably higher level. Neither of the latter have much use in irrigation.

7. To determine what water is available for use on an irrigation project necessitates a study of stream flow records covering as many years as possible. Measurements of the flow of most of the more important streams in the United States and Canada have been made over a considerable period of years and are available in Government publications. For streams, on which such records have not been kept, it is possible to estimate the probable discharge by a study of precipitation records for the water shed area.

8. The source of supply is generally from rivers fed by mountain streams, which carry heavy spring run-off with high flood discharge for short periods and possibly small flow during the greater part of the year. The area that can be irrigated depends on the quantity of water available, after prior rights on the stream have been satisfied, and unless storage is provided the period of minimum flow will govern as to the amount of water that can be supplied by direct diversion. The area that can be irrigated is however limited to the water supply and not the land area, the area of fertile land being considerably in excess of what can be irrigated.

9. If topographical features lend themselves, and if otherwise feasible and not precluded by cost, water may be impounded by the diversion dam at the intake, or in reservoirs away from the stream. Generally, however, the former is tied in whith power development and the latter will depend on what suitable reservoir sites are available.

10. Laws and customs governing diversion and use of water for irrigation are in force in all countries where irrigation is practised. Such laws are peculiar to each country and differ in accordance with customs and views, but general principles in regard to the design of irrigation works and their operation will to a large extent be similarly employed. In the United States and Canada, the Governments control the diversion of water from all streams, granting licenses to divert such quantities as are available after riparian and prior rights have been taken care of. The Government investigates every proposal as to its feasibility and need and has the power to refuse or allow as the case may be.

11. The first step towards the construction of an irrigation project is a field survey to determine the actual area to be irrigated, the location of canals to feed it and determination of water requirements. This survey is made by transit and level parties running alignment and profiles for the canals and laterals, tieing-in all road crossings, water courses, railways, buildings and other features which are affected by the general scheme. Correct levels must be carried from some known datum and bench marks established.

12. Plans and profiles are then prepared to show the areas to be irrigated, the location of canals and laterals, canal right-of-way and all structures necessary for the control and regulation of the water. These plans and also plans of highway and railway crossings are subject to approval by the administration of public affairs in most countries.

13. Estimates of materials required and work to be done are made up in detail, together with cost estimates.

14. Construction is generally carried out under contract. Tenders are called for and the work is done by the successful bidder in accordance with the plans and specifications of the Irrigation District. The contractor must have the equipment, experience and financial ability to successfully carry out the terms of the contract.

15. The structures for an irrigation project vary from large concrete dams and headgates to small wooden outlet structures and measuring devices. Take for example an irrigation project having its intake on a river which is fed from mountain streams and subject to high floods in the run-off period and low flow during the greater part of the year. To divert sufficient water for irrigation during the season a dam is constructed across the river, which will allow flood water to flow down the river and low flow to be held up high enough to provide maximum flow through the headgates into the main canal. The size of such diversion works will depend on maximum flood and capacity of diversion canal. There is considerable variation as to type, but such dams are generally built of concrete.

16. The main canal carries the water to branch canals and laterals, which reduce in size proportional to the lessening water requirements further down the system. The principal control structures on the project consist of diversion gates, where canals and laterals branch off; spillway gates, where water is released in priming or after rain storms; outlet structures, where farmers ditches take off or direct diversion is made; drops, flumes, chutes and siphons, where the fall is concentrated or valleys and depressions are crossed; hold-up and check structures to enable maximum diversion at certain points; weirs and other devices for the measurement of water; bridges and culverts at highways and railways, and numerous other structures including earth dams and levees to impound water in reservoirs and flooded areas.

17. Canals are located along the highest ground possible, so as to command the greatest possible area which can be economically irrigated; but within the boundaries of the district, the lower lands may have to be reached by drop lines, flumes and chutes as well as open ditch.

18. The ideal location for an irrigation ditch is on a contour grade with balancing cut and fill, and the best velocity to be obtained is that which can be maintained without erosion of the ditch section. The latter will vary from as low as one cu. ft. per second in fine sand to as high as 15 ft. per second, or more, in rock. On the other hand, if the velocity is too low, silt deposits and aquatic weed growth will tend to choke up the ditch.

19. Operation and maintenance of the project commences when construction has been completed and consists mainly of the control and regulation of the volume of water carried in the canals and its distribution to the farmers; also in keeping the canals and structures in good order. On the larger projects, these functions are carried out by an operating staff consisting of ditchriders, or patrolmen, and work crews under an administrative staff. The size of the operating organization depends on the size of the project. Buildings and equipment used by the operating staff represent a relatively large investment. Transportation of men and materials, within the project is chiefly done by motor cars and trucks and ditchwork by modern excavating machinery under its own motive power.

The running and measurement of water, repair and renewal of structures, betterment work and other matters are mostly of an engineering nature and most of the administrative staff on the larger projects have engineering qualifications.

20. The water is applied directly to the land by the farmer, who may run it in furrows to overflowing, or in

(*Continued on page 106*)

REPORT OF THE COUNCIL FOR THE YEAR 1945

Together with Committee and Branch Reports

It is a pleasant experience to record, year after year, a steady improvement in Institute affairs and a steady increase in activities. A glance back over the reports for the past ten years shows the progression clearly. A great deal of this has been due to the general conditions of the country, but credit must go also to the succeeding presidents, councils and committees, who have worked so intelligently and so diligently on behalf of the organization.

The year 1945 maintained the acceleration. Both membership and activities were enlarged materially. The reports of branches generally show a good year, and the increase in the number of branches is significant and gratifying. Although throughout the war the Institute carried on certain special activities, its sudden ending did not lessen the total amount of activity.

The War is Over

This report is different in at least one important respect from reports since 1939. It records the cessation of hostilities in Europe and Japan. The awfulness of that struggle being disclosed now to all the world both nauseates and infuriates all decent people, and leaves the non-combatant with a greater appreciation than ever of the services rendered to civilization by the man in uniform.

Engineers everywhere made outstanding contributions to the winning of the war, and within the ranks of Institute membership were great numbers who shared in these achievements. The Institute is proud of them all and is happy to stand with the membership of sister societies everywhere in grateful acknowledgement of their accomplishments and their sacrifices. They have brought great honour to their profession, and the shining record of their achievements will be an inspiration for generations.

Rehabilitation

With the cessation of hostilities came increased obligations to the Institute, and new opportunities to serve the profession. The rehabilitation service made possible by the voluntary contributions of members is reported in full elsewhere in these pages, but in these general remarks it can be pointed out that the members in the services have spoken well of it, which in the last analysis, is the only approbation that means anything. This service must be continued in 1946 because the job is far from finished.

Membership

Once again the membership reaches a new level. The increase is larger than any recorded previously with the added value that it has a higher proportion of new corporate members. The net increase in 1944 was 643, of which 372 were Students and 168 were corporate members. In 1945 the net increase is 653, of which 160 were Students and 471 corporate members. Another source of satisfaction is that the figure for transfer to Member is greater than ever, being 197 as compared to 60 in 1944.

Council Meetings

There were eleven meetings of council, five of them being away from Headquarters. The average attendance of councillors throughout the year was fourteen. For the first time, the five provincial professional organizations with which the Institute has agreements were represented on Council.

Annual Meeting

No review of the year's activities would be complete without reference to the annual meeting at Winnipeg in February 1945. From every point of view this was an outstanding event. The members of the branch earned the gratitude of members from all parts of Canada, and it is expected that before many years have passed there will be a demand from many quarters to return to the "Gateway to the West".

Committees

The work of committees is recounted formally in the report by the various chairmen, but from such reports it is never possible to judge the amount of work done and things accomplished. One of the great strengths of the Institute is the willingness of leading members of the profession to accept duties on committees. Through such groups is accomplished the best work that is done on behalf of the profession. There is need for more committees and now that the war is over there should be opportunity to develop several subjects, deserving and requiring study by technical committees, which have been held back pending the completion of war assignments by those most competent to make the studies.

Engineers' Council for Professional Development

The Engineers' Council for Professional Development continues to be an active and important interest. At its annual meeting the Institute was represented on all committees and throughout the year was active in all branches of the work. E.C.P.D. has some new projects before it that will give it a busy and useful 1946. The accrediting of technical institutes is not the least of these.

By-Law Changes

Proposals to change several by-laws were presented by different committees, and approved by Council. These include changes in examination procedure, transfers, and fees. All will be presented to the annual meeting on February 7th and if approved there, will go out to ballot early in the year. These changes are a logical corollary to the expansion of the Institute and if accepted by the membership will permit of a continuing acceleration of activities and usefulness. The work of the Board of Examiners, the Membership Committee, and the Finance Committee in preparing these proposals has been a valued contribution to the year's work.

New Branches

In October, with due ceremony, a branch was opened at Sarnia, Ontario, known as the Sarnia Branch. At the December 15th meeting of Council, authorization for the granting of a charter was given to a group of members at Trail, B.C., for a branch to be known as the Kootenay Branch.

There are prospects of other new branches and it would not be surprising if the near future were to see further additions to the list.

Mulberry

The Institute, in association with the Hudson's Bay Company, undertook an unusual activity—the showing of the War Office model of the prefabricated harbour known as "Mulberry". The purposes back of this endeavour were to show Canadians something of what the British people had done in the war, and to demonstrate the importance of the engineer in this life and death struggle.

The model is being exhibited in the main centres right across Canada. Attendance is exceeding expectations, and the purposes back of the endeavour are being fulfilled. It will take a full year to complete the exhibition circuit.

Roll of the Institute

The membership of all classifications now totals 7,370, which again is a record. New names added for the year 1945 amounted to 816, but deaths, resignations and removals reduce the net figure to a gain of 653.

During the year, 791 candidates were elected to various grades of membership. These were classified as follows: Members, 343; Juniors, 62; Students, 383; Affiliates, 3. The elections for the previous year totalled 760. Twenty-five reinstatements were effected, and sixteen life memberships were granted.

Transfers from one grade to another were as follows: Junior to Member, 108; Student to Member, 89; Student to Junior, 86, a total of 283.

The names of those elected or transferred are published in the *Journal* each month immediately following their election.

Removal from the Roll

There have been removed from the roll during the year for non-payment of fees and by resignation, 38 Members; 9 Juniors; 46 Students, and 3 Affiliates, a total of 96.

Deceased Members

During the year 1945 the deaths of sixty-seven members of the Institute have been reported as follows:

Members

Acres, Henry Girdlestone
Arkley, Lorne McKenzie
Ashbridge, Wellington Thomas
Bennett, Charles Samuel
Bennett, Harry Frederick
Blaylock, Selwyn Gwillym
Bond, Frank Lorn Campbell
Bone, Peter Turner
Bowman, Frederick Allison
Brown, George Laing
Brown, Harry Cleophas
Browne, George Alleyn
Burchell, Herbert Charles
Carpenter, Edward Emery
Collet, Aimé
Cranbrook, James Huntington
Dodge, George Blanchard
Fitzgerald, George G.
Gilchrist, James Macdonald
Gnaedinger, Frederick Theodore
Goodrich, Chauncey M.
Hazen, Hugh T.
Huestis, Harry Ernest
Kelsch, Raymond Stirling
Lea, Richard Smith
Lovelace, Edgar Sydney Montgomery
Meldrum, William
Mellor, Alfred Ayre
Morley, Edward Henry
Morrison, Duncan Seward
McCulloch, Andrew
Macdougall, George D.
McKenzie, James Edgar
MacLeod, George Roderick
Norrie, James Paul
Pottle, Walter Reginald
Roche, Robert Selwyn
Rostron, John Robert
Ryckman, John Hamilton
Sargent, Charles Daniel
Seabury, George Tilley
Smith, Arthur
Strong, Robert Ambrose
Taylor, Alfred James Towle
Thorne, Carl Busch
Tyrrell, James Williams
Walker, Andrew
Westman, Adolf Alfred Julius
Westman, LeRoy Egerton
Wilcox, Percy Lawrence
Williams, David G.

Juniors

Corbett, Bruce Sherwood (killed in action)
Johnson, Robert (killed in action)
Madeley, William Arthur
Watson, John Crittenden (missing and presumed dead)

Students

Brandt, René Edmond
Dowd, Elbert Watson (died of wounds received in action)
Hilton, Thomas Bradford (missing and presumed dead)
Krisiuk, Joseph
Mollard, Lloyd Bemister (missing and presumed dead)
McDunnough, William Ralph (killed in action)
Prideaux, Norman Llewellyn (killed in action)
Ramsay, Robert D.
Reynolds, Donald Doane (killed in action)
Reynolds, George G. (killed in action)

Affiliates

Mills, Alfred Arthur
Surveyer, Joseph Bernard Edouard Fabre

Total Membership

The membership of the Institute as at December 31st, 1945, totals 7,370. The corresponding number for the year 1944 was 6,717.

	1944	1945
Honorary Members	17	17
Members	3,988	4,453
Juniors	773	803
Students	1,843	2,003
Affiliates	96	94
	6,717	7,370

Respectfully submitted on behalf of the Council,

E. P. Fetherstonhaugh, M.E.I.C., *President*

L. Austin Wright, M.E.I.C., *General Secretary*

COMMITTEE ON PROFESSIONAL INTERESTS

The Institute's Committee on Professional Interests begs to submit herewith its report upon its activities for the year just completed.

There has been again ample evidence of the satisfactory operation of the co-operative agreements between the Institute and the five (5) provincial professional associations, viz. Saskatchewan, Alberta, New Brunswick, Nova Scotia and Quebec. It has been gratifying to note that right acrss Canada there has been an accelerated movement displayed by engineers to become members of both the Institute and their provincial professional association, and in commenting on this movement your committee feels that it cannot do better than repeat the recent words of President Fetherstonhaugh—

> "In looking into the future, one might hope to see an increasing tendency towards common membership in the Institute and the licensing bodies, a fuller recognition of the fields of activity of each,

and of the fields in which joint action and interest are desirable. As these conditions are more closely approached, the tendency should be for the Institute and the licensing bodies to work side by side in the interest of the profession, with harmony and unity of purpose, and with the closest possible co-operation in all matters of common interest."

The co-operative agreement between the Corporation of Professional Engineers of the Province of Quebec and the Institute was formally executed on January 20th last (E.I.C. *Journal*, March 1945) and the results are fully gratifying. Joint committee meetings have been held at frequent intervals and evidence is accumulating that matters of mutual interest are being worked out in a spirit of friendly and useful co-operation.

Due to continued war conditions throughout most of the year, little progress was made towards agreements with British engineering institutions, though contacts were maintained, and with the re-establishment of normal conditions it is hoped and expected that negotiations will be resumed. A proposal to participate in a suggested new international organization of engineering institutions was discussed, but from correspondence received from British institutions it was indicated that they were more interested in consolidating with existing organizations than in spending their resources and energies in setting up a new one. Accordingly, the matter was noted, and tabled by the Council at the September meeting. To the end of promoting this co-operation between existing societies, the British institutions have proposed an Empire conference in 1946. The Council of the Institute has accepted the invitation, and is now awaiting details.

This committee reported a year ago that it had been unable to recommend to Council that the Institute participate in a new organization known as the Canadian Council of Engineers and Scientists. Council unanimously approved of the decision and instructed the committee to evolve for consideration of Council a set of principles which would set out the policy and programme of the Institute with regard to co-operation among the members in Canada of Canadian, British and American engineering societies. A number of meetings were held by the committee and a considerable volume of correspondence was exchanged with engineers across the country, from which emerged a "Statement of Principles and Policy of the Institute on Relations with Sister Societies". This was published in full in the June 1945 *Journal*, and in the same issue appeared a statement by the committee giving the reasons leading up to its conclusions. The report to Council covering this statement was presented in May and was unanimously adopted. The door to co-operation with engineering societies was left wide open, however, and this committee concluded its statement as follows:

> "The decision of Council not to support the new organization does not in any way alter the Institute's well-established policy of promoting and participating in co-operation whenever it will react to the benefit of the profession or the public. Co-operative projects will find the Institute always ready to carry its share of the burden, and to work closely with its sister societies."

Several visits were made to branches. Your chairman, Vice-Chairman J. E. Armstrong, Mr. J. A. Vance, and the general secretary, met the Toronto Branch executive, when many matters of mutual interest were discussed (E. I. C. *Journal* June 1945). Two visits to the Halifax Branch were made by your chairman, one a joint meeting with the provincial professional association, and one visit to the Saint John Branch, where the Institute branch executive and provincial professional association had a joint meeting. The outstanding result was a definitely formed opinion as to the urgent need of a field secretary, or some officer of the Institute who could give attention to branch affairs. This was reported to Council. The inauguration of the Sarnia Branch was attended by your chairman, Vice-Chairman Armstrong, and Mr. J. A. Vance.

Your committee is pleased to report that following visits to Toronto, and as a result of discussion with officers and members of the A.S.M.E., in that district, several small revisions to the co-operative agreement between the Institute and The American Society of Mechanical Engineers were agreed upon, and upon submission to Council in December 1945 were adopted. Your committee delegated Messrs. R. S. Eadie, G. L. Wiggs, and Louis Trudel to present these at the annual meeting of the A.S.M.E. in New York, and at this meeting the amendments were approved. Members of the Institute, we are sure, will recognize this as a great forward step in international co-operation for the benefit of the profession, and it will be with gratification that pursuant to By-Law 78 we shall welcome to Council a representative of that great American society, The American Society of Mechanical Engineers.

As indicated above, the co-operative movement has been making headway, and it is with the keenest satisfaction that this committee notes that many branches have instituted joint meetings with sister societies in their respective districts. This cannot fail to be of immense benefit to the profession, and this committee's work is materially assisted by branch officers and members keeping this objective of co-operation continually before them.

Respectfully submitted,

J. B. Stirling, M.E.I.C., *Chairman.*

LEGISLATION COMMITTEE

During the course of the year, your committee's principal concern has been the decision rendered by a judge of the Superior Court against the defendant in the case of the Province of Quebec Association of Architects against Brian R. Perry, for having made plans of an industrial building.

In a spirit of co-operation with the Corporation of Professional Engineers of Quebec toward safeguarding the welfare of the profession, your committee offered its support and stated the Institute's interest in the above case and in the proposed application for revision of the Province of Quebec Engineers' Act. The offer gladly accepted by the Corporation resulted in the appointment of a Joint Committee of the Institute and the Corporation that was charged to do everything possible to see that engineers were not denied the age-old right to design industrial buildings.

After reviewing the case and having obtained the greatly valued advice of an eminent legal Counsellor, the Joint Committee decided that appeal against the decision of the Superior Court should be entered in the Court of King's Bench and that this proceeding should not interfere with the Corporation's application for amendments to the Engineers' Act.

The appeal has been lodged in the King's Court. All the documents have been submitted. Steps have also been initiated to apply to the Quebec Legislature for amendments to the Professional Engineers' Act which is to be considered as a public bill.

Respectfully submitted,

P. E. Poitras, *Chairman.*

COMMITTEE ON REHABILITATION

It has been possible, through the medium of the *Journal*, to keep the membership informed of the work of the Committee on Rehabilitation. Several monthly progress reports have been presented and a complete statement of all the activities was published in the October issue. Therefore, this report attempts only to summarize the information published earlier, and to revise the significant figures to the end of the year.

Activities

1. *Questionnaires:* A rehabilitation questionnaire was drawn up and mailed to all members on active service in March 1945. Twelve hundred and fifty copies were sent out and it has thereby been possible to establish contact with about seven hundred and fifty of the addressees.

2. *Pamphlets:* In answer to the many requests for information concerning the Post-Discharge Re-establishments Order as applied to veterans requiring further education, a pamphlet entitled "The Engineers Return to Civil Life" was prepared and distributed. About four hundred copies were sent also to representatives of the three services to be used by their personnel counsellors as required.

3. *Opportunities:* The majority of completed questionnaires indicated the need for information on the current employment situation. The employment page of the *Journal* was therefore expanded from one to three pages, to contain all vacancies obtainable, and about four hundred preprints of this sheet are being mailed each month to members on active service, with these objects in mind:

(a) To present a general overall picture

(b) To reach members who might otherwise not see the *Journal.*

(c) To give service men an opportunity to make contact while still away.

(d) To enable all service men waiting for discharge to apply for interesting openings, about two weeks before the *Journal* reaches the general public.

4. *Interviews:* As members become available for peacetime occupations, whether from service with the armed forces or from war plants, they are streaming into Headquarters, seeking new opportunities. The numbers being interviewed appear in Table I, and will be further mentioned later.

5. *Employers:* There are naturally two aspects to rehabilitation and employment work, the first dealing with finding vacancies for employees, the second dealing with the attempt to find suitable candidates for positions with employers. The first aspect is perhaps the motive for the work that is being done, but the second is of more immediate importance in that only by giving satisfaction to employers is the service possible. Therefore, it has been necessary, sometimes, to interview non-members and to keep some of their records available. In Table II the present situation is outlined, and it will be noted that there are 40 per cent fewer openings now than at October first.

The *Journal* has carried over four hundred advertisements of the requirements of more than two hundred employers. The number of answers received is given in Table I, and it may be seen that, in one way or another, a total of well over three thousand applications have been directed to about three hundred employers, or an average of ten to each vacancy.

Results

Table I

Classification	Members		Non-Members		Total
	Armed Forces	Civilians	Armed Forces	Civilians	
Applications to positions adv'd. forwarded to employers	278	391	56	239	964
Records sent and men directed to employers	888	783	394	352	2,417
Total	1,166	1,174	460	591	3,381
Men interviewed	267	218	164	93	742
Known placements	46	39	26	12	123

Table II

Employment vacancies:	No. of Companies	No. of men Required
Vacancies listed at April 1, 1945..	34	46
Vacancies received since April 1, 1945........................	291	503
Total handled........	325	549
Vacancies listed at December 31, 1945......................	102	151
Total closed during nine months..	223	398
Placements made (confirmed)....	99	123

Observations and Recommendations

1. *Interviews:* An average of one hundred and forty men are being interviewed each month. As this is about the limit that can be properly handled by the present permanent staff, and as the number of members becoming available is increasing, it is necessary to recommend that in future the service be restricted almost entirely to members.

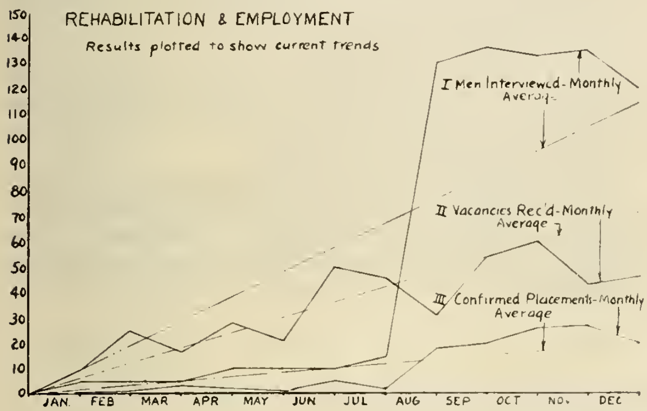
2. *Employers:* The decrease in the number of openings available also makes an effective service to members impossible if applications from non-members are also considered. A list of employers of engineers throughout Canada has been prepared and between two and three thousand copies of a letter asking for advice of possible vacancies were mailed early in January. It is felt that a favourable reply from even one or two per cent of these will more than justify the effort.

3. *Placements:* The total number of confirmed placements is not staggering, but it must be remembered that it is only during the last five months of the year that results have become apparent. This means that confirmation of satisfactory placements is being received at the rate of about one a day. It is felt that if all the facts were known, the service is probably responsible for approximately twice this number.

It is also interesting to note that of the one hundred ex-service members who have now become re-established in peacetime occupations after receiving assistance from the Committee, forty-seven are direct placements, forty-three have obtained positions other than those of which they learned directly from this

Department, and ten have already returned to their old jobs, satisfied at having first thoroughly examined the field.

4. *Membership:* Many of the non-members who have been interviewed have expressed their intention of applying for admission to the Institute. Applications have been received to date from about forty ex-service men who have received some assistance from the Committee.



5. *General Trend:* The graph that has been drawn to give pictorial representation to the above facts indicates certain interesting tendencies and ratios. As the work of the Committee only began to show results about the first of August, the actual curves show decided peaks at this time. Mean lines have been drawn in to show the effect of the work of the Committee distributed over the year. From these the following observations are possible:

(a) It appears to be necessary to interview about six men before one placement is obtained.

(b) Two confirmed placements result for every seven vacancies.

(c) For the last two months, the number of employment opportunities occurring has been well below average, and definite steps will have to be taken to overcome this.

(d) The number of men becoming available is indicated by the interview curve, and the "saturation" level of the existing facilities for interviewing has been reached and is being maintained. It is interesting to note that prior to August there were more vacancies than applicants, and that the position is now quite the reverse.

6. *Estimated Future Requirements:* To date answers have been received from about seven hundred and fifty of the men approached, leaving about five hundred still to be reached. Of those heard from, four hundred and sixty or sixty per cent required assistance. One hundred have been re-established, more or less satisfactorily, leaving three hundred and fifty to assist. It is therefore probable that the number who will need help in the future is

$$350 \text{ plus } 60\% \text{ of } 500 = 650$$

As past experience shows that about half of these will have to be direct placements (See paragraph 3 above), it will require 325 x 3.5 or about eleven hundred vacancies to do this, and at the rate of twenty-five placements per month this will take something over a year to accomplish.

Respectfully submitted,

Howard Kennedy, M.E.I.C., *Chairman.*

PUBLICATION COMMITTEE

Your committee, last year, pointed out that due to a curtailment in the allotment of paper for the *Journal* it would be necessary to temporarily eliminate several features which appeared monthly. Fortunately, during this year, our paper allotment has been increased, and as a result, it has been possible to reinstate a number of these items.

During the last few months of the year it has also been possible to increase the number of technical papers published with the result that the editorial content of the *Journal* has been expanded to about its pre-war size.

After considerable negotiation, a new contract was entered into for the printing of the *Journal* during the year. This has very considerably increased the cost of publication. It is expected that this increase will in time be balanced by increased receipts from our advertising contracts but this will take time. During this year the net profit from the publication of the *Journal* has been very greatly decreased.

It has been possible to obtain and publish a number of papers dealing with some of the activities of the Canadian and British engineering units on active service. These papers are long overdue but were unobtainable previously because of censorship regulations. It is hoped that it may be possible to obtain more papers of the same type so that finally an accurate record of, at least, the major achievements of our army engineers may be published. The work of the Canadian and British army engineers has not received the publicity it deserved and as a result their achievements have been lost sight of due to the great amount of publicity, allowed by the American censors, on the work of their army and navy engineers.

Your Committee has continued their study of several proposals for added features for the *Journal* during the year. Some of these proposals have reached the stage where if adequate editorial staff were available they could be introduced. However, the present staff is badly overloaded and it will be necessary to obtain more editorial assistance before further expansion can take place.

Respectfully submitted,

R. S. Eadie, M.E.I.C., *Chairman.*

BOARD OF EXAMINERS AND EDUCATION

Your Board of Examiners submits the following report of its activities for the current year.

The Board has not conducted any examinations whatever. At your request it studied the Institute's system of admission by examination with a view to suggesting alterations in procedure which might seem desirable.

As a result of these studies, your Board recommended on September 20th, 1945, that the Institute should revise its examination system and accept the examinations of the various provincial professional associations. This report was accepted by your body at its meeting on October 6th, and we understand its recommendations are in process of being implemented.

We wish to thank the general secretary and headquarters staff for courtesies extended to us and work done on our behalf.

Respectfully submitted,

R. DeL. French, M.E.I.C., *Chairman.*

TREASURER'S REPORT

The audited statements of Assets and Liabilities and of Revenue and Expenditure for the year ended December 31, 1945, are submitted herewith.

It will be noted that the accounts for the year show a deficit of $3,411.10 as compared with a surplus of $3,022.46 for the previous year, the latter after the transfer of a sum of $5,000.00 to Contingent Reserve.

Income from membership fees, excluding voluntary assessments in respect of Rehabilitation Fund, show an increase of $4,699.29 or 10 per cent as compared with the previous year. The increase in revenue from publications is $1,322.78 or 3.4 per cent.

Expenditure, exclusive of that chargeable to publications and to Rehabilitation Fund, shows an increase of $7,949.21 or 18 per cent. Expenditure in respect of publications shows an increase of $10,608.06 or 38.4 per cent.

The principal cause of the reduction in surplus is obviously attributable to the increase in the cost of publication of the *Journal*, this following the expiry of a contract for the printing of the same made in 1939. On account of unexpired contracts, increases in the rates for advertising are not yet fully reflected in the way of increased revenue. In short, the very substantial profit previously arising out of the *Journal* has for the year under consideration been largely eliminated.

If the surplus of Assets over Liabilities, built up over the course of years, is to be maintained, it is evident that the profit from the publication of the *Journal* must be restored, presumably by increasing the income from advertising, or that there must be an increase in membership fees or, alternately, some curtailment in the activities of the Institute that will be reflected in a reduction in operating expenses.

It is confidently anticipated that the year 1946 will witness an increase in the advertising revenue of the *Journal* and that the discharge of personnel from Canada's armed services, added to the normal increase in membership, will be reflected in increased revenue

COMPARATIVE STATEMENT OF REVENUE AND EXPENDITURE

FOR THE YEAR ENDED 31ST DECEMBER, 1945

Revenue	1945	1944
MEMBERSHIP FEES:		
Arrears	$ 3,934.24	$ 4,032.47

SURPLUS OR *Deficit* FOR YEAR	*3,411.10*	3,022.46
	$86,910.10	$79,786.39

from membership dues. Under the circumstances on the basis of the activities of 1945, the deficit for that year need not necessarily be considered in the light of a recurring item. Insofar as the *Journal* is concerned, it must be considered as the result of the expiry of a long-term contract for printing that, having regard to the general increase in costs, has been extraordinarily favourable to the Institute. If we are to meet the demand for increased activity it is obvious that an increase in the membership fees will be necessary.

R. E. Chadwick, M.E.I.C., *Treasurer.*

Rehabilitation Fund

Total amount received by voluntary assessment....		$ 7,207.71
Expenditures:		
Salaries........................	$3,998.10	
Sundry Travelling Expenses........	86.56	
Sundry Printing, Multigraphing, etc.	481.32	
		4,565.98
Balance as at 31st December, 1945............		$2,641.73

FINANCE COMMITTEE

As foreseen in the 1943 and 1944 reports of the Finance Committee, increases in costs and expenditures have now taken place which have resulted in a deficit instead of a surplus in the operations for 1945.

Principal among these has been the cost of printing the *Journal.* The contract made with the printers in 1939 has protected the Institute from increases in cost of labour and material that have developed, but it became necessary to rewrite it during the past year. The new contract rates are 30 per cent higher, which in the course of a year will cost the Institute between six and seven thousand dollars additional.

To offset this increase, advertising rates have been increased but, because of existing contracts, it will take a year for these to become fully effective. In the meantime, the balance sheet makes a less favourable showing.

Increase in committee expenses, additions to the staff, and a general increase in the cost of all supplies have contributed to offsetting the increase in fee income

COMPARATIVE STATEMENT OF ASSETS AND LIABILITIES

As at 31st December, 1945

Assets

Audit Certificate

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December, 1945, and have received all the information we required. We have verified the Cash in Banks and the Investment Securities and the revenue therefrom. In our opinion, the Statement of Assets and Liabilities and Statement of Revenue and Expenditure for 1945, as attached, are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December, 1945, and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books.

(Sgd.) RITCHIE BROWN & CO.,
Chartered Accountants.

Montreal, 16th January, 1946.

which follows an expansion in membership. A broad increase in all activities has also added to expenditures.

On the whole, the situation is not discouraging, but it indicates clearly the need for increasing annual fees. The activities have outgrown the income. The Institute has reached a new level in its development and certain readjustments now become necessary in order to meet new responsibilities and new opportunities. Approval of the proposals for increased fees will provide the solution.

Respectfully submitted,

J. E. Armstrong, M.E.I.C., *Chairman.*

LIBRARY AND HOUSE COMMITTEE

The committee would like to point out that the increased activities and increased membership of the Institute are taxing headquarters to capacity. The general office is now filled completely and the auditorium has overflowed at a number of the recent weekly meetings of the Montreal Branch.

To alleviate the office conditions your committee has had new lighting installed and the ceiling treated acoustically. The main office was also redecorated—the first time since 1928. The ladies' dressing room was also enlarged and redecorated. These changes have improved the conditions materially.

Some thought has been given to enlarging our quarters, and we recommend that your new Library and House Committee continue this study.

Library

The statistics customarily reported to indicate the extent to which the members use the library are as follows:

Library		
Volumes in library	12,690 volumes	
Shelving in library	2,475 feet	
Pamphlet files	42 drawers	
Days open—1945	276½ days	
Accessions	1945	1944
Books for review	56	67
Books presented	84	20
Proceedings and Transactions	23	23
Reports and Bulletins (including Standards & Tentative Standards)	353	257
Pamphlets	170	—
Reviews		
Book reviews	4	3
Book notes prepared by E.I.C. Library	32	0
Reference Work Done		
By phone	1,616	1,268
By letter	1,730	1,070
In person	661	379
Total	4,007	2,717
Loans, Photostats, Bibliographies		
Books and periodicals loaned	1,480	936
Books and periodicals borrowed	20	41
Photostats—Orders	34	24
Prints	314	189
Bibliographies—prepared	54	24
pages	117	30

The use of the library has been increased by all grades of membership. As shown by the comparative figures above, this increase is considerable. It is interesting to note, on looking back over the figures for the past few years, a somewhat proportionate rise each year since 1942.

It has become more and more evident of late that a complete revision of the library methods and materials must be effected if the library is to serve the membership adequately and efficiently. With this idea in mind, the librarian was sent to New York to study the organization, administration, services and collection of the Engineering Societies Library. As a result, a programme of reorganization has been drawn up and the work started.

The revision of the library stacks and files is almost completed. It had been hoped that this part of the reorganization of the library would be finished by the end of the year. However, lack of staff, the redecoration of the offices and the greatly increased use made of the library have made this impossible. It should be completed early in 1946. The revision of the records and catalogue and the weeding of the collection of obsolete material will begin as soon as the earlier work is completed.

The Committee wishes to remind all members that, on the deposit of a five-dollar cheque with the library, two books may be borrowed for a period of two weeks, and renewed, at the discretion of the librarian, for a further two-week period. The deposit will be returned when the books arrive back at Headquarters.

The library facilities are available to out-of-town members on the same basis as they are to members in Montreal, the only difference being that out-of-town members are asked to pay all postage charges.

Your committee has much pleasure in commending the work of the staff. Every member has given loyal support to all the multitudinous details of Institute affairs.

Respectfully submitted,

E. V. Gage, M.E.I.C., *Chairman.*

COMMITTEE ON THE ENGINEER IN THE ACTIVE SERVICES

Although 1944 saw the attainment of the objective of separating the engineers from the Ordnance Corps, and the creation of the Royal Canadian Electrical and Mechanical Engineers, it did not see the realization of the committee's hopes for proper recognition of the profession by the Army. Nor did 1945.

There is still a lot of work to be done before non-professional senior administrative officers see the need of putting engineers in engineering appointments. On paper the situation can be made to look not too bad, but in practice it is not too good. The war is over now but the situation becomes more than ever acute for the engineer who wants to remain in the service permanently.

During the year, the committee received appeals from many engineers in the service who asked for assistance in correcting situations involving their professional work and their status. In one instance at least, when a large number were involved, the Institute's interjection was influential in obtaining a satisfactory adjustment.

The committee recommends that some further study be given to the peace-time plans and policy of the R.C.E.M.E. towards engineers, and to the matter of professional allowance for the professional services of engineers, comparable to that made to the medical profession.

Respectfully submitted,

D. S. Ellis, M.E.I.C., *Chairman.*

COMMITTEE ON EMPLOYMENT CONDITIONS

Due to the importance of, and the interest in, the subject of Collective Bargaining, the activities of your Committee on Employment Conditions have been fully reported for 1945 in the various issues of *The Engineering Journal*. It therefore seems appropriate at this time merely to summarize briefly what has taken place during the past year.

On January 9th, the Committee of Three presented a Brief on Collective Bargaining, proposing a new order-in-council, to the Wartime Labour Relations Board at a public hearing at Ottawa on behalf of twenty organizations of engineers and scientists.

The proposal for a new order was opposed by the Canadian Congress of Labour, the Trades and Labour Congress and the Association of Technical Employees. The Canadian Catholic Federation of Labour was not unfavourable to it. The Canadian Manufacturers Association favoured excluding engineers from collective bargaining rights. The National Conference of Canadian Universities recorded its conviction that any application of P.C. 1003 "to include members of university staffs would violate the principles by which universities as free associations of scholars are founded". The Ontario Association and Federation supported the proposal.

The complete text of the brief presented to the W.L.R.B. and of the draft order-in-council presented to the Government with a copy to the board was published in the January and February issues of the *Journal* respectively. The report of your committee for 1944 was also published in the February *Journal*.

Following representations to the W.L.R.B. on January 9th the Minister of Labour, Mr. Mitchell, in a letter dated February 12th ruled that—

"The Board recommends that the present regulations be continued for a further period of six months and thereafter until otherwise determined, the Board meanwhile subdividing bargaining units so that employees engaged in a professional capacity may elect or appoint (as the case may be) bargaining representatives on their own behalf in a proper case".

The full text of the Minister's letter and the cost of collective bargaining negotiations distributed among the co-operating societies will be found in the March number of the *Journal*.

On June 12th, the Committee of Fourteen met at Ottawa and by a motion duly presented and carried by a majority vote transferred its responsibility for collective bargaining to the newly created Canadian Council of Professional Engineers and Scientists, of which the Institute is not a member. Earlier in the meeting the Institute attempted to preserve the Committee of Fourteen and its sub-committee of three, so that the joint effort which up to then had been so successful, might be continued, but its motion was defeated.

Later your committee proposed a further joint meeting stressing the importance of a common recommendation in replying to the Minister's letter of February 12th before the expiry of the six months period mentioned therein. As this suggestion was not accepted by the new council, your committee replied to the Minister's letter on August 11th requesting "that arrangements set forth in your letter be continued and that the Institute be given an opportunity of being heard when any changes in P.C. 1003 affecting professional employees are being considered". A report on recent events was published in the October *Journal*.

There has been no change in the legal position since February 12th. Engineers coming within the jurisdiction of P.C. 1003 may bargain for and on their own behalf if they so desire. They cannot be out-voted by labour. It is not known what changes may take place as a result of the Dominion-Provincial conference. Your committee will continue to watch developments and act in accordance with the best interests of the profession.

As chairman of your committee, I wish to express my sincere thanks to its members, Messrs. P. N. Gross, G. N. Martin, A. D. Ross, J. D. Sylvester and I. R. Tait for their deep sense of responsibility, invaluable advice and loyal support at all times, to Mr. L. Austin Wright for his untiring efforts and able assistance and to Mr. Louis Trudel and the Headquarters' staff for their efficient service.

Respectfully submitted,

R. E. Heartz, m.e.i.c., *Chairman.*

MEMBERSHIP COMMITTEE

During the past year your Membership Committee continued its study of the by-laws relating to classification requirements and methods of transfer.

As a result of decision made by Council at its Winnipeg Meeting in February 1945, the Committee's preliminary report was published in the *Journal* with a request for comments from the members. Replies received showed a keen interest in the subject and opinions submitted were carefully considered in a further report to Council which included recommended changes and additions to our by-laws.

It is hoped a decision will be reached by Council on all points still under consideration and that the subject will be ready for final disposition by the members at the next annual meeting.

Your Committee wishes to express its appreciation of the hearty co-operation received and the keen interest shown in this important phase of E.I.C. work.

Respectfully submitted,

John G. Hall, m.e.i.c., *Chairman.*

NOMINATING COMMITTEE

Chairman: C. G. R. Armstrong

Branch:	*Representative*
Border Cities	T. H. Jenkins
Calgary	D. P. Goodall
Cape Breton	J. H. Fraser
Edmonton	E. Nelson
Halifax	P. A. Lovett
Hamilton	Alex. Love
Kingston	S. D. Lash
Lakehead	W. L. Bird
Lethbridge	J. M. Campbell
London	R. S. Charles
Moncton	A. R. Bennett
Montreal	J. Benoit
Niagara Peninsula	C. G. Cline
Ottawa	G. H. Ferguson
Peterborough	H. R. Sills
Quebec	J. O. Martineau
Saguenay	W. J. Thomson
Saint John	F. A. Patriquen
St. Maurice Valley	H. J. Ward
Sarnia	J. W. MacDonald
Saskatchewan	I. M. Fraser
Sault Ste. Marie	R. A. Campbell
Toronto	J. G. Hall
Vancouver	T. V. Berry
Victoria	S. H. Frame
Winnipeg	T. H. Kirby

PAPERS COMMITTEE

While the papers presented before the branches furnish a large and important part of the branches' interests and programme and one feels that it should be possible to be of considerable assistance in this connection, such does not appear to be the case, particularly with reference to the more distant branches. The Committee has in reality only been able to supplement to a limited extent the work done in this direction by the general secretary and Headquarters staff.

However, it has been possible to assist in the securing of some desirable papers, and there are immediately available the following papers to branches within reasonable distance.

"Engineering Problems Facing the Canadian Army in N. W. Europe",
by—Brigadier G. Walsh,
Room 4074, Army Building, Ottawa.

"The Wartime Production of Precision Optics in Canada",
By—D. C. R. Miller, M.E.I.C.,
108 Wychwood Park, Toronto.

"The Electric Cables Made During the War for the Royal Canadian Navy",
by—Northern Electric Company Limited,
Montreal.

It is noted with gratification that all the branches have secured papers that cover the wide range of engineering interests represented by the Institute's membership.

The most important and time consuming undertaking of the Committee has been in connection with the "Mulberry Exhibit", which has been in Canada since September last and will complete its itinerary in Halifax about next midsummer. The expenses in connection with this project were fortunately assumed by the Hudson's Bay Company, but the Institute has cooperated with them in arranging for special meetings of the local Institute members and in those centres where the H. B. Co. is not represented, almost the entire responsibility for accommodation, programme, etc., has been taken by the local branch. The special meetings of the Institute members at which Col. V. C. Steer-Webster, O.B.E., who is directing the exhibit, has spoken have been very satisfactory and quite worth while from an engineering point of view. Your chairman has been greatly assisted in this work by the chairman of the International Relations Committee, M. J. McHenry and the general secretary.

Respectfully submitted,

C. E. Sisson, M.E.I.C., *Chairman.*

COMMITTEE ON INDUSTRIAL RELATIONS

Since the last annual meeting, the Committee on Industrial Relations has held five meetings; on 6th February, 16th March, 18th May, 26th September and 2nd November.

During the year, two papers were published in the *Journal* which were prepared at the request of the Committee, namely:

The Engineer in Administration, by Dean C. R. Young, Faculty of Applied Science and Engineering, University of Toronto.

Union Security Clauses in Canadian Collective Labour Agreements, by Professor J. C. Cameron, Head, Department of Industrial Relations, Queen's University, Kingston.

The problem of retraining and rehabilitating ex-service people has received attention from the committee and at one meeting Colonel W. Line, Director of Personnel Selection, Department of National Defence, attended and spoke to the members in regard to the Army's work of reorienting men to civilian life prior to their discharge. Other phases of this matter have also received attention.

The Committee has continued to keep in touch with matters concerning the position of professional engineers under collective bargaining and particularly regarding the effect of various proposed arrangements on general industrial relations within industry.

The Committee is also giving study to questions of the status of foremen in management and the present agitation in the United States for unionization of foremen. It hopes to be able to submit a paper on this subject for publication in the *Journal* in the near future.

The Committee has interested itself in the question of employee counselling, in particular the non-directive counselling of the type developed at the Hawthorne Works of the Western Electric Company. Mr. A. W. Entwistle, Employment Supervisor of the Bell Telephone Company of Canada, attended a meeting of the Committee and gave a very interesting account to the members of the general background of this type of counselling and its present application in the Bell Telephone Company organization.

Respectfully submitted,

Wills Maclachlan, M.E.I.C., *Chairman.*

COMMITTEE ON THE ENGINEER IN THE CIVIL SERVICE

It seems that the work of this committee is never ending. The progress to report is minute. A new group of positions was established in the Public Works Department for post-war reconstruction, with salaries substantially higher than for similar positions in the permanent staff. However, even with the increase the positions have been unattractive and the committee is informed that not many engineers have been secured.

In the Department of Reconstruction some new salaries were offered, but for the type of work required it appears that they too will be inadequate.

The committee is informed that a reclassification is possible whereby engineers who have been stuck in certain classifications for years without any salary increase may get a new deal. Apparently a war bonus supplement has been authorized temporarily until the reclassification survey is completed. It seems odd that men doing extra work because of the war should have to wait until the war is over before getting a war bonus, but if the additional money is there in adequate amounts, we will not quarrel with the name they give it.

Within the last few days the Ottawa press reports a move to increase remuneration for the scientists in the National Research Council. It is implied that this is an effort to stop exodus of highly trained men from the Research Council to better paid positions in industry. It was reported as a move to remedy some "gross injustices" in this department.

The committee recommends strongly that the efforts be continued. It begins to look as if the mass were moving slightly. Perhaps we have accomplished something in a field that looked hopeless. Continued efforts along with other agencies may yet bring to an end a situation that has brought no credit to the government officials responsible for it.

Respectfully submitted,

N. B. MacRostie, M.E.I.C., *Chairman.*

COMMITTEE ON THE TRAINING AND WELFARE OF THE YOUNG ENGINEER

The membership of the Institute does not need to be reminded of the death of Harry Bennett, M.E.I.C., nor of the great services he rendered to young engineers and to the Institute generally, as chairman of this committee, an office which he held since its formation in 1939. The future work of the committee will be built upon the foundation so well laid by Mr. Bennett, and he must be given full credit for any achievements.

In August 1945, the undersigned was appointed chairman in succession to Mr. Bennett. The first duty was to examine the work carried out previously, a task that required several weeks.

This disclosed that the activities of the committee have three phases:

(a) Guidance to high-school boys who are considering taking a university course leading to engineering.

(b) Guidance to the engineering undergraduate.

(c) Guidance to the recently graduated engineer.

(a) Guidance to high-school boys is now carried out with the Canadian Institute of Mining and Metallurgy and the Canadian Institute of Chemistry, a joint committee having been set up of which the chairman of the Institute's Young Engineer Committee is ex-officio chairman. There is a committee of counsellors in twenty-four of the twenty-six branches of the Institute, on which the C.I.M.M. and C.I.C. are represented. Much useful work is being done by these counsellors, but it is apparent that in some districts much more advantage is being taken of this than in others. In order to increase the use of this service early this year, the Deputy Ministers of Education in all provinces were notified of the names of the chairmen of the local counsellors' committees, and have also been informed of the wide distribution of the booklet "The Profession of Engineering in Canada" prepared by Mr. Bennett. Additional steps are being taken, which, it is hoped, will result in more schools availing themselves of the information and advice which can thus be given to boys who contemplate entering the profession.

(b) At present little is being done under the head of guidance to the engineering undergraduate, nor do I think that your committee can do much that is not already being done by the university faculties and the student engineering societies.

(c) It is the opinion of your committee that guidance and help to the young engineer after graduation and before he becomes established was the chief object of the committee when it was originally set up, and I cannot find that much has been accomplished here. A weakness is that none of the members of the committee are themselves recent graduates, and thus we are not in touch with the very men we are trying to help. With a view to correcting this, I have added to the committee Mr. J. W. Brooks, of London, Ont., who is the Institute's representative on the Junior Committee for Professional Training of the E.C.P.D. I have also asked each branch of the Institute to send me the name of a young engineer with whom this committee can correspond and who will give us his opinion as to what we can do for him and his generation.

I have recently written all branches suggesting two things which older engineers could do for their younger professional brethren, but it is too early to report on how these suggestions have been received.

In conclusion, I wish to say that the committee will welcome suggestions for action which may increase its usefulness.

Respectfully submitted,

L. F. Grant, M.E.I.C., *Chairman.*

CANADIAN STANDARDS ASSOCIATION

The Canadian Standards Association, incorporated in 1919 and still better known to most of us as the Canadian Engineering Standards Association, has continued throughout 1945 the pursuit of its policy of broadening its interests, and extending its services. During the past twenty-six years the CSA (CESA) has furnished many types of standard recommendations in many branches of industry, and is constantly revising and improving these standards so that they may represent the best possible and most up-to-date practice in their various fields. In the governing and administrative committees as well as in the numerous working committees of the Association, the E.I.C. has always been directly concerned, and many of its members have contributed time and effort to the vast amount of detailed and technical work involved. During the last year some twenty different committees have been engaged in the revision of the Canadian Electrical Code Part I, a truly major undertaking, preparatory to the general issue of a fifth edition. Fifteen committees have been busy with specifications dealing with the Control of Radio Interference under Part IV of the same Code. Also under the Code, Part II, much activity has been devoted to the modernisation of Approval Specifications in the Electrical field.

In the Welding Section, committees are dealing with revisions and extensions to the specifications for electrodes, processes, qualifications of operators, etc. A new safety code for the protection of head and eyes is under way, as also is a proposed standard designed to eliminate many of the hazards in hospital operating rooms. The Approvals Division has had a very busy year, having issued some 1073 approval reports on equipment tested in their Laboratory, having made over 2500 routine inspections of electrical devices, machines and installations, having made about 3000 further inspections on wire and cable, and 2185 tests on conductors, conduit and tubing. In addition 740 new applications for testing and approval were received for consideration.

The lifting of Government restrictions on the manufacture of certain types of oil-burning equipment has resulted in a flood of applications for test and approval, so that the Fire Hazards Listing Service has had an increasingly busy year, and may grow in importance as a means of guidance and protection to the public and to industry. Other committees are feeling the urge to activity now that war controls and limitations are becoming things of the past, and a vast new field of international and united nations standardisation is opening up in which the CSA is vitally interested and with which it is closely identified.

Your representative has for many years been elected to serve on the Executive Committee of the Association, besides serving as chairman of various Technical Sectional and Working Committees.

Respectfully submitted,

P. L. Pratley, M.E.I.C.,
E. I. C. Representative on C.S.A.

CANADIAN CHAMBER OF COMMERCE

The Canadian Chamber is a federation of 182 Boards of Trade and Chambers of Commerce located in every province of the Dominion.

The Chamber provides a national medium through which business can meet its own and the country's problems with united strength. The activities of the Chamber are directed by a National Board of directors representing all fields of business activities. The Engineering Institute is represented on this Board for 1946, by Dr. J. B. Challies, who is the Chairman of the Executive Committee and by Colonel R. D. Harkness, its Vice-Chairman. The writer is a member of this Board, as the representative of the Engineering Institute, and is also Chairman of the Reconstruction Committee of the Chamber.

The Chamber's aims are described as follows:

1. To stimulate and maintain a vigorous national unity;
2. To determine the views of business on legislative and economic questions affecting the financial, commercial, agricultural, social and industrial interests of the Dominion and to interpret those views to Parliament and to the Departments of Government;
3. To keep local business organizations and business men informed about national developments affecting them by supplying dependable current information;
4. To promote the efficiency and extend the usefulness of individual Boards of Trade and Chambers of Commerce in Canada;
5. To create a better understanding of the problems of business on the part of the public;
6. To promote high standards of business practice;
7. To encourage freedom of enterprise and preserve individual liberty.

These activities are helped by the various divisions of the Chamber's permanent staff. There are also a number of special committees, the principal of which are the following:

Agriculture, Canada-United-States Committee, Economic Development, Foreign Trade, International Chamber of Commerce, National Labour Policy, Reconstruction, and Taxation and Public Finance.

During 1945, these committees have all been very active. Perhaps some of the most valuable work has been accomplished by the Economic Development Committee which has been carrying on a campaign of education on the functions and accomplishments of private enterprise.

The Committee on Finance and Taxation has made, from time to time, representations to the Government on such subjects as the Industrial Development Bank, the Royal Commission on Taxation of annuities and family corporations, the Royal Commission on Co-operatives and on the effect of wartime taxation on production costs.

The Committee on National Labour Policy has made suitable representations from time to time to the Government, particularly on wartime labour regulations and on other matters of importance affecting the relations between employers and employees.

The Reconstruction Committee directed the Kitchener-Waterloo survey to determine the possibility of employment after the war and this survey became a national pattern for community postwar planning and analysis. It also studied the various questions discussed in the White Paper published by the Department of Reconstruction, particularly on the question of public works, housing, price controls, etc.

I think that the Chamber is doing very useful work for business in general and more particularly for the defence of private enterprise. I consider that it is to the advantage of The Engineering Institute of Canada to have a representative on the Executive Committee of the Chamber and I wish to point out that it is an honour shared by only two other national associations.

Respectfully submitted,

Arthur Surveyer, M.E.I.C.,
E.I.C. Representative on the National Board of the Canadian Chamber of Commerce.

COMMITTEE ON PRAIRIE WATER PROBLEMS

Your Committee on Prairie Water Problems has been following closely developments as regards irrigation on the Prairie. Informal representations have been made from time to time as to the desirability and urgency of proceeding with the St. Mary and Milk rivers project. It has now been announced that this project will be one of those to be undertaken immediately by the Dominion Government as a part of its post-war programme.

Respectfully submitted,

G. A. Gaherty, M.E.I.C., *Chairman.*

KEEFER MEDAL COMMITTEE

Your committee has examined carefully the papers presented to the Institute during the prize year and is of the opinion that no award should be made of the Keefer Medal for the year 1945.

Respectfully submitted,

E. P. Muntz, M.E.I.C., *Chairman.*

ROSS MEDAL COMMITTEE

It is the recommendation of your committee that the Ross Medal for the year 1945 be awarded to S. T. Fisher, M.E.I.C., for his paper "Radio for Over-land Long-Distance Telephone Service", as published in the May 1945 issue of the *Journal.*

Respectfully submitted,

E. V. Leipoldt, M.E.I.C., *Chairman.*

PLUMMER MEDAL COMMITTEE

As Chairman of the Plummer Medal Committee, acting on behalf of Dr. Paul E. Gagnon, I would say that the Committee is of the opinion that neither of the two papers submitted qualify for the Plummer Medal. Either they do not come within the scope of the terms of reference or they do not show sufficient originality.

Respectfully submitted,

Harold J. Roast, M.E.I.C., *Chairman.*

LEONARD MEDAL COMMITTEE

Your committee is of the opinion that the Leonard Medal for 1945 should be awarded to E. Cecil Roper for his paper "The Raising of No. 7 Shaft at Britannia", as published in the February 1945, issue of *The Canadian Mining and Metallurgical Bulletin.*

Respectfully submitted,

F. V. Seibert, M.E.I.C., *Chairman.*

JULIAN C. SMITH MEDAL

Carrying out the instructions pertaining to the award of the Julian C. Smith Medal for 1945, the special committee consisting of Past-Presidents C. R. Young, deGaspé Beaubien and myself has made a selection of two names, which have been submitted by letter ballot to all councillors.

As a result, Julian C. Smith Medals for 1945 are being awarded to:

Alexander Joseph Grant, formerly Engineer-in-Charge, Department of Railways and Canals, Welland Ship Canal Office, St. Catharines, Ontario.

George Alexander Walkem, Managing Director, Vancouver Machinery Depot Limited, Vancouver, British Columbia.

Respectfully submitted,

E. P. Fetherstonhaugh, M.E.I.C., *Chairman.*

SIR JOHN KENNEDY MEDAL

The Sir John Kennedy Medal for 1945 has been awarded by the Council of the Institute to John Morrice Roger Fairbairn, D.Sc., M.E.I.C., formerly Chief Engineer, Canadian Pacific Railway Company, Montreal.

Respectfully submitted,

L. Austin Wright, M.E.I.C., *General Secretary.*

GZOWSKI MEDAL COMMITTEE

It is the recommendation of your committee that the Gzowski Medal for the year 1945 be awarded to John T. Dyment, M.E.I.C., for his paper "The Engineering Selection of an Airline Aeroplane", as published in the June 1945, issue of the *Journal.*

Respectfully submitted,

E. G. M. Cape, M.E.I.C., *Chairman.*

DUGGAN MEDAL AND PRIZE COMMITTEE

It is the recommendation of your committee that the Duggan Medal and Prize for 1945 should be awarded to H. L. Lexier, Jr. E.I.C., for his paper "Metallurgy and Machine Design", as published in the May 1945 issue of the *Journal.*

Respectfully submitted,

W. J. W. Reid, M.E.I.C., *Chairman.*

CANADIAN LUMBERMEN'S ASSOCIATION PRIZE

No papers in competition for the Canadian Lumbermen's Association Prize have been submitted to the committee. There is consequently nothing to report for the year 1945.

Respectfully submitted,

J. L. Lang, M.E.I.C., *Chairman.*

STUDENTS' AND JUNIORS' PRIZES

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of the Institute were submitted to Council at its meeting on January 12th, 1946, and the following awards were made:

H. N. Ruttan Prize (Western Provinces) to Robert Peterson, Jr.E.I.C., for his paper "Soil Mechanics as Applied to P.F.R.A. Problems, with Special Reference to the Proposed St. Mary's Dam."

John Galbraith Prize (Province of Ontario), to F. J. McMulkin, Jr.E.I.C., for his paper "Welding and Fabrication of Canadian Light Armour".

Phelps Johnson Prize (Province of Quebec—English), to J. T. Madill, Jr.E.I.C., for his paper "Field Decay Characteristics of Large Hydro-Electric Generators".

Ernest Marceau Prize (Province of Quebec—French), to J. B. Nobert, S.E.I.C., for his paper "Etude d'installation d'usine de défibrage du bois par le procédé mécanique à la vapeur, à Pont Rouge".

Martin Murphy Prize (Maritime Provinces), to Fred W. Davidson, S.E.I.C., for his paper "Design of an Antenna for VE9AS".

Abstracts of Reports from Branches

Note—For Membership and Financial Statements see pages 102 and 103

BORDER CITIES BRANCH

The Executive Committee submits the following report for the year 1945:

We held thirteen meetings of the Executive Committee for the discussion of business.

There were ten regular branch meetings and one special meeting held this year. The ladies were invited to two of these and showed their appreciation by turning out in good numbers. One other meeting was of particular importance—the Inaugural Meeting held in Sarnia. At this particular meeting, this branch sponsored the former Sarnia members in becoming the first new branch to receive a charter from Headquarters for a long time.

The death of Mr. C. M. Goodrich, M.E.I.C., will be felt keenly by this Branch and the Institute in general for he has made many contributions to engineering.

Information relative to these meetings is as follows, attendance being shown in brackets:

Jan. 10—**Collective Bargaining and Accomplishments of the Association of Professional Engineers**, by Colonel T. Medland, Public Relations Officer of the Association of Professional Engineers. (54.)

Jan. 19—**Development and Testing of the Canadian Universal Trestle as used with the Bailey Bridge**, by R. C. Manning, Chief Engineer of the Canadian Institute of Steel Construction. Illustrated. (46.)

Feb. 16—**The Amplidyne**, by J. L. McKeever of the Peterborough plant of the Canadian General Electric Company. (60.)

Mar. 16—**Some Phases of Arc Welding** by W. D. Wolcott, Inspection Engineer of the Hydro-Electric Power Commission of Ontario. Illustrated. (34.)

Apr. 19—**Industrial Process Ventilation**, by W. N. Witheridge, Director and Chief Engineer of the Bureau of Industrial Hygiene, Detroit Department of Health. Illustrated. (33.)

May 18—**The Romance of Coal**—Technicolor sound films presented by R. Allaster, Western Sales Manager of the Pittsburg Coal Company.
Bridging San Francisco Bay—Sound film presented by T. Bronsom, Windsor representative of the United States Steel Export Company. (38.)

June 6—President's visit and Ladies Night. Dean E. P. Fetherstonhaugh spoke on **Engineering Education** with several other guest speakers. (98.)

Oct. 5—Joint Meeting with Detroit Branch of the A.S.M.E. General A.G.L. McNaughton spoke on **Canadian Engineering in the War.** (375.)

Oct. 6—Inaugural Meeting at Sarnia. (about 70.)

Nov. 16—**Some Employee Relations Aspects of Management Engineering**, by E. R. Complin, Manager of Industrial Relations of C.I.L. (40.)

Dec. 7—Annual Meeting and Election of Officers. **Fluid Drive in Industry**, by Glen V. Edmonson, Staff Engineer of the American Blower Corporation, Detroit. Illustrated (42.)

CALGARY BRANCH

The following report of activities is submitted by the Calgary Executive for the Branch Year 1945, the attendance at meetings being shown in brackets:

The Executive met eight times during the branch year.

Dec. 14—Annual Ladies Night was held at the Glencoe Club. Entertainment consisted of moving pictures. Refreshments were served. (79.)

Jan. 11—Joint Meeting with University of Alberta Alumni, Calgary Branch. Prof. R. M. Hardy, on **The Engineer and Society.** (38.)

Feb. 1—E. Kelly, on **Rural Electrification** (60.)

Feb. 15—G. W. Govier on **Straw Paper.** (55.)

Mar. 1—F/O Gidman on **Rehabilitation of the Members of the R.C.A.F.** (34.)

Mar. 10—Annual Meeting. Followed by dinner with bridge and dancing sponsored by Engineers Wives' Club. (56).

Oct. 15—A. G. Turnbull on **Recent Developments in Electrical Control.** (52.)

Nov. 1—D. F. Hamelin, on **Water Supply Investigation.** (70.)

Nov. 15—D. W. Clapperton, on **Full Employment in a Free Society.** (26.)

Nov. 21—L. Austin Wright, General Secretary, on **Institute Affairs.** (53.)

CAPE BRETON BRANCH

The Branch held the following meetings during the year:—

Jan. 15—Movie night and dinner meeting. Alaska Highway film courtesy William Stairs Son & Morrow. Bell Telephone film courtesy Northern Electric Company.

Feb. 8—**Lifeline of the Nation.** Dinner meeting with above film supplied by headquarters.

Mar. 5—**Ball and Roller Bearings,** by H. Little, R & M Bearings (Canada) Limited, with two films showing manufacture of New Departure Bearings. Dinner meeting.

Apr. 11—Annual General Dinner Meeting, at which the Branch was host to President E. P. Fetherstonhaugh, General Secretary L. Austin Wright, and G. L. Dickson, who addressed the meeting on E. I. C. affairs.

Oct. 25—**A Factual Analysis of the Tennessee Valley Authority,** by H. Massue, Statistical Engineer of the Shawinigan Water & Power Company, Limited. Dinner meeting.

EDMONTON BRANCH

The Edmonton Branch Executive met in March, April, May, September, October, twice in November and once in December in 1945, with an average attenfance of 8.

The general meetings of the Branch, except for the January meeting, opened with dinner at the Macdonald Hotel and featured the following programmes. The figure in brackets is the attendance.

Jan. 18—**A Trip Through the Andes,** with film, by Dr. N. McLeod, Engineer, the Asphalt Division of the Imperial Oil Company. This was a joint meeting held at University of Alberta with the Refresher School on Soil Mechanics and Concrete Testing. (150.)

Feb. 13—**The 12,500 K.W. Steam Electric Station of the Nova Scotia Light and Power Company Limited,** with slides by J. W. MacDonald of the Nova Scotia Light and Power Company. (42.)

Mar. 13—**Permanently Frozen Ground,** with slides and demonstrations by Prof. R. M. Hardy and E. D'Appolonia, Department of Civil Engineering, University of Alberta. (38.)

Apr. 24—**Annual Meeting of the Branch.** After reports from the officers and committees of the Branch, and the election and installation of the new executive, a moving picture entitled "From the Ground Up", being the manufacture of explosives in Canada, was shown. (32.)

Oct. 22—**German Oil Industry in the War,** by Dr. E. H. Boomer, Professor of Chemical Engineering at the University of Alberta, and one of Canada's two Oil Investigators for the Department of Munitions and Supply, with the Technical Intelligence Corps under General Eisenhower. (50.)

Nov. 20—**Annual Western Visit** of the general secretary of the E.I.C. Dr. L. Austin Wright showed the sound film **A Harbour Goes to France,** and discussed E.I.C. activities. (65.)

Dec. 10—**Rural Electrification in Alberta,** by F. T. Gale, Electrical Engineer of the Calgary Power Company, Calgary, Alberta. (36.)

Special meetings to which the Edmonton Branch had invitations were as follows:

A meeting of the Alberta Association of Architects, April 20th to hear Miss Jacqueline Tyrrwhitt, an authority from England on Town Planning.

The sessions for Technical Papers at the Western Annual Meeting of the Canadian Institute of Mining and Metallurgy in Edmonton, October 15th, 16th and 17th.

A meeting of the Chemical Institute of Canada, December 11th, when Mr. J. M. Dymond, Director of the Wartime Bureau of Technical Personnel spoke on "The Potential Employment of Technical Personnel".

HALIFAX BRANCH

During the past year, there have been held seven executive meetings in addition to the six following monthly gatherings:

Jan. 18—Combined Annual Banquet. (227.)
Feb. 22—**Steep Rock Lake Pumping,** by Mr. E. D. Brown. (76.)
Mar. 22—**Improving Personnel Relations in Industry,** by Mr. F. G. Hildebrand. (82.)
Apr. 13—Presidential Dinner. **Educational Trends in Engineering,** by Dean E. P. Fetherstonhaugh. (123.)
Oct. 23—**Factual Analysis of the Tennessee Valley Authority,** by H. Massue. (94.)
Nov. 22—**Research in Connection with Canada's Housing Problem,** by J. L. Gray. (114.)

HAMILTON BRANCH

During the year, the Branch held the following meetings with the attendance figures as given in brackets:

Jan. 11—The Annual Meeting and Dinner was held at the Scottish Rite Club, the guest speaker being Dean C. R. Young, Dean of the Faculty of Applied Science and Engineering, University of Toronto. His subject was **Trends in Engineering Education.** (66.)
Feb. 22—**Ball Bearings,** by H. Little, Vice-President and Sales Manager of R. & M. Bearings, Canada, Ltd. (48.)
Mar. 22—Students' Night—**The Design of a Tubular Conveyor Gallery,** by T. J. Boyle, At this meeting the film, **Life-Line of the Nation,** was shown through the courtesy of the American Association of Railroads. (42.)
Apr. 13—Annual Joint Meeting with the Toronto Section, A.I.E.E., and the Hamilton Sub-Section, A.I.E.E.—The subject was **Trends in Electric Power Generation,** by F. K. Fischer, Central Station Steam Engineer, Westinghouse Electric and Manufacturing Company, Philadelphia, Pa., U.S.A. (150.)
May 17—**Action Stations on the Front Line of Britain,** by L. L. Merrill. (130.)
June 8—**President's Visit**—A special dinner was held to honour the president, Dean E. P. Fetherstonhaugh, Dr. L. A. Wright, general secretary, and Major D. C. MacCallum. (65.)
June 9—Regional Meeting of Council at the Hamilton Golf and Country Club.
Aug. 23—Visit to the exhibit of the 47-ft. model of the **St. Lawrence Waterways Development** at the T. Eaton Company Ltd. (100.)
Sept. 25—Joint meeting with the Hamilton Sub-Section, A.I.E.E. —**Atomic Hydrogen Welding,** by P. H. Take, Canadian General Electric Co. Ltd., Toronto. (50.)
Oct. 15—**Steel Nesting Barges,** by W. B. Nicol, Chief Engineer, Hamilton Bridge Company Ltd., Hamilton. (65.)
Nov. 15—**Urban Transportation Problems,** by Charles E. DeLeuw, Consulting Engineer and Senior Partner of the firm of DeLeuw, Cotter & Company, Chicago, Illinois, U.S.A. (80.)
Dec. 8—The official opening in Hamilton of the **Mulberry Exhibition,** by His Worship Mayor Sam Lawrence. (500.)
Dec. 20—Joint meeting with the Hamilton Section of the Chemical Institute of Canada.—**Canada's Nitrogen Industry,** S. R. Frost, Department of Munitions and Supply, Montreal. (70.)

The Executive Committee of the Hamilton Branch held six meetings during the year with an average attendance of seven members.

KINGSTON BRANCH

During 1945, the following meetings were held by the Kingston Branch.

Jan. 10—**President's Visit**—de Gaspé Beaubien.
Feb. 1—**The Engineer in the Post-war World,** by Prof. R. F. Leggett.
Apr. 18—**Annual Meeting.**
Sept. 25—**Glued Laminated Timber Construction,** by Verne Ketchum.
Nov. 23—**The Work of the Association of Professional Engineers in Ontario,** by John Lang, and Col. T. Medland.
Dec. 4—**Industrial Training Schemes,** by Mr. D. E. Raymer.

LAKEHEAD BRANCH

The following meetings were held during the year:

Feb. 12—Fort William. **Modern Municipal Sanitation,** by E. M. Proctor, of James, Proctor and Redfern, Consulting Engineers, Toronto. Slides showing sewage treatment apparatus was shown after the meeting. (61.)
Mar. 7—Fort William. **Annual Dance,** held at the Royal Edward Hotel. (96.)
Apr. 18—Port Arthur. **Transportation in Wartime,** read by H. G. O'Leary from notes prepared by Mr. J. V. Dellabough, Transportation Engineer, Canadian National Railways, Winnipeg. Preceding this address the coloured sound motion picture film **Life line of the Nation** was shown. (31.)
May 3—Fort William. **Manufacture and Care of Ball Bearings,** by H. Little, Vice-President in charge of sales for R. & M. Bearings of Canada. Also two sound films were shown on "The Manufacture of Ball Bearings and Micro Instrument Bearings." (90.)
May 30—Port Arthur. **The Place of the Airplane in the Mining Industry,** by H. A. Oaks of Port Arthur. (30.)
June 27—Fort William. Annual Meeting and election of Officers. (32.)
Nov. 3—Cameron Falls, Ont. Branch visit to Cameron Falls and Alexander Landing power plants, H.E.P.C. of Ontario. Mr. Walter Looney, Superintendent of Thunder Bay System. (28.)
Dec. 7—Port Arthur. **Trends in Engineering Education,** by Dean E. P. Fetherstonhaugh, president of The Engineering Institute of Canada. Also Dr. L. Austin Wright, general secretary, spoke on Institute affairs.

LETHBRIDGE BRANCH

The following meetings were held by the Lethbridge Branch:

Jan. 26—A combined meeting of the Lethbridge Branch of the Engineering Institute and Association of Professional Engineers of Alberta was held in the Marquis Hotel. The speaker of the evening was Mr. George Spence and the subject was **A General Summary of Work Carried Out by the P.F.R.A.** The address was accompanied by very interesting slides. (45.)
Feb. 23—A general meeting was held in the small dining room of the Marquis Hotel with thirty present. The speaker at this meeting was Mr. D. D. Morris, General Manager of Nitrogen Products Limited. His address was entitled **Ammonia Plant at Calgary.**
Mar. 23—A general meeting was held in the Marquis Hotel with thirty present. The speaker for this meeting was Dr. J. A. Allan, Professor of Geology at the University of Alberta and his topic **Economic Aspects of the Yellowknife Area.**
Apr. 19—A corporate members meeting was held in the Department of Transport office with twelve members present. This meeting dealt mainly with the election of officers for the following year.
Apr. 27—A general meeting was held in the Marquis Hotel with forty present. The speaker for this meeting was Mr. Gard from the History Department of the University of Alberta and his subject was **Tall Tales in Alberta.** The film **Lifeline of a Nation** was shown at this meeting.
Oct. 26—A general meeting was held in the Marquis Hotel with thirty five members present. The guest speaker was Mr. H. W. Main, Chief Engineer of the Army Transport Service. The topic of his address was **Alaska.**

Nov. 22—A corporate members meeting was held in the small dining room of the Marquis Hotel on the occasion of Dr. L. Austin Wright's visit to this office. The speaker was Dr. L. Austin Wright and he spoke on topics of interest to this Branch and what Headquarters of The Engineering Institute of Canada propose doing.

Nov. 28—There was a combined meeting of the Lethbridge Branch of the Engineering Institute and the Association of Professional Engineers of Alberta. The guest speaker of the evening was Mr. C. G. Anderson, District Agriculturist and the topic **"Agriculture in Manchuria"**.

As well as general meetings, there were six executive meetings called to look after general administration of the Lethbridge Branch. The average attendance at these meetings was six.

LONDON BRANCH

During the year, the Branch held nine regular and special meetings.

Jan. 17—Annual meeting and election of Officers. **The University of Western Ontario and the War Effort,** by Dr. R. C. Dearle, Head of the Dept. of Physics at the University of Western Ontario.

Feb. 14—**Human Engineering,** by Dr. Herbert Moore, Ph. D., Clinical Psychologist of Stevenson & Kellogg, Management Engineers, Toronto.

Mar. 21—**Report on E.I.C. Annual Meeting in Winnipeg,** by J. A. Vance, Branch Councillor.

Apr. 25—**The Production of Electrical Current Indicating Instruments in Canada,** by A. L. Furanna, Instrument Division Engineer, Sparton of Canada, London.

June 5—President Dean E. P. Fetherstonhaugh and Mrs. Fetherstonhaugh were entertained by the Branch at the London Hunt Club.

Sept. 19—**A Review of Welding Processes,** by H. G. Stead, President and Chief Engineer of E. Leonard & Sons, Ltd., London.

Oct. 24—**Shipshaw,** by J. W. Brooks, Engineer, Hyatt Bros. Construction Co., London.

Nov. 15—London Branch was host at a luncheon meeting for its members and friends, newly returned from overseas.

Dec. 13—**The British Columbia Electric Railway Development,** by R. E. Heartz, Assistant Chief Engineer, Shawinigan Engineering Co. Ltd., Montreal.

MONTREAL BRANCH

The attendance this fall at meetings has been extremely high. This has been achieved to some extent, it is true, by the fact that several joint meetings have been held with other societies. This policy of holding joint meetings is undoubtedly a sound one but eventually it may not be possible to continue it due to the fact that the seating capacity of the hall at 2050 Mansfield is limited to a maximum of 200.

Following is the list of meetings held during the year 1945:

Jan. 11—**The Future of Aluminum,** by Dr. P. M. Haenni. (140.)

Jan. 18—Joint Meeting with A.I.E.E.—**The Amplidyne Machine,** by J. L. McKeever. (150.)

Jan. 25—Annual Meeting of the Branch (Refreshments) (110.)

Feb. 1—**The 12,500 KW Steam Electric Station of the Nova Scotia Light & Power Co. Ltd.,** by J. W. MacDonald and J. T. Farmer. (90.)

Feb. 8—**The Diesel Electric Power Plant in Industry and Transportation,** by Ira Sylvester. (125.)

Feb. 15—**Beet Sugar Manufacture,** by M. R. Allen. (115.)

Feb. 22—Annual Social Evening. (Refreshments). (400.)

Mar. 1—**The Automotive Industry in War,** by W. J. Davidson. (115.)

Mar. 8—**Train Communication,** by Dr. L. O. Grondahl. (100.)

Mar. 15—**Pollution Hazards in a Water Supply System,** by L. P. Cabana. (100.)

Mar. 22—**The Aircraft Industry,** by David Boyd. (130.)

Apr. 5—**Post War Problems of the Pulp and Paper Industry,** by R. E. Weldon. (90.)

Apr. 12—Joint Meeting with A.I.E.E.—**The Smith-Putnam Wind Turbine Project,** by Dr. John B. Wilbur. (150.)

Apr. 18—Joint Meeting with the Statistical Quality Control Association of Montreal.—**Progress of Quality Control in Great Britain during the War,** by Dr. John R. Womersley. (135.)

Apr. 26—**Factual Analysis of The Tennessee Valley Authority,** by H. Massue, (150.)

Sept. 27—Special Meeting—**Design and Use of Timber in Structures,** by Verne Ketchum. (240.)

Oct. 4—Opening Night—Films. (Refreshments). (325.)

Oct. 11—Visit to Mulberry Exhibit. (700.)

Oct. 13—Visit to Dorval Airport. (350.)

Oct. 18—Joint Meeting with A.I.E.E.—**A Modern Electric Boiler Installation at Arvida,** by F. L. Lawton and M. G. Saunders. (200.)

Oct. 25—**Central Steam Utilities as a Solution to the Urban Smoke and Heating Problem,** by R. L. Fitzgerald. (100.)

Nov. 1—**What is Good Management ,** by Wallace Clark. (225.)

Nov. 8—**Atomic Power,** by Dr. B. Weldon Sargent. (250.)

Nov. 15—Joint Meeting with I.R.E.—**Pulse Techniques,** by F/L R. W. Wilton, M.B.E. (150.)

Nov. 22—**Trends in Development of Airline Aircraft,** by John T. Dyment. (120.)

Nov. 29—**Application of the Cylindrical Shell for Concrete Roofs,** by Eric C. Molke. (130.)

Dec. 6—Joint Meeting with A.I.E.E.—**Gas Turbine Fundamentals,** by Dale D. Streid. (175.)

Dec. 13—**Patents,** by E. T. Henry. (125.)

Junior Section

Acting on the premise that the young engineer is a "social animal" like the rest of his fellow men, the Executive of the Junior Section took special pains this year in sponsoring evenings of a social character. That this policy met with full success is evidenced by the three film nights which attracted full house each time. Also, the crowning achievement of the season was the first annual dance of the Section. Some 200 couples attended the dance which was held in the ballroom of the Ritz-Carlton Hotel. The attendance of senior men to this function was particularly gratifying. Great credit is due to the Chairman of the Entertainment Committee, T. A. Monti, for his untiring efforts in organizing both the film nights and the dance.

Out of the eight sessions held by the Junior Section, three were devoted to papers, as shown below:

Jan. 29—Annual Meeting.—Reports and Film. (Refreshments).

Feb. 19—**Mechanical Impact,** by T. A. Monti.

Mar. 5—Film Night. (250.)

Apr. 9—**Planning and Construction of 10,000-ton Cargo Vessels,** by Edmond Pontbriand and Leo Scharry.

May 14—Film Night. (200.)

Oct. 22—Opening Night.—Mr. J. B. Stirling, Chairman of the Montreal Branch, addressed the members.—Film. (Refreshments).

Nov. 12—Film Night. (200.)

Nov. 23—Annual Dance. (400.)

MONCTON BRANCH

Eleven meetings of the Executive were held during the year. There were eight branch meetings held, at which technical subjects were discussed, and business transacted as follows:

Feb. 19—A meeting was held in the City Hall. H. W. Hole Manager, New Brunswick Gas & Oilfields, Ltd., gave an address on the **Formation and Development of the Stoney Creek Oil and Gas Field in Albert County, N.B.** At the conclusion of Mr. Hole's address, the film **Lifeline of the Nation** was shown.

Mar. 6—A joint meeting of Moncton Branch and the Engineering Society of Mount Allison, was held in the Science Building of the University, at Sackville. Two sound films dealing with the manufacture, care and handling of ball bearings were screened. H. Little, R. & M. Bearings, Canada, Limited, gave a commentary.

Mar. 7—A meeting was held in the City Hall. The films and commentary on ball bearings were presented.

Apr. 11—A meeting was held in the City Hall. Motion pictures were screened showing the Melocheville Construction, Surface Stripping at the East Malartic Gold Mine, and Soil-Cement Stabilization at Seven Islands Airport.

Apr. 20—A dinner meeting was held in the Brunswick Hotel in honour of the president of the Institute. The president addressed the meeting on the subject of **Engineering Education**, and the general Secretary, Dr. L. Austin Wright, spoke on conditions affecting the economic status of engineers.

May 22—A meeting was held for the purpose of nominating branch officers for the year 1945-46.

May 29—The Annual Meeting was held on this date.

Oct. 31—A meeting was held in the City Hall. Huet Massue, Statistical Engineer, Shawinigan Water and Power Co., Montreal, addressed the meeting on the subject **Factual Analysis of the Tennessee Valley Authority.**

NIAGARA PENINSULA BRANCH

The Branch Executive held six (6) executive meetings and one (1) electoral meeting during the year. The programme committee arranged for and conducted the following general professional meetings.

Jan. 25—Dinner meeting at the General Brock Hotel, Niagara Falls, Ontario, addressed by Mr. R. A. Abraham, of H. G. Acres and Company, on **The Engineer's Part in the History of Architecture.**

Mar. 1—**Smoker Meeting,** held at the Welland House, St. Catharines, Ontario. This was a joint meeting with the Association of Professional Engineers of the Province of Ontario, and was addressed by Lieut. Col. T. M. Medland, Director of Public Relations, Association of Professional Engineers of the Province of Ontario, who spoke on **The Association and Its Accomplishments.**

Apr. 5—Dinner meeting, held at the General Brock Hotel, Niagara Falls, Ontario. The guest speaker was Mr. A. E. K. Bunnell, Consultant to the Provincial Department of Planning and Development. His subject was **The Field of the Engineer in Community and Town Planning.**

Apr. 26—Dinner meeting, held at the Leonard Hotel, St. Catharines, Ontario, addressed by Mr. P. R. Sandwell, Development Engineer, Ontario Paper Company, on the subject **The Paper Industry in Australia.**

June 7—The branch annual dinner meeting was held at the Park Restaurant, Queen Victoria Park, Niagara Falls, Ontario. Dean E. P. Fetherstonhaugh, president; Dr. L. A. Wright, general secretary; and Major D. C. McCallum, director of rehabilitation and personnel services, all of The Engineering Institute of Canada, were guests of the Niagara Peninsula Branch, and addressed the meeting on professional and E.I.C. subjects.

June 20—A joint meeting with the Buffalo Branch of the American Society of Civil Engineers, held on board two United States Army "Self-Loading Dredges". The operation of these dredges was fully demonstrated by going on a short cruise and proceeding with loading and unloading operations.

Sept. 27—Dinner meeting, held at the Leonard Hotel, St. Catharines, Ontario. Mr. Morley Lazier delivered a very interesting talk on **Atomic Energy.**

Oct. 25—Dinner meeting at the Fox Head Hotel, Niagara Falls, Ontario, addressed by Mr. H. J. A. Chambers, on the subject **Steel in the Construction Industry.**

Nov. 22—**Annual Ladies Night,** dinner meeting held at the Leonard Hotel, St. Catharines, Ontario. Mr. George L. Long, Historian of the Bell Telephone Company of Canada, gave an address and demonstration on the subject **Your Voice as Others Hear It.**

OTTAWA BRANCH

The following meetings were held during the year:

Jan. 11—Annual evening meeting, Auditorium, National Research Council—Guest Speaker: De Gaspé Beaubien, C.B.E., President of The Engineering Institute of Canada.

Jan. 31—Evening meeting, Physical Metallurgical Research Laboratories of the Bureau of Mines—Demonstration of equipment.

Feb. 14—Luncheon meeting, Chateau Laurier—An illustrated talk entitled **The Heating of Dwellings,** by Huet Massue of the Shawinigan Water Power Company, Montreal.

Feb. 20—Joint evening meeting with the Ontario Section of the American Institute of Electrical Engineers—the Auditorium, National Research Council—**The Amplidyne Machine,** by J. L. McKeever, Canadian General Electric Co., Peterborough.

Mar. 8—Luncheon meeting, Chateau Laurier—a report on the Dominion Convention of the Institute by W. L. Saunders, councillor, Ottawa District.

Mar. 21—Luncheon meeting, Chateau Laurier, **The Development of Civil Aviation in Canada,** by J. A. Wilson, Director of Air Services, Dept. of Transport, Ottawa.

Apr. 6—Luncheon meeting, Chateau Laurier, **Rural Electrification**—an illustrated talk by Morris J. McHenry, Hydro-Electric Power Commission of Ontario, Toronto.

Apr. 19—Luncheon meeting, Chateau Laurier, **Some Experiences in Army Engineering Design**—an illustrated talk by R. E. Jamieson, Director General, Army Engineering Design Branch, Department of Munitions and Supply.

Apr. 20—Afternoon meeting in the Auditorium of the National Research Council—**River Control Structures in Australia,** by Mr. E. D. Shaw, State River & Water Supply Commission, Victoria, Australia.

May 24—Luncheon meeting, Chateau Laurier, held in honour of Major-General H. B. W. Hughes, C.B., D.S.O., O.B.E., Engineer-in-Chief, War Office, London, England.

Sept. 5—Evening inspection of the exhibit **Mulberry** as arranged by the Hudson's Bay Company, in collaboration with The Engineering Institute of Canada.

Sept. 13—Luncheon meeting at the Chateau Laurier in honour of E. P. Fetherstonhaugh, president of The Engineering Institute of Canada.

Sept. 26—Evening meeting in the Lecture Hall, Victoria Memorial Museum—an illustrated lecture on **Timber Structures,** by Mr. Verne Ketchum, New York.

Sept. 27—Members of the Ottawa Branch were invited to attend a general session of the Conference on **Unification of Engineering Standards,** Chateau Laurier—Speaker: Mr. Wm. Batt, Vice-Chairman of the American War Production Board and United States Representative on the combined Production and Resources Board.

Oct. 3—Evening meeting in the auditorium of the National Research Council, under the auspices of the Conference on the Unification of Engineering Standards—**Critical Instability in Structures,** by L. B. Tuckerman, National Bureau of Standards, Washington, U.S.A.

Oct. 4—Evening meeting in the Chateau Laurier under the auspices of the Conference on the Unification of Engineering Standards—**The Operation Pluto,** by Mr. James S. Blair, Stewarts & Lloyds, Ltd., Corby, England.

Nov. 27—A joint evening meeting with the American Institute of Electrical Engineers, auditorium, National Research Council—**Techniques of Radar and its Use in Peacetime,** by Mr. J. H. Rowlatt, Bell Telephone Co., Montreal.

No. 26-27—Inspection of an exhibition of radar and associated electronic developments arranged under the auspices of the Radio Branch of the National Research Council.

Dec. 7—A joint evening meeting held with the Ontario Section of the American Institute of Electrical Engineers—an illustrated lecture on **Gas Turbine Fundamentals,** by Mr. Dale D. Streid, General Electric Co., Lynn, Mass., U.S.A.

PETERBOROUGH BRANCH

The following meetings were held during 1945, with attendance shown in brackets.

Jan. 18—N. E. MacPherson, H.E.P.C. of Ontario, on **Rural Electrification.** (32.)

Feb. 15—Messrs. V. L. Richards, A. C. West, F. E. P. Griggs of Hanson & Van Winkle Co. Ltd., on **Electroplated Finishes.** (40.)

Mar. 1—A. C. Northover, Canadian General Electric Co. **The Design of a City.** (52.)

Mar. 15—Student and Junior Night. A. R. Hailey, on **Exciter Voltage Build-Down.** G. S. Wade and B. O. Baker, on **Some Problems in Gun Carriage Design.**

Mar. 21—Ladies Night. (79.)
Apr. 12—Mr. E. C. Gosnell, Lukens Steel Company, on **Clad Steels.**
June 9—Annual Meeting and Picnic. (62.)
Sept. 29—Joint Meeting with A.I.E.E. Toronto Branch. J. Cameron, Canadian General Electric Co., on **Some Aspects of Insulating Electrical Conductors.** (81.)
Oct. 18—Major S. Stucken, R.C.E.M.E., Barriefield, on **Some Notes on Canadian Tank Development.** (31.)
Nov. 20—Mr. D. Boyd—Victory Aircraft Limited, on **Manufacture of Heavy Aircraft.** (46.)
Dec. 12—Annual Dinner. President Fetherstonhaugh's visit. (47.)

QUEBEC BRANCH

The Executive Committee held seven meetings with an average attendance of eight (8) members for the transaction of Branch business.

The activities of the branch were varied and numerous. Two records were established: (1) in the number of meetings (15); (2) in the attendance (average of 68).

The programme of activities was as follows (attendance is given in brackets):

Jan. 15—**Wood, an Engineering Material,** by Dr. J. Risi, professor of organic chemistry, Laval University. (58.)
Jan. 22—President Beaubien's visit. (65.)
Jan. 29—**Training, Yesterday, To-Day and To-Morrow,** H. N. Bronson, Employment and training supervisor, Bell Telephone Co. (39.)
Feb. 12—Ladies' Night—Miss Rachel Audet, Quebec Power Co. **Interior Lighting.** (125.)
Feb. 26—Junior Night, Jules Mercier,'**Lightning.** Mr. L. Trudel. (66.)
Mar. 12—**Industrial Utilization of Waste Sulphite Liquor,** by Dr. A. C. Hill. (33.)
Mar. 26—**Technical Aspects of Radio Repairing,** Albert Dumas, Ecole Technique, Quebec. (60.)
Apr. 9—**"New Apparatus" for the Study of the Deformation of Solids,** Roger Potvin, professor of electrometallurgy, Laval University. (45.)
May 16—Luncheon—Speaker: T. E. Lyons, Sec'y.-administrator of American Free Ports. (24.)
May 21—Annual meeting. (32.)
June 8—Films. (80.)
June 13—President Fetherstonhaugh's visit. (130.)
Sept. 10—Annual Golf Tournament. (90.)
Nov. 19—**What's New in Lighting Sources,** by M. Laflamme. (115.)
Dec. 10—**A New Industry—Peat,** by J. P. Drolet. (65.)

SAGUENAY BRANCH

During the year the Branch held a total of 15 general meetings as follows:

Jan. 30—A special meeting called to present the steps taken by Headquarters with respect to **Collective Bargaining** and Order-in-Council P.C. 1003. This was followed by a showing of the Tacoma Bridge picture.
Feb. 16—**The Commercial Fabrication and Technical Applications of Precious Metals,** by D. C. Lloyd of Johnson Mathy Company, Montreal. This was a joint E.I.C.-C.I.C. meeting.
Mar. 23—**Cathodic Protection,** by Dr. John J. Grebe of Dow Chemical Company, Midland, Michigan. This was a joint E.I.C.-C.I.C. meeting.
Apr. 17—**Boiler Water Conditioning,** by W. J. Tomlinson, Technical Director, Betz Laboratories, Montreal.
May 9—**Flame Priming of Metal Surfaces,** by R. J. Anderson, Engineer-In-Charge of Union-Melt Welding, Dominion Oxygen Ltd., Toronto.
May 16—**Uses and Abuses of Paint and Varnish,** by Norman Holland, President and Managing Director, Brandram-Henderson Limited, Montreal.
June 18—A dinner meeting held in the Grill Room of the Saguenay Inn for the purpose of meeting the Institute President, Dean E. P. Fetherstonhaugh and Assistant General Secretary Louis Trudel.
June 28—**Central Control of a Power Station,** by Perry Pederson of Control Corporation, Minneapolis, Minn.
July 3—**England in War Time,** by J. Thwaites, Development Engineer, Canadian Westinghouse Co., Hamilton, Ont.
July 13—**Operational Research with the R.C.A.F.,** by Dr. J. W. T. Spinks, Professor of Chemical Engineering, University of Saskatchewan. This was a joint E.I.C.-C.I.C. meeting.
July 25—**Soils and the Engineer,** by Prof. R. F. Legget, University of Toronto.
Aug. 15—**The 12,500 Kw. Steam-Electric Station of the Nova Scotia Light and Power Co. Ltd.,** by J. T. Farmer, Mechanical Engineer, Montreal Engineering Company Ltd., Montreal.
Oct. 11—A special meeting called to discuss changes to the Institute constitution as proposed by the Membership Committee and the Finance Committee.
Oct. 25—**A Modern Electric Boiler Installation at Arvida,** by F. L. Lawton, Assistant Chief Engineer, Aluminum Company of Canada, Limited, Montreal, and Mr. M. G. Saunders, Plant Engineer, Aluminum Company of Canada, Limited, Kingston.
Nov. 25—**Sailplanes; Their Construction and Operation,** by J. D. O. Barry, Aluminum Company of Canada, Limited, Shipshaw, P.Q.

In addition to the above, the Junior Section held 9 general meetings.

SAINT JOHN BRANCH

The Executive held twelve meetings during the year with an average attendance of seven members.

Eight dinner meetings were held in the Admiral Beatty Hotel with the attendance noted below in brackets.

Jan. 25—Annual joint dinner meeting of the Branch and the Association of Professional Engineers of the Province of New Brunswick. R. A. H. Hayes, Assistant Chief Engineer, Aluminium Laboratories Ltd., Montreal, addressed the Branch on **The Shipshaw Power Development,** illustrating his talk by slides and films. (81.)
Feb. 15—A dinner meeting was held at which the guest speaker was Senator G. P. Burchill who spoke on **The Forest Resources of New Brunswick.** A programme of motion pictures was also shown at this meeting including **Lifeline of the Nation,** depicting the part the railways have played in World War II. (59.)
Mar. 8—A dinner was held at which two films were shown—**Manufacture of Ball Bearings** and **Micro Instrument Bearings—Their Care and Handling.** Mr. H. Little also addressed the meeting and displayed samples of the various types of bearings. (46.)
Apr. 18—A special dinner meeting of the Branch was held in honour of Dean Fetherstonhaugh and the presidential party on the occasion of the president's annual visit. This meeting was also attended by the wives of the members. (89.)
May 10—The annual dinner of the Branch was held with the new chairman, J. M. Lamb, presiding. Through the courtesy of M.D. 7 two sound films were shown which proved of great interest to engineers. (30.)
Oct. 30—Mr. Huet Massue of the Shawinigan Water and Power Co., Montreal, addressed the Branch while on a Maritime tour on **A Factual Analysis of the Tennessee Valley Authority.** (51.)
Nov. 16—A dinner meeting was held at which H. W. Hole, Manager of the New Brunswick Gas and Oil Fields, Ltd. spoke on **The Formation and Development of the Stoney Creek Oil and Gas Field, Albert County, N.B.** (58.)
Dec. 6—A dinner meeting was held at which John Flood spoke on **The Port of London.** This paper was compiled by an eminent British engineer and issued under the Port of London Authority. (38.)

ST-MAURICE VALLEY BRANCH

During the year 1945 the following general meetings were held:

Jan. 24—**Application of Electronics,** by G. Clarkson of the Canadian Westinghouse Company Limited with a film entitled "Electronics at Work". This was a joint meeting with the Chemical Institute of Canada.
Apr. 12—**Industrial Engineering,** by S. Lyman of Canadian Industries Limited. This was a joint meeting with the Chemical Institute of Canada.
June 12—**Presidential Visit and Annual Meeting.** This was an unusually good meeting. President Dean E. P.

Fetherstonhaugh spoke on **The Engineer and His Education** after relating some interesting engineering developments which he had experienced during his practice. P. E. Poitras, president of the Corporation of Professional Engineers of Quebec spoke on **The Engineering Profession.** L. Trudel, assistant general secretary, spoke on the administration of Institute affairs. Officers for the following year were elected.

Sept. 20—**A Factual Analysis of the Tennesee Valley Authority,** by Huet Massue, Statistical Engineer with the Shawinigan Water & Power Company. This was a dinner meeting held in Grand'Mère. (40.)

Oct. 31—**High Speed Photography** (with slides), by V. O. Marquez of the Northern Electric Company Ltd. This was a lecture meeting held in conjunction with the Chemical Institute of Canada.

Dec. 13—**Radio Frequency Heating** (with film and slides), by J. B. Knox of the R.C.A. Victor Co. Limited. This was a lecture meeting held in conjunction with the Chemical Institute of Canada.

SARNIA BRANCH

The Sarnia Branch was newly organized this year, and received its charter at the Inaugural Meeting on October 6, with many Institute officials present. Two other meetings were held as follows:

Nov. 17—Regular meeting, addressed by J. T. Thwaites on **Now It Can Be Told,** the story of radar and related subjects in England during the War.

Dec. 11—Annual meeting, election of officers and discussion on by-laws.

SASKATCHEWAN BRANCH

All meetings were held jointly with the Association of Professional Engineers. The programmes were as follows:

Jan. 19—Regular Meeting, 2 films followed by a social get-together.

Feb. 16—Annual Meeting, addressed by Judge P. E. Gordon on his trip to England as head of the National Red Cross.

Mar. 14—Regular Meeting, addressed by E. E. Eisenhauer, Deputy Min. of Reconstruction & Rehab. on **Reconstruction & Rehabilitation in Saskatchewan.**

June 8—Special Meeting to view film—**Tornado in a Box.**

Oct. 26—Regular Meeting, addressed by Henry Lewis, Deputy Minister of Nat. Res. & Ind. Dev. on **Industrial Development in Saskatchewan.**

Nov. 16—Regular Meeting, addressed by L. Austin Wright, gen. sec., on **Institute Affairs.**

Dec. 14—Regular Meeting, film—**Steam Generation** followed by a tour through the City Power House.

The average attendance at these meetings was 45. Eight Meetings of Executive were held during the year.

SAULT STE-MARIE BRANCH

During the year 1945, the Sault Ste. Marie Branch held four executive committee meetings and six general meetings.

The general meetings were:

Feb. 2—**Beam and Column Design,** by W. H. M. Laughlin, Dominion Bridge Co., Toronto.

Apr. 30—**Manufacture, Assembly and Final Inspection of Ball Bearings,** by H. Little, R. & M. Bearings Canada Ltd.

June 1—**Forest Insects,** by Dr. C. E. Atwood, Forest Insect Laboratory.

Nov. 12—Visit to the Branch by L. Austin Wright, gen'l. sec. E. I. C., and J. A. Vance, Councillor, London Branch.

Nov. 30—**Long Haul and Overland Belt Conveyor Systems,** by T. O'Neill, Field Engineer, Goodyear Tire & Rubber Company.

Dec. 28—Annual Dinner and Installation of Officers

The average attendance at the general meetings was thirty.

TORONTO BRANCH

The executive held sixteen meetings with an average attendance of ten.

Regular meetings of the Branch are listed below, with the attendance given in brackets:

Jan. 18—**Wartime Transport of Food,** by Dr. W. H. Cook. (25.)

Jan. 26—Joint meeting with the American Institute of Electrical Engineers. **The T. V. A. Hydro Plants—Mechanical and Electrical Features**—paper by Messrs. H. J. Peterson and R. A. Hopkins of T.V.A., read by Mr. A. H. Frampton. (101.)

Feb. 1—Ladies Night. Dance at Casa Loma. (135.)

Feb. 15—Student Night. **Metallurgical Testing by Electronic Means,** by R. T. Cavanagh; **Cavitation in Marine Propellers,** by D. E. Becks; **Continuously Moving Forms,** by H. H. Todgham. (62.)

Mar. 1—**Reinforced Concrete Design in South America,** by A. J. Boase. (81.)

Mar. 15—Joint meeting with the American Society of Mechanical Engineers. **Army Engineering Problems.** (84.)

Mar. 28—Annual meeting. (68.)

Sept. 24—**Timber Structures,** by Verne Ketchum. (102.)

Oct. 4—**Structures in Steel,** by W. H. M. Laughlin. (87.)

Oct. 18—**General Motors Technical Centre,** by W. J. Davidson. (52.)

Nov. 2—**Engineers' Ball,** joint under Aff. Engineering and Allied Societies. (493.)

Nov. 8—In collaboration with Hudson's Bay Company for Ladies Night showing of **Mulberry;** joint meeting with American Society of Mechanical Engineers, American Institute of Electrical Engineers, and Institute of Radio Engineers. (423.)

Nov. 29—**Problems Facing Canadian Engineers,** by Brigadier G. Walsh, R.C.E. (56.)

Dec. 11—Presidential visit. (65.)

VANCOUVER BRANCH

Jan. 8—A joint meeting with the A.I.E.E., Prof. Engineers Association of B.C. and Engineering Bureau of the Board of Trade. Speaker: T. Ingledow, on **Hydro-Electric Power Development on the Lower Coast Mainland of B.C.**

Feb. 22—Student Night. D. A. Fraser, S.E.I.C. spoke on **The Landing Wharf at Esquimalt Drydock.** W. G. Grimble, S.E.I.C. spoke on **Landing Floats for Pleasure Craft.** F. E. Turley, S.E.I.C. spoke on **Contracting and the Young Engineer.**

May 2—Speaker: Brig. A. T. MacLean, C.B.E., on **Engineering in Warfare.**

May 8—Joint meeting with American Society of Metals. Speaker: H. Little, Esq., on **The Manufacture and Care of Ball Bearings.**

May 17—Speaker: J. H. Maude, M.E.I.C., on **Improved Hydraulic Presses for Wartime Requirements.**

June 14—Ladies' Night at Stanley Park Pavilion, Oscar A. Olson, Esq., showed **Travel Films of B.C.**

Sept. 10—Joint meeting with A.I.E.E. Professional Engineers Association of B.C. and the Engineering Bureau of the Board of Trade. S. R. Weston, M.E.I.C., on **The Programmes of the British Columbia Power Commission.**

Nov. 27—Visit of the general secretary.

VICTORIA BRANCH

During the year there were two meetings of the executive committee and four general meetings of the branch. The branch meetings may be summarized as follows:

Jan. 15—Annual meeting. This was a luncheon meeting held in Spencer's Dining Room. The branch officers for 1945 were elected. The main feature of these elections was the re-election of Lt. Col. Sherwood as chairman.

Feb. 12—Lecture Meeting with a visit to the Mechanical Training Establishment of the R.C.N. at Esquimalt, B.C. The speaker and host was Commander Thomas Fife. Refreshments were served in the officers' mess after the meeting.

Apr. 25—Lecture Meeting. **Town Planning,** by Miss Jacqueline Tyrrwhitt of London, England. This meeting was held in conjunction with the Victoria Chapter of the Royal Architectural Institute of Canada.

Oct. 12—General Business Meeting. This meeting was held in the Oak Bay Municipal Hall for the purpose of studying the memorandum submitted by the finance committee with regard to an increase in fees of membership.

The following meetings were held by the Winnipeg Branch during the year 1945.

Jan. 11—P. A. Macdonald, Physicist, Manitoba Cancer Institute spoke on **The Design and Construction of High Voltage X-Ray Tubes.**

Feb. 15—Annual meeting of the branch. Following the business of the meeting two films were shown: **Making and Shaping of Steel and The Canol Oil Project.**

Mar. 1—W. D. Hurst, City Engineer and Commissioner of Buildings presented a paper on **City Engineering Problems.**

Apr. 5—J. V. Dillabough, Transportation Engineer, Canadian National Railways, presented a paper on **Transportation in Wartime.**

May 3—Two films were presented: **Lifeline of a Nation and Tornado in a Box.**

Sept. 20—Mr. Daoust addressed the meeting on **The Role of Private and Public Investment in a Full Employment Economy.**

Oct. 18—Two Student members addressed the meeting: W. C. Porter spoke on **The Principles of Seismic Exploration in Relation to Ore and Oil Bodies.** E. M. Scott spoke on **Operation and Construction of the Modern Oil Circuit Breaker.**

Nov. 15—Mr. Moran of Stevenson & Kellogg Ltd. spoke on **The Place of Management Engineers in Industry and Commerce.**

Dec. 6—On this day the branch was honoured by the official visit of our president, Dr. E. P. Fetherstonhaugh, Vice President J. E. Armstrong and General Secretary L. Austin Wright. Dr. Wright addressed the meeting on Institute Affairs.

IRRIGATION *(Continued from page 84)*

contour ditches with outlets cut where desired, or by various other methods depending on topography, the crop to be irrigated, and the practice in vogue in the locality.

21. It is customary in many places for farmers to form a group along a lateral running through their land and to operate it by agreement among themselves, under certain legal formalities, the water to which they are collectively entitled being supplied and measured at the head of the lateral by the Irrigation District or other parent organization. By this method, rotation of service permits each individual to use a larger head of water at one time than would be possible otherwise. Each parcel of irrigable land is entitled to a fixed legal duty of water during a certain irrigating period, which generally covers the crop growing season and varies from about 100 to 150 days in different parts of the United States and Canada.

22. Irrigation water used in excess of actual requirements may, by its movement in the soil and by evaporation at the surface, or by transpiration through plants, cause an accumulation of salts (known as alkali) in certain areas to such an extent as to be injurious to crop growth. This condition may however be remedied by drainage in many cases.

23. The duty of water is actually an expression of depth of water allowed per acre in a given time. If the duty is 2 ac. ft. per acre, that means that all the irrigable area in a certain farm unit is entitled to a depth of 2 ft. of water over the whole area during the irrigating season, and if the season is (say) 100 days, 1 cu. ft. of water flowing continuously will cover 100 acres 2 ft. deep in that period; but as crop requirements are much greater at certain times, rotation permits the flow to be increased to (say) 3 cu. ft. per second for such peaks and little or no flow at other times, until the full amount has been delivered. The duty of water is expressed by other equivalent units, according to locality and local practice.

24. The benefits derived from irrigation not only go to the farmer who irrigates the land and the local community with whom he has immediate dealings, but to the country as a whole, through transportation, marketing, processing of the products of the farm and the creation of trade by exchange of farm products for other commodities. The soil is one of the greatest of the natural resources and a source of wealth which can only attain its greatest value by production, and this is only possible in arid districts if the land is irrigated.

25. The fact that irrigation, when properly applied under proper farming methods, will produce higher and more profitable yields than could be obtained without it, is well established and needs no substantiation by figures. This fact is most evident in the more arid regions; but in semi-arid districts irrigation is profitable when the border line between wet and dry is not too nearly approached and is an assurance against a dry season or a cycle of dry seasons. The effect of irrigation is to raise the watertable, which even in areas of almost sufficient rainfall is very beneficial for stock and domestic use. Dry land farming areas, adjacent to irrigation districts, are also benefited to a great extent by their proximity.

Provision of irrigation usually means increased numbers of farmers on a given area. In extreme cases irrigation is provided for desert areas devoid of population in anticipation of settlement. The earlier stages of an irrigation project are usually associated with colonization.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

A BREAK IN THE CLOUDS

Signs are developing in Ottawa that some real consideration is being given to the subject of salaries for professional workers in the Civil Service. A reclassification survey is under way with the object of determining each employee's ability and responsibility. As an interim measure a supplementary bonus is being given to meet the situation at least partially, until the survey can be completed and new scales of remuneration approved by the Treasury Board.

The *Journal's* information is not official, but as the newspapers say, it comes from "a reliable source". It is not difficult to discern what the Civil Service Commission itself hopes to accomplish. Whether or not its proposals will be accepted by the Treasury Board remains to be seen. The past record of the Board is not encouraging, but a special effort is being made by officers of the Professional Institute of the Civil Service to inform cabinet members. It is believed that with a well informed cabinet there will be less chance of the Treasury Board refusing or revising the proposals.

It is expected that the reclassification survey will be finished about the first of April and the new salary scale in the hands of the Board shortly after.

The *Journal* understands that it is proposed that in the future there shall be a change in the system whereby an employee may continue to get salary increases even though he has reached the top rate for his classification and there are no openings for him in the next higher classification. Such a procedure would remove one of the greatest evils of the present system. Many men have been held for countless years at low salary levels because there were no openings ahead to which they might be transferred. The setting up of a fixed establishment has some advantage, but in the past it has been used as a cruel weapon to hold people at ridiculously low income levels. The hope of a promotion and the fear of losing accumulated pension benefits have kept many a man on his job who, with advantage to himself, might have taken employment elsewhere. It is encouraging to hear that this out-moded method of denying increases is to be done away with—at least if the Commission gets its way.

As for the new salaries—no one can be sure what will emerge from the present cover of secrecy, but the *Journal* has good reason to believe that the following classifications and salaries are to be recommended to the Treasury Board. The present rates are tabulated also for comparison purposes. Generally speaking, the proposed rates are from $900. to $1,200. a year better than the present ones. This is still nothing to enthuse about, but it is a substantial improvement. It surely does not meet the scales offered for the same services by industry at large. This scale is for the Department of Public Works but will be typical of that being considered for all departments.

Present Classification	New Grading	Proposed Salary	Present Salary
Junior Engr.	Grade 1	\$1800–\$2400	\$1800–\$2100
Asst. Engr.	Grade 2	\$2400–\$3000	\$2100–\$2400
" "	Grade 3	\$3000–\$3600	(new classif.)
Sr. Asst. Engr. (senior)	Grade 4	\$3600–\$4200	\$2400–\$3000
Grade 1	Grade 5	\$4200–\$4800	\$3000–\$3600
Grade 2	Grade 6	\$4800–\$5400	\$3600–\$4500
Supt. Engr.	Grade 7	\$5400–\$6000	\$4500–\$5100
Asst. Chief	Grade 8	\$6000 – ?	\$5100–\$6000

The creation of a second classification of "Assistant Engineer", designated as Grade 3, will be of inestimable value. There are great numbers of assistant engineers, and many hardships have developed because of the present top salary of $2,400. With this limit raised to $3,600 as proposed, some of the iniquities of this present scale can be overcome—or partially overcome.

There appears to be no basis for the report in the Ottawa papers that a Royal Commission is to be set up to examine the whole civil service salary structure. As far as engineers are concerned, no such commission is necessary. It is all very simple. There are no difficulties in the way of determining what should be paid in order to get proper results. It would be too bad if a commission were used as a means of further prolonging the present unjustifiable schedules. In the past, royal commissions seem to have accomplished very little, for the reason that governments would not accept the results of their studies unless they happened to suit the governments' preconceived ideas and policies, not always based on considerations of the employee or the national interest. Remember the Beatty report? Remember the Coon Committee? Let's have no more of such heartbreaking experiences.

If the government really wants to know all about the situation, it can still go back to the Beatty report and by using a modest factor make it equally applicable today. Or perhaps the report of the Coon Committee would be more up to date. Certainly no new fact-finding body is required. The need is for someone or something that will make the Treasury Board do something about it.

A break in the clouds is appearing. Let us hope it develops until the professional civil servant can get his just share of the golden sunshine so essential to decent living and to proper service.

CANADIAN RADIO TECHNICAL PLANNING BOARD

A report from A. B. Hunt, M.E.I.C., the Institute representative on the Administrative Committee.

The Canadian Radio Technical Planning Board, of which the Engineering Institute is a sponsoring member, was organized in November 1944 with the approval and support of the Department of Transport. Its stated objectives are to formulate sound engineering principles and to organize technical facts which will assist in the development, in accordance with public interest, of the electronic industry and electronic services of the nation, to advise Government, Industry and the People of its findings and recommendations.

At the first annual meeting held in Montreal on December 6th, 1945, the President, Mr. Brophy, announced that 16 non-profit-making organizations had given their support to the Board as sponsoring members. Total membership of the various panels and committees consists of 160 of the top ranking engineers, scientists and specialists of all kinds in the electronic fields who have been devoting a considerable portion of their time and effort to the work of the Board. The sponsoring members as at the annual meeting are as follows:

Air Industries and Transport Association of Canada
American Institute of Electrical Engineers, District No. 10
American Radio Relay League (Canadian Section)
Canadian Association of Broadcasters
Canadian Broadcasting Corporation
Canadian Electrical Association
Canadian Electrical Manufacturers Association
Canadian Transit Association
Dominion Motor Coach Association
Hydro-Electric Power Commission of Ontario
Institute of Radio Engineers
Quebec Hydro-Electric Commission
Radio Manufacturers Association of Canada
The Engineering Institute of Canada
The Railway Association of Canada
The Telephone Association of Canada

Invaluable assistance and technical advice has been given to the Board by representatives from the three Armed Services, the National Research Council and the Canadian Standards Association.

The Administrative Committee is the senior controlling body of the Planning Board and consists of one representative or alternate appointed by each of the sponsoring members. This Committee is responsible for the establishment of policy, and controls all financial expenditures. All reports and findings of the panels and committees are submitted to the Administrative Committee for final approval before being released for publication or forwarded as a recommendation to any department of government.

The Administrative Officers were re-elected at the annual meeting for a second term, with the exception of the Secretary-Treasurer, Mr. W. W. Richardson, who asked to be relieved of his duties due to his resignation as General Manager of the Radio Manufacturers Association to accept a position in Industry. He was replaced by Mr. S. D. Brownlee. The Administrative Officers for the ensuing year are as follows:

R. M. Brophy, President
R. A. Hackbusch, Vice-President
S. D. Brownlee, Secretary-Treasurer
A. B. Oxley, General Co-Ordinator
G. W. Olive, Co-Ordinator
G. J. Irwin, Co-Ordinator

A Steering Committee comprising the Vice-President, the Co-Ordinators, the Panel Chairmen and Vice-Chairmen acts in a technical advisory capacity and guides the overall operation of the Panels.

The work of the Board has been broken down into six main Panels identified by letters "A" to " F " inclusive and the Panels are in turn divided into a total of eleven Committees working on various aspects of their Panel problems. The Engineering Institute has representation on all of these Panels and Committees, as shown in the following list:

Panel A—Spectrum Utilization and Frequency Allocation. Institute representative: J. L. Clarke.

Panel B—Broadcasting Transmitters — Standard, Short Wave, FM, Television, Facsimile and Relay Systems pertaining thereto. Institute representative: R. W. Dobridge.
- Committee 1: Transmitters FM, Television, Facsimile and Relay Systems pertaining thereto.
- Committee 2: Transmitters AM, Standard and Short Wave.

Panel C—Radio Communication including Point-to-Point, Portable, Mobile and Emergency Service (other than Broadcasting). Institute representative: S. Sillitoe.
- Committee 1: Police, Fire, Forestry and Power Utilities.
- Committee 2: Railroad, Highway and Transit Utilities.
- Committee 3: Telephone, Telegraph, Facsimile (Public Service), Point-to-Point and Marine Communication Services and Relay Systems pertaining thereto.

Panel D—Broadcasting Receivers—Standard, Short Wave, FM, Television and Facsimile Services. Institute representative: A. S. Runciman.
- Committee 1: Receivers FM, Television and Facsimile.
- Committee 2: Receivers AM, Standard Broadcasting and Short Wave Sets.
- Committee 3: Standards Committee—Formulation of Proposed Canadian Standards based on U.S. Standards.

Panel E—Aeronautical Radio and Radio Aids to Navigation. Institute representative: A. B. Hunt.

Panel F—Industrial, Scientific and Medical. Institute representative: J. A. Ouimet.
- Committee 1: Industrial, Scientific and Control Applications.
- Committee 2: Medical and Surgical Applications.
- Committee 3: Interference.

The planning by the members of the Board is a co-operative effort of all branches and phases of industry and has been primarily concerned in making an exhaustive study of the allocation of radio frequency channels so as to recommend a fair and equitable distribution of the available frequencies to best serve the many demands for communications, aids to navigation and industry itself, using the radio frequency spectrum.

In the first year of operation, over thirty formal meetings were held by the panels and committees with a total attendance in excess of 450.

A tremendous amount of data has been handled by the committees and panels and preliminary reports were issued by practically all panels indicating their frequency allociation requirements during August of last year. These were forwarded to the Department of Transport for use at the Rio de Janeiro Conference on Frequency Allocations held during September. Unfortunately time did not permit the co-ordination of the preliminary reports to ensure that there was no overlapping of requirements between panels, so they were submitted as a guide only to the Department of Transport without the final approval of the Administrative Committee of the Board.

As indicated by the President at the annual meeting, final reports of all panels are now nearing completion and will soon be passing through Panel A for screening. This Panel is responsible for reconciling the frequency allocations recommended by the other panels and on the basis of the most efficient use of the common medium, to develop and recommend an overall frequency allocation plan.

The activities of the panels are co-ordinated by the Steering Committee and all panel reports, including the overall frequency allocation plan from Panel A, are submitted to the Administrative Committee for final consideration and approval.

The financial statement of the Canadian Radio Technical Planning Board, as approved at the annual meeting in December for the year ending November 30th, 1945, shows total receipts of dues from sponsoring members at $3,850. The expenses incurred during the same period amounted to $829.74, leaving a net surplus on the year's operations of $3,020.26. The expenses consisted principally of printing and mailing charges for the various reports and charts. No remuneration was paid to officers or clerical staff, the latter being supplied free of charge by the staff of the Radio Manufacturers' Association.

THE WAR RECORD OF BRITISH INDUSTRY

The Story of a Great Achievement

The effort to describe the Herculean task so successfully accomplished during the war by British industry has been made many times, but it is doubtful if there is any better account than that given in a special issue of the *London Times*. It is called "A Record of British War Production — The Story of a Great Achievement". It consists of 32 full newspaper size pages on a special paper of a weight very much like tissue.

The articles are full of startling information for one who does not know the history. The story of sudden expansion—the development of efficient methods — the mobilization of manpower, the denials and sacrifices of the people are told carefully and dispassionately.

The foreword, written by the Rt. Hon. Oliver Lyttelton, M.P., describes succinctly the British record. Here it is:—

"Victory in the War of 1939-45 was not only on the battlefield, on the sea and in the air, but in the workshops and factories of the Allied Nations.

"In this record there is collected together, for the first time in one document, a comprehensive summary of the many and varied aspects of Britain's achievement in war production. And a truly remarkable achievement it was.

"Of all the munitions used by the Armed Forces of the British Commonwealth and Empire (8¾ million men in all) since the beginning of the war, no less than 70 per cent was produced in the United Kingdom itself. The rest came from the United States of America, from Canada, and from the other nations of the Commonwealth. The First Lord of the Admiralty, the Minister of Supply, and the Minister of Aircraft Production can testify with me, who was responsible for the overall coordination of this vast and complex system of supply, that, nothwithstanding our own high rate of production, this aid from overseas was indispensable.

"In addition to what we produced for our own forces and those of the Commonwealth and Empire, we made and sent substantial supplies to our other Allies — the United States Forces in Britain, the U.S.S.R., China, and others of the United Nations.

"All this we had to do under conditions of almost unbelievable difficulty. We were bombed from the air; against this we had to disperse our production to black-out our cities, our railways, our roads, our factories. U-boats sank our ships bringing in our life-blood, food and raw materials. Yet, with our imports of raw materials cut by 50 per cent, we achieved the highest industrial output ever attained in the history of our country.

"Such a prodigious effort was made possible only by the great labours and heavy sacrifices of the British people. All men up to age 64 and all women to age 59 were mobilized; food, clothes, petrol were severely rationed; and supplies of other everyday things drastically limited. Our export trade too had to be deliberately curtailed, so that in 1943 and 1944 it was less than one-third in volume of the 1938 level. This meant hardships for our overseas customers, but it released over 1,000,000 men and women hitherto engaged in making exports for direct war work.

"During all this great outpouring of effort, the quality and ingenuity of British production have been more than maintained. We were the pioneers of radar and jet propulsion; it was a British scientist who discovered penicillin, a British engineer who invented and designed the Bailey Bridge; we designed and built the Mulberry harbours, the prefabricated portable harbours which made the invasion of France possible, British aircraft have proved themselves second to none in the world; and British scientists collaborated with American and Canadian scientists to develop and produce the Atomic Bomb.

"The inventiveness and ingenuity of British scientists and engineers, and the high standard of quality in our production, point the way to the future and show that we shall conquer too the problems which peace is bringing."

Not all of us appreciate that "It is claimed for the British people, after the most careful examination of the facts in all countries, that it was more fully deprived of its peace-time comforts and more fully mobilized for war than the people of any other country — not excluding Germany".

It would be a splendid thing if every Canadian could read this record. It would do much towards building within him not only an appreciation of what has been done, but as well a confidence that the British people will meet the problems of the future with the same courage, resolution and skill as they exhibited in their conquest of the problems of the past.

BRITISH SCIENCE AIDS RECONSTRUCTION

For the following sketch of plans for British industry and the leadership given by research, we are indebted to the United Kingdom Information Office. This is an abridgement of information supplied to the Institute.

" Today the United Kingdom intends to achieve similar, and even greater results, in the application of science to peacetime industry. Here she has entered the peace with the considerable asset that many of her wartime advances are applicable to non-military purposes. Sir John Anderson has listed some of them: Research in the textile industry has resulted in the production of cotton fabrics in which the fibres are so twisted that, on contact with water, they immediately swell and render the cloth waterproof, while at the same time allowing for the passage of air. Again, in the steel and non-ferrous metal industries, new processes have been developed and new materials produced for the first time including many types of alloy steel and great quantities of magnesium from sea water. " In television ", said Sir John, " we undoubtedly led the world before the war and are probably still ahead. Before the war the United Kingdom gained all the speed records in the air, on the water and on land, with British pilots and British machines made in British workshops. We now hold all those records again. All aeroplanes are fitted with perspex—a transparent, non-splintering plastic produced in this country, and during the war our chemical industry produced also polythene—the finest known insulator. An insecticide, gammexane, probably more efficient than DDT, a range of selective weedkillers, linked with the discovery of hormones produced in the growing tips of plants—which may well mean a revolution in agricultural methods—a synthetic adhesive, heat, water and acidproof, giving unions stronger than those obtained by riveting or spot welding, are other achievements of our progressive and virile chemical industry. In the manufacture of scientific instruments there is the same story of technical skill and successfully applied research.

" When the war ended the United Kingdom Government and industry immediately turned to the means of expanding scientific research and still further intensifying scientific and industrial collaboration. In August the Federation of British Industries announced the formation of a new research committee to establish a close peacetime partnership between individual industries and research centres. This was followed in September by the Government's plans for the reorganization of the scientific civil service on to a basis ensuring greater incentive and improved facilities. Last month, the Government announced its ten years plan for the full utilisation of the country's scientific manpower and resources. These three measures have been accompanied by a series of other important developments undertaken by different United Kingdom industries. The steel industry, for example, has set up a new research association with resources of four hundred thousand pounds a year, while the textile industry has announced a two-fold increase in the capacity of cotton research.

" There are three main factors involved in this large scale expansion of scientific research now under way in Britain; personnel, finance and organization. As far as financial aid is concerned, we now have the framework within which all that is required can be secured. More scientists are needed—but the Government and industry are determined to overcome this shortage. Here the contribution of British industry is of special interest. Among the many manufacturers who have given considerable financial assistance in training scientific workers are the Shell group (who have made a gift of four hundred and thirty-five thousand pounds to Cambridge University for the Department of Chemical Engineering, together with a yearly grant of two thousand five hundred pounds for scholarships), Imperial Chemical Industries who have given eighty fellowships at universities for research in physics and chemistry, and Courtaulds who have given one hundred eighteen thousand pounds for similar purposes to the Imperial College of Science. During the war the nation-wide scale of the organization of research was to a large degree responsible for the successes achieved."

MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, January 12th, 1946, at nine thirty a.m.

Present: Vice-President J. E. Armstrong in the chair; Vice-President E. V. Gage; Councillors R. S. Eadie, R. C. Flitton, J. A. Lalonde, C. C. Lindsay, E. Lavigne, C. A. Peachey and P. E. Poitras; Treasurer R. E. Chadwick; J. B. Stirling, chairman of the Committee on Professional Interests; Secretary Emeritus R. J. Durley and General Secretary L. Austin Wright.

Community Planning: The general secretary reported that in reply to the president's telegram relative to amendments to the National Housing Act (which was reported in full at the December meeting of council), the following letter had been received from the Minister of Finance.

Ottawa, December 12th, 1945.

Dear Mr. Fetherstonhaugh:

I wish to thaink you for your telegram of December 7th regarding the amendments to the National Housing Act and the legislation creating a Central Mortgage and Housing Corporation.

Your suggestion that a competent Town Planning Engineer be included on the Board of the Corporation will receive every consideration.

As to the amendments made by Order in Council P.C. 5794 giving the Minister some discrimination in the matter of community planning, I can understand your concern and I can assure you that I share your views as to the importance of promoting community planning wherever possible. When the Bill is under discussion in the House, I shall try to make my attitude on this point perfectly clear. The immediate problem is, however, that a number of large scale projects have been proposed for various cities where overcrowding and congestion are particularly serious. If the requirements regarding community planning do remain in the Act in its original form, it would have been necessary to delay construction of these projects until the municipal authorities had taken action to put a satisfactory plan into effect. In view of the very urgent need for accommodation, the Government did not consider that it could justify such a delay and it is therefore proposing to give the Minister some discretion in the matter of community planning until the immediate emergency is passed.

Yours very truly,

(Signed) J. L. Ilsley.

The general secretary reported that certain members of the Institute, very close to the housing situation, who had been consulted, stated that the amendment, if used only in cases of emergency, could be a useful thing, but they admitted also that it could readily mean the end of the government's support for planning.

Following up the portion of the letter which related to the Institute's recommendation that an engineer be included on the board of the new Central Mortgage and Housing Corporation, the secretary reported that the president of this new organization had recently been announced. He was D. B. Mansur, a life insurance and banking official. Mr. Wright also informed the meeting that information had come to him that the present plans did not include the appointment of an engineer to the board. Mr. Mansur had been informed directly of the necessity of such services but had not reacted favourably. He had not indicated who the other directors were to be but implied that they would not be engineers.

The general secretary reported other matters related to developments in the Department of Finance which indicated that technical personnel would not be used by the Corporation except as employees in a minor capacity.

A long discussion followed in which all councillors expressed their concern as to the efficiency of planning done without the support of engineers working with the financial personnel at the administrative level. Eventually, on the motion of Mr. Poitras, seconded by Mr. Peachey, it was unanimously agreed that a message should be sent to Mr. Ilsley urging definite action with regard to the use of engineering knowledge. Accordingly, the following telegram was approved, with copies going to the Minister of Reconstruction, the governor of the Bank of Canada, and Mr. Mansur, all of whom are to be represented on the Board.

"Pursuant to your letter of December twelfth and subsequent study of Bill twenty-three authorizing the establishment of the Central Mortgage and Housing Corporation the Council of The Engineering Institute of Canada is now more than ever convinced that in the public interest engineers should be appointed to the board of the Corporation Stop Community planning is an important function of the engineer and is essential for success in any type of housing it cannot be overemphasized that the inclusion of qualified engineers at the administrative level is essential to the formulation of sound policy necessary for the protection of owners and tenants and public funds Stop The council of the Institute therefore urges that an engineer be appointed to the office of Vice-President of the Central Mortgage and Housing Corporation and that two of the five directors to be appointed be selected from among the membership of the engineering profession Stop It is convinced that only in this way can the objectives of the National Housing Act be attained Stop The officers of the Institute will be glad to submit a list of persons qualified for the appointments."

Institute Medals and Prizes: At the last meeting of the Council consideration had been given to the desirability of establishing an over-all committee to co-ordinate the work of the various medal and prize committees. In order that the recommendations of such a committee might be made available before the end of the present prize year (June 30th), it was unanimously agreed that such a committee be appointed as soon as possible, the selection of members to be left with Vice-President Armstrong and the general secretary.

Financial Statement: The chairman of the Finance Committee reported that as the Institute's books had only closed on December 31st, the auditors had been unable to present the financial statement for the year 1945 until half an hour before the Finance Committee meeting on Friday evening, the 11th. Before accepting the statement and presenting it to Council, the Finance Committee desired to discuss certain items with the auditors, and following some discussion, it was agreed that this meeting of Council should be adjourned to seven thirty p.m. on Thursday, January 17th, so that the chairman of the Finance Committee and the general secretary could discuss the various items with the auditors and present the final statement for approval at that time.

Sarnia Branch By-Laws: The proposed branch by-laws for the new branch at Sarnia, as submitted by the executive, were unanimously approved.

A.S.M.E. Joint Committee: The general secretary reported that the revised co-operative agreement between the Institute and the American Society of Mechanical Engineers had now been approved by the Councils of both organizations, and it would therefore be in order for the Institute to name three representatives to the joint committee whose duty it will be to promote co-operation. It had been suggested that if possible this committee might meet in Montreal at the time of the Institute's annual meeting.

Following consultation with the general secretary and Mr. Eadie, who had attended the recent annual meeting of the A.S.M.E. in New York, Mr. Stirling recommended that the Institute's representatives be—John G. Hall and Robert C. Wiren of Toronto and W. A. Newman of Montreal. On the motion of Mr. Poitras, seconded by Mr. Eadie, it was unanimously resolved that these three members be appointed as the Institute's representatives on the joint committee, other members to be named by Vice-President Armstrong if any of these members is unable to act.

Meeting of Association Representatives: Mr. Stirling reported that arrangements were being made to have a representative of each of the provincial associations with which the Institute has a co-operative agreement attend a conference in Montreal on Wednesday, February 6th, at which matters of mutual interest will be discussed, particularly the subject of increased Institute fees in those provinces.

He reported that as a member of the New Brunswick Association he had received a copy of the report of the Council of the Association to the annual meeting of the Association to be held on January 24th. There were one or two items in it which he would like to report to Council. First, he read the following minute:

"In accordance with the policy decided on at the annual meeting, Council continued to oppose the Canadian Council of Professional Engineers and Scientists. It was felt after several discussions on the subject that the C.C. of P. E. and S. was being given authority in various matters that the Dominion Council had never had except as approved by the several Provincial Associations. It was noted that the trend was away from engineers in the new body. In view of the Council's stand regarding this body Dominion Council's assessment against this Association for the year 1945 was fully scrutinized to insure that none of the money paid to Dominion Council was being diverted toward support of the C.C. of P.E. and S."

Secondly, the Association approved of the proposal made by the Institute that non-graduates applying for membership in the Institute should be asked to write the examinations of the Association.

Thirdly, he read the following minute:

"Council declined to support proposal to support continuance of the Wartime Bureau of Technical Personnel although this move was favoured by Dominion Council. Council considered that the Bureau filled no useful purpose insofar as employers in New Brunswick were concerned."

The chairman thanked Mr. Stirling for bringing this information to the attention of the meeting.

Proposal to establish a Parliamentary and Scientific Committee: The general secretary read a letter dated December 10th which has been received from the Canadian Association of Scientific Workers, which stated that the Association had circularized members of the Federal Parliament to secure their opinions with regard to supporting a parliamentary and scientific committee along the lines of a similar committee operating in England.

The letter stressed the importance of science in the post-war period and the essentiality that such a committee be established in order to keep members of parliament properly informed.

The letter suggested that a meeting be held about the middle of January to which members of parliament who had indicated an interest, and delegates of organizations who are prepared to participate in the work, be invited. It concluded with an invitation to the Institute to participate.

The general secretary reported that he had submitted the entire file to a prominent member of the Institute who was in the best position to judge of the merits of the proposal. His reply had stated that such a committee was well established in England but he pointed out that it had the support of outstanding engineering and scientific bodies, and that only under such circumstances was such a body likely to be accepted in Canada. He emphasized the fact that such a committee would never be of any influence unless the non-parliamentary group was made up of the very best people in the country.

At the chairman's suggestion Mr. Wright read the aims and objects of the committee according to the material supplied by the Association. It was agreed that the description of purposes was vague in many details and that something much more definite should be prepared if the proposal were to succeed.

Mr. Stirling, as chairman of the Committee on Professional Interests, questioned the usefulness of such a committee in Canada. He was interested in knowing what the committee could do that could not be done by the National Research Council and other bodies particularly interested in science and engineering.

After further discussion, it was moved and seconded and approved unanimously that the general secretary investigate the matter further and report to a later meeting.

At twelve fifty the Council adjourned for lunch, and reconvened at two thirty p.m. with Vice-President Armstrong in the chair.

The Engineer in the Civil Service: The attention of Council was drawn to certain aspects of the Civil Service Commission with the suggestion that the Institute should make recommendations to the Minister of Finance. Following considerable discussion it was finally decided that the matter should be referred to the Institute's Committee on the Engineer in the Civil Service with the request that it present a report with recommendaions to the next meeting of Council.

Wartime Bureau of Technical Personnel: The general secretary reported that at the last meeting of the Advisory Board of the Wartime Bureau of Technical Personnel, it was agreed that opinions regarding the future of the Bureau should be secured from each of the three sponsoring organizations, namely, the Canadian Institute of Mining and Metallurgy, the Canadian Institute of Chemistry and The Engineering Institute of Canada. He pointed out that there appeared to be three possible developments (1) that the Bureau remain essentially as it is now, administering the legislation in accordance with the power and authority given to it; (2) the personnel of the Bureau to be distributed in the offices of the Executive and Professional Division of the employment offices of the Department of Labour, and (3) that the Bureau be abolished in its entirety.

Mr. Wright was of the opinion that the Department of Labour favoured the second proposal, the idea being that the experienced members of the staff would take over the operations of the Executive and Professional offices in the larger centres. Mr. Wright stated that there would be another meeting of the Advisory Board on January 24th and asked that he be given instructions on that point.

A very long and general discussion followed in which several members of Council expressed the opinion that the usefulness of the Bureau was now over insamuch as there was no longer any real scarcity of engineers nor were there any priorities which had to be considered. They were of the opinion that the present restrictions which required an employer to notify the Bureau of any openings in his organization and of any engineer whom he has employed, and which required the employee to report his availability, were in no way useful and therefore should be abolished.

Mr. Poitras called attention to the survey of their records which was being made by the Bureau. An early cessation of activities might stop this work which he thought should be continued to completion. It was explained by the general secretary that a separate appropriation had been made by the Department for this survey and that additional personnel had been employed to complete it. Therefore it stood by itself as a separate activity and under such circumstances might be continued even though the Bureau were abolished.

Eventually, it was moved by Mr. Gage, seconded by Mr. Chadwick, and carried unanimously, that the Engineering Institute is appreciative of the excellent work done during the war by the Wartime Bureau of Technical Personnel, but as the war is now over and priorities abolished it is the opinion of the Council of the Institute that the irksome and unavailing restrictions still remaining with the Bureau be abolished and that the Bureau itself be discontinued as quickly as possible. As for the survey of the records, it is feared the information will be out of date before it is completed, and therefore Council recommends that the end of the present fiscal year be set as the date for the cessation of Bureau activities.

Dominion Coat of Arms: The general secretary explained that a number of prominent engineers from the United States and Great Britain would be attending the annual meeting and a friend of the Institute would like to donate, for presentation to these distinguished guests by the president and Council of the Institute, plastic plaques of the Dominion Coat of Arms. The general secretary submitted a sample, and it was unanimously and enthusiastically agreed that this generous offer be accepted..

At four thirty p.m. the Council adjourned to reconvene on Thursday, January 17th, 1946, at seven thirty p.m.

The adjourned meeting of Council was held at Headquarters on Thursday, January 17th, 1946, at seven thirty p.m.

Present: Vice-President J. E. Armstrong in the chair; Councillors R. S. Eadie, J. A. Lalonde and C. A. Peachey; Treasurer R. E. Chadwick, and General Secretary L. Austin Wright.

Financial Statement and Treasurer's Report for the Year 1945: At the chairman's request, the general secretary presented the auditors' statement for the year 1945, explaining the various items in detail. Following some discussion, Mr. Armstrong suggested that it might be advisable to defer action on the financial statement until the treasurer had presented his report.

Mr. Chadwick presented his report which was a concise summary of the financial statement. Following some discussion and some explanations by Mr. Chadwick, on the motion of Mr. Lalonde, seconded by Mr. Eadie, it was unanimously resolved that the auditors' statement for the year 1945 be accepted for presentation to the annual meeting.

On the motion of Mr. Peachey, seconded by Mr. Lalonde, it was unanimously resolved that the treasurer's report be accepted for presentation to the annual meeting.

There being no further business the Council rose at eight o'clock p.m.

ELECTIONS AND TRANSFERS

A number of applications were considered, and the following elections and transfers were effected:

Members

Cameron, Donald Roy, B.Sc., (Elect. Engrg.), (Univ. of Man.), asst. estimator, Vulcan Iron Works, Ltd., Winnipeg, Man.
Carswell, David B., (Manchester Tech. College, Manchester, Eng.,) president, Wartime Shipping Ltd., Montreal, Que.
Heatley, John Pratt, B.A.Sc., (Chem. Engrg.), (Univ. of Toronto), contact man, production control dept., Imperial Oil Limited, Sarnia, Ont.
Henderson, Gordon Roberts, B.Sc., (Civil), (Queen's Univ.), chief engr., Polymer Corporation Ltd., Sarnia, Ont.
Johnston, Alan H., B.Sc., (Chem. Engrg.), (Queen's Univ.), project designer, Aluminum Co. of Can. Ltd., Arvida, Que.
Piper, Richard Lloyd, B. Eng., (McGill Univ.), office engr., (design), Imperial Oil Limited, Sarnia, Ont.
Raymond, Antonio, B.Eng., (McGill Univ.), industrial engineer, Dominion Rubber Co., Ltd., Montreal, Que.
Ring, Roy Percival, Lieut. (E), R.C.N.V.R., B.Eng., (Mech.), (Nova Scotia Tech. Coll.), student, special course, industrial relations, Queen's Univ., Kingston, awaiting discharge.
Robertson, Ernest E., B.A.Sc., (Univ. of Toronto), graduate student, Univ. of Western Ontario, London, Ont.
Sturdee, Charles P., B. Eng., (McGill Univ.), process mech. engr., Imperial Oil Limited, Sarnia, Ont.
Walker, Charles F., mech. engr., (Cornell Univ.), plant engr., Canadian International Paper Co., Three Rivers, Que.

Juniors

Cormack, Jack Waitt, B.Sc., (Civil Engrg.), (Univ. of Manitoba), engr. grade 2, Public Works of Canada, Winnipeg, Man.
Gibson, Desmond Hope, Major, R.C.E., graduate, Royal Military College, engr., Canadian Military Mission, Washington, D.C.
Jelly, Keith Braden, B.Sc., (Acadia Univ.), cost engr., Aluminum Co. of Canada, Ltd., Arvida, Que.
Ohrner, William Ernest, Base Mtce. Officer, R.C.N.V.R., B.Sc., (Elect. Engrg.), (Univ. of Manitoba), H.M.C. Dockyard, Esquimalt, B.C.
Woods, John Parker, Lieut. (E), R.C.N.V.R., B.Eng., (Mech.), (Nova Scotia Tech. Coll.), 4328 Walkeley Ave., Montreal, Que.

Transferred from the class of Student to that of Member

Asplin, Albert Grant, B.Eng., (McGill Univ.), asst. chief dftsman., Horton Steel Works Ltd., Fort Erie, Ont.
Edson, Ralph Everett, B.Eng., (McGill Univ.), apparatus sales engr., Canadian General Electric Co., Ltd., Montreal, Que.
Mason, Vere Karsdale, Lieut., (E), R.C.N.V.R., B.Eng., (McGill Univ.), H.M.C.S., "GIVENCHY", Esquimalt, B.C.

Transferred from the class of Student to that of Junior

Hiller, Walter Andrew, B.Sc., (Civil), (Univ. of Alberta), Officer in Charge, Special Engrg. Equipment, Petawawa Camp.
Koropatnick, Capt., R.C.E., B.Sc., (Civil), (Univ. of Manitoba), 3rd Canadian Repat Depot., Canadian Army Overseas.
Orloff, Irving, B.Sc., (Civil), (Univ. of Manitoba), asst. supt., Pembina Mountain Clays, Limited, Winnipeg, Man.

Admitted as Students

Allison, Russell Stafford, (Queen's Univ.), 288 Frontenac St., Kingston, Ont.
Anderson, Glover Samuel, (Univ. of Manitoba), 612 Lipton St., Winnipeg, Man.
Babington, Harold Ormond, (Univ. of Manitoba), 587 Rathgar Ave., Winnipeg, Man.
Bird, Robert Allen, (Univ. of Manitoba), 626 South Drive, Winnipeg, Man.
Booth, John Nelson, (Univ. of Toronto), 1185 Dufferin St., Toronto, Ont.
Carson, James Hunter, B.A.Sc., (Univ. of Toronto), Lieut., R.C.E.M.E., 1102 St. Clarens Ave., Toronto 10, Ont.
Chant, Raymond Earle, (Univ. of Manitoba), 454 Greenwood Place, Winnipeg, Man.
Craig, Albert Franklin, (Univ. of Manitoba), 65 Cordova St., Winnipeg, Man.
Crawford, Robert Theodore, (Univ. of Manitoba), Ste. 3, Anvers Apts., Winnipeg, Man.
Daiter, Philip, (Univ. of Manitoba), 149 Charles St., Winnipeg, Man.
Daoust, Jean Marc, (Ecole Poly.), 6350 Christopher Columbus St., Montreal, Que.
Dawson, Gerald Peter, (Dawson College), St. Johns, Que.
De Pauw, George, (Univ. of Manitoba), Box 195, Fort Garry, Man.
Durnin, George Rowe, (Univ. of Manitoba), 97 Balmoral Place, Winnipeg, Man.
Flavell, George, (Univ. of Manitoba), 257 Oakwood Ave., Winnipeg, Man.
Fokschaner, Peter, (McGill Univ.), 4414 Girouard Ave., Montreal, Que.
Gall, William J. C. Jr., (Univ. of Toronto), Trinity Coll., Hoskin Ave., Toronto, Ont.
Hermeston, Raymond, (Univ. of Manitoba), 1175 Dominion St., Winnipeg, Man.
Hicks, James Stewart, (Univ. of Manitoba), Ste. 31, Fairmont Apts., Winnipeg, Man.
Jex, William David, (Univ. of Manitoba), 134 Scotia St., Winnipeg, Man.
Kernahan, George Martin, (Univ. of Manitoba), 1841 Assiniboine Ave., Winnipeg, Man.
Labossiere, Gerard Romeo, B.Sc., (Elect.), (Univ. of Manitoba), jr. welding engr., Dominion Bridge, Lachine, Que.
Lucas, Ronald Owen, (Univ. of Manitoba), 826 Dorchester Ave., Winnipeg, Man.
MacLaren, James Wade, (Univ. of Toronto), 126 Golfdale Rd., Toronto, Ont.
Malmgren, Edward Vernon, (Univ. of Manitoba), 651 Henderson Ave., Winnipeg, Man.

Matheson, Donald Thomas, (N.S. Tech. Coll.), 327 South St., Halifax, N.S.
McIntyre, Alphonse Joseph, (Univ. of Manitoba), 780 Ingersoll St., Winnipeg, Man.
Murray, Denby Charles, (Univ. of Manitoba), 3rd Ave., So., Geraldton, Man.
Ott, Helmuth George, B.Eng. (Civil), (McGill Univ.) civil engr., Atlas Construction Co., Montreal, Que.
Overgaard, Edmund Christian, (Univ. of Manitoba), 524 Sprague St., Winnipeg, Man.
Patterson, Hugh John Trevor, (McGill Univ.), 5607 Queen Mary Rd., Hampstead, Que.
Pearson, John Henry Allnut, (Univ. of Manitoba), 97 Balmoral Pl., Winnipeg, Man.
Persoage, Nicholas, (Univ. of Manitoba), 421 Home St., Winnipeg, Man.
Reynaud, Julien C., (Univ. of Manitoba), Box 221, Univ. of Manitoba, Winnipeg, Man.
Richman, Harold, (Univ. of Manitoba), 524 Mountain Ave., Winnipeg, Man.
Roles, Clemence, (Univ. of Manitoba), Bruno, Sask.
Senyshyn, Emil, (Univ. of Manitoba), 565 Anderson Ave., Winnipeg, Man.
Smith, Russell Harvey, (Univ. of Manitoba), 40 Eastgate, Winnipeg, Man.
Speed, Stewart Richard, (Univ. of Manitoba), 799 St. Mary's Rd., St. Vital, Man.
Stober, Julius Leonard, (McGill Univ.), 15 Ainslie Ave., Outremont, Que.
Taylor, Jack Richard, (Univ. of Manitoba), 346 Home St., Winnipeg, Man.
Thomson, Alexander Findlay, (Univ. of Manitoba), 53 Home St., Winnipeg, Man.
Thorsteinson, Sigurdur Baldwin, (Univ. of Manitoba), 621 Maryland St., Winnipeg, Man.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective:

Alberta

Member

Bate, Thomas Edward, B.Sc., (Elect.), (Univ. of Alberta), asst. radio engr., Dept. of Transport, 222 Tegler Bldg., Edmonton, Alta.

Saskatchewan

Juniors

Ayers, Frank Edward, B.Sc., (Civil), (Univ. of Sask.), instructor, Univ. of Saskatchewan, Saskatoon, Sask.
Potts, Gerald Anderson, B.Sc., (Mech.), (Univ. of Saskatchewan), Engr. Officer, R.C.N., Regina, Sask.

Students at University of Saskatchewan

Anderson, Reidar, 509 Dufferin Ave., Saskatoon, Sask.
Bell, Charles Edward, 2 McKim Block, Saskatoon, Sask.
Butler, Percy Millard, 1006 - 13th St., E., Saskatoon, Sask.
Campbell, William Ralph, 1035 University Drive, Saskatoon, Sask.
Chalmer, Thomas Edward, 203 Albert Ave., Saskatoon, Sask.
Davis, Ernest George, 509 King St., Saskatoon, Sask.
Dunbar, Thomas William, 209 Albert St., Saskatoon, Sask.
Millar, Alan Stuart, 626 - 3rd Ave., North, Saskatoon, Sask.
Opsal, John Oliver, 333 - 4th Ave., North, Saskatoon, Sask.
Swystun, August, 304 - 4th Ave., North, Saskatoon, Sask.
Weckman, Byron Thomas, 841 Temperance St., Saskatoon, Sask.
Wilks, George Haden, 323 - 3rd Ave., South, Saskatoon, Sask.

Student to Junior

Traynor, John Clair, Capt., R.C.E., B.Sc., (Univ. of Saskatchewan), 1017 University Drive, Saskatoon, Sask.

Quebec

Members

Asselin, Louis, B.A.Sc., (Chem. & Civil), (Ecole Poly.), chief chemist, Industrial Steel & Fibre Co., Montreal, Que.
Bastien, Paul Maurice, B.A.Sc., C.E., (Ecole Poly.), asst. chief engr., J. M. Eugene Gray, Inc., consultg. engrs., Montreal, Que.
Beaulieu, Joseph Rene Roland, B.A.Sc., C.E., (Ecole Poly.), chief of divn., Dept. of Roads, Grand'Mere, Que.
Bleau, Jean Marie Alphonse, B.Sc., (McGill Univ.), M.Sc., (Queen's (Mett.) Univ.), mining engr., Dept. of Mines, Quebec, Que.
Bourgoin, Louis Georges, Dr.Sc., (Univ. of Algiers), Chem. Engr., (E.N.P.C.), Paris, France, director, Research Centre, Ecole Polytechnique, Montreal, Que.
Brodeur, Paul, B.A.Sc., C.E., (Ecole Poly.), sales engr., Imperial Oil Limited, Montreal, Que.
Cote, Gaetan Jules, B.A.Sc., C.E., (Ecole Poly.), sr. assoc. member, Crepeau & Cote, consultg. engrs., Sherbrooke, Que.
Delage, Jean, B.A.Sc., C.E., (Ecole Poly.), economic technician, City of Montreal, Que.

Sherwood, Marvin Lorne, B.A.Sc., (Univ. of Toronto), district plant engr., The Barrett Co., Ltd., Montreal, Que.
Wong, Walter James, B.Eng., (Civil), (McGill Univ.), structl. designer, Aluminum Co. of Canada, Ltd., Montreal, Que.

Student to Member

Labrosse, Fernand J., B.A.Sc., C.E., (Ecole Poly.), constrn. engr., Clairvale Construction Co., Montreal, Que.

AN URGENT REQUEST

Would members who do not file the *Journal* kindly return their January 1946 copy to headquarters.

On account of difficulties at the printers, fewer copies have been printed than had been ordered and the needs of several libraries have not been filled.

JAMES BERTRAM HAYES

PRESIDENT OF THE ENGINEERING INSTITUTE OF CANADA, 1946

The incoming President of The Engineering Institute of Canada is a Nova Scotian, one of the many engineers, born and educated in the Maritime Provinces, who have rendered distinguished service to their profession and to the Dominion of Canada. Like many of his brother engineers from the Maritimes, Mr. Hayes has spent a substantial proportion of his time in work outside the limits of his native province, having held positions of responsibility in the United States and in the West Indies as well as in Canada. His career has in fact shown very clearly that the professional training of an engineer may well lead to the successful performance of important executive duties. For more than twenty years he has been connected with the management and organization of public utilities giving service in the electric light and power, gas, and transportation industries.

J. B. Hayes, M.E.I.C.

Mr. Hayes was born at Springhill, Nova Scotia, in 1892, and educated at schools there and at Mount Allison University. After graduating there he proceeded to Dalhousie University and the Nova Scotia Technical College for his courses in science and engineering, taking his engineering degree at the latter institution in 1916. In that year he enlisted for active service and went overseas as a gunner in the Canadian Artillery. From May 1916 to June 1919 he served first with the 14th Brigade Headquarters, Canadian Field Artillery, then with the 12th Battalion, Royal Canadian Engineers, as lieutenant.

On returning to Canada he held for a year a position, in Halifax, as Industrial Surveyor in the Department of Soldiers' Civil Re-establishment. In 1920 he joined the staff of the Nova Scotia Tramways and Power Company in Halifax, as an Engineer of Maintenance of Way. The company was then being operated under the direction of the Stone and Webster Corporation of Boston; in 1922 Mr. Hayes went to the Boston office of that firm as secretary to their District Manager. A year later he was transferred to the staff of the Jamaica Public Service Company at Kingston, Jamaica, where he was appointed assistant manager.

In 1924 he went to Fort Madison, Iowa, as manager of the Fort Madison Electric Company. The following year he was sent to Richmond, Virginia, as assistant to the president of the Virginia Electric and Power Company. At that time, both these organizations were operated by the Stone and Webster Corporation. His next appointment in 1927 was that of general superintendent of transportation at Norfolk, Virginia, for that division of the Virginia Electric & Power Company. Mr. Hayes resigned that position in 1929 to become general manager of the Nova Scotia Light and Power Company at Halifax.

From that time to the present, under his progressive direction, the company's record has been one of steady achievement. During World War II, in addition to the maintenance of the regular services of the company in Halifax and the vicinity, heavy special assignments had to be carried out to meet the requirements of the naval and military authorities. As an example of these, the company, under the direction and organization of Mr. Hayes, degaussed the largest number of ships so equipped by any unit engaged in that line of activity. He also found time to undertake the onerous duties of Regional Chairman of A.R.P. for the Maritime Provinces.

Mr. Hayes became a member of The Engineering Institute of Canada in 1920. He has served on the executive committee of the Halifax Branch and is a Registered Professional Engineer of Nova Scotia. He was elected president of the Canadian Electrical Association in 1944. He is a past-president of the Halifax Board of Trade and of the Canadian Transit Association. Thus he is no stranger to the presidency of important technical and industrial societies.

From these biographical notes it will be evident that the new president of the Institute needs no introduction to our members in the Maritimes or indeed to any of those engaged in public utility engineering throughout Canada. The membership at large will welcome him as an engineer familiar with professional problems, and of wide experience with questions of management and organization.

Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items, such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form a basis of personal items in the *Journal*.

Sir Hugh Beaver, M.E.I.C., has relinquished his wartime appointment as Director-General in the Ministry of Works, London, Eng. Prior to his service in this capacity he was a partner with Sir Alexander Gibbs and Partners, consulting engineers, at London.

Frank A. Patriquen, M.E.I.C., of the Saint John, N.B., district office of the Department of Public Works of Canada, has been promoted from junior engineer to assistant engineer.

K. R. Swinton, M.E.I.C., who was recently discharged from the army with the rank of lieutenant-colonel after more than four years' service, has been appointed manager of the elctronic apparatus division of engineering products sales department of RCA Victor, Montreal.

A graduate of the University of Vienna with degrees in radio and television engineering, applied mathematics and physics, he came to Canada in 1940, shortly afterwards joining the Royal Canadian Corps of Signals. Attached to the Department of Munitions and Supply for a time as a technical assistant to the director general of signals production branch he was later appointed assistant director of the directorate of electrical communications design of the Department of National Defence in Ottawa. In this capacity he was responsible for the design of all radio and telephone equipment for the Canadian Army and of all development projects on such equipment undertaken by Canada on behalf of the British War Office.

In his new position Mr. Swinton will be responsible for the selection, merchandising and sales supervision of radio communications equipment (other than broadcast station equipment), industrial sound systems, R.F. heating and other electronic industrial equipment, electron microscopes and radio relay systems.

E. S. C. Carpenter, M.E.I.C., has received his release from the Canadian Army, after serving as a captain with the Royal Canadian Engineers overseas. He has returned to his former position as district engineer with the P.F.R.A., Dominion Department of Agriculture, Saskatoon.

S. A. Charters, M.E.I.C., has accepted a position as sales engineer with Westeel Products Limited, Montreal. Mr. Charters served in Canada and overseas as a captain in the Royal Canadian Artillery. A graduated from McGill University in civil engineering in 1936, he was prior to enlistment assistant sales manager for Watson Jack and Company Limited, in Montreal.

J. L. Charles, M.E.I.C., is back in his civil occupation with the Canadian National Railway Company in Winnipeg, after nearly four years service as a major in the Royal Canadian Engineers. Mr. Charles saw active service in the war of 1914-1918, and re-enlisted in the active army on September 3rd, 1939, with the 20th Field Company on the Pacific Coast.

News of the Personal Activities of members of the Institute

R. A. H. Hayes, M.E.I.C., has accepted a position with H. G. Acres and Company at Niagara Falls, Ont. He was formerly acting chief engineer with the Aluminum Laboratories, Limited, Montreal, which firm he joined in 1938. Mr. Hayes was the recipient of the Ross Medal of the Institute for 1945.

George S. Lace, M.E.I.C., has resigned his position of deputy chief inspector with the War Assets Corporation and has been appointed supervising inspector for the Montreal area, with the Civil Aviation Branch, Department of Transport.

R. J. Mattson, M.E.I.C., is now connected with the Canadian and General Finance Company Limited, Toronto, Ont., as an engineer. He was previously with the Aluminum Company of Canada Limited at Montreal.

A. T. Hurter, M.E.I.C., has become associated with John Stadler, M.E.I.C., consulting engineer. The organization, under the name of Stadler, Hurter & Company, consulting engineers, is located in Montreal and will specialize in pulp and paper mills from forest to finished product.

Prior to coming to this continent, Mr. Hurter worked in London with Brown & Pooley, consulting engineers, and also in Rumania as partner in the industrial engineering company of Huber & Hurter, Bucharest. In 1923 he was employed by Mr. John Stadler as draughtsman for the Cornerbrook mill. In the following year he became associated with Geo. F. Hardy, consulting engineer, New York, as designing engineer and for the next four years was successively field representative on mills for Price Brothers & Company Limited, Manitoba Paper Co. Ltd., and Anglo-Canadian Pulp & Paper Mills, and resident engineer for St. Lawrence Paper Co. Ltd.

From 1929 until 1937 Mr. Hurter was resident engineer for the Iroquois Falls Division of Abitibi Power & Paper Company, and during that time he was also acting as consulting engineer for other Abitibi divisions. During the following year he was engineer in charge of mill construction of Lake Sulphite Pulp Company Limited at Red Rock, Ont. From 1938 until 1940 he was representative at Red Rock of the receiver and general manager of the Lake Sulphite Pulp Company, in charge of all operations.

In 1940 he became project engineer of Defence Industries Limited in charge of layout and design and in the following year was transferred to the Bouchard Works at Ste. Therese, Que., in charge of production of shell filling plant. In 1942 he was transferred by Allied War Supply Corporation and worked for one year as project engineer in charge of layout and design for extension of Cherrier shell filling plant of Canadian Car Munitions Limited. From 1943 until his resignation Mr. Hurter held an executive position with Canadian Car and Foundry Company Limited, reporting to the vice-president and general manager on various war contracts.

Colonel Clarence E. Davies, M.E.I.C., was recently awarded the medal of the Legion of Merit in Washington for meritorious service while on active duty with the Ordnance Department of the United States Army. Colonel Davies is secretary of The American Society of Mechanical Engineers and has recently resumed his duties in New York after an extended leave of absence.

As Chief of the Control Division, Office of the Chief of Ordnance, he was concerned with problems of policy, organization, methods, procedures and statistical reporting practices for the Ordnance Department. He has been with the engineering society since 1920, consecutively as associate editor, managing editor, assistant secretary, executive secretary and, since 1934, as national secretary.

The Legion of Merit medal recognizes "extraordinary fidelity and essential service" in a position of responsibility, and is conferred on "outstanding officers and enlisted men of the armed forces of the United States or of friendly nations". It is the second highest award given to service forces.

Colonel Davies' citation reads:

"Colonel Clarence E. Davies, Ordnance Department, Army of the United States, demonstrated remarkable initiative as Chief, Control Division, Office of the Chief of Ordnance, from June 1942 to November 1945. Through his extensive engineering and production experience, able administration and continual analysis of Ordnance requirements, he successfully contributed to the efficient expansion of the Ordnance Department to a wartime basis."

Dr. O. W. Ellis, M.E.I.C., director, department of engineering and metallurgy, Ontario Research Foundation, Toronto, has been honoured by his *alma mater,* the University of Birmingham, England. In December last, by special warrant, the University conferred on him *in absentia* the degree of Doctor of Science (Metallurgy).

W. E. Hobbs, M.E.I.C., has resumed his former position of assistant manager, Land Department, Hudson's Bay Company, in Winnipeg. Mr. Hobbs served as a wing commander with the No. 2 Training Command, R.C.A.F.

O. Inkster, M.E.I.C., who served as a flight lieutenant with the R.C.A.F. for nearly three years, has returned to his civilian practice as consulting engineer and surveyor in Edmonton, Alberta.

G. Moes, M.E.I.C., is now president of Hamilton Sterling Company Limited. He has been associated with this company for several years, having been made general manager in 1932. In 1944, he obtained leave of absence to manage No. 10 Elementary Flying Training School, R.C.A.F. at Pendleton, Ontario.

K. Y. Lockhead, M.E.I.C., who served as an aeronautical engineer in the R.C.A.F., has been released with the rank of squadron leader. He has returned to the Hudson's Bay Company as building superintendent, Vancouver store.

C. H. Rosier, M.E.I.C., has accepted a position with Building Products Limited, in Montreal. He served overseas with the R.C.N.V.R. as lieutenant (E).

C. K. Lockwood, M.E.I.C.

C. K. Lockwood, M.E.I.C., has been appointed sales manager of the stainless steel and alloys division of Shawinigan Chemicals Limited. He was formerly metallurgist with the company.

F. W. Alexander, M.E.I.C., has retired from the position of assistant chief engineer, western lines, Canadian Pacific Railway. He was tendered a testamentary banquet by his fellow employees at Winnipeg in December, at which time a Life Membership in the Institute was presented to him by President Fetherstonhaugh. Mr. Alexander entered the service of the C.P.R. in 1903 as transitman from which time he received successive promotions in the engineering department in western Canada.

J. S. Cooper, M.E.I.C., who for the past four and one-half years has been serving as an engineer officer in the Royal Canadian Navy has recently retired with the rank of lieutenant-commander (E). He has accepted the position of assistant to the chief engineer of the Temiskaming and Northern Ontario Railway at North Bay, Ont.

Major R. B. Jennings, M.E.I.C., has been appointed property engineer of War Assets Corporation. His task will be to set salvage values on buildings placed with War Assets for disposal, and to advise on all engineering matters of the Lands and Buildings Department of the Corporation.

In the first World War, Major Jennings commanded a company in the Canadian Railway Troops serving in France and Belgium and on demobilization was made division engineer for the Canadian National Railways in Toronto, Ottawa and Montreal. He resigned in 1926 to become general manager for Canada of Robert W. Hunt Co. Ltd., inspection and testing engineers. In 1930 he joined Crane Limited as railroad sales engineer and in 1933 engaged in highway and railway construction.

In 1939 he joined the Defence Projects Construction Branch of the Department of Munitions and Supply. An inspecting engineer of the Montreal district, he supervised the construction of industrial plants, shipyards, aircraft plants and runways, military camps and the enlargement of municipal water and sewage plants for war purposes.

Carlyle Gerow, M.E.I.C.

Carlyle Gerow, M.E.I.C., returned in January to the Toronto offices of Dominion Coal Company Limited and Dominion Steel and Coal Corporation Limited, to resume his duties as district manager, coal sales, Ontario, after four and one-half years' service as a civilian technical officer of the Department of National Defence for Air, on loan to the government by his company. This post involved constant travelling, reporting and advising on supply, delivery, efficient and economical utilization of heating fuels in R.C.A.F. and British Commonwealth Air Training Establishments. He also acted as liaison between the Department and the coal and oil controllers' offices. In recognition of his war services he was made a Member of the Order of the British Empire in 1943.

A graduate of Queen's University in 1922, Mr. Gerow was first employed as steam plant superintendent of the Bathurst Power and Paper Company. He joined the coal sales department of the Dominion Steel and Coal Corporation Limited in 1931.

R. A. McLellan, M.E.I.C., who served as squadron leader with the R.C.A.F., has returned to his civilian occupation as partner in Underwood McLellan in Saskatoon, Saskatchewan.

J. M. Riddell, M.E.I.C., has retired from active service with the Canadian army, in which he held the appointment of command engineer officer, acting as technical adviser to the G.O.C. in C. Atlantic Command, with the rank of lieutenant-colonel. He has rejoined the Department of Mines and Resources, in the Geodetic Service in Ottawa.

A. K. Robertson, M.E.I.C., who served for four years with the Royal Canadian Engineers, has retired with the rank of lieutenant-colonel. He was executive officer with the Special Commission for Defence Projects in North West Canada.

S. N. Tremblay, M.E.I.C., has returned to his former position with the Quebec Streams Commission in Montreal. He served as a captain at No. 5 Vocational Training School at Rimouski, Quebec.

H. L. Trotter, M.E.I.C., has retired from active service with the rank of lieutenant-colonel, after four years with the Royal Canadian Engineers. Colonel Trotter won the D.S.O. during the last war, when he served overseas with the 11th Battalion.

H. W. McMillan, M.E.I.C., has been appointed to the position of manufacturing consultant, and heads the new industrial engineering department of the Eastern Division of Dominion Bridge Company Limited, Montreal. Prior to this appointment, Mr. McMillan was works manager of the Lachine shops of the company for nearly 20 years. Apart from his long experience with Dominion Bridge, he has held responsible positions such as: superintendent of inspectors in the bridge engineering department, eastern lines of C.P.R.; chief inspector of St. Lawrence Bridge Company (subsidiary of Dominion Bridge Company); chief inspector of shop fabrication and later chief inspector of erection for the Quebec Bridge Commission.

Gordon Cape, M.E.I.C., has been made chief assistant, and research and methods engineer of the new industrial engineering department, Eastern Division, Dominion Bridge Company Limited. After graduating in civil engineering from McGill University in 1930, Mr. Cape joined the company as supervisor of welding and later became welding engineer. Concurrently he held the position of chief inspector and later that of research and methods engineer in the works department.

Peter Millar, M.E.I.C., has been appointed general superintendent of the works department of the Eastern Division of Dominion Bridge Company Limited. Mr. Millar has been associated with the company since 1923, prior to which he was apprenticed to the engineering firm of Mechans Limited of Glasgow, in which city he received his education.

During his career with the company he has held various responsible positions in the designing offices, including that of assistant engineer in the plate and boiler department. He held the latter position until 1941 when he joined the works staff in the capacity of structural superintendent and later operating superintendent.

C. S. Kane, M.E.I.C., has been appointed sales consultant, Eastern Division of Dominion Bridge Company Limited. He has been with the company since 1909, following a short period with the Hart-Otis Car Company. At Dominion Bridge Mr. Kane started first in the engineering department and in 1912 took charge of design and estimating in the Montreal contracting office. He also devoted considerable time to sales work, being appointed engineer in charge of these activities in 1921. In 1934 he was transferred to the head office at Lachine, Que., as sales manager, Eastern Division.

Mr. Kane has been associated with many developments and in particular, is the inventor of the Kane system, now known as "Steel-Concrete Composite Construction". His present activities will free him for special advisory and negotiation work in the Eastern Division.

H. M. Watson, M.E.I.C., has recently been made sales manager of the Eastern Division of Dominion Bridge Company Limited in addition to his previous duties. His first eleven years with the company, which he joined in 1911 after graduating from McGill University, were spent in the engineering and draughting departments. Following this he joined the contracting office and in 1928 was appointed contracting engineer, a post he still holds in addition to his present appointment.

Geo. H. Midgley, M.E.I.C., has been appointed assistant sales manager, Eastern Division, Dominion Bridge Company Limited. He received his engineering education in the maritimes, having graduated from Mount Allison University, Sackville, N.B., in 1922, and Nova Scotia Technical College, Halifax, N.S., in 1934. Prior to joining Dominion Bridge Company he was in the engineering department of Canadian International Paper Company, then with the Dodge Manufacturing Company and United Steel Corporation in charge of engineering and sales. He joined Dominion Bridge as a sales engineer in 1936 and during the war was on loan for a period as chief engineer of Wartime Merchant Shipping Limited. On his return to Dominion Bridge he was appointed manager of manufacturing, a position he has held until recently.

W. D. Jewett, M.E.I.C., is now export manager, Eastern Division, Dominion Bridge Company Limited. He graduated in applied science and engineering at the University of Toronto and joined Dominion Bridge in 1923. He has held numerous responsibilities with the company in engineering design, field engineering, sales and advertising. In recent years he has been in charge of mechanical sales in the Eastern Division. In connection with the present appointment, Mr. Jewett has just completed an extensive tour of South America and is now back at Lachine, Que., organizing the company's activities in the export field.

J. S. Walsh, M.E.I.C., has been appointed sales development manager, Eastern Division, Dominion Bridge Company Limited. He gained the greater part of his experience in engineering and sales work in England and, after graduating from London University in 1929, went on to the British Thomson-Houston Company electrical manufacturers in Rugby, and thence to Browett-Lindley Limited, mechanical engineers and manufacturers, Letchworth, where he became sales development manager. During the war period he occupied the position of production engineer with the Armament Supply Department of the Admiralty serving first in England and then with the British Admiralty Technical Mission in Ottawa. He joined the staff of the Dominion Bridge Company recently and his new duties involve publicity, advertising and other forms of sales development work.

M. J. Spratt, M.E.I.C., who was in command of No. 6 Canadian Artizans Works Company, Royal Canadian Engineers, engaged in the building of hospitals, camps, leave hostels, etc., has returned to his former position as chief engineer, Saskatchewan Pool Elevators Limited, Regina, Sask. Mr. Spratt has been associated with this work since 1928.

Lieutenant-Colonel Richard Walkem, M.E.I.C., who was mentioned in despatches last fall, has been appointed officer commanding the 11th (R) Anti-Aircraft Regiment, R.C.A., in Vancouver. The new O.C. returned to Canada recently after more than five years' service overseas which he concluded as second-in-command of the 6th Field Regiment, R.C.A.

Robert A. Bradley, M.E.I.C., is at present employed as chief engineer with the Civil Aviation Division at Gander, Newfoundland.

C. A. Stollery, M.E.I.C., who served with the Royal Canadian Navy as an acting lieutenant commander (S.B.) (E), has been demobilized and is now with the Poole Construction Company, Edmonton, Alberta.

Dr. R. S. Jane, M.E.I.C.

Dr. R. S. Jane, M.E.I.C., has been appointed vice-president in charge of research of Shawinigan Chemicals Limited. For the past three years he has been director of the industrial research department of The Shawinigan Water and Power Company.

Dr. Jane graduated from the University of British Columbia in 1922, and was awarded a Ph.D. by McGill University in 1925. He subsequently attended the University of London for two years having won the Wembley Scholarship. He joined the plant research department of Shawinigan Chemicals Limited in Shawinigan Falls in 1927, being transferred to the research and development department of the company in Montreal in 1936, where he remained until his appointment to The Shawinigan Water and Power Company in 1943.

Hugh A. Lumsden, M.E.I.C., who has served for the past six years with the War Supply Board and the Department of Munitions and Supply has resumed his practice as consulting engineer at Hamilton, Ont.

Charles D. Woolward, M.E.I.C., has recently been appointed chief engineer of Anglin-Norcross Quebec Limited at Montreal. He has been with this company since 1938, previous to which he was employed as steel designer with Canadian Industries Limited, Montreal.

Andrew MacGillivray, M.E.I.C., has retired from the post of assistant engineer, Department of Public Works of Canada, Halifax district, thus bringing to a close a professional career of 37 years in the public service.

After graduating with a B.A. from St. Francis Xavier University in 1904, he attended Provincial Normal College at Truro, N.S., and returned to his *alma mater* to teach. At the same time he did post-graduate work and in 1908 obtained his B.Sc. From 1908 until 1910 he was engaged as engineer on the construction of the New Brunswick section of the National Transcontinental Railway. In the latter year he returned to Antigonish to join the staff of the Public Works of Canada. In 1918 he was transferred to the North Sydney office and in 1921, with the consolidation of the various provincial branch offices at Halifax, he was transferred to that city where he was stationed until his retirement.

R. G. Scott, M.E.I.C., has received his discharge from the R.C.N.V.R., with which he served for nearly three years as electrical lieutenant. Mr. Scott is now with the lighting division, British Columbia Electric Railway Company Limited, in Vancouver. Prior to enlistment he was sales engineer for the Winnipeg Electric Company in Winnipeg, Manitoba.

F. H. C. Sefton, M.E.I.C., has returned to his former position with the Way and Structures Department, Toronto Transportation Commission, in Toronto. He served as a flight-lieutenant in the R.C.A.F. Mr. Sefton was overseas for four years with the Canadian Expeditionary Force 1915-1919.

J. G. Spotton, M.E.I.C., has re-established his pre-war business as manufacturers' representative in Toronto, He served overseas with the 12th Field Regiment, R.C.A., returning later to Canada to the appointment of T.S.O. II with the Director of Artillery at N.D.H.Q. with the rank of major.

Maurice Pépin, M.E.I.C., is now employed as general manager by Abias Pépin, Limitée at Longueuil, Que. He was formerly associated with Hall Engineering Limited, Montreal.

Charles Miller, M.E.I.C., has resigned his position as chief engineer of Aluminum Power Company Limited to become assistant general superintendent of the Beauharnois Light, Heat and Power Company Limited.

R. E. Tweedale, M.E.I.C., has accepted a position with the New Brunswick Hydro Commission in Saint John, N.B. He served overseas for nearly four years as a flight-lieutenant in the R.C.A.F. Prior to his enlistment Mr. Tweedale was district highway engineer, located at Perth, N.B.

E. L. Zealand, M.E.I.C., has retired from active service after five years overseas with the R.C.E. He served as a captain with 1st Canadian Division Construction Company, and later with headquarters, 21 army group. Mr. Zealand has returned to the Pigott Construction Company in Hamilton, Ontario, having been associated with this Company for many years.

G. H. W. McKee, M.E.I.C., has returned to the University of Western Ontario, London, where he is teaching industrial management and cost accounting in the Department of Commerce. Mr. McKee left his position in 1940 to proceed overseas, where he served for five years, as a captain in the 1st Survey Regiment, R.C.A.

G. V. Eckenfelder, Jr.E.I.C., has returned to the Calgary Power Company Limited in Calgary, with which he was associated before the war. He served as a captain in First Canadian Army Signals, having spent four years overseas.

R. C. Fairchild, Jr.E.I.C., is now in private practice as partner in the firm of Murray & Fairchild, architects, in Toronto. Mr. Fairchild was overseas with the Royal Navy Fleet Air Arm. He graduated from the University of Toronto in 1943 with the degree of Bachelor of Architecture.

A. C. Findlay, Jr.E.I.C., has been released by the R.C.A.F., in which he served for two years as a flying officer. He is now with Canadian Vickers Limited in Montreal. Mr. Findlay graduated in mechanical engineering from McGill in 1942, and was then with the Steel Company of Canada Limited for a year.

D. E. Haldane, Jr.E.I.C., until recently a lieutenant with No. 9 Brigade Work Shop, R.C.E.M.E., overseas, is now employed at International Nickel Harvester Company of Canada in Hamilton, in the capacity of designing engineer. Mr. Haldane graduated in mechanical engineering from the University of Saskatchewan in 1942, and immediately entered the army.

A. G. Jarry, Jr.E.I.C., who joined the R.C.A.F. upon graduation in 1940 in civil engineering at McGill, is now working at Jarry & Frère in Montreal. Mr. Jarry served in Canada and overseas and was discharged with the rank of flight-lieutenant.

F. Kennedy, Jr.E.I.C., has left the Department of Public Works, with which he was engineer-in-charge at Great Bear River Road, Northwest Territories. He is now with Shawinigan Engineering Company at Shawinigan Falls, Quebec. Mr. Kennedy served overseas as lieutenant in the Royal Canadian Engineers.

H. I. King, Jr.E.I.C., has returned to Truscon Steel Company of Canada Limited in Montreal, where he was employed prior to his enlistment in 1943. Mr. King was discharged from the army recently having served as a lieutenant in the Royal Canadian Engineers.

M. S. Layton, Jr.E.I.C., who served as a squadron leader in the R.C.A.F. overseas, and who was awarded the D.S.O. in 1942 in recognition of his services, has returned to the Steel Company of Canada Limited, Montreal.

H. C. Oatway, Jr.E.I.C., received his release from the R.C.A.F., in which he served as squadron leader at A.F.Q.H. and No. 12 Training Command in charge of development and design and as consultant. He has joined the staff of Canadair Limited and has been on loan to Douglas Aircraft Corporation as a stress analyst at Santa Monica, California.

G. Osberg, Jr.E.I.C., has been demobilized and is at present employed on design work for the Department of Reconstruction, Ottawa. Mr. Osberg served as an electrical lieutenant in the R.C.N.V.R. overseas, having joined the Navy immediately upon graduation in electrical engineering from the University of Manitoba in 1942.

J. S. Osborne, Jr.E.I.C., has returned to McGill University to complete his undergraduate studies. Mr. Osborne was demobilized with the rank of captain after six years with the Royal Canadian Engineers mostly overseas with the 4th Field Company.

R. S. Beaudry, Jr.E.I.C., has joined the staff of the National Film Board in Ottawa. Mr. Beaudry entered the Navy immediately following his graduation in 1943 from Queens University as an electrical engineer. He served in the capacity of electrical lieutenant with the Directorate of Naval Ordnance in Canada and overseas.

Noel Campbell, Jr.E.I.C., has returned to the Ford Motor Company in Windsor, Ont., after two and a half years as a lieutenant in the R.C.N.V.R. Mr. Campbell graduated in mechanical engineering from McGill University 1938, and joined the engineering staff of this company immediately afterwards.

D. R. Taylor, Jr.E.I.C., who is employed by Trans-Canada Air Lines at Winnipeg, Man., now holds the position of radio and electrical engineering supervisor in the engineering department.

W. J. Farago, JR.E.I.C., retired from the Canadian Army in November last and is now employed as mechanical engineer by the Dominion Electrohome Industries Limited in Kitchener, Ont. Prior to joining the Army he was in the engineering department of the Kelsey Wheel Company Limited at Windsor, Ont.

C. C. Tompkins, S.E.I.C., a graduate of Queen's University in the class of 1945, is now employed by Canadian Hanson & Van Winkle Co. Limited at Toronto, Ont.

Pierre Troalen, S.E.I.C., has accepted a position with Standard Brands Limited at Montreal. He graduated from Ecole Polytechnique with his B.A.SC. in civil engineering last year.

Richard J. Joy, S.E.I.C., a graduate of McGill University in chemical engineering in 1945, is now attending Harvard where he is taking a course leading to a master's degree in business administration.

C. Bailey, S.E.I.C., has returned to the Canadian General Electric Company Limited, in Toronto. Mr. Bailey graduated from Perdue University in electrical engineering in 1942, following which he took the test course at G.G.E. He was employed as industrial leading sales engineer with this company when he left to join the R.C.N.V.R. in 1943, in which he served with the rank of lieutenant in the Directorate of Electrical Engineering.

W. R. Chilman, S.E.I.C., is now employed by the Tape Construction Company in Hamilton, Ontario. Mr. Chilman graduated in 1942 from Queens University with the degree of B.Sc. in civil engineering. He served as a lieutenant overseas with the 13th Field Company of the Royal Canadian Engineers.

J. M. Dype, S.E.I.C., who served with the R.C.N.V.R. as a lieutenant in the Naval Research Establishment, has been released by the navy and is now employed at the John Inglis Company in Toronto. Mr. Dype entered the service immediately following his graduation as a mechanical engineer from the University of Toronto in 1943.

A. D. Hamilton, S.E.I.C., has been released by the R.C.A.F., with which he served as squadron leader overseas attached to No. 83 group main headquarters, R.A.F.B.L.A. He has returned to Dominion Rubber Company Limited in Montreal, where he worked upon graduation in chemical engineering from McGill University in 1940.

C. P. Lentz, S.E.I.C., is now attending the University of Saskatchewan studying electrical engineering. He served with the R.C.A.F. in Canada and Newfoundland, being discharged with the rank of sergeant.

C. A. Loden, S.E.I.C., is now employed by the Imperial Oil Company Limited in Regina, Saskatchewan. He enlisted as a lieutenant in the Canadian Army following his graduation in 1944 in mechanical engineering at the University of Saskatchewan.

J. G. Matthews, S.E.I.C., has been discharged from the R.C.A.F. and is now employed by the Hudson Bay Mining and Smelting Company at Flin Flon, Manitoba. Mr. Matthews graduated in geological engineering from the University of Saskatchewan in 1944.

E. B. Pearson, S.E.I.C., has returned to McGill University to complete his studies towards the degree of Bachelor of Engineering. He served for two years as pilot officer in the R.C.A.F.

R. M. Powell, S.E.I.C., has been demobilized, after six years' service with the R.C.N.V.R., with the rank of lieutenant-commander. Mr. Powell has returned to Canadian Industries Limited, in Montreal, having been with this company at Shawinigan Falls, Quebec, before his enlistment.

P. J. Provias, S.E.I.C., is now enrolled in the Faculty of Engineering, University of Toronto, as an undergraduate. He served overseas as a flying officer, R.C.A.F., with Bomber Command.

G. D. Russell, S.E.I.C., has been demobilized with the rank of flight-lieutenant after serving two years as a pilot overseas with the R.C.A.F. Mr. Russell joined the service immediately upon graduation from McGill in chemical engineering in 1941. He has returned to the university to do post-graduate work in organic chemistry.

B. Taylor, S.E.I.C., who was demobilized with the rank of flying officer from the R.C.A.F., after serving in aircrew overseas, has accepted a position as junior geologist with the Winnipeg Corporation of Canada at Noranda, Quebec. Mr. Taylor graduated in 1941 from the University of Saekatchewan with a B.Sc. degree in geology.

E. S. Sutherland, S.E.I.C., has been released from the Canadian Army, in which he served overseas as a lieutenant with the Royal Canadian Engineers. He is with the Dominion Water and Power Bureau at North Bay, Ontario.

P. A. Verdier, S.E.I.C., and his brother, **Henrik Verdier,** S.E.I.C., have both been released from the R.C.N.V.R., in which they served as lieutenants (S.B.) (E.) They have both returned to Sir George Williams College in Montreal to complete their undergraduate courses.

J. M. Yuile, S.E.I.C., who served overseas as a squadron leader in the R.C.A.F., is now associated with Peacock Brothers Limited, in Montreal. Mr. Yuile returned to McGill University following his retirement from the R.C.A.F. and completed his final year for his engineering degree.

ANNUAL FEES

Members are reminded that a reduction of one dollar is allowed on their annual fees if paid before March 31st of the current year. The date of mailing, as shown on the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to all members wherever they are residing.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Phillips Bathurst Motley, M.E.I.C., retired engineer of bridges for the Canadian Pacific Railway, died on January 13th, 1946, after a short illness, at the Western division of the Montreal General Hospital. Born at Calcutta, India, on March 22nd, 1871, he received his engineering education at the School of Practical Engineering at Sydenham, England.

Coming from England to Montreal in 1892 to join the engineering department of the Canadian Pacific Railway, Mr. Motley occupied the positions of draughtsman and inspector of bridges both in the shops and during erection. In 1903 he became assistant engineer in the department and five years later was made assistant engineer of bridges. In 1911 he was promoted to engineer of bridges for the entire system, overseeing all design, construction and supervision of bridges from the Atlantic to the Pacific. Among the more important bridges for which Mr. Motley had been responsible are the Lethbridge viaduct, the Edmonton City bridge, the crossings of various large rivers on the prairies such as at Saskatoon, Outlook, Nipawin and Winnipeg, the bridge at Galt, Ont., the bridge over the St. Lawrence river near Montreal which was reconstructed to allow for double tracks, and the Saint John, N.B., cantilever bridge. There were many others of lesser magnitude and of difficult construction, particularly in the Rocky and Selkirk Mountains and on the north shore of Lake Superior. He remained with the Canadian Pacific Railway for 45 years, retiring in June, 1937.

Mr. Motley joined the Institute as an Associate Member in 1898, transferring to Member in 1905. In 1929, 1930 and 1931, he was a member of Council representing the Montreal Branch. He was made a Life Member in 1942. He was also a Life Member of the American Society of Civil Engineers and a Member of the Institution of Civil Engineers of Great Britain.

George D. Macdougall, M.E.I.C., died in New Glasgow, N.S., on December 29th, 1945. Born at St. Peters, Cape Breton Island, on September 26th, 1873, he graduated from McGill University with a B.A.Sc. in mechanical engineering. He was employed as a mechanical engineer in Boston, Buffalo, Ontario, Newfoundland and Nova Scotia until 20 years ago when he retired.

Mr. Macdougall joined the Institute as an Associate Member in 1901, transferring to Member in 1909. He was made a Life Member in 1932.

Andrew McCulloch, M.E.I.C., one of the Canadian railwaymen who pioneered the country's expansion, died on December 13th, 1945, in the Penticton hospital, Penticton, B.C. Born in Lanark County, Ont., on June 15th, 1864, he received his preliminary education at Kingston, Ont., and went west to Seattle, Wash., in 1889.

On joining a survey party identified with the Great Northern Railway he travelled throughout what is now the state of Washington being employed successively as chainman, rodman, instrument man, and general utility assistant. In the autumn of 1893 he left for the World's Fair in Chicago, and on his return to Seattle the following spring found that railroad building had ebbed. He went to Vancouver and after trying placer mining for a time returned to work for the Great Northern at Spokane. In 1896 he was made resident engineer building a line in the Lake Superior vicinity. In the following year he went to work as transitman on the Crow's Nest Branch of the Canadian Pacific Railway. He was resident engineer on a number of related projects and had further experience in the Fraser Valley. In 1903 he went to Saskatoon as locating engineer to run a line from Saskatoon west toward Edmonton. He did other work on prairie lines and farther east in the Fort William vicinity.

In 1906 Mr. McCulloch moved to the Grand Trunk Pacific as district engineer in charge of grading from Winnipeg to Saskatoon. When his wishes to return to the mountains of British Columbia did not materialize he returned to the Canadian Pacific. He was appointed division engineer with his office at Montreal and for three years worked on eastern operations. In 1910 when the idea of completing the line through British Columbia to the coast revived he was appointed chief engineer of the project. The enterprise was to be known as the Kettle Valley Railway and on its completion Mr. McCulloch was both chief engineer and general superintendent in full charge of operating the section. He continued as chief engineer for several years. In 1930 the Kettle Valley Railway was merged with the Canadian Pacific Railway and there was no further need for a chief engineer on the line. Mr. McCulloch concentrated his attention upon branch line building which was completed by 1933, and in that year his active railroading terminated.

Mr. McCulloch joined the Institute as a Member in 1907.

Edward Emery Carpenter, M.E.I.C., died in Vancouver, B.C., on October 26th, 1945. Born at Americus, Kansas, on November 12th, 1872, he graduated from Stanford University, Cal., with his B.S. in civil engineering in 1898.

For seven years after graduation Mr. Carpenter followed railway engineering in Arizona, Nevada, and California. In 1905 he was employed as chief construction engineer for Sanderson and Porter on construction in San Francisco. Four years later he was sent by the company to Vancouver Island as chief engineer in charge of design and construction of a power development installation for the British Columbia Electric Railway Company. He later undertook for the same company the Sooke waterworks project for the City of Victoria, B.C.

Mr. Carpenter returned to California and from 1912 until 1915 was in charge of all civil engineering work for the Panama-Pacific International Exposition in San Francisco. In 1916 he became a member of the firm of Baker and Carpenter, engineers, San Francisco, Cal., and engaged in general consulting and executive engineering practice for some years. He was executive engineer and project manager for the construction of the Stanford Stadium at Stanford University.

In 1923 he returned to British Columbia and joined the B.C. Electric Railway Company as consulting engineer. Among his projects with the company was the Ruskin power plant and dam and a power plant at Stave River. From 1925 until 1932 he was in charge of construction of the Bridge River hydro-electric development plant. He retired in 1944.

Mr. Carpenter joined the Institute as a Member in 1924. He was made a Life Member in 1944.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

A. B. Geddes, M.E.I.C. - *Secretary-Treasurer*

Thursday, December 13th was branch affiliate night. he meeting was addressed by Mr. J. R. Jenkins, Calıry Power Co. Limited. His address was on the **revention of Accidents.** He said that premeditated lling is ended on the battle front but not on the ome front. Accidents are on the increase, $113,000,000 ıving been lost in labour due to accidents in the pronce of Alberta in the last twenty-five years. From 40 to 1944 there were 1,400,000 accidents in Canaan industries. In the United States there were 260 dustrial accidents per day per 100,000 population. r. Jenkins also stated that day dreaming was the .use of most accidents .

A film entitled "Rules for Tools" brought Mr. enkins' talk to an end.

Mr. J. Warke of the Brown, Moyer and Brown imited was the next speaker and he spoke on oil ell drilling in Turner Valley. Mr. Warke gave a neral review of development in the Valley. He said out 75,000,000 barrels of oil had already been proıced and that 255 wells were now in production.

The derricks, with legs 26 feet apart at the base, uld lift 220 tons, he said. The rotary bits made 150 350 revolutions per minute. Usually there were ree boilers for generating steam, with the "mud" ımps consuming the greatest amount: Steam presre at 265 pounds was usually maintained. Gas essures of up to 4,000 and 5,000 pounds per sq. in. ere sometimes encountered in drilling. Most of the iation fuel used by the British Commonwealth Air aining Plan came from Turner Valley.

Much information was also given to the meeting on e coming explosion of the 5,000 quarts of nitroycerine which are to be exploded at the bottom of e West Flank No. 2 well. This is one of the largest ıdertakings of this kind ever to be attempted in oil ell shooting.

Persons "a long distance" from the well might hear slight rumble at the time of the explosion if they t their ear to the ground, he stated. There was no due excitement in Turner Valley at the prospect of e explosion. His own house was quite close to where e nitro-glycerine is stored.

The third speaker was Mr. H. Connolly, who spent years with the inspection department of the British miralty. He said the quality of work turned out at e Ogden munitions plant was second to none in ınada or Britain. He dealt with the fine precision quired in the manufacture of equipment for subırines. Replacements had to be made at top speed d under difficult conditions, and there was no room faulty tooling.

The meeting was under the chairmanship of F. Peele.

HAMILTON BRANCH

W. E. Brown, M.E.I.C. - - *Secretary-Treasurer*
L. C. Sentance, M.E.I.C. - *Branch News Editor*

On Thursday, December 20, 1945, approximately rty members of the Institute and their guests met at cMaster University for the regular monthly meeting the Branch. In the absence of N. Eager, chairman, R. Hannaford, vice-chairman officiated.

The speaker of the evening introduced by G. L. T. Vollmer, was Mr. S. R. Frost, past-chairman of the Toronto Branch of the Institute and past-president of the Ontario Association of Professional Engineers who chose for his subject **Canada's Nitrogen Industry.** By virtue of his previous association with the North American Cyanamid Company, Ltd. and his present association with the controller of chemicals, Department of Munitions and Supply, Montreal, as chemical engineer, Mr. Frost came before the meeting eminently qualified to develop his subject.

The speaker introduced his topic with a short historical sketch of the production of nitrogen, nitrates and fertilizers in general. The production of nitrates has always been an essential step in the production of explosives for war purposes. The low concentration of Chile nitrates combined with lack of shipping space has forced the synthetic production of suitable compounds of nitrogen. The largest plant producing such nitrates in Great Britain was located on the east coast in a position very vulnerable to air attacks. Early in the war it had been found necessary to seek additional and more reliable sources for these compounds.

The decision was made, therefore, to construct suitable plants in Canada and the site chosen for the main plant was at Welland, Ontario. The reasons for selection of this site were—easy access of rail and water transportation systems, proximity to an abundant source of electrical power and to the existing plant of the North American Cyanamid Company, Ltd.

The planning, designing and construction of this huge project involving many millions of dollars was accomplished in record time, partial production being attained approximately nine months after inception of the project.

The details of the construction of the plant were outlined by Mr. Frost and were well illustrated by means of a sound film.

Concurrent with construction work at Welland, Ontario, additional plants were being built at Trail, B.C. and at Calgary, Alta. With all three plants in operation the output of Canadian-made nitrogen and nitrates reached very great proportions.

By some strange quirk of fate the large nitrate plant in Great Britain was unharmed by bombing, with the consequence that the Canadian nitrate plants produced quantities far in excess of war requirements. In order to utilize the excess to advantage, an intensive research programme was undertaken and very shortly excess nitrogen was being converted into fertilizers. During the war a small part of this fertilizer production was used in growing Canada's crops.

At the present time the demand for nitrates and fertilizers is very great and Canada's production is in the neighbourhood of thirty million dollars per year. Canadian consumption of nitrate fertilizers is approximately 10 per cent of the total production. The remaining 90 per cent is being exported to approximately 40 different countries throughout the world.

At the conclusion of the talk Mr. Frost answered numerous questions which dealt chiefly with the technical phases of the production of various nitrogen compounds.

The members of the Hamilton Branch of the Institute met jointly with the Hamilton section of the Chemical Institute of Canada.

MONCTON BRANCH

V. C. Blackett, m.e.i.c. - *Secretary-Treasurer*

On Wednesday, October 31st, Huet Massue, statistical engineer of the Shawinigan Water and Power Co., Montreal, addressed the branch on the subject of the Tennessee Valley Authority, a project by which the United States Government had hoped to supply low-cost electricity in competition with privately owned companies.

The T.V.A., Mr. Massue stated, was a Roosevelt New Deal undertaking, commenced in 1933. Existing installations in the Tennessee Valley were bought, dams built and water powers developed. The project, costing over one billion dollars, produced two million horsepower, making the cost $500 per horsepower. The speaker pointed out that the maximum economical cost of a power installation was $100 per horsepower.

The people of the United States now pay twenty-five million dollars a year to the T.V.A. to make up the operating deficit. The power cost in Tennessee is very high, approximately three times as high as the cost in Quebec. Mr. Massue expressed the opinion that in a region where coal is plentiful, it is often more economical to use steam power rather than hydro. Among other things, the cost of huge dams is avoided.

H. W. Hole, the branch chairman, presented a vote of thanks to the speaker, on motion of A. Gordon, seconded by B. E. Bayne.

On Thursday, January 10th, an address on the mining of gypsum and the manufacture of gypsum products was given by B. W. Isner, manager of the Canadian Gypsum Company's Works at Hillsborough, N.B. H. W. Hole presided over the meeting.

The gypsum industry is one of the oldest in Canada, the speaker declared, and added that the mining of gypsum was carried on in the Hillsborough region early in the nineteenth century. During that period it was quarried by farmers in the winter and piled on the banks of the Petitcodiac River and in the spring was loaded in coasting vessels that arrived from New England ports. In 1847, the industry went on a 12-month basis with some 3,000 tons a year being produced. At the present time, the annual output is 60,000 tons.

Gypsum seams vary in depth from 33 inches to 120 feet. The seams at the Hillsborough development are, on the average, 30 feet deep. They are close to the surface of the ground and the product is obtained both by mining and quarrying. Mr. Isner described gypsum as hydrous calcium sulphate, and pointed out that it could be converted to plaster of paris by applying heat and driving off about 75 per cent of the water.

The industrial uses of gypsum are varied. It is used in the manufacture of paint, sulphuric acid, wall plaster, mouldings, self sealing gasoline tanks and wall boards. It is also used to sweeten soil, and to retard the setting of Portland cement.

J. A. Godfrey moved, and G. E. Smith seconded the vote of thanks to the speaker.

Following Mr. Isner's address, the film "Ten Thousand Feet Deep" was shown.

MONTREAL BRANCH

L. A. Duchastel, m.e.i.c. - - *Secretary-Treasurer*
Hyman Schwartz, s.e.i.c. - - } *Branch News Editors*
Eli L. Ilovitch, s.e.i.c. - - }

A joint meeting of the Montreal Branches of the A.I.E.E. and the E.I.C. was held at Headquarters of the E.I.C. on the evening of October 18, 1945, at which was presented a paper on **A Modern Electric Boiler Installation at Arvida, Que.**

M. G. Saunders, was mechanical superintendent at Arvida works for several years and has been responsible for the design of the steam generating plant. F. L. Lawton, assistant chief engineer of the Aluminum Company of Canada Limited also spoke at this meeting. The speakers told about steam generation with early forms of electric heating boilers and went on to describe the construction, design and operation of the electric steam generator at Arvida.

The meeting was very well attended and enjoyed by all those present.

G. R. Hale was chairman of the meeting.

❖ ❖ ❖

Central Steam Utilities as a Solution to the Urban Smoke and Heating Problem was the subject of a paper given before the Montreal Branch during the evening of October 25th, 1945. Mr. R. L. Fitzgerald, who was the speaker, is vice-president and general manager of the Duluth Steam Corporation and is recognized as an authority on the subject.

The early stages of domestic heating were covered from the fire in the centre of the floor of primitive man's cave, through the development of the hearth with its chimney, to the common stove and to-day's modern boilers and furnaces which are capable of using practically all the heat available in the fuel that they burn. A big problem in urban life due to manual firing of furnaces is the production of smoke and dirt. It has been estimated that the city of Cleveland, Ohio, a fairly typical American city, suffers an annual loss, due to smoke alone of close to $10,000,000.

Early attempts at central heating were not very economical because of low pressures under which the systems had to operate. Today, with modern methods and equipment, a central station can provide reliable service and maintain a clean healthful atmosphere in the area in which it operates. Steam for hot water heating is being provided through installation of heat exchangers, and a large portion of steam production is used in manufacturing processes. It may be of interest to note that in modern systems, 99.9 per cent of the steam generated at the plant is delivered to the customer. Because of the corrosive action of the condensate it is given to the customer to use as he sees fit.

There were 120 persons present and F. A. Combe, was chairman of the meeting.

❖ ❖ ❖

On Thursday evening, December 13th, Mr. E. T. Henry, legal expert of the Canadian Industries Limited, gave a short talk on **Patents.** The speech was followed by an hour and a half discussion period during which the speaker answered to the satisfaction of all a barrage of questions and statements on patents.

A summary of the speech and salient points brought out during the discussion period follows:

"The real purpose of the patent system is to encourage the development of new industries by giving to an individual who has invented something never before known, a limited monopoly in his invention.

The protection thus afforded induces risk capital in the development of new industries, but what is probably more important, it also induces disclosure of the invention so that others are stimulated to develop even better methods of producing the product. The result of this competition is that the public benefits by obtaining better articles at lower prices.

"A patent is really a contract between the inventor and the State and involves a consideration for the right granted. The right granted by the State is the right to exclude others from using the invention for a fixed period of time while the consideration required is the disclosure of the invention to the public so that it may be freely used by anyone on expiration of the patent. Patents are not granted on abstract theories or mere principles, but rather on practical applications of the new theory or principle. Furthermore, the matter patented must be new and useful and inventive ingenuity must have been exercised.

" The charge that patents are used to suppress competition or to stifle initiative is a most serious one, but under Canadian law no patent can actually be so used because remedies are provided against abuse of patents. These remedies are compulsory licensing or, if this does not correct the abuse, revocation of the patent may be obtained. Abuse of the patent monopoly may exist where the patent owner is not supplying the Canadian market by manufacture in this country or where unreasonable conditions are attached to the sale or license of the thing patented.

" To the engineering profession the importance of patents is through research and new developments which provide jobs for engineers. Because patents demand the disclosure of new inventions, research is stimulated and with it, competition. The modern patent system was devised over three hundred years ago to break the trade secrets of the ancient guilds. This it has done to the ultimate benefit of the public as a whole."

NIAGARA PENINSULA BRANCH

P. A. Pasquet, Jr.E.I.C. - *Secretary-Treasurer*
J. L. McDougall, M.E.I.C. - *Branch News Editor*

The Niagara Peninsula Branch held their annual ladies' night on Thursday, November 22nd, at the Leonard Hotel, St. Catharines, Ont., under the chairmanship of J. Ings.

A large gathering of members, and their guests attended the dinner and later listened with interest to a most instructive lecture and demonstration by George L. Long, historian for the Bell Telephone Co. of Canada. Mr. Long was introduced by F. S. Barclay.

The title of Mr. Long's address was **Your Voice as Others Hear It.** Beginning with the early experiments and development of the telephone by Graham Bell and his sons, he traced the advancement in speech communication up to and including some of the outstanding developments of the past war years. The advances made in new metallurgical alloys have done much to bring the telephone to the present day perfection and reduction in size.

Practical demonstrations showed the remarkable characteristics of two widely used alloys — "Vicaloy " for permanent magnets, and " Permaloy," very highly sensitive to the slightest magnetic field.

Mr. Long emphasized the importance of good enunciation when speaking and explained to the audience the two basic elements of speech—vocal sounds and breath sounds. He showed that personality in speech depends upon tongue, lips, resonant chambers, throat, mouth and nose. He illustrated by means of the artificial larynx. Many interesting hints for public speaking were also given.

Much equipment was displayed by the speaker and much interest was shown at the close of the meeting when members of the audience were given the opportunity to record and hear their own voices by means of the mirrophone.

On behalf of the guests and members Mrs. A. W. McQueen expressed the vote of thanks to the speaker.

OTTAWA BRANCH

C. G. Biesenthal, M.E.I.C. - *Secretary-Treasurer*
R. C. Purser, M.E.I.C. - - *Branch News Editor*

At an evening meeting, held in conjunction with the Ottawa Branch of the American Institute of Electrical Engineers, in the auditorium of the National Research Council on December 7th, 1945, the Ottawa Branch of the Engineering Institute heard an illustrated lecture on **Gas Turbine Fundamentals.** The speaker was Dale D. Streid, of the General Electric Company Ltd., Lynn, Mass.

The speaker told of the fundamentals of the gas turbine which was of great importance in the development of jet propelled aircraft in the later years of the war. Mr. Streid played an important part in the research and development of the gas turbine for the General Electric Company.

Following his talk, a film on jet propulsion, and illustrating the development of jet propelled aircraft was shown. A question period was also held.

The speaker was introduced by the chairman, L. Chabot, and thanked by Norman Marr, chairman of the Ottawa Branch of the Institute.

PETERBOROUGH BRANCH

E. Whiteley, M.E.I.C. - *Secretary-Treasurer*
J. C. Allan, M.E.I.C. - *Branch News Editor*

The annual dinner of the Peterborough Branch was held at the Empress Hotel on December 12th.

Members of the Branch Executive met President E. P. Fetherstonhaugh and Secretary L. Austin Wright, speakers of the evening, at the train from Toronto and lunched with them. After lunch E.I.C. affairs were discussed. Later in the afternoon Dean Fetherstonhaugh visited the Peterborough Works of the Canadian General Electric Co.

A reception for the president was held at the Empress Hotel at 6.00 p.m. and it was followed by dinner at 6.30.

Following the toast to the King, A. L. Killaly welcomed Dr. J. M. R. Fairbairn back to the branch and offered the congratulations of the branch members to him for receiving the Sir John Kennedy Medal, which is the highest award of the Institute, and also for receiving a life membership in the American Society of Railway Engineers.

D. A. Drynan introduced the president, Dean E. P. Fetherstonhaugh, of the Faculty of Engineering and Architecture of the University of Manitoba, who spoke on **Trends in Engineering Education.**

The president recalled his first visit to the works of the C.G.E., at Peterborough in 1899, and contrasted it with his impressions in the afternoon tour.

The president expressed his great interest in the achievements of Canadian engineers in the war effort as he had found it, on his tours all across Canada, shown in the design, construction and maintenance of stupendous and complex undertakings. He also recalled the debt we owe to those engineers who served overseas and expressed our pleasure at seeing many of them back again in our midst. He stated also that we must do everything possible to assist in re-establishing them in their chosen profession. In this latter connection the president recalled that the Institute was already working toward rehabilitation even before the war was over.

Dean Fetherstonhaugh then outlined the serious problems facing engineering colleges due to the overcrowding prevalent at this time, and discussed what the colleges can best do for their veteran students.

The growing importance of the " Humanities " in an engineering education was discussed and the present and immediate future position of the " Humanities " was evaluated.

The president then stated that the Engineering Institute's stand was 100 per cent behind the proposal for the establishment of technical institutes. For many returned men with some technical aspirations the opportunity to attend a technical institute would make the difference between incurring disappointment because of an overly ambitious course dropped before its completion, and satisfaction with a more modest effort well done and completed.

General Secretary L. Austin Wright reported to the branch on the affairs of the Institute. He also cited examples to illustrate what a colossal task the universities are now undertaking and commended the universal spirit of cheerfulness found among their faculties.

Dr. Wright reminded the branch that its member Ross Dobbin is chairman of the E.I.C. Committee on Community Planning.

Immediately following the meeting a motion picture film depicting the construction and operation of the artificial harbour " Mulberry " was shown and explained by Dr. Wright. Mulberry represents a tremendous undertaking which was the successful accomplishment of British engineers to whom the entire credit is due.

QUEBEC BRANCH

Leo Roy, M.E.I.C. - *Secretary-Treasurer*
A. E. Paré, M.E.I.C. - *Branch News Editor*

Soirée des jeunes tenue dans l'amphithéâtre de la Faculté des Sciences de l'Université Laval le 10 décembre 1945.

La réunion fut présidée par M. J.-O. Martineau, président de la section de Québec de l'E.I.C., et groupa une centaine de personnes, parmi lesquelles se trouvaient les élèves de la Faculté des Sciences, à titre d'invités.

Au début, M. Paul Vincent, exhorta ces élèves à faire partie de l'E.I.C. en leur donnant les raisons pour lesquelles ils devaient en faire partie et en démontra les avantages.

M. Adrien Pouliot, doyen de la Faculté des Sciences de l'Université Laval, invité à dire quelques mots, parla des liens qui doivent exister entre les hommes de sciences dans nos universités et les ingénieurs de la pratique privée.

M. René Dupuis, Directeur du Génie électrique à la Faculté des Sciences de l'Université Laval, remit ensuite le prix de l'E.I.C. pour l'année 1945 à M. Pierre Grenier, élève de 4e année de la faculté. Ce prix fut décerné à M. Grenier pour succès obtenus en 3e année l'année dernière.

M. J.-P. Drolet avait intitulé sa causerie **Une industrie nouvelle: la tourbe.**

Il nous donna d'abord la liste de nos ressources en tourbières au Canada et spécialement dans la province de Québec.

Au point de vue valeur commerciale, la tourbe se classe en deux catégories: la tourbe humifiée et la tourbe non humifiée. La première est désignée généralement sous le nom de " tourbe combustible " et la seconde comme " tourbe de mousse ".

Les différents modes d'extraction, de séchage et de traitement furent décrits par le conférencier.

La tourbe peut servir à plusieurs usages dont les principaux sont: emballage des bulbes, des tubercules et racines durant l'hiver, à cause du grand pouvoir d'absorption d'eau qu'elles possèdent; litière pour animaux et volailles à cause de ses qualités hygiéniques; utilisation de son grand pouvoir d'absorption qui varie de quinze à vingt-cinq fois son propre poids pour les gaz et les liquides; amendement des sols; amortissement du son; isolation contre le froid en hiver et contre la chaleur en été; emballage d'aliments périssables; fabrication de bandages et de tampons pour chirurgiens et vétérinaires; fabrication de briques de construction poreuses et de faible pesanteur et pour le chauffage, etc.

Au point de vue chauffage, si l'on compare la tourbe au bois et au charbon, on trouve que la tourbe a un pouvoir calorifique moyen, à 25 pour cent d'humidité, de 6,800 b.t.u. par livre; le charbon Pennsylvanie anthracite de 12,900 b.t.u. par livre tandis que le bois franc moyen, à 25 pour cent d'humidité, de 6,500 b.t.u. par livre.

L'an dernier, la province de Québec a produit 1,500 tonnes de tourbe combustible. La plus grande partie de la production de la tourbe cependant est expédiée aux Etats-Unis pour servir comme litières dans les étables.

Le conférencier fut remercié par M. Maurice D'Amours.

Un film intitulé " Noranda " nous fit voir les diférentes étapes de la production du cuivre, depuis l'extraction du minerai jusqu'au raffinage électrolytique.

TORONTO BRANCH

Junior Section

I. S. Widdifield, M.E.I.C. - *Secretary-Treasurer*

A dinner meeting of the Junior Section was held in the Winchester Hotel on November 14th, at which four members of the Section spoke on subjects that were of interest to all present.

Captain Ron Milne outlined the work of the Canadian Engineers in Holland and on the Rhine during the latter days of the war. Lieutenant Wilf Brotherhood, who was second in command of a corvette on convoy duty and latterly O.C. of a mine sweeper, told of some of his experiences in the Atlantic.

Mr. Murray Wiler spoke on aircraft liaison in the United Kingdom. He outlined the difficulties and procedures carried on in co-relating aircraft production in England and in Canada with particular reference to the production of the Lancaster Bomber. Mr. R. S. Segsworth described the cyclograph. He stated that this piece of electrical equipment is rapidly gaining ground as a new engineering tool for determining properties of materials which previously could be obtained only by destruction of the sample.

Dinner meeting held by the Junior Section of the Toronto Branch. The group standing at the rear includes, from left to right, E. Ross Graydon, chairman; Murray Wiler; Lieut. Wilf Brotherhood; Ivan S. Widdifield, secretary-treasurer; Capt. Ron Milne; R. S. Segsworth; J. Courtright; and Douglas D. Stiles.

VANCOUVER BRANCH

A. M. Eyre, s.e.i.c. - - *Secretary-Treasurer*
P. B. Stroyan, m.e.i.c. - *Branch News Editor*

On Tuesday, December 12th, about forty members of the Vancouver Branch had the pleasure of listening to Brian R. Perry, m.e.i.c., give an address on **The Development of the Plant and Manufacturing Methods for Penicillin.** Mr. Perry, formerly of Vancouver and now a prominent consulting engineer practising in Montreal, was introduced by T. V. Berry, who gave a brief summary of the speaker's training and engineering experience. The history of penicillin was traced from 1929 when it was first noted that the secretion from a mould retarded the growth of certain bacteria. Experiments were later carried on at Oxford University and, as these progressed, it was realized that the drug had marvellous properties although little progress was made in its commercial production until, in 1942, United States Army officials, impressed with the possibilities of penicillin, were responsible for getting a large appropriation for intensive research in the development of practical manufacturing methods. Rapid progress was made on the " bottle " method of producing the drug in quantity and the U.S. Army used all that could be manufactured. In 1943 it was decided to set up a Canadian plant near Montreal, and Mr. Perry was retained to design and supervise the erecting of the plant. The speaker paid glowing tribute to the work of scientists and research specialists whose indefatigable efforts proved so successful. The various steps were traced from the growing of the mould, its incubation in small bottles and its use to innoculate the matrix in the production bottles. Sterile conditions had to be maintained throughout the factory, the various sections of which were isolated from each other to prevent the passage of foreign moulds. All air used had to pass through triple filters to keep out dust particles which might carry spores. Constant supervision of each process was insisted upon and any sign of the appearance of foreign mould was checked immediately. Photographs and diagrams showed the various stages of manufacture, as well as an interesting conveyor and nozzle contrivance for cleaning and sterilizing the production bottles ready for use again in the process, some seventy-five thousand of which were necessary to produce the desired quantities of the drug.

As with many other wartime discoveries which were hardly perfected before being out of date, the " bottle " method of producing penicillin has now been superseded by the " tank " method, the principle being the same in both cases.

Mr. Peebles thanked the speaker for his most instructive address and Mr. Pybus, branch chairman, also conveyed the appreciation of the meeting.

WINNIPEG BRANCH

A. T. McCormick, m.e.i.c. - *Secretary-Treasurer*
V. W. Dick, m.e.i.c. - *Branch News Editor*

A joint meeting of the Winnipeg Branch and the Manitoba Association of Professional Engineers was held in theatre E, University Building, on Thursday, January 10th, with G. R. Fanset as chairman. Two papers were presented, one on field engineering for naval constructions, by E. V. Gilbert, who had considerable experience during the war in responsible charge of naval constructions on the East Coast and Newfoundland; and the other on field engineering for military constructions, by Lt.-Col. W. A. Capelle, giving his experiences on military constructions in England and Europe.

Mr. Gilbert gave an illustrated talk on his experiences while on loan from the Department of Public Works to the Board in charge of naval constructions in Canada, and confined his paper to the naval constructions at St. John's, Newfoundland, as typical of naval construction work.

A number of interesting views of St. John's harbour and works were shown along with a detailed description of the various facilities constructed, which included wharves, jetties, floating dock, ammunition storage vaults cut in the solid rock, gasoline storage farm with pumping station and fire protection, marine railway, and other interesting constructions including a complete training centre for naval personnel at Buckmasters Field, and a naval camp constructed on the sloping shore of the harbour in order to be close to a number of important naval constructions.

D. A. McCuaig moved a hearty vote of thanks to Mr. Gilbert for his interesting and instructive paper.

Lt.-Col. W. A. Capelle was then introduced by the chairman, and presented his paper, which described some of the interesting construction work done by the 2nd Battalion R.C.E. while in England and in Europe. A number of maps, photographs and blue prints illustrated the works described, the first being a detailed description of the construction of an airfield in England used to defeat the German U-boats. This airfield had to be built in a very short time to be of any use in the U-Boat war, and under adverse conditions; the worst of these being the rainy season during which this work had to be undertaken.

Despite these difficulties, the airfield was finished on schedule, and contributed greatly to the defeat of Germany's Wolf Pack.

The battalion then spent a period of training constructing Bailey bridges, etc. Shortly after D-Day they moved to France, and their first job was to rehabilitate an airfield at Carpiquet; the greatest difficulty encountered being to watch out for the German Air Force.

At this time preparations were being made for the big push against the Germans, and the 2nd Battalion R.C.E. were given the task of building a by-pass around the ruined city of Caen to enable the Allied armies to follow up the Germans and keep them on the run. This by-pass included the construction of a road and a bridge, the chief danger being the proximity of the German army, and for a while they were under direct observation of the Germans, who for some unknown reason did not take advantage of their position, so that the work was completed on time.

The battalion then moved to the Seine, near Rouen, where they were kept busy maintaining roads, and in the removal and moving forward of bridges.

The next move was to the other side of Brussels with the 2nd British Army, where they built two permanent bridges over a canal; an interesting feature being the removal of the old bridge destroyed by the Germans, and at the same time keeping traffic moving on the canal during construction.

Mr. Capelle stated that the prefabricated bituminous surfacing for temporary airfields used in the defeat of the Germans was distinctly a Canadian achievement, and closed by paying tribute to the sapper in warfare, as the best of officers and equipment would be useless without the sappers, who carried out the work under dangerous and difficult conditions.

W. D. Hurst expressed the appreciation of the audience for the presentation of this interesting paper, and moved a hearty vote of thanks to the speaker.

Items of business taken up before the presentation of the papers included the report of the Nominating Committee by T. H. Kirby, and a report by H. L. Briggs on the formation of an Electrical Section of the Winnipeg Branch, the first meeting to be held Monday, January 14th, when Mr. Perry Peterson, president of the Control Corporation of Minneapolis, would be in Winnipeg and would present a paper.

❖ ❖ ❖

A special meeting of the Winnipeg Branch and the Manitoba Association of Professional Engineers, sponsored by the newly formed Electrical Section, was held in theatre E, University Building, on Monday, January 14th, with C. P. Haltalin as chairman, to hear Mr. Perry Peterson, president of the Control Corporation of Minneapolis, on the subject of **Centralized Control of a Power System.**

H. L. Briggs gave detailed information on the formation of the Electrical Section of the Winnipeg Branch E.I.C. and urged all those interested to send their applications in as soon as possible, in order that the Nominating Committee could present a slate of officers at the next meeting of an election to be held in the near future.

S. G. Harknett then introduced Mr. Peterson, who gave in detail the application of centralized control to large power systems, including remote control operation, indication, and telemetering, with a demonstration on sample equipment.

All control operations are conducted over a pair of wires, which can be a system telephone line, using A.C. or D.C.; or over a pair of wires on H.T. line poles using insulating transformers for A.C. only; or by telephone wires rented from the local telephone company; or by carrier current over H.T. transmission lines.

Mr. Peterson then demonstrated the sample equipment, with detailed explanations of all operations, and described the operation of the relays which used four frequencies of 210, 270, 330, and 390 cycles per second to effect all operations over a single pair of wires.

A description of two out of seven systems used for telemetering was described, the first being the electronic bridge method which requires a metallic circuit for its operation. The second was the time delay impulse system, in which the length of the signal indicates the position of the pointer on the meter. This system can operate over any type of communication system.

An interesting discussion period followed, during which the remote control of synchronizing of generators, or interconnecting systems, was described, and also the use of combinations of 4 or 5 frequencies to control large numbers of breakers, or indications in large station or system. The discussion period was closed by J. W. Tomlinson, who moved a hearty vote of thanks to the speaker for his very interesting and instructive paper.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

ABSTRACTS ON UTILIZATION OF SAWDUST; N.R.C. No. 1285:

By Muriel E. Whalley. Ottawa, National Research Council of Canada, 1945. 103 pp., mimeo., $1.00.

These abstracts on the "Utilization of Sawdust" were compiled for the purpose of presenting means of utilizing this extensive Canadian waste. The material has been divided into two parts, namely, 160 articles, which have been arranged according to author, and 152 patents, arranged chronologically, each with a subject index. The abstracts were collected from the following sources:—1.—Forest Abstracts, vol 1 - 5, (1939-1944). 2.—American Chemical Abstracts, vol 1 - 38, (1907-1944). 3.—British Abstracts, vol 1 - 61, (1882-1942). 4.—Agricultural Index, vol 1 - 10, (1916-1944).

AMERICAN BUILDING CODE REQUIREMENTS FOR REINFORCED GYPSUM CONCRETE—A59.1-1945:

American Standards Association, N.Y., 1945, $0.25.

This new standard reaffirms many of the detailed definitions of the standard originally approved in 1941, but adds to it the results of four more years of study and experience with reinforced gypsum concrete as a building material. The standard covers design, construction and use of reinforced gypsum concrete, a building material widely used in floors and roofs. A new section deals with the position of the slabs of gypsum concrete in relation to the floor beams and roofs when they are installed by the suspension system.

The standard is divided into five main sections, covering "Materials", "Strength of Gypsum Concrete", "Allowable Stresses", "Design", and "Inspection".

INTRODUCTION TO PRACTICAL RADIO:

By Durand J. Tucker. N.Y., Toronto, Macmillan, 1945. 322 pp., illus., 8½ x 6 in., cloth, $4.00 (in Canada).

A single text dealing with the basic fundamentals of radio, this book may be used as a stepping stone to more advanced books on the subject. The book provides a complete basis for radio work. Beginning with the basic electrical principles, it covers all laws, and fundamental working parts of radio. In addition, the necessary mathematical tools are supplied as needed. Theory is explained in a practical manner and in simple language. Numerous specific examples of the practical application of principles to actual radio construction and operation are included throughout.

Because of its thoroughness, this book is a valuable reference tool for practising radio engineers and technicians, as well as a complete manual for beginners.

PORTABLE NOVELS OF SCIENCE:

Selected and with introduction by Donald A. Wollheim. N.Y., Viking Pr., Toronto, Macmillan, 1945. 737 pp., 7 x 4½ in., cloth, $2.75 (in Canada).

This volume is the first comprehensive collection of the science-fiction novel. The editor has made an interesting analysis of this type of fiction in his introduction, and has included the books in the field which manage "to combine a sound imagination and believable prognostication with a sincere desire to set the reader thinking along concepts as large at least as the movement of earth's inhabitants as a whole."

Included, with a preface to each, are: The First Men in the Moon, H. G. Wells; Before the Dawn, John Taine; The Shadow out of Time, H. P. Lovecraft; and Odd John, by Olag Stapledon.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

AMERICAN CHEMICAL INDUSTRY, The World War I Period; 1912-1922, Vol. 2.

By W. Haynes, D. Van Nostrand Co., New York, 1945. 440 pp. illus., tables, 9¾ x 6½ in., cloth, $8.00.

First to be published of a projected six-volume history, this volume covers the period during which the American chemical industry was stimulated and affected by the First World War. The first five chapters describe the political and commercial setting of the period. The succeeding chapters cover developments in the field of critical raw materials such as nitrates, potash, phosphates, sulphur, various metals, naval stores, and crude drugs. Over 100 pages of statistical data are appended. A chemical chronology precedes the text, and there is a bibliography.

AMERICAN PETROLEUM REFINING.

By H. S. Bell. 3 ed. D. Van Nostrand Co., New York, 1945. 619 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50.

Beginning with the characteristics and chemical and physical properties of crude oils, this concise reference work covers the various materials, processes and equipment which are necessary in the petroleum refining industry. The theory underlying the main processes is discussed as well as the practical applications. Allied topics such as bulk transportation are also considered. References are provided to more expanded treatments of the various topics covered in the book.

APPLIED ENERGY CONVERSION, a text in Power Plant Engineering.

By B. G. A. Skrotski and W. A. Vopat. McGraw-Hill Book Co., New York and London, 1945. 509 pp., illus., diagrs., charts, tables 9 x 5¾ in., cloth, $5.00.

The authors of this text in power-plant engineering cover the equipment and economics of industrial and central station power plants, describing the characteristics and performances of the major elements, and discussing the coordination of equipment for the generation of energy from a physical and economic viewpoint. No attempt has been made to present an extensive treatment of structural details or design. The newer developments in gas turbines and wind turbines, as well as special and European types of steam generators are included.

AUTOMOTIVE CHASSIS (without Powerplant).

By P. M. Heldt. Publ. by P. M. Heldt, Nyack, N.Y., 1945. 583 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $6.00.

This final volume of a series of four on automotive engineering deals with the various parts of the automotive chassis, with the exception of the powerplant. It discusses the functions of these parts—frames, springs, wheels, gears, brakes, etc.—their theory, the materials of which they are made, and their design. Rules for the proportioning of parts are given, and a brief historical survey of developments is included in some cases. Production processes are not covered except in cases where special methods yield superior results.

CALCULUS for PRACTICAL ENGINEERS in a simple, quick Engineering Way.

By A. Cibulka. Send orders to Clarke & Courts, Houston, Texas, 1944. 100 pp., illus., diagrs., tables, 12 x 9½ in., paper, $3.00.

The basic equations and functions are given from algebra through trigonometry, analytic geometry, differential and integral calculus to differential equations. The processes of differentiation and integration are described in simple, practical language, with applications to a number of actual and varied engineering problems.

Data Book for Civil Engineers, DESIGN.

By E. E. Seelye. John Wiley & Sons, New York; Chapman and Hall, London, 1945. diagrs., charts, tables, 12 x 9¼ in., cloth, $7.50.

This first volume of a three-volume set presents a considerable amount of effective data necessary for design procedures in the main fields of civil engineering: structures, sanitation, water supply, drainage, roads, airfields, dams, docks, bridges, and soils. The object is to provide a single reference volume for the engineer whose work may spread into fields outside his specialty. The two subsequent volumes will consist of a field manual and a book containing cost data and model specifications.

DAVISON'S KNIT GOODS TRADE, "The Standard",

Fifty-fifth Annual, October 1945, Pocket edition. Davison Publishing Company, Ridgewood, New Jersey, 1945. 736 pp., illus., maps, 8 x 5 in., cloth, $5.50, Pocket ed.; $6.50, De Luxe Office ed.

The 1945 edition of this well-known directory follows the pattern of previous issues and provides a complete, up-to-date register of manufacturers of knit goods arranged geographically and by-products. Spinners, dyers, wholesalers, and chain and large retail stores are also listed as well as other information pertaining to the trade.

DIESEL-ELECTRIC PLANTS.

By E. J. Eates. American Technical Society, Chicago. 2 ed. 1945. 272 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $3.75.

The purpose of this book is to deal with the coordinated aspects of the specialized subject, owing to the influence of the characteristics of the Diesel engine on the electrical equipment involved. These important characteristics are described first, followed by a description of the types of generators suitable for Diesel engine drive. Important topics covered include voltage regulation, automatic synchronizing, engine governors, automatic controls, electric starting, installation and maintenance practice, and Diesel-electric locomotives.

ENGINEERING ALLOYS, Names, Properties, Uses.

By N. E. Woldman and R. J. Metzler. 2 ed. American Society for Metals, Cleveland, Ohio, 1945. 832 pp., tables, 9¼ x 6 in., cloth.

Section I of this compilation is an alphabetical list of alloys with corresponding serial numbers. In the more than 400 pages of Section II are given the alloy trade name, composition, properties, uses and key numbers designating the manufacturers. The alloys are here listed by serial number. Section III is an alphabetical subject index of special characteristics and typical uses. Section IV is a directory of manufacturers with their addresses and a summary of the alloys produced by each. A key index to manufacturers lists them by the designating numbers as used in Section II. A useful data appendix includes also a classification of corrosion and heat resistant alloys. Some 12,500 entries appear in Section II in the new edition as compared with 8,200 in the first edition.

EVERYDAY PROBLEMS IN ECONOMICS.

By M. Wood-Simons. American Technical Society, Chicago, 1945. 544 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $3.50.

The opening chapter presents a historical background of our economic structure. Succeeding chapters discuss the production, distribution and consumption of economic goods; markets and trading; mining and agriculture; capital and labor; profits and wages; money and banking; foreign exchange and tariffs; etc. In general the material is presented from the viewpoint of consumption and the consumer. A twenty-page, specialized dictionary of economic terms is appended.

FUNDAMENTAL THEORY of SERVOMECHANISMS.

By L. A. MacColl. D. Van Nostrand Co., New York, 1945. 130 pp., diagrs., charts, 9¼ x 6 in., cloth, $2.25.

The advance in the art of automatic control is essentially the development of the modern servomechanism in which a change of condition affects the mechanism which in turn changes the condition, etc. This book is concerned mainly with the general theory which is applicable to all linear continuously operating servomechanisms, with emphasis on its identity with the theory of feedback amplifiers. Some particular servomechanisms are discussed briefly, but no serious attempt is made to deal with the details of practical design.

(*Continued on page 136*)

PRELIMINARY NOTICE

for Applications for Admission and for Transfer

January 26, 1946

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the March meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examination of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations or Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiner that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall nor remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BIRD—DAVID ADDAGH GODFREY, of 7 Powell Ave., Toronto. Ont. Born at Toronto, Ont., Jan. 24th, 1916. Educ.: Graduate, Royal Military College, 1939; Graduate, Military Coll. of Science, Stoke-on-Trent, Eng., enlisted, Permanent Force, as Lieut., became Ordnance Officer at Camp Borden 1944; 1939, (6 mos.) control chemist, Hudnut & Warner, Ltd., Toronto; 1939-42, & Halifax (M.D. 6), promoted to Capt., 1942, embarked for overseas, 1942-43, promoted to Major, 2nd in command, No. 3 Sub. Depot C.B.O.D., 1943-45, at Military College of Science, then seconded to British Ministry of Supply, as Deputy Asst. Dir. of Artillery, involving design of & modification to artillery equipts. & assoc. stores, investigation of defects arising during use, 1945, (Oct.) retired for health reasons, and at present temporarily employed.

B:ACKBURN—GERALD ALLEN, Major, R.C.E.M.E., of Aylesford, N.S. Born at Aylesford, N.S., April 23rd, 1914. Educ.: B.Eng., Nova Scotia Tech. Coll., 1935; R.P.E., Nova Scotia; with St. F. Xavier Univ., as follows: 1936-38, instructor machine design drawing, applied mechanics & mathematics, 1938-40, asst. prof. applied mechanics & mathematics, and head, dept. of engrg'; and during the period consultg. engr. for the Institution; 1940, joined R.C.E.M.E., training in Canada, 1941, Military Coll. of Science, Woolwich, Eng., 1941-42, District Ord. Mech. Engr., Military Dist. No. 5, responsible for repair and mtce. of all vehicles, wagons, etc., of Ordnance, 1942-43, lecturer in gun constrn. at Ordnance Training Centre, 1943-45, Staff Capt., then Major and Deputy Asst. Q.M.G., Army Equipt., responsible for co-ording provision, repair and mtce. of all unarmoured vehicles in 21 Army Group, and at present head of dept. of physics, Khaki Univ. of Canada, England.

CLARKE—JAMES MURDOCH, Lt. (E)., R.C.N.V.R., of Montreal, Que. Born at Westville, N.S., Nov. 30th, 1921. Educ.: B.Eng., (Mech.), McGill Univ., 1944; 1941-42, (summers), asst. to chief engr., Dominion Oilcloth & Linoleum Co. Ltd., Montreal, prod. control work, Electric Tamper & Equipt. Co. Ltd., Montreal; 1944 to date, with R.C.N.V.R., as Engr. Officer on H.M.C.Ss., Royalmount ,New Liskeard, Portage.
References: E. Brown, A. R. Roberts, R. H. Patten, G. J. Dodd, C. M. McKergow.

COOTE—ALEXANDER HARCUS, Lt. (A/E), R.C.N.V.R., of Montreal, Que. Born at Montreal, Jan. 21st, 1920. Educ.: B.Eng., (Mech.), McGill Univ., 1943; 1940-42, (summers), Conarium Gold Mines, Noranda Mines Ltd., D.I.L., Verdun; 1943 to date, with R.C.N.R.V., as qualified marine engr., in latter practise held responsible job at an R.N. air station servicing Seafire Aircraft.

JANKOWSKI—JERZY W., of 43 Forest Ave., Hamilton, Ont. Born at Lodz, Poland, Dec. 26th, 1897. Educ.: Mech. Engr., Politechnika, Warsaw, Poland, 1928, (educational qualifications guaranteed by Assn. Polish Engrs. in Canada); R.P.E., Ontario with Warsaw Locomotive Works as follows: 1928-31, dftsman. & designer, 1931-34, designer & estimator; 1935-39, i/c design, (compres. air dept.), Metallurgical Works, Ostrowizc; 1939, on active duty with Polish Army as Captain; 1940, designer, Westinghouse Air Brake Co., Paris, France; 1941-42, genl. engrg., Montreal Locomotive Works; 1943, chief engr., Buffwel Engrg. & Machinery Co., Welland, Ont.; 1943 to date mech. designing engr. Hamilton Bridge Co., Hamilton, Ont.
References: W. B. Nicol, A. Love, W. S. Macnamara, H. J. A. Chambers, C. C. Parker.

KEARNS—JOHN EDWARD, of 3495 Van Horne Ave., W., Montreal, Que. Born at St. John, N.B., June 26th, 1914; Educ.: Sir George Williams Coll., Engrg. & Dfting., (evenings), 1943; 1931-38, with Beauharnois Power Project, Consumers Glass Co., Ltd., Dominion Textile, Valleyfield; 1938-41, Montreal Locomotive Works, Montreal, asst. to chief engr., power plant; with Defence Industries, as follows: 1941-44, sr. power supt., Villeray, 1945 to date, sr. power supt., Cherrier Works, St. Paul l'Ermite.
References: C. R. Bown, H. C. Karn, G. H. Archibald, H. M. Esdaile, W. M. Kellett.

LOCKWOOD—ROBERT ORVILLE, Capt., R.C.E.M.E., of 504 Clarence Ave., N., Saskatoon, Sask. Born at Dadivson, Sask., July 18th, 1920. Educ.: B.Sc., (Mech.), Univ. of Saskatchewan, 1942; 1941 to date, with R.C.E.M.E., (3 years overseas).
References: R. A. Spencer, N. B. Hutcheon.

MASON—ERNEST, of 1930 Oak St., Trail, B.C. Born at Bolton, Lancs., England, April 3rd, 1895. Educ.: Bolton Tech. School, 1916, 1917, 1919; Manchester Coll. of Technology, (assoc. course in mech. engrg.), 1920-22; R.P.E., British Columbia; 1913, machinist, B. Greening Wire Co., Hamilton, Ont.; 1916, Homer & Wilson, Hamilton; tool designer, Rolls Royce Co., England; 1917-22, machine designer with the following companies; Dobson & Barlow, Bolton, Hans Renold Ltd., Manchester, Thomas Ryder and Chatwood Safe Co., both of Bolton, Eng.; with Consolidated Mining & Smelting Co., Trail, B.C., as follows: 1922-35, designer, (genl. engrg.), 1935-41, chief dftsman., 1941-45, asst. to chief engr., and at present, chief designing engr.
References: E. M. Stiles, S. C. Montgomery, A. S. Gentles, G. H. Bancroft, C. E. Marlatt, A. C. Ridgers.

McLEAN—DONALD D., of 1486 Chomedy St., Montreal, Que. Born at Ottawa, Ont., Aug. 26th, 1921. Educ.: B.Sc., (Elect. Engrg.), Queen's Univ., 1943; R.P.E., Ontario 1941, (summer), dftsman, Inspection Board, Ottawa; 1942, (summer), jr. radio engr., Canadian Marconi Co.; 1943-45, with R.C.N.-V.R., as Elect. Lieut. (R), and for two years on loan to Royal Navy as Radar Officer, involving instalns., mtce. & genl. responsibility for all Radar equipt., on the ship (cruiser); at present radio engr., Canadian Marconi Co., Montreal.

SMITH—PAUL DORRIAN, of 163 Jackson St., West, Hamilton, Ont. Born at Vancouver, B.C., Jan. 29th, 1915. Educ.: B.A.Sc., Univ. of British Columbia, 1938; R.P.E., Ontario; 1938-40, apprentice course, Can. Westinghouse; 1942-45, First Can. Army Signals (Overseas), served as wireless advisor to Chief Signal Officer, work involved carrying out of comprehensive tests on all new types wireless equipt., drawing up performance specifications for proposed equipt., doing some of the engrg. work involved in installing complete stations in vehicles and tanks, responsible for setting up wireless link between Can. H.Q. in London and Can. Army Base in North Africa, in 1944 promoted to rank of Major, in France, Holland & Germany in addition to setting up & operating complex wireless network, was frequently called upon to carry out special jobs for which engrg. work was required; at present engr. on the design of metal enclosed switchgear, Canadian Westinghouse Co., Ltd., Hamilton, Ont.

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET,
MONTREAL 2, QUE.

3

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Particular emphasis is laid at this time on the need for this service to fill the dual role of providing a general picture of employment conditions for members in the armed forces, and of making available to them specific contacts both now and at the time of their release from the services. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

NOTICE

SERVICE PERSONNEL: The completed rehabilitation questionnaires have indicated a need for the employment service to be made available to all members of the E.I.C. in the Armed Forces. It is suggested that all those who are interested—
1. **Consider these positions as indicative of present conditions.**
2. **Reply to interesting advertisements to establish contact for the future.**
3. **Apply for any of these positions when discharge is imminent.**

CIVILIAN TECHNICAL PERSONNEL should not reply to any of the advertisements for situations vacant unless—
1. **They are registered with the Wartime Bureau of Technical Personnel.**
2. **Their services are available.**
   A person's services are considered available only if he—
   (a) is unemployed;
   (b) is engaged in work other than of an engineering or scientific nature;
   (c) has given notice as of a definite date; or
   (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER, recent graduate, is required by a company in the Montreal area to learn glass making. Salary would be $175. to $200. a month. Apply to Box No. 3225-V.

JUNIOR CHEMIST, with university degree in chemistry, or chemical engineering, is wanted for the research department of a firm engaged in the manufacture of dry colours and white lead in the Montreal area. Work would consist of laboratory research and some plant control. Salary would be about $175. a month. Apply to Box. No. 3229-V.

CHEMIST OR CHEMICAL ENGINEER, preferably veteran, age 28-40 with ability to express himself clearly and possessing analytical mind, is required in Ottawa for patent work. Some familiarity with this type of work and a knowledge of foreign languages would be useful. Salary about $275. a month. Apply to Box No. 3231-V.

CHEMICAL ENGINEER with at least two years' experience in organic chemistry is wanted by a large manufacturing company in Montreal. Salary about $225. Apply to Box No. 3237-V.

SEVERAL CHEMICAL ENGINEERS for technical service and plant operations, (not laboratory work) with good personality and background are required by a manufacturer in Montreal. Preference will be given to ex-service men and successful candidates will be completely trained at a starting salary of $170. per month. Apply to Box No. 3260-V.

CHEMICAL ENGINEER preferably with graduate training in chemical engineering and some industrial experience will shortly be required in the chemical engineering department of a university in Ontario. Apply to Box No. 3280-V.

CIVIL

CIVIL ENGINEER, young and preferably bilingual, for surveying and supervisory work on sewer construction, is required by a contractor in the Montreal area. Salary would be $175. up according to qualifications. Apply to Box No. 3228-V.

STEEL BRIDGE INSPECTOR, not necessarily a graduate but with good experience, is wanted by a railway company with headquarters in Montreal, to supervise the erection and repair of steel bridges. Salary about $250. a month. Apply to Box No. 3246-V.

ENGINEER SALESMAN, preferably returned man under 40, with some road-building experience is wanted in Toronto by a firm engaged in the manufacture of asphalt emulsions. Apply to Box No. 3250-V.

ASSISTANT TO PURCHASING AGENT is wanted by a consulting engineer in Montreal. Candidates should be 23 to 28 years old, not necessarily graduates but preferably with some experience in construction work. Salary about $175. a month. Apply to Box No. 3254-V.

SALES ENGINEER with knowledge of building materials, preferably discharged service man with sales ability and inclinations, is required by a manufacturer in Montreal. Successful candidate will have opportunity to become head of this department. Salary is open according to qualifications. Apply to Box No. 3263-V.

CIVIL ENGINEER, graduate with road construction experience, preferably bilingual, age 30-45 years, is required to act as sales engineer for a manufacturer of building materials in Montreal. Candidates should have good personality and appearance to be able to contact government officials, sit in at council meetings, etc. Apply to Box No. 3264-V.

CIVIL ENGINEER, veteran from recent graduate up, is required to act as structural designer for a steel company in the Montreal area. Salary would be from $200. a month up according to experience. Apply to Box No. 3271-V.

CIVIL OR MECHANICAL ENGINEER with experience in plant layout, structures, steam plants, etc. is required by a mining company in Ontario for work in connection with changes in mining and smelting operations. Apply to Box No. 3285-V.

ELECTRICAL

ELECTRICAL ENGINEER with five to ten years' experience in industrial plants, age 30-40, preferably but not necessarily bilingual, is required for plant engineering, maintenance work, etc., in a new factory in the Montreal area. Salary would be about $300. a month. Apply to Box No. 3224-V.

PHYSICIST OR ELECTRICAL ENGINEER with knowledge of modern nuclear physics, preferably veteran, age 28-40 with ability to express himself clearly and possessing analytical mind is required in Ottawa for patent work. Some familiarity with this type of work and a knowledge of foreign languages would be useful. Salary about $275. a month. Apply to Box No. 3231-V.

ELECTRICAL ENGINEER, graduate with some experience in electronics, age 25-35, is required by a company in Montreal at a salary of $250. a month. Apply to Box No. 3236.

ELECTRICAL ENGINEER, graduate is required for work in the radio field by a manufacturer in eastern Ontario. Apply to Box No. 3256-V.

ELECTRICAL ENGINEER is required to be employed in the capacity of sales engineer representing a manufacturing company in the northern Ontario and Quebec mining districts. Apply to Box No. 3269-V.

ELECTRICAL ENGINEER, graduate, preferably ex-service man, is required by a large company in the Montreal area for work on wiring diagrams on electrical drives, etc. Apply to Box No. 3270-V.

ELECTRICAL ENGINEER with four or five years general design experience is required by a mining company in southern Ontario for work in connection with changes in mining and smelting operations. Apply to Box No. 3285-V.

MECHANICAL

MECHANICAL ENGINEER, recent graduate, preferably ex-service man, is required to act as assistant to the plant engineer on mechanical supervision and maintenance in a plant in South America. Salary would be about $200. a month. Apply to Box No. 3218-V.

MECHANICAL ENGINEER, age about 25 is required to act as sales engineer for a company engaged in the manufacture of bearings with headquarters in Montreal. Salary would be about $200. a month. Apply to Box No. 3219-V.

MECHANICAL ENGINEER with five to ten years' experience in industrial plants, age 30-40, preferably but not necessarily bilingual, is required for plant engineering, maintenance work, etc., in a new factory in the Montreal area. Salary would be about $300. a month. Apply to Box No. 3224-V.

MECHANICAL ENGINEER is required for general duties in connection with plant improvements by a pulp and paper company in western Ontario. Some experience in this type of work is desirable. Apply to Box No. 3226-V.

STEAM PLANT SUPERINTENDENT with extensive experience is required to superintend the steam plant of a pulp and paper mill in western Ontario. Salary would be $300. to $350. a month. Apply to Box No. 3227-V.

JUNIOR AND SENIOR MECHANICAL ENGINEERS, preferably veterans, are wanted by a large paper company for vacancies in a number of mills in eastern Canada. Senior men should have experience in design and layout work, if possible in the pulp and paper field. Salaries would be $175. to $250. a month depending on qualifications. Apply to Box No. 3232-V.

MECHANICAL ENGINEER with about ten years' experience in mechanical equipment for buildings, is wanted for office work on heating, ventilating and air conditioning by a firm of consulting engineers in Montreal. Salary would be $300. a month. Apply to Box 3233-V.

MECHANICAL ENGINEER with pulp and paper mill experience is required to act as assistant mechanical superintendent for a newsprint manufacturer in the St. Maurice Valley. Work will involve supervision of machine shop and all mechanical maintenance of paper mill machinery, and up-keep of buildings. Good advancement opportunity. Salary about $300. a month. Apply to Box No. 3234-V.

MECHANICAL ENGINEER age about 25, preferably veteran with some experience particularly in die work is wanted by a firm in Montreal. Salary $175. a month. Apply to Box No. 3235-V.

MECHANICAL ENGINEER, graduate with four or five years' experience in heating and ventilating layouts is wanted by a consulting engineer in Montreal. Apply to Box No. 3243-V.

MECHANICAL DRAUGHTSMAN, recent graduate is wanted by a railway company in Montreal for work in connection with plumbing, heating and lighting. Salary would be about $250. a month. Apply to Box No. 3245-V.

MECHANICAL ENGINEER, graduate under 30 years old, is wanted to act as sales engineer in Montreal for a distributor of marine and industrial engineering equipment. Starting salary $195. a month. Apply to Box No. 3247-V.

MECHANICAL ENGINEER with two or three years' experience in refrigeration work is required by a firm of contractors in Montreal. Salary would be about $250. Apply to Box No. 3252-V.

SALES ENGINEER preferably graduate mechanical with some shop experience, particularly in gearing, under 40 years old, is wanted by a manufacturer in Montreal. Preference will be given to ex-service man with good personality, and suitable inexperienced candidate would be trained. Salary $250. to $300. a month. Apply to Box No. 3253-V.

MECHANICAL ENGINEER with experience in general machine design, who can handle his own designing with a minimum of supervision, is required by a manufacturer in eastern Ontario. Preference will be given to ex-service man. Apply to Box No. 3261-V.

MECHANICAL ENGINEER, graduate, preferably but not necessarily experienced, is required for research and development work on new mechanical equipment by an experimental station in the Maritimes. Salary would be $200. to $250. per month. Apply to Box No. 3265-V.

ENGINEER SALESMAN, not necessarily a graduate but with good experience on truck mechanical work and some sales background, age 35-40, is required by an automobile manufacturer for work in the Montreal area. Preference will be given to ex-service men, and R.C.E.M.E. and workshop experience would be useful. Salary $250. to $350. a month. Apply to Box No. 3266-V.

MECHANICAL ENGINEER, graduate with two or three years' experience, preferably ex-service man, is wanted by a consulting engineer in Montreal for mechanical and electrical work in connection with plumbing, heating and ventilating installations in public and industrial buildings. Salary would be about $200. a month. Apply to Box No. 3267-V.

MECHANICAL ENGINEER, fluently bilingual, is required for the province of Quebec to represent a company engaged in the manufacture of bakers' machinery and candy-making machinery, etc. Apply to Box No. 3268-V.

JUNIOR AND SENIOR MECHANICAL DRAUGHTSMEN are required in Montreal by a firm engaged in the manufacture of conveyors, crushers, elevators, etc., Applicants for junior position should be 25-30 years of age and for senior position, 30-40 years of age. Apply to Box No. 3276-V.

SALES ENGINEER, age 30 to 35, preferably discharged service man, not necessarily a graduate but with good personality and mechanical inclinations, is required by a firm in Montreal engaged in the manufacture of marine equipment. Salary $300. to $350. a month. Apply to Box No. 3279-V.

MECHANICAL ENGINEER, graduate, under 35, with experience in production management and general drawing office work, also if possible, some structural experience, is wanted by a manufacturer in southern Ontario. Successful candidate will be trained to enable him to take complete charge of the plant and maintain production schedules, and generally under-study the works manager. Apply to Box No. 3282-V.

TWO AUTOMOTIVE ENGINEERS, university graduates, not over 35, with experience in the automobile business and familiar with the design, general operation and performance of major components, are required by an automobile manufacturer in Windsor, Ont. Apply to Box No. 3287-V.

MISCELLANEOUS

CONSTRUCTION AND MAINTENANCE ENGINEER and a DESIGNING ENGINEER, preferably with pulp and paper mills experience are wanted for a paper mill in Newfoundland. Salaries would be from $250. a month up depending on qualifications. Apply to Box No. 3239-V.

DRAUGHTSMAN, not necessarily a graduate, age about 25, ex-service man is required for a permanent position in the buildings and grounds department of an institution in the Montreal area. Salary would be about $150. a month. Apply to Box No. 3242-V.

TWO ENGINEERS, fairly recent graduates, with aggressiveness and ability to handle men, preferably discharged service men, are wanted to be trained as superintendents of field work in connection with the installation of plastic tank linings. Starting salary would be about $45. a week. Apply to Box No. 3248-V.

GRADUATE MECHANICAL OR CIVIL ENGINEER who has had four, or five years' experience in design and drawing in the pulp and paper industry is wanted by a company with mills in eastern Ontario. Apply to Box No. 3251-V.

SALES ENGINEER, bilingual and owning his own car, is required for the sale and servicing of small gas-driven pumps and generators. Remuneration is satisfactory and there is opportunity for self-advancement. This company is in the Montreal area. Apply to Box No. 3255-V.

PRODUCTION ENGINEER, either graduate or with good practical experience is required by a manufacturer in eastern Ontario. Candidates should be 30 to 40 years old and should have experience in production methods in the manufacture of small parts and assemblies, and in cost control. Apply to Box No. 3257-V.

SAWMILL SUPERINTENDENT, not necessarily a graduate engineer but with practical experience in the production of lumber and preferably with some engineering training is required for a mill in western Quebec. Successful candidate would be in charge of mill production and would supervise the piling and shipping of lumber and also would supervise the steam plant, machine shop, garage, etc. Salary would be about $300. a month. Apply to Box No. 3274-V.

ENGINEER accustomed to efficiency work, time study, methods, etc., is wanted by a manufacturer of malleable castings, brass and hardware in eastern Ontario. Apply to Box No. 3275-V.

GRADUATE ENGINEER in mechanical and electrical is required for a junior position as assistant to the works engineer of a company in southern Ontario engaged in the manufacture of wire, fences, gates, mesh, etc. Apply to Box No. 3278-V.

GRADUATE ENGINEER with a good knowledge of the manufacture of steel containers such as oil drums, etc., and with sales and manufacturing inclinations is required by a manufacturer of this type of product in Toronto. Apply to Box No. 3281-V.

TWO YOUNG ENGINEERS, university graduates, ex-service men, who have some knowledge of agriculture, are required by a firm engaged in the manufacture of farm machinery and implements in southern Ontario. Salary would be $2400. to $3600. a year depending upon ability and experience. Apply to Box No. 3283-V.

ASSISTANT SUPERINTENDENT OF MAINTENANCE age 40 to 50, preferably but not necessarily bilingual, is required by a textile company in the province of Quebec, to supervise all repair and maintenance, machine shop,plant protection, steam production, etc. Apply to Box No.3284-V.

METALLURGICAL, MINING OR CHEMICAL ENGINEER, age 25-30 years is required to act as sales engineer for a chemical company in northern Quebec and Ontario. Preference will be given to an ex-service man. Candidates should have a conversational knowledge of the French language and should expect to do considerable travelling. Salary $160. to $250. a month depending on qualifications. Apply to Box No. 3134-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER, young graduate, necessarily with some pulp and paper mill experience is required to take over control of the testing laboratories and to take charge of various engineering problems in a mill in the Eastern Townships of Quebec. Salary would be about $250 a month. Apply to Box No. 3211-V.

CHEMICAL ENGINEER, age about 34, graduate, preferably with some experience in the sale of chemical products is required by a company in Toronto for work in connection with problems of distribution, merchandising and selling. Salary would be about $300 a month plus share in profits. Apply to Box No. 3215-V

CIVIL

CIVIL ENGINEER, age 27-35, with experience in reinforced concrete and steel is required to act as structural designer for a large company in Montreal. Salary would be about $250. a month. Apply to Box No. 3140-V.

CIVIL ENGINEER with experience in the design of hydro-electric power stations is required to act as designer on reinforced concrete structures in Winnipeg. Apply to Box No. 3155-V.

CIVIL ENGINEER recent graduate is required to act as lecturer and assistant in the engineering faculty of a university in Ontario. Work will involve lecturing to third and fourth year students on highway and railway course, also elementary surveying and assisting in laboratory. Preference will be given to returned service man. Apply to Box No. 3163-V.

CIVIL ENGINEER, preferably discharged service man with considerable experience in construction, maintenance and servicing of buildings and real estate generally, is required to act as the manager of a company of this nature in a small town on the lower St. Lawrence. The successful candidate would be expected, in addition, to supervise the maintenance staff, rentals, sale of properties, town services, etc. Apply to Box No. 3198-V.

SEVERAL CIVIL ENGINEERS, not necessarily graduates but with from at least three years up to very extensive experience in construction, are required by a company in Montreal to estimate several big new developments. Salary would range from $200 to $450 a month depending on experience. Apply to Box No. 3209-V.

ELECTRICAL

ELECTRICAL ENGINEER with five years' aeronautical experience is required to be in charge of the electrical work in connection with modifications to aircraft. This position will be in the Montreal area and would be worth about $275. a month. Apply to Box No 3107-V.

ELECTRICAL ENGINEER with experience around mills or smelters, English-speaking, with a working knowledge of French, age 32-36, is required by a firm engaged in the manufacture of abrasives and refractories in the province of Quebec. Apply to Box No. 3122-V.

MECHANICAL

MECHANICAL ENGINEER, having some familiarity with pulp and paper machinery and suitable personality is required to act as sales engineer for a small manufacturing company in northern New Brunswick. This is a permanent position with a good future for the right man. Candidates should be between 30 and 35 years old and can expect a salary of between $200 and $300 a month depending on experience. Apply to Box 3088-V.

MECHANICAL ENGINEER, recent graduate, preferably returned service man is required by a well-known company in Montreal for draughting and design work on structural and mechanical problems. Apply to Box No. 3146-V.

MECHANICAL ENGINEER experienced plant and production superintendent is required for a machine shop and grey iron foundry in the Ottawa district, to take full charge of operations and planning. Salary $300. to $375. a month depending on experience. Apply to Box No. 3159-V.

MECHANICAL ENGINEER, recent graduate, is urgently required for the position of foreman in the mechanical department of a newsprint manufacturer in the St. Maurice Valley. Salary will be between $150 and $225 a month depending on qualifications. Preference will be given to ex-service men. Apply to Box No. 3174-V.

MECHANICAL ENGINEER with approximately ten years experience divided between design and machine shop is required to act as principal assistant to a mechanical engineer in a corporation in Toronto. Candidates should have general all around experience and particularly some manufacturing experience with heavy machinery. Salary would be from $300 a month according to qualifications. Apply to Box No. 3175-V.

SEVERAL MECHANICAL ENGINEERS, preferably recent graduates and discharged service men, are required by an engineering company in Montreal for draughting, testing and research work. Salary would be $185 to $220, depending on experience. Apply to Box No. 3183-V.

MECHANICAL ENGINEER is required to act as chief design engineer for a paper company in southern Ontario. Candidates should have had five or six years' experience preferably in pulp and paper mill work. Salary would be about $325 a month. Apply to Box No. 3184-V.

MECHANICAL ENGINEER, age 25-35 with some experience, preferably bilingual, is required by a manufacturer in the Eastern Townships of Quebec, to work under the supervision of the plant manager with responsibility for executing production schedules, manufacturing operations, and for quality and cost control work. Apply to Box No. 3192-V.

MECHANICAL ENGINEER, young graduate, preferably ex-service man with draughting ability, is required for general mechanical work by a paper mill in eastern Quebec. Apply to Box No. 3205-V.

MECHANICAL ENGINEER is required as draughtsman for layouts and general mechanical engineering by a paper company in the Lake St. John area. Salary would be $225 to $250 a month depending on experience. Apply to Box No. 3208-V.

MECHANICAL ENGINEER is required by a firm engaged in the manufacture of building materials in Montreal to act as junior engineer and to start on draughting and layout work of new equipment. Candidates need not be graduate engineers but preference will be given to ex-service men. Salary will be about $175 a month. Apply to Box No. 3213-V.

METALLURGICAL

METALLURGICAL ENGINEER with B.Eng., or B.Sc., in chemical or metallurgical engineering and at least one year's experience in non-ferrous metallurgical chemical analysis is required by a company in Montreal. Preference will be given to ex-service man and salary would be about $250 a month. Apply to Box No. 3200-V.

MISCELLANEOUS

ARCHITECT OR ARCHITECTURAL DRAUGHTSMAN with about three years' experience is required by a consulting engineer in the Montreal area. Salary would be about $250 a month. Apply to Box No. 3165-V.

DRAUGHTSMAN with about ten years' experience in structural and steel plate work, preferably, but not necessarily a graduate engineer, is required by a large company in Montreal. Apply to Box No. 3193-V.

ARCHITECTURAL DRAUGHTSMAN with enough experience to develop new types of windows, doors, trusses, steel sections, etc., is required by a manufacturer in Montreal. Salary would be about $300 a month. Apply to Box No. 3212-V.

MECHANICAL ENGINEER

For technical staff of a hydro electric utility. Experience in connection design hydraulic turbines, layout and piping for plant auxiliaries, and general hydraulics, are essential requirements. Salary $300-$350. depending upon qualifications. Location Toronto.

Apply to Box No. 3296-V.

MECHANICAL ENGINEER

Required by a paper company for a senior engineering position at mill located in an established town. Also, a position open for a junior mechanical engineer.

Apply to Box No. 3204-V.

WANTED

Experienced mechanical or architectural draughtsman for general work on equipment and building layout in processing industry in southern Ontario town. Position possibly permanent.

Apply to Box No. 3244-V.

WANTED

Personnel Director, by pulp and paper company in Quebec province. Prefer man with training in personnel management and industrial relations and some experience in personnel administration. Must speak both French and English. Address application to File No. 3214-V.

WANTED

Architect to undertake responsibility along general lines, such as class of work which comes under the jurisdiction of a Provincial Department of Public Works. Desirable age, not exceeding forty. Applicants to submit in writing, academic qualifications and practical experience, together with references and salary expected to the Civil Service Commission, Province of Nova Scotia, P.O. Box 943, Halifax, N.S.

WANTED

Graduate Mechanical or Aeronautical Engineer with at least five (5) years experience in aircraft, preferably in manufacturing. Must have a fair knowledge in mechanical aircraft installation. Familiar with heat and ventilating installations, controls, de-icing, hydraulics and landing gear. Permanent, responsible position. Candidates who do not qualify as above, please do not apply. Apply to Box No. 3300-V.

Qualified Engineer (and Architect if possible) required for position of Building Inspector for City of Regina. Applications will be received by City Commissioners to Noon, March 30th, 1946. Man capable of designing municipal buildings preferred, also experienced in dealing with public generally. Applicants should state age, qualifications, experience and salary expected.

Situations Wanted

CIVIL ENGINEER, B.Sc.M.E.I.C., R.P.E. (Man.) and Dominion Land Surveyor, now in the army but expects early discharge. Experience comprises seven years air photo surveys, land subdivision, drainage plans, precise levels and topographic mapping and seven years administrative and technical direction in connection with sewers, water mains, roads, building and camp construction. Age 42, married. Apply to Box No. 589-W.

ELECTRICAL ENGINEER, M.E.I.C., R.P.E. (Ont.) age 42, married. Experience in general plant engineering work, design, layout and testing of equipment. Also worked as field engineer on various construction projects. Position in Ontario preferred. Apply to Box No. 1249-W.

EXECUTIVE ENGINEER available. Graduate in mining, Jr.E.I.C., age 35, married, two dependents. Five years' experience in mining and milling, mine development, construction and operation. Canadian and foreign experience. Five years' administrative experience, mass production, development and supervision. Was assistant superintendent of operations in large industrial munitions works. Capable of handling personnel and planning, seeks a responsible position in industrial business or mining. Available on short notice, registered with W.B.P.P. Apply to Box No. 1423-W.

CHEMICAL ENGINEER, young university graduate, previously engaged in war industry, desires permanent position. Available immediately. Apply to Box No. 2464-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., available on one month's notice or less. Age 39 years. Experience as plant engineer of 400,000 KVA. hydro-electric generating station, operating engineer of 800,000 KVA. transformer and switching station and A.C. and D.C. conversion station handling approximately 90% of the output of the above station. Also one year's experience as electrical maintenance engineer of large industrial plant. Some experience in electrical construction and in cost and manufacturing methods engineering. Would prefer position in Ontario or the Maritimes. Apply to Box No. 2562-W.

GRADUATE CIVIL ENGINEER, age 24, presently in Vancouver, Experienced in layout of townsite and construction of buildings, ground service, and central steam-heating system. Familiar with soils investigation. Has 1½ years' experience as junior engineer on highway location, design and estimate. Apply to Box No. 2570-W.

CIVIL ENGINEER, graduate of UNB in 1941, age 27, with experience as instrumentman on highway construction, assistant engineer on town concrete street paving and concrete inspection, and one year as aircraft inspector for Department of National Defence. Expects early discharge from R.C.A.F. after nineteen months service overseas with bomber command as aeronautical engineer, and desires to make contacts for employment, preferably in Ontario. Apply to Box No. 2585-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill graduate, age 27, single. Five years' design and executive experience in manufacturing plants. Now available for position with progressive organization. Highest references from former employers. Apply to Box No. 2586-W.

MECHANICAL ENGINEER, Jr.E.I.C., age 23, single, with degree from N.S. Tech. '44, 18 months' experience as engineer officer afloat in the Royal Canadian Navy. Experience included the administration and control of the entire propelling and other machinery, and the discipline of 30 men in that department. Would prefer work of a responsible nature in a small firm doing manufacturing or installations. Have just been released from the Navy and am available for immediate employment in Canada or elsewhere depending on living conditions. Apply to Box No. 2587-W.

GRADUATE ELECTRICAL ENGINEER, UBC '41, P.E. Ont., Associate A.I.E.E. Age 32, married, one child. Six years school teaching, five months thawing assistant engineer; first class honors degree, C.G.E. Test Course. Major, Technical Staff, R.C.E.M.E., four years active service. Radar trained. Active part in build-up of Canadian Army Telecommunications maintenance and repair organization and production of technical literature. Accustomed to planning, forecasting, general organizing and supervision. Not a specialist. Available in B.C. after discharge February '46. Apply to Box No. 2588-W.

MECHANICAL ENGINEER, Jr.E.I.C., single, age 27, graduate Royal Naval Engineering College (Practical Engineering Prize) wishes work of practical nature, mainly outdoor. Interested in operation or construction of steam, hydro or internal combustion machinery. Eight years in R.C.N., including operational, overseeing and instructing. Medical discharge. Seven months on shipyard staff. Prefer to remain near Pacific Coast but would consider temperate climate like New Zealand, South Africa, southern England. Apply to Box No. 2589-W.

GRADUATE MECHANICAL ENGINEER (Sask. '36). Six years' experience on estimating, design and construction of industrial buildings and heavy. equipment installation as well as a fair amount of general shop experience Four and a half years as Engineer Officer in R.C.A.F. Two years in charge of servicing and maintenance of Anson trainers and two years in charge of Mosquito maintenance with operational squadrons in England and Europe. Interested in executive position on construction maintenance. Apply to Box No. 2591-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., with 18 years' experience in Canada and abroad in tool design, product design, shop and industrial engineering, labour relations. Successful organizer. Available due to closing of war plant. Apply to Box No. 2592-W.

CHEMICAL ENGINEER, single, age 25, B.Sc., Sask. '42. Recently discharged from the army. At present taking post graduate work. No significant industrial experience. Interested in a position in production or plant control. Services available in May 1946. Apply to Box No. 2593-W.

CHEMICAL ENGINEER, B.A.Sc., U.B.C., S.E.I.C., Jr.A.I.Ch.E., age 25, married, no dependents, residing in east, desires employment in production control and/or sales service in Ontario or Quebec. Apply to Box No. 2594-W.

CIVIL ENGINEER, R.P.E. (Ont.) desires executive position as plant engineer; seventeen years' experience, initial and layout surveys and plant installation for production of gold, coal and slate. Drainage design and road construction. Five years construction engineer officer (R.C.A.F.) supervising the construction and maintenance of air stations under the Commonwealth Air Training Plan. Available on one or two months' notice. Apply to Box No. 2595-W.

ELECTRICAL ENGINEER, R.P.E. (Ont.) age 28, married, C.G.E. Test Course and Sales. Five years' plant experience in direct charge of engineering, maintenance and construction of several large chemical plants. Would consider employment with progressive engineering organization or in sales. Prefer Ontario. Apply to Box No. 2596-W.

LIBRARY NOTES *(Continued from page 130)*

La FATIGUE des METAUX.

By R. Cazaud and L. Person, preface by A. Caquot. 2 ed. Dunod, Paris, 1943. 259 pp., illus., diagrs., charts, tables, 10 x 6½ in., paper, 262 frs.

This monograph analyzes the principal studies of the fatigue of metals and presents the results in form for use by engineers and metallurgists. The theories of fatigue in metals, methods of testing, fatigue limits, the factors that affect fatigue and the resistance of welded and riveted joints are discussed. Bibliographies accompany the several chapters.

HYDRODYNAMICS.

By Sir H. Lamb. 5 ed. Dover Publications, New York, 1945. 738 pp., diagrs., tables, 9 x 6 in., cloth, $4.95.

This is a reprinting of the sixth edition of this standard work on the classical theories of the dynamics of liquids and gases. These important theories, which underlie many present-day practical applications, are dealt with thoroughly and with mathematical rigidity. Among the special topics considered are the motion of solids through a liquid, vortex motion, and tidal waves.

MARINE ENGINEERS' HANDBOOK, prepared by a Staff of Specialists.

J. M. Labberton, Editor-in-Chief, with the general engineering fundamentals reproduced from Mechanical Engineers' Handbook (L. S. Marks, Editor-in-Chief). McGraw-Hill Book Co., New York, 1945. 2013 pp., illus., diagrs., charts, tables, 7¼ x 4¾ in., fabrikoid, $7.50.

Designed as the successor to Sterling's "Marine Engineers' Handbook", this new compilation is intended especially for the use of design engineers and technical students. Operating engineers should find the design and construction details useful, but no attempt has been made to include instruction on the adjustment and maintenance of marine propulsion machinery. The section on reciprocating steam engines is virtually the same as in the older work, but all other sections are completely new or extensively revised. Many technical data of value to the marine engineer have been reprinted from Marks' "Mechanical Engineers' Handbook".

National Research Council, HIGHWAY RESEARCH BOARD,

Proceedings of the Twenty-fourth Annual Meeting, 1944, edited by R. W. Crum and F. Burggraf. National Research Council, 2101 Constitution Ave., Washington, D.C., 1945. 543 pp., illus., diagrs., charts, tables, 9¾ x 6½ in., cloth, $5.00.

Some fifty papers and reports are included in this annual volume, broadly classified under the following headings: economics, finance, administration; design; materials and construction; maintenance; traffic and operations; soils investigations; and special projects. A wide range of topics is covered with many examples from actual practice. The volume also contains brief information about the activities of the Highway Research Board.

Industrial News

Industrial development—new products—changes in personnel—special events—trade literature

TO MANUFACTURE HERE

Cockshutt Plow Co. has completed an agreement whereby Cockshutt will manufacture tractors, harvester combines, swathers, and tiller combines at Brantford for Canadian Co-operative Implements Limited.

Due to shortage of supplies resulting from labor and material difficulties, the supplies of machinery to Canadian Co-operative Implements Limited will be limited in 1946 to harvester combines and swathers. In 1947 and subsequent years Cockshutt intends to supply Canadian Co-operative Implements Limited with adequate supplies of all the machinery indicated above.

The Canadian announcement climaxes the finalizing of negotiations resulting in the signing of a contract with National Farm Machinery Co-operative, Inc., in the United States, under which Cockshutt will manufacture tractors, harvester combines and other lines for the United States Co-operatives. The arrangement involves several thousand tractors and harvester combines.

JOINS WAR ASSETS

War Assets Corporation has announced the appointment of senior officers in merchandising. Lt. Col. T. P. Sutton, M.M., E.D., formerly of Ottawa, becomes assistant sales manager in charge of regions and branches, with office at Montreal.

A. H. Boyle, previously of Toronto, has been named assistant director of the pricing and distribution divisions, with office at Montreal.

REFRIGERATION MEETING

The Refrigeration Service Engineers Society, under sponsorship of the Interprovincial Association, is holding its 7th Annual Educational Conference at the King Edward Hotel in Toronto on March 17th and 18th, 1946.

Prominent speakers, including several from the United States, are scheduled to give addresses on subjects dealing with refrigeration service in Canada.

JOINS ENGLISH ELECTRIC

Thomas Henry has joined the staff of the English Electric Co. of Canada Limited as sales engineer in their Toronto office.

Mr. Henry was graduated in 1931 from the University of Toronto with a degree in electrical engineering. Since then he has been associated with the Square D Company of Canada Limited and the Canadian General Electric Co. Ltd., where for six years he was sales engineer in the Toronto district office.

For the past three years Mr. Henry served as an electrical officer in the Directorate of Electrical Engineering, Royal Canadian Navy. During this period of service he held the post of resident naval electrical overseer for the Toronto area. It was from this appointment that Mr. Henry was retired in October with the rank of Electrical Lieutenant.

Mr. Henry is a member of the Association of Professional Engineers, an associate member of the American Institute of Electrical Engineers, and a member of the Electrical Club of Toronto and the Niagara District Electric Club.

Thomas Henry

BECOMES SALES MANAGER

R. G. Alison has been appointed sales manager, welding division of the Lincoln Electric Co. of Canada Limited, Toronto.

Mr. Alison has been with the company for the past nine years. Born in Toronto, Ont., in 1912, he obtained his college education at the University of Toronto, where he received a degree in mechanical engineering. He is a member of the Association of Professional Engineers of the Province of Ontario, American Welding Society and the Canadian Welding Society.

BUYS COMPANY

Joliette Steel Limited, producers of manganese and alloy steel castings, announces that complete control of the company has been acquired by American Manganese Steel Division (AMSCO) of American Brake Shoe Co., New York, N.Y.

AMSCO products such as manganese dredge buckets, dippers, frog and crossing castings, crusher parts and mill liners will now be produced in Canada. AMSCO will also produce other abrasion resistant alloy steel castings for construction, mining and general industrial applications.

The present personnel will be retained and AMSCO plans to report in the near future on promotions and staff additions in Canada.

MONTREAL BRANCH MANAGER

G. McLachlan, who has been acting manager, has been appointed manager, Montreal Branch of The James Morrison Brass Manufacturing Co. Limited. He joined the Company in 1940 after many years' experience in the mechanical field.

GEARS ON PRODUCTION BASIS

William & J. G. Greey Limited, Toronto, will manufacture in Canada the products of the Philadelphia Gear Works Inc. of Philadelphia, Pa., manufacturers of speed reducers, gears, couplings and valve controls. These two firms will combine their engineering knowledge and experience in the manufacture of these products for the Canadian requirements.

William & J. G. Greey Limited is setting up quantity production machines for the manufacture of gears on a quantity production basis. The production of washing machine gears in large quantities has been undertaken and are being produced at the present time.

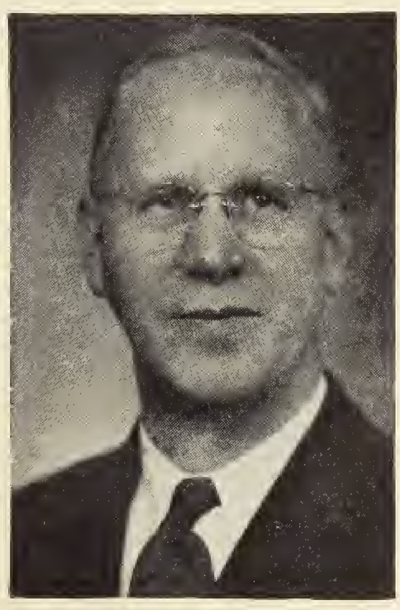
RECENT PROMOTION

Gordon F. McClay has been appointed assistant to manager of engineering by the Canadian Ingersoll-Rand Co. Limited, Sherbrooke, Quebec. Born in Foster Quebec, Mr. McClay was educated in the Eastern Townships and started his business career with the W. F. Vilas Co. of Cowansville, and the Norwood Engineering Co. in the United States. In May, 1913, he joined the staff of Canadian Ingersoll-Rand as a draftsman in the compressor engineering department.

On the outbreak of the First Great War, he was placed in charge of design of special tools for shell production used by the Company and other shell manufacturers. From 1917 to 1934 Mr. McClay served as a designer in various engineering departments of the Company.

From 1935 to 1944 Mr. McClay was in charge of compressor engineering, including production, testing and field engineering. In 1944 he was appointed assistant to the chief engineer, remaining in that capacity until his appointment as assistant to manager of engineering.

(*Continued on page 138*)



Gordon F. McClay

ASSISTANT TO PRESIDENT

Albert P. Craig, Jr., has been appointed assistant to the president of Canadian Westinghouse Co. Ltd. in Hamilton.

Born in Kaslo, British Columbia, Mr. Craig was graduated from Cornell University in Electrical Engineering in 1928, at which time he joined the Westinghouse Electric Corp. as a graduate student. Since then he has been salesman, assistant to the vice-president of the Steam Division at South Philadelphia and assistant manager of the Merchant Marine Works. He comes to his new appointment from the position of manager of the X-Ray Division, Westinghouse Electric Corp., at Baltimore, Maryland.

L. A. Hood

APPOINTED REPRESENTATIVE

L. A. Hood has been appointed Montreal representative for Chatco Steel Products Limited. His experience in the heating field is wide and varied. Since 1920, Mr. Hood has been associated with C. A. Dunham Co. Ltd., Pease Foundry and the Trane Company.

NEW SYDNEY MANAGER

The Canadian Ingersoll-Rand Co. announces the retirement of James P. Cotter, manager of the Sydney, Nova Scotia Branch, after 53 years of continuous service in various senior capacities.

Mr. Cotter entered the employ of the then Canadian Rand Drill Company in 1892 as an apprentice machinist. In 1894, before completing his statutory apprenticeship years, he became shop foreman. A year later he was appointed erecting and field engineer.

Acting on his knowledge of the coal miner's needs, Mr. Cotter found time during the next few years to work on an improved coal cutting machine with the result that in 1909 the first "Radialaxe" Coal Cutters were placed in service.

In 1910 Mr. Cotter was appointed branch manager of the Company's office in Sydney, Nova Scotia. In 1916 he returned to the Company's works at Sherbrooke to superintend the erection of marine engines and to assist in the management of shell production. At the end of the Great War he returned to Sydney as branch manager.

A member of the Mining Society of Nova Scotia since 1918, Mr. Cotter has presented several papers on compressed air to the Mining Society and to the Cape Breton Branch of The Engineering Institute of Canada.

George P. McCabe has been made manager to replace Mr. Cotter. Born in Toronto, Mr. McCabe attended Toronto University and then entered the mining industry, gaining underground experience in Northern Ontario and Western Canada.

Mr. McCabe joined the staff of Canadian Ingersoll-Rand in 1938 and entered the Student Training Course of the Ingersoll-Rand Company at Phillipsburg, New Jersey. In 1941 the mining, industrial and military developments in Newfoundland required the continuous services of a competent resident field representative and Mr. McCabe was transferred to Newfoundland with headquarters at St. John's.

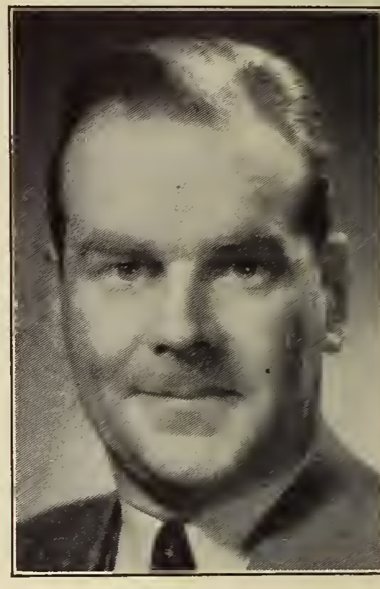
In January, 1945, he was transferred to the Sydney Branch as assistant to Mr. Cotter and was appointed Acting Branch Manager in the same year. In his new position Mr. McCabe will have charge of business in the Nova Scotia and Newfoundland districts.

Mr. McCabe is a member of the Mining Society of Nova Scotia and the American Institute of Mining and Metallurgical Engineers.

C.G.E. APPOINTMENT

B. J. Bourchier who has been appointed manager, Aircraft Equipment Section, Supply Department, Canadian General Electric Co., Limited, Toronto. A graduate in Mechanical Engineering from the University of Toronto, Mr. Bourchier undertook postgraduate study in the United States before joining the Air Conditioning Section of C.G.E. in 1936.

B. J. Bourchier



Tom Frame

PROMOTION

A. C. Wickman (Canada) Limited announce the promotion of Tom Frame to the position of field representative.

Prior to his joining this company when it was originally formed in 1941, Mr. Frame was responsible for tool, die and gauge engineering with Hayes Steel Products, McKinnon Industries and John Inglis Company. During the past four years he has been in charge of tool and gauge engineering with Wickman's.

OPENS OTTAWA BRANCH

Warren A. Jeffrey has been appointed manager of the newly-opened Ottawa Branch of Darling Brothers Limited. Mr. Jeffrey was a sales engineer for many years with Builders' Sales Limited (formerly Darling Brothers representative in Ottawa), prior to the establishment of the new branch.

NEW SALES ENGINEER

Handy & Harman of Canada Limited has appointed Donald W. Walker to their sales engineering staff. Mr. Walker, who held the rank of pilot officer in the R.C.A.F., has had a comprehensive engineering experience. Being graduated from the University of Toronto in 1941, following a special course in aviation and engineering, he was employed as a Government Inspector at De Havilland Aircraft and later joined Fairchild Aircraft Limited, at Longueuil, Quebec.

APPOINTED TREASURER

Appointment of W. C. Botkin as treasurer of Dominion Rubber Co. Limited has been announced. Mr. Botkin was formerly control manager of the United States Rubber Company's tire plant in Los Angeles, Calif., and control manager of U.S. Rubber ordnance plants at Milwaukee and Des Moines. A native of Winchester, Ky., he was educated there and at Los Angeles.

LIST OF INSTITUTE MEDALS AND PRIZES

Sir John Kennedy Medal		For outstanding merit or noteworthy contribution to science of engineering, or to benefit of the Institute.
Julian C. Smith Medal		For achievement in the development of Canada.
Duggan Medal and Prize	Medal and cash to value of $100.	For paper on constructional engineering involving the use of metals for structural or mechanical purposes.
Gzowski Medal	Gold medal	For a paper contributing to the literature of the profession of civil engineering.
Plummer Medal	Gold medal	For a paper on chemical and metallurgical subjects.
Leonard Medal	Gold medal	For a paper on a mining subject, open to members of the Canadian Institute of Mining and Metallurgy as well as The Engineering Institute.
T. C. Keefer Medal	Medal	For a paper on civil engineering subjects.
R. A. Ross Medal	Medal	For a paper on electrica engineering subjects.
Canadian Lumbermen's Association Prize	$100.00	For a paper on the use of lumber or timber in construction or related subjects in wood utilization.
Students and Juniors	Books to the value of $25 (5 prizes).	For papers on any subject presented by Student or Junior members.
University Students	$25 in cash (12 prizes)	For the third year student in each college, making the best showing in college work and activities in student or local branch of engineering society.

A MESSAGE FROM THE PRESIDENT

SIX YEARS OF STRIFE are over and now we turn to peace. The storm of war is past but the mountainous seas following the storm still beat on an uneasy and unstable world, and clouds continue to obscure the skies. The challenge that engineers met so ably in time of war commands us now with no less force. Our talents and abilities must be utilized to the utmost to restore order and normality in our country.

Many of us are in positions of professional activity, and the continuance of high standards of technical design and execution can be depended upon with confidence. Others of us who are in managerial or executive positions have a peculiar duty and opportunity in 1946. Industrial differences have disorganized sections of essential industry so that the prosperity of our nation and our continent is suffering. This is our opportunity to add tolerance and understanding to firmness and good judgment and to demonstrate as employers that we are sound at heart as well as in mind.

A vital necessity to the stability and happiness of our people is ample production of goods and services. If we can produce and distribute all the food, clothing, shelter and devices, hotel accommodation and railway and transit rides, and laundries and all the many things we now lack our troubles will largely be over. Increase in productivity seems to be artificially restricted by certain groups. Engineers should be natural leaders in improving productivity and establishing sound and progressive policies. First by our own example and then by leadership of others let us see to it that both machines and men are both put to work in the most efficient manner. Perhaps we should consider expanded activity in the field of political administration so that our training in factual appraisal may correct the less sound ideas of some politicians.

My predecessors have carried on our traditions in peace and for the last six years in war. Their successors, like myself, must devote our efforts to the re-establishment of those who have served us in the Armed Forces, the education of juniors, the maintenance of high engineering standards, and the prestige and welfare of the Institute and the profession.

I appreciate most sincerely the high honour that has been conferred upon me and I look foward with keen anticipation to widening my circle of friends among my betters and my equals in my calling.

President.

PERFORMANCE, INSTALLATION CHARACTERISTICS AND DESIGN OF THE ROLLS-ROYCE 'NENE' AND 'DERWENT' GAS TURBINES

J. D. PEARSON

Chief technical services engineer, Rolls-Royce Group, England.

Paper presented at the Sixtieth Annual General and Professional Meeting of The Engineering Institute of Canada, at Montreal, on February 7th, 1946.

Introduction

There have been a considerable number of technical papers and articles in the press on gas turbines since the end of the war and the lifting of wartime secrecy regulations. Most of these papers have dealt with the theoretical thermodynamic aspects or have given only very general information on the design and performance of particular units.

In this paper an endeavour is made to present the performance and installation characteristics of the jet propulsion gas turbine from the point of view of the aircraft man, and in order to assist in this, comparisons are made of its performance and installation characteristics with those of the familiar piston engine-propeller combination. So as to make this comparison realistic and of technical value, it has been done in terms of two specific turbine engines, which are fully type and flight tested and are in production—the Rolls-Royce 'Nene' and 'Derwent V'.

For the benefit of those who may wish to make use of some of this data, I would state that it is all based on official Air Ministry type tests and subject to the usual guarantees.

A portion of the paper has been devoted to the design of these units, as although the subject matter has been released in an article in the technical press, I think that the more complicated features in the design are worth going over again in a paper such as this, as it provides an opportunity for questioning and discussion.

Brief reference is also made to the history of the development of the jet propulsion gas turbine.

History

The idea of using jet propulsion for aircraft is by no means new, and photographs appeared many years ago of an Italian aircraft with a jet propulsion engine, but as there is no record of any of these aircraft ever having been produced in quantity, it is concluded that these early Italian experiments were unsuccessful.

There was in England, however, a man with an unquenchable faith in the jet turbine engine, and despite all kinds of difficulties, he persevered with his ideas and finally produced a successful design. This man was Air Commodore Whittle of the R.A.F. and all of the jet propelled aero engines which are now in production in England and the United States owe something to his original design.

It was in 1938 that the Rolls-Royce Company first took an interest in jet-propulsion units for aircraft, and in 1939 the first design projects were made. In 1940 test work began to be carried out on various components; the great experience of Rolls-Royce engineers and facilities for manufacture at the Rolls-Royce plant in Derby were lent to the producers of the Whittle type engine, and the machining of such parts as supercharger casings and wheelcases, and the manufacture of turbine blades and oil pumps was undertaken.

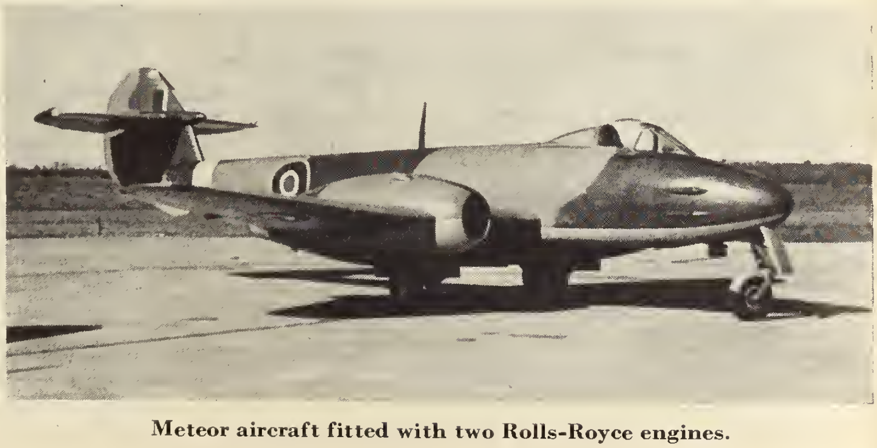
In June 1941, a test plant was set up at Rolls-Royce, Derby, for development work on compressors including a step-up gearbox capable of transmitting 2,000 hp. and running up to speeds of 17,000 r.p.m. This particular plant has been in operation ever since that date. At that time it was the only test plant in the world capable of handling the compressors employed in jet propulsion. At the same time, development was carried out on combustion chambers, and at the end of 1941, under instructions from the Air Ministry, the Rolls-Royce Company undertook the manufacture of the simple gas turbine unit of the Whittle type in conjunction with Power Jets Ltd. The limiting factor was the construction of the turbine blades due to limitations of temperature and r.p.m., but so much progress was made that Rolls-Royce was asked to take over the development and manufacture of the Whittle units.

Meanwhile one of the famous early wartime bombers, the Wellington or "Wimpey", as it was affectionately known, was turned into a flying test-bed for the first Rolls-Royce version which is known now as the "Welland", being the first of the Rolls-Royce "River" class of jet-propulsion units, this name being chosen to give the idea of flow associated with jet-propulsion.

While Rolls-Royce continued to supply these Whittle type units for test purposes in other aircraft, including the Meteor, they began in April 1943 to design a further development of an improved type which became famous as the Rolls-Royce "Derwent" which was the first British jet engine to go into quantity production, as well as the first jet engine to power British aircraft in operational service with the Royal Air Force. The first operational duties of the jet engined Meteor aircraft were to combat the grave menace of the Flying Bomb, against England in 1944.

Many thousands of hours test running both on the bench and in the air went to the perfecting of these early Rolls-Royce units and many 100-hour type tests were accomplished. The culmination of all these tests was a successful run of 500 hours on a "Derwent" engine without strip or major replacement of any kind.

To give some idea of the rapid development achieved by Rolls-Royce, the original Welland engine fitted to the Meteor aircraft gave 1,600 lb. thrust and weighed 850 lb. The Derwent V which is now being fitted to the same aircraft and which is of exactly the same overall diameter,



Meteor aircraft fitted with two Rolls-Royce engines.

gives 3,500 lb. thrust for weight of 1,250 lb. The specific fuel consumption per lb. of thrust has also been improved. It was the Derwent V engine which was fitted to the Meteor aircraft which recently established the world air speed record of 606 m.p.h.

During the same period, Rolls-Royce have developed a larger engine of similar design, the Nene, which gives 5,000 lb. thrust for a weight of 1,600 lb.

Performance

One of the difficulties in visualizing the performance of jet propulsion gas turbine engines is that it is expressed in the somewhat unfamiliar terms of lbs. thrust. Before dealing with the performance characteristics of the Nene and Derwent, an endeavour will be made to show why this is so by reference to the test bed performance curves and also to draw attention to the simple mathematical relation which exists between thrust and horsepower.

Test bed performance

The whole of the useful power on a jet propulsion gas turbine is in the propulsive effort of the jet. The performance of the engine on the test bed can only be measured by measuring the thrust from the jet as there is no shaft which can be coupled to a brake to measure horsepower. Thus, in the strict sense, the useful horsepower being developed by a jet engine on the test bed is zero as no measurable net work is being done. Actually the total energy in the jet is being dissipated in the form of kinetic energy and heat. It is most important to appreciate this point as it illustrates why the performance of a jet engine is expressed in terms of lb. thrust and also that the jet engine only begins to develop useful equivalent horsepower when it is moving forward, in other words when the thrust is multiplied by speed to give a rate of doing work which is normally expressed in horsepower.

Figures 1 and 2 show the test bed performance curves of the Nene and Derwent V engines. The maximum take-off, combat and climb ratings of the Nene are the same at 5,000 lb. thrust at 12,300 r.p.m. The corresponding figures for the Derwent V are 3,500 lb. thrust at 14,600 r.p.m. It

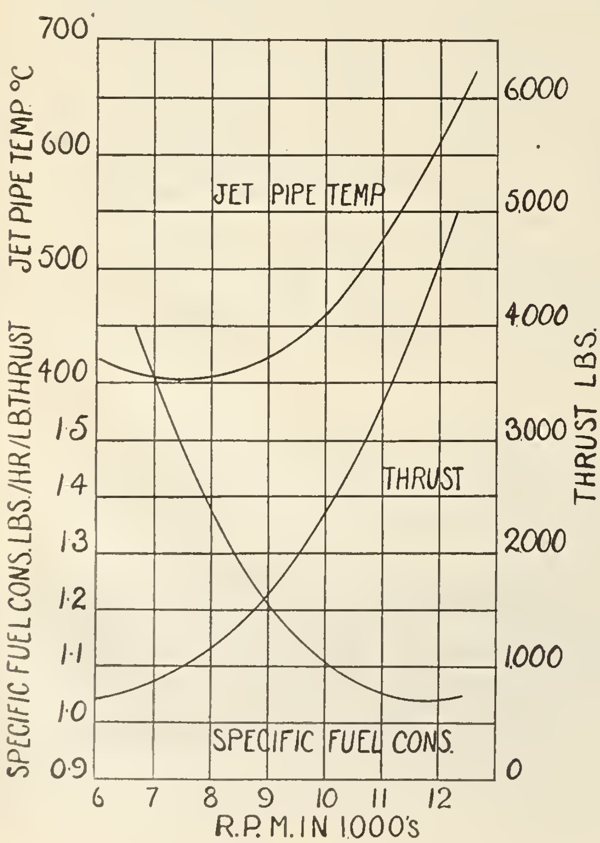


Fig. 1—Test bed performance curve; Rolls-Royce Nene.

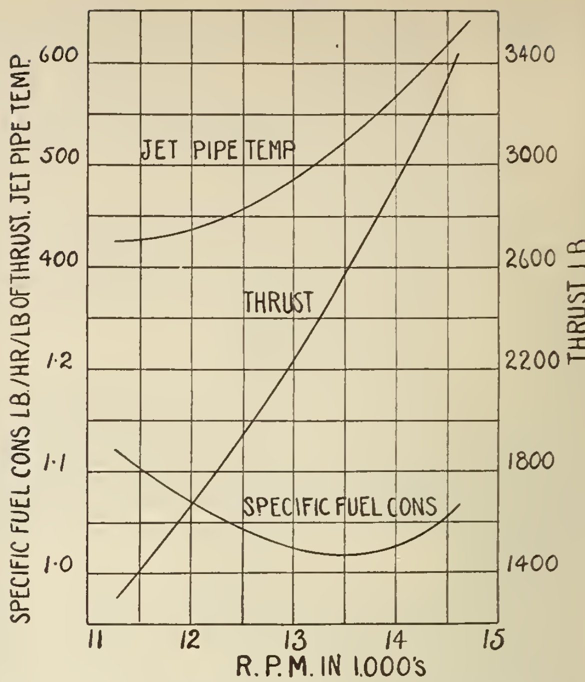

Fig. 2—Test bed performance curve; Rolls-Royce Derwent V.

should be mentioned again that the net dry weight of the Nene is 1,600 lb. and of the Derwent 1,300 lb. This weight includes all engine driven accessories but excludes the weight of the auxiliary gear box and aircraft accessories.

As the speed of the engine increases, the supercharger speed increases, which increases both the compression ratio and the weight of air passing through the engine. This is reflected in both increasing thrust and decreasing fuel consumption with increasing speed up to the optimum. At the same time the jet pipe temperature is increasing.

It will be noted from these curves that down from full thrust to half thrust, the fuel consumption rises only about 5 per cent, but that below half power the rise in specific consumption becomes greater. This characteristic differentiates the jet engine from the piston engine, in that the optimum specific fuel consumption occurs at close to maximum power.

Relation between horsepower and thrust

As the performance of the jet engine has to be expressed in terms of lb. thrust instead of the more familiar term of horsepower, it is worthwhile going over the mathematical relation between the two.

Basically, the thrust horsepower being used in the propulsion of an aircraft is obtained by multiplying thrust by the forward speed. Taking into account dimensions this gives:

$$\text{Thrust hp.} = \frac{\text{Thrust} \times \text{forward speed (in m.p.h.)}}{375}$$

The difference between the engine horsepower and thrust horsepower is determined by the propeller efficiency, so that:

$$\text{Engine hp.} = \frac{\text{Thrust} \times \text{Forward speed (in m.p.h.)}}{\text{Airscrew efficiency} \times 375}$$

which gives:

$$\text{Airscrew thrust} = \frac{\text{Engine hp.} \times \text{airscrew effic'y} \times 375}{\text{Forward speed (in m.p.h.)}}$$

This simple relation must be kept very clearly in mind when comparing jet and piston engines.

It is appreciated that the momentum drag of the intake air and the ejector thrust from the exhaust should be taken into account together with the propeller thrust in assessing the total net thrust exerted by the propeller-engine combination, but for the sake of simplicity in the comparisons which follow, both the momentum drag of the intake air and ejector thrust have been ignored for the piston engine,

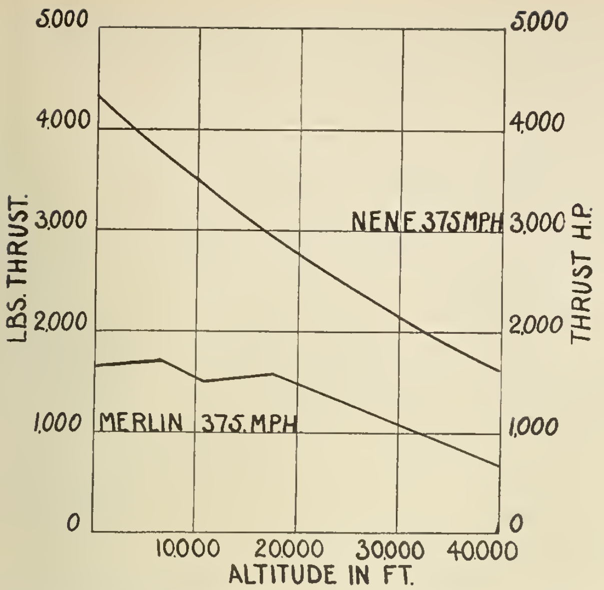

Fig. 3—Thrust and horsepower in function of altitude.

as the former is small in magnitude and the latter varies with the type of exhaust system.

COMPARISON OF THRUST AND HORSEPOWER AGAINST ALTITUDE

Figure 3 shows the maximum power output of the Nene and Merlin at 375 m.p.h. plotted against altitude. From what has already been said it will be appreciated that one horsepower is equivalent to one pound thrust at this speed and it will be noted that the abscissae are calibrated in terms of both.

One of the first things to note is that the thrust and horsepower of a jet engine fall off continuously with altitude, and as a first order approximation, this fall-off in power is proportional to the reduction of density with altitude. It will also be well noted as is well known, that the piston engine thrust and horsepower is artificially maintained by increasing the ambient density by supercharging up to the full throttle height after which the power falls off, again approximately in relation to the reducing density of the air.

Although the maximum Merlin thrust horsepower shown by this curve is only of the order of 1700, the maximum B.H.P. of the engine is 2,100, the difference being due to propeller losses. It is worth noting that there is no similar loss to be allowed for in the figures quoted by the jet engine manufacturer.

Under these particular conditions, the Nene is giving more than two and half times the Merlin thrust horsepower at sea level and just under twice its power at 40,000 ft.

THRUST HORSEPOWER AGAINST SPEED

Figure 4 shows the thrust horsepower of the Nene and the Merlin plotted against the forward speed. In calculating the Merlin thrust, a propeller suitable for high speed aircraft such as the Spitfire has been assumed. This curve illustrates the truly enormous powers developed by the jet engine at high forward speeds and also the deficiency of the piston engine-propeller combination at similar conditions. This difference is largely due to the difference in the efficiency characteristics of the jet and the propeller as shown in Fig. 5.

The fall-off in propeller efficiency with increasing forward speed is well known and is due to the compressibility effects of the outer portions of the propeller blades as they approach the speed of sound. In this connection, it is of course the true helical forward speed of the propeller tips which counts, which is the vector sum of the forward speed of the aircraft and the tip speed of the propeller due to rotation. The propeller of Fig. 5 is a typical high speed propeller and, whereas a little better than this might be done with a propeller especially designed for very high speeds, it is unlikely that any propeller could be designed to give reasonable efficiencies above 500 m.p.h.

The reason for this increasing propulsive efficiency of the jet with forward speed is a matter of simple mechanics. Theoretically, the maximum efficiency of any form of jet propulsion is obtained by dividing twice the forward velocity by the sum of the forward velocity plus the jet velocity, which shows that the efficiency increases with increasing relative speed of the aircraft and the jet, and reaches a theoretical value of unity when the aircraft velocity equals the jet velocity, but this is only attainable theoretically as at this point the thrust will have dropped to zero.

THRUST AND FUEL CONSUMPTION AGAINST FORWARD SPEED

Figure 6 shows thrust and fuel consumption of the Nene and Merlin plotted against forward speed at sea level. The fuel consumptions in terms of lb. of fuel per lb. of thrust per hr. against forward speed are also shown on the same curve All these curves refer to the combat rating of these engines and a high speed propeller has been assumed for the Merlin which accounts for the relatively low thrusts at low forward speeds.

The maintenance of the jet engine thrust with forward speed is apparent in comparison with the fall-off in thrust with the Merlin.

The increasing efficiency of the jet engine with increasing forward speed is reflected in the relatively small increase in fuel consumption per lb. of thrust per hour. In comparison, it will be noted how the piston engine fuel consumption expressed in the same terms begins to increase very rapidly over 450 m.p.h. due to rapid fall-off in propeller efficiency. At just over 500 m.p.h. the Merlin and the Nene consumptions run the same. It should be appreciated that, as far as the Merlin is concerned, the specific consumption is very dependent upon the choice of propeller, and it is probable that these figures do not represent the very best that could be done with a propeller design for optimum results at 500 m.p.h. The propeller used for this calculation is, however, a typical high speed propeller used on aircraft such as the Spitfire.

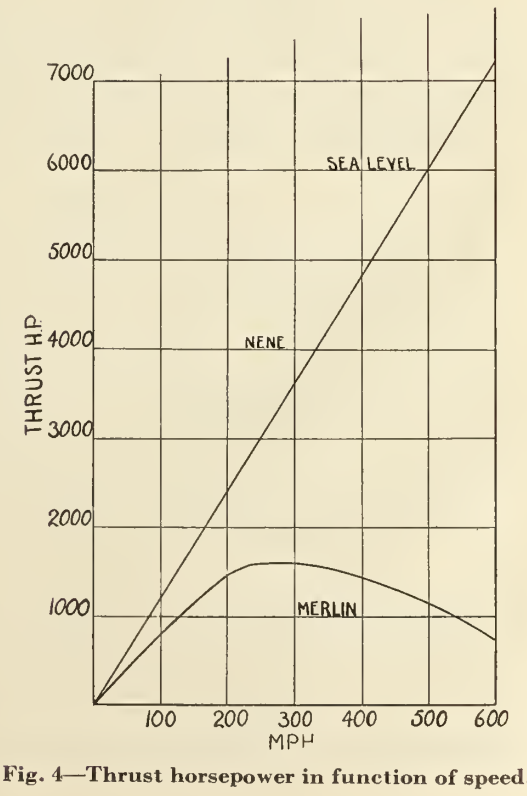

Fig. 4—Thrust horsepower in function of speed.

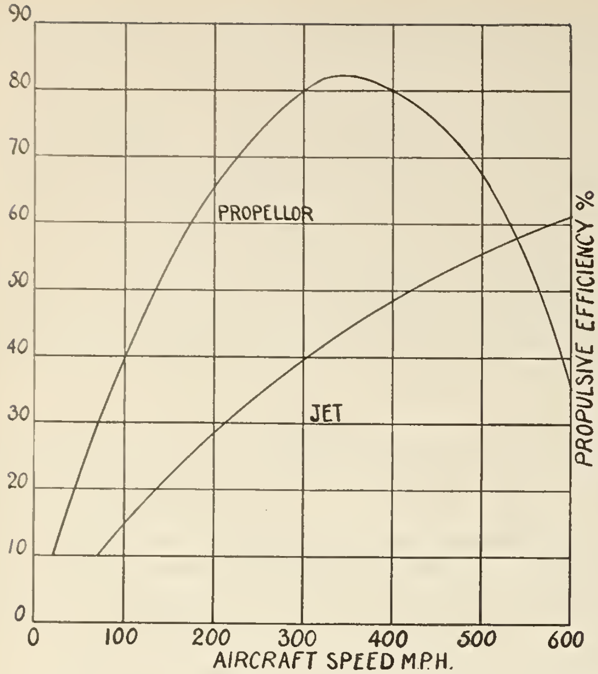

Fig. 5—Propulsive efficiency in function of aircraft speed.

VARIATION OF CRUISING THRUST AND FUEL CONSUMPTION WITH ALTITUDE AT 400 M.P.H.

The thrust and fuel consumption at the maximum permissible continuous cruising powers for the Nene and the Merlin at 400 m.p.h. are plotted against altitude in Fig. 7. The maximum continuous cruise r. p.m. on the Nene is 11,500 which gives a thrust of 3,120 lb. at 400 m.p.h. at sea level. The maximum permissible continuous cruising conditions of the Merlin are 2650 r.p.m., 48 in. boost which gives a maximum sea level horsepower of 1120, rising to 1250 at 14,000 ft. For the purpose of converting Merlin horsepower into thrust, a uniform propeller efficiency of 80 per cent has been assumed.

The Nene thrust falls off with altitude as previously mentioned, whereas the shape of the Merlin thrust curve is similar to that of the horsepower curve as the curve is drawn for thrust at constant speed.

This figure was drawn primarily, however, to illustrate the variation of fuel consumption per lb. of thrust per hr. with altitude for the jet engine and the piston engine-propeller conbination. It will be noted that, whereas the specific consumption of the Merlin falls off with increasing altitude, particularly after the full throttle height is reached,

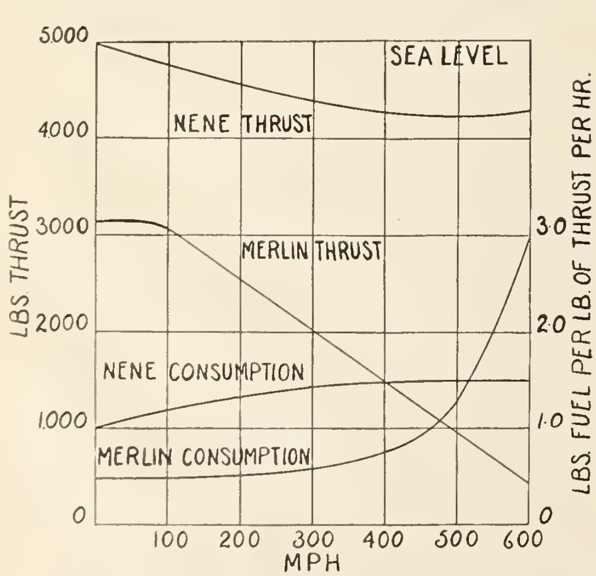

Fig. 6—Thrust and fuel consumption in function of forward speed.

the specific consumption of the Nene actually falls progressively with the increasing altitude. The reason for the reducing specific consumption of the jet engine is that the thermodynamic efficiency of the engine which, like the piston engine, is dependent on compression ratio increases with altitude due to the reduction in temperature as the centrifugal blower ration varies with the absolute temperature. Although in the illustration the fuel consumption curve appears as a straight line, there is in fact a slight discontinuity at 36,000 ft. and the specific fuel consumption above this altitude remains substantially constant with the air temperature.

The reason for the fall-off in specific consumption of the Merlin is that the mechanical losses in the engine remain substantially constant while the B.H.P. falls off with reducing density, so that the decreasing proportion of the total fuel is available as thrust horsepower.

This curve illustrates the fundamental advantage of flying high with jet engines from the engine efficiency point of view quite apart from the obvious advantages from the aircraft point of view of reduced drag.

Installation Characteristics

The basic installation requirements are comparatively simple. A forward facing air intake placed at the front of the fuselage or nacelle and opening straight into the chamber surrounding the engine is the most satisfactory arrangement.

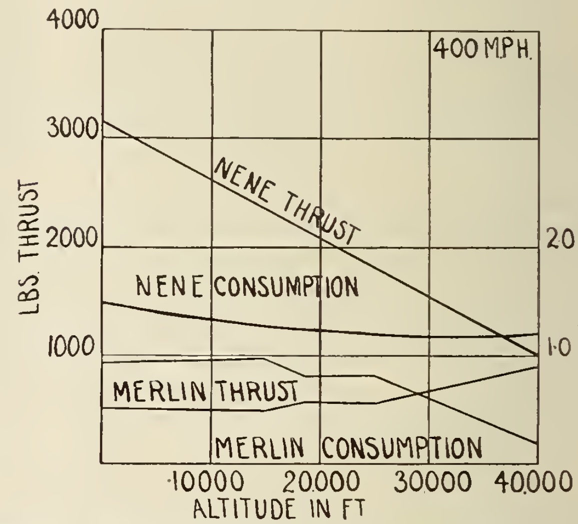

Fig. 7—Cruising thrust and fuel consumption in function of altitude at 400 m.p.h.

Air intakes on the side of the fuselage should be avoided owing to boundary layer effects. The jet pipe must of course, face rearwards but could if necessary be divided and can be inclined to the line of thrust up to about 15 deg.

Owing to the absence of anything but low amplitude high frequency vibration, the engine may be rigidly mounted and a variety of engine mounting attachment faces are provided in order to cater to various types of installation. There are a series of such faces on the outer diameter of the compressor casing and others on the front of the engine at the gear case at the rear. Any of these different combinations of pick-up points may be used.

ACCESSORIES

A self-contained wet sump type lubrication system is incorporated in the engine. No provision is to be made for oil coolers or de-aerators.

A 24-V electric starter motor, high pressure fuel pumps, an altitude control unit, filters and an oil pressure transmitter are mounted directly on, and supplied with the engine.

Three alternative drive positions are provided for driving the Rotol series of auxiliary gear boxes on which are mounted the aircraft accessories and, if required, the cabin supercharger. It is not considered practical to take the cabin supercharging from the engine supercharger, owing to the difficulty of excluding fumes.

Air heating jackets can easily be provided round the jet pipe for gun or cabin heating.

AIRCRAFT INSTRUMENTS

One of the advantages of jet propulsion gas turbines is the simplicity of control and the very few instruments required. The only engine instruments required are an r.p.m. indicator, the jet pipe temperature indicator, an oil pressure gauge and a burner pressure gauge.

The engine power is controlled by a single throttle lever.

Apart from the usual fuel supply cocks, a high pressure shut-off cock is required for stopping the engine.

For starting the engine, a single starter button only is required in the cockpit but provision must be made in the aircraft for an electric relay time panel which controls the starting cycle automatically.

FUEL SYSTEM

With Kerosene fuel systems, the fire and explosion risks are no less than in the case of petrol systems, therefore adequate self sealing and inert gas pressurising should be used wherever possible.

Tank mounted fuel booster pumps are essential, and they must be mounted either directly in or under the fuel tanks to ensure adequate venting of air. Considerable volumes of dissolved air and vapour are liberated from the fuel at altitude and, unless efficient and properly installed booster pumps are used, vapour locking of the pump and fuel pipe system will take place with a possible complete breakdown of fuel flow to the engine.

It is not necessary to provide a suction fuel filter in the fuel system. A coarse gauze filter is normally attached to the booster pumps and a fine mesh filter is fitted on the engine.

In addition to the normal tank selector cocks, shut-off cocks should be provided in the fuel pipe lines for the purpose of maintenance and fire prevention. A fuel pressure switch and warning light should be connected to the inlet of the accumulator housing on the engine fuel system and set to a pressure of 4 lb. per sq. in.

WEIGHT OF INSTALLATION

All the installations so far have been made by the aircraft manufacturers and no complete poweregg such as those designed by Rolls-Royce for the Lancasters have been supplied, so that is is difficult for us to give an accurate estimate of the installed weight.

Very roughly speaking, the total installation weight of the jet engine is 30 per cent of the net dry weight of the engine, which is very considerably less than a corresponding installation weight of either liquid or air cooled piston engines, so that when this factor is added to the extremely low weight of the engine itself, a very considerable weight reduction can be effected in comparison with piston engine propeller combination. It is this extremely low specific weight which makes the straight jet engine a possibility for applications where its high fuel consumption would on first sight rule it out, as the weight of the excess fuel can be balanced against the reduced installed engine weight.

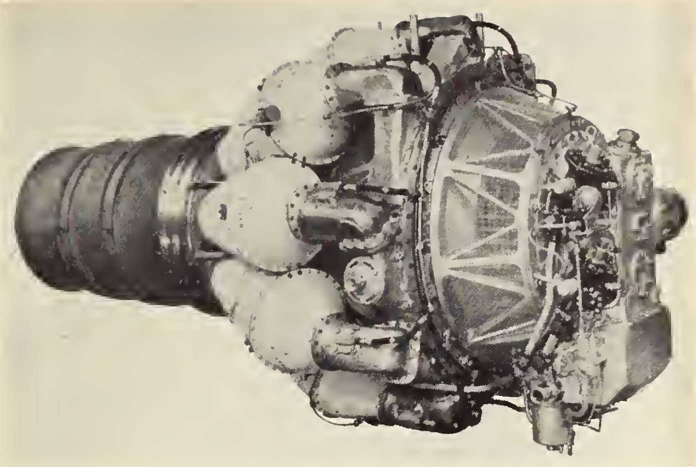
INSTALLATION DETAILS

The detail installation characteristics of the Nene and Derwent engines are given in Appendix I and II. As mentioned in the introduction, both these engines are fully type tested and the data given are based on such type test approval certificates.

Description of the Nene and Derwent Engines

The basic design of this engine is based on Air Commodore Whittle's original design as is the design of the American GEI-40 which powers the 'Shooting Star'.

Air is drawn in from the forward facing intake at the front of the engine and given some initial compression by the forward speed of the aircraft. This air is then led into the intake of a double-sided centrifugal compressor of the same basic type as that used for supercharging the conventional piston aero engine. The compressed air, which by virtue of its compression has also had its temperature raised, is then led into a series of nine combustion chambers. These combustion chambers are so arranged that some of the air enters the centre flame tube, into which paraffin oil is injected under pressure and burned. The remaining air flows around the outside of the flame tube and enters it through a series of holes to mix with the high temperature products of combustion and cools them down before they pass through the series of nozzle guide vanes to the turbine. The turbine consists of a single row of blades mounted on a disc and gases after passing through the blades are rejected rearwards through a jet pipe. The turbine disc and the centrifugal supercharger rotor are mounted on a common shaft so that the power taken out by the turbine is used to drive the compressor. The whole propulsive efforts comes from the jet and the only job the turbine has to do is to drive the compressor so the engine can truly be described as a hot air engine as the only function of moving parts is to enables quantities of hot air under pressure to be produced.



The Rolls-Royce Nene Engine.

Mounted on the shaft between the turbine and the compressor is a cooling fan whose function is to produce a flow of cooling air over the bearings and the turbine disc.

A wheel case is mounted on the front of the engine and driven from the main shaft. It drives the high pressure fuel pump and oil pumps and provides the drive for the gear box which is separate from the engine and on which are mounted the aircraft accessory units. The starter motor is also mounted on the wheelcase.

The main bearings of the engine are all of the anti-friction type. They are fed by oil under pressure which is drained back to the oil tank by means of scavenger pumps. Thus, the only oil which is directly consumed is that which leaks past the bearing oil seals. As this quantity is very small, the oil consumption of the engine is very low indeed and is specified as a maximum of less than 1 pt. per hour at all ratings. In general it is much lower than this and can be as low as 1 pt. per 50 hours. In view of this very low oil consumption, only a small quantity of oil has to be carried and this can be accommodated in a wet sump integrated with the engine. The heat to oil is also so low that no oil cooler is required so that the oil system is self-contained within the engine.

The engine power is controlled by regulating the pressure of the fuel to the burners by means of a needle type of valve which is operated by the pilot's throttle lever. Variations in fuel flow necessitated by changes of altitude are taken care of by means of an automatic unit known as a Barostat, so that the pilot's throttle gives a similar power at similar positions irrespective of altitude. A governor is incorporated in the fuel pump which automatically prevents the overspeeding of the engine, by controlling the fuel flow.

DESCRIPTION

A very comprehensive description of the Derwent engine together with exploded views of the various engine's components such as fuel pumps, fuel system and oil system, has already appeared in the technical press, and for this reason it is not proposed to go into any further detail on the engine design in this paper.

APPENDIX I

Installation Characteristics of the Rolls-Royce Derwent Engine

(1) *Overall Dimensions*

Maximum diameter..................... 43 in.
Diameter of compressor case..............42.5 in.
Overall length to exhaust cone flange......88.5 in.
Length with exhaust cone removed........60.15 in.
Length of jet pipe............To suit installation

(2) *Weights, Centre of Gravity, Gyro-couple*

Weight of engine including its auxiliaries but excluding aircraft accessories and jet pipe.............................1300 lb.
Weight of jet pipe...........15 lb. + 9 lb./ft. run
Distance of centre of gravity aft of the mounting trunions.....................15.94 in.
Gyro-couple at engine speed of 14,600 r.p.m. at 3½ radians/sec..................83,600 lb. in.

(3) *Performance*

The following table gives the leading performance data at sea level.

Rating	*R.P.M.*	*M.P.H.*	*Thrust lbs.*	*Fuel Consumption galls/hr.*
Take off Combat Max. Climb.......	14,600	0	3,500	462
		100	3,210	463
		200	3,010	465
		300	2,900	479
		400	2,850	500
		500	2,880	526
		600	2,970	562
Max. Cruising.....	14,000	0	3000	383
		100	2,720	385
		200	2,520	390
		300	2,400	397
		400	2,350	412
		500	2,360	440
		600	2,410	477

The static thrust at engine idling speed will not exceed 100 lb. at aircraft speeds below 100 m.p.h.

(4) *Lubricating Oil*

D.T.D. 44D.
Oil consumption less than 1 pt./hr. at all ratings
Oil tank capacity—10 pts.
The oil tank must always contain 2 pts. of oil for the purpose of circulation.
The oil tank is integral with the engine.
No provision is made for an oil cooler.

(5) *Accessory Gearbox*

Power available at gearbox drive............30 hp.
A single horizontal drive is provided at the front of the wheelcase to suit the Rotol SG series of accessory gearboxes.

(6) *Exhaust Jet Clearance*

Spread angle of exhaust jet. 15 deg.-20 deg. included.

APPENDIX II

Installation Characteristics on the Rolls-Royce Nene Engine

(1) *Overall Dimensions*

Maximum diameter.....................49.5 in.
Overall length to exhaust cone flange.......96.8 in.
Length with exhaust cone removed.........63.9 in.

(2) *Weights, Centre of Gravity, Gyro-Couple*

Weight of unit including engine auxiliaries but including aircraft accessories and jet pipe1600 lb.
Weight of jet pipe........35 lb. + 9.5 lb./ft. run
Distance of centre of gravity aft of centre line of impeller...................12.84 + .25 in.
Gyro-couple at an engine speed of 12,300 r.p.m. at 3½ radians/sec..................157,000 lb. in.

(3) *Performance*

The following table gives the leading performance data at sea level:-

Rating	*R.P.M.*	*M.P.H.*	*Thrust lbs.*	*Fuel Consumption Galls/hr.*
Take off and Max. Climb	12,300	00	5,000	660
		100	4,800	680
		200	4,620	702
		300	4,490	725
		400	4,390	755
		500	4,380	788
		600	4,450	825
Max. Cruise.......	12,000	100	4,360	612
		200	4,175	628
		300	4,040	650
		400	3,950	676
		500	3,925	705
		600	3,970	737
Cruise............	11,500	100	3,620	515
		200	3,380	520
		300	3,220	532
		400	3,120	552
		500	3,070	576

The static thrust at engine idling speed will not exceed 120 lb. at aircraft speeds below 100 m.p.h.

(4) *Lubricating Oil*

D.T.D. 44D
Oil Consumption less than 1 pt./hr. at all ratings.
Oil Tank Capacity — 10 pints.
The oil tank must always contain 2 pints of oil for the purpose of circulation.
The oil tank is integral with the engine.
No provision is to be made for an oil cooler.

(5) *Installation Details*

Entry area to nacelle.....................3 sq. ft.
Minimum nacelle diameter round compressor casing..........................50 in.
The exhaust cone is readily detachable if necessary for the purpose of installing the engine.

(6) *Accessory Gear Box*

Power available at gearbox drive............30 hp.
A single horizontal drive is provided at the front of the wheelcase to suit the Rotal S.G. series of accessory gearboxes.

(7) *Exhaust Jet Clearance*

Spread angle of exhaust jet. 15 deg.-20 deg. included

Acknowledgment

The author wishes to thank Rolls-Royce and the Ministry of Aircraft Production for permission to publish the information on the Nene and Derwent engines which is contained in this paper.

Thanks are also due to Mr. Agar of Canadair for his technical assistance and to Mr. Morrall of Rolls-Royce for preparation of the curves and for his general assistance.

COMBINED ACTION OF CONCRETE SLABS AND SUPPORTING STRUCTURAL STEEL BEAMS

R. C. MANNING, M.E.I.C.
Chief engineer, Canadian Institute of Steel Construction Inc., Toronto, Ont.

In spite of the fact that, as early as 1922, tests were conducted which indicated conclusively that a steel beam, completely haunched in concrete, was capable of carrying a much greater load than would the bare steel beam itself, little attention has been given to this feature in the building codes of our modern cities. The present general practice is to consider the steel beam as supporting the entire dead and live load without assistance from the surrounding envelope of concrete.

This practice led the engineer to seek for a method of protecting structural steel from excessive heat by means of some lighter form of covering.

Thus we find today that the steel floor beams and girders of our modern buildings are usually protected by some type of precast material which extends upward to the normal level of the concrete in the floor slab above.

Figure 1 indicated the changes in concrete section surrounding the steel beams which have resulted from these developments.

Figure 1(a) represents a section through a floor beam using the solid concrete fireproofing method when the floor slab is any type of concrete joisted floor, whether one or two-way construction.

Figure 1(c) shows the revised section using the newer method of precast fireproofing. Similarly, Figs. 1(b) and 1(d) show the change of section which has taken place when the floor slab is a solid poured concrete slab.

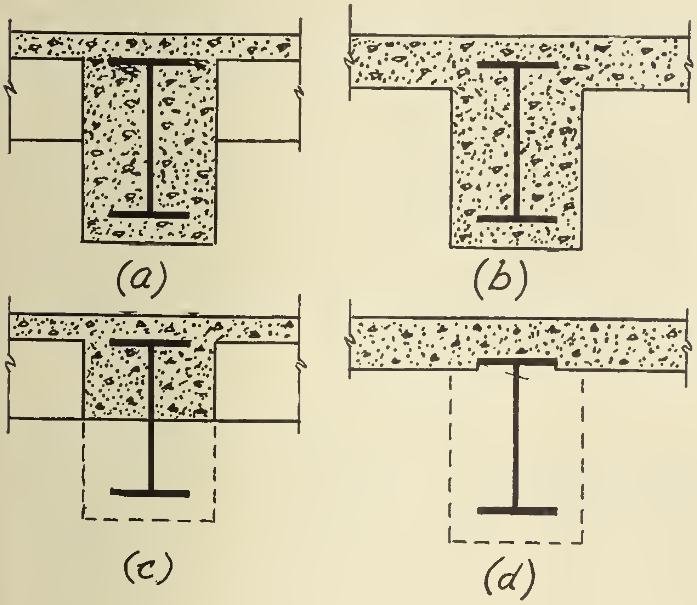


Fig. 1.

As it became more and more obvious that the practice of ignoring the load carrying value of the concrete surrounding a steel beam was wasteful, the Canadian Institute of Steel Construction has given serious thought to the idea of correcting the situation. Practically all the testing which had been done previously was based on the complete haunching of the steel beam in concrete. It was agreed that the extra weight involved in returning to this method of protecting the steel beam would sacrifice much of the potential saving to be made by figuring the combined action of the two materials. Moreover, it was felt that the concrete around the lower part of the web and around the bottom flange added little to this combined action.

Tests Undertaken

Early in 1937, a series of pilot tests were conducted under the auspices of the Canadian Institute of Steel Construction by Professor C. R. Young of the University of Toronto. Figure 2 shows the details of the specimens which were used. It will be seen that the sections of concrete used are similar to Figs. 1(c) and 1(d) as described above. Note that Specimen A in the test had welded cleats at one end only.

Some of the conclusions drawn by Professor Young as a result of these tests were:—

(*a*) Composite beams in which the top flange is augmented by a concrete slab, with or without haunching down to approximately the neutral axis, behave in substantial correspondence with the accepted theory of composite beams, so long as the bond between the concrete and the steel is not definitely broken.

(*b*) For the depth of beams tested, and for the grade of concrete employed, the capacity for third point loading, based on the extreme fibre stress in the bottom flange of the steel beam of 20,000 lb. per sq. in., and with intact bond is increased from 29 to 48 per cent, the larger figure being applicable to the shallower beam.

(*c*) For an extreme fibre stress of 33,000 lb. per sq. in., in the bottom of flange of a composite beam with intact bond the third point load capacity is increased from 13 to 36 per cent, the larger figure being for the shallower beam.

(*d*) The flexural stress in the top flange of the encased I-beam is moderate with intact bond. For the specimens investigated, the amount of concrete employed was relative-

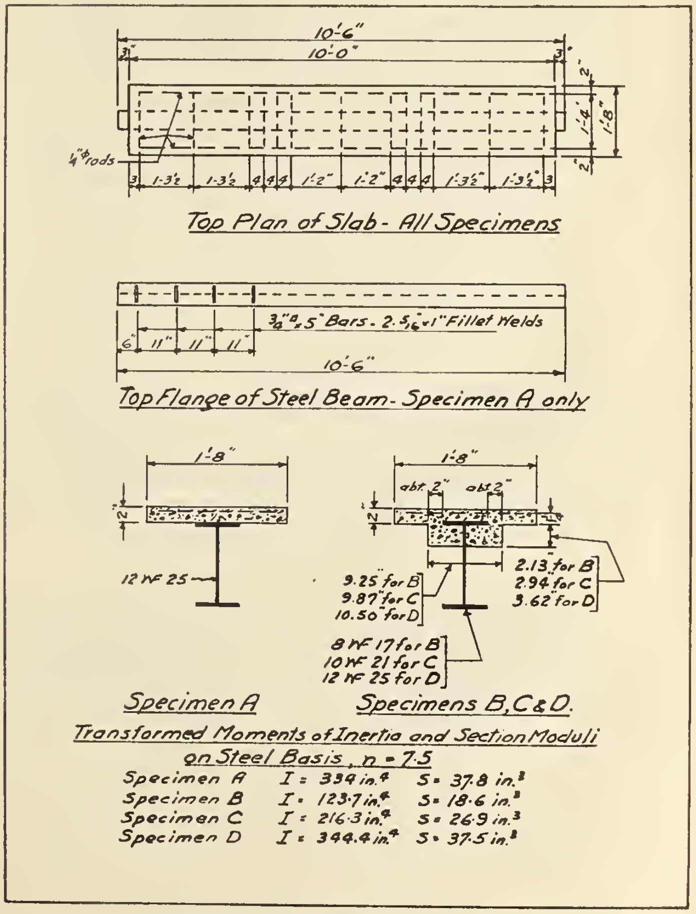

Fig. 2—Details of specimens.

ly large and consequently the extreme fibre compressive stress in the concrete was not a determining factor.

(*e*) Welded cleats, such as those employed at the left end of Specimen A (Fig. 2) provide an excellent security against early bond failure. A beam with attached cleats at both ends might be expected, even without haunching, to develop a capacity comparable with that developed by Specimen D with haunching.

(*f*) In continuous construction, where the slab abuts against steel columns, and where adequate reinforcement of the slab parallel to the steel girder in the neighborhood of the latter exists, it would appear that the capacity of the interior spans of composite beams might well be above that reported in the present pilot tests for the same grade of concrete. At the outer end of end spans, special need for providing adequate bond resistance would arise but it appears probable that the use of cleats similar to those employed in Specimen A would solve this problem.

Further Tests

In order to develop further conclusion (*f*) above relative to continuous structures, it was decided to carry on a further test at the University of Toronto.

Figure 3 shows the details of the specimen which was prepared.

The cross section of the three-span unit, was, for comparative purposes, made the same as that of Specimen C used in the pilot tests previously described. The haunching was, as in the previous case, carried down only to the neutral axis of the composite beam.

For the primary purpose of improving the resistance to slipping of the concrete slab and haunching on the top flange of the steel beam, continuity was provided at the two intermediate column supports by introducing four 5/8 in. dia. longitudinal top rods carried to the estimated points of inflection. The beams framing into these columns rested on stiffened brackets and were connected at the top by clip angles. The attachment of the beams was by means of turned bolts, the bolts in the bracket having roughly the same capacity as the four 5/8 in. dia. rods in the slab at the support.

While free support was provided at the north end of the unit, at the south end the steel beam rested on a column bracket and was provided with a clip angle similar to those at the intermediate columns. Further, a single 5/8 in. dia. rod was looped around the column in order to provide a small amount of restraint similar to that ordinarily found in building construction at wall columns.

In order to assist in bond resistance, three 3/4 in. square transverse cleats 5 in. long were welded to the top flange of the beam near the north end, as shown in Fig. 2 There were no cleats provided at the south end. The purpose of the cleats was to ensure bond resistance at the north end at least equal to that at the south end.

Conclusion from Tests

Based on the observations made during test and the theoretical analysis of the behaviour of the unit, the following conclusions were reached.

(*a*) Due to the combined influence of reinforcement of the top flange of the steel beam by haunching and slab incorporation, and the continuity arising from the end details, the maximum flexural stress on the steel at mid-span is substantially reduced. For loads that would produce flexural stresses of 15,500 lb. per sq. in. or over in a corresponding naked beam, the stress is reduced about 33 per cent. For loads that would produce flexural stresses of 13,200 lb. per sq. in. or over in a theoretical simply-supported composite beam, the actual stress in the steel at mid-span is about 21 per cent less.

(*b*) The flexural stress at mid-span increased according to a straight line law until a partial breakdown of bond and continuity took place at the supports. After the beam had reached a steady state due to the reloading, the acceleration of stress increase was found to begin at a flexural tensile stress of 20,000 lb. per sq. in.

(*c*) The effect of continuity was still important in the intermediate span from the point of sudden slip up to the maximum applied load and presumably had a substantial bearing on the observed stresses.

(*d*) Ordinary amounts of tensile steel in the slab at the intermediate supports do not materially improve the bond.

During these various tests, welded cleats on the top flange of the beams were found to greatly increase the bond between the concrete and the top flange of the beams.

Final Test

It was decided to conduct another test with a concrete slab on top of a steel beam as shown in Figure 4.

Since theoretical analyses and previous tests had indicated that the bond strength between the concrete and the steel would be the critical factor in determining the strength of the composite beam, it was decided to weld lugs to the top flange of the steel beam engaging the concrete, thus providing additional mechanical bond.

The beam was loaded with a single concentrated load at mid-span as shown in Figure 4. Measurements were recorded of the deflection of the beam at mid-span; the slips between the concrete slab and the top flange of the steel section at the two ends of the beam; the strains in the concrete and the steel at the points of the cross-section indicated in Figure 4. Since the load was applied at mid-span, it was not possible to measure the strains at this section but a section H one foot from mid-span, was chosen for the first six loadings, while another section K, two feet from mid-span, was chosen for loadings 7, 8 and 9. It will be noted that section H is at the location of a shear lug while section K is midway between two of the shear lugs. Since, for this type of loading, the bending moment and hence the strains would vary directly as the distance from the support, the measured strains at H were stepped up by the fraction 7/6 and at K by the fraction 7/5,

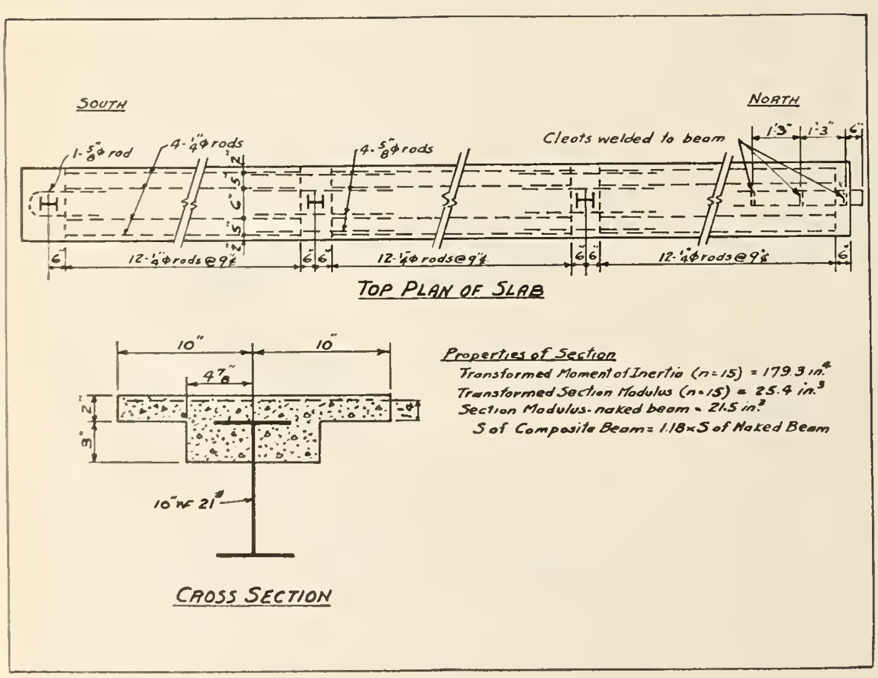

Fig. 3—Details of specimen.

so as to indicate the strains which would occur at the mid-span section.

In the second run, when the load reached 34 kips, there was a loud report and the load fell off to 32 kips. Inspection showed that sudden slip had occurred at the north end and it was concluded that the surface bond between the top flange of the steel beam and the concrete slab had broken through the north half of the beam. The bond stress accompanying the load of 34 kips, computed by the standard expression $\frac{V.Q.}{I.b.}$ was 182 lb. per sq. in. The measured stress in the steel was about 28,000 lb. per sq. in. when this first bond failure occurred. During the fourth run, when the load reached 38 kips, a similar occurrence indicated that the surface bond had broken throughout the south half of the beam, the intensity of bond stress being in this case 207 lb. per sq. in. Subsequently the shear lugs operated to transfer the stress into the concrete slab as was anticipated in the design of the composite section.

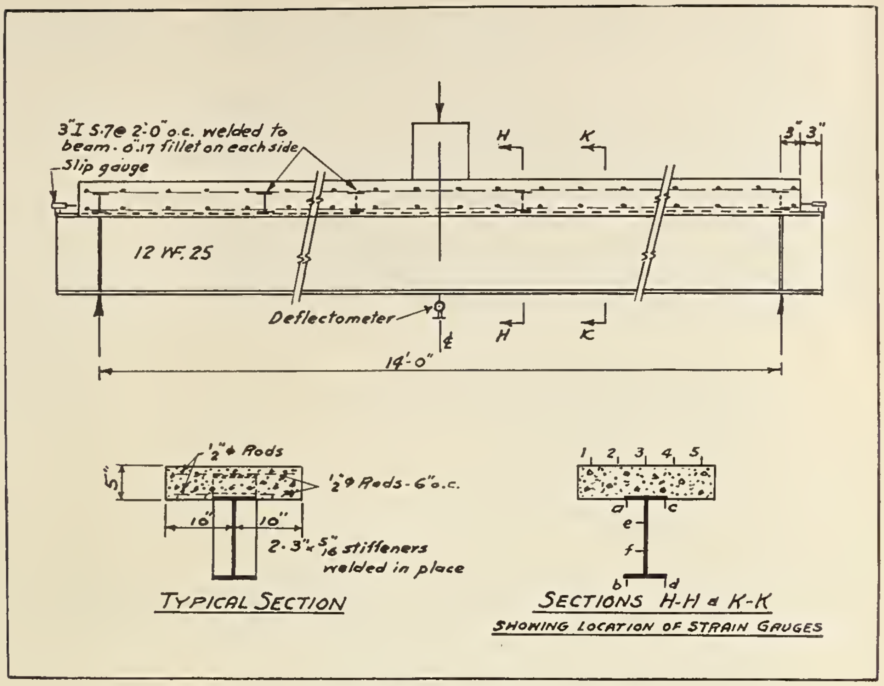

Fig. 4—Details and method of loading.

During the ninth and last loading, the instruments were left in position until a load of 50 kips was put on the beam after which they were removed and the beam loaded to failure. This failure occurred at a load of 75.5 kips as a result of crushing of the concrete at the edge of the loading block. The deflection of this load was 2 1/2 in. When the beam was taken from the machine and the slab removed, it was observed that the shear lugs were still in good condition. There was no evidence of failure in any of the welding.

Conclusion from Tests

(*a*) The reinforced concrete slab on the top flange of the I-beam has a marked strengthening effect. For a load concentrated at mid-span, the capacity is increased 46.5 per cent, approximately, over that of a corresponding naked beam.

This increase is indicated by a comparison of the respective safe loads for the naked steel section and the composite beam:

Permissible Stress in Steel lb. per sq. in.	Safe Load, Kips	
	Naked Beam	Composite Beam
20000	14.7	21.5
33000	24.3	35.5

(*b*) The composite beam behaves elastically for the fibre stresses and deflections developed up to a load of 35.5 kips. This load, as shown above, is the rated capacity of the composite beam for a permissible stress in the steel of 33,000 lb. per sq. in.

(*c*) Deflections mounted smoothly with applied load for loads not exceeding 40 kips. The observed deflections were less than those calculated for a naked beam, but larger than deflections calculated for the composite beam.

(*d*) The shear lugs were found to be in good condition after the test, with no evidence of failure in the welding.

Practical Application

The first practical Canadian recognition of the combined action of concrete slabs with steel beams will be found in the National Building Code which was prepared under the joint sponsorship of the National Housing Administration of the Department of Finance and the Codes and Specifications Section of the National Research Council of Canada.

The National Building Code, which was published in 1941, was the result of nearly four years of intensive work by a group of Committees made up of outstanding authorities in the various fields of construction.

Its purpose was to offer guidance to various communities which had no building regulations or whose codes were in need of modernization.

The following appears on Page 147 of the Code—3.5.10.11

Allowance for Concrete Encasement

(*a*) General—Allowance may be made, in accordance with the provisions of this Item, for the strengthening effect of concrete encasement or of a concrete slab on a beam, if the concrete has a minimum strength of 2000 pounds per square inch and the steel is not painted.

(*b*) Initial Stress—Allowance may be made only for the portion of the load that is supported by the beam after the concrete has set. If the concrete or any other loading causes stress in the steel before the concrete has set, such loads shall be assumed to be supported by the steel only.

(*c*) Method of Calculation—Allowance may be made for the strengthening effect of the concrete by assuming that the steel and the concrete act together elastically, in which case the stress in the steel shall not exceed that permitted in Article 3.5.4. If the horizontal shear stress on the upper surface of the steel beam exceeds .025 $f'c$ special provision shall be made to increase the bond between the steel and the concrete. Such provision shall be adequate to resist all horizontal shear stress on the upper surface of the steel beam in excess of .025 $f'c$ and may take the form of anchorage plates or angles rigidly attached to the top of the flange of the steel beam.

Preparation of Tables

Realizing that the busy structural designer will be helped by the preparation of printed tables giving the properties of composite steel beams and concrete slabs for the more common combinations of beams and slabs, the Canadian Institute of Steel Construction is preparing tables which will become available in the near future.

When completed, these tables will give the properties of all Canadian rolled beams from 8 I @ 18.4 to 15 I @ 55 combined with top slabs 3 in., 4 in., 5 in., and 6 in. in thickness (Fig. 1(d)), the properties being given for 2000 lb., 2500 lb. and 3000 lb. concrete.

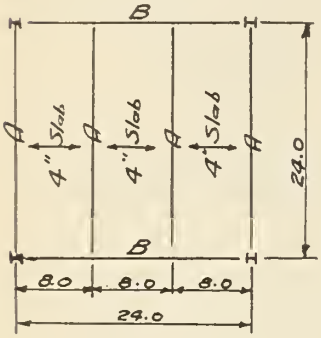
In like manner, the properties of the same thicknesses and grade of concrete slab will be given when combined with a large range of the more commonly used American wide flange sections.

The tables will also give the properties of all Canadian rolled beams from 8 I @18.4 to 15 I @ 55 combined with thin top slab and partial haunching (Fig. 1(c)) as used with joisted types of concrete floors. Here again figures will be given for 2000 lb., 2500 lb. and 3000 lb. concrete.

Similarly the tables will show the properties of thin top slabs and partial haunching combined with the commonly used American wide flange sections, using 2000 lb., 2500 lb. and 3000 lb. concrete.

Example of Calculations

LIGHT MANUFACTURING BUILDING



Live Load = 125 lb./sq. ft.
Concrete — 2500 lb. sq. in.
f_s = 20000 lb. sq. in.

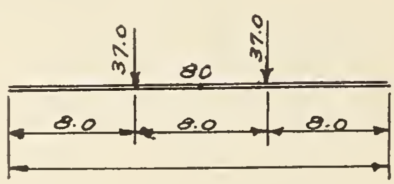
Ordinary Design Methods

Beam A LL = 125
DL = 50
Fin = 12 $R = 18500$

$$187 \times 8 = 1496$$
$$B_m = 45$$
$$\frac{1541 \times 24^2}{8} \times \frac{12}{20} = 66.2$$

Use 16 WF @ 45

Beam B 37.0
.9
37.9



Assuming 24 WF @ 80 $S = 185.8$

$$M = 37.9 \times 12.0 - 37.0 \times 4.0 - \frac{80 \times 12^2}{2}$$
$$= 455.0 \quad - 148.0 \quad - 5.8$$
$$= 301.2 \times \frac{12}{20} = 181.0$$

Use 24 WF @ 80

New Method—Assuming all concrete suspended from steel during setting period.

Beam A Assume 16 WF @ 36 Bare $S = 56.3$
Comb. $S = 81.9$
(from tables)

See Fig. 1 (d)

Stress in bare steel beam due to concrete load and weight of beam

$50 \times 8 = 400$ $R = 5220$ lb.
36

$$\frac{436 \times 24^2}{8} \times \frac{12}{56.3} = 6700 \text{ lb./ sq. in.}$$

Added Stress in Steel in Combined Section due to Live Load and Floor Finish

R = 13200 lb.

$$137 \times 8 = \frac{1096 \times 24^2}{8} \times \frac{12}{81.9} = 11600 \text{ lb./ sq. in.}$$

Total Steel Stress = 18300 lb. ok.
Use 16 WF @ 36 lb.

INVESTIGATION OF BOND AND MECHANICAL LUGS

Shear due to Live Load and Floor Finish only $R = 13200$

Max. Hor. Shear on Top Flange $= v = \frac{V.Q.}{I.B.}$

Where $Q = 744$ (from tables)
$I = 13480$ (from tables)
$b = 6.99$ (from tables)

$$v = \frac{13200 \times 744}{13480 \times 6.99} = 104 \text{ lb./ sq. in.}$$

National Building Code allows bond stress of $.025f'_c$ for concrete = 62.5 lb./ sq. in.

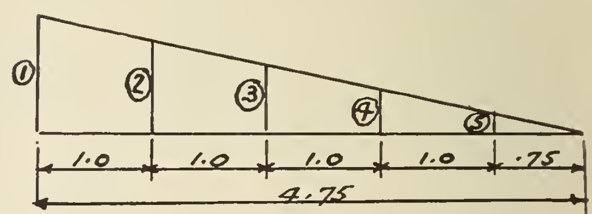
v to be taken on mechanical lugs = 41.5 lb./sq. in.

This represents a vertical shear of $\frac{41.5 \times 13480 \times 6.99}{744}$
$= 5250$ lb.

Shear lugs are required for $\frac{5250}{1096} = 4.75$ ft. from each end

Assume lugs — 1 in. sq. bar × 0 ft.—7 in. long.
Value in bearing on concrete = 7 sq. in × 2500 × .20
= 3500 lb.

Use 3/16 in. weld — 3 in. long



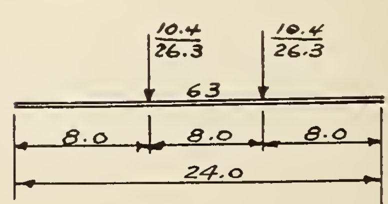
$$\text{Spacing at} \quad (1) = \frac{3500}{41.5 \times 7} = 12$$
$$(2) = 12 \times \frac{4.75}{3.75} = 15$$
$$(3) = 12 \times \frac{4.75}{2.75} = 20$$
$$(4) = 12 \times \frac{4.75}{1.75} = 32$$
$$(5) = 12 \times \frac{4.75}{.75} = 75$$

Space lugs — 6″, 15″, 20″, 20″
Total lugs per beam = 8 — 1″ sq. × 0′ — 7′ long

Beam B

Try 21 WF @ 63 Bare $S = 128.0$
Comb. $S = 171.5$ (from tables)

See Fig. 1 (d)



10.4
.8
11.2
26.3

Moment on *bare* steel $= 11.2 \times 12 - 10.4 \times 4 - \frac{63 \times 12^2}{2}$

$= 134.4 - 41.6 - 4.5 = 88.3$

$$\text{Stress} = \frac{88.3 \times 12}{128.0} = 8260 \text{ lb./ sq. in.}$$

Moment on combined section =
$26.3 \times 12 - 26.3 \times 4 = 210.4$

$$\text{Stress} = \frac{210.4 \times 12}{171.5} = 14750 \text{ lb./sq. in.}$$

Total Stress = 23010 lb./sq. in.

This stress is too great.

Try 24WF @ 74 Bare S = 170.4
Comb S=220.5 (from tables)

$$\text{Bare Steel Stress} = \frac{88.3 \times 12}{170.4} = 6200 \text{ lb./sq. in.}$$

$$\text{Added Steel Stress} = \frac{210.4 \times 12}{220.5} = 11450 \text{ lb./sq. in.}$$

Total Stress = 17650 lb./sq. in.

Use 24WF @ 74

INVESTIGATION OF BOND AND MECHANICAL LUGS

Shear due to Live Load
and Floor Finish only $R = 26300$

$Q = 1530$ (from tables)
$I = 47200$ (from tables)
$b = 9$ (from tables)

Max. Hor. Shear on Top Flange =

$$= v = \frac{V.Q.}{I.b} = \frac{26300 \times 1530}{47200 \times 9} = 95 \text{ lb./sq. in.}$$

Concrete Bond Allowable = 62.5 lb./sq. in.
v to be taken on mechanical lugs = 32.5 lb./sq. in.
Use 1″ sq. × 9″ lg. Comp. Value = 9 × .20 × 2500 = 4500 lb.

Use 3/16″ weld — 3″ long—

$$\text{Maximum spacing} = \frac{4500}{32.5 \times 9} = 15''.$$

Lugs required for entire 8′ — 0″
Space 7½, 15, 15, 15, 15, 15, 15
Total lugs per beam = 14 — 1″ sq. × 0′ — 9″ long

COMPARISON OF WEIGHTS (ignoring connections)

Weight per Panel—Ordinary Method

$45 \times 24 \times 3 = 3240$
$80 \times 24 \times 1 = 1920$

$$\frac{5160}{24 \times 24} = 8.95 \text{ lb./sq. ft.}$$

New Method

$36 \times 24 \times 3 = 2592$
$74 \times 24 \times 1 = 1776$
$3 \times 8 \times 3.4 \times 7/12 = 48$
$1 \times 14 \times 3.4 \times 9/12 = 36$

$$\frac{4452}{24 \times 24} = 7.74 \text{ lb./sq. ft.}$$

Saving = 1.2 lb./sq. ft. = 13½% on floor beams

CONCLUSION

The savings indicated above are obtained without the general contractor doing any part of his work other than in the usual manner.

In some cases, where the composite section is stronger in compression than in tension, it may be found advantageous to place temporary supports under the steel beam so that the entire load is carried on the composite section. Such procedure will reduce deflection to the minimum.

In all composite sections using a symmetrical steel beam, it will be found that the stresses in the top flange of the steel beam are low. This fact leads us to the idea of building up, out of Canadian plates or Canadian sections, a steel beam in which the top flange has a smaller area than the bottom flange. The savings thus obtained will go a long way toward neutralizing the extra cost of building up the sections. Such a procedure would make use of Canadian mill materials for sizes beyond their present maximum of 15 in. in depth much more practical than under the older design methods.

In our opinion, all Building Codes in Canada should take early steps to follow the lead of the National Building Code in recognizing the combined action of steel beams and supporting concrete slabs. The official recognition of this principle of design will not only eliminate waste of material but will also give the opportunity for a wider use of Canadian steel.

THE ENGINEER FAMILY IN THE BRITISH COMMONWEALTH

Dr. P. DUNSHEATH c.b.e.

President, Institution of Electrical Engineers (Great Britain) and Director and Chief Engineer of W. T. Henley's Telegraph Works Company Limited, London, England.

Address delivered at the Sixtieth Annual Banquet of The Engineering Institute of Canada held in the Mount Royal Hotel, Montreal, Que., on Friday, February 8th, 1946.

(As recorded verbatim by the stenotypist)

Mr. President, Ladies and Gentlemen:

I appreciate very highly the honour which you have done me this evening in inviting me to come here and be your guest speaker. I think of the remarks which were made by a speaker at the luncheon today who said how very pleased he was to come back to Montreal, to Canada, after an absence during which time he had retained many happy memories of former visits. I am not fortunate enough to have had former visits to this delightful country of yours but I am quite sure, after a space of only 36 hours, that I shall come back again at the earliest opportunity.

It so happens that the invitation from your Institute to The Institution of Electrical Engineers came at a very appropriate time. So far as I am personally concerned it arrived at a happy moment when, as president of that Institution in the first peace-time year, I was having opportunities which had not been available to any president for the past six years. Your invitation came, therefore, at a time when no president could possibly decline even if he had wished to do so.

It was also a happy coincidence that the other two chief Institutions of Engineers, the Institution of Civil Engineers and the Institution of Mechanical Engineers were both happy to allow me to represent them as well as my own Institution, at this most important gathering.

It also happened, Mr. President, that at the time of receiving your invitation my Institution, along with the other two bodies, were considering a subject which is of very great interest to your own Institute. We have had in mind for some time past the possibility of taking action to secure a better co-ordination throughout the Commonwealth, of engineering interests on all three sides, civil, mechanical, and electrical, and during the past few months those discussions have gone quite a long way, so that when your invitation came we said at once: "Here is an excellent opportunity to advance those relationships with the other parts of the British Commonwealth, the Dominions overseas, for which we are all seeking."

Commonwealth Conference

There would be many important questions to be settled in discussing this matter and I have very great pleasure today, therefore, in telling those of you who are not already aware, that during the coming summer we are arranging to hold in London a conference of the Commonwealth at which we are hoping to have delegates from every one of the Dominions. We have issued invitations and were very pleased indeed when the first acceptance came very quickly from The Engineering Institute of Canada. Not only did it come quickly but the enthusiastic terms with which you accepted our invitation gave us very great pleasure and inspired us for the work of the conference.

It is too early for me to attempt to outline the objectives which we hope to achieve in the summer when we all get together but we are hoping, Sir, that your representatives, while they are in London, will be the guests of our Institution. In this connection the three Institutions are operating together and, although no details can be proposed at this stage until we have more discussions, we can, I think, secure quick agreement on our general policy. Obviously the object of that conference will be to strengthen in every possible way the bonds of co-operation between the Dominions and the Mother Country in all matters which affect engineering. We shall hope to treat every matter in such a way that the individual societies in the different national groups will be able to fall in with a common policy which will bring interest to those separate groups and at the same time will be in the common interests. Naturally, we shall avoid taking any steps which would interfere with the government of the individual members.

Professional Organization in Great Britain

It may be that you would like to know at least something of the set-up which we have in our country carrying out the work which you are doing so admirably in your Institute here. Instead of having one body such as the E.I.C. which covers all branches of engineering, we have three separate institutions. They were formed at different times and have complete autonomy. They have also their separate buildings in which meetings and administration are carried on. The Institution of Civil Engineers was formed in 1818 and today has a membership of 15,000. The Institution of Mechanical Engineers was formed in 1847 and today has about 20,000 members. The Institution of Electrical Engineers is the baby of the three as it was formed in 1871 and now has a membership of 28,000.

Sometimes we have regrets that we are separate bodies. For many reasons it would be an advantage if we had joint administration and joint policy but in engineering bodies there seem to be schisms from time to time, breakings apart and reconnections and if we take a biological example we may say that is only a sign of really good health.

I am always reminded, when I refer to a biological example, of a speech I made when I was a very young man. In fact I think it was the very first time I spoke at a public gathering. This was at Liverpool University in the days when I, like many other young men, tried to prove the fallacies of socialism. I remember to this very day a question which I put to the audience: "What does the whole science of biology teach us?" I do not know now what answer I expected but I do remember that the theatre went up in serried ranks to the ceiling and that there was a lady in the back row, a very bright, young undergraduate, who immediately gave me the answer. It finished me for the day.

But although we have these three separate institutions and although we have complete autonomy, I am glad to be able to tell you that we are very happy in our relations with one another. In order to bring our common policies together as much as possible, we hold informal meetings of the three presidents. They meet under entirely informal conditions and in that way try to apply common sense to current problems and we are able to bring our common viewpoint to bear in such a way that perhaps we achieve much of what you get through your one body controlling all the different interests.

We also recognize, although we think we are the three main Institutions and cover the three main branches of engineering, certain other bodies which are quite strong, healthy, active, representative of engineers such as the Marine Engineers, the Aeronautical Society, the Institute of Naval Architects and the Municipal and County Engineers. It is interesting to note in connection with tendencies of administration how the approach of these Institutions is changing under modern conditions. I do not know whether you have noticed it with your body here but we have noticed quite definite changes in trend. We are being sought out by members of the engineering profession who have already established themselves. In the past, the distant past, the Institutions were approached by young men wishing to make a position in life but today more and more we are finding that those who in their youth did not take an interest in the Institution are now coming in and we feel that this is an example of what is being referred to at your conference here this week, the feeling that is getting abroad that the object of the engineering society or institute is to render service to the community rather than service to the individual member.

Service to the Community

These men who are now coming in to make application for admission are not coming in entirely for the sake of what they would get out of the Institution but because of a general wave of feeling throughout Britain that national bodies of this kind are worthwhile and should be supported. I hope that we shall see an increase in that attitude toward our national engineering bodies because I feel it is good for the profession.

That question of service to the community about which we are hearing so much, and quite rightly too, leads me to the general question that I have adopted for the title of this talk, "The Engineer Family in the British Commonwealth." There could be no closer tie between the different members of the Commonwealth than a tie such as we get in our common interests as engineers. Our three British Institutions each possess a charter and in the charter the objects of the institution are clearly laid down. In all three they are the same. The object of the institution is the advancement of science and its application for the good of humanity. If we live up to that charter we clearly are going to promote science and in applying this science we are going to benefit our fellow men. What better common ground could there be for co-operation throughout the Commonwealth than such a basis?

Engineer's Contribution to Allied Cause

The war has given us during the past six years many examples of the way in which the engineer is more and more being looked upon as the one profession, if I may say so, in which service to the community is the "be all and end all."

This afternoon I had the privilege of speaking at one of the professional meetings and outlined some of the activities of the engineer at home during the last six years. There is no time this evening to refer to more than a few of those activities but I think you probably would like to have me make a reference to them.

I want to tell you that it is my firm belief and the firm belief of many engineers in my country that the British engineer contributed very largely to the successful outcome of the Allied cause.

Civil Engineering

There were many things done in London which will never get into the newspapers because by now they are stale news from the point of view of the ordinary man in the street. I do feel, and this is one of my reasons for being in this country, that these things should be said over and over again. How many people appreciate today the extent to which the civil engineers devoted their professional ability to securing the safety of the millions of people who lived in London through the bombardment? Very few indeed. We had three underground citadels in London and, without going into the millions of tons of concrete and the millions of pounds they cost, I could give you an idea of one of them when I tell you it would house thousands of people who were concerned with the conduct of the war for at least three weeks without any outside communication at all. It had every possible requirement and was built during the war without the knowledge of the people in the neighbourhood. Many people who lived over that citadel, built 50 feet below the ground, never knew it was being constructed.

Shelters for the population were distributed to a very great extent on a basis of—"Here is the shelter. Put it up for yourself." We had what is known as the Anderson shelter and 2½ millions of these, taking many hundreds of tons of steel in their construction, were handed out to people who erected them, digging small holes in their back-yards and then having erected these shelters lived there the worst nights of the blitz as they came along. The accommodation provided in that way was, of course, not of a permanent nature but it resulted in a considerable saving of life because experience showed that people were not killed by a direct hit of a bomb but by houses falling on them. If, during an air-raid, they would go into their gardens and get under their shelters a little below the ground they were protected from the glass and, in that way, thousands of lives were saved.

Another contribution of the civil engineers which is known, but again not appreciated, is the extent to which they employed hundreds of thousands of workmen constructing airfields in Britain. There again one could mention millions of tons of soil that had to be moved but, to sum up the whole thing, the total area of runway that was provided for the British Commonwealth and American Air Transport flying from Britain to the Continent would represent a roadway in the neighbourhood of thirty feet wide and ten thousand miles long. I think that gives you a rough picture of the magnitude of that one task.

Mechanical Engineering

The mechanical engineers' contribution was a most spectacular one, in aircraft design and development, and particularly in jet propulsion. The latter work was done principally through the efforts of one man and has been referred to on many occasions. I mean, of course, Air Commodore Whittle, who from about 1930 to 1941 fought against technical difficulties and administrative apathy. However in a comparatively short time he produced the gas turbine. Practical trials began about 1935 and, in 1941, the first flight tests were made, and when the flying bombs were launched against us in 1944 the jet propelled aircraft provided a valuable weapon of defence for our island.

One of the things for which mechanical engineers deserve great credit was the development of the tank. We had an old fashioned tank in 1939 with which our soldiers had to go into war against the most up to date tanks. Its main armament was a .303 inch machine gun and it had an engine of 80 horsepower. Three years later we sent over our Churchill, 500-600 h.p. In four years our mechanical engineering designers caught up to the previous eight years' work of the German engineers. They did in four years what the German engineers had done in 12 years and beat them at their own game.

Electrical Engineering

A very great deal could be said, again, about radar and the contributions of the electrical engineer through this most spectacular device. Radar has now become a very popular study and some of the younger students know considerably more about the subject than I do. In 1939 we had started using radar, a few months before the war broke out, in providing coastal chain stations which ultimately were to become such a valuable defence against German planes flying across England. An experimental station had been built at Orfordness for floodlighting an area out to sea with radio waves and receiving reflections from ships and aircrafts some distance from the coast. The results were so successful that by the time the war broke out we were able to establish a complete set of stations at 50-mile intervals around our shores from South Wales and the South and East Coasts to Scotland.

However, the first station installed did not take into account the low-flying aircraft and, in order to spot these raiders, a group of shorter-wave transmitters with rotating aerials mounted on tall towers and synchronized were added to the floodlight stations. These were known as Chain Home Low Stations and were very accurate in catching those low flying planes coming in. This equipment gave our limited number of fighter machines and pilots information on position, speed and altitude of the raiders which enabled such spectacular results as when 185 enemy aircraft were destroyed in one day by pilots of our machines, inferior in numbers but so superior in courage.

I am old enough as an engineer to be able to look on new developments with a feeling that wonders never cease and that the days of miracles are not passed. The way in which ground-controlled interception and air interception could establish the position of a raiding machine, could send a signal to a two-man fighter plane in which we had a radar device, direct them through the thickest fogs and darkest clouds to fight until the enemy ceased to exist will ever be to me a source of wonder. I think on many occasions the German raider never really knew what had happened to him for it was all over so quickly.

When we consider that what these planes were guided by was not a single device or by actually seeing the ground below through the fog and mist but by using what is known as the H-2-S system, we must be filled with admiration for those men who worked so assiduously on development of designs and by their dauntless courage helped to overthrow the forces of barbarism. Those are the days in which the final results of the war were really settled. Except for the devotion of those men the war might have ended very differently.

The anti-aircraft control is a device with which anyone living in England in 1940-1941 was very familiar but it was a curious thing about these anti-aircraft guns, nobody ever talked about them. I had a daughter-in-law about 21. She used to go to some business or other about which I did not ask and about which she said nothing although I did know it was some sort of war job. Later I learned that her work was in one of the towers and connected with directing gunfire on aeroplanes. That is just typical of what was going on all the time.

Much of our work was more spectacular, particularly with the advent of the flying bomb, without interference of any human hand whatever. One device had a projecting mirror and was known as Cupid and is a small radar set operating in the centimetric band and designed to search for and follow automatically V-1 flying bombs. It is mounted directly above a close-range predictor. This apparatus made possible the good results against the flying bomb. It was a great occasion when we knew we could successfully combat that weapon. We remember that occasion very well because of the fact that 80 per cent of the docks were afire at that time. I remember it for a different reason, also. I have a picture of the chairman of my company, a very portly gentleman, and his secretary, a very portly lady, diving under the table at each new explosion and emerging very cautiously, about once every five minutes. It all seems funny now but it was not so funny at the time.

Pluto

One morning a representative of the Army came to us and said, " We want you to devise some means of getting a million gallons of petrol across the Channel daily. Not much of a job. Just get on with it." So one of the British oil companies and the cablemakers got together and very quickly we were able to devise a lead-alloy pipe about 3″ in diameter, with four steel tapes and longitudinally steel-wire armoured which could withstand an internal test pressure of 4000 lbs. per square inch. Between April 1942 and October 1944 a total of 570 nautical miles of this armoured pipe was made by five British firms and 140 miles to the same design brought over from the United States. A plain 3″ steel pipe welded into continuous lengths each of 70 miles and paid out from floating drums was also used for part of the work. That pipe was laid one very summery afternoon and it was a big installation. This operation was known as Pluto. The results that the Army wanted were achieved.

Magnetic Mines

A great deal could be said, again, on the way the engineers have handled the problem of defeating the magnetic mines. Trouble arose in the early months of the war and many ships were lost during September, October and November, 1939, but a party of engineers from *H.M.S. Vernon,* whose names should go down in history but I do not think anyone knows their names and they are not men who wanted any particular credit, approached this problem of mines and found out exactly the details of the magnetic properties of the mine. The antidote soon followed. Ships were protected in two ways, first by magnetic treatment at intervals by passing heavy currents for short periods through temporary coils rigged around the ship or, secondly, by the installation of permanent " degaussing " coils fed from the ship's supply. Ten thousand warships and merchant vessels were fitted in that manner.

This kept the cablemakers pretty busy. They produced large quantities of single-core cable which was made up into sausage coils with hessian strips and laid in the scuppers around the vessel. Previously the object was to blow up the mine rather than to protect the ship against a live mine and that was achieved but the double-L sweep method had been evolved and this system was destined to dispose during the next few years of many thousand magnetic mines.

The big problem with the cable was that all cables sink in water. Cables are not made like " Ivory soap, it floats," and so we had to get some means whereby the cable would stay on the surface. Various designs were achieved, one of which has brought me a good deal of discredit because so many of my friends have said " we ought to be able to get at least an afternoon's tennis " but the tennis balls were all being used to hold up the cable.

Engineers Under the Blitz

I do not want to go on detailing these technical things but I would like to pay a tribute, before I stop, to those men of the engineering profession, civil, mechanical and electrical, who maintained such splendid service in London during the blitz. Time and time again roads would be blocked, sewers would be burst, electric power was shut off and yet, immediately a raid was over, they would effect restoration of the various services as quickly as possible. I am tempted on this occasion to reminisce about one little incident which I think I shall always remember. It does not really apply so much to the engineer, though.

I was passing a fire station one day during an air raid and the firemen, as usual, were ready for anything to happen. A flying bomb was coming over and I heard one of the chaps say to another standing at the door " Start up, George," and they started running, chasing that bomb down the street and were on the spot ready to deal with it almost as soon as it landed.

Communications of course gave the engineers a headache. Thousands of long distance trunk circuits were destroyed time and time again by bombs and had to be repaired and it would have done your heart good to see some of those men making repairs with the bombs still flying carrying on with that most necessary work and being handed cups of tea from mobile canteens. From such things as that one ought to get a very good opinion of human nature.

Recognition of the Engineer

I would like before I sit down to refer to the lessons that one ought to learn from the very unusual experiences we have had during the past six years. There must be something fundamental in this question of engineering and the pride in the job which has kept men on the job, not because they were being compensated but because of a sense of duty, and I can see from your faces that you hold the same view of the essential results of education and training, the position of engineers as administrators and a recognition of engineering status. I would like to take part in your discussions on all these subjects but they are subjects which we could discuss for weeks and months and years before we arrive at the correct conclusions, and it is quite clear that all these things lead to one truth. The social status of engineers is not going to be achieved by engineers individually clamouring for social advancement. It is going to be achieved when the engineer is felt by the community to be worthwhile, and he is gradually—I would say rapidly—coming to the stage, and the war has helped along that stage, when he is being recognized by the manner in which he does a good job of work and therefore is worth a position in society, and that is far more valuable than any number of associations getting together and defining it. That is the conclusion we have come to in our country and I feel it is very much the same throughout the Commonwealth.

I am hoping that all these subjects will be discussed at our conference in London this summer. Naturally there are many other possibilities of subjects other than those I have mentioned, but whatever we do we must be quite sure that in that conference we do cement the friendship among all engineers which exists at present between engineers in my country and engineers in this great Dominion.

Greetings

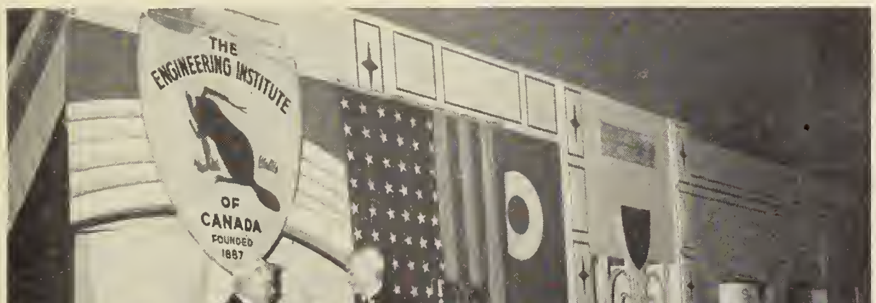
We still remember, Ladies and Gentlemen, the very noble gesture that your Institute made early in the war when it invited our children to come into your homes. We can never forget that gesture. You brought a great deal of thought over the ocean toward your own Institute, to think that you, with your own cares and difficulties, were willing to take our children and look after them as you did.

Not only that, but during the fall of France there is no doubt about it that the feeling we had in the Mother Country that the Dominions were behind us was a tremendous factor in maintaining the morale of our country. If we had not felt that the Dominions were there to strengthen and support us we would have gone down feeling that we were completely finished because otherwise we were all alone.

Mr. President, a few days ago I crossed the Atlantic in company with some 10,000 of your returning lads and lassies from their great enterprise over the water, an enterprise, an achievement unique in history. These men and women left their homes, gave up their youth, risked their lives to vindicate their belief in human right and freedom which in your country and ours we hold sacred. They sacrificed their youth to overthrow the greatest tyranny in history and they won.

I speak, I am sure, to some who have lost a son or a brother and I do so whose only son will never return, but with you I look for brighter days to come. During the trip on that great ship the *Queen Elizabeth*, I saw a symbol of hope, a symbol of certainty that Canada and Great Britain will stand shoulder to shoulder to preserve the sanctities of life.

To The Engineering Institute of Canada I bring the greetings of the civil, mechanical and electrical Engineers of Great Britain whom I am privileged to represent.



Dr. E. P. Fetherstonhaugh hands the reins of office over to the new president, J. B. Hayes, at the Annual Banquet. First head table (from left to right): Mrs. Fetherstonhaugh; J. G. Vail,, president, American Institute of Chemical Engineers; Dr. Percy Dunsheath, president, Institution of Electrical Engineers, London, England; D. R. Yarnall, president, American Society of Mechanical Engineers; Mrs. J. B. Hayes; Everett S. Lee, chairman, Engineers' Council for Professional Development. Second head table: Mrs. J. K. Wilson; Albert Deschamps, president, Canadian Construction Association; J. S. Cameron, vice-chairman, Canadian Standards Association; Mme J. A. Beauchemin; W. K. Brasher, secretary, Institution of Electrical Engineers; Dr. R. R. McLaughlin, president, Chemical Institute of Canada, Mme Albert Deschamps.

THE SIXTIETH ANNUAL GENERAL MEETING

Convened at Headquarters, Montreal, on January 31st, 1946, and adjourned to the Mount Royal Hotel, Montreal, on Thursday, February 7th, 1946

The Sixtieth Annual General Meeting of The Engineering Institute of Canada was convened at Headquarters on Thursday, January 31st, 1946, at eight o'clock p.m., with Vice-President J. E. Armstrong in the chair.

The general secretary having read the notice convening the meeting, the minutes of the Fifty-Ninth Annual General Meeting were submitted and, on the motion of F. L. Lawton, seconded by E. Baty, were taken as read and confirmed.

Appointment of Scrutineers

On the motion of J. A. H. Henderson, seconded by Walter G. Hunt, Messrs. L. C. Jacobs, G. N. Martin and G. E. Templeman were appointed scrutineers to canvass the officers' Ballot and report the results.

There being no other formal business, it was resolved, on the motion of S. F. Rutherford, seconded by A. Turner Bone, that the meeting do adjourn to reconvene at the Mount Royal Hotel, Montreal, at nine-thirty a.m. on the seventh day of February, nineteen hundred and forty-six.

Adjourned General Meeting at the Mount Royal Hotel, Montreal, Que.

The adjourned meeting convened at nine thirty a.m., on Thursday, February 7th, 1946, with President E. P. Fetherstonhaugh in the chair.

In opening the meeting, President Fetherstonhaugh welcomed all those present and expressed the hope that they would enjoy the meeting and find it very profitable.

Nominating Committee — 1946

The general secretary announced the membership of the Nominating Committee of the Institute for the year 1946 as follows:

Chairman: C. G. R. Armstrong

Branch:	*Representative*
Border Cities	T. H. Jenkins
Calgary	D. P. Goodall
Cape Breton	J. H. Fraser
Edmonton	E. Nelson
Halifax	P. A. Lovett
Hamilton	Alex. Love
Kingston	S. D. Lash
Lakehead	W. L. Bird
Lethbridge	J. M. Campbell
London	R. S. Charles
Moncton	A. R. Bennett
Montreal	J. Benoit
Niagara Peninsula	C. G. Cline
Ottawa	G. H. Ferguson
Peterborough	H. R. Sills
Quebec	J. O. Martineau
Saguenay	W. J. Thomson
Saint John	F. A. Patriquen
St. Maurice Valley	H. J. Ward
Sarnia	J. W. MacDonald
Saskatchewan	I. M. Fraser
Sault Ste. Marie	R. A. Campbell
Toronto	J. G. Hall
Vancouver	T. V. Berry
Victoria	S. H. Frame
Winnipeg	T. H. Kirby

Awards of Medals and Prizes

The general secretary announced the awards of the various medals and prizes of the Institute as follows, stating that the formal presentation of these distinctions would be made at the annual dinner of the Institute the following evening:

Sir John Kennedy Medal—"A recognition of outstanding merit in the profession or of noteworthy contribution to the science of engineering or to the benefit of the Institute."

To — J. M. R. Fairbain, D.Sc., M.E.I.C., Montreal.

Gzowski Medal

To — John T. Dyment, M.E.I.C., Winnipeg, for his paper "The Engineering Selection of an Airline Aeroplane."

Duggan Medal and Prize

To — H. L. Lexier, JR.E.I.C., for his paper "Metallurgy and Machine Design."

Leonard Medal

To — E. Cecil Roper, C.I.M.M., Britannia Beach, B.C., for his paper "The Raising of No. 7 Shaft at Britannia".

Ross Medal

To — Sidney T. Fisher, M.E.I.C., for his paper "Radio for Over-land, Long-distance Telephone Service."

Julian C. Smith Medals—"For Achievement in the Development of Canada."

To — Alexander Joseph Grant, M.E.I.C., St. Catharines, Ont.,—and—George Alexander Walkem, M.E.I.C., Vancouver, B.C.

Students' and Juniors' Prizes (Books or instruments to value of $25.00).

H. N. Ruttan Prize	(Western Provinces) to Robert Peterson, JR.E.I.C., for his paper "Soil Mechanics as Applied to P.F.R.A. Problems, with Specific Reference to the Proposed St. Mary's Dam."
John Galbraith Prize	(Province of Ontario) to F. J. McMulkin, JR.E.I.C., for his paper "Welding and Fabrication of Canadian Light Armour."
Phelps Johnson Prize	to J. T. Madill, JR.E.I.C., for his paper "Field Decay Characteristics of Large Hydro-Electric Generators."
Ernest Marceau Prize	(Province of Quebec—French) to J. B. Nobert, S.E.I.C., for his paper "Etude d'installation d'usine de defibrage du bois par le procédé mécanique à la vapeur à Pont Rouge."
Martin Murphy Prize	(Maritime Provinces)—to Fred W. Davidson, S.E.I.C., for his paper "Design of an Antenna for VE9AS."

Report of Council, Report of Finance Committee, Financial Statement and the Treasurer's Report

On the motion of deGaspé Beaubien, seconded by L. G. Trudeau, it was resolved that the report of Council for the year 1945, the report of the Finance Committee, the financial statement and the treasurer's report, as published in the February *Journal*, be accepted and approved.

Reports of Committees

On the motion of R. B. Jones, seconded by C. R. Lindsey, it was resolved that the reports of the following committees be taken as read and accepted: Professional Interests, Legislation, Rehabilitation, Publication, Board of Examiners and Education, Library and House, Engineer in the Active Service, Employment Conditions, Membership, Papers, Industrial Relations, Engineer in the Civil Service, the Young Engineer, Prairie Water Problems, Canadian Chamber of Commerce and Canadian Standards Association.

Branch Reports

On the motion of F. T. Julian, seconded by G. F. Layne, it was resolved that the reports of the various branches be taken as read and approved.

Amendments to the By-laws

Several amendments to the by-laws and one new by-law were submitted by Council. These related to a simplification and clarification of methods of transfer and admission to membership, to Institute fees and to branch finances. Some minor amendments were proposed by J. R. Dunbar and approved. Upon a motion of J. R. Dunbar, seconded by J. G. Hall, it was agreed that these proposals as amended be submitted to the corporate membership in accordance with by-law No. 80. (A copy of the proposals was mailed to every corporate member in January and a further copy with the revisions will be included with the ballot which will be mailed in April).

Election of Officers

The general secretary read the report of the scrutineers appointed to canvass the officers' ballot for the year 1946 as follows:

President:	J. B. Hayes	Halifax
Vice-Presidents:		
(Province of Ontario)	W. R. Manock	Fort Erie
(Province of Quebec)	G. F. Layne	Quebec
(Maritime Provinces)	C. M. Anson	Sydney, N.S.
Councillors:		
Cape Breton Branch	S. C. Mifflen	Sydney
Halifax Branch	G. J. Currie	Halifax
Moncton Branch	H. W. Hole	Moncton
Quebec Branch	Paul Vincent	Quebec
Montreal Branch	C. A. Peachey	Montreal
	J. B. Stirling	Montreal
Peterborough Branch	A. R. Jones	Peterborough
Ottawa Branch	Norman Marr	Ottawa
Toronto Branch	S. R. Frost	Toronto
Hamilton Branch	J. R. Dunbar	Hamilton
Niagara Pen. Branch	P. E. Buss	Thorold
Sarnia Branch	G. L. Macpherson	Sarnia
Sault Ste. Marie Branch	C. Stenbol	Sault Ste. Marie
Winnipeg Branch	D. M. Stephens	Winnipeg
Lethbridge Branch	C. S. Donaldson	Lethbridge
Calgary Branch	J. G. MacGregor	Calgary
Victoria Branch	Kenneth Reid	Victoria

On the motion of A. E. MacRae, seconded by B. E. Bauman, it was resolved that the report of the scrutineers be adopted, that a vote of thanks be tendered to the scrutineers for their services in preparing the report, and that the ballot papers be destroyed.

Retiring President's Address

In accordance with long established custom, the president delivered his retiring address which appears on page 168 of this issue of the *Journal.*

Vote of Thanks to the Retiring Officers

On the motion of G. M. Brown, seconded by D. Goldwag, it was unanimously resolved that a hearty vote of thanks be accorded to the retiring president and members of Council in appreciation of the work they have done for the Institute during the past year.

Vote of Thanks to the Montreal Branch

On the motion of H. N. Macpherson, seconded by L. M. Hovey, it was unanimously resolved that a hearty vote of thanks be extended to the officers and members of the Montreal Branch in recognition of their hospitality and activity in connection with the holding of the Sixtieth Annual General Meeting.

There being no further business, the meeting adjourned at twelve thirty p.m.

THE GENERAL PROFESSIONAL MEETING

As was to be expected, the attendance at the 1946 meeting established new records in every division. The facilities of the Mount Royal Hotel were taxed to their limit. With a banquet attendance of almost a thousand, augmented by an attendance of two hundred more at the dance the same evening, it is unmistakably apparent that hotel accommodation is becoming an increasing problem.

There were several features and innovations on this year's programme which of themselves would make the meeting outstanding. It was an ambitious programme but the results have justified the effort.

Distinguished Visitors

The principal feature was the presence of Dr. Percy Dunsheath, C.B.E., D.Sc., and W. K. Brasher, respectively president and secretary of The Institution of Electrical Engineers, who had come from London, England, on the invitation of the Institute for the sole purpose of representing the British institutions. Dr. Dunsheath, as the feature speaker of the entire meeting, made a great contribution to its success. Officers and members will long remember the honour done the Institute by the British institutions.

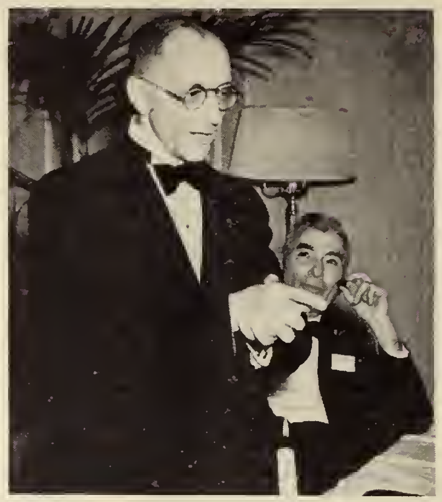
There were other distinguished visitors from outside Canada, whose presence added lustre to the occasion, such as D. R. Yarnall of Philadelphia, President of the American Society of Mechanical Engineers; James G. Vail, of Media, Pa., President of the American Society of Chemical Engineers; Dr. Harry S. Rogers, of Brooklyn, President of the Society for the Promotion of Engineering Education; Everett S. Lee, of Schenectady, N.Y., Chairman of Engineers' Council for Professional Development; Col. C. E. Davies, Secretary of the American Society of Mechanical Engineers; H. H. Henline, National Secretary of the American Institute of Electrical Engineers; Col. W. N. Carey, Secretary and Executive Officer of the American Society of Civil Engineers; George A. Stetson, Editor of *Mechanical Engineering.* The officers of the Institute are always happy to welcome these friends, and members join with them in expressing a warm appreciation of the compliment their presence pays the Institute.

Student Conference

For the first time the Institute invited each undergraduate engineering society in Canada to send its president to a student conference to be held during the meeting,

AT THE PRESIDENT'S DINNER

Past-President C. J. Mackenzie with Past-Presidents F. P. Shearwood and J. M. R. Fairbairn.



Past-President H. W. McKiel with Past-President T. H. Hogg on his left.

Incoming President J. B. Hayes of Halifax.

Past-President J. B. Challies of Montreal.

(On the left) J. M. M. Lamb, R. E. Heartz. (On the right) J. B. Stirling, J. A. Lalonde, Paul Vincent, Hector Cimon.

Past-President C. R. Young of Toronto.

E. O. Turner, Fredericton; N. B. MacRostie, Ottawa; J. A. Vance, Woodstock, Ont.; A. E. Flynn, Halifax; E. V. Caton, Winnipeg; G. J. Currie, Halifax.

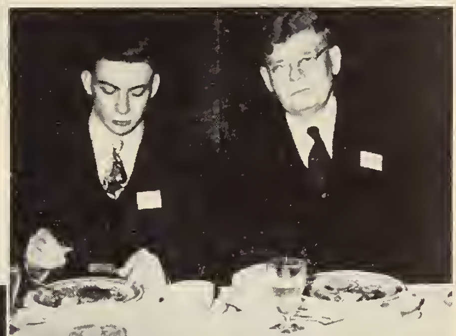
(Below) C. E. Sisson, Toronto; E. P. Muntz, Montreal; W. H. M. Laughlin, Toronto; P. E. Gagnon, Quebec; Wills Maclachlan, Toronto; R. E. Chadwick, Montreal; L. A. Duchastel, Montreal; Prof. Ernest Brown of McGill University.

The head table at the Thursday luncheon was occupied by authors and delegates to the Student Conference. Above: J. D. Pearson of Rolls-Royce; C. Macdonald (Halifax); Robt. Shore (Saskatoon).

H. M. Scott speaks on community planning.

W. K. Brasher, sec'y, Institution of Electrical Engineers (Great Britain) and Léo Sharry of Ecole Polytechnique who was elected chairman of the Student Conference.

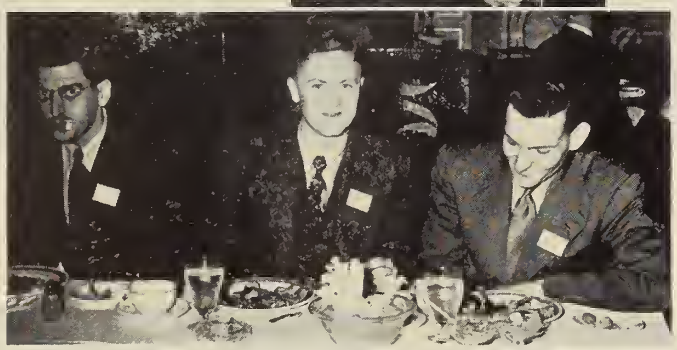
W. L. Hayhurst (Queen's), Gilles Perron (Laval), Murray D. McCulloch (Toronto), Eric Bergenstein (Winnipeg).



Thos. Scott of University of British Columbia and Professor J. A. Van den Broek of the University of Michigan.

Right: J. A. Beauchemin was chairman at the Thursday luncheon.

Dr. Harry S. Rogers president of the Society for the Promotion of Engineering Education speaks on engineering education.



Ottis I. Logue (University of New Brunswick), Jas. Clow (University of Alberta), Chas. J. Fox (McGill).

J. E. Armstrong was chairman at the Friday luncheon.

Head table guests at the Friday luncheon: S. R. Frost, V. S. Murray, Geo. A. Stetson, J. G. G. Kerry, Col. C. E. Davies, W. R. Manock, Col. W. N. Carey, A. B. Hunt, J. R. Dunbar, Paul Vincent, G. L. Macpherson, P. E. Buss.

J. A. Van den Broek discusses evaluation of light metal alloys.

J. G. G. Kerry's paper on winter navigation on the St. Lawrence raised an interesting discussion.

A. B. Hunt tells of the future of radio communications.

V. S. Murray was one of the joint authors of the paper on pre-stressed concrete.

W. A. Newman, head of the research department of the C.P.R., introduces J. D. Pearson.

J. D. Pearson describes the development of Rolls-Royce gas turbines.

The Montreal Branch Smoker on the Thursday night provided the necessary relaxation after an arduous day of technical meetings.

Student delegates chat with Lieutenant-Colonel L. F. Grant, chairman of the Committee on the Training and Welfare of the Young Engineer. Left to right: M. D. McCulloch (Toronto), Tom Scott (U.B.C.), Giles Perron (Laval), Jas. Clow (Alberta), Col. Grant, Leo Sharry (Polytechnique).

E. P. Murphy, Ottawa, deputy-minister of Department of Public Works, with Past-President A. J. Grant, St. Catharines.

René Dupuis, Quebec; E. V. Caton, Winnipeg; K. P. Billner, Philadelphia; Norman Eager, Hamilton; T. C. Creaghan, Montreal, discuss pre-stressed concrete.

Gordon D. Hulme, Montreal; Jas. McMillan, Calgary; Dr. C. A. Robb, Montreal.

At the registration desk: Captain A. C. M. Davy, Ottawa; Col. C. E. Davies, New York, secretary of the American Society of Mechanical Engineers; Col. W. N. Carey, New York, secretary and executive officer of the American Society of Civil Engineers.

T. R. Durley, with his father R. J. Durley, secretary-emeritus of the Engineering Institute.

The student conference sat for two days of arduous work. Above: The delegates are shown together with the observers under the chairmanship of Léo Sharry of Ecole Polytechnique and the guidance of Lieut.-Col. L. F. Grant of Kingston, chairman of the Committee on the Training and Welfare of the Young Engineer, and Major D. C. MacCallum, the Institute's Rehabilitation Officer.

starting on Wednesday, the 6th. Representatives were there from every university granting engineering degrees, in addition to which there were several observers. The conference opened under the chairmanship of vice-president J. E. Armstrong, who later was relieved by Lt. Col. L. F. Grant, chairman of the Committee on the Training and Welfare of the Young Engineer. Several members spoke to the group, but mostly the time was taken up with the specific items on the agenda.

It is planned to make a complete report on the conference in the April issue of the *Journal*, by which time the verbatim of the meeting will have become available as an accurate source of material. For the present, it can be said the conference was a genuine success. The students held three sessions on Wednesday, two on Thursday, and one on Friday. They have voted to request the Institute to make it an annual event.

Conference of Deans

Another innovation was a conference of deans of engineering organized by Dr. Fetherstonhaugh. This was held in the morning and afternoon of Saturday, February 9th. This conference was the outcome of proposals made before Council that the Institute should take some part in the discussions of engineering education that are going on in many places. Council was aware of the trends in these matters but felt the greatest good could be accomplished if the deans came together to discuss these problems among themselves. In this way, would best be disclosed any services that the Institute might render.

The conference was carried out entirely by the deans without any Institute officers participating. It is expected that eventually a report will be made by the conference that can be presented to the membership through the *Journal*. There were present representatives from thirteen universities. Because of the indisposition of Dr. Fetherstonhaugh, Dr. C. R. Young, Dean of Engineering at Toronto, presided.

Annual Meeting of Council

Although the official programme showed no events until Thursday the seventh, the preceding day was one of the busiest for officers of the Institute. At 10:00 a.m., there was the annual meeting of Council at which 59 attended—perhaps a new record. The meeting was not concluded until 5:30 p.m. Dr. Fetherstonhaugh presided.

At noon, those attending the Council meeting, and the student conference gathered together for lunch, thus affording excellent opportunities for expansion of professional contacts. Both meetings were resumed promptly at 2:00 p.m.

During the afternoon, the Committee on Professional Interests, under the chairmanship of J. B. Stirling, met with the several representatives of provincial professional organizations to discuss matters related to the cooperative agreements, and to the profession.

In the evening, as is the custom, the retiring president entertained at dinner the officers of the Institute, past officers, chairmen of committees and other guests to the number of seventy. Again following the custom, all past-presidents were called on to speak, thereby providing a delightful programme. Major D. C. MacCallum spoke on "Rehabilitation" with specific reference to the Institute's part in it.

The Ladies Committee entertained at dinner in the Samovar the wives of those out-of-town members who were attending Dr. Fetherstonhaugh's dinner.

Thursday, February 7th—The Annual General Meeting took place at 10:00 a.m. in the Ball Room with President Fetherstonhaugh in the chair. An account of the meeting appears earlier in this report.

Luncheon was held in the Normandie Roof, with J. A. Beauchemin, chairman of the Montreal Branch, presiding. Hew M. Scott, M.E.I.C., spoke on "The Engineers' Civic Responsibility in Community Planning", urging upon engineers a more active participation in the affairs of their country. There were five hundred and twenty in attendance.

In the afternoon there were two concurrent professional sessions—both exceedingly well attended. Prof. J. A. Van den Broek, M.E.I.C., Professor of Engineering Mechanics at the University of Michigan, spoke on "Evaluation of Light Metal Alloys", and J. D. Pearson, Chief Technical Services Engineer, North American offices of the Rolls-Royce Limited, spoke on "Performance, Installation Characteristics and Design of Rolls-Royce Nene and Derwent Gas Turbines".

Another event of importance which marks the beginning of a series of such meetings was the dinner meeting of the joint committee of the American Society of Mechanical Engineers and The Engineering Institute of Canada to consider a programme of cooperation for 1946, to be carried out under the cooperative agreement. Representatives of the American Society of Mechanical Engineers were D. R. Yarnall, Philadelphia, President of the American Society of Mechanical Engineers; James A. Parker, Detroit, past-president A.S.M.E., and President of Detroit Edison Company; Professor A. E. White, University of Michigan; Col. C. E. Davies, Secretary, American Society of Mechanical Engineers; and George Stetson, Editor of *Mechanical Engineering*. Representatives of the Institute were vice-president J. E. Armstrong, Chief Engineer of Canadian Pacific Railway; J. G. Hall, Combustion Engineering Corporation, Toronto; W. A. Newman, Director of Research, Canadian Pacific Railway; J. B. Stirling, chairman of the Institute's Committee on Professional Interests; L. Austin Wright, General Secretary, and Louis Trudel, Assistant General Secretary.

At 4:30 p.m., Dr. Dunsheath and Mr. Brasher visited a combined group of McGill and Ecole Polytechnique students at McGill, where Dr. Dunsheath described some of the work done during the war by British engineers. This meeting was under the chairmanship of Charles Fox, president of the McGill Engineering Society.

Another event on the supplementary programme for this afternoon was a meeting of the Committee on the Training and Welfare of the Young Engineer, with the chairman, Lt. Col. L. F. Grant, presiding.

Smoker

Each year the Montreal Branch includes in its programme a special social event—usually a smoker. It has been the custom to incorporate this function into the annual meeting programme when the meeting is in Montreal. This year the Ball Room was the " locale " and six hundred and twenty-two enjoyed an excellent variety programme, plus community singing and refreshments. Such an event, as staged by the Montreal Branch, is an important asset to any programme. The out-of-town members were particularly pleased to participate.

Friday, February 8th—During the morning two professional sessions were held concurrently. J. G. G. Kerry, M.E.I.C., presented a most interesting paper under the title of " The Winter Temperature Cycle of the St. Lawrence Waters—A Plea for more Data ". Mr. Kerry suggested that the possibility of keeping navigation open all winter on the Great Lakes and the St. Lawrence warranted a further study and the securing of additional data necessary to such a study. This paper appeared in the January *Journal,* and the discussions will be published shortly.

A comprehensive and significant paper " The Future of Radio Communications in Canada " was presented by A. B. Hunt, M.E.I.C., manager, Electronics Division of the Northern Electric Company Limited. It covered a very wide field and provided material for discussions that was almost limitless.

The first meeting of the new council, with President J. B. Hayes in the chair, was held at 10:00 a.m. Several routine matters were dealt with as is the custom for this meeting, but in addition there was a broad discussion promoted by the Ontario councillors relative to means for expanding cooperation in the province of Ontario. No decisions were reached but the matter is to be brought up again at later meetings.

The luncheon speaker was Dr. Harry S. Rogers, President of the Society for the Promotion of Engineering Education, and President of the Polytechnic Institute of Brooklyn. The chairman was J. E. Armstrong, vice-president of the Institute. Dr. Rogers gave a stirring talk on " What the War Has Done to Engineering Education ". Perhaps no one in the United States is better qualified to speak on engineering education and certainly no one could have done it more acceptably.

In the afternoon, Dr. Dunsheath, officially representing the British Institutions of Civil, Mechanical, and Electrical Engineers, spoke on "The British Engineers' Contribution to the Allied Cause ", using some interesting slides to illustrate his narrative. In Canada, it has been difficult to get the story of the British engineers' performance, due to censorship, and preoccupation with succeeding matters of great urgency. Dr. Dunsheath's talk was the most informative that has been heard here but even at that, due to limitations of time, disclosed only part of the story.

At the same time a meeting dealing with " Pre-Stressed Concrete " was in session before a capacity audience in the Convention Room. Contributors to the topic were T. C. Creaghan, M.E.I.C., president of Creaghan and Archibald, Montreal; V. S. Murray, Engineer of Bridges, Department of Highways of Ontario, Toronto; and K. P. Billner, president of Vacuum Concrete Company, Philadelphia. The discussions indicated clearly that the subject of pre-stressed concrete is far from being exhausted but that great progress has been made in its study. The talks were supplemented by tests and exhibits of considerable interest.

The Banquet

The climax of an annual meeting is the banquet. The colourful Normandie Roof afforded a gay background for a spectacular event, that excelled in every detail. It is true there was over-crowding, but that was taken as indicative of the success of the event. Not all the guests could be seated in the one room, and many tables were set up in the Ball Room for the late comers. In all, there were over nine hundred in the two rooms. This number was augmented later by about two hundred and fifty who came for the dance only.

The programme followed the usual form, including the presentation of prizes and awards, the feature address, and the induction of the new president. This was the occasion for which Dr. Dunsheath had journeyed all the way from London, the occasion for which the officers and members of the Institute had been waiting. Dr. Dunsheath's address fully met the expectations of his audience, and if his reception was as gratifying to him as his address was to his listeners, he will feel well rewarded for the trouble he had taken to be present.

Dr. Dunsheath chose as his title " The Engineer Family in the Commonwealth ". He told of the war work of British engineers, but he dwelt principally on the values to be gained by engineers through empire cooperation. He told something of the forthcoming conference in London next September, between the engineering societies of Canada, Australia, New Zealand, India, Africa and England.

Seldom has an annual banquet speaker charmed his audience as did Dr. Dunsheath. Speaking as the president of a great professional society, as the technical head of a great industry, and as an active participant in the war achievements of his people, he gave to his words a ringing force and an unmistakable sincerity that illuminated his every sentence. The life of the Institute has been greatly enriched by his message and his presence.

The Dance

Within the memory of members who have participated in this event for years, there has been no occasion upon which so many attended and so many remained to the end. The huge floor of the Ball Room was crowded from the first dance to the last, and not only with young folks either! The spirit of the whole evening was one of camaraderie and gaiety, as befits the occasion of a huge family party.

" Muriel's Room "

Once again this pleasant feature was made possible by friends of the Institute. With such a rendezvous available at luncheon and dinner time, it was possible to keep members and guests together throughout the day and evening. Such social amenities go a long way towards the success of a meeting, and the Institute is greatly indebted to the industries and their committee for the excellent results obtained under difficult circumstances.

Col. W. N. Carey, New York, secretary and executive officer of the American Society of Civil Engineers; C. E. Sisson, Toronto, vice-president of the Engineering Institute; Everett S. Lee, Schenectady, chairman of the Engineers' Council for Professional Development.

Gordon McL. Pitts, Montreal; J. G. G. Kerry, Port Hope; Councillor J. R. Dunbar, Hamilton.

T. R. Durley of Montreal with a group of former mates of the R.C.N.V.R.

Mrs. Fairbairn; Dr. J. M. R. Fairbairn; Mrs. E. V. Buchanan; Mrs. R. J. Durley; E. V. Buchanan, London.

S. Tremblay, Mrs. H. Oatway, H. Lamb, Mrs. Lamb, H. Oatway.

Councillor Paul Vincent, Quebec; Quebec Branch Chairman J. O. Martineau.

AT THE ANNUAL BANQUET

J. B. Hayes, the new president, takes over from Dr. Fetherstonhaugh. In the centre Dr. P. Dunsheath.

Dr. Fetherstonhaugh presents Dr. J. M. R. Fairbairn with the Sir John Kennedy Medal.

President J. B. Hayes acknowledges the honour of the presidency.

Dr. Percy Dunsheath brings greetings from sister societies of Great Britain.

Past-President Alex. J. Grant receives the Julian C. Smith Medal.

The Normandie Roof provided a spectacular setting for the head tables arrangement.

Dr. Fetherstonhaugh presents the Gzowski Medal to a fellow-resident of Winnipeg, J. T. Dyment.

ADDRESS OF THE RETIRING PRESIDENT

DR. E. P. FETHERSTONHAUGH, M.E.I.C.

Delivered before the Sixtieth Annual General and Professional Meeting of The Engineering Institute of Canada, at Montreal, on February 8th, 1946

It has been an interesting and inspiring experience to have been your president through a year of great activity, and when it comes to deciding what aspects of the year's progress should be referred to, I find so much material that a process of elimination must be put into effect.

The steady growth of the membership, the authorization of two new branches, problems of rehabilitation, the gradual evolution of policies in important matters, the establishment of committees, community planning, all these and many more matters might form topics for an address, but as most of them are recorded in the report of Council or in those of committees, I shall confine my remarks to a few subjects which are of special interest at the present time.

But before entering on that phase of my address, I cannot refrain from expressing my great appreciation of the honour you have done me in giving me the privilege of representing The Engineering Institute of Canada as its president for the past year.

I realize more fully now than I did before, that the president is much more of a symbol of the Institute than a director of its policies or a conductor of its affairs. The policies are evolved through the loyal and sometimes very arduous duties of your Council and committees, whose work in the past year and whose valuable advice call for the grateful acknowledgment of the president and every member of the Institute. I therefore take this opportunity of expressing sincere thanks on my own and on your behalf for the time and work they have freely given for the benefit of the profession and of the Institute of which we are so justly proud.

As to the conducting of the Institute's affairs, this as you know is in the capable hands of our general secretary and to him and to all the members of the staff at headquarters I wish to express my appreciation of the efficient manner in which the business of the Institute has been conducted.

In accordance with the custom established by my predecessors, I have endeavoured with the general secretary to visit all the branches of the Institute. It was with great pleasure that I succeeded in visiting all those in the Maritime Provinces and Quebec (if I may regard this meeting as a visit to the Montreal Branch), all but Kingston and Sault Ste. Marie in Ontario, and the Winnipeg and Saskatchewan branches in the West. It was also my privilege to visit and speak to the students at six of the universities where engineering instruction is given. I deeply regret that an exceptionally busy session at the University of Manitoba prevented my completing the programme.

The kindness and courtesies extended to me as your president by our members in all the branches, and by the staffs and students of the universities visited will remain a most pleasant memory for the rest of my life. I could not fail to be impressed with the feeling that the many courtesies extended to myself, my wife and the members of our party, wherever we went, was evidence of the esteem and the prestige enjoyed by the Institute not only in the hearts of its members, but also in those of many prominent people in other walks of life.

Engineers Share in Victory

In the year that has passed we have experienced some of the greatest events in the history of the world, the final collapse of Germany, the deeply regretted death of our great ally, President Roosevelt, the development of the atomic bomb, the conclusion of the war with Japan, and the defeat in the British elections of Winston Churchill, that great and inspiring leader of the people throughout the darkest days of the war; and now we have passed from the days when the flower of our youth was pouring into the maelstrom of that great conflict, to the time when most of those who survived are again with us and established, or seeking to be established, in their peace-time occupations.

We all knew that engineers and scientists had been making a remarkable contribution towards victory. But now that the stories of their achievements are being told, we are amazed to find how much more they had accomplished than the need for secrecy had made it possible previously to reveal. The Lieutenant-Governor of Manitoba, in opening the Mulberry exhibit in Winnipeg, put it aptly when he said, in substance, that the courage and unflagging determination of the British peoples had enabled them to win the wars of the past, but in this war they had shown that they also possessed the technical knowledge, experience and ingenuity needed to defeat the enemy in the most scientific war in the history of the world.

There is sorrow in our hearts at the loss of our members whose lives have been given in this great struggle for the safety of the world. And we know too that the lives of some of our members have been given in undertaking in the industrial effort more than human endurance could withstand.

But our sorrow is rightly mingled with pride in the knowledge that the traditions of our profession have been honourably maintained and enhanced in the face of a ruthless enemy.

Re-establishment is Under Way

In the past year we have made a beginning towards helping our members, who have served in the armed forces, to become re-established. The appointment of Major MacCallum to direct this work was made possible by your generous response to the call that was sent out for funds. And now, definite and encouraging results from this undertaking are in evidence.

But much remains to be done in many aspects of re-establishment. In addition to those who are already qualified to assume engineering responsibilities, and whose placement is an immediate problem, there is the very large body of young men who, having seen, during their service, the notable accomplishments of engineering and science, are now returning to civilian life fired with a great enthusiasm to qualify as engineers.

The provisions that have been made by the government for completing their education removes the financial problem in many cases. The immediate responsibility for the training of these young men is on the doorstep of the universities, and the magnitude of their task can be understood to some extent by a scrutiny of the figures published in the December issue of *The Engineering Journal.*

Our Responsibility Towards the Future Engineer

Towards these future engineers, the Institute, the profession and industry have a responsibility as well as have the universities. Ways and means should be devised whereby they may be assisted in obtaining engineering employment in their vacations, as we all recognize the importance of such work in the proper training of the young engineer. The Institute, the profession and all government and private organizations who employ engineers should also be looking forward to the time two or three years hence when the students now at the universities will be graduating in numbers far in excess of anything Canada has previously experienced. Are we going to be able to retain these men for the development of the industries and resources of our country, or are we going to witness a stream of potentially valuable engineers and scientists drawn into the vacuum now apparently developing in the United States? This is not a problem to which the answer is obvious as many economic and other factors are involved. But it is one to which all organizations must direct their early and careful thought if the tide is to be stemmed before it reaches serious proportions. A great deal of money will have been spent by the country in assisting these men to obtain their educational training, and so far as we have been able to judge, they are on the whole men of good calibre, and serious in their desire to avail themselves of the opportunities they have. Is it not then one of our problems as engineers and employers to see that all possible steps be taken to ensure that on graduation they will be absorbed into the classes of work in Canada for which their training will have fitted them? I urge your most careful consideration of this problem.

Mulberry Exhibit

An outstanding event of the year was the arrangement for co-operating with the Hudson's Bay Company in the showing of "Mulberry", the model of the prefabricated port designed and built by British engineers to afford a means of landing food and supplies for the troops in France following the invasion. The Institute has been glad to co-operate with the Hudson's Bay Company in this most interesting and informative enterprise. The interest taken in the exhibit by the public is evidenced by the great numbers who have attended. On the day of its opening in Winnipeg, for instance, 20,000 people were present. I need hardly say that to members of the Institute a visit to this exhibit will prove of intense interest, showing as it does what our brothers in the engineering profession in Great Britain were able to accomplish under conditions of great urgency and crippling shortages in material and labour.

Conference of Deans

An accumulation of problems relating to engineering education has led your Council to suggest that a meeting of Deans of Engineering Faculties might be arranged, to take advantage of the fact that a number of them would be present at this meeting of the Institute.

A meeting of Deans has accordingly been planned for Saturday morning and it is hoped that, out of their discussions, profitable suggestions may arise in matters that are of common interest to all the universities.

These matters are related not only to the best methods of dealing with the greatly increased number of students, but also to the general problems of entrance requirements and undergraduate curricula.

Institute Expanding Steadily

The steady and continued growth of the Institute membership over the past years is a matter to be noted with great satisfaction by all who are interested in its welfare. Looking back a few years we find that in 1936 the membership was 4,213, and with steady increase this figure has risen to 7,500.

The very size of our membership leads one to realize the great responsibility placed on the council and officers of the Institute. It suggests also the importance of maintaining the closest possible contact between councillors and branches in order that decisions reached may be in accordance with the wishes of the majority. Regional council meetings, visits of councillors and chairmen of committees and of the president and general secretary to the branches will all contribute to this end.

In the past year there have been several evidences of increased activity that justify a brief reference.

For the first time in a number of years there has been an increase in the number of branches. The authorization of the new Sarnia and Kootenay branches indicates an expanding interest in those areas and brings the total number of branches to twenty-seven.

As a result of the Annual Meeting held in Winnipeg last year, a renewed interest in the Institute has been noticeable in this locality. A new electrical section of the branch has recently been organized. Its first meeting was held in January and the large attendance and enthusiasm displayed would indicate that this section will prove of definite value to the branch members having a special interest in the electrical engineering field.

Another result has been the formation, at the University of Manitoba, of a students' section which has held its first meeting and is now in process of organizing and electing officers.

Still further evidences of the effects of the Annual Meeting are the increased applications for membership and an apparent renewal of interest among the members of the Association of Professional Engineers of the Province of Manitoba in the question of a co-operative agreement.

It was the first time in over thirty years that the Annual Meeting had been held in Winnipeg, and the results seem to indicate that the more frequent holding of annual meetings in western and eastern centres would have a pronounced effect on the membership and activity of the branches.

I hope this matter may receive the careful consideration of our Council when hotel accommodation becomes more normal.

In conclusion I feel that I should emphasize very strongly to this audience particularly the fact that our Institute has attained a position of great importance in the life of Canada. This is our heritage left by the wise policies and untiring devotion of those who have preceded us.

To those of us who now compose its membership there remains the task of upholding the prestige which the Institute now enjoys, and of doing all that lies within our power to plan for its growing responsibilities, and its increasing value to the profession and to all that pertains to engineering in Canada.

And now may I offer my good wishes to our incoming president, and express the hope that he may find his term of office as interesting an experience as I have found mine.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

YOU ARE URGED TO VOTE

The most important questions ever placed before the membership will be found in the ballots which are to be distributed in April. Upon these decisions will rest for many years the policy of the Institute. It is essential to progress and to acceptance of responsibilities that the results be favourable.

With the ballots are detailed accounts of why the proposals are made. Council is confident that a study of these will assure support for the amendments. It is important that members understand the issues, and have an appreciation of the study put on the problems by the various committees that make the recommendations. In your own and the profession's interest, please read these carefully.

In its 60th year the Institute has outgrown many of its limitations. It is necessary to revise some procedures and to provide additional income. The cost of doing business has gone up about 30 per cent, in addition to which many new opportunities and responsibilities face the organization. The opportunity for improved and increased services to the profession has never been so great.

For many years the fees of the Institute have been too low. A comparison with similar organizations elsewhere shows that none operate with so low a per capita income. There seems to be no reason why the Institute should be restricted to a fee one-half or less of that paid by engineers in England, Australia, the United States, and elsewhere. Even with the proposed increase of $5.00 per year per Corporate Member, the fee is still lower than that required by most societies. There seems to be no reason to believe that society business can be conducted in Canada for less than elsewhere.

The Engineering Institute of Canada is the only national professional all-embracing body in Canada. Its record since 1887 proves that it has served the profession diligently and intelligently. It has earned and received through steadily increasing membership acknowledgment of its attainments and its potential. Council believes it will continue to be worthy of the support of the profession. Upon these considerations, Council bases its approval of the amendments, and its solicitation of your support.

Remember, a two-thirds majority is essential for success. Do not hobble the Institute by your failure to complete your ballot. Vote for progress; vote for widening horizons; vote for the amendments.

A CORRECTION

In the article "A Break in the Clouds" appearing in the February *Journal*, it appears there were some inaccuracies in the tabulation of present salaries, in the Civil Service. Several members have written to point this out, but even they are not agreed as to what the figure should be. The trouble is that salaries are not uniform between departments.

Inquiries at Ottawa indicate that for the Department of Public Works the present salary scale should have been shown as follows:—

Grade 1—$1800—$2160
Grade 2—$2220—$2700
Grade 3—$2820—$3300

Beyond this grade the published scale seems to be reasonably close for at least two departments. However, no matter which figures are used, it is clear they are disgracefully low.

The new scale is still not adequate. After all the years of privation experienced under the present scale, the Government surely does not have to be penurious when recommending increases. It would take a lot of overpay to make up for the long record of underpay.

RECOGNITION OF ENGINEERING

There is still a lot to be done before many government officials appreciate that engineering is a profession—and an important one. Many documents from different departments deal with the professions without listing engineering. There are instances where the signature of school teachers, police officials, bankers, as well as doctors, lawyers etc., are accepted as authentication by departments of government, but those of engineers are not. Another case has come to light recently, this time in the Department of Munitions and Supply.

The Motor Vehicle Control Order No. 29 sets out the conditions under which new motor cars may be obtained. The priority schedule mentions many groups that undoubtedly have the right to be there, but there is no mention of the engineer unless he be a "Dominion, Provincial or Municipal official or employee" or engaged in "Public Services and Public Utilities". There is no specific mention of engineering, and no provision for anyone in private practice.

The Institute's attention was called to this condition by a member in the west who states "I would mention as an instance my own case. In spite of being 66 years of age, I have been obliged during these years and still have to carry on a considerable amount of engineering work, due to the scarcity of professional men in private practice as far as Western Canada is concerned. I am engaged in work for surface coal mines, water supply, rural highways etc., and I have been worrying along during the war years with a 1934 car, entailing regularly very heavy expenses in an endeavour to keep same in a working condition. It has now reached the limit of its usefulness, wherefore I submitted yesterday the regular application forms for Passenger Car Priority to the Local Motor Vehicle Rationing Officer here. I was quite surprised when he called my attention to the fact that engineers in private practice, no matter what important work they are engaged in, do not seem to fit into any of the classifications."

On February 15th the following letter was sent from Headquarters to the Motor Vehicle Controller at Ottawa. His reply follows, also a further letter from Headquarters.

February 15th, 1946.

Motor Vehicle Controller,
Department of Munitions and Supply,
Ottawa, Ontario.

Gentlemen:

In your order No. M.V.C. 29, dated November 10th, 1945, you make no provision for engineers obtaining a priority other than those engaged by government or public services.

There are many engineers whose work requires the use of a motor car and it is not only a serious matter for them but for the industries involved that they are not on the priority schedule.

As an example, I have a complaint from a member of the Institute that he has applied for a priority and been declined. This gentleman is a consulting engineer doing work in connection with surface coal mines, water supply, rural highways, etc., and he has been carrying on this class of work for many years using a 1934 car as his means of conveyance. It seems unfair that his case should not be considered simply because his classification is not included in the quite restricted groups shown in the class of A and B priority.

I noticed that in Class A you have included dentists. It seems to me inconsistent that a dentist, who, so far as I know has no professional use for a car, should have this privilege when a practising engineer, whose work absolutely requires the use of a motor car, is excluded.

I am sure that this omission is a pure oversight and I am hopeful that instructions may be issued immediately to your regional officers giving them authority to grant a priority to cases such as I have mentioned which are quite prevalent in the western provinces.

Yours sincerely,

L. Austin Wright,
General Secretary.

Department of Reconstruction and Supply
Ottawa, Canada

February 19th, 1946.

The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, P.Q.

Attention Mr. L. Austin Wright

Gentlemen:

This will acknowledge your letter of February 15th with reference to the failure of Schedule A of Order M.V.C. 29 to provide a category which would enable engineers who are engaged in private practice to secure Priority Certificates to purchase new passenger cars.

When Order M.V.C. 29 and the Schedule thereto was drawn, it was anticipated there would be an acute shortage of passenger cars in the early stages of reconversion. This has been borne out by subsequent events. In view of the anticipated limited supply, it was considered necessary to hold the categories in Schedule A to those whose operations were most closely allied with the general welfare of the people of Canada. When cars become available in greater supply, it is proposed to either broaden the scope of the categories or make provision for a dealer to make retail deliveries when he had filled all Priority Certificates on hand.

As you are no doubt aware, there has been a continual interruption of production since reconversion commenced. Notwithstanding the end of the steel strike in the United States, it will probably be some time before sufficient steel will be in transit to Canadian manufacturers to enable them to resume production. When new passenger cars are available in sufficient supply to justify such action and the broadening of the categories is being considered, your representations will be kept in mind. In the meantime, Rationing Officers must, of necessity, adhere to the categories in the Order.

We note your reference to dentists being included in Class A. This category is, of course, subject to need being established in accordance with the provisions of Section 4 of the Order, that is, a dentist will be required to establish that the vehicle for which he is making application will be used not less than 75 per cent of its mileage in his profession. Dentists were included only to provide for those who have branches or are attending the Armed Services.

Yours truly,

(Signed) E. T. Milne,
Motor Vehicle Controller.

February 27th, 1946.

E. T. Milne, Esq.,
Motor Vehicle Controller,
Department of Munitions & Supply,
Ottawa, Ontario.

Re: Your File 138-33

Dear Sir:

Thank you for your letter of the 19th, dealing with my inquiry as to car purchase priorities for engineers.

There is no argument with your statement of facts, but I do think " the general welfare of the people of Canada ", which you describe as the basis of the priority schedules, does not exclude engineers. Are not coal mining, highways, water supply, construction work essential to " the general welfare of the people ", just as much as many of the activities included in the schedules?

In replying to my comment on the need of dentists for motor cars, you say these cases are " subject to need being established ". Naturally, but on the other hand, they at least have the privilege of presenting proof of the need. Engineers have not.

Why couldn't engineers be included in the list, subject as the others are to proof of need? Wouldn't this be in " the general welfare of the people "? Isn't there some way in which your regional offices can be given the authority to issue permits or at least to submit cases to a higher authority when the public need justifies a permit?

Yours sincerely,

L. Austin Wright,
General Secretary.

Department of Reconstruction and Supply
Ottawa, Canada

March 1st, 1946.

The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal 2, Canada.

Attention: Mr. L. Austin Wright

Gentlemen:

This will acknowledge your letter of February 27th having further reference to the inclusion of civil engineers in the list of eligible consumers entitled to make application for priority certificates to purchase new passenger cars.

As stated in my letter of February 19th, the reason for priority certificates only being available to those listed in the schedule to Order M.V.C. 29 is the acute shortage of passenger cars due to difficulties in the industry. Just as soon as cars are available in sufficient quantity to justify such action, it is proposed to widen the scope of the Order, at which time the representations you and many others in a similar position have made will be considered.

Yours truly,

(Signed) E. T. Milne,
Motor Vehicle Controller.

ALBERTA ASSOCIATION NOMINATES OFFICERS

The Nominating Committee of the Association of Professional Engineers of Alberta has selected the following officers as official nominees of the Association:

President:	L. C. Stevens	Edmonton
Vice-President:	J. S. Irwin	Calgary
	J. G. Spratt	Calgary
Councillors:	Eric Avery	Calgary
	Wesley Crook	Brooks
	Alex Frame	Edmonton
	R. M. Hardy	Edmonton
	R. C. McPherson	Edmonton
	Harold Randle	Calgary

A unique development exists at the University of British Columbia which deserves to be better known to engineers across Canada. The students of U.B.C. have built with their own funds several of the university buildings. This most unusual departure is described modestly in the following article which was supplied by Dean Finlayson in response to the *Journal's* request. The college paper recently announced that the Student Council has plans underway for the expansion of Brock Memorial which may require the floating of a bond issue of not less than $100,000.

To many people this programme will be fantastic, and yet at U.B.C. such matters seem little more than commonplace. Is there any other university in Canada where similar contributions have been made?

Gymnasium

With the erection, in 1929, of a gymnasium on the campus, students at the U.B.C. realized the fulfilment of a seven year dream. The entire $35,000 needed for the construction of the building was raised by the students.

Interest in the erection of a campus gymnasium had been dormant since the march from the Fairview Shacks in 1922, but it took on new life in September 1926, with the announcement that a committee had been busily engaged throughout the preceding summer months investigating and gathering information on the cost of erection and the raising of money to pay for the building. Chief solution for the problem of raising the necessary money seemed to be the assessing of students through the Alma Mater Society fee.

On October 19, 1926, J. C. Oliver, president of Students' Council and chairman of the Building Committee, sent a letter to the Board of Governors asking that the students be allowed to negotiate a $90,000 loan for the construction of a gymnasium of semi-permanent design, and a Women's Union building, the loan to be paid by the money raised in increasing the A.M.S. fee by three dollars. This plan fell through, however, as being a far too ambitious one for the students to adopt, and it wasn't until 1929 that the gymnasium dream became a reality. Through the energetic work of the committee, and with the active co-operation of the faculty, the students of U.B.C. floated a $30,000 bond issue, bonds yielding 4½ per cent.

Work on the building started during the summer of 1929, with the grand opening of the $35,000 edifice scheduled for homecoming. As far as possible, student labour was employed during the building operations, and the gymnasium was finished and ready for use by homecoming.

The gymnasium, although not of imposing architectural design, is a living monument to the enthusiasm of U.B.C. students who sacrificed so much to ensure its erection.

The bond issue was retired in the fall of 1935, the same year that the stadium campaign began agitating for the erection of spectator stands and properly drained playing fields.

Stadium

The second building financed by the students was the stadium. "The new stadium is a monument in concrete and steel to the foresight of the undergraduates of the University. It is a monument to them personally, because the stadium was not donated as a gift nor erected by the Board of Governors, but was planned and paid for by the concerted efforts of the students themselves." So spoke Jay Gould, former president of the Students' Council at the opening celebrations of the $40,000 student-built stadium and playing fields, on October 2, 1937, before 4,000 University undergraduates.

Although many moves had been made since the erection in 1929 of the gymnasium to secure well-drained playing fields and adequate seating facilities for spectators on the campus, all efforts had met with failure until 1935 when Murray Mather, James Malkin, and Fred Bolton produced a two-page report on behalf of the Students' Council, recommending the floating of a bond issue not to exceed $40,000, the debt to be paid off with the money obtained from an increase of three dollars in Alma Mater fees.

Previous to this, however, the students had voted an expenditure of $19,000 for the laying out of playing fields and a cinder track on the site of the proposed stadium. In 1933 the student body sustained an increase of one dollar in fees for the installation of a modern drainage system.

At present, the stadium has a seating capacity of three thousand. The original plans, however, call for the erection of a similar grandstand on the east side of the field. Underneath the grandstand seats are located two dressing rooms, equipped with showers, strip rooms, and a large, dirt floor room soon to be used by the Boxing Club upon completion of their boxing ring.

Brock Memorial Hall

Like the other two great achievements of the undergraduates, the gymnasium and the stadium, the building of the Brock Memorial Building was made a success only by the foresight and grim determination of the student body.

It is an impressive tribute to the lives and work of deeply respected and revered Dean of Applied Science, Reginald W. Brock and his wife, who were killed in an aeroplane accident in 1935.

The first important drive for funds was launched on February 5, 1936. The sum of $30,000 was set as the student objective; pep-meetings were held, subscription forms printed in thousands, lists of potential donors prepared and people ' approached '. But for some unaccountable reason the student body of 1936 lacked the tireless energy and enthusiasm of their leaders, and by the end of the session the fund stood at less than $7,500. For

Brock Memorial Hall. Union College is shown in the background.

almost two years the matter appeared to be closed.

The intervening years saw the question of a Student Union building give way to that of a student stadium. 1938, however, gave rise to a revival of interest in the sleeping Brock Memorial issue. In February 1939, the possibility of a Union Building became a probability when the Government of British Columbia gave permission to the Board of Governors of the University to grant the Alma Mater Society ten annual instalments each of $2,500.00. In addition to this sum of $25,000, the Brock Memorial Trustees possessed a sum in the neighbourhood of $30,000. Consequently at the Alma Mater Society meeting of March 15, 1939, Students' Council was authorized to borrow $80,000, part of which was to retire the outstanding stadium bonds and part to finance the Student Union building. Of the $80,000 borrowed by the Alma Mater Society, some $30,000 went to retire the outstanding Stadium bonds. The remaining $50,000 was placed in the hands of the Permanent Brock Memorial Trustees. $10,000 of this latter sum, however, was earmarked by the students for furnishings, leaving a sum of $40,000 for the building proper. Since $25,000 had been guaranteed to the A.M.S. by the Board of Governors of U.B.C., the actual Alma Mater contribution will be in the neighbourhood of $15,000. The money which had been collected from subscriptions from the public, the faculty, the alumni and Summer Session amounted to almost $25,000 and the single donation of the Women's Undergraduate Society was on the generous side of $10,000.

Throughout the summer of 1939, students laboured over the plans. Plans were presented for approval by the Final Plans Committee of the Brock Memorial Committee, and the contract for the building was awarded. The building was opened January 31st, 1940. Planned to be a centre for the social and cultural activities of the students, the Union building is indeed a dream come true.

Armoury

This building, costing about $53,000 was officially opened by the Lieutenant-Governor on November 22, 1941. When the C.O.T.C. was re-organized in 1927-28, a precedent was set that all officers and cadets should contribute their local headquarters training pay to Corps Funds to be used for the benefit of the Unit. It had always been accepted that an Armoury was needed and should be the first objective for the Corps funds. With the exception of a grant from the Provincial Government of approximately one-seventh of its cost, the new structure was built entirely from funds raised by members of the corps. In April of 1941 the fund had reached the total of approximately $48,000 and it was decided to proceed with the construction of an Armoury. During the war, it was enlarged to meet the increased demands.

R.C.E.M.E.

The creation of the corps of the Royal Canadian Electrical and Mechanical Engineers out of the Ordnance Corps was a step forward in the utilization of engineers in the active services. In the minds of many interested people it was unnecessarily long in coming, but, now the war is over, attention should be directed to the future and not to the past.

Not long ago, the general secretary had an opportunity to examine the plans of the Corps for its peacetime establishment. In view of the frequent criticisms of the Corps personnel in these columns in the past, it is only fair to state that the existing situation shows great improvement. It is apparent that the present officials intend to make the corps one of engineers in fact and not only in title. Of the existing senior personnel and proposed additions to it, the proportion of university graduates in engineering is high, there being only three who are not so qualified, and they having other qualifications that suit them to their special appointments.

The establishment is not yet complete, and there are openings for qualified engineers who are interested in the permanent force as a life work. The *Journal* is happy to present the following article which has been furnished by the R.C.E.M.E. itself. Inquiries for further information may be made to the nearest Deputy Electrical Mechanical Engineer (D.E.M.E.) or direct to the O.C. at Ottawa, Col. J. W. Bishop, Director of Mechanical Engineering.

The Royal Canadian Electrical and Mechanical Engineers as a Career for Young Graduates

The rapid increase in the use of mechanical and scientific equipment for military purposes resulted in the formation of the Royal Canadian Electrical and Mechanical Engineers in May 1944. Subsequent progress and operation of the new Corps, during the campaigns in Italy and Northwest Europe, proved that it was formed on a sound basis for co-ordination of maintenance and repair and recovery of army equipment, as well as the investigation of equipment faults and the development of the necessary modifications.

RCEME, having now emerged from successful wartime activity, has a tremendous task to perform in Canada during the post-war period. In addition to the functions performed in operational theatres it will be required to provide skilled technicians for research, design and development so that the Canadian Army may have the finest and most efficient military equipment. It is fully intended that RCEME will maintain the same high standard that it achieved during active warfare.

RCEME, which is officered predominantly by graduate engineers, plans to recruit almost all future officers from universities. It follows, therefore, that a large number of attractive careers will be open to energetic and ambitious graduates who are interested in army activity. From present indications it would appear that the financial status of officers serving with the RCEME will compare favourably with that of engineers employed by large and progressive industrial and engineering organizations.

In addition to attractive remuneration and pension arrangements a proportion of young officers will be given every opportunity to further their technical advancement at both army and civilian educational establishments. Not only will they be employed in mass production repair organizations and administrative and technical appointments across Canada but also in research and development establishments. It is planned also that officers showing the necessary aptitude and inclination will be given opportunities to serve temporarily in the United Kingdom and with the armies of other Dominions of the Empire.

It is anticipated that further information regarding RCEME as a career will be available prior to the completion of the university term in 1946.

THE ENGINEER IN THE CIVIL SERVICE

Committee Reports to Annual Meeting of the Council of the Institute

A feature of the annual meeting of Council was a report from N. B. MacRostie, chairman of the Institute's Committee on The Engineer in the Civil Service. Reference to this report is made in the abstract of Council minutes published in the *Journal,* but its importance is such that the attention of the whole membership should be called to it.

To some extent, the plans of the Civil Service Commission, disclosed to N. B. MacRostie, seem to have received a blow by the announcement of the appointment of a Royal Commission to examine civil service salaries and other conditions of employment. If the newspaper announcements mean what they seem to, the plans of the Civil Service Commission will be held up indefinitely. This is regrettable because these plans were far advanced, and it was beginning to look as if relief were in sight.

Evasion

The *Journal* has already expressed an opinion on the necessity or desirability of a Royal Commission. To the outsider there appears to be no need for it. The whole situation is better known to many civil servants than it will ever be known to a group of outsiders, no matter who they may be. It isn't more commissions that are needed. It is action, fair play and commonsense.

Royal Commissions in this country are not distinguished for producing effective results. This does not seem to be the fault of the commissioners but of the politicians who, under no circumstance, will accept a commission's recommendations on their merits. One has no alternative but to believe that such procedures are adopted solely to delay action or to sidestep responsibilities. The conditions in the Canadian Civil Service will hardly withstand much more delay and evasion.

There is no use commenting on the qualifications or lack of qualifications of the appointed commissioners. It doesn't really matter who gets these jobs, because their report will be disregarded anyway. Under such circumstances, it is probably a mark of wisdom and efficiency to choose as many persons as possible who have retired from active life, rather than divert manpower from essential occupations.

A Concrete Proposal

But to return to the Institute's committee and Mr. MacRostie's report. The following proposals are offered as the plan of the Civil Service Commission. This is not an official statement, but it is an outline of the proposals as the committee believes they have been or were to be presented to the Minister of Finance. The information comes from the usual "unimpeachable source".

The proposals offer four main points as the basis of establishing government employment as a career service for professional, scientific and technical employees. They are—

1. Adequate entrance salaries sufficient to attract the best applicants.
2. Adequate ranges of compensation sufficient to retain the best of those who enter the Service.
3. Regular yearly increases, subject to satisfactory service, up to an adequate figure.
4. Additional increases in compensation for those who increase their value and add to their responsibilities most quickly. These can best be secured by means of periodical surveys made by the Civil Service Commission, commonly called "unit surveys".

It is believed by those who have been studying the situation that these four steps can be accomplished readily, provided the Treasury Board does not refuse the necessary financial support, etc. So far, support appears to be available for No. 1, and satisfactory progress is being made in applying more generous salary scales in connection with No. 2. Of the 2,700 professional, scientific and technical officers, duties investigations have been completed by the Commission in 2,000 cases. Of these, over 1,400 have already been recommended for increased compensation under the provisions of the Treasury Board directive allowing reclassifications in cases of gross injustice, and recommendations in connection with an additional 300 will be made shortly. None of the Commission's recommendations in this regard have so far been refused by the Treasury Board. The total amount to date of the immediate increase for the officers concerned is $350.000. and the total amount of the ultimate increase which they will receive is $625,000.

Add to these proposals another recommended by the committee and approved by Council, whereby the interest of the professional worker will be protected for the future, and the picture is complete. The committee's proposal is that the Civil Service Commission be enlarged by the addition of a professional technical member or that a technical panel be set up as in Great Britain, "to maintain a uniform standard for promotions and special advancements" and to keep "under review the well-being and efficiency of the Government Scientific Service". What more can a Royal Commission discover or recommend?

The committee is grateful to the Civil Service Commission for the friendly and frank manner in which the proposals of the Institute have been received, and for the helpful discussions that have taken place on this vital topic over the last few years. Surely something good will come out of it all before it is too late.

ENGINEERING BY CORRESPONDENCE

A member in Shawinigan Falls sends the *Journal* a newspaper clipping from the *Shawinigan Standard* of February 18th. It provides another example of confusion in thinking where professions are concerned. The careless use of the word "profession" is not infrequent, but the mention of "degrees" is not so common. It is something new to discover a society that can grant degrees and, at that, based perhaps on nothing more than its own correspondence courses. The clipping has been forwarded to the Corporation of Professional Engineers of Quebec, as the matter seems to lie specifically in that field.

Herewith are some quotations from the *Standard*:—

"One of the best attended and most enthusiastic organization meetings of the Canadian Society of Cost Accountants and Industrial Engineers was held at the Cascade Inn on Monday evening for the purpose of forming a St. Maurice Valley Chapter of the Cost and Management Institute of Quebec, which is affiliated with the Dominion Society".

Among the objectives of the Society was included — "To advance the profession of Cost Accounting and Industrial Management by granting degrees to qualified members and licensing the use by them of titles and initials signifying the possession of standard qualifications".

"As the Association grew they realized the necessity of a uniform course of study so that a young man could attend university, or through a correspondence course, obtain a degree or certificate similar to other professions".

"Mr. Patton, chairman of the Educational Committee, outlined the educational plans and said that degrees were given in each province where a division exists."

POLISH ENGINEERS IN CANADA

The Institute has had close contact with many Polish engineers who have been working in Canada during the war. These contacts began when the general secretary was assistant director of the Wartime Bureau of Technical Personnel, in the early days of that organization, at which time negotiations were under way between the Canadian Government, the British Government and the Polish Government representatives in England, to bring to Canada many highly experienced engineers and scientists who could assist in the war work in this country.

Subsequently, about two hundred and fifty of these gentlemen came here and set up their own technical society, calling it the Association of Polish Engineers in Canada. This society has met regularly, and has done a lot towards improving the situation for these highly trained specialists who so unhappily were forced out of their homeland.

Several branches of the Institute extended to the Polish engineers all the privileges of the branch on a complimentary basis, and from Headquarters *The Engineering Journal* was sent to over eighty of them on the same basis as to members of the Institute.

Recently, due to increased membership in the branches, it has been necessary to curtail these privileges. It is a matter of pleasure and gratification that so many of these guests have spoken so highly of the Institute's interest in them. Two letters are published on page 177, one of them from the president of the Association, in which considerable information of interest to Canadian engineers is given.

Engineers in Canada have some appreciation of the difficulties which this small band has survived. Each member has a story to tell that, although fascinating in interest, is very sobering in its effect. Such accounts more than ever impress upon us how lucky most of us have been to be living in Canada during those awful years.

From employers in many places have come expressions of praise for the services rendered by these gentlemen. Most of them were experts on subjects which, at that t me, were little known to Canadian engineers. They had just fled from a country where industry had been very highly developed, and their knowledge of æronautics, metallurgy, machine design, ballistics, etc. was of in-
and their ambitions.

Now that it is clear that they may remain in Canada, it is the wish of the Institute to greet them as Canadian citizens, and express the hope that in their new home they will find a ready outlet for their skill, their knowledge and their ambitions.

NEW OFFICERS FOR A.I.E.E.

The Headquarters of the American Institute of Electrical Engineers announces that the report of its Nominating Committee selects the following candidates for offices which become vacant on August 1st, 1946. These are to be voted on in the spring, but, as there is only one nominee for each position, it is not likely that the election will make any changes in the proposals of the Nominating Committee.

For President: J. Elmer Housley, district power manager, Aluminum Company of America, Alcoa, Tenn.

For Vice-President:

(North Eastern District) Ernest W. Davis, chief electrical engineer, Simplex Wire & Cable Co., Cambridge, Mass.

(New York City District) O. E. Buckley, president, Bell Telephone Laboratories, Inc., New York, N.Y.

(Great Lakes District) T. G. LeClair, supervising development engr., Commonwealth Edison Co., Chicago, Ill.

(South West District) R. F. Danner, general superintendent, Oklahoma Gas & Electric Company, Oklahoma City, Okla.

(North West District) Charles Foster Terrell, vice-president, Puget Sound Power & Light Company, Seattle, Wash.

For Directors: J. F. Fairman, vice-president, Consolidated Edison Co. of New York, Inc., New York, N Y.

Raymond T. Henry, chief electrical engineer, Buffalo, Niagara & Eastern Power Corp., Buffalo, N.Y.

E. P. Yerkes, engr. of equipment & buildings, Eastern Area, Bell Telephone Co. of Pa., Philadelphia, Pa.

For Treasurer: W. I. Slichter, professor emeritus of electrical eng., Columbia University, New York, N.Y.

SASKATCHEWAN ENGINEER

Under the above title the Engineering Society of the University of Saskatchewan is launching a new publication this year. It will be an annual publication, appearing about April 15th.

During the course of the general secretary's visit to the University of Saskatchewan last fall, he had an opportunity of meeting with the editorial staff to discuss the enterprise, but it was only recently that the final details of the publication have come to hand.

The proposal is quite an ambitious one, and speaks well for the society and for the individuals who are personally responsible for it. The Editorial Board is as follows:—

Editor-in-chief	Creighton W. Bildstein
Associate Editor........	Hugh Fraser
Managing Editor.......	Doug. Thierman
Advertising Manager ...	Mervin Pierce
Humour	Bob Thorvaldson
Photography	Ron Thompson
Art	George Cross, Joe Wise

There will be twelve separate papers in the publication, covering a very wide variety of subjects, the authors in each instance being graduates of the University. Following is the table of contents:—

1. The Young Engineer in the Electrical Industry, by L. C. Sentance, M.E.I.C., Director Manufacturing Methods, Canadian Westinghouse Co. Hamilton.
2. Aluminum Industry at Arvida, by E. H. Sangwine, Assistant Supt., Aluminum Plant, Arvida, Que.
3. Manufacture of Optical Components of Gun-Fire Control Instruments, by F. Feiffer, JR.E.I.C., in charge of optical machinery supervision, Research Enterprises Ltd.
4. The Geological Engineer in Canadian Metal Mines, by L. S. Trenholme, Belleterre Mines, Quebec.
5. Consulting Engineering in Canada, by C. F. Morrison, M.E.I.C., Prof. Civil Engineering, University of Toronto.

6. Electronics Past and Present, by Dr. Mackay, Prof. Eng. Physics, Univ. of Sask.

7. Petroleum Refining by E. C. Hurd, Manager of Toronto Refinery, B.A. Oil.

8. An Engineer in the Farm Implement Business, by D. S. Horne, Cockshutt Plow Co., Brantford, Ont.

9. Farm Machinery Engineering, 1946 Model, by Geo. E. Pickard, Massey Harris Co.

10. Problems of Natural Phenomena in Hydro-Electric Engineering, by J. K. Sexton, M.E.I.C., Montreal Engineering Co. Ltd.

11. The Engineer in the Air Force, by Air Commodore J. G. Bryans, R.C.A.F., Ottawa, Ontario.

12. Designing for Large Scale Production, by S. M. Young, Chief Engineer, International Harvester Co., Hamilton, Ontario.

Everyone will wish the students success. Their courage and enterprise in tackling such a difficult proposition is an encouraging sign of the calibre of students at Saskatchewan. Persons who desire copies had better write immediately to the Graduate Society or to any one of the editors. Early notification of interest will be helpful in determining the number of copies to be printed.

WARTIME BUREAU OF TECHNICAL PERSONNEL

Controls Affecting Technical Personnel as of January 1, 1946

Employment

The permit system which has applied to the engagement of technical personnel since March 23, 1942, has now been done away with and in its place there has been substituted what might be called a recording system. This change was outlined in a special notice appearing in the daily press throughout Canada on December 28, 1945, and as it is of interest to all technical personnel, it is assumed that the advertisement in question has been duly noted by the people affected.

As long as there was in existence the requirement that the engagement of a technical person was subject to approval of the Minister of Labour (through the Bureau) *before* the services of the technical person could be used, certain factors necessarily had to be subjected to scrutiny before action could be taken on an application for a permit. The principal considerations involved were the priority of the proposed work and the availability of the proposed employee. The need for applying for such permits now having disappeared, such matters as priority and availability are naturally not brought under any scrutiny. In other words, the engagement of technical personnel is not subject to manpower control in any way whatever.

The need for recording movements of technical persons, however, obviously still exists. Only by having a reasonably accurate picture of such movements, with related data as to supply and demand, can the Department of Labour intelligently render assistance not only in the immediate employment problems of both employers and individuals, but also in the planning and organizing of employment as a service to employers, to individual technical persons, to professional bodies, and to universities.

To this end, the regulations as now administered require the recording of needs and engagements by employers and the recording of cessations of employment, both by employers and employees. There is every reason to believe that full co-operation can be expected in this regard from those concerned. There has been no lack of such co-operation in the past and it is interesting to note that some months ago the Canadian Manufacturers' Association went on record as holding that, when the war was over, employers should have restored to them the right to engage and discharge employees as they saw fit, subject, however, to the obligation on the part of employers to register with the Employment Service both their requirements and their lay-offs.

To sum up on the question of employment, the actual business of engaging a technical person, or of leaving or entering employment, is no longer subject to scrutiny or approval but those concerned are expected to co-operate to the extent of providing notification of such movements *after* the necessary arrangements have been made.

At the same time, the Bureau is enabled to increase its efforts along the lines of a simple employment service for technical persons. The practice of referring the records of suitably qualified people to employers who register their needs with the Bureau is being continued and technical persons who are seeking employment are being assisted in every way possible to find a suitable connection. This applies particularly to those who are leaving the armed forces to return to civil life and to those who have served in war industry and whose employment is being terminated due to cessation of war production.

Labour Exit Permits

Some misunderstanding has been apparent as to the Bureau's connection with Labour Exit Permit Regulations. These regulations were put into effect in October, 1942, as a war measure and are still in force. While there is no reason to believe that Exit Permit controls were ever intended to be a permanent feature of manpower legislation, it should be distinctly understood that their revocation, like their implementation, is a matter of Government policy on which the Minister of Labour has, from time to time, kept the public informed. They apply to citizens generally with all types of skill and there is no limitation on the right of any citizen to apply for such a permit. The administration of the controls involved is naturally not vested in any of the officers of the Bureau as those affected include in their numbers only a comparatively small proportion of technical persons. When an application is being dealt with by the appropriate officials in the Department of Labour, normally on the basis of supply and demand as outlined in the original order setting the regulations up, the Bureau may be consulted if the applicant is a technical person, but its only function is to present such factual data as may apply to the individual case.

In order that any applicant whose application is not favourably dealt with may feel assured that the fullest consideration has been given to his case, provision exists for an appeal against an adverse decision, thus ensuring that no claim to consideration will be overlooked.

Salaries

Another question with which the Bureau has no official connection but which constantly comes up in discussions between Bureau officers and technical persons across the country is that of remuneration. Even while employment controls were in effect, the Bureau's function was merely to consider only whether the services of the individual technical person should be used in the capacity proposed. Such matters as salaries, working conditions, etc. were details of the individual employment contract which necessarily had to be left to the two parties concerned to deal with.

Actual amounts of remuneration are, of course, subject to control through the appropriate War Labour Board or through the Salaries Controller. It is only from these authorities that information as to any limitations on salaries should properly be sought.

As part of its operations, however, the Bureau has gathered a considerable amount of factual information as to salaries which has been made available as requested by various authorities, particularly in cases where doubt has arisen as to the adequacy of proposed rates, either in individual cases or where groups of technical personnel are concerned. In actual practice, this has had the effect of limiting to some extent the possibility of overlooking what might be called the current " market ".

Students

The necessary steps are being taken to furnish to universities lists of summer employment openings for undergraduates and of opportunities for employment of graduating students in 1946. While it is true that the war-time goal of increasing war production may happily be disregarded, stress is being laid on the necessity for combining with the student's academic work the most useful experience in activities related to his theoretical training. In this respect, employers who will find it necessary to engage young graduates in the future will benefit from a comprehensive scheme of summer training no less than the undergraduates themselves.

D. C. PRINCE AWARDED LAMME MEDAL

The 1945 Lamme Medal of the American Institute of Electrical Engineers has been awarded to David C. Prince, vice-president, general engineering and consulting laboratory, General Electric Company, Schenectady, N.Y.

For his distinguished work in the development of high voltage switching equipment and electronic converters.

The medal will be presented at the Summer Convention of the Institute to be held in Detroit, June 24-28.

The Lamme Medal was established through a bequest of Benjamin Garver Lamme, who was chief engineer of the Westinghouse Electric and Manufacturing Company from 1903 until his death in 1924. Beginning with 1928, the medal has been awarded annually for high achievements in the development of electric apparatus or machinery.

Dr. Prince will be well remembered by Institute members when, as president of the American Institute of Electrical Engineers, he attended the annual meeting of 1942 in Montreal.

CORRESPONDENCE

Polish Engineers in Canada

Association of Polish Engineers in Canada,
671 Belmont Street,
Montreal, February 6th, 1946.

L. Austin Wright, Esq., M.E.I.C.,
General Secretary,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, Que.

Dear Sir:

I have the privilege to reply to your letter of January 23rd, 1946, not personally but in behalf of the Association of Polish Engineers in Canada. On January 20th, 1946, I was elected the new President of the Association, and I wish to inform you that the Polish Engineers are entirely in accord with your opinion as to the necessity of providing a new base for our mutual relations; also that they highly appreciate the invitation to join The Engineering Institute of Canada as members.

When the Polish Engineers came to Canada some years ago, their aim was to help Canadian industry in order to contribute to the common victory.

They found this opportunity—and far more; in the difficult task of adjusting themselves to the new and sometimes different manner of life, they received all the friendship and support of their Canadian fellow-engineers as well as that of their various Associations. Therefore, I would ask you to accept on behalf of all your members the sincere thanks of the Polish Engineers associated in this organization.

However, and this is to explain our present situation—our status in Canada was for some considerable time quite uncertain, for our residency in this country was based only on " for duration of war " visas. So, we could make no plans; we had to stick to our Association, because this Association was the sole justification for our presence in Canada. Now, as the Canadian Government has granted us the status of permanent residents,—the distribution of visas taking place in December, 1945—many elements of our previous considerations have become evidently obsolete. For this reason, the aims of our Association—in fact the very *" raison d'etre "* of the Association—were vigorously discussed at the Annual Meeting on January 20th, 1946. The new board has received instructions to review the whole situation and to prepare the necessary amendments to the by-law at the next General Meeting.

It would be premature for me to make at this time a statement as to the aims of the Association of Polish Engineers in Canada. However, the following developments may be foreseen probably.

1. This Association does not intend to support its members beyond what seems necessary to prepare and introduce them to the professional organizations of the country. And this applies to present members as well as to other Polish engineers who may come in the future to Canada.
2. This Association wishes to refrain from any interference in the social or political issues of the day. But, as there are still many Polish engineers dispersed over the world; sometimes held in camps without social standing and with no hope of getting suitable work, this Association wishes to help them by providing material means, technical information and references.
3. The Association proposes to extend membership to other classes of Polish intellectuals, especially to university-trained forestry and agricultural engineers.
4. The Association will be glad to see friendly relations between Canada and Poland maintained and developed.

These outlines would seem to prove that our aims in Canada are rather limited. I hope to be able to visit you soon in your office in order to discuss some problems concerning the admission of Polish engineers to The Engineering Institute of Canada.

At this moment I would ask you to accept my thanks for your good will and kindness to our Association both of which you have proved on so many occasions.

Cordially yours,

(Signed) A. Grzedzielski,
President.

3210 Maplewood Ave., Apt. 11,
Montreal, Que., Feb. 9th, 1946.

L. Austin Wright, Esq., M.E.I.C.,
General Secretary,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, Que.

Dear Mr. Wright:

I wish to acknowledge with thanks receipt of your letter of January 23rd. It was a real pleasure to read about your appreciation of the work of Polish engineers. Your favourable personal opinion and the opinion of the other members of the Institute is very precious to us. We enjoyed it very much as we believe that it is not only an act of courtesy on your part, but the expression of your true friendly feelings.

I believe I can say in the name of my fellow-engineers and my own, that Canada is the only country in the world where not only true hospitality was given to us, but also the opportunity to work was extended to us. In the life of a technician this means more than words can express.

Canada has understood the problems of our emigration from our Motherland and the Institute has contributed in making us like this country.

We are sure that in this post-war period, our co-operation with our Canadian fellow-engineers will be still more efficient. On our part, we hope to be able to participate in the development of Canadian technical life in all its aspects.

I shall be delighted to become a member of the Institute and I shall be very anxious to return the form as soon as I find five members to introduce me.

Yours very truly,

(Signed) M. B. Szymanski, P.Eng. (Civil).

Rehabilitation Service Appreciated

The E. I. Dupont De Nemours & Co.,
Wilmington, Del., U.S.A.

Dr. L. Austin Wright,
2050 Mansfield Street,
Montreal, Que.

Dear Dr. Wright:

Thank you for your friendly letter of October 26th, in which you advise me on transfer to Junior. I am pleased to say that I have taken your advice, and have secured the necessary references.

I would like to add that down here I find it very pleasant to read *The Engineering Journal,* and to hear of the many graduates with whom one has worked or trained, and also to keep in touch with the engineering development in Canada. (With reference to this, might I suggest a column devoted to news of the month's new contracts let, or expansions planned).

Although I look with a little dismay at the large numbers of civilian non-members and civilian members who have made use of the employment service of the Institute, I would like to congratulate the Institute for its progressive policy in this regard. In the limited dealings I had with it, I found it most efficient, and ahead of anything existing in the United States that I have seen. I hope that industry will grow to lean on it more in the future.

Yours very truly,

(Signed) John F. Pink, Jr.E.I.C.

45 St. Clair Ave. West,
Toronto, Ontario.
January 18th, 1946.

Mr. L. Austin Wright,
General Secretary,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal 2, Quebec.

Dear Sirs:

In response to the appeal of the Finance Committee, I am glad to enclose my cheque for Twenty Dollars and Fifteen Cents ($20.15) to cover my annual dues, subscription to the *Journal,* and a $9.00 contribution for Rehabilitation Purposes.

We who stayed in Canada and saw the war through in comfort certainly owe a debt which we will never repay to those who served overseas and I hope that the Institute will consider ways and means of acknowledging this indebtedness to each individual. This should be prepared by a master hand in the style and spirit of Kipling.

Yours sincerely,

(Signed) A. E. K. Bunnell, M.E.I.C.

MEETINGS OF COUNCIL

The annual meeting of the Council of the Institute was held at the Mount Royal Hotel, Montreal, on Wednesday, February 6th, 1946, at ten o'clock a.m.

Present: Dean E. P. Fetherstonhaugh (Winnipeg) in the chair; Past-Presidents deGaspé Beaubien (Montreal), and C. R. Young (Toronto); Vice-Presidents J. E. Armstrong (Montreal), E. V. Gage (Montreal), and C. E. Sisson (Toronto); Councillors H. E. Brandon (Toronto), A. Cunningham (Saguenay), H. W. L. Doane (Halifax), representing the Association of Professional Engineers of Nova Scotia, R. S. Eadie (Montreal), R. C. Flitton (Montreal), A. E. Flynn (Halifax), P. E. Gagnon (Quebec), G. G. Henderson (Border Cities), J. A. Lalonde (Montreal), W. H. M. Laughlin (Toronto), Alex. Love (Hamilton), G. L. Macpherson (Sarnia), C. A. Peachey (Montreal), P. E. Poitras (Montreal), H. R. Sills (Peterborough), C. Stenbol (Sault Ste. Marie), E. O. Turner (Fredericton), representing the Association of Professional Engineers of New Brunswick, J. A. Vance (London), J. F. Wickenden (St. Maurice Valley), and W. S. Wilson (Toronto); Treasurer R. E. Chadwick (Montreal), Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

There were also present by invitation—President-Elect J. B. Hayes (Halifax), Vice-President Elect W. R. Manock (Fort Erie, Ont.), Councillors-Elect G. J. Currie (Halifax), J. R. Dunbar (Hamilton), S. R. Frost (Toronto), Norman Marr (Ottawa), J. B. Stirling (Montreal), and Paul Vincent (Quebec); Past-Presidents J. B. Challies (Montreal), T. H. Hogg (Toronto), C. J. Mackenzie (Ottawa), H. W. McKiel (Sackville), and F. P. Shearwood (Montreal); Past Vice-Presidents Hector Cimon (Quebec), and E. P. Muntz (Montreal); Branch Chairmen B. E. Bauman (Saguenay), J. O. Martineau (Quebec), S. C. Montgomery (Trail-Kootenay), C. F. Morrison (Toronto), F. J. Ryder (Border Cities), H. G. Stead (London), H. K. Wyman (St. Maurice Valley); Committee Chairmen J. G. Hall (Membership), Wills Maclachlan (Industrial Relations), N. R. MacRostie (Engineer in the Civil Service); J. A. Beauchemin, chairman, J. M. Crawford, vice-chairman, M. S. MacGillivray and G. N. Martin, members of the executive of the Montreal Branch.

In extending a cordial welcome, Dean Fetherstonhaugh invited all guests to take part in the discussions.

Harry Bennett Memorial Fund: Mr. Vance, Chairman of the Committee on the Harry Bennett Memorial Fund, reported that following the last meeting of Council he and Past-President Beaubien had interviewed government officials in Ottawa with a view to meeting tax requirements in the establishment of this fund.

Mr. Vance presented the following memorandum which, after some discussion, on his motion, seconded by Mr. Gage, was approved and adopted unanimously as the constitution for the Harry Bennett Memorial Fund:

1. The fund shall be known as the Harry F. Bennett Educational Fund of The Engineering Institute of Canada.
2. The purposes of this fund shall be to promote and advance the study of engineering sciences, more particularly the establishment of scholarships and fellowships to deserving persons; to encourage the establishment of departments in schools and colleges for the study of engineering and science; to make loans to deserving students under regulations primarily for the purposes of enabling them to pursue advanced study in engineering sciences, and generally do any matter which will advance and assist in the growth and development of such engineering sciences.
3. The rules and regulations governing this fund may be amended from time to time by the Council of the Institute not inconsistent with the purposes for which the fund is established.

Mr. Vance was planning to hold a meeting with Mr. Buchanan, of London, and Mr. R. E. Heartz, of Montreal, the other two members of his committee, during the annual meeting, and hoped to have the material for the campaign ready for submission to the branches at an early date.

Conference of British Engineering Societies: The general secretary reminded Council of the letter which had been received some time ago from the three leading British institutions asking if the Engineering Institute would be interested in receiving an invitation to meet with officers of similar British engineering societies in London in June, 1946. He now presented a letter from the three institutions advising that it has been decided to proceed with the arrangements for the meeting with representatives from engineering societies in the Dominions and in India, but that in view of the difficulties of travel and of obtaining accommodation in London during the early summer, the meeting had been postponed until September.

A cordial invitation was extended to the president and general secretary of The Engineering Institute of Canada to attend this conference and be the guests of the three British institutions during their stay in London. For this purpose accommodation has been provisionally booked for the delegates from the 14th to the 28th of September inclusive.

Following some discussion, on the motion of Dr. Gagnon, seconded by Mr. Brandon, it was unanimously resolved that the invitation be accepted and that the president and general secretary represent the Institute at this conference.

Amendments to the By-Laws: At the last meeting of Council attention had been called to the situation which, because of the proposal to increase fees, might develop in regard to the compounding of fees if a number of members decided to compound their fees under the present regulations. After consultation with the Institute's legal counsel, it had been suggested that the regulations regarding the compounding of fees, if approved, should be made retroactive to this date.

Following some discussion, on the motion of Dr. Turner, seconded by Mr. Lalonde, it was unanimously resolved that a sentence be added to the proposed amendment making the new regulations retroactive to the date of this meeting, such amendment to be made from the floor at the annual general meeting.

The general secretary reported that after the proposed amendments to the by-laws had been circulated to corporate members of the Institute, he had received from Mr. J. R. Dunbar, of Hamilton, a letter suggesting several amendments to the proposed amendments. These suggestions, with some explanations and further suggestions by the general secretary, had been passed on immediately to Mr. Hall, the chairman of the Membership Committee, the committee through which the original amendments had been made.

Each suggestion made by Mr. Dunbar was presented by him to the meeting and discussed in considerable detail, and it was finally agreed, with Mr. Hall's approval, that at the annual general meeting the following amendments should be proposed to the amendments which have already been approved by Council:

Section 10. At the end of the first paragraph add—

"or shall be required to write examinations as prescribed by the council."

Paragraph 2 (b) change to read—

"he shall be receiving a practical training in the profession in which case he shall be transferred to Junior automatically without payment of transfer fee providing he makes the application before attaining age twenty-five, and his application is approved by council."

Section 9. Third paragraph after the word "graduation" add—

"or if a non-graduate before attaining age twenty-nine"

Section 28. Add at the end of the 1st paragraph—

"and the rebates to the branches."

add—"The above schedule shall be made retroactive to February 6th, 1946."

Community Planning: For the benefit of those members not familiar with the situation, the general secretary outlined briefly the events leading up to the formation of the Central Mortgage and Housing Corporation and reviewed the action already taken by the Council of the Institute as described in the minutes of the last Council meeting. Since then he had been in Ottawa and had had an interview with Mr. Mansur, the president of the newly established Corporation, who had stated that although he did not know at the moment who else was to be appointed to the Board, it would be of great value to him to have, as vice-president, some person who was familiar with the engineering features of community planning and housing. At the present time there was nothing further to report.

Proposed Series of Lectures: The general secretary reported that following the last meeting of Council he had been in communication with Mr. Ross Dobbin, the chairman of the Institute's Committee on Community Planning, regarding the suggestion that the Institute might establish a course of lectures on community planning, possibly to be given through the branches in the larger centres such as Toronto, Montreal and Ottawa. He read to the meeting a letter from Mr. Dobbin making certain suggestions which would be followed up in due course. This was noted as a progress report.

A.S.M.E. Joint Committee: Mr. Stirling, as chairman of the Committee on Professional Interests, reported that a meeting of the A.S.M.E.-E.I.C. Joint Committee would be held during the course of the annual meeting, at which the following items would be discussed:

1. Permanent organization of the committee.
2. Completion of plans and assignment of responsibility for participation by Canadians in the programme for the semi-annual meeting of the A.S.M.E. in Detroit.
3. Detailed review of research projects which permit of joint participation.

It was expected that something very useful would develop and that a report would be ready for submission to the next meeting of Council.

As Mr. Robert C. Wiren, of Toronto had been unable to accept membership on the joint committee, it was unanimously resolved that Dr. O. W. Ellis, of Toronto be asked to serve as the Institute's third representative. The membership of the joint committee would then be as follows:

A.S.M.E.	A. G. Christie
	J. W. Parker
	A. C. White
E.I.C.	O. W. Ellis
	J. G. Hall
	W. A. Newman

Meeting with Association Representatives: Mr. Stirling reported that the Committee on Professional Interests was planning to meet later in the day with representatives of the provincial associations with which the Institute has co-operative agreements, with a view to discussing the question of the proposed increase in Institute fees and its application to members in provinces where the Institute has co-operative agreements. A report on their deliberations would be presented to Council in due course.

Proposed Amendment to New Brunswick Agreement: The general secretary presented the following resolution from the executive of the Moncton Branch:

> " Be it resolved that the Executive of Moncton Branch request the Council of the Institute to take such steps as may be necessary to have the phrase " if qualified for Institute membership " inserted immediately before the word " unless ", in Section 1(b) of the Co-operative Agreement between the Institute and the N.B. Professional Association.

Section 1(b) would then read as follows:

> "Any person resident in The Province of New Brunswick registering as a professional engineer in the Association subsequent to the date of this agreement, who is not a corporate member of the Institute, shall upon such registration become a corporate member of the Institute, if qualified for Institute membership, unless he notifies the Secretary of the Association of his desire to the contrary."

Following some discussion it was unanimously resolved that the resolution be referred to the Committee on Professional Interests for consideration and recommendation to Council.

Committee on Employment Conditions: The general secretary asked Council for instructions with regard to a matter that was considered at the September meeting of Council. At that time the committee reported that in the *Bulletin* of the Corporation of Professional Engineers of Quebec, the minutes of the last meeting of the Committee of Fourteen had been reported but in one instance the Institute was recorded as voting against a motion which actually it had supported, and in another instance, a very significant motion, proposed by the Institute which had been defeated at the meeting, was not mentioned at all.

At the previous meeting it was agreed that the Corporation should be asked to make the proper corrections and that, failing this, the complete story should be told in *The Engineering Journal.* The general secretary now asked Council to reconsider this ruling as he thought it unwise to print an account that would be critical of a sister organization. He reported that Mr. Heartz, the chairman of the Institute's Committee on Employment Conditions, had discussed the subject recently and had agreed that it would not be in the best interests of the profession to make such a report in the *Journal,* but at the same time he thought Council should conclude the subject, perhaps by a further statement of the facts of the case and a decision in the form of instructions to the general secretary to withhold the story from the *Journal.* Both Mr. Heartz and the general secretary felt that in view of Council's previous instructions the matter should not be allowed to drop without a further and final declaration.

Mr. Stirling expressed regret that the Institute's attitude should have been misrepresented by the minutes and he agreed that nothing would be gained by publishing the story in the *Journal.* He did think, however, that something should be done which would indicate that the Institute's position had not changed and that the facts were still as originally represented.

Mr. Brandon suggested that it might be helpful to have a careful statement of the facts prepared and circulated to the executive committees of the branches. In this way the officers of the branches would be fully informed without making any public display of the subject.

Mr. Poitras reviewed at length the events which had been recorded in the minutes. It was his impression that the Institute had opposed the resolution which the Institute claimed it had supported.

The secretary showed the meeting photostat copies of documents which proved the Institute's position but Mr. Poitras said the whole matter had been reviewed by certain members who had attended the meeting and several of them were of the opinion that the Institute's position was contrary to that claimed by it. He also described some of the developments which led to the formation of the new overall Council, expressing his opinion that the Institute had been wrong in not supporting the new organization.

Mr. Lalonde expressed his regret that this difference of opinion should have developed. He, too, reviewed some of the history, pointing out that the Institute's Committee on Professional Interests had endeavoured to reach an amicable understanding with the Corporation outside of Council meetings, and have a proper rectification made. He still thought that the Institute's representatives and the Corporation should get together and should jointly publish something in the *Bulletin* and in the *Journal* that would clear up the situation satisfactorily.

The general secretary stated that it had been reported to him from different parts of Canada that the incorrect minutes, as published by the Corporation, were being used as a basis of criticism of the Institute. In view of the documentary proof of the corrections of the Institute's position, he thought an effort should be made to remedy the situation.

Mr. Muntz said that in spite of the exhibits shown by the general secretary there were still differences of opinion as to what had occurred. He suggested that it would be better if the whole matter were dropped.

Dean Young agreed with others who had spoken, that there should not be any attempt to spread this story on the pages of the *Journal.* He thought the Institute should take a very dignified position and drop the matter without any further publicity. In conclusion, he moved that the directions given previously to the secretary to print the story in the *Journal* be rescinded. This was seconded by Mr. Poitras and carried unanimously.

Wartime Bureau of Technical Personnel: The general secretary reported that at the last meeting of the Advisory Board of the Wartime Bureau of Technical Personnel he and Mr. Jacobs had presented the Council's resolution as shown in Minute 4252. Other organizations represented on the Board had expressed opinions—some that the Bureau be continued in modified form, principally the register of technical personnel, and others thought that it should be dropped as soon as possible.

Due to the differences of opinion it was agreed that the chairman of the Board, and at least two other Ottawa members of it, should call on the Minister of Labour to see if he was prepared to announce any further plans for the Bureau. It was agreed that the matter would be left at this point until the committee reported back.

Dr. Gagnon read a portion of the report of the Chemical Institute of Canada which he had presented at the meeting of the Advisory Board. In this they recommended that the Bureau be continued in modified form, but restricted principally to the maintenance of the register. He expressed his opinion as to the possible attitude of the Department of Labour with regard to the record of the movements of technical personnel. He pointed out that the regulations would still require employers to report openings, new employees and dischargees, even if the Bureau were abolished. This was noted but no action was taken pending further word from the Board.

Proposal from Toronto Branch: The general secretary presented the following recommendation from the Toronto Branch, which had been passed by Junior and Senior Sections of the Branch:

> "We recommend that, on the employment page of the E.I.C. *Journal,* a graph or table incorporating the schedules of engineering salaries, as and when approved by the association of professional engineers in the various provinces, be published each month, to discourage advertisers offering positions at salaries below these figures, and as a guide to engineers seeking positions."

In the discussion which followed it was pointed out that there is a wide variation in the schedules of salaries adopted by the various associations, and that it was not feasible to publish all of them every month. It was suggested that this recommendation should be referred to the Committee on Employment Conditions for consideration and report.

Mr. Poitras pointed out that the schedule prepared by the Quebec Corporation applied mostly to government employees, but that the Ontario schedule applied to all engineers. He suggested that the Ontario schedule, which has been adopted recently by the Dominion Council, might be used in the *Journal.*

Mr. Sills reminded Council that the Institute had a Committee on Job Evaluation, under the chairmanship of Mr. G. R. Langley, of Peterborough and he thought this committee should be consulted.

Mr. Maclachlan pointed out that the Committee on Industrial Relations has also been discussing the question of job evaluation. Mr. Laughlin thought that some basic schedule could be worked out and published in the *Journal* which would give young engineers some idea of the salary they should receive. Some of the advertisements in the *Journal* offer salaries considerably below any acceptable scale and he thought that some action should be taken as soon as possible. Mr. Doane agreed with Mr. Laughlin and he thought it would be an excellent idea if some schedule could be worked out and published regularly in the *Journal.*

Following further discussion, on the motion of Mr. Sills, seconded by Mr. Love, it was unanimously resolved that the matter be referred to the Committee on Employment Conditions with authority to consult other committees and with a request for a report at the earliest possible date.

The Engineer in the Civil Service: Mr. MacRostie, as chairman of the Committee on the Engineer in the Civil Service, reported that he had been in touch with certain groups in Ottawa with regard to the Institute's proposal that the Civil Service Commission should be enlarged to include at least one professional technical employee and that a technical panel be set up by the Commission. His inquiries indicated that this proposal would be well received by the Professional Institute of the Civil Service and not unfavourably by the Civil Service Commission itself.

He had been informed from within the organization that the pressure from the Institute had had its effect and that an increase in salaries to the engineer in the Civil Service was on its way. He outlined some of the reforms that the Civil Service was reported to be advocating. These included:—

1. Adequate entrance salaries sufficient to attract the best applicants.
2. Adequate ranges of compensation sufficient to retain the best of those who enter the Service.
3. Regular yearly increases, subject to satisfactory service, up to an adequate figure.
4. Additional increases in compensation for those who increase their value and add to their responsibilities most quickly. These can best be secured by means of periodical surveys made by the Civil Service Commission, commonly called " unit surveys ".

Mr. MacRostie reported further that of the 2,700 professional, scientific and technical officers a re-classification survey had been completed by the Civil Service Commission in about 2,000 cases. Of these 1,400 have already been recommended for increased compensation under the provisions of the Treasury Board directive allowing reclassification in cases of gross injustice.

Recommendations for an additional 300 are going forward almost immediately. So far these recommendations have resulted in an immediate increase of over $350,000.00 and it is expected that the ultimate increase will be about $625,000.00.

Mr. MacRostie reported that the main obstacle to improvements for professional workers in the Civil Service had been the Treasury Board. He expressed the hope that the Board would not throw out or hold back the progressive recommendations which he understood the Civil Service was to present shortly.

In conclusion, the president thanked Mr. MacRostie for the work he had been doing and asked him if his committee would continue with it, following up in whatever way was thought necessary.

Memorandum from the Toronto Branch: The president called on Mr. Morrison, the chairman of the Toronto Branch, to present to Council the memorandum which had been sent to headquarters.

Mr. Morrison explained that fifty copies of the memorandum had been sent for distribution to councillors and that he did not think that this was the time to read such a lengthy document The general secretary pointed out that the fifty copies had been insufficient because no allowance was made for the new councillors taking office in 1946. However, he explained that the fifty had been distributed and that most of the councillors present had had copies.

Mr. Stirling referred to a previous and similar memorandum, prepared by the Toronto Branch, which had been discussed in Toronto by the Committee on Professional Interests with the executive of the Toronto Branch. He appreciated that the present memorandum was modified considerably but he pointed out that it contained some inaccuracies in the statements of facts. He did not like to make any comments on behalf of his committee as it had not yet been referred by Council to the committee.

Considerable discussion followed as to whether the memorandum should be read now or if it should be left to the Committee on Professional Interests for a report to Council. However, in view of the request of the Toronto councillors the president called on the general secretary to read it. At the conclusion of the reading the president asked the meeting for an open discussion.

Many councillors participated and several expressed surprise at some of the contents. Others referred to developments in these matters during the period of time in which they were officers of the Institute.

Mr. Stirling believed that the question was being approached from the wrong angle. He thought that the matter should be introduced by the Toronto Branch with the proper proofs of its statements and then be discussed by the councillors.

Considerable discussion followed with regard to the creation in Canada of sections of American societies, and the opposition which it was alleged in the memorandum had been offered by the Institute. Messrs. Young and Challies indicated that no opposition had come from the Institute as an organization but that there was some opposition from members of the American organizations themselves resident in Canada who were also members of the Institute. Mr. Challies described at length experiences he had had when president of the Institute and he expressed also the opinions of the various American organizations as disclosed around the table at the meetings of the Engineers' Council for Professional Development. He was of the opinion that several of the specific charges in the memorandum could not be proven but he felt that Council owed a debt of gratitude to the Toronto Branch for having raised the points and for having caused Council to review its position.

Mr. Eadie also described his experience when chairman of the Montreal Branch and the co-operation with the American Institute of Electrical Engineers was being discussed.

Mr. Morrison explained that he did not think the criticism in the memorandum was related to recent years but was based on actions of fifteen or twenty years ago. From such actions there had been left the unfortunate impression that the Institute was actively opposing the establishment of Canadian sections of American societies. At least, he explained, that is the impression held by the members of the Toronto Branch and of other societies in Toronto.

Further discussion was carried on by Messrs. Hall, Shearwood and Hogg, the latter suggesting that the report should be studied in a sympathetic manner. He thought the wording of the memorandum was unfortunate in certain spots but that it contained some helpful suggestions.

Mr. Frost, as past chairman of the Toronto Branch, stated that the memorandum represented almost three years of deep thinking on the part of the Toronto Branch. He recommended that the memorandum be laid on the table but that it should be submitted to branch executives.

Messrs. Sills, Flitton and Muntz added to the discussion, each pointing out the good features of the memorandum and recommending that it be given serious consideration by Council. In conclusion, Mr. Laughlin moved that the memorandum be tabled and that copies be sent to the various branches of the Institute asking for a study of its contents and a report to Council. This was seconded by Mr. Love.

Professor Turner thought it would be helpful to the branches to have a copy of the discussion at this meeting sent along with the memorandum. Mr. Armstrong was of the opinion that the memorandum should be submitted to the Committee on Professional Interests before it went to the branches and that in its accompanying statement the committee should point out any inaccuracies contained in the memorandum and emphasize other points which it thought helpful. He thought the memorandum in its original form should go to the branches but that the committee should submit to Council its report which, under Council's instructions, could accompany the memorandum. These recommendations were agreed upon and were included in the original motion, which was carried unanimously.

Institute War Memorial: The general secretary reminded Council that from time to time there had been discussions as to the possibility of erecting a new headquarters building. It is recognized that the space available in the present building is not adequate for present needs. Additional space is required for the library, for office files and for desk space for the staff.

Attention has recently been called to the amended federal legislation covering the War Charities Act which makes it possible to include buildings, as war memorials. The Institute is definitely interested in a war memorial of some kind and it would be most appropriate if it could be combined with a new headquarters building.

On the motion of Dean Young, seconded by Dr. Gagnon, it was unanimously resolved that the matter be referred to the House Committee for consideration and report.

International Engineering Congress: The general secretary reported that it seemed that some of the members of the Institute had been misinformed with regard to the proposed International Congress of Engineers in Paris next June. He explained that the International Federation which was sponsoring the congress had not yet been formed itself. Apparently it was one of the purposes of the congress to get the new federation inaugurated. He reported further that the three principal British institutions of engineering and the founder societies in the United States were not supporting the new federation or the congress.

Before adjourning the meeting, President Fetherstonhaugh expressed his thanks to councillors and guests for the assistance which they had given him at this meeting, and also for the assistance which he had received throughout the year. It had been a most interesting year for him and he was looking forward to meeting the various members at future meetings.

The Council rose at 5 o'clock p.m.

A meeting of the Council of the Institute was held at the Mount Royal Hotel, Montreal, on Friday, February 8th, 1946, convening at ten o'clock a.m.

Present: President J. B. Hayes in the chair; Past-President E. P. Fetherstonhaugh; Vice-Presidents J. E. Armstrong, W. R. Manock and C. E. Sisson; Councillors P. E. Buss, G. J. Currie, J. R. Dunbar, R. C. Flitton, A. E. Flynn, C. A. Peachey, P. E. Poitras, W. L. Saunders, J. B. Stirling, E. O. Turner, J. A. Vance and Paul Vincent; Past-Councillors R. E. Chadwick, J. A. Lalonde, James McMillan and H. R. Sills; H. G. Stead, immediate past-chairman of the London Branch; General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

Appointment of General Secretary: On the motion of Mr. Stirling, seconded by Mr. Vance, it was unanimously resolved that L. Austin Wright be re-appointed general secretary of the Institute.

Appointment of Treasurer: On the motion of Mr. Stirling, seconded by Mr. Armstrong, it was unanimously resolved that J. A. Lalonde be appointed treasurer of the Institute for the year 1946.

Appointment of Committees: On the recommendation of the Striking Committee, it was unanimously resolved that the chairmen of Institute committees for the year 1946 be appointed as follows, and that they be asked to submit the names of the other members of their committees for the approval of Council at the March meeting:

Finance .... J. E. Armstrong
Library and House.............. C. A. Peachey

Papers	C. E. Sisson
Publication	R. S. Eadie
Legislation	P. E. Poitras
Board of Examiners	R. DeL. French
Membership	H. R. Sills
Professional Interests	J. B. Stirling
Employment Conditions	R. E. Heartz
Industrial Relations	Wills Maclachlan
Rehabilitation	Howard Kennedy
International Relations	M. J. McHenry
Engineer in the Civil Service	N. B. MacRostie
Prairie Water Problems	G. A. Gaherty
The Young Engineer	L. F. Grant
Institute Prizes and Awards	E. P. Muntz
Harry Bennett Memorial Committee	J. A. Vance
H. N. Ruttan Prize	R. A. Spencer
John Galbraith Prize	W. R. Manock
Phelps Johnson Prize	J. E. Armstrong
Ernest Marceau Prize	G. F. Layne
Martin Murphy Prize	C. M. Anson

Thanks to Retiring Councillors: As chairman of one of the Institute committees, Mr. Stirling had had the privilege of attending a number of Council meetings during the year, and a real appreciation of the great volume of work which had been carried on during the year. It gave him much pleasure to move a hearty vote of thanks and appreciation to the retiring president, vice-presidents and councillors. The motion was seconded by Mr. Flitton and carried unanimously.

Past-President Fetherstonhaugh stated that it had been a great privilege and a matter of great interest to him to have been president of the Institute for the past year, an experience which he would value throughout the rest of his life. He could not emphasize too greatly the value of the work which had been done by the Council and the various committees, and in thanking Council for their kind resolution, he wished the Institute every success in the coming year.

Thanks to Montreal Branch: As a member from a distant part of the Dominion, Mr. McMillan of Calgary expressed his great pleasure in being able to attend this annual meeting, and on behalf of himself and other guests, he moved a hearty vote of thanks be extended to the officers, members and ladies of the Montreal Branch for the splendid arrangements which had been made and for the many courtesies and gracious hospitality received. Dr. Turner, as a member from a distance in the other direction, Fredericton, New Brunswick, had very much pleasure in seconding the motion. No one had experienced the slightest inconvenience which might reasonably have been expected in these days of congested travel and hotel conditions. The motion was carried unanimously.

Thanks to Hotel Staff and Management: Mr. Wright commented on the splendid co-operation which had been received from the hotel staff and management. In spite of extremely difficult circumstances, he had never had so many people remark on the good hotel accommodation received. On the motion of Mr. Armstrong, seconded by Mr. Vance, it was unanimously resolved that a message of thanks and appreciation be sent to the management and staff of the hotel for the excellent arrangements which had been made for the comfort and convenience of the guests.

In the discussion as to the time and place for the next Council meeting, it was pointed out that the president planned to visit the western branches in April and that a regional meeting should be held there. It was also suggested that an early meeting in Toronto would be desirable. Eventually it was left with the president to determine these points.

President Hayes thought that this might be a good opportunity for the chairmen of some of the committees which had been meeting during the course of the annual meeting to make an informal report if they cared to do so.

Committee on Professional Interests: Mr. Stirling commented briefly on the meeting with the representatives of the provincial professional associations. It had been in the nature of an exploratory meeting. They had considered how the proposed amendments to the by-laws could best be put before the membership for a vote. He had also had some very interesting talks with the young men attending the students conference. His committee had also met with representatives of the American Society of Mechanical Engineers and had explored the possibilities of the co-operative agreement which had just been signed. The proposed joint meeting in Detroit had been discussed and other means of implementing the agreement. A complete report would be made to the next meeting of Council.

Papers Committee: Mr. Sisson noted that he had again been nominated for the chairmanship of the Papers Committee. In the past year he had found it very difficult to accomplish what he had thought the Papers Committee should be able to do for the branches. Apart from a few papers which they had been able to provide, and a considerable time spent on Mulberry, very little had been accomplished. He would be glad to receive suggestions from members who had served on this committee or from any one as to ways and means whereby the Papers Committee could better serve the branches. The committee had not been able to give proper assistance to the western branches and to the smaller branches, which, in his opinion, were the ones that needed the assistance.

Mr. Vance, speaking as a past-chairman of the Papers Committee, thought that many of the smaller branches felt that travelling members of the Institute passed through their towns without stopping to visit with them. If more members could be induced to stop off and speak to such branches, either at a luncheon or a dinner meeting, it would be a great boost for them. He also emphasized the desirability of encouraging an interchange of speakers between branches.

Mr. Wright pointed out that one of the purposes for which the Institute needed additional revenue was to provide speakers for the smaller branches. He emphasized, too, the desirability of prominent members of the Institute visiting remote communities where there were perhaps a number of members of the Institute but no established branch. Visits of this kind would be good for the members and also good for the Institute.

Mr. McMillan stated that members of his branch would be greatly pleased if members passing through Calgary would stop off and talk to them either at a branch meeting or at a meeting of the executive. If such members could advise the branch in advance it would be greatly appreciated. The same thing applied in Edmonton to members passing through on the C.N.R. The general secretary undertook to publish an item covering this suggestion in an early number of the *Journal*.

Circulation of Council Minutes: Mr. Armstrong drew attention to a remark made at the recent meeting with the provincial associations, to the effect that the associations and branches were not kept well informed of what is going on at Council meetings and at Headquarters. He thought the Institute, through the wide circulation of Council minutes, had made a real effort to keep them informed, but that the minutes would have to be read and not just filed away. Minutes now go to councillors, past councillors for one year, past presidents, branch chairmen, committee chairmen and officers of provincial associations. He urged that all these people make certain to read them, so that Council's desire to give a widespread distribution to news of policy and events could be realized.

From the discussion which followed it appeared that in spite of the broad distribution, the minutes were very often apt to be filed without being read. It was suggested that councillors in the various branches and the branch chairmen might read these minutes in detail and extract from them the items of particular interest to their own branch and present them at a branch meeting for the information of the members of the branch. Any major project under consideration by Council appears in the minutes of three or four meetings before it is acted upon, and if the branches do not know anything about it, it means that the councillors are not performing one of their duties. Mr. Armstrong knew of no other organization that broadcasts its minutes so widely. In his opinion they should definitely be brought to the attention of the branch committee members so that they would be informed, and so that the branches could, in turn, keep Council informed of their reaction to the various matters under consideration.

Legislation Committee: Mr. Poitras, as chairman of the Legislation Committee, outlined some of the actions of the Corporation of Professional Engineers of Quebec in its proposal to have the Professional Engineers' Act amended. He referred to the joint committee of the Corporation and the Institute which had been set up to deal with the appeal of the case of Brian Perry and to negotiate for changes in legislation. He was encouraged to believe that the appeal would be successful and that the legislation would be amended as proposed.

Co-operation in Ontario: Mr. Buss thought that Mr. Vance's remarks regarding co-operation between the smaller branches were very timely. There were a number of medium sized branches in Ontario, not very far apart, which could co-operate very effectively, particularly in regard to speakers. He also hoped that something was being done with regard to co-operation with the Association of Professional Engineers of Ontario. A great many members belonged to both organizations and in his opinion there should be a co-operative agreement. With a proposed increase of fees in both organizations it might very well mean that some members would be resigning from one body or the other.

Mr. Stirling reported that progress in connection with a co-operative agreement in Ontario was not very encouraging. The most difficult situation was in the Toronto area. However, he thought if the members of the Ontario branches wanted to do some additional ground work, Mr. Buss' objective might be accomplished.

The general secretary reported that various members and officers in Ontario were of the opinion that an agreement might be reached in almost all parts of Ontario except the Toronto area. One member, a past-president of the Ontario Association, had suggested that the possibility of making agreements with separate sections of the province should be considered. He thought it was unwise to hold up all progress just because the situation seemed difficult in Toronto.

A past officer of the Institute in Ontario had also suggested that it might be advantageous to establish a provincial division of the Institute in Ontario in accordance with By-Law No. 69 in order to set up within the province a comprehensive organization that would survey the situation and take whatever action seemed most desirable.

Mr. Buss stated that he was going to initiate some action along these lines to see what could be accomplished.

Mr. Vincent suggested that it would be helpful if the Institute took more steps to make its relationships with the provincial associations perfectly clear. The fact that the Institute had sponsored these in the first instance and was solely responsible for the model act is not known to a great many engineers. He thought that even in the provinces where there were co-operative agreements the relationships would be improved if the Institute's position were made clear. He hoped that the relationships in each province might continue to improve so that eventually the work of both organizations would be thoroughly coordinated.

Dr. Turner suggested that when the Toronto memorandum, which was presented to Council on the 6th, goes out to branches, the inaccuracies in it be corrected. For instance, he noted that the report of attendance at Council meetings was not correct so far as he was concerned. He had been present at meetings beyond those shown in the tabulation. Other councillors pointed out that the same thing had occurred in their cases as well. This was noted by Mr. Stirling on behalf of the Committee on Professional Interests.

The Council rose at eleven fifteen a.m.

ELECTIONS AND TRANSFERS

A number of applications were considered, and the following elections and transfers were effected:

Members

Baxter, Andrew, Cert., Mech. Engr., (Royal Tech. Coll., Glasgow), engr., Dominion Bridge, Riverside Iron Works, Calgary, Alta.

Berger, Stephen Etienne, diploma civil engrg., (Univ. of Berlin, Germany), 234 St. George St., Toronto, Ont.

Busby, Arthur Henry Wilson, B.Sc., (Mining Engrg.), (Univ. of Birmingham, Eng.), supt. physical research, Consolidated Mining & Smelting Co. of Canada, Trail, B.C.

Byrn, James Charles, Graduate, (Royal Military Coll.), supt., dredging, Marine Industries Ltd., Montreal, Que.

Chipman, Samuel Gerard, B.Eng., (Mining), (McGill Univ.), sales engr., E. Leonard & Sons, Ltd., London, Ont.

Helliwell, Alfred Lloyd, B.A.Sc., (Univ. of Toronto), supvr., testing engine laboratories, Imperial Oil Ltd., Sarnia, Ont.

Irvine, Daniel John Sylvester, Lt. (E), R.C.N.V.R., B.Sc., (Chem. Engrg.), (Univ. of Saskatchewan), Montreal, Que.

Klawe, Czeslaw H., Elect. Engr., (Univ. of Grenoble, France), chief inspector, Prenco Progress & Engineering Corporation, Toronto, Ont.

MacLeod, Gordon Ross, B.Eng., (Mech.), (McGill Univ.), British Air Commission, Washington, D.C.

McLellan, John Gilmore, B.A.Sc., (Univ. of British Columbia), sales engr., power apparatus dept., Northern Electric Co., Ltd., Montreal, Que.

Milne, Frank Eric, B.Sc., (Univ. of Edinburgh), elect. engr., order, engrg., & specifying divn., service dept., Otis-Fensom Elevator Co., Ltd., Hamilton, Ont.

Moon, Clifford Leslie, B.A.Sc., (Univ. of Toronto), forest products engr., Forest Products Laboratories of Canada, Ottawa, Ont.

Parish, Charles Ernest, Lt. Col., O.C. No. 2, C.A.C.T.R., B.Eng., (Civil), (McGill Univ.), supt. genl. constrn., J.L.E. Price & Co., Ltd., Montreal.

Publicover, Lloyd David, B.Sc., (Chem. Engrg.), (Univ. of Alta.), engr., Canadian Stebbins Engineering & Manufacturing Co., Ltd., Montreal, Que.

Tomlinson, Walter John, Jr., B.Sc., (Chem. Engrg.), & Chem. Engr., (Lehigh Univ.), tech. director, Bezt Laboratories Ltd., Montreal, Que.

Turner, Gordon Chester, B.Aero Engrg., (Univ. of Detroit), Aero. Engr., with R.C.A.F., now demobilized, Simcoe, Ont.

Swan, David, B.Sc., (Mech. Engrg.), (Univ. of Saskatchewan), chief engr., Kipp-Kelly Ltd., Winnipeg, Man.

Juniors

deWitt, George Harding, B.Eng., (Elect.), (McGill Univ.), elect engr., Shawinigan Water & Power Co., Shawinigan Falls, Que.

Ford, William Rex, Lieut., Canadian Army, B.Eng., (Civil), (McGill Univ.), St. Johns, Que.

Jeffrey, Alexander, B.Sc., (Mech.), (Queen's Univ.), jr. engr., St. Clair Processing Corporation, Sarnia, Ont.

Salmon, Kenneth Waterbury, B.Sc., (Elect. Engrg.), (Univ. of New Brunswick), New Brunswick Telephone Co., Ltd., Saint John, N.B.

Schmidt, Donald Victor, B.A.Sc., (Chem.), (Univ. of Toronto), inspection chemist, Imperial Oil Limited, Sarnia, Ont.

Sloan, John Luxton, S/L., R.C.A.F., (Louborough Aero. Coll., Liverpool Univ.), Calgary, Alta.

Smith, Ian, Lieut., R.C.E., B.Sc., (Civil), (Univ. of Alberta), Calgary, Alta.

Willmot, Richard Stewart, B.A.Sc., (Mech.), (Univ. of Toronto), at Univ. of Western Ontario at present, Toronto, Ont.

Affiliate

Hughston, James Franklin, Q.M.S., R.C.E., Overseas, awaiting demobilization.

Transferred from the Class of Junior to that of Member

Kellam, George D., B.Sc., (Elect. Engr.), (Univ. of Manitoba), asst. engr., Canadian West Natural Gas, Light, Heat & Power, Calgary, Alta.

Transferred from the Class of Student to that of Member

Lombard, Robert Alexander, Capt., R.C.E., B.Sc., (Elect. Engrg.), Nova Scotia Tech. Coll.), now demobilized, St. Lambert, Que.

Transferred from the Class of Student to that of Junior

Burgess. Basil Arthur, Lieut. (E), R.C.N.V.R., B.Eng., (Mech.), (McGill Univ.), 4334 Harvard Ave., Montreal, Que.
Tkacz, William, Lieut. (E), R.C.N.V.R., B.Sc., (Mech.), (Queen's Univ.), 518 Hargrave St., Fort William, Ont.

Admitted as Students

Bartlett, William Wilton, B.A.Sc., (Elect. Engrg.), (Univ. of Toronto), testman, Canadian General Electric Co., Toronto, Ont.
Baxendale, Lawrence Robert, (St. Francis Xavier), Box 14, Antigonish, N.S.
Blair, David William, (Univ. of New Brunswick), 488 Charlotte St., Fredericton, N.B.
Hall, William Bertram, B.A.Sc., (Elect. Engrg.), switchgear testing, Canadian General Electric, Peterborough, Ont.
MacDonald, Ignatius Lloyd, B.A.Sc., (Univ. of Toronto), development engr., Dominion Rubber Co., Montreal, Que.
Marksfield, Harry, B.Eng., (McGill Univ.), test course, Canadian General Electric Co., Ltd., Peterborough, Ont.
McLaggan, William Alexander, (Univ. of Alberta), 2413 - 14th St., S.W., Calgary, Alta.
Miller, Charles Henry, (Nova Scotia Tech. Coll.), 277 Gottingen St., Halifax, N.S.
Muggah, James Edmond, Jr., (Nova Scotia Tech. Coll.), 35 Harvey St., Halifax, N.S.
Scott, Tom Foster, (Univ. of British Columbia), 4646 W. 8th Ave., Vancouver, B.C.

Students at McGill University

Abel, John Knight, 3506 University St., Montreal 2, Que.
Blackmore, Roland H., 3673 Park Avenue, Montreal, Que.
Brockhurst, Donald Norman, Douglas Hall, Montreal, Que.
Burroughs, John C., 3609 University St., Montreal, Que.
Dumka, Joseph, 593 Notre Dame Ave., St. Lambert, Que.
Jeffrey, Douglass Bruce, 785 Wilder Ave., Outremont, Montreal 8, Que.
Laberge, Jerome Guy, 525 Prince Arthur St. W., Montreal, Que.
Lupu, Melvin, 859 Rockland Ave., Outremont 8, Que.
Rossi, Ernest J., 6657 Monkland Ave., Montreal 28, Que.
Sidler, Joseph, 927 Pratt Ave., Outremont, Que.
Spino, Mario, 7793 Henri Julien St., Montreal, Que.
Villeneuve, Louis Philippe, St. Andre de Roberval, Que.
Wood, William Renfrew Muir, 784 Wilder Ave., Montreal 8, Que.

Students from University of Toronto

Booth, William Lawrence, 365 Dovercourt Road, Toronto, Ont.
Brown, Howard McCrae, 71 Queen's Park, Toronto, Ont.
Carr, William Hamilton, 175 Gamble Ave., Toronto, Ont.
Dalrymple, Alfred Eric, 42 King George's Road, Toronto 9, Ont.
Durand, Edwin Joseph, 45 Taylor St., Toronto, Ont.
Freeberg; James Arnold, 3 Devonshire Place, Toronto, Ont.
Freeman, Willard Arthur, 1 Maple Ave., Hamilton, Ont.
Harding, John Murray, 451 Blythwood Road, Toronto, Ont.
Jones, Harry Edwin, 69 Durban Road, Toronto, Sub. 82, Ont.
Richards, Vincent Llewellyn, 370 Huron St., Toronto, Ont.
Robinson, Alfred, 621A College St., Toronto, Ont.
Scott. William A., 68 Edith Drive, Toronto 12, Ont.
Short, Kenneth W., 2082 Gerrard St., E., Toronto, Ont.
Symes. Donald Cyril, Knox College, 59 St. George St., Toronto, Ont.

Students from Queen's University

Bennett, Lorne Maxwell, 33 Aberdeen St., Kingston, Ont.
Carter, Ronald Arnold, 250 Alfred St., Kingston, Ont.
Dean, Luther Allyn Shourds, 84 Clergy St., W., Kingston, Ont.
Douglas, Donald Hugh Charles, 85 Division St., Kingston, Ont.
Freeman, Reginald Garnet, Yarker, Ont.
Hovey, Frederick Lucas, Box 161, Clinton, Ont.
Mowbray, John Frederick, 619 Johnson St., Kingston, Ont.
Provan, James Thompson, 115 Collingwood St., Kingston, Ont.
Rothschild, Kurt, Queen's University, Kingston, Ont.
Soden, John Wilson, 134 Collingwood St., Kingston, Ont.

Students at Laval University

Belanger, A. Fernand, 315 Royal Ave., Beauport, Que.
Bernier, Charles, 8 Bougainville Ave., Quebec, Que.
Boisvert, Maurice, 46 Aberdeen St., Apt. No. 1, Quebec, Que.
Cahill, Lionel, 4 St. Leon St., Bienville, Levis County, Que.
Carrier, Marcel, 43½ Cartier Ave., Quebec, Que.
deLery, Alexandre C., 5 De Brebeuf, Quebec, Que.
Matte, Gerard, 36 - 10th St., Quebec, Que.
Langevin, Jean-Marie, 103 Ste. Anne St., Quebec, Que.
Lepine, Jerome, 97 Begin Avenue, Quebec, Que.
Milette, Jean-Paul, 3686 Ste. Marguerite St., Three Rivers, Que.
Morin, Adrien, 49 St. Joachim St., Quebec, Que.
Paradis, Maurice, 121 Garnier St., Quebec, Que.
Tousignant, Denys, 12 St. Denis Ave., Quebec, Que.
Trudel, Yves, 942 Ste. Genevieve St., Three Rivers, Que.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective.

Saskatchewan

Students, Univ. of Saskatchewan

Hill, Alexander Minett, 612 Albert Ave., Saskatoon, Sask.
Lotts, Gordon Richard, 713 Victoria Ave., Saskatoon, Sask.
McLean, William James Lloyd, Qu'Appelle Hall, Univ. of Saskatchewan, Saskatoon, Sask.
Pickering, John Ernest, 129 - 7th St., Saskatoon, Sask.
Putnam, James Morrison, 616 Lansdowne Ave., Saskatoon, Sask.
Shore, Robert Ellis, 617 Eastlake Ave., Saskatoon, Sask.
Thierman, Vernon Douglas, 1012 Melrose Ave., Saskatoon, Sask.
Tucker, Edwin Charles, 616 Lansdowne Ave., Saskatoon, Sask.
Ward, Lancelot William, 617 Eastlake Ave., Saskatoon, Sask.
Wilson, Andrew Grant, 408, 20th St., E., Saskatoon, Sask.

Student to Junior

Hamilton, Geoffrey Craig, B.Sc., (Civil), (Univ. of Saskatchewan), 839 University Drive, Saskatoon, Sask.

Quebec

Members

Borden, Douglas C., B.Sc., (McGill Univ.), Wiring Materials Mgr., Northern Electric Co., Ltd., Montreal, Que.

Member

Edgett, Conrad Seaton, instrumentman, Canadian National Railways, Moncton, N.B.

DISCUSSIONS

All written discussions on the following papers which were presented at the annual meeting should be received at Headquarters not later than April 20th, 1946:
"Performance, Installation Characteristics and Design of the Rolls-Royce 'Nene' and 'Derwent' Gas Turbines" by J. D. Pearson, M.E.I.C.
"The Future of Radio Communications in Canada" by A. B. Hunt, M.E.I.C.
"The Winter Temperature Cycle of the St. Lawrence Waters" by J. G. G. Kerry, M.E.I.C.
"Evaluation of Light Metal Alloys" by J. A. Van den Broek, M.E.I.C.

Personals

News of the Personal Activities of members of the Institute

Relatives and friends of members in the active forces are invited to inform the Institute of news items such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form the basis of personal items in the *Journal*.

W. G. Heslop, M.E.I.C., has returned to civil life and is now an associate professor of civil engineering at the University of British Columbia, Vancouver, B.C. For the five years prior to his enlistment he was employed by the Hollinger Consolidated Gold Mines Limited at Timmins, Ont., doing general mining and engineering work. He was also in charge of underground ventilation and dust control. He entered the R.C.A.F. as a pilot officer in 1940 and trained as a navigation instructor at Trenton, Ont. He subsequently served as a navigation instructor at McLeod, Alta., Yorkton, and Regina, Sask., and Brandon, Man. He was then employed for two years at Rivers, Man., and Trenton, Ont., on the standardization and redesign of navigation training throughout the Air Training Plan. He rose to the rank of squadron leader and later served as assistant chief instructor at Summerside, P.E.I.

W. W. Fotheringham, M.E.I.C., has joined the staff of Canadian Brown Steel Tank Company Limited at Brandon, Man. He was formerly employed by Plate and Structural Steel Products Company, Toronto, Ont.

R. E. Haskins, M.E.I.C., has accepted the position of plant engineer with the British Columbia Cement Company, Bamberton Works, Tod Inlet, B.C. He was previously assistant superintendent of the light, heat and power department, Defence Industries Limited, at Transcona, Man.

G. H. Kirby, M.E.I.C., is now employed with the Rolland Paper Company at St. Jerome, Que., as plant engineer. He was formerly chief engineer of Canadian Car Munitions Limited at the Cherrier plant, Que.

Léo Roy, M.E.I.C., has accepted the position of assistant superintendent of distribution at the Quebec Hydro-Electric Commission in Montreal, Que. He was formerly associated with the Quebec Power Company in Quebec City as assistant superintendent of the power division. Until his recent appointment Mr. Roy was secretary-treasurer of the Quebec Branch of the Institute.

R. E. L. Johnson, M.E.I.C., has been appointed manager of the Toronto division of Westeel Products Limited. His territory includes that part of Ontario from the Lakehead to Kingston. Born in Westmount, Que., Mr. Johnson graduated from McGill University in electrical engineering in 1932. After several years of production engineering in the automotive industry, he joined R.C.A. Victor in Montreal, following which he spent several years as an industrial engineer with the firm of Stevenson and Kellogg Limited, management engineers.

W. W. Brumby, M.E.I.C., formerly of the British Admiralty Technical Mission at Ottawa, is now associated with the English Electric Company of Canada Limited at St. Catharines, Ont.

W. J. S. Dormer, M.E.I.C., formerly district plant engineer, Laurentian district, Bell Telephone Company of Canada, has been promoted to special studies engineer of the Eastern Division, with headquarters in Montreal.

E. I. W. Jardine, M.E.I.C., formerly with the Inspection Board of the United Kingdom and Canada at Hamilton, Ont., is now associated with the Public Utilities Commission of British Columbia at Victoria, B.C.

Alan Brown, M.E.I.C.

Alan Brown, M.E.I.C., has been appointed general manager of distribution of Gatineau Power Company, Ottawa, Ont. After serving overseas with the Canadian Field Artillery in World War I, he graduated from Queen's University in 1923. Mr. Brown has been with the Gatineau Power Company since 1926. Prior to his recent appointment he was manager of the eastern distribution district of the company.

R. L. Dunsmore, M.E.I.C., has assumed the position of manager of refineries, International Petroleum Company Limited, at Toronto, Ont. Since joining Imperial Oil Limited in 1919 at Sarnia, Ont., he has held the positions of assistant superintendent of the refinery at Calgary, superintendent of the refinery at Halifax, and manager of the Montreal refinery. He worked for some years as general superintendent for the International Petroleum Company at Talara, Peru, S.A. From 1942 until 1944 he served in the R.C.N.V.R. with the rank of commander as director of fuel at Naval Service Headquarters, Department of National Defence, Ottawa.

Charles W. Carry, M.E.I.C., has entered private practice at Edmonton, Alta. He was previously associated with the Standard Iron Works at Edmonton as engineer on design and sales.

Ross E. Clarke, M.E.I.C., is now assistant engineer with the Department of Highways of Ontario at Kington, Ont. He was formerly employed as resident engineer by the Department of Transport, Air Service Airport Construction, at Kingston, Ont.

A. P. Boutilier, M.E.I.C., is now employed by Canadian Refractories Limited at Montreal, Que. He was recently discharged from the Royal Canadian Engineers with the rank of major after serving as chief works officer with the Department of National Defence, engineer services, at Sydney, N.S., and overseas.

Major W. B. Akerley, M.E.I.C., Saint John, N.B., has relinquished the post of district engineer at M.D. 7 to accept the position of field supervisor, Alaska Highway, which has recently been taken over by the Canadian Army. Prior to the outbreak of war he was employed by the New Brunswick Department of Public Works, Highway Division.

D. B. Sutherland, M.E.I.C., is at present employed as assistant to the superintendent, department of buildings, Montreal Protestant Central School Board, at Montreal, Que. He previously served in the R.C.N.V.R. prior to which he was employed with Guysboro Mines at Goldenville, N.S.

J. W. Brooks, M.E.I.C., has recently accepted a position with the Spruce Falls Power and Paper Company at Kapuskasing, Ont. He was formerly employed as engineer with Hyatt Bros. Construction Company, London, Ont.

R. B. Jones, M.E.I.C., engineer of track for the Canadian Pacific Railway at Montreal since 1939, has been appointed assistant chief engineer of the system. He has served with the C.P.R. for 32 years, except for four years during World War I when he saw service with the Royal Canadian Artillery, rising from the ranks to a commission. He served his rail engineering apprenticeship with the North British Railway 40 years ago and came to Canada in 1910. With the Grand Trunk Pacific Railway he had a part in construction of the Fort William terminals and location survey work in Saskatchewan and in 1913 went with the C.P.R. as a transitman in Montreal. On his return from overseas in 1919 he was made assistant engineer at Montreal, a position which he held until his appointment to engineer of track in 1939.

W. G. Dyer, M.E.I.C., division engineer with the Canadian Pacific Railway at Penticton, B.C., for the past three years, has been appointed engineer of track at Montreal to succeed R. B. Jones, M.E.I.C. A native of Saskatchewan, Mr. Dyer joined the C.P.R. as a rodman at Regina, while an engineering student at the University of Saskatchewan. Upon graduation in 1928, he was appointed building inspector at Saskatoon and has since served at Pennant, Prince Albert, Lanigan and Moose Jaw, all in Saskatchewan, before going to Penticton. At Moose Jaw he was at first resident engineer on construction and later division engineer from 1941 until 1943, when he was transferred to Penticton.

L. H. Laffoley, M.E.I.C., has been appointed to the position of engineer of buildings for the Canadian Pacific Railway. He has been in the engineering department of the company since 1919, when he entered their employ as a draughtsman. He had served overseas two years with the Royal Canadian Engineers and later with the Royal Flying Corps in World War I. On his return to Canada he served as a demonstrator in mechanical engineering at McGill University. After seven years as a draughtsman with the C.P.R. he spent twelve years as assistant engineer and for the past eight years has been assistant engineer of buildings.

G. R. Fanset, M.E.I.C., chief engineer of Ducks Unlimited (Canada) at Winnipeg, Man., has been elected chairman of the Winnipeg Branch of the Institute. Born at Morris, Man., he graduated from the University of Manitoba in civil engineering in 1931. He worked first as resident engineer of the Department of Northern Development, Province of Ontario, and in 1938 he joined the firm with which he is now associated.

Mr. Fanset joined the Institute as a Member in 1940.

Frederick Palmer, M.E.I.C., is opening a Canadian trade commissioner office in Stockholm, Sweden. Since the beginning of the year he has been on a tour of Canada interviewing business firms on the subject of trade with Sweden. Mr. Palmer, who has served in Europe, Britain and Australia as trade commissioner since 1921, has recently returned from a special mission to Chungking, China.

Charles Scrymgeour, M.E.I.C., of Imperial Oil Limited, has been transferred from Dartmouth, N.S., to Montreal, Que., where he occupies the position of superintendent.

E. G. Ryley, M.E.I.C., has accepted a position with Dinsmore-McIntire Company, general contractors of western Ontario, with headquarters at Windsor, Ont. He was formerly with A. W. Robertson Co., Long Branch, Ont.

D. O. D. Ramsdale, M.E.I.C., has been appointed manager of the Kirkland Lake district office of the English Electric Company of Canada Limited. His territory covers the mining area from the Timmins district to the Val d'Or district. After graduating from McGill University in 1933 Mr. Ramsdale went directly into the electrical industry and in 1940 joined the English Electric staff. He served with the R.C.N.V.R. from 1942 until 1945 when he resumed his employment with the company.

G. W. Griffin, M.E.I.C., assistant engineer of the Canadian Pacific Railway at Saint John, N.B., has been transferred to Toronto to become assistant division engineer, Bruce Division.

Lucien Allaire, M.E.I.C., is now employed as assistant engineer, West Division, Waterworks and Sewerage Department, City of Montreal. He was formerly division engineer with the Department of Highways of Quebec at Cap de la Madeleine, Que., and joined the engineering department of the City of Montreal in 1944.

Armand E. Lafleur, M.E.I.C., has established a private practice in civil engineering at Drummondville, Que. He was formerly associated with the Department of Roads, Province of Quebec, as resident engineer at Drummondville.

R. B. Jones, M.E.I.C.

W. G. Dyer, M.E.I.C.

L. H. Laffoley, M.E.I.C.

O. C. Steinmayer, M.E.I.C, retired on pension on February 1st from the services of the Canada Creosoting Company Limited, Montreal. At the time of his retirement he held the position of superintendent of timber preservation.

W. O. Sorby, M.E.I.C., has returned to the Canadian Westinghouse Company Limited and is now employed in the apparatus division at Montreal. Before serving in the Canadian Army he was sales engineer with the company at the Winnipeg office.

Colonel H. R. Lynn, M.E.I.C., who commanded the 1st Battalion of the Royal Canadian Engineers overseas, has retired from the Army and resumed his pre-war position as president of Lynn MacLeod Metallurgy Limited, Lynn MacLeod Engineering Limited and other associated firms at Thetford Mines, Que. Col Lynn was active in the development of flame warfare for the Canadian Army and was also technical and military adviser to the British Petroleum Warfare Department.

Jules A. Beauchemin, M.E.I.C., chief engineer of the Provincial Electricity Board, Montreal, has been elected chairman of the Montreal Branch of the Institute. Born in Montreal, Que., he graduated from Ecole Polytechnique with a B.A.Sc. degree in 1911. Upon graduation he became associated with the Federal Hydrometric Service at Ottawa where he remained until 1919 when he joined the staff of the Riordon Pulp Corporation, at Temiskaming, Que., as the engineer in charge of the study of hydro-electric developments. In 1921 he severed his connection with the Riordon Corporation to become chief engineer of Donnacona Paper Company where he remained until 1927 when he was appointed town manager for the new town of Dolbeau in the county of Lake St. John., Que. Mr. Beauchemin was in charge of the plans, organization, public works and services, acting for the Lake St. John Power and Paper Company Limited which was developing the new townsite. In 1930-31 he was manager of personnel and properties for the Consolidated Paper Corporation at Port Alfred, Que., and in the following year was employed as resident engineer on the construction of the Wellington Street Tunnel, under the Lachine Canal, representing the City of Montreal. In 1932, Mr. Beauchemin was resident engineer of the Lake St. Louis Bridge Corporation, later becoming comptroller of the same organization. In 1935 he was appointed chief engineer of the Provincial Electricity Board at Montreal, which position he holds at the present time.

J. A. Beachemin, M.E.I.C.

Mr. Beauchemin joined the Institute as an Associate Member in 1919, becoming a Member in 1940. He is chairman of the Ecole Polytechnique Graduates Society for 1946.

Gerald Molleur, M.E.I.C., was appointed joint director of personnel of the Quebec Hydro-Electric Commission at Montreal, Que., last November. He was formerly engineer in charge of the rural electrification division of the Commission.

J. E. Pepall, M.E.I.C., has left Canada to join the Indian Aluminium Company at Chota Muri, Bihar Province, India. He had been connected with the Aluminum Company of Canada Limited at Arvida and Montreal, Que.

A. M. Bain, M.E.I.C., has returned to the Dominion Bridge Co. Limited at Lachine, Que., from which company he was on loan to the Department of Munitions and Supply. He had transferred to the Department as technical assistant to the director-general, Army Engineering Design Branch, in 1941. He became assistant director of tank design in 1943 and from March 1945 until the present time he has been acting director.

George T. L. Andrews, M.E.I.C., has recently joined the engineering staff of Canadian Industries Limited at the nylon plant in Kingston, Ont. He was previously employed in agriculture and engineering practice at Blackdale, Man.

J. K. Angerman, M.E.I.C., was recently appointed electrical counsellor for the industrial division, Bureau of Supply, of UNRRA at Washington headquarters. He was formerly connected with the Montreal Armature Works Limited at Montreal, Que., as designer for A.C. meters and generators.

S. R. Weston, M.E.I.C., is the newly elected chairman of the Victoria Branch of the Institute. After graduation from the University of New Brunswick in 1914, he spent six years in general engineering and construction work. When the New Brunswick Electric Power Commission was established in 1920. Mr. Weston was appointed assistant chief engineer. Three years later he was promoted to chief engineer for the Commission, a position he held until 1939 when he resigned to become chief engineer and technical adviser to the B.C. Public Utilities Commission. Since that time he has supervised an appraisal of the fourteen companies in the B.C. Electric group and represented the Commission in the subsequent rate hearings of the company before the Public Utilities Commission. He was borrowed by the government to assist in the preparation of the Electric Power Act when it passed the legislature. In 1945 he was appointed chairman of the British Columbia Power Commission.

S. R. Weston, M.E.I.C.

Mr. Weston joined the Institute as an Associate Member in 1922, transferring to Member in 1925.

Donald S. Smith, M.E.I.C., who was formerly associated with the National Research Council, division of physics and electrical engineering, at Ottawa, Ont., is now employed as power apparatus sales engineer with Northern Electric Co. Limited at Vancouver, B.C.

G. W. E. Nicholson, M.E.I.C., has been appointed vice-president in charge of manufacturing of the Union Bag and Paper Corporation, New York, N.Y. Since 1941 he was employed as resident manager with the Corporation at Savannah, Ga.

Frank C. Dempsey, M.E.I.C., has been appointed by Flintkote Company of Canada Limited sales engineer for western Canada with headquarters at Calgary, Alta. A graduate of the University of Manitoba in civil engineering, he was first employed as resident engineer with the Manitoba Department of Public Works. He joined the British American Oil Company as asphalt engineer in charge of asphalt activities in western Canada, and later became manager of the British American Oil Asphalt Department at Toronto. He founded and operated Asphalt

Services Limited, from which company he goes to his new appointment.

J. W. Thomas, M.E.I.C., has accepted a position with McColl-Frontenac Oil Company in Montreal. Mr. Thomas, who has recently been retired from active service with the rank of major, served for over five years with the Royal Canadian Engineers. After four years overseas, he returned to Canada and for the past year he has been with the Directorate of Engineer Development at National Defence Headquarters in Ottawa.

Arthur Piché, M.E.I.C., who was formerly with the Department of Public Works of Canada, has recently joined the staff of the engineering department of the City of Quebec.

C. E. Olive, M.E.I.C., is now on the teaching staff of the University of Toronto at its Ajax Division. He served formerly as a commander in the R.C.N.V.R.

Denis Stairs, M.E.I.C., who has been serving as director of construction, Department of Munitions and Supply, Ottawa, Ont., has returned to the Montreal Engineering Company Limited, of which he is a director and with which he has been associated since 1922.

Harold C. Oatway, Jr.E.I.C., has now returned to Canadair Limited, Cartierville, Que., as stress analyst. For the past year he has been on loan from the company to Douglas Aircraft Corporation at Santa Monica, California.

James A. MacGibbon, Jr.E.I.C., is at present employed in the alkali division of Canadian Industries Limited at Windsor, Ont. He was formerly draughtsman in the engineering department of the company at Montreal.

O. L. Smith, Jr.E.I.C., is now associated with Price Brothers and Company Limited as an electrical engineer at Riverbend, Que. He was previously employed by Metropolitan Electric Company at Quebec City, Que.

Hugh J. Gordon, Jr.E.I.C., who was discharged from the Canadian Army in January with the rank of lieutenant, has returned to the Canadian Pacific Railway as transitman in Vancouver division.

P. O. Bourgeois, Jr.E.I.C., of International Water Supply Limited, has been transferred from London, Ont., to Montreal, Que.

Captain J. B. Glenn, Jr.E.I.C., has been recently promoted to his present rank and is now attached to Headquarters, R.C.E.M.E., 3 Canadian Infantry Division (C.A.O.F.), Canadian Army Overseas.

J. A. Caverley, Jr.E.I.C., former geologist with the Britannia Mining and Smelting Company, Britannia Beach, B.C., is now associated with the Howe Sound Exploration Co. Limited, Snow Lake Division, Snow Lake, Man.

Sydney M. S. Dunn, Jr.E.I.C., has severed his connection with Defence Industries Limited at Bouchard shell filling works, Jean Brillant, Que., and is now employed by General Steel Wares Limited, Toronto, Ont., as production engineer.

Warren Ball, S.E.I.C., was discharged from the Canadian Army last November with the rank of lieutenant (R.C.E.M.E.). He graduated from Nova Scotia Technical College in 1944 and is at present taking a post-graduate course leading to the degree of M.A.Sc. at the University of Toronto.

C. A. N. Baker, S.E.I.C., has joined the staff of the Norton Company at Chippawa, Ont., as a junior chemical engineer in the research and development section. He received his M.Sc. degree in chemical engineering at Queen's University in 1945.

Fernand Lareau, S.E.I.C., has accepted a position with T. Pringle & Son Limited, Montreal, as a structural designer. He was previously assistant engineer of the City of Verdun, Que.

J. D. Palmer, S.E.I.C., who was previously connected with the Northern Electric Limited at Montreal, is at present employed by the Commonwealth Electric Corporation in Welland, Ont., as a sales engineer.

Marcel Lefebvre, S.E.I.C., is now working for the Provincial Electricity Board at Montreal, Que. He graduated from Ecole Polytechnique in 1944.

Philip T. Nash, S.E.I.C., is at present employed in the maintenance and construction division of Brunner, Mond Canada Limited at Amherstburg,, Ont. He is a graduate of Queen's University in mechanical engineering in the class of 1945.

D. D. Hunter, S.E.I.C., has been discharged from the Canadian Army with the rank of captain and is now employed with Dominion Bridge Company Limited at Lachine, Que. He served overseas with the R.C.E.M.E. in the 1st Division in England, Sicily, Italy, France, Belgium and Holland from December 1942, until October 1945.

Gérard Lefebvre, S.E.I.C., is now associated with Dufresne, McLagan and Associates Regd., industrial consultants, in Montreal. He was formerly superintendent of the Montreal extension of St. Jerome branch of the Dominion Rubber Company Limited.

Ernest W. Wirtanen, S.E.I.C., of Canadian General Electric Co. Limited, has been transferred from the engineering service department at Toronto, Ont., to the apparatus division at Winnipeg, Man.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Charles Conyers Kirby, M.E.I.C.

On January 24, 1946, death, as it must to all, came to Charles Kirby at his home in Saint John, N.B. Amongst his many friends and associates it was no great surprise for Mr. Kirby's health had been poor for several years and had forced him into early retirement; yet the suddenness came as a complete shock. The sense of loss in engineering circles is felt to an increasing extent for, until the time of his death, Mr. Kirby was frequently called upon for advice and information, which was available from no other source.

Born at Newport, Monmouthshire, England, on March 8, 1880, son of Conyers Kirby, A.M.I.C.E., Town Engineer, Newport, Charles Kirby was educated at private school 1889 to 1896 and Welsh Intermediate School, Newport 1896 to 1898. In keeping with engineering education in the Old Country during that time, he was articled to the firm Conyers Kirby and Sons, Newport. From 1901 to 1907 he was assistant engineer in private practice on many works of water supply, sanitation, harbour development and structural engineering in various parts of England and Wales. He came to

Canada in 1907 and was at first employed as instrument man with the Grand Trunk Railway on location surveys. Later he was a construction engineer and superintendent of reinforced concrete work at Ottawa. He entered the service of the C.P.R. in Ottawa as instrument man in 1908. From 1910 to 1912 he was Resident Engineer of the C.P.R. at Montreal and from thence to 1915 was Assistant Engineer, Maintenance of Way, on the C.P.R. Staff at Montreal. From 1915 until the time of his retirement he was District Engineer, C.P.R., Saint John, N.B., in charge of New Brunswick and State of Maine lines.

C. C. Kirby M.E.I.C.

He was married in 1907 to Marion Rogers of Newport, who died in 1930. Of the two daughters of this marriage, one died in early childhood. He is survived by his wife, the former Kathleen Sturdee, daughter of Mr. and Mrs. E. T. Sturdee of Saint John, to whom he was married in 1934, his daughter, Mrs. J. M. Brady of Toronto and two grandchildren.

A big man, handsome and distinguished in appearance, courteous and polished in demeanour, of keen intellect and an infinite capacity for taking pains, honest and uncompromising in matters of honour and integrity, an eloquent and inspiring speaker, the stout and loyal champion of engineers' rights, Charles Kirby was well cast in the role he was called upon to play in the affairs of engineers in Canada during the past 35 years.

He joined The Engineering Institute of Canada, at that time the Canadian Society of Civil Engineers, in 1908, having previously been an Associate of the Institute of Sanitary Engineers, London, England, and maintained an active interest in Institute affairs until his death. He was a charter member of the Saint John Branch and was a delegate from this branch in 1919 to the Committee of Thirteen (one from each branch) which met in Montreal on April 7, 1919 and produced the "Model Act", which was the basis of all subsequent provincial legislation. He served as first president of the Association of Professional Engineers of New Brunswick. He was later called in for consultation when the Act and By-Laws were revised in 1938, 1939 and 1940. He advocated the co-operative agreement between the Institute and the Association, which was signed in 1941. He was a member of the "Committee of Four" of the Associations from New Brunswick and Nova Scotia which met in Montreal in 1931 and later the "Committee of Eight" which met in 1933 and proposed the formation of a Dominion Council of Professional Engineers, and in 1936 he was elected its first president, which office he held until 1940. He continued as Dominion Councillor from New Brunswick until forced by ill-health to resign.

Mr. Kirby was also a Warden of Camp IX and took an active interest in the ceremonies of the Ritual of the Calling of an Engineer.

After retirement he still maintained close contact with engineering activities. Even when finally, upon his doctor's orders, he was forced to resign as registrar of the N.B. Association he accepted the Saint John Branch chairmanship of the Committees on Student Guidance and Rehabilitation which he carried on till his death.

His hobby was chess and he was instrumental in founding the St. John Chess Club of which he was president when he died. During recent years he had made a study of the games of the great masters of chess and of chess openings and made a regular practice of visiting the Soldiers' Hospital and teaching the game to all who felt so inclined. He was also a member of Union Club, Riverside Golf and Country Club, Canadian Club and St. George's Society.

A man of deep religious convictions, he was for nearly 12 years on the Vestry of St. Pauls Anglican Church, during which he acted as Warden for two terms and was several times appointed as a delegate to the Anglican Synod. At the time of his death he was a member of the Council of the Church of England Institute.

In every field of endeavour where the well-being of his profession was concerned, Charles Kirby was to be found. Few, if any, have laboured longer and with more success, in laying the foundations and building up the status of the profession in Canada. His "History of Dominion Council", reports of Committees and meetings and other documents prove that the engineering profession may number Charles Kirby as one of its greatest. He might truly be called one of the "fathers of the engineering profession in Canada."

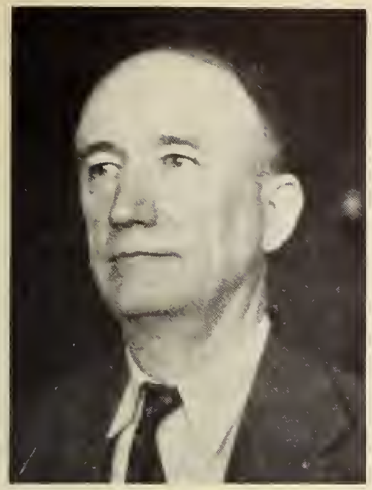
NEWLY ELECTED OFFICERS OF THE INSTITUTE

C. M. Anson, M.E.I.C., has been elected vice-president of the Institute for the Maritime provinces. A native of England, he moved to Australia at an early age and received his preliminary education there. The third generation of his family to be interested in the steel industry, he started to work in it at the age of 14 years and has been connected with it since that time. After obtaining experience in laboratories and rolling mills he worked through all jobs in the open hearth and became superintendent of an electrical steel making plant at the age of 18 years.

Mr. Anson left Australia in 1920 for Canada to enter McGill University and five years later graduated with a B.Sc. in metallurgy. In the year of his graduation he joined the Dominion Steel and Coal Corporation as a laborer at blast furnaces and in two years was made assistant superintendent. In 1928 he became assistant superintendent of rolling mills and later that same year assistant general superintendent. In 1931 he was made assistant general manager and in 1940 general manager of the Eastern Steel Division, which position he holds at the present time.

Mr. Anson joined the Institute as an Associate Member in 1931, becoming a Member in 1940.

G. F. Layne, M.E.I.C., is the newly elected vice-president of the Institute for the province of Quebec. Born in Barbados, B.W.I., he attended Harrison College, Barbados, and later McGill University, graduating from the latter with a B.Sc. in mechanical engineering in 1914. On graduation he enlisted, serving one year with the Canadian Field Artillery and four years with the Royal Field and Royal Garrison Artillery in France and Palestine. On being demobilized he was employed as draughtsman, first with Canadian Ingersoll-Rand and later with the Laurentide Company. In 1921 Mr. Layne joined Price Brothers & Company Limited as technical engineer located at Kenogami, Que., and subsequently held the following positions with the company: assistant mechanical superintendent, Kenogami mill; mechanical superintendent, River-



G. F. Layne, M.E.I.C.

W. R. Manock, M.E.I.C.

J. A. Lalonde, M.E.I.C.

bend mill; chief engineer, paper division. At present he is chief engineer of the company with headquarters in Quebec City.

Mr. Layne joined the Institute as a Student in 1914, transferring to Junior in 1919 and to Associate Member in 1920. He became a Member in 1940. He served as councillor representing Saguenay Branch in 1927 and again in 1933-4.

W. R. Manock, M.E.I.C., president of Horton Steel Works Limited, Fort Erie, has been elected vice-president of the Institute for the province of Ontario. Born at Farmer City, Illinois, he graduated from the University of Illinois in civil engineering in 1910. After graduation he was employed as resident engineer with the Illinois State Highway for one season, going from there to the county engineer's office in Sandusky, Ohio, where he was employed in the same capacity. In 1912 Mr. Manock became associated with the Chicago Bridge & Iron Company in Chicago, working in the draughting room and engineering department until 1917 when he was made chief draughtsman. He held this position until 1924 when he moved to Fort Erie, Ont., as manager of operations for the Horton Steel Works Limited, which is the Canadian subsidiary of the Chicago Bridge and Iron Company. Two years later he was made secretary-treasurer of the company and in 1936 became vice-president and managing director. In 1944 he was appointed president of the Horton Steel Works Limited.

Mr. Manock joined the Institute as an Associate Member in 1927, becoming a Member in 1940. He served as councillor for the Niagara Peninsula Branch from 1938 until 1942.

J. A. Lalonde, M.E.I.C., has been appointed secretary-treasurer of the Institute. Born at AuSable, Mich., he graduated from Ecole Polytechnique, Montreal, in 1912. After spending a few months on railway work with the North Railway Company at Hudson Bay, he joined the staff of the City of Outremont as assistant engineer in 1913. Seven years later he went with the City of Montreal as assistant superintendent of streets, a position which he left in 1924 to join the staff of Quinlan, Robertson and Janin, Montreal, as manager of the paving department. In addition to these duties he was chief engineer of A. Janin and Company from 1930 until 1939. At that time he became manager and chief engineer of the Quebec Paving Company and associated companies. In 1942 he accepted the position of production manager with Marine Industries Limited at Sorel, Que., which he left at the end of 1944. Since that time he has been acting as a consulting engineer in Montreal. He was professor in municipal engineering at Ecole Polytechnique from 1926 until 1942.

Mr. Lalonde joined the Institute as a Student in 1910, transferring to Junior in 1915, and to Associate Member in 1920. He became a Member in 1940. He served as chairman of the Montreal Branch in 1942, and as councillor of the Institute in 1943-44-45.

S. C. Mifflen, M.E.I.C., has been elected councillor of the Institute representing the Cape Breton Branch. Born at Catalina, Nfld., he graduated from McGill University with a B.Sc. in 1914. For a time he was employed on railway construction and maintenance, piers and general construction. In 1918 he became resident structural engineer of Dominion Iron and Steel Company's iron ore mines at Wabana, Nfld. Three years later he joined the Dominion Coal Company Limited, Glace Bay and Sydney, N.S., and since that time has been chief draughtsman, chief mine surveyor, and office engineer, mining engineering department. In 1944 he was appointed technical assistant to the general manager.

Mr. Mifflen joined the Institute as a Junior in 1918, transferring to Associate Member in 1920 and to Member in 1930. He has been active in the Cape Breton Branch for several years, serving as chairman in 1927-28 and as secretary-treasurer from 1929 until 1944. He was a councillor of the Institute representing the Branch in 1929-30 and served as vice-president in 1932-33.

G. J. Currie, M.E.I.C., is the newly-elected councillor of the Institute representing the Halifax Branch. Born at Halifax, N.S., he was educated at Dalhousie University and Nova Scotia Technical College where he graduated in 1931. Upon graduation he joined the Nova Scotia Light and Power Company at Halifax and has remained with the company since that time. For the present term he is also lecturer in hydraulic engineering at the Nova Scotia Technical College.

Mr. Currie joined the Institute as a Student in 1931, transferring to Associate Member in 1936 and becoming a Member in 1940. He served as chairman of the Halifax Branch in 1944.

S. W. Gray, M.E.I.C., has been appointed to the Council of the Institute representing the Association of Professional Engineers of Nova Scotia. Born at Westville, N.S., he graduated from the Nova Scotia Technical College with the degree of B.Sc. in civil engineering in 1914. For two years after graduation he was engaged in railway work and from 1916 until 1919 was on active service in Canada, England and France. After some time spent as industrial surveyor with the Department of Soldiers Re-establishment at Halifax, he joined the Nova Scotia Power Commission in 1924 and has been with the organization since that time. He holds the position of assistant hydraulic engineer. From 1942 until a few months ago he was on leave of absence to act as maritime regional representative of the Wartime Bureau of Technical Personnel, at Halifax.

Mr. Gray joined the Institute as an Associate Member in 1920, becoming a Member in 1940. He served as councillor for the Halifax Branch in 1941-42 and as secretary-treasurer of the Branch for several years. He is a past-president of the Association of Professional Engineers of Nova Scotia and has acted as joint secretary of the Association and the Halifax Branch.

H. W. Hole, M.E.I.C., director of New Brunswick Gas & Oilfields Limited, has been elected councillor of the Institute representing the Moncton Branch. Born at Rochester, Kent, England, he graduated from Leeds University with the degree of M.Sc. and from Cambridge University with an M.A. He has been engaged in various administrative capacities with Anglo-Iranian Oil Company Limited and from 1914 until 1939 served that company in Iran, Iraq, Palestine, Albania and England. He served in the Hants Regiment in World War I from 1917 until 1919, and in the Royal Sussex Regiment in 1939-40.

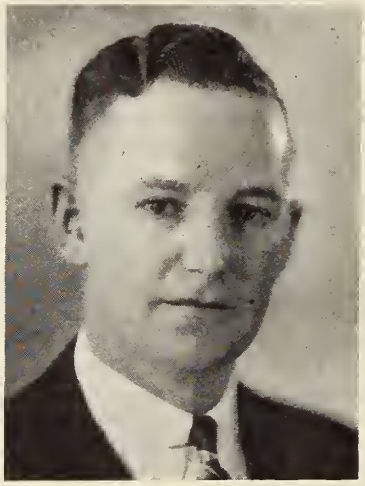
Mr. Hole joined the Institute as a Member in 1942. He was made chairman of the Moncton Branch in 1945.

Mr. Vincent joined the Institute as a Student in 1934, transferring to Junior in 1935 and to Associate Member in 1938. He became a Member in 1940. He served as secretary-treasurer of the Quebec Branch from 1940 until 1943.

C. A. Peachey, M.E.I.C., has been re-elected as one of the councillors of the Institute representing the Montreal Branch. Born in London, England, he graduated from the University of Toronto in 1927. Upon graduation he joined the Northern Electric Company Limited in Montreal and has remained with the company since that time. He spent a few years on manufacturing problems in the vacuum tube shop and the early " talking movie " equipment. He subsequently expanded his engineering interests and became technical superintendent of the telephone division in 1933. Early in World War II he was made shop superintendent of the telephone division and in 1942 became works manager of the rapidly growing electronics division. When victory was achieved the telephone division required a step-up in production and Mr. Peachey was moved into that division as works manager.

Mr. Peachey joined theInstitute as an Associate Member in 1937, becoming a Member in 1940.

H. W. Hole, M.E.I.C.



G. J. Currie, M.E.I.C.

Paul Vincent M.E.I.C.

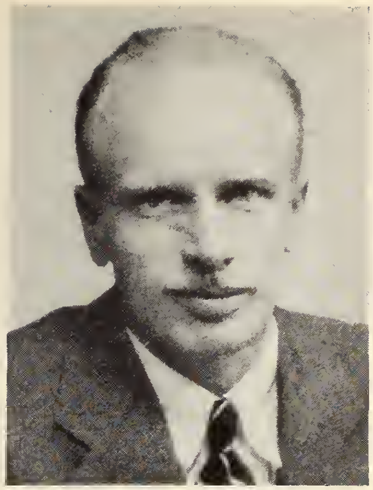
Paul Vincent, M.E.I.C., has been elected councillor of the Institute representing the Quebec Branch. Born in Montreal Que., he attended the University of Montreal from which he graduated with a B.A. degree in 1927. He then studied engineering at McGill University and, after working for two years in the building industry, attended Ecole Polytechnique from which he graduated with honours in 1934. After taking a post-graduate course in radio engineering he acted as laboratory demonstrator in electrical engineering at the Ecole until 1935. He worked for three months on the construction of an extension plant of the Aluminum Company at Arvida, Que., after which he joined the Water Levels Board, Department of Transport, Ottawa, conducting hydrographic surveys, stream gauging and weir studies along the St. Lawrence river channel. In 1937 Mr. Vincent was called to direct two surveying parties for the Quebec Provincial Department of Highways. A few months later he took charge of bridges, roads, and drainage projects for the Department of Colonization of Quebec as district engineer. Following three years' experience in this field he was made assistant chief engineer and in 1941 was called upon to act as superintendent of all civil engineering work in the Department of Colonization. In 1945 he was made director and chief engineer of all colonization works in the province of Quebec, which position he holds at the present time.

J. B. Stirling, M.E.I.C., is one of the newly elected councillors of the Institute for the Montreal Branch. Born at Dundas, Ont., he graduated from Queen's University with a B.A. in 1909 and a B.Sc. in 1911. After graduating he worked on municipal construction projects in Ontario, Manitoba and Saskatchewan. During World War I he served with the Canadian Expeditionary Forces overseas in the Royal Canadian Engineers. In 1915 Mr. Stirling joined E. G. M. Cape and Company, engineers and contractors, and has remained with the firm since that time. He worked first as a field engineer and later as a supervising engineer on many construction projects throughout Canada. In 1928 he became a partner in the firm and in 1940 was made vice-president. He has been connected with such construction projects as the Banting Institute in Toronto, docks and grain elevators at Saint John, N.B., and on Georgian Bay, and the Canadian Vickers plant in Montreal.

Mr. Stirling joined the Institute as an Associate Member in 1913, transferring to member in 1934. He has served on the executive committee of the Montreal Branch since 1939, being chairman in 1945. He has been chairman of the Institute Committee on Professional Interests since 1944.

C. A. Peachey, M.E.I.C.

J. B. Stirling, M.E.I.C.



A. R. Jones, M.E.I.C.

A. R. Jones, M.E.I.C., is the newly elected councillor of the Institute representing the Peterborough Branch. Born at Wessington, Alta., he graduated from the University of Alberta with a B.Sc. (elect.) in 1928. After working for some time in the Alberta mines he joined the Canadian General Electric Company. In 1930 he transferred to the engineering department of the company in Peterborough, Ont., and has remained there until the present time, working first on synchronous machines and later on induction motors.

Mr. Jones joined the Institute as a Junior in 1930, transferring to Member in 1943. He served as secretary-treasurer of the Peterborough Branch in 1942-3 and as chairman for the following year.

Norman Marr, M.E.I.C., has been elected councillor of the Institute representing the Ottawa Branch. Born at Walkerton, Ont., he graduated from the University of Toronto with the degree of B.A.Sc. in 1912. In 1922 he was the recipient of the degree of C.E. from the same institution. Early engineering work included Dominion land surveys in Manitoba, municipal waterworks investigations in Ontario, railway location surveys in the Eastern Townships of Quebec, railway construction in northern Ontario, and hydro-electric construction in Saskatchewan. Following this, Mr. Marr was made resident engineer on construction of the Trent Canal for the Department of Railways and Canals from 1913 until 1918. For the next eight years he was with the Dominion Water Power and Reclamation Service, Department of the Interior, Ottawa, as senior hydraulic engineer. He later became chief hydraulic engineer of the Dominion Water and Power Bureau in the Department of Mines and Resources at Ottawa. In 1941 he was appointed assistant controller.

Mr. Marr joined the Institute as a Student in 1909, transferring to Junior two years later. In 1916 he became an Associate Member and in 1928 transferred to Member. He served as chairman of the Ottawa Branch in 1945.

S. R. Frost, M.E.I.C., is the newly elected councillor of the Institute representing the Toronto Branch. Born at Owen Sound, Ont., he was for several years connected with the Portland Cement Company. In 1918 he was employed as chief draughtsman of American Cyanamide Company and in the following year was made chief mechanical engineer of the company at Niagara Falls, Ont. Since 1941 he has been on loan to the Department of Munitions and Supply in the chemical controller's department and is also in charge of the raw materials section of the fertilizer administration. He has acted as regional representative of the Wartime Bureau of Technical Personnel at Toronto.

Mr. Frost joined the Institute as an Associate Member in 1919, becoming a Member in 1940. He was chairman of the Toronto Branch for 1944.

J. R. Dunbar, M.E.I.C., has been elected councillor of the Institute for the Hamilton Branch. Born at Toronto, Ont., he received his education at the Ottawa Collegiate Institute and at McGill University. He graduated from the latter in 1920 with the degree of B.Sc. in electrical engineering with high honours, being awarded the British Association Medal. He subsequently spent a year on post-graduate study at the Massachusetts Institute of Tech-

Norman Marr, M.E.I.C.

J. R. Dunbar, M.E.I.C.

S. R. Frost, M.E.I.C.

P. E. Buss, M.E.I.C.

G. L. Macpherson, M.E.I.C.

C. Stenbol, M.E.I.C.

nology. During the summers he was engaged on the primary triangulation of the Geodetic Survey of Canada in the Maritime provinces and qualified as a Dominion Land Surveyor. Shortly after graduation he joined the engineering department of the Canadian Westinghouse Limited and has remained with the firm since that time.

Mr. Dunbar joined the Institute as a Student in 1917, transferring to Junior in 1922 and to Associate Member in 1927, becoming a Member in 1940. Besides being a member of the executive committee of the Branch for several years he served as secretary-treasurer for a term and as chairman in 1939-40.

P. E. Buss, M.E.I.C., is the newly elected councillor of the Institute representing the Niagara Peninsula Branch. Born in Three Rivers, Mich., he received his engineering education at the University of Michigan. During World War I he served with the United States Army Engineers in France. Mr. Buss was employed on the engineering staff of Provincial Paper Limited on construction of the first sulphite plant at the head of the lakes at Port Arthur, Ont. He later worked on the engineering staff of Dominion Engineering Works, and for a number of years was plant engineer at the Thorold division of Provincial Paper Limited. During 1932-33 he and his brothers carried on experiments in developing the new process for producing rock wool by the spinning method. He is now president of Spun Rock Wools Limited at Thorold.

Mr. Buss joined the Institute as an Associate Member in 1927, becoming a Member in 1940. He served as secretary-treasurer in 1931 and as chairman in 1935 of the Niagara Peninsula Branch.

G. L. Macpherson, M.E.I.C., has been elected councillor of the Institute for the Sarnia Branch. Born in Markdale, Ont., he studied mechanical engineering at the University of Toronto. After two years at the University he left in 1916 to join the Royal Navy Air Service and qualified as a flight-lieutenant attached to a night bombing squadron in France. In 1919 he returned to his studies and in the following year graduated in mechanical engineering from the University of Toronto. After some engineering experience he was employed by Imperial Oil Limited in 1923 as a junior engineer in the draughting room. Mr. Macpherson was especially interested in process design and his work soon involved most of the duties of head designing engineer. In 1930 he was given leave of absence to attend the Massachusetts Institute of Technology to study the more advanced details of oil refinery design. On his return he devoted himself to the development of the company's refinery equipment and in 1935 was appointed assistant chief engineer in charge of the engineering development department. In 1943 he was appointed chief engineer.

Mr. Macpherson joined the Institute as a Member in 1939. He was elected chairman of the newly formed Sarnia Branch in 1945.

Carl Stenbol, M.E.I.C., chief engineer of the Algoma Steel Corporation Limited, has been re-elected councillor for the Sault Ste. Marie Branch. Born in Norway he began his engineering career in Canada with the Dominion Steel & Coal Company, Sydney, N.S. He was subsequently employed as chief draughtsman with the Algoma Steel Corporation; as smelter engineer and chief draughtsman with Canadian Copper Company; as designer with Anaconda Copper Company, Montana; and as mechanical engineer with Dome Mines Company. During World War I he was with the Canada Cement Company, Montreal, as superintendent of their steel and forge plant. In 1917 he returned to the Algoma Steel Corporation at Sault Ste. Marie and became assistant to the managing director. In the same year he became mechanical superintendent and was later appointed chief engineer.

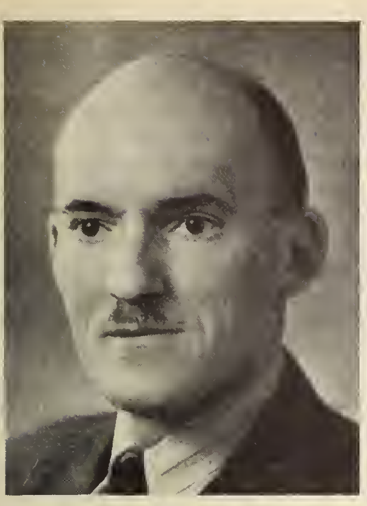
Mr. Stenbol joined the Institute as a Member in 1921.

D. M. Stephens, M.E.I.C., is the newly elected councillor of the Institute representing the Winnipeg Branch. Born near Reston, Man., he graduated from the University of Manitoba with the degree of B.Sc. in civil engineering. During 1929-30 he was engaged on topographic, reconnaissance and control surveys in the Churchill river area for the Topographic Surveys Branch, Dominion Department of the Interior. For the next two years he did similar work with the newly organized Department of Mines and Natural Resources, Province of Manitoba. In 1933 he joined the permanent staff of that Department as a technical draughtsman and was subsequently promoted to the position of office engineer in charge of design. After five years with the Department he was granted leave of absence to do other special work but in 1938 was recalled by the Department and appointed Deputy Minister of Mines and Resources, Province of Manitoba.

Mr. Stephens joined the Institute as a Junior in 1934, transferring to Associate Member in 1935. He became a Member in 1940. He was chairman of the Winnipeg Branch in 1942.

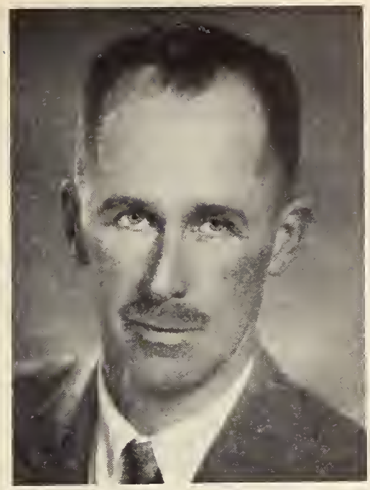
C. S. Donaldson, M.E.I.C., has been elected councillor of the Institute representing the Lethbridge Branch. Born in Scotland, he attended Lauder Technical College at Dunfermline, Fifeshire, Scotland, and worked for a few years at the Rosebank Colliery, Fifeshire. Since coming to Canada he has been employed as manager successively of Grace Coal Mines, Lethbridge, of Federal Coal Co. Limited, Lethbridge, and of Union Collieries, Diamond City, Alta. He is at present mine manager of the Lethbridge Collieries Limited at Lethbridge, Alta.

Mr. Donaldson joined the Institute as an Associate Member in 1925, becoming a Member in 1940.



D. M. Stephens, M.E.I.C.

J. G. MacGregor, M.E.I.C.



K. Reid, M.E.I.C.

J. G. MacGregor, M.E.I.C., has been elected councillor of the Institute for the Calgary Branch. Born in Scotland, he graduated from the University of Alberta with a B.A. in 1926 and a B.Sc. in electrical engineering in 1929. Upon graduation he joined Canadian Utilities Limited at Calgary where he remained until 1931 when he was transferred to Vegreville in charge of the company's diesel plants and transmission and distribution systems in that area. In 1939 he was transferred back to Calgary as assistant manager, which position he holds at the present time.

Mr. MacGregor joined the Institute as a Student in 1929, transferring to Associate Member in 1935, and becoming a Member in 1940. He served as chairman of the Calgary Branch in 1943.

Kenneth Reid, M.E.I.C., is the newly elected councillor for the Victoria Branch. Born at Victoria, B.C., he graduated from McGill University with a B.Sc. degree in electrical engineering in 1926. On graduation he joined the staff of Canadian General Electric Company at Peterborough, Ont., and worked as industrial control engineer for a few years. During this time he did some research work for the company at different points in the United States. In 1928 he was employed by the B.C. Electric Railway Company at Vancouver as engineer on street railway electrolysis and power factor correction and industrial power surveys. Two years later he became assistant chief electrician of Consolidated Mining and Smelting Company at Trail, B.C. In 1930 Mr. Reid was employed by the City of Victoria as assistant city electrician, supervising the city electrical services. From 1942 until 1945 he was on loan to the Department of National Defence as instructor in electrical engineering, army personnel. On his return to work for the City of Victoria in 1945 he was appointed city electrical engineer and superintendent of street lighting for the corporation. In addition to his other duties he has been instructor in electrical engineering at Victoria City Night Schools from 1938 until the present time.

Mr. Reid joined the Institute as Student in 1924, transferring to Junior in 1929, and becoming a Member in 1940.

INSTITUTE PRIZE WINNERS

John M. R. Fairbairn, D.Sc., M.E.I.C., past-president of the Institute and retired chief engineer of the Canadian Pacific Railway Company, has been awarded the Sir John Kennedy Medal of the Institute for 1945. The citation which accompanies the award reads as follows:

" The Chief Engineer of a great railway system should have outstanding personal and professional qualifications combined with technical knowledge and administrative ability. These conditions are fulfilled in the case of John Morrice Roger Fairbairn, who recently retired from the position of Chief Engineer of the Canadian Pacific Railway, and to whom the Council of the Institute is today awarding the Sir John Kennedy Medal.

"A native son of Ontario—he comes from Peterborough—he is a distinguished graduate of the University of Toronto (1893). He entered the service of the Canadian Pacific only five years after the first through train had made the journey from Montreal to the shores of the Pacific. At the beginning of this century Canada was entering upon a period of great activity in railway construction. The young engineer on the staff of the engineering department of a road which was in full development was able to take advantage of this situation. Rapidly gaining experience, he came to the Chief Engineer's office as principal assistant in 1908. Ten years later he was appointed Chief Engineer in the system, a position which he held for just over twenty years until his retirement to pension.

" His work during this period not only gained him a wide reputation as an engineer, but included much public-spirited activity in connection with professional and international matters. In 1929 he represented his company at the World Engineering Congress in Tokyo, Japan, where he also headed the Canadian delegation to the World Power Conference. Active in a number of professional societies, he served as President of The Engineering Institute of Canada in 1921, and was President of the American Railway Engineering Association in 1925. He is a past Member of Council of the Institution of Civil Engineers and has been chairman of its Canadian Advisory Committee. The American Society of Civil Engineers has awarded him Honorary Membership. He is chairman of that society's Canadian Membership Committee. In 1921 the University of Toronto conferred upon him the degree of Doctor of Science.

" With such a record of accomplishment, it is very fitting that he should receive the Sir John Kennedy Medal, the highest honour in the gift of the Institute."

Alexander Joseph Grant, M.E.I.C., past-president of the Institute and formerly engineer in charge, Department of Railways and Canals, Welland Ship Canal Office, St. Catharines, Ont., is one of the recipients for 1945 of the Julian C. Smith Medal awarded by the Institute for "achievement in the development of Canada." The citation, read upon presentation of the medal at the annual dinner, is as follows:

"A Scotsman who left his native Banffshire at the age of nine, Alexander Joseph Grant has a long record of distinguished service as an engineer in the employ of the Dominion of Canada. His professional career began in 1880 on a survey for the Canadian Pacific Railway, but six years later he entered government service and joined the staff of the Department of Railways and Canals, working on the construction of the Cape Breton Railway. At that time there was great activity in connection with canal and waterways improvement in the St. Lawrence basin, so that in 1891 Mr. Grant was transferred to the engineering staff of the Soulanges Canal, remaining as an assistant engineer until the completion of the canal in 1903. His next appointments were engineer in charge of the improvements at Port Colborne and then superintending engineer of the Trent Canal. In the latter position he was responsible for the construction of the Ontario-Rice Lake Division and the improvement of the navigation of the Severn river, work which had to be suspended in 1916 owing to war conditions.

"From January 1st, 1919, until his retirement in 1934, Mr. Grant was engineer in charge of the construction of the Welland Ship Canal. This great work, with its terminal harbours, bridges and flights of locks, is outstanding as an engineering achievement; its sound design and substantial construction bear witness to Mr. Grant's professional knowledge and ability.

"Mr. Grant joined the Institute fifty-five years ago. He took a leading part in the formation of the Niagara Peninsula Branch in 1919. He served on Council as Vice-President in 1928-29 and was elected President in the following year.

"It is not generally realized that our Dominion Civil Service includes many engineers representing various branches of the profession. Their technical skill and ability receive too little recognition, although our public works and communication systems are largely their responsibility. Mr. Grant is a leading example of this class. For this reason, and also in appreciation of his own services to the Dominion and to the engineering profession, the Council of The Engineering Institute of Canada is awarding to him a Julian C. Smith Medal."

George Alexander Walkem, M.E.I.C., of Vancouver, B.C., past-president of the Institute is one of the recipients of the Julian C. Smith Medal of the Institute for 1945. The citation which accompanies the award reads as follows:

"The prosperity of the city of Vancouver, and indeed that of the province of British Columbia, has been largely due to the enterprise and ability of men who have come to the Pacific coast and become industrial leaders or pioneers in productive undertakings. One of them, responsible for many activities connected with shipbuilding and marine engineering, is George Alexander Walkem, a prominent member of the profession in British Columbia, a member of the Institute of forty years standing—and a past-president—whose services to the community and to his fellow engineers have been outstanding.

"Born in Kingston, Ont., he took his degree in engineering at McGill University in 1896. Two years later he migrated to British Columbia, where he soon was made manager of the Vancouver Engineering Works Limited, then the largest plant in the province. His experience with that firm prompted him to enter the commercial field combined with engineering; accordingly, he incorporated the Vancouver Machinery Depot Limited in 1906.

"In 1915, after applying for a commission in the Canadian forces, he went to England and was commissioned in the Royal Engineers, being posted to the Egyptian Expeditionary Force. Later he was seconded to the Railway Operating Division of the R.E. in Palestine. For his services there he received a Mention in Despatches.

"On his return to Vancouver in 1919 he became interested in municipal and provincial political activities, sitting as a member in the Provincial House of Assembly for nine years. Mr. Walkem was able to assist in 1920 in securing legislation which established the Association of Professional Engineers of British Columbia, one of the two organizations of which he was president in 1926. The other was The Engineering Institute of Canada. He is a member of the Institution of Mechanical Engineers (Great Britain) and of the American Society of Mechanical Engineers.

"During the last twenty years the activities of Mr. Walkem's original company have led to notable developments. He is now president and managing director of three other companies, namely, the Gulf of Georgia Towing Co., the West Coast Salvage and Contracting Company, Vancouver Ironworks Limited, and finally the recently formed West Coast Shipbuilders Limited, whose war effort has been the building of 52 ships of the 10,000 ton class. The war work of these companies resulted in the development of many new methods and improvements, particularly in boiler making, and has established conditions which would seem favourable for the development of a permanent shipbuilding industry on the Pacific coast.

J. T. Dyment, M.E.I.C.

E. C. Roper, C.I.M.M.

S. T. Fisher, M.E.I.C.

" For fifteen years Mr. Walkem has been on the Board of the Vancouver General Hospital, two years as Chairman. He has also taken active interest in the Children's Aid Society of Vancouver, the Queen Alexandra Solarium for Crippled Children, and the Sea Scouts.

" In recognition of all these services and achievements a Julian C. Smith Medal has been awarded to George Alexander Walkem."

John T. Dyment, M.E.I.C., engineering superintendent, Trans-Canada Airlines, Winnipeg, Man., has been awarded the Gzowski Medal of the Institute for 1945 for his paper " The Engineering Selection of an Airline Aeroplane " which appeared in the June, 1945, issue of *The Engineering Journal.*

Born at Barrie, Ont., he received his engineering educationtion at the University of Toronto where he graduated in 1929. After a few months spent in the aeroplane division of the Ford Engineering Laboratories at Dearborn, Mich., he joined the staff of the Aero Division of the Department of National Defence, Ottawa, in 1930. In 1937 he transferred to the aeronautical division of the Department of Transport as aeronautical engineer and in 1938 he accepted a position in the same capacity with Trans-Canada Airlines in Winnipeg. He later became chief engineer and is now engineering superintendent of the Airlines.

E. Cecil Roper, C.I.M.M., Britannia Beach, B.C., is the recipient of the Leonard Medal for 1945 for his paper " The Raising of No. 7 Shaft at Britannia " which was published in the February 1945 issue of *The Canadian Mining and Metallurgical Bulletin.*

Born in Salvador, Sask., he graduated from the University of Alberta with a B.Sc. in mining engineering in 1936. Immediately after graduation he entered the employ of the Britannia Mining and Smelting Company Limited as a mucker. In 1937 he was attached to the engineering staff and worked first as sampler, surveyor's helper, surveyor, and head surveyor, and then underground as timberman, miner and shaft miner. In 1938 he was advanced to field engineer, exploration department. In that capacity he had charge of the company's exploration work in the Zeballos and Bridge river areas and examined properties in other parts of British Columbia. In 1940 he returned to the mine camp as chief engineer in charge of all the engineering departments. Early in 1945 he was promoted to the position of assistant mine superintendent and in July of the same year to that of mine superintendent, the position he now holds.

Sidney T. Fisher, M.E.I.C., Toronto, Ont., has been awarded the Ross Medal of the Institute for his paper " Radio for Over-Land, Long-Distance Telephone Service " which appeared in the May 1945 issue of *The Engineering Journal.*

Born in Edmonton, Alta., he spent four years at the University of Alberta and one year at the University of Toronto, graduating in 1930 with the degree of B.A.Sc. in electrical engineering. From the time of his graduation until 1943 Mr. Fisher was with the special products division of Northern Electric Company Limited at Montreal, becoming sales engineer and development engineer in 1941. During this period he was responsible for the engineering of the radio installations for Canadian-built Lancaster and Mosquito bombers. Mr. Fisher resigned from the Northern Electric Company in 1943 to organize F. T. Fisher's Sons Limited, consulting engineers specializing in communications and other electronic subjects. He has subsequently carried out engineering projects for Defence Communications Limited, Royal Canadian Air Force, and other service and government groups. In 1943 he became vice-president of Rogers Electronic Tubes Limited, Toronto, and since shortly after V-E day was in charge of the engineering and production of special purpose receiving and transmitting tubes. In 1945 he returned to give full time to his consulting practice.

Since 1941 Mr. Fisher has held a commission as flying officer in the Special Reserve of Officers (technical) of the R.C.A.F. and in this capacity has worked on air force signals problems.

H. L. Lexier, JR.E.I.C., of Regina, Sask., is the recipient of the Duggan Medal and Prize of the Institute for 1945 for his paper " Metallurgy and Machine Design " which was published in the May 1945 issue of *The Engineering Journal.*

Born in Winnipeg, Man., he received his preliminary education in Regina. In 1938 he graduated from the University of Minnesota with the degree of Bachelor of Mechanical Engineering. In 1942 Mr. Lexier joined the Physical Metallurgy Research Laboratories, Ottawa, as research engineer. He conducted extensive research on armour piercing projectiles, fatigue, stress analysis, etc. In 1945 he resigned his position and returned to Regina where he is now manager and plant superintendent of the Queen City Cleaners and Launderers.

Robert Peterson, JR.E.I.C., Saskatoon, Sask., has been awarded the H. N. Ruttan Prize of the Institute for 1945 for his paper " Soil Mechanics as Applied to P.F.R.A. Problems, with Specific Reference to the Proposed St. Mary's Dam " which appeared in the May 1945 issue of *The Engineering Journal.*

Born at Eston, Sask., he attended the University of

H. L. Lexier, Jr.E.I.C.

R. Peterson, Jr.E.I.C.

F. J. McMulkin, Jr.E.I.C.

J. T. Madill, Jr.E.I.C.

J. B. Nobert, S.E.I.C.

F. W. Davidson, S.E.I.C.

Saskatchewan, graduating with great distinction in civil engineering in 1939. For the following year he was employed by the Prairie Farm Rehabilitation Administration on investigation of irrigation projects. In September 1940 he entered the Graduate School of Engineering at Harvard University to take a course in soil mechanics, and received the degree of Master of Science in 1941. Since that time he has been with the P.F.R.A. in Saskatoon, in charge of foundation and soil mechanics projects.

F. J. McMulkin, jr.e.i.c., is the recipient of the John Galbraith Prize of the Institute for 1945 for his paper "The Welding and Fabrication of Canadian Light Armour" which was published in the March 1945 issue of *The Engineering Journal.*

Born in Sault Ste. Marie, Ont., he graduated from the Michigan College of Mining and Technology in 1937 with the degree of B.Sc. in physical metallurgy. From graduation until 1942 he was employed as a metallurgist in the metallurgical department of Algoma Steel Corporation Limited, Sault Ste. Marie, Ont. In that year he joined the department of engineering and metallurgy of the Ontario Research Foundation in the capacity of research metallurgist. His work with the Foundation until recent date has been primarily devoted to the work of the Hamilton Bridge Company which, during the war years, sustained a research fellowship with the Foundation for research and development in connection with the welding and fabrication of light armoured vehicles. During the three years he was connected with this fellowship he acted as welding engineer and metallurgist for the Hamilton Bridge Company, while at the same time carrying on work for other manufacturers who submitted work to the Foundation. In 1945 he was awarded the professional degree of Metallurgical Engineer by the Michigan College of Mining and Technology in recognition of his work on the development of welding of armour plate. At the present time he occupies the position of senior research metallurgist in the Department of Engineering and Metallurgy at the Ontario Research Foundation, Toronto.

J. T. Madill, jr.e.i.c., has been awarded the Phelps Johnson Prize of the Institute for 1945 for his paper "Field Decay Characteristics of Large Hydro-Electric Generators" published in the December 1945 issue of *The Engineering Journal.*

Born in Edmonton, Alta., he graduated in applied science from the University of Alberta in 1939 and received a M.Sc. degree in electrical engineering from the Massachusetts Institute of Technology in 1940. Until April 1941 he was a member of the system study group of Ebasco Services Inc. in New York City. He then came to Arvida to work for the Saguenay Power Company and has been associated with the operation of the Saguenay System since that time. In 1942 he was made system protection engineer, responsible for relaying, metering and test work, and since 1944 he has held the position of electrical engineer for the Shipshaw development of the Aluminum Company of Canada Limited.

J. B. Nobert, s.e.i.c., has received the Ernest Marceau Prize of the Institute for 1945 for his paper "Etude d'installation d'usine de défibrage du bois par le procédé mécanique à la vapeur, à Pont Rouge".

Born in Montreal, Que., he graduated in 1945 from Ecole Polytechnique with an option in industrial chemistry together with the degree of B.A.Sc. Upon graduation he joined the staff of Building Products Limited at Ville LaSalle, Que., where he is now doing research work.

Fred W. Davidson, s.e.i.c., is the recipient of the Martin Murphy Prize of the Institute for 1945 for his paper "Design of an Antenna for VE9AS".

Born at Petitcodiac, N.B., he received his preliminary education there. In 1941 he was the Provincial Matriculation Leader of New Brunswick and in the same year was awarded a Lord Beaverbrook Scholarship tenable at the University of New Brunswick. While at the University he was awarded the Alumni Society Prize for first year English, the Purvis Loggie Scholarship for mathematics and surveying, and the student prize of the Engineering Institute. He graduated in 1945 receiving his B.Sc. degree in electrical engineering. He is at present employed in the Montreal Division of the Bell Telephone Company of Canada, and is also studying for his M.A. degree in engineering at McGill University.

News of the Branches

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

J. G. Hoba, Jr.E.I.C. - *Secretary-Treasurer*

On Friday, November 16th, 1945, the regular meeting of the Branch was held at the Prince Edward Hotel with Mr. E. R. Complin, manager of the industrial relations department of Canadian Industries Limited, as the main speaker. His subject, **Some Employee Relations Aspects of Management Engineering** was well received, and a record attendance was established. Mr. Complin's present position on the National War Relations Board gave him an excellent background for the interesting question period that followed at the conclusion of his talk.

❖ ❖ ❖

The principle of driving with fluid (oil) through the use of a hydraulic coupling aroused considerable interest at the annual meeting of the Border Cities Branch on December 7th, 1945. Mr. Glen V. Edmondson, staff engineer of the American Blower Corporation, Detroit, presented a highly appreciated paper. He supplemented his talk with slides which further explained the future uses of this comparatively new torque converter.

EDMONTON BRANCH

W. W. Preston, Jr.E.I.C. - *Secretary-Treasurer*

The ever-growing use of electricity to increase the fighting and operating efficiency of ships in the Royal Canadian Navy, was discussed by Electrical Commander J. Deane, speaking on **Electricity in the Navy** before the Edmonton Branch in the Macdonald Hotel on January 17th. Commander Deane, engaged on electrical personnel for the permanent navy, traced the uses of electricity in the navy from early times to the present. He illustrated his address with lantern slides showing the most modern cruiser in the Canadian Navy, the 11,300 ton *Ontario*. In conclusion he outlined briefly the training received by an electrical officer.

Electricity, the speaker stated, was first used on ships in 1874 to fire guns, then in search lights, then for lighting the ship and later to run motors. The modern applications found on the *Ontario*, he said, include a master gyro-compass with several repeat compasses, a sensitive log and an A.R.L. automatic plotting table which receives electrical impulses from the two previous instruments and records a continuous plot of the ship's course. The ship also uses a precise depth sounding instrument which distinguishes between rock and mud, and other electronic equipment. The speaker explained that the power plants on the ship are well distributed so that if one plant is hit, power can be supplied by the others.

The most important development in the use of electricity on ships, he continued, was radar. By it, the ship's crew had ample warning of approaching enemy surface craft and air craft. Radar, he said, was also used to control gun fire with extreme accuracy and to determine the fall of shot and the positions of all craft in the battle area.

Commander Deane explained the importance of land transmission stations, for guiding ships in a fog, or through a mine field, or for locating enemy craft or for determining the ship's own geographic position.

In outlining the training of an electrical officer, the speaker mentioned that many courses are taken in industry, at sea, and at Naval School. After three years the student qualifies as a Lieutenant.

Chairman of the meeting was F. R. Burfield. The speaker was introduced by R. E. Phillips and received a hearty vote of thanks proposed by C. W. Carry. Dinner attendance was 35.

HAMILTON BRANCH

L. C. Sentance, M.E.I.C. - *Secretary-Treasurer*
I. M. Macdonald Jr.E.I.C. - *Branch News Editor*

The annual meeting and dinner of the Hamilton Branch was held on Tuesday, January 15th, at the Scottish Rite Club, with approximately 80 members and guests in attendance. H. A. Cooch presided in the absence of Chairman Norman Eager.

After the dinner was concluded and the head table introduced, W. E. Brown, secretary-treasurer, reported on the activities of the branch during the past year. The report of the nominating committee was read, and the executive for 1946 announced.

Business conducted included the ratification of a motion previously accepted by ballot concerning associate fees, the consensus of opinion being that these fees be $5.00 per year. T. S. Glover presented a scroll and cheque to T. S. Boyle, winner of the branch papers competition in 1945 with his presentation of "The Design of a Tubular Conveyor." J. R. Dunbar presented the nominating committee for this year, which was unanimously accepted.

The speaker of the evening, popular and well-known Dr. Sidney E. Smith, president of the University of Toronto, was introduced by W. J. W. Reid.

The years spent in educational work in Nova Scotia, Ontario, and as president of the University of Manitoba qualified Dr. Smith to speak on **Canada,** his subject of the evening.

Expressing himself as optimistic regarding the development of a strong spirit of unity in Canada, the president declared that all Canadians should learn the lesson afforded by members of the armed forces who enlisted and fought as Canadians, not as residents of the various provinces. Dr. Smith spoke of the great criss-crossing of reactions and inter-reactions by the young people in the services as they moved about the Dominion in training, and voiced the hope that this would lead to a reconciling of conflicting sectional interests with national aims and objectives.

Canada draws on many racial and cultural backgrounds for its stock and is better for it. If any doubted this, Dr. Smith referred them to Canada's achievements in war and peace.

While Canada is the 35th nation in the world in population, it holds first place in the production of foodstuffs for the United Nations, and in the production of nickel, asbestos and newsprint. The Dominion ranks third in trade and in sea-power, Dr. Smith said in listing Canada's important place.

We can have a stronger Canada, the speaker went on, provided we afford all the provinces an opportunity to work out their own destinies. In his opinion there is much reason for encouragement, in the attitude of both Federal and Provincial authorities at the recent Dominion-Provincial talks.

Dr. Smith defined democracy as "the free competition of ideas as put forth by individuals, provided that everyone recognizes comparable rights", and declared himself as opposed to a standard mould or pattern of Canadians.

The loss of gallant Canadians in the war was irreparable, Dr. Smith said. Out of the war had come a sense of loss and bitterness, but out of the war had come a realization that there was no satisfactory settlement of disputes between members of the human race other than through arbitration and law.

At the conclusion of Dr. Smith's talk, a vote of thanks was tendered by J. T. Thwaites.

The gavel of office was handed to the new chairman, A. R. Hannaford, who after a few remarks adjourned the meeting.

An Erratum

The *Journal* regrets that in the report from the Hamilton Branch contained in the January issue, the author of the paper, was reported incorrectly. The author was Mr. W. B. Nicol, M.E.I.C., chief engineer of the Hamilton Bridge Company.

KINGSTON BRANCH

J. Douglas Lee, Jr.E.I.C. - *Secretary-Treasurer*

The first 1946 meeting of the Kingston Branch was held on Wednesday, January 16th, at Queen's University. The speaker was Lieutenant-Commander H. G. Burchell, R.C.N,. an electrical officer, who described the part played by electricity in the navy during the war. Many of the developments have been given little publicity by the traditionally " silent service ", so that this address, which was illustrated, was of particular interest to engineers. Lieutenant-Commander Burchell informed his audience that in both the Royal Navy and in the Royal Canadian Navy the formation of a new electrical branch had been approved, as the increase in quantity and complexity of electrical equipment affecting the fighting and operating efficiency of ships had reached a point where such matters could no longer be handled with maximum efficiency by the torpedo branch. The latter, in future, will confine their activities to underwater warfare.

The following is a list of future meetings during the balance of the season: Feb. 7—Lt.-Col. A. Dove, M.E.I.C., " Some Engineering Aspects of the European Campaign." Feb. 21—Mr. Wm. Storrie, Gore and Storrie Consulting Engineers, Toronto, " Water Works and Sewerage with Particular Reference to Kingston." Mar. 21—Mr. R. N. Boyd and Mrs. W. R. Burks, Canadian Industries Ltd., Nylon Division, Kingston, "Air Conditioning."

LETHBRIDGE BRANCH

T. O. Neumann, M.E.I.C. - *Secretary-Treasurer*
H. T. Miard, M.E.I.C. - *Branch News Editor*

Friday evening, January 25th, thirty-five members of the Lethbridge Branch and their guests attended a banquet in the small dining room of the Marquis Hotel, following a cocktail hour. Enjoyable dinner music by the trio, Mr. and Mrs. George Brown and Mr. Henderson, humorous songs by Wm. Riley, community singing led by Bob Lawrence, and a short speech by Dave Elton featured the dinner. P. E. Kirkpatrick, chairman of the Branch, presided. Minutes of the previous meeting were read by the secretary, T. O. Neumann.

A. L. H. Somerville introduced the guest speaker, Dr. T. How, district meteorologist of the Department of Transport at Edmonton. Dr. How graduated from the University of British Columbia in 1933, and obtained his M.A. there in 1935. He lectured in physics at Perdue, and his Ph.D. degree was conferred in 1938. He joined the Department of Transport and was appointed district meteorologist at Edmonton in charge of weather observing and forecasting for the entire North West Territories and Arctic area.

Dr. How, a fluent and excellent speaker presented an interesting and enjoyable address on **Arctic Meteorology.**

To emphasise the importance of weather, particularly fog, to aviation, Dr. How showed a coloured motion picture prepared by Walt Disney for the U.S. Navy, illustrating the relation of land and air temperatures and the dew point, and the formation of fog; ground and advection fogs; land and coastal fogs, and the motion of fogs caused by wind.

In the introduction to his paper, Dr. How pointed out that Canada has been fighting an uphill battle against the universal miconception that it is a " land of ice and snow." Canadians know better, and have endeavoured to publicize our pleasant climate. We have, however, ignored the fact that the greater portion of our nation is practically uninhabited because of the extremes of climate. It will be necessary to conquer the Arctic to obtain the gold from Yellowknife, oil from Norman and uranium from Great Bear.

The Meteorological Service of Canada has been a pioneer in the Canadian Arctic, but information is still limited. It is necessary to obtain information and understanding of the Arctic weather to assist in designing technical devices to operate in the lowest temperatures and forecast accurately the Arctic storms. Only then can Canadian engineers and scientists conquer its coldness.

Dr. How stated that the northern summer was not exceptional, except for the long daylight. His talk was confined to winter conditions.

He exhibited a diagram showing the distribution of mean monthly temperatures for January over northern and western Canada. This showed the spacing of 5 deg. isotherms. The coldest area, —25 deg., was over Baffin Land, Pond's Inlet and Churchill. Over the Arctic regions the isotherms were spaced widely, indicating little variation in mean temperature, while in central and southern Alberta, the isotherms were closer, indicating a more rapid rise in temperature as one travelled southwest. Dr. How pointed out that the —25 deg. temperature in Churchill might prevail for a month and might be accompanied for several days by a 30-mile wind.

The wind in the Arctic is an important element, as a high wind in cold weather makes outdoor activity almost impossible. The Barrens and the Churchill area are more subject to wind than the McKenzie Valley.

A third element in the Arctic is snowdrift. This is fine snow, kept suspended in the air, and blown along by high winds. Arctic drift storms may rage for six or seven days at 30 m.p.h. with temperatures of 30 or 40 below, and, compared to them, prairie blizzards are mere flurries.

There is a lack of scientific records of Arctic meteorology. Official records have been taken by nurses, R.C.M.P., radio operators and traders, but these reports lacked scientific comment. In 1942, George Chapman moved into Aklavik with balloons, hydrogen generator, and radios and transmitters to establish a meteorological station north of the Circle. In 1943 another station was set up at Arctic Bay, another is operating at Coral Harbor, and a fourth is being constructed at Coppermine. Most of the Arctic is without stations.

Data are still required on freeze-ups and break-ups, soil temperatures, and permanent frost, to assist in planning building and industry in the Arctic.

The small amount of moisture held in cold air is an important factor in forecasting fog, clouds and snow. It is also important in the design of clothing. Study of humidity data is still required.

Dr. How exhibited three other maps showing isobars for three successive days, with 'high' and 'low' areas marked. Isobars are important because they represent accurately the direction of wind in levels near the earth. Air moves counterclockwise about a 'low' and clockwise about a 'high'. Crowded isobars indicate strong winds;

isobars spaced widely indicate light wind. 'Fronts' on the maps marked boundaries between two different types of air.

Before discussing the charts, the speaker mentioned that the atmosphere receives its heat from the earth by conduction, convection and radiation, and not from the sun.

The cold weather then prevailing was due to a polar front having passed over Lethbridge. When the polar front was north east of town, warmer weather prevailed. On the charts, fronts of cold air invading warm air are shown in blue; fronts of warm air in red. Polar fronts usually exist when the isotherms are close together, and the front is usually in Alberta. The weather system of the Pacific affects the polar fronts, and forecasters are on the lookout for these impulses.

The U.S. Weather Bureau has done research on long range forecasting. Five-day means for the entire northern hemisphere are plotted, and a prognostic chart issued to forecast the general weather trends for the next five days. These are of great assistance in local forecasting. "High index" indicates rapidly moving air travelling from west to east; "low index" indicates a north and south movement of air masses but little west to east movement.

The upper air is also observed at various Canadian stations and isotherms and isobars plotted for 1,000 ft., 5,000 ft. and 20,000 ft. levels. The circulation at these levels is different from that at ground level. Charts are simpler because of the absence of effects of terrain and moisture.

The upper air data obtained by radiosonde instruments. These consist of instruments measuring temperature, pressure and humidity. They are carried aloft by a balloon and transmit the information by a minute radio to an automatic graphing recorder. Such stations in the Arctic are difficult of access and hard to maintain.

High pressure areas are due to heavier cold air, and in the far Arctic are difficult to trace due to the scarcity of recording stations.

Forecasters watch all features of the weather map, particularly lows and the effects at mountain ranges.

The Muskox expedition is being accompanied by an experienced meteorologist to make observations. The Department of Transport stations at Churchill and Yellowknife are furnishing information for the party, and the Edmonton office will forward the basic forecasts. Weather maps will be dropped to the party daily, and other information will be radioed. The meteorologist with the party will radio information including data on snow conditions and wind.

A meteorologist has been sent to Baker Lake to take weather observations and data on magnetic declination.

Dr. How exhibited a radiosonde instrument at the conclusion of his address.

In answering questions, the speaker stated meteorologists have not been able to account for seasonal trends, but it could be due to radiation factors or ocean currents.

Russia has a great number of meteorological stations in the Arctic, placed not in convenient places, but where required. The information obtained has not been made available.

R. C. Bell thanked Dr. How for his interesting paper.

NIAGARA PENINSULA BRANCH

P. A. Pasquet, jr. e.i.c. - *Secretary-Treasurer*
J. L. McDougall, m.e.i.c. - *Branch News Editor*

The Niagara Peninsula Branch held its annual joint meeting on January 17th, 1946, with the Association of Professional Engineers of Ontario. Some 50 members of both organizations were welcomed by the local branch chairman, J. H. Ings, to the dinner held at the General Brock Hotel, Niagara Falls, Ont.

The guest speaker was Dr. G. R. Lord, president of the Association. A. W. F. McQueen introduced the speaker and Col. T. Medland who was also present. Dr. Lord outlined the activities and endeavours of the Association, tracing its growth. He stated that registration four years ago showed 2,600 engineers while to-day registration stands at 4,300 members, plus 3,000 student engineers in training.

The Professional Engineers' act was put through in 1922 and amended in 1937. The work in the main consists of registering of engineers, acting in an advisory capacity on legal matters, and helping in the standardization of salaries of engineers. In this connection the Association has published guidance booklets on job evaluation and standard practice. The Association provides an open membership to all who qualify and applications are reviewed carefully.

The function of the Federation of Engineers was also explained as a body composed of engineers and employers, handling such matters as collective bargaining.

Some matters before the Association include dignified advertising schemes, commensurate salary scales for engineers, co-operation with Dominion Council, endeavours to provide engineers for jobs, work in conjunction with Technical Service Council, responsibilities in public works, and town planning.

Dr. Lord in concluding stressed the importance of the Association having ample funds available on hand to contend with possible emergencies in getting necessary legislation. An appeal was made for the co-operation of all engineers and for volunteers wishing to serve on many committees now set up.

Col. Medland was called upon to say a few words. The meeting was thrown open to discussion and the numerous questions asked the speakers added much to what had already been said.

C. C. Moon, as a member of both the Association and the Institute, expressed a desire to see the two organizations more closely identified in Ontario. To many of the younger members of the Institute it was news when he stated that the Institute was really instrumental in launching the provincial associations.

An interesting highlight to the discussion was given by S. V. Jenkins, a guest from Niagara Falls, N.Y. He very ably outlined how professional engineers are granted state permission to practise. In New York State authority is given by meeting the necessary qualifications and being granted a State license, for which an annual fee is charged. Mr. Jenkins extended an invitation to those present to join the New York State Society of Engineers holding dinner meetings at Niagara Falls, N.Y.

At the close of the meeting J. L. McDougall thanked the speakers on behalf of those present.

OTTAWA BRANCH

C. G. Biesenthal, jr. e.i.c. - *Secretary-Treasurer*
R. C. Purser, m.e.i.c. - - *Branch News Editor*

The annual meeting of the Ottawa branch was held at the auditorium of the National Research Laboratories on the evening of January 10th. Norman Marr, chairman for 1945, presided. Committee reports were presented and the election of officers for the ensuing year took place.

The elections resulted as follows: chairman, J. H. Irvine; secretary-treasurer, C. G. Biesenthal, re-elected; members of managing committee to serve two years, L. M. Christmas, S. G. S. Murphy, and J. L. Shearer.

Following the business portion of the meeting an address was given by Allan C. Ross who had recently returned from the 27th session of the International Labour Conference held at Paris, France. He spoke on **Experiences**

of the European Trip. At the conclusion of the entire meeting refreshments were served.

Outlining his trip, he spoke of conditions as he experienced them in England, France, Switzerland, and the Low Countries. Many of the railways that lay in the path of war, he said, were not in good condition with temporary bridges doing duty until more permanent bridges could be erected. There was a serious shortage of fuel and it was a common sight to see the interior of large banks and other public buildings piled high with cordwood. If you wished to visit the Folies Bergeres you might have to sit in your overcoat with a blanket around you while the chorus turned blue with cold. Some days they would have to close up altogether.

Paris, he said, had "Lost its sparkle". It was, however, very little destroyed. Some damage was inflicted by machine gun fire in the city itself. In the suburbs, particularly to the north, there was more damage and there were more temporary structures in evidence.

One of the most affecting sights of all, according to Mr. Ross, was the farm houses throughout the country districts that had been war-damaged and were still being lived in. On account of the coal shortage and the necessity of using coal in its manufacture, very little glass was available to replace broken windowpanes. They would be stuffed with rags or patched with cardboard or other makeshift material. The farmers, just as everyone else, had difficult times ahead before they could get on their feet.

Prices in Paris were high. A pair of unlined leather gloves cost 1000 francs or \$20. Eating was expensive when you went "off the beaten track". A meal for three which he told about brought a bill for \$74.

The most enjoyable portion of his visit was a side trip to Switzerland. The Swiss people, however, are currency poor and though prices are fairly reasonable there is great difficulty in getting Swiss money in exchange for other currency. Food was strictly rationed, food coupons had to be surrendered before obtaining a meal and there were three meatless days a week. Automobiles generated gas from wood or charcoal or carried gas under compression. Mr. Ross commented upon the truly magnificent buildings that formerly housed the League of Nations assemblies at Geneva.

It was easy to get into Switzerland as far as the customs were concerned, but not as easy to get out. Baggage was examined closely and if it included purchases made in Switzerland then explanations were in order as to where the Swiss money came from to make such purchases.

Mr. Ross, at the conclusion of his address, expressed the belief that it would take another two or three years before facilities for civilian transportation to the European countries could be carried out in such a manner as to make travelling a real pleasure.

At a joint evening meeting with the Ottawa Section of the American Institute of Electrical Engineers, held at the National Research Auditorium on January 29th, the Ottawa Branch listened to an address on **Looking Ahead with Telephone Scientists.** G. L. Long, historian of the Bell Telephone Company, was the speaker and the address included demonstrations of various types of military telephones designed during the war.

The speaker outlined the prospects for extending telephone service to motor vehicles by radio, the use of radio telephony for serving outlying communities, and systems for relaying network programs as well as large numbers of telephone messages from station to station across country. He pointed out that while there is no prospect of radio replacing wires for the vast bulk of telephone messages, it is finding increasing use as a supplement to the regular wire network.

Some Impressions of German Wartime Metallurgy was the subject of an address before the Ottawa Branch at a noon luncheon at the Chateau Laurier on February 13th. The speaker was Dr. G. S. Farnum, chief metallurgist of the Department of Mines, who had recently returned from a three months' trip to Germany and the continent along with a number of other scientists who had investigated German processes and techniques for the Department of Reconstruction. Dr. Farnum's interest was in metallurgical processes and his travels took him through the greater part of western Germany.

Regarding the German industrial plants visited, many of them were located on the outskirts of the towns and accordingly were not damaged to the extent of the towns themselves. They did not fare as badly as some people might think. Though the exterior of factory buildings might be damaged as much as 50 per cent, quite often the equipment on the inside would only suffer to the extent of, say, 10 per cent. However, on the other hand, this 10 per cent might be key equipment in which case, of course, the factory would definitely be put out of commission at least until it was replaced. An exception was a Dornier factory that was totally destroyed while the surrounding buildings were unharmed.

German scientists, according to the speaker, naturally appeared to be "down in the mouth" at the time of his visit to the continent since many of them had been banned from working on account of their Nazi leanings. The Nazi set-up, contrary to the opinion of many, did not appear to him to produce a decadence of technological development.

"Germany produced very good results from her attempts to solve problems in production which arose from the shortage of raw materials," he said. "Any country which progressed so well in rocket, jet propulsion and atomic theory certainly could not be said to be scientifically decadent." Many of the efforts of German scientists had to be expended upon the production of substitutes and the solutions of problems with which they would not be faced under normal circumstances. Their contributions in this regard "cannot be sneered at" he said.

PETERBOROUGH BRANCH

E. Whiteley, M.E.I.C. - *Secretary-Treasurer*
J. C. Allan, M.E.I.C. - *Branch News Editor*

On Thursday evening January 10th, Mr. Paul Clark of the publicity department of the Aluminum Company of Canada presented a paper to the Peterborough Branch on **The Canadian Aluminum Industry.**

Mr. Clark briefly outlined the development of the aluminum industry until the beginning of World War II. Until this time little has been published about the accomplishments of the aluminum industry during the war. However, Mr. Clark stated that he was now at liberty to report briefly on those activities.

Although Canada's prewar position in the aluminum industry was relatively large, the position has been greatly altered by war circumstances. The so-called Battle of Britain early revealed the air weakness of the United Nations and impressed upon the general staff of the military forces the compelling necessity of strengthening our air arms. Almost overnight aluminum became the critical material in the prosecution of the war. Unheard of quantities of aluminum had to be made available with the greatest urgency. The ability of the various United Nations to produce additional aluminum was rapidly scanned, and Canada was found to be advantageously situated to cope with the problem. In Canada were considerable electrical resources, and available labour remote from the battlefields. Canada was assigned the job of producing the required crude aluminum and immediately the multitudes of industrial operations required for this end were initiated.

To far-off British Guiana, additional geologists, mining engineers and technicians were flown to open new bauxite mines to supply the four tons of ore needed for each ton of the pure metal. Railroad tracks were laid through the jungle to bring out the ore. To handle the increased flow of bauxite, a new powerhouse, a crushing and washing plant, three new dryers and a machine shop were required at Mackenzie, British Guiana,—a port far up the Demarara River. These buildings were designed, the materials and equipment ordered, shipment made and they were in service in "jig" time. Approximately 2,700 dark natives living in that torrid climate were marshalled and quickly taught new duties far remote from their primitive living.

At Trinidad, in the British West Indies, a completely new port was dredged, and the most modern of heavy equipment was hauled to Trinidad and erected. This building of a deep-water port for handling large volumes of ore shipments would ordinarily have been a major project, but in the overall scheme it decreased in stature and became only one relatively small phase of a tremendous program.

In damp, foggy Newfoundland, geologists located new fluorspar deposits to replace the shut-off sources in Europe. Shafts were sunk, miners engaged and facilities provided so that boat load after boat load of fluorspar channelled into the process followed at Arvida.

At Arvida, where at one time only two pot rooms had existed, 23 additional smelters were erected, making a total of 25. The prewar ore plant (where chemical processes made bauxite into alumina), which was regarded as a sizeable installation and, in fact, was one of the largest in existence, had to be greatly expanded in order to process the bauxite that was pouring into Arvida at the rate of five train loads a day. Houses, hospitals, schools, water facilities, food dispensaries, electricity and all the multitudinous details to sustain the greatly increased population were installed. At the peak, 25,000 persons were employed at Arvida.

Four new pot lines were installed at Shawinigan Falls, two at La Tuque, two at Beauharnois and one at Isle Maligne. One of these "little" plants turned out more aluminum than the entire Canadian output before the war.

Probably the hardest part of the expansion program was electric power, and to see the picture clearly a bit of background must be explained. Aluminum is a glutton for power,—that is what brought it to Canada in the first place some 45 years ago. All other basic materials of aluminum have to be imported into Canada.

At about the time when the Isle Maligne project was completed, plans for the power development, known as "Shipshaw", were drafted. By the late 1920's the prospects for increased consumption of aluminum were sufficiently promising to justify opening up of the first stage of the Shipshaw power site. However, by the time the first stage of the Shipshaw station was completed in 1931, we were well into the industrial depression and for quite a number of years its 240,000 h.p. capacity left a substantial power cushion in the Saguenay Valley. Then came the demands of the war, and the plans for the complete Shipshaw project—yellowed with age—were drawn from the drawer and the final construction commenced.

These aged plans of Shipshaw called for summer work only—no year-round work, winter camps nor special sub-zero equipment. The original design called for a devious canal route going through soft earth that could be shovelled instead of blasted. No concrete side dams were in the plans, but instead somewhat more risky but adequate earth dams were intended. The exigencies of the war scrapped all these intentions. The station had to be completed quickly, and that meant a year-round job with all the difficulties inherent in a site in the latitude of Labrador. The canal was re-routed through solid rock because in the Saguenay winters rock is easier to blast than is frozen earth and, in addition, the route was shorter. The canal sides were not earth dams but concrete—which were faster to build but much more costly. The original plans utilized the Little Shipshaw River as a tailrace, but as the Shipshaw River could not be dredged in winter these plans had to be discarded and a tailrace cut through a high ridge of solid stone. Thus, Shipshaw never touches the little stream which gives it its name. Economy was completely sacrificed for speed and there is no doubt that speed was made. Excavation started on August 15th, 1941 and in less than 15 months, on November 7th, 1942, the first generator was on the line. Five big dams were built, a wide, deep canal one and a half miles long was cut through solid rock and the six pen-stocks are rock tunnels, each 468 feet in length at a depth of 141 feet. The power house is a massive structure, and to build it over 3,000,000 cubic yards of earth and almost 3,000,000 cubic yards of rock had to be excavated. Over 3,250,000 pounds of dynamite were placed in 840 miles of blasting drills. To reach these totals over 55,000 individuals were engaged on the operation.

In order to make certain that sufficient water would be available at all times, upstream storage dams were required. Survey gangs found two locations,—one at Lake Manouan and the other at Passe Dangereuse, both of them in the upper reaches of the Peribonka River watershed. The most interesting of these two water-storages is that timber dam at Lake Manouan nearly 200 miles north-east at Arvida on the old canoe and portage route from Jacques Cartier's kingdom of the Saguenay to Hudson Bay. Every single piece of equipment, except timber, had to be flown to the site, and that added up to over four million pounds of air-borne traffic. The landing field was the lake, using pontoons in the summer and skiis in the winter. The other storage dam at Passe Dangereuse was 177 miles from Arvida, where the topography required a reinforced concrete dam. The location was inaccessible in that no roads led to the site, hence a highway had to be carved through virgin stands of timber. Working summer and winter, tough habitants cut their way through the forest making a road fit to bring in the material and the men. Over the woodland road moved the steel, concrete and machinery to construct a modern dam approximately 1,200 feet long by 160 feet high, containing 151,000 cubic yards of concrete.

As said before, the first stage of the Shipshaw power station had a capacity of 240,000 h.p. and the completion of the second stage added another 2,200,000 h.p. The combined capacity of Isle Maligne and Shipshaw power stations is 2,000,000 h.p. Since the installed turbine capacity of the whole of Canada is approximately 10,250,000 h.p., just about 25 per cent of the total is in the Saguenay district.

Submarines made carriage of the imported constituents through the Gulf of St. Lawrence and the Saguenay River to Port Alfred, too dangerous and uncertain. Scarcity of ships cut down even the cautious routing of lake steamers down the St. Lawrence from lake or canal points. The expanded supply of raw materials had to be brought into Arvida by rail from American ports. The rail connection in Canada was via the Canadian National Railways.

Mr. Clark stated that in the space of but a few paragraphs it is difficult to make clear what occurred during almost six years of frantic war effort. At times it seemed almost impossible to correlate the activities in far-off South America, foggy Newfoundland and in the vastness of Canada so that everthing fell into place at its proper time. Materials were difficult to get, it took time to design buildings and tabulate specification lists. Manufacturers of equipment were terribly overloaded with other urgent duties. Looking back at the accomplishments, it seems as though there was a "crisis" every day. So much had to be done at so many places. It was not done by the Aluminum Company of Canada, Ltd. alone. It was the outcome of the teamwork of the many industries of this continent who somehow or other fabricated their equipment and made deliveries. Not to be overlooked was the cooperation of the Provincial and Federal governments of this country whose staffs worked long hours day in and day out.

Following his paper, Mr. Clark presented an historical film on the Aluminum Industry entitled "Unfinished Rainbows".

At the close of the meeting there was a question period, and a vote of thanks was moved by J. F. Osborn.

QUEBEC BRANCH

Roger Desjardins, m.e.i.c. - *Secretary-Treasurer*

On January 16th, 1946, a meeting was held at the Faculty of Sciences of Laval University, during which a paper was given by Lt. Commander J. G. Ferraris, R.C.N.V.R., on **Electricity in the Navy.**

Lt. Commander Ferraris began his talk by giving the history of electricity in the Navy, dating back to 1874 for the firing of guns. Then came the discharging of torpedoes, 1879, searchlights in 1876, electric lighting in 1881, both arc and incandescent, at first, from Brush dynamos at 800 volts, changed later to 80 volts. A first class ship in those days had three dynamos 180-200 amperes at 80 volts.

The cables finally adopted as standard were rubber insulated with lead covering.

In most of the ships of the R.C.N. to-day, we have a D.C. voltage of 220 volts.

On a warship the electrical designer has to contend with many severe conditions, such as vibration, rolling, pitching and yawing of the ship, shock from gunfire, battle damage, extremes of temperature, restricted space, demand for reduced weight, effect of salt laden atmosphere, technical problems of design, etc.

With the aid of slides, Lt. Commander Ferraris, gave examples of the immense electrical installation in a man-of-war, by speaking of the installation on the cruiser H.M.C.S. "*Ontario*".

The lighting and fans cannot stop for more than 10 minutes. If that should happen the personnel in the engine and boiler rooms would have to be withdrawn and the ship would become a sitting target for the enemy.

Degaussing is used against magnetic mines by coils around the ship carrying just sufficient current to neutralize the magnetism induced in the hull of the ship by the earth's magnetic field.

The direction in which a ship is heading is given by the gyro-compass, consisting of a flywheel rotating at 6,000 r.p.m. about a horizontal axis, and so suspended about a vertical axis that it will respond to the feeble force tending to bring its axis of rotation parallel with that of the earth.

Distance and speed through the water are measured by a "Chernikaeff Log". This consists of a small propeller under the ship geared as to make and break a set of contacts 400 times every nautical mile (6080 feet).

A typical example among the many electronic systems which have been developed for long range navigation is "Loran", a pulsed system of hyperbolic navigation.

A number of ground stations are located to cover the area to be served and a single receiver is used aboard the ship or aircraft connected to an ordinary radio antenna. Pulses of radio energy are transmitted. These trigger off a station about 300 miles away which in turn transmits a second pulse on the same frequency after a fixed delay. The receiver on board an aircraft or ship simply measures the time between the arrival of the two pulses and thus a location on a certain line of position is obtained.

By taking another pair of stations a second line of position is obtained. Where the two lines intersect is the position of the ship.

The communication equipment of a ship like the cruiser "*Ontario*" is manifold. She has:—

a) Radio equipment to communicate with her own bases from nearly anywhere in the world;
b) Radio equipment for communication with
   1) Fighter Aircraft,
   2) Patrol Aircraft,
   3) Other ships in company,
   4) Bombardment liaison officers ashore,
   5) Spotting aircraft over enemy ships.

Infra-red devices are also used in communication and a great deal of work is being done in this field.

A radar set transmits a pulse of radio energy, of ultra high frequency, which is reflected by any object in its path and within a reasonable range. The time taken for the pulse to make the return trip to the object is measured extremely accurately and translated into range.

Slides were projected showing the radar aerials on the H.M.C.S. "*Ontario*" of:—

a) High powered air warning set capable of detecting A/C up to 120 miles away.
b) High powered height finding set with fully stabilized aerial which will determine the height of an A/C 40 miles away with an accuracy of 500 ft.
c) Main armament gunnery set capable of giving the range of another cruiser 15 miles away with an accuracy of—25 yds., and which is capable also of spotting shell splashes at great range. This aids in applying necessary corrections to the guns to obtain a hitting range and bearing.
d) High angle gunnery sets to give accurate range and hearing of A/C up to 10 miles range.
e) Close range gunnery sets to give an extremely accurate range of close-in targets. These sets will automatically follow a target once it has been set "On".
f) Gunnery bombardment sets for accurately ranging on shore bambardment targets, and also capable of following the large calibre shells to the target.
g) Target indication set which displays the whole surface and low flying A/C picture on a large scope, and which has attachments which enable it to indicate by bearing and range targets to be engaged by different sections of the armament.
h) Numerous sets designed to identify surface and air contacts as friendly or hostile.
i) Sets to identify the ship as friendly to our own forces.
j) Radar sets in shells cause latter to explode when a certain distance from target.

The control of naval guns has reached the point where a ship's first salvo usually straddles an enemy ship at a range of many miles. All the data necessary is transmitted electrically to a "Fire Control Table" which transmits in turn its "dictates" electrically to the guns.

Generation is divided among a larger number of units and with more capacity in reserve than in common shore practice. Instead of being arranged all in a row as in a power house, the generators are placed in as many separate compartments as possible, some are steam, (fed from different boilers) and some are diesel driven. A Ring-Main round the armoured section of the ship ties all the generators together and feeds the various loads. Under adverse conditions the ring can be split up into a number of sections each fed by a generator and independent of, but available to supply damaged adjacent sections.

The location of a navigable object by means of plotting the direction of arrival of a received signal at two or more stations is by no means new, but operational requirements during the war years have brought out many new refinements and opened up a large field of investigation and application.

Pre-eminent in this field is the cathode ray direction finder: a device which gives a visual indication of the direction of arrival of an incoming radio sgnal by means of a line on the face of a cathode ray tube. The direction and sense of the bearing can be read off instanteously from a compass scale marked on the face of the tube.

Radio communications, radio navigation, direction finding, radar and associated electronic methods have made necessary precise knowledge on the behaviour of wave propagation, which necessitates the study "Ionispheric Investigation ".

Canada, with the auroral zone traversing its northland and the north magnetic pole within its territory, is probably the world's greatest laboratory in the investigation of wave propagation.

International scientists and naval engineers in association with other services are working on the problems of ionispheric technique.

Lt. Commander J. G. Ferraris, R.C.N.V.R., finished his talk by giving details on the courses of the R.C.N. Electrical School which is being equipped in Halifax, which will be staffed by electrical officers and will train ratings and officers in all applications of electricity to the Navy including power, radar, radio, fire control, anti-submarine, etc.

SAGUENAY BRANCH

H. R. Fee, M.E.I.C. - *Secretary-Treasurer*

Industrial Electronics—Today and Tomorrow was the subject of a paper presented to the Saguenay Branch on January 31st, 1946, by Mr. J. D. Willis, assistant manager, Industrial Division of the Apparatus Department of Canadian General Electric Company, Toronto, Ont., who was introduced by Chairman B. E. Bauman.

The speaker reviewed the elements of electronics, explaining how some of the electrons could be freed from the atoms in certain substances, and forced to travel from atom to atom producing the electric current. He then described the elements of the electron tube, explaining how electrons could be emitted by a cathode heated directly or indirectly, or from a cold cathode by high voltage, by impact, or by light. By the application of external potential, these emitted electrons could be made to flow to an anode thus producing an electric current without the use of an internal connecting wire between the anode and cathode.

Mr. Willis then went on to describe a number of applications. As examples of application in measurement and inspection he gave the electron microscope and X-ray machine. He described in some detail the control system of a machine for applying force at a constantly increasing rate to test samples of textile.

As an application of the photo-electric cells he described an apparatus designed to inspect glass food containers for radial cracks.

Mr. Willis explained how electro-static precipitators were used to remove flue dust, and how this principle is used in the manufacture of sandpaper to produce maximum abrasive quality, in the manufacture of certain textiles and rugs, and for certain paint applications. In the field of lighting and light control the photo-electric cell is used extensively for on and off control, and the electronic principle is involved in florescent, germicidal, sodium paper, and mercury vapour lamps. Electronics also finds a wide application in the use of carrier current communication and power conversion.

The possible trend of electronic applications in the future was indicated by the use of various types of the electronic apparatus for the position control of paper in printing presses, for timing and counting, for welding control, heat control, high frequency heating, and automatic speed control. An application of the latter use was described in the control used for rewinding wire, in the manufacture of metallic cable.

M. L. Carey moved a vote of appreciation to Mr. Willis for his interesting and instructive paper.

* * * *

Mr. A. H. Tait, manager of the Mistassini Exploration Company, Arvida, Que., addressed the Saguenay Branch February 19th, choosing as his topic **The Romance of Gold Mining.**

The speaker defined an ore deposit as a concentration of minerals occurring in nature, which could be processed at a profit. Before any new development can be started the ore deposit has to be discovered, which makes prospecting one of the most important factors in the mining industry. The speaker told how some of the largest deposits in Canada, such as those at Sudbury, Cobalt, and Porcupine, were discovered more or less by accident. Out of every one hundred prospects only one to two prove to be ore deposit in the economic sense.

Mr. Tait explained in considerable detail the procedure usually followed in developing a prospect. Diamond drilling is first carried out to intersect the deposit at 100 to 150 feet below the surface close to the ore deposit, then a shaft is dug, a crosscut driven from the shaft to the ore deposit, and a drift driven along the ore body. Finally a raise is driven from the drift up through the vein. The material removed from the drift and raise is ore, and can be stored or processed.

The various methods of stoping, such as the open stope, shrinkage stope, and cut and filled stope were well illustrated by means of lantern slides.

Gordon Antenbring moved a vote of thanks to the speaker.

The programme also included a sound colour film entitled " River of Paper," which was loaned by the Powell River Company. This film depicted the various processes involved in making paper, and included a number of shots of the magnificent B.C. mountain scenery.

SARNIA BRANCH

F. F. Dyer, M.E.I.C. - *Secretary-Treasurer*
C. E. Leon, M.E.I.C. - *Branch News Editor*

On January 24 a joint meeting of the Sarnia Branch of the E.I.C. and the Sarnia Branch of the C.I.C. was held. The speaker of the evening was Mr. Earl Smith, a member of the research staff of the Dow Corning Company, Midland, Michigan. Mr. Smith graduated from Nebraska Wesleyan University and following his graduation did post-graduate work at the University of Nebraska. He was then an instructor in chemistry at Michigan State College until the early days of the war when he joined the chemical warfare branch of the Dow Corning Company.

Mr. Smith opened his remarks by defining the term " silicone "—a popular name for Organic Silicon Oxide Polymers. In chemistry they present a new field that combines both organic and inorganic study. In comparison to other elements, silicones are second in abundance to oxygen and comprise 27.7 per cent by weight of the earth's crust. They are the least electro-negative of all non-metals and the two basic linkages in silicone chemistry are to oxygen and carbon. Silicon polymers have electrical properties similar to glass. Mr. Smith reviewed a proposed nomenclature for organosilicone compounds that has been suggested by a sub-committee of the American Chemical Society.

In 1823 Berselius first synthesized $SiCl_4$ and Si. In 1899 a study of Organosilicone derivatives was started by Kipping, and from 1900 to 1930 most of the research developments in this field were dominated by Kipping and Stock. In 1904 Kipping first used the Grignard reagent which so far has been used by Dow Corning to produce their products. Early in 1930 flexible silicon polymers were discovered by Dr. Frank Hyde of Corning Glass Works. Previous to this any polymers produced resulted in hard, brittle substances but Dr. Hyde found that by hydrolizing a di-cloro-silicone with an alkyl phenyl and then heating, a viscous resin is produced. This resin cures at 250 deg. C. to a flexible film, and it is characteristic that this type of polymer and subsequent polymers so far discovered are all thermosetting.

In the field of silicone fluids, research has been carried on at the Mellon Institute under the direction of Dr. R. R. MacGregor. At the present time Dow Corning produces various silicone fluids which are characterized by their high viscosity index and water repellent properties. Water droplets on a silicone treated glass surface form a contact angle of 103 deg.; thus these fluids are useful in preventing the formation of water films on electrical insulators. Other uses of silicone fluids are as rubber lubricants and also foam inhibitors. Only a few part-per-million of fluid in oils will prevent foaming. In the field of lubrication, fluids have been produced that prove to be satisfactory lubricants under certain conditions. Work on these fluids is in an early stage of development. Silicone fluids also have a flat dielectric constant curve and a flat per cent power factor curve when plotted against frequencies up to 108 cycles.

Silicone rubbers retain their elasticity indefinitely under the elevated temperatures of 150 deg. to 250 deg. C. They do not have the tensile strength or abrasive resistance of natural rubber, but do have a strong resistance to chemicals and can be moulded, extruded, or coated on electrical condensers, resisters and other equipment.

Silicone resins as produced at the present time require curing from one to five hours at approximately 250 deg. C. and are later diluted with a volatile hydrocarbon to provide easy application and are ideal as a heat-resisting impregnating material. Prolonged heating carbonizes organic resins, but fifty hours exposure to 250 deg. C. does not affect silicone resin. As an example of their use in the electric motor industry, Mr. Smith told of a test on a 10 h.p. induction motor in which the insulation had been impregnated with one of the silicone resins. At the accelerated conditions of the test, this motor has run for 2,106 hours at 300 deg. C. which, converted to the usual operating temperature of 160 deg. F. means that this motor has been running for 782 years! By using heat-resistant pigments and silicone resins, paints have been made that stand up to over 1,000 hours exposure to a temperature of 250 deg. C. without blistering, cracking or running.

In conclusion, we should all be aware of the immense new field in chemistry that silicones present. This is a day of amazing scientific discovery and foremost in recent developments are silicones and their applications. Mr. Smith emphasized that designers should be aware of these applications depending upon thermal stability, electrical properties, high moisture resistance, and to realize that, at the present time, certain design problems can be solved only by the use of silicones.

TORONTO BRANCH

E. G. Tallman, m.e.i.c. - *Secretary-Treasurer*

One of the outstanding meetings in the history of the Toronto Branch was held in the Debates Room of Hart House on Thursday, January 24th. The meeting was the Annual "Student Night". Over 200 members and students were present.

The meeting was conducted by the Branch chairman, Prof. C. F. Morrison, who opened proceedings with a brief talk on the Engineering Institute. Four fourth year engineering students from the University of Toronto then presented papers. These four students were the finalists selected from a group of ten who competed in the preliminary contest.

The four students were: Mr. Rosenthal whose paper was on **High Speed Flight;** Mr. Findlay who spoke on **Earth Dams;** Mr. Buchanan who discussed **Variable Speed A.C. Motors** and Mr. Moore whose paper was entitled **Cemented Carbide Cutting Tools.** All the papers were excellent and the judges selected the winners with difficulty. Mr. Buchanan was awarded first prize of $40.; Mr. Findlay second prize of $30. and Messrs. Rosenthal and Moore were declared tied for third prize and received $10. each. Student Memberships in the Institute were given to all ten students.

While the judges were arriving at their decision the motion picture "The Failure of the Tacoma Narrows Bridge" was shown and was viewed with great interest by all.

Copies of the Annual Salary Survey Report, conducted and compiled by the Junior Section, were distributed to all the Students present.

The meeting was adjourned and re-convened in the Great Hall for coffee and doughnuts.

VANCOUVER BRANCH

A. M. Eyre, s.e.i.c. - - *Secretary-Treasurer*
P. B. Stroyan, m.e.i.c. - *Branch News Editor*

On January 21st about sixty members of the Branch gathered to hear Electrical Commander Deane, R.C.N., give an address on **Electricity in the Navy.** J. P. Fraser introduced the speaker, who had graduated from the University of British Columbia in 1934 in electrical engineering, followed his profession in electrical installation connected with the mining industry and, at the outbreak of war, joined the Royal Navy as an electrical engineer, later transferring to the Royal Canadian Navy. Commander Deane is now on the permanent force and explained that the Canadian Navy has laid down a policy of employing a definite number of electrical graduates each year to build up a competent staff of experts, giving them an intensive three year course of practical and theoretical training, with sufficient remuneration to attract and retain suitable candidates.

The speaker noted the tremendous strides taken in the development of electrical and electronic equipment during the war, and the incessant and continuous battle to keep ahead of the enemy by bringing out new devices for purposes of attack and counter-measures for combatting enemy inventiveness. The principles of navigation had been revolutionized by the invention of the electrically operated gyro-compass which had superseded the magnetic compass; an electrically operated device measured speed, and the combination of the two in an automatic plotter laid out the course and speed of the ship immediately. An electrically actuated echo-sounder plotted the depth of water and the condition of the sea-bottom so that the captain had all the navigational information required without any delay or guess-work. Latitude and longitude could be determined in any condition of weather by means of triangulation on fixed points by radio sending and receiving devices.

The miracle of radar had made possible the detection of aircraft at great distances, and later developments indicated the difference between friendly and hostile aircraft. Radar-directed long range guns spelled doom for enemy surface craft and anti-aircraft guns similarly equipped raked the skies. The final invention of the proximity fuse for large and small diameter shells, which picked their own targets by means of radar equipment in the head of the shell, had proven particularly deadly. By means of radar, details of coastlines and harbours within a range of several miles could be picked out on a receiving screen which indicated, almost as well as in an aerial view, the outlines of salient features as well as the disposition of any ships in the harbour.

The speaker showed slides picturing the maze of equipment and control panels necessitated by the tremendous use of electrical devices in the modern warship, including electrical installations for lighting, ventilating and steering the ship.

Commander Deane answered a number of questions and was warmly thanked for his instructive and informative address.

* * * *

About fifty members and student members of the Branch met in Salon B at the Hotel Vancouver on February 13th, on the occasion of the Annual Students' Night. R. C. Pybus, branch chairman, introduced Gordon Heal, chairman of the Student Chapter at the University of British Columbia, who presented the speakers.

The first address was given by D. R. Bakewell, who spoke on **Detailed Topographical Maps for Logging.** The speaker dwelt on the importance and long range economy of preparing detailed maps of an area which is to be logged, explaining that, by gathering definite and accurate information in the first instance, much wasted effort could be avoided. The method recommended was by dividing the area into sections of one square mile each, running a transit line on the perimeter, with an allowable error in closing of one foot horizontally and one foot in elevation. Fifteen strip lines in each direction, parallel to the sides of the square were then run by compass and chain, and the elevations taken by clinometer, with an allowable error on each strip of 60 ft. in alignment, 30 ft. in chainage and 8 ft. in elevation. Errors can thus be proportioned back up each strip line, and information on drainage and general topography noted, which when plotted on a map, would give adequate information on the area covered. When the original transit line is being run round the perimeter of the section tally points are referenced at 330 ft. centres to correspond to the strip lines. These are later used by the cruisers to tie in their work.

The completed map, with 20 ft. contours, with timber types shown in various colours, and with details of ground formations, is invaluable in laying out roads, railroads, stream-crossings, logging settings. It forms a permanent record which can be used as a basis for assessment of fire claims and future re-forestation plans.

The cost of procuring and recording the information would average, in ordinary country, about two dollars per acre, which for a fairly good stand of forty thousand board feet per acre, would not add appreciably to the cost of logging.

The second address, entitled **Ripple Rock**, was given by G. M. Ellis. This rock, situated about 110 miles north of Vancouver, at the southern end of Seymour Narrows, between Maude Island and Vancouver Island, has been a thorn in the flesh of coast navigators and has been the cause of a great many ship-wrecks. Through the years many representations have been made to the Federal government, but it was not until the United States government, anxious to use the inside passage to Alaska for supply ships, applied sufficient pressure to induce the Canadian government to seek bids for the removal of the rock.

Seymour Narrows is a long, narrow channel, about 2,600 ft. wide at this point, and subject to tides of fourteen knots in either direction, with only half hour periods at high and low water slack when the water is still. Ripple Rock is in the centre of the channel, and is 220 ft. long by 150 ft. wide, with an average depth at low water of only 15 ft. These conditions, combined with strong cross currents at certain stages of the tide, thus prove a very definite hazard to shipping.

When, in 1942, the Federal government called for tenders for the removal of the rock to a depth of 33.8 ft. below low water, no bids were received. Tenders were then called on a basis of cost plus a fixed fee, the individual contractors to suggest methods of doing the job. Several proposals were submitted, including the construction of a caisson and the use of open mining methods, tunnelling underwater from the shore and working from underneath, and the method which was finally settled upon, namely, anchoring a barge over the rock, drilling and blasting the material. A barge was constructed and held in position by cables fastened to underwater anchors, but the vibration caused by the current on the cables made this method unworkable. The barge was then held by overhead cables, and work proceeded on this basis. Due to the shortness of time during which drilling could be done at slack water periods and the impossibility of locating partly drilled holes on the next tide, progress was so slow as to be entirely uneconomical. The work had therefore been stopped pending further appropriation.

The speakers were thanked for their most interesting discourses and each received first prize for his efforts.

Tom Scott reported on his recent trip to the annual meeting of the Institute in Montreal, which he attended on behalf of the University of British Columbia, giving an outline of the subject under discussion at the student sessions. Mr. Scott was thanked for his report and congratulated by Dean J. N. Finlayson.

WINNIPEG BRANCH

A. T. McCormick, M.E.I.C. - *Secretary-Treasurer*
A. V. Dick, M.E.I.C. - - - *Branch News Editor*

The showing of the Mulberry Port Exhibition in Winnipeg, under the joint auspices of the Hudson's Bay Company and The Engineering Institute of Canada, was officially opened on Friday January 11th at 3:00 p.m., by the Lieutenant-Governor of Manitoba, and opened to the general public on Saturday, January 12th. The attendance of 20,500 on the opening day broke all records for attendance set so far in the showing of Mulberry in Canada. The total attendance for the first five days being over 60,000.

The members of the Winnipeg Branch and the Manitoba Association of Professional Engineers with their ladies were guests of the Hudson's Bay Company at a private showing of Mulberry on Friday night, January 18th, with a record attendance of over 500, at which those present were guests of the Hudson's Bay Company at a complimentary dinner, starting at 6:00 p.m. Mr. Geo. F. Klein, store manager of the Hudson's Bay Company, welcomed the guests to the dinner and private showing of Mulberry. C. P. Haltalin, chairman of the Winnipeg Branch, on behalf of those present thanked the Hudson's Bay Company and staff for their hospitality, and the management and staff of Mulberry for their assistance in putting on the private showing of the exhibit for the engineers of Winnipeg.

❖ ❖ ❖

The annual meeting of the Winnipeg Branch was held in theatre E, University Building, on Thursday, February 7th, with C. P. Haltalin in the chair. As retiring chairman, Mr. Haltalin gave a brief report on the activities of the Branch during 1945, outlining details of a very successful year, culminating in the successful showing of Mulberry, which created a record both for the greatest attendance for one day and in total attendance, which exceeded that of any city so far and amounted to approximately 70 per cent of the population of the City of Winnipeg.

The auditors' report was submitted and approved, showing a substantial surplus for the year, with a total surplus of $1,396.62.

The secretary-treasurer then submitted a report for the year covering the activities of the Branch and the Executive during 1945, in which the outstanding features were the proposed revisions to the Branch by-laws and the successful formation of two Branch Sections—the Electrical Section and the Student Section. A considerable increase in membership was reported, with a total of 63 new members in 1945, of which 60 were student members, making the total Branch membership 338.

During the evening nominations were received for the Electrical Section, the following being nominated:

Chairman ....H. L. Briggs
Vice-Chairmen ....S. G. Harknett, D. A. McCuaig
Executive Members....J. D. Peart, A. M. Thompson

It was announced that the Student Section was being organized under the following temporary officers:

Chairman ....E. M. Scott
Vice-Chairman ....Paul Bergman
Secretary ....George Flavelle
Chairman Papers Committee....Wm. Porter

The inaugural meeting of the Student Section was announced as being held on Friday, February 15th, at which H. L. Briggs would present a paper on **Carrier Current Control Applications.**

Following the business portion of the meeting, the latest moving picture of wild life and conservation construction was shown through the courtesy of Ducks Unlimited, and the beautiful coloured photography of Canada's "Duck Factory" was much appreciated by the large number of members in attendance.

Library Notes

Book notes, Additions to the Library of The Engineering Institute, Reviews of New Books and Publications

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS

Arch Design Simplified:
A text-book on rapid and economical design of arch bridges, including 33 tables and illustrative designs. W. A. Fairhurst. London, Concrete Publications Ltd., 1945. 9½ x 6½ ins., 61 pp., illus., cloth, 12s.

Canadian Almanac and Legal Court Directory, 1946:
Edited by Horace C. Corner. Toronto, Copp Clark, 1946. 9 x 6¼ in., 750 pp., cloth, $7.00.

Materials Handling Manual (II):
Edited by M. M. Williamson and G. W. Williamson. London, Paul Elek (Publishers), c1945. 9 x 5¾ in., 488 pp., illus., cloth, 30s.

Optical Instruments in Engineering:
Sydney H. Hemsley. London, Paul Elek (Publishers), 1945. 8½ x 5½ in., 80 pp., illus., cloth, 7s 6d.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

HISTORY OF THE KODAK

By Mina Fisher Hammer. N.Y., House of Little Books, c1940, 95 pp., illus., cloth, $2.00.

This is a history of the Kodak and its continuations, the fist folding and panoramic cameras, the magic lantern, kodak and movie camera. Biographical data about the inventor, David Henderson Houston, is also included. The history is fully documented with the U.S. Patent Office records, Federal Reports of the U.S. Supreme Court, together with patent drawings by the inventor. Assignments of patents, Houston to Eastman, include not only the original 1881 Kodak, but also the 1892 First Folding Pocket cameras and later Panoramics. The book is well illustrated with plates and drawings.

INTRODUCTION TO MAGNESIUM AND ITS ALLOYS

By John Alico. Chicago, New York, Ziff-Davis, 1945. 183 pp., illus., cloth, $5.00.

The need for an extensive American survey of available information on this subject has long existed. Serious metallurgical students and those concerned with the practical aspects of the fabrication and use of metals will find this need answered in the present work. With years of practical experience in the metal industries, including magnesium production and fabrication, the author is well qualified to evaluate technical information. The clarity and simplicity of his presentation will earn the appreciation of all readers. The book covers the fundamentals of production and fabrication for those manufacturers and design engineers who may be considering magnesium alloy applications for their particular products, and for research engineers, metallurgists, and students who desire such aid in their work. Bibliographical references are included at the end of each chapter.

SWEDISH CEMENT AND CONCRETE RESEARCH INSTITUTE —Proceedings

Svenska Forskningsinstitutet for Cement Och Betong Vid Kungl Tekniska Hogskolan I Stockholm. Handlingar N:R 1, 1945. Report of the Director on the Work of the Institute during the Period from July 1st, 1942, to June 30th, 1944. (In Swedish.)

A brief account is given of the organization, building, and resources of the Institute at the Royal Technical University, Stockholm, and of the work of the Institute from its inception on July, 1942, to July, 1944. The Chemical Department carried out investigations on the hardening of Portland cement, the extraction of alkalis from cement clinkers, and the rapid colorimetric analysis of silica materials. The Physics Department, which is the largest department of the Institute, studied some of the problems concerning the mechanics of concrete deformation. The primary purpose of this study was the evolving of methods and instruments of measurements suited to macroscopic observation. In this connection, research was carried out on the theoretical groundwork required for a detailed investigation into the structure of concrete and cement paste. The Technical Department made tests on the resistance to wear of concrete floors, and the development of cracks in reinforced concrete structures. In addition, this Department conducted courses in concrete engineering for concrete inspectors and supervisory staff.

. . . *Handlingar N:R 2; Beskrivning av Cement och Betonginstitutets Byggnad, Maj 1945. Description of the building of the Swedish Cement and Concrete Research Institute, May, 1945. (In Swedish.)*

A description of the new building of the Institute is detailed with many illustrations. *(Continued on page 212)*

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

September 30th, 1943.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the November meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thrity-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BANNATYNE—NINIAN, of 3876 Kent Ave., Montreal, Que. Born at New Romney, Kent, Eng., December 5th, 1889. Educ.: Birkenhead Tech. Coll., Birkenhead, Eng., 1908-13; 1914-23, R.C.N., as Eng. Sub. Lt., examined and promoted to Eng. Lieut.; 1923-30, Affiliated Engrg. Cos., Montreal; 1930-34, supt. engr., Canadian National Steamships; 1934-38, general work on steamships, survey, repairs, new constrn., assisting Lloyd's Register of Shipping, British Corp. Register of Shipping, Lambert & German, Naval Architects, etc.; 1939, boiler dept., Dominion Bridge Co.; 1939-45, recalled to R.C.N., promoted to Cmdr. (E), March 1941, and discharged, "services completed"; 1945 to date, temporarily employed on general boiler & steam engrg., Fraser Companies Limited, Montreal. (Assoc. Member, E.I.C., 1922-29).

References: F. S. B. Heward, F. A. Combe, G. H. Archibald, F. O. White, G. L. Stephens.

BJARNASON—JOHANNES, of Reykjavik, Iceland. Born at Knarrarnes, Myrasysla, Iceland, July 18th, 1920. Educ.: B.Eng. (Mech.), McGill Univ., 1943; 1944 to date, technical director, doing all kinds of engrg. work such as factory and machinery layouts, mounting of machinery and machinery instruction, Orka Limited, Machinery & Engineering, Reykjavik, Iceland.

References: E. Brown, C. M. McKergow, F. M. Wood, A. R. Roberts, G. A. Wallace.

BROADHURST—ERIC BERTRAM, of Trail, B. C. Born at Salford, England, January 1st, 1913. Educ.: Univ. of British Columbia, 1929-30; R.P.E. British Columbia, (by Exam.); with Consolidated Mining & Smelting Co. of Canada, Trail, as follows: 1934-38, apprentice dftsman., designing dftsman, 1938-45, genl. dtfing, and mechanical designing, including design of water-cooled screw conveyors, magnesium melting furnace and electrolytic layout, design of zinc roasters, layouts of ammonium nitrate plants, 1945 (4 mos.), on loan to Defence Industries Ltd., and at present mtce. engr. for lead smelting dept.

References: J. V. Rogers, S. C. Montgomery, G. H. Bancroft, T. W. Lazenby, A. C. Ridgers, C. R. Bown.

CHISTENSEN—HENRY FREDERIK OTTO, of Dolbeau, Que. Born at Horsens, Denmark, Nov. 13th, 1901. Educ.: Horsens Tech. School (evenings), 1917-21, Aarhns Electrotechnikon (evenings and day coure), 1921-24; 1921-25, licensed electrician and foreman on various A.C. and D.C. and H.T. installns. throughout Denmark; 1925-29, in business for self as elect. engr. and contractor; 1929 to date with Lake St. John Power & Paper Co., Dolbeau, Que. becoming asst. electrical supt. in 1942 and elect. supt. in 1944.

References: H. R. Fee, J. R. B. Milne, A. G. Jacques, N. F. McCaghey, A. Cunningham.

COMTOIS—PAUL-EMILE, of 34 Lamontagne Ave., Quebec City. Born at Quebec, Que., Feb. 5th, 1917. Educ.: B.Sc., (Mining), Laval Univ., 1941; 1941-42, asst. surveyor, Noranda Mines Ltd.; 1942 to date, Lieut. in R.C.E., Section Commander, returned from overseas and awaiting discharge.

References: G. J. Cote, A. Pouliot, G. W. Waddington, L. Roy, P. E. Gagnon.

CRAIG—GORDON HARBISON, of Winnipeg, Man. Born at Armagh, Northern Ireland, April 3rd, 1910. Educ.: B.Sc. (Elect.), Univ. of Manitoba, 1933; 1933-37, elect. dept., Swift Canadian, Winnipeg; 1933, (1 mo.), motor winding, Canadian Westinghouse, Winnipeg; 1938-39, costing, C.S.D., Canadian General Electric, Winnipeg; 1939 (part), sales engr., Mumford Medland Ltd., Winnipeg; 1939-45. Regt. Signals Officer in theatre of operations; 1946 to date, sales engr., Mumford Medland Ltd., 576 Wall St., Winnipeg, Man.

LIBRARY NOTES

(*Continued from page 209*)

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

A.S.M. REVIEW OF METAL LITERATURE, Vol. 1, 1944

Prepared by T. Reinberg. American Society for Metals, Cleveland, Ohio, 1945. 699 pp., 9 x 6 in., cloth, $15.00.

This volume contains the annotated lists of books and articles published during the year 1944 that appeared serially in "The Metals Review". The entries are classified carefully, and author and subject indexes are provided, affording three approaches to the literature. Appended is a bibliography of publications on quality evaluation that appeared between 1925 and 1932. The book is a valuable addition to metallurgical reference books.

AERIAL NAVIGATION

By H. E. Benham. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 344 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $4.00.

Beginning with a description of the characteristics of the earth and the methods of depicting all or parts of it on charts or maps, this book proceeds to describe the underlying principles of the main methods of aerial navigation. The effective techniques for applying these fundamentals to practical navigation are explained in detail with a wealth of helpful illustrations. A brief glossary of terms and abbreviations is appended.

PRACTICE of PRINTING

By R. W. Polk. Manual Arts Press, Peoria, Ill.; Copp Clark, Toronto, 1945. 300 pp., illus., diagrs., charts, tables, 8 x 5 in., cloth, $4.00 in Canada.

This work covers the essentials of a well-rounded apprentice training in the printing industry. Types, type cases and type setting are described in detail; the composition of text, tabular forms, stationery, advertisements, books, etc., is discussed with many illustrations; presses, composing machines, paper and inks are covered; the fundamental principles of display and the use of decoration and color are explained. The first chapter presents a brief history of printing, and the last chapter describes photo-offset-lithography. There is a glossary of trade and technical terms.

STRENGTH of MATERIALS

By A. P. Poorman. 4th edit. McGraw-Hill Book Co., New York and London, 1945. 339 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $3.00.

This standard textbook is intended for use in undergraduate courses in mechanics, and a knowledge of the principles of physics, the calculus, and statics is assumed. The first two chapters cover the general topics of stresses and strains in tension, compression and shear. The rest of the book deals with shear and moment in beams, stresses and deflections in beams, columns, riveted and welded joints, and resilience in bars and springs. Material on aluminum, duralumin and magnesium columns has been added in the new edition, with new problems throughout.

TABLE of ARC SIN X.

Prepared by the Mathematical Tables Project, conducted under the Sponsorship of the National Bureau of Standards, present volume began under the auspices of the Works Projects Administration for the City of New York. L. J. Briggs and A. N. Lowan, Directors. Published by Columbia University Press, New York, 1945. 121 pp., tables, 10¾ x 7¼ in., cloth, $3.50.

This present table of 12-place values of Arc sin x, in radian measure, may be regarded as a companion volume to the previously published Table of Arc tan x. The function is tabulated at intervals of 0.0001 in the range between 0 and 0.9890, and at intervals of 0.00001 in the range between 0.98900 and unity. A few useful auxiliary tables are included.

TABLES of ASSOCIATED LEGENDRE FUNCTIONS,

Prepared by the Mathematical Tables Project, conducted under the sponsorship of the National Bureau of Standards, L. J. Briggs, Director, and A. N. Lowan, Project Director. Columbia University Press, New York, 1945. pp. xlvl—306, tables, 11 x 7¼ in., cloth, $5.00

Legendre functions are encountered in the general solution of the differential equations of wave motion and the potential theory in spherical coordinates. The present volume of a series of mathematical tables was produced to meet needs for a table of Legendre functions to about six significant figures at intervals of 0.1. Further work is to be done to improve the process of interpolation of these functions.

THEORY of STRUCTURES.

By S. Timoshenko and D. H. Young. McGraw-Hill Book Co., New York and London, 1945. 486 pp., diagrs., charts, tables, 9 x 6 in., cloth, $5.00.

The various practical methods of analysis of trusses and frames are shown as a development of the general principles of mechanics. Separate chapters deal with the analysis of statically determinate trusses in one plane, influence lines, space trusses with hinged joints, principles of mechanics preparatory to the analysis of statically indeterminate structures, deflection calculations for trusses, bending of beams and frames, and the theory of arches.

TRANSMISSION LINES, Design, Construction and Performance.

By F. C. DeWeese. McGraw-Hill Book Co., London and New York, 1945. 297 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $3.50.

With clear explanation, illustrative examples, and typical problems, this book presents both the fundamental and the more involved aspects of electric power transmission engineering. It provides data and material applicable not only to transmission line problems but also to other problems of a similar nature. Special attention is given to modern methods of field work and to the recent developments in transmission line devices. (*Continued on page 216*)

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET,
MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Particular emphasis is laid at this time on the need for this service to fill the dual role of providing a general picture of employment conditions for members in the armed forces, and of making available to them specific contacts both now and at the time of their release from the services. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

NOTICE

SERVICE PERSONNEL: The completed rehabilitation questionnaires have indicated a need for the employment service to be made available to all members of the E.I.C. in the Armed Forces. It is suggested that all those who are interested—

1. Consider these positions as indicative of present conditions.
2. Reply to interesting advertisements to establish contact for the future.
3. Apply for any of these positions when discharge is imminent.

CIVILIAN TECHNICAL PERSONNEL should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the Wartime Bureau of Technical Personnel.
2. Their services are available.
A person's services are considered available only if he—
(a) is unemployed;
(b) is engaged in work other than of an engineering or scientific nature;
(c) has given notice as of a definite date; or
(d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

Situations Vacant

CHEMICAL

TECHNOLOGIST, preferably a chemical graduate, age 25 to 30, bilingual, with maturity, poise and personality is required by a firm in the Montreal area to be trained in U.S.A. in connection with solution of packaging and processing problems in field, factory and laboratory. Excellent salary is offered to suitable candidate. Apply to Box No. 3315-V.

GRADUATE CHEMICAL ENGINEER with good personality is required to act as assistant or second in command of a department, to be responsible for allocation of work to employees as well as administrative duties. Permanent position. Location northern Ontario. Salary $300.-350. month. Apply to Box No. 3362-V.

CHEMICAL ENGINEER, preferably graduate with natural aptitude for mathematics to head up a new department on statistical quality control for a paper company in Ontario. Good personality essential, with ability to contact employees and superintendents amicably. Salary about $350. a month depending on ability. Apply to Box No. 3362-V.

CHEMICAL ENGINEER with some experience in the use of control instruments (Bailey, Brown, Mason, etc.) is required for work in a paper mill in northern Ontario. Apply to Box No. 3362-V.

JUNIOR CHEMICAL ENGINEER, preferrably ex-sevice man, not necessarily experienced, is required for experimental and research work on the potentialities of newsprint for a company in Ontario. Starting salary of about $200 to 225. a month. Apply to Box No. 3362-V.

CIVIL

CIVIL ENGINEER, graduate, is required by a firm in Montreal to supervise construction, according to specifications, of new buildings all across Canada. Preferably young man with enough experience . Salary will be $300. to $400. a month. Apply to Box No. 3292-V.

TWO CIVIL ENGINEERS, age 25-40 are required as (1) road construction engineer and (2) general building construction engineer, for estimating , organizing and supervising construction work for a firm in Newfoundland. Some designing and draughting. Salary open according to qualifications. Apply to Box No. 3318-V.

CIVIL OR MECHANICAL ENGINEER, not necessarily a graduate, age 24-30, some experience in concrete and steel draughting, some sales ability, required to work with a consulting engineer and contractor in Montreal. Salary open. Apply to Box No. 3339-V.

CIVIL ENGINEER, young graduate with 2 or 3 years experience, is required to be trained for survey work on municipal, sewer, drainage, etc. problems with a consulting engineer in southern Ontario. (Might eventually be partner). Salary $200. to $225. a month. Apply to Box No. 3340-V.

CIVIL ENGINEER, young man with some experience, is required for survey work on a construction job in the Eastern Townships of Quebec. This is a temporary position and would be worth up to $300. a month. Apply to Box No. 3341-V.

CIVIL ENGINEER, age 30 to 40, bilingual with construction and hydraulic experience, is required for the Richelieu River development. Headquarters in Montreal, field work in St. Jean, Que. Salary $3000. to $3600. per year. Apply to Box No. 3348-V.

TWO CIVIL ENGINEERS, graduates with one or more years experience, are required for hydro electric construction and development in South America. Salary $300. to $350, a month. Applu to Box No. 3350-V.

SEVERAL CIVIL ENGINEERS, two with two or three years' experience in road construction and two recent graduates, are required for road building work in northern Quebec. Salary $2400. to $3000 a year. Apply to Box. No. 3351-V.

GRADUATE CIVIL ENGINEER, three or four years out of college, is required for surveying in bush in the Ottawa district, able to take charge of survey and do some plotting, make studies, etc. at office. Salary about $250. a month. Preference to veterans. Apply to Box. No 3357-V.

CIVIL ENGINEER graduate with a good background of experience is required to act as superintendent or project manager for a large company in the Montreal area. Experience in heavy building construction essential. Age 40-50. Salary open. Apply to Box No. 3358-V.

CIVIL ENGINEER, experienced in concrete and steel construction, is required for structural work with a paper company in Ontario. Apply to Box No. 3362-V.

CIVIL ENGINEER is required for work involving maintenance of company houses, roadways, sewage, lighting etc., in a townsite in Ontario for a large paper company Good personality and ability to deal with the public. Salary about $300. up a month. Apply to Box No. 3362-V.

CIVIL ENGINEER, experienced in highway or road construction, is required to act as resident engineer to extend railway spur for a large paper company in Ontario. Position would last six to eight months with good living accommodation on job. Salary $275. a month plus room and board. Apply to Box No. 3362-V.

CIVIL ENGINEER with some experience in highway or railway construction is required by a paper company in Ontario to act as instrumentman. Able to do some layout work on railway lines, take cross sections, calculate earth quantities and be familiar with surveying instruments. Salary about $200-225. a month plus room and board. Apply to Box No. 3362-V.

TWO CIVIL ENGINEERS, preferably but not necessarily graduates, are required to act as structural steel draughtsmen or checkers for a company engaged in this sort of work in Alberta. All applications should indicate education, experience and salary expected. Apply to Box No. 3365-V.

CIVIL OR MECHANICAL ENGINEER with four or five years experience in a pulp and paper company is required by a company engaged in this work in eastern Ontario. Apply to Box No. 3367-V.

ELECTRICAL

ELECTRICAL OR MECHANICAL ENGINEER is required by a firm in Ontario, for work in connection with research and development in electrical farm equipment. Some experience in design and manufacturing methods desirable. Apply to Box No. 3309-V.

ELECTRICAL ENGINEER with experience in steam power engineering is required by a consulting firm in the Montreal area for work in connection with the construction of a new chemical pulp mill. Salary up to $450. a month according to qualifications. Apply to Box No. 3312-V.

SIX ELECTRICAL ENGINEERS, preferably graduates, but not necessarily experienced, are required for specification work by a company in Montreal engaged in the production of telephone systems, automatic dialing equipment, etc. Preference will be given to young veterans, who will be completely trained. Salary $170. to $250. a month. Apply to Box No. 3324-V.

TWO ELECTRICAL ENGINEERS, graduates with at least five to ten years experience, preferably but not necessarily bilingual, are required for office engineering in connection with design and layout of sub-stations and transmission lines by a power company in Quebec. Salary $300. to $400. a month. Apply to Box No. 3329-V.

ELECTRICAL ENGINEER, graduate, young man with at least one year of construction experience since graduation, bilingual, is required for work in connection with the erection of wood pole, steel tower transmission lines and sub-stations in various parts of the province of Quebec. Salary open. Apply to Box No. 3332-V.

ELECTRICAL ENGINEER, graduate with a minimum of two years' experience, including a background in power generation. Preference to veterans. Location: southern Ontario. Salary $225. to $275. a month. Apply to Box No. 3344-V.

ELECTRICAL ENGINEER with some experience with machinery and/or electrical installation work, with ability to get along with people, and interested in investing some capital, is required for executive work with a small company on the west coast for work in connection with the electrical machinery requirements and installation of lighting and power plants in the province. Salary open. Apply to Box No. 3352-V.

SEVERAL ELECTRICAL ENGINEERS, two experienced ,if possible, in transmission and distribution line work; two recent graduates are required for rural electrification work in the province of Quebec. Salary $2400.-3000. yr. Apply to Box No. 3368-V.

ELECTRICAL ENGINEER, not necessarily experienced (recent graduates may apply) is wanted for design work on power distribution systems, by a firm of consulting engineers in Montreal. Salary $175. a month to start. Apply to Box No. 3371-V.

MECHANICAL

MECHANICAL ENGINEER, graduate, with at least four year's experience, some of it supervisory is required by a firm in Montreal, to be responsible for the maintenance of textile machinery and equipment. Age 26-32. Location: Ontario. Salary about $250. to $300. a month. Apply to Box No. 3294-V.

MECHANICAL ENGINEER, recent graduate, preferably ex-service man is required by a company in the Toronto area for work in salt processing, steam heating evaporators, power plant etc. Age 25-27. Salary $200. to $300. a month depending on qualifications. Apply to Box No. 3308-V.

MECHANICAL ENGINEER, age about 35-40 with experience in thermo-dynamics, mechanical and chemical work is required to be chief engineer of a company in the Toronto area. Preference to ex-service man. Salary about $400-$600. a month. Apply to Box No. 3308-V.

FIVE MECHANICAL ENGINEERS, preferably graduates but not necessarily experienced, are required for manufacturing methods engineering by a company in Montreal engaged in the production of telephone systems, automatic dialing equipment, etc. Preference will be given to young veterans who will be completely trained. Salary $170 to 250. a month. Apply to Box No. 3323-V.

MECHANICAL ENGINEER, with 4 or 5 years industrial experience since graduation, with knowledge of and interest in steam as applied to industrial equipment, and by preferably some experience in ventilation work and in pulp and paper mills, is required by a company in southern Ontario. Salary $3600. per year. Apply to Box No. 3333-V.

MECHANICAL OR CIVIL ENGINEER, with at least five years' experience in pulp and paper industry, and capable of assuming responsibility, is required to plan, direct, and technically supervise new development work in the mills of a company with headquarters in southern Ontario. Salary $4800 to $6000 per year. Apply to Box No. 3334-V.

THREE MECHANICAL ENGINEERS, recent graduates, (1946) for draughting and engineering work in the office and field. Location: southern Ontario. Preference to veterans. Salary $200. to $225. a month. Apply to Box No. 3344-V.

MECHANICAL ENGINEER, preferably graduate, with some experience in general lines of contractors' equipment including tractors, shovels, diesel engines, concrete machinery, etc., is required to act as manager of machinery department head office of a large machinery house in the maritimes. Salary excellent. Apply to Box. No. 3353-VI

MECHANICAL DRAUGHTSMAN is wanted for layout and design work in a pulp and paper mill in the province of Quebec. Salary $250. to $275. a month. Apply to Box No. 3354-V.

MECHANICAL ENGINEER, graduate, with some experience in the sale of marine engines, is required to head up the marine department of a large machinery house in the maritimes. Remuneration would depend entirely on the ability and efforts of successful candidate. Apply to Box No. 3355-V.

EIGHT MECHANICAL ENGINEERS or senior draughtsmen are required for design on a large plant extension project near Montreal. Salary $200. a month and good room and board available. Apply to Box No. 3360-V.

MECHANICAL ENGINEER, senior man is required for responsible position in a pulp and paper mill in the province of Quebec. Salary open according to qualifications. Apply to Box No. 3361-V.

MECHANICAL OR ELECTRICAL ENGINEER, preferably but not necessarily with some experience on design of tools and small parts is required by a company in the Montreal area. Salary: open. Apply to Box No. 3374-V.

MECHANICAL ENGINEER with some experience, and ability to handle men is required to act as rock quarry superintendent for a company in southern Ontario Company house available on property. Replies, which will be treated confidentially, should state experience, salary required, availability and should be addressed to Box No. 3378-V.

TWO OR THREE MECHANICAL ENGINEERS, preferably ex-service men, graduates, with some knowledge of steam, piping layouts, design are required by a firm in the Niagara peninsula. Salary open. Apply to Box No. 3380-V.

MINING ENGINEER

MINING ENGINEER, with good experience, is required by a company in Brazil, South America, engaged in the mining and smelting of lead. Successful candidate would have complete authority to operate mine, and in addition to salary would have house accommodation provided. Salary open. Apply to Box No. 3321-V.

MISCELLANEOUS

SALES ENGINEER, not necessarily a graduate but with engineering qualifications and aptitude, is required by a firm in Ontario engaged in selling machinery to the construction industry. Veteran preferred. Apply to Box No. 3290-V.

DRAUGHTSMAN, not a graduate, is required by a firm in Montreal engaged in heating and ventilating work. Prefer young man with little or no experience, to be trained. Apply to Box No. 3293-V.

SERVICE REPRESENTATIVE is required by a firm in Toronto to sell automotive, electrical and fuel system parts, and to train automotive mechanics. Position would be in Ontario and salary is open according to qualifications. Apply to Box No. 3295-V.

ARCHITECT, graduate, preferably, but with some reasonable experience, with good background and personality is required by a firm in Montreal. Interested in someone willing to start at the bottom with prospects of eventually becoming a partner in the firm. Apply to Box No. 3298-V.

DRAUGHTSMAN, preferably someone experienced in process piping work in food industries is required by a firm in the Montreal area engaged in consulting work Apply to Box No. 3299-V.

DRAUGHTSMAN, not necessarily a graduate but experienced, to assist in the work of preparing machinery, pipe arrangements and details of cargo ships, is required by a firm on the west coast. Salary about $225. a month. Apply to Box No. 3302-V.

SALES ENGINEER of proven ability is required by a Canadian manufacturer of high grade power apparatus specialties in demand by power companies, public utilities and manufacturers. Age 30 to 35 years. Apply in writing and state in detail education, experience, age, required salary and enclose photograph to Box No. 3303-V.

SALES ENGINEER, with some experience and if possible, bilingual, is required by a company in Montreal handling contractors' equipment, road building equipment, electrical devices such as generators and vibrators and snow machinery. Salary open according to qualifications. Apply to Box No. 3304-V.

SALES ENGINEER not necessarily a graduate but with some mechanical ability is required by a firm in Montreal. Candidate must be willing to travel throughout Canada selling to paper mills and will be trained by company. Age 25-30. Starting salary $175.-$250. a month. Apply to Box No. 3311-V.

SEVERAL DRAUGHTSMEN are required by a consulting firm in the Montreal area for layout and design work, piping, electrical layouts, detail, etc. Apply to Box No. 3312-V.

ENGINEER, French, bilingual, with some accounting and business experience is required by a company in the Montreal area to investigate prospects for loans, examine premises, evaluate assets, check expansion programmes and study personnel. Salary about $4000. a year. Apply to Box No. 3317-V.

TECHNICAL SALES ENGINEERS are required by an oil company in the Montreal area. Candidates must be bilingual, and experience may range from recent graduate up. Salary will be $150. to $250. a month depending on qualifications. Apply to Box No. 3320-V.

YOUNG ENGINEER, age 25-30, not necessarily a graduate, interested in photography, publicity, editorial and journalistic work, is required to act as assistant to the Sales Development Manager of a large company in the Montreal area. Salary $200-225 a month. Apply to Box No. 3322-V.

DESIGNING ENGINEER with four or five years experience in designing and detailing is required for work with consulting engineer in Vancouver. Salary is open according to qualifications. Apply to Box No. 3325-V.

TWO INSTRUMENTMEN, one experienced on layout and quantities on heavy construction, the other experienced in transit surveys and levelling, are required for survey work in eastern Ontario. Standard salaries will be paid and work will last for possibly two years or more. Apply to Box No. 3327-V.

TWO DESIGNERS, with a minimum of three years draughting experience, are required by a company in Montreal. One must have mechanical experience to specialize in refrigeration design, the other structural or architectural experience to specialize in design layout of food service equipment. Apply to Box No. 3328-V.

GRADUATE ENGINEER, age 25-35, preferably married wth five to 10 years experience in the design of complicated machines to be trained in the designing of shoe machinery. Starting wage will range from $60. to $75. a week for five-day week. Apply to Box No. 3330-V.

TWO ARCHITECTURAL DESIGNERS AND DRAUGHTSMEN, or architects with some experience in modern materials and design are required by a young progressive firm of architectural designers and engineers in Alberta. Salary will be commensurate with ability. Apply to Box No. 3331-V.

INDUSTRIAL ENGINEER is required by a city in New Brunswick to accept the appointment of Industrial Commissioner. Salary good. Apply to Box 3337-V.

GRADUATE ENGINEER, veteran, interested and talented in editorial work, age 27-30, is required for work in Montreal. Salary open. Apply to Box No. 3349-V.

TWO ENGINEERS experienced in heating and ventilation work in the newsprint field are required by a pulp and paper mill in eastern Canada. Salary open according to qualifications. Apply to Box No. 3356-V.

SEVERAL ENGINEERS, recent graduates in chemical, civil, electrical or mechanical engineering, are wanted to undertake an eight-month's course in pulp and paper with a company in Ontario. Permanent positions will be available for successful candidates. Apply to Box No. 3363-V.

ONE MECHANICAL AND TWO ELECTRICAL OR CHEMICAL graduates are wanted for a two-year course with a firm manufacturing electric wire and cables, telephone equipment, etc. Training through various departments of several factories, including some sales. Salary about $175. a month. Apply to Box No. 3364-V.

TRAINING SUPERVISOR to act as assistant to personnel manager, not necessarily a graduate but with engineering background and knowledge of shop procedures. Must be completely bilingual. Age 28-35. Location: Eastern Townships of Quebec. Salary about $3000. a year. Apply to Box No. 3370-V.

TWO ARCHITECTURAL DRAUGHTSMEN, not necessarily graduate engineers, are required for positions with a railway company in Montreal. Salary in accordance with qualifications. Apply to Box No. 3372-V.

MECHANICAL, ELECTRICAL OR CIVIL ENGINEER, recent graduate who must have fluent knowledge of Spanish, preferably under 30, is required by a firm in the Montreal area for technical work in connection with production. Some travelling. Salary open according to qualifications. Apply to Box No. 3373-V.

RECENT GRADUATE in chemical, mechanical or electrical engineering is required to be trained in heating and ventilating field with a company in Montreal. Candidates should be completely bilingual. Salary $30. to $50. a week. Apply to Box No. 3375-V.

DRAUGHTSMAN is required for design work, preferably with some experience in the construction field. Work will involve estimates and detailing of precast concrete work. Salary about $250. a month depending on qualifications. Apply to Box No. 3376-V.

ENGINEER, with considerable experience in foundry work and administration, is required for a senior position by a firm of manufacturers with head office in Toronto. Salary range $5000.-$8000. a year. Apply to Box No. 3379-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

SEVERAL CHEMICAL ENGINEERS for technical service and plant operations, (not laboratory work) with good personality and background are required by a manufacturer in Montreal. Preference will be given to ex-service men and successful candidates will be completely trained at a starting salary of $170. per month. Apply to Box No. 3260-V.

CHEMICAL ENGINEER, preferably with graduate training in chemical engineering and some industrial experience will shortly be required in the chemical engineering department of a university in Ontario. Apply to Box No. 3280-V.

CIVIL

STEEL BRIDGE INSPECTOR, not necessarily a graduate but with good experience, is wanted by a railway company with headquarters in Montreal, to supervise the erection and repair of steel bridges. Salary about $250. a month. Apply to Box No. 3246-V.

SALES ENGINEER with knowledge of building materials, preferably discharged service man with sales ability and inclinations, is required by a manufacturer in Montreal. Successful candidate will have opportunity to become head of this department. Salary is open according to qualifications. Apply to Box No. 3263-V.

CIVIL ENGINEER, graduate with road construction experience, preferably bilingual, age 30-45 years, is required to act as sales engineer for a manufacturer of building materials in Montreal. Candidates should have good personality and appearance to be able to contact government officials, sit in at council meetings, etc. Apply to Box No. 3264-V.

MISCELLANEOUS

CONSTRUCTION AND MAINTENANCE ENGINEER and a DESIGNING ENGINEER, preferably with pulp and paper mills experience are wanted for a paper mill in Newfoundland. Salaries would be from $250. a month up depending on qualifications. Apply to Box No. 3239-V.

PRODUCTION ENGINEER, either graduate or with good practical experience is required by a manufacturer in eastern Ontario. Candidates should be 30 to 40 years old and should have experience in production methods in the manufacture of small parts and assemblies, and in cost control. Apply to Box No. 3257-V.

SAWMILL SUPERINTENDENT, not necessarily a graduate engineer but with practical experience in the production of lumber and preferably with some engineering training is required for a mill in western Quebec. Successful candidate would be in charge of mill production and would supervise the piling and shipping of lumber and also would supervise the steam plant, machine shop, garage, etc. Salary would be about $300. a month. Apply to Box. No. 3274-V.

GRADUATE ENGINEER in mechanical and electrical is required for a junior position as assistant to the works engineer of a company in southern Ontario engaged in the manufacture of wire, fences, gates, mesh, etc. Apply to Box No. 3278-V.

GRADUATE ENGINEER with a good knowledge of the manufacture of steel containers such as oil drums, etc., and with sales and manufacturing inclinations is required by a manufacturer of this type of product in Toronto. Apply to Box No. 3281-V.

Situations Wanted

SENIOR REINFORCED CONCRETE DESIGNER and civil engineer, R.P.E. (Ont). experienced field and office, various countries, seeks first class opening. Apply to Box No. 107-W.

CIVIL ENGINEER, M.E.I.C., P.E.Q., age 39, married, B.Sc., U.N.B., widespread experience in construction with experience in plant maintenance both in civilian and Air Force capacities. Interested in responsible position involving plant maintenance. Apply to Box No. 225-W.

CIVIL ENGINEER, B.Sc.M.E.I.C., R.P.E. (Man.) and Dominion Land Surveyor, now in the army but expects early discharge. Experience comprises seven years air photo surveys, land subdivision, drainage plans, precise levels and topographic mapping and seven years administrative and technical direction in connection with sewers, water mains, roads, building and camp construction. Age 42, married. Apply to Box No. 589-W.

ELECTRICAL ENGINEER, M.E.I.C., R.P.E. (Ont.), age 42, married. Experience in general plant engineering work, design, layout and testing of equipment. Also worked as field engineer on various construction projects. Position in Ontario preferred. Apply to Box No. 1249-W.

EXECUTIVE ENGINEER available. Graduate in mining, Jr.E.I.C., age 35, married, two dependents. Five years' experience in mining and milling, mine development, construction and operation. Canadian and foreign experience. Five years' administrative experience, mass production, development and supervision. Was assistant superintendent of operations in large industrial munitions works. Capable of handling personnel and planning, seeks a responsible position in industrial business or mining. Available on short notice, registered with W.B.T.P. Apply to Box No. 1423-W.

ELECTRICAL ENGINEER, M.E.I.C., R.P.E. (Ont). interested in mechanical design and production; experienced in hydro-electric station design, transformer and machine layouts and in development and design of radar equipment. Services available immediately. Location preferred: Toronto or Hamilton. Apply to Box No. 1693-W.

GRADUATE ENGINEER, B.Sc. (Civil) M.E.I.C., services available. Thorough knowledge of building construction and fifteen years' experience in sales engineering and promotional work in connection with building products; also considerable practical experience in construction work as estimator and in field work. Recently resident engineer on large industrial project. Good connections with architectural and contracting firms, particularly in Toronto area. Apply to Box No. 2440-W.

MECHANICAL ENGINEER, age 34, Lt. (E) R.C.N.V.R. soon to be discharged. Experience, 6 years' heavy maintenance on railroad; 5 years as charge hand on maintenance and renewal of mine and smelter equipment, 2 years foreman of large boiler shop; 2 years production engineer, job estimating and planning, two years with Navy of which 20 months have been at sea. Thorough knowledge of machine and boiler shop, able to plan and handle men, registered with W.B.T.P. Apply to Box. No. 2456-W.

CHEMICAL ENGINEER, young university graduate, previously engaged in war industry, desires permanent position. Available immediately. Apply to Box No. 2464-W.

MECHANICAL ENGINEER, Jr. E.I.C., age 23, single, with degree from N.S. Tech. '44, 18 months' experience as engineer officer afloat in the Royal Canadian Navy. Experience included the administration and control of the entire propelling and other machinery, and the discipline of 30 men in that department. Would prefer work of a responsible nature in a small firm doing manufacturing or installations. Have just been released from the Navy and am available for immediate employment in Canada or elsewhere depending on living conditions. Apply to Box No. 2587-W.

GRADUATE ELECTRICAL ENGINEER, UBC '41, P.E. Ont., Associate A.I.E.E. Age 32, married, one child. Six years school teaching, five months thawing assistant engineer; first class honors degree, C.G.E. Test Course. Major, Technical Staff, R.C.E.M.E., four years active service. Radar trained. Active part in build-up of Canadian Army Telecommunications maintenance and repair organization and production of technical literature. Accustomed to planning, forecasting, general organizing and supervision. Not a specialist. Available in B.C. after discharge February '46. Apply to Box No. 2588-W.

MECHANICAL ENGINEER, Jr.E.I.C., single, age 27, graduate Royal Naval Engineering College (Practical Engineering Prize) wishes work of practical nature, mainly outdoor. Interested in operation or construction of steam, hydro or internal combustion machinery. Eight years in R.C.N., including operational, overseeing and instructing. Medical discharge. Seven months on shipyard staff. Prefer to remain near Pacific Coast but would consider temperate climate like New Zealand, South Africa, southern England. Apply to Box No. 2589-W.

GRADUATE MECHANICAL ENGINEER (Sask. '36). Six years' experience on estimating, design and construction of industrial buildings and heavy equipment installation as well as a fair amount of general shop experience. Four and a half years as Engineer Officer in R.C.A.F. Two years in charge of servicing and maintenance of Anson trainers and two years in charge of Mosquito maintenance with operational squadrons in England and Europe. Interested in executive position on construction maintenance. Apply to Box No. 2591-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., with 18 years' experience in Canada and abroad in tool design, product design, shop and industrial engineering, labour relations. Successful organizer. Available due to closing of war plant. Apply to Box No. 2592-W.

CHEMICAL ENGINEER, single, age 25, B.Sc., Sask. '42. Recently discharged from the army. At present taking post graduate work. No significant industrial experience. Interested in a position in production or plant control. Services available in May 1946. Apply to Box No. 2593-W.

CHEMICAL ENGINEER, B.A.Sc., U.B.C., S.E.I.C., Jr.A.I.Ch.E., age 25, married, no dependents, residing in east, desires employment in production control and/or sales service in Ontario or Quebec. Apply to Box No. 2594-W.

CIVIL ENGINEER, R.P.E. (Ont.) desires executive position as plant engineer; seventeen years' experience, initial and layout surveys and plant installation for production of gold, coal and slate. Drainage design and road construction. Five years construction engineer officer (R.C.A.F.) supervising the construction and maintenance of air stations under the Commonwealth Air Training Plan. Available on one or two months' notice. Apply to Nox. Bo. 2595-W.

ELECTRICAL ENGINEER, R.P.E. (Ont.) age 28, married, C.G.E. Test Course and Sales. Five years' plant experience in direct charge of engineering, maintenance and construction of several large chemical plants. Would consider employment with progressive engineering organization or in sales. Prefer Ontario. Apply to Box No. 2596-W.

MECHANICAL ENGINEER, B.Sc. Queen's, Jr. E.I.C., R.P.E., (Ont.) age 28 single, recently returned from overseas after service with R.C.E.M.E., presently in Ottawa, available shortly. Experience includes one year as demonstrator in thermodynamics, machine design, fuel testing laboratories; one year instructor R.C.A.F. wireless course; four years Telecommunication Officer R.C.E.M.E., maintenance radar, wireless and electrical equipment, experience in handling men. Willing to go anywhere in Canada. Apply to Box. No 2601-W.

PART-TIME SERVICES Engineer with 25 years construction experience, now operating a private practice, would consider part-time sales agency for building materials or equipment. Location: Maritime provinces. Apply to Box No. 2606-W.

ELECTRICAL GRADUATE '46, N.S.T.C., S.E.I.C., 23, single, available upon graduation anywhere in Canada. Interested in electronics, communications, industrial promotion and management. Experience in one of Canada's largest radio manufacturer's test department and electrical draughting. Apply to Box No. 2607-W

GRADUATE MECHANICAL-ELECTRICAL ENGINEER, 53 years old, with broad background in U.S. and Canada would like position in small or medium-sized organization as assistant to manager in operations but with freedom to do research and development touching any phase of the business. Apply to Box No. 2608-W.

LIBRARY NOTES

(*Continued from page 212*)

TREATISE ON APPLIED HYDRAULICS

By H. Addison. 3 ed. rev. and enl. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 514 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $6.50.

The purpose of this book is to present a compact summary of the fundamental principles of hydraulics and of the manner in which they are supplied by the engineer. Particular attention has been given to the following topics: frictional loss in closed and open conduits; pressure and thrust on immersed solids; water-hammer in pipes; and pressure distribution on pump and turbine blades. There is a bibliography divided by chapters.

URANIUM AND ATOMIC POWER

By J. De Ment and H. C. Dake. Chemical Publishing Co., Brooklyn, N.Y., 1945. 343 pp., illus., diagrs, charts, tables, 9 x 5½ in., cloth, $4.00.

Following a brief discussion of the background and possibilities of atomic power, come chapters on the constitution of uranium minerals and prospecting methods. Chapters 4 and 5 deal respectively with the physics and chemistry of uranium. Chapters 6 and 7 cover in detail the methods used in the detection and determination of uranium. A large bibliography of original sources of information and a number of tables of useful data are appended.

AN URGENT REQUEST

Would members who do not file the *Journal* kindly return their February 1946 copy to headquarters.

On account of difficulties at the printers, fewer copies have been printed than had been ordered and the needs of several libraries have not been filled.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

CONTENTS

COVER PICTURE

To save precious cargo space, the nourishing value of eggs is reduced to its simplest form, before being shipped to the millions of hungry people in Europe. The cover picture shows the huge cone into which the egg mixture is pumped at high pressure through a tiny nozzle, is immediately dried by an air current and settles to the bottom as egg powder.

WARTIME PRODUCTION OF PRECISION OPTICS IN CANADA

D. C. R. MILLER, M.E.I.C.

Development engineer, Fiberglas Canada Limited, Oshawa, Ont., formerly production superintendent of optical shops, Research Enterprises Limited, Toronto, Ont.

This is the first of four instalments of a paper describing the establishment, as a result of war exigencies, of a new industry in Canada. Because of the special interest created among engineers by this development, and the dearth of literature on the production of precision optical parts, the Publication Committee has allocated this unusual amount of space to the paper.—Ed.

The Nature of the Problem

When, late in 1940, war developments led to the decision to produce precision optical instruments in Canada, not the least of the difficulties involved was the quantity production of precision optics. This problem was itself a formidable one, quite apart from the problems of producing optical glasses, producing intricate metal parts and assembling the instruments so as to meet rigid specifications, since optics of the type used in military fire-control equipment had never before been produced in Canada except possibly on a laboratory scale.

The purpose of this paper is to outline the nature of this wartime problem and to describe in general terms the methods used and results achieved at the Government-owned plant of Research Enterprises Limited in Toronto[1].

Before proceeding to more detailed considerations, it may be as well to glance at the types of fire-control instruments for which optics had to be supplied. Between the years 1941 and 1945, nineteen different kinds of instruments with optics were built—nine different sighting telescopes, three different periscopes, the dial or panoramic sight, the director, two kinds of binoculars, and three different rangefinders—the one metre base, 12 ft. base, and 9 ft. base height and rangefinder. In addition, optics were supplied in quantity for assembly into similar instruments by other Canadian firms. These various instruments and their several models had in total some 350 different optical elements—lenses, prisms, mirrors, windows, filters or graticules—embracing virtually every type of precision optical part. In an article of this scope, it would obviously be impossible to describe in full detail the manufacturing techniques employed in all this wide variety of parts: all that is possible is a general description of methods on representative types.

Some idea of the number and variety of optical parts required may be gained from a study of the four assembly drawings in Figs. 1 to 4, showing the optical trains in some representative instruments, all of which were required and produced in very large numbers. Figure 1 shows the optical assembly in a typical sighting telescope. The entrant light passes first through a ¼ in. thick replaceable protecting window, then through the objective system comprising two achromatic doublets[2], next through an erector doublet which forms an erect image of the target on the surface of the graticule situated in the focal plane of the erector lens. The sighting lines and figures engraved on the graticule are thus superimposed on the target and the whole viewed through the two eyepiece doublets under magnification. This telescope, used in large quantities for aiming tank and anti-tank guns, and for close-range work on field artillery, has no less than ten precision optical elements.

Figure 2 shows the optical system in a typical panoramic sight. Light enters the rotatable sighting head by a parallel window and is directed by a front-surface mirror, through the objective lens doublet and top prism with two silvered surfaces to be imaged on the engraved surface of the plano-convex graticule. The image so formed is viewed through a system comprising two eyepiece doublets, two erector doublets, a 45°-45°-90° prism, and a rotating Dove prism. This instrument, used for azimuth sighting on the 25-pounder field gun, has 16 optical components.

Figure 3 shows the optical system of the prismatic binocular. Light enters through the objective doublets, passes through the two pairs of prisms which in the Porro system combine to compress the light path and give an erect image on the engraved graticule at the focal plane (on the right side only). These images are viewed through adjustable focus Kellner type eyepieces, each comprising an achromatic doublet and plano-convex field lens. Binoculars of this type have therefore a total of 15 optical elements.

Figure 4 shows the optical assembly arrangement in the 1-metre baselength coincidence-type rangefinder. Light enters the left window, passes through the left pentagonal prism and astigmatizer lens[3], thence through the left objective lens which images half of the target in the upper field of the centre prism cluster. The right side of the system is similar to the left, with the addition of a very accurate deviating wedge between the objective lens and the prism cluster. Traversing this wedge over a length of some 7 in. causes the image of the lower half of the target to travel across the focal plane of the lower field of the centre prism cluster, and the position of the wedge when upper and lower images coincide is a measure of the distance of the target.

Fig. 1—Optical assembly train in typical sighting telescope.

The centre prism cluster is a complex arrangement of four intricate prisms cemented together, with a cover glass cemented over the focal plane at the separating line between upper and lower fields. The eyepiece system comprises two achromatic doublets and a filter wheel with three colour filters. In addition there is a scale-viewing system, comprising a window, magnifying scale reflecting prism, Dove-type scale erecting prism and plano-convex lens, and a collimating viewfinder with plano-convex lens and opaque graticule. This instrument has 29 optical parts, many of them of the highest precision, while the different models necessitate variations in design raising this figure to 38.

The above outline gives a rough idea of the quantity and variety of optics required for representative types of instruments supplied in large numbers, but a better understanding of the nature of the problem will be gained by a brief consideration of the dimensional and surface accuracies involved. Actual tolerances on overall dimensions in most optical parts are well within limits commonly encountered in metal parts of similar size. That is, in prisms and lenses with maximum dimensions of about 4 in. (the great majority lying between ¾ and 2¼ in.) tolerances on lineal dimensions are rarely held closer than ± .001 in. and are often permitted to vary as much as ± 1/32 in. The only difficulty experienced here occurs when close tolerances are required between polished faces. As will appear later, not only is the measurement of such dimensions difficult during the polishing operation, but it is not easy to ensure that the desired

[1]See Col. W. E. Phillips—The Organization and Work of Research Enterprises Ltd. (*The Engineering Journal*, March, 1942).

[2]An achromatic doublet is a lens comprising two components cemented together. The double-convex component is usually made from 'crown' glass (index 1.510-1.615); the other component, usually concave-convex or plano-concave, is made from 'flint' glass (index 1.551-1.653).

[3]A plano-cylindrical lens which may be introduced into the system at will.

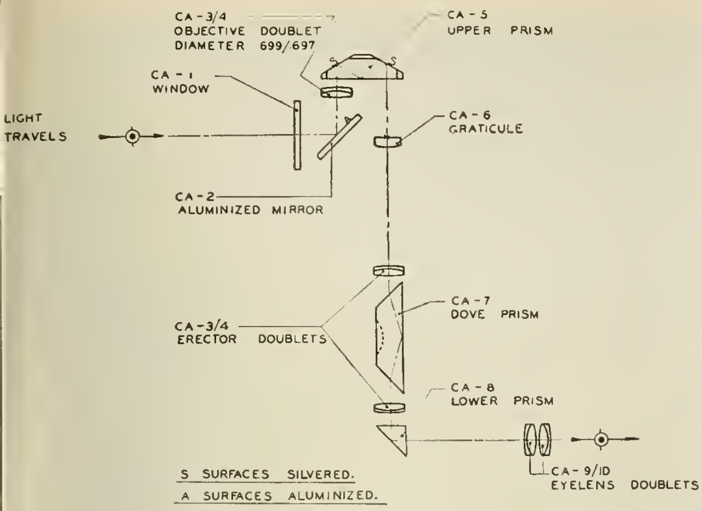

Fig. 2—Optical assembly train in typical panoramic sight.

surface quality will occur synchronically with the desired size.

The surface accuracy necessary in most optical parts is measured in wavelengths of light and varies from $^1/_{10}$ wavelength to as much as 5 wavelengths, depending on the position and function of the part. These figures may be converted into more familiar terms by remembering that one wavelength of white light measures roughly 2/100,000 in. Reflecting faces of prisms in the objective system are commonly held to $\frac{1}{4}$ λ in flatness, and entrant and exit faces from $\frac{1}{2}$ to 1 wavelength. With lenses, the curved surfaces of which are almost invariably spherical, actual sphericity is more important than exact radius of curvature and is usually held within $\frac{1}{4}$ λ on important image-forming optics, while the method of measurement entails holding the radius[4] to within $2\frac{1}{2}$ λ.

Angular tolerances in windows and prisms are of the greatest importance and vary from $\pm$ $\frac{1}{2}$ sec. for the end mirrors in the 12 ft. base rangefinder to $\pm$ 5 min. in binocular prisms. An angular tolerance of $\frac{1}{2}$ sec. may best be visualized by remembering that two surfaces parallel within this amount would diverge or converge by slightly over $\frac{1}{8}$ in. if extended a distance of one mile.

Surface quality is another factor of importance, apart from exact flatness or sphericity. The freedom from surface defects, such as scratches, pits and other blemishes, varies according to the position of the part in the optical train, but is in all cases of a very high standard. The quality of polish required in precision optics is far above that of ordinary plate glass or spectacle lenses, while for focal plane

[4]Or, to be more precise, the sagitta.

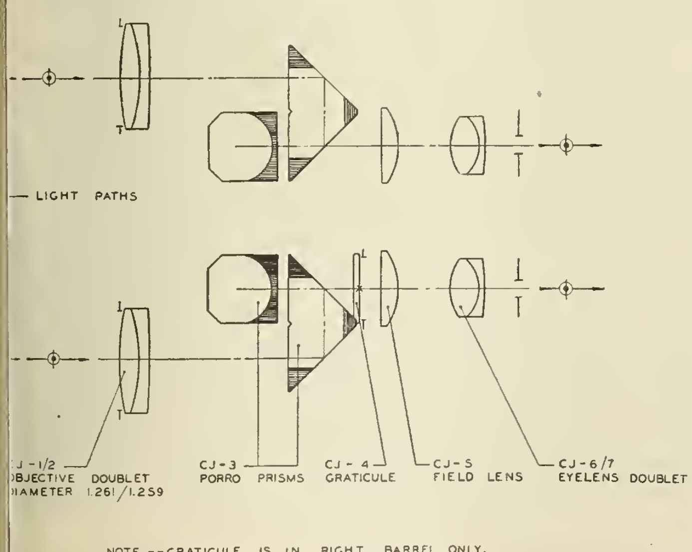

Fig. 3—Optical assembly train in typical prismatic binoculars.

surfaces optics are rejected for surface defects quite invisible to an untrained inspector even with a powerful magnifier.

There are of course other requirements for optical elements—exact composition as manifested in refractive index and dispersion, freedom from bubbles, stones and striae[5], correct annealing, etc., but these are glass-making problems and outside the scope of this article.

Some conception of the nature of the manufacturing difficulties involved may thus be gained by combining the quality and quantity requirements above outlined.

Preliminary Steps

Before production could commence, a number of preliminary steps were necessary. The most fundamental of these was the decision to standardize on English optical glass types, for this controlled the whole glass-making programme. It also affected the optical design of every instrument, since lens curvatures and prism angles vary according to glass composition. The fourteen main types of clear glass standardized ranged from Borosilicate Crown, index 1.510, to Extra Dense Flint, index 1.653.

The next important step was the selection of key personnel, and in this matter, the primary factor in the success or failure of any undertaking, Research Enterprises Limited was exceptionally fortunate. From the Optical Department of the National Research Council, Dr. D. C. Jones was procured as Director of Optical Shops, while from the University of British Columbia, Dr. A. M. Crooker was obtained on loan, as Chief Optical Physicist. Without the experience, skill and efforts of these two individuals the success of the whole programme might well have been jeopardized.

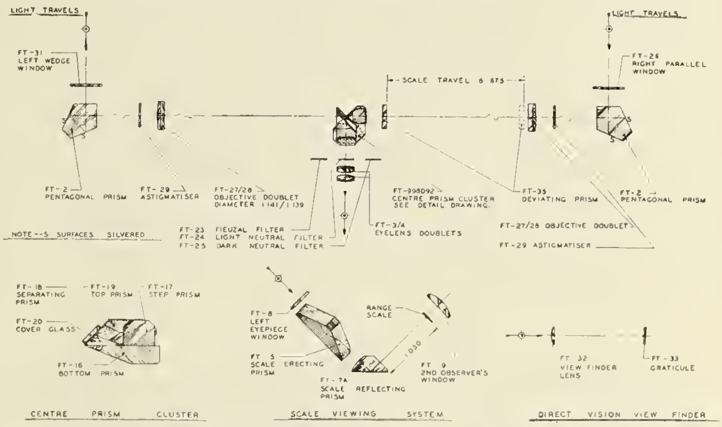

Fig. 4—Optical assembly train in typical short baselength coincidence-type rangefinder.

There were in Canada at that time no manufacturers of precision optics whatever. Work on a laboratory scale had been done at the National Research Council and there were a few spectacle lens manufacturers in Ontario. Furthermore there was then almost no printed information on large-scale production of optics of this type[6]: in fact, the methods and techniques of precision optics manufacture were generally confined to the few long-established firms whose work tended to be veiled by the same reticence as until recently surrounded the manufacture of optical glasses. Skilled technicians in this field simply did not exist in Canada. Our position for embarking on this difficult venture could therefore hardly have been worse.

From this predicament we were rescued by the generous co-operation of the Bausch and Lomb Optical Company, who volunteered to train a small number of men in the various

[5]Stria—a streaked or vein-like appearance caused by local variations in refractive index and composition.

[6]See references ②, ③, ④, and ⑤ in the bibliography at the end of this article, as representing the sum total of printed information then available.

phases of optical manufacture. Half a dozen capable individuals were therefore selected and assigned to different fields—grinding, lens polishing, planar polishing, hand correction, centering and cementing, and inspection. These men on their return, formed the main nucleus for a staff which was to grow within three years to over 1000 employees. At about the same time we were also lucky in being able to obtain from England, through the Department of Munitions and Supply, the services of a man experienced in English optical grinding methods and, by other means, an Austrian optical technician, with valuable experience in English, Swiss and German optical polishing shop methods. From all these sources we were therefore able to combine the good features from Continental and English practice, and ultimately many improvements of our own devising.

In this interim period, optical systems for the first few instruments were being re-computed under Dr. Crooker, while the necessary manufacturing facilities began to take shape under Dr. Jones' direction. It was thus that production began on a small scale in the early spring of 1941, in buildings barely completed, using optical glasses imported from England. Within three months, production was in full swing on our own glasses.

Before attempting to describe the results finally achieved, it is proposed to devote the major part of this article to an outline of the general methods used in the quantity production of military precision optics, since an appreciation of the manufacturing problems is essential to a proper evaluation of the results. This purpose may best be served by considering first the methods used with lenses, then prisms and flatwork. It should be understood that the methods described are not necessarily the ones adopted at first. In some cases several years were required to develop them into this final form. Other methods in use elsewhere will also be mentioned wherever of sufficient interest.

Production Methods—Lenses

The production of lenses, where large quantities are involved, begins with the receipt of mouldings from the glass plant. These mouldings are both thicker than the finished lens and of larger diameter, while the radii of the spherical surfaces are varied slightly from the final requirements, in a manner depending on whether the lens is to be ground or milled. It is assumed that the mouldings have already been inspected for correct refractive index, proper annealing, freedom from glass defects and serious moulding flaws. Where only small quantities are involved, the glass is supplied in slabs or plates which must first be cut into discs by methods to be described later. The lens is then worked to its final form by a succession of milling or grinding processes, each finer than the one preceding, until ready for polishing. In these operations, lenses are handled sometimes singly, sometimes in multiple on 'blocks', in a manner which will now be described in further detail.

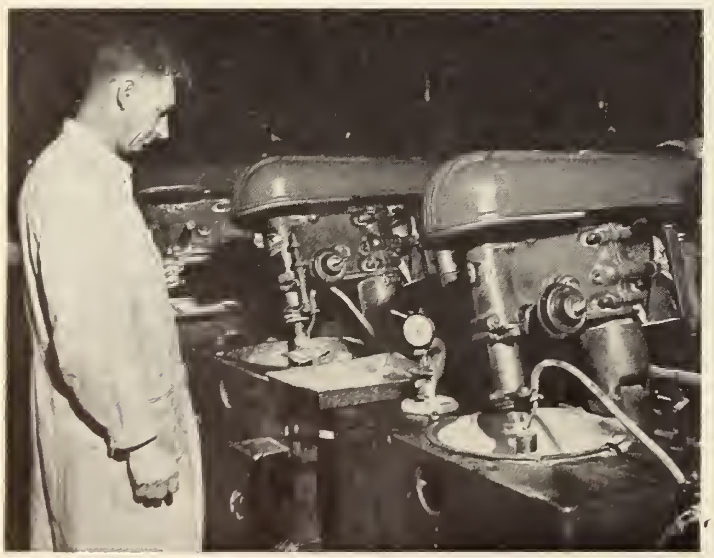

Fig. 5—Battery of Delta lens milling machines.

LENS HAND GRINDING

The simplest method of grinding lenses, and one which has been in use since the earliest times, is to shape them by abrasive action in concave or convex revolving tools of approximately the finished radius desired. This method is still used where small quantities are involved. The grinding tools are of a close-grained cast-iron, of diameter slightly larger than that of the lens blank itself. The revolving spindle may be either horizontal or vertical, the latter being preferred for larger lenses. Provision should be made for three-speed V-belt drive so that the peripheral speed of the grinding tool may be kept at about 200-500 ft. per min. The lens may be held in position by the thumb and fingers, or cemented to a wooden handle if difficult to hold. Two stages of grinding are usually necessary—rough grinding with abrasive of 90-125 micron grain size [7] and medium grinding with abrasive of 25-30 microns—the abrasive being applied to the tool by means of a small brush. Considerable skill is required with this hand-grinding method as the tools must be constantly trued to a brass gauge of the correct radius, and unless uniform pressure is applied, together with the proper random motion, the lens will assume some aspherical form. Trueing is accomplished by either relieving the tool wherever necessary with a carborundum stick, or selective grinding with loose abrasive and a cast-iron tool of correct and opposite curvature. As the grinding proceeds the lens is checked for correct radius across several diameters with a brass gauge. Care is also necessary during the grinding to prevent scratches. These may be caused by poorly graded abrasive or by too much pressure. Poor surface finish may be caused by failure to allow adequate time for the abrasive to break down. Care is also necessary to prevent development of 'prism', that is, the condition of unequal edge thickness caused by the centres of curvature of each side not lying on a line normal to the mechanical centre of the lens. The curvature of the successive grinding tools is so arranged that at each stage grinding starts at the edge and works in to the centre. Production rates with this method for the complete operation on both sides, with a skilled man, vary from 5 to 10 lenses per hour, for lenses ¾ in. to 2 in. diameter, depending on the size of the lens, curvature, and amount of glass removed. The latter may vary from .040 in. to .080 in. off each side.

LENS MILLING

Such methods, while entirely satisfactory in their results, are no solution to the problem of large-scale output by unskilled operators, and for such purposes have now been entirely superseded by lens milling techniques.

There are three methods by which lenses may be milled: the curve may be generated by revolving the lens and feeding into a groove of circular cross-section round the peripheral face of an abrasive wheel; or by revolving the lens beneath an inclined spherical-formed abrasive wheel of the same radius as is required of the lens; or by revolving the lens beneath an inclined cup-shaped abrasive wheel. The latter method is the most versatile, because by varying the inclination of the cutting wheel, and adjusting the offset so that either edge of the cutter is over the centre of the lens, any desired curve—concave, convex, or planar—may be generated, independent of the form of the cutter itself. Diamond abrasive wheels charged to a depth of ⅛ in. to ¼ in. or more, are in general use for this purpose and they may be of any of the three common types: hand-charged, where the copper wheel is grooved or nicked, charged with diamond-dust mixed with grease, and the grooves rolled over with a hardened roller in a lathe; resin-bonded, where

[7]The nomenclature used here for grain sizes will be clarified in a later section under 'Abrasives'.

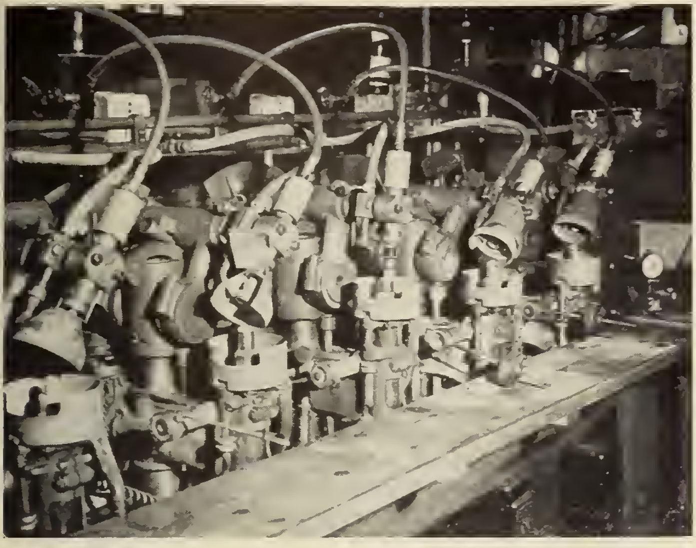

Fig. 6—Desoutter compressed air lens milling machine.

the diamond-dust is mixed with a phenolic resin and moulded to form; or metal-bonded, where the diamond-dust is mixed with powered bronze and moulded into the desired form by powder-metal techniques. The latter is the preferred type from the standpoint of cutting speed and life, although for well over a year we had to depend on the hand-charged type due to unavailability of the others. The diamond-dust may be of any desired mesh size depending on the finish required. As we used lens milling mainly for roughing lenses, wheels of 120-180 mesh (125-90 microns) gave the best compromise between speed of milling and finish. To a surprising extent, however, the latter is dependent on the rigidity of the cutter spindle and high peripheral speed. A speed of at least 4000 surface feet per minute is desirable, coolant of the oil emulsion type being used with a well-compartmented sump to permit settling of the powdered glass removed. Otherwise, this material will settle out in the coolant pipes and block them completely.

The first machines of this type which we built were designed and put into operation in 1942. These used Delta drill-press heads for both spindles—inverted for the bottom lens-carrying spindle, and upright for the inclined cutter spindle. Figure 5 shows a battery of these machines in operation. One operator can run two or more machines, since the lens thickness is controlled automatically by weights on the feed arm of the lower spindle, forcing it upwards until it reaches an adjustable stop. Cutter diameters of 1½ in. to 4 in. are used. These machines operated satisfactorily, but suffered from lack of rigidity in the cutter spindle at high speeds, resulting in some loss of surface finish.

To overcome this defect and to permit milling of small lenses with steep curves, we decided to risk a somewhat radical innovation, and ordered a similar type of machine using compressed-air Desoutter drills on the inclined spindles to give the cutter a speed of 20,000-30,000 rpm. These machines, shown in Fig. 6, were in operation towards the end of 1943, and proved extremely satisfactory. Deflectors were fitted to the exhaust air orifices to prevent the coolant being blown away, and thickness was controlled by automatic feed to separately adjustable stops on each of the five spindles. Using metal-bonded diamond cutters ½ to 1 in. diameter, the finish was so satisfactory that medium-grinding (normally the next operation) could be dispensed with entirely. About the only objectionable feature was the noise, which from 10 Desoutter drills running simultaneously was quite considerable. This type of machine was successfully used on convex and concave curves of 0.473 in. radius (Fig. 3, binocular eyelens cemented curves).

Methods of holding the lens during milling have considerable bearing on the speed of the operation and accuracy of curve. The problem is not a simple one because the lens mouldings vary in diameter by as much as .015 in., and chucks of the 3-jaw adjustable or collet type are slow and awkward to handle and apt to chip the lens. Furthermore, in milling the second side of double-convex lenses, there is almost no edge left whereby to grip the lens. Methods involving cementing or waxing the lens to steel discs which may be held in collet chucks are also very slow. We found the simplest and best solution was a type of chuck in which the lens is located in a shallow circular recess in the steel chuck, resting on a narrow band of fibre or hard rubber of the approximate curvature of the moulded or previously-milled surface. The lens is simply dropped into the chuck, milled to thickness and lifted out when finished, the drive being by friction from contact with the fibre locating ring. The recess is made to accommodate the high limit of moulding diameters. With very steep convex curves the slight wandering of loose-fitting lenses causes trouble in maintaining curvature which may necessitate correction by hand-grinding. This could be prevented by the use of vacuum-type chucks on which experiments are now proceeding. The amount of wandering is reduced to a minimum by so arranging the curves of the moulding that milling starts from the centre towards the edges. This also minimizes tendency to tip in the chuck and develop 'prism'.

Accuracy of curvature of milled lenses can with care be held to that of hand-grinding methods. As with the latter, curves are usually checked with brass gauges. When it is desired to omit medium grinding, however, a more accurate check on radii is desirable and is accomplished by means of a simple ring-type spherometer requiring no skill for its use. This locates the lens on a hardened and ground ring and measures its sagitta or bulge with a dial indicator graduated in 1/10,000ths, the latter being set to zero from a master lens of correct curvature. Two such spherometers of our own design are shown in Fig. 7, together with a variety of simple radius gauges. The Desoutter machines were quite capable of holding a sagittal tolerance of ± .0002 in., which, with a small lens of 0.500 in. radius, corresponds to a radius tolerance of ± .0004 in.

It should be mentioned that a rough bevelling operation is necessary on both sides of most lens mouldings before milling, both to remove moulding flash, and to reduce the tendency to chip. This is a quick operation, done by hand on a concave or shallow convex cast-iron tool with coarse abrasive or a similar diamond tool, at rates of about 200 pieces per hour for both sides.

The lens milling operations remove .040 in. to .080 in. from each side of the moulding and output varies from 40 to 64 pieces per man-hour for both sides, the time varying

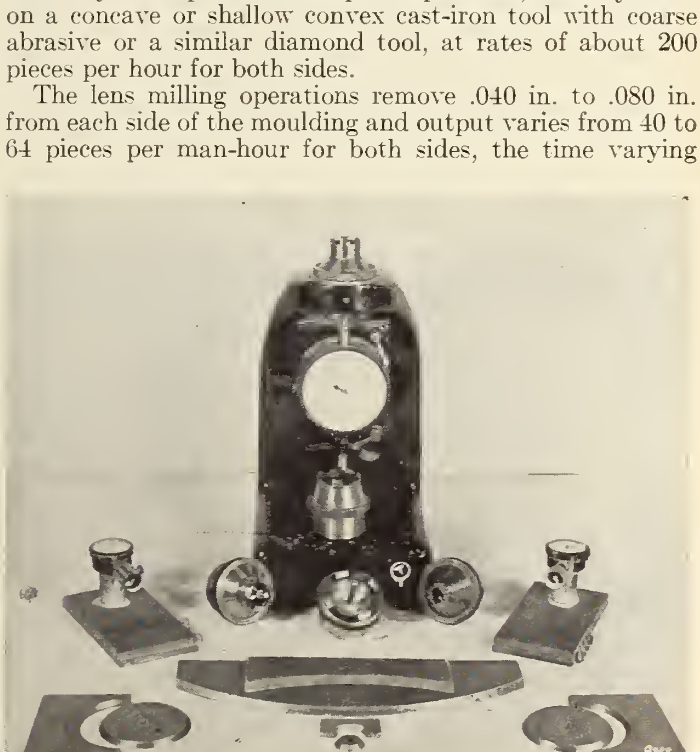

Fig. 7—Two types of shop spherometers and radius gauges.

surprisingly little for any lens up to 2½ in. diameter. Cutter life depends largely on the depth of charging of the milling cutter and the amount of glass removed, and normally lies between 5000 and 15000 sides, or as high as 25000 in exceptional cases. After milling, the lenses are inspected by wetting and examining for moulding flaws which may not have milled out, then fine bevelled preparatory to the subsequent operations.

LENS BLOCKING

What these operations are depends somewhat on the size of the lens and steepness of the curves. Wherever possible from this point the lenses are worked in blocks: that is, they are fastened on the surface of a spherical tool of as large a diameter as a hemisphere of the required radius, or if this is impracticably large, the largest size that can conveniently be handled—usually not over 12 in. diameter. It will thus be readily seen that small lenses with very steep curves can only be handled singly, while with slightly less steep curves it may be possible to get 3 to a block and with shallow curves 50 to 100 or more depending on the lens diameter. In practice, due to grinding and blocking difficulties, the spherical angle is usually limited to 160°. The exact number of lenses which may be placed on a block is a problem in spherical trigonometry, and the arrangement of the lenses—whether one or three are placed in the centre—must be so chosen as to give the maximum number and may considerably affect the cost per lens of block grinding and polishing.

There are numerous different ways of fastening the lenses to the block, but in all cases the main principles should be that the lenses are securely attached to the blocking tool by whatever cement or pitch is used, that the pitch should be hard enough that it will not cold-flow when the block is left standing overnight, that there is a uniform supporting thickness of this material between the lens and the tool, that the degree of support will obviate any distortion when the lens is removed from the tool, and that this removal may be quickly accomplished without damage to the lens. Of the many different methods tried, the most satisfactory appear to be those involving the use of pitch as a blocking medium. For double-convex or crown lenses of shallow curve a convex cast-iron blocking tool is used of radius somewhat less than that of the lens, to allow for the thickness of pitch. Where the curve of the underside of the lens is steep, the requirement of uniform supporting thickness may result in a pagoda or cusp-shaped, instead of spherical, blocking tool. This usually occurs only in 3-lens blocks.

The convex lenses are blocked by arranging them face downwards in a concave tool of the same, or slightly larger, radius as whatever grinding tool is to be used in the next grinding operation. This tool, and the lenses themselves, must be carefully cleaned to avoid tilting of the lenses which would result in 'prism'. The lenses are held in position in the concave tool by smearing it lightly with a thin grease or coal oil. The convex blocking tool is then heated in a gas flame, coated with liquid blocking pitch from a gas-heated pitch melting pot and the pitch formed to the desired radius by a concave pitch-forming tool in an arbor press. The blocking tool is thus coated with a uniform layer of pitch of thickness sufficient to retain the lens—from ¼ in. to ½ in. usually—and while still warm is pressed into the concave tool in which the lenses have been positioned. The lenses thus become firmly embedded in the pitch of the blocking tool yet remain raised above the surface of the pitch layer. When the pitch cools, any excess which has been displaced unduly close to the lens surfaces is removed by careful chipping, or dissolved by revolving the tool and rubbing with a kerosene-soaked cloth. For concave lenses, a convex instead of concave tool is used for positioning the lenses and the subsequent operations are the same as those described.

The quality of the blocking pitch is an important factor with this method. Trouble arises mainly from a pitch which is too soft. This may settle or cold-flow either before or during polishing, or may soften during polishing and cause distortion of the lenses through inadequate support. Yet if the pitch is too hard, trouble may develop when polishing concave lenses as it will not yield enough to accommodate deformations arising from the heat of polishing, with the result that the lenses are under strain and change shape when removed from the block. The types of blocking pitch furnished by optical supply firms were found to be more uniformly satisfactory than the various blocking pitches of our own to which, in times of shortage, we were obliged to resort.

With concave lenses of more than 1½ in. diameter, the thinness at the centre often causes trouble with distortion after removal from the blocking tool when polishing is complete. This trouble is apt to arise with such lenses no matter what blocking method is used. To overcome it, we made a practice of blocking thin concave lenses with sealing wax points. This is done by first melting the sealing wax and casting it into brass moulds to form little cylindrical sticks about ½ in. long and ¼ in. diameter. The lenses are then heated and the wax sticks fastened to the underside at about ½ in. centres all over the surface. The lenses, with these points attached, are next arranged face downwards on a convex tool and transferred from there to the blocking tool by heating the latter and picking them up. The hardness of the sealing wax and multiple supporting points reduce distortion trouble to a minimum and assist in maintaining an even temperature through the lens during polishing. A wide assortment of lens blocks of various types is shown in Fig. 8.

Other methods of blocking tried and discarded for various reasons included the use of individual 'mallets' or lumps of pitch for each lens (these may be cast like the sealing wax sticks), the use of cast-iron blocking tools with accurately machined recesses in which the lenses are cemented, and the use of recessed positioning tools to give even lens spacing and eliminate the necessity for chipping away the excess pitch.

Fig. 8—An assortment of concave and convex blocks.

LENS MEDIUM GRINDING

Once the lenses have been blocked, the next operation is medium grinding, which is done by hand on vertical-spindle machines, using a lever to apply pressure between the block of lenses and the grinding tool, and abrasive of 25-30 microns. This is an operation requiring much the same order of skill as individual lens grinding, and the same precautions must be taken to prevent scratches and maintain correct curvature. While the latter can be measured by large ring spherometers, our practice was to coordinate the medium grinding with the fine grinding by constant cross-checking, involving trial and correction when and as necessary. Control of the amount of glass removed can be effected by two methods: either by spotting[8] a few lenses in each block to the correct thickness in a drill press with a diamond tool, and continuing the grinding till the spots are removed, or by merely holding the thickness of the milled blanks to a close tolerance and limiting the time of medium grinding. On most telescope lenses, the tolerance on finished thickness is ± .010 in., so by holding the thick-

[8]Making a small conical indentation.

ness after milling to .005 in. over the high limit, and allowing .005 in. on each side for removal during subsequent operations, we found that thickness tolerances in the finished lenses can be met without the necessity for 'spotting', although for closer tolerances it is sometimes necessary.

Production rates for the medium grinding operation vary from 10 blocks per hour for 2 or 3-in. diameter blocks to 3 blocks per hour for the larger 10 in. or 12 in. diameter blocks. The time for each lens of course varies immensely, depending on the number per block.

LENS FINE GRINDING

The fine grinding which follows medium grinding is essentially the same operation, but requires more care and skill, because the radius of curvature of the lenses after fine grinding must agree with that of the test glass within a few wavelengths. The test glass, which is a thick polished disc of quartz with one surface perfectly spherical to the required radius, is used after polishing begins and permits variations in curvature, or other surface imperfections, to be measured by coloured interference fringes or rings which are formed between the test glass and the surface being tested. Each ring corresponds to a thickness of air film between the test glass and lens or other surface of one-half wavelength (say 0.28 micron or roughly 1/100,000 in.) and the method of use is now so general for precision work of all kinds as to require no further elaboration here. The method of preparing test glasses is of considerable importance, however, and will be discussed later under the heading of hand polishing. To maintain accurate curvature on the lens block after fine grinding to within say $2\frac{1}{2}\lambda$ or 5 rings requires considerable skill both in grinding and in keeping the grinding tools true, a condition which becomes more and more difficult to meet as the blocks become smaller and the curves steeper. After every few blocks have been fine ground, one is placed on a polishing spindle and given a 'shine' or rough polish just sufficient to permit readings to be taken with a test glass. The grinding tools are then corrected as necessary. It will thus be seen that the maintenance of correct curvature really starts with the test glass, each successive milling or grinding operation giving a curvature slightly steeper than the one preceding, until after fine grinding the curve is 5 rings or less shallow to the test glass in the case of convex lenses, or the same amount steeper for concave lenses. The appearance of interference fringes between a large lens and test glass is illustrated in Fig. 9.

Fig. 9—Showing the appearance of interference rings between lens and test glass.

The abrasives used for fine grinding start at about 18 microns and go down to 11 or sometimes 9, never finer. It is usually quicker, and causes less trouble with tools, to do the grinding in two stages, first with 15-18 grade and finishing with the finest abrasive. After each grinding stage the block must be very thoroughly washed off under a tap to make sure no particles of coarser abrasive are carried over to the next stage. This applies particularly after the last stage, to avoid trouble with scratches in polishing. The surface must also be carefully examined to make sure there are no deep pits which would not polish out subsequently. About .002 in. to .004 in. of glass are removed during both stages of fine grinding and production rates for the complete operation vary from 3 to 6 blocks per hour.

Fine grinding of lenses of very steep curve, which must be polished singly, can be done by hand, but this is a slow and costly process. Considerable time may be saved by using for this purpose similar machines to those used for lens polishing but running at much higher speeds, and this method is used by some firms for blocks of all sizes and for medium as well as fine grinding. It is doubtful, however, whether much time is saved except with 3-lens blocks or smaller and the machines take far more space than hand-spindles, when used for large blocks. In such machines, the emery feed may be made automatic by permitting the copper bowl surrounding the grinding spindle to rotate with it, causing the slurry of abrasive and water to be thrown by centrifugal action to the outside, whence it is picked up by a stationary scoop and directed as a jet onto the work. One operator may thus tend a large number of spindles.

LENS POLISHING

The block of lenses is now ready for polishing. This is done on machines which rotate the work on a vertical spindle while causing the polisher to oscillate over its surface, or conversely, the polisher may be rotated, and the lens block oscillate over it. The polishing machines vary in size and spacing between spindles according to the size of block to be polished. All however depend for their results on the random motion of the polisher over the work, and it is by controlling this motion that the operator is able to produce work of many times higher accuracy than that of the tools themselves. Figures 10 and 11 show two representative types of polishing machine, one suitable for single lenses, the other for large blocks. In all such machines there are independent variable speed drives to both the work spindle and oscillating arm, while the random motion of the latter is controlled either by varying the stroke of the arm or the amount of offset between the arm and rotating spindle, as well as by varying the relative speeds of arm and spindle. A selective polishing action can thus be obtained, permitting either the outside or centre of the block to be polished more heavily. Further control is possible by varying the amount of weight applied

Fig. 10—A typical single lens polishing machine.

Fig. 11—A typical lens polishing machine for large blocks.

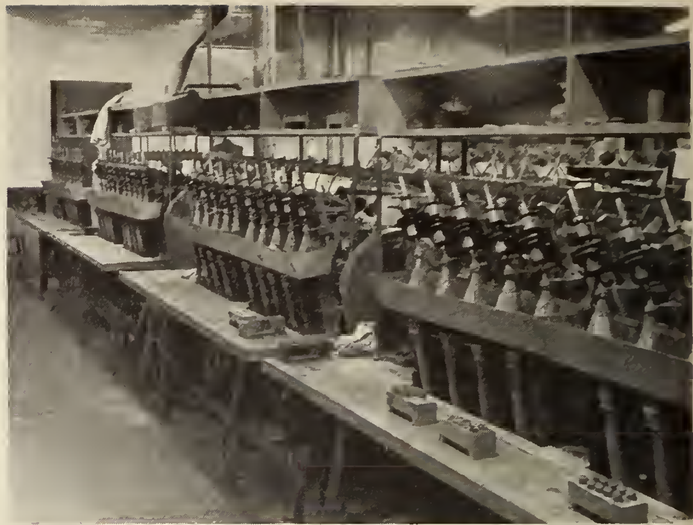

Fig. 12—A row of lens polishing machines equipped with automatic ceria feed.

to the polisher by means of the extension of the drive pin on the end of the arm, and by varying the size and contact area of the polisher itself.

The material commonly used for the polisher is pitch, which may be either Burgundy or Swedish (wood pitch), or asphaltic. Pure rosin is also used either alone or in combination with pitch. Other materials used include cloth impregnated with pitch or wax, laminated paper, and wood. For all precision work, however, pitch or rosin is used, since either of these materials are really viscous liquids at the temperatures used in polishing and can readily be formed to the correct curvature. The viscosity of the polisher must be so controlled as to maintain this condition, yet if the pitch is too soft, it will soon lose shape as polishing proceeds, causing bad curves and lost time for re-forming. If, on the other hand, it is too hard, there will be a tendency to scratch the glass surfaces either from dust or agglomerations of the polishing agent, nor will it as readily conform to the curvature of the lens block to polish it uniformly all over. The temperature of the room, amount of weight used on the polisher, speed and type of machine, size and type of block, are all additional factors affecting the choice of correct viscosity, so that very great experience is required in making the right choice. The pitch can usually be made harder by prolonged boiling, which progressively removes the more volatile elements, or softer by addition of such elements. Venetian turpentine is commonly used both with pitch or rosin for this purpose. Hardness may also be controlled by varying the proportions of rosin and pitch, since hardness increases as the percentage of rosin is raised.

For polishing convex lens blocks, a thin concave cast-iron shell is used, lined with a layer of pitch perhaps ¼ in. thick. This pitch surface is formed to the correct radius over a convex tool with curvature as close as possible to that of the finishing tool used in fine grinding, so that when the block is placed on the machine, polishing begins uniformly all over the surface.

The size of the polisher may be varied considerably. A diameter 80 per cent that of the block generally gives good results.

It is a standard practice, though not essential, to polish concave lenses upside down. That is, with concave lenses the blocking tool resembles the polishing shell used in convex lenses, while the polishing tool is convex and is mounted on the driving spindle of the polishing machine. Mention of this was omitted earlier, to avoid confusion.

After forming, the polishers are grooved radially and circularly with a sharp tool by hand or on an upright revolving spindle. These grooves assist in distributing an even film of the polishing agent over the surface of the block, and also, by breaking up the surface into facets, permit the polisher to conform more readily with the work.

Until a few years ago, rouge (ferric oxide, Fe_2O_3) was the material in practically universal use for glass polishing. We lay claim to the credit for having upset this tradition through the introduction of cerium oxide (CeO_2) to the English-speaking world late in 1941. More will be said of this later, but for the present it suffices that this material, properly made and used, will reduce polishing times to ⅔ or ½ of the times required with the best rouges. Hence since early 1942 we used cerium oxide exclusively for the polishing agent. As with rouge, ceria is applied to the work with a brush, after mixing a small amount of the powder with water. When this begins to dry up, the polishing pad makes a characteristic squealing noise, and under these conditions polishing proceeds at the maximum rate. Before the block dries up it is wetted again either with water alone or water and ceria. If the polisher is allowed to run too dry, 'burns' may result caused by the ceria seizing into the glass surfaces. These will usually polish out, but in bad cases, may necessitate re-fine grinding.

As the polishing proceeds, the polisher tends to lose shape and from time to time requires reforming. This is done by warming it under a hot tap and rubbing it with considerable pressure over the surface of the forming tool. By doing this repeatedly, the same polisher may be made to serve for many blocks and for large blocks may last 3 weeks or more; for small blocks, the life may be as short as 3 days. Regrooving is also necessary as the grooves gradually flow in and disappear. The work must constantly be checked with a test glass and adjustments made to the machine and the polisher to bring in the correct curve. For cemented lens surfaces, less accuracy is required than for outside surfaces, and for eye-lens components the sagittal tolerance may be relaxed to 10 rings on the cemented surface without danger. On other surfaces in medium-power telescope systems a 5-ring tolerance is usual. That is, with convex lenses, the radius is held shallow by this amount, but sphericity is always held within one ring or less. Lack of sphericity is indicated by non-circular shape of the rings themselves and cannot be accurately measured unless the curve is held within 5 rings or so. The lenses should also be checked for sphericity after de-blocking as distortions may not appear until this point. It is important when polishing cemented curves that the contact with the test glass should be at the outside of the lens rather than the centre, otherwise at cementing the lenses might rock at the centre and cause trouble. By applying pressure to the test glass the appearance of the rings will readily indicate whether contact is occurring at the outside or centre. By prolonged polishing a measurable thickness of glass may be removed and the radius of curvature considerably changed—the more readily so the smaller the block. Hence the accurate fine-grinding of large blocks is essential to rapid polishing. According to the latest theories, polishing is partly a chemical and partly a mechanical action, but far less mechanical than was formerly supposed, as the speed of polishing is considerably influenced by the chemical nature of the water base used—whether acid, alkaline or distilled, and the chemical composition of the glass itself.[9]

Sufficient has been said, it is believed, to give some idea of the number of variables involved in lens polishing. The difficulty lies mainly in analysing the trouble to find out which of the numerous possible factors is responsible. Bad curves may be due to the wrong blocking pitch, wrong fine grinding, wrong polishing pitch, poor shape or size of polisher, incorrect machine setting, or several of these in combination, and only long experience can determine which is to blame. Then, just as the block has been brought to correct curve, a scratch may develop which in severe cases will necessitate re-fine grinding. Deep curves, whether in single lenses or in blocks, are always the most troublesome, and because of the higher losses which result, it is wiser to polish the steeper lens curve first. Sometimes so much trouble is experienced with nearly hemi-spherical blocks, that it is found more economical to omit the outside ring of lenses, thus considerably reducing the number of lenses on the block, but with an overall saving.

After polishing, the lens blocks are inspected for surface accuracy and quality—freedom from grinding pits and scratches and for full polish. Reject lenses or lenses requiring reprocessing are marked and all lenses given a protective coating of shellac. The lenses are then removed from the blocks by chilling, cleaned, and reshellacked prior to blocking again for polishing the second side. The methods used in de-blocking and cleaning are of great importance and will be dealt with more fully later. Lenses marked for reprocess are simply blocked up again, re-fine ground, and repolished. The thickness tolerance on most finished lenses usually permits at least one reprocess on each side, sometimes two.

Polishing times for lenses using ceria average from 25-45 minutes for single convex lenses, 50-75 minutes for 3-lens convex blocks, and from 1½ to 3½ hours for convex blocks ranging from 4 in. to 10 in. diameter respectively. As the concave blocks are usually of flint glasses which are chemically less resistant than crowns, the polishing time is about 20 per cent less for a concave block than for a convex block of the same size and curve.

Of equal importance as affecting the cost of polishing is the number of spindles which may be run by one operator. This varies from 10 for single lenses and small 3-lens blocks to 6 or 8 for larger blocks. When using ceria, an operator tends to be able to run fewer spindles than with rouge because the curves change more rapidly and the machines require closer attention.

One approach towards reducing costs is through the use of automatic ceria feed. This is an adaptation of spectacle lens methods, which during the war was used by us only on the cemented curves of eyelenses where the minimum accuracy is required. A pump and piping system delivers a jet of ceria and water to each spindle. Heating of the water may be necessary to offset evaporative cooling from the numerous jets. The machine setting is left unchanged and after a fixed time (20-30 minutes) all lenses are removed and examined. While this is being done a fresh load is placed on the machine. One advantage of this method is that the flow of ceria cools off the polishers and enables the amount of weight to be increased, thus offsetting the less efficient wet polishing action. By this means, one operator may run as many as 40 single lens spindles. A row of polishing machines equipped in this manner is shown in Fig. 11. It seems very probable that the same principle could be extended for all the less troublesome blocks, with considerable cost saving.

The cost of tooling for lens production is by no means a negligible item, especially as blocking tools and grinding tools require considerable machining, and blocking tools especially are needed in large numbers to provide sufficient work in all stages of process. Ten blocking tools, for example, were found to be required for each polishing spindle in operation. As the number of spindles may run to 30 or more with quite large blocks, 300 or more blocking tools alone may be required for a particular curve. The variety, apart from the quantity, of tools required for a typical concave-convex objective flint component is illustrated in Fig. 13, which shows as well some tools and gauges required for auxiliary operations to be described later. After some years of operation, a large supply of tools in many different radii accumulates, and the lens designer usually attempts to repeat previously-used curves on new instruments, as well as duplicate curves within one instrument, in order to economize on tooling. An example of this is in the panoramic sight (Fig. 3) where the same doublet is made to serve both as an objective and for two erector lenses.

Before proceeding with discussion of subsequent operations on lenses, it will be convenient at this point to consider the analogous operations for planar optics.

TRANS-CANADA AIR LINES' RADAR INSTALLATION

WALTER A. COLE
Ground station radio engineer, Trans-Canada Air Lines, Winnipeg, Man.

Introduction

The greatly accelerated impetus given to scientific research during the war years has added enormously to our knowledge in the field of electronics. In no phase of electronic development has progress been more remarkable than in that of radar.

We read on every hand that radar has ushered in a new era of air transportation. We are led to believe radar has *per se* solved all airline safety problems. Let us not forget, however, that present radars were designed for military requirements and that between military and civil needs there is a vast difference.

It is inevitable that the impact, on commercial aviation, of wartime electronic development will be far-reaching. But the transition from military to civilian use is no small task—it will take time. It is not accurately known today just where radar techniques will fit into airline operations. The magnitude and scope of the problem are not yet clearly visualized. There has been little co-operative effort on the part of the airlines, industry and government agencies to produce a clear statement of what is required. In view of the short time that has elapsed since the cessation of hostilities, this is quite understandable.

The economic aspect must, of course, be considered. Existing navigational facilities represent a considerable investment. To replace them or supplement them with radar equipment will require great expenditures, for not only is ground equipment affected but aircraft equipment is equally concerned. The change, if it comes, will undoubtedly be a gradual process.

In order to determine to what extent present military radars will meet airline requirements, Trans-Canada Air Lines has initiated a programme in which the following major applications are being considered:

1. Airways control
2. Airport control
3. Approach and landing control
4. Meteorological observation

The type of equipment being employed in the present investigation is the MEW (Microwave Early Warning) radar, designed and constructed by the National Research Council at Ottawa. A description of the equipment and the results achieved thus far are presented later in this article.

Basic Principles

A detailed description of radar principles is beyond the scope of this paper; indeed, most of the circuit details have not yet been released from security restrictions. However, in order that those less familiar with the subject may have a clearer grasp of the ideas involved, a brief discussion of some of the basic principles will be given.

Radar (from Radio Detection and Ranging) is possible because of two physical laws: 1. radio waves are propagated through space with constant velocity 2. whenever there is an abrupt change in the medium of propagation some of this energy is re-radiated or reflected back in the direction of the incident wave.

Essentially, radar for the dectection and location of aircraft consists of a transmitter to generate high-frequency, high-power oscillations, an antenna to radiate the energy into space (and generally to concentrate the radiated energy into a narrow beam), a receiver to pick up the reflected signal, a timing and co-ordinating system to measure accurately the time interval between transmission and reception in terms of distance, and, lastly, a display system to indicate visually the results of these processes.

Early radars operated in the very-high-frequency band (see Table I), but it was not until the cavity magnetron was developed by a group of British scientists in 1940 that the present degree of perfection was approached. One of the most closely guarded secrets of the war, the cavity magnetron made possible the generation of high-power radio waves in the super-high frequency or microwave region and permitted the greatly increased definition and accuracy exemplified in the radar bombsight and blind landing systems.

TABLE I

Radio Frequency Classifications

Frequency in Kilocycles	*Wavelength in Meters*	*Designations*	*Abbreviations*
10-30	30,000-10,000	Very Low	VLF
30-300	10,000-1,000	Low	LF
300-3,000	1,000-100	Medium	MF
3,000-30,000	100-10	High	HF
30,000-300,000	10-1.0	Very High	VHF
300,000-3,000,000	1.0-0.1	Ultra High	UHF
3,000,000-30,000,000	0.1-0.01	Super High	SHF

The energy in a radio wave diminishes greatly with distance. The strength of the radiation impinging on an object 100 miles away is very much less than that at the transmitter. The magnitude of the reflected signal arriving back at the receiver after another hundred-mile journey is so incredibly small that it is only through the phenomenal amplification properties of the vacuum tube that any signal is discernible at all.

To increase the energy content of the radiated wave the transmitting tube oscillates in short bursts or pulses of very high amplitude. By confining the period of oscillation to a few microseconds it is possible to produce tremendous power outputs without damaging the tube. A further increase in energy in a given area is obtained by concentrating the radiation into a narrow beam.

Figure 1 is a block diagram of a possible radar set-up. It is not meant to represent any particular system. As mentioned above, the transmitter oscillates in pulses, the frequency of repetition of the pulses being determined by the modulator unit. A waiting period between pulses must be provided to allow time for the reflected wave to be received before the next pulse is sent out. The length of the quiet interval depends, of course, upon the maximum range desired.

The transmitter output is fed into the antenna and thence into space. In the super-high frequency band, antenna systems usually include a reflector in the form of a paraboloid or parabolic cylinder (the MEW antenna is an example of the latter). A small fraction of the transmitted pulse is fed into the timing section and initiates the action by which the time interval between transmission and reception is measured. When it is realized that a few millionths of a second are measured quite readily, one can appreciate the progress that has been made.

The received signal or echo is picked up by the same antenna, amplified enormously and applied to the display system already set into operation by a triggering pulse from the timing unit. The echo is then displayed so that its distance from a predetermined origin is a direct function of the time interval between transmission and reception, or what is the same thing, a direct function of the distance between the aircraft and the radar.

A switch is provided to prevent the transmitted pulse from feeding into the receiver and conversely to prevent the reflected wave from feeding into the transmitter. In this way, both receiver and transmitter operate with

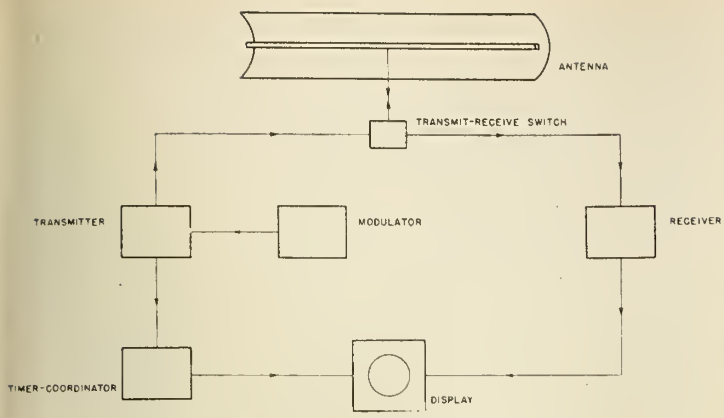

Fig. 1—Block diagram of typical radar.

maximum efficiency and the same antenna may serve for both functions.

Types of Displays

Many types of displays have been developed. Three of those more commonly encountered are shown in Fig. 2. Figure 2 (A) is called the A-display and indicates distance only. Echoes appear on the screen of the cathode-ray tube as sharp inverted V's or pips, above the base. The initial pip is caused by the transmitter pulse and locates the origin. Aircraft echoes are smaller pips displaced from the origin by an amount depending upon the aircraft's distance from the radar. This type of display is quite similar to that employed in the ordinary cathode-ray oscilloscope and uses a tube with a short persistence screen (that is, only slightly phosphorescent).

The obvious need for a presentation that indicated direction as well as range was met in the PPI (Plan Position Indicator) display, illustrated in Fig. 2(B). The PPI might be considered a plan view of the area surrounding the radar as seen from a high-flying aeroplane. Whereas in the A-display the electron beam in the cathode-ray tube starts its cycle at the left-hand side and sweeps across the tube to the right, in the PPI display the beam starts at the centre and sweeps radially outward. The direction of the sweep is rotated about the centre of the tube in synchronism with the antenna and the equipment is generally set up so that the beam sweeps toward the top of the screen when the antenna faces north. Pulses from the timing circuit cause the visual trace of the electron beam on the phosphorescent screen to brighten at intervals of, say, 20 miles, so that concentric circles (range markers) equally spaced from the centre are traced out on the screen. As the beam rotates, a switching system causes the whole trace to brighten every 10 deg. laying down a fan-like pattern of azimuth markers. Echoes appearing anywhere on the screen can then be located by means of the grid formed by the range and azimuth markers.

So that the echo may be more readily located, the screen of the cathode-ray tube is often constructed so that it glows or phosphoresces many seconds after the electron excitation has been removed. The electron beam causes a small bright spot to appear on the screen when an object is detected. As the beam moves away, the spot slowly fades, providing about 30 seconds for the operator to locate the echo.

A third type of display is shown in Fig. 2(C). It is the sector-B display. Here, approximately 90 deg. of the horizon is presented but with the azimuth markers parallel to each other, instead of converging as in the case of PPI. In this way a considerable expansion of the area close to the radar is achieved. There is an additional advantage because the echoes are elongated into small " blobs " while spots due to noise are not.

The range markers appear as equally spaced lines extending horizontally across the tube. Although a switching system enables any of four quadrants to be viewed, this type of display is generally used when it is desired to watch only a particular portion of the horizon.

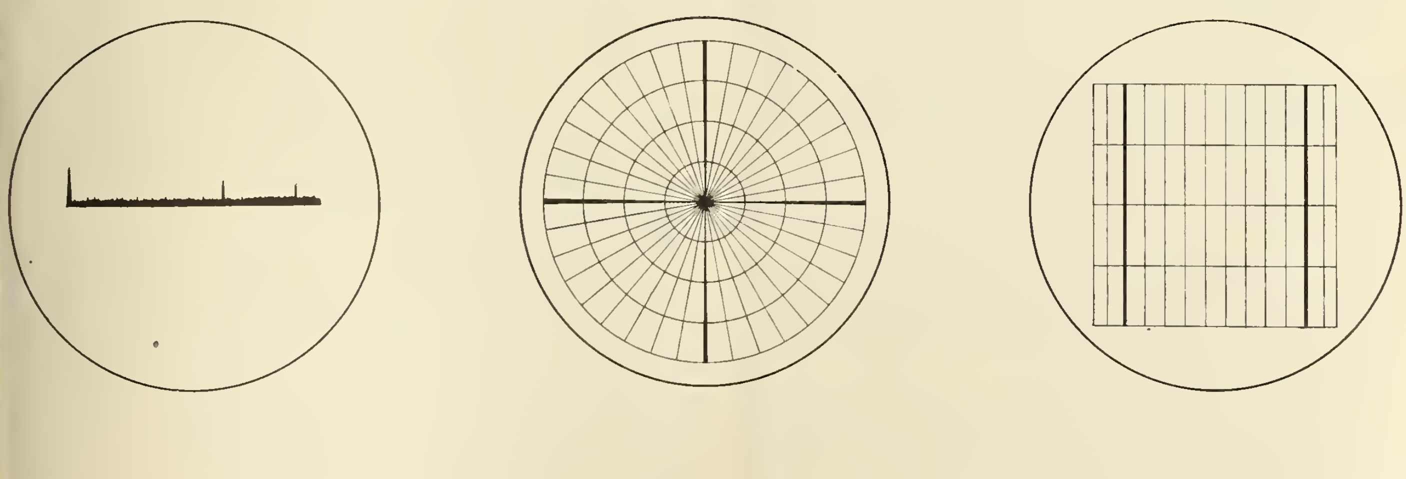
The PPI and sector-B display are intensely modulated; that is, the electron beam is practically invisible until an echo is received during which time the beam comes on to display a small, bright dot. The beam is also turned on to present the azimuth and range markers. Otherwise, the face of the tube is dark.

Height finding radar has, of course, been developed to an advanced state. Space limitations make it impossible to discuss it in this paper.

Description of Equipment

Early in June of this year Trans-Canada Air Lines, in co-operation with the National Research Council and the Royal Canadian Air Force, installed a MEW radar on the north-east corner of Stevenson Field, Winnipeg. Other MEW radars in almost exactly the same form saw wartime service on the east and west coasts as well as several stations across the Dominion.

This was probably the first radar to be exposed to the public gaze in this area and a considerable number of curious onlookers were often to be found on the road which passed outside the radar compound. During the course of installation and early operation many questions were asked. The personnel engaged on the project were hard put to answering in such a way as to allay suspicion of the true nature of their work. Railway tracks parallelled the road a few yards further removed. Passengers on the morning local were often seen straining their necks to



(A) (B) (C)

Fig. 2—Some radar display systems.

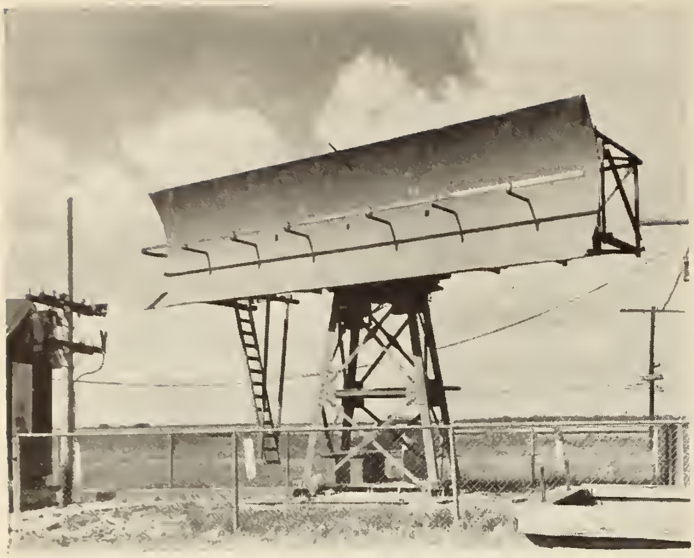


Fig. 3—Trans-Canada Air Lines' radar installation.

catch a glimpse of the strange structure turning slowly. On one occasion an unscheduled train stopped close by and the entire crew got down and came over to inspect the installation.

From Figure 3 it may be seen that the installation consists of a ground hut and a tower group. The latter is comprised of concrete footings, supporting gantry, turntable, tower hut and antenna. Inter-connecting power and signal cables are enclosed in the wooden trough seen on the ground between hut and tower. The long, thin metal tube extending across the centre of the sheet metal reflector is the antenna proper. Behind the reflector is the tower hut wherein are housed the modulator, transmitter, receiver and associated power supply and distribution panels. The antenna system and tower hut revolve on the turntable immediately below the hut. Alternating current power is supplied to the tower through a slip-ring unit. The video signals from the receiver are relayed to the ground hut via the same unit.

The large box at the base of the gantry contains the ground hut—tower hut junction strips and the Ward-Leonard tower turning system. Driven by an alternating-current prime mover, a direct-current generator provides the power for the turning motor mounted directly beneath the turntable. Controls in the ground hut allow a continuously variable tower speed of from zero to about seven revolutions per minute. In addition, the direction of rotation may be reversed at will. Both rate and direction of rotation are controlled from the ground.

The main power switch panels and radar display racks are located in the ground hut. A front view of the racks is shown in Figure 4. The left-hand rack contains the power switch panel for the radar equipment, the intercommunication amplifier and speaker, part of the display system and the video distribution chassis.

The timing and co-ordinating chassis, called the keying chassis, is located in the centre rack along with the PPI display.

The sector-B display is in the right-hand rack. All three racks have power supplies for their associated equipment.

The tower-turning controls and receiver-tuning controls are to be seen mounted on the panel between the centre and right-hand racks.

Two-way voice communication is provided between ground and tower huts by the intercom' system. By positioning the control switch so that sounds from the tower are heard over the downstairs speaker, a continuous aural check can be maintained over the equipment in the tower.

In addition to the two downstairs displays, there is an A-type presentation in the tower equipment. It is used primarily in tuning the receiver; the actual detection and location of aircraft are done on the downstairs equipment.

The phosphorescent characteristic of the main display tubes makes it necessary for the operators to work in almost complete darkness. In the T.C.A. installation. a partition between the top of the racks and the ceiling makes it possible to have the operating side dark but have the backs of the racks well lighted for maintenance work.

The transmitter employs a cavity magnetron. When " fired " by a high-voltage pulse of very short duration the magnetron oscillates at a frequency in the neighborhood of 3000 Mc. (wavelength 10 cm.), The modulator is of the spark gap type—reminiscent of radio's early days. The rate at which the modulator furnishes keying pulses to the transmitter is determined by the synchronous motor which drives the spark wheel and is of the order of three hundred per second. In this type of radar, the pulse repetition frequency of the modulator also controls the beginning of the timing cycle of the primary display systems.

The pulses generated by the magnetron are fed to the antenna through a hollow brass pipe called a wave guide. The pipe guides the radio-frequency energy in much the same manner as a ship's voice tube guides sound.

The antenna itself is a wave guide with narrow slots cut in the side facing the reflector. The radio energy flows from the slots and " floodlights " the reflector. Because of its shape and size the reflector concentrates the radiated energy into a very narrow beam.

The signal reflected from an object is picked up on the same antenna. An electronic transmit-receive switch of the type described earlier is employed to prevent inter-action between the transmitter and receiver.

Though considerably different in form, the receiver is the same in principle as the ordinary home radio receiver; that is, it is a superheterodyne. Since the receiver must function on infinitesimal signals, its amplification ratio is enormous, being of the order of ten billion.

As described previously, the output from the receiver is fed downstairs through coaxial transmission line, mixed with azimuth and range markers and displayed on the cathode-ray tubes.

The MEW radar includes no provision for height finding. As will be pointed out under operation of the equipment, a rough estimate of an aircraft's altitude is possible only at the time of initial pick-up. Before and after initial pick-up little or no altitude information can be obtained.

Operation of T.C.A. MEW Radar

Immediately after the equipment was installed a short period of time was devoted to removing " bugs " and restoring the set to first-class operating condition. No special difficulty was encountered in this regard. For most of the T.C.A. personnel working on the project, this was their first opportunity to see radar at first hand. The rapidity with which the equipment was put into operation and the smoothness with which it has been kept functioning is due in large measure to the R.C.A.F. personnel assigned to T.C.A. for this purpose.

Formal operations began when four T.C.A. radio operators were assigned as observers. With two men working an eight-hour shift the station was kept on the air about 16 hours a day. To those familiar with military radar operations an eight-hour shift must seem an intolerably long period for two men, but it must be remembered that conditions under which T.C.A. were operating were quite different. The operators were observers only. There was not the strain attendant with military work where any echo might represent an enemy aircraft or surface vessel. Flights were relatively few and far between, so that the time actually spent at the screen was not excessive. In any case, the operators alternated positions between the screen and recording table.

To facilitate collection of pertinent data, two forms were prepared. One was a flight record form on which were entered the flight involved (if known), time of observation, distance and bearing from the station, altitude (if known), strength of signal (weak, medium, strong) and remarks. The other form was used to record weather observations and included space for date, time, temperature, dew-point remarks, etc., as well as a representation of the PPI screen with the range-azimuth marker grid, upon which could be drawn the cloud echoes as they appeared on the cathode-ray tube. Lacking photographic equipment, the operators drew cloud patterns on these forms every hour or half-hour. In this way it was possible to record the development of cloud formations, frontal conditions, etc.

Direct communication between the radar operators and T.C.A. aircraft was made possible by installing a remote handset at the MEW hut, through which connection was made to the ground station transmitter and receiver control facilities in the Winnipeg station radio room. By talking to pilots the radar operators were able to get on-the-spot corroboration of weather being observed on the radar screens.

When the T.C.A. radar was first put into operation it was observed that responses from objects on the ground, generally called P.E.'s (permanent echoes), were surprisingly few. At the same time it was noted that ranges at which aircraft were first detected were quite short. This led to the conclusion that the angle of the beam of the antenna was too high. Once this situation was rectified, the extreme long ranges were considerably improved but the number of P.E.'s increased greatly.

On standard MEW radars three ranges are available: 0-40, 0-80, and 0-160, distances being in miles. Range markers appear every 20 miles. Fainter ten-mile markers are available if desired. The PPI and sector-B screens, depicted in Fig. 2, are set up for the 0-80 mile range. Ranges are changed simply by moving a switch. As will be brought out later, each range has its own special usefulness.

Observations were made with particular reference to the four applications stated in the introduction. These will now be discussed separately.

1. Airways Control

With the centre of the beam directed upward at an angle of about one degree, the maximum range achieved was about 115 miles. This was somewhat greater than what was usually recorded. Maximum range varied, of course, with the aircraft's altitude. At 8200 ft. (above terrain level at Winnipeg) the average first pick-up was about 79 miles; at 6200 ft. it was 67 miles; at 5200 ft. it was about 59 miles. Once detected, the aircraft could usually be followed into the vicinity of the field with little difficulty. Momentary fading was often evident but was not generally serious enough to cause the aircraft echo to be lost for any length of time.

It was in this particular application that the MEW radar functioned best, for it was for this purpose that the equipment was designed. Under normal conditions it was possible to monitor the movements of all aircraft above 3000 ft. within a distance of about 50 miles, with ranges of detection increasing as the altitude of the aircraft increased. As will be pointed out under meteorological observations, clouds containing precipitation could be detected out to much greater distances.

The chief use of the MEW radar in airways control was keeping the control tower officers informed of the position of non-scheduled aircraft and aircraft without radio. On several occasions the radar station has aided greatly in guiding both T.C.A. and Armed Forces aircraft around storms by telling the flight control authorities the extent of the more severe storm conditions.

During the months of July, August, September and October, a phenomenon occurred which had a pronounced effect on the operation of the equipment. This was a so-called "night effect" and was apparently caused by humidity inversion. The term "night effect" was given because the phenomenon occurred almost entirely at night. When it occurred, P.E.'s were observed out to 75 miles and the area within 20 miles of the radar was painted in almost solidly with P.E.'s. Under these conditions maximum ranges fell off appreciably, thereby reducing the efficacy of the radar as an airways monitor.

The 0-80 mile range and the PPI presentation proved most useful for this work.

2. Meteorological Observations

Here again, MEW radar fitted well into the operations picture. Cloud formations were often observed "right off the end of the tube" while on the 0-160 mile range. As in the preceding application, the PPI display was used almost exclusively.

Experience has shown that at the frequencies near those used in MEW type radars, only clouds containing precipitation cause responses on the cathode-ray tubes. The minimum size of droplet detectables varies with the frequency of the equipment; the higher the frequency, the smaller the droplet that may be detected. It has also been observed that radars in the 3000 megacycles per second (10 cm.) region give perhaps the best results in meteorological work. Lower frequency equipment can detect only fairly large drops, while with radars using higher frequencies the radio wave is attenuated very rapidly, resulting in poor penetration and consequently poor presentation of extensive cloud masses.

A great deal of "met" work had been done in Canada using MEW radar, particularly at Ottawa and Clinton, Ontario. With none of the elaborate teletype circuits for the rapid collection and dissemination of data on local weather conditions and lacking the experience of trained radar meteorologists, T.C.A. personnel were not in a position to exploit their observations to the fullest extent. They were, however, able on a number of occasions to inform flight control authorities of the extent and speed of fronts and storm areas. This aided local meteorological forecasts and permitted T.C.A. to give their passengers a quicker, safer and more comfortable passage to their destination. The 0-160 and 0-80 mile ranges were chiefly used for meteorological work.

A more extensive meteorological programme has been planned for the near future. The Department of Transport is to attach observers to T.C.A.'s radar. Working in co-operation with T.C.A. personnel, they will initiate an extensive schedule of observations utilizing more fully the existing weather facilities. Particular attention is to be directed to the vital problem of investigating icing conditions.

3. Airport Control

With airport control defined as the monitoring of all aircraft within 20-25 miles of an airport, experience showed that the capabilities of MEW radar were limited in this application.

The low angle of the beam created an extensive blind spot above the radar. This factor, together with the prevalence of P.E.'s, prevented the following of aircraft closer than about 3-5 miles from the station with any degree of ease. The higher the aircraft, the worse the situation became. It should be pointed out that a "high-looking" antenna would improve matters considerably by reducing the blind spot and missing most of the P.E.'s. The T.C.A. radar antenna was adjusted for long-range operation and there was no way to change the adjustment without physically raising or lowering the waveguide structure by means of blocks. It would have been possible to install an auxiliary high-looking antenna but this was not standard MEW equipment and was not done for the T.C.A. installation.

Despite these limitations, T.C.A. radar operators were able to assist the local Airways Traffic Control office on several occasions. At one time the position of a flight of R.C.A.F. bombers not making proper radio contact was relayed to A.T.C. along with that of a single aircraft approaching Winnipeg from a different direction at the same time. This allowed A.T.C. to maintain proper control of the airways. On other occasions the whereabouts of overdue and unreported aircraft have been determined and given to A.T.C. This information has been most useful when visibility was poor and when the aircraft carried no radio equipment.

One factor that proved seriously detrimental to airport control was the occurrence of night effect. When the effect was at its height, nearly the entire tube area out to 20 miles from the radar was painted solidly with P.E.'s. Under these conditions it was impossible to distinguish an aircraft echo.

There are a number of systems available by which clutter-free (no P.E.'s) presentation may be achieved. One such system, known as IFF (Identification, Friend or Foe), was used extensively during the war. Applied to airline work it might be described as follows. The aircraft carries a receiver tuned to the frequency of the ground radar transmitter. Each time the aircraft receiver intercepts a pulse from the ground transmitter an electronic relay in the aircraft trips, causing the aircraft transmitter to send out a pulse, but on a different frequency. The aircraft pulse is received by equipment associated with the ground radar and is displayed in the usual fashion. In this way an echo appears on the radar screen only from aircraft carrying responder equipment. The entire set up is usually referred to as a transponder system.

Aircraft without responder sets would not appear; nor would weather. A suitable switching arrangement might be provided, whereby either the clutter-free system or the ordinary system could be used. In this way weather and itinerant aircraft could be observed, while the transponder system could be switched in if necessary. The 0-40 mile range and a special 0-20 mile range were used in this application.

4. APPROACH AND LANDING CONTROL

Since MEW radar was designed for long-range detection, it was to be expected that its usefulness in monitoring aircraft movements in the immediate vicinity of the radar would be severely restricted. Experience at the Winnipeg installation confirmed this expectation.

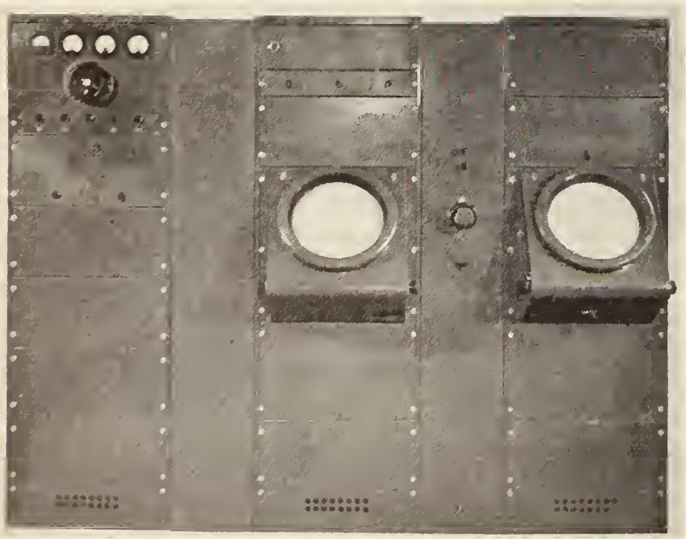

Fig. 4 Front view of ground hut display racks.

The limiting factors for this application were much the same as those encountered in airport control. With the antenna set for long-range operation, the number of P.E.'s prevented the following of aircraft closer to the radar than about 2-4 miles. The optimum results were achieved with aircraft approaching from the south and at best the minimum range was about one and a half miles.

An additional limiting factor was imposed by the design of the equipment. Even in the absence of ground returns, an aircraft echo would disappear into the sector-B tube baseline while the aircraft was still a mile away. The pulse recurrence frequency (about 300 per second) was not fast enough for close work. The type of tower turning drive was not satisfactory. The frequency and beam width were not optimum for this sort of work.

In an effort to extend the usefulness of the equipment, the normal 0-40 mile range of the sector-B display was expanded to a 0-10 mile range. Because of the type of presentation only slight advantage was gained thereby.

While lining aircraft up on a particular runway was beyond the capabilities of the equipment, it was possible to bring aircraft over the field quite readily by issuing verbal instructions to the pilot.

The results of several months' operation indicate that the MEW radar in its present form has only limited use for airline work but it is felt by those connected with the project that the experience gained will be very valuable in the considerations for future designs.

Future Prospects

No attempt at completeness will (or can) be made here. Space limitations prevent an evaluation of even the existing equipment, while a discussion of what might be evolved can only hint at the direction in which the development might progress. The entire field of radar application is so new that what can be stated now must be largely conjecture, but enough is known to indicate with some certainty the probable line of development.

The discussion that follows will be divided into the four classifications previously considered:

AIRPORT CONTROL

Airport control will probably receive the most attention in the immediate future, for it is in this application that the need is most pressing. There are many possible variations of a few basic set ups. Only a few can be mentioned here.

The fundamental unit will probably be the PPI. On its screen the control officer sees all aircraft in the vicinity of the airport. Clutter-free presentation can be achieved in a number of ways. A possible solution, the transponder system, has been outlined earlier. This system can be set up so that the frequencies transmitted from the aircraft depend on altitude and by having ground receivers tuned to different frequencies feeding into separate PPI's, the control officer can have a quasi-three-dimensional picture of what is in the air. This would be especially useful at airports handling large numbers of aircraft (e.g. New York), and would constitute an effective collision-warning device. By retransmitting the PPI display (perhaps by television) to all aircraft in that particular layer, the pilots thereof would be able to keep track of aircraft flying at the same altitude.

One radar device already well into the final design stage is the distance-rate indicator developed by the National Research Council. This light-weight (20 lb.) set enables a pilot to determine his distance from a ground station within two or three miles up to 100 miles away. Distance indication is obtained from a simple meter marked off in miles. A more accurate 20-mile scale allows the equipment to tie in very conveniently with the localizer beacons now employed in blind landing systems.

By including a feature to yield rate of change of distance, or velocity, the same equipment may be used for homing as well as airport control. The rate meter is calibrated from -50 m.p.h., through zero to + 300 m.p.h. A pilot can home on a station by keeping the needle at a maximum reading for a given throttle setting. By keeping the needle at zero the pilot is able to fly in circles around a station. This feature would be very important at busy airports where it may be necessary to "stack" aircraft before they can be cleared to land.

The PPI radar can be used in several ways as an omni-directional range in conjunction with the distance-rate indicator. One proposed system utilizes one SHF transmitter sending out omni-directional pulses and another with a revolving directional beam. The omni-directional pulse is transmitted at the instant the revolving beam passes through north. This omni-directional pulse is received and identified by the airborne equipment. The revolving beam turns at a constant known rate and the time interval between the reception of the omni-directional pulse and the revolving beam pulse can be measured to give an indication of the aircraft's bearing from the ground station.

AIRWAYS CONTROL AND METEOROLOGICAL OBSERVATIONS

Since both of these applications may be handled by the same type of radar, they will be considered together.

Experience with T.C.A.'s installation indicated that a radar similar to the MEW type might be used to monitor aircraft up to about 100 miles away and to observe weather out to 175-200 miles.

With equipment operating at a frequency of 10,000 megacycles per second and lower, fine drizzle and clouds cannot be detected. There must be precipitation (snow or rain) above a certain size before a response is secured on the radar screen. It has been noted, however, that all storms considered dangerous to flying can be seen on radars in this frequency band.

A considerable amount of weather data has already been amassed by military and governmental agencies during the war. It is likely that this work will continue on an even larger scale in the period that follows. The accuracy of short-range forecasting should benefit greatly from radar observation. Since a considerable number of flights are delayed much longer than necessary because of lack of information as to the extent and severity of storm areas, radar weather observation should aid considerably in the maintenance of scheduled operation.

The cost of installing enough radars to monitor the airways across Canada would be tremendous. Whether or not such a project would be feasible is a question that must be answered by the airlines and government agencies. To reduce operating expenses it may be possible to provide unattended radars in certain locations, relaying the information to control points by some suitable means.

INSTRUMENT APPROACH AND LANDING CONTROL

The approach and landing control problems dovetail one into the other and will be discussed together.

There are several systems in use today to land aircraft under adverse weather conditions. One that has seen extensive use in England during the war years is a radar device called GCA (Ground Controlled Approach). As the name implies, a ground controller directs the aircraft down by issuing verbal instructions over a radio link. The control officer reads altitude and bearing of the aircraft from two meters, which have data supplied to them by means of a complex system involving several operators manipulating controls at two PPI displays.

Though GCA has met with considerable success in military operations, it is felt that the "talk down" feature will not be well received in airline work. A pilot likes to fly himself down, following some instrument on his panel. The cost and complexity of the equipment and number of operating personnel required are also drawbacks. The fact that the equipment, far from being automatic, requires a human element in two vital positions is a further detrimental feature.

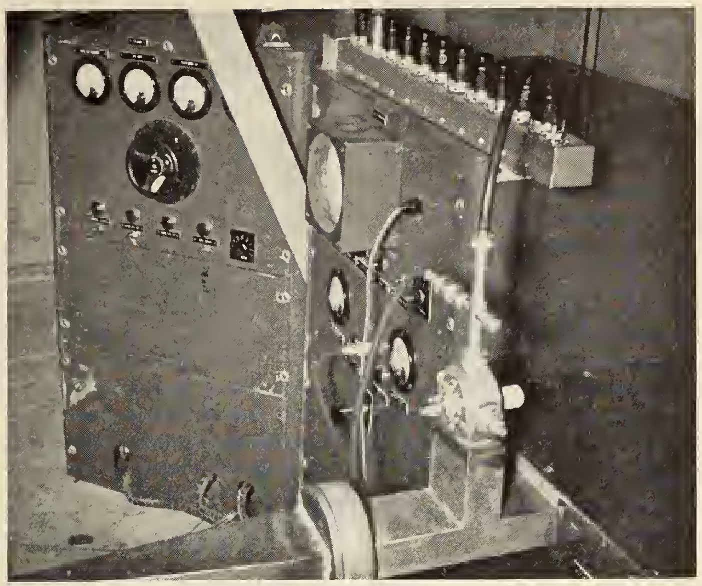

Fig. 5—Partial view of tower equipment. From left to right: control and distribution rack, receiver and A-scope rack, transmitter rack. Modulator rack is not shown.

A non-radar system, designated SCS-51, provides the pilot with an instrument which indicates the position of the aircraft relative to a fixed glide path by means of two intersecting pointers. The system has the advantage of being fully automatic as well as permitting the pilot to make his own decisions. In bumpy weather, it is quite difficult for a human pilot to fly the aircraft close to the ground with accuracy following the crossed pointers, but, coupled to the aircraft's automatic pilot, experience has shown it possible to land an aircraft quite readily.

SCS-51 suffers from a number of faults but at this writing, it appears to be the best system yet provided.

The final solution might possibly take the form of a dual system—SCS-51 to guide the aircraft down automatically and a simplified form of GCA to monitor the descent and to take over in case of emergency.

Concluding Remarks

There are, of course, a great many problems that have not been discussed here. One that might be mentioned is that of obtaining radar displays that may be viewed in daylight. Several solutions have been proposed. One is to photograph the screen with a movie camera, develop and fix the film by a special fast process that is available and project the image on a screen. This provides a daylight display with a permanent record of what has been observed. The ten-second time lag introduced is considered to be negligible.

A second solution is to have a television camera built into the cathode-ray display tube and to televise the information to the control tower where it may be displayed on a high-intensity, direct-vision television tube or projected on a screen.

Air transportation is assuming an ever-increasing importance in the world today. This relatively new mode of travel requires a new outlook; new ideas must be evolved, new methods developed, if commerce by air is to achieve the position it merits.

In radar, the aviation industry has a tool, which, if properly directed and utilized, will contribute much to air transportation. It should be emphasized, however, that despite the great advances made during the war, the final solution (if there be one) will not be forthcoming overnight.

This much we may expect in the not too distant future. Given a period of peaceful prosperity, the scientists and engineers of all nations working together will produce equipment that will take us a long way forward toward the goal of safe, speedy, scheduled air transportation.

ADVANTAGES OF HIGH STRENGTH STEEL AS REINFORCEMENT FOR CONCRETE

L. J. MENSCH
Civil Engineer and Contractor, Chicago, Ill., U.S.A.

The earliest modern users of the combination of concrete and steel turned to high yield point material. They were practical builders and considered the reinforcing as the main carrying member similar to the cables of a suspension bridge and the concrete only as filling to furnish the floor and ceiling of a building slab.

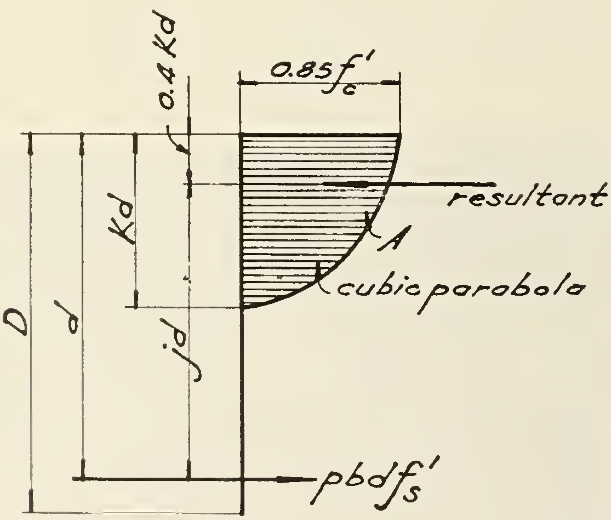
Wilkinson of Manchester, England, in 1854; Joseph Monier of Paris in 1867, Matrai of Budapest in 1890 and Cottancin of Paris in 1891 may be mentioned as early protagonists of this idea. It is interesting to note that Matrai used stresses in his wires of over 28,000 lb. per sq. in.

E. L. Ransome around 1890, then of San Francisco, was the first to have advocated high yield point steel on this continent and he proved its superiority by tests on slabs, in which he compared the efficiency of plain square bars with that of twisted bars of the same size and of the same material. The twisting raised the yield point and increased the strength of the combination of concrete and steel.

Around 1892, Mr. F. Hennebique, of Paris, first introduced reinforced concrete skeleton buildings and used, in his empirical formulas, working stresses on mild steel of 14,200 lb. per sq. in. and on higher yield point steel, stresses up to 21,300 lb. per sq. in.

The contractors thus mentioned and many others constructed empirical formulas based on their own tests of slabs to destruction and kept tests, formulas and their use of high yield point steel a business secret.

The most interesting formula established in the early days of reinforced concrete was that of Koenen & Wayss of Berlin in 1886. They tried to assess the strength of the slabs by assuming that, at the time of failure, the extreme fibres in compression reach the ultimate strength and that at the same time the tensile reinforcement reaches the yield point. They further assumed that the neutral axis is located at the middle of the depth of the slab and that the stress variation in compression follows a straight line. This led them to the formula $M = bd^2 \times f'_s \times 5/6$, an equation which agrees with modern tests for about one per cent of high elastic limit steel and about 2000 lb. per sq. in. concrete.



$$A = \text{Area} = \tfrac{3}{4}\,Kd \times 0.85\,f'_c$$
$$= 0.6275\,Kd\,f'_c$$
$$= \text{Sum of all compressive forces}$$

Fig. 1

Empirical formulas did not suit mathematically inclined engineers and they tried to analyse the molecular action of the combination of concrete and steel by the mathematical theory of elasticity. This theory aroused general interest in academic circles, although the theory of elasticity is evidently not applicable to heterogeneous materials; but the formulators were compelled to make arbitrary assumptions, not in accordance with observations, in order to obtain results which reasonably approached tests on the slightly reinforced concrete members mostly used at that time; and for reinforcement of over one per cent these so-called scientific formulas greatly underestimated the strength of reinforced concrete members mostly because of a faulty conception of the variation of compressive stresses and a faulty value of E for concrete under high stresses and long time loading.

Unfortunately, the magic in the name of elastic theory caused its adoption by the French Commission of Reinforced Concrete in 1906, and through the influence of this high standing commission and its 500-page report published in 1907, this theory was adopted by the building code authorities of the entire civilized world as a guide to reinforced concrete design. On the insistence of some of the most prominent French contractors who were members of the commission the mistake of adopting a theory which did not agree with tests to destruction was somewhat rectified by permitting high working stresses in concrete in compression and working stresses in the reinforcing steel equal to one half of the yield point (obtained by the drop of the beam in a testing machine), thus recognizing the value of high yield point steel. England and the rest of the continent and the Western Hemisphere did not adopt the liberal views of the French Commission, but adopted the elastic theory with lower permissible stresses on concrete and steel and made no rulings for high yield point steel. It is curious how tenacious the life of a false and disproved theory can be after it is once generally adopted; it may go on bidding defiance to truth for 50 or 100 years.

A notable exception in building codes on reinforced concrete was that of the City of Chicago of about 1910. It also adopted the theoretical principles of the French Commission but allowed working stresses in concrete more nearly as great as the latter and allowed steel stresses equal to one-third of the elastic limit, thus being the first code in the United States which recognized the value of high yield point steel in reinforced concrete construction. This code was so much superior to other codes in the States that engineers adopted it for use in localities where no code prevailed and did this for 25 years, until experience showed that still more liberal stresses were justified, especially with the better cement in the market and with the better knowledge gained to produce good concrete work.

The author first used high yield point steel in 1903 when the Inland Steel Company of Chicago began rolling bars from old rails in its plant at Chicago Heights, Illinois. In the same year the Expanded Metal & Corrugated Bar Company of St. Louis had its patented corrugated bar rolled by the same company and proved by tests on slabs that its bars were superior to the mild steel bars then in use. The majority of practising engineers did not make any tests but relied on the elastic theory for their designs, and this faulty theory did not give them any indication that high yield point steel was of advantage in reinforced concrete. To prove this clearly, it may be well to discuss the formulas derived from this theory, and using the standard notations, they are:

$$kd = d\left[\sqrt{2pn + (pn)^2} - pn\right] = \frac{d}{1 + n\,f_s/f_c} \quad \ldots\ldots (1)$$

$$jd = d\,(1 - k/3) \quad \ldots\ldots (2)$$

$$f_s/f_c = k/2p \quad \ldots\ldots (3)$$

$$M = A_s\,jdf_s = pbd^2\,jf_s \quad \ldots\ldots (4)$$

(As long as f_s/f_c is not greater than $k/2p$)

These equations have been believed by most of their formulators and their followers to be fundamentally scientific and correct. Nothing of that kind is true; they have a mathematical background, greatly falsified by the arbitrary and semi-empirical factor, n, which affects all proportions of the design.

Table I gives the result of these formulas for the concrete mixtures mostly in use.

TABLE I

f'_c	= 2000 to 2400		2500 to 2900		3000 to 3900		5000

The value of f_c commonly adopted before 1937 was 0.325 f'_c as given in the Final Report of the Special Committee on Concrete and Reinforced Concrete of the American Society of Civil Engineers, January 17, 1917, and for 2000 lb. per sq. in. concrete and one per cent of steel, Table I leads to $f_s = 20.9\,f_c = 20.9 \times 0.325 \times 2000 =$ 13,600 lb. per sq. in for any kind of steel, implying a factor of safety of $1/0.325 = 3.1$, provided that the yield point of steel be $3.1 \times 13600 = 42000$ lb. per sq. in.

In heavily loaded beams, frequently two per cent of reinforcement is employed and Table I leads to $f_s = 13.1 \times 0.325 \times 2000 = 8520$ lb. per sq. in.: certainly a very small and unlikely value, which does not give any indication that high yield point steel is of any particular advantage in this case.

The Building Regulations of the American Concrete Institute of 1941 and the Concrete Specifications of the Joint Committee of 1940 allow more liberal values of f_c namely 0.45 f'_c, for use in formulas 1 to 4, which would increase the steel stresses in the last two examples in the ratios of 0.45/0.325, that is to 18900 and 11,800 lb. per sq. in. respectively. A true believer in the elastic theory must be under the impression that the assumption of $f_c = 0.45\,f'_c$ means a factor of safety of only 2.2 and that, therefore, a material with a higher yield point than $2.2 \times 18900 = 41500$ lb. per sq. in would be of no advantage in a concrete beam with one per cent of reinforcement; conditions are still more unfavourable for the use of high yield point steel in the minds of the believers of this false theory where the formulas require a safe stress of only 11,800 lb. per sq. in., implying the necessity of a yield point of only $2.2 \times 11800 =$ 26000 lb. per sq. in.

In 1914, the author in a paper entitled "New-Old Theory of Reinforced Concrete in Bending" (December 1914, *Journal*, A.C.I.) discussed the restrictions which the application of the so-called elastic theory imposed upon the practical and economical design of reinforced concrete members. The standpoints were adopted: (1) that in order to judge the strength of a reinforced concrete beam we have to consider the status of the beam near failure, long after any possibility of a straight line deformation of the compressed concrete fibres has vanished; (2) that a parabolic law of variation of compressive stresses fits tests to destruction much better than any straight line variation; (3) that we have to assume that the steel reinforcement reaches its ultimate useful strength at the same time as the concrete reaches the failure point. In a later discussion of the same subject (Vol. 33, *Proceedings* A.C.I. 1937, page 498) it was shown that, in accordance with the observations of the most experienced investigators, the stress in the steel rods at the point of failure is considerably higher than the so-called yield point found by the drop of the beam of the testing machine on a bare bar. It is somewhat the mean of the yield point and the ultimate strength and is probably the point where the strain in a very slow tension test reaches the value of 0.005 in. per in. at which point the modulus of elasticity is only a fraction of the initial modulus. This stress we called the useful limit point. Further, the assumption of a third degree parabolic stress variation for the compression fibres was recommended and, as concrete is considered the less reliable material in the conbination of concrete and steel, the top fibres were assigned an ultimate strength of only 0.85 f'_c instead of f'_c.

Conservative values of the useful limit points, f'_s may be assumed as follows:

43,000 lb. per sq. in for mild steel.
52,000 lb. per sq. in for intermediate grade steel.
72,000 lb. per sq. in. for hard grade high carbon billet steels cold drawn wire and ordinary rail steel.
100,000 lb. per sq. in for special alloy steels and hard rail steel (over 120,000 lb. per sq. in. tensile strength)

Figure 1 shows the fundamental assumptions of stress distribution in accordance with the ultimate strength theory for a cross section of a reinforced concrete beam just before failure, and equilibrium requires that the sum of all horizontal forces be zero, or that the tensile forces must equal the compression forces.

Therefore, $p\,b\,d\,f'_s = 3/4\,kd \times b \times 0.85\,f'_c$

$$\text{or } kd = 1.57\,d\,p\,f'_s/f'_c \quad \ldots\ldots (5)$$

$$jd = d - 0.4\,kd = d\,(1\text{-}0.6275\,p\,f'_s/f'_c) \quad \ldots\ldots (6)$$

and the ultimate moment:

$$M = A_s\,jd\,f'_s = bd^2\,p\,f'_s\,(1\text{-}0.6275\,p\,f'_s/f'_c) \quad \ldots\ldots (7)$$

We have calculated the maximum bending moments in terms of bd^2 in accordance with the new standpoint by formulas 5 to 7 for 4 grades of steel and for 5 grades of concrete, together with the corresponding values of k and j and they may be found in Table II. The values of j are listed in this table in order to facilitate the computation of the ultimate moment by the more convenient formula $M = A_s\,jd\,f'_s$. By dividing the ultimate moment by the factor of safety desired, two, three or more, the safe working moments may be obtained; and the member will be safe both in compression and in tension.

This table shows the overwhelming influence of the useful limit point in all cases used in practice. High yield point steel is superior to milder steel whether the concrete strength is high or low, whether the percentage of reinforcing is 1/4 or whether it is two or more, provided that the compression zone, kd, does not become greater than $0.8d$, the point where nearly all longitudinal fibres of the concrete are in ultimate compression which leads to a minimum value of $jd = d-(0.4 \times 0.8d) = 0.68d$, a critical indication of over-reinforced slabs.

For example, for ½ per cent of mild steel reinforcement and 2000 lb. per sq. in concrete we find $M/bd^2 = 200$; for ½ per cent of intermediate grade steel, $M/bd^2 = 238$; for ½ per cent of ordinary rail steel $M/bd^2 = 319$ and for ½ per cent of hard rail steel, $M/bd^2 = 421$, showing the enormous economy in the use of high elastic limit steel, even with what is now considered low grade concrete. For one per cent of reinforcement and 3000 lb. per sq. in concrete we find as great differences when we advance from mild steel to the hard rail steel, M/bd^2 being 386, 463, 612 and 792, respectively, and the same we find for higher percentages of steel and for higher grades of concrete.

We shall now proceed to prove that the ultimate theory as here developed and embodied in Table II rests on a very solid foundation, namely, on the tests of a great many experienced investigators. Professor H. J. Gilkey of the Iowa State College, in his report of the Project Committee on the Use of High Elastic Limited Steel as Reinforcement of Concrete (see Proceedings of the Fourteenth Annual Meeting of the Highway Research Board, Dec. 1934), lists 58 references of investigations made to establish the merit of high yield point steel as reinforcement. We shall present only a few series of tests made on members where failures due to shear and diagonal tension were carefully guarded against by using hooks at the end of the bars, by bent-up bars and by stirrups where necessary or where the shear at failure was very low, say of the order of around 100 to 200 lb. per sq. in.

We consider the most convincing series of tests that made by Professor Inge Lyse and George R. Wernish at the Fritz Engineering Laboratory, Lehigh University, Bethlehem, Pa. (see Vol. 33, *Proceedings* of the American Concrete Institute, 1936, Pages 1 to 16). About 30 slabs, 34 in. wide and 4 in. thick, of various concrete strengths reinforced by various percentages of steel of widely different yield points (found by the drop of the lever of the testing machine) were tested, some as continuous slabs and others as simple spans and the maximum bending moment at failure is given by the authors together with other important factors for every case. Table III presents all the data, rearranged from the authors' paper and also gives the j and the f'_s calculated by the ultimate theory, using formulas 5 to 7. It shows that in every case the stress in the tensile reinforcement at the point of failure is considerably greater than the commercial yield point, and the greater the yield point, or more exactly the useful limit point, the greater is the strength of the member for the same concrete strength. The last column in Table III shows the ratio between the useful limit point calculated by the ultimate theory and the yield point of the bars determined in the testing machine. This ratio is as a rule not as great for the medium steel bars as for the harder grades of steel, but is always considerably greater than 1, varying in fact from 1.15 to 1.70 with an average of 1.40.

In order to use our formulas 5 to 7, we had to guess at the probable value of the useful limit point, as the authors did not give the ultimate strength of the bars, only the yield points being listed. This guess was rarely much out of the way and affected the calculated stresses only to a minor extent; a variation of 20 or 30 per cent in the assumed ratio of f'_s/f_c affects the value of jd only a few per cent.

Wide-awake engineers long ago realized the discrepancies between the results of the elastic theory and the tests to destruction; in order to save money for their clients they went somewhat around the codes by using the elastic theory

TABLE II

only for the determination of jd and allowed on the high elastic limit steel the maximum working stress permitted, regardless of the limitation imposed by the codes on the allowable compressive stresses on the concrete. Of course, in most T-beams the compressive stresses in the concrete are low, and there is rarely any conflict with the codes for use of high elastic-limit steel especially where the working stresses permitted are a fixed percentage of the yield point.

Table IV presents a similar series of tests on slabs, 34 in. wide and 4 to 6 in. nominal thickness, made by Professor T. D. Mylrea, Head of Civil Engineering, University of Delaware, and published in the Proceedings of the 16th Annual Meeting of the Highway Research Board, Nov. 1936. The concrete strength of the slabs varied from 2000 to 6000 lb. per sq. in., the yield point of the steel from 44000 to 112000 lb. per sq. in. and the percentage of reinforcing from 0.34 to 2.11. Professor Mylrea gave both the yield point and the ultimate strength of his reinforcement and we assumed the useful limit point about the mean of the two values; and calculated the values of j and f'_s by formulas 5 to 7 and again found that the calculated useful limit stress, f'_s, was higher than the yield point and the ratio $f'_s/Y.P.$ averaged about 1.3, except for items 36 to 38 which failed by defective concrete at the supports, but still showed higher steel stresses than the yield point.

It is desirable to cite the very interesting series of test beams made by Mr. Conde B. McCullough, Assistant Chief Highway Engineer of the Oregon Highway Department, Salem, Oregon (see *Engineering News-Record*, Sept. 19, 1935). The series consisted of 20 beams 24 in. wide and of an effective depth of 10 in., reinforced by 1 to 4.6 per cent of steel of a yield point which varied from 45000 to 55000 lb. per sq. in., tested on a span of 12 ft. 6 in. by two concentrated loads 5 ft. distant from the supports. All bars were hooked and some of the beams had bent-up bars and stirrups as noted in Table V. The author did not give the yield point or ultimate strength of the reinforcement for the individual members, therefore it was necessary to guess at an average useful limit point of 63000 lb. per sq. in.

The ultimate theory according to formulas 5 to 7 gave results which showed the useful limit point derived from these tests averaged about 20 per cent more than the average yield point of 50,000 lb. per sq. in. Item 55 is an example of an over-reinforced beam. The computed j is smaller than 0.68 previously referred to as the minimum value possible in any concrete beam, and this value was used instead of the value of 0.661 computed from formula 6. This particular beam would have sustained the same load if the reinforcement had been 10 per cent less.

By means of Tables III and IV we can now easily prove that Table II based on the ultimate theory leads to safe and conservative results.

Let us take as first example Item No. 1 in Table III. $M/bd^2 = 172600/(34 \times 3.12^2) = 525$, wherein 34 in. is the width and 3.12 in. is the effective depth d of the slab.

In Table II we find for 3000 lb. concrete and one per cent of intermediate grade steel reinforcement $M/bd^2 = 463$, adding to this value about 11 per cent on account of the

1.11 per cent of reinforcement in Item 1, we obtain the figure 511, which is about 3 per cent smaller than the test figure. As another example take Item No. 8 in Table III. $M/bd^2 = 88700/(34 \times 3.4^2) = 225$. In Table II we find for 3000 lb. concrete and ¼ per cent of rail steel reinforcement $M/bd^2 = 174$, which value increased in the ratio of 0.3/0.25 gives 209, again less than the test, and shows Table II to be conservative. Item 13 in Table III was a highly reinforced slab and $M/bd^2 = 305400/(34 \times 2.75^2) = 1190$. In Table II we find for 3000 lb. concrete and 2 per cent of rail steel reinforcement, $M/bd^2 = 1005$, which will increase to only 1025 for 2.62 per cent reinforcement, showing again that Table II gives conservative values, although this table recommends much higher moments than the straight line theory would allow.

For Item 31, Table IV, $m/bd^2 = 81025/(34 \times 3^2) = 264$. From Table II we learn for 3000 lb. concrete and ¼ per cent rail steel $M/bd^2 = 174$; this value increased by 0.34/0.25 gives 236, demonstrating again that Table II is conservative.

Item 40, Table IV can provide an example of another highly reinforced slab. $M/bd^2 = 319000/(34 \times 3^2) = 1040$. From Table II we learn that for 3000 lb. concrete and for 2 per cent of rail steel reinforcement, $M/bd^2 = 1005$, again a conservative figure.

Item 44 in Table IV has $M/bd^2 = 148000/(34 \times 3^2) = 484$, while in Table II we find for 3000 lb. concrete and for the average of ½ and 1 per cent of rail steel reinforcement $M/bd^2 = 473$, again a few percent smaller than the test result.

As a further indication of the adaptability and easy application of the ultimate theory, a design example is given.

The computations for the design of a T-beam according to the strict rules of the straight line theory as required by all codes are quite formidable affairs; the ultimate theory and Table II will enable engineers to produce a more economical and more correct design in a few minutes. As an example, take a beam of 24 ft. span, simply supported, connected to a slab 4 in. thick, to carry a total load of 1500 lb. per lin. ft., $f_s = 24000$ lb. per sq. in., $f'_s = 72000$ lb. per sq. in. $f'_c = 3000$ lb. per sq. in and assume $j = 0.9$ as a trial figure.

$M = 1500 \times 24^2/8 = 108000$ ft.-lb.
$V = 1500 \times 12 = 18000$ lb.

We have now to make some decisions regarding the total depth of the beam, D, the effective depth, d, the width of flange, b, and the width of the web, b'. We select $D = 24$ ft./15 = 1.6 ft., say 20 in.; $b = 16 \times 4$ in. = 64 in, $d = 20 - 3 = 17$ in. and $b' = 18000/100D = 9$ in., which on account of the commercial width of the 2 × 10 in. plank for the bottom form we shall assume as 9½ in.

$$A_s = M/jd \times 24000 = \frac{108000}{0.9 \times 17/12 \times 24000} = 3.54 \text{ sq. in.}$$

which is 0.32 per cent of the area of the rectangle 64 × 17 in. From Table II we find for $f'_s = 72000$ and $f'_c = 3000$, and for a percentage of reinforcement between ¼ and ½, $j = 0.95$ and $k = 0.125$. Hence A_s may be slightly reduced in the ratio of 0.9/0.95 to 3.35 sq. in.

The value of the unit shear $v = V/b' \times jd = 118$ lb. per sq. in. showing that hooks at the end of the straight and bent bars are necessary and that a moderate amount of stirrups should be used.

A careful designer will check the somewhat shallow beam of a non-continuous member for deflection, and will consider that the E for concrete for time loading should be taken as one-half to one-third of the initial E in cylinder tests; it should be also remembered that the moment of inertia of the rectangle $b' \times D$ should be increased about 50 per cent on account of the help from the flange of the beam, so that $I = 1.5 \times 9.5 \times 20^3/12 = 9000$ in. and assuming $E = 1.5 \times 10^9$, $E \times I = 13.5 \times 10^9$.

$$\text{The deflection} = \frac{1500}{12} \times \frac{5}{384} \times \frac{(24^4 \times 12^4)}{E \times I} = 0.835 \text{ in. or}$$

f'_s/f'_c replaces n of the straight line theory.

1/345 of the span. It is clear that a rectangular beam without flanges would have a larger deflection, and as an example for such a beam, we shall assume $D = 24$ in., $d = 21$ in. and $j = 0.8$. From equation 7, $A_s = 108000/0.8 \times 1.75 \times 24000 = 3.23$ sq. in. or 1.62 per cent of the rectangle 21×9.5 in. From Table II we can find by simple interpolation that $j = 0.76$, therefore A_s should be increased in the ratio of 0.8/0.76, or $A_s = 3.4$ sq. in.

Both examples would result in factors of safety of about 3 both in compression and tension when ordinary rail steel is used and in a factor of safety over 4 in tension when hard rail steel is used.

The author being a great believer in the use of high tensile steel, turned to the rail steel bar mills as a source of supply as early as 1904 and has been a consistent and successful user of rail steel over a period of over forty years. In this practice there has been no unfavourable instance that this material is less reliable than mild steel. Although job fabrication was the rule on most of his constructions, breakage in bending always proved a minor concern. It is true, the men were strictly trained and, in accordance with the author's belief that stresses do not turn sharp corners and further that tight bends subject enclosed concrete to extreme compression stresses, radii of ten diameters or larger were used on trussed bars.

Other occasionally encountered objections to the higher carbon steels were likewise unsupported in this experience and it is the author's firm conviction and experience that concern over reversal of stresses, vibration, and shocks are unfounded and the only limitation in proper design is brittleness of the concrete. The percentage of reinforcing is always comparatively low and the much greater mass of concrete is first affected and fails long before the steel rods can fail. This has often been observed on orders to make shock tests on structures, in driving reinforced concrete piling, in the continuous satisfactory performance of railroad trestles in steel mills, and in reinforced concrete industrial plants distinctly subject to impact and vibration; for instance that of the Seng Co., 1450 Dayton Street, Chicago, built in 1905, where rail steel with rather high stresses was used (no code for reinforced concrete was in force and the building department required that floors be tested to 4 times the live load of 100 lb. per sq. ft.) the building behaved splendidly and to date has been in continuous operation with stamping machines on all floors. Similarly the Utah Copper Company separating mill at Garfield, Utah, built in 1906, was designed with stresses never less and often, where possible, greater than present day limitations. The structure, still in use and reinforced with over 900 tons of rail steel, has 240,000 sq. ft. of floors which support shaking tables that subject the entire structure to continuous vibration. These typical experiences are also confirmed by tests made by Professor Mylrea (see Volume 6, *Proceedings* of the American Concrete Institute June 1940, pages 581-594) on a large number of beams, 10×16 in. in size and 8 ft. span, by letting a weight of 560 lb. repeatedly fall from a height of 8 ft. 4 in. The repeated blows shattered the concrete and it was impossible to break the reinforcing. The author concludes—Rail steel and other "brittle" steel reinforcements are quite as resistant to impact as is structural grade reinforcement.

Concerning factors of safety in reinforced concrete construction: In the light of the tests here presented, the French Code led to a factor of safety of 2×1.3 or 2×1.4, that is 2.6 to 2.8, according to whether low or high yield point steel be used. The old Chicago ordnance led to a factor of safety of $3 \times 1.4 = 4.2$ for rail steel. The new codes allowing stresses of 20,000 lb. per sq. in. on both intermediate grade and high elastic limit steel mean in the light of this paper allowable factors of safety of $52000/20000 = 2.6$ for intermediate grade and $72000/20000 = 3.6$ for ordinary rail steel. During the war, the U.S. Government directed that a stress of 24000 lb. per sq. in. be used in reinforced concrete construction, which corresponded to factors of safety of 2.17 for intermediate grade steel, 3.0 for ordinary rail steel and 4.17 for hard rail steel.

We believe presenting more proofs will tire the general practitioner; the specialist should study the previously mentioned references noted by Professor Gilkey. We believe we have demonstrated that Table II, based on the formulas

In Items 31 to 38 Billet Steel was used; in Items 39-46 Rail Steel.

Evidently no measurements were made in the series for the exact value of d, which was assumed as 1″ less than the nominal total thickness D.

Slabs 36 to 38 failed due to crushing of concrete at the supports.

Slabs 39 to 42 showed signs of diagonal tension failure; shearing stresses were high for beams without trussed bars or stirrups.

*Percent of total load at which first crack was observed.

THE EDUCATION OF ENGINEERS

C. R. YOUNG, M.E.I.C.
Dean of the Faculty of Applied Science and Engineering, University of Toronto

An address delivered at the Thirty-First Annual Dinner of the Graduates Society of Ecole Polytechnique, at Montreal on February 9th, 1946, and reproduced here with the kind permission of the Society.

We whose days are devoted to educational pursuits derive constant inspiration from our association with young men. For nearly forty years I have been engaged in teaching and administration, and every year I experience a new impetus, a new animation. There is a great deal to be said in praise of the freshmen who come up to the universities and colleges. Abbott Lawrence Lowell, at one time president of Harvard University, said that he always rejoiced in the coming of freshmen to Harvard because they brought in a great deal of knowledge and the seniors never took any away. So, on the balance, the university profited.

A Perennial and Changing Subject

I am to speak to night of the education of the engineer, a subject that is very close to my heart. It is a perennial subject. People will be making speeches about it a century from now—perhaps many centuries from now. It is a subject that is always changing. We are confronted with the ceaseless tide of civilization as it moves on, charged with all its trials and difficulties. We never have the same problems two years in succession. There is an uncurbed and turbulent stream of human dilemma rolling past us and, as Heraclitus said, " We can never step twice into the same river ". It is always a different river, and so we must modify our practices and methods. In seeking to serve well the community and the country in which we live, we must address ourselves to this constantly resurgent, ever fresh problem of what constitutes a proper education for engineers.

It is scarcely necessary to argue the justification for higher education. A century and a half ago a clever but cynical English essayist, Sydney Smith, presumably in no way related to the distinguished president of the University of Toronto, observed that the only consequence of university education was a growth of vice and a waste of money. I cannot subscribe to the first indictment, nor do I think that there is a waste of money. In fact there is so little available for educational institutions that it can scarcely be wasted.

Higher education affords an opportunity for young men to prepare themselves effectively for the tasks of life. They are enabled by it to put their educational houses in order and to deal with whatever situations may confront them. We can do only so much in the universities and colleges. Students and graduates must themselves do the rest. I often reflect on the words of the late Dr. Olivier Lefebvre, who used to point out that the young engineer who had just graduated had learned how to read. He could now discover things for himself. He could wend his way through the literature of his profession and find out how to solve his own problems. That is perhaps all that any of us in educational work can hope to do. You must do the rest.

Beginnings of Engineering Education

In days gone by there was little less than hostility towards the engineer trained in universities or colleges. In English-speaking countries the profession developed from lowly origins. The first engineers in Britain were the millwrights—clever mechanics, often with more than a touch of genius, who, with no formal education, were able to solve difficult problems with uncanny accuracy. One such was James Brindley, the man who made the great inland waterways system of Britain possible. He was able to solve engineering problems by going to bed for three days and thinking about them. Then there came George Stephenson, Thomas Telford, the Rennies, and many other great figures. It seemed that the proper way to develop an engineering practitioner was through constant contact with men and materials in the shops and in the field. And so the collegiate form of training progressed slowly in Britain. In the United States it was different. There was an urgent need to train large numbers of young engineers to carry out the great western expansion in the early part of the 19th century. They had few experienced engineers who could train large numbers of apprentices in a short time, and so they met the situation in another way. They followed the French system of collegiate training.

One might truthfully say that the first engineering school was established in France as a result of the appointment, by Louis XV, in 1747, of Perronet as chief engineer of bridges and highways. He was charged with " instructing the designers in the sciences and practices needful to fulfilling with competency the different occupations relating to the said bridges and highways ". Thus began the study of the sciences that lay behind the sound construction of bridges and roads. Then there were the French artillery schools, which played a great role. They, with the celebrated government-sponsored Ecole des Ponts et Chaussées, gave the most advanced training that had been available up to that time. Out of them came many able French mathematicians and engineers, such as Lagrange, Laplace, and Monge.

Along with many other engineering graduates, I have had occasion to speak flippantly of Monge, the inventor of descriptive geometry. I remember a distinguished graduate of the University of Toronto who, after listening to a few lectures in descriptive geometry, characterized it as " lines and planes and a horrible mess ". Actually, that is not exactly what he said but, out of respect to Monseigneur Maurault, I shall not give the actual version.

Based on the French concept, the American people developed formal engineering education in colleges. The first of them was the Rensselaer Polytechnic Institute. at Troy, N.Y., established in 1824. Your own Ecole Polytechnique is an outcome of that first pioneer college. I have on several occasions visited your great school and I compliment you, Mr. President, and Mr. Director, on the excellent institution that has been developed over the years. With fine classrooms, excellent laboratories, and an able and devoted staff, your school is contributing impressively to the sound education of young men in engineering in this country.

Objectives of Modern Education

It may be useful to examine briefly some of the objectives of modern engineering education. First of all, there is the need of bringing to young men a familiarity with the fundamental sciences that lie at the base of engineering. One cannot practise engineering in these enlightened days purely as an art. It would take too long. The young practitioner must find some principles to guide his judgment. That faculty may be developed by long experience and practice, but we know that careful study, tests, and experiment reveal certain principles that hold with reasonable accuracy. It is our business in the engineering schools to find them out and to communicate them to those young men who hope some day to practise engineering as a profession.

If we were to neglect scientific nourishment of the professional engineer, we should very soon come to a situation such as arose from the long stagnation of the middle ages. By the beginning of the 16th century, industry and the crafts had reached a stalemate. The few formal principles, the same limited technology, had been applied over and over again. Improvements had been made, but no outstanding progress was possible until the great scientific upsurge of the 16th century broke upon the world.

We cannot afford to rest upon our oars. We must be constantly moving on, making new applications of principles that the scientists have developed for us. Some idea of practice needs to be imparted in the engineering schools. It is not enough merely to study the philosophy and the theory of engineering. We must acquaint ourselves with those things that are found by experience to be practical within the limits of time and costs that are imposed by our employers or clients. At least rudimentary skills must be developed. It is not merely a matter of book study; some deftness of hand and some accuracy of manipulation will serve a young man in good stead when he enters the professional field. The acquisition of skills cannot be left wholly to the years following graduation. Those associated with drafting, testing, experimentation, and computation, may in substantial measure be acquired in college.

Dr. Baulne, one of your distinguished graduates, who is here tonight, did not reach eminence merely by relying on his efforts as a student of theory. He found out many things by trial and close observation, and so it is with all successful engineers. Practice must be had, but it needs rest on a sure foundation of theory.

In some respects, engineering is and always will be, an art. Unfortunately, science lags behind our needs. There are still many problems that confront the engineer for the solution of which there are no thoroughly recognized principles. Sound judgment and enlightened approximation must be brought to our aid. If we pursue theory too closely, without the tempering of judgment, we are likely to encounter unexpected difficulties, if not danger. Conclusions may be reached which are at wide variance with practical circumstances.

In the course of the last year, I have, with others spent much time in the study of mine hoisting safety in Ontario. Our Committee has received many proposals with respect to safety devices for the stopping of a cage if the cable should break. Some of them would undoubtedly arrest the fall of a cage in a very short distance but with the embarrassing feature that the stopping would be so sudden that the occupants of the cage would be killed. Such proposals ignore common sense. One must remember that there are limits to the endurance of the human organism. One must have some regard for anatomy and physiology, which lie outside the realm of engineering, but not outside common human experience.

There is need for acquisition in college of a fresh, firm understanding of those ethical principles that must guide every faithful practitioner of a learned profession. No hard and fast rules of conduct exist in it but there are certain standards of faithful service to the public and to the community, standards of fairness and consideration for colleagues and for rivals. Unless the young practitioner recognizes these things, he is in no true sense a member of a learned and enlightened profession. He must possess an appreciation of the larger role of the engineer as a member of a democratic society. It is not sufficient merely that he become accomplished and proficient in certain techniques of which he has gained some knowledge in college.

Technologists are valuable members of society. We depend vitally upon them and shall continue to do so; but the practice of engineering does not consist merely of the mechanical application of techniques. The engineer is above all a member of society and as such it is his duty to cooperate with other men of earnestness and good faith to advance its interests, to improve the welfare of his community, to do all in his power to make this world a better place in which to live. If he ignores these obligations and confines himself to his laboratory or to his office, letting the world go by, he may yet be set down as a clever technologist but not as a real engineer.

Post-War Trends

Certain trends are definitely apparent when we examine the recent progress of engineering education on this continent. The Society for the Promotion of Engineering Education, in its report of 1944 on Engineering Education After the War, identified three of them.

First, there is the strong current of traditional training with which we are all familiar. In most institutions it involves an undergraduate course of four or five years, basic and general in character, without marked specialization. That will continue to be the main stream along which most engineers will proceed to graduation and practice.

But there has come about, particularly in the last decade or two, a marked tendency for engineers to enter the field of management and administration. The recent war showed to a very remarkable degree the extent to which the engineer has taken part in management, direction, and control. It has shown that by reason of his technological background, his commonsense point of view, and his direct methods, the engineer is unexcelled as human material for managerial pursuits, provided that he has the personal characteristics that are associated with the successful handling of men. Many of the engineering colleges of the United States have recognized this and have introduced courses to give a type of training that is particularly suited to those who are, or appear to be, fitted for this type of activity. We have done this in the Universtiy of Toronto and look forward confidently to the outcome of the experiment.

A recognized need exists, too, for a moderate number of men who are trained much more rigorously in the sciences and in mathematics than those who pursue the other programmes that have been mentioned. These men will work at a very advanced level. A high order of achievement will be theirs. They are in the class of scientist-engineers to whose services we owed so much in the late war. I am happy to say that Dr. Dunsheath, President of the Institution of Electrical Engineers of Great Britain, who is here tonight, is one of those scientist-engineers. Another is Sir Robert Watson-Watt, with whose name will be forever associated the amazing development of radar. And there is Dr. Karl T. Compton, president of the Massachusetts Institute of Technology, one of your honorary alumni. With unrivalled knowledge of the facts, he has vigorously pointed out that in the solution of unusual problems in the recent war the scientists did rather better than the engineer trained in traditional courses. The latter did better in production, in the development of an idea, in the manufacture of devices, in devising sound financial and operational bases, but in the creation of the original concept the scientist-engineer has had the edge on the ordinary engineer.

It is not everybody who can function effectively in this field. Only a comparatively small percentage of young men, rarely endowed with native talent and interest, are able to serve in it with distinction and success. But I feel that we should have in our universities and colleges a small proportion of men who will not only take a particularly rigorous training in the undergraduate years but proceed to graduate work of two or three years duration. Upon them we may well rely for outstanding creative achievement, for those devices, methods, and processes that have meant so much to us in times of stress.

Selection of the particular type of college course that is to be pursued is not so vital a matter as some young men think. Actually, it makes but little difference in the long run whether the student selects this or that branch of engineering. With remarkable frequency prospective employers of our own graduates for permanent positions will say simply: " What I want for my organization is a bright, interested boy with a good personality. I do not care very much what course he has taken. We will see to his development and mastery of our methods, but he has to be good material—with a sound fundamental education. We will start from there."

I am often reminded of the practice said to have been followed by Sir John A. Macdonald when appointing judges. " My policy ", said he, " is to find a gentleman first of all. If he knows some law, so much the better ". Attractive personal qualities constitute a powerful reinforcement of whatever technical proficiency a young man may possess.

The Need of Humanities

Much was said at the recently concluded Annual Meeting of The Engineering Institute of Canada concerning the desirability of humanizing and liberalizing our engineering courses. I am entirely in agreement with the observations that were made in that respect. We have confined ourselves in the engineering colleges too narrowly to the scientific principles of engineering. We ought to remember that those who serve as professional engineers should take their full part in the society to which they belong. Unless we are able to mingle freely, naturally, and effectively with other educated persons and contribute as they do to the public service, we shall not receive full recognition as professional men.

I was struck with the remark of Dr. Dunsheath last evening to the effect that there is no point in the young man who seeks recognition and distinction in the profession clamouring for that recognition.* He will get it in due course if he is worth it. If he is not, all the striving in the world will not bring it. And so he should put his general educational and cultural house in order and acquire those personal interests and qualities that will make him an acceptable citizen, a creditable representative in any society, an effective champion of any cause that merits a champion.

There is need for young men while still in college to acquire some familiarity with the raw materials of thought on social and economic questions. If he has no material to work with, if he is charged with no ideas on these subjects, he cannot get very far in developing a philosophy pertaining to them. So, while in college he should do what he can to assimilate ideas about non-technical things with a view to his career as an effective citizen. If he develops a sympathetic interest in others and can broaden his point of view to include theirs, so much the better. Then when he comes out into the workaday world he will have laid a foundation of ideas, a basis for enthusiasm, and some qualifications for assuming his share in attempting to solve the difficult problems that will everywhere confront him.

He should acquire some familiarity with cultural matters. He should develop an interest in art, in the drama, in literature, in music, in social work, in things that educated, cultured, and refined people find to their liking the world over. He may never be a practitioner in the cultural field but he may at least develop and maintain an interest in it and be able to further the contribution of those who are creators therein.

Yes, humanistic interests and studies are of vital consequence to engineering students, quite as much as they are to any other students. They impinge on the fundamental questions of life.

I like to think of something that Lucien Price wrote a couple of years ago for *The Atlantic Monthly* in justification of the humanistic subjects of study in the universities and colleges. Said he

> " Here, in the subjects mentioned are charted the successes and failures of human society, with reasons for both. Here is a manual of civilization, examples of what has been tried, of what works and what does not. Here are the implements of long-range wisdom, hammered out on the ringing anvil of time ".

Education to be effective has to be broad, comprehensive, inclusive. We are citizens of a great country and our education should fashion us to serve it.

I like to muse, too, on the words of a great patriot, a stalwart figure in other days of testing and trial, words of John Milton:

> " I call, therefore, a complete and generous education that which fits a man to perform justly, skilfully and magnanimously all the offices, both private and public, of peace and war ".

*See *Engineering Journal*, March 1946, p. 157.

A BRIEF FOR ENGINEERS

Institute Makes Representations to Royal Commission

This brief was presented by the Institute Committee on the Engineer in the Civil Service to the Royal Commission on Administrative Classification in the Public Service, at Ottawa, on April 9, 1946

April 9th, 1946.

The Royal Commission on
Administrative Classification
in the Public Service,
Ottawa, Ontario.

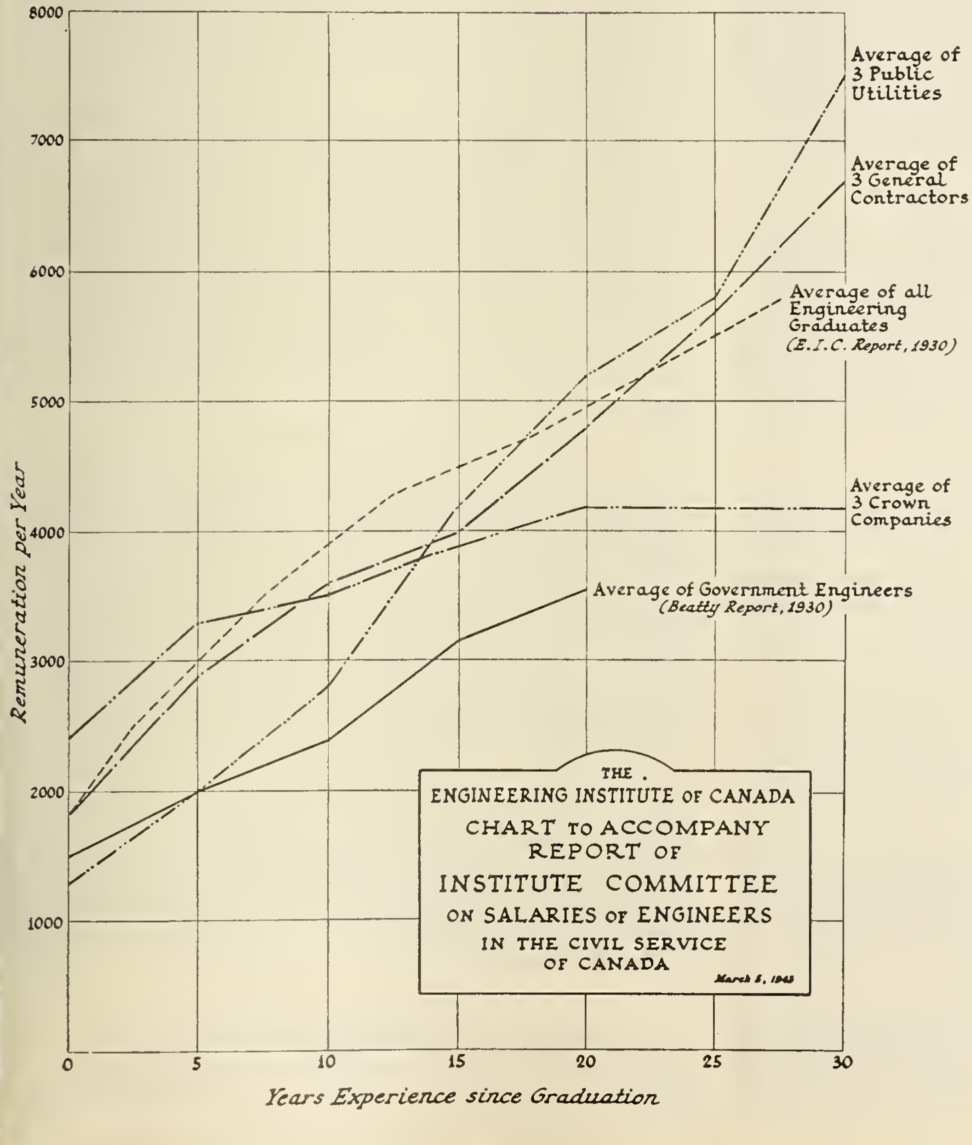
Gentlemen:

The Council of The Engineering Institute of Canada is appreciative of your invitation to present a brief on "matters relating to the senior personnel in the public service". The Institute is interested primarily in the case for the engineers, and herein confines itself entirely to that field, although it realizes the case for other professional workers is equally pressing. For over three years the Institute has had a special committee working on such matters and has entrusted the preparation and presentation of this brief to that committee.

The past action on reports of Royal Commissions in Canada does not encourage us to believe that the solution of the vitally important problem of supply and maintenance of technical services by the Federal Government will be found that way. We are not deprecating the personnel of the Commission or its work, but are generalizing on the record of the various governments that have used such agencies in the past. The work of the commissions has been excellent, but the failure of Government to implement the recommendations has been deplorable. If in this instance the same treatment is to follow, it is apparent that many busy people desirous of assisting in the solution of a serious problem will have wasted their time. May we asure this commission that it has the support of The Engineering Institute of Canada in anything which it may be able to do to correct this situation.

The problem facing the Commission is one that has existed for many years. The Institute has been working on it for over thirty years, and in that time has made surveys, proposed solutions, presented briefs and urged action, all to no avail.

The Institute's interest is easily understood. It is the national body representing employer and employee engineers of all classifications, and a large portion of its membership of 8,000 is made up of employees of the government. It has operated an employment service for over 25 years, through which it has kept in close contact with Civil Service affairs as they affect the engineer. Further, throughout its sixty years of existence it has always been interested in the financial welfare of the members of the profession, and has built up a specialized knowledge of the relationship between employer and employee in this field.



History

No organization outside the Civil Service itself has been as keenly or as continuously interested in employment conditions for Government engineers as has the Institute. The creation of the Professional Institute of the Civil Service over 25 years ago sprang from the interest of the Ottawa Branch of the Engineering Institute, in securing some amelioration of salary conditions of that time.

As far back as 1919 the Institute submitted a scale of remuneration which was eventually adopted by Griffenhagen and Associates in their recommendations, although it was not accepted at that time by the Government.

In August, 1929, the Engineering Institute submitted a sixty-five page brief to the Royal Commission on Technical and Professional Service, now referred to as the Beatty Commission. This brief was based on months of study and search, and dealt in detail with almost every angle of the problem. Thirty-one leading employers of engineers were consulted in order to give the Commission the true picture of employment conditions outside government circles. The Commission in its final report quoted from the brief as a basis for increased salaries of professional workers. The report was disregarded! To read that brief today in the light of the inaction which followed is to perceive the futility of such endeavours.

In 1943 the Institute again presented a brief, this time to the Sub-Committe of the Treasury Board, known as the Coon Committee. The report of this committee too was disregarded—in fact, its contents were not even made public. The valuable time of so many earnest and busy people should not be wasted again!

Limitation of Brief

The Institute's committee does not propose in this brief to go into job evaluations, departmental structures and procedures, or wage schedules. The committee believes that within the Civil Service Commission are the people most competent to do these things, providing their knowledge and efforts are not nullified by superimposed restrictions. The committee does propose to offer evidence that the present scales of remuneration are hopelessly inadequate, and that increasing inefficiency and attendant criticism will follow if substantial changes are not made immediately.

The graph prepared for the Coon Committee is resubmitted with this brief (Appendix A). It shows clearly and simply how far government salaries fall below those for comparable service elsewhere. Further, it shows the salaries actually paid by the government to crown companies, which indicate the scale necessary in that service, to meet the competition of other employers. Crown companies could not have been operated successfully with salaries at the Civil Service level. This admission should mean something for the post war thinking of government officials.

Pensions

For many years, the Civil Service scales of pay have been defended with the claim that the pension compensates for the lower rates of remuneration. This is an unsound claim. Many private employers have pension schemes as good or better than that of the Government, and at the same time they pay much higher salaries. The " security of tenure " and the value of pensions should not be offered as substitutes for proper salaries.

Far Reaching Effects

There are three phases of the problem which we would like to emphasize:

1—The fundamental necessity of securing and retaining an adequate supply of the best engineering skill the country affords.

2—The evil effect that low wages have on an entire profession.

3—The despoiling and frustrating of individuals by low wages.

These phases are dealt with in the following paragraphs.

1—Economics

Every intelligent citizen wishes to have his tax money spent wisely. He does not encourage government to employ low grade personnel for he knows that the most costly employee on any job is the one who commands only a low salary. The best man obtainable is the least costly, whatever his compensation.

It should be kept in mind that the work carried out by engineers requires the heaviest financial outlay of any service operated by the government. For instance, it is reported that the Department of Public Works has a programme for the year 1946-7 totalling over $20,000,000. A good engineer as compared to a poor one can save his employer many times the additional compensation which he may receive. Why then quibble over salaries? The objective of good business is find the best man for the job, and to pay him adequate compensation, not to find someone small enough to fit a small salary.

2—The Profession

The policy of the Dominion Government towards the remuneration of engineers has done a serious injury to the engineering profession. The provincial and municipal governments have tended to follow the federal example. With this large field of employment offering only low wages a cloud hangs over the profession. It is difficult, if not impossible, to attain professional status when earned income is less than or little more than that of an unskilled artisan. This youngest of the professions is being retarded in its professional development and in its advancement in the service of the people by the humiliating salaries offered by Canada's largest employer.

Fortunately for the profession, it is now possible to find full employment without entering civil servants ranks. This forecasts disaster for the government engineering services. Today the government stands discredited as an employer of engineers, and every encouragement is being given to young graduates not to enter the service. The time has come when responsible government officials must become practical business men, and adopt business methods. The government cannot long continue to face the situation which recently it seems to have seen for the first time. Engineering openings are going begging in all departments, and will continue to do so until decent wages are offered—and work vital to post-war recovery will remain no more than an idea in rough outline in somebody's mind.

The short sighted policy of the government has been an important factor in the recent development among engineers towards trade unionism. If not otherwise obtainable, it is natural for people to organize themselves to secure their just dues. Under present government policy, it is not unreasonable to expect the professional workers in due course to rise up as an organized body and demand their rights, under what may be embarrassing conditions. If trade unionism is the only means by which justice can be obtained, no one can blame the workers for resorting to it. They have waited long for justice and fair treatment.

3—The individual

The effect of the present salary policy on the employee is serious. Many men who entered the service in high hopes have found themselves caught in a trap. Without realizing fully what was happening, and still expecting the illusive promotion and attendant increase, they have let time slip by so that before they knew it they had reached an age where employment elsewhere was not easy to secure. As well, they had built up a substantial equity in a pension fund which would be lost if they made a change. This situation has kept them at their posts at salaries which pinched their very lives, and frustrated them in all their plans for the full development of themselves and their families. It is remarkable that under such circumstances they have been able to continue their faithful service to an unappreciative and unwise employer. It is not reasonable to expect from impoverished and frustrated people the high degree of efficiency required in engineering work, which is possible only in an atmosphere free from economic fear and worry.

Confusion In Terms

The terms of reference for your commission state you are to "examine into and make recommendations to the Government upon the scales of salary, classifications, and conditions of employment of the senior administrative officers in the public service." From that description, the Institute finds it difficult to draw a line across the organization. Where does "administrative" work begin with a professional worker? Years of study by many organizations and individuals have not produced a satisfactory answer.

Today in several departments, all or many senior officers are ready for retirement, and there is no person below them ready for promotion to senior responsibility. This is one result of the government's short sighted policy. Dealing only with senior appointments now will not solve the problem either for today or for the future.

The Institute believes there is only one problem, not two, as the terms of reference would imply. That problem begins with the most junior engineer and finishes with the Deputy Minister. It is folly to attempt to deal only with "senior officers", because there won't be any senior officers if competent staff cannot be recruited at the lower levels. Senior officers must come from promotion, and the lessons to be learned from today's critical situation must not be wasted.

Some Comparisons

The only reference the Institute wishes to make to specific salaries is related to the graph shown in Appendix A. A study of this is informative. It shows actual salaries being paid in 1943. Today's rates are somewhat higher. The line representing the "Average for Government Engineers (Beatty Report 1930)" is essentially correct for today for permanent positions. The only change the committee can discover is that the starting salary is now $1,800.00 per year instead of $1,000.00.

The average compensation of "all engineering graduates" in 1930 was approximately $1,500.00 a year higher than the "Average of Government Engineers." Today, according to the graph, a senior engineer can earn from $1,700.00 to $2,000.00 a year more in private industry than he can with the government. A survey conducted in Montreal in 1944 by officers of the Civil Service Commission and the Department of Public Works showed that for senior men such as described in the new Grade IV, private industry paid from $6,000 to $8,000 per year whereas the upwardly revised scale of the Department of Public Works (available only for those on post-war projects!) was only $3,600 to $4,200.

Again referring to the Department of Public Works let us look at the salary limitation of the Chief Engineer. He cannot receive more than the Deputy Minister, who apparently gets $10,000.00 a year. A study of the qualifications necessary for the position, and of its responsibilities, reveals requirements that would command not less than $15,000 and probably $20,000 in private industry. This is one of the most important engineering posts in Canada, and should be so recognized in dollars and cents. The Institute recommends that the salary of the Chief Engineer of this department be set at $15,000.00 to $20,000.00. With this for the top position, it would be possible to grade senior assistants and others at rates that would be attractive to competent men. The same basis would apply to other departments. The present rates will not secure or hold the best engineers.

Plan The Future From The Past

In recommending new scales of compensation, it should be kept in mind that generally speaking there have been no increases in the scale for engineers for almost 25 years. Any scale adopted now that is to be fair and adequate for the next 25 years should not be at today's minimum figures.

Changes In The Civil Service Commission

In addition to making representations regarding salaries, the Institute desires to make recommendations regarding the Civil Service Commission itself, which it is believed will be of real assistance in meeting the present problem of finding additional professional workers and of the even greater problem of retaining them after they are found. These proposals are intended to be constructive and are based on modern practice elsewhere.

When the Civil Service Commission was established in 1908, there were about 8,000 employees. Today there are about 140,000, of which 2,700 are professional. The Institute believes that this great increase justifies and requires an increase in the commission itself. Back in 1930, the Beatty Report said "the responsibilities borne by the three members of the Civil Service Commission are extraordinarily heavy". The Institute recommends that at least one more commissioner be added, and that he be taken from the professional ranks. In view of the preponderance of engineers in the professional group, we suggest that he be an engineer.

With so many professional workers and with such a variety of training and experience, we believe it is not fair to the present commissioners to ask them to handle these problems without the assistance of a professional man at their own level. It is not enough that there should be engineers in the office of the commission. At least one should be a member of the commission to specialize on this increasingly important phase of the commission's work. He should be someone who has been active in the affairs of the Professional Institute of the Civil Service and in fact that Institute should be consulted in his selection.

A Professional Panel

Further, the Institute recommends the creation of an Interdepartmental Professional Technical Panel. Such a panel should be of splendid assistance to the various departments and to the professional personnel. It should be made up of the heads of the departments using professional personnel, and should meet regularly to establish standards for promotion, consider promotions and transfers, and receive representation from employees. This would assure that a promising worker would not be overlooked or left to stagnate in some inconsequential job away below his capacity. The exchange of ideas between departments would also be of assistance in developing a greater utilization of the professional worker. It should also promote the transfer of personnel from one department to another to the advantage of the departments and the individual.

The panel would be of inestimable service to the Commission in examining, selecting, and grading applicants for new positions or for transfers.

This proposal is not unique. The Scientific Service of the British Civil Service has adopted such a panel. In announcing the plan, the Chancellor of the Exchequer stated "The Government proposed that the functions of the Panel shall be rather wide—They will include responsibility for keeping under review the well being and efficiency of the Government Scientific Service and for making proposals for any changes in the organization or conditions of service which would promote the well-being or increase the efficiency of the Service".

With the general increase in appreciation of the work of engineers and scientists in all phases of living, it is reasonable to expect that the Canadian Government should be prepared to utilize such service more efficiently in the business of Government. A technical panel such as the Institute recommends would go far towards making that possible.

Action Is the Need

The main purpose of this brief is to urge that constructive action be taken. There are no difficulties in the way of determining proper salaries, the best organizational set-up, and working conditions. Almost anyone reasonably familiar with conditions could set up suitable regulations. The great work to be done is to initiate action. Present scales are a disgrace not only to the government but to all of Canada. Someone must do something to overcome the lethargy and indifference of responsible officials who do not seem to appreciate their responsibility. If your Commission can do this, the citizens of Canada, and the professional workers in particular, will be eternally grateful. Whatever is done should be done quickly in order to stem the outward flow of the very best technical personnel in the services.

Gentlemen, may we assure you of the genuine interest of The Engineering Institute of Canada in the affairs of the engineers in the Civil Service. The Institute is the largest professional society in Canada, and accepts the responsibility which this imposes. If it can be of further assistance to your Commission, we assure you of its readiness to serve.

Respectfully submitted,

(Signed) N. B. MacRostie, M.E.I.C.
Chairman of the Institute's Committee.

Members of the Committee

N. B. MacRostie, M.E.I.C., R.P.E.O., Consulting Engineer, Ottawa, Ont., Chairman of the Institute's Committee.

deGaspé Beaubien, M.E.I.C., R.P.E.Q., Consulting Engineer, Montreal, Que.

Allan C. Ross, M.E.I.C., President, Ross & Meagher Limited, Ottawa, Ont.

L. Austin Wright, M.E.I.C., R.P.E.Q., General Secretary, The Engineering Institute of Canada, Montreal, Que.

ADVANTAGES OF HIGH STRENGTH STEEL AS REINFORCEMENT FOR CONCRETE

(*Continued from page 239*)

of the ultimate strength theory, equations 5 to 7, gives values which are on the safe side. If this contention is admitted, then the straight line theory should be discarded in codes and text-books. We believe we have also demonstrated that the old dictum that a reinforced concrete member fails when the steel reaches the elastic limit does not hold.* We have shown, that, where no bond or diagonal tension failure occurs, the steel stress may reach values 30 to 40 per cent greater on the average than the commercial yield point; we further believe that it would be much more advisable to introduce tests to find the useful limit point, which is the stress at a strain of 0.005 in. per in. As previously mentioned this should be a very slow test.

If Table II is accepted as correct, then engineers who refuse to use high elastic limit steel simply waste their clients' money, and it is up to them to defend their standpoint by clearly showing with proved data the possible disadvantages to their clients' structures introduced by the use of high elastic limit steel; and, whether these supposed disadvantages are incurred by the chemical composition of the steel or by the manner of rolling or are supposed to lie in less resistance to shocks or in the production of wider cracks. All these questions have been thoroughly discussed and the fabled disadvantages exploded in the paper by Professor H. J. Gilkey previously referred to.

*This is further confirmed by Professor F. E. Richart in University of Illinois, Engineering Experiment Station Bulletins: No. 314-Pages 47 & 60, No. 346—Pages 56 & 57, No. 345—Page 30.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

A BRIEF FOR ENGINEERS

What the present committee hopes will be its last act was staged at Ottawa on Tuesday, April 9th. A brief was presented to the Royal Commission on Administrative Classification in the Public Service. The document, reproduced in this number of the *Journal*, stresses three things. (a) The need of immediate and substantial increases in remuneration for the professional worker in the Civil Service. (b) The desirability of adding to the Civil Service Commission an additional commissioner who will be a professional technical employee, and (c) the advantages of setting up an Interdepartmental Professional Technical Panel to consider and advise on all matters relating to the use and welfare of the professional workers.

The delegation presenting the brief was headed by Norman B. MacRostie, chairman of the committee, deGaspé Beaubien and the general secretary. They had an hour with the Commission and received an excellent hearing. The impression was gained that the Commission already appreciates the necessity of adequate increases, and that the real problem is to determine from the vague terms of reference the field that is to be covered and the best form for their recommendations.

The commissioners are Chairman W. L. Gordon, of Toronto, a graduate of Royal Military College and the administrative head of a company of industrial engineers, Sir Thomas Gardiner, from England, a retired civil servant who has had extensive experience with engineers in different departments of government in the United Kingdom, and Major-General E. de B. Panet, of Montreal, former Officer-Commanding Military District No. 4

As the brief points out, this is at least the third time that the Institute has made formal representations on the same subject to commissions and committees since 1919. It is with all this in mind that the committee expressed the hope that at long last something sensible would be done that would make unnecessary the continuance of such a committee. At the same time, the Commission was informed that if an acceptable solution is not offered, the Institute would continue to press for action.

ENGINEERING JOBS GO ABEGGING

Specific examples are always more effective than generalizations, and therefore the *Journal* publishes an editorial from the Vancouver Sun of February 14th, which deserves the attention of Institute members. This is but another case of "penny-wise and pound-foolish", added to the long history of municipal, provincial and federal employment policy—or lack of policy.

"Who'll Work for the City?"

The City Council has advertised for applicants for City Engineer Brakenridge's job, but it hasn't made an appointment. It seems that men who are well established in the profession can't afford to work for the city.

At the peak of his municipal career, Mr. Brakenridge received a $6,846 salary in 1945. Now he wants to quit to enter private practice but few people want to quit private practice to succeed him. Salaries in private industry or fees earned by consultants are far more attractive.

This situation is all too characteristic of the civil service. The best men in government employ are usually those who started young and worked their way up. They either get the habit and enjoy the security or else they are so far out of touch with commercial conditions that they don't appreciate how underpaid they are. Many of the more enterprising strike out for themselves before they are undermined by the system.

Which is one reason why there is no one in the employ of the City of Vancouver today who is a standout candidate for Mr. Brakenridge's place.

The job calls for the highest technical knowledge, great organizing ability, uncommon talents in policy-making and diplomacy, and prudence in the expenditure of tens of millions of dollars of the public's money. All for $6,800 a year. No wonder the opening is still vacant when any one of these qualities will command comparable rewards in industrial pursuits.

Successive City Councils have striven to keep salaries down. They have "held the line" to the point of false economy. It appears that the line will have to bend sometime before Mr. Brakenridge walks out on June 30th.

STAFF CHANGES

It is with mixed feelings that the *Journal* records a change in the administration of the Institute's rehabilitation and employment service. It will be a matter of regret to all who have used the service in the last year to know that Major D. C. MacCallum is resigning. He has been in charge of rehabilitation since April 1945, and in that time has rendered an outstanding service to the Institute and to members. Attacking the situation with energy and intelligence, he has in that year re-organized the department and greatly increased its usefulness. He has won for the Institute praise and recognition in many circles, including the press and radio.

Major MacCallum's departure was not unexpected. He accepted the appointment originally to assist in doing something for the members retiring from the active services, and his interest has always been chiefly in such persons. Now that most members are back in civilian occupation he feels he is free to return to the industrial field. He is going to Canadair Limited in Montreal as Administrative Engineer. Everyone will wish him well in his new duties, but he will be missed by the many friends he made in the Institute, and particularly by his associates on the staff.

Fortunately, there is a bright side to the picture. The Institute has secured the services of Colonel A. J. Kerry, O.B.E., M.E.I.C., to take on the department, beginning early in April. After many years with the Royal Canadian Engineers, he has retired recently to take up civilian employment.

Col. A. J. Kerry, O.B.E., M.E.I.C.

Colonel Kerry was born in Montreal, son of J. G. G. Kerry, M.E.I.C. He attended Bradfield College, England, for four years, after which he entered the Royal Military College, graduating in 1927 with honours. From there he went to McGill where he was graduated in 1929 with a B.A.Sc. in civil engineering. From 1929 to 1931 he attended the School of Military Engineering in England. He joined the Institute as a Junior in 1931, transferring to Associate Member in 1934 and to Member in 1940

In 1931 Colonel Kerry was appointed Works Officer for Military District No. 5, Quebec, with the rank of Captain. In 1936 he was tranferred to M.D. 4, Montreal, as District Engineer Officer with the rank of Major. From this appointment he went overseas in 1940 with the 1st Bn. R.C.E. While overseas, he held various engineer staff and command appointments, including 12th Field Company, 1st Bn. R.C.E., and C.R.E. 2nd Cdn. Army Troops, and served in England and on the Continent, for which he was awarded the O.B.E. At the beginning of 1945 he was posted to command the Engineer Reinforcement Unit with the rank of Colonel, returning to Canada in July to take up the appointment of Director of Works and Construction at National Defence Headquarters, which appointment he has recently vacated on retiring from the Army.

Col. Kerry has been an active member of the Institute since 1931. His contacts go back farther than that as he is the son of J. G. G. Kerry, the well-known consultant who delivered such an excellent paper at the recent annual meeting on consideration of all year transportation on the Great Lakes. Mr. Kerry, Sr., joined the Institute in 1888.

It is planned that Col. Kerry will visit many of the branches shortly so that he may study the employment situation in various fields, and get to know the membership over a wide area.

CONFERENCE OF DEANS

When the president of the Institute, Dean Fetherstonhaugh, invited all the deans of engineering to meet in Montreal at the time of the annual meeting of the Institute, it was agreed that the conference would be more or less a private one. It was Dr. Fetherstonhaugh's idea that the time had come for these educationalists to get together for a discussion of their many common problems. Therefore there was in attendance no official representative of the Institute, and therefore also, it is not possible to publish details of the conference beyond whatever the deans themselves desire to report in due course.

However, it is interesting to know who was there. The following list supplies that information:

Dean C. R. Young, University of Toronto
Col. L. F. Grant, Royal Military College
Dean D. S. Ellis, Queen's University
Dean H. W. McKiel, Mount Allison University
Prof. René Dupuis, Laval University
Dr. E. O. Turner, University of New Brunswick
Dr. A. F. Baird, University of New Brunswick
Dr. Arthur Caron, University of Ottawa
Dean J. J. O'Neill, McGill University
Prof. A. E. Flynn, Nova Scotia Technical College
Prof. B. Cain, Acadia University
Rev. W. P. Fogarty, St. Francis-Xavier University
Dean I. Brouillet, Ecole Polytechnique
Dr. E. Brown, McGill University
Prof. R. M. Hardy, University of Alberta

One piece of business has been submitted to the Council of the Institute by Dr. McKiel on behalf of the conference in the form of a resolution as follows:

"That this meeting of deans and teachers of engineering expresses the willingness of its members to participate in a study of engineering curricula and engineering education in general.

"It further suggests that any such study should be cooperated in by all interested bodies, as, for example, the universities and schools of engineering, The Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy, the Canadian Institute of Chemistry, the Dominion Council of Professional Engineers and the various provincial professional organizations."

This was discussed at the March meeting of Council, and after reference to the opinions of three deans who had written on the subject, the general secretary was instructed to advise Dr. McKiel that the Institute is ready and willing to support the deans in whatever way they think the most help can be rendered. Any time a conference of deans desires assistance from the Institute, Council will be glad to see that it is given wholeheartedly. In the meantime, Council supports the suggestion made to it, that the educationalists themselves as a group, investigate the situation before consulting engineers in other fields.

Council is wise in leaving educational matters to educationalists. The time will come when the opinion of the practising engineer and the employer will be useful, and at that time doubtless they will be consulted. In the meantime, it is to be hoped that the National Conference of Canadian Universities will afford a proper forum for the further discussions which the deans desire.

LESSONS FROM THE STUDENTS CONFERENCE

Members will recall that during the annual meeting a conference was held in Montreal to which was invited the president of the undergraduate engineering society of every Canadian university, and certain observers drawn from the vice-presidents and immediate past-presidents. The minutes of the conference have been completed recently, and therefore some further observations can be made on the conference and what it accomplished.

There were six separate sessions, held during three days, and a very exhaustive agenda provided a wide field of relevant subjects for discussion. The verbatim account is actually more revealing than the minutes because it gives the thinking of each individual, much of which did not result in decisions for further action. There were nine resolutions finally approved for presentation to the Council of the Institute, but other points of equal importance were agreed upon as recorded in the minutes, which were not included in those sent to Council, and printed on p. 264 of this *Journal*. The full value of the conference is not indicated clearly in the nine resolutions but it is in the written record.

Chief among the purposes of the conference was the desire of the Institute to discuss with the students themselves the many means by which the graduate engineer can help the undergraduate. This topic has been under discussion for years by senior engineers, but there has been no unanimity of opinion. and even less evidence of a successful policy. To get some helpful decision, the Institute took the bold course of bringing the leading students together for the specific purpose of getting first hand information from those best fitted to know.

It was an interesting experience to sit with these young men while they wrestled with the problems that loom so large in their sphere of activity. It was an inspirational and satisfactory experience. The enthusiastic and intelligent manner in which they dealt with every subject on the agenda—and some not on it—was a delight to see and hear. Seventeen keen young minds attacking problems that are close to each of them and important to all, developed a conference rich in immediate results and promising for the future.

The chairmanship of the sessions was shared by Vice-President J. E. Armstrong and Lt.-Col. L. F. Grant, chairman of the Committee on the Training and Welfare of the Young Engineer. For some sessions the group elected one of their own number, Léo Scharry of Ecole Polytechnique. It was planned that the discussions would be left entirely to the students, the Institute officers serving only as guides and consultants. This produced excellent results, as it promoted free and open discussion of all subjects. It is apparent from the record that none of the delegates felt himself under any restrictions.

The students' principal interest was in employment—an opportunity to learn and earn. Concern was expressed for the future of the Wartime Bureau of Technical Personnel. The Bureau had done an excellent service in gathering together hundreds of employment opportunities for the summer months, and the need was felt for a continuation of this service. It was requested that the Institute take up the work if, as and when the Bureau had to discontinue it.

Other decisions recommended that a similar conference be held annually; that technical institutes be inaugurated by provincial governments; that a post-graduate college of outstanding merit be established on a national basis; that more encouragement be offered to staff for teaching purposes, particularly increased remuneration; that a portion of *The Engineering Journal* be devoted to news of the students and the profession, and to technical papers from students; that encouragement be given to the proposal of the Institute to establish an educational fund; that a survey of universities be undertaken with the ultimate objective of promoting uniform courses, standards, and degrees; that further consideration be given to enlarging the curricula content of the humanities.

It is a little early yet for a decision to be made, but shortly Council must decide if such a conference is to be an annual event. It has been an expensive experiment to bring representatives from such divergent points as Halifax and Vancouver, but if it enables the Institute to get a better grasp of the needs of the students, it will be a justifiable one. Some of the revenue from the proposed increase in annual fees could be used to good advantage here.

The delegates and observers were as follows:

University of British Columbia: Delegate: Tom Scott, Engineers' Undergraduate Society.

University of Saskatchewan: Delegate: Bob Shore, President, Engineering Society.

University of Alberta: Delegate: James A. Clow, President, Engineering Students Society.

University of Manitoba: Delegate: Eric Bergenstein, Senior Stick, Engineering Society. Observer: Ritchie Ward (held office in Students' Council—now 3rd year Mech. at McGill).

University of Toronto: Delegate: Murray D. McCulloch, President, Engineering Society. Observer: R. F. Moore, Past-President, Engineering Society.

Queen's University: Delegate: W. L. Hayhurst, President, Engineering Society. Observer: B. J. McColl, Past-Pres., Engineering Society.

McGill University: Delegate: Chas. J. Fox, President, Engineering Undergraduate Soc. Observer: Philip Laporta, Vice-Pres., Engineering Undergraduate Society.

Ecole Polytechnique: Delegate: Léo Scharry, Undergraduate Engrg. Society. Observers: Fernand Noiseux, Representative Junior Sect, Montreal Br. E.I.C. and Laurent Gendron, Vice-Pres., Undergraduate Engrg. Society.

Laval University: Delegate: Gilles Perron, Science Students Association.

University of New Brunswick: Delegate: Ottis I. Logue, President, Engineering Society. Observer: Fred W. Davidson, Past-Pres., Engineering Society.

Nova Scotia Technical College: Delegate: C. Macdonald, President, Students' Society.

PRESIDENTIAL TOUR OF ONTARIO AND WESTERN BRANCHES

The itinerary has just been completed for the presidential visit to branches in southwestern Ontario and in the western provinces.

President and Mrs. J. B. Hayes will inaugurate their tour at Toronto on April 26th and will return in time for the Semi-Annual Meeting of The American Society of Mechanical Engineers to be held in Detroit, June 17th to 20th. The presidential party will also include Councillor G. J. Currie of Halifax and General Secretary L. Austin Wright of Montreal.

A regional meeting of Council will be held in Toronto on Saturday, April 27th. The May meeting of Council will also be held away from Headquarters, this time at Trail, B.C., on May 18th. Occasion will also be taken of the president's visit at Trail to officially inaugurate the Kootenay Branch of the Institute whose establishment was authorized by Council a few months ago and which is now organized to function.

Present and past officers of the Institute are invited to accompany the president on all or part of this tour.

ITINERARY

Lv. Montreal	Thursday, April 25th	11:00 p.m.	
Arr. Toronto	Friday, April 26th	7:30 a.m.	
	Branch Meeting, Friday, April 26th		
	Council Meeting, Saturday, April 27th		
Hamilton	Branch Meeting, Monday, April 29th		By motor

	Branch Meeting, Friday, June 14th		
Detroit	A.S.M.E. Semi-Annual Meeting, June 17th to 20th		

E.I.C. INVITED TO PARTICIPATE IN A.S.M.E. DETROIT MEETING

The American Society of Mechanical Engineers has invited the Institute to participate in its Semi-Annual Meeting to be held in Detroit, June 17-20, 1946. Council has accepted this opportunity to implement the spirit of co-operation between the two societies already recognized in a formal agreement.

Several officers of the Institute, including the president and the general secretary, will be present and they expect that a large number of members will join with them. The programme, which is published in tentative form on another page, indicates a wide variety of interests and should appeal to a large section of our membership, particularly in Ontario. It is hoped that our participation in the meeting will extend to the point where our members will contribute to the discussion of papers. Those who feel qualified to do so are requested to inform Institute Headquarters, as soon as possible. It is expected that preprints of most of the papers will be available well in advance of the meeting.

A committee of the Border Cities Branch of the Institute has been formed to co-operate with the Detroit committee of the A.S.M.E. in making local arrangements, A visit is being organized to the plant of the Ford Motor Company of Canada in Windsor, while the ladies will be entertained, also on this side of the border.

The final programme, together with the necessary forms for reservations, will be mailed to all members shortly.

MARITIME PROFESSIONAL MEETING

Digby, Nova Scotia, has been chosen as the place for the revival of Institute summer professional meetings, which, before the war, were held alternately in the Maritimes and in the west. The dates have been set for September 5, 6 and 7th, 1946.

A joint committee of the Institute and the Associations of Professional Engineers in Nova Scotia and in New Brunswick is being formed to take care of the planning and the local arrangements.

These regional professional meetings are intended especially for the benefit of members who cannot conveniently attend the annual general professional meetings of the Institute. They provide an opportunity for meeting with fellow-members and for keeping in touch with Institute affairs.

The last meeting was held in Pictou, N.S., early in September, 1939, and was ended abruptly because of the outbreak of war. Since then, the Institute has concluded co-operative agreements with the professional associations in both provinces and the resultant closer relations are a guarantee of unprecedented success for the meeting.

In making plans for their holidays, members in other provinces should keep in mind that the Maritimes are known as the " Playground of the Atlantic ". All sessions will be held at the famous hotel " The Pines ".

Further details about the meeting will be published as they become available.

PUBLICATIONS OF OTHER ENGINEERING SOCIETIES

Exchange arrangements exist between The Engineering Institute of Canada and engineering societies in the United States and Great Britain whereby members of the Institute may secure the publications of these societies at special rates which in most instances are the same as charged to their own members. A list of these publications with the amounts charged is given below, and subscriptions should be sent to Headquarters of the Institute.

	Rate to E.I.C. Members	*Rate to Non-Members*
American Society of Civil Engineers		
Proceedings, single copies	$ 0.50	$ 1.00
Per Year	4.00*	8.00†
(Plus 75c to cover foreign postage)		
Civil Engineering, single copies	.50	.50
Per Year	4.00	5.00
(Plus 75c to cover Canadian postage: $1.50 foreign postage)		
Transactions, per year	6.00‡	12.00¶
(Other publications 50 per cent reduction on catalogue price to E.I.C. members)		
* *If subscription is received before Jan. 1st, otherwise $5.00.*		
† *If subscription is received before Jan. 1st, otherwise $10.00.*		
‡ *If subscription is received before Feb. 1st, otherwise $8.00.*		
¶ *If subscription is received before Feb. 1st, otherwise $16.00.*		
American Institute of Electrical Engineers		
Electrical Engineering, single copies	$ 0.75	$ 1.50
Per Year	6.00*	12.00*
(* Plus postage 50c.)		
Transactions—annual, bound	6.00*	12.00*
(* Plus postage $1.00.)		
(The single copy price for Electrical Engineering includes postage charge.)		
The American Society of Mechanical Engineers		
Mechanical Engineering, single copies	$ 0.50	$ 0.75
Per Year	4.00*	6.00*
(* Additional postage to Canada 75c, Outside United States and Canada, $1.50.)		
Transactions, bound, published annually, about March 1st (price of current volume)	10.00	15.00
(Other publications, same rate to E.I.C. members as to A.S.M.E. members.)		
Journal of Applied Mechanics—Quarterly publications.		
Dates of issue: March, June, Sept., Dec.	4.00*	5.00*
(* Plus postage 25c.)		
American Institute of Mining and Metallurgical Engineers		
Mining and Metallurgy, single copies	$ 0.50	$ 0.50
Per Year	3.00*	3.00*
(* Plus $1.00 postage.)		
Metals, Technology, single copies	1.25*	1.25*
(* Plus 10c postage.)		
Per Year	7.00*	7.00*
(* Plus 80c postage.)		
Transactions, per volume	5.00* to 10.00	5.00* to 10.00
(* Plus 50c postage.)		
Technical publications: Supplied at 1c per page, with a minimum charge of 25c for single copies, or at a subscription rate per year of	2.50	2.50

Subscriptions to the above publications are payable in U.S. funds.

Institution of Electrical Engineers		
Proceedings and Journal (in Three Parts)		
Per Year	£1–11s–6d	£3–3s–0d
Part I—General, Per Year	10s–6d	£1–1s–0d
Part II—Power Engineering; Per Year	15s–9d	£1–11s–6d
Part III—Communications Engineering, Per Year	15s–9d	£1–11s–6d
Science Abstracts (in Two Sections)		
Per Year	£1–10s–0d	£3–0s–0d
Section A—Physics Abstracts, Per Year	17s–6d	£1–15s–0d
Section B—Electrical Engineering, Per Year	17s–6d	£1–15s–0d

ON KEEPING CANADIANS IN CANADA

It is a commonplace that Canada's greatest export is brains. It is equally acknowledged that the profit on this export is nil. Thus we have a problem that has remained unsolved since the beginning of time—Canadian time. Like Mark Twain's frequently quoted comment on the weather, everybody talks about it but nobody does anything about it. Is it like the weather, too, in that nobody *can* do anything about it?

The problem becomes more pointed for engineers and scientists because of the present large enrolment at universities. Is this extra production to be forced to go elsewhere to get suitable employment, or will Canadian employers absorb it? There is a great shortage in the United States, and it is inevitable that thousands of our best young men will go there and be lost forever to Canada, if employment at adequate remuneration is not offered here.

In the March 2nd issue of the *Financial Post,* a page is devoted to expressing the opinions of many Canadians on the question "What specific steps would you suggest for checking shift of young Canadians to the United States?". The *Journal* herewith reproduces many of the opinions in abridged form. It is interesting, though not surprising, that almost every answer states that better wages must be offered. It is interesting, too, to see how many replies refer particularly to engineers and scientists, although the editor's question spoke only of Canadian youth. It is evident that many citizens outside the profession are concerned about the great potential loss of technical manpower that seems to be just around the corner.

A dollar is worth more in Canada than in the States. There are social and cultural values here that may not be so easily secured there. There are other advantages to being in Canada that must not be overlooked, but they are harder to explain to a young man than is the difference between one hundred dollars and two hundred dollars. To offer equal or better opportunities, Canadian salaries do not have to equal American, but in too many cases they must be higher than they are now. If we lose this forthcoming bumper crop of engineers—the best in quality and quantity that we have had since the last war—it will be largely the fault of the employers, the federal and provincial governments being themselves the greatest offenders. There are other factors, too, which are important but remuneration will always be the prime one. There is still time to prepare to meet the situation, but will any of the suggestions gathered by the *Financial Post* be implemented before it is too late?

Herewith the opinions and suggestions:—

A. G. Bailey, Deputy Chairman, Petroleum and Natural Gas Conservation Board, Calgary.

"Canadian engineers should be shown by education that they need not take a back seat to American engineers either in scholastic training, research ability, or engineering practice. Canadian employers should be made to realize the value of properly trained technical personnel in industry. Technical salary levels should be generally raised to be commensurate with the value of technical service."

Henry J. Foster, Managing Editor, Tribune, Welland.

"One way to encourage young Canadians to remain in Canada is to work from the top. By this I mean that leaders of industry and commerce and heads of institutions and organizations should give the preference to men educated in Canadian universities when seeking employees to be trained for executive posts."

Rex Frost, News commentator, Radio Station CFRB, Toronto.

"Many young Canadians are drifting to the United States because in school and social training they are not being sold on the opportunities of their own country. The reflected glitter of U.S. publicity methods here, plus the effect of Americanized radio, movies and magazines, created the impression in many junior minds that the big money is to be picked up across the border."

R. M. P. Hamilton, President, General Engineering Company (Canada) Limited, Toronto.

"To avoid young Canadians moving to United States, older men in business, industry and government should stop preaching to youngsters and take steps to help meet their personal problems Such steps should include establishment of more attractively paid government positions bringing men of affairs into the government councils so their opposites in private life are not depressed by government contacts. Leaders in private life should recognize young Canadians' potentialities and actively search in and out of their own businesses for opportunities to train younger men at attractive income levels. Making opportunities for learning and taking responsibilities will be the most effective aid."

John T. Hackett, K.C., Hackett, Mulvena, Foster, Hackett & Hannen, Montreal.

"The dazzling prizes of reputation and fortune will ever draw to a rich and prosperous state the spirited and strong of lesser and poorer communities. Thus Canada has lost millions of native Canadians to the U.S. Policies tending to equalize opportunity and accentuate the growing importance of the Canadian position in international affairs would check, if it did not entirely stop, the drift of young Canadians to the U.S. Canada has done much for the weak and weary but not so much for the able and aggressive, who seek opportunity rather than state aid, and freedom from monopoly rather than assured revenue."

R. M. Harrison, Columnist, Daily Star, Windsor.

"So long as 'money talks' there'll be little appreciable diminution in the south of the border stampede. On the score of financial returns it is doubtful if the Dominion will be able to compete with the United States for a long time to come.

Therefore the task would seem to be to sell Canada to Canadians from other angles: Love of a wonderful country, pride in the British connection and its inherent security, comfort, peace, neighborliness, fresh air, the greater freedom of the individual even though the U.S.A. preens as democracy's show window, the chance to join in making this a land worth sticking to. These things at forty a week are worth more than Uncle Sam has to offer at double. Let's stress 'em."

Louis G. Howard, Dominion President, Army and Navy Veterans of Canada, Selkirk.

"If Canada is to retain the cream of her graduating youth, industry and the civil service must make administrative and executive positions more attractive by higher salaries and opportunities for advancement."

Col. C. H. L. Jones, President, Price Brothers & Co., Quebec, Que.

"It is impossible to cover completely in a few words the ideas, reasons and remedies which drift young Canadians to the United States. Outstanding is the desire to improve living conditions and enjoy maximum luxuries and pleasures of life which depend largely on net income, or take-home pay. There are similar jobs on both sides of the border. This net is affected primarily by three items: gross wages, salaries paid, cost of living and net amount retained after taxation. The average Canadian wages are lower than in United States, but the cost of living is correspondingly lower and a raise of wage rates would increase the cost of living without achieving the objective of increased take-home pay."

Dean Sinclair Laird, School of Teachers, McGill University, Montreal.

" Retention of our own skilled young workmen, professional men, scientists, writers and other talented young people can best be secured by these steps:

1. Varieties of opportunity for talent, attractive salaries and rapid promotions.
2. Private and public encouragement of research in science, industry and education.
3. Development of pride in Canadian designs, crafts, materials and products.
4. More gambling by industrialists on new inventions and new enterprises and encouragement of individual inventors' and employees' suggestions.
5. Development and extension of vocational education in schools and colleges.
6. Giving prestige to careers in business and industry commensurate with that in the established professions.
7. Increased immigration to help carry our burdens and buy our products."

John L. Lang, Past-President, Ontario Professional Engineers, Sault Ste. Marie.

" Restricting the scope of my reply to young engineers, I believe that higher salaries are essential. The movement of technical personnel to United States is still minimized by requirement of exit permits under wartime controls, but this can be only a temporary expedient. The first step should be increased salaries, which are now inadequate, for engineers in Government employ, both Dominion and provincial. There can be no objection to interchange of technical personnel between Canada and the United States, but it should not be one-sided."

Ed Maloney, Program Manager, Radio Station CFCN, Calgary.

" Canada will always remain a United States reservoir for keen brains and willing hands unless a vigorous policy of selective immigration is undertaken to provide the Dominion eventually with an additional 20 or 30 million people. Also needed will be capital to develop fully our natural resources and industries by exclusively Canadian private and public enterprise to such an extent that living conditions, wages, luxuries and opportunity are on a par with those of the United States."

Pearson McCurdy, Business Manager, Halifax Chronicle & Star, Halifax.

" The absolute driving power of American publicity has completely sold the youth, not only of America, but of this country, too, on the advantages of life in the United States. We, generally, as Canadians, build up Americans and America far above our own people and our own country. A Canadian actor, to take a popular conception of success, is only a success when he receives an offer from Hollywood. And where does the fault lie? It lies squarely upon the shoulders of the governments, the newspapers, the industrialists and individuals that comprise our country's people. We've got to advertise Canada's academic, financial, industrial and social glamour thoroughly."

D. R. Moffat, Vice-President and General Manager, Moffats Limited, Weston, Ont.

" Canada is not growing rapidly enough to absorb production of Canadian factories. Large exports are essential. I recommend that industries separately or in conjunction with the Government triple expenditures on research and engineering with the object of producing products equal or in advance of those turned out by other countries. This is the only way Canada can develop a substantial and permanent export trade in spite of trade restrictions. We must be prepared to face and thereby keep our young Canadians at home."

Professor E. H. Morrow, University of British Columbia, Vancouver.

" The drift to United States is inevitable due to attractive opportunities, common language and similarities of business. Youth fortunately is ambitious and naturally impatient. If we wish to keep youth in Canada, we have only to encourage young men with quick promotion and earlier opportunity. The war shows young men can carry great responsibilities. With young people as with everyone else, ' money talks '."

H. R. Morgan, Editor, Recorder and Times, Brockville, Ont.

" I doubt if the migration of young Canadians to the United States will be checked until comparable opportunities are open to them in their own country. To that end we should, in my opinion, do our utmost to provide employment at satisfactory salary or wage levels, especially for technical personnel, through the continued development of natural resources and the introduction of new industrial processes, and strive towards the attainment of a larger population and the enlargement of markets for our products."

Dr. Fletcher Peacock, Department of Education, Fredericton, N.B.

" To check the drift towards United States, Canada should—

1. Thoroughly acquaint her youth with conditions and possibilities in each country, showing Canada's potential resources, high cost of living in the States, and large numbers who do not prosper there as well as if they remained in Canada and worked as hard.
2. Universalized vocational and cultural education emphasizing skills needed to build up Canadian industry.
3. Raise Canadian incomes and provide full employment with modern homes and communities all having amenities for full living.
4. Increase manufacturing through export duties on raw materials such as pulp, long lumber, gypsum.
5. Encourage Canadian culture through intensive development of appreciation and skills in arts and handicrafts."

Dr. L. M. Pidgeon, University of Toronto, Toronto.

" My remarks apply only to scientific workers. Ultimate salaries in terms of purchasing power must be reasonably close to those obtainable in the United States at the present time. The ultimate salaries for research workers in government and university laboratories are too low. A research worker to receive a reasonable maximum must take an executive position, giving up research. Specifically, the ultimate salary goal for scientific workers must be increased. Canadian manufacturers must carry out a larger fraction of research and development work in this country rather than importing technical information."

MORE OF THE SAME

And while we are on the subject, let us quote from an editorial in the *Montreal Herald* of February 9th:

> " Canadian industry must raise its premium on brains and technical training. When it is prepared to pay Canadian economists, engineers, scientists, technical personnel, salaries equal to those with which American industry has hitherto lured them south of the line, it can hope to retain a sufficient reserve of brain power to meet its own needs of today and tomorrow. The Dominion Government might well take the lead by upping the incomes of brain workers in its service. And we do not refer to M.P.'s and senators."

DEAN YOUNG RECEIVES DEGREE

Dean C. R. Young of the Faculty of Applied Science and Engineering of the University of Toronto has had added to his list of distinctions an honorary degree of Doctor of Applied Science from the University of Montreal. The degree was granted upon the recommendation of the Ecole Polytechnique and conferred at the Thirty-First Annual Dinner of the Ecole's Graduates Society, at the Windsor Hotel, Montreal, on February 9th.

Dr. Young was the guest speaker. The address on engineering education which he delivered appears elsewhere in this issue.

The degree was conferred by Monseigneur Olivier Maurault, Rector of the University. The following is a translation of the citation which, according to the translator, does not do justice to the author:

" We are honouring today a civil engineer of great repute, a builder of bridges.

" There is something about bridges that is fascinating. Ever since that day, now lost in the night of time, when primeval man noted a fallen tree joining the banks of a ravine, or a liana twining from tree to tree, he has applied his talent to joining river banks and walls of valleys with spans more and more audacious and powerful. Streams in flood and abysses have not prevented him throwing into space formidable structures of masonry, steel and concrete.

"Ancient bridges of Asia combine grace and strength. Those of the Roman Empire and of the Middle Ages still span European rivers with their sturdy and graceful arches and their picturesque silhouettes: bridges of Rome and of Toledo, bridges of Cahors and Avignon. The Renaissance gave us the Rialto bridge, the Bridge of Sighs, the bridges of Florence and those of all the capitals of the western world. When steel appeared, it gave beauty an almost fatal blow, but beauty triumphed. We owe to the combination of both, the bridge of the Forth, those of the East River and of the Hudson at New York, of Philadelphia and Charleston, of New Orleans and San Francisco; the bridges of Detroit and Quebec and that of Sydney, Australia; structures enormous yet light which remain unshaken in spite of tempests or the traversing of the heavy loads of commerce.

" Their sight brings to my mind the verses of an anonymous poet:

I like a bridge:
It breathes romance . . .
. . . .
I like a bridge:
It makes me think. . . .

" Mr. Young is not unconscious of the stirring beauty and the intellectual significance of bridges. In 1911 he published a study on ' Aesthetics in Bridge Design '. This consciousness was developed in a beautiful region of our sister-province of Ontario. He was born in Picton, on Prince Edward peninsula. It was this peninsula, known formerly as Kenté, which received as early as 1668 Sulpician missionaries coming from Montreal, who established themselves at the Consecon portage, unless it was at East Lake. It is interesting to note that it was at the point of embarkation of these missionaries at Lachine that Mr. Young had his first position in the offices of Dominion Bridge, from 1902 until 1904.

" His progress was rapid. He went shortly to the Toronto and York Radial Railway, then to Canada Foundry Company of Toronto, and later to the firm of Smith, Kerry and Chase. He then became lecturer in steel construction at the University of Toronto. He continued the same course until 1929 when he taught civil engineering. Since 1941 he has been dean of the Faculty of Applied Science and Engineering. His academic activities have not kept him from practising his profession. In the capacity of consulting engineer he has advised on problems relating to the bridges at Brockville and Detroit and to the Victoria bridge; he has built factories and schools and, in many legal disputes appeared as an expert witness. This role of expert led him to write, in collaboration with Hon. Justice Laidlaw, a volume entitled " Engineering Law ".

Msgr. O. Maurault, H. Gaudefroy, I. Brouillet, Dr. C. R. Young and Edouard Montpetit, secretary-general of the University.

" Three other books and two dozen articles in engineering periodicals have won him recognition throughout America; he has shown himself to be a theorist of wide scope, an excellent practitioner, an economist and a legist, a master of his art. Governments have had recourse to his services, and professional associations of Canada, the United States and England have enrolled him among their members and in 1942 The Engineering Institute of Canada elected him president. Finally, to add the finishing stroke to this portrait, I may say that Mr. Young is a pastel and landscape painter.

" To this very congenial dean and writer, the University of Montreal takes pleasure in awarding, at the request of its Ecole Polytechnique, the honorary degree of Doctor of Applied Sciences."

In acknowledging the honour, Dr. Young spoke as follows:

" Monseigneur le Recteur—

I am deeply grateful to your University for the honour that you have conferred upon me at the request of the Corporation of the Ecole Polytechnique—a school that occupies an honourable place amongst the institutions of higher learning constituting the great university that you are building on the slopes of Mount Royal. I am particularly appreciative of this evidence of good neighbourliness with respect to my own University, as well as the mark of esteem on the part of the staff of the Ecole Polytechnique, with whom I have enjoyed most pleasant relations in the course of past years.

Your engineering school has a long and honourable history. Fruit of the soil of this ancient province, it was founded four years before my own Faculty of Applied Science and Engineering. Its graduates are known throughout the length and breadth of Canada and beyond its borders. I am honoured to be able to count amongst my best friends many of them with whom I have often worked on common tasks.

May I be permitted, Monseigneur le Recteur, to express to you, your University, as well as to the graduates and the staff of the Ecole Polytechnique, the most cordial wishes of my University for your success, and the hope that your influence may grow in the training of young men for positions of responsibility in the service of Canada—a full-grown nation which now occupies a high place in the councils of the world."

REGISTRATION - - - - - - - - - - **9.30 a.m.**

COMMITTEE MEETINGS

GENERAL LUNCHEON - - - - - - - - - **12.30 p.m.**

1. Welcome.
2. Scope of Meeting.
3. Response.

I. AVIATION (Joint meeting with Society of Aeronautical Weight Engineers) - - - - **2.30 p.m.**

(a) Integrated Program for Weight Control PALMER KELSEM, *Group Engineer, The Glenn L. Martin Co., Baltimore, Md.*

(b) Civil Air Regulation as they affect Weight Control, WILLIAM H. DOWNS, *Engineer, Republic Aviation Corp., Farmingdale, N.Y.*

(c) Airline Compromises with Maximum Possible Pay Loads, WILLIAM DAVIES, *Asst. Chief Engr. United Air Lines, Chicago, Ill.*

II. HEAT TRANSFER - - - - - - - - **2.30 p.m.**

(a) Theory of Moving Sources of Heat and Its Applications to Metal Treatments, PROF. D. ROSENTHAL, *Dept. of Metallurgy, Massachusetts Institute of Technology, Cambridge, Mass.*

(b) Heat Transfer in Connection with Refrigeration and Involving Finned Coils. HUGH SCULLEN.

III. PRODUCTION ENGINEERING - - - - **2.30 p.m.**

(a) Carbide and Other Cutting Metals, ARCH MASON, *Ternstedt Division, G.M. Corp., Detroit, Mich.*

(b) Cutter Life Obtained from Carbide Blanks Mechanically Held Versus Brazed to Cutter Blades. FRED W. LUCHT, *Carboloy Co., Inc., Detroit, Mich.*

IV. GREAT LAKES CARRIERS - - - - - **2.30 p.m.**

(a) Diesel Power of Motorship "Henry Ford II" MALCOLM McLAREN, Ford Motor Co., Dearborn, Mich.

(b) Geared Turbine Bulk Carriers, R. C. STANBROOK, *Marine Engineer, Pittsburgh Steamship Co., Cleveland, O.*

V. MACHINE DESIGN - - - - - - - **2.30 p.m.**

(a) Application of Tables for Helical Spring Design, H. F. ROSS, *United Shoe Machinery Corp., Beverly, Mass.*

(b) High Speed Chain Developments, A. W. MYER, *Brown and Sharpe Mfg. Co., Providence, R.I.*

(c) Self Locking Nuts Applied to Industrial Equipment, WM. E. HORENBURGER, *Elastic Stop Nut Co. of America.*

GENERAL DINNER - - - - - - - - - **7.00 p.m.**

Joint Meeting with The Engineering Institute of Canada.

TUESDAY, JUNE 18

I. AVIATION (Gas Turbine Session) - - - - **9.30 a.m.**

(a) Aircraft Gas Turbines for Propeller Drive, ALLAN HOWARD and DR. C. J. WALKER, *Turbine Generator Engineering Division, General Electric Company, Schenectady, N.Y.*

(b) Combustion and Ignition in Aircraft Gas Turbines, A. J. NERAD, *Research Laboratory, General Electric Company, Schenectady, N.Y.* and W. D. CRATER, *Engineering Division, General Electric Co., Los Angeles, Calif.*

II. HEAT TRANSFER - - - - - - - - **9.30 a.m.**

Symposium of Recent Advances in Furnace and Kiln Technology Chairman: E. D. GRIMISON, *Babcock and Wilcox Company, New York, N.Y.* (Chairman Committee on Industrial Furnaces and Kilns.)

III. POWER - - - - - - - - - - **9.30 a.m.**

(a) Experiences with Automatic Air Soot Blowers, HAROLD L. SMITH, *Mechanical Engineer, Buffalo Niagara Electric Corp., Buffalo, N.Y.*

(b) Burning Low Grade Midwestern Coals on Spreader Stokers with Continuous Ash Discharge, JOHN M. DRABELLE, *Mech. and Elec. Engr., Iowa Electric Light and Power Co., Cedar Rapids, Iowa.*

IV. PRODUCTION ENGINEERING - - - **9.30 a.m.**

(a) Pressure of Solid Phase Welding, Representative of Linde Air Products Company.

(b) Resistance Welding with Storage Batteries, J. G. GORDON, *Progressive Welding Company, Detroit, Mich.*

V. GREAT LAKES CARRIERS - - - - - **9.30 a.m.**

(a) Hull Design, PROF. L. A. BAIER, *University of Michigan, Ann Arbor, Mich.*

(b) Self Unloaders, GEORGE PALMER, *Consulting Marine Engineer, Detroit, Mich.*

GENERAL LUNCHEON - - - - - - - - **12.30 p.m.**

Air Transportation and World Understanding, J. PARKER VAN ZANDT, *Director of Aviation Research, The Brookings Institution, Washington, D.C.*

I. AVIATION—Instruments and Regulators - **2.30 p.m.**

(a) Aerial Cameras, TALBOT ABRAMS, *President Abrams Instrument Corp., Lansing, Mich.*

(b) Radar Photogrammetry, R. G. SANDERS, *Asst. Vice-Pres., Fairchild Camera and Instrument Corp., Jamaica, N.Y.*

II. MANAGEMENT - - - - - - - - **2.30 p.m.**

(a) Works Standards, GUY BATES, *General Motors Corp., Detroit, Mich.*

(b) To be announced.

III. PRODUCTION ENGINEERING - - - **2.30 p.m.**

(a) High Frequency Induction Heat Treating, H. A. STRICKLAND, JR., *Chief Engineer, Budd Wheel Co., Detroit, Mich.*

(b) High Frequency Heating and Non-Conducting Materials, FREDERICK J. JOLLY, *Detroit Edison Company, Detroit, Mich.*

IV. OIL AND GAS POWER - - - - - - **2.30 p.m.**

(a) Metallurgical Consideration of Gas Turbines, NORMAN L. MOCHEL, *Westinghouse Electric Corp.*

(b) Control of the A K Closed Cycle Gas Turbine Power Plant, DR. KURT KELLER, *Kocher Wyss Engineering Works, Zurich, Switzerland.*

(c) Subject to be announced.
A. D. HUGHES, *Allis Chalmers Company, Milwaukee, Wis.*

V. FUELS - - - - - - - - - - - **2.30 p.m.**

(a) Lubrication and Sludge Removal Problems of Automotive Type Engines, J. MUSSER MILLER, *Standard Oil Company, Detroit, Mich.*

(b) To be announced.

GENERAL DINNER - - - - - - - - **7.00 p.m.**

(a) Air Industrial Planning in Postwar Period, MAJOR GENERAL B. W. CHIDLAW, *Deputy Commanding General Engineering T-3 Wright Field, Dayton, Ohio.*

(b) Subject to be announced.
J. CARLTON WARD, *President, Fairchild Aircraft Corp.*

WEDNESDAY, JUNE 19

I. AUTOMOTIVE - - - - - - - - 9.30 a.m.

(a) Emergency Engine Design for Medium Tanks, H. K. WOOLSON, *Executive Engineer, Chrysler Motor Corp., Detroit, Mich.*

(b) Application of Diesel Engines for Tank Warfare, F. G. SHOEMAKER, *Diesel Engine Division, General Motors Corp., Detroit, Mich.*

II. INSTRUMENTS AND REGULATORS - - 9.30 a.m.

(a) Latest Developments in Aircraft Controls, A. E. BAAK, R. A. FRANZEL and R. A. BROWN.

(b) To be announced.

III. PRODUCTION ENGINEERING - - - 9.30 a.m.

(a) The Influence on Tool Life and Power of Chamfer, Nose Radius and Peripheral Cutting—Edge Angles When Face Milling 40,000 psi Cast Iron, O. W. BOSTON, *University of Michigan, Ann Arbor, Michigan, and* W. W. GILBERT, *University of Michigan, Ann Arbor, Mich.*

(b) Specific Studies Pertaining to Tool Wear, Chip Characteristics and Surface Finish of Free Cutting Steels, G. P. WHITTEMAN, *Asst. Metallurgical Engineer, Bethlehem Steel Company, Bethlehem, Penn.*

IV. AVIATION—NOISE CONTROL - - - 9.30 a.m.

(a) Aircraft Acoustical Problems and Possible Solutions, K. R. JACKMAN, *Consolidated-Vultee Aircraft Corp., San Diego, Calif.*

(b) To be announced.

V. POWER - - - - - - - - - - - 9.30 a.m.

(a) Internal Cleaning of Boilers with Acid, SHEPPARD T. POWELL, *Consulting Chemical Engineer, Baltimore, Md.*

(b) Boiler Design for Extreme Load Variations, M. H. KUHNER, *Chief Mechanical Engineer, Riley Stoker Corp., Worcester, Mass.*

GENERAL LUNCHEON - - - - - - - - 12.30 p.m.

Subject to be announced.
Col. E. H. Gray, Aberdeen Proving Grounds.

I. AUTOMOTIVE - - - - - - - - - 2.30 p.m.

(a) Redesigning Ford Engines for Tank Service, P. PONTA, *Ford Motor Company, Dearborn, Mich.*

(b) Problems in Tank Engine Design, J. F. GORDON, *Cadillac Motor Car Div., General Motors Corp., Detroit, Mich.*

II. INSTRUMENTS AND REGULATORS - - 2.30 p.m.

Conference on Controller Air Supply.
Chairman to be announced.

III. PRODUCTION ENGINEERING - - - 2.30 p.m.

(a) The Results of an Investigation of the Removal of Metals by the Process of Grinding, R. E. MCKEE, *University of Michigan, Ann Arbor, Mich.;* R. S. MOORE, *Quaker Chemical Products Co., Consbocken, Penn.;* O. W. BOSTON, *University of Michigan, Ann Arbor, Mich.*

(b) What is New in Honing, L. S. MARTZ, *Asst. to President, Micromatic Hone Co., Detroit, Mich.*

IV. AVIATION—VARIABLE SPEED DRIVES - 2.30 p.m.

(a) Application of Variable Speed Drives, ERWIN R. BOYNTON, *Aeronautics and Machine Div., General Electric Co., West Lynn, Mass.*

(b) To be announced.

V. RUBBER AND PLASTICS - - - - -

(a) The Rubber Phenolio Cements As Structural Adhesives, Loughborough and Snyder.

(b) Analysis of Mechanical Properties of Plastic Laminates, R. K. WITT.

GENERAL DINNER - - - - - - - - 7.30 p.m.

Chairman: K. T. KELLER, *President, Chrysler Motor Corp., Detroit, Mich.*
Speaker: GENERAL J. DEVERS, formerly Commander 6th Army Corp., Washington, D.C.

THURSDAY, JUNE 20

I. PRODUCTION ENGINEERING - - - 9.30 a.m.

(a) Arc Welding of Alloy Steels, ROBERT J. HUSSELL, *Fisher Body Div., General Motors Corp., Detroit, Mich.*

(b) Photo Elastic Investigation of Residual Stresses in Welds, PROF. JAMES J. RYAN, *University of Minnesota, Minneapolis, Minn.*

II. MANAGEMENT - - - - - - - - 9.30 a.m.

(a) To be announced.

(b) To be announced.

III. RUBBER AND PLASTICS - - - - - 9.30 a.m.

(a) Plastic Mold Release, EARL ZIEGLER, *Dow Chemical Company, Midland, Mich.*

(b) Evaluation of Rubber and Rubber Like Materials, J. D. MORRON, *U.S. Rubber Company, Detroit, Mich.*

IV. STUDENT PAPERS - - - - - - - 9.30 a.m.

Papers to be provided by students.

GENERAL LUNCHEON - - - - - - - - 12.30 p.m.

Subject and speaker to be announced.

I. HEATING AND VENTILATING - - - 2.30 p.m.

(a) District Heating in Detroit, GLEN WINANS, *Detroit Edison Company, Detroit, Mich.*

(b) Terminal Velocity as the Measurement of Dust Particle Characteristics, R. B. FOLEY, *American Blower Company, Detroit, Mich.*

II. PRODUCTION ENGINEERING - - - - 2.30 p.m.

(a) Carbide Tooling at New York Navy Yard, Lt. (jg) C. A. PALMER, *N.Y. Navy Yard, Brooklyn, N.Y.* and J. G. KENNEY *N.Y. Navy Yard, Brooklyn, N.Y.*

(b) Cutting Action of Reamers, T. F. GITHERS, *Mech. Engineer, Cleveland Twist Drill Company, Cleveland, Ohio.*

(c) Further Work on Carbide Milling, O. W. BOSTON, *University of Michigan, Ann Arbor, Mich.*

III. STUDENT PAPERS - - - - - - - 2.30 p.m.

Papers to be provided by Students.

LADIES PROGRAMME

A special Ladies Committee is arranging to welcome all ladies who attend the meeting. Interesting trips and luncheons are being prepared and will include such places as Greenfield Village, Detroit Art Center and Belle Isle. It is hoped that a large number of ladies will attend and see Detroit at the most favourable time of year.

PLANT INSPECTION TRIPS

A number of plant inspection trips are being planned to supplement the Technical Sessions. Arrangements are being made to inspect a modern lake freighter, a type of ship peculiar to the Great Lakes. Automobile, Steel and Power Plants will be included in the trips, with emphasis on those industries for which Detroit is particularly noted.

FELLOWSHIPS IN TRAFFIC ENGINEERING

The Bureau of Highway Traffic in Yale University, New Haven, Conn., offers ten fellowships in Traffic Engineering for the academic year 1946-47. These awards have been made possible through a grant from the Automotive Safety Foundation.

This course of graduate study and research provides a broad foundation in the techniques of traffic operations. It is designed to give the student increased skill and ability in the analysis of traffic problems and to equip him with a thorough knowledge of traffic engineering.

The course of work begins September 23, 1946. Upon successful completion of the course of study, students will be eligible for a "Certificate in Traffic Engineering" subject to the approval of the Committee on Transportation of Yale University.

Qualifications for Fellowship

These fellowship awards are open to men who have been granted a degree by an accredited college in some branch of engineering. Applicants should have had practical experience in city engineering, highway engineering, or in related fields. Preference will be given to those applicants who are now employed in street and highway engineering and who secure a leave of absence in order to return to their present employer.

Fellowship Stipend

The fellowships provide a living stipend of $800.00, disbursed at the rate of $100.00 per month for a period of eight months while the student must be in residence in New Haven. The fellowships also provide a tuition fee of $400.00. In addition, a maximum of $200.00 is available to each Fellow for his individual research project to be approved by the Bureau. The total value of each of these fellowships is, therefore, approximately $1,400.00.

Applications

Request for additional information and application blanks should be addressed to BUREAU OF HIGHWAY TRAFFIC, YALE UNIVERSITY, STRATHCONA HALL, NEW HAVEN 11, CONNECTICUT. The closing date for application is June 1, 1946.

QUEBEC CORPORATION HOLDS ANNUAL MEETING

The Annual Meeting of the Corporation of Professional Engineers of Quebec was held at the Ecole Polytechnique, Montreal, on Saturday, March 30th.

The retiring president, P. E. Poitras, gave an informal report on the presentation by the Corporation of Bill 200 to have its charter amended by the Quebec Legislature. The bill met with considerable opposition when introduced before the Private Bills Committee and was finally withdrawn by the Corporation's representatives at the request of the prime minister. Mr. Poitras explained that it would be left with the new council to make the necessary changes in the bill so as to render it acceptable to the Legislature.

(*Associated Screen News*)
E. A. Ryan, M.E.I.C.

The reports of Council and of the various committees were then presented and discussed at length. An unprecedented increase in membership of nearly 700 during the year was reported, this being due in large part to the fact that a large number of members of the Engineering Institute joined the Corporation under the terms of the co-operative agreement.

Chief among the subjects under discussion was the recently formed Canadian Council of Professional Engineers and Scientists. It was recalled that, at the 1945 Annual Meeting, concern had been expressed by several members about the then proposed formation of this over-all organization and President Lindsay had explained that the Corporation's representatives had refrained from endorsing the establishment of such a body.

After an interesting discussion on the relations between the new Council and the Dominion Council the following resolution was introduced, put to the vote and carried by a large majority

WHEREAS the recently organized body known as The Canadian Council of Professional Engineers and Scientists is being financed in part by contributions from the Dominion Council which comes out of moneys furnished it by the Corporation and the other provincial professional associations, and in part by contributions made direct to it by certain other bodies, including the Corporation; and

WHEREAS the Corporation does not consider this new organization is serving a useful purpose for the engineering profession; and

WHEREAS the Corporation does not desire to contribute to the expenses of the new organization, either directly or indirectly;

THEREFORE be it resolved:

1. That as long as the Corporation remains a member of the Dominion Council its representative thereon should make certain that no contributions of the Corporation are used to support the Canadian Council of Professional Engineers and Scientists.
2. That as soon as practicable, the Secretary of this Corporation forthwith furnish a copy of this resolution to the President and Secretary of the Dominion Council and of each of the provincial professional associations.
3. That no further contributions be made by the Corporation to The Canadian Council of Professional Engineers and Scientists.

The scrutineers reported on the election of members of Council for the year 1946 and at the first Council meeting which took place immediately after the Annual Meeting, the following officers were appointed:

President—E. A. Ryan, M.E.I.C.

Vice-President—Ernest Lavigne, M.E.I.C.

Secretary-Treasurer—W. G. Hunt, M.E.I.C. (Deceased April 6th, 1946).

Councillors—Louis Beaudry, M.E.I.C; J. A. Lalonde, M.E.I.C.; E. Larochelle; J. W. McCammon, M.E.I.C.; G. H. Midgley, M.E.I.C.

Marc Boyer, M.E.I.C., was re-appointed as registrar.

UNIFICATION OF ENGINEERING STANDARDS

In the October number of *The Engineering Journal* considerable information was given about the International Conference held in Ottawa on September 24th to October 6th, 1945 to consider means of arriving at the unification of many engineering standards, particularly screw threads.

It was known at that time that the delegates from the three countries had agreed on many details, but that it was necessary to take these agreements back to the standardizing bodies of each country for further discussion and for approval. Just recently the Institute has received a report from the American Standards Association, which brings this subject pretty well up to date. The following is quoted from their report:—

The release of an official report by the Combined Production and Resources Board now makes it possible for the American Standards Association to give the results of the conference on Unification of Screw Thread Standards held last October at Ottawa.

This conference was the culmination of months of hard technical effort on the part of national engineering committees working through the British Standards Institute, the Canadian Standards Association, and the American Standards Association. Agreement was reached that there should be unification of the basic screw threads of the three countries. A technical basis was laid for such unification. The report that came out of the conference consists essentially of recommendations to the industries of the three countries as to how they may carry out the work of unification through their respective national standardizing bodies.

The immediate spur to completion of this job was the experience of the past war. Urgently needed equipment was sometimes kept out of action for months waiting for replacement parts because British and American screws were not interchangeable. Had there been a common system of screw thread forms in 1939, production could have been multiplied in volume and millions of dollars would have been saved for the Allies.

For some thirty years, engineers in the countries concerned have been working to this end with increasing conviction of its importance. The present agreement is the culmination of the work of three conferences which the Combined Production and Resources Board made possible by providing authorization under wartime restrictions and by supplying travel funds.

All recommendations of the conference have been referred to committees of the national standardizing bodies of the three countries with a view to their use in development of the national standards. The Committee on Screw Threads of the American Standards Association, working under the technical leadership of the American Society of Mechanical Engineers and the Society of Automotive Engineers will reduce these recommendations to the usual terminology of American Standards. The technical detail is to be identical in the standards of the three countries.

thus providing for complete interchangeability of threaded parts.

The American thread system, originally developed by Wm. Sellers for whom it is named, has a thread form with a 60 degree angle; while the British, called the Whitworth system, has an angle of 55 degrees. There are also other important differences. The pitches of the British fine thread are coarser than the pitches of the American fine thread. Fortunately the pitches of the coarse thread are the same except in the half-inch bolt for which the British have twelve threads per inch and the American thirteen. Furthermore, the Whitworth screw has a rounded top and bottom and the Sellers screw a flat top and bottom.

Whitworth Thread

Sellers Thread

The new basic form of thread which was endorsed by the conference has an angle of 60 degrees and rounded crest and root, with truncation of the crest of the screw permissible. Threaded products made to this new form will be practically interchangeable with those having the same nominal diameter and pitch made to the present American Standard. On the part of the British, however, a change in the thread angle from 55 to 60 degrees for threads of all sizes will be necessary.

In addition to the agreement on a unified basic form of thread, agreements were reached on special purpose threads, including acme threads, buttress threads and threads for fastening screws for precision instruments. It is expected that certain parts of the American War Standard for Acme Threads (the piano stool thread) published by the American Standards Association will be clarified when it is converted to a regular American Standard; that the final draft will be submitted to the British and Canadians before being approved; and that it will be adopted by all three countries as a national standard.

A standard form of buttress thread was agreed upon, particularly designed for use in applications involving exceptionally high stresses in one direction only. The agreements also included preferred series of diameters and pitches, formulas for calculating suitable tolerances and allowances, and a recommended system of gaging. The thread form has an over-all depth of engagement of 0.4 pitch, a pressure face angle of 7 degrees and the pressure face and back face connected by symmetrical radii of suitable proportions. The formula for calculating the effective diameter was the same as that used in British Standard 84-1940 (Screw Threads of Whitworth Form) but modified to suit the buttress thread and so arranged as to compromise the pitch-diameter factors to meet the wide range of pitch-diameter relationships.

An alternative form with a vertical pressure flank thread was in demand, the British found, particularly for larger gun work and on high pressure steam valves. An appendix added to the draft standard, therefore provides an alternative optional thread form having a vertical pressure flank.

It was also agreed at the conference that the method of calculating tolerances and allowances on Buttress threads as given in the British proposal should be accepted with the reservation that it is open to revision in accordance with any general change in basic formulas for tolerances and allowances in a unified standard for screw threads.

The conference reached agreement for unification on threads for optical tubes and cells; and on microscope objective threads (interchangeable with the Royal Microscopical Society thread).

These agreements on instrument screw-threads were based on the Swiss Horological Society standards and it was decided that gaging practices for small screws should be discussed with the Swiss.

For fine motion screws the new basic form of thread was proposed, possibly with the adoption of decimal inch diameters, particularly for sizes below ¼ inch.

In order to facilitate the supply of taps and dies, three series of nominal diameters were recommended.

On bearing adjusting screws, it was agreed that the diameters and pitches should be chosen from the series recommended for fastening screws of fine motion screws.

Screw threads for optical instruments were considered under three separate headings: major, minor and optical constructional screw threads.

The major optical component screw threads included microscope objective screw threads and screw threads for photographic or camera lens mountings.

It was recommended that the existing British and American Standards on screw threads for photographic or camera lens mountings be studied with a view to establishing uniform standards, giving particular attention to diameters, pitches, the proposed new basic thread form and length of threads to shoulder.

For minor optical components such as lens accessories, shutter cable release gear, between-the-lens shutters, and the like, it was recommended that the new basic thread form be adopted and the dimensions for such threads be based on the inch unit.

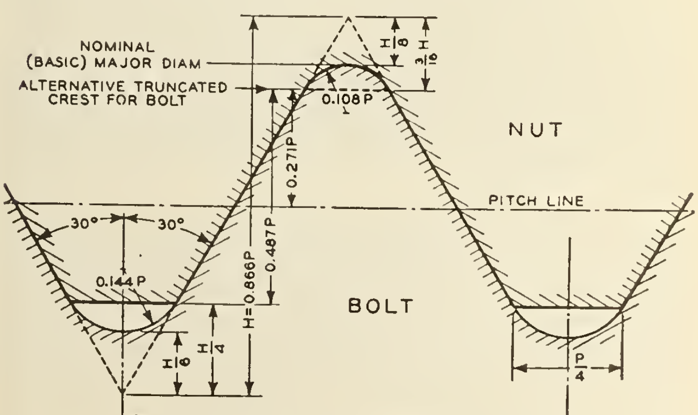
Agreement was reached on a common series of pitches for optical constructional threads on tubes and cells, to be used with the proposed new basic thread form.

On tripod mounting threads for surveying and similar equipment it was recommended that the Service departments of the three countries be asked to reconsider their diverse standards with a view to unification.

The use of the proposed basic thread form in the development of standard screw threads for mounting cameras and similar equipment on stands or tripods was referred to the standardizing organizations in each of the three countries.

The possibility of reaching agreements on pipe threads, methods of gaging and inspection, a universal system of nomenclature and definitions relating to drawing practice, high duty studs in light alloys and on rolled sheet metal threads and associated moulded plastic and die-cast threads was discussed but no agreements were reached. Arrangements were made for continuing the discussion.

The proposal on a basic thread form was by far the most outstanding accomplishment of the conferences and exemplifies the spirit of collaboration that prevails among the engineering professions of the three countries. Throughout the New York, London, and Ottawa conferences there was a spirit of accord which promises well for future cooperation between the three countries in the development of improved industrial methods and equipment.



Proposed basic screw thread form.

Headquarters was much surprised and not too displeased to receive a press release from the Technical Advertisers Association of Montreal, which indicated that *The Engineering Journal* was the most read publication in Canada, within the field surveyed.

It is interesting to note that the *Journal*, in this one particular office, has more readers than any similar Canadian or American publication, including the very popular "*Engineering News Record*". It is worthy of note also that the *Journal's* figure not only is higher, but is substantially higher than the others.

Occasionally a member has suggested that advertising in the *Journal* is not professional or ethical. It has been the opinion of the Publication Committee that members are interested in this advertising and that the *Journal* is more valuable with it than it would be without. One cannot help but notice that in this release it is the opinion of at least one engineer who has studied it that "engineers look at advertisements 90 to 95 per cent more than editorial content". He states also "the engineer reads technical advertisements regularly and spends an average of 2½ hours each week looking at technical publications".

Believing that members will be interested in getting these reactions to advertising, as well as knowing that their publication is well read, the release is being printed herewith.

Purchasing Agent and Engineer Tell What They Think of Technical Advertising

That "a man running can read it," that "it can be read by a tired man in a poor light" are the tests of a good advertisement in the technical press. So said John S. M. Hayes, Secretary and Purchasing Agent, Shipping Containers Limited, speaking before a large meeting of the Technical Advertisers Association of Montreal recently. In this he related the advertisement to instructions given in the army for clear message writing. He said that the average purchasing agent at his desk these days was just as busy as a message runner in the army,—he had little time for uninterrupted reading by reason of the press of work over his desk, "his day made hectic by delayed shipments, the need for tracing orders six months old, arranging emergency repairs when parts are unobtainable".

Bringing with him "close to 300 years of engineering experience" gained from discussions with twelve senior engineers on the subject of technical advertising, R. N. Ferguson, Engineering Department, Canadian Industries Limited, added greatly to the already stimulating ideas of Mr. Hayes, for the benefit and sometimes slight embarrassment of the advertisers.

That the opinions of the engineers are worth listening to is proven by the fact that "most of the money which is spent on construction and on new equipment is controlled by them. An example of this is the 53,959 orders written by the Defence Industries Limited, Engineering Department during the war. These resulted in the construction of plants valued at $125,000,000. During the same period, Canadian Industries Limited's Engineering Department wrote 17,056 orders which would also be valued in the millions of dollars."

It was most reassuring to all, the extent to which both Mr. Hayes and Mr. Ferguson felt the technical press, both editorial and advertising content, was read by purchasing agents and engineers. Both groups leaned heavily on such publications for information about the trade. "The engineer depends largely on technical advertisements to keep him informed of new types of equipment and material which becomes available. In general he feels that the advertisements fulfill this function."

In general Mr. Ferguson felt that engineers looked at advertisements 90 to 95% more than the editorial content; the purchasing agent thought his group looked at advertisements and editorial content equally.

"The engineer reads technical advertisements regularly and spends an average of two and one-half hours each week looking at technical publications. He would like to spend six hours but simply cannot find the time. He does not confine his reading only to his own field. He has no publication on which he is most dependent for information. . . ."

The technical library of Mr. Ferguson's own company regularly receive over one hundred periodicals. The most widely read by his group of engineers are:

Canadian Publications	*Number of Readers*
Engineering Journal	26
Manufacturing and Industrial Engineering	14
Industrial Canada	7
Business Management	5
Electrical News and Engineering	4
Hardware in Canada	4
Canadian Refrigeration Journal	3
United States Publications	
Chemical and Metallurgical Engineering	21
Engineering News Record	17
Construction Methods	16
Power	16
Product Engineering	15
Factory Management and Maintenance	14
New Pencil Points	12
Architectural Forum	12
Heating and Ventilating	11
Heating, Piping and Air Conditioning	10
Business Conditions and Forecasts	7
Modern Plastics	6

From the engineers, criticism and suggestions to technical advertisers might be listed as follows:

1) the technical advertisement should be informative, though not to sacrifice the attractiveness of the ad from the human viewpoint.
2) very often general price information would save useless correspondence.
3) engineers don't like extravagant statements.
4) many advertisers take themselves too seriously,—the humorous advertisement is not out of place in the technical press.
5) poor illustrations are inexcusable. One good picture per page, with complete information about it, is desirable.
6) many American and sometimes even Canadian advertisers omit mentioning their local agents. These should be noted.

Mr. Ferguson felt that advertisers could do engineers a real service and could influence them even more than at present by concentrating on helping them make the best use of their limited reading time.

In general the purchasing agents have the following suggestions:

1) many technical ads are too stuffed with words . . . "that tired purchasing agent just won't be bothered reading it all . . . he is looking for some manufacturer of welding equipment . . . he naturally passes the picture of the legs and eventually sees a large colour plate of a welder at work . . . he stops and reads".
2) picture your product prominently. Make it evident exactly what you sell . . . it is old stuff that a picture is worth a thousand words. . . .
3) do not labour the technical detail. "After all you are trying to impress trained men, who already know a lot of engineering principles"; they will write for the details or call in your representative if they are interested.
4) a miniature catalogue is wasted effort.

5) do not print " hurrah for you " letters. Most purchasing agents have the usual comment of " I wonder how much he got for that ".
6) " free trial or use of heavy equipment " offers do not get much of a response from purchasing agents.
7) be sure illustrations are clear and do not pose the question, " I wonder what it is? " Any technical man can be trapped by a neat model of the " here's how it's done " variety.
8) repetition gets attention,—but do not go to the point of monotony.
9) " the smiling face of the company President or any member of the firm " is not appreciated.
10) pictures showing the application of a unit actually at work in someone else's plant are interesting and informative.
11) do not be too technical. A large number of senior executives are not technical men and " a description full of highly technical terms actually can lose a large potential market ".
12) simple, clean illustrations are a MUST, an ad is better in colour.

VISIT OF BRAZILIAN ENGINEERING STUDENTS TO CANADA

A group of 13 engineering students (graduating class 1946) of the National School of Engineers of the University of Brazil, recently paid a visit to engineering plants in Quebec and Ontario. They were accompanied by two of their Professors in Civil Engineering, the whole visit being under the official patronage of the Brazilian Government and arranged by the Canadian Inter-American Association.

The series of industrial visits commenced with a day in Lachine, Que., at the Works of Dominion Bridge Company and Dominion Engineering Works Limited. Here the students were able to see a very great variety of heavy engineering work in actual progress in the shops, including export orders to South America. The accompanying picture was taken during the visit to the Dominion Bridge Company's plant and in it may be seen the only woman member of the graduating class Senhora Régina de Castro Barbosa.

Group of Brazilian students having a technical point described by one of their Professors during their recent visit to the Dominion Bridge Company's Lachine Plant. In the party may be seen the only woman student Senhora Régina de Castro Barbosa.

CORRESPONDENCE

An Invitation to Criticize

350 Willowdale Ave., Apt. 23,
Outremont, Montreal 26, Que.
March 12th, 1946.

The Editor,

The Engineering Journal.

Following upon recent activities of the Institute towards establishing a rational scale of earnings for engineers, and in the light of recent comments in the daily press on the serious exodus of Canadian engineers to the U.S., one cannot but feel dismayed upon glancing through the " Situations Vacant " columns in the February issue of *The Engineering Journal.*

Particularly striking, although not the worst, is the request for a physicist or an electrical engineer who, in addition to being preferably a veteran, must also possess the remarkable qualities of a knowledge of nuclear physics, the ability to express himself clearly, and an analytical mind. For this remarkable display of mental gymnastics the fortunate possessor is offered $275.00 per month. It can of course be assumed that such an adroit character should be in a position to substantially augment his salary at either the poker or barbotte table. For inexpensive amusement he also has the standard set of five years of unread *Journals.*

It would seem that, having reached some conclusions on the question of engineering earnings, the Engineering Institute should have the courage to implement them. The first and most obvious step towards this would probably be a refusal of advertisements for positions in *The Engineering Journal,* the salaries for which do not provide a recognized minimum.

I find it difficult to imagine that the critical comments of engineers on your " Situations Vacant " column have not already reached your ears. While I have noted your editorial criticism of salaries offered engineers for Government Service I fail to see why this criticism should not be extended to positions offered engineers generally. It can hardly be denied that the present situation is a most serious one affecting not only the individual engineer but also the profession and particularly the future of Canada itself and therefore of Canadians. I am sure that few of us will deny the lack of enthusiasm within the profession displayed in the meager attendance at meetings of the Institute, at least in Montreal. There is a growing cynicism, particularly in the ranks of the younger engineers, born of the feeling that the penalty to be paid for a serious attitude towards the practice of his profession is more than he can afford.

One can only conclude that the assessment of the value of its services on the part of the profession antiquates the timeworn quip, "dime-a-dozen". It is now a "dozen-a-dime".

The Engineering Institute, in view of its universal membership should provide, through its executive and *Journal*, dynamic leadership for the profession in matters of importance to all engineers. This it fails to do and I believe the fault lies both with executive and membership. It would be hypocrisy to deny the existence of a general attitude of scorn on the part of younger engineers towards the Institute, which it damned well deserves. It would seem to me that the very best place for the display of such criticism would be in the *Journal* itself.

Recommended—a Full Page Invitation to all engineers to criticize through the pages of the *Journal*.

Yours truly,

(Signed) WALTER K. DOW, JR.E.I.C.

April 8th, 1946.

Walter K. Dow, Esq., Jr. E.I.C.,
350 Willowdale Ave., No. 23.
Outremont, Montreal 26, Que.

Dear Mr. Dow:

Unfortunately, several absences from the city have prevented me acknowledging your letter of March 12th which reached us on the 15th. I think the points you raise require an answer, and while I regret that I do not have the opportunity to discuss this with you in person, I am glad to go into several matters by letter.

Everyone will share with you in your criticism of low salaries for engineers, and in particular those positions which occasionally are advertised in *The Engineering Journal*. However, there is one angle of this question which you may not appreciate.

You suggest that we should refuse to print advertisements where the remuneration is considered too low. Consideration has been given to such action, but it was agreed that the pages of the *Journal* could not be closed to a member who desires to secure engineering assistance. Supposing, for example, you were an employer and wanted to engage an engineer. Could we refuse you the right to state your case in our publication? The Publication Committee has agreed that we could not.

Our policy is to suggest to such advertisers that they are not likely to get any replies when the advertised rates are below the going price. Quite frequently, advertisers have changed their rates when we have so advised them, but in other instances they have asked us to insert the advertisement as prepared by them. We feel we have no alternative.

To illustrate our position further, let me call to your mind a letter which was printed in the December number of the *Journal*, addressed to the Civil Service Commission, in which we told them that we could not continue to advertise their positions at their scales of pay. We felt in this instance that we could do it, because the advertiser was not a member of the Institute. These are factors which you and probably others have overlooked.

In one part of your letter you say "Few of us will deny the lack of enthusiasm within the profession displayed in the meager attendance at meetings of the Institute." While appreciating that the word "meager" may have different meanings to different people, I find it difficult to agree with your use of it. In fact, the auditorium of the Institute has been so overcrowded on so many occasions that consideration has been given by the House Committee and Council to enlarging the premises. I am confident that if you attended all meetings of the Montreal Branch, you would find the average attendance was not adequately described by "meager."

Of course, the outstanding statement in your letter is: "It would be hypocrisy to deny the existence of a general attitude of scorn on the part of younger engineers towards the Institute". Again, I suggest that the record does not bear out your observation. The Institute's membership today is almost 8,000, of which about 3,000 are young men. At the meeting of Council held last Saturday, over 300 applications for membership were approved, and of this group, 250 were young men. Apparently they do not share with you the "scorn" you confess for the Institute.

It is a matter of concern to the officers of the Institute that a member should feel towards it as your letter indicates you do. It is their belief and hope that your opinion is not shared by any great block of the membership. Certainly there has been no evidence of it discernible to the officers. However, I personally am grateful to you for having had the courage to express your convictions, and I am glad to have the opportunity to discuss them with you. After consultation with the chairman of the Publication Committee, we are proposing to print your letter in the *Journal*, as you have requested, along with this reply.

Yours sincerely,

L. AUSTIN WRIGHT,

General Secretary.

Member Visits New Zealand

Hotel St. George,
Wellington, New Zealand,
February 23rd, 1946.

Dr. L. Austin Wright,
The Engineering Institute of Canada,
Montreal, Que.

Dear Dr. Wright:

I was sorry to have to miss the Annual Meeting this year but I may be allowed some credit as I have attended the Annual Conference of the New Zealand Institution of Engineers, which just yesterday concluded after being in session from Tuesday morning. I have been much impressed by their kindness and hospitality. The Engineers Club in Wellington hold a luncheon monthly and I have been asked to address the meeting on March 12th. I found the technical papers and discussions to be of a very high standard and I would say that the engineers generally are very competent. I also attended the annual meeting of the Professional Engineers Association which was formed only a year ago and is chiefly concerned with improving the economic status of the profession. They have nothing to do with registration as there is a Registration Board for that purpose. They have quite a distance to go before they arrive at the point we have attained in Ontario but they are working together with remarkable unanimity.

As far as I have observed, the country as a whole is not in a particularly happy position. There is a great scarcity of almost everything. The pegging of the New Zealand pound at 75 per cent of the pound sterling together with the practically universal practice of the 40-hour 5-day week and other advanced social legislation have been mixed blessings, to say the least.

Although it is now summer, the weather in Wellington is relatively cool, generally in the top 60's. There has been little rain in the past few weeks (which, I am told, is most unusual) and Wellington, which is known as the "Windy City" has certainly not lived up to its name. We had an earth tremor the other night which I thought quite severe but the people here took little notice. It was given about four lines in the next day's newspaper.

With kindest regards,

(Signed) A. H. MacQuarrie, M.E.I.C.

Stop Suggesting—Demand Higher Salaries

Department of Public Works, Canada,
District Office,
March 8th, 1946.

L. Austin Wright, Esq.,
The Engineering Institute of Canada,
Montreal, Que.

Dear Mr. Wright:

I have just read your article "A Break in the Clouds" in the February issue of *The Engineering Journal*.

It is gratifying to know that "signs are developing" regarding engineer salary revisions but the signs are by no means hopeful of a proper treatment of the case if the information in the article is anywhere nearly correct.

I maintain it is still difficult to discern what the Civil Service Commission itself hopes to accomplish. The treatment of the Civil Service staff during the war has made "Confusion worse confounded" showing that no intelligent effort is being made for proper adjustment of the salaries of the technical services. All stagnation and muddling cannot be blamed on the Treasury Board.

If the reclassification survey is to be pushed by the beginning of April there is still much work to do as this district for one has not yet been surveyed. What is feared is likely to take place. Salary revisions will be prepared and authorized by Order in Council before any opportunity is given to lodge a protest. If the proposed revision is such as is listed in the article it is far short of requirements.

Regarding the continued salary increases, this is an excellent objective but can be worked with any grading system, simply by fixing a point where promotions will cease, until vacancies above occur. This must be done somewhere and I would say that Grade 4 would be that place.

Now comes the important and vital part. I maintain that The Engineering Institute of Canada must make it its business to know definitely what is to emerge from the "cover of secrecy" and to raise what objections and recommendations it may have before those salaries become law.

That The Engineering Institute of Canada must interfere is inevitable. Why sit around outside waiting to see what will emerge? Such an aggregation of intelligent, sensible, practical men should be within, with a definite proposal as to what the Government must pay the classes of the Civil Service which the Engineering Institute represents as their official body.

No Royal Commission is required. Your Institute can definitely determine what are proper salaries for engineers in the service and should be strong enough to see that these are the salaries authorized by the Government.

I do not know on whom can be laid the blame for the failure of the adoption of the Beatty report or the Coon committee. If engineers had been granted the salaries proposed in the Beatty report the increases now proposed, as above, would have been forthcoming as they would not have appeared so radical as they do now, comparing them with 1921 salary scale on which we are now.

"The need is for someone or something that will make the Treasury Board do something about it." There is no need to go far to see that "someone or something"—it is The Engineering Institute of Canada, not by suggestion but by demand.

I would implore the Institute to take hold of this object firmly, to make up its mind definitely what salaries its Civil Service members should receive and to drive on unflinchingly until this object is attained, accepting no compromise. Thirty-three years of "existence" does make one rather bitter and radical ! !

Yours sincerely,

(Signed) ...., M.E.I.C.

Echoes of the Annual Meeting

The Institution of Electrical Engineers,
Savoy Place, W.C.2, London, England,
February 26th, 1946.

Dr. E. P. Fetherstonhaugh,
c/o Engineering Institute of Canada,
2050 Mansfield St.,
Montreal.

Dear Dr. Fetherstonhaugh,

Our recent visit to the Sixtieth Annual General Meeting of The Engineering Institute of Canada will always remain a very lively and happy memory. It gave us a long overdue closer knowledge of the organization of a very energetic and enthusiastic sister Engineering Society within the Commonwealth, and we have come away with high hopes of much greater collaboration in the future, towards which we expect to lay more definite foundations at the forthcoming Conference. But from a personal point of view the Convention gave us the opportunity of making many new friendships and of gaining a better understanding of the problems facing engineers in Canada, which would have been impossible in any other way.

Throughout our stay we enjoyed a hospitality warmer than I have ever experienced in any part of the world. I had known that Canada was renowned in this way but until I had experienced it I had not really believed that such sincere warmth of welcome could be possible. As the President in office during the greater part of the Convention, our personal thanks for the reception accorded to the President and to me are due to you, but I would like you to accept our appreciation in a personal capacity as much as in your capacity as President.

With my very kind regards to you and Mrs. Fetherstonhaugh.

Yours very sincerely,

(Signed) W. K. Brasher,
Secretary.

A meeting of the Council of the Institute was held at Headquarters on Saturday, March 23rd, 1946, convening at nine thirty a.m.

Present: Vice-President J. E. Armstrong (Montreal) in the chair; Past-President de Gaspé Beaubien (Montreal); Vice-Presidents G. F. Layne (Quebec), and C. E. Sisson (Toronto); Councillors S. R. Frost (Toronto), W. L. Saunders (Ottawa), Paul Vincent (Quebec), R. S. Eadie, R. C. Flitton, C. C. Lindsay, C. A. Peachey, P. E. Poitras and J. B Stirling of Montreal; Treasurer J. A. Lalonde (Montreal); E. P. Muntz, past-vice-president and member of the Committee on Professional Interests; General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

Harry Bennett Memorial Fund—Speaking for the committee on the Harry Bennett Memorial Fund, Mr. Wright reported that it had been found necessary in order to have contributions to the fund deductible from income for tax purposes to have a Deed of Trust prepared by the Institute's solicitors. This was now ready to be signed by the president and the general secretary and by the trustees of the fund, and was submitted for the approval of Council.

At the request of Vice-President Armstrong, the general secretary read the Deed, following which, on the motion of Mr. Beaubien, seconded by Mr. Flitton, it was unanimously resolved that the deed, as submitted, be approved.

The Engineer in the Civil Service—The general secretary reported that the Institute had received an invitation from the Royal Commission on Administrative Classifications in the Public Service to present a brief at a sitting in Ottawa on Tuesday, April 9th. He reported that he had been to Ottawa to discuss the matter with Mr. MacRostie, the chairman of the Institute's Committee on the Engineer in the Civil Service, and the lines which the brief was to follow had been agreed upon.

Co-operation in Ontario—Mr. Stirling referred to the discussion on co-operation in Ontario which had taken place at the first meeting of the new Council on February 8th, and inquired as to what progress had been made.

The chairman pointed out that as far as co-operation in any province is concerned the initial steps were not taken by the Council or by Council's committee but came from members of the Institute and the association within the province. He pointed out that it would be quite within the purview of Vice-President Sisson and the Toronto councillors or other Ontario councillors to initiate such action.

Mr. Sisson asked for further information as to the establishment of a provincial division and also asked whether or not the action by Mr. Buss referred to in Minute 4347 had yet taken place.

The general secretary replied that so far there had been no further word from Mr. Buss and the presumption was that there had been insufficient action to report.

Mr. Sisson suggested that an endeavour should be made to get the Ontario councillors together at a meeting in Toronto in order to discuss the Ontario situation. It was pointed out that a regional meeting of Council was planned for Toronto on April 27th and that the previous day should be a good date for the meeting of the Ontario councillors.

It was agreed eventually that the general secretary should communicate with Mr. Buss before any further action was initiated and that he should then inform Vice-President Sisson so that he could proceed with the Ontario conference.

Resolution from the Toronto Branch: Mr. Sisson presented a resolution from the Toronto Branch as follows:

"That Headquarters be advised that the Branch Executive believes the interests of the members of The Engineering Institute of Canada, and especially those of the Junior members, would be best served if The Engineering Institute of Canada were associated with, and had a representative on the Canadian Council of Professional Engineers and Scientists ".

He explained that this resolution had come from the Junior Section of the Branch to the senior executive for endorsation and transmittal to Council. The resolution, he explained, was very similar to one passed at a meeting of the Junior Section at which the subject of the Canadian Council and the Engineering Institute was discussed by Mr. Dobson, speaking for the Canadian Council, and Mr. Stirling and Mr. Wright for the Institute.

He pointed out that the Juniors at the meeting were very anxious that something should be done in order to bring the Ontario Association and the Institute, as well as the Canadian Council and the Institute, closer together. Their resolution had been supported by 50 votes in favour and 2 against.

Mr. Stirling expressed surprise that the resolution had come forward inasmuch as a member at the meeting had asked that a record be taken of the number who had not voted on the resolution. This showed 120 as not voting which, in his opinion, far outweighed the 50 that had voted for it.

Mr. Sisson was careful to point out that the action of the Junior Section was based primarily on a desire to improve the Institute's position in the Toronto area and he was very anxious to assure the Toronto executive and the Junior Section that the resolution would be given immediate consideration.

This reopened the whole question of the Institute's relationship with the new Council. The chairman suggested that Council was hardly in a position to change its decision at this meeting, in view of the fact that no evidence had been submitted to indicate that its decision had been incorrect or unwise. He pointed out that Council had not made the decision quickly and suggested that if there were sound reasons for Council changing its decision they should be submitted to the Committee on Professional Interests for preliminary consideration.

Mr. Stirling pointed out the position in which the committee would find itself. It had spent many weeks analysing the various elements and had prepared a statement of principles which had been approved by Council and widely circulated. There had been no further information submitted that would indicate that the decision should be reversed. In the light of these facts he asked as to what his committee could possibly do with this resolution.

It was pointed out that the Junior Section and the Toronto executive may not have a complete understanding of the reasons back of Council's decision and it was suggested that Mr. Stirling might ask the Junior Section for a statement of the reasons upon which they based the resolution and the decision to send it to Council. With such information in hand the committee would have something specific to answer.

Mr. Vincent stated that in the Quebec Branch there had also been some discussions as to Council's decision with regard to the new organization.

Mr. Muntz explained that at the meeting of the Junior Section in Toronto he had tried to give his views as to why the Canadian Council was not a proper body. At the same time he explained that he thought the members at large did not understand that the Institute was ready to co-operate with other organizations through an agency such as a Committee of Presidents which it had advocated from the beginning. Such a committee would have a much better chance of accomplishing something for the profession because of its ability to work informally and unofficially. Such a committee would not act as a mouthpiece for the entire group nor would it take any action of itself. It would merely co-ordinate the policies of the various bodies. He thought it would be helpful if this statement were reaffirmed so that the Institute's position would be more clearly understood.

Mr. Lindsay referred to the meetings of the Committee of Fourteen which he had attended as president of the Corporation of Professional Engineers of Quebec. He stated that he, too, had tried to direct the Committee of Fourteen's efforts into a Presidents Conference Committee, rather than into a new organization. He had hoped that at that time the Institute would be active in pushing the counter proposition and was disappointed that no such action had followed. He was still of the opinion that the committee type of organization had many advantages and should be given further consideration.

Mr. Lalonde pointed out that this matter had been before Council many times and that Council's position had been clearly indicated over and over again. It had been printed in the minutes and circulated to every councillor, to the chairman of every branch and to the chairman of every committee. He was surprised to hear that so many members do not know about it. He recommended that the Committee on Professional Interests should reiterate its policy, particularly with reference to the Presidents Conference Committee. He thought the proposed co-operative group should be restricted to those organizations made up of professional people. If this were not done there might be some confusion of interests.

The general secretary pointed out that at the last meeting of the Dominion Council a suggestion had been made that the Dominion Council should investigate further the proposal for a conference committee. At the same meeting only three of the provincial associations had voted in favour of the Dominion Council's support of the new Council.

Mr. Peachey emphasized the importance of the subject. He thought the Institute was being criticized for its stand by persons who did not understand the situation. He thought Council should take some action to inform the engineers in order to counteract the criticism. Mr. Muntz supported Mr. Peachey and re-emphasized the desirability of Council reiterating its decision with regard to participation in a Presidents Conference Committee.

Finally it was agreed that Mr. Stirling would communicate immediately with the Toronto Branch, informing them that the matter was being given immediate attention, at the same time making some inquiries along the lines which had been suggested by the discussion.

Proposed Amendment to New Brunswick Agreement—Mr. Stirling reported that he had been in communication with the Association of Professional Engineers of New Brunswick regarding the proposed amendment to the agreement between the Institute and the association, but had not yet had time to receive a reply. He hoped to be able to report on this matter at the next meeting of Council.

Memorandum from the Toronto Branch—Mr. Stirling reported that a copy of the Toronto memorandum presented at the February meeting had been sent to each member of his committee and he hoped to have a report ready for presentation to the next meeting of Council which he understood would be held in Toronto. He suggested that Vice-President Sisson should endeavour to have all Toronto councillors present at that meeting, which Mr. Sisson undertook to do.

Wartime Bureau of Technical Personnel—The general secretary reported that a memorandum had been issued by the Deputy Minister of Labour, dated March 6th, 1946, to the effect that it proposed to discontinue the Wartime Bureau of Technical Personnel on August 1st, 1946. It is understood that the records and work of the Bureau will be transferred to the executive and professional offices of the National Employment Service.

Proposal from Toronto Branch re Salaries—At the last meeting of Council, a resolution from the Toronto Branch regarding the publication in the *Journal* of a scale of salaries had been referred to the Institute's Committee on Employment Conditions. The general secretary reported that the committee is now making a study of all scales to see what can be approved by Council for publication. It is hoped that a report will be available for the next meeting of Council. This was accepted as a progress report and Mr. Sisson undertook to report progress to the Toronto Branch.

Society of Civil Engineers of France—The general secretary presented a translation of a letter from the president of the Society of Civil Engineers of France to the president of the Institute, inviting him to attend a meeting of representatives of engineering societies with whom the French Society was maintaining relations before the war. The meeting will be held in Paris, June 21-22, and will be attended also by chairmen of sections of the Society in France and abroad.

It was pointed out that although President Hayes expected to be in London in September to attend the conference of representatives of Commonwealth engineering societies, it was not likely that he would be there in June. It was noted, however, that Past-President C. J. Mackenzie would be in Europe this summer, and it was unanimously agreed that he be asked to represent the Institute at the meeting in Paris.

Engineers' Council for Professional Development—It was unanimously resolved that Dr. K. M. Cameron be appointed as one of the Institute's three representatives on the Engineers' Council for Professional Development (E.C.P.D.), replacing Dr. C. J. Mackenzie who had found it necessary to resign.

The general secretary reported that he had just returned from the semi-annual meeting of the executive of E.C.P.D. in New York. Dr. C. R. Young, the Institute's representative on the executive, had been unable to attend and had asked Mr. Wright to take his place.

Mr. Wright reported there were several items of importance and briefly touched on those which he thought were of most interest to Council, at the same time explaining that a more detailed account of the business of the meeting would appear in an early number of the *Journal*.

He reported that the executive had approved a proposal from the Ways and Means Committee for the publication of a booklet to commemorate the fifteenth anniversary of E.C.P.D. This booklet, a dummy of which was submitted to the meeting, would trace the beginning of engineering and bring it up to its present status. Graphs would be used in great numbers and the information was being presented in an extremely attractive way so as to have a broad general interest. The book would be basically a piece of propaganda for the profession.

It would also serve as a basis for soliciting subscriptions from individuals and organizations that felt they would like to assist E.C.P.D. in expanding its work.

The Committee on Engineering Schools reported that they proposed to make a resurvey of all curricula just as soon as conditions permitted. It was thought the work would begin this coming fall. $5,500.00 was appropriated from the reserve for this purpose.

The report from Dr. Vaughn's Committee on the Measurement and Guidance project indicated that the committee was continuing to enjoy success in its work and that it was now preparing to expand the tests into sophomore years and into the high schools. An abridgment of the full report has been printed in pamphlet form for wide distribution. A copy will be mailed to each councillor of the Institute.

Considerable time was spent discussing the possibilities of a new co-operative organization made up of the members of all existing engineering societies or of the engineers themselves. Recognition was made of the fact that the Presidents' Joint Conference Committee made up of the presidents, immediate past-presidents and secretaries of the American societies of Civil, Mechanical, Electrical, Mining and Chemical Engineers, has already done quite a bit of work of a preliminary nature on this subject. The Council of E.C.P.D., however, felt that they could make some contribution to the study and set up a committee for the purpose under the name of the Committee on Relations of E.C.P.D. to other Societies.

The general secretary reminded Council that it had been agreed some time ago that the Engineering Institute should invite E.C.P.D. to hold its 1946 annual meeting in Canada. An invitation had been presented to E.C.P.D. and this item was also discussed at the recent executive meeting. It developed that certain other meetings which members of E.C.P.D. committees would wish to attend had already been settled on dates so close to the desired dates for the E.C.P.D. meeting that it would be difficult for them to get from Toronto or Montreal in time for the other meetings. Certain other factors also affected the issue and eventually it was agreed that the meeting would be held in New York on October 18th and 19th, and with the motion was included a statement to the effect that they would ask the Institute to re-issue an invitation for 1947.

"The Profession of Engineering in Canada"—The recommendation of the Finance Committee that 10,000 copies of the present booklet "The Profession of Engineering in Canada" be printed at a cost of $300.00, to be paid for entirely by the Institute if the universities are not able to finance it, was unanimously approved. This quantity is adequate only to meet the immediate demand.

Bank Account in London, England—It was noted that the Institute had opened a bank account with the Canadian Bank of Commerce in London, England, for the purpose of facilitating the payment of fees of members in the United Kingdom.

Joint Committee on Legislation—The general secretary reminded Council that at the March 1945 meeting approval had been given to appointing three representatives of the Institute to sit on a joint committee with a corresponding number of members of the Corporation of Professional Engineers of Quebec to "work with the Corporation throughout the deliberations in determining the future action" with regard to amending the Professional Engineers Act and the appeal of the Brian Perry case. The Institute's representatives selected at that meeting were Messrs. deGaspé Beaubien, R. E. Chadwick and R. L. Weldon.

The general secretary presented a report to Council from the Institute's panel of the joint committee dated March 16th, 1946. The earlier portion of this report consisted largely of quotations from the minutes of the five meetings of the joint committee and concluded with the following paragraph:

"The Institute's panel has had no part in drafting the proposed amendments to the Act, nor has it been consulted or kept adequately informed in regard to them. In consequence of this, it must decline all responsibility and report to Council that it has been unable to fulfil its assignment. It asks that it be dismissed."

Considerable discussion followed in which important parts were taken by Messrs. Beaubien, Poitras, Lalonde and Armstrong. Mr. Beaubien explained that the committee was not criticizing the Corporation for having undertaken to handle the amendments to the Act under their own sole responsibility. He pointed out that the Institute panel had made proposals with regard to the amendments which had not been followed in the draft finally prepared for submission to the legislature, but he recognized that the final responsibility for the amendments rested legally with the Corporation.

Mr. Poitras was of the opinion that the joint committee had been set up primarily to assist in the appeal of the Brian Perry case. He did not agree with that portion of the report which stated that the committee was set up to discuss "ways and means of having legislation prepared for submission to the legislature and of conducting the appeal of the decision of the Architects vs. Brian Perry case." He was of the opinion that it would be unfortunate if the Institute panel withdrew from the committee. He thought the present situation was due to a misunderstanding and he explained the position in which the Corporation found itself in recent negotiations with regard to the proposed amendments, to illustrate the difficulties of keeping the joint committee properly informed. At the same time he reported progress with regard to the appeal and expressed his wish that the Institute panel continue to act. Mr. Beaubien expressed his pleasure at knowing that the committee could be of further assistance and he believed that under those circumstances the Institute's panel would be prepared to continue.

Finally, on the motion of Mr. Eadie, seconded by Mr. Flitton, it was agreed to accept the report of the panel with the omission of the last sentence referring to its dismissal. The panel was to be asked if it would continue in the matter of the appeal in the Brian Perry case.

Students' Conference—The general secretary briefly outlined the Students' Conference which had been held during the recent annual meeting of the Institute. To this conference had been invited the president of each undergraduate engineering society from every engineering degree-granting university in Canada. Certain others as observers were also included. The Institute had borne the entire cost of bringing the delegates from the universities.

The general secretary presented nine resolutions which had been approved by the conference for submission to Council. He reported that these had also been submitted to the Conference of Deans which was held also during the annual meeting. The deans had taken no action on the resolutions as they were directed to the Institute but they had discussed them and the various matters were recorded in the minutes of their meeting. Comments on the resolutions had also been received from Dean Spencer of Saskatoon, and Colonel Grant of Kingston. These were considered by Council as each resolution was discussed.

The resolutions and Council's decisions are recorded as follows:

Resolution No. 1—"That the minutes be edited and that the E.I.C. be requested to take the steps it deems necessary to act upon the suggestions as offered." Noted.

Resolution No. 2—"That a section be reserved in *The Engineering Journal* for the publication of news and technical papers as supplied by the students' societies. And further resolved that all the delegates to this meeting see that within each undergraduate society a committee be set up whose duty it will be to submit news for publication in the section. Be it further resolved that publication of student papers be encouraged."

There was considerable discussion with regard to this proposal and it was observed that it was very much in line with proposals already made by the Publication Committee. The general secretary was of the opinion that the section referred to could be included just as soon as additional finances were available to employ the necessary editorial help. Council agreed with the resolution in principle and referred it to the Publication Committee for consideration and report at an early date.

Resolution No. 3— "That this meeting go on record as favouring the establishment and expansion of the Bennett Memorial Fund to provide financial assistance to deserving student members."

As the committee for the Memorial has already been advised of this resolution Council found no further action necessary.

Resolution No. 4—"That this conference go on record as recommending to the E.I.C. Council that it establish an employment bureau in each of its local branches whose purpose it shall be to prepare lists of positions available for student engineers.

Moreover, that these bureaus assume the responsibility of launching a strong publicity programme to impress on employers the importance of maintaining student engineers in employment during the summer vacations and that these students be not necessarily employed in production work only but that they be given all possible cooperation and opportunities to broaden their knowledge of the industry or plant in which they happen to be employed.

Moreover, that it would be in the best interest of students and their future employers if such employment would take the form of progressive training from summer to summer."

This resolution promoted considerable discussion. It was pointed out that the Institute's usefulness in the field of employment for students might be broadened considerably, particularly if the services of the Wartime Bureau of Technical Personnel are to be discontinued. The Bureau has been furnishing to the students a very complete list of employment opportunities for vacations. It was recognized that this service would be very helpful if the Institute could continue it.

Council was sympathetic to the proposal and asked that the resolution be referred to the Committee on Employment Conditions with the suggestion that it discuss the proposal with the director of the Wartime Bureau of Technical Personnel.

Resolution No. 5—"As all students are assailed by doubts as to their wisdom in their selection of

i a university
ii a course
iii study options

and are also curious to know if their course of instruction compared favourably with that given in other universities:

Be it resolved that a critical survey of all engineering colleges in Canada, conducted by a reputable body, perhaps the group performing this service at the present time in the U.S. under the auspices of the E.C.P.D., would be of real value to students at large and educational authorities in particular.

It might be practical for the E.I.C. to sponsor this survey.

Furthermore, we believe it would be of value to industry and the profession if identical degrees were conferred upon all graduates of similar courses.

Discussion of this resolution revealed that there were wide differences of opinion. Outside authorities were quoted as being opposed to standardization of university courses across Canada. It was thought by some that it was desirable that each university should develop its own character as long as reasonably uniform standards were maintained.

With regard to the accrediting of curricula as carried out by E.C.P.D. in the States it was thought there was nothing the Institute could do about this unless the universities themselves expressed a desire that such accrediting should be conducted. It was pointed out also that one reason why the accrediting was much more necessary in the States than in Canada was that entrance to engineering courses in that country was attained on a basis similar to that described as junior matriculation in Canada, whereas senior matriculation was required for admission to engineering at Canadian universities. This additional year had permitted the universities to raise their standards considerably and to secure a more uniform level of training by entering students.

The general secretary pointed out that accrediting as carried out in the United States was a very expensive operation and that the principal costs were met by the universities themselves. This was further proof of the necessity of the universities desiring such accrediting before any action could be taken by the Institute or any other organization.

Council recognized that in some instances and for particular courses certain universities enjoyed what seemed a more favourable reputation, but a study of conditions indicated that standards were reasonably uniform at all universities and that no student would suffer any handicap in any given course no matter which university he attended.

As far as identical degrees were concerned, Council saw some advantages, inasmuch as the present variations lead to some confusion, but the engineers themselves understand what each degree means and the advantages of having uniform degrees would be largely from the public point of view. Council thought this should be given further discussion by the Conference of Deans.

The resolution has already been placed before the deans of engineering and Council felt that no further action could be taken unless that body supported it.

Resolution No. 6—"That as the engineer is occupying ever increasing responsibilities in industry and in community leadership, his training could better fit him for these responsibilities if university courses included studies in subjects known as the "humanities".

The proportion of the division of study time between technical and non-technical subjects must be left to the discretion of educational authorities, but a balanced training is a commendable goal".

Council agreed that the inclusion of the humanities in an engineering course was desirable but recognized the difficulties of adding any additional work to an already overcrowded course. It recognized, too, that most universities have already included some such subjects in the curriculum. From the Conference of Deans it was learned that each university is studying this subject closely and is prepared to make changes if a place can be found on the curriculum without replacing other subjects of equal importance and without making the course so heavy that its requirements cannot be met.

In view of the close study being given to this subject by the educationalists and the general support which has been given to it by individuals and bodies outside of those circles, Council felt that there was no further action which could be taken except to call the resolution again to the attention of the Conference of Deans.

Resolution No. 7—"That this conference go on record as being in favour of the establishment of technical institutes to train craftsmen and technicians for industry and for small private businesses. Moreover, that these institutes shall require a partial or full high school course as a prerequisite. Such action would not only insure high quality workmanship, but would greatly increase the appreciation by such persons of the engineering profession".

Council was pleased to get the support of the Students' Conference for the establishment of technical institutes, a proposal which had been supported by the Institute ever since the report made to Council by Dean C. R. Young in February 1944. Although very wide support had been secured previously to the proposal, it was interesting for Council to know that the students themselves favoured the establishment of such institutes.

Resolution No. 8—" That the Dominion government should establish a first-rate graduate school of engineering ".

Council regarded this as a proposal requiring more study. There was a difference of opinion as to the possibility of establishing a graduate school under the auspices of the Dominion government in view of the fact that education is a provincial matter. Some suggestions were made as to existing national organizations such as the National Research Council which might sponsor such a post-graduate school.

The general secretary was instructed to examine into the situation further and to discuss the proposal further with the Conference of Deans.

Resolution No. 9—" That encouragement be given to all universities to make their teaching appointments as attractive as possible to outstanding engineers, through facilities for research, consultation, practical work, and increased remuneration, particularly the latter ".

Council agreed wholly with the sentiment of this resolution although at the moment it was unable to inaugurate any activities that would assist in bringing it to pass. It was agreed that the subject should be kept alive and that the Institue should, as opportunities are presented, do everything possible to bring about these ideals.

The general secretary was instructed to report to the delegates to the Students' Conference, Council's pleasure at receiving these resolutions and to assure them of its continuing interest in all the matters proposed. Council also expressed its satisfaction at the outstanding success of the conference and hoped that much good would come out of it, both for the students and for the universities. It would be glad at all times to have these matters brought forward again by the students whenever they had more ideas or proposals to submit.

Conference of Deans: Council was reminded by the general secretary of the Conference of Deans which was held during the course of the annual meeting, at which fifteen were in attendance. Due to the sudden indisposition of Dean Fetherstonhaugh, Dean Young had presided. The conference met in the morning and the afternoon and it had been reported that both sessions had been very profitable. A verbatim had been taken and sent to Dean Young for the preparation of minutes, but up to the present time he had been unable to complete them. When these have been received a more complete report will be made to Council.

The general secretary presented the following resolution which had been passed at the conference and which was now submitted by Dean McKiel under instructions from the conference:

> " THAT this meeting of deans and teachers of engineering expresses the willingness of its members to participate in a study of engineering curricula and engineering education in general.
>
> It further suggests that any such study should be cooperated in by all interested bodies, as, for example, the universities and schools of engineering, The Engineering Institute of Canada, the Canadian Institute of Mining ad Metallurgy, the Canadian Institute of Chemistry, the Dominion Council of Professional Engineers and the various provincial professional organizations ".

A copy of a letter from Dean Young to Dean McKiel, in reply to his receipt of this resolution, was also presented. In this Dean Young expressed the opinion that the best plan for conducting a study of engineering education would be through the National Conference of Canadian Universities. That conference, he suggested, might set up a committee composed of persons who are experienced in engineering education, with a general instruction to study and report on broad policies. He suggested that in due course professional organizations should be brought into the picture with any comments or suggestions which they might wish to make. He emphasized the need of professionals in the field of education giving this subject prime consideration.

A copy of a letter which Dean Fetherstonhaugh had written to Dean McKiel was also presented and it was noted that he gave very firm support to the alternative proposals as submitted by Dean Young.

A copy of a letter from Dean Spencer to Dean McKiel was also submitted and it was noted that he, too, had alternative suggestions to make.

A telegram was presented from the president in which he agreed that if other organizations were to participate in this study of education, the Institute, too, should give thorough support.

In the discussion, general support was given to the policy as outlined by Dean Young. Mr. Poitras explained that in his opinion the Canadian Institute of Mining and Metallurgy, the Chemical Institute of Canada, the Dominion Council and the Engineering Institute should be invited to participate with the universities.

Finally, it was moved by Mr. Stirling and seconded by Mr. Vincent, that the Institute express its ready willingness to support the deans in whatever way they thought the most help could be rendered. Any time such a Conference of Deans desires assistance from the Engineering Institute, Council would be very glad to see that it is given wholeheartedly, but at the moment it supported the suggestion that the educationalists themselves should investigate the situation before consulting engineers in other fields.

Quebec Agreement: On the motion of Mr. Eadie, seconded by Mr. Poitras, it was unanimously resolved that the privileges available under the terms of the co-operative agreement between the Institute and the Corporation of Professional Engineers of Quebec should be granted to members of either body now returning from overseas and being reinstated on the active membership list, provided that application for membership in the other body is made within ninety days of such reinstatement.

Joint Finance Committee in Nova Scotia: On the motion of Mr. Beaubien, seconded by Mr. Flitton, it was unanimously resolved that Messrs. P. A. Lovett and S. G. Naish be appointed as the Institute's representatives on the joint finance committee in Nova Scotia.

Association Representatives on Council; The appointment of the following association representatives on the Institute Council for the year 1946 was noted and approved unanimously: Nova Scotia—S. W. Gray. New Brunswick—E. O. Turner.

James Watt International Medal: On the motion of Mr. Eadie, seconded by Mr. Stirling, it was unanimously resolved that Major-General A. E. Macrae, O.B.E., M.I. Mech. E., Assoc. Inst. C.E., be nominated by the Institute for the 1946 award of the James Watt International Medal.

Councillor for Kootenay Branch: On the recommendation of the Kootenay Branch it was unanimously resolved that S. C. Montgomery be appointed as councillor for the branch for the year 1946.

ELECTIONS AND TRANSFERS

A number of applications were considered, and the following elections and transfers were effected:

Members

Baker, Lorne Pearce, B.A.Sc. (Mech.), (Univ. of Toronto), Asst. Trade and Industrial Commissioner, Ontario House, 13 Charles II St., London, S.W.1, England.

Bird, David Ardah Godfrey, Graduate (Royal Military Coll.), 7 Powell Ave., Toronto, Ont.

Griffiths, Garth, Major, R.C.E.M.E., B.A.Sc. (Elect.), (Univ. of British Columbia), 1976 W. 15th Ave., Vancouver, B.C.

Jankowski, Jerzy W., Mech. Engr. (Politechnika, Warsaw, Poland), mech. designing engr., Hamilton Bridge Co., Hamilton, Ont.

Martin, Gerald Albert Bray, B.Sc. (Elect.), (Univ. of Manitoba), service and instrument engr., i c service dept., Victor X-Ray Corp. Canada Ltd., Winnipeg, Man.

Mason, Ernest (Manchester Coll. Technology), chief designing engr., Consolidated Mining & Smelting Co., Trail, B.C.
Plow, Gordon Locklin Patrick, B.Sc. (Civil), (McGill Univ.), divn. engr., Canadian National Railways, Ottawa, Ont.
Smith, Paul Dorrian, B.A.Sc. (Univ. of British Columbia), engr., Canadian Westinghouse Co., Ltd., Hamilton, Ont.
Suttie, Earle Ritchie, Brigadier, D.S.O., Graduate (Royal Military Coll.), Canadian Army Overseas.
Walkinshaw, William Maxwell, B.A.Sc. (Civil), (Univ. of Toronto), engr. on staff, Sir Alex. Gibb & Partners, London, Eng.
Walton, Ernest Norman, B.Sc. (Elect.), (Univ. of British Columbia), foreman, Phillips Electrical Works, Ltd., Montreal, Que.
Wintermark, Charles Roar, Mech. Engr. (Univ. of Mittweida, Saxony, Germany), mech. engr. and dftsman., Robert Mitchell Co., Montreal, Que.

Juniors

Dalrymple, James Ross, B.A.Sc. (Mech.), (Univ. of Toronto), staff engr., engrg. dept., Dominion Foundries & Steel Co., Hamilton, Ont.
Hawkins, Currie, Elect. Artificer, R.C.N.V.R., 4285 Dorchester St. W., Montreal, Que.
Holmes, Thomas Frederick, B.A.Sc. (Mech.), (Univ. of Toronto), 235 Charlotte St., Ottawa, Ont.
Leigh, Ernest Douglas, sales engr., Amalgamated Electric Corp., Montreal, Que.
Montgomery, Edward Wilford, B.Eng. (Metall.), (McGill Univ.), engr., development and engrg. dept., Canadian Liquid Air Co., Ltd., Montreal, Que.
Schuett, George Herbert, B.Sc. (Civil), (Queen's Univ.), engr., Anglin-Norcross Quebec Ltd., Montreal.

Transferred from the class of Student to that of Member

Balcom, Alfred Burpee, B.Eng. (McGill Univ.), 59 Maple Ave. Shawinigan Falls, Que.
Henselwood, Edward Wilton, Lt.-Col., R.C.E., B.Sc. (Elect.), (Univ. of Manitoba), Q.M.G. Branch, N.D.H.Q., Ottawa, Ont.
Phomin, Barney Louis, Lt., R.C.E., B.Sc. (Civil), (Univ. of Manitoba), 426 Burrows Ave., Winnipeg, Man.
Topham, William Richard, B.Eng. (Civil), (Univ. of Saskatchewan), asst. works engr. i/c plant construction, Canadian Industries Ltd., McMasterville, Que.
Woolsey, Edgar Garnet, B.Sc. (Civil), (Queen's Univ.), 160 Bay St., Ottawa, Ont.

Transferred from the class of Student to that of Junior

Ball, William Henry Warren, B.Eng. (Elect.), (Nova Scotia Technical Coll.), post-graduate course, Univ. of Toronto, Toronto 5, Ont.
MacCoy, Gerald Bates, B.Sc. (Mech.), (Univ. of Saskatchewan), designing dftsman., Shawinigan Chemicals Ltd., Shawinigan Falls, Que.
Rigsby, David Lorren, B.Sc. (Mech.), (Queen's Univ.), engrg. expeditor and co-ordinator, Aluminum Co. of Canada, Kingston, Ont.
Tulk, Egbert Gordon, B.Eng. (Elect.), (Nova Scotia Tech. Coll.), 261 Gerrard St. East, Toronto 2, Ont.

Admitted as Students

Chizen, Martin, B.Sc. (Elect.), (Univ. of Alberta), Inspection Board of U.K. and Canada, Peterborough, Ont.
Clark, Chester Graham, B.Sc. (Elect.), (Univ. of Alberta), test course, Canadian General Electric, Peterborough, Ont.
Creelman, Elliott Arthur, B.A.Sc. (Univ. of British Columbia), test course, Canadian General Electric, Peterborough, Ont.
Ellis, Harry M., B.A.Sc. (Elect.), (Univ. of British Columbia), test course, Canadian General Electric, Peterborough, Ont.
Mosher, Allison Frederick, B.A.Sc. (Elect.), (Univ. of British Columbia), student, University of Western Ontario, London, Ont.
O'Brien, Michael Joseph, B.A.Sc. (Mech.), (Univ. of Toronto), test course, Canadian General Electric, Peterborough, Ont.
Roos, Albert Edward, B.A.Sc. (Univ. of British Columbia), test course, Canadian General Electric, Peterborough, Ont.
Stevinson, Arthur Lawrence, B.Sc. (Elect.), (Univ. of Alberta), test course, Canadian General Electric, Peterborough, Ont.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective:

Alberta

Members

Barchard, Francis Maurice, B.A.Sc. (Univ. of British Columbia), chief engr., Northwest Industries Ltd., Edmonton, Alberta.
Kelly, Oliver G., B.Sc. (Oregon State Coll.), airway engr., Civil Aviation, Dept. of Transport, Edmonton, Alta.

Junior

Bath, Duncan Thomas, B.Sc. (Elect.), (Univ. of Alberta), sessional instructor, Dept. of Electrical Engrg., Univ. of Alberta, Edmonton, Alta.

Cormick, Harold Leslie, B.Sc. (Elect.), (Univ. of Alberta), sessional instructor, Dept. of Electrical Engrg., Univ. of Alberta, Edmonton, Alta.

Stothert, Winston Dunderdale, B.Sc. (Elect.), (Univ. of Alberta), elect. inspector, c/o Old Court House Bldg., Calgary, Alta.

Weeks, John Gordon, B.Sc. (Elect.) (Univ. of Alberta), sessional instructor in physics, Univ. of Alberta, Edmonton, Alta.

Junior to Member

McPherson, Frederick, B.S. (Civil), (Univ. of Alberta), instructor in civil engrg., Univ. of Alberta, Edmonton, Alta.

SASKATCHEWAN

Members

Downing, Charles Glenn Eldrick, B.Eng. (Agricultural—, (Univ. of Saskatchewan), Captain in R.C.E.M.E., Swift Current, Sask.

Hawley, Karl Tomkins, B.Sc. (Elect.), (Univ. of Manitoba), engr., engrg. dept., Saskatchewan Government Telephones, Regina, Sask.

Michalenko, Andrew, B.Sc. (Elect.), (Univ. of Manitoba), asst. professor, elect. engrg., Univ. of Saskatchewan, Saskatoon, Sask.

Milne, George Gordon, B.A.Sc. (Elect.), (Univ. of Toronto), specialist and educational engr., Saskatchewan Government Telephones, Regina, Sask.

Randlesome, Hugh Goffen, chief engr., Dept. of Reconstruction and Rehabilitation, Regina, Sask.

Students at University of Saskatchewan

Anderson, William James, 816 Avenue C North, Saskatoon, Sask.

Brehler, Robert John, 1718, 22nd St. W., Saskatoon, Sask.

Carpenter, Edwin Robert, St. Andrew's College, Saskatoon, Sask.

Harvey, Roger James, 508 Main St., Saskatoon, Sask.

Petuk, George, Qu'Appelle Hall, Univ. of Saskatchewan, Saskatoon, Sask.

Pierce, Mervin Booth, 1012 Melrose Ave., Saskatoon, Sask.

Smith, Elvie Lawrence, 605 Temperance St., Saskatoon, Sask.

Walker, Lyle James, 100-31st Street, Saskatoon, Sask.

Ward, Lyle Chester, 412-5th Street, Saskatoon, Sask.

Student to Junior

Chan, Lloyd George, B.Sc. (Civil), (Univ. of Saskatchewan), jr. engr., soil mechanics, Univ. of Saskatchewan, Saskatoon.

Humphrey, Kenneth Floyd, B.Sc. (Ceramic Engrg.), c/o Ceramic Dept., Univ. of Saskatchewan, Saskatoon, Sask.

Iverson, Norman Leif, B.Sc. (Civil), (Univ. of Saskatchewan), jr. engr., P.F.R.A., Soil Mechanics Lab., Univ. of Saskatchewan, Saskatoon, Sask.

Jacoby, Max George (Univ. of Saskatchewan), resident engr., Dept. of Highways, Regina, Sask.

Kaltio, Willard, B.Sc. (Mech.), (Univ. of Saskatchewan), Lieut., R.C.E.M.E., Esquimalt, B.C.

McLeod, George Carrol, B.Sc. (Civil), (Univ. of Saskatchewan), design and field engr., C. D. Howe Co., Ltd., Port Arthur, Ont.

Olafson, Ellaf Arni, B.Sc. (Agricultural), (Univ. of Saskatchewan), Agricultural Engrg. Dept., Univ. of Saskatchewan, Saskatoon, Sask.

NOVA SCOTIA

Members

Ahern, Phillip Charles, B.Sc. (Elect.), (McGill Univ.), District Engr. Officer, Canadian Army, Halifax, N.S.

Bedwin, Tegler West, B.Eng. (Nova Scotia Tech. Coll.), sales engr., Building Products Ltd., Montreal; Truro, N.S.

Cooper, Douglas LeBaron Peters, M.Sc., Ph.D. (Dalhousie & McGill Univ.), Director of Fisheries, Province of Nova Scotia.

Frost, Louis (Herriot-Watt Coll.), asst. mining engr., Dominion Coal Co., Ltd., Sydney, N.S.

Grisdale, Simpson Vipond, B.Eng. (Elect.), (McGill Univ.), ind. and central stn. engr., Canadian General Electric, Halifax, N.S.

Kline, Donald Robert, B.Eng. (Mining), (Nova Scotia Tech. Coll.), explosion damage appraiser, Halifax Explosion Claims Office. Halifax, N.S.

Smedley, Hubert, B.Sc. (Queen's Univ.), mill supt., Malagash Salt Co., Ltd., Malagash, N.S.

Somers, John Stephen, B.Sc. (Mech.), (Nova Scotia Tech. Coll.), engr. supt., Foundation Maritime Ltd., Halifax, N.S.

Stuewe, William L. (Montana School of Mines), asst. engr., constrn., Dosco; mech. supt. of coal mines, Dominion Steel & Coal Corp., Ltd., Sydney, N.S.

Junior to Member

Stanfield, Gordon Dawson, B.Eng. (Mech.), (McGill Univ.), Starr Mfg. Co. (owner), Dartmouth, N.S.

QUEBEC

Members

Portugais, J. Maurice, B.A.Sc., C.E. (Ecole Polytechnique), managing-director, Delorimier Construction Ltd., Montreal, Que.

Thibodeau, Henri Roger, B.A.Sc., C.E. (Ecole Polytechnique), Captain, R.C.E. (awaiting discharge), Montreal, Que.

Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form the basis of personal items in the *Journal*.

News of the Personal Activities of members of the Institute

Major-General H. F. G. Letson, M.E.I.C., was recently appointed secretary and comptroller of the household of the Governor-General of Canada. Born at Vancouver, B.C., he served in France in World War I with the 54th Battalion, C.E.F. He was severely wounded and was awarded the Military Cross.

General Letson graduated from the University of British Columbia with a B.Sc. in mechanical engineering in 1919. Four years later he was granted the degree of Ph.D. in engineering by the University of London, England, and was appointed assistant professor of mechanical engineering at the University of British Columbia. In 1931 he became associate professor in the department, a position which he retained until 1934. At that time he became chief engineer and managing director of Letson and Burpee, Vancouver.

In 1941 General Letson was appointed Canadian Military Attaché in Washington, the first military attaché to be appointed by Canada to the United States. In the following year he returned to Canada to become Adjutant General in the Department of National Defence Headquarters at Ottawa, Ont. In 1944 he was appointed commander of the Canadian Army Staff at Washington and chairman of the Canadian Joint Staff, Washington. In the same year he was awarded the United States Legion of Merit Medal and was designated as Commander of the Legion of Merit.

Einar Arnason, M.E.I.C., has been retired from the army with the rank of lieutenant-colonel. He enlisted in September 1939, and served five years overseas, finishing as commanding officer of Number 4 Wing, Canadian School of Infantry. He is now employed by Power and Mine Supply Company Limited in Winnipeg.

R. C. Pybus, M.E.I.C., has been elected chairman of the Vancouver Branch. Born at Winnipeg, Man., he graduated from the University of Manitoba with a B.Sc. in civil engineering in 1922. Two years later he obtained the degree of Bachelor of Architecture. After graduation he worked for a year with the Foundation Company of Canada in Montreal. In 1925 he joined the staff of Carter-Halls-Aldinger Company, general contractors and engineers, as assistant engineer in the Winnipeg office. Three years later he was transferred by the company to the Vancouver office with the appointment of engineer for British Columbia. In March 1945 he became associated with the Commonwealth Construction Company Limited, Vancouver.

Mr. Pybus joined the Institute as a Student in 1920, transferring to Junior in 1923, and to Associate Member in 1930. He became a Member in 1940.

E. A. Goodwin, M.E.I.C., has returned to his former position with the Montreal Engineering Company in Montreal. He was serving as lieutenant (E) stationed in Ottawa at the Department of National Defence, Naval Service.

Colonel C. B. R. Macdonald, M.E.I.C., has resigned his position as comptroller for development and welfare for the British West Indies. He has accepted the position of resident director in Venezuela for the English firm of engineers and contractors, Messrs. A. Monk & Co. Limited.

Elizabeth MacGill Soulsby, M.E.I.C., who attended recent PICAO meetings in Montreal as a technical adviser is the first woman to do so, thus adding another triumph to the long string of distinguished "firsts" which characterize her career. Mrs. Soulsby was the first woman in the world to receive a master's degree in aeronautical engineering, the first woman on the continent to become chief aeronautical engineer with any company, and the first to design, build and test her own aeroplane.

W. D. Adams, M.E.I.C.

W. D. Adams, M.E.I.C., is the newly elected chairman of the Sault Ste. Marie Branch of the Institute. Born at Saint John, N.B., he graduated from the Royal Military College, Kingston, Ont., in 1908. He was employed first with the Grand Trunk Railway as assistant engineer and later was in charge of the engineering department of the Canadian Buffalo Forge Company, Montreal. Before going overseas to serve in World War I, he worked in the railway and bridge section of the Department of Works of the City of Toronto. On demobilization he became a partner with Adams Brothers of Toronto, later joining the staff of the Toronto Transportation Commission in 1921. He subsequently was associated with Walter J. Francis and Company of Montreal and with A. Bentley & Sons, contractors, at Toledo, Ohio, returning to Toronto in 1925 as resident engineer with Toronto Waterfront Viaduct. He was later employed by Electric Tamper and Equipment Co. of Canada, Montreal and as Toronto manager of the Montreal firm of H. E. McKeen and Co. Limited. He is at present with the Algoma Steel Company of Canada.

Mr. Adams joined the Institute as a Student in 1908, transferring to Junior in 1912, to Associate Member in 1922 and to Member in 1936.

Lieutenant-Colonel C. R. McCort, M.E.I.C., former assistant quartermaster-general and assistant director of works and construction at National Defence Headquarters, is retiring from the Canadian Army. For the past seven months he has been special assistant to the Deputy Minister of Veterans' Affairs, on loan from the army. He served overseas for three years with the Canadian Forestry Corps, and is returning to his pre-war position as manager of development and construction with the Ontario Paper Company, Limited, at Thorold, Ont.

F. J. Ryder, M.E.I.C., has been elected chairman of the Border Cities Branch. Born at Holyoke, Mass., he graduated from McGill University in civil engineering in 1929. After graduation he was employed with Motor Products Corporation, Walkerville, and later with Taylor and Gaskin, Detroit. In 1938 he accepted the position of sales engineer with the Canadian Bridge Company in Toronto and in 1943 was transferred to Walkerville in the same capacity. In 1945 he was transferred from sales engineer in the estimating department to the position of assistant superintendent of Plant One.

Mr. Ryder joined the Institute as a Student in 1928, transferring to Junior in 1935, and to Member in 1942. He served as secretary-treasurer of the Border Cities Branch in 1945.

John Gilchrist, M.E.I.C., has now retired from the R.C.A.F. with which he served overseas in the capacity of chief technical officer at a Bomber Command station, with the rank of squadron leader. He is at present establishing his own business as a manufacturer's representative in Montreal.

Dr. G. R. Lord, M.E.I.C.

Dr. G. Ross Lord, M.E.I.C., associate professor of mechanical engineering at the University of Toronto, has been elected by acclamation as president of the Association of Professional Engineers of the Province of Ontario. He has been actively connected with the affairs of the Association for several years, serving as a member of the council, representing the mechanical branch, in 1942, 1943 and 1944 and as vice-president in 1945. He has also served on several committees, including the executive, finance, membership and publicity committees.

Born in Peterborough, Ont., he graduated from the Faculty of Applied Science and Engineering of the University of Toronto in 1929 with the degree of B.A.Sc. In 1932 he was granted the M.Sc. degree from the Massachusetts Institute of Technology. In 1932-33 he was named as Freeman Scholar, sent to Germany by the American Society of Mechanical Engineers, where he studied at engineering colleges in Berlin, Munich and Karlsruhe. In 1934 he returned to his *alma mater* as lecturer in hydraulics and later received successive promotions. He was awarded the Ph.D. degree from the University of Toronto in 1939 for his original research on cavitation in hydraulic turbines.

J. H. Irvine, M.E.I.C., office and designing engineer of the City of Ottawa, Ont., is the newly elected chairman of the Ottawa Branch. Born at Nile, Ont., he graduated in civil engineering from the University of Manitoba in 1912. After extensive experience in general construction work he was appointed representative of the Dominion Reinforcing Company Limited at Toronto in 1928. In 1932 he entered the city engineer's department at Ottawa, Ont.

Mr. Irvine joined the Institute as a Student in 1911, transferring to Associate Member in 1917. He became a Member in 1940.

J. H. Johnson, M.E.I.C., has been elected chairman of the London Branch. Born at Waverly, N.Y., he graduated in mechanical engineering from Syracuse University in 1915. For two years after graduation he was employed in the engineering department of The Merell Soule Company, manufacturers of milk products. During World War I he held the rank of captain and adjutant of the 37 Art., Coast Artillery. In 1920 he came to Canada as chief engineer of The Canadian Milk Products Company Limited and assisted in starting Klim powdered milk production in five of the company's plants. In 1928 the Canadian Milk Products Company was taken over by The Borden Company Limited and he became chief engineer of the manufactured milk products division of The Borden Company Limited. Since that time he has been in charge of the installation, operation and maintenance of plants from Phoenix, Arizona, to Richmond, Vermont. In 1934 he returned to Canada to assume added responsibility in the Canadian division of The Borden Company.

Mr. Johnson joined the Institute as a Member in 1937.

Photo Le Nouvelliste

F. X. T. Berlinguet, M.E.I.C., is shown in the above photograph, working as usual on his 91st birthday, March 15th last. Born in Quebec City, he studied civil engineering and land surveying at Laval University and was connected for a number of years with the development of the harbours at Quebec and Trois-Rivières. He retired from the Department of Public Works of Canada after 46 years of service with the government. Since then, he has been actively engaged in private practice at Trois-Rivières.

Mr. Berlinguet joined the Institute as an Associate Member upon its foundation as the Canadian Society of Civil Engineers, on February 24, 1887, and was transferred to Member in 1890. He became a Life Member in 1931. He enters upon his seventieth year of professional practice with the best wishes of all members of the Institute.

A. L. Tregillus, M.E.I.C., is at present employed by the Ministry of Health, British Government, on the National Housing Scheme. He will remain in England for some time.

A. L. Denton, M.E.I.C., has been released from the R.C.A.F. in which he served as flying officer. He is now with the Department of Lands and Mines of New Brunswick as a land surveyor in Fredericton, N.B.

H. J. Racey, M.E.I.C., has accepted the position of general manager of Cresswell Roll Forming Company Limited and its subsidiary Cresswell-Pomeroy Limited at Montreal, Que. The former company is engaged in the manufacture of cold rolled form shapes for building and other industries and the latter in the installation of window accessories and other building specialties.

A graduate of Queen's University in civil engineering, Mr. Racey spent eight years with Shawinigan Engineering Co. Ltd., on estimating, design and construction of hydro-electric power development work. Following two years in the export and manufacturing business on his own account he joined the staff of Crane Limited in industrial engineering work. Three years later he became employed by the Brown Corporation at La Tuque, Que., in the manufacture of bleached sulphate pulp, first as assistant chief engineer in charge of plant maintenance and construction work. In 1943 he was appointed assistant to the works manager taking charge of industrial and public relations work. At the end of 1944 he was appointed acting superintendent from which position he resigned to accept his present appointment.

Eric Grant, M.E.I.C., has been discharged from the R.C.A.F. with which he served with the rank of flight sergeant attached to Northwest Air Command at Edmonton, Alta. He is now with the gas distribution department of the Quebec Hydro-Electric Commission in Montreal as senior draughtsman. Prior to his enlistment Mr. Grant was on the engineering staff of the Canadian National Railway Company in Montreal.

A. R. Hannaford, M.E.I.C., building commissioner of the City of Hamilton, Ont., has been elected chairman of the Hamilton Branch. Born at Derby, England, he came to Canada in 1910 when he joined the engineering staff of the Grand Trunk Railway. He continued on various works with the railway until 1921 when he accepted the position of office and designing engineer with the city engineer's department at Hamilton, Ont. In 1944 he was appointed to the position he now holds.

Mr. Hannaford joined the Institute as an Associate Member in 1920, becoming a Member in 1940. He was secretary of the Hamilton Branch and served on the executive for several years.

Victor Michie, M.E.I.C., of War Assets Corporation, has been transferred from Montreal to Ottawa, Ont.

Murray A. Stewart, M.E.I.C., formerly principal assistant engineer in the Toronto Department of Works, has been promoted to the position of deputy city engineer. Born in Hamilton, Ont., he graduated from the University of Toronto in civil engineering in 1905. Since that time he has been continuously in the service of the city. From 1905 until 1910 he was draughtsman and assistant engineer in the Roadway Section of the Department of Works, in the latter year being appointed engineer in charge of the Roadway Section.

He was promoted in 1929 to the position of principal assistant engineer in the Department of Works, which position he held until his recent promotion.

Jacques Tétreault, M.E.I.C., formerly with the firm of German & Milne, naval architects, Montreal, is now associated with Marine Industries Limited, at Sorel, Que.

Brian R. Perry, M.E.I.C., Montreal consulting engineer, has been named a member of the board of trustees of the Woman's General Hospital, Montreal. Mr. Perry was elected councillor for the Montreal Branch of the Institute in 1939, after serving as chairman of the branch the previous year. Since 1925 he has been engaged in private practice as consulting engineer.

G. A. Campbell, M.E.I.C., is now with Quebec North Shore Paper Company Limited at Baie Comeau, Que. He served as a lieutenant in the Royal Canadian Engineers. He graduated in engineering at the University of New Brunswick in 1938, receiving his master's degree in civil engineering from that university in 1944.

F. E. Estlin, M.E.I.C. is the newly elected chairman of the Saskatchewan Branch. Born in Melita, Man., he graduated from the University of Manitoba with a B.Sc. (E.E.) in 1925. On graduation he joined the Canadian General Electric Company at Peterborough, Ont., being transferred the following year to Winnipeg as industrial control specialist. In 1932 he moved to Regina, Sask., as sales engineer with the company.

Mr. Estlin joined the Institute as an Associate Member in 1938, becoming a Member in 1940. He is also president of the Association of Professional Engineers of Saskatchewan.

F. E. Estlin, M.E.I.C.

C. D. Martin, M.E.I.C.

C. D. Martin, M.E.I.C., is the new chairman of the Halifax Branch. Born at Amherst, N.S., he graduated in electrical engineering from the Nova Scotia Technical College in 1938. On graduation he entered the services of the Halifax branch of the Northern Electric Company Limited and has remained with the company since that time.

Mr. Martin joined the Institute as a Student in 1938, transferring to Junior in 1941, and to Member in the same year.

T. Linsey Crossley, M.E.I.C., is resuming his work as consultant in paper technology in Toronto, Ont. He was with the deSalaberry Works of Defence Industries Limited at Nitro, Que., for the past five years until the recent closing of the department.

E. H. Davis, M.E.I.C., has entered into partnership with H. A. Ripley, M.E.I.C., to form the firm of Davis, Ripley and Associates, consulting engineers, in Calgary, Alta. Mr. Davis has been released from the R.C.N.V.R. in which he served as lieutenant (E).

D. B. Barry, M.E.I.C., has been released from the Navy, after overseas service as lieutenant with the Fleet Air Arm. He has accepted a position with Trans-Canada Air Lines on the engineering staff at Dorval Airport, Que.

E. Cowan, M.E.I.C., has established his private practice in Montreal, Que., as a consulting engineer to the paper industry.

Fernand Dugal, M.E.I.C., is now associated with the American Locomotive Company at Schenectady, N.Y. He was formerly employed as shop engineer, tank arsenal, Montreal Locomotive Works, Montreal.

Wm. Arsenault, M.E.I.C., is now employed as town engineer at Springhill, N.S. He was formerly assistant maintenance engineer with Imperial Oil Limited at Dartmouth, N.S.

D. H. Evers, Jr.E.I.C., is now registered at McGill University in engineering and is studying at Dawson College, St. Johns, Que. He served as major in the R.C.E. with 1 Canadian Division overseas.

W. E. Ohrner, Jr.E.I.C., has accepted a position on the engineering staff of the Hydro-Electric Power Commission of Ontario. A graduate of the University of Manitoba in electrical engineering in 1943, he served for some time in the R.C.N.V.R.

A. W. Bridgewater, Jr.E.I.C., who served overseas as a captain with 1 Canadian H.Q. Army Group Engineers, has accepted a position with the engineering department of the Canadian Pacific Railway Company in Montreal. Prior to his enlistment, Mr. Bridgewater was employed as structural designer for Canadian Industries Limited in Montreal.

H. M. Coverdale, Jr.E.I.C., has accepted a position in the engineering department of Trans-Canada Air Lines at Dorval airport. He graduated in mechanical engineering from the University of British Columbia in 1943, and enlisted immediately in the Royal Canadian Navy, with which he served overseas in the Air Branch.

Percy Codd, Jr.E.I.C., who served in the R.C.A.F. overseas (aircrew) has been discharged with the rank of flying officer. He has joined the staff of the Canadian Carborundum Company Limited at Shawinigan Falls, Que. He graduated in metallurgy at the University of Saskatchewan in 1939 after which he was employed by the Hudson Bay Mining and Smelting Company at Flin Flon, Man.

E. R. Hammond, Jr. E.I.C., is now with Electric Tamper and Equipment Company of Canada Limited in Montreal. He served as first lieutenant on a number of ships of the Royal Canadian Navy, and recently retired from active service with the rank of lieutenant. He is a graduate of the Royal Military College, Kingston, and of Massachusetts Institute of Technology where he received his master's degree in civil engineering in 1939. After graduation he was with Trinidad Leaseholds Limited in Trinidad, B.W.I.

H. H. Schwartz, Jr.E.I.C., has joined the staff of the engineering department of Dee Electronics Limited, Montreal, in the capacity of communications engineer. After graduation from McGill University in 1938 with the degree of B.Eng. (Elect.) with honours, he worked for the Canadian Marconi Company until 1941 as a radio design engineer, first on radio receivers and later in charge of the design of all iron core components. In 1941 he was awarded a scholarship at the Massachusetts Institute of Technology and he obtained the S.M. degree in communications in 1942. Upon his return from M.I.T., Mr. Schwartz joined the Northern Electric Company, engineering department, electronics division, to work on general radio design including F.M. communicating systems, traffic signal equipment, etc. Later he was with the audio frequency group developing amplifiers and other audio frequency equipment.

For the past two years Mr. Schwartz has lectured at McGill University on the design and construction of communication transformers. In his new position he will be engaged in the development of audio frequency transformers, audio amplifiers and other electronic equipment.

S. A. Dick, Jr.E.I.C., has been discharged from the R.C.N.V.R. in which he served overseas as lieutenant (E). He has accepted the offer of a position with Spruce Power & Paper Co. Ltd. in Kapuskasing, Ont. He graduated from Queen's University in 1940, at which time he joined the Bailey Meter Co. Ltd. for which he was sales engineer in Montreal when he enlisted.

E. A. Dillon, Jr.E.I.C., is now with English Electric Co. of Canada Limited in St. Catharines, Ont. He served in the R.C.N.V.R. as an electrical lieutenant. Prior to his enlistment he was with the Canadian General Electric Company Ltd., Peterborough, Ont.

René Dupuy, Jr.E.I.C., who served as flying officer with No. 1 Aeronautical Inspection Detachment in Longueuil, Que., is now with La Cie de Pouvoir du Bas St. Laurent at Rimouski, Que. Early in the war he was sent to England where he studied aircraft inspection at the A.I.D. school in Bristol and at a number of British factories.

I. M. Foster, Jr.E.I.C., has been released from the army after overseas service as lieutenant with 1 Canadian Base Workshop, R.C.E.M.E. He has accepted a position with Consolidated Paper Corporation Limited at Grand'Mère, Que. He graduated in mechanical engineering at McGill University in 1937 and prior to his enlistment was with Brown Corporation at La Tuque, Que.

G. M. Armstrong, S.E.I.C., has received his discharge from the army in which he served with the R.C.E.M.E. at National Defence Headquarters. He enlisted upon his graduation in electrical engineering from the University of New Brunswick in 1944. He is now employed as electrical engineer at Bepco Canada Limited in Montreal.

C. S. Baburek, S.E.I.C., has accepted a position with Monsanto Canada Limited in Montreal. He served as lieutenant (E) in the R.C.N.V.R. afloat in destroyers and minesweepers. He graduated in mechanical engineering at McGill University in 1941 and spent a year with the R.A.F. Transport Command in civilian capacity prior to his enlistment.

J. J. Archambault, S.E.I.C., is at present employed as student engineer in the switchgear engineering department of Canadian General Electric Co. Limited at Peterborough, Ont. He is a graduate of Ecole Polytechnique in the class of 1944.

A. H. Berry, S.E.I.C., is now employed in the Telephone Division, Northern Electric Company Limited in Montreal. He served as lieutenant (E) in the R.C.N.V.R. in Canada and overseas. He graduated in mechanical engineering from McGill University in 1943 and joined the Navy immediately.

R. C. Eddy, S.E.I.C., is now employed in the capacity of lecturer at Queen's University. He graduated in chemical engineering at this university in 1941 and joined the Royal Canadian Engineers as lieutenant the following winter. He was wounded in action but suffered only temporary disability.

W. D. Kirkland, S.E.I.C., is now employed in the city power plant at Edmonton, Alta.

W. F. Dawson, S.E.I.C., is now demonstrating in the Faculty of Engineering at McGill University. He graduated in mechanical engineering from McGill in 1945 and enlisted as a cadet in the Royal Canadian Engineers.

P. O. Freeman, S.E.I.C., having received his release from the Royal Canadian Engineers in which he served as captain, has returned to McGill University for post-graduate study. He enlisted upon graduation from this university in 1943.

J. P. Genge, S.E.I.C., has received his discharge with the rank of lieutenant from the R.C.N.V.R. which he joined upon graduation from the University of Saskatchewan in mechanical engineering in 1941. He served overseas for nearly four years. He is now employed by Combustion Engineering Corporation Limited, Montreal, Que.

M. R. Hannah, S.E.I.C., is now taking post-graduate training in electrical engineering at the Massachusetts Institute of Technology. He has been released from the Navy which he joined on graduation in electrical engineering at University of Alberta in 1943. He was attached to the Directorate of Electrical Engineering, Naval Service Headquarters, and held the rank of lieutenant (E).

W. M. Hayman, S.E.I.C., has retired from active service with the R.C.N.V.R. after overseas service as lieutenant. He enlisted following his graduation in mechanical engineering from McGill University in 1941. He has accepted a position with Westeel Products Limited in Montreal.

James F. McKay, S.E.I.C., has accepted a position in the production department of Naugaturk Chemicals, Elmira, Ont. He graduated from the University of Saskatchewan with a B.Sc. (chemical) in 1944.

G. A. Cooper, S.E.I.C., is now employed by Globelite Batteries Limited, Winnipeg, Man. He enlisted in the R.C.E.M.E. as a cadet immediately upon his graduation from McGill University in mechanical engineering in 1945.

S. C. Cooper, S.E.I.C., has been discharged from the Royal Canadian Engineers in which he was training as a cadet. He graduated in civil engineering from the University of Toronto in 1945. He is now employed with Finley W. McLachlan Limited, general contractors, in Toronto, Ont.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

PIONEER ENGINEER DIES

The first graduate of the Faculty of Applied Science and Engineering of the University of Toronto, which, at that time, was known as the School of Practical Science, died at Pembroke, on Thursday, February 21st. He was Dr. James Lewis Morris, M.E.I.C. He died in his eighty-third year. He was the only graduate of the class of 1881. He joined the Institute as an Associate Member in 1887. He was one of the few surviving members of the original group of founders.

Dr. Morris was one of the outstanding engineers of Canada. He exemplified the broad interest of the profession, inasmuch as he participated in the municipal affairs of his home city (being at one time Mayor of Pembroke), was a noted historian and author, and made extensive study of Indian life in Canada.

To the graduates in engineering at Toronto, Dr. Morris was a familiar figure. He attended many of the reunions, and was always the most honoured and distinguished guest present. He will be sadly missed in engineering circles.

Born in Greenlaw, near Renfrew, he received the degree of C.E. in 1885, and in 1927 the honorary degree of D.Eng. was conferred upon him by U. of T. Dr. Morris took a prominent part in many engineering projects. For more than five years he was engaged with the C.P.R. in construction work in the Rocky Mountain foothills.

He was associated actively with drainage operations in the Ottawa valley and in southwestern Ontario. One of his achievements was the laying out of the townsite of Sudbury, and another the designing of the Hydro-Electric plant on Black river.

For 43 years Dr. Morris practised as an engineer in Pembroke. Later he was a member for several years of Morris, Mackie and Co., contractors.

Several years ago Dr. Morris was appointed inspector of surveys and engineer in the Ontario department of lands and forests. While in the department he was the author of "Indians of Ontario", and he wrote the history of cities, towns and villages of Ontario.

Newton James Ker, M.E.I.C., pioneer civil engineer with the Canadian Pacific Railway Company, died at his home in Vancouver, B.C., on March 2nd, 1946. Born at Brantford, Ont., on May 6th, 1866, he was a descendant of United Empire Loyalists who settled in Niagara district in 1785.

Mr. Ker commenced his engineering career with the C.P.R. at Montreal in 1887 on the construction and extension of the rail line from Lachine to Windsor Street station, later working in a similar capacity at London and Windsor, Ont. In 1890 he became assistant city engineer for the City of Toronto, which position he held for nine years. In 1899 he was employed as city engineer at Ottawa, Ont., where he remained until 1913 when he became land agent for the C.P.R. at Vancouver. He was prominently associated with the development of Shaughnessy Heights and was active in other civic improvements.

He retired from the C.P.R. in 1935. During 1943-44 he served as special representative for the real estate adviser, Department of National Defence.

Mr. Ker joined the Institute as an Associate Member in 1893, becoming a Member in 1905. He was made a Life Member in 1936.

Howard Frederick Lambart, M.E.I.C., died at his home in Ottawa, Ont., on January 12th, 1946. Born in Ottawa on December 30th, 1880, he attended Ashbury College there and graduated from McGill University with his B.Sc. degree in 1904.

Mr. Lambart worked on the initial surveys of the Grand Trunk Pacific Railway in 1905 and then joined the Geodetic Surveys Branch of the Department of Interior, transferring later to the Topographical Surveys Branch. As a Dominion Land Surveyor he carried out surveys for the Department in many parts of Canada until his retirement in 1933, including seven years as surveyor in charge of the Yukon-Alaska boundary demarcation. In 1938 and 1939 he organized expeditions to survey the Mackenzie Mountains in the Northwest Territories and on the outbreak of war offered his services to the Inspection Board of the United Kingdom with which he served for some time until ill-health forced his retirement.

Mr. Lambart was one of the first engineers to take a practical interest in the use of aerial photography for mapping purposes and carried out the first experimental aerial surveys in the Ottawa area in 1920. He made early flights for reconnaissance as well as transportation purposes in many parts of Canada, employing air transport for his survey parties wherever possible He was a well known mountaineer and made many notable ascents in the course of his survey work, among them an ascent of Mount Robson, highest peak in the Rockies. The first ascent of Mount Logan in 1925 by the Canadian-American team of which Mr. Lambart was joint leader, on loan from the Canadian government, was a notable achievement in Canadian mountaineering history. The record of the climb was published in the world's leading geographical and alpine journals and widely publicized at the time.

Mr. Lambart was made a Fellow of the Royal Geographic Society in recognition.

Mr. Lambart joined the Institute as a Student in 1902, transferring to Associate Member in 1907. He became a Member in 1940 and was made a Life Member in the same year.

Karl Weatherbe, M.E.I.C., died suddenly in Montreal on March 7th, 1946. Born at Halifax, N.S., on April 1st, 1871, he graduated from King's College, Windsor, N.S., with the degrees of B.A. and B.Sc. in 1891. Two years later he took a special course in civil and mining engineering and mathematics at Massachusetts Institute of Technology.

After some time spent in railway work as a location engineer, he was appointed professor of engineering at King's College. He held this post from 1897 until 1904 when he returned to practising as an engineer. During World War I he served with the Royal Canadian Engineers with the rank of major. He was awarded the Military Cross. After the war he resumed engineering, being employed for some time as field engineer with the Hamilton Bridge Company.

Mr. Weatherbe joined the Institute as an Associate Member in 1904, transferring to Member two years later. He was made a Life Member in 1939.

Reginald Mudge, M.E.I.C., died on February 10th, 1946, in the Ross Memorial Pavilion of the Royal Victoria Hospital, Montreal, Que., after a long illness. Born in Montreal, Que., on May 1, 1885, he graduated from McGill University with a B.Sc. in 1906.

Mr. Mudge joined the Canadian Pacific Railway at Smiths Falls, Ont., in 1907 and four years later became resident engineer at Silver Creek, B.C., returning to Montreal as assistant engineer in 1912. He enlisted in the Army in 1914 and served overseas as a captain in the Canadian Overseas Railway Construction Corps until 1919 when he returned to the C.P.R. in the office of the chief engineer in Montreal. He was assistant engineer of construction until 1939 when he was named assistant engineer of track. He retired in 1943 because of ill health.

Mr. Mudge joined the Institute as a Student in 1906, transferring to Associate Member in 1913. He was made a Life Member in 1939.

Walter Percy Copp, M.E.I.C., head of the engineering department at Dalhousie University, died in Halifax, N.S., on January 31st, 1946. Born at Sackville, N.B., on August 25th, 1885, he took his Arts course at Acadia University. He graduated in applied science at McGill University in 1908, leading his class and winning the British Association Gold Medal.

Immediately after graduation he joined the engineering staff of the Dominion Bridge Company, holding a responsible position with them during the construction of the first Quebec bridge. From 1918 until 1920 he was with the Department of Railways and Canals, Ottawa, as a bridge and structural engineer. In 1920 he became professor of engineering at Dalhousie University and lectured there up to the time of his death. In the fall of 1945 his colleagues on the Faculty honoured him with a presentation on the completion of a quarter century of service there. He was a governor of the Nova Scotia Technical College.

Professor Copp joined the Institute as a Student in 1907, transferring to Associate Member in 1913, and to Member in 1925. He was an active member on the executive of the Halifax Branch of the Institute and on the council of the Association of Professional Engineers of Nova Scotia, serving as chairman of the Association during 1933. He was councillor of the Institute representing the Halifax Branch 1931-32.

Ralph Henry Goodchild, M.E.I.C., died on September 19th, 1945, in Calgary, Alta. Born at Montreal, Que., on April 30th, 1882, he studied civil engineering at McGill University.

In 1910-11 he worked as concrete inspector for the Canadian Pacific Railway irrigation western section. From then until 1932 he was with the Department of the Interior of the Dominion government on irrigation projects. This period was spent in southern Saskatchewan and Alberta doing hydrometric surveys, irrigation surveys, layouts of irrigation projects, preparation of plans, design of works, estimates, classification and reclassification of lands, preparation of contour maps, etc. He served overseas in the Canadian Army from 1916 until 1919.

In 1940 Mr. Goodchild joined the Department of Transport as a resident engineer. He was in charge of the construction of the Calgary airport in that year. In 1941 he was made senior assistant engineer for the Department and was in charge of the southern district of Alberta, supervising all airport construction in that territory. In the following year he was transferred to the northern district of Alberta. In 1944 he resigned from the Department on account of ill health.

Mr. Goodchild joined the Institute as an Associate Member in 1920, becoming a Member in 1940.

Dallas Forrest Grahame, M.E.I.C., died at his home at Montreal, Que., on February 15th, 1946. Born at Lachine, Que., on July 10th, 1885, he attended St. Johns School, now Lower Canada College, and McGill University, from where he graduated in 1910 with a B.Sc. in mechanical engineering.

For two years after graduation he was employed in the locomotive department of the Canadian Pacific Railway Company at Montreal, and from 1912 until 1915 was mechanical inspector of power plants for the company there. In the latter year he was appointed assistant director of heat, light and power of the Ontario government. In 1917 Mr. Grahame accepted the position of chief engineer on the military hospitals commission at Ottawa, where he remained until 1921 when he went to Toronto as chief engineer of Underfeed Stoker Company of Canada. In 1924 he returned to Montreal to become chief engineer of Atwood Limited, with which firm he was associated until the time of his death. During this time he also served as a consultant. From 1924 until 1927 he was supervisor of buildings of the Bell Telephone Company and from 1934 until his death was consulting engineer and member of the Board of the Children's Memorial Hospital.

Mr. Grahame joined the Institute as an Associate Member in 1925, becoming a Member in 1940.

John Cameron, M.E.I.C., died at his home at Peterborough, Ont., on February 8th, 1946, following an attack of coronary thrombosis the previous week. Born at Salt Springs, Antigonish County, N.S., on September 20th, 1902, he attended St. Francis Xavier University from 1922 until 1925 and Nova Scotia Technical College from 1925 until 1927, graduating from the latter with a B.Sc. degree in electrical engineering.

Shortly after graduation he went to Peterborough to enter the electrical test department of the Canadian General Electric Company Limited. One year later he was transferred to the industrial control engineering department as assistant engineer. It was from this department that he was transferred in 1942 to head the wire and cable department as managing engineer, the position he held at the time of his death. He had achieved much success in steel mill drive control and was regarded as an outstanding electrical engineer in that phase of his profession.

Mr. Cameron joined the Institute as a Student in 1927, transferring to Associate Member in 1937. He became a Member in 1940. He was active in the Peterborough Branch having served on the executive from 1939 until 1943 and as chariman of the Branch in 1941-42.

Francis Stanley Adamson, M.E.I.C., deputy city engineer and deputy commissioner of buildings, City of Winnipeg, died on March 6th, 1946, in the Winnipeg General Hospital.

Born at Nassagaweya, Ont., on April 7, 1902, he graduated from the University of Manitoba with the degree of B.Sc., (C.E.) in 1926. Following graduation he was employed by Kelker, Deleuw & Company, consulting engineers, Chicago, as field engineer in charge of construction of pavements, watermains, sewers and sewage treatment plants for Libertyville and Mundelein, Ill.

In 1927 Mr. Adamson was employed as office engineer for the Concrete Steel Company of Akron, Ohio, in charge of the detailing and designing of many important structures in the United States. He remained with this company until 1932 when he returned to Winnipeg to private practice. Two years later he joined the staff of Cowin & Co., structural engineers, Winnipeg, where he was engaged in designing, detailing and estimating reinforced concrete structures.

In 1935 Mr. Adamson was appointed designing engineer with the Greater Winnipeg Sanitary District which position he held for four years. In 1939 he was appointed assistant engineer with the City of Winnipeg engineering department, being in charge of the desinging office. Three years later he was made assistant engineer in charge of building and plumbing inspection and sewer maintenance in the same department. In 1944 he was promoted to the position which he held at the time of his death.

Mr. Adamson joined the Institute as a Member in 1943.

Activities of the Twenty-seven Branches of the Institute and abstracts of papers presented

EDMONTON BRANCH

W. W. Preston, jr.e.i.c. - *Secretary-Treasurer*

The chief pilot testing Gloster Meteor jet planes at the winter testing unit in Edmonton, Squadron Leader E. L. Baudoux, D.F.C., D.S.O., addressed the Edmonton Branch at its monthly dinner meeting in the Macdonald Hotel on February 18th, 1946. His subject was **Jet Propulsion and Future Aircraft.**

Squadron Leader Baudoux, who was introduced by Chairman F. R. Burfield said that the war has advanced aviation a great deal. Speed of travel is greater, higher altitudes are reached, and heavier loads are carried over longer distances than formerly.

He divided aircraft into four categories: (1) high-speed military planes; (2) commercial passenger planes; (3) commercial cargo planes and (4) light private planes. Of these, he claimed, only types 1 and 2 were likely to be jet propelled in the near future.

Attempts to propel by jets were first heard of, the speaker related, in 1680 when Sir Isaac Newton conceived the idea of driving a carriage by a steam jet. Prior to the war the Italians built the predecessor of the jet plane but it was unsuccessful. The development of the modern gas turbine jet propulsion system was begun in 1936 by Air Commodore Whittle.

In comparing the efficiency of propellers and jets, Squadron Leader Baudoux said there was little difference between them at a speed of 400 m.p.h. but that for greater speeds jets were better and for lesser speeds the propeller. He outlined the problem of reaching a flying speed approaching the speed of sound, about 760 m.p.h. which is a critical speed in aerodynamics, and he explained how a shock wave is set up that produces forces so great that they cannot be overcome by ordinary controls.

It is the experience of the speaker that a jet plane is easier to handle than the orthodox plane because there are fewer instruments and controls. He said that one doesn't feel uncomfortable at high speeds except when there is a quick change of direction, a practice which would not be necessary in civilian flying. A crash landing in a jet plane would be less hazardous than in a plane using gasoline.

The remainder of the speaker's paper dealt with future aircraft. Squadron Leader Baudoux expected planes to fly at a height of 30,000 feet or more to obtain greater speed for less power and to operate above "the weather". He said, pressurization of the plane cabin is necessary to permit operation at extreme altitudes. The speaker anticipated much difficulty in exceeding the speed of sound but expected that, as soon as it was passed speeds would soon increase to 1,000 m.p.h. To provide a complete range of speeds he foresaw a plane with propellers on the front of the plane and jets on the back. The appearance of the plane, he stated would depend on the streamlining required past the speed of sound. He thought the wings would decrease in span, be much thinner and have sharp edges. Higher landing speeds, probably 130 m.p.h. would be common. Larger and larger planes would be built, carrying heavier loads longer distances, he concluded.

A long discussion period ended with a vote of thanks to Squadron Leader Baudoux moved by E. D'Appolonia and heartily endorsed by the meeting. The dinner attendance was 73.

HALIFAX BRANCH

J. D. Kline, m.e.i.c. - *Secretary-Treasurer*

S. W. Gray, m.e.i.c. - *Branch News Editor*

On January 29th the annual combined banquet of the Halifax Branch, The Engineering Institute of Canada and the Association of Professional Engineers of Nova Scotia was held at the Nova Scotian Hotel. There were 275 present. This function has become an annual affair and its popularity is proven by our attendance figures. We were very fortunate in securing for the meeting as our guest speaker, Will R. Bird, noted Maritime author. Mr. Bird has had 546 short stories and six full length novels accepted and his most recent book "Here Stays Good Yorkshire" received the Ryerson Literary Award for fiction for the year 1945. Mr. Bird is a student of the history of Nova Scotia and in his talk related many experiences in the historical life of the province.

A very impressive floor show and entertainment was provided along with favours and donations from various industrial concerns, and the success of this informal function was attested by the many complimentary remarks received by the committee responsible.

Guests at the head table included Mr. Alan Butler, mayor of Halifax; Commodore C. R. H. Taylor, representative of the Navy; Air Vice Marshal A. L. Morfee of the Air Force and Brigadier J. C. Stewart of the Army, George Dickson, representative of the Institute, C. A. Fowler, Nova Scotia Architects' Association, G. G. Bowser, Nova Scotia Mining Society and E. G. Young, Canadian Institute of Chemistry.

The meeting was presided over by J. Cavanagh, president of the Association of Professional Engineers of Nova Scotia, and C. D. Martin, chairman of the Halifax Branch.

❖ ❖ ❖

On February 14th, 1946 the regular monthly meeting of the Halifax Branch was held in the Nova Scotian Hotel. The attendance was 56 including several engineers of the senior class of the Nova Scotia Technical College, who were guests of the Branch.

The guest speaker of the evening was an ex-mayor of Halifax, John Lloyd, a recent employee of U.N.R.R.A. in the United States and Europe. Mr. Lloyd was introduced by the vice-chairman of the Branch, E. C. O'Leary. Also present at the head table was Mr. J. B. Hayes, recently elected president of The Engineering Institute of Canada.

Mr. Lloyd spoke on the subject **Public Administration** and recited many of his experiences while a member of U.N.R.R.A. in Washington and on the European continent. He stated "If we are to have good public administration and the good things of a real democracy, self interest must be curbed and the old political system of patronage and rewards must be done away with." The chief point was that public administration was a science in which skilled leaders were needed. Mr. Lloyd's talk was very interesting and at the close a hearty vote of thanks was moved by W. C. Risley and seconded by E. C. Thomas.

❖ ❖ ❖

On March 21st, 1946 the regular monthly meeting of the Halifax Branch was held at the Nova Scotian Hotel. The attendance was 65, including several members of the senior class of the Nova Scotia Technical College who were guests of the Branch.

Other guests at the head table included Hon. Harold Connolly, Minister of Industry and Publicity in the Nova Scotia Government, Stewart Sime, traffic manager, Trans-Canada Air Lines, Halifax, N.S. The guest speaker of the evening was Mr. J. T. Dyment, engineering superintendent of the Trans-Canada Air Lines, who was introduced by the branch chairman, C. D. Martin.

Mr. Dyment's subject **Present and Future Development of Air Transportation** was especially interesting to our members and was very well received. This phase of transportation was divided into five broad headings: safety, dependability, comfort, speed and reduction of rates.

Mr. Dyment's talk was exceedingly interesting and instructive, and the keen interest of our members was proven by the lengthy period of discussion which followed his talk. L. E. Mitchell, past-chairman of the Branch moved a vote of thanks to the speaker which was seconded by W. C. Risley.

HAMILTON BRANCH

L. C. Sentance, M.E.I.C. - - *Secretary-Treasurer*
I. M. MacDonald, Jr.E.I.C. - *Branch News Editor*

The regular monthly meeting of the Hamilton Branch, attended by approximately 45 members, was held at McMaster University on February 21st, 1946. Branch Chairman A. R. Hannaford presided.

H. J. A. Chambers introduced the speaker of the evening, Lieut.-Col. V. S. Thompson. Col. Thompson returned last August after spending 22 months in Italy, for most of that time as chief of the public works division of the Allied Commission. The intimate knowledge gained in this project well qualified him to speak on **Reconstruction in Italy,** or "How to make Bricks without Straw".

Up to May, 1945, 70 per cent of all Bailey bridges were replaced with permanent or semi-permanent structures. The speaker explained that the Bailey bridge was the standard army operational structure, and during the campaign these bridges were in constant demand for re-use as the fighting proceeded up the leg of Italy. A total of 1,652 bridges, or about 3½ per day, were repaired or reconstructed by the division under Col. Thompson's command. This figure does not include any culverts or bridges under 12 ft. span.

In addition to bridge structures and 4,200 miles of road repairs, his work included the urgent rehousing of hundreds of thousands of refugees made homeless by enemy bombing. It was estimated that 3,700,000 persons were displaced from approximately 700,000 houses and apartments that were ruined or damaged during the fighting. Consideration was given to shipping prefabricated houses from this side of the Atlantic, but lack of shipping and more particularly the unsuitability of this type of accommodation for Italian conditions compelled this idea to be abandoned. It was found that the only suitable method was to rebuild and repair with local material and labour, following the traditional Italian methods.

Reconstruction work was always difficult because of lack of adequate labour, shortage of material, and almost complete lack of transport. Italian contractors who were called on to help co-operated very well despite lack of equipment. Col. Thompson and his staff worked very closely with local government engineers, whose knowledge of the country made their help inestimable.
It is estimated that 500,000 workers, both male and female, were engaged in this work of reconstruction at an approximate expenditure of $70,000,000.

Many pictures of the work and the country-side were shown during the lecture. These pictures, taken by Col. Thompson, well illustrated the magnitude of the work in which he was engaged.

At the conclusion of this talk, the speaker answered numerous questions, and a vote of thanks was moved by Alex. Love.

The chairman closed the meeting with a plea to the members to support the Harry F. Bennett Memorial fund, which will be used for the financial assistance of student engineers. The members then adjourned to the anteroom for customary refreshments.

KINGSTON BRANCH

J. Douglas Lee, Jr.E.I.C. - *Secretary-Treasurer*
T. L. Brock, M.E.I.C. - - *Branch News Editor*

On Thursday, February 21st, the Kingston Branch held a meeting in Old Arts Building, Queen's University, with J. R. Carter, branch chairman presiding. The speaker was Mr. William Storrie of the Toronto firm of consulting engineers, Gore and Storrie. Mr. Storrie's subject was **The Engineer and Public Health — With Particular Reference to Kingston.** Because of unusual interest in the topic under discussion the meeting was opened to the Kingston Junior Chamber of Commerce and to Queen's students. Mr. Storrie knows existing conditions with regard to Kingston utilities intimately, as his firm have been engineers for the Kingston Public Utilities Commission for many years, during which time they have made a thorough study of the city's need for water purification and sewage disposal facilities.

Mr. Storrie stressed the little appreciated fact that over half the supply of the world's fresh water is located in the Great Lakes. Canada has innumerable sources of fresh water, but communities in Eastern Canada near areas of water have an easy task in securing their supply compared to certain communities in the mid-west. Cities on the Great Lakes have merely a matter of water purification with which to contend without the task of transporting the water great distances. Mr. Storrie told the audience that the International Boundary Treaty detailed the use of boundary waters in the following order: (1) water supply, (2) navigation, (3) water power.

Mr. Storrie said that the question of public health is one of vital importance to a nation. He described it as the art of directing the forces of nature for the protection of the health of all citizens. It must be a public effort, however. The speaker cited typhoid fever as a case where the individual could not be relied upon for protective measures, but where community action was responsible for reducing the scourge to the point where doctors refer to number of cases rather than number of deaths.

Mr. Storrie asserted that the water chlorination process used in Kingston is not infallible and is certainly not the best system. He urged that Kingston should establish a water purification plant for the welfare of its citizens. The speaker described the $15,000,000 water purification system in Toronto which is now operating to the satisfaction and good health of the city. Slides were shown illustrating different systems for laying intake pipes. The newest system employed at Toronto has the pipe below the lake bed, thus preventing damage by ice flow in the spring. Slides of the construction of the Toronto project, the operations of the modern filter plant, the layout of the various piping systems throughout the city were shown and compared with various water purification plants in other Canadian cities.

In addition Mr. Storrie showed slides of the sewage disposal plant in Toronto and described some of the details of the work and process involved in the purification and disposal of the sewage.

LETHBRIDGE BRANCH

T. O. Neumann, M.E.I.C. - *Secretary-Treasurer*
H. T. Miard, M.E.I.C. - - - *Branch News Editor*

Mr. Doug. Brown, District Service Engineer for the Canadian General Electric, entertained members of the Lethbridge Branch of The Engineering Institute of Canada, and interested visitors, when he spoke on **Electronics,** and demonstrated various electronic phenomena, in the Marquis Hotel on Wednesday evening, March 13. He was ably assisted by Mr. "Jimmy" Munro of the Canadian General Electric.

Commencing by lighting an electric light with a match and extinguishing it by a puff of breath, he gave a performance that would be envied by any top-rate magician, while demonstrating the marvels of electronics.

The speaker described the diode, a vacuum tube with a filament and a plate, and the "Edison effect" or the flow of electrons from the filament to the plate, when the latter was charged positively. He demonstrated with a tungar rectifier tube, showing on a large meter the effects of changing the heat of the filament.

The triode tube had a grid interposed between the filament and the plate. By varying the grid voltage, the flow of electrons was controlled. These tubes are used for amplifying currents, and Mr. Brown demonstrated with a record-player, a pocket radio, and a radiosonde transmitter. He showed a home-made "time delay relay" for use in photography. This illuminated a lamp for any required time from one-half second to half-an-hour, then extinguished it.

Exposing a photo-electric cell to a beam of light, he controlled the lighting of a neon gas sign by interrupting the beam. Practical uses of this included opening mine doors as cars approached, opening kitchen doors, and inspections on assembly lines. He demonstrated rejection of defective articles from an endless belt by a photo-electric cell operating a relay.

Talking movies reproduce sounds by means of a photo-electric cell, and Mr. Brown proved sounds could be produced by unusual means. With a beam of light projected through a spinning perforated disc and through two reading glasses to a photo-electric cell, he produced musical tones in a sound reproduction machine about thirty feet away.

He then projected a beam of light through a space between two vertical pieces of cardboard. The lower piece was attached to the diaphragm of a speaker, which was connected to a gramophone pickup. The movements of the diaphragm varied the width of the beam, and these variations were picked up by a photo-electric cell and the sound was reproduced in a machine thirty feet distant.

Demonstrating gaseous lights, Mr. Brown displayed a half-finished fluorescent tube. He set it between contacts, and pointed out that a high voltage formed an arc through the gas, setting up ultra violet rays which caused fluorescence in the salts coating the finisched part. He then lifted the tube away from the contacts but it continued to glow. Finally six tubes of different colours were lying loose on the table and glowing brightly. The speaker explained that a very strong field was created at each terminal by plates beneath the table. The plates were connected to a transmitter.

Mr. Brown demonstrated a stroboscopic effect with a flashing mercury vapour lamp and with a flashing neon lamp. With a power supply at high voltage connected to condensers which discharged through the lamp, he produced some exceptional illusions on whirling discs.

He pointed out that this stroboscopic light was used to take photos at high speeds, and was particularly useful in industry in examining machinery in motion at high speed. Gears could be made to appear to stand still, or revolve slowly either way, and stresses could be studied.

Mr. Brown closed with a description and demonstration of a cathode-ray tube, and showed how the point of light produced by the impinging electrons could be deflected vertically or horizontally by impressed voltages. He demonstrated the use of the tube to show visually the sine curve of an alternating current, or impulses of music and voice.

P. E. Kirkpatrick was chairman of the meeting, Mr. Bradley introduced Mr. Brown and Mr. Munro, and Mr. Ryder thanked the speaker. There was a large audience composed of members of the Institute, technical students and teachers, and electrical men.

LONDON BRANCH

A. L. Furanna, m.e.i.c. - *Secretary-Treasurer*
J. C. Keppy, m.e.i.c. - - } *Branch News Editors*
J. W. Kirk, jr.e.i.c. - - - }

A review of the achievements and future plans of the Association of Professional Engineers of the Province of Ontario was made by Dr. G. R. Lord, president of the Association, before a well-attended joint meeting of the members of that body and the London Branch of the Engineering Institute on Friday, March 1st.

Dr. Lord outlined the history of the Association since the time it was formed in 1922. Acknowledgment was made of the ground work by the small group of engineers who pioneered during early years. Under the stimulus of the 1937 Amendment to the Provincial Act, by which the Association was formed, a very considerable growth in membership has been experienced, with the result that there are at present 4500 engineers and 3000 engineers-in-training registered with the Association. The desirability of strengthening the Association, by adding to the membership, was brought to the attention of the meeting.

The speaker made reference to the fact that the prestige of the engineer could be raised by gaining the confidence of the public. In this connection, the Association is carrying out a publicity campaign with a view to encouraging the employment of only registered engineers to carry out engineering work. Constant surveillance by the Association of the action of industries and engineers in general, is showing results.

A discussion period followed the address, with Lieut.-Col. Tom Medland, public relations officer of the Association, taking part.

J. H. Johnston, chairman of the London Branch, conducted the meeting. The speaker was introduced by E. V. Buchanan and thanked by W. R. Smith.

MONCTON BRANCH

V. C. Blackett, m.e.i.c. - *Secretary-Treasurer*

On March 5th a branch meeting was addressed by R. N. Fournier, supply manager, Canadian General Electric Co., Halifax. Mr. Fournier spoke on the subject **Electric Heating in Industry,** which he discussed under three main headings. First, he described the many forms of small electric heating devices which can be obtained as standard articles. In this class is found the strip or bare type heating unit, used in toasters, electric irons, hot plates and melting pots. There is also the calrod insulated element in which the heating wire is surrounded by insulating material, and the whole enclosed in a metallic casing which may be bent into any required form. This type is used for immersion heating and is often cast into place for use in modern electric ranges. The speaker next dealt with electric heat treating furnaces. Three types were discussed, the regulation type using a resistance heating element, the induction type of heat treating equipment, used principally for localized heating applications, such as hardening bearings in crankshafts without affecting the quality of the rest of the shaft, and, lastly, the salt bath type of heat treating equipment. Finally, the much publicized infra-red method of paint drying was described. This method has been used with great success in the drying of synthetic paints since the infra-red ray not only acts on the surface but penetrates the entire layer of the paint. Lead-oil base paints, on the other hand, do not respond to this treatment since they depend on the oxygen of the air and not on heat for drying.

Mr. Fournier's remarks were illustrated by numerous slides and samples of electric heating equipment. A vote of thanks was extended the speaker by the presiding chairman, T. H. Dickson, on motion of B. E. Bayne, seconded by H. J. Crudge.

The Mulberry film, "A Harbour Goes to France" was shown at this meeting.

MONTREAL BRANCH

E. M. Van Koughnet, m.e.i.c. - *Secretary-Treasurer*
Hyman Schwartz, s.e.i.c. - - - } *Branch News Editors*
Eli L. Ilovitch, m.e.i.c. - - - - }

"We must appreciate the resistance caused by fear and resentment that management, supervisors and employees have towards the installation of new methods in industry", Mr. Clifton H. Cox, the author and ex-director of Job Methods Training for the U.S. Manpower Commission, told the members of this branch on Thursday evening, January 10th, when he spoke on **Applying Industrial Engineering Techniques Through Supervisors.** These new methods are primarily aimed to give more goods of better quality at lower cost, and thus give greater job security and a higher standard of living to the people.

Mr. Cox explained that management consisted of three branches, viz. executive management, technical management, and supervisors, each of which must understand the others' problems as well as their own.

In introducing new methods the industrial engineer must see to it that each branch of management thoroughly understands his plan and how it will help production. After he has devised some recording or accounting system to prove the actual gains derived from his work, he is prepared to introduce his methods in the shop by securing the aid and co-operation of the supervisors who will enforce and use the new methods.

❖ ❖ ❖

The difficulty with forming an opinion on the economic aspect of **The St. Lawrence Waterway Project,** according to Professor John L. MacDougall, is that there are so many variables to the problem. Professor MacDougall, who has been lecturing at Queen's University for the past 13 years, gave this talk before the Montreal Branch of the E.I.C. on January 17th, 1946.

Today, freighters on the lakes carry iron ore to the east and bring back coal to the west, and transportation of grain is only a small part of the yearly tonnage hauled. What is needed on the lakes is not larger ships to carry bigger cargoes but small and faster freights which will run more often. The biggest competitors to lake transportation are the railways and truck agencies which can offer quicker, better and more regular service.

A commonly seen estimate of $392,000,000 is what the 25-foot seaway would cost. This figure does not mention any alterations to present port facilities which are adequate for only 14 foot navigation. Off the record estimates for deepening ports run between $100,000,000 and $200,000,000.

The seaway project as it is now planned will provide one large power site, said Mr. MacDougall. A more economical provision for hydro-electric power would be to develop small generator units as needed, as close to the final place of consumption as possible. In the opinion of the professor, too much of the cost of this project is being charged to navigation to give an unreasonably low figure as the cost of power generation.

A lively discussion was opened by G. De Beaulieu and R. E. Heartz thanked the speaker.

The annual meeting of the Montreal Branch was held on Thursday, January 31st, 1946, at 8.15 p.m. The minutes of the previous annual meeting were read by L. A. Duchastel, secretary-treasurer of the Branch. These were approved and adopted. The scrutineers' report was read and J. A. Beauchemin was elected branch chairman for 1946.

When the general meeting ended, Major D. C. MacCallum, Rehabilitation Officer of the Institute, gave a talk on **Rehabilitation.** This word means, among other things, "to reinstate, or restore to a former rank or privilege lost or forfeited". The men who have been in the fight have had an opportunity to feel things in the light of this new experience and they have found a new set of absolute values.

Most of these men need no rehabilitation; what they need is assimilation and a job. Their new philosophy will help them to make the best of any position they take.

Statistically, this department has received about 3,000 applications and has contacted about 300 employers. Approximately 800 interviews have been granted and 150 confirmed direct placements have been made. Probably a like number of placements have not yet reported back to the Institute.

"I can assure you that I very much appreciate the privilege of sharing in this undertaking, and as a measure of rehabilitation for myself, it couldn't be better", said Major MacCallum in closing.

NIAGARA PENINSULA BRANCH

P. A. Pasquet, Jr.E.I.C. - - *Secretary-Treasurer*
J. L. McDougall, M.E.I.C. - *Branch News Editor*

A meeting of the Niagara Peninsula Branch was held at St. Catharines on February 28th with J. Ings, branch chairman, presiding.

Branch Councillor P. Buss reported on the annual general meeting held in Montreal at which honours went to two local members, W. R. Manock being appointed a vice-president and A. J. Grant receiving the Julian C. Smith medal.

Dean C. R. Young of Toronto University, the speaker of the evening, was introduced by C. C. Cline. The title of the address chosen by Dean Young was **Engineering Organizations and Professional Development,** a subject of timely interest to all members. The subject was admirably covered and the growth of the profession was traced from early times up to the present. The steps in professional development and recognition were fully reviewed.

The speaker reminded his listeners that there is a perpetual challenge to the engineer "to assist his brother engineer, to give service to his fellow man, to work in the national sphere and to expand into the sphere international". Greater recognition of the engineering profession by the public, Dr. Young stressed, depends on how each individual member conducts himself. "Stature, not status, should be strived for among engineers. Satus will follow as a natural course."

Many questions were put to the speaker at the close of the talk and W. Jackson, on behalf of all present, voiced the vote of appreciation to Dr. Young.

C. G. Moon said a few words, expressing his desire to see closer working agreements for the benefit of the profession as a whole. At the close of the general meeting an executive meeting was held.

OTTAWA BRANCH

C. G. Biesenthal, Jr.E.I.C. - *Secretary-Treasurer*
R. C. Purser, M.E.I.C. - - - *Branch News Editor*

Safety and health, and the engineer's place in the community were discussed in an address before the Ottawa Branch at the noon luncheon on March 7th at the Chateau Laurier. H. J. McGough, Toronto, general manager of the Ontario Highway Construction Safety Association, was the speaker. J. H. Irvine, chairman of the Branch, presided.

Engineers, though qualified by careful and painstaking training to be leaders, are very little interested in public life and politics. This was to be regretted, said the speaker. They were taught the value of order, of meticulous care, and were given every possible educational aid and training to fit them for their occupation. All these would be of value in other spheres besides engineering alone. Why were engineers so backward in coming forward?

The engineer had many types of men under him and it was his task to plan not only for the safety of structures under construction but for the safety of every employee under his control. If the employee knows that this is being done, he will take greater interest in his work and accord greater respect to the engineer. "Until those in charge realize that the men and women on the payroll are human beings, we will not achieve one iota of that better world we are all eager to build", he declared.

PETERBOROUGH BRANCH

E. Whiteley, M.E.I.C. - *Secretary-Treasurer*
J. C. Allan, M.E.I.C. - *Branch News Editor*

A paper on **Compressed Air and Its Uses** was presented jointly by Mr. George M. Dick, manager of engineering, and Mr. Cyril N. Danks, district engineer, both of the Canadian Ingersoll-Rand Co. Ltd., before the February 14th meeting of the branch

Mr. Dick opened the subject with a brief historical account of the development of the use of compressed air down to modern times. One of the earliest uses of compressed air at relatively high pressures of possibly 7 or 8 atmospheres, was made by Egyptian priests who used it to move temple doors.

The development of compressors from about 1850 onwards was outlined by Mr. Dick, with a discussion of the problems involved and the nature of various advances in the art. The relative applications of rotary, centrifugal, and reciprocating compressors were outlined.

Reciprocating compressors were considered in more detail than the other types and the theory of this type was very briefly reviewed.

Compressor speeds have increased a great deal in the last 30 or 40 years. This has been due to several different factors, such as better bearing materials, better forgings and anti-friction bearings. The biggest influence, however, is due to the continual betterment in valving. Mr. Dick outlined the history and development of several types of valves each of which represented a considerable advance over its predecessors and permitted operation at higher speeds.

The function of unloaders were explained and several types were described.

Many of today's compressors are equipped with anti-friction bearings. The larger ones usually use roller self aligning bearings. On the smaller ones ball bearings are frequently used. Regardless of the type, everyone of them have only one crank. It is quite common to find 2 or 3 and some times 4 connecting rods on the one crank pin. This is because the use of 2 cranks would require the use of an intermediate anti-friction bearing and anti-friction bearings can not be split to permit their assembly in such a location.

Mr. Dick illustrated his paper with slides.

Mr. Danks added the second part of the paper.

Recorded data indicates that compressed air was used in the 18th century for elevating water and in connection with diving. However, it was not until the Rock Drill came into prominence that a real attempt was made to develop compressed air as a means of power transmission. Compressed air is now recognized as one of the most useful forms of power transmisison which mankind has ever known. The success of compressed air Rock Drills has lead to the use of many other compressed air devices in under ground workings. Jack hammers, stopers, drill sharpeners and small pneumatic tools have come into common use. Even large mine hoists installed underground have been powered by compressed air. Compressed air is also generally employed for such miscellaneous uses as sand blasting, spray gun painting, cement gun applicators, liquid agitators and forging hammers.

The uses of compressed air are therefore, of a very diversified nature and the application of compressed air as a Power Transmitting Medium is today a very far reaching and highly developed science.

Mr. Danks concluded the paper with 2 motion picture films. One illustrated the use of compressed air in tunneling the 13 mile Alva B. Adams bore and the other illustrated the use of compressed air in the paper box industry.

SARNIA BRANCH

F. F. Dyer, M.E.I.C. - *Secretary-Treasurer*
C. E. Leon, M.E.I.C. - *Branch News Editor*

On Thursday, February 28th, the Sarnia Branch held a dinner meeting at the Sarnia Golf Club. The speaker of the evening, Mr. I. G. Goddard, manager of the plastics division, Canadian General Electric Limited, chose as his subject **Plastics.** Assisting Mr. Goddard in the presentation of his talk was Mr. D. G. McNabb, also of Canadian General Electric.

In opening his talk, Mr. Goddard stated "If Medals were given to industrial products, plastics would win the Victoria Cross." In every theatre of war, plastics played their part—in a battleship alone there are over 1,000 applications of this substance. However, during the war, plastics were poorly represented on the home front, and in many cases incited public distrust by failing in ordinary household appliances. This was due to: article not being properly labeled as to suitable use, scrap material being used, wrong material being used, and poor design of article. At the present moment, there is a progressive movement in progress among manufacturers to overcome this distrust by standardized presentation of plastics to the public, and by accurate informative labelling of the articles. Mr. Goddard regards plastics as one of the three most rapidly advancing sciences. It shares an equal position with electronics, and neuclionics, all three being concerned with the re-arrangement of molecules.

The first plastic was accidentally discovered by John Wesley Hyatt over 75 years ago, when he found that by mixing guncotton with camphor it was possible to make celluloid. Since that time, the plastic industry has developed into over a 500 million dollar business. Following Hyatt's discovery, Leo H. Bakelon developed bakelite with the co-operation of Professor Redman of the University of Toronto. These three men are today considered the fathers of plastics.

In defining plastics, Mr. Goddard stated that a plastic is a material formed by the addition of a resin and a chemical substance that, by the application of heat and pressure, can be forced or moulded into any desired shape. The classification of plastics is based upon physical characteristics rather than their constituents.

Mr. Goddard emphasized that for successful application of plastics we must remember two modifying conditions. The "Whens' and the 'Whys'. Plastics will be successfully applied only if used

1. When they will do some job for less money than any other material.
2. When they will do a better job for the same money than any other material.
3. When no other material can be used.

Why we use them depends upon
1. Their properties of being light and strong
2. Their mouldability—with or without metal inserts.
3. Their excellent electrical and heat insulating properties.

By their versatility, designers of modern equipment are able to meet any exact function and design that may be required. In 1946 the U.S. expects an expansion of this industry to the order of 120 million dollars. Through plastics we can soon anticipate many new and worthwhile profits for the improvement of comfort and the enhancing of our standard of living.

Library Notes

Book notes, Additions to the Library of The Engineering Institute, Reviews of New Books and Publications

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Algoma Steel Sheet Piling:
Algoma Steel Corporation Ltd., Sault Ste. Marie; H. E. McKeen & Co., Ltd., Montreal, 1942, 11½ x 9 in., 106 pp., illus., leather.

Canadian Fisheries Manual; Thirty Years Progress in Canadian Fisheries Industry, 1914-1944:
Frederick William Wallace. Gardenvale, Que., National Business Publications, 1945. 11 x 9 in., 124 pp., illus., paper.

Engineering Interpretation of the Economic and Financial Aspects of American Industry; Vol. 7, Plastics and the Plastics Industry:
N.Y., Montreal, George S. Armstrong, 1946. 83 pp., paper.

Hackh's Chemical Dictionary; American and British Usage, 3d. ed.:
Edited by Julius Grant. Philadelphia, Toronto, Blakiston, 1946. 10 x 7 in., 925 pp., illus., cloth, $8.50.

How to Evaluate Supervisory Jobs; an Executive and Supervisory Appraisal Manual:
Albert N. Gillett. Deep River, Conn., National Foremen's Institute, 1945. 11½ x 10 in., looseleaf, illus., charts, cloth, $7.50.

Human Behaviour and Its Relation to Industry; a Series of Lectures Delivered at McGill University, Montreal, January 12, 1944—March 28, 1944:
Planned and Arranged by D. Ewen Cameron and H. Graham Ross. Montreal, McGill University, 1944. 9 x 6½ in., 204 pp., cloth, (McGill Monograph Series, No. 3.)

Metal Working and Heat-Treatment Manual; Vol. I:
F. Johnson. London, Paul Elek, 1945. 8½ x 6 in., 204 pp., illus., cloth, 17s. 6d.

Plan de Fabrication Aeronautique:
M. P. Guibert. Paris, Dunod, 1945. 10 x 6½ in., 126 pp., illus., paper, 255 fr. (in French).

Ports Maritimes:
A. de Roubille. Paris, Dunod, 1946. 8¼ x 5¼ in., 182 pp., illus., paper, 250 fr. (in French).

Practice of Printing:
Ralph W. Polk. Peoria, Ill., Manual Arts Press; Toronto, Copp Clark, 1945. 8 x 5½ in., 300 pp., illus., cloth, $4.00 in Canada.

Sheet Piling, Cofferdams, and Caissons:
Donovan H. Lee. London, Concrete Publications, 1945. 9½ x 6¾ in., 191 pp., illus., cloth, 10s.

Studies in Supervision; a Series of Lextures Delivered at McGill University, Montreal, January 30, 1945-March 20, 1945:
Planned and arranged by D. Ewen Cameron and H. Graham Ross. Montreal, McGill University, 1945. 9 x 6½ in., 149 pp., illus., cloth. (McGill Monograph Series, No. 6.)

PROCEEDINGS, TRANSACTIONS, ETC.

American Society for Testing Materials:
1945 Supplement to A.S.T.M. Standards, including Tentatives; Part III—Nonmetallic Materials—General.

American Society of Civil Engineers:
Transactions Number 110, 1945.

Nova Scotia Institute of Science, Halifax, N.S.:
Proceedings, Vol. 21, 1942-1944.

Quebec Library Association:
Papers read at the First Annual Convention, Montreal, October 11-13, 1945.

REPORTS, YEARBOOKS, ETC.

American Railway Engineering Association:
Program and Year Book, 1945. (Being Vol. 47, No. 459, March 1946 of the Bulletin.)

American Society of Civil Engineers:
Official Personnel Directory Number 1946.

British Engineers' Association:
Classified Handbook of Members and Their Manufactures, 1945.

Canada. Department of Labour:
Annual Report, 1944-45. (French Edition.)
Salaries and Hours of Work in Canada, 1943. (Report No. 26. French Edition.)

Canada. Department of Transport:
Annual Report, 1944-45.

Canada Permanent Mortgage Corporation:
Annual Report, 1945.

Canadian Radio Technical Planning Board:
Notices and Minutes of Meetings, Interim Reports of Committees and Panels, 1944-1945.

Combined Production and Resources Board:
Report on the Conference on Unification of Engineering Standards, Screw Threads, Pipe Threads, Limits and Fits, Drawing Practice and Metrology; Ottawa, September-October 1945.

Engineers' Council for Professional Development:
Thirteenth Annual Report, 1945.

Metropolitan Water District of Southern California:
Report for the Fiscal Year, July 1944 to June 1945.

TECHNICAL BULLETINS, ETC.

British Standards Association:
British Standard 1264: 1945—Methods of Test for Transport Gas Producer Fuels. P.D. 420: November 1945—Recommendations on Methods of Protection against Corrosion for Light Gauge Steel and Wrought Iron used in Permanent Building Construction.

Electrochemical Society:
Preprints:—*88-31—Effect of Electrolytically Released Halogens on an Absolute Methyl Alcohol Solution of Cinnamic Acid, by Robert Leininger and L. A. Pasiut.—89-3—High Titania Dielectrics, by Eugene Wainer.—89-4—Electrolysis of Manganese into a Metal Cathode from Suspensions of Manganese Oxide and Carbon in Molten Manganous Chloride, by Burke Cartwright and S. F. Ravitz.—89-5—Production of Beryllium Oxide and Beryllium Copper, by Bengt R. F. Kyellgren.—89-6—New Type of Electrochemical Reaction, by J. E. Stareck.—89-7—Protective Value of Lead and Lead-Tin Deposits on Steel, by A. H. Du Rose.—89-8—Electrochemistry of the Rare Earth Group, by B. S. Hopkins.—89-9—Production of Metallic Calcium by Thermal Reduction, C. C. Loomis.*

Illinois University. Engineering Experiment Station:
Bulletin Series *No. 359—Grain Sixes Produced by Recrystallization and Coalescence in Cold-Rolled Cartridge Brass, by Harold L. Walker.*

Circular Series *No. 51—Rating Equations for Hand-Fired Warm-Air Furnaces, by Alonzo P. Kratz and others.*

Reprint Series *No. 32—Progress Reports of Investigation of Railroad Rails and Joint Bars . . . by Herbert F. Moore and Others.—No. 33—Progress Report on the Effect of the Ratio of Wheel Diameter to Wheel Load on Extent of Rail Damage . . . By Norville J. Alleman.*

Institution of Mechanical Engineers:
Advance Papers, 1946—*Change in Mechanical Properties of Mild Steel under Repeated Impact, by F. V. Warnock and J. A. Pope.*
Flow of Gases at Sonic and Supersonic Speeds, by G. A. Hankins and W. F. Cope.
High-Pressure Gear Pumps, by T. E. Beacham.
Recent Developments in Alternating-Current Turbo-Electric Ship Propulsion, by G. O. Watson. (Eighteenth Thomas Lowe Gray Lecture.)
Use of Vibration as a Means of Industrial Drive, C. A. M. Thornton.

Purdue University. Engineering Experiment Station:

Vickers, Rockwell and Brinell Hardness Values for Various Materials and Alloys, Prepared by J. T. Agnew.

PAMPHLETS, ETC.

Aeronautical Facilities at the National Research Laboratories, Ottawa:

Ottawa, King's Printer, n.d.

British Speeches of the Day:

Ottawa, United Kingdom Information Office, 1946.

British Trade & Industry; the Lessons of Wartime Production Applied to World Reconstruction:

London, Country Life, 1945.

Glimpses of Industrial Britain:

Ottawa, United Kingdom Information Office, 1946.

Great Responsibility:

L. K. Sillcox. Columbus, Ohio State University, 1946. (Lincoln Lecture.)

Industrial and Scientific Research in Canada:

Toronto, Canadian Manufacturers' Association, 1946. (Reprinted from Industrial Canada, January 1946.)

Investigation into the Phenomenon of Screw Propeller Action:

Alexander Kari. North-East Coast Institution of Engineers and Shipbuilders, 1946.

National Foremen's Institute; What It Is and What It Does:

Camden, N.J., Warren Webster & Co. (Bulletin B 1600.)

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARD SPECIFICATION FOR METHODS OF TEST FOR TRANSPORT GAS PRODUCER FUELS; B.S. No. 1264, 1945:

London, British Standards Institution, 1945. 26 pp., illus., 2/–.

The standard tests cover methods for sampling; screen analysis; determination of strength and friability, total moisture, potential tar, critical air blast value, ash content, sulphur and chlorine, alkali used for activation, with an Appendix giving a graphical method of recording screen analyses.

While not complete, the tests are of immediate value to users and meet a definite need. The publication is subject to addition and revision as further experience is gained.

CHEMICAL PROCESSES IN THE HARDENING OF PORTLAND CEMENT:

By Rune Hedin. Svenska Forskningisnstitutet for Cement och Betong vid Kungl Tekniska Hogskolan I Stockholm—Handlingar N:R 3 (e), 1945 (Swedish Cement and Concrete Research Institute—Proceedings.) (In English.)

After a description of the constitution of the Portland Cement clinker and a survey of the most important published information on the hydration of Portland cement, the author reports on his own investigations in detail. Adducing extensive experimental evidence, he shows that the chemical reactions which take place when a mixture of Portland cement and water hardens under normal conditions are determined by the rate of solution of the clinker components as well as by the concentration and activity of ions in the solution formed. The reactions of the individual clinker components were studied separately, both in pure water and in various other solutions. This study included the principal components as well as those constituents which occur in comparatively small quantities. Special tests were made in order to investigate those reactions which continue in the solutions. Based on the results of his investigations, the author advances some theories which have been verified by tests on non-alkaline cements manufactured by a special calcining process and on ordinary commercial grades of cement.

HANDBOOK ON STAINLESS STEEL:

Brackenridge, Pa., Allegheny Ludlum Steel Corp., 1946. 100 pp., tables.

This handbook presents practical information on twenty-six types of stainless steel. It brings up to date, supersedes and amplifies the stainless steel chapters of the earlier "Handbook of Special Steels" and includes most of the data and information that is available on file-size "Blue Sheets" for the various types of stainless steel.

It contains a forty-four column finder table, corrosion resistance to 230 materials, discussions of properties, products, available forms and sizes, and fabrication methods.

ON THE MODULUS OF ELASTICITY OF CONCRETE:

By Erik Forslind. Svenska Forskningsinstitutet for Cement och Betong vid Kungl Tekniska Hogskolan in Stockholm—Handlingar N: 4 (e), 1945 (Swedish Cement and Concrete Research Institute—Proceedings.) (In English.)

In this paper an attempt is made to set up a theory of elasticity dispersion in concrete by means of elementary arguments based on the calculus of probabilities. The theory advanced was subjected to an experimental verification by tests made on a concrete beam, 3m in length, which was cut down by steps to an ultimate length of 1.765 m. The modulus of elasticity was determined by a dynamical method as a function of the length of the beam, and the results were compared with the variation in the modulus of elasticity computed from the theory. The paper concludes with a discussion of the assumptions and results of the investigation. A method for studying the variations in mass density of cement mortar is dealt with at some length in this connection.

RECOMMENDATIONS ON METHODS OF PROTECTION AGAINST CORROSION FOR LIGHT GAUGE STEEL AND WROUGHT IRON USED IN PERMANENT BUILDING CONSTRUCTION:

London, British Standards Institution, 1945. P.D. 420, 8 pp., 1/–.

A memorandum describing various methods which can be used for the protection of light gauge steel, the recommendations have been prepared and published, pending the completion of the work necessary before a Standard can be issued. The memorandum is intended essentially for general guidance, and gives recommendations as to the particular points which need to be observed.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

ATOMIC ENERGY IN WAR AND PEACE

By G. G. Hawley and S. W. Leifson. Rainhold Publishing Corp., New York, 1945. 211 pp., illus., diagrs., tables, 7¾ x 5 in., cloth, $2.50.

The first part of this book discusses atoms, neutrons, energy transformations, combustion, explosions, radioactivity, transmutation, nuclear fission and other subjects of fundamental importance. The second part, based on the official report of the atomic bomb project, gives the story of this tremendous job, the obstacles to be surmounted and the means by which it was done. A concluding section discusses future military and industrial applications of atomic energy in the light of present knowledge.

BASIC ELECTRICAL ENGINEERING, Circuits, Machines, Electronics

By A. E. Fitzgerald. 1st ed. McGraw-Hill Book Co., New York and London, 1945. 443 pp., illus., diagrs., charts, tables, 9 x 5¾ in., cloth, $3.75.

This new text-book presents an integrated treatment of circuit theory, electrical-machinery fundamentals and applications, and engineering electronics. Discussion of instrumentation and of automatic-control applications in research and industry supplements and correlates the treatment of individual items. The book is intended for students who have had a course in college physics and have some experience in simple d-c theory. No knowledge of alternating currents is assumed.

ELECTRICAL ESSENTIALS IN MARINE SERVICE, Vol. 1

(Marine Electricians' Library.) 419 pp., $3.00.

ELECTRICAL POWER SOURCES IN MARINE SERVICE, Vol. 2

(Marine Electricians' Library.) 458 pp., $4.00. By J. M. Dodds. McGraw-Hill Book Co., New York and London, 1945, illus., diagrs., charts, tables, 8½ x 5¼ in., cloth.

These volumes are the first two of a three-volume set covering all phases of marine electrical work except radio. Vol. 1 explains the essential principles of electricity and magnetism and the characteristics of electrical circuits; alternating and direct currents are discussed together, and their various uses are described and compared. Vol. II covers machines and devices involved in the generation and distribution of electrical power in shipyards and aboard ships. The size and limitations of the electrical machine are discussed, and separate sections are devoted to a.c. and d.c. generators, storage batteries, regulating devices, switchboards, and installation work.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

March 30th, 1946.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the May meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thrity-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BEECHER—KEITH DAVIDSON, of 270 Arlington Ave., Ottawa, Ont. Born at Montreal, Que., Dec. 6th, 1917. Educ.: B.Eng. (Elect.), McGill Univ., 1941; 1939-40 (summers), Aluminum Co. of Canada, Arvida, Que., Noranda Mines Ltd., Noranda, Que.; 1941-45, Lieut. E., Royal Canadian Navy; 1945-46, elect. engr., Montreal Locomotive works; and at present, patent examiner, Canadian Patent Office, Ottawa, Ont.

References: C. A. Norris, F. Dugal, A. E. MacRae, C. V. Christie, E. Brown, R. O. McGee, L. A. Wright, L. Trudel.

BORROWMAN—MURRAY LEROY, of Winnipeg, Man. Born at Winnipeg, Man., July 17th, 1914. B.Sc., (Civil), Queen's Univ., 1934; 1936-38, engrg. dept., Winnipeg Electric Co. Ltd.; 1938-41, constrn. dept., McColl-Frontenac Oil Co., Ltd., Winnipeg, Man.; 1941-45, Royal Canadian Engineers, with rank of Lieutenant, discharged December, 1945; at present, constrn. foreman, operating dept., McColl-Frontenac Oil Co., Ltd., Calgary, Alta.

References: N. M. Hall, J. N. Finlayson, J. S. Neil, R. W. Borrowman, E. V. Caton, C. P. Haltalin, A. Sandilands.

BROWN—HUGH CAREY, of 642 Lansdowne Ave., Westmount, Que. Born at Montreal, Que., Nov. 14th, 1914. Educ.: B.Eng., (Elect.), McGill Univ., 1936; 1936-41, test course and sales engrg., Canadian Westinghouse Co.; 1941-46, Royal Canadian Signals; 1946 to date, sales engr., Canadian Westinghouse Co., Montreal, Que.

LIBRARY NOTES

(Continued from page 279)

ELECTRONICS DICTIONARY

By N. M. Cooke and J. Markus. McGraw-Hill Book Co., New York and London, 1945. 433 pp., illus., diagrs., charts, tables, 9 x 5½ in., fabrikoid, $5.00.

Authoritative and readily understood definitions are given for nearly 6,500 terms used in radio, television, industrial electronics, communications, facsimile, sound recording, etc. More than 600 diagrams and sketches illustrate the principles and equipment described. A consistent policy on abbreviations and compound terms has been followed, based on groundwork laid by the American Standards Association but extended to cover many not yet listed by that association.

RIGHTS OF TRAINS, a Complete Analysis of Single Track Standard Code Rules

By the late H. W. Forman, revised by P. Josserand, 3 ed. Simmons-Boardman Publishing Corp., New York and London, 1945. 561 pp., diagrs., charts, tables, 7½ x 4¾ in., cloth, $3.50.

This manual analyses the Standard Code of Operating Rules of the Association of American Railroads as applied to single and double track. It completely explains and illustrates train rules, train orders and transportation problems of the operating department of any American railroad. Reasons for the rules are given, and questions and answers likely to be met in rules examinations are included to test the reader's understanding of the applications of the rules.

FAMOUS NEW ENGLAND LIGHTHOUSES

By E. R. Snow. Yankee Publishing Co., Boston, Mass., 457 pp., illus., 9 x 5¾ in., cloth, $3.75.

First of a series on American lighthouses, this volume gives briefly the history of every primary and secondary lighthouse in the Boston or New England district. The light itself is described, the stories of famous disasters and remarkable rescues associated with each are told with full credit to the man or woman whose participation was in the line of duty, the lighthouse-keeper.

PRODUCTION ILLUSTRATION, the Techniques and Applications of Perspective Engineering Drawings

By J. Treacy. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 202 pp., illus., diagrs., charts, tables, 9 x 11½ in., cloth, $4.00.

Perspective drawing found wide adoption during the war as a medium for presenting engineering facts, especially to inexperienced workers unfamiliar with blueprints. This book presents the forms and processes of production illustration in simple form. Part one deals with the actual preparation of production illustrations, including drafting and shading techniques, short-cuts, perspective methods and aids to reproduction. Part two shows why, when and where production illustration is of use in industrial production. The book is profusely illustrated with examples of actual production drawings.

Rehabilitation and Employment Service

THE ENGINEERING INSTITUTE OF CANADA
2050 MANSFIELD STREET,
MONTREAL 2, QUE.

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Particular emphasis is laid at this time on the need for this service to fill the dual role of providing a general picture of employment conditions for members in the armed forces, and of making available to them specific contacts both now and at the time of their release from the services. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

NOTICE

SERVICE PERSONNEL: The completed rehabilitation questionnaires have indicated a need for the employment service to be made available to all members of the E.I.C. in the Armed Forces. It is suggested that all those who are interested—

1. **Consider these positions as indicative of present conditions.**
2. **Reply to interesting advertisements to establish contact for the future.**
3. **Apply for any of these positions when discharge is imminent.**

Situations Vacant

CIVIL

CIVIL OR MECHANICAL ENGINEER is required for design works by a paper company in the St. Maurice Valley. Some mining experience helpful. Salary $275. a month. Apply to Box No. 3381-V.

CIVIL ENGINEER, graduate age 30 to 40 years, is required for supervision of construction on 2½ million dollar project near Montreal. Salary $300 plus expenses. Apply to Box No. 3383-V.

CIVIL ENGINEER is required to act as assistant to city engineer, some knowledge of town services such as, water works, sewage, building inspection, parks, lighting an asset. Location Montreal. Salary open. Apply to Box No. 3385-V.

CIVIL ENGINEER with five to ten years experience in reinforced concrete design is required by a firm of consulting engineers in Montreal. Salary open. Apply to Box No. 3387-V.

TWO CIVIL ENGINEERS are required to act as senior and junior structural designer respectively with a steel company in southern Ontario. Salary open. Apply to Box No. 3389-V.

CIVIL OR MECHANICAL ENGINEER recent graduate is required by a company in Montreal for work in field on construction; taking measurements with instruments and some surveying. Preferably bilingual. Salary $200 a month. Apply to Box No. 3390-V.

TWO CIVIL ENGINEERS, one experienced man to be in charge, the other to act as assistant, mostly for office work, are required for a building programme in Ontario, in connection with roads, trails, lookout towers, telephone line, buildings, etc. Preference to veterans. Salary up to $3,000 per year for senior and $2,000 per year for junior position. Apply to Box No. 3394-V.

RESIDENT ENGINEER graduate, preferably but not necessarily bilingual with several years' experience in building construction is required for a housing project in Montreal. Several civil engineers from recent graduates up are also required. Salary open. Apply to Box No. 3402-V.

CIVIL ENGINEER recent graduate is required by a pulp and paper company in the province of Quebec to understudy logging engineer on road-building, dam construction, etc. Candidates should be bilingual. Salary $200 a month. Apply to Box No. 3405-V.

SEVERAL CIVIL ENGINEERS with experience in the design of structural steel and reinforced concrete, or who are interested in testing and research work in connection with concrete and soils are required in the engineering department of a large organization in Toronto. Salary open. Apply to Box No. 3409-V.

CIVIL ENGINEER experienced in making surveys, laying out water lines, etc., is required by a firm of consulting engineers in Montreal to conduct a complete survey of a mill site. Partly field work and partly office work for at least 18 months. Salary $400-$450 a month. Apply to Box No. 3418-V.

CIVIL ENGINEER graduate with several years experience in construction work, preferably bilingual is required by a construction company in Montreal to take charge of a project as resident engineer in Quebec. Salary open. Apply to Box No. 3421-V.

CIVIL ENGINEER, young graduate, is required for work in connection with the design of pumping stations, substations, buildings, vaults, conduit lines, retaining walls, etc., and field survey, layout of railway works, and water supply system for a city in southern Ontario. Salary open. Apply to Box No. 3423-V.

CIVIL OR MECHANICAL ENGINEER graduate, with experience in construction and truck equipment, age 35 to 40, is required by an oil company to take charge of operations in Montreal area. Apply to Box No. 3427-V.

ELECTRICAL

ELECTRICAL ENGINEER graduate, experience in acoustics is required by a firm in the Montreal area. Some experience in radio acoustics might be helpful. Salary $250 to $300 or more. Apply to Box No. 3382-V.

TWO ELECTRICAL ENGINEERS with a minimum of four years' experience with commercial radio equipment are required by a firm in Montreal. Applicants must have good personality and ability to meet public. Please do not apply unless qualified. Salary open. Apply to Box No. 3395-V.

ELECTRICAL ENGINEER with experience in marine electrification is required by a consulting firm in the Montreal area. Salary open. Apply in writing to Box No. 3398-V.

TWO ELECTRICAL ENGINEERS graduates with construction experience preferably in utility substation and power plant work are required by a consulting firm in Montreal. Salary open. Apply to Box No. 3398-V.

ELECTRICAL ENGINEER graduate with several years experience is required for plant maintenance work. Preference to ex-service man with enough experience. Salary open. Apply to Box No. 3403-V.

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters, English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to Box No. 3415-V.

ELECTRICAL ENGINEER 5 to 10 years experience on general electrical design wiring of buildings, industrial plants and sub-stations, preferably a graduate, is wanted by a firm of consulting engineers in Montreal. Salary $250-$400 a month. Apply to Box No. 3420-V.

ELECTRICAL ENGINEERS from recent graduates up, if possible with experience in maintenance and repair of A.C. and D.C. motors, or in power plant work, are required by a mining corporation in South America. Salary $275 up. Apply to Box No. 3425-V

MECHANICAL

MECHANICAL ENGINEER is required to act as assistant mechanical superintendent of a paper mill in the St. Maurice Valley. Salary $350 a month. Apply to Box No. 3381-V

MECHANICAL ENGINEER under 30 years of age, with some experience in steam and refrigeration is required by a company in Montreal to act as assistant to plant engineer. Preference to veterans of R.C.N.V.R. Salary $200 a month. Apply to Box No. 3386-V.

MECHANICAL ENGINEER, not necessarily a graduate, but with 5 to 10 years' experience in industrial design concerning conveying equipment as used in rock or fertilizer plants, is required for work with a large company in Montreal. Salary $200 a month. Apply to Box No. 3390-V.

MECHANICAL ENGINEER, recent graduate, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to Box No. 3393-V.

MECHANICAL DRAUGHTSMAN is required for the preparation of plans and design work, for a textile company near Montreal. One or two years' experience necessary. Salary open. Apply to Box No. 3396-V.

THREE MECHANICAL ENGINEERS with one or two years experience in draughting and design are required for a paper company on the east coast. Work will involve draughting, design of new equipment and alterations to existing plant and equipment. Salary open. Apply to Box No. 3397-V.

MECHANICAL DRAUGHTSMAN is required by a paper company in Ontario. Must have industrial plant experience including conveyors, piping and machinery layouts. Salary $200-$225 a month. Apply to Box No. 3399-V.

MECHANICAL ENGINEER with paper mill experience is required to act as assistant mechanical superintendent of a large paper mill located in a city in western Quebec. Salary open. Apply to Box No. 3400-V.

JUNIOR MECHANICAL ENGINEER AND SENIOR MECHANICAL DRAUGHTSMAN, not necessarily graduates, but must have some experience of mechanical design problems. Preference will be given to ex-servicemen. Salary $1,800 to $2,700 depending on experience. Possibility of permanent employment located in Quebec City. Apply to Box No. 3401-V.

MECHANICAL ENGINEER with five to ten years experience in general industrial plant work, such as supervision of drafting office, building construction and maintenance machinery layouts, furnaces, boilers, etc., is required in a factory in Montreal. Salary open. Apply to Box No. 3403-V.

MECHANICAL ENGINEER, recent graduate, is required by a pulp and paper company in the province of Quebec, to learn woods operations with a view to mechanization. Candidates should be bilingual. Salary $200 a month. Apply to Box No. 3405-V.

CHIEF ENGINEER, age 35 to 40, preferably graduate mechanical, with experience in shop and production planning, running drafting office, etc., and ability to get along with people, is required by a factory in Sherbrooke ,Quebec. Salary $5,000 to $6,000 a year. Apply to Box No. 3410-V.

MECHANICAL ENGINEER, young graduate, veteran, preferably but not necessarily bilingual, is wanted by a company in Montreal engaged in light manufacturing to be trained for plant maintenance, trouble shooting, etc. Salary $200 to $250 a month. Apply to Box No. 3411-V.

MECHANICAL ENGINEER is required for junior position with an organization in the Montreal area. Successful candidate will be trained in tool designing with excellent opportunity to eventually work into supervisory capacity. Salary $185 to 240 a month. Apply to Box No. 3414-V.

MECHANICAL ENGINEER with considerable practical experience is required for general plant maintenance of production equipment for large out of town metal processing plant. Salary open. Apply in writing to Box No. 3417-V.

MECHANICAL ENGINEER DRAUGHTSMAN with two or three years experience, is required for work with a paper company in the province of Quebec. Salary $250 to $275 a month. Apply to Box No. 3424-V.

METALLURGICAL

RECENT GRADUATES in metallurgical or chemical engineering are wanted for quantitative non-ferrous chemical analysis by a mining corporation in South America. Salary open. Apply to Box No. 3425-V.

MINING

MINING ENGINEERS, necessarily with some experience in mining work, capable of becoming shift bosses, are wanted for work with a corporation in South America engaged in the production of coal and copper. Salary $275 to $400 a month. Apply to Box No. 3425-V.

MINING ENGINEER graduate experienced and capable of doing underground survey work, estimating tonnage extraction, etc., is wanted by a company in South America. Salary open. Apply to Box No. 3425-V.

MISCELLANEOUS

DRAUGHTSMAN familiar with reinforced concrete and structural steel is required by a consulting firm in Montreal. Salary open. Apply to Box No. 3387-V.

DESIGN ENGINEER not necessarily a graduate but with mechanical or structural experience in the paper industry is required by a firm in the St. Maurice Valley of Quebec. Salary $250 to $300 a month. Apply to Box No. 3388-V.

CHIEF INSTRUCTOR completely bilingual, veteran, not necessarily an engineer, is required by a pulp and paper company in the province of Quebec to instruct in labour relations, etc., and to understudy personnel manager. Salary $150 a month. Apply to Box No. 3405-V.

STEAM PLANT SUPERVISOR—Manufacturer with several plants in Ontario and Quebec requires an active man with technical training and field experience in efficient steam plant operation. Salary open. Apply to Box No. 3406-V.

GRADUATE ENGINEER with experience in structural design and detailing is required for work in bridge department of large transport company. Apply to Box No. 3407-V giving all particulars including salary expected.

ENGINEER with good knowledge of industrial practice, and ability to analyze financial statements, age 35 to 40, is wanted by a manufacturing concern in Toronto to act as assistant to the president. Salary will be commensurate with ability and experience. Apply to Box No. 3413-V.

YOUNG GRADUATE ENGINEER, recent graduate up, to learn operation of cement business, is required by a company with numerous plants in Canada. Not necessarily a specialist, to be trained for manager. Salary $175-$200 a month. Apply to Box No. 3419-V.

ENGINEERING SALESMAN with pleasing personality, bilingual, 25 to 35 years old, not necessarily a graduate, but with some engineering background and if possible some knowledge of lubrication is required by a large company in Montreal. Salary open. Apply to Box No. 3422-V.

CHIEF DRAUGHTSMAN, experienced in all types of structural work, required to take charge of a draughting office for a central Ontario city. Apply to Box No. 3428-V giving all particulars including salary expected.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

SEVERAL CHEMICAL ENGINEERS for technical service and plant operations, (not laboratory work) with good personality and background are required by a manufacturer in Montreal. Preference will be given to ex-service men and successful candidates will be completely trained at a starting salary of $170. per month. Apply to Box No. 3260-V.

CHEMICAL ENGINEER, preferably with graduate training in chemical engineering and some industrial experience will shortly be required in the chemical engineering department of a university in Ontario. Apply to Box No. 3280-V.

CIVIL

STEEL BRIDGE INSPECTOR, not necessarily a graduate but with good experience, is wanted by a railway company with headquarters in Montreal, to supervise the erection and repair of steel bridges. Salary about $250. a month. Apply to Box No. 3246-V.

SALES ENGINEER with knowledge of building materials, preferably discharged service man with sales ability and inclinations, is required by a manufacturer in Montreal. Successful candidate will have opportunity to become head of this department. Salary is open according to qualifications. Apply to Box No. 3263-V.

CIVIL ENGINEER, graduate with road construction experience, preferably bilingual, age 30-45 years, is required to act as sales engineer for a manufacturer of building materials in Montreal. Candidates should have good personality and appearance to be able to contact government officials, sit in at council meetings, etc. Apply to Box No. 3264-V.

CIVIL ENGINEER, graduate, is required by a firm in Montreal to supervise construction, according to specifications, of new buildings all across Canada. Preferably young man with enough experience . Salary will be $300. to $400. a month. Apply to Box No. 3292-V.

TWO CIVIL ENGINEERS, age 25-40 are required as (1) road construction engineer and (2) general building construction engineer, for estimating, organizing and supervising construction work for a firm in Newfoundland. Some designing and draughting. Salary open according to qualifications. Apply to Box No. 3318-V.

CIVIL OR MECHANICAL ENGINEER, not necessarily a graduate, age 24-30, some experience in concrete and steel draughting, some sales ability, required to work with a consulting engineer and contractor in Montreal. Salary open. Apply to Box No. 3339-V.

CIVIL ENGINEER, young graduate with 2 or 3 years experience, is required to be trained for survey work on municipal, sewer, drainage, etc. problems with a consulting engineer in southern Ontario. (Might eventually be partner). Salary $200. to $225. a month. Apply to Box No. 3340-V.

TWO CIVIL ENGINEERS, graduates with one or more years experience, are required for hydro electric construction and development in South America. Salary $300. to $350, a month. Apply to Box No. 3350-V.

SEVERAL CIVIL ENGINEERS, two with two or three years' experience in road construction and two recent graduates, are required for road building work in northern Quebec. Salary $2400. to $3000 a year. Apply to Box. No. 3351-V.

GRADUATE CIVIL ENGINEER, three or four years out of college, is required for surveying in bush in the Ottawa district, able to take charge of survey and do some plotting, make studies, etc. at office. Salary about $250. a month. Preference to veterans. Apply to Box. No. 3357-V.

CIVIL ENGINEER graduate with a good background of experience is required to act as superintendent or project manager for a large company in the Montreal area. Experience in heavy building construction essential. Age 40-50. Salary open. Apply to Box No. 3358-V.

CIVIL ENGINEER with some experience in highway or railway construction is required by a paper company in Ontario to act as instrumentman. Able to do some layout work on railway lines, take cross sections, calculate earth quantities and be familiar with surveying instruments. Salary about $200-225. a month plus room and board. Apply to Box No. 3362-V.

TWO CIVIL ENGINEERS, preferably but not necessarily graduates, are required to act as structural steel draughtsmen or checkers for a company engaged in this sort of work in Alberta. All applications should indicate education, experience and salary expected. Apply to Box No. 3365-V.

CIVIL OR MECHANICAL ENGINEER with four or five years experience in a pulp and paper company is required by a company engaged in this work in eastern Ontario. Apply to Box No. 3367-V.

ELECTRICAL

ELECTRICAL OR MECHANICAL ENGINEER is required by a firm in Ontario, for work in connection with research and development in electrical farm equipment. Some experience in design and manufacturing methods desirable. Apply to Box No. 3309-V.

SIX ELECTRICAL ENGINEERS, preferably graduates, but not necessarily experienced, are required for specification work by a company in Montreal engaged in the production of telephone systems, automatic dialing equipment, etc. Preference will be given to young veterans, who will be completely trained. Salary $170. to $250. a month. Apply to Box No. 3324-V.

ELECTRICAL ENGINEER, graduate, young man with at least one year of construction experience since graduation, bilingual, is required for work in connection with the erection of wood pole, steel tower transmission lines and sub-stations in various parts of the province of Quebec. Salary open. Apply to Box No. 3332-V.

ELECTRICAL ENGINEER, graduate with a minimum of two years' experience, including a background in power generation. Preference to veterans. Location: southern Ontario. Salary $225. to $275. a month. Apply to Box No. 3344-V.

ELECTRICAL ENGINEER with some experience with machinery and/or electrical installation work, with ability to get along with people, and interested in investing some capital, is required for executive work with a small company on the west coast for work in connection with the electrical machinery requirements and installation of lighting and power plants in the province. Salary open. Apply to Box No. 3352-V.

SEVERAL ELECTRICAL ENGINEERS, two experienced ,if possible, in transmission and distribution line work; two recent graduates are required for rural electrification work in the province of Quebec. Salary $2400.-3000. yr. Apply to Box No. 3368-V.

MECHANICAL

MECHANICAL ENGINEER, graduate, with at least four years' experience, some of it supervisory is required by a firm in Montreal, to be responsible for the maintenance of textile machinery and equipment. Age 26-32. Location: Ontario. Salary about $250. to $300. a month. Apply to Box No. 3294-V.

MECHANICAL ENGINEER, recent graduate, preferably ex-service man is required by a company in the Toronto area for work in salt processing, steam heating evaporators, power plant etc. Age 25-27. Salary $200. to $300. a month depending on qualifications. Apply to Box No. 3308-V.

MECHANICAL ENGINEER, age about 35-40 with experience in thermo-dynamics, mechanical and chemical work is required to be chief engineer of a company in the Toronto area. Preference to ex-service man. Salary about $400-$600. a month. Apply to Box No. 3308-V.

FIVE MECHANICAL ENGINEERS, preferably graduates but not necessarily experienced, are required for manufacturing methods engineering by a company in Montreal engaged in the production of telephone systems, automatic dialing equipment, etc. Preference will be given to young veterans who will be completely trained. Salary $170 to 250. a month. Apply to Box No. 3323-V.

MECHANICAL ENGINEER, with 4 or 5 years industrial experience since graduation, with knowledge of and interest in steam as applied to industrial equipment, and preferably some experience in ventilation work and in pulp and paper mills, is required by a company in southern Ontario. Salary $3600. per year. Apply to Box No. 3333-V.

MECHANICAL OR CIVIL ENGINEER, with at least five years' experience in pulp and paper industry, and capable of assuming responsibility, is required to plan, direct, and technically supervise new development work in the mills of a company with headquarters in southern Ontario. Salary $4800 to $6000 per year. Apply to Box No. 3334-V.

THREE MECHANICAL ENGINEERS, recent graduates, (1946) for draughting and engineering work in the office and field. Location: southern Ontario. Preference to veterans. Salary $200. to $225. a month. Apply to Box No. 3344-V.

MECHANICAL ENGINEER, preferably graduate, with some experience in general lines of contractors' equipment including tractors, shovels, diesel engines, concrete machinery, etc., is required to act as manager of machinery department head office of a large machinery house in the maritimes. Salary excellent. Apply to Box. No. 3353-V

MECHANICAL ENGINEER, graduate, with some experience in the sale of marine engines, is required to head up the marine department of a large machinery house in the maritimes. Remuneration would depend entirely on the ability and efforts of successful candidate. Apply to Box No. 3355-V.

EIGHT MECHANICAL ENGINEERS or senior draughtsmen are required for design on a large plant extension project near Montreal. Salary $200. a month and good room and board available. Apply to Box No. 3360-V.

MECHANICAL ENGINEER, senior man is required for responsible position in a pulp and paper mill in the province of Quebec. Salary open according to qualifications. Apply to Box No. 3361-V.

MECHANICAL OR ELECTRICAL ENGINEER, preferably but not necessarily with some experience on design of tools and small parts is required by a company in the Montreal area. Salary: open. Apply to Box No. 3374-V.

MECHANICAL ENGINEER with some experience, and ability to handle men is required to act as rock quarry superintendent for a company in southern Ontario. Company house available on property. Replies, which will be treated confidentially, should state experience, salary required, availability and should be addressed to Box No. 3378-V.

TWO OR THREE MECHANICAL ENGINEERS, preferably ex-service men, graduates, with some knowledge of steam, piping layouts, design are required by a firm in the Niagara peninsula. Salary open. Apply to Box No. 3380-V.

MINING ENGINEER

MINING ENGINEER, with good experience, is required by a company in Brazil, South America, engaged in the mining and smelting of lead. Successful candidate would have complete authority to operate mine, and in addition to salary would have house accommodation provided. Salary open. Apply to Box No. 3321-V.

MISCELLANEOUS

CONSTRUCTION AND MAINTENANCE ENGINEER and a DESIGNING ENGINEER, preferably witb pulp and paper mills experience are wanted for a paper mill in Newfoundland. Salaries would be from $250. a montb up depending on qualifications. Apply to Box No. 3239-V.

PRODUCTION ENGINEER, eitber graduate or with good practical experience is required by a manufacturer in eastern Ontario. Candidates should be 30 to 40 years old and should have experience in production methods in the manufacture of small parts and assemblies, and in cost control. Apply to Box No. 3257-V.

GRADUATE ENGINEER in mechanical and electrical is required for a junior position as assistant to the works engineer of a company in southern Ontario engaged in the manufacture of wire, fences, gates, mesh, etc. Apply to Box No 3278-V.

GRADUATE ENGINEER with a good knowledge of the manufacture of steel containers such as oil drums, etc., and with sales and manufacturing inclinations is required by a manufacturer of this type of product in Toronto. Apply to Box No. 3281-V.

SALES ENGINEER, not necessarily a graduate but with engineering qualifications and aptitude, is required by a firm in Ontario engaged in selling machinery to tbe construction industry. Veteran preferred. Apply to Box No. 3290-V.

DRAUGHTSMAN, not a graduate, is required by a firm in Montreal engaged in beating and ventilating work. Prefer young man with little or no experience, to be trained. Apply to Box No. 3293-V.

SERVICE REPRESENTATIVE is required by a firm in Toronto to sell automotive, electrical and fuel system parts, and to train automotive mechanics. Position would be in Ontario and salary is open according to qualifications. Apply to Box No. 3295-V.

ARCHITECT, graduate, preferably, but with some reasonable experience, with good background and personality is required by a firm in Montreal. Interested in someone willing to start at tbe bottom with prospects of eventually becoming a partner in the firm. Apply to Box No. 3298-V.

DRAUGHTSMAN, preferably someone experienced in process piping work in food industries is required by a firm in the Montreal area engaged in consulting work Apply to Box No. 3299-V.

DRAUGHTSMAN, not necessarily a graduate but experienced, to assist in tbe work of preparing machinery, pipe arrangements and details of cargo ships, is required by a firm on tbe west coast. Salary about $225. a montb. Apply to Box No. 3302-V.

SALES ENGINEER of proven ability is required by a Canadian manufacturer of bigb grade power apparatus specialties in demand by power companies, public utilities and manufacturers. Age 30 to 35 years. Apply in writing and state in detail education, experience, age, required salary and enclose pbotograph to Box No. 3303-V.

SALES ENGINEER, witb some experience and if possible, bilingual, is required by a company in Montreal handling contractors' equipment, road building equipment, electrical devices sucb as generators and vibrators and snow machinery. Salary open according to qualifications. Apply to Box No. 3304-V.

TECHNICAL SALES ENGINEERS are required by an oil company in tbe Montreal area. Candidates must be bilingual, and experience may range from recent graduate up. Salary will be $150. to $250. a montb depending on qualifications. Apply to Box No. 3320-V.

YOUNG ENGINEER, age 25-30, not necessarily a graduate, interested in pbotography, publicity, editorial and journalistic work, is required to act as assistant to the Sales Development Manager of a large company in the Montreal area. Salary $200-$225 a montb. Apply to Box No. 3322-V.

DESIGNING ENGINEER witb four or five years experience in designing and detailing is required for work with consulting engineer in Vancouver. Salary is open according to qualifications. Apply to Box No. 3325-V.

TWO INSTRUMENTMEN, one experienced on layout and quantities on beavy construction, the otber experienced in transit surveys and levelling, are required for survey work in eastern Ontario. Standard salaries will be paid and work will last for possibly two years or more. Apply to Box No. 3327-V.

TWO DESIGNERS, witb a minimum of tbree years draugbting experience, are required by a company in Montreal. One must have mechanical experience to specialize in refrigeration design, the other structural or architectural experience to specialize in design layout of food service equipment. Apply to Box No. 3328-V

GRADUATE ENGINEER, age 25-35, preferably married wtb five to 10 years experience in the design of complicated machines to be trained in the designing of sboe machinery. Starting wage will range from $60. to $75. a week for five-day week. Apply to Box No. 3330-V.

TWO ARCHITECTURAL DESIGNERS AND DRAUGHTSMEN, or arcbitects with some experience in modern materials and design are required by a young progressive firm of architectural designers and engineers in Alberta. Salary will be commensurate with ability. Apply to Box No. 3331-V.

GRADUATE ENGINEER, veteran, interested and talented in editorial work, age 27-30, is required for work in Montreal. Salary open. Apply to Box No. 3349-V

TWO ENGINEERS experienced in heating and ventilation work in the newsprint field are required by a pulp and paper mill in eastern Canada. Salary open according to qualifications. Apply to Box No. 3356-V.

ONE MECHANICAL AND TWO ELECTRICAL OR CHEMICAL graduates are wanted for a two-year course witb a firm manufacturing electric wire and cables, telepbone equipment, etc. Training through various departments of several factories, including some sales. Salary about $175. a month. Apply to Box No 3364-V.

MECHANICAL, ELECTRICAL OR CIVIL ENGINEER, recent graduate wbo must bave fluent knowledge of Spanisb, preferably under 30, is required by a firm in the Montreal area for technical work in connection with production. Some travelling. Salary open according to qualifications. Apply to Box No. 3373-V

RECENT GRADUATE in cbemical, mechanical or electrical engineering is required to be trained in beating and ventilating field with a company in Montreal. Candidates should be completely bilingual. Salary $30. to $50. a week. Apply to Box No. 3375-V.

DRAUGHTSMAN is required for design work, preferably witb some experience in the construction field. Work will involve estimates and detailing of precast concrete work. Salary about $250. a month depending on qualifications. Apply to Box No. 3376-V.

ENGINEER, witb considerable experience in foundry work and administration, is required for a senior position by a firm of manufacturers witb head office in Toronto. Salary range $5000.-$8000. a year. Apply to Box No. 3379-V.

RADIO ENGINEER

Graduate engineer with six years' experience preferably in aircraft radio and radar installations design. Must be thoroughly familiar with aircraft electrical design standards and methods. Permanent position. Good salary.

Apply: Canadair Limited, P.O. Box 6087, Montreal, P.Q.

ELECTRICAL ENGINEER

Graduate engineer with six years' experience preferably in aircraft. Four years in aircraft electrical system design and at least two years in aircraft instrument installation design. Must be thoroughly familiar with aircraft electrical design standards and methods. Permanent position. Good salary.

Apply: Canadair Limited, P.O. Box 6087, Montreal, P.Q.

STEAM PLANT ENGINEER

Wanted, fully qualified technical man, with at least five years' practical experience. Must be thoroughly familiar with thermo-dynamics, combustion control, steam turbines, mechanical refrigeration, hydraulics, etc.

Permanent position and attractive salary for the right man. Apply to Box No. 3177-V.

ELECTRICAL AND CIVIL ENGINEERS

Steady positions with large public utility, location Toronto, ages 30 to 40; 5 to 10 years' experience, salary range, $250. to $350. per month depending on experience.

Electrical engineers required for estimating, designing and general engineering work on hydro-electric generating or transformer stations.

Civil engineers required for estimating, designing and general engineering of steel and reinforced concrete structures.

Apply stating experience, education and professional affiliations to Box No. 3429-V.

Situations Wanted

SENIOR REINFORCED CONCRETE DESIGNER and civil engineer, R.P.E. (Ont). experienced field and office, various countries, seeks first class opening. Apply to Box No. 107-W.

CIVIL ENGINEER, B.Sc.M.E.I.C., R.P.E. (Man.) and Dominion Land Surveyor, now in the army but expects early discharge. Experience comprises seven years air photo surveys, land subdivision, drainage plans, precise levels and topographic mapping and seven years administrative and technical direction in connection with sewers, water mains, roads, building and camp construction. Age 42, married. Apply to Box No. 589-W.

ELECTRICAL ENGINEER, M.E.I.C., R.P.E. (Ont.), age 42, married. Experience in general plant engineering work, design, layout and testing of equipment. Also worked as field engineer on various construction projects. Position in Ontario preferred. Apply to Box No. 1249-W.

EXECUTIVE ENGINEER available. Graduate in mining, Jr.E.I.C., age 35, married, two dependents. Five years' experience in mining and milling, mine development, construction and operation. Canadian and foreign experience. Five years' administrative experience, mass production, development and supervision. Was assistant superintendent of operations in large industrial munitions works. Capable of handling personnel and planning, seeks a responsible position in industrial business or mining. Available on short notice, registered with W.B.T.P. Apply to Box No. 1423-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., 20 years work on hydraulic plants as designer and superintendant of construction. Extensive experience in guniting, diamond drilling and pressure grouting. One month notice. Apply to Box No. 1527-W.

ELECTRICAL ENGINEER, M.E.I.C., R.P.E. (Ont). interested in mechanical design and production; experienced in hydro-electric station design, transformer and machine layouts and in development and design of radar equipment. Services available immediately. Location preferred: Toronto or Hamilton. Apply to Box No. 1693-W.

GRADUATE ENGINEER, B.Sc. (Civil) M.E.I.C., services available. Thorough knowledge of building construction and fifteen years' experience in sales engineering and promotional work in connection with building products; also considerable practical experience in construction work as estimator and in field work. Recently resident engineer on large industrial project. Good connections with architectural and contracting firms, particularly in Toronto area. Apply to Box No. 2440-W.

MECHANICAL ENGINEER, age 34, Lt. (E) R.C.N.V.R. soon to be discharged. Experience, 6 years' heavy maintenance on railroad; 5 years as charge hand on maintenance and renewal of mine and smelter equipment, 2 years foreman of large boiler shop; 2 years production engineer, job estimating and planning, two years with Navy of which 20 months have been at sea. Thorough knowledge of machine and boiler shop, able to plan and handle men, registered with W.B.T.P. Apply to Box. No. 2456-W.

CHEMICAL ENGINEER, young university graduate, previously engaged in war industry, desires permanent position. Available immediately. Apply to Box No. 2464-W.

CHEMICAL ENGINEER, single, age 25, B.Sc., Sask. '42. Recently discharged from the army. At present taking post graduate work. No significant industrial experience. Interested in a position in production or plant control. Services available in May 1946. Apply to Box No. 2593-W.

CHEMICAL ENGINEER, B.A.Sc., U.B.C., S.E.I.C., Jr.A.I.Ch.E., age 25, married, no dependents, residing in east, desires employment in production control and/or sales service in Ontario or Quebec. Apply to Box No. 2594-W.

ELECTRICAL ENGINEER, R.P.E. (Ont.) age 28, married, C.G.E. Test Course and Sales. Five years' plant experience in direct charge of engineering, maintenance and construction of several large chemical plants. Would consider employment with progressive engineering organization or in sales. Prefer Ontario. Apply to Box No. 2596-W.

CHEMICAL ENGINEER, Jr.E.I.C., age 37, 12 years experience in pulp and paper industry, both technical and production, also three years research in paper containers, during war. Bilingual; would like to return to paper industry. Available at a month's notice. Apply to Box No. 2609-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng. (Ont.), vaailable with one month notice or less. Age 44, married, three children. Six months mining engineering experience, three years mechanical experience in large implement factory, supervision since 1940 for Inspection Board of U.K. and Canada of a large staff on inspection of electrical apparatus and equipment. Seeks position with considerable administrative responsibility based on electrical production or maintenance. Abl to go anywhere on continent. Apply to Box No. 2614-W.

INDUSTRIAL ENGINEER, graduate in civil engineering, B.Sc.A., M.E.I.C., single, age 30, bilingual. Experience in industrial engineering work; plant layout, time and motion study, wage incentive, work simplification, job evaluation, material handling, cost and production control, cost reductoin research available, prefer Montreal, highest references from former employers. Apply to Box No. 2616-W.

GRADUATE MECHANICAL ENGINEER, Prof. Eng. (Ont.) Jr. E.I.C.. married, age 31. Experience covers machine shop apprentice, engineering design, chemical plant design, field engineer on construction work, plant operation and superintendent in large plants employing modern plant management methods. Past 8 years have been with present employer. Now wishes to make change to smaller company with opportunity of securing position of responsibility. Apply to Box No. 2629-W

LIBRARY NOTES

(Continued from page 282)

A.S.T.M. STANDARDS ON ELECTRICAL INSULATING MATERIALS (with Related Information):

Prepared by A.S.T.M. Committee D-9 on Electrical Insulating Materials; Specifications, Methods of Testing; October, 1945. American Society for Testing Materials, 260 So. Broad St., Philadelphia. 545 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $3.25.

The specifications and test methods covering electrical insulating materials are here brought together, with several reports on the significance of the tests and other subjects of interest.

AMERICAN CHEMICAL INDUSTRY, the World War I Period: 1912-1922, Vol. 3:

By W. Haynes. D. Van Nostrand Co., New York, 1945. 606 pp., illus., tables, 10 x 6½ in., cloth, $8.00.

This volume covers the period of the first World War, during which the American chemical industry shook off its dependence upon Germany and laid the foundations for developments of later years. The advances in industrial, coal-tar and fine chemicals are described in some detail, and the chemicalization of industry is discussed. Many statistical tables and portraits of chemists are included, as well as numerous references to sources.

ART OF PLAIN TALK:

By R. Flesch, foreword by L. Bryson. Harper & Brothers, New York and London, 1946. 210 pp., tables, 8¼ x 5 in., cloth, $2.50.

Some two years ago Mr. Flesch published his Ph.D. dissertation, "Marks of Readable Style". Being a thesis it was not a very readable book, so he has rewritten it in simple language. This book is the result. It is not a book on Basic English. Scientific studies of readability have produced a formula based on sentence length, and on the number of affixes and personal references included. The main feature of this book is this formula which is intended only as a yardstick. Readers are warned not to wallow in the little rules and computations and thus lose sight of the principles of plain English. Examples of difficult material and the same rewritten in simple English are included. One reading of the book will not automatically make one a good writer.

AVIATION FACTS AND FIGURES 1945:

Edited by Aircraft Industries Association of America, Inc., R. Modley, editor. McGraw-Hill Book Co., New York and London, 1945. 173 pp., tables, 9 x 5¾ in., cloth, $2.50.

This is a comprehensive reference handbook of pertinent data and statistics on aviation as a whole, covering the entire field; the book gives particular emphasis on the aircraft industry. It deals fully with the civil and military use of aircraft, with exports, service facilities, and the relation of aviation to other means of transportation. Specifically a reference book for executives in the aircraft industry, transportation, finance and government, it is useful as well for editors and students.

FLUOROCHEMISTRY:

By J. De Mont. Chemical Publishing Co., Brooklyn, N.Y., 1945. 795 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.50.

The basic concepts of fluorochemistry are defined in this comprehensive work, with description of its characteristic phenomena. The applications of fluorescence, luminescence and radiation in science, medicine and industry are explained in simple language. The book describes methods for the preparation of the various luminescent organic substances, dyestuffs and coloring matters, ultraviolet-emitting inorganic and organic substances and gives qualitative and quantitative tests for their identification. Experimental research results are presented, and there is an extensive bibliography. A glossary of terms and notations is appended.

INDUSTRIAL OIL AND FAT PRODUCTS:

By A. E. Bailey. Interscience Publishers, New York, 1945. 755 pp., illus., diagrs., charts, tables, 9¾ x 6 in., cloth, $10.00.

Primarily a text on oil and fat technology, the greater part of this volume is devoted to a description and discussion of the commercially important oil and fat products and the processes used in the manufacture of these products. In two preliminary sections the chemical and physical nature of fats and oils is briefly reviewed, and the various fatty raw materials are considered with respect to their composition, characteristics and availability. Special attention has been given to the edible fats and oils and to the practical operations of refining, bleaching, deodorization and hydrogenation.

MACHINE-TOOL WORK, Fundamental Principles:

By W. P. Turner and H. F. Owen. 2 ed. McGraw-Hill Book Co., New York and London, 1945. 364 pp., illus., charts, tables, 8½ x 5 in., cloth, $3.00.

This textbook, based upon a course in the subject given at Purdue University, offers systematic instruction in the fundamental principles of the subject that will serve as a background for the necessary further study of industrial processes and practices.

NORMALISATION:

By J. Maily, preface by P. Salmon. Dunod, Paris, 1946. 472 pp., 9¾ x 6½ in., paper, 375 frs. (In French)

In this interesting study of standardization, attention is given especially to the legal aspects of the subject and on its effects on the general economy of a country. The principles and methods of standardization and the applications of standards are reviewed in the first section. The second deals with standardization in France. Standardization in Germany and England is briefly reviewed, as is international standardization.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 29 | MONTREAL, MAY 1946 | NUMBER 5

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

PUBLISHED MONTHLY BY

THE ENGINEERING INSTITUTE OF CANADA

2050 MANSFIELD STREET - MONTREAL

Price 50 cents a copy, $4.00 a year: in Canada, British Possessions, United States and Mexico. $5.50 a year in Foreign Countries. To Members and Affiliates, 25 cents a copy, $2.00 a year. —Entered at the Post Office, Montreal, as Second Class Matter.

CONTENTS

COVER PICTURE

Under proper soil conditions, underground telephone cable is now laid in one operation. The cover picture shows a plough train progressing through a ravine. The train consists of the lead tractor equipped with derrick designed to handle four-ton cable reels, the No. 2 tractor equipped with a four-drum winch used for raising or lowering the plough share, and finally the plough itself followed by two cable reel trailers. (See Article on p. 299).

A MODERN ELECTRIC BOILER INSTALLATION AT ARVIDA

F. L. LAWTON, M.E.I.C.
Assistant Chief Engineer

M. G. SAUNDERS, M.E.I.C.
Plant Engineer, Kingston Works, formerly Mechanical Superintendent, Arvida Works
Aluminum Company of Canada, Limited

Paper presented on October 18th, 1945, before a joint meeting of the Montreal Section of the American Institute of Electrical Engineers and the Montreal Branch of The Engineering Institute of Canada, and on October 25th, 1945, before the Saguenay Branch of The Engineering Institute of Canada

Introduction

This paper deals with a recent electric boiler installation at the Arvida Works of the Aluminum Company of Canada, Limited. Constructed in 1944, it embodies certain departures from previous practice which make it one of the outstanding electric-boiler plants in Canada.

The plant contains two electric boilers of the single-tank Kaelin type having a normal rating of 37,500 kw. at 6600 volts, and a maximum continuous rating of 40,000 kw. each. Provision has been made so that two additional boilers of the same rating can be readily added.

Existing Steam Production Facilities

Arvida Works already had available three electric steam generators, one of 8,000 kw. and two of 15,000 kw. rating, the first of which was installed in 1927 and the last two in 1937 and 1939 respectively.

The need for all available electric energy for the production of aluminum for war purposes made it imperative that coal-fired boilers be used instead of electric boilers. Consequently, the existing three 485 hp. coal-fired boilers were used together with six 131,000 lb. per hour pulverized-coal steam-generating units installed at various times throughout the war.

A comprehensive review of steam plant development at Arvida Works up to 1944 is contained in a paper "The Development of Steam Production at Arvida" by M. G. Saunders, presented at the 58th Annual Professional Meeting at Quebec, 11th February, 1944, and published in the June, 1944 issue of *The Engineering Journal.*

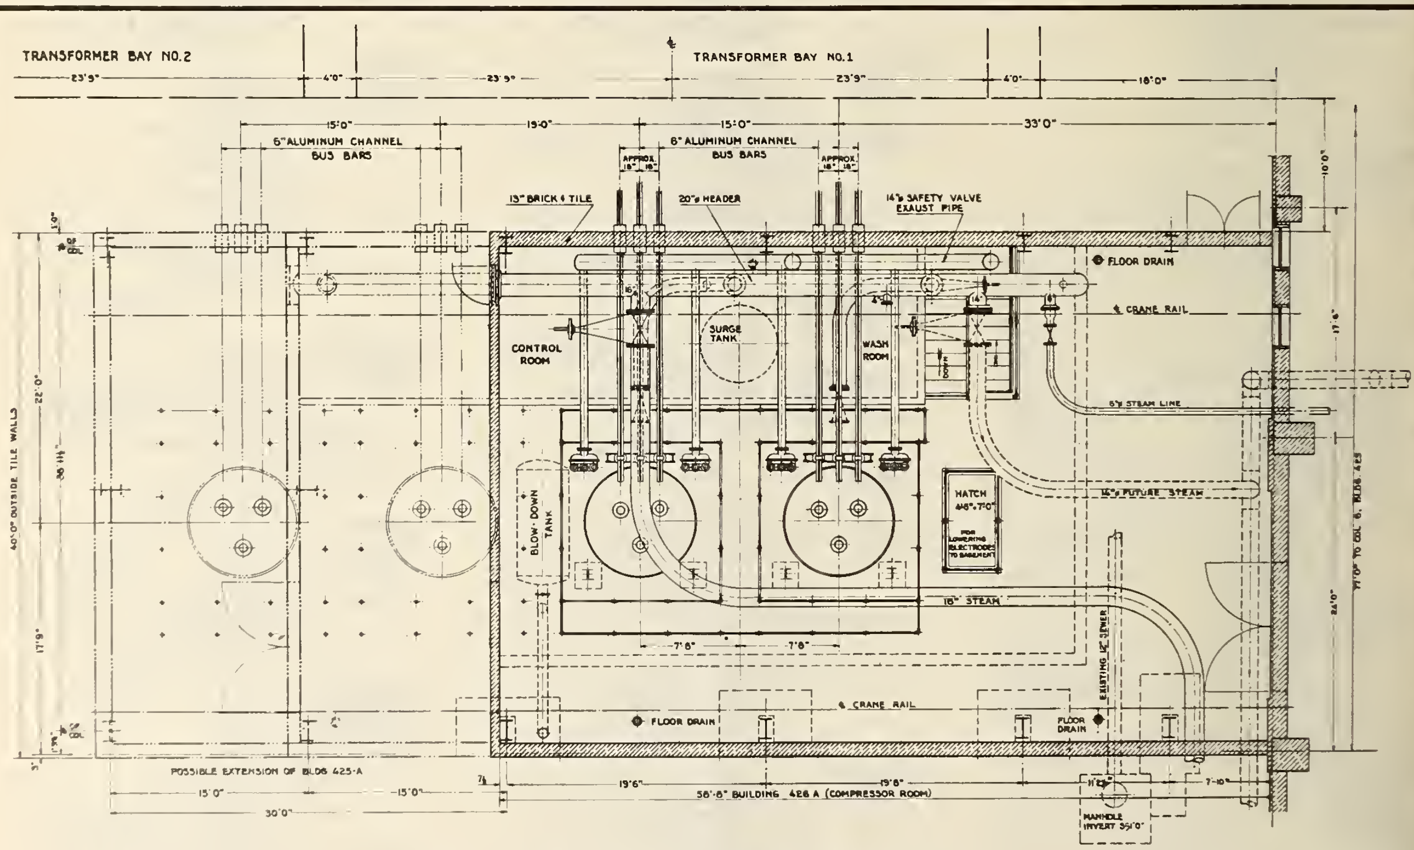
When it became apparent that surplus electric energy would once more be available for use, consideration was immediately given to the preparation of plans for additional electric steam generation.

After a careful survey, the initial electric-steam generating capacity was selected to meet all requirements for a reasonably optimistic post-war aluminum production.

In order to utilize this power to the best advantage it was decided that a final installation of four 37,500 kw. steam generators would be planned but that two such units would meet immediate needs.

Building

The building for the electric boiler plant is essentially an extension of the boiler plant serving Ore Plant No. 2. The existing fuel-fired plant in that location comprised two Combustion Engineering Corporation VU pulverized-coal units each with a capacity of 131,000 lb. steam per



NOTE:

PLAN OF ELECTRIC BOILER PLANT
FIG. 1

hour. Consequently, a prime consideration in the design of the new plant was the usage of the same auxiliaries for the existing and new boilers, as it was very unlikely that the complete combustion and electric boiler installations would ever have to be operated in parallel.

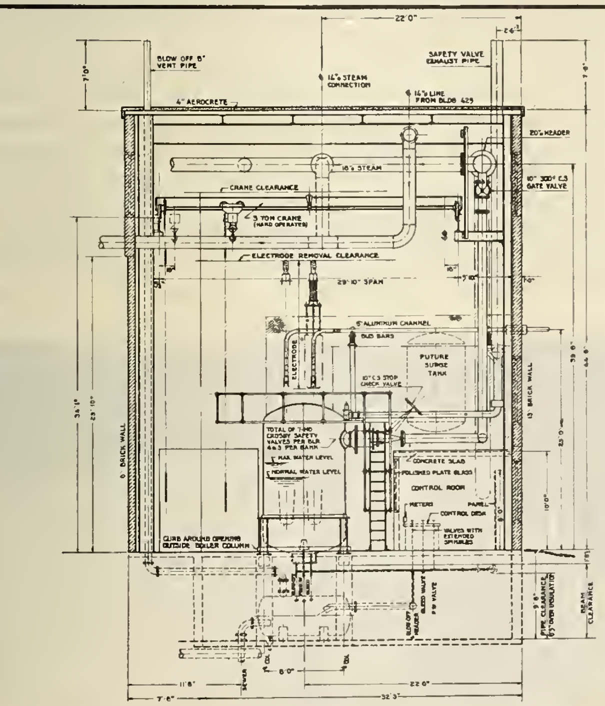
The addition matched the existing building and consisted of a structural steel framework, with 13 in. terracotta tile and brick walls, 4 in. aerocrete slab roof, reinforced concrete operating floor and concrete basement.

The design of the boiler house was such as to permit it being extended to take two additional electric boilers of the same rating at a later date and was so laid out that all operating controls could be run to a central operating table so located it would be in the centre of the final setup. A control room completely separated from the main boiler room was provided to protect the operators from injury in case of accident to the steam mains or boilers. Note Figs. 1 and 2. Figure 3 shows the control room to the right, with the hatch providing access to the basement for electrode repair, etc., in the foreground.

For the convenience of operating personnel, one end of the control room was enclosed, to provide toilet facilities.

The building provided rather more room than is usually allowed for electric boilers, which are ordinarily crowded into restricted areas in an existing plant, and embodied a 3-ton crane for handling the electrodes into and out of the boilers as required. As previously mentioned, it contained a basement in which all feed, bleed and blowdown piping could be carried on the ceiling so it would be readily accessible. This is a departure from usual practice in which such piping is ordinarily run in trenches below operating floor level. It is believed this feature will prove to be very advantageous in operation and maintenance over a long period. Figure 3 is a general view of the inside of the boiler room showing the end of the control room at the right. Accessibility to piping connections has been provided for in the design.

One of the difficulties frequently encountered in electric boiler rooms is the dusting of concrete floors due to maintenance work and the objectionable staining which sometimes occurs. For this reason, it was decided to finish the boiler room floor with Welsh quarry tile. This has resulted in an attractive and clean plant.



TYPICAL SECTION THROUGH ELECTRIC BOILER ROOM

FIG. 2

The cleanliness of the boiler room has been enhanced and the illumination improved by a dark dado above which aluminum paint has been applied directly to the tile walls and aerocrete roof slabs. The appearance of the boiler installation has also been enhanced by the use of aluminum railings on the platform at the upper heads and around the stairways and hatches, as illustrated by Fig. 3.

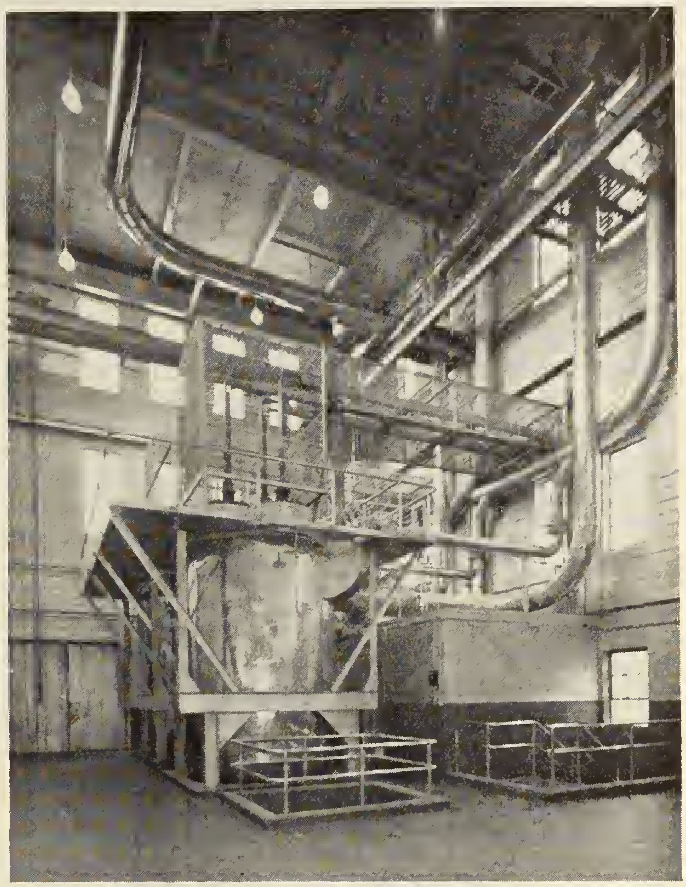


Fig. 3—Electric boiler plant, showing aluminum foil-air cell heat insulation on boilers and piping, aluminum railings and aluminum bus. Note control room to right.

Lighting

The operating floor is lit by eight 500-watt and two 200-watt Holophane prismatic glass units giving about 10 foot-candles on the working plane. To supplement this, four 100-watt RLM units are installed under the platform around the top of the boilers, to eliminate shading the area beneath.

The control room is lit by three fluorescent units, each unit consisting of two 40-watt fluorescent lamps. This room has an illumination of 30 to 40 foot-candles on the working plane. The units here were chosen so that there would be no undue heating from the lighting system. Because of the low ceiling a wide light source was necessary.

The basement is provided with seventeen 100-watt bare lamps in porcelain receptacles. Reflectors were not used because of the lowness of the ceiling; also the light painted surface acts as a reflector.

Particular attention was paid to lighting the water columns which register the water level in the boilers. Various schemes were considered, with four adjustable reflectors being provided. Two of these reflectors are above the gauge glass and two are below; 100-watt lamps are used and the light is so directed that no glare is experienced by the operator viewing the water columns.

Conventional lighting units are provided in the outdoor substation so that the operators can carry out switching at night and make their routine inspection of transformers and switchgear.

Factors Affecting Selection of Electric Boilers

In the operation of the first electric boilers at Arvida Works, a very good operating record had been built up, and with some changes in design it was believed the same type of units, namely single-tank Kaelin-type boilers, would give a very satisfactory operating performance. It was also considered that surplus electric energy would be available over a sufficiently long period of time to justify making a proper installation for its use.

Design of New Electric Boilers

A normal rating of 37,500 kw. per unit was chosen because of the capacity of the available transformers and also because it was about the limiting capacity which could be developed with the available feed water, the average conductivity of which is about 600 ohms per inch cube at boiler temperature, with the maximum size tanks (96 in. diameter) available.

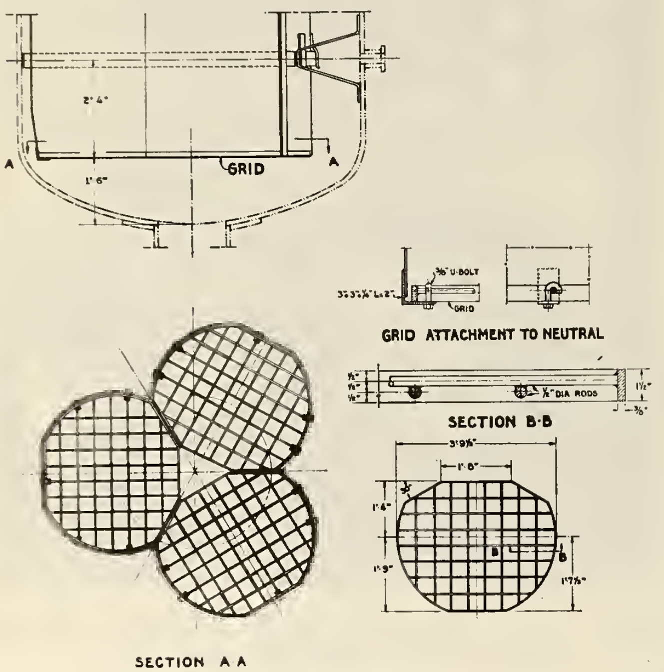

Fig. 4—Shielding grid for bottom head.

A welded design of electric-boiler tank was used. The welded design was adopted in order to get away from the leaks frequently experienced with large-size electric boilers due to the rapid temperature changes ordinarily encountered in operation: The welded design has proven itself entirely successful during the first eleven months of operation, even though this is the first time such large tanks with welded heads and connections have been used, so far as known, for electric boilers.

Careful consideration was given to the design of electrodes for the new boilers in order to avoid the rapid wear experienced with some of the older designs. The shape of these electrodes is essentially cylindrical in the upper portion with the lower section slightly conical and having a hemispherical tip, which tip is substantially thickened over previous practice. Although gray cast iron has given very good results, it was decided to equip one boiler with a set of electrodes made from Ni-resist cast iron, in order to obtain comparative results.

The electrodes are so shaped the current density is about 0.79 amps. per sq. in. with a boiler water conductivity of 600 ohms per inch cube, except on the tip where it reaches a maximum of 1.12 amps. per sq. in.

With some of the earlier installations of electric steam generators, and in particular the initial 8,000 kw. unit at Arvida, considerable pitting on the bottom head has been noted. Somewhat similar experience has been encountered with electric boiler installations in the paper-mill industry. The cause of this pitting is not definitely known but it appears to arise from chemical corrosion and arcing at low electrode immersions—that is to say, on light loads as a result of normal operation or during some emergency conditions, sludge accumulations on the botton head tend to develop localized current concentrations and burning at such points. To overcome this, an anti-pitting device consisting essentially of a shielding grid of bars covering the bottom head was provided, as shown by Fig. 4. This grid is composed of segments small enough to be introduced through the manhole or electrode openings. The bottom heads are made of fire-box grade steel, fully silicon killed and easily weldable.

General design of the electric boilers has been previously discussed but at this time particular note might be given the relatively low setting secured by having the clean-out sump below the operating floor level, so that it is accessible from the basement floor. By this means, approximately 3 ft. of head room was saved, as well as a certain amount of building height, which largely offset the cost of the basement.

In order to obtain an unrestricted working space alongside the boilers, the steam and blow-off leads and water columns are all located on the same side, which is shown by Figs. 2 and 3.

The electric boilers are designed for 250 lb. per sq. in. steam pressure, in line with the design of the entire steam system at Arvida Works, although present operating pressure is approximately 200 lb. per sq. in. As the length of distribution lines and losses, together with demand, increase, the pressure will be raised nearer to the design limit.

Feed-water Facilities

As the capacity of the electric steam-generator units is approximately the same as that of the previously-installed coal-fired boilers, it was planned to make use of the same feed-water auxiliaries, although, for electric boilers, feed-water treatment is not necessary.

However, the existing deaerating feed-water heater was used as it was believed that less expansion stresses would be placed on the boiler shell by using comparatively warm feed-water and there was no appreciable heat loss by so doing.

There was some extra feed-water heater capacity in the original plant design so it was felt that one or possibly more of the coal-fired boilers might be operated in parallel with the electric boilers. In order to make this possible, and to compensate for the additional amount of feed-water required due to the bleed from electric boilers, one large boiler feed pump was transferred from one of the other boiler houses to the new setup, but otherwise the existing feed-water auxiliaries were used as they stood.

Fig. 5—Preformed aluminum foil-air cell heat insulation "bats". The circular bats were used on steam pipes, whereas the flat bats were used on the electric boiler shells.

Operating tests indicate that one of the coal-fired boilers can be run at about one-third full load rating in parallel with the electric boilers before the feed-water heater becomes overloaded.

Steam Lines

General layout of the steam lines may be visualized from Figs. 1 and 2, as well as Fig. 3. It will be noted 10 in. leads are taken from each electric boiler through the customary tangential driers and stop-check valves, to a common 20 in. header. This header is so arranged that it can be readily extended at a future date to accommodate either the third or fourth boiler.

Each boiler lead contains a steam-flow meter orifice located just ahead of the gate valves immediately adjacent to the 20 in. header. These gate valves are arranged for chain operation from the operating floor level. To establish the steam connection between the 20 in. header and the outside distribution mains, a 16 in. line was provided. For operating convenience a gate valve was provided immediately adjacent to the header. With this connection and 256,000 lb. per hour steam production (two electric boilers), the pressure drop to the distribution or street main is estimated to be 10.5 lb. per sq. in. and the steam velocity about 7400 ft. per min.

Fig. 6—Preformed aluminum foil-air cell heat insulation bats applied to upper head of electric boiler.

Because there was a 14 in. line from the existing boiler plant, located on the electric-boiler room side of the common wall between the two plants, and because the combustion boilers would normally be shut down when the electric boilers were in operation, provision was made to tie in the 20 in. header with the existing line, also through a gate valve. The general arrangement is illustrated by Fig. 1.

In addition to ample provision for expansion and contraction by long radius bends, the steam lines are carried by spring-type suspension hangers inside the building and on saddles or towers outside.

All valves are 300 lb. per sq. in. cast-steel design. The possibility of leakage in the steam lines has been minimized by the use of all-welded construction except at valves, steam orifices and where necessary in a few cases for convenience in handling the lines.

It might be well to note that, should a third electric boiler be installed, pressure losses between the header and the street mains would be minimized by utilizing a 14 in. cross-connection between the 20 in. header and the existing 14 in. line to the street, in parallel with the 16 in. connection from the header to the street, actually installed. If and when the fourth electric boiler is added, an additional 16 in. connection to the street lines will be provided.

Fig. 7—Preformed aluminum foil-air cell heat insulation applied on vertical portion of electric boiler shell.

Exhaust from the two groups of safety valves (totalling seven) on each electric boiler is carried to atmosphere through 14 in. lines as indicated by Fig. 1. The simplicity of the layout of steam lines will be appreciated.

All feed, bleed and blow-off lines largely follow standard practice except that they are suspended from the ceiling of the basement, which provides a very flexible method of taking these lines to the control table as well as facilitating maintenance.

Heat Recovery Features

Provision has been made to recover as much of the heat loss from the bleed as is possible by running a connection from these lines to the existing feed-water heater system which was formerly used with the coal-fired units. Bleed is first passed through a flash tank and the water remaining passes through a heat exchanger and gives up further heat to the incoming feed-water.

A special steam-trap arrangement is used to recover the moisture removed by the tangential steam dryers, which is also returned to the feed-water heater directly. These features provide for the recovery of practically all heat losses from the boilers except radiation and heat loss in the blow-off or blow-down.

Heat Insulation

A unique feature of this boiler installation is that the boilers themselves are insulated with aluminum foil-air cell insulation covered with an outside casing of aluminum sheet. Also the main steam header, steam piping and connections to the main steam distribution line were insulated in a similar manner.

Reasons for the selection of aluminum foil for heat

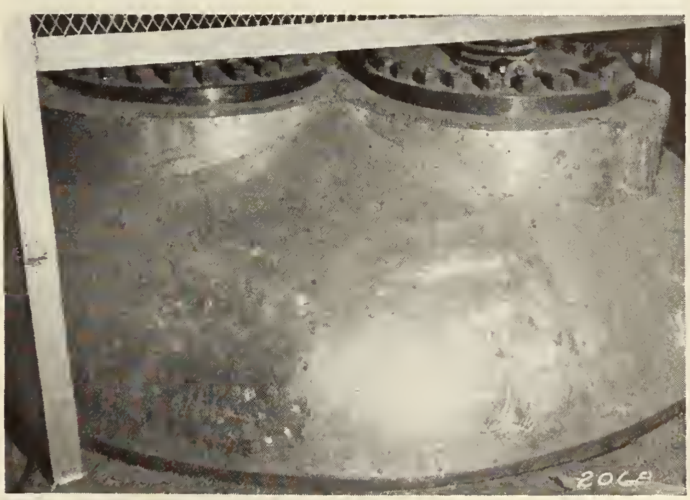

Fig. 8—Sheet aluminum protective jacket applied over preformed aluminum foil-air cell heat insulation, on top head.

insulation of the electric steam generators and steam lines, in addition to its high insulating value, were:

(a) Fireproof.
(b) Freedom from capillary absorption of water, so detrimental to most forms of heat insulation, in event of leakage.
(c) Permanency.

Aluminum foil-air cell insulation combines the low thermal conductivity of the air with the low emissivity or radiating power of bright aluminum foil in a structure designed to minimize air convection currents. The most practical structure for any particular application is necessarily a compromise between maximum thermal efficiency and cost, but it is possible to practically eliminate heat transfer due to radiation and convection, and approach the insulating value of still air, one of the best available forms of heat insulation.

There are two general methods of applying aluminum foil for heat insulation. The first involves supporting the

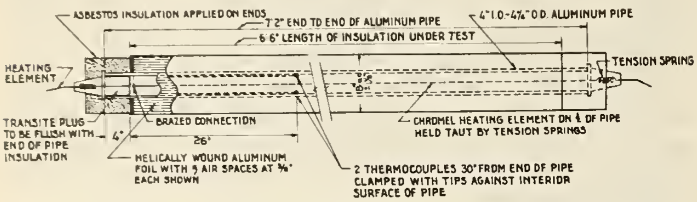

Fig. 9—Apparatus for testing effectiveness of heat insulation under conditions approximating field usage.

foil in such manner as to form a series of air cells between the bright foil surfaces. The second consists of first crumpling the foil and then partially stretching the sheets so that the wrinkles and high points separate the sheets when laid together, so forming air cells of irregular shape between the bright foil sheets.

It has been shown that the optimum spacing for aluminum foil-air cell insulation is between ¼ in. and ½ in., where maximum insulation must be secured in a given space. Convection plays very little effect under such make-up of foil and air spaces, but does above ½ in. spacing.*

* "Thermal Insulation with Aluminum Foil", by R. B. Mason, pp. 245-255, *Industrial and Engineering Chemistry,* March, 1933.

Fig. 10—Helically-wound aluminum foil-air cell heat insulation on pipe for use with cold water.

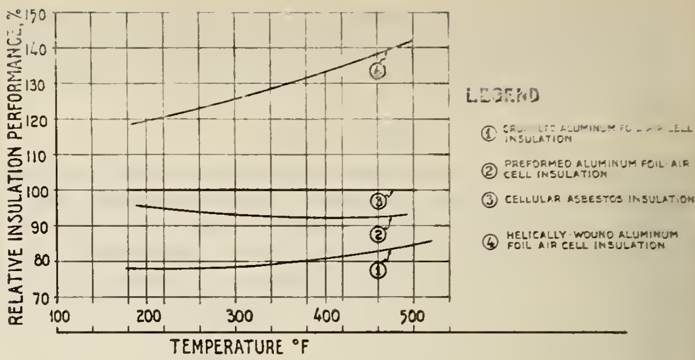

Fig. 11—Comparative insulation tests.

As no previous experience was available for the insulation of a boiler shell with aluminum foil, some experimental work was done in order to determine the best methods of application. Initially, it was planned to weld a steel grid frame to the boiler shell to support the aluminum foil but it was found that this frame transmitted a considerable amount of heat from the shell to the outer casing. In order to minimize this heat loss, the grid was finally clamped to the top flanges of the boiler shell, and was spot-welded to the boiler support channels. For further rigidity, asbestos spacers were inserted between this framework and the boiler shell where necessary. The

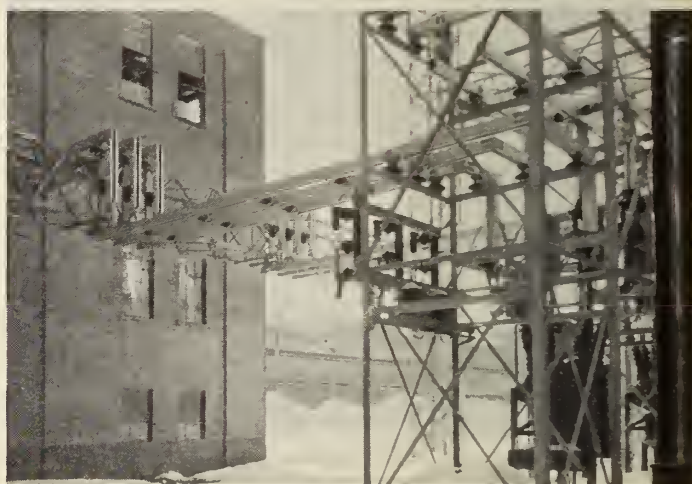

Fig. 12—6.6 kv. bus structure and electric boiler feeders for 90,000 kva. transformer bank supplying two 37,500 kw. electric boilers.

same procedure was followed for the section of the grid below the boiler support channels.

In preparing the foil for application to the boiler shell, instead of crumpling it by hand as has been common practice, a simple die was made up to do this work. Three sizes of corrugations were tried, these being ½ in., ¾ in., and ⅞ in. So far as can be ascertained to date, the ¾ in. size gave the best results as it seemed to form a more rigid structure. The foil was assembled in bats as shown in Fig. 5. As applied to the boiler shells, alternate sheets of foil were placed with the corrugations at right angles. Each bat consisted of ten layers of 0.0004 in. thick foil backed on both sides by chicken netting, ¾ in. mesh and No. 20 wire. These bats were held together by wire laced through from one side to the other and had sufficient structural strength to sustain their own weight without collapse. These bats were applied to the boiler shell as indicated by Figs. 6 and 7. Application was commenced at the bottom of the shell, working progressively upwards. Foil was allowed to project beyond the edges of the wire netting in making up each bat so that the joints could be overlapped. After the bats had been applied to the boiler shell, one further layer of foil was placed over the outside. When this work was completed an aluminum jacket, as illustrated by Fig. 8, was applied over the framework and held in position with self-tapping screws. This jacket consisted of 0.022 in. 23ST Alclad aluminum sheet. The top and bottom sections, which required considerable forming, were fabricated of standard 2S aluminum sheet.

The thickness of the aluminum foil-air cell insulation, as installed, varies from 4 to 4¼ in. With eleven layers of foil between the boiler shell and the protective jacket, there are twelve air spaces, Average thickness of the individual air cell thus is about 1/3 in.

The 10 in. steam leads from the boilers to the common header and the 16 in. main line from the header to the main plant distribution system were insulated with aluminum foil and covered with aluminum sheet applied in the same general manner. The difference in this application from that of foil applied to the boilers consisted in having the pipe inside the building insulated with preformed sections as illustrated by Fig. 5 in which the corrugations of all sheets of foil were parallel. Piping outside the building was insulated with hand crumpled foil and the metal casing was supported on metal supports.

Effectiveness of Heat Insulation

In order to secure a practical measure of the relative efficiency of the aluminum foil-air cell insulation, under conditions corresponding to field application, the apparatus shown by Fig. 9 was devised. Comparative measurements have been made to determine the performance of the insulation used as compared with other available heat insulation, such as cellular asbestos and 85 per cent magnesia.

It will be noted the test apparatus was essentially a closed vessel with a chromel heating element stretched along the axis by heavy springs supported on the transite asbestos closure plugs. The insulation under test was applied to the central 6 ft. 6 in. section of the aluminum test pipe, and end losses were minimized by a heavy carefully-moulded capping of asbestos heat insulation at either end.

Chromel-alumel thermocouples were clamped to the interior surface of the test pipe at several points, with the sensitive junctions in intimate contact with the internal pipe surface.

Although considerable initial difficulty was experienced in obtaining consistent internal surface temperatures at constant heating power inputs, these difficulties were gradually eliminated, and final observations were quite consistent. For the several test runs, the pipe position, thermocouple positions, etc., were standardized.

Experience showed that at least two hours should elapse between readings, with wattage input maintained constant.

In addition to cellular asbestos 1¾ to 1 13/16 in. thick, three forms of aluminum foil-air cell insulation were tested. The aluminum foil-air cell insulations tested consisted of four layers or sheets of 0.0004 in. foil spaced ⅜ in. with an outer protective jacket of 0.022 in. aluminum sheet, or a total insulation thickness of 1⅞-1 15/16 ins.

The helically-wound aluminum foil was applied in the manner indicated by Fig. 10. It should be noted the insulation shown in this photograph as helically-wound aluminum foil was intended for use on a cold water line but serves to demonstrate the method involved.

The preformed aluminum foil-air cell insulation was made up of bats as previously described, with the jacket

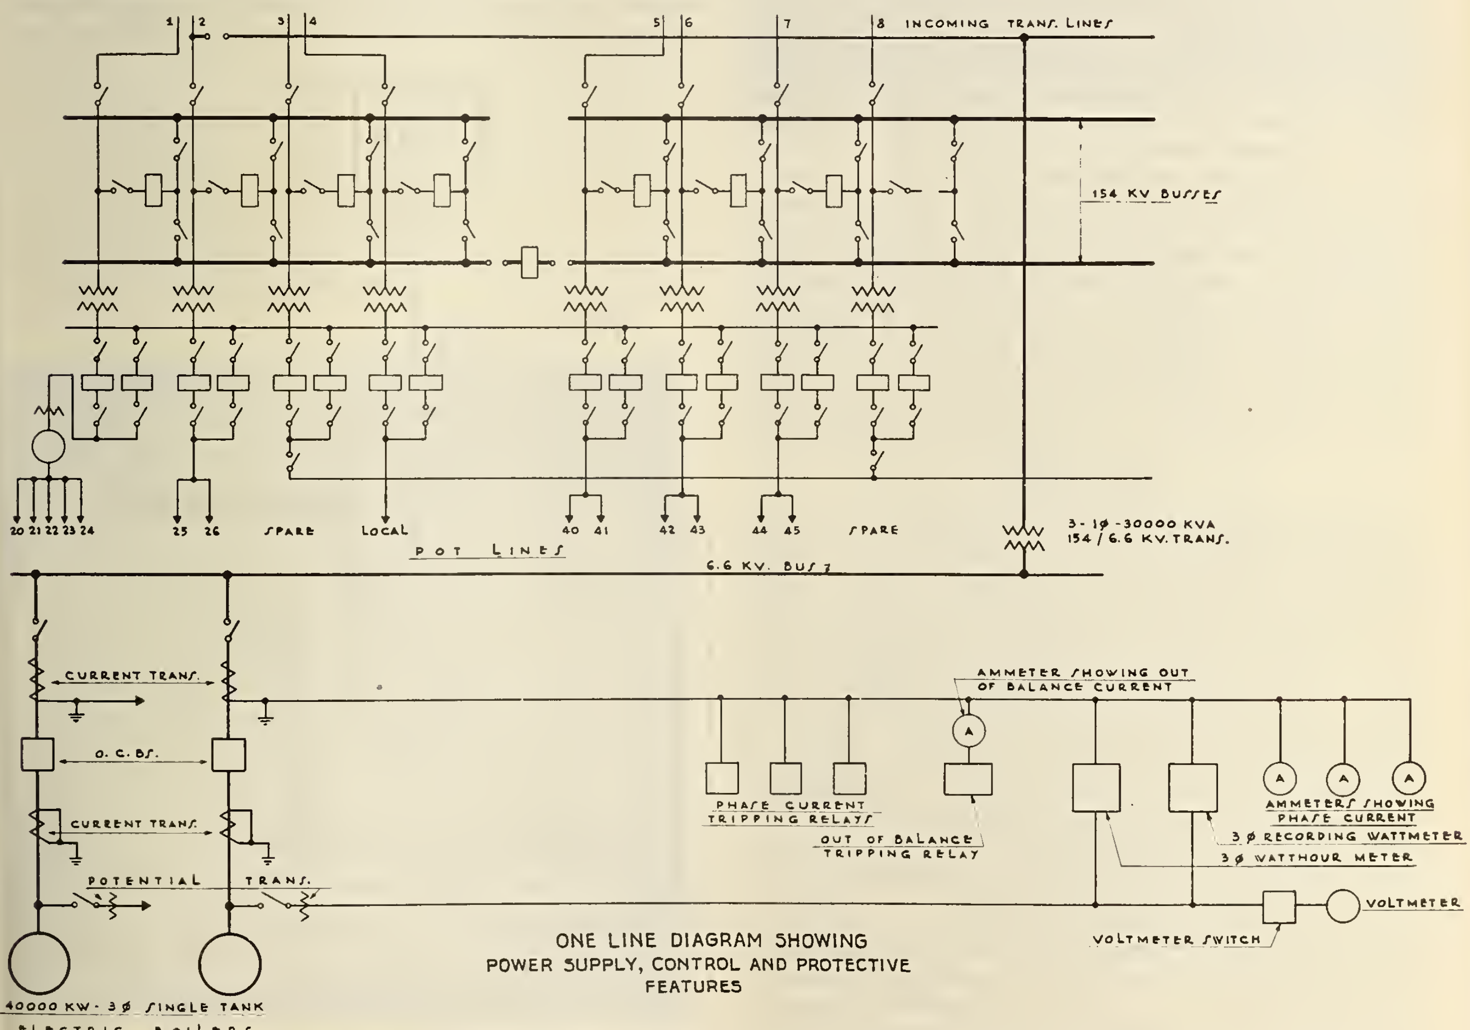

Fig. 13—One line diagram showing power supply, control and protective features.

Fig. 14—The compact control arrangements for the initial two electric boilers are shown to the left. This will be duplicated to the right, when additional boilers are added. The panels at the operator's back are the load dispatching board.

supported on transite-asbestos insulating "chairs" and rings. The preforming was carried out with a die and the individual sheets of foil had the corrugations running in the same direction.

The results obtained were quite consistent, as can be noted from Fig. 11. Apparently the preformed method of application is superior to the crumpled, and practically equivalent to cellular asbestos of equal thickness. On the other hand, the helically-wound method of application gives better results.

The comparative results are quite understandable, in that there are less areas or points of metal-to-metal contact and heat conduction with the preformed type as compared with the crumpled form. This is true in much greater measure with the helically-wound aluminum foil-air cell insulation, where the individual sheets of foil contact each other at scattered points and over small areas.

Several attempts have been made in the field to determine the heat losses from the shells and fittings of electric steam generators insulated with either aluminum foil-air cell or 85 per cent magnesia block and cement insulation. Difficulties in accurately measuring the small losses involved make it advisable to refrain from drawing any conclusions at this time but it can be stated the performance of preformed aluminum foil-air cell insulation in place on an electric steam generator compares very favourably with an equal thickness of 85 per cent magnesia block and cement insulation under similar circumstances.

Power Supply

Power for the electric boilers is furnished by a bank of three single-phase 30,000 kva. oil-insulated water-cooled transformers stepping down from 154 kv. to 6.6 kv. The transformers are located in a substation immediately adjacent to the boiler plant, as seen in Fig. 12. The transformers are supplied over a short 154 kv. steel-tower transmission line from the main step-down substation for Arvida Works. The single circuit consists of 477,000 C.M. A.C.S.R. conductors strung for a maximum tension of 9,000 lb. per sq. in. under ½ in. ice and 8 lb. wind loading at 0 deg. F. Provision has been made in the substation for an extension to accommodate a second bank of transformers if and when additional electric boilers are installed.

One of the outstanding features of the substation is the simplicity of the long-span 6 in. by 0.225 in. web, 2.99 lb. per ft. channeluminum 6.6 kv. bus which is clearly observable in Fig. 12. Spans of 16 ft. and somewhat longer are used, with two intermediate between-phase stiffeners.

It will be noted the bus is taken through wall bushings and carried inside a protective metal housing to the boiler electrode terminals. The simple long-span bus construction can be seen from Fig. 12. Flexible aluminum connections are provided at the boiler terminals, at the transformer terminals and the taps from the delta bus to the disconnect switches and circuit breakers.

The number of bolted joints in the channel bus has been minimized by the use of welded joints except where construction and maintenance convenience dictated the use of bolted joints. It is well worth noting that welded joints are of equal strength and conductivity to straight bus bar.

Figure 13 is a one-line diagram showing a portion of the power supply system and the control and protective features associated with the electric-boiler plant. It will be noted that the individual boilers are fed from the 6.6 kv. bus through gang-operated disconnects and 4,000 amp. oil circuit breakers.

All electrical equipment, including the substation structure, the transformers, 6.6 kv. circuit breakers and electric boilers, are thoroughly tied together through a heavy grounding network. This network is also tied into the general Works grounding net and the incoming transmission-line ground wires through a ½ in. ground wire on the 154 kv. line supplying the step-down transformers. The electric boilers are tied together through a 6 in. by ½ in. aluminum bus connection between suitable bosses on the boiler sumps, with the aluminum bus being tied into the network through two 400 MCM ground cables.

Control

As previously mentioned, the feed, bleed and blow-down lines are run on the basement ceiling to points under the control room. Extended valve stems are carried up to a control table fabricated of aluminum, which is so located in the control room that the operator can view the water columns of the several boilers through a large window provided with heavy plate glass. It will be noted that a

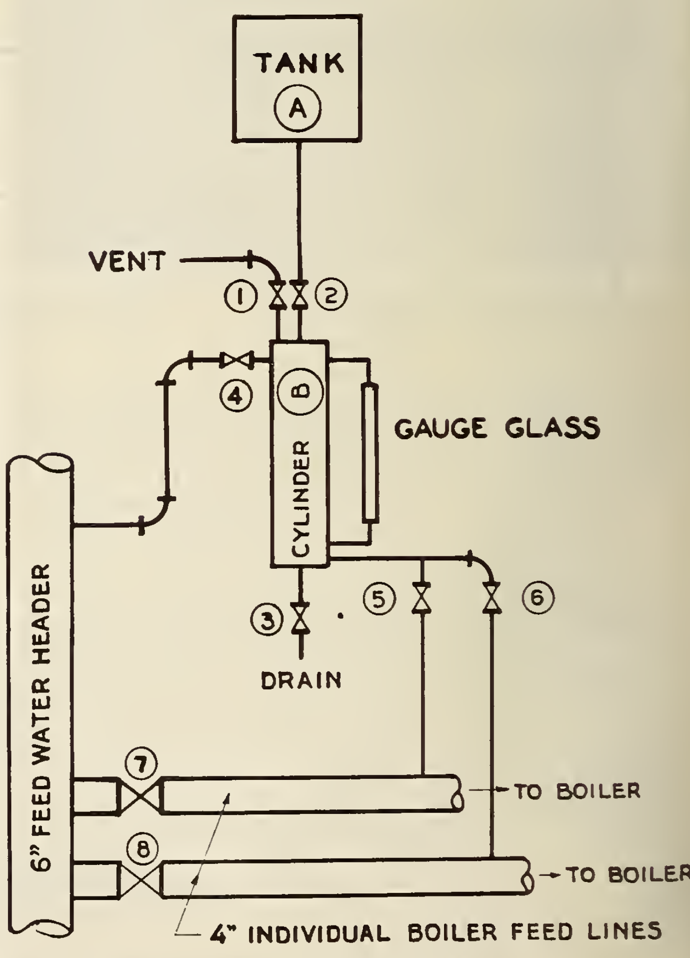

Fig. 15—Diagrammatic sketch of arrangement for doping electric boilers.

vertical section of the control desk carries the three-phase ammeters for each boiler so that the operator has before him at all times an indication of the current taken by each phase of the electric boilers. Immediately to his left are two control panels carying a three-phase watthour meter, a three-phase recording wattmeter, an ammeter showing the out-of-balance current and a voltmeter provided with a voltmeter switch so that the voltage on any phase of the 6.6 kv. bus can be readily ascertained. These panels also carry the protective relays of the inverse over-current type with instantaneous tripping feature. In addition, there is an inverse over-current relay operating on out-of-balance current. At the level of the ammeters indicating phase current a control switch is provided whereby the operator can immediately clear a boiler on trouble by tripping the 6.6 kv. circuit breaker.

A very compact arrangement for two boilers has been secured, and provision is made for duplicating this layout to the right, if and when the third and fourth boilers are added. Note Fig. 14.

Each boiler is provided with an integrating and recording steam-flow meter and graphic pressure gauge.

A 125-volt storage battery, trickle-charging motor-generator set and control panel located in the basement provides control power for the circuit breakers, indicating lights, etc., as well as emergency lighting.

As the electric boiler plant will be the nerve centre of steam production and distribution, at ordinary aluminum production levels, the dispatcher's steam control panel has been located immediately behind the operating table. This panel is shown in Fig. 14, and contains indicating meters which show the steam load on the various main plant units at any given time. This enables the boiler operator to immediately check where any sudden changes in demand may occur and allows him to regulate his boiler output accordingly. Telephone connection with the other boiler houses enables the operator to adjust the boiler loads to suit the demand from various sections of the plant. This board also contains similar meters showing air distribution for the plant as approximately one half the air compressor capacity for Arvida Works is located in the main building at this boiler plant.

Main water-supply meters are also located on this panel which makes the boiler operator the centre for the control and distribution of plant steam, air and water.

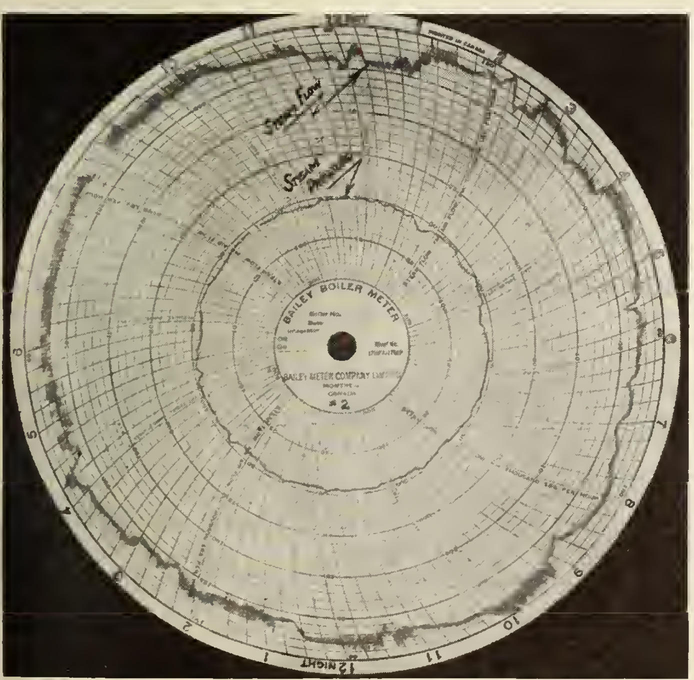

Fig. 16—Steam pressure and steam flow chart for No. 2 electric steam generator.

Serious consideration was given to the provision of automatic control for the electric boiler plant but it was not installed for several reasons, among which the following may be noted:

(1) Certain steam-plant personnel must be on duty, under provincial legislation. That is to say, a plant cannot be made completely automatic.
(2) Arvida Works' steam demand is relatively steady with few sharp surges. Consequently, it is quite easy for an operator to maintain a very steady pressure.
(3) Present automatic boiler control has not yet reached that stage of development where it leaves relatively little to be desired.

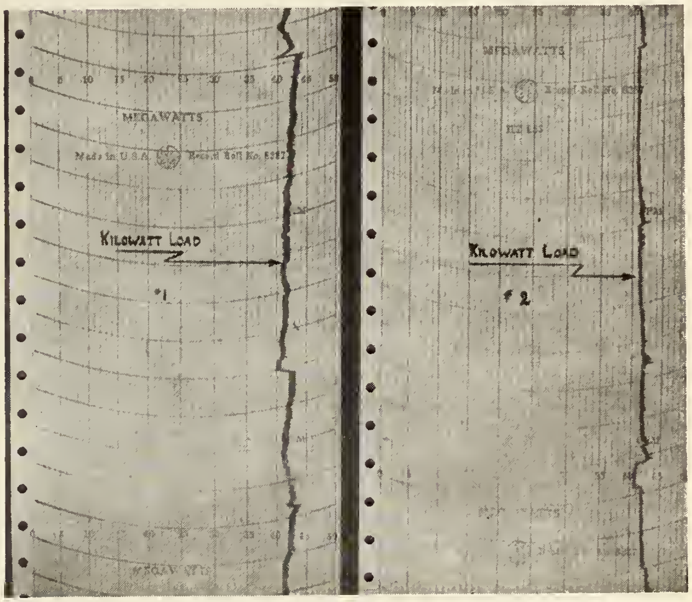

Fig. 17—The steady load developed by the electric steam generators is exemplified by the wattmeter charts for Nos. 1 and 2 boilers.

To take care of load fluctuations, facilities have been provided in the control room so that the operator can raise the conductivity of the boiler water rapidly by allowing a strong solution of soda ash to be injected into the boiler feed water. A diagrammatic sketch of the " doping " arrangement is shown in Fig. 15. The necessary control valves and gauges are mounted on the control-room wall at the height of, and just above, the control table as shown in Fig 14.

Tank (A), having a capacity equivalent to one to two weeks' requirement of " dope ", depending on operating conditions, is located at a sufficient elevation above the controls to permit gravity flow to cylinder (B). The charge of dope is of a concentration which will not crystallize at room temperature.

When boiler load conditions necessitate the addition of dope, the operating procedure is as follows:

> All valves being normally closed,vent valve (1) is opened. Valve (2) is opened allowing dope to flow to cylinder (B), the quantity being indicated in the gauge glass. With the required dosage admitted to (B), valves (1) and (2) are closed. Valve (4) is opened slowly admitting water at boiler feed pump pressure to the cylinder (B). With pump pressure on (B), valve (5) or (6), depending upon which boiler requires the increased dope content, is opened while valve (7) or (8) is throttled to increase the differential pressure across the cylinder and move the dope into thê boiler.
>
> The operation complete, valve (7) or (8) is reset to the normal operating position. Valves (4), (5),

TABLE I—Boiler Efficiency

	Test No. 1	*Test No. 2*
Date	2nd May, 1945	5th May, 1945
Duration of test	4 hours	4 hours
Average pressure (Boiler)	209.2 lb. ga.	204 lb. ga.
Average pressure (Orifice)	183.5 lb. ga.	184 lb. ga.
Orifice design pressure	200 lb. at 2% moisture	200 lb. at 2% moisture
Steam quality	98.44%	98.68%
Average temperature of feedwater	217° F.	215° F.
Average room temperature	80° F.	80° F.
Heat content of steam as measured	1184.8 B.T.U.	1187.2 B.T.U.
Kilowatt hour consumption	154,554 kwh.	137,137 kwh.
Steam production	522,042 lb. dry steam at boiler temperature and pressure	456,944 lb. dry steam at boiler temperature and pressure
Actual evaporation/kwh	$\frac{522{,}042}{154{,}554}=3.37$ lb./kwh.	$\frac{456{,}944}{137{,}137}=3.33$ lb./kwh.
Equivalent evaporation/kwh	$\frac{999.8}{970.4}\times 3.37=3.47$ lb./kwh.	$\frac{1004.2}{970.4}\times 3.33=3.42$ lb./kwh.
B.T.U. Input to steam/kwh	$(1{,}184.8-217+32)3.37=3{,}369.3$ B.T.U.	$(1187.2-215+32)3.33=3{,}343.9$ B.T.U.
Efficiency of boiler	$\frac{3{,}369.3}{3{,}412}\times 100=98.7\%$	$\frac{3{,}343.9}{3{,}412}\times 100=98.0\%$

(6) and (2) are closed. Valve (1) is opened to release any pressure on cylinder (B). Valve (3) is then opened to drain (B) to the sewer.

The dope used, of course, is an aqueous solution of soda ash.

Operating Experience

The general experience to date with these boilers has been entirely satisfactory. They have operated continuously for a period of eleven months under an average load of 40,000 kw. and at times for short peaks as high as 45,000 kw. So far as can be ascertained no injurious results have been met with and no overheating of electrical connections has been noticed. Recent tests indicate that these units operate with at least one per cent higher efficiency than the best of the previous units.

On examination of these boilers, made during the first week in April 1945, after they had been in continuous service for approximately six months, their interior condition appeared to be very good. Very little wear was noticed on the electrodes and the grid had apparently done a very satisfactory job in protecting the bottom head from pitting. This may not be conclusive as the water level was generally quite high in the boilers and it is possible that at low levels some difference might be found. Some evidences of wear were noticed on the neutral plates but this was to be expected and it would seem that both electrodes and neutral plates should give at least two years service if operating conditions do not change.

The specimen steam pressure and steam flow chart (Fig. 16) shown herewith indicates the load conditions are in general quite steady, even when operating at loads continuously well above normal rating. Little steam is lost through the operation of safety valves and bleed is held fairly constant at from 2 to 4 per cent. The steady nature of the load developed by the boilers is illustrated by Fig. 17.

In order to prevent accumulation of sediment in the bottom of the boiler, occasional charges of soda ash are injected into the feed water and the boiler blown down heavily. This results in a surging action which removes a considerable amount of the accumulated sediment. Operating experience has indicated that additional blow-down of this kind might be beneficial and the operating schedule now calls for the injection of soda ash once per shift, accompanied by a 6 to 10 in. boiler water level blow-down.

The steam dryers have operated satisfactorily, producing steam with a quality of approximately 98.5 per cent as compared with the guarantee of 98 per cent. At high water levels, this quality tends to fall off and, as far as can be determined, averages between 96 and 97 per cent. A number of runs have been made to determine boiler efficiency, two of which are embodied as Table I. A similar test on a previously installed unit showed an efficiency of 97 per cent as compared with the 98.7 and 98.0 per cent results on the new units.

It is worth noting that, beyond a leaky tangential dryer, not a single leak has developed in the welded boilers or main steam piping.

The authors wish to express their indebtedness to Messrs A. G. Joyce, H. Brayne and W. Fraser, M.E.I.C., as well as other members of the supervisory and technical staffs, for timely suggestions and help.

"MULBERRY" HELPS SOLVE HOUSING PROBLEMS

To help solve one of Britain's major postwar problems, the replacement and repair of the 4,500,000 homes destroyed or damaged by German bombs, the aid of "Mulberry", British portable harbors that were such a surprise to the Nazis on D-Day, has been enlisted. A firm that designed and built portions of it is now applying the experience gained to the housing problem and has developed a new and revolutionary type of prefabricated house. The basic unit of construction is a reinforced concrete panel of standard width, precast at the factory. Openings are left in some of the panels for doors and windows. After these components are assembled at the building site, it is a simple matter to erect the outside walls merely by hoisting the concrete panels into position with a crane. When they are placed side by side, liquid concrete is poured between the units, thus forming a solid wall. Within a week the outside is completed, and within a month an attractive permanent house is ready for occupancy.

THE CONSTRUCTION OF BURIED CABLE IN CANADA FOR LONG DISTANCE COMMUNICATION

M. J. AYKROYD, *Outside plant engineer.*
G. A. CALDWELL, *Exchange plant engineer.*
Western Area, The Bell Telephone Company of Canada, Toronto, Ont.

From the inception of the telephone industry, the practice has been to construct telephone lines by means of poles and open wire attached to them. During the past few years, changes have taken place in the means and methods of giving service. The open wire lines have had phantom circuits placed upon them, then, later, single and three channel carrier systems. More recently, a twelve-channel carrier system has been designed, all channels of which are superimposed on the voice frequency circuit.

This open-wire type of plant is subjected to all vagaries of nature. Often severe physical damage from sleet and wind results in service interruption and heavy associated expense. The emergency restoration of plant is costly as the work is carried on under abnormal conditions.

With increasing demands for service, cable construction has provided a satisfactory answer to the continuing growth of facilities on long distance routes and from the standpoint of service insurance the placing of such cable underground is attractive. Here again the development of a carrier system applicable to cable has made the use of cable plant increasingly attractive from the standpoint of costs and physical size. In the cables which have recently been installed on long distance routes between Montreal and Toronto, use has been made of what is known as the " K " carrier design.

This facility with a speed of transmission of the order of 100,000 miles per second, stabilized feed back amplifiers and other desirable transmission features, provides good transmission over long distances. This application is economical where a large number of circuits are to be provided, many of which will be ultimately several thousand miles in length.

The conception of ploughing cable directly into the ground is not novel. Back in the 1840's, the first known plough was designed by Mr. Ezra Cornell, the founder of Cornell University. The circumstances of this case are still interesting. A contract was undertaken to construct a telegraph line from Baltimore to Washington. At that time the stringing of wires on poles had not been proposed, so the first circuits were to be placed underground. Mr. Cornell built a machine and demonstrated—when his ponderous horse-drawn equipment moved forward, the cable was buried directly into the ground. Our history of the machine is not very clear, but it must be assumed that many difficulties arose since the machine was abandoned.

Many years went by before a successful cable laying plough was developed and used. Present-day equipment drawn by caterpillar tractors has power undreamed of one hundred years ago.

Design of Buried Cable Route

The first essential in the engineering of a specific buried toll cable project is the design of a satisfactory route. Into this design enter many considerations. One of the major ones is that of cost. Thus, the proposal to place cable between any two points will necessarily introduce a possibility of alternative routes on a buried cable basis. These routes will differ with respect to the obstacles to be encountered, conditions of terrain, towns to be passed through, length and so forth. Considerations of transmission layout also will suggest alternatives in the matter of location of repeater stations. It is generally the case that such layout will permit some degree of latitude in one or more of these sections and will allow for deviation of the route to permit the avoidance of major obstacles in construction. All of these factors must be reviewed and compared for the several alternatives which may be practicable in the light of cost.

Another factor which has been found to be of great importance from the point of view of construction costs is introduced by the existence of rivers and creeks in the territory covered and the strengh of the bridges spanning these. In a recent case, this factor was of sufficient importance to influence against one of the alternative routes, since the bridges were inadequate to carry construction equipment, and the crossing of frequent creeks and rivers would have introduced serious delays in the ploughing operations.

In general, in our territory, the construction of buried toll cable will introduce problems requiring conduit construction adjacent to and passing through cities, towns and villages along the route. Here it is most desirable to take a long term view of possible housing or other development along the route in such location. The decision should be based on the latest available studies of such development. In the same connection, where cities and towns are encountered along the route it is desirable, from the standpoint of service insurance and particularly where carrier cable construction is involved, to establish " in " and " out " cables on separate routes, where this can be achieved without important increase in cost and compatible with the development in exchange telephone plant in the location concerned.

Another factor to be considered in route design is the lightning hazard. Factors which have a bearing on this

Fig. 1—Gas pressure reading being made on cable prior to entering plough sheath.

hazard are the surface earth resistivities along the proposed route, the presence of isolated trees adjacent to the route and the lightning storm frequency in the territory. All of these require detailed consideration and the first two will generally exercise considerable influence on the route to be chosen. The lightning storm frequency factor derived from consideration of available isoceraunic charts will not generally influence the route design itself since these data are applicable usually over the entire section of country concerned. The factor, however, may be allowed to influence the cable design structure as will be discussed later. The foregoing data, of course, are always supplemented by observations made locally with respect to lightning conditions as evidenced by damage to pole lines, trees and other objects in the territory.

The lightning hazard in buried cable construction has been found to be influenced by the presences of long fences in open country on which there are no specific arrangements which provide for lightning drainage. In such cases it has been found advantageous to provide insulating panels in the fence lines where they cross over the buried cable routes.

Preliminary consideration of routes is also influenced by the presence of high tension power lines. Proximity to such lines may cause low frequency induction effects to be introduced in the telephone system at times of power line disturbances involving high tension short circuits to ground. In this study, earth resistivities at depth constitute a factor.

The presence of main line railways is also a consideration in route design, as it is desirable to keep the number of crossings of such railways to a minimum.

Accessibility for maintenance purposes is vital in view of the number of facilities involved and which would be affected in the event of damage to the cable.

It has been found by experience that it is necessary to give attention to problems of erosion where cable routes cross rivers and small creeks. In such locations, the ploughing operation provides a form of runway for drainage and it has been found that in the course of a few years the earth coverage over the cable may be substantially reduced. In the case of small creeks, care should be exercised to effect a point of crossing which will not be disturbed when the creek is in flood, due to change in direction of flow. If this is not done, in some cases where the flooding is heavy, sections of the bank will be washed away and the cable become exposed. Means of preventing erosion where it is liable to occur are the shoring of the bank by standard creosoted planking and back filling the trench or slot firmly by hand with earth and stones. However, it is believed that the most effective method is to choose a desirable crossing location with the possibility of reducing erosion as far as practicable, having in mind the problems of drainage and

Fig. 2 Skyline view of plough train underway.

flooding. It is of interest to note that a new design of plough now being considered includes a tamping arrangement which forces the back fill into the slot cut by the plough share.

In weighing the foregoing considerations, it has been found advantageous to make use of the topographical maps provided by the Department of National Defence, having a scale of one mile to the inch, and supplement these with aerial survey maps. The latter have been found helpful in the carrying out of the preliminary field survey work.

The procedure in obtaining right-of-way for buried cable plant involves the optioning of a strip of right-of-way 20 to 25 ft. wide from property owners. These options are taken up and registered as the survey progresses. The easement arranged for entitles the company the right to place and maintain buried cable in this strip of land.

At the time negotiations are proceeding for the purchase of right-of-way, it has been found convenient to arrange with the property owner to prepare fences to allow for the passage of the plough train equipment by the placing of new posts on both sides of the right-of-way and the provision of a temporary fence between, which can swing back to allow the train to pass. This work involved in clearing of the right-of-way of brush and isolated trees is generally done by the property owner, although in some cases the work is handled by contract.

Cable Reel Allocation

In the design of cable facilities over long distances, it is essential to establish reasonably uniform electrical conditions throughout the length of the cable to insure satisfactory transmission characteristics from the point of view of quality and service stability. To help achieve this result, it is advantageous to arrange for cable manufacture sufficiently far ahead of the actual field construction work to provide the engineer with full information on the characteristics of each reel of cable made. It is then practical for him to locate his reels in the field to the best advantage from the standpoint of the known electrical characteristics.

This is done by shipping the reels, usually by rail, each to the location closest to its final position in the field as recommended by the engineer. From this point the reel will be transported to its position, usually by a contractor. It has been found convenient for this purpose to use a small farm tractor or reel trailer equipped with tractor treads. Each reel contains about 3,000 ft. of lead sheathed, jute protected cable and weighs about four tons.

It might be noted that the cable itself is manufactured under controlled conditions of humidity, and every reasonable precaution is taken to avoid deviations from uniformity in electrical characteristics.

The cable is shipped from the factory under a gas pressure of about 9 lb. per sq. in., this pressure rating being recorded on a tag affixed to the reel. Before the cable is placed by the construction forces, this pressure is checked to insure that the reel is not placed in a damaged condition. Dry nitrogen gas is used for this purpose. Figure 1 illustrates field check of gas pressure on new reel length immediately before the cable is entered into the plough share prior to placing.

Ploughing Equipment

The plough itself weighs about five tons. It is mounted on two wheels with drawbar, 72,000 lb. shear pin, sod cutter and a 9-ft. vertical share which cuts a slot in the ground 3 in. wide and 30 to 50 in. deep. Oil spraying equipment is mounted on the plough frame to provide for lubrication of the cable as it passes into the share and is effective in reducing cable tension to less than 1,000 lb.

The lead or No. 1 tractor is a D8 full Diesel caterpillar with a 24-in. track. It weighs, equipped, about 20 tons

Fig. 3—Plough train in operation across flat country. Open wire line in foreground.

with a drawbar pull on the level of about 30,000 lb. The Hyster towing winch of 780-ft. ¾-in. steel line capacity has a pull of 76,000 lb. at a speed of 55 ft. per minute. The derrick on this tractor is designed to handle four-ton cable reels.

The No. 2 tractor has 85 hp. full Diesel caterpillar with a 24-in. track and is equipped with a four-drum winch which is used for raising or lowering the plough share and for loading the cable reels on the trailers. This tractor is coupled directly to the plough.

The cable reel trailers weigh about 6,000 lb. and are equipped to handle reels up to 84 in. dia. and 4 ft. 6 in. wide.

Ploughing Operation

Operation varies dependent on soil conditions, nature and frequency of obstacles. In clay or sandy soil, for example, with few obstacles, tractor, rooter plough, cable laying plough and tractor trailers can all be connected in the one train. The front plough roots through the earth with a 3¾ in. share loosening and breaking up the ground to a depth of from 30 to 50 in., thus insuring uninterrupted passage of the following plough which deposits the cable in the ground. The 100-ton train moves at a brisk walk under such conditions. Pauses are needed only to change reels or remove major obstructions.

In Southern Ontario, the farming subdivisions, side-roads, streams, wooded sections and other frequent obstacles make a modified operation desirable. One crew with a rooter plough, equipped with 85 hp. tractor bull-dozer, works about 3 to 6 miles ahead of the cable placing train. The job of this crew is to open up the earth to a depth of 30 in. or more along the route of the buried cable, to remove boulders, tree roots and other obstacles, to grade steep banks at side roads or other places, to see that fences have been so arranged as to facilitate the passage of the train and to remove isolated trees in exposed locations which are designated by the engineer as hazardous from the standpoint of lightning.

Figure 2 illustrates the plough train underway as described in the foregoing. The train, it will be observed, consists of the lead or No. 1 tractor equipped with derrick followed by the No. 2 tractor, the plough itself and two cable reel trailers. This arrangement was the one most generally followed in placing buried cable between Toronto and Kingston.

This month's cover picture illustrates the train emerging from a wooded section where the going was difficult because of a ravine and tree root conditions. In this section it was found advantageous to use the front tractor to "winch out" the train as described below.

Figure 3 shows the plough train in progress across flat country and indicates the slot cut in the ground by the routing operation ahead of the plough train.

In ploughing, the train may become stalled in ploughing up hill or through a ravine. In such cases, the front tractor with its single drum winch proceeds ahead to firm ground and prepares to "winch out" the train by making a two to one pull on the second tractor which remains coupled to the plough. When this procedure is necessary, the driver of the front tractor first puts tension on the winch line and sets the winch brake. He then guides the caterpillar tractors into firm ground, pulling against the taut winch rope until the tracks are sufficiently dug in to give the tractor firm footing for the pull. Now with the track brakes set on the front tractor, the winch pulling and the rear tractor exerting whatever forward effort with its tracks the condition of the ground permits, the train moves ahead. The winch line is coupled to the No. 2 tractor through a wire rope block attached to the tow hook at the front end of the tractor. The sheave of this block will take up to 1-in. wire rope and is equipped with a bronze bushing with runs on a 2-in. dia. sheave pin.

One caterpillar tractor's maximum draw bar pull is about 30,000 lb. on the level. In moving up hill, of course, the pull is decreased in proportion to the steepness of the grade since it is necessary to raise the tractor weight of some 40,000 lb. With the aid of a double line pull from the heavy duty winch of the forward tractor, the effort exerted may reach as much as 150,000 lb. On a well chosen route, there are few situations where this arrangement is not adequate.

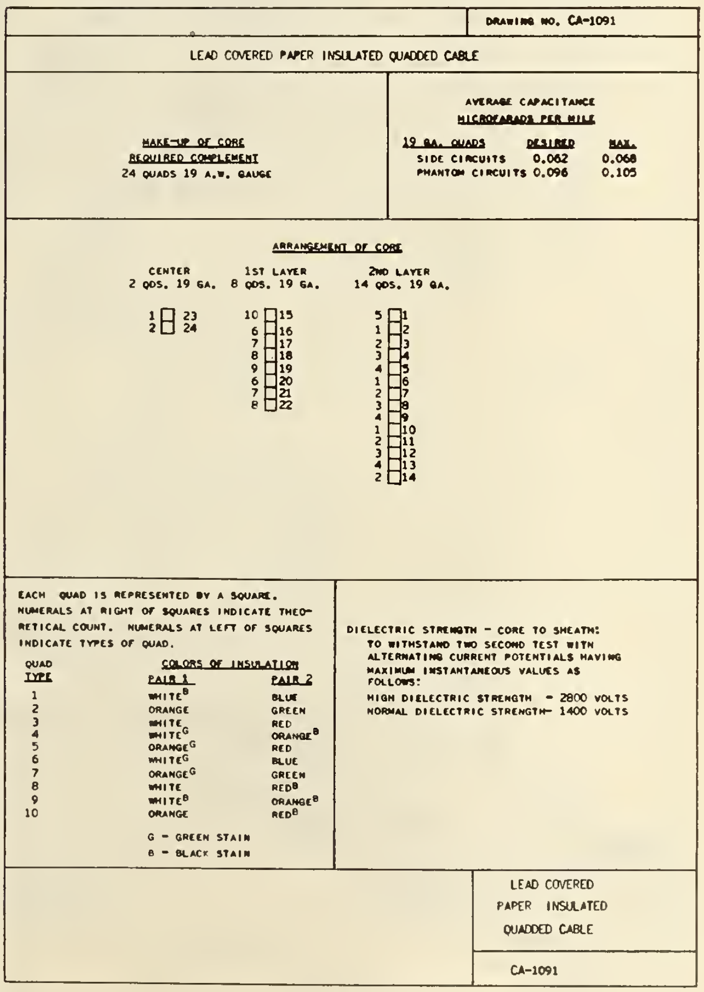

Fig. 4.

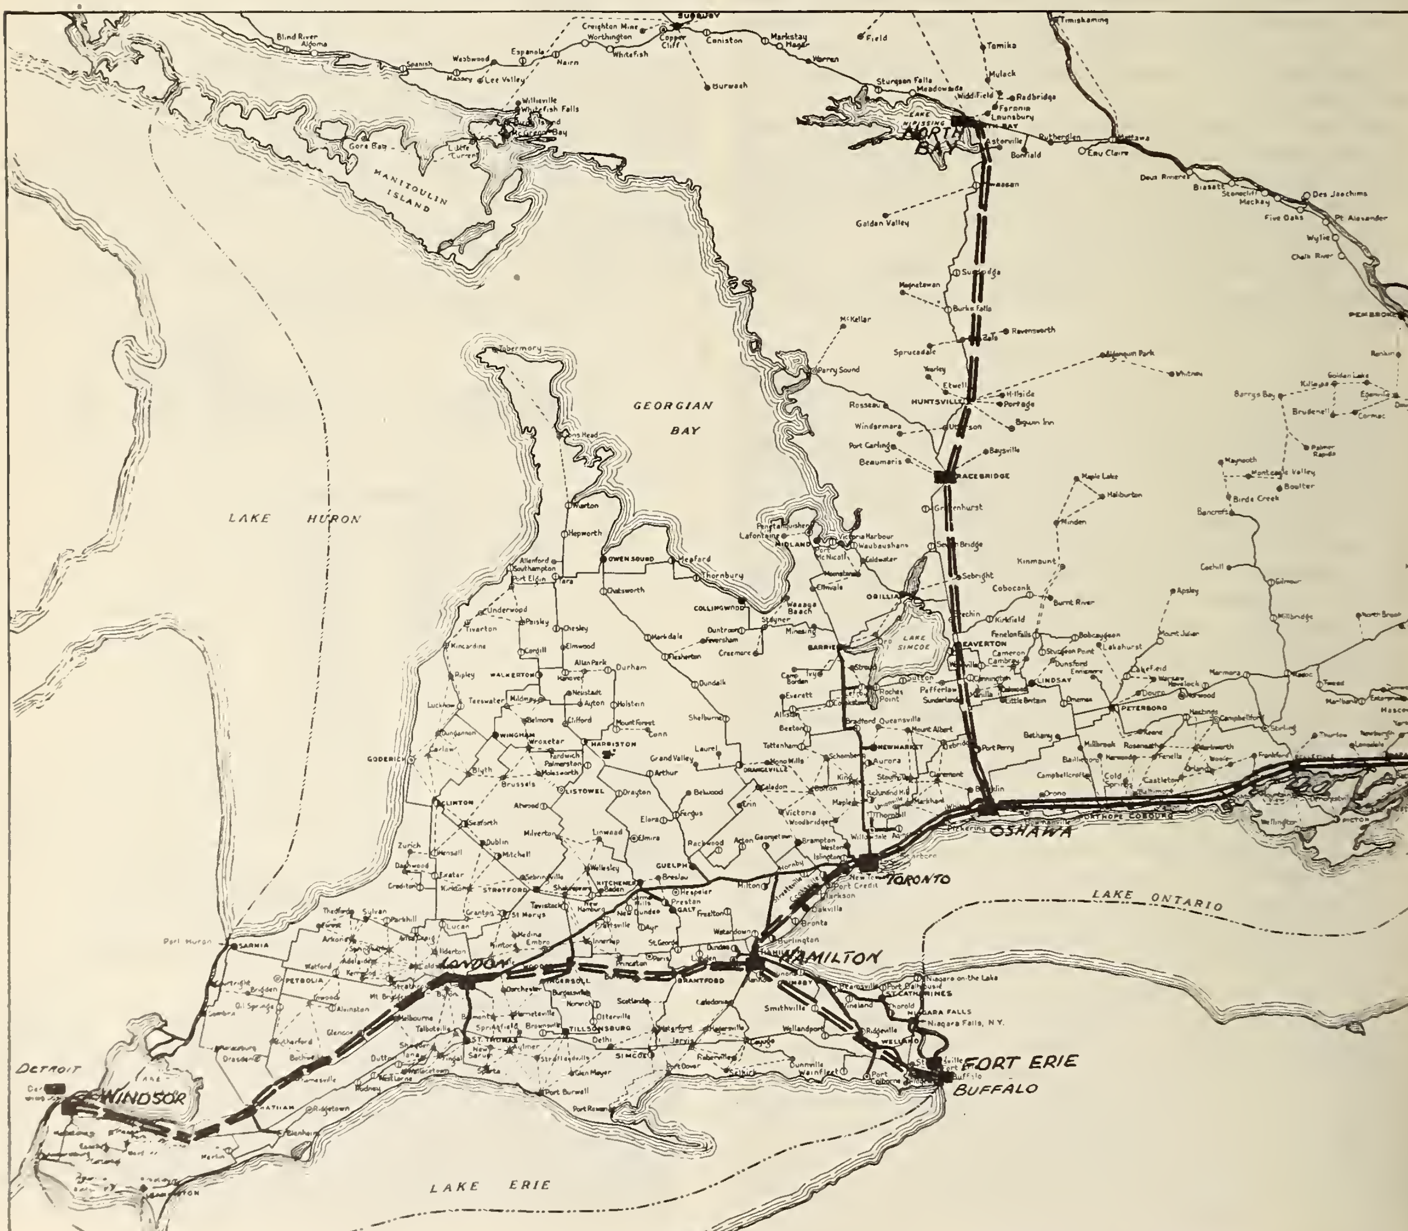
After passage of the plough, disturbed ground is restored to its former condition as far as practicable, particularly in the case of roads and ditches. Usually, in the case of straight runs on right-of-way, the soil is not sufficiently disturbed by passage of the plough to require back filling. We have found it satisfactory to mount beneath the rear trailer, in such a location as to take part of the weight of the trailer itself, a "V" shaped backfiller. This arrangement under ordinary conditions will pack most of the disturbed soil over the slot which has been formed by the passage of the ploughshare. Completion of the back filling can be accomplished readily by running one track of a service tractor over the top of the slot.

Splicing

The lay-up of cable used between Montreal and Toronto is shown in Fig. 4. This cable consists of a core of 24 quads of 19-gauge conductors This core is bound by two wrappings of paper providing a breakdown voltage between core and cable sheath of 2,000 root mean square volts at 60 cycles per second as compared with the normal arrangement of one paper wrapping providing a rated voltage breakdown of 1,000 root mean square volts at 60 cycles per second. Cables have been shipped, heretofore, on reels containing two lengths of somewhat over 1,500 ft. both on the same reel. However, in the projects now being planned, it is proposed to have one continuous length of somewhat over 3,000 ft. on the one reel. From the standpoint of splicing effort this is obviously advantageous.

In general there are three basic groups of circuits in the cable:

1. *The "K" Carrier Group*—Usually this group consists of about 10 quads segregated from direct adjacencies by voice frequency quads. This arrangement is advantageous from the standpoint of interference between carrier systems.
2. *Voice Frequency Quads* — These comprise the quads segregating the carrier quads and are utilized usually for the shorter haul facilities serving intermediate points between carrier system terminals.
3. *Control Quads*—These two quads are set aside for cable and maintenance purposes. One of the quads is available only at carrier terminals and at the intermediate carrier repeater stations located along the route, generally at intervals of about 17 miles. The other quad is established to provide a linemen's talking circuit and a gas pressure alarm pair. Both of these are made available at terminals provided for the purpose throughout the length of the cable. These terminals are mounted on marker posts adjacent to the cable and are connected to it by a



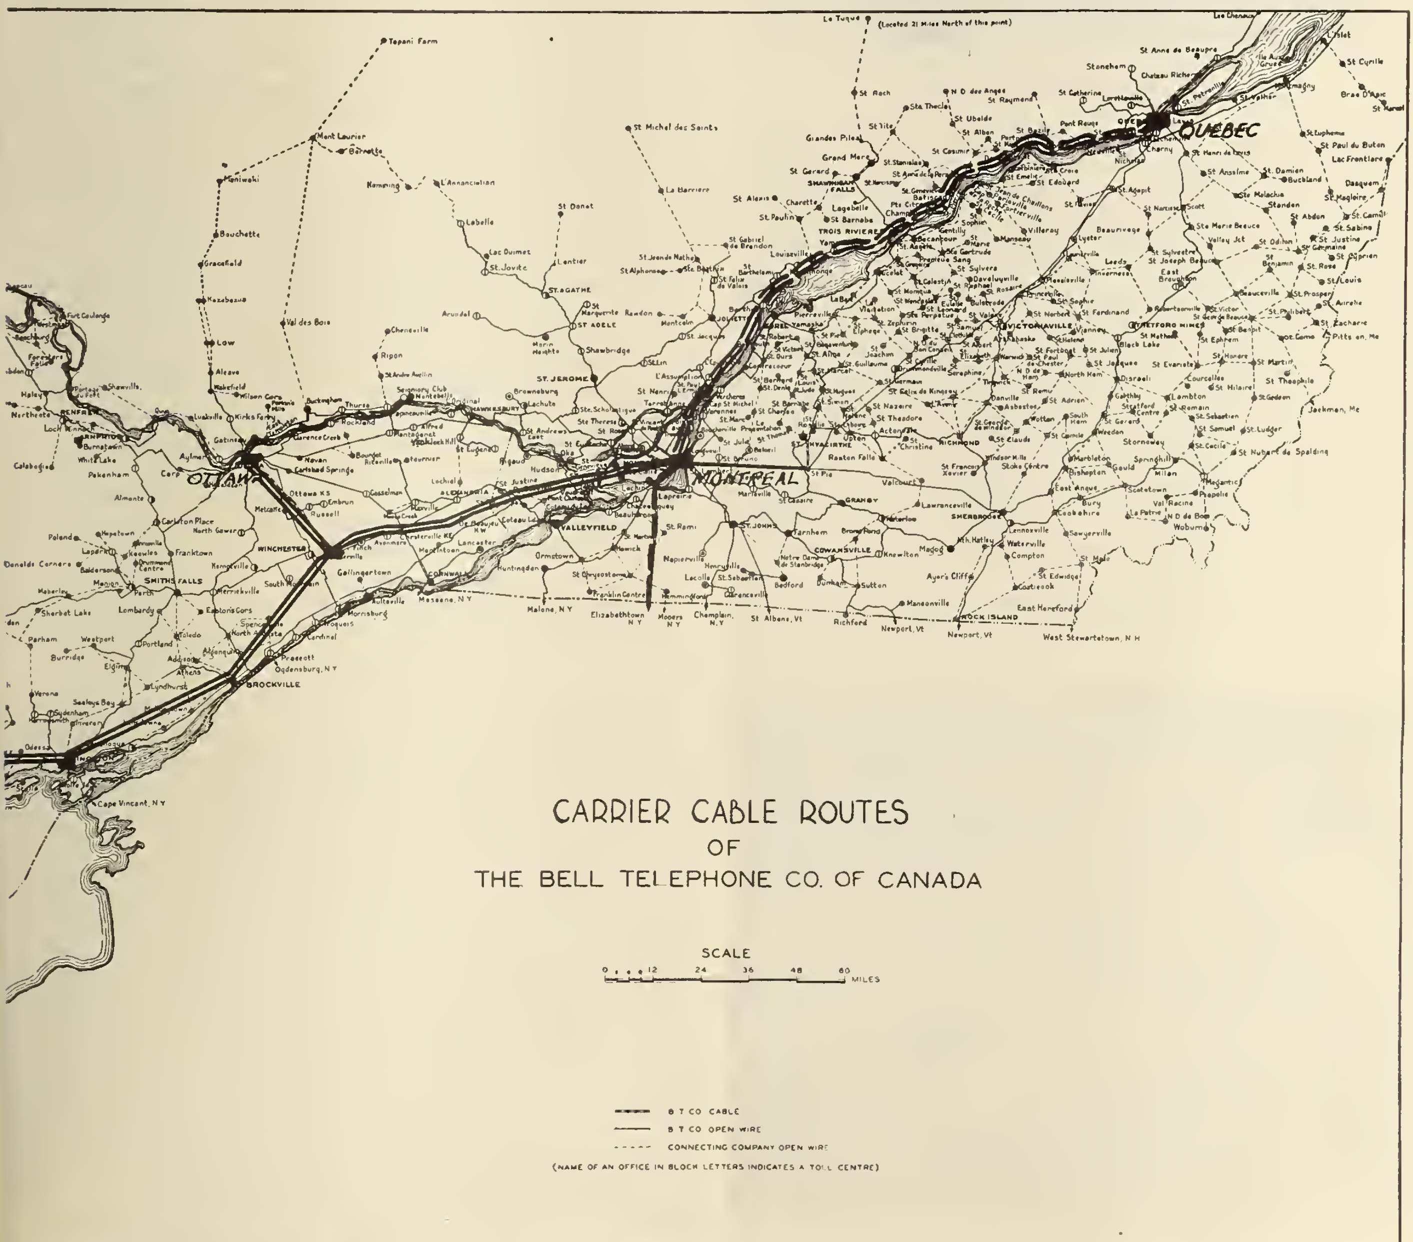
small size, light covered jute protected cable.

The requirements for splicing these various groups of conductors differ. On the carrier group the splicing is so designed as to minimize the length of proximity of any two quads in the group between carrier repeater stations. The splicing design is therefore on a planned basis with this objective. It might be pointed out that since a single cable is used for carrier purposes for transmission in one direction only, so called direct near-end cross talk effects are not involved. The design of the cable lay-up with regard to length of twist is arrived at with this in mind. In the case, however, of the voice frequency group, where the circuits are loaded and may be used on a two way basis to provide service to intermediate points, the near-end effects are important and special measures must be taken in the splicing procedure to insure satisfactory arrangements with respect to the capacitance balance between the wires of any quad. This is accomplished by field measurements, made by the splicing crew, of capacitance unbalance and the value reduced where the measurements so indicate by the use of small balancing condensers. This arrangement is supplemented by the selection of quads in the voice frequency groups in both directions from the splice point on the basis of reducing the capacitance unbalance, by association of groups in the splicing operation.

It has been a general practice for many years in splicing toll cable conductors to use solder. However, in the case of all the buried toll cable construction carried out here, splicing has been done by electric welding, the equipment used being a standard 6-volt storage battery and carbon electrode connected to one terminal and a suitable device connected to the other terminal so arranged that, when a joint is made by this means, a globule of metal is formed between the two conductors insuring a very satisfactory permanent and easily made joint. This procedure is not suitable for splicing in manholes associated with conduit plant because of the importance of avoiding arcing contacts in enclosed atmospheres in which may be present even a small portion of explosive gases. The use of the method is therefore being restricted to aerial and buried cable construction. A photograph of an enlarged sample joint is shown in Fig. 5.

Gas Pressure Installation

Upon completion of splicing, the cable is placed under gas pressure of about 9 lb. per sq. in. Contactor points are spaced about 10,000 ft. apart. In the event of a sheath break or puncture allowing the gas to escape, the pressure will fall in the cable and when it has reached a predetermined value at a contactor, the resultant operation of the contacts will close an alarm circuit bringing in a signal to the Central Office. Between contactor



CARRIER CABLE ROUTES OF THE BELL TELEPHONE CO. OF CANADA

Fig. 5—Illustration of welded joint splice used in buried cable sections.

points, the valves are placed about 3,000 ft. apart. Pressure readings made in the field in the vicinity of the cable fault, as indicated by the contactor operations, will specify the location of the trouble.

There is some variation in operating practices in the extent of gas sections. These vary from 50,000 up to about 200,000 ft. in the case of single full size toll cables. In the cases of twin cable installations, such as for carrier cable operation, the most desirable arrangement is to establish circular gas sections made up of the two cable sheaths between repeater stations spaced about 17 miles apart. This provides a satisfactory reservoir to protect cable against the ingress of water or moisture at the point of failure and is helpful also in determining the location of the fault by readings of the direction of gas flow supplementing pressure readings at valve points.

The reservoir of gas so provided is sufficient to insure, even under quite severe conditions of cable sheath fracture, adequate time for an employee to travel to the location of the break before pressure is reduced at the point of break to a level which would permit an ingress of moisture. In the case of most fractures, a time interval of as much as 48 hours depending upon the location of the break in the case of single cable jobs, would be available for maintenance attention. By check measurements at valve points and analysis of contactor operations, the control office can determine the seriousness of the situation.

Repeater Stations

Unattended repeater stations for the carrier circuits are located along the routes generally about every 17 miles. The circuit equipment including repeaters, cross talk balancing frames, etc., as well as the power, ventilating and electrical heating equipment are used in buildings having a standard floor plan design, the size of the buildings being about 17 ft. by 24 ft. Building locations are chosen having in mind specially the matter of accessibility and the availability of the commercial power supply, as well as having a desirable location from the point of view of the repeater arrangements on the overall carrier system layout.

Fully attended stations are provided about every 50 miles. At these stations, voice frequency repeater arrangements are usually provided. It has been possible in our territory to locate these stations in towns or cities where normally full attendance is available.

Maintenance

It has been pointed out in the foregoing that reasonable accessibility to all points on the route was a consideration in the design. This is most desirable from the standpoint of maintenance of the system after installation. It will be noted that every effort is made in design to select a route of cable likely to be free from disturbances, either electrical or physical. Nevertheless, trouble is to be expected to some extent and it is generally the case that the majority of these troubles arise because of trenching or digging operations by public contractors or others across the cable route. These occurrences are often due to their lack of precise knowledge as to the location of the cable or due to the fact that this location has been forgotten by such contractors or others. To warn the public and to help avoid these troubles and also to assist the maintenance man in locating the cable route, markers are used. These markers consist of posts of treated red or jack pine having about 5 in. tops, usually set in fence lines or other convenient locations where they will not interfere with agricultural or other operations. It is proposed in the Toronto-Windsor section to use 15-ft. markers that will be readily visible from a distance. These markers also serve, where necessary, as convenient mounts for the gas pressure valves and associated terminals located at the 3,000-ft. points along the cable route.

An instrument which has been used to advantage in buried cable locating work is the M-Scope. The set consists of a modulated radio frequency transmitter and a separate receiver, each unit having its own loop antenna. The path of an underground cable or pipe can be determined with this instrument where it is impractical to make a physical connection. For this use the receiver and transmitter are separate and operate as two units, the transmitter being used to introduce the signal into the cable or pipe while the receiver picks up the secondary radiated signal as it is carried along from the pipe or cable. The transmitter frequency is about 135 kilocycles. This instrument is of value also in route selection work where underground metallic structures along the route may be encountered.

It is of interest to note that trouble experience on buried toll cable jobs has been low and most satisfactory in comparison with aerial toll cable experience.

Future Developments

The accompanying map of Southern Ontario and Quebec illustrates the extent of the major communication cable network between Quebec City and Windsor. The section of this network linking Montreal, Ottawa, Toronto, Hamilton and London has been completed. Outside Plant construction work associated with the placing of the cable between London and Windsor was substantially completed this year. As far as practicable the network has been constructed in buried cable in the manner described above. In sections of country where rock is encountered near the surface, such as in the immediate vicinity of Kingston, buried construction is, of course, not practicable and aerial design has been provided. Plans are now actively in hand for the extension of this network east from Montreal through Three Rivers to Quebec and south and east from Hamilton to Fort Erie as shown on the map. Another extension which is foreseeable now is that to North Bay. It will be observed that connections are provided with the communications network of the United States at three principal points, viz., south of Montreal, Elizabethtown, N.Y., at Buffalo, N.Y., and at Detroit Michigan.

WARTIME PRODUCTION OF PRECISION OPTICS IN CANADA

D. C. R. MILLER, M.E.I.C.
Development engineer, Fiberglas Canada Limited, Oshawa, Ont., formerly production superintendent of optical shops, Research Enterprises Limited, Toronto, Ont.

This is the second of four instalments of a paper describing the establishment, as a result of war exigencies, of a new industry in Canada. The first instalment appeared in the April issue.—Ed.

(Continued from previous issue)

Production Methods—Planar Optics

As with lenses, production of planar optics begins with the receipt of raw glass from the glassplant. The glass may be in the form of mouldings, if the requirements warrant the expense of a mould, or otherwise in the form of slabs or plates of sufficient size and thickness for the economical production of the particular part. Because of the function of prisms in most applications, a higher quality of glass is needed than for lenses. The glass must be better annealed, and freer from striae or inhomogeneities, bubbles or seed. For many windows and graticules, however, the requirements are less exacting than for lenses.

PLANAR GRINDING

The operations covered under the heading of planar grinding include virtually all those involving the use of abrasive on the work—sawing, grinding, milling, disc-cutting and edging.

If the glass for prisms is supplied in plate or slab form, the first operation is to saw it into roughly the size and shape which would be supplied if mouldings were used. This is done with a rubber-bonded silicon carbide wheel of 10-14 in. diameter and .040 in. or .060 in. thick, revolving at 4000-6000 surface ft. per min. with water coolant. The cutting speed of such wheels, using 125 micron abrasive, is almost as high as with diamond-loaded copper wheels, and danger of damage from chipping is less. In the smaller saws the work is fed into the wheel manually; in the larger ones hydraulically. Some idea of the rate of cutting may be gained from the fact that a piece of glass of 1 in. square cross-section may be sawn through in slightly over 30 seconds, with a single cut. From .040 to .090 in. is left on each face of the moulding or sawn blank for subsequent removal.

After sawing to rough shape, the next operation on prism blanks or mouldings is milling. Before this can be done it is often necessary to select and grind whichever surface is to be used as the locating surface in milling. This is done by hand on large vertical-spindle cast-iron plates, known as roughing wheels, fed with 125-180 micron silicon carbide and water. These wheels are about 2 ft. in diameter, revolve at a surface speed of 1200 ft. per min. and were at one time the basic machines for planar grinding.

For planar milling, the best machines are tool-room vertical-spindle grinders, as these are designed with precision-type high-speed spindles of maximum rigidity. Almost any vertical-spindle machine can be made to serve the purpose, however. One of our first machines was a Pratt & Whitney grinder with a 24 by 72 in. table, fitted with a 14 in. diamond cup wheel, and used for rough milling large prisms of the tank periscope type or large numbers of smaller pieces. Such an arrangement is illustrated in Fig. 14. Later machines included Norton vertical grinders with 6 x 18 in. magnetic chucks and reciprocating tables and Blanchard grinders with 16 in. diameter revolving magnetic chucks, together with special-purpose machines of similar type and of our own design. Of these machines, the Blanchard is undoubtedly the best. Fitted with 10 in. diameter cup type diamond wheel, 15 hp. motor on the cutter spindle and automatic feed, it can remove glass from a 16 in. diameter surface at the rate of .023 in. per min. This machine is illustrated in Fig. 15. As with lens milling, precautions must be taken to permit this powdered glass to settle out in the coolant sump. Metal-bonded diamond wheels of about 90 micron grain size (180 mesh) give the best compromise between speed and finish. Wheels as fine as 26 microns (400 mesh) can be used and with them the finish is limited by the machine rigidity. Within the limits of the machine, the higher the surface speed, the better: 4000 ft. per min. may be regarded as a minimum.

The width of cutting face in the cup-type wheels is a matter of considerable importance. Heavier cuts can be taken with ½ in. face wheels than with 1 in., since with too wide a face, the coolant has difficulty taking away the powdered glass, and this tends to load the diamond wheel and cause overheating and slow cutting.

The method of holding the glass blanks while they are being milled is of great importance in affecting accuracy of angles and cost. The simplest methods are those involving waxing the blanks onto steel or cast-iron angle-bodies or flat plates and holding these on the magnetic chuck of the machine. Before any angles can be milled, the locating surface and one adjacent side must be milled flat, so as to provide a locating edge which is butted against a stop to prevent introduction of pyramidal or skew errors in the angle. Often the first operations are to mill two opposite sides parallel, subsequent to which the prisms are blocked together into sticks with wax, so that the angles on half a dozen or more prisms may be milled at the same time. In such cases, parallelism must be held to .0005 in. or less to prevent cumulative cross-angle errors. For these blocking operations paraffin wax usually gives sufficient adhesion. It is applied as a liquid by heating the blocking plates, angle bodies or work, as the case may be, and allowed to set. After milling, another heating process is necessary to de-block the work, from which the wax must then be removed by immersing in a suitable solvent. Because of the time entailed in these blocking, de-blocking, and cleaning operations, and danger of damage through extra handling, mechanical methods of holding the glass are to be preferred wherever possible. Glass parts are not easily held this way, and the provision of such fixtures taxes the ingenuity of the tool designer. One useful fix-

Fig. 14—Pratt & Whitney prism milling machine with 14″ diameter diamond cutter.

ture is shown in Fig. 16 and is suitable for milling parallel both sides of any 45°-45°-90° prism. The prisms are held loosely in groups of four inside the rectangular steel frame, separated where they meet by a cruciform spacer of bakelite or linoleum. The frames are then placed as close together as possible in the magnetic chuck and both sides milled in succession. Another way of reducing the amount of handling is to use a form of jig which is capable of being turned over into two, three, or more positions for milling successive angles and sides. Two such jigs, one for milling both 45° faces and vertex of binocular prisms, the other for milling three sides of a rangefinder pentagonal prism, are also shown in Fig. 16. Still other types of mechanical holding fixtures are shown in the background.

With proper care in blocking, and angle bodies accurate to one minute or less, angles may be milled to an accuracy of 1½ to 3 minutes. The care necessary may be imagined by considering that an angle of one minute represents a departure of .0003 in. per inch. Use is made of this fact

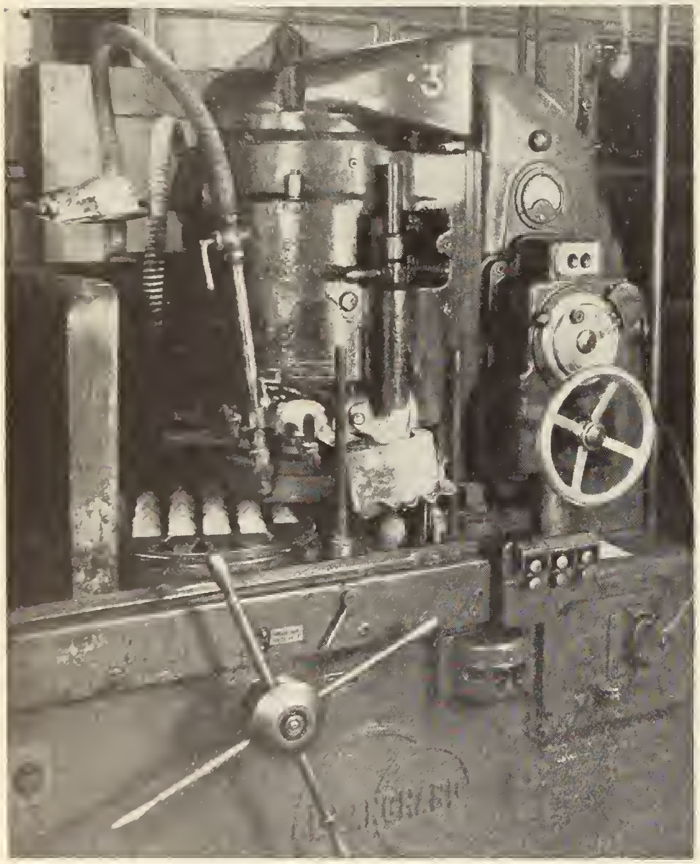


Fig. 15—View of Blanchard vertical grinder set up for prism milling.

for measuring angles by means of a direct-reading dial indicator graduated in 1/10,000ths. With its contact point about ½ in. from the base of the prism, this device will measure angles within about ½ minute. It may be used for any angle, and is set to zero with an accurate master prism. Angular tolerances of less than one minute involve control during polishing, and will be dealt with later. For many purposes an adjustable square, set from a master, is all that is necessary. These mechanical angle-checking devices are illustrated in Fig.17.

Lineal dimensions are seldom held to closer tolerances than ± .001 in. and can be maintained without undue difficulty. Allowance must of course be made on surfaces which are later to be polished, for the thickness of glass which will subsequently be removed in medium and fine grinding.

After prism blanks are milled, other operations, such as bevelling, radiusing, or slotting may be necessary. Wherever possible, bevelling is done on sticks of prisms, using a medium abrasive on a flat 10 in. or 12 in. cast-iron vertical-spindle grinding wheel. Individual prisms may be bevelled very quickly on a 10 in. diameter flat face-cutting diamond wheel mounted horizontally. Delta disc-sanding machines serve admirably for this purpose, the prism being held at the proper angle on a fixture and fed into the wheel by hand up to a stop. This method may also be used for heavy chamfers up to ¼ in. or more, and for removing corners.

The same machine also serves for radiusing the ends of prisms such as binocular prisms, using a fixture which pivots the prism around the centre of curvature while it is fed into the wheel. Both ends may be radius milled by this means at the rate of about 50 prisms per hour. The bevelling of such curved surfaces is done by hand on horizontal-spindle fine abrasive wheels with water coolant.

Circular windows, graticules, or filters, are sometimes made from moulded discs of optical glass, but it is often cheaper to cut them from commercial colourless plate glasses. The plate glass is cut into 6 in. by 6 in. squares with a glass cutter and these squares waxed onto a brass plate. This is immersed in a pan of kerosene and cut into discs on a drill press, using a hollow tubular steel or copper cutter with the end charged with diamond dust by nicking and rolling over. ¼ in. plate glass can be disc-cut in this way into 1 in. diameter pieces at the rate of 120 pieces per hr. Using high-speed drills of the Desoutter type and metal-bonded tubular cutters, it is expected that this output could be more than doubled. After milling parallel and to thickness, the discs are edged to diameter by blocking them into cylindrical sticks up to 6 in. long, using a special high-adhesion cement.* These sticks are prepared for cylindrical grinding by fastening hardened steel centres onto each end with sealing-wax. They are then edged to size between centres on a standard tool-room cylindrical grinder, equipped with a 14 in. diameter edge-cutting diamond wheel with 1 in. face. The discs are usually made about ⅛ in. oversize on diameter to allow for chips in disc-cutting and blocking errors. Tolerances in diameters vary from ± .0005 in. to ± .002 in. A stick 1 in. diameter and 6 in. long may contain 50 or more pieces, and can be edged to size in 10-15 minutes. This method is a great advance on earlier methods in which the pieces were edged singly or a few at a time on lens centering machines. Even greater cost savings may be possible if present experiments with centreless grinding are successful.

Slotting or grooving of faces and edges, when required, may conveniently be done on small horizontal milling machines using steel wheels and loose abrasive or metal-bonded diamond wheels. Graticules are often required to have a narrow slot at the edge to prevent the engraved surface from rotating after assembly. These slots are milled after the stick has been edged to size, and before de-blocking.

Inspection of the milled blanks for chips, flaws, bubbles, correct angles and dimensions is done at the end of each important operation.

PLANAR POLISHING

The methods used for planar polishing vary in accordance with the degree of accuracy required of lineal dimensions and angles. The variance lies chiefly in the methods used for supporting the glass during polishing, that is, the blocking methods; but regardless of what method of blocking is used, the methods of polishing have much in common. The polishing machines operate on the same principle as those used for lens polishing, but as they are usually designed to accommodate blocks 12 in. and more in diameter, the spindle spacing is larger, the construction heavier and more rigid, and the speeds lower. A typical planar polishing machine is shown in Fig. 18.

Medium and fine grinding are done on machines identical

*See (*) on page 307.

Fig. 16—A group of mechanical holding fixtures for prism milling.

with those used for polishing, operating at their highest speeds. The grinding tools are flat cast-iron discs of slightly larger diameter than the blocks. Abrasive is applied manually or, for the less precise work, by the rotating bowl and scoop method previously described. Two or three stages of grinding are used, depending on the finish of the work as received from the grinding shop. With a good milled finish, a medium grinding with 22½ micron abrasive for 1 hour followed by a first fine grind with 18 micron for ¾ hour and finish fine grind with 9-12½ micron for 20 minutes gives good results. About .010 in. of glass is removed in these combined grinding operations. In some cases, grinding must be continued until specific sizes are reached. All grinding is done upside-down, that is, with the block on top and the grinding tool on the revolving spindle of the machine.

The flatness of the grinding tools is of prime importance. Flatness is best checked in the same way as curves are checked in lens fine-grinding—by giving the work a quick shine on a polishing spindle and checking with a large optical flat. Sometimes the grinding tools are smooth enough to permit direct test glass readings to be taken. If the flatness is found to be off by only a few fringes across say 1/3 of the block, this may be corrected by utilizing the available adjustments on the grinding machine to give a selective grinding action. If the tools are out by a larger amount, emery paper is used to true them. For still larger errors, the tools are sent to the grinding shop and hand-ground on vertical revolving laps until flat to a straight edge. In work of the highest precision, where no error of more than one or two fringes is permissible across a 10 in. block, lower grinding speeds and constant checking are necessary, so that the grinding times given may be increased several-fold in the final stages.

The polishers used in planar work are of the same materials as for lens polishing, and the same remarks apply. The greater the flatness requirement of the surface being polished, the harder should be the pitch, otherwise ' edge-roll ' is apt to develop in the work, due to the edges being polished away more rapidly than the centre. The use of hard pitches is apt to result in scratching and this adds greatly to the difficulties of high precision work. The polishing shells are thin ribbed plates either of aluminum or cast-iron, usually of slightly smaller diameter than the block. They are coated with pitch by being stood face upwards and level, and pouring the pitch on to a thickness of ¼ in. to ½ in. The pitch is prevented from running over the edge by a rim of gummed paper stuck round the circumference of the tool. After cooling, the polisher is grooved either radially and circularly as with lens polishers, or in a pattern of squares with a heated grooving tool. For most work the polisher is now ready for use, but for work of the highest precision, a polisher is used which has already been ' broken in ' on slightly less accurate surfaces.

For all but the most precise work, polishing is done upside down, as this considerably reduces polishing time.

The degree of flatness necessary varies with different types of work. One quarter wavelength is usual for reflecting faces of prisms or mirrors in the objective system, one half to one wavelength for entrant and exit faces. For other surfaces, one wavelength is the standard tolerance, although with most focal plane surfaces, or surfaces in the eyepiece system, curvatures of 2½ wavelengths or more are quite acceptable.

Turning now to blocking methods, there are four such methods in common use. They are, in order of increasing precision: steel angle-body blocking, plaster blocking, glass angle-body blocking and contact blocking. These will now be discussed in turn.

Steel Angle-Body Blocking

Steel angle-body blocking cannot economically be justified unless the quantities required are very high—of the order of several hundred thousand prisms. This is because with any smaller number the cost of tooling would more than offset any savings attained. For that reason, we only used this method for 45°-45°-90° prisms is 6 x 30 binoculars (see Fig. 3). These prisms were polished on the two 45° faces by sticking them in groups of five on to the hypotenuse face of steel bodies, about 5 in. long, locating the prisms against a stop at one end. A special blocking jig is used to centre and align the prisms accurately on the bodies. A particularly strong cement * is required, composed of 20 oz. of rosin, 4 oz. of flake shellac and 1 oz. of beeswax. The bodies and prisms are heated and the prisms stuck to the bodies and to each other. Scrupulous care must be used to avoid dirt or dust between the prisms themselves and between the prisms and the bodies, and all traces of wax must be removed from the mounting faces of the latter. After cooling and cleaning, the bodies are mounted in groups of 14 on aluminum blocking plates, by means of Allen-head screws from underneath. The prisms at this stage are rough mouldings still on the 45° faces. After blocking, the whole block of 70 prisms is milled to the right height, fine ground, and polished. Without de-blocking the angle-bodies are then removed, cleaned, turned over 90°, and the same operations repeated on the second 45° face. Figure 19 shows the appearance of such a block at this stage. After de-blocking and cleaning, the hypotenuse face is polished by plaster blocking. In large-scale production, this method resulted in low costs, but with war-time labour the rejections for angle errors, particularly pyramidal error, in excess of 5 minutes, were seldom less than 15 per cent. Hence the method is limited to prisms with relatively large angle tolerances. Polishing times for the 45° faces in 10 in. blocks vary from two to three hours, one man operating 6 spindles.

Plaster Blocking

Plaster blocking is the most generally used of all blocking methods since no expensive tooling is involved and it is applicable to all commonly encountered classes of work. With plaster blocking, the prisms are cemented face downwards with paraffin wax onto a flat blocking

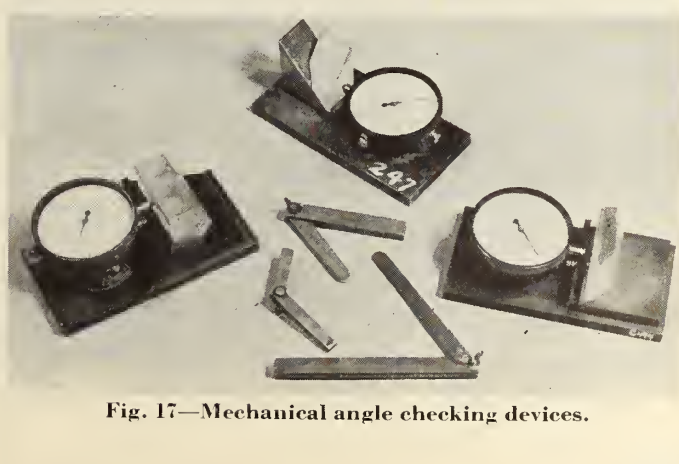

Fig. 17—Mechanical angle checking devices.

tool. A wide brass band is clamped round the rim of the tool and more melted paraffin wax poured over its surface and round the prisms to a depth of ⅛ in. The plaster mixture is then made up and poured in to the full depth of the band, which may be 4 in. or more. When this has partially set a backing plate with numerous large holes is placed on top and the plaster forced through the holes. After the plaster has set hard, this plate, which carries a hub for engaging the arm of the polishing machine, is keyed in place by the plaster which has overflowed through the holes. The block may now be removed by heating the blocking tool and sliding off. The layer of paraffin wax round the prisms is next scraped off, leaving the work projecting about ⅛ in. above the plaster surface. After shellacking to make waterproof, the block is then ready for fine-grinding and polishing. Some idea of the appearance of plaster blocks may be gathered from Fig. 18. Three points require careful attention up to this stage: first, the blocking tool must be accurately flat, the more so the closer the angular tolerance; second, the blocking tool and work must be kept scrupulously clean to avoid angular errors; third, the composition of the plaster must be carefully controlled. If too soft, the prisms will sink during grinding and polishing, and angle troubles result; if too hard, difficulty may be experienced in deblocking and the prisms may be damaged. A very good composition for this purpose is a mixture of 50 per cent. high quality (dental grade) plaster of Paris, and 50 per cent. of a special plaster made by the U.S. Gypsum Company known as Hydrocal 811. Blocks made with this mixture can be used within 12 hours. After polishing the first side, the polished surfaces are shellacked and the prisms removed by carefully tapping the block from the back until it breaks up. For many prisms all that is then necessary is to clean the prism, re-shellac the polished face, and block up in the same way, repeating the operation as many times as there are faces. With reasonable care, angles can be held within 5 minutes, usually within 2 minutes, but there are always some errors in the milled blanks and these may be superimposed on the blocking and grinding errors to cause rejection. Similarly, with two adjacent polished faces, each may make the correct angle with reference to a third face, but the cross-angle between them may be out by the sum of the individual errors. For these reasons, wherever angle tolerances of less than 5 minutes are involved it is wise to check the angle of the first polished face with the ground face next to be polished, and correct the latter if necessary, before proceeding. These hand-grinding operations are repeated for each successive face and ensure that angle rejections in the finished prisms will be low.

Fig. 18—A row of planar polishing machines with plaster blocks.

Measurements of angular errors are made optically on auto-collimating goniometers. Three types of such instruments which we designed and made ourselves are shown in Fig. 20. These are comparison devices, in which the image of an illuminated scale in the eyepiece of the viewing telescope is projected in a parallel beam, and reflected from the surface under test back onto the eyepiece scale. The co-ordinates of the reflected scale relative to the fixed scale are a measure of the amount and direction of error, the two images being first set in superposition from a master prism of correct angle. Accuracy to 1/5 min. or 12 sec. is possible. If the surface under observation is ground, a small parallel polished window is stuck to it by breathing in order to provide the necessary reflection. Correction of angle is made on a small stationary lapping disc using a medium abrasive. If the errors are of only a few minutes, a trained operator will correct 5 to 8 prisms per hour, depending on size.

A trouble frequently encountered with plaster blocks is staining. This occurs on polished faces in the plaster block and appears to be due to alkaline water penetrating the shellac from the plaster, or otherwise leaking under the shellac. Flint glasses, especially extra dense flints, are very susceptible to this trouble. Careful shellacking or a coat of clear lacquer over the shellac are both helpful. Light stains may be removed by rubbing with ceria on a soft cloth. Bad stains may necessitate hand-polishing using a pitch polisher and ceria.

Plaster blocks may be of any suitable size. 10 and 12 in. are the most common and 14-18 in. about the largest that can conveniently be handled, although blocks up to 24 in. are used by some firms. Polishing times vary with the accuracy of flatness required, size of block, and size of each individual surface in the block. For 10 in. blocks, polishing times run from 2½ to 4 hours, and with 12 in. blocks from 3 to 4½ hours. As 12 in. blocks contain nearly 50 per cent. more prisms, they are the more economical. With larger blocks still there is little increase in polishing time and even greater economies may be effected, although the difficulties in maintaining flatness are increased proportionately. An operator runs from 4 to 6 spindles, depending on the degree of precision of the work.

Glass Angle-Body Blocking

The biggest drawback of plaster blocking is the lack of control over lineal dimensions, since after blocking there is no reference surface available from which measurements may be made. This also implies some loss of control over angles, as during fine-grinding more glass may unwittingly be removed from one side of the block than the other. For these reasons we adopted glass body blocking for prisms where both angles and lineal dimensions had to be closely held. The method was particularly valuable for the intricate centre prisms in rangefinders (see detail, Fig. 4).

The angle bodies used for this purpose are made from a low-expansion glass and may be either single or double-sided—that is, the work may be blocked on either one or two faces. The bodies have ground surfaces and must be very carefully hand-corrected to the required angles and sharp height. Blocking is done with a high-adhesion cement of the type already described, the body being slightly elevated and rotated with its vertical axis horizontal. The work is then stuck on to the uppermost inclined face and slid down this until one edge locates against a horizontal stop. To ensure accurate alignment, this edge of the prism blank must be left sharp. Consideration will show that with this method of blocking there is a tendency while the cement is setting for the prisms to slide outwards, away from the body at the lower edge. This results in a slightly wedge-shaped film of cement between the prism and the body. Experience shows that the angle of the body must be increased from 1½ to 2 minutes to compensate for this—that is, a body for blocking a 45° prism face would be made with a lower base angle of 45°-1½ minutes.

After blocking, the bodies are cemented to an accurately flat base plate using a low melting-point wax, and returned to the grinding shop for rough and medium grinding of the uppermost edge. This is done by hand on vertical-spindle revolving laps about 12 in. in diameter and is an operation requiring care, and skill of a fairly high order. If the prism blanks are of correct size and the bodies all uniform in sharp height, accurate dimensions between prism faces may be held by controlling the height from the base plate as the work proceeds, using a depth micrometer. This control is continued during fine-grinding, after which polishing follows as usual. In certain cases, additional support during grinding and polishing is necessary and this is furnished by sticking supplementary supporting bodies onto the inclined face of the angle-body, in the manner shown in Fig. 21. After the first side has been polished the prisms are de-blocked, cleaned, and checked for angle. With care and experienced blocking, this method yields results such that 95 per cent of the prisms are within 3 min. of correct angle. The few which are off angle are allowed to accumulate until there are sufficient for a block. They are then re-blocked and re-polished. In addition to holding angles within 3 minutes, lineal dimensions of intricate prisms may be held within ± .002 in. The cost of tooling is not excessive and may be justified by any requirement of the order of 1,000 prisms or more.

As only precision surfaces are handled in this way, polishing times are fairly long—from 3½ to 4½ hours for a 10 in. block. One man usually operates 4 polishing spindles. Polishing is done right way up throughout.

Contact Blocking

Where angular tolerances of less than 1 min. are necessary, one is obliged to resort to contact blocking, if the work is to be done by machine rather than hand-polished. With contact blocking, the work is supported, from a face already polished, by pressing it into optical contact with the polished surface of the glass mounting body. If the parts in question were parallel windows, they would be contacted onto a 1 in. thick optical flat of the required diameter, preferably not less than 10 inches. Wedges of low angle such as rangefinder deviating wedges (Fig. 4) are contacted first onto angle bodies of the required wedge angle, then the pair are contacted as a unit onto the optical flat, which is secured to a backing plate by numerous sealing-wax points to prevent distortion and minimize temperature effects in polishing.

The optical contacting of two pieces of glass, which is analogous to the wringing together of Johanssen gauge blocks but gives a much stronger and more rigid bond, is no simple operation. Both surfaces must be perfect optical flats (within ¼ λ or less). They must be absolutely clean, as the least film of oil or speck of dust will prevent contact. This cleaning is done first with a cloth soaked in a soap-base solution with added detergent, followed by final cleaning with ether and a camel-hair brush to remove lint and dust. These precautions are of no avail unless the operator is of a dry-handed, unemotional type. If not, moisture coming from the hands and fingers will cause excessive trouble. The attainment of contact is indicated by progressive disappearance of the Newton's fringes and increasing difficulty in obtaining relative movement between the two surfaces. Many months of training are required to attain proficiency at contact blocking. After contacting, the edges in contact are shellacked to exclude water during grinding and polishing. Otherwise, contact may be broken later through capillary action.

Fig. 19—Block of 70 binocular prisms on steel angle bodies.

Let us now consider what is involved in polishing a block of parallel windows to an accuracy of ± 1 sec. An error of one second represents a departure of about .000005 or 1/200,000 in. per inch. If the block is 10 in. in diameter, this means that the parallelism of grinding across the full width of the block must be held within 1/20,000 in. This is just within the limit of what can be measured with a depth gauge of the most sensitive dial-indicator type. During grinding, the thickness of the block across several diameters is constantly checked and held inside this limit. But this is not enough. Additional errors may be introduced if the block as a whole is concave on convex. A concavity of only 5 rings would introduce a tilt at the outside of the block of 4 seconds. A high order of flatness must therefore be maintained across the whole block during grinding and polishing, and this requirement applies even more so to the optical flat to which the work is contacted. From every consideration it will be apparent that the larger the block, the higher the accuracy which is possible. Angle tolerances of ± 5 sec. can be maintained on contact blocks of 6 or 8 in. diameter. Tolerances of ± 2 sec. can be maintained with an average recovery of 75 per cent on 10 in. blocks. Where closer tolerances still are required, the pieces are made as near as possible on the machine, then individually hand-polished to perfection.

Contact blocking may be used to advantage on the important class of prisms known as roof prisms. These are usually of the form of a 45°-45°-90° prism in which the hypotenuse face, instead of being flat, is shaped like a roof whose 90° angle must be held within ± 2 sec. For polishing the last side of the roof angle, such prisms are blocked as shown in Fig. 22, being contacted first to heavy vertical bodies, and the latter contacted to the base flat. The vertical bodies wear down with each successive use and must eventually be replaced. There are other interesting methods of making roof prisms, but unfortunately space does not permit description here. This is the most difficult class of contact work, requiring great skill in blocking. If sufficient skill is available, prisms requiring reprocessing of either roof surface may be re-blocked with such accuracy that no fine-grinding is necessary.

De-blocking is accomplished by thermal shock which causes the surfaces to separate through the strains introduced. A gas flame may be used for this purpose, or ether poured on and caused to evaporate rapidly by blowing.

Fig. 20—Three types of optical goniometers.

Owing to the high order of flatness required over large areas, test glasses 4 in. or more in diameter are used for contact work. As the polishing reaches the final stages the block must be removed from the machine and allowed to cool to equilibrium before testing for flatness. For this reason, it is advantageous to work two blocks on the same spindle, alternately. Even so the lowest speeds must be used as polishing approaches completion. A skilled polisher operating four spindles may produce up to four 10 in. blocks in an 8-hour shift.

For checking angles to a tolerance of 1 sec. or less a Hilger interferometer is used after polishing is complete. This is the most sensitive comparison method available, the deviation in angle between the test piece and master prism being visible in the form of interference fringes. Estimates may be made to 1/10 of a fringe or 2 seconds with a 1 inch surface. The absolute accuracy of the master prism must be checked by mechanical methods. We used for this purpose an accurately divided circle, such as is available on the largest and most accurate spectrometers. With this, by averaging a large number of measurements across many different diameters of the divided circle, absolute accuracy is possible to $\pm$ ½ sec. across a 3 in. face. This is about the limit attainable. For checking parallel surfaces, no master is required, as the interferometer method is an absolute one. Other firms use methods of checking the work while still on the block by sensitive auto-collimators or portable interferoscopes, but we did not find such means necessary.

Windows, Filters and Graticules

For polishing windows, filters or graticules where parallelism of ½-2 minutes or more is all that is required, slightly different methods are used. For the first side, the pieces are fastened directly to the blocking plate with paraffin wax, ground, and polished. For the second side, they are laid on a flat tool with the polished face (protected by shellac) uppermost and transferred onto the blocking tool by picking them up with a thick pad of cheesecloth impregnated with high-adhesion cement. A layer of pitch may be used for this purpose instead of the cheesecloth and cement, but less trouble with sinking is encountered with the latter. The planar side of lenses may be polished by either of these last two methods, depending on the steepness of the curved side, or by blocking on a flat tool with shallow machined recesses into which the curved side is cemented.

Polishing times for 10 in. blocks are from 1 to 3 hours, depending mainly on the surface quality required. One man may run 6 or 8 spindles.

The distinction between graticules and windows lies in the quality of polish required. As these surfaces are engraved and viewed through the eye-piece of the instrument under high magnification, minute scratches, pits, seeds, or other imperfections normally invisible can be seen. Such focal plane surfaces may occur on prisms or lenses when these serve as graticules, or are cemented to them. Glass surfaces close to the focal plane also require the same order of finish as actual focal plane surfaces, and the higher the eyepiece magnification, the higher the quality required. As the magnification may be as high as 14 times, and normally lies between 8 and 12, the necessary quality of surface may be imagined.

The highest possible quality of polish depends more than anything else on great care in medium and fine grinding.

It was our experience that best results are secured by medium-grinding graticule blocks by hand on fast vertical spindle laps at 1200 ft. per min. or more. This grinding is done in two stages—25 minutes with 22½ micron, removing .005 in., and 25 minutes with 18 micron abrasive, removing .004 in. After this, the blocks are machine fine-ground in two stages, 1 hour with 12½ micron, finishing with 20 minutes with 9 micron abrasive. The actual thickness of glass removed at each stage should be checked, as damage to the surface extends much below what is apparent. The quality of abrasive and polishing agent and dust-free atmosphere are also important.

All polishing is done upside-down with very long polishing times to ensure removal of all grinding pits and other surface imperfections. For 10 in. blocks, polishing times vary from 4 to 6 hours, one man operating 6 spindles.

During and after polishing, the work is inspected on the block under the strongest light with a 7-power magnifier. The greatest skill is required for this inspection as defects are much harder to see by reflection than by transmitted light—a remark which applies to all block inspection, not only to focal plane surfaces. A polishing recovery of over 50 per cent is exceptional for graticules. The normal rates for pieces with two polished sides run from 25 to 45 per cent. The rejects are reprocessed until they become too thin.

The most difficult optical surfaces to work are focal plane prism surfaces where high surface quality must be combined with accuracy of flatness and close dimensional tolerances. Fortunately, there are not many of these.

PRODUCTION METHODS — HAND POLISHING

Before leaving the subject of polishing, a short description of hand polishing applications may be of interest. At one time all polishing was done by hand, using the same fundamental methods as those described except that the random motions and selective polishing of the machine were replaced by similar actions manually applied, usually

Fig. 21—Block of prisms on glass angle bodies with supplementary glass supporting bodies.

to one piece at a time. The trend nowadays is more and more away from hand polishing, and we carried this to the limit for two reasons: first, the almost total absence of skilled hand polishers in Canada; second, the high cost of such methods. We therefore used hand polishing mainly for the production of test glasses, both planar and spherical, for correcting contact bodies and flats, for finishing certain rangefinder parts, for emergency repairs on damaged surfaces of valuable prisms, and for correcting very small angular errors—of the order of a few seconds.

Wherever possible, all test glasses should be made from fused quartz, to minimize distortions due either to temperature differentials between the glass and the work, or to heat from the hand of the user. Quartz is harder than glass, hence more difficult to grind and polish, but the same methods are used.

Test glasses for lenses are made in pairs, one master pair of convex and concave glasses being made first for each new curve. Small diameter grinding tools are made specially for grinding test glasses. The curve on the tools is trued as accurately as possible to brass gauges which are machined to the correct radius within .0005 in. After grinding the test glass blanks in these tools, which are used for each successive stage of grinding, pitch polishers are formed in the tools and the test glasses hand polished on a slowly revolving spindle. The convex glass is usually made first and its radius checked with a precision spherometer of the Abbé type to an accuracy of approximately one part in three thousand. The attaining of correct radius is a matter of trial and correction. As soon as the radius appears to be correct, the concave glass is worked using the convex as a test glass. The polishing is completed by checking each glass against the other in a number of different relative positions and working each until perfect sphericity is attained to less than 1/4 wavelength. A pair of test glasses can seldom be made with less than 24 hours of hand work. From this master pair, working masters are then made for shop use by similar methods, and these take nearly as long to make as the original masters. On large production runs test glass making is a continuous job, as the working masters become scratched and worn after a few months' use and are subject to damage from careless handling.

Test flats are hand-worked as close as possible to a perfect reference flat. A flat is considered perfect if within 1/10 wavelength*, a condition which is harder and harder to obtain as the size increases. The large flats used for contact blocking are first polished on machines as close as possible, and then hand corrected to perfection, if necessary. With a highly skilled workman, perfect 10 in. optical flats can be made directly on the machine.

Space does not permit description of hand polishing techniques, except to mention that the greatest difficulty lies in avoiding distortions due to the heat of polishing and transmitted heat from the hand of the operator. Months of training are necessary for the simplest handwork, while the more difficult work is a craft which can only be acquired by years of practice.

Production Methods—De-Blocking and Cleaning

The importance of de-blocking and cleaning methods has never yet been sufficiently emphasized in print.

The simplest method of deblocking lenses is to chill the blocks in an electric refrigerator until the pitch becomes brittle and loses adhesion with the glass. A temperature of 0 deg. F. or lower is advisable for this purpose. First side lenses usually present no difficulty but second side lenses tend to stick in the block, because the shellacked first side is imbedded in the pitch which bonds to it strongly. Any conditions which necessitate prying of the lenses or hammering the block are bound to cause trouble either from chips, scratches, or pits caused by the excessive adhesion lifting out small particles of glass from the polished surface. Adhesion of the shellac to the pitch may be reduced by adding to the former 60 per cent. or more of rosin. After removal from the refrigerator the lenses must either drop off, or easily lift off the block.

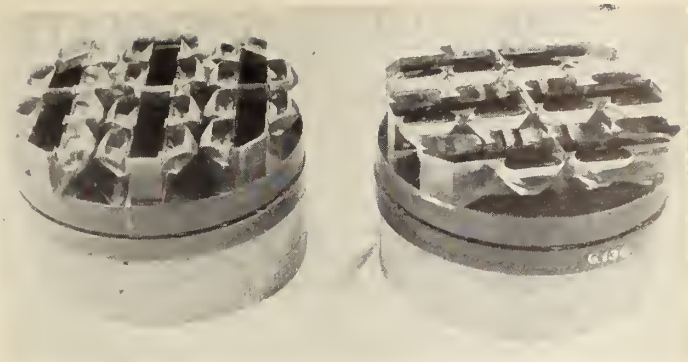

Fig. 22—Two contact blocks of roof prisms.

If sealing-wax points are used for blocking, the lenses may be de-blocked by freezing only if coated with the rosin-shellac mixture, otherwise they must first be heated off, then the sealing wax dissolved by prolonged soaking in alcohol. At one time this method was used for all lenses and prisms for removing shellac after de-blocking, but more rapid cleaning with less handling is obtained by first removing any residual pitch in a standard trichlorethylene vapour degreaser. The optics are then immersed in a series of tanks, the first with hot alkaline cleaner, followed by several hot water rinsings and wiping off. The work is loaded into wooden racks designed to prevent any possibility of contact between pieces, and the racks handled from one tank to the next, several at a time, by means of an overhead monorail. The strength, temperature, and time of immersion in the alkali are of great importance, as errors in any of these may ruin thousands of dollars worth of optics due to etching of the polished surfaces. The etching can cause a scratched appearance—perhaps through penetration and chemical attack below the surface through invisible flaws remaining from milling or grinding. A suitable alkali solution appears to be: sodium hydroxide 58 per cent, sodium carbonate 34 per cent, tri-sodium phosphate 6 per cent, detergent 2 per cent—used in the porportion of 5½ lb. to 40 gallons of water. With this solution, immersion for 2 minutes at 160 deg. F. gives satisfactory results. If a 1 to 3 per cent solution of soft soap is used in the last tank and allowed to dry on the glass, this will facilitate cleaning and prevent water stains. Care must be taken with large prisms as thermal shock may cause breakage when they are suddenly plunged into the hot cleaning solution. Flint glasses, particularly extra dense flints, are so subject to chemical attack that the closest control must be kept over all the factors mentioned to avoid trouble. Valuable prisms of such glasses are usually therefore cleaned individually, after soaking in pans of alcohol.

In handling the optics during processing, there are two fundamental points to watch: first, individual pieces or blocks must be prevented from coming into contact with each other at any point (with lenses in trays, perforated cardboard sheets are a convenient means); second, wherever pieces rest on polished surfaces, these surfaces should be protected from scratches and rubs by a piece of soft clean paper, frequently renewed. These rules for correct handling are so simple and obvious that for this very reason they seem to get overlooked or ignored, resulting in high losses or expensive repairs to finished pieces.

(To be continued in the June issue.)

* This is, of course, a purely arbitrary definition.

THE FOREMAN'S STATUS IN THE ORGANIZATION

E. R. COMPLIN

Industrial relations manager, Canadian Industries Limited, Montreal, Que., and Employers' representative, Wartime Labour Relations Board, Ottawa, Ont.

An article written at the request of the Institute Committee on Industrial Relations, being one of a series prepared for the *Journal*.

The observed tendency of foremen in the United States to listen to the advocates of unionism is leading to considerable inward scrutiny of itself by management in that country. A similar scrutiny in Canada may be beneficial whether a parallel situation is likely to arise or not.

Most companies refuse to admit any identity of interest between their foremen and the unions representing the rank-and-file employees on the grounds that disciplinary action would be seriously impaired, and that management cannot bargain collectively within itself. Such companies recognize, in words at least, that foremen, when properly titled, are a part of management. The problem is to satisfy the foremen that this is so.

What is a Foreman?

As the title "foreman" is used somewhat indiscriminately throughout industry to label men whose duties would more properly be described all the way down from superintendent to leading hand, it would be well to start with the following definition:

> "A foreman is the member of supervisory management in operations in closest direct personal contact with the working force. In general, he plans, controls and directs the work of subordinate employees, participating little or not at all in such work: his responsibilities include the operation and maintenance of the equipment in his unit of supervision subject to established production and quality control standards; and the effecting, or the effective recommendation, of the engagement, promotion, transfer or dismissal of employees in his unit."

The foregoing description excludes persons on the second and higher levels of supervision, as well as employees variously called charge-hands, group leaders, leading hands, working foremen, etc. who are characterized by (a) the absence of responsibility and authority in connection with the planning or controlling of work, and (b) regular participation in the work of the employees they lead.

Because the description appears to some management people to overstate the degree of responsibility and authority of foremen, or to lend unaccustomed dignity to the position as they know it in their own shops, there has arisen a school of thought which seeks to beg the question by denying that a foreman is any part of management, and by attempting to refer to his status as that of an agent of management. Any company, dealing with its rank-and-file employees under the terms of a union agreement which clearly sets forth a grievance procedure in which the first step is recourse to the foreman, appreciates the unfortunate results which would ensue from looking upon the foreman as an "agent". In any event, if there is anything further needed to confirm in a foreman's mind that he is a lone wolf and would be better off running in a pack devoted to the enhancement and protection of the objectives of the pack, it is for management to deny him a place within the portals while holding him responsible for results and at the same time maintaining that he may not identify himself with the employees he supervises.

There is no law forbidding foremen to be members of a union. Many foremen as a matter of course maintain membership in the union to which they belonged before promotion to foremen rank. Some laws governing collective bargaining bar foremen from inclusion in the bargaining unit designated as suitable for rank-and-file employees. Some unions will not represent foremen.

Foremen's Unions

While it is clear that foremen can be members of a union devoted to the representation of foremen's interests solely, the legal right of such a foremen's organization to compel the employer to enter into collective bargaining is not clear at the present time. In the United States, the Foreman's Association of America (F.A.A.) is the most active agent, not to be confused with the National Association of Foremen or the National Council of Foremen's Clubs (bodies which eschew collective bargaining and are devoted to the promotion by foremen of a better understanding of the nature of foremanship). The F.A.A. which has thousands of members and many locals, largely centred in the Detroit area, several months ago was the beneficiary of a ruling by the National Labour Relations Board directing the Packard Motor Car Company to negotiate with it. Recently that Board reaffirmed the ruling but, acknowledging its understanding that the employer was seeking a court decision in the matter, stated that a judicial review would be desirable in such an important issue. The issue has not yet been settled.

In Canada, one of the isolated instances of a union for foremen failed, at least temporarily, to secure certification from the Wartime Labour Relations Board for Ontario. The situation in this country is beclouded by the wording of the Wartime Labour Relations Regulations, P.C. 1003, which, while excluding from the benefits of the legislation any person "having authority to employ or discharge employees" with the intention of thereby eliminating foremen, fails to recognize that these forms of absolute authority have been passing out of existence in industry for years past.

In modern industry, absolute authority in many functions previously reposed in foremen is today placed one or two levels higher in an organization. The multiplicity of those matters, for which a foreman is now nonetheless customarily held responsible in order that he may give effective supervision, is so great that it has become necessary to introduce specialists in several lines of endeavour such as personnel, production planning and control, methods engineering, whose job it is to relieve the foreman of the necessity of devising the best procedures and to co-ordinate the application of these procedures by all foremen. This fact, coupled with the tendency of the specialists to fail to consult foremen, has led to the erroneous conception by some foremen that their importance in the general scheme has been minimized. It would appear that the majority of foremen are not concerned about having new or extended authority. Rather they are confused as to exactly what authority they are intended to possess and exercise in the various aspects of their responsibilities.

Foremen's Grievances

The more important reasons why foremen in the United States have not been impressed by management's statements that they are part of management are said to include the following:

1. Men whom he supervises may receive larger earnings than he does, and management has not appeared

concerned except to point out that the relative positions will be restored in the future.

2. The foremen see a company blithely sign an agreement with the men's union which forfeits the foreman's right to seniority credit for years spent as a foreman, if he should be demoted to the ranks.

3. The union steward knows about company decisions before the foreman does.

4. The men have recourse to a grievance procedure. It is said that the foremen can go one-over-one with personal grievances but few believe that they will be forgiven for making use of the procedure.

5. The union stewards are better trained in an understanding of the union agreement.

6. The foreman is not consulted in matters of policy affecting his men or himself but his men, through their union, have a say in matters concerning them.

7. Staff specialists such as engineers, personnel men, time clerks, etc. either countermand the foreman's orders, sell higher management without the foreman's knowledge on matters affecting his department, or issue directions without going through the foreman.

8. Conditions surrounding the jobs are sometimes less favourable than those accorded clerks who are not members of management and may themselves be unionized.

9. The foreman's responsibility and authority are not clearly defined — he is continually being charged with errors of commission or omission.

10. The company's policy in many matters is not known, and the foreman is left in the position of always having to postpone direct answers while he finds out, if he can, what the policy is.

Most of the reasons stated above could be operative in Canadian plants: all could be possible in a plant where the rank-and-file employees are unionized. Probably the higher density of union organization in the other country has brought the situation to the fore there before it has assumed any proportions in Canada. Canadian industrial relations practitioners usually watch events in the United States as an indication of what to expect here eventually unless timely first-aid is rendered. There are old adages about " forewarned " and " an ounce of prevention."

This paper opened with a reference to inward scrutiny by management in the United States where, early in 1944, a panel under the chairmanship of Dr. Sumner Slichter of Harvard University was established by the government to investigate the reasons for supervisory grievances. The extensive hearings were followed in 1945 by the publishing of a report by the American Management Association (A.M.A.) titled " The Development of Foremen in Management " which was based on a study of the Slichter Panel's report, the evaluation of questionnaire replies from almost 100 companies, interviews with many executives, discussion with a number of foremen, and a wide survey of published sources. Recently the National Association of Manufacturers of the United States issued a pamphlet " Strengthening Management Teamwork " which states the fundamental methods and techniques in much the same form as the A.M.A.'s report but without reference to the findings and reasoning which makes the latter the more outstanding contribution for the company which wishes to acquire a thorough understanding of the elements involved.

Effective Supervision Essential

Today, as never before, efficient industrial operation is required; the degree to which this objective is achieved depends in large part upon good supervision and sound relations within management. It will be found that the things which can be done to strengthen the foreman's position and improve the opportunities for him to be a manager in fact are many instances fairly simple to introduce but some may require an almost drastic, albeit beneficial, revision of many ideas and practices. A continuous organized programme of development training, one of the essentials, entails expense as well as constant attention and participation of all levels of supervisory and executive personnel.

It must be recognized also that the pursuit of effective supervision is bound to involve an investigation of how supervisors are selected, rated, and promoted if the maximum benefit is to be derived from the other class of steps to be taken. It is in this field that industry has been particularly handicapped due to lack of criteria. Much has been written about the supervisory process but little has been done yet clinically. Before selecting a supervisor, the qualities and characteristics to be sought should be clearly identified. It has been said that the vague and conflicting notions of supervisory quality entertained by managements are so sketchy that they cannot even be stated, much less measured. It is clear, of course, that quality of workmanship or long service are not indicative of a potential supervisor. Some better way than usual must be devised to determine whether a supervisor is strong or weak, in which qualities he is strong or weak, and the relative importance of the possession of various characteristics or knowledge. Lacking such indications, development training may fail to improve supervisory performance as much as it could do when the programme is tailored to fit the known needs of the organization. The difficulty envisaged by the foregoing remarks should not be permitted to discourage attempts to improve.

The A.M.A. report very aptly ends with the observation " remedial action by top management must not be confined to foremen alone, but must include their immediate supervisors as well lest a new category of ' forgotten ' men be created." As the status of men on any level is studied, the next higher level apparently becomes automatically involved. This looks like a chain reaction holding in store some rather startling effects if it proceeds far enough.

It is somewhat unfortunate that the current scrutiny of the foreman's status stemmed initially from the movement towards unionism rather than from desire to institute a sound application of the principles of organization, management, and applied psychology. However, regardless of the motivation, the important point now is that something be done to clarify the position of this member of management who has been described as the " key " man but who has not always been accorded commensurate thought nor given the training which makes it possible for him to act effectively.

It hardly seems necessary to point out that any attempt to improve the status of foremen should be proceeded with slowly, and judgment must be exercised in the selection of the stage at which to stop in light of local circumstances. It is possible to identify foremen with management too closely, and to surround him with " signs of office " to the extent that the people he supervises, with whom he may have had excellent relationships from any point of view, withdraw from him by leaving him out of their activities, out of the shop jokes and gossip, and out of their thoughts as one to whom they can turn for guidance and leadership. A reaction of this kind may be guarded against by giving adequate attention to the human and personnel aspects of good supervision in the lay-out of the development programme.

It is interesting, and provoking, to notice that whenever a group of foremen who scrutinize a list of their responsibilities are asked to indicate the topics which they feel are the most important to them, and which of these they would like to discuss first, invariably select those matters which touch upon an understanding of the human side of operations.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

A FUND TO PROVIDE EDUCATION

Before this *Journal* is distributed, all members will have been approached in reference to the creation of an educational fund by the Institute. It is hoped that, within the specified time, the full sum will have been subscribed.

The fund will enable the Institute to realise two of its objectives; firstly to commemorate the name of Harry Bennett, and secondly to play its part in providing education to deserving students of scholarship calibre who otherwise might not attend university. Both objectives are thoroughly worthy of support.

It is encouraging to have the approval of the Government in the form of tax exemption for contributions. Not only are the contributions deductible from income for tax purposes, but the fund itself will be exempt from tax. The notice from the Deputy Minister reads in part:

> "The Inspectors of Income Tax have been advised that donations to the above fund will be deductible from taxable income under the provisions of section 5 (j) and (jj) of the Income War Tax Act. The fund itself will also be exempt from tax under the provisions of section 4 (e)."

A fund of this kind is new to the Institute, but not to several other professional organizations. The history of such endeavours shows there is a genuine need for them in many fields. The broad terms under which the fund is established, will enable the money to be used for a variety of purposes, all or any of which can be changed if changed circumstances so warrant. It is a mistake to fix too firmly the conditions that control the distribution or use of such funds.

The committee handling the collection of subscriptions has done an exceptionally fine piece of work. Chairman James A. Vance of Woodstock has been well supported by R. E. Heartz of Montreal and E. V. Buchanan of London. With such careful and painstaking planning, success is bound to follow.

LEGISLATION IN QUEBEC

For several years the Corporation of Professional Engineers of Quebec has been working on amendments to the provincial engineers Act. The situation became acute last year when the provincial architects were successful in their suit to prove that an engineer was not legally permitted to design an industrial building. In addition to supporting the appeal of the court's decision, early in the year the Corporation applied for amendments to the Act that would return to the engineer his previous rights with regard to buildings.

After considerable preparation and negotiation, the amendments were brought before the Public Bills Committee for final consideration on March 26th and 27th. As opposition was offered from a variety of organizations the bill was withdrawn by the Corporation. The *Journal* understands that it is proposed to approach the legislature again shortly.

It is interesting to note the interests that opposed the amendments. There were the architects, of course, and certain others, some of whose interest in the case it was difficult to discover. There were also agronomists, contractors, miners, chemists and forest engineers.

It is disturbing to find with the opposition, representatives of such organizations which doubtless have been considered by the Corporation as "sister" societies. If the proposed amendments were not in their best interests, the Corporation would have been sympathetic to a private request for modification. It was evident that the Corporation had no intention of restricting them in any way, and if the legislation appeared to do so it was simply a misunderstanding.

This public conflict of technical groups was bad enough when it was restricted to the Architects Association and the Corporation, but it is definitely worse when other societies, seemingly more closely allied to engineers, join in the opposition. As a basis for promoting the much talked of cooperation between such groups, it is not as encouraging as could be desired.

The Corporation now faces the task of reconsidering its procedure. There was nothing basic in the proposals that should have developed opposition any place—perhaps not even with the architects. It was not the intention to infringe on the legitimate field of any individual or group. The main purpose was to remove the ambiguity of the legislation in relationship to the engineer and buildings, which had been indicated by the court's decision. Other objectives included minor matters proposed principally to bring about a clarification of wording.

It is regrettable that this temporary situation has developed, and the fact remains that it must be only temporary. The Brian Perry case is still proceeding, and it may be that a reversal of the decision here will make unnecessary any changes in the Act. It looks now at this writing as if the appeal will be heard this Spring.

A CORRECTION

Attention has been called to the statement at the foot of the fees tabulation recently circulated with the ballot for by-law amendments relative to the relationship between the grade of Fellow in the American Society of Mechanical Engineers and the American Institute of Electrical Engineers, and the grade of Member in The Engineering Institute.

This foot-note stated that "Qualifications for Fellow A.S.M.E. and A.I.E.E. are approximately the same as for Member E.I.C.". A casual study of the qualifications indicates immediately that the two are not at the same level. The grade of Fellow in each of the American organizations requires much more professional experience than does Member in the Institute, in addition to which recognized status in the profession is required. It is apparent that Fellows are selected largely for their attainments or their contributions to professional knowledge, rather than on an academic record.

The Institute's statement was based principally on the fact that graduation or an examination are not required for the Fellow grade. It was thought, in making the comparison, that the lower academic requirement balanced the higher requirement of experience and attainment.

It is difficult if not impossible to evaluate satisfactorily the two sets of qualifications, but the fact remains that no useful purpose was served in the first place by making the comparison and certainly it would not have been done had it occurred to the committee that offense might be given to members of the American Societies. Fellows of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers are distinguished members of the profession and the committee regrets that its report could have been interpreted as implying anything else.

SOUTHWARD HO!

As has been foretold for many months, great numbers of Canadians are now moving to the States. In its demand for decent wages for engineers, the Institute has pointed out the inevitability of this trend under existing conditions. In particular has it been brought to the attention of the Federal Government with the hope that salary adjustments might be made before it was too late. The following paragraph taken from the April 1st issue of *Time* indicates the urgency of the situation. Note the third paragraph in particular.

"Everybody seemed to want a U.S. visa. In 14 U.S. consulates, from Halifax to Vancouver, hard-pressed clerks interviewed Canadians, laboriously filled out long forms, took fingerprints of prospective new Americans. Last week consular officials paused to look at the record. In the last six months of 1945 they had okayed permanent visas for 8,767 Canadians. If the present pressure continued, 20,000 Canadians will migrate to the U.S. in the 1945-46 fiscal year. Not since 1931 had so many Canadians pulled up stakes and moved south.

"Officials did not have far to look for the reasons behind the increased emigration: 1) relaxation of the wartime Canadian law requiring a labor permit to leave the country; 2) easing of exchange restrictions on taking money out of Canada; 3) increased urban unemployment in the Dominion; 4) continuation of rigid Dominion wage controls.

"What worried Canadian authorities most was the sharp increase in the number of visas issued to top-class citizens. Visas for professional, clerical and other white-collar categories had shown the biggest rise of any group, 2,232 issued in the last six months of 1945, compared with 1,770 in the year 1944-45.

"For Canada this posed a major problem. The Dominion had lost one-sixth of her population to the U.S. before 1930. Stringent immigration and wartime controls had helped dry up that stream. Now the stream was rising again."

COLUMN RESEARCH COUNCIL

The announcement of the creation of this organization appeared in the October, 1945 *Journal*. It is now possible to tell something of the organizational setup, of the financial implications and the programme of work. The following paragraphs are taken from the minutes of the executive committee and the various technical committees.

The executive committee reports a revised "Statement of Purpose" as follows:

"Since existing knowledge relating to the design of compression members is inadequate, there is confusion and lack of harmony in the column formulas in the many and various specifications in use. There is an urgent need, in the interests of standardization, economy, and public safety, to bring about a general agreement among the specification-writing bodies, and thereby remove the present unsatisfactory condition.

"The purpose of the Council therefore is to review existing knowledge of the theory of columns and other compressive elements of metal structures, and of the properties of metals available for their construction; plan and carry out a program of research and tests to supplement and improve existing information regarding properties of materials and the functioning of compressive elements under various conditions in different types of structures; study the application of the results of this program to the design of such elements; develop a comprehensive, consistent set of formulas or rules covering their design; and promote the widest possible adoption of such formulas by designers and specification-writing bodies."

The chairman announced that $15,000 had been made available to the Council, and that the amount would be doubled as required. Further, it was indicated that the work of the Council would extend over several years, and that eventually it might cost as much as $250,000.00.

An initial organization was proposed to include four sub-committees as follows:

(a) Mechanical Properties of Materials.
(b) Initial Eccentricities of Compression Elements.
(c) Local Buckling of Compression Elements.
(d) Columns in Structural Frames.

It was agreed that a questionnaire be circulated, the answers to which would assist the Council in directing its initial activities towards the most urgent problems in the design of columns and other compressive elements of metal structure. Here are the questions:

1. What are the most important structural problems, involving stability against buckling, that you or your organization have encountered? In your answer to this question, please cover the following points, in addition to any other that you may consider:
   a. A clear description of the member or part of the member involved.
   b. The specification and specific design formula, used, if any.
   c. A specific reference to any research which substantiates the specification or formulas.
   d. Your opinion or experience as to the adequacy or inadequacy of the specification and formulas.
2. What structural design problems, involving stability against buckling, have you encountered or do you expect to encounter in the future, on which additional experimental or analytical research is needed? In your answer to this question, please indicate the factors which you believe have an important bearing on the buckling strength, and where the emphasis in research should be placed and why.
3. What metals do you expect to use in future structural designs? In your answer to this question, please specify clearly the particular alloys.

Your answer should be addressed to:

Shortridge Hardesty, Chairman,
Column Research Council,
101 Park Avenue, New York 17, N.Y.

The Institute representatives on the Council are P. L. Pratley and R. S. Eadie of Montreal and Dean J. N. Finlayson of Vancouver. Following is the latest list of participating organizations:

Engineering Foundation, New York.
American Society of Civil Engineers, New York.
Association of American Railroads (American Railway Engineering Association) Washington, D.C.
American Society of Mechanical Engineers, New York.
American Institute of Consulting Engineers, New York.
The Engineering Institute of Canada, Montreal.
American Institute of Steel Construction, New York.
Public Roads Administration, Washington, D.C.
American Association of State Highway Officials, Washington, D.C.
National Bureau of Standards, Washington, D.C.
Chief of Engineers, U.S. Army, Washington, D.C.
Bureau of Yards and Docks, Washington, D.C.
Bureau of Ships, Washington, D.C.
U.S. Coast Guard, Washington, D.C.
Society Naval Architects & Marine Engineers, New York.
American Standards Association, New York.
American Institute of Architects, Washington, D.C.

Pacific Coast Building Officials Conference, Los Angeles.
Structural Engineers Association of Southern California. Los Angeles.
Structural Engineers Association of Northern California. San Francisco.
American Iron and Steel Institute, New York.
Aluminum Company of America, Pittsburgh.
Steel Plate Fabricators Association, Chicago.
Institute of the Aeronautical Sciences, New York.

A LIST OF MEMBERS OF THE INSTITUTE

At last conditions seem propitious for printing a new list of members. The last one is dated 1938. No one would have thought it possible to carry on this long without a printed list, nor would anyone have dared to do so except under the unusual conditions of wartime. Shortage of paper has been the major difficulty, and of itself was sufficient to cause delay for several years. Shortage of staff and frequent change of address were two other important reasons.

It is planned to produce a list before the end of the year, perhaps in September or October. Under today's conditions of labour and materials, no one would be bold enough to say definitely when it would be ready, but shortly every member will receive a form upon which he will be asked to record certain information necessary for such a list. A facsimile of the form will appear in subsequent numbers of the *Journal* for the convenience of those who may not have received the first one, or who may have misplaced it.

A membership list is a heavy undertaking. This one will be particularly so. With over 8,000 names and addresses to arrange, and hundreds of changes going on all the time, it will not be easy to do, but it is under way and eventually will be completed.

ONE THOUSAND DOLLAR PRIZE FOR INVENTION AND RESEARCH

President Sidney Smith of the University of Toronto, announces that the University has adopted new regulations designed to encourage scientists, inventors and research workers whose discoveries may entitle them to special recognition under the terms governing the McCharles Prize. The conditions governing the Prize are as follows:

(1) to any Canadian from one end of the country to the other, and whether student or not, who invents or discovers any new and improved process for the treatment of Canadian ores or minerals of any kind, after such process has been proved to be of special merit on a practical scale;

(2) or for any important discovery, invention or device by any Canadian that will lessen the dangers and loss of life in connection with the use of electricity in supplying power and light;

(3) or for any marked public distinction achieved by any Canadian in scientific research in any useful practical line.

"The prize is offered through a bequest of the late Aeneas McCharles and is awarded by the Board of Governors of the University of Toronto.

"A committee will likely be giving consideration to an award of this prize early in 1946.

"Every candidate must be proposed in writing by some duly qualified person other than the candidate.

"Any discovery or invention claimed must be proved to the satisfaction of the award body, to possess the special practical merit indicated by the terms of the bequest.

"List of Winners of the Prize:

Mr. T. L. Willson of Ottawa, won the first award in 1909 for the invention of a process of manufacturing in a commercial way the carbide of calcium which is used in the production of acetylene gas.

Prof. S. F. Kirkpatrick won the award in 1917 for the invention of a new and improved process for the precipitation of silver from its solution in the ores of Cobalt, and also for a process for the separation of cobalt and nickel in solutions made from Cobalt ores.

Mr. S. G. Blaylock of the Consolidated Mining & Smelting Co. of Canada, won the award in 1924 for his achievements in connection with the production of electrolytic zinc and the solving of the difficulty of treating complex lead, zinc and silver ores.

Mr. R. W. Diamond of the Consolidated Mining & Smelting Co. of Canada, won the award of 1934 for (a) contribution to the solution of the concentration problem presented by the Sullivan orebody, and (b) work in the Chemical and Fertilizer Department of the Company in utilizing the roaster gases from the Trail plant.

Professor H. W. Price of Toronto won the award in 1935 for an invention in connection with the regulation of the electric power supply.

Dr. D. A. Irwin of the University of Toronto, and Dr. W. D. Robson of McIntyre Porcupine Mines, won the award in 1939 for joint investigation in connection with prevention of silicosis by metallic aluminum.

The latest recipient of the award was Dr. L. M. Pidgeon, developer of the Pidgeon Process for the production of magnesium metal from dolomite.

Any proposals for the awarding of this prize should be forwarded with necessary supporting documents to the *McCharles Prize Committee, c/o Mr. C. E. Higginbottom, Secretary, Board of Governors, University of Toronto.*"

INTERNATIONAL CONFERENCE ON LARGE ELECTRIC SYSTEMS (C.I.G.R.E.)

Reopens in Paris June 27th to July 6th

After a lapse of seven years the International Conference on large electric systems (Conférence Internationale des Grands Réseaux Electriques) will reconvene in Paris for the eleventh biennial session, which will be held from June 27th to July 6th, 1946. During the war these sessions were discontinued and the international exchange, through this organization, of operating experience and technical developments in the art of power generation and transmission was consequently discontinued.

It is anticipated that a large number of the forty-one nations represented at the 1939 Conference will participate in the discussions at the forthcoming meeting. The administrative Council of the C.I.G.R.E. has approved a programme of discussions on subjects which are of special interest due to wartime developments, or on account of technological improvements that have taken place during recent years.

The purpose of the C.I.G.R.E. is to promote the exchange of information on the design and operation of large electric systems, and through the appointment of international study groups to advance the art in all branches of the industry. These special committees, through association with the International Electrotechnical Commission, are able to formulate requirements for new or revised international standards.

The organization maintains a permanent secretariat in Paris and is administered by a Council presided over by Mr. Ernest Mercier, President of l'Union d'Electricité. International co-ordination is maintained through the individual national committees, the chairmen of which are eligible for the Administrative Council. The national committees are usually identified with a department or agency of the governments of their respective countries and members receive their appointment by this authority.

Canadian Representation

The Canadian National Committee functions under the ægis of the National Research Council at Ottawa and consists of the following members:—Mr. John Morse, M.E.I.C., Vice-President, Shawinigan Water & Power Company, Montreal—*Chairman*; Dr. C. J. Mackenzie, M.E.I.C., President, National Research Council, Ottawa—*ex-officio*; Dr. R. W. Boyle, M.E.I.C., Director, Division of Physics and Electrical Engineering, National Research Council, Ottawa —*ex-officio*; Mr. A. J. Grant, National Research Council, Ottawa—*ex-officio*; Mr. B. G. Ballard, M.E.I.C., National Research Council, Ottawa; Mr. E. V. Caton, M.E.I.C., Chief Engineer, Winnipeg Electric Company, Winnipeg; Prof. C. V. Christie, M.E.I.C., Faculty of Engineering, McGill University, Montreal; Dean E. P. Fetherstonhaugh, M.E.I.C., Faculty of Engineering and Architecture, University of Manitoba, Winnipeg, Man.; Mr. G. A. Gaherty, M.E.I.C., President, Calgary Power Company, Ltd., 244 St. James St. W., Montreal; Mr. Gordon Gale, M.E.I.C., President, Gatineau Power Company, Ottawa; Mr. R. A. C. Henry, M.E.I.C., Chairman, Air Transport Board, Ottawa, Ont.; Dr. T. H. Hogg, M.E.I.C., Chairman, Hydro-Electric Power Commission of Ontario, Toronto, Ont.; Prof. V. G. Smith, Faculty of Applied Science and Engineering, University of Toronto, Toronto, Ont.; Mr. J. W. McCammon, M.E.I.C., Commissioner and General Manager, Quebec Hydro-Electric Commission, Montreal; Mr. E. V. Leipoldt, M.E.I.C., Shawinigan Engineering Co. Ltd., *Acting Secretary* P.O. Box 6072, Montreal.

The Canadian National Committee has undertaken the sponsorship of three technical reports for presentation at the forthcoming meeting in Paris. These papers cover some of the outstanding contributions of Canadian engineers in the development, design and operation of large power systems as indicated by the following titles:—

(1) "A Review of Transmission Developments in the Systems of the Hydro-Electric Power Commission of Ontario," by A. H. Frampton and H. J. Muehleman.

(2) "Canada's 2,000,000 H.P. Hydro-Electric Saguenay System Provides Unusually Reliable Service," by F. L. Lawton, M.E.I.C.

(3) "Stability Problems on Interconnected Power System in the Province of Quebec," by John Morse, M.E.I.C.

The development of Canada as one of the world's leading producers of electric power, and as a manufacturer of electrical equipment on a large scale, entails a national responsibility to the industry and profession. The burden of this responsibility is carried by individuals who are willing to participate in the technical meetings and councils of the world, and contribute their share of knowledge.

The international organization of the C.I.G.R.E. is the natural medium for representing our interests and for exchanging technical information on operation and design which may be of mutual benefit. Anyone seeking further information about this organization or the forthcoming conference in Paris may communicate with the acting secretary of the Committee.

MEETING OF COUNCIL

A regional meeting of the Council of the Institute was held at the Royal York Hotel, Toronto, on Saturday, April 27th, 1946, convening at ten o'clock a.m.

Present: President J. B. Hayes (Halifax) in the chair; Past-President deGaspé Beaubien (Montreal); Vice-Presidents W. R. Manock (Fort Erie, Ont.), and C. E. Sisson (Toronto); Councillors P. E. Buss (Thorold); G. J. Currie (Halifax), J. R. Dunbar (Hamilton), A. R. Jones (Peterborough), W. H. M. Laughlin, (Toronto), E. Lavigne (Quebec), G. L. Macpherson (Sarnia), Norman Marr (Ottawa), C. A. Peachey (Montreal), J. B. Stirling (Montreal), J. A. Vance (London), and W. S. Wilson (Toronto); Treasurer J. A. Lalonde (Montreal); General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

There were also present by invitation—Past-Presidents T. H. Hogg and C. R. Young of Toronto; Past-Vice-Presidents R. L. Dobbin (Peterborough), and E. P. Muntz (Montreal); Past-Councillors H. E. Brandon, J. G. Hall and A. U. Sanderson of Toronto; F. R. Pope, chairman, Peterborough Branch; C. P. Haltalin, immediate past-chairman, Winnipeg Branch; P. A. Pasquet, secretary-treasurer, Niagara Peninsula Branch; G. A. Gaherty (Montreal), member of the Committee on Professional Interests; Wills Maclachlan (Toronto), chairman of the Committee on Industrial Relations; G. Ross Lord (Toronto), president of the Association of Professional Engineers of Ontario; R. C. Wiren (Toronto), chairman of the Ontario Section of the American Society of Mechanical Engineers; E. A. Cross, chairman, E. G. Tallman, secretary-treasurer, D. G. Geiger, member of the executive, J. Dibblee and Harvey Self, members of the Toronto Branch.

Conference of Empire Engineering Societies—The general secretary reported that word had been received from the British societies to the effect that every organization invited had accepted the invitation to the conference to be held in London in September next. He asked councillors to submit any subject which they thought should be included on the agenda.

Community Planning—The general secretary reported that he had been approached by Mr. Bland of the Department of Architecture at McGill University relative to the re-establishing of the Town Planning Institute. Mr. Bland believes that such an organization should be established, and wished to know if the Institute would collaborate.

Mr. Wright explained to Mr. Bland that a similar proposal had been before the Institute and the Royal Architectural Institute of Canada over a year ago, and at that time the Institute was active in getting such an organization under way. He had found, however, that there was no continued support for it from the R.A.I.C. Mr. Wright reported that Mr. Bland was to get in touch with him again with regard to a meeting.

Mr. Wright reported further with regard to the replanning of the City of Ottawa as a national memorial. Some progress had been made towards getting the situation clarified, and he had been informed by the chairman of the Federal District Commission that the government's final policy should be released through the press shortly.

A letter from the vice-president of the Central Mortgage and Housing Corporation, Major-General H. A. Young, was presented to the meeting. It reads as follows:

"24 April, 1946.

"The President,
Engineering Institute of Canada.
Dear Sir:

I learn with considerable interest and satisfaction that the Engineering Institute of Canada contemplates an active part in various aspects relative to what is commonly called "Regional and Community Planning".

Undoubtedly the provision of suitably designed homes in situations which reflect conditions of health and happiness have not received the consideration by us in the past which they should have done. Our Canada is, of course, a new country. We have only to think of the size of what our present large cities were 75 years ago, or of the number that have come into being within that time, to realize we are still a youthful country. Our efforts in most instances have been directed to the development of Canada and that is quite understandable.

But the time has now come, I feel, when we must make strong effort to make good the deficiencies of the past. It is true that to-day the word " Planning " has become a familiar word to many people, and this is a step in the right direction. But there is very much still to be done.

Various provinces throughout the Dominion are now considering suitable legislation and many municipalities have organized planning committees. One phase of the work of the Central Mortgage and Housing Corporation will be to render assistance in this connection.

We are progressing but practical fulfillment still lags behind theoretical discussions. Now, to my mind, the man who actually gets things done is the engineer. Consequently, we are dependent upon him, as a result of the various planning committees, to obtain the finished product in this development. Because of this fact, I welcome most strongly the proposed course of action by the Engineering Institute of Canada in supporting developments relating to this important field of activity.

With kindest personal regards, I am,

Sincerely,

H. A. YOUNG ".

Harry Bennett Memorial Fund—Mr. Vance, chairman of the Harry Bennett Memorial Fund Committee, reported that there had been some delay in getting material for the campaign in the hands of the branches, largely due to the fact that it had been necessary to have the Board of Trustees properly set up and authorized in order that donations to the fund could be made deductible from taxable income under the provisions of the Income War Tax Act. The necessary authorization had now been received from the Department of National Revenue, and the campaign was well under way. Encouraging reports were being received from the various branches, which indicated that the appeal was being well received by the membership. The London Branch had reached three times its quota, and the Windsor Branch was well over its quota. This progress report was noted.

A.S.M.E. Semi-Annual Meeting—Mr. Trudel gave a brief report on the semi-annual meeting of the American Society of Mechanical Engineers to be held in Detroit on June 17th to 20th inclusive, in collaboration with The Engineering Institute of Canada. He read the list of subjects to be discussed. A tentative programme appears in the April number of the *Journal,* and it was suggested that it would be very helpful to Headquarters if councillors, after having read the list of subjects, would submit names of any possible discussors. This report was noted.

The Engineer in the Civil Service—Mr. Beaubien, as a member of the Committee on the Engineer in the Civil Service, reported on the appearance made before the Royal Commission by the committee, and the brief presented at that time. He mentioned the highlights of the brief as being the recommendation that an engineer be appointed to the Civil Service Commission, and that there be an Interdepartmental Professional Technical Panel. He reported that the committee was well received, and had an interesting, and they hoped profitable discussion. The brief itself appears in the April number of the *Journal.*

Proposed Ontario Provincial Division—Mr. Sisson reported that following the suggestion made at the last meeting of council, a meeting of Ontario councillors had been held just previous to this council meeting, at which the general question of co-operation with other engineering bodies received considerable discussion. The final concensus of opinion was that this matter could best be furthered by the formation of a provincial division as provided for in the by-laws of the Institute, and he presented the following report:

> "At a meeting of the Ontario vice-presidents and councillors, at which were present representatives from the Ottawa, Peterborough, Hamilton, London, Toronto, and Niagara Peninsula Branches, the following resolution was passed unanimously:
>
> > 'Whereas there are specific problems peculiar to Ontario facing The Engineering Institute of Canada at this time, it is resolved that this meeting is in favour of the organization of a Provincial Division of The Engineering Institute of Canada, in accordance with the provisions of Sections 69 to 74 of the by-laws ' ".

Following some discussion, on the motion of Mr. Sisson, seconded by Mr. Wilson, it was unanimously resolved that council take the necessary steps to implement the resolution of the Ontario councillors. It was pointed out that the by-laws required that the majority of corporate members in the province request that a division be formed before it can be established. The general secretary was instructed to take the steps necessary to submit the proposal to the corporate membership in Ontario.

Resolution from the Toronto Branch re Canadian Council—A resolution from the Toronto Branch, submitted at the previous meeting, respecting the Canadian Council of Professional Engineers and Scientists, was dealt with by Mr. Stirling, chairman of the Committee on Professional Interests. A general discussion followed which was too long to be reported verbatim. As a summary of this discussion would not do justice to the many expressions of opinion, and as the matter was considered of such importance by all concerned, it was felt that the membership should be fully informed through an article which will be forthcoming in the *Journal.*

Toronto Branch Resolution re Salary Schedules—The general secretary, at the request of the chairman of the Committee on Employment Conditions, Mr. R. E. Heartz, reported that the committee had been working for some time in an endeavour to secure a salary schedule that would be suitable for printing on the employment page of the *Journal.* Mr. Heartz had found that there was a great variation between schedules as prepared by various organizations, and he wishes to make a very wide search before making a recommendation.

Mr. Self suggested that the resolution which had been sent to the council may have been misunderstood. It was the intention of the Junior Section that a series of salary schedules be published—not just the same one in every issue.

After considerable discussion, it was agreed that salary schedules would be printed in the *Journal,* starting with that of the Ontario Association—it being noted that these were not prepared by the Institute but were being published simply for the information of employers and employees. At the same time it was agreed that Mr. Heartz' committee should continue its work to find some one schedule that would meet all the conditions.

Appointment of Committees—A letter was presented from Mr. C. A. Peachey, advising that it would be impossible for him to accept the chairmanship of the Library and House Committee at this time. The general secretary reported that Mr. R. C. Flitton had kindly consented to act, and it was unanimously agreed that he be appointed to this office and that he be asked to name the other members of his committee for approval at the next meeting of Council.

Joint Committee on Engineering Legislation in Quebec—Mr. Beaubien, as a member of the Institute's panel on the Joint Committee, reported that the original field of the joint committee had been altered to include only considerations related to the appeal of the Brian Perry case. Considerable work had been done, and there was a possibility that the appeal would be heard some time in the month of May.

Engineering Education (Conference of Deans) — The general secretary reported that at the Conference of Deans held in Montreal during the anual meeting of the Institute, a resolution had been passed as recorded in Minute 4405 of the March meeting of Council. He reported that in accordance with instructions from council, he had written Dean McKiel and quoted from letters received from Deans Fetherstonhaugh, Young and Spencer. However, before this reply had reached Dean McKiel, a letter had been received from him stating that a date had been selected for a joint meeting to be held with the deans of engineering and representatives of certain technical professional societies. He asked the Institute to name a representative.

At the president's request, Dean Young outlined in considerable detail the discussions at the Conference of Deans which had led up to the resolution. It was the opinion of that meeting that any assistance that could be secured from engineers outside the professional educational ranks should be obtained, although it seemed evident that the educationalists themselves were better informed and more interested in the subject than most engineers in other circles.

The object of the resolution was to indicate to non-teaching bodies that the deans desired the benefit of the judgment and opinions of other persons interested in the subject. He explained that the Conference of Deans had not agreed that a joint committee should be established, but did wish to leave the door open so they could obtain the sound judgment of engineers practising in other fields. He went on to point out the trend that was developing and told of the work of the Society for the Promotion of Engineering Education. He thought the 1944 report of that committee was a firm basis for further consideration of the subject.

As far as the Universities' Conference was concerned, he thought that the deans and teachers of engineering would like to have a meeting by themselves, and that probably the engineering societies would like the same arrangement, but that this was a matter for the societies themselves to determine. He referred also to a suggestion that a Canadian section of the Society for the Promotion of Engineering Education be established in Canada.

The president thanked Dean Young for his very full and interesting statement. In view of the importance of the delegate to represent the Institute, he asked council if it would be agreeable to leaving the selection to him. This was agreed to unanimously.

Sixtieth Anniversary, 1947—The general secretary called the attention of Council to the fact that this important event was due to be celebrated at the next annual meeting. He wanted some instructions from council as to whether or not some special programme should be arranged to mark the event.

The president thought some special notice should be taken. He believed that after the long years of war, some special programme would be thoroughly justified.

Mr. Cross stated that an item on the agenda for the next meeting of the executive of the Toronto branch was consideration of inviting the Institute to hold its 1947 annual meeting in that city. He could not commit the executive in advance, but he believed the proposal would be well received. Mr. Laughlin supported him in this suggestion.

Canadian Construction Association—The general secretary presented a communication from the Canadian Construction Association in which was included a copy of a resolution passed by the Association relative to the federal and provincial governments' custom with regard to general contracts, and in particular the clause relating to the responsibilities of the contractor for determining foundation conditions.

Messrs. Muntz, Haltalin, Stirling, Young, Laughlin and Gaherty all spoke in strong support of the resolution. Eventually it was moved and seconded and carried unanimously that the Institute approve the resolution of the Canadian Construction Association and that notice of its approval be sent to the various departments of government concerned. The resolution of the Canadian Construction Association reads as follows:

"WHEREAS:—It is the practice of various Federal and Provincial Government Departments when calling for tenders on construction projects to furnish certain information regarding sub-soil conditions;

AND WHEREAS:—Said Departments place in their specifications a clause stating that all tendering parties must examine the site and obtain for themselves all necessary information for the proper carrying out of the work, and further stating that the Government does not guarantee any information furnished to the contractor regarding the nature, amount and class of materials to be excavated, and that no after claim will be allowed or entertained for any work or material that may be requisite and necessary for the proper execution of the work;

AND WHEREAS:—The obtaining of accurate sub-soil information before tendering is impracticable:—

(a) because for each tenderer so to do would cause unnecessary expense which directly or indirectly becomes a charge against the cost of carrying out the work;

(b) because it is usually impossible to make the necessary tests and borings within the time allowed for preparation and submission of tenders;

BE IT RESOLVED:—That this Association petition the Government Departments concerned to amend their specifications and Contract terms to provide,

(a) The furnishing of necessary sub-soil information based on tests made by Departmental Engineers.

(b) That in the event of Actual Sub-Soil conditions varying from the conditions described in the specifications an equitable adjustment will be made with the Contractor.

AND BE IT FURTHER RESOLVED:—That a similar petition be addressed to the R.A.I.C. and the E.I.C.".

Resolution passed at 28th Annual General Meeting, Winnipeg, January 16th, 1946.

Committee on Professional Interests—Under the heading of New Business, Mr. Dunbar moved that a sub-committee of the Committee on Professional Interests be appointed for the Province of Ontario, to be headed by an Ontario vice-chairman, the personnel of the committee to be recommended by the chairman of the committee in consultation with the Ontario vice-presidents. This motion was seconded by Mr. Stirling. Mr. Sisson pointed out that there were already three Ontario representatives on the committee, and he suggested that the sub-committee might properly be recommended by the Ontario provincial Division which was now being considered. On being put to the meeting, the motion was carried without any dissenting votes.

Mr. Sisson pointed out that if the 1947 annual meeting comes to Toronto, it would afford an excellent opportunity to complete the development of the proposed Ontario Provincial Division.

Mr. Stirling reported that since the meeting had begun, there had been a discussion between the five members of his committee who were present, and he now wished to submit the following resolution:

"That Council concurs with the recommendation of the Committee on Professional Interests that a statement reiterating and explaining the policy of the Institute along the lines outlined in the Committee's interim report dated April 12th, 1946, and that every member of council be requested to assist the committee by making observations regarding the draft, so that the statement may be accepted unanimously when presented for approval".

This was seconded by Mr. Marr, and carried unanimously.

Before adjourning the meeting, the president explained that this was the first branch meeting he had attended as president. He was very grateful for the hospitality and the warm welcome extended to him by the Toronto members. He was certain that if the Toronto branch extended an invitation to hold the Diamond Jubilee in Toronto, he would be most happy to be present.

It was noted that a regional meeting of council would be held in Trail, B.C., on May 18th, the day following the inaugural meeting of the Kootenay Branch.

The Council rose at five forty-five p.m.

ELECTIONS AND TRANSFERS

A number of applications were considered, and the following elections and transfers were effected:

Members

Craig, Gordon Harbison, B.Sc., (Elect.), (Man.), sales engr., Mumford Medland Ltd., Winnipeg, Man

Graeb, John William, B.A.Sc., (Toronto), instrument engr., St. Clair Processing Corp., Ltd., Sarnia, Ont.

Heron, Bruce O., B.A.Sc., (Toronto), executive asst. to Director of Inspection Services, Inspection Board U.K. & Canada, Ottawa, Ont.

Lockeberg, Rolf Sigurd, B.Sc., (Mech.), (Queen's), F/L., R.C.A.F., (awaiting discharge), Ottawa, Ont.

Rose, Donald Charles, B.Sc., M.Sc., (Engrg. Physics), (Queen's), Ph.D., (Cambridge), chief supt., Armament Research & Development Establishment, Valcartier, Que.

Ross, Alexander Stirling, equipt. & bldg. engr., B.C. Telephone Co., Vancouver, B.C.

Treloar, George Edward, B.A.Sc., (Toronto), chief engr., Sarnia Bridge Co., Ltd., Toronto, Ont.

Young, Minto Duncan, B.Sc., (Elect.), (Manitoba), asst. general supt., Winnipeg Hydro, Winnipeg, Man.

Juniors

Gillean, Ian, B.Eng. (Elect.), (McGill), jr. engr., Canadian Marconi Co., Montreal, Que.

Lockwood, Robert Orville, B.Sc., (Mech.), (Sask.), Capt., R.C.E.M.E., Saskatoon, Sask.

McCay, James Tackaberry, B.A.Sc., (Chem), (B.C.), heating & ventilating engr., Duwright Agencies Co., Ltd., & National Heating Products Co., Ltd., Montreal, Que.

Affiliate

Chisholm, Edward Owen, Capt., R.C.E., Oakville, Ont.

Transferred from the class of Junior to that of Member

Hunt, William Sinclair, B.Eng., (McGill), Major, R.C.E.M.E., (awaiting discharge), Montreal, Que.

Lilley, Ledford George Chester, B.Sc., (Elect.), (N.B.), Lt. Col., R.C.E., Executive Officer, N.D.H.Q., Ottawa, Ont.

McGeachy, Duncan Donald Cameron, B.Sc., (Mech.), (Queen's), student, Western Univ., London, Ont.

Transferred of the class of Student to that of Member

Eastwood, John Russell, B.Eng., (Mech.), (McGill), project engr., Canadian Industries Limited, Upper Almaville, Que.

Keeler, Russel Bruce, B.Sc., (Civil), (Sask.), F/O., R.C.A.F., Winnipeg, Man.

Schofield, William Douglas, B.Eng., (McGill), mech. supt., Slack Bros., Waterloo, Que.

Transferred from the class of Student to that of Junior

Archambault, Jean Henri, B.A.Sc., C.E., (Poly.) service manager, Lasalle Coke Co., Ltd., Montreal, Que.

Dancose, Leon Paul Emile, B.A.Sc., C.E., (Poly.), engr., mtce. of way, Canadian National Railway, Quebec, Que.

Monti, Thomas Attilio, B.A.Sc., C.E., (Poly.), assistant, Ecole Polytechnique, Montreal, Que.

Mundee, Lawrence Sterling, asst. equipt. engr., New Brunswick Telephone Co., Ltd., Saint John, N.B.

Steele, Owen Stevenson, Sub. Lieut., B. Eng., (Elect.), (N.S. Tech.), R.C.N.V.R., St. John's ,N'fld.

Whillans, Thomas George Douglas, Lieut., (E.M.E.), B.Sc., (Mech.), (Queen's), R.C.E.M.E., Ottawa, Ont.

Admitted as Students

Healey, Albert James, B.A.Sc., (Elect.), (B.C.), test course, Canadian Westinghouse, Hamilton, Ont.

Lynch, John Duncan, (N.S. Tech.), 86 Windmill Road, Dartmouth, N.S.

O'Keefe, Ronald Thomas, (N.S. Tech.), 248 Robie St., Halifax, N.S.

Vaughan, John Davidson, (N.B.), 117 Leinster St., Saint John, N.B.

By virtue of the co-operative agreement between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective.

SASKATCHEWAN

Members

Frombach, Maurice Fredolean, B.Sc., (Civil), (Sask.), engr., Natural Sodium Products Ltd., Bishopric, Sask.

Hilts, Ira Frederick, B. Sc., (Mech.), (Univ. of Montana), Dept. of Transport, Dominion Government, Winnipeg, Man.

McCallum, Francis, B.Sc., (Civil), (Sask.), district engr., P.F.R.A., Regina, Sask.

Juniors

Bothwell, William Thomas, B. Sc., (Chem.), (Alberta), plant chem. control, Imperial Oil Ltd., Regina, Sask.

Coons, Robert Melvin, B.Sc., (geological), (Sask.), geological asst., Univ. of Saskatchewan, Saskatoon, Sask.

Dokken, Lorne Albert, B.Sc., (agri.), (Sask.), engrg. dept., Imperial Oil Ltd., Regina, Sask.

Shienfield, Irvine, B.Sc.(Civil), (Sask.), jr. hydraulic engr., P.F.R.A., Regina, Sask.

Students

Boal, Alan Reginald, St. Andrew's College, Saskatoon, Sask.
Carss, Gordon Ewen, 336-6th Ave., North, Saskatoon, Sask.
Drabinsky, Ralph, 639 Ave. I So., Saskatoon, Sask.
Marshall, Douglas Hamilton, 509-12th St., Saskatoon, Sask.
Monaghan, Bernard Michael, 1718 - 22nd St., W., Saskatoon, Sask.
Moyer, Robert Lloyd, St. Andrew's College, Saskatoon, Sask.
Powell, David Allen, 806 - 8th Ave., N., Saskatoon, Sask.
Robinson, James Allen Law, St. Andrew's College, Saskatoon, Sask.
Shakotko, Leon, 209 - 29th St., W., Saskatoon, Sask.
Thompson, Francis Rex, Y.M.C.A., Saskatoon, Sask.
Uruski, Tony J. 209 Albert Ave., Saskatoon, Sask.
Westberg, Harold Arnason, 301 Bottomley Ave., Saskatoon, Sask.

Student to Junior

Clarke, Gerald Wallbridge, B.Sc., (Mech.), (Sask.), demonstrator, Univ. of Saskatchewan, Saskatoon, Sask.
Larmour, Donald Arthur, B.Sc., (Civil), (Sask.), resident engr., Department of Highways, Regina, Sask.
Loucks, George Irvin, B.Sc., (Mech.), (Sask.), demonstrator, mech. engr., Univ. of Saskatchewan, Saskatoon, Sask.
Pearson, Roderick Frank, B.Sc., (Engrg. Physics), (Sask.), power line constrn., R. J. MacRae, Saskatoon, Sask.
Spencer, Henry Anderson, B.Sc., (Mech.), (Sask.), instructor in mech. engrg. Univ. of Saskatchewan, Saskatoon, Sask.

Alberta

Members

Smith, David Athelstan Grove, B.Sc., (Mining & Met.), (Queen's), mine mgr., International Uranium Mining Co., Ltd., Contact Lake, via Yellowknife, N.W.T.
Stephenson, Robert John, resident engr., Water Supply & Sewerage, Dominion Government, Edmonton, Alta.

Junior

MacDonald, Donald Lyon, B.Sc., (Elect.), (Alberta), dftsman & asst. elect. engr., City of Edmonton Street Rly., Edmonton, Alta.

Junior to Member

Dale, John Clapham, B.Sc., (Elect.), (Alberta), asst. to constrn. supt., Canadian Utilities Ltd., Calgary, Alta.
Mitchell, Maurice Stephen, B.Sc., (Civil), (Alberta), sessional instructor, Civil Engrg. Dept., Univ. of Alberta, Edmonton, Alta.

Student to Junior

Walker, Lloyd Arthur, B.Sc., (Civil), (Alberta), jr. engr., Engineering & Construction Service, Dept. Mines & Resources, Banff, Alta.

New Brunswick

Member

Hughson, Horace Gifford, B.Sc., (Civil), (New Brunswick), resident engr., Department of Transport, Moncton, N.B.

Quebec

Members

Bourne, Obre Brabazon, Diploma, Civil Engrg., (Toronto), 5503 Trans-Island, Montreal, Que.
Bromley, George, B.Sc., (Elect.), (Manitoba), consulting engr., Montreal, Que.
McInnis, John Francis, B. Eng., (N.S. Tech.), constrn. & mtce. engr., Brown Corporation, La Tuque, Que.

Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form the basis of personal items in the *Journal*.

Dr. Charles Camsell, M.E.I.C., retiring deputy minister of mines and resources, has been honoured by the Professional Institute of the Civil Service of Canada with a special award of its medal. The award, made at that institute's annual meeting in April, is in recognition of his outstanding contribution to science and administration during his forty years in the public service.

Dr. Camsell is a past-president of the Engineering Institute.

Dr. K. M. Cameron, M.E.I.C., past-president of the Institute, has retired as chief engineer of the Department of Public Works of Canada at Ottawa. He joined the department in 1908, serving first in the offices at London, Ont., and later as district engineer at Sherbrooke, Que. In 1912 he was transferred to Ottawa as senior assistant in the dredging branch of the department. Six years later he became assistant chief engineer and in 1923 was appointed chief engineer of the department.

Works of major interest completed while Mr. Cameron has been chief engineer include three large drydocks, namely, the Saint John Drydock at Saint John, N.B., the Champlain Drydock, Quebec Harbour, and the Esquimalt Drydock at Esquimalt, B.C.

E. O. Turner, M.E.I.C., of the faculty of the University of New Brunswick, Fredericton, N.B., has been re-appointed to the Council of the Institute representing the Association of Professional Engineers of New Brunswick.

Major-General Howard Kennedy, M.E.I.C., has been appointed to the Ontario Royal Commission on Forestry at Long Branch, Ont. Formerly quartermaster general of the Canadian Army at Ottawa, General Kennedy has held the position of vice-president in charge of woods, Ontario Paper Company Limited and Quebec North Shore Paper Company for the past two years. He is chairman of the Rehabilitation Committee of the Institute.

Dr. G. M. Furnival, M.E.I.C., has recently resigned his position as field superintendent for California Standard Company in Alberta to take the appointment of director of mines, Manitoba Department of Mines and Natural Resources, Winnipeg.

H. A. Cooch, M.E.I.C., vice-president of the Canadian Westinghouse Company Limited, Hamilton, Ont., has been elected a director of the company. A graduate in electrical engineering of the University of Toronto, he has just completed 35 years with Westinghouse.

Dr. E. A. Cleveland, M.E.I.C., chief commissioner of the Greater Vancouver Water District, and past-president of the Institute, has been named by the Canadian Section of the American Water Works Association to receive its Fuller Award.

News of the Personal Activities of members of the Institute

Colonel G. W. Beecroft, M.E.I.C., has recently retired from the Canadian Army and returned to Imperial Oil Limited and International Petroleum Company Limited in Toronto.

He has served since the beginning of the war, in 1940 and 1941 in command of the No. 2 Army Field Workshop, R.C.O.C., and in 1942 with the W.G.O. Branch, Ottawa. The same year he was appointed military adviser to the Wartime Bureau of Technical Personnel at Ottawa, and in 1944 and 1945 he was overseas rehabilitation officer for the Department of Veterans Affairs, located in London, England.

He was overseas with the C.E.F. 1915-1919.

Lieutenant-Colonel W. A. Capelle, M.E.I.C., was awarded the Croix de Guerre avec palme in January. The award was made in recognition of the excellent work performed by the 2nd Bn. R.C.E. in the rapid construction of an urgently required by-pass around the bombed-out city of Caen, France, in August 1944.

Maurice Gérin, M.E.I.C., of the Canadian Fairbanks-Morse Company Limited, Montreal, has been appointed manager of the diesel sales and engineering division for the company throughout Canada. Mr. Gérin has spent his whole business life with the Canadian Fairbanks-Morse Company, starting in 1922, after having graduated from the Ecole Polytechnique as civil engineer in 1920, and with a master's degree from the Massachusetts Institute of Technology in 1921. Mr. Gérin acted as sales engineer with the company from 1925-1931, handling municipal water works equipment, diesel generating plants, quarry and mining equipment, etc. In 1931 he was appointed manager of the diesel engine department in Montreal, and in 1933 took over the electrical and pump sales as well.

Maurice Gérin, M.E.I.C.

On the declaration of war, Mr. Gérin was put in charge of the installation of diesel engines purchased by the Department of Munitions and Supply for the British Admiralty Technical Mission, which were installed in minesweepers built at Quebec, Meteghan, Shelburne, and St. John's, Newfoundland. In 1943 Mr. Gérin was put in complete charge of the shipbuilding plant of the Canadian Fairbanks-Morse Company at Shelburne, N.S., where many 126 ft. minesweepers were built for the British Admiralty.

H. R. Younger, M.E.I.C., district engineer of the Canadian Pacific Railway, Calgary, has been elected chairman of the Calgary Branch of the Institute. A graduate in civil engineering of McGill University in 1910, Mr. Younger was first employed by the Canadian Pacific during vacations, and upon graduation permanently joined its staff. Stages of his career included two years as instrumentman on construction, and two as resident engineer on construction, all at the Kootenay Central Branch. He has been division engineer at Nelson, B.C., and superintendent of the Kettle Valley Division located at Penticton, B.C., being appointed to his present position at Calgary in 1941.

Mr. Younger joined the institute as an Associate Member in 1913, becoming a Member in 1940.

A. W. Peters, M.E.I.C., has been elected chairman of the St. Maurice Valley Branch of the Institute. Born at Fredericton, N.B., he graduated in 1923 from McGill University with a B.Sc. degree. Becoming associated with the Shawinigan Water and Power Company, Three Rivers, Que., he has been with that company or a subsidiary since 1923, first as power house draughtsman, being transferred in 1924 to the operating department at the head office. In 1927 Mr. Peters engaged in general electrical distribution engineering for the North Shore Power Company and in 1930 was appointed distribution engineer for the Shawinigan Water and Power Company. He joined the Institute as a Member in 1943.

Stewart Young, M.E.I.C., was recently appointed councillor of the Institute representing the Association of Professional Engineers of Saskatchewan. Born in Owen Sound, Ont., he received the degree of B.A.Sc. from the University of Toronto in 1912.

He joined the Department of Public Works of Saskatchewan as assistant surveyor in 1912, subsequently becoming district surveyor and resident engineer. In 1924 he was appointed director of town planning in the department of municipal affairs of the Province of Saskatchewan and was later director of technical services in that department. He became director of the division of municipal planning for the government of the Province of Saskatchewan and in 1945 was named director of community planning.

Mr. Young became an Associate Member of the Institute in 1917, transferring to Member in 1935. For several years he was registrar of the Association of Professional Engineers of Saskatchewan, as well as secretary-treasurer of the Saskatchewan Branch of the Institute.

S. C. Montgomery, M.E.I.C., was recently appointed councillor of the Institute, representing the new Kootenay Branch. He was born at Winnipeg, Man., and graduated in mechanical engineering from McGill University in 1915 with the degree of B.Sc. After four years service overseas with the Canadian Expeditionary Force in World War I, he was employed in 1919 by the Whalen Pulp and Paper Company, Woodfibre, B.C., going in 1920 to the Western Canada Pulp and Paper Company at Port Mellon, B.C.

In 1923 he entered Pacific Mills Limited, Ocean Falls, B.C., as mechanical draughtsman, becoming assistant to the resident engineer in 1924 and assistant mechanical superintendent in 1926. Two years later he entered the employ of the Consolidated Mining and Smelting Company of Canada Limited at Trail, B.C., in their construction office, where he is still situated.

Mr. Montgomery, joined the Institute as a Student in 1911, transferring to Junior in 1920. He became an Associate Member in 1929 and a Member in 1940.

G. H. Wood, M.E.I.C., senior assistant engineer, Dominion Water and Power Bureau, Department of Mines and Resources, who has been stationed at Niagara Falls for many years, has been transferred to Ottawa following a recent promotion. Mr. Wood took an active part in the affairs of the Niagara Peninsula Branch of the Institute and is a past-chairman of the Branch.

Group-Captain C. A. Davidson, M.E.I.C., was the recipient of the Legion of Merit, Degree of Officer, from the Ambassador from the United States, at an investiture, in Ottawa in March, in recognition of services performed in western Canada and in the Yukon from 1942 to 1944. Group Captain Davidson is now at Maintenance Command, Uplands, Ont.

W. H. Stuart, M.E.I.C., has been transferred from the position of deputy minister, Department of Highways and Public Works, Nova Scotia Government, to that of deputy minister, Department of Industry and Publicity.

E. L. Cousins, M.E.I.C., was presented with a silver cigar box and an illuminated address from the City of Halifax in recognition of his services toward the war effort there and on behalf of the people of that city. Mr. Cousins, Wartime Administrator of Canadian Atlantic Ports, was previously general manager of the Toronto Harbour Commission.

E. A. Cross, M.E.I.C., is the newly elected chairman of the Toronto Branch of the Institute. Born in Petersfield, Hants, England, he attended Birmingham University, graduating in 1909 with the degree of B.Sc. (civil engineering). In 1910 he became associated with Birmingham Canal Navigations, England, as assistant engineer, and in 1917, after two years with the Royal Engineers in France, he became research engineer at the Royal Arsenal, Woolwich England. He returned to Birmingham Canal Navigations as Chief Assistant Engineer in 1919, remaining until 1920.

E. A. Cross, M.E.I.C.

In the United States, in the subsequent two years Mr. Cross was superintendent of construction for W. L. Stoddart, architect, New York City, on such projects as the Mica Insulating Factory, Schenectady, N.Y., Hotel Sheraton, High Point, N.C., and the Lycoming Hotel, Williamsport, Pa. He then accepted the position of structural engineer for Albert Kahn, Detroit, Mich., remaining until 1927, when he associated himself with Chapman and Oxley, Toronto, as structural engineer. In 1930 Mr. Cross established his private practice as consulting structural engineer in Toronto.

Joining the Institute as an Associate Member in 1925, he transferred to Member in 1935.

E. M. Van Koughnet, M.E.I.C., has been appointed secretary-treasurer of the Montreal Branch of the Institute. Born at Buffalo, N.Y., he attended Royal Military College, Kingston, Ont., and McGill University, Montreal, and in 1923-24 was employed by the Steel Company of Canada at Hamilton, Ont. Subsequently connected with the Bell Telephone Company, Montreal, Caron Brothers, Montreal, Shawinigan Water and Power Company, Three Rivers, Canadian and General Finance Company Limited, Toronto, he went to Brazil in 1929 for the Sao Paulo Tramway, Light and Power Company Limited.

Later he associated himself with Frederick B. Brown, consulting engineer, Montreal, with the Montreal Light, Heat and Power Company, and with Messrs. Crane and Company, Montreal, stockbrokers. In 1935 he was secretary of the League for National Government. In 1936 he became engineer for the Quebec Provincial Electricity Board, at Montreal, and returned to the board in 1946 after five years with the R.C.E., from which he was released with the rank of major.

Mr. Van Koughnet joined the Institute as a Student in 1922, transferring to Junior in 1928. He became an Associate member in 1936 and a Member in 1940.

W. D. Hurst, M.E.I.C., city engineer of Winnipeg, Man., has been named by the Minnesota Section of the American Water Works Association to receive its Fuller Award. The citation of the award refers to his work on water works schools, his work in cementing relations between the Minnesota and Canadian Sections of the association, and to his literary contributions.
