PUBLISHED MONTHLY BY

THE ENGINEERING INSTITUTE OF CANADA

2050 MANSFIELD STREET - MONTREAL

Indexed in The Engineering Index.

Price $4.00 a year in Canada, British Possessions, United States and Mexico. $5.50 a year in Foreign Countries. Current issues, 50 cents a copy, back issues 75 cents a copy. To members and affiliates, 25 cents a copy, $2.00 a year.—Authorized as second class mail, Post Office Department, Ottawa.

CONTENTS

COVER PICTURE

Canada's western coal mines produce millions of tons of lignite annually for domestic needs and export as well. At the Western Dominion Coal Mines at Taylorton, Saskatchewan, in the Estevan-Bienfait coal fields, mining is by the "stripping" method. Electrically-operated shovels and draglines strip the earth from the seams, most of which lie within 50 ft. of the surface. A giant stripping shovel operating at night is shown on the cover. This shovel works 24 hours a day, six days a week.

HOUSING PROBLEMS AND HOW HOUSING ENTERPRISES IS SOLVING THEM

D. H. STORMS
General Manager, Housing Enterprises of Canada Ltd., Toronto

An address delivered before the Hamilton Branch of The Engineering Institute of Canada, on September 26th, 1946

THE AUTHOR *enumerates the many causes of delay plaguing the house builder today, and offers some constructive suggestions for avoiding them or lessening their effect. The set-up of Housing Enterprises Limited is explained and its functions outlined. This privately financed corporation's methods of designing and building mass housing, and its system of tenant selection, are described.*

It will probably be admitted by even the most disinterested of thoughtful people that there definitely is a housing shortage in Canada. However, even that simple premise will be contested in these days of conferences, arbitration and talk, which too often delay and sometimes actually replace desperately needed action. A re-assuring writer in a recent issue of a certain trade journal attempted to show, from population statistics, that the 1946 occupancy rate of 4.37 persons for every dwelling indicates less overcrowding in Canada today than in any year since 1881. He made no allowance for the larger families of those days, requiring fewer homes for a given population, or the prevalence today of three-roomed apartments in place of more spacious dwellings. To achieve any fair comparison between occupancy rates over these six decades it should be based, not on persons per house, but on families per room. Such comparison would show a shocking condition in view of our present advanced standards of housing and hygiene.

Even the Rt. Hon. C. D. Howe admitted in a statement on housing given to Parliament last July that 150,000 units represented the minimum immediate shelter requirements. He added that by spring of 1947, thanks to more war brides and babies, there would be a housing deficit of 180,000 units. This figure takes no account of replacement of sub-standard homes, prewar overcrowding, or the attainment of a desirable vacancy rate. It is the minimum of new homes needed.

The two chief factors that created this shortage are the sharp decline in building during depression years, and the six years of war during which there was a minimum of permanent house construction. These basic factors have been further magnified by a highly increased marriage rate ever since 1940. Then, there have been several marked shifts in centres of industry during and since the war, leaving in their wake thousands of misplaced or transient workers and their families. The generally higher incomes today have created an expanded appetite for better housing, and the servant problem and income taxes have made the large house generally obsolete.

Mr. Howe estimated that to meet the need adequately we should build some 540,000 units during the next six years, approximately as follows: during 1946, 60,000; in 1947, 80,000; and in the following four years 100,000 annually. This is a sizable programme at any time compared with the average annual production to date of about 32,000 units annually. Today, with shortages of material and skilled labour, and the multiple requirements of municipal, provincial and federal bureaucracy, it is a staggering undertaking.

Before outlining some of the main difficulties, it should be pointed out that these remarks refer strictly to housing for the low to moderate income groups, or housing appropriate for the majority of our veterans. The rich will manage to build their homes in spite of the difficulties.

Delays From Shortages

Principal among these difficulties are material shortages, which will be worse before they are better, and are not confined to any one class of building material. Lumber of all kinds is scarce and largely unseasoned. Steel, copper and brass products are daily becoming scarcer due to continuing strikes. Shortage of pig iron has affected output of soil pipe, plumbing fixtures, pipe and fittings of all kinds. Sewer pipe and flue-lining are equally scarce, paper and asphalt products only slightly less so.

It is not necessary to delve deeply for the reasons. Strikes have certainly interfered with production, but these are not all on the side of labour. Certain industries have also " struck ", in effect, for higher prices or lessening of excess profits taxes. There has been dishonesty on the part of unscrupulous manufacturers and dealers who have chosen to deal in the black market both here and across the border. Conversion of industry has not always been prompt, due to conflict between management and labour, and between management and Government. The normal channels of supply, so disrupted in the interests of speed during the war, have not been fully restored. Much material is being used in construction less essential than housing, such as theatres, bowling alleys, banks, churches and " pop stands ".

Some material shortages can be alleviated by using substitutes. For others there are no substitutes, and construction delays are inevitable. For instance, where the municipality is unable to provide water and sewer services through lack of pipe, the house-builder must often go out of his way to find a water supply for his concrete. It is impossible to grade and surface the site and prepare winter construction roads if trenches cannot be back-filled. Where tile or cast iron floor drains are not available basement floors are held up, or a chase or trench must be left in the concrete. Plastering is held up for lack of water-pipe to be installed in walls, or a chased area must be left for later insertion. These postponements add to costs, and are reflected directly in higher purchase prices and rentals.

Next, labour shortages and stoppages, of both skilled and unskilled workmen, extend right through the piece: at the source, in manufacturing plants and on construction sites. The reasons are well known: First, we lost six years' production of new skilled tradesmen due to the diversion of young men to war. Now, on their return, no longer boys but adults with families to support, they naturally avoid unskilled labour or apprenticeship, with low earnings. The trades themselves are doing little to improve the situation; they jealously maintain restrictions on union membership, making it difficult for non-union workmen to get work and so qualify themselves on the job, while earning enough to support their families. Moreover, the tradesmen who have gained and are thus guarding a near monopoly of the skills, will use those skills only to a limited extent and for limited hours. The man who, in recognition of the emergency, would gladly lay his full pre-war potential of 1000 bricks a day, is practically outlawed by his fellows if he lays more than, say, 400. So, with lumbermen in the woods, with moulders in steel mills, and with carpenters on the job, the story is the same: there is not enough skilled or near skilled labour.

Delays From Other Causes

As for the red tape of building codes and administrative bureaucracy of all kinds, there are literally scores of separate agreements or approvals required for every large-scale housing project even to the start of construction, and many more minor adjustments that during construction have to be settled to the stubborn satisfaction of all parties. There could well be a cutting of red tape in all directions to achieve a more or less Dominion-wide standardized building code. Indeed, standardization could be carried into the field of town planning and zoning. Local zoning by-laws often impede the most economic installation of services, the fullest use of land, or the most attractive lay-out of houses.

Sometimes the municipal authorities are willing to amend such by-laws in their own interests, but adjacent home-owners protest any special concessions to large-scale builders. The fact that these agencies have been called in only to provide faster and more effective relief of the existing need is overlooked. The municipality at last satisfied, the whole project must still be approved as in conformity with provincial planning and development regulations; estimated rentals must be satisfactory to the Wartime Prices and Trade Board; and all costs must be approved at Ottawa before the Privy Council is asked to authorize the required loan under the National Housing Act.

The routine of calling tenders and letting contracts is aggravated today by the natural reluctance of contractors, in view of current shortages, delays, rising wage scales and rising price ceilings, to be pinned down to any price, no matter how loaded with contingencies.

Measures to Overcome Delays

This gives a dark picture of the housing problem. Yet, we should not become discouraged, for there are bright spots also. There is a general recognition of the urgency of the situation. Much has been done to facilitate the financing of large and small housing projects, through enlargement of the provisions of the National Housing Act, and their extension to lumber and mining companies to build employees' housing in outlying areas, to private builders to permit them to undertake larger-scale building than they could otherwise afford, and to private companies such as Housing Enterprises of Canada Ltd. for the construction of rental housing. The centralizing of both the federal financing authority and the federal supply authority under the one department, Reconstruction and Supply, has meant increased efficiency. Central Mortgage and Housing Corporation has under its jurisdiction the financing of all priority building, and only with its approval is the "Authority Priority Housing", or A.P.H., issued, which gives priority on construction materials of all kinds.

A.P.H.'s are available to Wartime Housing, Housing Enterprises of Canada, Veterans' Land Act building, Integrated Housing projects, and two agencies that produce dwelling units by conversion, Home Conversion and Emergency Shelter. Their issue has been extended to individual veterans who are building homes, within a price range, outside the V.L.A. though little use has been made of this as yet. A.P.H.'s are reserved to the low to moderate cost field. The prices that can be secured for luxury housing seem to provide adequate compensation and incentive to the speculative builders without any aid from Ottawa.

Agencies Engaged in Building Group Housing

Wartime Housing is a crown company which, since the war, has been constructing rental housing for municipalities, subject to provision of free land and services, and tax concessions. The houses conform to National Housing Act minimum standards, and most are without basements and furnaces. These omissions, combined with the quasi-subsidization of municipal concessions, permit their rental at lower rates than those of Housing Enterprises, to which they are otherwise comparable. Wartime Housing operates in the lowest rental field as far as new housing is concerned.

Veterans' Land Act building, under the Department of Veterans' Affairs, is largely for individual veterans who have taken advantage of the Government's liberal financing arrangement, with grants up to $1,300, for building their own homes. They may employ their own builders, but plans and costs must be approved by Central Mortgage and Housing Corporation to secure loans or priorities. A recent regulation requires the veteran to build on at least two or three acres of land, making the V.L.A. strictly a rural building agency. The "Home Conversion" scheme provides Government loans to owners of buildings for the purpose of remodelling them to new or additional dwelling units, while the "Emergency Shelter" scheme provides Government grants to municipalities for the conversion of buildings to the same purpose.

Housing Enterprises is a private company, owned by the life insurance companies that do business in Canada, using Government loans secured by mortgages. It operates in the rental field immediately above Wartime Housing, without municipal concessions of free land and tax exemptions, and their specifications are more generous, including full basements and furnaces. These features increase rentals, but make the projects more attractive to municipalities, being aimed at economic rentals. Estimates of the economic rentals set, based on estimated construction costs, must be approved by the Wartime Prices and Trade Board before construction begins. But costs today being unpredictable, should final economic rentals exceed those authorized by the Rent Controller, presumably the Company must operate at a loss. Anticipating this the Government, when it asked the life insurance companies to enter the field of rental housing, guaranteed them a 2½ per cent minimum return on their investment, while permitting them a maximum 5 per cent return if this could be achieved.

What Housing Enterprises is Trying To Do

First, there must be assurance that a sufficiently enduring need for the company's standard of rental housing exists in a given community to warrant a project of at least fifty units. Prospects must satisfy not only the mortgage men of the insurance companies but also the Government, which is both the mortgagee of the project and the guarantor of the owner's investment. Then property adequate for such a development must be located, convenient to employment centres—for working men are our logical tenants—yet one likely to retain its residential character for at least fifty years, the life of the investment, and the estimated useful life of the project. In order to keep costs down city-owned land is sought, with lowest service costs obtainable, for concessions on land and services by a municipality are reflected directly in lower rentals.

During 1946 this company is building 3500 housing units, about one-third of the number originally planned, on account of shortages in materials and labour. These 3500 comprise three standard types of dwellings, single houses, apartments and row or terrace housing. Each house type lends itself readily to variation in exterior details. They all take a square form for economy, hall space being sacrificed to living quarters, and all rooms are generally 10 per cent larger than N.H.A. minimum standards. The houses are of permanent construction, with ten-inch concrete basement walls, treated for waterproofing, and with insulated roofs. Original plans included concrete block and brick veneer construction, but due to local shortages of brick, block and bricklayers, the proportion of frame houses has been increased.

Designs and Layout of Group Housing

Apartments are designed in standard blocks, permitting many variations in design and layout. The blocks are two or three-storey, with two suites per floor, are entered by a central stairway and have rear stairs also. The apartments contain one to four bedrooms, heated from central heating plants, and equipped with refrigerators and stoves. Row or terrace housing consists of two to six-unit blocks, with units of two, three and four-bedroom design. Each unit is of two stories, with separate front and rear entrances and full basements.

All projects respect local tastes and building practices. In western communities, for example, stucco exterior replaces brick veneer and concrete block. In Saint John, coal and wood-burning kitchen ranges call for chimneys with double flues. On the West Coast the local preference is for fireplaces.

Local town planning commissions and consulting town planning engineers are always first consulted. Departure from the standard grid pattern avoids through streets and traffic, provides for green areas and play spaces, and usually achieves more lots per given area. Large-scale planning for an entire subdivision means economy for the municipality in the installation of services, and assurance of the permanent character of the neighbourhood. Terms for land and services vary in different municipalities, and are recorded in formal agreements. In some cases, in recognition of generous concessions by the municipality, the project will probably revert to it when the original financing by the company and by Ottawa is paid off.

Methods of Getting Them Built

Calling for tenders in the normal way is customary, giving competent local builders, large or small, a fair chance. We realize that customary building is somewhat reduced today due to lack of materials, for which we have certain priorities. Housing Enterprises has an understanding with the National House Builders Association that tenders from small builders would be accepted if submitted jointly by a number sufficient to undertake an entire project. It was hoped that small builders might achieve lower costs, but tenders showed otherwise, consequently most contracts have been awarded to large firms. In one case three small builders have combined on an apartment project and are giving an excellent account of themselves. Where there is little response to a call for tenders, time is often saved by going directly to a reliable contractor with the offer of a contract.

Lump sum bids are rare, and generally include allowances for contingencies such as exorbitant prices. It has become standard practice, therefore, to negotiate with the lowest of the reputable bidders on a so-called " target price " which includes the estimated costs of construction, allowance for off-site and on-site overhead, a fixed fee, plus a good contingency allowance. If the contractor keeps costs below the target, he receives 25 per cent of the saving, in addition to his fee. If his costs exceed the target, he receives the fixed fee only, and the contract actually becomes a cost-plus arrangement. Estimated rentals, as submitted to the Wartime Prices and Trade Board, are based on " target price ".

To avoid the anticipated delays, the Purchasing Department makes an early forecast of material requirements. Manufacturers and dealers are then queried as to delivery dates. Where it appears that production may be uncertain or slow, or where manufacturers are unwilling or unable to commit themselves to a large production programme, large-scale orders are placed. For example, orders were placed nearly a year ago for 3,000 warm-air furnaces and 5,000 kitchen cabinets and medicine cabinets, at a big saving in costs. When tenders are called, contractors are instructed to omit these items from their bids. Recently, in spite of this foresightedness, deliveries of furnaces and plumbing fixtures almost ceased owing to lack of steel and pig iron, occasioned by strikes.

Salvage Operations

Housing Enterprises' latest venture, one of the wisest yet undertaken, is in the field of wrecking and salvage operations. With the approval of Ottawa, several former service camps were purchased from War Assets Corporation, and a great deal of almost priceless material, lumber, plumbing, wire and electric fixtures, piping, is being salvaged therefrom. This material is saving costly delays in construction. All material is inspected, and the reports from the jobs have been excellent. Surplus salvaged materials are offered to other priority housing agencies.

Advantages of Mass Production

A word should here be added about the mass building of houses and the opportunity for low costs and speedy erection through " chain " production. Visualize a series of gangs starting out in succession, each allocated to a specific task and going from house to house doing the same or similar operation on each. This represents a " chain " and the number of chains may be suited to the job. Maintenance of an orderly sequence depends upon an ample supply of the skills required, and an adequate flow of materials. Unfortunately, neither of these conditions prevails today, hence the main advantage of mass building is lost, and costs approximate those of individual builders.

Selection of Tenants

In the realm of landlording the first problem will be tenant selection. In an owners' or " sellers " market like that of today, it would be satisfactory indeed to be able to pick and choose tenants for their financial capacity and desirability. However, by our agree-

NAVAL CABLES IN THE WAR

N. L. MORGAN, M.E.I.C.
Assistant Inspection Superintendent

S. B. THOMAS
Design Engineer

Wire and Cable Division, Northern Electric Co. Ltd., Montreal.

An address delivered before the Montreal Branch of The Engineering Institute of Canada on April 4th, 1946

This paper describes how industry has cooperated with naval authorities in converting English cable-designs to those suitable for Canadian conditions. It describes manufacturing operations and design features, made more difficult by Japan's capture of our chief sources of tin and natural rubber. It also describes some special cables used for harbour defence and the destruction of acoustic and magnetic mines.

The authors explain difficulties encountered in cable installation, and uses of electrical cables by the Royal Canadian Navy. The development and installation of different types of equipment during World War II are discussed, including a study of the magnetic field caused by a ship, its effect on the magnetic mine, the main principles of the German magnetic mine, and how floating cables were used for sweeping them.

At the beginning of the war, British Admiralty naval specifications were in use in Canada. The designs and materials referred to in these specifications were based on British cable making practice. One of the first problems of Canadian cable makers was to revise these cable designs to bring them in line with Canadian cable making practice. The cable makers made direct contact with Canadian representatives of the British Admiralty in the revision of these designs, enabling cable makers to get into production on the more urgently needed cables. It was soon found, however, that this arrangement was not the best, especially when it is considered that there were about 670 different designs of cable to be considered.

In prewar years " The Wire and Cable Manufacturers Technical Committee " was made up of representatives from engineering staffs of various cable makers in Canada, and was formed to consider various technical questions of common interest. The various branches of the Department of Defence, the Department of Munitions and Supply, the British Admiralty Technical Mission and the said Technical Committee therefore formed a committee, designated as XC—1, under the auspices of the Canadian Standards Association, to provide co-operation between the cable makers and the technical personnel of all the armed services. One of its first problems was to complete the revision of the specification to conform with Canadian cable making practice.

Early in the war it was realized that too many cable makers were making the same type of cable. In the interest of production, the various designs of cable were allocated to different makers so that, in general, only one manufacturer would be required to make any one particular design of cable.

The amount of naval cables made by the company with which the authors are associated was approximately as follows: for naval shipbuilding and refitting 15.8 million feet, for degaussing 7.4 million feet, for anti submarine cables 0.375 million feet, and anti-mine cables 0.123 million feet, a total of 23.7 million feet.

The cables weighed about 5,000 tons, included about 250 different designs and required the insulating of about 58,000,000 ft. of conductor. About 60 per cent were made for the Royal Navy and 40 per cent for the Royal Canadian Navy. Following is a description of how these cables are made and some of the problems encountered in making them.

Conductors

The conductors are of electrolytically refined copper.

The wire drawing operation starts with copper rod. This rod is ¼ in. dia. and in 1200-ft. coils of about 250 lb. The cable maker welds the coils of rod together for continuous wire drawing. The rod is stretched by drawing it through a succession of Carboloy and diamond dies, each reducing the wire one size B & S. The continuous wire-drawing machine may contain eight to sixteen dies depending on the fineness of the wire. A capstan pulls the wire through each die and the wire travels faster through each succeeding die. The dies are flooded with lubricant.

In this country, both solid and stranded conductors follow the Brown and Sharp gauge up to No. 4/0 B & S and for larger sizes they follow the circular-mill areas. In Britain, solid conductors follow the Standard Wire Gauge, but stranded conductors are made up of a number of wires of S.W.G. size, stranded together.

For those cable makers who draw their own wire, it would not have been very inconvenient to work to S.W.G. sizes but this would have increased the number of sizes of wire they must stock, which was undesirable during wartime. It was therefore agreed to work to Canadian standards and a large proportion of the wire sizes in the naval specification were changed to this end.

Annealing

Copper wires to be insulated are annealed to make them softer and more flexible. Annealing may be done in a " wet " or a " dry " furnace. In the former, the wire enters the furnace through a water lock and the atmosphere in the furnace is steam to prevent oxidation of the copper. The furnace is maintained at temperatures of from 600 to 900 deg. F. according to the type and size of wire and the annealing time is only long enough for the proper temperature.

In the " dry " type of furnace the copper is placed on a truck and covered with a metal hood. The truck is then placed in the furnace. The atmosphere inside the hood is an inert gas such as nitrogen or burnt illuminating gas, which prevents oxidation of the copper during annealing.

Wire Coatings

Practically all conductors of naval cables are copper, and when insulated with either natural or synthetic rubber, they must be coated to protect the copper and the rubber insulation from attacking each other and to assist in soldering.

Pure tin from the Dutch East Indies was originally used in coating the copper wires. The wire is coated by drawing it first through liquid flux and then through molten tin.

When the Japanese took over the East Indies they cut off about 80 per cent of our tin supply. After consultation with the Technical Committee, the Metal Controller directed that we replace the pure tin coating with an alloy of 10 per cent tin and 90 per cent lead. Later the tin content was increased to 30 per cent.

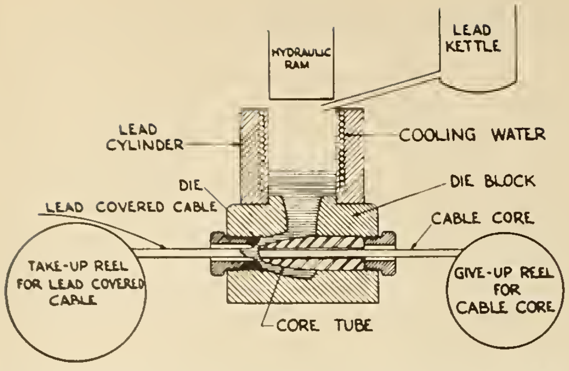

Fig. 1—Diagram showing the method of extruding lead sheath over naval cable, by means of hydraulic press.

Stranding

Conductors are solid, bunch stranded or concentric stranded. In naval cables a solid wire is generally used where the conductor is small, and not subject to movement after installation.

Where the conductor is small and is to be used in cables that may be flexed or roughly handled, the conductor generally consists of a number of fine wires of from about No. 28 to No. 34 B & S, i.e., all bunched and twisted together in the same direction. A number of bronze wires are stranded with the copper wires to give these conductors the necessary strength, annealed so as to have about the same elongation as the copper wires so they take their full share of any pull on the conductor.

Conductors larger than about No. 14 B & S are generally stranded in layers, each layer being stranded in the direction opposite to that of the layer underneath. When a large flexible conductor is desired, the solid wires of the stranded conductor may be replaced by strands, making what is called a rope-lay conductor.

Rubber Insulation

Rubber insulation is a compound of crude rubber, reclaimed rubber, curing agents, accelerators, antioxidants, softeners, reinforcing pigments and fillers, vulcanized together to provide the insulation with the physical and chemical properties required.

Crude rubber may be either natural or synthetic. The natural crude used in Canada, previous to Pearl Harbor, came mainly from Malaysia and the East Indies. The grade generally used in the cable industry is that known as " smoked sheets ", packed in bales of about 224 lb.

In formulating a rubber compound, the compound must mix satisfactorily, it must be capable of being applied to the conductor satisfactorily, it must cure satisfactorily, and it must meet all tests and operate satisfactorily. The rubber chemist must choose the proper materials in the proper amounts and have them added in the proper order, mixed for the proper time, and extruded at the proper plasticity, speed and temperature to provide a rubber compound with the desired electrical, mechanical and chemical properties.

By capturing Malaysia and the East Indies, the Japanese cut off about 97 per cent of our crude rubber supply. Stock piles of crude on this continent had to be conserved so they would last until synthetic rubber became available.

The type of synthetic rubber produced at Sarnia is called Buna-S. Buna-S containing about 25 per cent styrene is designated as GR-S. The technique of mixing GR-S compounds differs little from that of mixing natural rubber compounds but certain changes in the ingredients are important. GR-S is less tacky than natural rubber and there was an intensive search for suitable tackifiers. When one was found, the demand quickly exceeded the supply and the search continued for another. Certain fillers were found to give the compound better characteristics than others. During this period of change-over, cable makers had to develop a " synthetic-rubber " technique in a few months to replace a " natural-rubber " technique that had been gradually built up over the past 30 to 40 years. But today there are, on every sea, ships in which synthetic rubber insulated cables are operating successfully.

All ingredients, except sulphur and accelerators, are generally mixed in a Banbury internal mixer. The rubber compound is then strained by forcing the rubber compound through the screen of the strainer by means of a worm. The sulphur and accelerators are generally added after the straining operation so as to avoid premature curing due to the heat of the previous operations.

Rubber compound may be applied to wire by either the strip or the extrusion process. In Britain insulation is usually applied to conductors by the strip method, wherein the rubber compound is rolled into strips in a calender. The sheet of rubber is cut into tapes on one of the rolls, and applied to the conductor longitudinally. Several tapes may be applied, one over the other, with the seams staggered.

The extrusion method is used in Canada and it was therefore necessary to have naval authorities agree to this method. In this process, the soft, warm rubber compound is forced around the conductor by pressure exerted by a worm.

The wire is taken up in a pan containing powdered whiting. The whiting acts as a cushion for the wire and prevents turns from sticking together. The pans of wire are then placed in an autoclave in which they are cured or vulcanized under steam pressure. When large amounts of wire are to be rubber covered, the extrusion and curing is often done in one operation by what has been called the continuous insulating and vulcanizing process. The rubber compound is cured in a steam-filled pipe immediately after leaving the extruder.

Testing

Practically all rubber insulated conductors are immersed in water, after which they are subjected to a voltage test and their insulation resistance determined while still immersed. The minimum period of immersion was originally 24 hours but, because this was a production bottleneck, it was reduced to 12 hours.

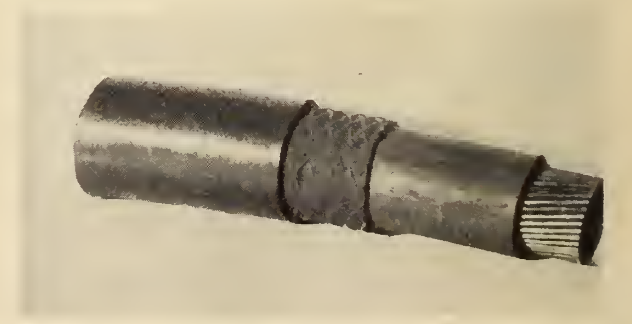

Fig. 2—Braid reinforcement between two rubber sheaths of cable.

Fig. 3—Single-conductor rubber-insulated cable used for harbour defence.

At this point of manufacture, the rubber insulation is also tested to determine its tensile strength, elongation, ageing performance, etc. In ageing the rubber insulation, the insulated wire is placed in a closed cylinder filled with oxygen at a pressure of 300 lb. per sq. in. and a temperature of 70 deg. C. for 96 hours. The effect of this ageing, on the tensile strength and elongation, is determined.

Taping and Printing

It was required that many of the rubber insulated conductors be covered with a rubber-faced cotton tape, wrapped helically on the insulated conductor with the rubber side in. In multi-conductor cables, the tape on each conductor bears a number printed on the cotton side for identification. These numbered tapes were not available in Canada at the outbreak of war. The numbers were, therefore, printed on the tape after it had been applied to the conductor.

Cabling

In making multi-conductor cables, the conductors are cabled together on a planetary strander. This type of stranding machine maintains the reels of conductors in the same orientation during their rotation around the cable and therefore, does not twist the conductors during the cabling operation.

The naval specification requires that the interstices between conductors be filled with rubber compound, since water might flow along the interstices if a cable in a flooded compartment became damaged. It is therefore necessary to extrude rubber compound over each layer of conductors before cabling the next layer of conductors.

Protective Coverings

All lead sheaths of naval cables consist of a ternary alloy of 0.15 per cent cadmium, 0.4 per cent tin and the remainder lead. British Admiralty has found this alloy to be the most suitable to withstand the vibration their cables are subjected to on shipboard.

One of the methods of producing the lead sheath is by extruding the lead over the cable by means of a hydraulic press. The molten lead is poured into the cylinder of the press and allowed to solidify. The lead, while still hot, but plastic, is forced through a die-block by a hydraulic ram and is formed around the cable as shown in Fig. 1.

Rubber sheathing compound is somewhat similar to rubber insulating compound except that it is designed to have extreme toughness regardless of electrical properties. It is extruded, using the same type of machine that extrudes rubber insulation. Rubber sheaths are often vulcanized in a lead mold, that is, a lead sheath is extruded over the unvulcanized rubber and removed after curing. This tends to make the rubber sheath more dense and give the surface a smooth and even appearance.

Some naval cables are designed with a reinforced rubber sheath, that is, they have two sheaths with canvas tape between them, applied longitudinally over the inner sheath, with edges butting. This type of reinforcement has not been used by Canadian cable makers, as far as the authors know. On account of the importance of starting delivery of cable as soon as possible, and the fact that canvas of the type specified was almost unobtainable, naval authorities agreed to accept a type of reinforcement with which the cable makers were familiar, consisting of an open hawser cord or seine twine braid. Such a braid is shown in Fig. 2. The two rubber sheaths, with the open braid between, are then cured under lead.

Some Naval Cables

One of the larger cables contains forty-three rubber insulated conductors. The insulated conductors are each covered with a numbered, rubber-faced tape. They are cabled together with a lay-up of 1-7-14-21, that is, there is one conductor in the centre, with seven in the first layer, 14 in the second layer and 21 in the third. Where each succeeding layer increases by more than six conductors there is an annular space between layers.

Some cables were covered with a tough rubber sheath whereas others were covered with a lead sheath. A number of cables were designed for use where they would be in contact with oil. In this case, the cable was covered with two layers of varnished cambric and a cotton braid impregnated with paint, offering resistance to fire and the absorption of oil.

One cable, used for harbour defence and shown in Fig. 3, was designed to lie dead at the bottom of a harbour. It was a single conductor rubber insulated cable, loaded with lead wires and single wire armoured. An interesting feature of this cable was that the interstices in the stranded conductor were filled with rubber so as to prevent water from penetrating along the conductor if the cable became damaged.

This cable was required in lengths of 18,000 ft. but 6,000 ft. was about the maximum length that could be insulated and loaded with lead wires. Three sections of lead-loaded cable were therefore spliced together and then wire-armoured to provide an 18,000-

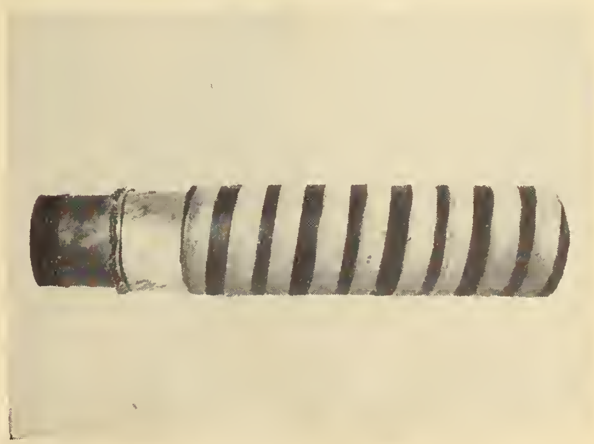

Fig. 4—Buoyant cable.

ft. length of completed cable which weighed about 23 tons.

A cable used in destroying acoustic mines consisted of five rubber insulated conductors made up into three single-wire armoured units cabled together. This construction was chosen because the cable had to be sufficiently flexible to withstand coiling and uncoiling during each operation in service.

Probably one of the most interesting cables is that designed to float on the water and shown in Fig. 4. Although several designs of cable have been made, only cable of one basic design was manufactured in Canada. These cables consisted essentially of two layers of tinned copper wires stranded around a buoyant core and covered with rubber insulation and a rubber jacket. The buoyant core consisted of cork or hard cellular rubber blocks separated by discs of soft cellular uncured rubber or neoprene to provide flexibility. Over this buoyant core were stranded four hundred No. 18 B & S medium hard drawn tinned copper wires.

The insulation consisted of rubber. A layer of rubberized canvas reinforcing tape and a rubber sheath were applied over the insulation. The discs, insulation and jacket were vulcanized under a lead sheath. The cable had an overall diameter of approximately 3.5 in.

This being a buoyant cable, it must float. It required 400 lb. of lead to keep 1200 ft. of this cable submerged in the testing tank.

Cabling Conditions and Requirements on Shipboard

During the early stages of the war, the Canadian Navy personnel were few, and for the most part quite unseasoned. It was inevitable that heavy responsibilities should be placed on men entirely inexperienced in naval matters, especially in the electrical field where so many new devices were being thrust into action before properly proving themselves. The ship itself may be aptly pictured as a floating power plant and the demands for cable are many and varied. Under these conditions it fell to cable manufacturers to supply most of the answers to the particular cable problems which repeatedly arose.

The importance of cable in the life of the ship cannot be over-emphasized. It is the channel by which the pulse is fed to every part of the ship. All navy cables are working under the worst possible conditions, due to continual exposure to water and

Fig. 5—Ice accumulation can make a 1/8 in. dia. cable grow to 6 in.

moisture, excessive heat and cold, icing conditions, and continuous vibration and movement of the ship itself. The corrosive action of salt water is well known and is an ever-present threat to the useful life of all cables wherever installed. For this reason there is a definite tendency to run to lead-covered cables in ship installations. On all modern ships there is much oil to contend with, and in the boiler and engine room many of the cables are unavoidably subjected to considerable heat. In rough seas during cold weather the accumulation of ice is amazing and a cable 1/8 in. dia. will grow to a 6 in. dia. in a very short time. (Fig. 5)

The installations of cables on shipboard are not far different from those made ashore. The same methods of making joints, splices, connections, etc., apply in both cases. The lack of space in a ship causes more congestion and therefore a more compact and neater installation is required. While installing electrical gear in a naval ship, it must be kept in mind that during the execution of duty no electrical failures must occur as this might easily result in loss of life. Maintenance duties are always at a maximum in a ship even at the best of times and especially so during enemy action. For this reason cables designed for the Navy are generally of a heavier construction than those normally employed. Lead-covered cables generally have a heavier sheath than standard. In most multi-conductor cables, unvulcanized rubber fillers replace the jute generally used.

One of the most important features of any ship is its water-tight compartments which must be kept intact at all costs. In running cables through the ship, these compartments and other bulkheads must be penetrated, and a water-tight gland must always be employed. Glands are of the usual type consisting of a packing which is screwed up tight around the cable. In all bulkheads, other than water-tight bulkheads, ordinary bushings are used to protect the cables.

Destroyers, frigates and larger ships are generally fitted with emergency circuits which may be readily connected up during failure in any part of the ship due to gun-fire, collision, or other causes. The ship is divided into compartments each with an auxiliary switchboard fitted with fuses and pilot lamps. In convenient locations throughout the ship there are wall racks containing coils of flexible cable. In an emergency, by connecting up from bulkhead to bulkhead with the flexible cable, a complete circuit may be run from the source of power to any part of the ship. To provide a quick method of pumping throughout the ship, and to assure the necessary power special connections are installed at six or eight points with flexible rubber leads to a portable pump.

A type of submarine or underwater cable is employed for controlled mines and permanent sea-bed installations and is of the usual jute protected steel wire armoured type. Single conductor cables sometimes require additional weight to prevent movement on the sea bottom and are therefore given a serving of lead wire. This type is used for leads to controlled mines and to indicator and guard loops to indicate the presence of traffic in vital areas such as the entrance to a harbour. This type of cable must withstand severe punishment where it enters the water.

Although the majority of cables are lead covered for protection against water, there are a number of flexible leads required for power, telephone, and firing circuits to revolving turrets where a lead-sheathed cable would not be practical. In some cases the outer covering of these flexible cables must have special flame or oil-proof treatment where there is excessive exposure to this source of trouble, and an outer bronze or galvanized steel braid. Light circuits to mastheads, and microphone and Aldis lamp leads are generally metal braided.

Magnetic Field of the Ship

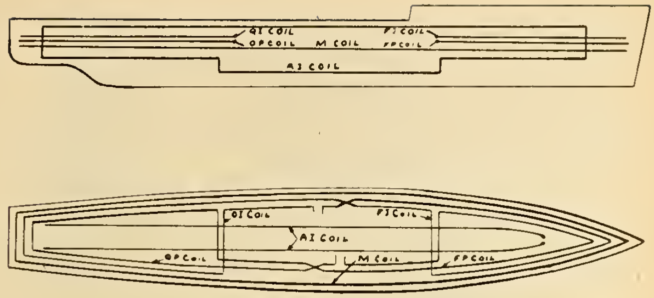
Degaussing was the Royal Navy's answer to the German magnetic mine. It derives its name from the gauss which is the unit of magnetic flux. Every ship has a magnetic field and the Germans took advantage of this fact to devise a magnetic unit which would be actuated by the increase or decrease of the earth's magnetic field as a ship moves near it. The main component of the ships magnetic field is induced by the earth's field. In the vicinity of the North Atlantic trade routes, the earth's field acts down through the ship at roughly 20 deg. from the perpendicular. Its vertical component is therefore much greater than its horizontal component and the German magnetic mine is designed to be actuated by the vertical component.

In addition to the induced field there is also a permanent field of magnetism which is set up in the ship by the earth's field while the ship is either lying in one position for a long time or during a shorter period in which the ship is subjected to excessive vibration such as riveting. Both the permanent and induced fields in the ship may be broken down into vertical, longitudinal or athwartship (horizontal across ship) components, and each can be considered and neutralized separately. Degaussing coils are installed to give a counter magnetic effect to that of the various components. The vertical component is the strongest and is compensated for by the main (M) coil, as shown in Fig. 6. The longitudinal component is neutralized by the forward (F) coil and the quarterdeck (Q) coil. The athwartship component is neutralized by the athwartship coil.

The ampere-turn has been generally accepted as a standard and convenient unit for referring to the magnetic strength of a coil. The degaussing circuit itself originally consisted of an M coil only, consisting of a few turns of cable fed through a switch from the ships generator. At the beginning of the war, little was known regarding the magnetic effect of coils on a ship and the first methods of determining the design of the degaussing coil was based on a trial and error method involving the dimensions of the ship and a multiplying factor. The coils ranged all the way from 300 to 3000 ampere-turns, according to the size of the ship.

The vertical component of earth's field varies from a maximum at the poles to zero near the equator. It is therefore necessary to adjust the strength of the degaussing coil as the ship changes latitude. To make this as simple as possible, the earth was divided into zones and a different coil setting was assigned to each zone. As the ship crossed the equator, the current in the coils was reversed by means of a reversing switch and the variation of current was generally obtained by resistors or, in some cases, by a variable voltage generator.

In the early days most installations consisted of an "M" coil only but it was found that the neutralizing effect obtained from this method was not sufficient, as it compensated for the vertical induced magnetism only. This condition may be represented by a bar magnet running horizontally fore and aft in the ship.



TYPE 2 M, FI, QI, FP, AND QP LOCATION OF COILS.

Fig. 6—Diagram illustrating the action of degaussing coils on magnetic field of ship.

The F (forward) and Q (quarterdeck) coils which counteract this horizontal longitudinal component each run roughly one-third the length of the ship but vary considerably, as determined by the structure of the ship. The horizontal longitudinal magnetism may be divided into permanent and induced components. The permanent component, during the early stages of the war, was counteracted by permanent F and O coils. Although these are still used, "deperming" is the latest method of treating this condition.

Even small wooden ships, because of the metal in their engines, have sufficient field under them to detonate the more sensitive German mines and a small degaussing coil is installed around that part of the ship.

Installation of Degaussing

In the early days of degaussing, all coils were placed outside the hull to avoid the shielding effect of iron bulwarks. They were generally run just below the main deck and secured with pitch or wooden cleats. Rough weather damaged this type of installation and the cables had to be removed to the main deck inside the bulwarks.

Even there it was difficult to keep the cables in place. Steel clamps welded to the deck would be torn off, and the cables cut or broken adrift. An endeavour was sometimes made to cover the coils with a bitumastic cement, but it was found that the water would get at the cables, resulting in shorts and grounds. The bitumastic compound also made it difficult to locate the fault and this type of installation was soon abandoned.

Eventually the degaussing coil was moved completely inside the hull of the ship. It was found that the loss in efficiency due to the shielding effect, was roughly 15 per cent and additional ampere turns were allowed for coils designed for internal installation. Single conductor cables were gradually replaced by multi-conductor cables wherever possible, resulting in much neater and quicker installation.

Tankers had to be treated differently from other types of ships due to the nature of their cargo and their structure. It was impractical to run the coil through the oil tanks, which meant the cables had to be run along the well deck, generally under water. To meet this problem, the cables were laid in a steel pipe, and through a gland into the deck house. Unfortunately, at first, it was often found that the installer had failed to provide an expansion joint so the motion of the ship soon cracked the steel pipe and salt water short-circuited the terminals. A later method of installation employed on tankers uses a lead covered and armoured cable lying along the well-deck.

Deperming

Deperming consists of removing the longitudinal permanent magnetism induced in the ship during refit or while under construction.

The P.L.M. can be roughly calculated by running over the degaussing range with the degaussing off. Most deperming stations are a mobile floating unit containing heavy duty batteries, motor generator set, reversing switches, rectifier unit and a variable liquid resistor to control the current. Deperming cable, rubber sheathed, is used in two sizes 570,000 CM and 300,000 CM for larger and smaller ships respectively, and is supplied in various lengths with lugs at each end (Fig. 7) and spiralled around the ship under the keel and over the superstructure. Rubber sleeves are clamped over the connecting lugs to keep out water. Two magnetometers or flux meters are placed under the ship's keel approximately 1/3 the distance from each end to measure the changes in field strength as the P.L.M. is reduced. About 10 or 12 turns of cable are sufficient for the test.

The initial charge or pulse, lasting several seconds, builds up a P.L.M. roughly 2½ times the original P.L.M. of the ship, but in the opposite direction. Magnetometer readings are then taken and a current calculated to reverse the P.L.M. back to 50 per cent of the original. The next pulse is calculated to bring the field to approximately zero. Two or three pulses of alternating polarity are then given the ship in rapid succession. Deperming eliminates the necessity for FP and QP coils. It should not be necessary to again deperm the ship until after a long refit or lay-up, but this can be determined periodically by ranging.

Wiping

Wiping stations were introduced in the British Isles to eliminate the necessity for degaussing coils in small coastal traders. As these ships always operate in the same zone, there is no necessity for a change of coil strength. Instead of installing a variable degaussing coil, the ship is treated by means of a horizontal coil wrapped around the ship just above the water line carrying heavy pulses of current. This places a semi-permanent vertical magnetic pole in the ship which is approximately equal and opposite to the induced vertical field. The coil is moved up and down the sides of the ship to avoid making local poles in the structure of the ship, hence the term "wiping."

The earth's field is continually weakening the effect of wiping and ships treated in this manner should be degauss-ranged approximately every three months and if necessary be rewiped. Wiping is only applied to smaller ships where the longitudinal magnetism is small enough to be ignored with safety.

Fig. 7—Rubber-sheathed deperming cables on the deck.

Degauss Ranging

Degaussing coils are designed according to the size and shape of the ship, but each ship has its own little peculiarities and no two ships react to the coil in exactly the same way. To overcome this and to obtain the proper coil setting for each ship, it is necessary to send the ship over the degaussing range. This range consists of a number of coils laid in a straight line on the ocean-bed.

These coils are accurately spaced and levelled off by a diver and weighted to hold them in position. The range is buoyed at each end and the ship passes as nearly as possible across the middle of the range at uniform speed. Ranges are laid at various depths to accommodate ships of different tonnage.

The leads from each range coil run to recording galvanometers in the range hut. As the ship moves over the coils, a graph is recorded which is proportional to the magnetic strength of the ship's field and usually referred to as the ship's signature. Signatures are measured in milli-gauss, as this unit is best suited to measure the high sensitivities of the magnetic mine. By ranging, it is possible to determine at what depths a ship will be protected against magnetic mines, depending, of course, on the sensitivity of the mines.

Another method of reading a ship's signature, generally referred to as a "pot test", was employed during the earlier days of the war and is still used for deperming and other experimental work. It employs a flux-meter in a small box which is lowered under the keel of the ship on ropes. By moving it along the length of the ship and taking readings at various points, a curve may be plotted which is just as accurate as the ship's signature obtained on the range. The original flux meter boxes (Fig. 8) were designed by the National Research Council in Halifax and consisted of a small armature revolving between two Helmholtz coils. Enough current was fed through the coils to counteract the earth's field so that the armature winding was cutting zero flux. The ship's field caused an increase in either red or blue field and the armature winding then generated a certain electromotive force which was calibrated to read directly in milligauss. The difficulties in designing this flux meter box were many, such as keeping the box and the electrical connections water-tight at the depths involved and keeping the box level by means of gymbols. Although this was a cumbersome method, it was the only one in use on this side of the Atlantic during the first year of the war.

Magnetic Mines

The Germans were the first to make use of the magnetic mine in the war just passed, and although it cannot be stated that the Allies were prepared to meet this threat, at least degaussing was advanced to the stage where installation could be immediately commenced. The circuit of the German magnetic mine consists fundamentally of an explosive charge, a battery, and a magnetic switch generally called a magnetic unit. The magnetic switch may be represented by a straight bar magnet balanced on a fulcrum which, when moved by an outside magnetic influence, closes two contacts, completing the circuit to the charge. The German magnetic unit is held upright in a gymbols and is only influenced by the vertical component of magnetism.

The sensitivity of the mine is proportional to the strength of magnetic field necessary for detonation and is controlled by the distance which the bar magnet must travel before the circuit is closed. The change in the vertical field over the surface of the earth is considerable and allowance must be made for this when laying the mine. A device known as the automatic latitude adjustment is fitted, which allows the mine unit to take up a setting corresponding to the magnetic field in that area, after which, a pre-determined sensitivity setting is put on the mine.

Many anti-sweep devices were used. The most simple of these being an anti-shock or tilting switch consisting of a sensitive arm, easily vibrated, which opens the circuit to the detonator and prevents one mine in a field detonating the remainder by shock.

Probably the best known and most effective anti-sweep device employed by the Germans is the period delay mechanism (PDM). This is a device which makes it necessary to actuate the firing mechanism several times before the mine is actually detonated. In the first days of the war before the British had time to organize their magnetic sweepers, there was no PDM and the first ship or sweep over the mine caused detonation. The introduction of the PDM made it necessary to sweep the area as many times as the maximum possible PDM setting before declaring it clear of mines.

The number of possible PDM settings increased gradually up to 24 in the mines being laid at the end of the war. When fitted with PDM, an outside magnetic influence can actuate the unit in the usual way but instead of detonating the mine, it operates a clock and runs off the predetermined setting. The last actuation closes the circuit to the detonator and fires the mines. There were also numerous slow release devices consisting of mechanical or electrical clocks or the simple soluble plug. These meant that the mine could be laid hours or days before it attained a condition enabling it to be swept.

Before the days of degaussing, all ships had a large field under them and the sensitivity of the German mine was very coarse (approx. 80 or 90 mg.). As all ships in the northern hemisphere have a north or red field, the mines were designed to be actuated by a red field (a red mine) and were unipolar. At this stage the Allies were inclined to overdegauss their ships or in other words, to leave them with a small blue field. To meet this, the Germans commenced to lay a certain percentage of blue mines which made it necessary for the Allies to further improve their degaussing and place closer limits on the safe field under the ship. The German reply to this was to introduce the bipolar mine, which is actuated by either a red or a blue field, and to considerably reduce the sensitivity of their magnetic unit. At this stage, the enemy developed and introduced the magnetic-acoustic mine. This has both a magnetic and an acoustic unit. The acoustic unit is operated first by the sound of the ship and this cocks the mine or completes the circuit to the magnetic unit. As the ship reaches a position where its magnetic field is sufficiently strong to influence the mine, the circuit to the detonator is completed and the mine explodes. This combination unit allowed the magnetic sensitivity to be reduced beyond the range which had been

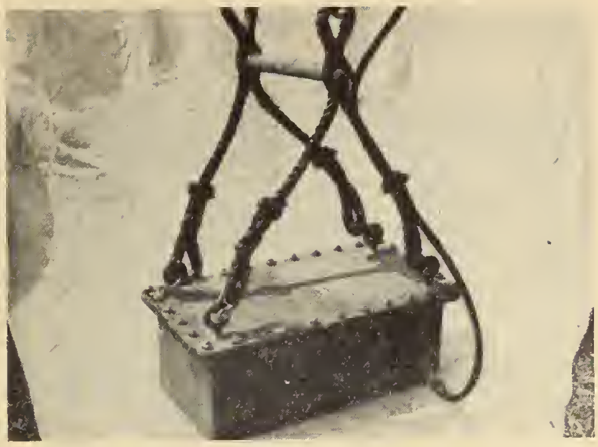


Fig. 8—Flux meter box of the type designed by the National Research Council.

practical up to this point, as sudden changes in the earth's field had formerly rendered the more sensitive magnetic mines uncontrollable.

Types of German Mines

Mines may be divided into two main classes, contact and non-contact. A contact mine must be contacted to produce detonation, while a non-contact mine is actuated by some outside influence originated at a distance. Contact mines are always moored while a non-contact mine may be either a moored or ground mine, that is, one which lies on the ocean bed. Moored mines, whether of the contact or non-contact type, are more effectively swept by an oropesa sweep which consists of a special serrated wire rope held off on the quarter by a float and paravane and towed at a specified depth by means of a multiplane kite-otter.

Non-contact mines must be swept by either a magnetic or an acoustic sweep. During the early part of the war, all magnetic mines were ground mines. The heaviest charge carried by this type of mine is approximately 1600 lb. and this weight of charge soon loses its effectiveness as the depth increases. Ground mines, therefore, are only swept for in coastal waters but with the advent of the moored magnetic mine and the magnetic pistol in torpedoes, it became necessary to extend this sweeping to deeper waters and to keep the degaussing circuit energized in any area considered dangerous, regardless of depth.

The Germans laid their mines from the air and from both surface and underwater vessels. They were either cylindrical or spherical shaped. The type "G" was one of the most effective of all German mines. It carried 1620 lb. of explosives and was equally effective as a bomb on land, or as a mine in the water. It was fitted with an impact fuse which detonated on contact with any solid substance, while if it landed in water, it acted as a ground magnetic mine. This mine was laid from the air only and, as no parachute was required, it could be used to bomb with accuracy. The most popular magnetic mine towards the close of the war was known as type "O". It was a moored magnetic mine with a charge of approximately 750 lb. (Fig. 9).

The "O" type mine was spherical shaped and could be laid either from surface craft or from special mine-laying U-boats. The Germans did not always use the conventional mines. Some mine cases were adaptable to either a magnetic or acoustic unit and the units themselves could be either red or blue or

Fig. 9—Type "O" German magnetic mine.

bi-polar (red and blue). Different magnetic units could be fitted having a large variety of sensitivities and PDM actuations. Different types of mines were laid in the same field and magnetic and acoustic mines were quite frequently mixed together, making the task of minesweeping a most difficult and hazardous duty.

Magnetic Mine Sweeping

The first Royal Navy method of sweeping magnetic mines was called the magnet-spar sweep and consisted of six bar magnets attached to a 25-ft. spar, so arranged that they were towed along at a predetermined distance above the sea bed. This sweep was clumsy and ineffective and soon gave way to the coil skid sweep which consisted of a coil of wire towed behind the sweep vessel on a small scow or skid. The current in the coil could be reversed to sweep either red or blue mines. The mine detonated under the coil skid, which was frequently damaged, but at sufficient distance astern so as not to endanger the towing vessel.

Another method used without much success was an energized coil or cable attached to a slow flying plane which skimmed across the surface of the ocean. All these methods were only used temporarily and were soon replaced by the LL magnetic sweep, which is the present-day method of sweeping mines.

The LL sweep derives its magnetic field from the heavy current flowing through a single conductor cable which floats on the surface of the water and is towed in a straight line directly astern of the mine sweeper. When first introduced by the Royal Navy, the sweep was energized by batteries, but in later models of this sweep, the source of supply is an impulse generator. The floating cables are generally referred to as tails, of which there are two behind each sweeper, a short and a long tail. At the end of each tail there is an electrode which enables the current to enter the salt water. The complete LL circuit consists of the source of power (either batteries with charging generators or an impulse generator), reversing switch, connection box for the tails at the stern, short tail, electrode, salt water, electrode, long tail and back to connection box. The salt water forms approximately 50 per cent of the circuit resistance in order to change the polarity of the sweep, heavy disconnects are provided to reverse the current.

The short tail is married to the long tail throughout its length by rope bindings about every six feet. This is of great importance to the safety of the ship as the current in the two tails are in opposite directions and where the cables are bound tightly together, they neutralize one another. This means that the actual sweeping field commences the length of the short tail astern of the sweeper and extends to the end of the long tail. The construction of the buoyant cable itself has been described previously.

The towing strain of the cable is taken by two braided wire stockings connected to two pendants at the stern. The ends of the cables receive rough usage around the stern of the ship, particularly at the wire stockings, so to lengthen their life, the usual cellular rubber blocks are replaced with wooden blocks for the first 50 ft.

The magnetic tails are stored on a reel where possible, otherwise they are flaked out on the deck. The reels in smaller sweepers are on deck, while on larger ships, they are quite often kept below decks, the cable being fed down to the reel through the deck. In larger ships, power operated reels are installed, while in the smaller ones the cables are either recovered by hand or a hand-operated reel is installed. Care must be taken not to scratch or cut the surface of the cable. Small holes soon become large, due to the leakage current, allowing water to enter the cable. The cable is inspected carefully after each sweep and all holes or scratches are wrapped with rubber tape and painted with glyptal. Periodically the tails are taken off the ship and given a megger test ashore. This discloses all the small cuts which cannot be detected visually. The life of a set of tails varies from six months to a year, depending on the treatment received. They are not generally damaged by the detonation of a mine, but occasionally the cable is severed. As the tails extend a considerable distance astern, it is not an uncommon occurrence for a ship to run over them. This generally results in a crushed section of cable or other damage and necessitates a splice or a new section put in.

The mechanism of the magnetic mine unit is such that it would be useless to maintain a steady magnetic field, even if it were practical to supply the tremendous power required. A series of pulses are carried out, the period of cycle of which, combined with the speed of the ships, assures that the entire area between ships is covered with the field, that is, that the pulses of the same polarity overlap.

Double pulsing is the usual method of sweeping, meaning that the ship pulses red and blue alternately and that the entire swept area between ships is covered both red and blue during one passage of the sweeper.

Two or more magnetic sweepers generally operate together as this gives a much more efficient sweep. The fields of each sweeper combine to give a rectangular-shaped sweep, the width of which is considered to be the distance between ships. In order that the fields will be cumulative, the two ships must be of opposite polarity and both pulsing at the same instance. This is arranged through polarity lamps on each ship which flash on as the ships pulse, indicating whether the field of the ship is blue to starboard or red to starboard. One ship assumes the role of master ship and the other is called the slave ship and keeps in synchronism with it. This may be done automatically with "slave gear" or by hand using a mechanical or electric clock, the speed of which is controlled from the bridge. It is important that the ships be accurately synchronized otherwise the efficiency of the sweep is considerably reduced.

There are several types of slave gear which involve sensitive relays, amplifying tubes and switching apparatus controlling the main disconnects. The tails of the slave ship are cut by the potential gradient set up by the tails of the master ship. This induces about .4 volts across the tail terminals which is picked up and amplified to operate the control gear on the slave ship.

In sweeping magnetic mines, using the LL sweep, the ship precedes the sweep and must pass over the mine before detonating it. It is therefore most imperative that all magnetic sweepers have as small a magnetic field as possible and for this reason the most effective magnetic sweeper is a small ship of wooden construction. Magnetic sweepers are sometimes fitted with "A" coils and may have additional small degaussing coils to further reduce their field. Great care must be taken in installing electrical circuits to eliminate any stray field and the battery connections in magnetic sweepers of this type must be carefully studied out. It is sometimes necessary to install a degaussing coil to reduce these stray fields.

HOUSING PROBLEMS AND HOW HOUSING ENTERPRISES IS SOLVING THEM (*Continued from page 4*)

ment with the Government preference must be given to (a) ex-service men with annual income not exceeding 60 per cent of the cost of the dwelling unit, or approximately $3,000; (b) ex-service men of higher incomes, but equally desperate in their search for homes; and (c) civilians whose total family income does not exceed five times the rent. From every indication there will be many more veterans from (a) alone than there are dwellings to rent, so, for the present, civilians are out of luck.

As a guide to selection among veterans a " point " system has been devised. Points are allotted for length and nature of service, size of family, and for existing need in terms of present accommodation, such as over-crowding, necessity to commute to work, broken homes, unhealthy or sub-standard quarters, or excessive rentals. Without regard to the point system special consideration is given to veterans suffering from disability or ill health. Yet shelter must not go to waste through the renting of a larger house to a childless couple. On the other hand families of six or seven cannot be permitted in a small house.

Improved Techniques Constantly Being Sought

Realizing that house building today is old fashioned and inefficient, Housing Enterprises has done some research, by substitution of certain materials for those more conventional but unobtainable, such as aluminum sheet for vitrified flue lining, and by trial of certain new and experimental construction methods. But wholesale modernization of house-building, in both methods and materials, is a pressing need. Housing Enterprises, one of the few large-scale building organizations in Canada, provides such an excellent field for experimentation that it is a " natural " to pioneer the coming revolution. The cautious, conservative guidance of the insurance companies should ensure against going too far off the rails as most revolutionaries do!

What might have been done to accelerate construction of housing in the present emergency is a measure of what must be done even yet, namely the withdrawal of materials for priority housing from the production stream at the source, on the basis of forecasts of the requirements by quantities, rate of flow, and geographical destination. Machinery to effect such an orderly distribution is fortunately now being formulated at Ottawa, with the earnest co-operation of the priority housing agencies chiefly concerned, including Housing Enterprises.

The development of industrial processes in house-building should also be pressed, to replace its unit-by-unit method and emphasis on hand operations. Such development would be helped by encouragement of large organizations and greater use of machinery and of parts factory-produced to standard specifications. A more basic change, though one not readily practicable for the Government to launch as an emergency measure, is the elimination or modification of the involved sub-contracting system. One hundred per cent co-ordination and efficiency seem unattainable so long as the materials, labour and assembly of the parts of a structure are controlled by several independent groups.

Final Solution Not Yet Reached

Such developments would undoubtedly speed the production of houses, but they are not a total solution of the problem, since they leave untouched the provision of rental housing for the low income group, which constitutes at least one third of the population. In normal times low rental housing, often of equally low or lower calibre, came from 7th or 8th-hand occupancy of houses. Today, with our emergency rent control and eviction freeze, excellent as they have been for their purpose, this source is closed. New low rental housing may be created by building shacks without any of the amenities, but this is unsound from the national health point of view, and because such building rapidly degenerates into unprofitable slums. Our family allowances legislation is an attempt, only partially successful, to raise incomes to meet the costs of decent living, but expansion of this provision to meet economic rents of new housing does not seem practicable.

Yet it remains an undeniable fact that no new housing of decent standards can be built today by any method, which at economic rents can provide shelter within the means of the low income group. The next few months should see the first few hundreds of Housing Enterprises dwelling units happily occupied. Let us look forward to the day when not a few hundreds only, but every Canadian who needs one, may secure a " home " worthy of the name.

UTILIZATION OF SYDNEY SLAGS FOR ENGINEERING AND AGRICULTURE

NORMAN A. PARLEE, JR.E.I.C.
Director of Research and Development, Dominion Steel and Coal Corporation, Sydney, N.S.

A paper delivered at the 1946 Maritime Professional Meeting of The Engineering Institute of Canada, The Pines, Digby, N.S., September 6, 1946.

The use of Sydney blast furnace slag for railroad ballast, road building, insulation, aggregate, etc., its possible use in cement manufacture, in making light concrete, and as a soil conditioner are discussed.

Their lime, phosphorus and magnesia content make Sydney open hearth slags valuable as soil conditioners and fertilizers. Researches by the Nova Scotia Agricultural Slag Committee in this field are described. Chemical treatment of run-off slag for recovery of phosphorus and vanadium is mentioned.

Large quantities of slag are produced in the making of blast furnace pig iron and in the making of open hearth steel at the Sydney plant of the Dominion Steel and Coal Corporation (Dosco). The production of slags at Sydney during 1944 amounted to some 320,000 tons of blast furnace slag and 146,000 tons of open hearth slag. The chemical compositions of the different slags are given in the accompanying table. The open hearth slag is of two general types—run-off slag and tapping slag. The run-off slag runs out of the front doors of the furnace early in the working of the heat and generally shortly after the hot metal addition. This slag flushes off a large proportion of the easily oxidizable elements and easily removable impurities. Following this, a second slag is built up for further refining of the bath. This and any later finishing slags necessary are generally referred to as tapping slags because they are run off at or about the time of tapping the finished steel from the furnace.

The bulk of the slag produced finds its way to dumps at the harbour edge or in nearby swamps. Many acres of slag-made land are found today where charts of forty-five years ago showed only deep water.

Disposal and utilization of slag has always been a problem and a challenge. Plants in congested areas such as Pittsburgh, find suitable dumping space scarce and may be forced to dispose of it by other means. In a highly industrialized district blast furnace slag may be disposed of profitably. Large quantities are used for railroad ballast, road building, roof covering, concrete aggregate, Portland cement making, insulating materials, soil conditioner, brick, sand for mortar, etc.

If the Sydney plant had been situated within a short rail or truck haul range of a city such as Montreal, slag dumps of such a size would never have existed. Due to its geographical position the movement of unprocessed slag has been limited to the local market, and the use of processed slag has not been uniformly successful. Sydney slag has nevertheless been adapted to different uses throughout the years, and the demand is rapidly increasing.

Blast Furnace Slag for Ballast and Roads

Normally the molten slag runs into large cast iron ladle cars hauled to the dumps by locomotive. It is this dumping which reddens the night skies and fixes the direction of Sydney for travellers and mariners many miles away. The cooled slag is an artificial cellular igneous rock. For most purposes it is removed by power shovel and then crushed and screened. For some purposes, such as for making cement and light weight concrete aggregate, special means of cooling the molten slag are employed.

Crushed blast furnace slag screened to $-2\frac{1}{2}$ in. $+\frac{1}{2}$ in. is very popular for railroad ballast. Its chief virtue is the excellent drainage it gives. It has also been claimed that the chemicals in the slag retard the rotting of the ties. Of recent years about 35,000 tons per year has been used for this purpose. Its use is limited only by the distance it can be hauled economically by rail.

Large tonnages of "run-of-shovel" slag are also used as filling material. During the war the expansion of the nearby airport at Reserve required huge quantities of slag for the filling of swamp land. Slag is always in demand for such purposes. The $-\frac{3}{4}$ in. $+\frac{1}{2}$ in. size is frequently used for cellar bottoms.

For road building, slag of about $-\frac{3}{4}$ in. $+\frac{1}{2}$ in. size is a satisfactory substitute for crushed rock. Although the slag is porous, engineers' handbooks claim it is hard and of high compressive strength. Hubbard(1) states that slag is especially adaptable for macadam roads. It has been widely used in the U.S.A. in macadamizing streets, airstrips, etc.

The $-\frac{3}{4}$ in. $+\frac{1}{2}$ in. size is very popular for driveways in the residential districts, the light colour of the slag making an attractive appearance. The $-\frac{1}{2}$ in. material is better for walkways and general beautification.

Slag Used for Insulation

During the last two years a new market has opened up for Sydney slag. With the current building boom the demand for rock wool for insulating purposes has greatly increased. The Elmac Company was formed in Saint John, N.B. for making this product from blast furnace slag and other materials. Recently this company moved to Amherst, N.S., where they have set up a larger permanent plant which is already nearing capacity operation.

The general method is to charge lump slag ($2\frac{1}{2}$ to $3\frac{1}{2}$ in. size) into a cupola with enough sand, sandstone or siliceous material to give a melted slag of the desired fluidity. The molten slag is tapped out at high temperature and atomized by a stream of high pressure steam or air directed at right angles to the slag stream.

Fig. 1—Blast furnace slag—cooled naturally. Crushed and screened to ($-2\frac{1}{2}''+\frac{1}{2}''$). Railroad ballast size.

The fine "wool" produced is caught in a "cage" and conveyed away from the jet. The finished rock wool is said to be second to none in quality for insulation. One of the early difficulties was its shot-iron content, but this has been overcome by selection of the slag and the installation of a strong magnet at the crusher to remove slag of high metal content. About 5000 tons of slag is now used for this purpose annually and consumption is expected to increase soon to 25,000 tons. The heat and sound insulating properties of mineral wools are well known.

Slag for Concrete Aggregate

Due to the abundance of beach sand and gravel, slag has not been used widely for aggregates in the Sydney district. Yet authorities claim that slag, offering as it does a rough pitted surface for the adhesion of cement, produces a very strong concrete. At the same time they caution that the slag should be low in sulphur content if the concrete is to be durable. Where slag has been used for concrete aggregate in Sydney no complaints have arisen. Inhibitions to its use for this purpose may be overcome by proper tests and demonstration. Hubbard(1) states that strengths, both compressive and flexural, developed in slag concrete are at least equal to those resulting from the use of other types of aggregate.

Foamed Slag for Light Weight Concrete

Recently, enquiries concerning foamed slag for light weight concrete aggregate have been received. Foamed slag is produced by pouring molten slag into a relatively smaller volume of water, whereupon the water is largely converted to steam before the slag loses its plastic condition; the expanding steam fluffs the slag up into a foam, which solidifies almost immediately. This foamed slag is very cellular and light. The crushed and screened material from a number of tests varied in weight from 21 to 33 lbs. per cu. ft. depending on size as compared with slag from the dump weighing from 60 to 75 lbs.

It is quite possible that, by careful control, an even lighter material could be produced. Correspondence on foamed slag between British experts and the Nova Scotia Department of Industry has shown that the

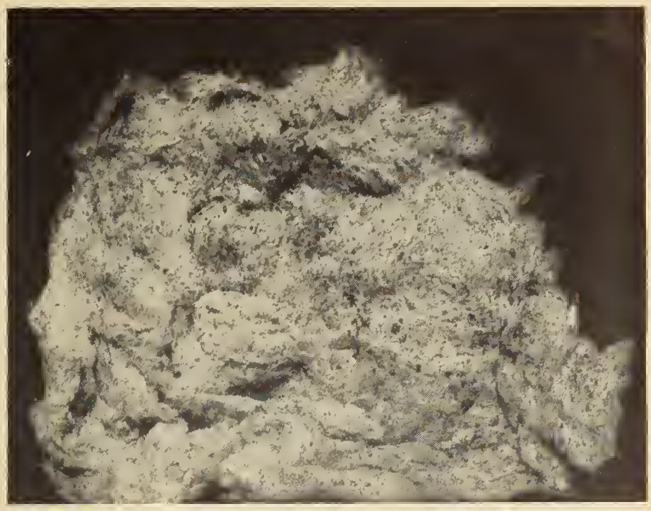

Fig. 2—Mineral wool insulation made from slag. "Loose" wool—unrefined.

chemical composition of Sydney slag is suitable for this purpose. Special Report No. 19 of the (British) Iron and Steel Institute by T. W. Parker(3) deals with a study of the suitability of this slag as a light weight aggregate. Foaming stabilizes the slag and prevents the phenomenon of "falling" found with certain compositions. Foamed slag is not intrinsically corrosive to steel. The protection afforded to steel however by light weight concrete, whether of foamed slag or other light weight aggregate, is not so complete as that given by heavy aggregate. The concretes examined showed higher strengths than those made from other light weight aggregates. Such properties as thermal insulation, moisture movement, ease of plastering, etc., were comparable with other types.

Slag for Making Building Cement

Slag cement, made by grinding slag and slaked lime together in the proper proportions, has been used in Europe for many years.

TABLE I

Chemical Composition of Sydney Slags

	Symbol	Blast Furnace	Open Hearth	
			Run-Off	Tapping
Calcium oxide	CaO	50.0	21.0	50.0
Phosphoric anhydride	P_2O_5	—	11.0	10.0
Magnesia	MgO	3.75	3.6	7.5
Silica	SiO_2	31.0	23.5	12.5
Alumina	Al_2O_3	14.0	3.0	2.0
Iron oxide	FeO	0.30	32.0	11.5
Manganese oxide	MnO	0.16	2.9	5.8
Vanadium pentoxide	V_2O_5	Nil	0.9	0.2
Titanium dioxide	TiO_2	0.40	—	—
Sulphur	S	2.50	—	—

Fig. 3—"Foamed" blast furnace slag. For light weight concrete aggregate. Crushed and screened to $-1/8''$ size.

A plant operated for several years in Sydney at two different periods, and produced both slag cement and slag brick. The bricks were made from granulated slag bound with slaked lime. Although the slag cement was a satisfactory building material, it was not as popular as regular Portland cement due to its slow setting. When Portland cement became plentiful and cheap again after 1918 local demand fell and freight haul to large centres was high, hence the company went out of business. Since that time, addition agents to improve setting properties have been developed and there are possibilities for reviving this business. The bricks produced at this plant were widely used for building construction around Sydney. When well wetted down before use they are said to be the equal of any brick.

In 1892, Albrect Stein and Company in Germany perfected a process for producing a Portland cement clinker by calcining slag and limestone together. This clinker, when mixed with further additions of unburned blast furnace slag, was ground into cement. The cement was used in Germany for public works construction. Variations of this process have been used all over the world. Companies employing slag in Portland cement manufacture accounted for some 8 per cent of the U.S. output in 1935. This process has never been tried at Sydney.

Slag for Agricultural Purposes

A review of literature on slag used in agriculture, by F. E. Lathe(2) disclosed that it generally is the equal of limestone as a soil acid neutralizer, on account of its high lime and magnesia content. As about 100,000 tons of agricultural limestone are used yearly in the Maritimes, and as the demand will more than double in the not distant future, it can be seen that slag has possibilities in this field. Laboratory tests by Dr. G. R. Smith, provincial chemist for Nova Scotia and his assistant, Mr. B. Coldwell, show that Sydney slag has a neutralizing value equal to limestone. Pot tests are now in progress at the Dominion Experimental Farm at Kentville under the direction of Mr. A. Kelsall. These will reveal the true value of slag as a soil neutralizer and conditioner. This slag should be suitable for neutralizing or sweetening any acid waste or acid producing waste.

Large amounts of slag are also used in the U.S.A. for trickling and sprinkling filter beds, for roofing purposes, for making asphalt shingles and glass making.

Fig. 4—Granulated open hearth tapping slag. At left—as granulated, coarse. At right—as ground to 80% minus mesh. For agricultural use.

Open Hearth Slags for Fertilizer

In normal plant operation, the open hearth slags are allowed to solidify in slag boxes and ladles from which they are dumped when cool. They freeze to a hard igneous rocklike mass, the run-off slag nearly black, the tapping slag brown to dark brown. Blast furnace slags are light gray to white.

Slags from both Bessemer and open hearth processes have been used in agriculture for fertilizers and soil conditioners for many years and their value is established beyond all doubt. Slags contain phosphorus, lime, magnesia, manganese and other elements necessary to plant growth. Phosphorus, one of the all important N—P—K trio, has generally been the basis of evaluation. A figure of close to 20 per cent phosphoric anhydride has been reached by some slags.

Slag produced from the Bessemer process has been most generally used because the process is conducive to concentrating the oxidized phosphorus into a relatively small slag volume, and to leaving the phosphoric anhydride bound loosely enough to have a rapid availability for plant nutrition when the slag is ground to the 80% minus mesh standard. Open hearth slags are also used where the phosphoric acid content is high enough and where its availability as shown by the citric acid test is sufficient.

The relatively high phosphorus content of the Wabana ore used at Sydney made it inevitable that much consideration would be given to possibilities of use for Sydney steelmaking slags in agriculture. After installation of Bessemer converters at Sydney for duplexing, the Cross Fertilizer Company produced a good grade of Bessemer slag. Eventually the Bessemer Duplex process was abandoned in favour of the present open hearth process of steelmaking, which produced a slag containing 10-11 per cent phosphoric anhydride as against about 16 per cent for Bessemer slag. A good grade of Belgian Bessemer slag was then being imported and sold very cheaply. The Cross Company could not meet this competition and went out of business, because availability of phosphorus in the new slag was low, its lime value was not recognized and grinding and bagging costs were high. Improvements in grinding equipment and the invention of the paper bagging machine have changed part of the picture. But someone had still to find a means of raising the availability of the phosphorus and to test the actual value of the lime content of the slag and its nutritive elements.

Tapping Slag as a Soil Conditioner, etc.

Attempts have often been made to increase the availability of the phosphoric acid in the slag and evaluate it by agricultural experiments, and enough encouragement has been received to point to the feasibility of a real research and development job being done.

In December 1943, a committee was formed from various representatives of government, government technical and research bodies, Dosco technical staff etc., under the chairmanship of Dr. J. R. Smith, provincial chemist at Truro, with metallurgical subcommittee chaired by Dr. A. E. Cameron, Deputy Minister of Mines, and agricultural subcommittee under Mr. A. Kelsall of Kentville Experimental Station.

This committee has proved a model of co-operation and energy since its inception. It was found that granulation of both run-off and tapping slags in water greatly increased the availability of phosphoric acid. Although the run-off slag responded more readily than tapping slag in this respect, the committee chose to concentrate on the tapping slag because its granulation

FUEL OIL FOR INDUSTRIAL BOILERS AND HIGH HEAT COMBUSTION CHAMBERS

GEORGE F. HAYNES,
Chief Engineer, Todd Shipyards Corporation, New York City.

A paper presented before the Montreal Branch of The Engineering Institute of Canada, March 28, 1946.

The author analyzes various types of liquid fuel, discusses atomizers, pumps and heaters with the aid of illustrations, and adds a generous measure of helpful hints for their use based on long and varied operating experience.

There are two outstanding types of petroleum; one with a paraffin base and the other with an asphalt base. The asphalt base type is dark coloured, has high viscosity, and generally contains more sulphur than the paraffin base type. The paraffin base crudes are almost wholly used for producing lubricants and little, if any, finds its way into the boiler fuel field. While the two types of crude are outstanding, there is considerable of a mixed base type containing both paraffin and asphaltum. Distillation and cracking processes, to obtain the maximum yield of the lighter fractions, have resulted in heavy residues which, under some conditions, must be blended with less viscous oils to produce a marketable product.

Petroleum consists almost entirely of carbon and hydrogen, with small quantities of oxygen, nitrogen and sulphur. Generally, the proportion of these elements is about as follows; carbon 80 to 87 percent, hydrogen 12 to 15 per cent, oxygen, nitrogen and sulphur, 0.1 to 7 per cent. All natural oils consist of mixtures of hydrocarbons belonging to various well recognized series, some of the principal ones being; paraffins—$C_n H_{2n+2}$, olefines—$C^n H_{2n}$, naphthenes—$n(CH)_2$, benzenes or aromatic—$C^n H_{2n-6}$.

The sulphur in petroleum seldom exceeds one per cent, but over two per cent occurs in many oils from the Gulf section of the States, and still higher quantities in some Mexican crudes. A high sulphur content, in the past, was considered objectionable on the ground of possible corrosion of metal by the combustion gases, but this has been found to be insignificant except where condensation can occur and sulphur acids are formed.

The use of liquid fuel has many advantages over coal for steam generation, for example, it has higher calorific value, namely 18500 B.T.U. per pound of liquid fuel as compared with 13500 B.T.U. per pound of coal. Liquid fuel has a bulk storage value of 38 as compared with 43 cu. ft. per ton for coal, which permits a greater number of heat units to be stored per unit space in the ratio of about 1.5 to 1.

In confined spaces, oil can be stored in tanks below ground, or remote from the location where it is to be used, due to the ease with which it can be handled over long distances. Liquid fuel will not deteriorate in storage. Its use is usually accompanied by a reduction in operating staff, while maintenance of firing equipment and boilers is usually less with oil than with coal. Moreover, the elimination of ash, with the attendant expense of handling and disposal, is avoided. Coal users seldom consider the transportation cost of the ash and moisture in their fuel.

The location of oil storage facilities, above or below ground, their size, etc., depends upon local conditions and requirements. If tanks are buried they should be at least 2 ft. below grade and, if necessary, protected with a concrete slab extending beyond the tank in all directions. Because of their corrosive effect, cinders should not be used as back fill. Welded construction is recommended, and a careful hydrostatic test is essential prior to back filling after the tank is set in its final position on saddles. The metal surfaces should be well protected with a heavy coating of asphaltum or bitumastic paint to prevent corrosion.

If the location presents a possibility of the tank floating when empty, it should be securely anchored to a concrete slab to offset its buoyancy. All pipe connections should be arranged with sufficient flexibility, to preclude strains which would accompany any settling of the tank that might occur. Access manhole openings should be provided for inspection, cleaning and repairs.

The boilers for which oil firing equipment is furnished embrace the wide diversity of size and type with which all are familiar. Each lays claim to some special merit for its design, and for the particular service in which it is to be used.

The various types of atomizers available for firing these boilers are; the straight pressure or mechanical atomizer, with or without the addition of return flow system bleeding oil from the discharge orifice, to increase the range of capacity; the rotary spinning cup atomizer type; and the steam atomizer type.

The pressure atomizers are always used in conjunction with air admission registers. The rotary spinning cup is sometimes installed in a register, but more frequently the combustion air is admitted through an opening in the furnace front below the atomizer. It may also be admitted through a checkered arrangement of ports in the refractory furnace floor. The steam atomizer is usually installed with the checkered floor, but a few have been used with registers.

Each of the foregoing methods has its own points of advantage. The basic reasons for the several methods are that the straight pressure or so called mechanical atomizer is undoubtedly the simplest as the supply pump is the only moving unit on the system. It uses an atomizer having a fixed orifice and is the most efficient for plants with fairly uniform steady operating loads. Without making a change in sprayer plate size, the range of operation is limited to that which can be

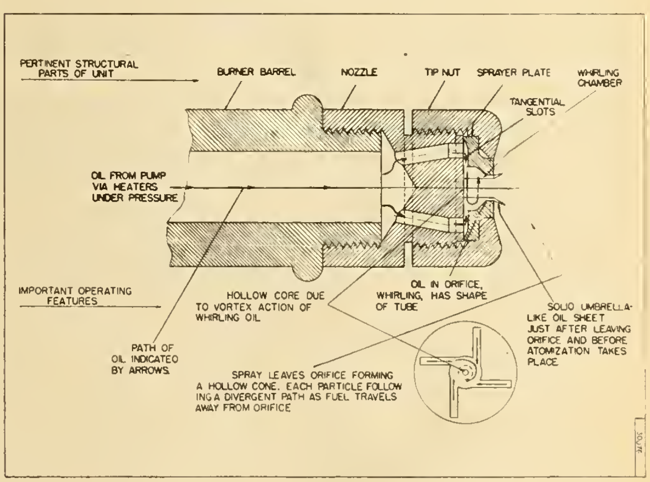

Fig. 1—Section through pressure atomizer.

obtained by varying the supply pressure which is approximately 2 to 1. If the installation is operated by an automatic combustion control, it must be reset for each sprayer plate change. While these changes and readjustments can be made quickly, they always require the service of an attendant. The oil must be delivered at uniform temperature and steady pressure, which pressure can be varied manually or automatically to meet changes in load demands. The temperature should be equivalent to that which is required to effect an oil viscosity of 150 S.S.U.

Atomization by pressure is sometimes known as dynamic pulverization, since the energy imparted to the oil by the fuel-oil pumps in the form of pressure is converted, in the final stage of the atomizer, into a velocity force which projects each oil particle in a diverging path, thereby breaking up the solid mass into minute particles. This energy must overcome the fuel-oil surface tension, the viscosity forces which tend to hold the mass together, the friction of the atomizer and the resistance of the gas in the furnace to penetration. It is therefore obvious that the ability of the atomizer to counteract these resistances will depend on the amount of energy supplied, and that the size of the atomized particle will be reduced as the pressure is increased.

Figure 1 shows the working end of a successful and efficient fuel-oil atomizer, in use at the present time. The path of the oil flow is shown by arrows. Conventional names of the pertinent parts are indicated together with notes bringing out the important operating

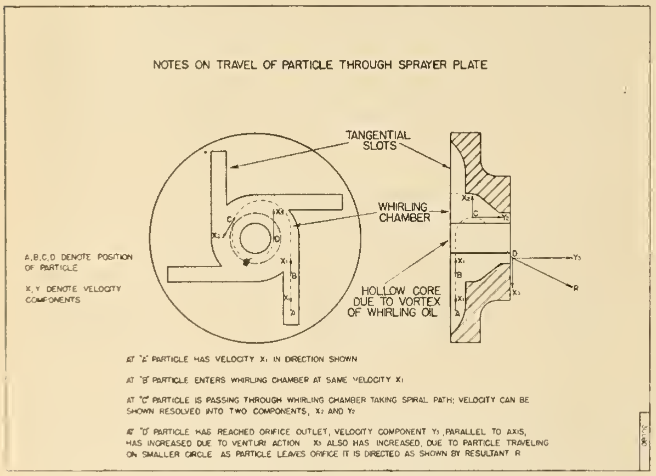

Fig. 2—Sprayer plate.

features. This figure is shown in lieu of a verbal description, as it depicts what actually takes place in the atomization of fuel.

Figure 2 shows an enlarged view of the sprayer plate of this unit, indicating the various dynamic forces and velocities as they occur, and their effect on a particle of oil passing through the atomizer.

In general, it can be stated that pressure atomization consists of forcing oil under pressure through a series of passages designed to develop rapid rotation. The centrifugal force thus obtained causes the oil to emerge from the atomizer orifice and enter the combustion chamber in the form of a hollow conical spray.

The quality of atomization for any atomizer design is primarily dependent on the delivery pressure. This is because the dynamic energy imparted to the oil must be of sufficient magnitude to rend the oil into minute particles as it leaves the confining walls of the atomizer orifice.

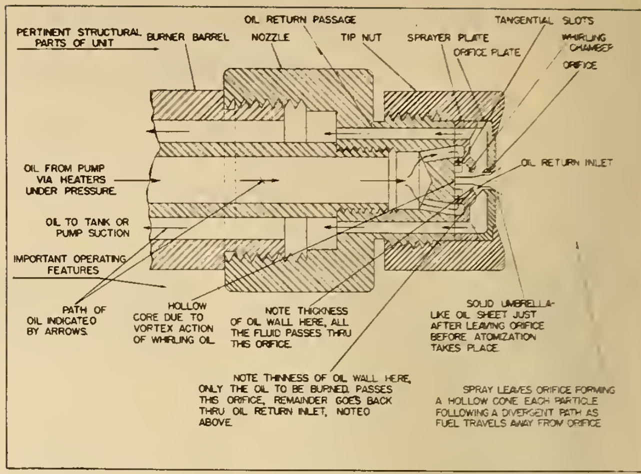

Fig. 3—Section of variable-capacity fuel oil atomizer.

The design of the present-day pressure atomizer used by leading manufacturers has reached an extremely high state of development, as regards the quality of atomization. But it has one serious drawback; namely, a very limited operating range, without recourse to a manual change in the size of the atomizer orifice.

Figure 3 shows the construction features of the variable-capacity atomizer. It is comparable to Fig. 1 which shows the construction features of the ordinary pressure atomizer.

This type, called the variable capacity—"Vee-Cee" atomizer, uses a fixed sprayer orifice with the addition of a bleed off which provides a return flow back to storage or pump suction. This materially increases the operating range and without the necessity of changing sprayer plates a range of 6/1 and greater can be provided. Supply pressure and temperature are maintained constant, and the range is controlled by varying the quantity bled away from the atomizer through the return line. A plurality of burners and boilers can be handled by one master valve in a single return connected to all burners. It is most efficient for plants with widely fluctuating loads and exceptionally well adapted for use with a combustion control system. This is because one sprayer plate size can cover a wide range of capacity, and because after system is once adjusted, it requires no further resetting. The oil must be delivered at constant pressure—300 lb. per sq. in. minimum—and temperature equivalent to viscosity of 100 S.S.U.

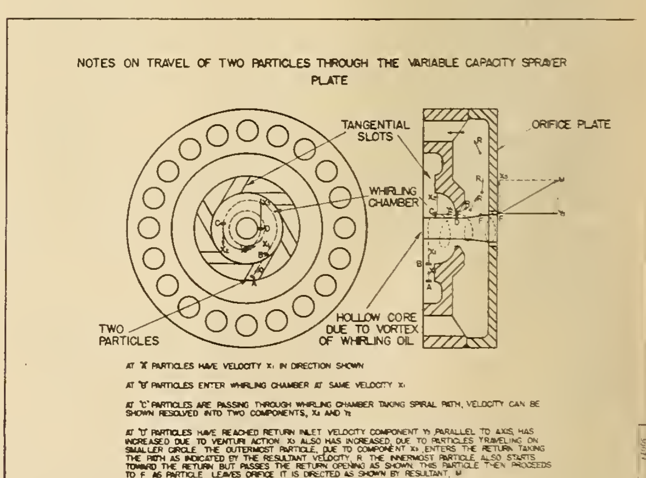

Fig. 4—Forces and velocities in variable capacity atomizer. Compare with Fig. 2.

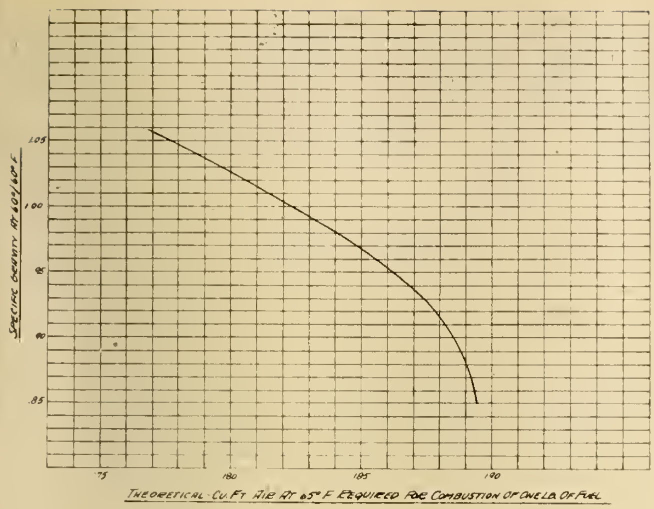

Fig. 5.

The design shown in Fig. 3 consists structurally of the same members as the ordinary atomizer, except for an additional passage to return unused oil and a separate atomizer orifice plate. The sprayer and orifice plates are centered in the burner nut, the orifices being of the same diameter and in alinement.

The orifice plate is made dome-like to provide an annular space in the orifice for the oil to return as it leaves the whirling chamber. The return passage is made by placing a large tube on the outside of the supply tube. The inner or supply tube carries the fuel oil to the sprayer plate, while the annular space between the inner and outer tubes provides a return-flow passage. Oil under pressure is delivered through the inner tube to the annulus surrounding the whirling chamber, from which it passes into the whirling chamber through a series of slots.

Since these slots are tangent to the whirling chamber side wall, the oil rotates in this section of the sprayer plate. It follows a spiral path as it progresses toward the outlet orifices. Entering these orifices, the pressure parallel to the axis of the sprayer plate, forcing the fluid outward, has been converted into velocity in the same direction. This is due to the venturi action of the whirling chamber and its orifice. At the same time, after leaving the tangential slots, the whirling oil sets up a definite centrifugal pressure perpendicular to the axis of the sprayer plate.

As the rotating mass reaches the return annulus, the quantity of oil which is being by-passed will be forced into this opening by the centrifugal force. This is because there is no static pressure, it having been converted into velocity parallel with the sprayer-plate axis. The oil on the inner wall of the vortex, due to its centrifugal force, moves to a position nearer the side wall of the orifice previously occupied by the by-passed oil. This oil then leaves the confining walls of the orifice with its energy undiminished, and atomization takes place.

The quantity of oil by-passed is a function of the return pressure. If the return-line valve is closed, a pressure gage placed in the line ahead of this valve will show the pressure in the orifice. As the return-line valve is opened, this pressure will drop and the quantity returned will be proportionately increased, since the centrifugal force is transferred into velocity in the by-passed oil.

Theoretically and practically the quality of atomization for this variable-capacity atomizer is constant over the entire range as described above. All oil passing the sprayer plate is given the energy required for proper

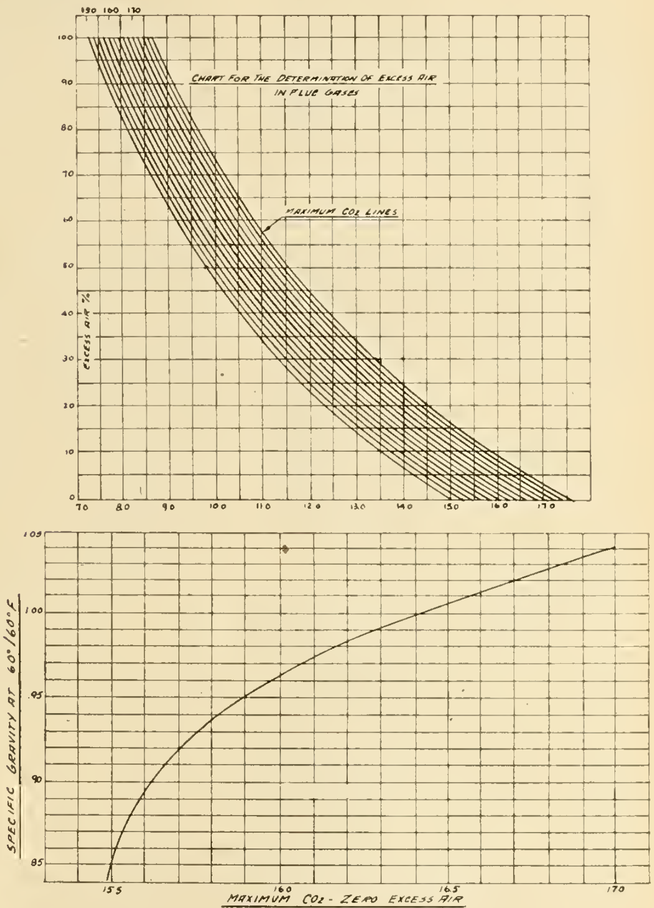

Fig. 6.

TABLE I

Burner Clearances—Minimum Dimensions

Firing Rate—Lbs. Hr. Burner	750.	1500.	3000.

Centerline Burner to Refractory Walls	27″	30″	36″
Centerline Burner to Water Wall Tubes	27″	30″	36″
Centerline Burner to Steam Generating Tubes	30″	33″	38″
Centerline Burner to Shell—HRT Boilers	42″	48″	—

atomization by means of the constant supply pressure.

The rotary spinning cup type is generally used on boilers where operating pressure is 15 lb. per sq. in. or less, because it can atomize the heavier fuels at higher viscosities than either of the pressure types. As already stated, the straight pressure atomizer requires 150 SSU. Optimum for the return flow is 100 SSU, while the rotary can operate with the same fuel at 375 SSU. This means that on low pressure installations where the steam temperature is insufficient to provide fuel at high temperatures the rotary type can be used effectively. It is not as efficient, however, as either of the foregoing, and as each burner is motor-driven, mechanical failures are ever present. Yet it has a wide range of capacity and is readily adaptable to handle Bunker "C" oil automatically when provided with gas ignition.

The use of the steam atomizer is indicated where heavy tars, sludges and other by products are used, which require atomizers with generous port areas to preclude clogging. The viscosity is not usually required to be below 375 SSU, and the supply pressure about 100 lb. per sq. in. Combustion control can be readily applied. The main drawback is the continual use of steam for atomization.

From the foregoing it is apparent that:

①For a plant with steady load, with slight fluctuations, and using Bunker "C" oil,—the most efficient and simplest installation is the straight pressure atomizer.

②For a plant under conditions as above, but with widely fluctuating load, return flow atomizers are preferable.

③For low pressure plants, rotary atomizers are best.

④For a plant using by product waste fuels, where the use of steam for atomization can be afforded—steam atomizers should be used.

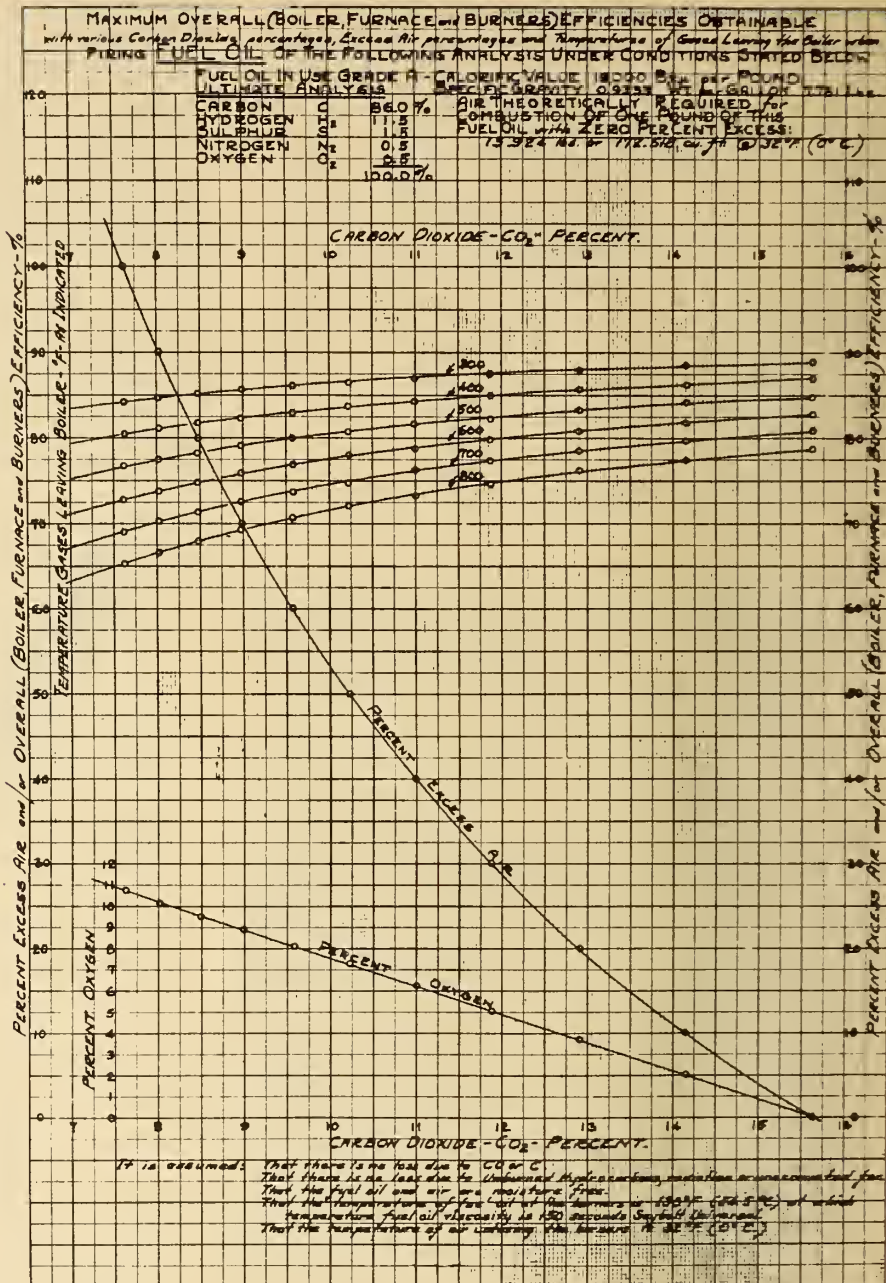

Fig. 7.

As previously stated, pressure type atomizers require the use of air admission registers, and all types are most effective when used with them. These registers are built in a range of sizes and their capacity depends on the draft available. Capacity can be closely approximated from the following:

Knowing the gravity of fuel, the theoretical volume of air required for combustion of one pound can be determined from the curve in Fig. 5. The draft loss in inches of water across a register is then:

$$D_L = \left(\frac{Q \times F \times T_{abs}}{A \times K \times 525 \times 956 \times \sqrt{\dfrac{T_{abs}}{B}}} \right)^2$$

Q = Lb. fuel burned/min.

F = Cu. ft. air required/lb. fuel $\times$ % excess air used.

A = Area of register throat in square feet.

B = Barometric pressure.

K = Coefficient which varies with type of register and number installed on a boiler. This is usually determined by the manufacturer by test.

If the coefficient "K" and the furnace draft available are known, the maximum capacity of a register can be estimated operating under natural draft. This establishes the number of burners required to meet the load requirement. By use of table of clearances, as shown in Table I, a check can be made to determine if space available on boiler front is sufficient to provide for their installation.

If the available draft is insufficient, forced draft, induced draft, or a combination of the two must be provided—artificial draft is quite common in present day practice due to the higher ratings at which boilers are fired, and has the advantage of being more positive and easier to handle than natural draft.

Furnace volume is somewhat indeterminate, as the

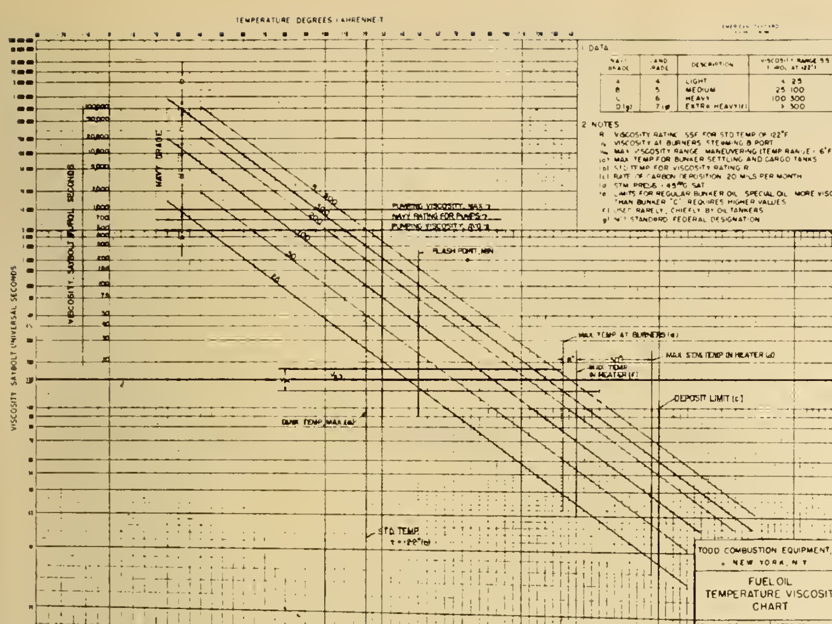

Fig. 8.

The curve, in Fig. 6 gives a ready check on this item, while, Fig 7, shows the approximate equivalent boiler efficiency under the conditions as stated thereon.

In order to obtain uniformity of atomization and firing rate it is necessary to maintain the viscosity previously mentioned for the different types of atomizers. The chart on Fig. 8, gives temperature required, and this should be held as close as possible. It also gives proper preheat for pumping. Most plants are not equipped with viscosimeters, and as viscosity has no relation to specific gravity, this must usually be obtained from the oil vendor.

Reciprocating pumps should be selected on basis that oil capacity is approximately 20 per cent of the water capacity. Duplex-double acting pumps are recommended. Due to slow speed and low rating, the steam and exhaust lines can be reduced at least one pipe size smaller than required for water. The reason for the reduction in piston speed is to give the oil a chance to fill up the cylinder, thereby maintaining a steadier discharged pressure. A pump that is under size or running too fast usually produces a wide fluctuation in supply line pressure, which is felt by the burners and creates a surge in the furnace.

To further steady the supply pressure and dampen the pressure changes due to pump strokes, an air chamber of generous proportions is recommended. This should be located between pump discharge and oil heater, and should be arranged with inlet and outlet connections so that oil enters and leaves it. If put on a line with only one connection off a tee branch its effectiveness is greatly reduced and at times nullified.

All steam pumps should have an adjustable pressure regulator on steam supply and a relief valve on discharge, set at 25 lb. per sq. in. above maximum operating pressure. The market affords many motor operated pumps, gear, screw and the like, some of which are excellent. When used these should be provided with readily adjustable relief valves for controlling pressure.

Heaters are available in many designs.—Those that can contaminate the boiler water by internal leaks should be avoided. The recommended type is that which has all joints external of the steam space. In making a selection, ease of cleaning, either mechanical or by solvent, should be given consideration.

Strainers should always be of the duplex type, properly valved so they can be cleaned without interrupting operation. One should be installed on the suction line ahead of the pumps. This should have openings not over .060 in. dia. Another should be installed on the discharge line after the heaters, so it will be handling heated oil, and should have openings of .030 in. dia. Piping should be sized so that the velocity in the suction to the fuel pumps is not over 40 ft. per minute, and in the supply line to the burners 120 ft. per minute.

The need for large quantities of high temperature gas at various pressures, for process work and in gas turbines, has resulted in the development of an all-metal combustion chamber. These have been designed and operated in sizes ranging from 40 to 10,000 cu. ft. per min., and at pressures up to 90 lb. per sq. in. Outlet

relation between the total volume and that occupied by the flame body is not always favourable to accepting the total as useful volume. It is usual, if possible, to limit the heat release to 40,000 B.T.U. per hour, per cubic foot of total volume on boilers with refractory lined furnaces, in order to anticipate reasonable life of the linings. With air cooled walls this figure can be increased, and with water wall, boilers in naval service have operated continuously at 500,000 B.T.U. heat release. Although there is no need to approach this figure on shore installations, it is believed the volumes now used are far too conservative.

The efficiency of combustion is mainly related to the amount of excess air supplied to the burner. This should not exceed more than 25 per cent of that theoretically required. Many installations operate with 10 to 15 per cent and an efficient air admission register should produce intimate intermixture of air with the atomized fuel within these limits. The percentage of excess air can be determined by orsat analysis of the stack gases.

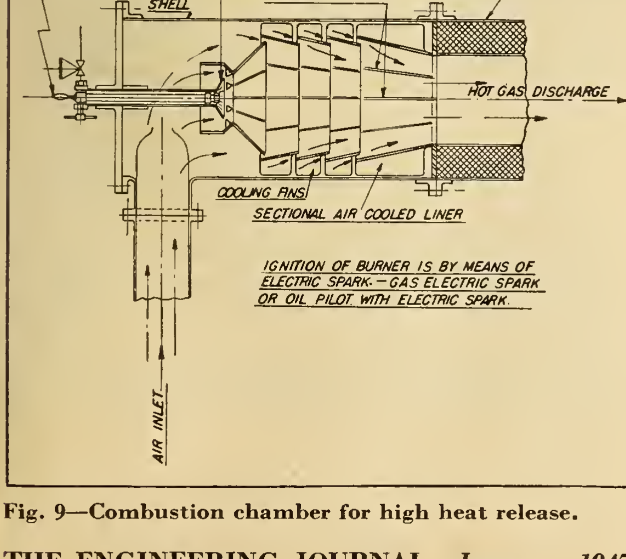

Fig. 9—Combustion chamber for high heat release.

temperatures of 1,800 deg. F. have been attained.

Heat releases up to 12,000,000 B.T.U. per cu. ft. per hr. of furnace volume have been reached. The chambers have been fired with straight pressure and return flow atomizers. The design provides for a portion of the air to enter the burner proper. The remainder enters the combustion space through the annular furnace liner openings, simultaneously cooling the liners. This secondary air provides additional oxygen to complete the combustion process or lower the outlet temperature by dilutions of the hot gases. Figure 9 shows a typical combustion chamber unit.

Originally this design of furnace was developed for gas turbines. However, during the war it was first applied to a device for generating screening fog. This was installed on most of our combatant vessels and later in a smaller size for portable units for use on shore. It has since been used to distribute insecticide by the aerosol method for mosquito control. Many other applications are pending. The use of the variable capacity type atomizer with these chambers provides the operator with ready control of outlet temperature over the full range of the chamber's capacity, without change in sprayer plate size.

UTILIZATION OF SYDNEY SLAGS FOR ENGINEERING AND AGRICULTURE

(*Continued from page 16*)

was practical under plant conditions. The quantity available was much larger than that of run-off slag, and its lime content, and consequent soil acid neutralizing value, was much higher.

A method of steam granulation was developed, whereby a stream of molten slag is broken up by a high pressure steam jet into a spray of globules, which are quenched in a tank of water. Experiments in 1944 showed that this increased the "availability" of the phosphoric acid (by the citric acid test) from about 16 per cent for air cooled slag, to 50 per cent for the steam granulated material, when both were ground to pass 100 mesh. Extensive greenhouse pot and plot tests were conducted at experimental farms, while full scale tests on many farms of various soil types were carried out, which showed that a ton of this slag was equivalent in value to about one ton of agricultural limestone plus 500 lb. of superphosphate.

It was long believed that the citric acid test for availability of phosphoric acid was not a fair means of gauging the true fertilizing value of the phosphoric acid in the slag, and that it only approximated the phosphorus available in the first crop year, and that the greater part of the remainder would become available over a period of years. Agricultural tests have confirmed this. In cases where "grain was sown to hay" on some forty Nova Scotia farms, the yield in hay in the second year from one ton of slag per acre was about 40 per cent above the check plots. Third year results are being compiled. All results confirm the belief that the greater part of even the so called "unavailable" phosphorus becomes available within a very few years.

This year a pilot plant was erected which can produce about four thousand tons of the steam granulated tapping slag per year. A small amount was produced this spring, chiefly for orchard tests in the Annapolis valley. Some believe it will improve the keeping quality of the apples as well as supply usual soil nutrients. Limited scale commercial production may soon commence. If the demand is encouraging, plant capacity will be greatly increased. This is welcome news to those concerned with the world fertilizer shortage.

Meanwhile, pilot plant experiments will be carried on in an effort to improve the slag still further. Past experiments have shown that fluorine content, fineness of granulation, rate of cooling, the P_2O_5/SiO_2 ratio, and fineness of grinding are all potent factors affecting phosphoric acid availability. Numerous points of interest and importance have been discovered through research by both the metallurgical and agricultural subcommittees. Some have been covered by published papers.(5) Others will be given in later papers dealing solely with this branch of slag utilization.

Run-off Slag as a Fertilizer

No practical means has yet been found for realizing the full potential phosphorus value of run-off slag. At the dump, however, it contains about 5 per cent available phosphoric acid, and 5 per cent of so-called unavailable phosphoric which probably would become available in the soil over a period of years.

Experiments not yet complete indicate that run-off slag can be mixed with ammonium sulphate without loss of ammonia, and will yield a remarkably free running mixture even when dampened. The addition of potassium chloride does not seem to change this behaviour. If subsequent experiments confirm this, it means that run-off slag may be successfully used as the phosphorus carrier in mixed fertilizers or, at least, as an active filler in mixing.

Extraction of Vanadium and Phosphorus

Along with the phosphorus, Sydney open hearth slag contains appreciable amounts of vanadium. Because of the shortage of vanadium for special steels during the war, the Dominion Government encouraged attempts to extract this valuable element. Both vanadium and phosphorus can be recovered by chemical means and, had the critical shortage not been alleviated, the development of the process would have continued. Without further research it would be impossible to say whether or not it could be done feasibly at peacetime prices.

HYDRO-ELECTRIC PROGRESS IN CANADA DURING 1946

The annual review of hydro-electric progress in Canada prepared by the Dominion Water and Power Bureau, Department of Mines and Resources, Ottawa, discloses that, during 1946, the hydro-electric industry in Canada has made good progress in the transition to normal peacetime economy. The dislocations due to cessation of war demands have not proved to be as severe as were anticipated; growing domestic demands and the use of secondary power for steam generation have so largely absorbed a potential surplus that primary demand may exceed supply before new developments can be brought into operation.

Some temporary reductions in demand for primary power resulted from labour difficulties, particularly in Ontario. Production in central Ontario, eastern Quebec and the Maritimes was curtailed by low stream flow during late summer and early autumn. The output of electricity by central electric stations during the year continued at a high level; for the first ten months of 1946 total electrical production by central stations was 2.6 per cent higher than for the same periods of 1943, 1944 and 1945.

New installations coming into operation during the year were few in number totalling only 27,760 hp. At the year's end, a total capacity of over 400,000 hp. was under active construction across the Dominion and preliminary work or investigations were under way on projects involving an additional 600,000 hp.

British Columbia

Although two important hydro-electric developments are under active construction, no new installations were brought into operation during the year. The consumption of electrical energy for the year shows a rising trend, particularly in the Greater Vancouver area.

The British Columbia Power Commission made good progress on the first phase of its development on the Campbell River, Vancouver Island, consisting of two 25,000 hp. units; the first unit is expected to be brought into operation during 1947.

Construction of the British Columbia Electric Railway Company's Bridge River project has been proceeding according to schedule; work is being rushed on the diversion dam, and a beginning has been made on the 130-mile transmission line from Seton Lake to Vancouver. The company has an extensive expansion of its distribution facilities planned for 1947.

The Powell River Company has proceeded with the completion of the concrete variable radius arch dam on the Lois River for raising the present structure 20 ft. The installation of a second 18,000 kva. unit at Lois River is contemplated for 1947. Other smaller hydro-electric projects were under way or planned in various parts of the province.

Northwest Territories

The Department of Mines and Resources commenced construction of an 8,000 hp. development on the Snare River, about 90 miles northwest of Yellowknife which will supply power at cost to mines in the Yellowknife area. The development involves the construction of an earth-fill dam across the Snare River. An average head of 56 ft. will be created. A 110,000 volt transmission line is being built by Giant Yellowknife Gold Mines to transmit power to Yellowknife, the Dominion having the right to take over this line after completion. Present plans call for delivery of power in the fall of 1948.

Alberta and Saskatchewan

No new power projects have been completed or brought into operation in Alberta or Saskatchewan. The one project under construction is that of the Calgary Power Company at Barrier on the Kananaskis River, involving a single unit of 13,500 hp. under a head of 150 ft. The plant will supplement the peak capacity of the company's system; the water passed through the Barrier plant will provide additional power at the Kananaskis, Horseshoe and Ghost plants.

Manitoba

In the Slave Falls plant of the Winnipeg Hydro-Electric System, two new units of 12,000 hp. have been installed, one being now in operation. Work is under way for the completion of this plant by the addition of Units No. 7 and No. 8 during 1947. During the year, the Manitoba Power Commission carried out an extensive program of extending electric power to towns, small communities and farms. About 286 miles of transmission lines were built; extension of the "Farm Electrification Program" involving construction of 939 miles of transmission lines of all types, was carried out, and several new substations were added to the system.

The Winnipeg Electric Company completed a 13,000-volt transmission line to Goldbeam Mines. A new transformer bank of 30,000-kva. capacity was put into operation at the Fort Garry substations. At the Seven Sisters power house, preliminary work is under way to raise the head at the site to the final limit. Contracts for rock excavation in the tailrace and for the raising of the dykes are to be let before the end of the year.

In the northern mining area, the 43-mile transmission line from Sherridon to Snow Lake is expected to be completed early in 1947. This area is served from the Island Falls plant of the Churchill Power Company.

Ontario

No new developments were completed by the Hydro-Electric Power Commission of Ontario, though four major projects were under active construction, three being located in southern Ontario and one north of Lake Superior; a fifth project consisting of the extension of a northern Ontario development was also commenced.

Reference was made in last year's review to a second 70,000-hp. unit at DeCew Falls. Extensive improvements are under way in the headwater area which will increase the pondage available and raise the headwater elevation by about 4 ft. The tailwater also is being lowered. The new unit is expected to be in service by October, 1947. Work proceeded on the 81,000-hp. development at Stewartville on the Madawaska River. The first unit of the plant is expected to be in operation by February 1, 1948. Preliminary work has also commenced on the Des Joachims development on the Ottawa River upstream from Pembroke. The development will have a capacity of 360,000 hp. in six units of about 60,000 hp., with provision for two additional units. The plant will have

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

THE DIAMOND JUBILEE

In February 1947, The Engineering Institute of Canada will have completed sixty years of service to Canada and to the profession. This occasion is to be marked by special features at the annual meeting in Toronto on May 8th, 9th and 10th.

The Institute, then known as the Canadian Society of Civil Engineers, was organized on February 24th, 1887, and was incorporated by federal charter on the 23rd of June the same year. On the walls at Headquarters there is the first certificate of membership ever issued. It is in the name of T. C. Keefer, the first president, and is signed by Mr. Keefer in that capacity and by Henry T. Bovey as secretary. Strangely enough, it is dated January 20th, 1887, which might indicate that they worked a lot faster in those days than we do now. More probably what has occurred is that the organization was functioning well in advance of receiving its charter. The early history shows that the society had completed the organizational work in 1886, and it is easy to believe that they went to work immediately.

Those who have followed these pioneers of the profession, have learned with gratitude of their wisdom in setting up a society that would cater to all classifications of engineers. As the charter says one of the objectives of the society was " to encourage investigation in connection with all branches and departments of knowledge connected with the profession ".

This policy has enabled Canadian engineers to work together as one group rather than scatter their efforts through a multitude of smaller societies, each dealing with one specialization, or to lose their identity in the excellent but gigantic specialized societies of the United States and Great Britain.

The Canadian type of organization has been adopted in Australia, New Zealand, India and South Africa. In each of the countries there is an engineering institute, embracing all branches of the profession. Canada's example has been followed in other countries as well, such as Switzerland, Belgium and Holland. In the more populous countries where the specialized society has made most progress there is an increasing demand for some sort of set-up that will provide for the co-operative effort of all engineers. Canada has that type of organization now in the Institute, and to its far sighted founders belongs the credit.

Each month in the *Journal* there will be news about the Diamond Jubilee, but members are urged to accept this notice now and to make all arrangements at the earliest date. Hotel and transportation accommodation will still be hard to get then, but early attention to these details will help avoid confusion and disappointment.

The dates are May 8th, 9th and 10th and the hotel is the Royal York at Toronto. There will be a regional meeting of Council on the 7th.

THE NEW BY-LAWS BEGIN TO WORK

Last spring, members voted favourably on several important amendments to the by-laws. With the turning of the year these all become effective—and the results will soon be apparent to every member. Firstly, the fees have been increased, for Members and Juniors, as the annual account will show. Secondly, a routine transfer from Student to Junior was agreed upon, and thirdly, all members became eligible for Life Membership. Treating with these in reverse order the results so far are as follows.

Life Members

Any person who has paid fees as a corporate member for thirty-five years, or who has reached age seventy and has paid fees as a corporate member for thirty years, is entitled to Life Membership. On January 1st, 209 Members became Life Members and will not be required to pay the annual fee in the future. One of these, John Murphy of Ottawa, has been a corporate member for fifty-seven years and has paid fees in full for that period of time. There are members in the Institute whose membership goes back farther than that but of the first group to be affected by the new by-laws Mr. Murphy is surely the *doyen*. Support of this kind is one of the things that has made the success of the Institute possible.

Transfers

A Student member who has been graduated is now transferred automatically (without transfer fee) on the second January after his graduation. Under this by-law, 988 Students have just become Juniors. Non-graduates are still required to write an examination.

A new privilege is also available to Juniors. They may now transfer to Member without paying a transfer fee, providing they apply before the end of the seventh year after graduation and their qualifications meet the approval of Council. They may not remain as Juniors beyond the end of the eighth year after graduation.

These far reaching changes will mean great things for the Institute. They wipe out the old difficulties about Life Membership which used to be optional with Council. Now everyone is entitled to it, and each January new groups will reach this exalted rank. All this means a serious loss of revenue but it will be more than made up by the increase in fees, and the quicker transfer of Students to Juniors. On the whole, the change in the transfer system should produce an increase in income greater than the loss entailed in the new rules for Life Membership. Incidentally, the changes bring about great savings in labour at Headquarters.

As the working of these by-laws comes to the attention of the membership, they are urged to communicate with Headquarters if any points are not clear. There has been a lot of overtime work and pressure to get the machinery in motion and the material ready for " processing ". Nobody will be surprised if in some instances changes or adjustments become necessary.

THIS JOURNAL IS DIFFERENT

Cutting its coat according to its cloth, the *Journal* must again squeeze its expanding features of mature publication into the tight-fitting garb adopted during the war as an economy measure. Starting with this issue, the format is now 8¼ by 11¼ in., which is ¼ in. all around smaller than the previous size.

It will be recalled that, in March 1946, the *Journal* along with other publications in the same field, returned to pre-war size. Such a move was evidently premature as the paper supply situation, far from improving, has deteriorated to a point where the shortage is more acute than at any time during the war. The National Industrial Advertisers Association having decided to return to the economy trim size, the *Journal* must follow suit because the same printing plates are being used for the same advertisements in several publications. From the reader's point of view, the change is hardly perceptible, and is no hardship to anyone but the editor who has had to make several readjustments.

New Features

Upon the recommendation of the Publication Committee, a new cover design has been adopted which, it is believed, improves the outside appearance, at the same time retaining the characteristic features which have identified the monthly publication of the Institute since its beginnings. One of the advantages of the new design is that it allows a better display on the cover.

Another improvement, which should meet with the reader's approval, is the introduction of a short summary at the beginning of each technical article, which enables a reader to decide at a quick glance whether or not the article is of interest to him.

As the paper supply improves, and the additional editorial staff made possible by the increase in fees has been secured, other improvements will be introduced which should make the *Journal* more valuable. Among these are the revival of the former section containing abstracts of current technical literature and the establishment of a special section for students.

LORNE CAMPBELL AWARDED KENNEDY MEDAL

The Sir John Kennedy Medal, the Institute's senior award, goes this year to Lorne A. Campbell, M.E.I.C., president and managing director of the West Kootenay Power and Light Company, Trail, B.C. This was announced at a recent meeting of Council when the letter-ballots from councillors were opened.

The medal is awarded by the council of the Institute at intervals of not less than two years as " a recognition of outstanding merit in the profession or of noteworthy contributions to the science of engineering or to the benefit of the Institute ". It was established in 1927, in commemoration of the great services rendered to the development of Canada, to engineering science and to the profession by the late Sir John Kennedy, past-president of the Institute.

Mr. Campbell was born at Perth, Ont., on March 5th, 1871. Educated in the public schools and Collegiate Institute of Perth, he joined the engineering staff of the Edison General Electric Company in Toronto in 1889, becoming chief engineer of its successor, the Canadian General Electric Co., in 1891, at the age of 22.

Moving West in 1898, to Rossland, B.C., he became general manager of the newly formed West Kootenay Power and Light Co. Limited, organized by Sir Charles Ross to develop power on the Kootenay river for the mines in that area. Later he became vice-president of the company. In 1912, he was elected to the B.C. legislature for the Rossland-Trail constituency, and in 1916, he was appointed to the cabinet of the conservative provincial government as Minister of Mines.

Now president and managing director of the West Kootenay Power and Light Company, he is also president of the McGillivray Creek Coal and Coke Company and a director of the Consolidated Mining and Smelting Co. Ltd. He is also member of the Trail Board of Trade and Rotary, and in 1942 was vice-president of the Associated Boards of Trade of B.C.

He married Mary Spahr Hosier, of Jamestown, Ohio, in 1903, and has one son and one daughter. He continues to make his home in Rossland, where he has lived for 48 years and takes an active interest in local community welfare, particularly in regard to hospitals.

CONGRATULATIONS TO TORONTO

The year 1946 marked the Diamond Jubilee of the University of Toronto Engineering Society. The sixtieth edition of the Transactions and Year Book has just come to hand to remind us of this important event and to refresh our minds on many historic details. The Society reaches its jubilee one year before the Institute, and therefore takes seniority over it. In due appreciation of this relationship the Institute sends its warmest greetings to its elder brother, and expresses the hope that the future may give it equal opportunities for service as has the past, and that the strength to meet them accompanies the opportunities.

At the banquet which featured the celebration, Dr. T. Kennard Thomson, M.E.I.C., a gradute of '86, was the special guest. It was his interest and unextinguishable enthusiasm that brought the Society into existence so many years ago. It was fitting that he should have been selected as the guest of honour. Those who had the rare privilege of knowing Dean John Galbraith would applaud Dr. Thomson's words " John Galbraith—was a Man and an Engineer who has never been excelled ", but it was not known to all that he had so large a part in the formation of the Society. Dr. Thomson says " If there had been no John Galbraith there would have been no S.P.S. and no U. of T. Engineering Society ".

Dr. Galbraith was the first president of the society, and Professor H. E. T. Haultain, M.E.I.C., was the first student to be president. Other pioneers who were closely associated with the beginning of the Society were Dr. James L. Morris, M.E.I.C., Dr. George Herrick Duggan, Hon. M.E.I.C., and W. F Tye, M.E.I.C. These names are also part of the early history of the Institute and indicate the similarity of interests of the two organizations. Both were the result of the same interests and the same desires.

From this happy relationship of a common beginning, a common objective and a parallel history, the Institute looks forward with the Society to the future development of Canada and the profession in which both will have so important a part to play.

JULIAN C. SMITH MEDALS

Go to Chas. Camsell and J. B. Challies

Two past-presidents of the Institute, who have been closely associated with the development of Canada's natural resources, are the recipients of Julian C. Smith Medals for 1946.

Established in 1939 to perpetuate the name of the late past-president of the Institute, the medal is awarded by Council upon the recommendation of a special committee consisting of the president and two members of council appointed by him.

After forty years in the public service of Canada, Dr. Charles Camsell retired last spring from the position of Deputy Minister of Mines and Resources. Graduating with a B.A. from the University of Manitoba in 1894, he later took post-graduate courses in geology at Queen's University in 1901, at Harvard University in 1903, and carried on further advanced studies at Massachusetts Institute of Technology in 1908 and 1909.

From 1894 until his appointment as Deputy Minister of Mines in 1920, Dr. Camsell was engaged in the study and exploration needed to ascertain geological data of the kind on which mining and engineering work must be based. Later, his duties at Ottawa have given him a thorough acquaintance with the Canadian mining industry and with Canadian problems connected with fuel and power supply.

In 1920 he was appointed Deputy Minister of the Federal Department of Mines, (now the Department of Mines and Resources) and since that time he has served as chairman of the Dominion Fuel Board, as member of Council for the Northwest Territories, as a member of the National Research Council, as a member of the special International Niagara Board, and as Chairman of the Canadian National Committee of the World Power Conference.

Dr. Camsell joined the Institute as a Member on February 16th, 1923, served on Council in 1929 and 1930, and was president in 1932. He was vice-president of the Canadian Institute of Mining and Metallurgy in 1921-22, and was elected president for the current year, vice-president of the Royal Society of Canada in 1930, becoming its president in 1931, was president and one of the founders of the Canadian Geographical Society, and holds membership in a number of other scientific and learned organizations.

Among his academic honours may be noted the degree of LL.D., which he received from Queen's University in 1922 and from the University of Alberta in 1929. His achievements as an explorer were recognized in 1922 by the award to him of the Murchison Grant by the Royal Geographical Society as an appreciation of his services in exploring northern Canada; his long connection with the mining industry was fittingly acknowledged in 1931 when the Institution of Mining and Metallurgy, London, presented him with its gold medal for his work in promoting the development of the natural resources of the Dominion and furthering the general interests of the mineral industry.

In 1935, in the King's Birthday List of Honours, Dr. Camsell was made a Companion of the Order of St. Michael and St. George.

In 1945 Dr. Camsell was awarded the R. B. Bennett Empire Prize of 100 guineas for his paper "Canada's New North" which was read before the Royal Society of Arts; also the Founders' Medal of the Royal Geographical Society in recognition of his contribution to the geology and geography of the Canadian north and for his work in advancing geographical science in the Dominion. In April 1946, he was honoured by the Professional Institute of the Civil Service of Canada with a special award of its medal in recognition of his outstanding contribution to science and administration during his forty years in the public service.

A vice-president and executive engineer with the Shawinigan Water and Power Company, Dr. J. B. Challies is a recognized authority on administrative investigatory and international features of water resources and power matters.

A graduate of the University of Toronto in the class of 1903, Dr. Challies commenced his professional career at Ottawa as an engineer of the Topographical Surveys of Canada. Subsequently he successively occupied the positions of chief hydraulic engineer, Department of the Interior; superintendent of Water Power for Canada; director and chief engineer of Water Power and Reclamation Service; director, Dominion Hydrometric Survey; member, Dominion Power Board; member, Dominion Fuel Board; consulting engineer to the Department of External Affairs. In the latter position, as adviser to four Federal premiers, he was for many years a familiar figure before the International Joint Commission and at Federal-Provincial conferences regarding international waterway matters. As its first director, he was largely responsible for the organization of the Hydrometric Survey of Canada and the Water Power Bureau which are of great importance to engineers dealing with run-off or river flow problems. He took a leading part as special liaison officer representing the Federal Departments in the establishing of the National Research Council. Few contributed more constructively to the Dominion-wide movement among governmental employees for an adequate recognition of the engineer in the public service. He was one of the founders of the Professional Institute of the Civil Service. He represented the Government of Canada at the International Engineering Congress in San Francisco in 1915. The outstandingly successful character of Canadian participation in the World Power Conference at London in 1924, at Berlin in 1930, and at Washington in 1936, was due in no small measure to Dr. Challies' initiative. While in the Federal Public Service he was a recognized authority on administrative, investigatory and international features of water resources and power matters. Since assuming, in 1924, a professional position with The Shawinigan Water and Power Company, of which Company he is now a vice-president, he has become equally well known in the electrical utility field.

In 1938, the University of Toronto conferred upon Mr. Challies the honorary degree of Doctor of Engineering, for achievement in the conservation and use of the water power resources of Canada."

Dr. Challies' activities in the Institute were crowned by his election to the presidency in 1938.

In 1945-46 he served as chairman of the executive committee of the Canadian Chamber of Commerce.

A prominent layman in the United Church of Canada, he is chairman of the board of governors of the United Theological College, Montreal.

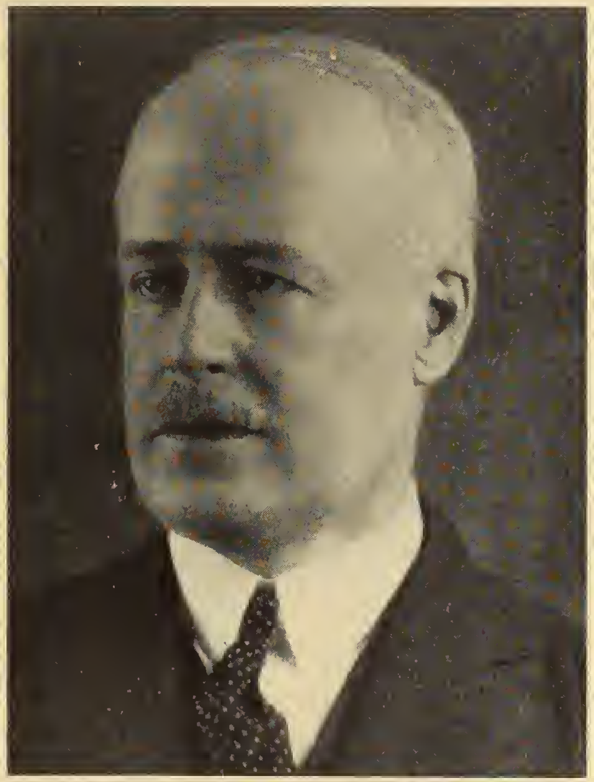
GEORGE ALEXANDER WALKEM

1872-1946

One of Western Canada's most distinguished engineers and industrialists, and a past-president of the Institute, died in Vancouver on Friday, December 13th, 1946. George A. Walkem, has lived in the west for almost fifty years. He established a number of leading industries at the coast, all of which were active in the production of war materials.

Born on July 8th, 1872, at Kingston, Ont., Mr. Walkem attended Kingston public and high schools, and received his engineering education at McGill University, where he obtained the degree of B.Sc. in 1896. He had previously served an apprenticeship in the Kingston Foundry and Locomotive Works from 1887 to 1891. For two years after graduation, he was employed as engineer with the Collins Bay Rafting Company and in 1898 he went to British Columbia where he worked on construction for the British Columbia Electric Railway at Vancouver until 1899 when he established a consulting mechanical engineering practice which he carried on until 1901. In that year, he was appointed manager of the Vancouver Engineering Works Ltd., then the largest plant in the province. In 1906, Mr. Walkem incorporated the Vancouver Machinery Depot Ltd., and, in 1911, the Gulf of Georgia Towing Company, of which he was president until last year.

In 1915, he went to England and secured a commission in the Royal Engineers, serving in France, Egypt and Palestine. His duties in Egypt and Palestine included the charge of the Kantara Military Railway, and work in connection with its extension across the Sinai Desert to Beersheba, with other branches to Jerusalem and Haifa. This involved a great deal of construction as well as maintenance work, and Major Walkem was mentioned in despatches by Lord Allenby "for gallant and distinguished service in the field".



George Alexander Walkem.

After the war, Mr. Walkem re-established himself in Vancouver, eventually becoming president and general manager of the Gulf of Georgia Towing Company, one of the most important maritime activities on the west coast. Associated with the latter is the West Coast Salvage and Contracting Company Ltd., of which Mr. Walkem was president and managing director.

In the year 1926, a new company was formed, the Vancouver Iron Works Ltd., which, under Mr. Walkem's presidency, expanded its business enormously and played an important part in the manufacture of ship machinery during the last war.

As a further aid to the war effort, a new company was formed in 1942 and established a four-berth shipyard to build freighters. The West Coast Shipbuilders Ltd., of which Mr. Walkem was president, built 52 ships of the 10,000-ton class.

The war work of the companies with which Mr. Walkem was associated has been distinguished for the ingenuity applied throughout their operations. Under Mr. Walkem's leadership, entirely new methods and operations were developed that greatly reduced costs and increased production. This was particularly true in the boiler plant where his methods were outstanding in their originality and their success, and became a pattern for other manufacturers.

Mr. Walkem's interest in the professional and industrial fields was equalled by his public service. On his return to Vancouver after the first world war, he became interested in municipal and provincial political activities, sitting as a member in the Provincial House of Assembly for five years. In 1920 he was able to assist in securing the legislation which established the Association of Professional Engineers of British Columbia, one of the two organizations of which he was president in 1926. The other was the Engineering Institute of Canada.

For fifteen years, Mr. Walkem was on the board of the Vancouver General Hospital, two years as chairman. He also took an active interest in the Children's Aid Society of Vancouver, the Queen Alexandria Solarium for Crippled Children, and the Sea Scouts. For a number of years, he lectured on a voluntary basis on industrial management in the department of mechanical engineering at the University of British Columbia. It is interesting to recall, at this point, that Mr. Walkem's father had been a well-known lecturer at Queen's University, Kingston.

Joining the Institute in 1906 as an Associate Member, he was elected Member in 1920. He served as a councillor during 1921 and 1922 and was vice-president during 1923 and 1924. He was elected to the presidency in 1926. Last year, Mr. Walkem was awarded the Julian C. Smith Medal of the Institute "for achievement in the development of Canada". He was a member of the Institution of Mechanical

Engineers (Great Britain) and of the American Society of Civil Engineers.

Surviving are his widow, formerly Mrs. J. Byrn (Mary Collins), and four children, Lt.-Col. Richard Walkem, A. D. Walkem, Mrs. John Baxter, and Mrs. Harry Alder, all of Vancouver. The youngest son, George, was killed in action while in service with the R.C.A.F. There are also three step-children, Stafford Byrn, Mrs. R. Bicknell, both of Vancouver, and Lt.-Col. J. C. Byrn, O.B.E., M.E.I.C., of Montreal. Mr. Walkem leaves also one sister and two brothers, Mrs. Henry Joseph, Lt-Col. Hugh Walkem, both of Montreal, and Knox Walkem, K.C., of Vancouver.

EIGHTH INTERNATIONAL MANAGEMENT CONGRESS

Stockholm, July 3-8, 1947

After a lapse of nine years between meetings, the International Committee of Scientific Management (Comité International de l'Organisation Scientifique, C.I.O.S.) will meet in Stockholm, Sweden, next summer.

World Management Congresses have previously been held in Prague (1924), Brussels (1925), Rome (1927), Paris (1929), Amsterdam (1932), London (1935) and Washington (1938).

It is appropriate that leaders of thought and action should meet to review and evaluate the extensive developments in management work since 1938 and to examine management problems of tomorrow. This is the background to the Eighth International Management Congress.

The programme and discussions of the Congress will in the main serve:

> "to state and appraise the progress made in the various fields of management (industry, agriculture, public administration and the home),
>
> to provide a meeting ground for the exchange of ideas and experiences between people in responsible positions of management in different countries,
>
> to discuss the function of economic planning on different levels,
>
> to examine ways and means of promoting improved education for management and raising the level of economic thinking."

The programme comprises Plenary Sessions, Sectional Meetings and Study Tours.

Canadian Participation

Participation of the various countries is arranged by national committees made up of representatives of the various organizations interested in the objects of C.I.O.S. In view of the leading part played by engineers in management, W. L. Batt, Hon.M.E.I.C., president of C.I.O.S. and president of S.K.F. Industries, Philadelphia, has requested The Engineering Institute of Canada to bring the various Canadian organizations together with the object of having them set up a co-operative group that could apply for membership in C.I.O.S. Meetings have been held and the matter is now under way.

Last June the executive committee of the Congress met in Stockholm and the Institute was represented by Frederick Palmer, M.E.I.C., who is Canadian Government Trade Commissioner in that city. Mr. Palmer reports that representatives were in attendance from Great Britain, France, Belgium, Sweden, Denmark and the United States, with the chairman, W. L. Batt, presiding. Several procedures for the future of the organization were agreed upon.

The American delegation has chartered a ship for the journey to Stockholm and has set aside accommodation for twenty Canadians. A conference has been arranged for the voyage which will provide unusual opportunities for study and discussion, with several leading American management experts taking the lead.

Anyone interested in attending the Congress may get further details from Headquarters.

RELIEF FROM TAXATION

While the amount is not large a recent reduction in tax expenditure will be well received. Engineers will be glad to know that certain fees which they pay are now deductible from their incomes for tax computation purposes.

Over several years the Institute has been protesting to the Department of National Revenue that fees paid by engineers to their professional societies should be free of income tax, but answer to letters and to delegations was firm—that persons who worked for a salary were not entitled to any deductions for expenses.

It has taken the lawyers to succeed where engineers have failed. A lawyer of Winnipeg, by name Bond, took action against the Minister of National Revenue in the Exchequer Court of Canada, and won his case. Although the case applied to a lawyer it seems evident that it should apply equally well to engineers.

To clarify this point the general secretary wrote the Minister and received a reply which is reproduced at the conclusion of this article. That letter indicates that the fees of engineers to their provincial professional associations (or corporation) are now deductible for tax purposes. According to the Department's ruling as shown in the letter, the same deduction is not permissible for the fees of the Institute.

The limitations placed on the salaried engineer have never applied to the self-employed or consulting engineer. He has deducted his fees to professional societies for many years. It is a simple matter for him to show that membership in organizations even beyond the registration body, is necessary to his business.

It is interesting to read the Reasons for Judgment given by Mr. Justice Thorson. In it he appears to reprimand the Minister for his dogmatic decision. The Minister's reply to the appellant's original appeal reads:

"The Honourable the Minister of National Revenue having duly considered the facts as set forth in the Notice of Appeal and matters thereto relating hereby affirms the said Assessment on the ground that the taxpayer has been correctly assessed and that the deductions claimed are not permissible under the provisions of the Act. Therefore on these and related grounds and by reason of other provisions of the Income War Tax Act the said Assessment is affirmed."

To this Mr. Thorson says in a reproving phraseology:

"The ground thus assigned for affirming the assessment does not disclose any specific reasons at all. But the validity or otherwise of an assessment does not depend upon the soundness or unsoundness of the reasons given by the Minister for his decision on the appeal to him under section 58 of the Act or whether reasons are given or not. The appeal to the Court provided by the Act is an appeal from the assessment, not from the Minister's decision or the reasons or lack of reasons for it".

Herewith is the letter from the Department:

"L. Austin Wright, Esq., M.E.I.C.,
General Secretary, etc.

Dear Sir:

With reference to your letter of November 19th, we are enclosing for your information a copy of the Reasons for Judgment of Mr. Justice Thorson in the case of Bond v. Minister of National Revenue. From that you will see that the professional man on a salary is permitted to deduct his annual fees if payment of such is absolutely necessary in order to carry out his duties. However, if Mr. Bond had not been required to appear in the Manitoba Courts, it would not have been necessary for him to be a member of the Manitoba Bar.

As you will see, under the law of Manitoba, Mr. Bond was required to be a member of the Bar Society if he practised in the Courts of that Province. Is there any similar legislation requiring your members to belong to your Society or to any provincial organization?

Comparing the case again with the lawyers, membership in the Canadian Bar Association would not be an allowable deduction as no one is under any obligation to belong to that society and may practise his profession without being a member.

Yours faithfully

(Signed) C. F. Elliott,
Deputy Minister (Taxation)

NEWCOMEN SOCIETY IN AMERICA

Canadians will be pleased at the recent announcement that D. C. Coleman, chairman and president of the Canadian Pacific Railway Company, has been honoured with the presidency of the Newcomen Society of England. He is the first Canadian to hold this high office and is the third person in North America to be so honoured. For some time, Mr. Coleman has been active in the American activities, and to those who are familiar with the affairs of the Society his appointment to the presidency seems a logical development.

The Newcomen Society of England has as its principal aim the fostering of research and study of the history of material civilization throughout the world. As would be expected, such an objective comes very close to the work and to the hearts of engineers. As a consequence, the membership of the Society is built up largely of engineers, physicists and industrialists. Another great purpose of the Society is to promote friendly and intimate relations between Great Britain, the United States and Canada.

The members of the Institute will be interested to know that of the three presidents who have come from this side of the water one was Col. C. E. Davies, secretary of the American Society of Mechanical Engineers, and a member of The Engineering Institute of Canada. The third president was W. M. Vermilye, senior vice-president of the National City Bank of New York.

It will be very gratifying to Canadians to know that the proposal of Mr. Coleman's nomination for the presidency was put forward at the annual elections in London, England, by the American Headquarters of the Society in New York.

CIVIL SERVICE IMPROVEMENTS IN U.S.

Recently, the Board of the United States Civil Service Examiners for the Scientific and Technical Personnel of the Potomac River Naval Command has been formed as the authority for evaluating new employees to be delegated to the laboratories. This has come as the result of joint efforts of the Naval Research Laboratory, the Naval Ordnance Laboratory and the David Taylor Model Basin.

The creation of this Board is of particular significance to Canadian engineers. It is along the lines of the Technical Panel which the Institute recommended in its report to the recently held Royal Commission, and appears to be the only commonsense solution of the many personnel problems now in the hands of government departments and agencies. There has been so much bad management as far as professional workers are concerned, due to the policy of handling these things with non-professional workers, that something has to be done or the government activities will not be carried on efficiently or economically.

The United States Board will be made up of scientists whose time will be devoted exclusively to the procurement and evaluation of scientific and technical personnel. In this way, the Navy has shown its high regard for its scientific personnel, and has recognized the scientific service as an integral unit in its organization. So far as is known, this is the first Board of Examiners which is composed of scientists devoted exclusively to the scientific service. In Great Britain, a year ago, a somewhat similar set-up was adopted, but in their case the board was referred to as a scientific and technical panel and was made up of professional employees from various departments.

It would be a splendid achievement if something of this kind would be adopted at Ottawa. There seems to be no other way to solve satisfactorily the special problems of the many services.

MAYOR CONSULTS THE INSTITUTE

Mayor Bridges of Moncton, N.B., seems to be a man of good common sense. When a serious problem of an engineering nature faced the city he asked the branch of the Institute to call a special meeting of the executive so that he could discuss it with them.

According to the *Moncton Transcript*, the city is facing a serious water shortage due to the unusually low water precipitation. The average precipitation for the last twenty years is 38.10 in. whereas this year's figure is only 25.99 in., the lowest on record. The water level at the reservoir is 16 ft. 8 in. lower than normal for this time of year and the supply is being used up at a rate of more than two million gallons a day, which is two million below normal.

The meeting with the executive resulted in a decision to sink some wells to find new sources of supply. The provincial geologist was sent for in order to check with him on locations that were agreed upon. It is expected that artesian wells not far from the reservoir will solve the problem without the necessity of laying extensive pipe lines, as the outflow could be directed into the normal stream channels.

The action of Mayor Bridges is a tribute to the Moncton engineers — a recognition of their special training and experience in the terms of the special needs of the municipality.

A MEMORIAL TO ROYAL CANADIAN ENGINEERS

Military Engineers Association of Canada
Ottawa, Dec. 20, 1946.

The Secretary,
Engineering Institute of Canada.

Dear Dr. Wright:

General Turner told me about your interest in the memorial to the Royal Canadian Engineers and I believe he mentioned to you our plans to raise $3,500 so that we can start the preparation of our second "Book of Remembrance". The following is a fairly complete story of our previous efforts and a description of the book, a copy of which I am sending for your members to see.

In memory of a great soldier and engineer, Earl Kitchener, All Souls Chapel of St. Paul's Cathedral was erected. By kind permission of the Dean and Chapter it was arranged that the rolls of honour of all ranks of the Corps throughout the British Commonwealth who fell in World War I should be deposited in the chapel as part of the Royal Engineers War Memorial. Subsequently, rolls commemorating the Engineers of Australia, New Zealand and India were deposited in this chapel.

At the Annual Meeting of the Military Engineers Association of Canada in 1935 a committee was appointed to consider and report on the Canadian Engineers part in this memorial. After careful study it was decided that a "Book of Remembrance" should be prepared containing the 2004 names of Engineers, Signals and Pioneers who had died prior to demobilization. Signals were included because, during World War I, they were part of the Corps of Engineers and did not become a separate Corps until later.

We were fortunate in securing the services of Miss Grace Melvin, D.A., head of the Department of Design of the Vancouver School of Arts to do the intricate illumination and lettering and the work was finally completed in 1944. After being viewed by His Excellency the Governor General, the Prime Minister and Gen. McNaughton, the book was placed in the National Art Gallery pending an opportunity of delivering to the custody of the Dean and Chapter of St. Paul's Cathedral. This occasion took place on the 6th of July, 1945, at an appropriate ceremony attended by representatives of the Corps of Royal Engineers and Royal Canadian Engineers.

The opening page of illumination, in full colour, suggests the spirit and message of the book. The text is an excerpt from a poem by the Canadian poet, Duncan Campbell Scott, "Why Mourn Thy Dead", and is dedicated to the "bereaved" of the Canadian Engineers whose names are written on the following pages. At the top left hand corner of the page, an angel, militant, supports the laurel leaf of the immortals, who form a symbolic procession in the broad border at the foot of the page.

The words of the poem read:

"Why mourn thy dead, they are the world's possessions?
These our immortals—Shall we give them up
To the complaint of private loss and dole?
Nay—mourn for them, if mourn thou must,—
Grief is thy private treasure;
Thy soul alone can count its weight or measure,
But we who know they saved the world
Think of them joined to that unwithering throng,
Who in the long dread strife
Have thought and fought for Liberty.

Be comforted,—nay sob, if sob thou must,
Cover thy face and dim thy head with dust,
And we who know they live
Gather thy dead in triumph—
Exalted from the caves of memory,
Purified from the least as soil of time—
And lay them with all that is most living,
In light transcendent,
In the ageless aisles of silence,
With the Immortals that have saved the world."

Page two is dedicated to "the Dead" and the dominant theme is the golden cross of sacrifice surmounted with the martyrs' crown of victory. Supporting the cross are two kneeling angels each holding the "Torch of Remembrance". The cross is rooted in a symbolic rendering of the maple trees of Canada, in whose branches the Canadian song-birds sing their immortal songs. On the heraldic riband on the cross are the words: "Vincet amor patriæ" (Love of country will conquer). At the foot of the page is the quotation from Virgil's Aeneid":

"Et quorum pars magna fui";

and the translation of the full passage is:

"All the deeds of woe mine eyes beheld
and those whereof I was no small part".

Above this quotation are the words from the Apocalypse:

"Be thou faithful unto death and I will give thee a crown of life".

The entire page is in gold leaf—vermilion and white.

Page three is the "title page" showing the badge of the Canadian Engineers, below which is lettered the following quotation from Lawrence Binyon.

"They shall grow not old;
As we that are left grow old;
Age shall not weary them,
Nor the years condemn.
At the going down of the sun and in the morning
We will remember them."

Heraldic borders complete this page.

The next twenty-four pages are devoted to the 2004 names of the fallen together with rank and date of death. Throughout these pages, incidental decoration and borders are used, introducing knots, shoulder badges of C.E. units—bridges, men with shovels, crossed flags, grenades and other Engineer motifs. The names are arranged in three groups: 1. Engineers, 2. Signals, 3. Pioneers.

On the last page there is a "Prayer For Canada" taken from a poem written by Duncan Campbell Scott in 1911. The words are prophetically suitable for the ending of this book:

"Grant us this presage for a guiding star,
To lead the van of peace, not with a craven spirit,
But with the consciousness that we inherit
What built the Empire out of blood and fire,
And can smite, too, in passion and with ire,
Purge us of pride, who are so quick in vaunting
Thy gist, this land, that is in nothing wanting;
Give mind to match the glory of the gift,
Give great Ideals to bridge the sordid rift
Between our heritage and our use of it.
Then in some day of terror for the world:

When all the flags of the Furies are unfurled,
When Truth and Justice, wildered and unknit,
Shall turn for help to this young, radiant land,
What shall we answer in that stricken hour?
Shall the deep thought be pregnant then with power?
Shall the few words spring swift and grave and clear?
Use well the present moment. They shall hear ".

The binding is in rich red English Morocco, lined with blue English Morocco. The large cross in the centre and the border are modelled in relief.

The entire book is carried out with original " Work of Art " of the 20th century, and is not in any way copied from traditional illumination.

Once again we are preparing a record, which may be placed with those of the other members of the Commonwealth, of the personnel of the Corps who failed to return. For this purpose a committee has been formed under the chairmanship of Maj. Gen. G. R. Turner, C.B., M.C., D.C.M., with Lt. Col. J. A. Warburton, P.O. Box 591, Ottawa as treasurer. Contributions will be gratefully received from former Sappers and members of the families of those who thought enough of Canada to give their lives

Any assistance you can give in publicizing our appeal will be greatly appreciated. As you will appreciate our only direct contact is through our Branches and the Army. We have no means of reaching former Sappers who, when they returned to professional practice, severed all connections with things military.

Yours sincerely,

E. M. Medlen, M.E.I.C.,
Hon. Secy.

❖ ❖ ❖

Editor's Note

The *Journal* is happy to bring Mr. Medlen's letter to the attention of its readers as in this way they will be made aware of the proposal to prepare a worthy record of the personnel of the Corps who gave their lives in the recent war.

During his recent visit to England, the general secretary visited the chapel referred to in Mr. Medlen's letter (All Souls of St. Paul's). It is indeed a beautiful memorial. As is pointed out, the main purpose of the chapel is to commemorate the deeds of Earl Kitchener. Occupying the main portion of the floor area is a magnificent life size white marble figure of the great soldier (reclining), and in the north wall beyond the figure, facing the single entrance, is a recess closed with a bronze grill behind which is the " Book of Remembrance ".

Engineers who visit St. Paul's will find this chapel worthy of special attention. It is easy to find, being the first opening to the left of the main entrance of the cathedral.

Incidentally, the photostatic copy of the Book of Remembrance will be at Headquarters for some time, where it can be seen by anyone who is interested.

POET TO ENGINEER

Alexander Pope in his " Epistle to Lord Bathurst " in Moral Essays (1731-5) sums up in a few lines the contribution of the engineer of that time to the development of prosperity in his homeland. Where is the poet who can so succinctly describe the task of today's engineer in the rebuilding of the world; who can so colourfully praise the work of the successors to those early masters of the profession? Pray God that again

" These honours Peace to happy Britain brings ".

"Bid harbours open, public ways extend,
Bid temples, worthier of the God, ascend;
Bid the broad arch the dangerous flood contain,
The mole projected break the roaring main,
Back to his bounds their subject sea command,
And roll obedient rivers thru' the land.
These honours Peace to happy Britain brings;
These are imperial works, and worthy Kings."

AN APPEAL FROM GREECE

We are glad to print the following letter, which was recently received at Headquarters. The letter was written in French, and the following is a literal translation:

Florina, Oct. 28th, 1946.

To our confreres,

The Civil Engineers of Great Britain, United States of America, Canada, Australia, Brazil, South Africa.

Gentlemen:

From Florina, the remotest Greek city between Yugoslavia and Albania, wherefrom, for the first time, the Greek forces pushed the enemy back and gave the United Nations in the war against the Axis (up to then invincible) their first victory (capture of the city of Corytsa) we, the chief engineer of the Department of Public Works of Florina, and the engineer in charge of works for the township, send to you all, our confreres at work, our warmest salutations.

In this distant part of our beloved and heroic country, alone we supervise the reconstruction of our communications destroyed without mercy by the enemy.

In this superhuman task, alone without any mechanical help because we are short of everything, we still find an insurmountable obstacle and enormous difficulty as a result of the absolute lack of office instruments.

Unfortunately, our country in its gigantic effort of reconstruction with the meagre means at its disposal, cannot supply the necessary instruments.

For this reason we appeal to you and request your assistance in the difficulties facing us, and we ask you to send to us all the office instruments that you can dispose of, that is, tachometers, levels, slide rules, draughting instruments, etc.

Such shipments from you would brace up our courage in our work, in the same way as the sole thought during the war that we were fighting against the same enemies and for the same cause gave our people and our forces the courage and the tenacity to face the Axis victoriously in the towns and on the battlefield.

Looking forward to a favourable response to our request, we would like to express our most sincere thanks.

(Signed) Spyros Dimitriades,
Civil Engineer i/c Public Works for the Department of Florina, Greece.

(Signed) Georges Carayamis,
Civil Engineer, A.I.G., Florina, Greece.

CORRESPONDENCE

Montreal Public Lacks Adequate Protection

The following letter was sent to the editors of the Montreal dailies by the general secretary of the Institute.

November 22nd, 1946.

Dear Sir:

The recent failure of a newly poured concrete wall in Montreal has focussed attention on a condition which, in our opinion, requires correction. The wall failed—not because of faulty engineering design, but because of failure to build it in accordance with good construction practice. It appears that a competent and qualified engineer was engaged to do the designing but that the services of a qualified engineer were not retained to supervise construction. The one without the other is senseless and in the public interest should not be permitted.

A quick examination of the regulations does not reveal that the building inspection department of the City of Montreal has any authority to demand that competent engineering services be retained until the construction work is completed. A committee appointed by the Engineering Institute has investigated this particular case and, from their report, it appears that the collapse of the wall was due to failure to shore up the adjacent earth embankment and to properly brace the concrete walls after pouring, pending construction of adjacent floors.

Again in this instance deep excavation was made below the level of the bottom of the wall and adjacent to it. Naturally the subsequent settlement of the earth embankment was accompanied by a movement in the wall, and eventually the overloaded embankment gave way, carrying with it a large part of the concrete wall and imprisoning beneath it a workman whose life was in danger for many hours before he could be released.

The lesson to be learned is that all owners of buildings under construction should be forced to maintain competent professional services until the work is completed. Good construction methods and design are two inseparable requisites for safe and satisfactory building. Without either the lives of the people are not protected adequately. Something should be done to put the proper authority into the hands of the city.

It is unfortunate that from newspaper accounts of this minor disaster some persons should have gained the impression that it was due to faulty engineering. Such was not the case. It was due to the failure to have a professional engineer on the job during construction—a condition which it is difficult to realize would be permitted in a city the size of Montreal.

It would be appreciated if you would publish this letter so that to some extent at least the public will understand what has occurred. Perhaps too, a wider realization of the shortcomings of the present building regulations will be helpful to those who desire to bring about the necessary changes. Such hazards to life and limb should not be allowed to continue.

Yours sincerely,

L. Austin Wright,
General Secretary,
The Engineering Institute of Canada.

Montreal, December 14, 1946.

The General Secretary,
The Engineering Institute of Canada.

Dear Dr. Wright:

It was with great interest that I read your letter, published in the *Gazette,* in connection with the recent wall failure in Montreal.

The appropriateness of your suggestion to force builders, by means of city by-laws, to employ competent contractors and engage engineers to supervise construction might be illustrated by a further example.

I was recently called in to inspect a commercial building erected by the owner without the help of an architect and or engineer. The structure is of steel beams and mill floor. However, the mill floor is not resting on the beams designed for this purpose by the steel supplier, but on the intermediate tie beams which were only designed as lateral braces.

While writing to you I would also like to bring to the attention of the Institute the fact that, very frequently, structural engineers are not engaged for designing buildings in the Province of Quebec, as material suppliers for structural steel and reinforcing steel and general contractors furnish design drawings. A number of steel firms do not even have qualified designing engineers in their organization.

Yours very truly,

Henry Jasen, M.E.I.C.,
Consulting Engineer.

ELECTIONS AND TRANSFERS

At a meeting on December 21st 1946, a number of applications were considered and the following elections and transfers were effected.

Admitted as Students

Students at University of Toronto

W. A. Anderton	M. J. Hutton	R. A. Robertson
W. H. Bacon	R. E. Lashley	R. W. Rogers
L. E. Clark	E. B. MacCuish	B. M. Ross

Budden, John Hastings, B.Eng., (Elect.), McGill, telephone equipt. engr., Northern Electric Co., Ltd., Montreal, Que.

HYDRO-ELECTRIC PROGRESS IN CANADA DURING 1946

Continued from page 23

an operating head of 135 ft. The first three units are expected to be in service in 1951 and the remainder a year later.

A new development was commenced on the Aguasabon River, with power house located at Terrace Bay on Lake Superior. The plant will operate under a head of 297 ft. and will contain two 27,500 hp. units. It will supply a local pulp and paper project, but will also be connected to the Nipigon River plants. An extension of the Ear Falls plant on the English River is also proceeding, the fourth and last unit being under installation. Unit No. 1 at Rat Rapids (1,200 hp.) has been reinstalled. The Kalamazoo Vegetable Parchment Company completed alterations to its water-power plant at Espanola. Three turbines, rated at 2,480 hp. each, have been replaced by a 10,000-hp. turbine driving a 7,500-kva. generator; this change increases the capacity of the plant by 2,560 hp.

During the year, 1150 miles of rural distribution lines and 377 miles of high tension transmission lines were built. Of the latter, 66 miles is accounted for in the line connecting the Thunder Bay System with the Aguasabon development.

Quebec

In Quebec province, the intensive progress in hydro-electric installation during war years has provided adequate capacity for the immediate post-war demand and no new units were placed in operation during 1946.

The Quebec Hydro-Electric Commission, through Beauharnois Light, Heat and Power Company, continued its long range program of dredging operations in the Beauharnois Canal; application has been made for permission to install a 14th unit of 50,000 hp. in the Beauharnois plant. In the Montreal district, a large expansion of substation and distribution facilities is being pushed through to meet substantial increases in loads; additional power will be brought from Beauharnois. In the Temiscamingue and Abitibi district, the Commission has started the construction of a storage dam at Lake Dozois.

During the year, the Shawinigan Water and Power Company carried out extensions to its distribution system, involving an expenditure of about $2,500,000; new work included the construction of about 500 miles of distribution lines; a further $1,000,000 was spent for additions to substations. An important addition to the company's development at Shawinigan Falls has been undertaken; this comprises three additional 65,000-hp. units to be installed in a new power house; this work will cost $12,500,000 and will take at least two years to complete.

The Lower St. Lawrence Power Company has under construction a 6,000-hp. plant on the lower Metis River which will come into operation during 1947. In Saguenay County, the Canadian International Paper Company has a small project under construction which is expected to be in operation about July, 1947. The Gatineau Power Company expects to complete the installation of the fifth and final 24,000-hp. unit in the Farmers Rapids plant early in 1947. Construction was completed of a 36-mile 100-kw. wood pole line from Calumet to St. Jerome.

The Southern Canada Power Company completed

(Continued on page 35)

Personals

News of the Personal Activities of members of the Institute

G. M. Brown, M.E.I.C., district engineer of the Department of Public Works of Canada at Saint John, N.B., will represent the New Brunswick Association of Professional Engineers on the Council of the Institute for the year 1947.

Major R. C. Farrow, M.E.I.C., is the newly elected chairman of the Victoria Branch of the Institute. In 1928 he joined the staff of the Water Rights Branch of the Department of Lands of British Columbia as a hydraulic engineer in the power investigation division, and in 1938 he became chief hydraulic engineer. His activities were interrupted in 1940 when he volunteered for active service with the R.C.E., and he resumed his duties with the Government in 1945. A year later he received the appointment to his present position as comptroller of water rights for the Province.

Prior to service with the Government and after returning from World War I, he was in private practice in Vancouver until 1923, at which time he joined the staff of the Southern California Edison Co. at Los Angeles, Calif. He is chairman of the Pacific North West Section of the Western Snow Conference and vice-chairman of the Committee on the Hydrology of Snow of the American Geophysical Union.

John P. Fraser, M.E.I.C., is the newly elected chairman of the Vancouver Branch of the Institute. He was born in Hamiota, Man., and studied at the University of Manitoba, receiving a bachelor degree in electrical engineering in 1914. Going first to Canadian Westinghouse Company in Hamilton, Ont., he left that company in 1929 as a designing engineer. He was with the Northwestern Power Company then for four years, and in 1933 transferred to the Manitoba Power Commission as a statistical and rates engineer. He became district general manager in 1934 and two years later was general superintendent. Going to the British Columbia Electric Railway in 1940, he was successively superintendent of hydroelectric plants and assistant chief engineer. His most recent appointment was to the position of assistant chief engineer of the electrical operating division of the company.

A. D. Harris, M.E.I.C., chief engineer of the Ford Motor Company of Canada at Windsor, Ont., has been elected chairman of the Border Cities Branch of the Institute. Born in Scotland, he studied at the London Polytechnic Institute. In Canada he was first employed by the Canada Foundry Company Limited, Toronto, on structural draughting, estimates and costs. After four years service with the Canadian Expeditionary Force in World War I, he entered the Canadian Bridge Company Limited, Walkerville, Ont., employed on structural detailing, checking and designing. Going to the Ford Motor Company in 1922 as a design and construction engineer, he became assistant chief engineer in 1930. He went to New Zealand in 1936 as engineer in charge of design, construction and equipment of an assembly branch, returning in 1937. He was appointed to his present position in 1941.

E. G. Wyckoff, M.E.I.C., administrative engineer with the Otis Fensom Elevator Company, Hamilton, Ont., has been elected chairman of the Hamilton Branch of the Institute. Born in Vittoria, Ont., he received a B.A.Sc. degree from the University of Toronto in 1930. He then entered the employ of the company with which he is still connected. Starting as an engineering student at the Hamilton Works, he assumed charge of various manufacturing departments and manufacturing procedures and is now head of the engineering department of the company.

G. W. Lusby, M.E.I.C., is the newly elected secretary-treasurer of the Border Cities Branch. He is an engineer with the Ford Motor Company of Canada at Windsor, Ont. He joined the company in 1927, having been employed previously by the Fraser Brace Company, Gatineau, Que., and by the Canadian International Paper Company at Trois Rivières, Que. Born at Amherst, N.S., he is a graduate of Nova Scotia Technical College, Halifax, having received a B.Sc. in mechanical engineering in 1925.

S. H. Frame, M.E.I.C., is the new secretary-treasurer of the Victoria Branch of the Institute. He is hydraulic engineer for the Water Rights Branch of the Department of Lands and Forests, coming to the Branch in 1928 from the Department of Natural Resources of the Canadian Pacific Railway at Brooks, Alta.

Colonel W. G. Swan, M.E.I.C., Vancouver consulting engineer, and **Colonel H. G. Thompson,** M.E.I.C., manager of Aluminate Chemicals Limited, Toronto, were awarded Alumni Medals at the University of Toronto Alumni Reunion dinner on November 2nd, 1946, for outstanding achievements in the field of engineering.

Lieut. Col. John M. Cape, M.E.I.C., director of E. G. M. Cape and Company, Montreal, took over command of the 34th Field Regiment, R.C.A., at a ceremony held recently at the Montreal headquarters. He served overseas with the R.C.A. from 1940 to 1945. He entered his company in 1934 after graduation from R.M.C., Kingston, Ont.

Dr. R. R. McLaughlin, M.E.I.C., was made head of the department of chemical engineering of the University of Toronto in October 1946. He was formerly professor of chemical engineering, having joined the faculty in 1931 as an assistant professor. An alumnus of Toronto, after receiving a Ph.D. degree in 1926, he performed research at the University until 1929 under the National Research Council. He was president of the Chemical Institute of Canada in 1945.

N. R. Crump, M.E.I.C., general manager at Toronto for Canadian Pacific Railway since January 1946, has been named vice-president and general manager of eastern lines, with headquarters in Toronto. He studied at Purdue University, Lafayette, Ind., specializing in railway mechanical engineering. His railroading career was in the west until 1942 when he was transferred from the position of assistant superintendent of motive power for the west at Winnipeg, to that of assistant to the vice-president at Montreal. He went to Toronto the following year as Ontario general superintendent and was made assistant general manager of eastern lines in 1944.

Digby Wyatt, M.E.I.C., was recently appointed manager of the newly formed Ontario Division of Cresswell Pomeroy Limited, with headquarters at Toronto. He had been regional representative for the Wartime Bureau of Technical Personnel in Toronto from 1942, on leave of absence from his position as industrial combustion engineer for the Elias Rogers Company Limited, Toronto.

W. H. Stuart, M.E.I.C., has resigned as Nova Scotia deputy minister of industry and publicity, and has accepted the appointment as assistant manager of Fred Mannix Construction Companies of Western Canada, with headquarters at Calgary. He became manager of the War Assets Corporation for Nova Scotia in 1944 after service with the R.C.A.F. as manager of the Stanley Flying Training School in N.S., and from that position he went to the post of deputy minister of highways and public works for the province. Mr. Stuart later transferred to the newly created post of deputy minister, Department of Industry and Publicity.

A. C. Eddy, M.E.I.C., chief engineer of way and structures for the British Columbia Electric Railway retired in December 1946, after many years of service with the company which he joined in 1912 as construction engineer, after serving with the Great Northern Railway in charge of construction for extensions of the road in B.C., and as resident engineer in Vancouver. He was made a Life Member of the Institute in November 1946.

Dr. Paul E. Gagnon, M.E.I.C., director of the department of chemical engineering at Laval University, Quebec, will act in an honorary capacity on the interim defence research board recently established at Ottawa. Since 1942 he has been an adviser to the Wartime Bureau of Technical Personnel.

Col. R. D. Harkness, M.E.I.C., vice-president and general manager of the Northern Electric Company Limited, Montreal, will act in an honorary capacity on the interim defence research board newly established at Ottawa. He is industrial representative on the cabinet sub-committee on research for defence.

Dr. C. J. Mackenzie, M.E.I.C., president of the National Research Council is an ex-officio member of the new interim defence research board established at Ottawa.

J. W. Tomlinson, M.E.I.C., of the Manitoba Power Commission was promoted in November 1946 to the position of chief engineer and assistant general manager. He was formerly engineer in charge of construction, supervising the rural electrification programme. He joined the commission in 1937.

R. W. Stickney, M.E.I.C., is now with the Canadian Welding Bureau, a new division of the Canadian Standards Association. He was formerly welding engineer with Canadian Vickers Limited in Montreal.

C. E. Helwig, M.E.I.C., of the faculty of applied science of the University of Toronto, was promoted from the rank of lecturer to that of assistant professor of civil engineering (municipal and structural), in October last. He joined the staff of the University in 1930 as an instructor, after receiving his M.A.Sc. degree.

J. J. Spence, M.E.I.C., was promoted in October last to the rank of assistant professor of engineering drawing at the University of Toronto. A former secretary-treasurer of the Toronto Branch of the Institute, he joined the faculty of applied science at Toronto in 1923.

Douglas E. Covey, M.E.I.C., who has been with the Wayagamack Division of the Consolidated Paper Corporation Limited at Trois Rivières, Que., is now transferred to the Wayagamack 'B' Division of the corporation at Cap de la Madeleine, Que., retaining his official designation as assistant mechanical engineer.

N. C. Cowie, M.E.I.C., former chairman of the Sault Ste. Marie Branch of the Institute has left the employ of the Great Lakes Power Company of that city and has joined the staff of the Abitibi Power and Paper Company Limited at Iroquois Falls, Ont.

J. J. Lefebvre, M.E.I.C., formerly with the Canadian Underwriters Association, Montreal, as fire protection engineer, is now with Irish and Maulson Limited, Montreal, as insurance engineer.

Charles E. Tourigny, M.E.I.C., has left Shawinigan Water and Power Company, to establish a private practice in Montreal. He is president and general director of the Home Family Laundry Inc., and director and consulting engineer of Chaleur Bay Power Limited. With the Shawinigan Company he was manager and editor of the employee magazine, with headquarters at Montreal.

C. H. White, M.E.I.C., has been transferred from the engineering department of Burns & Co. Ltd., at Calgary, Alta., to the engineering department of the company at Winnipeg, Man. He joined the company on his release in 1946 from the R.C.N.V.R.

Guy Beaudet, Jr.E.I.C., has been appointed assistant manager of the Montreal Harbour. He has been with the Central Mortgage and Housing Corporation as Montreal branch manager since early 1946 when he returned from service overseas with the R.C.E. He was city engineer at Thetford Mines, Que., after graduating in 1938 from Ecole Polytechnique, Montreal.

D. D. McLean, Jr.E.I.C., is with the engineering department of Trans-Canada Airlines at Dorval, Que. He was formerly a radio engineer with the Canadian Marconi Company, Montreal.

A. M. Berbrayer, Jr.E.I.C., is employed with the Coast Testing Laboratories Limited in Vancouver, B.C., as an inspection engineer.

H. H. Walker, Jr.E.I.C., is with Waterous Limited, Brantford, Ont. He is employed in the engineering department on design work on pulp and paper machinery.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Wm. Joseph de Wolfe, M.E.I.C., an employee of the city of Halifax for twenty-five years until his retirement in 1940, died in November 1946 in that city, where he was born in 1873. He was educated in Halifax and commenced his engineering career there with the McKenzie and Mann Construction Company, employed on Halifax and South West Railway surveys. He was appointed in 1904 to the post of resident engineer on construction for the project. In the same capacity he was connected with the James Bay Railway in Ontario in 1906 and with the National Transcontinental Railways in New Brunswick. He became division engineer on construction for the latter, remaining until 1911, when he went to Edson, Alta., as resident engineer on construction for the C.N.R. to Yellowhead Pass. Three years later he returned to Halifax to join the staff of the city engineer and it was in 1928 that he was promoted to the position of assistant city engineer.

Mr. de Wolfe has been a member of the Nova Scotia Association of Professional Engineers since its inception and for a number of years served as its auditor. He was an Associate Member of the Engineering Institute from 1906, and was elected to Life Membership in 1939.

Charles Harvey, M.E.I.C., died on February 5th, 1946, in Toronto, Ont. He was born at Cummingsville, Ont., in 1874, and attended the University of Toronto, graduating as a B.A.Sc. in 1901. He was first employed as assistant on Dominion land surveys and in 1904 opened a practice in civil engineering and land surveying at Kelowna, B.C., during which time he was engineer and surveyor for the Okanagan Falls Land Co., and chief engineer for the Okanagan Power and Development Company. He served in 1917 and 1918 with the C.E.F. and on his return joined the Riordon Company Limited of Temiskaming, Que., as inspector of building construction. He later went to the John V. Gray Construction Company in Toronto as an engineer, and in 1931 he entered the Department of Highways of Ontario as a civil engineer, remaining fifteen years until his death.

Mr. Harvey joined the Institute in 1921 as an Associate Member, becoming a Member in 1940.

Eric S. Sutherland, Jr.E.I.C., of Winnipeg, Man., passed away on October 29th, 1946. He was born in Winnipeg in 1918 and attended school and university in that city, receiving a B.Sc. degree in civil engineering in 1940. He spent vacation periods working for the Newman Construction Company on dam construction and for the Winnipeg Electric Company, where he started as an electrician's helper and later acted as relief foreman in charge of generating equipment. He was awarded a fellowship at the California Institute of Technology but shortly after graduation he enlisted in the R.C.E. and served overseas as a lieutenant. Released early in 1945, he became employed by the Dominion Water and Power Bureau at North Bay, Ont.

Mr. Sutherland, son of D. G. Sutherland, M.E.I.C., Winnipeg industrial engineer, joined the Institute as a Student in 1939, and transferred to Junior in 1946.

HYDRO-ELECTRIC PROGRESS IN CANADA DURING 1946

(*Continued from page 33*)

309 miles of rural distribution and an additional 178 miles are under construction. The Dixville power station is being completely overhauled and put in first-class operating condition.

The Northern Quebec Power Company is now installing three 1,000-kva. transformers in place of three 500's previously in use. During 1946, the company constructed lines of 12,000-volt capacity to serve fifteen new mines. The Quebec Rural Electrification Bureau reports that some 188 miles of rural distribution lines have been completed this year and that 625 additional miles are under way.

Maritime Provinces

No new hydro-electric installations were made in the Maritime Provinces during 1946. Tenders have been called by the Nova Scotia Power Commission for a development four miles from Guysborough. The project includes a head dam on Dickie Brook and 6,700 ft. of pipe line to a small power house at tidewater. The average net head will be 297 ft. and installation will consist of two 1,600 hp. units, with provision for a third.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

J. F. Langston, m.e.i.c. - *Secretary-Treasurer*
D. C. Jones, Jr.e.i.c. - - *Branch News Editor*

A regular meeting of the Calgary Branch was held in the Palliser Hotel on December 12th.

S. G. Coultis, introduced a film " Search Unending ", produced by the Imperial Oil Company. He stated that the search for oil was very much more difficult today than it was when seepages indicated the presence of oil. Through the years, oil has become increasingly important in the manufacture of a wide variety of products, including rubber, plastics, abrasives, and many others.

Mr. Coultis believes that there will be similar expansion in the use of natural gas in the future. At present it is being used to produce gasoline, and experiments have proven it a satisfactory material for the production of synthetic soap and a resin much like cellophane.

The film depicts very clearly the modern methods of searching for possible oil-bearing structures. It shows the work of the surface geology and seismograph parties and the laboratory and office study of the field results. Aerial photography is also used to find topographical features which might indicate the presence of oil bearing structures below the surface. Maps are made from seismograph and geological records and a study of them is made to determine whether or not the structure is favorable for the accumulations of oil and gas.

After a drilling site is chosen it is sometimes necessary to build access roads to the site in order to move in the heavy equipment. The picture then showed drilling operations being carried on at a test well.

A second picture, " From Coast to Coast " presented a study of Canadian scenery from the Atlantic to the Pacific.

The meeting was under the chairmanship of H. R. Younger.

EDMONTON BRANCH

W. W. Preston, Jr.e.i.c. - *Secretary-Treasurer*

An electrical method of charting the conditions in a drill hole, recently introduced to Canadian oil fields, was described by Mr. A. A. Perebinossoff, of the Schlumberger Well Surveying Corporation of Houston, Texas, when he presented a paper entitled **Electrical Logging in Bore Holes,** at a meeting of the Edmonton Branch, in the Macdonald Hotel, on November 25th, 1946.

An electrical log, Mr. Perebinossoff explained, is a graph of the resistivity in the materials in the region of the drill hole, recorded as electrodes are moved along the hole. A person trained to interpret the wavy log can correlate the geology in different drill holes, which may be many miles apart; determine the nature of the formations and their thickness; and tell the contents of a reservoir, e.g. whether oil or water.

The illustrated lecture traced the development of electrical logging. The idea originated with Professor Schlumberger in Europe, before he went to the United States. About 1928, an operator had to set up his equipment over a drill hole, fill the hole with liquid or mud, lower three electrodes into the hole, turn on the current, and take readings of resistivity point by point, along the hole. One electrode was at the centre of spheres of equal potential and the other two electrodes, which were connected to a potentiometer, were in different equipotential spheres. By 1932, the logging equipment and automatic recorders were installed in a truck. The speaker claimed that the equipment is getting more complicated every day and that maintenance is a major problem.

The effect of various underground conditions on the log was also described. In porous material the fluid from the hole may " invade " its surroundings and affect the resistivity. Increasing the size of the equipotential spheres may get beyond the region affected, but may then pass through overburden or underburden of a different structure, which again will affect the readings. The present practice is to take two logs. The relative sizes of the hole and equipotential spheres are also important, because of the effect of the mud in the hole on the readings.

In conclusion, the speaker described the logging truck in detail and told how auxiliary equipment is used. Among these are the following—a temperature recorder; a sidewall sampler, in which six bullets force a core punch into the sidewall and a spring returns the core; a depth marker which shoots a radio active bullet; a photo clinometer, which traces the direction and inclination of the hole; and a device which determines the dip and strike of a vein pierced by the drill hole.

Mr. Perebinossoff was introduced to the 48 members present, by Chairman J. W. Porteous, and Dr. J. Allan proposed a vote of thanks, which was carried unanimously.

HAMILTON BRANCH

L. C. Sentance, m.e.i.c. - - *Secretary-Treasurer*
I. M. Macdonald, Jr.e.i.c. - *Branch News Editor*

The annual joint meeting of the Hamilton Branch of the Institute and the Hamilton Subsection of the American Institute of Electrical Engineers took place on Friday, December 13th, 1946, at the Westinghouse Auditorium, with about 135 persons in attendance. John McDiarmid of the A.I.E.E. and E. G. Wyckoff of the E.I.C. were joint chairmen of the meeting.

Mr. H. J. Clyman, the speaker, who was introduced by A. A. Moline, is assistant to the manager of engineering, aviation gas turbine division, Westinghouse Electric Corporation. Mr. Clyman has been active in the development of several Westinghouse gas turbine jet engines, and toured Europe shortly after V-E day to obtain data on German jet propulsion developments.

The application of jet engines to aircraft is a recent development, said the speaker, and its history in the United States begins in 1941. At that time, work was commenced on a gas turbine jet engine, and this same engine was tested less than a year and a half later. This was accomplished in spite of the fact that the designers and builders had not seen any plans or models of a similar design. The engine was an axial compressor type, and performed satisfactorily. Many improvements were made in the original design, such as a reduction in weight, an increase in thrust, and simplifications in the structure and component parts to speed up fabrication. The latest jet engines built by Westinghouse weigh less than 700 lb. and develop 10,000 shaft horsepower at 15,000 r.p.m.

The turbojet is similar to a rocket except that a rocket carries its own oxygen supply. The turbojet, however, has a better specific fuel rate. Jet engines perform more efficiently, and specific fuel consumption decreases, as the speed of the aircraft increases. This makes the jet engine preferable to the reciprocating engine at high speeds, but the reciprocating engine is still more economical at low speds. Jet engines have been used mainly in military aircraft in the past, because of their high speed and light weight, and commercial developments have been small. Jet engines are used at present largely in conjunction with reciprocating engines to assist in taking off with a heavy load.

The first gas turbine in the commercial plane will probably be the gas turbine propeller, or turboprop, and may be used in three or four years. Constant improvements in design are making more shaft horsepower available, and it is believed that a jet engine with a geared down propeller will be widely used.

A very interesting discussion period was held at the completion of Mr. Clyman's talk, after which Neil Metcalf conveyed the thanks of the meeting to the speaker.

NIAGARA PENINSULA BRANCH

P. A. Pasquet, Jr.e.i.c. - *Secretary-Treasurer*
C. A. O. Dell, m.e.i.c. - *Branch News Editor*

The Niagara Peninsula Branch held a November dinner meeting at the Red Casque Inn near Niagara Falls, on Thursday, November 28th, with chairman W. D. Brownlee presiding.

Vice-Chairman M. F. Ker introduced the speaker of the evening, Mr. J. D. Millar, deputy minister of the Department of Highways of Ontario. Mr. Millar gave a very interesting talk outlining the condition of the highways and highway structures of Ontario after six years of wartime traffic, and showing how the Provincial Highways Department is meeting the most urgent needs immediately, and at the same time developing highways for the future. He strongly stressed the need for planning highways for moving the large present and future volumes of traffic over the roads safely, at statutory speeds, and emphasized the need of Canadians becoming "safety conscious" in their driving and in their demands for highway facilities. Mr. Millar stated that the budget for the Highways Department, amounting to $47,000,000 for the current year, was the largest in the history of the province.

After the address several reels of technicolour films were shown which pictured highways and highway construction, including work on the trans-Canada highway which was opened on October 28th this year, and also including aerial photography of Queen Elizabeth Highway.

C. G. Cline, at the close of the meeting, thanked the speaker for one of the most interesting and enlightening talks of the season.

PETERBOROUGH BRANCH

A. R. Hailey, M.E.I.C. - *Secretary-Treasurer*
J. C. Allan, M.E.I.C. - - *Branch News Editor*

The 27th Annual Dinner of the Peterborough Branch of the Institute was held at the Empress Hotel on the evening of November 27th with seventy-five members and guests present.

A. J. Girdwood, chairman of the Branch, briefly introduced those at the head table: E. P. Muntz, past vice-president of the Institute; A. R. Jones; L. Trudel, assistant general secretary; President J. B. Hayes; Vice-president C. E. Sisson; G. C. S. Lucas, assistant chief electrical engineer, B. Pringle, generator engineer and T. F. Robinson, capacitor engineer, of the British Thompson-Houston Company; and Alderman J. Dutton of Peterborough.

Addressing the meeting, Alderman Dutton said that engineers had aided greatly in the development of Peterborough and predicted that they would continue to play an increasing part in the future development of the city. Peterborough, he said, has shown itself to be more planning conscious than most cities in that a high percentage of the citizens had visited the town planning exhibit held in the public library during the previous week. In their planning activities the city council will continue to look to engineers for guidance.

Mr. Louis Trudel, the next speaker, outlined the progress of the Institute during the past year and its present status. With 28 branches and a membership of 8200, it is the largest professional group in Canada.

Mr. Trudel said that community planning should receive the interest of every member of the Institute. Ross Dobbin of Peterborough is the Institute's representative on the newly formed Community Planning Association of Canada.

G. R. Langley introduced the three visitors from the British Thompson-Houston Company of Rugby, England. Mr Lucas spoke of the appreciation of the people of England for the wartime contributions to the common cause by the engineers and people of Canada. Mr. Lucas stated that he believed close co-operation and personal contacts between English and Canadian engineers to be very desirable.

Vice-president C. E. Sisson introduced the president. Mr. Hayes told the members of his satisfaction in visiting all 28 Branches, of which Peterborough was the last on his itinerary, and also in attending the general meeting of Commonwealth Engineers, held in London, England. Mr. Hayes recounted many items of general interest from his visit to England and the Commonwealth Conference.

A disturbing production situation was observed by the president all across Canada, because of strikes and unrest. He ascribed the unsatisfactory situation to war weariness and he called upon engineers to endeavour to lead industry out of that situation by setting a suitable example. He stressed the importance in this regard of turning in an honest day's work every day. In such manner, he concluded, real prosperity can be created.

SAGUENAY BRANCH

J. E. Dyck, M.E.I.C. - *Secretary-Treasurer*

Exploitation of the Caustic Chlorine Industry in Germany was the topic of an address given by Dr. W. C. Gardner to the Saguenay Branch of the Institute on December 5th.

Dr. Gardner was a member of a group of technical men sent to Germany by the American Government to investigate the processes used in that country for the preparation of chlorine and caustic soda.

This group spent four months in Germany and was able to inspect many plants in the occupied zones. Dr. Gardner stated that the Germans had done considerable research on the caustic chlorine process and complete research records on this process had been obtained. The American Government was not interested in confiscating plant equipment for shipment to the United States but rather in obtaining information such as research records, photographs of equipment, etc.

In discussing the methods of making caustic soda and chlorine, Dr. Gardner described the diaphragm process and the mercury cell process. The mercury cell was made in two types, the horizontal cell and the vertical cell. The process in each case was electrolytic and considerable electric current was essential to the process. The vertical type mercury cell had the advantage of requiring considerably less floor space for the same output.

Dr. Gardner illustrated his address with slides showing the various types of cells used in the production of caustic and chlorine.

Since these two products are made simultaneously by the process, it has often been found that to fill the demand for the one product resulted in the other being a drug on the market.

Dr. Gardner was asked whether Germany had been able to keep a sufficient supply of mercury on hand during the war for the mercury cells. It was his opinion that sufficient quantities had been obtained from Spain before the war so that no shortage of this material had resulted.

Many of the slides shown by Dr. Gardner illustrated the devastation in Germany. In some cases plants were operating before the walls and roof had been replaced.

E. F. Hartwick thanked the speaker on behalf of the Branch for an interesting and instructive address.

SAINT JOHN BRANCH

K. W. Salmon, Jr.E.I.C. - *Secretary-Treasurer*
A. R. Bonnell, M.E.I.C. - *Branch News Editor*

The annual meeting of Saint John Branch of the Institute was held in the Admiral Beatty Hotel on the evening of Dec. 12, with L. O. Cass presiding.

Refreshments and dinner were followed by routine business of the year.

After a short discussion on duties on engineering drawings and specifications imported from the United States, it was decided to leave this matter to the Council.

There was no election of officers due to the change in the date of the annual meeting from the spring to the end of the year. Those officers elected last May will hold office until December, 1947.

SASKATCHEWAN BRANCH

D. W. Houston, M.E.I.C. - *Secretary-Treasurer*
L. A. Dokken, M.E.I.C. - - *Branch News Editor*

Members of the Saskatchewan Branch were given a special treat at the dinner meeting held December 12th at the Kitchener Hotel. Mr. Lloyd Bunting of "Ducks Unlimited" presented films on wild life conservation work carried on by his group especially in the field of game birds. The main film "The Big Marsh Lives Again" reviewed, step by step, the measures taken to restore dried up marsh lands which were exploited and drained at various times by land promotion schemes despite the inadequacy of the soil for agricultural purposes. The film dealt in detail with the causes of a high duck mortality rate, and with the steps being taken by this organization, operating on voluntary contributions and on a non-profit basis, to improve the overall situation. A second film on forest management and conservation also proved highly interesting.

Chairman Estlin thanked the speaker and mentioned that the films were most appealing both to engineers and to sportsmen.

Items of business discussed included the proposed Saskatchewan government legislation designed to incorporate professional groups under provincial board control. As little is known of the intended provisions of this legislation our Legislative Committee was instructed to study the problem as thoroughly as may be possible and co-operate fully with other professional groups in the drafting of a suitable brief declaring the stand of the professional man.

A "News-letter" service is to be set up very soon in which all of our members at large as well as those in Regina will be kept posted and up to-date on council activities and general activities of the branch. The announcement that this service was to be given was made by Chairman Estlin, who said that such service would constitute part of the regular duties of the Branch News Editor.

BOOK REVIEW

ENGINEERING AND SOCIETY WITH SPECIAL REFERENCE TO CANADA

By C. R. Young, H. A. Innis and J. H. Dales

Reviewed by Professor R. DeL. French, M.E.I.C.,*

Toronto. University of Toronto Press, 1946, 430 pp., one map, paper, $2.25

This book is the outgrowth of lectures delivered to students in engineering at the University of Toronto. Part I, comprising about one-third of the total text and prepared by Dean Young, outlines the profession of engineering broadly, goes into some detail as to its branches and discusses the impacts of engineering on society and of society on engineering.

Part II, written by Professor Innis and Mr. Dales, is a brief economic history of Canada, treatment being by natural geographical divisions of the country. To one not especially trained in economics and political science, a group in which this reviewer unfortunately finds himself, it explains phenomena long apparent to everybody, but seldom so clearly set forth as here. Skilful and economical writing has packed an immense amount of material into little space, without the sacrifice of clarity or apparent commission of anything revelant.

Part I is required reading for all engineers, but especially for those concerned in any way with the education and early training of beginners in the profession. Needless to say, it is also required reading for all students in engineering themselves, and for all those who are contemplating engineering as a career.

Dean Young has handled a difficult subject skilfully; his prose is never tiresome, though dealing with abstracts. His long experience in what is probably the largest school of engineering in the Empire, abundantly qualifies him as the author of what is, so far as this reviewer knows, the first attempt to deal from a Canadian point of view with the problems which vex every student of engineering. It is pleasing to be dependent no longer upon the ideas of authors who, no matter how competent in their own countries, are not necessarily completely in tune with Canadian rhythm.

LIBRARY OPEN THURSDAY EVENING

For the convenience of the Montreal Branch members, the Reference Library will remain open until 8.30 p.m. each Thursday evening when a Montreal Branch meeting is held at Headquarters. Books, etc., may be borrowed and the Library catalogues and indices consulted.

Regular Library Hours

Monday-Friday............	9.00 a.m.— 5.00 p.m.
Thursday.................	9.00 a.m.— 8.30 p.m.
Saturday..................	9.00 a.m.—12.00 noon

Out-of-Town Members

Books, periodicals, photostats, etc., may be borrowed or purchased by any member of The Institute. Postal charges are paid by the borrower. A Five-dollar deposit fee is required before items may be borrowed. Subject bibliographies will be compiled on request. Detailed or extensive literary searches will be made at cost.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Aircraft Lofting and Template Layout with Descriptive Geometry:

Howard Thrasher. San Francisco, Aviation Press, c1942. 212 pp., illus., paper.

Aircraft Production Design:

James E. Thompson. San Carlos, Calif., Aviation Press, c1945. 238 pp., illus., paper.

Applied Elasticity:

John Prescott. N.Y., Dover Pubs., 1946. 666 pp., illus., cloth.

Bell Telephone System:

Arthur W. Page. N.Y., Harper, 1941. 216 pp., illus., paper.

Career Opportunities:

Edited by Mark Morris. Washington, Progress Press, c1946. 354 pp., illus., cardboard.

Concrete Materials and Practice:

L. J. Murdock. London, Edward Arnold; Toronto, Longmans Green, 1946. 320 pp., illus.

Decibel Notation: Its Application to Radio and Acoustics

V. V. L. Rao. Brooklyn, N.Y., Chemical Publishing Co., 1946. 179 pp., illus., cloth.

Efficient Use of Fuel; Prepared under the Direction of the Education Sub-Committee of the Fuel Efficiency Committee of the Ministry of Fuel and Power: forward to American Edition by John C. Olsen.

Brooklyn, N.Y., Chemical Publishing Co., 1945. 807 pp., illus. cloth.

Electric Motor Repair: a Practical Book on the Winding, Repair, and Trouble-shooting of A-C and D-C Motors and Controllers:

Robert Rosenberg. N.Y., Toronto, Murray Hill Books, 1946. 2 volumes in 1, illus., fabrikoid.

Elementary Heat Power:

Harry L. Solberg, Orville C. Cromer, and Albert R. Spalding. N.Y., Wiley, c1946. 480 pp., illus., cloth.

Engineer at Law; a Resume of Modern Engineering Jurisprudence:

Conde B. McCullough and J. R. McCullough. Ames. Iowa State College Press, 1946. 2 volumes, cloth.

Fifty Years of Suretyship and Insurance; the Story of United States Fidelity and Guaranty Company:

Clarke J. Fitzpatrick and Elliott Buse. Baltimore, 1946. 198 pp., illus., cloth.

Higher Mathematics for Students of Chemistry and Physics; with Special Reference to Practical Work:

J. W. Mellor. N.Y., Dover Publications, 1946. 641 pp., illus., cloth.

London Building Law; an Introduction and Guide to the Requirements of the London Building Acts . . . for the Use of Architects, Surveyors and Students . . .

Horace R. Chanter. London, B. T. Batsford, 1946. 358 pp., illus., cloth.

Manual for Aircraft Hydraulics; Theory, Maintenance, and Design:

James E. Thompson and Rodney B. Campbell. San Francisco, Aviation Press, c1942.

Naval Architecture of Planing Hulls:

Lindsay Lord. N.Y., Cornell Maritime Press; Toronto, McLeod, 1946, 305 pp., illus., cloth.

Plastics for Electrical and Radio Engineers:

Walter J. Tucker and R. S. Roberts. London, Technical Press, 1946. 148 pp., illus., cloth.

Principles of Radar; 2nd ed.:

Staff of Radar School, Massachusetts Institute of Technology. N.Y., McGraw-Hill, 1946. v.p., illus., cloth.

Science; Its Effect on Industry, Politics, War, Education, Religion and Leadership:

D. W. Hill. Brooklyn, N.Y., Chemical Publishing Co., 1946. 114 pp., cloth.

PROCEEDINGS, TRANSACTIONS, ETC.

Institution of Electrical Engineers:

Proceedings of the Radiolocation Convention, March-May, 1946, Part IIIA. (Supplement to I.E.E. Journal, Vol. 93. Part 111A. No. 2.)

North East Coast Institution of Engineers and Shipbuilders:

Transactions, Vol. 62, 1945-1946.

TECHNICAL BULLETINS, REPORTS, ETC.

American Society of Civil Engineers. Manuals of Engineering Practice:

No. 19—Water Treatment Plant Design, Prepared by the Com-

*Professor of Civil Engineering, Faculty of Engineering, McGill University, Montreal, Canada.

mittee of the Sanitary Engineering Division on Water Treatment Plant Design, 1939.

Canada. Dept. of Mines and Resources. Mines and Geology Branch:

Publications (1909—1946 inclusive) of the Geological Survey and National Museum. Ottawa, 1946.

Edison Electric Institute and National Electrical Manufacturers Association:

Preferred Voltage Ratings for A-C Systems and Equipment. (E.E.I. Publication No. 0-10.)

Electrochemical Society. Preprints:

90-19—Silicones as Electrical Insulating Materials, Shailer L. Bass, Melvin J. Hunter and T. A. Kauppi.—90-27—Electrodeposition of Cobalt and Nickel from Coordination Compounds, Margaret Davis Kramer, Sherlock Swann, Jr., and John C. Bailar.—90-28—New Addition Agent for the Electrolytic Refining of Tin and Lead, F. C. Mathers and M. M. Felger.—90-29—Thermosetting Vinyl Polymers, E. L. Kropa.—90-30—Service Life of and Gases Evolved from Dry Batteries Stored at 55° C. (130° F.), Walter J. Hamer, John P. Schrodt, and George W. Vinal.—90-31—Study of Equilibrium Reactions in the Leclanche Dry Cell, H. F. McMurdie, D. N. Craig and George W. Vinal. —90-32—Military Applications of Electroplating in World War II, William Blum.

Ingeniors Vetenskaps Akademien. Handlingar:

Nr 187—Forces Exerted on a Rigid Cylinder in a Viscous Fluid between Two Parallel Fixed Planes, O. H. Faxen.
. . . Nr 188—Three-dimensional Theory of Turbine Flow and its Application to the Design of Wheel Vanes for Francis and Propeller Turbines, Ludwig Arthur Dreyfus.

Institution of Mechanical Engineers. Advance Papers—1946:

Free-Piston Compressor-Engines, H. O. Farmer.—Future of Pulverized-Coal Firing in Great Britain, D. H. Sparks.—Investigation of the Airbox Method of Measuring the Air Consumption of Internal Combustion Engines, L. J. Kastner.—Research and Development Applied to Bomb Disposal, H. J. Gough (Thirty-third Thomas Hawksley Lecture).

National Research Council of Canada. Information for the Press:

Release *No. 9—Merchant Marine Radar for Canadian Vessels. —No. 10—Radio Distance Indicator.—No. 11—Progress on the National Research Council's Radiant Heating Project.*

PAMPHLETS, ETC.

Alcan Chemicals:

Aluminum Co. of Canada, Ltd., Montreal.

High-Frequency Heating in Industry:

Baltimore, Westinghouse Electric and Manufacturing Co., Radio Division. (Reprint No. 4153) from Westinghouse Engineer, July, 1944.)

Housing in Canada; a Factual Summary:

Ottawa, Central Mortgage and Housing Corporation, 1946.

Indexing and Alphabetizing Simplified; with a list of Illustrations:

V. A. Avery and F. Kraines. N.Y., Pamphlet Distributing Co., 1946.

Light Alloy Forgings:

Montreal, Aluminum Co. of Canada, Ltd.

New Involute Spline Standard:

N.Y., Broaching Tool Institute, 1946. (Reprinted from Tool Engineer, November, 1946.)

Pleistocene Deposits of the Shipshaw Area, Quebec:

Robert F. Leggett. (In Trans. R.S.C., Section LV, 1945.)

Positex; a New Form of Natural Rubber Latex with Reversed Charge:

C. M. Blow. London, British Rubber Development Board, 1946. (Positex Pamphlet No. 1.)

Pulp and Paper Facts and Figures; Reference Data:

Montreal, Canadian Pulp and Paper Association, 1946.

Read Rapidly and Well:

R. M. Bear. Yellow Springs, Ohio, Antioch Bookplate Co., c1941.

Saskatchewan. Dept. of Municipal Affairs. Community Planning Branch:

Regulations Respecting the Subdivision of Land. Regina, King's Printer, 1946.

Riveting Aluminum:

Montreal, Aluminum Co. of Canada, Ltd., c1946.

Shortening Eyebars by Heating with an Oxyacetylene Torch:

N.Y., Engineering Foundation, 1946.

Theoretical Analysis of Combustion Gases:

Boleslaw Szczeniowski. (Reprinted from Revue Trimestrielle Canadienne, Autumn, 1946.)

Welding Aluminum:

Montreal, Aluminum Co. of Canada, Ltd., c 1946.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

ART OF SCALE MODEL AIRCRAFT BUILDING:

V. J. G. Woodason; edited by Walter Buchler. London, Useful Publications, n.d. 110 pp., illus., paper, 4/11, cloth, 8/6.

Scale model-making is not merely a pastime; it has developed into a new industry. This small book is of value to those readers interested in flying who desire to make faithful copies of real aircraft. The instructions and suggestions contained in the book are based on the author's actual experience, accumulated during more than twenty years of model aircraft building. Many sketches and photographs are included, all of Woodason models.

BRITISH STANDARD SPECIFICATION FOR THERMO-SETTING, SYNTHETIC-RESIN BONDED-PAPER SHEET FOR USE IN THE BUILDING INDUSTRY. B.S. 1323-1946:

London, British Standards Institution, 1946. 2/-.

Due to the demand for laminated plastic materials for building and interior decorating, B.S.I. have prepared this specification covering sheet, made with phenolic-type resins, with urea or other aminoplastic type resins, or with both; supplied for use as wall-board or for veneering onto wood or other surfaces, in thicknesses from 1/32 in. to ½ in. Nominal dimensions, tolerances, appearance, flatness, straightness of edges, cross-breaking strength, resistance to impact, to water absorption, marking by hot water, etc., are specified.

CHANGING THE SHAPE OF METALS WITH AN ENGINE LATHE:

Shell Oil Co., Inc. Toronto, Shell Oil Company of Canada, Ltd., c1946. 160 pp., illus., fabrikoid, $7.50.

Written in a simple, concise, logical manner, this book was designed to serve machine-tool, aircraft and automotive parts manufacturers, as well as the entire metal-working industry. It assumes a knowledge of lathe operation on the part of the reader, and was written with the idea that once a man knew why a thing was done in a certain way, he not only could learn how to do it, but often how to do it better.

After outlining the fundamentals of machine tool design and performance, it covers the basic characteristics of lathe construction and operation, and discusses the primary features of different lathe operations, i.e., turning, boring, facing, threading, etc. The book includes in each chapter all the fundamental information necessary to a clear understanding of its subject.

VERTICAL CURVES FOR ROADS, a Textbook for Highway Engineers and Students:

F. G. Royal-Dawson. E. & F. N. Spon, Ltd., London, 1946. 141 pp., diagrs., charts, tables, cloth, 15/4.

This book was written to meet the need for a lucid and comprehensive text book on the subject of Vertical Curves, and covers their functions and design on rational principles to meet the contingencies of modern transport. Treating summit curves and valley curves for one and two-way roads, it contains examples of calculations and their solutions, charts, tables, and formulae. One chapter deals with effect of wheel impact on road obstacles.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

AIRPORTS: Design, Construction and Management:

By H. K. Gliddon, H. F. Law and J. E. Cowles. McGraw-Hill Book Co., New York and London; Toronto, Embassy, 1946. 583 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.00.

The first part of this comprehensive work outlines the requirements and factors entering into the problem of site selection and runway layout. This is followed by a condensed version of the field and laboratory tests and procedure for grading, drainage, and pavement design. Turfing, lighting, radio aids, traffic control, communications, and the basic principles of management are covered. Special features of the book are: a discussion of the role of the United States Government in the design and construction of civil airports; a chapter on obstructions, their lighting and removal; and a 300-page appendix containing full and exact specifications and test procedures for materials and construction methods.

APPLIED ELASTICITY:

J. Prescott. Dover Publications, New York, 1946. 666 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $3.95.

Written from the viewpoint of the engineer rather than the mathematician, the mathematical theory is carried out only so far as is necessary for its application to practical problems. General stress-strain relations are first dealt with, followed by a number of chapters on thin rods, thin plates, and cylinders under various conditions of pressure and strain. Separate chapters are devoted to the vibrations of rotating disks and to elastic bodies in contact.

CAREER OPPORTUNITIES:

Edited by M. Morris. Progress Press, Washington, D.C., 1946. 354 pp., illus., 9¼ x 6 in., cardboard, $3.25.

Over a hundred occupations offering substantial possibilities in the post-war world are briefly considered. The information covers the nature of the work involved, the necessary qualifications, how and where to get the proper training and education, and the normal expectation in wages, salary or fees. The fields of industry, business, agriculture, engineering, science, medicine, social work, the arts, education and religion are covered, from the clerical worker and mechanic to the professional man.

EFFICIENT USE OF FUEL:

Foreword for the American Edition by J. C. Olsen. Chemical Publishing Co., Brooklyn, N.Y.; Toronto, General Publishing, 1945. 807 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $11.90 (in Canada).

This very comprehensive book, the work of a group of British technologists, covers all aspects of the subject: the composition and properties of all types of fuel; the theories and principles of combustion; the equipment used in burning coal and other solid fuels, fuel oil, and industrial gases; boiler efficiency and testing; water purification and auxiliary boiler equipment; the utilization of steam for industrial processes, central heating, evaporation, etc.; automatic control; and the sampling and analysis of coal and gases. The book is intended both for the student and for the technical man in industry.

ELECTRIC MOTOR REPAIR:

R. Rosenberg. Murray Hill Books, New York and Toronto, 1946. Text, 308 pp.; illustrations and diagrs., 243 pp., 9 x 6 in., paper, loose leaf duo-spiral binder, $5.00.

The construction and operation of the various types of electric motors, both A.C. and D.C., are described in considerable detail. With this groundwork, specific procedures for troubleshooting and repair are given. Over 900 illustrative drawings are included, showing in detail what is treated in the text. The book is so arranged that the text and illustrations are separate so that several pages of text may be consulted while keeping one illustration in view, and vice versa. There is a detailed index.

NAVAL ARCHITECTURE OF PLANING HULLS:

L. Lord. Cornell Maritime Press, New York; McLeod, Toronto, 1946. 305 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.75 (in Canada).

Demands for speedy sea-going planing craft during the recent War led to extensive work on planing hulls, previously largely built by rule-of-thumb and then largely for fresh water use. The author here presents calculations, formulas, charts, graphs and information to give a mathematical basis for the design of sea-going craft that skim the surface of the water.

PRELIMINARY NOTICE

(Continued from page 42)

SPENCER—GEORGE HYLTON of Kingston, Ont. Born at Seaford, England, Nov. 20, 1916. Educ.: graduation diploma R.M.C. 1938, B.Sc. (Civil) Queen's 1939; 1940-42, with R.C.E. as O/C and Staff Officer to chief engr. 1st Can. Army; 1945 (6 mos.) asst. dir. of works & constrn. National Defence Hdqts.; 1946, general staff officer, grade 1, Canadian Staff College, Kingston, Ont. (St. 1938. Jr. 1946).

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

December 31st, 1946

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the February meeting.

L. Austin Wright, General Secretary

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BRANT—ARTHUR A., 15 Grenadier Heights, Toronto, Ont. Born a. Toronto, Ont. Oct. 3, 1910. Educ.: M.A., Toronto, 1933; 1933-34, Princeton as Queen's Scholar; Ph.D., Univ. of Berlin, Germany. 1936; R.P.E., Ontario (on credentials); with Ontario Dept. of Mines, as follows: 1937, geophysics, 1938-40 i/c geophysics, Steep Rock Lake, 1940-42, oil and gas work; 1944, i/c geophysical exploration, Eldorado Mines; 1945 to date, private consultant in mining exploration & engrg. physics of mining for various mining companies and from 1936 up to present, associate professor of physics & geophysics, Univ. of Toronto.

KOZLOWSKI—MELVIN MARIAN, of Lachine, Que. Born at Niagara Falls, N.Y., Jan. 18th, 1919. Diploma, Jr. Engr., Sir George Williams Coll., 1945; at present pursuing course in science at Sir George Williams; 1942-46, mech. dftsman., industrial divn., Dominion Engineering Co., Lachine, Que.

References: J. H. Maude, C. E. Herd, V. Harisay, W. S. McIlquham, H. E. Cunningham.

McGILL—WILLIAM JAMES, of Calgary, Alta. Born at Calgary, Alta., June 14, 1912. Educ.: B.Sc., (Mining & Metall.); M. Sc., (Mining Engrg.) Queen's, 1937 & 1939 respectively; attended California Inst. Technology, Pasadena, 1939-40 (accredited E.C.P.D.); 1936-39, (summers) asst. geologist & geologist for various mining companies; 1940-41, asst. geologist, mine exploration & development, Paymaster Cons. Gold Mines Ltd.; 1941, (6 mos.), asst. supt., plant No. 3, prod. & operation engr., Welland Chemical Works; 1941-45, Aero. Engr., aircraft mtce., R.C.A.F.; 1945 to date; industrial engr., Research & Development Br., Dept. Reconstruction & Supply, Calgary, Alta.

References: B. P. Scull, F. B. Connors, R. M. Hardy, R W. Brews.

MILLAR—JAMES WALLACE, of Vancouver, B.C. Born at Airdrie, Scotland, Oct. 25, 1904. Educ.: B.A.Sc., (Mech.), British Columbia, 1927; R.P.E., B.C.; with Canadian Pacific Railways, as follows: 1929, (7 mos.), dynamometer car operator, 1930-32, asst. chief dftsman., responsible for design of loco. parts & plant machny., etc., 1932-36, shop mech. engr., i/c engrg. shop prod. methods, responsible for mtce. shop equipt., control of costs of tools & mchy., supvr. dftng. office, etc., Weston shops, Wpg., 1936-43, genl. loco. foreman, i/c loco. & car shop, Vancouver; 1943 to date, inspector, Dept. Railways, British Columbia, checking & approv. boiler & pressure vessels designs, etc., etc.

References: W. T. Fraser, W. Rae, W. O. Scott, J. G. Oliver, J. G. D'Aoust, L. B. Stacey.

MOTHERWELL—ROBERT KING, 513 Sherbrooke St., Peterboro, Ont. Born at Ottawa, Ont., March 8, 1917. Educ.: B.Sc., (Mech. Engrg.), Queen's 1942; R.P.E., Ontario; R.C.E.M.E., 1942-43, O. C. Light Aid Detachment, 1943-44, 2 I C Tank Fitters' School, 1944-45, Workshop Officer in N. W. Europe; at present, test course, Canadian General Electric, Peterboro, Ont.

RUSSELL—JAMES REGINALD, 45 De Vere Gardens, Toronto, Ont. Born at Wyebridge, Ont., Dec. 29, 1895. Educ.: Chicago Tech. Coll., 2 yrs.; with Grand Trunk Rly., as follows: 1911-15, apptce'ship., machine shop, 1915-16, engr., pumping stn., rly. constrn., 1919-20, master mechanic, crushed stone plant; 1921-24, dftsman., Detroit Gear & Machine Co.; 1924-26, dftsman., E. Long Ltd., Orillia, Ont.; 1927-29, dftsman. & designer, Carborundum Co.; 1929-39, engr., incl. design & constrn., 3 mos. operation of large lumber mill at Callander, Ont., P. Payette Co.; 1939-40, master mech., Canadian Gypsum Co.; 1940-42, process engr., marine engines, condensers & boilers, John Inglis Co.; 1942-43, engr., Wayman Engrg.; 1943, supt. Midland Foundry & Machine Co.; 1943-44, supt. Davis Automatic Controls; 1944-46, engr., incl. 10 mos on loan to Marathon Paper Co., squad boss (part of time), design & erection of Cellufix plant for Standard Chemical Co., put plant in operation incl. process equipt., bldgs. power plant, etc., Meadows Critoph Co., Toronto; 1946 (Dec.), engr. i/c constrn., Standard Chemical Co., Ltd., Longford Mills, Ont.

References: A. C. Northover, C. A. Meadows, R. W. Emery, W. G. Muir, L. G. McNeice.

SHALES—JOHN STANLEY LENNOX, of Toronto, Ont. Born at Burlington, Ont., Aug. 24, 1919. Educ.: B.A.Sc., (Engrg. Physics), Toronto, 1943 R.P.E., Ontario; 1940-42, (summers), aircraft wood worker, tool designer, Massey-Harris Co., Ltd., Weston, Ont.; 1943, (after graduation), 3 mos., stress analysis, modification request assessing, remaining time i/c modifications to Anson A/C, directing staff of two engrs., six dftsmen., clerks, etc. Federal Aircraft, Montreal; 1944-45, group leader, eventually work on Canadian adaptation engrg. models, such as inter-changeable English & American rockets on Mosquito—left before project completed; in interval decided to leave strictly technical aspects of engrg. & studied hydraulics & diesel engines prior to accepting in July 1946 position of sales engr. Toronto Branch Canadian Fairbanks Morse Co. Ltd., present work, trouble shooting, tech. service designing pump instlns., estimating, supvr. instlns. (selling smallest part of work).

FOR TRANSFER FROM THE CLASS OF JUNIOR

CLAWSON—WILLIAM KENNERLEY of London, Ont. Born at Toronto, June 6, 1916. Educ.: B.A.Sc. Toronto, 1940; R.P.E. of Ont.; summer jobs as follows: 1945, miner, McIntyre Porcupine Gold Mines; 1937, asst. to field engr. Toronto York Rds. Commission; 1940-43 with R.C.E. rank of Captain, 2nd. in command field company; 1943-44, Major & Staff Officer, various Hdqts.; 1945-46, contracting engr., designing, estimating of shop built & field erected steel structures, Horton Steel Works Ltd.; at present county engr. & road supt., county of Middlesex, Ont. (Jr. 1944).

References: W. R. Smith, G. H. Crase, R. F. Legget, C. R. Young.

CONNELLY—ALAN BURTON of Ottawa. Born at Amble, England. Mar. 25, 1908. Educ.: graduation diploma, R.M.C. 1931, B.Eng. (Civil) McGill, 1933; 1933-39 with R.C.E. as works officer, Mil. Dist. No. 10, surveys, reinf. concrete, general bldg. constrn. airfields, road, water supply; 1939-46, Deputy Adjutant General, Army Hdqts. Dept. of National Defence, Ottawa. (St. 1932. Jr. 1946).

References: H. Kennedy, J. L. Melville, L. F. Grant, H. L. Meuser, J. P Carriere, H. W. Love, A. J. Kerry.

DAVIES—RICHARD LLEWELYN of Wiarton, Ont. Born at Passburg, Alta. Jan. 12, 1914. Educ.: B.Sc. (Civil) Alberta 1942; R.P.E. of Alberta; 1942 (5 mos.) Jr. engr. Aluminum Co. of Canada, Shipshaw Power Develpt. doing designing, layout of transm. line, concrete inspectn.; 1943 (5 mos.) with Univ. of Alberta, Civil Engrg. Dept. as instructor in the following: hydraulic laboratory, practical problems, adjustments to survey instruments; with Dept. of Transport as follows: May '43—June '45, resident engr. i/c of airport constrn. doing designing, layout of water supply & sewerages for highway to Radio Range Station, Whitecourt, Alta.; June '45—May '46, organizing & training staff of technicians at Univ. of Toronto to carry out soil tests on runway subgrade & materials for various Canadian airports; May 1946 to date, testing engr. for airports, Dept. of Transport, Ottawa, (St. 1941. Jr. 1944).

FARMER—PHILIP JOHN of St. Catharines, Ont. Born at Vancouver, B.C. Nov. 3, 1915. Educ.: B.A.Sc. (Elec.) B.C. 1939; R.P.E. of Ont. 1939-40, with English Electric Co. of Canada Ltd. as follows: training course including practical shop work, testing of rotating machinery, switchgear & transformers; 1940-42, sales engr. preparation of estimates & tenders with tech. data on apparatus, synchronous, induction & direct current motors & generators; 1942-45, liaison engr. handling details of design, manfg. testing of naval ordnance with Elect. Dept. of R.C.N. & British Admiralty Technical Mission; 1945-46, mgr., order & estimating dept. with same company, St. Catharines, Ont. (St. 1939. Jr. 1946).

References: J. N. Finlayson, H. J. MacLeod, G. Morrison, R. A. H. Hayes A. J. Bennett, D.O.D. Ramsdale.

HOLGATE—DAVID CROSSLEY, of Sault Ste. Marie, Ont. Born at Montreal, Que., March 27, 1915. Educ.: B. Eng., (Civil), 1938; R.P.E., Ontario 1938, structl. steel dftsman. & designer, MacKinnon Steel Corp, Ltd., Sherbrooke, Que.; 1939-41, structl. steel dftsman. & designer, Dominion Bridge Co. Ltd., Toronto, Ont.; 1941 to date, engr. i/c of all design & drawing office work; also asst. to mgr. in co-ordination of work in drawing office, fabrication & erection depths., Sault Structural Steel Co., Ltd., Sault Ste. Marie, Ont. (Jr. 1942).

References: H. P. Wilbur, W. H. M. Laughlin, C. Stenbol, W. D. Adams, A. M. Wilson, E. R. Graydon, E. A. Kelly.

HUBBARD—FREDERICK WILMOT of Kingston, Ont. Born at Burton, N.B. May 15, 1917. Educ.: B.Sc. (Elec.) N.B. 1943; summer work as follows: 1937-42, lathe operator, motor mechanic, transmitting station operator; 1943 (4 mos.), Naval Service, asst to O/C of elect. artificers shop; 1943-45 (18 mos.) Elect. Officer on H.M.C.S. Prince Robert; 1945 (6 mos.) elect. designing, supply & distribution for New Canadian Built Destroyers; Halifax, N.S. 1946, elect. foreman, i/c mtce. for elect. equipt. instruments, & operation of air conditioning equipt., Canadian Industries Ltd., Nylon Div. Kingston Ont. (St. 1943. Jr. 1946).

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CIVIL

CIVIL ENGINEER, senior designer, experienced in reinforced concrete and structural steel and general building construction, required to take charge of structuraldesign staff for a firm of consulting engineers in Montreal. Salary $300-$400. Apply to File No. 3585-V.

CIVIL ENGINEERS, from recent graduates up, required by a public utility in Toronto for the design and construction of dams, bridges and power houses. Salary open. Apply to File No. 3736-V.

ELECTRICAL

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEER with construction experience, required by an electrical contractor in Montreal for estimating, etc. Salary $250. up. Apply to File No. 3720-V.

ELECTRICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

ELECTRICAL ENGINEERS experienced in the design and installation of private communication systems required for a public utility in Toronto. Salary open. Apply to File No. 3736-V.

ELECTRICAL ENGINEER, with at least five years experience on overhead and underground transmission and distribution systems. Required as distribution engineer by a public utility in Brazil. Salary open. Apply to File No. 3738-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with broad practical experience and theoretical knowledge required for a firm in Quebec. Salary from $225. Apply to File No. 3743-V.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area, in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEER, under 45, with at least ten years' experience in design of heating, ventilating and refrigeration layouts, required as heating engineer for a government organization on West Coast. Salary $250-300. Apply to File No. 3724-V.

YOUNG MECHANICAL ENGINEERS, with practical experience either in automotive or general manufacturing industries, together with ability to operate engineering office systems, required by an industrial organization in Ontario. Salary open. Apply to File No. 3732-V.

MECHANICAL ENGINEERS, with at least five years' experience in the Pulp and Paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

SENIOR MECHANICAL ENGINEER, ten to fifteen years' experience required by a West Coast manufacturer of heavy equipment and vehicles to take charge of engineering design and inspection departments. Salary about $350. Apply to File No. 3734-V.

MECHANICAL ENGINEERS, with experience in plant layouts and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

MINING

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3743-V.

MISCELLANEOUS

CIVIL OR MECHANICAL ENGINEER, required by a pulp and paper company in Newfoundland to look after new development work and general engineering in connection with woods operations. Salary open. Apply to File No. 3655-V.

ASSISTANT PLANT ENGINEER, preferably with pulp and paper or structural design experience, required for a newsprint mill in a city on north shore of Lake Superior. Salary open. Apply to File No. 3657-V.

CIVIL OR MECHANICAL ENGINEERS, recent graduates, required by major oil company engineering Dept. Work consists of design of buildings and miscellaneous equipment for handling petroleum products. Salary open. Apply to File No. 3685-V.

CIVIL OR MECHANICAL ENGINEER, experienced in design and field supervision of construction of industrial buildings, piping, pumping and mechanical equipment, for products distribution of major oil company. Ten years experience required. Salary open. Apply to File No. 3685-V.

JUNIOR CIVIL OR MECHANICAL ENGINEERS with design or structural experience required by a manufacturer of contractors' equipment in the Hamilton area. Salary open. Apply to File No. 3698-V.

JUNIOR ENGINEERS, preferably with some mechanical design experience, required for the engineering staff of a manufacturer in Sherbrooke. Salary open. Apply to File No. 3721-V.

JUNIOR ENGINEERS, recent graduates up, with mechanical background required by a Montreal manufacturer for the design and supervision of boiler plant installations, preferably bilingual. May have sales work. Salary from $200. Apply to File No. 3722-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

INDUSTRIAL ENGINEERS, age 28-40, required by a firm located in Toronto and Montreal for plant inspection and investigation of manufacturing operations. Knowledge of cost accounting, plant construction, machinery, manufacturing methods needed. Travelling involved. Salary open. Apply to File No. 3727-V.

CONSTRUCTION ENGINEER with considerable experience required for the permanent staff of a Montreal inspection company. Salary about $200. Age immaterial. Apply to File No. 3728-V.

JUNIOR ENGINEER, preferably with experience in heating and combustion problems, required by a specialist firm in Montreal. Salary $250-325. Apply to File No. 3729-V.

GRADUATE, interested in economics of iron and steel production and with experience in ferrous metallurgy, required by an organization in Toronto to study the applicability in Canada of various processes of iron production. Salary open. Apply to File No. 3731-V.

PLANT ENGINEER, age about 35, with factory experience and mechanical background, including maintenance and power plants, steam and electrical, required by a manufacturer in Montreal. Salary from $350. Apply to File No. 3735-V.

PLANT MANAGER, age 35-40, with engineering background and management experience, required by a manufacturer in Montreal. Salary from $500. Apply to File No. 3735-V.

SALES ENGINEERS, with mechanical background, bilingual, required by a Montreal firm handling road building and contractors equipment, generators, pumps, etc. Salary open. Apply to File No. 3737-V.

SALES ENGINEERS with electrical or mechanical background required in Toronto for the sale of electrical equipment. Salary open. Apply to File No. 3739-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DESIGN ENGINEERS, age about 30, with experience in the design and layout of chemical plants, required by an industrial organization in the St. Maurice Valley. Salary from $250. Apply to File No. 3741-V.

DESIGN DRAUGHTSMEN, age about 25, with experience in chemical plant layouts, required by an industrial organization in the St. Maurice Valley. Salary from $200. Apply to File No. 3741-V.

INDUSTRIAL ENGINEER, with broad experience in plant development, operation, costs and management required for a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

SALES ENGINEER, preferably bilingual, required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER OR CHEMIST, from recent graduate up, is required by an industrial concern in Montreal for chemical control of products. Salary open. Bilingual preferred. Apply to File No. 3564-V.

CHEMICAL ENGINEER required by a petroleum refining company in Montreal for process and design work. Salary about $225. Apply to File No. 3575-V.

CHEMICAL ENGINEER required as assistant professor of chemical engineering in a Canadian university to start autumn 1947. Salary open. Apply to File No. 3600-V (D).

CHEMICAL ENGINEERS OR CHEMISTS for analytical work in the laboratory of an industrial firm in Central Ontario. Salary from $175. Veteran preferred. Apply to File No. 3642-V.

CHEMICAL ENGINEER, preferably with sales experience, for sales and service with an industrial firm in Central Ontario. Salary open. Apply to File No. 3642-V.

CHEMICAL ENGINEERS, both with experience and recent graduates, required by an industrial organization in the St. Maurice Valley. Salary open. Apply to File No. 3644-V.

CHEMICAL ENGINEER recent graduate up, to be assistant to the department superintendent of a tar distillery in the Toronto area. Salary $225. Apply to File No. 3674-V.

CHEMICAL ENGINEERS OR METALLURGISTS, with knowledge of French or German, required by a government department for literature researches on industrial problems. Salary about $300. Apply to File No. 3682-V.

JUNIOR CHEMICAL ENGINEER, recent graduate up, required for a paper mill in the Lake St. John area. Salary about $225. Apply to File No. 3684-V.

CHEMICAL ENGINEER with considerable experience in the pulp and paper industry required as chief chemist in a paper mill in Northern Quebec. Salary from $350. Apply to File No. 3684-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

CHEMICAL ENGINEERS with about five years' industrial experience required by a manufacturer in Central Ontario. Salary open. Apply to File No. 3702-V.

CHEMICAL ENGINEER, recent graduate, required as process engineer in production control by a manufacturer in Central Ontario. Salary open. Apply to File No. 3708-V.

CIVIL

CIVIL ENGINEER with experience in the mechanical trades required as designer by a building contractor in Quebec, age 30-35, salary open. Apply to File No. 3444-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position, salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEERS with master's degree, teaching and consulting experience. age 28-40, required for the staff of a unifersity in N.Y. State. Salary open. Apply to File No. 3600-V (C).

CIVIL ENGINEER with construction experience required as plant engineer by a textile firm with headquarters in Montreal. Salary open. Apply to File No. 3615-V.

JUNIOR CIVIL ENGINEER for general construction work with a manufacturer in the province of Quebec. Salary open. Apply to File No. 3672-V.

CIVIL ENGINEER, preferably with railroad experience, required by a company engaged in large scale asbestos production in Quebec to supervise construction of local railroad. Salary open. Apply to File No. 3683-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters. English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to File No. 3415-V.

ELECTRICAL ENGINEER age 30 - 45 with sales training with large manufacturer of electrical equipment instruments and 5-10 years experience as sales service and sales engineer required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment. Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER with experience in teaching or practical electrical work required as full-time technical instructor in the Montreal area. Salary open with overtime. Apply to File No. 3600-V. (B).

ELECTRICAL ENGINEER for sales engineering, with previous experience, age 25-40, required by a Montreal firm handling pumps, valves, automatic controls, etc. Salary according to experience. Apply to File No. 3614-V.

ELECTRICAL ENGINEER with knowledge of power apparatus, preferably bilingual, required for sales work with a manufacturer in the Montreal area. Salary open. Apply to File No. 3646-V.

ELECTRICAL ENGINEERS with at least five years experience, mostly in aircraft design, required for the design staff of an industrial organization in Montreal. Salary from $275. Apply to File No. 3650-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER to be chief engineer, responsible for electrical and mechanical design and testing, required by a firm in Ontario manufacturing electric motors. Salary open. Apply to File No. 3656-V.

ELECTRICAL ENGINEER with at least three years experience in the design of generating plants and high tension transformer stations required by an engineering firm in Toronto. Salary open. Apply to File No. 3661-V.

ELECTRICAL ENGINEER with several years experience required as a designer by an industrial organization in Montreal. Salary open. Apply to File No. 3677-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35, salary open. Apply to File No. 3695-V.

ELECTRICAL ENGINEER, recent graduate, preferably bilingual, required by a public utility in the Ottawa area to learn the distribution business from the management end. Salary open. Apply to File No. 3699-V.

ELECTRICAL DRAUGHTSMAN with several years' experience in industrial layouts for large concern in Eastern Townships. Permanent position and attractive salary available for experienced men. Apply to File No. 3701-V.

ELECTRICAL ENGINEER with construction experience, required by an electrical contractor in Montreal for estimating, etc. Salary $250 up. Apply to File No. 3720-V.

MECHANICAL

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to File No. 3393-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the re-conversion of a paper mill in Eastern Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MECHANICAL ENGINEER with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEER with paper mill or mining experience required as assistant mechanical superintendent and understudy to mechanical superintendent in a paper mill in the St. Maurice Valley. Salary from $300 according to experience. Apply to File No. 3581-V.

MECHANICAL ENGINEER with extensive knowledge of machine shop practice and general industrial experience is required by a specialized industrial plant in the Montreal area. Veteran preferred. Salary according to experience. Apply to File No. 3595-V.

YOUNG MECHANICAL ENGINEER, recent graduate up, single, to be assistant maintenance engineer in a cement plant in South America. Salary about $250 with keep. Apply to File No. 3621-V.

MECHANICAL ENGINEERS to be design squad leaders on heavy machinery design required by a company in Central Ontario. Salary open. Apply to File No. 3623-V.

MECHANICAL ENGINEER recent graduate, required by an industrial firm in south western Quebec, for the design and erection of complex textile machinery. Salary open. Permanent position. Apply to File No. 3625-V.

JUNIOR MECHANICAL ENGINEER with construction or machine shop experience, required in Halifax by a Montreal firm handling heavy construction equipment. Salary open. Apply to File No. 3635-V.

MECHANICAL ENGINEER with experience in machine design required by a firm in the Maritimes engaged in ship repair and conversion and the manufacture of marine and heating equipment. Salary open. Apply to File No. 3638-V.

MECHANICAL ENGINEER with experience in the fabrication of Farm Implements, required by a Quebec firm. Bilingual man preferred. Salary according to experience. Apply to File No. 3666-V.

MECHANICAL ENGINEER with experience in the design of industrial machinery required by a Montreal firm manufacturing custom built machines. Salary $200-$250. Apply to File No. 3669-V.

MECHANICAL ENGINEER with industrial experience required as plant engineer for a plant in central Quebec manufacturing assorted building products. Salary from $250. Bilingual an advantage. Apply to File No. 3671-V.

MECHANICAL ENGINEER with design experience in the pulp and paper industry required by a firm with headquarters in Montreal. Salary $350. Apply to File No. 3673-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEER with industrial or construction experience, required by a firm of consulting engineers to inspect machinery deliveries in the Cornwall area. Salary open. Apply to File No. 3691-V.

MECHANICAL ENGINEER, recent graduate up, required for maintenance and production engineering by an industria firm in Montreal. Salary open Apply to File No. 3692-V.

MECHANICAL ENGINEER with considerable experience in chemical plant design and equipment required by a manufacturer in Central Ontario. Salary open. Apply to File No. 3702-V.

MECHANICAL ENGINEERS, age 25-35, required by a manufacturer in Montreal, for training as sales engineers and for executive positions. Salary from $200. Apply to File No. 3710-V.

JUNIOR MECHANICAL ENGINEER, under 30 and preferably bilingual, required by a Montreal firm to train as sales engineer for pumps, engines and allied electrical equipment. Salary open. Apply to File No. 3714-V.

MECHANICAL ENGINEER with experience in tools, dies and shop work required as assistant to the plant manager of a factory in the Montreal area. Duties include obtaining materials. Salary $250-$350. Apply to File No. 3719-V.

MINING

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

MISCELLANEOUS

INDUSTRIAL ENGINEER, with engineering background in mechanical, electrical or chemical, age 35 up, bilingual with some practical experience, required by an engineering consultant in Montreal. Apply to File No. 3307-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

MECHANICAL OR ELECTRICAL ENGINEER with experience in paper mill or steam plant operation, bilingual if possible, is required by an industrial firm near Montreal. Salary from $300, according to experience. Apply to File No. 3498-V.

RESIDENT ENGINEER with considerable construction experience and bilingual is required by a public utility for employment on the upper Ottawa River. Salary from $350. Apply to File No. 3505-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

MECHANICAL OR MINING ENGINEER, age 30-40 with experience in industrial engineering, required by a large mining and processing firm for methods studies of equipment, labour and costs. Salary according to qualifications. Apply to File No. 3524-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

INDUSTRIAL ENGINEER, under 40, with not less than 5 years' experience in industrial methods engineering, required by a paper company in British Columbia. Salary open. Apply to File No. 3550-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

DESIGN ENGINEER with considerable experience required by a pulp and paper firm in the St. Maurice Valley. Salary open. Apply to File No. 3573-V.

CIVIL AND MECHANICAL ENGINEERS AND DRAUGHTSMEN, preferably experienced in building design and plant layout, required for a pulp and paper mill in Southern Ontario. Salary open. Apply to File No. 3578-V.

GRADUATE ENGINEERS, required by a large industrial and chemical organization with headquarters in Montreal for all phases of research design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

ASSISTANT PROFESSORS AND INSTRUCTORS required for the staff of a technical college in New York State. Salary open. Apply to File No. 3600-V. (A)

MECHANICAL OR ELECTRICAL ENGINEER with considerable construction experience required as executive assistant to chief engineer of general contracting firm with headquarters in Montreal. Salary from $300 according to experience. Apply to File No. 3604-V.

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL OR MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

SALES AND SERVICE ENGINEER with considerable experience in sales and heavy mechanical equipment required by a sales organization on the West Coast. Salary open. Apply to File No. 3626-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply to File No. 3628-V by letter with full details. Salary open.

MECHANICAL OR CHEMICAL ENGINEER for sales and sales engineering of industrial oils and greases, preferably bilingual and with experience in the paper or textile industries, required by an oil company in Montreal. Considerable travelling. Salary from $250. Apply to File No. 3632-V.

QUALIFIED ENGINEER required to represent for sales purposes in Northern Ontario a company engaged in the supply of coal. Knowledge of territory essential. Salary open. Apply to File No. 3634-V.

AERONAUTICAL OR MECHANICAL ENGINEER, recent graduate up, required as owner's representative on aircraft design and manufacture in the Toronto area. Salary open. Apply to File No. 3637-V.

SALES ENGINEER with wide engineering experience wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

JUNIOR ENGINEERS, CIVIL OR MECHANICAL, recent graduates up, required for the design staff of a large industrial organization in Montreal. Salary from $175 according to experience. Apply to File No. 3644-V.

MECHANICAL OR AERONAUTICAL ENGINEER with at least five years experience, mostly in design of aircraft power plants or of installations in passenger craft, required by an industrial organization in the Montreal area. Salary from $275. Apply to File No. 3650-V.

CIVIL, MECHANICAL OR AERONAUTICAL ENGINEERS, with some experience in aircraft design or construction, required by an industrial organization in the Montreal area. Salary from $225. Apply to File No. 3650-V.

MECHANICAL AND STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

ASSISTANT ENGINEER with experience in estimates and specifications for industrial work required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CHIEF DRAUGHTSMAN with at least five years draughting room and related engineering office experience, preferably in pulp and paper or process industries, required by a pulp and paper mill in the Port Arthur district. Salary open. Apply to File No. 3653-V.

JUNIOR ELECTRICAL OR MECHANICAL ENGINEER required by an industrial firm in Montreal for training as an industrial engineer, including plant layout and maintenance. Salary open. Apply to File No. 3660-V.

MECHANICAL OR ELECTRICAL ENGINEERS for training as production engineers with an industrial firm in Montreal. Salary open. Apply to File No. 3662-V.

CONSTRUCTION ENGINEER with ten years' experience in the design and erection of steel and concrete buildings required for the staff of an oil company in Montreal. Travelling involved. Salary open. Apply to File No. 3663-V.

JUNIOR ENGINEERS preferably with pulp and paper or other industrial experience required for training for the sales staff of a Montreal manufacturer of machines and equipment. Salary from $175. Apply to File No. 3664-V.

GRADUATE ENGINEERS for mechanical design, experimental, test and development departments of a Canadian firm producing aircraft gas turbines. Salary open. Apply to File No. 3667-V.

STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3668-V.

JUNIOR ENGINEERS, recent graduates up, as designing draughtsmen for a brewing company with headquarters in Montreal. Salary from $200. Apply to File No. 3670-V.

SALES ENGINEER with knowledge of sawmill and woodworking equipment, preferably bilingual, required for the sale of specialized equipment. Salary $200 plus commission. Apply to File No. 3678-V.

CHEMICAL OR MECHANICAL ENGINEER, recent graduate required for the service dept. of a chemical industry in Central Ontario. Salary open. Apply to File No. 3680-V.

INDUSTRIAL ENGINEER as field representative in the Toronto-Niagara area for a government department, five to ten years experience. Salary about $300. Apply to File No. 3682-V.

JUNIOR ENGINEER, recent graduate up, required as surveyor by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

STRUCTURAL STEEL CHECKER OR DRAUGHTSMAN required immediately for a steel fabricating company in Niagara Peninsula. Salary open. Apply to File No. 3687-V.

MECHANICAL OR ELECTRICAL ENGINEER with general industrial experience, preferably with knowledge of time study, required by a wire and cable manufacturing company in Ontario. Salary approximately $225, depending on qualifications. Apply to File No. 3690-V.

SALES ENGINEER, electrical graduate, preferably bilingual, required in Quebec for the sales staff of a firm manufacturing power specialties. Salary open, plus expenses. Apply to File No. 3697-V.

CONSTRUCTION ENGINEER with field experience, age about 30, required as office engineer and assistant to general manager for a firm of contractors in Montreal. Salary open. Apply to File No. 3703-V.

CIVIL OR MECHANICAL ENGINEER with considerable experience in the design and layout of industrial plants required for the design staff of an industrial organization in Montreal. Salary from $250. Apply to File No. 3704-V.

SPECTROSCOPIST with experience in chemical analytical work and the use of the commission spectograph required by an industrial organization with headquarters in Montreal. Salary open. Apply to File No. 3706-V.

FORESTRY ENGINEER, recent graduate up, required by a paper company for woods operations on the Lower St. Lawrence. Salary from $175. Apply to File No. 3707-V.

CHEMICAL, MECHANICAL OR METALLURGICAL ENGINEER, recent graduate up, required by a manufacturer in Central Ontario for construction project work from inception to completion as required. Salary from $200. Apply to File No. 3708-V.

JUNIOR SALES ENGINEER, mechanical background, age 25-30, required by a Montreal firm manufacturing steel tanks, oil drums and other equipment for the oil industry. Salary about $200. Bilingual an advantage. Apply to File No. 3709-V.

JUNIOR ENGINEER DRAUGHTSMAN required by a Montreal firm designing and manufacturing aeroplane equipment. Salary open. Apply to File No. 3712-V.

JUNIOR ENGINEERS, recent graduate up, required for the engineering staff of a communications company with headquarters in Montreal. Veterans preferred. Salary from $175. Apply to File No. 3713-V.

JUNIOR STRUCTURAL DESIGN ENGINEER required by a steel fabricating firm in Central Ontario. Salary open. Apply to File No. 3715-V.

Situations Wanted

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., 20 years work on Hydraulic Plants as designer and superintendent of construction. Extensive experience in Guniting, diamond drilling and pressure grouting. One month notice. Apply to File No. 1527-W.

INDUSTRIAL ENGINEER—C.E., B.A.Sc., M.E.I.C., age 38, married, bilingual, process development, methods, time study, production control, job evaluation, plant layout, sales. Services available at short notice. Apply to File No. 2157-W.

DESIGN-DRAUGHTSMAN, M.E.I.C. With experience in all classes of Structural Steel detailing and design. Plant layout. Equipment drawings, piping. Paper Mill construction. Wishes change of position to suit experience. Capable of assuming duties of Assistant Chief Draughtsman. Location preferably Montreal, Que. Apply to File No. 2439-W.

GRADUATE ENGINEER, Jr. E.I.C., having proven executive and administrative ability, a liking for and experience in Sales Engineering work, and ten years production and maintenance experience in industry, wishes to locate in the Winnipeg area. Apply to File No. 2500-W.

PART TIME WORK—YOUNG CIVIL ENGINEER, S.E.I.C., would accept some work at night or during spare time; at office or at home. Now engaged in design work during day-time. Apply to File No. 2735-W.

MECHANICAL ENGINEER, S.E.I.C. Class of 1946 age 25, single, bilingual, veteran. Seven months experience in heating and ventilating. Would prefer work including surveys, test installations and service of automatic heating systems, in Montreal area. Available on one-week notice. Apply to File No. 2807-W.

Business Opportunity

MECHANICAL ENGINEER with shop and capital desires partner with experience and capital to set up a Heating, Plumbing and Air-Conditioning Contracting and Engineering Firm in Montreal. Write to File No. 2262-W.

WANTED

SALES ENGINEER

for

Montreal Office

of

Electrical Manufacturing Concern

Must be university graduate of excellent personality and with three to five years' experience since graduation.

Some knowledge of French desirable. Replies will be treated confidentially.

THIS IS AN EXCEPTIONAL OPPORTUNITY FOR THE RIGHT MAN

File No. 3697-V

Price $4.00 a year in Canada, British Possessions, United States and Mexico. $5.50 a year in Foreign Countries. Current issues, 50 cents a copy, back issues 75 cents a copy. To members and affiliates, 25 cents a copy, $2.00 a year.—Authorized as second class mail, Post Office Department, Ottawa.

CONTENTS

COVER PICTURE

The pulp and paper industry is one of the leading single manufacturing industries of Canada. During the war years, because of the extraordinary demands for munitions, vehicles and certain food products, other industries advanced temporarily to higher positions. The pulp and paper industry, however, is resuming its former place as the leading peacetime industry in Canada. In world trade, pulp and paper are Canada's main commodities except gold; greater than wheat and far greater than nickel. The cover picture is a view of the yards of the International Pulp and Paper Company at Gatineau Mills, Quebec, showing the two-armed stacker and piles of debarked logs.

OXYGEN ACCELERATED COMBUSTION IN OPEN HEARTH FURNACES

E. T. W. BAILEY, M.E.I.C.
Combustion Engineer, The Steel Company of Canada Limited, Hamilton, Ont.

The author describes tests carried out in the Steel Company of Canada plant at Hamilton using oxygen in an open hearth furnace. Results proved most satisfactory, and he predicts that cheap oxygen foreshadows great industrial changes in the steel and chemical industries.

Men have dreamed of using oxygen in large volumes for melting and heating operations since the time of its discovery by Priestley in 1774. But the high cost of producing the pure gas has always prevented the realization of this dream. The production and use of oxygen has been economical up to the present chiefly for operations such as burning, scarfing and welding, which require relatively small volumes.

Eventually it became known that oxygen at a volumetric purity of 98 per cent could be produced for what appeared to be a cost that justified its use in large volumes. Plans were then discussed with a view to initiating experiments to show what could be accomplished.

The Hamilton plant of the Canadian Liquid Air Company supplies the Hamilton Works of the Steel Company of Canada with oxygen (99.5 per cent) for cutting, scarfing and welding, by means of a system of piping between the two plants. The line pressure averages 160 lb. per sq. in. It was found that by making use of all storage capacity and by operating the oxygen plant at maximum rate on week-ends, when normal consumption was lowest, about 250,000 cu. ft. of oxygen could be provided for experimental use.

A study was made of all the potential consumers of oxygen in the steel plant. The most promising unit, and one that was within the range of the facilities at hand, appeared to be the open hearth furnace. Once it had been decided to apply oxygen experimentally to this furnace, the next step was to work out the details of how to introduce this gas into the furnace system.

Early ideas favoured the introduction of oxygen into the checkers, where it could be added to or could replace a portion of the regular volume of air. For reasons which are explained later, it was decided that cold oxygen could be more effectively introduced directly into the furnace, adjacent to the incoming stream of oil.

Furnace Pressure

It was reasoned the introduction of oxygen would lower the furnace pressure by reducing the volume of products per unit of fuel burnt. Immediate advantage could then be taken of this smaller volume of products, and more fuel could then be burnt and still maintain furnace pressure by arranging dampers in a position to suit the original volume of products. In other words, there was eliminated a substantial volume of nitrogen, which could at once be replaced by regular products of combustion resulting from the burning of extra fuel.

Fuel Rate

The opportunity to burn more fuel at a time when the furnace was coldest appeared desirable. The ability of the furnace to consume a higher rate of fuel input just when it is vitally needed for melting down the cold charge, and when both maximum temperature and calorific input are required, is ordinarily not existant. The reduction in the volume of air required from the checker system per unit of fuel burnt has the added effect of increasing the air temperature.

Oil Ignition

Heavy fuel oils in particular, as all furnace men well know, burn poorly as the furnace becomes colder, even though correct combustion air volumes are supplied. The introduction of oxygen adjacent to the atomized oil seems to entirely eliminate this difficulty. The oil burns or ignites much better than when using standard methods in a very hot furnace. This feature is highly desirable to ensure quick and efficient release of heat to the body of the flame.

Flame Development

The ratio between the port area admitting fuel oil on the one hand and hot air from the checkers on the other hand, is very great. It has always been a source of wonderment as to how fuel oil entering the furnace through a ¾ in. or 1 in. pipe could completely contact a large volume of air entering the furnace through an opening of some 36 sq. ft. It would appear that any method that could concentrate the vital oxygen of the air around the oil stream should improve the all important flame. There were good reasons to believe that a melting flame needed conditioning. It has been said that pre-mixing and burning of fuel with air to get a maximum flame temperature and flame location in a furnace is the most desirable approach of fuel economy. The means at hand to lengthen or shorten a flame to increase or decrease its calorific output, and at the same time to direct its travel, are somewhat limited. The introduction of oxygen along with the flame can be compared to the discovery of a new and useful tool, which will materially add to present means for controlling and conditioning flames.

Refractories

It was reasoned that the proximity and concentration of the oxygen to the oil would localize the heat in the scrap area and prevent direct loss to, or contact with the brickwork. It was felt that no danger to refractories from the hotter flames would exist, so long as any substantial amount of unmelted scrap remained in the furnace. The hot, quickly developed flame would lose its heat so rapidly to the scrap that no excessive furnace temperatures could be produced. It was conceded that the roof and walls of the furnace would probably need careful watching toward the end of the melting period. The introduction of oxygen into the checkers would tend to heat the whole furnace, and means to control direction and intensity of the flame would be curtailed. This method would seemingly shorten refractory life without commensurate advantage to the flame. Tests made by others are reported to have confirmed this supposition.

Description of Open Hearth Furnace

A brief description of the No. 12 furnace, used in connection with the oxygen tests, would seem to be in order. The furnace has a nominal capacity of 175 net tons, and taps around 180 tons. The inside dimensions are 43 ft. 6 in. long and 15 ft. 6 in. wide. The depth below the floor plate level is 30 in. The area at floor plate level amounts to 534.75 sq. ft. There are two checkers at each end, having a length of 23 ft. by 11 ft. 6 in. width and 16 ft. 1 in. width respectively. The mean depth of the checkers is 14 ft. The waste heat boiler of horizontal fire tube design has a nominal rating of 577 bhp. Both forced and induced draft fans are in use. The furnace is equipped with fuel air ratio controls for both oil and gas, automatic reversal control by temperature difference, constant oil flow controller valve and recording flowmeters for air, oil and gas. In addition there is a modern furnace pressure control, actuating louver dampers at the outlet of the induced draft fan.

Early Tests

The first test at the Steel Company of Canada, using oxygen adjacent to the oil stream, was made early in 1942. A ¼ in. dia. copper tube was inserted along the regular burner, so that two streams emerged side by side. This arrangement was only used on one end of the furnace, but even this relatively small amount of oxygen was sufficient to lessen the time required to melt scrap at the end of the furnace in which it was installed, as compared to the opposite end. For obvious reasons no further experimental work was undertaken until after the war.

The next test, and the first one of any real importance, was made on March 10, 1946. This test was also somewhat preliminary in nature. It was intended to indicate what data should be collected and what instruments might be needed to furnish information for tabulation, so as to give an overall picture wherefrom the effects of the oxygen could be studied. Thus, from the observations made, plans were formulated for conducting future tests.

The test consisted of admitting an average flow of 587 cu. ft. per min. of oxygen 3 in. above the stream of fuel oil entering the furnace. A 1 in. pipe was used to conduct both the oil and the oxygen into the furnace. A total of 122,134 cu. ft. of oxygen was consumed over a period of 3 hrs. and 27 minutes. The furnace was reversed on a time basis, and the oxygen valves were manually operated so that flow was practically constant. This precaution was used in order to ease the problem of controlling pressures at the source of supply.

Observation of the flame showed an intense white streak where the steam-oil mixture raced outward from the burner pipe, parallel to the oxygen stream. This 'silver streak' seemed to pre-ignite the oil, so that a brightness was developed in the flame almost as soon as the oil emerged from the burner pipe. No prolonged black core existed in the flame, as is common during the regular scrap melting operation. The flame was intense yet short, and did not extend beyond the middle door.

The roof remained relatively cool. The melting effect on scrap was very interesting. The heavy crop ends soon began to flow and lighter scrap seemed to settle much sooner than usual, and in some respects resembled a brush pile being burnt in the woods. There was general agreement that the speed of melting was materially increased. No special efforts were made to charge the scrap faster than normal, and, as a result, additional scrap was not ready when required. On the basis of this test, the managements of both companies concerned agreed to facilitate further tests as soon as all practical arrangements could be made.

Fig. 1—Open hearth flame without oxygen.

Preliminary Test Notes

Even with the use of oxygen, the amount of extra fuel that can be economically burnt by a furnace is not the maximum fuel it can burn. Increases in fuel input from 35 to 62 per cent above normal were tried, and it appears the optimum amount will settle out at around 40 per cent. Even this is a substantial boost, and accounts for the marked increased speed of melting. A typical pre-test outline is shown by the following figures:

Normal flow of oil—370 U.S. gal. per hr.
Normal flow of air—10,000 cu. ft. per min. to fan.
Theoretical flow of air—9,570 cu. ft. per min. at burner.
Estimated actual flow of air—12,000 cu. ft. per min. at burner.

For the test, the oil flow was increased from a normal 370 U.S. gal. per hr. to 500 U.S. gal. per hr., or by 130 U.S. gal. per hr., which required 663 cu. ft.

Fig. 2—View of burner outlet and open hearth flame with oxygen. (West port.)

per min. of oxygen. A flow of 700 cu. ft. per min. oxygen was selected. Air flow was adjusted to give approximately 2-5 per cent oxygen in flue gases. This amount will vary depending on opening of charging doors. The best flue gas sample is obtained toward the tapping side of the downtake flue.

The following items were measured;—Temperature of air coming from checker at regular intervals after reversal; percent oxygen and combustibles in flue gas; flame index number; steam pressure at stand; oxygen pressure at point upstream from measuring orifice; furnace pressure; weight of scrap, pig iron and stone; tons produced, oil and oxygen used; steam produced and waste gas temperature at checker outlets.

Notes from Second Test

A second major test was made on June 9, 1946, in which a burner was used which had been adapted for combination burning of gas and oil. The oxygen was admitted into the regular gas passage, and formed an annular ring around the oil burner pipe. It was considered this would facilitate in a physical way the uniform and speedy mixture of oxygen and oil. It is interesting to note here that while a pressure of 63 lb. per sq. in. existed in the oxygen line, 75 ft. from the burner, a pressure of minus 34.5 in. water column existed in the annular space through which the oxygen was passing. This type of burner was selected because of its advantage for dual service, as well as to suit the probable delivery conditions of large volumes of oxygen at an estimated pressure of 5 lb. per sq. in.

The second test was highly satisfactory. It was noted that the heats melted hard. This unforeseen condition delayed the final tapping time until adjustments could be made. It was also evident that no standard for judging the improved performance was at hand. The scrap was charged much faster, while records did not show exactly similar heats. Estimates of time required without oxygen, given by first helpers, melters and supervisors, varied considerably. It was therefore decided to run a blank heat and let the operators do all they could to make a heat in as short a time as possible.

Notes and Results on Tests 3, 4 & 4a

The results of tests 3 & 4 using oxygen and the blank heat (4-A) are indicated in Table I.

Table I

Item	*Test No. 3*	*Test No. 4*	*Test No. 4-A*
Total metallic charge—tons	396,430	415,165	399,470
Per cent hot metal	41.9	43.5	41.6
Charging time (hrs.-mins.)	2–45	2–22	3–55
Time to addition of hot metal (hrs.-mins.)	3–18	3-09	5–20
Melt time (hrs.-mins.)	6–50	5–50	7–50
Total time of heat (hrs.-mins.)	8–10	9.05	11–10
Tons produced	179.10	188.95	174.95
Yield—per cent	90.5	91.0	87.6
Tons per hour (charge to tap)	21.9	20.72	15.67
Thousand Btu per ton	2,939	3,486	4,346
Fuel as U.S. gal. oil/net ton	19.49	23.11	28.8
Fuel as Imp. gal. oil/net ton	16.23	19.25	24.0
Fuel rate as oil—U.S. gal. per hr.	500	610	496
Slag, actual FeO %	9.8	6.0	11.5
Rate of flow, oxygen	700	800	None
Cu. ft. of oxygen used	155,700	165,500	None
Cu. ft. of oxygen used per net ton	873	877	None

The average of tests 3 and 4 compared with test 4-A indicates;—

Reduction in time—24 per cent.

Increase in tons per hour charge to tap—36 per cent.

Reduction in fuel 35 per cent.—This is probably higher than can be expected, as fuel was used generously in order to beat the time set by the 'oxygen' heats. Other tests indicate a possible fuel saving of around 17 per cent. The yield on all tests has been consistently high.

Spot tests have been made lately which indicate that on some furnaces the increase in output will exceed 40 per cent. An accurate figure cannot of course be obtained until a given furnace has been operated through a campaign, using oxygen during the melting period of every heat. The life of the furnace under the new conditions is another question mark. Given proper supervision, and assuming a reduction in the extent of the drop in refractory temperatures between heats and during charging, there should be an increase in total time between rebuilds. The consumption of brick per ton of steel should be reduced.

General Observations

In order to keep pace, scrap handling facilities will have to be modernized in many shops if oxygen is used.

While the use of oxygen appears to shorten the scrap melting time by at least 2½ hours, it is probable that the bubbling of oxygen into the bath of molten metal will also substantially lessen the time required for refining. The author has had no experience with this, but it is a scheme that holds promise.

If 98 per cent oxygen can be produced in large volumes for around 25c per thousand cu. ft., its arrival as a cheap plentiful gas heralds great industrial changes. In a steel plant it can be used to materially increase the capacity of any gas producer or heating furnace. Existing boilers may be forced to produce unheard of amounts of steam, while blast furnace gas may become a rich fuel. In the chemical industry, the output of sulphuric acid could be increased fivefold, even with existing equipment. These things now seem somewhat fanciful, but it *is* interesting to find a way to heat an object, without expending so much energy to heat large volumes of unwanted nitrogen.

Some day it may be quite possible to build an open hearth furnace without checkers, and to obtain even higher efficiencies than are possible with existing units. Yet to fuel engineers and operating supervisors, the advent of oxygen will but add another item for which cost must be kept down. The free air will disappear.

Devices and instruments for control will have to be designed. Oxygen is difficult to meter, since the mercury used as a manometer seal becomes oxidized. Displacement meters are bulky and costly. The use of silicone as a manometer seal or bellows might prove to be the answer to this problem. Instruments recording the percentage of oxygen in the flue gas will be essential on each furnace, and there will be a real need for a small dependable recorder for this service.

ANALYSIS OF AN ARCH SUPPORTED CONTINUOUS GIRDER

R. N. McMANUS, M.E.I.C.
Lecturer,

G. FORD, JR. E.I.C.
Formerly demonstrator,

Department of Civil Engineering, University of Alberta, Edmonton.

This paper has been condensed from a thesis by the authors in part fulfilment of the requirements for their Masters Degree. It deals with a type of structure which, although highly indeterminate, may well become a useful and attractive type for bridges with spans of 300 to 600 ft. The process of solution is new for this type of structure, and presents an interesting method of attack for other indeterminate structures. It consists of a recognition of certain equations, which arise naturally, as "difference equations", and in the application of the methods of the calculus of finite differences to the solution of them. Those interested in structural analysis should find this paper stimulating. Because of its condensed form, it requires careful reading.

Introduction

An arch-supported continuous girder, more commonly known as a tied arch, resembles the ordinary arch bridge so widely used today. Because this structure has a lower chord which will carry moment, thrust and shear, the engineer can distribute the moment both to the rib and to the girder. This at once allows the use of heavier members in the chords and lighter rib members, which is, in itself, an obvious advantage in construction. The rib and girder, being stable within themselves, require only light hangers to distribute the moment. Moreover, the elimination of the usual diagonals adds to the aesthetic qualities of the truss.

This type of structure, though common in Europe, is relatively new to this continent. There are consequently few methods of analysis available in our literature. The general approach has been to use the differential calculus, with necessary assumptions and approximations. European literature, on the other hand, indicates that the calculus of finite differences offers a powerful approach to such an analysis. This is especially true where concentrated loads occur at regular intervals. In the following article, a "difference equation" has been used to obtain a general analysis of the tied arch.

Type of Structure

The structure to be dealt with (Fig. 4) consists of an arched rib held together by a tie girder which, in turn, is supported at regular intervals from the arch by vertical hangers connected to the rib at the panel points. For the purpose of analysis, the girder and rib will be considered to be pin-connected, and the structure as a whole to be simply supported. Both rib and girder can take moment, thrust, and shear, while the hangers are restricted to tensile stress only. In order to have a load system of concentrated forces occurring at regular intervals, the floor beams are assumed to frame into the girder at the panel points.

With the use of the following notation the degree of indeterminateness may be obtained.

Let n = number of panels
k = number of joints (= $2n$ in this case)
r_1 = number of stiff members (= $2n$)
r_2 = number of simple members = $(n\text{-}1)$
e = number of stiff corners = $2(n\text{-}1)$

Degree of indeterminateness is

$r_1 + r_2 + e - 2K + 3 = N.$

Therefore, $N = 2n + (n\text{-}1) + 2(n\text{-}1) - 4n + 3 = n$ and the system is indeterminate to the n^{th} degree. If the connections between the girder and rib are not pinned, then $e = 2n$ and $N = n+2$.

Assumptions

The computations are carried out on the basis of the following assumptions:

1. All members are considered straight between the panel points.
2. The loads are vertical and may come on the structure only at the panel points.
3. The moments of inertia of all members between panel points will be constant and will be so chosen that the relation

$$\frac{I_r^R \cos \phi_r}{I_r^G} = \alpha$$

will be a constant throughout the structure.
4. The hangers are slender pin connected members, restricted to tensile stresses only, and are assumed not to change in length. This is the usual assumption.
5. The bottom chord is horizontal, though computations are not appreciably affected by a small camber in the girder.
6. Deformations due to normal and shearing stresses are neglected throughout.

Notation

A = Area of cross section.
A_r^G = area of the r^{th} member in the girder.
A_r^R = area of the r^{th} member in the rib.
E = Modulus of elasticity (assumed constant for the entire structure).
H = Horizontal component of rib compression or tie tension.
I = Moment of inertia.
I_r^R = the moment of inertia of the r^{th} member in the rib.
I_r^G = the moment of inertia of the r^{th} member in the girder.
ϕ_r = Slope of the arch rib in the r^{th} panel.
h_r = Rise of the arch rib at the r^{th} panel point.
L = Length of the panel.
M_r' = Simple beam moment at the r^{th} panel point.
M_r^t = The total bending moment to be resisted by the girder and tie at the r^{th} panel point $= (M_r' - Hh_r)$
M_r^G = The moment to be resisted by the girder at the r^{th} panel point.
M_r^R = The moment to be resisted by the rib at the r^{th} panel point.
$\overline{M}$ = The moment due to a unit couple.
$\overline{N}$ = The direct stress in any member of the structure due to $H = 1$.
$\alpha = \dfrac{I_r^R \cos \phi_r}{I_r^G}$

Analysis

The necessary and sufficient conditions for determining the redundant forces and bending moments in a structure, indeterminate to the n^{th} degree, are that $n+3$ independent linear equations containing these unknowns be obtained. In general, the n equations (in addition to the three equations of statics) are most satisfactorily obtained from the work equations. These equations, obtained from the law of Virtual Work, may be expressed algebraically as:

$$\theta = \sum \int \frac{\overline{M}\, M dx}{EI} \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

i.e. the change in angle at the point of the application of a unit couple.

$$\delta = \sum \int \frac{\overline{M}\, M dx}{EI} + \sum \int \frac{\overline{N} N dx}{AE} \ * \quad . \quad . \quad . \quad (2)$$

i.e. the deflection at the point of application of a unit load.

The expression $\int \frac{\overline{M}\, M dx}{EI}$ may conveniently be evaluated by the moment-area method. This is especially true if one of the bending moment curves is a trapezoid.

Consider a straight beam which may not have a constant moment of inertia over the whole span.

Then the equation $\delta = \int_0^l \frac{\overline{M}\, M dx}{EI}$ may be multiplied by any constant moment of inertia I_o so that for convenience

$$EI_o\delta = \int_0^l \frac{\overline{M} M I_o dx}{I} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3)$$

The multiplication of either bending moment by $\frac{I_o}{I}$ gives an area between the bending moment curve and the OX axis, called a modified M-surface. Referring to the bending moment diagrams for the unit load at a

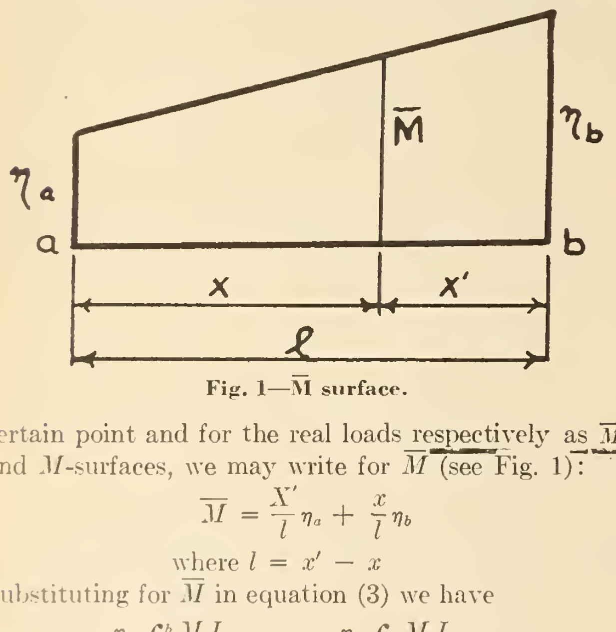

Fig. 1—$\overline{M}$ surface.

certain point and for the real loads respectively as $\overline{M}$- and M-surfaces, we may write for $\overline{M}$ (see Fig. 1):

$$\overline{M} = \frac{X'}{l}\eta_a + \frac{x}{l}\eta_b$$

where $l = x' - x$

Substituting for $\overline{M}$ in equation (3) we have

$$EI_o\delta = \frac{\eta_a}{l}\int_a^b \frac{M\, I_o}{I} x' d\, x' + \frac{\eta_b}{l}\int_a \frac{M\, I_o}{I} x dx$$

but $\int_a^b \frac{M\, I_o}{I} x' dx'$ and $\int_a^b \frac{M\, I_o}{I} + dx$

are statical moments of the modified M-surface, which may be simplified in the case of a trapezoidal M-surface to

$$S_{Ba} = \frac{\xi_a (l)^2}{6} + \frac{\xi_b (l)^2}{3}$$

$$\text{and } S_{Bb} = \frac{\xi_a (l)^2}{3} + \frac{\xi_b (l)^2}{6}$$

as in Fig. 2.

*The terms containing changes of temperature have been neglected.

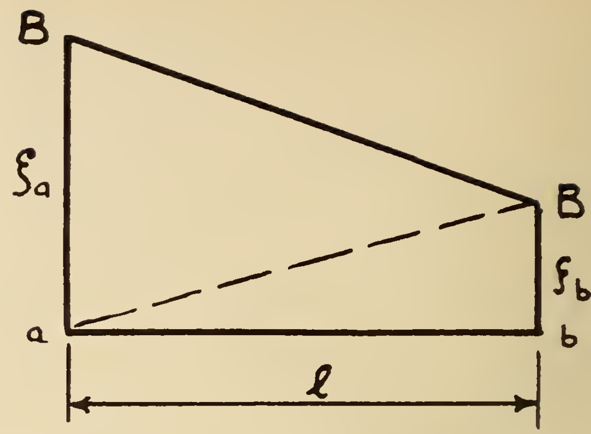

Fig. 2—M surface. As a trapezoid.

$$\text{Thus, } EI_o\delta = \frac{\eta_a l}{6}(2\xi_a + \xi_b) + \frac{\eta_b l}{6}(\xi_a + 2\xi_b) \quad . \quad . \quad . \quad (4)$$

The analysis now resolves itself into the solution of two main problems.

(a) The determination of the division of the total moment between the rib and girder.

(b) The determination of the horizontal components of the longitudinal forces in the chord members.

The computation for (a) takes place by the use of the first of the work equations. The $\overline{M}$ surface in this case is that due to a unit couple placed at the panel point.

Then using equation (4), and the notation as given, the change of angle for the top chord at the r^{th} panel point is (see Figs. 3a and 3b):

$$\theta = \frac{L}{6EI_r^R \cos \phi_r}(M_{r-1}^R + 2M_r^R)$$

for the lower chord at the r^{th} panel point

$$\theta = \frac{L}{6EI_r^G}[M_{r-1}^t - M_{r-1}^R + 2(M_r^t - M_r^R)]$$

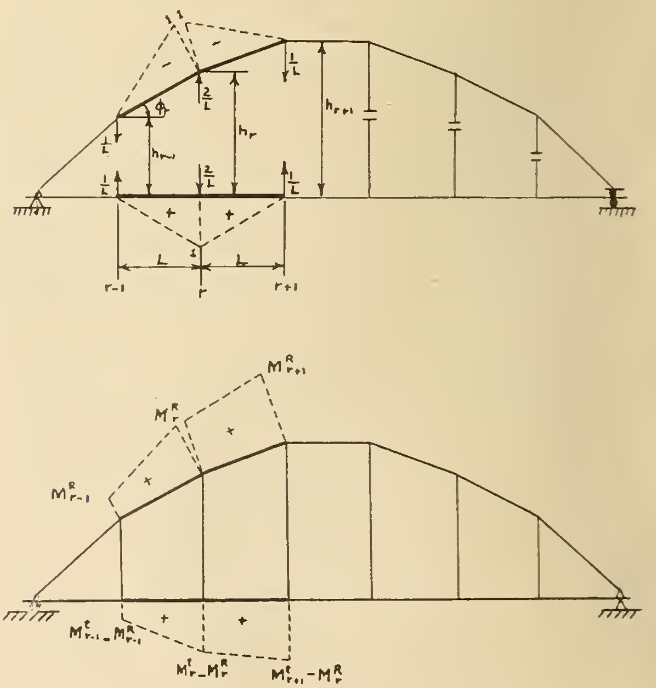

Fig. 3—(a) $\overline{M}$ surface on the statically determinate structure. (b) M surface on the statically indeterminate structure.

Since the hangers are assumed to have no change of length, θ for the top chord $= \theta$ for the lower chord at the same panel point.
Then:

$$\frac{L}{6EI^R_r \cos\phi_r}\left[M^R_{r-1} + 2M^R_r\right] =$$

$$\frac{L}{6EI^G_r}\left[M^t_{r-1} - M^R_{r-1} + 2M^t_r - 2M^R_r\right]$$

From which

$$(M^R_{r-1} + 2M^R_r) = \frac{\alpha}{1+\alpha}\,(M^t_{r-1} + 2M^t_r)$$

Similarly, at the $r+1$ panel

$$(2M^R_r + M^R_{r+1}) = \frac{\alpha}{1+\alpha}\,(2M^t_r + M^t_{r+1})$$

Adding, we have:

$$(M^R_{r-1} + 4M^R_r + M^R_{r+1}) = \frac{\alpha}{1+\alpha}$$

$$(M^T_{r-1} + 4M^t_r + M^t_{r+1})$$

The general solution of this difference equation is:

$$M^R_r = C_1\,(K_1)^r + C_2\,(K_2)^r + \frac{\alpha}{1+\alpha}\,M^t_r$$

where K_1 and K_2 are the roots of the characteristic equation

$$(K)^2 + 4K + 1 = 0$$

and C_1 and C_2 are constants to be determined from the boundary conditions.

Also, since, $K_1 \,.\, K_2 = 1$ we may write

$$M^R_r = C_1\,(K)^r + C_2\,(K)^{-r} + \frac{\alpha}{1+\alpha}\,M^t_r$$

and since $M^t_o = M^t_n = 0$ and $h_o = h_n = 0$ then in this case $C_1 = C_2 = 0$

The general solution now becomes:

$$M^R_r = \frac{\alpha}{1+\alpha}\,M^t_r$$

$$M^G_r = M^t_r - M^R_r$$

$$= M^t_r - \frac{\alpha}{1+\alpha}\,M^t_r$$

$$= \frac{1}{1+\alpha}\,M^t_r$$

Therefore, $$\frac{M^G_r}{M^R_r} = \frac{1}{\alpha} \qquad \ldots\ldots\ldots \quad (5)$$

A complete solution now requires only that the horizontal component H be found. Since the hangers are assumed to be pin connected, it is obvious that the horizontal component H is constant. The second work equation permits the computation of H.

By placing a unit load along the center-line of the girder an $\overline{M}$ surface (Fig. 4) is obtained which combined with the M surface of Fig. 5 in equation (2) gives rise to the following equation.

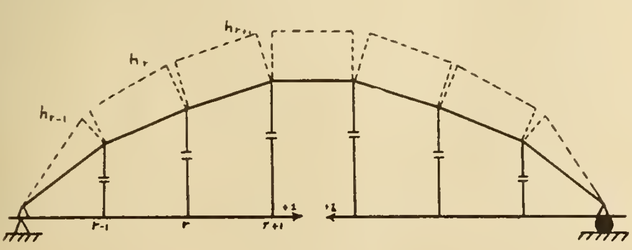

Fig. 4—$\overline{M}$ surface.

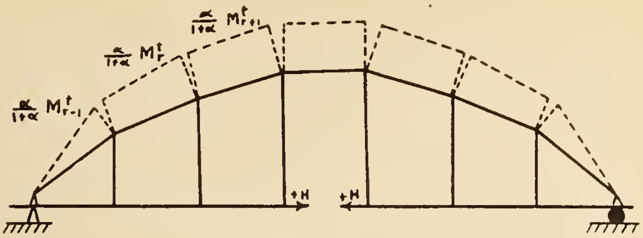

Fig. 5—M surface.

$$\delta = \sum_o^n \int_o^l \frac{\overline{M}Mdx}{EI} + \sum_o^n \int_o^l \frac{\overline{N}Ndx}{AE} = \sum_o^n \frac{HL}{A_G E}$$

By combining the M-surfaces and using equation (5) the solution for H is determined as follows:

$$\sum_o^h \frac{\alpha}{1+\alpha}\left\{\frac{h_{r-1}}{6I^R_r \cos\phi_r}\left[2(M'_{r-1} - Hh_{r-1}) + (M'_r - Hh_r)\right]\right.$$

$$\left. + \frac{h_r}{6I^R_r \cos\phi_r}\left[(M'_{r-1} - Hh_{r-1}) + 2(M'_r - Hh_r)\right]\right\}$$

$$+ \sum_o^n \frac{H}{(\cos\phi_{r-1})^3 A^R_r} = H\sum_o^n \frac{1}{A^G_r}$$

from which

$$\sum_o^n \left[(2h_{r-1} + h_r)\,M'_{r-1} + (2h_r + h_{r-1})\,M'_r\right]$$

$$= 2H\sum_o^n\left[(h_{r-1})^2 + h_{r-1}\,.\,h_r + (h_r)^2\right] - \frac{\alpha+1}{\alpha}\,H\sum_o^n \frac{6I^R_r}{(\cos\phi_r)^2 A^R_r}$$

$$+ \frac{\alpha+1}{\alpha}\,H\sum_o^n \frac{6\cos\phi_r}{A^G_r}$$

Since the last two terms are small, when compared to the first term, they can be neglected.

Therefore,

$$H = \frac{\sum_o^n\left[(2h_{r-1} + h_r)\,M'_{r-1} + (2h_r + h_{r-1})\,M_r'\right]}{2\sum_o^n\left[(h_{r-1})^2 + h_{r-1}\,.\,h_r + (h_r)^2\right]}$$

CONCLUSIONS

The solution of the following equations resolves the structure into a statically determinate case,

$$M^t_r = M'_r - H\,h_r$$

$$M^G_r = \frac{1}{1+\alpha}\,M^t_r$$

$$M^R_r = \frac{\alpha}{1+\alpha}\,M^t_r$$

$$H = \frac{\sum_o^n\left[(2h_{r-1} + h_r)\,M'_{r-1} + (2h_r + h_{r-1})\,M'_r\right]}{2\sum_o^n\left[(h_{r-1})^2 + h_{r-1}\,.\,h_r + (h_r)^2\right]}$$

All the necessary information for solving these equations may be obtained from the dimensions and loads for any particular tied arch. With the moments at the panel points as well as the horizontal tension in the girder and thrust rib known, stresses in the hangers may be computed by the ordinary methods of statics.

A comparison of results obtained by the method here described with those obtained by other methods, shows a maximum difference of but 2 per cent in the value of H. In the former case a numerical computation was used for an actual structure with a small camber in bottom chord.

RESEARCH COUNCIL RECONVERTS TO PEACE

The many and varied activities of National Research are listed and the purpose of each described. The reader is permitted a "peek through the key-hole" of each laboratory at all the interesting scientific studies and experiments. The story here unfolded of Canada's scientific future is one which no engineer can afford to miss.

The end of 1946 has seen the completion of the National Research Council's reconversion from war to peace. Just as in 1939 it was a major task to convert the existing peacetime organization into a powerful weapon for war, so too in 1946 reconversion posed even more arduous problems. Huge war research facilities had to be discontinued or modified. Most of the additional wartime staff have been absorbed into the peacetime establishment, but many younger members have left to complete their prewar academic studies. Other matured and skilled scientists with years of intensive research training on the Council staff, have joined the service of Canadian industries, thus indirectly extending the influence of the Council. The Council is now recruiting the necessary high calibre personnel to fill its peacetime establishment.

During the year, three new divisions and several new laboratory sections have been established; radar and other war equipments are being adapted to commercial use; hundreds of investigations are in progress; and the Council is actively engaged in the promotion and coordination of scientific research throughout the Dominion.

An Atomic Energy Research Division has been established at Chalk River to investigate the applications of atomic energy and the use of its products in industry and medicine. A Division of Medical Research has been organized. A Building Research Division is shortly to be set up to study construction materials and their use. Work is progressing on the building of a Prairie Regional Laboratory at Saskatoon for studying better utilization of farm surpluses, such as wheat and farm waste products. An Electrical and Radio Branch has been created. The activities of the Chemistry Division have been regrouped into two new branches: (i) Fundamental Chemistry, and (ii) Applied Chemistry. The tailless glider designed and built in the aeronautical laboratories, was test flown successfully at Edmonton. Jointly with the R.C.A.F., a Flight Research Section has been established at Arnprior. A new section of the Mechanical Engineering Division deals with problems in gas dynamics, such as gas turbines and jet propulsion.

Atomic Energy Research

In June 1946, the Dominion Parliament passed "The Atomic Energy Control Act". This Bill provides means for the development of atomic energy and for the control of work in this field as may be required in the interest of public safety and in the fulfilment of international obligations. A Board of five members was set up under the Right Honourable C. D. Howe, Hon. M.E.I.C., as Chairman of the Privy Council Committee on Scientific and Industrial Research. The President of National Research is an ex officio member of the Atomic Energy Control Board.

The engineering, construction and operation at Chalk River were carried out by Defence Industries Limited, under contract with the Department of Reconstruction and Supply. As the undertaking was really a pilot plant which must be closely integrated with the Research Laboratories, it was realized that one Government organization should assume all over-all operating responsibilities. The Atomic Energy Control Board therefore recommended that National Research be asked to undertake the integration of the various projects and their operation on its behalf. This was agreed to, and early in 1947 the Council will take over the administration and operation of the entire atomic energy development at Chalk River, in accordance with general policies fixed by the Control Board.

Information Services

In the newly established Division of Information Services, including library, liaison offices, *Canadian Journal of Research,* and technical information service, all activities relate to the collection and distribution of scientific and technical information. Of special interest are numerous reports on technical developments in Germany. Recent studies carried out in that country confirm that United Nations have not lagged behind in scientific and technical progress; in some fields, however, Germany had worked out improved methods of production. Reports on enemy science and technology are being distributed to industrial and scientific organizations in Canada. Arrangements have also been made to secure for scientific libraries copies of German scientific books and journals. On request, specially trained workers search not only German but many other reports for the solution of specific manufacturing problems.

Radio Research

The most important contribution in the development of radio aids to both air and marine navigation during the year was a radar distance indicator which enables an aircraft pilot to ascertain his distance from one or more pre-selected ground stations, thereby determining his position. The distance is read directly in miles on a simple meter and no interpretation or computation is necessary. This device has outperformed foreign devices. A more recent addition to this same unit to enable the pilot to determine his direction from pre-selected stations as well as distance, is now awaiting airborne trials.

In the marine field, most of the year's effort has been devoted to the installation of surplus radar equipment on Canadian merchant ships. The success of this programme has been most gratifying and many ships' captains have reported in glowing terms of radar performance.

Canada has long been a leader in advancing the technique of surveying. Canadian surveyors were quick to recognize the possibility of employing radar location in their work. The Council is cooperating in the development of radar equipment to determine base lines up to 300 miles long with an accuracy of 20 ft. and to permit spot fixes of photographic aircraft with an accuracy of 100 ft. in 200 miles. The laboratory is also developing an accurate radio altimeter capable of providing a continuously recorded altitude measurement, accurate within 50 ft.

In cooperation with the Canadian Radio Wave Propagation Committee, National Research Council engineers undertook the direct supervision of a study of the effects of the troposphere on radio wave propagation in the 10 cm. and 3 cm. regions. Experimental work is completed, and the data are now being analyzed. Many examples of tropospheric "skip-distance" were noted and the data should be of value in the evolution of the theory of radio wave propagation in the lower atmosphere. Along the Alaska Highway and in the Yellowknife region experimental installations of microwave radio have been made for army and R.C.A.F. The Laboratory and the Railways have established an experimental chain of radio stations between Montreal and Windsor. Communication links of this type may supplement land lines or even supplant them in some cases.

Of particular interest is a 5,000,000-volt direct current generator now under construction in the electrical engineering laboratory for the Division of Atomic Energy at Chalk River. This unit will be employed in the acceleration of both electrons and ions in nuclear research. An experimental cavity type accelerator, the principle of which springs from the development of radar equipment during the war, is also being built.

Discrimination between spurious or interfering radar pulses and desired pulses is being studied. Success here may make it possible to operate pulse systems with much closer channel spacing than has been possible heretofore.

Influence of radar on the approach to every day problems is very noticeable in the development of a fault locator for long-distance power lines. This device imposes a sharp pulse on a line and measures the time of propagation and the return of the echo from any discontinuity in the system. Open circuit, short circuit, and partial faults can be identified readily. Preliminary application of this unit has been encouraging.

Studies have been carried out on the radio disturbance created by the sun in the 10 cm. band. Very interesting results were realized on the day of the eclipse, 23 November. A systematic comparison of the "clutter" from rain and snow on both the 3 and 10 cm. bands is under way at Scarboro.

General Physics

In the field of geophysical research and prospecting, an entirely new exploit with a magnetic airborne detector (M.A.D.) has been undertaken, with the help of the United States Navy and Army authorities, in the loan of essential equipment. This new application of apparatus devised originally for detection of submarines is greatly hampered by lack of staff. Efforts will be devoted to determination from the air of the earth's magnetic elements, as well as the location of ferrous and oil mineral deposits.

Sonic and ultrasonic echo-ranging equipment has been designed to determine the depths of over-burdens in certain terrains. Also under way is an attempt to discover radio-active deposits (of uranium) by the use of Geiger counters let down into vertical drill holes.

Conversion of the 600 K. V. rectifier set for accelerating ions rather than electrons has been completed. The necessary auxiliary control and detection equipment for measurements in nuclear physics, has been built and experiments have been undertaken. Researches with this positive ion beam include studies of fission by fast neutrons and cloud chamber investigations of certain atomic disintegration.

It has become necessary to construct two more standardization sets for certification of radium. During the year some 2500 radium containers were measured and certified as to their X-ray equivalent

Certain possible uses of high-intensity, high-frequency sound are being investigated, for example its lethal effect on bacteria. Experiments were carried out on using high-frequency vibrations to improve the soldering of aluminium. In the reverberation chamber several types of acoustical materials have been tested. The anechoic, or "dead" room was completed and put to considerable use. Measurements in it have been made on loud-speakers, hearing aids and on a model aircraft engine exhaust stack.

Heat Studies

Two experimental buildings of the radiant heating project have been completed and heat turned on. Interesting results will be available in the Spring. Work on thermostatic control of heated refrigerator cars, has been resumed. By improving the heat-control mechanism better results have been obtained than ever before but the thermostat itself is still too sensitive to mechanical vibration.

A model infra-red detector to ascertain whether joints were heating on transmission lines, is being rebuilt to make it more suitable for field work. An apparatus has been completed by measuring the thermal conductivity of metals up to 800 deg. C. Results obtained correlate well with determinations made in other countries, so that it can now be used with assurance for the measurement of thermal conductivities of metals as required.

Measurements on the thermal conductivity of building materials and on moisture transmission of building papers have been carried out. An apparatus to supply moisture in homes was tested. Work is being continued on migration of moisture. Importance of this work arises from the necessity of improving our forest-fire-prediction methods and our grain-storing techniques. The cause of low friction of ice under certain conditions is being sought. Results could help solve problems of getting sleighs to slip and tires to grip.

Photographic Research

Work on night photography has been concluded and a paper describing the final techniques is in process of publication. Development of a tri-camera mount for the B-25's was completed and a paper published. In high-speed motion-picture photography research progress has been made in the design of a properly engineered model of a camera to attain 200,000 frames per second, and higher speeds are anticipated.

Studies have been made regarding dimensional stability of film under actual survey conditions, and results published. A successful densitometer has been completed. Further work has been done on the measurement of emulsion speed for aerial photography by a resolving power criterion.

The Canadian Photographic Research Committee has been replaced by an Associate Committee on Photographic Research, which has sponsored much of the photographic research done in this laboratory. Work has also been done on photometric standardization, as well as in colorimetry. A General Electric recording spectrophotometer is being installed. Some spectrochemical analysis has also been carried out, but work is hampered by shortage of staff.

Industrial Uses for Agricultural Products

Recent expansion of work on industrial utilization of agricultural wastes and surpluses includes a modern laboratory on the campus of the University of Saskatchewan. Some laboratory and pilot-plant equipment has been delivered, and a small group is actively at work in space borrowed from the University.

Meanwhile, in the Ottawa laboratories, production of new chemicals from farm crops is being studied. Pilot-plant studies on the production of *levo*-2, 3-butanediol from wheat with *Aerobacillus polymyxa* were completed. Contamination difficulties have been overcome, and fermentation efficiencies of 90-100 per cent were consistently obtained. A start has been made on fermentations using other organisms and other substrates. Several hundred strains of bacteria of the *Bacillus* group and a number of *Serratia* have been examined. The former produces glycerol as well as diol; some of the *Serratia* produce formic acid in addition to diol. Several of the more promising strains will be studied on a pilot-plant scale.

A study of the reaction between 2, 3-butanediol and phthalic anhydride led to the development of a method suitable for the commercial production of the resulting phthalate resin. Its physical properties mark it as outstanding. This new material has a low solution viscosity. It is lustrous, very hard, and almost colourless, has a wide range of solubilities in industrial solvents and is water- and light-resistant. Its flow point is much higher than that of commercial ethylene phthalate. It is now being evaluated as a non-convertible binder in paints, lacquers, and varnishes.

Because of shortages of sugars and corn syrups, wheat syrup was investigated on a semi-pilot-plant scale. The pilot plant has been redesigned and used for separating starch and gluten from wheat; first quality syrups were prepared from this starch.

Chemistry

In the Fundamental Chemistry Branch, the organic section has been engaged in research on synthetic rubber and the isolation of new alkaloids, while the work of the inorganic section has been confined to investigations for the atomic energy project.

Studies in surface chemistry have included the effect of physical adsorption on the electrical conductivity of activated carbon rods and the length changes of carbon rods caused by physical adsorption of vapours.

An investigation of the physical properties of gases at high temperatures was undertaken and apparatus built which will permit precise determination of equation of state data up to a temperature of 1500 deg. C. and a pressure of approximately 100 atmospheres.

Some of the chemical engineering staff have been on loan at Chalk River, and have been responsible for chemical process development and equipment design for the atomic energy plant. They provided water-treatment and heat-transfer data for the pile cooling system. Another major project has been the design of a new chemical engineering building at Ottawa.

Industrial Applications

The textile section has completed a number of investigations such as treatment of fabrics with dust-laying oil for hospital use; rot-proofing of textiles; thermal insulation of protective clothing, and impact testing of cordage materials. Cooperation has been continued with Government departments on wool standards, the testing of flax quality and in the drafting of textile specifications. Cooperation with industry has been continued in the adaptation of textiles to special uses, and in improving methods for laundering and cleaning textiles. Much has been done on the use of synthetic detergents, water repellents and moth-proofing agents.

An important project is the study of corrosion of steel by water. The mechanism of corrosion inhibitors and the role of the potential of metals during corrosion are being investigated. Equipment is being designed to obtain reproducible results, in testing the corrosion resistance of metals under salt spray or high humidity conditions. The corrosion resistance of welded special stainless steels before and after heat treatment is being examined.

Catalytic air oxidation of ethylene to ethylene oxide has been studied and preliminary data have been obtained on a new type of catalyst. Deuterium compounds have been prepared for use in the atomic energy project.

The protective coating section has continued an extensive research into the chemistry of long-chain unsaturated fatty acids, which are an essential constituent of drying oils in protective coatings. Another project deals with rot-proofed coatings for wood.

The rubber section has continued to advise Government and industry on natural and synthetic rubber, including special applications of synthetic rubber. A current project is the standardization of tests for ageing, resilience, abrasion resistance and tensile strength of rubber carried on in cooperation with Polymer Corporation.

In applied physical chemistry a number of wartime investigations may lead to important peacetime applications, such as: (i) a new method of propeller de-icing; (ii) control of frost on standing aircraft; (iii) an effective rain repellent for aircraft windows, now adopted by the RCAF and under test in England; (iv) a stable catalyst for the oxidation of carbon monoxide to accurately determine low concentrations in air. Atmospheric pollution by smelter smoke in the Sudbury district is being investigated, to determine concentration and distribution of sulphur dioxide from smelter smoke at different levels under varying atmospheric conditions.

In colloids and plastics, assistance has been given to the Canadian Standards Association in the drafting of a Canadian code for head and eye protection. Relation between chemical structure and plasticizer reaction is being studied. Further work has been done on the activation of contact-bleaching clays. Lubricating problems in connection with railway-car journals have been investigated. In addition, many studies in colloid chemistry have dealt with special subjects of fundamental interest. On the applied side, several projects supported by industry are in progress. Results are made available to firms concerned.

Aeronautical Engineering

The tailless glider has been a major project of the aeronautical laboratories. It is well equipped with photographically recording flight instruments. Readings during flight trials are now being studied to determine the control and stability characteristics of tailless aircraft.

Inauguration of the Flight Research Section of the aeronautical laboratories at Arnprior was another item of major importance in 1946. To date the emphasis in this work has been on building up a research staff and developing suitable flight research techniques and instruments. However, work has been initiated on airborne magnetometer apparatus for determining ore bodies from the air, airborne radar altimeters useful for topographical survey; and full-scale flying projects for the aerodynamics section, including the study of aircraft controls and stability. The facilities were used to demonstrate Australian multiple-track radar beam before PICAO officials and others.

In cooperation with the Royal Canadian Air Force and British Ministry of Supply (Air) an investgation of aircraft de-icing is proceeding using a Consolidated RY3 aircraft which has been equipped for extensive tests and for the collection of meteorological data on ice formation. Woven-wire-type heater elements have also been designed for both continuous and cyclic wing de-icing tests on aircraft.

There have been more wind-tunnel tests on new Canadian-designed aircraft than ever before. Tests on two aircraft started prior to 1946 were completed in that year; tests on two more aircraft were both started and completed in 1946, and construction of models for another aircraft is under way. In addition, wind-tunnel and spinning tunnel models have been constructed and tests are nearing completion on a new American-designed aircraft for a Canadian firm.

An intensive programme has been undertaken to train junior engineers for fundamental research in the field of gas dynamics. Extensive calculations have been made on the various types of gas turbine power plants with particular attention to the significance of turbine blade cooling by compressor air-bleed methods.

Engine Research

Work has proceeded in the engine laboratory on single cylinder engine units along the pattern set up by the C.F.R. Aviation Fuels Division. Fuels can now be rated in regard to detonation characteristics on both Perseus and Peregrine single-cylinder engines. The study of the glow-plug method of ignition is proceeding to eliminate high-tension ignition and reduce detonation. A theoretical study of an aircraft lubrication system with reference to the effects of entrained and dissolved air has shown that the altitude at which the oil system fails, depends largely upon percentages of entrained and dissolved air.

Hydraulics

In the hydraulics laboratory a model of a Great Lakes' harbour was tested to determine the effect of a proposed pier extension upon sand-bar formation in the harbour entrance. Tests are being conducted on a model of a large Canadian river to determine the effects of various types of dykes upon river currents and sand-bar formations. In each case it was possible to determine quickly and cheaply the effect of large structures.

Model tests were performed on a proposed spillway structure designed to carry flood discharge, to determine discharge capacity and to indicate possible improvements in flood conditions.

Fuels and Lubricants

Research on lubricants has yielded much valuable information on flow characteristics of greases at low temperatures. Work on oils included examination of oils and filter cartridges from high-temperature road tests and a problem in the lubrication of parachute release mechanisms at low temperature. A new supercharged knock-test engine was installed for the testing of high octane fuels. Methods for measuring detonation, and for determining octane numbers of very small fuel samples were investigated.

Testing of domestic oil-burning equipment was continued for the Canadian Standards Association. Seventy-seven appliances submitted by 45 different dealers have been under test. Listing was recommended for 42 of these, of which 80 per cent had first to be modified to meet requirements.

Structures

To demonstrate to Canadian boat builders the possibility of moulded plywood techniques for sporting craft, a 14-foot international dinghy was built. Five-ply veneer was used for the hull, and only one rib, made of laminated spruce and located just after the mast, was used. The hull was bonded to a laminated spruce keel.

Work on artificial limbs has continued making use of processes developed during research on moulded aircraft components. A latex hand, a hollow impregnated fabric hand and moulded forearm sections have been developed and several Symes' prostheses have been designed and constructed. An above-knee leg has been made from low-pressure fabric laminations. Some of the limbs produced are undergoing service tests on amputation cases.

Building Research

A Building Research Division is soon to be established. Various National Research projects have had for their object the improvement of building materials and housing construction. Intensive work was initiated some years ago on the requirements for structures, and the National Building Code was subsequently published for use as a model in the drafting of municipal building by-laws. A model zoning by-law was also prepared. Both of these publications have been extensively used as reference works by Canadian municipalities.

In the laboratories, numerous studies have been directed towards the bettering of housing conditions, such as efficiency in lighting, researches on sound-deadening, relative values of different insulating materials, measurements on vapour barriers to prevent moisture condensation, and on ventilation. Reports have been issued on heat losses through windows and moisture on windows. Tests are being made continuously on oil burners to ensure their safe operation. One of the earliest studies made was on fuel saving possibilities in house heating.

Among the newer projects is the current investigation on " panel " or radiant heating, to find satisfactory answers to questions raised by heating engineers regarding this new plan of heating whereby the source of heat is in or under the floor or in the ceiling instead of conventional type radiators. Two experimental houses have been built for study and data will be available in the spring.

A modular system for the construction of prefabricated houses has been developed. By means of prefabricated wall panels and flat roof panels incorporating structural strength, insulation, vapour barrier, finished surfaces, and a connection system, the construction of houses almost entirely in the factory under mass production methods will be feasible. The various standard wall panels, all with identical overall dimensions, permit the adoption of practically any floor plan to suit the requirements of the site and the builder. Further work on details of fabrication is in progress.

With the establishment of the proposed Building Research Division, all of this work will be brought sharply into focus and new projects will be initiated as required, to provide complete coverage of Canada's most pressing problem, the provision of adequate and efficient housing for its people.

In peace as in war, the National Research Council is ever on the alert to bring the miracles of modern science into the service of the Canadian people.

REPORT OF THE COUNCIL FOR THE YEAR 1946

Together with Committee and Branch Reports

The decrease in growth and activities that was expected to follow the cessation of war has not materialized. 1946 made new records from every point of view and has added one more step to the record of progression built up over the last ten years. This will bring a glow of satisfaction to all those persons who have so unselfishly given of their precious time to advance the affairs of the Institute.

Not only has 1946 maintained the progression but it has amplified it, as a study of this report will show. The increasing demands on the Institute are a definite indication of its usefulness to the profession and the public.

Membership

The end of 1946 saw the Institute with an overall membership of 8,407—again a record. New names added to the roster totalled 1,234 as compared to 791 for the previous year. This is the largest acquisition ever recorded. The losses from deaths, resignations and removals for non-payment of fees leave a net gain of 1,037 as compared to 653 for 1945.

A noticeable change in the statistics is the great increase in the number of Juniors. Over one thousand were transferred from Student, mostly under the automatic feature of the new by-laws. This will do much to maintain the vitality of the organization. The total of Students and Juniors is now over 3,600—thus providing a unique opportunity for service to the young engineer.

Rehabilitation

Happily, the requirements of members from the forces have been reduced greatly. The funds provided voluntarily by the membership for this service have been adequate, and sufficient remains to take care of the needs of any who may need assistance in 1947. The service to veterans now consists mostly in finding new employment, either more suited to their tastes and talents, or perhaps more remunerative.

Council Meetings

Eleven meetings of council were held during the year, four of them being away from Headquarters. The average attendance of councillors throughout the year was fourteen.

Annual Meeting

Again this meeting made new records in every department. Over 1270 were registered and almost 1,000 attended the banquet. Lack of proper hotel accommodation has become a serious problem for the Institute, particularly in Montreal, where the largest branch membership is concentrated. The work of the committee is more than ever praiseworthy in the light of these handicaps.

Maritime Professional Meeting

The Maritime Professional Meeting, which took place at Digby in early September, as a continuation of the Pictou Meeting interrupted by the war in 1939, was the first professional meeting to be held in the Maritimes since the Institute has entered cooperative agreements with the Associations of Professional Engineers of Nova Scotia and New Brunswick, and therefore was made a joint meeting. The success achieved is a good illustration of effective cooperation.

The hope has been expressed that, in future, Maritime Professional Meetings will be held every other year, alternating between Nova Scotia and New Brunswick for locale.

Committees

Without committees the Institute could not function. Over 400 members now devote considerable time to such work, and probably more committees, particularly in the technical field, will be set up in the near future. The contribution in time made by these people represents a real sacrifice. These days, every engineer has more than he can compress into his working day, attending strictly to his own professional and personal affairs—and yet these hundreds of members accept Institute responsibilities because they are in the interests of the profession. It is a genuine service of which the benefactors are not always aware.

By-Law Changes

Probably no amendments to the by-laws have been as important as those approved with impressive majorities in 1946. The full effect will not be apparent until well on in this year, but already noticeable results have been obtained. Perhaps the most significant change relates to the automatic transfer of Students to Juniors. Over a thousand were transferred by January 1st 1947, without payment of transfer fee, all of which will result in increased branch activity and increased revenue both for branches and Headquarters.

Another far-reaching amendment related to the election to life membership of all those who have paid fees as corporate members for thirty-five years, or who having reached age seventy have paid such fees for thirty years. In this way, on January 1st, 209 Members became Life Members. No longer will they be required to pay the fees of the Institute.

Other changes affected the conditions for admission, and resulted in the establishment of an Admissions Committee. The latter is now functioning nicely and already has clarified and reduced the work of Council.

New Branches

Not for many years have two new branches been established in one year, but 1946 saw charters presented to the Kootenay Branch at Trail, B.C., and to the Cornwall Branch at Cornwall, Ont. Both ceremonies were outstanding events that launched the new enterprises with a considerable show of success and publicity.

Negotiations are under way for branches in four other centres, and it may be that by the end of this year further additions to the family can be announced.

Cooperation

The history of the year contains several examples of cooperative success with sister societies. Outstanding, of course, is the Conference of Commonwealth Engineering Institutions held in London, England, in September, at which procedures and programmes were agreed upon to promote cooperation between organizations throughout the Commonwealth. The president and general secretary attended to represent the Institute.

In June, the summer meeting of the American Society of Mechanical Engineers, held in Detroit, was made a cooperative endeavour and was billed "with the Engineering Institute of Canada participating". The president and general secretary and many members from Ontario were present.

The joint committee met in New York in December and agreed upon further cooperative projects to be worked out in 1947. Already arrangements for some of these are under way.

Steps have been taken to revive the cooperative agreement between the Institute and the Royal Aeronautical Society, which was inaugurated in 1931, but which has been dormant during the war years. The proposal now is to make it a three-cornered document embracing also the Institute of the Aeronautical Sciences of the United States. Already interviews with the officers in London and New York have taken place and it is possible the agreement may become effective early in 1947. The objective is to have the members of the other two organizations resident in Canada join with members of the Engineering Institute to establish cooperative aeronautical sections in different parts of this country.

Through the year in many places there have been joint meetings between the Institute and other societies, and it has been amply proven that these combined efforts are mutually pleasant and profitable. It is hoped and expected that the practice will expand even beyond the present achievements.

Student Conference

A highlight in the year was the conference of students held in Montreal during the Annual Meeting. Representatives from every university were invited to meet with officers of the Institute's Committee on the Training and Welfare of the Young Engineer, to discuss their own problems and the part that the Institute could play in helping to solve them. The group met for three days and covered an astonishing amount of ground. The costs including transportation were met out of Institute funds.

With the 1947 meeting being called for May it will be difficult to get full attendance this year, but discussions with the universities are now under way, and it is expected some arrangement will be agreed upon that will meet the situation.

Deans Conference

Another highlight was the conference of deans held during the annual meeting. This was a preliminary session out of which has grown a formal organization that will permit the educational authorities to come together at regular periods to discuss engineering education and the modern trends.

Library

The year saw great progress made in the overhauling of the library at Headquarters. The increasing demand for books, periodicals and bibliographies has emphasized the need of "streamlining" this service. It has been difficult to accomplish, as the increased use of the facilities has required the full time of the staff during office hours, and only overtime and some additional temporary help has made possible the many changes that have been completed during the year. The work still goes on and eventually it will be possible to offer to the membership a thoroughly up-to-date and complete engineering library.

The statistics for the library as given in the report of the Library and House Committee show how much the service is used, and how essential it is to the profession. It is an expensive operation which must continue to be so if it is to meet the demands made upon it.

Educational Fund

The year end brought assurance that Council's proposal to establish an educational fund in the name of the late Harry F. Bennett was possible of attainment. Through the branches the members have contributed generously, and in some few instances the branch attainments have been startling, although it has to be admitted that results were not uniform across Canada. The objective is $25,000, and the central committee reports that the campaign will not be closed until that amount has been reached.

Already the fund is in use and loans to deserving students have been made. It is expected that further publicity will increase the demand. Great credit is due the trustees for the success of this unique proposal. Such a fund will provide special facilities for aiding the student, thereby serving the profession, as is the aim of the Institute.

Premises

The expanding membership and the increased activities have made it necessary to add to Headquarters staff. This in turn has brought about a congestion in every part of the building, which it has not been possible to alleviate to any great extent.

It becomes painfully apparent that existing premises will not continue to meet the needs of the Institute if progress is to continue. The Library and House Committee is doing some preliminary investigation work to discover how best the situation may be met.

E.C.P.D.

The Engineers' Council for Professional Development is preparing to celebrate its 15th anniversary. It is still the outstanding example of cooperation between engineering organizations. The work of its four main committees has been advanced during the year, and expanded plans for the future are being prepared. The work of accrediting engineering curricula has been resumed and the inspection of technical institute facilities has been inaugurated. This latter is an entirely new interest undertaken at the request of the institutes themselves, and because of the need to establish standards of teaching at that level.

E.C.P.D. has accepted the invitation of the Institute to hold its 1947 annual meeting in Canada—which will be the first time that event has taken place outside the United States.

President's Visits to Branches

Because of his attendance at the Commonwealth Conference in England it was not possible for the president to complete his tour of the branches before the end of the year. However, as the annual meeting will not be held until May, he will be able to finish the task in the Spring of this year. He has only the Maritime branches left. When the travelling is finished he will have attended thirty-five meetings at all of which he was the principal speaker.

The Roll of the Institute

A new record in membership has again been attained. The total for all classifications at the end of the year is 8,407. New names added to the list during the year totalled 1,234. The deaths, resignations and removals bring the figure down to a net gain of 1,037.

Elections throughout the year produced the following results. Members 240, Juniors 78, Students 894, Affiliates 3. In 1945 the total was 791. In addition, 19 reinstatements were effected and 38 life memberships were granted. Under the new by-laws, not effective until January 1st, 1947, 209 members were granted life membership. The record of transfers was as follows. From Junior to Member 60; from Student to Member 41; from Student to Junior 1,042; from Affiliate to Member 1, a total of 1,144.

The names of all those elected or transferred are published in the *Journal* every month immediately following their election.

Removals from the Roll

There have been removed for non-payment of fees and as a result of resignations 60 Members, 32 Juniors, 33 Students and 1 Affiliate—a total of 126.

Deceased Members

During the year 1946 the deaths of seventy-one members of the Institute have been reported as follows:—

Honorary Member

Duggan, George Herrick

Members

Adamson, Francis Stanley
Akin, Thomas Bernard
Anderson, James
Armstrong, Walter James
Ashcroft, Glenn B.
Bainbridge, Robert Arthur
Beman, Edwin Arthur
Bingham, Albert Raiguel
Blair, Donald
Brillon, Jacques P.
Burns, C. H. McL.
Calvin, Reginald March
Cameron, John
Cochrane, John Bray
Copp, Walter Percy
Cook, William Henry
Cunningham, A. Irwin
DeWolfe, William Joseph
Dingman, Charles Willard
Duclos, Lewis Murray
Ewart, Cecil
Fairhurst, Thurstan William
Forde, John Preston
Fraser, William Stanley
Goodchild, Ralph Henry
Grahame, Dallas Forrest
Gransaull, Louis Raymond
Griffin, Augustus
Griffith, John Edgar
Hancox, Frederick James
Harrison, Noel Faure
Harvey, Charles
Heuperman, Frederick Justinus
Hinchliffe, Joseph Edward
Hull, George B.
Hunt, Walter George
Joron, Rodolphe Emile
Kennedy, Henry Cron
Ker, Newton James
Kirby, Charles Conyers
Lambart, Howard Frederick J.
Leebosh, Ilja
Luscombe, Charles
McCormick, R. S.
McIntyre, Vernard Howard
McLeod, Simon Fraser
Morris, James Lewis
Morrison, David
Moss, Charles S.
Motley, Phillips Bathurst
Mudge, Reginald
Richardson, Bertram P.
Roberts, Arthur R.
Roberts, John Randall
Ross, John W. LeB.
Ross, William Hope
Rothwell, James Moscrip
Routledge, George Graham
Rutledge, Lewis Traver
Stuart, Harold Brownlee
Tennant, David Cowan
Thomson, Alexander
Tremblay, Althéod
Walkem, George Alexander
Weatherbe, Karl
Willett, Norman E.

JUNIORS

Rombough, Joseph Harold Melville
Sutherland, Eric Sinclair

STUDENT

Ross, James Finlay

AFFILIATE

Mold, Robert Charles

TOTAL MEMBERSHIP

The membership of the Institute as at December 31st, 1946, totals 8,407. The corresponding number in 1945 was 7,370.

	1945	1946
Honorary Members	17	16
Members	4453	4681
Juniors	803	1833
Students	2003	1783
Affiliates	94	94
	7370	8407

Respectfully submitted on behalf of the Council.

J. B. HAYES, M.E.I.C., *President*.
L. AUSTIN WRIGHT, M.E.I.C., *General Secretary*.

LEGISLATION COMMITTEE

There has been no necessity for the committee to meet during the past year and we have no business to report.

The case of the Architects Association vs. Brian R. Perry in Montreal, is slowly progressing. The appeal of Mr. Perry against the decisions of the Superior Court has been allowed to be heard by the Court of King's Bench. It was to have been heard at the September session but has been delayed till the January session.

P. E. POITRAS, M.E.I.C., *Chairman*.

EMPLOYMENT AND REHABILITATION SERVICE

As the great bulk of the work of the Rehabilitation Committee was complete by the end of 1945, this committee has been disbanded during the course of the year and the duties carried out by the permanent staff at Headquarters. For most of the year this has involved overtime work. A report on the procedure now in force appeared in the October issue of the *Journal*. The main difficulty encountered is to find out from both prospective employers and prospective employees just what is happening. A system of follow-up letters has been instituted, with automatic closing out of files when no replies are received.

The following statistics may be of interest:—

Number of interviews during 1946	837
Number of known placements during 1946	198
Number of job files open 1st January 1946	54
New job files opened during 1946	518
Number of job files open 31st December 1946	157
Number of men's files open 31st December 1946	45

There are two major problems for the future. The first is the problem of locating openings. It is felt that members can help their fellow-members greatly by bringing the employment service to the attention of all local employers who may require engineers. While at present there are many more openings than there are engineers available to fill them, it is doubtful if this will continue. Hence it is necessary to make all possible connections with prospective employers. The majority of men now looking for employment are already employed.

The second problem arises more or less directly out of the first, having regard to the thousands of students, of whom over half are veterans, who will be graduating in the next few years. If we are not to have many dissatisfied young men unable to obtain their chosen employment, plans for their absorption must be set up now. Because of the geography of Canada this cannot be done by Headquarters alone. This is the real rehabilitation problem and one of the most serious tasks for 1947. There is no doubt that Headquarters can be of great assistance and that the Institute, through its many branches, can be a real factor in solving the problem.

A. J. KERRY, M.E.I.C., *Employment Officer*.

BOARD OF EXAMINERS AND EDUCATION

The board of examiners has been completely inactive since its recommendation that the examinations of the Provincial Associations be accepted by the Institute was adopted by Council. It, therefore, has no formal report to make.

Respectfully submitted,

R. DEL. FRENCH, M.E.I.C., *Chairman*.

PUBLICATION COMMITTEE

For the third year, the contents of the *Journal* has been governed by the paper supply. At the end of last year your committee expected that it would be possible during 1946 to increase the editorial content of the *Journal* and restore certain features which had been dropped due to the paper shortage. However, instead of improving, the situation is worse than it was at the corresponding time last year. As a result of this shortage and because of the increase in circulation, it has been found necessary to curtail the number of technical papers and also to reduce the size of type used in the Branch News and Personals sections. It would appear, at present, that the shortage will continue for some months in 1947.

In the November issue, a list of the members of the Institute was published. This list was long overdue and your Committee urges that, if it is at all possible, a membership list should be published at least every two years.

During the year, the printers have requested a further increase in their contract price. The possible extent of an increase is still under negotiation, but it will undoubtedly materially affect the future cost of publication.

Your committee has carefully considered, in conjuction with our advertising agents, our present advertising rates. It was agreed that in view of the increase in circulation and the increased cost of publication, the rates should be increased, to be effective during 1947.

Your committee has considered a number of suggestions for the improvement of the *Journal*. A re-arrangement of the editorial pages has been put into effect and, we believe, will make the *Journal* more acceptable to its readers. Early in 1947 a new cover design will be introduced which, while retaining the established characteristics of the present *Journal*, will improve its appearance. Additional editorial assistance is still an essential and it is hoped that Council will be successful in finding such assistance early in 1947. This will permit of the introduction of a number of new features in the *Journal* which have already been considered and approved by this committee.

Respectfully submitted,

R. S. EADIE, *Chairman*.

MEMBERSHIP COMMITTEE

The changes in by-laws with regard to the transfer of members, recommended by your preceding Membership Committee, were approved by the membership with tremendous majorities in the ballot taken last spring. The present committee is observing the functioning of the new procedure, and, so far, it has been working out very satisfactorily.

The committee has considered some of the probable requirements of the Branch Membership Committees as a result of the large growth of the Institute in the last few years and is submitting a brief to Council on the subject. As yet, the submission is tentative and there is enough time to permit a more complete study of the matter, so there is nothing concrete to report at the present.

The committee would welcome suggestions from the membership as to how they can best serve.

Respectfully submitted,

H. R. SILLS, M.E.I.C., *Chairman*

COMMITTEE ON INDUSTRIAL RELATIONS

Since the last annual meeting, the Committee on Industrial Relations has held three meetings—on 15th April, 17th May and 15th November. A further meeting is scheduled for the month of January.

The committee had the pleasure, at its meeting of 15th April, of a discussion with Mr. A. P. Young, O.B.E., regarding broad trends in industrial relations as exemplified in Great Britain.

The committee also heard, at its meeting of 17th May, an account of the procedures adopted by Messrs. Lever Brothers Limited in introducing the 40-hour week in their Toronto plant without loss of production, presented by Mr. J. P. Brierley.

At its meeting of 15th November, the Committee heard an account of the newly-established Institute of Industrial Relations of the University of Toronto from its head, Professor V. W. Bladen, and discussed possible cooperation with that Institute in making its purposes and facilities known to engineers.

The committee is proposing further study on the following subjects:

(i) Psychological and other techniques for the selection of employees.
(ii) Provision of employee services in industry.
(iii) Technical factors affecting the employment of women in industry.
(iv) The place of the industrial relations department in a business organization.
(v) The function of the industrial relations consultant.
(vi) Factors affecting employee morale.
(vii) Questions of supply of common labour and other subjects of interest to civil engineers in construction.
(viii) Programmes for the absorption of engineering graduates in industry.

Respectfully submitted,

WILLS MACLACHLAN, M.E.I.C., *Chairman.*

COMMITTEE ON PRAIRIE WATER PROBLEMS

While this committee did not hold any meetings during the past year, the members of the committee individually seized every opportunity to continue to advocate the construction of the works for the St. Mary and Milk Rivers Development in Alberta.

Early this year, the Canadian Pacific Railway Company transferred the irrigation works operated by it near Lethbridge to the Alberta Government. This is the key to the St. Mary and Milk Rivers Development and the transfer is a step recommended by the Meek Committee and will make it easier for the Federal and Alberta governments to get together for the early development of the larger project. Negotiations for an agreement to outline the plan of development have been started and it is felt that an agreement will be consummated at an early date. In the meantime, construction has been started on the dams for the reservoirs on Pothole Coulee near Magrath and on the St. Mary River near Spring Coulee and the canal connecting Pothole Coulee reservoir with the old main canal.

The Lethbridge Board of Trade staged an irrigation celebration on October 18th to celebrate the Silver Jubilee of the Lethbridge Northern Irrigation District and to salute the new St. Mary and Milk Rivers Development. The jubilee attracted a large number of people, many of whom came from places a long distance from Lethbridge. Seven members of this committee attended the celebration.

With a dearth of arable land the world over, the next decade should see great activity in irrigation. Plans for the Bow River and the North Saskatchewan River developments are being studied by members of the committee but the committee as a whole has not decided on a policy for these. When sufficient data is available, the committee may be asked to recommend a policy and program for the development of these projects. At any rate it is believed that the committee should continue for the time being as a standing committee that can be called up when circumstances warrant.

Your committee recommends that, if the 1948 Annual Meeting of the Engineering Institute is held at Banff, consideration should be given to the presentation of a symposium of papers dealing with water conservation and irrigation and to arranging visits to the various irrigation projects in the vicinity.

We regret to have to report that a very valuable member of this committee, Mr. A. Griffin, of Calgary, died on October 13th.

Respectfully submitted,

G. A. GAHERTY, M.E.I.C., *Chairman.*

COMMITTEE ON COMMUNITY PLANNING

The work of this Committee for the past year has been principally that of organization.

The following members have consented to act on the committee:

C. A. Meadows, Toronto; Allan K. Hay, Ottawa; Hew M. Scott, Toronto; A. E. K. Bunnell, Toronto, Aimé Cousineau, Montreal; J. S. Galbraith, York Mills, Ont.; R. L. Dobbin, Peterborough.

The Committee held a meeting in Peterborough on Monday, August 19th, at which nearly all the members were present.

A general discussion on the aims and objects of the committee took place, and among other things, it was decided to take steps to encourage the branches of the Institute to hold meetings dealing with community planning.

It was also decided that an acceptable definition of community planning would be set up by the Committee, and that the interest of the members of the Institute should be encouraged.

The committee recommended with emphasis that, due to the present day importance of community planning, a substantial portion of the time of the annual meeting should be devoted to that subject.

The committee also has taken part in the organization of the newly established Community Planning Association of Canada.

Delegates from the E.I.C. have attended meetings of this Association in Ottawa on three occasions, and the Institute is represented on the provisional board of the Association by Messrs. Dobbin, Wright and MacRostie.

Respectfully submitted,

ROSS L. DOBBIN, M.E.I.C., *Chairman.*

PAPERS COMMITTEE

At the beginning of the year the Papers Committee continued its interest in the Mulberry exhibit which was then in the western cities. Unfortunately those supporting and those immediately directing this programme decided to cut it short, and discontinued the schedule after the showing at Victoria. It was greatly regretted by those interested in this project that the eastern branches did not have an opportunity of seeing this very important and instructive exhibit.

The branches have all enjoyed a very desirable programme of papers and discussions without very much assistance from the Papers Committee. They are to be congratulated in this respect.

An effort was made to study how branches might be of assistance to each other in the furnishing of speakers, but only a limited degree of success has been experienced. However, some worthwhile suggestions have been put forth and these will be passed on for the assistance of future Papers Committees.

C. E. SISSON, M.E.I.C., *Chairman.*

CANADIAN STANDARDS ASSOCIATION

One of the principal accomplishments of the Canadian Standards Association during the current year has been the decision to set up a Welding Bureau for the purpose of qualifying plants and operators that are concerned with the application of electric arc welding to steel parts. A need has been expressed throughout industry for such a bureau and, during the year, many of the preliminary decisions have been taken and the machinery established for its operation. It is expected that, early in January, the new Bureau will be actively engaged in its first line of activity—inspection of fabricating shops, both structural and mechanical, where important welding is being carried out, with the idea of preparing records and lists of qualified firms and welders, with details as to their equipment and experience. It is generally felt that the field for welded construction can be broadened to general advantage once a proper control is established, and in response to the suggestion of interested industrial concerns, the C.S.A. appointed a provisional committee, which in turn has suggested a Provisional Administrative Board, who will, in the near future, deal with all matters of policy. It is the general opinion of those closely associated with this Bureau that it will ultimately be involved in work of a much wider scope, some of it definitely educative, and every effort is therefore being made to throughly prepare the ground and set up a competent and trustworthy organization.

During the year also, much work has been done in the electrical division both in respect to the work of continued revision of specifications, the removal of wartime concessions, and the extension of the "Approvals" work. The Approvals Board reports a very definite advance in the amount of work covered, with a corresponding increase in the staff required and in the scale of finance.

Developments in the newer fields, such as textiles and paint have been slow and, in some respects, disappointing. Nevertheless it is thought to be only proper that these matters should grow as the needs indicate and should not be pushed beyond the degree to which industry and the consumer interests require.

Much interest has been shown in the international and Commonwealth field of standardization and the director was sent to London to attend important meetings in both these connections.

The Executive Committee of the Association upon which your representative sits, has had an unusually busy year with all these new and active developments and it is the general belief that the C.S.A. has a very important part to play in the future industrial growth of Canada, particularly in the export field.

Several engineering specifications are due for revision to a lesser or greater degree, and the new year should see much activity in this branch of the Association's work.

Respectfully submitted,

P. L. Pratley, m.e.i.c., *Institute Representative.*

FINANCE COMMITTEE

During 1946 there was an increase in revenues due to expansion in membership and the appropriate application thereto of the higher annual fees approved during the year, to a correspondingly larger number of subscriptions to the *Journal*, and to a greater return from advertising in the *Journal* arising principally out of increased advertising rates made effective as existing contracts expired during the year.

There was also an increase in expenditures due to necessary alterations in the Ladies Rest Room in the headquarters building, to the larger number of Journals printed and distributed, to the Student Conference held in Montreal at the time of the Annual Meeting of the Institute, to a Professional Meeting, the first since 1939, held in Digby, N.S., in September, to a Commonwealth Engineering Conference held in London, England, in September, to increased rebates to branches, and generally to a continuous rise in the cost and volume of all materials and supplies.

The increase in revenues was more than adequate to offset the increase in expenditures, but total revenues were inadequate to defray total expenditures. The result for the year is a deficit approximately one half that of 1945.

Further increase in expenditures is expected during 1947 due to further increases in the cost of the Journal, notice of which has already been received from the printers, to the implementation as rapidly as conditions permit of the undertakings contemplated under the increase in annual fees, some of which have already been advertised in the *Journal*, to increased rebates to branches, and to the general rise in costs which is still continuing. This should be more than offset by the additional revenues from a further increase in Journal advertising rates which will become effective upon the expiration of existing contracts, and from the higher annual membership fees which became generally applicable on January 1, 1947.

The Institute has come through a year of increasing activities and costs without serious detriment to its financial position, and the prospects for the coming year are good. Unless subjected to an inflationary explosion not now in sight, the Institute should be able, during 1947, to improve its financial position.

J. E. Armstrong, m.e.i.c., *Chairman.*

COMPARATIVE STATEMENT OF REVENUE AND EXPENDITURE

For the year ended 31st December, 1946

Revenue

	1946	1945
Membership Fees:		
Arrears	$ 3,774.76	$ 3,934.24
Current	42,144.92	36,064.87

	$ 14,294.34	$ 9,797.53
Rebates to Branches	$ 9,227.53	$ 7,895.87
Total Expenditure	$106,390.66	$ 90,321.20
Surplus or *Deficit* for Year	*1,775.51*	*3,411.10*
	$104,615.15	$ 86,910.10

TREASURER'S REPORT

The audited statements of assets and liabilities and of revenue and expenditure for the year ended December 31st, 1945, are herewith submitted. The accounts for the year show a deficit of $1,775.41.

The securities as shown in the auditor's statement have been checked and found in order. The market value of these at today's date is approximately $52,250.00 as against $48,895.97, the cost to the Institute.

The revenue from membership fees shows an increase of $5,725.34 or 13.4% over the previous year; that of publications shows an increase of $12,608.41 or 31.4% over the previous year.

Expenditure exclusive of that chargeable to publications, shows an increase of 21.5% over 1945; that in respect of publications only, shows an increase of 12.7% over 1945.

It is interesting to note that the net profit from publications is $9,689.63; a decided improvement over the previous year's figure of $1,927.32.

A general study of the statements herewith submitted and various statements since 1936 will prove decidedly the wisdom of the increased fees which have been voted so generously by the membership. Notwithstanding the higher receipt from fees, no effort should be spared to increase substantially our net profit from publications.

The Institute and its branches with the increase in revenue to be expected from the increase in fees and increased membership will now be in a position to face their greater opportunities and responsibilities. We hope that the increase in revenue for 1947 will permit not only a substantial addition to the building fund, but also a substantial increase in our surplus fund, which should be brought back to at least the figure of 1944.

J. A. Lalonde, M.E.I.C., *Chairman.*

Rehabilitation Fund

Balance as at 31st December, 1945		$ 2,641.73
Receipts, 1946		7,526.68
		$ 10,168.41
Expenditures:		
Salaries	$ 6,303.96	
Travel	40.30	
Printing, etc.	652.48	
		6,996.74
Balance as at 31st December, 1946		$ 3,171.67

COMPARATIVE STATEMENT OF ASSETS AND LIABILITIES

As at 31st December, 1946

Assets

Current:	1946	1945
Cash on hand and in Savings Account	$ 2,657.10	$ 2,357.71

Surplus Account:			
Balance as at 31st December, 1945	$ 60,385.58		
Less: Excess of Expenditure over Revenue for year as per Statement attached	1,775.51		
		58,610.07	60,385.58
		$103,376.53	$102,417.84

Audit Certificate

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December, 1946, and have received all the information we required. We have verified the Cash in Banks and the Investment Securities and the revenue therefrom. In our opinion, the Statement of Assets and Liabilities and Statement of Revenue and Expenditure for 1946, as attached, are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December, 1946, and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books.

(Sgd.) RITCHIE, BROWN & CO.,
Chartered Accountants.

Montreal, 1st February, 1947.

LIBRARY AND HOUSE COMMITTEE

Two well-attended meetings of your committee were held and several inspections of the headquarters premises were made. Necessary repairs to roof and skylight were recommended and carried out. The committee recommended the repair of the boundary fence on the south side of the property. Before this could be done it was necessary to determine the proper location of the lot boundary and to this end a survey of the lot was recommended. This survey was made and a plan of the property was delivered, with a suggestion that the owners of the neighboring property be notified that an iron-clad building was encroaching on the Institute property. This letter was sent to the owners.

The committee discussed at length the present inadequacy of the headquarters premises and the need for still more accommodation when the contemplated additional services are installed.

It is felt that no additions or alterations to present premises would be advisable. The committee is now making a study of the replacement of the older parts of the headquarters building to form a new unit covering the whole property. The general secretary was asked to provide a statement of present and future needs with regard to space so that a preliminary plan can be worked out. It is hoped that this preliminary study will be completed before the present committee turns over its duties to its successors.

Library

The Library consists of approximately 12,850 volumes including text books, reference books, periodicals, transactions, etc., some 2,475 ft. of shelving, and 47 file drawers of pamphlets.

Accessions	1946	1945
New Books	101	60
Proceedings & Transactions	33	23
Reports & Bulletins	541	353
Standards & Tentative Standards	91	not recorded
Pamphlets	155	170

Text books to the value of $1,000 have been added to the Library in the last three years. Periodicals and serials are received on a subscription and exchange basis. Many periodicals are bound and filed permanently in the Library, others, not as frequently used, but nevertheless equally important are also filed permanently. For reference purposes, the Library has a complete set of The Engineering Index from 1892, and subscribes to The Industrial Arts Index (monthly) and other bibliographical services.

We wish to thank publishers and reviewers for their very kind co-operation during the past year. Due to paper shortage, we were able to publish only six signed book reviews in 1946, as against four in 1945, however, in 1947 we hope to publish at least one signed review a month. The Library prepared 43 book notes this year, being 11 more than in 1945. By publishing reviews and notes of new books in the *Journal*, we bring new publications to the attention of readers, and also acquire considerable new material for the Library, thus serving a two-fold purpose.

Use of the Library has increased by over 1,000 requests since 1945, as shown by the following statistics:

	1946	1945
Days Open	267½	276½
Inquiries Received		
By Phone	2,037	1,616
In Person	1,056	661
By Letter	998	723
Total	4,091	3,000
Circulation		
Books borrowed	620	542
Periodicals borrowed	1,348	938
Pamphlets borrowed	636	not recorded
Inter-Library Loans borrowed	33	20
Total	2,637	1,500
Registered Library Borrowers	329	not recorded
Special Services		
Bibliographies Prepared	102	54
Pages	229	117
Photostat Orders	18	34
Prints	442	314
Book Orders for Members	150	not recorded

The work of reorganization of the Library is progressing slowly. The stacks have been completely rearranged, and a preliminary listing of the material has been completed.

In 1947 we hope to complete all serials records and to prepare a list of Library holdings, other than text books. The weeding of the collection of obsolete material must be undertaken in the near future as lack of shelving space, file drawers, etc., is becoming a very serious handicap. However, at the present rate of demand on the Library services, little if any reorganization will be possible without further additions to the staff.

We wish to draw the following facts to the attention of members:

1. Any member may borrow material from the library. Out of town members are asked to pay all carrying charges.
2. A deposit of $5.00 must be made before material may be borrowed. This is a safe-guard against loss or non-return of material, and is refundable on receipt, in the library, of borrowed items.
3. Material may be borrowed for a period of two weeks, and renewed, at the discretion of the Librarian, for a further two week period.
4. Books, photostats, etc., may be ordered through the Library.
5. Subject bibliographies will be compiled at cost.
6. For the convenience of members, the Reference Library will be open each Thursday evening on which a Montreal Branch Meeting is being held at Headquarters.

The Library is for the use of the membership. Inquiries and suggestions are welcomed.

Your committee wishes to commend the staff for their diligent application to the work of the Institute under conditions rendered more difficult by reason of lack of adequate working space.

Respectfully submitted,

R. C. Flitton, m.e.i.c., *Chairman.*

THE ENGINEER IN THE CIVIL SERVICE

In preparing an annual statement the committee's greatest desire would be to report that its objectives had been accomplished—that professional workers in the civil service were now paid adequately. Unfortunately this cannot be done. Some progress has been made but upon examination the results seem to be more apparent than real.

The reclassification spoken of in last year's report has been carried out in many departments, but it appears as if the authority for this change is too restricted. Another directive permits the Commission to adjust salaries when there are cases of "gross injustice". Under this heading several salaries have been increased, but in too many instances the increase has been only $60.00 per year. Just how a "gross injustice" could be remedied by the addition of such a small increase is not apparent to everyone.

The reclassification has not been done with a generous hand. but on the whole it does provide some such needed amelioration. The Professional Institute of the Civil Service in its Journal for January reports that "the progress made under this partially corrective arrangement has improved morale and introduced a new hope for the future."

Royal Commission

In April your committee appeared before the Royal Commission on Administrative Classifications in the Civil Service, and presented a constructive brief as evidence of the need of salary increases. In the report of the Royal Commission there is no evidence that the Institute's presentation had produced any effect. As a matter of fact there appeared to be nothing in the report to indicate that any presentation had produced any effect. The report was far from satisfactory to many people and up to the end of the year, with the exception of increased salaries for deputy ministers, there appear to have been no results from their deliberations.

Conclusion

Your committee does not seek any credit for what has been accomplished. Today so many agencies are interesting themselves in this problem that it will be difficult if not impossible, and certainly improper for any one to claim that it has done the trick. The kudos is of no importance as long as the results are obtained. Your committee will continue the interest that the Institute has shown in the professional worker over the last fifty years, and will be happy if it is able to make even some modest contribution towards a successful outcome.

N. B. MacRostie, m.e.i.c., *Chairman.*

COMMITTEE ON THE TRAINING AND WELFARE OF THE YOUNG ENGINEER

During 1946, the activities of this committee were directed towards finding out from the branches and from young engineers just what the Institute could do to help the new-comer in the profession. Certain proposals were submitted and each branch was asked to nominate a young engineer from whom the committee could get first-hand opinions of what is wanted.

Sixteen branches replied, ten of them appointing a young engineer as requested, five of whom have written to the chairman. This is a discouraging response, but on the other hand the five wrote such constructive letters that something has been accomplished.

The following suggestions have been made, and are now submitted to Council and to the membership of the Institute, with the hope that they will be implemented. It is realized that each branch has its own problems, and that what is suitable for one may not be for another.

1. Getting Acquainted With the Young Engineer, Especially the New-comer.

From Young Engineers

(a) Branch secretaries should invite new-comers to their first meeting, by telephone or other personal message, and make sure that they are introduced to the older members.

(b) "I see no reason why a more active social life between engineers would not be most enjoyable. To the Junior it would be a means to help widen his circle of friends in the engineering world. In the case of a young married engineer coming to a strange city, I'm sure some initiative on the part of the engineering members to make him and his wife acquainted would be very welcome".

(c) Lapel buttons should be worn at meetings. A branch membership list would be very valuable.

(d) "Experience indicates that acquaintanceship is not developed by chance, but requires a definite program. It is suggested that at each meeting someone should introduce four or five junior members and four or five seniors, giving place of birth, university, year of graduation, and nature of present work. When dinner meetings are held the introductions should be made before the meal is served, and those already acquainted should be seated away from each other".

(e) "An occasional ladies' night to give the wives of all engineers an opportunity to become acquainted".

(f) (From a member of the committee.) "When a young engineer arrives in a city in which there is a branch, a senior engineer should personally invite and conduct him to his first meeting, and there introduce him to some of the members of all ages.

From Branches

(g) "Some of our Executive stated that they were never contacted (while at a university) or issued any invitations to attend meetings, or to join the Institute and when they did attend no attention was paid to them and they were not offered welcome or encouragement".

(h) "The Engineers' Wives Association has proved very successful in welcoming and befriending newcomers".

(i) "It was the unanimous opinion of those present (at an executive meeting) that something should be done to make the young engineer feel more at home".

(j) "Social contacts could be developed most easily as a result of introductions of the new members at branch meetings".

(k) "It was decided by the executive that the reception committee should be especially instructed to seek out new members and young engineers, and to make them welcome at meetings".

(l) "All our young engineers are invited to all social functions".

2. Proposal to Sponsor a Young Engineer by a Senior

From Young Engineers

(a) Rather opposed.

(b) "A step in the right direction".

(c) "The general opinion of the younger engineers here is that they are very much in favour of it. We feel that such a 'guide, philosopher and friend' would be very much appreciated in the last few months of an engineer's graduating year. If at that time the prospective young engineer had such a person appointed as a personal advisor to him, someone with whom he could talk periodically during the last few months prior to graduation, a great deal of worry and uncertainty could be eliminated".

(d) "I believe this plan could be of inestimable value to the graduate in seeking his first year or two of employment".

(e) "If the majority of senior engineers in the branch prove to be sufficiently interested in the welfare of the junior engineers to really become acquainted, the junior will know whom he may approach for help and advice".

From Branches

(f) "An individual adviser for each young engineer is not the best solution of the problem. The creation of a friendlier atmosphere at meetings would offer spontaneous opportunities for any needed guidance".

(g) "The idea of having a particular member to advise a particular young engineer is to be discouraged. However we should like to submit an alternative suggestion . . . (a) that the various branches canvass their membership to determine those members who are willing to act as advisers to any young engineers who may request assistance; and (b) that the names and addresses of these members, their academic qualifications and their professional positions be published periodically in a list in the *Engineering Journal,* under some such heading as 'Members willing to discuss problems with junior engineers who seek assistance'".

3. Employment

From Young Engineers

(a) That a local employment service be opened by his branch because the Institute employment service is too far away, and not in touch with the local situation.

(b) That a promotional programme should be undertaken with the object of making more engineering positions: that is, municipal bodies and firms not now employing engineers should be urged to do so, the advantages of so doing being made clear to them by the Institute.

4. Training

From Young Engineers

(a) "I feel the branches should attempt to organize classes in public speaking".

(b) "A factor often overlooked is that the junior engineer cannot possibly feel himself part of the organization unless he plays a part in it. Two or three meetings during the year should be organized and carried out by the junior engineers". (Presumably this is for branches where no junior section exists).

(c) One branch has arranged for junior engineers to be taken on tours through large industrial plants in the vicinity.

From the foregoing opinions, gathered from many parts of Canada, two major conclusions are justified: first that there should be a planned and concerted effort to make young engineers feel at home in the branches, both professionally and socially, and that it is not enough to simply send a notice of meeting. Secondly, that while there is no desire to have an assigned sponsor for each junior, there is a feeling that from time to time the helpful advice of an older man would be very welcome.

It seems to the chairman of this committee that these two points constitute a challenge to the older engineers to interest themselves directly in their younger professional brethren.

Other work of the committee—Counselling for high school students has been carried on jointly with the C.I.M.M. and the C.I.C. The Montreal Branch in particular has sent a very full report of its work in this line.

Following a meeting of the committee held at the time of the Annual General Meeting of the Institute, letters were sent to the deputy ministers of education in all provinces calling their attention to the very large enrolment of students in science faculties in Canadian universities.

The chairman wishes to thank especially the Halifax, Montreal, Border Cities, Sarnia and Edmonton branches for the very thorough way in which they considered the proposals of this committee.

In conclusion one more paragraph from a young engineer's letter is quoted: "In our opinion the junior engineers would welcome the hand of fellowship on the part of the senior members. We must, here, stress however, that the onus rests largely if not entirely on the senior engineers, and unless the majority of them are really interested in the welfare of their junior fellows, the objective will not be reached. The question is not so much what *can* the members do for their younger brethren as what *will* they do".

Respectfully submitted,

L. F. Grant, m.e.i.c., *Chairman.*

CANADIAN CHAMBER OF COMMERCE

Some years ago, the role of the Chambers of Commerce and of the Boards of Trade in Canada was limited to promoting the exchange of commodities and goods between the provinces and to fostering the sale of our products to other countries. Conditions are very different now. The Canadian economy is now partly free and partly managed. Our economic and individual freedom is threatened from all sides. The most important duty of the Chambers of Commerce is now to defend private enterprise and to urge the Government to adopt policies favourable to the maintenance of our capitalist democracy. The danger in this mixed economy from which there is no early escape is that we suffer most of the ills of both free enterprise and regimentation. This dangerous situation has compelled the Canadian Chamber of Commerce to concentrate not so much on urging the Government to do something to prevent a depression but rather in trying to stop the Government from doing a hundred things leading towards depression. These activities of the Canadian Chamber of Commerce have been carried out through the various sub-committees of the Executive, the work of which is summarized below.

Economic Development Committee

This Committee has endeavoured to demonstrate to the people of Canada the advantages of the system of private enterprise and to defend capitalism against communistic or socialistic propaganda. The amazing fact is that a system so much abused and so little understood has functioned as well as it has. Convinced that no other system can give a higher standard of living, the Chamber has encouraged the organization of Boards of Trade in the country, and the Economic Development Committee has placed at their disposal the data and the literature needed to demonstrate the advantages of private enterprise over any other politico-economic system. At the suggestion of the Committee, private enterprise was placed on the agenda of the regional clinics held under the auspices of the Field Service Department.

A series of radio scripts under the title of "How is Business?" was prepared for the use of Member Boards and Chambers. Over 100,000 pieces of literature of various types were distributed: among others, "Planning your Future", "This is Business", "Basic Facts" and "Canadian Capitalism and the Menace of a Fifth Column". Members of the Directorate, the Secretariat, and the Speakers' Bureau have addressed over 100 audiences from coast to coast. The Department of Economic Development now publishes twice monthly the "News Letter", with a circulation of over 3,500 copies. This letter brings to the attention of its readers the economic fallacies of the socialistic or communistic propaganda and the advantages of the capitalist democracy. It is felt that this educational programme has brought about a greater understanding of the business men's point of view and of the danger involved in changing from private enterprise to statism.

Labour Management Relations

The relations between labour and management have not been good during 1946, and 4 million man-days have been lost as a result of strikes. Soviet economists base their belief of the inevitability of an American economic collapse largely on the inability of the American economy to operate on a large enough profit. The workers' opposition to increased efficiency and their fight for higher wages, regardless of their effect on costs, constitute grave dangers. The chiefs of the international labour unions now wield power over the life and living of the people greater than any group of business tycoons ever enjoyed. The events of the last year have demonstated that governments are at present powerless against the labour dictators. In Canada, the situation is aggravated by the fact that our industrial activity is, through the working of international unions, controlled by the labour leaders of our greatest industrial competitor.

It is evident from the above that the Chamber's Committee on National Labour Policies was greatly handicapped in its efforts. The Committee, however, during the year, kept a very close watch on legislation and developments in the field of employer-employee relations. When in November 1945, legislation was foreshadowed which would compel the inclusion of provisions for union security in labour agreements, the Chamber strongly opposed the compulsory feature.

The Chamber submitted a statement of view on industrial unrest to the Industrial Relations Committee of the House of Commons in July and August. It made representations to the Unemployment Insurance Advisory Committee on its proposal to amend the schedule of contributions and benefits under the Unemployment Insurance Act. On the invitation of the Minister of Labour, the Special Committee on Labour Relations submitted its views on the Government's proposed revision of the Wartime Wages Control Order.

Public Finance and Taxation

The government, by its fiscal policies, can encourage or discourage business activity and industrial expansion in the country. The only way to reduce costs in the face of increased wages is by the modernization of the industrial machinery. This entails the investment of new money by individuals or by corporations, but the present high income taxes discourage the taking of risks.

The Committee on Finance and Taxation, all through the year, kept close watch on moves and measures in the field of federal finance. Well in advance of the introduction of the budget to Parliament, the views of business, as represented by the Chamber, were placed before the Minister of Finance in a brief recommending several changes. While a number of these recommendations were implemented in the budget, the business community was greatly disappointed at the lack of tax relief, and a public statement expressing this disappointment was released over the president's signature on July 6, 1946.

A brief was presented to the Special Committee of the Senate inquiring into the Provisions and Workings of the Income War Tax Act and the Excess Profits Tax Act, 1940. In March of this year, the Executive reiterated the recommendations, anent co-operatives, which it had made before the Royal Commission in 1945.

As the budget resolutions of October 1945 made no provision for amending the Dominion Succession Duties Act to permit reciprocal arrangements with the United Kingdom to eliminate double taxation, the Chamber recommended that the practicability of an agreement similar to our agreement with the United States should be studied with representatives of the British Government.

Post War Policies

During the past year, the Committee on Reconstruction was entrusted with the study of all questions outside the purview of the other committees. As a result, this Committee had to tackle such controversial questions as control versus decontrol of prices and wages; the best measures to prevent inflation; the regulation of consumer credit, etc. The discussions resulting from these studies, although very interesting to the members of the Committee, did not bring out any unanimity of opinion. The only result was a serial letter commending the government for removing the price ceilings on a selected list of goods and also urging the raising of the 1941 price ceilings and the eventual removal of price controls as the surest method of increasing production and thus preventing price inflation.

The Committee was more successful in its study of the question of immigration and of the remuneration of the civil servants. A memorandum on immigration was submitted to the Prime Minister and, on the invitation of the Royal Commission of Administrative Classification in the Public Service, a submission was made to the Commission.

The Executive Committee made special studies of the following questions: the Dominion-Provincial Conference, the co-ordination of public welfare campaigns, the long term wheat contract with the United Kingdom, land settlement and various phases of rehabilitation and reconversion.

The Chamber expressed its opposition to the government's proposed amendment to the Combines Investigation Act in a brief to the Senate Committee on Banking and Commerce.

International Affairs

The Chamber's Fourth National Foreign Trade Conference of exporters and importers was held in Hamilton on May 8th, 9th and 10th, 1946. More than two hundred delegates were in attendance.

The President and Executive Chairman led a Canadian delegation of six to the Annual Meeting of the United States Chamber at Atlantic City. The President was a featured speaker on the programme.

The Canada-United States Committee, jointly maintained by the two national Chambers of Commerce, held its first post-war meeting at Quebec City in September 1946. The discussion centered on private enterprise in the two countries, the United Kingdom, United States and Canada trade triangle, and bulk purchasing agreements by governments.

The secretarial services were supplied by the Canadian Chamber of Commerce to the Canadian Section of the International Chamber of Commerce, organized a year ago. This organization had made substantial progress under the chairmanship of Mr. R. P. Jellett.

The Foreign Trade Committee, under the chairmanship of Mr. W. D. Jones, has been extremely active. Through this committee and the secretariat, a commercial intelligence service is supplied to foreign trade inquiries. In the past two years a record of several thousand inquiries were handled. In January a summary of the American Trade Proposals for an International Trade Organization was prepared and issued to the membership. In preparation for an International Trade Fair in Canada, in 1948, the Chamber has accepted the government invitation to nominate a representative to the Advisory Committee to the Director of Exhibitions and Mr. Paul Béique, M.E.I.C., will serve in this capacity.

This brief outline of the activities of the Canadian Chamber of Commerce indicates how valuable the work of the Chamber is to Canada as a whole. Several members of the Engineering Institute of Canada took an active part in the work of the Chamber. Dr. J. B. Challies was Chairman of the Executive Committee and Col. R. D. Harkness, Vice-Chairman. Messrs. Paul Béique, P. F. Sise, R. E. Stavert, Arthur Surveyer and H. G. Welsford were members of some of the sub-committees enumerated above and collaborated in the preparation of the submissions made to the government.

Respectfully submitted,

Arthur Surveyer, M.E.I.C.,
Chairman of the Reconstruction Committee of the Canadian Chamber of Commerce. Institute Representative on the Board of the Chamber.

COMMITTEE ON EMPLOYMENT CONDITIONS

In two important decisions, the Wartime Labour Relations Board (National) has largely cleared up the long uncertainty about the status of engineers under labour legislation. The Board made clear that, in its opinion, professional employees come under the provision of current labour laws, and that, as a general rule, they should be segregated from other employees for purposes of collective bargaining. In determining an "appropriate unit", the Board favours the grouping of sub-professional and professional employees engaged in common employment in the same line of skilled work. Classification of employees will thus be on a functional basis. Those employed in a confidential capacity or having the authority to employ and discharge are excluded under the provision of the law. The detailed rulings given by the Board were reported in the July *Journal*.

In a draft bill of The Industrial Relations and Disputes Investigation Act 1947 which is to be presented at the next session of Parliament, there is an ambiguous section in which it appears professional employees could be compelled, against their wishes, to have a labour union bargain for them. Representations are being made to the Minister of Labour that this unsatisfactory condition should be remedied.

Your committee feels that the question of salaries cannot be satisfactorily settled by mere publication of a schedule, because too many variables are involved. Your committee considers that an engineer's compensation must in fact depend on the importance of his work, his ability to produce results, the degree of responsibility carried and many other factors. Job evaluation may be the answer to this complex problem, but much further work remains to be done before something can be produced which will satisfy engineers and convince their employers.

Many of the young men now taking engineering courses are believed to have no intention of continuing technical work after graduation; otherwise, your committee would be apprehensive about the capacity of industry to absorb them.

Your committee wishes to express its deep appreciation and thanks to Dr. Wright and Mr. Trudel and the general Headquarters' staff for their assistance during the year.

Respectfully submitted,

R. E. Heartz, M.E.I.C., *Chairman.*

COMMITTEE ON PROFESSIONAL INTERESTS

Your Committee maintained its contact with the various branches of the Institute and with the cooperating associations. Its members visited many branches and associations and one member, G. J. Currie of Halifax, visited every branch of the Institute. Much benefit was derived by the committee from these contacts and it is hoped that branches and associations also benefited.

It is gratifying to record the inauguration of the Kootenay Branch and the Cornwall Branch during the year, and at this time confidently to predict the inauguration of two more branches during the coming year. This is indicative of the steady growth of Institute strength and membership.

A brief was presented by the Toronto Branch in the interest of closer cooperation and better relations with Headquarters. The reply, made at the time of the April meeting of Council in Toronto, led to a full, frank and friendly discussion which eliminated various misunderstandings.

A suggestion that an Ontario Division of the Institute be established, grew into a resolution that steps be taken to secure a letter ballot as to its desirability. Voting is still in progress.

Due to a change in Institute fees a revision of the By-laws of co-operating associations was found necessary and these revisions are in hand.

Drastic legislation is proposed in the Province of Saskatchewan, which would take from all professions in that province their present power of regulating their own members. The matter is under observation by your committee.

The matter of removal of duty on engineer's plans entering Canada protested by the Institute last July—was referred to this Committee for further action. In co-operation with other interested organizations a resolution supported by a strong delegation was sent to the Minister of Finance. The matter is still under consideration by the Department of Government concerned.

As a result of the cooperative agreement negotiated last year, meetings of the joint committee of the American Society of Mechanical Engineers and the Engineering Institute of Canada were held in New York, and further means of cooperation between the two organizations explored. The joint A.S.M.E.-E.I.C. meeting held in Detroit last summer and attended by our President, J. B. Hayes, O.B.E., was a distinct success.

Your committee has found it desirable to make further statements through the Engineering Journal, special bulletins and letters for the purpose of clarifying misunderstandings of the Institute's position in relation to the Canadian Council of Professional Engineers and Scientists. Proponents of the new organization claim that up to 90% of their members are members of the Engineering Institute. This fact supports the considered opinion of this Committee, as repeatedly endorsed by Council, that it is unnecessary to form a new over-riding body, involving travelling of delegates, operating expenses and duplication of activities. The Institute has therefore continued to decline membership in that organization.

Continuing growth in Institute membership impels your committee to reiterate its statement of one year ago concerning the "urgent need of a field secretary or some officer who could give his attention to branch affairs." It is gratifying to note that this matter is now actively in hand.

The growth of the cooperative movement among engineering societies continued and joint meetings became more frequent. This committee looks forward to the time when all engineering societies in Canada will be linked by cooperative agreements which will preserve their autonomy and provide the fullest measure of cooperation among professional engineering organizations.

Respectfully submitted,

J. B. Stirling, M.E.I.C., *Chairman.*

CANADIAN RADIO TECHNICAL PLANNING BOARD

The second Annual General Meeting of the Canadian Radio Technical Planning Board was held in Montreal on December 10th, 1946.

Since the last Annual Meeting, final reports have been submitted to the Administrative Committee on frequency allocations by all the working panels concerned. Panel A, which is charged with the responsibility of coordinating the reports of other panels, has been very active during recent months and the report of this panel was the main subject of the discussion during the Annual General Meeting.

Panel A, in examining the reports of other panels, found there was a great deal of overlapping in the frequency space required by the various interested groups in Canada and particularly in the medium frequency portions of the spectrum. Panel A is therefore confronted with the extremely difficult task of weighing the merits and priorities of the various services in order to eliminate the present overlapping requirements.

As a result of Panel A's deliberations during the past four or five months, they have put forward a general plan asking the other panel chairmen to review their requirements in the light of this revised plan. It appears that the major conflicts are between those of Panel C dealing with radio communications, including point-to-point, portable, mobile and emergency communication services, and those of Panel E dealing with aeronautical radio and radio aids to navigation.

As a result of the discussions at the Annual Meeting, the chairmen of these panels were requested to review their requirements immediately in the hope that a mutually satisfactory solution can be arrived at between the conflicting interests as soon as possible. It is hoped that Panel A will therefore be able to make a final report for submission to the Department of Transport to be used at the next World Frequency Allocation Conference which will be held sometime before the middle of 1947.

All executive officers were re-elected for the ensuing year, as follows: R. M. Brophy, President; R. A. Hackbusch, Vice-President; S D. Brownlee, Secretary-Treasurer.

The total revenue for the year, consisting primarily of fees from sponsoring members and bank interest, amounted to $1,659.75 and expenditures for the year were $697.78, leaving a surplus of $961.97. To this surplus was added surplus from the previous year of $3,020.26, giving a total surplus as at November 20th, 1946, of $3,982.23.

In view of the amount of surplus on hand at the present time, the annual fees were reduced from $100 to $50, except in the case of the technical engineering societies which have been reduced to a nominal amount of $10; the Engineering Institute is grouped in the latter category.

A. B. Hunt, M.E.I.C.,
Institute Representative on the Board.

JULIAN C. SMITH MEDAL

Carrying out the instructions pertaining to the award of the Julian C. Smith Medal for 1946, the special committee consisting of Past-President K. M. Cameron, deGaspe Beaubien and myself has made a selection of two names, which have been submitted by letter ballot to all councillors.

As a result, Julian C. Smith Medals for 1946 are being awarded to:

Charles Camsell, formerly Deputy Minister of Mines and Resources, Ottawa, Ontario.

John Bow Challies, Vice-President and Executive Engineer, The Shawinigan Water & Power Company, Montreal, Quebec.

Respectfully submitted,
J. B. Hayes, M.E.I.C., *Chairman.*

SIR JOHN KENNEDY MEDAL

The Sir John Kennedy Medal for 1946 has been awarded by the Council of the Institute to Lorne Argyle Campbell, President and Managing Director, West Kootenay Power and Light Company, Limited, Trail, British Columbia.

Respectfully submitted,
L. Austin Wright, M.E.I.C., *General Secretary.*

STUDENTS' AND JUNIORS' PRIZES

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of the Institute were submitted to Council at its meeting on January 11th, 1947, and accepted as follows:

H. N. Ruttan Prize (Western Provinces) to E. M. Scott, S.E.I.C., for his paper " The Operation and Construction of the Modern Oil Circuit-Breaker ".

John Galbraith Prize (Province of Ontario)—No papers received.

Phelps Johnson Prize (Province of Quebec—English)—No papers received.

Ernest Marceau Prize (Province of Quebec—French)—No papers received.

Martin Murphy Prize (Maritime Provinces)—No papers received.

Abstracts of Reports from Branches

Note—For Membership and Financial Statements see pages 72 and 73

BORDER CITIES BRANCH

The Executive Committee submits the following report for the year 1946.

The branch held twelve Executive Committee meetings during the year and nine general meetings.

The branch was honoured in having Mr. C. G. R. Armstrong appointed Chairman of the Institute Nominating Committee.

The branch membership vastly surpassed their quota in funds for the Harry F. Bennett Educational Fund.

The second of post-war joint annual meetings with the Detroit Section of the A.S.M.E. was held in Windsor. Joint meetings were held with the Independent Association of Electrical Engineers and the Royal Astronomical Society of Canada. Ladies were invited to attend our annual meeting with the Detroit Section of the A.S.M.E.

The branch took an active part in the A.S.M.E. Semi Annual Meeting held in Detroit in June, 1946.

The following is information relative to our general meetings. The attendance is noted in brackets.

Jan. 18—**Inside the Diesel Engine** by R. K. Weldy, Fuel Injection Division of the Ex-Cell-O Corporation, Detroit. (62.)

Feb. 15—**High Speed Railroading** by James E. McCort, District Manager, Railway Division, Timken Roller Bearing Company, Cleveland, Ohio. (29.)

Mar. 22—**Radar** by J. H. Rowlatt, Bell Telephone Company, Montreal. (300.)

Apr. 12—**Material Handling Methods and Equipment** by Glen R. Johnson, Clark Tructractor, Battle Creek, Mich. (55.)

May 1—The annual visit of the Institute president, J. B. Hayes. (45.)

May 31—**The Glories of the Heaven** by W. A. Hare, Hare Engineering Co. of Detroit, Mich. (110.)

Oct. 11—**The Steep Rock Iron Mine—Its General Features and Power Supply** by A. H. Frampton, Assistant Chief Electrical Engineer, Hydro Electric Power Commission of Ontario. (38.)

Nov. 6—**The Electric Home of the Future** by J. W. McWhirter, Appliance Division, Canadian General Electric Company of Canada. (300.)

Dec 6—Annual meeting and election of officers, and award to O. Rolfson, M.E.I.C. (27.)

CALGARY BRANCH

The following report of activities is submitted by the Calgary Executive for the Branch Year 1946, the attendance at meetings being shown in brackets.

The Executive met ten times during the year.

Dec. 13—**Oilwell Drilling in Turner Valley** by J. Wark, Field Superintendent of the Brown, Moyer and Brown Oil Company Limited, and **Accident Prevention** by J. R. Jenkins, Calgary Power Company Limited. (47.)

Jan. 17—Annual Ladies' Night was held at the American Woman's Club under the auspices of the Engineers'

Wives Club. Entertainment consisted of moving pictures and a talk on **Conditions in Wartime Sweden** by Leone MacGregor Heldstedt. (120.)

Jan. 31—**Operation of Railways in France After D-Day** by Lieut.-Col. Wootten, M.C., O.B.E. (40.)

Feb. 14—**Railway Signalling** by W. Abell of the Canadian Pacific Railway. Also a moving picture was shown on "Railroading". (43.)

Feb. 28—**Atomic Energy** by Dr. J. W. T. Spinks, of the University of Saskatchewan. This meeting was held jointly with Calgary Branch of the Chemical Institute of Canada.

Mar. 16—Annual Meeting followed by Dinner. (43.) This meeting was followed by the attendance at the Glencoe Club of the members and wives for bridge.

June 4—Annual western visit of the president, J. B. Hayes. Accompanying Mr. Hayes were: Mrs. J. B. Hayes, G. J. Currie, Councillor of the Halifax Branch, Dr. L. Austin Wright, and Miss McLaren of the Institute Headquarters staff. (101.)

Sept. 26—Sound films showing development of North West Territories and illustrating the salmon fisheries in Alaska and British Columbia were shown. (73.)

Oct. 17—**Urban Transportation** by V. A. Newhall, City Commissioner. (78.)

Nov. 14—**Hydro-Electric Power Development in the Yellowknife North West Territories Area** by Bev Monkman, Calgary Power Company Ltd. (50.)

Nov. 28—**The Need for University Facilities in Calgary** by F. G. Buchanan, Superintendent of Schools in Calgary. (35.)

CAPE BRETON BRANCH

The following dinner meetings were held during the year. In the case of "The Magic of the Spectrum" and "Operation Crossroads" the meetings were considered to be of sufficient general interest to invite the ladies.

Jan. 9—**Housing Research,** by J. L. Gray, Assistant Director General of Research and Development in the Department of Reconstruction. (42.)

Feb. 13—**The Magic of the Spectrum,** by C. A. Morrison, Halifax District Manager, Canadian General Electric Co. Ltd. (75.)

Mar. 28—**Overseas Experiences with the Engineers,** by E. C. Bannerman, together with a showing of "The Mulberry Film". (25.)

Sept. 23—**Manufacture of Carbon Electrodes,** by A. G. Dilks, Sales Engineer, Canadian National Carbon Co. Ltd. (26.)

Nov. 20—**Bluenose Oil,** by Dr. D. J. MacNeil, Consulting Geologist, Antigonish, N.S. (28.)

Dec. 17—**Operation Crossroads,** by Major General R. M. Luton, C.B.E., M.C., late Director General of Medical Services Overseas. Colour movies with descriptive talk. (66.)

CORNWALL BRANCH

The Cornwall Branch was newly organized this year, and received its charter at the Inaugural Meeting on November 22nd, with many Institute officials present.

EDMONTON BRANCH

The Edmonton Branch Executive met eight times during the year, with an average attendance of 7.

The general meetings of the Branch, with one exception, (May 23rd), were dinner meetings at the Macdonald Hotel, starting at 6.30 p.m. The dates, programmes and attendance, which is the figure in brackets, were as follows:

Jan. 17—**Electricity in the Navy**—an illustrated lecture, by Electrical Commander J. Deane, R.C.N. of Ottawa (35.)

Feb. 18—**Jet Propulsion and Future Aircraft**—an illustrated lecture, by Sqd. Ldr. E. L. Baudoux, D.F.C., D.S.O., Edmonton. (73.)

Mar. 29—**Technical Features of 'Mulberry'** by Col. V. C. Steer-Webster, O.B.E., preceding a visit to the exhibition of the Mulberry models, and a private showing of the film "A Harbour Goes to France". This was a joint meeting with the Association of Professional Engineers of Alberta. (114.)

Apr. 24—**Branch Annual Meeting**—Highlights of the year's activities, and election of officers, concluding with a smoker. (44.)

May 13—**Western Visit of the E.I.C. President**—J. B. Hayes—An informal dinner meeting, to which ladies were invited. (79.)

May 23—A special joint meeting with the Science Association of the University of Alberta, in the Medical Building of the University. Sqd. Ldr. R. Kronfeld, A.F.C., of the National Research Council of Canada, gave an illustrated lecture entitled **Gliding and Soaring.** (135.)

Oct. 28—**Canada's Role in the Tantalum and Columbium Industries,** by Dr. Daniel Gardner, of New York, N.Y. Joint meeting with the Canadian Institute of Mining and Metallurgy, and the Chemical Institute of Canada. (116.)

Nov. 25—**Electrical Logging of Bore Holes,** by A. A. Perebinossoff, of the Schlumberger Well Surveying Corporation of Houston, Texas — an illustrated lecture. (48.)

HAMILTON BRANCH

During the past year, the Branch held the following meetings, with attendance as shown in brackets:

Jan. 15—Annual Meeting and Dinner at the Scottish Rite Club, the speaker of the evening being Dr. Sidney Smith, President of the University of Toronto. (78.)

Feb. 21—**Reconstruction in Italy,** by Lt. Col. V. S. Thompson, M.E.I.C., Department of Reconstruction. (45.)

Mar. 28—**The Association of Professional Engineers — Its Objectives and Accomplishments,** by Dr. G. Ross Lord, M.E.I.C., President of the Association of Professional Engineers of Ontario. (100.)

Apr. 26—**Lightning,** by Dr. G. D. McCann, Westinghouse Electric Corporation. This meeting was the annual joint gathering of the Toronto Section of the American Institute of Electrical Engineers, and the Hamilton Branch. (175.)

Apr. 29—**The President's Visit.** A special dinner was held to honour the President, J. B. Hayes, M.E.I.C., Louis Trudel, M.E.I.C., Assistant General Secretary, and Councillor G. J. Currie, M.E.I.C. (40.)

Sept. 26—**Housing in Canada—The Problem and Prospects,** by Brigadier D. H. Storms, General Manager, Housing Enterprises of Canada. (48.)

Oct. 24—**Exercise Musk-Ox,** by Dr. J. T. Wilson, Professor of Geophysics, University of Toronto. (80.)

Nov. 14—**Iraq,** by Mr. Frank Alexander, of the Waterloo Manufacturing Company. This meeting was the annual "Ladies' Night" dinner meeting. (110.)

Dec. 13—**Jet Propulsion—The History and Development of the Westinghouse Aviation Gas Turbine,** by H. J. Clyman, Westinghouse Electric Corporation, South Philadelphia, Pa. This meeting was the annual joint gathering with the Hamilton Sub-section of the American Institute of Electrical Engineers. (140.)

The Executive Committee of the Hamilton Branch held seven meetings during the year, with an average attendance of seven members.

KINGSTON BRANCH

Th following meetings were held during the year:

Jan. 16—Lt. Cmdr. H. G. Burchell—**Electricity in the Navy.**

Feb. —Student Papers Night.

Feb. 21—Wm. Storrie—**The Engineer and Public Health.**

Mar. 21—R. N. Boyd and W. R. Birks—**Air Conditioning.**

Apr. —Col. Sawyer—**Smoke Control.**

July 4—Annual Meeting.

Oct. 7—Tour of Aluminum Co. of Canada, Kingston Works, Dinner Meeting. (64.)

Nov. 4—T. M. Medland—**Collective Bargaining and the Engineer.** (200.)

Nov. 27—Annual Visit of the president, J. B. Hayes, Dinner Meeting. (60.)

KOOTENAY BRANCH

The Kootenay Branch was newly organized this year and received its charter at the Inaugural Meeting in Trail, B.C., on Friday, May 17th. The charter was presented by J. B. Hayes, president of the Institute, to S. C. Montgomery, chairman of the local branch.

Officers of the Institute present at the Inaugural Meeting included: Messrs. L. Austin Wright, G. J. Currie (Halifax), P. M. Sauder (Strathmore, Alta.), C. S. Clendening (Lethbridge, Alta.), Dean R. A. Spencer (Saskatoon), W. G. Carry

(Edmonton), J. G. McGregor (Calgary) and S. Young (Regina).

Three luncheon meetings were held during the year, as follows (attendance in brackets):

May 31—General business meeting including the chairman's report on the recent presidential visit. (16.)

Nov. 5—General business meeting. Film **Carbon-Black Treasure** was shown and a short talk given by Mr. C. Vatcher, of the Canadian National Carbon Co. Ltd. (19.)

Dec. 20—General business meeting. Film **Electronic Light** was shown describing the operation and manufacture of fluorescent lamps. (17.)

In addition to the above, two meetings of the Executive Committee were held during the year.

LAKEHEAD BRANCH

The following meetings were held during the year:

Jan. 28—Fort William. A tour of inspection through the Canadian Car & Foundry Co. plant at Fort William where Brill busses are being manufactured. Mr. Bicknell, of the Canadian Car & Foundry Co. was in charge of the tour. (36.)

Feb. 22—Fort William. **Annual Dance,** held at the Royal Edward Hotel. (60.)

May 28—Port Arthur. **Annual Meeting,** and election of branch officers. (38.)

June 10—Kakabeka Falls. **Halifax During the War Years,** by J. B. Hayes, president of the Institute. Also Dr. L. Austin Wright, General Secretary E.I.C., and G. J. Currie, Councillor of the Halifax Branch spoke. The ladies were present on this occasion. (96.)

Sept. 5—Port Arthur. **The Association of Professional Engineers of Ontario,** by Dr. G. Ross Lord, president of the Association and Col. T. M. Medland, Director of Public Relations of the Association. (53.)

Oct. 19—Fort William. A tour through the Great Lakes Paper Co. mill. S. T. McCavour of the Great Lakes Mill spoke on pulp and paper mills. (33.)

Nov. 15—**Development of the Lakehead Harbours,** by J. R. Mathieson, Assistant Engineer of the Dept. of Public Works of Canada. Also Mr. MacRae, Librarian, Fort William Library showed a sound film entitled "The Great Lakes". (25.)

LETHBRIDGE BRANCH

The following meetings were held by the Lethbridge Branch:

Jan. 25—Dinner meeting. Dr. T. How, district meteorologist of the Department of Transport, Edmonton, spoke on **Arctic Meteorology.**

Feb. 22—Don Livingstone, of the Lethbridge Collieries, discussed the **Bailey Bridge.**

Mar. 13—D. Brown, district service engineer for Canadian General Electric, Lethbridge, spoke on **Electronics.**

May 3—Dinner meeting. G. E. Elkington, M.E.I.C., Manager, East Kootenay Power Co., Fernie, B.C., spoke on the **Power Supply in the Crow's Nest Pass Area.**

May 14—Banquet and meeting. Branch entertained presidential party.

Sept. 21—Dinner meeting. Speaker was Wm. Murday, of Richard Sutcliffe Ltd., Horbury, England, who discussed **Belt Conveyers in Britain.**

Oct. 19—Dinner meeting. The deputy minister of reconstruction for Saskatchewan, E. E. Eisenhauer, M.E.I.C., spoke on **The Farmer in a Program of Reconstruction.**

Nov. 16—Dinner meeting and ladies' night. J. D. Sutcliffe, of London, England, spoke on the **Wavy Navy Ashore and Afloat.**

LONDON BRANCH

The Executive of the London Branch is pleased to report the following ten regular and special meetings:

Jan. 23—Annual Dinner. Guest Speaker, Lt.-Col. B. W. Grover, O.B.E., whose subject was **Intercommunications in the Canadian Army during Operations.**

Mar. 1—Joint Meeting with Association of Professional Engineers of Ontario. Speaker—Dr. G. Ross, London.

Mar. 28—Supper Meeting. Councillors' Report by J. A. Vance, and report on **Thames Valley Conservation Scheme,** by W. R. Smith.

Apr. 17—**Civil Affairs Administration in Italy,** by Lt.-Col. S. W. Archibald, E.D.

May 2—President's Visit—Guests of honour—President and Mrs. J. B. Hayes.

May 18—Plant visit to Borden Company at Belmont and Ingersoll, conducted by J. H. Johnson.

Sept. 12—**Engineering with a Field Company in Italy,** by Maj. W. J. Bright, D.S.O.

Nov. 5—**The London Town Plan,** by Gordon Culham.

Nov. 19—**The Engineer and the War,** by Maj.-Gen. H. Kennedy, C.B.E., M.C.

Dec. 11—Dinner and Films. **Clean Waters** and **The Raindrop and Erosion,** presented by W. P. Willis and W. R. Smith, respectively.

The Branch Executive and special committees met eight times during the year.

MONCTON BRANCH

Three meetings of the Executive were held during the year. There were four branch meetings held, at which technical subjects were discussed and business transacted as follows:

Jan. 10—A meeting was held in the City Hall. B. W. Isner, Manager, Canadian Gypsum Co., gave an address on the **Production and Manufacture of Gypsum Products.**

Mar. 5—A meeting was held in the City Hall. R. N. Fournier, Manager of Supply, Canadian General Electric Co., Halifax, N.S., delivered an address on **Electric Heating in Industry.** The "Mulberry Film" was shown at this meeting.

May 28—A meeting was held for the purpose of nominating branch officers for the year 1946-47.

June 4—The Annual Meeting was held on this date.

MONTREAL BRANCH

The following meetings (attendances are shown in brackets) were held in 1946:

Jan. 10—**Applying Industrial Engineering Techniques Through Supervisors,** by Clifton H. Cox. (150.)

Jan. 17—**St. Lawrence Water Way,** by Prof. John L. MacDougall. (180.)

Jan. 24—**Housing,** by J. L. E. Price, M.E.I.C. (175.)

Jan. 31—**Annual Meeting of the Branch.** (90.)

Feb. 14—**Annual Student Night.**

Feb. 21—**Trends in Central Station Development,** by F. R. Benedict. Joint Meeting with A.I.E.E. (100.)

Feb. 28—**Traffic and Engineering,** by John T. Gibala, C.E. (100.)

Mar. 7—**Outline of Pre-Stressed Concrete Design,** by Col. Jean P. Carrière, P. Eng., M.E.I.C. (180.)

Mar. 14—**The Application of Gas Turbines to Railway Locomotives,** by A. K. Leuthold, M.E.I.C. (175.)

Mar. 21—**Radio-Microwaves and Radar,** by W. H. Doherty. Joint Meeting with I.R.E. & A.I.E.E.. (330.)

Mar. 28—**Fuel Oil Burning as Applied to Commercial Boilers for Industrial Service,** by George P. Haynes. (130.)

Apr. 4—**The Manufacture of Naval Cables and the Part They Played in Hastening Victory,** by N. L. Morgan, M.E.I.C., and S. B. Thomas. (70.)

Apr. 11—**Engineers and Public Policy,** by W. E. Wickenden, D. Eng., D.Sc., LL.D., L.H.D., Joint Meeting with A.I.E.E. (170.)

May 30—**Developments in Reinforced Concrete,** by Prof. G. Magnel, M.I. Struct. E. (215.)

Oct. 3—**Opening Night.—Films** (Refreshments). (280.)

Oct. 10—**Structural Analysis and Strength,** Prof. Hardy Cross, M.A.S.C.E. (200.)

Oct. 17—**Industrial Power Distribution,** by G. M. McHenry. Joint Meeting with A.I.E.E. (180.)

Oct. 19—**Afternoon Visit to Plant of Montreal Coke & Mfg. Co.,** Ville La Salle. (100.)

Oct. 24—**Industrial Engineering and Profit Control,** by Frank L. Sweetser. (220.)

Oct. 31—**Coal-Burning Gas Turbines for Locomotives,** by John I. Yellot, M.A.S.M.E. (210.)

Nov. 5—**Radar in the British Commonwealth,** by Sir Robert Watson-Watt, C.B. (360.)

Nov. 7—**Construction of City Subways,** by Charles E. Deleuw, M.A.S.C.E. (220.)

Nov. 14—**Frequency-Modulation and Television Broadcasting in Canada,** by J. Alphonse Ouimet, M.E.I.C. Joint Meeting with I.R.E. (210.)

Nov. 21—**Visit of the President of The Engineering Institute of Canada,** J. B. Hayes, M.E.I.C. (150.)
Nov. 28—**Design and Construction of Large-Scale Housing,** by John P. Riley, M.A.S.C.E. (150.)
Dec. 5—**Gyroscopes in Transportation,** by Capt. C. B. Potts. (100.)
Dec. 12—**The Polymer Plant, Sarnia,** by G. R. Henderson, M.E.I.C. (150.)

JUNIOR SECTION

Considering that papers constitute the backbone of the activities of any professional society, it was decided this year to let the members choose their own subjects. A survey through the mail indicated that non-technical subjects were preferred.

Thanks must be given to Mr. J. D. McPherson, Chairman of the Papers Committee, who conducted the survey and also approached most of the speakers.

The addition of a Telephone Committee was made so that all members could be reminded of coming events. This Committee saw to the distribution at meetings of breast-pocket name cards, a practice designed to familiarize members with one-another's face and name.

The result of these new policies was an increase in interest of the Juniors and Students for the activities of their section.

The second Annual Dance was held at the Ritz-Carlton Hotel with great success. All available tickets were sold before the dance and among the 500 people present we were happy to count Mr. J. B. Hayes, Mr. J. A. Beauchemin and Mr. J. B. Stirling and their Ladies.

Again, as in the past, the Film Night attracted a full house of members and their friends.

Here follows a list of meetings.

Feb. 25—**Annual Meetings—Reports,** (Refreshments) (125.)
Mar. 18—**Film Night** (210.)
Apr. 8—**The Engineer and his Relation to Human Progress,** by A. P. Young, O.B.E. (65.)
May 6—**A.C. Reactors,** by J. M. Rousseau, JR.E.I.C. (50.)
Oct. 7—**Opening Night: Tomorrow's Challenge to the Young Engineer,** by A. W. Whitaker, Jr., M.E.I.C. (Refreshments). (205.)
Oct. 21—**Outline of Business Management,** by G. H Kimpton, M.E.I.C. of Stevenson & Kellogg. (120.)
Nov. 4—**Effective Speaking,** by D. A. McDonald. (90.)
Nov. 18—**Principles of Production,** by Mr. R. Marien. (85.)
Nov. 29—**Annual Dance,** (500.)
Dec. 9—**Psychology and You,** by Dr. E. C. Webster. (110.)

NIAGARA PENINSULA BRANCH

The Branch Executive held four (4) executive meetings and one (1) electoral meeting during the year. The programme committee arranged for and conducted the following general professional meetings.

Jan. 17—Dinner Meeting at the General Brock Hotel, Niagara Falls, Ont. Joint meeting with the Association of Professional Engineers of Ontario, addressed by Dr. G. R. Lord, M.E.I.C., President of the Association of Professional Engineers of Ontario.
Feb. 28—Dinner Meeting at the Queensway Hotel, St. Catharines, Ont. The speaker was Dean C. R. Young, M.E.I.C., of the University of Toronto, on the subject of **Engineering Development.**
Mar. 28—Dinner Meeting at the Red Casque Inn, Niagara Falls, Ont. The guest speaker was Mr. H. Little, M.E.I.C., Sales Manager of R. & N. Bearings, Canada, Limited who spoke and showed films on **The Manufacture of Ball Bearings.**
Apr. 30—The president of the Institute, Mr. J. B. Hayes, was the guest speaker at this presidential meeting, which was held at the Hotel Leonard, St. Catharines, Ont. Mr. Hayes was accompanied by G. J. Currie, M.E.I.C., Councillor of the Halifax Branch and Louis Trudel, Assistant Secretary of the Institute.
May 28—Annual Meeting at the Park Restaurant, Niagara Falls, Ont. Colonel Herbert D. Vogel, Corps of Engineers, United States Engineer's Office, Buffalo, N.Y., presented an address on **Operations of Engineer Troops in the South Pacific.**
Oct. 24—A Dinner Meeting was held at Leonard Hotel, St. Catharines, Ont., at which Mr. W. C. Effrick, General Sales Manager, Canadian Carborundum, Limited, presented films and a discussion on **Romance in Industry.**
Nov. 28—Dinner Meeting at the Red Casque Inn, Niagara Falls, Ont. Mr. J. D. Millar, Deputy Minister Department of Highways of Ontario outlined and presented films on **The Highways of Ontario.**

OTTAWA BRANCH

The following meetings were held during the year (attendance being shown in brackets):

Jan. 10—Annual Evening Meeting, Auditorium of the National Research Council — **Experiences of the European Trip,** by Allan C. Ross, who had attended the 27th Session of the International Labour Conference held at Paris. (75.)
Jan. 29—Joint Evening Meeting with the Ottawa Branch of the American Institute of Electrical Engineers, Auditorium of the National Research Council—**Looking Ahead with Telephone Scientists,** by G. L. Long, Historian of the Bell Telephone Company. (75.)
Feb. 13—Luncheon Meeting, Chateau Laurier, **Some Impressions of German Wartime Metallurgy,** by Dr. G. S. Farnham, at that time Chief Metallurgist of the Department of Mines. (85.)
Mar. 7—Luncheon Meeting, Chateau Laurier—**Are We Our Brothers' Keeper,** by H. J. McGough, General Manager of the Ontario Highway Construction Safety Association. (90.)
Mar. 22—Evening Meeting, Lecture Hall of the National Museum — **An Outline of Pre-Stressed Concrete Design,** by Col. J. P. Carrière. (60.)
Apr. 5—Luncheon Meeting, Chateau Laurier—**The Engineer and His Relation to Human Progress,** by A. P. Young, O.B.E., of London, England. (65.)
Apr. 18—Luncheon Meeting, Chateau Laurier—**The Canadian National Railways' Contribution to the War Effort,** by S. W. Fairweather, Vice-President of the C.N.R. in charge of Research and Development. (100.)
May 2—Luncheon Meeting, Chateau Laurier—A film entitled **No Keener Blade,** shown through the courtesy of the Canadian Liquid Air Company (102.)
May 31—Evening Meeting, Lecture Hall of the National Museum — **Pre-Stressed Concrete Design,** an illustrated talk by Professor Magnel, University of Ghent, Belgium. (60.)
Sept. 18—Evening Meeting, Auditorium of the National Research Council—A showing of Scientific Films.
Oct. 16—Evening Meeting, Lecture Hall of the National Museum—**The Development of the Bailey Bridge,** an illustrated talk by Sir Donald Bailey. (200.)
Nov. 1—Evening Meeting, Lecture Hall of the National Museum—**The Use of Coal Burning Gas Turbines in Locomotives,** by Mr. John I. Yellott, of Baltimore. (75.)
Nov. 26—Dinner Meeting, Chateau Laurier—In honour of Mr. J. B. Hayes, President of the Engineering Institute of Canada. An illustrated talk **The Atomic Bomb Tests at Bikini,** by Air Vice-Marshal E. W. Steadman, C.B., O.B.E. (160.)
Dec. 19—Luncheon Meeting, Chateau Laurier—A film entitled **Clean Waters,** shown through the courtesy of the Canadian General Electric Co. (100.)

PETERBOROUGH BRANCH

The following meetings were held during 1946, with attendance shown in brackets:

Jan. 10—Mr. Paul Clark, Aluminum Company of Canada—**The World's Aluminum Industry and Canada's Relation to it.** (51.)
Feb. 14—Messrs. Dick, Parr, Danks, Canadian Ingersoll Rand—**Compressed Air in Industry.** (51.)
Mar. 14—Mr. J. P. Sesia, Faircraft Industries of Canada—**Factory Built Homes.** (93.)
May 15—Annual Meeting—Guest Speaker R. H. Spencer, Bell Telephone Company—**Your Voice as Others Hear It.** (65.)
June 22—Annual Picnic. (76.)
Oct. 26—Trip to Kingston as guests of Aluminum Company of Canada. (60.)
Nov. 21—Dr. E. G. Faludi, Town Planning Consultants, Limited—**Town Planning in Peterborough.** (94.)
Nov. 27—Annual Dinner. (56.)
Dec. 12—Dr. H. Moore, Stevenson & Kellogg, **Management Engineering.** (49.)

QUEBEC BRANCH

The programme of activities was as follows (attendance is given in brackets):

Jan. 16—**Electricity in the Navy.** Lt.-Cmdt. J. G. Ferraris, R.C.N.V.R. (41.)
Feb. 25 **Some Notes on Engineers and Engineering.** Lt.-Col. E. D. Gray-Donald, Quebec Power Co. (125.)
Apr. 4—**Radar.** W. A. Laurie, Bell Telephone Company. (76.)
Apr. 29 **Transport par Autobus, hier, aujourd'hui et demain.** C. H. Boisvert, Chairman of the Branch. (70.)
May 29 **Béton armé — Béton pré-contraint.** Professor G. Magnel, Head of the department of civil engineering at the University of Ghent, Belgium. (60.)
June 3—Annual Meeting of the Branch. (20.)
Sept. 9—Annual Golf Tournament. (90.)
Nov. 1—**L'Après-guerre en Allemagne.** Dr. P. E. Gagnon and Dr. Roger Potvin of Laval University. (46.)
Nov 18—**The President's Visit.** (75.)
Dec. 9—**Recent Developments in the Use of Carbon and Graphite.** A. G. Dilks, electrical engineer, Canadian National Carbon, Montreal. (35.)

SAGUENAY BRANCH

During the year the Branch held a total of nine general meetings:—

Jan. 31—**Industrial Electronics—To-day and To-morrow,** by J. D. Willis, Assistant Manager, Industrial Division of the Apparatus Department, Canadian General Electric Co., Toronto, Ont.
Feb. 19—**The Romance of Gold Mining,** by A. H. Tait, Manager of Mistassini Exploration Company, Arvida, Que. This program also included a sound color film entitled "River of Paper" by Powell River Co.
Mar. 29—**Canadian Technical Investigator Tours Europe after V-J Day,** by R. W. Herzer, Aluminum Company of Canada, Ltd.. Montreal, Que.
Apr. 26—**Parks for Use of the People,** by G. F. Todd, Landscape Architect, Montreal, Que.
May 28—**Magic of the Spectrum,** by M. Laflamme, Lighting Service Engineer, Canadian General Electric Company, Montreal. This meeting was held jointly with C.I.C.
June 26—Annual Dinner Meeting held in the Grill Room of the Saguenay Inn for the purpose of meeting the Institute President, Mr. J. B. Hayes.
Sept. 24—**How Student Architects View Arvida and District,** by Gordon Webber, Instructor in visual design, McGill University. Also **Town Planning in Postwar England,** by Mr. Spencer Sales, Assistant Professor of Architecture, McGill University, Montreal.
Nov. 5—**Yacht Racing,** by D. M. Jemmett, Professor of Electrical Engineering, Queen's University.
Dec. 5—**Exploitation of the Caustic Chlorine Industry in Germany,** by Dr. W. C. Gardner of the Mathieson Alkali Works Inc.

In addition to the above, the Junior Section held six general meetings and a dinner meeting.

SAINT JOHN BRANCH

The Executive held ten meetings during the year with an average attendance of seven members.

Six general meetings of the Branch were held during 1946, five at the Admiral Beatty Hotel in Saint John, and one, a public meeting, in the Saint John High School.

Jan. 24—Annual Joint Dinner of the Branch and Association —A. S. Donald. Chief Highway Engineer, Department of Public Works, N.B., spoke on the **Construction of the Goose Bay Airport.** (78.)
Feb. 21—Dinner Meeting at which Mr. J. W. MacDonald, Resident Engineer, N.S. Light and Power Co. spoke on the **12,500 k.w. Steam-Electric Station of the N.S. Light and Power Company.** (36.)
Mar. 21—B. W. Isner, Manager, Canadian Gypsum Company, Hillsborough, spoke on the **Production and Manufacture of Gypsum Products.** (26.)
Apr. 17—Dr. G. C. Laurence of the National Research Council addressed a public gathering in the Saint John High School on **Atomic Energy.**
Oct. 29—A. V. Tracy-Gould spoke on **A General Outline of the Manufacture of Kraft Paper.** (32.)
Nov. 21—Mr. R. M. Doull, General Manager of Canada Gunite Company spoke on the **Reconstruction of the Halifax High Service Reservoir.** (54.)

An Annual Meeting was held at the end of April, 1946. At this meeting it was decided by ballot that the Annual Meeting of the Branch should be held on or before the second Tuesday in December instead of on or before the second Tuesday in May, thus coinciding with the date of the Annual Report required for the E.I.C. in December. The Branch Officers elected at this Annual Meeting will hold office until the Annual Meeting in December, 1947. In accordance with the above an Annual Meeting was held at the Admiral Beatty Hotel on December 12. The Annual Branch Report for the year ending December 31, 1946 was presented and vigorous discussions took place on matters of current E.I.C. interest.

ST. MAURICE VALLEY BRANCH

During the year 1946, the following general meetings were held:

Jan. 9—Lecture Meeting: T. A. Carter of the Aluminum Co. of Canada spoke on **Some Aspects of Engineering in India.** The lecture was illustrated.
Jan. 29—Dinner Meeting: A. B. McEwen of the Defense Industries Limited spoke on **Design and Construction of Munition Plants in Canada.**
Feb. 8—Lecture Meeting: J. H. Rawlatt of the Bell Telephone Co. of Canada spoke on **Radar.** This meeting was joint with the Chemical Institute of Canada.
Apr. 13—Annual (Luncheon) Meeting: P. L. Pratley, Consulting Engineer, spoke on **Preliminary Considerations for Bridge Projects.** The results of the annual elections were announced and the new officers of the Branch installed in office.
Oct. 22—Lecture Meeting: G. M. McHenry of the Canadian General Electric Co. spoke on **Industrial Power Distribution.**
Nov. 20—President's Visit: Always a highlight of the Branch Activities, this year's visit from Mr. J. B. Hayes was no exception. Mr. Hayes, Mr. Heartz and Mr. Trudel, all spoke briefly after a dinner held in the main dining room of the Chateau de Blois in Three Rivers.

SARNIA BRANCH

This was the first full year of operations of the Sarnia Branch, having been officially organized as a branch in October 1945. During the year there were eight general meetings including the annual meeting, and the executive held ten meetings. A list of the general meetings with speakers and subjects, follows:

Jan. 24—A joint E.I.C. and C.I.C. meeting, held in St. George Hall. The speaker was E. Smith of the Dow Corning Corporation, his subject being **Silicones.**
Feb. 28—A dinner meeting at the Sarnia Golf Club with 33 members present. The speaker was I. G. Goddard, of the Canadian General Electric Co. who spoke on **Plastics.**
Apr. 4—A dinner meeting at the Sarnia Golf Club with 24 present, with Mr. T. J. Holme. of the Canadian G.E. Co. as speaker. His subject was **Electronics.**
May 9—A dinner meeting at the Sarnia Golf Club with 24 present. The speaker was Mr. C. F. Davison, of the Dominion Salt Co., speaking on **Salt.**
June 14—This was the occasion of the president's visit, and a dinner meeting was held at the Golf Club, to which the ladies were invited. President Hayes, and Dr. L, Austin Wright both addressed the meeting. The attendance was 52.
Oct. 3—A. E. K. Bunnell of Toronto addressed a dinner meeting at the Polymer Cafeteria, with 30 present. His subject was **The Engineer and Community Planning.**
Nov. 21—A dinner meeting at the Polymer Cafeteria with Dr. M. K. Inman of the University of Western Ontario as speaker. Twenty-six heard his address on, **The Gold Standard, and the International Monetary Fund.**
Dec. 5—The annual meeting, at which thirty-four attended. Reports of committees, the election of officers, and a discussion of local problems, were followed by a social evening.

SASKATCHEWAN BRANCH

All meetings were held jointly with the Association of Professional Engineers. The respective programmes were as follows:

Jan. 18—Discussion on Collective Bargaining, followed by social evening.

Feb. 13—Annual Meeting addressed by Col. Steer-Webster on **Mulberry.**

Apr. 4—Regular meeting addressed by Dr. E. G. Faludi on **Principles of Town Planning.**

June 7—Special meeting addressed by J. B. Hayes, president; L. Austin Wright, Gen. Sec'y., and G. J. Currie, Councillor.

Oct. 25—Regular meeting addressed by W. H. Prevey on **G. E. Fault Selective Protection on Distributive Systems.**

Nov. 15—Regular meeting addressed by G. E. Kent, with technicolor film **Search Unending.**

Dec. 12—Regular meeting addressed by W. L. Bunting with film showing restoration of wild bird breeding places.

The average attendance at these meetings was 35.

Ten meetings of the Executive were held during the year.

SAULT STE. MARIE BRANCH

During the year 1946 the Sault Ste. Marie Branch held three executive committee meetings and six general meetings. The general meetings were:—

Feb. 22—**Prepakt Concrete,** by William Johnson, Intrusion Prepakt Company Limited, Toronto.

Mar. 29—**Algoma Steel Corporation North Ore Dock Extension,** by Carl Stenbol, Algoma Steel Corporation Limited, Sault Ste. Marie, Ont.

Apr. 6—**Artificial Harbours,** by W. D. Adams, Algoma Steel Corporation Limited, Sault Ste. Marie, Ont.

June 12—Visit to the Branch by President J. B. Hayes and General Secretary Dr. L. Austin Wright.

Nov. 29—**Fundamentals of the Oxy-Acetylene Process,** by Gordon N. Sale, Dominion Oxygen Company Limited, Sault Ste. Marie, Ont.

Dec. 30—Annual Dinner and Induction of Officers. The average attendance at the general meetings was 22.

TORONTO BRANCH

The executive held seventeen meetings, with an average attendance of nine.

Regular meetings of the Branch are listed below, with the attendance given in brackets:

Jan. 10—**Developments in Concrete Practice and Construction,** by R. A. Crysler. (67.)

Jan. 24—**Student Night** — (Joint with Junior Section):
—**High Speed Flight and its Difficulties,** by G. Rosenthal.
—**Earth Dams,** by W. Finley.
—**Variable Speed A.C. Motors,** by N. R. Buchanan.
—**Cemented Carbides,** by J. R. Moore. (182.)

Feb. 14—**Electric Transportation,** by C. M. Davis. (48.)

Feb. 21—**The Profession of Engineering**—10 speakers and general discussion. (152.)

Mar. 7—**New Frontiers for Chemistry,** by H. H. Lank (joint with Chemical Institute of Canada.) (28.)

Mar. 14—**Aircraft Gas Turbines,** by W. Boyd (joint with A.S.M.E.) (170.)

Mar. 28—Annual Meeting—**Looking Ahead with Telephone Scientists,** by G. L. Long. (79.)

Apr. 26—**Presidential Visit**—President Hayes. (62.)

June 3—**Pre-stressed Concrete,** by Prof. G. Magnel. (110.)

Oct. 4—**Exercise Musk-Ox,** by Dr. J. T. Wilson. (390.)

Oct. 24—**Community Planning**—Panel Discussion, by R. F. Legget, A. Adamson, R. Dobbin, P. A. Deacon, J. F. MacLaren, J. Layng, H. Scott, (joint with Ontario Association of Architects.) (127.)

Nov. 1—**Engineers' Dance,** joint under Affiliated Engineering and Allied Society, and University of Toronto Engineering Alumni Association. (1,386.)

Nov. 28—**Toronto's Smoke Problem,** by Professor A. E. Allcut. (184.)

Junior Section

The primary aims of the Junior Section have resolved themselves into a consideration of the social, economic and professional problems as well as technical problems and also into a concerted effort to promote the interests of the Institute. A special drive to obtain student interest has been launched. The secondary aim has been to point out to non-members of the Institute that they can associate themselves with the Junior Section. The schedule of meetings for the past year follows:

Jan. 24—Student's Night. (180.)

Feb. 4—Dinner meeting, technical. (60.)

Mar. 4—Relation of E.I.C. with C.C.P.E. & S. (150.)

Mar. 19—Plant trip, Victory Mills. (70.)

Apr. 2—Annual meeting. (40.)

Oct. 8—Jet Propulsion. (225.)

Nov. 12—Dinner meeting, Atomic Energy, Frequency Modulation, Salary Survey. (110.)

Nov. 21—Plant trip, Consumers Gas. (80.)

Nov. 27—Ajax meeting, Pres. Hayes. (800.)

Dec. 11—Job Evaluation & Wage Incentive. (65.)

All meetings have been made more interesting by the showing of one or two movies and the presenting of an attendance prize.

VANCOUVER BRANCH

Dec. 11, 1945—Brian Perry, Consulting Engineer, of Montreal, on **Development of Plant and Manufacturing Methods for Penicillin.**

Jan. 21, 1946—Electrical Commander Deane of the Royal Canadian Navy on **Electricity in the Navy.**

Feb. 13—Student Night with Gordon Heal of the Student Branch, presiding. The three speakers were Gordon Ellis, speaking of **Ripple Rock;** Dave Bakewell on **Detailed Topographic Maps for Logging;** and Tom Scott, who represented the University Engineering Students' Branch at the Annual Institute Convention held in Montreal, gave a report on their deliberations.

Mar. 21—M. O. Paquette, Chief Engineer of Stevenson & Kellogg, Ltd., gave an outline of **Modern Scientific Approach to Job Evaluation and Personnel Problems.**

Apr. 16—Annual Ladies' Night—held at the Hudson's Bay Store, viewing "Operation Mulberry". This was an exceptionally fine evening, with members, their wives and friends, gathered to view the British War Office's model exhibit of the preparations for the beach landings undertaken in the invasion of Europe. The personnel was headed by Col. Steer-Webster of the British War Office. The Hudson's Bay Company very kindly served lunch on that occasion.

May 22—President's Dinner held at Stanley Park. President Hayes was accompanied by our genial Secretary Dr. Austin Wright and Councillor G. J. Currie from Halifax.

Oct. —Professor Forward of the University of British Columbia spoke on his recent trip to China.

The attendance at our meetings has been very gratifying, ranging from 45 to 75 at our meetings, 85 at last year's annual meeting and an attendance of about 550 members, ladies and friends at the Annual Ladies' Night. It has been the Executive's policy to co-operate with the Association of Professional Engineers, because of our very close mutual interest, and they have received an invitation to all meetings. Your Executive Member, Mr. Noel Lambert, who is also a member of the Council of the Profession, placed before that body our desire for closer co-operation in arranging joint meetings.

VICTORIA BRANCH

During the year there were four meetings of the executive committee and seven general meetings of the branch. The branch meetings may be summarized as follows:

Jan. 3—**Annual meeting.** This was a luncheon meeting held in Spencer's Dining Room.

Mar. 7—General meeting. **Snow Surveys** by Major R. C. Farrow, M.E.I.C., vice-chairman, Victoria Branch.

May 10 to 18—**Mulberry.** During this week, the Mulberry Exhibit was shown under the auspices of the Hudson's Bay Company and the Engineering Institute of Canada at the Bay Street Armories. A dinner meeting was held by the Hudson's Bay Company to which the members of the Victoria Branch of the Engineering Institute were invited. The meeting was addressed by Col. Steer-Webster, Commanding Officer of the Exhibit.

May 27—Presidential Dinner. A dinner was held in honour of the President on Monday evening, May 27th, at the Empress Hotel. There were forty-five members and ladies present. The meeting was addressed by Mr. Hayes, President, and by Mr. Currie, Councillor from the Halifax Branch, and also by Dr. Wright.

May 28—General business meeting in the Oak Bay Municipal Hall. President Hayes addressed the meeting on the growth of the Engineering Institute of Canada, the impressions gained on his trip across country and on the part played by the Engineers of Canada in the War Effort. Mr. Currie brought greetings from the other Branches across the Dominion and also particularly from the Halifax Branch. The main address of the evening was given by Dr. Wright who spoke on a number of subjects of interest to the engineering profession. A considerable amount of discussion followed Dr. Wright's informative address.

Nov. 28—Luncheon meeting for the purpose of selecting a slate of nominees for office in the Victoria Branch for 1947.

Dec. 16—Annual meeting of the Branch for the purpose of electing an executive committee for the year 1947. The meeting was addressed by Major-General W. W. Foster on **Developments in Northern Canada.**

WINNIPEG BRANCH

Late in 1945 Electrical and Student Sections of the Branch were formed and after a full year's operation it can be reported that the results are very satisfactory. Below are listed the meetings held by the Branch and the two sections. The Branch general meetings are frequently held jointly with the A.P.E.M.

The Branch Executive has held 10 meetings during the year with an average attendance of 10.

Jan. 10—**Field Engineering for Military and Naval Construction,** E. V. Gilbert, M.E.I.C. and Lt. Col. W. A. Capelle, M.E.I.C.—Dept. of Public Works, Dominion Government, E.I.C.-A.P.E.M. (60.)

Jan. 14—**Centralized Control of a Power System,** Mr. Perry Peterson, Chairman Automatic Stations Committee A.I.E.E. and President Control Corporation, Minneapolis—E.I.C., Elec. Sect. E.I.C., A.P.E.M. (68.)

Feb. 7—**Annual Meeting of the Branch**—Following various reports and installation of the new Executive, a moving picture " The Big Duck Factory " was shown under the auspices of " Ducks Unlimited " E.I.C (67.)

Feb. 25—Film " No Keener Blade " shown and described by Mr. Dunn, Canadian Liquid Air Company.
The Present Situation in Respect to Housing Under the Veteran's Land Act. Informal talk by Mr. Bruce Johnson, District Construction Supervisor.
The Wildwood Housing Project. Informal description of this local housing project. (400 units) by H. S. Bird, M.E.I.C., Pres. Bird Construction Co. Ltd. This was a dinner meeting held at the St. Regis Hotel. E.I.C.—A.P.E.M. (84.)

Apr. 2—**The Shipshaw Power Development**—F. L. Lawton, M.E.I.C., Assistant Chief Engineer, Aluminum Company of Canada Ltd., Montreal. Illustrated. E.I.C.—A.P.E.M. (69.)

May 9—**President's Visit**—Pres. J. B. Hayes spoke informally to the Branch. Halifax Councillor G. J. Currie brought greetings and Gen. Sec. L. A. Wright spoke on Institute affairs. This was a luncheon meeting held in Hudson's Bay Company Dining Room. E.I.C. (62.)

Oct. 24—**Inflation**—Prof. W. J. Waines, Dept. of Political Economy, University of Manitoba E.I.C.—A.P.E.M. (66.)

Nov. 21—**Early History of Canada** — Rev. Father Antoine d'Eschambault, Chancellor of the diocese of St. Boniface. This was a dinner meeting held in the Marlborough Hotel. E.I.C.—A.P.E.M. (54.)

Electrical Section

The following meetings were held by the Electrical Section of the Winnipeg Branch during the year 1946.

Jan. 14—Perry Peterson, Chairman, Automatic Stations Committee A.I.E.E. and President of Control Corporation of Minneapolis, spoke on **Centralized Control of a Power System.** (66.)

Mar. 14—W. A. Trott of Greenlaw & Trott — Consulting Engineers, spoke at the inaugural dinner meeting of the Section on **The Technique of Modern Lighting.** The members and their wives heard several prominent members of the engineering profession give their well wishes to the Electrical Section on this memorable occasion. (62.)

Apr. 25—C. E. Tremblay, formerly chief Engineer of Radio Station C.J.O.B., spoke on the **Design of a Broadcasting Station from Studio at Antenna.** This meeting was followed by an inspection of the studios of C.J.O.B. (25.)

May 9—W. A. Cole, Ground Station Radio Engineer for Trans-Canada Airlines, spoke on **Radar Principles and Applications.** This talk was illustrated with slides and samples. (43.)

Oct. 10—M. D. Young, General Superintendent of Distribution for City of Winnipeg Hydro Electric System, spoke on **Factors and Features in an Urban Distribution System.** Mr. Young covered some of the problems peculiar to Winnipeg including the joint use of poles. (44.)

Nov. 7—C. H. Dahl, Manager of Transportation for the Winnipeg Electric Company, spoke on **Modern Trends in Urban Transportation.** Mr. Dahl outlined some of the modernization plans of his company for improving service to the citizens of Winnipeg. (38.)

Dec. 5—An open Forum on **Electronics** was led by Professor E. R. Love after a Canadian Westinghouse Film " Electronics at Work ", was shown. The principal speakers of the evening were: J. D. Peart of Northern Electric who spoke briefly on **The Development of Telephony;** V. C. Jones of the C.P.R. Communication Department discussed **Carrier Communication;** while E. W. Wirtanen of the Canadian General Electric, outlined the **Principle of the Amplidyne** and a few of its applications. The discussion period following was one of the best experienced by the Section. (47.)

Dec. 10—A special meeting of the Electrical Section was called to hear Mr. J. T. Thwaites, Division Engineer—Electronics of the Canadian Westinghouse Company, speak generally on **Electronics.** This was one of the most interesting meetings of the Section and was called on short notice when it was learned that Mr. Thwaites would be in Winnipeg. (40.)

Student Section

The Student Section Executive has held two meetings with an average attendance of 8.

Jan. 22—Election of officers by Mr. C. P. Haltalin, Chairman Winnipeg Branch E.I.C., Mr. H. L. Briggs gave a short talk on the aims of the E.I.C., Mr. Eric Bergenstein, as Manitoba representative for the Student Conference at the Annual Meeting of the E.I.C. in Montreal, asked for discussion topics. Meeting held at Broadway Site at 8.00 p.m. (60.)

Feb. 15—**Carrier Current Control,** L. A. Bateman. JR.E.I.C. **Report on E.I.C. Annual Meeting,** Eric Bergenstein, S.E.I.C. Election of Student Officers. Meeting held at Broadway Site at 8.00 p.m. (54.)

Mar. 20—**Construction of an Electric Light Bulb** and **Dare Devils** Films. Discussion by Ernest Scott on Summer Correspondence. Meeting held at Fort Garry Site at 12.30 p.m. (60.)

Oct. 25—**Purpose of the E.I.C.,** Dean E. P. Fetherstonhaugh, M.E.I.C. **Opportunities of the Young Engineer in Canada,** M. A. Lyons, M.E.I.C. Meeting held at Broadway Site 8.00 p.m. (40.)

Nov. 27—**Soil Mechanics,** Mr. G. B. Williams, Dept. of Public Works, Manitoba, supported by film. Meeting held at Broadway Site 8.00 p.m. (54.)

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

NEW LABOUR LEGISLATION

The Institute's Committee on Employment Conditions has been studying the draft of a bill which it is proposed will replace the much discussed order-in-council 1003. It is identified as "The Industrial Relations and Disputes Investigation Act 1947". Two changes of importance have been noted, i.e., the word "professional" now appears for the first time in the definition of an employee, and the word "profession" appears alongside the word "craft" in clause 10. Herewith are the relevant contexts:

> "employee" means a person employed by an employer to do skilled or unskilled manual, clerical, technical or professional work.
>
> *and—*
>
> Where the majority of a group of employees of an employer who belong to a craft or profession, by reason of which they are distinguishable from the employees as a whole, are separately organized into one trade union pertaining to the craft or profession, if the group is otherwise appropriate as a unit for collective bargaining, the trade union may apply to the Board and shall be entitled to be certified as the bargaining agent of the employees in the group.

These clauses indicate clearly that the professional worker is now to be included in the groups embraced by the order. Not everyone knows that in the definition of "employee" in the original Order 1003 it was never the intention of the framers of the legislation to include the professions. The word "technical" in the Order was taken by the Committee of Fourteen to mean professional, but it has been disclosed that that was not the intention of the Department of Labour. The new order however is different.

In the beginning of negotiations the Committee of Fourteen pressed for collective bargaining rights for the professional worker, but always with the reservation that its complete control should be in the hands of the profession. Eventually collective bargaining agencies were set up in Ontario and Quebec under the aegis of the registration bodies, and after considerable intensive work these agencies were recognized by the National and Provincial Labour Boards. Unfortunately however the Boards ruled that in applying for the bargaining rights for any group of professional workers, the agencies had to include also the non-professional workers in the same unit. For example, in the engineering department of an employer the agency would have to accept representation for draughtsmen, tracers, blue-printers, stenographers, and so on, as well as for engineers.

In the opinion of many people, these rulings have ruined the situation for engineers, because the non-professional employees in a unit might well outnumber the professional, and therefore by their numerical superiority take control, and in the course of time vote the unit into a trade union. In fact, the unions themselves have seen in the bargaining agencies established for engineers, a ready recruiting agency or a semi-ready union for themselves. This is precisely the sort of thing the Committee of Fourteen tried to avoid, but the Board rulings have dealt the Committee's ideas a fatal blow.

Right from the beginning there were many engineers who maintained that collective bargaining was not good for the profession—and was not feasible. Circulated in 1944 the Institute questionnaire showed that a strong majority wanted complete exclusion from the Order if the profession could not have control of its own bargaining. Therefore today the committee finds itself in the position of petitioning the Minister to separate the professional workers from the non-professional in collective bargaining or to exclude them entirely from the order.

The *Journal* is informed that recently the Ontario federation declined to accept the bargaining certification granted by a Board—although they had applied for it—because the Board insisted they include the non-professionals as well.

The *Journal* is informed also that the Corporation of Professional Engineers of Quebec has just reversed its stand, and now asks the Minister of Labour that engineers be excluded from the new order. It believes that the Board's interpretations have put the engineers into an impossible position, and that the best hope for the future is to get back to where the entire group is excluded, being subject only to provincial legislation.

After referring to "the decreasing membership of the federations," their message to the Minister states, "it is evident that the wish of professional engineers is that their interests be served through the medium of their professional societies or associations, without need of recourse to the machinery of collective bargaining under the auspices of labour laws".

These two developments make serious reading. It is evident that the well-meant efforts to obtain bargaining for engineers have not produced the results desired by everyone. Just what the future holds no one can say, but there should be no difference of opinion as to the unfavourable treatment up to now, nor as to the hopes for the future. If the profession cannot have complete control of its own affairs, it should endeavour to escape entirely from the order.

DIAMOND JUBILEE MEETING

The programme for the Annual Meeting at the Royal York Hotel, Toronto, next May, is taking definite shape and it will be possible in the next few weeks to send detailed information together with the necessary cards for reservations. In the meantime, the following outline may be of interest.

The annual meeting of Council will be held on May 7th. The annual general business meeting will take place on the morning of May 8th. General A. G. L. McNaughton will speak at lunch on atomic energy; a technical session on the same subject will follow in the afternoon under the chairmanship of Dr. C. J. Mackenzie. A smoker is being organized by the Junior Section for that evening.

Friday the 9th will be devoted to technical sessions covering various branches of engineering.

The annual banquet and dance are scheduled for Friday the 9th.

SIR FREDERICK HANDLEY PAGE IN MONTREAL

From time to time the Institute has an opportunity to entertain some distinguished visitor from outside Canada. It was only a short time ago that Sir Robert Watson-Watt was the luncheon guest of the officers of the Institute, and on February 26th Sir Frederick Handley Page similarly honoured the Institute.

Sir Frederick who is founder and head of the well known firm of aircraft manufacturers bearing his name, is in Canada as leader of the United Kingdom delegation to the meeting of the Provisional International Civil Aviation Organization (PICAO) dealing with air worthiness. He is also president of the Royal Aeronautical Society, and in this capacity was host to the president and general secretary of the Engineering Institute in London, England, last September.

Other guests of the Institute included two associates of Sir Frederick's, namely Dr. E. P. Warner, president of the Interim Council of PICAO, and Sir James Cotton, head of the United Kingdom permanent delegation to PICAO.

President J. B. Hayes flew from Halifax to meet the guests, but in the short interval before his arrival Vice-President Armstrong presided.

Sir Frederick spoke in some detail of industrial conditions in England, dwelling particularly on the labour situation. Without minimizing the emergency he expressed the opinion that things were not as bad as reported. While naturally not enthusiastic about a labour form of government, he felt that the good men in the present government—of which there were many—would work out the problems satisfactorily. He had great faith in the British workman—in his industry, his integrity and his insistence on good government. He was confident that the native conservatism of the people would prevent the country from becoming too radical or going communistic.

In conclusion, Sir Frederick extended the good wishes of the Royal Aeronautical Society to the officers and members of the Institute. The luncheon was held at the Engineers' Club, Montreal.

INDUSTRIAL RELATIONS IN GREAT BRITAIN

It is pretty well recognized everywhere that economic conditions in Great Britain are not as favourable as could be desired. It is apparent too that the British people propose to do something about it. A recently issued White Paper sets down some interesting facts for the benefit of employers and trade unions, who through the National Joint Advisory Council are endeavouring to prepare for the government a statement on all matters affecting industrial relations.

The paper begins by emphasizing the great need of the United Kingdom for a considerable sustained increase in the production of goods of all kinds. The biggest problem is the shortage of manpower. "The country has six years of civilian work to catch up, in addition to repairing a vast amount of bomb damage and rebuilding the blitzed areas."

In addition, the United Kingdom must pay her way abroad. As a result of the war she has incurred debts, and lost half her overseas investments—and their income. Britain imports more than half her food and most of her raw materials. To make up, she must increase her exports. At present, though she exports more goods than in 1938, she imports only 70 per cent of that year's imports. Yet Britain cannot even pay for this low amount of imports except by using the Canadian and U.S.A. loans.

The wage rate increase since July 1945, reckoned in terms of the 1945 Wage Bill, means some $1,000,000,000. The total increase since the beginning of the war, in terms of the 1939 Bill, is some $4,800,000,000. "The Government and the country desire that these gains should be made secure and become a permanent advance in real wages. How is this desire to be achieved?"

The statement says "the answer first and last is by increasing production. At present there is too much money chasing after too few goods". Over $28,000,000,000 of income (after income tax has been paid) is trying to buy some $24,000,000,000 worth of goods and services.

"We must concentrate on increasing production in those home industries which supply the vital materials required for the necessities of life. This is not only essential if we are to achieve the standard of life which full employment should ensure, but it is even more urgent in the short run to break the shortage of basic materials which is holding up the whole process of reconversion of civilian life and industry".

CUSTOMS DUTY ON ENGINEERS' PLANS

Following an exchange of letters and telegrams with the Department of Finance dating back to July 1946, representatives of the Institute appeared before the Minister of Finance—the Hon. Mr. Abbott—on Thursday, January 23rd, as joint delegates with the Corporation of Professional Engineers of Quebec, to protest the removal of protective tariffs against engineers' plans entering Canada from other countries.

The delegation emphasized the points raised in the resolutions that had been sent to the Minister previously (see December *Journal*, p. 725) and asked that the protection be restored. Without wishing in any way to encourage the Government to remove the protection on architects' plans, the delegation pointed out the inconsistency of removing the duty on engineers' plans but leaving it on architects' plans, when both sets of plans might well be for different parts of the same project.

The Minister was sympathetic without being committal, and asked that the interview be followed up with a memorandum reviewing the points and the argument.

The delegation was made up of E. A. Ryan, deGaspé Beaubien, R. E. Chadwick, R. S. Eadie, N. B. MacRostie, J. G. Chênevert, Marc Boyer and the general secretary. A delegation from the Canadian Council of Engineers and Scientists was also present consisting of G. B. Langford, T. M. Medland, Hazen Sise and Mrs. M. L. White.

ONTARIO ASSOCIATION ELECTS NEW PRESIDENT

At its twenty-fifth annual meeting held in Toronto on January 18th, the Association of Professional Engineers of Ontario announced the election of Dr. George B. Langford as its president for the year 1947. Dr. Langford is professor of mining and geology at the University of Toronto. Recently he has been on loan to the Ontario Department of Planning and Development as director. Dr. Langford has taken a prominent part in the affairs of the profession in Ontario and was particularly active in the work of the Committee of Fourteen during its negotiations on collective bargaining.

ONTARIO HYDRO NEWS

Certainly the news of the month for the profession is that Dr. T. H. Hogg, chairman and chief engineer of The Hydro Electric Power Commission of Ontario, has been asked for his resignation. Mr. Drew, Premier of Ontario, has stated in the press and over the radio that Dr. Hogg has failed to keep him informed of the activities of the Commission and therefore he proposed to dispense with his services.

The examples which Mr. Drew gives through the press to illustrate Dr. Hogg's derelictions of duty are not very convincing. To an outsider it would seem that there must be more behind the story than has yet been made public. However the fact remains that the Commission is a government appointed organization, and hence is subject to government control; therefore Dr. Hogg would have no alternative but to resign. The press reveals that his resignation was submitted on January 31st.

This is the second example of a chief engineer of this Commission being removed from office peremptorily. There is no suggestion of incompetency. When Dr. Gaby was removed in 1934, engineers across Canada were very critical of the government's action. They are not likely to be less critical in the case of Dr. Hogg.

It is no part of *Journal* policy to become involved in political issues, but there is some significance in these developments for the engineer or other professional worker which can be discussed appropriately in these columns. It is apparent that the engineer accepting employment with a government—any government, municipal, provincial or federal — faces a hazard which is not found in other employment. Not only is he liable to dismissal for incompetence as in any other employment but he may become a victim —even an innocent victim—of a political exigency or expediency.

Engineers are not distinguished for their political sagacity and therefore it might be well for them to keep in mind the hazards of government appointments. The salaries offered for such employment are not so attractive that one can afford to neglect these possibilities. What has happened in the Ontario Hydro may well be considered seriously by engineers everywhere.

Later Developments

Since the news of the attack on Dr. Hogg, Mr. Drew has announced a programme of investigation of the Hydro. Chief among the agencies employed for the purpose is a firm of American engineers. Citizens everywhere may well be surprised that a government would choose to spend the taxpayers' money with a foreign organization, when Canadian consulting engineers are fully competent to do the work. No country in the world has better hydraulic engineers than Canada, and certainly there are no people who know Canadian conditions as well as Canadians.

In spite of the eminence of Canadian engineers in this field it would be hard to imagine an American state employing a firm of Canadians to carry out a similar investigation in the United States. Canada does not equal or excel the States in many things, but here at least is one field in which Canadians have no superiors, and yet the business is denied to them. Perhaps it will be contended that as the firm has a small contact office in Toronto, it can be considered as a Canadian organization. To make such a claim would be simply to beggar the question.

Here is another stirring example of how we drive our citizens into the United States. If governments cannot give Canadian work to Canadians how can others be expected to do so?

NATIONAL RESEARCH COUNCIL APPOINTMENT

An appointment of interest and importance to Canadian engineers was announced on January 24th by the Right Honourable C. D. Howe. Dr. David A. Keys, Macdonald Professor of Physics at McGill, has been made vice-president of the National Research Council, in charge of the overall atomic energy establishment at Chalk River, Ont.

This appointment marks a change in management at Chalk River. Heretofore the operation of the plant has been in charge of Defence Industries Limited, but, with the appointment of Dr. Keys, all phases of the plant activities become the responsibility of National Research Council.

Dr. Keys, who as vice-president will be the senior resident officer in charge, is one of Canada's most distinguished physicists with a long and impressive experience in research, scientific education and administration. Born in Toronto, he attended Upper Canada College and had a brilliant record at the Universities of Toronto, Harvard and Cambridge where he obtained Doctorate of Science degrees. He joined the staff of McGill University in 1922.

During the war of 1914-18, he saw service in the Anti-submarine Division of Admiralty, and during the years since has contributed many valuable papers to scientific societies. Dr. Keys is a Fellow of the Royal Society of Canada, has served on innumerable scientific and technical committees during the war, is a member of the National Research Council, and has a great deal of experience on the administrative side of research work and general scientific activities.

CANADIAN CONSTRUCTION ASSOCIATION CHANGES

It was fitting that the Canadian Construction Association should tender a complimentary luncheon to J. Clark Reilly to mark his retirement after twenty-eight years of service as general manager. The luncheon was a feature of the 29th Annual Meeting of the Association held in Niagara Falls on January 14th, 15th & 16th, 1947.

Mr. Reilly, a graduate of McGill, has been an integral part of the construction business for many years, although his early training was designed to fit him for the Methodist ministry. After his return from the first world war he found no opening in a pastoral charge so he turned to the Association of Canadian Building and Construction Industries, which subsequently became the Canadian Construction Association, and there he has remained, rendering a unique service to the industry and to his country.

Mr. Reilly has been succeeded by R. G. Johnson who has been assistant manager for several months. To Mr. Reilly the Institute expresses its appreciation of his splendid cooperation, and to Mr. Johnson it extends its best wishes for success in his new responsibilities.

MUNICIPAL MANAGEMENT AS A CAREER FOR ENGINEERS

The idea of having a professional man as manager and executive officer of a municipality, responsible to an elected council, was first tried in Staunton, Virginia, in 1908. Dayton, Ohio, was the next to try it six years later. The idea has met with such success that today about one-fifth of all American cities with population between ten and one hundred thousand, and one-fourth of all cities exceeding this size are run by managers, most of whom are engineers.

In 1914, an International City Managers' Association was founded to form a medium to exchange information, and to aid in the improvement of local government administration. Its numbers and activities have expanded greatly and it now supplies management information service, conducts an institute for training in municipal administration, and publishes authoritative statistical information.

Briefly, the main features of a council-manager government are: A council, elected at large, determines all municipal policies which are not set forth in the charter itself, adopts ordinances, votes appropriations, and is required to appoint a chief executive officer, called the manager. The council is the governing body, and the manager is wholly responsible for carrying out the policies which it determines. It is definitely understood that the council deals with administration only in a formal manner, through the manager, and that administrative functions are at no time delegated to committees or individual members of the council.

The manager should be selected on the basis of his training, ability and experience. He provides the council with information which enables it to determine municipal policies, advises the council in matters of policy if the council so desires, and executes the policies determined by council. He introduces the best principles of administrative organization and practice, and is held responsible for the proper co-ordination of all departmental activities under his direction.

In the province of Quebec, where lie the majority of Canadian municipalities using this form of government, authority for setting it up is given by the Cities and Towns Act of the Province. The actual decision to adopt such form of government rests with the council itself, although the approval by ballot of the general electorate may be required.

It is obvious that such a form of administration is more efficient in every aspect of the work. It saves time and work for the members of the council, who are usually not remunerated, and who usually have had no special training in the departments they administered under the old regime. It can reasonably be expected that it reduces inefficiency by eliminating patronage.

In Canada, relatively few municipalities have adopted the system, and those who have are mostly in the province of Quebec. There is no doubt, however, that as it becomes known to those who desire efficient government, it is more widely adopted.

Engineers, being trained to reasoned and systematic thinking, are well equipped for positions as managers, and the code of professional ethics to which they subscribe assures the moral approach to the work which is so necessary in municipal administration. It is essential however that any man undertaking this work shall have a proper understanding of the duties which he must assume, and a real and thorough interest in civic government. Municipal management offers a career which members of the profession may well consider.

A further advantage not to be overlooked is the opportunity such positions afford for establishing a home among pleasant surroundings. Too often an engineer must choose between a job " out in the bush ", far away from home and civilization, where his family cannot be with him for want of schooling facilities, or work in the big city, where living costs are higher, and fresh air and a garden are only a nostalgic dream.

C.C.A. CONVENTION AT NIAGARA FALLS

The 29th Annual Convention of the Canadian Construction Association was held at the General Brock Hotel at Niagara Falls, Ont., on January 14th, 15th and 16th.

Following a welcoming luncheon address by His Worship W. L. Houck, Mayor of Niagara Falls, and a few words by the Honourable Humphrey Mitchell, Minister of Labour, Alan C. Ross, Ontario Vice-President, read the annual address of C.C.A. President, Albert Deschamps, O.B.E., who was unable to attend, due to an unfortunate accident.

Mr. Deschamps pleaded for a " balanced construction program ". This was being advocated by the industry to reconcile competing demands for housing and industrial, commercial, institutional and engineering construction. Essential construction, he pointed out, included such types as low priced and low rental housing, industrial projects to provide jobs and assist in obtaining a share of world trade, expanding facilities for producing materials, roads to help the tourist industry and development of our resources, new power projects for overcoming existing shortages and for supplying power for new industries.

" We believe ", continued Mr. Deschamps, " that . . . elimination of all construction other than housing . . . would seriously hamper Canada's reconversion program ". As examples of certain types that should be deferred until 1948 at least, he named theatres and other places of amusement, summer cottages, and luxury homes. He believed the industry had carried out the maximum of housing construction that was possible with material available for that type of construction. Speaking of labor relations, he stated that union recognition and union rights carry with them moral responsibilities. Some unions were fully seized with this fact and to them all commendation was due. But the principle of union responsibility is one which calls for legislation in every province to avoid repetition of the excesses the nation so bitterly experienced in 1946. He closed by appealing to all to be zealous in keeping costs of construction within reason by self control, when all controls are lifted.

The afternoon session included an illustrated talk prepared by Dr. T. H. Hogg, Chairman of the Ontario Hydro, delivered by R. L. Hearn, Chief Engineer. The subject was the St. Lawrence Seaway, and what quantities were involved in the various component structures. The speaker traced the growth of Ontario's power load since before the war and the steps taken to meet the growth in demand, stressing the province's need for the million horsepower which was Canada's share of the potential capacity in the International rapids section only. The project would employ from 2,500 to 3,000 workers for a period of six years.

Mr. Hearn was followed by W. J. Leclair, Secretary Manager of the Canadian Lumbermen's Association, who painted a somewhat gloomy picture of the lumber supply situation over the next few years and blamed government controls for the current shortages and black market operations.

A fleet of Hamilton buses conveyed visiting members to a smoker in Buffalo for the evening, held at the Town Casino Club.

The second morning was taken up in discussions of the various resolutions prepared by the Resolutions Committee for consideration by the membership as a whole. A "Clark Reilly Luncheon" followed in honour of the retiring General Manager of the Association, J. Clark Reilly. Mr. E. Roland Gilley, Vice President for British Columbia, occupied the chair. J. M. Pigott, Past President, sketched in humorous and touching words, the history of the Association and the invaluable part in its growth and success played by Clark Reilly, presenting him on behalf of the Association with a very handsome silver tray.

The afternoon session was opened with addresses on the current materials supply situation, by Coordinator of Building Materials, Wilbur Uren, of Reconstruction and Supply, and by Robert Drummond, Ontario Vice President and Chairman of the C.C.A. Materials Committee. The latter outlined the Committee's recommendations made last spring for improving the supply situation, while the former acknowledged the value of the assistance given by the Committee to the government, telling how recommendations had been implemented, and explaining why it was impossible to take the actions suggested in the case of certain recommendations.

After further addresses by J. L. E. Price on veterans housing and vocational training, and reports from chairmen of general and trade contractors, roadbuilders and manufacturer's sections, the meetings adjourned for the President's reception and annual dinner, at which the principal speaker was the Honourable Dana Porter, Ontario Minister of Planning and Development, speaking on behalf of the Honourable George Drew, Premier of Ontario.

The third day was taken up with sectional meetings and unfinished business, a farewell luncheon, and an address by John Flood of Saint John, N.B., describing the recent Brussels Meeting of the I.L.O., which he and J. Clark Reilly had attended in December as delegates from the Construction Industry of Canada. The afternoon was occupied in moving adoption of reports and resolutions, and with the election and installation of officers for the ensuing year.

Resolutions passed included pleas for further increasing the output of building materials, for cooperation between management, organized labour and government in stepping up production, in cutting costs of materials and in speeding erection, in the field. The Dominion was asked for surveys and statistics to enable house builders to better schedule their supply and manpower needs both regionally and locally. Extension and improvement of the Dominion provincial program for training of tradesmen and apprentices was demanded, as well as the appointment of officers for vocational guidance in schools. The building and improvement of roads which will encourage resources development and the tourist trade, was advocated.

METAL CUTTING DATA

This is the name of a monthly magazine published by the American Society of Mechanical Engineers. It was developed during the war, and while it was sponsored by the U.S. War Production Board, the developing, assembling and publishing of the information was the work of an A.S.M.E. Committee. Its publication as an A.S.M.E. activity was recently undertaken because of the continuing need in peacetime for the unique service which such a magazine can render.

The publication is designed to keep its readers informed of new and unusual developments in cutting tools, tool materials, and machine methods. It provides:

—first-hand information on the practical application of carbides to boring, broaching, drilling, grinding, milling, reaming, turning and other types of machine tools;

—concise data on new uses of standard and specially designed cutting tools;

—results of important research laboratory investigations undertaken to determine tool life, tool wear characteristics; influence of cutting speeds upon tool life; power requirements and surface roughness when using different types of tool materials, etc.;

—clear and informative illustrations of special tools, tool holding equipment; tool wear; and actual machining operations;

—an annotated bibliography of important articles in current technical periodicals on metal cutting problems; also a list of new books on the subject.

The information is published on 8½ by 11 in. punched, loose-leaf pages, and is obtainable at $1.25 a month or $15.00 a year. There is no special price for members of either the A.S.M.E. or the E.I.C.

Subscriptions should be entered with The American Society of Mechanical Engineers, Publication Sales Department, 29 West 39th St., New York 18, N.Y.

ANNUAL FEES

Members are reminded that a reduction of one dollar is allowed on their annual fees if paid before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to all members wherever they are residing.

SOUTH AFRICAN LETTER

A member of the Institute, who has recently taken up residence in South Africa, has undertaken, at our request, to send, periodically, news which might be of interest to *Journal* readers. Mr. W. O. Maclaren lived in Canada from 1924 to 1939 and was engaged in structural design work in Niagara Falls and later in Toronto. In 1939, he went to England to work with Sir Alexander Gibb and Partners, consulting engineers. During the war, Mr. Maclaren was employed with the Ministry of Aircraft Production and later joined the firm of Brian Colquhoun and Partners, consulting engineers, London, England. Here is Mr. Maclaren's first South African Letter.—Ed.

Some five months ago I was asked by our firm to visit South Africa to investigate the advisability of opening a branch of our London firm of consulting engineers in Johannesburg, or elsewhere in the Union. After some difficulty with the Government departments in England I was given passage on one of the C-class flying-boats made by Messrs. Short Brothers of Rochester, England, in 1936, and I had an extremely comfortable trip to Durban, South Africa. My route was via Marseilles, Malta, El Adem, Cairo, Khartoum, Malakal, Kisumu, Dar-es-Salaam, Mombasa, Beira, Mozambique and Lourenco Marques. It was a most interesting and enjoyable journey.

I then flew from Durban to Johannesburg, and was interested to see that, although this city is only 60 years old, it is a fine modern and friendly city. I met a large number of charming and helpful people in a short time and after two weeks made up my mind I would recommend strongly that we open an organization in South Africa. I was fortunate to also meet several Cabinet ministers and leading industrialists, who filled me with optimism about the future developments in this enormous country.

Within four weeks I was again bound for Johannesburg via Durban for the purpose of opening an office here. On my arrival in Johannesburg I was fully prepared to acquire at once a suite of six or seven offices to house our staff. This was urgent, as I had already made arrangements to send staff out from England because of shortages of technical staff in South Africa. After contacting almost every estate agent in Johannesburg, I was finally fortunate in obtaining one small office, on loan from an acquaintance.

We are now well established in South Africa, but I would warn those who are proposing to come to the Union of some serious shortages which will retard the establishment of new enterprises in the Union. First, there is the severe shortage of accommodation. Unless one has friends in high quarters it is almost impossible to obtain office accommodation of any kind in the city, particularly since offices change hands when they do become available, long before any estate agent even hears about them.

The second serious shortage is that of telephone facilities. The local exchanges are much too small, instruments are scarce and it is almost impossible to obtain even one new telephone. The third shortage is that of living accommodation. After four months in a hotel in Johannesburg, my wife and I finally found a small furnished house in a fairly good district of Johannesburg at a rental of £30 a month after having turned down one offer at £100 a month, another at £80 a month and two offers of most unsuitable houses at £60 a month. Unfurnished houses are impossible to obtain, and flats, or apartments do not appear to exist at all. Any that become vacant are immediately transferred to friends or are offered furnished at exorbitant prices. Those considering coming out to South Africa, particularly Johannesburg, should not expect to find suitable accommodation within six months. Do not arrange for any members of your staff to come over until you have arranged living accommodation, and have assured yourself that office accommodation is available, together with telephone facilities.

There are also the grave questions of shortages of building materials, particularly shortages of cement and steel. The cement position is likely to improve within the next twelve months, as new plants are now being designed and will shortly be constructed, while existing ones are being extended. The position regarding steel supplies is likely to remain acute for a number of years. Steps are now being taken to extend steelworks and to build new ones.

The climate is almost ideal, although at times we shall undoubtedly yearn for a good Canadian winter. After leaving gloomy and fogbound England it is pleasant to see the sun every day, and although this is alleged to be the rainy season, the sun almost invariably returns and is indeed welcome. There is so much opportunity for recreational exercise that the biggest difficulty is in finding time to do any work.

The biggest single organization here concerned with engineering development is the Railways and Harbours Administration, which controls the construction, operation and maintenance of all railways and harbours in the Union. The Railways Department is now surveying thousands of miles of new track and is building new harbours, together with the immediate construction of three large airfields, in Johannesburg, Durban and Cape Town. This, of course, is only part of the Railways' interest in immediate development, as they are also ordering large quantities of locomotives and rolling stock of all kinds for immediate use and later expansion.

The large mining groups are also looking to the future, particularly with regard to the enormous engineering development which must come in the Orange Free State. It has been known, of course, for some time that the Orange Free State contains large gold deposits, and the first new leases for development of these gold deposits were granted by the Government last week. Others are bound to follow, and the development of the Orange Free State and a large expanse of country south-south-west of Johannesburg is bound to follow.

Two major problems have to be faced in this country very shortly. First, there is likely to be a very grave shortage of water in the Union of South Africa, and it is my considered opinion, shared with many others, that the future development of the Union will be in direct ratio to the amount of water which can be made available. Steps are being taken, almost daily, to implement the water supply in dry spots in the Union, but I am sure until some government department takes immediate and aggressive steps to bring huge quantities of water from outside the Union into the country, the shortage of water will become more acute with every year that passes.

The second important problem is the ratio of coloured to white population. This stands at about three coloured to one white. The Government is presently sitting in Cape Town and is debating the question of the new immigration policy for the Union. Most of us who are interested in the long-term development of this magnificent country are hoping that a strong immigration policy will follow quickly, and as there appears to be few Canadians here, I should not be surprised if we see many more in the near future.

With kindest regards to all who may remember me,

W. O. Maclaren, M.E.I.C.

Johannesburg, January 30, 1947.

MEETING OF COUNCIL

A meeting of the Council of the Institute held at Headquarters on Saturday, January 11th, 1947, convening at nine-thirty a.m.

Present: Vice-President J. E. Armstrong (Montreal) in the chair; Councillors P. E. Buss (Thorold), S. R. Frost (Toronto), J. A. Vance (Woodstock), Paul Vincent (Quebec), R. S. Eadie, C. C. Lindsay and J. B. Stirling of Montreal; Treasurer J. A. Lalonde (Montreal) General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

National Construction Council: Mr. Stirling presented a letter received by the Institute from the National Construction Council which made certain inquiries as to what the Institute wanted the Council to do about the removal of controls, particularly on items which affect the construction industry. The letter contained three questions.

After a thorough review, Council's decisions on these points were as follows:

1. Any objection to the Council itself moving to obtain the removal of controls.

The Institute's decision on this is that the National Construction Council should take no action. The Institute believes that it is no part of the function of the National Construction Council to speak on behalf of its constituent members.

2. Any objection to the Council taking measures to encourage the organizations represented on the Council to express their views on this matter direct to the Ottawa authorities.

The Institute's decision on this was also in the affirmative, inasmuch as the organization is represented on the National Construction Council and therefore is in a position to receive direct from its representative any recommendations from the Council along with his own personal comments thereon. The National Construction Council should do nothing "to encourage" its member organizations in determining the details of their policies.

3. If it holds the opinion that the Council should take no action whatever in this matter.

The Institute's answer to this is also in the affirmative. Many councillors expressed the opinion that the officers of the Wartime Prices and Trade Board were in the best position to know what action should be taken, keeping in mind at all times the broad general interest of the country rather than the specific interests of any particular groups.

It was unanimously resolved that Mr. W. E. Bonn, of Toronto, be asked to represent the Institute on the executive of the National Construction Council to replace the late Mr. D. C. Tennant.

Report of Special Committee on Professional Ethics: The general secretary reminded Council that about three years ago it had appointed a committee with Mr. F. H. Peters, of Ottawa, as chairman, to report on the Canons of Ethics proposed by the Engineers Council for Professional Development. Mr. Peters' committee had been scattered across Canada and negotiations had to be carried on by correspondence. He reported that under the circumstances it was difficult to handle the matter satisfactorily, but eventually a report was presented which indicated that the committee was not unanimous in accepting the proposed code as written.

Recently, E.C.P.D. has expressed the wish that the matter be considered again by those organizations which had not given approval. Apparently each of the eight constituent members, with the exception of the Institute and one other, had accepted the code in its entirety or with simple modifications.

In August Council appointed a further committee with all members located in the city of Toronto. This committee, of which Dr. Otto Holden is chairman, has now presented a communication from Dr. C. R. Young to the effect that he had seen the report and was well pleased with it. He recommended that Council accept it and refer it to E.C.P.D. This Council did unanimously.

Membership Committee: In addition to its annual report for the year, the Membership Committee submitted to Council a brief dealing with some of the probable requirements of branch membership committees resulting from the large growth of the Institute in the last few years. The main recommendation was that the Institute should issue a handbook or book of instructions for the use of branch membership committees.

The general secretary reported that for a long time he and Mr. Trudel had realized the need and had only been waiting for the time and opportunity to undertake the preparation of such a booklet. He would be glad to receive from Council instructions to proceed. Following some discussion, during which all members expressed approval of the suggestion, it was unanimously resolved that the recommendation of the Membership Committee be approved and that the general secretary be instructed to discuss the matter with the committee as soon as possible.

Statistical Control of Quality: The general secretary presented a letter from Councillor C. A. Peachey, who was unable to be at the meeting. In this Mr. Peachey pointed out that statistical control of quality was but one of several tools used by industry and he questioned the advisability of the Institute showing any special interest in this particular one when others were of equal importance. He was of the opinion, also, that there was considerable artificial stimulation in the publicity on this subject.

He pointed out that various organizations in the United States had recently established a central organization known as the American Society of Quality Control with which his company is in very close contact. He recommended that for the time being at least the Institute should not proceed with the organization of its committee. Through his company he would be closely in touch with developments in Canada and the United States and would advise

Council if subsequently it appeared that the Institute could render a service by establishing such a committee. Mr. Peachey's report was accepted unanimously.

Harry Bennett Educational Fund: Mr. Vance one of the trustees of the Harry Bennett Educational Fund, and chairman of the committee, reported that the funds already subscribed very closely approached the $25,000 which had been set as the objective. The campaign was to be continued until all the members and all the branches had been given further opportunities to contribute.

His report was of a preliminary nature but he expressed the hope that very shortly there would be a final report with an audited statement. At the same time he thought the three trustees, who were appointed temporarily, should resign so that Council could reconstitute the Board in the light of present conditions.

Mr. Armstrong pointed out that the trustees have not only been the committee which collected the money but they had also negotiated the difficult arrangements with Ottawa to obtain the tax free privilege. He thought Council should record its appreciation of the outstanding work done by the trustees and that their resignations should be accepted if they preferred to retire now.

Mr. Vincent supported Mr. Armstrong's expression of appreciation and he proposed that the minutes of this meeting record Council's enthusiastic reception of Mr. Vance's report. This was seconded by Mr. Lalonde and carried unanimously.

It was agreed that in view of the far-reaching possibilities of this fund, a publicity release should be prepared immediately.

Committee on Employment Conditions: In the absence of the chairman, the general secretary reported on behalf of the Committee on Employment Conditions. Mr. Heartz had asked Council to accept this report as incomplete, but he expected to have the final report for printing in their hands shortly.

The outstanding part of the report was that which referred to the Industrial Relations and Disputes Investigation Act 1947. Mr. Heartz' committee had met to consider a preliminary draft of the Act and at the same time considered opinions which had been submitted to it by members of the Institute who discussed the Act before their national bodies. The report pointed out that the new Act, in the definition of an employee, specifically mentioned professional work. This word was not included in Order-in-Council 1003 which the new Act was to replace.

Also, in Section 10 (1) the new Act provides that, " Where the majority of a group of employees of an employer who belong to a craft or profession, by reason of which they are distinguishable from the employees as a whole, are separately organized into one trade union pertaining to the craft or profession, if the group is otherwise appropriate as a unit for collective bargaining, the trade union may apply to the Board and shall be entitled to be certified as the bargaining agent of the employees in the group ". This is the first time professional workers were included specifically in such a clause.

The report stated that the committee was transmitting its opinions to the Minister of Labour in accordance with his request for comments and must repeat that because of the clear decision recorded by the Institute's questionnaire, the committee could still only support the proposal that collective bargaining for professional workers should be in the sole control of such workers. To include them with non-professional workers in any bargaining unit, as had been ordered in more than one case by the National War Labour Board, would be eventually to have the professional workers outvoted and quite possibly forced to transfer their collective bargaining affiliations to a trade union.

Council accepted the report and agreed with its recommendation that the Institute could not change the opinion expressed by the membership and agreed to by the Committee of Fourteen.

Joint Aeronautical Section: The general secretary reminded Council of the co-operative agreement which had been in force for some time between the Institute and the Royal Aeronautical Society. During the war the agreement had been dormant but there were now definite signs of renewed activity and interest. The Institute of Aeronautical Science, with Headquarters in New York, was becoming quite active in Canada, and had expressed an interest in a three-way agreement. A draft agreement was now being prepared for the consideration of the three bodies and he hoped to be able to submit this to Council for approval at an early meeting.

A.S.M.E. Semi-Annual Meeting: A letter was presented from the secretary of the American Society of Mechanical Engineers inviting the Institute to participate formally in a meeting on " passenger comfort " being planned by the Aviation Division for the Society's Semi-Annual Meeting to be held in Chicago in June 1947. It was unanimously resolved that the invitation be accepted.

American Institute of Mining and Metallurgical Engineers: A letter was presented from the American Institute of Mining and Metallurgical Engineers inviting the Institute to appoint an official delegate to the 75th Anniversary Celebration of the Founding of the Institute in 1871. The celebration will be held in New York City on March 17th, 18th and 19th, 1947.

It was unanimously resolved that the invitation be accepted and that the president be asked to represent the Institute, with the understanding that if he is unable to attend he will appoint another officer of the Institute to represent him.

Kelvin Medal: The general secretary presented a communication from the Kelvin Medal Award Committee inviting the Institute to make a recommendation for the 1947 award of the medal, such recommendation to be received in England before the first of June. The general secretary was instructed to make the necessary inquiries and submit suitable names for the consideration of Council.

Life Membership: It was noted that the following names had been added to the list of members upon whom, under the revised by-laws, Life Membership had been conferred as of January 1st, 1947: A. C. D. Blanchard, Montreal; Geo. Wm. Burpee, New York; Wm. Geo. H. Cam, Montreal; Douglas M. Chadwick, Montreal; Charles J. Chaplin, Almonte, Ont.; John G. Dickenson, Toronto; Llewellyn C. Jacobs, Montreal; Ibbotson Leonard, London, Ont.; James C. MacDonald, Victoria, B.C.; Wm. H. McGaan Montreal; Thos. A. McGinnis, Kingston, John H. McLaren, Montreal; Douglas L. McLean, Winnipeg; Kenneth R. McLennan, Toronto; Harold G. McVean, Toronto; Charles R. Murdock, Kapuskasing, Ont.; G. W. F. Ridout-Evans, Ottawa; J. F. Robertson, Copper Cliff, Ont.; Murray A. Stewart, Toronto; Stephen J. H. Waller, Quebec.

It was decided that the next meeting of Council would be held in Montreal on Saturday, February 15th, 1947. The March meeting will probably be held on the 15th of the month in Fredericton or Saint John during the president's tour of the maritime branches, but no decision has been reached on this as yet.

The Council rose at twelve-thirty p.m.

ELECTIONS AND TRANSFERS

Members

Ambrose, Howard George, B.A.Sc., (Mining Engrg.), Toronto, instrumentman, Canadian National Railways, London, Ont.

Anderson, Burrett Lyman, B.A.Sc., (Mech. Engrg.), Toronto, managing-director, Keith Tool & Production Co., Ltd., Cippenham, Bucks., England.

Barwick, William Stanley, consultg. engr., 1002 Hall Bldg., Vancouver, B.C.

Creighton, Hugh Herbert Lowry, B.Sc., (Elect. Engrg.), Alberta, A. D. Ross & Co., Ltd., Ste. Therese, Que.

Greason, James W., B.A.Sc., Toronto, designing engr., plant engrg. dept., Ford Motor Co. of Canada, Ltd., Windsor, Ont.

Heaps, John Morton, mech. engr., Consolidated Mining & Smelting Co. of Canada, Ltd., Trail, B.C.

Henderson, John Charles, B.A.Sc., Toronto, 717 Eglinton Ave., W., Toronto, Ont.

Mackenzie, Bruce Hugh, B.A.Sc., Toronto, development engr., Imperial Oil Limited, Sarnia, Ont.

Macpherson, Ian James, engineer, Howard Smith Paper Mills Limited, Cornwall, Ont.

Raney, Frederick Everett, Lt.-Col., Royal Canadian Signals, B.Sc., (Elect.), Queen's, Canadian Army Staff, Washington, D.C.

Ritchie, Frank Albert, B.Sc., (Mech.), Queen's, process and purchasing engr., machine engrg. dept., Ford Motor Co. of Canada, Windsor, Ont.

Rochester, Donald Harvey, Major, R.C.E., B.A.Sc., Toronto, Staff College of Canada, Royal Military College, Kingston, Ont.

Shopsowitz, David, B.A.Sc., (Elect.), Toronto, demonstrator, Univ. of Toronto, Toronto, Ont.

Svenningson, Freeman, Mech. Engr., Cornell Univ., designing dftsman., Shawinigan Engineering Co., Ltd., Montreal, Que.

Talbot, Louis Rene, Graduate, R.M.C.; B.Sc., (Civil), Queen's, president and genl. mgr., Rene Talbot Limited, Quebec City, Que.

Thomson, John Morton, B.A.Sc., M.A.Sc., Ph.D., Toronto, asst. genl. mgr., Ferranti Electric Limited, Toronto, Ont.

Wilson, Ralph Frederick, B.A.Sc., (Civil), Toronto, genl. supt. & personnel mgr., Donald Ropes & Wire Co., Ltd., Hamilton Ont.

Juniors

Barron, William Donald, B.Sc., (Mining), Queen's inspectr.. sprinklered risk dept., Canadian Underwriters Assoc., Montreal Que.

Damecour, Charles, B.Eng., (Mech.), McGill, 419 Belanger St., Montreal 10, Que.

Hunt, Thomas Richard, B.Sc., (Chem. Engrg.), Saskatchewan, asst. engr., British American Oil Refinery, Montreal East, Que.

Mens, John Roderick, B.A.Sc., (Mech.), Toronto, mech. engr., engrg. & mtce. dept., Canadian Kodak Co., Ltd., Toronto, Ont.

Tremayne, William Maurice, B.Sc., (Civil Engrg.), New Brunswick, structl, engr., Canadian Bridge Co., Windsor, Ont.

White, Herbert Brian, B.Sc., (Civil), Toronto, special lecturer, Univ. of Toronto, Ajax Division, Ajax, Ont.

Affiliate

Stevenson, Henry Frederick, B.Arch., Manitoba, asst. to chief engr., marketing dept., Imperial Oil Limited, Toronto, Ont.

Transferred from the class of Junior to that of Member

Bartlett, Ewart H., B.Eng., (Elect.), N.S. Tech. Coll., engr., Newfoundland Light & Power Co., St. John's, N'fld.

Blackett, Robert Leslie, B.Sc., (Chem.), Queen's, engr. i/c dfting. and engrg. office, Tropical Oil Co., Barranca Bermeja, Colombia, S.A.

Briceland, Emmett V., B.Sc., (Mech.), Queen's, managing engr., Elevator Specialty Co., Ltd., Toronto, Ont.

DeMaio, Alexander, B.A.Sc., (Mech.), Toronto, supt. of constrn. of main dam, Aguasabou, Hydro Electric Power Commission of Ontario, Schreiber, Ont.

Doehler, Rolf John, B.Eng., (Civil), McGill, asst. engr., Montreal Welding Co., Montreal, Que.

Fraser, Campbell, B.Sc., (Civil), Queen's, asst. divn. engr., Dept. Highways Ontario, Stratford, Ont.

Hopkins, Peter McMillan, Graduate, R.M.C., transformer and right of way divn., Quebec Hydro Electric Commission, Montreal, Que.

Nadeau, Leopold M., B.A.Sc., C.E., Ecole Polytechnique, asst. registrar, Corporation of Professional Engineers of Quebec, Montreal, Que.

Scott, Walter Barrett, B.Eng., (Civil), McGill, woods engr. and party chief, woods engrg. dept., Quebec North Shore Paper Co., Baie Comeau, Que.

Steiman, Morris Irvin, B.Sc., (Civil), Manitoba, technical reconstrn. officer, Public Works of Canada, Winnipeg, Man.

Woodhall, Thomas Latimer, B.Sc., (Elect.), M.Sc., Manitoba elect. & design engr. & asst. chief engr., Manitoba Power Commission, Winnipeg, Man.

Stoddart, Thomas William Hartley, B.A.Sc., Toronto, development engr., Northern Electric Co., Ltd., Montreal, Que.

Junior to Member

Cameron, Adam Kirkland, B.Eng., (Mech.), McGill, industrial engr., Canadian Industries Limited, Montreal, Que.

Personals

News of the Personal Activities of members of the Institute

H. A. McKay, M.E.I.C., is the newly-elected chairman of the London Branch of the Institute. He was born at Seaforth, Ont., and studied at Toronto University, receiving a B.A. Sc. degree in 1923. He was first employed by the Disher Steel Construction Company Limited, Toronto, as a draughtsman and engineer, and he went to Sutcliffe & Company at New Liskeard in 1924. He entered the London Structural Steel Company Limited in 1925, and in 1928 he was vice-president and manager, with charge of design, sales, production and erection work. From 1940 he served for over four years with the R.C.E. He was with the directorate of works and construction in Ottawa, and later with the directorate of accomodation and fire prevention at National Defence Headquarters. He was promoted to the rank of colonel and awarded the O.B.E. He is now president and engineer of McKay-Cocker Construction Limited, London, Ont.

J. M. Crawford, M.E.I.C., is chairman of the Montreal Branch of the Institute for 1947. He was born at Howick, Que., and holds a B. Sc. and a master of engineering degree from McGill University, Montreal, the latter received in 1932. He demonstrated in the electrical engineering department of the university during the 1929-30 session, and then entered the Shawinigan Water and Power Company, Montreal, as an electrical engineer. He is now assistant superintendent of the engineering division of the company.

F. F. Dyer, M.E.I.C., Imperial Oil Limited engineer, is the newly-elected chairman of the Sarnia Branch of the Institute. He was born at Toronto, Ont., and studied at Toronto University, receiving a B.A.Sc. degree in 1931. On graduation, he joined the Turnbull Elevator Company, Toronto, where he was employed on design and draughting, and he worked in 1932 as factory superintendent for Cutting Limited, Toronto. He joined the faculty of his University that year, and for three terms he was demonstrator in hydraulics. He entered Imperial Oil Limited in 1934, and was first employed on boiler and meter tests in the combustion department. He transferred in 1937 to the general engineering department.

E. C. O'Leary, M.E.I.C., has been elected chairman of the Halifax Branch of the Institute. Born in Halifax, he attended the Nova Scotia Technical College, receiving a B.A.Sc. degree in civil engineering in 1936. He went to the Standard Paving Company Halifax, after graduation, remaining until 1944 and holding various positions. He was in charge of phases of highway construction and paving and preliminary investigations preparatory to tendering on highway projects for several years, and became field superintendent in charge of construction in 1939. He went as operating engineer to the Public Service Commission of Halifax, N.S., in 1944.

Major-General G. R. Turner, M.E.I.C., the newly-elected chairman of the Ottawa Branch of the Institute, was born at Four Falls, N.B., and was educated in that province. He was engaged on railway construction for several years and enlisted in the Engineers at the outbreak of war in August, 1914. He was commissioned in 1915, and promoted to the rank of captain a year later. Appointments in regimental and staff services followed, and he received his majority in 1918. He was mentioned in dispatches and awarded the Distinguished Conduct Medal and the Military Cross and bar. In 1920 he was appointed to the R.C.E. (Permanent Force) with the rank of captain, and attended the School of Military Engineering, Chatham, England, for two years. Returning to Canada, he became instructor in military engineering at Royal Military College, Kingston. He later attended the Staff College at Quetta, India, for two years, and in 1927 was appointed district engineer officer at Winnipeg, Man. Two years later he was made Assistant Director of Engineer Services, National Defence Headquarters, Ottawa, with the rank of major, and from 1933 to 1937 he served in the General Staff and M.G.O. Branches at N.D.H.Q., Ottawa, with the rank of lieutenant-colonel. In 1938 he attended the Imperial Defence College, London, England, for a year and on his return was appointed General Staff Officer, grade 1, at M.D. No. 11, Victoria, B.C. His service also included periods of duty at Halifax, Saint John, N.B., Quebec, and Toronto, on Engineer Works.

At the outbreak of World War II he went overseas as General Staff Officer, grade 1, with the 1st Division. On formation of the Canadian Corps in 1940, he was appointed deputy adjutant and quartermaster general of the corps with the rank of brigadier, and on formation of the First Canadian Army in 1942 he received a similar appointment there with the rank of major-general. He was made a Companion of the Most Honorable Order of the Bath in 1943. Returning from overseas service in 1944, he was loaned for several months to the Department of Veterans Affairs as Special Assistant to the Deputy Minister for work on accommodation projects. In 1945 he was made Inspector General of the Army in Western Canada with headquarters in Calgary and, having reached the age limit for service in the postwar Army, was retired in 1946.

F. F. Walsh, M.E.I.C., has been appointed secretary-treasurer of the Sarnia Branch of the Institute. He was born in Toronto, and studied at Toronto University, graduating with a B.A.Sc. in mechanical engineering in 1940. He went to the Steel Company of Canada, Hamilton, that year and in 1943 to the St. Clair Processing Corporation, Limited, Sarnia, Ont., as technical supervisor in the steam and power plant. He transferred to the Polymer Corporation Limited at Sarnia, in 1946, where he is employed as plant utility engineer.

Arthur Surveyer, M.E.I.C., **Emil Nenniger,** M.E.I.C., and **J. G. Chênevert,** M.E.I.C., consulting engineers of Montreal, and partners for a number of years under the firm name of Arthur Surveyer and Company, have recently renewed their partnership contract under the firm name of Surveyer, Nenniger and Chênevert.

Dr. Charles Camsell, M.E.I.C., has been elected to the presidency of the Canadian Institute of Mining and Metallurgy. A recipient of the Engineering Institute's Julian C. Smith medal for 1946, and recently retired from a twenty-five year tenure as Dominion Deputy Minister of Mines and Resources, Dr. Camsell was vice-president of the C.I.M.M. in 1921-22.

D. B. Carswell, M.E.I.C., marine consultant, Montreal, recently became the first Canadian elected a fellow of the Society of Consulting Marine Engineers and Ship Surveyors, London, England. After long association with marine affairs in Canada, he was called to the War Supply Board in 1939 as director of shipbuilding, and was appointed director general of shipbuilding on the formation of the Department of Munitions and Supply. Made controller of ship repairs and ship salvage in 1941, with headquarters in Montreal, he became president of Wartime Shipbuilding Limited in Montreal in 1945.

Dr. de Gaspé Beaubien, M.E.I.C., Montreal consulting engineer and past-president of the Institute, has been elected president of the Royal Automobile Club of Canada. He has served the Club as vice-president, and has taken an active interest in highway safety problems.

John H. T. Morrison, M.I.E.C., of Campbellton, N.B., district highway engineer for the Department of Public Works of New Brunswick, was elected president of the Association of Professional Engineers of New Brunswick, at the annual meeting held at Saint John, N.B.

Aimé Cousineau, M.E.I.C., director of city planning of the City of Montreal was presented with the honorary degree of doctor of applied science by the University of Montreal, at the annual general meeting of the Graduates Association of Ecole Polytechnique on February 8th. Mr. Cousineau is a graduate of Ecole Polytechnique, of the Massachusetts Institute of Technology and of Harvard University.

Huet Massue, M.E.I.C., of the Shawinigan Water and Power Company, Montreal, received the honorary degree of doctor of applied science from the University of Montreal, at the annual general meeting of the graduates of Ecole Polytechnique on February 8th. He is a graduate of Ecole Polytechnique and the Massachusetts Institute of Technology.

A. B. Cooper, M.E.I.C., president of Ferranti Electric Limited, Toronto, recently retired as general manager of the company. He has been with Ferranti since 1922, when he became general manager, coming from the Canadian General Electric Company Limited in Toronto. He is a past-president of the Association of Professional Engineers of Ontario, a past vice-president of the American Institute of Electrical Engineers, and has been on the executive council for Ontario of the Canadian Manufacturers' Association.

Dr. J. M. Thomson, M.E.I.C., has been appointed general manager of Ferranti Electric Limited, Toronto, to succeed Mr. Cooper. He became associated with Ferranti Electric in 1926 as a radio engineer, since which time he has held various positions in engineering design and development. He became chief designing engineer in 1937 and chief engineer in 1942. He was assistant general manager for the company prior to his recent appointment. He is an Associate Member of the British Institution of Electrical Engineers, and a member and past vice-president of the American Institute of Electrical Engineers.

W. Raywood Smith, M.E.I.C., who recently resigned as county engineer for Middlesex County, Ont., was appointed in January as special consultant to the Ontario Department of Planning and Development. He will act as an advisory engineer between the department and municipal bodies in the Thames River Valley, which has been surveyed for extensive flood control and conservation development.

Albert Deschamps, M.E.I.C., Montreal contractor and engineer, was re-elected president of the Canadian Construction Association at its twenty-ninth annual meeting at Niagara Falls, Ont., on January 16th. **Allan C. Ross,** M.E.I.C., president of Ross and Meagher Limited, Ottawa, was re-elected as first vice-president. Regional vice-president for Quebec is **P. N. Gross,** M.E.I.C., of Montreal, president of the Anglin-Norcross Corporation Limited. **Norman Eager,** M.E.I.C., is the new chairman of the manufacturers and supply dealers section. He is general manager of the Burlington Steel Company Limited, Hamilton, Ont. Re-elected as chairman of the general contractors section is **Tullis N. Carter,** M.E.I.C., vice-president and chief engineer of the Carter Construction Company Limited, Toronto, and the vice-chairman of this section is **C. Howard Gordon,** M.E.I.C., of Montreal, vice-president and managing director of the Atlas Construction Company Limited.

J. N. Langelier, M.E.I.C., chief engineer of the Metropolitan Commission of Montreal was elected president of the Graduates Association of Ecole Polytechnique, Montreal, at its recent annual meeting. He is a B.A.Sc. in civil engineering of the class of 1910.

S. A. Charters, M.E.I.C., of Westeel Products Limited, now represents the company in Ottawa, Ont. He transferred from his position as sales engineer in the Montreal office in January 1947. A graduate of McGill University, he spent six years with Watson Jack and Company, Montreal, as sales engineer, and served three years with the R.C.A. Discharged with the rank of captain, he joined Westeel in 1946.

P. W. Geldard, M.E.I.C., has been appointed engineer of distribution of the Consumers' Gas Company of Toronto. He joined the company as a cadet engineer in 1929, on graduation from the University of Toronto. A year later he was general foreman, and he received subsequent appointments as district superintendent in 1931, superintendent of the street department in 1935, and assistant engineer of distribution in 1939.

S. G. Naish, M.E.I.C., has been appointed to the position of manager of mining sales for the maritime provinces for Canadian Sullivan Machinery Company Limited, with office located at Sydney, N.S. He was formerly eastern district manager for Peacock Brothers Limited, Sydney. He is secretary-treasurer of the Cape Breton Branch of the Institute and secretary of the Eastern Section of the Coal Division of the Canadian Institute of Mining and Metallurgy.

H. S. Petford, M.E.I.C., is now at the head office of National Breweries Limited, Montreal, as assistant director of engineering. He was formerly at the company's Dawes Black Horse Brewery, Montreal, where he was manager since 1943.

J. W. Reside, M.E.I.C., recently accepted a position as industrial engineer with the Department of Industry and Publicity of Nova Scotia at Halifax. He had been with the Department of Highways at Yarmouth, N.S.

F. G. Rounthwaite, M.E.I.C., has been appointed president of the newly formed import-export firm of Drake Gardner (Canada) Limited, Montreal. He served with the Department of Munitions and Supply of the Canadian Government at Washington as director of procurement, and later as president of War Supplies Limited.

Lt.-Colonel S. Stephenson, M.E.I.C., who has been in Austria with the Royal Engineers as technical staff officer engaged on British Intelligence objective survey of instrument targets, is back in England. He is in the research and development section of the staff of the director general of artillery.

F. S. Stratton, M.E.I.C., is now Canadian engineering representative for the Copperweld Steel International Company, of New York. He is located at Toronto. A graduate in electrical engineering of the University of Manitoba, he has been associated with the Winnipeg Electric Company and the Montreal Light, Heat and Power Company. Prior to his recent appointment, he was with the Exide Battery Company of Canada Limited, Toronto, as a sales engineer.

T. F. Rahilly, M.E.I.C., has been elected chairman of the Sault Ste. Marie Branch, of the Institute. He was born in that city, and studied at Queen's University, Kingston, Ont., receiving a B. Sc. in mechanical engineering in 1939. That year he entered the Algoma Steel Corporation Limited in Sault Ste. Marie. He was assistant master mechanic in the blast furnace department in 1939, and was promoted to master mechanic the following year. He is now assistant superintendent of the mechanical department of the company.

Robert Griesbach, JR.E.I.C., the new chairman of the Junior Section of the Montreal Branch of the Institute is a designing engineer with Surveyer, Nenniger and Chênevert, consulting engineers, Montreal. He is a graduate of McGill University, Montreal, class of 1942, with the degree of bachelor of engineering.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Louis Raymond Gransaull, M.E.I.C., of St. Joseph, Trinidad, B.W.I., passed away on June 27th, 1946, in New York City. He was born in St. Joseph in 1883, and graduated as a sworn surveyor from St. Mary's colleger there. He was first employed as assistant on the trigonometrical survey of Trinidad in 1904.

Coming to Canada the next year, he spent several years on railway engineering projects at Montreal, Shawinigan Falls, Three Rivers, Que., Fort William, Ont., North Battleford, Sask.. Brandon, Man., and Wainwright, Alta., undertaken by the St. Maurice Valley Railway, the Grand Trunk Pacific Railway or the Canadian Pacific Railway. He returned to Trinidad in 1915, where he was assistant engineer for Trinidad Leaseholds, Limited, at Pointe-à-Pierre. He was later connected with engineering for the Siparia Railway Extension in St. Joseph, with Engineering Contractors and Manufacturers, Port of Spain, and with the Palo Seco Oilfields. He had a consulting practice in Port of Spain in 1926 and has practised as a land surveyor in St. Joseph since 1927. He has also been successful as a lime grower and producer of lime oil.

Mr. Gransaull joined the Institute in 1905 as a Student, transferring to Associate Member in 1911 and to Member in 1940.

Claude Vernon Johnson, M.E.I.C., died in Quebec on January 27th, 1947. He was born in Ottawa, Ont., in 1881 and commenced his engineering career with five years duty as rodman, instrumentman or draughtsman on location and construction of the Canadian Northern Railway, the Grand Trunk Pacific Railway and the National Transcontinental Railway. With the last mentioned, in 1908, he became assistant engineer and assistant office engineer in charge of headquarters general draughting staff at Ottawa, remaining until 1913 when he went to Quebec, as engineer in charge of construction for Jos. Gosselin Limited, general contractors. Here he was responsible for the construction of plants, railways, bridges and buildings in the province of Quebec. In 1918 he went to the Foundation Company in Montreal, returning later to Quebec where for many years he carried on a consulting engineering practice. In 1946 he was appointed technical writer and translator for the Department of Roads of Quebec. Mr. Johnson was the author of two books, "A Travers le Temps et l'Espace" and "Le Pendule Mysterieux."

He joined the Institute as a Student in 1907, transferring to Associate Member in 1910, and to Member in 1918. Life Membership was awarded to him on January 1st this year.

Homer Lindsay Currie, M.E.I.C., of the Canadian National Railways, died on January 2nd, after an association of nearly a quarter of a century with C.N.R. in various sections of eastern and western Canada. He was born in Woodstock, N.B., in 1892, and studied at the University of New Brunswick, graduating with a B.Sc. degree in 1913. He began his railway service in the same year, when he joined the Canadian Government Railways at Moncton as a leveller. He became a draughtsman in 1915 and in the following year enlisted with the C.E.F. He returned to the railway, serving successively at Moncton, Fort William, St. Catharines, Montreal and Halifax until 1925, when he was promoted to resident engineer at Toronto. Moving to Montreal in 1927, he held the posts of supervisor of buildings, engineer, grade separations, before his appointment as office engineer in 1943.

Among the large C.N.R. construction projects of which he had charge were the construction of the terminal at Neebing, Ont. in 1922-24; engine and car yard facilities at the Toronto terminals in 1926-27; the locomotive erection shops at Montreal in 1928; and many problems connected with the new Montreal terminal plan between 1929 and 1943. He directed war emergency track requirements for the C.N.R. system.

Mr. Currie was interested in photography as a hobby, and he made fine furniture and violins. He studied astronomy, and had made a telescope.

He joined the Institute as an Associate Member in 1921, transferring to Member in 1940.

Herbert A. Ricker, M.E.I.C., of Hamilton, Ont., passed away at his home on December 30th, 1946. Ill health had forced him to end his career in engineering with the Canadian Westinghouse Company in Hamilton in 1938, when he was chief draughtsman. He had formerly been mechanical engineer. In that capacity he had been responsible for the mechanical design of many large alternating current machines. These included vertical generators for hydro-electric power stations in Quebec on the Saguenay River, in Nova Scotia, in British Columbia, at Chats Falls on the Ottawa River, at Beauharnois, Que., at Queenston on the Niagara River, and many other stations. During his association with the company some unusual designs were evolved, which included the 25,000 kva., 25 cycle, 500 rpm., synchronous condensers which are now installed at Leaside in Ontario and the 45,000 kva, 300 rpm. 25 to 60 cycle frequency changers which are installed at Chats Falls and Masson.

Mr. Ricker was born at Dunnville, Ont., in 1882. He studied at Dunnville and Caledonia, returning to teach in the public schools near Dunnville. Later he went to western Canada to teach in Saskatchewan, returned to enter the University of Toronto, and graduated in mechanical and electrical engineering in 1910 with a B.A.Sc. degree. He entered Canadian Westinghouse Company in Hamilton that year. Starting as a draughtsman, he later became mechanical engineer on a/c generator design.

He joined the Institute as a Member in 1928.

A. G. Fleming, M.E.I.C., of Montreal, died on January 8th 1947, after a few days illness. Born at Craigleith, Ont., in 1882, he attended Queen's University, Kingston, Ont., graduating in 1904 with a B.A. degree. He later attended the School of Mines at Queen's. He was employed by the Exshaw Portland Cement Company at Exshaw, Alta., and by the International Cement Company at Hull, Que. When the Canada Cement Company was formed in 1909 he became chemist at the Hull plant. In 1913 he became chief chemist in Montreal, in which position he continued until his death. Possibly his outstanding research work was in connection with the deterioration of concrete in alkali soils. In 1932 he developed a special cement, Kalicrete, which has been of great value to the construction industry particularly in western Canada. He received the Plummer Medal of the Engineering Institute in 1933 for his paper on "The Development of Special Portland Cements in Canada". He had an important part in the organization of the Chemical Societies in Canada. He was consulting chemist to the Campanhia Brasileira de Cimento Portland Perus at Sao Bralo, Brazil.

Mr. Fleming joined the Institute in 1928 as a Member.

William S. Fraser, M.E.I.C., district engineer for the Canadian Westinghouse Company Limited at Calgary, died suddenly on December 1st, 1946, at his home in Calgary.

He was born in Hamiota, Man., in 1895, and graduated from the University of Manitoba with the degree of B.Sc. in electrical engineering in 1922. After graduation he joined the Westinghouse test course at Hamilton, Ont. He was assistant district engineer at Winnipeg from 1923 to 1925, service engineer at Fort William, Ont., from 1925 to 1929, and district engineer at Calgary from 1929 until the time of his death.

He became an Associate Member of the Engineering Institute in 1939, transferring to Member the next year. He was also a member of the Association of Professional Engineers of Alberta, and of the Electrical Engineers Association.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

EDMONTON BRANCH

W. W. Preston, Jr.E.I.C. - *Secretary-Treasurer*

A brighter future for Alberta in agriculture and industry, to be made possible by proposed programmes of water reclamation, was foreseen by John R. MacNicol, of Toronto, when he addressed the Edmonton Branch on January 10th, 1947, at a dinner meeting in Merrick's Embassy Room. Mr. MacNicol, who has recently taken pictures of irrigation projects in the Platte river basin, in Nebraska, Wyoming and Colorado, showed coloured slides of prosperous sites which had been arid before irrigation. He envisioned similar improvements on our prairies.

The speaker claimed that the western provinces have failed to conserve water, and consequently 180 acres of prairie are required to produce what one acre of irrigated land can produce. He outlined the progress being made on the St. Mary's and Bow River projects and discussed plans for damming the South Saskatchewan River.

The magnitude of the irrigation programme developed by the U.S. Bureau of Reclamation in the Platte river basin was clearly shown by photographs of various canals, dams, tunnels, siphons and power houses. Other slides showed thriving cities which had sprung up near alfalfa plants, dehydrating plants, bean factories and other industries. With irrigation came hydro-electric systems and electricity on the farms.

In conclusion, Mr. MacNicol urged his audience to support the P.F.R.A. enthusiastically. He predicted that their efforts would double the population of western cities and bring several sugar beet, canning and other factories to Alberta. He claimed that prosperity in the west would mean prosperity for all of Canada.

Chairman of the meeting, which was attended by 69 members and guests, was J. W. Porteous. Mr. MacNicol was introduced by Mr. C. Garnett, and a unanimously supported vote of thanks was proposed by Ben Russell.

HAMILTON BRANCH

L. C. Sentance, M.E.I.C. - - *Secretary-Treasurer*
I. M. Macdonald, Jr.E.I.C. - *Branch News Editor*

The Hamilton Branch of the Institute held its annual meeting and dinner on January 9th, 1947, at the Scottish Rite Cathedral, with 85 members and guests attending. Chairman A. R. Hannaford presided.

Mr. E. T. Sterne, the guest speaker, was introduced by G. H. Richards as the manager of G. F. Sterne & Sons, Brantford. Mr. Sterne served on the Imperial Munitions Board during World War I, and during World War II was director of explosives, Allied War Supplies, and controller of chemicals, Department of Munitions & Supply. Mr. Richards described some of the speaker's many activities in his profession and in public life, and indicated that Mr. Sterne was well qualified to speak on **John Q. Engineer-Citizen.**

The engineering profession, by virtue of training and insistence on straight thinking on the part of its members, has a great responsibility to the future of this or any country. The engineer must expand his citizenship duties, and make use of his particular talents. The greatest function to be performed by the engineer is the function of service, maintained Mr. Sterne. Engineers must give their leadership, or else they will not achieve the type of management, both civic and industrial, that they know is best.

At the conclusion of Mr. Sterne's talk, H. A. Cooch expressed the thanks of the meeting to the speaker. Mr. Hannaford then handed the gavel of office to the new chairman, who closed the meeting after a few remarks.

LETHBRIDGE BRANCH

H. T. Miard, m.e.i.c. - - *Secretary-Treasurer*
E. A. Lawrence, s.e.i.c. - *Branch News Editor*

Forty-nine members and guests of the Lethbridge Branch of the Institute, attended a supper meeting in the Marquis Hotel, Saturday, January 18th, to hear W. L. Foss, supervising construction engineer in charge of the St. Mary's River Development, discuss the St. Mary's Dam. Chairman R. S. Lawrence presided.

Guests from district points were introduced by the chairman, and G. S. Brown introduced the speaker.

Mr. Foss paid tribute to local irrigation engineers for their intense interest in this major project. By use of a map he showed how waters of the Waterton, and Belly Rivers could be brought across country by canal to the St. Mary's River and the flood waters of these three rivers impounded behind the large St. Mary's River dam at Spring Coulee, thence diverted by canal to storage reservoirs along the Milk River ridge. This storage will not only assure existing irrigation projects of a steady supply of water but will make it possible to increase the present irrigable area to around 465,000 acres. This is only a portion of what could be irrigated if more water was available.

Several problems beset engineers in choice of a dam site. Among these were: the steep slope of St. Mary's River, 10 to 15 ft. per mile, running in a deep narrow basin, making adequate storage a problem; the location with regard to getting the maximum of stored water into an outlet canal; entrance of waters from the Belly and Waterton Rivers, which will eventually have to come in above the dam site; suitable foundations for dam, and availability of material i.e. fill, gravel, etc. Several types of dam were considered, and it was finally decided to construct an earth fill dam as best suiting the conditions.

A site was finally chosen near Spring Coulee with a capacity of 290,000 acres. At this point the rock, i.e. sandstone and shale with a high compressive strength, rises well above water level on either side of the river, and lies below the bed of the river to a depth of approximately 1,000 ft.

The dam will be earth fill construction about 2,600 ft. long and 30 ft. wide at the top, and will rise 186 ft. above the river bed. It will require about 3,250,000 cu. yd. of glacial till, i.e. clay formation, and 900,000 cu. yd. of gravel, both materials being available near the site. The speaker stressed the importance of getting the necessary moisture content in the fill material and compacting it in the dam in order to get a high density in the clay particles and a bond which would be impervious to water. The upstream side of the dam will be protected by a heavy blanket of gravel. The downstream side will be protected with a sand and gravel filter which will take care of any seepage through the dam and keep the back of the dam dry. The toe will be protected by rock rip-rap.

During construction of the dam the flow of the river will be diverted by a coffer-dam, 35 ft. high, into a circular diversion tunnel 20 ft. in dia. which is at present under construction and is designed to handle the maximum flood stage of the river.

The irrigation tunnel carrying water from the reservoir will exit 86 ft. above the river bed, has a horse-shoe shape and is 17 ft. in dia., designed to carry 3,200 cu. ft. per sec. Four hyraulically operated headgates will control the flow of water through this tunnel.

The spillway will be designed to take care of any large floods which may occur in the future. With only 40 years of records available and a very erratic weatherman holding sway over a drainage area of 830 sq. mi., this constitutes a problem for engineers who are building for the next 300 or 400 years.

Mr. Foss said that shortage of material was proving a handicap, but satisfactory progress was being made at the present time.

R. M. Stanley, on behalf of the branch, moved a hearty vote of thanks to Mr. Foss for his interesting address.

LONDON BRANCH

A. L. Furanna, m.e.i.c. - - *Secretary-Treasurer*
G. N. Scroggie, m.e.i.c. - - - *Branch News Editor*

On the evening of the 29th January, 1947, the London Branch held its annual meeting in the Hotel London with 60 members and guests attending. Before the dinner, refreshments were served and the assembled company had the opportunity of meeting and talking with acquaintances, old and new.

In the absence of Chairman J. H. Johnson, Vice-chairman H. A. McKay presided. After welcoming all guests and representatives of other societies, he announced the election of V. A. McKillop to succed J. A. Vance as councillor. The latter, who has been a councillor since 1933, spoke briefly, referring to the growth of the Institute, his work with the E.C.P.D., and with the Harry F. Bennett Educational Fund. Mr. Buchanan spoke on the progress of the Fund, saying that it was nearing its objective of $25,000, and that the London Branch had subscribed 250 per cent of their objective, to head all the Branches. He made special reference to the response from young graduates, and said that already two applications had been received for loans from the Fund.

Mr. McKay then introduced the speaker of the evening, Dr. Gordon H. Turner of the Department of Psychology of the University of Western Ontario. Dr. Turner, himself a graduate of Toronto, was greeted by an S.P.S. yell led by S. W. Archibald. Having served at C.M.H.Q., London, England, in World War II, the speaker was no stranger to several engineer officers present.

Human Relations was the subject of Dr. Turner's address, in which he said: "Wherever we go or whatever we do, we are dealing with people, and how we get along with these people greatly determines our success in life, whether the relations be family, social or business".

Expediency governs our conduct towards our employers or other people who are in a position to do something for us, the speaker explained, but our attitude governs our conduct towards other than these. "We do not mind looking up to people, but we dislike anyone looking down upon us", said Dr. Turner. The superior attitude held by some people is the answer to such questions as: Why are some people hard to like? Why do they engender hostile feelings in their fellow men? Why are their dealings unsuccessful? This feeling of superiority is manifested by lack of respect, sarcasm, criticism with anger, orders given in an officious manner, and aloofness. "It is not so much what we say as how we say it", said Dr. Turner. The cause for this superior attitude is either a sincere belief in one's superiority, or a lack of confidence and a fear of one's weaknesses being discovered. The solution for the latter is a complete knowledge of one's work, which will develop confidence.

W. J. Bright thanked the speaker on behalf of a very attentive audience for a very interesting address.

Mr. McKay then announced that Colonel I. Leonard and C. V. Corless had been awarded Life Membership in the Institute. A. L. Furanna gave a financial report and stated that the Branch membership was 102. The councillor-elect, Mr. McKillop, announced the results of the recent elections.

MONTREAL BRANCH

E. M. Van Koughnet, m.e.i.c. - *Secretary-Treasurer*
Hyman Schwartz, s.e.i.c. - - - } *Branch News Editors*
Eli L. Ilovitch, s.e.i.c. - - - - }

An engineer deals primarily with the proper utilization of materials. He studies their properties, analyzes their behaviour under various conditions, determines their cost, and then, weighing everything, reaches a decision on their use. Yet, although engineering schools recognize the importance of teaching the properties of materials and stress analysis, they have, by and large, neglected two important phases of the work, namely proper fabrication of the materials and proper co-ordination of the human element that must enter into their construction.

Only a small proportion of engineers stay in the purely technical field. Most of them ultimately graduate to supervisory and administrative positions. Many enter the selling field. A fair proportion end up by owning their own businesses.

On Thursday night, January 23rd, 1947, Professor D. B. Porter of New York University discussed the latter two phases of the engineer's work under the title **Education for Industrial Engineers.** He pointed out that it has been only within the past few years that schools have awakened to the fact that industrial engineering, factory management and factory relations are equally as important as the properties of materials. In fact, Canadian schools have sadly neglected this field and are far behind the United States.

Although industrial engineers as a distinct group within the engineering profession do exist, Professor Porter entered a strong plea for the recognition of the vital importance of industrial engineering education for engineers. "I have frequently had Commerce graduates come to me and ask if they could take post-graduate study work in industrial engineering," stated Professor Porter, "and I have had to explain to them that an industrial engineer is primarily an engineer".

Professor R. De L. French, who chaired the meeting, added that he had at all times attempted to impress upon the students the vital necessity of clear thinking and clear expression, an attribute which, unfortunately, many engineers appear to consider as unnecessary to the practice of their profession. Yet engineers must submit reports and propositions to non-technical people, must discuss plans with men who are not engineers, must understand how to convey their ideas to the other fellow. The ability to express oneself clearly, both orally and in writing, is a vital asset to an engineer.

OTTAWA BRANCH

C. G. Biesenthal, jr.e.i.c. - *Secretary-Treasurer*
R. C. Purser, m.e.i.c. - - - *Branch News Editor*

At the last noon luncheon of the calendar year, held on December 19, the programme portion of the meeting was given over entirely to the showing of a sound film, "Clean Waters". This film, provided through the courtesy of the Canadian General Electric Company, vividly demonstrated the dangers from polluted waters to public health, fish life, property values and recreation areas.

Although the film was entirely based on United States conditions, its lessons could well be applied to Canada with equal or even greater force. Almost $100,000,000 is lost annually in the United States through the lack of sewage disposal facilities. Clean water, man's greatest friend, not only enhances the claim of properties, but is also essential to the maintenance of public health, the preservation of marine and wild life, the existence of commercial enterprises and the operation of proper irrigation methods.

"We make open sewers of many of our waterways," the commentator said, "waterways from which 75 per cent of the communities in the United States get their water supply."

The annual loss would almost cover the cost of constructing the required 10,500 sewage disposal plants in the United States and would help to supply essential modern equipment to many of the 6,000 plants at present in operation. The film illustrated the operation of such plants.

❖ ❖ ❖

At the Annual Branch Meeting, held at the auditorium of the National Research Council Laboratories on the evening of January 8th, the chairman and executive of the branch for the ensuing year were elected.

Mr. Biesenthal presented the financial report for 1946, J. L. Shearer reported on the Membership Committee and L. M. Christmas on the Proceedings Committee. J. H. Irvine, retiring chairman, gave a brief review of the work of the Institute for the past year. The members decided that the usual grants made to technical schools in Ottawa and Hull for prizes to outstanding students would be continued in 1947. At the same time, it was recommended that Carleton College and Ottawa University should be included in this plan. Congratulations were extended to John J. Murphy, a corporate member for 57 years, on being appointed a life member.

Following the business meeting, three films were shown: "Transfer of Power", "The New North", and "Photo Canada". The first dealt with the progress of power from early times to the present, the second mainly with the Alaska Highway, and the last-mentioned with aerial mapping.

Refreshments were served.

PETERBOROUGH BRANCH

A. R. Hailey, m.e.i.c. - *Secretary-Treasurer*
J. C. Allan, m.e.i.c. - *Branch News Editor*

Dr. Herbert Moore of Stevenson & Kellogg Ltd., delivered a paper before the Peterborough Branch on **Management Engineering** on the evening of December 12, 1946.

Dr. Moore stated that management engineering could hardly have a concise and limited definition, but that he proposed to discuss such phases as job and salary evaluation, time study and methods, cost control, and personnel.

The speaker stated that studies made in many manufacturing establishments indicated that the effectiveness of engineers depended to the extent of 60% upon their personalities and their manner of selling their results and conclusions to the rest of the organization and only 40% upon the quality of the work itself.

Furthermore, due to a widespread defect in engineering education, such technical men are commonly less effective from the psychological or personality aspect than from the purely technical one. Some universities have undertaken to correct this situation by strengthening their engineering courses by the inclusion of more cultural subjects such as economics, history, social sciences, and English.

Dr. Moore discussed the personal characteristics required by various engineering positions, and contrasted the aptitudes required in a good research technician with those of a good supervisor. He also deplored the absence of opportunities for research men in Canadian industry.

Potential technicians should be about 30% above the average in mental ability but they are frequently not sociable and are single job performers. They tend to be introverts. Potential supervisors do not need as high a level of mental ability but they must be more sociable. They are frequently sportsmen, and may become joiners, club men and community leaders outside of their employment activities.

Technical Engineering Sales was stated to be an important and growing opportunity for those having an engineering training. Salesmen require strong personal qualities and a good service spirit with a keen interest in the customer's outlook and problems, which means in effect the objective outlook characteristic of extroverts. They also require a good technical training and habits of analytical thought and creative imagination characteristic of introverts. In addition direct knowledge of the manufacture and operation of their product lines is very important. This can only be obtained in its most useful form from direct operating experience.

Dr. Moore then discussed methods of classifying persons by their interests and aptitudes. Occupational growth involves a gradual selection of life interests and the exclusion of others. Occupational maturity is the condition where areas of interest are firmly established, and a reliable recommendation regarding occupational guidance can hardly be made before that condition is achieved. The level of aptitudes or abilities within the chosen area of interest is the second basis of classification. Personality traits are the third and least definite of the points of classification. This involves the type of personality whether objective or subjective, service spirit, loyalty, patience and emotional stability.

Dr. Moore said that he believed that about three to five per cent of the population should never be employed by any company.

The army type of leadership is not acceptable in industry, being developed for a peculiar set of conditions so that officers from the services do not necessarily fit well into supervisory positions in industry.

Industrial leadership requires, among other things, personal respect and room for individual initiative and judgment.

SAGUENAY BRANCH—JUNIOR SECTION

T. T. Anderson, jr.e.i.c. - *Secretary-Treasurer*

The fourth annual dinner meeting of the Saguenay Branch Junior Section was held in the banquet room of the Saguenay Inn on Wednesday evening, November 20th, 1946.

Present at the head table as guests of the Junior Section were Messrs. McNeely Dubose, P. H. Skelton and E. H. Eberts of the Aluminum Company of Canada Limited and F. T. Boutilier chairman of the Senior Section. Messrs. Dubose and Boutilier addressed the meeting on behalf of the Aluminum Company and of the Senior Branch, respectively.

The guest speaker was E. R. Complin of Canadian Industries Limited, who gave a most interesting and enjoyable talk. He was introduced by J. T. Madill, chairman of the Junior Section. Following his talk, Mr. Complin consented to answer questions and an interesting half-hour followed.

The speaker was thanked by H. A. Estabrook at the close of a most worthwhile evening.

❖ ❖ ❖

On Wednesday evening December 11th, at the Saguenay Inn, Mr. D. F. Nasmith of Aluminum Company of Canada, Ltd., addressed the Junior Section of the Sageunay Branch on the subject, **Some Applications of Statistical Technique in the Chemical Industry.** His address was illustrated by slides.

The history of statistical methods was briefly outlined by Mr. Nasmith. It was pointed out that the use of these methods in industry was very recent, dating only to about 1943.

Mr. Nasmith then described the background behind the construction of outline charts and showed a number of practical examples taken from chemical industry. Results of these applications were discussed. Correlation technique was next discussed and some examples given. It was emphasized that correlation calculations had proved quite valuable in analyzing data from plant operations where many complicated actions were often present. The use of various tests for significance was described and examples given. It was pointed out that a certain risk was always attached to any inference of significance. Brief references were made to the use of statistics in developing sampling methods and a wartime development, sequential sampling, was described.

In conclusion, the speaker pointed out that statistical techniques would not accomplish miracles but the evidence seemed to indicate that they had many applications in chemical industry, only a few of which have as yet been exploited.

The paper was very well received by the audience and an interesting question period followed.

The speaker was introduced by J. T. Madill and thanked by J. J. Miller. Refreshments were served after the meeting.

SAINT JOHN BRANCH

K. W. Salmon, jr.e.i.c. - *Secretary-Treasurer*
A. R. Bonnell, m.e.i.c. - *Branch News Editor*

The joint annual meeting of the Association of Professional Engineers of N.B. and the Saint John Branch of the Institute was held on January 23 in the Admiral Beatty Hotel, with L. O. Cass in the chair.

After refreshments and dinner a toast to the Association was proposed by L. S. Mundee and responded to by J. F. T. Morrison, newly elected president of the Association. A toast to the E.I.C. was proposed by Frank Vaughn and responded to by J. H. Scovil, president of the Engineering Society of the University of New Brunswick.

A paper was read by John N. Flood, one of the Canadian representatives to the International Labor Office Conference held recently in Brussels. Mr. Flood contrasted present living standards in London with those in Brussels, stressing the rigid rationing in Britain and the great spending and lack of rationing in Belgium. Mr. Flood also went into detail on the conference in Brussels, stressing the need for greater co-operation between employee and employer and noting the trend among the European delegates to the desire to eliminate private enterprise.

A vote of thanks to Mr. Flood was proposed by A. V. Tracy-Gould, and seconded by J. M. Lamb.

D. O. Turnbull read a paper on the construction of the new Atlantic Wholesalers warehouse. Mr. Turnbull went into detail on the economy of mechanical handling of goods in the new warehouse of one-storey construction, as compared to the older method of manual handling in the multiple-storied old warehouse.

R. E. Tweedale moved a vote of thanks to Mr. Turnbull, which was seconded by B. Hagerman.

Major H. J. C. MacLean then spoke briefly in the interest of the Reserve Force of the R.C.E.M.E.

The meeting was then adjourned.

SARNIA BRANCH

F. F. Walsh, m.e.i.c. - - - *Secretary-Treasurer*
S. V. Antenbring, jr.e.i.c. - *Branch News Editor*

The Sarnia Branch of the Institute held a dinner meeting at the Polymer Cafeteria on Friday evening, January 17th, 1947. The guest speaker was Dr. John J. Grebe, a director of the Dow physical research laboratory, Midland, Michigan.

Dr. Grebe spent a considerable time at the American atomic power experimental station at Oak Ridge and he was one of the scientific observers at the Bikini experiments. He displayed the official technicolor film released to the participating scientists by the United States Army and Navy, and also a series of slides of particular points in the Bikini experiments. Following the showing of the slides a question period ensued in which Dr. Grebe dealt effectively with many of the problems concerning atomic energy that are prominent in the public mind at the present time.

If used for the benefit of mankind, rather than as an instrument of war, nuclear energy, as a source of fuel, motive power, and other forms of energy, could make possible a world population of ten times the present figure which is limited to the facilities of the earth, Dr. Grebe reported. If used for the welfare of the people, nuclear energy would make it unnecessary for people to shift to crowded centres for specific raw materials, shipping facilities and fuel.

He pointed out that although the films showed the bomb as presenting a beautiful display, in reality it was terrible, ghastly and severe. The only hope of scientists is that good-will will prevail among nations and that the atom bomb will never again be used as a weapon of war. It is absolutely essential that nations realize the full potentialities for total destruction of this new instrument of warfare, Dr. Grebe emphasized. The American Association of Atomic Scientists are endeavouring to raise $1,000,000 to finance a campaign to bring this situation in its full gravity home to the average citizen. Further, he said that the realization of the seriousness of the situation on which we are poised is perhaps the only, and certainly the best guarantee of enduring peace.

Questioned as to the extent of Russian knowledge of atomic bombs, he declared that undoubtedly the Soviet scientists are at least as well advanced as were the Germans and they knew all that was necessary to utilize the effect of the atom. He credited the accuracy of British bombing for the failure of Germany to use the atom bomb before us.

Dr. Grebe praised the United States Army and Navy for their co-ordinated effort at Bikini. There were 42,000 men involved in the tests and of these only two men were killed. He pointed out that the experiments were a definite success and deplored the ill-considered criticism due possibly to the fact that the public were led to expect a great many things that did not happen, nor were they expected to happen by the authorities. It was not the aim of the experiment to prove the effectiveness of the bomb, but rather to ascertain its effect on implements of war, particularly naval vessels and personnel.

He revealed that the bomb weighed between 10 and 100 pounds, was about the size of an apple, and that one grain of matter would provide sufficient energy for such a bomb.

The effect of the radioactivity on personnel is to cause the marrow of the bones to become sterile thereby drying up the source of the red blood corpuscles.

Dr. Grebe deplored the lack of interest in the atom among the members of the engineering profession.

The speaker had been introduced by Dr. B. Hillary, and the vote of thanks, enthusiastically endorsed by the large audience present, was tendered by Frazer Davidson.

SASKATCHEWAN BRANCH

D. W. Houston, m.e.i.c. - - - *Secretary-Treasurer*
L. A. Dokken, m.e.i.c. - - - *Branch News Editor*

On Friday, January 17, 1947, our Saskatchewan Branch held its regular monthly meeting at the Kitchener Hotel in Regina. A general business meeting was held during which an amendment to the constitution of the Association of Professional Engineers was passed, enabling this group to handle the general increase of fees passed recently by the Institute members at large. A general news letter designed for circulation among Branch members, was then read by the branch news editor. This news letter service was approved in principle by the members who feel it is a worth while step towards a closer, more integrated group of engineers in Saskatchewan.

The group was then privileged to hear R. Peterson, head of the Soil Mechanics Branch of the P.F.R.A., give an illustrated talk on this very interesting and rather "new" field. After reviewing the history of this scientific phase of civil engineering, Mr. Peterson explained that the research on this subject is constantly altering our so-called established principles of soil as a bearing material. In this phase of this address, the fact was brought out that there is a wide variation between the geologist's definition of soil and that conception used by engineers in the soil mechanics field.

The speaker's introduction was followed by an explanation of practical soil mechanics and its relation to common misconceptions by engineers in practice. He also said a few words on the peculiarities of our Regina clay soils. Summing up, he stated that the changes in water content of soil had more to do with their behaviour under load than any other single factor. A very lively discussion took place following the address, which indicated the general interest in the subject.

R. Bing Wo thanked Mr. Peterson, and on a motion from the floor, Chairman F. E. Estlin declared the meeting adjourned.

TORONTO BRANCH

E. G. Tallman, m.e.i.c. - *Secretary-Treasurer*
E. R. Graydon, m.e.i.c. - *Branch News Editor*

The Annual Students' Night of the Toronto Branch was held on January 23rd in Hart House, at the University of Toronto. The meeting was jointly sponsored by the Senior and Junior Sections; and Ivan Widdifield, Junior Section chairman, presided. Great interest was shown by the students and preliminary contests were necessary to select six finalists from some thirty contestants.

About one hundred and seventy-five Branch members heard the six third and fourth year engineering students present their papers. First prize of fifty dollars, donated by the T Eaton Company, was awarded to W. M. Clarkson for his paper on **The Modern Low Head Propeller Turbine.** The remaining prizes presented by the Institute were as follows:

Second prize for thirty dollars to A. J. Prell for his paper, **Boiler Feed Water Conditioning;** third prize to H. Dederer, who spoke on **Mechanized Harvesting of Grain.** Consolation prizes of ten dollars each were awarded to the remaining three contestants: F. J. Humphrey, **Engineering Aspects of Aviation Medicine;** F. Weinberg, **The Photo Multiplier Tube;** and W. G. Ratz, **The Gas Turbine Locomotive.** In addition, all six contestants received Student membership in the Institute.

J. F. McLaren, Chairman of the Branch Committee on The Young Engineer, presented the prizes. He also presented the Institute's Student prize to Mr. Hendricks, a fourth year mechanical engineering student at the University of Toronto and one of the two Rhodes Scholars for this year.

Two films added to the enjoyment of the meeting. The first was "Arc Welded Structures" by Lincoln Electric, and the second "Preliminary Construction at Stewartsville" by the Hydro Electric Power Commission of Ontario. Refreshments served in the Great Hall brought a very successful meeting to a close.

VANCOUVER BRANCH

A. M. Eyre, s.e.i.c. - - - - *Secretary-Treasurer*
G. W. Allan, m.e.i.c. - - - *Branch News Editor*

The Vancouver Branch held its Annual Meeting on Saturday, November 22nd, at the University of British Columbia's Brock Memorial Hall.

After an enjoyable dinner, attended by eighty members, the business session was held.

Retiring chairman R. C. Pybus voiced his appreciation to the members of his executive for their assistance during his tenure of office and spoke of the growing opportunities for engineers in Vancouver and British Columbia, and also announced the award to Ben Quan, of the prize donated each year by W. N. Kelly to a university student for proficiency in shop practice.

The incoming chairman, J. P. Fraser, in taking office, expressed his appreciation to the members on his election as chairman of the Branch, and urged the amalgamation of the various engineering associations, of which there are several operating in Vancouver.

C. E. Webb reported on the present status of the Harry F. Bennett Educational Fund as far as the local Branch is concerned, and suggested that a subscription from any member who has not already subscribed to this deserving fund, would be appreciated.

The speaker of the evening, F. H. Soward, Professor and Director of International Studies at the University of British Columbia, was introduced by J. P. Fraser. Professor Soward chose as his subject **The Atomic Bomb and World Government.** He disclosed that atomic warheads now can be fitted to rocket bombs and warned that the only sure defence in the Atomic Age is complete international agreement. The atomic bomb has narrowed the spread between great and small nations, and he felt that there was every hope that nations can merge their sovereign ties, and that it rests with the citizens of each country to assure their governments they are willing to join such world organizations. Because of the cheapness of manufacture and the terrible efficiency of the bomb, we may see some remarkable changes in small countries that are now lacking in raw materials. Professor Soward suggested that in from three to ten years, every small nation should be able to manufacture atomic bombs. The size of mines and plants necessary to develop atom bombs, and the fact that any country would have to test bombs before using them, made international control possible.

At the conclusion of the address J. P. Fraser thanked the speaker for his interesting talk.

BOOK REVIEW

EVALUATION OF EFFECTS OF TORSIONAL VIBRATION

S.A.E. War Engineering Board, New York Society of Automotive Engineers, 1946, 578 pp., illus., cloth, $10.00

Reviewed by J. P. Uffen*

Development of Improved Means for Evaluating Effects of Torsional Vibration on Internal Combustion Engine Installations is the result of the response of the S.A.E. War Emergency Board to an appeal by the U.S. Navy for the development of improved means for evaluating the effects of torsional vibrations in Diesel and other reciprocating engines. The board considered it necessary first to establish an understanding of the pertinent details involved in present-day practices, and the book consists of accounts of those of four engine manufacturers.

An outline of the general subject is given and a review of the written discussions. Conclusions and recommendations to the Navy are made. The remainder of the work consists of a report by each of the firms included, each report being divided into four phases. They are reviewed collectively, by phase, below.

Phase one deals with the measurement of torsional vibration. Optical, mechanical, electrical phase shift, and seismic torsiographs are explained in detail. The description of the seismic type contains an excellent account of the associated amplifiers. The calibration of these instruments is stressed. Hooke's joint, oscillating beam, and walking beam calibrators are presented critically and the limitations of each discussed.

The second phase deals with the estimation of stress. The distributed-mass method of calculation is given with graphs and tables to expedite the work. An example is worked in detail and compared with the Holzer procedure. Mathematical short-cuts for the Holzer method are given and their accuracy discussed. Simplified methods of obtaining natural frequencies are given, and reference is made to electrical analogies but not enlarged upon adequately. Detailed analyses of dampers are presented with reference to large angles of swing and include numerous graphs and charts to assist in arriving at a workable design.

The significance of estimated stresses as derived from calculation or torsiograph measurement is discussed in phase three, with reference to the effect of fillets, oil holes, the endurance limit of the material, residual stress, and surface treatment. Brittle lacquer methods and strain gauge techniques are discussed in detail.

Phase four suggests that, at present, the mechanical torsiograph is the simplest and most reliable to enable unspecialized personnel to determine dangerous degrees of vibration.

The format of the book with its topical repetition from each firm detracts much from its usefulness as a text: the continuity of the discussion of each phase is lost. However, valuable data is given competently in detail and comprehensive bibliographies are included, making it an excellent reference work for Technologists and Engineers concerned with vibration work.

Junior research engineer, Structures Laboratory, Division of Mechanical Engineering, National Research Council, Ottawa, Ont.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Advanced Mathematics for Engineers; 2 ed.:
H. W. Reddick and F. H. Miller. N.Y., Wiley, c1947. 508 p., illus., cloth.

Automotive Mechanics:
William H. Crouse. N.Y., McGraw-Hill; Toronto, Embassy, c 1946. 473 p., illus., cloth.

Engineering Designs for Re-Planning:
Edited by J. B. Pinkerton. London, Princes Press, 1946. 97 p., illus., paper. (Reprinted from Air-Treatment Engineer).

Geology for Engineers; 2 ed.:
F. G. H. Blyth. London, Edward Arnold; Toronto, Longmans, Green, 1945. 329 p., illus., cloth.

Industrial Electric Heating and Electrical Furnaces:
E. S. Lincoln. N.Y., Essential Books; Toronto, Collins, c1945. 192 p., illus., cloth.

Literature Search on the Preservation of Food by Freezing:
B. H. Weil and Frances Sterne. Atlanta, Georgia School of Technology, 1946. 409 p., paper. (Special Report No. 23).

National Fire Codes, Vol. 5, National Electrical Code, 1947:
National Fire Protection Association, Boston, c1946. 376 p., cloth. (ASA C1-1946).

Organization of Official Traffic Agencies in Cities and States:

Wilbur S. Smith. Saugatuck, Conn., Eno Foundation for Highway Traffic Control, 1946. 100 p., illus., paper.

Organized Labor and Production; Next Steps in Industrial Democracy; rev. ed.:
Morris Llewellyn Cooke and Philip Murray. N.Y., Harper, c1946. 277 p., cloth.

Radiant Heating:
T. Napier Adlam. N.Y., Industrial Press., c1947. 472 p., illus., fabrikoid.

Rock Tunneling with Steel Supports:
R. V. Proctor and T. L. White, with an Introduction to Tunnel Geology by Karl Terzaghi. Youngstown, Ohio, Commercial Shearing & Stamping Co., c1946. 271 p., illus., fabrikoid.

Terminal Airport Financing and Management:
Lynn L. Bollinger, Alan Passen and Robert E. McElfresh. Boston, Graduate School of Business Administration, Harvard University, 1946. 385 p., cloth.

These were the Nerves: the Story of the Electric Cable and Wire Industry of Great Britain during the years of war:
Douglas Reekie. London, Insulated Conductors Export Group, (1946). 128 p., illus., cloth.

Women Can Be Engineers:
Alice C. Goff. Youngstown, Ohio, A.C. Goff; Ann Arbor, Mich., Edward Bros., 1946. 227 p., cloth.

PROCEEDINGS, TRANSACTIONS, ETC.

American Public Works Association:
Public Works Congress Reports, 59th Annual Meeting, 1946.

Engineering College Research Association:
Proceedings of the Annual Meeting, 1946.

Institution of Electrical Engineers:
Proceedings of the Radiolocation Convention, 1946. (Vol. 93, Part 111A, No. 3).

New Zealand Institution of Engineers:
Proceedings, Vol. 32, 1946.

ANNUAL REPORTS, ETC.

British Engineers' Association:
Classified Handbook of Members and their Manufactures, 1946.

Canada. Dominion Bureau of Statistics.
Report on the Construction Industry in Canada, 1945.

Manitoba. Dept of Mines and Natural Resources:
Seventeenth Annual Report on Mines and Minerals, 1944-45.

Quebec (Prov.) Dept. of Trade and Commerce:
Statistical Year Book, 1945-46.

TECHNICAL BULLETINS, ETC.

American Society of Mechanical Engineers:
Notes of Submarine Design, A. I. McKee. (Paper No. 46-A-61).

Canada. Dept. of Reconstruction and Supply. Economic Research Branch:
Chart Book of Employment and Payrolls in Canadian Industries —Employment 1939-1946; Payrolls 1941-1946.

Comite International de L'Organisation Scientifique (CIOS):
Eight International Management Congress, Stockholm, 1947, Bulletin No. 1, November, 1946.

Electrochemical Society. Preprints:
90-33—Characteristics of the Silver Chloride-Magnesium Water Activated Battery, J. B. Mullen and P. L. Howard.-09-34—Control of pH in Nickel Plating Solutions, H. Bandes.- 90-35—Effect of Cell Variables on the Electrowinning of Manganese, J. H. Jacobs.--90-36—Polyethylenes, A. E. Maibauer and C. S. Myers.- 90-37—Electrographic Methods of Analysis, Eric A. Arnold—90-38—Dry Cell Dynamics: The Bobbin, J. J. Coleman.

Institution of Mechanical Engineers. Advance Papers:
Mechanical Engineering and Agriculture, S. J. Wright. (First Agriculture Lecture).
. . . Progress in Turbine Gear Manufacture in Recent Years, A. Sykes.
. . . Measurement of Errors in Gears for Turbine Reduction Drives, C. Timms. (Bound with A. Sykes' Paper).

Institution of Structural Engineers:
Regulations Governing Admission to Membership; Examination Syllabuses, 1946.
. . . Scale of Charges for Consulting Structural Engineers, 1946.

North-East Coast Institution of Engineers and Shipbuilders:
Combustion of Fuels, Alfred C. Egerton. (Fifteenth Andrew Laing Lecture, 1946).

Princeton University. Industrial Relations Section:
State Legislation for Cash Sickness Benefits. (Selected References, No. 13, 1947).

Purdue University. Engineering Extension Dept.:
Proceedings of the Second Industrial Waste Conference, 1946. (Extension Series No. 60).

U.S. Bureau of Mines. Technical Papers:
No. 694—Prospecting for Mineralization in Steeply Dippling Beds covered by Glacial Till, Talus, and Weathered Zones, F. W. Lee, H. L. Scharon and C. H. Sandberg.

U.S. Geological Survey Professional Papers:
205-D—Late Mesozoic and Early Cenozoic History of Central Urah.--206—Upper Cretaceous Foraminigera of the Gulf Coastal Region of the United States and Adjacent Areas.—207—Geology and Paleontology of Palos Verdes Hills California.—210-A—Tertiary Foraminifera from St. Croix, Virgin Islands.

U.S. Geological Survey Water-Supply Papers:
986—Water Levels and Artesian Pressure in Observation Wells in the United States in 1943—Part 1—Northwestern States.-1001—Surface Water Supply of the United States, 1944-Part 1 —North Atlantic Slope Basins.-1002—op. cit.—Part 2-South Atlantic Slope and Eastern Gulf of Mexico Basins.-1005—op. cit.—Part 5—Hudson Bay and Upper Mississippi River Basins.-1006—op. cit.—Part 6—Missouri River Basin.-1008—op. cit.-Part 8—Western Gulf of Mexico Basins.-1012—op. cit.—Part 12 —Pacific Slope Basins in Washington and Upper Columbia River Basins.

STANDARDS, SPECIFICATIONS, ETC.

Edison Electric Institute:
TD-12, 1946—Specifications for Pole Guards. TD-15, 1946—Specifications for Pole and Tower Steps.

Codes of Practice Committee:
CP(B) 624—Masonry Walls with Natural and Cast Stone Ashlar Facing.

PAMPHLETS, ETC.

Accredited Undergraduate Engineering Curricula:
Engineer Council for Professional Development. (Preprinted from Fourteenth Annual Report, 1946).

Conservation of Soil:
Royal Bank of Canada. August 1946.

Pipe Coils; including Comprehensive Listing of Types of Pipe Coils, Materials, Pipe Data, Engineering Data, Accessories:
Crane Limited, Montreal, 1946. (Circular No. M-318).

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

A.S.T.M. STANDARDS on GLASS and GLASS PRODUCTS

Prepared by A.S.T.M. Committee C-14 on Glass and Glass Products. Methods of Testing; Specifications. Nov. 1946. American Society for Testing Materials, Philadelphia, Pa. 86 pp., illus., diagrs., charts, tables 9 x 6 in., paper, $1.25 (A.S.T.M. members, $.95).

Definitions, specifications, and methods of testing of glass, glass containers, glass insulators, and glass textiles are presented. The twenty-six items cover both accepted and tentative standards, and include a few selected ones prepared by other committees which are applicable in the glass industry.

ELECTRICAL ENGINEERING

E. E. Kimberly. 2 ed. International Textbook Co., Scranton, Pa., International Correspondence Schools Canadian Ltd., Montreal, 1946. 407 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50.

Written specifically for the engineering students not majoring in electrical engineering, this text is designed to enable them to deal understandingly with electrical problems and electrical engineers, and to select electric power equipment intelligently. It covers, in a functional manner, electric and magnetic theory, electric circuits and machinery, both S.C. and D.C., batteries, transformers, illumination, electric heating, and electronic devices. Consideration is also given to the economics of the use of electrical apparatus.

ENGINEER AT LAW:

C. B. McCullough and J. R. McCullough, with forewords by J. T. Brand and J. M. Devers. Iowa State College Press, issued in 1946 by The Collegiate Press, Ames, Iowa, under cooperative agreement with the Oregon State Highway Department. 9¼ x 6 in., cloth, Vol. 1, 447 pp.; Vol. 2, 442 pp.; $3 each Vol., $6 both vols.

The object of this work is to provide the engineer with a source of information which will help him to avoid legal pitfalls and to deal more efficiently with problems which arise if legal difficulties do occur. Volume I covers court procedures, systems of jurisprudence, and equity considerations. It discusses the important topics of contracts and contractual relationships, engineering specifications, real property laws, and torts incident to engineering operations. Volume II considers the engineer in trial work as technical witness or consultant, and deals with employment relations, patents, negotiable instruments, and numerous special laws of interest to the engineer.

ENGINEERING DESIGNS FOR RE-PLANNING:

Edited by J. B. Pinkerton. Princes Press, Westminster, London, S.W.1, 1946. 97 pp., illus., diagrs., maps, tables, 12 x 9½ in., paper, 5s.

Selected from the magazine, "Air Treatment Engineer", the articles reprinted here demonstrate various methods used by engineers in reconstruction work on the mechanical equipment of various types of buildings: libraries, hospitals, residences, etc. There is an index showing on which pages certain boilers, pumps, etc., are described.

HEAT TREATMENT OF CARBON STEELS:

F. Johnson. Chemical Publishing Co., Brooklyn, N.Y.; General Publishing, Toronto, 1946. 204 pp., illus., diagrs., charts, tables 8¾ x 5½ in., cloth, $5.60 (in Canada).

This volume is the first of a series of four intended to provide a source of information on the treatment which metals and alloys receive before being delivered to the engineer for his use. The present volume covers the influence of composition and treatment on the structure and properties of carbon steel, the various practical heat-treating operations, the important topic of hardenability, and the description and testing of mechanical properties. Succeeding volumes will deal with alloy steels, cast iron, and non-ferrous alloys; surface-hardening processes; furnaces and pyrometry.

INDUSTRIAL ELECTRIC HEATING and ELECTRICAL FURNACES:

E. S. Lincoln. Essential Books, Duell, Sloan and Pearce, New York; Collins, Toronto, 1945. 192 pp., illus., diagrs., charts, tables, 8¼ x 5¼ in., cloth, $3.50 (Can.).

The three principles of electric heating—resistance, infra-red and induction—are discussed, with detailed descriptions of the equipment by which they are put to practical use. Electric steam boilers, electric ovens and dryers, and electric furnaces are dealt with particularly, including discussion of efficiencies and the calculation of heating requirements. Space is devoted to the selection and installation of heating units.

Literature Search on the PRESERVATION OF FOODS BY FREEZING:

B. H. Weil and F. Sterns. Georgia School of Technology, State Engineering Experiment Station, Atlanta, Ga., June, 1946. 409 pp., 8½ x 5½ in., paper, $4.00. (Special Report No. 23.)

Over 2,000 abstracts of articles and digests of patents are contained in this bibliography, arranged alphabetically by author. While not exhaustive, the object has been to include all important items dealing directly with food freezing and certain other references which contribute engineering or other information of value on the general subject. A 60-page alphabetical subject index provides detailed access to the material covered.

MEXICAN-AMERICAN CONFERENCE on INDUSTRIAL RESEARCH, September 30—October 6, 1945:

Apply to S. C. Pappageorge, Armour Research Foundation of Illinois Institute of Technology, 35 West 33rd St., Chicago 16, Ill. 176 pp., diagrs., charts, maps, 9 x 6 in., paper, $2.50.

The twenty-two papers presented at the Conference are printed here in full, describing representative types of university research, foundation research, Government research, and research in private industry in a wide variety of fields. General patterns of research, both in national and international, are discussed, and the value of standards to American industry is briefly considered together with some descriptions of the work of two large standardizing bodies, the American Standards Association and the National Bureau of Standards.

MODERN ORGANIC FINISHES, their Application to Industrial Products:

R. H. Wampler. Chemical Publishing Co., Brooklyn, N.Y.; General Publishing Co., Toronto, 1946. 452 pp., illus., diagrs., 8½ x 5½ in., cloth, $11.90 (in Canada).

This book is primarily a book of methods. Descriptions of modern finishing materials and equipment for their application, drying and conveying are presented, with emphasis on the proper selection and proper use of materials and equipment to get the best possible finish at minimum cost. Enamels, lacquers, varnishes, stains and "synthetics" are mainly considered, with little consideration given to oil-base paints.

ORGANIZED LABOR AND PRODUCTION, Next Steps in Industrial Democracy:

M. L. Cooke and P. Murray. Rev. ed. Harper & Brothers, New York and London, 1946. 277 pp., diagrs., charts, 8¾ x 6 in., cloth, $2.50.

A prominent expert in scientific management and the head of a leading union join in setting forth what they both believe is the basis for greater collaboration among employers and organized workers to assure greater production under fair terms of employment. The book covers the responsibilities and activities of both labor and management and discusses some of the questionable practices of both.

PRINCIPLES of RADAR:

By members of the staff of the Radar School, Massachusetts Institute of Technology. 2 ed. McGraw-Hill Book Co., New York and London, Embassy Bk Co., Toronto, 1946. paged in sections, diagrs., charts, tables, 9 x 6 in., cloth, $5.00.

Originally prepared for use in war training courses, this comprehensive work has been revised to bring the subject matter up to date. It begins with a brief description of the components and functions of radar systems and continues with detailed discussion of typical system components. The intent has been to give a technically thorough and accurate treatment with minimum dependence upon mathematics. Emphasis in the treatment of circuits is upon quantitative analysis directly from tube characteristics and physical principles.

RADIO TUBE VADE-MECUM, 6th ed. 1946:

P. H. Brans. Editions Techniques P. H. Brans, 28 rue du Prince Léopold, Antwerp (Borgerhout) Belgium. 232 pp., diagrs., tables, 10½ x 7¼ in., paper, 105 Belgian francs.

The first seven tables of this manual are the same as in previous editions and are as follows: characteristics of the most widely used tubes, including static characteristics and working data; characteristics of tubes less used on the Continent, chiefly British; listing of tubes having same electrical characteristics as certain ones in table I; tubes with approximately similar characteristics for use as replacements; diagrams of tube sockets; characteristics of Russian tubes; Allied Army tubes corresponding to commercial tubes. This 1946 edition also includes the characteristics of German and Italian army tubes. All headings are given in Dutch, French, English and German. The directions for use in the 1946 edition are in English only.

REFERENCE DATA for RADIO ENGINEERS, 2 ed.:

Published by Federal Telephone and Radio Corporation, an associate of International Telephone and Telegraph Corporation, 67 Broad St., New York, Federal Electric Manufacturing Co. Ltd., Montreal, 1946. 322 pp., diagrs., charts, tables. 8½ x 5½ in., fabrikoid, $2.00.

This useful compilation of reference data has been considerably revised and enlarged in order to keep up with the rapid advances in the art. It covers audio and radio design, vacuum tubes and other equipment, acoustics, wire transmission, wave guides and resonators, as well as general engineering and material data and mathematical formulas and tables. The chapters on transformers and room acoustics are new, and noteworthy additions have been made to the material on cathode-ray tubes, electrical circuit formulas, and wave guides. A detailed subject index has been included in this new edition.

SCIENCE: Its Effect on Industry, Politics, War Education, Religion and Leadership:

D. W. Hill. Chemical Publishing Co., Brooklyn, N.Y., General Publishing Co., Toronto, 1946. 114 pp., 8¾ x 5½ in., cloth, $2.75.

In a series of seven essays the author briefly discusses the scientific outlook and the effect of science on industry, politics, war, education, religion and leadership. The object of the whole is to demonstrate that the application of the scientific method, or way of thinking, to these diverse fields can lead to social and economic, as well as technical, progress, despite the inherent weaknesses and difficulties which exist.

(Continued on page 96)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

February 10th, 1947

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the March meeting.

L. Austin Wright, General Secretary

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professionl responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practial experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BALL—ROBERT SPENCER, of 908 Roberts St., Niagara Falls, Ont. Born at Yorkshire, Eng., Dec. 10, 1922. Educ.: B.A.Sc., (Mech.), Toronto, 1946; May 1946-Feb. 1947, jr. engr., H. G. Acres & Co., Niagara Falls; at present, assignment engr., Canadian Cellucotton Products Co., Ltd., Niagara Falls, Ont.

References: E. A. Allcut, S. W. Andrews, W. P. London, G. R. Lord.

BARR—FRANCIS ELMO, Capt. R.C E., of Saint John, N.B. Born at Weymouth, N.S., Feb. 20, 1919. Educ.: B.Sc., (with Engrg.), Acadia, 1940; with Govt. mining-geo. survey party, 1938, (4 mos.), as geologist and dftsman., 1939, (5 mos.), chief of party; 1940-41, asst. engr., (constrn. Pennfield Airport, N.B.), Dept. National Defence; with R.C.E., as follows: 1941-46, 2/Lt., overseas, various positions of command, military engrg., 1946, (7 mos.), seconded to War Assets Corp., U.K. repr. sale of surplus military engrg. equipt. to foreign countries; 1946 to date, enlistment in post war army as Capt., R.C.E., A & T Staff Officer, 1st Field Coy., Saint John, N.B.

LIBRARY NOTES (*Continued from page 94*)

ROCK TUNNELING with STEEL SUPPORT:

R. V. Proctor and T. L. White, with an Introduction to Tunnel Geology by K. Terzaghi. Commercial Shearing & Stamping Co., Youngstown, Ohio, 1946. 271 pp., illus., diagrs., charts, tables, 11¾ x 7½ in., cloth, $2.50.

Section I presents the geological information required for estimating the rock pressure on tunnel supports. Section II is devoted to the relationship between rock behavior, type of steel support, and the method of excavation, covering selection and general design of supports. Analytical methods of design of the supporting structure under assumed loading conditions are discussed in Section III. A catalog of the supports manufactured by the company issuing the volume is included as Section IV.

STATISTICAL QUALITY CONTROL:

E. L. Grant. McGraw-Hill Book Co., New York and London; Embassy Bk. Co., Toronto, 1946. 563 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

This book deals with the laws of probability that may be used to improve acceptance procedures and thus secure the best possible quality assurance from a given inspection cost. It explains the Shewhart control chart and its use in manufacturing to reduce costs of spoilage and rework and to obtain better coordination among design, production and inspection. The careful explanation of basic principles is accompanied by many practical examples demonstrating the broad usefulness of quality control techniques in dealing with quality problems in mass production.

TABLES of FRACTIONAL POWERS:

Prepared by the Mathematical Tables Project under the sponsorship of the National Bureau of Standards and the Work Projects Administration for the City of New York and completed with the support of the Office of Scientific Research and Development, I. J. Briggs, Director, and A. N. Lowan. Columbia University Press, New York, 1946. 486 pp., tables, 10¾ x 7¾ in., cloth, $7.50.

The present volume of this steadily expanding series is a compilation of tables of decimal and fractional powers. In Part I the values of Ax, for fixed bases and variable exponents, are given to 15 decimal places for two-digit decimals of A and x. In Part II the function X2, for variable bases and the frequently occurring exponents ±½, ±⅓, ±⅔, ±¼, ±¾, is also tabulated to 15 places. As usual, there is a bibliography of similar tables. In the foreword to the volume various problems are suggested, the solution of which is facilitated by the use of the present tables.

TERMINAL AIRPORT FINANCING and MANAGEMENT:

L. L. Bollinger, A. Passen and R. E. McElfresh. Harvard University, Graduate School of Business Administration, Division of Research, Soldiers Field, Boston 63, Mass., 1946. 385 pp., charts, tables, 8½ x 5¼ in., cloth, $4.25.

Based on an intensive field study of 51 airports and numerous conferences with executives and officials, this book presents the results in four parts: Part I considers public and private financial responsibilities, and develops a proposal for a rate-setting procedure to be used in assessing fair charges against airport users; Part II presents a financial analysis of airport operations based on the actual figures obtained from the airports studied; Part III tests the practicability of the proposed rate-setting formula against the actual operating results reported in Part II; and Part IV is concerned with management, and after a brief discussion of essential airport records, emphasizes the questions of organization, incentives and controls.

WAVE PROPAGATION in PERIODIC STRUCTURES, Electric Filters and Crystal Lattices:

L. Brillouin. McGraw-Hill Book Co., New York and London, Embassy Bk. Co., Toronto, 1946. 247 pp., diagrs., charts, tables, 8½ x 5¼ in., cloth, $4.00.

Based on lectures given at the University of Wisconsin, this volume includes a variety of problems having a common mathematical background. They extend from electrical engineering to electromagnetism and wave mechanics of the spinning electron. The book includes explanations of electric filters, rest-rays, anomalous optical reflection, selective reflection of X-rays or electrons from a crystal, and omission of energy dissipation.

WHAT IS INDUSTRIAL ENGINEERING?

J. D. Woods & Gordon Limited, Industrial Engineers & Consultants, 15 Wellington Street West, Toronto, Canada, 1946. 74 pp., 10¼ x 7 in., paper, gratis.

In a brief, practical manner this book discusses the function of an industrial engineer, which boils down to the study and analysis of a situation as it exists, and the recommendation of procedures for improving the situation under review. This theme is developed under the following headings: business and industrial surveys; selling and marketing analysis; training programs; time and motion study; incentive plans; and personnel work.

NOTICE

The Library of the late I. Leebosh, M.E.I.C. is for sale. Individual items, or the complete collection may be purchased. The list of material available may be consulted at the Institute Library.

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

JUNIOR CHEMICAL ENGINEER required for the control department of a paper mill in Shawinigan Falls. Salary from $175-$275. Apply to File No. 3765-V.

JUNIOR CHEMICAL ENGINEER, required by a chemical firm in Shawinigan Falls, Quebec, as assistant to Plant Engineer. Duties include specifications, checking and development of flow sheets. Salary open. Apply to File No. 3769-V.

CIVIL

CIVIL ENGINEER, recent graduate up, required for government organization on West Coast, to carry out field surveys, investigations of water resources and their application and to make reports, maps, plans, etc. Salary $200 up. Apply to File No. 3724-V.

CIVIL ENGINEER, with at least five years' experience, to be assistant to the Director of Community Planning of the Province of Saskatchewan. Starting salary $200-$250. Apply to File No. 3746-V.

CIVIL ENGINEER with experience in survey and construction, preferably bilingual, required to take charge of the engineering department for the woods operations of a paper company in Eastern Quebec. House available. Salary $350 up. Apply to File No. 3749-V.

CIVIL ENGINEER, qualified O.L.S., required as town engineer and superintendent of works for a town in Central Ontario. State age and salary desired. Apply to File No. 3750-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years' experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

GRADUATE CIVIL ENGINEER, required as structural designing engineer by a firm engaged in the manufacture of cranes, crushers, pumps, etc., in the Toronto area. Preferably with 5 to 10 years' experience in designing and detailing steel buildings and bridges. Salary open. Apply to File No. 3771-V.

ELECTRICAL

ELECTRICAL DESIGNING DRAUGHTSMAN with considerable industrial experience and initiative required by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER with estimating and contract experience, required as office engineer by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200. up. Apply to File No. 3761-V.

JUNIOR ELECTRICAL ENGINEER, required to act as assistant in an engineering sales office of an electrical firm in the Montreal area. Salary open. Apply to File No. 3768-V.

MECHANICAL

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3756-V.

JUNIOR MECHANICAL ENGINEER with industrial experience required as assistant to the plant engineer in a factory in the Montreal area. Salary about $225. Apply to File No. 3758-V.

MECHANICAL ENGINEER, preferably bilingual, with design experience required by a manufacturer in Quebec, for development of new textile machinery. Salary $350-$400. Apply to File No. 3767-V.

GRADUATE MECHANICAL ENGINEER, experienced in boiler operation, required as assistant superintendent on maintenance of railroad and tramways rolling stock, in the Quebec area. Salary $200. per month. Apply to File No. 3772-V.

MISCELLANEOUS

SALES ENGINEER required in the St. John, N.B., district by a firm handling oil purifiers, piston rings and allied engineering products. Salary $250. plus commission. Apply to File No. 3744-V.

TOWNSITE SUPERINTENDENT required for a paper company town in Western Ontario. Salary open. Apply to File No. 3747-V.

GRADUATE ENGINEERS, recent graduates up, preferably mechanical, required for the engineering and operating staff of a pulp mill in Eastern Quebec. Salary open. Apply to File No. 3748-V.

PUBLICITY ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

GRADUATE ENGINEER, under 40, with industrial and manufacturing experience and some knowledge of sales, required by a bolt and nut manufacturer in the Montreal area. Salary open. Apply to File No. 3752-V.

GRADUATE ENGINEER required by an insurance company in Montreal for the inspection of boilers, steam plant and allied equipment. Salary from $200. Apply to File No. 3754-V.

JUNIOR DESIGN DRAUGHTSMAN, preferably with heating and ventilating experience, required by a consultant in Montreal. Salary from $175. Apply to File No. 3755-V.

CHIEF DRAUGHTSMAN with experience in Pulp and Paper Mill design wanted immediately in Port Arthur. Reply stating education, experience. Salary open. Apply to File No. 3760-V.

CIVIL, MECHANICAL OR CHEMICAL ENGINEERS, recent graduates up, preferably with experience in petroleum and heavy industry such as chemical or paper, required by an oil company in Toronto. Salary open. Apply to File No. 3762-V.

MECHANICAL OR STRUCTURAL ENGINEER required for the engineering staff of a paper mill in the Ottawa valley. Salary open. Apply to File No. 3763-V.

GRADUATE ENGINEER, with practical experience, production and maintenance, to take charge of Farm Equipment Factory with Grey Iron Foundry, located in Ontario. Apply with photo or snapshot to File No. 3764-V. Salary open.

GRADUATE ELECTRICAL OR MECHANICAL ENGINEER, must have thorough knowledge of fractional H.P. Motors required by a Montreal firm to take charge of small engineering department. Salary $350-$500. Apply to File No. 3770-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER OR CHEMIST, from recent graduate up, is required by an industrial concern in Montreal for chemical control of products. Salary open. Bilingual preferred. Apply to File No. 3564-V.

CHEMICAL ENGINEER required by a petroleum refining company in Montreal for process and design work. Salary about $225. Apply to File No. 3575-V.

CHEMICAL ENGINEER required as assistant professor of chemical engineering in a Canadian university to start autumn 1947. Salary open. Apply to File No. 3600-V (D).

CHEMICAL ENGINEERS OR CHEMISTS for analytical work in the laboratory of an industrial firm in Central Ontario. Salary from $175. Veteran preferred. Apply to File No. 3642-V.

CHEMICAL ENGINEER, preferably with sales experience, for sales and service with an industrial firm in Central Ontario. Salary open. Apply to File No. 3642-V.

CHEMICAL ENGINEERS, both with experience and recent graduates, required by an industrial organization in the St. Maurice Valley. Salary open. Apply to File No. 3644-V.

CHEMICAL ENGINEER recent graduate up, to be assistant to the department superintendent of a tar distillery in the Toronto area. Salary $225. Apply to File No. 3674-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

CHEMICAL ENGINEER, recent graduate, required as process engineer in production control by a manufacturer in Central Ontario. Salary open. Apply to File No. 3708-V.

CIVIL

CIVIL ENGINEER with experience in the mechanical trades required as designer by a building contractor in Quebec, age 30-35, salary open. Apply to File No. 3444-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position, salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER, senior designer, experienced in reinforced concrete and structural steel and general building construction, required to take charge of structuraldesign staff for a firm of consulting engineers in Montreal. Salary $300-$400. Apply to File No. 3585-V.

CIVIL ENGINEERS with master's degree, teaching and consulting experience, age 28-40, required for the staff of a university in N.Y. State. Salary open. Apply to File No. 3600-V (C).

CIVIL ENGINEER with construction experience required as plant engineer by a textile firm with headquarters in Montreal. Salary open. Apply to File No. 3615-V.

CIVIL ENGINEER, preferably with railroad experience, required by a company engaged in large scale asbestos production in Quebec to supervise construction of local railroad. Salary open. Apply to File No. 3683-V.

CIVIL ENGINEERS, from recent graduates up, required by a public utility in Toronto for the design and construction of dams, bridges and power houses. Salary open. Apply to File No. 3736-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters. English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to File No. 3415-V.

ELECTRICAL ENGINEER age 30 - 45 with sales training with large manufacturer of electrical equipment instruments and 5-10 years experience as sales service and sales engineer required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER with experience in teaching or practical electrical work required as full-time technical instructor in the Montreal area. Salary open with overtime. Apply to File No. 3600-V. (B).

ELECTRICAL ENGINEER for sales engineering, with previous experience, age 25-40, required by a Montreal firm handling pumps, valves, automatic controls, etc. Salary according to experience. Apply to File No. 3614-V.

ELECTRICAL ENGINEER with knowledge of power apparatus, preferably bilingual, required for sales work with a manufacturer in the Montreal area. Salary open. Apply to File No. 3646-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER to be chief engineer, responsible for electrical and mechanical design and testing, required by a firm in Ontario manufacturing electric motors. Salary open. Apply to File No. 3656-V.

ELECTRICAL ENGINEER with at least three years experience in the design of generating plants and high tension transformer stations required by an engineering firm in Toronto. Salary open. Apply to File No. 3661-V.

ELECTRICAL ENGINEER with several years experience required as a designer by an industrial organization in Montreal. Salary open. Apply to File No. 3677-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35, salary open. Apply to File No. 3695-V.

ELECTRICAL ENGINEER, recent graduate, preferably bilingual, required by a public utility in the Ottawa area to learn the distribution business from the management end. Salary open. Apply to File No. 3699-V.

ELECTRICAL DRAUGHTSMAN with several years' experience in industrial layouts for large concern in Eastern Townships. Permanent position and attractive salary available for experienced men. Apply to File No. 3701-V.

ELECTRICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

ELECTRICAL ENGINEERS experienced in the design and installation of private communication systems required for a public utility in Toronto. Salary open. Apply to File No. 3736-V.

ELECTRICAL ENGINEER, with at least five years experience on overhead and underground transmission and distribution systems. Required as distribution engineer by a public utility in Brazil. Salary open. Apply to File No. 3738-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with broad practical experience and theoretical knowledge required for a firm in Quebec. Salary from $225. Apply to File No. 3743-V.

MECHANICAL

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to File No. 3393-V.

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area, in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the re-conversion of a paper mill in Eastern Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MECHANICAL ENGINEER with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEERS to be design squad leaders on heavy machinery design required by a company in Central Ontario. Salary open. Apply to File No. 3623-V.

MECHANICAL ENGINEER recent graduate, required by an industrial firm in south western Quebec, for the design and erection of complex textile machinery. Salary open. Permanent position. Apply to File No. 3625-V.

JUNIOR MECHANICAL ENGINEER with construction or machine shop experience, required in Halifax by a Montreal firm handling heavy construction equipment. Salary open. Apply to File No. 3635-V.

MECHANICAL ENGINEER with experience in machine design required by a firm in the Maritimes engaged in ship repair and conversion and the manufacture of marine and heating equipment. Salary open. Apply to File No. 3638-V.

MECHANICAL ENGINEER with experience in the fabrication of Farm Implements, required by a Quebec firm. Bilingual man preferred. Salary according to experience. Apply to File No. 3666-V.

MECHANICAL ENGINEER with experience in the design of industrial machinery required by a Montreal firm manufacturing custom built machines. Salary $200-$250. Apply to File No. 3669-V.

MECHANICAL ENGINEER with design experience in the pulp and paper industry required by a firm with headquarters in Montreal. Salary $350. Apply to File No. 3673-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEER with industrial or construction experience, required by a firm of consulting engineers to inspect machinery deliveries in the Cornwall area. Salary open. Apply to File No. 3691-V.

MECHANICAL ENGINEER, recent graduate up, required for maintenance and production engineering by an industria firm in Montreal. Salary open. Apply to File No. 3692-V.

MECHANICAL ENGINEERS, age 25-35, required by a manufacturer in Montreal, for training as sales engineers and for executive positions. Salary from $200. Apply to File No. 3710-V.

JUNIOR MECHANICAL ENGINEER, under 30 and preferably bilingual, required by a Montreal firm to train as sales engineer for pumps, engines and allied electrical equipment. Salary open. Apply to File No. 3714-V.

MECHANICAL ENGINEER, under 45, with at least ten years' experience in design of heating, ventilating and refrigeration layouts, required as heating engineer for a government organization on West Coast. Salary $250-300. Apply to File No. 3724-V.

YOUNG MECHANICAL ENGINEERS, with practical experience either in automotive or general manufacturing industries, together with ability to operate engineering office systems, required by an industrial organization in Ontario. Salary open. Apply to File No. 3732-V.

MECHANICAL ENGINEERS, with at least five years' experience in the Pulp and Paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

SENIOR MECHANICAL ENGINEER, ten to fifteen years' experience required by a West Coast manufacturer of heavy equipment and vehicles to take charge of engineering design and inspection departments. Salary about $350. Apply to File No. 3734-V.

MECHANICAL ENGINEERS, with experience in plant layouts and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

MINING

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3743-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least 5 years practical experience, required by an industrial engineering consultant in Montreal. Apply to File No. 3307-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

MECHANICAL OR ELECTRICAL ENGINEER with experience in paper mill or steam plant operation, bilingual if possible, is required by an industrial firm near Montreal. Salary from $300, according to experience. Apply to File No. 3498-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

MECHANICAL OR MINING ENGINEER, age 30-40 with experience in industrial engineering, required by a large mining and processing firm for methods studies of equipment, labour and costs. Salary according to qualifications. Apply to File No. 3524-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

DESIGN ENGINEER with considerable experience required by a pulp and paper firm in the St. Maurice Valley. Salary open. Apply to File No. 3573-V.

CIVIL AND MECHANICAL ENGINEERS AND DRAUGHTSMEN, preferably experienced in building design and plant layout, required for a pulp and paper mill in Southern Ontario. Salary open. Apply to File No. 3578-V.

GRADUATE ENGINEERS, required by a large industrial and chemical organization with headquarters in Montreal for all phases of research design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

ASSISTANT PROFESSORS AND INSTRUCTORS required for the staff of a technical college in New York State. Salary open. Apply to File No. 3600-V. (A)

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL OR MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

SALES AND SERVICE ENGINEER with considerable experience in sales and heavy mechanical equipment required by a sales organization on the West Coast. Salary open. Apply to File No. 3626-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply to File No. 3628-V by letter with full details. Salary open.

SALES ENGINEER with wide engineering experience wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

MECHANICAL AND STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

ASSISTANT ENGINEER with experience in estimates and specifications for industrial work required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CHIEF DRAUGHTSMAN with at least five years draughting room and related engineering office experience, preferably in pulp and paper or process industries, required by a pulp and paper mill in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CIVIL OR MECHANICAL ENGINEER, required by a pulp and paper company in Newfoundland to look after new development work and general engineering in connection with woods operations. Salary open. Apply to File No. 3655-V.

ASSISTANT PLANT ENGINEER, preferably with pulp and paper or structural design experience, required for a newsprint mill in a city on north shore of Lake Superior. Salary open. Apply to File No. 3657-V.

JUNIOR ELECTRICAL OR MECHANICAL ENGINEER required by an industrial firm in Montreal for training as an industrial engineer, including plant layout and maintenance. Salary open. Apply to File No. 3660-V.

MECHANICAL OR ELECTRICAL ENGINEERS for training as production engineers with an industrial firm in Montreal. Salary open. Apply to File No. 3662-V.

CONSTRUCTION ENGINEER with ten years' experience in the design and erection of steel and concrete buildings required for the staff of an oil company in Montreal. Travelling involved. Salary open. Apply to File No. 3663-V.

JUNIOR ENGINEERS preferably with pulp and paper or other industrial experience required for training for the sales staff of a Montreal manufacturer of machines and equipment. Salary from $175. Apply to File No. 3664-V.

GRADUATE ENGINEERS for mechanical design, experimental, test and development departments of a Canadian firm producing aircraft gas turbines. Salary open. Apply to File No. 3667-V.

STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3668-V.

JUNIOR ENGINEERS, recent graduates up, as designing draughtsmen for a brewing company with headquarters in Montreal. Salary from $200. Apply to File No. 3670-V.

SALES ENGINEER with knowledge of sawmill and woodworking equipment, preferably bilingual, required for the sale of specialized equipment. Salary $200 plus commission. Apply to File No. 3678-V.

INDUSTRIAL ENGINEER as field representative in the Toronto-Niagara area for a government department, five to ten years experience. Salary about $300. Apply to File No. 3682-V.

JUNIOR ENGINEER, recent graduate up, required as surveyor by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

CIVIL OR MECHANICAL ENGINEERS, recent graduates, required by major oil company engineering Dept. Work consists of design of buildings and miscellaneous equipment for handling petroleum products. Salary open. Apply to File No. 3685-V.

CIVIL OR MECHANICAL ENGINEER, experienced in design and field supervision of construction of industrial buildings, piping, pumping and mechanical equipment, for products distribution of major oil company. Ten years experience required. Salary open. Apply to File No. 3685-V.

STRUCTURAL STEEL CHECKER OR DRAUGHTSMAN required immediately for a steel fabricating company in Niagara Peninsula. Salary open. Apply to File No. 3687-V.

MECHANICAL OR ELECTRICAL ENGINEER with general industrial experience, preferably with knowledge of time study, required by a wire and cable manufacturing company in Ontario. Salary approximately $225, depending on qualifications. Apply to File No. 3690-V.

JUNIOR CIVIL OR MECHANICAL ENGINEERS with design or structural experience required by a manufacturer of contractors' equipment in the Hamilton area. Salary open. Apply to File No. 3698-V.

CONSTRUCTION ENGINEER with field experience, age about 30, required as office engineer and assistant to general manager for a firm of contractors in Montreal. Salary open. Apply to File No. 3703-V.

CIVIL OR MECHANICAL ENGINEER with considerable experience in the design and layout of industrial plants required for the design staff of an industrial organization in Montreal. Salary from $250. Apply to File No. 3704-V.

SPECTROSCOPIST with experience in chemical analytical work and the use of the commission spectograph required by an industrial organization with headquarters in Montreal. Salary open. Apply to File No. 3706-V.

FORESTRY ENGINEER, recent graduate up, required by a paper company for woods operations on the Lower St. Lawrence. Salary from $175. Apply to File No. 3707-V.

CHEMICAL, MECHANICAL OR METALLURGICAL ENGINEER, recent graduate up, required by a manufacturer in Central Ontario for construction project work from inception to completion as required. Salary from $200. Apply to File No. 3708-V.

JUNIOR SALES ENGINEER, mechanical background, age 25-30, required by a Montreal firm manufacturing steel tanks, oil drums and other equipment for the oil industry. Salary about $200. Bilingual an advantage. Apply to File No. 3709-V.

JUNIOR ENGINEER DRAUGHTSMAN required by a Montreal firm designing and manufacturing aeroplane equipment. Salary open. Apply to File No. 3712-V.

JUNIOR ENGINEERS, recent graduate up, required for the engineering staff of a communications company with headquarters in Montreal. Veterans preferred. Salary from $175. Apply to File No. 3713-V.

JUNIOR STRUCTURAL DESIGN ENGINEER required by a steel fabricating firm in Central Ontario. Salary open. Apply to File No. 3715-V.

JUNIOR ENGINEERS, preferably with some mechanical design experience, required for the engineering staff of a manufacturer in Sherbrooke. Salary open. Apply to File No. 3721-V.

JUNIOR ENGINEERS, recent graduates up, with mechanical background required by a Montreal manufacturer for the design and supervision of boiler plant installations, preferably bilingual. May have sales work. Salary from $200. Apply to File No. 3722-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

CONSTRUCTION ENGINEER with considerable experience required for the permanent staff of a Montreal inspection company. Salary about $200. Age immaterial. Apply to File No. 3728-V.

JUNIOR ENGINEER, preferably with experience in heating and combustion problems, required by a specialist firm in Montreal. Salary $250-325. Apply to File No. 3729-V.

PLANT ENGINEER, age about 35, with factory experience and mechanical background, including maintenance and power plants, steam and electrical, required by a manufacturer in Montreal. Salary from $350. Apply to File No. 3735-V.

SALES ENGINEERS, with mechanical background, bilingual, required by a Montreal firm handling road building and contractors equipment, generators, pumps, etc. Salary open. Apply to File No. 3737-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DESIGN ENGINEERS, age about 30, with experience in the design and layout of chemical plants, required by an industrial organization in the St. Maurice Valley. Salary from $250. Apply to File No. 3741-V.

DESIGN DRAUGHTSMEN, age about 25, with experience in chemical plant layouts, required by an industrial organization in the St. Maurice Valley. Salary from $200. Apply to File No. 3741-V.

INDUSTRIAL ENGINEER, with broad experience in plant development, operation, costs and management required for a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

SALES ENGINEER, preferably bilingual, required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

SUMMER EMPLOYMENT . . . WANTED

The Employment Service of the Engineering Institute is endeavouring to aid their Student members to obtain suitable practical experience during the summer months. We would appreciate any assistance from firms anticipating such openings.

HEADQUARTERS OF THE ENGINEERING INSTITUTE OF CANADA

requires

ASSISTANT GENERAL SECRETARY *and* TECHNICAL EDITOR

ASSISTANT GENERAL SECRETARY to have charge of staff, to assist Institute committees in secretarial capacity, to have general supervision over Engineering Journal on behalf of Publication Committee, and in general to assist General Secretary in all duties. Travelling will be required. Must be a professional engineer and preference will be given to a member of the Institute.

TECHNICAL EDITOR to take full charge and responsibility under the Publication Committee, for all material in the Journal, with the exception of editorials and advertising. Required to appraise and edit manuscripts, prepare articles and seek out suitable papers that might not otherwise be obtained. Some travelling will be required. Appointment on a full time basis preferred but consideration will be given to a part time appointment.

Applicants are requested to communicate with the GENERAL SECRETARY, HEADQUARTERS, THE ENGINEERING INSTITUTE OF CANADA. All applications will be submitted to the Finance Committee for selection and recommendation to Council.

Civil Engineer

GRADUATE CIVIL ENGINEER required for structural design work by an established firm of consulting engineers in Toronto. The applicant should preferably be experienced in the construction and design of both structural steel and reinforced concrete structures. The application should contain a list of experience from date of graduation. All replies to this advertisement will be answered. Apply File No. 3753-V.

Technical Graduate

Preferably Mechanical, Chemical or Electrical, under 30, returned from military service, for permanent position with engineering organization doing business throughout Canada. After a training period in the United States, work will include travelling for consultation among leading industrial plants. Opportunity for advancement. Enclose photo when answering. Apply to File No. 3759-V.

Situations Wanted

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., 20 years work on Hydraulic Plants as designer and superintendent of construction. Extensive experience in guniting, diamond drilling and pressure grouting. One month notice. Apply to File No. 1527-W.

CIVIL ENGINEER, Jr. E.I.C., P.Eng., McGill, 30 years of age, bilingual, ex-R.C.E. officer, 3 years' experience on construction, 2 years pulp and paper industry, 1 year with public utility firm, administrative and contact ability, seeking permanent position. Available on short notice. Apply to File No. 1552-W.

GRADUATE ENGINEER, M.E.I.C., member of Board of Trade, Corporation of Professional Engineers, age 33. Interested in: Consultation, analyzing problems, constructive planning, programming projects and over-all direction. Have had real experience and responsibilities in executive planning, inspection and supervision in industry, scheduling, control, costing, promoting production, customer satisfaction, technical sales. Apply to File No. 2441-W.

PART TIME WORK—YOUNG CIVIL ENGINEER, S.E.I.C., would accept some work at night or during spare time; at office or at home. Now engaged in design work during day-time. Apply to File No. 2735-W.

CIVIL ENGINEER, B.A., B.Sc., M.E.I.C., R.P.E., age 44, with over 20 years' experience in railway, municipal and highway engineering, also consultative, including design, location, construction and maintenance. Extensive administrative and executive experience. Desires position in construction engineering or superintendent for construction firm. Apply to File No. 2808-W.

ELECTRICAL ENGINEER, Jr. E.I.C., age 34, R.P.E., Ont., on University staff, with sales, maintenance and switchboard design experience. Desires summer employment. Apply to File No. 2809-W.

GRADUATE ENGINEER, mining, Jr. E.I.C., R.P.E., Ont., age 31, married. Approximately three years' experience in mine and land surveying, and three years as a supervisor in production, development and process control in heavy industry. Presently employed, but interested in a position with Consulting Engineer, Surveyor, or in Production. Location preference: Ottawa or Toronto areas. Apply to File No. 2810-W.

AVAILABLE — Internationally Known Engineer and Manager

Chartered Member of British Technical Institutions. P.Eng. Ontario and Quebec:—Grading P.G. VIII.

ADVISORY AND CONSULTING PRACTICE OF REPUTE covering large British, Canadian and Australian Power Projects; individual and grid schemes.

SPECIALIST in Railway (Main Line) Electrification, Industrial Engineering, Works and Factory Management and Control, Sales and Industrial Administration relative to high capacity Manufacture of Electrical and Mechanical Plant and Equipment. World-wide experience and connections.

What has Canadian or American Industry to offer in the way of an Executive Appointment, location immaterial providing scope for extensive experience and ability, full responsibility, freedom of action and adequate financial return is assured.

All enquiries treated as confidential. Apply to File No. 1697-W.

CONTENTS

COVER PICTURE

March 3rd marks the 100th anniversary of the birth of Alexander Graham Bell, the inventor of the telephone. Bell had a summer home near Baddeck, N.S. The cover picture, taken in his laboratory there, is a study of Mr. Bell in later life. He spent many hundred "man-hours" of his time just this way—tabulating statistics concerning the deaf. The number of congenitally deaf children born of congenitally deaf parents worried him so greatly that at one time he produced a "Memoir upon the Formation of a Deaf Variety of the Human Race".

CANADA'S SYNTHETIC RUBBER PRODUCTION

GORDON R. HENDERSON, M.E.I.C.
Chief Engineer, Polymer Corporation Limited, Sarnia, Ont.

A paper presented before the Montreal Branch of The Engineering Institute of Canada, December 12th, 1946.

The author traces the early developments in synthetic rubber production in Germany and America, and describes the evolution of butadiene from the oil industry. The tie-in between the Polymer plant and the Imperial Oil refinery is outlined and the manufacturing process described. Details of the utility requirements are given. The methods of separating and treating the gaseous products are dealt with. Safety measures and plant control are discussed.

The Baruch Report on the rubber situation as presented to the President of the United States in 1942, prefaced its findings by the following statement:

> Of all critical and strategic materials, rubber is the one which presents the greatest threat to the safety of our nation and the success of the allied cause. Production of steel, copper, aluminum alloys or aviation gasoline may be inadequate to prosecute the war as rapidly and effectively as we could wish, but at the worst, we are still assured of sufficient supplies of these items to operate our forces on a very powerful scale. But, if we fail to secure quickly a large new rubber supply, our war effort and our domestic economy both will collapse.

The above statement is undoubtedly familiar to all of us. The subsequent result is even more familiar, because the war was prosecuted and won by huge armies adequately supplied with all necessary materials, and our domestic transportation did not suffer from any crippling shortage of tires. Moreover, the production of synthetic rubber in huge quantities is a real contribution to the present slow but sure return to normal conditions throughout the world today.

The production of large quantities of synthetic rubber was not a question of waving a magic wand. It was the result of years of development and research by the industries that combined to make the development possible, namely, the rubber manufacturers, the chemical producers and the oil industry. Before outlining a few of the problems which confront the engineer in the production of synthetic rubber, it is profitable to review briefly the events which made the programme possible, and thus gain a clearer understanding of the type of equipment in use at Sarnia.

Prewar Synthetic Production

A great number of rubber-like synthetics have been produced from a great variety of raw materials. It is an old adage that "necessity is the mother of invention". In consequence, the development of a satisfactory rubber-like synthetic was first announced by the German I. G. Farbenindustrie. During the last war the German army had been seriously handicapped by the lack of rubber, and this commodity was essential for the successful prosecution of another war. The Buna-S and Buna-N produced there were both developed from the reactive hydrocarbon acetylene made from the limestone and coal, both of which are found in great abundance in Germany. The development can be considered natural in a country which has a very limited supply of hydrocarbon in the form of crude oil.

On this continent, the necessity for a rubber-like material was not considered essential for national existence, but the variation in cost of rubber during the past thirty years fostered a constant research programme. It is somewhat ludicrous to recall that the Dupont Chemical Co. priced their synthetic neoprene at $1.05 per lb. in 1931, when natural rubber sank to its all-time low of 3½c per lb. Neoprene is made by the polymerization of chloroprene, which is in turn prepared by adding chlorine to the hydrocarbon isoprene. Regardless of the price differential, the new synthetic lived, and its sales increased rapidly.

During the next ten years many new synthetics were placed on the market. Their trade names are now well known: Buna-N, Thiokol, Vistanex, Flamenol, Pliofilm, Koroseal, and a host of others. However, none of these materials was satisfactory as tire rubbers, although they had characteristics very desirable in other fields. When the supply of natural rubber disappeared with the Japanese conquest of Malaya early in 1942, it was realized that the most suitable tire rubber was Buna-S, prepared by the copolymerization of butadiene and styrene.

"Polymerization" can be defined as the means of joining molecules of the same compound to form a new substance of higher molecular weight and of different physical characteristics. In the reactions considered here it is a linkage of hydrocarbon molecules, for all the world like a chain of paper clips linked end to end. Estimates of the number of isoprene molecules in natural rubber ranges from 200 to 4000.

War Made Synthetic a Necessity

Some of the rubber manufacturers had carried on exhaustive research for the preparation of the buna-S type rubber through the 1930's, and when war broke out there were two semi-commercial plants in the process of design and construction. Moreover, the Dow Chemical Co. of Midland, Michigan, had developed a process for the production of styrene, essentially as a thermal plastic, and a small commercial plant was put into operation in 1938.

The problem of expanding both the Buna-S and styrene plants from semi-commercial production to enormous commercial output, was a major undertaking. The production of butadiene, which is equivalent to approximately 75 per cent of the required material, without even pilot plant work, was an unprecedented task. Two methods were practical, one using alcohol as the primary material, and the second by dehydrogenation of the normal butylene, which is present in sizeable quantities from the gases produced in oil refinery cracking operation.

Chemical manufacturers of carbon and carbide produced butadiene from alcohol in a surprisingly short period of time. This material provided feedstock for the first synthetic rubber produced on a major scale during the war. However, it was realized when the programme was commenced, that butadiene from alcohol would cost considerably more than that from petroleum, roughly 40c per lb., as compared to 10c per lb. In consequence, its manufacture was stopped

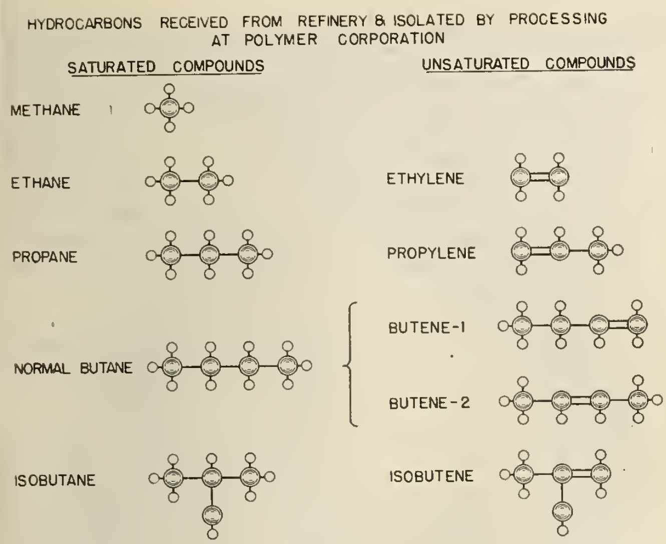

Fig. 1

shortly after Japan capitulated, with the exception of those plants retained for development purposes.

The government-owned plant at Sarnia is designed to extract butylene from the gas stream produced by the cracking operations at the adjacent Imperial Oil refinery. Polymer is the only plant which combines all operations to produce the two major synthetics used in tire manufacture, namely, Buna-S now called GR-S (Government Rubber Styrene), and Butyl GR-I (Government Rubber Isobutylene).

How Butadiene Was Evolved from Gasoline Industry

Let us look for a moment at the transition through which the oil industry passed in the nineteen twenties and thirties, that led up to their ability to produce butadiene.

The plant at Sarnia may be considered as a tangible result of development and progress in the gasoline industry during the twenty odd years preceding the outbreak of war. During this time the improvement in quality of gasoline, and the increase in percentage of this product obtained from a barrel of crude oil, was accomplished by the cracking or breaking down of heavy complex hydrocarbons to the simpler forms which are present in the gasoline boiling range.

The " octane " race of the twenties and the thirties was induced by a highly competitive automotive industry which increased cylinder compression ratios to decrease engine weights and improve the performance of the internal combustion engine. All of this resulted in lower costs per horsepower. But each new car design forced the refiner toward more severe cracking conditions (that is, increased temperature and pressure) to meet the higher gasoline specifications demanded by new engines. Unfortunately, the cracking plant losses by the formation of non-condensible gases increased along with the specification. In consequence the refiner turned his attention toward the utilization of the materials contained in the gas stream.

It was readily recognized that if the gaseous hydrocarbons could be combined, a heavier product would be produced as a liquid in the gasoline range. Therefore, if two molecules, each containing four carbon atoms, could be joined together (synthesized), iso-octane would be produced, which could be used to increase the anti-knock qualities of base stock gasoline. About 1935 this reaction was accomplished by a number of processes, both thermal and catalytic, and over the next few years the industry learned a great deal about catalytic synthesis.

It is well to recognize here that the treatment of the gaseous portion of the hydrocarbon stream introduced new problems into an already complicated industry. The equipment manufacturers were called upon to meet the new demands, and if time would permit it would be interesting to review the changes that took place during this period.

Up until the outbreak of the European war, the plants that were designed to utilize the hydrocarbon gases were relatively small and few in number. Polymerization and alkylation plants were added to existing refineries, and their products supplied a considerable portion of the aviation gasoline requirements. But, even this was soon recognized as being insufficient to meet the increasing demand of the airplane. Only those hydrocarbons which are deficient in hydrogen (that is, unsaturated) were reactive enough to be utilized. The balance of the C4 or butane stream, which was about 65 per cent of the total, provided additional potentialities for high octane blending stock. Considerable research work was conducted to develop the technique of removing hydrogen from saturated butane. By the time Japan attacked Pearl Harbour, the reaction was fundamentally understood, and at least one plant had been placed in commercial production.

The foregoing sequence of events gave the research chemists and process engineers a general understanding of the technique required to dehydrogenate butylene to butadiene, or to produce a double dehydrogenation from butane to butylene to butadiene. At the same time, the industry increased its knowledge of fractionation to a point where the isolation of individual hydrocarbon monomers had progressed from the laboratory to commercial processes.

How Polymer Is Geared to Imperial Refinery

The Polymer plant at Sarnia commences where the refiner leaves off. Although the materials used are any but waste products, the operation is complementary to the refinery. The gaseous product from the neighbouring Imperial refinery is delivered to first fractionation unit. There it is separated into its various components by means of fractionating equipment, and temperatures in this plant range from —120 to 250 deg. F. with pressures up to 480 lb. per sq. in. gauge. Here ethylene is extracted for styrene manufacture. This material is used both as a major constituent of Buna-S rubber and also as a thermal plastic. It is

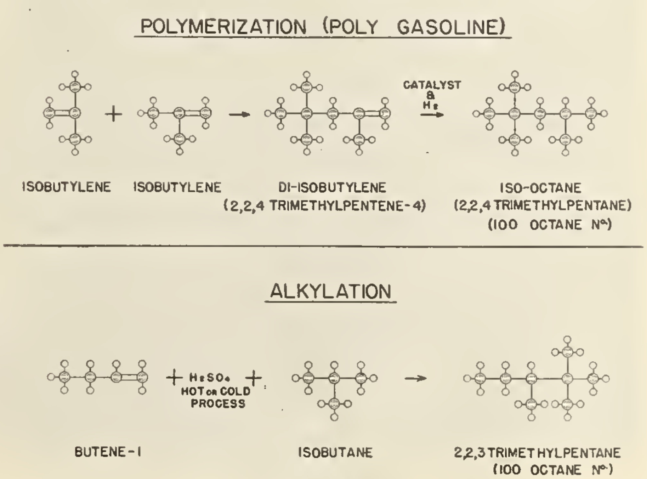

Fig. 2

Fig. 3—Light ends fractionating unit.

anticipated that within the next year a portion of the ethylene will also be used for the manufacture of ethylene glycol.

The only other hydrocarbon contained in the gas stream which is utilized in the manufacture of rubber is contained in the butane or C4 cut, taken as overhead from the top of the debutanizer column. In the processes at Sarnia, only the unsaturated or olefinic forms of the C4 cut are used. After the butanes are isolated however, they are fed into the second unit where isobutylene is extracted from the C4's by dissolving this material from the stream with sulphuric acid. The isobutylene fraction is removed from the normal butylenes in order to prevent dilution in the butadiene dehydrogenation plant. Since isobutylene is thus made available, Sarnia installed the butyl rubber plant, designed to produce butyl rubber by the polymerization of isobutylene.

Manufacturing Process Described

This butyl rubber reaction takes place in a vertical tubular reactor at —140 deg. F. where it is contacted with a liquid catalyst. Both the feed stream and the catalyst stream are dried through alumina driers. Next they are precooled to the desired temperature, before being injected into the bottom of the reactor. The temperature is obtained by using conventional compressor refrigeration systems with ammonia and

Fig. 4—Panorama of operating units. Butyl rubber unit, right centre.

ethylene as refrigerants. The unused portion of the gases are flashed off immediately after the reaction, and recycled through the plant. The solid butyl rubber which is formed in the reactor, is transported by a water stream to the finishing section. There the butyl rubber is very thoroughly dried and worked at a temperature of about 300 deg. F. through extruders and milling machines, before being cut into strips for packaging. This material is an excellent gas container, and has been the source of all inner tubes in Canada during the past 18 months.

The residual stream from the isobutylene extraction plant is composed of butane, isobutane, and normal butylenes. The latter monomer is removed from the stream by extractive distillation, using acetone as a solvent. The butylenes are fed into the dehydrogenation unit. Butylene dehydrogenation is accomplished by feeding a mixture containing approximately twenty volumes of steam to one volume of butylene at a temperature of approximately 1100 deg. F. The mixture passes through a fixed bed catalyst at a nominal pressure of five to ten pounds. Here, hydrogen is released from the butylene, and carbon is deposited upon the catalyst bed. It is therefore necessary to regenerate the catalyst by burning off the carbon at periodic intervals. The normal cycle is about 60

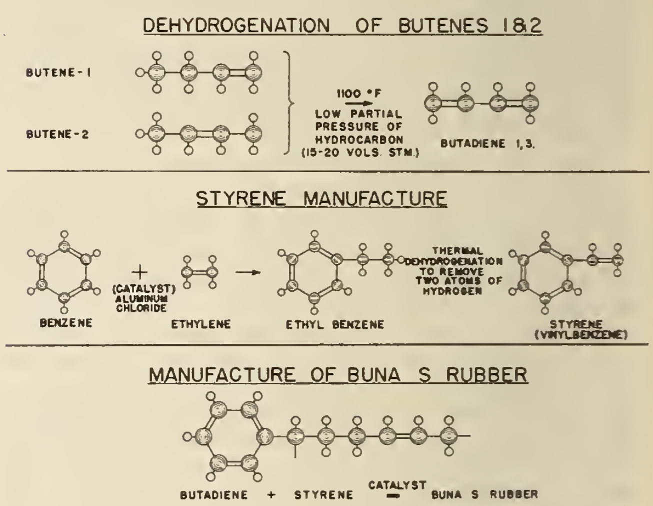

Fig. 5

minutes, and an automatic time-cycle controller operates the necessary valves to change reactors each hour during the operation.

The outlet from the reactors themselves is a mixture of steam, and gases, which are a combination of virtually all materials in cracking reaction. These latter have to be separated by normal fractionation. But before doing so the temperature must be reduced from 1100 to something around 100 deg. F. Fractionation is accomplished in a liquid phase, so that gases are compressed to normal fractionating pressures and condensed to their liquid form. The resulting product from the butadiene plant contains in the neighbourhood of 20 per cent butadiene in a mixture of C4 materials, and as the boiling points differ by only about 5 deg. F., it is necessary to isolate the butadiene content. This is done by dissolving the material in a copper ammonia solution, to obtain the high degree of purity necessary for the Buna-S reaction.

Styrene is made in the section of the plant operated by the Dow Chemical Company, by mixing ethylene from the light ends plant with imported benzol. The combination of these two substances is carried out in

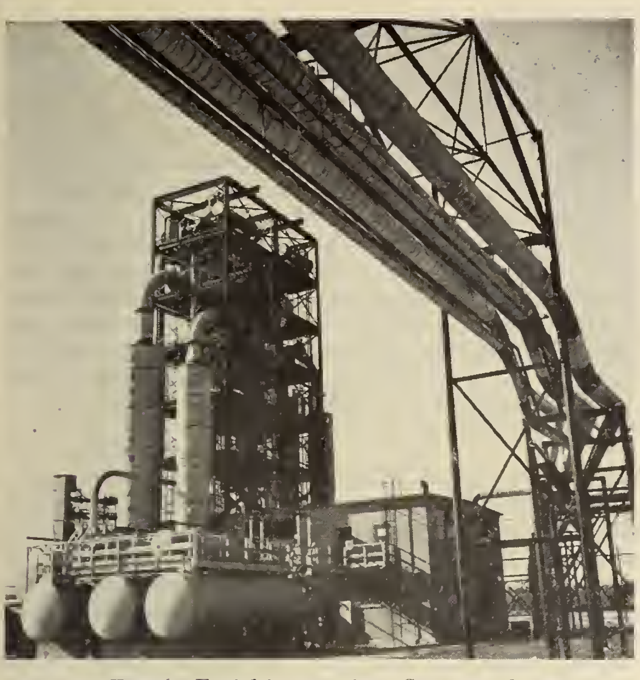

Fig. 6—Finishing section. Styrene plant.

the presence of a liquid catalyst. The resulting main product from this unit, ethylbenzene, is then passed through a fixed bed catalyst reactor in the presence of high temperature steam (1500 deg. F) where it is dehydrogenated. The resulting styrene is then concentrated to a very high purity 99.6 per cent by vacuum distillation. (Fig. 5).

These two main components of buna-S rubber (butadiene and styrene) are charged to glass-lined reactors in the synthetic rubber plant. Here the reaction is controlled in the presence of a soap solution emulsifier, antioxidant and modifier, to produce a heavy milk-like latex over a period of 13 to 16 hours. Although the reaction was originally designed as batch process, it has been possible to arrange continuous reaction by joining 12 reactors in one line. Resulting latex contains about 28 per cent solids, and a considerable portion of unused gas butadiene and styrene. These latter materials are recovered in a distillation section, and the gases are returned to the front end of the plant for recycle. (Fig. 5).

The stripped latex is delivered to storage tanks in the finishing building. It is kept constantly agitated and under inert gas blanket to stop additional polymerization. Finally, the latex is fed through a coagulation trough. The solids are here separated out by coagulation with salt and acid, or alum, or salt alone, depending upon requirements of the rubber companies. The solution is removed from the solid material by screens or Dorr skimmers. They are then transported by water to Oliver filters, where the cake is washed, and finally delivered to large steam-heated driers. This material is shipped by compressing it under hydraulic pressure to a 75 lb. bale.

Utility Requirements

The steam and water requirements of the plant were somewhat overestimated, but even present day normal consumption of these is very large, with a steam production of over 800,000 lb. per hour and a cooling water consumption which totals approximately 85,000 U.S. gal. per min. during the summer season. Seven different types of fuel are used in the plant, but six of these are either used for economic convenience or as emergency generation. The basic fuel is mine-run coal, burned as pulverized fuel.

The annual coal consumption exceeds three hundred thousand tons. Coal is brought to the site by self-unloading lake freighters, which discharge their cargo at the rate of about 1,000 tons an hour. The coal is delivered to the pile by conveyor belt, and dumped off the end of a boom conveyor. During the summer, a portion of the coal is fed directly to the primary crushers by caterpillar tractors, and the balance stockpiled by Letourneau drag scrapers. This equipment has proved very satisfactory. Even distribution and adequate compacting have eliminated any tendency toward overheating. The maximum temperature recorded in the pile, which averages 250,000 tons at the beginning of winter, is 115 deg., and no fires of any description have ever occurred.

In order to obtain delivery of small process electrical equipment in the shortest period of time during the war emergency, it was necessary to use a frequency of 60 cycles. Consequently generating equipment had to be installed in the power plant. Although the turbo-generators used for this service were second-hand condensing machines, it was recognized that an economic power supply could be generated by the use of extraction turbines. It is expected that this type of generating equipment will be installed during 1947, and that all power needed to operate the plant will be provided in this manner. Although the steam and power plant is the largest unit of its kind in Canada, with five boilers, each rated at 300,000 lb. per hour, and an installed generating capacity of 25,000 kw, it is only briefly referred to here, as the subject under discussion is the manufacture of synthetic rubber.

Gaseous Products

One of the major problems of both design and

Fig. 7—Reactors for GR-S rubber.

operation of the plant is that a daily maximum of 19,000,000 cu. ft. of gas, and over 6,000 bbl. of light hydrocarbons have to be processed continuously. It is not economically feasible to provide any storage capacity, either in feed streams from the refinery to the rubber plant, or the return fuel gas line which is indispensable for uninterrupted operation of the system. Coordinated operation, and the continuous satisfactory performance of control instruments, are an absolute necessity to assure uninterrupted production. In addition, all materials passing between the two plants must be measured, sampled, and analysed, to assure adequate control of the mechanics of buying and selling.

Furthermore, it is now the intention to sell gaseous products from the gas fractionating plants in the Polymer operation, to a large chemical industry. This will increase the number of problems for the engineers, although no undue difficulty is foreseen. The eventual layout of the Sarnia area indicates what can be accomplished by coordinated effort on the part of industries of this nature.

The first operation in the sequence of isolating the individual hydrocarbons is to remove the hydrogen-sulphide, because large quantities of fuel gas are utilized in the operation of the 15,000 hp. gas driven compressors required in the various processes. Normally, it would be possible to caustic-wash the products only, but general operations dictated the necessity of treating the entire feedstock.

One of the most important and interesting developments, has been that of reducing the leakage of highly volatile and/or toxic liquids during pumping operations. Virtually every conceivable application may be found in the plant, including the conventional packing, the dry mechanical seal, single liquid seals, double liquid seals. It is now the intention to use as well an application of the packless pump on ethylene product service. This latter unit comprises a motor running in a sealed casing filled with oil, and having a mechanical seal between the motor and pump. The pressure maintained on the oil is somewhat higher than the product pumped, and therefore there is a slight leakage into the product. A balance chamber is provided between the product on one side of a diaphram, and the oil on the other. This application is being used because of the value of the material produced, and the high reflux rate at which the fractionating system must operate.

Fig. 8—Fuel gas driven compressors. Butyl rubber plant.

This comparatively new industry uses for the first time large quantities of di-olefins. These are hydrocarbons which are deficient in two hydrogen molecules, and are therefore doubly reactive. Although the final plant products are obtained by polymerization, it becomes most embarrassing when this reaction occurs at times when it is not supposed to. The formation of "popcorn polymer" has been a perplexing phenomena and one of the headaches to both the operator and the maintenance engineer. Condenser shells begin to enlarge and when taken out of service the material in the shell can be heard to burst, very much in the manner of popcorn exposed to flame. The growth will continue during steaming-out operation, and will probably render the exchanger a total loss.

Safety Measures

An overall plant inspection department has been set up to assure continuous operation, and to guarantee as far as humanly possible, the safety of pressure vessels and all equipment. These inspection engineers are called in to advise upon the design of new equipment, and to act as inspectors during fabrication either at the plant shops or when vessel manufacture is contracted. By this procedure, they are assured of the suitability of equipment for the designed service. They also become familiar with the equipment before it arrives on the job. Permanent records are retained on material thicknesses and any other unusual features. The plant inspectors requisition all safety valves used in the plant, and test and maintain these vital pieces of equipment at all times. The group are used as consultants for the use of ferrous and non-ferrous materials, as well as the procedure of welding technique used on original fabrication and repairs, necessary from time to time.

Safety of plant personnel in all phases of the industry is directed by a committee maintained at all times under the direction of the safety department. This committee discusses specific hazards and analyses protective measures which should be, or have been, incorporated throughout the plant. Some of the inherent hazards require a great deal of careful thought by the operating and engineering departments. prior to design and installation. One of the major problems is to provide adequate ventilation in the buildings which house the large gas compressors. The hydrocarbon gases are heavier than air. For this reason fresh air supplies are taken from high points on structures to avoid the possibility of gas accumulation near the ground.

Experience has shown that it is not feasible to exhaust these gases at floor level. This is because the heat from compressor engines creates a natural circulation to the top of the building. Both from a standpoint of personal comfort, and also an adequate purging of the gases which may be present in the building, it has been found desirable to exhaust from the roof. The fresh air which is forced into the building is admitted to the room at floor level or used to purge the trenches installed for process piping.

Fire protection is the responsibility of the fire marshal, and a small force of permanent firemen. The water for fire fighting purposes is supplied from special pumps in the main pumphouse through ring main fire systems. These are designed to feed into any specific location from two or three points. In addition, adequate chemical storage is provided for the foam systems used as blanketing for certain types of fires. The capacity of the system is sufficient to provide

3500 gal. of water per minute to each of two isolated fires in the plant at the same time.

When, as, and if a fire occurs in one of the processing units, it is highly desirable to reduce the pressure in the equipment and remove the liquid hydrocarbons contained in the vessels or drums. In order to do this there are numerous problems confronting the engineer. A portion of the gaseous stream is not condensible, except in the very heavy equipment. If it were used it would be necessary to provide pumps to remove the material from the unit to a place of safe storage. On the other hand, if the pressure is suddenly reduced, the rapid expansion causes a very large temperature drop and consequent freezing. All these factors have to be taken into consideration in the design of equipment which will give even reasonable protection during emergency period.

A few of the problems confronting the engineer have been briefly referred to in the foregoing short description. Space will not permit any discussion on the multitudinous instrumentation and control problems, but their magnitude can be visualized by realizing that the instrument department has a personnel of 47, and that the installed value of instruments in the plant amounts to well over a million dollars.

Research and Plant Control

In the popular book " This Chemical Age ", written by William Haynes, and published in 1942, the author titled his chapter on petroleum refining as " Chemists in Spite of Themselves ". The laboratory at Polymer fully bears out the caption. The personnel amounts to approximately 160, of which some 40 members are university graduates, and a rather large portion of these have Ph.D. degrees. Some of the work consists of current plant control problems, the analysis of feed stock streams for accounting control, and the evaluation of rubber products, both in the crude state and compounded by standard methods used in the rubber industry. In order to accomplish the vast amount of work undertaken, podbielniak distillation columns, spectroscopes, and even the mass spectrameter are in constant use.

The synthetic rubber industry has only been in existence for three years. It is probable that changes in manufacturing technique, the type of hydrocarbon monomers used, and the technique of rubber compounding will advantageously affect the quality of the finished product. For this reason a comprehensive research programme has been actively commenced, headed by the present Polymer personnel and coordinated with research work at universities, the rubber companies, and the National Research Council. Early this year, a pilot plant was completed for the preparation of styrene-like monomers and copolymerization of Buna-S type rubbers. Already valuable information is being obtained. It is the intention to actively promote research on all types of synthetic rubber, as both the company at Sarnia and the Canadian government are convinced of the advantages that this industry will provide in Canada.

Polymer Will Stabilize Rubber Prices

The future of the synthetic rubber industry is essentially one of economics, although United States rubber companies recommend government protection for a reasonable amount of synthetic production during reconversion. All parties are convinced that the economic value of maintaining synthetic production is well worth while if only to act as a stabilizer on the price of all rubber used. A glance at the cost of rubber during the past 40 years emphasizes the concern of rubber manufacturers in maintaining synthetic production on this continent. Sarnia management has been very active in trying to maintain full production rates. A considerable portion of Sarnia production has already been exported to Scandinavian countries, Great Britain and South America.

In addition it is recognized that some of the by-products from operations can be profitably sold, and contracts have already been made with Dow Chemical Co. at Sarnia, and with Monsanto Chemical Co. at Montreal, for the sale of 12 million lbs. styrene per year. This is the excess capacity of the present styrene plant at Sarnia. The Dow Company is now building a new plant at Sarnia for the manufacture of ethylene glycol, which will utilize ethylene production in excess of that required for synthetic manufacture. This plant is large and will require utilities which are available at the steam and power plant. Arrangements have already been made to serve this large neighbouring industry.

The new industry is paying its way. All indications point to a bright future, and it is confidently expected that Canada's Polymer Corporation will remain to serve the community at Sarnia, and the Canadian people at large, for a long time to come.

DIAMOND JUBILEE MEETING

of the Institute

ROYAL YORK HOTEL, TORONTO

May 8th, 9th and 10th

THE PRINCIPLES OF PRESTRESSED CONCRETE

PROFESSOR G. MAGNEL
University of Ghent, Belgium

This paper is a resume of several addresses given by the author before various Branches of The Engineering Institute of Canada in May 1946, and has been prepared for the Journal by special request. Prestressing is explained in a way that any member of the profession could understand. Three methods of prestressing are given and each explained in detail. The economies obtainable by the use of prestressing make this short and very clear explanation a subject of prime interest and importance to today's and tomorrow's engineers.

The idea of prestressing is so simple and logical that it has been applied daily for ages in a great number of human activities.

In making a wooden wheel, when the workman places the external steel hoop around it, properly heated, so as to put the wheel under compression after the temperature has returned to normal; that is prestressing. If the hoop were heated electrically, Mr. Billner would speak of it in modern terms as " electrical prestressing ".

When we want to remove a series of books standing in line on the shelf of a library, we are careful about two main things; not to take too many books at a time, and to press them as hard as necessary between our hands; this again is prestressing. Together the books resemble the shape of a prismatic beam, but the material of which that beam is made has no tensile strength, so that it cannot resist the bending due to the dead load of the books between our hands which act as end supports. But if with our hands we put the whole beam under a longitudinal compression, it acquires a tensile resistance, since it will be able to resist any bending moment giving tensile stresses smaller than the compressive stresses set up by the action of our hands.

The theory of prestressing being so simple, it is quite natural that, as soon as reinforced concrete was developed, the idea should have been applied to it. This actually did happen, although the first steps in that direction were far from successful.

In reinforced concrete there are more reasons than anywhere else for applying the idea of prestressing, because;

1.—Concrete has a very poor tensile strength, and a poor capacity for elongation before it breaks under tension. The result is that in a concrete beam, carrying its working load, the concrete submitted to tension is incapable of following the deformations of the tensile steel reinforcement to which it is united by bond; moreover in all beams under working load, the concrete is haircracked, which increases the deflections of the structures.

2.—The low tensile strength of concrete is accompanied by poor resistance of beams against shear; this compels the engineer to give great thickness to the webs of the beams he is designing, and makes long spans impossible in reinforced concrete, because the dead weight becomes too great.

3.—Concrete is subject to cracking as a result of shrinking, and these cracks are frequently wider than hair cracks.

The reader can no doubt understand that these three evils would be avoided if we could put the concrete under uniform compression, possibly in all directions, before the unavoidable forces of dead and live load and the effects of shrinkage act upon it. This means prestressing the concrete, or arranging things so that, if dead and live load together with shrinkage give a tensile stress on a certain surface around a certain point, this surface will be subject to a pre-established compressive stress higher than the tensile stress referred to. The resultant stress will then be compression, and cracking will be out of question.

How are we to apply this in practice on concrete structures? There are three different ways of doing so known to us at present. Let us enumerate them and analyze each one.

A.—Consider a bridge of 66 ft. span, capable of carrying a live load of 420 lb. per sq. ft. The quality of the concrete allows a safety stress of 1500 lb. per sq. in. The bridge is supposed to be a simple slab. Let us make a slab 2 ft. 8 in. thick, containing in each strip of one foot width and close to the lower fibres at mid-span, two rods capable of being stretched each up to about 75 tons. These rods are placed in a sheet steel tube to prevent a bond between them and the concrete. They are somewhat longer than the slab, so that their free ends can be seen outside the slab at both ends of the span.

As soon as the concrete has sufficient strength, we will prestress it by putting the reinforcing rods under tension, this tension being transmitted as a compression to the concrete. This can be done by special anchorages fixing the rods at both ends against the concrete. In reality, one anchorage is fixed against the concrete before the rod is stretched, then the tensile load is applied to the rod on its other end, and while the rod is under tension the second anchorage is applied to it so that when the jack loosens its grip on the rod, this rod cannot resume its initial length again. This puts the concrete under compression between the anchorages fixed to its two ends.

For the past fifty years many inventors have tried to apply the above method. The first to be successful was the French engineer Freyssinet. All his predecessors used rods in mild or semi-mild steel. They got some results immediately after the first prestressing, but the greater part of the prestress had disappeared after one or two years.

The reason for this lack of success is obvious, but it took the engineering world some thirty years to grasp it. It reflects great credit on Mr.

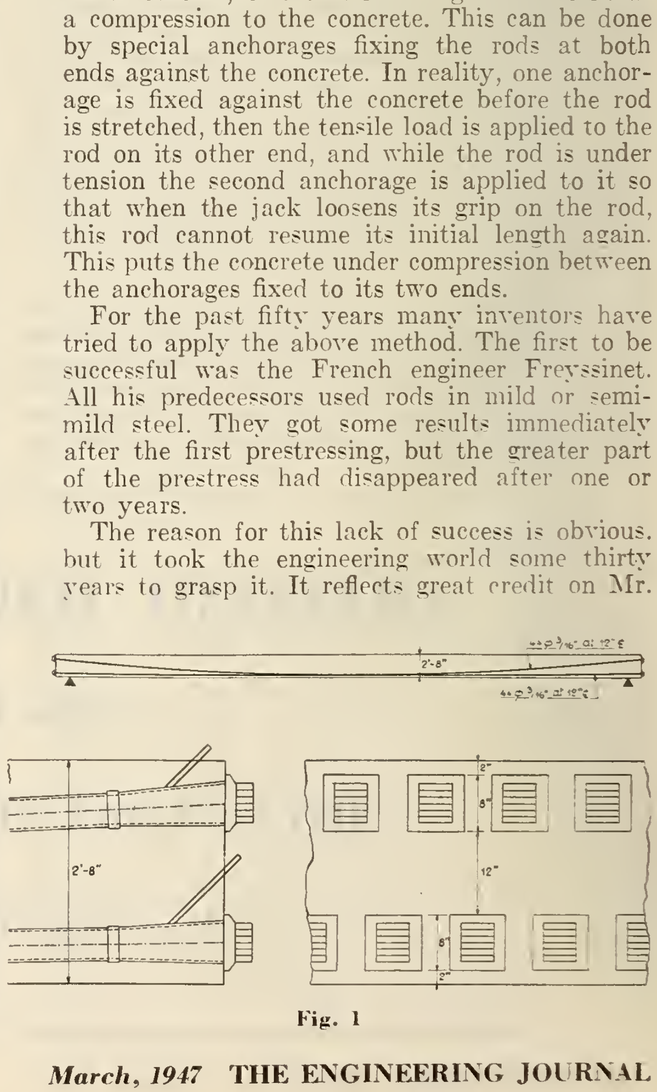

Fig. 1

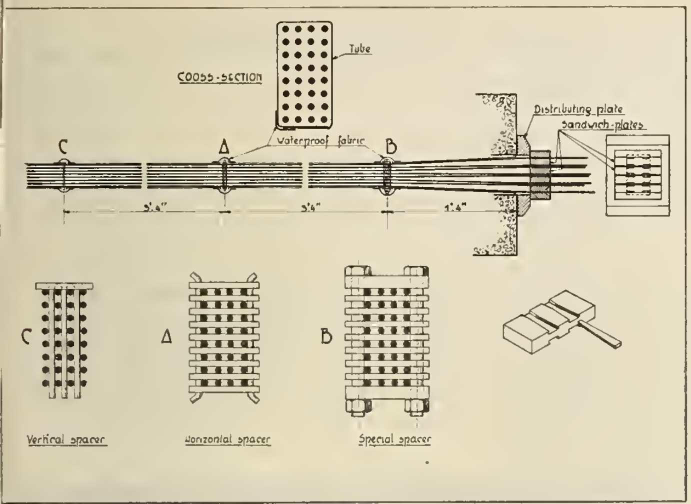

Fig. 2

Freyssinet that he called attention to it. With mild steel stressed up to 16,000 lb. per sq. in., the elongation in our 66 ft. bridge span is roughly half an inch. But if we consider the shrinkage and creep of concrete, we soon realize that with the concrete decreasing in length in the direction of the span by one quarter of an inch, due to the creep and due also to shrinkage, nothing will be left of the prestress after the first few months. In other words, with mild steel rods we cannot establish a permanent prestress. The half inch elongation of the rods disappears gradually, and the grip on the concrete is loosened.

But, if we could use a grade of steel which permitted working stress of, not 16,000, but 120,000 lb. per sq. in., the elongation would be about four inches, whereas the reduction in length of the concrete through shrinkage and creep would remain at its original value of about one half an inch. This means that here the loss of prestress would be limited to about 12½ per cent, so that it would be sufficient to increase the theoretical quantity of steel by the same amount, if ultimately we wish the prestress to remain sufficiently high.

Now, steel that can carry a safe stress of 120,000 lb. per sq. in., is available in the form of cold drawn steel wire up to 3/16 in. in all countries, while in Belgium it can be procured in sizes up to 5/16 in. We will then replace each rod, each with a tensile strength of 75 tons, by a cable containing 44 wires of 3/16 in., to which we will apply a stress of 120,000 lb. per sq. in.

Fig. 3—Prestressing apparatus.

In Fig. 1 is given a schematic view of the bridge; Fig. 2 gives the details of the anchorage at the ends of the cables, and of the cables themselves; Fig. 3 is a photograph of the light prestressing apparatus which prestresses two wires at a time, wires which are fixed after prestressing with a common wedge in one of the four grooves of what we call the "sandwich plates".

As seen on Fig. 2, the wires are placed in a sheet steel tube. When all the prestressing work is finished we inject cement grout in the tube, so as to protect the wires against rust and to get the benefit of the bond between the wires and the concrete. This bond, although not required for normal safety purposes, is an additional safety measure. This is shown by the following experiment made in our laboratory.

A normally prestressed beam is such that the first cracks occur at mid-span for a point load of 36 tons; its ultimate load, which causes breaking of the wires, is 60 tons; the safety load is 26 tons. We have tested a similar beam after cutting the anchorages away so that we could rely only on the bond. This beam behaved exactly as a

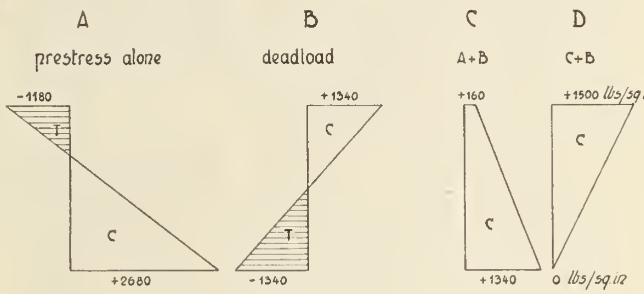

Fig. 4

normal one up to a 27 ton load, then the slipping of the wires commenced in the concrete. This shows that the anchorages at the ends of the cables do practically nothing, as long as the working load is not exceeded.

In Fig. 4 are reproduced the stress diagrams in the section at mid span of this slab. Here the dead load is exactly equal to the live load.

A is the diagram due to prestressing alone.

B is the diagram due to the dead load if the concrete were capable of resisting a high tensile stress up to 1340 lb. per sq. in.

C is the diagram under prestress plus dead load. Here it should be noted that these forces always exist together.

D is the diagram when we add to C the live load (equivalent to B). In other words it is the diagram when the bridge is fully loaded.

It should also be noted that whereas in an ordinary reinforced concrete slab or beam, the shear develops diagonal tension which is equal to the shear stress; in a prestressed beam the shear stress is similar but is no longer equal to the maximum tensile stress; this can be easily shown by the use of the circle of Mohr. For example, in the bridge under consideration, the shearing stress is 95 lb. per sq. in., but the principal tensile stress is only 13 lb. per sq. in.

Finally the reader will understand that it is impossible to use straight prestressing cables in a slab similar to the one considered above. The

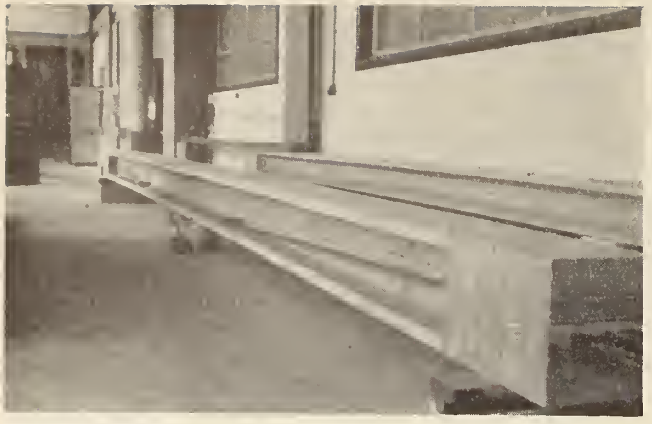

Fig. 5—Prestressed concrete beam cast in the University of Ghent laboratory.

cable must be placed so that it is close to the lower fibres of the slab at mid span. But if it were kept so low close to the end supports, the concrete would crack under tension at the top of the slab. The cable must therefore be lifted up towards the supports and have a parabolic shape, as shown on Fig. 1. A special characteristic of a prestressed bridge is that the stress in the steel varies only by 3 or 4 per cent when the live load is applied. Thus ends a somewhat lengthy description of a bridge made in accordance with the first system of prestressing.

B.—A second method is to place the cables outside the concrete. Let us assume we have a beam with an I-shaped cross section. We can then place the prestressing cables on each side of the web and let them pass through special end blocks, against which we will apply the anchorages. The change in the direction of the cables can be made around

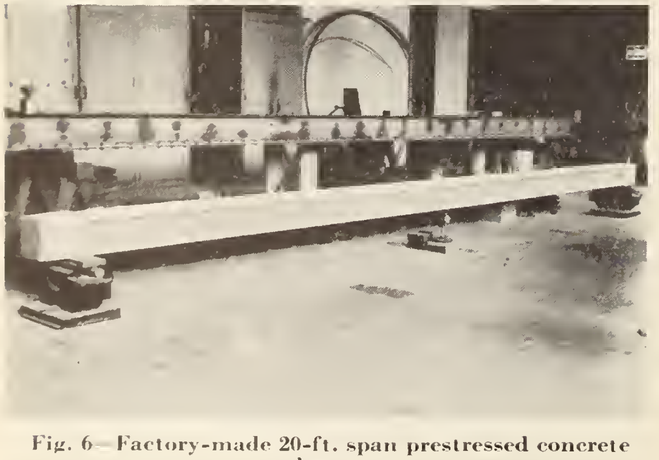

Fig. 6—Factory-made 20-ft. span prestressed concrete beam.

short ends of steel rods placed through the web at convenient places. Such beams can be made in precast unit blocks put together either with mortar in the joints, or without any bonding if their geometrical shape is sufficiently accurate. Figure 5 is a photo of such a beam built in our laboratory. Many such beams have been erected in Belgium.

C.—Finally there is a quite different way of making prestressed beams, where no anchorages are used at the ends of the cables, but where the bond between concrete and steel takes the place of such anchorages. It is presumed that the wires used are very thin so as to increase the surface capable of giving bond. Maximum diameters of 5/64 in. (or 2 mm.) are used.

The method of building the beams is as follows; the wires are stretched up to 200,000 lb. per sq. in. between end abutments, or by carrying the reaction on the steel mould of the beam, which in such case must be very strong. The concrete is then poured in and vibrated. Once the concrete has sufficiently hardened, the wires are cut off. They have a tendency to resume their initial length but the bond prevents them from doing this, so that the concrete is placed under compression.

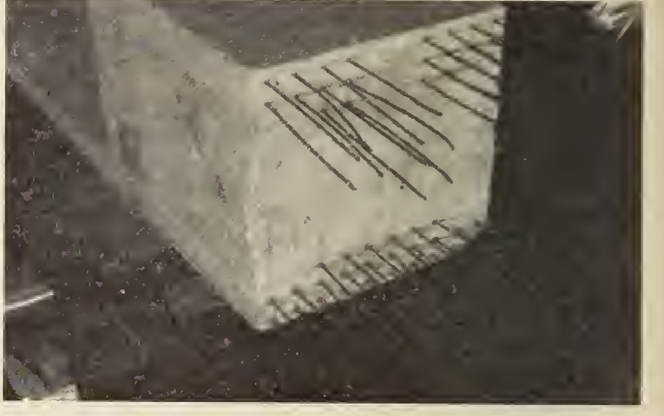

Fig. 7—End of prestressed concrete beam showing piano wires used for prestressing.

In a small beam of 20 ft. span, it is necessary to place as many as 40 piano wires of 5/64 in. diameter. It is at once seen that such beams can only be made in a factory. This limits them to a size that can be transported to the job. Figure 6 gives a view of such a beam. Figure 7 shows one end of it where the wires may be seen coming out of the concrete.

Conclusion

Prestressing is so logical that it is bound to be the solution of the future. Its actual development is such that it is practical and at the same time economical. Consider that the bridge referred to under "A", with its thickness of 2 ft. 8 in., must have a thickness of 3 ft. 7 in. if we make it in reinforced concrete, even when using the high safety stress in the concrete of 1500 lb. per sq. in. Consider also that the quantity of steel required in prestressed work is only one fourth to one fifth of what is required in ordinary reinforced concrete.

Consider finally that in ordinary reinforced concrete we cannot use the high qualities of modern concrete, as this would mean making beams of such little depth that the amount of steel reinforcing required is prohibitive. In the bridge referred to above, with a concrete stress of 1500 lb. per sq. in., we find a percentage of steel in the 3 ft. 7 in. slab as high as 2.4, which is unreasonable, so it is obvious that the 3 ft. 7 in. thickness is too small for ordinary reinforced concrete work, whereas we can make the slab satisfactorily in 2 ft. 8 in. thickness in prestressed work.

There is no doubt that prestressing has a great future. A few years from now there will be no more bridges built in concrete, except on prestressed lines.

LARGE-SCALE HOUSING—ITS PLANNING AND CONSTRUCTION

JOHN P. RILEY
Director of Development, New York City Housing Authority

An address delivered before the Montreal branch of The Engineering Institute of Canada, on November 28th, 1946.

Mr. Riley is one of the foremost authorities on large-scale housing. Two hundred million dollars worth of housing construction is a normal year's undertaking for him. In this interesting and timely article, he tells of the New York City housing authority's prewar success in cutting costs per apartment by improvement in design, by standardization, by elimination of non-essentials, by use of controlled concrete, and by securing co-operation between owner and contractor.

Potential savings in various building components are analyzed, and possible unit savings in walls, floors and roofs are translated into savings per apartment.

The Authority's difficulty in forecasting building costs, and its experience in securing acceptable bids in a rising postwar market are described. Current trends in construction costs are discussed.

The problems and solutions dealt with in this address are those pertaining to large public housing projects. Large-scale housing, as we know it today, is a development of the past decade. It is here to stay, whether publicly or privately financed, and the problems of design and construction are similar to either one, no matter who does the financing.

To help visualize the scale of the New York City Housing Authority's operations, it should first be explained that the fourteen housing projects now operated, house 17,000 families, or 57,000 persons. All the population of Three Rivers could be put into them, leaving quite a lot of room for visiting relatives. They cost about $90,000,000 for land and buildings, and range in size from 100 families to 3,500 families, with an average size of 1,200 families.

The post-war programme which the Authority already has started will add sixteen more projects, holding 20,800 families, or 80,000 persons. They range in size from 600 families to 1,900 families, with an average size of 1,300 families. The cost for land and buildings will be at least $225,000,000 and probably more. Add them to what is already built and they could accommodate nearly all the city of Quebec, or the city of Ottawa. This programme has already been started. All of the sites are owned by the Authority. Plans are completed for eleven of them. Buildings have been demolished and the Authority is now building on seven sites, and is asking for construction bids on four others. In addition, preliminary plans are to be started for six more projects to house 7,500 families, in the hope that financing will be available next year.

It is not intended to discuss temporary or emergency housing, except to say that provision is being made for such dwellings for 10,000 families by every possible means; Quonset huts, re-assembled barracks and temporary houses, and emergency conversions of vacant tenements. In addition to this, there is the programme of the Metropolitan Life Insurance Company, already under way, as well as the projects contemplated by other insurance companies, and by the various savings banks under recently enacted legislation by the State of New York. Thus it can be seen without going outside the boundaries of New York City that large-scale housing is no longer an experiment.

No audience cares to listen to a lot of dry statistics, not even an audience of engineers. Yet a few must be quoted so that the scale of operations involved can be visualized, and some of the otherwise inconspicuous but very effective ways of achieving economy can be realized. Economy is stressed, not cheapness, and every engineer will know what is meant. There is no economy in the use of poor methods or materials. It is necessary to determine in advance, and from actual experience both in construction and operation, the most economical standard for each element of construction; and then to see to it that not one iota more than this standard creeps into the design, and that not one iota less than this standard is permitted in the construction, using the very best materials and equipment obtainable.

It may be helpful to quote a little history at this point, to show how this works out in practice. The first three public housing projects in New York City were First Houses, Williamsburg, and Harlem River Houses. They were built, and are still owned, by the Federal government. The Authority operates them on a lease basis. Their total population is 2,300 families, and the cost of construction alone, was $5,400 per apartment. In 1938, the New York City Housing Authority started building on its own. Since then, and until the war halted building operations, eleven projects were built, housing about 15,000 families. The average cost for construction alone was $3,300 per apartment, though they have been built for under $3,000. These projects are just as well built as, and possibly better than, the first three.

What made it possible to cut construction costs almost overnight to 60 per cent of what they were before? It was done by a very realistic and direct approach. Instead of specifications such as would be written for monumental buildings, standards of design and construction based on good commercial practice were formulated. Inspection, while thorough and efficient, was carried out for the good of the job, rather than through rigid and blind observance of the specifications. All non-essentials were stripped from the design. Prospective bidders were taken into the confidence of the owner, so to speak, by open meetings to discuss plans and specifications *before* bidding, and to prevent errors and misunderstanding.

It is most interesting to see what results are attained by a deliberate effort to promote good understanding between owner and contractor. The practice adopted of pre-qualifying bidders on major contracts made it safe before the war, when the construction market was stable, to eliminate the usual surety bonds, with a consequent saving of several hundred thousand dollars. The practice of open discussions, continued past the bidding stage and throughout construction, has paid dividends, too. Because of these factors, plus the most thorough design and inspection, the Authority's record for cost of extra work has totalled less than one-half

Kingsborough Houses. The cost here was less than $3,000 per apartment for construction. The development of Z-type units is shown. Buildings occupy only 18 per cent of the site.

are familiar with the closet at the incinerator where refuse is disposed of. The Authority developed its own type of incinerator hopper door, with a fire-resistive rating equivalent to the enclosure previously used. This not only saves the cost of the usual closet, or enclosure, but by its elimination permits more compact design of the buildings. Doors are left off all the closets, except one, in each apartment. A closet need not even be within the bedroom if it can be more compactly located just outside the door. This is not necessarily recommended for higher-rental apartments, but the intention was to eliminate non-essentials, and this saved at least $60 per apartment, even at pre-war prices. Nothing but oversize brick is now used. Corners are cut so fine that even the metal door bucks come to the job with the metal saddle already welded to the buck to save separate installation at the job. These few points are cited to outline the technique.

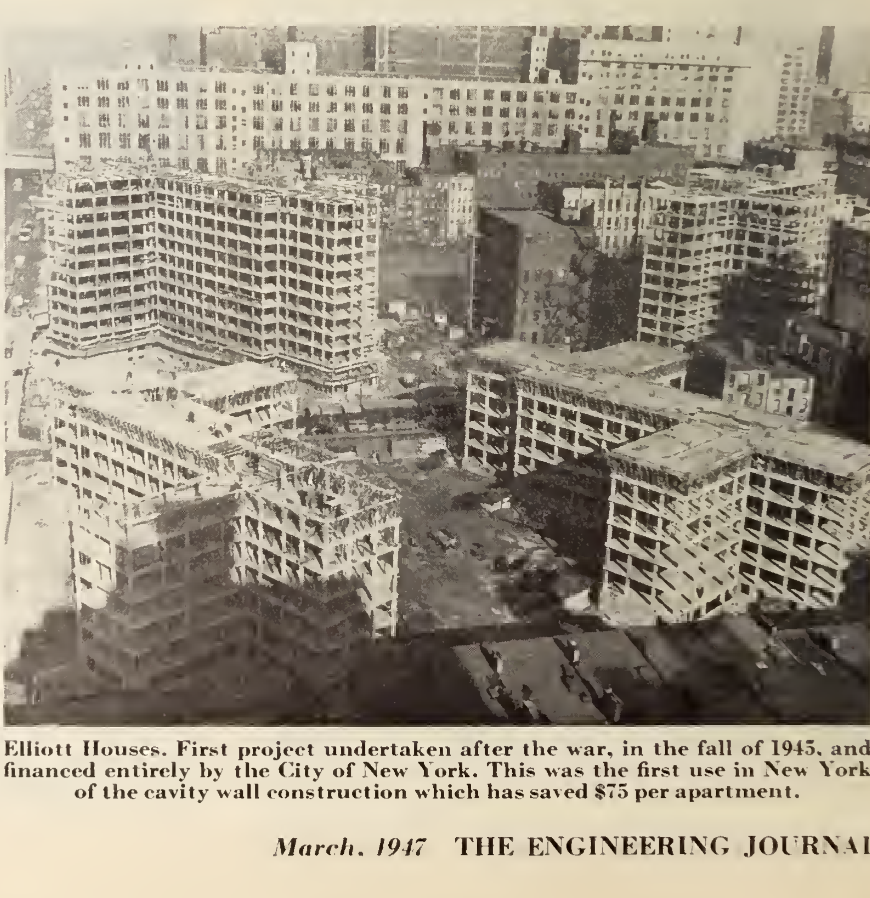
of one per cent on all their jobs; a figure which is believed to be unusually low for construction work of any kind.

The Authority was, so far as is known, one of the first organizations to use controlled concrete on a large scale. By controlled concrete is meant the preparation of design mixes before a job starts, using the very same cement and aggregates which will be used on the job, and ascertaining accurately in advance just what will give the most economical results for the design strength used. It is so efficient and so important, that a staff of trained concrete engineers is maintained just for this one phase of construction operations. It is so economical that it is even used for cellar floors, ramps, etc., where strength is not even a factor, and where plain concrete is normally considered cheaper. It brings double-barrelled economy, both in saving in cement and in the saving in space because of reduced size of members.

This is emphasized because it is estimated that about $100 is saved per apartment, and when apartments are built by the thousands, that saving mounts up. There are no plastered ceilings. The emphasis on "quality" concreting makes it possible to get a perfectly presentable ceiling by painting the under side of the concrete floor slab. This saves another $100 per apartment, exclusive of the saving in height of buildings by using this method of construction.

Those who live in apartments

These large housing projects are very complex. In the first place, the existing New York city ordinances, such as the building code and the multiple dwelling law, under which the Authority must operate, never contemplated these large multi-block developments. In the second place, the very act of taking several city blocks out of the heart of a busy city, closing the streets and revamping the whole area, is a major undertaking by itself. For example, in the case of the Fort Greene houses there were 26 city blocks involved.



Elliott Houses. First project undertaken after the war, in the fall of 1945, and financed entirely by the City of New York. This was the first use in New York of the cavity wall construction which has saved $75 per apartment.

It takes months alone just to work out the re-arrangement of all the public and private utility lines which run beneath and above the surface. All these studies and negotiations have to be carried on simultaneously with the design of the project itself, so that a start has to be made at least a year ahead.

East River Houses. Notice the open parapets in place of solid masonry. This project showed a record low construction cost of $2,980 per apartment, for modern fireproof construction with all conveniences. Eighty per cent of the site is open space.

The New York City Housing Authority was the first to show that fireproof housing, in large-scale operations, need cost no more than non-fireproof and can even be built at less cost. The Authority showed that it is more economical to build six-storey elevator type buildings than the three- and four-storey walk-up type previously considered the least expensive. Other things were learned as well. A start was made with wall-bearing construction, on the premise that it was more economical. After the first two jobs, a switch was made to skeleton-frame construction as an experiment. It has been found just as economical, just as fast, and conducive to much cleaner construction operations. Over and above these factors, the war has since shown the greater safety of this type of structure in disaster.

As the programme progressed, construction began to reach further into the heart of the slums. With land costs increasing and with soil conditions requiring costly piling operations, it became apparent that perhaps six storeys were not enough to realize full economy. When one considers that on some of the projects the cost of piling alone is $1,500,000 it can be understood why there was so much at stake. But apparently there is some theory that the higher the building, the more undesirable the social effect. With some trepidation, therefore, and with social workers all over the country watching, the Authority went to ten and eleven storeys. It worked perfectly. On the next job, 13-storeys were tried and, on some of the jobs yet to be started, heights up to 14-storeys will be undertaken. Since building frames are predominantly concrete, it is interesting to note that this present economic height of 14-storeys is based on the working limit at which concrete can be efficiently placed by crane and bucket. The hoist and runway method disappeared from our operations years ago.

Aerial view of East River Houses. The Authority's first project featuring more than six storeys. It represents an excellent treatment of bulk. Note the long central mall with eleven-storey building at one end.

Bids are being opened on December 10, on a $14,000,000 construction contract which will be bid both in concrete and steel, with a complete set of plans for each. All buildings in this project are 14-storey and it is desired to find out just where a height limit is reached where steel may be more economical than concrete. At the same time, the design of a 1,900 family project is being started where all 16-storey buildings will be used, in order to reduce the number of buildings so that interference with important underground utilities can be avoided. The Authority is seeking to determine whether to make these buildings steel or concrete. With cost factors as erratic as they now are this requires a very careful analysis.

No one type of housing unit can

be said to be the most desirable for all use. The particular problem at each site, coupled with the types of buildings used, dictate different requirements. In each instance, however, the emphasis is on how space is used. The secret of economical housing construction is the efficiency,—one might even say the frugality, with which space is planned. This cannot be over-emphasized. More time is spent studying plans for this than for any other aspect. If that central core of the building can be made as compact as possible, you are over the first hurdle.

The minuteness with which one must approach large-scale operations, in order to reap the fullest benefits, is best exemplified by analyzing those parts of the building which involve *areas* primarily. For example, the exterior walls represent 17 per cent of the cost of the building; the floors represent 20 per cent; the roof represents four per cent, and the interior partitions represent eight per cent. These four parts total 49 per cent, so that half the cost of the building is in these area factors alone, as distinguished from plumbing, or heating, or doors or elevators, etc. To show vividly what this means, two-inch solid plaster partitions are used. If those partitions were 2¼ in., even though the partitions themselves cost no more, the cost of the increased area of floors, walls and roof, because of this additional ¼ in., would be the equivalent of 12 cents per square yard of partition, and it would bring no advantages. For a 2½ in. partition, the penalty would be 24 cents per square yard. For a 3 in. partition it would be 48 cents. If you think these are small figures, just consider that for the average project they amount to $20,000, $40,000 and $80,000 respectively.

On the exterior walls, for every cent saved in the cost per square foot of exterior walls, the saving per apartment is $4.50. For every cent saved in the cost per square foot of floors, the saving per apartment is $8.00. For every cent saved in the cost per square foot of roof, the saving is about $1.00 per apartment. Much trouble is even taken to get the concrete columns down to 11½ in. square instead of 12 in. because you can form an 11½ in. column with one 4-foot width of plywood, but you can't form the 12 in. column. All this shows you what that cent is really worth. The point of all this is that it is not necessary to make spectacular changes in design to save money. There is just as much gold to be extracted by concentrating on the factors just listed, even though when you are done, the building may look practically the same and the quality will not be impaired. The pay-off is in the aggregate money saved.

It has been asked whether major changes in methods and materials of construction are expected to evolve from war discoveries. In 1943, the Authority took a major gamble. We wanted to be ready to build housing at the earliest possible time after the war. The Authority had to decide whether we should prepare only preliminary plans, so as to be ready to adapt ourselves to changes arising from the war, or to go the whole way and prepare complete plans and specifications for over $150,000,000 worth of work. The latter was recommended by the author, even to the extent of using the then standard specifications. These, by the way, still fit practically 90 per cent of our work on any of our jobs. This, the Authority decided to do, and the answer is that we are right now building and bidding projects with practically no deviations from the path we plotted in 1943.

Fortunately we guessed right and are ready. It is disappointing, however, that so little wheat can be sifted from the chaff of the glowing predictions of high-pressure salesmen, about the changes we would see immediately after the war. For example, why hasn't someone evolved a plastic floor covering? There are 230 acres of floors to build. Why hasn't someone brought out an economical pre-fabricated partition to eliminate the time lost by the present archaic method of plastering? There are many new types of partitions, but, so far, none is less costly than our 2 in. plaster partition. Why hasn't someone improved on the present method of exterior wall construction? Here again, study has been given to every new type of wall construction in the hope that someone, sometime, would come in with the answer. The cavity wall construction at Elliott Houses is an example of what can be done in this respect. This wall construction has been the subject of an excellent report by the British Building Research Station. The Authority was the first concern in New York city to use this type of wall construction. Its use has saved nearly $75.00 per apartment.

As to pre-fabrication, there has been a great deal of misunderstanding about this term as applied to large-scale housing, primarily because it has been associated popularly with the delivery to a site of a completely fabricated dwelling unit. In the true sense of the word, there should be a constantly increasing field for pre-fabrication in work such as ours. For example, in the case of partition construction, certain plumbing and kitchen assemblies could be pre-fabricated. We already pre-fabricate the door frame and saddle, in effect.

There is another inconsistency which has puzzled everyone whose duty it has been to administer building ordinances. A fireproof building embodies all precautions against combustion, both in materials and in the forms of construction used. A non-fireproof structure does not and should, in principle, therefore require more safeguards. Fundamentally, the enclosure walls of the fireproof building are there to provide adequate insulation and protection against the elements. Yet, in New York City, and in many other cities exterior walls of the fireproof building must have a higher fire-resistive rating than those of the non-fireproof building. How can improvements in wall construction develop with inconsistencies and penalties like these?

Construction Costs

Now, a word about construction costs in this year of 1946. Prior to the war, we were building fireproof buildings for less than 40 cents per cubic foot. It had been a hard fight to accomplish that low cost, and an attempt has been made to show you how the Authority went at it.

During the war years, when we were planning the projects which we are now building, the hardest problem was to estimate costs of projects for which we were then making financial contracts, but for which no one could forecast when they would be built or under what cost factors. The author is not an economist. Yet, by a combination of crystal ball, ouija-board and instinct, we set the probable post-war costs at about one-third more than 1940, the last normal year. When we were ready to resume building a year ago, we were rather proud when all the so-called construction economists stated that current costs then were about 35 per cent above 1940 —almost exactly what had been guessed two years before. (*Continued on page 135*)

CERTAIN ASPECTS OF FREQUENCY MODULATION AND TELEVISION BROADCASTING IN CANADA

J. ALPHONSE OUIMET, M.E.I.C.
Assistant Chief Engineer, Canadian Broadcasting Corporation, Montreal

A summary of addresses given on November 14th, 1946, before a joint meeting of the Montreal branches of The Engineering Institute of Canada and the Institute of Radio Engineers, and on February 4th, 1947, before a joint meeting of the Toronto branches of The Engineering Institute of Canada, the Institute of Radio Engineers, and the American Institute of Electrical Engineers.

This is an article of exceptional interest to Canadian radio and communication engineers. The author's comparison between AM and FM broadcasting is a clear explanation of what may be expected from frequency modulation. The presentation of the problems involved in television is timely and deserves serious consideration by the profession. The industry is aware that much educational work must be done in advising engineers, and the public, as to what they may expect in these fields and as to the pitfalls if good engineering principles are not employed.

Recently there have been two very important developments in radio: the rapid growth of frequency modulation in sound broadcasting, and the introduction of television in the United States as a regular public service. Before the war, both these developments had already made a good start when more vital problems forced them to the background for the duration. Now, with the restoration of peace-time conditions, both frequency modulation and television, revitalized by extremely important wartime developments in allied fields, are emerging from their forced retirement with greater impetus than ever before. In the United States, which seems to be leading the world at this time in technical broadcasting development, the introduction of these new services is taking place under very controversial conditions, reminiscent of the historic technical battles of bygone years. Evidently, because of their natural scepticism or, as some uncharitable souls might even suggest, because of the influence of the vested interests which employ them, engineers do not seem able to bring forth any significant technological development, without indulging at the same time in some more or less playful scrapping.

In 1860, it was "AC vs. DC", the "Battle of the Currents" they called it then, with Thomas Edison and George Westinghouse leading the factions. And now, after many other similar historical controversies, the engineers and their employers are at it again; today, in sound broadcasting, it is FM vs. AM; in vision broadcasting, even before the new industry has had a chance to make a start, it is colour vs. black and white.

Of course, there is nothing like a good argument to bring out the facts, and for Canada these controversies have much more than academic interest. Not only is our own technical economy bound to be influenced greatly by developments in the United States, but the similarity of our problems often demands similar solutions. It may, therefore, be of interest at this time to examine more closely these two issues, starting first with the question of FM and AM.

Comparison of AM and FM

The terms AM and FM are simply abbreviations for Amplitude Modulation and Frequency Modulation, respectively. Speaking generally, electro-magnetic waves are characterized by their amplitude and their frequency; and transmission of intelligence by radio is accomplished by changing either or both of these variables. Figure 1 illustrates the difference between AM and FM. Without modulation, both AM and FM carriers are the same, and the difference between the two systems appears only with modulation. In this illustration the intelligence to be transmitted, or in other words, the modulation, is taken to be a sine wave or pure tone.

In amplitude modulation, the system which was used exclusively until now, the frequency of the transmitted wave remains constant, while its amplitude is made to vary up and down with the rhythm and volume of the sound, voice or music to be transmitted. In contrast, in frequency modulation the amplitude remains constant, while the frequency is made to vary back and forth in accordance with the character of the intelligence to be conveyed. In AM, the degree of modulation is expressed in per cent, where 100 per cent corresponds to the unalterable limit of distortionless modulation when the amplitude of the carrier varies between zero and twice its unmodulated value. Deeper modulation than this results in distortion.

In FM, on the other hand, the point at which distortion is reached depends on the design of the system. Thus, there can be systems with swings of plus or minus 15, 30, 75 kilocycles; or more or less if desired. This change in frequency of the carrier from its mean position is called "deviation". Obviously, there are practical limits to usable deviations, but these come from considerations of economy in spectrum utilization rather than from circuit limitations.

This is the only fundamental difference between AM and FM, but in practice, when considering the

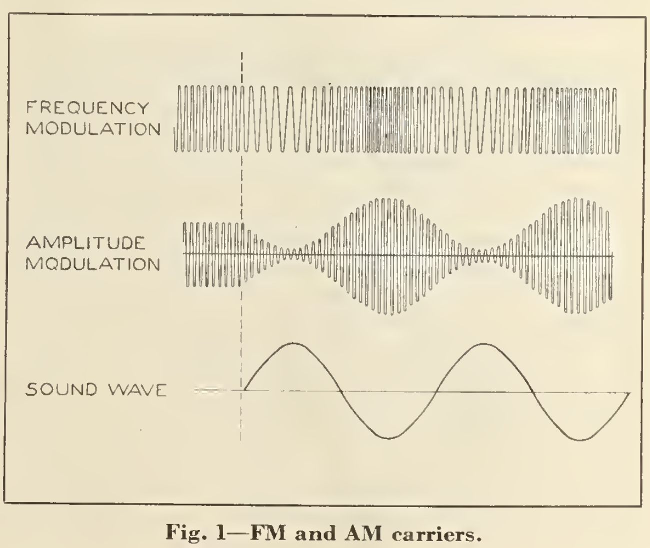


Fig. 1—FM and AM carriers.

application of the two types of modulation to broadcasting, there is an incidental difference which is also of paramount importance. Standard AM broadcasting operates on medium frequencies between roughly 0.5 and 1.5 megacycles. On the other hand, FM broadcasting uses much higher frequencies, in the neighbourhood of 100 megacycles. In comparing AM and FM broadcasting it must, therefore, be kept in mind that there are two important differences; the difference in modulation and the difference in frequency.

However, before going too far with any new system, it might be well to find out if there is anything wrong with what we already have. As a matter of fact, we all know that there has been tremendous progress in the development of AM broadcasting since it started on a large scale twenty-five years ago. Generally, it may well be said that, technically, broadcasting as it exists today is a fairly good system. This is at least the way it appears to the majority of listeners, who are probably more conscious of deficiencies in programming than of technical imperfections.

For the listener who is fortunate enough to be located under the shadow of a powerful transmitter, for the broadcaster who already enjoys a particularly good channel, for a soap opera fan who lives away from trolley lines, neon signs and other unlicensed generators of radio frequencies, broadcasting as it is today on AM, probably gives everything that is desired, at least technically speaking.

But what about the others? What about the newcomer in broadcasting who cannot get started because he cannot get one of the precious frequencies? What about the listeners who are deprived of this possible additional service for the same reason? And the many others who cannot enjoy existing service because they happen to live in urban areas of high noise level? What about the music lover who had to buy himself a phonograph and records, simply because he does not think radio reproduction is good enough?

Engineers should be the first to realize that, although in an advanced stage of progress, present broadcasting can stand considerable further technical improvement. It is, therefore, the purpose of this article to look more closely at these technical deficiencies of present broadcasting and, at the same time, see what FM on the very high frequencies can do either as a substitute or an adjunct of the present system.

Need for More Channels

Perhaps the most serious problem existing today in broadcasting is that the broadcast band is absolutely saturated. In certain areas it is literally impossible to obtain a single additional acceptable frequency. The result is that it is also impossible to expand coverage, or to establish alternate service in many sections of this country which would have a right to better service, on the basis of their population or of their resources. If the situation is already serious, how much more serious will it be in a few years, when the general growth of population will have created new communities and further developed existing cities. Already there are some 1,005 AM stations in the United States, 112 in Canada and 110 in Mexico and Cuba. For these 1,227 existing stations, there are approximately 100 channels only to be shared, and there are already another 350 stations under construction. On top of this, there is still a waiting list of at least 1,000 applicants doing everything in their power to break down existing interference safeguards so that they may also have access to what is considered a most profitable business.

Under the circumstances, the situation is serious even for stations already well established; and there is no doubt that new channels have to be found for future expansion and to relieve present congestion. Of course, the only part of the spectrum which can provide this added "lebensraum", as Hitler used to call it, is in the frequency range above 30 megacycles.

Recognizing this need, federal authorities, in both the United States and in Canada, have already assigned the band from 88 to 108 megacycles for broadcasting purposes. This band has 20 times the width of the broadcast band and were it to be used for AM, it could accommodate 2000 channels instead of the present 100. However, for other reasons to be studied shortly, wide-band FM will be used rather than AM, and on this basis only 100 new channels, will be provided. But these 100 new channels can be shared by thousands of new stations in the United States and in Canada. Obviously then, the solution to the present overcrowding of stations in the broadcast band has already been found in the opening up of the higher frequencies for broadcasting.

Static and Noise

Another important deficiency of the present AM system, with which everyone is already too familiar, is its inability to overcome static. This defect is so serious that it has been the object of a continuous search, ever since the early days of radio, in the hope of discovering some anti-static device. The curse of static is fortunately not too frequent in urban areas well served by powerful transmitters, but even then it does spoil reception for millions of listeners many times a year during electric storms. In rural districts where the signals are usually much weaker, the effect of static is much more frequent and much more serious.

The same thing is also true of the inability of AM to overcome man-made interference in populated industrial centres where, in certain areas, the use of electrical machinery practically ruins reception during most of the day. Some forms of interference are also serious in residential areas; and most residents of multi-apartment dwellings would much rather listen to the news than to the characteristic buzzes which accompany the morning shaves of their neighbours. Although in Canada we have a government department which is doing everything it can to reduce such man-made interference, this problem remains a very difficult one in most cities.

As far as the listener is concerned, this problem of static and man-made interference is probably the most apparent and annoying deficiency of our present AM system. The only thing that could be done about it until now was to increase the power of stations until their signal overrode the noise. This measure improves the signal-to-noise ratio but also increases interference with other stations, unless all stations are similarly increased in power, thus leading to an impossible economic situation.

Now, of course, we have a solution, and a beautiful one at that . . . FM on very high frequencies was perfected and presented to the world by Major Armstrong as the very cure for our static and noise problems. FM is relatively free from electrical noises, because these interfering noises generally have the characteristics of amplitude modulated signals, to which the FM system is practically deaf. In FM, the receiver has been designed to respond only to changes in frequency and not to changes in amplitude. (See Appendix) Although electrical interference contains some components which vary in frequency, these variations are rather small in comparison to the frequency deviation of the signal itself.

The total inherent advantage of FM over AM in noise rejection is about 24 to 26 decibles, or expressed in terms of power between 250 and 400 to 1. In other words, if it is necessary to move to the very high frequencies in order to find more channels, the same signal-to-noise ratio can be obtained on FM as on AM with only a small fraction of the transmitter power, say 200 instead of 50,000 watts. Or similarly, if comparable power is used, the signal-to-noise ratio can be improved as much as twenty times by using FM.

These figures are derived from theoretical considerations for fluctuating noise, but they have also been confirmed by actual field tests. For impulse noise, such as automobile ignition, FM has also a similar great advantage over AM, but specific figures cannot be given because actual gains will vary with the wave form of the impulses.

Table 1 illustrates the advantage of FM over AM for automobile interference, which is the most serious type of noise we have on very high frequencies. This table was prepared by BBC engineers on the basis of recent field tests on 45 mc. The same report states that on 90 mc. the same effect would be obtained with one third of the field strengths. It is interesting to note that horizontal polarization is much better than vertical polarization for this type of interference. And as horizontal polarization is to be used in this country, only the second and last column should be compared.

But the most important fact to note is that on FM, cars can be only one fifth of the distance away to cause the same trouble as on AM for high values of field strength. For the low signal values which are still usable on FM, the internal noise in the AM set was already so high that it masked the automobile interference.

Interstation Interference

Another troublesome characteristic of the present AM system is the interference which is heard so frequently between stations operating on the same channel. Both the desired and the interfering stations are heard through the receiver at a loudness proportional to their relative strength at the antenna. Thus, as the interfering signal is decreased, the audible interference continues to be heard but at a proportionally reduced level, until the interfering signal is approximately one per cent of the desired signal, when it ceases to be troublesome. On FM, however, the desired signal suppresses the undesired signal, provided the interference is less than ten per cent of the desired signal. The interference may even be increased to 30 per cent before it becomes intelligible, but the resulting noise under these conditions does mar reception to a certain extent.

In any case, it is safe to state that a ratio of 10 to 1 is quite acceptable for FM, while 100 to 1 is needed for AM. This is a ten fold improvement in favour of FM, or 20 decibels. In addition, there is the further improvement contributed by the absence of sky-wave on very high frequencies. Unlike stations on the broadcast band, which at night can interfere with other stations thousands of miles away, the interference range of very high frequency stations is in the neighbourhood of only 200 miles.

It follows that, with the advantage of FM with respect to inter-station interference and with the very short interference range of very high frequencies, it is possible to locate stations operating on the same frequency much closer together. Thus, in the Canadian allocation plan, frequencies which are used in Montreal can be used again in Belleville and Toronto and again at intervals of a few hundred miles across the country. This obviously multiplies the number of stations which can be assigned on a fixed number of frequencies.

Fidelity of Reproduction

Another important and controversial question in the FM vs AM picture is the matter of fidelity of reproduction. Generally speaking, except for custom built models, even the best AM receivers reproduce only a small section of the audio spectrum under normal conditions. This condition is illustrated in Fig. 2,

TABLE I

Comparison of FM and AM Systems for Susceptibility to Automobile Ignition Interference
(From BBC Quarterly Review, Page 65, Volume 1, No. 2)

Field Strength 45 Mc/s Half-wavelength dipole 30 feet above ground	*Extinction Distance*		
	F.M.		A.M.
	Horizontal polarisation	Vertical polarisation	Horizontal polarisation
50 μV/m	200 yards	>200 yards	At 100 yards the ignition was very disturbing, but merged into the set noise, which was very high.
100 "	150 "	200 "	
300 "	80 "	120 "	As above, but less disturbing.
500 "	60 "	120 "	Perceptible at 100 yards but merging into the set noise.
1000 "	40 "	80 "	190 yards
5000 "	25 "	50 "	120 "

which shows the frequency range of various sounds and musical instruments as compared to the limits of reproduction of average receivers.

Thus it can be seen that the faithful reproduction of orchestral music would require a range of 30 to 16,000 cycles, while the average console receiver passes effectively only from 100 to 400 cycles. For the table models the range of reproduction is even more limited. Frankly, the general public is perhaps not very conscious of these limitations, as the ears of the listener seem to have become accustomed to this lack of fidelity. It is of course granted that, in the transmission of voice and dance music, which by public demand constitutes a major portion of the broadcasting fare, the frequency limitations already mentioned may not appreciably affect the enjoyment of the programme.

There can be no doubt that in the case of certain modern orchestrations, the narrower the frequency range the greater the enjoyment, and this is valid even to the point when there is no range and no music left at all. But, if poor music may actually be improved with reduced range, and if a good joke can be just as funny on a cheap miniature as on an expensive high fidelity set, it would be difficult to argue that the average radio reproduction of music could not be improved a great deal yet.

It should be pointed out at this stage that the narrow range of reproduction of AM receivers is the inevitable result of the present AM allocation pattern, and cannot be improved under the present system. The 10 kilocycle separation between stations imposes a practical limit of 5000 cycles on fidelity, specially when the tone control has to be used already to reduce the background noise.

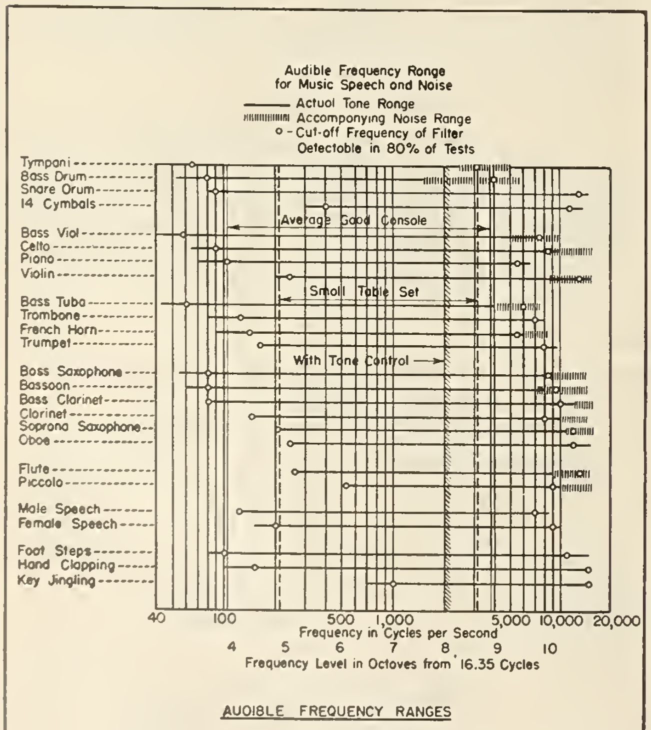

Fig. 2—Frequency range of musical instruments (from Pender and McIlwain Electrical Engineering Handbook)—reproduction range of typical receivers added by author.

On the other hand, on very high frequencies, the frequency separation between stations can be as great as needed, and, with FM, noise is no problem, so that the listener can have all the fidelity he can afford. The word " afford " is used here intentionally rather than the word " desire ", because high fidelity will cost more, there is no doubt about it. The important thing, however, is that on FM the listener can have the best in musical entertainment if he wants it and can afford it. With present radio, however, he generally cannot get it even if he wants it and can afford it.

Furthermore, good audio frequency range is not the only requirement of good reproduction. Present AM broadcasting also reduces the dynamic range, that is, the volume contrast of the reproduction. This is because it is necessary to raise the lower passages so that they may be heard above the noise level of the system. In FM, with its lower inherent noise, this range compression will not be necessary to the same extent. Thus, if desired, the audio contrast can be increased more than ten times with FM. It should be pointed out, however, that if advantage is taken of the lower noise of FM to increase dynamic range, it cannot at the same time be used to increase coverage, or to reduce the power of transmitters. In all, there are some 25 decibels of possible improvement which can be divided up as desired between coverage, dynamic range or power reduction.

In the FM-AM debate, the question of fidelity is probably the most controversial one, because it deals more or less with individual taste and appreciation. And on such subjective reactions, opinions can obviously be divided. But no matter what individual reactions happen to be, it should be remembered that the question of fidelity or " infidelity " would have little bearing on the acceptance or non-acceptance of FM as an overall system. The other advantages of FM, which have already been reviewed, should be quite sufficient in themselves to assure its wide acceptance.

The question of fidelity in FM is rather that, given an FM system, is it really worth-while to spend a little more to really give it good fidelity? The legislators have already ruled on that question as far as the transmitter end is concerned, and FM broadcasters will have to install equipment capable of transmitting practically the whole audio spectrum with a minimum of noise and distortion. Now this is of no use unless the receiving end is also reasonably good. If the listener does not like a true reproduction and wishes to improve on the real thing, he should do so himself and, for that purpose, the engineer should provide him with the necessary tone controls. The function of the engineer is certainly not to develop new musical instruments.

Thus the defects of our present system, the extreme congestion in the broadcast band, its susceptibility to parasitics and interstation interference and the relatively poor fidelity of reproduction, find in FM on very high frequencies an excellent solution. But FM has other advantages, such as economy in transmitter construction and operation. While an AM transmitter must be designed to carry peak powers of four times the carrier power, the FM transmitter has to carry only the carrier power itself which remains constant. This and other circuit features result in smaller and cheaper units as well as in economy in tube and power consumption.

Possible Limitations

But this is probably enough on the good points of

FM and, inasmuch as there is definitely an AM-FM controversy, it is due time to look at the other side of the ledger. Fortunately here there does not seem to be anything very serious.

First of all, FM got off to a bad start, from which it has had some difficulty in recovering, when a long time ago radio theorists proved mathematically that it was not so good. But that was narrow band FM on medium frequencies, and some of the experts were undoubtedly right as far as they went. F.M.'s advantages in noise reduction under these conditions were too slight to compensate for the probability of rather bad distortion due to selective fading on skywave reception. But FM broadcasting considered today is not narrow band FM on medium frequencies, but wide band FM on very high frequencies, where there is no skywave and where the noise improvement can be ten times as great.

On very high frequencies, because there is no skywave, and because very high frequency propagation tends to follow the line of sight, it will not be possible to get the same coverage from a single station as is possible on the broadcast band on a good channel and with good ground conductivity. However, this limitation in range is a blessing in disguise, as it contributes to the reduction of inter-station interference, as we have already seen. On AM, under favourable ground conditions, it is possible to have extended coverage, provided stations are protected against interference by wide geographical separation, that is, by using only a limited number of stations. That is what is done on clear channels. On FM, in the very high frequency band, coverage will be samewhat less. As it has already been shown, this apparent loss is compensated by the possibility of using more stations and, of course, by the other extremely important advantages of FM in noiseless and realistic reception.

In any case, this limitation of range is a factor which is of concern only to the broadcaster. In so far as the listener is concerned, it makes no difference whether the service he obtains is from a distant station, or from one half the distance away, as long as he gets the service. On that basis, there is no doubt that FM service, with its higher inherent faithfulness and noiselessness, appears to be the ultimate in broadcasting even for areas of scattered population, if the broadcasters can eventually afford the extra stations required. In the meantime regional stations operating on the better AM frequencies will probably continue as the economical method of serving rural areas. On the other hand service in cities and other areas of concentrated populations can best be carried on FM. Actually, many existing AM stations on some of the Class III and Class IV channels will improve their coverage by going to FM, not to mention again the better service to the listener in improved quality and reduced noise. As local coverage gradually shifts from the broadcast band to the very high frequencies on FM, the congestion on the broadcast band itself will decrease, thus releasing additional channels for improving coverage of rural areas and outlying regions.

Another possible disadvantage of the very high frequency quasi-line of sight propagation are the shadows which are cast by hills, mountains or steel structures. Fortunately these shadows are not completely black due to diffraction and reflection. Their extent can be reduced to a reasonable minimum by proper selection of the transmitting site, and by the use of as high an aerial as possible. In this respect the requirements of antenna height for very high frequencies are probably less stringent than for standard broadcasting, where radiating structures of 300 to 600 ft. are the rule rather than the exception.

Another phenomenon peculiar to very high frequencies is what is called " bursts ". These are bursts of interference from distant stations. Reflection from meteoric clouds has been given as a possible explanation for these bursts. They seem to last only a very short time, and for the moment at least are seldom heard.

Then there is the possibility of multipath distortion, which may affect FM on very high frequencies in mountainous country or in cities with high buildings. This distortion is caused when strong reflections arriving over a much longer path interfere with the direct wave at the receiver. Fortunately this difficulty, which occurs only under special conditions, can usually be entirely eliminated by moving the antenna a few feet one way or the other.

Opposition to FM

Mention has been made of these characteristics of high frequency propagation to give as complete a picture as possible. But these are seldom used as arguments against FM on very high frequencies. Most of those who oppose FM do so because they are satisfied with what they have now. Some broadcasters already on good AM channels not only see in FM little advantage to themselves, but also fear a possible threat to their present favourable positions. This refers generally to conditions in the United States, as well as in Canada. Similarly, some manufacturers see in FM a new element of competition, which may weaken their present advantageous situation. The listening public itself wants to be reassured that a too rapid transition to FM will not render AM receivers obsolete.

Again, even if FM is the solution to many of the present troubles in local broadcasting, there is the cost and risk of the change-over itself, which is a strong factor in slowing down normal progress. Manufacturers are not too anxious to produce sets unless there are already programmes on the air on FM. Similarly, broadcasters do not see why they should invest large sums in FM programmes when there are no sets to receive them. It is the old chicken and egg routine. Which should come first, the chicken or the egg? In addition to this, the musicians' union in the United States is making things even tougher by preventing in effect the duplication of musical programmes on both AM and FM.

But all these difficulties do not alter in any way the fact that a solution is needed to present broadcast band difficulties, and that FM on very high frequencies appears to be the best solution. The present opposition to FM is only a normal reaction to the economic and social re-adjustments which accompany all important technological developments. This situation is a challenge to the engineers who must assume their full responsibilities in achieving what they believe is technically correct, in spite of annoying opposition based on side issues. This duty falls equally on all radio engineers whether they are engaged in radio legislation, manufacturing, or broadcasting. If there must be a period of transition between AM and FM, it should be assured that this transition is brought about as efficiently and smoothly as possible. It might be of interest at this point to examine what these three engineering groups have done or have yet to do about FM.

Legislative Aspects

First the legislative side. Both in the U.S. and in Canada, definite allocation plans and engineering standards have now been completed by the federal authorities concerned. These allocation plans assign specific channels to specific cities or areas so that the most efficient use of the FM spectrum may be made at all times. This allocation plan provides for roughly 50 per cent more FM stations than there are AM stations already in any particular centre, and generally provides in addition a channel for every community of 5000 or more population. This allocation plan has been developed on the basis of normal maximum effective radiated powers of 20 kw. to 500 ft., and on standards of interference which will give full protection to the 100 microvolt per metre contours.

Because it was already at war when FM started in the United States in the 50 megacycle band, Canada will not have the economic and technical difficulties of changing over from low band FM to high band FM. In the United States, this conversion, which rendered a few hundred thousand low band FM receivers obsolete, will cost some $75 millions. This early and radical change in standards of FM, which Canadian listeners and broadcasters have luckily escaped, illustrates why it is sometimes wise not to jump too fast into a rapidly moving technical field, even when everyone else expects you to do so. But more about this later when dealing with television.

The important thing now is that a complete allocation plan for FM in Canada has now been made, and existing AM license holders have been invited to apply for FM licenses as soon as possible. When the authorities know how many of the existing stations are interested in FM, applications from others not already in broadcasting will be dealt with. To encourage broadcasters to make an early start, experimental licenses will be granted for operation on 250 watts, without the necessity for the filing of the usual exhaustive engineering brief. There is no intention to impose this figure of 250 watts as a general power ceiling, as some had misunderstood it. Rather, it is an interim measure to permit an earlier start in FM while the necessary engineering data may be gathered for the preparation of applications for higher powers, and until manufacturers can supply equipment of higher power and, above all, FM receiving sets.

Responsibilities of Manufacturers

Now, let us assess the responsibilities of the manufacturers in the establishment of FM. If there are yet no receivers on the Canadian market and practically none in the United States, in the author's opinion it is not because manufacturers are holding up FM, as some have suggested. It is rather because it takes time to engineer for mass production the delicate circuits which make up an FM receiver. It must be remembered that the prewar designs on the low FM band are now obsolete, and brand new designs had to be developed. In the meantime, production lines which were idle since the demand for military equipment has ceased, have been kept busy turning out AM receivers which offered no real problems. Of course, this delay in the manufacture of FM sets does not help to get FM moving. But this delay is extremely preferable to the early flooding of the market with cheap FM receivers, which would not do justice to the possibilities of FM.

The inherent advantages of FM with respect to interference and quality of reproduction depend on the use of efficient limiters, good audio systems and generally stable circuits. At this stage of development of the art, such an FM receiver simply cannot be made for $19.95. Perhaps this will come some day, but it is not here yet. In the United States, serious damage was done to pre-war FM by the sale of such receivers which could receive FM, but with no advantage over regular receivers as far as noise and quality were concerned.

It is clearly the duty of radio manufacturing engineers to make sure that the essential advantages of FM are realized in practice. First of all, it is their duty to see that the public is made conscious of these greater possibilities of the new system. In that connection it is interesting to note that Canadian manufacturers seem to be keenly aware of the danger of the cheap FM set, and it is understood that they will concentrate on the manufacture of the better models. No doubt this policy reveals the influence of engineering thought over usual merchandising methods. It should not be too much to hope that the same engineering thought will permeate through to the retailing levels, where FM for the first time comes in contact with the public.

Responsibilities of Broadcasters

If the best FM programme will sound no better on a cheap or poorly designed FM receiver than on AM miniatures, it is also true that the best FM receivers cannot turn out fine music when receiving programmes from worn-out phonograph records. So broadcasters also have their FM responsibilities. It is not enough to invest in a low power FM transmitter as a sort of insurance against possible future developments. When the listener has made a substantial investment in a better receiver he will very reasonably expect greater enjoyment out of it. And he will be disappointed if the clarity of FM serves only to lay bare the technical imperfections of existing programmes.

Many technical deficiencies in our present AM studio equipment and acoustics will have to be corrected for high quality FM. The audio range of transmission of radio networks will have to be improved. Efforts in this direction have already started, and in Canada the wire and telephone companies will soon be ready to meet the demand of broadcasting in this respect. As far as the CBC is concerned, it hopes to have high fidelity circuits to link its FM installations in Montreal, Ottawa and Toronto, sometime in 1947.

Another responsibility of the broadcasters is the use of sufficient effective radiated power on FM to give a true basis of comparison with standard AM. In other words, it would hardly be fair to expect FM to satisfy the listener, if it is only given 250 watts to match the performance of its big AM brother of 50,000 watts. Putting it another way, if all the inherent advantage of FM in improved signal-to-noise ratio are used up by the broadcaster to save on original cost, there will be little advantage left for the listener.

What the CBC Plans for FM

At this time of writing there are three FM stations in operation in Canada on the FM broadcast band. All three are experimental stations owned and operated by the CBC. Two of them are in Montreal, one relaying programmes from the Trans-Canada and the other from the French network. These two stations are located temporarily at CBC Engineering Headquarters in downtown Montreal, until the proposed permanent CBM FM and television station is built on top of Mount Royal. This location will be an ideal one for high frequency service, giving the best possible coverage to the city and its surroundings.

The third FM transmitter already in operation is the CBC Toronto station, which is located on the top of the Bank of Commerce building. This building, which is the highest structure in Toronto, constitutes the best possible location for maximum FM coverage in that city. Plans are already well under way for similar installations in Vancouver, Ottawa and Winnipeg as soon as equipment already on order becomes available.

The CBC sincerely hopes that private stations throughout Canada will also realize the tremendous potentialities of FM towards improved service and that, through the joint efforts of the private stations and of the CBC, most Canadian centres may within a few years enjoy FM transmission.

It can, therefore, be seen that the CBC is quite enthusiastic about FM. It is already a well known fact that the present broadcast band will not meet Canada's need for more stations. It is also known that only the very high frequencies can provide the additional channels required. Because of their particular propagation characteristics, very high frequencies can best be used, at least at the start, for improving local service, at the same time relieving congestion on the standard band, this in turn permitting improvement in rural service.

From theoretical consideration and from results of actual tests, it is also known that on very high frequencies FM is far better than AM, for freedom of interference of all sorts and for improved quality. With these convictions, and in the absence of any serious economic difficulties, the CBC can do nothing else than encourage the rapid development of FM for the better service of the Canadian public.

Television

In view of the recent television developments in the United States, and at the request of its Board of Governors, the CBC is currently engaged in a very thorough study to determine under what conditions television can be inaugurated in Canada at the earliest possible date. It is of course too early yet to say just when the CBC may give the " go ahead " signal in television. First the CBC must determine at what phase in its rapidly evolving development the new art can most efficiently and economically be fitted in the broadcasting and economic pattern of Canadian life.

Technically, television is already quite good. Some think that it is developing much too fast. Just when black-and-white decides that it is ready to make the big jump from experiment to regular service, colour television had to make its appearance. As a result of this indiscretion, the American radio industry is again divided into two camps—those who will go ahead with black-and-white anyway, and those who have decided to wait for colour. Both sides of the issue have their followings, not only in the manufacturing industry, but amongst the broadcasters and amongst the public as well; both sides are going all out to prove their case with all the effectiveness of modern advertising and publicity behind them.

In the United States, and apparently in Canada also, if you appear to favour one side, you are damned by the other, and vice versa; and if you are reserving judgment until the issue can be judged under more propitious conditions, you simply get it from both sides. The facts are that, when demonstrated under controlled conditions in the laboratory, television in black-and-white is technically good, but television in colour is more pleasing. However, under practical conditions, black-and-white television seems to be ready for home use, while colour television may not be. In the United States, proponents of colour claim that if everyone would get behind it instead of fighting it, color television might be ready in a year or two. But its opponents say it will surely take another five years, perhaps ten. In any case, the FCC, apparently satisfied that black-and-white was good enough and ready to go, has given the " go-ahead " for commercial operations. At the same time the colour interests are rushing all necessary preliminaries in an effort to obtain a similar approval for their system.

In Britain the BBC has decided to use black-and-white while colour is being developed. It should be remembered that both England and the United States had black-and-white service, with a few transmitters and a few thousand receivers even before the war. These represented, in addition to their development cost, a sizable investment. In Canada, consideration of past investment and of obsolescence of equipment on hand does not enter in the picture. We are, therefore, perfectly free to look with a certain detachment on the turn of events across the border. Should we act too quickly, we would risk leading the Canadian public into a considerable investment in a system which may possibly last only a few years. But the way things are moving, patience for a few more months will undoubtedly greatly reduce this risk. Then we should be in a much better position to decide wisely which way we should go technically. " Technically " is used here advisedly, because the technical progress of television is far ahead of its programming techniques, or of any satisfactory solution of the economic problems associated with its introduction.

The present black-and-white picture on a modern receiver is bright enough to be seen comfortably in daylight. It is steady and without flicker. Its size varies from 4½ in. x 5⅝ in. to 15 in. x 20 in., for which the public will pay in the United States between $300 and $2,500 for any machine worth the investment. It is by no means perfect yet, lacking somewhat in contrast and with a definition like an 8 mm. home movie, under good conditions.

But this picture seems to be quite good enough to permit the enjoyment of most programmes, particularly sports. Unfortunately, at this early stage of development of the art, the quality of programmes varies a great deal. It is the same situation as in the early days of sound broadcasting. As television matures it will gradually develop new techniques and new ideas which will make more efficient use of the vast potentialities of the new medium. Although the future looks bright, much has yet to be accomplished in this particular field.

Yet the problems of television programming are nothing compared to those of television financing, that is, the overall economics of television rather than the particularly attractive possibilities which it might offer to certain specific groups within the industry.

In the United States, by mutual agreement the black-and-white proponents amongst the manufacturing, broadcasting and advertising agencies have now decided that television is ready for exploitation. There the problem of cost has been dealt with in

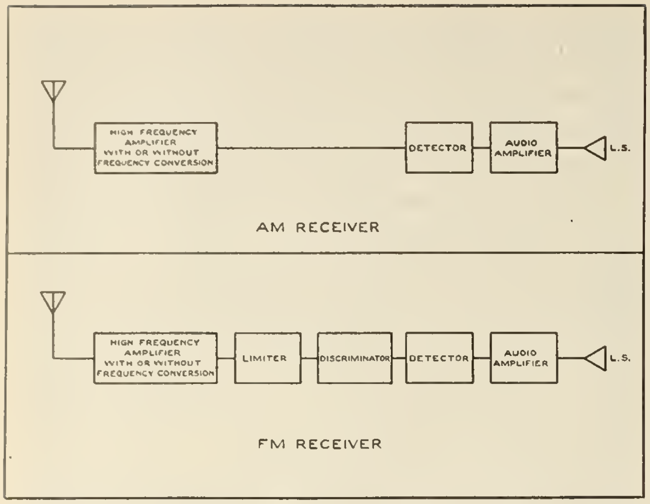

Fig. 3—Simplified circuit line-up of AM and FM receivers.

a way which Canada can well envy, but which Canada seems to be in no position to copy. Everyone in the American television industry well knows that the cost of a full fledged national television service will dwarf the already exorbitant economics of present sound broadcasting, with its $25,000 an hour cost for talent alone. But who is going to foot the bill? The public, of course, and no doubt the public will get its money's worth eventually.

Just how much it may cost or how the public will finance it, the Americans are quite frank to admit they do not know, but they will find out. There is, however, one thing certain, that the cost for an identical television service can be far less for the United States with its 135 million population and its 3 million square miles, or for Great Britain with its 45 million population and its 89 thousand square miles, than for Canada with its 12 million people and its 3½ million square miles. If only a single television station could be made to cover the whole population of Canada in one shot without networks, time zones and language difficulties, then the question of costs would be a simple one.

Yet, that is exactly what the Americans can do in the New York area, where the population within the coverage of a single transmitter is more than our own Canadian population spread over half a continent. If we compare wealth instead of population, the comparison is even more staggering. The comparison with conditions in England is equally illuminating. How easy it would be for us to concentrate on an area only 150 miles wide and extending between Windsor and Montreal and forget about the rest of the country. In addition, to make things still simpler, instead of the 4½ million Canadian people we actually have in this strip, let us assume ten times this number, or 45 million people. Then surely the economics of television would be simple; just as simple, or as complex, as in Great Britain where such conditions actually exist. So let us not be too surprised if Canada actually lags today behind England and the United States in television. It cannot be otherwise, because our own decision must be based on economic and geographical conditions as they are in Canada, and not as they are in other countries.

There is no doubt that, given an already established television programme service, enough receivers could be sold to make it a worth-while venture from a manufacturing or sales standpoint. At a high sales cost per unit of $300 to $2,500 in the United States, it may not take a very large turn-over to establish a reasonable margin of profit. But how many receivers will it take and how much will each television set owner have to pay, directly or indirectly, to make it economically possible for the broadcaster to build, operate and provide an adequate Canadian programme service to the stations we have already assumed to exist? For sound broadcasting it costs the American radio home approximately $12.50 a year for his programmes, which he pays for indirectly through advertising. In Canada the set owner pays about $10.00 for his programme service, $2.50 directly in licence fee and $7.50 indirectly in advertising. In England, the cost is $4.50 paid directly as a licence fee. Although these figures are not directly comparable because of the wide difference in population between the three countries, they might be of interest at this time as a basis to arrive at possible television costs.

Various estimates claim that television broadcasting will cost from 3 to 10 times as much as ordinary sound broadcasting, which for Canada is approximately $10.00 per radio home per year. On that basis, television service would cost each television home from $30 to $100 a year more or less. A little more if the listener or rather the televiewer pays it in small instalments every time he washes his teeth or his underwear; a little less if he pays it all at one time for a licence fee. If you add to this annual operating cost, the maintenance and depreciation of the receiver, which will cost on an average at least $500, the total is nothing to take lightly, especially if there is no guarantee against rapid obsolescence. Taking a life of 5 years for the receiver, the total annual cost will be roughly $150 to $220 a year including both receiver and programme costs. For anyone who realizes the potentialities of television, this should not appear out of line with the enjoyment it may create. But it does lift television bodily out of the realm of technical achievements into the realm of social and economic problems.

No wonder those who have the responsibility of making the decisions appear to be moving slowly. It is your money that is involved, and they simply want to be sure that it will be spent wisely in bringing you the enjoyment of television as soon and as economically as possible.

Appendix

Noise Susceptibility of AM and FM Systems

In order to understand the characteristic behaviour

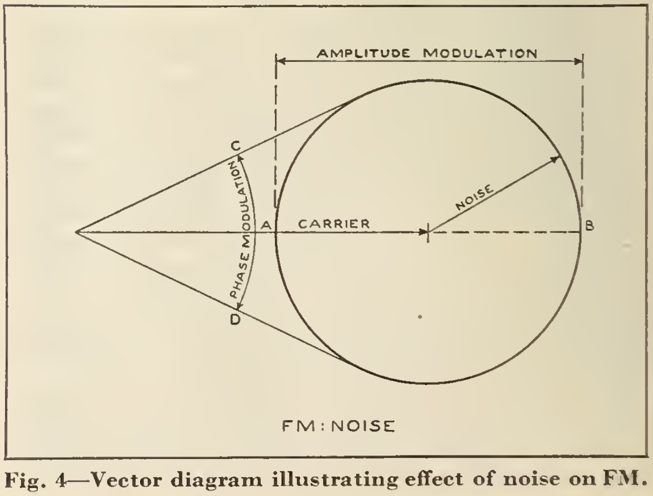

Fig. 4—Vector diagram illustrating effect of noise on FM.

of AM and FM systems in the presence of noise, it is first necessary to compare the circuits of the receivers used for the two systems, as shown in Figure 3. In both cases the radio signal picked up by the antenna is first amplified, with or without frequency conversion. In AM, this amplified high frequency signal is immediately detected or changed into the audio frequencies which actuate the speaker. In FM the amplified high frequency signal first goes through a limiter, which chops off all amplitude variations above a certain maximum value, but leaves the frequency variations unchanged. It is immediately apparent that this limiter will at the same time block most of the noise, which would otherwise go through the system. The use of an amplitude limiter is possible on FM because changes in amplitude are accidental or incidental to the system and convey no intelligence.

A further difference between the FM and AM sets is the introduction of the discriminator. This circuit is necessary to change the frequency modulated signal into an amplitude-modulated one, to permit its detection in the usual way.

The use of the limiter does not remove all the interfering noise. The reason for this can be shown by the vector diagram in Figure 4. Radio noise consists of closely overlapping impulses of random amplitude, frequency and phase. In other words, it can be considered as a number of individual carriers of random characteristics. This diagram shows the FM carrier vector and any one of the numerous noise vectors just mentioned. The desired carrier-vector rotates continuously and the noise vector also rotates continually around it. However, since we are only concerned here with the interaction of the two signals, we can picture the desired carrier as static. The noise vector rotates at a frequency equal to the difference in frequency and the carrier and the noise impulse considered.

This rotation produces amplitude modulation between A and B, and phase modulation between C and D. For signals greater than a certain minimum value the amplitude modulation is eliminated by the limiter, but the phase modulation due to noise remains. This phase modulation takes place at the speed of rotation of the noise vector, thus producing frequency modulation, which in turn produces an audible noise in the FM set, which will be proportional to frequency.

Figure 5 illustrates the magnitude of the noise components in AM and FM systems as a function of frequency. On AM, the noise is the same at all frequencies, but the ear and the audio and intermediate frequency amplifiers cut everything above approximately 15,000 cycles, so that on AM the total noise spectrum corresponds to the rectangle ABDC. In other words, AM has a rectangular noise spectrum. On FM, it has already been seen that the noise is proportional to frequency, so that it is zero for

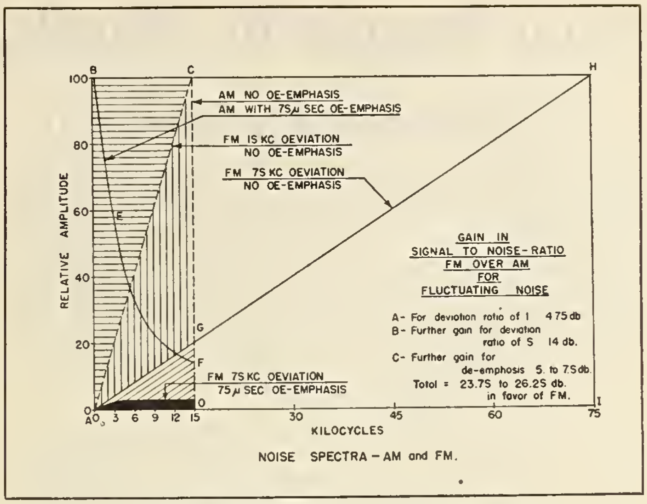

Fig. 5—Noise spectra of AM and FM.

frequency, zero and maximum for maximum deviation. The FM noise spectrum is, therefore, triangular in shape, as is indicated by the triangle ACD for a deviation of 15 kc. which corresponds to a deviation ratio of 1. Since noise is measured in RMS values, the ratio of AM noise to FM noise is equal to the square root of the squared areas of the two spectra. This immediately gives FM an initial advantage of 4.75 db. over AM.

In the case of FM broadcasting on very high frequencies with deviations of 75 Kc., which corresponds to a deviation ratio of 5, the noise spectrum is the triangle AHI. As in the case of AM, the ear and the audio amplifier will cut off anything above 15 kilocycles, so the audible noise will be that in the small triangle AGD, which is only one fifth of the height of ACD, this gives another 5 fold improvement as compared to AM, that is, another 14 db. This makes a total of 18.75 db. which is the total gain of FM over AM operating on the same frequency, and without audio pre-emphasis, in the case of fluctuating noise.

With pre-emphasis, however, further improvement is possible, and since present FM standards call for 75 microsecond de-emphasis, this is the case we are really interested in. In this system the higher audio frequencies are pre-emphasized at the transmitter by a certain amount, and linearity is restored at the receiver by a corresponding de-emphasis. Under this condition the effective noise spectrum of AM is given by the curve BEF and the spectrum of 75 Kc. FM is given by the thin black strip AD. This de-emphasis at the receiver gives a further gain in favour of FM over AM of 5 to 7.5 db., depending on the type of programme transmitted. The total inherent advantage of FM over AM in noise rejection is, therefore, about 24 to 26 db., or expressed in terms of power, between 250 and 400 to 1.

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

ONTARIO DIVISION AUTHORIZED

At the February meeting of Council, authorization was given to the members in Ontario for the establishment of a Provincial Division as provided in By-law No. 69. The necessary support of a majority of the corporate members in the province has been secured, and now Council has transferred the proposal to the Ontario councillors with power to act. Vice-President C. E. Sisson of Toronto was appointed provisional chairman.

Mr. Sisson proposes to hold a meeting of councillors in Toronto on Saturday, May 10, after the annual meeting of the Institute, for the purposes of completing the organization and determining policy. Branches will receive further advice direct from the provisional chairman.

It has been discovered that many Ontario members have viewed with uneasiness the move to establish a division. In their minds the word " division " seemed to connote a separation from other parts of Canada, and they were disinclined to support such a move. However, it has been explained that, instead of promoting organizational division, it will promote solidarity with other provinces.

Ontario councillors present at the February 1946 annual meeting suggested that the interests of the Institute and the profession in Ontario could be developed more intensively and helpfully if the power to study the possibilities were transferred from the whole Council to a provincial division. It was explained that several things were so local in their implication, that those resident in the area were better able to understand them and to make recommendations. For example, one matter that has been discussed as an item for the division to consider is the expansion of co-operative activities between the Institute and the many other organizations in the province. Another is to consider means by which the Institute can enlarge its service to Ontario members. After all, there are now twelve branches in the province, and it is possible that their needs will be better met if some agency of the Institute is established in the area to act as a division of Headquarters.

These and other matters may be on the agenda for early meetings of the division, but members may be assured that the division will be an aid to Council and not a substitute for it.

FUNDS FOR EDUCATIONAL PURPOSES

For many years members of the Institute have spoken of the good that could be done if the Institute had funds to assist better-than-average students to complete their courses in engineering—students who otherwise might not be able to become engineers. Such a fund is now available and in use.

The Harry F. Bennett Educational Fund of The Engineering Institute of Canada serves two purposes. In the first place it commemorates the services rendered the Institute and the profession by Mr. Bennett, and secondly, it provides funds to aid engineering education in many ways. The trust deed describes the educational objectives as follows:—" The purposes and objects of the fund are to establish engineering and science scholarships and fellowships and to award the same to deserving persons, to encourage by way of financial assistance and otherwise the establishment and maintenance of engineering and science departments in schools and colleges, to make loans to deserving students to enable them to pursue engineering and scientific studies, and generally, in any way to promote and advance the study of engineering and science ".

Members will be pleased to know that the objective of $25,000.00 has been reached. The contributions from members across Canada have met the immediate needs, but the trustees and Council are hopeful that further contributions, either through the branches, or by bequests will swell the amount and make possible an increased usefulness for the fund.

Great credit is due the committee that organized the fund and collected the money. This has been one of the Institute's greatest accomplishments. It seems to be the largest financial effort ever undertaken and certainly it is one of the greatest potentials for good with which the Institute has been associated. The committee consisted of James A. Vance of Woodstock (chairman), R. E. Heartz of Montreal, and E. V. Buchanan of London. The trustees who will administer the fund and who have been proposed by Mr. Vance and Mr. Heartz are J. B. Macphail of Montreal, V. A. McKillop and E. V. Buchanan, both of London.

It is interesting to see where the money came from. The committee had prepared a quota for every branch proportionate to its membership, and therefore a comparison is simple. The outstanding effort was made in London where the branch collected $2,500.00 or 500% of its quota. London is a small branch with only 100 members of all classifications. Next in line was the Border Cities Branch where 210% of the objective was reached. Then came St. Maurice Valley with 144%, then the new branch at Kootenay with 137%, and Calgary with 134%. Five other branches also exceeded their quota in the following order: Niagara Peninsula, Quebec, Montreal, Saint John and Sault Ste. Marie. Montreal's share of the total collected was $8,000. The figures will be altered somewhat as further returns are received.

It is gratifying to note that before the trustees were prepared to appropriate money, applications for assistance began to arrive. It is interesting, too, to discover that the first recipient of assistance was a fourth year student—president of his engineering society.

Notices of the fund's existence will appear in the calendar of each university, in addition to which a small poster is being made for notice boards at universities and other appropriate places. The trustees will be pleased to receive recommendations from members who know of instances where the fund can be used to advantage. These should be sent to Headquarters.

A MESSAGE TO JUNIORS

Under the recently revised by-laws a Junior member may transfer to Member without payment of the five dollar transfer fee, providing he makes application not later than the end of the seventh year after graduation and providing too that his qualifications are accepted by Council.

It is not necessary to wait the seven years. Any Junior who has had the necessary two years of professional responsibility, and is a graduate may transfer under the same advantageous conditions any time he chooses before the end of the seven years.

Persons who do not transfer by the time specified, are required to pay the transfer fee and no person will be allowed to remain a Junior beyond the end of the eighth year after graduation except under very special conditions and upon permission of Council.

Thus it becomes apparent that graduates of 1940 are now in the last year in which they can transfer without paying the transfer fee. Already Headquarters has received many requests for transfer forms from this group, but this notice is inserted in the Journal for the benefit of those who do not know that this privilege is available to them.

ONE HUNDREDTH ANNIVERSARY

On March the third the world will pay homage to a great benefactor, Alexander Graham Bell. The controversy still wages as to whether the telephone was invented in Boston or in Brantford, but it really doesn't matter. What is important is that it was invented some place and has been a servant of man ever since. Mr. Bell wrote in 1904 " It so happens that the telephone was invented in Canada ". The confusion seems to have developed from the fact that the first telephone instrument and the first experiments were made in Boston, whereas Mr. Bell said " The first transmission of a human voice over a telegraph wire where the speaker and listener were miles apart, was in Canada ".

Mr. Bell himself was a Scotsman who came to Canada with his father in 1870. Already he had become an inventor, and his interests in sound transference began somewhere about 1862 when he was a student teacher at Weston House. Earlier his interest in sound had been developed through his father's work on speech therapeutics and phonetics, as related to methods of teaching deaf mutes to speak. A misunderstanding of the German text relating to Helmholtz experiments with electrically activated tuning forks started him off on the idea of the telephone. What a fortunate misunderstanding.

To Canadians this anniversary has a significance apart from the telephone. Mr. Bell left the telephone field, still less than forty years of age after a long series of lawsuits over patent rights, which incidentally he won, and after setting up the first telephone company. He returned to his early love—the study of deafness, and to other researches. In 1886 he purchased a property at Baddeck, N.S., where he surrounded himself with a group of bright enthusiastic young men and all became interested in powered flight—among other things. They formed the Aerial Experiment Association. The names of J. A. D. MacCurdy now of Ottawa, F. W. (Casey) Baldwin, Glen Curtiss and Selfridge are an important part of the proud record of that modest Association.

Alexander Graham Bell died at Baddeck, N.S., in 1922, and was buried on a nearby hillside with only a rough boulder to mark the spot, but actually every telephone is a monument to his intelligence, to his character, and to his indefatigable spirit.

A.I.E.E. 1947 SUMMER MEETING

Montreal, June 9-13th

Following is an outline of the programme for the meeting of the American Institute of Electrical Engineers, to be held next June at the Mount Royal Hotel, Montreal.

It will be remembered that members of the Engineering Institute have been invited to participate, and that the arrangements are being made by a joint committee of representatives of both institutes.

TENTATIVE PROGRAMME

Monday, June 9th

Morning: Registration and Meetings.
Afternoon: Meetings.

Tuesday, June 10th

Morning: Meetings.
Afternoon: Meetings and Golf—Ladies' Sightseeing Tour and Tea at Botanical Gardens.
Evening: Smoker and Ladies' Bridge.

Wednesday, June 11th

Morning: Meetings and General Session.
Afternoon: Inspection Trips and Golf—Ladies' Conducted Shopping Tour.
Evening: Free.

Thursday, June 12th

Morning: Meetings.
Afternoon: Meetings.
Evening: President's Reception and Dinner Dance.

Friday, June 13th

Morning: Meetings.
Afternoon: Meetings.
Evening: Saguenay Boat Trip. (For those unable to be accommodated on Friday, arrangements will be made on boat leaving Saturday evening).

Note: Smoker—Tuesday, June 10th, 1947. Accommodation for 1000 only. Get your reservation in early.

Wednesday, June 11th, 1947—An endeavour is being made to arrange for two plane flights to Shipshaw during the afternoon.

GET YOUR HOTEL RESERVATIONS EARLY.

HIGHLIGHTS, SAGUENAY BOAT TRIP

Orchestra on board for the trip.

Friday, June 13th, 1947—6 p.m. Boat leaves Montreal.

Saturday, June 14th, 1947—5 p.m. A trip to the Shipshaw Power Development has been arranged through the courtesy of The Aluminum Company of Canada.

Sunday, June 15th, 1947—Stop-over visits.
7.30 to 11 a.m.—Murray Bay.
3.30 to 8 p.m.—Quebec City.

Monday, June 16th, 1947—6 a.m. Arrive Montreal.

As reservations are to be filled on the basis of first come first served, you are advised to get your application in early. Please signify on the application whether or not you intend to visit the Shipshaw Plant.

For all reservations address: Mr. G. H. Gillett, Secretary-Treasurer, Summer Meeting Committee, A.I.E.E., c/o Canadian General Electric Co. Ltd., 1000 Beaver Hall Hill, Montreal, Quebec.

ART FOR THE ENGINEER

An innovation in Institute circles has been arranged for the annual meeting. There will be an arts and crafts exhibit. There will be classes for oils, water colours, pastels, photographs and many forms of handicraft. All details are not yet determined, but the special committee is working on them. This is by way of a preliminary notice.

For years officers of the Institute as they have travelled across Canada have been impressed with the number of engineers who find a cultural outlet in the arts and crafts. If all these members will show their products at Toronto, a really impressive salon will result. Besides providing a pleasant entertainment for members and guests, it will afford an opportunity for many modest beginners to get into a show perhaps for the first time.

Admittedly it is an experiment, which entails a lot of additional work and worry for the Toronto committee, but the committee believes the results will more than justify the effort.

A GREAT EDUCATIONALIST RETIRES

It is a matter of interest and concern in every part of Canada that Dr. Frederic H. Sexton has retired. For forty years he has headed up the Nova Scotia Technical College at Halifax, having been its founder in 1907.

Not many Canadians have established for themselves the record that is now Dr. Sexton's. Although his efforts have been centred in Nova Scotia, he is well and favourably known in all provinces. Through his own activities and through the loyalty and attainments of his graduates, he has become a Canadian of great distinction. No university in Canada enjoys a better reputation with employers than does Nova Scotia Tech. This is perhaps the finest tribute that could be paid to the man who has made the training of young Canadians his life work.

Dr. Sexton is a man of great breadth. His interests and his accomplishments embraced many fields. Not content with turning out engineers, he played a leading part in establishing and maintaining evening technical schools, mining schools, industrial courses, correspondence courses, apprenticeship and vocational training. All these he did in his dual capacity of president of the college and provincial director of technical education.

Dr. Sexton was born in the United States at New Boston, N.H., on June 9, 1879. He was educated at the public schools of Billerica, Mass., Cambridge English high school, and the Massachusetts Institute of Technology, graduating from the Institute in 1901 with the degree of bachelor of science in mining engineering. In 1919 he received the honorary degree of doctor of science from Acadia University and of doctor of laws from Dalhousie University.

After his graduation at MIT he was assistant in metallurgy at the Institute and research metallurgist with the General Electric Company at Schenectady, N.Y. He came to Nova Scotia in 1904 to become assistant professor of mining engineering at Dalhousie University. In 1907 he was chosen by the provincial government to found the Nova Scotia Technical College. He has been president of the college and provincial director of technical education ever since.

Dr. Sexton is a member of the Canadian Advisory Council on Vocational Education, vice-chairman of the Atlantic Coast committee of the Canadian Legion Educational Services, and a member of the Maritime Division board of directors, National Institute for the Blind. He is also a trustee of the Maritime Foundation for the Blind. He is past president of the Mining Society of Nova Scotia, the Canadian Education Association, and the Nova Scotia College of Art. He was formerly district governor of Rotary International and a member of the council of the Nova Scotia Association of Professional Engineers. In 1931-33 he was chairman of the committee which revised the Nova Scotia public school curriculum.

Dr. Sexton was awarded the Julian C. Smith Medal in 1943 by the Engineering Institute. This award is made for " achievement in the development of Canada ". It would be difficult to find a more worthy recipient.

Members of the profession everywhere will wish Dr. Sexton good health and a long life in which to enjoy the good things that he has earned by his life of service to his fellow men.

NEW PRESIDENT FOR NOVA SCOTIA TECH

Coupled with the announcement of the retirement of Dr. Sexton comes the news of the appointment of Dr. Alan E. Cameron to the post of president of the Nova Scotia Technical College.

In the minds of those who know both gentlemen, the news of Dr. Cameron's appointment largely compensates for the departure of Dr. Sexton. It is a happy circumstance that makes possible the replacement of Dr. Sexton with such an excellent and well qualified successor. Dr. Cameron is already widely known across Canada because of his work in Alberta, Ontario and Nova Scotia, and it is difficult to think of anyone whose training and natural talents would fit him more precisely for the work and opportunity that goes with this appointment.

Dr. Cameron was born at London, Ont. He received his primary and secondary education at Ottawa and graduated from McGill University in mining engineering in 1913 with honours in geology. The following year he obtained his master of science degree.

He joined the staff of the University of Alberta to develop the department of mining engineering. During the First World War he served with the Geological Survey of Canada in the Northwest Territories, was an engineer with the Imperial Munitions Board, and saw active service as a lieutenant of Engineers in France and Belgium.

At the end of the war he joined the staff of Khaki University, remaining in England with the college until it disbanded. Returning to the University of Alberta he spent six years teaching mining and metallurgy and in professional consulting work, particularly in the search for oil in Alberta and the northwest.

He attended the Massachusetts Institute of Technology in 1924-25, receiving the degree of doctor of science in metallurgy. Going back to the University of Alberta, he became associate professor and then professor of metallurgy and acted as secretary of the Research Council of Alberta.

During the next 12 years, Dr. Cameron carried on explorations in northern Alberta for the Research Council and private consulting work in the Northwest Territories. He was among the first to go into Great Bear Lake after the discovery of radium there, and the first post office for mineral developments, Cameron Bay, N.W.T., bore his name. In 1935 he ascended the South Nahanni river and explored the so-called Headless Valley and tropical valley of that area.

Dr. Cameron joined the staff of the Nova Scotia Department of Mines in 1937 as deputy minister. He has been successively president of the Association of Professional Engineers of Nova Scotia, of the Nova Scotia Mining Society, and of the Canadian Institute of Mining and Metallurgy.

At present he is chairman of the engineering education committee of the Dominion Council of Professional Engineers, chairman of committees on educational and vocational training in the coal industry and the mineral industry of the Canadian Institute of Mining and Metallurgy. Dr. Cameron joined The Engineering Institute of Canada as a Member in 1937; was on the executive of the Halifax Branch in 1941 and 1942; served on the Leonard Medal Committee for several years and was chairman in 1943; represented the Association of Professional Engineers of Nova Scotia on the Council of the Institute for 1944.

He has written many scientific and technical articles on subjects related to geology, mining and metallurgy. He prepared and presented the Nova Scotia brief to the Royal Commission on Coal in 1944.

A CANADIAN WELDING BUREAU

A new division of the Canadian Standards Association has recently come into operation on the formation of the Canadian Welding Bureau. The Canadian Standards Association undertook this work on the urgent request of a wide section of the welding and fabricating industry.

One of its principal functions will be to ensure good welding by approving shops, engineering and supervisory personnel and operators. The basis of qualification will be the welding codes and specifications prepared by the Canadian Standards Association, which association will progressively prepare and issue codes covering the whole welding field, thus avoiding a costly multiplicity of standards and specifications such as has already developed in some countries.

Approved Fabricators

The Bureau has recognized that the existence of codes is not in itself sufficient to ensure good welding, although they do form a valuable guide. For this reason and to satisfy all users and potential users of welding, approval by the Bureau is granted only to those fabricators whose welding equipment, operators, supervisory and engineering personnel satisfy the standards under which the Bureau operates.

Lists of such approved members are now in the course of preparation for release to municipal and city engineers, government departments, architects, consulting engineers, buyers and other interested parties.

The Bureau's engineering personnel is at present busily engaged in testing and according approval under arc welding standards. Codes are projected for resistance welding, gas welding and brazing.

The Bureau is being staffed by experienced welding engineers who, it is anticipated, can be of material assistance to member firms. It will be their duty to assist any firm desirous of becoming a member to meet the standards required and further to generally promote welding and its proper development and progress throughout the Dominion.

Personnel

The newly appointed General Manager of the Bureau is Mr. R. M. Gooderham, B.A.Sc., M.E., who since his graduation at Toronto University in 1926 in electrical engineering, has been closely associated with welding. On leaving university he joined the Lincoln Electric Co. of Canada Ltd., and later organized and developed the British and European business of the Lincoln group. In the early part of World War II, he became welding advisor to the British Ministry of Supply and promoted and assisted in the formation of the advisory welding service of that Ministry, and later became welding advisor to the shipbuilding branch of the Canadian Department of Munitions and Supply. In recent years he has been in private practice.

Another prominent Canadian welding engineer to join the staff of the Bureau is W. Ralph Stickney, B.A.Sc., M.E.I.C., winner of the Duggan Medal and Prize for his paper on welding to the Engineering Institute of Canada in 1943. He is a graduate engineer from Toronto University in 1936. Most of his career has been devoted to welding and he has gained a broad experience by serving with the Canadian Bridge Co. Ltd., Walkerville, where he became Welding Engineer in 1939, and more recently at Canadian Vickers Ltd., where his duties embraced a very wide field of welding applications. In addition to the permanent staff of the Bureau, there will be a Welding Bureau Board, which has recently been formed. It will direct and control the operations of the Bureau and provide through its membership a liaison with both industry and the Canadian Standards Association. Members of the Board, all of whom are prominent engineers, directors or executives are:

Colonel A. H. Cowie, M.E.I.C.; Mr. E. S. Sargeant; Mr. D. S. Lloyd, M.E.I.C.; Mr. G. P. Wilbur, M.E.I.C.; Colonel W. R. McCaffrey, M.E.I.C.; Mr. M. N. Vuchnich.

Headquarters of the Canadian Welding Bureau are at present located at 86 Bloor Street West, Toronto; that of the Canadian Standards Association in the National Research Building, Ottawa.

DETAILS OF MEMBERSHIP

For years there has been the desire to have a breakdown of the membership list of the Institute in order to discover who are the people who make up this great organization, what they do and where they live. Not long ago the Institute joined the Audit Bureau of Circulations (A.B.C.), the foremost rating organization in the publishing field. A statement on the pages of a publication that it is audited by A.B.C. is like the sterling mark on silver. To the advertiser, A.B.C. is a guarantee of "paid for" circulation, and in other ways as well is his best protection. Members of the Institute will be pleased to know that *The Engineering Journal* meets these rigid requirements.

One of the requirements of A.B.C. is that the publisher provides a complete classification of the occupations or business of his subscribers. This has made it necessary for Headquarters to survey the entire membership—a task of no mean proportions. Recently it has been completed and it is now possible to publish the whole picture in a way that will be interesting to readers and advertisers alike.

There are many interesting facts disclosed in such a breakdown. For instance, the membership embraces over 1,300 government employees at the federal, provincial and municipal levels—about 16 per cent of the total membership. Over 400 are in educational institutions. Over 1,100 are owners of their own businesses or are managers of businesses. In the electrical, mechanical and industrial fields there are over 3,500 members. Over 1,500 or 19 per cent are recent graduates or students.

Geographically, there are some interesting discoveries too. For instance the provinces of Quebec and Ontario make up 65 per cent of the total with Quebec providing slightly more than Ontario. British Columbia comes next with 486, followed by Alberta, Nova Scotia, Manitoba, New Brunswick and Saskatchewan in that order. Eight per cent of the membership lies outside of Canada.

From the tabulation shown below can be seen the great detail that has been developed. Not only does it show the industrial classification but also the nature of the work done by the engineer in each classification. In all there are 260 divisions of the membership providing a most useful, interesting but nevertheless difficult to obtain answer to the question of " who is the Engineering Institute of Canada?".

COMMUNITY PLANNING IN BRITAIN

A curious thing about community planning is that it never seems to get beyond the planning stage. One is surely reminded of Mark Twain's comment on the weather. Experts offer a number of reasons for this lack of action. To the average citizen most of them sound ridiculous and at times fantastic and yet the fact remains that selfish personal interests, inter-community differences of opinion, and an overall lack of objective thinking is blocking progress.

Plans, both comprehensive and sectional, are being made for several municipalities in Canada, but reports indicate that even now, most, if not all of them, are in pigeon-holes or are on their way there. All this in spite of the fact that the federal and provincial governments are giving encouragement in many forms, and are even urging that their offers of financial assistance be accepted. What is wrong?

The condition is not peculiar to Canada, but one can appreciate that the difficulties in Britain for example, may be more real than here. Over there the labour and materials situation is really serious, but still they are making efforts to overcome the other obstacles as well. A bill which in its scope is staggering was published in London on January 8th under the title "The Town and Country Planning Bill". It may have passed its second reading in the House of Commons by now.

The bill proposes to sweep away a lot of privileges which up to now have been thought to be the inalienable rights of the citizen. It proposes to reduce the privileges of the individual in the interests of the community. It recognizes the almost impossible task of getting anything done under present circumstances. If it is accepted without being shorn of its strong points, it may make the "new city" a possibility.

Already, strong opposition has made itself apparent, and it is too much to hope that the millennium has occurred, but it is interesting and encouraging to planners and broad-minded citizens here to know that someone somewhere has the courage to face the situation and to at least try to block the stupid and selfish obstructionist whose interest is not that of the community.

Here follows an outline of what the bill proposes to do. The information has been supplied by the United Kingdom Information Office.

Land Planning in Britain

The Town and Country Planning Bill is the consummation of years of inquiry by successive governments into the problems of using land to the best national advantage.

The Bill's main objects are to set up a planning system to meet present day requirements, to produce a comprehensive solution of the problem of development values in land and thereby to remove one of the main obstacles to good planning, and to provide national grants of money to help local authorities in the purchase and clearing of land for the execution of plans.

The Bill sets up a new system which, in the view of the Government, makes practical for the first time such projects as the reconstruction and redevelopment of old towns, the preservation of green belts around towns, the provision of open spaces in crowded areas, and the allocation of land in the right place for new houses and factories etc., as exemplified in the Abercrombie plan for London and similar projects for other cities. Such things have been impossible hitherto because of the heavy compensation due to landowners from local authorities, and because of the static and rigid planning system which gave undue emphasis to local at the expense of regional and national needs.

The Bill does not nationalize land, but deprives landowners of the right to build on their land except in accordance with planning requirements. A development charge (betterment) will be imposed on the owner if he is granted permission to build, thus depriving him of what is called unearned increment in land values. The Government hold that owners who thereby lose development value are not necessarily entitled to compensation. The Government recognize, however, that if no payments were made, hardships would often be caused, and have decided that a capital sum of $1,200,000,000 be made available from which payments may be made to landowners throughout Britain.

Landowners are to be left in enjoyment of the existing use value of their land. The private land developer would have to pay part of the price of the land to the Central Land Board as a development charge. The cost of land to the developer would be much the same as now, but a landowner in a key position would not be able to hold him to ransom. Private development would, as now, have to be in accordance with local and national planning requirements. If the developer is the landowner himself, he would pay the development charge.

The Government propose a positive system of planning in place of the present negative and restrictive machinery. Local authorities would be obliged to submit development plans within three years, to be reviewed at least every five years for adaptation to changing conditions. County Councils would for the first time receive direct planning functions, so that the requirements of town and country would be coordinated over a wider area than hitherto. Local councils within the counties would be fully consulted, and the carrying out of the plan, including building whether by private or public enterprise, would remain their responsibility. Where regional planning overlaps county boundaries, the counties (which include cities administered as counties) would be able to form joint planning boards. The Minister of Town and Country Planning would co-ordinate on the national plane.

The Bill provides full powers for the public purchase of land required for carrying out a plan, and provides a national grant to local authorities for loss on redevelopment operations, for compulsory purchase where they reduce the value of land they buy by putting it to less profitable use, and for payments to the landowner if the value of his land is reduced below its existing value. All purchases of land for public use, whether by Government departments, local authorities or statutory undertakings, would be at the existing use value on March 1939 standard. This decision, in view of the change since then in the value of money, will be challenged on behalf of the landowners.

The powers already possessed by local authorities for dealing with devastated areas are extended to any land wanted for development or redevelopment for a 10-year building programme. Such programmes could be extended when plans are reviewed at least every five years, and could thus always be kept five to ten years ahead.

The Bill also provides powers to control outdoor advertisements which have long disfigured town and country. Authorities already have powers to preserve trees in the interests of amenity, and historic buildings, and these are reaffirmed at the same time as the Bill repeals previous planning legislation.

Land development or replanning, the provision of basic services and the erection or demolition of buildings require not only legislation to make them possible, but a labour force, a wealth of raw materials and financial reserves not yet available in sufficient strength and quantity. Nevertheless, essential preliminary measures have been and continue to be taken. Local planning committees have been formed, town planning schemes approved, sites for hundreds of thousands of future houses chosen, a vast programme of varied map production and revision undertaken, and expert advisory committees set to work. The main principles of the plan for decentralizing Greater London have been approved, and the creation of new satellite towns outside it provided for by Parliament. Hydro-electric generating works have been decided on for harnessing the waterpower of the Scottish Highlands. The Severn Barrage scheme for using the strong tidal streams as a source of electricity has been found practicable and economic. And other major regional schemes are contemplated.

MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, February 15th, 1947, at nine thirty a.m.

Present: Vice-President J. E. Armstrong (Montreal) in the chair; Vice-President G. F. Layne (Quebec); Councillors P. E. Buss (Thorold), G. J. Currie (Halifax), J. R. Dunbar (Hamilton), E. Lavigne (Quebec), W. L. Saunders (Ottawa), J. A. Vance (Woodstock), W. S. Wilson (Toronto), R. S. Eadie, R. C. Flitton, C. C. Lindsay, C. A. Peachey, P. E. Poitras, J. B. Stirling, and Treasurer J. A. Lalonde, of Montreal; General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel. There were also present by invitation—President-Designate Colonel L. F. Grant, of Kingston, and Mr. F. F. Dyer, chairman of the Sarnia Branch.

Annual Meeting 1947: The general secretary reported on the meeting which he and Mr. Trudel had had with the annual meeting committee of the Toronto Branch on January 22nd in Toronto. He concluded by presenting the draft of a programme which had been sent to Headquarters by the committee following the meeting.

The general secretary then presented a letter from the Committee on Community Planning which stated that due to the short period of time available on the annual meeting programme for community planning, the committee would prefer not to participate but in its place would like to have authorization to arrange another conference, either in Toronto or Ottawa, to be devoted exclusively to that subject.

A long discussion followed in which most councillors took part and during which many proposals were made. Mr. Eadie expressed the opinion that the technical sessions were by far the most popular part of an annual meeting programme. Mr. Dunbar and Mr. Lalonde agreed with this, and Mr. Dunbar recommended that Friday be devoted entirely to technical sessions so that persons attending for that purpose, if pressed for time, could leave Toronto Friday night rather than wait over until Saturday morning for further technical subjects. Council agreed generally with this recommendation and was unanimous in recommending to the Toronto committee that Air Commodore Whittle's paper be delivered on Friday, preferably in the afternoon, and that Friday morning be devoted to additional technical subjects. It was recommended also that Commodore Whittle be asked to be the luncheon speaker on the same day, taking as his subject the early history of his experiences in the turbo-jet field. This would be a non-technical paper which would have a very wide appeal to a mixed audience.

Council next considered the request of the Committee on Community Planning, and eventually agreed unanimously that there be no paper at this meeting on that subject, it being understood that this is in accordance with the wishes of the Toronto committee and the Committee on Community Planning. It was agreed also that the Committee on Community Planning be authorized to proceed with a special session under the auspices of the Council and within the control of the committee.

The chairman suggested that some members of Council should accompany the general secretary to Toronto to make these recommendations to the committee. Councillor Saunders stated that he would be in Toronto next week and it was agreed that he, Councillor Wilson from Toronto, and President-Designate Grant should endeavour to arrange a meeting with the Toronto committee at the earliest possible date.

Honorary Memberships: The general secretary presented a list of eleven names made up of recommendations from the various branches, for election to honorary membership. He pointed out that the by-laws restrict the total number of honorary members to twenty but that there were now four vacancies.

Different means were considered by which the Council could be canvassed and eventually it was agreed that, at this meeting, four of the eleven should be selected to go out by final letter ballot to all councillors. Accordingly, each councillor present was given a ballot with eleven names upon which he was requested to place in the order of his preference, a number opposite each name. Mr. Trudel was appointed scrutineer and, after an intermission, he reported the four names which were given the best support. The general secretary was instructed to send these names out immediately by ballot to all councillors, it being the intention to have the ballot returned in time to be opened at the next meeting of Council in Saint John on March 15th.

Canadian Council: Mr. Stirling, the chairman of the Committee on Professional Interests, reported on the reactions to the circular letter sent out by his committee dealing with the Canadian Council of Professional Engineers and Scientists. Several letters have been received encouraging the committee in its policy, but at the same time two communications had been received that offered criticism. One of these members has misunderstood the communication, and has thought it was the Dominion Council that was referred to. He recommended that the letters be left with the committee for further study and for report at the next meeting. This was approved unanimously.

Harry Bennett Educational Fund: Mr. Vance presented a progress report which brought Council up to date on the activities of the committee, and made recommendations with regard to the appointment of trustees. He pointed out that the campaign had been successful and that the objective had been almost reached, with additional contributions still coming in. He presented also the auditors' statement up tc the end of 1946, which report was accepted by Council.

Mr. Vance reviewed the development which had led to the securing of a trust deed and the setting up of trustees to control the funds. He explained that the three members of the committee, R. E. Heartz of Montreal, E. V. Buchanan of London and himself, had accepted the positions of trustees temporarily, in order to get the whole matter under way. He now recommended, with the approval of the other members of the committee, that the resignations of all three trustees be accepted, and that the following appointments be made in their place:

J. B. McPhail, Montreal, appointment to terminate at the end of 1949;

V. A. McKillop, London, Ont., appointment to terminate at the end of 1948;

E. V. Buchanan, London, Ont., appointment to terminate at the end of 1947.

Council regretted that Mr. Heartz and Mr. Vance found it necessary to retire. The work which they had done up to the present time was fully appreciated, and Council realized that they should be excused from further duties if they so desired.

Mr. Vance explained further that the committee would like to suggest, for the guidance of Council, that an effort be made at all times to select two trustees who would be located close together so that decisions could be reached quickly. It would be possible to obtain this result and yet rotate the trusteeship through a fairly wide area. The committee recommended also that an effort be made to always have on the Board of Trustees one who is a member of Council.

After considerable discussion, in which the chairman and councillors expressed further appreciation of the work done by the committee, the report was accepted unanimously, it being stipulated that the new trustees take office as of the date of this meeting.

Committee on Employment Conditions: The general secretary presented a copy of a letter which had been sent by the Committee on Employment Conditions to the Minister of Labour, which reads as follows:

February 10, 1947.

The Hon. Humphrey Mitchell,
Minister of Labour,
Parliament Buildings,
Ottawa, Ont.

Dear Mr. Mitchell:

Recently, the Institute's Committee on Employment Conditions has examined the draft of The Industrial Relations and Disputes Investigation Act, 1947. This appears to be a more workable piece of legislation than Order-in-Council 1003.

The committee's attention has been called particularly to the changes in the definition of an employee, and also to the inclusion of the word "profession" in Clause 10.

At the time Order-in-Council 1003 was being considered, the Institute made a complete canvass of its membership across Canada and the returned questionnaires gave many clear and decisive proofs of what the membership wanted. Bargaining by professional engineers for themselves was uniformly desired in 92% of the replies; and if this were not assured, 65% desired total exclusion from the provisions of the Order. Less than 1% desired trade unions as bargaining agencies.

As the largest organization of professional people in Canada we observe with great concern that Section 10 of the draft bill, due to rulings of the federal and provincial boards, could be used readily to compel professional engineers to accept representation in a draftsmen's or other trade union. We respectfully submit that there is no reason why compulsion of this sort should be applied to engineers against their wishes so clearly expressed. We therefore ask that the draft bill be amended to give professional engineers the clear right to do their own bargaining in all cases where they may so desire; and failing this, we ask that they be excluded equally clearly from the operation of the bill.

Yours sincerely,

(Signed) L. Austin Wright,
General Secretary.

The chairman pointed out that this was by way of a progress report and that in the letter the committee was endeavouring to carry out the mandate from the membership as indicated on the questionnaire. It was moved by Mr. Eadie and seconded by Mr. Vance and agreed unanimously that the action taken by the committee be approved.

American Institute of Mining and Metallurgical Engineers: The general secretary reported that Past-President Beaubien had been approached to represent the Institute at the seventy-fifth anniversary meeting of the American Institute of Mining and Metallurgical Engineers, and had agreed to act. Accordingly, on the motion of Mr. Dunbar, seconded by Mr. Poitras, it was unanimously resolved that Mr. Beaubien be appointed the official representative.

Financial Statement for the Year 1946: The financial statement for the year 1946 was presented by the chairman of the Finance Committee who, in addition to circulating the report, summarized the contents for discussion. He pointed out that the statement is more favourable than was the one for 1945 but noted that income and expenditures were both up. The increase in the former more than made up for the latter but the year finished up with a deficit of approximately $1700.00, whereas for 1945 it had been approximately $3500.00. After discussion, the statement was approved unanimously for submission to the annual meeting.

Headquarters Staff: The general secretary announced that Mr. Louis Trudel, the assistant general secretary, had presented his resignation to be effective April 1st. Mr. Trudel had received an attractive offer which the Institute could not meet. He explained that Mr. Trudel had been with the Institute for eight years during which time he had rendered exceedingly satisfactory service. He pointed out to Council the seriousness of this development, and suggested that each person make every endeavour to assist in finding a replacement. The chairman observed that this was a serious blow to the Institute, but he agreed that Mr. Trudel could not very well refuse the offer that had been made. He recommended that the Institute had no option but to release him, and certainly would wish him every success in his new field.

In reply Mr. Trudel thanked the chairman and Council for their kind remarks. He said that he had had a difficult time making the decision to sever his connection with the Institute. He had enjoyed his employment, and would still remain closely associated with the Institute. Upon a motion which was unanimously approved, Mr. Trudel's resignation was accepted.

Committee on Deterioration of Concrete Structures: A letter was presented from Mr. R. B. Young, assistant director of research of the Hydro Electric Power Commission of Ontario, who had been chairman for many years of the Institute's Committee on Deterioration of Concrete Structures, in which Mr. Young made inquiries as to Council's interest in the development of research in this field.

The letter reviewed the past work of the Committee and described the importance and the complications of carrying out further work. Mr. Young felt that there was a great deal of good work that could be accomplished provided Council was interested in proceeding with it.

He suggested that he might call together the former members of the committee and others for a meeting during the time of the annual meeting in Toronto, with the thought of preparing some recommendations for Council's consideration.

Council expressed appreciation of the importance of work of this kind, and also of the accomplishments of the committee in the past, and gave unanimous approval to Mr. Young's suggestion with regard to the meeting in Toronto.

Students' Conference: The general secretary reported that a circular letter had been sent to all the undergraduate engineering societies and to the deans of engineering, inquiring as to the next students' conference. So far replies have been received from only one university, and it supported the idea that the conference should be continued. This was noted.

Aid to Veterans: Colonel Grant stated that he was somewhat concerned about the future of the many veterans who are now enrolled in engineering courses in different parts of Canada. He was considering whether or not there was something which the Institute might do that would be of assistance to them. He stated that his actual contacts with these students had shown that they were a group of earnest, hard-working young men, and their spirit and performance was inspiring.

Colonel Wilson expressed his interest in the same problem, although like Colonel Grant he was not able to make any specific proposal at the moment as to what the Institute might do.

It was pointed out that through the employment department, the Institute had already rendered a service to the group, and that it would be increasingly important to them on graduation. Colonel Grant suggested that this might be a problem that could be taken up by the new Field Secretary.

A.S.M.E. Semi-Annual Meeting: Unanimous approval was given to the proposal that the Institute join with the American Society of Mechanical Engineers in developing a joint session at their summer meeting in Chicago on the subject of "Coal Handling with Earth Moving Equipment".

National Safety Week: In response to a suggestion from the Canadian Chamber of Commerce unanimous approval was given to the proposal that the Institute participate in a conference to consider the promotion of a National Safety Week.

A.I.E.E. Summer Meeting—Montreal: A letter was presented from the Montreal committee giving particulars of a boat trip up the Saguenay which had been arranged for the week-end of June 13th. The committee would be glad to arrange accommodation for any officers of the Institute who wished to participate in this trip. This was noted with appreciation.

Mr. Dyer asked the chairman's permission to express to Council the pleasure it had given him to be able to attend this meeting. He stated that he would take a lot of interesting information back to the Sarnia Branch. He reported that the Sarnia Branch, which in 1945 had only 15 members, now had a total of 64. He explained that in Sarnia there was a large body of engineers in miscellaneous occupations. He thought that the Engineering Institute, as the largest organization, might do a lot towards bringing the group together so that there would be close cooperation.

It was noted that the next meeting of Council would be held at the Admiral Beatty Hotel, Saint John, New Brunswick, on Saturday, March 15th, during the president's tour of the maritime branches.

The Council rose at five twenty p.m.

ELECTIONS AND TRANSFERS

A number of applications were presented for consideration, and on the recommendation of the Admissions Committee, the following elections and transfers were effected:

Members

Carruthers, Harvey, B.A.Sc., British Columbia, district mgr., Bingham Pump Co., Vancouver, B.C.

Code, Robert G., B.Sc., (Civil), Queen's civil engr. & Ontario Land Surveyor, London, Ont.

Fugler, Ronald William, B.A.Sc., (Chem. Engrg.), Toronto, mech. supvr., fabrication plant, Canadian Resins & Chemicals Ltd., Shawinigan Falls, Que.

Huda, A. F. M. Mirza Shamsul, B.Eng., (Civil), Univ. of Calcutta, graduate studies, Univ. of Toronto, Ont.

Johnston, David H., B.Sc., (Elect. Engrg.), Queen's asst. operator, seismograph field party, Imperial Oil Limited, Ottawa, Ont.

Little, Donald Cameron, B.Sc., (Mining), Saskatchewan, jr. engr., Kelsey Wheel Co. Ltd., Windsor, Ont.

Morton, Stanley, B.C. manager, Renold-Coventry Ltd., R&M Bearings Canada Ltd., Vancouver, B.C.

Motherwell, Robert King, B.Sc., (Mech. Engrg.), Queen's, student, Canadian General Electric, Peterborough, Ont.

Neilson, Maurice O., Civil Engr., Univ. of Stockholm, consultg. engr., Toronto, Ont.

Noyes, Richard Roe, B.A.Sc., (Mech. Engrg.), Toronto, asst. district mgr., Canadian Sirocco Co. Ltd., 630 Dorchester St., W., Montreal, Que.

Perkins, Charles Lee, B.Sc., (Elect. Engrg.), New Brunswick resident engr., Civil Aviation Br., Dept. of Transport, Toronto, Ont.

Walker, William Deans, B.Sc., (Mech.), Queen's, asst. supt. of machine shop, Ford Motor Co. of Canada, Windsor, Ont.

Juniors

Green, Kenneth Wilson, B.Sc., (Elect.), Manitoba, 408 Rosedale Ave., Winnipeg, Man.

Skene, Alexander Wilbert, B.A.Sc., British Columbia, sr. engr., Imperial Oil Limited, Calgary, Alta.

Affiliates

Phelps, Thomas Henry, vocational director, Collegiate and Vocational School, Cornwall, Ont.

Stanley, Ross Meredith, B.Sc., (Arch.), Alberta, designer, Meech, Mitchell & Meech, Lethbridge, Alta.

Transferred from the class of Junior to that of Member

Ackhurst, William Hall, B.Sc., (Elect.), N.S. Tech. College, industrial app. engr., Canadian General Electric, Toronto, Ont.

Bethel, Vincent Walter, Major, R.C.E.M.E., B.Sc., (Elect.), Toronto, Barriefield Military Camp, Kingston, Ont.

Holgate, David Crossley, B.Eng., (Civil), McGill, engr., Sault Structural Steel Co., Ltd., Sault Ste. Marie, Ont.

Hubbard, Frederick Wilmot, B.Sc., (Elect.), New Brunswick, elect. foreman, nylon divn., Canadian Industries Limited, Kingston, Ont.

Langley, John Gordon, B.Eng., (Elect.), McGill, sales engr., apparatus dept., Canadian General Electric Co., Ltd., Toronto, Ont.
Near, Frank Manning, B.A.Sc., Toronto, jr. engr., hydraulic dept., H.E.P.C. of Ontario, Toronto, Ont.
Rahilly, Thomas Francis, B.Sc., (Mech.), Queen's, asst. supt., mech. dept., Algoma Steel Corporation, Sault Ste. Marie, Ont.
Rattenbury, David James, B.A.Sc., (Mech.), British Columbia, chief dftsman., Canadian Sumner Iron Works, Vancouver, B.C.
Seifert, Harold Lorne B., B.Eng., (Chem.), McGill, tech. supt., Spruce Falls Power & Paper Co., Ltd., Kapuskasing, Ont.
Spencer, George Hylton, R.C.E. Graduate, R.M.C.; B.Sc., (Civil), Queen's, General Staff Officer, Royal Military College, Kingston, Ont.

By virtue of the cooperative agreements between the Institute and the associations of professional engineers, the following elections and transfers have become effective:

ALBERTA

Members

Morris, Darcy Drummond, B.Sc., (Engrg.), Alberta, genl. supt., Alberta Nitrogen (dept. of Consolidated Mining & Smelting Co.), Calgary, Alta.
Redman, Donald Lee, B.Sc., (Mining Engrg.), Alberta, petroleum engr., California Standard Co. Calgary, Alta.

SASKATCHEWAN

Members

McKillop, Douglas Bruce, B.Sc., (Civil), Queen's, division engr., Canadian National Railways, Regina, Sask.

Junior to Member

Graham, Harry Marker, B.Sc., (Mech. Engrg.), Saskatchewan, lecturer, Univ. of Saskatchewan, Saskatoon, Sask.
Mantle, John Bertram, B.Sc., (Mech.), Sask., instructor, dept. of engineering, Univ. of Saskatchewan, Saskatoon, Sask.
McMorine, James Gordon Stalker, B.Sc., (Civil Engrg.), Saskatchewan, jr. hydraulic engr., Dept. of Agriculture, P.F.R.A., Regina, Sask.

NOVA SCOTIA

Members

Cohn, Albert Raymond, B.Eng., Nova Scotia Tech., appraiser, estimator, structl. damage, Dominion Government, Halifax, N.S.
Fleming, William Crawford, B.Eng., (Civil), Nova Scotia Tech., stripping supt., Canadian Gypsum Co. Ltd., Windsor, N.S.

QUEBEC

Members

Brault, Joseph Real, B.A.Sc., C.E., Ecole Poly., asst. sales mgr., Plessisville Foundry Co., Montreal, Que.
Chernovsky, Bernard, B.A.Sc., Toronto, consultg., engr., Kearns & Bromley, Montreal, Que.
Girard, Napoleon Raoul, B.A.Sc., C.E., Ecole Poly., bridge engr., Public Works Dept., Province of Quebec, Quebec.
Middleton, Brian McLaren, B.Sc., Toronto, field engr., Cuvier Mines Ltd., Montreal, Que.
Paquette, Joseph Leo, B.A.Sc., Toronto, consultg. & design engr., Atwood Limited, Montreal, Que.
Rutherford, Ronald Murray, B. Eng., (Elect.), McGill, elect. engr., water resources dept., Shawinigan Water & Power Co., Montreal, Que.

Junior to Member

Green, Michael Stephen, B.Eng., Nova Scotia Tech. College, asst. to sales development mgr., Dominion Bridge Co., Ltd., Montreal, Que.
Sylvester, Jack Douglas, B.Sc., (Elect.), Alberta, asst. engr., Canadian National Railways, Montreal, Que.
Vergin, Leonard John, B.Sc., (Elect. Engrg.), Manitoba, high tension transmission engr., Aluminum Laboratories Limited, Montreal, Que.

Student

Gravel, Jean Paul, designer & dftsman., McDougall & Friedman, Montreal, Que.

LARGE-SCALE HOUSING—ITS PLANNING AND CONSTRUCTION

(*Continued from page 116*)

When first bids were opened, however, they showed exactly a 60 per cent increase over 1940. We threw them out as beyond reason; that reason being the limits set by the economists. We decided to start foundations only, sitting out the market for a few months. When we re-bid the first job after a three months sitting period, the cost was 67 per cent over 1940, and the scales fell from our eyes. We knew then we were in a rising market, so we proceeded to get our work under contract as soon as possible. Costs kept going up, 75 per cent, 80 per cent, and more. We are now paying double what we used to, and costs are expected to go even higher before they start to recede. The economists are still showing by charts and cost indices that current costs are possibly 50 per cent to 60 per cent higher than 1940. But we refuse to even read their analyses any more, because the trouble with a cost index as usually prepared is that it is based on posted material prices, and on current wage scales. But the former may or may not be realistic, considering shortages and delays in deliveries, while the latter do not reflect productive effort on the job.

The acid test is in bidding and building, and with nearly $80,000,000 of construction contracts bid by us during 1946 alone, it does not need any economist to tell us what current costs are. They are already twice what they were in 1940. This is fact, not theory. With costs like these, the need for economy is even more pressing.

Personals

News of the Personal Activities of members of the Institute

E. K. Phillips, M.E.I.C., the new chairman of the Saskatchewan Branch of the Institute, was born in Ottawa, Ont. He attended schools in Saskatoon and Regina and entered the University of Saskatchewan, graduating in 1925 with a B.E. degree. He demonstrated in civil engineering at the University and obtained his M.Sc. degree in 1927. He was then appointed lecturer in the civil engineering department. For many years he was also connected with the firm of Phillips, Stewart and Phillips, land surveyors and municipal engineers of Saskatoon, practising during the summers and becoming a junior partner of the firm around 1930. He is still with the University, and practises as a consulting engineer.

Dr. W. W. Colpitts, M.E.I.C., consulting engineering of the firm of Coverdale and Colpitts, New York City, was appointed a Governor of McGill University, Montreal, in July, 1946. He is a McGill alumnus, with B.Sc., M.Sc. and LL.D. degrees received in 1899, 1901 and 1921. A Member of long standing of the Institute, he was awarded Life Membership in January this year.

Frederick Palmer, M.E.I.C., senior Canadian government trade commissioner in Stockholm, Sweden, was appointed chargé d'affaires on the recent opening of a Canadian legation in Stockholm. Mr. Palmer went to Stockholm early last year. He had previously carried out a special trade mission to China and has served as the Canadian Government Trade Commissioner in Holland, Italy, Norway, Denmark, Finland, Great Britain and Australia.

Ephrem Viens, M.E.I.C., director of the testing laboratories of the Department of Public Works, Ottawa, retired in January. He joined the staff of the Department of Public Works in 1907 as a chemist in the testing laboratories, two years after he graduated in arts from McMaster University, specializing in chemistry and physics. He served on the council of the Institute representing the Ottawa Branch in 1938-39.

Ira P. Macnab, M.E.I.C., of the Nova Scotia Board of Commissioners of Public Utilities has accepted the appointment of manager of the Halifax Public Service Commission. Mr. Macnab, who was for three years chairman of the Halifax City Planning Commission, has been on the provincial commission since 1935. Active in the Institute, he has served as chairman and councillor for the Halifax Branch.

Dr. R. Melville Smith, M.E.I.C., was presented with honorary life membership in the Ontario Good Roads Association at its annual meeting in February. Mr. Smith is president of the Canada Culvert Company Limited, Toronto, which position he accepted in 1945 after fifteen years service as Deputy Minister of Highways for Ontario.

W. A. McLean, M.E.I.C., consulting engineer of Pickering, Ont., received a life honorary membership in the Ontario Good Roads Association recently. After many years of service with the Ontario Government, he resigned as Deputy Minister of Highways in 1923, and in 1925 joined the firm of Wynne-Roberts, Son, and McLean, Toronto. He is a member of the Institution of Civil Engineers of Great Britain, and a past-president of the Canadian Good Roads Association and of the American Road Builders Association. He was a councillor of the Institute in 1919-1921.

Tullis N. Carter, M.E.I.C., vice-president and chief engineer of the Carter Construction Company Limited, Toronto, was elected president of the Ontario Road Builders' Association at the annual meeting in February.

W. F. Mainguy, M.E.I.C., has been appointed vice-president in charge of distribution for the Shawinigan Water and Power Company, Montreal. He has been with the company since 1928 when he was employed as a draughtsman with the company's engineering subsidiary, the Shawinigan Engineering Company Limited. In 1932 he was appointed power sales engineer of the commercial and distribution department of the Shawinigan Water and Power Company, becoming power sales manager of that department in 1937. In 1942 he was appointed personnel co-ordinator, and in 1943 personnel manager, which position he held until his new appointment. He is a graduate of Queen's University, Kingston, Ont., a member of the Corporation of Professional Engineers of Quebec, of the Canadian Electrical Association, and of the American Management Association. He is a past-chairman of the Montreal chapter of the Illuminating Engineering Society. He is on the Institute's Committee on Industrial Relations.

J. M. Breen, M.E.I.C., has been appointed assistant general manager of the Canada Cement Company Limited, Montreal. He is a graduate of the University of Toronto, class of 1921, and joined Canada Cement in Toronto in 1922 as a technical engineer. Transferred to Montreal in 1934, he was chief of technical staff for the company until his recent appointment.

E. B. Jost, M.E.I.C., who was general superintendent of canals, for the Department of Transport, Ottawa, has retired. He has been in government service for many years, joining the federal department of railways and canals in 1911, as resident engineer. He was later appointed divisional engineer and senior hydraulic engineer. He received his post with the Department of Transport in Ottawa in 1936.

C. W. West, M.E.I.C., who was superintending engineer of the Welland Ship Canal for the Department of Transport, succeeds Mr. Jost as director of canal services for the Department. He has been connected with the Welland Ship Canal since 1920, becoming superintending engineer in 1934.

S. R. Frost, M.E.I.C., has resumed his position with the North American Cyanamid Limited, Toronto, Ont. For the past three years he has been on loan to the Fertilizers Administration of the Wartime Prices and Trade Board, where he has been in charge of domestic production distribution, exports and imports of chemicals used in fertilizer production, and has been a member for Canada of the Committee on Fertilizers, International Emergency Food Council, Washington, D.C. Mr. Frost will be doing development engineering for his firm.

C. E. Frost, M.E.I.C., engineer (exchange) at the chief engineer's office, outside plant division, Bell Telephone Company of Canada, Montreal, has recently been transferred to the position of special studies engineer, Montreal division.

Lucien Buteau, M.E.I.C., engineer, Quebec district, Bell Telephone Company of Canada, has recently been transferred to the chief engineer's office, Montreal, as engineer (exchange), reporting to the exchange plant engineer, outside plant division.

W. Czerwinski, M.E.I.C., is now employed by A. V. Roe of Canada, Toronto, as senior stress analyst. He was formerly chief engineer of the Canadian Wooden Aircraft, Toronto.

T. Fife, M.E.I.C., is now in Halifax, N.S., as engineer manager of the H.M.C. Dockyard, after completing his sea time in the aircraft carrier *H.M.C.S. Warrior.*

J. M. Heaps, M.E.I.C., mechanical engineer with the Consolidated Mining and Smelting Company of Canada Limited at Trail, B.C., was awarded the Letson Memorial Prize for the best mechanical thesis presented to the Association of Professional Engineers of British Columbia in 1946. His thesis was entitled "Design of a Steam Edger Spotter" and describes an original design of a machine for use in sawmill operations.

F. C. Richardson, M.E.I.C., who was formerly with the Aluminum Company of Canada Limited at Shawinigan Falls, Que., has gone to Sarnia, Ont., where he is foundry superintendent for Mueller Limited.

A. L. MacDonald, M.E.I.C., was discharged from the army in December 1946, and has accepted employment in the sales department of Watson Jack and Company Limited, Montreal.

T. F. Kennedy, JR.E.I.C., has been appointed superintendent of Plant No. 2 in Amherst, N.S., for the Enamel and Heating Products Limited. A graduate of the University of New Brunswick with the degree of bachelor of science in engineering in 1941, he served with the R.C.A.F. until 1945, being discharged with the rank of squadron leader.

Bruce S. Taylor, JR.E.I.C., is now in Vancouver, B.C., as industrial engineer with the Industrial Development Bank.

John M. Dyke, JR.E.I.C., is with the Canadian Pacific Railway at Montreal in the capacity of mechanical engineer. He was formerly with the John Inglis Company Limited, Toronto, as boiler design engineer.

G. J. Dodd, JR.E.I.C., has been appointed manager of the prepared mix plant of the Russell-Miller Milling Company, Minneapolis, Minn. He was formerly assistant to the chief engineer of the company.

W. D. Johnston, JR.E.I.C., has gone to the Ideal Welding Company Limited, Toronto, as an engineer. He was formerly with the Dominion Bridge Company in that city.

H. D. Ralph, JR.E.I.C., is in Brantford, Ont., where he has been employed by the Cockshutt Plow Company Limited since his discharge from the Canadian Active Army in April last. He is assistant project engineer in the farm tractor division of the experimental department.

C. A. Stollery, JR.E.I.C., has recently become general manager of the Calgary Branch of the Poole Construction Company Limited. He was formerly building construction superintendent for the company.

L. E. Smith, JR.E.I.C., who was at Whitecourt, Alberta, with the Department of Transport, is now employed by the Alberta Department of Public Works, Highways Branch, as a resident highway engineer. He is located at Edmonton.

W. L. Hayhurst, S.E.I.C., a graduate of Queen's University, Kingston, in 1946, is at the California Institute of Technology, Pasadena, Calif., where he is doing post-graduate study.

A. R. Leger, S.E.I.C., was recently appointed to the position of sulphite mill engineer of the Anglo-Newfoundland Development Company Limited at Grand Falls, Newfoundland. A recent graduate in chemical engineering of Laval University, he joined the engineering staff of the Gaspesia Sulphite Company Limited at Chandler, Que., as a junior engineer last May.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

David O. Lewis, M.E.I.C., veteran railroadman and civil engineer, died in February, 1947, in Vancouver, B.C. He was born in Newtown, North Wales, in 1865. Coming to Canada, he was connected with railway engineering for many years. From 1882 to 1889 and from 1893 to 1903 he was with the Canadian Pacific Railway, working at many points on location and construction, as chainman, rodman, topographer, transitman, roadmaster, bridge and building master and resident engineer on maintenance. In the interval he was assistant engineer on land surveys for municipal and railway work for the State of Washington, U.S.A., and later had charge of land and townsite surveys for Gore, Burnet and Company, Victoria, B.C. From 1903 to 1921 he was connected with the Canadian National Railways. During these years his activities took him across Canada from Quebec to Northern B.C. In 1921 he went into private practice as a consulting engineer, when he was much in demand as an expert witness in court cases, coming east as adviser to the counsel for British Columbia in the freight rates enquiry of 1921. He was for a time connected with the Engineering Corporation, Limited, Vancouver, B.C., and in the last ten years he has been consulting engineer for the Pacific Great Eastern Railway in addition to many other calls.

Mr. Lewis, a Life Member of the Institute since March 1943, joined in 1894 as an Associate Member, transferring in 1907 to Member. He served on the Council in 1919-20, representing the Vancouver Branch.

Samuel J. Chapleau, M.E.I.C., former consulting engineer with the Department of Public Works of Canada, Ottawa, Ont., died on February 26th, 1947. He was born in Atlanta, Georgia, in 1869, and studied at the Rensselaer Polytechnic Institute, Troy, N.Y., from 1887 to 1891. He did some railway, municipal and hydrographic work in New York State, that year, and came to Montreal in 1892 as assistant division engineer on maintenance of way for Canadian Pacific Railway. Two years later he entered the Department of Public Works of Canada, and was first located in British Columbia on the hydrographic survey of the Fraser River. With the Railways and Canals Department he worked at Sault Ste. Marie, Ont., and as assistant engineer and structural draughtsman on the construction of the Soulanges Canal. Other work in the early years of his association with the Department of Public Works included hydrographic investigations of the St. Lawrence River channel above Brockville, improvements to harbours at Kingston, Gananoque, Brockville and Prescott, Ont., marine surveys above Montreal, and work on the Georgian Bay Ship Canal. Soon after 1900 he was stationed at Ottawa for the Department as resident engineer, and he remained with the board of engineers until his retirement eight years ago.

Mr. Chapleau joined the Institute as an Associate Member in 1896, becoming a Member in 1909. He served on the Council of the Institute from 1913 to 1915, and Life Membership was awarded to him in October, 1935. He was also a member of the American Society of Civil Engineers.

George Macleod, M.E.I.C., of New Westminster, B.C., died suddenly on January 5th, 1946. He was born in Scotland in 1886 and received his early education there. He served an apprenticeship as a pupil teacher and passed the King's Scholarship Examination in 1905. Coming to Canada in 1907 he was first employed by the Canadian Pacific Railway and he continued in railway work until the first World War. He enlisted as a Sapper in 1916 and served in France with the Canadian Railway Troops. Transferring to the 1st Canadian Bridging Company, he served in Egypt, Palestine and Syria, and returned to Canada in 1919. On his discharge, he worked as instrumentman on harbour improvement for the Vancouver Harbour Commission. In 1924 he joined the staff of the Provincial Public Works Department. He was located at Merritt, B.C., and at New Westminster, B.C., as general foreman, and was later assistant district engineer at Salmon Arm, B.C. In 1938 he was transferred to New Westminster as assistant district engineer, and he remained in that position until the time of his death.

Mr. Macleod joined the Institute as a Junior in 1912, transferring to Associate Member in 1940.

J. Arthur Jetté, M.E.I.C., former superintendent of the Montreal Aqueduct, died on February 19th, 1947. He was born in St. Paul of Joliette, Que., in 1883, and studied at Ecole Polytechnique, graduating in 1908 as a B.A.Sc. in civil engineering. He was employed first by the Trans-Continental Railway as instrumentman and in 1910 he worked as assistant engineer at St. Boniface, Man., on surveying for the Dominion Land Survey. He was assistant engineer for the city of Maisonneuve in 1912, and in 1913 assistant engineer for the city of Montreal, roads department. He transferred to the water works department in 1914 as assistant engineer and in 1920 went to the Montreal Water Board. He was made assistant superintending engineer of the canalization department of the city of Montreal in 1925, and later became superintending engineer.

Mr. Jetté joined the Institute in 1920 as an Associate Member, becoming a Member in 1925.

F. R. Reevely, M.E.I.C., of Mimico, Ont., passed away in August, 1945. He was production superintendent of the Power Tube Division of Rogers Radio Tubes Limited, Toronto. He was born at Bolton, Ont., in 1906 and studied arts at the University of Toronto, and mechanical drawing and allied subjects at Sir George Williams College, Montreal. He attended the shop student course of the Northern Electric Company in 1929, and was employed that year as an engineer in the technical development division of the company in Montreal. He remained with the company until 1942, concerned with electrical and chemical development problems, and then joined the chemical control office of the Department of Munitions and Supply in Montreal. He went to Rogers Radio Tubes Limited in 1944.

Mr. Reevely joined the Institute as a Junior in 1932, becoming an Associate Member in 1939 and a Member in 1940.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

J. F. Langston, m.e.i.c. - - - *Secretary-Treasurer*
D. C. Jones, jr.e.i.c. - - - - *Branch News Editor*

J. I. Strong, assistant city engineer, addressed the Calgary Branch on January 30th in the Palliser Hotel, on the subject of **Sewage Disposal**.

Mr. Strong stated that proper sewage disposal was important in industry and sanitation, and for the survival of fish and game life. Complete purification is the artificial adaptation of natural processes, the energy of countless bacteria, which is sustained by oxygen. In modern systems of sewage disposal, these natural processes are speeded up and intensified.

The treatment of sewage is divided into primary and secondary treatments. The first is concerned with the removal of solids by means of coarse and fine screens, grit chambers, settling tanks and digestors. The sewage passes through the grit tank where a reduction in velocity permits settling out of grit and silt. The coarse and fine screens then remove larger material, this material being raked off the screens and taken away for burning. The sewage then passes to a settling tank for a period of two to four hours, where further solids settle out and are scraped to the centre, from which point they are pumped to the digestor. The digestor contains heating coils which maintain a temperature of 85 to 90 deg. F. to speed up decomposition. The residue is then dried prior to being removed or burned.

The effluent from the settling tanks may be discharged into the river, or may be further processed in a secondary treatment. The basic process is that of oxidation of organic impurities in the sewage by bacterial action. This is accomplished by spraying the sewage on a filter bed of crushed rock. It is acted on by bacterial film covering the rock, which results in the formation of nitrates. Another form of this treatment is one using activated sludge, which results in a very clear effluent. However, with this latter treatment a very large volume of sludge must be handled.

Finally, the effluent goes to a settling tank before discharge, and in some cases chlorination of the effluent is employed.

Through the courtesy of the Canadian General Electric, a film "Clean Waters" was shown. This pictured the effects of pollution and outlined several typical treatment layouts.

At the conclusion of the film, J. McMillan thanked the speaker.

❖ ❖ ❖

J. M. Fleming, president of C. D. Howe Co. Ltd., consulting engineers, addressed this branch on the subject **Dust Control in Terminal Elevators** at a meeting held in the Palliser Hotel on February 13th.

The reduction of dust is important not only for the prevention of explosion but also since it may be injurious to the health of employees. Moreover, in some industries dust is collected because of its value.

Mr. Fleming stated that in the United States since 1900 there had been 177 grain dust explosions causing a property loss of $42,000,000. In that period there have been six in Canada, the most recent being in 1945. Since 1945 the Ontario Government has enacted safety regulations designed to reduce the hazard of grain dust explosions.

All grain dusts are combustible when properly mixed and the rate of propagation and the pressure developed are very high. Combustion is not spontaneous, it may be caused by hot bearings, tramp iron in elevators causing sparks, defective electrical equipment, and other similar sources of heat.

Elevators cannot be made strong enough to resist explosions, but venting areas can be provided to permit release of internal pressure. The grain bins should be covered and vented to outside air. A clean elevator is of prime importance in preventing secondary explosions, all floors, window ledges and machinery should be kept clean.

A dust control system reduces the amount of dust released to the air. Wherever dust is released, at conveyor loading and discharge points, elevator boots, etc., a hood is placed. Air and dust are pulled into the hoods by fans and carried in trunk lines to a cyclone. The dust is collected here and stored in a central bin before being shipped out.

The cost of a complete system is about $40,000 per million bushels of storage, with an installed capacity of 75 hp. per million bushels. From the point of view of reduced hazard and improved working conditions this cost is not excessive.

Mr. Fleming described the effect of the explosion at the Saskatchewan Wheat Pool terminal elevator. C. D. Howe Company Limited acted as consultants in the demolition of the remaining structure. Vertical sections of the concrete walls were made with a jack hammer, the reinforcing steel being cut with an acetylene torch. Dynamite charges were placed in the supporting concrete columns and the section was blasted out across the railway spur tracks; the rubble loaded on flat cars and dumped. A very interesting film of these operations was shown.

The chairman of the meeting, K. W. Mitchell, thanked the speaker for his interesting address.

EDMONTON BRANCH

W. W. Preston, jr.e.i.c. - *Secretary-Treasurer*

Professor R. M. Hardy, recently appointed dean of the Faculty of Applied Science of the University of Alberta, addressed a joint meeting of the Association of Professional Engineers of Alberta, the Edmonton Branch of The Engineering Institute of Canada and the Northern Alberta Branch of the Canadian Institute of Mining and Metallurgy, on February 7th, in the MacDonald Hotel.

He discussed aspects of **Engineering Education**, particularly conditions in our Canadian universities, resulting from greatly increased registrations of engineering students, and the employment problem facing the profession in the next two or three years.

Dean Hardy revealed that although other professions had restricted the number of students admitted to their faculties, engineering had admitted all people having the necessary qualifications. Seventy-five per cent of the students are veterans. By 1949 and 1950 there will be 3,000 to 4,000 graduate engineers to be absorbed into our economic life. The bright spot of this problem is that even though Canada has not absorbed engineers at the same rate as the United States, there are prospects that many new openings will be found during our industrial development.

Concerning the quality of the training which students are receiving today as compared with normal times, the speaker thought there was an improvement. The existing staff had to pay more attention to the organization of their courses and equipment, and the new junior staff were of a better grade as a result of instruction classes held for them.

In conclusion, Dean Hardy explained the trend in engineering education toward considering problems of human relationships. He pointed out that if the present curriculum is to be changed so that more time is spent on non-technical subjects, the technical subjects will suffer, but that the majority opinion opposes such a reduction. This means the curriculum must be lengthened, which in turn means that more money will be needed for education. Dean Hardy hoped that outside organizations would advocate the kind of training they consider desirable.

Chairman of the meeting, which was attended by 102, was L. C. Stevens, president of the A.P.E.A. The speaker was introduced by J. W. Porteous, chairman of the Edmonton Branch E.I.C., and the vote of thanks, which was heartily applauded, was proposed by R. M. Watson, secretary of the C.I.M.M.

LETHBRIDGE BRANCH

H. T. Miard, m.e.i.c. - - *Secretary-Treasurer*
E. A. Lawrence, s.e.i.c. - *Branch News Editor*

Members and guests of the Lethbridge Branch of the Institute entertained the ladies at a well attended dinner meeting in the Marquis Hotel, Saturday 15th February 1947.

Seated at the head table were Chairman and Mrs. R. S. Lawrence, Mr. and Mrs. W. Foss, Mr. and Mrs. C. S. Clendening, Mr. and Mrs. P. Kirkpatrick and Mr. A. L. H. Somerville.

George Brown's Instrumental Trio rendered selections during the dinner hour, and afterwards an outstanding musical programme was enjoyed by the assembled guests. Soloists included Miss Dawn Purkis and Miss Ella Findlay accompanied by Mrs. George Brown, and Mr. Arthur Hunt accompanied by Miss Ella Findlay. Guest violinist was Mr. Frank Hosek, accompanied by Miss Beatrice Livingstone. Community singing was led by E. A. Lawrence.

The chairman thanked the artists for their fine performance. The guests then viewed a film showing Toscanini directing the Westminster Choir, a cartoon on the history of electricity, and a travelogue on Mexico.

KINGSTON BRANCH

J. E. Thom, M.E.I.C. - *Secretary-Treasurer*

The January meeting of the Kingston Branch was held January 14th in the Hotel LaSalle, when Professor J. T. Wilson of Toronto spoke on **Exercise Musk-ox and the Canadian Arctic.** Prof. Wilson's enthusiasm for the Canadian North and the excellent films of the Musk-ox Operation provided a most interesting meeting.

❖ ❖ ❖

On February 5th the Branch met at Club 83 to hear J. I. McAskill, ceramist, Frontenac Floor and Wall Tile Company, Kingston, discuss **The Manufacture of Floor and Wall Tile.**

The Frontenac Floor and Wall Tile Company is the only organization in Canada producing such tile. Using local and imported clays, the company turns out tile in a wide range of colours and shapes and in addition produces pottery, tableware and a number of specialties. Mr. McAskill provided a brief background of the industry and then discussed the process now being used, illustrating his talk with samples of the raw materials and the product at each stage in its manufacture. D. Helsby, pottery foreman, assisted the speaker and gave a demonstration of moulding pottery products.

PETERBOROUGH BRANCH

A. R. Hailey, M.E.I.C. - *Secretary-Treasurer*
J. C. Allan, M.E.I.C. - *Branch News Editor*

A. E. H. Fair, president of the Alliance Paper Corporation spoke on **The Paper Industry in Canada** at a meeting of the Peterborough branch on February 6th. The general and historical features of the subject were very lucidly covered by a coloured motion picture made available through the courtesy of the Kenwood Company.

Mr. Fair described various aspects of the several methods of paper making, and the raw materials balsam, jack pine, hemlock, poplar, beech, birch and maple. Most of the standard papers in both high and low grades are made from these woods, but special papers may require cotton and linen rags, flax fibre, manila hemp, jute, and even straw. Methods of producing fine and specialty papers were described more fully and samples were distributed.

Almost all of the vanilla consumed in Canada and a large proportion of the British Empire is being made at Cornwall, Ont., from waste sulphite liquor.

Mr. Fair stated that the most evident influence in the paper industry today is that of technical progress. Mechanical logging is coming into its own and more attention is being paid to the procurement of uniform wood supplies. Improved mechanical barkers have been devised. Continuous fibre treatments have been developed to eliminate the human element in the setting of beaters and refining jordans.

Mr. Fair concluded with a summary of factors upon which the future of the paper industry depends.

A broad forest policy should be guided sanely by our government and carried out with sincerity by our operating companies. This involves the equitable distribution of the available wood, selective cutting to permit re-growth of the desirable species, and reforestation. Adequate protection of the forests from pests and fire is also necessary. Closer co-operation between lumber and pulp wood operators is possible. Joint operations are desirable whereby pulpwood and sawn timber are produced together, by allocating according to size and species. In addition to this, it is being proven now, that by removing bark from the larger logs prior to sawing, the slabs, which were burnt in the past, can be used for pulpwood. The settler, too, should be educated to improve his cutting practices and save the forests. This may be summarized by saying that we must look upon our forests not as a mineral but as a crop.

The second factor in the security of the industry is a sound labour policy, involving a continuing understanding between labour and management. The old policy of suspicion and collective bullying must go. Confidence and co-operation must prevail. Finally, the industry needs an increase in the number of engineers and technicians. These men must take time to learn the industry, which must have a training programme for technical men so that some assurance of their future position and responsibility will be available.

SAGUENAY BRANCH

Junior Section

T. T. Anderson, Jr.E.I.C. - *Secretary-Treasurer.*

An informal smoker meeting was held at the Saguenay Inn, Wednesday evening February 12th.

J. T. Madill introduced the speaker of the evening, Peter Simonds, presently of Aluminum Laboratories Limited, and formerly a captain overseas with the Royal Canadian Signals. His topic was **The Campaigns in North Western Europe.**

Illustrating his lecture with numerous personal snapshots as well as some official Canadian and enemy photographs, the speaker plunged into a thrilling authentic account of action from the Normandy beachhead right into Germany. Although primarily concerned with the campaigns, the talk touched also on line and wireless communications and other aspects of army signals.

He used line cut diagrams from his recent book, "Maple Leaf Up—Maple Leaf Down", to illustrate the Normandy landing and the closing of the Falaise "pocket" by part of General Patton's 3rd U.S. Army driving up from the Alencon and Argentan areas to join up with the Canadian wedge driving down from the north to take Falaise, key German communications centre. The speaker's brother, Lieut.-General Guy Granville Simonds, commanded the Canadian Corps which carried out this drive; the same corps having previously liberated Caen. The speaker explained how, although the 3rd U.S. Army and Canadian Corps were the "punch lines" in this fray, the 2nd British and first U.S. armies also played important roles in squeezing and containing the pocket. This is the battle which General Eisenhower in his official report has called the decisive one of the war. Although the speaker did not mention it, the line-cuts from his book were accurately reduced tracings from army quarter-inch battle maps used at the time and not the rather approximate maps which have often appeared on the subject.

The speaker went on to discuss the Battle of the Schelde which led to the opening of the great seaport of Antwerp to the allies the solving of their difficult supply problem at a time when it threatened the success of allied operations in the west, and an early ending of the war. This battle, which lasted a month from October to November 1944 was the biggest in which the first Canadian Army became engaged during the war. Mr. Simonds touched on the final drive into Germany with a series of small anecdotes and snapshots of damaged German towns and installations, including the Krupp Works at Essen, and pictures in the Hochwald and Reichwald forests of Germany where some of the bitterest fighting in the west took place.

At the close of the talk a hearty vote of thanks was moved by Graham Campbell and the meeting adjourned.

VICTORIA BRANCH

S. H. Frame, M.E.I.C. - *Secretary-Treasurer*
W. A. Ker, Jr.E.I.C. - - *Branch News Editor*

A general meeting of the Victoria Branch was held on Wednesday, January 29th in the Victoria Y.M.C.A. Building, with over 60 members and guests in attendance. Maj. R. C. Farrow, chairman of the branch introduced the speaker for the evening, Andrew G. Graham, supervisor of the Provincial Regional Planning Division, whose subject was **Regional Planning.**

Mr. Graham traced the development of organized town planning and pointed out that the first zoning by-law in Canada was passed in 1922 by the municipality of Point Grey. As a result of this legislation the conditions today in that area have fully justified the wisdom and foresight of the members of the municipal council of that date.

The speaker stressed the importance of regional planning as distinct from town planning, pointing out that "regional planning does not recognize local boundaries, and when the boundaries are outlined for a regional plan the area may cover a very wide or a small area".

He described the work done by the Provincial Regional Planning Division in British Columbia in which reports are made of each of the ten regions into which the province is divided, showing, in great detail, the physical assets, public services, amount of trade and industry, tourist attractions, and, in general, all factual data to indicate in what manner economic development of the Region could be recommended. In addition, advice is given as a free Government service to small incorporated cities and villages. In 1946 the Town Planning Act Amendment Act was passed giving the Provincial Government power to declare any area in unorganized territory a "regulated area" and to apply to that area such restrictions as are considered necessary for its proper regulation and development.

The speaker then outlined the work done in Regional Planning by some of the regions comprising the larger cities of Canada, including Montreal, Toronto, Ottawa and Winnipeg, pointing out that in each case surrounding areas were included in the "master plan".

Mr. Graham concluded his address by bringing forth the thought that was obviously foremost in his mind—"Why not a Greater Victoria Plan?"—and outlined for his audience the necessary steps to be taken.

A number of questions were asked of the speaker and a general discussion followed. Maj. R. G. Farrow thanked the speaker for his interesting and timely talk.

In addition to the members, guests included members of the Victoria and Oak Bay Town Planning Commission, members of the Municipal Councils and representatives of the local Architects and Land Surveyors.

WINNIPEG BRANCH

D. Hunter, M.E.I.C. - *Secretary-Treasurer*

Electrical Section

L. A. Bateman - *Secretary*
D. C. Brydon - - *News Editor*

The regular December meeting of the Electrical Section was held on December 5th. In view of the interest in electronics throughout the section, this meeting was arranged as an open forum on **Electronic Applications**. Professor E. R. Love directed the meeting and J. D. Peart and V. C. Jones discussed briefly the development of telephony and the use of carrier in the transmission of messages. Mr. E. W. Wirtanen outlined the amplidyne principle and discussed a few of its applications. A Canadian Westinghouse Company film entitled "Electronics at Work" was also shown. At the conclusion of the three short addresses, the meeting was thrown open for general discussion of electronic applications.

❖ ❖ ❖

Later in December, the section was fortunate in hearing J. T. Thwaites, division engineer, Electronics, of the Canadian Westinghouse Company. Mr. Thwaites covered a wide range of electronic applications. The applications with which he was directly connected during the war, such as radar, defense against V-2 rockets, equipment for jamming German radio communication, proved of exceptional interest to the members.

❖ ❖ ❖

The January meeting was held on January 9 in conjunction with the Winnipeg Branch meeting. The section nominating committee presented its report for officers for the ensuing year. The speaker for the evening was L. M. Hovey of the Winnipeg Electric Company, who spoke on **Installation of Distance Relays on the Transmission System of the Winnipeg Electric Company**. The paper was very ably presented and was illustrated with slides and a working model of a transmission line on which faults could be simulated and cleared by a HZ-211 distance relay.

BOOK REVIEW

LAYING OUT FOR BOILER MAKERS AND PLATE FABRICATORS

Revised by George M. Davies. New York, Simmons-Boardman, 5th edition, c1944. 522 pp., illus., 11¼ x 8¾ in., cloth, $8.00.

Reviewed by John T. Farmer, M.E.I.C.*

This work deals with the technique of a very specialized subject, that of laying out the material for the various structures fabricated in metal plate, such as tanks, pipes, boilers, flues and stacks: and miscellaneous plate work. It concentrates particularly on boilers of standardized construction such as cylindrical and locomotive types. The present day land boiler, largely of tubular construction, is rather outside the scope of this work.

The present edition is the outcome of a series of issues dating back some forty years. In this period there have been many changes in design and developments in methods of construction; but basic principles have remained unaltered. In the course of the earlier half dozen editions, the opportunity has been taken to introduce new matter in keeping with the progress of the art. Furthermore, as time has passed certain earlier types and features have become obsolescent and consequently have been eliminated as no longer of practical interest.

The author, in introducing his subject, does not disdain to begin with the elementary principles; and the whole treatment of the subject is devoid of any recourse to advanced mathematics. Thus the work should be instructive and useful to any intelligent craftsman, as well as to those who have had the advantage of a more elaborate technical education.

The problems dealt with are illustrated profusely with some 750 excellent diagrams and illustrations; and the descriptive text accompanying them is notable for its clarity and completeness. Attention is given not only to the theory underlying the various problems, but also to the practical considerations which arise in the course of the actual working of the material involved.

One rather recent innovation is the extensive use of welding in platework, and in this edition a chapter has been devoted to this development.

The discussion of light sheet construction is not attempted in the present work, as there are many sources of information on that subject. Without going beyond the field of heavy plate construction, the matter dealt with extends to over 500 large pages. The reasonably large and very clear type used is to be commended.

**Mechanical Engineer, Montreal Engineering Company Limited.*

ADDITIONS TO THE LIBRARY

BOOKS, ETC.

Book of A.S.T.M. Methods of Chemical Analysis of Metals, 1946:
Philadelphia, American Society for Testing Materials, 1946. 402 p., illus., cloth.

Concise Chemical and Technical Dictionary:

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

A.S.T.M. METHODS of CHEMICAL ANALYSIS of METALS, 1946:
American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. 402 pp., diagrs., tables, 9¼ x 6 in., cloth, $4.50; to A.S.T.M. members, $3.00.

This revised and expanded volume gives in their latest approved form all of the methods issued by the American Society for Testing Materials covering the chemical analysis of the major ferrous and non-ferrous metals and alloys. In addition to methods for specific materials, recommended practices are given for apparatus,
(Continued on page 144)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

March 10th, 1947

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the April meeting.

L. Austin Wright, General Secretary

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professionl responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.
Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.
He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practlal experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BOTHAM—JOHN CHARLES, of Sydney, N.S. Born at Ottawa, Ont. May 12, 1920. Educ.: B.Sc. (Metall. Engrg.), Queen's, 1946; 1939, (summer), H. B. O'Connel Constrn. LIBRARY NOTES *(Continued from page 141)*

reagents and sampling. Of particular interest and importance are several new photometric procedures. Five spectrochemical analysis methods are also included.

DESIGNING with MAGNESIUM:

American Magnesium Corporation, subsidiary of Aluminum Company of America, New York, 1945. 323 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., fabrikoid, gratis.

The rise in the use of magnesium as a structural material is reflected in this new book. The early chapters discuss the properties of magnesium, when and why magnesium is desirable, and the choice of fabrication methods. Succeeding chapters take up these fabrication methods in detail, with critical comments on their special features or faults with regard to various uses. The last three chapters present design considerations for casting, forging, and structural work. There is a large section of tables of technical data relating to magnesium.

ELEMENTARY HEAT POWER:

H. L. Solberg, O. C. Cromer and A. R. Spalding. John Wiley & Sons, New York; Chapman & Hall, London, 1946. 480 pp., illus., diagrs., charts, maps, tables, 8½ x 5½ in., cloth, $5.70.

This new text aims to develop an understanding of the functions, principles of construction, and actual performance of heat-power machinery as a preliminary to the study of engineering thermodynamics. Consideration of matter and energy, fuels and combustion are first given, followed by chapters on internal-combustion engines, fuel-burning equipment, and steam-generating and utilizing installations. Pumps, compressors and other auxiliary equipment are dealt with, and there are also brief chapters on the gas turbine and mechanical refrigeration.

HEATING and AIR CONDITIONING:

J. R. Allen, J. H. Walker and J. W. James. 6th ed. McGraw-Hill Book Co., New York and London Embassy, Toronto, 1946, 667 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

The new edition of this standard text has been revised as needed to bring it up to date. In addition to the revision of existing material, a new section on panel heating is included and the principle of a reversed-cycle refrigeration system has been treated from a theoretical and practical viewpoint. A feature of the book is a detailed discussion of the design of an actual air conditioning system. The book is suitable both for the engineering student and for home study.

HIGHER MATHEMATICS for Students of Chemistry and Physics:

J. W. Mellor, Dover Publications, New York, 1946. 641 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth $4.50.

Mathematical concepts and methods are introduced and discussed in close connection with the manipulation of the results of physical or chemical observations. The mathematical fields dealt with are as follows: calculus, analytical geometry, infinite series, differential equations, Fourier's theorem, probability and the theory of errors, calculus of variations, determinants, certain special functions, and the solving of numerical equations.

METALLURGY of QUALITY STEELS:

C. M. Parker, Reinhold Publishing Corp., New York, 1946. 248 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00.

Following a brief chapter on the general nature of steel, this introductory text discusses steel quality as related to methods of manufacture, chemical composition and control, ingot and rolling practice. Heat treating, testing and inspection procedures are described, and the effects of alloying and incidental elements are considered. Hardenability and other special characteristics are dealt with, and a final chapter tabulates the general characteristics of standard steel grades.

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER, recent graduate up, preferably with experience, required for production work by a chemical firm in Shawinigan Falls, Quebec. Salary $175 to $250. Apply to File No. 3769-V.

GRADUATE CHEMICAL ENGINEER required by a Montreal firm to supervise and control Chemical plant engaged in production of fine chemicals about 60 miles from Montreal. Preferably with actual experience in bandling both laboratory and plant personnel. Salary open. Apply to File No. 3783-V.

CHEMICAL ENGINEER with knowledge of how to treat sulphate or failing this sulphite and soda pulp, required as Regional Manager by a large paper company in Northern Ontario. Executive and management ability necessary. Permanent position. Salary $15,000. Apply to File No. 3808-V.

CIVIL

CIVIL ENGINEER with considerable experience in the design and construction of structural steel and reinforced concrete structures, required by a firm of consulting engineers in Toronto. Salary open. Apply to File No. 3753-V.

CIVIL ENGINEER is required to act as Town Engineer and take complete charge of the engineering service of a town in Ontario. Maximum salary $3,000. per annum. Apply to File No. 3782-V.

GRADUATE CIVIL ENGINEER required by an industrial corporation in Montreal for design work in draughting room. Must be familiar with structural steel and concrete design. Position offers good opportunity and permanency to right man. Salary from $250 up according to experience, Apply to File No. 3785-V.

ELECTRICAL

GRADUATE ELECTRICAL ENGINEER with 5 or more years experience in electrical equipment of buildings, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

GRADUATE ELECTRICAL ENGINEER witb at least three years experience, preferably construction required by a manufacturer in Central Ontario, to supervise electrical installations on construction jobs. Salary open. Apply to File No. 3775-V.

GRADUATE ELECTRICAL ENGINEERS with 3 to 10 years experience in design, operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

GRADUATE ELECTRICAL ENGINEER, required to train as Sales Engineer witb National organization. Permanent position. Must be prepared to be stationed in Alberta or Saskatchewan. Reply giving full particulars. Enclose photo when answering. Apply to File No. 3790-V.

MECHANICAL

MECHANICAL ENGINEER with 5 or more years experience in heating, ventilating and air-conditioning, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

JUNIOR MECHANICAL ENGINEER, required by a manufacturer in Central Ontario, to be responsible to Mechanical Superintendent. Salary open. Apply to File No. 3774-V.

MECHANICAL ENGINEER, with paper mill or mining experience required for design and layout by a paper mill in Northern Quebec. Salary $375-400. Apply to File No. 3778-V.

MECHANICAL ENGINEER with considerable experience willing to act as assistant to Mechanical Superintendent of a textile manufacturing concern near Montreal. Salary open. Apply to File No. 3784.-V.

SENIOR MECHANICAL DRAUGHTSMAN, age 25 to 45, with at least 5 years mechanical design and detailing experience, required for the mechanical department of an industrial organization in Montreal. Salary from $230 up according to experience. Apply to File No. 3786-V.

MECHANICAL ENGINEER, recent graduate up, required by a Pulp and Paper Company in the Province of Quebec for work entirely centred in logging operations. Salary open. Apply to File No. 3789-V.

MECHANICAL ENGINEER, recent graduate up, required by major oil company in Montreal area. Salary $175 up according to experience. Apply to File No. 3792-V.

MISCELLANEOUS

TECHNICAL GRADUATE, preferably Mechanical, Chemical or Electrical, under 30, veteran preferred, for permanent position with engineering organization. Training period in U.S. Work will include travelling for consultation among leading industrial plants. Enclose photo wben answering. Salary open. Apply to File No. 3759-V.

ROD-MEN AND INSPECTORS up to ASSISTANT PROJECT ENGINEERS, wanted by an American Engineering firm for an employment contract in Alaska for one year. Board and room furnished also transportation from point of hire. Excellent salary. Apply to File No. 3776-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

DESIGN ENGINEER to make investigations and preliminary drawings of cost estimates of alterations to buildings and machinery for a large paper mill in the St. Maurice Valley. Salary around $300. Apply to File No. 3779-V.

MECHANICAL OR ELECTRICAL ENGINEER, age 25-35, required as field service engineer, to handle technical refrigeration service and maintain liaison with national distributors, dealers and service organizations, in the Provinces of Canada, for an American firm. Salary $300-350. Enclose photo when answering. Apply to File No. 3781-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years experience in design, cost estimates, draughting, and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

SALES ENGINEER with electrical engineering background in public utility or industrial field required by wire and cable manufacturer for engineering contact work in Ontario. Salary open. Apply to File No. 3788-V giving complete details.

GRADUATE ENGINEER with experience in pre-stressed concrete and pipe manufacture, required by construction firm in Montreal area, veteran with administrative experience preferably. Salary open. Apply to File No. 3793-V.

GRADUATE, with some knowledge of looms, weave construction and clotb analysis, required as manager for rayon weaving plant in Peru. Administrative ability necessary. Knowledge of Spanish would be an advantage although not a necessity. Salary open. Apply to File No. 3794-V.

GRADUATE ENGINEERS, not exceeding 45 years, required by Contracting firm in Western Canada for railway construction and higbway work. Salary $300. Apply to File No. 3795-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably witb Pb.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a petroleum refining company in Montreal for process and design work. Salary about $225. Apply to File No. 3575-V.

CHEMICAL ENGINEER required as assistant professor of chemical engineering in a Canadian university to start autumn 1947. Salary open. Apply to File No. 3600-V (D).

CHEMICAL ENGINEERS OR CHEMISTS for analytical work in tbe laboratory of an industrial firm in Central Ontario. Salary from $175. Veteran preferred. Apply to File No. 3642-V.

CHEMICAL ENGINEER. preferably with sales experience, for sales and service with an industrial firm in Central Ontario. Salary open. Apply to File No. 3642-V.

CHEMICAL ENGINEERS, both with experience and recent graduates, required by an industrial organization in the St. Maurice Valley. Salary open. Apply to File No. 3644-V.

CHEMICAL ENGINEER recent graduate up, to be assistant to tbe department superintendent of a tar distillery in the Toronto area. Salary $225. Apply to File No. 3674-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

CHEMICAL ENGINEER, recent graduate, required as process engineer in production control by a manufacturer in Central Ontario. Salary open. Apply to File No. 3708-V.

JUNIOR CHEMICAL ENGINEER required for the control department of a paper mill in Shawinigan Falls. Salary from $175-$275. Apply to File No. 3765-V.

CIVIL

CIVIL ENGINEER with experience in the mechanical trades required as designer by a building contractor in Quebec, age 30-35, salary open. Apply to File No. 3444-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position, salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER, senior designer, experienced in reinforced concrete and structural steel and general building construction, required to take charge of structuraldesign staff for a firm of consulting engineers in Montreal. Salary $300-$400. Apply to File No. 3585-V.

CIVIL ENGINEERS with master's degree, teaching and consulting experience, age 28-40, required for the staff of a university in N.Y. State. Salary open. Apply to File No. 3600-V (C).

CIVIL ENGINEER, preferably with railroad experience, required by a company engaged in large scale asbestos production in Quebec to supervise construction of local railroad. Salary open. Apply to File No. 3683-V.

CIVIL ENGINEER, recent graduate up, required for government organization on West Coast, to carry out field surveys, investigations of water resources and their application and to make reports, maps, plans, etc. Salary $200 up. Apply to File No. 3724-V.

CIVIL ENGINEERS, from recent graduates up, required by a public utility in Toronto for the design and construction of dams, bridges and power houses. Salary open. Apply to File No. 3736-V.

CIVIL ENGINEER, with at least five years' experience, to be assistant to the Director of Community Planning of the Province of Saskatcbewan. Starting salary $200-$250. Apply to File No. 3746-V.

CIVIL ENGINEER with experience in survey and construction, preferably bilingual, required to take charge of the engineering department for tbe woods operations of a paper company in Eastern Quebec. House available. Salary $350 up. Apply to File No. 3749-V.

CIVIL ENGINEER, qualified O.L.S., required as town engineer and superintendent of works for a town in Central Ontario. State age and salary desired. Apply to File No. 3750-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years' experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

GRADUATE CIVIL ENGINEER, required as structural designing engineer by a firm engaged in the manufacture of cranes, crushers, pumps, etc., in the Toronto area. Preferably with 5 to 10 years' experience in designing and detailing steel buildings and bridges. Salary open. Apply to File No. 3771-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters. English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to File No. 3415-V.

ELECTRICAL ENGINEER age 30-45 with sales training with large manufacturer of electrical equipment instruments and 5-10 years experience as sales service and sales engineer required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER for sales engineering, with previous experience, age 25-40, required by a Montreal firm handling pumps, valves, automatic controls, etc. Salary according to experience. Apply to File No. 3614-V.

ELECTRICAL ENGINEER with knowledge of power apparatus, preferably bilingual, required for sales work with a manufacturer in the Montreal area. Salary open. Apply to File No. 3646-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER to be chief engineer, responsible for electrical and mechanical design and testing, required by a firm in Ontario manufacturing electric motors. Salary open. Apply to File No. 3656-V.

ELECTRICAL ENGINEER with several years experience required as a designer by an industrial organization in Montreal. Salary open. Apply to File No. 3677-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35, salary open. Apply to File No. 3695-V.

ELECTRICAL DRAUGHTSMAN with several years' experience in industrial layouts for large concern in Eastern Townships. Permanent position and attractive salary available for experienced men. Apply to File No. 3701-V.

ELECTRICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

ELECTRICAL ENGINEERS experienced in the design and installation of private communication systems required for a public utility in Toronto. Salary open. Apply to File No. 3736-V.

ELECTRICAL ENGINEER, with at least five years experience on overhead and underground transmission and distribution systems. Required as distribution engineer by a public utility in Brazil. Salary open. Apply to File No. 3738-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with broad practical experience and theoretical knowledge required for a firm in Quebec. Salary from $225. Apply to File No. 3743-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with considerable industrial experience and initiative required by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER with estimating and contract experience, required as office engineer by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200. up. Apply to File No. 3761-V.

JUNIOR ELECTRICAL ENGINEER, required to act as assistant in an engineering sales office of an electrical firm in the Montreal area. Salary open. Apply to File No. 3768-V.

GRADUATE ELECTRICAL OR MECHANICAL ENGINEER, must have thorough knowledge of fractional H.P. Motors required by a Montreal firm to take charge of small engineering department. Salary $350-$500. Apply to File No. 3770-V.

MECHANICAL

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to File No. 3393-V.

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area, in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEER, with mine mechanical draughting experience, for producing gold mine in Quebec. Apply to File No. 3436-V, stating experience, references and salary expected.

MECHANICAL ENGINEER with experience in pulp and paper work is required as draughtsman for a company in New Brunswick. Salary is open according to qualifications. Apply to File No. 3471-V.

MECHANICAL ENGINEER with paper mill experience for design and layout in connection with the re-conversion of a paper mill in Eastern Quebec. Salary from $200-$350 according to experience. Apply to File No. 3497-V.

MECHANICAL ENGINEER with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEERS to be design squad leaders on heavy machinery design required by a company in Central Ontario. Salary open. Apply to File No.3623-V.

MECHANICAL ENGINEER recent graduate, required by an industrial firm in south western Quebec, for the design and erection of complex textile machinery. Salary open. Permanent position. Apply to File No. 3625-V.

JUNIOR MECHANICAL ENGINEER with construction or machine shop experience, required by a Montreal firm handling heavy construction equipment. Salary open. Apply to File No. 3635-V.

MECHANICAL ENGINEER with experience in the fabrication of Farm Implements, required by a Quebec firm. Bilingual man preferred. Salary according to experience. Apply to File No. 3666-V.

MECHANICAL ENGINEER with experience in the design of industrial machinery required by a Montreal firm manufacturing custom built machines. Salary $200-$250. Apply to File No. 3669-V.

MECHANICAL ENGINEER with design experience in the pulp and paper industry required by a firm with headquarters in Montreal. Salary $350. Apply to File No. 3673-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEER with industrial or construction experience, required by a firm of consulting engineers to inspect machinery deliveries in the Cornwall area. Salary open. Apply to File No. 3691-V.

MECHANICAL ENGINEER, recent graduate up, required for maintenance and production engineering by an industrial firm in Montreal. Salary open. Apply to File No. 3692-V.

MECHANICAL ENGINEERS, age 25-35, required by a manufacturer in Montreal, for training as sales engineers and for executive positions. Salary from $200. Apply to File No. 3710-V.

JUNIOR MECHANICAL ENGINEER, under 30 and preferably bilingual, required by a Montreal firm to train as sales engineer for pumps, engines and allied electrical equipment. Salary open. Apply to File No. 3714-V.

MECHANICAL ENGINEER, under 45, with at least ten years' experience in design of heating, ventilating and refrigeration layouts, required as heating engineer for a government organization on West Coast. Salary $250-300. Apply to File No. 3724-V.

YOUNG MECHANICAL ENGINEERS, with practical experience either in automotive or general manufacturing industries, together with ability to operate engineering office systems, required by an industrial organization in Ontario. Salary open. Apply to File No. 3732-V.

MECHANICAL ENGINEERS, with at least five years' experience in the Pulp and Paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

SENIOR MECHANICAL ENGINEER, ten to fifteen years' experience required by a West Coast manufacturer of heavy equipment and vehicles to take charge of engineering design and inspection departments. Salary about $350. Apply to File No. 3734-V.

MECHANICAL ENGINEERS, with experience in plant layouts and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3756-V.

JUNIOR MECHANICAL ENGINEER with industrial experience required as assistant to the plant engineer in a factory in the Montreal area. Salary about $225. Apply to File No. 3758-V.

MECHANICAL ENGINEER, preferably bilingual, with design experience required by a manufacturer in Quebec, for development of new textile machinery. Salary $350-$400. Apply to File No. 3767-V.

GRADUATE MECHANICAL ENGINEER, experienced in boiler operation, required as assistant superintendent on maintenance of railroad and tramways rolling stock, in the Quebec area. Salary $200. per month. Apply to File No. 3772-V.

MINING

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3743-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least 5 years practical experience, required by an industrial engineering consultant in Montreal. Apply to File No. 3307-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

MECHANICAL OR ELECTRICAL ENGINEER with experience in paper mill or steam plant operation, bilingual if possible, is required by an industrial firm near Montreal. Salary from $300, according to experience. Apply to File No. 3498-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

MECHANICAL OR MINING ENGINEER, age 30-40 with experience in industrial engineering, required by a large mining and processing firm for methods studies of equipment, labour and costs. Salary according to qualifications. Apply to File No. 3524-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

DESIGN ENGINEER with considerable experience required by a pulp and paper firm in the St. Maurice Valley. Salary open. Apply to File No. 3573-V.

GRADUATE ENGINEERS, required by a large industrial and chemical organization with headquarters in Montreal for all phases of research design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

ASSISTANT PROFESSORS AND INSTRUCTORS required for the staff of a technical college in New York State. Salary open. Apply to File No. 3600-V. (A)

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL AND MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

SALES AND SERVICE ENGINEER with considerable experience in sales and heavy mechanical equipment required by a sales organization on the West Coast. Salary open. Apply to File No. 3626-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply to File No. 3628-V by letter with full details. Salary open.

SALES ENGINEER with wide engineering experience wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

MECHANICAL AND STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

ASSISTANT ENGINEER with experience in estimates and specifications for industrial work required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CHIEF DRAUGHTSMAN with at least five years draughting room and related engineering office experience, preferably in pulp and paper or process industries, required by a pulp and paper mill in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CIVIL OR MECHANICAL ENGINEER, required by a pulp and paper company in Newfoundland to look after new development work and general engineering in connection with woods operations. Salary open. Apply to File No. 3655-V.

ASSISTANT PLANT ENGINEER, preferably with pulp and paper or structural design experience, required for a newsprint mill in a city on north shore of Lake Superior. Salary open. Apply to File No. 3657-V.

JUNIOR ELECTRICAL OR MECHANICAL ENGINEER required by an industrial firm in Montreal for training as an industrial engineer, including plant layout and maintenance. Salary open. Apply to File No. 3660-V.

MECHANICAL OR ELECTRICAL ENGINEERS for training as production engineers with an industrial firm in Montreal. Salary open. Apply to File No. 3662-V.

CONSTRUCTION ENGINEER with ten years' experience in the design and erection of steel and concrete buildings required for the staff of an oil company in Montreal. Travelling involved. Salary open. Apply to File No. 3663-V.

JUNIOR ENGINEERS preferably with pulp and paper or other industrial experience required for training for the sales staff of a Montreal manufacturer of machines and equipment. Salary from $175. Apply to File No. 3664-V.

GRADUATE ENGINEERS for mechanical design, experimental, test and development departments of a Canadian firm producing aircraft gas turbines. Salary open. Apply to File No. 3667-V.

STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3668-V.

JUNIOR ENGINEERS, recent graduates up, as designing draughtsmen for a brewing company with headquarters in Montreal. Salary from $200. Apply to File No. 3670-V.

SALES ENGINEER with knowledge of sawmill and woodworking equipment, preferably bilingual, required for the sale of specialized equipment. Salary $200 plus commission. Apply to File No. 3678-V.

INDUSTRIAL ENGINEER as field representative in the Toronto-Niagara area for a government department, five to ten years experience. Salary about $300. Apply to File No. 3682-V.

JUNIOR ENGINEER, recent graduate up, required as surveyor by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

CIVIL OR MECHANICAL ENGINEER, experienced in design and field supervision of construction of industrial buildings, piping, pumping and mechanical equipment, for products distribution of major oil company. Ten years experience required. Salary open. Apply to File No. 3685-V.

STRUCTURAL STEEL CHECKER OR DRAUGHTSMAN required immediately for a steel fabricating company in Niagara Peninsula. Salary open. Apply to File No. 3687-V.

MECHANICAL OR ELECTRICAL ENGINEER with general industrial experience, preferably with knowledge of time study, required by a wire and cable manufacturing company in Ontario. Salary approximately $225, depending on qualifications. Apply to File No. 3690-V.

JUNIOR CIVIL OR MECHANICAL ENGINEERS with design or structural experience required by a manufacturer of contractors' equipment in the Hamilton area. Salary open. Apply to File No. 3698-V.

CONSTRUCTION ENGINEER with field experience, age about 30, required as office engineer and assistant to general manager for a firm of contractors in Montreal. Salary open. Apply to File No. 3703-V.

CIVIL OR MECHANICAL ENGINEER with considerable experience in the design and layout of industrial plants required for the design staff of an industrial organization in Montreal. Salary from $250. Apply to File No. 3704-V.

SPECTROSCOPIST with experience in chemical analytical work and the use of the commission spectograph required by an industrial organization with headquarters in Montreal. Salary open. Apply to File No. 3706-V.

FORESTRY ENGINEER, recent graduate up, required by a paper company for woods operations on the Lower St. Lawrence. Salary from $175. Apply to File No. 3707-V.

JUNIOR SALES ENGINEER, mechanical background, age 25-30, required by a Montreal firm manufacturing steel tanks, oil drums and other equipment for the oil industry. Salary about $200. Bilingual an advantage. Apply to File No. 3709-V.

JUNIOR ENGINEER DRAUGHTSMAN required by a Montreal firm designing and manufacturing aeroplane equipment. Salary open. Apply to File No. 3712-V.

JUNIOR ENGINEERS, recent graduate up, required for the engineering staff of a communications company with headquarters in Montreal. Veterans preferred. Salary from $175. Apply to File No. 3713-V.

JUNIOR STRUCTURAL DESIGN ENGINEER required by a steel fabricating firm in Central Ontario. Salary open. Apply to File No. 3715-V.

JUNIOR ENGINEERS, preferably with some mechanical design experience, required for the engineering staff of a manufacturer in Sherbrooke. Salary open. Apply to File No. 3721-V.

JUNIOR ENGINEERS, recent graduates up, with mechanical background required by a Montreal manufacturer for the design and supervision of boiler plant installations, preferably bilingual. May have sales work. Salary from $200. Apply to File No. 3722-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

CONSTRUCTION ENGINEER with considerable experience required for the permanent staff of a Montreal inspection company. Salary about $200. Age immaterial. Apply to File No. 3728-V.

JUNIOR ENGINEER, preferably with experience in heating and combustion problems, required by a specialist firm in Montreal. Salary $250-325. Apply to File No. 3729-V.

PLANT ENGINEER, age about 35, with factory experience and mechanical background, including maintenance and power plants, steam and electrical, required by a manufacturer in Montreal. Salary from $350. Apply to File No. 3735-V.

SALES ENGINEERS, with mechanical and electrical background, bilingual, required by a Montreal firm handling road building and contractors equipment, generators, pumps, etc. Salary open. Apply to File No. 3737-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DESIGN ENGINEERS, age about 30, with experience in the design and layout of chemical plants, required by an industrial organization in the St. Maurice Valley. Salary from $250. Apply to File No. 3741-V.

DESIGN DRAUGHTSMEN, age about 25, with experience in chemical plant layouts, required by an industrial organization in the St. Maurice Valley. Salary from $200. Apply to File No. 3741-V.

INDUSTRIAL ENGINEER, with broad experience in plant development, operation, costs and management required for a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

SALES ENGINEER required in the St. John, N.B., district by a firm handling oil purifiers, piston rings and allied engineering products. Salary $250. plus commission. Apply to File No. 3744-V.

SALES ENGINEER, preferably bilingual, required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

TOWNSITE SUPERINTENDENT required for a paper company town in Western Ontario. Salary open. Apply to File No. 3747-V.

GRADUATE ENGINEERS, recent graduates up, preferably mechanical, required for the engineering and operating staff of a pulp mill in Eastern Quebec. Salary open. Apply to File No. 3748-V.

PUBLICITY ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

SUMMER EMPLOYMENT...WANTED

The Employment Service of the Engineering Institute is endeavouring to aid their Student members to obtain suitable practical experience during the summer months. We would appreciate any assistance from firms anticipating such openings.

GRADUATE ENGINEER, under 40, with industrial and manufacturing experience and some knowledge of sales, required by a bolt and nut manufacturer in the Montreal area. Salary open. Apply to File No. 3752-V.

GRADUATE ENGINEER required by an insurance company in Montreal for the inspection of boilers, steam plant and allied equipment. Salary from $200. Apply to File No. 3754-V.

CHIEF DRAUGHTSMAN with experience in Pulp and Paper Mill design wanted immediately in Port Arthur. Reply stating education, experience. Salary open. Apply to File No. 3760-V.

CIVIL, MECHANICAL OR CHEMICAL ENGINEERS, recent graduates up, preferably with experience in petroleum and heavy industry such as chemical or paper, required by an oil company in Toronto. Salary open. Apply to File No. 3762-V.

GRADUATE ENGINEER, with practical experience, production and maintenance, to take charge of Farm Equipment Factory with Grey Iron Foundry, located in Ontario. Apply with photo or snapshot to File No. 3764-V. Salary open.

Situations Wanted

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., 20 years work on Hydraulic Plants as designer and superintendent of construction. Extensive experience in guniting, diamond drilling and pressure grouting. One month notice. Apply to File No. 1527-W.

CIVIL ENGINEER, Jr. E.I.C., P.Eng., McGill, 30 years of age, bilingual, ex-R.C.E. officer, 3 years' experience on construction, 2 years pulp and paper industry, 1 year with public utility firm, administrative and contact ability, seeking permanent position. Available on short notice. Apply to File No. 1552-W.

INDUSTRIAL ENGINEER, C.E., B.A.Sc., M.E.I.C., age 38, married, bilingual, process development, methods, time-study, production control, job evaluation, plant layout, sales. Services available at short notice. Apply to File No. 2157-W.

GRADUATE ENGINEER, M.E.I.C., member of Board of Trade, Corporation of Professional Engineers, age 33. Interested in: Consultation, analyzing problems, constructive planning, programming projects and over-all direction. Have had real experience and responsibilities in executive planning, inspection and supervision in industry, scheduling, control, costing, promoting production, customer satisfaction, technical sales. Apply to File No. 2441-W.

HYDRAULIC ENGINEER, B.Sc., M.E.I.C., 20 years experience in Hydraulics relative to hydro-electric power development, hydraulic machinery design and manufacture and development in hydraulic turbine design. Experience in handling men. Desires change in position. Apply to File No. 2638-W.

CIVIL ENGINEER, M.E.I.C., Registered Professional Civil Engineer of Ontario, Resident Engineer on large unit price projects plus wide general experience. Available on short notice. Apply to File No. 2651-W.

ELECTRICAL-MECHANICAL ENGINEER, Jr.E.I.C., age 30, graduate of Naval Electrical Engineering Officers course at Nova Scotia Technical College, 1945. Graduate of Naval Electrical Artificer's course at University of Alberta, followed by 6 months of instructional work on same. One year at sea as Chief Electrical Artificer on frigate, in charge of all electrical equipment. Completed apprenticeship as machinest in railway repair shops in design work testing, research and calculations. Available on two weeks notice. Apply to File No. 2693-W.

MECHANICAL ENGINEER, S.E.I.C., P.E.Q., Jun. A.S.M.E., McGill 1946. Age 22. Single. Experience in methods engineering, tool design, heating and ventilating. Would prefer position with an established firm with a machine shop in order to gain shop experience. Suitable position anywhere in Canada acceptable. Available on short notice. Apply to File No. 2707-W.

PART TIME WORK—YOUNG CIVIL ENGINEER, S.E.I.C., would accept some work at night or during spare time; at office or at home. Now engaged in design work during day-time. Apply to File No. 2735-W.

CIVIL ENGINEER, B.A., B.Sc., M.E.I.C., R.P.E., age 44, with over 20 years' experience in railway, municipal and highway engineering, also consultative, including design, location, construction and maintenance. Extensive administrative and executive experience. Desires position in construction engineering or superintendent for construction firm. Apply to File No. 2808-W.

ELECTRICAL ENGINEER, Jr. E.I.C., age 34, R.P.E., Ont., on University staff, with sales, maintenance and switchboard design experience. Desires summer employment. Apply to File No. 2809-W.

GRADUATE ENGINEER, mining, Jr. E.I.C., R.P.E., Ont., age 31, married. Approximately three years' experience in mine and land surveying, and three years as a supervisor in production, development and process control in heavy industry. Presently employed, but interested in a position with Consulting Engineer, Surveyor, or in Production. Location preference: Ottawa or Toronto areas. Apply to File No. 2810-W.

RECENT GRADUATE ENGINEER—(Civil, electrical, mechanical) B.Sc., S.E.I.C., would accept sales work during spare time, anywhere in Province of Quebec. Apply to File No. 2814-W.

YOUNG MECHANICAL ENGINEER, B.A.Sc. Toronto, S.E.I.C., single, now engaged in product design and development with firm in the Maritimes, would prefer similar work in Southern Ontario requiring more technical and also some artistic ability. Apply to File No. 2818-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., with five years intensive work with large pulp mill, construction, maintenance, estimate, layouts, process development, time study, etc., also experience in public workmanagement: water, sewer, electric system generation, transmission and distribution with full responsabilities of design and work, etc. Services available at short notice. Age 30, married and bilingual. Apply to File No. 2823-W.

GRADUATE MECHANICAL ENGINEER, Toronto '37, M.E.I.C., P.E.Q., with 10 years experience in design, layout and production of power plant and allied equipment. Available on short notice. Montreal area preferred. Apply to File No. 2826-W.

APPLICATION OF THE CYLINDRICAL SHELL FOR CONCRETE ROOFS

ERIC C. MOLKE
Chief Engineer, The Roberts & Schaefer Company, Chicago, Ill.

A paper presented before the Montreal Branch of The Engineering Institute of Canada on November 26th, 1945

The basic principles of cylindrical shell design are described by the author, and the application of these principles to roof and pipe designs are illustrated.

The object of this paper is to give a short review of the basic principles of the structural design of a cylindrical shell and to show, by various illustrations and comparisons, the possibilities for the application of these principles in the design of structures such as roofs and pipes.

Fundamentally, a shell is a comparatively thin plate, curved in one or in two directions and properly stiffened against undue deformation at the edges. A three dimensional structure of this type constitutes one of the oldest forms of building construction, the dome.

The principle of stiffening the edges of a shell has been used for ages in shaping glass and earthenware. Lately, it is being used particularly in the sheet metal industry on the edges of thin curved sheets to form automobile fenders and bodies, aeroplane wings and fuselages and many other items used in our everyday lives. Considering that the strength and stiffness of such small objects is due to the high carrying capacity of shell construction, it is logical that the use of these principles should be extended to the construction of large roof structures. Such application necessitates, however, a deeper understanding of the problem of stress distribution in a shell and, therefore, in the following we will develop the conceptions of the three dimensional shell action from the conventional beam slab design.

Straight Line Distribution of Stresses

In the solution of ordinary design problems, it is customary to base our calculations on the straight line distribution of stresses in a cross section. Our standard beam formulas gave satisfactory results if the proportion of depth to span is small. However, the distribution of stresses in a high wall supported on columns requires a different approach. This problem occurs repeatedly in shell structures and is to be considered the first principle of structural shell design.

Referring to the diagrams, Fig. 1 shows the distribution of principal stresses in a high beam wall continuously supported over several spans. Full lines indicate the direction of compressive stresses and dotted lines the direction of tensile stresses. Stresses change in magnitude along the trajectories. The diagram in the centre of the span and also the one at the right edge show the stress distribution in vertical cross sections at the respective positions and present a comparison of magnitudes.

Figure 1(a) is calculated with the usual assumption of a straight line distribution of stresses while Fig. 1(b) is calculated with the use of more exact stress theories. It can be seen that the main bridging action, that is the guiding of the load into the columns, takes place near the lower edge. The upper part in a high beam acts merely as a column carrying the load downwards. By comparing the stress diagram in Fig. 1(a) with 1(b) one can see how dangerous it would be to apply the assumption of a straight line distribution of stress to high diaphragm structures.

To continue, it will be helpful to visualize a simple three dimensional structural member which can be developed from a plane diaphragm by rolling it

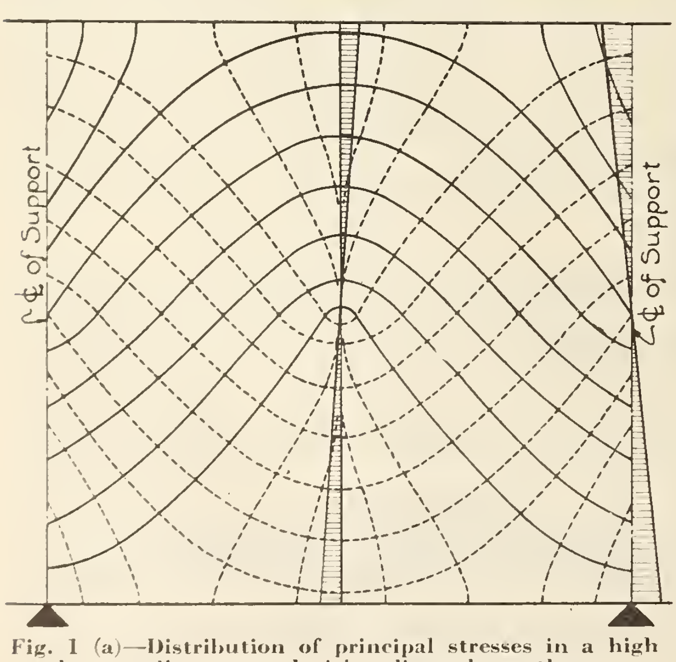

Fig. 1 (a)—Distribution of principal stresses in a high beam wall; computed with ordinary beam theory.

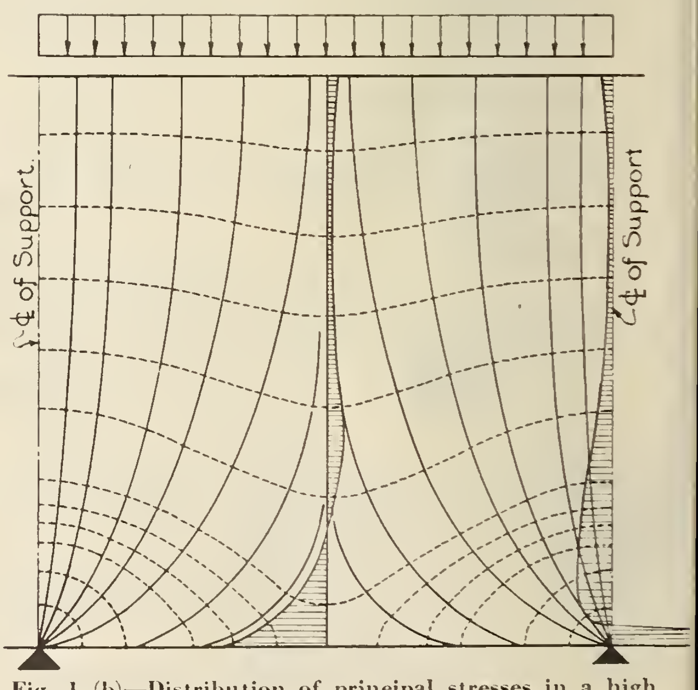

Fig. 1 (b)—Distribution of principal stresses in a high beam wall; computed with stress functions.

around a cylinder and joining the top and bottom edges of the diaphragm, thus forming a continuous pipe surface. The simple column supports in the case of the plane diaphragm must be replaced by ring girders supporting this pipe shell continuously around the surface.

Diaphragms offer great resistance to loads acting in their plane and, likewise, the pipe shell has great resistance to loads which can be transferred by a set of direct "membrane" forces, over the material of the shell, to the supports.

Figure 2a illustrates the lines of principal stresses due to dead load over a full pipe shell. It is assumed that the pipe is supported at each end by stiff frames all along the periphery. To obtain a better understanding of the stress lines one could imagine the pipe to consist of a flexible membrane like an umbrella and supported by bar ribs shaped to the solid lines representing compression and suspended by ropes strung along the dotted lines which are representing tension.

The forces acting on the stiffener ring, also called end frame, are the resultant components of the principal stresses in the connecting pipe shell. Since the principal stresses act along the membrane of the pipe, these resulting forces act tangential to the surface of the pipe at this location, as can be judged from the stress trajectories.

Observing these stress lines in Fig. 2a, one can easily understand how the membrane of a shell will be able to carry great loads by merely tensile and compressive forces acting along the material of the membrane. Visualizing this stress action along the end frame, one can sense a discontinuity in the deformation near the supports where the heavy stiffener rings do not permit a free adjustment of the strains resulting from the membrane stresses. It is therefore apparent that some longitudinal bending moment will occur in a zone adjacent to the stiffener rings, which is called "rim bending". It will always be necessary to reinforce the shell in this "rim zone" to resist the flexural stresses.

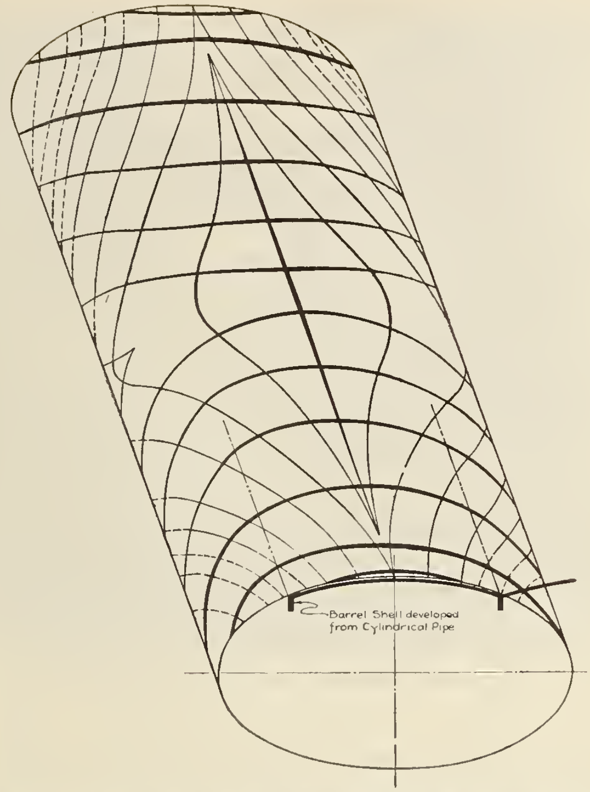

Fig. 2 (a)—Illustrates the lines of principal stresses due to dead load over a full pipe shell. The barrel shell consists of a part of such a cylindrical pipe.

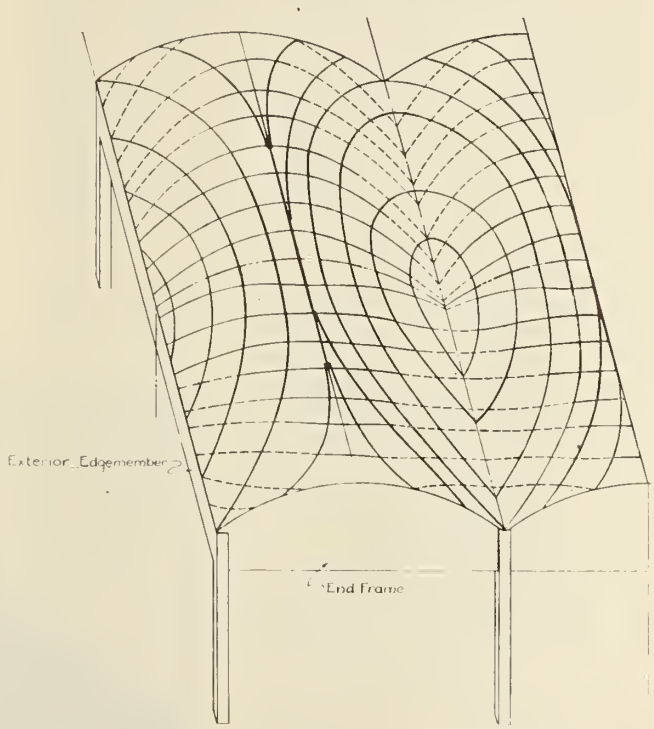

Fig. 2 (b)—Illustrates the lines of principal stresses on a multiple barrel roof. Note the dome action by which the load is carried towards the columns.

Application to Large Roof Spans

It is logical that part of such strong lightweight structural members should also be applied for the economical construction of roofs of large span. A barrel shell roof is made up of such building units. It consists of a part of a pipe stiffened at the edges by edge members and end frames as indicated in Fig. 2b. In cutting off the lower portion of the pipe and substituting edge members of considerably less stiffness than the detached part of the pipe, it is logical that a certain change in the stress distribution has to take place. The edge member cut loose from the shell could deform if acted upon by the original shell stresses. A gap, of course, cannot exist and therefore the stresses along the edge must be smaller, and as a consequence the excess has to be absorbed by the shell itself. The resultant stress lines are shown in Fig. 2b.

Figure 3, an isometric view, shows distribution of principal stresses or trajectories over one concrete shell unit of the Hershey, Pa., sports arena, which was the first shell structure of large span built in the United States.

The two hinged arch ribs are spaced 39 ft. 2 in. on centres, and have a theoretical span of 222 ft. The shell slab is 3½ in. thick of elliptical shape, having a radius of 132 ft. over the larger portion, and a minimum radius of 42 ft. over a narrow zone along the edge members. The slab spans between two arch ribs and cantilevers beyond each 19 ft. 7 in.

The trajectories in the vicinity of the edge member show a striking resemblance to the lines of principal stresses for a diaphragm with load applied on the top edge such as has been illustrated in Fig. 1b. As

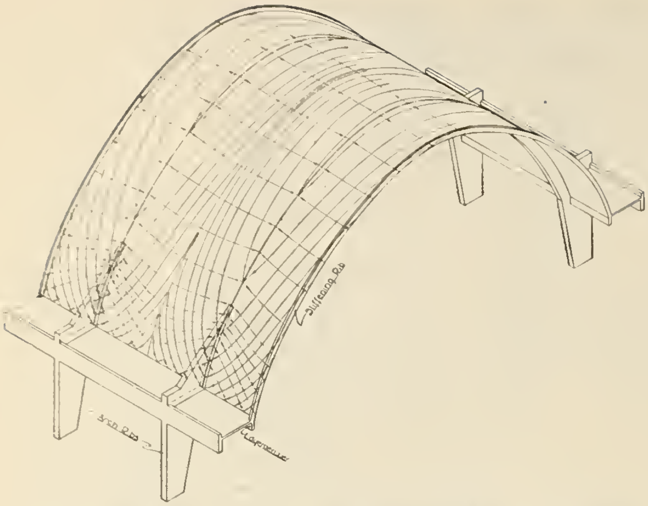

Fig. 3—Isometric view of principal stresses over a barrel shell carried on arches. Note how edge member is hung to the arches. The dotted lines represent direct tensile stresses in the shell. The solid lines represent direct compression stresses.

a matter of fact, the lower part of the shell acts exactly like such a diaphragm wall, bridging the arch forces of the shell towards the supporting arch legs. Consequently a shell structure can also be compared with a full tunnel arch on which the continuous support along the bases has been substituted by point supports at intervals.

It is not the small edge member at the base of the arch which is acting as a bridge, but the lower part of the shell. In fact, edge members are so weak on many shell structures that they are not even able to carry their own dead load and the adjoining shell has to carry them with diaphragm action. The edge member acts merely to perform a function similarly as the tension chord on a truss, stiffening at the same time the edge of the thin shell. The bridging action extends only over the lower part of the shell. In the example illustrated, the acting diaphragm is about 25 ft. high which is two-thirds of the span.

Characteristic of barrel shell roofs besides these point supports along the bases, is also that they have stiffening arches at these supports which, on account of their stiffness, draw to themselves and concentrate all the moment actions inherent in tunnel arches. This makes it possible to use a thin shell stretched between the arches similar to the skin of an umbrella held between the stiff spokes.

In an umbrella, an ordinary tent or in water tanks, which are all thin shell structures commonly used, the skin taking the load is principally under tension. In a cylindrical roof most of the skin forming the surface is under compression. This makes concrete the logical material for such construction. Steel plates used for a cylindrical roof would be too thin to withstand such compressive action without buckling ribs. Even with concrete roofs, the shell, which is usually about three inches thick, has to be specially investigated for buckling and proper curvature and sometimes buckling ribs have to be provided as stiffeners. Compressive stresses in general are, however, low and amount to only about 200 to 300 lb. per sq. in. of concrete.

On account of secondary bending moments and shrinkage actions, a layer of light reinforcing steel or welded wire fabric is usually provided in the top and bottom of a concrete shell. These top and bottom layers form a rectangular pattern in a horizontal and arch direction. Additional bars are placed diagonally near the middle of the shell only along the tensile stress trajectories (the dotted lines in Figs. 2b and 3). Depending upon the span of the shell in both the transverse and longitudinal directions, as well as the curvature, location of live loads, openings, etc., it may be necessary to place additional moment bars at the points where such factors produce forces similar to "rim bending" previously described.

Where it is desired to provide openings in shell roofs, the stress trajectories simply adjust themselves and the shell bridges the opening. Expansion joints are usually placed midway between alternate supporting arch ribs, so that the building is divided into independent structural units composed of a shell and two supporting arch ribs with the shell cantilevering beyond the arches for half the distance between ribs.

Construction Not More Complicated Nor Expensive

Concrete for large shell slabs is no more difficult to place and finish than with ordinary slab construction. The shell is the steepest at the springing line, but, even there, top forms in general are not necessary as long as the slope does not exceed 45 deg. It has been found that a tightly wired mesh of reinforcing bars is able to keep the comparatively thin layer of wet concrete from sliding.

Since supporting ribs on American shell structures have been usually placed above the shell, an unobstructed underside has been obtained permitting the use of travelling formwork. Formwork travellers are usually built the full width of the transverse span and the length of a standard construction unit, generally about 80 ft. from expansion joint to expansion joint. The shell reinforcing is placed on the traveller centering, rib forms are set up around the arch rib reinforcing

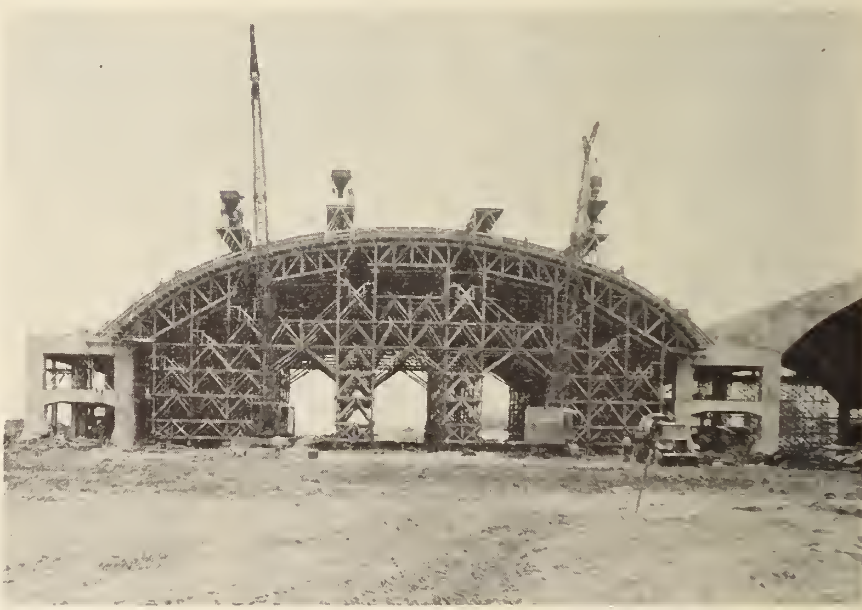

Fig. 4—Twin hangar built for U.S. Navy. Formwork and arrangement of runways.

and concrete is then placed.

In the forms the concrete is spaded to a rough grade about one-half inch above the final thickness of the shell. The slump of this approximate 1:2:3 concrete varies from 1 to 4 in., depending entirely on the slope of the section. This low slump makes it possible to place the concrete without top forms, even on quite steep slopes. The concrete is screeded off by a straight edge to the screed strips, and the strips removed. After it has hardened slightly the surface is floated with a wood float or darby and then the concrete is covered and thoroughly cured by keeping it wet for a period of at least seven days. After two days the concrete usually obtains sufficient strength so that the forms are lowered a few inches by means of screw jacks or wedges and are then rolled ahead to the next unit, and the operation is repeated.

Fig. 5—Interior view of the Engineering Shops Building at Wright Field, Ohio.

Strength and elastic properties of the thin slabs are excellent. The average cylinder strength obtained is about 4,000 lb. per sq. in. and the modulus of elasticity 3,000,000 lb. per sq. in. after 28 days. Since the average stress in a shell roof does not amount to more than 300 to 400 lb. per sq. in., safety beyond that required by standard codes is obtained. After the shell roof is finished it is covered with a two-ply built-up roofing.

Actual construction has proved that the placing of reinforcing in this shell is no more expensive than for standard reinforced concrete structures. Of course it must be remembered that approximately 40 to 50 percent of the bars entering a shell structure are of small diameter, and accordingly the unit price will be higher on a tonnage basis but not higher than in any structure where small bars are used. Placing and supporting of bars need not be done more accurately than general practice demands. Doubly curved diagonal bars in the shell slab are furnished straight and when tied at the required spacing, they tend to curve properly by their own weight. A close spacing of small bars has distinct advantages as it is more effective against volume change of the concrete and increases the fireproofness by reducing the tendency of the concrete to spall over larger bars.

For buildings which are regular in shape, particularly those of long rectangular plan, and for equal conditions of load and span, reinforced concrete shell structures will require fewer pounds of steel per square foot of covered area than structural steel buildings with wood decks, and less wood than wooden buildings. On a dollar basis, shell structures will often be less expensive than, and in most cases will be competitive. with other types of structures.

Fire Hazards Minimized

The fire safety of the shell roofs was vividly illustrated on a recent job where, under cold weather conditions, the roof concrete was being kept warm by salamanders underneath the shell forms. The concrete had " set " but its strength was rather low (1,500 lb. per sq. in.) when the formwork caught fire from overheated salamanders and, under the drive of a high wind, was completely burned out in less than two hours. When the fire had cooled and an examination could be made, it was found that the damage was minor, consisting of some spalling and minor cracking of the shell, but it was decided that load tests should be made prior to any repair work. This was done, and it was found that no serious decrease of load carrying capacity had been caused by the fire. All that was necessary to repair the building was to " gunite " over the areas where the concrete had spalled.

Figure 4 illustrates one of the twin hangars built for an eastern U.S. Naval Base. The clear span of these hangars is 160 ft. Note the simplicity of the form centering and the arrangement of runways for pouring concrete. Figure 5 is an interior view of the Engineering Shops Building at Wright Field, Ohio. This building is 362 ft. by 421 ft. and consists of nine 40-ft. barrels spanning 56 ft. between columns. Note the monorails suspended from the shell slab and the percentage of roof area taken by skylights.

The development of the modern design and the economical methods of construction of thin shell concrete barrel shaped roofs is the result of many years experience in design, supervision of construction, continuous research work and tests of various structures during and after construction.

At the present, an ice arena at Victoria, B.C., is being built, using the principles of the cylindrical thin shell, under the direction of Mr. C. T. Hamilton. Earlier the theory of the cylindrical shell has been applied in Canada on the pipeline for the Ontario Paper Co.'s Outardes development on the Lower St. Lawrence, and was described in *The Engineering Journal*, April 1938.

THE SMOKE PROBLEM

E. A. ALLCUT, M.E.I.C.
Professor of Mechanical Engineering, University of Toronto.

A paper presented before the Toronto Branch of The Engineering Institute of Canada on November 28th, 1946.

The author defines the term "smoke", and shows where smoke comes from and where it goes, what causes it and what are its consequences. He also discusses how smoke is measured, what remedies are available and what organization is required to enforce such remedies. A bibliography is added.

This paper was originally intended to deal with "Toronto's Smoke Problem", but, after consideration, it became evident that the general nature of the smoke problem was common to all densely populated areas, save for a few matters of detail. It follows, therefore, that a general discussion of the smoke problem is more appropriate, and that principles only should be discussed, as the details concerned are too numerous and depend largely on local circumstances. The following considerations, therefore, will deal with the nature of smoke, its origin, disposal, causes and effects; its prevalence, methods of measurement and the remedial measures available.

What is smoke?

This question is not a purely rhetorical one, as a good deal of uncertainty exists regarding the nature of smoke and its components. All smoke is considered to be a nuisance, but the extent of the nuisance at any given time or place, depends less on the general characteristics of the smoke emitted than on certain factors or components which cause trouble in that particular area. Until the nature of the nuisance is defined, it is obviously impossible to take appropriate measures for dealing with it. The Oxford Dictionary defines smoke as "the volatile products of combustion, especially visible vapour with carbon, etc., in suspension, emitted by burning substance". This is a very general definition, and perhaps that given by Baltzer[15] is a little more appropriate, namely, "any *dirt forming* or *harmful* substance, visible or not, issuing from a *chimney*". The important words in this definition have been italicized, and thus the whole question resolves itself into a consideration of the nature and degree of atmospheric pollution resulting from the products of combustion. In the popular mind, smoke is frequently associated with the amount of haze or loss of visibility, which reduces the radius of vision. But this idea makes no allowance for dull or hazy days caused by other circumstances, or for night periods when visibility is always extremely limited. Indeed, when soot blowing or filter cleaning is performed at night, as it frequently is, the resulting local nuisance may be very great even though, at that time, nothing is visible.

Smoke usually includes four principal constituents, namely, (1) *Soot*, which consists of solid carbon particles, frequently associated with tarry matter. (2) *Combustible gases* or fumes. (3) *Ash* or non-combustible matter, which escapes from the furnace with the gases. (4) *Sulphurous gases* and other chemical agents, which are of a corrosive nature. (In some instances ammonia is also important.) The solid particles may be divided into two classes, namely, grit, which is large enough and heavy enough to be deposited in collecting vessels, and smoke proper, consisting of smaller particles which may remain suspended in the atmosphere almost indefinitely. It has been stated that, if the particles are larger than 10 microns in diameter $(\frac{1}{2500}$ in.) they are unlikely to remain suspended in moderate air currents,[25] and the larger and heavier they are, the shorter will be the distance travelled from the chimney in question. Professor Ter Linden[5] made a detailed study of this question in Holland and found that 100-ft. chimneys in Delft were emitting 50 tons of coarse grit per annum, giving rise to considerable local complaints. On the other hand, at Velsen, where the chimney was 230 ft. high, there was an emission of from 500 to 1000 tons of fine grit per annum and no complaints were received, because the grit was of a smaller size and was deposited over a wider area. (Fig. 1) He also stated that, while there is little or no visible smoke from anthracite and other similar fuels, the quantity of grit (over 50 microns) carried away may be very considerable, and detrimental to the surrounding district.

Table 1 gives the approximate composition of deposited material from domestic and factory chimneys, as obtained by various authorities in the United States and Great Britain.

Table I

Composition of Deposited Material from Chimneys

	General		
	Domestic Origin	*Factory Chimney*	*Toronto 1933*
Carbon	55–37%	48–27%	31–46%
Tar	37–40%	about 1%	below 1%
Ash	7–5%	51–62%	50–68%

In a parallel column there is an approximate analysis of the deposits collected in various parts of Toronto by the School of Hygiene, University of Toronto.[17] This would seem to indicate that the smoke in Toronto at that time was mostly of industrial origin but, on the other hand, the domestic fuels mostly used at that time were relatively free from volatile matter and the smoke obtained from them would contain very little tar. A similar survey made at the present time might produce a very different result.

The small particles, which remain indefinitely in suspension as smoke, are usually less than 1 micron in diameter $(\frac{1}{25000}$ in.) and may be as small as 1/10 micron $(\frac{1}{250,000}$ in.). This fact, which has been verified by different authorities,[5][6] indicates the extreme difficulty of isolating such particles on a large scale by filtration or other similar methods. (Fig. 3). There is a tendency for these particles to become larger in foggy weather by aggregation or by other means. The solid particles of carbon, which constitute black smoke, seldom account for more than one per cent of the combustible loss, but they are usually accompanied by combustible gases which involve serious losses of heat. Carbon burned to carbon monoxide produces only about one third of the total heat that would otherwise be available, and the volatile hydrocarbons which are invisible, produce additional heat losses. Black smoke, therefore, is usually an indicator of bad combustion conditions, which should be corrected wherever possible. Sulphur, when burned, produces SO_2 and SO_3 which, in the presence

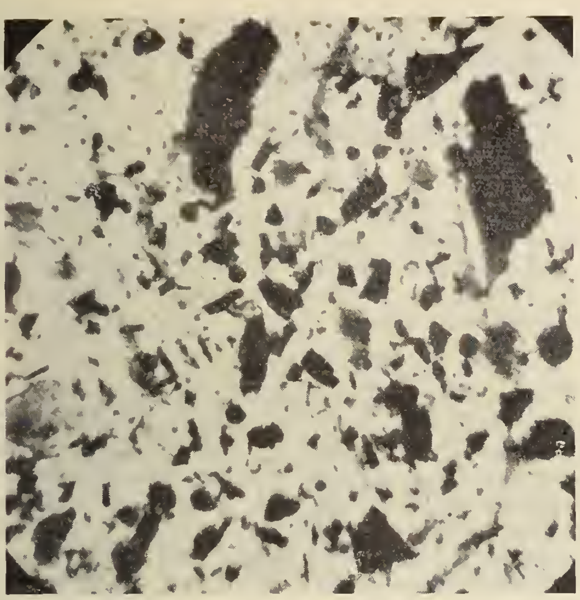

Fig. 1 (a)

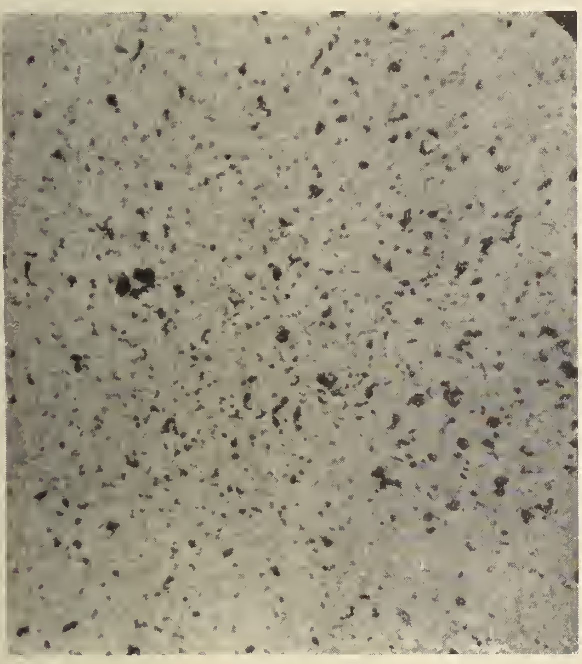

Fig. 1 (b)

of water, produce sulphurous and sulphuric acids, both of which are corrosive. One per cent of sulphur, in the fuel, which is by no means unusual, is capable of producing about 60 lb. of sulphuric acid per ton of coal.

Smoke, particularly the finer particles, becomes diffused after mixing with the atmosphere. Maclaurin[6] states that at the chimneys there are about 10,000 times as many particles per cubic foot as there are after dilution by the atmosphere, and therefore, that the right place to collect them is at the source. At Leicester[5] the following amounts of diffusion were estimated in the direction of the prevailing wind;

At chimney 118 grains per cubic yard (approx.)
20 ft. down wind (2 sec. later) 2.5 grains
100 ft. down wind (10 sec. later) 0.5 grains
4 miles down wind (30 min. later) $\frac{1}{840,000}$ grains

Smoke, however, is not always black; fly ash from pulverized coal installations, smokes from incinerators and from metallurgical furnaces are frequently of a light yellowish grey colour, and this nullifies methods of measurement that are based on colour and density. Meller[11] states that a survey in Chicago indicated that 40 per cent of the deposits collected were from sources other than fuel.

Where does smoke come from?

It is evident that any remedy to be applied at the source depends on the identification of that source. To a limited extent, the distribution tends to follow the direction of the prevailing wind, but local distribution is obviously dependent on the proximity of local sources of contamination and upon eddies or local air currents. It is advisable, therefore, to have a large number of observing stations, the locations of which are carefully chosen to avoid local disturbances. In a recent survey made at Leicester[5], fifteen observing stations were employed. Grit may be collected in deposit gauges of standard construction (about 12 in. dia.) which are uncovered when the wind is in the worst direction. In some instances, directional deposit gauges have been used satisfactorily, but some observers do not consider these to be good.[2] Cross checks may be made in different places and the direction from which the grit comes may be established reasonably well in this way. For the suspended matter, automatic filters may be employed (Fig. 8), and in some instances, the times at which successive samples are taken are also indicated automatically. This information may be correlated with the direction of the prevailing wind at those times. The Stevens Institute, in Hoboken, New Jersey,[13] plotted observations of this kind against wind direction and corrected each reading for the velocity of the wind, producing a component unit called shade-miles per hour. This was observed at two points. and when these figures were plotted, they assumed an oval form in which the long axis in each case was directed toward the same point, which included the large railway freight yards in Jersey City (Fig. 5). When appropriate action was taken there, it was recorded that the amount of smoke was reduced by 30-40 per cent. In the Leicester survey, where more observation points were used, lines of equal smoke density were plotted (Fig. 4). This procedure indicated not only the point of maximum smoke density, but also the relatively minor effect of the wind. It was found that the contours moved down wind for distances up to 1 mile and that

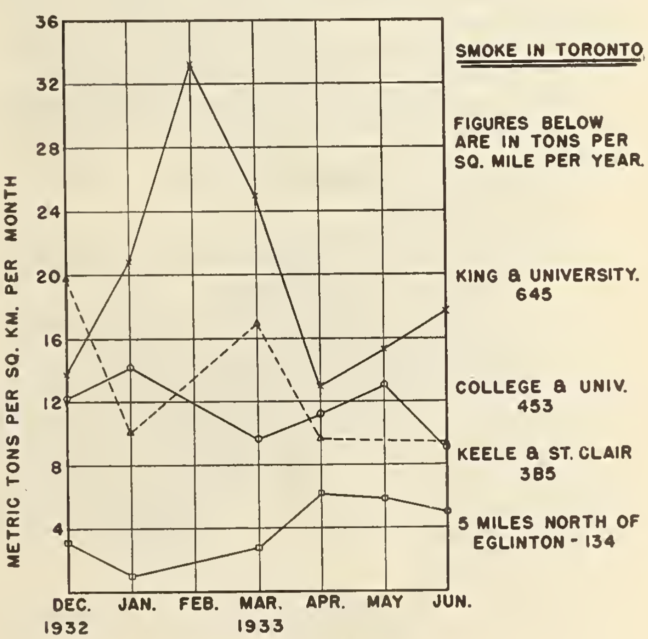

Fig. 2

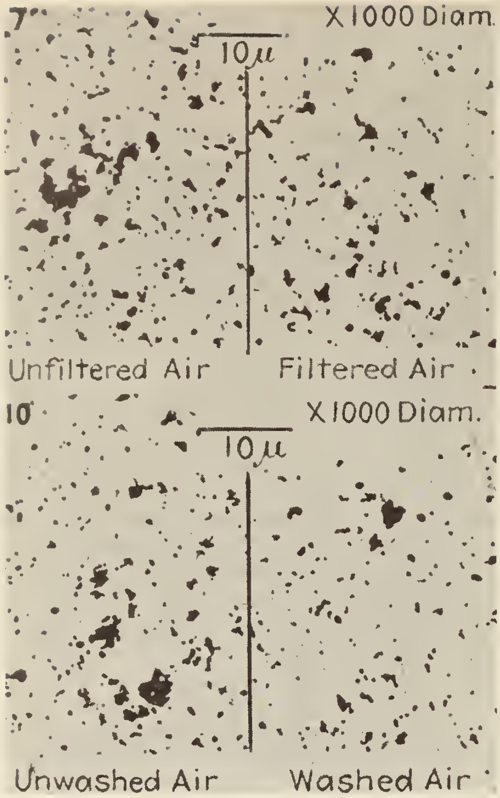

Fig. 3

the point of maximum concentration was never more than half a mile from the centre of the city.

The average conditions observed are given in Table II, which indicates that there was very little difference in the form of the contours in summer and winter respectively, the distribution being similar in both cases.

Table II—*Total Solids Deposited from Chimneys*

Distance from centre, miles	0	1	1¾	2¾
Summer—Tons per annum	241	170	146	91
Winter—Tons per annum	296	146	116	62

It was observed also that on Sundays and holidays, the smoke concentrations were from 20-50 per cent less than on week days. The causes of the daily smoke variations are shown in the diagram in Fig. 6, which has been redrawn from the original report. It was found moreover that the curve for the concentrations of sulphur dioxide was similar to that for smoke.

Owens② suggested that the source of pollution might be identified by one or a combination of the following methods:

(1) Nature of the deposit
(2) Tar content.
(3) Chemical composition.
(4) The addition of identifiable dust to the gases at the suspected source.
(5) The sizes of the particles, which give some idea of the distance from the source.

In addition to local pollution, the diagram indicates that there is some general pollution, since air can travel as much as 6,000 miles in six days, carrying fine smoke particles with it. The usual distance travelled however is from 500 to 2,000 miles. The smoke of a city generally increases with the population, and the following formula was found to express the most usual conditions.⑤

$$\text{W.M.S.} \times 10^4 = \sqrt{\text{Population}} \times (7 \pm 1)$$

(W.M.S. = Winter Mean Smoke in milligrams per cubic metre)

A further point is that, in calm weather the daily smoke carried may be from one-half to five times its normal concentration, and the SO_2 from 0.6 to 3.2 times the normal concentration. This is due to variations in turbulence, which forms an important variable factor at such times.

The extent of general pollution may be estimated from areas in which no smoke is normally emitted, but this is necessarily an approximate figure. In general, it is suggested that a proper smoke survey is not a short term proposition, but should occupy a period of not less than three to five years.

Where does the smoke go?

It has already been noted that small light particles remain in suspension for a long time, and therefore there must be some natural means of removing them. At normal times they are dissipated by the effects of wind, rain and turbulence or vertical air currents. It has also been remarked that the effect of wind is comparatively small and rain is only partly effective. Most of the removable impurities are taken out by the early part of the rain, but a good deal still remains after the initial washing. In the Leicester survey, it was found that the most effective factor in reducing pollution near the ground was vertical turbulence, as the concentration near the ground was similar in heavy or light winds. In the former case, there was less time for the particles to escape in an upward direction. The degree of such vertical turbulence varies with different meteorological conditions, and therefore any comprehensive survey should include investigations at different levels. This, however, would be both difficult and expensive.

What causes smoke?

Where fuel is the source of smoke, there are three principal factors concerned, namely, plant design, plant operation, and the characteristics of the fuel

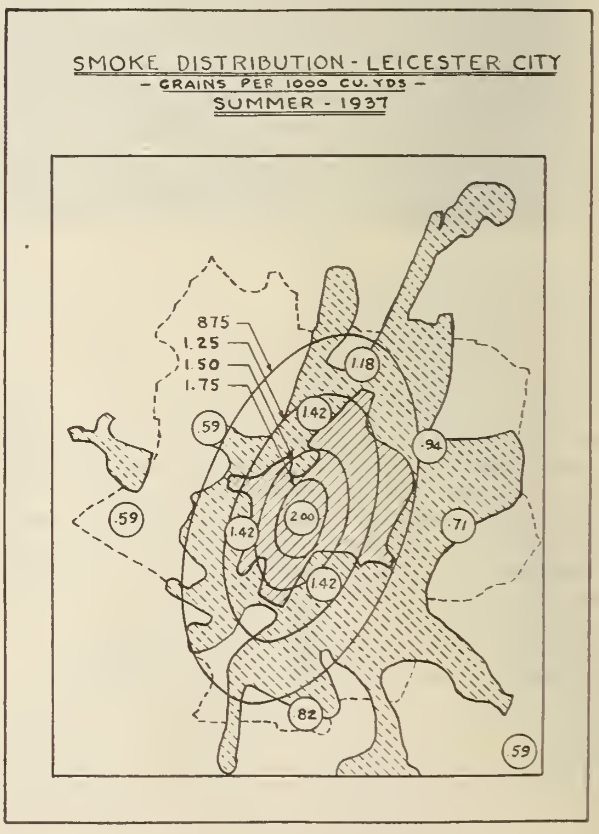

Fig. 4

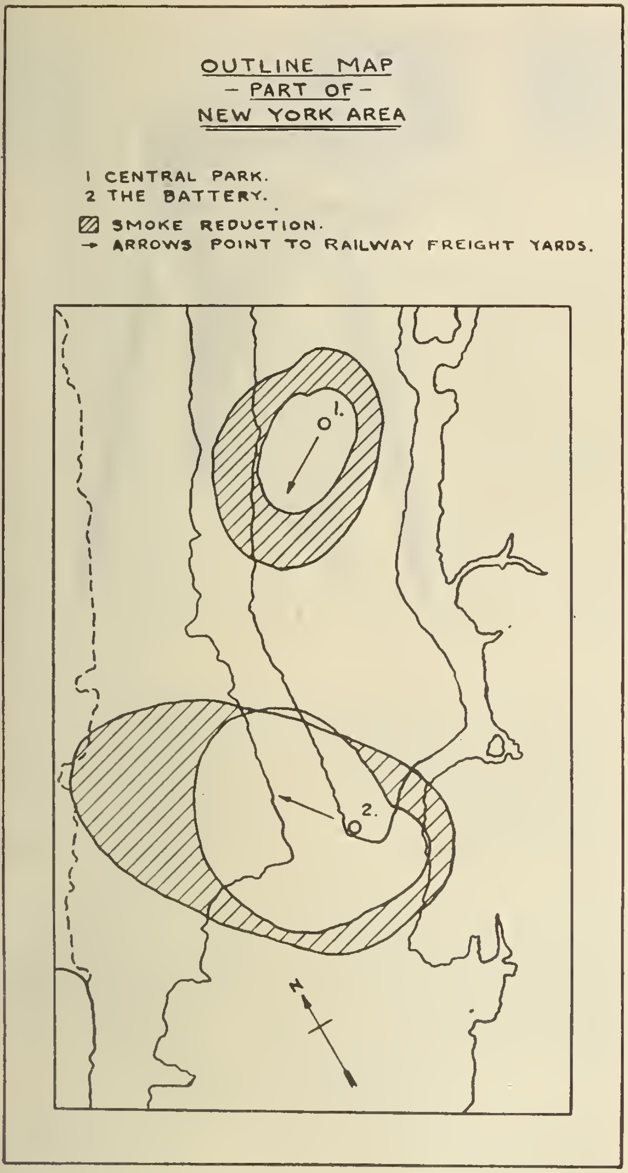

Fig. 5

supply. Firstly, the plant must be designed to enable complete combustion to be obtained under normal operating conditions. This requires that the fuel shall be raised to its self-ignition temperature and kept there for the time required for complete combustion, before it is allowed to cool. For this purpose, sufficient space must be available in the combustion chamber, and suitable draft must be provided with the proper degree of turbulence to enable the air and fuel to mix thoroughly within the time and space provided. If, therefore, the furnace is too small, or of the wrong shape, or if the cooling (heating) surfaces are too near the grate, incomplete combustion is likely to result.

Sufficient air passage areas or air pressures, or both, must be available to overcome any frictional resistances that oppose the air supply or the passage of the gas past the tubes or through the flues. Poor baffling, or the lack of an arch to preheat the coal and to mix fuel and air effectively, are also important factors. In an oil furnace, because of the volatile characteristics of the oil, larger combustion chambers of the correct shape must be provided than those necessary for coal. Lack of sufficient preheating may also contribute to incomplete combustion.

Secondly, the method of firing, which may be poor or irregular, the habit of breaking a fire to counteract coking (or caking) effects while leaving the fan running, and also that of blanketing the fire by heavy stoking, are contributory factors. If the furnace is too cool, or if an excessive load is put on the boiler, this may also produce incomplete combustion. Poor draft control and the improper use of secondary air supply above the fire may produce smoke. The boiler passages should be kept reasonably clean since, if they are clogged or dirty, the free area, which should normally be sufficient for its intended purpose, becomes too small.

Thirdly, the nature of the fuel, and more particularly the percentage of volatile matter present, is very important. Combustion can only occur on the surfaces of fuel particles, and as a rule, the hydrogen is burned in preference to the carbon. The latter assumes the form of soot, in which condition it is very difficult to burn. Much smoke is being produced at this time by the unavoidable use of fuels in furnaces that were designed for different types of fuel than those now available.

What are the consequences of smoke ?

These may be divided into human and material consequences. It has been estimated that the average human being consumes per day about 2.7 lb. of food, 4.5 lb. of water and 30 lb. of air. Other authorities suggest that the weight of the air consumed is from six to seven times that of the solid and liquid matter and yet, while we are very careful about the quality of the food and water consumed, we take very little care about the contamination of the air. It was found in St. Louis[4] that a decrease in smoke caused corresponding decreases in nose and throat ailments and of eye infections. The Leicester survey[5] indicated that smoke reduced the ultra violet light in winter by 30 per cent. Reduced visibility due to darkening windows or skylights may result in the absorption of 50 per cent of the light that would otherwise be received from outside.

Smoke also produces a greater tendency to form fog, as the water condenses on the smoke particles as nuclei, and tends to settle at lower levels for longer periods.[10] In materials, plant life is affected by poisonous soot, which also tends to clog the pores. In boilers, surface conductivity may be reduced by 25 per cent or more by fairly thin layers of soot, because the latter tends

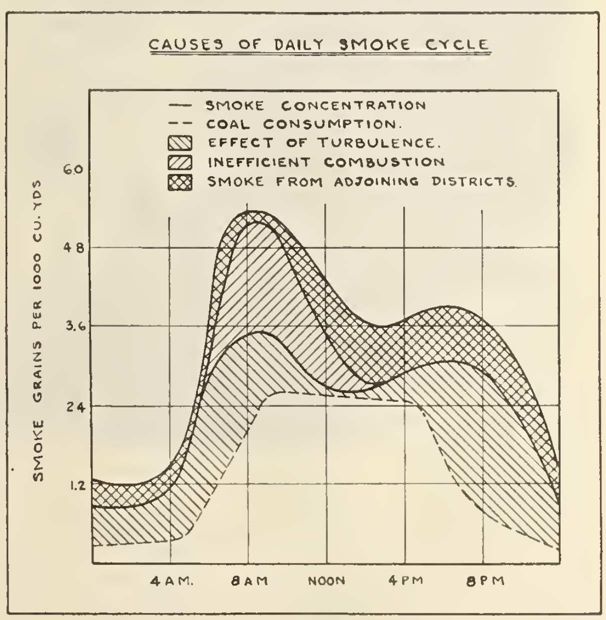

Fig. 6

to collect in fluffy forms containing considerable amounts of gas, (Fig. 7) the whole structure having very bad heat conductivity. Stone is soiled by soot and the presence of tar makes the carbon very adherent. Sulphuric acid tends to corrode stone and metal and disintegrates mortar. Copper is corroded in the presence of hydrogen sulphide. Smoke damages and soils fabrics and increases laundry costs. Paint and wallpaper also deteriorate, increasing the cost of interior decoration. In general, exposed metal must be painted about twice as often in a smoky city as in a clean one.

The cost of all this is difficult to estimate, because much of the cost is indirect, but such estimates vary from $20 per head per annum at Pittsburgh (1912) to $5 per head per annum in England (1918-22). In general, the cost is found to be roughly proportional to the amount of solid matter present.

How prevalent is smoke?

Table III indicates the mean average amounts of deposited matter in various locations, as indicated by various authorities at different times. They are given in short tons per square mile per annum, and the last two figures relate to the range of a survey made in Great Britain, where one station in London gave the smallest value and one station in Liverpool the largest. The quantities obtained in Toronto are given in Fig. 2.

Table III

Mean Average Amounts of Deposited Matter in Various Cities.

Leicester (centre) 1945	280–330	short tons/sq. mile/annum
Toronto (city) 1933	380–650	
Toronto (country)	134	
Pittsburgh 1923-4	1304	
1912-13	937	
Duisberg (Germany)	1200	
London (minimum)	328	
Liverpool (maximum)	783	

Fig. 7

Maclaurin estimates that suspended solids in the form of small particles are worse than deposited matter, being generally of the order of 49,000 to 163,000 particles per cubic inch. Meller found that in clear weather there were from 65,000 to 81,000 particles per

cubic inch in London air, but that in fog it might rise to 1,300,000 or 1,600,000. Even high above the street the air is not clean, as it was found in New York that the air seventeen storeys above the street contained about 18,000 dust particles per cubic inch.[25]

How is smoke measured?

There are various ways of measuring smoke, but that adopted depends on its objective. If it is required for the purpose of reducing the smoke emitted, the indicator or recorder will be placed inside the plant and there will be ready access to the chimney; on the other hand, if it is to be used as a basis for prosecution, the readings must be taken from some convenient position outside.

In the case of a smoke survey, the instruments are of a precise scientific character.[1][5] The principal ones are the deposit gauge, the ultra-violet integrator, and the smoke filter, which may be either of the visual or photometric type. In the last type, the stain on white filter paper is compared with samples (divided into ten shades), or with the density of stain as measured by a photometer. In either case, the standard used for comparison is previously calibrated by weight. The thermal precipitator (Fig. 9) consists of a hot wire,

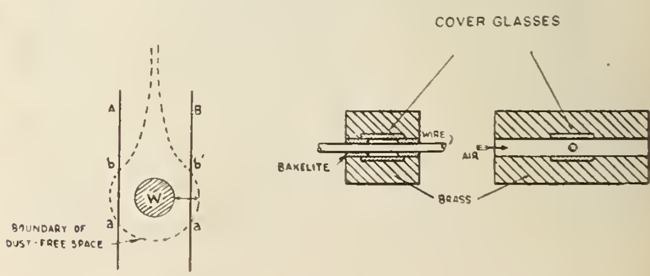

Fig. 9—W indicates position of hot wire.

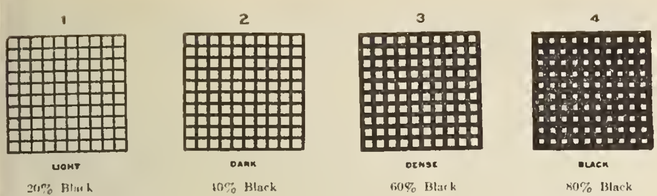

Fig. 10

past which the dust and gases are caused to flow. The solid particles are repelled from the hot wire and are collected on glass slides, upon which the dust is counted microscopically. A sulphur dioxide indicator of an approved design is also frequently employed.[5]

For internal control, continuous samples may be taken from the chimney, but correct sampling is a matter of some difficulty owing to the uneven distribution of velocity and smoke particles across the diameter of the chimney.[8] Great care must, therefore, be taken to have sampling tubes of the right proportions and in the correct positions. In most instances a beam of light is passed through the smoke column and the indication depends either on the amount of light obstructed or on the diffraction of light beams by the solid particles.

With regard to smoke inspection and law enforcement, the method and apparatus employed must be inconspicuous, simple, portable and usable at a distance and at a point considerably below the top of the chimney. The Ringelmann chart (Fig. 10) consists of a series of white cards with black lines which occupy successively 20, 40, 60, and 80 per cent of the area. When held at 50 ft. from the eye of the observer, these cards appear as varying shades of grey and are compared with the colour of the smoke issuing from the stack. The appearance of the smoke column, however, is affected considerably by its diameter, (Fig. 11) by the background (clear or dark sky), and by the colour of the smoke, and readings taken in this way can only be very approximate and of comparative value.

The umbrascope and carboscope involve the use of tinted glasses of varying densities, and with these the actual smoke is compared. Both have half discs of clear glass but the latter has a revolving diaphragm. Owen's smoke density indicator[1] has a series of revolving vanes with gaps between them of which the widths can be varied (Fig. 12), so that the light can be obstructed to a varying extent. The appearance of the revolving disc is then matched with the appearance of the smoke leaving the stack (Fig 13), but this also is subject to the same kinds of objections as the Ringelmann chart. There is room, therefore, for an instrument that smoke inspectors can use conveniently and that can be employed with a reasonable degree of accuracy.

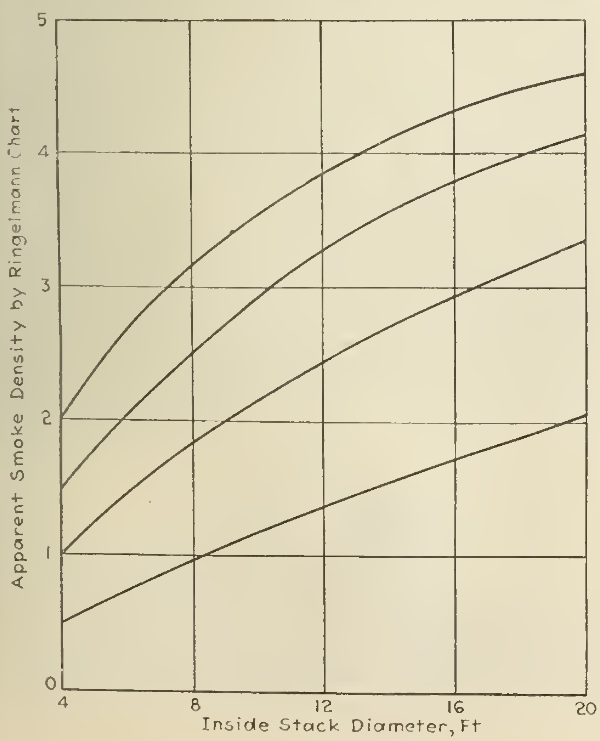

Fig. 11

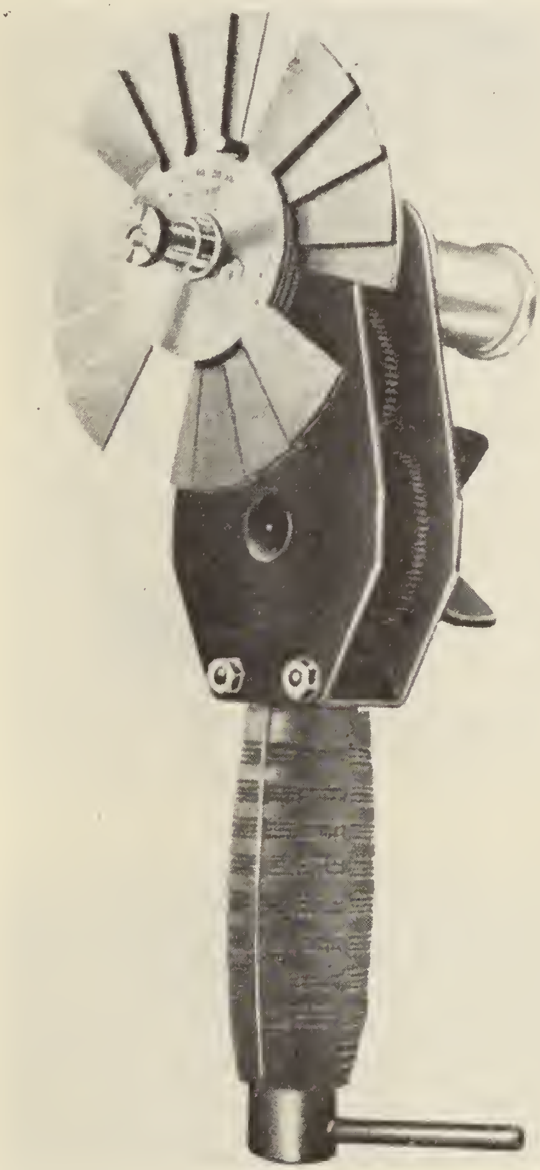

Fig. 12

What remedies are available ?

In many instances, the appropriate remedies are indicated by the causes, but in most cases smoke eliminating devices cost money, and therefore, the question arises as to the relative cost of the different methods that are available in any particular case. Also, as stated before, where legal action is contemplated there must be a clear definition of what constitutes a nuisance, for it is impossible to prove anything that is not clearly defined.

Fig. 13

Smoke consuming devices which are offered for sale, usually by interested parties, are generally useless. Filtering, wet baffles or washers, cyclones and bags are usually only effective in the case of comparatively large particles where their efficiency may be as high as 98 to 100 per cent.[8] In most instances however, their resistance increases rapidly with their efficiency and, therefore, sufficient pressure must be available, either in the form of natural draft or fan pressure, to overcome that resistance in the most economical manner. Baffles or filters may have low resistances to begin with, but afterwards their resistance is liable to build up considerably in a comparatively short time. Either frequent cleaning is necessary or a very strong draft must be available.

Electrostatic precipitators have been used successfully, both for metallurgical furnaces and for the removal of fly ash in the case of large power plants[1], but these are somewhat expensive and it is doubtful whether they can be installed economically in small plants.

Improved combustion conditions as indicated above, are the best means of avoiding incomplete combustion and, in this connection, a good deal of attention has been paid recently to the use of air jets above the fire. These may be operated either by blowers or steam jets. They supply the necessary secondary air and provide turbulence. Charts indicating the pressure, jet diameter and the degree of air penetration, together with the proper locations of these jets in various cases (Fig. 14), have been published by the fuel research laboratory, Battelle Institute.[23] It is estimated that light smoke requires about 10 per cent secondary air, moderate smoke 20 per cent and heavy smoke 30 per cent for a uniformly smoking bed. The penetration for uniform smoke should be generally about equal to the grate length. In some instances, the amount of air supplied in this way is controlled automatically by a photo-electric cell and, by this means, a boiler plant in Louisville, Ky., saved about $660 a year in the cost of steam used for the jets.[22] The boiler in question produced one million pounds of steam a day, and by automatic control the steam consumption of the jets was reduced from twenty thousand to ten thousand pounds a day.

While air jets are not to be considered as a cure-all for the smoke problem, they have been applied successfully to locomotives and to stationary boilers. A test on a 107 hp. horizontal return tube boiler at Ohio State University[24] showed that the efficiency of the boiler was not affected by the use of the jets, which were run by a blower, and that the smoke density was reduced considerably.

With regard to combustion conditions generally, much useful information is given in the manual of instructions on proper firing methods which was published in 1945 by the Smoke Prevention Association of America.[19] Probably one of the most effective methods is the greater use of central or block heating, where large and efficient furnaces may be used and skilled continuous attention is available.

What organization is required?

Most authorities are agreed that compulsion is no cure, but that in the case of stubborn operators, some degree of compulsion must nevertheless be provided. Experience in other fields has shown that no legislation is effective unless it has popular support and, therefore, that questions of public consciousness and responsibility have an important bearing on this problem.

In view of the fact already pointed out, that atmospheric pollution is general as well as local, it is apparent that, in polluted areas, smoke regulations should be organized by districts rather than by individual municipalities. It has been suggested, on many occasions, that smoke commissions should be set up to regulate smoke and also to educate citizens in the necessity for smoke control. In disputed cases where prosecution is being undertaken, there should preferably be some impartial referee who could give the necessary decisions or advice.[15] Results from such a campaign should not be expected immediately, for as has been stated above, a proper smoke survey takes several years to complete. Substantial results can be obtained, however, by a properly organized campaign. For instance, the St. Louis Smoke Ordinance was put

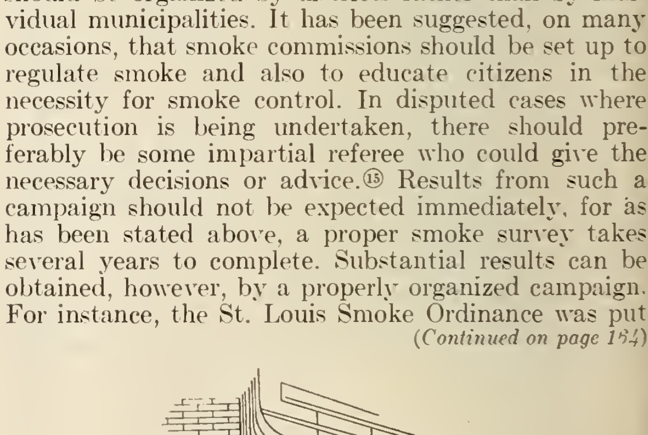

Fig. 14

STEEL RAIL PILES REPLACE CONCRETE PILES

E. P. MUNTZ, M.E.I.C.
Consulting Engineer, Hamilton, Ont.

This article describes the use of built-up steel piles made of three rails welded together, to replace poured-in-place concrete piles which were found useless due to waisting and fracture. Reasons for the unsatisfactory results obtained with concrete piles are discussed, and suggestions given for remedying them. A description of the method of placing the steel rail piles is added and costs given.

For a certain proposed reinforced concrete building, cast-in-place concrete piles had originally been driven to carry the superstructure, dimensions of which were to be 100 ft. by 120 ft. Before the superstructure was started, however, defects in some of these piles had been observed, and the author was retained to report on the piles as driven and subsequently to procure a satisfactory foundation.

No bearing value could be assigned to the concrete piles, the unit capacity of which was intended to be fifty tons apiece. Steel piles, each made of three rails, were added. The capacity of these steel rail piles was taken as 75 and 100 tons for piles made of three 60-lb. and 70-lb. rails respectively. One hundred and one of the rail piles were driven to assume the load intended for the original 173 concrete piles.

Conditions Found Upon First Inspection

Four soil borings had been taken, one at each corner of the building. These showed an undisturbed layer of hard clay from four to five feet thick extending below the sub-grade of the basement floor, then very soft clay varying from seven to eleven feet, then silt or silt and sand varying from three to nine feet, overlying rock or boulders at an average depth of about 23 ft. below sub-grade of basement floor.

The building column spacing was 20 ft. both ways. The exterior columns, and the foundation walls, were supported by clusters of two, three, four and five concrete piles, and the interior columns by clusters of five, six and seven. The minimum distance centre to centre of piles was 3 ft. 6 in. When first inspected by the author, the site had been excavated to subgrade of the basement floor between columns. The concrete piles had all been driven and the pile rig had been removed from the site. The top of the concrete in the piles was approximately at the subgrade of the floor. Excavations for the pile caps therefore exposed stems of the piles above the cut-off to be made at the bottom of the caps. The concrete in these stems appeared to be of good quality. The stems were in general full size, namely 16 in. dia.

Excavation for some caps had been made, and a number of stems cut off. Some forms were in place ready for concreting the caps. The excavation for the caps cut almost through the hard layer of clay in some places, and elsewhere into the shadow zone between hard and plastic clay. It was reported that, while excavation was proceeding, the remaining butt of one pile appeared loose. The excavation was deepened, and it was found that the pile was waisted, that is, a section of the pile below the hard clay had the general form of an hourglass. The minimum diameter was eight inches, and the concrete was fractured at the waist. Other footings were then excavated deeper and waisting was found on a large percentage of the piles then exposed, the diameter varying between eight and sixteen inches (Fig. 1). Figure 2 shows the waisted and fractured stem of a pile.

While the waisting of some piles was not excessive, the reduction in area of others was so great that the reported design load of 50 tons would impose a unit stress in excess of 2000 lb. per sq. in. It appeared that a loading test might show that a reasonable factor of safety existed, in spite of the severe waisting. The advisability of such a test was considered until it was shown that the waisting was accompanied in certain places by a fractured condition. Apparently the partly hardened concrete in some piles had been disturbed, probably by driving adjoining piles, until there was no allowable value in the waisted section. Clay had been forced into the cracks in the concrete in some piles, and was found in the centre of the piles in horizontal, vertical and oblique cracks.

Procedure in Placing the Original Concrete Piles Described

The pile subcontractor claimed that the procedure was as outlined in their published literature and had been used successfully on many jobs. In general, this procedure consisted of driving a steel tube (¾ in. thick walls and 14 in. inside dia.) on the bottom of which was fitted a cast iron shoe. Ground water was kept from entering the tube by a grummet of oakum between the shoe and tube. A single acting steam hammer was used, the kinetic energy of blow being approx. 15,000 ft. lb. The safe carrying capacity per pile was taken as 50 tons for a penetration of 0.1 in. When this penetration was obtained, the tube was filled with concrete and the tube withdrawn. The withdrawing action was by means of a pile line to the winch on the pile rig, the hammer alternately acting up and down, 80 cycles per minute, driving the tube up and driving it

Fig. 1—Typical example "waisting" found on concrete piles.

Fig. 2—Example of a waisted and fractured pile.

down part of the distance raised by the upstroke. Each cycle was supposed to raise the tube about one-half inch. It is claimed that the downstroke tamps and consolidates the concrete against the soil in the space left by the receding tube.

Standard Portland cement was used in the concrete, and there was no reinforcing steel in the piles. The portion of the pile in the hard clay layer showed excellent surface corrugations because of the tamping (Fig. 3). It should be noted that this figure shows corrugation spacing of 1.3 in. and 2.4 in., which must have been the difference between upward and downward movements of the tube as it was withdrawn.

Apparent Reasons Why Waisting had Occurred

It was evident that the waisting was due to insufficient pressure from the green concrete to balance the surrounding soil pressure in the plastic clay. It was logical that the waisting might occur towards the top of the plastic clay where the pressure from the concrete would be less than lower down. The specific gravity of the concrete is nearly one and one-half times that of the soil, and it would naturally be thought that a head of concrete in the tube up to the subgrade level would exert an outward pressure for any location of the bottom of the tube. Such a head should be sufficient, providing the consistency of the concrete and rate of raising the tube were such that the outward pressure of the concrete was not reduced even momentarily below the inward soil pressure.

If the raising rates shown in Fig. 3 in the harder clay were used in the plastic clay, it is probable that momentary relief of outward pressure of concrete was given, resulting in the waisting. The plastic clay underlying the hard clay is so soft that a steel pile may be forced down several feet under the dead weight of the pile hammer. It seems that the tube should be raised in very small increments, if waisting is to be avoided.

Causes of Fracturing

The fracturing of the concrete at the waisted section was due to driving adjoining piles.

Displacements of soil when adjoining piles were driven undoubtedly raised the hard clay layer. The top of a pile already driven would have a good grip on this layer, due to the corrugations forced into the hard clay (Fig. 3). The concrete in the pile would be subjected to a vertical tensile pull and failure would occur at the waist where the section of concrete would be the smallest. The observation of a clay layer in several horizontal cracks leads to the conclusion that fracturing at the waisted sections was due chiefly to uplift.

Difference in lateral displacement in the hard clay and soft clay might readily produce shearing stresses in the pile sufficient to fracture concrete only a few hours old. While piles were not driven within 6 ft. of a pile already driven until the next day, it is reasonable to expect that some piles may have been driven within 16 hours of the driving of one or more of its neighbours. Even if a full 24-hour interval had been observed, the strength of the concrete would have been negligible and quite insufficient to withstand any appreciable tension or transverse shear.

Investigation Shows Concrete Piles Useless

It seemed, as already noted, that the waisting and fracturing might occur only towards the top of the very soft clay near the hard clay. If this could be proved, then the piles might safely be capped at a lower level, below the waisting. Accordingly, an open caisson of 4 ft. dia. precast concrete pipe was sunk encircling a pile. This pile including the cast iron shoe was removed. It was waisted to approximately 8 in. dia. and fractured about 18 in. above the shoe.

When excavation has been carried down a short distance into the soft clay, the majority of piles partly uncovered have been found waisted and fractured. The only pile completely uncovered has been found waisted and fractured near the bottom. While some piles may not be waisted or fractured, it is evident that there could be no assurance whatever of their condition. It was concluded, therefore, that

Fig. 3—Typical corrugations in upper portion of concrete piles through top hard clay layer.

no carrying value could be assigned to them.

There are no buildings near the back or either side of the proposed structure. Foundations for future adjacent buildings and deep trench work in the street might permit movement of the very soft clay underlying the site. Therefore spread footings or a floating mat foundation could not be considered, and it was evident that the foundation must go to rock.

Possible Substitutes Considered

Other types of cast-in-place piles were discussed. All such piles are liable, under the conditions at this site, to somewhat the same type of damage as described above due to lateral displacement. When reinforcing is omitted, they will also be liable to damage due to uplift caused by driving adjoining piles.

Four alternatives then presented themselves.

(1) CONCRETE PIPE OR OTHER TYPE OF OPEN CAISSON

The existing concrete piles would make the sinking of caissons uncertain and costly both in time and money.

(2) CREOSOTED TIMBER PILES

Because of existing concrete piles and the number of timber piles required, much larger caps with more excavation, forms, reinforcing, and concrete would be required. There was also the question of delivery of such piles.

(3) PRECAST CONCRETE PILES

Precast concrete piles could be cast and driven having 50 tons carrying capacity. Using high early strength cement, driving could start within three days of casting. Considerable reinforcing steel, then very difficult to obtain, would be required. Driving would be difficult because of existing concrete piles, and the redesign of several caps involving changes in reinforcing would be required.

(4) STEEL PILES

Standard shapes could not be obtained quickly. A satisfactory pile could be made by welding the flanges of three rails together, so that the flanges form an equilateral triangle.

A further alternative considered was a built-up pile, consisting of three 60 lb. A.S.C.E. rails, the flanges joined with three ten-inch welds at

Fig. 4—Steel rail pile of three welded rails.

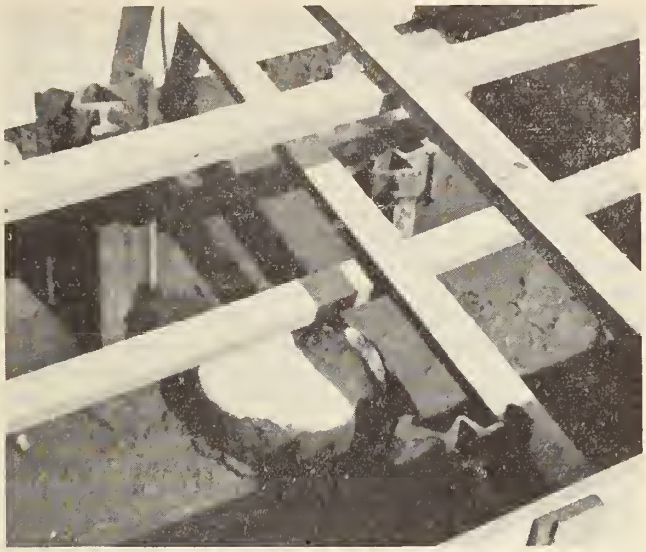

Fig. 5—Comparative sectional areas of concrete and steel rail piles.

bottom (Fig. 4), three four-inch welds at centre, and three eight-inch welds at top, will carry 150 tons for an unsupported length of 18 ft. The displacement of such a pile is small. The cross-sectional area is only 17.8 sq. in., compared to 200 sq. in. for the concrete piles then in the ground (Fig. 5).

To provide for some eccentricity of end bearing, 75 tons was considered the maximum safe load for these piles made up of 60 lb. rails, and 100 tons as the safe load for piles made up of 70 lb. rails. Pile shoes were deemed unnecessary in this case. Under other conditions any size shoe required could be attached.

Of the above alternatives, the steel rail piles offered the quickest and cheapest solution, and were therefore chosen.

Driving Performance on Steel Rail Piles

The subcontractor is to be commended for the speed with which relaying rails were secured, welded and driven. Welding and driving the steel rail piles was completed 12 days after the decision to use them was made, and 18 days after the condition of the concrete piles was known.

The piles sank through the plastic clay readily and almost under the weight of the hammer. It was thought that the hard driving before refusal would be limited to a few inches only. From 2 ft. 6 in. to 4 ft. above refusal, the driving required from four to ten blows per inch under the McKiernan Terry 9-B.2 hammer. Such hard driving had not been anticipated, and as a result some of the welds were broken. Of the hundred and one piles driven, the three welds at the top were intact after driving on seventy-three of them. One of the three welds was cracked on thirteen piles, two on eight more piles, and all three on a further seven piles.

The hard driving showed that the length of pile unsupported laterally, except for the plastic clay, was reduced from 18 ft. as originally anticipated to a maximum of 15 ft. Therefore, providing the rails could be maintained in their triangular relationship, the rails would carry the loads assigned to them, even though all flange welds cracked. As soon as cracks in the welds at the top appeared, two bands were added on all piles. These bands were of ¼ in. by

2 in. steel, welded in place about 3 ft. each side of the centre of length, or at approximately the third points in the length unsupported except for the plastic clay.

Cost of the Rail Piles

To avoid wasting steel, two rail stubs were butt-welded to form one of the three rails in each pile. The welding per pile then consisted of one butt weld and 78 linear inches of 1/4 in. fillet weld, used to join the flanges. The welding time required per pile was 1.9 hours for assembly and 0.3 hours for cutting off after driving and welding bearing plates in place. The total welding cost was approximately $10.00 per pile. Other costs were as usual for driving short piles weighing 1200 to 1500 lb. with a crane and suspended loads and a 9-B.2 hammer.

Conclusions Reached

The waisting of the concrete piles described above would have been avoided by the use of stiffer concrete, and an internal vibrator and by a slower extraction of the shell, using much smaller lifts per cycle of the extracting hammer.

The fracturing of the concrete at the waisted sections would also have been avoided by using high early strength cement, definitely keeping the bulb of pressure of the next pile to be driven clear of a driven pile under 24 hours old and, of course, by using reinforcing.

Cast-in-place piles should be reinforced, and when the concrete is placed with a water content above the plastic limit, the stirrups should be welded to the longitudinal steel. Care must be taken that the concrete in cast-in-place piles should be thoroughly set before the driving of other piles nearby can adversely affect it. A careful study of soil conditions, as well as continuous engineering supervision is necessary, to avoid damage when cast-in-place piles are used.

With no structural steel shapes available, the steel rail piles have undoubtedly provided the cheapest and most expeditious method of securing adequate supporting value for this building, although the bearing plates between pile cut-off and concrete are somewhat heavier than for H-beams of approximately the same net area driven as piles, and although the welding is an additional cost.

Where the unsupported length of pile, except for very soft material, is greater than was experienced in this case, rail piles should be shop welded. The length and thickness of welds beyond that necessary to develop the three rails into a column, will be governed by the weight of hammer, the weight of the pile, and the extent of hard driving.

THE SMOKE PROBLEM

(*Continued from page 160*)

into operation in April 1940 and it is stated that by 1946, smoke had been reduced by 73 per cent and heavy smoke by 81 per cent.④. The Leicester report indicates also that, as a result of a proper smoke survey, an elementary form of smoke forecasting is possible, so that it may be known in advance when unusually high concentrations of smoke are to be expected.

In conclusion, it is the author's opinion that the ultimate answer to the smoke problem is to be found in *education*, supplemented by *legislation* applied with *discrimination*.

RECENT HIGHWAY DEVELOPMENTS IN ONTARIO

J. D. MILLAR
Deputy Minister of Highways, Ontario

A paper presented before the Niagara Peninsula Branch of The Engineering Institute of Canada on November 28th, 1946

The author outlines the objectives set for the 1946 highway construction programme for the province of Ontario, and tells in what measure these objectives have been attained. Particular mention is made of new Toronto-Barrie highway.

Highway administrators know only too well the problem that faces manufacturers, distributors and retailers in this first post-war year. Of the demands for consumer goods in short supply, there is possibly none greater than that for the replacement and improvement of highways seriously damaged by the strain of the war years. Repairs have lagged far behind the destruction caused by exceptional wartime commercial traffic. The casual motorist found his long distance driving sharply curtailed by gasoline rationing and shortage of tires during the war. He has returned to the open road to find the highway systems of this continent greatly deteriorated from their former condition—and he does not like it. He is paying heavily in gasoline taxes and licence fees for adequate highway facilities. Consequently he has no hesitation in asking for the restoration of the pre-war standards of construction and maintenance to which he was accustomed.

1946 Objectives

In Ontario, every effort is being made to meet this demand. The highway budget, estimated at more than $47 millions for the current year, is the largest in the history of the province. Even in the face of continuing shortages of various road building materials and skilled labour, there will be completed the largest milage of new highways ever added to the system in any single year. By the time weather conditions call a halt to the season's paving operations there will be added some 300 miles of new paved surface. This comprises 130 miles of light road-mixed mulch, 160 miles of hot-mixed bituminous macadam and 10 miles of cement concrete.

More than 190 miles of grading on new highways is under contract, which at the time of writing is 60 per cent complete and which, it is hoped, will be more than 75 per cent complete before the end of the calendar year (1946). To restore existing pavements to their former condition, over 140 miles of hot-mixed macadam has been laid in varying thickness of from two to seven inches. To improve existing gravel road surfaces which cannot be paved immediately, some 1800 miles have been treated with a heavy coating of dust laying oil or "prime".

To this programme on the King's Highways, which are under the direct jurisdiction of the province, is added the heavy expenditures being made by the Counties and Townships, which are subsidized 50 to 80 per cent by the Highways Department. During the current year (1946), the rural municipalities are investing an amount equal to nearly half the total being expended by the department on the provincial system.

Programme for Northern and Northwestern Ontario

While the above mentioned expenditures appear large for a province having a population of slightly over four millions, it must be borne in mind that they are spread over nearly one-third of the widest expanse of the North American continent. For more than 1200 miles across some of the richest and yet the most forbidding and desolate sections of Canada, the Ontario King's Highways stretch from eastern New York State to western Minnesota. In this far-flung empire of agricultural, industrial, mining and lumbering developments transportation is a vital need. The joining of the eastern and northwestern portions of the province by road was accomplished during the war years. Current interest in the northern part of the province fastens on the rapid expansion of the highway system to meet the pressing demands of the mines, the lumbering industry and the tourist trade.

North from Quibell in the district of Kenora is being pushed a road which is possibly the forerunner of many pioneer routes to open the area north of the height-of-land. With its completion, the frontier in north-western Ontario will be set back nearly 100 miles. The Red Lake mining camp, instead of being an outpost of civilization, will become the centre of mining developments, whose full potential can only be conjectured. Another mining road sharing the spotlight with Red Lake is that being constructed from Matheson easterly into the Lightning River basin. Rated by many to rival the Kirkland-Larder Lake area in the years to come, development of this field has been at a standstill until transportation could be provided.

Programme for Central Ontario

Throughout central Ontario, the great bulk of the work of the Highways Department has been to modernize and pave established highways and "finish the job" undertaken some years ago of mak-

Fig. 2—Sub-grade on a level stretch of the new Toronto-Barrie highway, showing width and easy alignment.

ing the provincial parks and forest reserves accessible to the tourist traffic. An extensive paving programme has been carried out in this area which extends roughly from the district of Muskoka northerly to Hearst and from Renfrew on the east, west to Sault Ste. Marie. Many miles of grading completed prior to the war were surfaced either with permanent pavements or with light bituminous top sufficient for automobile and light truck traffic. With the exception of a 13-mile gap in the Timagami Reserve, Highway 11 now has continuous pavement from Toronto to Kirkland Lake. This is a major accomplishment when it is remembered that only twenty years ago many sections of this highway did not exist north of the city of North Bay, and that ten years ago only a small portion of this entire stretch was paved.

A considerable milage of what are called " development " roads has been built during the current year throughout this extensive area. Along with northwestern Ontario, it forms the great playground of the province. It is the drawing-card which makes Ontario the Mecca of many millions of visitors each year. Agriculture, mining and lumbering have benefited materially by the extension of roads of this type, which are rapidly opening many inaccessible lakes and rivers for the use of generations to come.

Programme for Southern Ontario

In the older and more heavily populated southern area of the province the most pressing problem facing the department was the rebuilding of war-damaged main arteries of traffic. The great bulk of the paving and resurfacing programme above mentioned has been concentrated here to prevent further deterioration of old pavements. Gaps had to be closed in the main arteries of traffic, which had been without attention in many cases for more than five years. Nearly fifty miles of " Ontario's Main Street ", or Highway 2, stretching from Windsor through Chatham, London, Hamilton, Toronto, Oshawa, Belleville, Kingston and Cornwall to the Quebec border have been resurfaced. Pavement has been laid on gravel sections of many important highways, particularly in the rich agricultural lands of southwestern Ontario and in the Ottawa and St. Lawrence valleys. Very little new grading work, except in connection with paving, has been undertaken in these districts, as the need for pavement was the most pressing.

Coupled with the need for pavement in the older portions of the province and the development of new highways reaching into New Ontario, has come the necessity of relieving congestion on those highways in the immediate vicinity of the large centres of population. Carrying the greatest concentration of traffic known in the province, the highways from Toronto to Hamilton had become obsolete. Prior to the war these had been supplemented by the divided type highway known as the Queen Elizabeth Way, familiar throughout the province for its utility and beauty. The continuation of this same type of construction east of Toronto had been undertaken before the war, but its final completion to Oshawa had been suspended. During the current year the remaining eighteen-mile section from West Hill to Oshawa was placed under contract for paving. By the close of the year's operations this will be more than one-third complete.

The Toronto-Barrie Highway

It is, however, the relief of congestion on Yonge Street, or Highway 11, running north from Toronto, which has been most insistently sought by motorists both at home and abroad. As one of the oldest established routes in the province, its strategic importance for many years has ruled against any drastic change in its location. Various attempts have been made from time to time to adapt this heavily settled and very hilly route to the use of the motor vehicle. Throughout the southerly end of the fifty mile section between Toronto and Barrie a continuous line of towns made the highway almost an urban street. To bring about any substantial improvement in grades on this line would have meant the disruption of all these towns, if any heavy cutting were done.

In the light of experience with the Queen Eliza-

Fig. 3—A paver at work on the Toronto-Oshawa highway, July, 1946.

Fig. 4—Grubbing with a dragline on the new Red Lake highway, summer 1946.

Fig. 5—Peacetime use for war equipment, Red Lake highway, summer 1946.

beth Way and similar highways, such as the Pennsylvania Turnpike and the Westchester County highways in New York State, it was decided that permanent improvement could only be accomplished by building an entirely new road. After more than two years of study and comparison of various lines, it was decided to follow a route along the back of the lot lines in the centre of the fifth concession of the townships of York, Vaughan and King in the county of York. A slight westerly deflection was found necessary across the Holland marsh and following the line between Lots 6 and 7 across the townships of West Gwillimbury and Innisfil in the county of Simcoe. The line thus chosen, while avoiding the hills adjacent to Yonge Street, is still in a direct line southerly from Barrie, and is adaptable to a satisfactory connection into the heart of the city of Toronto.

This highway, about sixty per cent graded at the time of writing, is known as a "controlled-access highway", a phrase coined in Ontario to describe most accurately the purpose for which it is intended. It is a road which will have points of entry at distances of from three to five miles apart at the intersection of the main highway and county road crossings. Between these points, traffic will flow without interference from the side, and the congestion and hazard of level crossing intersections will be eliminated. It will form a continuation of the Queen Elizabeth Way leading from Fort Erie through Niagara Falls and Hamilton to Toronto and northerly to Barrie. At Barrie, traffic will branch off for Owen Sound, for Midland, for Huntsville and the Algonquin Park and North Bay. In conjunction with a new highway of similar type being constructed by the State of New York from Buffalo, Albany and New York City, it will place the heart of the eastern United States within two days' easy driving distance of the central part of the province.

Congestion and Hazards to Be Overcome

The completion of this road will remove from Yonge Street those vehicles wishing to proceed to Barrie and beyond. These represent more than fifty per cent of the present traffic throughout the entire year, and a much higher percentage during the peak months of the summer. As has been the case with the Queen Elizabeth Way, it will draw to itself traffic from many other districts in the area bounded by Owen Sound on the west and the Algonquin Park on the east. It will relieve other highways from the congestion of holiday week-end travel. It is a highway conceived in the light of past experience and anticipating traffic conditions as they will be, not at the present, but in the course of the next quarter-century. It will be part of the main frame-work, to which are connected the other roads of the central and northern part of the province.

Every safety feature known to road building science is being incorporated into this highway. It will serve not only Toronto, but motorists from all over the province. It will be equally important to the miner at Timmins, to the resort owner in the Timagami park, to the market gardener in the Holland marsh, as it is to the residents of Toronto themselves. Over this highway in the years to come will flow the products of the forest, of the farmland, of the manufacturer and, along with them, the tourist traffic which today represents an industry almost as important as the others mentioned. In the saving of lives it will materially reduce the number of tragic accidents presently occurring on the congested arteries of the central part of the province.

Bridges Deferred

Such then are the highlights of the year's programme of highway building in Ontario. As will be noted, very little mention has been made of the construction of new bridges. This unfortunately has been one problem incapable of solution, with the present shortage of steel, cement and lumber. It is sincerely hoped that before the 1947 construction season these materials will be available in sufficient quantities to allow the replacement of bridges. There are many of these on existing main highways, as well as many hundreds on the lesser travelled arteries throughout the province, which are badly in need of attention. There is no alternative, however, except to defer work of this kind until at least one of the three materials mentioned is available.

Motorists of the province have been very patient and understanding of the problems facing the department in this first post-war year. It is hoped that this brief review will present the case of the men behind the counter when they have to report that certain products are still "temporarily out of stock".

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

LOW SALARIES AND DEPRESSIONS

The relationship between low salaries for engineers and an economic depression was easily discernible in the report of the New Development Committee of the Canadian Construction Association presented at the annual meeting of the Association.

The report is based on the results of a survey made by the committee through a questionnaire sent to the Dominion and provincial ministers of reconstruction. It asked what planning of deferable projects had been completed by each province and by the Dominion. Answers were received from all but one province but only two made any pretence of completing the form. The showing was extremely discouraging, for it appears that in almost no instance has the planning progressed to the point where it could be a real hedge against unemployment.

Two provinces admitted frankly that they had done no planning. Two others had completed only an insignificant amount. Two other provinces, Saskatchewan and Ontario, reported work completed to an extent almost double their portion of the hoped for $500 million reserve for all of Canada. Such excess amounts however, could not be used in combating a depression in its first year, and therefore should not be included in the minimum figures for a one-year reserve.

The total of all work now planned on a one-year basis according to the survey is $278 millions, against the objective of $500 millions. As all projects which hope to receive financial assistance from the Dominion government must be approved by the Department of Reconstruction, it is quite possible that some of these now reported by the provinces may not be approved, in which case the figures for the reserve would be reduced.

The figure of $278 million may well be questioned inasmuch as the Department of Reconstruction in January this year issued a statement that the reserve, including projects still in the process of screening, amounted to only $35 million. With the Canadian construction industry able to handle $800 million of work in one year as it did during the war, $35 million is rather insignificant. The department stated at the same time that $700 million of work had been " considered ", and that this amount may be said to be the potential reserve. There is a vast difference between $35 million planned and $700 million on which the department states " there is agreement that future construction would be in the national interest ".

Any way it is examined the showing is not encouraging. The total volume is inadequate, the distribution across Canada is uneven and the type of work lacks the variety necessary to produce maximum employment. It is to be hoped that an even balance can be established between building projects and engineering projects. During the war engineering work dropped to about one-third of the total instead of the one-half which it maintained in peacetime.

It is impossible to overstress the urgency and necessity of building up a proper reserve. Not only is there a great need for public work projects such as hospitals, schools and other institutions, recreational and community centres, highways and municipal services, but there may well be an urgent need for a ready programme to step into the breach, if as and when private business nears the end of its present abundant programme.

We must never again see " make work " projects such as followed the 1914-18 war when $800 million was spent for almost nothing. Surely human beings can read the lessons that come from experiences through which they have lived. There is no need to take someone's word for it. The magnitude of the objective must not be underestimated, and yet those in authority must not despair of reaching it. The issue is so clear in the minds of all people that there can be no doubt of where the responsibility will lie if they fail.

The report of the committee places considerable responsibility for the present unsatisfactory situation on the shortage of technical personnel available to the government service, and indicates that remuneration is the basis of the shortage. It says—

"A. It is evident to our Committee that extremely unsatisfactory progress in planning exists on a wide front. The reasons for this are mainly as follows:—

1. Failure of the Dominion-Provincial Conference to implement the Dominion's proposals on planning, with resulting delay in establishing planning grants by the Dominion to provinces and municipalities.
2. The critical shortage of planning personnel, due to insufficient numbers having been trained, and to the loss of large numbers by emigration, and
3. The low salary scales for technical persons offered by the Dominion and provincial governments, in contrast to those paid by industry ".

For countless years the Institute has been pressing the Federal authorities to recognize the importance of the work they have to do and the competency of their staffs to do it. Over these years some minor improvements have come to pass, but on the whole the situation is still far from satisfactory, and still far from indicating that the authorities have any conception of their responsibilities. If this short sightedness and bad administration prevents proper planning for the future, there is going to be an awful price to pay some day by someone.

Canadians will appreciate the good work done by the association's committee in exposing the situation. Let us hope their efforts will help to produce the needed results before it is too late.

NEW OFFICERS CORPORATION OF PROFESSIONAL ENGINEERS OF QUEBEC

At the annual meeting of the Corporation of Professional Engineers of Quebec held in the Ecole Polytechnique auditorium on Saturday, March 29th, 1947, the results of the recent elections for councillors were announced. The new Council held its first meeting and announced the new officers for 1947-1948 as follows:

President: Ernest Lavigne, Quebec.
Vice-President: J. B. Stirling, Montreal.
Secretary-Treasurer: J. A. Lalonde, Montreal.
Councillors: Louis Beaudry, Quebec; Leo Dufresne, Quebec; J. A. H. Henderson, Montreal; F. S. Howes, Montreal; J. W. McCammon, Montreal.

STAFF CHANGE

It is a matter of more than ordinary concern to the Institute that Louis Trudel who for over eight years has been assistant general secretary is leaving the organization to take a more senior appointment elsewhere. Members everywhere will regret this change but will wish him continuing success in his new activities.

Louis Trudel, M.E.I.C.

Fortunately for the Institute Mr. Trudel's new employer has given him leave of absence from April 1st to May 15th in order that he may complete the preparations for the annual meeting. This followed an explanation by the president of the Institute to Mr. James Wilson, president of Shawinigan Water and Power Co., which emphasized the serious position in which the Institute would find itself if Mr. Trudel's services were lost before the annual meeting. In reply Mr. Wilson graciously proposed the leave of absence. This gesture of understanding and helpfulness will be of real benefit to the members and particularly to Headquarters.

It will not be easy to replace Louis. His years of experience plus his natural talents have made him a most valuable and valued officer of the Institute. His untiring efforts, his intelligence and his geniality have endeared him to all who have had the privilege of knowing him. The services he has rendered are unique, and not many persons outside of a few officers and his associates at Headquarters really know the breadth and depth of his contribution to the success of the Institute.

It is of some consolation to members in Montreal to know that he is not leaving the city. Perhaps through a multitude of established channels he will be able to continue his contributions to life within the organization, and will remain an integral part of it all.

COMMITTEE WILL STUDY QUALITY CONTROL METHODS

A Special Committee has just been established by the National Research Council to promote the application of mathematical methods in the treatment of certain industrial production problems. Techniques in this field are now being widely used and it is estimated that, in the United States, some 4,000 persons are currently engaged in statistical quality control work.

Industries have achieved marked success with sampling inspection schemes which are used by manufacturers to control the quality or dimensions of mass-produced articles through the testing of a small fraction of the total output. Purchasers have also put acceptance-testing on an actuarial basis. Sample surveys of consumer requirements, welfare conditions, etc., provide data that can be used for a variety of purposes. In the experimental sciences, research workers find it necessary to make statistical analyses of their data for the proper planning and analysis of tests which must be undertaken with variable materials. The special techniques required in this comparatively new field of work are based on the mathematical theory of probability and special skills are required in the adaptation of these techniques for various purposes. Members of the Council's committee include specialists in statistical quality control procedures, in sampling surveys, in the design of experiments, and in biometry or the statistical study of variation.

The Committee will assist Canadian users of mathematical statistical methods by consultation and advice respecting specific technical problems, will support research in this field by qualified workers, and provide a means of liaison with technical groups in Canada and abroad. Chairman of the Committee is Dr. J. W. Hopkins, National Research Council, Ottawa.

A.I.E.E. MONTREAL MEETING FEATURES

For the 62nd Annual Summer Convention of the A.I.E.E. to be held in Montreal, Que., June 9-13, 1947, the Summer Convention Committee has planned, in addition to the excellent technical sessions, a programme of entertainment, inspection trips and recreation, which should make the Convention attractive as a vacation as well as of benefit professionally. Convention headquarters will be at the Mount Royal Hotel, in the heart of the city. Members of the Engineering Institute are cordially invited to participate in the meeting.

Entertainment

Excellent programmes for both men and women have been planned by the Hospitality and Sports Committees. Among the hospitality features for the men are the president's reception and cocktail hour, a smoker with refreshments and entertainment, and for both men and women is the famous Saguenay Boat Trip.

SAGUENAY BOAT TRIP:

The boat will leave Victoria Pier, Montreal, on Friday, June 13th at 6 p.m., arriving at Bagotville on the Saguenay River at 5 p.m. Saturday, June 14th. The scenery on this trip is some of the most impressive in the world. On arrival at Bagotville a trip to the Shipshaw Power Development has been arranged through the courtesy of the Aluminum Company of Canada. The boat will sail from Bagotville on Sunday morning at 1 a.m. and, on the return trip, arrangements have been made for stop overs at beautiful Murray Bay for 3½ hours and also at Quebec City from 3.30 in the afternoon until 8 o'clock at night. Passengers will thus have an opportunity to visit this historic city during daylight hours. The boat will dock in Montreal at 6 a.m. Monday, June 16th.

Note: The boat leaving on Friday, June 13th, has been completely reserved for members attending the A.I.E.E. Convention. In addition, arrangements have been made to take care of any overflow on the regular trip sailing from Montreal Saturday afternoon, June 14th, and returning to Montreal on Tuesday morning, June 17th.

SMOKER:

Tuesday, June 10th, starting at 8.30 p.m. using both the ballroom and the Normandie Roof on the ninth floor of the Mount Royal Hotel.

There will be two continuous shows, one in the Normandie Roof where tables will be provided, and food will be served from 8.30 to 11.00 p.m. An orchestra will be provided during the evening and there will be a continuous floor show, including dance teams, vocalists, sleight of hand artists and other acts.

At the same time, a carnival type of show will be in continuous operation in the ballroom. Beer will be available at a bar in this room and there will be continuous orchestra music, boxing matches, games of chance, tumbling acts, juggling and other entertainment.

Accommodation will be limited to 900 and it is suggested that reservations should be made at the earliest possible date.

LADIES' ENTERTAINMENT:

Open house will be held all day Monday, June 9th, for the ladies in one of the Mount Royal Hotel salons where they may avail themselves of the opportunity to meet old friends and to make new ones.

On the following day, there will be a Fashion Show and tea at one of the leading Montreal department stores at 3.30 in the afternoon.

On Tuesday evening, June 10th, arrangements have been made to hold a card party at the Mount Royal Hotel. A light lunch will be served and prizes distributed.

One of the features of the Ladies' Entertainment will be a Laurentian Mountains Tour. On Wednesday, June 11th, buses will leave the Mount Royal Hotel at 10 a.m. and return towards 5 p.m. This tour presents an excellent opportunity to secure a view of the playground of eastern Canada. The tour consists of a 100-mile trip through a region covered with lakes and rivers in a mountainous setting. Lunch will be served at the Alpine Inn where an opportunity will be given the guests to walk about and view the exceptional scenery.

On Thursday afternoon, June 12th, arrangements have been made for a sightseeing tour of Montreal, ending with a visit to the Botanical Gardens. Buses will leave the Mount Royal Hotel at 1 p.m. and return at 4.30 p.m. During the tour, there will be an opportunity to visit many of the main points of interest within the city, such as St. Joseph's Shrine, Notre Dame Cathedral, the old business area with its narrow streets, the city buildings, the Chateau de Ramezay, constructed between the years 1705 and 1723 and now being used as a museum, the markets, harbour, parks and residential areas. Towards the end of the tour, tea will be served at the Botanical Gardens.

GOLF:

The Sports Committee are making arrangements for a full golfing programme.

Inspection Trips

BEAUHARNOIS POWER PLANT:

This is one of Canada's largest hydro-electric installations and is located on the shores of Lake St. Louis, some 22 miles west of Montreal. The power house itself is over 1,000 ft. long and contains 14 generating units, aggregating 650,000 hp. The development utilizes the normal drop of 82 ft. between Lake St. Francis and Lake St. Louis on the St. Lawrence River.

On the trip one of the points of interest will be the Indian village of Caughnawaga, founded in 1716, and still retaining many features of the early atmosphere.

SCENIC TOUR OF MONTREAL:

A tour has been arranged, exceeding two hours in length, in which delegates will see Montreal at its best: the unequalled Notre Dame Cathedral, the Chateau de Ramezay, built in 1705 as the Governor's residence, St. Joseph's Oratory (a world famous shrine), McGill University, Montreal's beautiful residential areas, factory districts, financial centres, the old French district and many scenic subjects of the historic city.

MCGILL CYCLOTRON:

For delegates interested in nuclear research, an inspection trip has been arranged to the cyclotron laboratory at McGill University.

At the time of its undertaking, this cyclotron was of unique design and the largest of its type.

Much of Lord Rutherford's early work in nuclear physics was done at McGill and, since then, the University has contributed many prominent names connected with the developments leading to the atomic bomb. It is not expected that the cyclotron will be completed at the time of the Convention but the delegates will be able to see many components of this highly complex machine in a state of assembly.

INSPECTION OF THE SHIPSHAW POWER DEVELOPMENT:

For those delegates taking the boat trip from Montreal to the Saguenay, the Committee has arranged a special side journey of outstanding engineering interest. The delegates will be taken from the boat side to the Shipshaw development of the Aluminum Company of Canada. The Shipshaw development comprises two generating stations with a total installed capacity of 1,500,000 hp.

In addition to the above trip, the Inspection Trip Committee has arranged for limited accommodation on a commercial air line on June 11th for delegates who, by force of circumstances, are unable to spare the time for the boat trip. This trip can accommodate only 28 persons and delegates wishing to take advantage are cautioned to request space well in advance. Accommodation will not be held later than 10 a.m. June 10th.

Hotel Accommodations

The Hotel Committee has been fortunate in securing block reservations at a group of hotels. All are within a short distance of Convention Headquarters.

Single rooms will not be available. To facilitate the work of the Committee, delegates should indicate with whom they desire to share a room or preferably, make a joint reservation.

Reservations

Delegates should make their reservations now for all events, and especially for their hotel accommodation and the Saguenay Boat Trip. Address all requests to Mr. G. H. Gillett, c/o Canadian General Electric Company, 1000 Beaver Hall Hill, Montreal, Que.

PRESIDENT HAYES VISITS MARITIME BRANCHES

With the completion of his visits to the branches in the Maritimes last month, J. B. Hayes of Halifax has become the most travelled president in the history of the Institute. This is accounted for by the fact that there are now 28 branches, two of which were inaugurated in the past year, and that he represented the Institute at a Commonwealth Conference of Engineering Institutions held in London last September. Following the practice established in recent years, the president in the course of his branch visits called upon most of the universities across Canada and spoke to the students.

Other events, besides the Annual Meeting, which in the course of the year made important demands upon the president's time were the Semi-Annual Meeting of The American Society of Mechanical Engineers in Detroit last June and the Maritime Professional Meeting of the Institute at Digby, N.S., in September.

Moncton

The presidential party, throughout the maritime tour, consisted of President and Mrs. Hayes, Councillor and Mrs. G. J. Currie of Halifax, and the assistant general secretary from Headquarters. Other officers joined the group for various parts of the trip as indicated later.

The tour was inaugurated at Moncton on March 12th. Soon after arrival the party was taken on an inspection trip, with executive officers of the branch and their wives, through the Ice Manufacturing Company and the Marvens Biscuit Company's plants, and the Trans-Canada Air Lines airport.

A dinner, with the ladies present, was held in the evening at the Brunswick Hotel. In the absence of Branch Chairman E. R. Evans, Past Vice-President George L. Dickson directed the proceedings in a most informal and pleasant fashion. Invited to say a few words, Mayor Bridges paid tribute to the Moncton Branch whose members had been of great help to the City in the recent water supply emergency. The president was the principal speaker and was followed by Councillor Currie, the assistant general secretary and W. C. MacDonald. Attention was called to the fact that C. G. S. Rogers and H. J. Crudge, both past officers of the branch, had attained the distinction of Life Members. Visitors from other branches were Mr. and Mrs. N. F. Nutter from Truro, R. M. Richardson from Saint John, N.B., and C. D. Martin, Halifax.

Fredericton

Upon arrival at Saint John, the next morning, the party were met at the station by branch executives and later a caravan of several automobiles set out for Fredericton by the river road. Saint John members who accompanied the presidential party on this now traditional excursion to Fredericton were Councillors G. M. Brown and A. A. Turnbull, Past Vice-President G. G. Murdoch, Chairman L. O. Cass, Secretary K. W. Salmon, J. T. Turnbull, V. S. Chestnut, A. R. Bonnell, C. D. McAllister.

At the luncheon meeting presided over by John A. Scovil, president of the University of New Brunswick Engineering Society, there were present Milton V. Gregg, president of the University, several members from Fredericton and about 90 students, all members of the Institute. In view of this display of interest, the opinion was expressed by Professor E. O. Turner and heartily endorsed by the meeting, that application in

PRESIDENTIAL VISIT TO SACKVILLE

At left, left to right: President J. B. Hayes, H. W. McKiel, Dean of Science at Mount Allison, Mrs. Hayes and President Flemington of Mount Allison.

Above, left to right: Professor West, Mrs. McKiel, Wing Commander C. F. Johns, and Mrs. Flemington.

Below: The students at Mount Allison hear President Hayes speak.

THE PRESIDENT IN SAINT JOHN

Mrs. G. J. Currie responds to the toast to the ladies.

Head table, left to right: General Secretary L. A. Wright, Mrs. Currie, Vice-President C. M. Anson, President Hayes, Branch Chairman L. O. Cass, Mrs. Hayes, Mayor McKenna.

F. A. Patriquen (fourth from the left) and C. D. McAllister (extreme right) are seen in the above group.

Above, left to right: B. E. Bayne, V. S. Chestnut, J. T. Turnbull, Mrs. Mooney, Mrs. Turnbull, J. P. Mooney.

the near future for the establishment of a branch of the Institute in Fredericton would be justified.

The visitors were shown through the University buildings in the afternoon and at 4 o'clock proceeded to the Convocation Hall where the students heard from President Hayes, Dr. L. Austin Wright who had joined the party at Fredericton, and Councillor Currie. A feature of the meeting was the presentation of the Institute prize certificate for 1946 to A. M. Stevens.

The visitors then joined the ladies for tea at the home of Dr. E. O. Turner after which they returned to Saint John.

Saint John

At this point, C. M. Anson of Sydney, vice-president of the Institute for the Maritimes, and Councillor J. B. Stirling of Montreal, joined the party. On Friday, March 14th, the visitors were entertained for lunch at the Union Club, Past Vice-President Murdoch doing the honours. Members of the branch executive and officers of the provincial association were present.

In the afternoon, a meeting was held between officers of the association and members of the Institute headquarters' staff in order to discuss a simplified procedure in the implementing of the co-operative agreement.

The branch meeting was held that evening at the Admiral Beatty Hotel and took the form of a dinner with ladies present. Branch Chairman L. O. Cass presided and Mayor McKenna extended the city's welcome to the visitors. A toast to the Institute was proposed by Frank P. Vaughan and responded to by President Hayes. The toast to the ladies was proposed by Otis Logue and very aptly responded to by Mrs. G. J. Currie. Other speakers were Dr. L. Austin Wright, C. M. Anson, G. J. Currie, and Louis Trudel. Visitors from other branches included B. E. Bayne, Moncton, and C. D. Martin, Halifax.

Council Meeting

On Saturday, March 15th, a regional meeting of the council was held at the Admiral Beatty Hotel. President Hayes was in the chair and, following his established custom, asked Vice-President Anson to take over for part of the proceedings.

In addition to members of council, there were also present officers of the Association of Professional Engineers of New Brunswick, past officers of the Institute in the province and members of the branch executive. A valuable discussion took place on matters of professional interest to both the provincial association and the Institute. Other questions of local interest were also dealt with such as the ratification of amendments discussed the day before with officers of the Association, and the possibility of holding a Maritime Professional Meeting in New Brunswick in the fall of 1948.

Sackville

After a quiet Sunday in Saint John, the presidential party left Monday morning, March 17th, for Sackville. At Moncton, Past Vice-President G. L. Dickson and John Hardman joined the group. At Sackville, Past-President H. W. McKiel, Dean of Science at Mount Allison, and Mrs. McKiel greeted the party at the station and took them over to Marshlands Inn where they were the guests of the owners, H. W. Read, M.E.I.C., and Mrs. Read. President Flemington of Mount Allison and Mrs. Flemington were present as well as members of the Institute in Sackville and their wives, and Dave MacCallum, president of the Engineering Undergraduate Society.

The visitors were then escorted through the University buildings by Dr. McKiel and Professor F. L. West and later addressed the students. The party, minus Messrs. Dickson and Hardman who had returned to Moncton, left Sackville by train at the end of the afternoon.

Cape Breton

Sydney was reached on the morning of March 18th after an overnight journey from Truro. The party were met at the station by Vice-President C. M. Anson, Branch Secretary Gordon Naish and Walter Graham.

At lunch that day, the visitors were guests at the Rotary Club where the Institute vice-president, Clem Anson, general manager of Dominion Steel and Coal Corporation, was the speaker and gave an interesting address on the background of Sydney's steel industry. In the afternoon, J. H. Fraser, general superintendent of Dosco's steel division, showed the visitors through

EMPLOYER PRACTICE REGARDING ENGINEERING GRADUATES

Recently the results of an unique survey were reported to The Engineers' Council for Professional Development (E.C.P.D.), with the request that they be submitted to the constituent members of the Council for whatever action they think appropriate. The Engineering Institute is a member of E.C.P.D. and therefore is one of the eight organizations to which the report has been submitted. The survey was conducted by the Engineers' Joint Council (E.J.C.), a group made of representatives of the six leading engineering societies in the States.

The survey is unique in that it uncovers a lot of useful and interesting information other than salaries. It deals with salaries of course but is important principally for the information it provides about employers' policies and attitudes towards the graduate.

The sub-committee making the survey is careful to point out that the data are of limited scope and should be accepted with some reservation. They recommend that Engineers' Joint Council make a more complete survey along the same lines perhaps in the Fall of 1947.

Of particular interest is the information about future needs of employers. The average increase in numbers of engineers to be employed per year for the next four years is just a little less than 8 per cent. The Compton Committee report completed in April 1946 based on replies from 125 companies showed a figure of 17 per cent per year. This disagreement indicates the difficulty of obtaining thoroughly reliable information. Both reports cover about the same number of firms and apply to periods of time only three or four months apart.

It is interesting, too, to note that personality is first on the list of considerations which influence employers in examining applicants. Salary is the last item on the list. From a professional society point of view it is encouraging to see that "practically all" employers encourage membership in engineering societies, and that "travelling expenses are usually paid for attendance at meetings".

The following paragraphs make up the major portion, but do not constitute the complete report.

Introduction

The younger engineers have been actively seeking advice and guidance from the national engineering societies, of which they are junior members. The Engineers' Council for Professional Development has consistently endeavoured to better the professional status of the engineer, but in the recent years there has been an insistent request from a small but voluble portion of the junior engineers to obtain from the societies some tangible aid regarding their economic status.

The Engineers' Joint Council recognized that surveys of the engineering profession regarding salaries and advancement based upon data obtained from employees as individuals should be supplemented with a survey of employers in industry. The object of this survey is to learn directly from a representative group of industrial employers their attitudes and policies pertaining to the selection, training, placement, advancement, guidance, and professional activities of engineering graduate employees.

Before canvassing industry on a large scale, a trial questionnaire was sent in May, 1946 to 174 employers of engineers, including small and large organizations. Replies were received from 104 employers in 19 fields of industry up to August 1, and form the basis of this report. Colleges were also included, as they, too, employ the graduates of their own or other schools, as well as those who return from industry to teach.

This report has been prepared with a belief that the present data may be helpful to the Junior Engineers, the employers of engineering graduates, the colleges from which future graduates will be available for employment and the engineering societies.

Collectively the 104 cooperators employ more than 2,000,000 persons, of whom about 40,000 are engineers. Because of the representative character and distribution of the cooperators, the data received from this preliminary survey are regarded as worthy of a brief analysis and report. See summary data in the Table I.

Who Are Hired?

Ninety-six per cent of the cooperators employ cadet engineers directly upon graduation from engineering schools, but only 4 per cent recruit their engineering staffs exclusively from the new graduates. About 43 per cent hire more than half of their new engineer employees after one or more years' experience with other employers. This is evidently a matter of necessity or expediency rather than preference, because more than 60 per cent of those reporting indicate that they prefer to hire the new graduate.

How Are Cadet Engineers Recruited?

Seventy per cent of those replying send representatives to engineering schools, who interview students individually; nearly all of these discuss the candidates personally with members of college faculties, in addition to interviewing the students themselves.

Other means of recruiting new graduates are apparently of little avail.

How Are Experienced Engineers For Specific Openings Obtained?

For filling specific openings, advertising is used by 50 per cent of those replying and employment agencies by 35 per cent. Thirty-five per cent also utilize the facilities of Engineering Societies Personnel Service, Inc., 18 per cent consult placement bureaux, and 12 per cent report that their present employees bring men in. A few cooperators obtain engineers from associated companies, but United States Employment Service and the National Roster of Scientific Personnel are each used by only one company in this group.

How Are Engineering Employees Selected?

Twenty-five per cent of those reporting do not differentiate between engineers and other employees in the process of hiring. The other 75 per cent rely chiefly on personal interviews between the candidates and engineering executives, although 20 per cent of the cooperators employ aptitude or other tests for evaluating the applicant's ability.

What are the Bases on which Engineering Employees are Selected?

The questionnaire listed nine items presumably considered when selecting an engineering employee, asking each cooperator to list the order of importance given to each in arriving at an overall evaluation. From a statistical analysis of the replies, weighting the first, second and lower choices in the way that preferential ballots are usually counted, the considerations which carry the most weight in selecting a candidate for an engineering position, in the order of their importance, are as follows:

1. Personality

2.-3. Scholastic record; Indicated promise of development in specific field of engineering

4. Engineering experience
5. Evidence of ability to cooperate with others
6. Recommendations by qualified people
7. Indicated promise for executive development
8. Standing of college from which candidate was graduated
9. Salary requested

If only first choices are considered, the order of preference is somewhat changed, engineering experience ranking second instead of fourth, but personality still leads the list. Experience would no doubt rank higher and scholastic record lower, if it were not for the fact that the employment of recent graduates is uppermost in the minds of those seeking to increase their engineering forces.

Is the Present College Training of Engineers Satisfactory?

Eighty-three per cent voted yes, 14 per cent no. The predominant criticism of applicants for engineering employment by the 14 per cent were:

1. Lack of fundamentals—physical sciences and mathematics
2. Inarticulateness in speech and writing

3.-4.-5. Lack of education in the humanities; Lack of drafting and design experience; Lack of knowledge of economics and business

6. Lack of knowledge of operation and production

What is the Prevailing Policy in Regard to Starting Salaries and Advancement?

Twenty per cent of the cooperators indicated that every new engineer employee is regarded as a special case, and starting salary is based on his particular qualifications. The others were about equally divided between those who are influenced by prevailing rates in other companies and those who indicate that their salary scales are arrived at independently.

No company reports a starting monthly salary of less than \$150. and only four less than \$175. Five companies report starting salaries above \$250. The median (50 per cent level) is approximately \$207 per month.

In regard to advancement after initial employment, only 26 of the cooperators gave data. They were all within twelve industries, but none had enough data to indicate reliably consistent trend for the individual industry, therefore they were grouped and the average rate of advancement is approximately as follows:

Time of Advancement	*Minimum Percentage*	*Median* *Percentage Base-\$207*	*Median* *Actual*	*Maximum Percentage*
At the end of 6 months	2.5	8.0	\$16.60	14.3
At the end of 12 months	3.6	14.6	30.30	28.6
At the end of 18 months	7.5	24.2	50.00	42.9
At the end of 24 months	10.0	29.2	60.40	57.2

What is Done for Technical and Professional Development of Engineer Employees?

Only 50 per cent of the cooperators report that special provision is made for professional development of the young engineers in their employ, but practically all indicate that their engineering organization provides definite opportunities for professional advancement.

Thirty-seven per cent have formal training programmes for young engineers; 65 per cent indicate that

Table I

Summary of Significant Data from Survey of Employer Practice Regarding Engineering Graduates

Industries arranged in Groups according to Percentage of Engineers to Total Employees. Item 10

1 Group	A	B	C	D	Total and Averages Weighted by Indiv. Coopertrs.
2 Industries included	Colleges	Instrument Electrical Petroleum Chemical Aircraft	Machinery Building Paper Glass Utilities Metals Coal	Textiles Soap Rubber Automotive Shipbuilding Transport'n. Food	
3 Questionnaires sent out	10	47	74	43	174
4 Questionnaires returned	8	32	44	20	104
5 Questionnaires returned—%	80	68	60	47	60
6 Total Employees of Cooperators	4,785	438,874	788,408	780,994	2,013,061
7 Total Employees Reporting, both Total and Engrg. Grad. Employees	1,310	438,874	630,658	500,994	1,571,836
8 Engrg. Graduate Employees	585	21,252	9,333	2,588	33,758
9 Engineer Employees to Total—%	44.6	4.85	1.48	0.52	2.15
10 Range in % of Engrs. to Total Employees, when Grouped by Industries	44.6	6.6 to 3.9	2.0 to 1.0	0.9 to 0.3	44.6 to 0.3
11 Starting Monthly Aver. Salary—\$	198	208	210	204	207
12 Executives who are Engrg. Grad. % of Total Executives	70	41	48	23	42
13 Officers who are Engrg. Grad.—% of Total Officers	52	39	41	24	37
14 Engrs. Role in Development of Company "Very Important"—% Cooperators	100	90	77	65	80
15 Engrg. Grad. "Better Potential Opportunities" than other Employees with Comparable Education—% Cooperators	50	57	66	45	58
16 Opportunities for Future Advancement of Engrg. Grad. "Greater than Ever."—% Cooperators	86	57	64	42	59
17 Estimated Increase in Engrg. Grads. needed in next 4 years—% of Present Engineers	23	32	34	26	31

jobs are varied to provide a broad training; 41 per cent provide technical programmes within the company; 78 per cent encourage taking courses outside of company hours, and more than half of these contribute to the cost of tuition for such courses. (Some multiple choices are included in the foregoing percentages.)

Is Membership in Engineering Societies Encouraged?

Practically all encourage membership in engineering societies. Nearly 30 per cent pay the dues of certain employees in certain societies. Travelling expenses are usually paid by employers for attendance at meetings when employees are authorized to serve on committees, prepare papers, present discussion, and the like.

Need for Engineers During the Next Four Years

Item 17 of the Summary Table shows that over the next four years an average annual increase of about 8 per cent in the number of engineers was anticipated by the cooperators when they replied in June and July, 1946 to the questionnaire.

Conclusions

It is recognized by the Committee that the data are of limited scope, and therefore, should be accepted with some reservations.

This committee recommends to the Engineers' Joint Council that a better and more complete questionnaire be prepared and a more extensive survey be made along the line in which this trial survey was directed, in the near future, say the Fall of 1947.

PRESIDENT HAYES VISITS MARITIME BRANCHES

(*Continued from page 174*)

the plant, after which they called on the chairman of the branch, Colonel Johnny Angus Macdonald, who was at home recovering from a recent illness. The ladies were being entertained at tea by Mrs. Macdonald.

In the evening, while Mrs. C. M. Anson was hostess to the ladies for dinner at her home, the branch dinner meeting was held at the Navy League, under the chairmanship of C. M. Anson. The president was the principal speaker and was followed by G. J. Currie, Louis Trudel and W. S. Wilson.

After the meeting, the visitors joined the ladies at the home of C. M. Anson.

Antigonish

The morning of March 19th, the presidential party, accompanied by Vice-President and Mrs. Anson, left by motor for Antigonish where they arrived for lunch after an epic crossing of the Straits of Canso.

Reverend P. J. Nicholson, president, and Reverend W. P. Fogarty, M.E.I.C., professor of engineering, did the honours at St. Francis Xavier University. A. M. Macgillivray, an alumnus of St. Francis Xavier and a past-councillor of the Institute from Saskatchewan, now retired at Antigonish, joined the party at the university.

The group first had an opportunity of meeting with the students and were then shown through the buildings. Tea was served in the faculty dining room. During that time, the ladies were escorted by Mrs. D. J. MacNeil through the Mount St-Bernard Convent and went for tea to Professor MacNeil's home where they were later joined by the men, and the caravan got under way for Halifax.

Halifax

Like Ulysses returning to the fatherland after a long journey, President Hayes was given a great welcome in his own branch.

On the evening of March 20th, he paid a visit to Nova Scotia Technical College where the boys from St. Mary's College had joined with the local students to hear words of wisdom from the president. Dr. F. H. Sexton, retiring president of the college, expressed the welcome on behalf of the faculty who were all present and the students. President Hayes first presented the Institute prize certificate for 1946 to J. P. Oakley. He then addressed the student body, recalling his experiences across Canada and during his trip to England last September. His remarks concluded with three pieces of advice which were enthusiastically received. He was followed by Vice-President Anson who urged the students to remain in the Maritimes upon graduation and thus give their own province the benefit of their education, assuring them that local industry could use their talents. The assistant general secretary then spoke on the organization of the Institute.

The branch meeting at night took the form of a dinner in the Nova Scotian Hotel. Branch Chairman E. C. O'Leary presided and introduced the president.

Mr. Hayes expressed his satisfaction at the pleasant experiences which the discharge of his presidential duties had procured him. He recalled his trip across Canada and in England, and concluded with an outline of what he felt were the engineers' responsibilities in the future. He was thanked by Ira P. Macnab who praised very highly the manner in which President Hayes had discharged his duties.

The toast to the ladies was proposed by W. C. Risley and was very aptly responded to by Mrs. Hayes. Other speakers were C. M. Anson and Louis Trudel.

The meeting concluded with musical numbers rendered by local artists.

NOTICE TO STUDENTS

Student members of the Institute who are about to leave the university, whether definitely or only for the summer season, are requested to inform Headquarters of their new address, so that the *Journal* may be forwarded to them.

This is particularly important in the case of those who live in fraternities or boarding houses during the scholastic year. With present restrictions on the use of paper, it is imperative that no copies of the *Journal* go to waste.

Don't forget to inform us of your new address when returning to college in the Fall. Headquarters will change your mailing address as often as necessary provided you supply the information.

All changes should be recorded with the General Secretary, 2050 Mansfield St., Montreal 2.

As reported in the February *Journal*, the officers of the Institute entertained at luncheon on February 26th, Sir Frederick Handley Page, president of the Royal Aeronautical Society. The above photographs illustrate the occasion. On the left, left to right: (facing camera) Sir Frederick Handley Page; J. B. Hayes, president of the Institute; Dr. E. P. Warner, president of the Interim Council of ICAO. (Backs to camera) J. B. Stirling, councillor of the Institute; J. H. Parkin, National Research Council, Ottawa. On the right, left to right: Dr. J. J. Green, Air Transport Board; Sir James Cotton, head of the United Kingdom permanent delegation to ICAO; J. E. Armstrong, vice-president of the Institute, J. J. O'Neill, dean of engineering at McGill; W. A. Newman, head of research department, C.P.R.; F. P. Shearwood, past-president of the Institute.

CORRESPONDENCE

The Case Against " Free Designing "

Ottawa, March 12, 1947.

Dr. L. Austin Wright,
General Secretary,
The Engineering Institute of Canada,
Montreal, Que.

Dear Dr. Wright:

In the closing paragraph of his letter in the January issue of *The Engineering Journal,* Mr. Henry Jasen states that . . . " very frequently, structural engineers are not engaged for designing buildings in the province of Quebec, because material suppliers . . . furnish design drawings ". This state of affairs is not restricted to Quebec, nor is it restricted to the structural branch of the profession.

The blame for the condition lies chiefly with the architects, since most of the structural engineering, heating and ventilation, mechanical engineering etc., that is tied up with the design of a building, is put into the hands of the supply houses by them. The architects' code of practice states distinctly that no architect may permit any supply house to provide him with free engineering services; that if such service is supplied, the supplier shall not be allowed to bid on the work, except under conditions that will ensure competitive bidding.

In Ottawa, about 90 per cent of the work done by local architects is farmed out in this manner and, in consequence, architects who do abide by the rules are at a disadvantage, since they pay for such services. The result is that the consulting engineer finds himself compelled to cut fees by 50 per cent or more, in order to have some chance of competing against firms giving " free designs ".

I feel that much of the apathy towards this matter is due to the fact that in Ontario at least, most of the architects in Toronto abide by the rules, the consulting engineers get the work, and are, therefore, not interested in the problems of the smaller man outside that centre.

There is no objection to a supply firm carrying out design, provided that it is done by competent engineers, that a definite fee is charged for the work (whether or not that firm gets the contract), and that the seal of the responsible engineer is put on the drawings.

The supply house heads, in every case where I have discussed this matter with them, profess to deplore the present practice, and state they would be only too willing to discontinue it, " if the other fellow would do the same ".

Some time ago I wrote the Ontario Association of Professional Engineers suggesting that since the supply house heads profess to be of this mind, all that is needed is a conference to be called by the Association, to which supply representatives would be invited, to agree to an announcement that as of a certain date there would be no more free designing.

The Professional Engineers' Act, revised statutes of Ontario, 1937, chapter 237 as amended by 1946 chapter 75 states, " Each member of the Association shall have a seal . . . with which seal he shall stamp all official documents and *plans* ". That is the law of the land. Yet I know of no case where the plans prepared by a supply house bear the imprint of such a seal. I do know of many cases where plans prepared by supply houses have been used for the construction of buildings without it.

If the provincial associations could come to agreement, they have it in their power to advise their membership, that any engineer performing professional services for which he did not make a direct charge, or turning out any plan not bearing his professional seal, would be proceeded against, or be struck off the membership list. Drastic, certainly, but I am certain it would get results.

I consider that the Professional Engineers' Council under the powers vested in them by Section 32 (1) of the Ontario Act, should take action against supply house engineers, as being guilty of unprofessional conduct, even though the Council is not prepared to bring a charge of contravening the statutes.

The abolition of " free designing " will give the ultimate buyer a better job for less money. There will be an end to ' handbook engineering ', and the practising engineer will get better value for the Association fees he has to pay.

Yours faithfully

(Signed) H. B. Dickens, M.E.I.C.,
Consulting Engineer,
Ottawa, Ont.

EDUCATION FOR MANAGEMENT

Under this heading the Minister of Education for Great Britain has issued a report prepared by a special committee appointed by the government to study and recommend means by which adequate educational facilities for the study of management in industry and commerce could be provided.

The report has been in the possession of the Institute for some time, but it is only recently that it has been taken out of the "confidential" classification. The chairman of the committee is Lt. Col. L. Urwick, O.B.E., M.C., a world leader in this field. Readers of the *Journal* may recall that his article "Education for Management" appeared in the October, 1946 issue.

As a background for studying the work of the committee, Canadians should recall that some time ago the government announced that it had arranged some very substantial support to aid in the establishment of a British National Management Institute. This support takes the form of an annual contribution of £30,000 for a period of five years. The recommendations of the committee will be fundamental to the policy and operation of the Institute.

Incidentally, it is significant that British industry has also taken steps to advance the study of management. They have set up a staff college at Henley on Thames, and should be well into their programme by now.

It should be borne in mind that the terms of reference made specific mention of "the requirements of professional organizations and the need of their coordination". This explains the frequent reference to "multiplicity of courses" in the following paragraphs.

By way of arousing in the management student an interest in the report, and of providing some interesting information to the casually interested reader, the following excerpts are taken from different sections of the report:

"We have not been able to arrive at an accurate estimate of the number of persons engaged in managerial functions at the present time, as there are no statistics later than the 1931 Census to serve as a basis. Starting from these 1931 figures, however, and making allowance for the considerable changes that have taken place since, it can be estimated that between 400,000 and 450,000 persons in the United Kingdom are so engaged at the present time.

"If it is assumed that the working life of individuals discharging managerial functions is 35 years, an annual intake of some 12,000 recruits is required. It must be understood that this figure is no more than an estimate, in which allowance has been made for changes in the size and distribution of the working population since 1931, and that it is necessarily subject to a considerable margin of error, owing to the presence of factors whose significance cannot be accurately known. None the less, the figure is of an order of magnitude which shows the importance of the field of work under consideration.

"We wish to express our agreement with the Percy Committee on Higher Technological Education in its findings on 'management studies'. That Committee was 'impressed by the statement made by several witnesses, that the highly trained technician is often ignorant of the principles of industrial organization and management and that he often shows no inclination to accept administrative responsibility. Admittedly there is much in this field that can be learnt only from experience; but there is a body of knowledge, awareness of which may greatly facilitate the process of learning'.

"The art of conducting human systems of co-operation of many kinds has been a constant preoccupation throughout the ages. A valid distinction cannot be drawn between the study of management for one purpose rather than for another, nor is there anything new in the suggestion that management should be the subject of theoretical study.

"The channels through which the individual approaches managerial responsibilities are as varied as the intake into industry itself; they could not conceivably be made to correspond with any common educational background. Thus the future manager may be drawn from the boy or girl who leaves school at 15 or from the graduate who enters business between 22 and 25 years of age. While both may possess the same potential capacity for leadership and for exercising managerial functions, there is a marked disparity between their educational standards and immediate achievements. This leads to the core of the whole problem, the difficulty of providing a course of study suited to a wide diversity of needs.

"The pattern of recruitment to managerial posts has changed considerably over the last twenty years. Where previously appointments to such positions as Works Manager and Departmental Manager had been from among those who had achieved advancement from the ranks through the various foremen grades, the more recent employment of an increasing number of qualified engineers, chemists and so on has introduced a new class of competitors for such positions.

"We have examined statistics relating to three of the recognized professional institutions (2 engineering and 1 accountancy), the purpose of which was to estimate the extent to which men who had originally entered these professions had, during their careers, acquired managerial responsibilities. The figures for the three institutions, based on random samples, show a remarkable agreement, and demonstrate that in the course of their career some 70 per cent of these men engaged in 'managerial functions'.

"We believe that the practical results of this development (multiplicity of syllabuses) are likely to prove embarrassing to education authorities, on whom rests the responsibility for providing facilities for training in management. Some means should therefore be found of simplifying and assimilating the curricula devised by various professional bodies."

The report supplies a summary of the committee recommendations which is reproduced herewith. The report, itself, runs into about 15,000 words—all of them interesting—but making up a volume too large to reproduce in their entirety in the *Journal*. Here is the summary—

(1) That action is necessary if multiplication of courses in management is not to dissipate national facilities which are already inadequate. So long as each professional institution requires its own syllabus in this field, this must create difficulties for the teaching institutions.

(2) That the professional institutions should accept the obligation to include in their syllabuses as large a common management content as possible and confine specialized demands in this field to the essential minimum.

(3) That courses leading to qualifications in man-

agement should be limited to two stages, namely, "Intermediate" and "Final".

(4) That all Management Professional Institutions should adopt a common curriculum for the Intermediate course and that Technical Professional Institutions should adapt any management requirements in their syllabuses to this common curriculum.

(5) That the Intermediate course should consist of three parts—an Introduction to management, the "Background" subjects and the "Tool" subjects.

(6) That there should be two types of Final course, one for those who wish to qualify for management in some specialized field, the other for those who wish to qualify in general management.

(7) That the curriculum for the Final course in each specialized field should be prescribed in large part by the appropriate Management Professional Institution and that the curriculum for the Final course in general management should be prescribed by the appropriate national authority, but that Final courses of both types should contain certain common elements.

(8) That both Intermediate and Final courses should lead to qualifying examinations.

(9) That all professional institutions concerned should consider whether the syllabuses given in Appendices B and C are acceptable in broad outline as a basis for the action recommended above.

(10) That a student wishing to qualify in general management after qualifying in specialized management should do so only after an appropriate interval.

(11) That students should not begin a Final course in specialized management before the age of 23 or in general management before the age of 25. Special arrangements should be made for the older student.

(12) That students should not be expected to give more than 100 hours a year to formal part-time instruction at any stage of their courses. The possibility of granting day release should be considered.

(13) That statistical information should be collected and published on the need for men trained in management and the educational facilities available. A number of agencies should collaborate in this work.

(14) That immediate steps should be taken to secure an increase in the supply of trained teachers in management, both part-time and full-time.

(15) That an Advisory Council on Education for Management should, from the outset, be associated with the proposed Central Institute of Management.

(16) That a commission of enquiry should visit the United States of America to investigate and to report on the facilities for education in management in that country as compared with those provided in Great Britain.

MEETING OF COUNCIL

A regional meeting of the Council of the Institute was held at the Admiral Beatty Hotel, Saint John, New Brunswick, on Saturday, March 15th, 1947, convening at ten o'clock a.m.

Present: President J. B. Hayes (Halifax) in the chair; Vice-President C. M. Anson (Sydney); Councillors G. M. Brown (Saint John), G. J. Currie (Halifax), J. B. Stirling (Montreal), A. A. Turnbull (Saint John); General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel. There were also present by invitation—Councillor-Elect C. D. McAllister (Saint John); Past-Councillors B. E. Bayne (Moncton), A. R. Crookshank (Saint John), J. P. Mooney (Saint John); R. M. Richardson, vice-president, E. G. Percy, councillor, and E. L. Ball, secretary, of the New Association of Professional Engineers of New Brunswick, V. S. Chestnut, chairman of the joint finance committee; L. O. Cass, chairman, J. M. M. Lamb, immediate past chairman, J. N. Flood and F. A. Patriquen, past chairmen, and K. W. Salmon, secretary-treasurer, of the Saint John Branch, C. D. Martin, of Halifax.

Honorary Memberships: Councillor Turnbull and Past Councillor Bayne were appointed scrutineers to open the ballot for honorary memberships. They presented their report which indicated that a unanimous favourable vote had been recorded. Accordingly, Dr. Ernest Brown, former Dean and Emeritus Professor of Civil Engineering at McGill University, Montreal, Dr. Percy Dunsheath, past president of the Institution of Civil Engineers, London, England, Dr. C. J. Mackenzie, President of the National Research Council, Ottawa, and Dr. F. H. Sexton, President of the Nova Scotia Technical College, Halifax, were declared elected honorary members of the Institute.

Canadian Council: Mr. Stirling stated that he would like to make an explanation to Council of the delay in dealing with some of the matters referred to his committee. This was due to the fact that the committee was made up of members located from Halifax to Vancouver. Last year it had been possible to hold three or four meetings at which all members except Mr. W. G. Swan, of Vancouver, had been present. He much preferred to have meetings of his committee rather than deal with the various items by correspondence, but it was not always possible to do so.

At the last meeting of Council a resolution from the Winnipeg Branch had been referred to his committee and he had replied to the secretary of the branch informing him that the matter was being considered and that a reply would be given to Council at the April meeting.

At the president's request, Mr. Stirling read the resolution and commented on the various items paragraph by paragraph. The resolution was a little difficult to understand but seemed to express support of the recommendation of the Committee on Professional Interests that a committee of presidents be set up rather than the Canadian Council of Professional Engineers and Scientists. Mr. Stirling pointed out that the Institute was definitely in favour of co-operation with other engineering bodies.

Mr. Richardson reported that as far as New Brunswick is concerned, both the Saint John Branch and the New Brunswick Association could see no need for a Canadian Council. At its recent annual meeting, the New Brunswick Association had confirmed its decision of a year ago that it could not support the Canadian Council in any way, financially or otherwise.

At this point, at the request of the president, Vice-President Anson took over the chairmanship.

Ontario Provincial Division: The general secretary reported that requests for the establishment of a provincial division had been received from a majority of the corporate members residing in Ontario. When he was in Toronto on February 22nd, the matter had been discussed with Vice-President Sisson, who had been appointed by Council at the last meeting as provisional chairman. It had been decided to call a meeting of Ontario councillors on Saturday, May 10th, immediately following the annual meeting of the Institute. This was noted.

Harry Bennett Educational Fund: Mr. Wright presented a brief report on the results of the campaign to date. The $25,000.00 objective has been reached but contributions are still coming in and most of the branches who have not yet reached their quota are hoping to do so. Ten branches have exceeded their quota.

Mr. Wright explained that the fund is in the hands of a Board of three trustees, operating under a trust deed approved by the Department of Finance. Mr. Wright outlined briefly the terms of the loan, the only requirement being that the applicant must be enrolled and in attendance at a university and must prove his need of assistance. No interest is charged while the candidate is at college, it being left to the trustees to decide whether or not interest should be charged after graduation.

Canadian Management Council: The general secretary reported that a series of meetings had been held at the Institute at which representatives of the several organizations interested in management had gathered to discuss the possibility of Canada participating in the forthcoming International Management Congress (Stockholm, July 3rd to 8th, 1947). The group had decided that membership in the international committee should be applied for and that a joint organization should be set up so that the membership could be conferred on one national body in accordance with standard practice for international organizations. This central organization does not have any activities beyond securing a membership on the international committee for Canada. The actual conduct of Canada's part in the meeting will be carried out by the original constituent organizations.

Mr. Wright explained that the same procedure was followed in the United States and in the other countries, too. In the States the organization was known as the American National Council.

After considerable discussion, it was agreed that in view of the fact that the new organization did not in any way usurp the powers of the constituent organizations, the Institute should join with the other Canadian societies in its establishment.

Definition of "Professional Employee": The general secretary presented a letter from the secretary of the Winnipeg Branch drawing Council's attention to an extract from *Engineering News Record* of February 13, 1947, which contained a definition of the term "professional employee" taken from a bill recently introduced in the United States Congress. The branch suggested that similar definitions could profitably be adopted by acts of the Canadian legislature.

Mr. Wright read extracts from the article and commented thereon. Following some discussion, in view of the fact that the functions of the National Labour Board lapse at the end of this month, it was unanimously agreed that the communication be acknowledged with the suggestion that any action along the line suggested should be taken through the provincial professional association.

At this point, President Hayes resumed the chairmanship.

Headquarters Staff Changes and Additions: The general secretary reviewed the situation at Headquarters pointing out that Mr. Trudel had resigned as assistant general secretary in order to take a position with the Shawinigan Water and Power Company. Thus, it became necessary to secure not only a field secretary and a technical editor for the *Journal* but also a new assistant general secretary. He reported that every Member and Junior of the Institute had been circularized and that several applications had been received. These are to be examined by the Finance Committee and interviews arranged with those whose qualifications seemed most nearly to meet the requirements.

The president expressed his own personal regret at the necessity of accepting Mr. Trudel's resignation. He explained that he had been in correspondence with Mr. James Wilson, president of Shawinigan, the outcome of which was that Mr. Wilson had agreed that Mr. Trudel could have leave of absence until after the annual meeting of the Institute. This kindness on behalf of Mr. Wilson was very much appreciated by Council and it was moved by Mr. Currie, seconded by Mr. Turnbull, and carried unanimously, that a vote of thanks be conveyed to Mr. Wilson.

In reply Mr. Trudel stated that it had been a very difficult decision for him to make and that it was only after "much deliberation and mental torture" that he had made up his mind to sever his connection with the Institute. He hoped and expected, however, to remain very active in the affairs of the Montreal Branch and he hoped also to take an active part in the annual meeting.

Student Conference: Mr. Wright reported that replies from five out of eleven universities had been received to his memorandum regarding the possibility of holding another student conference such as had been held at the time of the Institute's annual meeting in Montreal in February 1946. It had been suggested previously that for this year it might be advisable to hold an executive meeting of delegates residing near Toronto, but the replies received had encouraged the holding of a conference on a full scale. The conference last year had cost the Institute about $1200.00 and Mr. Wright wondered if the Council would be willing to give authorization to go ahead and hold the conference provided favourable replies were received from other universities.

Considerable discussion followed, during which Mr. Currie pointed out that the delegates to last year's conference had been the presidents of the engineering societies and as these boys had not returned to the university the following year the full benefit of their experience and enthusiasm had been lost. He suggested that if the delegates could be chosen from the junior year, possibly the vice-president of the engineering society, and continue at the university, it would be a great advantage.

Mr. Wright stated that this had been discussed on his last trip to the west, and he thought it very likely that at future conferences, the vice-presidents of the societies would be the delegates rather than the presidents. Following further discussion, it was unanimously agreed that Council approves in principle of the continuance of the engineering students conference.

Institution of Mechanical Engineers 100th Anniversary: Mr. Wright reported that Mr. J. Murray Fleming had accepted an invitation to go to London in June of this year to present a paper on the handling of bulk materials at the 100th Anniversary of the Institution of Mechanical Engineers.

Kelvin Medal 1947 Award: At Council's request the general secretary had endeavoured to secure suggestions of suitable persons who might be nominated by the Institute for the 1947 award of the Kelvin Medal. Several names were submitted and following considerable discussion it was unanimously agreed that no decision be made until the next meeting of Council.

The meeting adjourned for lunch at twelve thirty p.m. and reconvened at two fifteen p.m. with the president in the chair.

Western Professional Meeting 1934: The general secretary reported that a letter had been received from Past-President E. A. Cleveland which stated that an amount of $78.54 had been left over from the funds collected for the 1934 professional meeting held in Vancouver in association with the American Society of Civil Engineers. Dr. Cleveland, chairman, and Major Oliver, secretary, of the Institute's local committee, had agreed that the money should now be returned to Headquarters' general fund. The Finance Committee recommended that this money be accepted and that acknowledgment be made to Dr. Cleveland and Major Oliver. This was noted with appreciation and the Finance Committee's recommendation was approved unanimously by Council.

Institute Pension Fund: Mr. Turnbull stated that he had an item of new business for the consideration of the new Finance Committee which he thought might appropriately be brought up at this time. He suggested that consideration should be given to the establishment of a pension or annuity fund for the Headquarters staff. He did not know whether anything had been or could be done about it.

The president assured Mr. Turnbull that serious consideration had been given to this subject and asked Mr. Wright to explain just what the situation was. Mr. Wright pointed out that the matter had been investigated on several occasions and it had been found to be an expensive proposition. The finances of the Institute had not permitted it. Whether or not it would be possible to do anything under the increased fees he did not know, but he hoped that the matter was not closed. He hoped that it would be possible later to present to the Finance Committee for consideration some kind of a pension scheme for the staff. It was agreed that serious thought should be given to Mr. Turnbull's suggestion, and the matter was referred to the incoming Finance Committee for consideration and report.

New Brunswick Agreement: Mr. Wright reported on a meeting held the previous afternoon, at which he and Mr. Trudel, and Mr. Stirling, as chairman of the Committee on Professional Interests, had met the officers of the Association of Professional Engineers of New Brunswick. At that meeting it had been unanimously agreed to recommend certain amendments to the agreement in order to facilitate its operation, including the elimination of joint student membership.

On the motion of Mr. Brown, seconded by Mr. Turnbull, it was unanimously resolved that the proposed amendments to the co-operative agreement between the Institute and the Association of Professional Engineers of New Brunswick be approved, these amendments to be confirmed by an exchange of letters between the Institute and the Association.

In order to provide for the collection by the Association of the increase of $5.00 in the Institute annual fee for Members, on the motion of Mr. Stirling, seconded by Mr. Brown, it was unanimously agreed that Clause 3(a) of the agreement be amended by changing in two places the amount "$6.00" to "$11.00". This amendment had also been approved by the representatives of the two bodies at the meeting held on the previous afternoon.

Maritime Professional Meeting 1948: Considerable discussion took place as to the desirability of holding a maritime professional meeting in 1948. Mr. Cass had sounded out some of the members of the Saint John Branch who had all appeared to be in favour of such a meeting. Mr. Bayne believed the Moncton Branch would also be willing to co-operate. Mr. Turnbull suggested that St. Andrews would be an ideal location for such a meeting, possibly in the fall of the year, and he made a motion to that effect.

The president remarked that everyone seemed to be in favour of holding a maritime professional meeting at St. Andrews in the fall of 1948, the thing to be decided upon being the method of organization.

Mr. Turnbull suggested that if this Council approves of the suggestion it might be desirable for Headquarters to immediately make inquiries regarding hotel accommodation, and then correspond with the Saint John and Moncton branches. The Saint John branch could, on its own initiative or through Headquarters, get the approval of the New Brunswick Association and possibly the Nova Scotia Association and the Halifax and Cape Breton branches. In his opinion, the details of getting agreement between the associations and the branches would follow after Headquarters had obtained information about accommodation.

Following further discussion, Mr. Turnbull's original motion was revised, seconded by Mr. Brown, and carried unanimously as follows—that it is the sense of this Council that a joint maritime professional meeting should be held at St. Andrews in the fall of 1948, Headquarters to make immediate inquiries at the hotel and then communicate with the New Brunswick Association and the maritime branches.

Conference of Commonwealth Engineering Institutions: Mr. Wright reminded Council that at the Commonwealth Conference it had been agreed that all institutions represented there would make their publications available to members of the other bodies at the same price as paid by their own members. A letter had been received from the New Zealand Institute of Engineers advising that they have passed a resolution making their publications available to Institute members at the reduced rate.

On the motion of Mr. Brown, seconded by Mr. Currie, it was unanimously resolved that reciprocal privileges be accorded to the members of the New Zealand Institution of Engineers.

In response to an inquiry from Mr. Flood, Mr. Wright explained the reciprocal membership privileges are now in effect whereby members of one society may have six months complimentary membership with all privileges in any of the other societies without charge.

Canadian Construction Association: The general secretary presented a communication from the Canadian Construction Association which stated that it was the intention of the Association to make representations to the Dominion and provincial governments emphasizing the need for the preparation of detailed plans and specifications so that public works might proceed without delay when required by economic conditions. The letter suggested that the Engineering Institute and other bodies might be equally concerned with the situation which indicated that the present reserve of such works was totally inadequate to meet any serious shortage of employment.

The letter was supported by a report of the New Developments Committee of the Association, of which Mr. J. B. Stirling was chairman. This report was based on a survey made by the committee of the planning work already in hand by the provincial and federal governments.

The letter from the Association concluded with the request that the Institute forward copies of the report to other interested engineering bodies and suggested that such organizations might wish to forward appropriate resolutions to the Dominion and provincial governments.

After some discussion, it was agreed unanimously that the Institute endorses the resolutions of the Canadian Construction Association and their representations to the government. It was agreed that the report should be referred to the Committee on Professional Interests for action.

It was decided that the next meeting of Council would be held in Montreal on Saturday, April 12th. In view of the fact that the annual meeting of Council will be held at the Royal York Hotel, Toronto, on Wednesday, May 7th, it was agreed that at the April meeting, only routine business or items requiring attention before the annual meeting, would be on the agenda.

In closing the meeting, the president expressed the pleasure it had given him to attend a Council meeting in New Brunswick, and on behalf of the out of town councillors and guests expressed appreciation and thanks to the officers and members of the Saint John branch for their hospitality and many kindnesses.

The Council rose at four thirty p.m.

ELECTIONS AND TRANSFERS

A number of applications were presented for consideration, and on the recommendation of the Admissions Committee, the following elections and transfers were effected:

Members

Brockington, Hugh, B.Sc., (Mech.), Univ. of Wales, consultg. engr., Vancouver, B.C.

Bullock, Charlton Woodward, B.Sc., (Eng.) Univ. of London, jr. engr., Foundation Co. of Canada, Montreal, Que.

Cyma, Zygmunt Stanislaw, Mech. Engr., Politechnika Lwowska, Poland, chief plant engr., A. V. Roe Canada Limited, Malton, Ont.

DeWolfe, Harold Albert, B.Sc., (Mech.), Univ. of Maine, asst. mtce engr., Howard Smith Paper Mills, Cornwall, Ont.

Gibbons, James Fenton, B.Sc., (Elect.), New Brunswick, instructor, Canadian Vocational Training Rehab., Moncton, N.B.

Helyer, Maurice, structl. engr. and partner, McCarton & Nairne, Vancouver, B.C.

Libby, Hugh T., supt., gas distribution, B.C. Electric Co., Vancouver, B.C.

Millar, James Wallace, B.A.Sc., (Mech.), British Columbia, inspector, Dept. of Railways, Province of British Columbia, Vancouver, B.C.

Milne, Harrison Scott, B.Sc., Saskatchewan, resident engr., Defence Industries Limited, Petawawa Works, Chalk River, Ont.

Swanson, Robert Eugene, chief inspector, Det. of Railways, Province of British Columbia, Vancouver, B.C.

van Steenburgh, William Elgin, Colonel, R.C.A., MA.., Ph.D., Toronto, Director of Armament Development, N.D.H.Q., Ottawa, Ont.

Wilson, Morton Holmes, B.Sc., (Mech.), Queen's, works mgr., George White & Sons Co., London, Ont.

Transferred from the class of Junior to that of Member

Boyle, Thomas James, B.Sc., (Civil), Saskatchewan, asst. engr., Canadian Pacific Railway, Montreal, Que.

McColl, Bruce John, B.Sc., (Mech.), Queen's, chief, power plant section, design office, Canadair, Montreal, Que.

McNaughton, Andrew Robert L. Graduate, R.M.C., Kingston, president, Norcan Limited, Ottawa, Ont.

By virtue of the cooperative agreements between the Institute and the associations of professional engineers, the following elections and transfers have become effective.

Alberta

Member

Evans, Kenneth George, B.Sc., (Civil), Saskatchewan, hydraulic engr., P.F.R.A., Calgary, Alta.

Junior to Member

Cumming, Edwin Keith, B.Eng., (Mech.), McGill, lecturer, mech. engrg., University of Alberta, Edmonton, Alta.

Jones, David Carlton, B.Eng., (Mech.), McGill, jr. engr. and statistician, Canadian Western Natural Gas L. H. & Power Co., Calgary, Alta.

Saskatchewan

Members

Small, Frederick Lloyd, B.Eng., (Civil), Saskatchewan, design and inspecn. water and sewage works, Underwood & McLellan, Saskatoon, Sask.

Wells, Robert Bird, B.Sc., (Civil), Saskatchewan, jr. engr., P.F.R.A., Regina, Sask.

Student

Riemer, Paul, Univ. of Saskatchewan, Saskatoon, Sask.

Junior to Member

Gunter, Allan Nelson, B.Sc., (Chem.), Alberta, hydraulic engr., P.F.R.A., Regina, Sask.

Traynor, John Clair, B.Sc., (Civil), Saskatchewan, jr. engr., Underwood & McLellan, Saskatoon, Sask.

New Brunswick

Members

Gray, George Merrick, B.Sc., (Mining Engrg.), Toronto, supvr. constrn., D. O. Turnbull, consultg. engr., Saint John, N.B.

Williamson, W. A., B.A.Sc., (Elect.), Toronto, sales engr., Canadian General Electric, Toronto, Ont.

Junior to Member

McDermott, Arthur Gregory Paul, B.Sc., (Elect.), New Brunswick, asst. engr., New Brunswick Telephone Co., Ltd., Saint John, N.B.

Student to Member

Weyman, Charles Edward, B.Sc., (Civil), New Brunswick, estimator and constrn. engr., Coldwell Construction Co., Fredericton, N.B.

Nova Scotia

Member

MacInnes, Joseph, B.Sc., (Elect.), Nova Scotia Tech., asst. elect. supt., Dominion Steel & Coal Corp., Sydney, N.S.

Quebec

Members

Duff, Cameron Ferguson, B.Eng., (Mining), McGill, vice-pres. and genl. supt., Moldply Limited, Montreal, Que.

Schmelz, Herbert Felix, graduate, Polytechnical Institute of Vienna, mech. supt., Standard Machine Shop Ltd. Montreal, Que.

Sharpe, James MacDonald, B.Sc., (Elect. Engrg.), McGill, supt., system operating divn., Shawinigan Water & Power Co., Montreal, Que.

Junior to Member

Bourbonnais, George Valois, graduate, R.M.C., Kingston; B.Eng., (Civil), McGill, asst. consultg. engr., Z. Langlais, Quebec, Que.

Simons, Samuel John, B.A.Sc., Toronto, field engr., Ontario Paper Co., Ltd., (Quebec North Shore Paper Co.), Baie Comeau, Que.

Swift, John William, B.Eng., McGill, mech. engr., engrg. dept., Aluminum Laboratories Limited, Montreal, Que.

Thompson, Arthur McCall, B.Sc., (Elect.), Alberta, app. sales engr., Canadian General Electric Ltd. Winnipeg, Man.

Transferred from the class of Student to that of Member

Illaszewicz, Jerzy, B.A.Sc., (Mech.), Lwow Univ., Poland, mech. engr., E. B. Eddy Co. Parent, Que.

Zimmerman, G. Douglas, B.A.Sc., (Chem.), Toronto, district engr., Fischer & Porter, Montreal, Que.

Transferred from the class of Student to that of Junior

Hall, Kenneth Logan, B.Eng., Saskatchewan, lubrication engr., McColl-Frontenac Co. (B.C.) Limited, New Westminister, B.C.

Personals

News of the Personal Activities of members of the Institute

Charles E. Marlatt, M.E.I.C., has been elected chairman of the Kootenay Branch of the Institute. Born at Fort William, Ont., he graduated from Queen's University in 1923 with the degree of B.Sc. Immediately following graduation he was employed as topographer with the Department of Highways of British Columbia. He subsequently joined the engineering staff of the West Kootenay Light and Power Company as instrumentman in connection with the construction of the company's new hydro-electric plant. In 1926 he became employed by the Consolidated Mining & Smelting Company, Trail, B.C., and two years later was made superintendent of safety and fire insurance. He has been with the company since that time.

Mr. Marlatt joined the Institute as a Student in 1922, transferring to Junior in 1925, and to Associate Member in 1931. He became a Member in 1940.

Lloyd G. Scott, M.E.I.C., formerly with Greenlaw and Trott, consulting engineers, Winnipeg, Man., is now employed as plant engineer with Canadair Limited, Montreal.

A. Lloyd Huber, M.E.I.C., chief engineer of Link-Belt Limited, Toronto, has been elected a vice-president of the firm. He entered the employ of the company in 1929 and has served as district manager at Montreal.

Bruce O. Heron, M.E.I.C., has accepted the position of industrial engineer with the Industrial Development Bank at Montreal. He relinquished the appointment of executive assistant to the controller, The Inspection Board of Canada at Ottawa in February.

Jacques Drouin, M.E.I.C., is at present employed as service engineer with the Mathews Conveyer Company, Limited at Montreal.

William Storrie, M.E.I.C., of Gore and Storrie, consulting engineers, Toronto, has accepted appointment to a three-member Board of Engineers named by the City of Detroit to make a sanitary survey dealing with pollution of the Detroit River and Lake St. Clair in relation to Detroit's water supply.

R. F. Legget, M.E.I.C., associate professor of civil engineering, municipal and structural division, University of Toronto, has been named to head a division of building research being set up under the National Research Council.

Born in Liverpool, England, he graduated from the University of Liverpool in 1925 and received the degree of Master of Engineering from that institution in 1927. Professor Legget had extensive experience in construction engineering in Great Britain and on the Continent before coming to Canada in 1929 to join the construction division of the Power Corporation of Canada. In 1936 he became a member of the staff of Queen's University and later of the University of Toronto. He is a noted author having published many engineering papers and in 1939 a book entitled "Geology and Engineering" which deals with the application of the science of geology to the art of civil engineering.

The new Division of Building Research will work very closely with the Central Mortgage and Housing Corporation and will provide the required scientific data for an adequate programme in all fields of construction, including building materials, types of construction, layout and other essential features.

Sidney Hogg, M.E.I.C., was recently named general manager of West Coast Shipbuilders, Vancouver, to supervise reconversion of that company. Since going to Vancouver three years ago from Saint John, N.B., he has been chief engineer and general sales manager at Western Bridge and Steel Fabricators Limited, Vancouver.

E. Aboud, M.E.I.C., has joined Libby-Long Engineering Limited. The firm, now known as Libby-Long-Aboud Engineering Limited, is specializing in air conditioning, ventilation and heating engineering and contracting.

Thos. E. Storey, M.E.I.C., is the newly elected chairman of the Winnipeg Branch. A native of Brockville, Ont., he graduated from the University of Manitoba with the degree of B.Sc. in 1928. Following graduation he was employed by the City of Winnipeg Hydro-Electric System and in 1931 was made senior operator at their Slave Falls power house in charge of operation and maintenance. At the present time he holds the position of general superintendent in charge of production, City of Winnipeg Hydro-Electric System.

Mr. Storey joined the Institute as a Student in 1926. In 1933 he was transferred to Junior and two years later to Associate Member. He became a Member in 1940.

E. S. P. Braddell, M.E.I.C., is now with Trans-Canada Air Lines at Winnipeg, Man., as electrical and mechanical engineer on technical ground services. Until recently he was with Northern Electric Co. Ltd., as a power apparatus engineer in the general sales division at Montreal.

D. A. Chisholm, M.E.I.C., has resigned his position as resident engineer with the Department of Highways and Public Works of Nova Scotia. He has entered into a partnership with R. K. MacDonald and will carry on a general contracting business under the name of R. K. MacDonald Construction Company with head office at Antigonish, N.S.

Major R. B. Jennings, M.E.I.C., formerly inspecting engineer, Defence Projects Construction Branch, Department of Munitions and Supply, and latterly property engineer, War Assets Corporation, is now with T. Pringle and Sons, Limited, industrial engineers, Montreal, as general field supervisor.

A. L. MacDonald, M.E.I.C., is now employed as sales engineer with Watson Jack Co. Limited, Montreal. After serving throughout the war with the R.C.E., the R.C.A. Searchlight and Heavy Batteries, he joined the Inspection Board of Canada, Ottawa, as inspector of electrical engineering stores, which position he held until recently.

R. R. Colpitts, JR.E.I.C., has been appointed assistant mechanical engineer of the Canadian National Railways, with headquarters at Moncton, N.B. He was formerly with the Canadian International Paper Co. Ltd., at Dalhousie, N.B.

R. W. McNally, JR.E.I.C., is now employed in the Toronto office of the Mathews Conveyer Company, Limited, as a service engineer.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

William Joseph Bruce, M.E.I.C., died at his home in Lansing, Ont., on March 3rd, 1947. Born at Gamebridge, Ont., on January 6th, 1888, he attended the University of Toronto. After completing his civil engineering course he was employed for a time with the Canadian National Railways in Ontario and the western provinces on maintenance and construction. He was employed as assistant engineer in the Department of Public Works at Sault Ste. Marie, Ont., from 1913 until 1919 when he joined the Great Lakes Power Company as assistant engineer in charge of dredging and construction. He subsequently joined the staff of the International Power and Paper Company in Newfoundland and later worked for the Foundation Company of Canada Limited at Saint John, N.B., on reconstruction of wharves. On the outbreak of war, Mr. Bruce joined the Department of National Defence, air force division, to build air training schools at Windsor, Goderich and Port Albert, after which he joined the Allied War Supplies Corporation as supervising engineer of war plants at Ajax, Montreal and Windsor. After such war construction was completed he joined the staff of the Department of Public Works of Canada at Toronto, Ont., which position he held at the time of his death.

Mr. Bruce joined the Institute as an Associate Member in 1926, becoming a Member in 1940.

Earl John McIntire, M.E.I.C., died on November 23rd, 1946, after a lengthy illness. Born at Cleveland, Ohio, on December 24th, 1882, he first joined the Republic Iron and Steel Company in Youngstown, O., in 1899. Five years later he was made construction engineer of the company in complete charge of all construction work, building blast furnaces, open-hearth steel works, etc. In 1916 he went to Windsor to join the Canadian Steel Corporation Limited where he remained for ten years when he was employed by the Dinsmore Construction Company of Windsor. Mr. McIntire later became vice-president in the firm and the name of the company was changed to Dinsmore-McIntire Limited. Owing to poor health he had not been active in the firm for some months before his death.

Mr. McIntire joined the Institute as an Associate Member in 1920, becoming a Member in 1940.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

ERRATUM

We regret that due to an oversight the following Halifax Branch report of meetings for 1946 was omitted from the general report published in the February issue.

HALIFAX BRANCH

During the year the Halifax Branch has held seven executive meetings, all of which were very well attended. Two of the main events in 1946 were the Annual Banquet held in conjunction with the Association of Professional Engineers of Nova Scotia and the Maritime Professional Meeting at the Pines in Digby. The meetings of the Branch were as listed below and attendance is given in brackets.

Jan. 29—Annual Banquet, held in conjunction with the Association of Professional Engineers of Nova Scotia. (274.)

Feb. 21—**Public Administration and Personal Experience with U.N.R.R.A.,** by John E. Lloyd, who had been special assistant to the director on the Bureau of Finance and Administration U.N.R.R.A. (56.)

Mar. 21—**Developments in Air Transportation,** by J. T. Dyment, Engineering Superintendent, Trans-Canada Air Lines. (65.)

April 15—**Atomic Energy,** by G. C. Laurence, Chief of the Technical Physics Division of the National Research Council's Chalk River Laboratory. (190.)

May 17—Luncheon tendered to Dominion Council by Branch executive—Speaker, E. Burke-Gaffney, President of Dominion Council.

Sept. 4-7—Maritime Professional Meeting held at the Pines Hotel, Digby, N.S., in conjunction with the other Maritime Branches and the A.P.E.N.S. and A.P.E.N.B. (274.)

Oct. 31—**More Power for Canada,** by William E. Ross, Canadian Manager of the Apparatus Department of the Canadian General Electric. (85.)

Dec. 19—Annual Meeting of the Halifax Branch. (40.)

EDMONTON BRANCH

W. W. Preston, Jr.E.I.C. - *Secretary-Treasurer*

The need for research on aircraft skis under the field conditions found in Northern Alberta, was explained by Mr. K. Korsak, engineer, of the North West Industries Ltd., Edmonton, when he presented a paper entitled **Design of Winter Landing Gear for Aircraft,** at a dinner meeting of the Edmonton Branch, on February 28th in the Macdonald Hotel. Mr. Korsak revealed that existing technical information provided by the National Research Council, was limited to higher temperatures than are usual in northern Alberta. It was obtained on flat landing fields, rather than the rough lake or river ice areas often used in this province. The speaker suggested that research might develop a truck type of landing gear, which was now impracticable, because of the excessive accelerations produced.

Lantern views of aircraft and design graphs were shown to illustrate current practice in ski design. Factors which must be considered include (1) sliding resistance, which depends on the dimensions of the ski and on the condition of the snow; (2) adhesion resistance resulting from stationary skis freezing to the snow; (3) wear resistance and (4) the performance of the aircraft necessitating streamlining to reduce drag, and shock absorbers to protect the undercarriage during landing. Mr. Korsak explained that the heat produced as a ski moves over snow produces water as lubrication. There is little resistance on hard snow, but considerable on wet snow. In low temperatures, a narrow ski is needed to increase the heat energy required to produce the water for lubricating the ski.

The speaker advocated the practice of attaching skis to the wheels of large planes because changes could be made easily, and because the tires absorbed much of the landing shock. However, the additional weight made this practice objectionable for small aircraft. For them, he recommended a light pedestal and a shock absorber, having an air cushion.

Chairman of the meeting, at which the attendance was 39, was J. W. Porteous. Mr. Korsak was introduced by J. E Cranswick, and at the conclusion of a lively discussion period R. M. Hardy proposed a well applauded vote of thanks.

HAMILTON BRANCH

L. C. Sentance, M.E.I.C. - *Secretary-Treasurer*
I. M. Macdonald, Jr.E.I.C. - *Branch News Editor*

The Hamilton Branch of the Institute held its regular meeting on Thursday, February 20th, 1947, at McMaster University, with 75 members and guests attending. E. G. Wyckoff presided, and announced the appointment of branch members, John Taylor, Wm. Hollingworth and Charles Waterous to Life Membership in the Institute. They have long been active in the Institute, the first two since 1908, and Mr. Waterous since 1896.

W. E. Brown introduced A. E. H. Fair, the evening's speaker, who is president of the Alliance Paper Mills, Toronto. Mr. Fair has spent 25 years in Canada's pulp and paper industry, and is well qualified to speak on the subject, and particularly the fine paper industry, in which he is most interested.

After sketching briefly the history of papermaking, which originated about 105 A.D. in China, Mr. Fair outlined the methods used today in the manufacture of both newsprint and fine papers. He then dwelt at greater length on new equipment in use and being developed, such as improved apparatus for removing bark from logs, and improvements in many other phases of manufacture.

New by-products are continually being extracted from the paper manufacturing process, some of which result in an improved paper, and all of which make the process more economical. Such things as pressboard and vanilla are recent by-products of the paper industry. Mr. Fair suggested that by-products may eventually become so important that paper itself will become a by-product of the process.

There is a shortage of trained technicians in the paper industry at present, said the speaker, but this can be remedied with the help of the universities in training men, and of engineers in placing them where they will be most useful. Mr. Fair urged the proper training of technical men, not only for paper manufacturing, but for the very important work of forest preservation and re-forestation as well. The future of the paper industry in Canada depends upon a sound forest policy; this policy is in the hands of the Government who can be assured of the co-operation of the pulp and paper industry.

Two very interesting colour films, tracing the history of paper making and describing modern pulp and paper making, were shown at the end of the address.

KOOTENAY BRANCH

E. B. Broadhurst, M.E.I.C. - *Secretary-Treasurer*

The Annual Meeting of the Kootenay Branch of the Institute was held in the Conference Room on February 21, 1947, with seventeen members present.

The results of election of officers for 1947 were announced.

Following routine business, a film entitled "The Freight Yard" was shown by A. H. W. Busby. The film dealt with New York Central's system of handling fast freight including classification of cars; types of cars; maintenance of cars and engines; type of locomotives assigned to trains depending on loads and speeds. The film gave an interesting insight to the complexities of our transportation problem.

LONDON BRANCH

A. L. Furanna, M.E.I.C. - - *Secretary-Treasurer*
G. N. Scroggie, M.E.I.C. - - *Branch News Editor*

A monthly meeting of the London Branch was held on February 27th in the Board of Education Board Room, with H. A. McKay presiding.

After reading a letter from J. H. Johnson, our past-chairman, who has been ill for the past few months, Mr. McKay introduced the speaker for the evening, Mr. V. S. Baker, who spoke on **Essential Links in Sanitation.** Mr. Baker is plumbing inspector for the City of London and secretary of the Ontario Association of Plumbing Inspectors and Affiliates. He is not only consulted about plumbing problems in other communities than London, but he journeys to various places here and in the United States, attending lectures and laboratory courses.

After giving figures of total costs to date of our water and sewerage systems, the speaker went on to point out the importance of a proper plumbing system as a connecting link between them.

Methods of testing by ball, water and smoke, the advantages and disadvantages of traps, the importance of proper back venting and cross connections, the problems of seepage and eave waters, and sewer gases were dealt with by Mr. Baker. He used carefully prepared drawings in such a manner that his attentive audience readily realized the necessity of proper plumbing methods to protect them as residents of this or any community.

During his talk a moving picture was presented which showed how submerged inlets and negative pressures could cause siphoning of possibly contaminated water from even a toilet bowl through a tap where water is drawn for human consumption. All too often this results in sickness and even in death.

Mr. Baker, citing specific instances of faulty plumbing, explained that often the plumbing system would conform to the code at the time of installation, but that the handy man would supplement the plumbing in a manner not in keeping with good practice. The speaker told of the high standards required of plumbers examined in London, the amendments he feels should be made in our by-laws, and stressed the need for re-inspection. It is hoped that the manufacturer will produce fixtures which will offer more protection to the public with such features as that important air gap that prevents siphoning from fixtures.

The speaker was thanked by W. M. Veitch who voiced the opinion of all present when he said that Mr. Baker is indeed an important civil servant to the City of London.

MONTREAL BRANCH

E. M. Van Koughnet, M.E.I.C. - *Secretary-Treasurer*

Montreal Branch Committees have been formed as follows:

- Programme—Emil Nenninger, Chairman.
- Membership—L. McGillis, Chairman.
- Admissions—J. A. H. Henderson, Chairman.
- Entertainment and Reception—C. A. Laverty, Chairman.
- Publicity—W. Sharples, Chairman.
- Student Guidance—G. B. Moxon and L. A. Duchastel, Joint Chairmen.
- House Committee—R. N. Coke, Chairman.
- Policy Committee—E. B. Jubien, Chairman.
- Branch Rep. Institute Nomination Com.—J. J. H. Miller.
- Junior Section—R. J. Griesbach, Chairman.

The Montreal Branch had an increase in membership last year of 302, bringing the total to 2,490. The membership has been showing an increase each year since 1932, and has almost doubled since 1939. This increase should be maintained in the coming years, especially if the many engineers who are not now members are encouraged to join.

The providing of Branch facilities to keep pace with this increased membership is one of the problems facing the Executive Committee. Accordingly the House Committee was formed to thoroughly examine the whole question. This committee will keep in close touch with the House Committee of the Institute which is presently looking into ways and means of taking care of the expanded programme of services at Headquarters. Since many of the facilities available at the Headquarters building are made use of by both the Institute and the Montreal Branch, the problems facing the two are closely related.

Another newly-formed committee is the Policy Committee, to provide a means whereby Branch policy may be examined and recommendations made to the Executive Committee for action. One of the first objectives of the committee will be to ascertain from the membership at large, the various functions that they feel it desirable for the Branch to fulfil, so that steps may be taken, before the end of the year, to broaden the field of Branch activities towards this end.

Over the last few weeks, members had the opportunity of hearing a number of interesting speakers at the regular Thursday evening meetings.

Colour films of the Bikini Test were shown and described by Air Vice-Marshall Stedman, one of the official observers. **Fluid Drives in Industry** was discussed by J. D. Roseborough. **How Trunk Water Mains Were Recently Re-Conditioned in Montreal** was described by F. Y. Dorrance. In a joint meeting with the A.I.E.E. and the I.R.E. members heard Dr. Harvey Fletcher discuss **Pitch, Loudness and Quality of Musical Tone.**

A successful Annual Smoker was held at the Mount Royal Hotel, and attended by over 300 members and their friends. We are indebted to Mr. Laverty for the excellent arrangements

Junior Section

"What concerns Juniors of the Institute?" That has been the question uppermost in the minds of the Junior Section executive in shaping the programme of the past year, and will continue to guide the activities of the Junior Section through 1947.

Film nights constitute a highly popular means of putting forward ideas and information and aid in keeping up with the forward march of industry and commerce.

Addresses before the Junior Section have ranged over a wide number of vital subjects providing a comprehensive picture of the fields explored. The 1947-48 programme is rapidly being mapped out and promises to provide many valuable evenings of profitable enjoyment throughout the coming session. The executive hopes that 1947 will see the Junior Section truly "come of age".

NIAGARA PENINSULA BRANCH

P. A. Pasquet, Jr.E.I.C. - - *Secretary-Treasurer*
C. A. O. Dell, M.E.I.C. - - *Branch News Editor*

On Thursday, February 27th, the Niagara Peninsula Branch of the E.I.C. held a joint meeting with the Association of Professional Engineers of Ontario at the Red Casque Inn on Highway No. 8, three miles from Niagara Falls.

The speaker for the evening was Dr. G. B. Langford, president of the Association of Professional Engineers, who was introduced by A. W. F. McQueen, councillor for 1945, and former classmate of Dr. Langford.

Dr. Langford gave an inspiring address touching on the high moral duty that engineers must assume as leaders in community and national life. He pointed out that all who receive higher education at the universities of this country pay only a small portion of the actual cost of their training, the remainder being borne by the people of the country as a whole, many of whom never have the opportunity to make direct use of the universities for themselves or their children. University graduates, therefore, have a duty to perform and should consider themselves as obliged to render service to their fellows by acting as leaders in the moral, intellectual, physical, and political development of the country to which they belong.

Dr. Langford reminded his audience of the pronouncement of another philosopher who said that the actions of men could be divided into three classes: those made under compulsion of law, those made under the free will of the actor, and those in between made partly by compulsion and partly by free will. The speaker pointed out that only as men advance in the realm of free will action do they attain toward true democracy. As their moral and intellectual standards advance, men are able to take free will action which will react to the benefit of the community as a whole, thus approaching a true democratic state. If, on the other hand, moral and mental development become such that more and more actions must be taken under compulsion of law, then society approaches the realm of dictatorship. Engineers today, through the moral and intellectual training which they have received and are receiving at the universities, have inherited a great responsibility which demands that they lead and continue to lead their fellow men toward true democracy.

Col. T. M. Medland, field representative of the Association of Professional Engineers, also addressed the meeting and answered many questions regarding the present status and progress of the Association.

Chairman W. D. Brownlee occupied the chair for the evening and others at the speaker's table were A. N. Conklin, councillor for the Association of Professional Engineers, and P. Buss, councillor of the Engineering Institute.

OTTAWA BRANCH

C. G. Biesenthal, Jr.E.I.C. - *Secretary-Treasurer*
R. C. Purser, M.E.I.C. - - - *Branch News Editor*

The first noon luncheon of the Ottawa Branch for the 1947 season was held at the Chateau Laurier on February 13th. At that time announcement was made of the presentation to thirty members of the Branch of life memberships in The Engineering Institute of Canada as of January 1st, 1947. Maj.-Gen. G. R. Turner, the new chairman, presided and made the announcement.

Among those granted such memberships were Charles H. Pinhey, who joined as a student member when the Institute was founded in 1887; A. J. Grant, charter member since 1891, and president of the Institute in 1930; and K. M. Cameron, president in 1943.

Others honoured were: James Adam, N. F. Ballantyne. Walter W. Benny, E. G. Cameron, R. deB. Corriveau, James Dick, J. A. Ewart, O. S. Finnie, G. H Ferguson, G. G. Gale, F. G. Goodspeed, George Kydd, J. E. Larochelle, J. G. Macphail, D. W. McLachlan, Victor Miche, W. H. Munro, F. H. Peters, G. W. F. Ridout-Evans, Frank E. Sterns, H. W. Swabey, Leslie R. Thomson, J. A. Wilson, Charles O. Wood. all of Ottawa; C. J. Chaplin, of Almonte; J. A. Freeland and A. K. Grimmer, both of Temiskaming; and John Handley, of Noranda.

Life Memberships had previously been granted to R. F. C. Alexander, F. Anderson, A. M. Beale, A. A. Belanger, S. J. Chapleau, M. F. Cochrane, H. M. Davy, T. H. Dunn, H. A. Dupre, B. F. C. Hoanel, W. S. Lawson, John Murphy, D. H. Nelles, L. H. Sherwood, and J. A. Stiles.

On behalf of the new life members, K. M. Cameron expressed their appreciation of the honour.

Announcement was also made by the chairman that consideration was being given to the formation of a junior section of the Branch, and of a women's auxiliary. Col. J. P. Carriere, chairman of the Programme Committee, outlined plans for the coming year.

Dr. L. Austin Wright, Montreal, general secretary of the Institute, who was present, spoke briefly on the affairs of the Institute, reporting that the membership now totals approximately 8,500.

A film, "The Story of Aluminum" was shown. The history of this metal was traced from the days when Napoleon III first startled his dinner guests with an aluminum table service. at a cost of more than $500 a pound, down to the present day.

❖ ❖ ❖

At a noon luncheon on March 6, Roy A. Crysler, of the Canada Cement Company Limited, described in an illustrated address the construction by his company of five double houses in Montreal, erected of concrete. A basic principle of their construction was that so far as possible no other material was to be used. One thing in particular that was cut out was the use of plaster, although a little was used in the kitchen and bathroom to conceal pipes and heating ducts in the ceilings.

This type of house was not really new, stated the speaker, and was not intended as an example of low-cost construction. The five houses were built in a row and when finished were painted in different colours presenting an attractive appearance. Portland cement paint was used to seal the walls, both inside and outside.

Outer walls were composed of double hollow concrete block walls with a two-inch space between filled with an insulating board compressed to that thickness. This board was also a cement product. The outer blocks were 4 in. thick and the interior blocks 6 in. thick. The wall between the houses also had a one-inch space between the double row of blocks filled with the board, the blocks on either side being 4 in. thick.

Floors had pre-cast concrete joists supporting 2 in. concrete slabs cast in place. To make the joists a plant had to be set up for that purpose by a Montreal firm under the direction of the company. All ceilings were left exposed. The " beamed " effect to the bedroom ceilings appeared rather unusual to some of the occupants but was not objected to after they were used to it. For the roofs and the ground floor temperature re-inforcements were used in erecting the slabs. On the bedroom floor slabs no re-inforcement was used.

Ceilings, walls and floors were painted to individual taste. Some of the prospective owners were dubious about the painted cement floors but soon got used to them. They found that the painted cement floors did not give them sore feet as they had expected. As a matter of fact, the women found them easy on the feet and easy to keep clean. A little wax now and then to protect the paint, that was all.

Wall ties were used while building the wall. All joints were carefully tooled and the speaker considered that an excellent job of block laying had been done. On each unit an endeavour was made to use a different joint for demonstration purposes. The roof was built dead flat.

Various features of the construction were illustrated by slides. All electric wiring was in the wall or in the slab, mostly the former. Plenty of base plugs were provided. The heating system was hot air, air-conditioned, fully automatic all the way through, equipped to change the air winter or summer. The furnace uses oil. Pipes for plumbing were exposed in the basement only, but were so placed as not to be in evidence. The basement besides having room for the furnace, laundry tubs and other features, provided space for a recreation room 13 ft. by 25 ft. in size.

Accurate costs were kept of the construction. The houses were not small and were in no way intended to be cheap. Not including the land the cost of construction was 63c per cu. ft.; with land and landscaping it was 67¼c for the completed job. These costs were not considered high for Montreal for this type of job.

Maj.-Gen. G. R. Turner, chairman of the branch, presided. The speaker was introduced by E. Viens, and thanked by A. C. Ross. Before the main address felicitations were extended to Dr. C. Camsell, recently awarded the Julian C. Smith medal of the Engineering Institute. Dr. Camsell was also elected president of the Canadian Institute of Mining and Metallurgy; and is also an honorary member of the American Institute of Mining and Metallurgical Engineers.

❖ ❖ ❖

At a joint evening meeting with the American Institute of Electrical Engineers on March 18th at the National Research Laboratories on Sussex street, J. R. Montague, assistant hydraulic engineer, Hydro Electric Power Commission of Ontario, gave an address on **Hydro Development on the Madawaska River.** Illuminating Engineering Society members were also present. The meeting was presided over by R. M. Prendergast and the speaker was introduced by M. J. McHenry. Thanks to the speaker were extended by Major-General G. R. Turner.

Illustrating his talk with slides and coloured motion pictures, Mr. Montague gave a complete story of the planning and the work done to date on the new power site near Stewartville. The Madawaska river, he said, has a possible peak when ultimately developed of 330,000 horse power.

The 81,000 horse power Stewartville development was begun in November, 1945, and it is expected will be completed early in 1948. The dam here will tower 200 feet above the present bed of the river. It will be 150 feet thick at the base and will taper to a thickness of 20 feet at the top. It will be 1200 feet long.

Diversion of the river around the main dam site while the dam is being constructed will be effected by a 30-foot tunnel through 750 feet of solid rock. Two coffer dams, one upstream from the site of the final concrete structure and the other below the site, will effect the diversion and keep the dam site itself unwatered during the main construction.

SAGUENAY BRANCH

J. E. Dyck, M.E.I.C. - *Secretary-Treasurer*

The History of Sulphuric Acid was the topic of an address given by W. H. DeBlois to the Saguenay Branch of the Institute on February 20th, 1947.

The speaker was wartime deputy controller of chemicals in the Department of Munitions and Supply and subsequently was appointed administrator of chemicals for the Wartime Prices and Trade Board. At the present time he is connected with the chemical group of Canadian Industries Limited and is one of this continent's leading authorities on sulphuric acid.

Mr. DeBlois discussed the production of sulphuric acid from its pioneer days when acid was made on a small scale and was consequently a costly product, up to the present time when 1,000 tons per day is produced in a single large plant. The first acid was produced on a commercial basis by the chamber process. When acid producers using this process began raising prices, research was stimulated and the contact process was introduced. Today both processes are used extensively. The chamber process will produce acid as high as 80 per cent strength while the contact process produces concentrated acid of 98 per cent strength.

The slides shown by Mr. DeBlois illustrated clearly the process, equipment and plant buildings involved in the production of sulphuric acid.

At the close of his address on sulphuric acid Mr. DeBlois discussed his wartime experiences as deputy controller of chemicals. One of his chief duties was to control the dispensation of chemicals which were vital to the war effort. This included products such as soda ash, pitch, glycerine, ethyl alcohol, fertilizers, quinine and penicillin. He mentioned also the complete co-operation that existed between his department and the War Production Board in Washington.

D. F. Nasmith thanked the speaker on behalf of the Branch.

SAINT JOHN BRANCH

K. W. Salmon, Jr.E.I.C. - *Secretary-Treasurer*
A. R. Bonnell, M.E.I.C. - *Branch News Editor*

The regular monthly meeting of the Saint John Branch was held Tuesday evening, February 18, in the Admiral Beatty Hotel, with L. O. Cass presiding.

The meeting was the first ladies' night of the season and a record number attended, there being 126 engineers and guests.

After refreshments and dinner, Charles Morrison of the Canadian General Electric Co. gave a very interesting illustrated talk on **The Magic of the Spectrum.**

Mr. Morrison began his talk with an outline of the history of light in relation to mankind, up to the time of the development of the incandescent lamp.

Mr. Morrison then went into detail on the spectrum, giving a demonstration on each band from ultra-violet to infra-red and radio waves. He spoke of the advantages of ultra-violet rays in hospitals, schools and public buildings in combating bacteria; and of the use of sodium vapor and mercury vapor lamps in street lighting. He told of the uses of polarized light, pointing out that " polaroid " is not used in automobiles at present due to the great amount of extra electrical power required for automobile headlights.

Mr. Morrison also demonstrated infra-red lamps for use in quick drying, and the use of black light on fabrics dyed with fluorescent material, showing where this method of lighting could be used to advantage in motion picture theatres.

He concluded his talk by showing the advantages of fluorescent lighting over the older methods of electric lighting

A vote of thanks was extended Mr. Morrison by R. M. Richardson and seconded by J. H. McKinney.

SARNIA BRANCH

F. F. Walsh, M.E.I.C. - - *Secretary-Treasurer*
J. E. Pickering, S.E.I.C. - *Branch News Editor*

On Thursday evening, February 20th, 1947, the Sarnia Branch of the Institute, in conjunction with the Sarnia Branch of the Chemical Institute of Canada held a dinner meeting in the Polymer Cafeteria. The guest speaker was Dr. Sidney E. Smith, president of the University of Toronto.

Gordon R. Henderson was chairman for the evening. He stated that the 147 men present represented the greatest gathering of technical brains in Sarnia's history.

As Dr. Smith rose to speak he was greeted by a rousing rendition of the Varsity yell. The subject of his address was **Canadianism.** He said we all tend to paint far too gloomy a picture of Canada's future and that we need " a greater faith and more passionate belief " in this country. Many think of Canada as a colony of Great Britain and an economic appendage of the United States. Yet two world wars have shown this to be untrue, and in them our youth has fought magnificently for this country. He gave scientists much of the credit for developing Canada, from a population of

4,000,000 in 1867 to the world's third greatest trading nation today, even though we rank 35th in population. He asserted, "it may be truly stated that our record since confederation is one of faith in social and Christian ideals".

Dr. Smith maintained that "in their very genesis, federations are very difficult nations to govern. There is always a tendency towards stress and strain and pulling between the central authority and the various component parts". Politicians of all parties tend to magnify these differences in order to gain votes. Yet, in spite of all these possibilities of friction ours is the only nation in North or South America which has never had a civil war. Our differences can be solved but a standard mould is not a good thing. He maintained that "democracy's unity is in diversity". Each part should fulfil its own objective with the national objective in mind.

As an example of the strength and unity obtainable through diversity Dr. Smith cited "the great polyglot that is Winnipeg". As president of the University of Manitoba from 1934 to 1944 and he had ample opportunity to observe Winnipeg. He maintained that we cannot point to one group of foreign origin in Canada which has not contributed something to this country. Prior to the last World War, 40 per cent of the enrolment of 4,000 at the University of Manitoba was not of Anglo-Saxon origin. The Winnipeg *Free Press* prints the New Year's greetings in 73 languages, yet nearly all people in these groups can read and write English. The movement of service personnel in Canada during the war was a great help in building understanding between various sections and groups.

In conclusion Dr. Smith urged those present to "exemplify in your thoughts, faith; in your words, wisdom; in your deeds, courage; and in action, service". In that way "we will go forward in a manner worthy of the destiny of this great country".

Dr. R. K. Stratford tendered the vote of thanks to the speaker and it was enthusiastically seconded by the audience.

TORONTO BRANCH

E. G. Tallman, m.e.i.c. - *Secretary-Treasurer*
E. R. Graydon, m.e.i.c. - *Branch News Editor*

The February meeting of the Toronto Branch was held on the 19th of the month, in the Physics Building at the University of Toronto.

Research in Ontario was the subject of the meeting, and the speaker, Dr. R. C. Wallace, chairman of the Ontario Research Commission, was well qualified to deal with it.

The meeting was arranged by the Engineering Institute in Toronto and, due to its appeal to all technical men, it was held under the auspices of the Affiliated Engineering and Allied Societies in Ontario.

An audience of some 220 heard Dr. Wallace, principal of Queen's University and a former president of the University of Manitoba and University of Alberta, tell of the work of the Commission and its findings. The speaker pointed out that the Commission's work was divided into five main classes, namely, industrial organizations, fisheries, soil husbandry, forests and mining. Thus a wide variety of problems were under consideration and practically every industry or group in Ontario could receive benefit from the Commission's work.

Discussion followed the meeting, and Dean C. R. Young, who as a member of the Ontario Research Commission had personal knowledge of Dr. Wallace's ability in the field of research, expressed the thanks of those present.

VANCOUVER BRANCH

Alan Eyre, s.e.i.c. - - - - *Secretary-Treasurer*
G. W. Allan, m.e.i.c. - - - *Branch News Editor*

On Monday, Feb. 17th, 1946, the Vancouver Branch of the Institute held its annual Students Meeting, with seventy members and students attending.

T. V. Berry, councillor elect of the Branch, presented The Engineering Institute of Canada award to Edward T. Kirkpatrick, last year's winner. This prize is presented each year to a student of any department of engineering who has proved himself most deserving, not only in connection with his college work, but also by his activities in the student engineering organizations.

J. P. Fraser, chairman of the Branch, introduced Stephen Herring, chairman of the Student Section, who acted as chairman of the meeting, and introduced the Speakers: F. J. Andrew, A. G. Fletcher, and R. Phillman, engineering students at the University of British Columbia. F. J. Andrew's subject was **The Use of an Ice Frozen Caisson in the Removal of Ripple Rock.** Ripple Rocks are situated in Seymour Narrows, one hundred and twenty miles north of Vancouver. The main rock is two hundred and twenty feet by one hundred and fifty feet, the lesser rock being one hundred feet by seventy-five. The minimum water coverage is six feet, while the maximum is twenty feet, with a tide current of twenty feet per second. Mr. Andrew reviewed briefly the various methods suggested in the past for the removal of the rocks, and talked at some length of working from a caisson frozen to the surface of the rock, describing the caisson, and the method of freezing the joint to the surface of the rock—an idea developed by James Lubzinki, a graduate of the University of British Columbia.

A. G. Fletcher chose as his subject **Logging Engineering** dividing his talk into four main headings: topography—reconnaissance—road construction—and the operation of truck logging. Mr. Fletcher in dealing with the construction of logging roads pointed out that the maximum adverse grade of five per cent, and a favorable grade of twenty per cent, with a minimum curvature radius of at least fifty feet, was generally used in truck logging roads. The skyline method of handling logs was discussed in some detail by the speaker.

The accuracy of the **One-Minute Transit** was the subject discussed by R. Phillman.

A very interesting discussion period followed the addresses, which indicated the general interest in the subjects, and a vote of thanks, enthusiastically endorsed by the audience present, was tendered by Jack Fraser.

VICTORIA BRANCH

S. H. Frame, m.e.i.c. - *Secretary-Treasurer*

On Wednesday evening, February 19th, the Victoria Branch held its second meeting of the year in the council chamber of the City Hall with Chairman R. C. Farrow presiding.

Major Farrow introduced the speaker of the evening, A. L. Carruthers. Mr. Carruthers is Deputy Minister of Public Works for British Columbia, previously being chief engineer and chairman of the Highway Board. He gave an enlightening and instructive address on **The Provincial Highway System** dealing with the physiography of the province as related to highways telling the difficulty in constructing east-west highways across north-west mountain ranges and rivers. He said the distance from Vancouver to Lethbridge was 872 miles by road but only 476 miles by air.

He dealt with "through versus local traffic" and contended that the number of persons using coast to coast roads in the United States was far below the number merely driving from town to town.

He mentioned a number of highway projects in British Columbia and said 441 miles of road were now under construction. A section of the Hope-Princeton road, he said, cost as much as $210,000 per 1500 feet.

Mr. Carruthers touched upon the history of British Columbia roads, paying high tribute to the pioneers for the excellent judgment used in locating their trails. He said many of them were perfectly situated and that a great number of our highways today follow the old trails as originally laid out.

Hon. E. C. Carson, Minister of Public Works, attended the meeting, along with representatives of bus lines, the Chamber of Commerce, corporation of B.C. Land Surveyors and the Victoria and Island Publicity Bureau.

At the close of his address the speaker was thanked by the chairman.

WINNIPEG BRANCH

R. T. Harland, m.e.i.c. - *Secretary-Treasurer*

Electrical Section

L. A. Bateman - *Secretary*
D. C. Bryden - - *News Editor*

The first annual meeting of the Electrical Section was held on February 13, 1947. H. L. Briggs, the chairman, outlined the activities during the past year and noted that the membership in the section is now 105, an increase of 40 during the year. The need for this type of meeting is demonstrated by the support of the members of the Winnipeg Branch.

S. S. Stevens, director of communications for Trans-Canada Airlines, addressed the meeting on **Electronic Aids to Aviation.** This subject proved most timely as he described in detail the method of blind landing that TCA is perfecting at the present time. Mr. Stevens provided the members with explanatory diagrams, and his talk provoked many questions.

BOOK REVIEW

HEATING AND AIR CONDITIONING

6th ed. J. R. Allen, J. H. Walker and J. W. James, N.Y., London McGraw-Hill; Toronto, Embassy Book Company, 12 Richmond Street East, 1946. 667 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.05 (in Canada).

Reviewed by W. H. Wilson, Jr.E.I.C.*

The latest edition of this book brings it completely up to date. Much of the text has been revised and some new material added. This text book is clearly written and sufficiently thorough to enable the student to obtain a solid theoretical groundwork, as well as some knowledge of practice. It contains a great many excellent illustrations, and several very good charts and graphs. However, the double page graphs bound into the book rather than being of the fly leaf type, lose some of their value, as the central portions are difficult to read.

The first chapter deals with the basic conception of heat, and the related physical properties of steam and air. There follows a discussion on heat loss from buildings, and methods of computing transmission coefficients for combinations of materials. Methods of heating buildings, and descriptions of various types of radiators, convectors, and unit heaters are given, including a timely section on the use and design of panel heating systems. Different types of fuels and boilers are discussed, and methods of firing are described with sections on mechanical stokers and oil burners. The manner in which boilers and furnaces should be selected is given. Various types of heating systems and their design is next dealt with, and a section is devoted to the description of piping materials and practice. Automatic controls and devices are described briefly and there is a short chapter on central and district heating.

The air conditioning section opens with a study of the properties of mixtures of air and water vapour, and the theoretical consideration of this subject is covered in some detail. Another chapter is devoted to the description of the various methods used for air conditioning in different types of buildings and a general description of the equipment used, including washers, fans, and filters. The transmission and distribution of air, friction losses, design and sizing of ducts and grilles, and noise levels are covered in some detail. The following chapter deals with methods of cooling and dehumidifying air, with a description of the apparatus used, and a section on the various types of refrigerants in common use. General considerations of the cooling and dehumidifying load are discussed, and a chapter is devoted to the design of an air conditioning system. There are several short chapters on residence air conditioning, unit air conditioners, and data on industrial air conditioning. The appendices deal with a more advanced study of the theory of air and vapour mixtures, sizes and ratings of radiators, the conductivity and conductance of various types of building construction, and a list of symbols used in drawings.

**Engineer, E. A. Ryan and R. A. Combe, Consulting Engineers, Montreal.*

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Cities of Latin America; Housing and Planning to the South:
Francis Violich. N.Y., Reinhold, c1944. 241 pp., illus., cloth.

Control Charts in Factory Management:
William B. Rice. N.Y., Wiley; London, Chapman & Hall, c1947. 149pp., illus., cloth.

Current Waterworks Practice; a Practical Treatise on the Provision of Water Supplies for Urban and Rural Communities:
W. H. Maxwell. London, Batsford, 1946. 254 pp., illus., cloth.

Electronic Engineering Master Index; a Subject Index to Electronic Engineering Periodical, January 1935 to June 1945:
F. A. Petraglia, Editor. New York, Toronto, Macmillan 1946, 209 pp., cloth.

Elements of Mechanism; 6th ed rev:

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

Prepared by the Library of The Engineering Institute of Canada

APPLICATIONS OF ELECTRICITY TO RAILWAYS, 1942-1945:

Edmund Arthur Freeman and Douglas Rae Stephenson. Washington 6, D. C., Bureau of Railway Economics Library, Association of American Railroads, (1946). 87 pp., paper.

This booklet contains a classified bibliography of periodical articles appearing in a select-list of thirty-six periodicals, with an author index. References are arranged in three large groups by subject in chronological order. Bibliographies on Signaling and on Telegraph and Telephone are included as appendices. In the section "Key to Periodicals", it is understood that the files of foreign periodicals are not complete, but may be present for only a part of the year. The appendix contains lists of books and periodicals contributed by various sections of the Association of American Railroads.

BRITISH STANDARD SPECIFICATION FOR ACID RESISTING SILICON IRON PIPES AND PIPE FITTINGS. B.S. 1333-1946:

London, British Standards Institution, 1946. 2/-.

This new British Standard deals with the dimensions of high silicon pipes and pipe fittings from 1 inch to 12 inches nominal bore which are used in chemical plant and where excessive corrosion is inevitable or anticipated. Minimum silicon content to give maximum corrosion resisting properties is generally agreed to be 14.25%. Flanged pipes are specified with 45° cone ends for assembly by halved loose coupling flanges of ordinary cast iron impinging upon the 45° cone ends of the pipe. The Standard also deals with spigot and socket pipes, the spigots of which are generally similar to the ends of the cone and pipes, thus allowing inter-connection between cone end and spigot and socket pipes. The fittings included comprise elbows, bonds, tees and crosses for both flanged and spigot and socket pipes.

BRITISH STANDARD SPECIFICATION FOR AIR-DEPOLARISED PRIMARY CELLS. B.S. 1335-1946:

London, British Standards Institution, 1946. 2/-.

This specification prescribes the minimum rating of air-depolarised type primary cells on continuous discharge and gives the methods of test on which the rating is based. A system of nomenclature is prescribed by which the type and size of cell are expressed by a sequence of two or three letters and a number. Details of the quality of materials to be used, and also dimensions of electrodes, containers, connecting wires and terminals are also given.

BRITISH STANDARD SPECIFICATION FOR BLACK BOLTS AND NUTS (SMALL HEXAGON AND SQUARE) B.S.W. AND B.S.F. B.S. 916-1946:

London, British Standards Institution, 1946. 2/-.

The British Standards Institution has reissued B.S. 916 as the regular British Standard for black hexagon and square bolts and nuts for general engineering.

Because of the desirability of using the old large (Whitworth) size nuts in certain applications of heavy engineering work and in specially corrosive situations, consideration is being given to the reissue, for such applications of the table of Whitworth Standard nuts formerly contained in B.S. 28: 1932 (withdrawn in 1943).

BRITISH STANDARD SPECIFICATION FOR MANILA ROPES FOR GENERAL PURPOSES. B.S. 431-1946:

London, British Standards Institution, 1946. 2/-.

This revised standard (first published 1931) comprises three grades of manila rope "special", "standard" and "merchant" hawser laid (3 strand) shroud laid (4 strand) and cable or water laid (9 strand). Tensile breaking strengths of both yarns and ropes and weights of ropes are specified. The amendment to the 1940 edition of 13 additional clauses dealing with water repellent (water-proofed ropes) has now been incorporated.

BRITISH STANDARD SPECIFICATION FOR SISAL ROPE FOR GENERAL PURPOSES. B.S. 908-1946:

London, British Standards Institution, 1946. 2/-.

This revised standard (first published 1940) comprises one grade of sisal rope comparable as to strength with "standard" grade manila rope to B.S. 431, hawser laid (3 strand) shroud laid (4 strand) and cable or water laid (9 strand). Tensile breaking strengths of both yarns and ropes and weights of rope are specified. The amendment to the 1940 edition of 13 additional clauses dealing with water repellant (water-proofed) ropes has been incorporated.

BRITISH STANDARD SPECIFICATION FOR SOCKETS FOR WIRE ROPES FOR GENERAL ENGINEERING PURPOSES. B.S. 463-1946:

London, British Standards Institution, 1946. 2/-.

This revised standard (first published 1932) incorporates an existing amendment and corrects dimensions in Tables 1 and 2. The standard deals with both "open" and "closed" sockets for wire ropes from ⅞ in. to 5 in. circumference and provides for workmanship, tolerances, heat treatment and proof testing, while the Appendix gives a recommended method of socketing with white metal to B.S.643.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

ADVANCED MATHEMATICS for ENGINEERS:

H. W. Reddick and F. H. Miller. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 508 pp., diagrs., tables, 8½ x 5½ in., cloth, $5.00.

Assuming a knowledge of mathematics through the calculus, this book begins with the theory and standard methods of manipulation of ordinary differential equations. Succeeding chapters deal with various special functions, integrals, series and equations, with vector analysis, probability, and the operational calculus. To emphasize physical applications, problems are presented, with each principal topic, relating to the main fields of engineering. In this reviewed addition, an appendix has been added giving a brief discussion of dimensional analysis and systems of physical units.

DECIBEL NOTATION; Its Application to Radio and Acoustics:

V. V. Rao. Chemical Publishing Co., Brooklyn and New York; General Publishing Co., Toronto, 1946. 179 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $3.75.

This book explains in detail the origin and development of decibel notation and describes a wide range of applications, with special reference to radio engineering and acoustics. Among the topics surveyed are the logarithmic unit, zero levels and level signs, decibel meter and decibel graphs, sound levels and phonic calculations. Since the book was originally published in India, the terminology is English rather than American, but the differences are few.

ENGINEERING PRACTICE; a Review of Modern Technique. Vol. 1:

H. Hirst. Engineering Practice, 359 Collins St. Melbourne, C.1, Australia, 1945. 159 pp., illus., diagrs., tables, 9⅛ x 7¼ in., fabrikoid, 25s.

First of a projected series dealing with the important aspects of present-day engineering technique, this volume covers the following topics: soldering of aluminum and its alloys; centrifugal casting of ferrous and non-ferrous components; properties and manufacture of bearings and bearing materials; forging of aluminum alloys; die casting. Intended for the Australian engineering industry, these articles review the technical literature and discuss developments of the last five years both in Australia and overseas. The connection between theory and practice is adequately stressed, and bibliographies are provided. Succeeding volumes will deal similarly with some five or six selected topics.

IMPROVING LONDON'S TRANSPORT:

Published by "The Railway Gazette", 33 Tothill St., Westminster, London, S.W.1, 1946. 108 pp., illus., diagrs., maps, tables, 12 x 9 in., paper, 5s.

Covering both surface and sub-surface lines, this publication opens with a brief historical discussion and an account of the scope and extent of the present works. Succeeding chapters cover subway construction work including special details, signaling practice, stations and buildings, escalators and lighting, new rolling stock, power supply and distribution, and traffic operation. The book is well illustrated by photographs, diagrams and maps.

INDUSTRIAL CARBON; its Elemental, Adsorptive and Manufactured Forms:

C. L. Mantell. 2 ed. D. Van Nostrand Co., New York, 1946. 472 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50.

This revision of a standard work has four sections: the elemental forms of carbon, the diamond, natural graphite, carbon black, acetylene black, lamp black and pigments, with their applications, form the first section; the second covers the adsorptive forms; the third section deals with the manufactured forms, artificial graphite, electrodes, brushes, arc-light carbons, specialties and resistors, materials of construction, porous forms, electronic tube anodes, and refractories; the fourth section includes analytical and testing methods, and physical and chemical properties. Many bibliographical references are included.

LONDON BUILDING LAW for the use of Architects, Surveyors and Students:

H. R. Chanter. B. T. Batsford Ltd., London, 1946. 358 pp., diagrs., tables, 9 x 6 in., cloth, 21s.

Intended as an introduction and guide to the various enactments and bylaws which affect building in London, this book provides a comprehensive digest of the essential requirements in the actual construction of buildings in that city. The book includes definitions and interpretations, design tables and calculations, and a historical review of London building law, in addition to the definite regulations on construction practice. Miscellaneous topics dealt with include illumination, noise, drainage, smoke, advertising signs, streets, area planning, etc.

SURVEYING; Theory and Practice:

J. C. Tracy. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 1279 pp., illus., diagrs., charts, tables, 7¾ x 4¾ in., fabrikoid, $7.50.

Each branch of field work, as covered in Part I, is treated under three heads: the use of the instrument; the general method of procedure; the practical details of the field work. Part II explains general methods of office work, both drafting and computation, with emphasis on systematic procedure. Part III is a critical study of the construction and adjustment of instruments, with directions and suggestions for standardizing tapes. Part IV furnishes a working knowledge of requirements and procedures for special types of surveys, such as horizontal control surveys, aerial photographic surveys, etc.

USE of RESEARCH by PROFESSIONAL ASSOCIATIONS in DETERMINING PROGRAM and POLICY:

E. L. Brown. Russell Sage Foundation, New York, 1946. 39 pp., 9 x 6 in., paper, $0.25.

The weaknesses of program and policy determination for large professional associations by individuals or conference table methods are briefly discussed, and the use and value of research for these activities are shown by examples in actual association work dealing with professional training, salary and personnel practices, and the structure and function of the associations themselves.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

April 1st, 1947

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the May meeting.

L. Austin Wright, General Secretary

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professionl responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practial experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ABBOTT—ROSS HUGHSON, of Niagara Falls, Ont. Born at Lindsay, Ont., Jan. 21, 1914. Educ.: B.Sc., (Chem. Engrg.), Queen's, 1943. 1940, (summer), dftsman., Shawinigan Chemicals Ltd., Shawinigan Falls, Que.; 1941-42, (summers), dftsman, Horton Steel Works, Fort Erie, Ont.; 1943, (8 mos.), asst. chemist, Irvington Varnish, Hamilton, Ont.; 1943-45, zinc mill, inspecn. and quality control, Burgess Battery Co., Niagara Falls, Ont.; 1945 to date, dftsman., engrg. dept., North American Cyanamid Ltd., Niagara Falls, Ont.

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST interested in textile dyeing, required by an industrial firm in South Western Quebec. Salary open. Apply to File No. 3798-V.

CHEMICAL ENGINEER, with pulp and paper experience, required by a firm of consulting engineers in Montreal, for design and research. Salary according to experience. Apply to File No. 3799-V.

CIVIL

SEVERAL CIVIL ENGINEERS, with two or three years' experience in road construction required for road building work in Northern Quebec. Salary open. Apply to File No. 3804-V.

ELECTRICAL

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEER, recent graduate, required in central engineering department of industrial organization in Montreal. Duties include development, design and installation. Permanent position. Salary $175 up. Apply to File No. 3807-V.

MECHANICAL

MECHANICAL ENGINEERS required by a Pulp and Paper mill at Powell River, B.C. Preferably with experience in plant design in the pulp and paper industry. Salary according to qualifications. Apply to File No. 3796-V.

MECHANICAL ENGINEER, 35-40, with steel, copper or brass mill experience, required to take charge of a small engineering department for a firm in Montreal making rock metal. Salary $350 up. Apply to File No. 3800-V.

MECHANICAL ENGINEER required to establish and operate an estimating and planning department for the grinding and machine shop of a firm located in Central Ontario. Experience in tools, dies, and shop work essential. Salary open. Apply to File No. 3801-V.

MECHANICAL DRAUGHTSMAN, with several years experience in machine design, required by an industrial organization in Montreal. Salary $250 up. Apply to File No. 3807-V.

MECHANICAL ENGINEER with at least 10 years experience in design and installation of machinery also supervisory ability required by an industrial organization in Montreal, Salary open. Apply to File No. 3807-V.

MISCELLANEOUS

INDUSTRIAL ENGINEER, with two to five years experience in time-study and job evaluation required by a firm in Montreal making rock metal. Salary $200 up. Apply to File No. 3800-V.

GRADUATE CIVIL OR MINING ENGINEER required to take charge of several small instrument parties, for layout work in New Brunswick area. Salary $350. Apply to File No. 3803-V.

MECHANICAL AND ELECTRICAL ENGINEER required by a consulting engineer in Montreal for service engineering. Preferably with design experience in heating and ventilating. Salary $225 up. Apply to File No. 3805-V.

CHEMICAL OR MECHANICAL ENGINEERS, recent graduates, required by an organization in the Montreal area, for experimental and development work, with view to supervisory positions in production. Salary $200 up. Apply to File No. 3806-V.

ENGINEERING DRAUGHTSMEN, required by large transport company in Montreal for work leading to design. Salary $200 to start. Apply to File No. 3809-V.

BRIDGE INSPECTOR required by a large transport company in Montreal area. Salary open. Apply to File No. 3809-V.

RECENT GRADUATES OR JUNIOR ENGINEERS with mechanical background, required by a Montreal Engineering, fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175 up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER, required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a petroleum refining company in Montreal for process and design work. Salary about $225. Apply to File No. 3575-V.

CHEMICAL ENGINEER required as assistant professor of chemical engineering in a Canadian university to start autumn 1947. Salary open. Apply to File No. 3600-V (D).

CHEMICAL ENGINEERS OR CHEMISTS for analytical work in the laboratory of an industrial firm in Central Ontario. Salary from $175. Veteran preferred. Apply to File No. 3642-V.

CHEMICAL ENGINEER, preferably with sales experience, for sales and service with an industrial firm in Central Ontario. Salary open. Apply to File No. 3642-V.

CHEMICAL ENGINEERS, both with experience and recent graduates, required by an industrial organization in the St. Maurice Valley. Salary open. Apply to File No. 3644-V.

CHEMICAL ENGINEER recent graduate up, to be assistant to the department superintendent of a tar distillery in the Toronto area. Salary $225. Apply to File No. 3674-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

CHEMICAL ENGINEER, recent graduate, required as process engineer in production control by a manufacturer in Central Ontario. Salary open. Apply to File No. 3708-V.

JUNIOR CHEMICAL ENGINEER required for the control department of a paper mill in Shawinigan Falls. Salary from $175-$275. Apply to File No. 3765-V.

GRADUATE CHEMICAL ENGINEER required by a Montreal firm to supervise and control Chemical plant engaged in production of fine chemicals about 60 miles from Montreal. Preferably with actual experience in handling both laboratory and plant personnel. Salary open. Apply to File No. 3783-V.

CHEMICAL ENGINEER with knowledge of how to treat sulphate or failing this sulphite and soda pulp, required as Regional Manager by a large paper company in Northern Ontario. Executive and management ability necessary. Permanent position. Salary $15,000. Apply to File No. 3808-V.

CIVIL

CIVIL ENGINEER with experience in the mechanical trades required as designer by a building contractor in Quebec, age 30-35, salary open. Apply to File No. 3444-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER, senior designer, experienced in reinforced concrete and structural steel and general building construction, required to take charge of structuraldesign staff for a firm of consulting engineers in Montreal. Salary $300–$400. Apply to File No. 3585-V.

CIVIL ENGINEERS with master's degree, teaching and consulting experience, age 28-40, required for the staff of a university in N.Y. State. Salary open. Apply to File No. 3600-V (C).

CIVIL ENGINEER, preferably with railroad experience, required by a company engaged in large scale asbestos production in Quebec to supervise construction of local railroad. Salary open. Apply to File No. 3683-V.

CIVIL ENGINEER, recent graduate up, required for government organization on West Coast, to carry out field surveys, investigations of water resources and their application and to make reports, maps, plans, etc. Salary $200 up. Apply to File No. 3724-V.

CIVIL ENGINEER, with at least five years' experience, to be assistant to the Director of Community Planning of the Province of Saskatchewan. Starting salary $200-$250. Apply to File No. 3746-V.

CIVIL ENGINEER with experience in survey and construction, preferably bilingual, required to take charge of the engineering department for the woods operations of a paper company in Eastern Quebec. House available. Salary $350 up. Apply to File No. 3749-V.

CIVIL ENGINEER, qualified O.L.S., required as town engineer and superintendent of works for a town in Central Ontario. State age and salary desired. Apply to File No. 3750-V.

CIVIL ENGINEER with considerable experience in the design and construction of structural steel and reinforced concrete structures, required by a firm of consulting engineers in Toronto. Salary open. Apply to File No. 3753-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years' experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

GRADUATE CIVIL ENGINEER, required as structural designing engineer by a firm engaged in the manufacture of cranes, crushers, pumps, etc., in the Toronto area. Preferably with 5 to 10 years' experience in designing and detailing steel buildings and bridges. Salary open. Apply to File No. 3771-V.

CIVIL ENGINEER is required to act as Town Engineer and take complete charge of the engineering service of a town in Ontario. Maximum salary $3,000. per annum. Apply to File No. 3782-V.

GRADUATE CIVIL ENGINEER required by an industrial corporation in Montreal for design work in draughting room. Must be familiar with structural steel and concrete design. Position offers good opportunity and permanency to right man. Salary from $250 up according to experience, Apply to File No. 3785-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters. English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to File No. 3415-V.

ELECTRICAL ENGINEER age 30 - 45 with sales training with large manufacturer of electrical equipment instruments and 5-10 years experience as sales service and sales engineer required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER with knowledge of power apparatus, preferably bilingual, required for sales work with a manufacturer in the Montreal area. Salary open. Apply to File No. 3646-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER to be chief engineer, responsible for electrical and mechanical design and testing, required by a firm in Ontario manufacturing electric motors. Salary open. Apply to File No. 3656-V.

ELECTRICAL ENGINEER with several years experience required as a designer by an industrial organization in Montreal. Salary open. Apply to File No. 3677-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35, salary open. Apply to File No. 3695-V.

ELECTRICAL DRAUGHTSMAN with several years' experience in industrial layouts for large concern in Eastern Townships. Permanent position and attractive salary available for experienced men. Apply to File No. 3701-V.

ELECTRICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

ELECTRICAL ENGINEER, with at least five years experience on overhead and underground transmission and distribution systems. Required as distribution engineer by a public utility in Brazil. Salary open. Apply to File No. 3738-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with broad practical experience and theoretical knowledge required for a firm in Quebec. Salary from $225. Apply to File No. 3743-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with considerable industrial experience and initiative required by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER with estimating and contract experience, required as office engineer by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200. up. Apply to File No. 3761-V.

JUNIOR ELECTRICAL ENGINEER, required to act as assistant in an engineering sales office of an electrical firm in the Montreal area. Salary open. Apply to File No. 3768-V.

GRADUATE ELECTRICAL ENGINEER with 5 or more years experience in electrical equipment of buildings, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

GRADUATE ELECTRICAL ENGINEER with at least three years experience, preferably construction required by a manufacturer in Central Ontario, to supervise electrical installations on construction jobs. Salary open. Apply to File No. 3775-V.

GRADUATE ELECTRICAL ENGINEERS with 3 to 10 years experience in design, operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

GRADUATE ELECTRICAL ENGINEER, required to train as Sales Engineer with National organization. Permanent position. Must be prepared to be stationed in Alberta or Saskatchewan. Reply giving full particulars. Enclose photo when answering. Apply to File No. 3790-V.

MECHANICAL

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to File No. 3393-V.

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area, in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEER with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEERS to be design squad leaders on heavy machinery design required by a company in Central Ontario. Salary open. Apply to File No. 3623-V.

MECHANICAL ENGINEER recent graduate, required by an industrial firm in south western Quebec, for the design and erection of complex textile machinery. Salary open. Permanent position. Apply to File No. 3625-V.

UNIOR MECHANICAL ENGINEER with construction or machine shop experience, required by a Montreal firm handling heavy construction equipment. Salary open. Apply to File No. 3635-V.

MECHANICAL ENGINEER with experience in the fabrication of Farm Implements, required by a Quebec firm. Bilingual man preferred. Salary according to experience. Apply to File No. 3666-V.

MECHANICAL ENGINEER with experience in the design of industrial machinery required by a Montreal firm manufacturing custom built machines. Salary $200-$250. Apply to File No. 3669-V.

MECHANICAL ENGINEER with design experience in the pulp and paper industry required by a firm with headquarters in Montreal. Salary $350. Apply to File No. 3673-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEER with industrial or construction experience, required by a firm of consulting engineers to inspect machinery deliveries in the Cornwall area. Salary open. Apply to File No. 3691-V.

MECHANICAL ENGINEER, recent graduate up, required for maintenance and production engineering by an industrial firm in Montreal. Salary open. Apply to File No. 3692-V.

MECHANICAL ENGINEERS, age 25-35, required by a manufacturer in Montreal, for training as sales engineers and for executive positions. Salary from $200. Apply to File No. 3710-V.

JUNIOR MECHANICAL ENGINEER, under 30 and preferably bilingual, required by a Montreal firm to train as sales engineer for pumps, engines and allied electrical equipment. Salary open. Apply to File No. 3714-V.

MECHANICAL ENGINEER, under 45, with at least ten years' experience in design of heating, ventilating and refrigeration layouts, required as heating engineer for a government organization on West Coast. Salary $250-300. Apply to File No. 3724-V.

YOUNG MECHANICAL ENGINEERS, with practical experience either in automotive or general manufacturing industries, together with ability to operate engineering office systems, required by an industrial organization in Ontario. Salary open. Apply to File No. 3732-V.

MECHANICAL ENGINEERS, with at least five years' experience in the Pulp and Paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

SENIOR MECHANICAL ENGINEER, ten to fifteen years' experience required by a West Coast manufacturer of heavy equipment and vehicles to take charge of engineering design and inspection departments. Salary about $350. Apply to File No. 3734-V.

MECHANICAL ENGINEERS, with experience in plant layouts and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3756-V.

JUNIOR MECHANICAL ENGINEER with industrial experience required as assistant to the plant engineer in a factory in the Montreal area. Salary about $225. Apply to File No. 3758-V.

GRADUATE MECHANICAL ENGINEER, experienced in boiler operation, required as assistant superintendent on maintenance of railroad and tramways rolling stock, in the Quebec area. Salary $200. per month. Apply to File No. 3772-V.

MECHANICAL ENGINEER with 5 or more years experience in heating, ventilating and air-conditioning, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

JUNIOR MECHANICAL ENGINEER, required by a manufacturer in Central Ontario, to be responsible to Mechanical Superintendent. Salary open. Apply to File No. 3774-V.

MECHANICAL ENGINEER, with paper mill or mining experience required for design and layout by a paper mill in Northern Quebec. Salary $375-400. Apply to File No. 3778-V.

MECHANICAL ENGINEER with considerable experience willing to act as assistant to Mechanical Superintendent of a textile manufacturing concern near Montreal. Salary open. Apply to File No. 3784.-V

SENIOR MECHANICAL DRAUGHTSMAN, age 25 to 45, with at least 5 years mechanical design and detailing experience, required for the mechanical department of an industrial organization in Montreal. Salary from $230 up according to experience. Apply to File No. 3786-V.

MECHANICAL ENGINEER, recent graduate up, required by a Pulp and Paper Company in the Province of Quebec for work entirely centred in logging operations. Salary open. Apply to File No. 3789-V.

MECHANICAL ENGINEER, recent graduate up, required by major oil company in Montreal area. Salary $175 up according to experience. Apply to File No. 3792-V.

MINING

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3743-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least 5 years practical experience, required by an industrial engineering consultant in Montreal. Apply to File No. 3307-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

DESIGN ENGINEER with considerable experience required by a pulp and paper firm in the St. Maurice Valley. Salary open. Apply to File No. 3573-V.

GRADUATE ENGINEERS, required by a large industrial and chemical organization with headquarters in Montreal for all phases of research design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

ASSISTANT PROFESSORS AND INSTRUCTORS required for the staff of a technical college in New York State. Salary open. Apply to File No. 3600-V. (A)

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL AND MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply to File No. 3628-V by letter with full details. Salary open.

SALES ENGINEER with wide engineering experience wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

MECHANICAL AND STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

ASSISTANT ENGINEER with experience in estimates and specifications for industrial work required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CHIEF DRAUGHTSMAN with at least five years draughting room and related engineering office experience, preferably in pulp and paper or process industries, required by a pulp and paper mill in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CIVIL OR MECHANICAL ENGINEER, required by a pulp and paper company in Newfoundland to look after new development work and general engineering in connection with woods operations. Salary open. Apply to File No. 3655-V.

ASSISTANT PLANT ENGINEER, preferably with pulp and paper or structural design experience, required for a newsprint mill in a city on north shore of Lake Superior. Salary open. Apply to File No. 3657-V.

MECHANICAL OR ELECTRICAL ENGINEERS for training as production engineers with an industrial firm in Montreal. Salary open. Apply to File No. 3662-V.

JUNIOR ENGINEERS preferably with pulp and paper or other industrial experience required for training for the sales staff of a Montreal manufacturer of machines and equipment. Salary from $175. Apply to File No. 3664-V.

GRADUATE ENGINEERS for mechanical design, experimental, test and development departments of a Canadian firm producing aircraft gas turbines. Salary open. Apply to File No. 3667-V.

STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3668-V.

JUNIOR ENGINEERS, recent graduates up, as designing draughtsmen for a brewing company with headquarters in Montreal. Salary from $200. Apply to File No. 3670-V.

SALES ENGINEER with knowledge of sawmill and woodworking equipment, preferably bilingual, required for the sale of specialized equipment. Salary $200 plus commission. Apply to File No. 3678-V.

JUNIOR ENGINEER, recent graduate up, required as surveyor by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

CIVIL OR MECHANICAL ENGINEERS with design or structural experience required by a manufacturer of contractors' equipment in the Hamilton area. Salary open. Apply to File No. 3698-V.

CONSTRUCTION ENGINEER with field experience, age about 30, required as office engineer and assistant to general manager for a firm of contractors in Montreal. Salary open. Apply to File No. 3703-V.

SPECTROSCOPIST with experience in chemical analytical work and the use of the commission spectograph required by an industrial organization with headquarters in Montreal. Salary open. Apply to File No. 3706-V.

FORESTRY ENGINEER, recent graduate up, required by a paper company for woods operations on the Lower St. Lawrence. Salary from $175. Apply to File No. 3707-V.

JUNIOR ENGINEERS, recent graduate up, required for the engineering staff of a communications company with headquarters in Montreal. Veterans preferred. Salary from $175. Apply to File No. 3713-V.

JUNIOR STRUCTURAL DESIGN ENGINEER required by a steel fabricating firm in Central Ontario. Salary open. Apply to File No. 3715-V.

JUNIOR ENGINEERS, preferably with some mechanical design experience, required for the engineering staff of a manufacturer in Sherbrooke. Salary open. Apply to File No. 3721-V.

JUNIOR ENGINEERS, recent graduates up, with mechanical background required by a Montreal manufacturer for the design and supervision of boiler plant installations, preferably bilingual. May have sales work. Salary from $200. Apply to File No. 3722-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

CONSTRUCTION ENGINEER with considerable experience required for the permanent staff of a Montreal inspection company. Salary about $200. Age immaterial. Apply to File No. 3728-V

JUNIOR ENGINEER, preferably with experience in heating and combustion problems, required by a specialist firm in Montreal. Salary $250-325. Apply to File No. 3729-V.

SALES ENGINEERS, with mechanical and electrical background, bilingual, required by a Montreal firm handling road building and contractors equipment, generators, pumps, etc. Salary open. Apply to File No. 3737-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DESIGN ENGINEERS, age about 30, with experience in the design and layout of chemical plants, required by an industrial organization in the St. Maurice Valley. Salary from $250. Apply to File No. 3741-V.

DESIGN DRAUGHTSMEN, age about 25, with experience in chemical plant layouts, required by an industrial organization in the St. Maurice Valley. Salary from $200. Apply to File No. 3741-V.

INDUSTRIAL ENGINEER, with broad experience in plant development, operation, costs and management required for a firm in Quebec. Salary from $250. Apply to File No. 3743-V.

SALES ENGINEER required in the St. John, N.B., district by a firm handling oil purifiers, piston rings and allied engineering products. Salary $250. plus commission. Apply to File No. 3744-V.

SALES ENGINEER, preferably bilingual, required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEERS, recent graduates up, preferably mechanical, required for the engineering and operating staff of a pulp mill in Eastern Quebec. Salary open. Apply to File No. 3748-V.

PUBLICITY ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

GRADUATE ENGINEER, under 40, with industrial and manufacturing experience and some knowledge of sales, required by a bolt and nut manufacturer in the Montreal area. Salary open. Apply to File No. 3752-V.

GRADUATE ENGINEER required by an insurance company in Montreal for the inspection of boilers, steam plant and allied equipment. Salary from $200. Apply to File No. 3754-V.

TECHNICAL GRADUATE, preferably Mechanical, Chemical or Electrical, under 30, veteran preferred, for permanent position with engineering organization. Training period in U.S. Work will include travelling for consultation among leading industrial plants. Enclose photo when answering. Salary open. Apply to File No. 3759-V.

CHIEF DRAUGHTSMAN with experience in Pulp and Paper Mill design wanted immediately in Port Arthur. Reply stating education, experience. Salary open. Apply to File No. 3760-V.

CIVIL, MECHANICAL OR CHEMICAL ENGINEERS, recent graduates up, preferably with experience in petroleum and heavy industry such as chemical or paper, required by an oil company in Toronto. Salary open. Apply to File No. 3762-V.

GRADUATE ENGINEER, with practical experience, production and maintenance, to take charge of Farm Equipment Factory with Grey Iron Foundry, located in Ontario. Apply with photo or snapshot to File No. 3764-V. Salary open.

GRADUATE ELECTRICAL OR MECHANICAL ENGINEER, must have thorough knowledge of fractional H.P. Motors required by a Montreal firm to take charge of small engineering department. Salary $350-$500. Apply to File No. 3770-V.

ROD-MEN AND INSPECTORS up to ASSISTANT PROJECT ENGINEERS, wanted by an American Engineering firm for an employment contract in Alaska for one year. Board and room furnished also transportation from point of hire. Excellent salary. Apply to File No. 3776-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

DESIGN ENGINEER to make investigations and preliminary drawings of cost estimates of alterations to buildings and machinery for a large paper mill in the St. Maurice Valley. Salary around $300. Apply to File No. 3779-V.

MECHANICAL OR ELECTRICAL ENGINEER, age 25-35, required as field service engineer, to handle technical refrigeration service and maintain liaison with national distributors, dealers and service organizations, in the Provinces of Canada, for an American firm. Salary $300-350. Enclose photo when answering. Apply to File No. 3781-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years experience in design, cost estimates, draughting, and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

SALES ENGINEER with electrical engineering background in public utility or industrial field required by wire and cable manufacturer for engineering contact work in Ontario. Salary open. Apply to File No. 3788-V giving complete details.

GRADUATE ENGINEER with experience in pre-stressed concrete and pipe manufacture, required by construction firm in Montreal area, veteran with administrative experience preferably. Salary open. Apply to File No. 3793-V.

GRADUATE, with some knowledge of looms, weave construction and cloth analysis, required as manager for rayon weaving plant in Peru. Administrative ability necessary. Knowledge of Spanish would be an advantage although not a necessity. Salary open. Apply to File No. 3794-V.

University of Manitoba Requires Engineering Instructors

The Faculty of Engineering and Architecture of the University of Manitoba will require additional instructors for teaching duties beginning with the session 1947-1948. Applicants should be Engineering graduates from recognized Universities. The grades required will be assistant professors, lecturers and demonstrators in Civil Engineering and Mechanical Engineering. Salaries will depend on experience and general qualifications.

Apply as soon as possible to Dean of Engineering and Architecture, University of Manitoba, Winnipeg.

University of Toronto Requires Engineer Instructors

Instructors of various grades up to and including lecturer are required by the Faculty of Applied Science and Engineering of the University of Toronto for duty starting in September, 1947. Applicants must be engineering, science, or mathematics graduates. Salary will depend on experience and general qualifications.

Apply to the Secretary of the Faculty of Applied Science and Engineering, Mining Building, University of Toronto.

SUMMER EMPLOYMENT...WANTED

The Employment Service of the Engineering Institute is endeavouring to aid their Student members to obtain suitable practical experience during the summer months. We would appreciate any assistance from firms anticipating such openings.

Situations Wanted

CIVIL ENGINEER, Jr. E.I.C., P.Eng., McGill, 30 years of age, bilingual, ex-R.C.E. officer, 3 years' experience on construction, 2 years pulp and paper industry, 1 year with public utility firm, administrative and contact ability, seeking permanent position. Available on short notice. Apply to File No. 1552-W.

YOUNG CIVIL ENGINEER, M.E.I.C., would accept some work at night at home. Preparation of estimates and tenders. At present employed on construction work. Apply to File No. 2128-W.

GRADUATE ENGINEER, M.E.I.C., member of Board of Trade, Corporation of Professional Engineers, age 33. Interested in: Consultation, analyzing problems, constructive planning, programming projects and over-all direction. Have had real experience and responsibilities in executive planning, inspection and supervision in industry, scheduling, control, costing, promoting production, customer satisfaction, technical sales. Apply to File No. 2441-W.

CIVIL ENGINEER, B.A.Sc., M.E.I.C., P. Eng., .ex-R.C.E. Officer with several years experience in municipal, highway and hydraulic engineering. Presently employed but interested in position with municipality or firm where extensive construction and maintenance work is contemplated. Apply to File No. 2463-W.

HYDRAULIC ENGINEER, B.Sc., M.E.I.C., 20 years experience in Hydraulics relative to hydro-electric power development, hydraulic machinery design and manufacture and development in hydraulic turbine design. Experience in handling men. Desires change in position. Apply to File No. 2638-W.

CIVIL ENGINEER, M.E.I.C., Registered Professional Civil Engineer of Ontario, Resident Engineer on large unit price projects plus wide general experience. Available on short notice. Apply to File No. 2651-W.

ELECTRICAL-MECHANICAL ENGINEER, Jr.E.I.C., age 30, graduate of Naval Electrical Engineering Officers course at Nova Scotia Technical College, 1945. Graduate of Naval Electrical Artificer's course at University of Alberta, followed by 6 months of instructional work on same. One year at sea as Chief Electrical Artificer on frigate, in charge of all electrical equipment. Completed apprenticeship as machinest in railway repair shops in design work testing, research and calculations. Available on two weeks notice. Apply to File No. 2693-W.

MECHANICAL ENGINEER, S.E.I.C., P.E.Q., Jun. A.S.M.E., McGill 1946. Age 22. Single. Experience in methods engineering, tool design, heating and ventilating. Would prefer position with an established firm with a machine shop in order to gain shop experience. Suitable position anywhere in Canada acceptable. Available on short notice. Apply to File No. 2707-W.

CIVIL ENGINEER, B.A., B.Sc., M.E.I.C., R.P.E., age 44, with over 20 years' experience in railway, municipal and highway engineering, also consultative, including design, location, construction and maintenance. Extensive administrative and executive experience. Desires position in construction engineering or superintendent for construction firm. Apply to File No. 2808-W.

ELECTRICAL ENGINEER, Jr. E.I.C., age 34, R.P.E., Ont., on University staff, with sales, maintenance and switchboard design experience. Desires summer employment. Apply to File No. 2809-W.

GRADUATE ENGINEER, mining, Jr. E.I.C., R.P.E., Ont., age 31, married. Approximately three years' experience in mine and land surveying, and three years as a supervisor in production, development and process control in heavy industry. Presently employed, but interested in a position with Consulting Engineer, Surveyor, or in Production. Location preference: Ottawa or Toronto areas. Apply to File No. 2810-W.

RECENT GRADUATE ENGINEER—(Civil, electrical, mechanical) B.Sc., S.E.I.C., would accept sales work during spare time, anywhere in Province of Quebec. Apply to File No. 2814-W.

YOUNG MECHANICAL ENGINEER, B.A.Sc. Toronto, S.E.I.C., single, now engaged in product design and development with firm in the Maritimes, would prefer similar work in Southern Ontario requiring more technical and also some artistic ability. Apply to File No. 2818-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., with five years intensive work with large pulp mill, construction, maintenance, estimate, layouts, process development, time study, etc., also experience in public workmanagement: water, sewer, electric system generation, transmission and distribution with full responsabilities of design and work, etc. Services available at short notice. Age 30, married and bilingual. Apply to File No. 2823-W.

GRADUATE MECHANICAL ENGINEER, Toronto '37, M.E.I.C., P.E.Q., with 10 years experience in design, layout and production of power plant and allied equipment. Available on short notice. Montreal area preferred. Apply to File No. 2826-W.

ELECTRICAL ENGINEER, M.E.I.C., graduated '34, desires summer employment (May 20th-Sept. 15th). At present teaching in Electrical Engineering Department of a University in Eastern Canada. Experience: 4 years' Power and Telegraph Line Construction, 3 years Assistant Electrical Superintendent in a Canadian Gold Mine, 3 years' R.C.E. Electrical Distribution Layouts. Apply to File No. 2827-W.

MECHANICAL ENGINEER (Sask. '45), S.E.I.C., one year's experience with Consultant Engineering Firm, desires employment in Plant maintenance or design, preferably in the vicinity of Toronto, Montreal or Winnipeg. Available June 1st. Apply to File No. 2829-W.

GRADUATE ENGINEER, age 39, bilingual, M.E.I.C., P.E.Q., Ex-R.C.E., with extensive experience on staff work involving planning, organization, administration, procedure and secretarial duties. Varied experience in civil, and electrical engineering including planning, coordination and execution of large projects. Would be interested in position as executive or assistant either in engineering or business organization. Apply to File No. 2832-W.

METALLURGICAL ENGINEER, expert in research, design and management phases of non-metallic mineral industry. Age 41. Experience includes 10 years as manager. Desires connection in similar capacity with reliable concern. Available April 30th. Apply to File No. 2831-W.

PUBLISHED MONTHLY BY

THE ENGINEERING INSTITUTE OF CANADA

2050 MANSFIELD STREET - MONTREAL

Indexed in The Engineering Index.

Price $4.00 a year in Canada, British Possessions, United States and Mexico. $5.50 a year in Foreign Countries. Current issues, 50 cents a copy, back issues 75 cents a copy. To members and affiliates, 25 cents a copy, $2.00 a year.—Authorized as second class mail. Post Office Department, Ottawa.

CONTENTS

COVER PICTURE

One of the main problems in handling coal in a large metropolis is the unloading of the bulk commodity from the holds of boats to storage piles, and the subsequent handling for screening before distribution by motor-truck.

The cover illustration shows a coal-bridge in the yards of the Rochester Pittsburgh Coal Company Canada Limited, Wellington Basin, Montreal, capable of handling on straight digging, 225 tons of coal per hour from the holds of lake boats.

(Fabricated by Dominion Bridge Company)

President's Message

For sixty years the Institute has served the profession of engineering in Canada, and we may look back with some satisfaction on what has been accomplished since 1887. The service we can render to society, our standing with the public and our fellowship within the profession have all increased, and the material rewards to the individual engineer are far better than they were at the time of the birth of the Canadian Society of Civil Engineers.

Particularly the status of the young man entering the profession is greatly improved. Sixty years ago he found it difficult to get a good engineering education in Canada; to-day in every part of the country there are engineering schools which can challenge comparison with any elsewhere. In 1887 the young graduate was a nobody, but in 1947 many of our corporations look upon him as the material from which future leaders will be made, and train him accordingly.

In both wars, members of the Institute have served on the battlefield and in production with honour to themselves and benefit to Canada.

On the other hand we must admit that Canadian engineering is too much inclined to copy and not ready enough to originate, and that there are few structures and few trends in engineering which we can claim as peculiarly Canadian. We have been content to remain competent imitators and improvers, rather than audacious pioneers.

Frequently too, we have thought more of efficiency and economic excellence than we have of aesthetics, and some of our work has left scars on the natural beauty of our country. There are many honourable exceptions, but as a whole, Canadian engineering has been too ready to sacrifice beauty and grace to stark utilitarianism. Nor have we played that part in conserving the natural resources of Canada that our knowledge qualified us to do.

As the achievements of the next sixty years will surpass those of the last, in magnitude and in usefulness to mankind, so we may hope that good engineering and satisfying appearance will be inseparable, and that Canadian engineering may evolve its own characteristics.

In acknowledging the high honour that the Institute has conferred upon me, I pledge myself to serve it in the fullest measure possible.

Message du président

Au terme des soixante ans pendant lesquels l'Institut a servi la profession d'ingénieur au Canada, c'est avec satisfaction que nous pouvons jeter un regard en arrière et contempler ce qui a été accompli depuis 1887. Nous avons enregistré de grands progrès dans l'étendue de notre contribution au bien commun, dans notre position sociale et dans le développement de l'esprit de camaraderie au sein de la profession. De la même façon, la rémunération de l'ingénieur est beaucoup meilleure qu'elle ne l'était au moment de la fondation de la Société Canadienne des Ingénieurs Civils.

En particulier, la position du jeune ingénieur au seuil de la profession s'est beaucoup améliorée. Il y a soixante ans, il était difficile pour lui d'acquérir au Canada une solide formation d'ingénieur; il existe aujourd'hui, par tout le pays, des écoles d'ingénieurs qui peuvent rivaliser avec celles des autres pays. En 1887, le jeune diplômé était quantité négligeable, mais en 1947, plusieurs de nos compagnies le considèrent comme de l'étoffe dont on fait les chefs, et le préparent en conséquence.

Dans les deux guerres, les membres de l'Institut se sont distingués et ont servi le Canada tant sur les champs de bataille que dans la production industrielle.

D'autre part, il faut admettre que l'art de l'ingénieur au Canada tend vers la copie plutôt que vers l'originalité, et qu'il existe peu de structures et de tendances qui soient typiquement canadiennes. Nous nous sommes contentés d'imiter fidèlement et de perfectionner, plutôt que de faire œuvre de pionniers.

Trop souvent aussi, nos préoccupations de rendement et d'économie sans égard pour l'esthétique, ont laissé des marques honteuses sur la beauté naturelle de notre pays. Il existe plusieurs nobles exceptions, mais, en somme, l'art canadien de l'ingénieur a cédé trop facilement à l'utilitarisme froid, au grand détriment de la beauté et de la grâce. Non plus, hélas! n'avons-nous joué, dans la préservation de nos ressources naturelles, le rôle que nous imposait notre savoir.

Comme les réalisations des prochaines soixante années surpasseront, en magnitude et en profit pour l'humanité, celles du passé, ainsi pouvons-nous espérer que des formes plaisantes naîtront de conceptions saines, et que l'ingénieur canadien découvrira un art qui lui soit propre.

En acceptant l'honneur qui m'est conféré, je m'engage à donner le meilleur de moi-même au service de l'Institut.

L. F. Grant.

President.

THE DIRECT OPERATING COSTS OF TRANSPORT AIRCRAFT

J. J. GREEN, M.E.I.C.
Chief Research Aeronautical Engineer

H. S. REES, M.E.I.C.
Research Aeronautical Engineer

Air Transport Board, Ottawa, Ont.

A paper delivered before the Montreal Branch of The Engineering Institute of Canada on April 17th, 1947.

In this paper, consideration is given to those items of airline costs which depend directly on the flying operations and which are affected by such things as aircraft size, power, initial cost, etc. These costs are known as the "direct operating costs". Comparatively simple equations are developed, based on the information given in aircraft manufacturers' brochures, which allow an estimate to be made of the various items which constitute the direct operating costs of any particular aircraft in Canada.

Examples are given of the application of the equations to specific cases. The paper concludes with a study of the effect of aircraft size, block distance, utilization and cruising speed on the economics of air transport operations.

In the air transport industry, revenues exceed the operating expenses by so small a margin, if at all, that a constant close scrutiny of expenses is imperative. References 1 to 10 indicate that this need has been recognized throughout the period during which the air transport industry was in its infancy. Mentzer and Nourse(11) carried out the first systematic study of air transport operating costs to receive general acceptance. They divided the total operating costs into three general groups: first, the direct or significant operating costs, defined as those resulting from the flight of an aeroplane or those affected by variation of aeroplane size, power, initial cost and aerodynamic efficiency; second, the passenger service costs, defined as those which vary with the number of passengers on board; third, the overhead costs. Mentzer and Nourse derived a series of formulae or equations from which the direct operating costs could be calculated in any particular case. These formulae have been widely used in the air transport industry. They have formed the basis for the development of alternative formulae considered more suitable in specific instances. In particular, the Mentzer and Nourse equations are the basis for the direct flying cost data given by the American Air Transport Association in its "Method of Presentation of Data for Proposed Aircraft".

In Canada it is customary to include passenger supplies, meals and interrupted trip expenses in the direct operating cost group.

This paper deals only with direct operating costs. The so-called indirect costs which include administration, ground operation, maintenance and depreciation of ground equipment and buildings, traffic and general administration, general taxes, etc., are beyond the scope of this study.

The original equations for calculating the several components of direct operating costs, as developed by Mentzer and Nourse, contain such symbols as the following:

C_a : Cost of aeroplane less engines
C_e : Cost of one engine
W_a : Weight of aeroplane less engines
W_e : Weight of one engine

Formulae developed by others on the basis of the Mentzer and Nourse method contain the same or similar symbols. In making an analysis of its operating costs an airline will, in general, be in a position to supply the required numerical values of such symbols. There are, however, a number of organizations interested in the question of direct air transport operating costs which do not have access to reliable information on the values of such symbols. It is the object of this paper to indicate the development of simplified formulae for the calculation of the direct operating costs of aircraft used in air transport work and to study some of the results obtained from the application of these formulae.

The commonest sources of information concerning new transport aircraft are the manufacturers' brochures describing the aircraft and the various press releases, usually containing the same or similar information. The brochures usually give the main dimensions, power, payload, cruising speeds, range, etc. It is often desired to make some comparative estimates of direct operating costs on new and existing aircraft, when the only information available is that contained in a manufacturer's brochure. In this paper an attempt is made to simplify the equations for direct operating cost to the extent that the symbols appearing in the equation are limited to those normally obtainable from the manufacturer's brochure. The equations themselves are in most cases based on the Mentzer and Nourse equations or on equations derived by similar methods. To some extent the experience of Trans-Canada Air Lines has been drawn from, as being representative of Canadian conditions, particularly in regard to labour and material costs per hour flown.

It is not considered that the simplification of the formulae has resulted in any significant loss in accuracy. For some of the items which go to make up the direct operating costs of an aircraft, no formula can be universally applicable with precision. For example, the aircraft and engine maintenance costs are to some extent a function of the quality of the design of the structure and the servicing costs are again dependent on the ingenuity of the designer, factors which cannot be represented in a mathematical formula. Therefore, whilst a formula can be given to analyze fairly accurately the operating costs of existing aircraft, there is never any certainty that it can be applied with reliance to the case of a new aircraft type. This paper is intended for the use of those who wish to make quick and reasonably reliable estimates of operating costs, where great precision is not a prime requirement. The formulae are based on Canadian costs for domestic operations but can be applied elsewhere by suitable changes in the values of the various assumed quantities. Each item is given in terms of the cost per aeroplane-mile flown.

1. FLYING PERSONNEL SALARIES

The formula for the determination of flying personnel salary costs per mile is usually dependent on the wage rate structure and may include such details as the number of flying personnel employed in specific categories. While such formulae are highly satisfactory for use by airlines, they do not lend themselves to more general use. This is because the wage rate structures vary in different countries and, in Canada, the wage rate structure is different for each airline and for the smaller operators. In the case of pilots, for instance, there is a basic wage which varies among the airlines, with or without a commission based on miles flown or flying revenue. There is also, of course, a distinction between the pay of captains and first officers. In all cases there are pay increases for length of time with the company. There is a higher pay for flight over mountainous terrain than when over flat terrain, in the case of one company which operates over both types of terrain. In the case of stewardesses, there are pay increases with length of service and there may or may not be a distinction during the training and probationary periods.

For the purpose of this study, typical average salary classifications have been assumed for pilots and an average salary assumed for stewardesses, as shown in Table I. Depending on the aircraft gross weight, typical salary classifications have been assumed for the pilot or pilots, as shown in Table II. The agreements between the airline pilots and their companies usually include a limitation on the flying time permitted in any given period. On the average this allows pilots to fly a maximum number of hours varying between about 860 and 1150 per annum, allowing for two weeks' vacation. For the purpose of this study, 900 hours' flying per annum is assumed. Stewardesses customarily fly under similar time limitations and the same figure of 900 hours is assumed for their annual flying time. Dividing the assumed annual salary by the number of flying hours, yields the cost per hour. Dividing again by the block speed V_b gives the cost per mile, as indicated in Tables I and II.

Table I

Crew Member	*Pilots*					*Stewardesses*
Monthly Salary	\$250	300	350	500	650	150
Annual Flying Hours	900	900	900	900	900	900
Cost per mile \$	$\frac{3.33}{V_b}$	$\frac{4}{V_b}$	$\frac{4.67}{V_b}$	$\frac{6.67}{V_b}$	$\frac{8.67}{V_b}$	$\frac{2}{V_b}$

Table II

Aircraft Gross Weight	*Crew Assumed*	*Crew Salary Costs per mile flown*
0 to 5,000 lb.	1 Pilot at \$250.00	\$ $3.33/V_b$
5,000 to 10,000 lb.	2 Pilots at \$300.00	$8.0/V_b$
10,000 to 15,000 lb.	2 Pilots at \$500.00 and \$300.00	$10.67/V_b$
15,000 to 45,000 lb.	2 Pilots at \$650.00 and \$350.00, 1 Stewardess	$15.34/V_b$
Over 45,000 lb.	2 Pilots at \$650.00 and \$350.00, 2 Stewardesses	$17.34/V_b$

The block speed is defined as the distance between terminals divided by the time from passenger ramp to passenger ramp. Mentzer and Nourse in their original study simplified the calculation of block speed by assuming the following:

Flight altitude—14,000 ft.	Terminal altitudes—sea level
Wind velocity—zero	Time lost in climb and descent—0.06 hour
Taxi and manoeuvring time—0.20 hour	

Block distance is increased by 2% to allow for inaccuracies in flying and necessary deviations in course.

The equation for block speed is then—

$$V_b = \frac{D}{(1.02\ D/V_c) + 0.26}$$

Where V_b is block speed in mi. per hr.
D is the trip length or block distance in miles
V_c is the level flight cruising speed at altitude, in mi. per hr.

This formula for block speed is reasonably accurate for most purposes.

In making this study it is assumed that the relationship between the number of crews and the number of aircraft is such that all flying personnel can complete their 900 hours annually irrespective of the utilization assumed (hours flown per annum per aircraft).

Since this study is intended to refer to domestic operations as currently performed, no allowance is made for the fact that aircraft on transoceanic flights would need the addition of a navigator and radio operator and the substitution of stewards for stewardesses. This would increase the crew pay costs per mile in the case of the heavier aircraft, over 45,000 lb. gross weight.

2. Flying personnel supplies and expenses

Included in this item are a host of miscellaneous expenses, such as, hotels, meals, taxis, travelling, training, transfers, etc., and the only source for estimating such costs lies in the past experience of the airlines. In the United States, 35c to 45c per hour flown will account for this cost for each crew member. In Canada this item is higher, being of the order of 70c per hour flown per crew member.

In this study it is assumed that for aircraft of gross weight less than 15,000 lb. the cost per hour is 40c per crew member and for aircraft of gross weight exceeding 15,000 lb. the cost per hour for this item is 70c per crew member.

Table III accordingly gives the costs per mile for this item.

Table III

Aircraft Gross Weight	*Cost per mile for Crew Supplies and Expenses*
0 to 5,000 lb.	\$$0.4/V_b$
5,000 to 15,000 lb.	$0.8/V_b$
15,000 to 45,000 lb.	$2.1/V_b$
Over 45,000 lb.	$2.8/V_b$

3. Aircraft engine fuel cost

The formula used by Mentzer and Nourse for estimating fuel costs assumes a specific fuel consumption (cruising) of 0.45 lb. per brake horsepower per hour which they considered the best obtainable with modern engines (1940) operated at 50 per cent of take-off power.

A study of the fuel consumed and miles flown by several of the major airlines (including Trans-Canada Air Lines) indicates that the average value of the Imperial gallons of fuel consumed per mile flown is given by the following formula—

$$\text{Imp. gals. per mile} = 0.0771\ \frac{H.P._c}{V_c}$$

Where $H.P._c$ is the total horsepower used for cruising and V_c is the cruising speed in mi. per hr.

For any of the individual airlines, the variation from the mean of the annual estimate of gallons per mile seldom exceeded ± 3 per cent over a three-year period (1942-45). Averaging the value for each airline over this three-year period indicated a maximum variation among the different airlines of about ± 4 per cent from the mean value of 0.0771 given in the above equation.

The above formula indicates a specific fuel consumption of

$$7.2 \times 0.0771 \cdot \frac{V_b}{V_c} \text{ or } 0.555 \ \frac{V_b}{V_c} \text{ lb./B.H.P./hr.}$$

Where V_b is an overall average block speed.

Assuming an average fuel cost in Canada of 28.0 cents per gallon the equation for fuel costs per mile reduces to—

$$\text{Fuel cost per mile flown} = \$0.0216 \cdot \frac{H.P._c}{V_c}$$

In general, the fuel cost per mile is the largest single item of direct operating expense in Canada and should therefore be computed with appropriate precision. For general purposes it is felt that the above equation is accurate to within a few per cent. For specific flight operations it might be possible to make an even more exact estimate of fuel consumption and costs if so desired.

4. AIRCRAFT ENGINE OIL COST

A study of aircraft engine oil consumption figures during recent years for a number of the airlines indicates that the gallons consumed per mile flown can be approximately represented by the following equation:

$$\text{gal./mile} = 0.00109 \cdot \frac{H.P._c}{V_c}$$

This equation indicates a specific oil consumption of—

$0.0098 \cdot \frac{V_b}{V_c}$ lb./B.H.P./hr. Where V_b is again an average block speed. Mentzer and Nourse considered 0.01 lb./B.H.P./hr. as a reasonable approximate cruising specific consumption for known engines.

Assuming an average oil cost in Canada of 80.0 cents per gallon—

$$\text{Oil cost per mile flown} = \$0.00087 \cdot \frac{H.P._c}{V_c}$$

5. PASSENGER SUPPLIES, MEALS AND INTERRUPTED TRIP EXPENSES

As with item 2, the only source of information for the computation of this item is the accumulated experience of the airlines.

This expense varies considerably from year to year and increases as aircraft size increases. Fortunately, it only represents about 5 per cent of the total of the direct operating expenses.

An arbitrary scale based to some extent on past experience in Canada is assumed, as given in Table IV.

TABLE IV

Aircraft Gross Weight	*Cost per Mile Flown*
0 – 5,000 lb.	\$ 0.0005 . N_p
5,000 – 10,000 lb.	.0015 . N_p
10,000 – 15,000 lb.	.0020 . N_p
15,000 – 20,000 lb.	.00275. N_p
20,000 – 40,000 lb.	.0035 . N_p
40,000 – 80,000 lb.	.0045 . N_p
over 80,000 lb.	.0055 . N_p

N_p = number of passengers carried

6. AIRCRAFT SERVICING COST FOR LABOUR AND SUPPLIES

This item is of the order of 10 per cent of the total direct operating costs. Mentzer and Nourse indicate that it is difficult to estimate accurately this item, partly because it is not directly associated with any particular aeroplane characteristic and partly because fluctuations of servicing costs are difficult to explain even by airline servicing experts. Included in this item is the labour in washing and cleaning (including the aircraft interior) and in periodically inspecting and checking the airframe and engine, together with materials expended in servicing.

Following the lead given by Mentzer and Nourse and adopted with slight variation in most subsequent studies, the cost of aircraft servicing is assumed to vary, partly with the number of engines and partly with the aircraft empty weight less the weight of the engines. A formula giving effect to this is assumed as follows—

$$\text{Cost/mile flown} = \$ \frac{9.0}{3\,V_b} \left(N_e + \frac{W_a}{10{,}000} \right)$$

Where N_e is the number of engines per aircraft, W_a is the aircraft empty weight less weight of engines and \$9.0 is the sum, in Canada, of the labour and material costs for servicing, per hour flown, by a twin-engined aircraft for which W_a = 10,000 lb. This figure for costs per hour flown is derived directly from airline experience in Canada.

This formula assumes that each engine and the airframe itself contribute equally to the cost of servicing, the contributions being proportional directly to the number of engines and the empty weight less engine weight, respectively.

For typical existing aircraft, W_a is approximately 55 per cent of the gross weight (W_g). The cost equation can accordingly be reduced to—

$$\text{Cost/mile flown} = \$ \frac{3.0}{V_b} \left(N_e + 0.55 \ \frac{W_g}{10{,}000} \right)$$

7. AIRCRAFT REPAIR COSTS FOR LABOUR AND MATERIALS

This cost item covers overhaul and repair expenses of the aircraft, excluding engines and propellers, radio,

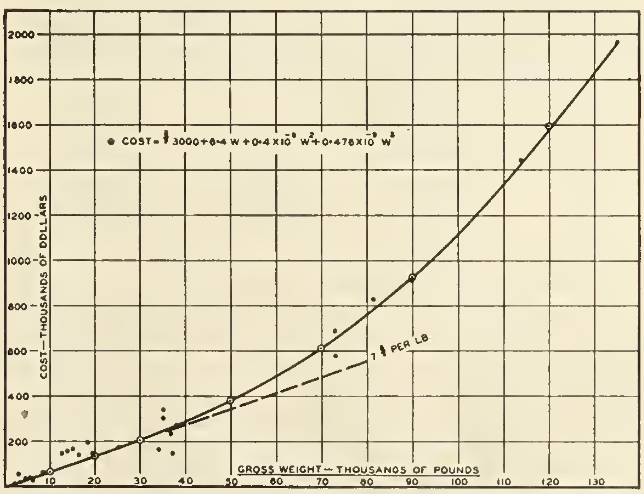

Fig. 1—The initial cost in Canada of aircraft of various gross weights—solid points represent actual aircraft, circles satisfy mathematical equation.

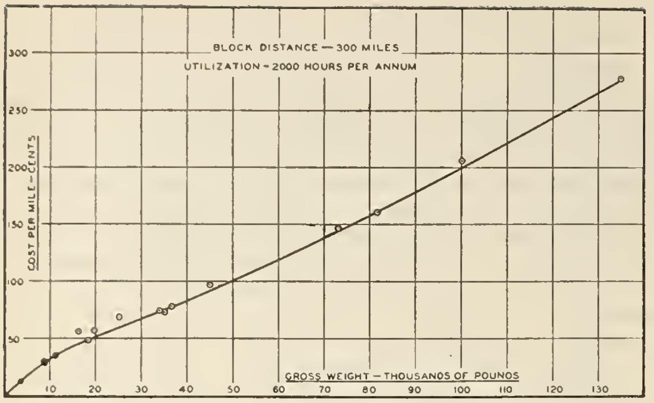

Fig. 2—The direct operating cost per mile for aircraft of various gross weights for a block distance of 300 miles, at an annual utilization of 2000 hours. This curve shows the typical scatter of points.

instruments and miscellaneous flying equipment and is the sum of labour and supplies costs.

It is assumed that the labour costs depend on the number of engines and on the size of the aircraft as indicated by the wing area. The size of the aircraft is assumed to control half the overhaul and repair labour costs and the presence of each engine is assumed to contribute 25 per cent of the labour costs.

The material costs are assumed to depend to an equal extent on the empty weight of the aircraft less engines, propellers, radio and miscellaneous equipment, and on the initial cost of the aircraft less these items. Now for a typical existing aircraft this weight and cost can be expressed in terms of the gross weight and initial cost (C_a) of the whole aircraft, figures which are more readily available, as follows—

Weight of empty aircraft less engines, propellers, radio and miscellaneous equipment $= 0.463\ W_g$

Cost $= 0.665\ C_a$

A formula expressing these costs in this manner is then—

$$\text{Cost/mile} = \frac{1}{2V_b} \cdot \left\{3.65\left(\frac{N_e}{2} + \frac{S}{550}\right) + 3.55\left(\frac{0.463\ W_g}{9028} + \frac{0.665\ C_a}{103{,}900}\right)\right\}$$

Where S is the wing area in sq. ft. and \$3.65 is the aircraft repair labour costs per hour flown and \$3.55 is the aircraft repair material costs per hour flown in Canada for the typical aircraft for which the number of engines (N_e) is two, the wing area is 550 sq. ft. and the weight and cost of the aircraft less engines, propellers, etc., are 9028 lb. and \$103,900 respectively.

This formula reduces to—

$$\text{Cost/mile} = \$\frac{1}{V_b}\left\{0.9125\ N_e + 0.3318\ .\ \frac{S}{100} + \left(\frac{0.9102\ W_g + 0.1136\ C_a}{10{,}000}\right)\right\}$$

It is realized that some loss in accuracy may result from the inclusion of constants relating component weights and costs to gross weight and total cost, with the assumption that these constants will not change for different aircraft. It is expected that these constants will vary with design changes and with increasing size. It is not considered, however, that the change will have very profound effect on the cost estimated by the above equation. The constants in any case may be changed to suit any specific aircraft, if the relevant information is available.

Wing area in the above equation is preferred to floor area of cabin or number of seats, as used in the equations developed by others, since it is more readily known and is equally applicable.

The cost of the complete aircraft (C_a) is not always readily obtainable, even in a manufacturers' brochure. A study of the meagre information available on the initial cost of modern aircraft in Canada indicates considerable scatter, when plotted as initial cost against empty weight. For empty weights below 25,000 lb., a figure of \$12 per lb. of empty weight appears to be a good mean assumption for initial cost. There is often considerable doubt as to just what is included in empty weight and it becomes much easier to use the gross weight. Plotting initial cost as a function of gross weight indicates about the same degree of scatter. For gross weights below 40,000 lb., a figure of \$7 per lb. of gross weight is a fair assumption for initial cost. Thereafter, the initial cost rises rapidly with increasing gross weight, as indicated in Fig. 1.

A formula which closely fits the assumed curve is given by—

$$\text{Cost in dollars} = 3000 + 6.4W + 0.4 \times 10^{-6}\ .\ W^2 + 0.476 \times 10^{-9} . W^3$$

Where W = Gross weight in lb.

If information on initial price is lacking, this relationship will provide an approximate estimate for use in an operating cost analysis.

8. ENGINE AND PROPELLER REPAIR COSTS FOR LABOUR AND SUPPLIES

As in the case of aircraft servicing and aircraft overhaul and repair, the airlines have accumulated extensive experience in estimating engine and propeller repair costs for twin-engined equipment.

Engine repair costs for labour and material are, of course, directly proportional to the number of engines per aircraft. The labour costs for engine repair are assumed to be equally influenced by the weight per engine and the number of cylinders per engine. The material costs for engine repair are considered to be equally affected by the weight per engine and the initial cost of one engine.

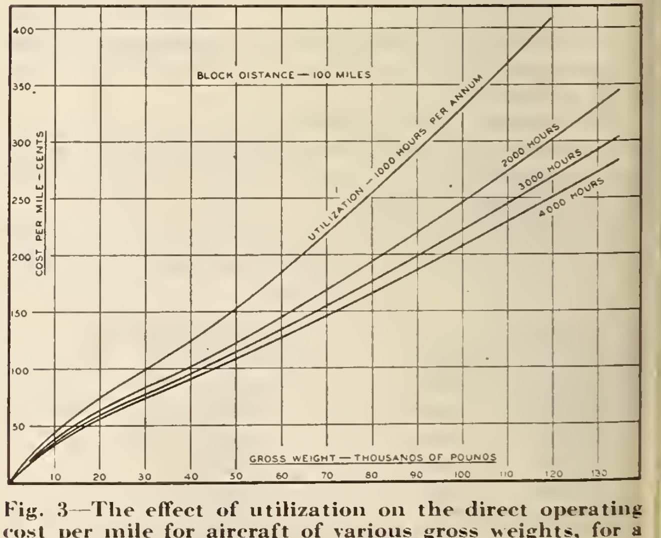

Fig. 3—The effect of utilization on the direct operating cost per mile for aircraft of various gross weights, for a block distance of 100 miles.

A formula expressing these relationships is—

$$\text{Cost/mile} = \frac{N_e}{2\ V_b}\left\{1.53\left(\frac{W_e}{1400}+\frac{N_c}{14}\right) + 2.97\left(\frac{W_e}{1400}+\frac{C_e}{16{,}990}\right)\right\}$$

Where W_e = weight per engine
N_c = number of cylinders per engine
C_e = initial cost per engine

\$1.53 and \$2.97 are the labour and material costs per hour flown, respectively, for the repair of a 14 cylinder engine of 1400 lb. weight and costing initially \$16,990. These cost figures are derived from Canadian airline experience.

This equation is similar in form to that developed by Mentzer and Nourse in their original study. Subsequent studies by others continue to adopt this method for the analysis of engine repair costs.

Mentzer and Nourse had no separate equation for propeller overhaul and repair costs and it is presumed that this item was included either in the aircraft overhaul costs or the engine repair costs.

Trans-Canada Air Lines has developed an equation for predicting propeller repair costs as follows—

Propeller repair costs are assumed to vary directly with the number of propellers (here assumed equal to the number of engines). Labour costs per hour flown are assumed to be constant at \$0.20, based on Canadian experience but material costs for propeller repairs are assumed to be equally influenced by propeller weight and propeller cost, as indicated in the following equation

$$\text{Cost/mile} = N_e\left\{\frac{0.008}{2}\left(\frac{W_p}{376}+\frac{C_p}{3931}\right)+0.20\right\}$$

Where W_p = Weight per propeller
C_p = Cost per propeller

and \$0.008 is the material cost per hour flown for the repair of a propeller weighing 376 lb. and costing \$3931, derived from Canadian airline experience.

These two equations are combined to give the total repair costs for engines and propellers. The combined equation can be considerably simplified by the following assumptions, which are true for the Canadian airline aircraft and sufficiently typical of most aircraft to be allowable in a study of this nature.

$W_e = 1.333\,P_r$
$C_e = 12.14\,W_e$
$W_p = 0.358\,P_r$
$C_p = 10.45\,W_p$

Where P_r = Rated power per engine

With these substitutions, the equation for engine and propeller repair costs becomes—

$$\text{Cost/mile} = \$\ \frac{N_e}{V_b}\left\{3.565\ \frac{P_r}{1000} + 0.0546\ N_c + 0.2\right\}$$

9. OVERHAUL AND REPAIR COSTS FOR INSTRUMENTS, RADIO AND MISCELLANEOUS FLYING EQUIPMENT

The study of a few aircraft indicated that on the average the total weight of instruments, radio and miscellaneous flying equipment amounted to 3.1 per cent of the gross weight and the corresponding cost of this equipment was \$21.0 per lb.

Canadian airline experience indicates that the labour and material costs per hour flown for this repair item are \$1.373 and \$0.951, respectively. Assuming that the labour costs are proportional to the weight of the equipment and the material costs depend on the weight and cost of the equipment, that is, on the weight, since cost is proportional to weight, then—

$$\text{Cost/mile} = \frac{1}{V_b}\left\{1.373\left(\frac{0.031\ W_g}{605}\right) + 0.951\left(\frac{0.031\ W_g}{605}\right)\right\}$$

Where 605 is the value of 0.031 W_g for the Canadian airline aircraft for which the hourly cost figures have been quoted.

This equation reduces to—

$$\text{Cost/mile} = \$\ \frac{0.119}{V_b}\cdot\frac{W_g}{1000}$$

10. FLYING EQUIPMENT INSURANCE

Premiums for the insurance of flying equipment are approximately 10 per cent of the insured value. Assuming that the aircraft is insured for its full initial value—

$$\text{Cost/mile} = \$\ \frac{0.1\ C_a}{V_b\ .\ U}$$

Where U is the utilization in hours flown per annum

11. LIABILITY AND PROPERTY DAMAGE INSURANCE

The minimum insurance required by the Air Transport Board is:

Public liability	\$20,000 one person	\$40,000 total
Property damage	\$ 5,000	
Passenger liability	\$20,000	

Typical premiums are shown in Tables V, VI and VII.

It is assumed for the purpose of this study that the following insurance is carried—

TABLE V
Public Liability

Amount	*Premium*
5/10	\$15.00
10/20	18.75
20/40	22.20
25/50	23.40
50/100	27.60
100/200	29.85

TABLE VI
Property Damage

Amount	*Premium*
\$ 5,000	\$17.50
10,000	19.78
15,000	21.53
20,000	22.75
25,000	23.98
50,000	28.00
75,000	30.63
100,000	32.03

TABLE VII
Passenger Liability

Number of Seats / *Amount*	*1*	*2*	*3*	*4*	*5*	*6*	*7*	*8*	*9*
\$ 5,000	\$ 75.00	110.00	145.00	175.00	205.00	235.00	265.00	295.00	325.00
10,000	102.00	149.60	197.20	238.00	278.80	319.60	360.40	401.20	442.00
20,000	124.50	182.60	240.70	290.50	340.30	390.10	439.90	489.70	539.50
25,000	127.50	187.00	246.50	297.50	348.50	399.50	450.50	501.50	552.50
50,000	137.25	201.30	265.35	320.25	375.15	430.05	484.95	539.85	594.75

Aircraft Gross Weight	*Public Liability*	*Property Damage*	*Passenger Liability*
0 to 10,000 lb.	\$ 20/ 40,000...	\$ 5,000	\$20,000
10,000 to 18,000 lb.	50/100,000...	50,000	25,000
Above 18,000 lb.	100/200,000...	100,000	50,000

The cost per mile flown for public liability and property damage insurance is therefore, from Tables V and VI—

Aircraft Gross Weight	*Cost/mile*
0 to 10,000 lb.	\$ $39.70/UV_b$
10,000 to 18,000 lb.	$55.60/UV_b$
over 18,000 lb.	$61.88/UV_b$

For passenger liability the insurance cost/mile is—

$$\text{Cost/mile} = P/UV_b$$

Where P is the premium given below deduced from Table VII (100% occupancy is assumed)

Number of Seats	*Gross Weight* 0—10,000 lb.	10,000—18,000 lb.	over 18,000 lb.
1	\$124.50	127.50	137.25
2	182.60	187.00	201.30
3	240.70	246.50	265.35
each additional seat	49.80	51.00	54.90

As most aircraft under consideration will have more than three seats, the total cost/mile for public liability, property damage and passenger liability can be written as follows—

Aircraft Gross Weight	*Cost/mile*
0—10,000 lb.	$1/UV_b \left\{39.70+240.70+(N_p-3)49.80\right\}$
10,000—18,000 lb.	$1/UV_b \left\{55.60+246.50+(N_p-3)51.00\right\}$
Over 18,000 lb.	$1/UV_b \left\{61.88+265.35+(N_p-3)54.90\right\}$

Where N_p = number of passenger seats

For employer's liability insurance, airline experience in Canada indicates a cost/mile formula as follows—

$$\text{Cost/mile} = \frac{1}{UV_b}\left(I_e \cdot \frac{12C_p}{100} + I_g \cdot \frac{V_i}{100}\right)$$

Where I_e = Employer's liability insurance percentage rate on crew payroll. Assume 3%

C_p = Crew monthly payroll

I_g = Flight risk group insurance percentage rate on insured value of crew. Assume 1%

V_i = Insured value of flying crew. Assume \$5000 for pilots and \$3000 for stewardesses.

Cost per mile for this item therefore reduces to the figures given in the following table—

Aircraft Gross Weight	C_p	V_i	*Cost/mile*
0 to 5,000 lb.	250	5,000	$140/UV_b$
5,000 to 10,000 lb.	600	10,000	$316/UV_b$
10,000 to 15,000 lb.	800	10,000	$388/UV_b$
15,000 to 45,000 lb.	1150	13,000	$544/UV_b$
over 45,000 lb.	1300	16,000	$628/UV_b$

Combining all four insurance costs—public liability and property damage, passenger liability and employer's liability, the cost per mile is given in Table VIII.

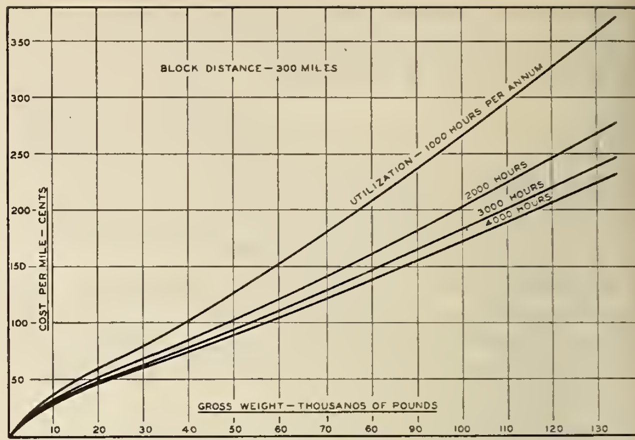

Fig. 4—The effect of utilization on the direct operating cost per mile for aircraft of various gross weights, for a block distance of 300 miles.

Table VIII
Insurance Costs per Mile

Aircraft Gross Weight	*Cost/mile \$*
0— 5,000 lb.	$1/UV_b\left\{420.40+ (N_p-3)\,49.8\right\}$
5,000—10,000 lb.	$1/UV_b\left\{596.40+ (N_p-3)\,49.8\right\}$
10,000—15,000 lb.	$1/UV_b\left\{690.10+ (N_p-3)\,51.0\right\}$
15,000—18,000 lb.	$1/UV_b\left\{846.10+ (N_p-3)\,51.0\right\}$
18,000—45,000 lb.	$1/UV_b\left\{871.20+ (N_p-3)\,54.9\right\}$
Over 45,000 lb.	$1/UV_b\left\{955.20+ (N_p-3)\,54.9\right\}$

12. AIRCRAFT DEPRECIATION COSTS

The aircraft depreciation cost per mile is equal to the initial cost of the aircraft (which excludes engines, propellers, communication equipment and miscellaneous flying equipment) less the residual value, divided by the total miles flown during the life of the aircraft. An equation expressing this cost is therefore—

$$\text{Cost/mile} = \$\left(\frac{0.665\ C_a - Z}{U\ L\ V_b}\right)$$

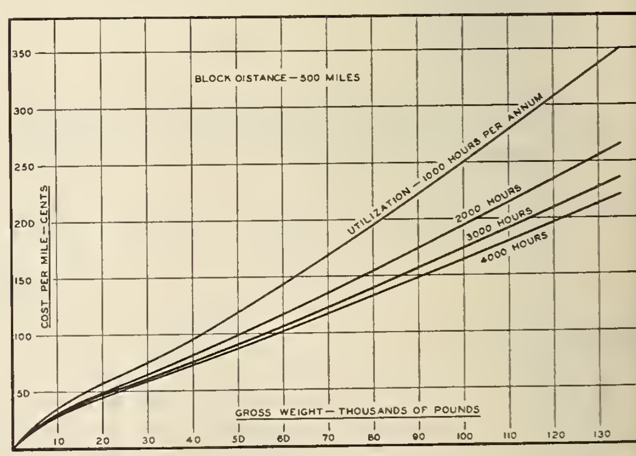

Fig. 5—The effect of utilization on the direct operating cost per mile for aircraft of various gross weights, for a block distance of 500 miles.

Where 0.665 is the proportion of the initial cost of the complete aircraft assumed to be applicable to the aircraft less engines, propellers, communication equipment and miscellaneous flying equipment. This figure applies to a typical airline aircraft in Canada and is not likely to be much in error for existing types of transport aircraft.

Z = residual value of the aircraft less engines, propellers, etc. Assume $Z = 0.10\ (0.665\ C_a)$

L = Aircraft life in years. Assume $L = 6$

With these assumptions the equation reduces to—

$$\text{Cost/mile} = \$\ \frac{0.0998\ C_a}{U V_b}$$

13. AIRCRAFT ENGINE AND PROPELLER DEPRECIATION

It is assumed that the engine depreciation period or life is 6000 hours, with a residual value of 5 per cent of the initial cost. The initial cost is assumed to be \$12.14 per lb. of weight and the weight is assumed to be 1.333 lb. per rated horsepower as assumed in the equation for engine repair costs.

Engine depreciation cost/mile is then—

$$\frac{N_e\ .\ 0.95\ .\ 12.14\ (1.333\ P_r)}{6000\ V_b} = N_e \frac{0.00256}{V_b} P_r$$

Propeller depreciation period is assumed to be 7000 hours with a residual value of 0.3 of the initial value. This is equivalent to a life of 10,000 hours with no residual value. This assumption is based on Canadian airline experience.

Initial cost is assumed, as before, to be \$10.45 per lb. of propeller weight and propeller weight is assumed to be equal to 0.358 P_r.

$$\text{Cost/mile is then } \frac{N_e\ .\ 10.45\ .\ 0.358\ P_r}{10{,}000\ V_b}$$

Simplifying this and combining with the engine depreciation cost we have a total engine and propeller depreciation cost of—

$$\text{Cost/mile} = \$\ 0.00294\ \frac{N_e\ .\ P_r}{V_b}$$

14. DEPRECIATION OF INSTRUMENTS, RADIO AND MISCELLANEOUS FLYING EQUIPMENT

Based on Canadian experience, instruments are assumed to be depreciated over a 6-year period, radio and miscellaneous flying equipment over a 5-year period, with no residual values.

In this study it is assumed that instrument weight is ½ per cent of gross weight and instrument cost is \$36 per lb.

Instrument depreciation cost/mile is therefore

$$0.03\ \frac{W_g}{U\ V_b}$$

Radio and miscellaneous equipment is assumed to weigh 2.4 per cent of gross weight and to cost \$18.50 per lb., giving a depreciation

$$\text{Cost/mile of } 0.089\ .\ \frac{W_g}{U\ V_b}$$

The total depreciation cost is therefore

$$\text{Cost/mile} = \$0.119\ \frac{W_g}{U\ V_b}$$

ILLUSTRATIVE EXAMPLE OF THE USE OF THE FORMULAE

In order to show the absolute and relative magnitudes of the various items which constitute the direct operating costs in a typical case, an example is considered below.

Assumptions:

Block distance—300 miles
Utilization—2000 hours per annum
W_g —Gross weight—25,200 lb.
S —Wing area—987 sq. ft.
N_e —Number of engines—2
N_c —Number of cylinders per engine—14
P_r —Rated power per engine—1050 hp.
C_a —Initial cost of complete aircraft—\$173,000 in Canada
$H.P._c$—Total cruising horsepower—1200 hp.
V_c —Cruising speed—186 m.p.h. (at 10,000 ft.)
V_b —Block speed—158 m.p.h.
N_p —Number of passengers carried—21

Inserting the values of these quantities in the various formulae for the direct operating cost items yields the results given in Table IX.

TABLE IX

Item of Direct Operating Cost	Cost per Mile cents	% of Total (approx.)
1 Flying personnel salaries...	9.71	14
2 Flying personnel supplies and expenses............	1.33	2
3 Aircraft engine fuel.......	13.93	20
4 Aircraft engine oil........	0.56	1
5 Passenger supplies, meals, interrupted trip expenses..	7.35	11
6 Servicing of aircraft—labour and supplies............	6.43	9
7 Repair of aircraft—labour and materials............	5.92	8.5
8 Repair of engines and propellers—labour and supplies	5.96	8.5
9 Repair of instruments, radio, miscellaneous equipment..................	1.90	3
10 Insurance of flying equipment..................	5.47	8
11 Insurance for liability and property damage.........	0.59	1
12 Depreciation—aircraft....	5.46	8
13 Depreciation—engines and propellers..............	3.90	6

Total cost per mile.....	69.46 cents	

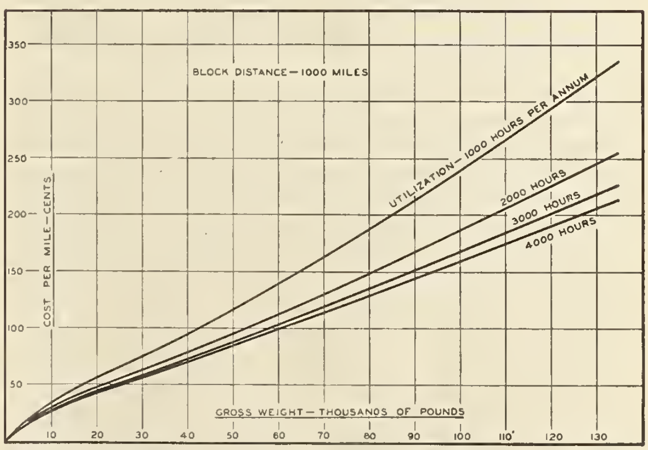

Fig. 6—The effect of utilization on the direct operating cost per mile for aircraft of various gross weights, for a block distance of 1000 miles.

Variation of Direct Operating Costs with Increasing Gross Weight

In order to show the trend of direct operating costs, as the size and weight of aircraft are varied, the formulae have been used to calculate the direct operating costs for a number of existing and projected aircraft, the gross weight of which range from 3500 lb. to 135,000 lb., as follows:

Aircraft No.	*Gross weight lb.*	*Aircraft No.*	*Gross weight lb.*
1	3,500	9	34,000
2	8,500	10	35,000
3	8,750	11	36,600
4	11,000	12	45,000
5	16,240	13	73,000
6	18,350	14	81,500
7	19,500	15	100,000
8	25,200	16	135,000

The costs have been computed for block distances of 100, 200, 300, 400, 500, 750 and 1000 miles and for utilizations of 1000, 2000, 3000 and 4000 hours per annum.

Wherever available, reliable flight test data has been used for the assumptions regarding $H.P._c$ the cruising power and V_c the crusing speed. Wherever possible, a cruising power close to 60 per cent of rated power (maximum except take-off) and the cruising speed at or close to 10,000 ft. have been used in the calculations.

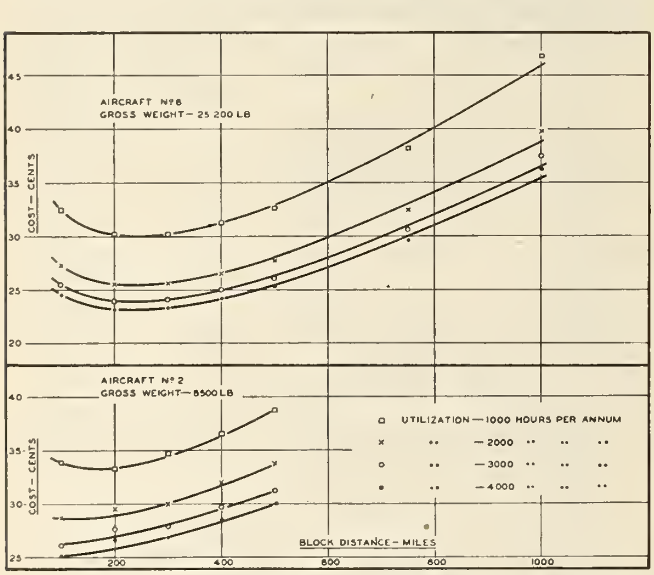

Fig. 7—The effect of block distance on the direct operating cost per payload ton-mile for aircraft No's 2 and 8, at annual utilizations of 1000, 2000, 3000 and 4000 hours.

In the case of projected aircraft, manufacturers' estimates of performance have been used.

Figure 2 shows a plot of the direct operating costs per mile for the sixteen aircraft listed above, when used over a block distance of 300 miles and at a utilization of 2000 hours per annum.

Aircraft No's 5, 7 and 8 all fall somewhat above the faired curve. Since No. 5 is a four-engined aircraft and all others below 70,000 lb. gross weight are twin-engined machines, it would be expected that the operating costs for this case would be somewhat higher. Aircraft servicing, aircraft repair, aircraft engine and propeller repair, and aircraft engine and propeller depreciation are all dependent on the number of engines and will therefore be slightly higher for a four-engined aircraft than for a comparable twin-engined one.

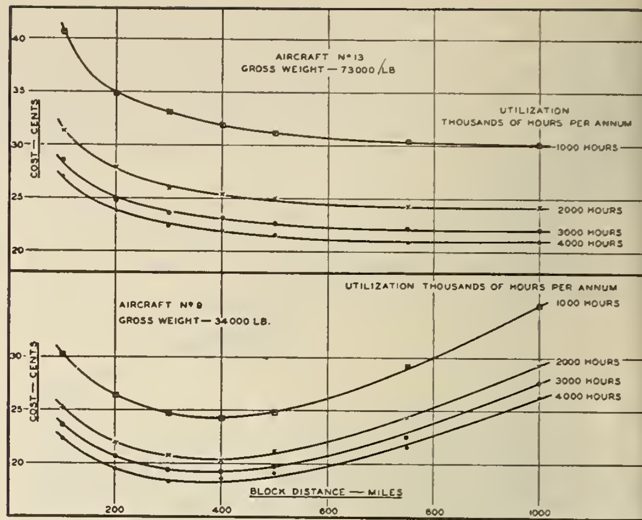

Fig. 8—The effect of block distance on the direct operating cost per payload ton-mile for aircraft No's 9 and 13, at annual utilizations of 1000, 2000, 3000 and 4000 hours.

Aircraft No's 7 and 8 are becoming obsolescent and it is not surprising that their costs appear slightly higher than those of more modern aircraft. The curve is based on twin-engined aircraft, except above 70,000 lb. gross weight where the points refer to four-engined types. With existing piston engines and commonly used power loadings, aircraft over 50,000 or 60,000 lb. gross weight would be equipped with four engines. With this in mind, the curve represents the trend of direct operating costs for modern aircraft.

Figures 3, 4, 5 and 6 give the results of the calculations of direct operating costs for the sixteen aircraft considered, for block distances of 100, 300, 500 and 1000 miles and for utilizations of 1000, 2000, 3000 and 4000 hours per annum. For the sake of clarity the individual points have been omitted, the scatter of the points being similar to that shown in Fig. 2. These charts indicate the reduction in direct operating costs per mile consequent upon increasing the utilization figure, being particularly marked at low utilization and less significant at high utilizations. They also show the decreasing gains in cost per mile to be derived from increased block distances (due solely to the resulting increase in block speeds at constant cruising speed).

Since airline revenues depend on the payload ton-miles flown (the product of the payload and the

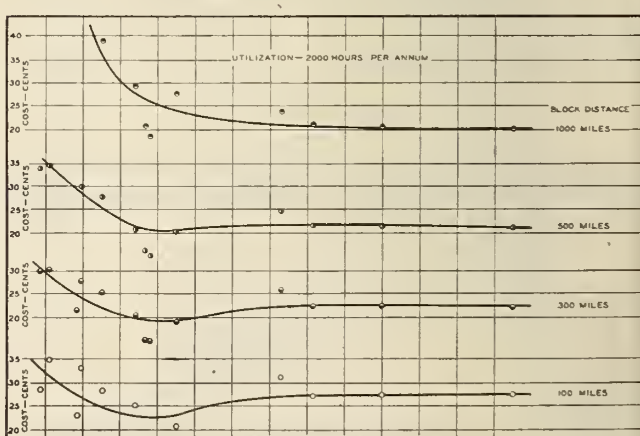

Fig. 9—The variation of direct operating cost per payload ton-mile with gross weight for block distances of 100, 300, 500 and 1000 miles, at an annual utilization of 2000 hours.

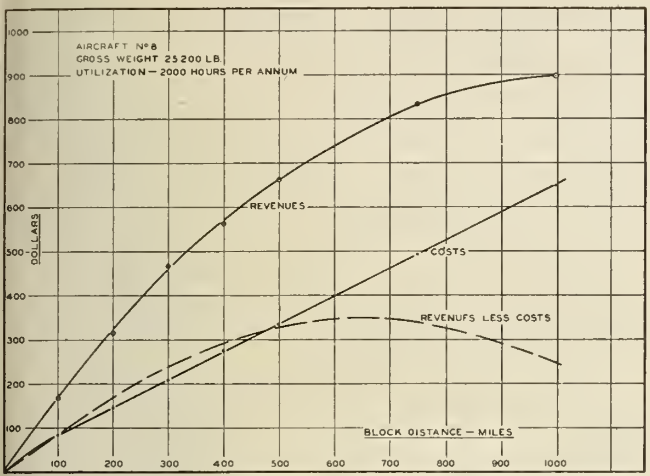

Fig. 10—The effect of block distance on the direct operating cost per trip and the revenue per trip for aircraft No. 8, at an annual utilization of 2000 hours.

distance flown) it has become customary to express the direct operating costs on a per ton-mile basis. Figures 7 and 8 show the costs per ton-mile plotted against block distance for four aircraft of gross weights ranging from 8500 to 73,000 lb. These costs per ton-mile were derived from the information given in Figs. 3 to 6 and the appropriate payload values deduced from the manufacturers' figures for disposable load. Fuel reserves were allowed for in all cases, using the commonly accepted basis, viz., a fuel allowance sufficient to fly the block distance plus 200 miles plus ¾ hour flight at cruising speed, all against a 10 mi. per hr. headwind. For the lightest aircraft, operating over the shortest block distances, it was more sensible to assume a 100 per cent reserve of fuel.

Figure 9 shows the costs per ton-mile plotted against gross weight, for the sixteen aircraft considered, for a utilization of 2000 hours per annum and for four block distances. These curves indicate that for an operation involving the transportation of a given payload over a specific block distance the economic advantage, if any, lies in the use of a number of aircraft in the 30,000-40,000 lb. class in preference to the use of a lesser number of larger aircraft, at least over block distances up to 500 miles. At a 1000-mile block distance and over, the advantage is probably with the heavier aircraft.

Returning to Figs. 7 and 8, it might be assumed that for each aircraft the point of minimum costs per ton-mile represents the optimum block distance, over which operation of the aircraft is most profitable. This is not necessarily the case and the true economic significance of block distance can only be determined from a consideration of trip costs and revenues.

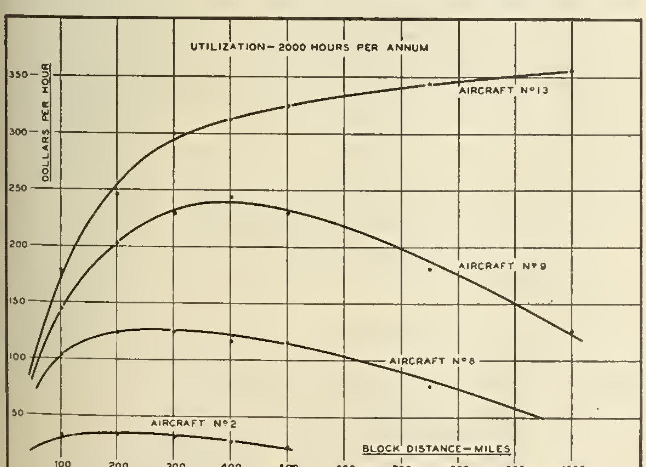

Fig. 11—The effect of block distance on the revenue less the direct operating cost, per hour flown, for aircraft No's 2, 8, 9 and 13, at an annual utilization of 2000 hours.

Figure 10 shows the relationship between trip costs for 2000 hours per annum utilization, trip revenues and block distance, for aircraft No. 8 with a gross weight of 25,200 lb. Trip costs were derived from the costs per mile (Figs. 3 to 6) multiplied by the block distance. Trip revenues were calculated on the basis of 100 per cent load factors (full payloads) at a rate of 55 cents per ton-mile, a typical value in Canada. These curves indicate that the maximum difference between revenue and cost occurs at a block distance of approximately 650 miles. However, by operating over shorter distances and refuelling, it is obviously possible to increase the total value of revenue less cost for the same utilization. The determination, therefore, of the optimum block distance for each aircraft will be made from a plot of revenue less cost, per hour flown, against block distance. This quantity is obtained by dividing the revenue less cost per trip by the trip time.

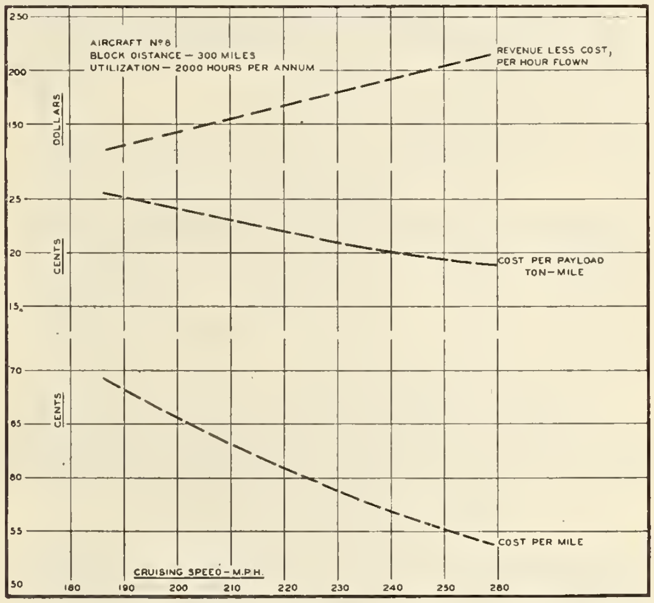

Fig. 12—The effect of increasing speed by aerodynamic improvements only, leaving the power unchanged, for aircraft No. 8 over a block distance of 300 miles, at an annual utilization of 2000 hours.

Figure 11 shows a plot of revenue less cost, per hour flown, against block distance for aircraft No's 2, 8, 9 and 13 for a utilization of 2000 hours per annum. This indicates optimum block distances of 200, 300 and 380 miles for aircraft No's 2, 8 and 9. For aircraft No. 13 the optimum block distance exceeds 1000 miles. It should be noted here that the difference between revenue and cost does not represent airline profit, as there are still the "indirect" or ground costs to be met. The optimum block distances indicated by Fig. 11 are seen to be approximately the same as the distances for minimum cost per ton-mile in Figs. 7 and 8.

Effect of Cruising Speed on Direct Operating Cost

An inspection of the various equations for direct operating costs shows that passenger supplies and expenses are independent of cruising speed; fuel and oil costs are inversely proportional to cruising speed and all other items of direct costs vary inversely with the

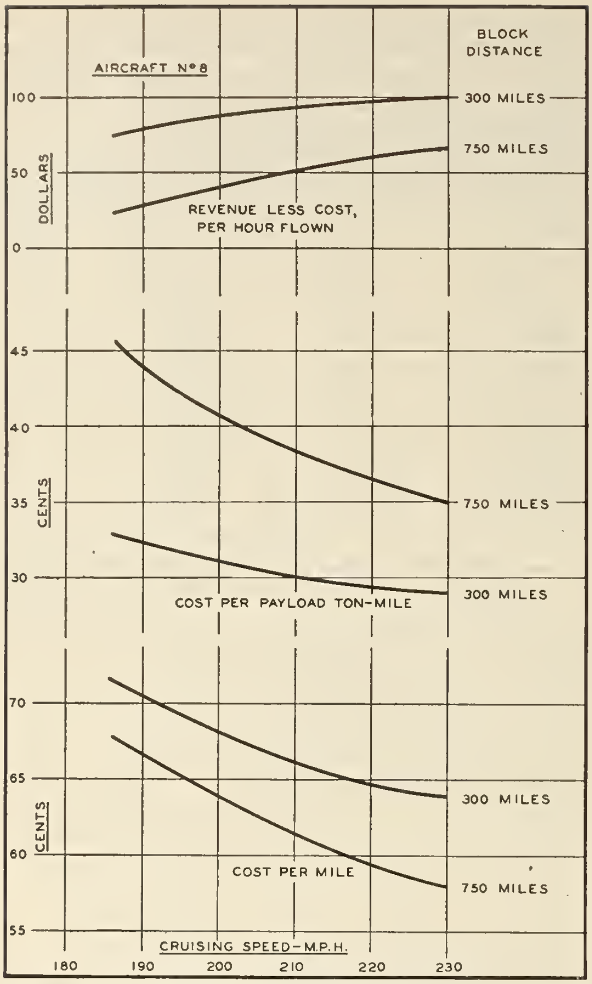

Fig. 13—The effect of increasing speed by increasing altitude only, leaving the power unchanged, for aircraft No. 8 over block distances of 300 and 750 miles, at an annual utilization of 2000 hours.

block speed and hence the cruising speed. Other things being equal, higher cruising speeds are therefore capable of yielding a reduction in direct operating costs.

If cruising speed is raised by the simple expedient of opening the throttle and using a cruising power in excess of that customarily used, which is in the neighbourhood of 60 per cent M.E.T.O. power, fuel and oil consumption will increase. Since the consumption of fuel and oil represents some 20 per cent of the total direct operating cost, an increase in this item is liable to materially reduce the advantage of increased cruising speed. The additional fuel required also tends to reduce the payload carried and hence the revenue derived. More important, possibly, than these features is the serious effect of high cruising powers on engine maintenance, reliability and life. Such a method of increasing the cruising speed in quest of greater economy must therefore be ruled out.

If the cruising speed is increased by aerodynamic refinement, so that the cruising power taken from the engines is unchanged, no adverse effects are to be expected. It is assumed that the increase in cruising speed resulting from aerodynamic improvements is, at the present state of the art, not likely to be proportionately large and therefore the possible need for increased structural strength and hence structural weight can be ignored. The reduction in block time consequent upon the increased speed of flight will reduce the fuel load somewhat, tending to increase the payload carried. In addition to this, the higher cruising speed enables more trips to be made for a given utilization, thereby further increasing the revenue, so that the overall economic picture is materially improved. Fig. 12 shows the effect of such hypothetical increases in cruising speed on the operating economics of aircraft No. 8 on a block distance of 300 miles at 2000 hours per annum utilization. For aircraft propelled by piston engines these economies are the most that could be reasonably hoped for from increased cruising speeds. The introduction of gas turbines and jet engines appears to promise considerably greater economies, not only because of greatly increased cruising speeds but because of the prospects of lower initial and maintenance costs.

Another method of increasing cruising speed is to operate at higher altitude where, for the same power expenditure, considerably greater speeds are possible because of reduced air density, particularly in the case of aerodynamically refined aircraft. At constant power, therefore, the true air speed increases with altitude but the indicated air speed decreases. Consequently, no increase in structural strength or structure weight is required on account of the increased speed. Since the power drawn from the engines is to be the same as at lower altitudes, there is no deterioration in engine reliability, life or maintenance costs. Fuel consumption at altitude may be reduced due to the reduction of exhaust back pressure, if a turbo supercharger is used. With a gear-driven supercharger, fuel consumption at altitude will be increased due to the additional power required to drive the supercharger. The further benefits due to high cruising speed, discussed in the preceding paragraph, again apply. On the debit side there is the additional fuel required at climbing power during the long climb after take-off, balanced to some extent by the descent prior to landing. The time required to attain the operating altitude, at the speed for best climb, reduces the gain in block speed which is derived from high altitude cruising, particularly on shorter block distances. Engine weight is increased by the addition of a larger supercharger to maintain power at great heights and payload must be sacrificed to allow cabin supercharging and air conditioning equipment to be carried. If a turbo supercharger is not used in preference to the gear-driven supercharger, the net power supplied to the propeller will be reduced by the power required to drive the supercharger. Propeller weight for the efficient development of thrust power at altitude will

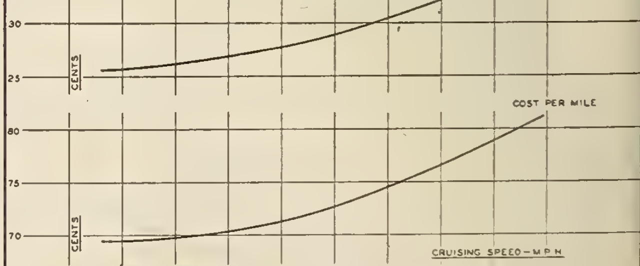

Fig. 14—The effect of increasing speed by installing engines of greater power, for aircraft No. 8 over a block distance of 300 miles, at an annual utilization of 2000 hours.

RECONSTRUCTION OF HALIFAX WATER RESERVOIR

Prestressed Concrete Dome Roof

R. M. DOULL, M.E.I.C.
General Manager and Director, the Canada Gunite Company Limited and Preload Company of Canada Limited, Montreal.

A paper presented recently before the Saint John, Kingston, Halifax, Quebec and Ottawa Branches of the Engineering Institute of Canada.

Because of the rapidly growing interest among members of the profession in "prestressing", a description of an actual job, and the success achieved in carrying it out, is of particular value at this time. The author shows the serious condition of the original structure, and describes the design and the methods of construction of the prestressed concrete dome roof, as well as the procedure in repairing the interior and exterior of the reservoir walls with gunite.

The City of Halifax draws its water supply from a system of lakes located a few miles outside the city. The water is carried to the city from these natural reservoirs in 24 in. and 27 in. cast iron pipe lines and distributed to the mains partly by gravity flow and partly through pumping stations located at various points within the city.

In 1917, a reservoir was built to provide storage capacity within the city and also to improve pressure conditions in the High Service district of the water system. This structure, known as the High Service reservoir, was built on a hill in the northern part of the city, the highest point available for such construction. This hill is exposed on all sides; until the Second World War, when the district was partly developed, there were few houses and no trees to protect it from the elements. In November 1917, shortly after completion of the reservoir, the Halifax explosion occurred in the Narrows, a scant half mile to the east. This blasted every tree and house from the face of the hill. Again in 1945, the magazines on Bedford Basin, a few miles to the north, across the water, caught fire and a series of violent explosions shook the city, although little or no damage was suffered by the reservoir as a direct result.

How the Original Reservoir Was Built

The reservoir was a massive concrete structure 160 ft. inside dia., 25 ft. deep, with a capacity of 3½ million gallons. The foundations were carried down about 8 ft. below grade and heavily reinforced. The floor consisted of a 6 in. slab poured with the footings, over a compacted fill, covered with another 6 in. reinforced slab, poured in place after walls and columns were built. The close spacing of the reinforcing steel and structural frames in the concrete contributed to a material extent to the eventual failure of the walls.

The roof was built as a flat cone with barely enough slope to provide for run-off of rain and melting snow. The slab was four inches thick and was carried on a series of radial concrete girders 12 in. by 20 in., and cross beams of various sizes and spans. This whole structure was in turn supported by 53 18-in. by 18-in. concrete columns, and by the walls themselves. Each girder was haunched into the walls at the outer ends and heavy caps attached them to the columns.

Disintegration Due to Frost Action and Neglect

During the years that followed the completion of the reservoir, very little maintenance work was done to correct troubles as they appeared, and the work done was ineffective and served only to cover up the real trouble for a time. The reservoir finally came up for critical inspection under the direction of the newly formed Public Service Commission. Their engineers ordered a thorough survey and inspection to determine what action should be taken in connection with this important link in the Halifax water system. In brief, their findings were these:

1. The roof was near the point of collapse. (Fig. 1). Several large sections had already fallen into the reservoir. The top surface had settled and heaved. In many places the slab had pulled away from the wall.
2. Many of the supporting beams and girders had failed, and some were deflected several feet with nothing but the reinforcing steel holding up the remaining concrete. Other beams had spalled, exposing steel which, in some cases, had completely rusted through.
3. The columns appeared to be fairly good, except that a number of the caps were fractured and some minor cracks were also in evidence in the columns themselves.
4. A four foot band 15 ft. above the floor, completely around the inside wall, was so badly eroded that the interior layer of reinforcing lay exposed.
5. The floor could not be inspected, since no provision had ever been made to completely drain the reservoir. About six to eight inches of mud and slime covered the entire floor area.
6. The exterior walls were in an even more alarming condition. (Fig. 2). Fully 50 per cent of the wall area above grade was heavily spalled. Large sections of concrete had fallen off. Many of the bars had come loose from their supports and had fallen to the ground. The concrete, which had been exposed, resembled piles of loose gravel held in place by the steel rods. There was no actual flow of water through the walls, but the concrete was damp and the steel was badly rusted.
7. The gatehouse was generally in the same condition as the rest of the structure, except that the spalling did not appear to have penetrated to as great a depth.

Fig. 1—Old roof showing failures in slab.

Fig. 2—Loose outer shell and partially exposed reinforcing.

8. Actual test measurements disclosed that in spite of the bad condition of the walls, very little loss of water was taking place. This was confirmed by test pits dug around the walls which also showed that little disintegration had taken place below ground level where the concrete was protected from frost.

The greatest single cause was probably frost action. Water penetrating from the top lodged within the concrete and alternate freezing and thawing plus rusting out of the steel did the rest. It is considered also in light of present information that the beam structure was somewhat underdesigned, which probably assisted the action of frost and water in its work of destruction.

The deterioration of the walls was much easier to analyze. This was a definite case of direct frost action. Water gradually seeped through the walls and construction joints. The water bars were not completely successful because of the poor concrete in this section. The water lodged in the porous concrete around the outer layer of steel and gradually by repeated thawing and freezing built up sufficient pressure to force off the outer layer. The freezing and thawing action proceeded unchecked, and the core between the inner and outer system of bars was attacked. This area was closely restrained however by the steel and, although it did fall out in places, it generally remained in place, crushed and broken. Some of the bars bonded to the outer shell were torn from their supports when the loosened sections, sometimes weighing several tons, fell away.

Choices Confronting New Commission

The problem which faced the Public Service Commission was whether to rebuild the reservoir or demolish it completely and build another. No other site with sufficient altitude was available. If a new unit was to be built, it would mean relying on the pumping stations alone to service a large part of the city for a considerable time, since complete demolition of the old reservoir would have to be undertaken before construction of a new one could commence. Many opinions were expressed; some claimed that it was beyond repair, others took the stand that repairs were practical and economical.

Finally, the Commission issued a general specification, with photographs and plans of the structure, and called for competitive tenders. Each contractor was obliged to submit his own detail drawings; an outline of the method he proposed to follow; a complete specification for the work and a guaranteed time schedule. The time schedule was important, as the city had to rely on pumps alone during the time the reservoir was out of service. This might have been serious in the event of a fire or mechanical trouble with the pumps.

The Method Selected for Rebuilding

The proposal selected by the Commission contained a number of features which proved to be original and of considerable value. Under the proposed design, the capacity of the reservoir was increased by half a million gallons, and the maximum head was increased by four feet, (see Fig. 3). These features represented a most desirable asset to the city's system. The reservoir was to be rebuilt inside and out by the gunite process, and a new prestressed concrete dome roof was to be erected in place of the conventional flat slab and columns.

The increase in head and capacity was found to be possible from an analysis of the stresses in the original design. After careful checking it was found that the working stresses were extremely low and could safely be increased by 15 per cent and still be well within limits of conservative design.

The work of reconstruction fell naturally into three distinct phases. Demolition of the old roof structure; restoration of the old concrete; and the construction of the new prestressed dome roof. Each of these sections will be dealt with separately, although they were carried out together as part of one operation in the field.

Equipment Needed

The equipment set up played an important part in the method specified for the job. The main power was compressed air furnished by two 365 c.f.m. air compressors. Air lines were piped to various points

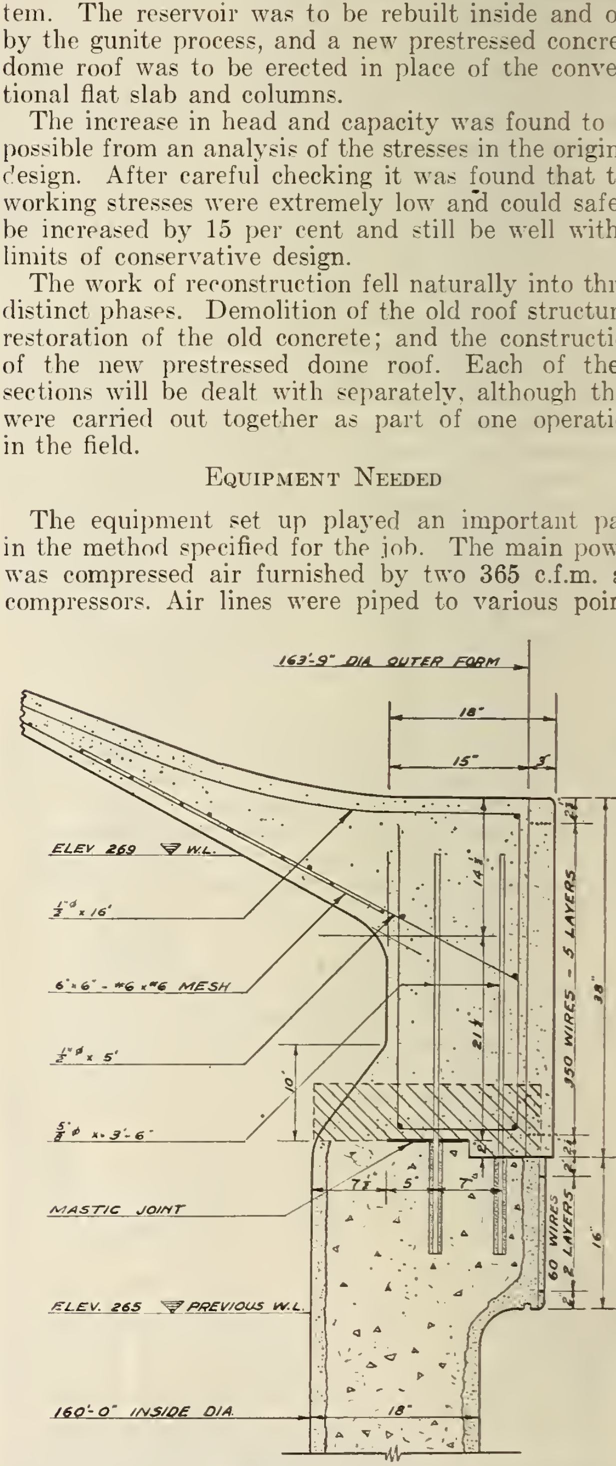

Fig. 3—Design sketch of prestressed ring and seating on old wall.

Fig. 4—Shooting gunite on dome roof.

on the job to operate the cement guns, pneumatic tools and air hoists. Heavy demolition was undertaken with standard paving breakers but the bulk of the chipping and cutting was done with six chipping tools of a new design recently developed in Canada.

An electric mixer specially fitted for the dry gunite mix fed two cement guns through screens and gravity hoppers. Each gun was equipped with modern dual hydration nozzles. Safeway scaffolds, drills, power saws, air hoists and other miscellaneous equipment also played their part. Finally the wire winding machine, commonly called the "Merry-Go-Round" completed the picture. This machine, which makes these large dome roofs possible, will be dealt with in more detail later.

Advantages of Gunite

Gunite was used in all the work. It has certain characteristics which make it particularly effective in the restoration of concrete structures such as the reservoir, and in prestressed work generally. It develops high strengths in excess of 4,000 lb. per sq. in., it is so dense that it is waterproof for all practical purposes. Forms are not usually required, and it can be finished to almost any desired lines and texture. One of its main advantages is that when applied to a properly prepared surface it develops a positive bond, which tests have shown to possess strengths in excess of the concrete to which it has been applied. It is particularly well suited to prestressed work because shrinkage and plastic flow are considerably less than in ordinary concrete.

Removal of Roof Came First

The first part of the job was the removal of the old roof. The reservoir was emptied, and the roof was marked off in sections for the three crews that carried out the work of demolition. Each crew consisted of two breaker men and four labourers. To save hoisting and unnecessary handling jumbos constructed with safeway steel scaffolds and mounted on wheels were erected inside the reservoir. A heavy wooden platform was built on the top of each jumbo. The breaking was then done over the top of these platforms; the break was discharged down a shute into trucks for disposal. Since there were over 400 tons of concrete in the roof structure, this method saved much time and rehandling. The columns were not removed, but the caps were cut off and the tops grouted over. Since they only displaced 12,000 gallons of water, it was considered uneconomical to remove them.

Repairing Interior Walls

The restoration of the interior of the reservoir began as soon as sufficient roof had been removed to permit men to work safely. Movable scaffolds were used for washing and chipping the walls. Wood scaffolds were gradually erected around the walls for chipping and gunite, as well as for later supporting the dome forms.

After the preparatory work had been completed, gunite anchors were set in the concrete at approximately 30 in. centres in each direction, and the entire area was covered with 6 in. by 6 in. electrically welded steel wire mesh, secured to the anchors with tie wires.

Immediately prior to placing each coat of gunite, the surfaces to be treated were thoroughly water blasted. The gunite was shot in two or more successive layers. On the interior walls, a minimum thickness of 1½ in. was required, but the average was higher. The final coat was screeded with straight edges, then finished with wood floats. After pumping, and cleaning the floor, it was found that on this part of the structure very little repair work was required.

Worst Damage on Exterior Walls

The work of restoration on the exterior walls, however, proved to be more difficult than anticipated. Although about 50 per cent of the area was heavily spalled and cracked, the remainder appeared to be sound except for the construction joints. However, as chipping operations proceeded, it became evident that this outer shell was not bonded to the structure and that it would have to be removed.

It was also found that the core of the wall between the inner and outer rows of steel was in very bad condition. In some cases this part of the wall fell out when the steel came away and in other cases it had to be chipped and cut to reach sound materials.

The chipping operations were followed by further cleaning and sand-blasting and setting of gunite anchors and ties. A heavy base coat of gunite was then shot, filling the holes, construction joints, and bonding in the old steel. This part of the work was then cured before further guniting to restore the original strength of the wall. The final two inches of reinforced gunite was not shot until after the reservoir was filled, in order that the walls would be under stress when the final surface was applied.

In the meantime, the tank walls were excavated down to the footings and repair proceeded on this sec-

Fig. 5—Wire winding dome roof ring.

tion. The excellent condition of this part of the wall below grade provided further evidence that the disintegration above grade was largely caused by frost action.

Gatehouse Floor Had to Be Raised

The gatehouse was gunited inside and out in the same manner as the reservoir proper. The existing floor and walls, however, were too low to accommodate the increased water level. It was necessary, therefore, to raise the upper part and build a new floor, since the water level within the gatehouse is equal to that in the reservoir. This work was completed without raising the roof elevation as there was sufficient head room available. The exterior was remodelled to harmonize with the new lines of the structure; glass block windows and a new door installed and a steel platform and ladder replaced the old concrete walkway and stair.

Recent Growth in Use of Preload Designs

The Preload design of dome roofs has been evolved over the past few years from the construction of tanks and other circular structures, which represent the first serious development of prestressed concrete work on this Continent. Very large roof spans are possible without the necessity of elaborate framing or any interior columns. At the present time, the Halifax dome is the largest of its kind in the world, 164 ft. 3 in. diameter, but several will be built in the near future exceeding two hundred feet, while others with diameters of over three hundred feet have been projected. These large spans open up entirely new fields for engineers in designing buildings of various kinds. Due to their utility and economy, particular attention has been created and designs completed utilizing this type of roof for sports arenas, aircraft hangars and other buildings where large clear floor areas are desirable.

The dome roof is simply a segment of a hollow sphere having a very thin shell enclosed by a heavy ring section. The radius of the dome surface is fixed by the amount of rise desired for the particular structure, but it has been found that for practical purposes a rise of about one eighth the diameter of the dome is most satisfactory. In Halifax the shell was 2½ in. thick and the radius about 171 ft. Obviously such a shell develops from its own dead weight plus any live load which may be imposed, tensile stress in the ring as well as meridional shear and bending stresses in the shell itself. The computation of these various stresses is extremely complex and does not form part of this article. The theories and techniques involved have been developed from a careful study of research data and tests of full size structures in the field.

How the Dome Roof Is Stressed

In the construction of the dome roof the stresses are carried by prestressing the main ring, and by the use of standard steel reinforcement. The prestressing is designed to induce sufficient compressive stresses to reverse the tensile stresses set up in the ring and shell under the maximum load condition. The bending and shear stresses, which are a maximum near the ring, are compensated for by means of standard steel reinforcing and by thickening the shell itself. The actual design used in Halifax is illustrated in Fig. 3. The seating or connection of the new dome roof to the old structure was the first consideration requiring particular attention. It was necessary to develop a positive connection between the new ring and the old structure. It was also known that some movement would take place in the ring as the compressive forces of prestressing were built up. At the same time the joint must be watertight from the inside under the hydrostatic pressure which would be developed.

Preparation for Construction

The top of the old wall was cut down to the required elevation and levelled off. A key was cut in this surface to form the joint illustrated in Fig. 3. The inside half of the joint was prevented from bonding with the ring by a ¼ in. mastic joint. This joint was later covered on the inside by overlapping the gunite lining and bonding it to the ring itself. This final operation was of course done after prestressing.

The first step in the construction of the roof was to erect a tower in the middle of the reservoir to set the centre point. Since the old walls were not truly circular, an average was taken to establish this working point. The ring forms were prefabricated on the ground in sections and set in place by instrument. A full form was used on the outside but on the inside the form was built up to the springing line of the dome only.

Forms

The dome forms were carried on a series of posts from the floor of the reservoir, set at 10 ft. centres and in concentric rings. Cross pieces were fastened across the tops of the posts at pre-determined elevations to suit the contour of the dome. Radial ribs were then laid up on these cross pieces, each rib being cut to template with the correct curvature.

Placing Steel and Shooting Gunite

The main reinforcing in the shell itself was electrically welded 6 in. by 6 in. steel wire mesh, weighing 42 lb. per hundred square feet. The mesh was supported by small chairs to locate it in the middle of the shell. Gunite was used throughout in the construction of the roof because it is best suited to prestressed construction, because it produces higher strengths than ordinary concrete, is more economical, and the loss of stress in the steel due to plastic flow and shrinkage is less.

The ring containing about 90 cu. yd. of gunite was shot first, and allowed to set for several days before shooting the shell itself. This procedure eliminates to some extent shrinkage stresses from being transmitted to the shell. The dome was then shot in a continuous operation (Fig. 4) for two cement guns, working for five and a half days.

Curing

Curing is a most important consideration, as this affects the quality of the work to a marked degree.

Fig. 6—Completed reconstruction before backfilling and grading.

The procedure followed was to place a perforated circular pipe around the ventilator curb and allow water to flow over the dome continuously. This was supplemented by revolving sprinklers. The dome was cured for two weeks before the prestressing operations commenced.

Prestressing

Prestressing was done by using a special high tensile strength wire, specially developed for this class of work. The wire was about 0.162 in. diameter in its initial state, with a yield point in excess of 180,000 lb. per sq. in. and an ultimate strength in excess of 220,000 lb. per sq. in. An initial stress of about 140,000 lb. per sq. in. was applied, to allow for loss of stress which occurs from shrinkage and plastic flow in the gunite, and from creep in the steel itself. Much research has been done on this subject and many complicated theories have been advanced as to the magnitude of this loss. In the Halifax design, a working stress of 110,000 lb. per sq. in. was used allowing for a total loss of 30,000 lb. per sq. in. from all causes. This is believed to be a conservative figure, and is borne out by experience in the field and tests in the laboratory.

Five layers of wire were applied in continuous spirals on the ring, using a total of about forty-two miles, or 12,000 lbs. Each layer of wire was bonded in immediately after winding with a thin coat of gunite and when this was set, the next layer was applied. The final layer was covered with about 1 in. of gunite for permanent protection. Two layers of wire were also wound on the remaining part ot the old ring, to induce some measure of prestress in this part of the structure and to assist in the transmission of stresses from the new work to the old.

The wire winding machine, (Fig. 5) hangs from a supporting carriage which travels on pneumatic tires around the ring. Tie cables to a centre pin extending through the centre of the dome hold the carriage to its track. The machine itself is self propelled by a gas engine operating a drum which engages an endless wire rope passing around the perimeter of the structure being prestressed. A spring-loaded take-up is provided to maintain the amount of tension required for proper traction. Vertical travel of the mechanism is obtained by hand wheels operating a simple winch device, although on the newer machine this is taken care of by automatic power drive. The preload wire is carried on a reel, mounted on the working platform. This wire is led to a die of predetermined size through which it is drawn, to develop the necessary stress in the wire. Winding of the wire starts at the bottom of the ring from an anchor set in the gunite and proceeds spirally around the circumference. Each coil of wire is joined to the following roll by means of a special torpedo splice. The machine travels at a speed of about 3 m.p.h., requiring only a few hours to actually apply the mileage of wire needed for an ordinary tank or roof.

Stripping

Following completion of the prestressing, the dome forms were stripped and removed. Water tests were then conducted by pumping in water until maximum capacity was reached. The reservoir was maintained at near capacity for a considerable time before backfilling, with no evidence of any leaks or defects appearing. The entire surface above grade was then treated with a special surfacing material of a grey-white colour to give a pleasing appearance.

Quantities Compared in Old and New Designs

There are a few figures which are interesting and which demonstrate one of the advantages of the prestressing. The original reservoir was, with the possible exception of the roof, of a conservative design. The roof, including the supporting columns contained almost 600 cu. yd. of concrete and 60,000 lb. of steel, while the new Preload roof which replaced it, including the ring, contained only 300 cu. yd. of gunite and 27,000 lb. of steel, or about half the original quantities. A comparison between total quantities in the whole reservoir and a modern prestressed design for one of similar capacity is even more startling. The old reservoir contained 2,200 cu. yd. of concrete and 522,000 lb. of steel. By comparison, a modern prestressed design of similar dimensions would contain 750 cu. yd. of gunite and only 80,000 lb. of steel; one third of the concrete and less than a sixth of the steel in the original structure.

In conclusion, this work demonstrated the efficiency of the gunite method of repairing such heavy structures, even when disintegration had proceeded to a marked degree. It also marked a major step forward in the practice of prestressed concrete construction. The Halifax dome roof Figs. 5 and 6 proves beyond question on theory the practicability of this type of construction, and offers many new possibilities to engineers in the design of structures hitherto considered impractical.

Acknowledgment

The design of the dome roof was undertaken by the Preload Company of Canada Limited.

THE ENGINEERING INSTITUTE OF CANADA AND RESEARCH*

C. R. YOUNG, M.E.I.C.
Dean of the Faculty of Applied Science and Engineering, University of Toronto

My assignment, as I understand it, is to say something of the attitude of The Engineering Institute of Canada to research in this country. I may say immediately, sir, that that attitude is a most cordial one.

The Institute, which is now nearly sixty years of age —actually 59—adopted in its charter a statement of its attitude to research which called for original investigation in all branches and departments of knowledge which might be associated with the engineering profession. That particular item in the charter has persisted through these sixty years and the Institute stands strongly in support of all useful activities in this field.

The Engineering Institute of Canada is an organization of over 8,000 members, with 28 branches extending from Sydney to Victoria. It is organized, not only for purely technical proceedings having to do with the preparation and reading of papers and the carrying on of discussions, but for the support of any national enterprise which might properly come within the purview of a professional organization. By reason of the fact that the membership is composed of engineers of all kinds and sorts, its activities are extremely diversified.

Its research interest might be said to have been directed to production research and development rather than to scientific research and development. An engineer is a person who takes the discoveries of the pure scientist and puts them to use, and it is in the adapting of these discoveries to the use and convenience of man that the engineer performs his greatest task.

In 1907, on the occasion of the failure of the first Quebec bridge, there developed a demand for the setting up of testing laboratories in Canada which would be able to test structural members and materials of a scale which had not been possible in this country up to that time. The Institute carried on a campaign running from 1909 to 1917 directed towards bringing about this new establishment. There came upon the scene in the last war those who advocated the building of a great research laboratory at Ottawa, and the Institute, feeling that this was a broader and more comprehensive enterprise than merely the establishment of testing laboratories, supported the project warmly. Out of that campaign came, as you know, sir, the National Research Council. The Institute has always supported that Council most warmly.

It formerly was very active in the field of specifications and standards. That is an activity which I presume might reasonably be classified under professional research and so the Institute formulated many specifications. During the last war there was developed the idea of what was then known as the Canadian Engineering Standards Association, which now goes under the new name of the Canadian Standards Association. That Association has carried on very valuable work throughout the years.

Many special activities have come within the field of research interest of the Institute. One is the study of the deterioration of concrete in the West. Those who are concerned with concrete structures there have had a great problem over the years. Back in 1921 the Institute set up a committee on the deterioration of concrete in alkali water areas. Succeeding that committee came the present committee on deterioration of concrete, which is doing useful service in trying to devise ways and means for the production of better concrete and for remedying concrete which may be faulty.

To show that the Institute's interests have been wide and varied, Mr. Chairman, I might cite, as other activities of the Institute, the inquiry into the fuel field in 1923 and 1924. It did not settle the fuel problem in Canada, but I think it outlined the essential factors in that situation.

For some time it has maintained a standing committee on prairie water problems and has formulated a proposal for the conservation of water and its utilization in southern Alberta, a project which has received the sponsorship of the federal government and was granted high priority in the reconstruction programme.

During the war we were greatly interested in civil defence and set up a committee which brought out Professor Webster from London to lecture in this country on civil defence. There are other committees which have just been started, one on quality control and another on community planning, which is another aspect of research.

May I say, Mr. Chairman, that the Institute supports wholeheartedly research in the field of pure science. We realize that the science of today is the engineering of tomorrow. Unless we have new lifeblood from scientific investigation we will not go very far. The engineer is not blind to the tremendous contribution the scientist makes; he realizes his own special role and gives all credit to those who by original discovery of new ideas and principles give him something to which he can bend his own particular talent. It is important to realize that unless we have that constant stimulation from science there will come a stalemate just as there was at the end of the 15th century in Europe. Manufacturers, such as they were, had come to the end of their tether so far as perfecting the methods of manufacturing was concerned. It was not until the 16th century that we began to realize the need for scientific and technical development, such as that now in the making. The Industrial Revolution came as a result of that.

So I say, Mr. Chairman, that The Engineering Institute of Canada is warmly and enthusiastically behind every legitimate activity in the field of scientific research.

*—From an address at the Industrial and Scientific Research Conference held on the occasion of the 75th Annual General Meeting of The Canadian Manufacturers' Association, Toronto, June 4-6, 1946.

THE ONTARIO RESEARCH COMMISSION

Dr. R. C. Wallace, Hon.M.E.I.C.
Chairman, Ontario Research Commission and Principal, Queen's University, Kingston, Ont.

An address given before the Toronto Branch of The Engineering Institute of Canada on February 19th, 1947.

Dr. Wallace describes the functions of the Commission, and explains how it is being aided by the various advisory committees. He tells of the interest in, and support of, the research programme by all levels of the Ontario Government. He outlines what industry is doing for the programme and how industrial research may be co-ordinated with the work of advisory committees and of Universities. Encouragement is being given to students of promise, in an effort to overcome the serious shortage of scientific personnel.

The Ontario Research Commission was established by Order-in-Council of the Government of Ontario on August 28th, 1945, under the Public Enquiries Act, to survey existing research facilities in the province, and to advise as to ways and means by which industrial research might be facilitated. Premier Drew was greatly concerned that the need for research in lessening the cost of existing products and in finding new products should be appreciated everywhere by industry. He was determined that research organizations, whether governmental, university or private, should work in co-ordination, each in their own field, in order that there be no duplication and no gaps in the research front. The personnel of the Commission is representative of private industry, the Ontario Research Foundation, and the universities. Care has been taken that the smaller industries, as well as large scale industry, are represented on the Commission. It was fortunate that Dr. Wilhelm could be secured as secretary of the Commission. His contact with research men both federal and provincial is unusually wide, and his experience and knowledge have been invaluable.

Two principles have guided the Commission in initiating its work. The first is that if research men in any broad field of enquiry can get together to discuss their problems, out of these discussions there will come ideas and proposals. These will be stimulating to further research, and will go far to co-ordinate the research that is at present going on. There will be no need to ask for co-operation on the research front. That comes of itself, when full discussion is possible. The second guiding principle is that industrial life is based mainly on the resources that are available. Research into the resources of the province is the preliminary to industrial research and industrial expansion.

Advisory Committees Tied in with Province's Research Programme

Acting on these two principles, the Commission has set up advisory committees on agriculture, on soils, on forestry, on mines and minerals, on fisheries and wild life. These committees consist of fifteen to twenty members in each committee, drawn from the federal service, the provincial departments, the Ontario Research Foundation, the universities, and industry. The members are all active scientific workers, or are closely identified with scientific research. They meet several times a year, and have executive committees which carry on between meetings. They have already done excellent work in surveying the field, and in making proposals to the Commission for extension of research in important areas not already cultivated.

There is a unanimous feeling that these committees should become a permanent part of the research establishment of the province. They serve to co-ordinate the interests of the men in the universities, whose main concern is fundamental research, with the men in the governmental departments, who are interested in research which will assist in administrative problems, and with the research men in the research foundations and in industry, who are in the field of applied research. This coming together is wholesome, not that it draws a man away from fundamental to applied research, or vice versa, but in that it gives the research worker in any field a better understanding of the relation of fundamental research to the practical problems which have to be met in the province of Ontario.

I do not propose to deal with all the recommendations that have come to the Commission from the advisory committees. Single instances will suffice to serve as illustrations. The committee on fisheries and wildlife stimulates the work at the biological stations. It is working towards an ecological centre which will be the mainspring of research in all biological problems in which the province is interested. The committee on mines and minerals is concerned with the corrosion of wire rope as used for cables, and with the development of electric smelting for iron ores. The committee on soils is concerned with the climatological, the physiographical and the micro bacteriological problems associated with soils in their practical bearing. The committee on forestry has divided into two subcommittees. One deals with research problems in forest growth and forest management. The other develops research on the waste products of the sawmills and the pulp mills. In a similar way the committee on agriculture has organized five subcommittees to deal with various phases of research in the field of agriculture. Here the Commission has had the advantage of discussions with all the departments of the Ontario College of Agriculture, in which a great part of the research in agriculture for the province is being carried on.

Provincial Government's Support Assured

From these advisory committees there have come to the Commission recommendations with reference to expenditures on research which the Commission has dealt with, and, where it seemed advisable, has presented to the Government through Hon. M. Michener, Provincial Secretary, under whose authority the Commission acts. A Committee of the Cabinet has been set up to act with Mr. Michener on financial and other requests in which the Government may be concerned. They are the Provincial Treasurer, the Minister of Mines, the Minister of Lands and Forests, the Minister of Agriculture, the Minister of Planning and

Development. They represent departments with which the Commission has close contacts, and with which problems of policy have from time to time to be worked out.

The Commission has met this Committee of Cabinet, and has discussed with the Committee the situation as they see it and the part that we feel the Government may play, both in financial assistance and otherwise, in the furtherance of research in Ontario. May I be permitted to express my appreciation, and that of my colleagues, at the very active interest in our work on the part of the Government. Our Minister has sat in with us at many long meetings. His judgment and advice have meant much. And the Commission was established as a result of the very lively concern on the part of the Premier that research should play its part in the establishing, the maintaining and the enlarging of markets, export and otherwise, for the products of our Ontario industries. The time is not far distant when the competition will be very severe. Cost and quality will decide. Without new ideas, new knowledge, new methods, the race may well be lost. It is from research that these new ways come.

Industry's Part in Research Programme

Industry may carry on research on its own behalf, or use the results of research as carried on by others. All the larger industries now have their own research establishments, and are doing excellent work. But over 80 per cent of all industry is small—that is, in units of not more than 200 men. It is not feasible in such industries to establish research personnel. Not infrequently the management is not alive to the need for research, nor in touch with the progress of research in his own particular field. Nowhere has it been found easy to apply a technique which will be effective for small industry, but the experience of other countries has given the Commission some basis of policy which is now being recommended to the Government.

The first requirement is information. The manufacturer needs to know what is going on in his field of operation. He needs to know it in a form which is simple and non technical. This necessitates an information service, competently handled and directed to his particular needs. Arrangements are on foot for the setting up of this information service, either directly by the Government, or through the Ontario Research Foundation. This in turn is likely to lead to requests for research on special problems connected with the industry, and to relationships with the Foundation or the National Research Council which these organizations are especially fitted to develop.

There is a further step in this process which has come about fairly successfully in England, but has not as yet met with success in Canada. It is the formation of trade research associations, in which the Government participates with the members of the Association in financing research institutes for that particular trade. It seems to the Commission advisable to explore fully the possibility of such associations in Ontario as the ultimate goal in the developing of research for the benefit of the small and large manufacturer together. It is fully realized that much preliminary work will be necessary before such a step can be contemplated with any hope of success.

Some material steps have been taken. The Canadian Manufacturers' Association have had a panel discussion on industrial research at their annual meeting in 1945 and 1946. These discussions have in each case lasted for two days, and have been well attended by industrialists not only from Ontario, but from all parts of Canada. The papers which have been presented, and the summary of the discussions, have been published in booklets which have had very wide circulation. Considerable interest has been aroused, and the groundwork has been laid for practical developments. The Canadian Manufacturers' Association also endeavoured to find out what the expenditures in research were in Canada by industry, but this led to very inconclusive results as so few manufacturers gave information of value. The Department of Reconstruction in Ottawa has arranged for a field service where the problem of the manufacturer is discussed in person, and such information given and suggestions made as will help him to tie up more clearly to the research institutions. It is still too early to assess the value of this work, but it gives real promise.

Current Expenditures Compared

Notwithstanding the imperfect data, some measure of relative weight of the importance to be placed on research can be illustrated by the figures which are available. The Government of Ontario, through the various administrative departments, spends almost $1,000,000 per year on fundamental and applied research. The Ontario Research Foundation has an annual budget of $350,000 all of which is given to research. The universities in Ontario spent a sum probably exceeding $750,000 in fundamental research in 1944-45, of which over $250,000 was provided by the National Research Council. As three of the universities, Toronto, Queen's and Western obtain funds from the Provincial Treasury, part of this expenditure may be considered to come directly from the treasury of the province. Two hundred and eighty firms in the Dominion (a large proportion in Ontario) reported that they spent in 1944 over $10,000,000 in research, while the National Research Council and the departments of Government in Ottawa spend very considerable sums, which have not been estimated as to provinces, for the carrying on of research directly related to Ontario's resources and industries.

These sums in aggregate may seem considerable, but they are small as compared with what some other countries are doing. It is considered reasonable in industry that two per cent of total value of production should be put into research. None but the very large companies even approximate to this figure, and the smaller companies fall woefully short of any such goal. The United States Government is spending a billion and a half dollars this fiscal year on research and development, a considerable portion of it in the colleges and universities. In Great Britain the Government places so much stress on the fundamental research which the universities carry on, in its bearing on industrial development and the recovery of export markets, that the funds available to the Parliamentary Grant Committee for distribution to the universities has risen from two million to over nine million pounds. It has been predicted by Sir Ernest Simon that as much as twenty-five million pounds will be available in 1955 for purposes of the universities. Britain is not now a wealthy country. She has to husband her resources. The figures quoted above are an indication of the weight which the British place on the necessity for fundamental research on which all applied research must be based.

Supply of Trained Personnel a Limitation

One of the problems which the war has bequeathed to us is rooted in the dearth of trained scientific personnel. Young men and women were drawn into war forces or war services before they had had time to be given training in research. It is of first importance that personnel be made available for the needs that now have to be met. In the biological field, for example, where programmes of considerable magnitude are calling for action, there is a very grave lack of young workers with enough experience to give valuable assistance. The Commission, at the instance of the Minister, has established fellowships in order to attract able students, and already is finding men and women of promise who will become in a few years capable research workers in those fields in which research workers are greatly needed. This is an expenditure of funds which will give valuable returns.

This is not a continuing Commission. Its function is to advise the Government as to the best method of encouraging research for industry, and not for the time being alone, but on a permanent basis. A preliminary report is now in the hands of the Government, and a final report will be submitted at the end of this year. It will be our responsibility to see to it that a method of procedure is recommended that will make it possible and easy to carry forward into the future some of the most profitable undertakings which have been set on foot by the Commission. If that can be achieved, the Commission will have served its purpose.

THE DIRECT OPERATING COSTS OF TRANSPORT AIRCRAFT

(Continued from page 210)

also be increased. Initial cost and maintenance costs will be higher for such an aircraft. Making reasonable allowances for the effect of these factors on the block speed, operating costs and payload, the data plotted in Fig. 13 shows the influence of such increases in cruising speed, derived from increasing altitude at constant cruising power, on the operating economics of aircraft No. 8 at a utilization of 2000 hours per annum, over block distances of 300 and 750 miles. The longer block distance has been included because the advantages of high altitude cruising are more likely to be realized on long-range operations than in short-range services.

The fourth method of increasing cruising speed is by installing engines of greater power. This necessitates an increase in gross weight to carry the same disposable load and an increase in structural strength and weight consequent from considerations of load factors at increased speed. This means of increasing speed has been treated by Mentzer and Nourse in Reference 11 and their method has been adopted here in calculating the resultant operating costs for aircraft No. 8 over a 300-mile block distance, as shown in Fig. 14.

Figure 13 shows that the effect of increasing cruising speed by using higher altitudes is somewhat more marked over block distances of 750 miles than over a 300-mile distance, although from the economic viewpoint operation over 300 miles is preferable, regardless of cruising speed. In order to gain a cruising speed of 230 mi. per hr. at the same cruising power as used at lower altitudes (10,000 ft.), ascent to 37,400 ft. is necessary.

Figure 14 shows that costs per mile and costs per ton-mile both increase as a result of installing larger and more powerful engines. However, from the revenue less cost per hour flown curve it is evident that the overall economy does not suffer until the cruising speed is raised above 220 mi. per hr. by this means.

The costs given in this paper were applicable to operating conditions during the early part of 1946. Rising costs since that time should be taken into account in any application of the formulae given herein.

Acknowledgments

The authors wish to acknowledge the kind co-operation of the Civil Aeronautics Board in providing figures relative to airline consumption of gasoline in the United States. They are also indebted to Trans-Canada Air Lines, who furnished them with considerable information concerning airline operations in Canada.

THE I.L.O. BRUSSELS CONFERENCE

J. N. FLOOD, M.E.I.C.
President and Manager, John Flood & Sons Limited, Engineers and Contractors, Saint John, N.B.

A condensed summary of Canadian Delegate's report to the Canadian Construction Association

This condensed redraft of the Canadian Delegate's report on the conference was prepared by Mr. Flood specially for publication in the Journal. In it he describes the work of the conference and outlines the statement of policy presented by the employer group. The implications of the conference and its importance as part of a world wide movement are discussed, and the importance of employer participation is shown. Every practising engineer and particularly those concerned with labour-management relations, should study it.

The conference was held at Brussels, Belgium, November 25th to December 3rd, 1946, and was the initial meeting of the International Labour Organization Industrial Committee on Building, Civil Engineering and Public Works. Nineteen nations were invited to this initial meeting, namely: U.S.A., Australia, Belgium, Brazil, Canada, Chile, China, Czechoslovakia, Denmark, Finland, France, United Kingdom, India, Netherlands, Sweden, Switzerland, South Africa, Italy and Mexico. The last two did not send representatives. The committee was tripartite, with each member nation being entitled to send six representatives; two employers, two workers, and two government delegates. In addition to the six official representatives each was entitled to have non voting technical advisers. Most nations, but not all, sent the full quota of delegates. The total number attending was about 135. The writer was one of the two employer representatives from Canada, both of whom were nominated by the Canadian Construction Association, the other employer representative being J. Clark Reilly of Mansonville, Que.

The conference proceedings were held in the Palais du Brabant, and were carried on in two official languages, English and French. Our impression of the delegates was that the labour group and the employer group were well represented by qualified men, but that the government representatives were not selected with regard to their knowledge of the problems of the construction industry, and were therefore not in a position to participate as fully as they might have done. This point should receive attention if the I.L.O. is to be of value in charting the course we are to follow.

To expedite the handling of the agenda the conference resolved itself into three committees, designated as follows: (1) sub-committee on general problems relating to production and reconstruction, (2) sub-committee on general conditions of work, and (3) sub-committee on Industrial Relations. In addition to these committees both the employer group and the labour group met in daily caucus to consider conference topics as they might affect their particular interests.

Policy Stated By Employer Group

At the opening session the employer representatives submitted a brief. In this brief they enunciated the principles which they felt most apt to produce the desired result of increasing the world's supply of fixed structures. These principles were in the form of nine statements of policy which may be very briefly summarized as follows:

1st. Our belief in the private enterprise system as opposed to state control and operation.

2nd. That management should be free to exercise its function to manage.

3rd. That sanctity of contract is essential to satisfactory industrial relations.

4th. Our belief in the principle of social security.

5th. The need for adoption of the most modern technique in the production of buildings.

6th. Our belief that freedom of world trade, coupled with lowered costs and higher standards of living, are the most effective means of promoting and maintaining industrial peace.

7th. Our belief that a high level of employment, at satisfactory and economic wage levels, can be maintained only by a high level of production.

8th. That steps should be taken to increase the number of skilled craftsmen in the industry by apprenticeship training and also by training in approved technical establishments.

9th. That the industry's responsibility to the community is a dual one, shared by both employers and employees, and can be discharged best by increasing the over-all efficiency of the industry.

While these nine points of basic policy were opposed in principle by some of the labour representatives, there can be no argument about the fact that they did exert an influence on the trend of the conference, and furnished evidence of the good intent of the employers with respect to some of the reasonable aspirations of labour.

Work Divided Up Between Three Committees

The results of the conference were contained in a series of resolutions. These were presented by each of the three committees, and were adopted by the plenary session in the closing days. Some of the topics dealt with in the resolutions are as follows:

Committee No. 1:—Stabilization of employment by long term works programmes, methods of increasing productivity, standardization of building components and practices, advance planning, steps to overcome building material shortages, controls in relation to urgency of work, recruitment and training of workers, movement of manpower as between countries, emergency accelerated training of workers, compilation of statistics, and research.

Committee No. 2:—Construction hazards; job sanitary measures and industrial hygiene; social security covering industrial diseases, accidents, unemployment, sickness, disability and old age; working hours; seasonal change in work day (longer in summer than winter); forty hour week; holidays with pay; relationship of unemployment to over supply of workers; stabilization of employment and earnings; and rural housing.

Committee No. 3:—Rights of employers and employees to safeguard their collective interests; public welfare in relation to industrial disputes; industrial peace in relation to production; sanctity of contract;

negotiation, mediation, arbitration; jurisdictional disputes; work stoppages; management-worker cooperation; freedom of association; recognition of trade unions as bargaining agents; worker participation in safety, health and welfare measures; living standards of workers; and national joint committees to explore the economic problem touched upon by conference.

All three committees requested I.L.O. to prepare studies and collect data on specific matters for the information of future conferences. This material will give the next meeting of the committee a background of information, the lack of which was in part responsible for the failure of this meeting to deal more fully with certain matters. This lack nevertheless may not have been without its advantages. One of the greatest dangers in such a movement may be too much haste. Some of our labour friends are prone to ignore the need for caution and would accelerate the process of change, without due consideration of the inherent dangers.

Importance of Employer Participation

This initial conference of the Building, Civil Engineering and Public Works Committee of the I.L.O. could hardly have been expected to say the final word in drawing up a programme to cover such a vast aggregation of diversified interests. It unquestionably did lay the foundation, and set up some of the framework around which future conferences may build the structure, stone by stone.

The writer, being an employer delegate, makes no apology for the fact that his observation and viewpoint are those of the employer. The reaction of many of the worker delegates would naturally be quite different to his, and it was no surprise that many of these worker delegates evinced no friendliness toward private enterprise. As employers, we might well ask ourselves if we are wise in participating in these international conferences. Well, in the first place, the conferences will unquestionably go on, even if we withdraw. In the second place, the symptoms of a world condition which are manifest at such a conference are not caused by the I.L.O. Our withdrawal would not mend these conditions. Being inside the organization gives us the opportunity to oppose developments we may not like. Remaining aloof would deprive us of this opportunity to influence world opinion and trends.

I.L.O. Conferences Part of a World Wide Movement

The Brussels conference furnishes ample evidence that definite forces are on the march, and that these forces are bound to influence our economy. We cannot play ostrich and hope to remain untouched by the economic reforms that are taking place in other countries. There is also evidence that individuals, groups and nations are tending toward the belief that our progress must be regulated by planning. If this be so, then the nature of the planning will be determined, or at least influenced, by the decisions of just such conferences as this one. This gives us the key to the place these conferences should have in our national thinking.

Sitting in on such a conference one experiences something of a shock at the scope and significance of the movement of which this conference is but a part. This may be due in some measure to the obvious fact that the most radical and the most irresponsible elements are sometimes the most vocal. There is also the ever present difficulty of finding a common denominator for the economic anomalies of a group of nations whose problems differ as widely as do those of say India and the U.S.A. The findings of any committee within such a conference are necessarily a compromise between extremes.

Frankly, our Canadian delegates assess the I.L.O. as an organization dedicated to the cause of elevating the status of the workers of the member nations. There is one school of thought in evidence which would do the elevating at any cost, even if it involves the sacrificing of everyone and everything not " Labour ". But there is also some evidence of a more tempered viewpoint, and signs that management is being welcomed for the definite purpose of lessening the increasingly apparent danger of economic disintegration inherent in the process of change. Management's participation now may perhaps assure that, when the millennium comes, there will be something better than steerage accommodation for the survivors.

Changes Must Be Gradual

We, as employers, did not let pass the opportunity of pointing out the significant fact that real wages and standards of living are higher in those countries where private enterprise flourishes. Under-the-surface, but nevertheless significant incidents during the conference indicate this point has not been altogether overlooked by some of the more level-headed leaders of labour. We suspect some of the snipers had their tongue in their cheek, and were more hopeful of impressing their followers at home than their conference associates on occasions when they were loudest in their denunciation of private enterprise.

Whether or not this analysis is the right one, it remains a fact that our participation in these conferences is our opportunity. It gives us a chance to do what we can to ensure that the process of change shall be wisely controlled, to the extent that this is possible. It is to be expected that changes, and great changes too, are inevitable. The objective to strive for is that they may be controlled and directed so as to produce a minimum of dislocation to our economy. The I.L.O., in setting up these Industrial Committees, may have just this in mind. In any case, it is the writer's view, as an employer, that we should continue to participate, and to arrange that the views of our industry are formulated and presented to future conferences by our representatives. This was not possible at this initial conference, but will be of increasing importance as the committee develops and expands its work.

In conclusion it may be said that to have participated in a conference of this nature cannot be other than a broadening experience, affording as it does an opportunity to see the development and unfolding of a movement which is destined undoubtedly to have a profound effect upon management-labour relations in our industry; indeed upon our whole economy. We may not like and agree with all that transpires, but it is better to be a party to it than to remain outside the movement and allow these trends to develop unchecked in a manner we may not like.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

CIVIL SERVICE SURVEY

Recently the Classification and Salary Committee of the Professional Institute of the Civil Service circulated a questionnaire to their members in order to ascertain how far the recent salary increases following the Gross Inequality and Gross Injustice Order, had permeated their organization.

There are 1880 members of the Professional Institute. Only 941 returned the questionnaire, which again demonstrates how difficult it is to get people to complete a ballot or other form, even when the purpose is to secure more salary for them. It is discouraging to committees to see such small returns for their labours—so little appreciation of their efforts.

The results of the survey show that 73 per cent had received increases ranging from $60 to $1,500 per year, with an average of $256 per year. In the light of the ridiculously low scale previously in force, these figures are not impressive. A further disturbing factor is that the fixed and short range of salary in each bracket will mean that before long most people will be at the top of their schedule, and with no opening ahead will have to stand at that figure until they stagnate or find better rewards elsewhere.

The inadequacy of the recent improvement is shown by the fact that of those reporting 76 per cent expressed dissatisfaction with their classification.

For some time nothing has been heard of the Royal Commission report. As a result of their recommendations several top officials had their salaries raised—with which nobody will disagree—but it would be nice if the little man could get into the slightly changing pictures to a greater extent.

Everyone seems interested in the plight of the professional worker except the Treasury Board, and without their interest all else is in vain. There must be some way of moving that obstruction, but no one has found it as yet.

PARLIAMENT HEARS ABOUT LOW SALARIES

Speaking in the House of Commons on March 7th, 1947, in the debate on the Speech from the Throne, Monsieur Maurice Bourget, M.E.I.C., member from Levis, brought to parliament's attention the importance to the nation of scientists and engineers, and pleaded for better recognition of the service they render. Monsieur Bourget, in making these remarks, has done a valuable service to the profession, and for the benefit of the membership his address is quoted here in part:

" Since I am dealing with labour, I believe it is my duty to draw the attention of the house to a section of our population which is performing essential services in the economy of our country, even if this section is not great in numbers. I refer to scientists, architects and engineers. Since I am a professional engineer, I may be in a better position than many of our people to understand the role played by the members of these professions before and during the last war, and the great task which they will be called upon to fulfil in the future. But for the information of hon. members and for the public in general, may I quote an extract from an article which appeared in the *Institute Journal* of December, 1945, and which is entitled, "Scientists in Government Service ", by C. R. Twinn:

' The British and United States governments have publicly expressed their comprehension of the tremendous importance of science in the modern world. In a white paper dealing with the scientific civil service presented to parliament in September, 1945, by the chancellor of the exchequer appeared the statement:

' The governments are deeply conscious of the contribution made by scientists toward the winning of the war. They are equally conscious of the contribution which science can make during peace to the efficiency of production, to higher standards of living, to improved health and the means of defence.'

" In November, 1944 the President of the United States, impressed with the importance of scientific research in the national life and concerned with its continuing future in that country, requested Doctor Vannevar Bush, director of the office of scientific research and development, to make recommendations on a number of points related thereto. Doctor Bush, in reporting to the President in July, 1945, had this to say:

' Without scientific progress no amount of achievement in other directions can insure our health, prosperity and security as a nation in the modern world.'

" Nobody can deny that men who merit such magnificent praise are at least entitled to recognition from their respective governments of the service which they render to society."

Monsieur Bourget then referred the House to a recent editorial in *The Engineering Journal* which drew attention to a number of cases, taken at random, of grossly inadequate salaries paid in the federal Civil Service; a Bachelor of Science from British Columbia who is an M.A. of McGill receiving $3,180 after 19 years experience; another M.A. with four years experience and an $1,800 salary; a Manitoba graduate with M.Sc. from Cornell, who gets $1,620 after three years service; an Arts graduate of McGill, with M.A. from Wisconsin and D.Sc. from Edinburgh, drawing $3,180 after fifteen years.

Quoting from a number of recent Civil Service application notices for engineers and architects, offering salaries too low to attract applicants, Monsieur Bourget continued:

". . . Is it surprising that governments are having difficulty in retaining valued employees after they have worked under these unsatisfactory conditions for a few years? Will our governments not realize that they will lose employees whom it will be impossible to replace, and that such loss will cripple the public services of which we should be so proud? I hope that, since war-time restrictions are abolished, the Minister of Finance (Mr. Abbott) and the treasury board will do their best to remedy these wrongs.

May I ask fair-minded members of this house to support me on this issue. I should like the public at large and the federal and provincial governments to recognize that those whom Doctor Samuel Smiles rightly called ' the makers of modern civilization ' are entitled to a salary commensurate with the great services they are rendering."

Following are copies of a subsequent exchange of correspondence on the subject, between the General Secretary of the Institute, the Prime Minister and the Secretary of State:

March 13, 1947.

Right Honourable W. L. Mackenzie King,
Prime Minister of Canada,
House of Commons,
Ottawa, Ont.

Sir:

On Friday, March 7th, a member of your Government, Maurice Bourget, spoke in the House of Commons about the salaries paid by the Federal Government to its professional employees. In this talk Mr. Bourget pointed out the evils of the present policy.

The Engineering Institute of Canada supports Mr. Bourget in every detail of his address. For years we have been presenting these arguments to members of the government and to the Civil Service Commission, and we have been giving considerable publicity to the subject through the columns of our monthly publication, *The Engineering Journal.*

Engineers everywhere will be delighted to know that Mr. Bourget has brought this subject so fairly and so fully before the House, and I am sure his address has been well and favourably received right across Canada, even outside the professional circles.

We sincerely hope that the facts presented by Mr. Bourget will lead to some remedial action on the part of your government.

Yours sincerely,
L. Austin Wright,
General Secretary.

OFFICE OF THE PRIME MINISTER
CANADA

Ottawa, March 17, 1947.

L. Austin Wright, Esq., M.E.I.C.,
Etc.

Dear Sir:

The Prime Minister has asked me to acknowledge your letter of the 13th of March, written on behalf of The Engineering Institute of Canada, concerning professional personnel employed in the Civil Service of Canada.

At Mr. King's direction the representations of your letter are being brought to the attention of the Secretary of State.

Yours sincerely,
(Signed) G. J. Matte,
Private Secretary.

THE SECRETARY OF STATE OF CANADA

Ottawa, March 18, 1947.

L. Austin Wright, Esq., M.E.I.C.,
Etc.

Dear Mr. Wright:

My Minister has asked me to acknowledge your letter of March 13th, addressed to the Right Honourable the Prime Minister, and referred to this office attention.

My Minister wishes me to assure you that Mr. Bourget's observations and your representations will be given the most thorough and sympathetic consideration.

Yours truly,
(Signed) W. O. Davis,
Private Secretary.

MORE ON FUTURE OPPORTUNITIES

The following report issued by the Bureau of Technical Personnel, is based on a survey of employment opportunities for professionally trained persons. The survey covers over one-half of the total employment field numerically, but much more than half of the employers likely to require new graduates.

These figures, coupled with the report from the Engineers' Joint Council on page 176 of the April *Journal,* fill in a large portion of the picture of prospective employment, and definitely supply new information for Canadians.

MEMORANDUM BASED ON FURTHER ACTIVITIES RELATING TO THE SURVEY OF CANADIAN REQUIREMENTS FOR PROFESSIONALLY TRAINED PERSONS

(With particular reference to Engineering)

1. *1919-1944*

Dominion Bureau of Statistics ("Supply and Demand in the Professions")—1945

Approximate population 25 years ago	9,000,000
Approximate population now	12,000,000
Increase	33 1/3%
Average graduating class in engineering 25 years ago	400
Average *normal* class now	800
Increase	100%

Assuming fixed long-term average of percentage absorbed, there is every indication of a marked increase in numbers of opportunities in proportion to population over the period considered.

2. *1939-1946*

Employment in Canada as reported by employers in industries other than Agriculture, from "The Employment Situation at the beginning of January, 1947".

1939 Index (1926—100)	120
1946 Index (1926—100)	180
Increase	50%
Estimated number of engineers in Canada 1939	18,500
Estimated number of engineers in Canada 1946	24,000
Increase	30%

3. *1947-1951*

Number of engineering graduates expected in 5-year period by latest estimate of universities	13,000
Deduct allowance for emigration and for diversion to non-engineering fields	1,500
Number available for engineering openings in Canada	11,500
Numbers of openings forecast by employers covered by survey	8,000
Remainder	3,500

The employers covered by the survey represent about one-half of the total employment field numerically, but considerably more than one-half of those industrial and other types of activity most likely to absorb new graduates. A complete coverage of all employers could not, therefore, be expected to yield a further 8,000 openings, but will likely account for the additional 3,500 or a substantial portion thereof.

An analysis of this aspect of the survey has now been initiated.

There are several factors which appear to have a bearing on the question of why it may be possible to absorb engineering graduates at roughly three times the normal rate.

Reference has already been made to the fact that the numbers employed in industry have increased 50 per cent over 1939 while the number of engineers increased only about 30 per cent in the same period. This raises the question whether industry is likely to function with a smaller ratio of engineers to total employees than has applied in the past.

Both the Bureau's experience and the opinions of employers suggest that the trend is rather towards a freer use of graduate engineers.

Some concern was expressed prior to demobilization that the release of thousands of engineers from the armed forces and war production would result in a substantial unemployable surplus. Actually all such engineers were rapidly absorbed in peacetime operations as were the new graduates who became available in the meantime. Furthermore, except for one short period late in 1945, when "resettlement" was at its peak, there has been a marked shortage of engineers to fill listed openings.

In this connection it might be mentioned that, while the proportion of veterans generally who qualified for out of work benefits was about 1 in 20, the proportion among veterans who were engineers was something of the order of 1 in 2,000.

In the course of the current survey employers have been asked if, in their opinion, there is any trend towards freer use of university-trained personnel. The last compilation shows that, out of 1,334 employers interviewed, 1,005 gave an answer to this question. Of these, 850 answered yes. These 850 employers have approximately 650,000 persons on their payrolls including 16,807 with university training. The 155 employers who did not feel there was any such trend employ about 100,000 persons of whom 2,671 have university training.

Just a word might be said about numbers in the different branches of engineering. Some caution must be used in dealing with the figures gathered in the survey to date. Extent of coverage varies.

It is pretty safe to say, however, that over the next five years the greatest demand will be for civils followed closely by mechanicals and electricals. Chemical engineering and mining show somewhat smaller proportions of the whole, and the balance is composed of a number of still smaller groups.

FEDERATION OF EMPLOYEE-PROFESSIONAL ENGINEERS OF ONTARIO PRESENT VIEWS

In the following letter the president of The Federation of Employee-Professional Engineers and Assistants of Ontario takes the *Journal* to task for an editorial appearing in the February issue. The information printed in that editorial was received from very reliable sources, which sources still maintain that the information is correct. Nevertheless, the *Journal* is pleased to reproduce Mr. Barnes's letter so that both sides of the case may be presented.

In the fourth paragraph of his letter Mr. Barnes refers to the *Journal* statement that the Board was certifying groups of engineers that included many non-professional types as well, the whole being employees of the same department. The letter goes on to say "There has been no case where the Labour Boards have insisted on the inclusion of such groups of persons in the bargaining unit". Our information is that in the Bell Telephone group the non-professional employees in the department doing work of an engineering nature had to be included before the certification was authorized. Further inquiry reveals that this *is* the case and what is more, the non-professional outnumber the professional.

In a later paragraph Mr. Barnes refers to the developments in the province of Quebec, and suggests that the brief recently presented by the Quebec Corporation to the Minister of Labour "was prepared in a Council composed almost if not entirely of men in the management class". The fact is that in the Corporation the majority of the membership is in the management class, and this group gave strong support to the proposal that collective bargaining for engineers by engineers should be supported by the Corporation.

The same thing is true in the membership of the Institute. The questionnaire circulated by the Institute's committee showed that uniform support for collective bargaining came from the senior members, most of whom were in the management class. In the light of these facts, it does not seem fair to imply that the senior engineers are opposed to collective bargaining. The facts do not bear out such conclusions.

If collective bargaining is desirable for engineers, then it is most certainly desirable that it should be controlled by the profession itself. The editorial in the *Journal* was intended to indicate that bargaining was not now within the control of the engineers, or that at least the present set-up was such that this control might readily pass into the hands of others—perhaps the trade unions.

Herewith is the letter:

Toronto, Ont.,
April 8th, 1947

Editor,
The Engineering Journal,
Montreal, Que.

Dear Sir:

In *The Engineering Journal,* February 1947, there appears an article under the heading of "New Labour Legislation". Certain statements are made in this article, particularly those referring to the Ontario Federation activities, which are not, in fact, correct. We request, therefore, that you publish the facts as outlined in this letter in the next issue of *The Engineering Journal*, and give them the same prominence as the article referred to.

Regardless of the intentions of the framers of the Labour Legislation known as P.C. 1003, the Labour Boards (Wartime Labour Relations Board, National, and the Ontario Labour Relations Board) have recognized the right of employee engineers and scientists to organize themselves into groups or units for the purpose of collective bargaining with their employers. In many cases, this action has allowed engineers to bargain for themselves, through bargaining representatives of their own choice, instead of being forced to bargain through an agency representing a large group of employees from the office boy up. In such a union, a professional group would find (and has, in fact, found) itself a small minority, being represented by agents who know nothing of the classification of professional positions or their value to the employers. The professional engineers in Ontario, in response to a questionnaire, indicated by a large majority that they preferred to be " bargained for " by engineers of their own choice.

It is true that Labour Boards have taken the position, in granting certifications, that the unit must be a functional group to be appropriate for collective bargaining; i.e., they will not certify a group of engineers simply because they are members of a Professional Engineering Association, but will certify, as an appropriate group for collective bargaining, persons who are performing professional engineering services. If persons who are not registered with the Provincial Association are doing engineering work contrary to the law of the province, the Labour Boards leave it to the Professional Association to enforce the law through the powers given to them under their Act.

You give as an example of the way the Boards are acting the following: " In the engineering department of an employer, the agency would have to accept representation for draughtsmen, tracers, blue-printers, stenographers and so on, as well as for engineers." In the fourteen units which have applied or are presently applying for certification through the Ontario Federation, there has been no case where the Labour Boards have insisted on the inclusion of such groups of persons in the bargaining unit. In one or two cases, a few draughtsmen requested the bargaining agents of the Federation unit involved to act for them, and it agreed because of the peculiar circumstances of the cases and the fact that the persons added constituted only a very small minority. They have not been admitted to membership in the Federation or in the Federation Branch or Unit.

In another paragraph, you state that " the Ontario Federation declined to accept the bargaining certification granted by a Board—although they had applied for it—because the Board insisted they include the non-professionals as well." This is indeed news to us, because such a certification has never been granted or refused.

Reference is made to the brief submitted by the Council of the Quebec Corporation of Professional Engineers to the Labour Minister, reversing its stand on collective bargaining for engineers and scientists. You do not say that this brief was prepared in a council composed almost if not entirely of men in the management class, without any directive from the members of the Corporation at large. In spite of the fact that Quebec Legislation does not encourage collective bargaining organization in purely provincial cases, the Quebec Federation obtained certification for two groups of engineers and scientists, which were inter-provincial in nature, before the Wartime Labour Relations Board (National). It is obvious that the reason why the Quebec Federation has not obtained more certifications (and more members) is because they are limited in their scope to groups outside the provincial jurisdiction.

You mention that the brief of the Corporation of Professional Engineers to the Labour Minister refers to the decreasing membership of the Federations. The inference is that membership in the Ontario Federation is decreasing, which is not a fact. We have more members in good standing today than at any time since the Federation was started in 1944. The Professional Societies and Associations have been attempting for the last twenty-five years to better the financial and professional status of the engineer and scientist and have achieved gratifying success. We are convinced, however, that, since the Federation was formed, more success has been obtained in securing a better financial status and recognition of the value of the services of employee engineers than ever before.

The cooperation of all professional, technical and scientific groups can do much to achieve the results for which we are all striving.

(Signed) F. C. Barnes,

President,
The Federation of Employee-Professional Engineers and Assistants of Ontario.

CHEMICAL INSTITUTE TO HOLD ANNUAL MEETING

Announcement is made that the Chemical Institute of Canada will be holding its 1947 meeting at the Banff Springs Hotel at Banff, Alta., on June 8th, 9th, 10th and 11th.

Special features of the programme will be a discussion on atomic energy in relationship to the Chalk River plant; a talk on the social responsibilities of science; and on the economic and professional status of engineers and scientists.

One morning will be devoted to a symposium on the resources of western Canada.

An outstanding feature will be an exhibition that will illustrate recent developments in the chemical industry. Many firms and individuals promise to participate in it.

The Institute announces that all sessions will be open providing the participants are registered. In addition to the professional and social programmes, a post-conference tour has been arranged, which would take parties to the oil refineries, chemical plants; the huge development at Trail; ending up with a visit to Vancouver on the Pacific Coast. Special trains to cover this feature have been arranged.

Heavy advance registration indicates that the conference will be well attended, therefore, persons who are considering the meeting should make early reservations both at the hotel and with the transportation companies.

The conference office is at 818 19th Ave., West, Calgary, Alta.

CANADIAN ASSOCIATION OF PROFESSIONAL PHYSICISTS

The Association will hold its Second Annual Congress at the University of Western Ontario, London, Ontario, from June 12th to 14th. The afternoon of Thursday, June 12th, is to be devoted to papers and a discussion on " Physics in Industry ". This should be of especial interest to engineers as well as physicists. Friday, June 13th, will be devoted to symposium sessions on " Nuclear and Atomic Physics ", and " Geophysics ".

The C.A.P.P. was organized in 1945, to fill the badly needed function of a national society devoted to the interests of Physics in Canada. It is a member society of the Canadian Council of Professional Engineers and Scientists.

THE CANADIAN MUTUAL AID BOARD

A Resume of the Board's Final Report to Parliament

The purpose of Mutual Aid was to make available the products of Canadian war industry to the United Nations in such a manner as to contribute most effectively to winning the war. Due to the policy of Mutual Aid and Lend-Lease, the United Nations have been able to enter upon the postwar period free from the strangling burden of international war debts which, in the twenties, did so much to prevent recovery.

How the Board Functioned

From its inception, the Board's policy was to avoid as far as possible setting up new governmental machinery, so that only a relatively small administrative staff was required. Administrative expenses amounted to only 0.03 per cent of the total expenditures made by the Board.

Formal applications for aid were made in the first instance to the Department of External Affairs, where they were considered from the viewpoint of Canada's international policy. The programmes were next submitted to the Board for consideration and decision, and then forwarded in the form of a requisition to the several procurement departments. These departments placed contracts and arranged shipments. To facilitate orderly disposition of the work involved in consultation with United States authorities, a Washington Advisory Committee was established.

Military supplies produced in Canada, and in short supply, were assigned monthly by the Munitions Assignment Committee to armed services and allied claimants on basis of strategic need. A Committee in London functioned similarly respecting British, Indian and Dominion requirements from British production, while in Washington the Munitions Assignment Board under combined Chiefs of Staff, dealt with American, British and other needs from total supplies.

A Joint War Aid Committee of the United States and Canada was also set up to study problems arising from operations of Mutual Aid and Lend-Lease. Canada was represented on this Committee by members of the Washington Advisory Committee. An Inter-departmental Committee on Mutual Aid was also established in Ottawa with representatives from External Affairs, National Defence, Finance, Munitions and Supply, Agriculture, Fisheries, Trade and Commerce and the W.P.T.B. The Board's Director of Administration was Chairman.

Mutual Aid to Britain

Before Mutual Aid was inaugurated, British and Sterling Area requirements in Canada, which could not be met out of current receipts, were dealt with by four special financial measures. The first of these was the repatriation of Canadian Government and C.N.R. securities held by residents of Britain, amounting to some $700 millions. The second was a loan early in 1942, of $700 millions made under the authority of the War Appropriation Act (U.K. financing). The third was of a more complicated character. In early stages of the war, the United Kingdom had joined with Canada in paying the costs of building special plants in Canada to produce war supplies. In 1943 Canada undertook to repay the United Kingdom what she had spent for this purpose, so funds could be used to purchase munitions rather than for capital equipment. The result was that slightly more than $200 millions was placed at the disposal of the United Kingdom, and plant ownership was vested in the Dominion Government. The fourth measure was a contribution of $1,000 millions to the United Kingdom to purchase foodstuffs and war supplies in Canada. This money was provided under the U.K. War Appropriation Act of 1942. The total made available under these four measures was approximately $2,700 millions.

Aid to Other Nations

Prior to Mutual Aid, Canada provided a credit of $10 millions to Russia to purchase Canadian wheat and flour, two contributions of $77 millions each to UNRRA and shipped a gift of wheat to Greece valued at $19 millions. While Allied Armies were administering occupied areas, Canada also spent $85 millions for supplies purchased in Canada.

The provision of supplies as Mutual Aid ceased on September 1st, 1945. At a later stage, Canada made available to various allied governments substantial long term credits under the provisions of Part II of the Export Credits Insurance Act.

Summary and Distribution of Mutual Aid Expenditures

Funds expended by the Mutual Aid Board up to March 3rd, 1946, totalled $3,975,132,153, of which UNRRA received $1 million, payments for military relief totalled $84,661,968, cash for U.K. purchases in Canada totalled $1,407,031,906 and Mutual Aid totalled $2,482,438,277.

A breakdown of the Mutual Aid shipments to various countries, amounting approximately to $2,484,438,000 was as follows: United Kingdom $2,112 millions, Russia $167 millions, China $40 millions, France $25 millions, New Zealand $15 millions, India, West Indies and Greece $20 millions, and UNRRA $11 millions.

Of Canada's total production for war, valued at $4,921 millions, a total value of $2,797 millions was produced for Mutual Aid countries, broken down as follows, in millions of dollars: Shipbuilding $303, Aircraft $342, Transportation Equipment $843, Ordnance $217, Ammunition Chemicals and Explosives $574, Instruments and Signals $173, General Stores $184, Freight and Inspection $161. The total represented 57 per cent of Canada's total war production.

The cost of the supplies procured for the Board by the various government departments concerned was: Munitions and Supply $2,797 millions, Agriculture $501.2 millions, Trade and Commerce $496.5 millions, Fisheries $38.6 millions.

Winding Up of Board's Activities After VE Day

Immediately after VE Day, commitments were reviewed with representatives of all countries concerned and military programmes were revised and readjusted to meet the needs of the Pacific campaign. When the war ended, all outstanding contracts were reviewed and arrangements made to continue production and delivery of supplies only when an agreement had been reached regarding payment. These supplies were chiefly industrial equipment and foodstuffs. Unshipped Mutual Aid stores were inventoried, and it was found that Canada's own armed services needed some of these stores. The rest were declared surplus to the Crown Assets Allocations Committee.

The United Kingdom, the United States and Canada later undertook to finance procurement of foodstuffs and other supplies for military relief in Europe. The total value of supplies and services so provided was approximately $1,725 millions of which Canada's share was approximately $95 millions, including supplies under Mutual Aid to the United Kingdom and diverted to military relief.

Mutual Aid Advertised Canadian Products

Supplies shipped as Mutual Aid went to all theatres of war, and these as well as UNRRA shipments were identified by the Mutual Aid Seal. The quality of Canadian workmanship has thus been identified all over the world. Many countries previously unaware of the high standards of Canadian industry have made enquiries regarding the peacetime supply of goods made in Canada.

SOUTH AFRICAN LETTER

On 18th February I received a letter from you in reply to my first South African Newsletter in which it was indicated that further contributions of this kind might be of some interest to the readers of the *Journal*. It was apparently considered by you that some information on the vital statistics of the country, with particular reference to engineering activities therein, would be of some general interest. I have, accordingly, endeavoured in this rather statistical newsletter to give some of the basic data on the history, population and general economic structure of the Union which might well act as a background to any further contributions that I am able to make. The author would welcome comments, suggestions and questions from any readers of the *Journal* as it is very difficult, in compiling a newsletter of this kind, to determine which subjects should be covered in detail and which should only be touched upon generally. In giving the following more or less statistical information it should be appreciated that, because of the intervening war period, many of these figures are not as accurate as they might be. This particularly refers to the figures of population which were published in 1936 and have not since been revised.

The Union of South Africa was formed in 1910 by a Union of the Provinces of the Cape of Good Hope, Natal, the Orange Free State and the Transvaal. The adjoining British territories of Basutoland, Swaziland and the Bechuanaland Protectorate are administered by the Colonial Office and the Union Government has no political or administrative control over them although they form an integral part of the economy of the Union, providing large numbers of natives for work in the mines and industries.

It is generally conceded that the gold-mining industry dominates the economy of the Union. The gold industry provides one-fifth of the Union's net income, two-fifths of Government Revenue and seven-tenths of the country's exports. As well there are the basic industries of diamond and coal-mining and agriculture, although the products of the latter are nearly all consumed internally with the exception of sugar cane, citrus fruits, wool and hides etc. During and since the last war secondary industry has made large strides in the Union. Previously this country was almost entirely dependent on imports for all manufactured goods but, when the shortage of shipping cut off this supply, many factories were established in the Union and many overseas companies are establishing branches in the Union and starting to invest capital in this country where the Excess Profits Tax has just been removed in the last Budget and direct taxation is comparatively low. In 1938-39 44.2 per cent of the raw materials used in manufacture were imported and this figure is still high, although more of the Union's natural resources are being developed as time goes on.

Most of the secondary industries are centred in or near the main centres of the Union. Johannesburg is the main centre of industry in the Union, surrounded as it is by the towns and mines of the Reef which contain, with Johannesburg, by far the largest section of the population of the Union as will be shown later. Cape Town comes second with its fine port, and many industries are being established there. Durban is also an important port and the industries there have the advantage of being very close to the Natal coalfields which gives them very cheap fuel of all kinds. Port Elizabeth and East London, also on the coast, are rapidly-developing industrial centres and the former is the site of existing and proposed production and assembly plants for motor cars, mainly American. Although there is a sufficient amount of unskilled native labour in the country there is a severe shortage of trained artisans, technicians and professional men of all kinds. Much of the future of industrial development in the Union depends on large-scale immigration and this will be unsuccessful, as I pointed out in my last letter, until the shortages of housing accommodation and water supplies have been eased.

The administration of the Union of South Africa is shared by the central Government and the Provincial Councils. These latter are concerned with:

(1) Education and higher education.
(2) Supervision and maintenance of local authorities.
(3) Supervision and maintenance of hospitals and charitable institutions.
(4) Building and maintenance of roads, bridges and local works within the Province (excepting the National Roads which are planned by the National Roads Board but constructed by the Provinces with funds provided by the central Government). All other administration is done by the central Government including the control of the vast Railways and Harbours Administration which controls the South African Airways also. All mining owned by private enterprise is controlled by the Minister of Mines and there is a Minister of Native Affairs who deals with the problems of allocating land to the natives and controlling the flow of natives to the urban areas without any definite prospects of employment, etc.

To come to the question of the proportions of white and black population, following is the last official table which was drawn up in 1936. There have been increases since then in all sections of the population but I believe the ratio has been fairly well maintained:

Urban Areas.

	Europeans	Natives	Asiatic	Coloured	Total
Cape	503,997	219,229	10,198	356,368	1,089,792
Natal	145,510	127,920	113,549	12,493	399,472
Transvaal	566,066	696,737	21,820	37,591	1,322,214
O.F.S.	91,813	103,988	29	8,455	204,285
Union (total)	1,307,386	1,147,874	145,596	414,907	3,015,763
Rural Areas					
Cape	287,577	1,826,341	310	325,800	2,440,108
Natal	45,039	1,425,709	70,112	6,136	1,546,996
Transvaal	254,690	1,747,643	3,673	13,250	2,019,256
O.F.S.	109,165	449,122	......	9,488	567,775
Union (total)	696,471	5,448,815	74,095	354,754	6,574,135
Total	2,003,857	6,596,689	219,691	769,661	9,589,898

From this it will be easily perceived how small a minority of the population is composed of Europeans, and the need for immigration is made increasingly obvious.

With regard to the prospects for a market for Canadian engineering products, in the pre-war period Canada ranked fourth in the list of countries from whom the Union imported goods. Among the Canadian imports were vehicle chassis and bodies, wood, newsprint, railway track materials, agricultural machinery, base metal manufactures, etc. There is no reason to suppose that the demand for Canadian goods of this type has decreased as there is still a severe shortage of all engineering products in this country. Nearly every existing industry is considering expansion and many new ones are being established in this country, the Government has large-scale plans for developments for the Harbours, Railways and Airports, including the construction of the three new airports I mentioned in my last letter. The severe shortage of housing accommodation caused by lack of materials will take several years to remedy and, meanwhile, all building activity is controlled and so are the commodities used in the trade. The central Government is financing many new housing schemes in the various Provinces and many private enterprises are waiting to go ahead when the supplies situation eases and the Government control is abandoned.

I hope to write more on this subject in later letters.

W. O. Maclaren, M.E.I.C.

Johannesburg, March 24, 1947.

PRODUCTION OF BASIC AND BUILDING MATERIALS—OUTLOOK FOR 1947

The building of houses and the construction of industrial plants and premises depend, among other things, on the flow of building materials. Recently that supply of materials has not been adequate.

Building materials like plumbing, heating or electrical equipment are fabricated out of basic materials like steel, lead, zinc or copper. There have been shortages of these basic materials as well as of manufactured building materials. Producers of these materials were asked to state their production intentions for 1947. The results of this survey show that for most materials output in 1947 will be between 10 and 30 per cent above the level of 1946. In spite of great improvement in the supply situation ahead, not all investment plans will be realized in 1947.

An expanded and uninterrupted production of basic and building materials in Canada is one of the important factors that would help to maintain a high level of employment and income in 1947. Adequate supplies of these materials are necessary to build the houses, hospitals, plants, warehouses, transportation and communication facilities required, and to produce the many consumer goods that have been short in the last eight years.

Basic Materials

Significant production increases are expected during 1947 for seven of the ten basic materials selected for review. Barring unforeseen circumstances, such as prolonged management-labour disputes, increases are likely to range from 11 per cent for asbestos to 35 per cent for steel ingots and to 44 per cent for gypsum. Other important increases expected include pig iron with 36 per cent, nickel 28 per cent, steel castings 24 per cent, and copper with 21 per cent. Only such basic commodities as had already reached peak production indicate but small increases, e.g., lumber up to 6 per cent and lead up 1 per cent; or very little change, e.g., zinc down 1 per cent.

Inventory statistics show five increases in stocks during 1946. The increases were of the order of 7 per cent for lead, 14 per cent for steel ingots, 16 per cent for lumber and 19 per cent for copper. On the whole, inventories held were small in relation to total output or sales. Little accumulation took place during the year.

Building Materials

Among the 29 building material items covered, seven show an expected increase of production of less than 10 per cent. They include: cement, structural tile, gypsum wallboard, gypsum lath, gypsum plaster, cast iron radiators, and paints, varnishes and lacquers.

The next group with probable increases of 10 to 19 per cent includes the following twelve items:—concrete brick and building blocks, cement drain pipe, sewer pipe, water pipe nd culvert tile, building brick (including sand-lime brick), vitrified flue linings, vitrified sewer pipe, asphalt shingles, smooth and mineral roofing products (surfaced rolls), steel pipes, tubes and fittings, wash basins, hot water storage tanks (range boilers), builders' hardware and rigid insulating boards.

Expanded production between 20 and 39 per cent is expected for seven commodities, including bulk rock wool (granulated and loose), cast iron soil pipe and fittings, sinks, furnaces (warm air and heating boilers), electric water heaters and wire nails and spikes. To this group has to be added window glass, the bulk of which is imported from the United States, the United Kingdom, Belgium and Czecho-Slovakia. Increases of 40 per cent or more are indicated for three kinds of building material items, rock wool batts, bath tubs and non-metallic sheathed cable.

Increases in stocks held were recorded for cement products, vitrified flue linings, vitrified sewer pipe, rock wool and gypsum products (excluding gypsum plaster), and all plumbing, heating and electrical equipment items covered (with the exception of bath tubs and hot water storage tanks). On the other hand, a decline in inventories was shown in seven items, including cement, building brick, structural tile, wire nails and spikes, and the three building products mentioned above.

With more basic and building materials available in the coming year, it should be possible for Canada to improve her capital structure, provide for many of the unfilled needs for durable goods needed by the consuming public, and to assist other countries in their effort to re-establish their economies following the ravages of six years of war. Meeting these needs both at home and abroad will mean a significant contribution to the maintenance of a high level of economic activity in Canada in 1947.

ELECTIONS

At a meeting on April 12th a number of applications were presented for consideration, and on the recommendation of the Admissions Committee, the following elections were effected:

Members

Bricout, Pierre, Lic. es Sciences Maths., Dr. es Sciences Physiques, Ecole Poly., Paris; Ing. Elect., Ecole Superieure d'Electricite, Paris, Professor of Elect. Engrg., Laval University, Quebec, Que.

Cummings, George Lewis, B.Sc., (Civil), Alberta, studying for M.Sc., Engrg., (Civil), McGill Univ., Montreal, Que.

Hermanowicz, Tadeusz, Metall. Engr., Mining Academy, Cracow, Poland, chief metallurgist, Sorel Industries Limited, Sorel, Que.

Katz, Allen Elvin, B.Sc., (Elect.), Manitoba, M.M.Miller & Co., Toronto, Ont.

Laidlaw, Clinton T., B.Sc., (Civil), Queen's, city engineer, City of Sarnia, Ontario.

McGill, William James, B.Sc., (Mining and Metall.); M.Sc., (Mining Engrg.), Queen's, industrial engr., Research & Development Branch, Dept. of Reconstruction and Supply, Calgary, Alta.

Osterland, Clifford Donald, B.Sc., (Elect. Engrg.), Alberta, mgr., app. dept., Canadian General Electric Co., Winnipeg, Man.

Powell, Thomas Clifford, B.A.Sc., Toronto, prod. sr. foreman, Nylon divn., Canadian Industries Limited, Kingston, Ont.

Starr, Grant Bondy, B.Sc., (Civil Engrg.), Manitoba, civil engr., Pacific Biological Stn., Nanaimo, B.C.

Juniors

Keough, John Edgar, B.Sc., (Mech.), Queen's, utility engr., steam and power plant, Polymer Corporation Ltd., Sarnia, Ont.

McBride, James Montgomery, B.Sc., (Elect. Engrg.), Alberta, sales engr., Electrical Contracting & Machinery Co., Calgary, Alta.

Takahashi, William Yoshito, B.Sc., (Elect.), Manitoba; B.Sc., (Mech.), British Columbia, jr. engr., Dominion Bridge Co., Ltd., Lachine, Que.

By virtue of the cooperative agreements between the Institute and the associations of professional engineers, the following elections and transfers have become effective.

Alberta

Junior to Member

Samuel, Albert Benjamin, B.Sc., (Civil), Alberta, field engr., engineers' dept., City of Edmonton, Alta.

Student to Junior

Snow, Alfred Harold Grant, B.Sc., (Civil), Saskatchewan, jr. hydraulic engr., P.F.R.A., Spring Coulee, Alta.

Saskatchewan

Member

Goode, Norman John, B.A.Sc., (Civil Engrg.), British Columbia, sr. sanitary engr., Dept. of National Health, Regina, Sask.

Junior

Sundeen, Paul Gustave, B.Sc., (Engr. Physics), Saskatchewan, jr. engr., Saskatchewan Power Commission, Regina, Sask.

Students at University of Saskatchewan

R. H. Bacon	D. B. Dundee	R. W. Potts
C. H. Bell	A. L. Jones	E. W. Wenhardt
J. Bortolotto	H. C. Moulding	G. L. Williams

Junior to Member

Ball, Walter Harvey, B.Sc., (Civil Engrg.), Saskatchewan, research engr. in housing, University of Saskatchewan, Saskatoon, Sask.

Coons, Robert Melvin, B.Sc., (Geo. Engrg.), Saskatchewan, geological asst., F. H. Edmunds, consultg. geologist, Lloydminster, Sask.

Middleton, Jack Spencer Gordon, B.Eng., (Agric. Engrg.), Saskatchewan, asst. city engr., Swift Current, Sask.

Quebec

Member

Marion, Hector Edmond, B.Sc., (Elect.), Queen's, engr., Shawinigan Engineering Co., Montreal, Que.

Admitted as Students

Students at Queen's University

LeROY FRASER GRANT

PRESIDENT OF THE ENGINEERING INSTITUTE OF CANADA

The career of the well known member of the Kingston Branch who has been chosen as the President of the Institute for 1947-1948 has included activities in many fields of work, in all of which he achieved success. Railway construction, land surveys, municipal projects, irrigation schemes, largely in the West, occupied him as a civilian. He has contributed to the development of engineering education in Canada while serving on the teaching staff of two of our principal engineering colleges. Joining the Institute some forty years ago, he has rendered notable services to the Institute, to its branches and to the engineering profession.

He served in the Canadian Army in both great wars. His record in the field and on the staff speaks for itself.

Born in Toronto in 1884, LeRoy Fraser Grant was educated at St. Alban's School, Berthierville, Que. (later at Brockville, Ont.), and graduated with honours from the Royal Military College, Kingston, in 1905. Later, while on the teaching staff of the Royal Military College in 1926, he received the degree of B.Sc., with honours, from Queen's University.

On graduation from the Royal Military College he entered the Royal Canadian Artillery (Permanent Force) and was one of the two officers to take over the defences of Halifax from the Imperial Government in that year.

In 1907 he left the army to take up civilian engineering work, joining the staff of the Grand Trunk Pacific Railway, and serving as resident engineer at Prince Rupert, B.C., until 1909.

Lieutenant-Colonel L. F. Grant, M.E.I.C.

In 1910 he obtained a commission as a British Columbia Land Surveyor. From 1911 till 1914 he was associated with Dutcher, Maxwell and Co., consulting engineers and surveyors, Vancouver.

On the outbreak of war in 1914 he entered the Canadian Expeditionary Force, going overseas in the following year with the rank of Captain as adjutant of the Canadian Overseas Railway Construction Corps. Two years later he transferred to the 5th Battalion Canadian Railway Troops as second-in-command with the rank of Major. He was mentioned in despatches on three occasions.

On the conclusion of the war he returned to British Columbia. He was then employed by the provincial Department of Lands on surveys for the Southern Okanagan Irrigation Project, continuing land-surveying work until 1921, when he was appointed Instructor in Engineering at the Royal Military College.

Two years later he was made Associate Professor, an appointment which he held with distinction until he entered the Canadian Army in 1939. During this period he commanded the 32nd Field Battery from 1932 to 1936, and the 9th Field Brigade, Royal Canadian Artillery, from 1936 to 1938. He was promoted Lieutenant-Colonel in 1937.

In 1940 Colonel Grant was appointed General Staff Officer, 1st Grade, for Military District No. 3 at Kingston, remaining in that position until he reached the age limit for retirement in 1944. He then became Associate Professor of Engineering in the Faculty of Applied Science in Queen's University, Kingston, an appointment which he still holds.

His interest in the activities of The Engineering Institute of Canada dates from 1908, when he joined as a Student. He was elected an Associate Member in 1913 and a Member in 1927.

His long participation in the administrative work of the Institute has given him first-hand acquaintance with Institute and Branch problems. He was Chairman of the Kingston Branch in 1925, and its Secretary-Treasurer from 1928 to 1937. In 1938, 1939 and 1940 he was a councillor of the Institute, and was one of Ontario's Vice Presidents for 1943 and 1944. He was then appointed chairman of the Institute's Committee on the Training and Welfare of the Young Engineer. Like his predecessor in that position, the late Harry F. Bennett, he has an intimate knowledge of the problems and reactions of the younger section of the profession, and of the importance of the tasks which are being dealt with by that Committee.

The incoming President's chief recreation has long been yachting. Following in the wake of past-president Shearwood and the late Dr. G. H. Duggan he has distinguished himself as a yachtsman. His field of activity has naturally been Lake Ontario, where on several occasions his yacht has won the championship of its class. Twice—in 1945 and 1946—he carried off the Freeman Cup for the long distance race open to yachts on both the Canadian and United States shores of the lake. In 1934 and 1935 he was president of the Lake Yacht Racing Association.

He was instrumental in starting the Kingston Branch of the Navy League of Canada, and is now its Secretary.

Joining the British Columbia Association of Professional Engineers shortly after the first Great War, he relinquished its membership when he moved to Kingston, becoming a Registered Professional Engineer of Ontario in 1938. He is a member of the Professional Institute of the Civil Service of Canada.

The election of Colonel Grant as President of The Engineering Institute of Canada will be welcomed by a wide circle of friends, colleagues, comrades, and former udents. Looking back on his career as engineer, oldier, and professor, it is difficult to say which of these ranches of work is the one in which he has been of the reatest service to the community and to the engineering profession.

Greatly esteemed in private life, he is a man who has never sought publicity. His sound judgment and wide range of experience will enable him to take a prominent part in guiding the present rapid growth and development of The Engineering Institute of Canada.

Personals

News of the Personal Activities of members of the Institute

rnest Lavigne, M.E.I.C., president of the Corporation of Professional Engineers of Quebec has been re-elected as councillor f the Institute to represent the Corporation for 1947. He is re commissioner for the Province of Quebec.

. M. Sauder, M.E.I.C., was re-elected as councillor of the nstitute representing the Association of Professional Engineers of Alberta for the year 1947. He is general manager of he Western Irrigation District at Strathmore, Alta.

A. W. Jennings, M.E.I.C., is the new chairman of the Calgary Branch of the Institute. Born in Saint John, N.B., he attended New Brunswick University, receiving a B.Sc. degree in 1911. He was employed first by the Canadian Pacific Railway, and he spent the summer of 1912 as assistant to the highway engineer of the city of Saint John. Returning to railway work later that year as draughtsman on construction for the National Transcontinental Railway at Saint John, he transferred in the same capacity to Cochrane, Ont., in 1913. He became draughtsman on maintenance for the Canadian Government Railways there in 1915 and was appointed chief clerk to the district engineer in 1915 and assistant engineer (maintenance) in 1916. He was acting division engineer at Cochrane for some time and in 1918 he became assistant engineer for Canadian National Railways at Cochrane, transferring as assistant engineer to Port Arthur the next year. He joined the Alberta Wheat Pool in Calgary in 1927 and is still with the company as superintendent of construction.

R. L. Hearn, M.E.I.C., has been appointed general manager and chief engineer of the Hydro-Electric Power Commission of Ontario. A graduate of Toronto University in 1913, he joined the Ontario Hydro that year and later served with large Canadian and American concerns. He supervised and coordinated engineering and construction of the Polymer Corporation, Sarnia, from 1942-44. He was chief engineer, design and construction, for the H.E.P.C. prior to his recent appointment.

W. D. Black, M.E.I.C., president of the Otis-Fensom Elevator Company Limited at Hamilton, Ont., and past-president of the Canadian Manufacturers' Association, has been elected to the Board of Directors of the Excelsior Life Insurance Company. He is also an executive director of the Royal Bank of Canada and of the Industrial Development Bank of Canada.

A. J. Girdwood, M.E.I.C., chairman of the Peterborough Branch of the Institute, has resigned that office to take up duties in Guelph, Ont., as chief engineer of Leland Electric (Canada) Limited. He is a bachelor of applied science, University of Toronto, 1934, and subsequently took the Canadian General Electric Company's Test Course at Peterborough and Toronto, Ont. He entered the A.C. and D.C. Engineering Department of the Company in 1935, and has a number of patents on synchronous machines to his credit in connection with his work as assistant design engineer on alternating current rotating equipment.

F. R. Pope, M.E.I.C., immediate past chairman of the Peterborough Branch, will resume that office for the unexpired portion of Mr. Girdwood's term. He is assistant superintendent for the Western Clock Company Limited in that city.

E. A. Pinto, M.E.I.C., is technical editor with the British General Electric Company at the Witton Engineering Works, Birmingham, England. He will be remembered as having come to Montreal in the early days of the war as a member of the United Kingdom Technical Mission, transferring later to the Allied War Supplies Corporation. After acting as the Montreal inspection officer to the Inspection Board of the United Kingdom and Canada, he was on the engineering staff of United Shipyards Limited, Montreal, until his return to England in 1945.

The Shawinigan Engineering Company Limited, Montreal, has announced the following appointments affecting members of the Institute: **J. B. Challies,** M.E.I.C., **R. E. Heartz,** M.E.I.C., **E. V. Leipoldt,** M.E.I.C., and **John Morse,** M.E.I.C., have been made directors. **J. A. McCrory,** M.E.I.C., is appointed president; **R. E. Heartz,** M.E.I.C., vice-president and chief engineer; **C. R. Lindsey,** M.E.I.C., and **E. V. Leipoldt,** M.E.I.C., vice-presidents.

A. L. Patterson, M.E.I.C., is assistant chief engineer in charge of all design. **Guy Rinfret,** M.E.I.C., supervising engineer in charge of all construction, field engineering and inspection; **J. B. Macphail,** M.E.I.C., hydraulic engineer; **A. B. Rogers,** M.E.I.C., senior electrical engineer; **J. D. Stott,** M.E.I.C., structural engineer.

A. P. Shearwood, M.E.I.C., has been appointed general sales manager of the National Steel Car Corporation Limited, Montreal. He joined the engineering department of the company at Hamilton, Ont., in 1932, was transferred in 1934 to the Montreal Office, and in 1937 became mechanical assistant to the president.

M. F. Ker, M.E.I.C., on completion of 25 years' service as engineer of Stamford Township, Ont., received from the Township Council at its March meeting this year a resolution ascribing to him much of the credit for industrial development in the section. It was emphasized that his far-seeing planning programme has attracted large industries to the township, and has enabled it to benefit of the great tourist interest in Niagara's Canadian section.

E. F. Barratt, M.E.I.C., has been appointed city engineer for North Bay, Ont., He was formerly engineer and road superintendent for the County of Wentworth, Ont.

A. Raymond, M.E.I.C., vice-president and general-manager of the International Braid Company of Canada Limited, Ste. Rose, Que., has been appointed president of Safeway Heat Elements of Canada Limited. This organization will operate on the premises of the International Braid Company.

G. Percy Cole, M.E.I.C., technical engineer of the Dominion Glass Company Limited, Montreal, has been elected to fellowship in the Society of Glass Technology, at a meeting of the Board of Fellows and Council of the Society held at Sheffield, England, in January, 1947.

G. St. Jacques, M.E.I.C., has been appointed transportation engineer with the Provincial Transport Company, Montreal. He was previously engineer-economist with the Provincial Transportation and Communication Board of Quebec at Montreal.

W. H. Hooper, M.E.I.C., of Amalgamated Electric Corporation Limited, Toronto, has received the appointment as manager, apparatus sales, in charge of distribution equipment and Canadian Cutler-Hammer sales. He joined the company in 1939, serving as field engineer until 1945, when he was named manager, distribution equipment sales, which position he occupied upon his recent promotion.

G. G. M. Carr-Harris, M.E.I.C., is now permanently with the National Research Council in Ottawa, Ont., and no longer on loan to the Department of Reconstruction and Supply. He is, however, still with the Technical Information Service.

Roger Lord, M.E.I.C., took office at the beginning of this year as manager of the town of Cap-de-la-Madeleine, Que. He was formerly assistant to the resident engineer at the power house of the Beauharnois Light Heat and Power Company at Beauharnois, Que.

H. S. Nicklin, M.E.I.C., city engineer of Guelph, Ont., the 1946-47 chairman of the Canadian Section of the American Water Works Association, presided at the opening of the 27th Annual Meeting of the Section in Montreal on April 14th.

F. J. Veale, M.E.I.C., superintendent of Waterworks, Hamilton, Ont., was elected chairman of the Canadian Section of the American Water Works Association for 1947-48, at the Annual Meeting in April in Montreal.

J. D. Mollard, JR.E.I.C., is now with the Water Development Branch of the P.F.R.A. in Regina, Sask. He graduated in 1945 with a B.Sc. from University of Saskatchewan and attended Purdue University, Lafayette, Ind., in 1946-47, serving as a graduate assistant while obtaining an M.Sc. degree.

W. J. C. Gall, S.E.I.C., is no longer with the Canada and Dominion Sugar Company at Chatham, Ont. He travelled via England and France to Switzerland, where he has been attending the University of Zurich since April 15th this year.

A. H. Hoffer, S.E.I.C., is with the General Electric Company in Schenectady, N.Y. He is assistant product engineer assigned to the special products section of the electro-mechanical division of the general engineering and consulting laboratory.

NEWLY ELECTED OFFICERS OF THE INSTITUTE

R. S. Eadie, M.E.I.C., has been elected vice-president of the Institute for the province of Quebec. Born at Hintonburgh Ont., he was educated at McGill University where he obtained the degree of B.A.Sc. in civil engineering in 1920 and the degree of M.Sc. in 1922. His course was interrupted in 1916 when he joined the Royal Canadian Engineers as a lieutenant and served in Canada and overseas until the end of the war.

After graduation Mr. Eadie accepted a position as lecturer in the Department of Applied Mechanics at McGill and remained in that position until 1924. In that year he joined the staff of the Dominion Bridge Company at Montreal. He has been associated with the company since that time. In 1935 he was appointed designing engineer and in October 1937, was made assistant chief engineer. In February, 1944, he became chief engineer of the Eastern Division of the company, which position he holds at the present time.

Mr. Eadie joined the Institute as a Student in 1914, transferring to Junior in 1920, to Associate Member in 1926 and to Member in 1936. He was a member of the executive committee of the Montreal Branch in 1939-40, vice-chairman in 1942 and chairman in 1943. He served as councillor representing the Montreal Branch from 1944 until 1945.

W. L. Saunders, M.E.I.C., is the newly elected vice-president of the Institute for the province of Ontario. Born at Goderich, Ont., he studied engineering at the University of Toronto. He was engaged in railway engineering from 1907 until 1915 when he enlisted in the Canadian Expeditionary Force. He held the rank of lieutenant in the 6th Battalion of Canadian Railway Troops, serving in France from 1917 until 1919. For two years following his discharge he was employed as assistant engineer with the Canadian Pacific Railway in Saskatchewan on construction and maintenance. Since 1922 he has been with the Department of Highways of Ontario, his present position being that of resident engineer.

Mr. Saunders joined the Institute as a Student in 1910, becoming a Junior in 1913, an Associate Member in 1920 and a Member in 1940. He served as chairman of the Ottawa Branch in 1944 and in the following year was elected councillor of the Institute representing the Ottawa Branch.

S. G. Coultis, M.E.I.C., has been elected vice-president of the Institute for the Western provinces. Born at Forest, Ont., he was educated at the University of Michigan, where he graduated in chemistry in 1909. He was employed by Smith and Leisenring as a chemist from 1909 until 1913 when he went to Calgary as assistant chemist with the city. In 1917 he became superintendent of the Southern Alberta Refineries and three years later was given the same position with the Royalite Oil Company at Black Diamond, Alta. In 1937 he returned to Calgary where he is now with the Valley Pipe Line Company Limited as president and general manager.

Mr. Coultis joined the Institute as a Member in 1926. He served as councillor representing the Calgary Branch in 1942-43.

L. E. Mitchell, M.E.I.C., is the newly elected councillor of the Institute representing the Halifax Branch. Born at Campobello, N.B., he graduated from Mount Allison University in 1930 with a B.A. degree and from the Nova Scotia Technical College in 1932 with a B.Sc. in mechanical engineering. He joined the staff of the Halifax refinery of the Imperial Oil Limited on graduation and has been in the employ of this company and its South American subsidiaries ever since. Mr. Mitchell served for a period of six years with the International Petroleum Co. Ltd. in Peru and the Tropical Oil Company in Colombia. He is at present chief engineer of the Halifax refinery.

Mr. Mitchell joined the Institute as a Student in 1930. He transferred to Associate Member in 1940 and became a Member in the same year. He served as chairman of the Halifax Branch in 1945.

C. D. McAllister, M.E.I.C., has been elected councillor of the Institute representing the Saint John Branch. Born at Saint John, N.B., he graduated from the University of New Brunswick in 1918 with the degree of B.Sc. in civil engineering.

For two years following graduation he was employed with the Canadian Pacific Railway in the New Brunswick and Algoma districts as engineer maintenance of way. The next three years were spent in municipal engineering with the City of Saint John, after which he was employed on investigation and construction pertaining to hydro-electric de-

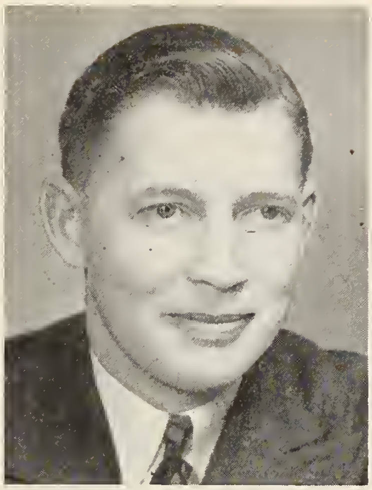
W. J. Thomson, M.E.I.C.



Viggo Jepsen, M.E.I.C.

elopment in New Brunswick and Quebec. After some time ent on road construction in his native province he entered ie Department of Public Works of Canada at Saint John 1928. He is at present senior assistant engineer in the ew Brunswick district for the same department.

Mr. McAllister joined the Institute as a Member in 1942. e served as chairman of the Saint John Branch in 1944.

'. J. Thomson, M.E.I.C., has been elected councillor of the istitute representing the Saguenay Branch. Born at Orillia. nt., he graduated from Queen's University with a B.Sc. egree in 1927. After graduation he was employed for a ear by Treadwell Yukon Mines, Bradley, Ont., in the impling, surveying and assay laboratory. In 1929 he worked or American Cyanamid, Niagara Falls, Ont., on the analysis f raw materials. In the following year he joined the staff f the Abrasive Company of Canada as a chemist at Hamilon, Ont. In 1938 he was transferred to Arvida, Que., where e is at present managing director of Simonds Canada brasive Company Limited.

Mr. Thomson joined the Institute as a Junior in 1913, ransferring to Associate Member in 1936. He became a Member in 1940.

ules A. Beauchemin, M.E.I.C., has been elected one of the ouncillors of the Institute representing the Montreal Branch. Born at Montreal, Que., he graduated from Ecole Polyechnique with a B.A.Sc. degree in 1911. Upon graduation e became associated with the Federal Hydrometric Service t Ottawa where he remained until 1919. At that time he oined the staff of the Riordon Pulp Corporation at Temisaming, Que., as the engineer in charge of the study of hydrolectric developments. Two years later he severed his conection with Riordon Corporation to become chief engineer f Donnacona Paper Company where he remained until 1927 vhen he was appointed town manager for the new town of Dolbeau in the county of Lake St. John, Que. Mr. Beauhemin was in charge of the plans, organization, public works and services, acting for the Lake St. John Power and Paper Company Limited which was developing the new townsite. In 1930-31 he was manager of personnel and properties for the Consolidated Paper Corporation at Port Alfred, Que., and in the following year was employed as resident engineer on the construction of the Wellington Street Tunnel, under the Lachine Canal, representing the City of Montreal. In 1932, Mr. Beauchemin was resident engineer of the Lake St. Louis Bridge Corporation, later becoming comptroller of the same organization. In 1935 he was appointed chief engineer of the Provincial Electricity Board at Montreal, which position he holds at the present time.

J. A. Beauchemin, M.E.I.C.

Mr. Beauchemin joined the Institute as an Associate Member in 1919, becoming a Member in 1940. He served as chairman of the Montreal Branch in 1946.

Viggo Jepsen, M.E.I.C., has been elected councillor of the Institute representing the St. Maurice Valley Branch. Born and educated in Denmark he came to Canada in 1928. He joined the staff of the Shawinigan Water and Power Company, Limited where he was engaged in power development In 1932 he went with James A. Ogilvy's Limited, Montreal as sales engineer for oil burning equipment. For a few months in 1936 he worked on the installation of caustic treatment plant at the Canadian Copper Refineries Limited, Montreal. Later in the same year he joined the staff of Consolidated Paper Corporation, Limited, in the Laurentide Division at Grand'Mere, Que., and soon became chief draughtsman. He is at present division engineer with the company at Grand'Mere.

Mr. Jepsen joined the Institute as a Junior in 1932, transferring to Associate Member in 1938. He became a Member in 1940. He served as chairman of the St. Maurice Valley Branch in 1942.

K. G. Cameron, M.E.I.C., is one of the newly elected councillors of the Institute representing the Montreal Branch. Born in London, England, he graduated from the University of Edinburgh with a B.Sc. degree in 1912. Following graduation he came to Canada and was employed from 1912 until 1916 with the Grand Trunk Railway at Montreal on inspection and supervision of various construction projects. After one year in charge of inspection of munition steel for the Canadian Inspection Company at the plant of Nova Scotia Steel and Coal Company at New Glasgow, he returned to railway works for some months but in 1917 was recalled to the Nova Scotia Steel and Coal Company. For a year he was responsible for all inspection and in 1918 became office assistant to the superintendent of machine shops and hydraulic forge department. In 1919 he was employed as chief draughtsman in the mechanical department of Dominion Iron and Steel Company at Sydney, N.S. Four years later he went to Montreal and became chief engineer of Canada and Dominion Sugar Co. Limited. He subsequently became town manager of Hampstead, Que., which position he holds at the present time.

Mr. Cameron joined the Institute as a Jun-

K. G. Cameron, M.E.I.C.

C. E. Gelinas, M.E.I.C.

J. R. Carter, M.E.I.C.

J. H. Irvine, M.E.I.C.

ior in 1914, transferring to Associate Member in 1920. He became a Member in 1940.

C. E. Gelinas, M.E.I.C., has been elected one of the councillors of the Institute representing the Montreal Branch. Born at Three Rivers, Que., he received the degree of B.A.Sc. from Ecole Polytechnique in 1911. For three years after graduation he was employed as draughtsman and designer with Trussed Concrete Steel Company. After one year as superintendent of construction for Archambault and Conway, contractors, at Montreal, he joined the staff of T. Pringle and Son as checker on reinforced concrete.

In 1915 Mr. Gelinas became city engineer of Grand'Mere. Que., and from that date until 1922 served also as manager of the Municipal Power Company and as engineer with the Laurentian Pulp and Paper Company. From 1922 until 1926 he was employed as city engineer at Three Rivers, Que. The next four years were spent in the paper industry. In 1931 he was employed by the City of Montreal where he now holds the position of engineer superintendent of maintenance and construction.

Mr. Gelinas joined the Institute as an Associate Member in 1924, becoming a Member in 1940. He was a charter member of the St. Maurice Valley Branch of the Institute which he helped to organize in 1925.

J. H. Irvine, M.E.I.C., has been elected councillor of the Institute representing the Ottawa Branch. Born at Nile, Ont., he graduated in civil engineering from the University of Manitoba in 1912. After extensive experience in general construction work he was appointed representative of the Dominion Reinforcing Company Limited at Toronto in 1928. In 1932 he entered the city engineer's department at Ottawa, Ont. His present position is that of office and designing engineer of the City of Ottawa.

Mr. Irvine joined the Institute as a Student in 1911, transferring to Associate Member in 1917. He became a Member in 1940. He served as chairman of the Ottawa Branch in 1946.

J. R. Carter, M.E.I.C., is the newly elected councillor of the Institute representing the Kingston Branch. Born at Kagawong, Ont., he graduated from the University of Toronto with a B.A.Sc. (civil) in 1931. Following graduation he joined the Hydro-Electric Power Company of Ontario. From 1933 until 1936 he was employed by the Department of Northern Development as resident engineer on highway construction, after which he spent some months on development and prospecting with mining companies in northern Ontario. In 1937 he became designer in the engineering department of the Canadian Johns-Manville Co. Limited at Asbestos, Que. Mr. Carter then joined the staff of Canadian Industries Limited at Montreal and in 1941 was transferred to the nylon division at Kingston, Ont., where he is at the present time.

Mr. Carter joined the Institute as a Student in 1931, transferring to Associate Member in 1937. He became a Member in 1940.

Carson F. Morrison, M.E.I.C., is the newly elected councillor of the Institute representing the Toronto Branch. Born at File Hills, Sask., he graduated from the University of Saskatchewan with the degree of B.E. (civil) in 1925. Two years later he received his M.Sc. degree in structural engineering at McGill University. Mr. Morrison joined the staff of the University of Alberta in 1927 and in the following year he went to the University of Toronto where he is now associate professor of civil engineering.

Mr. Morrison joined the Institute as a Junior in 1929, transferring to Associate Member in 1936. He became a Member in 1940. He served as chairman of the Toronto Branch in 1945.

V. A. McKillop, M.E.I.C., has been elected councillor of the Institute representing the London Branch. Born at West

V. A. McKillop, M.E.I.C.

A. H. MacQuarrie, M.E.I.C.

S. T. McCavour, M.E.I.C.

N. B. Hutcheon, M.E.I.C.

F. R. Burfield, M.E.I.C.

Lorne, Ont., he graduated from the University of Toronto with a B.A.Sc. degree in 1924. On graduation Mr. McKillop joined the staff of the Public Utilities Commission at London, Ont., as assistant engineer and two years later was promoted to engineer. He is at present assistant manager of the Commission.

Mr. McKillop joined the Institute as a Junior in 1926, transferring to Associate Member in 1927. He became a Member in 1940.

A. H. MacQuarrie, M.E.I.C., is the newly elected councillor of the Institute representing the Border Cities Branch. Born at Tansley, Ont., he graduated from the University of Toronto with a B.A.Sc. degree in 1914. From 1919 until 1921 he was employed as draughtsman with the Canadian Bridge Company at Windsor. For the year following he worked as laboratory engineer with the Ford Motor Company of Canada and in 1922 returned to his former position with Canadian Bridge Company. The next year he worked as squad foreman in charge of tower department draughting and in 1927 was made sales engineer on designing, estimating and contracting, specializing in transmission towers and substation structures.

Mr. MacQuarrie joined the Institute as a Member in 1941.

Neil B. Hutcheon, M.E.I.C., professor in mechanical engineering at the University of Saskatchewan, has been elected councillor of the Institute representing the Saskatchewan Branch. Born in Rosetown, Sask., he graduated from the University of Saskatchewan with the degree of B.Sc. (Mech. Eng.) and M.Sc. in 1933 and 1935 respectively. He spent the two years after graduation in research work at the University of London, University College, London, England, returning in 1937 to the University of Saskatchewan, Saskatoon, as assistant professor in mechanical engineering.

Mr. Hutcheon joined the Institute as an Associate Member in 1938, becoming a Member in 1940. He served as chairman of the Saskatchewan Branch in 1945.

S. T. McCavour, M.E.I.C., has been elected councillor of the Institute representing the Lakehead Branch. Born at St. John, N.B., he graduated from the University of New Brunswick in 1920. After graduation he became engaged in the pulp and paper industry and in 1929 joined the Great Lakes Paper Company Limited, Fort William, Ont., as resident engineer. In 1931 he was promoted to his present position of chief engineer and joint manager.

Mr. McCavour joined the Institute as a Member in 1941. He served as chairman of the Lakehead Branch in 1944.

F. R. Burfield, M.E.I.C., is the newly elected councillor of the Institute representing the Edmonton Branch. Born and educated in England, he became employed with the Department of Interior, Irrigation Office, at Calgary, Alta., in 1913. From 1916 until 1919 he served with the Allied Armies and, on demobilization, returned to his former position with the Dominion government where he remained until 1930. For the eight years following he worked as inspecting engineer with the Water Resources Office, Province of Alberta, Edmonton, and in 1938 he became chief engineer which position he holds at the present time.

Mr. Burfield joined the Institute as a Member in 1916. He served as secretary-treasurer of the Edmonton Branch from 1941 until 1944, and as chairman of the Branch in 1945.

S. C. Montgomery, M.E.I.C., was elected councillor of the Institute representing the Kootenay Branch. Born at Winnipeg, Man., he graduated in mechanical engineering from McGill University in 1915 with the degree of B.Sc. After four years service overseas with the Canadian Expeditionary Force in World War I, he was employed in 1919 by the Whalen Pulp and Paper Company, Woodfibre, B.C., going in 1920 to the Western Canada Pulp and Paper Company at Port Mellon, B.C.

S. C. Montgomery, M.E.I.C.

(Photo by Stanley, Vancouver)

T. V. Berry, M.E.I.C.

C. B. Hamilton, Jr., M.E.I.C.

In 1923 he entered Pacific Mills Limited, Ocean Falls, B.C., as mechanical draughtsman, becoming assistant to the resident engineer in 1924 and assistant mechanical superintendent in 1926. Two years later he entered the employ of the Consolidated Mining and Smelting Company of Canada Limited at Trail, B.C., where he now holds the position of maintenance engineer.

Mr. Montgomery joined the Institute as a Student in 1911, transferring to Junior in 1920. He became an Associate Member in 1929 and a Member in 1940. He was appointed councillor representing the Kootenay Branch when it was inaugurated in 1946.

T. V. Berry, M.E.I.C., is the newly elected councillor of the Institute representing the Vancouver Branch. Born in England he came to Canada at an early age and received his education at the University of British Columbia where he graduated in 1923 as a B.A.Sc. Upon graduation he was engaged for a year in hydro-electric surveys and investigations made for the City of Vancouver. In 1924 he joined the staff of the City of Vancouver as an assistant in the municipal engineering department and two years later he became assistant engineer with the Greater Vancouver Water District. He is now treasurer of the Greater Vancouver Water District and secretary-treasurer of Vancouver and Districts Joint Sewerage and Drainage Board.

Mr. Berry joined the Institute as an Associate Member in 1934 becoming a Member in 1940. He served as chairman of the Vancouver Branch in 1944 and as secretary-treasurer of the Branch for several years.

Chester B. Hamilton, Jr., M.E.I.C., has been appointed councillor of the Institute representing The American Society of Mechanical Engineers, as a result of the agreement between the Institute and the Society.

Born at Toronto, Ont., he graduated from the University of Toronto with a B.A.Sc. degree in 1907. In 19[illegible] he was employed as a draughtsman with Johnston Oil Engine Company and for the next two years worked on specification and inspection work with Smith Kerry and Chace. In 1911 Mr. Hamilton founded his own business The Hamilton Gear & Machine Company, of which he is still the president.

Mr. Hamilton joined the Institute as a Member in 1918. He holds a Life Membership in The American Society of Mechanical Engineers.

INSTITUTE PRIZE WINNERS

Lorne A. Campbell, M.E.I.C., president and managing director of the West Kootenay Power and Light Company, Trail, B.C., has been awarded the Sir John Kennedy Medal of the Institute for 1946. The citation which accompanies the award reads as follows:

"The Sir John Kennedy Medal, the highest award of the Institute, is being presented this year to a man who over the years has consistently occupied a high place in engineering esteem. His attainments and the high regard with which he has been held were early evidenced when at the tender age of 22 he was given the important post of chief engineer of the Canadian General Electric Company in Toronto.

Lorne A. Campbell, M.E.I.C.

"He later moved to the new mining community of Rossland in British Columbia, where he became general manager of the newly-formed West Kootenay Power and Light Company Limited. Subsequently he rose to the position of vice-president, and then president and managing director of the company. He is also president of the McGillivray Creek Coal and Coke Company Limited and a director of the Consolidated Mining and Smelting Company of Canada Limited.

"He continues to make his home in Rossland, where he has lived for nearly 48 years and he still takes an active interest in local community affairs, particularly with regard to hospitals.

"Living in the days when the west was distinguished for its giants, Mr. Campbell attained pre-eminence among them. The story of the development of the power resource of the Kootenay River parallels the story of the development of Trail. It is the story of his life, and, too, is a part of the proud story of Canada's industrial achievement.

"The Institute is proud to recognize Mr. Campbell's wide accomplishments, and is proud of his membership in the society."

Charles Camsell, M.E.I.C., past-president of the Institute, is one of the recipients for 1946 of the Julian C. Smith Medal awarded by the Institute for "achievement in the development of Canada". The citation, read upon presentation of the medal at the annual dinner, is as follows:

"Born at Fort Liard in the Northwest Territories, the story of the life of Dr. Camsell is the story of the development of the West. He has seen and participated in an expansion of territory and activity that is unique in the history of any land, and yet he remains young and active and as keen as ever.

"His travels took him into many obscure parts of Canada —on foot, by dog train, by canoe and by pack train—always seeking out the facts related to minerals, water power and a multitude of natural resources.

"With all this as a background he became Deputy Minister of what is now the Department of Mines and Resources, a post which he has filled with great distinction for twenty-seven years.

(Photo courtesy C.I.M.M.)

Dr. Charles Camsell, M.E.I.C.

"As was his due, he has been the recipient of many honours including an LL.D. from Queen's and one from Alberta. He has been awarded the Murchison grant of the Royal Geographical Society for his services as an explorer, and the Founder Medal by the same society, the gold medal of the Institution of Mining and Metallurgy of Great Britain for his interests in the natural resources of Canada, the R. B. Bennett Empire prize for his paper on 'Canada's New North', and last year the medal of the Professional Institute of the Civil Service of Canada in recognition of his contribution to science and administration during his fifty years of public service.

"In the King's Birthday List of 1935 he was made a Companion of the Order of St. Michael and St. George.

"In 1932 he was president of The Engineering Institute of Canada and this year is president of the Canadian Institute of Mining and Metallurgy.

"It is most fitting that a great Canadian so successful in developing our great country should be awarded the Julian C. Smith Medal of the Institute."

J. B. Challies, M.E.I.C., past-president of the Institute, and vice-president and executive engineer with The Shawinigan Water and Power Company, Montreal, is one of the recipients of the Julian C. Smith Medal of the Institute for 1946. The citation which accompanies the award reads as follows:

"This gentleman is known in every mainland province for his leadership in the conservation of the water resources of the Dominion. As the founder of the Hydrometric Survey of Canada, the organization that measures their flow, organizer of the Dominion Water and Power Bureau that promotes their best use, vice-president of one of the great electric utility corporations whose main duty is to see that the power of several large Quebec rivers is harnessed to serve the public interest, he has achieved a knowledge of river lore that is unique and unrivalled.

"Dr. Challies received his diploma in civil engineering from the old 'School' here in Toronto in 1903; the degree of Civil Engineering in 1908 and the honorary degree of Doctor of Engineering in 1938.

Dr. J. B. Challies, M.E.I.C.

"In The Engineering Institute of Canada he has held practically every office from secretary of the Ottawa Branch in 1908 to the presidency in 1938.

"He has sat in every court of the United Church of Canada, and for several years has been chairman of the Board of Governors of The United Theological College, Montreal.

"Last year he was chairman of the Canadian Chamber of Commerce.

"In addition to a senior vice-presidency in The Shawinigan Water and Power Company, Dr. Challies is a director of several important hydro-electric and industrial corporations. A recognition he prizes highly is honorary membership in the Professional Institute of the Civil Service of Canada, an organization of which he was one of the founders. His 23 years in the Federal Civil Service and his subsequent similar period in the service of the Shawinigan companies, involving responsibilities of constantly increasing importance in respect of the study, the conservation and the use of the water resources of Canada, is being fittingly recognized by the Institute in the award of the Julian C. Smith Medal."

A. K. Leuthold, M.E.I.C., of Montreal, Que., is the recipient of the Duggan Medal and Prize of the Institute for 1946 for his paper "The Application of the Gas Turbine to Railway Locomotives" which appeared in the August 1946 issue of *The Engineering Journal.*

Born in Zurich, Switzerland, Mr. Leuthold graduated in 1927 as an electrical engineer from the Swiss Federal Polytechnical College at Zurich. Soon after graduation, he joined Brown Boveri and Company at Baden, Switzerland, where he spent several years on research on high voltage and high current mercury arc rectifiers. In connection with this occupation, he put into service many large rectifier installations for electrified railway and city-subway systems as well as for large electrolytic plants in various European countries. In 1935 he successfully put into operation several substations for the South African Railways.

From 1931 until 1937 Mr. Leuthold made several trips to Canada in connection with some high capacity rectifier installations in large electrolytic plants. In 1938 he joined permanently the staff of Brown Boveri Canada Limited, where he is still employed as chief engineer.

J. G. G. Kerry, M.E.I.C., of Port Hope, Ont., has been awarded the Gzowski Medal of the Institute for 1946 for his paper "The Winter Temperature Cycle of the St. Lawrence Waters" which appeared in the January 1946 issue of *The Engineering Journal.*

Born at Montreal, Que., he graduated with honours from McGill University with a B.A.Sc. degree in 1886. Six years later he received his M. Eng. degree there. After graduation some years were spent on the engineering staffs of railway lines in Canada and the United States. In 1893 Mr. Kerry joined the teaching staff of the Faculty of Applied Science, McGill University, where he remained until 1907.

In 1898 he became a partner in Smith, Kerry & Chace, later Kerry & Chace Limited, with which firm he remained until his retirement. From 1907 until 1932 Mr. Kerry acted as consulting engineer of the Temiskaming and Northern Ontario Railway. He also constructed power plants for several companies including Nipissing Power Company, Seymour Power & Electric Company, Canada Cement Company and Hollinger Gold Mines. The paper mills which he constructed included those for Northumberland Paper & Electric Company and Canadian Paperboard Company.

Among the executive positions occupied by Mr. Kerry was that of president, Northumberland Paper & Electric Company; president, Seymour Electric Power Company and associated companies; president, Canadian Paperboard Company; president, Quinte & Trent Valley Power Company; and secretary of Boundary Investments Limited. Mr. Kerry retired in 1939.

George Gedge, C.I.M.M., of Timmins, Ont., is the recipient of the Leonard Medal for 1946 for his paper "Safety in the Handling and Use of Explosives at Hollinger Mine" which was published in the December 1945 issue of *The Canadian Mining and Metallurgical Bulletin.*

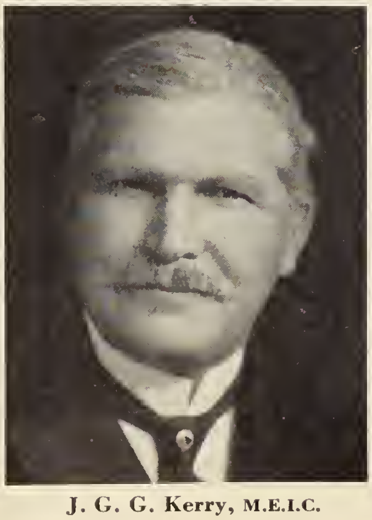
Born in Brazil, Mr. Gedge received his education there and in England. In 1913 he entered the employ of the St. John del Rey Mining Company under a four-year agreement, on the expiration of which he went to England and joining the Royal Air Force, served as an observer until he was shot down and taken prisoner about three months before the end of the war.

In 1919 Mr. Gedge returned to St. John del Rey and held positions successively as charge man, assistant mine captain, and mine captain until 1929. In the following year he joined the staff of Hollinger Consolidated Gold Mines as shift boss. In 1932 he was placed at the head of the underground safety department, the position he now holds.

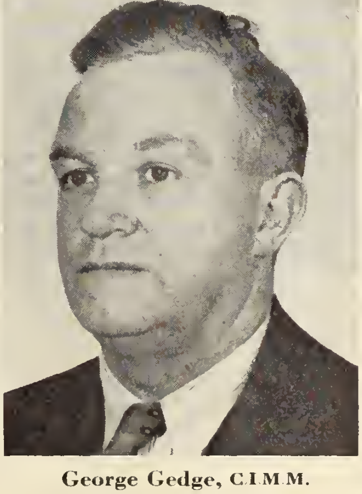
W. J. Tomlinson, M.E.I.C., Montreal, Que., is the recipient of the Plummer Medal of the Institute for 1946 for his paper "Modern Methods of Conditioning Boiler Water Externally" which appeared in the September 1946 issue of *The Engineering Journal.*

Born at Newark, N.J., he attended Lehigh University at Bethlehem, Penn., graduating with a B.Sc. in chemical engineering with honours and the Senior Chemical Engineering

A. K. Leuthold, M.E.I.C.



J. G. G. Kerry, M.E.I.C.



George Gedge, C.I.M.M.

W. J. Tomlinson, M.E.I.C.

R. M. Hardy, M.E.I.C.

E. D'Appolonia, M.E.I.C.

Prize in 1931. In 1936 he received the professional degree of Chemical Engineering from the same institution.

After working on the plant engineering staff of Koppers Gas & Coke Co., Kearny, N.Y., Mr. Tomlinson joined the technical department of W. H. & L. D. Betz, Philadelphia, specialists in the field of water conditioning. In 1938 he came to Canada as technical director for Betz Laboratories Division of Wood Industries Supply Company, later becoming manager and technical director for Betz Laboratories Limited. In October 1946 he joined E. F. Drew & Co. Ltd., Montreal, as technical director in the water treatment division, which position he holds at the present time.

R. M. Hardy, M.E.I.C., and **E. D'Appolonia,** M.E.I.C., are the recipients of the Keefer Medal of the Institute for 1946 for their paper "Permanently Frozen Ground and Foundation Design" which appeared in the January 1946 issue of *The Engineering Journal.*

R. M. Hardy, Dean of the Faculty of Applied Science at the University of Alberta, Edmonton, was born at Winnipeg. He graduated with a B.Sc. in civil engineering from the University of Manitoba in 1929 and obtained a Master's degree from McGill University in 1930. The same year he joined the staff of the University of Alberta as a lecturer in the Department of Civil Engineering. He was later appointed assistant professor and in recent years became associate professor. Dean Hardy spent a number of summers at the University of Michigan, studying structural engineering, and during the session 1939-40 he went to Harvard University where he studied soil mechanics, a field in which he has become recognized as an expert. He has done consulting work for the past twenty years for industrial concerns both in eastern and western Canada, one of his most important assignments being with the Aluminum Company of Canada. He has also given extensive advice on structural and foundation problems in Alberta.

E. D'Appolonia was born in Coleman, Alta., in 1918. He attended the University of Alberta from 1938 to 1942, receiving a B.Sc. in civil engineering. In the summer of 1942 he was employed by the Aluminum Company of Canada as a designer. Returning to the University in the fall, he taught there until 1946, and completed requirements for a M.Sc. degree, graduating in 1946. During the summers of 1943 to 1945 he was employed by the United States War Department as a structural engineer, and it was during this period that the investigations and studies pertaining to permanently frozen ground in Canada and Alaska were carried out. At present he is completing the requirements for a doctorate at the University of Illinois. The field of major study is in structural engineering with minors in mathematics and theoretical and applied mechanics.

A. B. Hunt, M.E.I.C., Montreal, Que., has been awarded the Ross Medal of the Institute for 1946 for his paper "The Future of Radio Communications in Canada" which appeared in the February 1946 issue of *The Engineering Journal.*

Born at London, Ont., he graduated from the University of Toronto with a B.A.Sc. degree in 1928, when he was awarded a medal from the British Association for the Advancement of Science, which is the highest engineering award of the University. Upon graduation, he joined the Northern Electric Company and since that time has been actively associated with radio communication. His early years with the company were spent as a manufacturing methods engineer in connection with theatre sound system and vacuum tube production. In 1931 he was appointed assistant operating superintendent in charge of radio and other associated lines. During 1935 he was given the additional responsibility of engineering and designing the products he was manufacturing. When a separate division of the company was established in 1938 to handle the expanding business in the electronics field, Mr. Hunt was appointed manager, which position he holds at the present time.

A. B. Hunt, M.E.I.C.

E. M. Scott, S.E.I.C., has been awarded the H. N. Ruttan Prize of the Institute for 1946 for his paper, "The Operation and Construction of the Modern Oil Circuit Breaker".

Mr. Scott was born in Winnipeg, Man. Entering the University of Manitoba in 1942, he followed a course in electrical engineering and graduated in 1946. It was during summer employment with the Winnipeg Electric Company that the information and knowledge was obtained which made possible the writing of this paper. He was chairman of the Student Section of the Winnipeg Branch of the Institute, when that section was formed during his final year at University. He is at present located in Toronto, where he is employed on the Test Course with the Canadian General Electric Company.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

George D. Archibald, M.E.I.C., a former chairman of the Saskatchewan Branch of the Institute, died suddenly on March 22nd. He was born in 1886 at Truro, N.S., studied at King's University in Windsor, N.S., and worked first as a draughtsman with the Dominion Iron and Steel Company at Sydney, N.S. In 1905 he went to Winnipeg where he worked for the old Grand Trunk Pacific Railway on location. Within two years he joined the Canadian Northern Railway as maintenance of way engineer. In 1911 he went into the private contracting business, and during this time built many miles of road and journeyed to Philadelphia, Pa., where he did more of that type of work. Shortly after, he worked on the Welland Canal when it was under construction. In 1914, he began his life's work as city engineer of Saskatoon, Sask. The following year he was appointed superintendent of the street railway system. He held both posts up to the time of his death.

Perhaps the biggest achievement of his career was the building of the Skeena Highway between Prince Rupert and Hazelton, B.C., during the Second World War. Recognized by the Federal Government as an expert on highway construction, he was loaned by the city of Saskatoon for about two years to take charge of this project which ranks next to the building of the Alaska Highway.

Mr. Archibald took great pride in Saskatoon and, throughout the years, he played a leading role in construction of landmarks which will remain as monuments to his ability and progressive ideas. He was engineer in charge of construction of the Broadway Bridge, he built the city incinerator and developed the first municipal airport, and he successfully reclaimed the McCraney slide. He designed the Nineteenth Street subway and developed the pumping station to keep it abreast of the city's development. The Lorne Avenue diversion which eliminated two dangerous railway level crossings was his design, and he planned the sewage disposal plant now under construction. He also endeavoured to combine beauty with usefulness, instigating the construction of the stone revetment walls along the river banks and planning the terraces which now add to the beauty of that part of the city. Shortly before he died, he received the approval of the city council on his plans for the conversion of the city's street railway system to trolley busses.

Mr. Archibald joined the Institute in 1938 as a Member.

George Breck Mitchell, M.E.I.C., who was resident engineer for T. Pringle and Son at Magog, Que., died on March 25th, 1947, in Sherbrooke, Que. He was born in Philadelphia, Pa., in 1875, and studied civil engineering at the Colorado State School of Mines, Golden, Col., graduating in 1896. He was associated in 1897 with William Cramp and Son of Philadelphia, as draughtsman and assistant to the chief engineer, and the following year he became assistant engineer with the United States Deep Waterway Commission and was located at Ogdensburg, N.Y., and Detroit, Mich. In August, 1899, he was located at Nicaragua as assistant engineer with the Isthmian Canal Commission. One year later he became office engineer in Washington for the same commission. He entered private practice in 1902 as a member of the firm, A. J. Norris and Company, Amsterdam, N.Y., but in September of the same year he accepted a position with the Canadian Pacific Railway Company as assistant engineer at the Angus Shops, Montreal. Two years later he was placed in charge as assistant engineer of the mechanical work of the company's engineering department at Montreal In December, 1905, he accepted the position of superintendent of buildings with the New York, New Haven and Hartford Railroad at New Haven, Conn.

He went to C. E. Deakin Limited, general contractors, Montreal, in 1907, as vice-president, and remained until 1916 when he entered private practice as a general contractor with headquarters in Montreal, and the next year he joined the staff of the Foundation Company of New York, with charge of projects in various parts of the United States and in Lima, Peru. In 1923 he went to Victoria, B.C., as western manager for P. Lyall and Sons Construction Company and he was transferred by the company to Bogota, Colombia, three years later. Returning to Montreal, he joined the Atlas Construction Company in 1930 as general superintendent and director. In 1937 he was at Kewagama, Que., with the Wood Cadillac Mines Limited, and later joined the Fraser Brace Engineering Company Limited, serving at Nobel, Ont. From 1940 to 1942 he was general superintendent of the Dufferin Shipbuilding Company Limited, Toronto, and was connected with the Davie Shipbuilding and Repairing Company at Lauzon, Que., until 1946, when he joined T. Pringle and Son at Magog, Que.

An active Member of the Institute since 1913, Mr. Mitchell was chairman of the Victoria Branch, and Councillor of the Institute in 1925.

Stanley G. Moseson, JR.E.I.C., of Critchley, Alta., assistant general manager of Fred Mannix & Company Limited, Calgary contractors, was killed in an airplane crash at Coaldale, Alta., February 14th, 1947. He was born in Wetaskiwin, Alta., and attended school there and at Camrose, Alta. He graduated with a B.Sc. in civil engineering from the University of Alberta in 1942, and was with the Calgary Power Company Limited at Banff and Seebe, Alta., for a year before joining the Mannix Company as field superintendent. He was made assistant general manager in 1945.

He joined the Institute as a Student in 1941, transferring to Junior in 1945.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

G. W. Lusby, M.E.I.C. - - . . *Secretary-Treasurer*
W. R. Mitchell, M.E.I.C. - *Branch News Editor*

A joint dinner meeting of the Border Cities Branch of the Institute and the Association of Professional Engineers of Ontario was held on March 14 in the Prince Edward Hotel with Chairman A. D. Harris, presiding.

The guest speaker was Dr. G. B. Langford, president of the Association, who gave a thought-provoking address on **The Engineer and the State.**

Dr. Langford was accompanied to Windsor by Colonel Tom Medland, public relations director for the Association. Colonel Medland spoke on current activities of the Association and also on his particular duties in publicizing the engineer and his work.

The dinner was preceded by a reception at which all present had an opportunity to meet and talk with the guests.

The meeting wound up with a discussion period in which a large proportion of those present took part.

EDMONTON BRANCH

W. W. Preston, Jr.E.I.C. - *Secretary-Treasurer*

Weather forecasts may soon be expressed in terms of human comfort. This was the forecast of Dr. Thomas How, officer in charge of the Dominion Public Weather Office in Edmonton, in an address to the Edmonton Branch, at its dinner meeting on the evening of April 7th, in the Macdonald Hotel. Speaking on the subject **Measuring Wind-Chill,** Dr. How stated that research is in progress to devise a system of numbers, known as wind-chill values, which will express the effect produced on the human body by evaporization of moisture on the skin, by convection currents, and by radiation of heat to or from the body. The unit of wind-chill is a kilogram calorie per square meter per hour. As the weather becomes more severe, the wind-chill numbers become larger. It was found on a Byrd Antarctic Expedition that one's cheeks would freeze at a W.C. value of from 1500 to 1600. An important fact to be kept in mind while interpreting W.C. readings, the speaker said, is that the values are based on the criterion that the person has been comfortable and that on exposure to more severe weather he is still comfortable.

Dr. How prefaced his paper with comments on the weather forecaster's problems. Daily he receives many requests from people in all walks of life for 36-hour forecasts. Among these people are engineers in firms whose business is affected by the weather. One of the forecaster's chief worries is in expressing himself. He must describe the state of the sky,—clear, cloudy, overcast; the wind,—velocity; the weather—precipitation, fog; and the temperature trend,—number of degrees warmer or colder than the forecast for the previous day. The difficulty, the speaker stated, is to express this data in plain English briefly enough to send reports by telegram yet clearly enough to be understood.

Research on wind-chill needs a man with the qualifications of a medical man, engineer, meteorologist, research physicist and one familiar with the hydrodynamics of fluids. The human body produces heat through the normal action of the internal organs or by exercise, and retains or gets rid of this heat in different ways, in order to regulate the body temperature to a constant value of 98.6°F. The external conditions which influence this regulation are evaporization of moisture from the skin requiring latent heat; exchange of heat between the body and warmer or cooler moving air; and radiation, which may be caused for example by the sun or a block of ice. Relationships between these quantities are complicated because of their variability. However, in northern regions where evaporization and radiation factors are small enough to be neglected, a simple relationship obtains. This applies only to our winter forecasts. First experiments on wind-chill consisted simply in taking a thermometer from a heated room to the outside temperature and recording the changes of temperature. Later, on a Byrd expedition to Antartica, a cylindrical plastic container was designed. It was filled with water, heated above freezing and allowed to cool. A record of the calories released per hour was kept. Present endeavours are to standardize the cylindrical measuring apparatus.

Engineers, the speaker continued, are concerned with insulation. The U.S. Army has studied wind-chill and the insulation of clothing, but no literature has been available during the war. It is known that as humidity increases, the insulation quality decreases. Dr. How suggested that heating and ventilating engineers should consider wind-chill in studying the insulating properties of walls.

The meeting was under the chairmanship of J. W. Porteous. L. A. Thorssen introduced Dr. How, and K. Cumming proposed a vote of thanks which carried unanimously. Attendance was 36.

HALIFAX BRANCH

J. D. Kline, M.E.I.C. - - *Secretary-Treasurer*
M. L. Baker, M.E.I.C. - - *Branch News Editor*

The March meeting, one of special interest, was held at the Nova Scotian Hotel on March 20th. At this meeting the members welcomed the president of the Institute, J. B. Hayes, who paid his official visit to the Halifax branch at this time.

In honour of the president the wives of the members were guests at the dinner. Members and guests numbered 142. Accompanying Mr. Hayes were the regional vice-president, C. M. Anson, Assistant General Secretary Louis Trudel; and Councillor G. J. Currie, E. C. O'Leary, chairman of the Branch, presided at the meeting.

Following the dinner a toast to the ladies was ably proposed by W. C. Risley and graciously responded to by Mrs. Hayes.

Mr. Hayes in his most interesting and enjoyable address described his recent trans-Canada presidential tour and also recounted many of his experiences on his visit to England last fall when he attended, as Canadian representative, the conference of the engineering institutions of the Commonwealth. In the course of his talk Mr. Hayes paid tribute to Dr. F. H. Sexton, retiring president of the Nova Scotia Technical College, to whom he referred as " a man who has done much for the profession in this Province ".

Mr. Anson spoke briefly on labor management relations. He uphelp the right of workers to organize and told the members that if employees are treated fairly and reasonably they will respond with their full co-operation.

Mr. Trudel gave a concise report on the activities of the Institute during the past year. He said the objective of the Harry Bennett Educational Fund was in sight and pointed out that already, through the fund, assistance in engineering training was in effect.

I. P. Macnab, in proposing a vote of thanks to Mr. Hayes, outlined the latter's career as a student at Mount Allison, Dalhousie, at the Nova Scotia Technical College, and as a soldier in World War I. He traced the president's activities with the Nova Scotia Light and Power Company from the time he entered it as field engineer under Mr. Macnab's supervision to the present time.

At the conclusion of the speeches a musical programme was presented by Harry Cochrane and accompanying artists.

❖ ❖ ❖

Thursday morning, March 20, Mr. Hayes addressed the students of the Nova Scotia Technical College and St. Mary's College in the Assembly Hall at the Nova Scotia Technical College. Dr. Sexton, president of the Technical College, presided. Messrs. Anson, Trudel, Currie and O'Leary were members of the president's party.

Before addressing the students Mr. Hayes presented to J. Oakley, senior mechanical engineering student, the certificate for the Institute prize which he won last year, and to H. McClymont, junior mechanical engineering student, the Institute prize for the term 1946-47. Then, in a most inspiring talk, the president referred to the many phases of engineering he encountered on his presidential visit across Canada and on his visit to England in 1946.

Mr. Anson spoke of the value to industry of men with engineering training. He pointed out that there were opportunities in Nova Scotia for young men with such training, and it was these men who were needed to cope with and solve the many problems that arise in industry.

Mr. Trudel gave the students a comprehensive picture of the objectives of the Institute and reviewed the work of the organization during the past year.

HAMILTON BRANCH

L. C. Sentence, m.e.i.c. - *Secretary-Treasurer*
I. M. Macdonald, jr.e.i.c. - *Branch News Editor*

The Annual Students' and Juniors' night of the Hamilton Branch of the Institute was held at McMaster University on Thursday, March 20th, 1947. Forty members attended the meeting which was opened by Chairman E. G. Wyckoff, and presided over by Neil Metcalf.

Four papers were presented in competition for the Branch prizes, as follows:

1. **Modern Engraving Practices,** by W. A. Freeman, s.e.i.c. Mr. Freeman, introduced by G. L. T. Vollmer, is a graduate in mechanical engineering from the University of Toronto, and is superintendent of the Barnard Stamp & Stencil Company Limited.
2. **Comparative Costs of Stage and Compound Dies,** by L. G. Galloway, s.e.i.c. Mr. Galloway, introduced by A. A. Moline, is an honour graduate of the University of British Columbia in mechanical engineering, and is now an engineering apprentice, Canadian Westinghouse Company Limited.
3. **Lightning Effects on Buried Telephone Cable,** by R. N. E. Haughton, s.e.i.c. Introduced by Norman Eager, Mr. Haughton is an electrical engineering graduate of Queens University. He is with the transmission engineering department of the Bell Telephone Company of Canada.
4. **Some Aspects of Atomic Energy,** by L. A. Cook, jr.e.i.c. Mr. Cook is a graduate of Queens University in engineering physics, and was introduced by A. A. Moline. He is at present an engineering apprentice with Canadian Westinghouse Company Limited.

After the judges W. E. Brown, Neil Metcalf and E. H. Tovee, had reached a decision, Mr. Haughton was presented with the first prize. Second place went to Mr. Galloway, and third to Mr. Cook. Mr. Freeman's paper was given honourable mention by the judges who recommended that all four papers be submitted for the Galbraith prize of the Institute.

At the conclusion of the papers, a discussion period was held and A. R. Hannaford expressed the appreciation of the meeting by moving a vote of thanks to the four speakers.

LETHBRIDGE BRANCH

H. T. Miard, m.e.i.c. - - *Secretary-Treasurer*
E. A. Lawrence, s.e.i.c. - *Branch News Editor*

The joint meeting of the Lethbridge Branch of the Institute and the Association of Professional Engineers of Alberta was held in the Marquis Hotel, Friday, March 21st, 1947, commencing with a dinner at 6.30 p.m.

L. C. Stevens, president of the Association, presided; head table guests included Mayor J. A. Jardine, J. Harper Prowse, J. Randle, Dean R. M. Hardy, R. S. Lawrence, chairman of the Branch, J. S. Irwin, J. G. Dale, Julian Garrett.

J. Randle introduced the speaker, Dean R. M. Hardy of the University of Alberta who spoke on **Engineering Education.** Dean Hardy stated that there is a very large number of students registered in Canadian Universities for the course in Applied Science and mentioned the University of Toronto with 4,000, University of Alberta with 980, and the total in Canada of 14,000.

Engineering students graduating in applied science from University of Alberta in 1949 will be about 300, and in 1950 about 400, when it is expected the intake will be back to normal. About 75 percent of the students registered in engineering courses are war veterans and the standard being attained by these men was never higher, due, the speaker thought, to their more mature minds and broader outlook.

Therefore a large influx of engineers can be expected in 1949 and 1950, and provision must be made now by the engineering societies, and Canadian society as a whole to absorb these men into the business and industrial life of Canada. There are some bright spots in the picture. Canadian society could make far greater use of technically trained men than it has done in the past. Furthermore, other parts of the British Empire and the United States of America would absorb some of them, although loss of technically trained men to other countries is being deplored. In addition, Canadian industry could be expanded to absorb a large number, and the speaker thinks this is the proper course to pursue.

Dean Hardy mentioned that the Senate of the University of Alberta was thinking of broadening the Engineering curriculum to include some non-scientific subjects to give the young engineer a broader outlook and a better approach to the problems of today. Should this idea be adopted then the course in applied science would become a five-year course in place of the present four years.

J. S. Irwin thanked the speaker for his excellent address.

MONCTON BRANCH

V. C. Blackett, m.e.i.c. - *Secretary-Treasurer*

On February 4th an unusually large attendance of branch members and their ladies heard G. R. Murray of the Canadian General Electric Company, Saint John, N.B., speak on the **All Electric Home.**

Illustrating his remarks with slides, Mr. Murray took his listeners on a tour of the modern home. He showed the various forms of lighting used to illuminate the grounds about the house, and the electrical appliances, such as doorbell chimes, two-way radio to announce callers, and an electric bell to signal the arrival of mail. Inside the house, lumiline and fluorescent lights cast an even glow over the rooms, instead of the old-time concentration of light in the centre, leaving the corners dark and dingy. As Mr. Murray declared, nowadays we do not merely light rooms—we light-condition them—we move the sun indoors. In the kitchen of the all electric home, cooking, dish washing and garbage disposal were shown to have become largely a matter of throwing switches and pushing buttons. The speaker concluded with a description of methods of ventilation and oil heating systems having automatic electric control.

A vote of thanks was extended Mr. Murray by T. H. Dickson, the presiding chairman, on motion of B. E. Bayne, seconded by G. L. Dickson.

MONTREAL BRANCH

E. M. Van Koughnet, m.e.i.c. - *Secretary-Treasurer*

Congratulations are extended by the Montreal Branch to L. F. Grant newly-elected President of the Institute for 1947 and to the new members of Council.

We are pleased that the suggestion put forward by this Branch to hold a conference of Executive Committee Members at the Annual General Meeting, has been accepted. This conference, attended by one or two members from each branch, provides for closer contact between those representing the different sections of the country than is ordinarily possible at the Annual Meeting. Branch problems of both a particular and general nature can be discussed and ideas, information and assistance exchanged.

J. A. Beauchemin, Chairman of the Montreal Branch Campaign Committee for the Harry F. Bennett Educational Fund wishes to take this opportunity to thank all those who assisted in conducting the Campaign canvass and to express his gratitude to the members for their generous contribution to this very worthy cause.

Recent guest speakers at the Thursday evening meetings have been: T. W. Mowat of Ottawa who described **High Voltage Direct Current Generators for Nuclear Research;** McNeely DuBose who delivered, in F. L. Lawton's absence, the latter's paper on **Economics of Water Diversion;** G. Lorne Wiggs who spoke on **Radiant Heating** and Dr. J. J. Green and H. S. Rees who gave a paper on the **Direct Operating Costs of Transport Aircraft.**

Montreal Branch Members receiving recognition at the Annual Meeting in Toronto are:

J. B. Challies: the Julian C. Smith Medal for Achievement in the Development of Canada.

A. B. Hunt: the Ross Medal for his paper "The Future of Radio Communication in Canada."

A. K. Leuthold: the Duggan Medal and Prize for his paper "The Application of the Gas Turbine to Railway Locomotives."

W. J. Tomlinson, the Plummer Medal for his paper "Modern Methods of Conditioning Boiler Water Externally."

Dr. Ernest Brown of McGill University: an Honorary Membership.

Members are reminded that reciprocal agreements now in force permit E.I.C. members to avail themselves of the publications of other similar societies on the same basis as their own membership. A list of these societies with their publications can be obtained at Headquarters.

NIAGARA PENINSULA BRANCH

P. A. Pasquet, jr.e.i.c. - - *Secretary-Treasurer*
C. A. O. Dell, m.e.i.c. - - *Branch News Editor*

Members and friends of the Niagara Peninsula Branch held a dinner meeting at the Queensway Hotel in St. Catharines, on Thursday, March 20th.

President W. D. Brownlee, occupied the chair, and after the dinner called upon C. Climo, member of the branch executive, who introduced the speaker of the evening, J. C. Thwaites, of the Electronics Division of Canadian Westinghouse Company, Hamilton. Mr. Climo spoke of an earlier acquaintance with the speaker at Queens University, and assured the audience of an interesting evening to come.

Mr. Thwaites, subject was **Atomic Power in Industry,** and in his opening remarks he made the assertion that, of the immense and far-reaching scientific development in electronics and electrical science which had taken place during the war, practically all was based on Maxwell's four equations. Using these equations it can be shown that the best insulation for high frequency currents is copper placed at the nodal points of the wave. Copper is also one of the best conductors of electricity.

The speaker traced some of the highlights in the development of the Ignitron tube for purposes of producing aluminum during the war. The first Ignitron tube was put into service for this purpose at Messina, N.Y., in 1939. At the beginning of the war, Canada was producing about 350,000 lb. of aluminum per day. Orders were received to jump up this production and development of the equipment was immediately started. The first aluminum was poured from the new equipment on August 10, 1941. Canada now produced about 4,000,000 lb. of aluminum per day, and at one time during the war had a stockpile amounting to a 10-acre field piled 40 feet deep. In spite of the tremendous production during the war, production for the month of March, 1947, was expected to be higher than for any month during the war.

The speaker also told of the development of electronic equipment which was used to upset the aim of the German V2 bomb which was controlled from the ground by radio for the first 50 seconds of travel. The Germans were able to tell the course and speed of these bombs by means of radio signals sent out from the bomb to an operator at the starting point. By means of other signals sent to the bombs, they were able to steer them for the first 50 seconds of flight. The method of upsetting the aim was to introduce another signal from the coast of Britain which was received by the German ground operator. This signal was composed in such a way as to combine with the signal from the flying bomb and give a net effect to the German operator such as to make the bomb appear to be lower and more horizontal than was actually the case in its line of flight toward England. The operator would then send out impulses to raise the line of flight of the bomb. The net result would be that the bomb would curve back over the French coast to land on German-held territory. About 2900 of these bombs were directed at Britain during the war. They travel at about 500 miles an hour. Although there is only 50 seconds' time during which the course of a bomb could be influenced, nevertheless by the method described the operators of the interfering equipment were able to detect and upset the aim of some 900 out of the total of 2600.

Several other types of equipment were described and the speaker drew attention to the amazing equipment developed by Perce Level for shooting down the V1 bomb. The V1 bomb travels at about 400 miles per hour and carries no radio control equipment, but can be detected by sight due to the intense torchlike tail fire. Equipment used against this bomb consisted of two telescopes connected to an electronic device about the size of a suitcase. Two operators trained the telescopes on the bomb and followed its line of flight for one second. In this short period of time, all necessary information about the line of flight and the speed of the bomb was set up in the electronic calculating device by means of the motions of the telescopes in following its course. This information was automatically transmitted to an anti-aircraft battery of three guns, along with several other variables such as temperature, barometric pressure, humidity, etc. which affect the aiming of anti-aircraft guns. The guns, loaded with shells equipped with proximity fuses, were automatically aimed from the electronically recorded information. At a given signal, an A.T.S. girl would pull the lanyard firing three shells only, and 20 seconds later would expect to see a terrific explosion in the sky. The speaker, on a night of observation, saw these girls knocking down 95 per cent of the bombs coming over.

Another amazing development was the Shoran Radar, by means of which targets from 50 to 75 miles away were bombed by remote control. By use of this equipment, a bridge in Italy which had eluded bombing raids for weeks was hit on the first bombing run using the equipment. Three bombs were dropped, with one falling just short of the target, one just beyond, and one dead centre.

Mr. Thwaites concluded by giving great credit to British scientists and to the British people for their scientific contributions and vigorous prosecution of the war. Among other things developed by the British, he mentioned Fido, Pluto, and Radar. The first indication of radar was observed by Watson Watt in England when he received reflections from the R101, which flew over his station during experiments. This discovery led to the erection of short wave transmitter stations on the east coast of England which, though ostensibly for short wave transmission, were actually for radar detection work.

The meeting closed with a vote of appreciation to Mr. Thwaites.

OTTAWA BRANCH

C. G. Biesenthal, Jr.E.I.C. - *Secretary-Treasurer*
R. C. Purser, M.E.I.C. - - *Branch News Editor*

Industrial Lighting was the subject of an address, with accompanying motion picture, "Let Us See", at a noon luncheon of the Branch on Thursday, March 27, at the Chateau Laurier. The speaker was Major G. D. Mills, representing the Ottawa Chapter of the Illuminating Engineering Society.

The basic factors concerning vision are four in number: size of object looked at, contrast of object with surroundings, time to accommodate eye to view, brightness. The last mentioned is the factor that may be controlled by illumination.

The amount of light given by a candle at one foot distance is called a foot-candle and is a standard unit of measurement. At noon on a normally bright day, there may be as much as 10,000 foot-candles of light outside, whereas inside a room the light from a window may vary from one foot-candle upward.

In the past 15 years the science of illumination has made wonderful strides, and it has been found that comfortable seeing, without undue eyestrain to a worker, may be aided by the avoidance of: (a) harsh shadows in and around work, (b) bright or flaring lights within line of vision, and (c) excessive brightness ratio around the work; and by the provision of enough light for the particular job in hand.

Regarding item (c), the brightness ratio should be kept well within 10:1 and preferably 3:1. Thus there should be no dark walls and brightly lighted machines, and the decorating scheme should be tied in with the working operations. The amount of light required, naturally, may vary from one task to another.

The speaker referred his listeners for further information on this subject to a booklet, "Recommended Practice for Industrial Lighting", adopted in the United States in 1943 and now approved by the Canadian Efficiency Standards Association and accepted in this country by the Canadian Department of Labour for practice here.

Chairman Major-General G. R. Turner presided. Major Mills was introduced by R. M. Prendergast, president of the Ottawa Branch of the A.I.E.E., and thanked by William C. Brown. The chairman announced that Gordon Murphy, an Ottawa Branch member, would shortly leave to reside in Montreal, where he has been appointed port manager.

PETERBOROUGH BRANCH

A. R. Hailey, M.E.I.C. - - *Secretary-Treasurer*
J. C. Allan, M.E.I.C. - - *Branch News Editor*

Professor G. A. Wallace of the Electrical Engineering Department of McGill University addressed a dinner meeting of the Peterborough Branch of the Institute on Saturday, March 22nd at the Kawartha Club. About 110 members and guests were present, including visitors from Toronto with representatives from the Bell Telephone Company, the Hydro Electric Power Commission, the Toronto Transportation Commission and the Canadian General Electric Company.

Chairman A. J. Girdwood introduced Professor Wallace, who spoke on **The Inductive Co-ordination of Power and Telephone Lines.**

The speaker gave a very lucid explanation of a highly technical subject, starting with a description of the part of the extended subject to be treated. He explained that there are two kinds of interference between power and telephone lines. They are due to magnetic induction and electrostatic interference. The interference might be otherwise classified as normal interference and transient interference. The paper presented confined itself to a discussion of inductive interference, and normal rather than transient interference.

Noise, for the purposes of telephone men, is measured by its interference with the intelligibility of speech. A graph was presented to show that sounds of about 1,050 cycles produce the most interference, and that sounds below 250 cycles or above 4,000 cycles produce very little interference. Noise meters have been produced to compensate for these differences in interference. They may have scales in milli-amps or in decibels. A perfect transmission line produces no interference, and a perfect telephone line will not pick up any interference, but no one can construct perfect lines of either kind, so that inductive co-ordination is necessary. In other words, co-operation is required between the power company and the telephone company in every locality.

The speaker described and illustrated researches in co-ordination, which he had conducted in Alberta and in Quebec, and analyzed the causes of interference in each case.

Following the presentation of the paper there was a general discussion in which representatives of the Bell Telephone Company and the Hydro Electric Power Commission were prominent. They stressed the happy co-operation which there has been between their organizations in dealing with these problems.

The vote of thanks was moved by E. W. Henselwood of the Canadian General Electric Central Station Department, Toronto.

SAGUENAY BRANCH

J. E. Dyck, M.E.I.C. - - - *Secretary-Treasurer*

A Programme for Improvement of Maintenance Methods was the subject of an address given by H. A. Estabrook to the Saguenay Branch of the Institute on March 20, 1947.

Mr. Estabrook for the past three years held the position of superintendent of the Industrial Engineering Department at the Arvida Works of the Aluminum Company of Canada, Limited. His address was based on the paper delivered by him at the Time Study and Methods Conference sponsored jointly by The Society for the Advancement of Management and The American Society of Mechanical Engineers in New York in April, 1946.

The speaker discussed briefly the processes and operations carried on in the Arvida Works pointing out the large quantity and variation of equipment which has to be kept in operating condition by the maintenance forces. It was decided by the plant management that a consulting firm of engineers should be called in to investigate this maintenance problem.

The method of attacking this problem followed several definite lines:

Identifying the principal causes of high maintenance cost and setting up the means for effectively getting these costs back into line.

Preventive maintenance through scheduled plant inspections of apparatus and equipment, with follow-up.

Improvement of the methods and practices of the maintenance crews themselves.

Review of the storeskeeping of maintenance supplies to revise order points, requisitions routines and material controls.

Review of the organization of maintenance work, both in its relation to the operating departments and in its internal structure.

Establishment of budgets which would reflect the "should cost" for maintenance work, and the setting up of the necessary executive reports which would bring to the top officials the records of performance against budgets and other standards established.

An analysis of maintenance work revealed that a substantial proportion of the repairs were of a highly repetitive nature and specialized crews were set up to handle these on a routine basis. The size of the crews were determined after making extensive time studies on this work. The setting-up of standard crews and methods was accomplished by a committee composed of representatives of the maintenance department and the industrial engineering department.

To control labour efficiencies on varied maintenance, the jobs were planned daily by use of the Gantt Chart. In this way man-hours for each job were scheduled and performance was later compared with the schedule.

Budgets for maintenance were established based on past performance as to material costs but based on the new standard crews for labour costs. As improved equipment and methods are introduced the budget is revised accordingly. Executive reports giving a graphic picture of maintenance costs per unit of production in the various plants were introduced. In addition to these such costs as maintenance of yards, trucks, buildings and equipment were charted.

The mechanical department organization itself was changed to some extent. The function of mechanical inspection was decentralized placing an inspector in each plant reporting directly to the maintenance supervisor of that plant. An engineering section was set up within the mechanical department for purposes of carrying on development work designed to reduce maintenance costs.

Mr. Estabrook illustrated his talk with a number of slides showing improvements resulting from the programme carried out.

B. E. Bauman thanked the speaker on behalf of the branch.

Junior Section

T. T. Anderson, jr.E.I.C. - *Secretary-Treasurer*

A meeting of the Junior Section of the Saguenay Branch was held at the Arvida Protestant School at 8.15 p.m. on Thursday, March 28th. K. V. Gow, of the Aluminum Company of Canada Limited, addressed the meeting on the subject of **Ceramics.**

Mr. Gow discussed generally what ceramics and ceramic engineering involves and the industries which they include. He traced the history of the ceramic industry from prehistoric man to the present day and cited the development of porcelain and glass as examples. Manufacturing processes for porcelain, refractories, structural brick, and tile, etc., were outlined briefly. Compositions of electrical and chemical porcelain were discussed and possible uses for highly refractory pure oxide ceramics such as alumina zirconia, etc. were mentioned. The compositions and methods of manufacture of some special glasses such as Pyrex, Vycor, Fiberglas were described.

Following his talk, Mr. Gow showed the following films: Manufacture of Continuous Filament Fiberglas; Sand and Flame—A Film on Manufacture of Glass and Safety Glass; Looking through Glass—A Reel Dealing with Optical Glass.

The meeting proved exceptionally interesting to everyone The speaker was introduced by J. T. Madill, chairman of the Junior Section, and thanked by B. L. Davis.

SASKATCHEWAN BRANCH

D. W. Houston, M.E.I.C. - *Secretary-Treasurer*
L. A. Dokken, M.E.I.C. - *Branch News Editor*

The annual meeting of the Saskatchewan Branch was held Friday, February 19th, 1947, at the Saskatchewan Hotel in Regina with over ninety members in attendance. Morning and afternoon sessions were devoted to business and a good turnout of the general membership was in evidence. Reports from committee chairmen of both Regina and Saskatoon Branches were heard and approved. The secretary reported an increased membership and an improved financial condition of the Branch.

At six thirty an informal reception was held, followed by dinner, at which the guest speaker was the Hon. J. L. Phelps, Minister of Natural Resources for the Province of Saskatchewan. Mr. Phelps outlined the problems of his department when planning the development of the various resources in the Province. He stressed the fact that in many cases plans had been made on projects which can not be carried out at present due to the lack of trained men, notably engineers. As such the long range view must be taken, and in the interim the department is endeavouring to train men by the medium of short courses of instruction which will enable them to get by "until such time as the trained engineers are available". Mr. Phelps commented briefly on each of the resources to which attention is being given, and spoke of the difficulties he has encountered in each of the projects inasfar as immediate large scale development is concerned.

W. O. Longworthy, in thanking the speaker, said that he was pleased that the problem of natural resources development was considered by Government officials to be essentially a technical one, and that he felt sure that the utmost co-operation of the engineering bodies could be counted upon in assisting the development of the various projects.

In the absence of Chairman-elect E. K. Phillips, Vice-chairman Stewart Young tendered his appreciation to the speaker and declared the meeting adjourned.

❖ ❖ ❖

The regular monthly meeting of the Saskatchewan Branch was held on Friday, March 14th, 1947, at the Kitchener Hotel in Regina.

Branch Chairman E. K. Phillips presided, and after the introduction of guests, announced that the chairmanship of the monthly dinner meetings would be rotated among members of council, the next chairman being E. S. C. Carpenter. He then introduced the speaker of the evening, J. H. Palmason, superintendent of operation, Western Region, Canada Creosoting Company.

The speaker discussed **Methods of Wood Preserving** and first commented briefly on the importance of the field to the nation and gave statistics to show the volume of creosoting business handled throughout the Dominion. Although "tie" treating for the railways constituted the bulk of the work, an ever increasing amount of "pole" and "pile" treating is being done.

The methods used to treat various materials were outlined, and the process for "butt treating" and the three basic pressure systems were described. It is most important to have the wood in a good condition to absorb the creosote and oil mixture, absence of free moisture and air being especially helpful. Air seasoned wood gave best results, but fair results are being obtained with artificially seasoned material. This process was developed as part of the war emergency programme.

The speaker then discussed various treatment control methods, e.g. depth of penetration and amount of absorption, and illustrated the effect of wood cellular structure in obtaining the quality of treatment required. Cedar gives best results, and woods such as fir are very difficult to treat since the penetration is not uniform. Research on wood treating is being carried on with the hope of being able to guarantee proper treating of most woods in the near future. The shortage of cedar is bringing out the substitute woods and the problem is being tackled by the wood treating industry.

Figures show the average life of an untreated tie to be ten years, whereas treating adds at least eighteen years to this figure. Railway statistics show a saving of 8.1c a year on each treated tie as compared to the untreated, and the total estimated annual savings to all Canadian Railways will approximate eleven million dollars.

E. Durnin, in thanking the speaker, mentioned that due to the predominance of "power" men and highway engineers in our merbership, the information on "pole" and "pile" treating was especially interesting. Mr. Durnin pointed out also that the whole field had been clearly outlined by the speaker and thanked Mr. Palmason for the work and attention he had given the subject.

TORONTO BRANCH

E. G. Tallman, M.E.I.C. - *Secretary-Treasurer*
E. R. Graydon, M.E.I.C. - *Branch News Editor*

Labour Relations and the Engineer was the subject at the March meeting of the Toronto Branch, held in the Debates Room, Hart House, at the University of Toronto. Chairman Edgar Cross presided, and Professor R. F. Legget introduced the speaker, W. F. Clive Kidd.

Mr. Kidd graduated from the University of British Columbia and took post-graduate studies in Economics at the University of Toronto. As research director of the United Steelworkers of America, at Toronto, Mr. Kidd was closely concerned with the critical labour negotiations of the past few years and was able to present an intimate review of these with particular attention to the steel industry.

Mr. Kidd's talk was roughly divided into two parts: the strikes in 1946, and union plans for 1947. His remarks applied not only to his own union, but to all associated Canadian Congress of Labour unions.

Strikes in 1946 were attributed to five main factors: the drop in take-home pay; rise in cost of living; the desire of management for a test of strength; the attitude of the government; and the desire for a rise in the workers' standard of living. Mr. Kidd discussed all these points thoroughly, giving much background material other than that which appeared in the papers.

For 1947, no co-ordinated policy for C.C.L. unions had been established as yet. The unions' aims in general terms were full employment, expansion of purchasing power in the lower income brackets, and assistance in stalling off any chance of business recession before it starts.

Mr. Kidd closed with some general remarks regarding profits and distribution of the national income. He presented government statistics indicating that in 1942 45 percent of the workers earned less than $1,000 and received 16 percent of the national income; 82 percent earned less than $2,000 and obtained 50 percent of the national income; about 2 percent earned more than $5,000 and received 13 percent of the national income.

The speaker suggested the possibility of an over-production of capital goods and an under-production of consumer goods if present trends continue, and closed with the hope that no further test of strength will be necessary in union activities.

Over 100 branch members listened to Mr. Kidd's talk with great interest and a very lively discussion followed.

WINNIPEG BRANCH

R. T. Harland, M.E.I.C - - *Secretary-Treasury*

A joint general meeting of the Manitoba Association of Professional Engineers and the Winnipeg Branch of the Engineering Institute, held March 14 at the University of Manitoba, was addressed by F. L. Lawton, assistant chief engineer, Aluminum Company of Canada, Limited, Montreal, on the subject **The Economics of Water Diversion.**

Mr. Lawton drew attention to the invisible waterpower available in many parts of the world, and especially Canada, which can be developed by diverting water from one watershed to another. He noted that such waterpower is frequently overlooked by governmental agencies and the public generally, who commonly think waterpower is associated only with such visible sites as water falls and rapids.

He went on to state that experience in hydro-electric power development has amply demonstrated the parable of the buried talent. The time to develop waterpower, particularly a diversion, is as soon as possible. Every delay not only increases the cost of making the development, but also increases the interference occasioned by the claims of other parties that their rights are being invaded. If the delay is long enough, then due to the actual construction of private and public works which conflict with the plans of the development, the cost of materialization becomes so great that it is uneconomical to proceed and the opportunity to create the power is lost. On the other hand, if the job had been tackled earlier, the private and public works, instead of interfering, could have proceeded equally well and probably even more rapidly as one of the results of the power developed.

The address was illustrated with diagrammatic lantern slides and figures covering a wide range of diversion developments in Canada, the United States, Brazil, Germany, Norway and other countries the world over. The whole address seemed to emphasize the universal and international nature of the engineering art as applied to the development of hydro-electric power for man's use.

Some 50 engineers were in attendance at the meeting, and H. W. McLeod presided.

AN URGENT REQUEST

Would members who do not file the *Journal* kindly return their March 1947 copy to headquarters.

Due to difficulties at the printers, fewer copies have been printed than had been ordered and the needs of several libraries have not been filled.

Library Notes

BOOK REVIEW

PIEZO—ELECTRICITE; THEORIE ET PRATIQUE

Ed. Palmans. Editions Techniques P. H. Brans, Anvers; 1946 161 pp., illus., 150 Fr.

Reviewed by G. E. Sarault, m.e.i.c.*

This compact little book contains considerable information in its 150-odd pages. It is profusely illustrated by numerous well executed drawings and a few excellent photographs. A bibliography of 97 references is given to articles in European and American technical publications. It is divided in two parts: Part I—The physics viewpoint; Part II—The practical applications.

The first chapter is devoted to a study of crystal structures in general with special reference to characteristic symmetries and their reference to the piézo-electric properties. The resonance phenomenon in crystals is treated in the second chapter; various oscillation modes are considered, the most important "cuts" employed are described, and the frequency variation with respect to temperature is well covered. The usual equivalent electrical circuit is analyzed and formulas are derived for the L, R and C elements. The third chapter gives an interesting explanation of the piézo-electric effects based on the molecular structure of the crystals.

Chapter one of Part II covers the use of Rochelle salt crystals as electro-acoustic transformers. Pickups, microphones, cutters, phones are considered in turn; detailed information being given on principles of operation, construction, properties and characteristics. The 33 pages of chapter two are of primary interest to radio engineers, being devoted to applications of the resonance properties of crystals; impedance-frequency characteristics are derived from equivalent electrical circuits, frequency stability of a few oscillator circuits is considered and general notes are given on frequency measurements, quartz filters and ultra-sonic sounders.

The book is intended for the general technical reader who desires basic information on the subject; it should prove of considerable interest to all radio engineers or others interested in crystal applications, who have a reading knowledge of French.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS

Applied Engineering Mechanics:
Alfred Jensen. N.Y., McGraw-Hill; Toronto, Embassy, 1947. 316 pp., illus., cloth.

Bibliography of Soil Science, Fertilizers and General Agronomy, 1940-1944:
Imperial Bureau of Soil Science, Harpenden, England, 1946. 567 pp., cloth.

City and Regional Planning Papers:
Alfred Bettman; edited by Arthur C. Comey. Cambridge, Harvard University Press, 1946. 294 pp., cloth.

Construction des Avions; 2d ed:
Guy Du Merle. Paris, Dunod, 1947. 855 pp., illus., paper.

Encyclopaedia Britannica; a New Survey of Universal Knowledge:
Chicago, Toronto, Encyclopædia Britannica, c1947. 24 volumes, cloth.

Engineering Problems Manual; 4th ed:
Forest C. Dana and Lawrence R. Hillyard. N.Y., London, McGraw-Hill; Toronto, Embassy, 1947. 419 pp., illus., cloth.

Ganaraska Watershed, a Report on:
A. H. Richardson. Toronto, King's Printer, 1944. 248 pp., illus., paper.

Introduction to Aerodynamics of a Compressible Fluid:
Hans Wolfgang Liepmann and Allen E. Puckett. N.Y., Wiley; London, Chapman & Hall, c1947. 262 pp., illus., cloth. (Calcit Aeronautical Series.)

Metal Working and Heat-Treatment Manual, Volume 2; Alloy Steels, Cast Iron and Non-Ferrous Metals:
F. Johnson. London, Paul Elek (1947). 226 pp., illus., cloth.

Consulting Engineer and Professor, Department of Electrical Engineering, Laval University, Quebec City, Que.

Book notes, Additions to the Library of The Engineering Institute, Reviews of New Books and Publications

Operation of Job Evaluation Plans; a Survey of Experience:
Helen Baker and John M. True. Princeton, Princeton University. Industrial Relations Section, 1947. 111 pp., paper.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

INTRODUCTION TO PRODUCTION CONTROL:

D. Tiranti, with the collaboration of W. F. Walker. Chapman & Hall, London, 1946. 159 pp., illus., cloth, 15s.

This book is intended as an introduction to the subject of production control. The method and working of a production control system is explained in a practical manner, and the many charts and diagrams help to make clear the details involved.

The principal chapters in this book include: Relationship of Production Control to Factory Organization; Written Standard Practice; Forms; Charting; Pre-Production; Target Date; Time Cycle; Routing and Despatching; Detail Arrangements for Control and Progress of Work in the Shops.

RADIANT HEATING:

T. Napier Adlam. Industrial Press, N.Y., 1946. 472 pp., illus., cloth, $6.00.

Intended for engineers, contractors, architects, builders and others concerned with building heating and snow melting for walls, driveways or airports, "Radiant Heating" is primarily a working manual on the subjects.

Practical in its approach, this book covers information on theory of heat radiation, artificial heating as related to bodily heat losses, measurement of comfort, determining mean radiant temperature, temperature studies in radiant heated rooms, radiant heating with ceiling panels, radiant heating with floor panels, use of wall panels, metal panels, and electricity, air venting and flow adjusting, controls for radiant heating, areas and surface temperatures of radiant heat panels, determining panel type size, spacing and heat input, radiant cooling and air conditioning, snow melting by embedded pipes, etc.

Data resulting from the author's own tests on effect of floor coverings are also included. Formulas have been reduced to the simplest terms consistent with sufficient accuracy to meet practical requirements, and simple easy-to-use charts give most of the essential design data without calculation. Exact step-by-step procedure in designing and installing radiant heating systems is summarized.

Mr. Adlam, the author, is a recognized authority on radiant heating.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

ATOMIC THEORY for Students of Metallurgy (Institute of Metals Monograph and Report Series No. 3).

W. Hume-Rothery. Institute of Metals, 4 Grosvenor Gardens, London, S.W.1, 1946. 286 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, 7s.6d.

This book was written primarily to provide the general background of atomic theory required for the effective understanding of the electron theory of metals. The first half of the book presents this necessary background on a thorough mathematical basis, while the second half develops the metallurgical aspects with emphasis on the properties of metals, conductivity, emission, magnetism, etc., for which the underlying theories provide a direct explanation. Intended for advanced students and research workers in metallurgy, much of the subject matter should also be of interest to chemists and physicists.

Bellman Publishing Company (American Industries Series):

No. 4. ALUMINUM INDUSTRY, *by S. V. Malcuit. 36 pp.*
No. 5. PLASTICS INDUSTRY, *by B. L. Crandall. 36 pp.*
No. 6. REFRIGERATION INDUSTRY, *by D. C. Choate. 32 pp.*

Bellman Publishing Company, 83 Newbury St., Boston, Mass., 1946. Illus., tables, 9 x 6 in., paper, $1.00 each.

Three of a series of pamphlets intended to present an over-all account of a large number of basic American industries, as well as information about the "jobs" that comprise these industries. The job information part provides material on personal qualifications and scholastic training needed, remuneration, chances for advancement, possibilities for both men and women in the industry, and a statement of advantages and disadvantages. A feature of each pamphlet is the analytical index of occupations in the particular industry, with brief descriptions farther along of the duties of the various jobs listed.

CITY and REGIONAL PLANNING PAPERS:

A. Bettman, edited by A. C. Comey. Harvard University Press, Cambridge, Mass., 1946. 294 pp., tables, 10 x 7 in., cloth, $4.50.

This book contains a selection of the published papers of a noted lawyer and city planning advocate. In Part I are collected a group of 24 important papers on various aspects of city and regional planning. Part II consists of two of the author's most important law briefs, relating to the constitutionality of zoning and to public housing. Part III presents two contributions in the presentation of model drafts for statutes. Part IV is a bibliography of Alfred Bettman's published writings on planning and housing from 1917 to 1945.

Le COBALT:

R. Perrault, preface by P. Chevenard. Dunod, Paris, 1946. 151 pp., illus., diagrs., charts, tables, 10 x 6½ in., paper, 390 frs.

This comprehensive work opens with a brief historical introduction concerning cobalt and its early uses. The following two sections describe the minerals containing cobalt and the location and nature of the important deposits. Processes for the concentration and extraction of cobalt are given, including the electrolytic method. Mechanical and chemical properties of cobalt are discussed, and a large section is devoted to a detailed survey of its applications, including uses of its oxides and salts. The final chapter gives briefly some production and consumption figures and various price quotations. *(Continued on page 248)*

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

April 30th, 1947

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the June meeting.

L. Austin Wright, General Secretary

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professionl responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practial experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BELSHAW—FRANK, of Sarnia, Ont. Born at Brantford, Ont., Sept. 12, 1922. Educ.: B.A.Sc., (Mech.), Toronto, 1946; 1940-42, apprent., mech. engr., Waterous Ltd., Brantford, Ont.; 1943, (summer), jr. dftsman., Waterous Ltd.; 1944, (summer), dftsman., Goodyear Tire & Rubber Co., New Toronto; 1945, (summer), dftsman., Waterous Ltd., Brantford; 1946 to date, drfsman., Imperial Oil Limited, Sarnia, Ont.

References: C. P. Sturdee, W. A. Williams, M. L. Walker, R. L. Piper, R. Neave, G. L. Macpherson.

BLOCH-HANSEN—FELIX ALBIN LEOPOLD, of Hamilton, Ont. Born at Hillerod, Denmark, Jan. 24, 1898. Educ.: Technologish Institute, Denmark, 1919-20; 1920-21, testing and research of turbines, Atlas Turbine Mfg. Co., Copenhagen; 1922-26, chief engr., and mech. supt., complete charge of boiler turbines and machinery on ships, J. Lauritzen Gronningen, Copenhagen, Denmark; 1926-41, complete charge of bldg., boilers and all prod. machinery and new constrn., Canada and McCormick Biscuit Co.; 1941-45, Lieut. Engr., R.C.N.R.; 1946 to date, erection and modification of all brewing and bottling machinery incl. boilerhouse, refrigeration system and general service, supvr. of bldg., erection, sub-contracts work and purchase and instln. of all new machinery, Peller Brewing Co., Ltd., Hamilton, Ont.

LIBRARY NOTES *(Continued from page 246)*

COSMIC RADIATION, Fifteen Lectures:

Edited by W. Heisenberg, translated by T. H. Johnson. Dover Publications, New York, 1946. 192 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $3.50.

The fifteen lectures collected in this book were presented in Germany in 1941 and 1942. They are broadly grouped as follows: an introductory review of the present state of knowledge of cosmic radiation; two papers on the cascade theory; nine papers dealing with mesons; two papers on nuclear particles; and one paper on geomagnetic effects. Although the work of several authors, the material is well integrated, with cross-references and a consistent notation. A general view is given of recent accomplishments and outstanding problems in this branch of physics. There is a general index.

FUNDAMENTALS of INDUSTRIAL ELECTRONIC CIRCUITS:

W. Richter. McGraw-Hill Book Co., New York and London; Embassy, Toronto, 1947. 569 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.50.

Striking a middle course between the popular treatment and the exhaustive treatise, this book aims to show the fundamental principles applying to circuits containing vacuum tubes. These circuits are reduced to a combination of more familiar circuit elements so that the average electrical engineer and practical man can analyze the performance of the circuits and can design them himself. Illustrative sketches, circuit diagrams, and practical problems effectively supplement the text material.

INTRODUCTION TO AERODYNAMICS OF A COMPRESSIBLE FLUID (Ga cit Aeronautical Series):

H. W. Liepman and A. E. Puckett. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 262 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth. $4.00.

The material presented in this book is designed to furnish the reader with a background of fundamentals in this increasingly important subject to enable him to understand and systematize observed compressibility effects and to approach the more mathematical literature of the subject. The first part of the book stresses basic phenomena under simple geometrical conditions, with a discussion of elementary one-dimensional gas dynamics. Part II takes up the more difficult subject of general two and three-dimensional equations and some of the approximate methods of solving them.

MATRIX and TENSOR CALCULUS with applications to Mechanics, Elasticity and Aeronautics (Galcit Aeronautical Series):

A. D. Michal. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 132 pp., diagrs., tables, 9¼ x 6 in., cloth, $3.00.

Matrix calculus and tensor calculus are dealt with separately in the two parts of this book. The minimum of mathematical concepts is presented in the introduction to each part, with the more advanced mathematical ideas being developed as needed in connection with the material on applications. Although the emphasis is on aeronautical and mechanical applications, such as vibrations, aircraft flutter, elasticity, hydrodynamics, and fluid mechanics, the purpose is to provide a working knowledge of use in many technical fields.

PANEL HEATING and COOLING ANALYSIS:

B. F. Faber and F. W. Hutchinson. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 208 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $4.20 (in Canada).

The first four chapters of this new book present non-technical, descriptive material on the background, development, advantages, disadvantages, and types of installations of panel heating and cooling systems. The second and largest section, Chapters V to XI, contains a detailed and rigorous treatment of the theory of radiant exchange and the mathematical analysis of panel systems. The last two chapters discuss simplified design procedure and the concept of "equivalent conductance". It should be noted that the design procedure, as developed, is applicable to all system types whether energized by hot water, steam, warm air, or electricity.

PRINCIPLES AND PRACTICE OF SURVEYING, Vol. 2. Higher Surveying:

C. B. Breed and G. L. Hesmer. 6 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 674 pp., illus., diagrs., charts, tables, 7½ x 4½ in., cloth, $5.40 (in Canada).

The five sections of this standard work have been generally revised to conform to current practice. Topics covered are as follows: Part I, Survey control, astronomical observations, leveling practice; Part II, Topographical surveying by the stadia method and by the plane-table method, with discussion of the relation of geology to topography; Part III, Ground, aerial, and stereo-photogrammetry; Part IV, Hydrographic surveying and stream gaging; Part V, Constructing and finishing maps. Effectively illustrated, the volume also contains some 30 pages of tabular data in addition to that included with the text. Methods for the adjustment of triangulations and level circuits are appended.

RESISTANCE OF MATERIALS:

F. B. Seely. 3 ed., John Wiley & Sons, New York; Chapman & Hall, London, 1947. 486 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $4.00.

Part I of this standard text is concerned with the generalized basic aspects of the subject; the main problem being the determination of the relationships between the loads acting on a member and the resulting stresses and deformations in the member. Part II deals with more specialized topics such as particular kinds of stresses or structural members which may be dealt with independently. The emphasis throughout is on the engineering significance of the subject, with consideration given to altered conditions resulting from recent technological developments.

ROADWAY AND TRACK:

W. F. Rench. Simmons-Boardman Publishing Corp., New York, 1946. 350 pp., illus., diagrs., tables, 9¼ x 6 in., cloth, $5.00.

Modern methods of roadway and track maintenance are described and illustrated in the new edition of this standard practical handbook. While the utilization of mechanical equipment is featured, methods in use where such equipment is not available are also covered. Part III on special problems and duties includes the economics of track labour, safety precautions, and the investigation of train accidents.

TABLES OF SPHERICAL BESSEL FUNCTIONS, Vol. 1:

Prepared by the Mathematical Tables Project, National Bureau of Standards. Columbia University Press, New York, 1947. 375 pp., tables, 10¾ x 8 in., cloth, $7.50.

In the theoretical analysis of wave motion, solutions of various coordinate systems are necessary, and in certain ones Bessel functions are involved having orders equal to one-half an odd integer. The present volume provides tables to seven or more significant figures for the spherical Bessel functions of orders $\pm(n+1/2)$ where $n=0$ to 13 with an interval of 1, and for a range of X from 0 to 10 with intervals of .01 and from 10 to 25 with .1 intervals. The customary detailed explanatory introduction is included, and a list of the previous publications of the series is appended.

UNIONIZATION OF PROFESSIONAL ENGINEERS AND CHEMISTS:

H. R. Northrup. Industrial Relations Counselors, New York, 1946. 52 pp., 9¼ x 6 in., paper, $1.50. (Industrial Relations Monograph No. 12.)

No. 12 of this series of studies examines the union movement among engineers and chemists of professional status. Existing unions, the reasons for unionization, the attitude of the professional societies, Labour Relations Board decisions, and collective bargaining activities are discussed in a brief, factual manner.

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER, required by a chemical firm in Shawinigan Falls, Quebec, for development work on plastics. Salary open. Apply to File No. 3812-V.

CIVIL

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEER, age 35-40, with considerable experience in design of structures, water supply, sewers, required by an organization in Montreal. Salary $300-$400. Apply to File No. 3820-V.

JUNIOR CIVIL ENGINEER, required by a firm of contractors in Montreal, for general duties in connection with construction. Salary according to experience. Apply to File No. 3822-V.

CIVIL ENGINEER required to act as superintendent and assistant to general contractor in Shawinigan Falls. Must be bilingual. Salary $300-$400 Apply to File No. 3827-V.

JUNIOR CIVIL ENGINEER, required in the Province of Quebec for the locating of roads and highways. Salary $250 up plus expenses. Apply to File No. 3830-V.

ELECTRICAL

ELECTRICAL ENGINEER with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

ELECTRICAL ENGINEER required by a manufacturer in Western Canada to be in charge of production. Preferably between 30 and 40 years with desire to earn or buy interest in the business. Salary $4,000 up. Apply to File No. 3815-V.

JUNIOR ELECTRICAL ENGINEER required by a Montreal firm for inspection of electrical equipment of all kinds, in Toronto area. Salary $225. Apply to File No. 3816-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with broad practical experience and theoretical knowledge required for a firm in Quebec. Salary from $225. Apply to File No. 3818-V.

ELECTRICAL ENGINEER, recent graduate up, preferably with experience in audio circuits design and maintenance also practical knowledge of fractional horsepower motors and wiring layouts, required to eventually take charge of sound maintenance for motion picture studio in Ontario. Salary open. Apply to File No. 3826-V.

MECHANICAL

JUNIOR MECHANICAL ENGINEERS, required by a Montreal manufacturer of machines and equipment for mechanical type of work such as machine design, etc. Salary $175 up. Apply to File No. 3664-V.

MECHANICAL ENGINEERS, with experience in plant layout and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER, age 35-40, with considerable experience in design and layout of machinery and equipment, required by an organization in Montreal. Salary $300-$400. Apply to File No. 3820-V.

MECHANICAL ENGINEERS, preferably with experience in machine design, required by a steel fabricating firm in Montreal for design and layout. Salary open. Apply to File No. 3824-V.

MECHANICAL ENGINEER with considerable experience, required to supervise installation of coating machine also design necessary, tankage and piping systems, for a paper mill in Ontario. Salary around $400. Apply to File No. 3828-V.

MECHANICAL ENGINEERS, required by a pulp and paper mill in Ontario for design and layout also mechanical installations. Salary around $300. Apply to File No. 3828-V.

JUNIOR MECHANICAL ENGINEER with sales experience and good knowledge of Montreal, required for sale of power house equipment. Preferably bilingual. Salary $200-$250. Apply to File No. 3831-V.

MECHANICAL ENGINEER, required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work, required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MINING

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MISCELLANEOUS

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted to File No. 3780-V.

STEAM PLANT ENGINEER for large concern in Eastern Townships, with at least 5 years practical experience. Must be familiar with thermo-dynamics, combustion control, steam turbines, mechanical refrigeration, hydraulics, etc. Permanent position and attractive salary for the right man. Apply to File No. 3791-V.

CHIEF ENGINEER required for coal stripping and mining operations in Alberta, would also have responsibilities in highway construction in this Province. Minimum salary $6,000. Apply to File No. 3814-V.

ASSISTANT GENERAL MANAGER to be in charge of all coal development operations in Alberta and some highway contracts. Salary $8,000 to $10,000. Apply to File No. 3814-V.

INDUSTRIAL ENGINEER with broad experience in plant development, operation, costs and management required for a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

GRADUATE ENGINEER, preferably with chemical and industrial experience, required to supervise operations at the Sodium Sulphate Plant now being constructed at Chaplin, Sask. Salary open. Apply to File No. 3821-V.

DRAUGHTSMEN required by a pulp and paper mill in the Eastern Townships for general draughting and detailing. Three or four years experience preferred but not essential. Salary open. Apply to File No. 3823-V.

CAPABLE JUNIOR ENGINEER, required to represent Canadian manufacturer in France. Must be fluently bilingual. Salary open. Apply to File No. 3825-V.

DRAUGHTSMAN, preferably with mechanical background, required by a manufacturer in Montreal for design work on electrical equipment. Salary open. Apply to File No. 3829-V.

SALES ENGINEER, preferably with sales experience, required by an oil company in Montreal for sales engineering of industrial oils and greases in Eastern Ontario. Considerable travelling. Salary open. Apply to File No. 3832-V.

DEPUTY DIRECTOR OF IRRIGATION, Ceylon, must be Corporate Member of the Institute of Civil Engineers or possess degrees or diplomas recognized by that body. Technical duties include designing, estimating for and reporting on schemes of irrigation water supply and flood protection and checking the construction costs of such schemes. Apply to File No. 3834-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a petroleum refining company in Montreal for process and design work. Salary about $225. Apply to File No. 3575-V.

CHEMICAL ENGINEER required as assistant professor of chemical engineering in a Canadian university to start autumn 1947. Salary open. Apply to File No. 3600-V (D).

CHEMICAL ENGINEERS OR CHEMISTS for analytical work in the laboratory of an industrial firm in Central Ontario. Salary from $175. Veteran preferred. Apply to File No. 3642-V.

CHEMICAL ENGINEER. preferably with sales experience, for sales and service with an industrial firm in Central Ontario. Salary open. Apply to File No. 3642-V.

CHEMICAL ENGINEERS, both with experience and recent graduates, required by an industrial organization in the St. Maurice Valley. Salary open. Apply to File No. 3644-V.

CHEMICAL ENGINEER recent graduate up, to be assistant to the department superintendent of a tar distillery in the Toronto area. Salary $225. Apply to File No. 3674-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

JUNIOR CHEMICAL ENGINEER required for the control department of a paper mill in Shawinigan Falls. Salary from $175-$275. Apply to File No. 3765-V.

CHEMICAL ENGINEER OR CHEMIST interested in textile dyeing, required by an industrial firm in South Western Quebec. Salary open. Apply to File No. 3798-V.

CHEMICAL ENGINEER, with pulp and paper experience, required by a firm of consulting engineers in Montreal, for design and research. Salary according to experience. Apply to File No. 3799-V.

CHEMICAL ENGINEER with knowledge of how to treat sulphate or failing this sulphite and soda pulp, required as Regional Manager by a large paper company in Northern Ontario. Executive and management ability necessary. Permanent position. Salary $15,000. Apply to File No. 3808-V.

CIVIL

CIVIL ENGINEER with experience in the mechanical trades required as designer by a building contractor in Quebec, age 30-35, salary open. Apply to File No. 3444-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position, salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER, senior designer, experienced in reinforced concrete and structural steel and general building construction, required to take charge of structuraldesign staff for a firm of consulting engineers in Montreal. Salary $300-$400. Apply to File No. 3585-V.

CIVIL ENGINEERS with master's degree, teaching and consulting experience, age 28-40, required for the staff of a university in N.Y. State. Salary open. Apply to File No. 3600-V (C).

CIVIL ENGINEER, preferably with railroad experience, required by a company engaged in large scale asbestos production in Quebec to supervise construction of local railroad. Salary open. Apply to File No. 3683-V.

CIVIL ENGINEER, recent graduate up, required for government organization on West Coast, to carry out field surveys, investigations of water resources and their application and to make reports, maps, plans, etc. Salary $200 up. Apply to File No. 3724-V.

CIVIL ENGINEER, with at least five years' experience, to be assistant to the Director of Community Planning of the Province of Saskatchewan. Starting salary $200-$250. Apply to File No. 3746-V.

CIVIL ENGINEER with experience in survey and construction, preferably bilingual, required to take charge of the engineering department for the woods operations of a paper company in Eastern Quebec. House available. Salary $350 up. Apply to File No. 3749-V.

CIVIL ENGINEER, qualified O.L.S., required as town engineer and superintendent of works for a town in Central Ontario. State age and salary desired. Apply to File No. 3750-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years' experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

GRADUATE CIVIL ENGINEER, required as structural designing engineer by a firm engaged in the manufacture of cranes, crushers, pumps, etc., in the Toronto area. Preferably with 5 to 10 years' experience in designing and detailing steel buildings and bridges. Salary open. Apply to File No. 3771-V.

CIVIL ENGINEER is required to act as Town Engineer and take complete charge of the engineering service of a town in Ontario. Maximum salary $3,000. per annum. Apply to File No. 3782-V.

GRADUATE CIVIL ENGINEER required by an industrial corporation in Montreal for design work in draughting room. Must be familiar with structural steel and concrete design. Position offers good opportunity and permanency to right man. Salary from $250 up according to experience. Apply to File No. 3785-V.

SEVERAL CIVIL ENGINEERS, with two or three years' experience in road construction required for road building work in Northern Quebec. Salary open. Apply to File No. 3804-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters. English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to File No. 3415-V.

ELECTRICAL ENGINEER age 30 - 45 with sales training with large manufacturer of electrical equipment instruments and 5-10 years experience as sales service and sales engineer required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment Veterans preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER with knowledge of power apparatus, preferably bilingual, required for sales work with a manufacturer in the Montreal area. Salary open. Apply to File No. 3646-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER with several years experience required as a designer by an industrial organization in Montreal. Salary open. Apply to File No. 3677-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35, salary open. Apply to File No. 3695-V.

ELECTRICAL DRAUGHTSMAN with several years' experience in industrial layouts for large concern in Eastern Townships. Permanent position and attractive salary available for experienced men. Apply to File No. 3701-V.

ELECTRICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

ELECTRICAL ENGINEER, with at least five years experience on overhead and underground transmission and distribution systems. Required as distribution engineer by a public utility in Brazil. Salary open. Apply to File No. 3738-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with considerable industrial experience and initiative required by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER with estimating and contract experience, required as office engineer by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200. up. Apply to File No. 3761-V.

GRADUATE ELECTRICAL ENGINEER with 5 or more years experience in electrical equipment of buildings, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

GRADUATE ELECTRICAL ENGINEER with at least three years experience, preferably construction required by a manufacturer in Central Ontario, to supervise electrical installations on construction jobs. Salary open. Apply to File No. 3775-V.

GRADUATE ELECTRICAL ENGINEERS with 3 to 10 years experience in design, operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

GRADUATE ELECTRICAL ENGINEER, required to train as Sales Engineer with National organization. Permanent position. Must be prepared to be stationed in Alberta or Saskatchewan. Reply giving full particulars. Enclose photo when answering. Apply to File No. 3790-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

MECHANICAL

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to File No. 3393-V.

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area, in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEER with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER from recent graduates up, preferably with paper and pulp experience, required by a firm in the St. Maurice Valley. Salary according to experience. Apply to File No. 3573-V.

MECHANICAL ENGINEERS to be design squad leaders on heavy machinery design required by a company in Central Ontario. Salary open. Apply to File No. 3623-V.

MECHANICAL ENGINEER recent graduate, required by an industrial firm in south western Quebec, for the design and erection of complex textile machinery. Salary open. Permanent position. Apply to File No. 3625-V.

MECHANICAL ENGINEER with experience in the fabrication of Farm Implements, required by a Quebec firm. Bilingual man preferred. Salary according to experience. Apply to File No. 3666-V.

MECHANICAL ENGINEER with experience in the design of industrial machinery required by a Montreal firm manufacturing custom built machines. Salary $200-$250. Apply to File No. 3669-V.

MECHANICAL ENGINEER with design experience in the pulp and paper industry required by a firm with headquarters in Montreal. Salary $350. Apply to File No. 3673-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEER with industrial or construction experience, required by a firm of consulting engineers to inspect machinery deliveries in the Cornwall area. Salary open. Apply to File No. 3691-V.

MECHANICAL ENGINEER, recent graduate up, required for maintenance and production engineering by an industrial firm in Montreal. Salary open. Apply to File No. 3692-V.

MECHANICAL ENGINEERS, age 25-35, required by a manufacturer in Montreal, for training as sales engineers and for executive positions. Salary from $200. Apply to File No. 3710-V.

JUNIOR MECHANICAL ENGINEER, under 30 and preferably bilingual, required by a Montreal firm to train as sales engineer for pumps, engines and allied electrical equipment. Salary open. Apply to File No. 3714-V.

MECHANICAL ENGINEER, under 45, with at least ten years' experience in design of heating, ventilating and refrigeration layouts, required as heating engineer for a government organization on West Coast. Salary $250-300. Apply to File No. 3724-V.

YOUNG MECHANICAL ENGINEERS, with practical experience either in automotive or general manufacturing industries, together with ability to operate engineering office systems, required by an industrial organization in Ontario. Salary open. Apply to File No. 3732-V.

MECHANICAL ENGINEERS, with at least five years' experience in the Pulp and Paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

JUNIOR MECHANICAL ENGINEER with industrial experience required as assistant to the plant engineer in a factory in the Montreal area. Salary about $225. Apply to File No. 3758-V.

GRADUATE MECHANICAL ENGINEER, experienced in boiler operation, required as assistant superintendent on maintenance of railroad and tramways rolling stock, in the Quebec area. Salary $200. per month. Apply to File No. 3772-V.

MECHANICAL ENGINEER with 5 or more years experience in heating. ventilating and air-conditioning, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

MECHANICAL ENGINEER, with paper mill or mining experience required for design and layout by a paper mill in Northern Quebec. Salary $375-400. Apply to File No. 3778-V.

MECHANICAL ENGINEER with considerable experience willing to act as assistant to Mechanical Superintendent of a textile manufacturing concern near Montreal. Salary open. Apply to File No. 3784.-V

MECHANICAL ENGINEER, recent graduate up, required by a Pulp and Paper Company in the Province of Quebec for work entirely centred in logging operations. Salary open. Apply to File No. 3789-V.

MECHANICAL ENGINEER, recent graduate up, required by major oil company in Montreal area. Salary $175 up according to experience. Apply to File No. 3792-V.

MECHANICAL ENGINEERS required by a Pulp and Paper mill at Powell River, B.C. Preferably with experience in plant design in the pulp and paper industry. Salary according to qualifications. Apply to File No. 3796-V.

MECHANICAL ENGINEER required to establish and operate an estimating and planning department for the grinding and machine shop of a firm located in Central Ontario. Experience in tools, dies, and shop work essential. Salary open. Apply to File No. 3801-V.

MECHANICAL DRAUGHTSMAN, with several years experience in machine design, required by an industrial organization in Montreal. Salary $250 up. Apply to File No. 3807-V.

MECHANICAL ENGINEER with at least 10 years experience in design and installation of machinery also supervisory ability required by an industrial organization in Montreal, Salary open. Apply to File No. 3807-V.

MINING

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least 5 years practical experience, required by an industrial engineering consultant in Montreal. Apply to File No. 3307-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

DESIGN ENGINEER with considerable experience required by a pulp and paper firm in the St. Maurice Valley. Salary open. Apply to File No. 3573-V.

GRADUATE ENGINEERS, required by a large industrial and chemical organization with headquarters in Montreal for all phases of research design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

ASSISTANT PROFESSORS AND INSTRUCTORS required for the staff of a technical college in New York State. Salary open. Apply to File No. 3600-V. (A)

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL AND MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply to File No. 3628-V by letter with full details. Salary open.

SALES ENGINEER with wide engineering experience wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

MECHANICAL AND STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

ASSISTANT ENGINEER with experience in estimates and specifications for industrial work required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CHIEF DRAUGHTSMAN with at least five years draughting room and related engineering office experience, preferably in pulp and paper or process industries, required by a pulp and paper mill in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CIVIL OR MECHANICAL ENGINEER, required by a pulp and paper company in Newfoundland to look after new development work and general engineering in connection with woods operations. Salary open. Apply to File No. 3655-V.

ASSISTANT PLANT ENGINEER, preferably with pulp and paper or structural design experience, required for a newsprint mill in a city on north shore of Lake Superior. Salary open. Apply to File No. 3657-V.

MECHANICAL OR ELECTRICAL ENGINEERS for training as production engineers with an industrial firm in Montreal. Salary open. Apply to File No. 3662-V.

GRADUATE ENGINEERS for mechanical design, experimental, test and development departments of a Canadian firm producing aircraft gas turbines. Salary open. Apply to File No. 3667-V.

STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3668-V.

JUNIOR ENGINEERS, recent graduates up, as designing draughtsmen for a brewing company with headquarters in Montreal. Salary from $200. Apply to File No. 3670-V.

JUNIOR ENGINEER, recent graduate up, required as surveyor by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3683-V.

CIVIL OR MECHANICAL ENGINEERS with design or structural experience required by a manufacturer of contractors' equipment in the Hamilton area. Salary open. Apply to File No. 3698-V.

JUNIOR ENGINEERS, recent graduate up, required for the engineering staff of a communications company with headquarters in Montreal. Veterans preferred. Salary from $175. Apply to File No. 3713-V.

JUNIOR STRUCTURAL DESIGN ENGINEER required by a steel fabricating firm in Central Ontario. Salary open. Apply to File No. 3715-V.

JUNIOR ENGINEERS, recent graduates up, with mechanical background required by a Montreal manufacturer for the design and supervision of boiler plant installations, preferably bilingual. May have sales work. Salary from $200. Apply to File No. 3722-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

CONSTRUCTION ENGINEER with considerable experience required for the permanent staff of a Montreal inspection company. Salary about $200. Age immaterial. Apply to File No. 3728-V

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DESIGN ENGINEERS, age about 30, with experience in the design and layout of chemical plants, required by an industrial organization in the St. Maurice Valley. Salary from $250. Apply to File No. 3741-V.

DESIGN DRAUGHTSMEN, age about 25, with experience in chemical plant layouts, required by an industrial organization in the St. Maurice Valley. Salary from $200. Apply to File No. 3741-V.

SALES ENGINEER required in the St. John, N.B., district by a firm handling oil purifiers, piston rings and allied engineering products. Salary $250. plus commission. Apply to File No. 3744-V.

SALES ENGINEER, preferably bilingual, required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEERS, recent graduates up, preferably mechanical, required for the engineering and operating staff of a pulp mill in Eastern Quebec. Salary open. Apply to File No. 3748-V.

PUBLICITY ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

GRADUATE ENGINEER, under 40, with industrial and manufacturing experience and some knowledge of sales, required by a bolt and nut manufacturer in the Montreal area. Salary open. Apply to File No. 3752-V.

GRADUATE ENGINEER required by an insurance company in Montreal for the inspection of boilers, steam plant and allied equipment. Salary from $200. Apply to File No. 3754-V.

TECHNICAL GRADUATE, preferably Mechanical, Chemical or Electrical, under 30, veteran preferred, for permanent position with engineering organization. Training period in U.S. Work will include travelling for consultation among leading industrial plants. Enclose photo when answering. Salary open. Apply to File No. 3759-V.

CHIEF DRAUGHTSMAN with experience in Pulp and Paper Mill design wanted immediately in Port Arthur. Reply stating education, experience. Salary open. Apply to File No. 3760-V.

CIVIL, MECHANICAL OR CHEMICAL ENGINEERS, recent graduates up, preferably with experience in petroleum and heavy industry such as chemical or paper, required by an oil company in Toronto. Salary open. Apply to File No. 3762-V.

GRADUATE ENGINEER, with practical experience, production and maintenance, to take charge of Farm Equipment Factory with Grey Iron Foundry, located in Ontario. Apply with photo or snapshot to File No. 3764-V. Salary open.

GRADUATE ELECTRICAL OR MECHANICAL ENGINEER, must have thorough knowledge of fractional H.P. Motors required by a Montreal firm to take charge of small engineering department. Salary $350-$500. Apply to File No. 3770-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

DESIGN ENGINEER to make investigations and preliminary drawings of cost estimates of alterations to buildings and machinery for a large paper mill in the St. Maurice Valley. Salary around $300. Apply to File No. 3779-V.

MECHANICAL OR ELECTRICAL ENGINEER, age 25-35, required as field service engineer, to handle technical refrigeration service and maintain liaison with national distributors, dealers and service organizations, in the Provinces of Canada, for an American firm. Salary $300-350. Enclose photo when answering. Apply to File No. 3781-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years experience in design, cost estimates, draughting, and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

SALES ENGINEER with electrical engineering background in public utility or industrial field required by wire and cable manufacturer for engineering contact work in Ontario. Salary open. Apply to File No. 3788-V giving complete details.

GRADUATE, with some knowledge of looms, weave construction and cloth analysis, required as manager for rayon weaving plant in Peru. Administrative ability necessary. Knowledge of Spanish would be an advantage although not a necessity. Salary open. Apply to File No. 3794-V.

INDUSTRIAL ENGINEER, with two to five years experience in time-study and job evaluation required by a firm in Montreal making rock metal. Salary $200 up. Apply to File No. 3800-V.

GRADUATE CIVIL OR MINING ENGINEER required to take charge of several small instrument parties, for layout work in New Brunswick area. Salary $350. Apply to File No. 3803-V.

MECHANICAL AND ELECTRICAL ENGINEER required by a consulting engineer in Montreal for service engineering. Preferably with design experience in heating and ventilating. Salary $225 up. Apply to File No. 3805-V.

CHEMICAL OR MECHANICAL ENGINEERS, recent graduates, required by an organization in the Montreal area, for experimental and development work, with view to supervisory positions in production. Salary $200 up. Apply to File No. 3806-V.

ENGINEERING DRAUGHTSMEN, required by large transport company in Montreal for work leading to design. Salary $200 to start. Apply to File No. 3809-V.

BRIDGE INSPECTOR required by a large transport company in Montreal area. Salary open. Apply to File No. 3809-V.

RECENT GRADUATES OR JUNIOR ENGINEERS with mechanical background, required by a Montreal Engineering, fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175 up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER, required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

University of Manitoba Requires Engineering Instructors

The Faculty of Engineering and Architecture of the University of Manitoba will require additional instructors for teaching duties beginning with the session 1947-1948. Applicants should be Engineering graduates from recognized Universities. The grades required will be assistant professors, lecturers and demonstrators in Civil Engineering and Mechanical Engineering. Salaries will depend on experience and general qualifications.

Apply as soon as possible to Dean of Engineering and Architecture, University of Manitoba, Winnipeg.

McGILL UNIVERSITY

Chemical Engineering teacher, unit operations and thermodynamics, salary $2,500 to $3,800, depending on qualifications. Apply to Department of Chemical Engineering, McGill University, Montreal 2, Canada.

Situations Wanted

MECHANICAL ENGINEER, M.E.I.C., P.E. Ont., 10 years' experience chemical industry of Ontario. Wishes to locate in West. Apply to File No. 1309-W.

GRADUATE ELECTRICAL ENGINEER, McGill, Jr. E.I.C., P. Eng. (Que.), whose eleven years' experience lie in the fields of specification writing for and supervision of small contract jobs, fire prevention and safety work in heavy and light industry, desires position in production-management line. Recent personal evaluation by prominent firm of Management Consultants in Montreal disclosed high general ability and aptitude for production work. Willing to consider any location in Canada. Age 35. Apply to File No. 1494-W.

YOUNG CIVIL ENGINEER, M.E.I.C., would accept some work at night at home. Preparation of estimates and tenders. At present employed on construction work. Apply to File No. 2128-W.

CIVIL ENGINEER, B.A.Sc., M.E.I.C., P. Eng., ex-R.C.E. Officer with several years experience in municipal, highway and hydraulic engineering. Presently employed but interested in position with municipality or firm where extensive construction and maintenance work is contemplated. Apply to File No. 2463-W.

HYDRAULIC ENGINEER, B.Sc., M.E.I.C., 20 years experience in Hydraulics relative to hydro-electric power development, hydraulic machinery design and manufacture and development in hydraulic turbine design. Experience in handling men. Desires change in position. Apply to File No. 2638-W.

CIVIL ENGINEER, M.E.I.C., Registered Professional Civil Engineer of Ontario, Resident Engineer on large unit price projects plus wide general experience. Available on short notice. Apply to File No. 2651-W.

ELECTRICAL-MECHANICAL ENGINEER, Jr.E.I.C., age 30, graduate of Naval Electrical Engineering Officers course at Nova Scotia Technical College, 1945. Graduate of Naval Electrical Artificer's course at University of Alberta, followed by 6 months of instructional work on same. One year at sea as Chief Electrical Artificer on frigate, in charge of all electrical equipment. Completed apprenticeship as machinest in railway repair shops in design work testing, research and calculations. Available on two weeks notice. Apply to File No. 2693-W.

MECHANICAL ENGINEER, S.E.I.C., P.E.Q., Jun. A.S.M.E., McGill 1946. Age 22. Single. Experience in methods engineering, tool design, heating and ventilating. Would prefer position with an established firm with a machine shop in order to gain shop experience. Suitable position anywhere in Canada acceptable. Available on short notice. Apply to File No. 2707-W.

RECENT GRADUATE ENGINEER—(Civil, electrical, mechanical) B.Sc., S.E.I.C., would accept sales work during spare time, anywhere in Province of Quebec. Apply to File No. 2814-W.

YOUNG MECHANICAL ENGINEER, B.A.Sc. Toronto, S.E.I.C., single, now engaged in product design and development with firm in the Maritimes, would prefer similar work in Southern Ontario requiring more technical and also some artistic ability. Apply to File No. 2818-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., with five years intensive work with large pulp mill, construction, maintenance, estimate, layouts, process development, time study, etc., also experience in public workmanagement: water, sewer, electric system generation, transmission and distribution with full responsabilities of design and work, etc. Services available at short notice. Age 30, married and bilingual. Apply to File No. 2823-W.

GRADUATE MECHANICAL ENGINEER, Toronto '37, M.E.I.C., P.E.Q., with 10 years experience in design, layout and production of power plant and allied equipment. Available on short notice. Montreal area preferred. Apply to File No. 2826-W.

ELECTRICAL ENGINEER, M.E.I.C., graduated '34, desires summer employment (May 20th-Sept. 15th). At present teaching in Electrical Engineering Department of a University in Eastern Canada. Experience: 4 years' Power and Telegraph Line Construction, 3 years Assistant Electrical Superintendent in a Canadian Gold Mine, 3 years' R.C.E. Electrical Distribution Layouts. Apply to File No. 2827-W.

MECHANICAL ENGINEER (Sask. '45), S.E.I.C., one year's experience with Consultant Engineering Firm, desires employment in Plant maintenance or design, preferably in the vicinity of Toronto, Montreal or Winnipeg. Available June 1st. Apply to File No. 2829-W.

METALLURGICAL ENGINEER, expert in research, design and management phases of non-metallic mineral industry. Age 41. Experience includes 10 years as manager. Desires connection in similar capacity with reliable concern. Available April 30th. Apply to File No. 2831-W.

GRADUATE ENGINEER, age 39, bilingual, M.E.I.C., P.E.Q., Ex-R.C.E., with extensive experience on staff work involving planning, organization, administration, procedure and secretarial duties. Varied experience in civil, and electrical engineering including planning, coordination and execution of large projects. Would be interested in position as executive or assistant either in engineering or business organization. Apply to File No. 2832-W.

THE ENGINEERING INSTITUTE OF CANADA

2050 MANSFIELD STREET - MONTREAL

Indexed in The Engineering Index.

Price $4.00 a year in Canada, British Possessions, United States and Mexico. $5.50 a year in Foreign Countries. Current issues, 50 cents a copy, back issues 75 cents a copy. To members and affiliates, 25 cents a copy, $2.00 a year.—Authorized as second class mail, Post Office Department, Ottawa.

COVER PICTURE

All technical papers in this issue relate to the National Research Council Atomic Energy Project at Chalk River, Ont., and were presented at the Diamond Jubilee Meeting of the Institute recently held in Toronto.

The cover picture is one of the first over-all views of the plant to be reclassified from the secret list.

THE DEVELOPMENT AND CONTROL OF ATOMIC ENERGY

GENERAL THE HON. A. G. L. McNAUGHTON, P.C., C.H., C.B., C.M.G., D.S.O., M.E.I.C.
President and Chairman, Canadian Atomic Energy Control Board

An address delivered at the Sixty-first Annual General and Professional Meeting of The Engineering Institute of Canada at Toronto, May 8th, 1947

General McNaughton traces the early developments in research which led to the splitting of the atom. Canada's share in the programme initiated in 1940 for making an atom bomb is told in detail. Steps taken to safeguard our uranium resources are enumerated. The research being carried out at Chalk river for peacetime uses of nuclear energy is discussed.

Steps taken toward international control since VJ day are listed. The American and Soviet plans for control are briefly explained and reasons why most nations favor the former are given. The United Nations Atomic Energy Commission's ffort s to date in attempting to bridge the gap between these two plans are described.

I count it a great privilege to be able to attend the Diamond Jubilee meeting of The Engineering Institute of Canada, and particularly today to have the pleasure of speaking to you briefly on some aspects of a subject which quite literally has burst on the attention of the world with a suddenness and with a violence the like of which has heretofore never even been imagined.

It is now not yet two years since atomic bombs were dropped on the cities of Hiroshima and Nagasaki. The consequence directly attributable to this action was the surrender of the Japanese Empire within a matter of hours, and thus ended the military operations of World War II. The first major use of atomic energy will therefore always be associated in our minds with a proper ending to a terrific long-enduring world-wide ordeal, in which our very existence was in hazard, and in which our conceptions of right and justice and the principles of our way of life had been sustained against the evil which the Axis autocracies had sought to impose on the world. This first use to end a tyranny and to restore peace is for us, and for those who think with us, a good augury into the future as to what the application of atomic energy may mean to the peaceful progress of the world and to the happiness and welfare of men of good will everywhere.

The evidence shows clearly that the possibilities for beneficial peaceful uses of atomic energy are very substantial. The larger industrial uses will naturally require time for development. It is therefore not to be expected that there will be any sudden revolution in the electrical power industry, for example. It seems to be the consensus of opinion of those best informed that the application of atomic power in special circumstances may come within a decade, and that large scale substitutions of atomic energy for coal derived power may require several decades.

Already some important applications are being made in the fields of medicine, of chemistry and of biology, by the use of minute quantities of the radioactive isotopes as tracers in the various processes being studied. Other substances in this category, for example, have been used as catalysts, to promote desired reactions in the cracking of oil and in the production of new plastics. One well known chemist has observed that the use of radioactive catalysts usually resulted in a nasty, sticky mess! This only goes to show, however, that we have yet a lot to learn about how to handle them.

When we come to consider the use of somewhat larger quantities, it has been proved that from a few pounds of the vital source materials, uranium and thorium, energy may be released in amounts capable (if it can be properly used) of heating or lighting a large city for months on end. These possibilities for the special and the larger uses of atomic energy lie in the realm of engineering. Each new idea that may evolve will need the most thorough enquiry and prompt analysis.

I think, therefore, we are fortunate in the decision taken by the President and Council of our Engineering Institute, that this jubilee meeting should be devoted to a study of atomic energy. It is imperative that we as engineers should become fully acquainted with the subject, with all its ramifications, from the location of the minerals in the ground, their mining and extraction, their separation, purification and reduction to metal, to their use in reactors. This is not only on account of the power which may be made available, but also because of the new products of great interest; perhaps also for the effective multiplication of the very materials from which the reactions releasing atomic energy have been started.

At our sessions this afternoon we are to hear addresses by three of the engineers who have been closely associated with the Canadian atomic energy programme. I propose, therefore, to confine my remarks to a brief review of the part Canada has taken in the field of nuclear physics, and to a discussion of some of the national and international aspects of the very acute and far-reaching problems which have been presented for solution.

Chronology of Nuclear Research

Canada has been associated with scientific development in nuclear physics ever since Lord Rutherford began his investigations on radioactivity at McGill University in 1899. In Canada as in other countries research dealing with the fundamental constitution of matter was largely the concern of the Physics Departments of the Colleges and Universities engaged in pure research. It was concerned with driving back the frontiers of human knowledge rather than with any so called "practical" application of the knowledge thus gained.

The theoretical equivalents of mass and energy had come to be accepted during the first decade of this century. For a long time it seemed that this transformation could only be realized on a minute scale. It was not until 1939, with the discovery in Germany that under certain conditions the atom of a particular isotope of uranium would split into two equal parts, that this matter began to assume practical implications. This split, or 'fission', as it came to be called, was accompanied by an enormous release of energy; and the even more spectacular idea was advanced that the process might be made to propagate itself as a "chain" reaction.

Calculations made at the time showed that a ilogram of uranium undergoing fission might release 1 one form or another energy equivalent to perhaps ome 20,000 tons of T.N.T. Thus the possibility pened up of a new weapon of war of fantastic power elative to anything which had previously been used.

Shortly after these discoveries were made, World Var II broke out. The possibility of producing a ecisive weapon based on the principle of fission in chain reaction became of immense importance to ll governments. If this could be done, obviously that ation which succeeded first might well gain thereby he power to eliminate all its enemies. The enormous otential value of the result was quickly recognized y the war leaders of all countries. Nowhere was this nore so than in the United States, where support rew in crescendo on a tremendous scale, in a careully planned and directed programme of mass effort hat swept all obstacles before it.

Never has there been any comparable undertaking r achievement in research and development in vorld history. We can rightly claim for scientists rom the United Kingdom, from Canada and from lsewhere in the British Commonwealth a share in he inception of these undertakings in the evolution f the scientific basis on which progress was made. We can claim a share too in the working out of the ictual methods which were used. But we must pay our generous tribute primarily to the United States, or without their effective participation in production, not even the best ideas could have been transated into accomplishment.

In 1940 information on atomic energy, as well as n other war research projects, was exchanged by the United Kingdom, the United States and Canada. In 1942 a laboratory was established at the University of Montreal, under the direction of the National Research Council, for the further investigation of the atomic energy problem. The staff for this laboratory was recruited not only from among scientists from Britain and Canada, but also from experts in nuclear physics from allied countries the world over. Research in this laboratory was closely co-ordinated with that which was taking place in Britain and the United States. Contributions of value were made to many phases of the joint undertaking.

Canada's Share in the Atom Bomb

In 1943 it seemed that a new way to manufacture and separate a fissionable material for use in a bomb should be studied on a pilot plant scale. Available facilities in the United States were fully taken up in existing research programmes and in production. In the United Kingdom it did not seem wise to attempt to build even a pilot plant, which would be exposed to the hazards of interference or destruction by reason of aircraft or V-bomb attack.

In consequence, Canada undertook the execution of this project. The design was developed in the Montreal laboratories. The plant itself was built at Chalk River, Ontario, where ample supplies of pure water were available from the Ottawa river. This very novel task was executed by a Canadian Company, "Defence Industries Limited", with Canadian engineers, Canadian workmen and Canadian management. I would like here to pay tribute to their magnificent achievement which I can say, as the President of our Canadian Atomic Energy Control Board, has met with the satisfaction of everyone concerned in the further operation of the plant.

This plant was approaching completion on schedule when war ended. We found ourselves in the very fortunate position of having in existence facilities on a scale commensurate with the carrying forward of research in atomic energy. Yet these facilities were not so large nor so expensive to operate as would make their continued use prohibitive in peacetime.

Besides carrying out the research work referred to, in the Montreal laboratories, and elsewhere in the National Research Council in Ottawa, in the laboratories of our Mines Branch and in our universities throughout the country, Canada contributed many men to the scientific work in projects in the United States and in the United Kingdom.

Another important contribution made by Canada to the atomic energy project was in the supply of uranium. This is the only substance which occurs in nature capable of releasing atomic energy, and usable as a starting point for the preparation of other fissionable materials with explosive properties.

Canada's Uranium Resources

At the Eldorado Mine on Great Bear Lake in the Northwest Territories, Canada possesses extensive deposits of pitchblende. This is one of the ores of uranium which had been worked in pre-war years for their radium content. In this important substance Canada had ranked as one of the world's two most important producers.

The whole process of radium production had been carried out in Canada from the mining at Great Bear Lake to refining at Port Hope on Lake Ontario, with final testing and measurement at Ottawa. The processes from beginning to end were developed by Canadian scientists in the National Research Council and in the Mines Branch. I feel that this is a useful example to show the value of national research. Here, when necessity called, we had not only the vital materials but also the most complete knowledge of the processes through which they had to be put. I believe that this knowledge of refining procedures and other related matters was perhaps as important to the allied cause as the possession of substantial amounts of the material itelf. Further, it is perhaps not generally known that metallic uranium was made in the National Research Council in Ottawa in 1938.

The mine at Great Bear Lake, closed in 1940 because of the war and because of the restricted requirements for radium, was re-opened in 1942 to secure adequate supplies of uranium oxide, which had previously been a by-product of little application. I may say that the minimum of publicity was sought, and that later in 1944, when it became clear that this project should be operated as a government enterprise, the ownership both of the mine and of the refinery was taken over by the Dominion Government.

Thus as a consequence of our war effort in the field of atomic energy, Canada attained a position in development which, while not of the same order of magnitude as that of the United States, was nevertheless second only to that country. Canada has considerable reserves of uranium. She has a staff of scientists—not nearly as many as we would like—who have wide experience in carrying out nuclear research. At Chalk River we have excellent facilities for further research which are being developed to acquire new knowledge, to train other scientists, and for the carrying forward of the particular investigations required to expedite the peaceful application of atomic energy in our own country.

Research on Peacetime Uses

Research on the peacetime applications of atomic energy, even when carried out on a comparatively small scale, is a very costly business. However, judging by what has been said in Parliament and in the press, it seems evident that Canadians fully realize the importance of such research, and are determined that it should be adequately supported. At its last session Parliament established the Atomic Energy Control Board, and assigned to it the duty of controlling and supervising future developments and applications of atomic energy in the interests of the people of Canada. Full responsibility for all phases of this problem has been vested in the Board.

After careful investigation and consideration, the Board decided that research at Chalk River could best be carried out under the auspices of the National Research Council. It therefore requested the Council to undertake the operation of that plant on its behalf. The Board has also made plans to encourage Canadian Universities to continue fundamental research in nuclear physics and its application in the fields of chemistry, medicine, etc. At the present time McGill University, the University of British Columbia and the University of Saskatchewan are planning extensive researches in this field. These plans have been reviewed with the National Research Council, and the Board has now been authorized by the Rt. Hon. C. D. Howe, Minister of Reconstruction and Supply, and Chairman of the Committee of the Privy Council on Scientific and Industrial Research, to announce that, subject to confirmation by Parliament, the Board will assist their work by financial grants for the purchase of special equipment.

To McGill University, which has already erected a new laboratory in which a 100 million electron volt cyclotron is being constructed, the Board plans to grant the sum of $87,500. Under the Board's proposals the University of British Columbia will receive $32,500 to assist in the provision of a Van de Graaf Generator and a Linear Accelerator to be used in the University's nuclear research programme. The Board proposes also that the University of Saskatchewan will receive $30,000 towards the purchase of a 20 million electron volt betatron. Such equipment is not available at Chalk River, so these Universities will be put in a position to undertake important research studies which cannot now be carried out elsewhere in Canada.

Peacetime Controls and Censorship

Canadian research, I would emphasize, is being devoted to the acquisition of fundamental knowledge in nuclear physics and towards the peacetime applications of atomic energy. However, the successful use of the atomic bomb during the war has shown that the Board cannot ignore the possible dangers to our national security resulting from non-peaceful applications. Consequently, when the wartime controls over substances useful in the production of atomic bombs expired last month, the Board issued regulations controlling dealings in these substances to ensure that they did not fall into improper hands. For similar reasons of national security the Board has also imposed restrictions on the publication of information on some aspects of this new science.

In these few remarks I have summarized the purely Canadian developments in the field of atomic energy. I would now like to call your attention to some of the international developments in this subject since the war.

Steps Toward International Control

Since 1945 the principal nations of the world have all established national organizations of one kind or another to plan and supervise research on the industrial applications of nuclear energy. In their planning, the nations of the world dare not lose sight of the fact that mankind has in the atomic bomb a means of destruction which is in a totally different category of power from anything previously known. The terrible destructive effects of the bomb as shown by the ruins of Hiroshima and of Nagasaki, and by the sunken and radioactive warships at Bikini, have caused thinking men in all parts of the world to realize that the use of atomic bombs in a future war might well prove disastrous for the survival of civilization. Efforts have therefore been made to bring about an international agreement for the control of this new kind of energy to ensure that it will never again be used for destructive purposes. In this worthwhile humanitarian purpose I am happy to claim that the leaders of Canada have had an important part.

The first international step towards the creation of such a programme was made very shortly after the termination of the war by the United States, Great Britain and Canada, the three countries which were associated in the wartime project. The Washington declaration on atomic energy issued on November 15, 1945, by President Truman, Prime Minister Attlee and Prime Minister King recognized the need for an international agreement and proposed as a matter of great urgency the setting up of a Commission under the United Nations to study the problem and to make recommendations for its control.

These discussions were followed by a meeting of the Foreign Ministers in Moscow in December, 1945, at which the Washington proposals were endorsed. At the meeting of the General Assembly on 24 January, 1946, in London, the United Nations Atomic Energy Commission was established by unanimous resolution.

The Commission, composed of delegates from each country represented on the Security Council, as well as Canada when Canada is not a member of the Council, was charged with making specific proposals:

(a) For extending between all nations an exchange of basic scientific information on peaceful ends,
(b) For the control of atomic energy to the extent necessary to ensure its use only for peaceful purposes,
(c) For the elimination from national armaments of atomic weapons and of all other major weapons adaptable to mass destruction,
(d) For effective safeguards by way of inspection and other means to protect complying states against the hazards of violations and evasions.

Two Alternative Plans for International Control

When the Commission first met in New York in June, 1946, it was presented with two different plans for the control of atomic energy, one proposed by the United States and the other by the Soviet Union. The United States proposal generally resembled that outlined in the Lilienthal Report, which had been

eleased in the United States a few months pre-
'iously. It called for the formation of an International Atomic Development Authority, which would oster beneficial uses of atomic energy and would :ontrol atomic activities in all nations either by lirect ownership, management or supervision, in the :ase of activities potentially dangerous to world ecurity, or by a licensing and inspection system n the case of other activities. This system of con-rol would be set up by stages and after it was in operation, the manufacture of atomic bombs would stop. Existing bombs would be disposed of, and he world authority would be given information regarding the production of atomic energy. In addition, he United States proposal emphasized that the veto of the Great Powers in the Security Council should not apply in the event that any nation was charged with having violated the international agreement not to develop or use atomic energy for destructive purposes.

I may say that the proposals made by the United States accord very closely with the views of the Government of Canada, and of many other nations in the Western World, as to how this problem might be brought under control. On the other hand, the Soviet Government put forward a plan which differed fundamentally. It proposed the immediate outlawing of the atomic bombs and the destruction of all existing stocks of atomic weapons within a three months period. To this end the Soviet delegate tabled a draft convention which, he said, should be negotiated forthwith as the step towards the establishment of a system of international control. The Soviet delegate was prepared to discuss methods of control and inspection but he maintained that this should not hold up the immediate prohibition of atom bombs.

Majority Favor American Proposal

The idea that the menace to world peace presented by the atomic bomb could be solved merely by the signing of an international agreement to prohibit its use or manufacture seems very unreal. The experiences of the last twenty-five years have shown that international agreements alone are not enough to safeguard the peace. The prohibition of the use and manufacture of the atomic bomb at the present time would merely seriously reduce the military strength of the United States, the only nation now in possession of atomic bombs. This would give no assurance that any country engaged in atomic energy activities would not or could not make and use the bomb in the future. Fissionable material, the essential material for such peaceful applications of atomic energy as the development of industrial power, is also the explosive element of the bomb, and could readily be diverted from peaceful to military uses by a nation secretly preparing for atomic war.

For this reason, most members of the Commission were in general agreement with the principles of the American proposals. They considered that the prohibition of the use or manufacture of the atomic bomb should form part of an overall control plan, so that when such prohibitions were put into effect they would be accompanied by the applications of safeguards such as international inspection of all countries to ensure that no secret activities in atomic energy were in progress.

Effective Control Technologically Feasible

After weeks of discussion along these lines, the Commission decided to seek a new approach to the problem by a study, in committee, of the available scientific information, to determine whether an effective control of atomic energy was feasible. This study resulted in a unanimous report by the scientists of all nations represented on the Commission that " they did not find any basis in the available scientific facts for supposing that effective control is not technologically feasible." With this conclusion before it, the Commission then proceeded to discuss the safeguards that would be required at each stage in the production and application of atomic energy to ensure its use only for peaceful purposes.

The Commission's findings were set out in detail in its first Report which was approved on December 31, 1946, by a vote of 10 to 0, with the Soviet and Polish Delegations abstaining. In this Report, the Commission pointed out that as all applications of atomic energy depended on uranium and thorium, control of these materials was an essential safeguard. The Commission, therefore, recommended international inspection of all mines, mills and refineries to prevent possible diversion of materials to the making of atomic bombs. As the materials assumed a more concentrated form and were therefore more directly applicable to bomb making, the Commission believed that the controls would have to be even stricter. They considered that at least certain plants producing substantial quantities of fissionable material should be placed under the exclusive operation and management of the international authority.

Minimum Powers of International Authority Being Considered

The Commission is now giving consideration to the minimum powers such an international authority would require in order to exercise effective control of atomic energy. This is a very important matter, for in the operation of any such control it is evident that there must be undue interference with the economic and political life of any country. However, I believe that the interests of all nations in the maintenance of peace so far transcends any other purpose or interest that they will eventually come to accept such limitations to their national sovereignty as are shown to be really essential for the effective control of atomic energy.

Progress in this direction may be slow, but I am hopeful that a proper agreement between nations may eventually be reached. This would not only make a great contribution towards the peace of the world. It would also make unnecessary the secrecy now imposed on new developments of atomic energy. It would thus permit all nations of the world to share in the benefits to be derived from its peaceful applications.

ENGINEERING NUCLEONICS

K. F. TUPPER
Director, Engineering Division, Atomic Energy Project,
National Research Council, Chalk River, Ont.

A paper presented at the Sixty-first Annual General and Professional Meeting of The Engineering Institute of Canada, May 8th, 1947, at Toronto, Ont.

Pointing out that nuclear energy will gradually pass from the hands of the physicist to those of the engineer, the author draws the attention of the latter to the need for becoming familiar with the subject. Beginning with the concept of the atom, definitions are given of isotopes, shielding, radioactivity, fission, elements of the "pile", the "cross section", plutonium reaction and fission products. Radioisotopes are described, as well as the need for isotope separation. Two atomic fuels, uranium and thorium, are defined and compared.

Today it seems that nuclear energy may become an important supplement to the sources which man can control and use. It is extremely difficult to assess the importance. The possibilities are staggering in their immensity, but the technical difficulties and limitations are only slightly less immense.

Nuclear energy is still in the hands of the physicist. The aid of the engineer is needed by the physicist, and recent accomplishments can be said to have been co-operative achievements. In a years few, however, nuclear energy will have passed largely into the hands of the engineer, If the generation of power from nuclear energy is to be accomplished on an economic basis, the final phases of the undertaking will fall solely into the hands of the engineer. As engineers it behooves us to commence becoming familiar with the subject.

It is the purpose of this paper to present to you some of the concepts of nuclear physics which will be essential to a better understanding of the two companion papers published in this issue of the *Journal*. Reference should be made to an earlier paper① presented before the Institute and also to the Smyth report② which presents most of the available information on atomic energy in a form easily assimilated by the engineer. The present paper is given from the engineering point of view and there is no claim to scientific rigour.

Concept of the Atom

The atom consists of a nucleus surrounded by a cloud of electrons. Almost all of the mass of the atom is in the nucleus, the electrons possessing only about 1/40th of 1 per cent. The electrons travel in orbits about the nucleus much in the same manner that planets in the solar system travel about the sun. They are arranged in groups at various distances from the nucleus in an orderly fashion. Figure 1 presents a simplified picture of a helium atom. Electrons are particles having one unit of negative electric charge. They have small mass, about 1/1840th the mass of a nuclear particle. The nucleus is an aggregation of heavy particles. These nuclear particles are of two kinds, called protons and neutrons. Neutrons have no electric charge, whereas protons have each a single unit of positive charge.

The number of protons for any atom in a neutral state is exactly equal to the number of electrons in the electron cloud. This number is called the atomic number. It is the difference in atomic number which distinguishes one element from another. The atomic numbers for the natural elements run in sequence from unity to hydrogen to 92 for uranium. Nature apparently neglected to provide us with samples of elements of atomic numbers 43 and 61. The sum of the number of neutrons and the number of protons, that is, the total number of nuclear particles, is called the atomic mass number. The diameter of an atom is approximately 10^{-8} cm. The nucleus is very much smaller, having a diameter of about 10^{-12} cm. in the case of the largest nuclei.

Isotopes

Atoms of the same atomic number but differing in mass number are called isotopes. All isotopes of one element have the same number of protons in their nuclei but have different numbers of neutrons. For example, the nuclei of all carbon atoms have six protons, but they may have six, seven or eight neutrons (the nuclei with eight neutrons are unstable). Some elements have many natural isotopes. Tin has ten isotopes with mass numbers from 112 to 124. Other elements occur in nature with only a single isotope—aluminum, manganese, and gold are examples.

Physicists, with the aid of cyclotrons and other devices, are able to create many isotopes which do not occur in nature, and most of these are radioactive. This creation of new isotopes is accomplished by bombarding the nucleus with high speed particles. Various things may happen, In some cases the nucleus will capture the projectile and thus becomes a heavier nucleus. In other cases the projectile will knock out a particle or several particles and the nucleus will become lighter. In still other cases the particle will exchange places with a particle of different kind.

The number of neutrons in a nucleus is as great or greater than the number of protons. At the light end of the table of elements the numbers are approximately equal, but as the elements get heavier the number of neutrons begins to exceed the number of protons. At the end of the table the ratio of neutrons to protons is about 3 to 2. (Hydrogen and one isotope of helium are

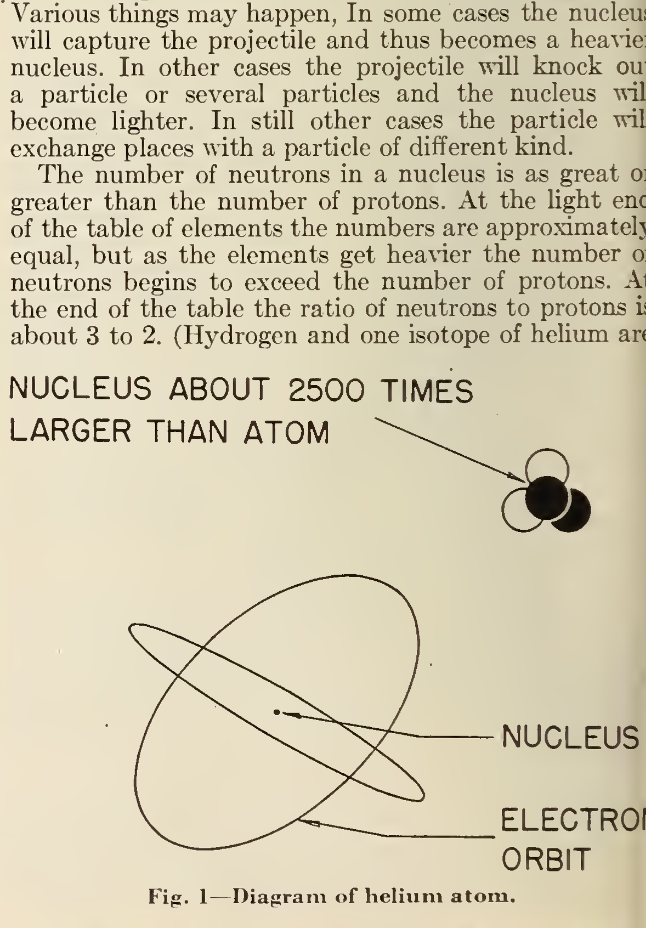

Fig. 1—Diagram of helium atom.

②Atomic Energy for Military Purposes, H. D. Smyth, Princeton University Press.

exceptions to the rule.) Table I gives an example of the neutron content of the nucleus for elements near the ends, middle and quarter points of the natural series.

Table I

Neutron Content of Certain Nuclei

Element	*Mass No.*	*Atomic No.*	*Number of Neutrons*	Ratio: $\frac{Neutrons}{Protons}$
Helium	4	2	2	1.00
Manganese	55	25	30	1.20
Silver	107	47	60	1.28
Thulium	169	69	100	1.45
Uranium	238	92	146	1.59

Radiation

An excited nucleus may radiate gamma rays. These are like X-rays, travelling at the velocity of light, and lie toward the high frequency end of the spectrum from X-rays. The emission of gamma rays accompanies a great many other nuclear processes.

Showers or streams of particles are also called radiation. High speed detached electrons are called beta particles or beta rays. They are able to penetrate small thicknesses of matter. Many unstable nuclei have the ability of emitting a beta particle, in which case one of the neutrons becomes a proton, and the atom increases its atomic number to the next higher value without changing its mass number.

An aggregation of two protons and two neutrons is known as an alpha particle. Some heavy radioactive elements emit alpha particles. Because of their size these have little penetrating power and are easily stopped by a little solid matter. Alpha particles are the nuclei of helium atoms.

Shielding

Radiation is destructive to living organisms. The human body can be subjected with safety to only certain limited amounts. Consequently, all devices generating radiation must be shielded so that personnel can work in safety nearby. Gamma radiation is stopped best by heavy substances, and the material widely used for this purpose is lead. Where bulk is not a factor, less costly materials, such as iron or concrete, are also used.

Neutron radiation is very difficult to stop. Because of their absence of electric charge, neutrons can pass undeflected in close proximity to atomic nuclei. The neutron is so small with respect to inter-atomic spaces that it readily passes through large numbers of atoms without colliding with anything. A high speed neutron can be expected to travel in a straight line through several inches of almost any substance. Neutrons are slowed down in a way which is described later. Slow neutrons are stopped effectively by certain particular elements, two of these being cadmium and boron. It is generally advisable to arrange neutron shielding in the following steps. A material containing large numbers of light nuclei, usually hydrogen in the form of water or paraffin wax, is first interposed so that most of the neutrons emerging do so with low velocity. The next material will be chosen for its ability to stop slow neutrons and may well be cadmium. The final part of the shielding will in reality be shielding against the gamma radiation created by the neutron capture. An effective neutron shield could consist therefore of a water jacket, a cadmium plate and a lead plate each of appropriate thickness.

Radioactivity

The nuclei of some natural isotopes, and of many which can now be created by man, are unstable or radioactive. The degree of instability or activity is denoted by a period of time known as the "half life". The half life is defined as the length of time required for half of any given large number of atoms of one kind to disintegrate. At the end of this time the remaining half are still unchanged. It is impossible to predict when any particular atom will disintegrate, but it has a certain probability of doing so in each unit of time.

There is a fairly close analogy between the decay of a radioactive material and death in a human population. It is not possible to predict when any particular person will die, but there is a very definite probability that he will do so in a unit of time. This probability is so definite that life insurance companies can count on it and so do a flourishing business. Whereas the probability of a person dying increases with his age, the probability of an unstable atom disintegrating remains constant.

A long half life denotes relatively great stability. A short half life indicates an intensely radioactive isotope. The measured half lives of isotopes vary over an almost incomprehensively wide span of time, from 10^{-7} seconds to 10^{10} years.

Radioactivity is called alpha or beta activity according to the kind of particle emitted. Gamma radiation frequently accompanies the alpha or beta emission. Radioactive isotopes must be carefully handled, so people will not be injured by their radiation. It is most important not to permit certain isotopes to enter the human body through inhalation or ingestion because of selective deposition, usually in the bone. Once deposited the damaging radiation continues at the closest possible range.

Fission and the Chain Reaction

Some isotopes undergo a particular kind of disintegration known as fission. Although fission may occasionally occur spontaneously, it can be caused by bombarding the fissile nucleus with a neutron of appropriate velocity. The only readily available fissile isotope in nature is uranium of mass number 235. This nucleus contains 92 protons and 143 neutrons. When struck by a slow neutron it splits into two nuclei of smaller and generally unequal size. There are more than enough neutrons to satisfy the requirements of the two new nuclei and there will be, on the average, one to three set free.

A large amount of energy is released at fission. It is distributed in these forms: 1—As gamma radiation (intense). 2—As kinetic energy possessed by the two new nuclei which have high velocities. (This energy is imparted to and distributed amongst the neighbouring atoms by collision. The net effect is an increase in temperature, i.e., heat is released.) and 3,—As kinetic energy in the neutrons released.

It is possible to arrange pieces of uranium with respect to one another and to other materials so that one or more of the neutrons released at fission will be slowed down to an appropriate velocity and will then strike another U235 atom causing a second fission. The continuation of this process is known as a chain reaction. The system which will produce it is called a 'pile', a 'chain reaction pile', an 'atomic pile' or a 'reactor'. Since it has already come into wide usage, the word 'pile' is used here.

The Elements of a Pile

A pile, to use natural uranium, can consist in its simplest form of; (a), Fissile Material (the uranium), or (b), A moderator or neutron slowing-down material. Because there are 140 atoms of U238, which is not fissile by slow neutrons, present with each atom of U235, it

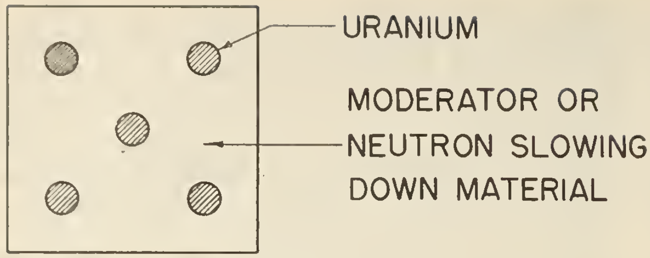

Fig. 2—Elementary pile.

is obvious that there will be collisions between neutrons and U238 nuclei. Some of these collisions will result in capture, which as we shall see later is the reaction ending with the creation of plutonium. Any neutron so captured is no longer available to sustain the chain reaction.

The probability of fission in U235 depends on the velocity of the striking neutron, and is greatest when the neutron has been slowed down to a negligible fraction of its original velocity. It is necessary, therefore, in some manner to slow down the neutrons resulting from fission before they are permitted to reach more uranium atoms. A material introduced only for the purpose of slowing down neutrons is called a moderator.

It is interesting to make here a simple analogy. A neutron migrating amongst atoms can be compared with a billiard ball moving on the surface of a billiard table. The neutron striking a heavy nucleus is similar to the billiard ball striking the cushion, it rebounds with almost undiminished velocity. If, on the other hand, it strikes a light nucleus, it imparts a substantial velocity to its target and suffers a large reduction in its own velocity. This is the condition which exists when a billiard ball strikes another billiard ball.

The requirements for a moderator are that it shall have nuclei of small mass, and that neutrons striking these nuclei shall not be captured. From the standpoint of small mass, the hydrogen nucleus is ideal, since it has the least massive nucleus, consisting of one proton. Unfortunately, the hydrogen nucleus does have a tendency to capture slow neutrons, and it cannot be used in a pile of natural uranium. The next lightest nucleus, consisting of one proton and one neutron, is that of heavy hydrogen which is also called deuterium. It makes a good moderator and is used in chemical combination with oxygen as heavy water. Approximately one in each 5,000 atoms in natural hydrogen is a deuterium atom, so that deuterium is not particularly scarce. It is, however, a very difficult and expensive operation to separate deuterium from ordinary hydrogen.

An alternative moderator material is carbon, which when pure has only a small tendency to capture slow neutrons. It has not as light a nucleus as deuterium. Carbon is used in the form of graphite, which can be quite highly purified. Another possible moderator is beryllium.

The elementary pile described above and illustrated in Fig. 2 is too simple to be used. If it would react at all, it would likely run away, as no means of control has been provided. In order to control it, one needs some way of curbing its runaway tendencies. These are caused by the fact that for each fission, more than one neutron is available to cause a new fission. The method of stopping this tendency is to introduce some material which will capture these surplus neutrons. A powerful neutron absorber is needed. The neutron capturing properties of cadmium and boron have already been referred to. If then, pieces of cadmium or boron can be inserted into the pile, these will serve as control devices. At a particular position setting the pile will run steadily. If the pieces are withdrawn then the rate of reaction increases. If they are inserted, the rate will decrease.

This elementary pile needs some further refinement. It is uneconomical in neutrons because these can escape freely at its boundaries. To decrease this loss the pile must be lagged just as one would lag a steam pipe to prevent unnecessary loss of heat. The pile lagging system is called a reflector. It is made of a material having a minimum tendency to capture neutrons. In such a medium, a portion of the neutrons outward bound and which would otherwise escape, are re-directed, after a series of collisions, back into the pile. A pile with a reflector may be a smaller physical size than one without. Fig. 3 depicts the pile with control devices and reflector added.

The next modification which must be made to this simple pile before it is very useful, is some provision for cooling it. If it is to operate in a steady state, with its temperature neither increasing nor decreasing, exactly as much heat must be removed as is generated in each unit of time. If operation at a few watts is sufficient, cooling can be provided by convection currents of the air in the room. If, on the other hand, it is desired to operate at many kilowatts, provision must be made to take away these large quantities of heat.

If cooling is accomplished by running some fluid, such as air or water, through the pile, then it is necessary to take account of the capture of neutrons in the coolant and in the materials used as pipes or ducts carrying it. Another modification, before this simple pile can be used, is the provision of shielding, so that people can safely come near it. This might take the form of a thickness of concrete wall.

There are not yet enough components to make the pile really workable. It will require some instrumentation, otherwise the operators will be unable to dedetermine the operating condition and the amount of response to the controls. So it must include some ionization instruments which will respond to neutron radiation, and which will transmit their measurement to external indicators. Fig. 4 illustrates a pile with these further additions.

Concept of Cross Section

The relative dimensions of an atom and its nucleus have already been mentioned. It should be emphasized that an atom consists almost entirely of vacant space. Imagine an atom magnified until its diameter appears

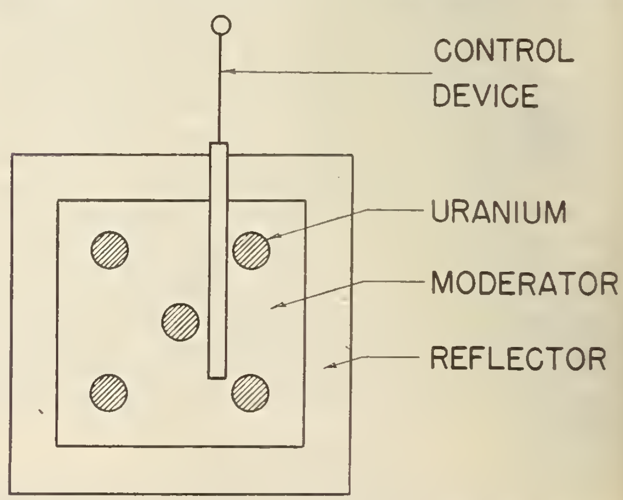

Fig. 3—Elementary pile with reflector and control device.

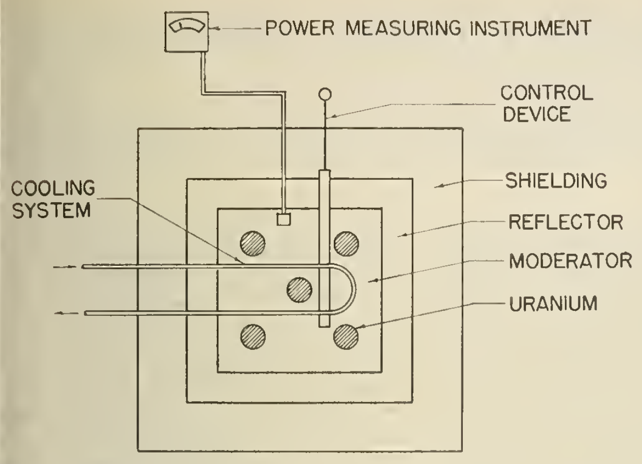

Fig. 4— Elementary pile with all essential components.

to be two feet. The nucleus will have been brought just into the range of human vision and will appear as a particle as big as a short cylinder cut from a human hair with height equal to diameter! On a volume basis the atom is about 10^{12} times the volume of its nucleus.

Reference has been made to the fact that materials differ from one another in their ability to capture neutrons. One wishes to be able to deal with neutron capturing and other properties on a quantitative basis. This is done by assuming that the different materials present different target areas to the bombarding particles, which are assumed to have zero size. If one knows the flux density of the particles, then the probability that a collision will occur can be computed directly from this area, which is called the cross section. In dealing with such minute areas as are presented by nuclei, the physicists have chosen a convenient unit called the "barn", which is 10^{-24}cm^2.

The term "cross section" is used to express the probability of a certain event occurring. "Capture cross section" denotes the probability of capture, and "fission cross section" denotes the probability of fission, and similarly with other events.

Cross section is an attribute not only of the kind of target nucleus but also of the kind of bombarding particle and its velocity. With ordinary uranium piles, the fission occurs with slow③ neutrons hitting U235 nuclei and most of the interest lies in cross section for slow neutrons. Good moderator materials have very small capture cross section; fractions of a barn. Materials used for control and shut-off devices such as cadmium and boron have very large capture cross section; hundreds of barns.

The Plutonium Reaction

When an atom of U238 captures a neutron it becomes U239, which is unstable, decaying by beta emission with a half life of 23 minutes to a new element not found in nature called Neptunium, which has an atomic number of 93. Neptunium 239 is also unstable and decays again by beta emission and with a half life of 2.3 days to another new element called Plutonium, atomic number 94. Plutonium 239 is weakly radioactive and decays by alpha emission to U235. Pu239 is fissile and is a most important nuclear fuel. Because it is a different element it can be separated by chemical means from the uranium in which it was born. It can be obtained as a pure fissile substance and hence is of military importance. The creation of plutonium 239 in uranium tends to overcome the impoverishment in U235 resulting from pile operation, since the plutonium formed will also serve to support the chain reaction.

Fission Products

The two new atoms formed by the fission of an uranium atom are in general highly radioactive. They will have more neutrons with respect to the number of protons than the equilibrium ratio for their mass. Most of these radioactive isotopes transmute by beta emission to the element of next higher atomic number. A single such transmutation is seldon sufficient to achieve a stable nucleus, and fission products go through a series of such decays finally to become stable atoms, though not always of an isotope known to nature.

The beta emissions are accompanied by gamma radiation, so that fission products are radioactive and dangerous. Since they are distributed throughout the whole of any uranium which has been reacting in a pile, the uranium is difficult to handle on removal, and it must be concealed behind heavy shielding. Fission products have another effect on pile operation. Some of the elements produced have neutron capturing properties, and they effect the reactivity of the pile. This effect is called poisoning.

Production of Radio-Isotopes

A wide variety of radioactive isotopes can be produced with a pile. These are created by subjecting inert materials to neutron bombardment. In many cases the element produced is a radioactive isotope of the element bombarded. An example of this kind is radio cobalt. The active material is diluted or mixed with the large amount of the original inert isotope. The specific activity in this case will not be high and will be limited by the neutron flux available for bombardment.

In other cases the element produced is different from that bombarded. An example is radio carbon which is produced by bombarding nitrogen. The active material in this case is diluted with a different element, so that it is possible by chemical separation to obtain a pure radio isotope. Intense specific activities are possible in this way.

Fission products are an enormous source of radio isotopes, since for each pound of uranium "burned" in a pile, a pound of fission products result. It is possible by chemical processes to separate the fission products from the uranium and from one another.

Isotope Separation

It should be pointed out that it is possible, using processes that are costly and technically difficult, to separate U235 from U238 so that a pure fissile material, or uranium enriched in U235, can be obtained. A pile using natural uranium ceases to react when the U235 content of its fuel is materially reduced. This makes the utilization of the remaining U235 a problem. In order to utilize all of the world's supplies of U235, it may be necessary to employ isotope separation processes.

Atomic Fuels

There are two elements which are currently regarded as being atomic fuels—uranium and thorium. Unfortunately, neither of these can be regarded as plentiful.

Uranium occurs as a constituent in the earth's crust to the extent of about 1 part in 250,000. It is a mixture of three isotopes which occur in the following amounts:

(Continued on page 267)

③A slow neutron (or thermal neutron) has a velocity in equilibrium with the temperature of the material in which it moves. In some of its collisions it will lose velocity and in others it will gain velocity. Its actual velocity is of the order of 7,000 ft. per second.

THE CHALK RIVER ATOMIC ENERGY PROJECT

C. H. JACKSON, M.E.I.C.
Chief Engineer, Special Projects Department, Defence Industries Limited, Montreal.

A paper presented at the Sixty-first Annual General and Professional Meeting of The Engineering Institute of Canada, at Toronto, Ont., May 8th, 1947.

The author traces the history of the project and tells how the site was selected. The administration and operating areas are described in detail. Though details of the "pile" itself cannot be disclosed, the general requirements and limitations affecting its design are discussed. The elaborate precautions taken for safeguarding personnel are outlined, as well as the many control devices and how they function. Descriptions are also given of the chemical area, power plant, water treatment plant, and village. Expenditures to date on the project are given, and savings effected by the use of surplus materials and equipment are enumerated.

In the September 1945 number of *The Engineering Journal,* issued soon after the world learned that two atomic bombs had been used to hasten the end of the war in the Pacific, there appeared an article entitled "The Atomic Bomb and Canada's Contribution to It." In that article was a brief description of some of the engineering features of the chain reacting pile at the Petawawa Plant, now better known as the Chalk River Laboratories of the National Research Council. It is the purpose of this paper to describe in more detail some of the general features of the project, including the village housing the operating and research personnel. No restrictions remain on the disclosure of facts regarding the village, though security regulations still forbid disclosure of many of the more interesting details of the pile and of the chemical processes for separation of the final products.

History

While nuclear physical research and development of fundamental design data had been in progress in the Laboratories of the National Research Council since 1942, it was not until well into 1944 that it was decided to proceed with construction in Canada of a pilot plant for the production of plutonium. At this stage it had been settled that the Canadian pile would be of the type using heavy water as a moderator, and shortly after the middle of the year the principal basic dimensions of the pile were fixed and a starting point for the design of the plant was therefore available.

Until this time all basic design work in connection with the pile had been done by the National Research Council. Design of a complete plant and village was, however, beyond the scope of that organization, and Defence Industries Limited, who had designed and supervised the construction of a number of large government-owned munitions plants during the previous five years, were requested to, and agreed to undertake the work.

Selection of Site

As the design of the pile was getting under way the search for a suitable plant site began. At the time, one of the principal requirements of the site was that it be remote from any large centre of population. It was known that cooling air would be required and that it would have to be discharged to the atmosphere in a radioactive condition. Just how serious this would be was not known, and it was the recommendation of scientists that the plant be kept well away from any large town.

Other site requirements were that an abundant supply of cold water be available, and that the location be reasonably accessible to scientists from the larger Canadian universities and preferably not too far from the Ottawa headquarters of the National Research Council. A site with a good general slope was desirable to facilitate gravity flow of water and chemicals. A suitable site for a housing development, not too close to the plant, had to be found, it being recognized that the isolation from large centres of population which was specified would preclude the availability of sufficient local labour to operate the plant. The scientific staff, which would come largely from the Montreal Laboratory, would also have to be provided with houses as it would have been too much to expect to find a sufficient number already available within a reasonable distance of any isolated plant site.

Railway siding facilities were not essential, the raw materials and final product being of small volume, coal being the only large bulk requirement. It is hoped that some day the use of coal at such a plant will become unnecessary.

Of a number of sites considered and inspected, that on the Ottawa River approximately five miles from the C.P.R. divisional point at Chalk River, fulfilled the requirements to the greatest degree. Its isolation is ample but it is not too remote, being not too far from Ottawa, Toronto and Montreal. The Ottawa river provides a large supply of cold water, the river here was deep, and quite cold at reasonably accessible depth. The site has an adequate slope and good foundation conditions, and an attractive site for a village, at a suitable distance from the plant site, was available. These plant and village sites were accordingly decided on, and an area of approximately 10,000 acres was expropriated, of which the village accounted for a little less than one square mile, the plant site for the other fifteen square miles. A quite small pro-

Fig. 1—Operating area (pile building).

Photographs illustrating this article supplied by the National Film Board.

portion of the plant site is actually occupied by the plant proper, the balance assures isolation from privately-owned property. The fact that the property adjoins one end of the large Petawawa Military Reserve reduced the amount of land which had to be expropriated, that end of the reserve being unoccupied.

Plant in Two Parts

The plant consists of some one hundred buildings and structures along with the outside steam, air, power, water and sewer lines serving them. A system of gravelled roads and paths connects all buildings. The plant area proper can be divided roughly into two parts, namely the administrative area and the operating area. The former contains the usual gatehouse, office building, cafeteria, shops, general stores and storage buildings, bus garage, fire hall and laundry, as well as the plant hospital and medical research centre, an instrument shop and an electronics laboratory. The operating area contains a number of laboratory buildings, the pile building and auxiliary buildings, the chemical extraction plant, a water filtration plant and a boiler plant, electrical sub-station and pump house.

Of most of the buildings it need only be said that they are of conventional types built for semi-permanence, all are on concrete foundations and most are of wood frame construction. There are, however, a number of structures which by their nature are of a permanent type. Into this category fall the power house, filtration plant and pile building, all of which are of concrete, steel and brick.

The Administration Area

In the administration area such buildings as the gatehouse, office, cafeteria and storage buildings have no especially noteworthy features and require no comment. Others are, however, unusual to some degree. The shops, though conventional, are, due to the relatively isolated nature of the site and to the need for building special experimental equipment on short notice, somewhat more extensive than would be warranted in a normal plant of similar size located close to a large city.

A portion of the medical centre is equipped for emergency treatment of plant accident cases, but the largest part is devoted to preventive health control and to medical research. As is now well known, exposure to large amounts of radioactivity can be

Fig. 2—Pile building.

Fig. 3—Chemical plant.

extremely dangerous. The nature of the Chalk River plant is such that large quantities of radioactive materials are present in certain parts of the plant, and precautions must be taken to make sure that personnel are not unduly exposed to them. The responsibility for checking to make sure that working conditions are safe from a radiation viewpoint rests with the health control section.

In this connection it might be noted that the permissible radiation exposure level chosen for operation of the plant is much below the tolerance level generally accepted as safe for this type of work. In other words the policy is to lean heavily towards the safe side in questions of health. A large part of the medical centre is given over to research connected with radioactivity, a number of laboratories being provided, as well as an animal house and a greenhouse, and a building having 2 million volt X-ray equipment for use in special biological radiation research.

The instrument shop is a necessity due to the large number of instruments of all types used in many parts of the plant. The shop is equipped to calibrate and repair this large variety of instruments, and to make up special ones normally available outside only with difficulty or not at all. The electronics laboratory is responsible for the development of special electronic equipment, prototype construction, calibration and repair. The importance of this department will be realized when it is considered that the detection and measurement of radioactivity deals largely with extremely small quantities of electricity.

As no plant personnel lives within walking distance and no previously established transportation systems were available, a substantial fleet of busses had to be acquired. A garage for housing and servicing the busses and other transportation equipment had therefore to be built.

The Operating Area

In the operating area are several research laboratory buildings of various sizes, the smallest having a floor area of about 5000 square feet and the largest an area of approximately 14,000 square feet. These laboratories are for research work in connection with nuclear physics, technical physics and chemistry. The materials handled in some of the laboratories can be highly radioactive, and special precautions have to be taken to protect personnel from exposure. Accordingly the laboratory floors and walls in some sections are of concrete to pre-

Fig. 4—Chemistry laboratory.

vent the escape of radiation to the outside or to adjacent rooms. Experiments are carried on by remote control and general ventilating air supply and fume hood exhausts had to be given special consideration. Fans are driven by steam turbines to ensure continuous adequate ventilation even during electric power failures. As highly radioactive materials are transported and handled behind the protection of several inches of lead, floors had to be designed for unusually heavy loads. Special clothing is worn and checked regularly for pick-up of radioactive contamination.

In laboratories used for inactive chemical research, however, these special precautions are not required. The laboratories themselves, therefore, have few especially noteworthy features. Similarly, the technical physics and nuclear physics laboratories have no unusual health exposures and are of conventional construction.

The Pile

The pile building is the central feature of the project, but it will be realized that the details of the pile are still of a secret nature and can not yet be disclosed. However, an outline of the general requirements and limitations of its design will at least give some idea of the difficulties which had to be overcome. In the first place the reacting part of the pile, contains the two components essential to the chain reaction, namely uranium and heavy water, but it also contains cooling water, air, and materials for confining the liquids.

The amounts of these materials and their disposition are fixed by nuclear physical considerations, and it accordingly was too much to expect that the general dimensions and proportions of the pile and the arrangement of the materials therein would be good from an engineering point of view. All materials absorb neutrons to some degree, and for the functioning of a uranium pile this absorption must be kept low. No known materials combine low absorption with high strength and satisfactory workability, and a compromise had to be made in the choice of a material for fabrication of the containing devices for the heavy water and for the cooling water.

In order to obtain high rates of heat transfer, and to minimize the absorption of neutrons in the cooling water in the system by reducing the amount of water present, the cooling water velocities had to be kept at a much higher value than would normally be favoured.

Elaborate Precautions Taken

But there were other difficulties to be overcome. The reacting part of the pile had to be surrounded by a reflector, which has the property of diverting back into the pile neutrons which would otherwise be lost. The whole had to be surrounded by a complicated system of shielding consisting of lead, steel, cast iron, water, many feet of concrete and other materials. Means had to be provided for introducing into the pile the uranium, heavy water and cooling water, and for removing them. No unshielded holes were permissible through which those materials could be handled, and it will be realized that the pile is a very complicated structure and that it presented design problems both novel and difficult.

Reference has been made to shielding. A word of explanation is in order. When the pile is in operation at normal power output, there is in the interior an intensely strong emission of very harmful radiation. The intensity of the harmful gamma radiation alone is equivalent to that which would be given off by a mass of radium many times larger than the entire world production to date. The precautions that are taken in shielding the few milligrams or grams of radium used by hospitals give some indication of what protection is needed for the pile. It is fortunate that most of the radiation can travel only in direct lines, hence pipes or other devices may be introduced in other than straight lines, always taking care that the total amount of protection in any direct line is not reduced below a set minimum.

The complications for which the radiation is responsible would not be nearly so serious if the radioactivity could be turned off at will, but there is no known way, or any likely future way, of accomplishing this. The pile can, of course, be shut down, that is, the self-sustaining chain reaction can be stopped. If the rate of operation has been high however, the interior of the pile will be highly radioactive and this radioactivity will decay at a fixed rate. It may still be too intense to permit access to the interior of the pile months after the chain reaction has been stopped.

The pile is expected to provide unusual opportunities for experimental work in nuclear physics. Many experiments will, in part, consist of exposure of different elements to radiation of various intensities. In

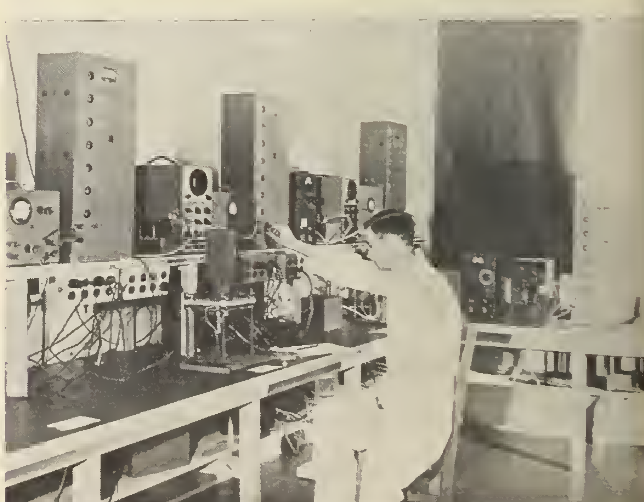

Fig. 5—Radioactivity counting room.

order, therefore, to make such exposure possible means must be provided for introducing samples of material into the interior of the pile. This is done by leaving holes of various sizes in the pile structure. To avoid leakage of dangerous radiation through these holes, plugs must be provided, and to stop radiation from shooting through the annuli between plugs and holes, both plugs and holes must be stopped. Samples to be exposed to radiation may be inserted in the plugs in various locations.

Many Unusual Problems Encountered

When the pile is in normal operation, a large amount of heat is generated within it. While this all stems from the fission of the uranium, a very substantial proportion is actually liberated outside of the uranium itself. This is because the energy originating in the uranium is in the form of particles travelling at extremely high speed, whose energy is given up when they are slowed down or stopped by collision with the materials in the system. Hence all materials in the interior of the pile tend to heat up to a greater or lesser degree, depending on the nature of the materials themselves and on the intensity of radiation to which they are exposed.

The thermal expansion of these materials had to be investigated very carefully to make sure that experimental plugs and other items inserted into the pile, either permanently or intermittently, will not foul any part of the structure under any of the temperatures expected to be encountered during the operation of the pile. As clearances around plugs and other similar items had to be kept small to minimize radiation leakage, it was not only necessary to make sure that expansion would not be more than calculated clearances. It was also essential that the whole massive structure be assembled to individual tolerances of a few thousandths of an inch. The remark was made while installation was proceeding that the erection was a watchmaker's job. Apart from the question of size, the remark was not too fanciful. The fact is that the construction of the pile presented a number of most unusual problems, and called for extreme care in setting the components, great accuracy on measurements, and meticulous care throughout. Great credit is due the construction staff of the general contractor, Fraser Brace Limited, for their successful performance of this work.

The key component of a chain reacting uranium pile is the uranium 235 which, however, is present in normal uranium to the extent of only about seven tenths of one percent. The U·235 is present in much too small a proportion of the total uranium to turn the pile into an efficient atomic bomb. However, the chain reaction, once started, must be controlled or the rate of heat production could increase, at a rapid rate, to the point where the uranium would melt or even cause an explosion, not of atomic violence, but still an explosion. Either of those occurrences would damage the pile irreparably, hence it becomes necessary to provide means for controlling the rate of reaction of the pile.

Many Control Devices Used

As mentioned earlier, all materials absorb neutrons to some degree and the structural materials inside the pile are chosen for low absorption in order for the pile to function at all. For control, it is necessary to introduce materials having high neutron-absorption characteristics. This is required in order to trap all neutrons in excess of those necessary to maintain the operation of the pile at any given level of power output. Two elements having very high absorption characteristics are boron and cadmium. These materials are accordingly used in the control devices.

Fig. 6—Nuclear physics research laboratory.

The number of devices initiating operation of the various controls is considerably greater than needed to ensure the safety of the operation. However as the whole installation is in the nature of a pilot plant, it was considered desirable to test the functioning of a large number of devices in order to prove which are the best and which ones are actually required. Tripping of any one of a good many hundred individual units will shut down the pile. It seems quite probable that a substantial number will be found unnecessary, and subsequent piles will benefit from this experience.

Ionization chambers are used in a large number of places for detection of radioactivity. A number are located in the operating areas of the pile building and in various other places in the plant to ensure that under no conditions will personnel be exposed to dangerous amounts of radiation. They are also used to measure the amount of radioactivity discharged to the river, and to ensure that the very large factor of safety set for such discharge is not lowered. Portable devices, containing their own ionization chambers, power supply and amplifiers are also employed for surveying all areas not covered by fixed devices, where radioactivity might be encountered.

As all material entering the pile becomes radioactive to some degree, it follows that the cooling water is also affected. Luckily the activity of water falls off at a rapid rate, though not so quickly as to permit the water to be discharged to the river directly after use. It is therefore held in baffled tanks long enough for the activity to die down to a very low intensity. All water and other effluent that may be radioactive is monitored before it enters the river, so that a complete record is kept of exactly how much radioactivity is discharged into the stream. The total is kept very low, so low in fact that from a radioactivity viewpoint the effluent would be quite safe for regular use as drinking water. Also, the activity dies away more and more as the water flows downstream.

Fig. 7—Shopping centre at Deep River Village.

The Chemical Area

During the stay of the uranium in the pile a percentage is converted into plutonium. This product must be recovered for use in further experimental developments. Its separation from the original materials becomes necessary. To effect this result the uranium-plutonium mixture must be removed from the pile and treated chemically. When it is removed from the pile, the mixture is intensely radioactive, and must be kept carefully shielded at all times while being transported to a chemical plant for the separation of the plutonium from the mixture.

All radioactive materials in process, except those of very mild intensity, must also be shielded. In the chemical plant this protection is provided by concrete walls of substantial thickness. Chemical solutions made up for use in extracting the desired products can be prepared and stored outside the shielded area in vessels accessible to operating personnel. The actual extraction operations however must be carried on behind the heavy concrete walls, all by remote control. Extensive control boards are therefore necessary.

The nature of the chemical process is such that a great deal of piping is necessary, hence numerous pipe lines must pass into the shielded area and between rooms of this area. None of these pipes can be permitted to pass through the thick concrete walls in continuous straight lines; they must follow curved paths or be diverted at an angle within the walls. This feature naturally added many difficulties to design and to construction. In addition, after the plant has been in operation the shielded spaces cannot be entered until all possible radioactive materials are removed, and until the activity of any quantities remaining is allowed to decay to a safe value. It has therefore been necessary to take precautions in design, construction and testing far beyond those which could be considered in a commercial plant, where leaks or other defects which might show up in the early stages of operation are accessible for repair.

The chemical plant operations are the final stages of the production processes at the plant. However, a short description of some of the other features may be of interest.

The Power House

The power house, located on the bank of the Ottawa River, contains a water pumping station, power distribution substation, air compressors and boilers. Both electric power and steam are used for driving the water pumps and air compressors, the steam drives being used to ensure continuity of supply in case of electric power failure. Power is taken from a substation on the property, the substation being at the end of a 110,000 volt transmission line erected primarily for the Chalk River plant, but soon to supply power as well for construction of the Ontario Hydro Electric Power Commission's new development at Des Joachims a few miles upstream. Emergency power for essential lighting and process loads is provided by two gasoline engine driven generator sets. The boiler installation supplies all the steam required for processes and for heating the plant buildings, the steam being distributed through an overhead piping system.

The Water Treatment Plant

A water treatment plant of substantial size has been built. Chemical treatment has been provided for, and filtering equipment of capacity sufficient to provide the needs of a small city has been installed. The filters are of the rapid sand type with the usual mixing chambers, sedimentation basins and clear wells. The pumps for pumping the water from the clear wells into the pressure mains are housed in the filtration plant building.

Both power plant and water treatment plant, while they presented some special problems due to site conditions, and the more than normal requirement of reliability of service, are largely conventional in design and detailed description is not necessary here.

The Village

Several possible village sites were investigated, and one on the Ottawa River, six to seven miles away from the plant building in a straight line, was chosen. Though this much separation of plant and village may have been unnecessarily large, the site chosen is actually considerably more attractive than those available nearer to the operating area.

The site was mostly wooded, though part was occupied by a small summer cottage and several log cabins housing Indian families. It has sandy soil and good general drainage, therefore excavation is easy and foundation conditions are good. The topsoil is, however, very sparse and light and a good deal of treatment and addition of topsoil was necessary to provide for lawns and to control erosion.

Living accommodation consists of about three hundred and sixty dwellings, a staff hotel housing approximately two hundred persons, and dormitories for about three hundred. The dormitories are actually eleven separate buildings, all arranged for two persons per room. About sixty percent of the dwellings are Wartime Houses, moved either in panels or in halves from Parry Sound, Nobel and Arvida. The balance are single family or two family houses or four family apartments, some moved in panels from Nobel, but mostly built new.

The village is self-contained, with its own water pump house and chlorinator, Imhoff tanks and chlorination chamber for sewage treatment, boiler plant, administration buildings, hospital, school, post office, bank, department store and groceteria, barber, tailor, and shoe repair shops, beauty parlor and community hall. The latter contains bowling alleys, meeting hall, library and an auditorium with projection booth, also a coffee shop where one can buy a snack outside of ɘgular meal hours. The above facilities were provided) meet the regular day-to-day needs of the villagers. embroke, nearly thirty miles away, is sufficiently ırge and close enough to supply most other requireıents.

A word about the choice of the name of the village ıight be of interest. The section of the Ottawa River ı the general vicinity of the plant and village is very eep, so much so that the adjoining land on the ntario side has been known locally as Deep River ɔr many years. In fact there is a record of a French xplorer who went up the Ottawa in the sixteen ighties and reported that the district was then known y the French equivalent of Deep River. As there 'as no other post office of the same name in Canada nd as the name, Deep River, was euphonious and ot easily misunderstood, it was decided to call it that.

Conclusion

Little more can be said about the village, the pile nd the plant itself within the limits set by time vailable and security regulations. It is felt however hat a few other facts should be known.

The Chalk River Project is comparable in cost to he largest chemicals and explosives plants built in ;anada during the war, the expenditures, including apital and operating costs, as reported in Hansard, aving been as follows:

For the fiscal year 1944-45..	$ 2,830,106.82
For the fiscal year 1945-46..	14,202,466.82
For the fiscal year 1946-47 (to February 28, 1947)..	6,504,828.26
making a total, to that date, of	$23,537,401.90

A point that should be of interest to taxpayers is that a substantial amount of government-owned assets from other plants was utilized. In addition to the Wartime Houses and other houses mentioned earlier, items moved from elsewhere included construction camps, mess halls, cafeterias, emergency generator sets, boilers for plant and village, shop equipment and a large number of other items, many small, some large. In all, assets costing originally in the order of $2,000,000 were dismantled and moved to Chalk River.

Last, but by no means least is this. The Chalk River pile is an original design. While certain basic nuclear physical data was pooled by Canada, Great Britain and the United States, only a very limited amount of data on a different type of pile from that at Chalk River was available to Canada. To all intents and purposes the complete design of the Chalk River plant, except for the basic nuclear physical data, was originated and developed and the plant was brought into being by the efforts of Canadian and British engineers.

ENGINEERING NUCLEONICS

(*Continued from page 261*)

U238—99.28 per cent—half life 4.51 x 10^9 years.
U235— 0.71 per cent—half life 7.07 x 10^8 years.
U234— .006 per cent—half life 2.69 x 10^5 years.

Uranium is a heavy metal, sp. gr. 19, with a melting point about 1100 deg. C. It corrodes in both air and water rather more vigorously than iron.

Thorium occurs more extensively, being about three times as plentiful as uranium. Only one isotope Th232 is found in nature. It is also a metal, sp. gr. 11.5, and melting point about 1840 deg. C. Its oxidation properties are very similar to those of uranium. The half-life of Th232 is 1.39 x 10^{10} years.

Although the energy equivalent of mass is obtained by multiplying by a factor equal to the square of the velocity of light, we have no method as yet of converting very much matter into energy. In the fission of U235 the mass of the fission products accounts for almost all of the original mass, only about 1/10th of 1 per cent being converted into heat energy. One pound of U235 will yield about 10^7 kilowatt hours of energy.

POWER PRODUCTION FROM NUCLEAR REACTORS

DR. E. J. WIGGINS
Head of the Engineering Development Section, Engineering Division, Atomic Energy Project, National Research Council, Chalk River, Ont.

A paper presented at the Sixty-first Annual General and Professional Meeting of The Engineering Institute of Canada at Toronto on May 8th, 1947.

Starting with the recovery of energy from primary piles, Dr. Wiggins describes within the limits imposed by security regulations, the materials, devices and methods used in the production of power, as well as those used in producing energy from secondary piles. A diagrammatic illustration is given in the latter case of a hypothetical power plant. The most promising immediate applications of nuclear energy are discussed, as well as the possible applications of radiation in medicine, chemistry and industry. The effects of radiation on structural materials and on personnel are listed. Reasons are given as to why nuclear energy must remain a public utility.

The purpose of this paper is to attempt to answer that often-asked question: "When will we have atomic power?". To this there is no positive answer, since the time required will depend entirely on the effort put into the development. However, some idea may be given as to what can and cannot be done with nuclear energy, and how much development lies ahead before commercial nuclear power is a reality. The picture presented will not be as specific nor as complete as a gathering of engineers deserves. The shortcomings are largely a result of the heavy security restrictions on the technology of power reactors, which have made it necessary to omit most of the interesting details such as actual arrangements, dimensions, and so forth.

It should be mentioned that there is always the possibility that further research in nuclear physics will change the entire picture before some of the steps described are actually taken. However, we have no definite reason to expect this occurrence within the next decade or so. It is felt that immediate progress will be in the direction of higher efficiencies, rather than of radical changes. As will be seen, much can be done on the basis of present knowledge alone.

The first paper of the series, presented by Mr. Tupper, outlined the fundamental principles of nuclear science, and described a simple nuclear chain reacting system. It is proposed to start at this point and show the ways in which useful power and other by-products may be obtained from nuclear reactors. A few topics of particular importance in nuclear engineering design will be discussed separately in view of their greater interest to engineers. Finally, an attempt will be made to review the whole picture of nuclear power production as it appears today.

Energy Production from Nuclear Fission

As mentioned in the first paper of this series, a quantity of energy is released each time a U235 atom undergoes fission. The source of this energy is the annihilation of a small part of the mass of the nucleus during fission. We know that the fission of a nucleus will yield two large fragments of comparable size, plus several neutrons. In the case of U235, the total mass of these fission fragments and neutrons is found to be approximately 1/10 per cent less than the original mass of the nucleus. This 1/10 per cent of mass reappears as energy according to the relation $E=MC^2$, where E is the energy release in foot-poundals, M is the loss of mass in pounds, and C is the velocity of light in feet per second. Thus, we find that the quantity of energy released by the fission of one pound of U235 is approximately 12,000,000 kwh.

Energy released in form of heat

At the present time it does not appear possible to release this energy in any form other than heat. The bulk of the energy of fission appears in the two large fission fragments, which move away from each other at enormous velocities. A portion of the energy is imparted to the neutrons, while the remainder is carried by the gamma radiation emitted at fission. The fission fragments are soon slowed down by collision with the other uranium atoms, and in so doing liberate their kinetic energy in the form of heat. The neutrons, the gamma radiation from fission, and the radiations from the fission fragments are absorbed in the uranium or surrounding materials, yielding smaller quantities of heat.

Thus, the immediate result of a fission reaction in uranium is an increase in the temperature of the uranium itself. This heat may be removed by passing some suitable working fluid over the uranium. The thermal energy of the working fluid may then be converted to mechanical or electrical energy by conventional means, as for example by a steam boiler and turbine. There is a remote possibility that it may eventually be possible to recover nuclear energy by more direct routes, but this is still well in the future.

Fission chain reactions

The first paper also discussed the way in which a large number of U235 atoms could be made to undergo fission, i.e. the use of a neutron-induced chain reaction. A chain reaction may be maintained in natural uranium by the artifice of slowing down the fission neutrons in a moderator before allowing them to encounter other uranium atoms. In this way, capture of neutrons by the predominant isotope U238 is avoided sufficiently to allow the continuance of the chain reaction in the U235 isotope. Those neutrons which are captured by U238 produce the new fissile element plutonium.

The fission chain reaction in natural uranium has been carried out on a large scale in the United States for the production of plutonium. The reaction takes place in an assembly of uranium metal and graphite moderator commonly known as a "pile". The quantity of heat released in the pile is very large if an appreciable amount of plutonium is produced. We are told in the Smyth report that the production of one pound of plutonium per day involves the liberation of heat at the rate of 250,000 to 750,000 kilowatts.

OOLING WATER NOT A SOURCE OF USEFUL POWER

However, in the piles constructed during the war iis heat is removed by cooling water at too low a emperature to be available as useful power. Since ie objective is the production of plutonium at the ighest possible rate, the cooling systems are designed o remove the largest amount of heat per unit weight f uranium. This requires that the exit cooling water emperature be so low that the availability of the eat is little better than that in the condenser cooling rater from a steam power station.

It is true that uses might be devised for this low rade heat under favorable circumstances, as for instance in heating systems with the aid of a "heat ump". However, since safety considerations will robably make it undesirable to locate plutonium roduction piles in urban areas, such circumstances vill be rare. It is clearly necessary to raise the temerature of the coolant, leaving the reactor if reason.ble thermodynamic efficiency is to be obtained. The nethods by which this may be accomplished for the ecovery of useful power from nuclear fission will iow be discussed.

Power Production From Primary Piles

The operation of a natural uranium pile, often ermed a "primary pile", is a necessary first step in he utilization of nuclear energy. Such piles have so ar been designed to yield plutonium as the only useul product. If power is the principal interest, the lutonium need not be separated, but may remain n the pile to contribute to the total energy release. Some combination of the two objectives may be desired in a particular instance.

In a natural uranium pile, nuclear physical considerations necessitate the use of a so-called heterogeneous system, in which the uranium is in relatively large pieces, separated by layers of moderator. We are told in the Smyth report that the uranium used in the piles constructed in the United States during the war was in the form of short cylinders individually sealed in aluminum cans. These cylinders were arranged in strings, in channels running through the graphite structure which served as the moderator. The cylinders were cooled by water conveyed through aluminum tubes surrounding the cylinders. The aluminum cans thus served the dual purpose of preventing corrosion of the uranium, and of preventing fission products from escaping into the cooling water.

LOW TEMPERATURES OF EXIT COOLING WATER

The use of aluminum and water in a pile immediately imposes temperature limitations. The neutron capture cross-section of water is sufficiently high that thin layers of correspondingly high velocity must be used in the cooling system. Due to the peculiar distribution of heat production in a pile and the steep temperature gradients involved, the bulk exit temperature must be well below the maximum surface temperature. The maximum surface temperature is set by the risk of aluminum corrosion and surface boiling. The net result is that a temperature well below the boiling point is the highest likely to be attained in the exit cooling water with an aluminum system.

Let us see how the primary pile might be redesigned to allow recovery of thermal energy at a higher temperature. Since the cooling fluid and the materials of the cooling system impose the principal temperature limitation, we should consider the use of combinations other than that of aluminum and water.

NO PRESENT ALTERNATIVE FOR ALUMINUM

In a natural uranium system the proportion of spare neutrons is quite small, and thus the additional materials introduced for the cooling system must have small neutron capture cross-sections, and be used in minimum quantities. In practice, aluminum and beryllium are the only materials which have sufficiently low capture cross sections and acceptable mechanical properties. Pure beryllium is difficult to produce, and its capability of fabrication into the forms required in a pile is still uncertain. Thus we are reduced to aluminum as the only choice for the present.

Somewhat greater freedom is possible in the case of the cooling fluid, although here again only substances of low neutron capture can be used. In addition, the coolant must be chemically stable and be one which does not undergo nuclear reactions leading to the formation of long-lived radioactive products with an embarrassing disposal problem.

WATER THE BEST COOLANT

Considering liquids first, the obvious choice of ordinary water turns out to be one of the best possible choice of materials. Pure water forms radioactive products, which decay sufficiently rapidly that no serious disposal problems result. However, its neutron capture cross section, due to its hydrogen content, is sufficiently high that care has to be taken to use the thinnest practicable layers. Heavy water has a much smaller neutron capture cross section, and might conceivably be used by circulating through the pile and a heat exchanger cooled by ordinary water. While this would allow greater freedom of design of the pile cooling system, the net availability of heat would be no greater and the added complexity of the circulating system would outweigh any advantages.

SOME GASES ARE POSSIBLE ALTERNATIVES

At the present time no other liquids appear to be available with sufficiently low capture cross sections and chemical stability under irradiation. A rather more hopeful picture is presented by the possibility of gas cooling. The most promising gases from the point of view of low capture cross section and chemical inertness are helium and carbon dioxide; hydrogen, air and nitrogen are less desirable by virtue of their higher capture cross sections, oxygen by the danger of oxidation of the graphite or aluminum surfaces in the pile.

The use of gas cooling introduces several advantages over liquid cooling. Wider cooling passages may be used and the total size of the pile may be reduced as a result of their much smaller neutron capture cross sections. Corrosion and film formation on the cooling surfaces are almost completely eliminated, allowing the use of much higher surface temperatures. The use of gas cooling in fact considerably increases the number of possible sites for primary piles, by eliminating the requirement for large quantities of pure cooling water.

DISADVANTAGES OF USING GASES

As usual, there are drawbacks as well as advantages. Unless very high gas velocities and pressures or elaborately extended cooling surfaces are used, the amount of heat removable per unit weight of uranium will be smaller than with a liquid cooled pile. The use of high gas pressures introduces a serious hazard from leakage of radioactive gas, and involves mechanical complications in charging and discharging uranium while the pile is operating. A circulating coolant system with a heat exchanger would have to be used, since the cost of the coolant is far too great to permit single-pass cooling. Recirculation involves the danger of contaminating the entire cooling system in the event of leakage of fission products from the uranium, while in a straight-through water cooling system only the outlet can become so contaminated. Standby blowers and power systems would be required to maintain gas cooling in the event of failure of the normal supplies, since the simple expedient of a reserve gravity tank cannot be adopted as with water. It is nevertheless true that most of these difficulties can be overcome, since they are design problems rather than fundamental obstacles.

ENERGY RECOVERY FROM GAS COOLED PILES

So far we have said nothing specific about the possible energy recovery from a gas cooled pile. This is largely due to our present lack of knowledge of permissible operating temperatures in the pile, due in turn to the uncertainty of the combined effects of temperature and radiation on the mechanical properties of the aluminum. Even in the absence of radiation, a definite upper temperature limit is set by the rapid fall off in strength of pure aluminum. Some improvement may conceivably be obtained by the use of high-strength alloys in thinner sections to compensate for their greater neutron capture, although this is still a matter of doubt. However, most authorities agree that there is a good chance of recovering more than enough power to operate the pile itself and the associated equipment. Combining this consideration with the greater freedom in the choice of site, it is likely that future primary piles will tend more and more toward gas cooling.

In summary, we see that it should be possible to design future primary piles, so that useful power is a product in addition to or in place of plutonium. However, as with all natural uranium piles, the units will be physically large and not well adapted for use by individual industrial or municipal power consumers. The next section will deal with reactors which can be constructed in sufficiently compact form for general use.

Power Production from Secondary Piles

A chain reacting system using uranium which contains more than the normal 0.7 per cent of fissionable material offers many advantages. Since the ratio of U238 to fissionable material is lower, the relative loss of neutrons by capture in U238 is also smaller. More neutrons can therefore be lost by other processes without stopping the chain reaction.

The latter consideration permits much greater freedom in the design and operation of the nuclear reactor. Constructional materials suitable for high temperatures may be used in spite of their greater neutron capture. A larger fraction of the volume of the reacting system may be devoted to cooling passages and other equipment. Finally, the complete unit may be greatly reduced in size, since greater losses of neutrons from the surface of the system can be tolerated. The foregoing remarks should not be interpreted as meaning that one can be too prodigal in consumption of neutrons. While a chain reaction can be maintained with a large wastage of neutrons, it will do so only at the expense of a large consumption of fissile material. Thus, economy of nuclear fuel dictates the use of the minimum quantity of neutron absorbing material which will achieve the desired performance characteristics.

METHODS OF PRODUCING ENRICHED URANIUM

Reactors operating on uranium which contains more than the normal proportion of fissionable material are frequently termed "secondary piles", since preliminary operations are required to produce the enriched uranium. Two general methods are available for this purpose. The first involves the removal of a portion of the U238 isotope from natural uranium, leaving the remainder with a higher ratio of U235 to U238. This separation was carried out on a large scale in the United States during the war for the production of U235. The processes employed were the diffusion of gaseous uranium compounds through porous barriers and the electromagnetic separation of uranium ions. While apparently a simple and direct method, isotope separation actually involves the construction of very large and expensive equipment. The total expenditure on isotope separation plants in the United States was of the order of a billion dollars. The plants could undoubtedly be much smaller where only partial separation of U238 from U235 were required, but would still represent a major industrial effort.

The second method for production of enriched uranium involves the addition of plutonium in place of U235. The plutonium is produced from natural uranium in a primary pile as described in the preceding section. The primary piles themselves are large and expensive units, requiring associated plants for the chemical separation of plutonium from uranium. However, they have the pronounced advantage of being capable of producing useful power, while isotope separation plants are necessarily large consumers of power.

LIMIT TO SIZE OF UNITS

As already mentioned, greater freedom of design is possible with secondary piles than with primary piles. This freedom may be used to advantage by raising the working temperature to permit efficient recovery of power, and by reducing the overall size of the unit. Needless to say, the reduction in size is eventually limited by the difficulties of removing energy at a high rate from a small volume, so that power producing units will have an optimum size for any particular service. Yet the size can certainly be reduced to the point where secondary piles may be used to replace coal-fired boilers in the larger steam power stations, and even to much smaller proportions in special cases.

The secondary pile will normally be designed to operate at the highest temperature consistent with long life and reasonably small neutron losses, though other considerations such as low construction costs or ruggedness may be involved at times. Unfortunately, we cannot discuss the actual arrangements likely to be used, due to the present security restrictions. We can, however, point out the principal ways in which power-producing secondary piles will differ from low-temperature primary piles.

CHOICE OF COOLANTS

The coolant can be water, helium or carbon dioxide as with primary piles, or it can be a molten metal of reasonably low capture cross section, such as bismuth or lead. The common high-temperature organic coolants such as Dowtherm or tetra cresyl silicate are not likely to be sufficiently stable under irradiation for the purpose. Any of the coolants mentioned could theoretically be used at temperatures limited only by the other materials of construction. The use of water (as steam), helium or carbon dioxide would require high flow rates and pressures for efficient heat transfer. This would be partially offset by the possibility of using the hot gas directly in a gas turbine without an intermediate boiler. However, since the coolant will become radioactive in circulating through the pile, the gas turbine would require shielding and elaborate precautions to prevent leakage.

The molten metals offer attractive possibilities for high-temperature piles, in spite of their somewhat greater neutron capture. Large amounts of heat can be removed at relatively low pressures and flow rates, and can then be efficiently transferred to a second working fluid in a conventional heat exchanger. The second working fluid would probably be steam to enable the use of existing types of auxiliary equipment and prime movers. The insertion of the heat exchanger would effectively isolate the two fluid circuits, and prevent contamination of the mechanical equipment by radioactive products.

CHOICE OF MATERIALS

The materials used to enclose the coolant in a high temperature pile must be selected on the basis of reasonably low neutron capture, high melting point and resistance to attack by the cooling fluid. Aluminum and its alloys have serious temperature limitations, as discussed earlier. Stainless steels offer much better possibilities due to their excellent temperature and corrosion resistance. The neutron capture of a typical stainless steel is unfortunately rather high, although this is offset by the strength and fabricating properties which enable the use of thin sections. The possibility also exists that refractory materials may be developed in the future which are stable under irradiation, impervious, and at the same time reasonably good heat conductors.

CHOICE OF A MODERATOR

The choice of the moderator for use in a high temperature pile involves the normal considerations of low atomic weight and low neutron capture in addition to temperature stability. The material most frequently used in primary piles, graphite, is quite suitable for high temperatures provided that air is excluded. Heavy water is virtually eliminated by its low boiling point. Ordinary water, in spite of its low boiling point and rather high neutron capture, might be used as a combined moderator and coolant under special circumstances. A group of materials which may become increasingly important are the beryllium compounds, due to their high melting points and inertness.

CHOICE OF A REFLECTOR

We have so far considered only the reacting core of the pile, namely the coolant, the moderator and the barrier used for separating the fissionable material from the coolant. Various other components are required for a practical unit. First, the reacting core should be surrounded by a "reflector", which will serve to return to the reacting system a large fraction of the neutrons which would otherwise escape from the walls. The reflector should be composed of some material such as graphite which has low atomic weight and low neutron capture; the requirements are, in fact, much the same as for the moderator.

The reflector should be surrounded in turn by a layer of shielding to absorb the remaining neutrons and other radiations from the pile. The materials for this purpose should be good neutron absorbers and should be used in sufficient weights to absorb gamma radiations. Steel and concrete will probably be used in most cases as a result of their low cost and ease of fabrication.

NEUTRON ABSORBERS

Next, means must be provided for controlling the neutron reaction to maintain the desired power output. This can be accomplished by adjustable neutron absorbers, such as cadmium or boron rods, which are moved in or out of the reacting core by automatic control mechanisms. In addition, safety devices consisting of large neutron absorbers should be available for stopping the reaction rapidly in the event of any dangerous departure from normal operating conditions.

REPLENISHING FISSIONABLE MATERIAL

Equipment must be provided for removing spent fissionable material from the pile and replacing it with fresh material. These operations would necessarily be carried out within the shielding by remote control, due to the intense radioactivity from the

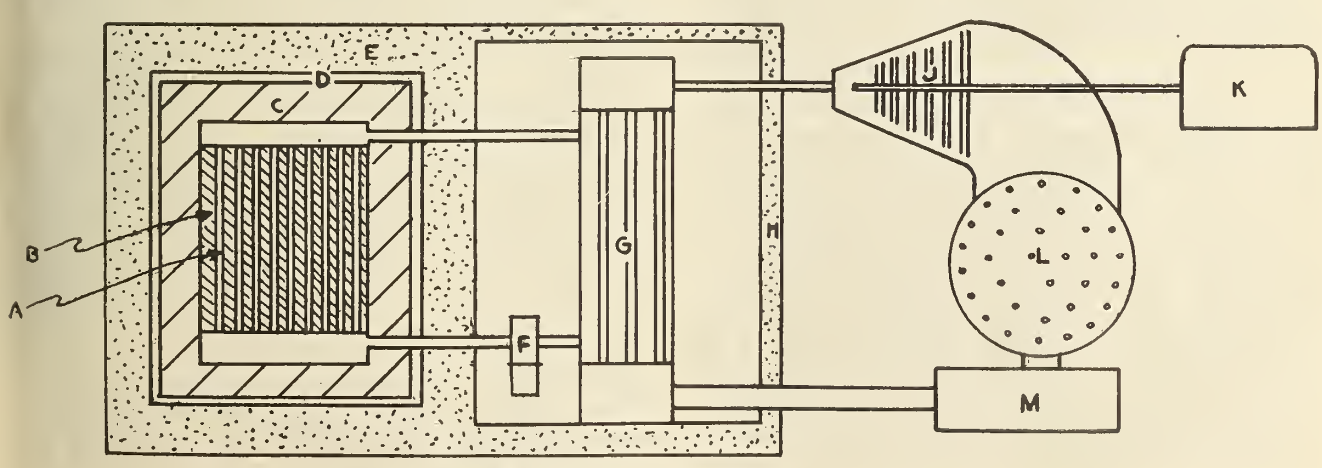

Fig. 1—Simplified hypothetical atomic pile power plant.

fission products. Finally, chemical processing equipment will be required for recovering fissionable material from the spent mixture and preparing the fission products for use or disposal.

A much simplified diagram of a hypothetical power plant of this type is shown in Fig. 1.

The fissile material is in the form of rods A, arranged in vertical holes in the block of moderator B. This reacting core is surrounded by the reflector C, the steel shell D and the heavy concrete shielding E. The molten metal coolant is forced by the pump F through cooling passages in the reacting core, and then through the heat exchanger G. The pump and heat exchanger are enclosed by the light concrete shield H. The working fluid for the power producing circuit is water which is heated to conventional steam temperatures in the heat exchanger G. The resulting steam drives the turbine J and the generator K, is condensed in L, and returned to the heat exchanger by pump M. Required but not shown in the diagram are the absorbers for control and emergency shut down, and the mechanical arrangements for renewing the fissionable material in the reacting core.

Fields of Application of Nuclear Energy

The preceding sections have outlined some of the considerations involved in producing power from primary and secondary piles. It is now appropriate to examine the general picture of nuclear energy to see what useful applications it may find in the visible future. For convenience, we will deal first with the power aspects of nuclear energy and postpone the discussion of other applications to the next section. It should be borne in mind, however, that many of these other applications arise from by-products of power production and may therefore contribute substantially toward operating costs.

The advantages of nuclear power are few in number but of extraordinary importance. We can state them simply as the very high ratio of energy production to fuel consumption, and the flexibility of control of energy production. The concentrated energy storage in nuclear fuels is well illustrated by the fact that U235 on fission yields approximately 3 million times the energy from the combustion of an equal weight of coal. The flexibility of control arises from the fact that energy may be released at any rate from zero to a level which results in destruction of the system merely by adjusting a small neutron absorber.

The disadvantages of nuclear power are numerous but not necessarily so decisive. Primary piles are very large units which can normally be built only in a few selected localities. Secondary piles are much more compact but require the use of enriched uranium, which is itself the product of elaborate physical and chemical processes. All chain reacting units require massive shields for protection of personnel from neutron and gamma radiations; the weight of this shielding would be of the order of tons for even the smallest power producing pile. All parts of the unit which contain radioactive materials require special design and elaborate operating precautions to avoid leakage of materials or radiation. The final and perhaps the most troublesome feature is the necessity of separating and disposing of the highly radioactive fission products from the uranium.

Our knowledge of the various factors is not yet sufficiently complete to give an accurate appraisal of the part nuclear energy will play in the future. Past experience suggests that nuclear energy will not cause a sudden revolution, but will be gradually introduced in specific instances where it is found to be the most economical solution. We can expect that the cost of nuclear energy will gradually decrease with further development so that the number of favorable situations will increase. However, there will probably always be fields where hydroelectric power, coal or oil provide the best solution.

MOST PROMISING APPLICATIONS

One of the large scale applications of nuclear power plants might be the industrial development of parts of the world where conventional fuels or hydroelectric power are not readily available. Since the transportation costs for nuclear fuel would be insignificant, such areas would be in virtually as favorable a power situation as the present industrial centres.

Another step might be the replacement of coal-fired boilers in the larger steam-electric power stations by nuclear reactors. Most industrial districts in Europe and many in the United States are now entirely dependent on coal for electric power. The steadily-rising costs of coal suggest that the time when such a change is economically desirable may not be too far distant. The conversion might be a particularly expensive undertaking in this instance, since much of the mechanical equipment and all of the distribution system could be retained.

The use of nuclear power plants does not seem to be so favorable where hydroélectric power is now available, as in most parts of Canada. Some saving may be possible by locating the power plant close to the load centre to avoid long transmission lines. Similarly, industries which require large amounts of electric power might find it advantageous to locate near established markets or transportation routes and construct a nuclear power plant rather than move to an isolated power site. Another important advantage in some industries might be the ability of nuclear power plants to supply heating and process steam directly in addition to electric power.

NOT SUITABLE FOR SMALL INSTALLATIONS

Very small nuclear power plants are unlikely to be used at all for normal purposes as long as other power sources are available at reasonable cost. Due to the critical size phenomenon, a certain minimum quantity of fissionable material is required for a reactor regardless of the power output. The value of the material is sufficiently high that the interest on the investment might greatly exceed the cost of the fuel consumed in a small reactor.

One of the least attractive applications of nuclear power at the moment is that of transportation. An exception may be made in the case of large naval craft, where weight-carrying capacity is adequate, and where infrequency of refuelling is of paramount importance. It is possible that nuclear power plants may be developed which are sufficiently small and rugged for use in railway locomotives. A more attractive course, if coal and oil were scarce, would probably be the electrification of the system with power supplied from central stations. There is no visible prospect of the development of plants sufficiently small or light for use in ordinary aircraft or motor vehicles. The possibility that pilotless aircraft using nuclear reactors with little or no shielding may be built cannot be discounted, but this is still well into the future.

COST OF COAL AND NUCLEAR POWER COMPARED

So far nothing specific has been said about the economic side of nuclear power production. It should be stressed at the outset that any estimates of costs which are made can be little more than intelligent guesses, due to the lack of actual experience in operating power producing piles. The uncertainties include not only the construction costs, but also the useful life and the cost of nuclear fuels on a commercial basis.

The only authoritative estimates now available are those prepared for the United Nations Atomic Energy Commission by members of the engineering staff of the Clinton Laboratories at Oak Ridge, and of the Monsanto Chemical Company. No details are given as to the type of pile considered nor of the assumptions made in estimating costs.

It is stated that a 75,000 kilowatt plant could be built in a normal locality in the eastern United States for $25 millions at current prices. On the assumption that the plant would operate at 100 per cent of capacity and that interest charges on the investment would be 3 per cent, the operating cost would be approximately 0.8 cents per kilowatt hour.

A coal-fired plant of the same capacity would cost $10 millions at current prices. The cost of bituminous coal of 13,500 B.T.U. is about $7 per ton delivered at a power plant in the eastern United States. Assuming again that the plant would operate at 100 per cent of capacity and that interest charges on the investment would be 3 per cent, the operating cost would be approximately 0.65 cents per kilowatt hour. Equality between coal and nuclear power plants would be reached if coal were to cost $10 per ton delivered.

The comment is made that the higher cost of nuclear power results principally from the larger investment, and the expected higher labor and supervision costs for the nuclear plant. Both the investment and the operating costs are likely to fall as standardization of design and construction take place and as the simplicity and safety of operation are improved.

Other Industrial Applications of Nuclear Energy

An obvious alternative application of nuclear energy is the direct employment of heat in industrial processes or heating systems. Serious difficulties will usually be encountered in isolating the material to be heated from radiation and from contamination by fission products. The possibility of attaining extremely high temperatures may eventually outweight the difficulties by making possible entirely new processes. For some time, however, utilization of thermal energy will probably be confined to recovery of waste heat from electric power generation, or to combined electric power and process steam production.

Before leaving this subject, some comment should be made on the possibilities of producing climatic changes by heat from nuclear energy. Many extravagant statements have been made in this regard, ranging from heating and lighting cities by atomic "suns" to turning our northern territories into orange groves. It is therefore well to consider the actual quantities of energy involved.

NO CLIMATIC CHANGES FORESEEN

Climatic conditions are determined mainly by solar radiation, which amounts to 3.5 million kilowatts of heat energy per square mile at the equator. The production of heat from nuclear fuels at this rate would require the consumption of slightly over 1 ton of pure fissionable material per square mile per year. Since nuclear fuels will probably cost tens of thousands of dollars per pound for some time to come, the cost of supplementing solar radiation over any large area is obviously rather high. It is true that cities might well be heated by nuclear energy, but this would probably be accomplished by more conventional means than suspending an atomic sun overhead. Not only would the latter scheme be somewhat extravagant of heat energy, but the gamma rays emitted would soon eliminate the inhabitants.

USES FOR RADIATION

The other great field of application of nuclear energy involves the use of the various types of radiation which can be produced. These radiations are similar to those which have been known for years through radium and X-rays, but are available on an enormously greater scale and at much lower cost than before. Gamma rays, similar to hard X-rays, are emitted on fission. The fission products are themselves radioactive and emit beta particles (high speed electrons) and gamma rays. In addition, surplus neutrons from fission may be used to produce synthetic radioactive materials by absorption in suitable substances inserted in a chain reacting pile. The radiations may thus be utilized in three ways: by direct exposure in the pile, by separating radioactive fission products from the uranium, or by preparing new radioactive materials from surplus pile neutrons. The last two methods enable use away from the pile, since the radioactive materials may be readily shipped in shielded containers to any destination. The last method is particularly useful since radioactive materials can be virtually "tailor-made" for the specific application.

These radioactive materials may be expected to find more and more uses in physics, chemistry, metallurgy, biology and medicine. Treatment of cancer, now carried out by the use of X-rays or radium, is expected to be greatly facilitated by new radioactive materials. Gamma radiations from suitable materials may be used as substitutes for X-ray equipment in clinical and industrial radiography, being particularly adaptable by virtue of the small size of the source. The destructive effect of radiation on living organisms may eventually be applied to water purification, sewage disposal and other sanitary problems. The ionization of air by small quantities of radioactive materials has been suggested as a means of reducing static electricity hazards in explosives plants and dusty locations. Long-lived radioactive materials in combination with suitable phosphors may eventually be used as cold light sources, requiring no power or maintenance.

RADIATION CHEMISTRY

Two new branches of chemistry, known as "tracer chemistry" and "radiation chemistry" are coming into prominence as a result of the ready availability of radioactive materials. The first is based on the fact that radioactive atoms of a given element are identical with normal atoms in their chemical behaviour. The radioactive atoms may be followed through any physical or chemical process by means of instruments sensitive to their radiations, and thus enable the course of the whole reaction to be traced. Knowledge of the way in which atoms transfer from one molecule to another or from one place to another is of great importance in research on diffusion, adsorption, corrosion, phase changes and many other processes. A few of the suggested applications of tracers to engineering problems are the study of the performance of distillation columns in the oil industry, the identification and location of minor constituents of alloys, the study of lubrication of moving parts, and the tracing of liquid and gas flows in hydro and aerodynamics. This list can probably be greatly expanded since the field is virtually untouched at the moment.

Radiation chemistry deals with the chemical reactions produced by radiation. This subject is still in too early a stage of development to predict any definite applications. However, it appears likely to be of interest in polymerization and cracking, in catalysis and in many other organic and inorganic processes. A subsidiary consideration is the change in physical properties of solids which result from exposure to radiation. Whether this may lead to the development of new and useful properties in familiar materials is a question for the future.

Nuclear Engineering

The preceding sections have been an attempt to show the part which this new energy source is likely to play in the industrial world. Before concluding, two aspects of nuclear energy will be mentioned which, it is hoped, will be of particular interest to engineers. The first of these will be a resume of the principal ways in which nuclear engineering differs from the more familiar branches of applied science; the second will be a brief summary of the development work which lies ahead before nuclear power is a reality.

The differences between equipment designed for use in nuclear reactors and for ordinary chemical and mechanical processes arise from two main considerations: first, the effects of neutrons and other radiations on structural materials, and second, the necessity of protecting personnel from these radiations. A third consideration which may arise eventually is that nuclear reactors afford a means of releasing energy at enormously greater rates and in much smaller volumes than in molecular reactions, so that much higher temperatures and temperature gradients may be encountered.

Effect of radiation on structural materials

Considering the effects of radiation on structural materials, we know that neutrons cause nuclear reactions with almost all elements, although the actual extent of the reaction varies very widely. Such reactions result (a) in loss of neutrons, (b) in production of radioactive isotopes of the material, (c) in production of heat in the material, (d) in chemical decomposition of the material, and (e) in changes in the physical properties of the material. Other radiations such as beta and gamma rays usually cause heat production only. Any or all of the above effects can be serious depending on the particular case. Thus, the nuclear designer must;

(a) Select materials which have sufficiently low neutron capture to avoid upsetting the reacting system.
(b) Select materials which produce only short-lived isotopes, which decay rapidly after the system is shut down, or else accept the fact that the part cannot be serviced.
(c) Provide auxiliary cooling systems for all parts where significant heat is produced.
(d) Avoid materials which undergo chemical decomposition, including most plastics, organic lubricants, etc.
(e) Use large safety factors in designing for structural strength, or carry out experimental work to determine whether any serious deterioration occurs.

In addition, the designer has the normal problems of heat transfer, thermal expansion, corrosion and so forth. Needless to say, many of these requirements are mutually conflicting and any actual reactor will represent an elaborate series of compromises.

Neutron capture of elements compared

Before leaving this subject it may be of interest to list the approximate slow neutron capture cross sections of a few common elements. These cross-sections as shown in Table I are given in " barns ", which, as mentioned in the first paper, indicate the relative probability of neutrons being absorbed in a given number of atoms of the material. The capture cross-sections for compounds may be obtained by simply adding the cross-sections of the individual atoms.

Table I

Slow Neutron Capture Cross-sections of Certain Common Elements Expressed in " Barns ".

Element	*Cross-Section*	*Element*	*Cross-Section*
Hydrogen	0.3	Chromium	3.
Deuterium	.001	Manganese	13.
Helium	0.0	Iron	3.
Lithium	60.	Nickel	4.
Beryllium	.01	Copper	4.
Boron	700.	Zinc	1.
Carbon	.005	Cadmium	2500.
Nitrogen	2.	Tin	0.7
Oxygen	.002	Antimony	5.
Sodium	0.5	Mercury	400.
Magnesium	0.4	Lead	0.2
Aluminum	0.2	Bismuth	.02
Silicon	0.3		

Without considering each element individually, it may be pointed out that the capture cross-sections vary widely, but that very few elements combine both low cross-sections and good structural properties. When some of the resulting possibilities are discarded on the basis of undesirable neutron reactions, it can be seen that the choice of materials left to the designer is small indeed.

Protection of personnel

The protection of personnel involves shielding from direct radiation and prevention of leakage of radioactive materials into the working areas. Both of these problems are fairly straightforward although their detailed solution may involve considerable effort. The shielding is usually of a composite type, with layers of water or other hydrogenous material to slow down the neutrons, layers of metal of fairly high capture cross section to absorb the neutrons, and finally a heavy layer of concrete or lead to absorb gamma radiation. The shielding itself, at least in the inner layers, requires cooling to remove the heat produced by absorption of radiation. Special arrangements are required at the charging and discharge openings, at pipe lines, and at control and power shafts to prevent leakage or radiation. The remaining problem, the prevention of leakage of radioactive gases and liquids, involves the use of valves, pumps and blowers especially designed for this service.

MANY PROBLEMS STILL TO BE SOLVED

Finally, let us consider the principal engineering development problems which must be solved before nuclear power can be produced commercially. First, a comprehensive programme must be undertaken for investigating the properties of materials for use in the proposed reactor, under working temperatures and radiation intensity. A programme of this nature requires that a working pile be available to produce the necessary radiation. Following this, a series of heat transfer investigations must be carried out for the most efficient design of the cooling system. Next, mechanical equipment must be developed for use in the reactor, which will operate for very long periods of time without requiring servicing. The equipment must be so arranged that the more complex mechanical parts do not become active, or alternatively that these may be removed and replaced by a new unit without opening the shielding. To repeat, the development of fluid handling equipment which allows no leakage of active material, is a very important requirement. Finally, chemical separation processes must be developed which will operate with a minimum loss of fissionable material or of recycled uranium, yet be reasonably simple and be capable of complete operation by remote control within shielding.

Conclusion

We may conclude by attempting to show some of the implications of our present status. First, it can be seen that the outstanding aspect of nuclear power development is the tremendous amount of work which remains to be accomplished. The effort involved in building up a complete set of facilities for the economical utilization of nuclear energy is probably nearly as great as that expended on the atomic bomb project during the war.

Next, it must be appreciated that we have in nuclear energy merely a new source of heat, which still requires the bulk of the equipment of a conventional steam power station for its conversion to electrical energy. This has both good and bad features. In areas where coal-fired steam power plants are now the main source of energy, such as England and many parts of the United States, conversion to nuclear fuels may require relatively few changes. The increasingly difficult coal situation may, in fact, make it desirable to convert while nuclear fuels are still quite expensive. However, in countries such as Canada where hydroelectric power is the principal source of electrical energy, the use of nuclear fuel would involve the construction of entirely new plants, and it will be generally true that nuclear fuel costs will have to fall to a low level before any extensive conversion takes place.

Again, there is the consideration that nuclear power plants will probably be most economical and most easily constructed in large sizes, say from 100,000 to 1,000,000 kw. Nuclear power plants will thus be largely confined to heavy load centres or extensive distribution networks.

PUBLIC OWNERSHIP ESSENTIAL

Last, but by no means least, we have the problem of controlling activities in the nuclear energy field. Since the fissionable materials required for power production are virtually the same as those used in atomic weapons, national interests will inevitably require the maintenance of rigid control until some really workable international agreement is put into effect. Even after the establishment of such an agreement, control measures will be required to prevent diversion of fissionable materials for illegal activities.

The upshot of this situation is that we are never likely to have free participation by private industry in all phases of nuclear energy. Future progress, as for example the development of "denatured" fissionable material which can be used for power production but not for atomic weapons, may permit free activities in some fields. However, the operation of primary piles and isotope separation plants is likely always to remain under federal or international control. It may be added that the expenditures involved in the construction and operation of these units are in any case likely to be too large for private enterprise.

In spite of all difficulties, it is felt that nuclear energy can be and should be exploited, for by so doing we can postpone for a very long time any fear of exhaustion of the world's power resources, and bring industrial power to areas now undeveloped.

THE SIXTY-FIRST ANNUAL GENERAL MEETING

Convened at Headquarters, Montreal, on January 30th, 1947, and adjourned to the Royal York Hotel, Toronto, Ontario, on Thursday, May 8th, 1947

The Sixty-First Annual General Meeting of The Engineering Institute of Canada was convened at Headquarters on Thursday, January 30th, 1947, at eight o'clock p.m., with Vice-President J. E. Armstrong in the chair.

The assistant general secretary having read the notice convening the meeting, the minutes of the Sixtieth Annual General Meeting were submitted, and on the motion of Huet Massue, seconded by D. W. Campbell, were taken as read and confirmed.

Appointment of Scrutineers

On the motion of R. S. Eadie, seconded by C. R. Wintermark, Messrs. Henri Gaudefroy, Bruce H. Johnston and H. S. Van Scoyoc, were appointed scrutineers to canvass the officers' ballot and report the results.

There being no other formal business, on the motion of G. W. Jarvis, seconded by Jacques Benoit, it was resolved that the meeting do adjourn to reconvene at the Royal York Hotel, Toronto, at nine thirty a.m. on the eighth day of May, nineteen hundred and forty-seven.

Adjourned General Meeting at the Royal York Hotel, Toronto, Ontario

The adjourned meeting convened at nine thirty a.m. on Thursday, May 8th, 1947, with President J. B. Hayes in the chair.

Nominating Committee—1947

The general secretary announced the membership of the Nominating Committee of the Institute for the year 1947 as follows:

Chairman: Stewart Young

Branch:	*Representative*
Border Cities	T. H. Jenkins
Calgary	P. F. Peele
Cape Breton	J. H. Fraser
Cornwall	W. P. Nesbitt
Edmonton	C. W. Carry
Halifax	A. E. Flynn
Hamilton	Alex. Love
Kingston	D. S. Ellis
Kootenay	Ernest Mason
Lakehead	W. L. Bird
Lethbridge	G. S. Brown
London	J. H. Johnson
Moncton	A. R. Bennett
Montreal	J. J. H. Miller
Niagara Peninsula	C. G. Cline
Ottawa	E. G. Cameron
Peterborough	W. T. Fanjoy
Quebec	J. O. Martineau
Saguenay	W. F. Campbell
St. Maurice Valley	A. S. Holder
Saint John	K. V. Cox
Sarnia	J. W. MacDonald
Saskatchewan	A. P. Linton
Sault Ste. Marie	R. A. Campbell
Toronto	A. E. Berry
Vancouver	A. Peebles
Victoria	J. C. MacDonald
Winnipeg	C. P. Haltalin

Honorary Memberships

The general secretary reported that the following had been elected to honorary membership in the Institute and that certificates would be presented at the annual dinner:

Ernest Brown, D.Eng., Former Dean and Emeritus Professor of Civil Engineering, McGill University, Montreal, Que.

Percy Dunsheath, C.B.E., M.A., D.Sc. (Eng.), Past-President, Institution of Electrical Engineers, Chief Engineer, W. T. Henley's Telegraph Works Co. Ltd., Hatton Gardens, London, E.C.1.

Chalmers Jack Mackenzie, C.M.G., B.E., M.C.E., D.Sc., LL.D., President, National Research Council of Canada, Ottawa, Ontario.

Frederic Henry Sexton, B.Sc., LL.D., President, Nova Scotia Technical College, Halifax, N.S.

Award of Medals and Prizes

The general secretary announced the awards of the various medals and prizes of the Institute as follows, stating that the formal presentation of these distinctions would be made at the annual dinner of the Institute the following evening:

Sir John Kennedy Medal—"A recognition of outstanding merit in the profession or of noteworthy contribution to the science of engineering or to the benefit of the Institute." To—Lorne A. Campbell, M.E.I.C., Trail, British Columbia.

Julian C. Smith Medals—"For achievement in the development of Canada." To—Charles Camsell, M.E.I.C., Ottawa, Ontario, and John Bow Challies, M.E.I.C., Montreal, Quebec.

Gzowski Medal—To—J. G. G. Kerry, M.E.I.C., for his paper "The Winter Temperature Cycles of the St. Lawrence Waters."

Duggan Medal and Prize—To—A. K. Leuthold, M.E.I.C., for his paper "The Application of the Gas Turbine to Railway Locomotives."

Leonard Medal—To—George Gedge, C.I.M.M., for his paper "Safety in the Handling of Explosives at the Hollinger Mine."'

Plummer Medal—To—W. J. Tomlinson, M.E.I.C., for his paper "Modern Methods of Conditioning Boiler Water Externally."

Keefer Medal—To—R. M. Hardy, M.E.I.C., and E. D'Appolonia, M.E.I.C., for their paper "Permanently Frozen Ground and Foundation Design."

Ross Medal—To—A. B. Hunt, M.E.I.C., for his paper "The Future of Radio Communications in Canada."

Students and Juniors Prize

H. N. Ruttan Prize—(Western Provinces)—E. M. Scott, S.E.I.C., for his paper "The Operation and Construction of the Modern Oil Circuit Breaker."

Report of Council, Report of Finance Committee, Financial Statement and Treasurer's Report

On the motion of A. R. Hannaford, seconded by I. Brouillet, it was resolved that the report of Council, the report of the Finance Committee, the Financial Statement and the Treasurer's report, be accepted and approved.

5.

4.

6.

ATOMIC ENERGY

The opening luncheon, Thursday May 8th, and the afternoon technical session were devoted to Atomic Energy, the outstanding technical achievement of the Second World War. In 5, K. F. Tupper, director of the Engineering Division at Chalk River deals with "Engineering Nucleonics". Photo 6 shows C. H. Jackson, chief engineer, Special Projects Dept., Defence Industries Ltd., Montreal, telling of the building of the Chalk River plant. Photo 7, from a balcony of the ballroom, shows Prof. R. F. Legget, Toronto, introducing the luncheon speaker, Gen. A. G. L. McNaughton, C.H., C.B., C.M.G., D.S.O., who is shown in the 8th picture delivering his address which dealt with "International Control of Atomic Energy".

7.

8.

Reports of Committees

On the motion of Charles Miller, seconded by A. J. S. Taunton, it was resolved that the reports of the following committees be taken as read and accepted: Legislation, Employment and Rehabilitation Service, Board of Examiners, Publication, Membership, Industrial Relations, Prairie Water Problems, Community Planning, Papers, Library and House, Engineer in the Civil Service, The Young Engineer, Employment Conditions, Professional Interests, Canadian Chamber of Commerce, Canadian Standards Association, Canadian Radio Technical Planning Board.

Branch Reports

On the motion of I. S. Patterson, seconded by A. Sandilands, it was resolved that the reports of the various branches be taken as read and approved.

Election of Officers

The general secretary read the report of the scrutineers appointed to canvass the officers' ballot for the year 1947 as follows:

President: L. F. Grant, Kingston, Ont.

Vice-Presidents:

Zone A (Western Provinces), S. G. Coultis, Calgary
Zone B (Province of Ontario), W. L. Saunders, Ottawa
Zone C (Province of Quebec), R. S. Eadie, Montreal

Councillors:

Vancouver Branch	T. V. Berry
Kootenay Branch	S. C. Montgomery
Edmonton Branch	F. R. Burfield
Saskatchewan Branch	N. B. Hutcheon
Lakehead Branch	S. T. McCavour
Border Cities Branch	A. H. MacQuarrie
London Branch	V. A. McKillop
Toronto Branch	C. F. Morrison
Ottawa Branch	J. H. Irvine
Kingston Branch	J. R. Carter
Cornwall Branch	B. deHueck
Montreal Branch	J. A. Beauchemin
	K. G. Cameron
	C. E. Gelinas
St. Maurice Valley Branch	Viggo Jepsen
Saguenay Branch	W. J. Thomson
Saint John Branch	C. D. McAllister
Halifax Branch	L. E. Mitchell

On the motion of A. J. S. Taunton, seconded by A. D. Harris, it was resolved that the reports of the scrutineers be adopted, that the scrutineers be thanked for their services in preparing the report, and that the ballot papers be destroyed.

The president announced that the newly elected officers would be inducted at the annual dinner of the Institute the following evening.

New Business

A motion was presented by Mr. Self (Toronto) proposing that the Institute should canvass the individual members of the organization with regard to whether or not the Institute should support the new Canadian Council of Engineers and Scientists. Mr. Dobson (Toronto) seconded the motion. The president asked Mr. Stirling (Montreal) chairman of the Committee on Professional Interests, if he would care to reply to Mr. Self's remarks. Mr. Stirling reminded the meeting that this subject had been canvassed thoroughly some time ago by his committee, at the time it prepared its statement of co-operation with sister societies. The statement had been submitted to the executive of every branch in Canada, and to every councillor and to every past-president. It had also been discussed before several Council meetings. This canvass did not reveal a single negative opinion. Subsequently the statement was approved by Council. Under these circumstances he was of the opinion that a vote for the motion was a vote of lack of confidence in the Council of the Institute.

Mr. Hannaford (Hamilton) and Mr. Dunbar (Hamilton) were of the opinion that the councillors in voting in favour of the statement had acted in accordance with the wishes of their branches. They felt that Mr. Self's motion now would in essence be a vote of lack of confidence in Council.

The general secretary reported that this subject had been discussed for over an hour at the meeting of Council which took place the day previously. The discussion had indicated that many members were unfamiliar with the details and had not seen all the material that had been published on it. Finally it had been agreed that the committee should re-examine the situation and if it appeared desirable, again circularize the membership with the full story.

Mr. Stevens (Winnipeg) stated that the executive of his branch had passed a resolution on this subject which had been forwarded to Council, but at the meeting of Council on the day previous he thought the situation had been clarified considerably. He did not think that a national body such as the Institute could adopt a sound policy by submitting such matters to a plebiscite. He did not think one could have a satisfactory organization if Council were required constantly to refer matters of policy to the entire membership for opinion. Therefore, he supported Mr. Stirling's belief that this would be a motion of lack of confidence. Mr. Heartz (Montreal) also supported this opinion.

President-elect Grant drew attention to the possible difference of interpretation of the word "support" as used in Mr. Self's motion. He pointed out that the Institute was always ready to support any organization in a cooperative endeavour that was for the good of the profession or other worthy causes. If Mr. Self intended the word to mean the Institute should join the new Council, then it was an altogether different matter.

Mr. Sisson (Toronto) pointed out that in the discussion it was apparent that Mr. Self and his seconder, Mr. Dobson, held different ideas as to how the membership of the Institute should be canvassed. Mr. Self had asked for an individual canvass, whereas Mr. Dobson had recommended that it be handled through the branches. Mr. Self replied that it was immaterial to him how it was carried out, and that either method would be satisfactory.

The president restated the motion as follows: That the individual members of the Institute be canvassed either directly through headquarters, or through the individual branches, in order to ascertain their opinion as to support and collaboration with the Council of Engineers and Scientists. Mr. Self agreed to this wording, whereupon the president put the motion which was defeated, only ten members supporting it.

Retiring President's Address

In accordance with established custom, the president delivered his retiring address, which appears in full on page 286 of this issue of the *Journal*.

Vote of Thanks to the Toronto Branch

On the motion of A. E. Flynn, seconded by R. C. Flitton, it was unanimously resolved that a hearty vote of thanks be extended to the officers and members of the Toronto Branch in recognition of their hospitality and activity in connection with the holding of the Sixty-First Annual General Meeting.

Vote of Thanks to Retiring Officers

It was moved by Past-President Cleveland that a hearty vote of thanks be tendered to the retiring president and to the able councillors who had supported him throughout the year.

He observed that the president had brought to his high office an enthusiasm and personality which were wholly refreshing. Those who had followed the president's extensive travels in Canada and to the Old Country had some realization of the sacrifice he had made on behalf of the Institute.

He concluded by asking the meeting to join with him in extending this vote of thanks. The motion was received with applause and the president acknowledged it on behalf of himself and his fellow workers.

The meeting adjourned at eleven forty-five a.m.

THE ANNUAL MEETING

The Diamond Jubilee Meeting was indeed a jubilee. The activities carried out in accordance with the programme and those developed on the spot by the delegates indicated clearly that 60 years in the life of a society brings it only to its prime—certainly not to its dotage. It is doubtful if a more profitable and enjoyable meeting could be devised.

Toronto made a new record for attendancee, the registration just falling short of a 1000 by 40. Doubtless there were many at various sessions who did not register, so that in fact the attendance was well over that figure. For the first luncheon there were 570, the second luncheon, 617 and for the banquet, 745. The smoker drew 405.

The innovation of holding the meeting in the Spring instead of the Winter was well received, judging by the full attendance at all functions. It is likely that future meetings will be held about the same time, unless special circumstances warrant a change.

Distinguished Guests

Again the Institute was fortunate in having a number of distinguished engineers participate in the programme, some of them from other parts of the world. Outstanding in this group was Air Commodore Whittle of jet propulsion fame, who made the trip to Toronto solely for this purpose. After a visit to the United States last December to receive the Guggenheim Medal, he suffered a severe illness and was in hospital at Washington for many weeks. Instead of returning to England for his leave and convalescence he remained on this side to fulfil his engagement to the Institute. It was fortunate for the Institute that he did so because his contribution was outstanding. His expert knowledge of his subject and his charming personality were the highlights of the meeting.

From the States we had many representatives: R. G. Standerwick of the General Electric Co., Lynn, Mass., was one of the principal discussors of Whittle's paper, and as well introduced the Air Commodore for his luncheon address—a remarkably skillful build-up both for the speaker and for his subject. We were also honoured by the presence of Eugene W. O'Brien, of Atlanta, Georgia, president of the American Society of Mechanical Engineers, C. E. Davies, of New York, secretary of the same society, and H. H. Henline, of New York, national secretary of the American Institute of Electrical Engineers. The Institute was also glad to have as its guests Evelyn Fenwick, of the Institution of Electrical Engineers, Great Britain, who was returning to his home in New Zealand, and Capt. R. C. Petter, of London, England, a member of the Council of the British Engineers Association, and a member of the Institutions of Mechanical Engineers and Marine Engineers.

Council Meeting

So far as can be discovered no previous meeting of Council has shown an attendance as representative of the branches as the one held all day Wednesday, May the 7th. Twenty-two branches were counted in the roll call including Vancouver, B.C., and Sydney, N.S. The total attendance was sixty-six.

The retiring president J. B. Hayes combined in nice proportions the ability to get the business completed and to draw out discussions from everyone who had anything to contribute. For part of the afternoon session he asked vice-president C. E. Sisson to preside.

The business of the meeting will be reported later.

The President's Dinner

As usual this turned out to be one of the pleasantest events on the programme. It is the occasion when the retiring president gathers around him the officers of the Institute and other advisers who have helped him throughout his term of office. It is his "thank you" to them for services rendered. It usually follows the annual meeting of council.

The custom has grown of asking each past-president to make a speech—of very short duration. Always these are gems, and it is regrettable that the whole membership could not hear them. These senior statesmen have not lost their cunning in such matters, nor their sense of humor. In all there were seventy-six present.

Exhibits

Two exhibitions were features of the programme—one shown by the National Research Council, and the other by members of the Institute—an arts and crafts show. Both were excellent and added much to the interest and pleasure of the meeting.

The arts and crafts exhibition was an innovation. After many years of "toying" with the idea it was finally put on the programme. Its success indicates that it should be a frequent and perhaps annual event. It is evident that engineers have many talents, not normally considered a part of engineering. Included were oil paintings, water colors, pastels, photographs, ship and locomotive models, instruments, beaten metal work, and so on—and all of it good. The exhibition itself was arranged excellently—another tribute to the engineers.

The National Research Council exhibit, though small, was of unusual interest. It divided generally into two sections—one made up of samples of German electrical equipment and the other including several devices developed by the Council. Personnel from the Council were on hand to explain the operation of the equipment and considerable interest was evidenced by the engineers and their guests. Among the devices

ARTS AND CRAFTS EXHIBIT

A highlight of the meeting was the excellent exhibit of painting and other hobby work by Institute members. Mr. Phil Croft was the committee chairman.

N.R.C. TECHNICAL EXHIBIT

from the Council was a recently developed transmission line fault locator which was of great interest to those specializing in this field of electrical engineering. Of more general interest was the radar distance indicator which enables the pilot of an aircraft to determine his distance from one or more preselected points and which represents only one of the many varied uses to which radar can be applied in the operation of ships and aircraft.

The exhibit was another of several features which all contributed to the success of the Toronto meeting. The Institute is indebted to the officers and personnel of the National Research Council for their participation.

Another new endeavour was the screen set up by the Peterborough Branch to show something of the branch's activity, through copies of notices of meetings. It was both interesting and informative and doubtless gave officers of other branches some new ideas for their own programmes. The records of this branch have been preserved by a succession of secretaries to whom the credit is due for this interesting panel.

Students Conference

Once again the Institute invited each university to send a delegate to the Student Conference. All eleven institutions where engineering is taught were represented in addition to which there were several observers from university student bodies, from the teaching staff, from industry, and from sister societies.

The conference was held on Saturday the 10th from 10 a.m. to 6.30 p.m., with the new chairman of the Committee on the Training and Welfare of the Young Engineer, G. R. Langley, chief engineer of the Canadian General Electric Co., Peterboro, presiding.

Subsequently the resolutions of the conference will be published. In the meantime it is interesting to note that it was agreed unanimously that the conference should become a fixed annual event in the

THE ANNUAL BANQUET

Dr. C. J. Mackenzie, the dinner speaker, had some serious thoughts to leave with the engineers. Eugene O'Brien, Mrs. J. B. Hayes, Gen. McNaughton, and A/C Whittle appear to be listening carefully to every word.

Above—Charles Camsell, Ottawa, receives the Julian C. Smith Medal "for achievement in the development of Canada".

Below—The Plummer Medal was awarded to W. J. Tomlinson, Montreal.

Dr. Mackenzie receives the certificate of honorary membership in the Institute. His sponsor was Dr. K. M. Cameron of Ottawa who stands behind Eugene O'Brien and Mrs. J. B. Hayes.

President Hayes presents the Keefer Medal to R. M. Hardy, Edmonton.

Dr. E. A. Cleveland standing between President Hayes and Dr. F. H. Sexton sponsors Dr. Sexton for honorary membership in the Institute.

Right—Dr. Ernest Brown, Prof. Emeritus of McGill University, is sponsored for honorary membership by Dr. de Gaspé Beaubien. Seated are Dr. Camsell, Mrs. Frank Whittle and Dr. Mackenzie.

AT THE PRESIDENT'S DINNER

Above—Head Table guests enjoying a remark by Dr. E. A. Cleveland, Vancouver. General Secretary Austin Wright; Eugene W. O'Brien, New York, President, A.S.M.E.; and the host, President Hayes of Halifax in a characteristic pose.

Past President C. R. Young, Dean of the Faculty of Applied Science and Engineering, University of Toronto; T. H. Hogg also a past president, is on his left.

Above—Past Presidents F. P. Shearwood, Montreal; Dr. F. A. Gaby, Toronto; and Dr. C. J. Mackenzie, President of the National Research Council.

Dr. Mackenzie with Dr. Gaby and Past President K. M. Cameron of Ottawa at his right and left respectively.

annual meeting programme, and that a single day does not provide adequate opportunity to complete the business.

The delegates were as follows: University of British Columbia, Ronald D. Grantham; University of Alberta, R. A. Spencer; University of Saskatchewan, E. Ross Walsh; University of Manitoba, R. W. McLennan; University of Toronto, William A. MacDonald; (Observers), J. R. A. Walker, C. W. Daniel; Queen's University, J. S. Dalziel; (Observer), Norman Simmons; Representing Queen's Summer Session, J. G. S. Billingsley; McGill University, E. A. Gauthier; Ecole Polytechnique, Gaetan Ducharme; Laval University, Maurice Lavallee; University of New Brunswick, John W. Holmes; Nova Scotia Technical College, F. B. Schafheitlin.

Conference of Branch Officers

On Thursday evening a branch conference was held at which sixteen branches were represented. Vice-President C. E. Sisson presided with the following in attendance: E. K. Cumming, Edmonton; F. R. Burfield, Lethbridge; J. M. Patton, Regina; D. M. Stephens and R. T. Harland, Winnipeg; F. F. Walsh, Sarnia; A. D. Harris and G. W. Lusby, Windsor; F. R. Pope and A. R. T. Hailey, Peterborough; J. R. Dunbar, E. G. Wyckoff and L. C. Sentance, Hamilton; R. F. Legget and D. G. Geiger, Toronto; G. R. Turner, Ottawa; D. Ross-Ross, Cornwall; J. M. Crawford and R. N. Coke, Montreal; P. A. Dupuis and R. Desjardins, Quebec; V. Jepsen and W. R. Mackay, St. Maurice Valley; E. C. O'Leary, Halifax; S. G. Naish, Sydney.

A fuller account of the business of the session will appear in a later issue after the minutes have been circulated, although it might be noted here that the meeting agreed that a similar conference should be held every year.

Ontario Division Meets

History was made when the first meeting of the newly formed Ontario Division was held on Saturday morning. It opened under the provisional chairmanship of C. E. Sisson of Toronto. Elections were held immediately and W. R. Manock of Fort Erie was made chairman, J. R. Dunbar, of Hamilton, vice-chairman, and E. R. Graydon, of Toronto, secretary-treasurer.

At the time of going to press the minutes were not complete, but a complete report will appear in the next issue.

Joint A.S.M.E.-E.I.C. Committee

This committee endeavours to meet twice a year to discuss ways and means of promoting more co-operation between the members of both societies in Canada and the United States. This year the meeting took place during the course of the annual meeting and reviewed past performances and prepared for the future.

In 1946 the Institute participated in the A.S.M.E. summer meeting held in Detroit, and for 1947 arrangements have been made for joint sessions during the summer meeting to be held in Chicago. Also efforts are being made to have the Americans participate in the Institute's 1948 annual meeting which will be held in Banff in the month of June.

In attendance, representing A.S.M.E., were Eugene W. O'Brien, of Atlanta, Georgia, president; Professor S. R. Beitler, of Ohio State University, vice-president of the society; C. E. Davies, secretary, and Fred Truman, of Toronto, chairman of the Ontario section. Representing the Institute, John G. Hall and Dr. O. W. Ellis, both of Toronto, and the general secretary.

Papers to Be Published

It is planned to print in the *Journal,* all papers and addresses, thus it becomes unnecessary to give any description in the general account. The programme throughout was of an extremely high character and members who were not at the meeting may look forward with pleasurable anticipation to reading the material as the paper supply permits its publication.

Muriel's Room

"Muriel's Room" has become an institution within an institution and serves the very desirable purpose of keeping members and guests together to renew old acquaintances and lay the foundations of new friendships. In Toronto this year 34 industries co-operated in this now thoroughly entrenched custom and their reception of members and guests left little to be desired. The institute acknowledges its debt to the industries and their committee composed of chairman Cy. N. Danks, Canadian Ingersoll Rand Limited; Col. Geo. W. Beecroft, Geo. W. Beecroft Co.; and Paul W. Doddridge, Canadian General Electric Co.

SATURDAY CONFERENCES

Top—The student delegates met for a full day on Saturday. The discussion, directed by the new chairman of the Committee for the Welfare of the Young Engineer, brought about an interesting and informative exchange of ideas. Minutes are expected to be published in a forthcoming issue of the *Journal*.

Left—The first meeting of officers of the recently inaugurated Ontario Division.

Right—Lt. Col. Grant, E.I.C. President and retiring chairman of the "Young Engineer" Committee, Dr. G. R. Langley and the General Secretary.

NON-TECHNICAL ACTIVITIES

As the photos at left and below left illustrate, the Thursday evening smoker provided a measure of relaxation.

Below—the Publicity Committee. Left to right, Herb. Todgham, Prof. Mark Huggins (chairman), Jim Stanners, Jim Brown.

ANNUAL BANQUET AND DANCE
(right and below)

Above—Retiring Asst. Gen. Secretary Louis Trudel with Mrs. Trudel, M. Barry Watson and Mrs. Watson; Lt. Col. T. M. Medland, director of public relations of the Association of Professional Engineers of Ontario; Mrs. McCaffrey, Col. W. R. McCaffrey and Mrs. Medland.

Above—(left to right)—Representatives from Halifax. G. J. Currie, W. W. Downie, the late S. W. Gray and E. C. O'Leary, with Mrs. Currie, Mrs. O'Leary and Mrs. Downie.

Below—A Toronto group enjoying the hospitality of "Muriel's Room". Mr. and Mrs. C. P. Disney, Mr. and Mrs. R. W. Teagle and Mr. and Mrs. Bob Hewitt.

Above—Chairman A. D. Harris of Border Cities Branch (centre), with a party of friends.

Right—l. to r.—J. M. Millman and Mrs. Millman; Mrs. Morrison and Prof. Carson Morrison, all of Toronto; A. B. Hunt, Montreal, N. B. Hutcheon, Saskatoon; Mrs. A. D. McKinney, Mrs. C. W. Bell and Mr. C. W. Bell, Toronto.

Left—At the Friday luncheon—l. to r., Mrs. R. G. Standerwick, Mrs. E. A. Allcut, Mrs. C. R. Young, and Mrs. Frank Whittle.

Right—Student delegates with Institute officers at the Friday Luncheon—Past President J. B. Hayes; N. D. Simmons (Queen's University), E. A. Cross, Toronto; R. D. Grantham (University of B.C.); Dr. deGaspé Beaubien, Montreal; Maurice Lavalée (Laval University); Dr. K. M. Cameron, Ottawa; R. W. McLennan (University of Manitoba).

Above—Col. Davies, Capt. R. C. Petter, London, Eng., Dr. Mackenzie and Prof. Loudon exchanging technical (?) opinions.

Right—Chairman Cy. Danks and his committee with their invitation card to Muriel's Room.

ADDRESS OF THE RETIRING PRESIDENT

J. B. HAYES, M.E.I.C.

Delivered before the Sixty-first Annual General and Professional Meeting of The Engineering Institute of Canada, at Toronto, on May 8th, 1947

When I was honoured by being elected President of the Institute I appreciated the opportunities that go with the office, but I was by no means fully aware of the experience that would be mine. Perhaps the outstanding impression is the wider knowledge that I have obtained of the workings of our Institute and the enhanced respect that I have for the members of our profession. There is nothing more past than a past president of The Engineering Institute of Canada and as I approach that position I have a disturbing opinion that my personal gain has been far in excess of anything I have been able to do for the Institute.

On assuming office I subjected myself to a bit of self-analysis to determine which of my outstanding talents could best be applied to the benefit of the Institute during my term of office. The result was devastating because, instead of discovering which talent could be brought into play, I had to admit that I had little if any talent to contribute. I finally came to the conclusion that I might form a thread of contact on which to draw together the pearls of the Branches that make up our organization, by visiting all branches and meeting the engineers from coast to coast. This was an ambitious and delightful programme. I have run into a serious handicap in that I have been swamped with new friends so that I have found that it was impossible to identify and remember them all. To make matters worse, trained in the Public Utility business to show no discrimination, I scarcely dare recognize people whom I happen to know when by all the rules of the game I should know their neighbour. This I say at the start, because it will explain that any apparent " high hat " is not real.

Two new branches were inaugurated during the past year, the Kootenay Branch at Trail, B.C., and the Cornwall Branch in Ontario. These functions proved most stimulating and afford an excellent example of the kind of help that has been given me during my term of office by everybody I have met. At Trail there were representatives from branches as wide-spread as Halifax and Victoria and the hospitality and enthusiasm of the engineers in that vicinity should stimulate interest in the future of our profession. In short, it would be impossible to equal anywhere the hospitality and warmth of our reception.

Then in the fall, at Cornwall, we were received with greater enthusiasm than anywhere else on our trip. This may sound like impossible English, but when the King's English gets in my way, God help the King's English. At Cornwall, four of the six vice-presidents of the Institute made it their business to be present, and we were crusty with councillors, past-presidents, chairmen of branches and other distinguished members of the Institute. The way these two branches started off augurs well for their future success.

Subscriptions to the Harry F. Bennett Memorial Fund for the assistance of university engineering students have reached the desired quota, and the fund has already started to function. It was a pleasure to speak of this new line of activity to engineering students.

Our efforts to raise the standard of engineers' pay have had material success.

During part of my trip across this country my time-table conflicted with the work at some colleges, but I was able to speak to eleven of them. All these visits were inspiring and it is particularly pleasing to record the work done by returned service men who are studying engineering. These young men know what they are after and propose to get it without any foolishness. The deans of engineering where I was not privileged to visit, tell me the same story of the very good work being done there by returned men. Many of them suffer a handicap in that their preliminary training was not fully adequate, and they require, and are receiving, special attention from their instructors. At the moment, engineering education may be the greatest problem that faces our profession in Canada—and indeed all over the engineering world.

Austin Wright and I represented Canadian engineers at the Commonwealth conference in England, as two of ten representatives from the Overseas Dominions and India and as guests of the three senior institutes in Britain. We worked hard and played hard and, in my opinion, achieved constructive results.

From a first impression of despair at the condition of the Old Country, experience rapidly changed one's idea from despair to depression—to sympathy—to admiration—and to confidence in the future of that sorely-tried Country. In England, as in Canada, your President was received with great courtesy and consideration. No wish on our part could be expressed that was not fulfilled, and we were given a unique opportunity to see the engineering and scientific progress of the British laboratories, as well as glimpses of the remarkable work that in a large part stemmed from the British scientists' efforts to produce devices which contributed greatly to the successful conclusion of the war.

We Canadians had a chance to explain our close association with the great Republic to the south of us, and found a ready understanding on the part of the leaders of British engineering of the necessity of maintaining these contacts both for our sake and for the sake of the Old Country.

The meeting of members of our Institute residing in England was a unique affair, and if a similar engineering conference takes place in the future, I am satisfied that the meeting should be repeated.

The actual direction of the affairs of the Institute is necessarily centered around head office, and I pay a ready tribute to the quality of our general secretary and his staff. The Council of the Institute is about the most democratic body I ever saw, and in order to arrive at the best solution to our problems the finer shades of parliamentary procedure are forgotten. A council meeting is, however, a somewhat ponderous performance and in the interval between such meetings a custom has arisen to refer matters to our finance committee. I may be nistaken but it seems to me that the finance ommittee has evolved in part into an executive ommittee of Council. This has worked very well, argely because of the extremely high-grade personnel on the finance committee. I am a little loubtful, however, if it is the wish of the Institute o carry this development much further.

It is not possible to select particular committees or honourable mention, but if you will permit me o group them all together for a blanket tribute, I lo that without restraint. I do not know all of the vork done by the Committees, but I know enough o recognize and appreciate the debt that our membership owes to them.

Many people across Canada share in interesting phases of Canadian industry, particularly the production of basic goods from raw materials. Those that I have seen range all the way from steel, aluminum, lead and zinc to rock wool, powdered eggs and Nylon thread. In addition, of course, we saw manufacturing processes of varying sorts. It nay be almost impossible for one not given the advantages that have fallen to my lot in the last year, to appreciate the strength of our country. It seems that the greatest weakness we have is inherent in ourselves. These paralyzing stoppages of vork in the lumber industry in British Columbia; n the steel production in various parts of Canada; and at this moment, in the production of coal in the Maritime Provinces, are detrimental almost beyond one's power of description. However, this is a challenge that comes directly to the feet of the engineer and if our firm and concentrated efforts can be applied to increase production in our country, we ought to be able to exert a profound influence for good.

The Institute will be on more sound ground in the future than it has been in the past because of the approval, by an overwhelming majority of our members, of an increase in dues. This will enable us to expand and improve our services to our membership in various respects.

After we have written and talked about our professional problems and our professional progress and our achievements, there is still another field that is of great importance. Life is broader than logic. To our mechanical skills we must add a quality of personality which is extremely hard to define. I suggest, with great humbleness, that the development of personal responsibility and the introduction of something of one's own spirit in the work that comes to our hands will add to and round out the work we professional men are called upon to do. This personal responsibility might properly be extended to our activities as members and officers of The Engineering Institute of Canada, so that this Institute, which is growing in strength every month, can go forward to even greater successes.

Above left—J. B. Hayes of Halifax, the retiring president, addresses the Sixty-first Annual General Meeting, with the incoming president, Lieut.-Col. L. F. Grant of Kingston on his right, and General Secretary L. Austin Wright on his left.

Above right—The Friday afternoon technical session. C. E. Sisson, Toronto, introduces one of the speakers with (left to right) Lesslie R. Thomson (Ottawa), Dean C. R. Young (Toronto), and H. Birchard Taylor, President of the Cramp Shipbuilding Company of Philadelphia, Pa.

ANNOUNCEMENT

The incoming council of the Institute at its first meeting, held in Toronto on Friday, May 9th, voted to accept with pleasure the invitation of the Alberta Branches to convene the 1948 annual meeting at the Banff Springs Hotel in the first week of June.

From Month to Month

SEE PAGES 289 TO 296

Attention is drawn to the minutes of the annual meeting of Council and the annual business meeting of the Institute on pages 289 to 296. Portions of these minutes deal with Institute policy in relationship to other societies. It is believed many members will find them interesting and informative.

APPOINTMENT OF ASSISTANT TO THE GENERAL SECRETARY

On the recommendation of the finance committee, the Council have unanimously approved the appointment of W. Douglas Laird, B.Sc. (C.E.), M.E.I.C., P. Eng., as assistant to the General Secretary, the appointment to be effective May 7th. This position was formerly held by Louis Trudel for a period of eight years.

W. D. Laird, M.E.I.C.

Mr. Laird was graduated in civil engineeering (1940) from the University of Manitoba. Coming to Montreal he joined the Shawinigan Engineering Company, and in December of 1940 was appointed to an R. C. A. F. commission in the Aero Engineers branch. Following the course at the Service Engineering School in Montreal he served at A.F.H.Q., Ottawa, Western Air Command and Alaska. He was seconded to the U.S. Navy for courses in Aero Engines at Massachusetts Institute of Technology and Pratt and Whitney, Hartford, Conn., completing his service career as test engineer with the Cold Weather Flight of the R.C.A.F.

Following discharge Mr. Laird took up gas turbine research with Turbo Research Limited at the Cold Test Station in Winnipeg. In July 1946 he returned to Montreal as representative of the Technical Information Service of the Department of Reconstruction and Supply which position he held until his appointment as assistant.

At Manitoba he won Isbister Scholarships in his first four years and the scholarship of the Association of Professional Engineers in his second year. He was also awarded the Gold Medal at graduation. Extra-curricular activities included fencing, debating and contributions to the *Slide Rule* and *Year Book.*

ENGINEERS' WIVES ORGANIZE

Recently in Ottawa there was completed another engineers' wives association. This has been modeled somewhat along the lines of an organization of the same title in Winnipeg, which organization has been functioning successfully for many years.

Mrs. K. M. Cameron was elected president of the Association, and the following additional officers were selected at the same time: Vice-president, Mrs. L. N. Christmas; secretary, Mrs. D. H. Hand; treasurer, Mrs. R. L. Franklin, society chairman, Mrs. H. E. Treble; membership chairman, Mrs. J. Irvine; and councillors, Mrs. G. R. Turner and Mrs. Robert Blais.

The Association has drawn up and approved a constitution and rules of procedure.

Membership in the Association is open to the wives and widows of professional engineers, without regard to whether or not their men folks belong to any of the established engineering organizations.

The purpose of the Association is to afford the wives opportunities for renewing old friendships and for making new ones, particularly in the case of families moving into Ottawa; and also, for assisting various undertakings that have a professional, municipal or national significance.

At the inauguration meeting there were 46 ladies in attendance, and since that time 23 additional persons have joined the Association. In this way there is a strong group already behind the new undertaking which guarantees its success.

In order to properly publicize the plan to form such an association a preliminary dinner dance was sponsored last April. This brought together a large group and afforded the promoters the necessary opportunity for explaining the objectives and advantages of such an organization.

This completion of the organization for the second engineers' wives association in Canada will offer encouragement to groups at other centres who have been considering the same idea. The pattern was set by the ladies in Winnipeg, and any persons who are interested can secure complete information from that city. The Headquarters of the Institute has copies of the constitution of both organizations and will be glad to supply them to any groups that may be interested.

HOOVER MEDAL AWARDED TO DR. VANNEVAR BUSH

The Board of Award for the Hoover Medal has announced that the 1946 recipient has been chosen. The medal was presented at the Winter meeting of the American Institute of Electrical Engineers to Dr. Vannevar Bush, President of the Carnegie Institution of Washington, and Chairman of the recently created U.S. Joint Research and Development Board of the War and Navy Departments.

The Hoover Medal, founded in 1929, was instituted to commemorate the civic and humanitarian achievements of Herbert Hoover and the first award was made to him in 1930. The fund is held by the A.S.M.E. and is administered by a board representing the four founder societies of the United States. The medal is awarded " to a fellow engineer for distinguished public service " and the citation for the 1946 award reads in part, " Vannevar Bush, engineer, educator, and administrator who, in critical time of need, was in a most special sense, an organizer, guiding spirit and driving force of the nation's achievements in physical and medical science".

Vannevar Bush is perhaps best known for his development of the differential analyzer and his proposal, organization and chairmanship of the U.S. Office of Scientific Research and Development, which directed and coordinated all U.S. Scientific efforts during the second world war.

THE ARCHITECTS WIN AGAIN

Recently the Court of King's Bench of the Province of Quebec handed down a decision in the appeal of Brian R. Perry, M.E.I.C., against the judgment of the Superior Court which had ruled at the request of the Architects Association of Quebec that he had contravened the architects' act when he designed and supervised the construction of an industrial building. The appeal judges upheld the decision of the lower court.

There is a lot to be said on the case, and the *Journal* will treat it at length in the next issue, but for the moment attention is called to an editorial appearing in the *Engineering News Record* of May the 15th as follows:

A Jurisdictional Dispute

Across the Border in Quebec, architects have dragged a civil engineer into court in a jurisdictional dispute that should cause all reputable architects in the province to blush with shame as the court action was inaugurated and carried up to the provincial court of appeals by the Architects Association of the Province of Quebec. The civil engineer concerned had designed and supervised construction of an extension to the plant of the Harrington Tool and Die Co. at Lachine, Que. No question of his competence to design a safe structure was involved; the court action was obviously an effort to use the wording of the architects' registration act as a means for curtailing the building design work done by registered civil engineers, thus cutting down their competition with architects in that field. About 15 years ago, a small group of architects in New York State started a similar action with the same objective, but when it was brought to the attention of the top men in the American Institute of Architects they stopped the movement. It is too late now for similar action in Quebec, but the leading architects of that province can nullify the effort of the appeals court decision by seeing to it that the decision is never used to keep engineers from designing buildings.

MEETING OF COUNCIL

Minutes of the annual meeting of the Council of the Institute held at the Royal York Hotel, Toronto, Ontario, on Wednesday, May 7th, 1947, convening at ten o'clock A.M.

Present: President J. B. Hayes (Halifax) in the chair; Past-President deGaspe Beaubien (Montreal); Vice-Presidents J. E. Armstrong (Montreal), W. R. Manock (Fort Erie), and C. E. Sisson (Toronto); Councillors G. M. Brown (Saint John, representing the Association of Professional Engineers of New Brunswick), C. S. Clendening (Lethbridge), G. J. Currie (Halifax), J. R. Dunbar (Hamilton), R. S. Eadie (Montreal), R. C. Flitton (Montreal), A. E. Flynn (Halifax), S. W. Gray (Halifax, representing the Association of Professional Engineers of Nova Scotia), A. R. Jones (Peterborough), W. H. M. Laughlin (Toronto), C. C. Lindsay (Montreal), J. G. MacGregor (Calgary), G. L. Macpherson (Sarnia), Norman Marr (Ottawa), J. M. Patton (Regina), C. A. Peachey (Montreal), P. M. Sauder (Strathmore, representing the Association of Professional Engineers of Alberta), Carl Stenbol (Sault Ste. Marie), D. M. Stephens (Winnipeg), J. B. Stirling (Montreal), J. A. Vance (Woodstock), Paul Vincent (Quebec), and W. S. Wilson (Toronto); Treasurer J. A. Lalonde (Montreal); General Secretary L. Austin Wright, retiring Assistant General Secretary Louis Trudel, and the newly appointed Assistant General Secretary W. D. Laird.

There were also present by invitation: Past-Presidents E. A. Cleveland (Vancouver), T. H. Hogg (Toronto), C. J. Mackenzie (Ottawa), F. P. Shearwood (Montreal) and C. R. Young (Toronto); Past-Vice-President E. V. Buchanan (London); Past-Councillor H. E. Brandon (Toronto); President-Elect L. F. Grant (Kingston); Councillors-Elect J. A. Beauchemin (Montreal), F. R. Burfield (Edmonton), K. G. Cameron (Montreal), J. R. Carter (Kingston), C. E. Gelinas (Montreal), Viggo Jepson (Grand'-Mere), J. H. Irvine (Ottawa), A. H. MacQuarrie (Walkerville), and L. E. Mitchell (Halifax); Branch Chairmen: P. A. Dupuis (Quebec), A. D. Harris (Border Cities), C. E. Marlatt (Kootenay), E. C. O'Leary (Halifax), F. R. Pope (Peterborough), and E. G. Wyckoff (Hamilton); Roger Desjardins, secretary, Quebec Branch; Committee Chairmen: G. A. Gaherty, Prairie Water Problems, Wills Maclachlan, Industrial Relations, G. N. Martin, Employment Conditions, H. R. Sills, Membership, and H. M. Scott, representing R. L. Dobbin, Community Planning; J. Murray Muir, secretary, Association of Professional Engineers of Ontario; Toronto Branch: R. F. Legget, chairman, E. A. Cross, immediate past chairman, J. G. Hall and D. D. Whitson, members of the executive.

In welcoming the councillors and guests, President Hayes invited all persons present to take part in the various discussions. He felt that this was an inspiring group, representatives being present from twenty-two out of twenty-eight of the Institute branches, which in his opinion constituted a record attendance.

Death of Lorne A. Campbell: Council noted with sincere regret the death of Lorne A. Campbell, of Trail, British Columbia, which had occurred on April 29th, 1947. Mr. Campbell had been awarded the

Sir John Kennedy Medal for 1946. The following resolution was passed unanimously:

"The Council of The Engineering Institute of Canada, at this annual meeting, wishes to record its deep sorrow at the passing of Lorne A. Campbell—a beloved and respected member of this organization for many years. Councillors have an appreciation of the great work he has accomplished for Canada—of the example of perseverance which he has set for the profession. Few men have been able to build such outstanding monuments to themselves as those left behind by Mr. Campbell in the Kootenay area—monuments which will continue for generations, to benefit mankind.

To the members of Mr. Campbell's family, Council sends its sympathy."

Committee on Professional Interests—Mr. Stirling, chairman of the committee, reported on the following items.

(a) *Letter from Vancouver Member:* This letter (from W. O. Scott) had been directed by Council to the committee for a recommendation as to action. Mr. Stirling reported that the letter had been carefully considered and the committee regrets that Mr. Scott cannot concur with Council's decision concerning Institute policy. Mr. Stirling pointed out that Mr. Scott stated his views were personal and his letter did not ask for a reply. However, Mr. Stirling stated that, as this was the only one received from an individual member that has not approved of Institute policy, he thought a reply was warranted. He submitted a draft letter which was approved.

(b) *Resolution from Winnipeg Branch:* This resolution had been studied by the committee and was found to be far from clear. It seemed to be possible of different interpretations and, accordingly, the committee had written back to the branch asking for some clarification. Upon receipt of a reply the resolution will be studied and a reply prepared.

(c) *Budget Item 180e:* At Mr. Stirling's request the general secretary reported on the situation as it stood now.

(d) *Letter from the Saguenay Branch:* This communication had been received at Headquarters on March 17th just too late to be referred to Council at the meeting in Saint John on March 15th. The letter dealt with the Institute's relationship with the new Canadian Council. As the branch was holding a meeting on March 20th and wanted a reply by that time Mr. Stirling had written to the secretary of the branch immediately, and a letter was also sent by the general secretary suggesting that the matter might be discussed in detail before the whole branch on the occasion of the president's visit there, at which time it was expected that one or more members of the committee would be in attendance.

Mr. Stirling reported that, up to the present time, no acknowledgments of the letters or telegrams had been received and therefore the committee felt somewhat at a loss to know how to proceed. He reported that as soon as some word is received from the branch the matter will be given further attention.

Mr. Cross asked if Council could be informed of the contents of the letter to which Mr. Stirling had referred. Mr. Stephens asked what further information the committee would like to have with regard to the Winnipeg resolution.

Mr. Stirling replied that as far as Winnipeg was concerned all they were trying to get was some clarification as to what certain clauses of the resolution meant. He then read the letter from the Saguenay Branch, in response to which the president suggested that the chairman of the committee continue to contact the branch so that the matter could be concluded to everyone's satisfaction.

Mr. Sauder reported that some of the junior members of the Association of Professional Engineers of Alberta were confused by the fact that one of the organizations to which they belonged supported the new Council, whereas The Engineering Institute did not.

The president suggested that this was a good time to discuss the matter in detail so that the councillors could be fully informed when they returned to their branches. In his opinion one criticism of the new Council was that it was made up of a miscellaneous group, several members of which were not in the engineering field. He commented that the matter had been seriously considered by the committee and by Council many times and that on every occasion Council had come back to the same conclusion. However, if the councillors thought that the younger members did not understand the situation or were concerned by the action of their Council, he believed the matter should be given further consideration openly before this meeting.

Mr. Dunbar stated that he was thoroughly behind the stand taken by Council and that he was of the opinion that the younger engineers did not know all the facts and therefore misunderstood what had occurred.

Mr. Stephens reported that the Winnipeg Branch would support Mr. Dunbar's views and would oppose the Institute joining the Canadian Council as it is presently constituted. However, some members of the Winnipeg Branch had thought that the Institute had failed to give the leadership that had been hoped for in providing a forum through which sister societies or related scientific bodies could be co-ordinated. He stated that the Winnipeg Branch had had some difficulty in framing the memorandum referred to. In essence, the branch had wished to express the hope that something might be devised to establish a more systematic method for co-operation rather than just getting together as an occasion arises. He hoped the Institute would be prepared to take steps towards bringing this to pass. The Winnipeg resolution was not an endorsement of the Canadian Council.

Mr. Martlatt reported that, in the Trail area, there were several societies which had set up a joint committee in order to prevent overlapping and to expand the usefulness of each organization. It had worked out to be mutually advantageous.

Mr. Burfield reported that the Edmonton Branch had asked him to discuss this matter so that they might have some explanation as to why the Alberta Association supported the Council and the Institute did not. Mr. Patton reported that a somewhat similar situation existed in Saskatchewan. He appreciated that the Institute's principal objection to the new organization was that it (the Institute) did not wish to delegate executive powers to an overall organization.

Mr. Stirling stated that the discussion was very interesting and that already he had obtained answers to some of the questions which had been referred back to the Winnipeg Branch. The contributions of other speakers had also been helpful. He agreed with Mr. Patton's comment that the Institute did not wish to delegate executive powers to another organization. He thought the Institute, in view of its size and its actives, was too large and important to hand over some its power to another group. He quite agreed that ere should be consultation and co-operation between all groups and pointed out that in the statement of Council this point had been covered clearly. e did think, however, that it was more difficult to velop basic co-operation in a miscellaneous group an in a group with an identity of interests. He ought engineering groups had a great deal in common and could co-operate quite readily but was raid that the specialized interests of non-engineerg societies, including agronomists and dietitians oth being members of the Canadian Council) would nit co-operation to subjects of lesser importance.

Mr. Vincent suggested that Council publish a memandum reviewing the whole subject so that the embers would have a better understanding of the asons why the Institute did not support the Canaan Council.

The general secretary stated that, as the Institute embership had been circularized by other individuals and/or organizations with material which did ot present the story as the Institute saw it, the ommittee on Professional Interests had felt it derable to also circularize the membership, stating the ise as it was seen by the committee and by Council. ouncil had approved this proposal and, in January 947, a detailed memorandum had been sent by direct ail to every member. In addition to this, Mr. tirling had spoken to several branch executives, and, om time to time there had been other comments *The Engineering Journal*. He was of the opinion hat the complete material had already been placed efore the membership.

Mr. Lindsay was of the opinion that many people isunderstood the new Council, believing that all rganizations in Canada other than the Institute were upporting it. He stated that this was not so. Recently he Canadian Institute of Surveyors had withdrawn rom it. There was one organization of foresters in he membership but it did not represent the main group as did the provincial organizations. He thought t was quite unreasonable to ask the Institute to pay portion of the financing, based on its large memberhip and yet to have only one single vote on any ssue. He pointed out, too, that on the Canadian Council, a two-thirds majority could carry any issue egardless of the small number of individuals that night be represented by the majority vote.

Mr. Lindsay pointed out, further, that the cost of he new Council might become very great. In fact, at one time a budget of over $30,000.00 had been proposed. He thought the additional expense was not ustified. He was of the opinion, also, that the activities of other organizations such as the Engineering Institute and the provincial professional associations ncluded largely the same subjects as the Canadian Council proposed to deal with. In his opinion, the field s already well covered.

Mr. Armstrong stated that there were four minor points that he would like to make.

(1) The correspondence which has come to Headquarters and to the committee indicated that the "engineer in the street" does not always distinguish between the Dominion Council and the Canadian Council. He referred to a letter received by the Institute protesting its failure to support the Dominion Council. The author had the two organizations mixed.
(2) The Dominion Council has announced through its president that it speaks with the voice of all Canadian engineers, and the Canadian Council has also made the statement, in writing, that it speaks with the voice of all Canadian engineers. He pointed out that the Institute had never made such a claim. He thought the two statements showed the overlapping of the policies of those two organizations.
(3) He pointed out also that in the statement of policy of Council it had proposed a committee of collaboration between appropriate bodies with no organizational cost and a minimum of secretarial cost, and that the chairmanship and the secretariat be rotated among the participating bodies in order to give a balance in control.
(4) It was his opinion that this subject had been given considerable space in *The Engineering Journal* and he suggested that the pages might be reprinted and issued as a special issue or as a supplement to *The Engineering Journal.*

Referring to the subject of operating the Canadian Council, he pointed out that, at one stage, it had been recommended by one member organization that the supporting societies be assessed $2.00 per member. This would mean that the Institute would have to pay between $15,000.00 and $25,000.00 a year which, of course, was ridiculous — all for the purpose of having one vote in a miscellaneous group of ten or twelve societies.

Mr. Peachey directed a question to the Winnipeg councillor, asking him if the branch executive had carefully read the material in the *Journal* item by item, at the time they prepared their resolution. As a councillor, he had read the various articles and had come to the conclusion that the Institute was right in not joining the new Council.

In reply, Mr. Stephens stated that the committee had studied all the material they could find and he emphasized that the Winnipeg executive, in its resolution, had not proposed that the Institute should join the Canadian Council but had been concerned principally with the fact that there were several problems in common which might well be discussed in a common forum.

Mr. Jones was of the opinion that, from the evidence at this meeting, it was apparent that articles in *The Engineering Journal* had been misinterpreted or misunderstood. He inquired as to whether or not it would be an imposition to ask Mr. Stirling's committee to prepare a summary of the situation which would be presented to Council for the information of the branches. He thought such a restatement would do away with any suggestion that this matter had developed into a controversy.

Mr. Eadie reminded Mr. Stephens that Council had already declared itself as prepared to support a co-operative committee which acted in a consultative capacity only. This fact was communicated to the chairman of the Canadian Council and to the constituent members but there had been no response from them.

Mr. Beaubien pointed out that as one familiar with this subject from its beginning, he thought it should be noted that the Institute, by its refusal to join, had not intended any disparagement of the new Council. He referred to the memorandum which was sent to all members in January which he thought stated the case very clearly and concisely, and he emphasized that the Institute itself was ready to join a co-operative body of the type described.

Mr. Sills thought that in issuing anything to the membership the following points should be covered.

(1) That the present secretariat (of the Canadian Council) is much quicker on its feet in finding out what legislation is being prepared than is the Institute secretariat.
(2) That the Ministers listen more favourably to representations of one body speaking for many than to representations of several individual organizations.
(3) That although the Institute would have only one vote on the new Council the mere fact that it can resign at any time means that it would not have to give away its authority to another organization.

Mr. Stirling replied to Mr. Sills' three points as follows:

(1) The only evidence available indicated that the secretariat of the Institute had been much quicker on its feet than had that of the Canadian Council. He referred to Item 180e in the customs tariff, pointing out that the Minister of Finance had stated in the House, according to Hansard, that up to the time he was questioned by a member of parliament he had had only one complaint about this tariff change and that had been from the general secretary of The Engineering Institute of Canada. It was five months later than the date of the original protest from the general secretary that the Canadian Council brought its protest to the authorities at Ottawa.
(2) He was of the opinion that the Ministers are more impressed by separate representations from several organizations than from one. He pointed out that in the last six or seven years he had had a great deal to do with matters of this kind and he was confident that the group voice in this instance would not carry the weight that the separate voices would carry.
(3) He admitted it was true that the Institute could always withdraw from the Canadian Council if it were outvoted on an issue which it could not support. However, he thought this was poor policy and referred to what had happened in the Committee of Fourteen at the time the proposal was made to establish the Canadian Council. Although the Institute at that time had asked that no action be taken at that particular meeting, in view of the fact that in the Institute's opinion there was insufficient representation, the vote was taken and the Institute was outvoted.

   He also referred to the development in the Dominion Council, pointing out that originally it was a non-executive body, restricted in its interests to the matter of registration. Bit by bit its by-laws have been amended until today it proposed to participate in many activities already covered by the Institute, and even stated through its president that it was now " recognized as the voice and mind of the professional engineers in Canada."

Mr. Flynn stated that he had been following discussions of this kind for many years. He had heard the same arguments over and over. He thought some persons were frightened of the possibilities of an organization such as the Canadian Council. However, he had attended recently a meeting of the organization and he had not seen any reasons to be frightened. He reported that no action was taken on any issue unless it was agreed to unanimously. He said he would like to see the Institute take some positive action although he did not care to suggest what it might be. He would like to see some means established " to get us all acting together ".

Mr. Sauder reported that he had heard discussions on this subject at meetings of the Association in Alberta but that he did not feel that he was sufficiently well informed to meet some of the criticisms that had been offered. However, he thought this discussion was very valuable and because of it he was now in a position to answer the criticisms, including those which came to him in the mail in the form of letters or speeches circulated by other organizations.

Mr. Lalonde stated that he had attended many meetings of Council where this matter had been discussed. Frequently he had moved or seconded motions not to join the Canadian Council. He felt that the reasons had been adequately stated in the statement of policy issued by Council and through the circular distributed in January and mentioned by Mr. Beaubien. He favoured co-operation with other organizations " to the limit ", as long as the interests of other societies were not jeopardized. He pointed out that it was not easy to get complete co-operation. As an example, he referred to the application made by the Corporation of Professional Engineers of Quebec for an amendment to its Act. When the Bill was before the committee in Quebec, several organizations represented on the Canadian Council had officers and legal counsel there to argue against the amendment being allowed. This was not a very good example of the results of setting up a co-operative organization.

He referred to one of the publications mentioned by Mr. Sauder which had been circulated presumably by the Canadian Council. He could not agree with the document and thought the author was making proposals which he (Mr. Lalonde) as an engineer and a member of the Corporation of Professional Engineers of Quebec could not support. In conclusion, he asked the question, " What good are we going to get out of a super-organization like the Canadian Council? " He stated that the matter had been discussed many times in the Council of the Corporation and the Council of the Institute. He thought the Institute should be certain of its own policy and be prepared to stand on its own feet to make its organization as big and as good as it can be, not only for the older members but for the younger members as well, rather than spend " all our time discussing this matter " of another council.

Colonel Grant stated that he agreed entirely with the action taken by Council but he was somewhat disturbed by the possibility that criticisms and questions were arising with the young engineers who, in a few years, would be the bulk of the membership of the Institute. In that connection he asked councillors at this meeting to bring up this question when he is visiting the branches so that the younger men could be given a full opportunity to express their views and to know that the senior officers of the Institute are interested in considering all questions that affect them.

The president pointed out that there was no action that Council should take at this meeting but he was glad that the subject had been discussed at such length as it had thrown a great deal of light on the subject. Personally, he was certain that the policy of the Institute was sound and correct. Perhaps a good job of selling Council's decision had not been done in the membership although several steps had been taken to that end.

Students' Conference: Mr. Wright reported second conference of representatives from the various engineering societies would be held in the hotel on Saturday morning, May 10th. It was expected that every university would be represented although the Nova Scotia Technical College is unable to send a representative from Halifax, as their examinations are being held this week. They hope, however, to have a recent graduate represent them. The conference is being held under the auspices of the Institute's Committee on the Training and Welfare of the Young Engineer. The first conference held in Montreal last year at the time of the annual meeting had been most successful and the students were enthusiastically in favour of holding another such conference this year. It had been suggested that it would contribute greatly to the success of the conference if members of Council and officers of the Institute present at this meeting would take a special interest in these young men. This report was noted.

Changes and Additions to Headquarters Staff: The president reminded the meeting that the Institute was losing the services of Louis Trudel who, for eight years, had been with the Institute in the capacity of assistant general secretary. He wanted to take advantage of this opportunity to pay a tribute to Mr. Trudel for the work that he had done. He stated that by reason of his travelling and through meetings he had gained a very close picture of Mr. Trudel's personality and ability. He thought that his contribution to the Institute had been very great and was certain that he would be seriously missed.

In acknowledgment, Mr. Trudel thanked the president for his kind words and also expressed his gratitude to the officers of the Institute and to the past-presidents. He believed the experience gained in the Institute would be of great help to him in other places. He thought the Institute was a great school of Canadianism. He wished his successor every success and at the same time assured him of his availability if his assistance was required.

The general secretary reported on the results of the canvass for someone to replace Mr. Trudel. He stated that there had been applications from many well qualified persons and that in the last analysis it was not easy to make a decision. However, the final decision had been made and he presented to the meeting Mr. William Douglas Laird, a graduate of the University of Manitoba, who had accepted the appointment.

Mr. Wright went on to report that no decision had been made with regard to a field secretary or a technical editor inasmuch as these vacancies had been held in abeyance until the assistant secretaryship had been filled.

Mr. Laird thanked the meeting for its kind reception and stated that he had seen enough of the operations of the Institute to realize how difficult it would be for him to replace Mr. Trudel. He could only promise that he would do his best to fill the position to the satisfaction of the officers of the Institute.

The meeting adjourned for lunch at twelve thirty P.M., and reconvened at two o'clock P.M., with Vice-President C. E. Sisson in the chair.

Pension Plan for Headquarters Staff: The desirability of establishing a pension scheme of some kind for the Headquarters staff was discussed, and on the motion of Mr. Sauder, seconded by Mr. Patton, it was unanimously resolved that the Finance Committee be asked to study the question and bring in a comprehensive report to an early meeting of Council.

Brian Perry Case: The general secretary reported that the appeal against the decision that Mr. Perry was at fault in designing a specific building in the Montreal area had been lost. The five judges of the Court of King's Bench had returned a unanimous verdict supporting the findings of the trial judge.

He reported further that the Corporation of Professional Engineers of Quebec and the Association of Architects of the Province had a joint committee discussing proposals to amend the Engineers' Act and it was hoped that eventually some amendments to the Act could be secured that would clarify the present confusion with regard to the fields of the two professions.

Mr. Stirling pointed out the seriousness of this adverse ruling and he thought councillors should all familiarize themselves with what had occurred so that they could inform their branches.

Mr. Laughlin stated that as a councillor of the Association of Professional Engineers of Ontario and as a consulting engineer he was much interested in the King's Bench decision. He inquired as to whether or not there was any further appeal. If there were, he hoped that the Institute would take advantage of every opportunity to take the case to a higher court.

The general secretary stated that the notes of the five judges were now being examined by legal counsel to find grounds upon which a further appeal could be entered.

Mr. Laughlin pointed out further that this decision would have significance in other provinces and he hoped Headquarters would make the full information in the case available to those provinces that desired to study it.

Committee on Community Planning: Mr. H. M. Scott, a member of the Institute's Committee on Community Planning, had been asked by the chairman, Mr. R. L. Dobbin, to present a report on the work in the community planning field with which the committee thought the Institute should concern itself. The report may be described briefly as follows.

In the preamble the statement is made that "Community planning has been a failure to date in that it has not demonstrated its effectiveness to correct the social sores of modern civilization."

As far as the Institute is concerned the committee believes that "to obtain full benefit for our country in general and to the individual communities, the Institute as a whole must be the responsible leader in community planning so that the whole weight of the engineering profession may be thrown into the balance rather than the windmill tilting of an individual engineer or engineering firm".

The report concludes with a list of fundamentals which it recommends must be recognized and treated if community planning is to fulfil its purpose.

The general secretary augmented the report by stating that this proposal was devised as a lead up to the community planning conference which was planned for November in Toronto.

Mr. Peachey thought the report an excellent one but pointed out that the question of costs would be a serious one. Mr. Scott replied that the costs of not doing these things might even be greater. He thought the costs to do these things properly would be much less than the costs as they are accruing today for having them done incorrectly.

Mr. Armstrong asked if his summarizing of the report was correct, namely, that it was proposed to develop certain essential basic information which would be put together in one manual. In his opinion this was perfectly sound project — one that should not be difficult to "sell".

Mr. Patton said he would like to give support to the recommendations of the committee. He referred to planning that was being done in the city of Regina and he thought the Institute should definitely support town planning in any community.

Past-President Mackenzie stated that it was a long time since he had been specially interested in community planning but he still thought it was a very commendable thing. He did not believe that the matter of costs was the controlling factor but he did think it was essential to have the proper support given to the movement if anything were to be accomplished. He stated that at the Research Council they were starting a research project on housing and building materials in which the Institute might become interested. He thought the subject of community planning was an active one and would grow in interest and he thought the Institute should definitely take a leading part in it.

Mr. Sisson, Mr. Armstrong and Mr. Eadie were of the opinion that the conference should afford the engineers the maximum opportunity to develop their thinking and their support for community planning. It was recognized that other professions and other groups of people were interested in the subject but it was their idea that to introduce other groups into this conference would be to lessen the benefits that might accrue to the engineers.

At this point President Hayes returned to the chair.

Toronto Memorandum: Mr. Laughlin explained that at the request of the Toronto Branch he had asked the general secretary to place on the agenda the memorandum which had been sent to Headquarters by the Toronto Branch in December 1945. (Secretary's note: This brief was presented to the annual meeting of Council in Montreal in February 1946 and was referred to the Committee on Professional Interests. That committee had prepared a reply which was presented at a regional meeting of Council held in Toronto in April 1946. At this meeting the reply was accepted without a dissenting vote—see minutes 4452-55).

Professor Legget explained that the Toronto Branch had thought it desirable that the memorandum be reconsidered at this annual meeting of Council. He did not consider that it was necessary to go into all details but he wanted to point out that the memorandum covered three main points—(1) A recommendation that the fees of the Institute should be increased; (2) references to a matter of policy; and (3) the reconstitution of the Council.

He noted that Item 1 had adready been attended to and he stated that for Item 2 it was not proposed to go into that at this time, but he did want to emphasize Item 3.

The Toronto memorandum recommended a reduction in the number of members of Council and that Council should meet four times a year with an executive committee functioning between meetings. It was recommended that the expenses of councillors coming to Council meetings be paid. In this way it was believed there would be a fuller attendance of councillors and a more efficient handling of Institute business. He thought this method would be much more democratic than that which is now being followed.

The president pointed out that it was the practice of the Institute to hold Council meetings from one end of the country to the other. He proposed that any suggestions of a reorganization of Council should more properly be considered by the incoming president and the incoming Council.

Mr. Dunbar pointed out that many of the problems referred to in the brief were particular to the city of Toronto but that some were also applicable to other parts of Ontario. Therefore he moved that the memorandum be referred to the Ontario Provincial Division for discussion and report. This was seconded by Mr. Laughlin.

The general secretary reported that recently he had reread the minutes of the branch round table conference held in Montreal in 1937, at which Professor Legget was present. These minutes indicated that the identical subject had been discussed very widely at that time but had not been approved by the conference.

Mr. Eadie stated that as he recalled it, the Toronto memorandum and the committee's reply had already been circulated to all branches (in 1946).

Mr. Sauder stated he was a member of the committee which had discussed this same subject ten years ago. He referred to an endeavour which had been made in Alberta to set up a provincial division which had not been successful. He stated that as far as the western branches were concerned they preferred the present system which was found satisfactory.

At this point the president put Mr. Dunbar's motion to the meeting and it was carried unanimously.

Conference on Industrial Management: The general secretary reported that certain members had proposed that the Institute hold a conference on industrial management some time after the conclusion of the International Management Conference which is being held in July in Stockholm. He was presenting the matter to Council on behalf of these members with a request that authorization be given for such a conference.

Mr. Peachey stated that he was one of the members who had raised the question. He pointed out the rapid growth of Canadian industry and the consequent increase in importance of management. He thought the Institute should do everything it could to develop management ideas in the young engineers. In response to the president's inquiry as to a plan, he replied that he thought a conference something along the lines of that planned by the Committee on Community Planning would be excellent. It might be held in Montreal, Toronto, or some intermediate place. He concluded by making a motion that in order to show a definite interest and to give leadership in the problem of administration, the Institute approve of a one or two day conference on management some time in the fall of 1947 or the winter of 1948. This was seconded by Mr. Harris and carried unanimously.

Student Guidance: The general secretary presented a letter from W. R. McClelland, secretary of the Canadian Committee for Student Guidance in Science and Engineering (This committee is made up of representatives of the Canadian Institute of Chemistry, the Canadian Institute of Mining and Metallurgy and The Engineering Institute).

This letter asked the Institute for an expression of opinion with regard to a proposal to issue a new booklet covering all branches of engineering and professional science. The letter states that at present different booklets are being used to cover different parts of the field and suggests that a single joint booklet might do a better job.

The letter points out that the Interdepartmental Committee on Professionally Trained Persons (composed of certain departmental heads, which functions as an advisory body to the Minister of Labour) is alive to the need of such a publication " as a proper function of government".

Colonel Grant outlined the work of the Institute's Committee on the Training and Welfare of the Young Engineer, mentioning that the Institute's booklet " The Profession of Engineering in Canada " has been revised recently to include sections on radio and aeronautics. This booklet has been used by the joint committee on student guidance and Colonel Grant was of the impression that in its new form it met the situation reasonably well.

He emphasized the difficulties of getting a new booklet that would be satisfactory to all concerned but thought that the Institute should go along with the other two institutes in investigating further the possibilities of such a project. This recommendation was approved unanimously.

Border Cities Branch By-Laws: On the motion of Mr. Dunbar, seconded by Mr. Eadie, it was unanimously resolved that the proposed amendments to the by-laws of the Border Cities Branch, as submitted, be approved.

Membership Committee: The general secretary reported that Mr. Huet Massue, M.E.I.C., of Montreal, had prepared a very comprehensive and interesting report on the development of membership within the Institute. The report was accompanied by many graphs. A copy of the report had been sent to the chairman of the Membership Committee, Mr. Sills, who had expressed approval of it and had stated that it would be very useful to the committee.

Mr. Sills stated that the report was " really a masterpiece ". He thought the information could be used to advantage by most of the standing committees and some of the special committees. He suggested that additional copies be made available for such purposes.

The president approved of the suggestion that the report be put in the hands of other committees as well as the one on membership. Finally, on the motion of Mr. Flynn, seconded by Mr. Flitton, it was resolved unanimously that the graphs be displayed during the annual meeting and that Mr. Massue be thanked on behalf of Council for this excellent piece of work.

Proposal for a Branch in Newfoundland: The general secretary reported that from time to time members in Newfoundland had inquired as to the possibility of a branch being established there. Recently two members had written in about it and within the last ten days a member had called at the office to discuss the matter in greater detail.

This member pointed out that as there was no professional engineers' act in the country, membership in the Institute would have an added significance. He also suggested that through activities of an organized group something might be done to enhance the prestige of the profession which, up to now, had not been impressive in that country.

The secretary reported that there were now about thirty-five members of all classes. The member visiting the office had brought with him a further list containing thirty-five engineers who were not members but who would be interested in joining if a branch were established. This member had suggested that if a senior officer of the Institute could visit the country and perhaps speak at the main centres, he would have rendered a real service to the profession and doubtless the trip would result in the formation of a branch.

Mr. Stirling stated that during the years 1940 to 1945 he had spent about one-third of his time in that country and therefore was thoroughly familiar with conditions. Therefore he moved that steps be taken forthwith to investigate the possibility of establishing a branch there. This was seconded by Mr. Eadie and carried unanimously.

Parliamentary and Scientific Committee in Canada: The general secretary reported that recently a meeting of several organizations had been held in Ottawa to consider the formation of a Parliamentary and Scientific Committee along the lines of such an organization established some time ago in Great Britain. The meeting had been held on April 25th and Past-President Cameron had attended as the Institute's representative.

The president suggested that in view of the lateness of the hour and the amount of material that had to be considered, the whole matter be referred without further discussion to the Committee on Professional Interests. This was agreed to.

Expenses of Councillors: Mr. Marlatt proposed that Council should give consideration to meeting the expenses of councillors in attendance at meetings. He emphasized the difficulty of a councillor from a branch as far away as the Kootenay being able to finance expenses to a meeting at a central point such as Toronto. Mr. Gray stated that councillors in the east were also interested in such a proposal, and Mr. Patton said that he would like to give support to Mr. Marlatt's suggestion.

Mr. Armstrong thought this matter was the one mentioned in the Toronto memorandum which was to be considered by the Ontario Division, and Mr. Peachey pointed out that Council had already expressed a favourable opinion on such a proposal.

It was pointed out that one of the reasons for recommending the recent increase in fees had been that it was hoped to meet some part of the expenses of councillors attending meetings. In view of the fact that it was already before the Finance Committee no further action was taken.

Banff Meeting—1948: The general secretary reminded Council that it had been agreed that a meeting would be held in the Banff Springs Hotel, Banff, Alberta, in June 1948, although it had not yet been decided as to whether this would be an annual meeting or a summer professional meeting. This was a point which should be settled by the incoming Council but it had been proposed that the subject be discussed before this meeting so that an expression of opinion could be transmitted to the new Council.

Messrs. Burfield and MacGregor stated that their branches were hoping that it would be an annual meeting. The president called for a showing of hands which indicated that all but a very small minority voted to recommend to the incoming Council that the Banff meeting be made the annual meeting for 1948.

Thanks to the Retiring President: Mr. Beaubien asked permission to express on behalf of all the members of Council, congratulations and thanks to the president for the masterly way in which he had conducted this and other meetings. He wished to say on behalf of all, " Thank you. You have done a splendid job."

In reply the president stated that he had hoped the meeting would conclude early enough that he could go around the table and personally thank everyone for his co-operation but as it was now too late he would like to say how stimulating the Council meetings had been to him.

The Council rose at five o'clock P.M.

L. Austin Wright, General Secretary.

ELECTIONS AND TRANSFERS

A number of applications were presented for consideration, and on the recommendation of the Admissions Committee, the following elections and transfers were effected.

Members

Brant, Arthur A., M.A., Toronto; Ph.D., Berlin Univ. (Germany); assoc. prof. physics, geophysics, Univ. of Toronto; private consultant, Toronto, Ont.

Darling, Douglas George, B.A.Sc., (Mech.); M.A.Sc., Toronto; production engr., Toronto Brick Co., Ltd., Toronto, Ont.

Golubowski, Wiaczeslaw, Mech. Engr., Tech. Institute of Danzig, tool design checker, Canadair Limited, Montreal,Que.

Holbrook, George William, Major, R.C.S., B.Sc., (Engrg.), Univ. of London, Canadian School of Signals, Kingston, Ont.

Kuhns, Allan Charles, B.Sc., (Civil), Queen's, asst. planning engr., National Capital Planning Commission, Ottawa, Ont.

L'Heureux, Joseph Francis Rene, B.A.Sc., C.E., Polytechnique, Supt. Chambly Canal, Chambly Basin, Que.

MacLean, James Herbert, Capt., R.C.E.M.E., B.A.Sc., (Mech.), Toronto, Directorate of Vehicle Development, M.G.O. Branch, Dept. National Defence, Ottawa, Ont.

McAdam, Wilfrid Josias, B.Sc., (Civil), Saskatchewan, asst. to chief engr., J. L. E. Price & Co. Ltd., Montreal, Que.

Mickleborough, Karl Franklin, B.A.Sc., Toronto, genl. asst. engr., canal services, Dept. of Transport, Ottawa, Ont.

Smith, John McClement, Graduate, R.M.C.; B.Sc., (Civil), Queen's, junior engr., (civil), H.E.P.C. of Ontario, Toronto, Ont.

Sznajder, Stanislaw Feliks, B.Sc., (Civil Engrg.), Warsaw University, structural designer, C. D. Howe Co., Ltd., Hamilton, Ont.

Williams, Egbert R., B.A.Sc., Toronto, works manager, Shawinigan Chemicals Limited, Shawinigan Falls, Que.

Juniors

Ball, Robert Spencer, B.A.Sc., (Mech.), Toronto, assignment engr., Canadian Cellucotton Products Co., Ltd:, Niagara Falls, Ont.

Brown, Gordon Leroy, B.A.Sc., (Civil), Toronto, field engr., L. R. Brown Co., Ltd., Sault Ste. Marie, Ont.

Denham, Harry Frederick, B.A.Sc., (Mech.), Toronto, asst. to elect. engr., Canadian Pacific Railway, Toronto, Ont.

Feldman, Saul, B.Sc., (Elect. Engrg.), Manitoba, demonstrator, dept. of elect. engrg., Univ. of Manitoba, Winnipeg, Man.

Shales, John Stanley Lennox, B.A.Sc., (Engrg. Physics), Toronto, sales engr., engine, pump and elect. dept., Canadian Fairbanks Morse Co., Ltd., Toronto, Ont.

Tracy, William Raland, B.Eng., (Mech.), Nova Scotia Tech. College, Sackville, N.B.

Affiliate

Scott, Arthur Benjamin, B.Arch., Toronto, consultant, arch. structural design, Welland, Ont.

Transferred from the class of Junior to that of Member

Clawson, William Kennerly, B.A.Sc., Toronto, engr. and road supt., County of Middlesex, London, Ont.

Connelly, Alan Burton, Brigadier, Graduate, Royal Military College; B.Eng., (Civil), McGill; Deputy Adjutant General, Army H.Q., Dept. of National Defence, Ottawa, Ont.

Craig, Clarence Edward, B.Sc., (Mech.), Queen's, supt., tubing and extrusion dept., Aluminum Co. of Canada, Kingston, Ont.

Davies, Richard Llewelyn, B.Sc., (Civil), Alberta, testing engr. for airports, Dept. of Transport, Wiarton, Ont.

Rodger, Norman Elliot, Major-General, Graduate, Royal Military College; B.Sc., Civil, McGill; Quarter Master General, National Defence Headquarters, Ottawa, Ont.

Weir, William Cecil, B.Sc., (Mech.), Saskatchewan, dist. constrn. supervisor, Veterans Land Act, Ottawa, Ont.

Wilde, William Clayton, B.Sc., (Elect.), Alberta, Edmonton branch mgr., Automatic Electric (Canada) Ltd., Edmonton, Alta.

Wishart, William Donald, B.Sc., (Elect.), Manitoba, General Staff Officer, Grade I, Directorate of Signals, Army H.Q., Ottawa, Ont.

Wright, H. Sinclair, B.Sc., (Mech.), Nova Scotia Tech. College, genl. supt., Demerara Electric Co., Ltd., Maracaibo, Venezuela, S.A.

Transferred from the class of Student to that of Junior

Martin, William Anderson, B.A.Sc., Toronto, metallurgist, Canadian General Electric, Toronto, Ont.

Admitted as Students

Students at McGill University

V. J. Goodman R. B. Todd

Student at University of Alberta

G. V. Greenwood

By virtue of the cooperative agreements between the Institute and the associations of professional engineers, the following elections and transfers have become effective.

Alberta

Member

Bunston, Roy Frank Edward, B.Sc., Queen's, electrical engineer, Exshaw, Alta.

Junior to Member

McDiarmaid, Robert Batson, B.Sc., Alberta, manager, Insulation Industries Limited, Winnipeg, Man.

Saskatchewan

Junior

Pattison, Kenneth Reid, B.Sc., (Civil Engrg.), Saskatchewan, engrg. asst., City Engineer's Dept., City of Regina, Sask.

New Brunswick

Members

Peck, Gerald Allison, B.Sc., Acadia, Capt., R.C.E., camp engineer, Sussex, N.B.

Wetmore, Raymond Eugene, B.Sc., (Mech. Engrg.), Nova Scotia Tech., lubrication engr., eastern divn., McColl Frontenac Oil Co., Ltd., Moncton, N.B.

Woodroffe, Harvey A., Prov. Land Surveyer, N.S. Tech. Coll., engr. on constrn. and Mtce., R.C.A.F., Moncton, N.B.

Junior to Member

Baldwin, Oscar Lionel, B.Sc., (Civil Engrg.), New Brunswick, resident engr., highway constrn., Dept. of Public Works, New Brunswick, Boiestown, N.B.

Colpitts, Rolfe Reynolds, B.Eng., (Mech.), Nova Scotia Tech., design work, piping, structures, ventilation, International Paper Co., Dalhousie, N.B.

MacPherson, John Miles, B.Sc., (Civil Engrg.), New Brunswick, resident engr., highway reconstrn., Dept. Public Works, N.B., Fredericton, N.B.

Quebec

Members

Irwin, William Eric Crommelin, B.Sc., Elect. Engrg., McGill, processor, elect. section War Assets Corporation, Montreal, Que.

Sharpe, David Harold, executive chief engineer, Robert A. Rankin & Co., Montreal, Que.

Personals

News of the Personal Activities of members of the Institute

E. T. Buchanan, M.E.I.C., the newly elected chairman of the St. Maurice Valley Branch of the Institute was born at Montreal, Que. He attended McGill University, graduating in 1928 with a B.Sc. degree in electrical engineering. He spent four years with the Northern Electric Company as commercial engineer on toll telephone equipment, and from 1933 to 1935 he worked with L. R. Thomson of Montreal on economics of railways. In 1935 he joined the Consolidated Paper Corporation, Shawinigan Falls, Que., working first on mill costs and statistics and being appointed assistant master mechanic in 1937. He is still with the company at Grand'Mère, Que., as assistant chief engineer.

R. E. Kirkpatrick, Jr.E.I.C., has been appointed secretary-treasurer of the St. Maurice Valley Branch. Born in Montreal West, Que., he holds a bachelor of engineering degree from McGill University, Montreal. After graduation in 1937 he joined Dominion Engineering Co. Ltd., Lachine, Que. Two years later he entered the B. S. Coghlin Company, and in 1940 he went overseas with the R.C.A., and was seconded to the chief inspector of armaments in Woolwich Arsenal, England, with the rank of Captain. Recalled to Canada he was attached to the Inspection Board of the United Kingdom and Canada. He is now at Grand'mère, Que., as mechanical engineer for Consolidated Paper Corporation.

General the Honourable A. G. L. McNaughton, M.E.I.C., was decorated in April last as a Companion of Honour, at a ceremony at Government House, Ottawa.

Dr. Ernest Cormier, M.E.I.C., Montreal architect and engineer, has been appointed to the planning board of the United Nations Capital in New York. He is the only Canadian member of the consulting body.

A. L. Carruthers, M.E.I.C., has been named deputy works minister for the Department of Public Works of British Columbia. He had been chief engineer and chairman of the Highways Board for the Department. His service dates from 1917, when he was district engineer at Prince Rupert, B.C. He went to Victoria as bridge engineer in 1923, remaining in this position until his appointment in 1943 as chief engineer.

H. C. Anderson, M.E.I.C., has been appointed chief engineer of the Department of Public Works of British Columbia at Victoria, B.C. He has held the position of assistant chief engineer since 1942. He joined the Department in 1921 as assistant district engineer for Yale District. He was appointed assistant district engineer at New Westminster in 1929 and district engineer in 1931.

George Phelps, M.E.I.C., recently retired as engineer of sewers for the Works Department of the city of Toronto. A life member of the Institute, Mr. Phelps was in the service of the city for many years, joining the department in 1913.

G. P. Wilbur, M.E.I.C., manager of the Ontario Division of Dominion Bridge Company Limited, Toronto, was elected chairman of the Toronto Branch, Canadian Manufacturers Associaton, at the recent annual meeting.

D. O. Robinson, M.E.I.C., of Canada Cement Company Limited, Toronto, Ont., is appointed as chief engineer of the Technical Branch of the company. A graduate in civil engineering of Queen's University, he has been with the technical department of the company since 1930.

J. V. Arpin, M.E.I.C., has entered the services of La Cie Bedard Limitée, L'Assomption, Que., where he will be responsible for organizing production, development and maintenance. For the past six years he had been employed as group superintendent in the shell filling factory at St. Paul L'Ermite, Que.

W. F. Dechman, M.E.I.C., who joined Bowater's Newfoundland Pulp and Paper Mills Limited at Corner Brook, Newfoundland, in March, 1946, has been appointed superintendent in charge of all construction for the company. He will supervise the company's current expansion programme which will increase the capacity of the Bowater Mill at Corner Brook to over 1000 tons of newsprint per day plus 175 tons of sulphite pulp.

J. Edgar Dion, M.E.I.C., will continue his consulting management engineering work under his own name, in Montreal, specializing in organization, personnel, operating efficiency and control, costing administration and selling. Until recently he has been senior supervisory engineer with Stevenson and Kellogg Company Limited, Montreal.

G. W. F. Johnston, M.E.I.C., of War Assets Corporation, Montreal, has been promoted to the position of manager, pricing and distribution divisions. He was formerly assistant manager of the divisions, having joined the corporation in 1944.

R. K. Motherwell, M.E.I.C., is no longer with Canadian General Electric Company at Peterborough, Ont., but is at Leduc, Alta., in the producing department of Imperial Oil Limited.

J. P. Donnelly, M.E.I.C., is chief engineer in charge of engineering products for the Concargo Aircraft Manufacturing Company Limited at Montreal. He was previously executive engineer with Noorduyn Aviation Limited in Montreal.

J. J. Samson, M.E.I.C., is resident engineer for the Rolland Paper Company at St. Jerome, Que. He was previously at Coaticook, Que., in charge of municipal services.

Dr. Karel R. Rybka, M.E.I.C., Toronto consulting engineer has transferred his practice to premises on Bloor Street. Associated with Dr. Rybka is **O. H. Smith,** Jr.E.I.C., who returned some time ago from service overseas with the R.C.O.C.

Jacques L. Dery, M.E.I.C., and **Gerard A. Lapointe,** Jr.E.I.C., have established a firm in Montreal as consulting engineers in steel and reinforced concrete structures, waterworks and town planning, etc.

After war service, finally as second in command of the 2nd Survey Regiment, R.C.A., Mr. Dery returned in 1945 to the Department of Public Works of Canada at Montreal, where he had been employed since 1934.

Mr. Lapointe worked with the Highway department of the Quebec Government, and with the city of Montreal sewers and hydraulic commission. He was construction engineer with McColl-Frontenac Oil Company Limited from 1940 to 1945, and in 1946 he was connected with the National Capital Planning Service at Ottawa.

E. G. DeWolf, Jr.E.I.C., is now employed as assistant plant superintendent of Maritime Industries Limited, Amherst, N.S. He was previously with Standard Chemicals Company Limited in Halifax, N.S., as chemical engineer.

J. H. Merzetti, Jr.E.I.C., was retired in November 1946, from the active force, R.C.E.M.E., with the rank of lieutenant. He is at present employed as a junior supervisor of operations with the atomic energy division of the National Research Council at Chalk River, Ont.

W. D. Barron, Jr.E.I.C., is no longer with the Canadian Underwriters Association, Montreal. He has accepted a position in the Transit Pipe Division of Canadian Johns-Manville in Montreal.

R. A. Frigon, Jr.E.I.C., is now scientific liaison officer in charge of the National Research Council Liaison Office, at Washington, D.C. He was previously regional representative for the Research and Development Branch of the Department of Reconstruction at Montreal, Que.

E. M. Cantwell, Jr.E.I.C., is the newly appointed sales engineer for Darling Brothers, Limited, Montreal. A graduate in mining engineering from McGill University, 1942, Mr. Cantwell spent two years with Consolidated Mining and Smelting Company Limited, Kimberley, B.C., including a period on geological survey work at Yellowknife, N.W.T. After two and a half years in the R.C.A.F. as navigator instructor, he was with Stadler Hurter and Company, Montreal consulting engineers.

W. L. Keay, Jr.E.I.C., began his duties on May 1st as assistant city engineer of Brantford, Ont. A graduate in civil engineering of the University of Manitoba in 1943 he served with the R.C.N. Following discharge he took a postgraduate course in sanitary engineering at the University of Toronto receiving an M.Sc. degree.

J. W. Kerr, Jr.E.I.C., is appointed assistant manager, central station sales for Canadian Westinghouse Company Limited, Hamilton, Ont. A graduate electrical engineer of the University of Toronto, he served with the R.C.A.F., retiring as a squadron leader in 1945, and returning to the Company to be placed in charge of all transformer sales.

A. G. Ballantyne, Jr.E.I.C., is now employed in the engineering department of the Consolidated Mining and Smelting Company of Canada Limited, Trail, B.C. He was with the P.F.R.A. in Calgary, Alta., as junior engineer.

Obituaries

The sympathy of the institute is extended to the relatives of those whose passing is recorded here.

LORNE ARGYLE CAMPBELL

With the passing of Lorne Campbell on April 29th at the age of 76 an exciting chapter in the industrial history of British Columbia was closed. For almost 50 years he has been an intelligent, industrious worker in the mining and smelting industry, specializing in the development of electric power, so essential to the economic expansion of that great enterprise the Consolidated Mining and Smelting Company of Canada Limited. He and S. G. Blaylock who predeceased him by a year and a half were the giants of their time and together built one of the greatest industries in North America.

The story of the utilization of the power of the Kootenay River is indeed the story of Mr. Campbell's life. Beginning in 1898 he has been responsible for each successive development on the Kootenay until today it stands as one of the most efficiently utilized rivers of the world, and a monument to the great man whose vision and driving power made these things possible.

Mr. Campbell was born in Perth, Ontario, March 5, 1871, the son of John G. and Helen Gray (Murdoch) Campbell. He was educated in the public schools and the Collegiate Institute of Perth and joined the engineering staff of the Edison General Electric Company in Toronto on graduation in 1889.

He continued with the Canadian General Electric Company after that firm took over the Edison Company in 1891, and in 1893, at the age of 22, became chief engineer.

In 1898 he left CGE to come west to the new mining community of Rossland and was appointed general manager of the newly-formed West Kootenay Power and Light Company Limited, organized by Sir Charles Ross to build power installations on the Kootenay river for provision of power to the mines of the area.

He was later appointed vice-president of the company and, in 1912, was elected to the British Columbia Legislature for the Rossland-Trail constituency. In 1916 he was appointed to the cabinet of the conservative provincial government as minister of mines.

At the time of his death he was president and managing director of the West Kootenay Power and Light Company, he was also president of the McGillivray Creek Coal & Coke Company Limited and a director of the Consolidated Mining and Smelting Company of Canada, Limited.

In 1903 he married Mary Spahr Hosier, of Jamestown, Ohio, and had one son and one daughter. For almost 48 years he lived in Rossland where he was active in local community welfare, particularly hospitals. He was a member of the Trail Board of Trade, and of Rotary. In 1942 he was vice president of the Associated Boards of Trade of British Columbia.

He joined the Institute in 1935, and in 1946 was awarded the Sir John Kennedy Medal—the senior award of the Institute. Up until shortly before his death he had planned to come to the annual meeting in Toronto for the formal presentation.

W. S. Fetherstonhaugh, M.E.I.C., died on April 17th, 1947, in Victoria, B.C., where he had been residing for two years. He was born at Ottawa, Ont., in 1874, attended school there and worked first in Alberta from 1893 to 1896 as chainman and rodman on Dominion government land survey and irrigation work. He was instrumentman for the Columbia and Western Railway for two years, and worked for the Canadian Pacific Railway from 1899 to 1904 as instrumentman and resident engineer. He was locating engineer for the Grand Trunk Pacific for several years and assistant engineer in charge of construction from 1907 to 1910. That year he was appointed by the Grand Trunk Pacific as district engineer on the National Transcontinental Railway.

Enlisting in 1916 as a lieutenant in the 224th Battalion, C.F.C., he was acting captain in charge of recruiting in Manitoba and Saskatchewan before going overseas. He was demobilized in 1919 with the rank of lieutenant-colonel, after four mentions in despatches and with the C.B.E. decoration. That year he returned to the Grand Trunk Pacific as division engineer at Prince Rupert, B.C., and transferred to the Canadian National Railways at Calgary, Alta.

Mr. Fetherstonhaugh joined the Institute as an Associate Member in 1907, becoming a Member in 1914. Life membership was awarded him in 1939.

H. A. Moore, M.E.I.C., died at his home in Trenton, Ont., on March 19th, 1947. He was born at Hamilton, Ont., in 1871, and studied at the University of Toronto, graduating in 1893 with a B.A. degree. He then entered the engineering department of the Canadian General Electric Works at Peterborough, taking the student course, and in 1895 was made assistant to the works engineer. In 1896 he became general superintendent for the Trenton Electric and Water Company at Trenton and Belleville, Ont., and in 1901 he returned to the Canadian General Electric Company at Toronto as estimating engineer. He was district manager for the Canadian Bullock Electric Manufacturing Company at Toronto in 1903-4 and then came to Montreal as assistant to the president of Allis Chalmers Bullock works. In 1906 he went to the Dominion Engineering and Construction Company, Limited, Montreal, as general manager. He went to the Calgary Power Company in 1912, was later connected with the English Electric Company of Canada Limited at Toronto for some years, and practised as a consulting engineer in Toronto until he accepted in 1937 an appointment with the engineering department of the Consolidated Mining and Smelting Company of Canada at Trail, B.C. He left Trail in 1944 to take up residence again in Trenton.

An enthusiastic yachtsman, especially interested in lake racing, he was judge in 1930 of Canada's cup contest and chairman of the sailing committee of the Royal Canadian Yacht Club. He is credited with having organized Canada's cup race competitions within the framework of the Canadian Yachting Association.

He joined the Institute as a Member in 1907, and was awarded Life Membership in 1937. He was Chairman of the Toronto Branch of the American Institute of Electrical Engineers in 1905.

George Rixon Hill, M.E.I.C., who was with the Department of Transport at Port Arthur, Ont., since 1942, died on April 6th, 1947. Born at Peterborough, Ont., Mr. Hill received his early education at Renfrew, Ont. He served on railway location work with the Canadian Pacific Railway in the west, and on road surveys for the Manitoba Good Roads Board. He was employed as municipal engineer at Virden, Man., for nineteen years prior to his service with the Department of Transport in 1936. He served as district airway engineer with the Department at Sioux Lookout and Nakina, Ont., and came to a similar position at Port Arthur in 1942.

Mr. Hill joined the Institute as a Junior in 1917, transferring to Associate Member in 1931 and to Member in 1940. He was a member of the Manitoba Association of Professional Engineers.

P. B. Roberts, M.E.I.C., of Eltham, England, died on January 3rd, 1947. Born in London, England, in 1877, he studied under C. W. Bevis, surveyor of Portsmouth, and later served as his assistant. He was with the Works Department of the Portsmouth dockyard as a draughtsman and later served in the Royal Engineer's Office at Isle of Wight as a surveyor's assistant. He was surveyor and chief assistant to the commanding officer for five years at Bulford Camp, Salisbury.

Coming to Canada he joined Messrs. Burke and Horwood, Toronto, serving as an inspector in charge of all outside work in 1906 and 1907. Then for seven years he was with the Grand Trunk Railway. He was in charge of construction of works at London, Ont., station foundations at Ottawa, Ont., the bridge over the Yamaska River at St. Hyacinthe, Que., and later became chief draughtsman and engineering architect for the company in charge of all building work on the railway, which brought him to Chicago, Buffalo, Detroit, Ottawa and Montreal.

He returned to England in 1915 to take up war service and was for four years surveyor on the staff of the Royal Arsenal at Woolwich. He was superintending surveyor for the Royal Ordnance Factories of the Royal Arsenal from 1928 until his retirement in 1942. He visited Canada in 1940 as a government official to advise on the building of the Cherrier shell filling plant in Montreal.

Mr. Roberts joined the Institute in 1919 as a Member.

Peter James MacDonald, M.E.I.C., of the town of Mount Royal, Que., passed away at his home on April 11th, 1947, after a brief illness. He was born at Loch Garry, Glengarry County, Ont., in 1879 and studied applied science at McGill University. He worked first on construction with the Dominion Bridge Company in New Brunswick and then with the Canadian Pacific Railway in Manitoba from 1904 to 1908. After a few years contracting at Fort William and later at Swift Current, Sask., he set up practice as a municipal engineer at Swift Current. In 1930 he became district engineer for the Department of Highways at Swift Current, and in 1935 district engineer for the P.F.R.A. In 1937 he came east to work with the Department of Highways in Northern Ontario. His last active work, prior to his retirement was in charge of the proportioning of concrete on the Shipshaw project.

Mr. MacDonald joined the Institute in 1919 as an Associate Member, becoming a Member in 1940 and a Life Member in 1946.

Edward Floyd, M.E.I.C., director of West Coast Collieries, Vancouver, B.C., died recently. Born at Yorkshire, England, in 1874, he studied science in England and worked first with the Ashington Collieries in Northumberland. He served from 1905 to 1915 as consulting engineer for the Miners Executive Committee and Federation of Great Britain and in 1915 he joined the Royal Army Medical Corps. Returning after discharge in 1917 to his former position, he was loaned to Canada and was engaged to make valuations of the operating coal mines and the undeveloped coal areas. From 1920 he practised privately in Vancouver, acting as consultant to various mining and industrial firms in the province. He returned to England in 1930, but he was back in Vancouver in 1933 as general manager of Maple Leaf Iron Works and in 1935 he was elected director, as mining engineer on board, and consulting mining engineer to the West Coast Collieries.

Mr. Floyd joined the Institute as a Member in 1943.

NEW HONORARY MEMBERS OF THE INSTITUTE

The following are the citations read at the Annual Banquet in Toronto upon presentation of the certificates to the four new Honorary Members of the Institute.

ERNEST BROWN

"The hydraulic resources of Canada are large. Their industrial development is a matter of vital importance. Tonight we honour a man who has made outstanding contributions to this development and to the development of engineering knowledge covering a wide range of activities. His investigations in the field of reinforced concrete are notable. He had an important share in the difficult special studies carried out in connection with the design of the Quebec Bridge, and his experiments and researches on the strength of ice have added greatly to the engineer's knowledge of this troublesome substance in relation to his structures and machines. Of notable importance, too, have been his studies, pursued over many years, on model turbine runners.

"At the same time he has carried a heavy load of responsibilities on the staff of the faculty of engineering at McGill University, serving as dean for many years.

"He has taken an active part in the affairs of The Engineering Institute of Canada, giving liberally of his time to its interests. In 1909 and again in 1915 he received the Gzowski Medal for outstanding contributions to the literature of the profession. In 1942 the University of Toronto conferred on him the degree of Doctor of Engineering.

"Today, in recognition of his attainments as an engineer and educationalist, the Council of The Engineering Institute of Canada is conferring upon him an honorary membership."

PERCY DUNSHEATH

"In the field of electrical engineering our confrere has made outstanding contributions that have had far-reaching effects in many parts of the world. One of the most spectacular, a contribution of vital importance to the war effort, was the development of buoyant cables for sweeping magnetic mines, utilizing cylindrical so-called 'tennis balls' to form the buoyant centre for the cables.

"Of great importance, too, though not so spectacular, have been the many improvements that he has effected in the design and manufacture of electric cables, particularly in the supertension field. For these and other contributions he has brought honour to himself and to his native England. For instance, it is of interest to note that Dr. Dunsheath was the pioneer of the continuous extrusion process for producing lead pipe and was the inventor of the first machine to operate successfully on this principle. He is the author of many papers and articles on electrical engineering, physics, the organization of research and education in industry.

"In 1946 he was president of that great society, The Institution of Electrical Engineers, and in that capacity greatly honoured The Engineering Institute of Canada by attending the annual meeting in Montreal, representing also the Institutions of Civil and Mechanical Engineers.

"Today, in recognition of his outstanding contributions to the field of engineering and to his leadership, the Council of the Engineering Institute is conferring upon him an honorary membership."

C. J. MACKENZIE

"As a pioneer consulting engineer and educationalist in the Canadian West our distinguished past-president early in life evidenced a talent for leadership that carried him to great heights in the Canadian engineering, scientific and educational field.

"While still a young man he inaugurated the engineering courses at the University of Saskatchewan. As dean of the faculty he brought engineering education there to a level that has added a touch of distinction to Saskatchewan graduates ever since.

"As acting president of the National Research Council and later as president, he rendered a vital service to the national effort and contributed much to international scientific achievement.

"In addition to his duties as president of the Research Council he is director of industrial research and development in the Department of Reconstruction. He has made many valuable contributions to the work of other organizations concerned with the advancement of engineering and scientific knowledge.

"Few men in Canada have had greater responsibilities on their shoulders, and none has met them with greater success than the gentleman we honour this evening. Unfortunately for him the war's end did not bring an end to the emergencies that have faced him for so many war years. One of Canada's greatest opportunities and responsibilities still lies heavily upon him—the atomic energy project at Chalk River. It is fortunate for us all that he is here to guide it.

"He is a past-president of The Engineering Institute of Canada.

"Today, in recognition of these outstanding attainments, the Council of The Engineering Institute of Canada is conferring upon him its highest honour—honorary membership in the Institute."

F. H. SEXTON

"The wide range of activities that it is possible for an engineer to encompass are well illustrated in the career of our next candidate. His accomplishments, the recognition he has earned in his diversified public activities and the esteem with which he is held by all who know him, have done much to enhance and add lustre to the entire profession.

"In the field of engineering education he has attained a pre-eminent position. He has been responsible for the building and development of the Nova Scotia Technical College at Halifax from its inception in 1907 to its high attainments of today. The great majority of engineers who have come from Canada's maritime provinces for the past forty years have passed through his competent hands. He has been director of technical education for Nova Scotia since 1907.

"In addition he has served with many organizations and public bodies, some of whose activities range rather far from the field of engineering as we usually think of it.

"Today, in recognition of these many contributions, the Council of The Engineering Institute of Canada is conferring upon him an honorary membership."

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

BORDER CITIES BRANCH

G. W. Lusby, m.e.i.c. - - *Secretary-Treasurer*
W. R. Mitchell, m.e.i.c. - *Branch News Editor*

On Friday evening, April 11th, 1947, the Border Cities Branch of the Institute held its monthly meeting at the Prince Edward Hotel, Windsor, Ontario.

A very interesting talk on **Radiant Panel Heating** was given by J. S. Mitchener of J. T. Wing & Company Limited, Windsor. The subject matter, being of a very interesting nature due to the problems of heating caused by increased costs, etc., led to one of the most lively question and answer periods that the Branch has seen in a long time.

Mr. Mitchener sketched the history of Radiant Heating from the time of the large built-in fireplaces in England, and considered the temperature of rooms having a fireplace wall in them but no open fire. He discussed the present day applications for floor-heating, wall heating and ceiling heating.

Most of the members present were surprised to hear that, although there are not many installations in Canada at present, the Border Cities area has shown the largest development in this type of heating installation.

The talk was well illustrated by means of slides showing several types of installation coils, both floor and wall types.

HALIFAX BRANCH

J. D. Kline, m.e.i.c. - - *Secretary-Treasurer*
M. L. Baker, m.e.i.c. - - *Branch News Editor*

The April meeting of the Branch was held at the Nova Scotian Hotel on April 17. E. C. O'Leary, Chairman of the branch, presided. Members and guests numbered one hundred. Among the guests present were Hon. A. L. MacDonald, Premier of Nova Scotia; and Mr. A. M. MacKay, general manager of Maritime Telegraph and Telephone Company, and president of the Halifax Board of Trade.

Bridge over the Strait of Canso was the topic of the address given by Mr. Charles P. Disney, consulting engineer and vice-president of Intrusion-Prepakt, Limited, formerly chief bridge engineer with the Canadian National Railways. In view of the timeliness of the subject, a number of members of the Halifax Board of Trade was invited to hear the address.

Mr. Disney's proposed method of building the bridge involves the use of a patented new type of concrete construction of piers in conjunction with steel H-piles. He anticipated no problems with ice, tides or deep water. The cost of constructing the piers by this method would be, according to the speaker, a great deal less than if built in the conventional way.

Mr. Disney illustrated his talk with slides showing the procedure involved in using this method of concrete construction both on new projects and in repair work.

The number of questions asked of the speaker during the discussion period was an indication of the interest of his listeners.

Following the discussion, a vote of thanks was moved by Dr. Cameron, Deputy Minister of Mines of Nova Scotia, and president-elect of the Nova Scotia Technical College, and seconded by J. R. Kaye, president of Engineering Service Limited.

KINGSTON BRANCH

J. E. Thom, m.e.i.c. - - - *Secretary-Treasurer*

Four interesting papers were delivered before the Kingston Branch on February 24, 1947, by undergraduate students of the faculty of applied science, Queen's University, on the occasion of the Annual Student Papers Competition.

W. H. Finch, s.e.i.c., took first prize with his paper **Long Distance Radio Propagation** in which he dealt with long range communication by radio waves, the effect of the ionized layers of the stratosphere, the regular and irregular variations of these layers and the further problems to be investigated in this field of activity.

A. E. Fee, s.e.i.c., was awarded second place for his paper dealing with **Radar** in which he discussed various types of radar equipment and their applications.

Third prize was given to W. R. Anderson, s.e.i.c., for his paper on **Rubber** in which he discussed the history and production of natural rubber, the various types of synthetic rubber and compared the properties of each.

The fourth paper was presented by J. G. S. Billingsley, s.e.i.c., who also spoke on **Radar** dealing particularly with certain land stations, outlining their construction, operation and range.

The judges, Colonel A. Walker, Department of English, Queen's University, M. G. Saunders and A. Narduzzi, Engineering Society, Queen's University, reported briefly on the reasons for their decisions. They stated that the high quality and good presentation of all papers had made their task very difficult.

While the judges were deliberating the National Film Board film " Salmon Run " was shown to the audience through the courtesy of A. L. Crossland, Personnel Department, Nylon Plant.

On April 9th, Mr. R. M. Doull of the Canada Gunite Company, Montreal, presented a paper on the **Reconstruction of the Halifax High Service Reservoir.** Mr. Doull's clear and informative talk dealt with the rebuilding of a 30-year-old, heavily reinforced concrete structure in Halifax, and was much appreciated by the members.

LONDON BRANCH

A. L. Furanna, m.e.i.c. - - *Secretary-Treasurer*
G. N. Scroggie, m.e.i.c. - - *Branch New Editor*

The regular monthly meeting of the London Branch was held on the evening of March 27th in the London city hall, with H. A. McKay presiding.

The Chairman introduced the speaker of the evening V. A. McKillop, assistant general manager of the London Public Utilities Commission, who spoke on **The Proposed Change in Frequency in the Niagara System of the H.E.P.C.**

" The advantages claimed for the change from 25 to 60 cycles should be carefully weighed against the costs," said the speaker. " The selection of 25 cycles in the early part of the century was made for good and sufficient reasons, and neither blame nor credit should be attached to any member of the H.E.P.C. since decisions were made and power generated at 25 cycles before the Commission came into the market as a purchaser."

In 1888 Mr. George Westinghouse entered the electrical field in the United States, using a belt-driven A-C generator and a frequency of 133-1/3 cycles per second. In 1898, direct-coupled engine-type A-C generators were adopted and this necessitated the use of a lower frequency and 60 cycles was accepted as most suitable, and in time became the " standard frequency ".

When the Niagara Falls Power Company started their No. 1 Plant on the American side of the Falls, a consulting engineer recommended a frequency of 16 2/3 cycles. Mr. George Westinghouse, however, advised that he would not manufacture and guarantee any machine of a frequency lower than 25 cycles, and hence this was adopted as a second standard of frequency.

The installed generating capacity for this Niagara Falls District is 1,017,000 kva., and the investment in generation and transmission is approximately $200,000,000. In addition, the H.E.P.C. has contracts for 575,000 kw. of 25-cycle power with power companies in the Province of Quebec.

After outlining the history of power generation in the province, Mr. McKillop went on to give arguments pro and con on the proposed change-over from 25 to 60 cycles. Twenty-five cycle regulation is better, there being less voltage drop than on a 60-cycle line, which means that there would have to be more transmission lines for the higher frequency. Heavy industries prefer low speed induction motors that operate on 25 cycles.

New equipment and appliances developed in the United States for 60 cycles are not available here for a considerable period of time, and American industrial firms would like to locate branches here and be able to standardize their equipment with that of the home plant. Sixty cycles means less flicker, although fluorescent lighting is being adapted to 25 cycles. Sixty-cycle motors are smaller and cheaper, but not sufficiently so to affect the price of such appliances as refrigerators and washing machines. Sixty-cycle generators in the small sizes are cheaper and less bulky than 25-cycle generators, while 60-cycle transformers cost about 1/3 less and weigh about 20 per cent less than the 25-cycle transformers.

The cost of the change in the City of London has been estimated at $4,500,000. About one-third of this would be required for the distribution system and the balance on the consumers' premises. The estimated cost for changing the equipment in the average household would be about $75. The speaker explained how the change could be gradually brought about, and a question period followed.

Mr. McKillip was thanked by W. J. Bright.

❖ ❖ ❖

On Tuesday, May 6th, the Branch held a dinner meeting at the Y.M.C.A., and Mr. Ralph C. Manning, chief engineer of the Canadian Institute of Steel Construction, was the speaker of the evening.

H. A. McKay was in the chair and introduced the speaker who chose as his subject, **Steel in Small Houses.**

Mr. Manning spoke briefly on the development of this light steel section which is rolled in the shape of a channel. The channels come in various depths but have a constant flange width, and gauge. He explained how those members can be employed as rafters, joists and studdings in fire resistant construction, and then presented a film showing the actual construction of a home near Hamilton. This was the first such home erected and the floors were pre-fabricated in sections and shipped ready for use. The speaker went on to say that a second house had been constructed satisfactorily, using the members as they came, no prefabricating being done in the shop.

After the showing of the film, Mr. Manning showed a piece of this new section and answered several questions.

The speaker was thanked by Mr. A. Joedicke.

MONCTON BRANCH

V. C. Blackett, M.E.I.C. - *Secretary-Treasurer*

On March 12th, the Moncton Branch was favored with an official visit from the president of the Institute, Mr. J. B. Hayes. The President was accompanied by Mrs. Hayes, Councillor and Mrs. G. J. Currie, and Assistant General Secretary Louis Trudel. The presidential party was met at the station by members of the branch executive and their wives. Later in the afternoon, they were taken on a sight seeing tour. This included a visit to the plant of the Moncton Ice Company where the complete cycle of operations in the manufacture of artificial ice was shown; then to the Marven Biscuit Factory, and finally to the Moncton Airport.

In the evening, a dinner meeting was held in the Palm Room of the Brunswick Hotel. G. L. Dickson presided and introduced Mr. Hayes. In his address, the president declared that education is the greatest problem in Canada today. There is need for more engineering teachers with salaries higher than at present. They should have more time for research in pure science. Other speakers included Mayor G. F. G. Bridges, G. J. Currie, Louis Trudel, W. C. MacDonald and A. S. Gunn. During the course of the dinner, two enjoyable solos were sung by Corey Smith.

After the meeting, a reception for the visiting ladies was held at the home of Mrs. T. H. Dickson and attended by the wives of branch members.

❖ ❖ ❖

On April 9th, E. D. Bent, cable development engineer, Northern Electric Company, Montreal, addressed a branch meeting, taking as his subject, **The Role of Synthetics in the Design and Manufacture of Electric Cables.** Mr. Bent described the various substitutes that had been developed during the war, to take the place of natural insulating materials, notably rubber and silk. A vote of thanks was moved by T. H. Dickson and seconded by J. A. Godfrey.

MONTREAL BRANCH

E. M. Van Koughnet, M.E.I.C. - *Secretary-Treasurer*

A conference of branch officers was held at the recent annual meeting at Toronto. It was well attended and many points of common interest were discussed. The feeling of those present was that the conference had been well worthwhile and should become a feature of future annual meetings. The Montreal Branch was represented by J. M. Crawford, chairman and R. N. Coke, vice-chairman.

About 100 members of the Montreal Branch attended the annual meeting. Dr. Massue's charts on membership created considerable interest and it is hoped that these charts will be available to show the members of Montreal Branch later in the season. The Annual General Meeting Committee of the Toronto Branch is to be congratulated on its organization of a thoroughly successful annual meeting.

The branch House Committee reports as a result of its suggestion to the Institute House Committee that certain changes at Headquarters will be carried out in order to better serve the needs of the Branch. It is hoped that these changes will be in effect by the autumn of this year. The Institute House Committee is considering the possibility of effecting major changes at Headquarters in order to better serve the membership at large. However, it is expected that it will be some time before any major changes will be undertaken.

The Montreal Branch extends its congratulations to the following on their election to Council:

R. S. Eadie, Vice-President, K. G. Cameron, Councillor,
J. A. Beauchemin, Councillor, C. E. Gélinas, Councillor.

Congratulations are also extended to the following on their election to the Council of the Corporation of Professional Engineers of Quebec:

J. B. Stirling, Vice-President, J. A. H. Henderson, Councillor,
J. A. Lalonde, Secretary-Treasurer

OTTAWA BRANCH

C. G. Biesenthal, Jr.E.I.C. - *Secretary-Treasurer*
R. C. Purser, M.E.I.C. - - *Branch News Editor*

At an evening meeting held at the Auditorium of the National Museum on April 16 an illustrated talk was given on the **Reconstruction of the Halifax High Service Reservoir** by R. M. Doull, M.E.I.C., Montreal. Major-General G. R. Turner, chairman of the Branch, introduced the speaker and occupied the chair.

The speaker told how a pre-stressed concrete shell, 2½ in. thick and 164 ft. in diameter, was built to cover a reservoir at Halifax. Originally constructed in 1917, the reservoir had to be rebuilt recently. Its original capacity had been reduced from 3½ million gallons to 2 million gallons with consequent fire danger to the city. When the reservoir was rebuilt, it had a capacity of 4 million gallons.

Mr. Doull asserted that the job resulted in the largest roof of its type in the world. Waters from nearby lakes feed the reservoir through a pumping system and run into the city down a slope. No columns were used in the construction. The tank is 25 ft. deep.

❖ ❖ ❖

At a noon luncheon at Standish Hall, Hull, on April 24, Dan Gasper, manager of the Canada Cement Plant at Hull, spoke on **Safety Calling Leadership.**

The amount of money lost in accidents in Canada annually would provide $10,000 homes for every family in a city larger than Hull, stated Mr. Gasper.

Addressing his plea of "Safety Calling Leadership" to engineers, "who blazed a trail across the wilderness only to meet the demon of accident", he said that the world has failed to keep up with preventative methods. Man has developed much in science and the production line but has forgotten human relations.

"This has resulted in God's chosen creature, man, playing a minor role to machines", he declared. "I see fear creeping into the industrial home. Much has been done to eliminate dangerous hazards, and it provides us with the incentive to complete the task."

"The hard-boiled captains of industry, who scorned safety flags and crests, have disappeared", he continued. "In their place are men who believe in cooperative effort and in the stimulation of men and minds."

"Canadian youth goes through two of the greatest institutions in existence, the home and the school", Mr. Gasper said, "yet he still knows nothing about safety when he applies for a job. We try now to make them safety-conscious in their industrial home, where one-third of their lives is spent."

He stressed, however, that safety-consciousness must apply to both the home and the plant. Of 100,000 accidental deaths annually in the U.S., 30,000 occur in the home.

Benefits of a safety campaign are twofold. First, the saving in money alone justifies such a programme. Secondly, excellent public relationship results that goes far to reduce labour-management strife.

J. H. Irvine, immediate past chairman, presided in the absence of Major-General G. R. Turner, chairman.

PETERBOROUGH BRANCH

A. R. Hailey, M.E.I.C. - - *Secretary-Treasurer*
J. C. Allan, M.E.I.C. - - *Branch News Editor*

Mr. C. R. Whittemore, research metallurgist for the Deloro Smelting and Refining Company, presented a paper on **Cobalt** before the Peterborough Branch on the evening of April 3rd.

Mr. Whittemore informed the branch that cobalt is a versatile metal of considerable importance. It is used to impart strength and high temperature hardness to steel alloys. It has also a great variety of other uses, ranging from paints and ceramic stains to catalysis and fertilizers.

The Belgian Congo is the world's chief source of cobalt as a by-product from the treatment of the copper ores found there. Canada is the chief North American source for cobalt. It is also obtained from Northern Rhodesia, British India and French Morocco. During the War the Deloro Mining & Smelting Company processed ores from all of the principal sources, and in fact was the principal source of the refined forms of this critical material for the United Nations.

The most important use of cobalt is in stellite, which contains cobalt, chromium, tungsten and small amounts of other metals. Stellite is used for high speed cutting tools, hard surfacing compositions and other applications requiring corrosion and heat resistance. Certain steel alloys contain cobalt to impart toughness and hardness at high temperatures. Many of the best magnetic alloys contain cobalt.

The earliest known uses of cobalt were by the Egyptians—some 3,000 years ago. They used cobalt to colour glass and statuettes blue. It was also used for pottery decorations by the early Persians, Assyrians, Arabians and Chinese.

Cobalt oxide is still employed as a stain for ceramic bodies to offset the yellow stain imparted by traces of iron in the clays used for whiteware. It is also used in glazing, where in combination with oxides of manganese, nickel and chromium, all shades of blue and green glazes can be obtained. Cobalt is also used in catalytic driers for paints and varnishes. Cobalt chloride and cobalt sulphate improve many soil fertilizers and certain soluble cobalt salts may be fed directly to animals to improve their diet. When cobalt 59 is exposed to neutron bombardment in an atomic pile, it becomes radio-active, and only drops to one-half its initial strength after five years. For certain purposes it may be superior to radium and free us from dependence on radium for therapeutic purposes.

The name *Cobalt* was derived from the German name *Kobold* for gnomes and goblins. It was applied by German miners to cobalt ores, which had a bad effect on their health due to arsenic content.

Following the presentation of the paper, Otto Laderach, a former naval officer, rose and thanked Mr. Whittemore for assistance which he had received from him in making urgently needed repairs to vessels at a critical time. Mr. Laderach described some of Mr. Whittemore's metallurgical products in glowing terms, and intimated that they had enabled him to surmount great difficulties in getting damaged ship machinery back into service.

J. M. King, laboratory metallurgist for the Canadian General Electric moved a vote of thanks, and also acknowledged a debt for advice from Mr. Whittemore on metallurgical problems.

SAGUENAY BRANCH

J. E. Dyck, M.E.I.C. - - - *Secretary-Treasurer*

Junior Section

T. T. Anderson, Jr.E.I.C. - *Secretary-Treasurer*

A meeting of the Junior Section of the Saguenay Branch of the Institute was held at the Saguenay Inn, Wednesday evening, April 9th.

A. H. Johnston of the Aluminum Company of Canada, Limited, delivered an interesting address on the subject of **Engineering in Cellulose Acetate Manufacture.** He presented slides showing flow sheets and pictures of equipment used in a similar plant in the U.S.A. The process, up to the production of dry cellulose acetate powder, was discussed in more detail, Mr. Johnston having been attached to the engineering department servicing that section.

Although no details were given, it was intimated that Canadian Celanese Limited had developed specialized equipment to handle the various operations in the production of dry acetate powder. Routing of materials to finished dyed fabrics was also discussed.

Samples of materials used in the process as well as finished fabrics, loaned by Canadian Celanese, Limited, were displayed to the general interest of the audience.

The speaker was introduced by J. T. Madill, chairman of the Junior Section, and thanked by J. P. Estabrook.

Following the talk, coffee and sandwiches were served to the assembled company.

❖ ❖ ❖

A meeting of the Junior Section of the Saguenay Branch of the Institute was held in the Banquet Hall of the Saguenay Inn at 8.15 p.m., Wednesday, April 30th.

G. K. Clement of the Aluminum Company of Canada Limited spoke on the subject of **Glass Lining of Tanks** as practiced by the John Inglis Company of Toronto.

Mr. Clement dealt first with the design considerations of a tank suitable for glass lining, covering such points as type of steel, shapes, variations in section thickness and strengths at elevated temperatures. Preparation of the glass was discussed, together with its characteristics and peculiarities.

A detailed account was given of the application and firing of the glass, and the requirements of atmosphere control, exacting cleanliness, and inspection. The properties, advantages and application of glass lined storage vessels were also outlined. The lecture was illustrated with slides.

An interesting discussion period followed the talk.

Mr. Clement was introduced by C. J. Tanner and thanked by T. T. Anderson.

SAINT MAURICE VALLEY BRANCH

W. R. Mackay, Jr.E.I.C. - *Secretary-Treasurer*

The Annual Dinner Meeting of the Branch was held at Laurentide Inn, Grand'Mère, on Thursday evening, April 17th. The special speaker for the evening was Guy Rinfret, whose subject was **Hydro-Electric Power Developments in China.** Mr. Rinfret had spent three months in China last fall, investigating power sites for the Chinese Government. During that time, he travelled over 4000 miles in that country, and his address was extremely interesting. The address was illustrated by slides and a discussion period followed in which everyone had a chance to question the speaker.

The business part of the meeting followed. The Treasurer read a brief summary of the financial statement for the year. Then the results of the branch by-election were announced and the officers for the coming year installed in office.

Attendance at the meeting was fifty-four.

SARNIA BRANCH

F. F. Walsh, M.E.I.C. - - *Secretary-Treasurer*
J. S. Pickering, S.E.I.C. - *Branch News Editor*

The first informal evening meeting of the Sarnia Branch for 1947 was held at the Lutheran Hall on March 27th. A portrayal of the extensive amount of work entailed in laying the petroleum carrying pipelines across the English Channel was shown as a feature of the evening in the form of a movie entitled "Operation Pluto", sponsored by the Drummond-McCall Company.

A lively discussion preceded the movie during which D. S. Simmons, chairman of the Special Projects Committee outlined work that had been done by various interests towards Town Planning for Sarnia. A resolution was passed that the Sarnia Branch should offer its services to the Sarnia, Point Edward and Township Councils, and the Chamber of Commerce, towards a combined effort in the study of future planning.

An editorial in the *Sarnia Canadian Observer*, which was rather critical of an editorial reprinted on the same page from the *Journal*, was discussed. It was decided that further action if any should be left to the executive. The editorial concerned the recent resignation of Dr. Hogg from the Hydro, ıd in general the position of the engineer in administrative ›sitions.

A dinner meeting was held in the Polymer Cafeteria on ›pril 24th at which A. H. Frampton, director of engineering r the Hydro, was guest speaker. He was introduced by G. R. enderson, and his topic was the **Romance of Niagara Power.**

Mr. Frampton sketched the growth and development of ydro from its inception and also outlined the geological story of the Great Lakes and the Niagara area in particular.

He went on to discuss the controversial issue of the change-·er in frequency for Southern Ontario, and it appeared that everyone knew the facts as presented by Mr. Frampton, a eat many of the arguments against the change, particularly regard to the uncertainty of the financing, should disappear.

The main issue as to whether the change is economically stified is being studied by a committee at the present time. e estimated cost of $200,000,000 was emphasized as including e total cost of the undertaking; that is, it includes the cost converting the facilities of the provincial Hydro system, the unicipalities, and the domestic consumers. He pointed out at the Hydro had built up a surplus of $32,000,000 during e war period which might increase to a possible $60,000,000 a short time with the present rate structure. This amount ›uld probably be used in helping to finance the venture.

He explained how, in many cases, equipment would be re-aced with new equipment, and in addition the consumer ould be able to purchase 60 cycle equipment at lower cost.

Mr. Frampton also discussed the possibility that, if the ange-over is not made now, there might come a time in the ture when, after many more dollars have been spent on ‹ cycle facilities, the change might be found to be necessary?

The 60 cycle system would have greater efficiency in the stribution of power, as much as 40,000 kw. being saved in ıe district alone. In an area such as Sarnia where there are ·ospects of wide industrial expansion, the advantages of ıving 60 cycle power to offer are manifold, particularly as ost industrial equipment would otherwise have to be designed.

There is much to be said in favor of standardization, espe-ally in an emergency such as recently occurred during the st war when England considered herself fortunate to have andardized the cycle just before the war.

The totally unexpected increase in power consumption has ıught everyone off balance just at a time when a breathing ›ace was looked for.

In short, the speaker concluded that now appears to be the est time for a change.

E. W. Dill expressed the thanks of the Branch to Mr. 'rampton.

The next meeting was announced as the Annual Junior leeting on May 14th. This would take the form of a smoker t which several of the Junior members would present papers.

VICTORIA BRANCH

S. H. Frame, M.E.I.C. - - *Secretary-Treasurer*
K. Reid, M.E.I.C. - - - - *Branch News Editor*

The Canol Pipe Line was the subject of an address given ›n April 10 to 50 members and interested engineers of the 'ictoria Branch by Major General W. W. Foster, C.M.G.,).S.O., member of the B.C. Power Commission.

General Foster was appointed as liaison officer representing he Canadian Government on the various North West projects ınd has a wealth of first hand knowledge on the construction ›f both the Alaska Highway and the Canol Pipe Line. His ıddress was illustrated by two reels of coloured motion picture ilm depicting the construction from start to finish. These pic-ures were taken by the U.S. Army signal corps, and were ›resented to General Foster on completion of the project in ıppreciation of his active participation. This was the third ime the pictures have been shown in Canada.

The Canol Pipe Line project was conceived by the U.S. Government to ensure a safe supply of vital gasoline and ›etroleum products following the construction of the North West staging route and the Alaska Highway since by 1942, the Japanese war strategy in the Aleutians and on the Pacific Coast had virtually cut off supplies by the water route from California to Alaska.

The land haul was from Edmonton to Nome via Whitehorse and Fairbanks, a distance further than from Edmonton to Ottawa, and included 1,600 miles of Alaska highway together with 1,500 miles of subsidiary roads constructed in conjunction with the highway. A preliminary survey proved the oil fields at Norman Wells on the McKenzie River to be major fields capable of producing 3,000 barrels of oil per day. With the cooperation of the Canadian Government the Canol project was proposed as part of the whole north west scheme. The word *Canol* is an abreviation for *Canadian Oil.* The whole plan, the N.W. staging route, the Alaska Highway and the Canol Pipe Line constituted the largest construction project in the history of the world.

The presence of oil on the McKenzie River had been known for many years. The Imperial Oil Company had operated a refinery at Norman Wells for 5 months of the year, producing 950 barrels per day. This oil had a very high paraffin base and a viscosity that would allow flow at a temperature as low as 70 deg. F. below zero. The distance from Norman Wells to Whitehorse on the Alaska Highway was about 600 miles across two mountain ranges of 5,500 feet altitude through country much of which had never before been explored by man.

In the summer of 1942 some 2,500 engineer troops proceeded the 1,200 miles from Edmonton to Norman Wells; 60,000 tons of freight were necessary for construction of the project. Time was an essential element. Transportation at first was by barge and boat on the water route down the McKenzie River. A winter road was built to Norman Wells for use after freeze-up. Fifteen thousand Canadian civilians and 7,500 Americans were employed on the project. Construction commenced from the Norman Wells end only, but later, when the Japs were driven from the Aleutians, construction proceeded from both ends in order to speed up completion of the project. Ten pumping stations were required for delivery of the oil over a four-inch steel pipe line of welded construction, laid on the surface of the ground and following the contours of the topography. Tank storage and tank farms were constructed at various points including the Alaska Highway. The whole project took 21 months to complete and 3,000 barrels per day were delivered from the 4,000 barrels of crude oil per day produced from 63 wells at Norman Wells. The first oil was delivered within 24 hours of the scheduled date. By March 1945 over 2,000,000 barrels had been produced and 1¾ million barrels refined at the refinery built at Whitehorse.

After the first year of operation refined oil could be brought safely and more economically by water from California to Skagway and with less use of man-power, and operation of the project was curtailed.

The pipe line and refinery are still in use, however, and will continue to be employed to a limited extent. The oil field at Norman Wells has a conservative estimated reserve of over 40 million barrels. Prospecting of the country is proceeding as it is considered that a reserve of some 300 million barrels would be required to make extensive production commercially economical. Meanwhile a vast potential worth has been created and developed for future use.

The Canol pipe project was a valuable insurance against Japanese attack for at least 12 months and probably changed the course of the war. As General Marshall summed it up, because of the action taken by the United States and Canada the course of the war was changed and if its duration was shortened by only one day the cost was justified.

The experience gained through this huge development shattered forever the myth of a barren and inhospitable Northland. By May of this year a new air route from this continent to Asia is to be inaugurated by way of the North West and Alaska. The development of this area has served its purpose in time of war and will have an ever increasing value in time of peace.

❖ ❖ ❖

The regular monthly meeting of the Victoria Branch of the Institute was held Thursday evening, March 13th at the Little Centre in Victoria with about 50 members and guests in attendance.

The speaker for the evening was the chairman of the local branch, Major. R. C. Farrow, comptroller of water rights for the Province of British Columbia, who spoke on **The Work of Artillery Survey Regiments in the Late War.** Major Farrow was second in command of the Second Survey Regiment, R.C.A., during operations in north-west Europe.

The speaker gave a brief outline of the development of artillery survey work during the First Great War, out of which were developed Survey Regiments as a part of the Royal Artillery. The organization, training of men and type of equipment used by these regiments in the late war was described.

"Artillery survey" said Major Farrow, "is hard to compare with ordinary civilian survey. It first appeared cumbersome and overmanned but—we have to admit that the elaborate and formalized set-up had a very real purpose. It was designed to produce results under any conceivable condition in the shortest possible time with highest possible accuracy."

The sciences of flash-spotting and sound-ranging were described in detail and proved to be of considerable interest to the engineer.

Flash-spotting is essentially cross-observation by instrumental methods, using specially designed binocular theodolites from accurately surveyed posts commanding a good field of view. By observing the gun flash the bearing and range of the gun location could be obtained, usually after the second flash.

Sound ranging is similar to the above, but employs sound rays instead of visual ones. Its great advantage lies in independence of visibility. Accurate meteorological data is essential for sound ranging, as wind will alter the amplitude of sound. The sound waves are picked up by a series of microphones in succession, recorded on film with marked time intervals, read off and plotted by rays. An accurate survey of flash spotting posts and sound ranging microphones is essential for good results by either method of observation.

Major Farrow closed his address with an extremely interesting account of the work carried out during "Operation Ventable", which was the combined Canadian and British operation which broke through the Siegfried Line in February, 1945.

A. S. G. Musgrave acted as chairman for the evening and conveyed the thanks of the meeting to the speaker for his interesting address.

WINNIPEG BRANCH

R. T. Harland, M.E.I.C. - - *Secretary-Treasurer*

Electrical Section

L. A. Bateman - - - - - - - - *Secretary*
D. C. Bryden - - - - - - - *News Editor*

The regular April meeting of the Electrical Section of the Winnipeg Branch was held in Theatre F, University of Manitoba on April 3. D. A. McCuaig, the newly-elected chairman, presided.

The paper **The Maintenance of Power Transformers** was presented by T. E. Storey, general superintendent of production, Winnipeg Hydro Electric System. Mr. Storey discussed his subject under four general headings: tank and fittings, bushings, core and coils, and oil. Methods of tank maintenance for the prevention of rust and exclusion of moisture were outlined generally, with particular reference to the prevention of rust and breathing in relief pipes. The detection of moisture and deterioration in bushings and transformer windings by the power factor method was discussed in some detail and illustrated by test results of transformer windings before and after drying. The use of the low voltage capacitance bridge as a testing tool in measuring power factor was indicated. The various tests that can be applied to insulating oil were described and the equipment used for making these tests shown. These include dielectric, color and acidity, and power factor. The value of interfacial tension tests on oil was also noted.

The various phases of maintenance and testing of transformers provoked considerable discussion, and a vote of thanks was proposed by L. M. Hovey, Winnipeg Electric Company.

BOOK REVIEW

ELECTRONIC ENGINEERING MASTER INDEX

Edited by Frank A. Petraglia. New York, Toronto, Macmillan, 1946. 209 p. 10¼ x 7 in., fabrikoid, $6.00.

Reviewed by Josephine Sheffield*

As indicated in the preface, this is a special edition of the complete and unabridged contents of Part II of the Electronic Engineering Master Index, which was published in 1945 by Electronic Research Publishing Company, New York City. Part II indexes sixty-five periodicals for the 1935-1945 period. A certain number of these periodicals are completely indexed; the remainder are indexed only for articles dealing with electronic subjects. Of approximately 10,000 entries, 7,000 listings belong to the former group, and over 3,000 to the latter.

Each entry gives the title of the article, the author, periodical, volume, page, and date of issue. The articles are grouped and cross-indexed under topical headings, alphabetically arranged. The subject headings chosen are in line with the terminology familiar to engineers and technologists in this field and the cross-indexing is adequate. "See also" references are used sparingly. To facilitate searches a "cross-index of subjects" is included at the back of the book. This lists all subject headings used as well as "see" references.

This bibliography will be particularly useful to new libraries in the electronic field or to individual engineers. For well-established libraries, with back files of other available indexes, its usefulness will be limited. In no case could it be considered an exhaustive list of references on any one subject, even for the period covered; two leading English magazines (Electronic Engineering and Wireless World) and some American periodicals (Radio, Electronic Industries (now Tele-Tech) and FM Magazine) are unfortunate omissions. The lack of author and title entries does not limit its usefulness.

Its chief value is for speedy reference, as the starting point for a more exhaustive search, and as a quick, handy, bibliography of electronic subjects.

Librarian, Electronics Division, Engineering Dept., Northern Electric Company, Limited, Montreal, Canada.

Zoning Applied to Parking:

Charles S. LeCraw, Jr. and Wilbur S. Smith. Saugatuck, Conn., Eno Foundation for Highway Traffic Control, 1947.

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York, and may be consulted at the Institute Library.

APPLIED ENGINEERING MECHANICS:

A. Jensen. McGraw-Hill Book Co., New York and London, Toronto, Embassy, 1947. 316 pp., diagrs., tables, 9¼ x 6 in., cloth, $3.00.

This book is intended to provide a text that meets the minimum requirements of the usual college course but needs only an understanding of high-school mathematics. Mathematical manipulations have been replaced in large part by basic scientific reasoning from the physical concepts. The book is divided into the customary two sections, statics and dynamics, with a logical gradation from the elementary to the more involved concepts in each case. Analytical and graphical solutions are presented side by side to show relationship and encourage the student to check one against the other.

CONCISE CHEMICAL and TECHNICAL DICTIONARY:

Edited by H. Bennett. Chemical Publishing Company, Brooklyn, N.Y.; General Publishing Co., Toronto, 1947. 1055 pp., diagrs 9¼ x 6 in., cloth, $14.00 (in Canada).

Some 50,000 definitions are included in this volume which covers the whole field of scientific and technical development, including common and rare chemicals, raw materials and finished products, processes and machinery, engineering terms, etc. Basic data are given for chemical compounds. A feature of the book is the inclusion of a large number of trade-name or proprietary products giving chemical composition, properties, and major applications. The appendix contains diagrammatic representations of important organic ring systems. The chemical field is emphasized.

CONTROL CHARTS in FACTORY MANAGEMENT:

W. B. Rice. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 149 pp., diagrs., charts, tables, 9¼ x 5¾ in. cloth, $3.00 (in Canada).

The underlying theory of statistical control is first discussed, followed by practical information concerning its proper and effective use. Its basic functions in manufacturing plants are demonstrated, particularly by the use of case histories which show how causes of bad work can be eliminated and business efficiency increased through the study and analysis of factory processes. Intended particularly for the business or factory executive, the book should be of equal value to those who have the direct responsibility of such work.

ELEMENTS OF MECHANISM:

P. Schwamb, A. L. Merrill and W. H. James. 6 ed., revised by V. L. Doughtie. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 428 pp., illus., diagrs., charts, tables, 9½ x 5¾ in., cloth, $4.00.

This standard textbook gives the fundamental principles of kinematics in the field of mechanical movements. Principal machine elements are selected, and a study is presented of their motions when combined in certain ways. The early chapters cover motion in general, vectors, velocity and acceleration analysis, and linkages. Cams, gears, belts, etc., are discussed in detail in the later chapters. This new edition includes for the first time a group of laboratory problems emphasizing practical applications.

ENGINEERING PROBLEMS MANUAL:

F. C. Dana and L. R. Hillyard. 4th ed. McGraw-Hill Book Co. New York and London, Embassy, Toronto 1947. 419 pp., illus. diagrs., charts, tables, 9¼ x 6 in., cloth, $3.25.

As in previous editions of this book, the purpose has been to offer a student manual for the engineering problems course. The material is based upon practical engineering situations and aims to coordinate the work in algebra, trigonometry and calculus, and to develop good habits of work and study toward the attainment of a high degree of clearness and accuracy in calculation. The problems have been selected from a wide variety of applications and many new ones have been added in the present edition. The book has undergone considerable general revision.

HEATING, VENTILATING, AIR CONDITIONING GUIDE. 1947, Vol. 25:

Tehnical Data Section and Manufacturers' Catalog Data Section, also Roll of Membership of the Society, with Complete Indexes.

American Society of Heating and Ventilating Engineers, 51 Madison Ave., New York. 1282 pp. plus 128 pp., illus., diagrs., charts, tables, 9¼ x 6 in., fabrikoid, $6.00.

This standard manual constitutes both a textbook and handbook on the design and specification of heating, ventilating, and air conditoning systems. The technical section has been thoroughly revised, and new material has been added, particularly in the chapters on heating and cooling loads. There is also a new section describing the air refrigeration cycle. It provides all the data ordinarily needed by engineers and architects, cross indexed for quick reference. The catalog section contains information on the products of over two hundred manufacturers, with a classified index. (Continued on page 308)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

May 30th, 1947

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the July meeting.

L. Austin Wright, General Secretary

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professionl responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BEECHING—THOMAS ARTHUR GEORGE, of Montreal, Que. Born at Great Yarmouth, Eng., Oct. 10, 1913. Educ.: B.A.Sc. (Elect.), British Columbia, 1939; 1938 (summer), bond testing, street car tracks, B.C. Electric; 1940-44, Air Force Inspecn. Canada (3 mos.), inspecn. school in Toronto, then posted No. 13 Tech. Detach., Vancouver, work in connection with bldg. Catalina Amp. Flying Boats at Boeing Aircraft, covered all phases constrn. of plane incl. industrial processes, tooling; 1944-46, asst. to elect. supt., on constrn. 5-10,000 ton mtce. ships for Royal Navy, work consisted principally of laying out circuits, ordering equipt., layout of elect. circuits for several cargo vessels, tugboats, converted Naval vessels (for Union S.S. Co.), West Coast Shipbuilding Co., Vancouver, B.C.; 1946 (4 mos.), went to Sweden, visited most of principal heavy industries and modern generating plants with view to broadening experience; at present, sales engr., Brown, Boveri (Canada) Ltd., Montreal, Que.

BOEHM—CARL RICE, Colonel, R.C.E.M.E., of Toronto, Ont. Born at Toronto, Ont., July 9, 1905. Educ.: B.A.Sc., Toronto, 1929; R.P.E., Ontario; 1925-29 (summers), eng. student, International Nickel; eng. student, mill operator, Hollinger Cons. Gold Mines; asst. engr., Paymaster Gold Mines; 1929 (4 mos.), mine engr., Howey Gold Mines Ltd.; 1929-32, asst. surveyor, asst. ventilation engr., Frood Mine (Int. Nickel); 1932-37, asst. mine engr., chief mine engr., shift boss, Falconbridge Nickel Mines; 1937-38, mine mgr., Denison Nickel Mines Ltd.; 1939, shaft supt., Powell Rouyn Gold Mines, mine mgr., Denison Nickel Mines; 1939-44, Ordnance Mech. Engr., R.C.O.C.; with R.C.E.M.E., as follows: 1946-47, Director, Mech. Engrg., and at present, Deputy Director, Mech. Engrg., Army H.Q., Directorate of Mech. Engrg., Ottawa, Ont. Member C.I.M.M.

References: J. W. Bishop, G. R. Turner, H. E. T. Haultain, G. Thompson, L. A. Wright.

BROWN—ARCHIBALD MAXWELL, of Toronto, Ont. Born at Polemont, Scotland, Nov. 8, 1904. Educ.: National Diploma (Mech. and Elect.), 1926, while at Rutherford Tech. Coll.; R.P.E., Ontario (by exam.); with C. A. Parsons & Co., Ltd., Newcastle-on-Tyne, 1924, apprent., 1926, pattern, gear, genl. erection, transformer, shops, alternator and transformer test shop, etc., 1926-28, alternator, steam turbine, condenser, gearing, blower, compressor, transformer, design depts., 1928, loaned to F. John Bell, M.E.I.C. (Canadian representative C. A. Parsons & Co., Ltd.), sales engrg., preparation specifications, handling and completing contracts, preliminary layouts and tenders covering steam turbo alternator units, surface condensers, etc., 1945, chief engr. and director, and at present, general mgr. and director, C. A. Parsons of Canada, Limited, Toronto, Ont.

LIBRARY NOTES (*Continued from page 306*)

HYDRAULIC MEASUREMENTS:

H. Addison. 2 ed. rev. & enl. John Wiley & Sons, New York, 1946, 327 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $5.00.

This manual for engineers is an amplification of the last chapter of the author's "Textbook of Applied Hydraulics". Wholly practical in treatment, the book covers the measurement of both open channel flow and flow in pipes and conduits. It deals with liquids only, omitting any discussion of gas metering. The final chapter covers indicating, recording and integrating instruments. There is a bibliography.

INTRODUCTION TO ENGINEERING PLASTICS:

D. W. Brown and W. T. Harris. Murray Hill Books, Inc., Technical Division, New York and Toronto, 1947, 274 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00.

A detailed account is given of the various plastics that have found commercial acceptance. Chapters are included on the engineering properties and the chemical and physical characteristics of plastics; applications and techniques in handling plastics; and a list of the types of plastics with trade names and manufacturers. The authors have also furnished plant and equipment data, design considerations, and commercial tolerances.

METAL WORKING AND HEAT-TREATMENT MANUAL, Vol. 2. Alloy Steels, Cast Iron and Non-Ferrous Metals:

F. Johnson, Paul Elek Publishers, Ltd., London, E.C.1., England 1947. 226 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth 17s.6d.

This is the second volume in a series of four to cover the entire range of heat-treatment of metals. Beginning with a brief resumé of steel-making processes, the book continues with detailed description of the important steel alloys and the characteristics imparted by various alloying elements and heat treatments. Two chapters are devoted to the composition and treatment of cast iron and the alloys of copper with zinc, tin and aluminium. Tables and diagrams are extensively used for the effective presentation of mechanical and metallurgical data. The final chapter deals with the phenomena of age-hardening in various alloys.

PRACTICAL DESIGNS for DRILLING, MILLING and TAPPING TOOLS:

C. W. Hinman. 2 ed. McGraw-Hill Book Co., New York and London; Embassy, Toronto 1946. 416 pp., illus., diagrs., tables, 9 x 5¾ in., cloth, $5.00.

This practical manual demonstrates the best methods for designing, drafting, and using drilling jigs, gages, hand tools, and tapping and milling fixtures. It illustrates the fundamental principles by which all tools must be designed for successful operation. With a wealth of illustrative material, detailed operational functions of tools, mathematical formulas, tool engineering tables, etc., it supplies the essentials for beginners and suggests new ideas for the experienced man. A list of educational films in the field is included.

RADIO AMATEUR'S HANDBOOK, 24th edition, 1947:

American Radio Relay League, West Hartford 7, Conn., 468 pp., illus., diagrs., charts, tables, 9½ x 6½ in., paper, $1.25 in U.S., elsewhere $2.00.

The three main sections of this annual publication are as follows: "Principles and Design" covers comprehensively the theory of radio communications and design of amateur transmitting, receiving, radiating and measuring apparatus; "Equipment Construction" starts with a brief chapter on workshop practice and continues with detailed instructions for the building of various types of receivers and transmitters, v.h.f. apparatus, emergency and portable equipment; "General" contains extensive tables of vacuum-tube characteristics and miscellaneous data and a chapter on amateur radio operating. The whole volume has been thoroughly revised to conform with current practice. A catalog section of short-wave equipment is appended.

RUSSIAN-ENGLISH TECHNICAL AND CHEMICAL DICTIONARY:

L. I. Callaham. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 794 pp., 8 x 5½ in., fabrikoid, $10.00.

Originally planned to cover the chemical and process industries this dictionary has been expanded to give comprehensive coverage of mineralogy, metallurgy, mining and geology, general engineering, machinery and mechanics, electrical engineering, pharmacy and botany. Frequently used terms are also included for aeronautics, agriculture, medicine, physics, mathematics, and other scientific fields. A general vocabulary is included in the same alphabet, together with a large number of prefixes and suffixes. American usage and spelling are followed rather than British in the English equivalents.

SEWERAGE AND SEWAGE TREATMENT:

H. E. Babbitt. 6th ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 692 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $6.50.

In the new edition of this standard text stress has been laid more on problems of design, methods of treatment, and the operation of plants than on construction. Its comprehensive coverage of all phases of the subject has been widened by the addition of material on high-rate filters, contact aerators, and other changes in practice. The most extensive revision has been in the material on runoff determinations and the hydraulics of sewers. Some forty-five pages of problems and literature references are appended.

AN URGENT REQUEST

Would members who do not file the *Journal* kindly return their April 1947 copy to headquarters.

Due to difficulties at the printers, fewer copies have been printed than had been ordered and the needs of several libraries have not been filled.

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. Personal interviews by appointment.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER to be assigned to mill process problems for the technical department of a pulp and paper firm in the St. Maurice Valley. Salary $250. up. Apply to File No. 3573-V.

CHEMIST OR CHEMICAL ENGINEER required for work on fuel combustion by a Canadian firm producing aircraft gas turbines. Salary open. Apply to File No. 3836-V.

CHEMICAL ENGINEER, recent graduate up, required by a firm in Ottawa for plant and research work. Salary $200 up. Apply to File No. 3849-V.

CIVIL

CIVIL ENGINEER, recent graduate up, required by a pulp and paper company in the Province of Quebec, for work centered in logging operations and will consist principally of the construction of roads, bridges, dams and camps. Preferably bilingual. Salary from $225—$275. Apply to File No. 3850-V.

CIVIL ENGINEER with building construction experience required by a manufacturer in Montreal. Salary $250 up. Apply to File No. 3858-V.

CIVIL ENGINEER required by Town of Pointe Claire, bilingual, minimum five years experience in municipal work, capable of preparing tenders, specifications and drawings, water and sewer systems. Salary open. Apply to File No. 3863-V.

MECHANICAL

SENIOR MECHANICAL DESIGN ENGINEER required by a pulp and paper firm in the St. Maurice Valley to work directly under Chief Engineer on long range engineering projects. Salary $300 up. Apply to File No. 3573-V.

MECHANICAL ENGINEER required as assistant to vice-president and general manager of a medium sized company in Central Ontario. Experience in paper converting would be helpful. Prospects are excellent and salary open. Apply to File No. 3819-V.

MECHANICAL ENGINEER, recent graduate up, veteran preferred must be bilingual. Required to under study Manager and eventually take charge of four plants at St. John. Salary around $200 to start. Apply to File No. 3842-V.

MECHANICAL ENGINEER, recent graduate up, required by a company in Montreal for toll design. Salary $175 up. Apply to File No. 3843-V.

MECHANICAL ENGINEER experienced in mining plant construction, operation and maintenance, required by a mining company in Northwestern Quebec, at present constructing plant for relatively large scale operation. Salary $5,000 to $6,000. Apply to File No. 3845-V.

MECHANICAL ENGINEER recent graduate, preferably with some practical experience in manufacturing, required by a Farm Equipment manufacturer in Ontario. Starting salary $225. Apply to File No. 3851-V.

MECHANICAL ENGINEER, recent graduate, required by a paper mill in Northern Quebec. Salary $250. Apply to File No. 3852-V.

MECHANICAL ENGINEER, preferably with experience in heating and ventilating problems required in Montreal for design and investigation. Salary $250 up. Apply to File No. 3858-V.

METALLURGICAL

METALLURGIST, with at least 2 years foundry experience, required by a Montreal manufacturer to take charge of foundry practice and annealing. Salary open. Apply to File No. 3853-V.

MISCELLANEOUS

GRADUATE ENGINEERS, recent graduates up, preferably with pulp and paper experience, required by a pulp and paper firm in the St. Maurice Valley, to work under Chief Engineer and Senior Designer on long range modern projects. Salary $3,000 up. Apply to File No. 3573-V.

PROFESSOR in machine design, required for fall term by a university in Central Ontario. Salary open. Apply to File No. 3600-V (F).

CIVIL ENGINEERS AND ASSISTANT HYDRAULIC ENGINEERS required for government organization on West Coast for highway and construction. Salary open. Apply to File No. 3724-V.

GRADUATE ENGINEER with some aircraft engine experience required by a Canadian Firm to act as Liaison Engineer between engineering and production. Must have experience in Stress Analysis. Salary open. Apply to File No. 3836-V.

RESIDENT ENGINEER to take full charge of construction of $2,000,000. worth of buildings in Central Ontario. Salary around $5,000. Apply to File No. 3837-V.

CONSTRUCTION ENGINEER with carpenter foreman or supervisory experience required by an Engineering and Contracting firm in Montreal. Salary around $500. Apply to File No. 3838-V.

MECHANICAL, CHEMICAL AND ELECTRICAL ENGINEERS required by a firm of industrial consultants in Montreal. Salary from $400. Apply to File No. 3844-V.

GRADUATE ENGINEER, age 35-40, with 10 years experience in building construction and general contracting work; to supervise design, construction and maintenance of structures for Public Utility in Toronto. Permanent job. Salary open. Send photo and full particulars of education and experience. Apply to File No. 3847-V.

MAINTENANCE SUPERINTENDENT required by an industrial organization in Montreal to supervise the maintenance of wharves, buildings, conveyors, ships, loading and discharging equipment at Port Alfred docks. Salary $350 up. Apply to File No. 3848-V.

PLANT ENGINEER, preferably with paper mill experience required by a paper company in Quebec, to take charge of maintenance crews. Salary around $350. Apply to File No. 3854-V.

JUNIOR INDUSTRIAL ENGINEER, with mechanical or chemical background, preferably with knowledge of chemical plants, required in Montreal. Salary $250 up. Apply to File No. 3857-V.

RECENT GRADUATE required by a manufacturer in Ontario as assistant to Industrial Engineer duties include design and sales engineering of water and oil pumping equipment and water treatment equipment. Good chance for advancement. Salary open. Apply to File No. 3859-V.

DRAUGHTSMEN of the following classes: Architectural, piping layout, equipment layout, mechanical design, steam plant, heating, and ventilating, electrical and plumbing required by an industrial organization in Montreal. Salaries open. Apply to File No. 3860-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a petroleum refining company in Montreal for process and design work. Salary about $225. Apply to File No. 3575-V.

CHEMICAL ENGINEER required as assistant professor of chemical engineering in a Canadian university to start autumn 1947. Salary open. Apply to File No. 3600-V (D).

CHEMICAL ENGINEERS OR CHEMISTS for analytical work in the laboratory of an industrial firm in Central Ontario. Salary from $175. Veteran preferred. Apply to File No. 3642-V.

CHEMICAL ENGINEER, preferably with sales experience, for sales and service with an industrial firm in Central Ontario. Salary open. Apply to File No. 3642-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

CHEMICAL ENGINEER required for the control department of a paper mill in Shawinigan Falls. Salary from $250-$350. Apply to File No. 3765-V.

CHEMICAL ENGINEER OR CHEMIST interested in textile dyeing, required by an industrial firm in South Western Quebec. Salary open. Apply to File No. 3798-V.

CHEMICAL ENGINEER, required by a chemical firm in Shawinigan Falls, Quebec, for development work on plastics. Salary open. Apply to File No. 3812-V.

CIVIL

CIVIL ENGINEER with experience in the mechanical trades required as designer by a building contractor in Quebec, age 30-35, salary open. Apply to File No. 3444-V.

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEER for design work in an industrial plant in the Montreal area with experience in building construction, probably permanent position. salary from $200 up according to experience. Apply File No. 3504-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

CIVIL ENGINEER, age 35-40, with extensive experience in detailing and checking structural steel in buildings and bridges, required by a steel fabricating company in Southern Ontario. Salary open. Apply to File No. 3570-V.

CIVIL ENGINEER with experience in survey and construction, preferably bilingual, required to take charge of the engineering department for the woods operations of a paper company in Eastern Quebec. House available. Salary $350 up. Apply to File No. 3749-V.

CIVIL ENGINEER, qualified O.L.S., required as town engineer and superintendent of works for a town in Central Ontario. State age and salary desired. Apply to File No. 3750-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years' experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

GRADUATE CIVIL ENGINEER, required as structural designing engineer by a firm engaged in the manufacture of cranes, crushers, pumps, etc., in the Toronto area. Preferably with 5 to 10 years' experience in designing and detailing steel buildings and bridges. Salary open. Apply to File No. 3771-V

GRADUATE CIVIL ENGINEER required by an industrial corporation in Montreal for design work in draughting room. Must be familiar with structural steel and concrete design. Position offers good opportunity and permanency to right man. Salary from $250 up according to experience. Apply to File No. 3785-V.

SEVERAL CIVIL ENGINEERS, with two or three years' experience in road construction required for road building work in Northern Quebec. Salary open. Apply to File No. 3804-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEER, age 35-40, with considerable experience in design of structures, water supply, sewers, required by an organization in Montreal. Salary $300-$400. Apply to File No. 3820-V.

CIVIL ENGINEER required to act as superintendent and assistant to general contractor in Shawinigan Falls. Must be bilingual. Salary $300-$400. Apply to File No. 3827-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 32-36, with electrical experience around mines or smelters. English speaking with working knowledge of French, is required by a company in Shawinigan Falls, Quebec. Salary open. Apply to File No. 3415-V.

ELECTRICAL ENGINEER age 30 - 45 with sales training with large manufacturer of electrical equipment instruments and 5-10 years experience as sales service and sales engineer required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEERS, from recent graduates up, required by a company in Montreal engaged in the production of telephone, etc., equipment Veterane preferred. Salary open. Apply to File No. 3551-V.

ELECTRICAL ENGINEER with knowledge of power apparatus, preferably bilingual, required for sales work with a manufacturer in the Montreal area. Salary open. Apply to File No. 3646-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER with several years experience required as a designer by an industrial organization in Montreal. Salary open. Apply to File No. 3677-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35, salary open. Apply to File No. 3695-V.

ELECTRICAL DRAUGHTSMAN with several years' experience in industrial layouts for large concern in Eastern Townships. Permanent position and attractive salary available for experienced men. Apply to File No. 3701-V.

ELECTRICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with considerable industrial experience and initiative required by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER with estimating and contract experience, required as office engineer by an electrical firm in Montreal. Salary open. Apply to File No. 3751-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200. up. Apply to File No. 3761-V.

GRADUATE ELECTRICAL ENGINEER with 5 or more years experience in electrical equipment of buildings, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

GRADUATE ELECTRICAL ENGINEERS with 3 to 10 years experience in design, operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEER with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

ELECTRICAL ENGINEER required by a manufacturer in Western Canada to be in charge of production. Preferably between 30 and 40 years with desire to earn or buy interest in the business. Salary $4,000 up. Apply to File No. 3815-V.

JUNIOR ELECTRICAL ENGINEER required by a Montreal firm for inspection of electrical equipment of all kinds, in Toronto area. Salary $225. Apply to File No. 3816-V.

ELECTRICAL DESIGNING DRAUGHTSMAN with broad practical experience and theoretical knowledge required for a firm in Quebec. Salary from $225. Apply to File No. 3818-V.

ELECTRICAL ENGINEER, recent graduate up, preferably with experience in audio circuits design and maintenance also practical knowledge of fractional horsepower motors and wiring layouts, required to eventually take charge of sound maintenance for motion picture studio in Ontario. Salary open. Apply to File No. 3826-V.

MECHANICAL

MECHANICAL ENGINEER, is required for draughting and detail work with a company in central Ontario. Good prospects for advancement. Single man preferred. Salary open. Apply to File No. 3393-V.

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area, in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEER with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER recent graduate, required by an industrial firm in south western Quebec, for the design and erection of complex textile machinery. Salary open. Permanent position. Apply to File No. 3625-V.

JUNIOR MECHANICAL ENGINEERS, required by a Montreal manufacturer of machines and equipment for mechanical type of work such as machine design, etc. Salary $175 up. Apply to File No. 3664-V.

MECHANICAL ENGINEER with experience in the fabrication of Farm Implemente, required by a Quebec firm. Bilingual man preferred. Salary according to experience. Apply to File No. 3666-V.

MECHANICAL ENGINEER with design experience in the pulp and paper industry required by a firm in the St. Maurice Valley. Salary $350. Apply to File No. 3673-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEER with industrial or construction experience, required by a firm of consulting engineers to inspect machinery deliveries in the Cornwall area. Salary open. Apply to File No. 3691-V.

JUNIOR MECHANICAL ENGINEER, under 30 and preferably bilingual, required by a Montreal firm to train as sales engineer for pumps, engines and allied electrical equipment. Salary open. Apply to File No. 3714-V.

YOUNG MECHANICAL ENGINEERS, with practical experience either in automotive or general manufacturing industries, together with ability to operate engineering office systems, required by an industrial organization in Ontario. Salary open. Apply to File No. 3732-V.

MECHANICAL ENGINEERS, with at least five years' experience in the Pulp and Paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

JUNIOR MECHANICAL ENGINEER with industrial experience required as assistant to the plant engineer in a factory in the Montreal area. Salary about $225. Apply to File No. 3758-V.

GRADUATE MECHANICAL ENGINEER, experienced in boiler operation, required as assistant superintendent on maintenance of railroad and tramways rolling stock, in the Quebec area. Salary $200. per month. Apply to File No. 3772-V.

MECHANICAL ENGINEER with 5 or more years experience in heating, ventilating and air-conditioning, required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

MECHANICAL ENGINEER, with paper mill or mining experience required for design and layout by a paper mill in Northern Quebec. Salary $375-400. Apply to File No. 3778-V.

MECHANICAL ENGINEER with considerable experience willing to act as assistant to Mechanical Superintendent of a textile manufacturing concern near Montreal. Salary open. Apply to File No. 3784.-V

MECHANICAL ENGINEER, recent graduate up, required by a Pulp and Paper Company in the Province of Quebec for work entirely centred in logging operations. Salary open. Apply to File No. 3789-V.

MECHANICAL ENGINEER, recent graduate up, required by major oil company in Montreal area. Salary $175 up according to experience. Apply to File No. 3792-V.

MECHANICAL ENGINEERS required by a Pulp and Paper mill at Powell River, B.C. Preferably with experience in plant design in the pulp and paper industry. Salary according to qualifications. Apply to File No. 3796-V.

MECHANICAL ENGINEER required to establish and operate an estimating and planning department for the grinding and machine shop of a firm located in Central Ontario. Experience in tools, dies, and shop work essential. Salary open. Apply to File No. 3801-V.

MECHANICAL DRAUGHTSMAN, with several years experience in machine design, required by an industrial organization in Montreal. Salary $250 up. Apply to File No. 3807-V.

MECHANICAL ENGINEER with at least 10 years experience in design and installation of machinery also supervisory ability required by an industrial organization in Montreal, Salary open. Apply to File No. 3807-V.

MECHANICAL ENGINEERS, with experience in plant layout and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER, age 35-40, with considerable experience in design and layout of machinery and equipment, required by an organization in Montreal. Salary $300-$400. Apply to File No. 3820-V.

MECHANICAL ENGINEERS, preferably with experience in machine design, required by a steel fabricating firm in Montreal for design and layout. Salary open. Apply to File No. 3824-V.

MECHANICAL ENGINEER with considerable experience, required to supervise installation of coating machine also design necessary, tankage and piping systems, for a paper mill in Ontario. Salary around $400. Apply to File No. 3828-V.

MECHANICAL ENGINEERS, required by a pulp and paper mill in Ontario for design and layout also mechanical installations. Salary around $300. Apply to File No. 3828-V.

JUNIOR MECHANICAL ENGINEER with sales experience and good knowledge of Montreal, required for sale of power house equipment. Preferably bilingual. Salary $200-$250. Apply to File No. 3831-V.

MECHANICAL ENGINEER, required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work, required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MINING

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least 5 years practical experience, required by an industrial engineering consultant in Montreal. Apply to File No. 3307-V.

CIVIL OR MECHANICAL ENGINEER with experience in pulp and paper mills, to be assistant to plant engineer in a paper mill in Central Quebec. Salary open. Apply to File No. 3445-V.

TWO STRUCTURAL STEEL DRAUGHTSMEN with five or more years experience in designing and detailing steel structures. State experience and salary required. Location Toronto. Apply to File No. 3451-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE ENGINEERS with experience in air-conditioning, heating, refrigeration and allied problems, required by a manufacturer in the Montreal area. Salary open. Apply to File No. 3566-V.

GRADUATE ENGINEERS, required by a large industrial and chemical organization with headquarters in Montreal for all phases of research design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

ASSISTANT PROFESSORS AND INSTRUCTORS required for the staff of a technical college in New York State. Salary open. Apply to File No. 3600-V. (A)

DESIGN ENGINEERS with experience in reinforced concrete and hydraulic structures for hydro-electric developments for an engineering firm with headquarters in Toronto. Salary open. Apply to File No. 3612-V.

CHIEF ENGINEER with industrial experience required for a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

STRUCTURAL AND MECHANICAL DRAUGHTSMAN required for detail drawings by a steel fabricating plant in Western Canada. Salary open. Apply to File No. 3616-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply to File No. 3628-V by letter with full details. Salary open.

SALES ENGINEER with wide engineering experience wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

MECHANICAL AND STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

ASSISTANT ENGINEER with experience in estimates and specifications for industrial work required by a pulp and paper company in the Port Arthur district. Salary open. Apply to File No. 3653-V.

CHIEF DRAUGHTSMAN with at least five years draughting room and related engineering office experience, preferably in pulp and paper or process industries, required by a pulp and paper mill in the Port Arthur district. Salary open. Apply to File No. 3653-V.

MECHANICAL OR ELECTRICAL ENGINEERS for training as production engineers with an industrial firm in Montreal. Salary open. Apply to File No. 3662-V.

GRADUATE ENGINEERS for mechanical design, experimental, test and development departments of a Canadian firm producing aircraft gas turbines. Salary open. Apply to File No. 3667-V.

STRUCTURAL DESIGNERS AND DRAUGHTSMEN required by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 3668-V.

JUNIOR ENGINEERS, recent graduates up, as designing draughtsmen for a brewing company with headquarters in Montreal. Salary from $200. Apply to File No. 3670-V.

CIVIL OR MECHANICAL ENGINEERS with design or structural experience required by a manufacturer of contractors' equipment in the Hamilton area. Salary open. Apply to File No. 3698-V.

JUNIOR ENGINEERS, recent graduate up, required for the engineering staff of a communications company with headquarters in Montreal. Veterans preferred. Salary from $175. Apply to File No. 3713-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

CONSTRUCTION ENGINEER with considerable experience required for the permanent staff of a Montreal inspection company. Salary about $200. Age immaterial. Apply to File No. 3728-V

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DESIGN ENGINEERS, age about 30, with experience in the design and layout of chemical plants, required by an industrial organization in the St. Maurice Valley. Salary from $250. Apply to File No. 3741-V.

DESIGN DRAUGHTSMEN, age about 25, with experience in chemical plant layouts, required by an industrial organization in the St. Maurice Valley. Salary from $200. Apply to File No. 3741-V.

SALES ENGINEER, preferably bilingual, required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEERS, recent graduates up, preferably mechanical, required for the engineering and operating staff of a pulp mill in Eastern Quebec. Salary open. Apply to File No. 3748-V.

PUBLICITY ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

GRADUATE ENGINEER required by an insurance company in Montreal for the inspection of boilers, steam plant and allied equipment. Salary from $200. Apply to File No. 3754-V.

TECHNICAL GRADUATE, preferably Mechanical, Chemical or Electrical, under 30, veteran preferred, for permanent position with engineering organization. Training period in U.S. Work will include travelling for consultation among leading industrial plants. Enclose photo when answering. Salary open. Apply to File No. 3759-V.

CHIEF DRAUGHTSMAN with experience in Pulp and Paper Mill design wanted immediately in Port Arthur. Reply stating education, experience. Salary open. Apply to File No. 3760-V.

CIVIL, MECHANICAL OR CHEMICAL ENGINEERS, recent graduates up, preferably with experience in petroleum and heavy industry such as chemical or paper, required by an oil company in Toronto. Salary open. Apply to File No. 3762-V.

GRADUATE ENGINEER, with practical experience, production and maintenance, to take charge of Farm Equipment Factory with Grey Iron Foundry, located in Ontario. Apply with photo or snapshot to File No. 3764-V. Salary open.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted to File No. 3780-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years experience in design, cost estimates, draughting, and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up. Apply to File No. 3787-V.

SALES ENGINEER with electrical engineering background in public utility or industrial field required by wire and cable manufacturer for engineering contact work in Ontario. Salary open. Apply to File No. 3788-V giving complete details.

STEAM PLANT ENGINEER for large concern in Eastern Townships, with at least 5 years practical experience. Must be familiar with thermo-dynamics, combustion control, steam turbines, mechanical refrigeration, hydraulics, etc. Permanent position and attractive salary for the right man. Apply to File No. 3791-V.

GRADUATE, with some knowledge of looms, weave construction and cloth analysis, required as manager for rayon weaving plant in Peru. Administrative ability necessary. Knowledge of Spanish would be an advantage although not a necessity. Salary open. Apply to File No. 3794-V.

INDUSTRIAL ENGINEER, with two to five years experience in time-study and job evaluation required by a firm in Montreal making rock metal. Salary $200 up. Apply to File No. 3800-V.

GRADUATE CIVIL OR MINING ENGINEER required to take charge of several small instrument parties, for layout work in New Brunswick area. Salary $350. Apply to File No. 3803-V.

CHEMICAL OR MECHANICAL ENGINEERS, recent graduates, required by an organization in the Montreal area, for experimental and development work, with view to supervisory positions in production. Salary $200 up. Apply to File No. 3806-V.

RECENT GRADUATES OR JUNIOR ENGINEERS with mechanical background, required by a Montreal Engineering, fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175 up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER, required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

CHIEF ENGINEER required for coal stripping and mining operations in Alberta, would also have responsibilities in highway construction in this Province. Minimum salary $6,000. Apply to File No. 3814-V.

ASSISTANT GENERAL MANAGER to be in charge of all coal development operations in Alberta and some highway contracts. Salary $8,000 to $10,000. Apply to File No. 3814-V.

INDUSTRIAL ENGINEER with broad experience in plant development, operation, costs and management required for a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

GRADUATE ENGINEER, preferably with chemical and industrial experiencee required to supervise operations at the Sodium Sulphate Plant now being constructed at Chaplin, Sask. Salary open. Apply to File No. 3821-V.

DRAUGHTSMEN required by a pulp and paper mill in the Eastern Townships for general draughting and detailing. Three or four years experience preferred but not essential. Salary open. Apply to File No. 3823-V.

DRAUGHTSMAN, preferably with mechanical background, required by a manufacturer in Montreal for design work on electrical equipment. Salary open. Apply to File No. 3829-V.

DEPUTY DIRECTOR OF IRRIGATION, Ceylon, must be Corporate Member of the Institute of Civil Engineers or possess degrees or diplomas recognized by that body. Technical duties include designing, estimating for and reporting on schemes of irrigation water supply and flood protection and checking the construction costs of such schemes. Apply to File No. 3834-V.

SALES ENGINEER
WANTED

For Eastern Canada, of nationally advertised mechanical product. Excellent opportunity for the right man, willing to study and work on specialized equipment needed in every industry. Secure and prosperous future awaits the right man with ambition and energy. Give fullest information re present employment, training, age, commencing salary expected. Applications treated in strictest confidence. Apply to File No. 3861-V.

The University of British Columbia
REQUIRES

Several instructors in Civil Engineering for Academic Session 1947—1948. Salaries approximately $200. per month.

Apply:

DEAN OF APPLIED SCIENCE,
THE UNIVERSITY OF BRITISH COLUMBIA,
VANCOUVER, B.C.

UNIVERSITY OF SASKATCHEWAN
Requires
INSTRUCTORS FOR COLLEGE OF ENGINEERING

There are several vacancies, both junior and senior, on the staff of the College of Engineering.

Applications should be addressed to the Dean, College of Engineering, University of Saskatchewan, Saskatoon, Saskatchewan.

Situations Wanted

SECOND YEAR ENGINEERING STUDENT at McGill University, S.E.I.C., forced to abandon, would like to be trained as a sales engineer by a responsible concern. Age 23, single, good appearance and personality, free to travel and bilingual. Apply to File No. 339-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., age 42; P. Eng. in B.C., ten years experience as superintendent and engineer on large building construction, two years design and installation of waterworks, two years municipal and seven years administrative experience. Thoroughly familiar with manufacturing problems, cost accounting, production control, time study and methods, plant layout etc. Excellent record of accomplishment and earnings. At present employed but seeking a permanent position in one of the larger centres of the west coast. Apply to File No. 880-W.

MECHANICAL ENGINEER, M.E.I.C., P.E. Ont., 10 years' experience chemical industry of Ontario. Wishes to locate in West. Apply to File No. 1309-W.

MECHANICAL ENGINEER, M.E.I.C., P.E.Q., age 42, twenty years experience as engineer in pulp and paper mills, maintenance construction and design interested in responsible position in the pulp and paper industry. Apply to File No. 1371-W.

GRADUATE ELECTRICAL ENGINEER, McGill, Jr. E.I.C., P. Eng. (Que.), whose eleven years' experience lie in the fields of specification writing for and supervision of small contract jobs, fire prevention and safety work in heavy and light industry, desires position in production-management line. Recent personal evaluation by prominent firm of Management Consultants in Montreal disclosed high general ability and aptitude for production work. Willing to consider any location in Canada. Age 35. Apply to File No. 1494-W.

PLANT MANAGER, MECHANICAL GRADUATE, Jr.E.I.C., age 34, with a lot of industrial engineering experience including, organization, wage incentive plans, production control, development, cost control, etc., and with special personnel qualifications, seeks position on the east or west coast or in Central Ontario. Intererested in locating progressive organization requiring an engineer to head up a plant. Apply to File No. 1500-W.

CIVIL ENGINEER, M.E.I.C., P.E.Q., would accept work at night. Design and checking of reinforced Concrete structures, estimates, Hydraulic. At present employed in Montreal. Apply to File No. 1527-W.

SALES ENGINEER, Jr.E.I.C., Prof. Eng. Ont. '36 McGill, wants to sell reliable engineering equipment. Agressive, bilingual, age 32, Good engineering background. Apply to File No. 1698-W.

ELECTRICAL ENGINEER, M.E.I.C., with twenty years experience in Sales and Technical Service of Electrical Machinery and Allied Equipment and at present manager of his department, is looking for position with a broader horizon. Apply to File No. 1854-W.

YOUNG CIVIL ENGINEER, M.E.I.C., would accept some work at night at home. Preparation of estimates and tenders. At present employed on construction work. Apply to File No. 2128-W.

CIVIL ENGINEER, B.A.Sc., M.E.I.C., P. Eng., ex-R.C.E. Officer with several years experience in municipal, highway and hydraulic engineering. Presently employed but interested in position with municipality or firm where extensive construction and maintenance work is contemplated. Apply to File No. 2463-W.

ELECTRICAL ENGINEER, M.E.I.C., graduated '34, desires summer employment (May 20th-Sept. 15th). At present teaching in Electrical Engineering Department of a University in Eastern Canada. Experience: 4 years' Power and Telegraph Line Construction, 3 years Assistant Electrical Superintendent in a Canadian Gold Mine, 3 years' R.C.E. Electrical Distribution Layouts. Apply to File No. 2827-W.

MECHANICAL ENGINEER (Sask. '45), S.E.I.C., one year's experience with Consultant Engineering Firm, desires employment in Plant maintenance or design, preferably in the vicinity of Toronto, Montreal or Winnipeg. Available June 1st. Apply to File No. 2829-W.

METALLURGICAL ENGINEER, expert in research, design and management phases of non-metallic mineral industry. Age 41. Experience includes 10 years as manager. Desires connection in similar capacity with reliable concern. Available April 30th. Apply to File No. 2831-W.

GRADUATE ENGINEER, age 39, bilingual, M.E.I.C., P.E.Q., Ex-R.C.E., with extensive experience on staff work involving planning, organization, administration, procedure and secretarial duties.
