ELECTRICAL DRAUGHTSMAN, required by a firm of Engineer Contractors in Alberta for layout and plotting with a minimum of supervision. Should be accustomed to working with power lines to 2,300 volts and must be able to do lighting circuits, both overhead and underground. Salary $250 to $300. Apply to File No. 3972-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery design, lab., etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

ELECTRICAL ENGINEERS, age 30 to 40, required for the Commercial and Distribution Department of large Hydro Electric Utility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

ELECTRICAL ENGINEER experienced in Power Station, Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Salary open. Apply to File No. 4024-V.

JUNIOR ELECTRICAL ENGINEER, required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

*ELECTRICAL ENGINEER with minimum of 5 years experience in paper industry, between 35-45 years of age, for responsible position with large newsprint manufacturing concern in Northern Ontario. Salary commensurate with qualifications. Living accommodation assured. Apply to File No. 4032-V.

*ELECTRICAL ENGINEERS with some experience in reasearch, design, and development, backgrounds in communications, electronics, power or physics are preferred. Required for the staff of a technical college in N.Y. State. Salary and rank will be commensurate with experience and training. Apply to File No. 4038-V.

*ELECTRICAL ENGINEER required by an industrial firm in the Montreal area. Duties include follow up of electrical installations and planning also layout and design. Salary open. Apply to File No. 4061-V.

GRADUATE ELECTRICAL ENGINEER with a minimum of 2 years practical experience to assist in electrical engineering design work. Field work on construction and maintenance of structures, service and installation of equipment. Required by Manitoba city. Salary $226. to $257. Apply to File No. 4069-V.

*ELECTRICAL ENGINEER, required to act as Project Engineer by an industrial organization with Head Office in Montreal. Duties include the design of industrial electrical layouts and the preparation of material requisitions for industrial installations. Salary open. Apply to File No. 4085-V.

Mechanical

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEERS, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

*MECHANICAL ENGINEER, age 35-40 with considerable experience in design and layout of machinery and equipment, required by an organization with Head Office in Montreal. Salary $300-$400. Apply to File No. 3820-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER, required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER, age 30-38, required for northern Ontario Paper Mill. Preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping, conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

MECHANICAL ENGINEER, age 25 to 35, experienced in industrial plant layout and machine design required by manufacturing firm in Brantford. Salary open. Apply to File No. 3907-V.

MECHANICAL ENGINEER, recent graduate, bilingual, with some experience in general plant work, required in Montreal. Industrial engineering experience would be useful. Duties include time-study in Standards Department. Salary open. Apply to File No. 3980-V.

*MECHANICAL ENGINEER, with experience in plant layout and knowledge of reinforced concrete, timber and steel design, required in an industrial manufacturing and processing plant situated 75 miles from both Ottawa and Montreal. Salary open. Apply to File No. 3990-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3994-V.

MECHANICAL ENGINEER, with 2 or 3 years experience, preferably bilingual, required as Mechanical Development Engineer by industrial and chemical organization with headquarters in Montreal. Duties will be conducting investigations on existing equipment and a certain amount of plant layout work and draughting. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER with 1 to 3 years experience in production, required as Industrial Engineer by industrial and chemical organization with headquarters in Montreal. Duties include responsibility for conducting methods engineering studies using methods of process charts, time and motion study. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER, required by a Montreal manufacturer of machines and equipment for work consisting of general engineering and design in connection with the manufacture of pulp and paper machinery. Salary open. Apply to File No. 4000-V.

MECHANICAL ENGINEER required as assistant in Chief Engineers Department by large paper company. Paper experience essential. Some knowledge of French language would be helpful. Age 28-40. Salary $350-$450. Apply to File No. 4022-V.

MECHANICAL ENGINEER required in Ontario by a firm specializing in machine tools. Applicant must be experienced in production control. Salary open. Apply to File No. 4026-V.

MECHANICAL DRAUGHTSMAN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures etc. Salary $240 up depending upon ability. Apply to File No. 4030-V.

CHIEF ENGINEER, mechanical background required by a specialized industrial plant in the Montreal area. Work covers mechanical design, preparation of work drawings, bills of materials, specifications and the ordering of all materials for contracts also design of necessary tooling. Minimum salary $450.00. Apply to File No. 4066-V.

MECHANICAL ENGINEERS with experience in the design of hydraulic turbines, valves, penstocks, surge tanks and associated equipment required by large manufacturer in Montreal to participate in expanding program of hydro electric development. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER with minimum of eight years experience in the design of heavy mechanical equipment required by well established firm in Montreal for general supervision and checking. Must be alert and aggressive. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEERS with experience in estimating or design required by well known general engineering firm in Montreal. Good future for those with right qualifications. Salary commensurate with ability. Apply to File No. 4074-V.

Mining

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

Miscellaneous

STRUCTURAL STEEL DRAUGHTSMAN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEER, required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation development, production and maintenance. Salaries open. Apply to File No. 3588-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience, required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience, required by a steel fabricating firm in Montreal. Apply to File No. 3740-V.

SALES ENGINEER, preferably bilingual required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEER, required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel, and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted. Apply to File No. 3780-V.

RECENT GRADUATES OR JUNIOR ENGINEERS, with mechanical background, required by a Montreal Engineering, fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175. up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

DRAUGHTSMAN of the following classes: Architectural, piping layout, equipment layout, mechanical design, steam plant, heating, and ventilating electrical and plumbing required by an industrial organization in Montreal. Salaries open. Apply to File No. 3860-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER, wanted for large fabricating plant in Vancouver, B.C. Age between 30 and 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

STRUCTURAL ENGINEER required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

TWO METALLURGICAL ENGINEERS AND ONE CHEMICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training etc. Salary open. Apply to File No. 3951-V.

DRAUGHTSMAN required by a firm of engineer contractors in Alberta for layout of pipelines and details in refinery construction. Preferably background of refinery experience or alternately powerhouse piping or heavy industrial draughting. Salary $300.00. Apply to File No. 3972-V.

STRUCTURAL ENGINEER DRAUGHTSMAN, required by a firm of engineer contractors in Alberta. Duties include structural detailer and requires knowledge of major concrete foundations; to detail structural steel buildings, access tower platforms and miscellaneous small steel structures. Salary $300.00. Apply to File No. 3972-V.

GRADUATE ENGINEER, age 32 up, preferably bilingual and with 10 years experience in industrial design required by chemical organization with headquarters in Montreal. Duties include supervision of Works Design Department, supply draughting and design service for plant, prepare appropriation requests, maintain cost estimating units etc. Salary open. Apply to File No. 3995-V.

GRADUATE ENGINEER, three to 5 years plant experience, required by chemical organization in Montreal. Duties include assisting in developing and carrying out in various plants training programs in subject and related fields for junior industrial engineers. Develop and apply such office routine as may be necessary. Salary open. Apply to File 3995-V.

MECHANICAL ELECTRICAL OR CIVIL ENGINEER, age 23-30, preferably single and bilingual with some experience in maintenance required by an industrial and chemical organization with headquarters in Montreal. Duties include construction project and design studies. Salary open. Apply to File No. 3995-V.

CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years experience for key position in moderate size plant in Manitoba doing fabrication of Plate Work and Light Steel Work, also Grey Iron Foundry and Machine Shop. This will lead to key position in a growing organization. Salary open. Apply to File No. 4003-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry, required in Newfoundland. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and paper experience is not necessary. Salary open. Apply to File No. 4009-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred. To supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375 U.S. currency. Apply to File 4011-V.

ELECTRICAL OR MECHANICAL ENGINEERS required by large Montreal firm to prepare and analyze specifications for telephone equipment manufacturing and installation. Other type of engineering work also available. Salary open. Please send photo together with particulars of education and experience. Apply to File No. 4018-V.

GRADUATE ENGINEER, required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential also some sales ability. Salary around $400. Apply to File No. 4021-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships, good salary, permanent position to the right man. Apply to File No. 4031-V.

DESIGNING ENGINEERS or DRAUGHTSMEN, preferably but not necessarily with experience in Pulp and Paper Mill work required for paper mill in Newfoundland. Salaries $300 per month or better depending upon experience and ability. Apply to File No. 4036-V.

GRADUATE ENGINEERS preferably with about five years light structural and mechanical experience required by growing concern in central Ontario to learn business thoroughly and thereby be in a position to accept responsibility in Engineering Department. Salary open, based on experience and aptitude. Apply to File No. 4045-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experienced in installations of Production and Cost Control, Wage Incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

SALES ENGINEER for popular line of Diesel Engines applicants must be specialists on Power Units and Generator Sets. Required for permanent employment with well established organization. Apply to File No. 4055-V.

JUNIOR GRADUATE ENGINEER with civil or mechanical qualifications. Moderate salary with excellent prospects for advancement. Required for Canadian University in Montreal for its department of buildings and grounds. Apply to File No. 4057-V.

GRADUATE ENGINEER, preferably mechanical or electrical background, required for drop forging plant operation and production in Province of Ontario, by large steel company with head office in Ontario. Good commercial sense essential. Salary open. Apply to File No. 4062-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience. Between 30 and 40 years of age. Required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

POWER STATION OPERATOR with about five years' experience principally in operation and maintenance of turbines and mechanical equipment of hydro-electric plants required by public utility in Brazil. Preferably not over 30 and single but will consider married man without minor dependents. Replies held in strictest confidence. Salary open. Apply to File No. 4073-V.

MECHANICAL OR CIVIL ENGINEER with at least four years experience in stress analysis and vibration required by one of Canada's leading manufacturers of heavy mechanical equipment. Considerable scope for man of proper qualifications. Salary open. Apply to File No. 4074-V.

Situations Wanted

MECHANICAL ENGINEER, B.Sc. Queen's '33, M.E.I.C., M.I.A.S., P. Eng. Que. Married, age 37, over twelve years experience including design, stress analysis, maintenance, inspection, administration and 5½ years as an R.C.A.F. Engineer Officer. Presently employed desires permanent position with good future prospects. Preferably in an English speaking locality. Apply to File No. 1042-W.

GRADUATE CIVIL ENGINEER, S.E.I.C., B.Sc. Queen's; P. Eng. Que., would accept part time work during evenings or weekends at home, preferably, on steel construction and reinforced concrete design, estimating and detailing. Residing in Montreal. Apply to File No. 1487-W.

PART TIME WORK: Civil engineer, age 34, R.P.E., M.E.I.C., perfectly bilingual, with post-graduate work at University of Toronto in Public Health Engineering and at Harvard University in Industrial Hygiene, also experienced in structural and plate work and in municipal engineering, would take work evenings and week-ends, specially in consulting form to industry in problems related to Industrial Hygiene and local exhaust ventilation. Apply to File No. 2272-W.

MECHANICAL ENGINEER, McGill, Jr.E.I.C., P. Eng. Que., age 26, single, veteran, bilingual. Six years of varied experience covering general plant maintenance; power-house operation; gasoline and diesel trucks, tractor and locomotive maintenance; residential and some industrial construction. Well versed in Time Study and job evaluation. Position desired in Montreal. Now employed out of town. Available after reasonable notice to present employers. Apply to File No. 2338-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C., desires part time work during evenings and week-ends. Experience in plant layout, design estimating, etc. Apply to File No. 2715-W.

CHEMICAL PROCESS ENGINEER, Jr.E.I.C., McGill, Vetrean, over four years overseas as Engineer Officer (construction). Two years design, correlation and economic evaluation work on petroleum refining processes with major U.S. oil company. Present salary $4,000. Age 27, married. Desire responsible position in Canada. Apply to File No. 2778-W.

CIVIL ENGINEER, S.E.I.C., P. Eng. Interested in part time work. Structural steel, reinforced concrete or earthwork. Estimating, designing and draughting. Apply to File No. 2817-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E. (N.B.) age 35, married, 12 years experience in electrical machinery including 2 years District Manager of Sub Station in North West Quebec; 3 years Assistant Electrical Superintendent of Gold Mine in North West Quebec; 3 years R.C.E. Electrical Distribution Systems; 2 years teaching in electrical department of a Canadian University. Present teaching position temporary. Apply to File No. 2827-W.

MECHANICAL ENGINEER, S.E.I.C., two years experience in consulting and general engineering work desires position in consulting or industrial work. Montreal or Ottawa preferred. Available on short notice. Apply to File No. 2829-W.

CIVIL ENGINEER, Jr.E.I.C., B.A.Sc. (Toronto), P. Eng. (Ont.) with some experience in reinforced concrete and structural steel design including detailing of reinforced concrete and estimating. Would accept part time work during evenings and week-ends. At present employed and residing in the Toronto area. Apply to File No. 2910-W.

GRADUATE ELECTRICAL ENGINEER, McGill '24; M.E.I.C., Prof. Eng. Que; over 20 years experience in High Voltage Transmission Line design and construction. Interested in part time or temporary position in general Engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. available at once. Apply to File No. 2918-W.

GRADUATE MECHANICAL AND ELECTRICAL ENGINEER, M.E.I.C., P. Eng. (Ont.), age 39, married. 16 years of experience here and in Europe includes mechanical, electrical and optical design, applications, sales, administration, inspection of production, statistical quality control. Knowledge of foreign languages. Presently engaged in Montreal area, salary $420 per month, would prefer position in Ontario or B.C. Available one month's notice. Apply to File No. 2931-W.

CHEMICAL ENGINEER, S.E.I.C., age 25, experience, process control in rubber and heavy chemicals; engineering in distillery. Presently employed seeks position with greater scope in engineering work. Available one-month's notice. Will travel anywhere. Apply to File No. 2936-W.

MECHANICAL ENGINEER, Jr.E.I.C., B. Eng. McGill '44, P. Eng. Que., age 24, veteran, proceeding toward Masters Degree, seeks employment for months May to September inclusive, on research or development projects or with consulting engineer. Varied experience in production, mechanical design and layout work. Would be able to continue project part time after October if necessary. Apply to File No. 2942-W.

CAMBRIDGE GRADUATE ENGINEER, M.E.I.C., P. Eng. (Ont.), age 29, married. With Civil, Aeronautical and Mechanical background. 4½ years R.A.F. Pilot and Instructor and 3½ years practical experience in consulting and municipal engineering on surveys, design estimating and construction work. Requires responsible and progressive position where ful use can be made of wide interests. Location Ontario (where presently employed) or Western Canada. Apply to File No. 2943-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng. (Que.), B.A.Sc., Diploma in Business Administration, age 29, married; seven years industrial engineering and technical sales supervision in electrical industry. Available in May. Industrial marketing, or management engineering. Apply to File 2946-W.

CIVIL ENGINEER, Jr.E.I.C., P. Eng. (Que.) McGill graduate desires spare time work evenings and week-ends on design and detail of reinforced concrete and steel structures. Also qualified to make stress analysis of rigid frames and most statically indeterminate, structures. Location Montreal. Apply to File No. 2947-W.

2 STUDENTS, S.E.I.C., both on executive of Junior Section, desire summer employment in Ottawa area. Have 2 years Engineering at Carleton College, specializing in Engineering Physics or Electrical Engineering. Jobs need not be together. Available April 30th, 1948. Both experienced draughtsmen but prefer work at which they can gain fundamental knowledge in Physics. Apply to File No. 2948-W.

WANTED—TOWN ENGINEER

Qualified to take charge of all town services, including electric (distribution system) and water utilities. State qualifications, experience and salary expected. References required.

***Apply to* L. W. GELDERT, Town Clerk**
LUNENBERG, NOVA SCOTIA

ALUMINUM COMPANY OF CANADA, LIMITED
AND ASSOCIATED COMPANIES

Have opportunities for

QUALIFIED GRADUATE ENGINEERS

Information regarding current requirements may be obtained from Employment Department, 1700 Sun Life Building, Montreal, Quebec.

Plant Engineer for Paper Mill

A leading Paper Company has immediate vacancy for a qualified Plant Engineer. *Paper Mill experience essential.* Permanent position. Starting salary $475-$550 per month — to be based on experience and qualifications.

Write, stating in full details of experience and qualifications to FILE V.4132.

ENGINEER, M.E.I.C., B.Sc., P.Eng. Ont. Married, veteran R.C.E.M.E. Officer. Two years in plant mechanical and physical control laboratory. Two years as construction engineer, fieldwork and supervisory experience, reinforced concrete, masonry and steel structures. Chiefly interested in position as construction supervisor or concrete research. Apply to File No. 2949-W.

INDUSTRIAL AND PRODUCTION ENGINEERING, Jr.E.I.C., P. Eng. (Mechanical) Ont. 5 years experience in cost reduction and analysis, production planning and scheduling, systems and administration. Background of experience covers both industrial and mechanical engineering. Presently employed, available on six weeks notice. Age 28. Apply to File No. 2955-W.

CIVIL ENGINEER, P. Eng. Ont., M.E.I.C., would like spare time work at design of reinforced concrete or structural steel on a fee basis or otherwise. At present employed in the Hamilton, Ont., area. Appy to File No. 2964-W.

STRUCTURAL ENGINEER, Jr.E.I.C., B.E. '46, N.S.T.C., S.M. '48, M.I.T. Interested in Structural planning, design or construction, or working with consultants. Available June 15. Apply to File No. 2965-W.

MECHANICAL ENGINEER, M.E.I.C., B.Sc. Queen's 1936. Position wanted leading to design and installation of automatic controls and allied equipment; eleven years diversified experience including supervision of plant engineering and maintenance, with four years work on many types of control problems involving measurement and control of such factors as temperature, atmosphere, and flow. Available at one month's notice; Toronto area preferred. Apply to File No. 2966-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng., twelve years experience in the following fields; Automotive, Aircraft and Air handling Equipment on product design, development and testing, improvement of production. Also on design of special machinery; Maintenance in Paper Converting Mill and six years executive in Sales and Service. Desires position with responsible firm, or partnership with Consultant. Apply to File No. 2967-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., B.Sc., 1931. Age 40, married. Requires employment with opportunity for advancement. Have extensive experience in power generation, conversion, plant power distribution, plant design and construction. Also experience in management and the setting up of new organizations. Available on one month's notice, additional information upon request. Apply to File No. 2976-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc., P. Eng. (Ont.) Age 44. Single, past experience includes administrative, executive and sales engineering in metal products, building materials and subcontract work in construction industry. Also held responsible position in personnel administration. Desires permanent position requiring initiative with good future prospects. Apply to File No. 2983-W.

MECHANICAL ENGINEER (27), B.Sc., A.M.I. Mech. E., in responsible position with world-famous engineering concern in England is willing to emigrate to Canada if suitable opening is found there. Experienced in production development work, production planning and manufacturing methods of wide range of power station plant. With initiative and adaptability for most positions on the production side. Further particulars on request. Apply to File No. 2984-W.

GRADUATE ELECTRICAL ENGINEER, Manitoba, age 36, M.E.I.C., 12 years experience in industrial manufacturing. Married with family. Well grounded training in costs and estimating of machinery - structural - miscellaneous ironwork and platework. Same experience in sales development and promotion work. Now employed but desires position with progressive firm where opportunity for advancement not restricted either in a similar capacity or position under superintendent. For further information apply to File No. 2986-W.

The Public Service of Canada

Requires

ENGINEERS, BILINGUAL, Department of Transport, various centres in the Province of Quebec, $3,900-$4,500 and $3,300-$3,900

Poster announcements giving full details are on display and application forms are obtainable at Post Offices, National Employment Service Offices and Offices of the Civil Service Commission, Montreal, Quebec or Ottawa. Application forms should be filed immediately with the

CIVIL SERVICE COMMISSION OF CANADA
OTTAWA

SALES ENGINEER

Openings are available in a growing Canadian Company located in Ontario for Sales Engineers, experienced in the commercial side of the heavy electrical industry. Successful applicants should have a thorough knowledge of the preparation of tenders, propositions, on Transformers, Motors, and Switchgear equipment. Replies will be treated in strict confidence. Apply to File No. 4102-V.

Graduate Electrical Engineer

Required for position with large Northern Ontario Paper Mill. Preferably man with some paper mill or other industrial experience. Salary commensurate with qualifications and experience. Apply stating experience and qualifications to File No. 4032-V.

THE UNIVERSITY OF MANITOBA REQUIRES ENGINEERING INSTRUCTORS

The Faculty of Engineering and Architecture of the University of Manitoba will require additional instructors for teaching duties beginning September 1, 1948.

Applicants should be Engineering Graduates from recognized Universities. The grades required will be assistant professors, lecturers and demonstrators in Civil, Electrical, and Mechanical Engineering. Salaries dependent on experience and general qualifications. Apply as soon as possible to Dean of Engineering and Architecture, or Head of Department Concerned, The University of Manitoba, Winnipeg.

Business & Industrial Briefs

A Digest of Information received by The Editor

Appointments and Transfers

On April 9, the Canadian Standards Association formed an Advisory Committee on which many of Canada's leading industrialists, scientists and engineers will serve.

The members of the new Committee are:

Wm. F. Angus, M.E.I.C., President, Dominion Bridge Company Ltd.

Sir Frederick Carson, Executive Vice-President, Montreal Locomotive Works Ltd.

Victor Drury, President, Canadian Car & Foundry Company Ltd.

James S. Duncan, President, Massey-Harris Company Limited.

A. E. Grauer, President, British Columbia Power Corporation Limited.

R. L. Hearn, M.E.I.C., General Manager & Chief Engineer, Hydro-Electric Power Commission of Ontario.

H. G. Hilton, President, The Steel Company of Canada Limited.

Frederick Johnson, President, The Bell Telephone Company of Canada.

F. B. Kilbourn, M.E.I.C., President, Canada Cement Company Limited.

W. A. Mather, M.E.I.C., President, Canadian Pacific Railway Company.

R. E. Powell, President, Aluminum Company of Canada Limited.

J. R. Read, Chairman and President, Canadian Westinghouse Company Limited.

P. F. Sise, M.E.I.C., President, Northern Electric Company Limited.

H. M. Turner, President, Canadian General Electric Company Limited.

R. C. Vaughan, President, Canadian National Railways.

James Wilson, President, Shawinigan Water and Power Company.

At a recent annual meeting of the Board of Directors of Babcock-Wilcox and Goldie-McCulloch, Limited, R. M. Robertson was appointed Assistant General Manager of the Company. He will also continue his present duties as Chief Engineer.

Mr. Robertson was educated in Mechanical Engineering at the University of Toronto, and since graduation has been actively engaged in steam plant engineering.

He joined Babcock-Wilcox and Goldie-McCulloch, Limited, in 1934 and became Chief Engineer in 1937. For some time he was a member of the Council of Professional Engineers of Ontario.

•

S. J. Beaton has been appointed to the staff of the Industrial Heating Section of Canadian General Electric Company's Head Office. He is a graduate of the University of British Columbia where he received the degree of B.A.Sc. in 1944.

•

W. E. Ross, Manager of Canadian General Electric's Apparatus Department recently announced a reorganization of the Department. The change has involved the creation of new Divisions.

Promoted to Division Manager are D. L. McLaren, M.E.I.C., Generator Division; H. Rose, Switchgear Division; V. B. Ross, Transformer Division; A. G. Turnbull, Control Division, and J. D. Willis, Industrial Division.

The Company has also announced the appointment of I. M. MacLean as Manager of the Application Engineering Division. He has succeeded the late W. D. Robertson.

Ferranti Electric Limited, Mount Dennis, Toronto, has announced the appointment of Dr. J. M. Thomson, M.E.I.C., as Vice-President.

Dr. Thomson joined the Company in 1926, as Radio Engineer responsible for the design and experimental work being carried on at that time. He was also in charge of transformer development and research work, and, in 1942, became Chief Engineer responsible for all the engineering decisions of the Company. In 1946 he was appointed Assistant General Manager and in 1947 he was promoted to the post of General Manager, which position he still holds.

Dr. Thomson graduated from the School of Practical Science, University of Toronto in 1924. Following graduation he worked for some time in the test department of General Electric Co. in Schenectady and in the engineering department of the English Electric Co. of Canada Ltd., St. Catharines. In 1937 he obtained a Ph.D. degree at the University of Toronto.

He has been very active in the work of the American Institute of Electrical Engineers, having held the offices of Chairman of the Toronto Section and Vice-President of the Canadian District. He was appointed, recently, a Fellow of the Institute.

Dr. Thomson has served on many committees of the Canadian Standards Association, the Canadian Electrical Manufacturers Association, the University of Toronto Engineering Alumni and is a past Chairman of the Board of Education at Weston.

•

Webster B. Todd formerly Chairman of the Board of Todd & Brown Inc., has been appointed to the Executive Committee of the American Wheelabrator & Equipment Corp., Mishawaka, Indiana.

W. F. Koehn has succeeded G. N. Curley as General Superintendent of the Ontario District of the Canadian Pacific Railway. Mr. Curley was recently appointed General Manager of the Company's Eastern region.

N. R. Crump, M.E.I.C., formerly Vice-President of the Eastern Region at Toronto has been appointed Vice-President in Montreal, with jurisdiction over all lines. William Manson has been appointed to the Prairie Region, which post was occupied by W. A. Mather, M.E.I.C., prior to his appointment as President of the Company on March 8. D. S. Thomson, formerly General Manager of the Eastern Region has succeeded Mr. Crump as Vice-President of that region with headquarters at Toronto.

J. O. Johnston has been appointed Superintendent of the Trenton Division. T. E. Wheeler, formerly of the Trenton Division has been moved to the superintendency at Schreiber, Ont., and G. E. Mayne is now Superintendent of the Montreal Terminal.

E. H. Despard has been appointed manager of the Permanent Magnet Section in Canadian General Electric Company's Chemical Division. He graduated from the University of Toronto as a B.A.Sc., in Metalurgical Engineering and has had extensive experience with his Company in the field of Carboloy and Industrial Heating.

At the fourth Annual Meeting of the Canadian Fan Manufacturers' Association held at Kitchener, Ontario on February 26, the following officers were elected for the year:

President, C. W. Johnson; Vice-President, A. H. Blake; Secretary-Treasurer, L. O. Monroe.

Mr. Johnson is Vice-President of Canadian Sirocco Company Ltd., Windsor, Ontario and Mr. Blake is General Manager of B. F. Sturtevant Company of Canada Ltd., Toronto, Ont.

Crawford Gordon, Jr., has been appointed Executive Vice-President and Director of John Inglis Co. Ltd. Mr. Gordon will continue as President of the English Electric Company of Canada Limited.

D. R. Machum has been appointed Assistant to the Manager of the Broadcast Equipment Sales Division of RCA Victor. Mr. Machum is a native of New Brunswick and he graduated from the University of New Brunswick, Fredericton, in 1947, with the degree of B.Sc. in Electrical Engineering. Upon graduation he was employed by the Radio Division of the Department of Transport at Ottawa. He will be located in Montreal.

J. D. Shortall has been appointed Wire and Cable Engineer in the Toronto District Office of the Canadian General Electric Company. His appointment covers the sales and application engineering of power cables, and special application to the new synthetic insulants.

He graduated from McGill University with the degree of B.Eng. (E.E.). He has been with the Canadian General Electric Co. Ltd. since 1936.

The Western Ontario Sales Office of the C. A. Dunham Company, Limited, is now located at 310 Main Street East, Hamilton. The Manager is F. W. Stott. The new location will enable Mr. Stott and his staff to better serve the Company's customers throughout the territory.

The Canadian General Electric Company opened, recently, a new office and warehouse in Regina. Manager is F. E. Estlin, M.E.I.C., and there are sixteen people on his staff, to provide complete electrical distribution service for the farms, homes and industries in the district.

The building cost $100,000 and it has a total of 14,200 square feet of floor space. It is constructed of reinforced concrete and Saskatchewan brick and stone.

M. C. Bailey has been appointed Manager of the Toronto Office of the C. A. Dunham Company, Limited. He has been acting in that capacity for the past year.

Mr. Bailey was engaged in the promotion of the sale of Dunham products before joining the R.C.A.F., and on discharge he returned to his former position in the Sales Department.

E. Fox has been appointed as a Sales Engineer with the C. A. Dunham Company, Limited. He will make his headquarters at the Company's Toronto Sales Office, 1139 Bay Street. Mr. Fox has been with the Company for a number of years and in his new position he will specialize in engineering counsel in the correct selection of Dunham systems and products. He is a member of the Ontario Association of Professional Engineers.

New Equipment and Developments

The Chrysler Corporation of Canada Ltd. have announced the construction of a new administration building at Windsor, Ont. The new structure will cost more than one million dollars and will be made entirely of Canadian materials. It will be located on the East side of Drouillard Road in Sandwich East Township, facing the Corporation motor car and engine plants. They intend to occupy the building at the end of this year.

The building will be two storeys high, E-shaped, 400 feet long, 147 feet deep and it will have 80,320 square feet of space.

Although Foster Wheeler Limited, of St. Catharines, Ont., have in past years completed contracts with South American countries, the first shipment by the Company to Venezuela is a 200-ton steam-generating unit. It will be installed as part of a large steam generated electric power plant. The generating equipment was designed, engineered and built by the Foster Wheeler Co. in their St. Catharines shops.

Assembled on eight railway gondola cars, the unit will be shipped direct to New York where it will be transhipped to Maracaibo, Venezuela, by freighter.

Foster Wheeler officials state that the unit which has been under construction for the past three months is one of several similar major export jobs scheduled for completion this year.

The unit has a capacity of 150,000 pounds of steam per hour at 250 pounds per square inch pressure with final steam temperature of 700 degrees fahrenheit. It will be oil fired and equipped with all necessary parts.

●

In the very near future the Canadian Standards Association will publish a new code concerning protectors for the heads and eyes of industrial workers.

●

The Solder Division of Alpha Metals Inc., have announced a new development in acid core solders, recently, engineered by the research staff. For details communicate with the Company at 363 Hudson Ave., Brooklyn 1, N.Y.

●

Lindberg Engineering Company, 2444 West Hubbard Street, Chicago, manufacturers of industrial heat treating and melting furnaces, have acquired the assets of the Electronics Division of Illinois Tool Works.

John A. Callanan, who headed this division for Illinois Tool Company, will, with his staff, join the Lindberg organization.

●

The Gardner-Denver at 400 West Madison Street, Chicago 6, Illinois have announced a new B67 Paving Breaker. It is intended for use on concrete and is a companion to the heavier Model B87. The manufacturers claim that it is especially suitable for horizontal operations, such as tearing out walls, for boulder breaking in quarries or mines, for trenching in shale or hardpan, or for preparing black-top for patching. It is also suitable for demolition work in altering and maintaining industrial plants.

For complete information communicate with the Company.

●

The Dominion Oxygen Co. Ltd., 159 Bay Street, Toronto 1, Ont., have announced that they have available "A more efficient Shutoff Valve for Oxy-Acetylene Production Welding ".

The valve is designed to prevent oxygen and acetylene waste in shops doing production welding. It is called the Oxweld V-31 Dual Shutoff Station Valve. When used with the oxy-acetylene blowpipe it controls the supply of both oxygen and acetylene or other fuel gas. When welding is interrupted, the operator just hangs the blowpipe on to a hook and gas consumption immediately stops. A blowpipe weighing as little as 12 oz., will it is claimed, tightly seal the valve.

For further information communicate directly with the company.

●

The Canadian General Electric Co. Ltd., 212 King St. W., Toronto, have announced a new portable Potentiometer.

The Potentiometer is designed for checking temperature measurement instruments and for testing rotating machines, ovens, furnaces, oil-burners, steam-driven equipment, and air-conditioning units. It was designed originally for measuring the low voltages of thermocouple outputs in testing steam turbines.

The equipment of the potentiometer, which is contained in a fabric-covered luggage case, includes the galvanometer, standard cell, working batteries and rheostats for adjusting the current through the potentiometer circuit.

The manufacturer will be pleased to supply complete details and illustrated material.

●

The Director of the Government of India Supply Mission, A. R. Palit, stated on April 22nd, in Washington, that his organization hoped to obtain between $120,000,000 and $125,000,000 worth of goods in Canada and the United States during 1948. Mr. Palit referred to the dollar shortage, but stated that he hoped to spend one-fifth of the total amount in Canada. Among the goods to be purchased are locomotives and parts, fertilizers, chemicals, ships, aircraft parts, machine tools, radio equipment and various types of machinery.

●

The American Electroplaters' Society, 473 York Road, Jenkintown, Pa., have announced a series of technical sessions for metal products manufacturers and the metal finishing industry at Atlantic City, June 28th to July 1st. These sessions will coincide with the Industrial Finishing Exposition, also sponsored by the Society, and they will be held in the Atlantic City Convention Hall. Communicate with the Society for details.

●

The Coliseum Building on the Toronto Fair Grounds has been faced with aluminum for the Canadian International Trade Fair, which will be held from May 31st to June 12th.

The Fair will feature more than 1,500 exhibits from 32 countries. It is the first event of its kind to be undertaken by a Canadian Government.

●

A new development in the search for new sources of lead and zinc has appeared through the recent granting of a concession in the Northwest Territories, to the Consolidated Mining and Smelting Company of Canada Limited, and Ventures Limited. The concession grants the exclusive right to prospect an area of some 500 square miles on the south shore of Great Slave Lake. The boundaries of the area in general terms are the south shore of Great Slave Lake, the 115th Meridian of West Longitude, an east-west line, inland from fifteen to twenty-eight miles and a north-south line twenty-eight miles east of the 115th Meridian.

●

On March 31, Canadian Industries Limited opened a new $2,000,000 paint plant in York Township near Toronto.

The new plant, fourth C.I.L. Paint works, will specialize in the production of enamels for finishing automobiles, refrigerators, washing machines and other items of industrial and household use. It will also manufacture anti-freeze from ethylene glycol.

The plant employs the latest scientific devices and methods to synchronize all its operations and embodies many features entirely new to the paint industry on this continent.

●

The Dominion Oxygen Company, Limited, 159 Bay Street, Toronto 1, claims savings, estimated at about 75 per cent of the overall welding and grinding costs, when the manufacturer of a stainless steel condenser used the Heliarc inert-gas-shielded arc welding process.

Many advantages are claimed for the process for such work. In the case referred to above, no filler metal was necessary and the welds were started and stopped without crater-crack difficulties. Welds of good corrosion-resistance properties were obtained and a low degree of porosity minimized the test and repair costs.

Publications

Dominion Bridge Company Ltd., Lachine, Que., have produced a well-illustrated and highly informative catalogue on their "M-M Safety Gratings". For copies apply to the Company at the address given above.

●

The Laurentide Equipment Company Ltd., 440 Beaumont Avenue. Montreal, have issued a new folder which gives the complete specifications of the new Laurentide "Beetle" Tractor and Angledozer.

Copies may be obtained from the Company. Please specify whether English or French is required.

●

The Canadian General Electric Company have issued a bulletin describing their "Electric Steam Boiler".

This bulletin should be of special interest to plant engineers and purchasing agents. It describes fully the equipment for the production of process steam from 0.3 to 108 boiler hp. Features of the bulletin are tables of ratings, outline drawings and installation photographs.

Direct your inquiries to the Company and ask for bulletin (4039B).

●

The R.C.A. Victor Company Ltd., Lenoir Street, Montreal have issued a brochure entitled "RCA Headliners". It lists oscillators, amplifiers, doublers, modulators, and rectifiers. It should be of particular interest to readers who are interested in electronics in the capacity of amateur or professional workers.

●

Hobbs Glass Ltd., London, Ontario, have issued a booklet giving details of a new type of glass block. This new product is designed to give a soft, diffused, light and to eliminate sun glare and heat. It features glass fiber screen sealed between two half blocks. The title of the booklet is "Daylight Where You Want It". Apply to the company for copies.

Nordberg Manufacturing Co., Milwaukee 7, Wis., have available two bulletins on their equipment. Bulletin No. 149 describes the Company's machinery for processing ores and minerals. Bulletin 152 describes Grinding Mills. Copies are available on request to the manufacturer.

●

The Northern Electric Co. Ltd., publish, periodically, a publication entitled the "Northern Circuit." It is intended primarily for the strengthening of the ties between the Company and its agents and dealers. Copies are, however, available to readers of the *Journal*. To have your name placed on the mailing list write to the Public Relations Manager, The Northern Electric Co. Ltd., 1620 Notre Dame St. West, Montreal 3, Que.

●

The Canadian Fairbanks-Morse Co. Ltd. have available literature on the American Flexible Metal Hose for which they are agents. This hose can be used in connection with air, chemicals, exhausts, gas, oil, refrigerants, steam, tar and asphalt, vacuum, water, and for vibration elimination. For copies of special bulletins dealing with the application of this hose to any particular type of work or for a complete catalogue showing all types, apply to the Company at 980 St. Antoine Street, Montreal, Que.

The B. Greening Wire Company Ltd., Hamilton, Ont., have issued a new 160 page Wire Rope Catalogue and Engineering Handbook WR 48. The catalogue is compact and fits easily into the pocket. It should be extremely useful to all users of wire rope. For copies please communicate with the B. Greening Wire Company Ltd., Hamilton, Ont., and mention, specifically, Handbook WR 48.

●

The Brunson Instrument Company of 1405 Walnut Street, Kansas City 6, Mo., manufacturers of precision surveying instruments have available a number of well illustrated bulletins describing their products. Readers of the *Journal* are invited to communicate with the Company stating their requirements so that appropriate bulletins may be mailed to them.

●

Chain Belt Company of Milwaukee have released a new brochure describing Rex Hi-Discharge Moto-Mixers. It describes truck mixers in detail and various types are illustrated. There are complete specification charts. For copies apply to the Company.

●

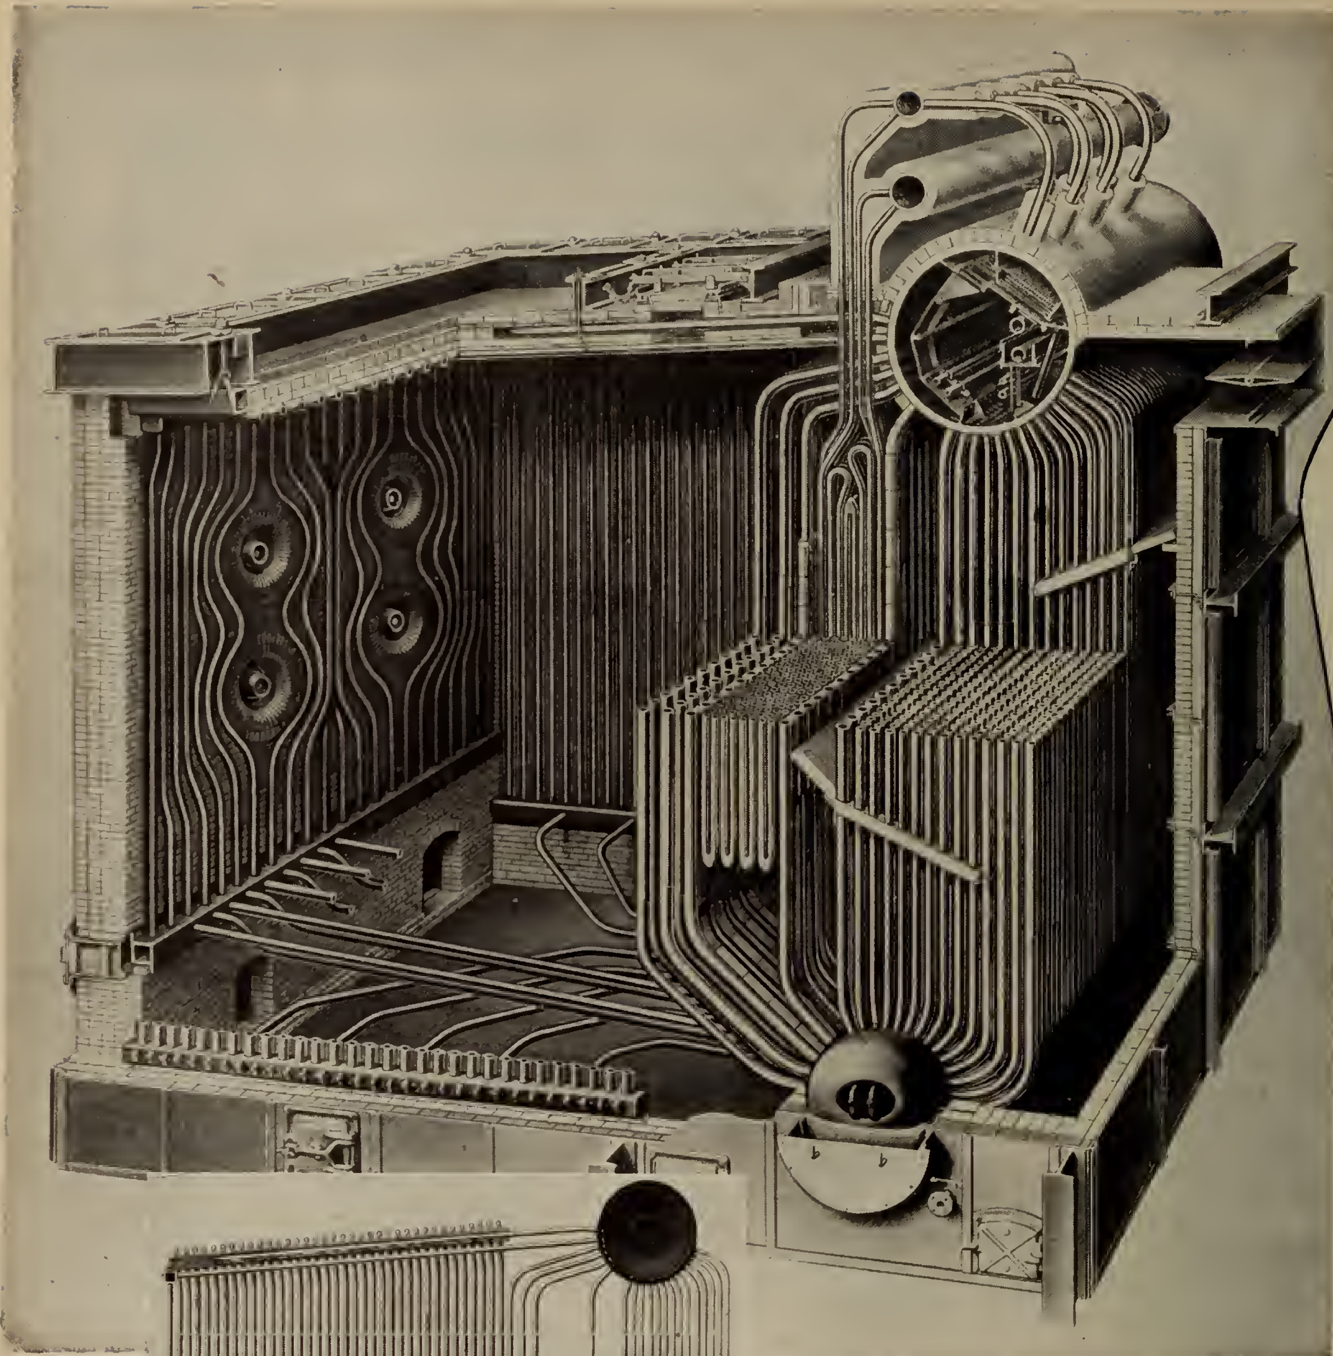
O. G. Moffat (P.Eng.) Air Conditioning Specialist, Canadian Westinghouse Co. Ltd., Hamilton, Ontario, has written a simplified explanation of Air Cleaning problems for builders and owners. It is titled "When Mechanical Air Filters? When Electrostatic Air Cleansers? When to Use Both?" It is available in sheet form. For copies communicate with the Company, requesting "Mr. Moffat's article on Air Cleaning problems."

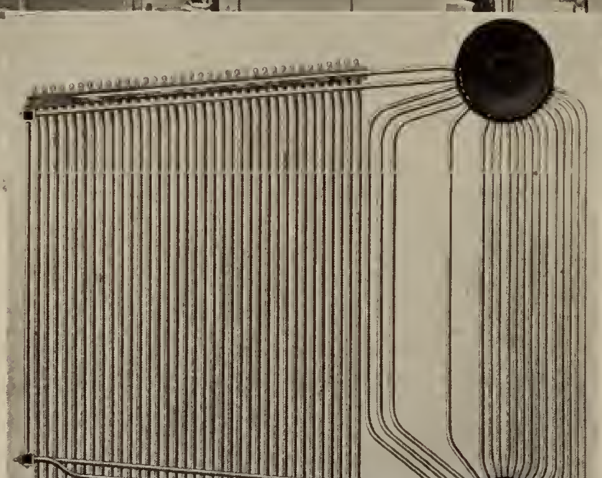
"Business & Industrial Briefs"

This section of the *Journal* is intended to keep readers informed on developments and changes in those business and industrial enterprises, and on new products, which affect the engineer.

If you write with respect to any of the items in this, or other, sections please mention

THE ENGINEERING JOURNAL





Symmetrical Design. Any section taken through the VU Unit fram front ta rear is similar to any other section so taken. The volume of gases, their velocity and temperature, at any point from front to rear, are practically constant across the width of the unit.

This view, taken in the Oshawa Waterworks, shows two Cameron pumps with oil engine drive and control equipment. These units were installed under the direction of G. F. Shreve, General Manager, and E. A. Colvin, Chief Engineer, of the Oshawa Public Utilities Commission, and their Consulting Engineers, Gore and Storrie of Toronto.

Cameron Engine Driven Pumps for Auxiliary and Standby Service

BUILT at our Sherbrooke, Quebec works, these two Cameron No. 5-GT Two-Stage Pumps are rated at 1,800,000 G.P.D. each when operating against a total head of 320 ft. including 15 ft. suction. Each pump is driven by a heavy duty full Diesel Type Oil Engine developing 170 hp at 1700 rpm. Each unit is equipped with electric starting system and shutdown devices for protection against high circulating water temperature or low lubricating oil pressure and overspeeding.

In the selection of this pumping equipment, careful consideration was given not only to the use of the units for standby service, but also as auxiliaries to previously installed electrically driven pumps for peak load and emergency work. On many occasions, it has been necessary to operate the pumps as auxiliaries over long periods because of electrical power shortage or to meet the increased water demand resulting from expanding industrial and civic requirements.

Cameron Engine Driven Pumps are available in single and multi-stage types with capacities suitable for the requirements of municipalities, mines, mills and industrial plants.

HIGHEST AWARD CERTIFICATE

Won by

THE ENGINEERING JOURNAL

In the 1948 Contest sponsored by

THE INTERNATIONAL COUNCIL OF INDUSTRIAL EDITORS

Six hundred and fifty Canadian and U.S. publications were entered in this contest. The *Journal* was judged to be outstanding when compared with the entire list of entries and the leading publication in its own class.

The judges' decisions were based on accomplishment of purpose, editorial style, appearance and production achievement.

FOR STRENGTH 4340

IN NEW EQUIPMENT, or for replacement parts, where heavy loads and sudden shocks are factors, specify Nickel Alloy Steel, type 4340.

High hardenability gives "4340" good mechanical properties in heavy sections.

In shovels such as the one illustrated, for example, this nickel-chromium-molybdenum steel is used satisfactorily in dipper handles, boom parts, caterpillar mountings and propelling machinery.

You are invited to write for a recommendation regarding the best type of steel for your application and a suggested source of supply.

E INTERNATIONAL NICKEL COMPANY OF CANADA, LIMITED • 25 KING STREET WEST, TORONT

EMBLEM OF INCO SERVICE

Dear Sirs, Please advise us concerning the best type of steel for the application named below.

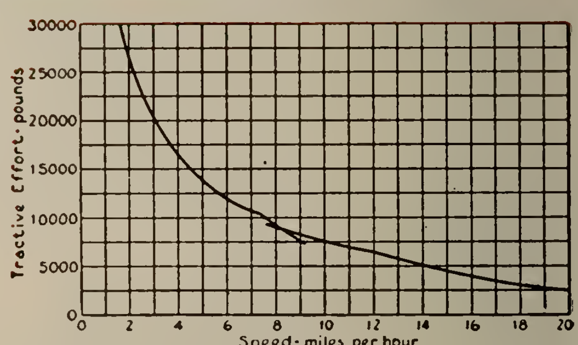
20	70	41	23	12	—	—	—

Hauling capacity is conservatively based on 20 per cent maximum running adhesion, thus allowing for starting trains. There are no restrictions on the tonnages listed for 5 mph and above when the locomotive is used for switching or transfer service. For loads which restrict speed to less than 5 mph. maximum tonnage should be limited to that shown in the table and confined to switching, unless transfer moves are of less than 15 minutes' continuous duration.



1. Maximum speed, 20 mph—provides ample leeway against overspeed troubles in switching work.
2. Single motor connection, simple control, no transition, thus giving steady pull.
3. Full engine horsepower utilization to 12 mph gives maximum output in switching moves.
4. Smooth output curve, automatically giving equivalent of infinite number of gear ratios.
5. Double-reduction drive gives high efficiency at switching speeds.

That Makes Your Barrett SPECIFICATION* Roof Finest in the Field

You can't see the research that goes into your "SPECIFICATION" roof. But the results of it are there. And the part it plays is just as important as that of the felt, the pitch or the gravel.

Barrett research has paved every step of the way from raw materials to the finished "SPECIFICATION" roof. Research determined the quality of the felt and the pitch, introduced improved manufacturing techniques, pioneered the now time-tested Barrett specifications. The result was record-making Barrett "SPECIFICATION" roof Job. No. 1 . . . 29 years without maintenance or repair. This was the first bonded built-up roof in Canada, and the first of many Barrett "SPECIFICATION" roofs to outlast their bonds.

Today the Barrett "SPECIFICATION" roof is accepted as leader in the field of build-up roofing . . . Canada's No. 1 Roof.

Barrett* Specification* Roofs

*Reg'd. Trade Mark

Depend on that reputation. Specify Barrett all the way.

The built-up felt, pitch and gravel roof, as supplied by Barrett in the record-making "SPECIFICATION" roof, incorporates these special features:

1. Barrett "SPECIFICATION" felt—carefully processed from selected stock . . . must pass rigid tests for tensile strength and durability.
2. Barrett "SPECIFICATION" pitch—specially refined, straight-run, coal-tar pitch . . . mopped between layers of felt; *heavy-poured* on top.
3. Gravel or slag armoured top, embedded in hot pitch, protects roof against elements, mechanical damage, wear and tear. It interposes a surface of fireproof rock between building and flying embers.

Only these materials, applied by a Barrett Approved Roofer in accordance with time-tested Barrett requirements, and examined by a Barrett Inspector make the Barrett "SPECIFICATION" roof.

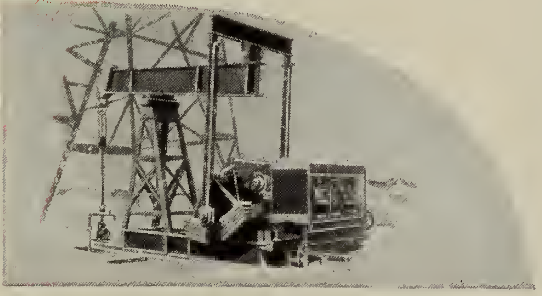
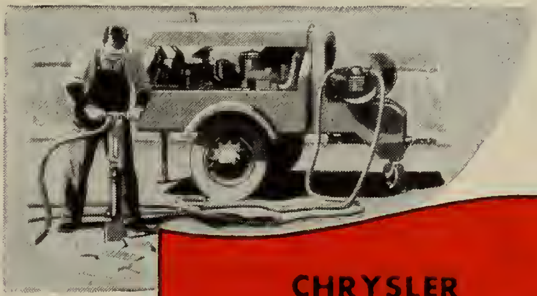
CHRYSLER INDUSTRIAL ENGINES

CAN HELP SELL YOUR PRODUCT



POWER YOUR EQUIPMENT WITH A CHRYSLER INDUSTRIAL ENGINE AND YOU ADD EXTRA SALES FEATURES!



CHRYSLER Industrial Engines feature all 9 requirements which experts have set as the standard for performance and saleability of industrial engines! Power your equipment with "horsepower with a pedigree" and you've added these extra sales points. More than that, you've added the Chrysler reputation for fine engineering and production "know-how." You've added the reputation of Chrysler Industrial Engines for dependable performance, under toughest conditions, through years of actual service in the field.

Before you buy any industrial engine, send for free booklet "Power, Coast-to-Coast." Write the Industrial Engine Division, Chrysler Corporation of Canada, Limited, Windsor, Ontario.

CHRYSLER ANSWERS ALL 9 INDUSTRIAL ENGINE REQUIREMENTS

Chrysler Industrial Engines answer all 9 industrial engine requirements. (1) adequate power and torque, (2) low first cost, (3) low operating cost, (4) parts and service availability, (5) dependability, (6) facility of installation, (7) simplicity of repairs, (8) flexibility, (9) greater sales value for your product

Test Piles for Saguenay Terminals Wharf

by

W. L. Pugh, M.E.I.C.

Assistant Chief Engineer, Aluminum Company of Canada Ltd., Montreal

Prepared for the Engineering Journal, from the Engineering Report to the owners, Saguenay Terminals Ltd., this paper records valuable data on the driving and testing of piles for a proposed new wharf at Port Alfred, P.Q. It describes the field investigations leading to the decision to drive four test piles on the site of the proposed wharf, including soil tests. The action of the soil surrounding friction piles is discussed, as well as the action of the pile itself as the load is applied. A "blow by blow" description is given of the actual driving operations, with the aid of diagrams. Details of the load testing apparatus are given and the results from the load tests are recorded and interpreted.

Port Alfred, Quebec, the home of Saguenay Terminals Limited, is an ocean port on Ha! Ha! Bay at the head of navigation on the Saguenay River. It has served for many years as the terminus for incoming cargo vessels bringing bauxite and other raw materials necessary for the production of aluminum ingot at the plant of the Aluminum Company of Canada, Limited at Arvida, Quebec. In addition, the port has handled an increasing volume of outgoing cargoes of aluminum, paper, and general ocean freight.

The original timber-crib rock-filled wharf on this site was used for shipping logs. It was rebuilt in 1920, using timber-pile construction, and was designed to handle both incoming and outgoing cargoes direct from ship to rail or from rail to ship. The berths were also dredged deeper to accommodate larger vessels. Since the chief export at this time was paper from the large paper mills located in the Saguenay and Lake St. John districts, this wharf became known as the "Paper Wharf."

As the operations of the Aluminum Company of Canada, Limited at Arvida increased, it became necessary to build a second wharf to handle the traffic. This "Duncan's Wharf", built in 1937-38, was also of timber-pile construction. It was designed to handle all incoming bulk cargo by means of two mechanical unloading towers of modern design. The "Paper Wharf" was also rebuilt thoroughly in 1938, and has been used since that time for all outgoing cargoes.

Now that the aluminum plant at Arvida, with its 8,000 employees, has become the largest aluminum ingot-producing works in the world, the tremendous amount of incoming ores and exported pure aluminum has overloaded the capacity of the two existing wharfs. In addition, the "Paper Wharf" has become badly decayed and its load-carrying capacity has been greatly reduced.

This port handled 336 vessels in the 1947 season, and a total of 1,853,000 net tons of cargo. The import tonnage of 1,576,000 tons is made up of 74 per cent bauxite, the ore of aluminum, and 26 per cent other raw materials, such as coke, petroleum products, sulphur, cryolite and fluorspar. Export cargoes amounting to 187,000 tons are 58 per cent aluminum ingot and other products of the Aluminum Company of Canada, Limited, and 42 per cent pulp and paper.

It was decided late in 1946 that a new wharf was to be constructed just south of the "Old Paper Wharf" as shown in Figure 3, and a slip dredged to Elev. − 31.0 (Saguenay Terminals datum) along the south side. The wharf deck surface will be approximately at Elev. (plus) 31.75. The tidal range at the wharf site is from Elev. 0.0 for extreme low tide to Elev. (plus) 24.0 for extreme high tide.

Considerable study was required to determine the most suitable type of construction for the wharf. Due to the extremely long unsupported pile length along the south side of the wharf, namely 62 ft., and the fact that the bottom is soft silt and clay, wood piles were finally ruled out because they were unobtainable in such lengths. Furthermore, it was desired to build a wharf of fireproof construction, so steel piles were finally decided upon. Precast concrete piles were not considered, due to the severe temperature variations and ice conditions in winter. Cylindrical steel piles were first considered, but due to the scarcity of steel plate, these were ruled out in favour of steel H piles, which were available.

The design of the new wharf is based on a maximum load of 50 tons for each pile, with a minimum factor of safety of 2 for such pile loads. The soil underlying the whole of the Port Alfred area consists of fluid silt overlying a bed of plastic clay, which is deep and of a fairly uniform character and varies in thickness from 60 ft. to 100 ft. Below this clay bed is a bed of sand and gravel of variable thickness with bed rock at approximately Elev. — 175.0. With rock at such depths and no firm bearing material existing at a lesser depth, the most economical and practical type of pile for this location is a friction pile.

Friction Piles — Description of the Action of Surrounding Soil

A friction pile is one that supports the load which comes upon it by the action of friction or adhesion along the surface of contact of pile, with the soil in which it rests. This friction force is passive in character and is induced only as required to maintain equilibrium. There is, of course, some direct compressive resistance developed at the point of the pile but with this friction type of pile such resistance is likely to be relatively small compared to the skin friction or frictional resistance of the pile.

When a pile is driven, in its effort to displace the surrounding material, a lateral expansive force is exerted, which is balanced by the reactive force of the soil against the surface of the pile. One part of this reactive force is supplied by the water phase and the other by the skeleton composed of the soil particles. With permeable materials such as sand, the pressure exerted by the water phase disappears rapidly. This is because the water can easily flow away from the surface of the pile under the hydrostatic stress difference set up when the pile is driven. This permits an immediate development of the frictional resistance of the pile surface with the soil, for this resistance is dependent on the pressure exerted by the soil skeleton on the pile. On the other hand, with impermeable soils such as clays, the development of frictional resistance takes place slowly and, in fact, only as fast as the pressure against the pile surface is transferred from the water to the soil skeleton.

The driving of piles into a clay soil results in some compression and considerable displacement, unless the forces causing the penetration act slowly. For the clay soil to be compressed, the water must be displaced from it. Driving into soft clay may be quite easy but if a rest period of a few days or even several hours is given, thus providing the necessary time for the water phase to allow some of the pressure to be transferred to the soil skeleton, further driving can be resumed only with difficulty. This condition has been clearly exhibited during the re-driving of some of the wood piles in Duncan's Wharf, constructed in 1938, and in driving the present test piles.

Fig. 1—View during driving of test piles, showing driving equipment, etc.

Description of Pile Action

After a pile is in place in the ground and before any load has been applied, there is no shearing stress in the soil. When a load is applied to the pile head, there is a downward movement of the upper end of the pile due to the elastic shortening of the pile. As the pile starts to move with respect to the surrounding soil, the movement mobilizes the shearing resistance of the soil. Since the movement begins at the top of the pile, the mobilization of shearing resistance in the soil also begins at the top of the pile near the ground surface. When a small load is applied to a long friction pile, all of the reaction for the load is developed in the soil around the upper part of the pile. The load produces no stress in the lower part of the pile and, consequently, no elastic contraction and no mobilization of shearing resistance in the soil surrounding the lower part of the pile. As the load is increased the stress in the pile approaches the pile point but it does not actually reach the point until the load attains a certain value which is de-

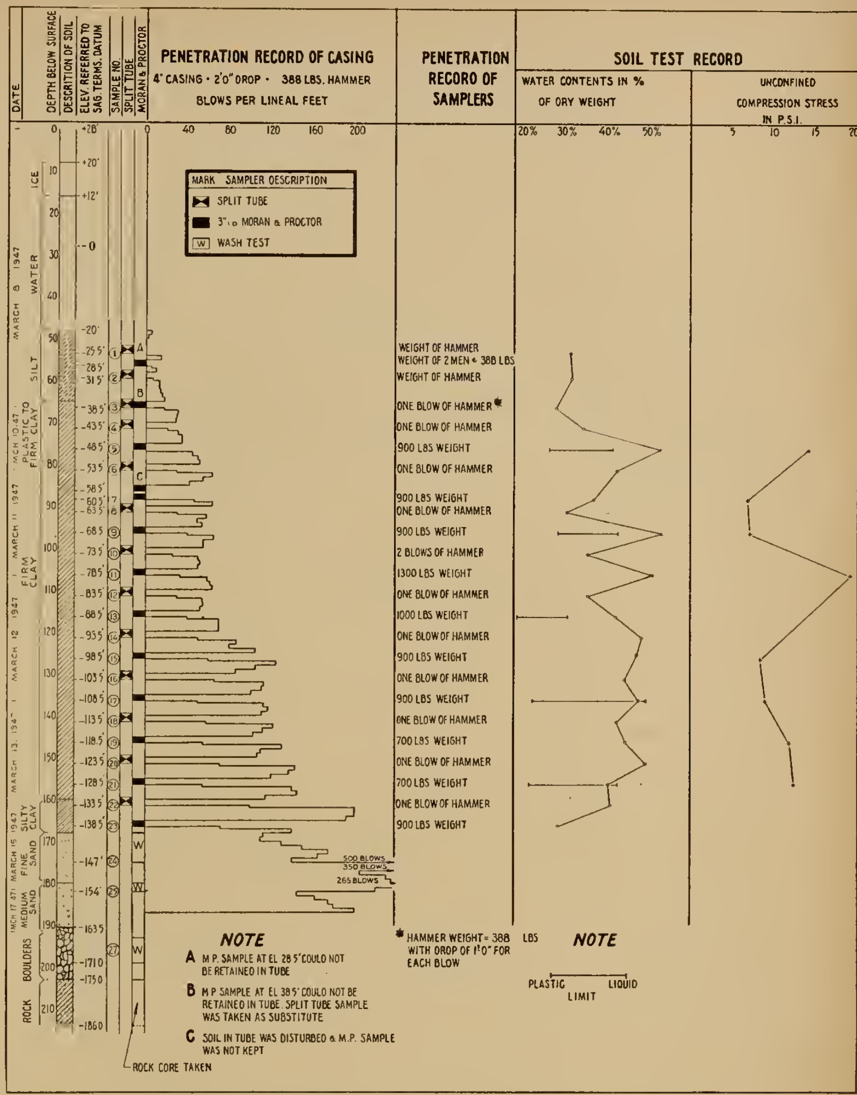

Fig. 2—Boring Investigation. Hole No. M.P.-1.

termined by the elastic properties of the pile and the surrounding soil.

The usual procedure for a pile load test is to place the load on top of the pile and then measure the downward movement of the head of the pile for each load increment. It is not possible to determine the elastic shortening of the pile from such measurements because nothing is known about the movement of the pile point. Neither can such measurements furnish any information as to the manner in which the pile transfers the load to the surrounding soil. By extrapolation of the test results, some estimate of the amount of the point resistance is made later in this paper. If the actual elastic shortening of the pile could be determined by suitable measurements, it would be possible to determine approximately how the pile was transferring its load to the soil. For example, it is a simple matter to compute what the elastic shortening of the pile will be as a free-standing strut, with no part of the load supported by friction on the sides of the strut. When any part of the load is supported by friction along the sides of the pile, the elastic shortening is always less than it would be for the same pile carrying the same load as a free-standing strut. To compensate for this condition, we have used the free strut length to the midpoint of the embedded length, for figuring the elastic shortening of the test piles. (See Fig. 10.)

Test Piles

Because of the uncertainty of how much load such a friction pile will carry, and because no pile driving formula will apply, a pile test carried to failure is definitely required to permit the selection of the proper penetration and carrying capacity of the piles with the specified factor of safety. Such a test procedure was first proposed by the author in November, 1946. The necessity was later confirmed by Mr. E. J. Quirin, Chief Engineer of Frederic R. Harris, Inc., and Mr. R. P. Pennoyer of Carnegie-Illinois Steel Corp., in August, 1947, when final arrangements were made for the tests.

Soil Testing Procedure and Results

To obtain as much information as possible regarding the soil underlying this new wharf site, a programme of soil sampling and testing was outlined and a specification prepared. A series of wash borings had been made in 1927 in the area between the "Old Paper Wharf" and Duncan's Wharf, but in view of the present day developments pertaining to soil sampling and soil mechanics, these earlier tests were discarded.

A series of drill holes were sunk over the new wharf site in early 1947 by the Foundation Company of Canada Limited, under the supervision of Mr. J. F. Mathys, Geologist. Soil samples were taken in the holes by means of a 3 in. i.d. Moran & Proctor Sampler, using a four inch i.d. pipe-cased hole, and alternately by means of a 2 in. i.d. Shelby Tube Type Sampler. As Drill Hole No. MP-1 is located adjacent to the site of the test piles, information pertaining to it is embodied in this paper. The logs of the driving of the casing and sampler are shown in Fig. 2.

All soil samples were shipped to the Laboratory of Ecole Polytechnique, Montreal, and tests and comments on same were made under the direction of Prof. J. E. Hurtubise, M.E.I.C. Table No. 1 is a summary of the laboratory tests for the soil samples from Drill Hole No. MP-1. The boring and testing programme has revealed that the stratum studied is a fairly uniform deposit of silty clay, containing thin lenses of coarse silt or fine sand. This material has the type of complicated structure resulting from soil deposition in sea water. It is brittle and has a rather high strength in the undisturbed condition. It becomes soft and sticky when remolded and the strength is reduced appreciably.

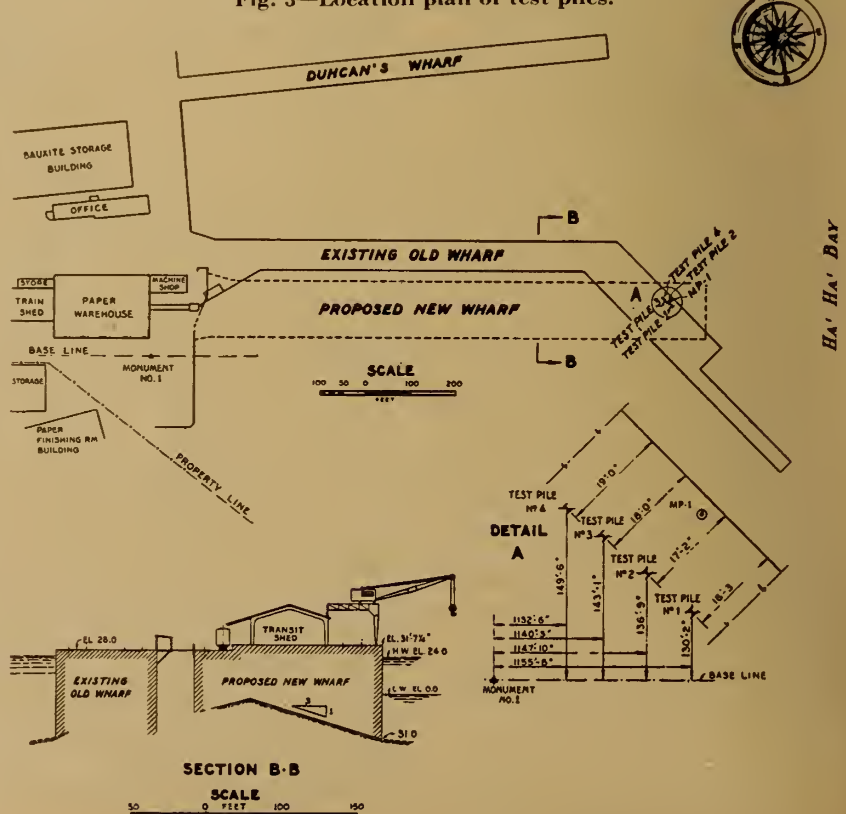
Tests Made By:
Soil Mechanics Laboratory,
Ecole Polytechnique,
April 1st, 1947.

The results of the water content determination vary between fairly wide limits, even from the same sample. It is important to note that these values are nearly always higher than the liquid limit or else practically equal to it, for the whole depth of the stratum. The variation of the limiting values of the liquid limit, plastic limit and plasticity index with depth is not very noticeable, thus indicating a fairly uniform deposit that can be classified as varying from clay and silt to silty clay.

The structure of a clayey soil should be kept undisturbed as much as possible. This is especially so in this case, as any remoulding will tend to liquify the soil. Part of the strength thus destroyed will be recovered with time, but never restored to its original value. The results of the unconfined compression tests appear to be pretty much scattered, but it should be pointed out that this soil is very difficult to sample. The least little disturbance affects its resistance and furthermore, as noted above, it is not entirely homogenous. An examination of the stress-strain curves obtained, reveal this disturbance to a variable degree on most of the samples. No general trend of variation of strength with depth could be established.

The consolidated quick direct shear tests were made on two specimens from each sample, one under an applied normal load at least equal to the overburden pressure, and the other under twice that load. The specimens were submerged and consolidation allowed for 24 hours before being tested. From graphs of the maximum shearing strength against applied normal pressure, it was observed that some of the straight lines, joining the two points obtained with one sample, intercept the ordinate below the origin when this line is produced. Apart from the ex-

Fig. 3—Location plan of test piles.



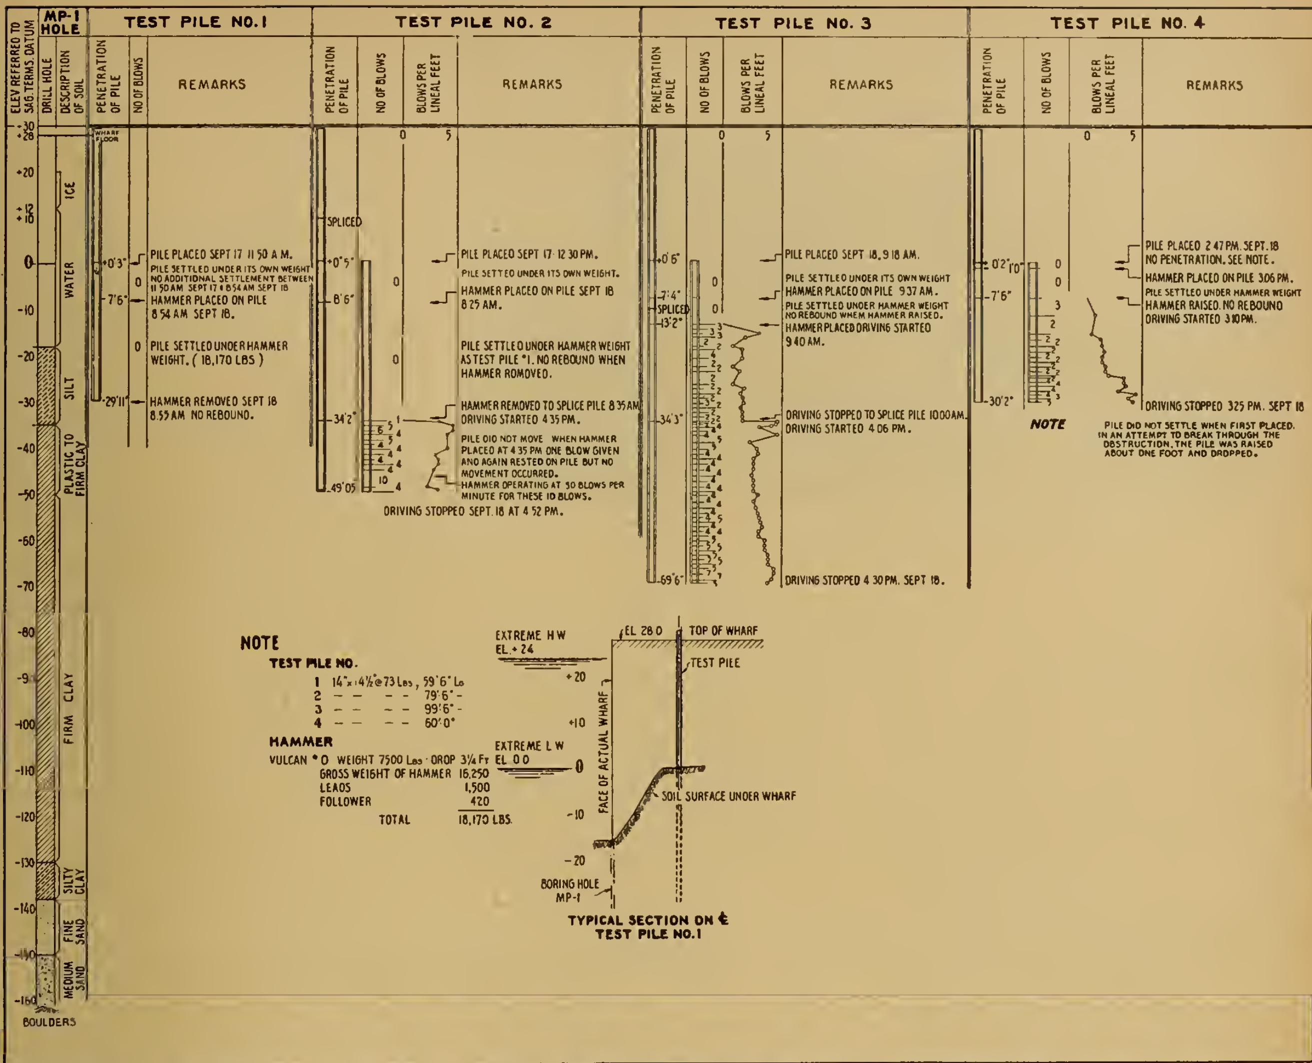


Fig. 4—Test pile driving records.

perimental error factor, it should be pointed out that usually this line tends to curve upwards when supplementary tests are made at lower applied normal pressures.

It is thus seen that this stratum of silty clay is rather uniform in its texture, that the water content is usually higher than the liquid limit and that, consequently, any kneeding or remoulding would seriously impair its resistance.

Test Piles—Driving

The Carnegie - Illinois Steel Corp., through the U.S. Steel Export Co., Montreal, were able to supply the necessary 14 in. x 14½ in. @ 73 lbs. H Pile Sections for the test. It had previously been decided by Frederic R. Harris, Inc., the consulting engineers, that three test piles should be driven with a penetration of 30 ft., 50 ft. and 70 ft., respectively, from the top of the underlying soil. Due to the uncertainty of the carrying capacity of the soil, Mr. Pennoyer of Carnegie-Illinois Steel Corp., suggested a lagged pile be used as No. 4 Test Pile, to determine if such a pile possessed a greater load carrying capacity compared with the plain pile. It was thought this was of some help when piles were driven for Duncan's Wharf.

These four test piles were located as shown on Fig. 3, and driven through the outer end of the " Old Paper Wharf " and on the centre line between existing pile bents. This site was selected due to the availability of the " Old Paper Wharf " for supporting driving equipment and test equipment. The test piles were guided at their heads from the deck of the wharf but otherwise they were free in all directions.

It was found after starting the pile driving that the piles were located on top of a steep soil slope at the face of the wharf, (see Fig. 4) and because of this condition it was later decided to disregard the upper seven (7) feet of the penetration as being effective. Thus, the penetration considered effective was 23 ft. for Pile No. 1, 43 ft. for Pile No. 2 and 63 ft. for Pile No. 3. No. 4 pile was lagged for 19 ft. of its length (commencing 5 ft. from the point) with two 12 in. by 12 in. timbers, tapered to 7 in. by 12 in. at the lower end and bolted to the pile web. It was felt that due to the clay being displaced or remoulded by the lagging, no frictional support could be considered on the shaft of the lagged pile above the top of the lagging.

The pile driving hammer used for driving the test piles was a No. 0 Vulcan single acting hammer, weighing approximately 16,250 lb. operated by steam from the crane boiler. The weight of the ram was 7,500 lb. and its normal fall or stroke is 3 ft. 3 in. The weight of the leads was 1,500 lb. and the

Fig. 5—View of static test load and supporting grillage.

follower 420 lb., thus making a total weight of 18,170 lb.

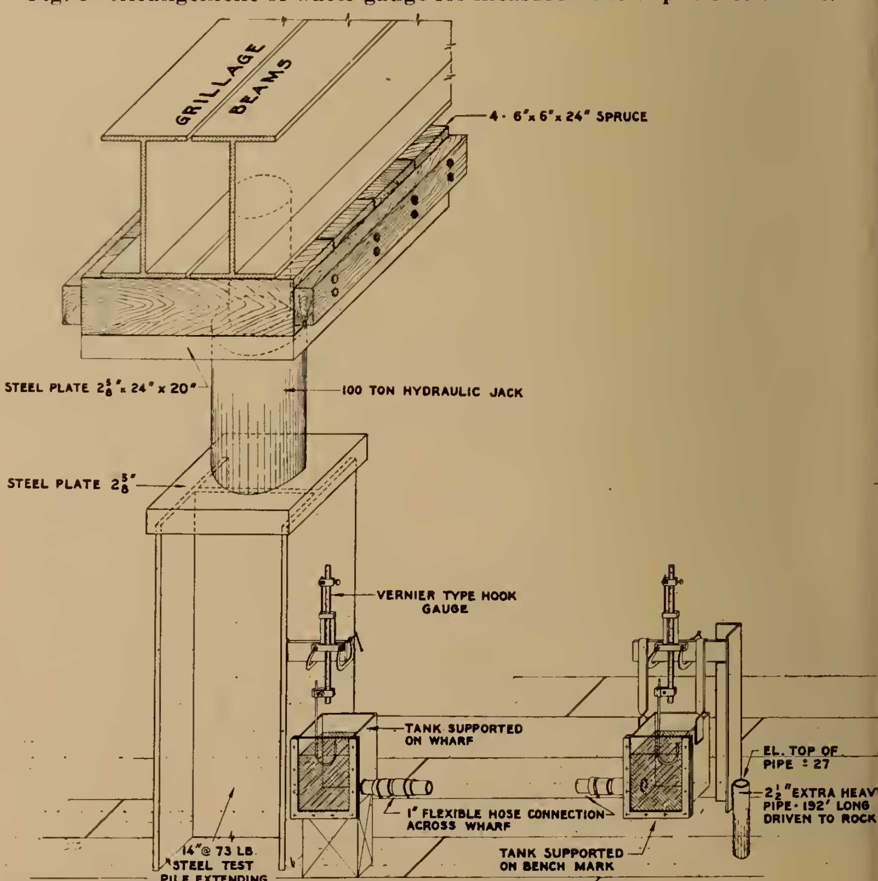
The records of the driving of the four test piles are shown in Fig. 4. Test Pile No. 1 was a single 59 ft. 6 in. length of steel section. When set in place it settled a distance of 7 ft. 6 in. into the silt under its own weight of 4,345 lb. When the weight of the hammer, leads and follower were placed on it, the pile settled an additional 22 ft. 5 in. in one minute's time. The hammer had to be removed to prevent the pile from settling more than the specified penetration of 30 feet.

Test Pile No. 2 consisted of a lower section 59 ft. 6 in. long and an upper section 20 feet long. The lower section was set in place, similarly to Pile No. 1, and settled a distance of 8 ft. 6 in. under its own weight. When the hammer was placed on this pile section it settled an additional 25 ft. 8 in. The hammer was then removed to prevent further penetration and to provide sufficient projection above the wharf deck for splicing. The top section was then spliced to the lower section by welding, using three steel plates and a butt weld. The hammer was again placed on the pile and as no further settlement occurred, driving was then started and continued until the final penetration of 49 ft. 10 in. was obtained.

Test Pile No. 3 consisted of a lower section 59 ft. 6 in. long and an upper section 40 feet long. The lower section was set in place and it settled a distance of 7 ft. 4 in. under its own weight of 4,345 lb. The hammer was then placed on the pile and it settled an additional 5 ft. 10 in. As this pile did not settle under the weight of the hammer as Piles Nos. 1 and 2 had done, it was thought that it must be resting on some obstruction. Driving was started and continued until the penetration was 33 ft. 4 in. The hammer was then removed and the top section was spliced on by welding similarly to Pile No. 2. When driving was resumed an increase in driving resistance was noted. The driving was continued until the total penetration was 70 ft. The crane, used for the pile driving, had some difficulty in slacking off its line supporting the pile driver in order to keep up with the pile settlement, hence some of the hammer blows were not entirely effective.

Test Pile No. 4 consisted of a single 60 ft. length of piling lagged with timber. This pile did not settle under its own weight at all, and after several attempts a settlement of 1 ft. was obtained. Apparently the pile was resting on some obstruction. The hammer was then placed on the pile and it settled an additional 6 ft. 6 in. under this weight. Driving was then started and continued until the final penetration of 30 ft. 4 in. was obtained. Driving resistance seemed to increase as the penetration was increased, which was as expected.

Fig. 6—Arrangement of water gauge for measurement of pile settlement.



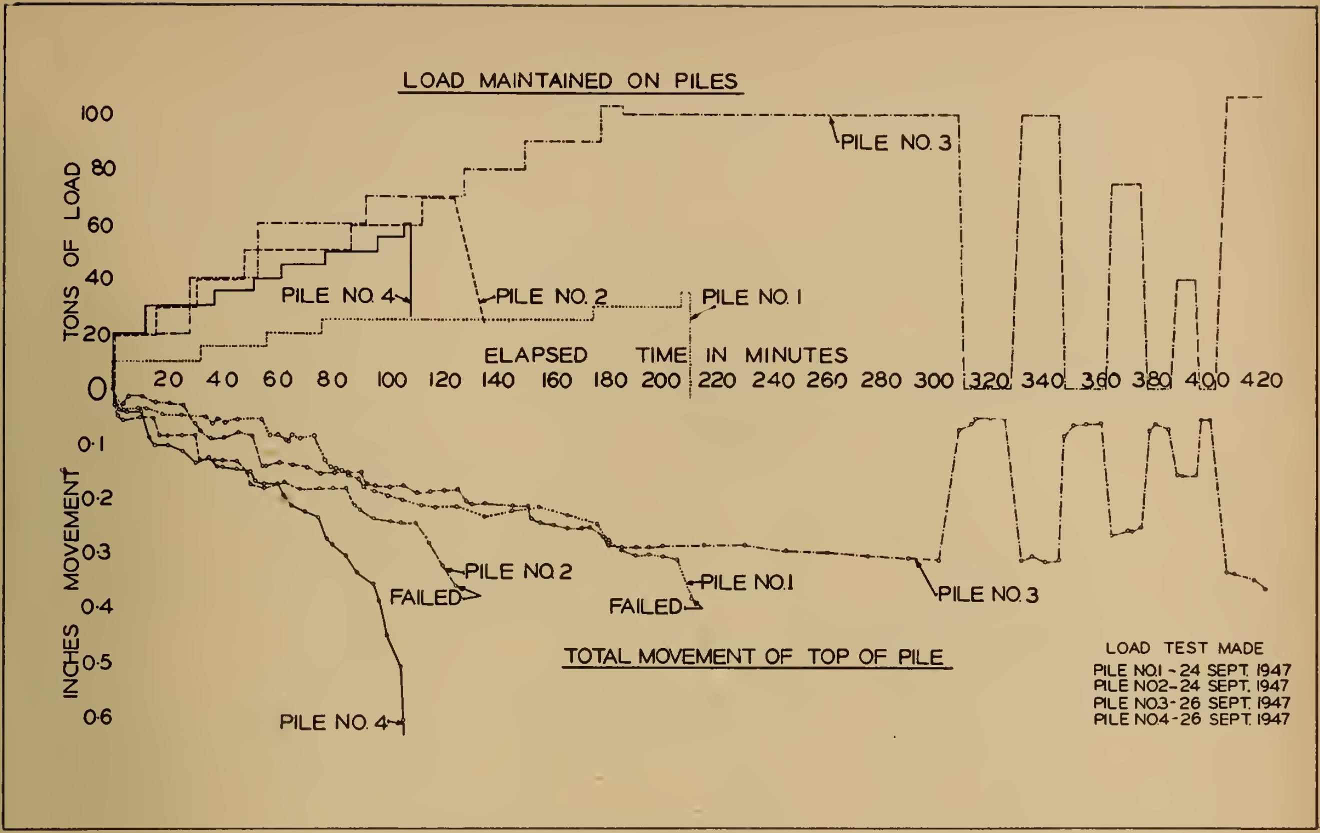


Fig. 8—Typical time-load-settlement curves for test piles.

Load Testing Apparatus

Loading Arrangement: The static loading of the test piles was carried out by means of a 100 ton capacity hydraulic jack resting on top of the test pile, and exerting a pressure against a static load above the jack. This static load consisted of a grillage of 24 in. steel beams resting on a cribwork of railroad ties on top of the wharf deck. A pile of 85 lbs. steel railroad rails, comprising a total weight of about 180 tons, was stacked upon this grillage. This load was so arranged that two piles could be tested without moving the load and there would be an effective resistance of approximately 100 tons over each pile. This load arrangement is clearly illustrated in Fig. 5.

Hydraulic Jack: The pump of the hydraulic jack was fitted with two pressure gauges, one registering to 2,000 lb. per sq. in. and the other to 20,000 lb. per sq. in. The jack was calibrated by the Donald Inspection Company on the testing machines at McGill University, and it was found that there was an error of 600 lbs. in the large pressure gauge. This 600 lb. was therefore added to actual readings for loads in excess of 40 tons.

The top or plunger of the hydraulic jack was capped by a steel plate 24 in. x 20 in. x 2⅝ in. thick and between this plate and the 24 in. grillage beams there was a wood block consisting of four pieces of 6 in. x 6 in. x 2 ft. spruce. After the completion of the test it was found that the 100 ton pressure had compressed these wood blocks for about ⅛ in. permanent set.

Settlement Measuring System: The settlement measuring system consisted of two small steel tanks connected with each other by means of a flexible one inch diameter hose lying on top of the wharf surface as shown in Fig. No. 6. A lug had previously been welded onto the side of the test pile and on this was clamped a standard Vernier depth gauge. A standard brass hook had also been attached, which projected down into water in the small steel tank mentioned above. This tank was approximately six inches square and about eight inches deep with clear glass on the one face.

Fig. 7—View of water measurement gauge at bench mark.

A similar lug and hook gauge was also attached to the bench mark (See Fig. 7). By measuring the difference between the initial hook gauge reading from this common water surface it was possible to determine the settlement of the test pile with reference to the bench mark. This system of measurement worked very effectively, and proved to be accurate to 1/1000th of an inch. As a check on this measuring system an engineer's level was used. Three wood piles had previously been driven between the existing wharf bents and a platform constructed independent of the present wharf structure and a standard engineer's "Y" level mounted on same. Level rod readings were taken but after considerable checking it was decided that the hydraulic system gave a much more consistent

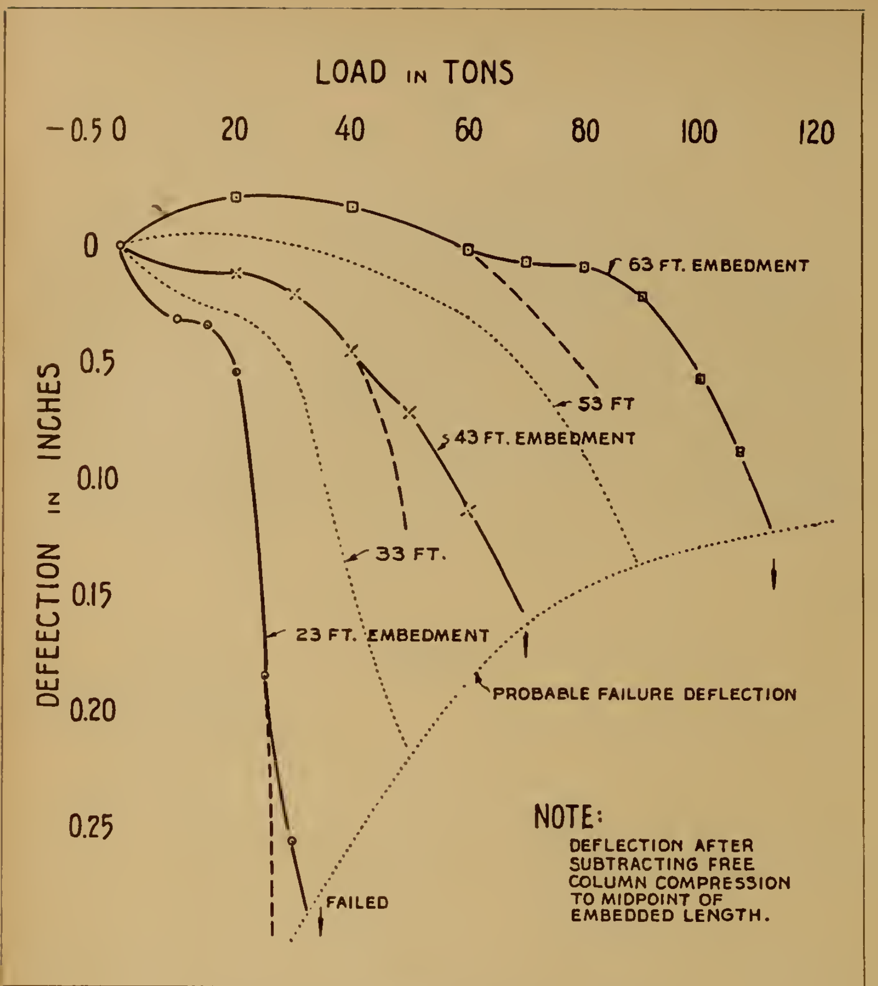

Fig. 9—Load deflection curve for test piles.

and accurate measurement of the pile settlement and the use of the level was abandoned.

Bench Mark: A bench mark was established close by the location of the test piles by means of driving 192 ft. of extra heavy 2½ in. steel pipe to bedrock. The top of this pipe was at +27.0 feet and the bottom was −165.0 feet. A steel angle was welded to the top of this pipe to provide a support for the hook gauge. After the tests of piles Nos. 1 and 2 were completed, the tank was supported on the cross-arm of the bench mark, and this system was used for piles Nos. 3 and 4. It was thought that this arrangement would better eliminate any vibration or movement of the water surface due to wharf movement.

Load Testing Results

The load tests were performed on piles Nos. 1 and 2 on September 24th, and as it took a day to move the test load, the tests were performed on piles Nos. 3 and 4 on September 26th. Thus, there was a rest period of six days between driving and tests for piles Nos. 1 and 2 and eight days for piles Nos. 3 and 4.

The time, loading and settlement readings for the test piles are shown graphically in Fig. 8. It is believed from the shape of the graphs that if smaller load increments had been used for Test Pile No. 1, especially a smaller final increment, the failure load of this pile might be nearer 33 tons than that of 35 tons as recorded, and this failure value will be used in the following comments.

The failure of piles Nos. 1 and 2 was clearly marked by the fact that, once the failure load was reached, the pile moved downward so rapidly that it was impossible to keep up the pressure on the jack or maintain a constant load on the pile. The failure of pile No. 4 was quite different from the other piles, in that the rate of settlement was much faster and larger than for other piles, but the failure was a gradual slackening off rather than an abrupt failure, as in piles Nos. 1 and 2. This was probably due to the taper of the lagging, resulting in a gradual remoulding of the clay with this wedge action tending to hold up the pile.

There was not sufficient weight in the test load to cause complete failure of test pile No. 3. With the ultimate load of 107 tons on the pile, the grillage beams supporting the rail loading were clear of the wood cribbing, indicating that all available load was carried by the pile. With this pile it was possible to observe the permanent set of the pile by repeatedly removing and applying the load in decreasing amounts.

Figure 9 shows the load vs. deflection curves for the four test piles. The straight lines superimposed on the graphs represent the axial shortening of the steel piles themselves, varying with the applied load, depending upon the column length under stress. It is apparent, in the case of pile No. 3 especially, that the lighter loads were carried entirely by the upper part of the pile in friction. As the load was increased, more of the load was transmitted to a greater depth, as the soil surrounding the upper part of the pile yielded from shearing stress, until eventually some load reached the point. Up to this time, the load-deflection curve had a smooth parabolic shape. When the point resistance comes into play, a different stress-strain characteristic becomes evident, resulting in the changed shape that appears in the curves for all of the piles.

It might thus appear that each curve is made up of two curves, one superimposed upon the other. The first of these curves would start at zero and curve steadily downward and could be extrapolated, as shown by the dotted lines in the graph, and interpreted as the relationship between stress and strain for friction support alone. The second, superimposed on the first, is probably the stress-strain relationship for the point support alone.

If we take the hypothetical failure load by friction alone from these extrapolated curves and divide the load so found by the actual failure load, the following values might be developed:

Test Pile Number	Hypothetical Frict. Failure Load (Tons)	Actual Failure Ld. (Tons)	Percent Friction	Average Friction at Failure (Lbs. per Sq. Ft.)
1	25	33	76	360
2	56	70	80	480
3	96	116*	83	590
4	35	52	67	440

* Estimated.

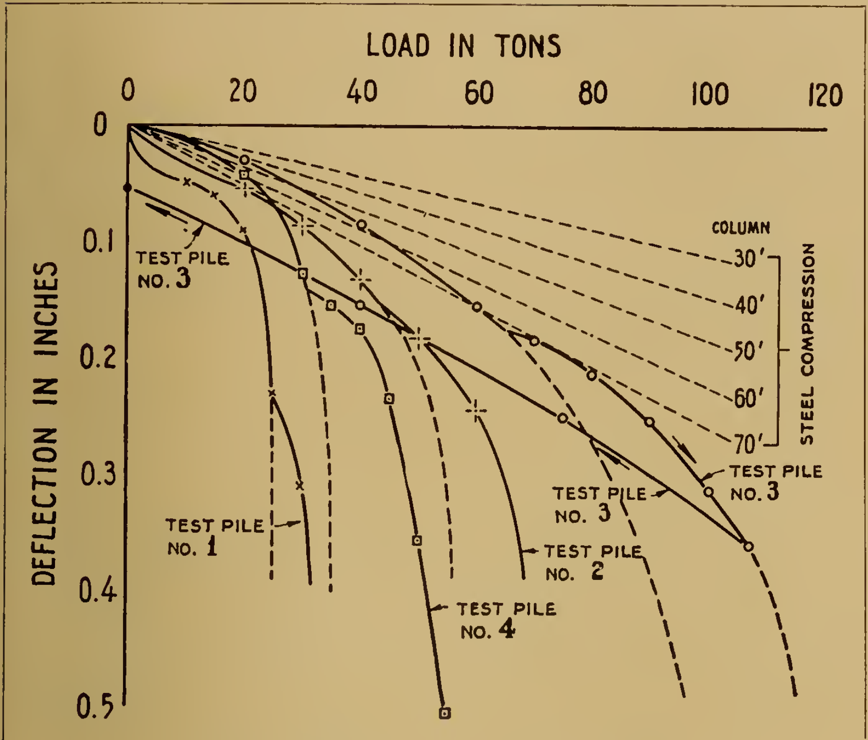

Fig. 10—Deflection of soil under pile loads.

Assuming the effective depth of penetration for piles Nos. 1, 2 and 3, as 23 ft., 43 ft. and 63 ft., respectively, and the circumference of the pile as 4.66 ft., based on the sides of a rectangular section, we have a surface area of 107, 200 and 294 sq. ft., respectively, for these piles. Based on the failure load of 33 tons for pile No. 1, 70 tons for pile No. 2 and the ultimate load of 107 tons placed on pile No. 3, we have an average surface frictional value, neglecting any point resistance or support, of 615, 700 and 728 lbs. per sq. ft., respectively, for these piles.

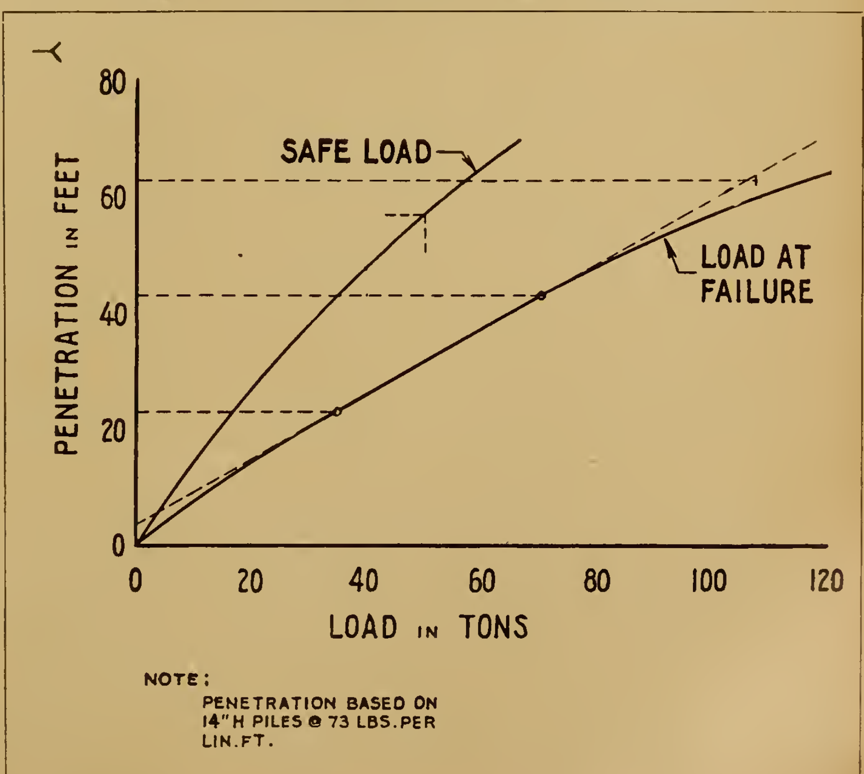
Interpretation of Test Results

The results of these pile tests have been carefully analyzed by Mr. E. H. Harlow, Foundation Engineer of Frederic R. Harris, Inc. and the comments regarding Fig. 9, in the last three paragraphs above are those of Mr. Harlow. Based on these results Mr. Harlow has prepared Fig. 11, from which we can obtain the pile load vs. penetration relationship for the design of the New Wharf. The bearing values given in this figure are based on a factor of safety of 2, determined from the pile failure values, and

It is obvious that these values are only approximations for in several cases it is difficult to extrapolate the final position of the curves with any assurance, but it is logical to assume that when a stress-strain relation suddenly changes its character, another factor has begun to exert an influence. We know that at light loads, friction in the upper soil strata carries the full load, and it is reasonable to believe that when the stressed part of the pile reaches the point, and the point tries to punch downward, the load-deflection relationship for this action will follow a different pattern from that developed by frictional resistance on the sides of the pile. It is believed that this condition is the cause for the definite break in these load-deflection curves.

Figure 10 is a load vs. deflection curve, which is developed to show the deflection of the soil under the pile load after subtracting the free column compression or shortening of the pile taken to the midpoint of the embedded lengths.

Fig. 11—Pile load penetration relation for pier design.



assuming the clay under the wharf site to be similar to that found at the location of the test piles. The soil samples taken from the other borings on the wharf site confirm this condition.

With reference to possible pile settlement over a long time period, we have an excellent reference in Duncan's Wharf and the "Old Paper Wharf". Duncan's Wharf was constructed in 1938 and supports two large steel bulk cargo unloading towers weighing approximately 140 tons each. (A third unloading tower was added in August 1947). This load is never removed from this wharf and the towers are usually tied up close together for the winter or closed navigation months. During the winter it is also estimated that this wharf carries an ice load equal to 500 to 650 lbs. per sq. ft. of wharf. With all this concentration of load, there does not appear to be any appreciable settlement of these piles up to the present time.

The "Old Paper Wharf" was constructed in 1920, and is of all timber construction with pile bents at 10 ft. centres. No records are available of the pile lengths or pile driving for this wharf. However, parts of the wharf have been known to have been loaded for long periods of time to 15 or more tons per pile, and no settlement was apparent. The soil condition at these wharfs is very similar to that found on the site of the New Wharf. Thus, with these illustrations so close at hand, we need anticipate little settling with time for the new wharf structure.

Duncan's Wharf is of all timber construction, with pile bents at 10 ft. centres. The piles are spaced to carry a maximum design load of 15 tons. An examination of the pile driving records for this wharf show that the piles used in the outer end of the wharf were from 85 to 93 feet long with 9 inch tip and 19 inch butt. The shorter piles vary from 75 to 85 feet long, and have 7 inch tip and 14 inch butt. They were all driven with a McKiernan-Terry Hammer No. 9-B-2 using steam at 125 pounds pressure. The last blow penetration of these piles for an average penetration of 35 to 40 feet varied from 0.10 to 0.60 inches.

Some of the piles were lagged with four pieces of 3 in. x 6 in. plank, with lengths varying from 4 feet to 8 feet long, and located from 6 to 10 feet from the pile tip. These piles seemed to drive to better alignment when the lagging was located more than 6 feet from the tip. The lagged piles settled from 2 to 5 feet under the weight of the hammer and the unlagged piles from 5 to 15 feet, depending on pile size and hammer.

There was considerable irregularity in the driving of all piles, whether lagged or plain, for the same total penetration. Piles in the same bent or adjacent bents without lagging might be much better than lagged ones for the same total depths of penetration, or vice versa. No definite conclusions can therefore be drawn to show that the use of lagging is superior or inferior to the plain pile.

No load tests were made on any of these piles, and the only load carrying value was that found by computation, using the "Engineering News" formula and the final blow penetration. Such values, of course, are known to be very doubtful or inconsistent for piles driven in a cohesive or clay soil. Some of the piles were left 5 feet high and then redriven again after varying periods of rest.

With lagged piles and 40 feet penetration the reduction in the penetration for the last blow was from 29 percent to 42 percent for one day's rest and from 32 percent to 80 percent, with an average near 40 percent for a two day's rest period. There was one such test made on an unlagged pile having a 47 foot penetration, which showed a 65 percent reduction in last blow penetration for an overnight rest period. These tests might indicate that while the bearing value of the pile increases during a rest period after driving, its rate of increase might be greater for the plain pile than for the lagged pile. Such a condition could be caused during the driving operation by the remoulding of the clay surrounding this lagged pile.

Removal of Test Piles

Test pile No. 1 was pulled on October 2nd. The pile was moved with a load of 38 tons on the hydraulic jack, and was then removed by the crane. The side recesses of the pile were completely filled with clay to resemble a square section. Some scattered chunks of clay fell out in handling, but most of it was still in position after the pile had been placed on the wharf deck. The clay clinging to the pile was described as a "greasy" blue clay with no sign of any sand, shell or other materials of a different nature.

An attempt was made to pull test pile No. 2, but with a combined pulling force of 210 tons this pile failed to move and was abandoned. This combined pulling force was composed of 115 tons on the hydraulic jack, two rachet jacks at 35 tons each and a 25 ton pull of the locomotive crane. This same combined loading was applied to test pile No. 3, but no movement was obtained and this pile was abandoned.

Test pile No. 4 was pulled on October 1st. This pile was moved with a load of 43 tons on the hydraulic jack. The pile then had to be jacked up vertically for about 10 feet before the crane could handle it. The recesses of the H section were completely filled with clay, both above and below the lagged section. The clay clinging to the upper end of the pile fell out during the landing of the pile but at the lower end it only fell out after the pile had been laid horizontally on the wharf deck.

Acknowledgments

The Foundation Company of Canada, Limited, are the Designing Engineers and General Contractors for this new Port Alfred Wharf, Frederic R. Harris, Inc. of New York City are the Consulting Engineers. The pile driving and testing was performed by the general contractor. Mr. J. M. Thomas was their Special Engineer in charge of arrangements, and Mr. W. H. Hunter, General Superintendent. The testing procedure was outlined by Mr. E. J. Quirin, Chief Engineer, and directed by Mr. E. H. Harlow, Foundation Engineer of Frederic R. Harris, Inc., and witnessed by Mr. R. P. Pennoyer, Special Engineer of Carnegie-Illinois Steel Corporation, Mr. A. O. Hawes and the author.

The interests of the owners, Saguenay Terminals Limited, are being protected and directed by the General Engineering Department of the Aluminum Company of Canada, Limited, of which Mr. P. E. Radley is Chief Engineer, and the writer is Assistant Chief Engineer in charge of civil engineering work. Mr. A. O. Hawes is Manager of Construction.

Notes on Units & Standards

by

R. H. Field

and

L. G. Turnbull,

Metrology Section, National Research Council, Ottawa

An address given before conferences of officers of the Standards Division (Department of Trade and Commerce) held in Calgary on October 21, and in Ottawa on October 28, 1947.

This address outlines in simple and popular language the fundamental ideas behind the units and standards on which all engineering quantities are based. The authors, after defining the terms "units" and "standards", show how the former are nominal amounts fixed by definition, while the latter are the physical embodiment of the units. Standards of time, mass, length and volume in turn are discussed. Difficulties in the way of maintaining various standard units inviolate against the effects of temperature, pressure, humidity, time, etc., are explained. Some of the precautions taken in the National Research Council Laboratories for maintaining accuracy in comparing various unit quantities with standard units are enumerated.

In presenting a scientific paper or treatise, it is important for the speaker to define his terms. While this paper is not highly scientific, most of it has such a bearing on exact knowledge and definition that we should be clear about what we mean by the terms we employ. Two of these terms are widely used in the course of the duties of officers of the Standards Division, and are worth a little study. They are the common words "units" and "standards".

Units

First of all what do we mean by a unit? When we form an estimate of the magnitude of some physical quantity we mentally try to sub-divide it into a number of equal amounts of the same quantity. For example, when we see a pile of bricks we can guess the number of bricks it contains, simply because we have an idea of the size of a single brick, which in this case is our unit of measurement. In the same way we can speak or make calculations with regard to length, weight, capacity and so on. Even in more abstract cases we can reason intelligently regarding the number of units in any given quantity. A little thought shows that in all such cases we imagine a unit of some kind and mentally endow it with just that property or properties necessary for our calculations: whether such a unit could exist in nature in a tangible form is immaterial. It is commonplace to speak of units of measurement, such as feet, pounds, seconds, volts, degrees Fahrenheit and many others. We can be quite intelligible when we discuss such units or make calculations involving them, especially when in such cases, we deal solely with a single unique property of the unit.

Let us therefore define the unit of a physical quantity as being a nominal amount fixed by definition. It is, consequently, independent of all physical conditions such as temperature, pressure, geographic location, etc. These last considerations are very important, and I would like to emphasize them. Thus when we are talking of our unit brick for our brick pile, we say that there are 300 bricks in the pile and we mean just that. We don't care whether the unit brick is at a temperature of 20 deg. C, what the barometric pressure is, or whether the gravitational attraction is that in Calgary or in Ethiopia. It is just a brick.

Basic Units

In the case of the units employed to evaluate physical magnitudes, of which there may be many hundreds, it has been found advantageous to attempt to relate them to one another, or better still to a few basic ones. We can see how desirable it is to do this. If we fixed all of our units by definition but without regard to other units, and then afterwards found out that they could all be expressed in terms of each other, we would soon have a terrific confusion wondering which was the correct definition to apply in each case. The unit of volume is especially to the point, and

I would like to say more about this later. In this way we have found that as our knowledge of the true nature of physical phenomena increased, we have been able to boil down all of our units into three basic or fundamental ones viz. those of length, mass and time, (L, M and T). There are, of course, a few units the physical nature of which we do not at present understand, and which are therefore excepted.

Thus volume is obtained by multiplying together three lengths or as we say, it has the dimension L^3. In a similar way velocity is compounded from length and time, or can be expressed as LT^{-1}, while the unit of acceleration becomes LT^{-2}. Force has the dimensions MLT^{-2}, voltage $L^{\frac{3}{2}}M^{\frac{1}{2}}T^{-2}\mu^{\frac{1}{2}}$ (where μ is a so-called dimensionless constant—the permeability), current $L^{\frac{1}{2}}M^{\frac{1}{2}}T^{-1}\mu^{-\frac{1}{2}}$, and so on. These last two units are actually examples of the absolute system of electro-magnetic units, which is based on length, mass and time, and in the past year has been sanctioned by the International Committee of Weights & Measures. It is now officially adopted by all of the great national standards laboratories of the world.

Standards

So far we have been talking about units, things which we can picture in our minds, but which do not necessarily have a physical existence. When we come to actual measurement, however, we find we can do nothing unless we first have some material reference measure or standard, which in some way or other embodies the unit. The situation is now different. We see we are forced to use physical matter, and however simple we may make our reference measure, we are always up against the physical properties of matter and all that this implies.

A simple illustration of our difficulties is given by geometry. We study propositions and proofs about the relations of points, lines and planes. These have very simple definitions and we might call them our units. The moment, however, that we wish to make physical examples of these concepts (i.e. our standards), we find that we can only represent a point by a dot, a line by a streak and a plane by a sheet of, say, metal or glass. So the definitions of our ideal point, line and plane now become much more difficult and complicated, and must be hedged in with all sorts of requirements and conditions.

To repeat, we have on the one hand *a unit* which is a nominal amount of a quantity, fixed by definition and independent of any physical condition such as temperature, pressure, humidity, etc., and on the other *a standard* which is the physical embodiment of the unit, and which, in general, is dependent on physical conditions. We all know, for instance that the International Metre Standard is considered to be a metre of length only at the temperature of melting ice.

Basic Standards

We speak also as in the case of units, of *fundamental* standards which, as the name implies, form the basis of our system of standards and hence our system of units. As we have seen, from these fundamental standards others can be derived, e.g. volume from length, pressure from mass, length, and time. The actual realization even of these primary standards is not simple and they are not in every case ideal, that is to say unchanging and invariable. For example, we know that it is a metre in length today, but in a million years from now, would it still be exactly the same length?

Time

In making a few observations about these standards, let us first discuss very briefly the standard of "time". We will not even attempt to discuss it from a relativistic point of view. That would truly complicate matters, because if we drag in the theory of relativity, we would soon find ourselves rushing about the Universe equipped with clocks which, although they seemed perfectly accurate to us, would appear to someone else to be running slow.

Time is something which is continually flowing by, like a river or stream. Whatever time is, it is certainly different from length and mass which are essentially attributes of physical matter. To us, time implies the length of a duration between separate events. The ancients used for their standards the duration between pulse beats, day and night, lunar months, and recurring seasons. Today, the astronomers use as their standard the sidereal day. Due to the rotation of the earth this is the time which elapses between two successive passages of the same star across a certain imaginary line, called a meridian.

Although the sidereal day is the best time standard we have, it is not altogether ideal or invariable. There is evidence that the speed of the earth's rotation is slightly erratic and moreover, it is very gradually slowing down, due in part to tidal friction. It is not, however, intended to give the impression that our fundamental standard of time is not a good standard, for it certainly is. It is merely necessary to understand that excellent though it is, it is not ideal.

We do have, however, a very curious situation in the case of some of our most precise clocks. These can actually measure an interval of a single day more accurately than the standard sidereal day can itself be measured, but over a long period of time our natural standard is infinitely more reliable than our artificial clocks. Before leaving this subject it should be pointed out that another standard which may turn out to be ideal has been suggested. It is the period of vibration of certain kinds of light.

Mass

In the case of mass, our physics text books tell us that it is measured by inertia, which is proportional to the amount of matter in a body. It is difficult to define inertia, but one definition is recalled which states that it is the "stay-as-it-is-ness" of a body, whatever that means. Anyway, it is of little help here. So, in the end we are forced to take as our standard a certain lump of matter described by law. In our case, the Dominion Standard Pound is a cylinder of platinum-iridium alloy, while the International Kilogram is a nearly similar, but larger cylinder preserved at Sèvres in France.

We all know that over a period of time physical matter may change, however imperceptibly, by chemical or other actions. It is quite possible that this can happen to our mass standard, even when it is sealed up in a vault. Then, too, from time to time, it has to be intercompared with secondary standards, and it is almost inevitable that during this procedure it must suffer some slight wear, with consequent loss of mass. So we see that despite the apparent simplicity of the quantity concerned, it is by no means a reproducible and invariable unit.

It has been suggested that a natural standard, such as the mass of the hydrogen atom (which is 1.6×10^{-24} grammes) on the one hand, or the mass of the earth

(6×10^{24} kilogrammes) on the other be adopted as ideal standards, since each is considered to be invariable. But it is difficult to believe that the precision of determining such standards can ever approach the remarkable accuracy of 1 part in several hundred million attainable in the most precise comparisons of the masses of two one-kilogramme standard weights made on the balance.

Length

Next, let us see how we fare when we deal with the fundamental standard of length. Our Dominion Standard Yard, as you know, is defined by the distance between two particular lines ruled on gold plugs inserted in a certain bronze bar, when the bar is at a temperature of 61.91 deg. F. and is supported in a certain way. We have also the Canadian Standard Metre, verified, in terms of the International Metre. While there is no evidence of any secular change in the International Metre or for that matter in the Canadian Standard Metre, some of our secondary standard bars or rules which at the time of their manufacture had been submitted to the best known methods of heat-treatment, have shown a progressive shortening since their purchase about 25 years ago. It has been brought to our attention, on the other hand, that bars made of nickel-steel alloys, similar to our own have been progressively lengthening at the National Bureau of Standards in Washington and at the National Physical Laboratory in England. With such evidence confronting us, can we positively say that the International Metre itself will remain invariable forever?

Some years ago it was strongly recommended that a natural standard, the wave-length of the red radiation from Cadmium, become the standard of length. Indeed in 1927 the International Committee of Weights and Measures adopted an alternate and provisional definition of the metre in terms of the number of cadmium wave-lengths it contained. These light-waves have the virtue of being extremely small, the average length being about 20 micro-inches, and it is possible to have at our disposal a number of different wave-lengths each of known value. They are very useful in Metrology and are universally employed for measuring such precision measures as Johansson gauges to an accuracy of about a millionth of an inch Light-waves, however, like natural standards, are affected by atmospheric temperatures, pressures, etc. As far as we know, however, they are always the same when brought to the same physical conditions which, as we have seen, is not the case with all of our metal bars. But again, where we once thought that the cadmium red radiation was a pure wave, it is now known that this is not quite true. Scientists are, therefore, now looking for new and purer radiations, such as isotopes of mercury. And so the search goes on.

Volume

Something might be said at this point about derived standards, of which volume is a good example. As we saw earlier, the unit of volume has the dimension of length cubed. Hence at first sight it would appear that the standard of volume should be linked directly to the standard of length. In actual practice, however, the measurements of volume in terms of a length standard is very difficult. Take for instance one of the simplest of solid bodies, the cube. In order to determine its volume from length measurements, we have to ascertain that all six faces are truly plane, and that adjacent faces are perpendicular to each other to a very high degree of accuracy. In this connection, an error of only a thousandth of a millimetre in the measurements of the distance between opposite faces of a cube of 10 cm. side would produce an error of about 30 cu.mm. in the volume. Hence the practical realization of such units as the United States gallon from its definition of 231 cubic inches is by no means an easy task, even for the most efficiently staffed and lavishly equipped metrological laboratory.

The Metric Standards

It is considerations of this kind which prevented the exact embodiment of the ideal of the metric system when it was first conceived back in 1792. It was intended that the litre was to be equal to a cubic decimeter or 1000 cubic centimeters, while the kilogramme was to be the weight of a litre of water under stated conditions. Actually it was found necessary to construct the kilogramme and the metre, each as a distinct unrelated standard. These were known as the "kilogramme des Archives" and the "mètre des Archives", respectively. A few years after their construction it was found by careful experiment that these standards did not fulfil the terms of the original definition, i.e. that the weight of a cubic decimetre of water did not equal the weight of the kilogramme des Archives.

Later, in 1875 when the International Metric Commission was formed and the problem was taken up of constructing new standards to form the fundamental international standards and the national prototypes (these latter for distribution throughout the world) it was decided to make them conform as closely as possible to the Archives standards. Still later, in 1901, since the exact significance of the term "litre" was still in doubt, it was defined by the International Committee of Weights and Measures as the volume occupied by an International kilogramme of water under stated conditions. But it was not until 1910 after a long and difficult series of experiments that the International Bureau of Weights & Measures found a reliable figure for the cubic contents of the litre. This turned out to be 1000.028 c.c.'s, and hence one millilitre is *not* equal to one cubic centimeter. How many of our teachers made this distinction to us when we were studying our elementary physics? It is interesting to note that the figure determined by the I.B. forms the basis of our most reliable conversion tables for other units. For example, you can use this result to calculate the number of cu.ft. in an imperial gallon or the weight of a cu.ft. of water.

Measurement of Liquids

It is also interesting to note that a flask which at room temperature contains a quantity of water weighing 1000 grammes, and which we might think of as containing 1000 cc., has an actual volume of water of approximately 1002 cc., due to its thermal expansion from its maximum density at 4 deg. C.

The thermal expansion of liquids has been known for a long time. Many a gasoline station attendant has discovered this fact for himself on a hot day; especially where the old fashioned hand pumps were concerned. With these, gasoline could be pumped from a cool tank underground, to a glass container above, which was exposed to the hot summer sun. We don't know how many gallons this type of container held, but we do know that you could pump 30 gallons up into it and sell 31 of them.

Mass, as distinct from volume, is independent of temperature and it would only be by selling liquids by weight that constant amounts could be realized. You could always pay the same price for the same potential mileage of the fuel used in your car.

Standards in the Laboratory

As we observed when discussing units, the relation between the electrical standards and those of length, mass, and time are even more complicated. Most elaborate equipment, to say nothing of laborious observations, followed by difficult calculations, are required to derive those standards. In fact much of the activity of such well-known institutions as the National Physical Laboratory in England and the National Bureau of Standards in the United States is devoted to the realization of accurate values of derived standards. The work is of such a nature that in nearly all countries it is confined to the well-equipped and well-staffed central government laboratories. In Canada these functions are undertaken by the National Research Council.

Even when we restrict ourselves to the comparatively simple fundamental standards, in comparing similar measures, say of length or mass, many complications may arise. As the need for accuracy becomes more pressing (as say in comparisons involving the fundamental standards themselves) so does the operation become complicated by numerous secondary measurements of temperature, pressure, humidity, time and so on. The control of such quantities is sometimes difficult, and in addition, due to known and accidental sources of error in himself, his instruments and in the secondary measurements, the metrologist must make his primary measurement many times before he will commit himself to the value of his result.

Let us consider just a few complications in connection with the very accurate comparison of two masses. In the first case, a high precision balance is necessary. In the National Research Laboratories we have a balance which will, under the best conditions, compare two one-kilogramme weights to an accuracy of about one part in 50 million. We keep this instrument in a temperature-controlled room, to make sure that its relevant parts preserve their correct ratios. The weights themselves are placed in the balance case several hours before the comparison is begun, so that they will come to equilibrium temperature with the balance.

The observer reads the balance indications with the aid of a telescope from the far side of the room, for here again he is dissipating heat at a rate something like that of a 100 watt lamp. Temperature, pressure and humidity are carefully measured to determine the air density when the weights are of different materials and hence of different volume; for in the case of two one-kilogramme weights, if one is steel and the other brass, the steel kilo has a greater volume, and hence the buoyant force of the air which it displaces is greater, making it lighter than the brass by about 10 milligrammes when weighed in air.

The National Physical Laboratory has built a remote controlled balance which, it is claimed, will compare two one-kilogramme weights to an accuracy of about 1 part in several hundred million. This instrument has an automatic arrangement which can interchange the weights from one pan to the other while the knife-edge is still in contact with its plane. We can see that this is necessary when we consider the tiny contact area, and consequently the very great intensity of pressure of probably several hundred tons per square inch on the knife-edge itself, and which might deform it differently every time the arrestment is released.

When such accuracies are considered, the size and shape of the weights involved become highly important, for as you know weight is proportional to the gravity acceleration, and consequently if the centre of gravity of one of the kilos is only one-tenth of an inch above that of the other, the difference in their weight due to this should be detectable by this balance.

It is believed by scientists that the ultimate attainable precision of a balance when used in air will be limited by molecular bombardment against its moving parts, which is a remarkable tribute to a measuring instrument which was one of the very first to be devised by mankind.

Universal Chinese Standards

In conclusion let me mention an ancient Chinese standard, described in a publication of the Chinese Ministry of Industries in 1934. This standard was established in 2700 B.C. and consisted of a piece of bamboo. When the distance between two knots was such that the bamboo when used as a whistle emitted a certain note, it gave the standard of length. The one-hundredth part of this length was the breadth of a grain, while the volume of the cylinder of bamboo capable of containing 1200 of these grains was the standard of capacity. The weight of 1200 grains was the standard of weight. You will observe that this was primarily based on the vibration or the frequency of the emitted note, which is linked up with the wave-length of sound, just as we are proposing to do nearly 5000 years later, in adopting a light wave-length as the basis of the metric system.

BARK REMOVAL

by the

HYDRAULIC METHOD

A paper prepared for presentation at The Annual General and Professional Meeting, The Engineering Institute of Canada, Banff, Alberta, June 4, 1948

by

P. R. Sandwell, M.E.I.C., *Chief Engineer*

G. Goumeniouk, M.E.I.C., *Research Engineer*

R. M. Stewart, M.E.I.C., *Project Engineer*

Powell River Company Limited, Vancouver, B.C.

The authors outline the fundamental principles behind the hydraulic method of bark removal. The Weyerhaeuser Barker, installed in 1943, one of several types of hydraulic barkers, is described, and the results obtained over twelve months operations of a similar installation at Powell River, installed in 1946, are recorded. Savings of 10 per cent of wood per unit of newsprint, and 20 per cent per unit of chemical pulp by this method, have been effected. Less power and labor are required. The hydraulic method has gained wide acceptance among large Pacific Coast pulp and paper producers, and has proved of inestimable value to the industry and to our economy generally.

In the manufacture of wood pulp the pulpwood must be free of bark and rot. The early method of peeling the logs in the forest has been almost entirely superseded by less costly methods, removing the bark in the pulp mills by means of various debarking machines called " barkers ". In the Pacific Coast region of North America the largest and most economic machines developed in recent years remove the bark and rot by means of hydraulic jets applied in various ways.

History of Method

Prior Methods

The wood pulp industry was first established in regions where the trees were relatively small (plus or minus 8 in. diameter). The first machine to replace the woodcutter with his peeling knife consisted of apparatus for rotating several knives (by means of power), against which the operator could press a billet of wood. Such machines not only removed the bark but the wood directly beneath it. Where rot was present it was often necessary to remove a significant quantity of wood to get to the bottom of the seam in which the rot was found.

Such machines were later followed by barking drums, i.e., rotating cylinders with ribs on the inside by means of which the pulpwood sticks were tumbled, one against the other, until the bark was removed. As a matter of fact, this " friction " method of removing bark is used in a variety of successful modern machines of various types. It is, for example, the method most commonly used in Eastern Canada and in the Southern United States, where the pulpwood sticks are round, thus allowing the drum barker to be effective.

On the Pacific Coast, wood-pulp is made from logs of an average diameter of approximately 20 in., with extremes of diameter as high as 60 in. In order to be able to treat such wood in drums, it was necessary to saw the logs into billets of approximately the same size as the pulpwood sticks found in other parts of the country. In such sizes the wood billets are no longer round, and the effectiveness of the drum barker is much reduced. An alternate method, widely used before the introduction of the hydraulic method, consisted of cutting the logs into cants and then removing the outer bark by means of rapidly rotating cutter heads on machines especially designed for the purpose.

Economic Problem on Pacific Coast

No matter whether the log was first cut into billets or into cants, the waste, in the form of sawdust and edgings, was considerable. Particularly in the case of the machines with the rotating cutters, the loss of wood adhering to the bark was relatively large. The actual amount of waste often reached 20 per cent of the original volume. In cases where the wood was eventually converted into chips for the manufacture of chemical pulp, it was evident that if the complete log could first be debarked and then converted directly into chips, without the intermediate slabbing process, the savings would be of great significance. Thus, there was an obvious need for any type of barking machine

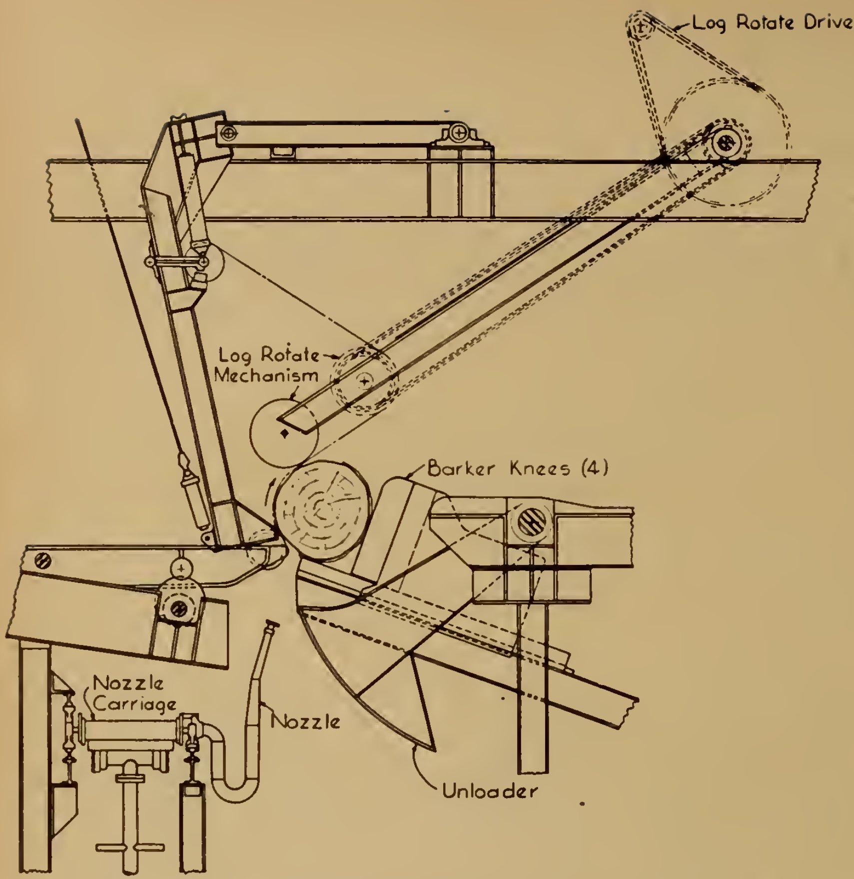


Fig. 1—Section through hydraulic barker showing log support and rotate mechanism

which would remove the bark from complete logs. It so happens that the hydraulic method, in which destructive jets are used, was the first to achieve commercial recognition.

Development of Hydraulic Method

It has been known for many years that a high velocity stream of water directed against a log would remove the bark without damaging the wood beneath it. Early experimental work was hampered by a lack of reliable pumping equipment. When this difficulty had been overcome, experimental work by different investigators resulted in various mechanical arrangements to provide motion of a jet or multiple jets relative to the log, as well as in various hydraulic circuits arranged for the delivery of a thin sheet of water either approximately tangentially or approximately perpendicularly to the log.

Apart from the fact that for the debarking of large whole logs, the hydraulic method was developed faster than the mechanical method, it soon became evident that the hydraulic method had distinct advantages, particularly with an increase in the irregularity of the surfaces to be barked. In fact, this ability of the hydraulic barker to handle irregularities has been exploited to extend the range of size and shape of wood which may be handled. Where a large range of such variations exist it now completely overshadows other barkers.

Furthermore, because the hydraulic barker is capable of expending an almost unlimited input of power, it is theoretically capable of almost unlimited capacity. Thus, on the Pacific Coast, where large variations exist in wood size, species, shape and conditions, and where high capacity is required, the hydraulic barker has offered distinctive advantages which could not be overlooked.

Nevertheless, in its present state of development, the hydraulic barker brings with it certain troubles and disadvantages. It is expensive, inefficient in the use of power, and (in its present state) is still hampered by misapplications both in principle and in mechanical and electrical details. This is to be expected in the early stages of development.

Basic Principles

Nature of Bark

In general, the substance to be destroyed by a hydraulic jet may be said to lie between two extreme types: a non-porous material on the one hand, and a porous material on the other. The first may be a semi-homogeneous substance in which the stress causing destruction is low at the outside but increases uniformly to some high value on the inside. In the case of logs with bark resembling this material, which is of such a nature by virtue of its formation or as a result of freezing or some other process, the logs are usually referred to as " hard barking ".

The porous material, at the other extreme, is an irregularly composed substance, in which the stress causing destruction is uniformly low in a definitely bounded region on the outside and is uniformly high on the inside. The stress required for separation at the boundary between the two regions will be lower than the ultimate stress on the outside region. In the case of logs with bark resembling this material, which is such by virtue of a rough and porous outside surface, and by the existence of a weak zone between the bark and the wood, the logs are called " easy barking ".

Nature of Jet Action

The function of a destructive hydraulic jet is to stress the material to be destroyed beyond its maximum resistance, and then to remove such pieces as have been sufficiently damaged and loosened. Two things are essential: 1) a created pressure or pressure gradient applied advantageously to cause damage to the material; 2) a supply of energy to do work against the resisting forces during the removal of the material.

In the case of the non-porous material (hard barking) practically nothing will be removed until the maximum specific pressure created by the jet exceeds the lowest ultimate stress in the material. At that point the material will be removed in pieces of the order of magnitude of the particles in the jet. They will be removed to a depth at which the ultimate stress again exceeds the maximum specific pressure. Increase of the relative speed of the jet past the material increases the power required by the mechanism which provides the motion. If the jet removes material, most of the power goes into energy of removal; otherwise it goes into an increase of the kinetic energy of the rebounding fluid.

In the case of the porous material (easy barking) the maximum created stress in the material is greater than the maximum pressure created by the jet by a " porosity factor ". This is the ratio of the empty areas to the solid areas on a random plane through the material to be removed. The porosity to be considered is of the order of magnitude of the particles in the jet. Again, nothing is removed until the ultimate stress in the outside portion is exceeded, at which point pieces will be taken off which may be larger than the particles in the jet. In this case the lower limit of jet pressure which removes material depends a great deal on the physical configuration of the substance in the outside layer.

Furthermore, in the case of the porous material (easy barking), because barking is accomplished by blasting it off, the jet need not be solid but may contain air. The air provides a rapid means of transferring the created pressure through and under the material. Through the presence of the compressible air, a greater proportion of the kinetic energy of the jet can be used. However, for efficient operation, the relative motion between the jet and log must be high: the jet must keep up with the rate of propagation of the blast. This leads to low requirements as to the volume and pressure of water, but also to difficulties in construction.

Design Requirements

The requirements of the two conditions of barking may be summarized as follows:

1. Non-porous material (hard barking) requires a high pressure, well formed, solid, thin sheet jet of low traverse velocity, which utilizes an increased water supply by increase of its width while maintaining its thin dimension and traverse velocity. The thin dimension of the jet is one order smaller than the thickness of the bark to be removed.
2. Porous material (easy barking) requires a low pressure jet of high traverse velocity which contains air and, therefore, is not critical as to form. Increased water supply is utilized by an increase of traverse velocity and/or jet width. The thin dimension of the jet is of the order of thickness of the bark to be removed.

As a final generalization it may be said that for the barking of wood a fluid jet is required, consisting of a substance or substances provided with kinetic energy required to destroy and remove the bark. The kinetic energy of the particles would be graded, by variation of their density, all the way from the large specific amounts necessary to damage the strongest regions to be removed to the lowest specific amounts required to remove the damaged regions.

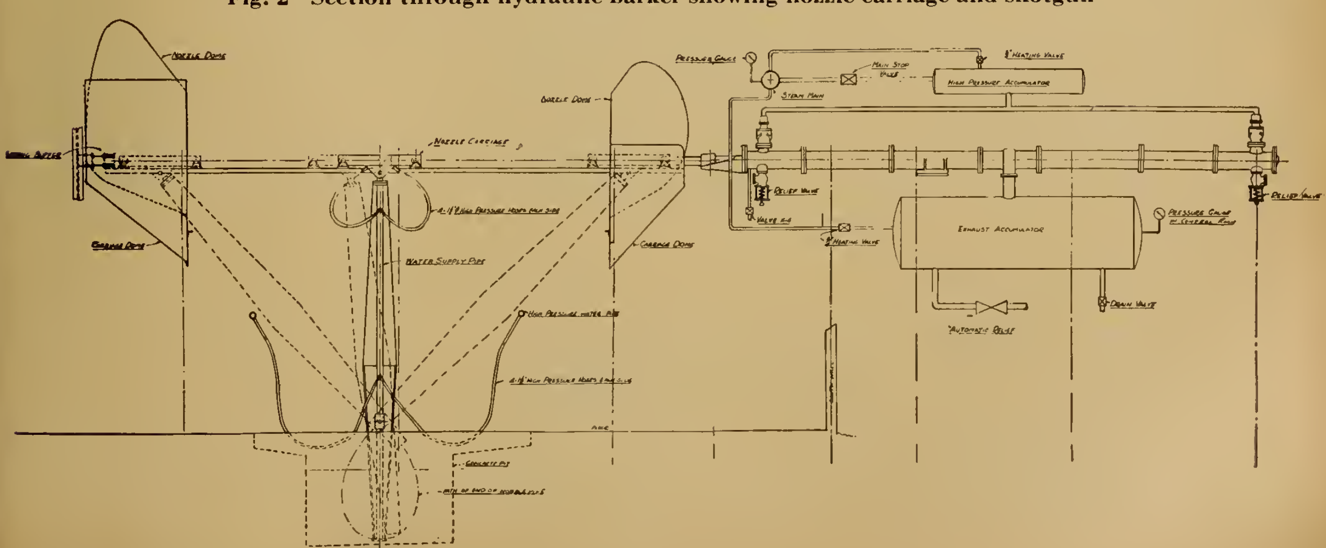
The generalized design of the hydraulic barker jet will consist of the choice of substances of suitable densities which can be conveniently obtained and handled. There is also the choice of a method which will provide particles with velocities such that the highest specific kinetic energies are slightly lower than those which would damage the wood. The actual distribution of specific kinetic energy throughout the particles of the jet or jets is governed by the nature and condition of the bark to be removed.

More specifically, the hydraulic barking process may be divided into two types:

1. Erosion barking in which the bark is crushed and worn off in relatively small pieces by a jet of water discharging from a relatively high pressure.
2. Blast barking in which, because of a weak zone between the bark and the wood and because of the porosity of the bark, the bark is blown off in relatively large pieces by a mixture of water and air discharged from a relatively low pressure.

The minimum power required is approximately proportional to the weight of bark removed per minute. It is approximately inversely proportional to the weight of the average piece of bark refuse which is formed during barking. There is almost no limit to the wastage of power during barking, because the wastage can be increased by prolonging the time that the areas already barked are washed by the barking stream. This inadvertently happens because the desirable speed of the jet relative to the wood is

Fig. 2—Section through hydraulic barker showing nozzle carriage and shotgun



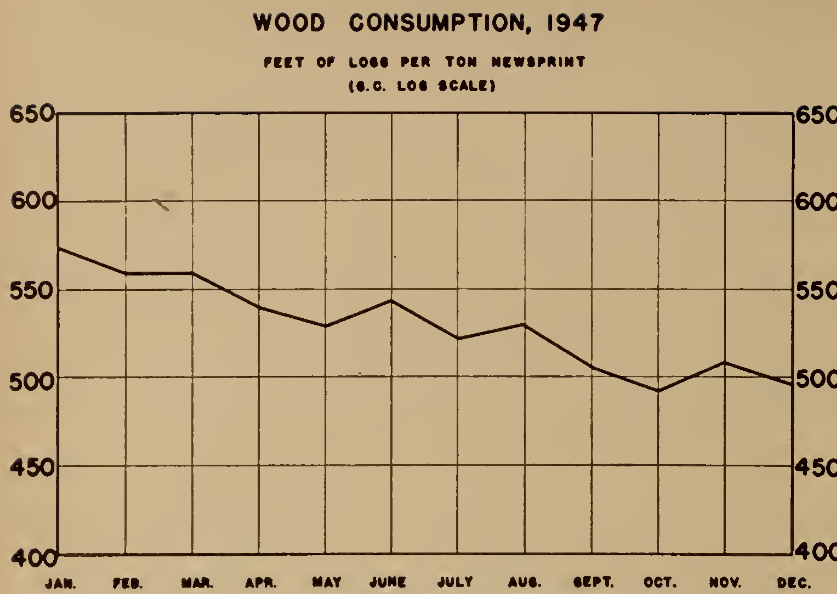


Fig. 3—Statistical record for 1947 showing effect of hydraulic barker on unit consumption of pulpwood per ton of newsprint paper produced

makes a difficult engineering problem. It can only be applied where the power supply is unlimited.

In view of all this, it is necessary to consider partial log length and partial circumference jets which are traversed relative to the log at right angles to their speed. The choice lies between jets moving past the logs circumferentially and jets moving past it longitudinally. The choice between moving the nozzle or moving the log lies with the former, because the weight of the moving parts can be much less, and can be kept constant once a design has been completed. A *rapidly* rotating nozzle with the log progressing endwise may be the best choice. However, until the problem of making a seal has been overcome to permit the rotating nozzle to be supplied with water from stationary pumps, the development of this type of machine will be hindered.

not usually obtainable. Therefore, it is desirable to remove the bark in pieces as large as possible. To that end a localized jet moving rapidly relative to the log is desirable.

The speed of motion should tend to approach that of the propagation of the blast along the log. That the jet must be localized is evident from the consideration that if the log were completely surrounded by jets there would be no place for the bark to go. Furthermore, at extremely high pressures, although the bark at the middle of the log would be crushed, very little of it would be removed. When the bark approaches the non-porous class of material, which requires erosion barking, many of the advantages of the hydraulic barking method disappear.

The Two Extremes

Carrying the basic design requirements somewhat farther, we find that the nozzle arrangement can lie between the two following extremes:

1. A nozzle to give a thin jet the whole length of the log, or part thereof.
2. A nozzle to give a thin jet completely around the log, or part thereof.

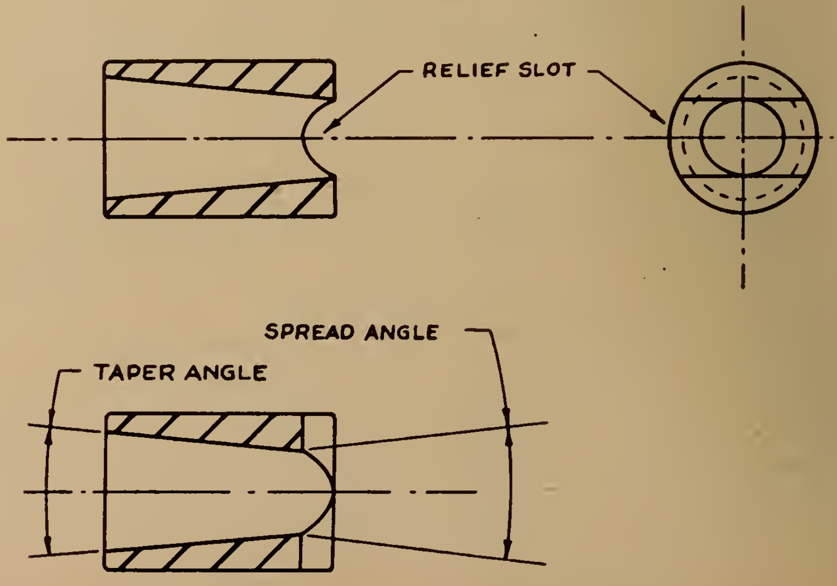
In the case of a full length jet, the log would make one turn. In the case of a full circumference jet, the log would move once through its length past the job. The full length jet, beside requiring enormous power, would certainly split the log. The full circumference jet, besides requiring enormous power, would require very high endwise velocities for its exploitation. There is some question as to the theoretical correctness of a full circumference jet. This is for the reason that bark failure would be restricted in one direction: that of greater bark strength. Also, because the nozzle should be angled against the motion of the log, desirable angles would make it difficult to move large logs through the jet. To move a full circumference jet past a stationary log

Final Choice a Compromise

The final choice seems to lie between a nozzle which spans the log circumference and moves longitudinally past an indexed or slowly rotating log, and a nozzle which spans the log longitudinally and progresses through the length of the log while the log is rotating rapidly. The first may be called the "axial" and the second the "circumferential" type.

The axial type of barker permits the attainment of a high jet velocity past the log, with a greater efficiency in the use of water and power. It has the disadvantage of mechanical and electrical complica-

Fig. 4—Typical hydraulic barker nozzle



tions, which increase both with the length of the barker and with the speed of the nozzle along the log.

Although the circumferential type of barker may have simplicity for an advantage, its performance depends almost entirely on the log characteristics. A log which is not round and straight cannot be rotated rapidly. Thus, to shorten the time of barking, the jet must be widened to cover more surface per turn of the log. If the barker is designed for maximum output on straight logs, widening the jet will split the log. Therefore, if irregular logs are encountered, the peripheral speed must be dropped to the detriment of production.

In choosing between the two types, one must compare mechanical complication on the one hand with long sensitivity on the other. Since it is economically desirable for a pulp mill to use logs which are unsuitable for the sawmill and related industries, it is desirable to avoid sensitivity and to choose therefore a slowly rotating log with a rapidly travelling nozzle. After all, the main reason for installing a hydraulic barker is to extend the range of size and irregularity of the logs that can be handled. There would be no justification in installing a type which would not perform well over a large range of size or on irregular wood.

Weyerhaeuser Barker

Support and Rotating Mechanism

A commercial barker, in which all of the above basic requirements have been met, was first installed by the Weyerhaeuser Timber Company at their Everett sulphite pulp mill in 1943. Subsequent installations with minor modifications have been made at their Longview sulphite pulp mill and at the newsprint and sulphite pulp mills of the Powell River Company in British Columbia.

The apparatus which is used to support and rotate the log is shown in Figure 1. It consists of skids and knees, which can be adjusted to suit the size and shape of the log, but which remain stationary, at will, during the rotation of the log. Rotation is accomplished by means of chains, supported by overhead arms, which wrap themselves around the log, thereby adjusting themselves to any irregularity. With this mechanism the log can be firmly gripped and its rotation can be controlled within the limits of the log irregularity experienced on the Pacific Coast. The speed of rotation can be adjusted to suit the condition of the bark. In cases where the bark is porous and loose, high rotational speeds are used. The range of surface speed is from 10 to 60 ft. per minute.

Jets, Carriage and Supply Piping

The jet mechanism is arranged to give a jet velocity of the greatest practical magnitude relative to the log in a longitudinal direction. It has been previously stated that the relative speed of the jet and the log should approach the rate of propagation of the blast. It is believed that the latter is of the order of 200 ft. per second. Wear of the hose mechanism has prevented the relative speed from exceeding approximately 25 ft. per second in operations which have been conducted to date.

The jets themselves are produced by two over-lapping nozzles which travel back and forth beneath the log while the log is rotated. Details of the nozzles are discussed in Appendix I. The nozzles are situated approximately 18 in. to 22 in. below the bottom surface of the log, and are directed at right angles to it. They are supported on a carriage of light construction which slides on micarta ways.

The carriage is driven back and forth by a " shot gun " steam cylinder of the type commonly used to propel sawmill carriages. Steam is admitted to the cylinder by means of electrically-operated automatic equipment. Once the operator has pressed a " start " button, the carriage will move back and forth continuously until he presses a " stop " button, whereupon the carriage is retracted into an end zone where the jets are discharged harmlessly. The nature of the shot gun and the carriage mechanism can be seen in Figure 2. This illustration also shows the flexible rubber lines which extend from the fixed supply pumps to the travelling carriage. It is the whipping and destruction of these lines which limits the speed of the carriage to the 25 ft. per second mentioned above.

Pumps

It has been found that, for the proper action of the jets, pressures in the range from 1200 to 1400 p.s.i. are required. Such pressures will allow the removal of the bark without destruction of the wood, provided that the jets do not remain in contact with the wood for too long a period. While the duty is not arduous, principally because the pumps operate under conditions of constant discharge and constant pressure, maintenance of high efficiency under conditions of continuous operation requires that the pumps operate practically without wear.

It is considered that the ideal arrangement of the pumps is one in which there are several units, of which one is always out of service but ready for immediate operation. Combinations of pumps can be so arranged that a low pressure can be delivered during the " easy barking " season, and a high pressure in the " hard barking " season. Actually it has been found that the high pressure is desirable at all times; the rate of production being adjusted to suit the condition of the bark.

Control Equipment

A variety of auxiliary devices such as the entry door, the indexing chain arms, the lift arms, the lift skids, the entry and exit deck chains, etc., are all operated electrically. By means of a system of relays and interlocks a sequence of operations may be started simply by pressing a button. A skillful operator can pass complete logs through the machine at the rate of 180 per hour. The operator can vary both the location of the knees which support the log, and the speed of rotation of the log. In addition to the automatic control, manual controls are provided to give the operator a means of meeting any unusual condition which may be encountered.

Related Log Transporting Equipment

The hydraulic barker itself, while somewhat complicated, is not a large piece of equipment. The barking plant as a whole, however, consists of numerous conveyors, transfer decks, trimming saws, loaders, unloaders, and kickers, and the necessary controls required to route the logs through them. All of this equipment, which has been inherited from sawmill practice, is to some extent sensitive to log irregularities. It works extremely well on round straight logs and not at all on logs with roots and limbs still attached. The investment in the auxiliary equipment exceeds the investment in the barker. The design of such equipment is quite as important for the successful operation of the plant as a whole, as is the design of the hydraulic barking unit. Provision for sorting of the logs, including the rejection and subsequent disposal of unacceptable logs, is essential to the efficient operation of the barker.

Results

Installation at Powell River

In the case of the hydraulic barker and related equipment installed at Powell River, the barker section was placed in operation in December, 1946. Several weeks were required to train crews, to overcome mechanical and electrical difficulties, and to adjust procedures to suit the new method. By July most of the wood required by the pulp and paper mills was being processed in the hydraulic barker. However, all of the wood was still being cut into billets in the sawmill before being sent to the pulpwood grinders and to the pulpwood chippers. In August, a new chipping plant of sufficient capacity to take complete logs up to 26 in. diameter was placed in operation. Approximately 40 per cent by volume of the pulpwood required by the pulp mills is converted into chips, the balance must remain in billet form for processing in the pulpwood grinders.

Statistical Records

The effect of hydraulic barking upon the consumption of wood per unit of newsprint paper is shown in Figure 3. With the method now in stable operation a unit consumption consistently under 500 ft. b. m. per ton of newsprint is being maintained. This is equivalent to a saving of at least 10 per cent of the original wood volume. In the case of chemical pulps the saving is over 20 per cent.

Costs

The total cost of a complete hydraulic barker installation, together with the alterations required to a conventional Pacific Coast wood preparation plant, may be as much as $2,000,000. In the case of the installation at Powell River. the reduction of waste alone is of the order of 1,700,000 ft. b. m. of logs each month. The annual saving in wood is worth, at current market prices, over $700,000. Moreover, the hydraulic method reduces the cost of operating labour. In some cases it actually requires less power than the aggregation of barking drums, knife barkers, chippers, conveyors, etc., to be found in the plants previously used. The hydraulic barker does away with the arduous and unpleasant work associated with the former methods.

Apart from the benefit to the owners of the plant in which the equipment is installed, the nation benefits to the extent that its resources are more effectively used than has been the case in the past. The hydraulic barker is, then, not only a means of earning money but a means of conserving our natural resources.

Conclusion

The commercial development of the hydraulic barker has taken place within the last five years. On the Pacific Coast, it has provided a means of removing bark from complete irregular logs without the necessity of cutting them into small pieces with a consequent waste of wood substance. For this reason it has gained rapid acceptance among the large producers of pulp and paper on the Pacific Coast. Several types of machines have been, and are being, developed. Only the barker described herein fully satisfies the theoretical requirements outlined in this paper. The others effect compromises whose purpose is to reduce the mechanical and electrical complication of the machines.

Disregarding the relative performances of the various types which have been installed, it can be fairly stated that the development of the hydraulic method has been of inestimable benefit to the Pacific Coast Pulp & Paper Industry, and to our economy generally.

Appendix I

Notes on Nozzle Design

A typical nozzle of the type used in the hydraulic barker at Powell River is illustrated in Figure 4.

In a conical nozzle, if the radial convergence and axial flow are symmetrical about the axis, the discharge will be cylindrical at the lower pressures. At the higher pressures, the discharge is an expanding cone (approximately 5 deg.) because of the explosion of the dissolved gases. If, in a conical nozzle, we remove diametrically opposite sides at the outlet, the discharge will expand into the openings so formed and will tend to form a fan. As cutting of the sides progresses, the fan increases its spread, eventually becoming stationary at an angle about a degree or two larger than the taper angle of the nozzle. The condition where the taper angle equals the spread angle is said to be at the " critical relief slot ". At a depth of slot approximately 20 per cent greater than the critical depth, it is said to be at the " full relief slot ". The critical depth equals approximately two-third the radius of the opening for the usual range of pressures and tapers. The relief slot is cut by a sprocket cutter sunk in approximately to a depth equal to the radius of the nozzle. The nozzle angles range from 9 deg. to 40 deg. The present nozzle angles are from 10 deg. to 11 deg. If the operation is in the " shallow relief slot " range the slightest wear and alteration at or near the perimeter of the opening alters the shape of the discharge. With the " critical relief slot " the dependence is not as marked, but the life of a nozzle is only about a month. The discharge is not perceptibly better at " critical depth " than at " full depth ", where the life is over eight months. (One pair of nozzles with stainless steel tips has been in operation since August, 1947). With " extra deep " relief slots the discharge is not as well formed as at " full depth ".

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

The President Completes a Task

Yesterday here at Victoria another president finished another tour of the branches. This time there were thirty-one meetings—three more than there are branches—and visits to sixteen universities. A new record for distance was set up, 16,000 miles being covered. The completion of a task of these dimensions is indeed a dedication of one's self to the Institute and the profession. Within two weeks time LeRoy Fraser Grant joins that exalted group of distinguished gentlemen—The Past-Presidents—with the satisfaction of knowing he has contributed something real to the advancement of the profession, and with the warm thanks and good wishes of all who met him.

The enthusiasm with which the president has been met at every branch is alike a tribute to him and to his predecessors. It is also a sign that the Institute is alive and is an influence in the land. It is an indication of an increasing usefulness and is an inspiration to those who give leadership in Council and in branch deliberations.

It is neither fair nor simple to single out a branch or a few branches for special mention. In almost every instance the number in attendance constituted a new record. The hospitality in every case was remarkable. The devotion to the Institute was uniform across Canada and was most inspirational. It was evident that the Institute is in a thriving, healthy state and that the future holds for it great opportunities and responsibilities.

New ground was broken this year by a visit to Prince Albert, Sask. Although it seemed as if the entire area were under floods, an enthusiastic group of engineers were able to leave their work of great urgency to meet with the president. With only ten members in that area twenty-seven engineers and wives turned out for a dinner meeting. The group requested that a Section of the Saskatchewan Branch be formed there with Prince Albert as the centre.

For the second time a president visited Kamloops, and again it was an inspirational experience. There were forty-two present at the luncheon. A request was received that a new branch be created for the area with Kamloops as the centre. This would embrace all the Okanagan territory including Penticton, Kelowna and Vernon.

The experience at Trail was similar to that of previous meetings in that it afforded the largest attendance of all meetings with the exception of one—Montreal. There were 192 engineers and wives there, and yet the membership is only fifty. It is characteristic of the engineers in the Kootenay district that the members of one society turn out for the special meetings of the others. A splendid spirit that does much for the profession and for the communal good.

At Vancouver the president spoke to the Board of Trade at a luncheon. His theme was " Canadians for Canada ". He urged employers to show more confidence in Canadian engineers and Canadian industry, pointing out by logic and by example that Canadians are competent to do the work required in Canada—that it is not necessary to employ engineers from another country to take care of Canada's needs. He argued that as long as Canadian governments and Canadian industry send to the United States for the brains to do the design for Canadian expansion just so long will young Canadians feel that their best future lies in that country. It is time to stop such thinking said the president and keep " Canadians for Canada ". (The *Journal* hopes to have Dr. Grant present this address for publication. Ed.)

At the conclusion of a tour like this, and with a few spare hours in this pleasant garden which is Victoria, in which to contemplate the recent past one may well wonder how many engineers in Canada have any conception of what a president gives to the Institute. Only a person who travels the distance in his company, can even approach an understanding of the task. Dr. Grant has been absent from his home on Institute business for almost four months. Besides visiting all the branches, he has attended every council meeting but two. He has represented the Institute at innumerable meetings of other societies in Canada and has twice visited the United States on the same mission. He has gone from his home to the west coast twice in the interests of the profession.

On most of these visits he has been accompanied by Mrs. Grant, who by her charm, tact and wit has added much to the pleasure of branch functions and the pleasure of travelling with the president.

L. A. W.

A Challenging Letter

Late in February of this year, Stewart Young, M.E.I.C., was elected President of the Association of Professional Engineers of Saskatchewan and Chairman of the Saskatchewan Branch of the Institute. On taking over the duties of these important offices, Mr. Young sent a letter to the members of the Saskatchewan Professional Engineers Association and to the members of the Saskatchewan Branch of the Institute. The message in this letter is stated most clearly and is of such importance that it is reprinted in the *Journal*, with Mr. Young's permission, without further comment.

"Let me first thank you for the honor of election to the highest office in your gift. In assuming my duties as President of the Association and Chairman of the Saskatchewan Branch, E.I.C., I make no promise other than to be heedful of my responsibilities.

"Sometimes I wonder whether or not we appreciate the trust that is ours. We bear a great responsibility, greater, I believe, than the engineers of any other country, in that we have the legislative right to determine and to discipline the members of our profession. I need not outline the reasoning in support of the system other than to say that it is an outgrowth of the British Craft Guilds and that the purpose is to provide a means of assuring the public of competent engineering services.

"Not long ago there was discussion of the advisability of limiting the powers of the professional societies. Why? Because of fear that some were acting more in their own than in the public interest. We have a double duty: first to the public and then to ourselves. It is our first duty to choose men of standing and to see that they deal fairly with the public.

"There is, however, a school of thought advocating regimentation; of which Owen J. Roberts, formerly of the Supreme Court of the United States said to a group of students: 'Reject the thought that the state is your boss. Let's stop talking as if we lived in a police state. The state is your agent and you are its master. Never forget that'. This thought was recently restated by Mr. A. J. Bater, President of the Saskatchewan Association of Rural Municipalities when addressing their annual meeting.

"And yet, I am not a little concerned over the future of our profession. Not long ago the well known Hollywood actor, Joe E. Brown, said: 'One of the greatest losses the world has suffered in the past ten years is pride of achievement. We all seem to want to get as much as possible for a minimum of effort'. I am not prepared to point a finger of criticism at our membership but I suggest that if we give the other fellow a little more than the contract calls for, our public relations will not suffer.

"Last fall I attended the National Conference on Community Planning in Montreal. There were engineers in attendance from Halifax to Victoria. My general reaction was that we are not living up to our opportunities. With slide rule and log tables we are daily working out engineering problems but so intent are we on each project that too often we fail to see the effect on its surroundings. Herein lies one of our opportunities—a chance to broaden our vision—a chance to do a better job.

"From time to time mention is made of the scarcity of engineers in public life. A few years ago there were none. Some of us have done our bit; others have not even tried. There are many opportunities for public service, in clubs and societies, on municipal councils and school boards. A good place to begin is in your own organization. In any event the benefit to be derived in character building is far beyond the effort expended."

Personals

Notes of the Personal Activities of Members of the Institute

R. E. Heartz, M.E.I.C., vice-president and chief engineer of the Shawinigan Engineering Company Limited has been appointed treasurer of the Institute.

He was born at Marshfield, P.E.I., and following graduation from McGill University, Montreal, in 1917, he enlisted with the Royal Flying Corps and received his commission with the Royal Air Force the following year. Upon demobilization in 1919 he joined the Fraser Brace Engineering Company.

In 1920 he began his long association with the Shawinigan Engineering Company. As resident engineer on power developments at Shawinigan Falls, La Gabelle, St. Narcisse and Paugan Falls, he gained engineering and construction experience, subsequently being transferred to the Head Office in Montreal. In 1935 he was appointed assistant chief engineer and since then has been associated with all phases of the diversified projects of the Company. Many innovations in methods and equipment, which have led to increased economies, have been initiated by him.

In 1941, during the recent war, he was loaned by the Shawinigan Company to Wartime Merchant Shipping Limited, where he acted in the capacity of general manager until 1942. In January 1947, Mr. Heartz was appointed vice-president and chief engineer and was made a director of the Shawinigan Engineering Company.

Active in the affairs of the Institute for some years, Mr. Heartz was chairman of the Montreal Branch in 1941, member of Council in 1942-44. Other

R. E. Heartz, M.E.I.C.

professional affiliations include the Corporation of Professional Engineers of Quebec, the Canadian Electrical Association, and the American Society of Civil Engineers.

J. F. MacLaren, M.E.I.C., the newly elected chairman of the Toronto Branch of the Institute is a partner of the firm of Gore & Storrie, Toronto consulting engineers. Originally from Ingersoll, Ont,. he has been connected with that firm for twenty years. He had been at one time superintendent of construction and assistant engineer with the Water Supply Section, Department of Works, Toronto, and later was connected with John Inglis Company Limited, there. In 1912 he was draughtsman with Hazen and Whipple, Toronto, and his service with the Toronto Department of Works dated from 1913 and was interrupted for three years service overseas in World War I with the infantry. He served with the rank of major and was awarded the Military Cross and Bar.

M. Eaton, M.E.I.C.

H. W. Tye, M.E.I.C.,, engineer, maintenance of way and structures for Northern Alberta Railways Company, Edmonton, Alta., has been elected chairman of the Edmonton Branch of the Institute for the year 1948-49.

He is from Haysville, Ont., and a civil engineering graduate of the University of Toronto, class of 1908. He was with Canadian Pacific Railway in Winnipeg for a number of years in charge of various railway construction projects. In World War I he served for two years in France with the 78th Winnipeg Grenadiers, after which he returned to C.P.R. In 1922-28 he was resident engineer in charge of the Lacombe North-Western Railway, and then he assumed his present position at Edmonton.

Milton Eaton, M.E.I.C., has been elected chairman of the St. Maurice Valley Branch of the Institute.

Born at Whitewater, Man., Mr. Eaton was educated at McGill University and graduated with the degree of B.Sc. in electrical engineering in 1921. During 1921-22 he was on the engineering staff of the Shawinigan Water and Power Company at Shawinigan Falls, Que., and was employed on the installation of a 41,000 hp. unit and extension to the power house; he was in charge also of steel erection, and the installation of oil and water filtering and circulating systems.

From October 1922, he was electrical engineer for the Canadian Electro Products Co. Ltd., in charge of the electrical department. The company is now known as Shawinigan Chemicals.

H. J. McCann, Jr., M.E.I.C., is chairman of the Cape Breton Branch of the Institute. He is located at Sydney, N.S., branch manager for Wm. Stairs Son and Morrow Ltd. He is a native of that city, a graduate of St. Francis Xavier University, Antigonish, class of 1929. He received the degree of B.Sc. in electrical engineering from Marquette University, Milwaukee, Wisconsin, in 1933.

He joined Dominion Steel and Coal Corporation in 1934 as assistant electrical engineer, but accepted his present position in 1939. He is a member of the Nova Scotia Mining Society.

Lt. R. L. Nixon, M.E.I.C., retiring bursar and alumnus of King's College, Halifax, completed, this year, 32 years of service to the College. After winning his M.Sc. in civil engineering at Nova Scotia Technical College, he joined the staff of King's College, Windsor, in the capacity of lecturer in engineering. In 1920 he became professor of engineering, which post he held until the college was destroyed by fire and King's became associated with Dalhousie University in Halifax. At Halifax he received the appointment as college bursar. During the recent war, the College buildings were taken over by the R.C.N. as an officers training establishment. Lt. Nixon received his commission and acted as liaison officer between the Navy and the Board of Governors. He has served as secretary of the board of governors for 25 years and has been instrumental in the university's campaign for funds.

D. Hutchison, M.E.I.C., was appointed superintendent of the Power Corporation of Canada Ltd., Montreal. The past-chairman of the Edmonton Branch of the Institute, and Queen's University graduate, was formerly connected with the Hudson's Bay Company as manager of Mackenzie River Transport at Edmonton. Earlier, in 1926-1938, he was with the Power Corporation in Montreal, in the position of construction superintendent.

J. Garrett, M.E.I.C.

Steel Institute Elections

The Eighteenth Annual Meeting of the Canadian Institute of Steel Construction, Inc., was held in May at Toronto. The list of officers for the coming year include the following members of the Engineering Institute:

G. E. Trelaar, M.E.I.C., chief engineer of Sarnia Bridge Company Limited, Toronto, Ont., is re-elected as president; **F. P. Flett,** M.E.I.C., district manager of Truscon Steel Company of Canada Ltd., Toronto, is second vice-president; **H. W. Shart,** of Dominion Bridge Company Limited, Toronto, is treasurer.

Other officers are:

G. P. Wilbur, M.E.I.C., of Dominion Bridge, Toronto and **C. S. Kane,** M.E.I.C., of the same company, Montreal; **G. G. Henderson,** M.E.I.C., of the Canadian Bridge Co. Ltd., Walkerville, Ont.; **Norman Eager,** M.E.I.C., general manager of the Burlington Steel Co. Ltd., Hamilton, Ont.; **G. H. Midgley,** M.E.I.C., and **A. S. Gentles,** M.E.I.C., of the Montreal and Vancouver sections of Dominion Bridge, respectively; **J. F. F. Mackenzie,** M.E.I.C., of Robb Engineering Works Ltd., Amherst, N.S., and **G. H. Crase,** of Horton Steel Works Limited, Toronto.

R. C. Manning, M.E.I.C., was promoted to the position of general manager and chief engineer of the Canadian Institute of Steel Construction, Inc., at the same meeting. He had completed eighteen years of continuous service with that Institute.

Julian Garrett, M.E.I.C., has retired as vice-president of Northwestern Utilities Limited, and has opened an office as a natural gas consultant in Edmonton, Alta. Mr. Garrett, a past-councillor of the Institute, joined Northwestern Utilities in 1924 as its secretary-treasurer.

D. Hutchison, M.E.I.C.

Lt. Commander C. P. Edwards, M.E.I.C., Deputy Minister of Transport for Air Services, was expected back in Canada late in June from Europe, where he attended the International Telegraph Union conference in Brussels in May as head of the Canadian delegation. Early in June he went to London to attend the board meeting of the Commonwealth Communications Council as the Canadian Representative.

Canadian Westinghouse Company Limited, have announced the following appointments in Montreal and Hamilton.

K. W. Fraser, M.E.I.C., formerly district manager, Quebec District, becomes assistant to the vice-president in charge of sales at Hamilton. He graduated from the University of Toronto in 1927 with the degree of B.A.Sc. in electrical engineering, and following graduation, spent several years in Pittsburgh with the Westinghouse Electric and Manufacturing Company. He returned to Canada in 1930 for district office sales work in Montreal.

E. E. Orlando, M.E.I.C., formerly manager of central station sales in Hamilton, returns to Montreal to become district manager, Quebec district, of Canadian Westinghouse. After graduating in 1927 from Nova Scotia Technical College, he joined Canadian Westinghouse in the engineering department. He transferred to the sales department in Montreal in 1934, where he ultimately became manager of the Apparatus Division, a position he held until 1946, when he was appointed manager, central station sales, at Hamilton.

J. W. Kerr, M.E.I.C. formerly assistant manager, is appointed manager, central station sales, for Canadian Westinghouse, at Hamilton. He is a graduate of the University of Toronto, receiving the degree of B.A.Sc. in electrical engineering in 1937. He took the Westinghouse Apprenticeship Training Course, and was transferred to the Sales Department, Toronto District Office, in 1940. After his service in the R.C.A.F. in World War II, finally with the rank of squadron leader, he returned to the Company in 1945 in the Central Station Sales Division in Hamilton, and was appointed assistant manager in 1947.

J. W. Kerr, M.E.I.C.

K. W. Fraser, M.E.I.C.

E. E. Orlando, M.E.I.C.

E. G. Wyckoff, M.E.I.C., is in Warsaw, N.Y., connected with the Warsaw Elevator Company in the capacity of chief engineer. A past-chairman of the Hamilton Branch of the Institute, Mr. Wyckoff was connected with the Otis Fensom Elevator Company in that city since graduating in 1930 from the University of Toronto. He was head of the engineering department of the company.

J. I. Carmichael, M.E.I.C., has been employed since last March by Fleet Manufacturing Limited, Fort Erie, Ont., in the capacity of executive assistant to the president, and plant manager. He had been employed by Canadian Car and Foundry Company as chief engineer at their Fort William plant.

O. W. Titus, M.E.I.C., is now general manager of Canada Wire and Cable Company, Toronto, Ont. He rejoins the company from which he separated early this year to become vice-president of English Electric Company of Canada Limited, St. Catharines, Ont.

Emile Lourence, M.E.I.C., who was assistant joint chief engineer in the Montreal region for the Provincial Department of Public Works, has been transferred to Quebec, Que., as assistant structural engineer.

R. C. Bryce, M.E.I.C., is at Port Colborne, Ont., plant engineer with Maple Leaf Milling Company. He completed this year a course in industrial relations at Queen's University.

H. R. M. Acheson, M.E.I.C., recently joined the Abitibi Power and Paper Company Ltd., as assistant manager of the mill at Fort William, Ontario. He was previously with Gaspesia Sulphite Company Limited, a plant engineer of their mill at Chandler, Que.

E. C. Percy, ME.I.C., who has been engineer with Coastal Asphalt Products, Saint John, N.B., is now engineer and vice-president of Fowlers Paving Ltd. Mr. Percy went to Saint John in 1946, from Moncton, where he was assistant district airways engineer for the civil aviation division of the Department of Transport.

E. K. Cumming, M.E.I.C., is the new secretary-treasurer of the Edmonton Branch of the Institute. He is lecturer in charge of mechanical engineering courses at the University of Alberta, Edmonton. He was born at Cayley, Alberta, and studied engineering at the University of Alberta, and McGill University, Montreal, receiving from the latter in 1944 the degree of B.Eng. He joined the R.C.N. after graduation and was discharged with the rank of Lieutenant (E) in 1945.

R. T. Sonsom, M.E.I.C., has been appointed signal engineer for the Atlantic Region of the Canadian National Railways. A graduate of the University of New Brunswick, Fredericton, N.B., receiving a B.Sc. degree in 1935, he worked first as engineer in the electric light department of his home town of Campbellton. He joined the Army in 1940 and returned from overseas in 1946 with the rank of Captain. He joined Canadian National Railways that year as assistant engineer in the signal department, the position he held until his present appointment.

G. R. Pritchard, M.E.I.C., has been named Alberta district sales manager for the General Engineering Division of John Inglis Co. Limited, Calgary. He is a graduate in engineering of the University of Manitoba and comes to Alberta from the mining and industrial areas of Manitoba, Ontario and Western Quebec.

G. R. Pritchard, M.E.I.C.

Ross T. Sawle, M.E.I.C., is secretary-treasurer of Blenkhorn & Sawle, Limited, St. Catharines, Ont., a newly formed industry which will provide engineering consultant, sales representation and manufacturing services in the Canadian electrical field, including electronics. He was formerly assistant engineer with English Electric Company. The possessor of a M.A.Sc. degree in electrical engineering he joined English Electric in 1935, and worked on the development of new products in addition to regular engineering duties.

J. E. Brett, M.E.I.C., has accepted a teaching position at Stevens Institute of Technology to start September 1st, and will be located at Haverford, Pa. Mr. Brett had been lecturing in civil engineering at McGill University, Montreal, during the past year, and had managed also a consulting engineering practice.

William J. Neale, Jr.E.I.C., is now with Chas. Magee & Sons Limited, steel fabricators, Port Colborne, Ont. He was formerly employed by the Maple Leaf Milling Co. Ltd., in that city. He received the degree of B.A.Sc., Mechanical, from University of Toronto in 1946.

R. T. Sawle, M.E.I.C.

G. W. Bond, Jr.E.I.C., is on the engineering staff of the Canadian International Paper Company plant at Three Rivers, Que. He was formerly with Canada Cement Company in Montreal. He graduated from University of New Brunswick with a B.Sc. degree, civil, in 1946.

H. H. Todgham, Jr., Jr.E.I.C., has gone to work with Mr. C. G. R. Armstrong, consulting engineer and land surveyor, of Windsor, Ont. He was in Toronto, Ont., employed by E. A. Cross, M.E.I.C., consulting engineer. He is a University of Toronto graduate, having received the degree of B.A.Sc., civil, in 1946.

A. B. Bamford, Jr.E.I.C., is a student apprentice with A. Reyrolle and Co. Ltd., of Durham, England, manufacturers of switchgear, etc. He went to England last year, after some work on seismic survey with Imperial Oil Ltd., Edmonton, Alta. He received the degree of B.Sc., in electrical engineering from University of Manitoba in 1945.

Charles Metherell, Jr.E.I.C., has gone to Fort William to be control engineer in the mill of the Abitibi Power and Paper Company. He was previously employed by Price Brothers and Company at Riverbend, Que. He graduated in 1946 from University of Toronto.

Robert D. Morrison, S.E.I.C., has been appointed technical representative in charge of the Montreal office of Carbide and Carbon Chemicals, Limited, of Toronto. He has been associated with the company since his graduation from the University of Toronto.

J. K. Melville, S.E.I.C., graduated with honours from Queen's University in May, with the degree of bachelor of science in civil engineering. He has entered the International Paper Company Limited as junior engineer at Hawkesbury, Ont. He is the son of Jas. L. Melville, M.E.I.C., who is chairman of the Canadian Pension Commission.

Geoffrey W. Ince, S.E.I.C., is secretary-treasurer of the St. Maurice Valley Branch of the Institute. He was born at Barbados, B.W.I., and studied at Harrison College there. He attended McGill University, Montreal, graduating with the degree of B.Eng. in electrical engineering in 1947. He is in the engineering department of Shawinigan Chemicals Limited at Shawinigan Falls, Que.

Institute Prize Winners

P. L. Pratley, M.E.I.C., Montreal consulting engineer, is one of two recipients of the Julian C. Smith Medal of the Institute for the year 1947. The citation which accompanies the award reads as follows:

"Philip Louis Pratley is a consulting engineer in the city of Montreal. He was born in Liverpool, England and has been awarded the following degrees from the University of Liverpool; B. Eng. (ordinary) 1904; B. Eng. (1st Class Honours) 1905; M. Eng. 1908; D. Eng. 1939.

"From April, 1906 when he joined the Quebec Bridge Board of Engineers, Department of Railways and Canals, Dr. Pratley accumulated a wealth of experience with the St. Lawrence Bridge Company of Montreal, the Dominion Bridge Company Limited, and the Grand Trunk Railway System and its subsidiaries. He has been engaged professionally by several Departments of the Dominion Government, by various Provincial Governments, cities and municipalities throughout the country, by railways and industrial corporations, by private companies and by general contractors, and has collaborated as Canadian consultant with different American engineering firms working on international bridges.

"Among the more important structures in this country where Dr. Pratley was responsible for the complete design and construction, are the Montreal Harbour Bridge, the Island of Orleans Bridge, the Lions' Gate Bridge, the Reconstruction of Second Narrows Lift Span, and the deep water piers of the Patullo Bridge at New Westminster. Among the International bridges where he has been engaged either for design or inspection or in collaboration with other engineers, are the Detroit Ambassador Bridge, the Blue Water Bridge at Sarnia, the Thousand Islands Bridge at Gananoque, several bridges over the Niagara River, and projects at Amherstburg and Kingston which were later abandoned in favour of alternative schemes.

Dr. P. L. Pratley, M.E.I.C.

"From 1921 to 1940 he was a member of the firm of Monsarrat and Pratley, consulting civil engineers in Montreal, and since the death of Colonel Monsarrat in 1940, he has carried on the consulting practice under his own name. He has served on the executive committee and on numerous technical committees of the Canadian Engineering Standards Association.

"Dr. Pratley joined the Institute as a Student in 1907, transferred to Associate Member in 1909, and to Member in 1917. He was a member of Council in 1927, 1928, 1929, 1932, 1933 and 1934, and a vice-president in 1935 and 1936. He was treasurer of the Institute in 1933. In 1935 Dr. Pratley was awarded the Gzowski Medal, and in 1937 was the first recipient of the Duggan Medal and Prize. In addition to serving on the Council of the Institute for many years, Dr. Pratley has also served as Canadian member of Council for the Institution of Civil Engineers in London. Dr. Pratley has long taken an active interest in Institute affairs and has delivered many papers before various branches of the Institute."

P. M. Sauder, M.E.I.C., general manager of the Western Irrigation District, Strathmore, Alta., is one of the recipients for 1947 of the Julian C. Smith medal of the Institute. The citation read upon presentation of the medal at the Annual dinner, is as follows:

"Penrose Melvin Sauder was born near Preston, Ontario. He attended the University of Toronto and in 1904, graduated with a diploma in mechanical and electrical engineering. In 1904, he joined the staff of the Irrigation Branch of the Dominion Department of the Interior and by 1909 had become chief hydrometric engineer in charge of hydrometric surveys of Alberta and Saskatchewan.

"In 1920 he joined the staff of the

P. M. Sauder, M.E.I.C.

Lethbridge Northern Irrigation District and served for three years as division engineer in charge of location. Later, he was assistant project manager in charge of maintenance and repairs of the works, and from 1924-40 he was project manager and district engineer in full charge of the operation and maintenance of the work of the project. From 1940-44 he was Director of Water Resources for Alberta, and in 1944 was appointed general manager, Western Irrigation District, Strathmore, Alberta, which position he still holds.

"Mr. Sauder joined the Institute as an Associate Member in 1908 and transferred to full membership in 1914. He was a member of Council representing the Lethbridge Branch in 1927 and was vice-president in 1939-40. He is past chairman of the Lethbridge Branch. He is past-president of the Association of Professional Engineers of Alberta, and from 1944 to date has represented the Association on the Institute Council."

E. A. Allcut, M.E.I.C., of University of Toronto, has been awarded the Gzowski Medal of the Institute for 1947 for his paper "The Smoke Problem", which

E. A. Allcut, M.E.I.C.

appeared in the April, 1947, issue of *The Engineering Journal.*

Born at Birmingham, England, he was educated at the University of Birmingham where he received the degree of B.Sc. in engineering with honours in 1908 and the degree of M.Sc. in engineering in 1909. From 1908 to 1910 he was research scholar at the University of Birmingham. From 1910 to 1913 he was assistant engineer with the Humphrey Pump Company at Westminster, England, and in 1913 he became manager of the engineering and testing machine department of W. & T. Avery Limited, Birmingham. Professor Allcut came to Canada in 1921 as associate professor of mechanical engineering at the University of Toronto and in 1931 he became professor of mechanical engineering, and was made head of the department.

In 1930 Professor Allcut was awarded the Herbert Akroyd Stuart prize of the Institution of Mechanical Engineers, London, England, for the best paper published in their Proceedings during the years 1927-28 and 1929, on the general subject of the origin and development of heavy oil engines. He was the recipient of the Plummer Medal of the Institute in 1943 for his paper "Producer Gas for Motor Transport", which was published in the April, 1942, issue of the Journal.

Professor Allcut, a fellow of the Royal Aeronautical Society since 1939, was president of the Affiliated Engineering Societies of Ontario in 1946. Other memberships and offices are as follows: member and past chairman of the Ontario Section of the American Society of Mechanical Engineers; chairman of the Canadian Advisory Committee of the Institution of Mechanical Engineers; member of the Association of Professional Engineers of Ontario; member of Committee on Substitute Fuels of the National Research Council, and chairman of the Sub-Committee on Producer Gas (War Research); joint author with R. H. Patten of the two reports of this Committee. Professor Allcut is the author of several scientific books and of many technical articles and papers. He has served on many Institute Committees, currently that of Industrial Relations.

G. S. Hume, of Ottawa, is the recipient of the Leonard Medal for 1947, for his paper "Results and Significance of Drilling Operations in the Athabaska Bituminous Sands", published in the May, 1947, issue of *The Canadian Mining and Metallurgical Bulletin.*

Dr. Hume was born in Milton, Ont., and received his early education there and at Galt, Ontario. He graduated in

Dr. G. S. Hume

1915 from the University of Toronto with the degree of B.A., majoring in geology. After a period of overseas service with the C.E.F. and the Imperial Artillery, he returned to Canada in 1919 and thence to the U.S. to continue his education at Yale University, from which he obtained his Ph.D. degree, specializing in stratigraphy. A short lectureship at McGill University preceded his appointment to the staff of the Geological Survey in May 1921. His first assignment was to make a special study of petroleum and natural gas resources of Canada. Oil geology of the Great Plains area of Western Canada has been Dr. Hume's specialization. He was made chief of the Bureau of Geology and Topography, Mines and Geology Branch, early in 1947.

Because of his comprehensive knowledge and experience with the petroleum and natural gas industry of Canada, he was loaned to the office of the Oil Controller, Department of Munitions and Supply, from 1941 to 1945. Canada was faced with a serious shortage of oil products to supply her industries under the stress of wartime conditions and Dr. Hume was called on to advise Oil Control on all possible means of developing her oil resources. In the King's Dominion Day Honours List of 1945, he was awarded an O.B.E. in recognition of his services.

Dr. Hume has been a Member, C.I.M. since 1920. He is a Fellow of the Royal Society of Canada, of the Geological Society of America, and of the American Association of Petroleum Geologists.

Photo by Cunningham, Hamilton

E. T. W. Bailey, M.E.I.C.

E. T. W. Bailey, M.E.I.C., of Hamilton, Ont., has been awarded the Plummer Medal of the Institute for 1947, for his paper entitled "Oxygen Accelerated Combustion in Open Hearth Furnaces", which was published in the February, 1947, issue of *The Engineering Journal.*

Mr. Bailey was born at Hawkesbury, Ont., and received his early education at Lakefield and Peterborough, Ont. He graduated from the University of Toronto with a B.A. Sc. degree in chemical engineering in 1926. In 1932 he received the professional degree of Chem. E. from the same institution.

After graduation he joined the staff of the Aluminum Company of Canada Limited, Arvida, Quebec, where he acted as assistant chief chemist. In 1928 he transferred to the engineering department of The Steel Company of Canada Limited, in Hamilton, and some years later became head of the Combustion Engineering Department.

E. P. Muntz, M.E.I.C., of Hamilton, Ont., has been awarded the Keefer Medal of the Institute for his paper entitled "Steel Rail Piles Replace Concrete Piles", which appeared in the April, 1947, issue of *The Engineering Journal.*

Mr. Muntz was born in Toronto, Ont., and was educated at Upper Canada College, and University of Toronto. He received the degree of B.A.Sc. with honors in 1914. He began his professional career as assistant engineer, Welland Ship Canal, from 1914 to 1920, but this employment was interrupted by service overseas from 1916 to 1919, with the Canadian Railway Troops. He served with the rank of captain in France and Palestine, and was mentioned in General Allenby's despatches.

He was superintendent for E. A. Rigby, railroad contractor, at Galt, Ont., in 1920-21. From 1921 to 1923 he was construction manager for J. B. Nicholson Ltd., and J. B. Nicholson Inc., coal handling facilities in Canada and the United States, after which he was president of E. P. Muntz, Limited, of Ontario and New York State, until 1932, when engineering work executed exceeded four million dollars, including work for seven railroads and many large industries. He was vice-president of Canadian Engineering and Contracting Company (Quebec) Ltd., which company was formed in 1937 to build the plant for Abrasive Co. of Canada Ltd., Arvida, Que. Mr. Muntz was engineer on special work for The Foundation Co. of Canada, Ltd., and subsidiaries from 1940 to 1943. From 1944 he has been a consulting engineer in his own behalf with offices in Montreal until 1946, since then in Toronto and Hamilton. He has been advising the Hydro-Electric Power Commission of Ontario on various bridge and building problems in connection with the very large expansion programme now under way in Ontario. In this connection the use of surplus war stocks of Bailey Bridge equipment are of particular interest.

E. P. Muntz, M.E.I.C.

Mr. Muntz is a past vice-president of the Institute; a past-president and life member of the Association of Professional Engineers of the Province of Ontario. He was twice president of the National Construction Council. He is also a member of the Corporation of Professional Engineers of Quebec, and is licensed in the State of New York, and is a member of the American Concrete Institute.

J. A. Ouimet, M.E.I.C.

J. A. Ouimet, M.E.I.C., has been awarded the Ross Medal of the Institute for 1947 for his paper entitled "Certain Aspects of Frequency Modulation and Television Broadcasting in Canada", which appeared in the March, 1947, issue of *The Engineering Journal.*

Born at Montreal, he was educated at the College Ste-Marie and obtained his B.A. degree from the Université de Montréal in 1928. He received his engineering training at McGill University where he was graduated in electrical engineering, with the highest honours, in 1932. After graduation he was employed as research engineer with the Canadian Television Limited and the Canadian Electronic Company until 1935 when he joined the staff of the Canadian Radio Broadcasting Commission, now the Canadian Broadcasting Corporation. He was employed in development work until 1937 when, as operations engineer, he was put in charge of the operation and maintenance of all CBC stations.

In 1939 he was made general supervising engineer and in 1941, he became assistant chief engineer of the CBC. As such, he is concerned with the general direction of the technical activities of the Corporation and more particularly with current developments in frequency modulation and television engineering.

Mr. Ouimet is a member of the Corporation of Professional Engineers of Quebec, a senior member of the Institute of Radio Engineers. He has served on a number of committees of the Engineering Institute and is currently serving on the Finance Committee.

N. A. Parlee, Jr.E.I.C., has been awarded the Martin Murphy Prize of the Institute for 1946-47, for his paper entitled, "Utilization of Sydney Slag for Engineering and Agriculture", which appeared in the January, 1947, issue of *The Engineering Journal.*

Born at South Farmington, N.S., he attended school at Kingston, N.S., and high school at Halifax Academy. He entered Dalhousie University in 1930 and graduated in 1935 with B.Sc. in Chemistry, winning the Hugh Graeme Fraser Memorial Prize in Chemistry. Awarded a National Research Council Bursary in 1936, he carried on research at Dalhousie University on Reaction Kinetics, this work leading to the degree of M.Sc. in Physical Chemistry from Dalhousie in 1937. He was awarded a National Research Council Bursary in 1937 and a Studentship in 1938, which were held at McGill University. There he specialized in Physical Chemistry and did research on Atomic Reactions and received a Ph.D. degree in 1939.

Dr. Parlee joined Dominion Steel and Coal Corporation, Sydney, N.S., in 1939 and held positions as analytical chemist, metallographer, research chemist and assistant chief metallurgist, before being appointed to his present position as director of research and development.

Dr. N. A. Parlee, Jr.E.I.C.

R. N. E. Haughton, Jr.E.I.C., has been awarded the John Galbraith Prize of the Institute for his paper entitled "Effects of Lightning on Buried Telephone Cable", which appeared in the May issue of the *Journal.*

Mr. Haughton was born at Toronto, Ont., but was educated in Hamilton. He graduated from Hamilton Delta Collegiate Institute in June, 1942. There his sporting activities included boxing and weight lifting; he was Ontario junior weight lifting champion in 1941. He entered McMaster University in 1942, in the Pre-Engineering course. He was McMaster University Boxing Champion, light weight class, that year. Transfer-

R. N. E. Haughton, Jr.E.I.C.

ring to Queen's University in 1943, he entered the electrical engineering course and graduated in 1946, with the B.Sc. degree.

At present he is engaged on electrical coordination and protection studies, Transmission Group, General Engineering Department of the Bell Telephone Company of Canada, Western Area. He is assistant secretary-treasurer of the Toronto Branch of the Institute this year.

Photo by Van Dyck

R. B. Todd, S.E.I.C.

R. B. Todd, S.E.I.C., has been awarded the Phelps Johnson Prize, which is presented to English speaking students in the Province of Quebec, for his paper "The Manufacture of .22 Calibre Long Range Rifle Cartridges".

Mr. Todd was born in Grand Falls, Que. He graduated from West Hill High School, Montreal, in 1935 and from the Montreal Technical School in 1938. He was employed by Canadian Industries Limited, Ammunition Division, from 1938 until 1943 in the positions of draughtsman and foreman in charge of tool, gauge, and cartridge design and development. He served with the R.C.A.F. from 1943 until 1945 when he was discharged with the rank of pilot officer, (flight engineer).

Mr. Todd entered McGill University in 1945 and he has now completed his third year in mechanical engineering.

Photo by LaRose

Robert Riopelle, S.E.I.C.

Robert Riopelle, S.E.I.C., a native of Montreal, has been awarded the Ernest Marceau Prize which is offered each year to French-speaking students in the Province of Quebec. His prize-winning paper is entitled "Etude, Plans et Devis d'un Generateur de Haute Frequence pour la prechauffage dielectrique d'une poudre a mouler thermostable".

He graduated from the Montreal Technical School in 1940 where he was the recipient of the Gold Medal as an outstanding student. He also attended Ecole Polytechnique, Montreal, where he was awarded the degree of bachelor of applied science in electrical engineering in 1947. Here again he was awarded a gold medal for his thesis.

He served in several capacities with various companies during the summer months, while attending the Ecole; and his post-graduate work has consisted of service as an electrical engineer and assistant superintendent of construction, and as works manager of Metropole Electric Incorporated. He has also acted as a consulting engineer.

Raymond A. Pillman, S.E.I.C.

Raymond A. Pillman, S.E.I.C., has been awarded the H. N. Ruttan Prize for his paper "The Accuracy of a One-Minute Transit".

A native of Montreal, Mr. Pillman was educated in Western Canada where he attended the University of British Columbia and graduated this spring with the degree of bachelor of applied science in civil engineering.

His prize-winning paper is the result of a series of original tests he made in order to determine the heretofore undetermined precision of repetition work with one-minute instruments. He is now employed by H. G. Acres and Company on the construction of the John Hart Development at Campbell River, B.C. He is a former secretary of the student section of the Institute's Vancouver Branch at the University of British Columbia.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

G. K. McDougall, M.E.I.C., Montreal consulting engineer, died in Hospital on April 27, 1948, after a short illness.

Born at Three Rivers, Que., in 1882, Mr. McDougall was educated at Montreal High School and McGill University, receiving from the latter in 1904 the degree of bachelor of science in electrical engineering. He did engineering work in the U.S.A. for a time, but in 1908 returned to Canada and became connected with Shawinigan Water and Power Company as assistant to the treasurer. Later he was sales manager of the Canada Carbide Company, until he entered consulting engineering practice in 1914. He became associated with the late Raymond E. Pease and with Ferdinand J. Friedman. At the time of his death he was a partner in the firm of McDougall and Friedman.

Mr. McDougall joined the Institute as a Student in 1904, transferring to Associate Member in 1912 and to Member in 1919. He was awarded Life Membership in 1948.

William Walker, M.E.I.C., of Montreal, who had retired in 1946 from Canadian National Railways in Montreal, died in July 1947.

He was born at Eldorado Mine, Chile, in 1883, but was educated in Scotland, following his high school and technical school training in Glasgow. After some years of practical engineering experience in railway and dock construction in Scotland and Brazil, he entered the Grand Trunk service in 1908 as assistant in the office of the engineer of maintenance of way in Montreal. He was made assistant engineer in the chief engineer's office in 1909; was appointed assistant engineer of the Ottawa Division in 1910, and assistant land commissioner in 1916. He was acting division engineer on the eastern lines of the Grand Trunk from 1917 until 1919, when he was made division engineer of eastern lines for the System. On his retirement in 1946, Mr. Walker was district engineer for C.N.R. in Montreal. He was a Life Member of the Institute from 1945. He joined as an Associate Member in 1910, transferring to Member in 1940.

E. S. Miles, M.E.I.C., chief engineer and president of Angus Robertson Ltd., died at his home in Toronto on May 29, 1948.

Born at Maugerville, N.B., in 1883, he graduated from the University of New Brunswick in 1904. He worked as an assistant engineer on Georgian Bay canal survey for a few years. He was assistant resident engineer of St. Andrews Lock and Dam from 1907 to 1911. He also served as a supervising engineer in the Department of Public Works for three years.

He was then attracted to the Welland Canal project at the beginning of its construction in 1914. He left the project several times for other construction jobs, but always came back to it, finally as chief engineer in charge of concrete construction. His work from 1914 to 1918, was resident engineer for O'Brien, Doheny, Quinlan and Robertson on the Canal. He then became local manager for Matane Lumber Development Company at Matane, Que. He was back at the Welland project in 1921 as resident engineer for A. W. Robertson Ltd. but shortly afterward went to Belleville, Ont., for the Fuller Gravel Company. He again represented A. W. Robertson on the Canal from 1924 to 1929.

Among other engineering activities which highlighted his career, Mr. Miles served as resident manager of the tunnel division of the Rayner Construction Co., which had the contract for the construction of the intake and clear water tunnel in connection with the duplicate water supply for Toronto which was begun in 1930. He also was a consultant in the Shand Dam project, and figured in the major undertaking of resurfacing Alexandria Pier at the entrance of the Lachine Canal at Montreal in 1937.

He was appointed president of Angus Robertson Ltd., a year ago, with offices in Toronto and Montreal.

Mr. Miles joined the Institute in 1911 as an Associate Member, transferring in 1936 to Member. He attained Life Membership in 1936.

H. P. Fuller, M.E.I.C., of North Battleford, Sask., died on March 6, 1948. He had been a railroader for many years, having joined the Grand Trunk Railway in 1907.

He was born at Bury, Que., in 1887, and after his first work for Grand Trunk he went on location for the Quebec Central Railway and later worked on construction for the Montreal and Southern Counties Railway. From 1910 to 1914 he was instrumentman for Grand Trunk Pacific on construction, location and maintenance. He was then an instrumentman for Canadian National Railways for a year before being appointed assistant engineer at St. James, Man., in 1916. He went to Kamsack, Sask., as assistant engineer, and he was sent in 1927 to The Pas, Man., to be roadmaster for the Hudson Bay Railway. He remained at The Pas until 1939 when he went to North Battleford, Sask., as roadmaster for C.N.R.

Mr. Fuller joined the Institute in 1919 as an Associate Member, becoming a Member in 1940.

F. W. Groves, M.E.I.C., who played an important role in many major construction projects in Kelowna, B.C., and district, during the past 40 years, died there on Thursday, March 25, 1948.

He had led an active life as consulting civil and hydraulic engineer. He was born in Ireland in 1867 and obtained his diploma in civil engineering from the Royal College of Science, Dublin, in 1888. He came to Vancouver in 1893 and for several years was employed on laying out townsites and on other projects throughout the province. As a B.C. land surveyor, Mr. Groves moved to the Okanagan in 1907, residing first at Okanagan Centre where he set up an irrigation system for some 2,000 acres. In 1909 he moved to Kelowna and supervised, for the Southeast Kelowna Land Co., the construction of the McCulloch dam and works.

He started a practice as consulting engineer and B.C. land surveyor in 1917 and later was appointed acting district engineer for the department of water rights. He resumed private practice in 1920, acting as consulting engineer for the Southeast Kelowna, Black Mountain, Glenmore and Scotty Creek Irrigation Districts. He was in partnership with F. H. Alwood a few years ago until the time of Mr. Alwood's death in 1946.

Mr. Groves was a Life Member of the Association of Professional Engineers of British Columbia. He joined the Engineering Institute in 1913 as a Member, and attained Life Membership in 1947.

M. M. Price, M.E.I.C., who was division engineer for Canadian National Railways at Edmonton, Alta., passed away in hospital there on May 1, 1948.

Mr. Price, who was born in Boston, Mass., in 1896, and was educated in Western Canada, was in the C.N.R. service for many years, joining in 1919 as chainman on construction at Winnipeg. He was later named resident engineer at Winnipeg in charge of water supply investigations. He transferred to Port Arthur, Ont., in 1934 as instrumentman for the company, and in 1939 became assistant bridge and building master there. In 1942 he moved to Prince Rupert, B.C., as assistant division engineer, and went two years later to Edmonton to the position he held at the time of his death.

Mr. Price, who was a member of the Association of Professional engineers of Ontario, joined the Institute in 1942 as a Member.

E. W. Jeffrey, M.E.I.C., of Montreal, who died in hospital on May 21, 1948, was connected with Northern Electric, general sales division, as illuminating engineer.

Born in Montreal in 1892, and educated there, he joined Northern Electric in 1910 in Montreal, transferring to Halifax Office in 1914. In 1918 he joined Canadian General Electric Co. Ltd., but left after 3 years to establish an electrical contracting business in Truro, N.S. He rejoined Northern Electric Co. Ltd., Halifax, in 1923, as assistant district sales manager in charge of the illuminating and wiring supply divisions of the Company in the Maritimes. He was transferred to his position as illuminating engineer in Montreal in 1944.

Mr. Jeffrey joined the Institute in 1943.

W. J. English, JR.E.I.C., of Saskatoon, Sask., died March 12, 1948, in hospital, after a long illness.

Mr. English, who was born in Saskatoon, in 1915, attended high school there. He studied at Nutane Collegiate and then went to the University of Saskatchewan, Saskatoon, receiving a B.Sc. degree in mechanical engineering in 1941. He did some engineering work in British Columbia, and later came east to work for Canadian Industries Limited at McMasterville, Que. He returned to Saskatoon in 1945.

Mr. English joined the Institute as a Student in his fourth year of engineering, transferring to Junior in 1945.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Edmonton

E. K. CUMMING, M.E.I.C.
Secretary-Treasurer

On April 16 the Young Engineers Committee sponsored an evening meeting at the University of Alberta. E. K. Cumming was in the chair. R. M. Hardy, M.E.I.C., Dean of the Faculty of Engineering at the University, presented an illustrated lecture entitled **Foundation Conditions in the Edmonton Area**. Following a brief geological history of the area, the speaker discussed local soil and foundation conditions that had been investigated by him during the past few years under the auspices of the National Research Council. Dean Hardy stated that, for the most part, the Edmonton soil consisted of a glacial clay, classified as medium, or of medium to high compressibility. The two most common methods of foundation failure, consolidation and shear failure, were not usually encountered. A third means, however, that of shrinking or swelling due to changes in moisture content, was responsible for practically all the failures in this city. The soil that presents the most difficulty is a clay that has been preshrunk to a nugget structure, sometimes to a depth of ten feet. Dean Hardy pointed out the serious effects that may result from using an allowable bearing pressure as outlined in a building code, but expressed the belief that with further investigation, to be carried out in 1948, any foundation in the Edmonton area could be economically designed on the basis of a minimum of soil tests and site investigation.

Guests at the meeting included members of the Edmonton Builders Exchange and the Alberta Association of Architects. Dean Hardy thanked these organizations for their co-operation during the soil testing programme. The meeting concluded with refreshments and a visit to the Soils Testing Laboratory in the Civil Engineering Department.

❖ ❖ ❖

A coloured film of unrivalled action aroused the members of the Edmonton Branch, following their Annual meeting, which began with dinner and concluded with a smoker, in the Macdonald Hotel on the evening of April 23rd.

Election of officers for the year 1948-49, resulted in the following executive: J. W. Tye, Chairman; T. W. Dalkin, vice-chairman; E. K. Cumming, secretary-treasurer; D. K. Campbell, H. Hole, Jr., J. E. Kellett, O. G. Kelly, W. I. McFarland and E. L. Smith, members of the executive.

The meeting decided that a committee be appointed to organize a competition for the best paper prepared by a member of the Branch each year

Two fine films were shown by courtesy of Mr. Dan Campbell, director of the Alberta Government Travel Bureau. They were filmed by Mr. George Eisenschiml of Banff, in the setting of the Institute's Annual meeting. The first entitled "Mount Bulyea" showed a party of mountain climbers ascend the lofty peak and return. The other was the outstanding colour film, "Ski Pro's Holiday", in which a team of Professional skiers give a unique demonstration of their skill near Sunset and Temple Lodges, Banff.

❖ ❖ ❖

During the week-end of May 1, Col. and Mrs. Grant and Dr. and Mrs. Wright were guests of the Edmonton Branch of the Institute. Their visit was highlighted by Colonel Grant's address at a dinner held in his honour Saturday evening at the MacDonald Hotel.

Colonel Grant expressed the belief that the engineering students of today will have a great deal to offer to Canadian industry and civic work of tomorrow. These students, he said, are to some extent unlike the students of past years; they have gained maturity in their war experience and have therefore been able to absorb more of their University training. Colonel Grant also spoke of the great accomplishments of Canadian industry and Canadian engineers during the war, accomplishments which have not been equalled by any other country of comparative size. Yet, because of our modesty few know of our achievements.

Following his address the President presented the Institute award for high standing in third year at the University of Alberta.

President Grant and Dr. Wright met with the members of the executive at a luncheon at the Edmonton Club, Saturday afternoon. At this meeting labour legislation and a tariff on plans coming into Canada were discussed in detail and all present were in agreement with the Institute's action on these matters. While this meeting was being held, the ladies were entertained at a tea given by Mrs. H. W. Tye.

Sunday afternoon a very enjoyable and educational tour of the Edmonton airport was arranged by Group Captain M. M. Hendricks of the R.C.A.F., when latest Radar and G.C.A. equipment was demonstrated. Following this tour members of the executive and their guests were entertained at the homes of F. R. Burfield and J. E. Cranswick.

Halifax

W. E. Jefferson, M.E.I.C.
Secretary-Treasurer

Max L. Baker, M.E.I.C.
Branch News Editor

One of the outstanding dinner meetings of the season was held in the Lord Nelson Hotel on Thursday, March 18. About 70 members attended to hear the guest speaker, the Hon. Harold Connolly, Minister of Industry and Publicity for Nova Scotia, discuss **Industry in Nova Scotia.** Among the guests present were: Walter Ward, superintendent of the Marine Engineering Department, Imperial Oil Ltd.; G. P. Elliott, president of the Port of Halifax Club; S. R. Balcolm, vice-president of the Halifax Board of Trade; L. E. Mitchell, M.E.I.C. Councillor, Halifax, and G. A. Smith, president of the Trades and Labor Council, Halifax. Presiding at the meeting was W. C. Risley, chairman of the Branch.

Mr. Connolly paid tribute to the many organizations contributing to the welfare of the province. He referred, in particular, to the splendid efforts that the Port of Halifax Club was making in securing increasing business for Halifax, to the good work done by the Halifax Board of Trade, and of the influence for good in Halifax by the organizations headed by Mr. G. W. Smith.

Turning to his particular department in the Nova Scotia Government, the speaker dwelt at some length upon four main divisions set up within the department. The first, the tourist industry, has developed into a really big business. Tourist bureaux with permanent staffs have been placed in three points in Nova Scotia. Offices have been established in Boston and New York and one is to be established in a central Canadian city.

The second division is fisheries. Here the speaker told of the changes in the methods of fishing, the determination of the department to establish quality products, and the need of, and opportunity for, trained technical men in the many branches of this industry.

Handicrafts was the third item discussed by Mr. Connolly. Under the expert supervision of the head of this division, organized classes for this work have been set up in many parts of the province, particularly in the smaller communities. From the skills developed by the personnel in these classes, many products are now being made that find a ready sale among tourists.

The fourth and last topic under discussion was the industrial division. During the war, Nova Scotia played an important part in war industries, but has since fallen down industrially. Nova Scotians, said the speaker, contributed to this state of affairs by failure to keep pace with the times, by not having worked hard enough, and by being a little too cautious with their money. Engineers are in a position to give invaluable aid concerning industrial expansion in Nova Scotia, and their advice would be welcomed.

A vigorous discussion on the type of industries suited to Nova Scotia followed Mr. Connolly's address, both senior and junior members entering whole-heartedly in the subject. The outcome was the unanimous approval of a motion that Halifax Branch of the Institute form a committee to assist the Department of Industry in its work. The naming of the committee was left to the executive.

A vote of thanks to the speaker moved by R. N. Fournier and seconded by L. E. Mitchell, was enthusiastically endorsed by the meeting.

❖ ❖ ❖

On April 20 the members of the Halifax Branch were hosts to eighty-one young men who will receive their degrees from the Nova Scotia Technical College in May of this year. The meeting was held in The Merchant Seamen's Auditorium. Chairman W. C. Risley presided.

Three senior members of the Branch and three graduates had been invited to give ten-minute talks; the former on **What does industry and the profession expect from the graduate**, and the latter on **What does the graduate expect from the profession and industry?**

The speakers for the engineers were: I. P. McNab, H. W. L. Doane, Wm. H. Chisholm.

They considered the young engineer's relation to industry, and discussed such matters as: willingness to work; loyalty to the boss, the job, and the organization; preparation for advancement; advantage of looking on the bright side; satisfaction in seeing a job well done; the value of being observant and curious; willingness to teach others; the development of self-confidence and good judgment.

The graduates' side of the topic was presented by: C. Johnstone, graduating in electrical engineering; H. McClymont, mechanical; F. Theakston, civil. From the students' point of view, it was thought desirable to place more emphasis on guidance during the first years of college training in order that the student engineer would better know the kind of work for which he was fitted.

Job particulars came in for some discussion. In referring to available jobs, particularly in summer employment, the speakers felt that giving students a full picture of what the job entailed, would enable them to give better service to prospective employers because students naturally attempt to secure the kind of work in which they are most interested.

The help given to engineering students

and to graduates in engineering by senior members of the profession was spoken of with appreciation by one of the speakers, while another suggested that all engineering students should be encouraged to join the Engineering Institute early in their college careers.

In the discussion period following the prepared talks, valuable contributions were made by J. B. Hayes, past-president of the Institute; R. M. Richardson, president of the Association of Professional Engineers of New Brunswick, and J. R. Kaye, president of Engineering Service Company. L. D. McKenna, president of the Engineering Society of the Nova Scotia Technical College thanked the Institute for the invitation extended to the graduate students.

Refreshments served by members of the Branch and a motion picture, "Railroading", shown by S. V. Grisdale through the courtesy of the Canadian General Electric Company, completed a very successful evening.

❖ ❖ ❖

A joint meeting of the Halifax Branch and the Association of Professional Engineers of Nova Scotia was held in the Lord Nelson Hotel on May 20.. This was the last meeting of the current season. W. C. Risley, chairman of the Branch, presided.

About sixty members were present to hear the guest speaker—D. O. Robinson, chief engineer with the Canada Cement Company Sales Department, who discussed **Developments in Cement and Concrete.**

One of the major developments in cement making was changing from the dry to the wet process. This has eliminated some of the disadvantages inherent in the dry process and made it easier to control the composition and blending of materials, with the result that a more uniform product has been obtained. Great changes are apparent also in the handling of cement, in that considerably more is handled in bulk than was the practice a few years ago. Storage facilities are provided in the larger centres, from which bulk cement is transported by trucks to the job. Two minor changes worthy of note were: increased efficiency in the cement making plants, and improved service to customers.

Twenty-five years ago, said the speaker, only one cement was made—Portland cement. Since that time, because of particular needs in different parts of the Country, special cements have been developed; for example, alkali resistant cement for some parts of Western Canada, and air entrainment cement.

Developments in the use of concrete in the structural field are the principle of continuity, and the principle of prestressing. While it is possible to extend the idea to all structural design, it is limited at the present time to beams, joists and pipes. Turning to the art of making concrete, the speaker told of the development of the water-cement ratio and how emphasis was placed on strength alone, rather than on the three factors, durability, strength, and economy. He also discussed new methods of handling concrete—the ready mix, central mix, pumping concrete and the vibrator.

Coming back to a previously mentioned topic, that of air-entrainment, the speaker said this was the outstanding development of our time in cement making. He then gave a most interesting account of how the air entrainment principle came from the research and experiments conducted in New York State in an effort to find a solution to the problem of deterioration of the surface of the concrete highways in that State caused by the salt and calcium chloride used in combatting icy surface.

Viewed both from the excellence of the address and the discussion it promoted, this meeting was an outstanding success. Not only were many questions asked Mr. Robinson, all of which were answered fully and clearly, but many of the members taking part in the discussion contributed materially to the general topic. Leading the discussion was H. C. Loring, consulting engineer. Interestingly enough, he was with a firm doing research on the problem mentioned by Mr. Robinson that led to air-entrained concrete.

A vote a thanks to the speaker was moved by A. Norman.

Lethbridge

E. A. Lawrence, M.E.I.C.
Acting Secretary-Treasurer

J. A. Haberman, M.E.I.C.,
Branch News Editor

Frank Taylor, general superintendent of the Canadian Sugar Factories Limited, addressed the Lethbridge Branch of the Engineering Institute of Canada at a dinner meeting held in the Marquis Hotel on April 24. Mr. A. G. Donaldson was in the chair, and the usual musical programme was enjoyed.

A. E. Palmer introduced Mr. Taylor. The speaker sketched the history of sugar from its discovery in India and further development in Persia and the Euphrates River Valley. A Frenchman, Oliver de Sirus in 1600 discovered beets as a source of sugar. In 1779, Ekhard, a German, made the first commercial beet sugar, and he built the first sugar mill about the same time. Napoleon Bonaparte established six schools in France for technical instruction in the manufacture of beet sugar. By 1812, there were 40 sugar factories in France.

Beet sugar manufacturing came to the United States of America about 1852, but little was done in a large commercial way until the early 1900. The first sugar mill in the West was established by the members of the Church of the Latter Day Saints, and has since spread through the States of Utah, Colorado, California and up to Southern Alberta in Canada.

The Canadian Government has undertaken to absorb its share of displaced persons in Europe, and the bulk of these people will be absorbed in the sugar growing industry.

The speaker remarked that Southern Alberta is the best agricultural district he has seen with the unlimited lands to be developed within the next century if we expand in irrigation and increase our population. Mr. Taylor forecast a steady growth for Lethbridge due to its close association with agriculture.

A hearty vote of thanks was tendered the speaker by M. S. Mitchell.

❖ ❖ ❖

At a dinner meeting attended by thirty-four members and guests of the Lethbridge Branch of the Institute held at the Marquis Hotel on Monday, May 3, a welcome was extended to the President, L. F. Grant, and to the General Secretary, L. Austin Wright.

In his talk to the meeting, Mr. Grant referred to the Engineering Institute's attitude toward collective bargaining. He informed the members that it appears likely that now engineers will be named with other professionals in a bill which excludes professional men from collective bargaining. He referred to Labor Bill No. 195 now before the House of Commons.

Mr. Grant particularly praised the achievements of Canadian engineers in industry. "The Canadian engineer can do the job and can do it as well as any other engineer", said Mr. Grant. He stated that in 1941, Canada produced more war materials than the United States and had, at the same time, mastered complicated mechanisms that before this time were thought to be beyond the ability of Canadian engineers. He emphasized that one need not go out of this country for men to do any type of engineering.

Dr. Wright outlined the highlights of the coming annual meeting of the Institute to be held at Banff, June 1 to 5. He also commented on the expected improvements in The *Engineering Journal* which now has a circulation of approximately eleven thousand.

W. L. Foss moved a vote of thanks to the speakers, stating that he concurred with Colonel Grant regarding the problems of the Canadian engineer and his ability to master them. He said that on a recent visit to projects of the Bureau of Reclamation, he found that their engineers were confronted with the same problems as the Canadians and that they treated them in the same manner.

The meeting concluded with a lively discussion period.

A sing-song led by R. S. Lawrence, assisted by his son, E. A. Lawrence, and accompanied by Mr. Walter Hay, together with a solo by Mr. H. C. Ritchie and a recitation by Mr. A. J. Branch, were well received.

London

N. J. W. Smith, M.E.I.C.,
Secretary-Treasurer

G. N. Scroggie, M.E.I.C.
Branch News Editor

At a meeting on April 27, of the London Branch of the Institute, the guest speaker, Eric Leaver of The Electronic Associates, Toronto, was introduced by K. J. Clowson, M.E.I.C., Middlesex County engineer. Mr. Leaver opened his address by speaking generally on the possibility of operating machines by records. He outlined briefly the history of machines and tools.

Steam was the greatest advent to the machine age. Henry Ford was the first man to introduce its many applications to industry. Ford's theory was that true security in industry rests on the ability to change.

Mr. Leaver continued by illustrating how the emphasis of production has been changed, and referred to different types of production that would be applicable to records, citing for example the simple shaft. The velocity, acceleration and positions of cutting tools, when recorded, would apply to lathes, milling machines, etc. Records may be made to record in spherical and cylindrical shapes and control such machines as lathes, rivetters, etc. This type of record would have many practical applications. Steel records—steel wire with impressions on it—would not wear out and could be used for thousands of times. Motions of machines would be controlled in three or more dimensions. In the future machines could be integrated. Substitution could be made of highly skilled craftsmen to make records, instead of unskilled labour operating many machines.

Mr. Leaver cited the possibility of certain shops manufacturing only records, for other plants and shops on a royalty basis.

Mr. Leaver spoke briefly on how these machines, controlled by records, would affect labour. He considers that the machines would produce a greater diversity of production, more cheaply, and in greater quantity, which would be highly favourable from the consumers' stand-point. He concluded by stating that "the more flexible our production situation can be the more suitable it will be to peace and security."

Mr. Leaver was thanked by Dr. J. K. Watson, President of the London Branch Canadian Institute of Chemistry.

The editor wishes to thank Robt. G. Code for reporting on this meeting.

Montreal

One of the most pleasant visits made this year by Montreal Branch took place on Saturday, May 15, when, upon the invitation of the Institute of Radio Engineers, a large number of the members of the branch visited the R.C.A.F. Station at St. Hubert. From a sun-drenched terrace on the edge of the field, the members heard a most interesting address by Dr. O. M. Solandt, O.B.E., Chairman of the Defence Research Board, and this was followed by a conducted tour of the Station and an actual demonstration in flight of a jet propelled DeHavilland Vampire Fighter. Dr. Solandt's address stressed the aspects of national defence in Canada and the part which the engineer must play, together with those engaged in pure research. He has been fully reported in the daily press but it may be as well to again mention his view that engineers are tending to devote too great a proportion of their efforts to production at the expense of research, at least in the practical field.

The tour of the Station included visits to the various hangars and to the mobile radar convoy and, of course, the highlight was the demonstration in flight of the Vampire Fighter. Before taking it aloft, the pilot Russ Bannock, formerly R.C.A.F., described exactly what he would do and then proceeded to go up and do it in a series of vertical climbs, tight turns, high speed and slow speed runs topped off by a perfect landing, all within close view of the spectators—a most impressive display.

A number of the members of the Institute attended a luncheon at the Mess prior to the afternoon programme where they were welcomed by the Station Commander, Wing Commander Baxter Richer, who outlined to them the purposes of the Station; to provide a flying base for the two local auxiliary squadrons and to maintain peace-time interest in the R.C.A.F. Squadron Leader Molloy and Flight Lieutenant Patrick also spoke briefly.

We wish to thank the I.R.E. for making such a pleasurable and instructive afternoon possible to our Membership.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

A whirlwind trip to Istanbul, Turkey, was the subject on which A. D. Smith of Foster Wheeler Ltd., spoke before the Niagara Peninsula Branch of the Engineering Institute of Canada on April 22.

The word picture supplemented by movies made by Mr. Smith, showed that Turkey is a mixture of east and west. The city of Istanbul reminded Mr. Smith of Quebec City. Most of the streets are narrow and winding and paved with stone. One street is so narrow and crooked, that there is a large mirror installed so that drivers can see around the corner.

There are 400 mosques in the city, largely unused now. Most of the people dress as Europeans, except the very old. The veil is banned, but some of the older women pull their shawls around their faces to create the same effect.

Most of the people are very poor. Mr. Smith said that there are only a few public eating places in a city of one million people, because very few can afford to take advantage of them.

Concerning the engineering aspects of his trip. Mr. Smith said, "Turkey is very alive to western progress. I was asked questions of all kinds, they have an intense desire to know. Only the younger engineers speak English, the older ones all had their training in Germany, France and even Russia."

"Much of the equipment used in the country today was made in Germany, and I must admit that it is very efficient. I had to deal with only one or two firms, but all the large businesses are government owned.

"I was surprised at the difference in technical drawings. All the details of our new installations had been received, but the engineers could not understand them, as they were different from the German type."

Mr. Smith was dealing with a paper company, A vast variety of raw material is used in Turkey to make paper, including rags, waste paper, wood and even carpets. The speaker also remarked on the tremendous amount of military activity in Turkey, where there are 800,000 men under arms.

Chairman M. F. Ker presided at the meeting and C. L. Mason introduced the speaker. He was thanked by George Griffith.

Ottawa

C. G. Biesenthal, M.E.I.C.
Secretary-Treasurer

R. C. Purser, M.E.I.C.
Branch News Editor

The story of an interesting trip to the southwestern States and to Mexico City, with emphasis on some soil problems, was told in an illustrated address at an evening meeting on Wednesday, April 28. The speaker, F. Lionel Peckover, of the Division of Building Research, National Research Council, was introduced by Major-General G. R. Turner, and thanked by W. L. Saunders. Ottawa branch chairman, J. L. Shearer, presided.

In addition to a description of points of scenic interest visited on the trip, Mr. Peckover dealt first of all with problems relating to the construction of the famous Boulder Dam and of other engineering developments of the Colorado watershed. Among these was included the Colorado-Big Thompson project, a water diversion project involving the construction of several large earth fill dams. He characterized these as an example of aggressive engineering development combined with a sensible conservation of the natural beauty of the region.

The speaker then devoted a considerable portion of his time to the problem of the settlement of buildings and other heavy structures in Mexico City due to the unusual nature of the soil. The soil here is mostly a water-deposited volcanic ash interspersed with occasional layers of water-bearing sand. The city obtains its water supply from these sand layers. Settlement of ground surface level at times is as much as five inches in a year.

Various types of foundations have been tried out, the general method being to use wooden piles driven to the first sand layer about 100 feet down. These piles are in sections connected with steel dowels and are estimated to bear a weight up to 25 tons per pile. The National Lottery building, he gave as a good example of the displacement or floating type of foundation. No damage had resulted to this building as the settlement, in accordance with the design, was uniform with relationship to the surrounding ground.

The Palace of Fine Arts, views of which he showed upon the screen, exhibited over nine feet of settlement since its construction. The foundation of this beautiful building, however, was rigid so that no damage has resulted to the structure itself. The differential settlement was about six inches, which was small by Mexico City standards.

The settlement of these heavy structures naturally causes damage to surrounding pavements, entranceways and approaches. He showed several views where this damage was most pronounced. The effects in some cases were almost unbelievable. He showed pictures, for instance, where the doorways of business buildings had to be converted into windows on account of the impossibility of using them for their original purpose.

At the conclusion of his address, the speaker remarked that it was not really necessary to go to Mexico City to view the effects of settlement on building structures. In the building in which the meeting took place, the National Museum, there was a moderate example of the same thing, with a differential settlement of about a foot or so showing up in its foundation.

The meeting then adjourned to go to the basement of the building where this settlement was very much in evidence resulting in inclined floors, walls with large cracks, and doorways that were far out of plumb.

❖ ❖ ❖

At the last regular noon luncheon of the spring season, held on May 6, S. A. Gitterman, Ottawa, Architectural branch, Central Mortgage and Housing Corporation, spoke on **The Engineer and Community Planning.**

"Too many people", said Mr. Gitterman, "think of community planning solely from the aspect of beautification." Proper planning takes in far more than this with considerations of utility taking a paramount place.

The grid pattern of city development, so common in Canada, can be very expensive, he said. By the use of loops, and the breaking down of areas to neighborhoods, on to "precincts" as the English call them, highways can be reduced as much as 40 per cent and other benefits can result to the population.

These nighbourhoods are bounded generally by high speed traffic arteries but internally are free of fast traffic, and may have their own local shops and educational areas. Among other benefits danger to school children on the way to and from school is greatly reduced and through traffic to other parts of the city expedited. With the grid pattern makeshifts are required that aggravate rather than relieve congestion.

The speaker stressed the necessity of planning for possible populations ahead. If you have no idea what the population of the city is going to be how can you design it adequately, he asked.

The speaker was thanked by Tom Foulkes. Chairman J. L. Shearer, who introduced the speaker, announced that the following were recently named as life members: W. F. M. Bryce, F. E. Bronson, E. G. Carty, F. Coburn, and E. B. Jost.

Saint John

J. H. C. MacLure, M.E.I.C.
Secretary-Treasurer

A. R. Bonnell, M.E.I.C.
Branch News Editor

The monthly dinner meeting of the Saint John Branch was held Thursday evening, April 22, in the Admiral Beatty Hotel, with the vice-chairman H. P. Lingley presiding.

In addition to a large turnout of members and affiliates, many guests interested in heating were present. Members from other branches included C. F. G. Bennett, Halifax, and J. F. MacKenzie, Amherst, N.S.

The guest speaker for the evening was G. Lorne Wiggs, M.E.I.C., of Wiggs, Walford, Frost and Lindsay, Montreal. His subject was **Radiant Heating and Cooling.**

Mr. Wiggs stated that radiant heating installed in the ceiling had a great advantage over other types of heating in that the circulation of dust is eliminated. Mr. Wiggs said that germs are carried in the air on dust particles, and that where radiant heating was installed, the tendency for the occupants to have colds was reduced.

Mr. Wiggs also described prefabricated floor and ceiling sections with all services installed. He illustrated his remarks by color slides.

Saguenay

J. E. Dyck, M.E.I.C.
Secretary-Treasurer

Scandinavia as seen by a Canadian Hydro-Electric Engineer was the topic of an address given by F. L. Lawton, M.E.I.C., to the Saguenay Branch of the Institute on May 27, 1948. Mr. Lawton, who is on special assignments for the Aluminum Company of Canada, Limited, Montreal, spent approximately 6 months in Europe during 1947, and visited hydro-electric installations in Norway and Sweden.

Mr. Lawton discussed the amount of water power developed and the efficiencies of installations in these two countries. He pointed out that due to limited coal and oil resources the Scandinavian people had turned to water power for a great part of their power supply. Realizing that water power would have to be their main supply, the people of these countries developed their water wheels and generators to achieve good efficiencies. Mr. Lawton used slides to illustrate statistical data such as per cent of available power developed as well as photographs and cross sections of various installations. He pointed out that Norway with a population of 3 million people had developed over 2 million kw.

Norway and Sweden, due to a sharp contrast in topography, present different problems from the power development point of view. In Norway due to the rugged terrain, power plants are generally of the high head type and power line maintenance presents a problem. In certain localities, service camps are located at 6 mile intervals along the power lines to remove ice and generally maintain the lines. In Sweden practically all plants are tied into one system and transmission distances are considerably greater than in Norway. Power houses in Sweden are being built to some extent underground, not as a safeguard against bombing but rather to reduce the cost of concrete and upkeep.

Both countries operate on a 50 cycle frequency and develop power at 10,000 volts which is considered an economical voltage at the generators. There are certain plants however which generate at 18,000 volts. Transmission lines are well advanced in these countries and a 380,000-volt line under construction has 7-ton towers with a 39-foot distance between conductors. Concrete towers have been experimented with but are used only for lower voltage lines. Mr. Lawton pointed out that due to severe winter conditions, some dams were electrically heated to prevent excessive contraction and leakages.

At the conclusion of the address a question period brought out the following interesting facts: The cost of power in Scandinavia in large blocks ran about $25.00 to $30.00 per kw. year. Lightning conditions on power lines were relatively mild. Pitting and wear on water wheels was about the same as in Canada. J. T. Madill, thanked the speaker on behalf of the Branch.

Vancouver

Alan M. Eyre, Jr.E.I.C.
Secretary-Treasurer

Stuart Lefeaux, Jr.E.I.C.
Branch News Editor

A meeting of the Vancouver Branch was held on April 21 in the Forest Products Laboratory of the University of British Columbia. The speaker of the evening was J. B. Alexander, chief of Timber Mechanics Division, Forest Products Laboratories of Canada. Roscoe Brown, director of the Laboratory introduced the speaker. The title of the address was **Wood as an Engineering Material.**

Mr. Alexander opened his remarks with some facts not generally known about the growth of trees. The moisture content of a tree varies little in the course of a year; more water passing through the tree in the spring and summer. A tree is not a product of the soil, it is a product of the air and water; approximately one per cent by weight of the tree comes from the soil. Trees extend in height from the terminal bud only; a nail driven into the trunk of a three will not change in elevation.

The speaker illustrated his talk with slides of tree growth and lumber testing. The positions of knots in structural members should be taken into account, especially in regions of high stress. Compression wood is dark and appears to be made up of all dark rings of summer wood; it shrinks longitudinally and should not be used for structural members. Spiral grain and ribbon grain lumber has little strength for stressed members. Shakes and checks are of no account unless they come in the centre quarter of a beam. The strongest wood is found at the outside stump of an old tree. Douglas Fir is as strong as any other structural wood of comparable density.

Mr. Alexander conducted machine loading tests to illustrate to those present that the l/d of columns is the determining factor in loading. With l/d greater than 25 there is no need for first quality lumber as the compressive strength does not determine failure. A test was made of a plywood beam to illustrate the weakness of horizontal glued laminations.

The speaker was thanked for his interesting presentation by W. O. Scott. The members then adjourned to the Brock Memorial Building for refreshments.

Toronto

R. A. Muller, M.E.I.C.
Secretary-Treasurer

D. D. Whitson, M.E.I.C.
Branch News Editor

Due to an error in the handling of mail at Headquarters, Toronto Branch activities have not been reported regularly in these columns. An attempt is being made in this issue to compensate for this error. The February meeting, with a summary of guest speaker N. W. McLeod's remarks, was reported in the May issue.

❖ ❖ ❖

On January 24, 1948, the Toronto Branch held its annual Ladies' Night. This year's event was held at the Boulevard Club where 125 members, their wives and friends met for dinner, cards and musical entertainment. Of special interest was the attendance of President Grant and Mrs. Grant and some of the out-of-town councillors. The President spoke entertainingly after dinner and touched on his earlier experiences involving many domiciles in different parts of Canada, and said how much he appreciates the friendly welcome he receives from the members of the various Branches.

The evening afforded an excellent opportunity for "get-togethers" and is a firmly established part of the Toronto activities. The Branch was fortunate in obtaining two interesting films from the Bell Telephone Company and the H.E.P.C. of Ontario which were much appreciated.

The Chairman of the entertainment committee was Professor Mark Huggins of the Faculty of Applied Sciences, University of Toronto. D. G. Geiger occupied the chair.

❖ ❖ ❖

On Wednesday, January 29, 1948, at Hart House, University of Toronto, the annual Students' Night was held. This has become a widely featured event encouraging and giving an opportunity to Varsity's many undergraduate engineers to deliver short technical addresses before the Branch for monetary prizes. Elimination contests were held at the University and the five best were selected to speak before the Branch. Seventy-five members heard five first class talks on a variety of subjects, illustrated with slides and diagrams. The judges were Messrs. Muntz, Bonn and Whitson who, after detailed comparison of their notes, selected A. S. Halpenny of Toronto as winner of the first place award of $50.00 donated by the T. Eaton Co. Ltd. T. L. Faul, of Czechoslovakia, was winner of the second place award of $30.00; V. L. Richards, of Bermuda and England, won the third place award of $20.00; and J. R. MacKenzie of Stettler, Alberta, and R. S. Hill of Havana, Cuba, tied for fourth place award of $5.00 each.

Mr. Halpenny's subject was **Atomic Power Engineering.** He listed informative facts about the isotopic content of uranium, the process of fission, the phenomenon of transmutation. He places the engineer in the scheme as the man who will design the power plant to minimize losses and assure a chain reaction. He described in detail a plutonium or uranium "pile".

Vincent Richards, of third year Engineering and Business, discussed the application of the **Heat Pump** as a year-round air conditioning unit. The heat pump is the term given to the use of refrigeration equipment to deliver heat in the winter and to abstract heat in the summer. Although extravagant claims had been made in the popular press, the heat pump did offer remarkable advantages over other systems. Air above 35 deg. F., water above 32 deg. F., or even groundheat from the earth below 60 feet, could all be used effectively as heat sources. The refrigeration cycle on which the heat pump operates permitted coefficients of performance of 3-5 in practice, thus enabling electricity to compete profitably for the first time with the older types of heating.

❖ ❖ ❖

On April 27, 1948 the Annual Meeting of the Toronto Branch was held at the Royal York Hotel, and was preceded by a dinner attended by a large number of members of the Branch, and honoured by the presence of two life-members, Mr. Wheaton and Mr. Wm. Rogers of the Halifax Branch. An added feature of the evening was the announcement that Prof. Allcut of the Faculty of Applied Science of the University of Toronto had been awarded the Gzowski Medal for his paper on Toronto's Smoke Problem, which he presented before the Toronto Branch in November, 1946.

Elections for the Branch Executive for 1948-1949 had been held previously and the scrutineers reported the following results: Chairman, J. F. MacLaren; Vice Chairman, E. R. Graydon; Executive, John Hall, W. H. Patterson, E. G. Tallman, D. C. Beam, Prof. M. W. Huggins and D. D. Whitson.

The secretary-treasurer reported the financial position of the Branch. A. Murray Lount gave a particularly good report of the activities of the Junior Section. Their Ajax (U. of T.) meeting was attended by over 800 students, and other meetings were very well attended.

At a certain point the meeting was declared to be a regular meeting of the Branch. Business was discussed, and voting was carried out with the following results. The Branch Year was changed to coincide with the calendar year and with Headquarters' year. It is expected that this will keep the Branch finances on a more readily workable basis, and will assist future vice-chairmen in lining up speakers. It is worthy of note that a majority of a group of ten past-chairman, who were contacted regarding this matter, did not approve the change.

Also approved by standing vote was a change covering the duties of the Nominating Committee. Henceforth, if insufficient nominations are obtained from the members for the various offices of the Branch, the Committee need only nominate one member for the position of Vice-Chairman, and three for Committeemen instead of two and six as formerly required.

On presentation of a petition signed by seventeen corporate members, and after a motion by Mr. Storrie, it was decided to call a special meeting of the Branch to discuss Council's stand, and the stand of the Toronto Branch Executive on the subject of collective bargaining by engineers and the proposed bill No. 195, now "in committee" at Ottawa.

The special meeting was planned for May 17, 1948, and it was expected that Mr. G. Martin would attend to explain Council's stand, and the stand of the special committee of Council on collective bargaining. Mr. Martin is chairman of that committee. The Toronto Branch Executive passed a resolution on April 16, opposing Council's stand on this important matter.

The Branch had the pleasure during the evening of hearing G. L. Long, customer relations supervisor of the Bell Telephone Company discuss the use of microwaves in the transmission of the human voice. Mr. Long had elaborate apparatus to illustrate his talk and greatly entertained and enlightened the members. The system improves on what is known in the telephone business as "carrier", which is a method of transmitting several telephone messages over the same wires at the same time. Carrier telephony operates on different wave lengths like radio, and by use of special co-axial cable, 600 messages may be transmitted simultaneously. The frequencies used in this method run to several million cycles per second. If more messages are to be transmitted, the frequencies must be raised still higher, and microwaves come into their own. At 1,000 messages on the system it becomes cheaper than present co-axial wire systems. The ultimate hope is for 4,000 simultaneous messages to be transmitted over one channel.

Even co-axial conductors cannot carry microwaves. The wire and insulators interfere with the tiny waves. Special radio tubes had to be developed. The wave lengths are 1¼" long compared with 1000 feet for home power supply. The frequency of micro-waves, as generated by a klystron tube or the newer British magnetron tube developed for use in "radar", is 10 million cycles per second. These waves come out of a transmitter by a wave guide and are picked up by a similar device, using a special silicon crystal detector, which lowers the microwave frequencies to frequencies which can be amplified.

Micro-waves are not interferred with, cut-off, or reflected by non-electrical conductors such as wood, glass, etc., but are blocked, and may be reflected by metal plates, or normal electrical conductors. The waves in many respects are similar to light-waves, and are polarized. A metal grid or "lens" is used to direct the waves at both the transmitting and receiving ends. These grids focus the waves, which cannot be transmitted beyond the visible horizon. The transmitters and receivers must therefore be on high buildings or hill tops, or towers at about 35 mile spacings, and must be relayed from one station to the next. A ten-foot square grid collects 1 part in 400,000 of the energy transmitted by a station 35 miles distant. It is expected that the system can be used eventually for the transmission of television programmes as well as telephone conversations.

BOOK REVIEWS

CONSTRUCTION ESTIMATES AND COSTS, 2nd ed.

H. E. Pulver. N.Y., Toronto, London, McGraw-Hill, 1947. 653 pp., illus., 9½ x 6½ in., cloth, $7.20 (in Canada).

This book on the estimating of building costs is both a text book and a practical manual. It describes in detail the purposes and functions of estimating, giving the reader an adequate background knowledge of the subject before proceeding to the practical applications. In the first section on estimating in general, the author defines the various types of estimates, describes the methods used in computing the figures, and discusses the various factors that must be taken into consideration by the estimator.

The main part of the book is taken up with the problem of estimating the cost of construction. This includes not only the cost of the actual construction work, but such problems as the handling and transporting of materials, the excavation, the installation of machinery, the equipment used, the temporary buildings erected on the site, and also the overhead and profit. With regard to the actual building operations, the author includes piling and bracing, concrete, masonry, damp-proofing and waterproofing, wood construction, structural steel, roofing and flashing, lathing and plastering, heating and air conditioning, plumbing, electrical work, painting, papering, and glazing.

Not only does the author discuss the factors that must be considered, but he also provides many concrete examples and illustrations from which the estimator may work directly. Methods of computing costs are described, with illustrative tables and graphs. The revised edition bases prices and materials on 1947 standards, though they are necessarily only approximate. An appendix provides a check list that the estimator may use in approaching the problem. Also in appendices are included a schedule of average ownership expense, a table of construction equipment rental rates, a depreciation schedule for construction equipment, a list of compensation insurance rates for construction, and a considerable number of examples of graphical diagrams.

The final chapter in the book deals with construction management, and outlines in detail the steps that must be taken by the estimator from the beginning to the end of the construction job. The author has used many tables, diagrams, and examples as well as explanatory text, and the material is presented in a manner that is both straightforward and concise. N. T.

WHO'S WHO IN ENGINEERING; A BIOGRAPHICAL DICTIONARY OF THE ENGINEERING PROFESSION, 6th ed:

Winfield Scott Downs, ed. N.Y., Lewis Historical Publishing Company, 1948. 2357 pp., 9½ x 6½ in., cloth, $15.00.

The qualifications for inclusion in Who's Who in Engineering were established by the Engineers' Joint Council, and include engineers of outstanding and acknowledged professional eminence, who have had ten years of active practice, five years of which has been in responsible charge of important engineering work (including teachers in colleges and schools of accepted standards in engineering). Almost 18,000 engineers are listed, an increase of twelve per cent over the fifth edition, which was published in 1941.

The biographical material is listed alphabetically and comprises 2260 two-column pages of text. The information given includes full name; position held; business and home address; type of engineer; place and date of birth; parents' names; universities attended and degrees received; date of marriage and names of wife and children; positions held throughout career; books written; and society and club memberships. There is a geographical index to the biographies, by state and city for the United States, and by city for other countries.

Besides this there are lists of American and some Canadian engineering organizations, with their address, officers, membership, and in some cases, purpose, arranged alphabetically in one section, and geographically in another. There is a subject list of professional fraternities and honour societies. The engineers included in this dictionary are mainly American, but Canada is well represented. L. S.

ABSTRACTS

FUEL ECONOMY CONFERENCE OF THE WORLD POWER CONFERENCE, THE HAGUE, SEPTEMBER 1947

The following are official summaries of papers presented at the Fuel Economy Conference. The complete text of these papers, together with reports of the discussions on the Section in which they were included, will be published in the "Transactions of the Fuel Economy Conference". Enquiries may be addressed to Mr. Norman Marr, Canadian Committee, World Power Conference, Laurentian Building, 54 Albert Street, Ottawa, Ontario.

DISTRICT HEATING

Ir. M. C. Hoenkamp. The Hague, Fuel Economy Conference of the World Power Conference, 1947. (Fuel Economy Conference Section C5 Paper No. 3).

A district heating system can meet the demands which the human organism may make. In the Netherlands the consideration of district heating is urgent, because extensive quarters of several towns have been destroyed. With a view to the reconstruction of the destroyed heart of Rotterdam schemes for district heating in this city have been studied. (1) Supply of the heat from the Schiehaven power station, which is situated at some distance from the area of consumption. The supply of heat would be combined with the generation of electric energy. Considerable savings of fuel would be secured, but very large capital investment would be entailed. (2) Supply of the heat from ten small boiler houses, to be established in the area of heat demand, these being heating plants only without power generation. In this case the saving of fuel will be considerably smaller but less capital would be needed. (3) Combination of methods (1) and (2), the Schiehaven power station to supply the base heat load, this being combined with the generation of electrical energy. In the area of heat demand the peak load would be supplied by a small number of boiler stations supplying heat only.

This third scheme is to be adopted. A large quantity of fuel will be saved thereby. The capital required is not soo great. The price of a thermal unit will be lower for the adopted scheme than for either scheme (1) or (2).

A general description is given of the Schiehaven power station, and of the hot water mains, the connections to the houses, and other factors.

DEVELOPMENTS IN THE HEATING OF BUILDINGS IN SWEDEN

Erik O. Jonsson and E. Lagerstedt. The Hague, Fuel Economy Conference of the World Power Conference, 1947. (Fuel Economy Conference Section C5 Paper No. 6).

During and after the second world war, imported coke, which had been the principal fuel employed in central heating boilers in Sweden, was replaced by home-produced wood fuel. The use of wood in boilers designed for coke firing is facilitated by various special devices and methods of firing. Efficient wood-fired boilers of large heating capacity are now available. The efficiencies of these boilers are high also when fired with coal. No satisfactory commercial wood-fired heating boilers have so far been produced for small houses, but a new type of boiler has been found to have a high test-bench efficiency. Special systems of boiler connections have come into use for preventing corrosion due to condensation of steam, etc., from flue gases in wood-fired boilers feeding hot water heating systems. It seems, however, that the most reliable method for preventing corrosion is to use low-pressure steam boilers equipped with heat exchangers built into the steam domes. As a rule, modern coke-fired heating boilers are now so designed that they can be alternatively fired with fuel oil. Large boilers of this type can also be fired with coal by means of work feed stakers. New materials are being used for heat insulation of buildings. Regulations applicable to the whole of Sweden have been issued for the heat insulation and ventilation of dwelling houses. Research is being conducted into the heating of buildings.

Beneficiation of Over-Spray Porcelain Enamel:

D. W. Scott, L. A. Roe, and B. J. Sweo. N.Y., American Institute of Mining and Metallurgical Engineers, 1947. (AIMME Technical Publication No. 2253).

Canadian Export Timbers; their Properties and Uses:

Department of Trade and Commerce and Forest Products Laboratories, Ottawa, 1948.

Distruzioni e Ricostruzioni in Italia; Attivita Attuali e Programmi di Lavor del Ministero dei Lavori Pubblici:

Ministry of Public Works, Rome, 1948.

Effects of Radiant Heat on Reinforced-Concrete Rigid Frames:

Milan A. Johnston. N.Y., American Society of Civil Engineers, 1946. (ASCE. Paper No. 2289).

Electrets:

Thomas A. Dickinson. Alhambra, Calif., Plastics Research Co., 1948.

Patterns of Power:

L. K. Sillcox. Cambridge, Massachusetts Institute of Technology, 1948.

Regulation to Amend Manitoba Regulation 54/55, being a Regulation under "The Mines Act", R.S.M. 1940, CAP. 136 Governing the Disposal of Mineral Locations in the Province of Manitoba:

Manitoba Parliament, Winnipeg, 1948. (Manitoba Regulation 11/48).

Rubber and the Chemical Engineer:

H. C. Young. London, British Rubber Development Board, 1948.

Steam Turbine Locomotive:

Charles Kerr. Montreal, Engineering Institute of Canada, 1948.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

HERITAGE OF THE ENGLISH-SPEAKING PEOPLES AND THEIR RESPONSIBILITY; ADDRESSES AT THE SECOND CONFERENCE, September 1947:

Kenyon College, Gambier, Ohio, 1948. 268 pp., 9 x 6 in., paper, $2.50.

The second conference was intended as a study of the ideas by which we live. Discussion included such topics as "Responsibility for World Peace and Justice", "Our Liberal Heritage: What it is and how to keep it", "Some Philosophical Facets of Anglo-American Culture", "The English Turn of Mind in Philosophy", Education and the Literary Heritage", "The Meaning of Fairness", "Labor Relations and Freedom", "Freedom and Community in an Industrial Society", "The Spirit of the Age", and "The Past and the Future".

INTERNATIONAL CIVIL AVIATION ORGANIZATION. PUBLICATIONS: SUPPLEMENTARY PROCEDURES FOR THE SOUTH AMERICAN REGION (Doc 4976):

These supplementary Procedures detail the specific arrangements applicable to the South American Region, and in conjunction with the general *"Procedures for Air Navigation Services"* provide complete information for International Civil Aviation within the region.

SUPPLEMENTARY PROCEDURES FOR THE SOUTH ATLANTIC REGION (Doc 4977):

These are the same for the South Atlantic Region as the above.

METEOROLOGICAL DIVISION. SPECIAL SESSION. FINAL REPORT, September 1947 (Doc 4820-MET/509):

This includes definitions, classification of meteorological information, meteorological observing stations and observations, aeronautical climatology, telecommunications for aeronautical meteorology, and procedures for meteorological service on international air routes, with several appendices.

PROCEDURES FOR AIR NAVIGATION SERVICES. AERODROMES AND GROUND AIDS (Doc 4810-AGA/559):

These procedures are recommended for implementation, as far as practicable and appropriate, at all regular, alternate and supplementary aerodromes in the Caribbean, South American and South Atlantic Regions.

SPECIAL COMMITTEE ON TEMPERATURE ACCOUNTABILITY. FINAL REPORT ON THE PARIS MEETING (Doc 4643-AIR/510 and OPS/510):

The purpose of the committee was to clarify the issues raised by temperature accountability, and to state the principles involved in the clearest possible terms.

STATISTICAL SUMMARY (Doc 4900-AT/634).

The predecessor to an official series of statistical publications soon to be published.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

ALLEN'S DICTIONARY OF ABBREVIATIONS AND SYMBOLS.

E. F. Allen. Coward-McCann, Inc., New York, 1946. 189 pp., 7¾ x 5 in., cloth, $3.50.

The major part of the book consists of some 6000 abbreviations alphabetically arranged. The abbreviations are ones commonly used in a wide variety of fields such as: literature, science, engineering, business, politics, religion, etc., and where more than one word or phrase is represented all are given. At the back of the book several pages are devoted to classified groups of symbols used in typography, mathematics, astronomy, and a few other fields.

COLLEGE PHYSICS, Complete Edition. Electricity, Magnetism, Optics.

F. W. Sears and M. W. Zemansky. Addison-Wesley Press, Inc., Cambridge 42, Mass., 1948. 848 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50.

An adaptation of the Sears' "Principles of Physics" series, this text puts the emphasis on physical principles. Those parts of the original text that come within the scope of intermediate physics and needed the aid of calculus have been removed or rewritten in simpler form. In addition to the standard material on electricity, magnetism and optics, this volume briefly discusses radioactivity, atomic and nuclear physics. Problems are presented at the end of each chapter and answers are provided for the odd-numbered problems. A companion first volume covers mechanics, heat and sound.

ENAMELER'S DICTIONARY.

Ferro Enamel Corporation, Cleveland, Ohio, 1947. 84 pp., illus., 9 x 6 in., paper, gratis to persons interested in porcelain enameling.

Of interest to those who wish to have a thorough working knowledge of the language of porcelain enameling, this volume contains definitions of words and terms adopted for use by the industry. In addition to the definitions, there is an Appendix containing useful charts and tables.

ENGINEERING LAMINATES, Fundamentals Underlying the Problems of Their Inhomogeneity (Edgar Marburg Lecture 1947).

W. C. Voss. American Society for Testing Materials, Philadelphia 3, Pa. 34 pp., illus., diagrs., tables, 9¼ x 6 in., paper, $1.00.

Following a brief introduction noting the steps through which the present knowledge of materials has developed, this booklet presents a review of some of the fundamentals involved, including: atomic structure, crystal lattices, and plastics. This is followed by a section on adhesion. Some of the common laminates are described along with methods of evaluating their properties.

HOT-DIP GALVANIZING PRACTICE.

W. H. Spowers, Jr. 2 ed. Penton Publishing Co., Cleveland, Ohio, 1947. 188 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00.

In this second edition much of the subject matter of the first has been rearranged to conform more nearly with the sequence of operations. New material on the control of oxidation and radiation in galvanizing kettles has been added as well as on plant construction and procedure. New references have been added to the extensive bibliography.

HOW TO ORGANIZE AND MANAGE A SMALL BUSINESS:

N. Black. University of Oklahoma Press, Norman, Okla., 1946. 367 pp., charts, tables, 8¼ x 5½ in., cloth, $3.00.

The reader is taken point by point through the problems, planning, decision and action of small-business organization and management. Modern management methods are described, and techniques are explained for forecasting and preventing mistakes by the use of business ratio and percentage guides. Important features of the book are the emphasis on effective study of business fundamentals, and the discussion of methods necessary for adequate price-setting. Illustrative examples of particular types of small businesses are freely used.

MANUAL OF DESIGN FOR ARC WELDED STEEL STRUCTURES.

Compiled by L. Grover. Air Reduction Sales Co., New York, March 1946. 281 pp., illus., diagrs., charts, tables, 9¼ x 6 in., fabrikoid, $2.00.

The material in this manual is divided broadly into three sections. The first covers fundamentals of design, typical details, data and diagrams for design calculations, the estimation of cost, and inspection methods. Part II presents standardized welded connections for simple framing and tables of allowable loads on beams and piece marks for welded connections. Part III contains welding terms, definitions and symbols, acceptable and unacceptable weld profiles and joints, and condensed information on electrodes for structural welding.

PHOTOELASTICITY, Vol 2.

M. M. Frocht. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 505 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $10.00.

This treatise on advanced principles and methods includes the following: essential elements of the theory of elasticity; a critical examination of the influence of the physical constants on the state of stress in two dimensions; a broad survey of the methods for the determination of the sums of the principal stresses with special emphasis on the numerical solution of Laplace's Equations. It also presents the theory and technique of three-dimensional photoelasticity with applications to stress concentrations.

REPORT ON GERMAN BLAST FURNACE PRACTICE AND PLANT.

British Iron and Steel Federation and British Iron and Steel Research Association, London, 1946. 57 pp., diagrs., Charts, tables, 9¼ x 6¼ in., paper, 10s.6d.

Prepared under the auspices of a British Intelligence Sub-Committee, this volume deals with the development of German blast furnace practice and design during the war. Among the changes in processes and equipment, the progress made in the installation of plants for ore crushing and sintering is particularly noted. The changes in furnace design are discussed as well as the progress made in the development of blower equipment, gas cleaning practice, and vortex dust catchers.

TABLES OF PROPERTIES OF GASES WITH DISSOCIATION THEORY AND ITS APPLICATIONS.

E. W. Geyer and E. A. Bruges. Longmans, Green and Co., London, New York and Toronto. 1948. 102 pp., charts, tables 9¼ x 6 in., cloth, $3.50 (in Canada).

This book contains ables on the thermal properties of oxygen, nitrogen, hydrogen, water vapor, carbon monoxide and dioxide, ethylene, octane and benzene. The tables run from 400° to 5400° F. abs. for the most part, with a few going higher. Linear interpolation for intermediate temperatures is possible. The derivation of the tables, a modern approach to the theory of dissociation, and directions for the use of the tables are included.

UNIT HEATERS, Types, Application, Installation and Maintenance. (Mechanical World Monographs No. 40.)

S. E. Nelson. Emmott & Co., Ltd., 31 King Street West, Manchester, England, and 21 Bedford Street, Strand, London, W.C.2., 1947. 23 pp., diagrs., 7¼ x 5 in., paper, 1s.6d.

A concise survey of the types of unit heaters with suggestions as to methods of applying them to general warming and ventilating problems. Comparisons are made with other systems regarding installation and running costs and accessories required. Setting systems in operation, testing, supervision and maintenance are dealt with briefly.

VACUUM-TUBE CIRCUITS.

L. B. Arguimbau. John Wiley & Sons, Inc., New York; Chapman & Hall, Limited, London, 1948. 668 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $6.00.

Emphasizing physical concepts and ideas rather than detailed discussion of actual circuits, this book includes the fundamental material needed by the reader who is unacquainted with electronics. It deals at some length with frequency modulation, transient response and the generation of microwaves, with special treatments of inverse feedback, video-amplifier transients, pulses and television. A knowledge of alternating-current circuits, calculus, and Fourier Series is assumed.

WELDING ENCYCLOPEDIA, Completely Revised:

Re-edited by T. B. Jefferson, Originally compiled and edited by L. B. Mackenzie. 12th ed. Welding Engineer Publishing Co., New York 18, 1947. 1024 pp., illus., diagrs., tables, 9 x 5½ in., fabrikoid, $6.50.

From abrasion to zirconium this standard reference work covers all terms relating to the broad field of metal joining and cutting by the application of heat, including heat treating processes and other allied subjects. Photographs, line drawings, graphs, data tables, and equilibrium diagrams are extensively used to illustrate or amplify the text. Various pertinent codes, standards, and specifications are appended, and there is a 90-page list of trade names with descriptive information. The volume has been revised throughout in accordance with current practice.

Although not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

ANALYSIS AND SYNTHESIS OF LINEAR SERVOMECHANISMS.

A. C. Hall. Technology Press, Massachusetts Institute of Technology, Cambridge, Mass., 1947. 193 pp., diagrs., charts, tables, 11 x 8½ in., paper, $2.50.

This publication is a formulation of a servomechanism design procedure based primarily upon an analysis of the system response to sinusoidal inputs of various frequencies. The methods developed are based upon the characteristics of the servomechanism transfer function. Following the discussion of compensating functions, their physical realization is considered using several different types of circuits. Advantages and short-comings of the various compensating devices are discussed.

CHEMICAL AND TECHNICAL STENOGRAPHY.

J. Kanegis. James Kanegis, 619 Eye St., S.W., Washington 4, D.C., 1947. 387 pp., diagrs., 8¾ x 5½in., cloth, $5.00.

Using the Gregg system, this volume presents forms of technical stenography used particularly in the chemical and metallurgical fields. Introductory matter is given to provide the idiom of each field. No previous science training is necessary, although a basic understanding of Gregg shorthand is assumed. Extensive word and phrase vocabularies are included, following the detailed classified sections and the explanations of formula and equation representation.

COMBAT SCIENTISTS.

L. R. Thiesmeyer and J. E. Burchard; volume editor, A. T. Waterman, foreword by E. T. Compton. Little, Brown and Company, Boston, 1947. 412 pp., illus., tables, 8¾ x 5½ in., cloth, $5.00.

This book tells the story of the field activities of the Office of Scientific Research and Development as instituted and carried out for the purpose of providing the armed forces with scientific advice on new weapons, devices and techniques. The many forms of this assistance, its scope, and a glimpse of the manner in which this activity was organized and operated are presented. Two illustrations of the work are given in the studies dealing with the navigational and demolition aspects of landing operations. Subject and personnel indexes and a glossary of organization and operation abbreviations are included.

ECONOMICS OF TRANSPORTATION.

D. P. Locklin. 3 ed. Richard D. Irwin, Inc., Chicago, Ill., 1947. 885 pp., diagrs., charts, maps, tables, 9¼ x 6 in., cloth, $5.50.

This well-documented volume provides comprehensive coverage of the fields of water, highway, air, railroad and pipeline transportation. The new edition has been revised to include discussion of new legislation, and some of the issues which arose from the administration of the laws are treated. Other important changes are the expansion of the chapter on transport coordination and the omission of the one on common-carrier liability.

ELECTRIC POWER TRANSMISSION.

M. P. Weinbach. Macmillan Company, New York, Toronto, 1948. 364 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $5.50.

Emphasizing the electrical problems of power transmission, this book provides a knowledge of the physical phenomena involved and the mathematical processes needed for their solution. The three-phase system, circuit properties of transmission lines, voltage control, steady state power limits and other problems are considered. Some items omitted from the book are generating equipment, schemes of mechanical suspension of lines, insulation structures, switching apparatus, current-limiting reactors, relay installations, and lightning protection. Lists of references at the ends of the chapters provide sources for additional information on special phases of the subject.

ELEMENTARY ENGINEERING MECHANICS.

C. O. Harris. Irwin-Farnham Publishing Co., Chicago, Ill., 1947. 445 pp., diagrs., tables, 9¼ x 6 in., cloth, $5.00.

Covering both statics and dynamics, the material in this text is so organized as to give first the general theory and methods of the several topics dealt with, then continuing with special cases and practical applications. The object is to develop the analytical and reasoning ability of the student as well as to present the principles of mechanics and show how to apply them. A great many illustrative diagrams and problems are provided.

ENCYCLOPEDIA OF CHEMICAL TECHNOLOGY, Vol. 1, A to Anthrimides.

Edited by R. E. Kirk, D. F. Othmer and others. Interscience Encyclopedia, Inc., New York, 1947. 982 pp., illus., diagrs., charts, maps, tables, 10½ x 7½ in., cloth, $20.00 per volume.

Primarily designed for chemists and chemical engineers, the set of which this is the first volume, will present a comprehensive summary of industrial knowledge on materials, methods, processes and equipment. The theoretical and mathematical treatment is restricted, except where it is necessary to bring out established principles and provide a background for applications. The bibliographies serve as selected reading lists. Diagrams, flow sheets, formulas and equations have been used freely. All articles have been written by authorities in the respective fields. The wide range of topics includes metallurgy, industrial hazards, fuels, fibers and polymeric substances, coatings, foods, pharmaceuticals, and all other industries served by chemical processes.

FRACTIONAL HORSEPOWER ELECTRIC MOTORS.

C. G. Veinott. 2 ed. McGraw-Hill Book Co., New York, Toronto, London, 1948. 554 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

This practical book is written for those engaged in the design, manufacture, installation, maintenance, or repair of fractional horsepower motors. It discusses what types are available, what makes them run, and what they will do, together with a detailed analysis of testing methods. This thoroughly revised and rewritten edition conforms to the standards of the American Standards Association, the National Electrical Manufacturers Association, and the American Institute of Electrical Engineers. Special attention is given to electrolytic capacitors, regeneration, commutator refinishing, and fractional-slot winding layouts.

SOUND, A PHYSICAL TEXT-BOOK.

E. G. Richardson. Longmans, Green & Co., New York, Toronto; Edward Arnold & Co., London, 1947. 344 pp., illus., diagrs., 8½ x 5½ in., cloth, $5.00.

This volume deals with the physics of sound and its applications. The results of experimental research are included as well as a selective survey of the periodical literature from 1907 to date. A knowledge of basic physics and calculus is assumed. In this fourth edition, the material is brought up to date and re-arranged to provide a logical progression from the simple characteristics of sound to the modern technological aspects.

STARTING A SMALL MACHINE SHOP.

F. H. Colvin. McGraw-Hill Book Co., New York, Toronto, London, 1948. 212 pp., illus., diagrs., charts, tables, 7¾ x 4¾ in., cloth, $2.50.

This book is written to help the machinist who wants to start his own business. It sets forth the problems that must be considered and shows how they have been solved by others. The location of the shop, the selection of machine equipment with regard to both cost and efficiency, the shop layout, work and employee management, and the handling of special work with limited equipment are discussed.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield St., Montreal—Telephone BElair 3019—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER for work in the Development Department of a large chemical manufacturing company involving chemical engineering design, preparation of mass and descriptive flow sheets, specification of equipment, comparison of processes, pilot plant liaison work. Must have had from three to five years in chemical plant engineering, maintenance or operation, in order of decreasing preference. Must be able to co-operate well with other departments in the Company. Work would be in Montreal. Salary open. Apply to File No. 4119-V.

CIVIL

CIVIL ENGINEER required for consulting engineer and surveyors' office in Montreal. Work includes surveying, topographical draughting, preparation of designs and plans of engineering work, etc. Must be bilingual. Salary according to experience with future depending on ability. Apply to File No. 4105-V.

CIVIL ENGINEER, thoroughly experienced and competent in structural design required by an established firm of consulting engineers in Toronto. Applications are invited from engineers with high qualifications and references. Salary open. Apply to File No. 4112-V.

CIVIL ENGINEER age 25 to 35 with experience in structural design required by an established firm of consulting engineers in Toronto. Opportunity for progressing in this work under proper supervision. Salary will be relative to experience and ability. Apply to File No. 4112-V.

CIVIL ENGINEER with considerable experience in structural steel and reinforced concrete design. Preferably bilingual. Required in Montreal. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4137-V.

ELECTRICAL

ELECTRICAL ENGINEER required by company in Shawinigan Falls, Quebec. Vacancies exist for first class electrical engineer capable of taking entire charge of electrical department also electrical engineer for work as assistant plant engineer. Salary open. Apply to File No. 4106-V.

EXPERIENCED ELECTRICAL ENGINEERS required by consulting engineering office in Montreal as Assistant Engineers, Designers, Checkers, Draughtsmen and Quantity Estimator. Salaries open. Apply to File No. 4110-V.

ELECTRICAL ENGINEER, age 30-40, required as Sales Engineer for Electrical Power Apparatus Company, manufacturing motors, transformers, rectifiers, switchgear, etc. Test course graduate specializing in switchgear preferred. Sales experience desirable but not essential. Location Toronto. Salary open. Apply to File No. 4128-V.

MECHANICAL

EXPERIENCED MECHANICAL ENGINEERS required by consulting engineering office in Montreal as Assistant Engineers, Designers, Checkers, Draughtsmen and Quantity Estimator. Salaries open. Apply to File No 4110-V.

JUNIOR MECHANICAL ENGINEER, age 25 to 27 years, preferably with three to four years experience required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

MECHANICAL ENGINEER with two or more years experience in machine shop practice required in Montreal as sales engineer handling cutting oils and other chemicals and oils used in machine shops. Salary open. Apply to File No. 4116-V.

MECHANICAL ENGINEER with at least ten years experience including plant maintenance and preferably in the pulp and paper industry required in New Brunswick. Salary open. Apply to File No. 4117-V.

MECHANICAL ENGINEER for work in the Development Department of a large chemical manufacturing company involving chemical engineering design, preparation of mass and descriptive flow sheets, specification of equipment, comparison of processes, pilot plant liaison work. Must have had three to five years in chemical plant engineering, maintenance or operation, in order of decreasing preference. Must be able to cooperate well with other departments in the Company. Work would be in Montreal. Salary open. Apply to File No. 4119-V.

MECHANICAL ENGINEER preferably with two or three years general plant experience required as production engineer by National Beverage Company in Eastern Canada. Salary open. Apply to File No. 4122-V.

MECHANICAL ENGINEER, recent graduate, required by a chemical plant in Central Ontario. Salary open. Apply to File No. 4123-V.

MECHANICAL ENGINEER or other engineer with equivalent draughting training, for position of assistant plant manager of a granite plant 25 miles south of Montreal. Applicant should be 28 to 34 years old with one or two years business experience. Position offers prompt promotion for a capable man as present manager must take over new duties in two to five years. Starting salary about $275.00 per month with regular annual increases. Apply to File No. 4126-V.

MECHANICAL ENGINEER required for a Western industry engaged in the manufacture of truck bodies and trailers, overhaul and repair of industrial engines and construction equipment, repair and maintenance of R.C.A.F. and civilian aircraft. Service as an Engineering Officer in the R.C.A.F. during the war will be an advantage. An excellent opportunity is offered to the right man. Apply to File No. 4129-V.

MECHANICAL ENGINEER with knowledge of design and considerable experience with steam and diesel engines and refrigeration equipment. Required in Montreal. Preferably bilingual. Must be veteran with overseas service. Applicants should state age, experience and salary expected. Apply to File No. 4137-V.

MECHANICAL ENGINEER OR DRAUGHTSMAN with minimum of four or five years experience. Knowledge of paper mill engineering desirable but not essential. Required by large Pulp and Paper Mill for general engineering design and draughting. Salary up to $400 depending on qualifications. Apply to File No. 4138-V.

MISCELLANEOUS

CONSTRUCTION ENGINEER, recent graduate, required in Montreal for general duties. Salary around $275. Apply to File No. 4107-V.

SALES ENGINEER required by Canadian manufacturer of industrial instruments. Territory: Montreal and Quebec. Sales and process experience very helpful. Salary open. Apply to File No. 4109-V.

MECHANICAL OR ELECTRICAL GRADUATE, age about 35 years with experience in building construction machinery maintenance and repair capable of taking over the engineering and maintenance services in a large textile mill in Province of Quebec. Salary open. Apply to File No. 4114-V.

DRAUGHTSMEN with some experience in building design or architectural work required by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

MECHANICAL ENGINEERS required for manufacturing and related duties with well established reputable paper company. Four to six years general industrial experience required. Salary open. Apply to File No. 4115-V.

SALES ENGINEERS, one experienced man also two juniors willing to learn required by an electrical and power house equipment manufacturer in Montreal. Salary open. Apply to File No. 4121-V.

RECENT GRADUATE preferably mechanical or civil background required by Maritime branch of large industrial Canadian firm. Duties of general engineering nature. Salary open. Apply to File No. 4125-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

SENIOR CHEMICAL ENGINEER OR CHEMIST, required by leading Paper Manufacturer in Eastern Canada. Applicant should have some experience in Paper Mill Control work. This position offers plenty of scope for advancement. Salary open. Apply to File No. 4013-V.

CHEMICAL ENGINEER required by a major Canadian Company located in Toronto as Technical Service Man. 25 to 35 years old. Definite sales personality. Position will include 6 to 12 months' training. It will carry the responsibility for servicing all types of adhesives to industries throughout Canada. Salary open. Apply to File No. 4044-V.

GRADUATE CHEMICAL ENGINEERS OR CHEMISTS required by an industrial chemical plant in the Montreal area. Preferably with experience in production and the operation of chemical equipment such as filters, presses etc. Must be able to organize work and direct workmen. Salary open. Apply to File No. 4071-V.

CHEMICAL ENGINEER age 25 to 35 years, experience in the Pulp and Paper industry, preferably Kraft, required by paper manufacturer in Eastern Ontario for position of Control Superintendent. Salary according to qualifications. Apply to File No. 4099-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary $2,400 per annum for the first three months, $2,700 after 3 months and $3,000 after 12 months. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsman in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Salary open. Apply to File No. 3884-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Dept. Works Dept. also construction of a general nature for the Electric Light Dept. Salary open. Apply to File No. 3930-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of water-proofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEERS required by a Montreal firm for field inspection in Ontario and North Shore St. Lawrence. Salary open. Apply to File No. 4084-V.

CIVIL ENGINEER with at least two years experience required in a Pulp and Paper Mill in the Province of Quebec for surveying and general paper mill engineering and draughting. Salary $250 to $300. Apply to File No. 4094-V.

ELECTRICAL

ELECTRICAL ENGINEER, recent graduate up required by a manufacturer in Montreal for sales engineering. Must be bilingual and familiar with rotating electrical equipment. Salary $200 up. Apply to File No. 3761-V.

GRADUATE ELECTRICAL ENGINEERS, with 3 to 10 years experience in design, operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced, bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEERS with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN for the design and layout of industrial power and control systems required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

ELECTRICAL ENGINEERS required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

ELECTRICAL ENGINEER, age about 30 required as assistant to Supt. of Light Dept. in Montreal area. Practical experience in Hydro Distribution and Steam Turbines. General office routine of administrative nature. Salary open. Apply to File No. 3950-V.

ELECTRICAL DRAUGHTSMAN required by a firm of Engineer Contractors in Alberta for layout and plotting with a minimum of supervision. Should be accustomed to working with power lines to 2,300 volts and must be able to do lighting circuits, both overhead and underground. Salary $250 to $300. Apply to File No. 3972-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery design, lab. etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

ELECTRICAL ENGINEERS, age 30 to 40 required for the Commercial and Distribution Department of large Hydro Electric Utility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

ELECTRICAL ENGINEER, experienced in Power Station Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Salary open. Apply to File No. 4024-V.

JUNIOR ELECTRICAL ENGINEER required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

GRADUATE ELECTRICAL ENGINEER with a minimum of 2 years practical experience to assist in electrical engineering design work, field work on construction and maintenance of structures, service and installation of equipment required by Manitoba City. Salary $226 to $257. Apply to File No. 4069-V.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience are required for armament research and development in the Quebec area in a government establishment. Salary from $190.00. Apply to File No. 3401-V.

MECHANICAL ENGINEERS required by a Pulp and Paper Company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

RECENT GRADUATES OR JUNIOR ENGINEERS with mechanical background required by a Montreal Engineering, fabricating and contracting firm, for training purposes leading to sales and service. Montreal area. Salary $175 up. Apply to File No. 3810-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with knowledge of physical metallurgy heat treatment, ability in stress analysis and design required for research work in B.C. Maximum salary $4,000. Apply to File No. 3865-V.

MECHANICAL ENGINEER age 30-38 required for Northern Ontario Paper Mill, preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in re-inforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3994-V.

MECHANICAL ENGINEER required as assistant in Chief Engineers Department by large paper company. Paper experience essential, some knowledge of the French language would be helpful. Age 28-40. Salary $350-$450. Apply to File No. 4022-V.

MECHANICAL ENGINEER required in Ontario by a firm specializing in machine tools. Applicant must be experienced in production control. Salary open. Apply to File No. 4026-V.

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures etc. Salary $240 up depending upon ability. Apply to File No. 4030-V.

CHIEF ENGINEER, mechanical background required by a specialized industrial plant in the Montreal area. Work covers mechanical design, preparation of work drawings, bills of materials, specifications and the ordering of all materials for contracts, also design of necessary tooling. Minimum salary $450. Apply to File No. 4066-V.

MECHANICAL ENGINEERS with experience in estimating or design required by well known general engineering firm in Montreal. Good future for those with right qualifications. Salary commensurate with ability. Apply to File No. 4074-V.

MECHANICAL ENGINEER with experience in the design of hydraulic turbines, valves, penstocks, surge tanks and associated equipment required by large manufacturer in Montreal to participate in expanding program of hydro electric development. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER with minimum of eight years experience in the design of heavy mechanical equipment required by well established firm in Montreal for general supervision and checking. Must be alert and aggressive. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER required in Montreal with considerable experience in machine shop practice and some administrative experience in shop work. Applicant should be around 35 years of age and bilingual. Salary depending on qualifications. Apply to File No. 4100-V.

METALLURGICAL

RECENT GRADUATES in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

METALLURGICAL ENGINEER required by a farm implement manufacturer in Ontario to take over the necessary duties in new mechanized foundry. Salary open. Apply to File No. 4086-V.

MINING

MINING ENGINEERS with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years experience required by a Company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

STRUCTURAL STEEL DRAUGHTSMAN AND CHECKERS, preferably graduate engineers but any experienced man acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

SALES ENGINEER, preferably bilingual required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted. Apply to File No. 3780-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER wanted for large fabricating plant in Vancouver, B.C. Age between 30 to 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

MECHANICAL, CHEMICAL OR CIVIL ENGINEER, recent graduate up required for sales and service in Montreal. Must be bilingual. Salary open. Apply to File No. 3867-V.

STRUCTURAL ENGINEER required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

TWO METALLURGICAL ENGINEERS AND ONE CHEMICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training, etc. Salary open. Apply to File No. 3951-V.

STRUCTURAL ENGINEER DRAUGHTSMAN required by a firm of engineer contractors in Alberta. Duties include structural detailer and requires knowledge of major concrete foundations: to detail structural steel buildings, access tower platforms and miscellaneous small steel structures. Salary $300.00. Apply to File No. 3972-V.

DRAUGHTSMAN required by a firm of engineer contractors in Alberta for layout of pipelines and details in refinery construction. Preferably background of refinery experience or alternately power-house piping or heavy industrial draughting. Salary $300. Apply to File No. 3972-V.

CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years experience for key position in moderate size plant in Manitoba, doing fabrication of Plate Work and Light Steel Work, also Grey Iron Foundry and Machine Shop. This will lead to a key position in a growing organization. Salary open. Apply to File No. 4003-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry required in Nfld. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and Paper experience is not necessary. Salary open. Apply to File No. 4009-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred to supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375 U.S. currency. Apply to File No. 4011-V.

ELECTRICAL OR MECHANICAL ENGINEERS required by large Montreal firm to prepare and analyze specifications for telephone equipment manufacturing and installation. Other types of engineering work also available. Salary open. Please send photo together with particulars of education and experience. Apply to File No. 4018-V.

GRADUATE ENGINEER required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential also some sales ability. Salary around $400. Apply to File No. 4021-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships. Good salary, permanent position to the right man. Apply to File No. 4031-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experienced in installations of production and cost control, wage incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

SALES ENGINEER for popular line of Diesel Engines. Applicants must be specialists on Power Units and Generator Sets, required for permanent employment with well established organization. Apply to File No. 4055-V.

GRADUATE ENGINEER, preferably mechanical or electrical background required for drop forging plant operation and production in Province of Ontario by a steel company with headquarters in Ontario. Good commercial sense essential. Salary open. Apply to File No. 4062-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience between 30 and 40 years of age required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

DRAUGHTSMAN preferably with mechanical and structural experience required by engineering firm in Toronto for design of material handling equipment such as belt conveyors also crushing plants and gold mills. Salary $200 to $350. Apply to File No. 4072-V.

POWER STATION OPERATOR with about five years' experience principally in operation and maintenance of turbines and mechanical equipment of hydro-electric plants required by public utility in Brazil. Preferably not over 30 and single but will consider married man without minor dependents. Replies held in strictest confidence. Salary open. Apply to File No. 4073-V.

MECHANICAL OR CIVIL ENGINEER with at least four years experience in stress analysis and vibration required by one of Canada's leading manufacturers of heavy mechanical equipment. Considerable scope for man of proper qualifications. Salary open. Apply to File No. 4074-V.

SALES ENGINEER required by well known engineering supply company doing business with Mining and Pulp and Paper companies. Excellent opportunity for advancement. Travelling not extensive. No experience necessary but desirable. Salary open. Apply to File No. 4079-V.

TOWN ENGINEER required by town in Ontario. Duties include the supervision of Board of Works and Sanitation Departments as well as acting in an advisory capacity to the telephone, electric and water utilities. Salary from $250 to $300. Apply to File No. 4087-V.

RECENT GRADUATE, MECHANICAL OR ELECTRICAL background required by engineering firm in Montreal. Duties include training in Public Utility in Administration Department. Eventually for South America. Salary to start $225. Apply to File No. 4089-V.

SALES ENGINEER preferably mechanical graduate, required for sales engineering work on blowers and vacuum pumps. Compressed air experience would be advantageous. Location Montreal. Salary and commission. Apply to File No. 4090-V.

JUNIOR ENGINEER preferably with a few years experience in production control and some knowledge of the textile industry required for Montreal area. Salary $250 to $275. Apply to File No. 4092-V.

SENIOR INDUSTRIAL ENGINEER with business administration and mechanical background, bilingual, with at least five years experience in production control, wage incentives and cost control required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 4092-V.

SENIOR DESIGNER with from five to ten years experience and a general knowledge of structural design in relation to buildings and bridges required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

JUNIOR ENGINEER with from one to five years experience and at least a working knowledge of structural design of buildings required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

SALES ENGINEER required by large manufacturer of Air Handling equipment in Toronto area. Applicant should have either industrial or Public Building application and sales experience. Salary open. Apply to File No. 4101-V.

SALES ENGINEER required by Canadian Company in Ontario. Must have thorough knowledge of the preparation of tenders, propositions on Transformers, Motors and Switchgear equipment also experience in the commercial side of the heavy electrical industry. Salary open. Apply to File No. 4102-V.

MAINTENANCE ENGINEER required in Quebec City to do installation work in heating, ventilating, refrigeration and air-conditioning, gas and diesel motors. Must be bilingual. Salary open. Apply to File No. 4104-V.

JUNIOR ENGINEER required in Quebec City. Preferably with three to five years experience in heating, ventilating and air-conditioning. Salary open. Apply to File No. 4104-V.

Situations Wanted

CIVIL OR MECHANICAL ENGINEER, M.E.I.C., age 42, B.Sc. Civil Graduate Work in Industrial Engineering at McGill University. Seventeen years experience in following field: Manufacture of incentive bonus systems in two of Canada's largest aircraft plants. Production planning on the manufacture of shells and shell parts. Design and construction of explosive proving equipment. Superintendent during construction of one of Canada's largest shell filling plants. Other experience covering oil refining, contracting, and installation of pulp and paper mill equipment. Interested in position with responsible firm or partnership with consultant. Home in Montreal area. Apply to File No. 981-W.

MECHANICAL ENGINEER, B.Sc., Queen's '33, M.E.I.C., M.I.A.S., P.Eng., Quebec; married, age 37. Over twelve years experience including design, stress analysis, maintenance, inspection, administration and 5½ years as an R.C.A.F., Engineer Officer. Presently employed. Desires permanent position with good future prospects preferably in a English speaking locality. Apply to File No. 1042-W.

GRADUATE CIVIL ENGINEER, B.Sc., Queen's, S.E.I.C., P.Eng., Que., would accept part time work during evenings or weekends at home preferably on steel construction and reinforced concrete design, estimating and detailing. Residing in Montreal. Apply to File No. 1487-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., Quebec, with more than 20 years experience in design and construction of dams and Power Plants in U.S.A. and Canada. Desire change in position preferably in the construction field. Apply to File No. 1527-W.

MINING ENGINEER-GEOLOGIST, M.E.I.C., R.P.E. (Man.) 39. Experience includes: supervision of mine operation and mine plant layout and construction, general mine engineering, field and underground geological mapping, mine examination and appraisal. At present employed as field scout for mining company. Available in two months. Apply to File No. 1922-W.

PART TIME WORK: CIVIL ENGINEER, age 34, R.P.E., M.E.I.C., perfectly bilingual, with post-graduate work at University of Toronto in Public Health Engineering and at Harvard University in Industrial Hygiene also experienced in structural and plate work and in municipal engineering, would take work evenings and week-ends, specially in consulting form to industry in problems related to Industrial Hygiene and local exhaust ventilation. Apply to File No. 2272-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng. (N.S.), age 39, married, desires position in industrial part of Canada. Eight years experience in Mechanical Department shops and in the mills of large steel company. Five and one-half years Engineer Officer R.C.A.F., rank Wing Commander. Five years Sales Engineering, conveyors, drives, pumps, heavy construction equipment. Particularly interested in Sales, Executive or Personnel work carrying responsibility and having a future. Employed at present, but desire to get out of the Maritimes to where there is greater opportunity. One month's notice. Correspondence invited. References. Apply to File No. 2711-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C. Desires part time work during evenings and week-ends. Experience in plant layout, design, estimating, etc. Apply to File No. 2715-W.

CHEMICAL PROCESS ENGINEER, McGill. Veteran, over 4 years overseas as Engineer Officer (construction). Two years design, correlation and economic evaluation work on Petroleum Refining Processes with Major U.S. Oil Company. Present salary $4,600. Age 27, married. Desire responsible position in Canada. Apply to File No. 2778-W.

CIVIL ENGINEER, S.E.I.C., P.Eng. Interested in part time work. Structural steel, reinforced concrete, or earthwork, estimating, designing and draughting. Apply to File No. 2817-W.

MECHANICAL ENGINEER, S.E.I.C., two years experience in consulting and general engineering work desires position in consulting or industrial work, Montreal or Ottawa preferred. Available on short notice. Apply to File No. 2829-W.

GRADUATE ELECTRICAL ENGINEER, McGill '24. M.E.I.C., Prof. Eng., Que.; over 20 years experience in high voltage transmission lines, design and construction. Interested in part time or temporary position in general engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No. 2918-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Que.) McGill graduate desires spare time work evenings and week-ends on design and detail of reinforced concrete and steel structures. Also qualified to make stress analysis of rigid frames and most statically indeterminate structures. Location Montreal. Apply to File No. 2947-W.

2 STUDENTS, S.E.I.C. both on executive of Junior Section, desire summer employment in Ottawa area. Have 2 years Engineering at Carleton College, specializing in Eng. Physics or Electrical Engineering. Jobs need not be together. Available April 30, 1948. Both experienced draughtsmen but prefer work at which they can gain fundamental knowledge in Physics. Apply to File No. 2948-W.

ENGINEER, B.Sc., M.E.I.C., P.Eng., Ont. Married, veteran R.C.E.M.E. officer. Two years in plant chemical and physical control laboratory. Two years as construction engineer, fieldwork and supervisory experience, reinforced concrete, masonry and steel structures. Chiefly interested in position as construction supervisor or concrete research. Apply to File No. 2949-W.

INDUSTRIAL AND PRODUCTION ENGINEER, Jr.E.I.C., Eng. (Mechanical), Ont. 5 years experience in cost reduction and analysis, production planning and scheduling, systems and administration. Background of experience covers both industrial and mechanical engineering. Presently employed available on six weeks notice. Age 28. Apply to File No. 2955-W.

CIVIL ENGINEER, P.Eng., Ont., M.E.I.C., would like spare time work at design of reinforced concrete or structural steel on a fee basis or otherwise. At present employed in the Hamilton area. Apply to File No. 2964-W.

STRUCTURAL ENGINEER, Jr.E.I.C., B.E., '46, N.S.T.C., S.M., '48, M.I.T. interested in Structural planning, design or construction or working with consultants. Available June 15. Apply to File No. 2965-W.

MECHANICAL ENGINEER, M.E.I.C., B.Sc., Queen's, 1936. Position wanted leading to design and installation of automatic controls and allied equipment; eleven years diversified experience including supervision of plant engineering and maintenance, with four years work on many types of control problems involving measurement and control of such factors as temperature, atmosphere, and flow. Available at one month's notice. Toronto area preferred. Apply to File No. 2966-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng. Twelve years experience in the following fields: Automotive, Aircraft and Airhandling Equipment on product design, development and testing, improvement of production. Also on design of special machinery; Maintenance in Paper Converting Mill and six years executive in Sales and Service. Desires position with responsible firm, or partnership with Consultant. Apply to File No. 2967-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., B.Sc., 1931. Age 40, married. Requires employment with opportunity for advancement. Have extensive experience in power generation, conversion, plant power distribution, plant design and construction. Also experienced in management and the setting up of new organizations. Available on one month's notice, additional information upon request. Apply to File No. 2976-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc., P.Eng. (Ont.) Age 44, single. Past experience includes administrative, executive and sales engineering in metal products, building materials and sub contract work in construction industry. Also held responsible position in Personnel Administration. Desires permanent position requiring initiative with good future prospects. Apply to File No. 2983-W.

MECHANICAL ENGINEER (27), B.Sc., A.M.I. Mech. E., in responsible position with world-famous engineering concern in England is willing to emigrate to Canada if suitable opening is found there. Experienced in production development work, production planning and manufacturing methods of wide range of power station plant. With initiative and adaptability for most positions on the production side. Further particulars on request. Apply to File No. 2984-W.

GRADUATE ELECTRICAL ENGINEER, Manitoba, age 36, M.E.I.C., 12 years experience in industrial manufacturing. Married with family. Well grounded training in costs and estimating of machinery, structural, miscellaneous ironwork and platework. Some experience in sales development and promotion work. Now employed but desires position with progressive firm where opportunity for advancement not restricted either in a similar capacity or position under superintendent. Apply to File No. 2986-W.

ENGLISH ENGINEER, A.M.I.E.E., 33 years of age, married. Wishing to emigrate requires post where his experience will be of most use. 17 years experience comprising workshop, test, development research on public address and television E.M.I. Co. Field and development engineering, radio navigation aids and radio teleprinter equipment. At present Technical Officer, Air Ministry. Could possibly arrange to visit Canada for interviews if required. Apply to File No. 2994-W.

MECHANICAL ENGINEER, M.A., M.I., Mech. E. wide experience in Vibrations and Balancing presently residing in England interested in emigrating to Canada if suitable contacts could be arranged. For details of past experience apply to File No. 2995-W.

Graduate Electrical Engineer

Required for position with large Northern Ontario Paper Mill. Preferably man with some paper mill or other industrial experience. Salary commensurate with qualifications and experience. Apply stating experience and qualifications to File No. 4032-V.

THE UNIVERSITY OF MANITOBA REQUIRES ENGINEERING INSTRUCTORS

The Faculty of Engineering and Architecture of the University of Manitoba will require additional instructors for teaching duties beginning September 1, 1948.

Applicants should be Engineering Graduates from recognized Universities. The grades required will be assistant professors, lecturers and demonstrators in Civil, Electrical, and Mechanical Engineering. Salaries dependent on experience and general qualifications. Apply as soon as possible to Dean of Engineering and Architecture, or Head of Department Concerned, The University of Manitoba, Winnipeg.

BUSINESS & INDUSTRIAL BRIEFS

A Digest of Information received by The Editor

Appointments and Transfers

The English Electric Co. of Canada Ltd., St. Catharines, Ont., have announced the following staff changes.

I. S. Patterson, M.E.I.C. has been promoted to the post of Manager Central Station Sales; P. J. Farmer, M.E.I.C., is now acting Manager of Industrial Sales and D. C. Brooking, M.E.I.C., is District Manager of the Winnipeg area.

Mr. Patterson, who for the past two years has been District Manager in Winnipeg, will be located at the Head Office of the Company at St. Catharines, Ont. Mr. Farmer, a graduate of the University of British Columbia in Electrical Engineering, has been with the Company for the past ten years. Mr. Brooking is a graduate in Electrical Engineering of the University of Manitoba. He has been with the English Electric Sales Staff since 1946.

●

James Irwin Robinson, has been elected President of Crane Limited. He was formerly Vice-President and General Manager of the Company.

Mr. Robinson has had forty-one years of service with the Crane organization. He is a native of Ontario and was educated at Prescott High School and the Ottawa Business College.

He joined the Crane Company in San Francisco, in 1907, and returned to Canada during the first World War to serve with Canadian Engineers. Following his demobilization he was named Sales Manager with Crane Limited. Shortly after this appointment he became General Manager of Sales for Canada and in 1927 was elected a director of the Company. Mr. Robinson was named Vice-President and General Manager in 1937.

The Arborite Company Ltd., have announced that Dr. Alexander Szwarc, F.C.I.C., has been appointed Technical Director of the Company. A native of Poland, but now a Canadian citizen, Dr. Szwarc served as a consulting chemist with Allied War Supplies Corporation, while on leave from the Polish Army, during the war. He has had very wide experience in the field of resins, waxes, coatings and laminates.

●

The Technical Advertisers' Association of Montreal has elected B. McK. Davey as its President for the forthcoming year. He succeeds H. Putnam of Canadian Marconi Co.

Mr. Davey is General Manager of the Rudel Machinery Co. Ltd. and President of Rudel Exports Ltd. He has had long association with technical advertising affairs in Canada.

●

H. John Racey, M.E.I.C., of Montreal has been appointed President and Managing Director of Cresswell Roll Forming Company Limited and its subsidiary Cresswell Pomeroy Limited.

Charles M. Kinghorn of Montreal has been appointed Director and Vice-President in charge of Engineering and Research of the two companies named above.

●

A new firm of engineers and contractors, Blenkhorn & Sawle Limited has been formed in St. Catharines, Ontario.

H. C. Blenkhorn is the President and Ross T. Sawle, M.E.I.C., the Secretary-Treasurer.

The new company will serve industry as engineering consultants and sales representatives and by providing manufacturing services in the electrical field, including electronics.

Mr. Blenkhorn was formerly vice-president and general manager of the English Electric Company of Canada Limited and Mr. Sawle was assistant engineer of that company. Both are graduate electrical engineers.

●

J. R. Menzies, M.E.I.C., of Montreal has been promoted by the Civil Service Commission to head the public health engineering division of the Department of National Health and Welfare.

●

B. T. Tinling has been appointed General Manager and a Director of the International Varnish Company. For the past five years Mr. Tinling has served his Company in the capacity of Sales Manager. He is also a Director of the Tait Plate Glass Company of Kitchener and the Scott Paint-Varnish Company of London.

●

Ulric S. Annett has been appointed Winnipeg District Sales Manager for the Explosives Division of Canadian Industries Ltd. He succeeds J. S. Morrey who has retired after 35 years of service with the Company.

Mr. Annett is a native of Montreal and he has been associated with the Explosives Division of C.I.L. for the past 28 years. Prior to his present appointment he was technical representative in Vancouver.

●

A. P. Craig formerly assistant to the President has been appointed Vice-President of the Canadian Westinghouse Co. Ltd. Mr. Craig joined the Westinghouse Electric Corporation, after graduation from

Cornell University in Electrical Engineering, in 1928. He has held many important posts with the Company including 12 years in commercial activities in the New York office. He spent 4 years building and assisting in the operation of war plants for Westinghouse and 2 years as manager of the X-Ray Division of the Company in Baltimore.

In his new position, Mr. Craig will be responsible for the operation of the Company's Appliance, Lamp, Tube and Lighting Divisions and he will work in co-operation with the Vice-Presidents of Sales, Manufacturing and Engineering for the Purchasing and Service activities of the Company.

●

Allan T. Loucks of the Railway & Power Engineering Corporation Ltd., has been elected chairman of the Montreal Chapter of the American Society of Metals.

●

At a recent meeting of the directors of the Burlington Steel Company Ltd., Harold H. Leather, M.B.E., was elected a member of the Board.

●

Spielman Agencies of Montreal well known to the construction industry, have recently incorporated as a Limited Company under Dominion Charter.

The firm is the Canadian distributor of 'Pudlo' Brand waterproofer and of the 'Duro-Kote' line of hardeners, paints and protective coatings.

●

Norman A. Hesler of Sackville, N.B., has been elected president of the Canadian Manufacturers' Association. M. A. East of Saskatoon was elected first vice-president, H. G. Hilton, Hamilton, Ont., second vice-president and J. C. MacFarlane, K.C., of Toronto, treasurer. Mr. Hesler is president and managing director of the Enamel & Heating Products, Ltd. of Sackville, N.B. He succeeds R. C. Berkinshaw of Toronto, in his post as president of the Association.

Chairman of Standing Committees of the Association are as follows:

S. G. Bennett, Toronto, Tariff Committee; W. Ferguson, Toronto, Transportation Committee; O. H. Barrett, New Toronto, Legislation Committee; C. B. C. Scott, Toronto, Industrial Relations Committee; F. G. Rolph, Toronto, Membership Committee; L. L. Lang, Kitchener, Insurance Committee; J. A. Terrace, Toronto, Commercial Intelligence Committee; W. C. Laidlaw, Toronto, Publishing Committee; Hugh Crombie, Montreal, Education Committee.

Publications

The Automatic Clutch Corporation of Canada, 388 Yonge Street, Toronto, have available an excellent brochure entitled "B.L.M. Automatic Clutch". The booklet is well prepared and most informative. It contains important technical data and general specifications. Also available from the same source are wall charts giving fractional and decimal equivalents.

●

R. G. LeTourneau Inc. of Peoria, Illinois, have available a new four-page folder which explains how non-productive dozer time can be cut, etc. For copies apply to the company and ask for Bulletin No. TD-118.

●

Hobbs Glass Limited, London, Ontario, have published a new booklet "Glass That Tames the Sun". The booklet describes the advantages of "Coolite" a product of the Company.

Copies may be obtained by applying to the Company.

●

For more than twenty years red-stain and pocket-rot in standing jack pine has been under study at the Forest Products Laboratory, Department of Mines & Resources, Ottawa. These studies have been concerned with the strength of affected wood and with the progress of the red-stain disease in timber in service. A compilation of the results of all the work carried on to date has now been made and has been published in Circular No. 63, "Red-Stain and Pocket-Rot in Jack Pine". Copies of this circular are now available and will be sent to readers of the *Journal* on request. Requests for copies should be addressed to: Superintendent, Forest Products Laboratory, Department of Mines and Resources, Ottawa.

Brown, Boveri (Canada) Limited, 1111 Beaver Hall Hill, Montreal 1, have received from Switzerland a well illustrated brochure on the Brown Boveri On-load Disconnecting Switch. For copies ask for bulletin No. 1492-E.

●

Darling Brothers Limited, 140 Prince Street, Montreal, have just completed a new "Yeomans-Darling Manual".

The publication has been produced to inform architects. and engineers of the latest Yeomans-Darling features in heavy-duty automatic electric vertical centrifugal pumps. The manual embraces a "Selection Guide" which covers all important points.

To quote the publisher, "the purpose of this manual is to present in concise form essential data on Yeomans-Darling Bilge and Sewage Pumps, and to indicate their field of application".

Copies of the manual are available on request from any Darling Brothers representative, or the Head Office of the Company at the address given above.

●

The Atlas Asbestos Company Limited, 110 McGill Street, Montreal, have available literature describing "Chemiseal," the trademark name for chemically inert gaskets. The plastic protective covering used in "CHEMISEAL" Gaskets is "TEFLON" the du Pont designation for polymerized tetrafluoroethylene. Many important advantages are claimed for "CHEMISEAL" products.

●

Ferranti Electric Limited, Mount Dennis, Toronto 15, Ontario, offer a "long span" calendar. It is pocket size and can be used to determine any date from 1865 to the year 2000. For a copy apply to the address given above. The supply is limited.

New Equipment and Developments

On Thursday, May 27th, a preview of the New Canadian Johns-Manville Company Limited plant at Port Union, Scarborough Township, was held. The new plant cost several million dollars to construct. It is located on a 212-acre site adjacent to Lake Ontario and it is claimed as " Canada's most modern production centre for Rock Wool and ' Transite ' Asbestos-Cement Pipe ". The Company's statement said, " It is part of our programme to develop greater domestic use of Canada's native raw materials, of which Asbestos has the highest value of all our non-metallic minerals ".

•

According to a statement released by the Dominion Oxygen Company Limited clean-up operations were reduced to a minimum by a manufacturer who used the Heliarc inert-gas shielded arc welding process in fabricating alloy tanks for the storage of chemicals. High purity argon gas shielded the electrode and weld area and thus eliminated the use of flux.

The tanks on which the work was carried out are 8 feet in diameter and have an overall length of 18 ft. with a 3 ft. steel skirt. Plate thicknesses were 3/16 in. for the shell and ¼ in. for the head.

•

A new Photoelectric Recording Wattmeter designed for such applications as analyzing welding circuits and measuring industrial heating load, motor-starting load, and power surge is available from the Meter and Instrument Section of Canadian General Electric Company. Consisting of a high-speed photoelectric recorder and a newly designed wattmeter measuring unit, the new instrument can be used to measure d-c power or a-c power up to 10.000 cycles per second. For complete details communicate with the manufacturer.

•

Crawford Gordon, Jr., President of the English Electric Company of Canada, Limited, announces that an important contract has been awarded by the Hydro Electric Power Commission of Ontario, to the English Electric Company Limited, represented exclusively in Canada by English Electric Company of Canada Limited and John Inglis Co. Limited. The $3,000,000 contract covers the manufacture of two Steam Turbo-Generator units, to be installed in the first large steam-electric generating plant on the Hydro Electric Power Commission's system, in the Windsor district.

The first two units will be steam turbine driven generators, each of 80,000 hp. at a speed of 3,600 r.p.m., for high pressure, high temperature steam, supplying 60 cycle power. The Electric Generators will be hydrogen cooled. An idea of the size of each unit is indicated by its overall length of 75 feet and shipping weight of 300 tons.

These units will form a most important part of the power plant, which is designed throughout for the highest degree of efficiency in generation of electric power from fuel.

It is anticipated that certain items of auxiliary equipment for this order will be built in Canada.

•

Bepco Canada Limited, 4018 St. Catherine St. W., Montreal, manufacturing electrical engineers, have announced that Messrs. Cooke & Ferguson of Manchester, England, have now joined their group of British companies. As a result of this new affiliation the switchgear range of Bepco Canada Limited has greatly increased. They now have circuit breakers of the oil-break type and the minimum oil type, both indoor and outdoor—built in all sizes up to 3000 amperes and for voltages up to 132 kv and rupturing capacities up to 2,500,000 kva.

Bepco's oil circuit breakers are built in one or another of their British works, making full use of their approved Short-Circuit Testing Station.

Most of their other switchgear components are made in Canada in line with Canadian requirements.

•

A new self-propelled rock drilling plant designed for large diameter blast holes in quarries, open pit mines and coal stripping operations has been announced by Ingersoll-Rand Company.

Known as the " Quarrymaster ", this machine is a completely self-contained unit consisting of a drill, compressor plant, propulsion equipment, and accessories. The "Quarrymaster" is claimed to be capable of drilling at a faster rate than conventional machines such as are generally used in pit and quarry work. It is easily manoeuverable, collars a hole with ease, and drills up to 6 inches in diameter and up to 70 feet in depth.

Mounting an air-operated, piston-type rock drill that strikes more than 200 blows per minute, the " Quarrymaster " has an unusually high rate of rock penetration. A patented valve action and power cycle insures maximum efficiency and drilling speed, while maintenance is reduced to a minimum by utilizing a cushion of air to bring the piston to rest before it can strike the front head. Feeding of the drill is accomplished by an air motor which drives the feed chain. An illustrated folder describing the " Quarrymaster Drill, No. 4077 " may be obtained from the Canadian Ingersoll - Rand Company Limited, 620 Cathcart Street Montreal or from any branch office of the Company.

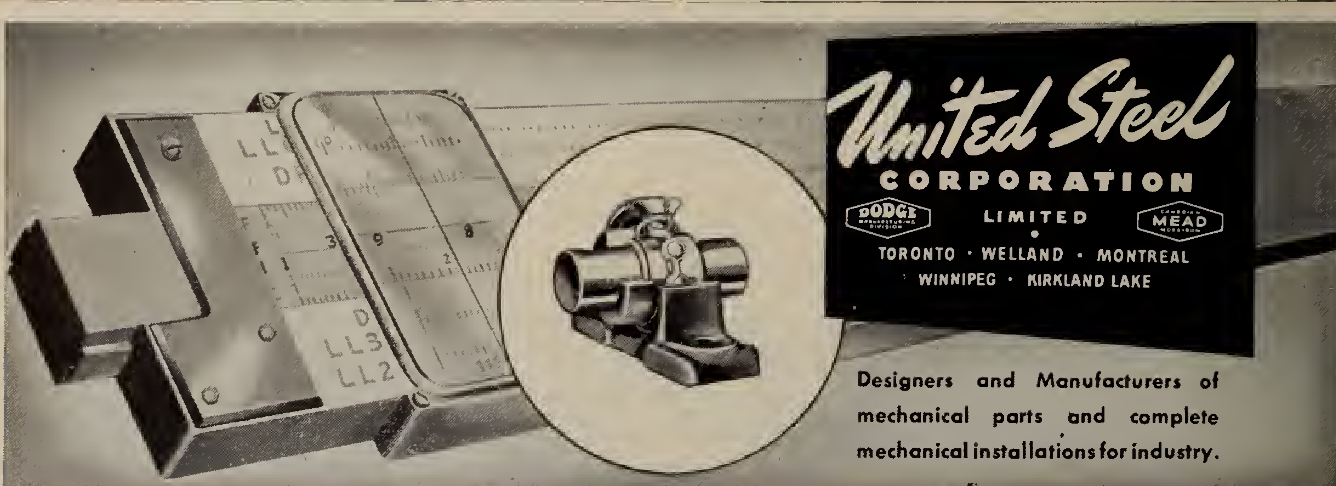
"THE ENGINEERING JOURNAL"



THERE is no mystery, no legerdemain, about the way special machines to do special jobs for various industries are produced by Canadian Vickers. It is all a matter of having the men, materials, machinery and know-how . . . all working together in one harmonious unit. It's as simple as that.

A large dairy company wants some special apparatus? It is designed, plans drawn, stainless steel specified and Canadian Vickers craftsmen go to work. The illustration shows the finishing being done.

Brewers want copper kettles; hospitals want mechano-therapy machines; distillers want distilling columns; candy manufacturers want kettles; food companies want tables, etc. We are told the need . . . Canadian Vickers designs and builds the answer.

If you have need of a special machine or industrial equipment of any kind, remember . . . *if industry needs it . . . Canadian Vickers builds it.*

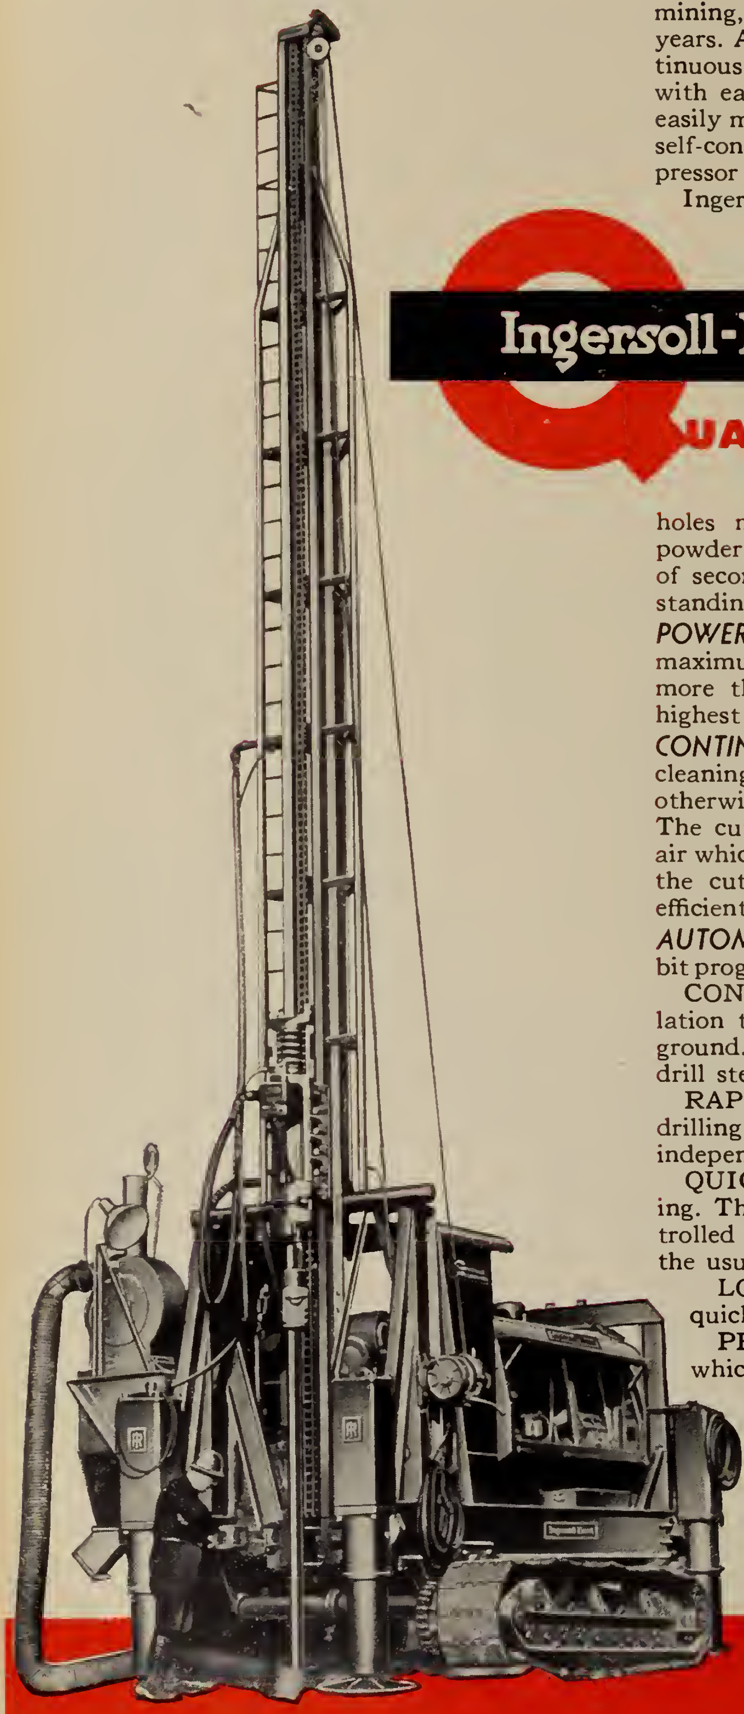
JUNE 1948

The DRILL you asked for



Here's the drill for open cut work that mining, quarrying and construction men have wanted for years. A drill with vastly superior drilling speed and continuous hole cleaning ability. A drill that collars a hole with ease, requires no water, has automatic rotation, is easily maneuverable and quickly set up. It is a completely self-contained unit, including an air-powered drill, a compressor plant, propulsion equipment and auxiliaries.

Ingersoll-Rand presents the **QUARRYMASTER** as the greatest advance in rock drilling for open pit mining, quarrying and general large scale excavation work since the days of hand drilling.

Ingersoll-Rand

QUARRYMASTER

The overall efficiency of the **QUARRYMASTER** results in a new low in drilling costs. Now operators can afford to space holes more closely, permitting proper distribution of powder. The result is better fragmentation and a minimum of secondary blasting. Here are but a few of the outstanding features found in this revolutionary machine.

POWERED DRILLING . . . Powered drilling guarantees maximum efficiency. The air-operated piston drill striking more than 200 powerful blows per minute insures the highest rate of rock penetration.

CONTINUOUS HOLE CLEANING . . . Continuous hole cleaning eliminates bailing. It also saves power that is otherwise wasted in drilling through previous cuttings. The cuttings are removed from the hole by compressed air which passes down through the hollow drill steel. When the cuttings reach the surface they are caught by an efficient dust collector.

AUTOMATIC ROTATION . . . Automatic rotation turns the bit progressively to a fresh cutting position with each blow.

CONTROLLED FEED permits a fine degree of regulation that is necessary in drilling gravelly and fitchery ground. EASY COLLARING is assured by a time-saving drill steel centralizer.

RAPID SPOTTING will save many hours of valuable drilling time. The quick acting crawlers are powered by independent Ingersoll-Rand Air Motors.

QUICK SET-UPS allow more time to be spent in drilling. This unit is equipped with four independently controlled hydraulic leveling jacks that save up to 20% of the usual set-up time.

LONG WEARING BITS that are light-weight and quickly changed is another important cost-saving feature.

PROVEN POWER PLANT . . . The power plant which is an integral part of this unit is the Ingersoll-Rand MOBIL-AIR KA500 Portable Compressor.

Ingersoll-Rand **QUARRYMASTERS** are now operating in quarries, strip and open pit operations. They are drilling in many kinds of rock and under various operating conditions.

Arrange with us to see a **QUARRYMASTER** in operation. Our nearest branch office has full information.

JOBS LIKE THIS...

prove the value of the lubricant that Seals out Dirt and Moisture

GOODBYE bearings if that mud ever works its way into them! Put Texaco Marfak into a bearing and here's what happens —

Marfak stays where you put it. It doesn't squeeze out when the load is heavy, doesn't jar out when the going is rough. Marfak holds together. It clings to the bearing — guards it with a persistent lubricating barrier against dirt and moisture. It protects parts better, longer, with fewer applications.

In wheel bearings, use Texaco Marfak Heavy Duty. Here the secret of long-lasting protection is Marfak Heavy Duty's ability to form a fluid lubricating film inside the bearing while retaining its original consistency at the outer edges — thus sealing itself in, sealing out dirt and moisture.

Best testimonial to Marfak effectiveness is this fact: *More than 275 million pounds of Marfak have been used to date!*

McColl-Frontenac Lubrication Engineering Service is available to you; just call the nearest of the more than 200 McColl-Frontenac Distributing Bulk Stations across Canada, or write McColl-Frontenac Oil Company Limited, Executive Offices, Royal Bank Bldg., Montreal, Que.

GET FULL ENGINE POWER

Your heavy-duty gasoline and high-speed Diesel engines will run more efficiently and deliver more power when lubricated with oil that keeps them clean — *Texaco Ursa Oil X***. Made especially for this service, *Ursa Oil X*** is fully detergent, dispersive, and has high resistance to oxidation. It keeps rings free, assuring better compression and combustion — great power and fuel economy. It protects bearings from corrosion, greatly reduces engine wear and maintenance costs.

Engineering Facts about

Johns-Manville TRANSITE PRESSURE PIPE

*Winnipeg: A case history**

In 1932 the city of Winnipeg, Manitoba, made its initial installation of Transite Pressure Pipe. A portion of the installation consisted of an 18″ line. Recently this pipe was subjected to a series of field and laboratory tests to determine its condition after 14 years of service, which had included exposure to an extremely corrosive soil.

Pitometer Flow Test

Before the pipe was removed from the line for the laboratory tests which were to follow, its flow capacity was checked. The Pitometer Company, Inc., New York, was selected to conduct these field tests. Velocities ranged from 1.1 to 1.9 feet per second and readings were made at 30-second intervals. During each test, the velocity was held constant. Results were summarized by the Pitometer Company as follows:

Assembly of pipe and coupling being removed from the line for laboratory tests.

"*The high value of C=140, which we believe is a reliable index of the present capacity of the pipe tested, shows that there has been little if any loss in capacity since 1932 when the pipe was laid.*"

Readings being recorded during Pitometer flow tests on the line.

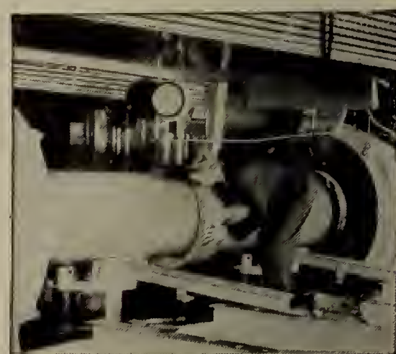
Soil Conditions

The soil in which this Transite installation was made was known to be destructive to water pipe. Analysis showed the presence of certain soluble salts, which, when dissolved by ground water, became highly corrosive.

It was desired, therefore, to determine how well the Transite line had withstood these severely corrosive conditions and thereby to provide a basis for gauging its life expectancy. To do this, a series of physical tests were made, using the sections of pipe which had been removed from the line for the purpose: The most significant of the tests conducted on the pipe were the hydrostatic pressure tests.

Hydrostatic Pressure Tests

In order to simulate field conditions as closely as possible, an assembly consisting of portions of two lengths of pipe joined by a Simplex Coupling with rubber rings and sleeve intact was tested. The complete assembly was placed in a hydrostatic testing machine and the water pressure was raised to 260 pounds per square inch. This was the original test pressure to which this pipe had been subjected at the factory and 4 times the normal working pressure of the line.



Assembly of pipe and coupling undergoing hydrostatic pressure test.

Pressure was held at 260 pounds while observers closely examined the coupling for leakage. No leakage occurred. The rubber rings, undisturbed and in their original position, functioned as well as when the pipe had been placed in service 14 years previously. Subsequent careful inspection and tests confirmed that the rubber rings removed from this Transite line were free from any signs of deterioration.

Specimens of the Winnipeg pipe were also subjected to other laboratory tests. Crushing tests showed that its strength compared favorably with that of Transite Pressure Pipe as manufactured today. A corporation stop pull-out test provided further verification that the strength of this pipe was in no way impaired.

Summary

The above series of tests provided conclusive evidence that the strength, flow capacity and other physical characteristics of the Winnipeg pipe were unimpaired after 14 years' service under severe conditions. Further, as summarized in the original report, they demonstrated that "on the basis of the performance rendered to date, it is reasonable to anticipate a life-expectancy of many times that already obtained."

* *A copy of the detailed performance report on this Transite Pipe installation is available on request. Address Canadian Johns-Manville, Co., Limited. Toronto, Montreal, Winnipeg, Vancouver.*

A Valve with . . .

★ **ISOLATED WORKING PARTS**
★ **CORROSION-PROOF LININGS**
★ **STREAMLINED FLOW**

GRINNELL-SAUNDERS DIAPHRAGM VALVES

● The flexible diaphragm isolates the working parts of the valve from the fluid, preventing contamination, and permits streamlined flow plus positive closure even with suspended solids.

A selection of diaphragm materials and also body linings of glass, porcelain, lead, rubber or synthetics protects against corrosion.

- No packing glonds to demond constant ottention. Non-rising stem eliminates breakage . . . seoled for protection from dust, weather and corrosion.
- Working parts completely isolated from the fluid. No sticking, corroding or clogging to interfere with easy operation and tight closure. No contamination from valve lubricants.
- Compressor and finger plate combine to support the diaphragm in all positions.
- The large area of contact of the diaphragm on the seat, plus the resilience of the diaphragm, permits positive closure even when foreign matter is trapped.
- No metal-to-metal seats to become damaged or wire-drawn.
- No refacing or reseating is required.
- Streamlined passage without pockets reduces friction to a minimum and prevents accumulation of sludge and foreign solids.
- The valve body—the only metal that could contact the fluid—can be completely lined with glass, porcelain, lead, rubber or synthetic compounds (flange type only) to suit service requirements.

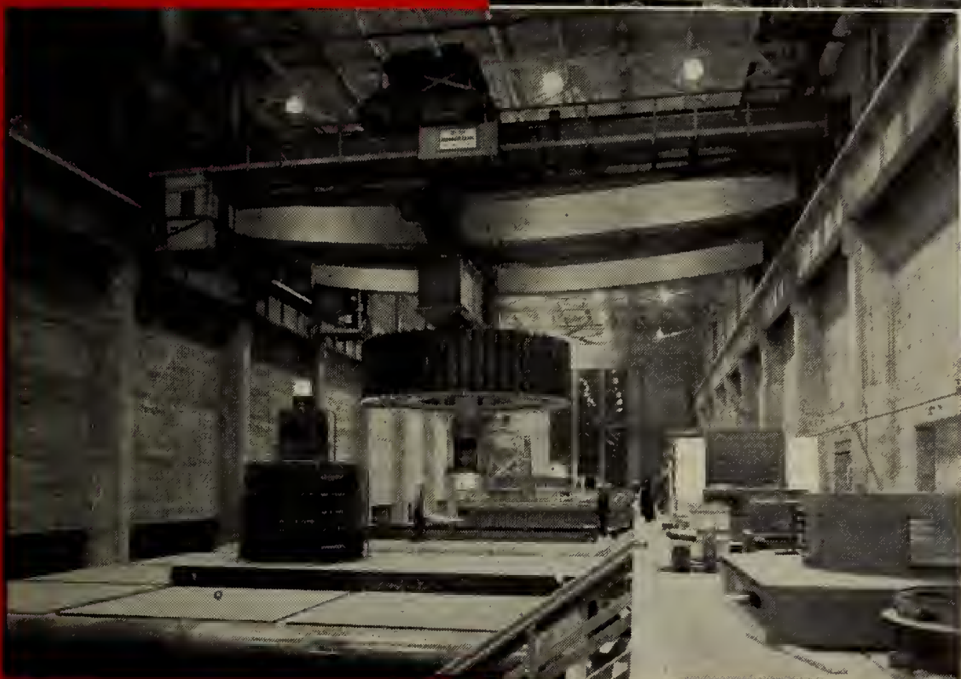
CONTRASTS
in handling



IT would be difficult to find two more contrasting crane installations than those illustrated. The massive power house cranes, capable of lifting nearly 400 tons, move at slow speeds for the precision handling of heavy equipment. The sturdy little gantry shown above, is a toiler from start to finish—on duty all day, every day, in its interminable back-and-forth trips through the grimy atmosphere of a busy foundry.

No one is so well aware of the contrasts as the designer. To him, cranes are as dissimilar as personalities—each possessing distinctive characteristics, carefully developed for the job in hand. Dominion Bridge Company's staff of experienced designers are ready to apply the most advanced techniques to the design of handling equipment for your individual requirements.

TWELVE YEARS . . .
WITHOUT GIVING AN INCH

Twenty-four hours a day, every day for twelve years—without stretching or shrinking an inch! That's the sort of punishing service this belt has given—is still giving.

Installed in 1935 for Daley Brothers in Magnetawan . . . to produce power for both mill and town . . . this belt must carry the load of social and industrial life of a community faultlessly. And says J. E. Daley:

> "No appreciable variation in stretch or shrinkage throughout its twelve year, 24-hour-a-day record of service with an average load of 65 H.P. and maximum load of 85 H.P. (considerably in excess of recommendations for six-ply belting under our conditions) . . . at a cost of eleven cents per horse power per year".

The long service operation of this belt provides honest, work-a-day proof that Gutta Percha industrialized rubber pays off in rugged performance.

** Gutta Percha Engineering Service is available to Canadian Industry to help meet and beat production problems with Industrialized Rubber. You are invited to make use of it. Just write our nearest branch.*

announcing a basically new idea in resistance welding . . . . .

SYNCHRO-TROL Packaged Controls

You'll profit many ways from this newest Westinghouse first in resistance welding . . . Synchro-Trol controls that come to you as a factory-tested, factory-assembled, compact, packaged unit.

It simplifies your operation because it brings all controls together in one cabinet. You get swift, easy settings and tamperproof protection. It simplifies installation, for it eliminates multiple connections, awkward sizes and complicated mountings. You can save up to 50% in floor space. And it simplifies buying, since you select only the units you need.

You can choose from eight basic subunits and five auxiliary subunits to build up your Synchro-Trol (see panel), plus a blank panel to house any small controls required for your special process. Get the facts today from your nearest Westinghouse office on the ways Synchro-Trol can bring new flexibility to your resistance welding operations. Or write Canadian Westinghouse Company, Limited Hamilton, Ontario

92-T-7050

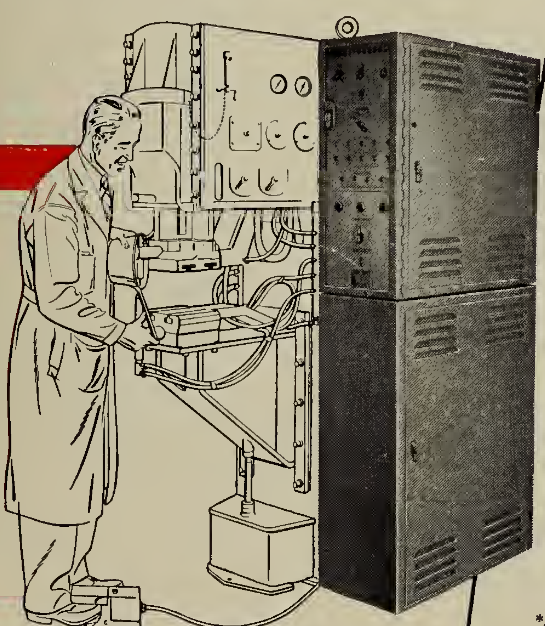

Illustration shows one type of arrangement for resistance welding. Panels can be substituted quickly and easily to employ other functions.

HERE'S HOW YOU CAN BUILD UP YOUR SYNCHRO-TROL

You take the basic units of Electronic Contactor and Heat Control . . .

add one of the following*

Weld Timer
Pulsation Weld Timer
Electronic Seam Timer

and one of these*

7B Sequence
9B Sequence
Blank Panel

and one of these (if you want it)

Blank Panel
Voltage Regulator
Current Regulator
Forge Timer

**or you can use an electro-mechanical seam timer or temper sequence.*

Get the full story in this new book that tells you how to form combinations of the subunits and gain the special advantages they offer. Ask for booklet B-3839.

"O.K. So You Pre-compress the Springs---Then What Happens?"

This fellow may sound a bit skeptical about Spring-Mounted Roller Conveyer, but that's not exactly so. Like other men who work with Foundry Conveyers, he knows that Roller Conveyer applied in this industry must have extra weight and strength built into it. He has seen a lot of too-light conveying equipment beaten to pieces in a short time under severe foundry service. That is why he is interested in Spring-Mounted construction. He is learning that when springs are pre-compressed to normal roller capacity, the load does not *bounce*, and the conveying surface is *smooth* and *even*. When the rollers are overloaded, the *springs* rather than the *bearings* of the rollers absorb the shock. Spring-Mounted Roller Conveyer is a Mathews development to meet the requirements of heavy industry for Roller Conveyer which will operate under severe conditions with a minimum of maintenance attention and expense, and it is establishing quite a reputation for itself by doing just that.

Recent Canadian Radar

by

B. G. Ballard, M.E.I.C.

Director, Radio and Electrical Engineering Division,
National Research Council, Ottawa, Ontario

A paper presented at the Annual General and Professional Meeting of The Engineering Institute of Canada, Banff, Alberta, June 4th, 1948

This paper deals with the more common uses of Radar, of general interest to engineers. Cautioning that there is still much to be learned, the author tells how various universities and the National Research Defence Board are co-operating with the National Research Council in further studies and experiments. Other sciences, he contends, will find Radar a useful tool. Three examples are given of problems that can be solved with its help, namely accelerators, solar noise, and meteor studies.

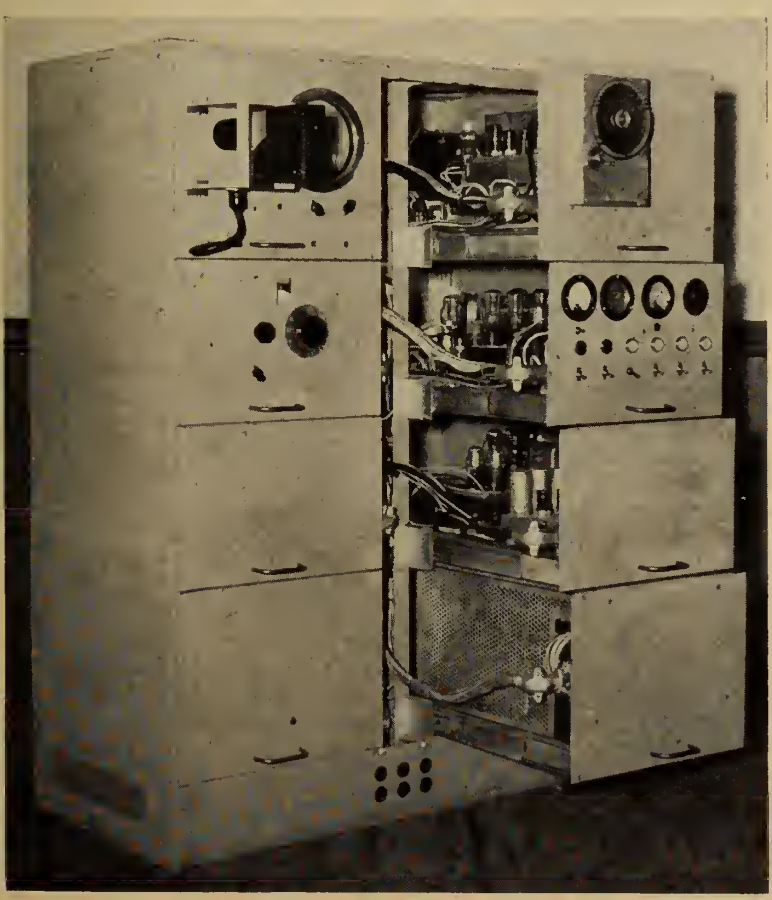
Application of Radar to marine work and harbour controls are discussed, as well as marine mapping. Its use in aerial mapping is also described. Research currently being undertaken by National Research to develop a suitable altimeter is outlined.

As late as 1933, R. N. Vyvyan, Chief Engineer of Marconi's Wireless Telegraph Company Limited, cautioned young men about selecting wireless engineering as a profession because, as he said, "Wireless is getting to be a crowded profession, and with the tendency to rationalization, and possible merging of campanies into one monopolistic organization, the number of vacancies for engineers will become less and less. . . ."

It is unfair, perhaps, to confront the memory of Vyvyan with this statement, but no reflection on a great engineer is intended. The statement merely emphasizes the phenomenal progress which has been made beyond the wildest dreams of the early pioneers, who were themselves men of vision. Certainly Vyvyan was one of the leading wireless engineers of his day.

Out of the humble beginnings of Marconi's work, aided by the brilliant contributions of Clerk Maxwell and Hertz, and the long line of later scientists, has grown the present expansion of electron science in modern communication systems. These embrace broadcasting, facsimile transmission, telephone repeaters, television, sound pictures and radar, to say nothing of a host of scientific and industrial applications, which are in no way connected with communication.

Fig. 1. Panoramic ionosphere recorder.



Radar is certainly the most recent offspring of electronics in the communication field. It is one to which Canada has made notable contributions, both in the advance of fundamental knowledge and in practical application. It is encouraging to note that this work is continuing in industry, in the universities and in government laboratories. True, since the war, the emphasis has shifted to different phases of the work. There is no longer the

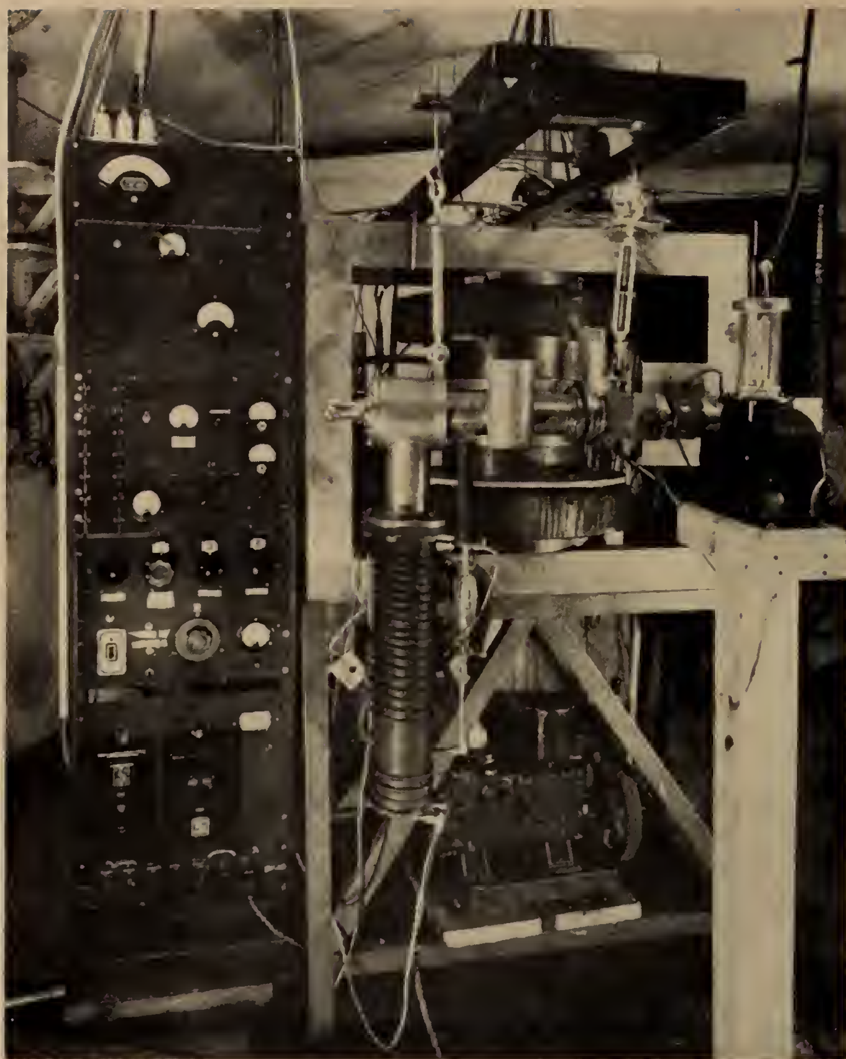


Fig. 2. National Research Council cavity accelerator.

terrible urgency which dominated during the war, but satisfactory progress is being made nevertheless.

Fundamental Work

Despite the many successful accomplishments in the field of radar, and despite the very intense effort which has been devoted to it, there is still much to be learned. We must pursue our investigations into the absorption effects at very high frequencies, and we must know more about the performance of materials under their influence. It might be expected that most materials would display quite unusual properties when exposed to frequencies of the same order as the natural frequencies of the molecules themselves, but unexpected phenomena occur long before these natural frequencies are reached. Ice, for example, has a dielectric constant of approximately 75 at commercial frequencies, but this value drops to approximately 4 at 300 kc.

Nor is dielectric constant the only factor about which we must concern ourselves. Conductivity and losses demand critical study. Propagation in a wave guide involves surface phenomena, and the condition of the surface has a profound influence on the efficiency. Paradoxically, a conductor may be a better insulator than the best known insulating materials available. Yet it should be emphasized that these new phenomena are not discrediting established theory. Rather, many factors which are insignificant at commercial power frequencies become prominent at microwave frequencies.

Since radar frequencies approach those of light, it is quite natural that radar waves display many of the properties of light. It is not surprising, therefore, that the application of optical theory to radar work is receiving attention. The University of Western Ontario has been engaged on these studies for the past two years, and from their laboratories we are learning new facts which will lead to better radar in the future.

Workers at McGill University are studying the performance of various materials under microwave frequencies, and from this work we can expect a better understanding of conductivity, dielectric constant and dielectric losses. Other Canadian universities are pursuing similar studies.

It is, of course, essential to understand fully the limitations and characteristics of propagation under various conditions. As our knowledge in this field grows, so will the application and usefulness of radar grow. The Propagation Laboratory of the Defence Research Board includes a large and capable establishment at Suffield, Alberta for the study of the ionosphere, which plays such an important part in much of our radar and radio work.

The National Research Council is assisting this work by developing measuring instruments. There is now in the course of development a panoramic ionosphere recorder, the purpose of which is to determine the characteristics of the ionosphere by transmitting a vertical pulsed signal at frequencies ranging from 1 to 20 mc. and recording the return echo.

An illustration of this equipment is shown in Figure 1. It is probable that the development will continue, to embrace oblique ionosphere recorders.

It would be surprising if other sciences had not found radar to be an exceedingly useful tool for their own purposes and radar does offer a technique for solving many problems. Only three that are being pursued in Canada will be mentioned here.

Accelerators

Much has been written regarding the development of various types of accelerators, such as the Van de Graaf generator, the cyclotron, betatron, synchrotron, etc. But radar technique offers still another possibility, known as the cavity accelerator. Essentially it consists of an evacuated chamber, containing a cavity which is excited by a 10 cm. magnetron. Electrons are accelerated through the cavity electrostatically, and then under the influence of a magnetic field are directed through a circular orbit to re-enter the same cavity. A single electron may be re-accelerated as many as eight times, following

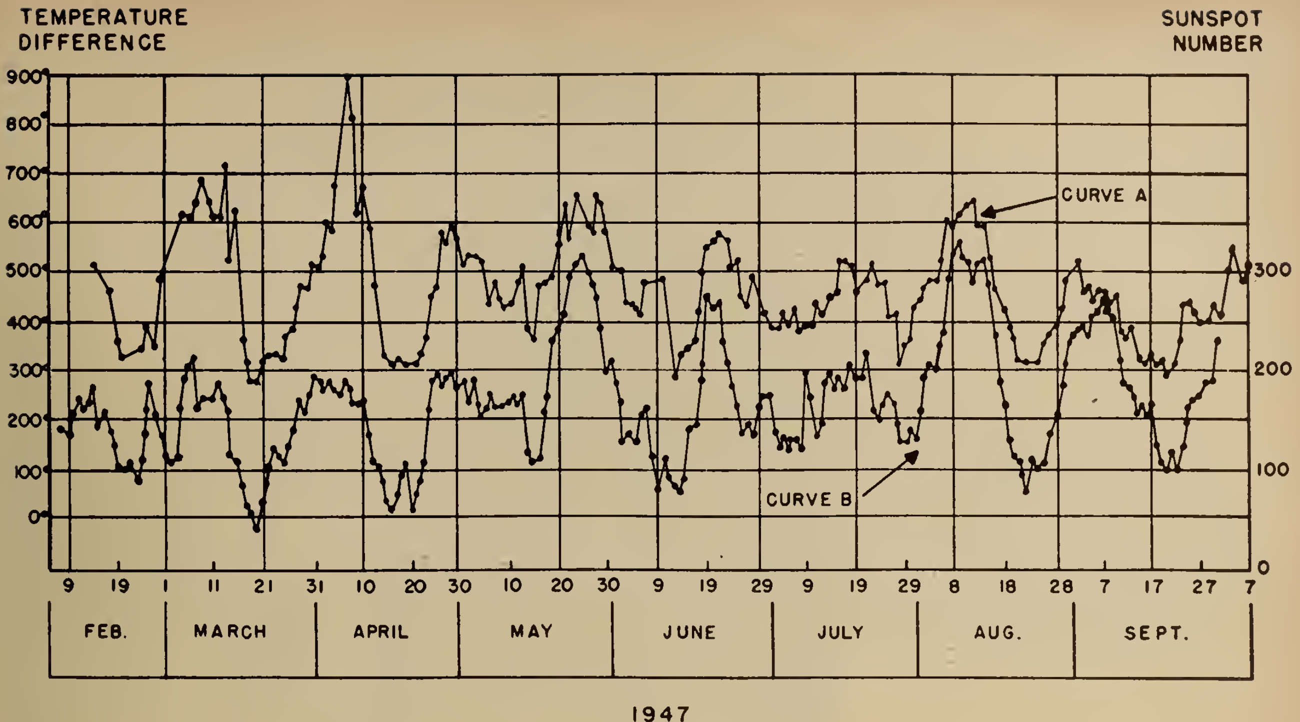

Fig. 3. Comparison of solar noise variation with sun spot numbers. Curve A—daily variations of solar noise. Curve B—American relative sunspot numbers.

eight distinct orbits for the return paths because of its increasing velocity.

An illustration of the National Research Council's cavity accelerator is shown in Figure 2. It should be emphasized that this is not a full-scale machine. It has been set up to study the soundness of the principle involved. Not more than four or five million electron volts can be realized from a machine of this size. The results of this investigation may lead to the development of a full-scale unit, generating 100 or more million electron volts.

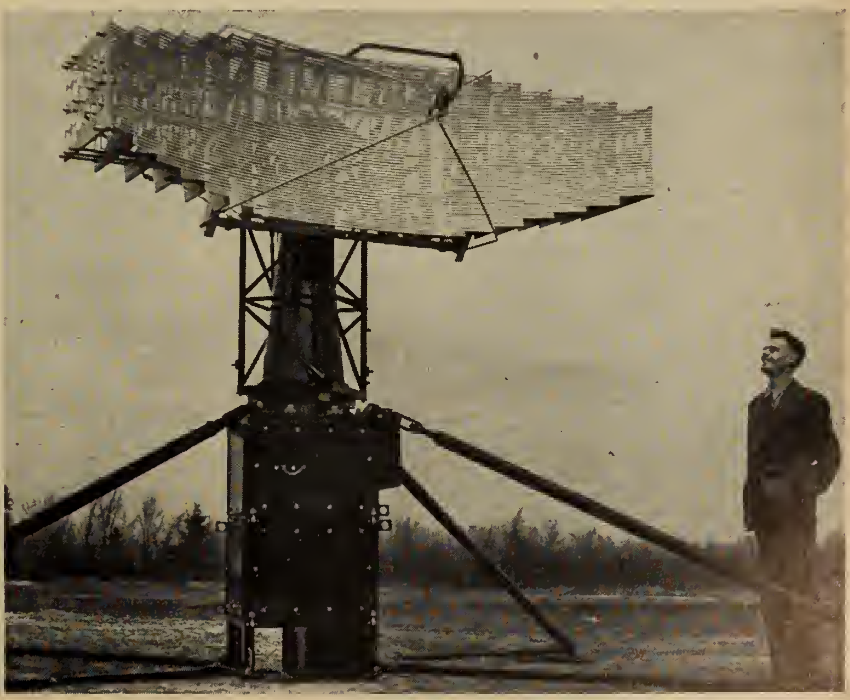
Solar Noise

Since the sun is the source of terrestrial energy, and since aberrations of the sun have been held responsible for many of our terrestrial disturbances, it has been the object of intensive study from many quarters. At the National Research Council interest was aroused in the sun's radiation through the 10 cm. portion of the spectrum. These studies have shown that radiation in the 10 cm. band is correlated very closely with sun spot number. This correlation is shown in Figure 3. Studies on longer wave lengths do not reveal this close correlation, but it is possible that some other frequency will give an even better correspondence.

During the eclipse in 1946 the radiation was studied very carefully, as the sun's disk was obscured and exposed. Fortunately, a very large sun spot was in evidence at that time, and the reduction and increase in radiation as the spot was obscured and exposed was very notable.

It is well-known that high temperatures are measured by means of pyrometry. Pyrometers, of course, utilize a very limited range of the spectrum and their operation is based on the fact that the law of black body radiation at elevated temperatures is very consistent. It is obvious, however, that some

Fig. 4. A recently developed radar antenna. ***National Film Board photo.***



other part of the spectrum might be selected for measuring temperature, and when the 10 cm. band is selected, it leads to very interesting results. The 10 cm. radiation, for example, suggests a sun's temperature well in excess of that revealed by radiation in the optical range. The scientists are busily seeking the explanation. The solution may add to our knowledge of nuclear physics, particularly in view of the fact that much of the sun's energy is attributed to atomic fission.

But these solar studies may lead to more immediate practical results. It is now possible to determine the position of the sun through its electromagnetic radiation in the radar frequency band. Such determination may be made regardless of an overcast sky, so that mariners are provided with a more reliable means of solar navigation.

Meteor Studies

For many years the astronomers have studied the performance of meteors, have charted their orbits, and have predicted their arrival in the earth's atmosphere with uncanny accuracy. The meteors themselves are usually present in clouds or showers, and consist of many fine particles of matter rarely exceeding the size of a pin head. To observe these particles either visually or by radar would be a hopeless task were it not for the fact that in entering the earth's atmosphere they leave an ionized trail which is visible, and which will reflect radar echoes.

By coordinating radar and visual observations, our knowledge of meteors and meteorites (those meteors large anough to survive the passage through the earth's atmosphere until they reach the earth's surface) can be accelerated very substantially. The radar set can see many more meteors than the visual observer during the hours of darkness, and it may continue observations throughout the day. The increased knowledge of meteors serves also to increase our knowledge of the upper atmosphere. Already the results of our trials at Ottawa in cooperation with the Dominion Observatory have lead to the postulation of a new layer in the upper atmosphere.

Part of the fundamental work in progress is directly applicable to the design of radar antennae, upon which depends so largely the performance of any radar set. The National Research Council is investigating intensively the design and performance of the various kinds of radar antennae and reflectors, paying particular attention to the antenna pattern and the sharpness of the beam. One of the recently developed radar antennae is shown in Figure 4.

In addition to the antenna work, investigations are under way on the effect of rain and snow on radar propagation, the absorption of radar waves over snow layers, and the most suitable design of radar targets for navigational markers. Also, the development of special electronic tubes, particularly in the millimeter range wavelength, is being pursued intensively.

Fig. 6. Type 268 marine radar set developed for naval service.

Fig. 5. Marine radar set.

Marine Radar Application

During the war, the National Research Council developed what was known as the Type 268 Radar Set, which was ultimately put into production at Research Enterprises Limited. This was a very successful set, and many of the war surplus units are now serving merchant ships effectively. Nevertheless, the Type 268 set was designed for naval use, and it was to be expected that it would not be ideally adapted for merchant service. The National Research Council undertook, therefore, to develop a new marine set based very largely on the wartime set, but eliminating many of the naval features which were unnecessary for merchant service. The performance in general was improved, and the inherent cost reduced to a point which would enable the set to be employed by even the smaller vessels. The performance was improved mainly by reducing the minimum range at which it will operate, since for coastal and harbour navigation the ship's master is interested in obstacles and targets at very short range.

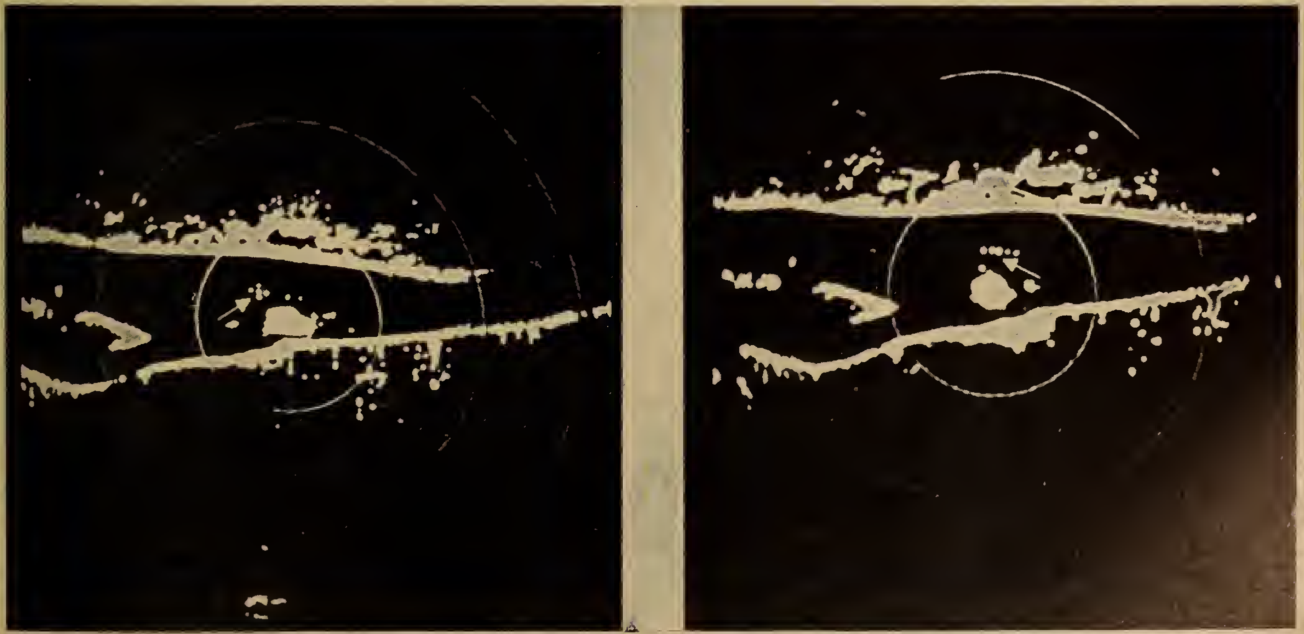
It is obvious that the echo from any target returns to the radar set after extremely short intervals. When the target is at close range, and unless the initial pulse transmitted is of exceedingly short duration, the echo from the pulse front may return before the transmission of the pulse itself has been completed. Therefore, the first objective was to reduce the pulse length of the set. This reduces the total energy of the pulse, assuming a given pulse power, and range is a function of pulse energy rather than power. However, some reduction from the possible range of the Type 268 set can be tolerated, since the latter was required to detect targets at some distance from the set itself, whereas the merchant set is more concerned with targets close at hand. Furthermore, the range over water varies approximately as the 6th root of the energy and it is obvious that a substantial reduction in energy has a relatively small effect on total range. For example, if the energy were reduced in the ratio of 40 to 7, the range would be reduced by about 25 per cent.

It must be remembered that at short range the target image appearing on the display is very close to the ship's image. Unless the images are sharp and the discrimination good, it will be difficult or impossible to separate the target and the ship on the display. Discrimination, therefore, is an important factor in reducing the minimum range of the set. This has been improved by providing a sharper beam, which in turn has been accomplished by modifying the antenna system. The necessity for a sharp beam becomes obvious when it is realized that any beam sweeping across a single point of infinitesimal dimensions on a target will return an echo during the interval that the beam illuminates the point and if that beam were 5° wide, the point's image would subtend an angle of 5° on the screen.

The marine set, as developed by the National Research Council, has a beam width in the horizontal plane of 3°, a range under normal conditions of 20 miles, and it will enable targets to be identified at ranges as close as 50 yards from the ship. As a matter of fact, the writer has been able repeatedly to follow targets up to within eight yards.

Fig. 8. M.V. "Radel".

Fig. 7. Preliminary buoy pattern trials conducted with merchant marine radar (MMR-B) equipment in the Ottawa River. 8-inch buoy reflectors, only 2 feet above water, with 50-yard separation. Arrows indicate 5-point cross and straight-line patterns used to identify shoal.



The set is exceedingly simple, and contains no controls or features which are unnecessary. The pulse power is only 10 kw, and the average power requirements are so small that the unit may be fed from the regular ship's electrical supply. The simplicity of the set will be apparent by comparing the illustration in Figure 5 with that in Figure 6. Figure 6 represents the Type 268 set, as developed for naval service.

A prominent Canadian manufacturer is now putting into production the new Merchant Marine Radar.

Harbour Control

Only a small percentage of ships are equipped with radar, and indeed many vessels, particularly in the smaller tonnages, cannot justify economically the installation of radar equipment. Moreover, the master of a radar-equipped ship, not knowing if his neighbour is similarly equipped, cannot predict the course the latter is likely to pursue under conditions of poor visibility. The congestion of traffic in harbours accentuates the problem. If however the harbour master is able to see all vessels within the harbour, whether they be equipped with radar or not, it is possible to direct harbour traffic.

With this end in view, the National Research Council has developed a harbour control unit which again employs as a basis the original Type 268 Radar Set. In the case of harbour control, however it is practicable to employ a more elaborate and complex set. It will be under the control of a fully qualified radar expert, so that the demand for simplicity is not as compelling as in the case of a ship. In order to obtain maximum discrimination, the harbour control set is equipped with a special antenna, an antenna which would be much too expensive for the majority of smaller radar-equipped vessels.

The set has been installed as an experiment at Camperdown, Nova Scotia, to control traffic in Halifax Harbour. The Department of Transport very properly is unwilling to announce the use of the set until they are fully satisfied that it is completely reliable. There is some doubt as to whether or not the harbour control unit will detect reliably the presence of smaller wooden craft, which do not give as powerful an echo as the larger metal vessels. Moreover, there is the danger that one vessel may screen from radar view the existence of a second one. These possibilities are now being studied carefully. The equipment has been in operation for a period of about one year, and the results have been most gratifying. Many of the ships' masters have spoken in glowing terms of the service which the harbour control equipment renders. A similar unit in a mobile form is now under construction, to permit a study of the most suitable harbour control for the city of Vancouver.

In general, the procedure is to follow the ship's progress on the radar chart and communicate directly with the ship's pilot by radio so as to give him suitable guidance. At one time it was proposed to achieve this communication by modulating the radar beam, that is to say, by modulating the pulse recurrence frequency. While the normal pulse recurrence rate is too low to permit a normal voice frequency range, it was possible to communicate successfully on experimental trials. However, during rough weather it was very difficult to keep the beam trained on the ship, and the proposal was finally abandoned. Other methods of communication appear to be more economical, and the use of the radar beam is restricted to its primary purpose.

One of the radar's inherent weaknesses is the fact that it is colour blind, and it will not distinguish between a red and a black navigational buoy. Nor is the discrimination sufficiently accurate for it to identify reliably different shapes of navigational aids. For this reason, ship's masters are reluctant to rely on radar to navigate through confined channels. Considerable study has been devoted to the possibility of providing navigational buoys which radar will identify.

Most of this effort has been devoted to the arrangement of distinctive patterns of buoys, and there is no attempt to rely on any single identifiable buoy. Five buoys arranged in various configurations enable a ship's master to identify them readily. The five buoys may be arranged in line, in a triangle, a star, a five spot on the die of a pair of dice, and in other combinations employing fewer units. It must be recongized that at best radar does not, as yet, give the same discrimination as a good optical system. If the buoys in the pattern are too close together, the radar will not identify that particular configuration. Hence, it is preferable to space the buoys at a distance of 50 yards. Figure 7 shows a radar display of a number of buoy patterns.

As a matter of interest, much of this work is carried out by the National Research Council's radar vessel, "Radel", which is shown in Figure 8. It operates for a large part of the year on Lake Ontario in conjunction with the National Research Council's Scarboro station.

Marine Radar Mapping

The "Radel" has been engaged in the development of the merchant marine radar, the buoy patterns, some studies on radar clutter due to snow and ice, and also some studies of mapping by radar. In this connection a radar map of a portion of the Ottawa River together with the corresponding chart of the Hydrographic Service is shown in Figure 9. The radar map was made as the vessel proceeded on its normal course. The chart differs from most charts in that it is plotted from a point at relatively low elevation, whereas most charts assume an observer's position well above the area charted. High precision cannot be claimed for this sort of chart, but it may become more popular as the use of radar increases, since it shows exactly what the radar set sees, rather than what the hydrographic surveyor puts on his charts. Already radar is being considered for charting certain areas although it is unlikely that the system will be used extensively.

Aerial Surveying

Perhaps one of the most interesting applications of radar is that of mapping those great unexplored areas of Canada. In undertaking conventional aerial surveys it is necessary to "locate" each photograph by having within it some fixed and known spot, usually determined by land survey. If very large areas are to be surveyed, both geodetic and topographic techniques must be employed, and the operation becomes one of considerable magnitude. By employing radar, the time and effort required can be reduced substantially.

Everyone is familiar with the conventional method of radar location,—that is, a transmitter sends out a signal which is reflected from a target. By timing the interval between transmission of signal and reception of the echo, and by noting the direction in which the signal was transmitted at the time an echo is received, the range and bearing of the target is determined. However, it is apparent if one attempts to represent a range of, say, 200 miles, on a radar display about four inches long, the degree of accuracy possible is completely inadequate for survey purposes. Nor does the measurement of bearing offer any more promise. The precise measurement of angles by radar has yet to be realized, although these measurements can be undertaken with a sufficiently high order of accuracy to be suitable for many applications. Surveying, however, is not one of these.

Fortunately, despite the remarks made earlier, radar can measure range with an exceedingly high precision. There are several methods of realizing this precision, but the one proposed for the mapping of the northern part of the country is one employing "Shoran" equipment.

The high precision with which radar ranges may be determined arises from two factors. First, the ability to measure frequency very accurately (actually to within one part in ten million) and secondly, because of the precise knowledge of the velocity of electromagnetic propagation in the atmosphere. Through knowledge of the frequency, the period of a single oscillation can be derived with corresponding precision, and knowing the velocity of propagation, the distance traversed in space by a signal during an oscillator period, is known.

It should be emphasized that the timing oscillator frequency is not necessarily the frequency of the propagated wave. The progress of the signal during an oscillator period corresponds to a wave length of the oscillator, and this term will be used in the following description. The timing oscillator wavelength, therefore, provides a very precise standard of measurement, and any system which measures an unknown distance in these oscillator wavelengths will yield an accurate result.

"Shoran"

One of the most successful systems employing this principle is the "Shoran". Briefly, an oscillator provides a standard frequency, which serves as a timing device for the initiation of a radar pulse once during each cycle. It also controls the angular velocity of a circular sweep on a cathode-ray tube display. The sweep completes exactly one revolution for each cycle of the oscillator. At a predetermined point on the sweep a signal is transmitted to the target. A pip on the circular trace indicates the return of the echo. If the frequency were selected so as to have one complete revolution correspond to a distance of one mile, then any target within the one-mile range of the radar set would register on the screen with conventional radar accuracy. A second pip appears on the display, the position of which is controlled manually, and it is the operator's duty to keep the two pips in alignment. A dial connected mechanically to the pip aligning control indicates the target's distance within the one-mile range.

Let us assume now that the radar set moves away from the target. As the distance increases, the operator adjusts the position of the second pip to coincide with that of the return echo, and the dial indicates the separation distance at any instant. As the radar set moves beyond the one-mile range, the revolving echo pip begins its second revolution, but a counter device records the fact that one complete revolution has been made by the manual follow-up. This mechanical counting continues for each succeeding mile as the radar set continues to recede. Of course, a decreasing range can be followed with equal facility. It is apparent therefore that, at any instant, the radar set indicates its distance from the target in oscillator wavelengths plus some fraction of a wavelength.

As mentioned previously, the fractional wavelength can be determined to conventional radar accuracy only. However, if the total distance embraces a large number of wavelengths, the error in the fractional wavelength will have no significant influence on the final accuracy of measurement.

The above describes a very simple but very precise ranging device. Two modifications, and we have a Shoran radar similar to that employed for precision bombing during World War II. The first modification is to employ a responder beacon instead of a dead target. The use of a responder beacon permits a substantial reduction in the power of the initial radar signal, and permits a corresponding reduction in the weight of the set, rendering it more suitable for aircraft use. Moreover, it eliminates the problem of identifying a particular target against a non-contrasting background from the aircraft. The second modification is the introduction of a second responder, with a corresponding radar receiver and a second manually operated dial. By following the pip positions of the two returning echoes the operator maintains a range indication of his radar set with respect to two separate stations.

Ranging

Undoubtedly the question will arise in the minds of many as to what occurs if the operator happens to "lose" the echo pip. He can, of course, re-align the pips, but he cannot be certain that the counter then indicates the proper number of wavelengths. With the system described above, it would be necessary to return the radar set to some known point and begin the ranging operation all over again. In actual practice, however, such a procedure is unnecessary, because the oscillator frequency can be adjusted to make one pip revolution correspond to almost any required distance. By so doing, the operator may, by a series of reductions, relocate himself regardless of where he may happen to be with respect to the responder stations, assuming of course that he is within radar range. Once he has relocated his position, the oscillator can be reset to its normal frequency.

If, instead of flying directly away from a target or responder station, the pilot flies a course across a line joining two responder stations, it is obvious that the sum of the two distances to the responder stations will gradually decrease until he reaches the joining line, and then increase. Continuous photographic records are maintained of the dial and counter readings, and from the minimum sum of the two ranges, the true range between the two stations can be computed. The computation involves a knowledge of the plane's elevation. This may be determined either by barometric or radar means, and the measurements are automatically recorded by the same camera as is used for the radar ranges.

Thus, by locating responder beacons at strategic points throughout the area to be surveyed, their positions can be determined very accurately. Subsequently, aerial topographic surveys may be undertaken, locating the plane's position with respect to these responder stations by radar. The radar used for the topographic surveys is the same as that used for the locating of the responder stations. After locating the survey plane's position with respect to the responder stations, the pilot will fly a course indicated to him by the plane's radar. It so happens that for normal photographic survey purposes it is very desirable to fly the plane in a straight line over the area to be

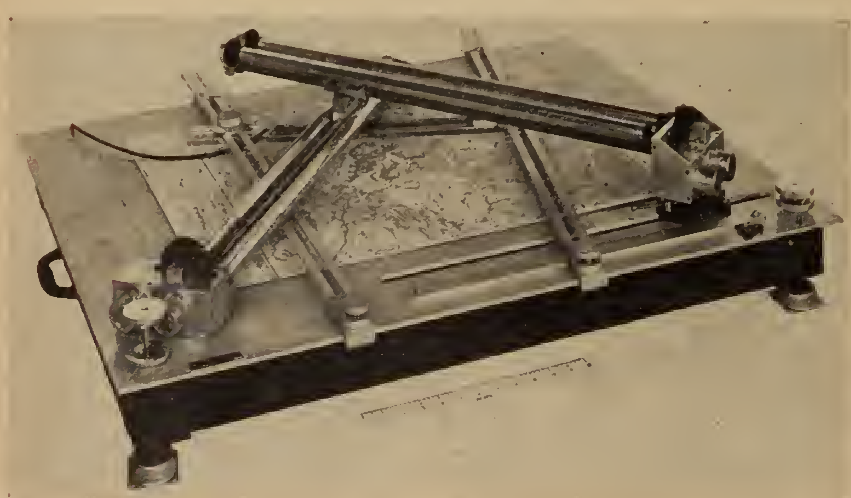
Fig. 9. Radar mosaic of Ottawa River, (composed from MMR display) with map of corresponding area.

charted. Yet shoran, as will be obvious, lends itself more readily to circular courses than to straight courses.

To overcome this difficulty the Council devised a so-called straight-line computer, which provides the pilot with the required information to follow a straight course. The computer is illustrated in Figure 10. The length of two radius arms is adjusted automatically by a servo-mechanism from the control dials of the radar, to correspond to the distances between the radar and the responder stations. A stylus is mounted at the intersection of these two radius arms, and obviously the position of the stylus on the chart corresponds with the position of the plane.

A straight-line course is laid out on the chart, and over this is placed a relatively wide strip of high resistance conducting material, each edge of which is bounded by a metallic conductor. The stylus and the outer boundaries of the strip are connected in the arms of a wheatstone bridge, and as long as the stylus is in the central part of the strip, the bridge is balanced, and an indicator on the pilot's instrument board reads zero. If the pilot deviates from the course plotted, the radar immediately detects the deviation. The servo follow-up from the straight-line computer shifts the stylus accordingly, thereby upsetting the bridge balance and indicating to the pilot that he should adjust the course. A shoran installation in a survey craft is shown in Figure 11.

Fig. 10. Straight-line computer.



This undertaking is a joint effort on the part of the Department of National Defence, the Department of Mines and Resources and the National Research Council.

The Altimeter

So far we have considered only the question of planimetric surveys, but for many purposes information on topographic elevation is exceedingly valuable. Only about 12 percent of Canada's area has been reasonably well contoured. Another 28 per cent has contouring of a "conjectural" kind, while in the remaining 60 per cent very few elevations are available. There exists, therefore, a real need for a method of rapidly and economically running elevation traverses. This problem prompted the National Research Council to undertake the development of a suitable radar altimeter.

Obviously, if the radar beam is too wide, the information gives an average elevation over a relatively large area, and is not suitable for contouring purposes. It is essential, therefore, to devise a radar set with a relatively narrow beam. This is difficult with airborne equipment, because the radar reflector or antenna must have a diameter of many times the wavelength if a narrow beam is to be realized.

At the time this development was undertaken the only equipment immediately available for the prototype models had a wavelength of

3.2 cm., which requires a parabolic reflector of about four feet in diameter to realize a beam width to half intensity of 1.6°. The problem of mounting such a reflector on an aircraft, without interfering seriously with the streamlining, was overcome as shown in Figure 12. Admittedly it is not an ideal solution. If the craft were specially designed for this type of altimeter, better streamlining could be achieved. Still better results would be possible with a smaller reflector which the adoption of 1.25 cm. equipment would permit. Altimeters of this wavelength are now under consideration.

It is of interest to note that even with a beam width of 1.6°, the area illuminated per thousand feet of altitude is 28 feet in diameter. At an altitude of 30,000 feet, the diameter of the area illuminated is 840 feet.

In ordinary contour surveying the plane will be flown at relatively low altitudes, permitting small illuminated spots, and demanding a short maximum range on the radar set. However, the possibility was borne in mind that the altimeter might be employed for shoran geodetic fixes as mentioned previously. In such a case altitudes up to 30,000 feet might be anticipated. For this reason the instrument was designed for that maximum altitude. It employs the conventional pulse with echo return. As in the case of shoran radar, however, greater accuracy was required than could be realized by contracting the whole 30,000 foot range into a single scale in the aircraft. Accordingly, a scheme similar to, although not identical with that of shoran was adopted. Instead of counting wavelengths, a manually controlled delay circuit was inserted. Thus the recorder does not commence timing the return of the echo until a predetermined interval after the transmission of the pulse.

By this means the scale of the radar instrument represents only a small part of the total range. The latter is determined by adding to the scale reading the elevation corresponding to the distance the radar signal travels during the artificial delay interval. The delay, incidentally, is inserted in blocks equivalent to 1,000 feet of elevation, each block corresponding to a delay of approximately two microseconds. The exact value of the delay must of course be determined very accurately, and is derived from an oscillator which, like the shoran oscillator, provides the ultimate standard of reference. To simplify operation, the reading is registered on the chart of a recording milliameter, and a continuous record of elevation is thus provided.

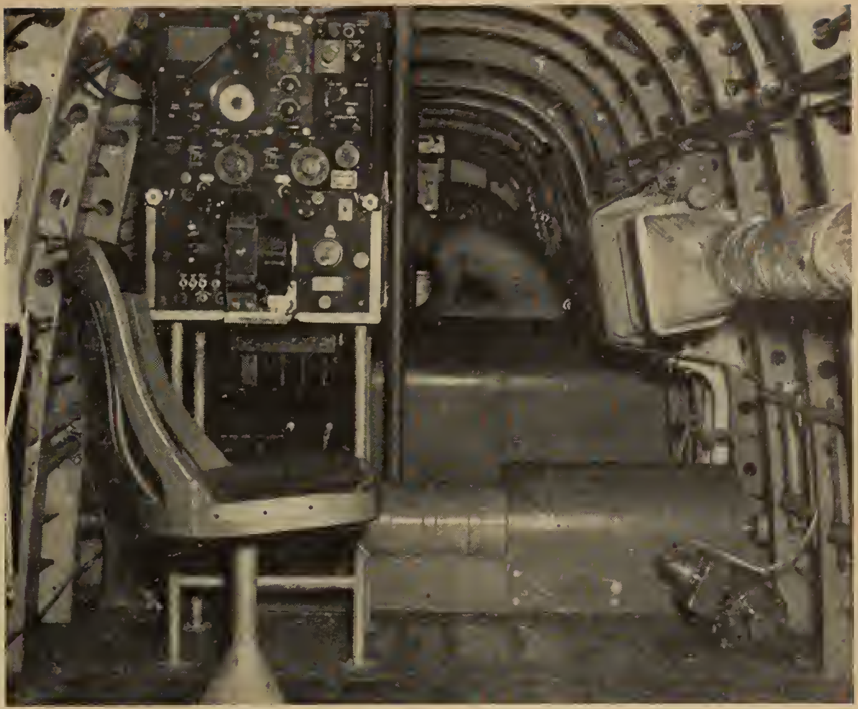


Fig. 11. Shoran installation in a survey craft. ***R.C.A.F. photo.***

Fig. 12. Altimeter antenna mounted on aircraft.

The use of radar altimeters immediately suggests the possibility of a warning device to notify a pilot when he is approaching an obstruction. The device just described is not well adapted for applications of this type. It is much too cumbersome and heavy. The total weight is approximately 350 pounds. Every pound of pay load displaced by equipment of this kind results in a loss of revenue from one hundred to two hundred dollars annually. Moreover, it is designed primarily for recording elevations directly underneath the plane. That information is of no value for an anti-collision warning; the pilot must know the elevation of obstacles some distance ahead of his plane, so that suitable corrective action may be taken. To provide this service it would be necessary to devise a

(Continued on page 391)

Localized Overheating

in the Wall of a High Pressure Vessel and its

Effect on Rupture Strength

by

A. H. Wilson Busby, M.E.I.C.

Superintendent, Research and Development, Engineering Division, Consolidated Mining and Smelting Co., Ltd., Trail, B.C.

A paper presented at the Annual General and Professional Meeting of the Engineering Institute of Canada, Banff, Alta., June 4, 1948.

When a pressure vessel weighing some 90 tons, and having walls over 6 in. thick, ruptures while undergoing routine hydrostatic pressure tests, this type of failure in high pressure equipment is a serious matter. The unusual nature of such a break has resulted in a detailed investigation to determine the cause of failure and the condition of the steel in the vessel. This paper presents some of the more important aspects of the investigation. The conclusions reached should serve as a guide to other users of high pressure vessels.

This paper records a detailed investigation into the causes of failure in a heavy pressure vessel containing the catalyst used in the synthesis of ammonia. The vessel and the operating conditions are described in detail as well as the nature of the failure and the physical and metallographic examinations carried out to determine its cause. An examination of the steel indicated the formation of martensite, which caused cracking. Stresses are analysed, causes of the failure are discussed, and conclusions are arrived at. Finally some precautions necessary in the care and operation of high pressure vessels are listed.

Description of the Vessel

The vessel which failed contained the catalyst used in the synthesis of ammonia from nitrogen and hydrogen and is generally referred to as a converter column. This is designed for a maximum working pressure of 4400 psi., and consists of two almost identical halves, bolted together at the centre. Each half is a steel forging weighing about 45 tons, flanged top and bottom, and having the following principal dimensions:—(see Fig. 1.)

Total length	23	feet
Inside diameter of middle section	33.5	inches
Outside diameter of middle section	46	,,
Thickness of wall in middle section	6.25	,,
Outside diameter of flange	51.85	,,
Inside diameter of flange	29.53	,,
Thickness of wall at flange	11.16	,,

The column contains the catalyst necessary for the reaction, a heat exchanger, and an electric heating element. In order to supply the latter with current, one lead consisting of a copper rod, insulated with porcelain sleeves and asbestos, is taken through a hole 1.42 in. in diameter in the top flange. The other lead is grounded to the body of the column. The power for the heater is supplied from a 250 kva. transformer with secondary taps of 50 to 220 volts. The insert in Fig. 1 shows the manner in which the lead-in conductor is installed in the column.

Operating Conditions

Figure 2 is a flow diagram of an ammonia synthesis unit, of which the converter column is a part. The unit consists of compressor *A*, converter column *B*, cooler *C*, condenser column *D* and circulating pump *F*. Since the failure occurred in the converter column, only its operation will be considered in any detail.

A mixture of hydrogen and nitrogen in the proportions of 3:1 by volume enters the top of converter *B* at a temperature of 20°C. The mixture passes down between the basket containing the catalyst and the column walls, in order to keep the latter cool. It then proceeds up through a heat exchanger and through the tubes embedded in the catalyst. From here it passes down through the catalyst, where the heat of reaction raises the temperature of the gas to around 550°C. Finally it passes around the outside of the heat exchanger, leaving the column at about 160°C.

The gases, now containing about 13 per cent ammonia, pass through cooler *C*, at which point fresh gas, raised to a pressure of 3700 psi. by means of compressor *A*, is added. The gases then pass to condenser

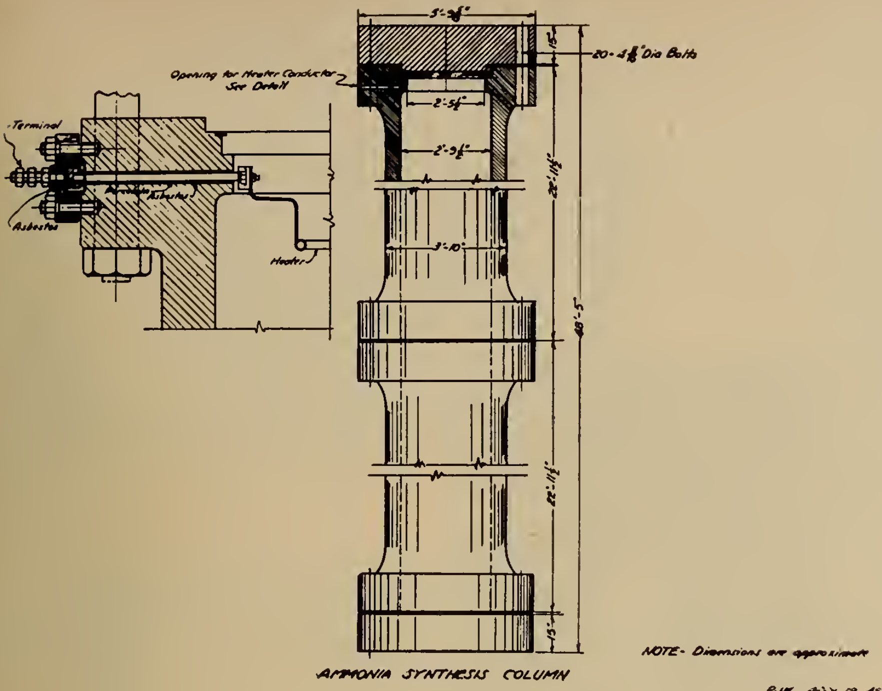

Fig. 1. Dimensioned diagram of the vessel that failed—a converter column used in the synthesis of ammonia from nitrogen.

D and evaporator *E*, where they are cooled to –20°C. Here the ammonia is removed, while the remaining hydrogen and nitrogen mixture then proceeds to pump *F* for re-circulation. While the reaction in the catalyst is normally exothermic, so that the process is self-sustaining, an electric heater is necessary for starting-up the process, and for maintaining heat when operating at low production rates.

Hydrostatic Test

As a safety measure, all high pressure equipment in the plant is periodically subjected to routine hydrostatic tests. In accordance with Provincial regulations the pressure at which the columns are tested is 1½ times the maximum working pressure, (in this case 6600 psi.) It was during one of these routine tests that the column failed at a pressure of 5500 psi. A few of the pertinent details of the test under discussion are as follows.

The maximum temperature on on the walls of the column before being taken out of service to carry out the test, was 218°C near the lower flange of the top half. The last recorded temperature in the same location after shut down was 64°C, and was taken 22½ hours before the column was filled with water. By this time the walls of the column should have cooled to room temperature.

The failure occurred during the winter months. The temperature of the water with which the column was filled prior to test was about 3°C. While temperature readings were not taken on the walls of the column before applying the hydrostatic pressure, it is fairly certain that equilibrium conditions had been reached between the water and the walls. In such case the temperature of the latter would have been somewhere between 5° and 10°C.

The hydrostatic pressure was raised over a period of 1½ hours to 5200 psi., and was then dropped to 2100 psi. in order to repair a leaking flange. The pressure was again increased slowly, and the column was suddenly ruptured at a pressure of 5500 psi.

Description of Failure

Examination of the remains of the column immediately after the failure showed a considerable amount of fragmentation had taken place. The whole appearance of the failure gave the impression of cracks having developed in a material, which was in a brittle condition. This is illustrated in Figs. 3 and 4, which are photographs taken shortly after the accident occurred, and in Fig. 5 which is a drawing showing as nearly as possible how the cracks developed in the column steel at the instant of rupture.

Further examination revealed that the fracture was trans-crystalline, (see Fig. 6) and immediately suggested that the failure was due

Fig. 2. Flow sheet for the ammonia synthesis unit.

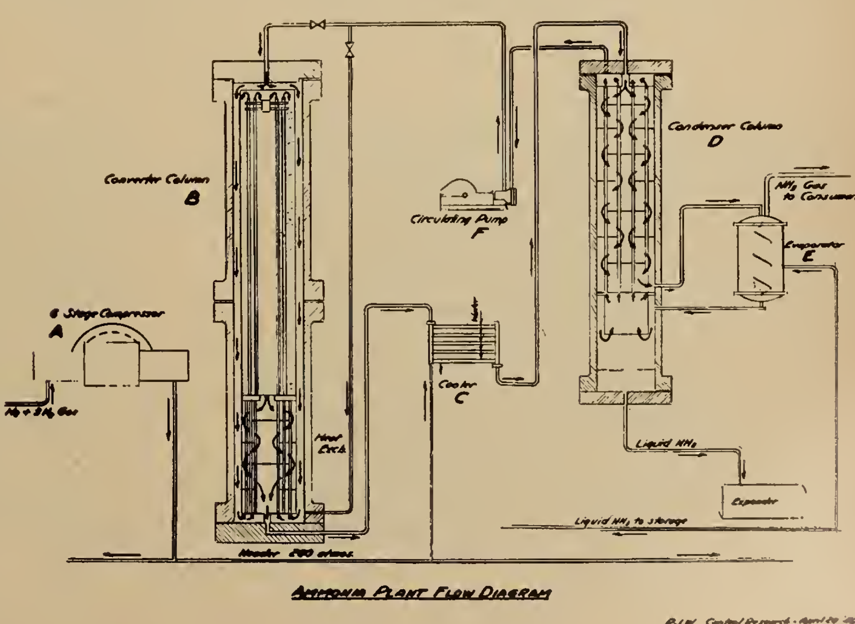

Fig. 3. Photograph of fractured portion of the column.

to almost instantaneous propagation of a small crack, such as a fatigue crack. Now it is well known that cracks in most materials are notorious stress raisers. Such cracks can, given the necessary conditions, produce stresses at their roots far in excess of the breaking strength of the material. The result is that a crack will propagate with destructive rapidity through material that is otherwise perfectly normal. The required conditions for crack propagation can be due to a number of causes, such as subjecting the material containing the crack to stresses in excess of those to which it is normally accustomed, to a sudden shock, or to a rapid reversal of stresses. The propagation of a crack in steel is invariably transcrystalline. Evidence that this was so in the case of the column is shown in Fig. 7, which is a photomicrograph of the edge of one of the main cracks.

In searching for evidence which would lead to the location of the originating crack, it was observed that one of the main cracks passed directly through the centre of the electrical lead-in port, (Fig. 8.) Further inspection of the port revealed that at some period prior to the failure it had been fused throughout its whole length, due to a short circuit between the copper lead-in conductor and the sides of the port. Several cracks had developed in the fused area. It seemed logical to assume from the results of the preliminary examination that the failure had originated in the electrical lead-in port. Yet the manner in which the crack had propagated through the main body of the column, appeared to indicate that possibly some condition in the steel itself may have been at least partially responsible for the failure.

This brought up the question as to whether the type of steel originally used in the fabrication of the column when it was purchased some twenty years before was unsatisfactory, or whether the steel had deteriorated in service. This thought was rather disturbing, as there were in operation three other columns which had been made at the same time from similar material. For this reason it was decided to carry out a complete investigation of all the factors which might have contributed to the failure. The investigations included:

(A) Complete physical and metallographical examination of the steel in the column, both in the main body of the forging and in the fused area.

(B) Analysis of mechanical and thermal stresses in the column which would be present during normal operation, and while undergoing hydrostatic tests.

Fig. 4. Photograph of the fracture.

Chemical, Physical and Metallographical Examinations

A chemical analysis of the steel in main body of the forging was as follows:

C—0.31%, Si—0.21%, Mn—0.65%, Ni—1.5%, Cr—0.80%, Mo—0.08%, S—0.03%, P—0.04%.

This analysis corresponds to the familiar AISI Type 3130 nickel-chromium medium carbon forging steel. The presence of molybdenum was probably fortuitous. According

to the manufacturer's specifications, the heat treatment given the column after fabrication consisted of heating to 840°C (1544°F), soaking until uniform, and allowing to cool completely in furnace.

To obtain representative samples for the physical tests, a block was cut from the column wall about four feet from the top flange, and adjacent to one of the fractures. Test specimens were cut from this block in such a manner that both longitudinal and transverse samples were obtained across the wall. While tests were carried out on samples from both orientations, it is obvious that with a vessel of this construction, only the results obtained from the transverse specimens are of real importance, and only these will be considered here. (By transverse is meant normal to the long axis of the column).

The following were the average values obtained for the physical properties of the steel:

yield strength, 46,000 psi.; tensile strength, 93,850 psi.; breaking stress, 146,230 psi.; reduction in area, 46%; elongation in 2", 23%.

Hardness—195 to 200 VPN.

Impact Strength—6 to 15 ft. lbs. (Charpy "V" notch 220 ft. lbs. at room temperature)

Metallographic

Microscopic examination of the steel (Fig. 9) showed it to be very coarse grained, being almost ASTM-3; essentially pearlitic in structure with much free ferrite, which had been rejected in heavy masses to the grain boundaries, presumably during the pre-austenitic phase. It is probable that the steel was silicon-deoxidized without regard to grain size control.

The terms austenite and martensite will be used several times during the following discussion, and a brief definition of their meaning might be in order; *Austenite* is the solid solution of iron carbide in iron, and in an ordinary carbon steel is the first phase formed as the steel solidifies from the molten state. This takes place at about 1100°C. (2012°F). *Martensite* is an extremely hard brittle phase. It is produced when a medium-carbon steel and certain alloy steels are rapidly quenched from the austenitic phase. The volume changes occurring during the formation of martensite are restrained by the rigidity of the steel, and thus result in tremendous internal stresses. Martensite is the essential constituent of hardened tool steel.

Sulphur prints (Fig. 10) showed that there had been marked sulphur segregation in the core of the original ingot, with the result that sulphur inclusions are more numerous in the wall of the column near the inside surface. The sulphur is possibly rather higher than would be considered normal in a steel of this type, but cannot be considered deleterious.

Deep etching indicated that other non-metallic impurities were low and that there were no hair cracks or flaws present. (Fig. 11.) With a vessel operating in an atmosphere of nitrogen and hydrogen, consideration had to be given to the possibility of nitriding or hydrogen embrittlement having contributed to the failure. Microscopic examination showed, however, that neither phenomenon had occurred.

Discussion of Physical and Microscopic Examination

In examining the results of the preceding series of tests, it will be seen that the steel can be considered normal for its type in the fully annealed condition, with the exception of two very important properties; viz. impact strength, which is low, and grain size, which is large. As these features, which are to a certain extent dependent on each other, have an important bearing on the type of fracture produced when the vessel failed, they will be considered in some detail.

In order to study the impact properties of a steel it is necessary to secure information regarding the variation of impact strength with temperature. If the necessary tests are made and a curve is drawn of the results obtained, it will be seen that there is a point on the curve where the impact value falls off steeply with decrease in temperature. This is known as the transition zone. (Fig. 12.) If the impact specimens are examined after breaking, it will be noticed that over this range in temperature the nature of the fracture will change from one that is tough and ductile at the upper part of the transition zone, where the temperature is high, to one that is brittle with a crystalline appearance at the lower part of the transition zone, where the temperature is low. Steels which have their transition zones at high temperatures have low impact values at room temperature, and vice versa.

One of the chief factors affecting transition temperature of a steel is the austenite grain size. This is largely controlled by the degree and manner in which deoxidization of the steel was carried out during manufacture. In general, completely deoxidized steels have a very small grain size with little free ferrite at the grain boundaries. They also have their transition zone at low temperatures. Such steels will retain these characteristics even when annealed or normalized. On the other hand, steels which have *not* been deoxidized, or only partly deoxidized, have relatively large grain size with large masses of free ferrite at the grain boundaries. The effect of this is to shift the transition zone towards the high temperature region, that is, to the right of the curve. The steel from which the column was fabricated is of this latter type. Fig. 12 shows comparative transition curves for steels that have been completely deoxidized *A*, semi-deoxidized *B*, and not deoxidized *C*.

In considering the impact properties it should be kept in mind that, irrespective of the degree of deoxidization, steels which have been quenched and tempered have characteristically lower transition zones than those which have not been so treated. Figure 13 gives the temperature-impact curve for the steel in the failed column. The values plotted are the averages for a large number of determinations made in two independent laboratories, and may be taken as fairly characteristic of the steel.

Examination of the curve shows that at room temperature (25°C) the impact value is about 12 ft.-lbs., while in the region of 5°C-10°C, which is approximately the temperature at which the hydrostatic test was carried out, the impact value is only 6 to 8 ft.-lbs. It is generally conceded that a steel for use in the fabrication of forged pressure vessels should have a grain size of about ASTM 6-8 and an impact value of at least 20 ft.-lbs. at room temperature. That the impact properties of the steel can be considerably improved by heat treatment is shown by the top curve in Fig. 13. Here the steel was heated to a temperature of 900°C (1650°F), drawn for two hours at 650°C (1200°F), and then water-quenched.

It might be asked why a grain size controlled steel, or one that had been heat treated, was not used in the original fabrication of the columns. It should be pointed out, however, that at the time the vessel was purchased, some 20 years ago, the amount of technical information available, both relating to the metallurgy of alloy steels and the design of high pressure vessels, was considerably less than it is today. At the time of manufacture the steel was considered to be entirely suitable for the purpose.

Examination of Steel Surrounding Lead-in Port

When the lead-in port was opened up it was evident that the short circuit had caused fusion to occur along the whole length of the bore. This resulted in a heat affected area penetrating the steel surrounding the hole to a depth of about 1 in., (Fig. 14). It is clear from the photograph that the heat-affected area consisted of two zones. Examination of the zone nearest the surface of the bore showed it to consist of a hard brittle copper-iron alloy, having the following approximate chemical analysis; — *Cu*—22.8%; *Fe*—74.0%; *Ni*—1.4%; and *Cr*—Trace. This zone, which had a hardness of 470 VPN, penetrated from ⅛ in. to ¼ in. and contained many small cracks.

Microscopic examination of the succeeding zone showed that it consisted chiefly of untempered martensite, into which the copper-iron alloy had penetrated along the grain boundaries. The hardness of this zone varied from 435 VPN adjacent to the copper-iron alloy, to 290 VPN near the unaffected steel of the column. This zone also contained a number of cracks, some of which had continued from the preceding zone. Fig. 15 is a photomicrograph of the heat-affected zone, showing the copper-iron alloy (dark portion). Fig. 16 shows the martensitic zone, with the penetration of the copper-iron alloy into the grain boundaries.

Evidently, the arcing which resulted from the short circuit fused the copper conductor. It also raised the steel in the walls of the port to a very high temperature. This resulted in the formation of a copper-iron alloy and also caused the steel in the vicinity to be rendered austenitic. It was while the steel was in this condition that some of the copper-iron alloy penetrated the austenite grain boundaries.

When the arc was finally interrupted, the severely heated copper-iron alloy and adjacent steel cooled with extreme rapidity. This was due to the rapid heat flow to the great mass of contiguous steel. This series of events created several conditions conducive to crack formation and propagation. In the first place the copper-iron alloy formed during the fusion is extremely hard and brittle. It would readily crack when subjected either to the very large thermal stresses set up during cooling, or to the normal repeated elastic stresses in the column during operations.

Secondly, the rapid cooling of the fused zone changed the austenite to martensite with large grain size near the surface of the bore, where the temperature was highest, decreasing to a smaller grain size at the lower temperature zone adjacent to the main body of the steel. In this connection it should be noted that the large grain size of the martensite in the heat affected zone was to some extent determined by the coarse grain size of the original steel.

During the formation of martensite it is known that large volume changes tend to occur, which in this case would be restricted by the large mass of metal surrounding the port. Tremendous stresses therefore would be set up in the fused area. These stresses could readily cause crack formation and propagation in the hard coarse grained untempered martensite.

Thirdly, the penetration of the copper-iron alloy into the martensite grain boundaries provides further stress raisers, where under proper conditions of stress, cracks could form and propagate. Fig. 17 shows a crack in the copper-iron alloy zone and Fig. 18 shows the continuation of a crack in the martensite zone. It will be observed that in a vessel of the type under review, the formation of martensite alone without the copper-iron alloy, can cause cracking. That this condition can be caused by welding is shown in Fig. 19, where a weld bead has been laid on a piece of the column steel. The martensitic zone in the heat affected area of the weld, in which cracks have developed, will be noted.

Stress Analysis

To obtain information regarding the distribution of stresses in the column under various conditions of operation and testing, the following calculations were made.

1. *Radial Stress* (S_r) which is equal to the internal pressure in the inner wall of column and since compressive, will have negative value $S_r = -P$.

2. *Tangential or Hoop Stress* (S_t) in both inner walls and outer walls of centre section and flange of column, using Lamé formula.

3. *Longitudinal Stress* (S_l) which is equal to the total pressure on end cap divided by wall area.

4. *Maximum Shear Stress* (S_o) on both inner walls and outer walls of centre sections and flange of column, using maximum shear strain energy equations of von Mises, H. Hencky and M. T. Huber. This stress is important, because if the value of the maximum shear stress becomes greater than the yield stress of the steel in the column, then the steel would start to yield.

5. *Thermal Stresses* which occur in operation, using the equations and nomographs of L. H. Baker (*Engineering* 1927, pp. 443). These stresses can be either additive to or subtractive from the stresses due to internal pressure.

6. *Combined Pressure and Thermal Stresses.* The stresses due to internal pressure which have been calculated for operating, design and hydrostatic test conditions are given in Table I. It will be seen that during operation the maximum tangential stress appears at the inner wall of the centre section of the column, and for a pressure of 3700 psi. amounts to approximately 12,000 psi., while for the same location the maximum shear stress is approximately 13,600 psi. If a yield stress for the steel of 46,000 psi. at room temperature is taken, then the factor of safety is 3.4.

When under maximum hydrostatic test pressure of 6600 psi., the tangential and shear stresses in the centre section are 21,300 psi. and 24,200 psi. respectively, and the factor of safety is 1.9. For the flange section under operating conditions the factor of safety if 4.85, and at maximum hydrostatic test pressure the factor of safety is 2.7.

In calculating the thermal stresses, the results of which are given in Table 2, a normal operating temperature difference of 20°C between the inside and outside wall of the column has been taken. It should be noted that for the inside wall of the centre section and of the flange, these stresses are compressive, and will reduce the tangential stresses due to internal pressure. On the outside walls of the centre section and the flange they are in tension, and will increase the tangential stress due to internal pressure.

The combined effect of stress due to temperature and pressure are

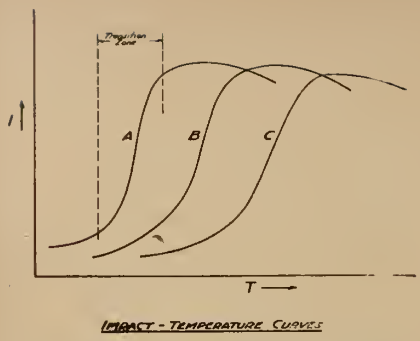

Fig. 12. Impact-temperature curves for completely deoxidized steel (A); for semi-deoxidized steel (B); and for non-deoxidized steel (C).

shown in Table 3. From these results it will be seen that, due to the inclusion of the thermal stresess, the relationship of the stresses as shown in Table 1 has reversed. The tangential and shear stresses are now greater on the outer wall of both the centre section and the flange.

That the effect of thermal stresses can be very important was demonstrated a number of years ago, when a catalyst column similar to the one under discussion developed a crack while under operating pressure, due to the temperature gradient across the wall becoming excessive. Where pressure vessels are used at elevated temperatures it is important that they be allowed to cool down sufficiently before being filled with water for hydrostatic testing. After filling, the temperature of the walls and the water should be allowed to reach equilibrium before applying the hydrostatic pressure.

In the present instance, it is interesting to note that, had a temperature gradient of 20°C existed across the walls of the vessel during hydrostatic testing, then at 6600 psi. the tangential stress on the inside wall would have amounted to around 28,000 psi., and the shear stress to about 29,000 psi. thus reducing the factor of safety in the centre section to 1.58.

The thermal stresses at the lead-in port at the time of fusion can only be guessed because actual temperature conditions are not known. For the formation of austenite however, the temperature of the heat affected zone at the surface of the bore must have been in the region of 1000°C (1832°F). If this figure is used and the heat affected zone considered as a cylinder with walls 1 in. thick, and if a logarithmic distribution of temperature is assumed, then by applying Baker's equation, the stress on the internal size of the lead-in port would be about 300,000 psi. in compression, for a temperature difference of 1000°C between the inner surface and outer surface of the heat affected zone.

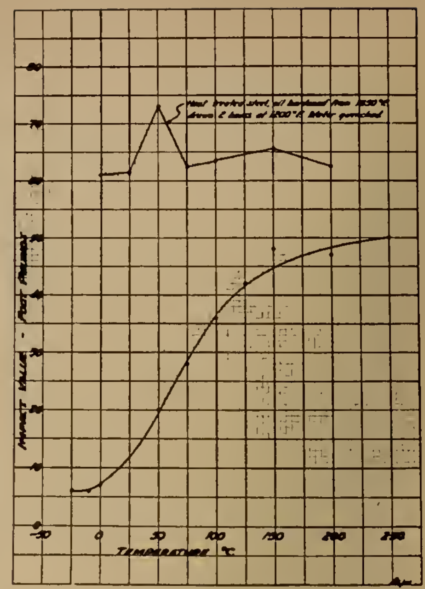

Fig. 13. Impact-temperature curve for the steel in the failed column.

Discussion

Metallographical and physical examination of the steel in the column shows that it is satisfactory

STRESSES IN WALLS OF COLUMN DUE TO PRESSURE AND TEMPERATURE

TABLE 1 - Pressure Stresses Only

	Centre Section of Column			Flange Section of Column		
	psi	psi	psi	psi	psi	psi
Internal Pressure	3700	4400	6600	3700	4400	6600
S_r(Max)	-3700	-4400	-6600	-3700	-4400	-6600
S_t(Max) Inner Wall	11,970	14,230	21,350	7,250	8,620	12,930

Figs. 14-19 (above) are photographs and photomicrographs relating to investigation of the steel in the region of the electrical lead-in port.

for normal operating conditions. Yet its high transition zone, together with coarse grain structure, does not make it the most desirable type of steel for the fabrication of high pressure vessels. The actual failure of the vessel, however, cannot be directly attributed to any condition existing in the steel.

A more suitable steel for the purpose would have been one with a much lower transition zone and smaller grain size. Both of these characteristics could have been obtained during manufacture of the steel by proper deoxidization, preferably by the addition of vanadium. A higher molybdenum content would also have been desirable in order to still further refine the grain size. The transition zone of the steel in the column could also have been lowered by suitable heat treatment of the vessel after fabrication, as indicated earlier in the paper. It is doubtful, however, whether a forging of this size could be quenched without serious warping taking place.

Examination of the fused area around the electrical lead-in port revealed that the high temperature to which this part had been subjected had resulted in the formation around the inside of the bore of a hard brittle copper-iron alloy zone. This was followed in depth by an untempered martensitic zone, into the grain boundaries of which the copper-iron alloy had penetrated. All these conditions resulted in an area that was highly susceptible to crack formation and propagation.

From the analysis of the normal stresses existing during operation, and while undergoing hydrostatic tests, it is evident that the yield point of the steel in the column was not exceeded under these conditions. Thus the original failure cannot be attributed to this cause.

From the foregoing considerations and the fact that one of the main cracks passed directly through the lead-in port, it may be concluded that the failure of the column was due to the almost instantaneous propagation of a crack. This crack originated in the fused area of the port, and continued through the main body of the steel in the column, which at the temperature of the test had low impact strength, and was therefore very notch-sensitive.

The original crack in the fused area of the lead-in port was probably formed by the tremendous stresses developed at the time of fusion. What "trigger" caused the crack to propagate, however, it is hard to say. The trigger may have been the increased stresses resulting from the hydrostatic pressure. It may have been a sudden shock produced by the pulsations of the hydraulic pump, or a combination of both.

It is probably extremely fortunate that the hydrostatic test was so severe in this case. There is little doubt that the cracks in the lead-in port developed when the short circuit occurred, some two years before. Although at the normal temperature of operation of the column, the steel is above the transition zone, and therefore ductile with high impact strength, once a crack had been formed it could, under certain stress conditions, have propagated with extreme rapidity through the steel. Had this occurred while the vessel was under gas pressure, as could easily have happened, the results might have been extremely serious.

Conclusions

That the column should have been allowed to continue in service after the lead-in port had been damaged might appear to be surprising. However, the massive proportions of the equipment undoubtedly gave a false sense of security, so that the serious consequences that could result from what was considered to be an apparently minor accident to the lead-in port were not fully realized. Had the column not failed under hydrostatic pressure the defect in the port might still have passed unnoticed. The inspection procedure existing at that time did not include examination for minor cracks. As a result of the failure, the remaining columns were thoroughly tested and inspected. In consequence two additional half columns, which showed evidence of fusion at the lead-in port, were immediately removed from service.

While the hydrostatic test is necessary and desirable, it is felt that in the past too much reliance has been placed on it. The need for proper and regular inspection for cracks cannot be too strongly emphasized, and the aid of such testing methods as magnaflux, radiograph, strain gauge, etc. is strongly recommended. It is also recommended that when damage has been found in high pressure equipment, the advice of a competent physical metallurgist be obtained before carrying out any repairs or placing the equipment back in service.

The result of the investigation was very reassuring insofar as the remainder of the columns was concerned, indicating as it did, that the failure, per se, was not due to any defect in the steel or the operating conditions. The investigation did point out, however, the necessity of avoiding conditions which could cause the formation of cracks of any kind in pressure vessels, particularly those having thick walls. It also showed that in vessels of this type, (apart from the effects of overheating due to local fusion) even moderate temperature differences in the walls of the vessel can cause the development of dangerous thermal stresses, which may result in the rupture of the vessel.

The following are some of the precautions which should be taken in the care and operation of high pressure vessels:

1. If the vessel has been fabricated from an alloy steel or a steel containing over 0.2 per cent carbon, do not allow any welding operations to be carried out, unless the vessel can be suitably preheated. Otherwise, welding will cause the formation of martensite with subsequent danger of crack formation. While vessels fabricated from low carbon, low manganese steels can of course be welded without danger of formation of martensite, it is preferable that they also should be preheated prior to welding. In any case, all vessels should be stress-relieved after welding.

2. Avoid heavy grinding operations on thick walled vessels, because the heat generated can cause the formation of martensite.

3. Avoid all scoring or marking of the vessel, such as rough machining, chisel marks, stamping of numbers, etc. These can cause stress concentrations with the subsequent development of fatigue cracks.

4. Do not allow large temperature gradients to exist between the inside and outside walls of the vessel during operation or hydrostatic testing.

5. If the vessel is at elevated temperatures during operation, allow it to cool to approximately room temperature before filling with water for hydrostatic tests. Before applying the pressure allow the temperature of the water and walls of the column to come to equilibrium.

6. Following hydrostatic testing, examine the vessel carefully, prefer-

ably by the magnaflux method, for any cracks or defects.

7. Avoid subjecting the vessel to a heavy blow while under pressure. The shock may be sufficient to act as a "trigger" for the propagation of a small crack.

Acknowledgments

In preparing this paper the author is indebted to the following; Dr. Robert F. Mehl, director, Metals Research Laboratories, Carnegie Institute of Technology, who was retained as consultant in the investigation; Metallurgical Laboratories, Bureau of Mines, Ottawa, who conducted an independent investigation into the physical properties of the steel in the vessel; members of the staff of the Materials Testing Laboratory, C.M. & S. Co., who carried out the majority of the investigation work and prepared the photographs; Mr. E. M. Stiles, chief engineer and Mr. E. Mason, chief designing engineer, C.M. & S. Co. for their advice during the investigation; and The Consolidated Mining and Smelting Company for permission to publish this paper. To all the foregoing, and to many others who assisted in the investigation, the author offers his most sincere thanks.

RECENT CANADIAN RADAR

(*Continued from page 381*)

scanning device, to explore the region ahead of the plane.

In surveying service, however, the problem is quite different. The survey craft can afford to carry relatively cumbersome and heavy equipment to obtain the data required. Moreover, the pilot is no longer interested in the elevation between his craft and the ground. He is interested in the ground contours. This information is given accurately only if the aircraft flies at a constant elevation above sea level. Such a requirement is impossible of realization, even with the best of pilots, because air pockets and vertical currents are encountered frequently. If accurate contours are to be charted, the level of the plane with respect to some fixed horizontal surface must be known at all times, or some other compensation must be provided.

To overcome this difficulty, the Research Council has developed a device which inserts a correction in the radar circuit. It consists primarily of a variable condenser controlled automatically by a barometric device. Any change in barometric pressure associated with a change in elevation reacts immediately on the variable condenser, and suitable compensation is made. It should be noted that as in the case of the shoran equipment, the velocity of electro-magnetic propagation varies slightly with altitude, and suitable corrections are introduced in the calculations.

The Armed Services are engaged also on the development of special equipment, and the National Research Council is cooperating in some of this work. However, it is of a secret nature and cannot be disclosed here.

It is, of course, impossible in a broad survey of this kind to discuss in great detail the individual applications. More time has been devoted to those which it is felt would be of general interest to engineers. The emphasis placed on these items does not reflect the effort devoted nor the degree of importance attached to them.

The author has emphasized particularly the work which is in progress at the National Research Council. This is due, of course, to his closer contact with that work. It is not intended to minimize the importance of work in progress in other institutions in Canada.

Two of the Prize Awards at Banff

Left—J. A. Ouimet, M.E.I.C., assistant chief engineer of the Canadian Broadcasting Corporation, receives the Ross Medal and the congratulations of the president.

Right—N. A. D. Parlee, Jr.E.I.C., is awarded the Martin Murphy Prize for his paper entitled, "Utilization of Sydney Slag for Engineering and Agriculture".

Sixty-Second Annual General Meeting

Convened at Headquarters, Montreal, on January 22nd, 1948, and adjourned to the Banff Springs Hotel, Banff, Alberta, June 1st, 1948

THE BUSINESS MEETING

The Sixty-Second Annual General Meeting of The Engineering Institute of Canada was convened at Headquarters on Thursday, January 22nd, 1948, at eight o'clock p.m., with Vice-President R. S. Eadie in the chair.

The general secretary having read the notice convening the meeting, the minutes of the Sixty-First Annual General Meeting were submitted, and on the motion of E. M. Van Koughnet, seconded by R. H. Findlay, were taken as read and confirmed.

Appointment of Scrutineers

On the motion of Huet Massue, seconded by J. M. Crawford, Messrs. J. A. Beauchemin, Leonard Cartier and E. R. Smallhorn were appointed scrutineers to canvass the officers' ballot and report the results.

There being no other formal business, on the motion of F. L. Lawton, seconded by R. H. Hobner, it was resolved that the meeting do adjourn to reconvene at the Banff Springs Hotel, Banff, Alberta, at eight o'clock p.m., on the first day of June, nineteen hundred and forty-eight.

The adjourned meeting convened at eight thirty p.m. on Tuesday, June 1st, 1948, with President L. F. Grant in the chair.

Nominating Committee — 1948

The general secretary announced the membership of the Nominating Committee of the Institute for the year 1948 as follows:

Chairman: W. F. M. Bryce, Ottawa, Ont.

Branch	*Representative*
Border Cities	T. H. Jenkins
Calgary	H. R. Younger
Cape Breton	W. E. Clarke
Cornwall	D. Ross-Ross
Edmonton	C. W. Carry
Halifax	A. E. Flynn
Hamilton	A. R. Hannaford
Kingston	D. S. Ellis
Kootenay	C. E. Marlatt
Lakehead	J. I. Carmichael
Lethbridge	A. L. H. Somerville
London	H. A. McKay
Moncton	B. E. Bayne
Montreal	Andre Benoit
Niagara Peninsula	C. G. Cline
Ottawa	E. G. Cameron
Peterborough	C. R. Whittemore
Quebec	A. E. Pare
Saguenay	K. A. Booth
Sarnia	C. F. Davison
Saskatchewan	J. McD. Patton
Sault Ste. Marie	R. A. Campbell
Saint John	G. M. Gray
St. Maurice Valley	J. F. Wickenden
Toronto	A. E. Berry
Vancouver	R. C. Pybus
Victoria	A. S. G. Musgrave
Winnipeg	G. Fansett.

Award of Medals and Prizes

The general secretary announced the awards of the various medals and prizes of the Institute as follows, stating that the formal presentation of these distinctions would be made at the annual dinner of the Institute on the evening of June 4th:

Julian C. Smith Medals—" For Achievement in the Development of Canada "—to P. L. Pratley, M.E.I.C., consulting engineer, Montreal, Que., and P. M. Sauder, M.E.I.C., general manager, Western Irrigation District, Strathmore, Alta.

Gzowski Medal—to E. A. Allcut, M.E.I.C., professor and head of the Department of Mechanical Engineering, University of Toronto, for his paper " The Smoke Problem ".

Leonard Medal—to G. S. Hume, C.I.M.M., chief, Geological Survey, Ottawa, Ont., for his paper " Results and Significance of Drilling Operations in the Athabaska Bituminous Sands ".

Plummer Medal—to E. T. W. Bailey, M.E.I.C., Steel Company of Canada, Hamilton, Ont., for his paper " Oxygen Accelerated Combustion in Open Hearth Furnaces ".

Keefer Medal—to E. P. Muntz, M.E.I.C., consulting engineer, Hamilton, Ont., for his paper " Steel Rail Piles Replace Concrete Piles ".

Ross Medal—to J. A. Ouimet, M.E.I.C., assistant chief engineer, Canadian Broadcasting Corporation, Montreal, Que., for his paper " Certain Aspects of Frequency Modulation and Television Broadcasting in Canada ".

Students and Juniors Prizes

H. N. Ruttan Prize—(Western Provinces)—to Raymond Pillman, S.E.I.C., for his paper " The Accuracy of a One-Minute Transit ".

John Galbraith Prize—(Province of Ontario)—to R. N. E. Haughton, JR.E.I.C., for his paper " Effects of Lightning on Buried Telephone Cables ".

Martin Murphy Prize — to N. A. D. Parlee, JR.E.I.C., for his paper "Utilization of Sydney Slag for Engineering and Agriculture ".

Phelps Johnson Prize—(Province of Quebec, English) — to R. B. Todd, S.E.I.C., for his paper " The Manufacture of .22 Calibre Long Rifle Cartridges ".

Ernest Marceau Prize—(Province of Quebec, French)—to R. Riopelle, S.E.I.C., for his paper "Etude, Plans et Devis d'un Generateur de Haute Frequence pour le prechauffage dielectrique d'une poudre a mouler thermostable ".

Report of Council, Report of Finance Committee, Financial Statement and Treasurer's Report

On the motion of D. M. Stephens, seconded by J. R. Dunbar, it was resolved that the report of Council,

Candid Shots at Banff

Above: Results of some fine Maritime humour by Past-President McKiel at the President's Dinner. President-Elect Finlayson, Mrs. G. F. Layne, Quebec, Vice-Presidents C. M. Anson and W. R. Manock.

Below: The President-Elect accepts a crested cigarette lighter, presented by I. P. Macnab on behalf of the City of Halifax.

Above: Some of the President's head table guests: Vice-President G. F. Layne (behind flowers), Mrs. C. M. Anson, Past-President deGaspé Beaubien, Mrs. J. N. Finlayson, Past-President H. W. McKiel, Mrs. Grant, Past-President F. P. Shearwood and Mrs. E. P. Fetherstonhaugh.

Left: Vice-President R. S. Eadie took the chair at dinner on Wednesday.

Above: Vice-President C. M. Anson introduces head table guests at luncheon on Friday. The speaker, the Honourable N. E. Tanner is seated on his right, and on the left, in the shadow of the microphone is Mrs. J. S. Neil, president of the Engineers' Wives Club of Calgary.

Right: Norman Simmons, student delegate from Queen's and chairman of the student conference.

Right: Mrs. E. S. Carpenter and Mrs. P. G. McAra, Regina, with Mrs. H. Nolan Macpherson, Vancouver.

Annual Banquet Pictures

Left: Allan C. Ross, president, Canadian Construction Association; Mrs. V. A. Newhall, Calgary; Dean J. N. Finlayson and Mrs. E. V. Buchanan, London, Ont.

Right: Mrs. L. F. Grant; Dr. Norman A. M. Mackenzie, president of the University of British Columbia, and dinner speaker; the Honourable J. C. Bowen, Lieutenant-Governor of Alberta and Dr. Grant who was chairman of the banquet.

Left: Mrs. J. B. Stirling, Montreal; Stewart Young, president of the Saskatchewan Association and chairman of the Saskatchewan Branch; Mrs. J. N. Finlayson and J. B. Stirling, president of the Corporation of Professional Engineers of Quebec, and also representing the Canadian Chamber of Commerce.

Left: R. T. Hollies, chairman of the Calgary Branch; E. V. Buchanan, vice-president of the Ontario Association; Mrs. C. S. Clendening, Lethbridge; V. A. Newhall, city commissioner of Calgary.

Right: Mrs. H. R. Banks, Trail, B.C.; Colonel H. W. Love, director of works and construction, N.D.H.Q., Ottawa; Mrs. R. T. Hollies, Calgary.

the report of the Finance Committee, the financial statement and the Treasurer's report be accepted and approved.

Reports of Committees

On the motion of R. F. Legget, seconded by J. K. Partridge, it was resolved that the reports of the following committees be taken as read and accepted: Legislation, Board of Examiners, Publication, Membership, Industrial Relations, Community Planning, Papers, Library and House, Admissions, The Young Engineer, Employment Conditions, Professional Interests, Prairie Water Problems, Canadian Standards Association, National Construction Council, Canadian Radio Technical Planning Board.

Branch Reports

On the motion of E. V. Buchanan, seconded by J. M. Fleming, it was resolved that the reports of the various branches be taken as read and approved.

Ontario Division

On the motion of W. R. Manock, seconded by G. R. Turner, it was resolved that the report of the Ontario Division be taken as read and approved.

Election of Officers

The general secretary read the report of the scrutineers appointed to canvass the officers' ballot for the year 1948 as follows:

President:

J. N. Finlayson, Vancouver, B.C.

Vice-Presidents:

Province of Ontario — J. A. Vance, Woodstock, Ont.
Province of Quebec—Alex Lariviere, Quebec, Que.
Maritime Provinces—I. P. Macnab, Halifax, N.S.

Councillors:

Victoria Branch—S. H. Frame.
Lethbridge Branch—R. S. Lawrance.
Calgary Branch—K. W. Mitchell.
Winnipeg Branch—D. M. Stephens.
Sault Ste. Marie Branch—L. R. Brown.
Sarnia Branch—R. W. Dunlop.
Niagara Peninsula Branch—P. E. Buss.
Hamilton Branch—W. A. T. Gilmour.
Toronto Branch—E. A. Cross.
Peterborough Branch—A. L. Malby.
Ottawa Branch—G. R. Turner.
Cornwall Branch—Drummond Giles.
Montreal Branch—J. M. Crawford. H. F. Finnemore.
Quebec Branch—E. D. Gray-Donald.
Moncton Branch—W. C. MacDonald.
Cape Breton Br.—W. A. MacDonald.
Halifax Branch—C. D. Martin.

On the motion of Norman Marr, seconded by C. S. Clendening, it was resolved that the report of the scrutineers be adopted, that the scrutineers be thanked for their services in preparing the report, and that the ballot papers be destroyed.

The president announced that the newly elected officers would be inducted at the annual dinner of the Institute on Friday evening, June 4th.

Retiring President's Address

In accordance with established custom, the president delivered his retiring address, which appears in full on page 399 of this issue of the *Journal.*

Vote of Thanks to the Calgary Branch

On the motion of J. A. Vance, seconded by C. M. Anson, it was unanimously resolved that a hearty vote of thanks be extended to the officers and members of the Calgary Branch in recognition of their hospitality and activity in connection with the holding of the Sixty-Second Annual General Meeting.

Vote of Thanks to Retiring Officers

On the motion of N. F. McCaghey, seconded by R. N. Coke, it was unanimously resolved that a hearty vote of thanks be accorded to the retiring president, vice-presidents and members of Council in appreciation of the work they have done for the Institute during the past year.

The meeting adjourned at nine-thirty p.m.

The Professional Meeting

The Canadian Rockies and the Banff Springs Hotel combined to provide the background for the 1948 meeting and a very acceptable background too. Six hundred and forty members and guests registered to enjoy a programme providing for consideration of technical subjects and enjoyment of social contacts, superb hotel facilities and majestic scenery. It was unfortunate that many persons who had made reservations were forced to cancel because flood conditions in British Columbia required their attention "on the job" or rendered transportation too difficult.

This is not the first time the Institute has met at Banff, but it is the first time for an Annual Meeting. Many persons expressed the opinion that this was the best meeting of all time and it was agreed generally that the annual meeting should return there at the earliest opportunity. Certainly conditions combined to make possible an outstanding event in Institute history. Even the weather, not noted for being good at that time of year, was kind and provided excellent facilities for "extra circricular" activities every day. True, it did rain a bit Thursday afternoon but not enough to stop the golfers from finishing their competition.

History

The earlier meetings in Banff were Western Professional Sessions in August 1920 and July 1925. They took the form of camps with most of the delegates and their families living in tents pitched near the junction of the Bow and Spray Rivers—a point which this year's delegates will recall as being in front of and below the front terrace of the Banff Springs Hotel.

It is interesting to note among the registration list for the 1925 meeting the names of C. E. Sisson, Toronto; G. A. Gaherty, Montreal; Dr. J. A. Allan, Edmonton, and J. M. Wardle, Banff. These names may be found also in this year's list. In contrast to the peak registration of 640 this year, the registration in 1920 was 150 and in 1925 it was just under 100.

The technical programme was longer than any offered for many years. In all there were eighteen sessions. In addition there were the customary two meetings of council, the old and the new, the conference of branch officers, the conference of students, four committee meetings and the social events such as the Banquet, the Ball and the President's Dinner. These events made up three very full days.

Prairie Water Problems

Perhaps the outstanding feature of the programme was the symposium on Prairie Water Problems. This subject has been a continuing

At the Technical Sessions

Above left: Chester B. Hamilton, Jr., Toronto, discusses "Research for National Defence" with the author, Dr. H. M. Barrett of the Defence Research Station, Suffield, Alta.

Above right: Dr. J. A. Allan addresses the opening luncheon on the subject of conservation of natural resources.

Left: J. Alex. Walker, executive engineer of the Vancouver Town Planning Commission outlines "Some Standards and Procedures for Modern Community Planning".

Left: A. H. Wilson Busby presented a paper of outstanding practical value. It concerned the failure of a high pressure vessel at the Ammonia Plant of Consolidated Mining and Smelting Co. Ltd., Trail, B.C.

Below: Major General Howard Kennedy described the work of the Eastern Rockies Forest Conservation Board at dinner on Wednesday.

Below: F. T. Gale of Calgary Power Limited, presented interesting economic facts and figures concerning "Rural Electrification".

interest of the Institute for many years under the chairmanship of G. A. Gaherty of Calgary and Montreal. The committee presented five extremely valuable papers as can be seen from the programme following these general remarks. Judging from the notice taken by the Press throughout Canada the work of the Institute is considered of great value. Certainly a group could not be found more competent to discuss these perplexing problems.

Conservation

So closely related to the water problems that it is hard to decide where one leaves off and the other begins, is the subject of Conservation of Natural Resources. The Institute committee under the chairmanship of Dr. Alan E. Cameron of Halifax contributed three papers to the programme, all of which fitted perfectly into the picture as drawn up by the programme planners. When it is remembered that the committee was authorized only a short time ago this contribution becomes more than ever noteworthy.

Oil and Gas

So closely allied were the subjects that the programme of the second day seemed almost a continuation of that of the first day. There were three papers on oil and gas with particular reference to the Alberta situation. Surely this comes under the heading of natural resources. The papers together presented an excellent account of what has been done, and what can be expected in the future.

Variety

On the third day there were seven papers of a diversified nature, covering subjects of equal interest to all parts of Canada, as can be seen from the following list. They tend to show the wide interest of the membership of the Institute for they included electrical, mechanical, metallurgical, civil and military subjects. A very successful session on the engineer's part in, and relation to, management was held also, although not shown on the official programme.

Conferences

A Conference of Branch Officers was held for the second time in two years, under the chairmanship of Mr. J. F. MacLaren, of Toronto, and Mr. G. R. Henderson, of Sarnia. A great deal of ground was covered, and a report will appear in the *Journal* as soon as the minutes are prepared and studied. It is apparent that this should be a feature of the annual meeting each year.

For the third year, a Students' Conference was held. Every university granting engineering degrees was represented and the discussions were both lively and lengthy. Dr. G. R. Langley, of Peterborough, chairman of the Institute's Committee on the Training and Welfare of the Young Engineer presided over the first two sessions after which, following the established custom, the conference was turned over to a student chairman of the delegates' own selection. This conference too, will be reported in detail in the *Journal* after the minutes and resolutions have been prepared and studied.

Speakers

The special speakers for the non-technical subjects were The Honourable N. E. Tanner, Minister of Lands & Mines for the Province of Alberta, who spoke at luncheon on Tuesday, and Dr. N. A. M. Mackenzie, president of the University of British Columbia, who spoke at the Annual Banquet. Mr. Tanner tied in the engineer to the work of his department and spoke of the great resources of his province which he believed presaged great things for Alberta. Dr. Mackenzie gave his listeners food for deep thought in expanding his subject " Some Principles for Modern Living ".

The officers and members were delighted to receive as their guests The Honourable J. C. Bowen, Lieutenant-Governor of the Province of Alberta, and Mrs. Bowen. Their presence at the banquet and in the reception line after the banquet was indeed an added pleasure for all. The opportunity to know them was appreciated, particularly by the members from the east and their wives. They were accompanied by their Aide-de-Camp, Major Sutherland, and Mrs. Sutherland.

The Kindess of Friends

Once again the Institute's many friends in the commercial world gave great aid in the conduct of the meeting. Movie films were loaned by Imperial Oil Limited (Search Unending), the Canadian Ingersoll Rand Co. (Alva B. Adams Tunnel), The Powell River Co. (River of Paper), and the Government of British Columbia (Snow Harvest).

" Muriel's Room " again was a feature made possible by industrial and commercial organizations. With the day of arrival and the day of departure added to a three day technical programme, Muriel became more than ever important, and in her generosity welcomed the entire assembly to her spacious quarters in the River View Lounge on eleven different occasions. The many friends who sponsor this feature year after year are indeed contributing much to the pleasure and success of our annual meeting. They may be assured that their interest is recognized and appreciated.

A New President

No account of an annual meeting would be complete without reference to the transfer of authority from one set of officers to another—particularly in the case of the presidency. Throughout its long history, the Institute has been most fortunate in its selection of presidents, and yet there are always feelings of regret upon the retirement of a president. This year was no exception. Dr. Grant was widely known even before he assumed office, but now numbers many more among his host of admiring friends. He was excellently suited to this honourable position—this " labour of love "—and by his interest, his intelligence, and his industry he has raised the Institute to new heights.

To offset the feeling of regret that he must leave his position of leadership, there is the rejoicing that so excellent a successor has been selected. Dean J. N. Finlayson of the University of British Columbia comes to this high office with unusual qualifications of personality and experience. His, too, will be a great year, and the applause that greeted him upon " taking over " at the banquet is but the promise of support and encouragement from the membership everywhere.

1949

The termination of one Annual Meeting is but the beginning of another. While Banff is still pleasantly fresh in the minds of so many, Quebec becomes the urgent objective of those who are charged with the planning of the meetings. The 63rd Annual Meeting of the Institute will take place at The Chateau Frontenac in Quebec City on May 11th, 12th and 13th, 1949.

Annual Meeting Technical Programme

WEDNESDAY, JUNE 2nd

The day's papers comprised a symposium on Prairie Water Problems under the chairmanship of P. M. Sauder, M.E.I.C., with an introduction by G. A. Gaherty, M.E.I.C., Chairman of the Institute's Committee on the subject.

9:30 a.m. *"Water Resources of Alberta—Their Present and Ultimate Uses."* Ben Russell, M.E.I.C., Director of Water Resources, Province of Alberta.

10:10 a.m. *"The Saskatchewan River and Manitoba's Water Problem."* D. M. Stephens, M.E.I.C., Deputy Minister of Mines and Resources, Province of Manitoba.

10:50 a.m. *"The St. Mary-Milk River Irrigation Project."* G. L. Mackenzie, M.E.I.C., Chief Engineer, P.F.R.A., Regina.

11:30 a.m. *"Irrigation in Western Canada — Its possible Effect on Industry and Population."* A. E. Palmer, M.Sc., Superintendent, Dominion Experimental Station, Lethbridge, Alberta.

12:30 p.m. Luncheon

Chairman: S. G. Coultis, M.E.I.C., President and Gen. Manager, Valley Pipe Line Co., Ltd., Calgary and Vice-President of the Institute for the western region.

"The work of the Institute's Committee on Conservation of Natural Resources." Dr. Alan E. Cameron, M.E.I.C., President, Nova Scotia Technical College, Halifax.

"The place of the Engineer in the Conservation and Development of the Natural Resources of Alberta." Dr. John A. Allan, M.E.I.C., Professor of Geology, University of Alberta, Edmonton.

2:15 p.m. *"Hydro Power Development on the Eastern Slopes of the Canadian Rockies."* T. D. Stanley, M.E.I.C., Production Superintendent, Calgary Power Limited, Calgary, Alta.

3:00 p.m. Discussion of all papers.

6.30 p.m. Dinner

Chairman: R. S. Eadie, M.E.I.C., Chief Engineer, Dominion Bridge Co., Ltd., Montreal, and Vice-President of the Institute for Quebec.

"Forest Management on the Eastern Slopes." Major General Howard Kennedy, M.E.I.C., Chairman, Eastern Rockies Forest Conservation Board, Ottawa.

THURSDAY, JUNE 3rd

Canada's Petroleum Resources

9:30 a.m. *"Gas and Oil Resources of Western Canada."* Dr. G. S. Hume, O.B.E., Chief, Geological Survey of Canada, Ottawa.

Chairman: J. S. Irwin, M.E.I.C., Consulting Geologist, Calgary, Alta.

10:30 a.m. *"Gas Synthesis."* T. B. Doherty, M.E.I.C. Process Design Engineer, Imperial Oil Ltd., Sarnia.

Chairman: H. Stevens-Guille, Coordinating Engineer, Imperial Oil Ltd., Calgary, Alta.

11:30 a.m. *"Engineering Aspects of Petroleum Production."* E. D. Wilson, Imperial Oil Ltd., Calgary, Alta.

Chairman: J. F. Langston, M.E.I.C., Denton-Spencer Co. Ltd., Consulting Engineers, Calgary, Alta.

FRIDAY, JUNE 4th

General Professional Sessions

9:30 a.m. *"Research in Canada for National Defense."* Dr. H. M. Barrett, Chief Superintendent Defence Research Board, Experimental Station, Suffield, Alta.

Chairman: R. M. Hardy, M.E.I.C., Dean of Engineering, University of Alberta, Edmonton.

10:30 a.m. *"Rural Electrification."* F. T. Gale, M.E.I.C., Superintendent of Rural Electrification, Calgary Power Limited.

Chairman: J. C. Dale, M.E.I.C., Canadian Utilities Ltd., Calgary.

10:30 a.m. *"Localized Overheating in the Wall of a High Pressure Vessel and its Effect on Rupture Strength."* A. H. W. Busby, M.E.I.C. Superintendent, Engineering Research Development, Consolidated Mining and Smelting Co. Ltd., Trail, B.C.

Chairman: D. D. Morris, M.E.I.C., General Superintendent, Alberta Nitrogen Products, Ltd., Calgary.

11:30 a.m. *"Removal of Bark from Pulp Logs by the Hydraulic Method."* P. R. Sandwell, M.E.I.C., Chief Engineer, Powell River Co. Ltd., Vancouver, B.C.

Chairman: G. F. Layne, M.E.I.C., Vice-President, Price Bros. & Co., Quebec, P.Q.

12:45 p.m. Luncheon

Chairman: C. M. Anson, M.E.I.C., General Manager, Dominion Steel and Coal Corp., Ltd., Sydney, N.S. and Vice-President of the Institute for the Maritime Region.

"Engineering Enterprise." The Honorable N. E. Tanner, Minister of Lands and Mines, Province of Alberta.

2:30 p.m. *"Recent Canadian Radar."* B. G. Ballard, M.E.I.C. Director, Radio and Electrical Engineering Division, National Research Council, Ottawa.

Chairman: H. Randle, M.E.I.C., Equipment and Waterworks Engineer, Calgary Power Ltd., Calgary, Alta.

3:30 p.m. *"Kootenay River Power Below Nelson, B.C."* W. J. Tindale, M.E.I.C., Chief Engineer, West Kootenay Light and Power Co. Ltd., Trail, B.C.

Chairman: J. A. McCrory, M.E.I.C., President, Shawinigan Engineering Co., Ltd., Montreal.

4:30 p.m. *"Physical Standards and Procedures in Modern Community Planning."* J. Alexander Walker, M.E.I.C. Executive Engineer, Town Planning Commission, City of Vancouver.

Chairman: E. Mason, M.E.I.C., Chief Designing Engineer, Consolidated Mining and Smelting Co., Trail, B.C.

7:00 p.m. Annual Banquet

Chairman: Lieut.-Colonel L. F. Grant, D.Sc., President of the Institute, Kingston, Ont.

Speaker: N. A. M. Mackenzie, C.M.G., K.C., President, University of British Columbia, Vancouver, B.C.

Address of the Retiring President

Lieut.-Col. L. F. Grant, D.Sc., M.E.I.C.

Delivered before the Sixty-first Annual General and Professional Meeting of The Engineering Institute of Canada, Banff, Alberta, June 4, 1948

The time has come for me to give an account of my stewardship and to report to this meeting on the activities of the Institute for the year.

Our membership shows an encouraging growth — the present numbers being well over 10,000—and it is interesting to note that nearly half of these are in the junior and student classes, which indicates a very healthy prospect for the future.

There are further tangible signs of growth. A third section of the Saskatchewan Branch is being set up in Prince Albert, and the first steps have been taken towards the formation of a new branch at Kamloops to include the Okanagan and Thompson Valleys.

The Engineers' Council for Professional Development held its 15th annual meeting in October last in Montreal under our auspices. This was the first time that such a meeting had been held outside the United States. There was a large attendance from the eight constituent bodies, and the Institute received many compliments on the manner in which the arrangements for the meeting were carried out.

A joint meeting with the Community Planning Association of Canada was held in Montreal in October and some excellent papers by Canadian, English and United States authorities were presented. This was the Institute's first venture on this scale in the planning field, and the results indicated a real need for the Institute to continue its interest and its activity. We are indebted to His Worship the Mayor and the Corporation of Montreal for providing entertainment for the ladies at both of the above meetings.

Five meetings of Council have been held away from Montreal,—two in Toronto, and one each in Banff, Halifax and Quebec. It is the policy of Council to have as many meetings as possible away from Headquarters for the benefit of those councillors who do not live in Montreal.

In response to the appeal of many life members, some thought was given to work which this group might do for the Institute and for the profession. Professor C. M. McKergow, has undertaken the work of circulating a questionnaire among them outlining several proposals and asking them to comment thereon. This work is continuing.

President L. F. Grant.

The work of the Committee on the Training and Welfare of the Young Engineer has continued under the chairmanship of Dr. G. R. Langley, of Peterborough. As in the past two years, under the auspices of this committee, representatives of all the degree-granting Universities in Canada have been brought together at Banff to confer on matters of interest to students, and,—more important,—to meet the older members of the Institute.

Our relationship with sister organizations has claimed the attention of the officers on several occasions during the year, and I am glad to say that certain points of difference and of misunderstanding have been cleared up. In my opinion corporate union of engineering bodies is not possible at the present time, nor do I consider that it is necessarily desirable. I do think, however, that unity of effort in major matters of policy is essential for the welfare of the profession, and I feel that with the co-operation and goodwill of other engineering organizations, good progress is being made.

The question of labour legislation affecting engineers came before Council again this year. It will be recalled that the membership of the Institute was opposed to the inclusion of engineers in collective bargaining legislation, unless such legislation provided bargaining by engineers for engineers. It having been made clear to the officers of the Institute that there was no hope of securing such special legislation, Council recommended to the Minister of Labour that engineers should be excluded from the provisions of the proposed Industrial Disputes Act.

When, in early April, 1948, the draft of the Act was presented for first reading as House of Commons Bill 195, it excluded engineers, using the following words: "Employee . . . does not include a member of the medical, dental, architectural, engineering or legal professions qualified to practise under the laws of a province and employed in that capacity." It is to be noted that the Dominion Government thus definitely places engineering among the learned professions, something that we have sought for many years. This appeared very satisfactory to Council, and the Minister of Labour was so informed, with our recommendation that the Bill be adopted as drafted.

This action of Council has since been approved by all the Western branches and by several of the Eastern ones, and the only contrary opinions that have been expressed are those of the Toronto, Peterborough and Moncton branches, and some individual members in Toronto and in Ottawa.

Council believes, therefore, that its action is approved by the vast majority of the membership of the Institute.

It is also very striking and very gratifying to note that the eight provincial engineers' associations have also expressed approval of the Bill, as well as the Canadian Institute of Mining and Metallurgy and the Chemical Institute of Canada.

It appears, therefore, that the engineering profession is very strongly in favour of being treated as a profession rather than as a trade or craft.

While this result is satisfactory to Council and to most of the membership, I believe that it lays a heavy responsibility on the older engineers, and especially on those in managerial positions. There is no doubt that certain of the younger men, notably in the more highly industrialized parts of the country, believe that collective bargaining is, or can be of benefit to them, and it is for those who are in positions of authority to show that the rights and reasonable aspirations of their younger brothers in the profession will be as well protected without collective bargaining as with it.

Unless this is done the question may lead to a cleavage in the future between the younger and the older engineers which will be very detrimental to our profession.

The Institute has continued its efforts to have the customs tariff replaced on plans entering this country from outside. The removal of the tariff has not only taken employment from Canadian consulting engineers, but because of the natural tendency of engineers from other countries to specify equipment from those countries, it has resulted in a loss of business to Canadian manufacturers.

During my term as president, I have visited all of the 28 branches of the Institute, and three other centres of engineering activity, and I have addressed the science students in sixteen Canadian universities. This task has been a most inspiring one and has given me a great deal of pride in this country, in its achievements, and the people who are in it. I have seen the greatest hydro-electric development in the world, the most up-to-date short-wave transmitting station in North America, and many other outstanding works planned and built by Canadian engineering knowledge and skill. I have seen products which have been developed and made by Canadian engineers and scientists for use in all parts of the world. I have learned something of the marvellous record of Canadian industry in the Second World War, a record in which our profession played a great and vital part.

I have seen much of what Canadian engineers in the public service are doing to make Canada a better place in which to live, and I feel very strongly that the competence of Canadians, their ability to adapt themselves to difficult and rapidly changing circumstances, their ingenuity in overcoming obstacles, warrants a far higher degree of confidence in our country, in our people, and in our profession than we have hitherto displayed. There is still a tendency on the part of too many Canadian governments and Canadian employers to disregard Canadians when engineering services are required, and I am of the opinion that a campaign across the country addressed to municipalities and to industrial organizations might well be undertaken to enlighten them as to what Canadians are capable of doing. Let us have done with this feeling of inferiority and this too-prevalent opinion that Canadians are capable of doing only the lesser work. There is nothing in the record to justify such an opinion, nor is it held by people outside of Canada.

As most of you know, Dr. Wright, our general secretary, suffered a serious illness which began in August, and from which he has not fully recovered, although his progress is now satisfactory. During his absence from the office most of his duties were performed most acceptably by our new assistant general secretary, Mr. W. D. Laird, by Miss McLaren, and the other members of the Headquarters staff. We are very glad to have again the benefit of Dr. Wright's services.

The list of persons whom I desire to thank for help and for hospitality during the past year is an impressive one. It includes the officers and many individual members of all the branches, the vice-presidents, the treasurer, councillors, and chairmen of committees, and the Headquarters staff. Finally, I owe a great deal of gratitude to the deans of Science and Engineering at the various universities who have given me the opportunity of addressing the students.

To my successor, I extend my sincere congratulations, assuring him that he is entering upon a year of great interest, and of great inspiration, and to the membership at large I wish to proffer my thanks for having given me the greatest honour of my professional life in electing me to the presidency.

I hope that my efforts during the past year have been of service to the Institute.

Presidents confer; retiring President Grant and incoming President Finlayson in an informal moment on the terrace at Banff.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

In the Years of Peace

"Probably the only guarantee of peace today is that these newer weapons are so mutually destructive to the population as a whole that any nation might well hesitate attacking another which was fully prepared. Let us remember that such preparation will only be possible in the years of peace. After war has started it will be too late".

Although they appreciated that limitations were necessarily placed on the author of the annual meeting paper "Research in Canada for National Defence" (Dr. H. M. Barrett, chief superintendent, Defence Research Board, Suffield, Alta.), many listeners regretted that he could not expand his subject to tell about the more spectacular phases of the research effort. He confined himself largely to the development and use of toxic agents for the destruction of mankind. New weapons, explosives, and the behaviour of machines, materials and men in the Arctic would have been much more exciting, but though hoping for it no one really expected to hear it.

The really significant portion of the address is quoted above. These are the last lines of the paper appearing in the May *Journal*. Not many people appreciate that only the discoveries and developments that take place in peace time can be used in war. Either we have it when the war begins or we don't have it at all. There are a few minor exceptions to this but in general the statement is true.

For instance, not a single plane was used in the last war that was not at least in the design stage before the war began. Even jet propulsion was a pre-war discovery as everyone will appreciate who heard Air Commodore Frank Whittle (now Sir Frank) at the 1947 Annual Meeting of the Institute.

It is difficult to grasp this truth, but it is frightfully important that it be grasped—particularly by those whose responsibility it is to control our war department and our research activities. Without adequate encouragement, support and leadership from these sources the danger of war will be increased greatly and the results, if war should follow will be more disastrous.

"After war has started it will be too late".

Correspondence

Dear Mr. Laird,

Enclosed is a copy of a letter received by air mail from the General Secretary of the Institution of Engineers (India) referring to the article by me published in the March, 1948 issue of the *Journal.*

On account of the indication of the widespread distribution and interest in the *Journal* you might like to publish it.

Over fifty requests for the additional nomographs were received, coming from every province of Canada as well as several from the States.

Yours sincerely,

J. Morrow Oxley, M.E.I.C.

THE INSTITUTION OF ENGINEERS (INDIA)

May 20, 1948.

J. Morrow Oxley Esq., M.E.I.C.,
Toronto, Canada.

Dear Sir,

I have seen your excellent nomograph detailed on pages 172 and 173 of *The Engineering Journal* for March, 1948, published by The Engineering Institute of Canada, and shall be grateful if you will very kindly send me separate copies of all the three nomographs for 2000-lb., 2500-lb. and 3000-lb. concretes. If you could possibly spare about 15 copies of each, I shall be very grateful to have them on payment if necessary; otherwise kindly send as many copies as you can conveniently spare.

Thanking you,

Yours faithfully,

R. D. Ratnagar,
General Secretary.

Please Note

The new telephone number of Headquarters is

PLateau 5078

Personals

Notes of the Personal Activities of Members of the Institute

A. L. H. Somerville, M.E.I.C.

Dr. Charles Camsell, M.E.I.C., was present on June 14 in London, England, to receive from the Royal Geographical Society the founders medal which was awarded to him two years ago. The award was for his contribution to the geology and geography of Canada and his work in advancing geographical science in the Dominion.

G. H. Ferguson, M.E.I.C., who retired early this year as chief of the public health engineering division of the Department of National Health and Welfare, is chairman of the board of technical advisers to the Canadian Section of the International Joint Commission re pollution of the international boundary waters of the St. Mary River, the St. Clair River and Lake St. Clair, and the Detroit River. He is also a consultant to the International Joint Commission, and to the Federal Department of National Health and Welfare, Ottawa.

During World War II he was actively engaged on public health engineering projects for the armed forces, prisoner of war camps and industrial developments. In 1938 he was an associate member of the engineering board of review re sewage disposal for the city of Toronto.

From 1923 until his retirement he was engineer in charge of developing public health engineering policies for the Federal Department of Health, now the Department of National Health and Welfare. There he worked on the national building code with special attention to the work of the committee on health and sanitation of which he was chairman. In 1919-20 Mr. Ferguson was assistant to the housing and town planning adviser of the Commission of Conservation, and in 1920-21 he was principal assistant to the chief traffic adviser of the Grand Trunk Arbitration Board, in Montreal. He served subsequently as chief inspecting engineer on the rehabilitation of lines of the Toronto Transportation Commission.

Mr. Ferguson had been with the Commission of Conservation prior to service in the first World War. Previously, he had served with the H.E.P.C. of Ontario and on surveys for the Metabetchouan River power development. He had completed post-graduate work at University of Toronto in 1907, having received the degree of B.A.Sc. in 1906.

F. L. Lawton, M.E.I.C., formerly assistant chief engineer with Aluminum Company of Canada, Limited, was recently appointed head of the newly-formed Power Department of Aluminum Laboratories Limited. Mr. Lawton is well known in North American engineering circles,

F. L. Lawton, M.E.I.C.

having been closely associated with the wartime expansion of power and other plant facilities of the Aluminum Company, especially Shipshaw. He is a former Canadian vice-president of the American Institute of Electrical Engineers and has taken a leading part in Canadian engineering activities, in the hydro-electric power field.

As head of the Power Department of Aluminium Laboratories Limited he will continue his close connection with investigation, design and constructon of water-power facilities.

C. B. R. Macdonald, M.E.I.C., returned to England recently, and has rejoined Humphreys Limited, engineers and building contractors, at Knightsbridge, London, as a director. He had been in Canada for a short time this year, after spending several years in Barbados, B.W.I., and Venezuela, S.A. Most recently he was civil engineer for Raymond Pile Company.

J. S. Bryant, M.E.I.C., has returned to the Provincial Electricity Board in Montreal. He resumes his position as an electrical engineer, which he relinquished in October last to go to the Carborundum Company at Shawinigan Falls, Que.

A. L. H. Somerville, M.E.I.C., is no longer with the Department of Transport, Civil Aviation Branch, as district airway engineer at Lethbridge, Alta. He has accepted the post of assistant city manager at Lethbridge. A graduate of University of British Columbia, Mr. Somerville joined the Department of Transport in 1936 at Coleman, Alta.

C. Garrett, M.E.I.C., is employed at the Low Temperature Laboratory of the National Research Council in Ottawa. He received a master's degree from University of Saskatchewan in September, 1947.

P. V. Palmer, JR.E.I.C., is now employed by Arborite Company Limited at Ville LaSalle, Que., as plant engineer. A graduate of Ecole Polytechnique, Montreal, 1945, he was employed by the Manitoba Paper Company Limited, Pine Falls, Man., returning to Montreal during 1947 where for a time he was with Howard Smith Paper Mills.

D. M. Venton, JR.E.I.C., is in Owen Sound, Ont., working as assistant city engineer He had been with R. V. Anderson, consulting engineer, Toronto, from 1946, but spent a short time at H. G. Acres, Niagara Falls, Ont.

L. C. Fleet, S.E.I.C., is with Canadian Westinghouse Company, Hamilton. He graduated this year from McGill University, Montreal, with the degree of B.Eng., electrical.

G. I. Hector, JR.E.I.C., recently resigned from the Bell Telephone Company of Canada, Toronto, and has accepted a position with the Lake St. John Power and Paper Company at Dolbeau, Que. He is assistant electrical superintendent.

D. F. Messervey, JR.E.I.C., recently accepted a position with Canadian Allis-Chalmers Company Limited, Toronto, in the capacity of sales engineer. He was formerly plant engineer at the Minas Basin Pulp and Power Company, Hantsport, N.S.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

J. M. Anderson, M.E.I.C., who was district engineer for the Department of Public Works of Alberta at Medecine Hat, died early in June this year.

Born in Aberdeen, Scotland, in 1890, he studied civil engineering for a time at the Royal Technical College, Glasgow, Scotland. Coming to Canada, he was employed on construction work with the Canadian Pacific Railway until 1921 except for a period of service during the first world war with the Canadian Overseas Railway Construction Corps. From 1921 to 1923 he was draughtsman and office engineer for the Edmonton, Dunvegan and British Columbia Railway. In 1923-24 he was draughtsman with the Alberta and Great Waterways Railway. He then entered on his long association with the Main Highways Branch of the Department of Public Works of Alberta. He was at first resident engineer at Edmonton and later district engineer at Hanna, at Drumheller, and at Medicine Hat.

He was a member of the Association of Professional Engineers of Alberta from 1927. He had been admitted to the Institute in 1919 as an Associate Member. He transferred to Member in 1940.

N. E. D. Sheppard, M.E.I.C., well known in engineering and publishing circles as president of Canadian Engineering Publications Limited, Montreal and Toronto, died in his sleep while returning from a business trip to Toronto, on Friday morning, June 11. Mr. Sheppard was connected with the Engineering Institute staff and that of *The Engineering Journal* for many years.

He was born in Ottawa in 1891, received his primary education there and then proceeded to the University of Toronto, where he graduated in 1914 with the degree of B.A.Sc. In 1914 he became assistant engineer in the Dominion Water Power Branch, Department of the Interior, Ottawa, Ont. In 1922 he was appointed assistant to the secretary of The Engineering Institute of Canada. He was office manager for Headquarters Staff, Montreal, and assistant editor of *The Engineering Journal*. In 1932 he was appointed manager of the Publications Division of the Institute, and was responsible for the founding of The Engineering Catalogue.

It was apparent from Mr. Sheppard's work with the Institute's publications, that his future lay in the field of technical and industrial publishing and in 1938 he founded the Canadian Engineering Publications Limited. Starting with The Engineering Catalogue, which was purchased from the Institute, the company developed under Mr. Sheppard's guidance into one of the largest publishers of exclusively technical and industrial periodicals and annuals in Canada, issuing *The Engineering and Industrial Catalogue; The Architectural and Building Catalogue; New Equipment News; Building Materials News,* and *Canadian Diesel Power and Traction.* Mr. Sheppard also continued to produce the advertising section of *The Engineering Journal* until this year.

Mr. Sheppard was admitted to the Institute as a Student in 1914, transferring to Associate Member in 1916 and to Member in 1940. He was affiliated also with The Technical Advertisers Association of Montreal, the Advertising and Sales Executive Club, the Montreal Board of Trade, and other business organizations.

N. E. D. Sheppard, M.E.I.C.

R. A. Brown, M.E.I.C., the discoverer of crude oil in Western Canada in 1936, and former superintendent of the Calgary electric light and street railway departments, died May 16, 1948, at his residence in Calgary. He had been in poor health for some time.

He was one of the pioneers in the search for crude oil in Alberta and when he brought in the Turner Valley Royalties discovery well in 1936 it gave the oil industry the necessary impetus to develop Alberta as one of the leading oil fields of the British Empire.

He started his electrical career at the turn of the century when he joined the staff of the Westinghouse Electric Co., and he learned his profession by practical experience, investigation and experimentation. He kept abreast of the latest developments in the electrical field and his opinion was sought on many problems.

Mr. Brown was born at Point Pevis, Que., in 1886, and started his electrical career at the age of 15 with the Westinghouse Electric Co., at Pittsburgh and St. Louis. He came to Calgary in 1906 as superintendent of the North West Electric Co. In 1907 he was appointed city electrical superintendent at Nelson, B.C., and designed and supervised the construction of the Bonnington Falls dam and power plant during the four years he was at Nelson.

He came to Calgary in 1911 as superintendent of the electric light department and added the supervision of the street railway department to his duties in 1921. Mr. Brown retired from the city's staff in 1937 after serving for 25 years. During that period he installed electrical plants at Bassano, Gleichen, Strathmore, Cluny, Rockyford, Standard, Olds and Okotoks through the United Electrical and Engineering Co. Mr. Brown designed and installed the first fully automatic mercury arc rectifier portable substation in Calgary in 1929.

It was when he became keenly interested in the search for crude oil in Turner Valley that he relinquished his interest in electrical expansion. When the first crude oil well was brought in in Turner Valley in 1936 Mr. Brown was president of Brown, Moyer and Brown Ltd., Federated Petroleums Limited, Coastal Oils Limited and their associated companies. A total of 23 wells were drilled in the Turner Valley crude oil field under his direction.

At the age of 18, Mr. Brown was chairman of the board of examiners of Local No. 1, Electrical Union (America) and was one of the assistants of the famous scientist Charles P. Steinmetz. He was a charter member and one of the founders of the Association of Professional Engineers of Alberta of which he was president in 1921. He was a member of the American Institute of Electrical Engineers, the Western Canadian Petroleum Association, and recently received his 25-year membership plaque from the Calgary Board of Trade.

Mr. Brown was a member of the senate and board of governors of the University of Alberta and was a member of the engineering examining board, University of Alberta from 1926-1946. He became a Member of the Engineering Institute in 1941.

BOOK REVIEWS

CENTRIFUGAL AND AXIAL FLOW PUMPS, THEORY, DESIGN AND APPLICATION:

A. J. Stepanoff. N.Y., Wiley, 1948. 428 pp., illus., 9¼ x 5¾ in., cloth, $7.50.

Reviewed by Robert W. Angus*

This book attacks the subject treated in a somewhat different way to other recent works on the pump. After a brief discussion on general flow problems specific speed and its bearing on the proportion and action of pumps is introduced, and is not lost sight of throughout the book. Practically all coefficients used are referred to this and other affinity values.

Naturally the fundamental theory is based on Euler's equation and by systematic analysis the author deduces the modifications necessary to make it fit the actual performance of the machine. The effect of whirl at impeller entrance and the pressure and velocity in it and in the casing are noticed, and the theory is given in such general form as to make it apply to axial flow impellers as well as those of low specific speed. A chapter has been devoted to "Specific Speed and Design Constants" in which the terms "unit speed" and "unit capacity" appear as in the turbine. This chapter contains a number of useful practical diagrams which relate the efficiency and the impeller dimensions to the specific speed. It is assumed that the author's twenty years experience with one of the best Pacific Coast pump builders, as well as that in his present connection, establishes the reliability of the curves and coefficients given. A brief discussion on the effect of turning down the impeller is helpful.

There is a complete chapter on the detailed method of laying out impeller vanes, a complicated matter with low specific speed pumps, and requiring much experience. Considerable attention has been given to the casing and the diffusion ring and to the radial thrust, and pressures produced in the former. In the discussion on axial flow pumps the aerofoil method of attack has been described.

In Chapter IX hydraulic losses and pump efficiency are treated in some detail but one of the most interesting features of the chapter, and indeed of the whole book, is a diagram devised by the author for determining the principal dimensions of a single suction water pump to fulfil given specified conditions of speed, head and discharge and for a selected exit vane angle. Since the diagram is the result of experience it should be reliable. Axial and radial thrust have been discussed in some detail and individual chapters have been given to Cavitation and to Shaft Design and Critical Speeds and there are many illustrations and considerable material on the selection and application of pumps.

Professor Emeritus of Mechanical Engineering, University of Toronto, Toronto, Ontario.

Pumping of oils and fluids other than water, have, in the writer's opinion been dealt with rather briefly.

While many of the practical parts of the book can be easily read other parts require careful study. The author has shown a familiarity with his subject that gives one confidence in his treatment and the lists of references at the ends of the chapters are much more complete than is usual, a feature to be especially commended. The book contains much information that will be valuable to designers, operators and purchasers of pumps and at the same time it will be stimulating to those interested in the finer points of the theory of the pump.

BRITISH INTERNATIONAL PLASTICS ANNUAL, 1947:

Croome Hill International Ltd., London, 1947. 459 pp., illus., 10¼ x 8 in., cloth, $15.00.

This book was written to provide engineers with technical data on the grades of materials available to them commercially; on where and how to contact the practical authorities on each type of material; and on the machinery and practice of application of these materials to industry. Its purpose is to furnish a central source of information on every aspect of the plastics industry.

The authors divide plastics into six types: ceramics, bitumens, vitreous materials, resins, botanical (non-resinous) plastics, and synthetic materials. The last is given special consideration in this, the first issue, and each of the others will be singled out in turn in subsequent issues.

The book opens with a short introduction to plastics and goes on to a study of the chemistry of synthetic plastics in its many aspects. In the next section on properties of synthetic plastics, accepted methods of test and their limitations are discussed and analyzed. Other sections give detailed information on fabrication processes, applications of plastics, and notes on physical tests.

In addition to the technical and practical matter contained in the work there are complete indices, not only of the common forms of plastic materials and their properties, but also a list of trade names and generic terms, the mechanical properties of synthetic plastics, the effect of chemicals upon them, and their optical and electrical properties. L.S.

BOOK NOTES

The Institute does not assume responsibility for any statements male; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

BENTLEY'S MACHINE SHOP COMPANION, 11th ed:
Wallace Bentley. London, Bentley, 1947. 181 pp., illus., 6½ x 4¼ in., cloth, 2/6.

This little book is a guide to practical shop work. It treats of turning, capstan lathe work, machine drilling and tapping, milling, planing, shaping and slotting, broaches and broaching, templates, jigs and fixtures, press work, grinding, toothed gearing, gear cutting, rope driving, driving belts, electrical terms, electric driving, screw threads and screwed fittings, keys and shafting, die-casting practice, materials, forging and welding, hardening and tempering, workshop arithmetic, trigonometry, and logarithms.

BRITISH STANDARD FOR ANNEALED STEEL WIRE FOR OIL-HARDENED AND TEMPERED SPRINGS. BS 1429-1948:
London, British Standards Institution, 1948. 2/-.

This British Standard provides for a range of qualities of plain carbon steel and two types of alloy steels, silicon manganese and chromium vanadium, as specified in B.S.970. Included are details of manufacture, details of a test on the rod from which the wire is to be produced, methods of test on the wire, and tolerances. For each steel the chemical composition and acceptance tests are specified.

BRITISH STANDARDS INSTITUTION YEARBOOK, 1947:
London, British Standards Institution, 1947. 3/6.

The yearbook gives a subject index and a synopsis of each of the 1400 British Standards now current. These standards have been prepared by representative committees of fifty different industries. The yearbook includes lists of members of the General Council, the Divisional Councils and the Industry Committee of the Institution as well as other useful information about its work.

GROWTH OF PHYSICAL SCIENCE:

Sir James Jeans. Cambridge, the University Press, Toronto, Macmillan, 1947. 364 pp., illus., 7¾ x 5½ in., cloth, $3.50.

This is a history describing the main lines of advance of physical science, including astronomy and mathematics, in language non-technical enough to be understood by readers who have no scientific attainments or knowledge. The author covers the history of science in its beginnings in Babylonia, Egypt, Phoenicia, and Greece; he treats of science in Alexandria and science in the Middle Ages in Islam; he describes the dawn of western science; and he traces the growth of science to the present day of modern physics. In this latter part he discusses the theory of relativity, the electrical structure of matter, the quantum theory, and astrophysics and observational astronomy.

INDUSTRIAL ELECTRICAL INSTRUMENTS:

G. W. Stubbings. Manchester, Emmott, 1947. 22 pp., illus., 7¼ x 4¾ in., paper, 1/6. (Mechanical World Monographs No. 13).

This pamphlet is a guide to the different types of industrial electrical instruments. The author divides these into two main classes: indicating and graphic instruments, and integrating instruments or meters. Included are ammeters and voltmeters, current transformers, insulation test sets, meters, sub-meters for works costing, and field tests of three-phase consumption.

INTERNATIONAL CIVIL AVIATION ORGANIZATION. SURVEY ON OWNERSHIP OF AIRLINES, as at November 30th, 1947:

International Civil Aviation Organization, Montreal, 1948. illus., 10½ x 8 in., paper, 75c. (Doc 4954-AT/633).

This is a survey of the ownership of international airlines, and covers practically all scheduled airlines of the world as of November 30th, 1947. The first part contains information on ownership of airlines, country by country, in alphabetical order, and the second part presents in summarized form information on the main airline systems of the world.

ISOMETRIC DRAWING EXPLAINED:

G. H. Pearson. London, Bentley, 1947. 38 pp., illus., 7½ x 5 in., paper, 2/-.

An isometric drawing enables us to have more than one plane presented to our vision at a time. It is an aid to the clearer visualization of a complete assembly or component, and it offers a more easily assimilated alternative to orthographic illustration. Its greatest sphere of usefulness lies in drawings destined for illustrating technical articles, and in catalogue work, since it brings better understanding and interpretation to those hitherto unaccustomed to reading drawings.

APRIL JOURNALS NEEDED

A previous request for the return to Headquarters of used copies of the April, 1948, issue of the Journal, did not result in an adequate supply.

If you do not file your April copy, will you please send it to:—

The Library,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal.

Additional copies will then be available at Headquarters for future reference.

STRUCTURAL ANALYSIS; THE SOLUTION OF STATICALLY INDETERMINATE STRUCTURES:

W. Fisher Cassie. London, Toronto, Longmans Green, 1947. 260 pp., illus., 9 x 5¾ in., cloth, $4.48.

In this text book on the principle of least work and its application to determining the stresses in a structure containing superfluous bars, the author has brought together applications of the general principles of statically indeterminate structures and their illustration by worked solutions. He has worked out numerous examples showing the practical application of theory to problem in logical sequence and with ample detail.

TABLES OF PHYSICAL AND CHEMICAL CONSTANTS AND SOME MATHEMATICAL FUNCTIONS, 9th ed:

G. W. C. Kaye and T. H. Laby. London, Toronto, Longmans Green, 1941. 181 pp., illus., 9¾ x 6½ in., cloth, $5.50.

This is an up-to-date edition of a book first published in 1911 of English physical and chemical tables, definitions and explanations. The subjects dealt with are atomic weights, units, general physics and astronomy, heat, sound, light, including spectroscopy, electricity and magnetism, x-rays, atoms, and ions, chemistry and geology, mathematical tables, and isotopes. There are bibliographies in many of the sections.

UNIVERSAL DECIMAL CLASSIFICATION, ABRIDGED ENGLISH EDITION. BS 1000A:1948:

London, British Standards Institution, 1948. 25/-.

This is the first abridgement of the full Universal Decimal Classification to be published in English, and is intended for use in libraries or private collections where detailed sub-divisions of subjects is not required, or in special libraries using the full classification in a given subject but requiring an abridged classification for other fields. The complete fourth edition in English is being published section by section.

VERTICAL BOILER DEFECTS AND REPAIRS:

Sydney D. Scorer. London, John D. Troup, 1947. 40 pp., illus., 9 x 6 in., paper, 5/6.

This pamphlet, reprinted from the Steam Engineer (London), January-July 1947, contains a series of articles dealing with vertical boiler maintenance. It treats of such subjects as the strength of shells, furnaces and endplates; vertical cross-tube boilers; firebox crown-plate corrosion; uptake connection defects and repairs; ashpit corrosion in crane boilers; corrosion of upper tube-plates in multitubular boilers; repairing tube-plates on horizontal multitubular boilers; and furnace tables for easy calculation of safe working pressure.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

ANNUAL REPORT ON THE PROGRESS OF RUBBER TECHNOLOGY, Vol. X, 1946.

Edited by T. J. Drakeley; published by W. Heffer & Sons Ltd., Cambridge, England, for the Institution of the Rubber Industry, 12 Whitehall, London, S.W.1, England. 129 pp., tables, 9½ x 7 in., paper, 12s.6d. to non-members; 4s.6d. to members.

Following a historical and statistical review are papers on natural and synthetic rubber. Testing equipment and processing are next discussed, followed by papers on the applications of rubber. An extensive reference list accompanies each paper. Officers and members of the Council of the Institution of the Rubber Industry are listed. There is a complete name index to both papers and references.

AUTOMATIC REGULATION, Vol. I.

W. R. Ahrendt and J. F. Taplin; preliminary edition, published and distributed by Ahrendt and Taplin, Post Office Box 4673, Washington 20, D.C., 1947. 171 pp. plus Appendices A-D, illus., diagrs., charts, tables, 8¾ x 5¾ in., cloth, $3.50.

Following a brief introductory chapter, the mathematical background is established. Differential equations and the Laplace transformation are discussed in their application to properties of closed causal loops. There is an adaptation of the methods of Fourier through frequency spectrum analysis, and the analysis of multi-loop systems is undertaken. Mechanical and electrical details of regulator design are not considered, because the practical aspects are to be covered in another volume. A bibliography, problems and a glossary complete the book.

BASIC ENGINEERING DRAWING.

H. D. Orth, R. R. Worsencroft and H. B. Doke. Irwin-Farnham Publishing Company, Chicago, Ill., 1946. 346 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50.

PROBLEMS IN BASIC ENGINEERING DRAWING.

H. D. Orth, R. R. Worsencroft and H. B. Doke. Same publisher, 1946. no pagination, diagrs., tables, 11 x 9¼ in., stiff paper, spiral binding, $2.50.

The object of this text is to present the fundamentals of the subject in a logical sequence that will properly develop both the theory and the necessary manual skill. The early chapters cover instruments and materials, the basic methods of representation, lettering, and technical sketching. Succeeding chapters deal with instrumental drawing methods, tracing, geometrical constructions, dimensioning, graphs and charts, and the detailed representation of machine parts and instructions as for working drawings. A large group of drafting problems together with complemental problems in theory is contained in a separate work book.

CHAMBERS'S MINERALOGICAL DICTIONARY WITH FORTY PLATES OF COLOURED ILLUSTRATIONS.

Chemical Publishing Co., Inc., Brooklyn, New York, 1948. 47 pp., 8¼ x 5¼ in., cloth, $4.75.

Over 1400 mineralogical terms are given in this dictionary, listing briefly the chemical composition, cyrstal form and occurrences of the minerals included. Chemical and physical properties are given for the elements and certain other items. Some two hundred minerals are shown in their original colours.

ELECTRETS.

T. A. Dickinson. Plastics Research Co., Box 346, Alhambra, California, 1948. 32 pp., diagrs., charts, tables, 5½ x 4 in., fabrikoid, $2.50.

Written for engineers and technicians, this little book is devoted to methods of rearranging atoms in non-metallic materials so as to produce electrical equivalents of permanent magnets. History and theory are presented as well as potential applications. There is a bibliography of periodical articles on the subject, and pertinent books and magazines are listed.

F-M TRANSMISSION AND RECEPTION.

J. F. Rider and S. D. Uslan. John F. Rider Publisher, Inc., 404 Fourth Ave., New York, 1948. 409 pp., illus., diagrs., charts, tables, 8¼ x 5½ in., paper, $2.70.

The first half of this comprehensive work presents the underlying theory of f-m and indirect f-m (p-m), discusses the propagation of f-m signals and the basic characteristics of f-m transmitters, and presents an analysis of transmitters in use today. The second part deals with f-m receiving antennas and the f-m receivers. Four currently used types of f-m detector are covered in detail. The last two chapters describe the alignment and servicing of receivers. There is a bibliography.

FREQUENCY MODULATION, Vol. I.

Edited by A. N. Goldsmith and others, January, 1948. RCA Review, Radio Corporation of America, RCA Laboratories Division, Princeton, New Jersey, 1948. 515 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $2.50 plus $0.20 postage.

In this volume are brought together papers from various technical periodicals for the years 1936-1947. It is divided into four parts dealing with general information, transmission, reception, and miscellaneous subjects. Some papers are reprinted in full, others in summary form. Appendixes contain a frequency modulation bibliography and a list of papers dealing with F-M station placement and field survey techniques.

INFLUENCE LINES, THEIR PRACTICAL USE IN BRIDGE CALCULATION.

D. S. Stewart. 2nd ed. Constable & Company, London, W.C.2, Longmans Green, Toronto, 1947. 209 pp., diagrs., charts, tobles, 8¾ x 5½ in., cloth, 12s.6d.

Beginning with reaction and shear influence lines in simple beams, the author proceeds to deal with the analysis of various trusses and other bridge members, ending with material on bridge loadings and impact. Selected practical applications have been worked out in full for several types of structures. Although all necessary calculations are included, the mathematics has been kept as simple as possible. The use of graphical integration is demonstrated in the last chapter.

INVENTIONS, PATENTS AND MONOPOLY.

P. Meinhardt, with a foreword by J. Mould. Stevens & Sons, Ltd., London, 1946. 352 pp., tables, 8¾ x 5½ in., cloth, 25s.

Containing concise information concerning British patent law practice and procedure, this volume is divided into four parts. Part I is concerned with the characteristics of inventors and inventions; Part II, the major portion of the volume, with a concise description of the law and practice. Characteristics of a patentable invention, patent application procedure, grant of patents, maintenance of patents, and other topics are discussed. Part III is concerned with abuse of patent monopoly; and Part IV with suggestions for reform.

LAW FOR ENGINEERS AND ARCHITECTS.

L. P. Simpson and E. R. Dillavou. 3 ed. by L. P. Simpson. West Publishing Co., St. Paul, Minn., 1946. 855 pp., 9¼ x 5¾ in., cloth, $6.00 (in Conoda).

The method of presentation used in this text is to state the fundamental principles of law in those branches which bear most directly upon the engineering profession and to illustrate these principles, where space permits, with cases in which an engineer, builder, architect, or owner are involved as parties. In the new edition some 70 cases have been added, most of which were decided after 1941. Particular emphasis has been given to the law of contracts with separate chapters devoted to its various elements. Standard forms of contracts and agreements are appended.

LOCOMOTIVE CYCLOPEDIA OF AMERICAN PRACTICE 1947, 13th ed.

Edited by R. V. Wright and R. C. Augur. Simmons-Boardman Publishing Corporation, 1947. 1418 pp., illus., diagrs., charts, tables, 11¾ x 8 in., cloth, $8.00.

This standard reference book presents the latest practices in American locomotive building. It contains a dictionary of terms and data on steam, electric and Diesel-electric locomotives for industrial and export purposes. Different parts and accessories are described in detail, locomotive maintenance and operation are thoroughly covered, and an index to trade names is provided. New features are a bibliography of the literature on locomotive shop and engine terminal layout, operation and practices, and material on recent applications of Diesel engines. Over 4000 photographs and dimensional sketches illustrate the text.

NATIONAL PAINT DICTIONARY.

J. R. Stewart, E. F. Hickson and R. B. Seymour. 3rd ed. Stewart Research Laboratory, P.O. Box No. 173, Benjamin Franklin Station, Washington, D.C., 1948. 704 pp., illus., diagrs., charts, maps, tables, 9¼ x 6 in., cloth, $7.50.

This book provides practical information of interest to manufacturers, distributors, and industrial consumers of protective and decorative coatings. Old terms omitted from previous editions have been added as well as the new terms developed during the war. Errors have been corrected and the style and format altered. The definitions are direct quotations from men in the industry. The terms cover industrial raw materials, trade names, processes and methods, scientific testing instruments, and various properties of paints, such as colours, textures, etc.

PRINCIPLES OF TILE ENGINEERING, HANDBOOK OF DESIGN.

H. C. Plummer and E. F. Wanner. Structural Clay Products Institute, Washington 6, D.C., 1947. 453 pp., illus., diagrs., charts, tables, fabrikoid, $4.50.

Chapter 1 of this manual covers the manufacture, classification and properties of structural clay tile. Succeeding chapters deal with the design, construction and properties of structural tile walls, floors and roofs. Information is also given on tile masonry details, mortar, foundations, fireproofing and furring. Estimating tables and standard specifications are appended.

TORQUE CONVERTERS OR TRANSMISSIONS.

P. M. Heldt, 3 ed. P. M. Heldt, Nyack, New York, 1947. 438 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $6.00.

Of interest to designing engineers and those whose duties include the inspection, testing, servicing and repairing of automotive transmissions, this book covers the various types in use today. New developments are discussed in the chapters on hydro-kinetic torque converters, and automatic stepped transmission. Additional material explains more fully the operating principle of inertia-type transmissions. Errors of earlier editions are corrected and new illustrations added.

Although not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

INDUSTRIAL ELECTRIC CONTROL.

E. S. Lincoln. Essential Books, Duell, Sloan and Pearce, New York, 1945. 374 pp., illus., diagrs., charts, tables 8¼ x 5¼ in., cloth, $3.00.

This book provides a manual for the study of the control equipment by means of which the basic voltage of all electrical apparatus is regulated. The fundamentals of control by resistance, reactance, switching and electronic means are described in a simple, straightforward manner. Following the description of equipment available, examples are given for the use of each device in different processes. Over 200 diagrams and photographs are used to illustrate the text material.

INTRODUCTORY PHYSICAL METALLURGY.

C. W. Mason. American Society for Metals, 7301 Euclid Ave., Cleveland, 3 Ohio, 1947. 134 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.00.

Composed of lectures given at the 1947 National Metal Congress, this volume discusses the following phases of physical metallurgy: metal crystals; alloys as solid solutions; the working and annealing of metals; the unmixing of solid and liquid solutions; solid solution in brasses and bronzes; transformations and heat treatments of iron and steel; and corrosion. All discussions are principally in general terms for the encouragement of the student.

MEASUREMENT OF COLOUR.

W. D. Wright. Adam Hilger Ltd., London, N.W.1, 1944. 223 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, 30s. (obtainable from Jarrell-Ash Co., 165 Newbury St., Boston, Mass., $9.75 plus postage).

Giving a comprehensive but concise account of the principles and methods of colour measurement and specification, this volume also describes visual and photo-electric instruments, as well as the relation of colour physics to many technical processes. The principles, methods and applications of the fundamental trichromatic system of colour measurement are described.

Mechanical World Monographs No. 26, ENGINEERING RADIOGRAPHY. 57 pp.
Mechanical World Monographs, No. 29, COSTING IN THE ENGINEERING INDUSTRY, by F. R. Coody, 62 pp.

Emmott & Co., Ltd., Manchester, England, 1946. illus., diagrs., charts, tables, 7¼ x 5 in., paper, 2s.6d. each.

No. 26. Discusses fundamental principles of radiography and the requirements of X-ray equipment. Describes the operation of X-ray plant and explains the apparatus, characteristics and technique of gamma-ray radiography and crystal analysis. The last chapter covers various applications, both of simple penetration for the detection of flaws and of diffraction methods.

No. 29. Covers cost systems generally, with additional information such as coding of materials and equipment, wage incentives, and mechanical accounting.

STRENGTH OF MATERIALS.

J. Marin. The Macmillan Company, New York, Toronto, 1948. 464 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $4.75.

Written as a text for a beginning college course, this book coordinates mechanical properties under various types of static stress, analysis of stresses, and design of simple machine and structural members. Arranged in four parts, Part I deals with simple stresses, Part II with combined stresses, and Part III with statically indeterminate stresses. Special topics are considered in Part IV, and an appendix treats centroids and moments of inertia of plane areas. Tables of physical properties and design stresses for common engineering materials are included.

STORY OF THE ENGINEERS, 1800-1945.

J. D. Jefferys. Lawrence & Wishart Ltd., 81 Chancery Lane, London, W.C.2, 1946. 301 pp., illus., tables, 8¾ x 5½ in., cloth, 10s.6d.

This book, essentially a history of the Amalgamated Engineering Union in Great Britain, describes the development of the engineering trades from the beginnings of the Industrial Revolution to the present time and the efforts of the skilled workmen to better their wages and conditions of work by the trade union system. The industrial relations aspects are emphasized, and the activities of the Union, of smaller groups, and of individuals are discussed in considerable detail.

TELECASTING AND COLOUR.

K. S. Tyler. Harcourt, Brace & Co., New York, 1946. 213 pp., illus., diagrs., 8½ x 5½ in., cloth, $2.75.

Each step of a program from its inception in the studio to its appearance on the television receivers is explained in simple language. Information is given on black and white television, color television, and a new system of transmission called pulse time modulation, a method of transmitting sound and picture together. The necessary equipment is described in detail, and there is a discussion of the duties of the operating personnel in studios and control room. A short bibliography is appended.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Hamilton

I. M. Macdonald, jr.e.i.c.
Secretary-Treasurer

L. C. Galloway, jr.e.i.c.
Branch News Editor

The Hamilton branch of the Institute held its last meeting of the 1947-48 winter season on Thursday, April 22 in the Westinghouse Auditorium in conjunction with the Toronto branch of the American Institute of Electrical Engineers. One hundred and seventy-five guests and members of the two associations attended the joint meeting.

Chairman T. C. D. Churchill of the A.I.E.E. opened the meeting and turned the chair over to A. E. Tuck of the E.I.C. The chief engineer of the Canadian Westinghouse Company, A. A. Moline, then introduced the speaker of the evening, A. W. Hill, manager of circuit-breaker engineering at the Westinghouse Electric Corporation, Pittsburgh, Pa. Mr. Hill spoke on **Ten Million KVA Circuit Breaker Engineering.**

Mr. Hill described the development of the modern circuit-breaker, illustrating his description with slides. He pointed out that 20 years ago, circuit-breakers were tested with laboratory generators which developed momentary short-circuit currents comparable to those met in the field. At the present time, however, it is not practical to carry out such tests with laboratory equipment. For example, it is possible, by switching arrangement for the 18 generators at the Grand Coulee power project to develop as much as 10 million k.v.a.

Circuit-breakers capable of interrupting short-circuits of this order have recently been built and Mr. Hill described the method of testing them and the results obtained.

At the conclusion of his address Mr. Hill responded to a brisk question period sponsored by his appreciative audience.

Montreal
Junior Section

Though the activities of the Section are at a standstill during the summer months, the Executive Council is busy preparing the programme for the 1948-49 season. Already subjects and speakers have been agreed upon. These will be announced in a later issue of the *Journal* but below are presented the main features of the Fall Session Programme.

October 4th—Opening meeting. Presentation of the programme of the year of the Group Study on "Public Speaking". At that meeting members of the Council will elaborate on "Effective Speaking", and on its value to junior engineers.

November 15th—Students Night and Film Night. Last year's success of the students Night has led the Executive Council to repeat this meeting devoted especially to student members. All students interested in participating in the evening's programme are asked to forward their names and essays to John D. McPherson, 2050 Mansfield St., Montreal.

November 19th—Annual Dance. This will be the Junior Section Fourth Annual Dance. This dance promises to be a great event again this year. Be sure to reserve your tickets well in advance, otherwise you may be disappointed as some people were last year.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield St., Montreal—Telephone BElair 3019—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER for technical department of pulp and paper firm in the St. Maurice Valley. Applicant must have supervisory capacity and also be able to undertake investigational work involving the coordination of laboratory experiments and mill operations. Salary open. Apply to File No. 4130-V.

CIVIL

CIVIL ENGINEER required by a Montreal firm for field inspection in Ontario and North Shore St. Lawrence. Salary open. Apply to File No. 4084-V.

CIVIL ENGINEER around 30 years of age required as Assistant City Engineer of small city in Province of Quebec. General duties eventually to replace City Manager. Salary $3,000 to $3,600 according to qualifications. Apply to File No. 4144-V.

CIVIL ENGINEER, qualified to take charge of all town services including water and electric (distribution system) utilities required by a Town in Nova Scotia. Population 4,000. Salary open. Apply to File No. 4147-V.

CIVIL ENGINEERS required in Eastern Ontario for employment as designers of service systems for housing and other building projects. Preferably men with at least 10 years' experience in that line. Salary according to qualifications. Apply to File No. 4156-V.

CIVIL ENGINEER recent graduate with up to one year's experience since graduation. Preferably single man. Required by Northern Ontario Paper Mill. Salary around $250. Apply to File No 4158-V.

ELECTRICAL

GRADUATE ELECTRICAL ENGINEER required for position with large Northern Ontario Paper Mill. Preferably man with some paper mill or other industrial experience. Salary commensurate with qualifications and experience Apply stating experience and qualifications. Apply to File No. 4032-V.

ELECTRICAL DESIGNING DRAUGHTSMEN for work with a firm of consulting engineers in Southern Ontario. Must be experienced. Salary up to $300 Apply to File No. 4133-V.

ELECTRICAL ENGINEER required for Toronto area for engineering and design of power transformers. Salary will be commensurate with ability and experience. Apply to File No. 4141-V.

ELECTRICAL ENGINEER required as Senior Transformer Draughtsman by Canadian Company in Ontario. Must be experienced in layout and design of high voltage power transformers also capable of assuming responsibility. Salary open. Apply to File No. 4146-V.

MECHANICAL

MECHANICAL ENGINEER required as Plant Engineer by large Pulp and Paper Mill. Must have paper mill engineering experience. Permanent position. Salary between $475 to $550 depending on experience. Apply to File No. 4132-V.

MECHANICAL ENGINEER required for work in Alberta by a consulting engineer in Montreal. Duties include supervision of mining machinery. Salary up to $5,000. Apply to File No. 4134-V.

MECHANICAL ENGINEER with at least 5 years experience in heavy industry preferably rolling mill required in Montreal for design, preparation of estimates, etc. Salary $300 to $350. Apply to File No. 4139-V.

MECHANICAL ENGINEER, around 35 years of age required as Assistant to Project Engineer on construction of large pulp plant. Experience in design and piping essential. Duties in Montreal and British Columbia. Salary $5,000 to $6,000. Apply to File No. 4149-V.

MECHANICAL ENGINEER recent graduate required in Engineering and Servicing Department of Canadian Firm with Headquarters in Montreal. Duties include service work in connection with Railway, Pulp Mill and other Industrial Products. Salary open. Apply to File No. 4150-V.

MECHANICAL ENGINEER with 1 to 3 years experience in production required as Industrial Engineer by industrial and chemical organization with headquarters in Montreal. Duties include responsibility for conducting methods engineering studies using techniques of process charts, time and motion study. Salary open. Apply to File No. 4152-V.

MECHANICAL ENGINEER with 2 or 3 years experience, preferably bilingual, required as Mechanical Development Engineer by industrial and chemical organization with headquarters in Montreal. Duties will be conducting investigations on existing equipment and a certain amount of plant layout work and draughting. Salary open. Apply to File No. 4155-V.

MISCELLANEOUS

GRADUATE ENGINEERS required as Assistant Professors, Lecturers and Demonstrators in Civil, Electrical and Mechanical Engineering by a Canadian University. Salaries dependent on experience and general qualifications. Apply to File No. 4127-V.

JUNIOR ENGINEERS required as assistant engineers on construction work at Saint John Harbour. Salary $200 to $250 depending on training and experience. Apply to File No. 4131-V.

MECHANICAL OR CIVIL ENGINEER with shop experience required in Montreal. Duties include design on railway equipment. Salary open. Apply to File No. 4135-V.

SALES ENGINEER required by prominent distributor of heavy equipment for forestry, road building and construction industries. Head office in Montreal. Working knowledge of French and executive ability necessary. Salary open. Apply to File No. 4140-V.

GRADUATE ENGINEER with engineering and sales experience required as a Street Lighting Specialist in Toronto area. Position involves direct sales engineering with municipalities and utilities also engineering and production problems directly concerned with the manufacture of street lighting equipment. Age under 35 years. Salary open. Apply to File No. 4141-V.

HEATING AND VENTILATING ENGINEER with considerable experience in mechanical equipment for buildings is wanted for office work on heating, ventilating and air conditioning by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 4142-V.

MAINTENANCE ENGINEER, under 30 years of age, required by Public Institution for Montreal area. Duties include maintenance of buildings, heating plants, electric services, etc. Salary open. Apply to File No. 4143-V.

TOWN ENGINEER required for town in Nova Scotia. Applicant must be qualified to take charge of all town services including electric (distribution system) and water utilities. Salary open. Apply to File No. 4145-V.

MECHANICAL OR CHEMICAL ENGINEER with Masters' or Doctors' degree and several years' experience in industrial or University research work required to head the Engineering Development Section of the National Research Council, Atomic Energy Project. Salary open. Apply to File No. 4148-V.

GRADUATE ENGINEER age 32 up, preferably bilingual and with 10 years experience in industrial design required by chemical organization with headquarters in Montreal. Duties include supervision of works design department supply draughting and design service for plant, prepare appropriation requests, maintain cost estimating units etc. Salary open. Apply to File 4153-V.

MECHANICAL ELECTRICAL OR CIVIL ENGINEER, age 23-30, preferably single and bilingual with some experience in maintenance required by an industrial and chemical organization with headquarters in Montreal. Duties include construction project and design studies. Salary open. Apply to File No. 4154-V.

ENGINEER required in Montreal. Applicant should have railroad construction experience and a knowledge of welding technique also the ability to organize and carry out special track construction jobs. Salary open. Apply to File No. 4157-V.

CIVIL OR STRUCTURAL ENGINEER, 24 to 35 years, required for Northern Ontario Paper Mill. At least four years experience, 2 of which should be on construction and 2 on design. Opportunity to train junior personnel. Salary not less than $400.00. Apply to File No. 4158-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMIAL ENGINEER OR CHEMIST, preferably with Ph. D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Tecnical and Development Department. Several years experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

SENIOR CHEMICAL ENGINEER OR CHEMIST, required by leading Paper Manufacturer in Eastern Canada. Applicant should have some experience in Paper Mill Control work. This position offers plenty of scope for advancement. Salary open. Apply to File No. 4013-V.

CHEMICAL ENGINEER required by a major Canadian Company located in Toronto as Technical Service Man. 25 to 35 years old. Definite sales personality. Position will include 6 to 12 months' training. It will carry the responsibility for servicing all types of adhesives to industries throughout Canada. Salary open. Apply to File No. 4044-V.

GRADUATE CHEMICAL ENGINEERS OR CHEMISTS required by an industrial chemical plant in the Montreal area. Preferably with experience in production and the operation of chemical equipment such as filters, presses, etc. Must be able to organize work and direct workmen. Salary $200. up. Apply to File No. 4071-V.

CHEMICAL ENGINEER age 25 to 35 years, experience in the Pulp and Paper industry, preferably Kraft, required by paper manufacturer in Eastern Ontario for position of Control Superintendent. Salary according to qualifications. Apply to File No. 4099-V.

CHEMICAL ENGINEER for work in the Development Department of a large chemical manufacturing company involving chemical engineering design, preparation of mass and descriptive flow sheets, specification of equipment, comparison of processes, pilot plant liaison work. Must have had from three to five years in chemical plant engineering, maintenance or operation, in order of decreasing preference. Must be able to co-operate well with other departments in the Company. Work would be in Montreal. Salary open. Apply to File No. 4119-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary $2,400 per annum for the first three months, $2,700 after 3 months and $3,000 after 12 months. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years experience in design of reinforced concrete and structural steel. Salary $250-300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsman in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Salary open. Apply to File No. 3884-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewage Dept., Works Dept., also construction of a general nature for the Electric Light Dept. Salary open. Apply to File No. 3930-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEER with at least two years experience required in a Pulp and Paper Mill in the Province of Quebec for surveying and general paper mill engineering and draughting. Salary $250 to $300. Apply to File No 4094-V.

CIVIL ENGINEER required for consulting engineer and surveyors' office in Montreal. Work includes surveying, topographical draughting, preparation of designs and plans of engineering work, etc. Must be bilingual. Salary according to experience with future depending on ability. Apply to File No. 4105-V.

CIVIL ENGINEER, thoroughly experienced and competent in structural design required by an established firm of consulting engineers in Toronto. Applications are invited from engineers with high qualifications and references. Salary open. Apply to File No. 4112-V.

CIVIL ENGINEER age 25 to 35 with experience in structural design required by an established firm of consulting engineers in Toronto. Opportunity for progressing in this work under proper supervision. Salary will be relative to experience and ability. Apply to File No. 4112-V.

ELECTRICAL

ELECTRICAL ENGINEER, recent graduate up required by a manufacturer in Montreal for sales engineering. Must be bilingual and familiar with rotating electrical equipment. Salary $200 up. Apply to File No. 3761-V.

GRADUATE ELECTRICAL ENGINEERS, with 3 to 10 years experience in design, operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced, bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEERS with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN for the design and layout of industrial power and control systems required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

ELECTRICAL ENGINEERS required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery design, lab., etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

ELECTRICAL ENGINEERS, age 30 to 40 required for the Commercial and Distribution Department of large Hydro Electric Utility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

ELECTRICAL ENGINEER, experienced in Power Station Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Salary open. Apply to File No. 4024-V.

JUNIOR ELECTRICAL ENGINEER required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

GRADUATE ELECTRICAL ENGINEER with a minimum of 2 years practical experience to assist in electrical engineering design work, field work on construction and maintenance of structures, service and installation of equipment required by Manitoba City. Salary $226. to $257. Apply to File No. 4069-V.

ELECTRICAL ENGINEER required by company in Shawinigan Falls, Quebec. Vacancies exist for first class electrical engineer capable of taking entire charge of electrical department also electrical engineer for work as assistant plant engineer. Salary open. Apply to File No. 4106-V.

EXPERIENCED ELECTRICAL ENGINEERS required by consulting engineering office in Montreal as Assistant Engineers, Designers, Checkers, Draughtsmen and Quantity Estimator. Salaries open. Apply to File No. 4110-V.

ELECTRICAL ENGINEER, age 30-40, required as Sales Engineer for Electrical Power Apparatus Company, manufacturing motors, transformers, rectifiers, switchgear, etc. Test course graduate specializing in switchgear preferred. Sales experience desirable but not essential. Location Toronto. Salary open. Apply to File No. 4128-V.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience are required for armament research and development in the Quebec area in a government establishment. Salary from $190.00. Apply to File No. 3401-V.

MECHANICAL ENGINEERS required by a Pulp and Paper Company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

RECENT GRADUATES OR JUNIOR ENGINEERS with mechanical background required by a Montreal Engineering fabricating and contracting firm, for training purposes leading to sales and service. Montreal area. Salary $175. up. Apply to File No. 3810-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with knowledge of physical metallurgy heat treatment, ability in stress analysis and design required for research work in B.C. Maximum salary $4,000. Apply to File No. 3865-V.

MECHANICAL ENGINEER age 30-38 required for Northern Ontario Paper Mill, preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in re-inforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3994-V.

MECHANICAL ENGINEER required as assistant in Chief Engineers Department by large paper company. Paper experience essential, some knowledge of the French language would be helpful. Age 28-40. Salary $350-450. Apply to File No. 4022-V.

MECHANICAL ENGINEER required in Ontario by a firm specializing in machine tools. Applicant must be experienced in production control. Salary open. Apply to File No. 4026-V.

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures, etc. Salary $240 up depending upon ability. Apply to File No. 4030-V.

CHIEF ENGINEER, mechanical background required by a specialized industrial plant in the Montreal area. Work covers mechanical design, preparation of work drawings, bills of materials, specifications and the ordering of all materials for contracts, also design of necessary tooling. Minimum salary $450.00. Apply to File No. 4066-V.

MECHANICAL ENGINEERS with experience in estimating or design required by well known general engineering firm in Montreal. Good future for those with right qualifications. Salary commensurate with ability. Apply to File No. 4074-V.

MECHANICAL ENGINEER with experience in the design of hydraulic turbines, valves, penstocks, surge tanks and associated equipment required by large manufacturer in Montreal to participate in expanding program of hydro electric development. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER with minimum of eight years experience in the design of heavy mechanical equipment required by well established firm in Montreal for general supervision and checking. Must be alert and aggressive. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER required in Montreal with considerable experience in machine shop practice and some administrative experience in shop work. Applicant should be around 35 years of age and bilingual. Salary depending on qualifications. Apply to File No. 4100-V.

EXPERIENCED MECHANICAL ENGINEERS required by consulting engineering office in Montreal as Assistant Engineers, Designers, Checkers, Draughtsmen and Quantity Estimator. Salaries open. Apply to File No. 4110-V.

JUNIOR MECHANICAL ENGINEER, age 25 to 27 years, preferably with three to four years experience required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

MECHANICAL ENGINEERS required for manufacturing and related duties with well established reputable paper company. Four to six years general industrial experience required. Salary open. Apply to File No. 4115-V.

MECHANICAL ENGINEER with two or more years experience in machine shop practice required in Montreal as sales engineer handling cutting oils and other chemicals and oils used in machine shops. Salary open. Apply to File No. 4116-V.

MECHANICAL ENGINEER with at least ten years experience including plant maintenance and preferably in the pulp and paper industry required in New Brunswick. Salary open. Apply to File No. 4117-V.

MECHANICAL ENGINEER for work in the Development Department of a large chemical manufacturing company involving chemical engineering design, preparation of mass and descriptive flow sheets, specification of equipment, comparison of processes, pilot plant liaison work. Must have had three to five years in chemical plant engineering, maintenance or operation, in order of decreasing preference. Must be able to co-operate well with other departments in the Company. Work would be in Montreal. Salary open. Apply to File No. 4119-V.

MECHANICAL ENGINEER preferably with two or three years general plant experience required as production engineer by National Beverage Company in Eastern Canada. Salary open. Apply to File No. 4122-V.

MECHANICAL ENGINEER or other engineer with equivalent draughting training, for position of assistant plant manager of a granite plant 25 miles south of Montreal. Applicant should be 28 to 34 years old with one or two years business experience. Position offers prompt promotion for a capable man as present manager must take over new duties in two to five years. Starting salary about $275.00 per month with regular annual increases. Apply to File No. 4126-V.

MECHANICAL ENGINEER required for a Western industry engaged in the manufacturer of truck bodies and trailers, overhaul and repair of industrial engines and construction equipment, repair and maintenance of R.C.A.F. and civilian aircraft. Service as an Engineering Officer in the R.C.A.F. during the war will be an advantage. An excellent opportunity is offered to the right man. Apply to File No. 4129-V.

MECHANICAL ENGINEER with knowledge of design and considerable experience with steam and diesel engines and refrigeration equipment. Required in Montreal. Preferably bilingual. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4137-V.

MECHANICAL ENGINEER OR DRAUGHTSMAN with minimum of four or five years experience. Knowledge of paper mill engineering desirable but not essential. Required by large Pulp and Paper Mill for general engineering design and draughting. Salary up to $400. depending on qualifications. Apply to File No. 4138-V.

METALLURGICAL

RECENT GRADUATES in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

METALLURGICAL ENGINEER required by a farm implement manufacturer in Ontario to take over the necessary duties in new mechanized foundry. Salary open. Apply to File No. 4086-V.

MINING

MINING ENGINEERS with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years experience required by a Company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

STRUCTURAL STEEL DRAUGHTSMAN AND CHECKERS, preferably graduate engineers but any experienced man acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

GRADUATE ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted. Apply to File No. 3780-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER wanted for large fabricating plant in Vancouver, B.C. Age between 30 to 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

STRUCTURAL ENGINEER required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

TWO METALLURGICAL ENGINEERS AND ONE CHEMICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training, etc. Salary open. Apply to File No. 3951-V.

CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years experience for key position in moderate size plant in Manitoba, doing fabrication of Plate Work and Light Steel Work, also Grey Iron Foundry and Machine Shop. This will lead to a key position in a growing organization. Salary open. Apply to File No. 4003-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry required in Nfld. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and Paper experience is not necessary. Salary open. Apply to File No. 4009-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred to supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375. U.S. currency. Apply to File No. 4011-V.

ELECTRICAL OR MECHANICAL ENGINEERS required by large Montreal firm to prepare and analyze specifications for telephone equipment manufacturing and installation. Other types of engineering work also available. Salary open. Please send photo together with particulars of education and experience. Apply to File No. 4018-V.

GRADUATE ENGINEER required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential also some sales ability. Salary around $400. Apply to File No. 4021-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships. Good salary, permanent position to the right man. Apply to File No. 4031-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experienced in installations of production and cost control, wage incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

SALES ENGINEER for popular line of Diesel Engines. Applicants must be specialists on Power Units and Generator Sets, required for permanent employment with well established organization. Apply to File No. 4055-V.

GRADUATE ENGINEER, preferably mechanical or electrical background required for drop forging plant operation and production in Province of Ontario by a steel company with headquarters in Ontario. Good commercial sense essential. Salary open. Apply to File No. 4062-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience between 30 and 40 years of age required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

DRAUGHTSMAN preferably with mechanical and structural experience required by engineering firm in Toronto for design of material handling equipment such as belt conveyors also crushing plants and gold mills. Salary $200. to $350. Apply to File No. 4072-V.

POWER STATION OPERATOR with about five years' experience principally in operation and maintenance of turbines and mechanical equipment of hydro-electric plants required by public utility in Brazil. Preferably not over 30 and single but will consider married man without minor dependents. Replies held in strictest confidence. Salary open. Apply to File No. 4073-V.

MECHANICAL OR CIVIL ENGINEER with at least four years experience in stress analysis and Vibration required by one of Canada's leading manufacturers of heavy mechanical equipment. Considerable scope for man of proper qualifications. Salary open. Apply to File No. 4074-V.

SALES ENGINEER required by well known engineering supply company doing business with Mining and Pulp and Paper companies. Excellent opportunity for advancement. Travelling not extensive. No experience necessary but desirable. Salary open. Apply to File No. 4079-V.

TOWN ENGINEER required by town in Ontario. Duties include the supervision of Board of Works and Sanitation Departments as well as acting in an advisory capacity to the telephone, electric and water utilities. Salary from $250. to $300. Apply to File No. 4087-V.

RECENT GRADUATE MECHANICAL OR ELECTRICAL background required by engineering firm in Montreal. Duties include training in Public Utility in Administration Department. Eventually for South America. Salary to start $225. Apply to File No. 4089-V.

SALES ENGINEER preferably mechanical graduate, required for sales engineering work on blowers and vacuum pumps. Compressed air experience would be advantageous. Location in Montreal. Salary and commission. Apply to File No. 4090-V.

JUNIOR ENGINEER preferably with a few years experience in production control and some knowledge of the textile industry required for Montreal area. Salary $250 to $275. Apply to File No. 4092-V.

SENIOR INDUSTRIAL ENGINEER with business administration and mechanical background, bilingual, with at least five years experience in production control, wage incentives and cost control required by an industrial engineering consultant in Montreal Salary open. Apply to File No. 4092-V.

SENIOR DESIGNER with from five to ten years experience and a general knowledge of structural design in relation to building and bridges required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

JUNIOR ENGINEER with from one to five years experience and at least a working knowledge of structural design of buildings required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

SALES ENGINEER required by large manufacturer of Air Handling equipment in Toronto area. Applicant should have either industrial or Public Building application and sales experience. Salary open. Apply to File No. 4101-V.

SALES ENGINEER required by Canadian Company in Ontario. Must have thorough knowledge of the preparation of tenders, propositions on Transformers, Motors and Switchgear equipment, also experience in the commercial side of the heavy electrical industry. Salary open. Apply to File No. 4102-V.

MAINTENANCE ENGINEER required in Quebec City to do installation work in heating, ventilating, refrigeration and air-conditioning, gas and diesel motors. Must be bilingual. Salary open. Apply to File No. 4104-V.

JUNIOR ENGINEER required in Quebec City. Preferably with three to five years experience in heating, ventilating and air-conditioning. Salary open. Apply to File No. 4104-V.

CONSTRUCTION ENGINEER, recent graduate, required in Montreal for general duties. Salary around $275. Apply to File No. 4107-V.

MECHANICAL OR ELECTRICAL GRADUATE, age about 35 years with experience in building construction machinery maintenance and repair capable of taking over the engineering and maintenance services in a large textile mill in Province of Quebec. Salary open. Apply to File No. 4114-V.

DRAUGHTSMEN with some experience in building design or architectural work required by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

SALES ENGINEERS, one experienced man, also two juniors willing to learn required by an electrical and power house equipment manufacturer in Montreal. Salary open. Apply to File No. 4121-V.

RECENT GRADUATE preferably mechanical or civil background required by Maritime branch of large industrial Canadian firm. Duties of general engineering nature. Salary open. Apply to File No. 4125-V.

Situations Wanted

CIVIL AND MECHANICAL ENGINEER M.E.I.C., age 42, B.Sc. Civil Graduate work in industrial engineering at McGill University. Seventeen years experience in following field: Manufacture of welding rod and hardfacing alloys, installation of incentive bonus system in two of Canada's largest Aircraft Plants. Production planning on the manufacture of shells and shell parts. Design and construction of explosive proving equipment. Superintendent during construction of one of Canada's largest Shell Filling Plants. Other experience covering Oil Refining, Contracting, and installation of Pulp and Paper Mill Equipment. Interested in position with responsible firm or partnership with consultant. Home in Montreal area. Apply to File No. 981-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., Quebec, with more than 20 years experience in design and construction of dams and Power Plants in U.S.A. and Canada. Desire change in position preferably in the construction field. Apply to File No. 1527-W.

ENGINEER, M.E.I.C., with Bachelor and Master Degrees, over twenty years diversified background of experience, interested in post on plant operation, administration, or general management. Service overseas in army. Now employed but available on short notice. Apply to File No. 1645-W.

CIVIL Engineer, M.E.I.C., Prof. Eng., Quebec, age 39, married. Fluently bilingual with a certificate in Municipal Public Works administration. Experienced in Municipal, Highway Engineering, design of sewer and aqueduct, construction and maintenance. Seeks position as executive, Town Engineer, Construction Superintendent, Sales Engineer. Available on short notice. Apply to File No. 1859-W.

PART TIME WORK: Senior Design Engineer, B.A. Sc. P. Eng. M.E.I.C., has available an experienced group of engineers and draughtsmen desirous of obtaining evening work. Experience in the group includes municipal, mechanical, mining and water-power engineering ranging from the initial layout to the final design, as well as structural steel and reinforced concrete design and layout. All members of this group are permanently employed. Apply to File No. 2463-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng. (N.S.), age 39, married, desires position in industrial part of Canada. Eight years experience in Mechanical Department shops and in the mills of large steel company. Five and one-half years Engineer Officer R.C.A.F., rank Wing Commander. Five years Sales Engineering, conveyors, drives, pumps, heavy construction equipment. Particularly interested in Sales Executive or Personnel work carrying responsibility and having a future. Employed at present, but desire to get out of the Maritimes to where there is greater opportunity. One month's notice. Correspondence invited. References. Apply to File No. 2711-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C. Desires part time work during evenings and week-ends. Experience in plant layout, design, estimating, etc. Apply to File No. 2715-W.

CIVIL ENGINEER, S.E.I.C., P.Eng. Interested in part time work. Structural steel, reinforced concrete, or earthwork, estimating, designing and draughting. Apply to File No. 2817-W.

GRADUATE ELECTRICAL ENGINEER, McGill '24, M.E.I.C., Prof Eng., Que.; over 20 years experience in high voltage transmission lines, design and construction. Interested in part time or temporary position in general engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No. 2918-W.

GRADUATE ELECTRICAL ENGINEER, S.E.I.C., Manitoba '47, single, presently employed in electronic research but desirous of entering the industrial or Production engineering field. Preferably in Ontario, or B.C. Experience in maintenance and research. Apply to File No. 2975-W.

Two Industrial Research Engineers

Chemical & Mechanical for Sask. Dept. of Natural Resources

Salary Range $214-$264 per month, including Cost-of-Living Bonus.

Duties: To carry out technical and economic studies of existing and proposed industries to determine industrial opportunities of Saskatchewan.

Qualifications: University graduation in the required engineering field, preferably supplemented with post-graduate studies.

For application forms and further information apply to:

PUBLIC SERVICE COMMISSION
1730 Scarth St., Regina, Sask.

CLOSING DATE FOR RECEIPT OF APPLICATIONS — August 28, 1948.

DRAFTSMEN WANTED

Alberta Firm Requires 3 Structural Draftsmen

One able to check all classes of structures and tanks. Another able to detail all types of structures. A third able to detail light structures and general handling machinery. Must be experienced.

Position permanent if suitable. Please give full particulars of experience and qualifications . . . together with salary expected. Transportation repaid upon completion of six months' satisfactory service.

Apply to File 4167-V

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., B.Sc. 1931. Age 40, married. Requires employment with opportunity for advancement. Have extensive experience in power generation, conversion, plant power distribution, plant design and construction. Also experienced in management and the setting up of new organizations. Available on one month's notice, additional information upon request. Apply to File No. 2976-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc., P.Eng. (Ont.) Age 44, single. Past experience includes administrative, executive and sales engineering in metal products, building materials and sub-contract work in construction industry. Also held responsible position in Personnel Administration. Desires permanent position requiring initiative with good future prospects. Apply to File No. 2983-W.

MECHANICAL ENGINEER (27), B.Sc., A.M.I. Mech. E., in responsible position with world-famous engineering concern in England is willing to emigrate to Canada if suitable opening is found there. Experienced in production development work, production planning and manufacturing methods of wide range of power station plant. With initiative and adaptability for most positions on the production side. Further particulars on request. Apply to File No. 2984-W.

GRADUATE ELECTRICAL ENGINEER, Manitoba, age 36, M.E.I.C., 12 years experience in industrial manufacturing. Married with family. Well grounded training in costs and estimating of machinery, structural, miscellaneous Ironwork and platework. Some experience in sales development and promotion work. Now employed but desires position with progressive firm where opportunity for advancement not restricted either in a similar capacity or position under superintendent. Apply to File No. 2986-W.

ENGINEER, B.Sc. (Honors), McGill '31, M.E.I.C., P. Eng. (Quebec). Married, age 40, 9 years experience in general business field, managing and organization of departments. 8 years mechanical engineering experience primarily in erection and maintenance of equipment in Chemical and Metallurgical field. Last 3 years as Chief Engineer of Cement Plant in South America, reconditioning plant, designing and installing new equipment Perfectly bilingual. (English and French). Working knowledge of Portuguese. Desires position with reliable firm leading to position with a future. Locations preferred are B.C., Montreal District, or Southern Ontario—available on short notice. Apply to File No. 2987-W.

ENGLISH ENGINEER, A.M.I.E.E., 33 years of age, married. Wishing to emigrate requires post where his experience will be of most use. 17 years experience comprising workshop, test, development research on public address and television E.M.I. Co. Field and development engineering, radio navigation aids and radio teleprinter equipment. At present Technical Officer, Air Ministry. Could possibly arrange to visit Canada for interviews if required. Apply to File No. 2994-W.

MECHANICAL ENGINEER, M.A., M.I., Mech.E., wide experience in Vibrations and Balancing presently residing in England, interested in emigrating to Canada if suitable contacts could be arranged. For details of past experience apply to File No. 2995-W.

CIVIL ENGINEER, B.A.Sc., S.E.I.C., veteran, aged 26, experience in surveying, industrial layout and inspection, construction of underground heating system. 1 year design and construction water and sewerage system. Presently employed in Ontario. Apply to File No. 2997-W.

CHEMICAL ENGINEER, B.Sc., Queen's, S.E.I.C., married, veteran. Employed at present. Experience in light metals industry; corrosion testing; production control; spectrographic analysis; desires position in chemical or metallurgical process industry. Available on reasonable notice to present employer. Apply to File No. 2999-W.

Business & Industrial Briefs

A Digest of Information received by The Editor

New Equipment and Developments

The Canadian Liquid Air Company has constructed a new plant at 8615 Stadium Road, Edmonton.

The plant is in full operation. Edmonton was selected as the site of this, the fifteenth Canadian plant of the Company, because of the increasing demand for oxygen and acteylene in the district. Before the erection of the plant, shipments were made from Calgary.

•

In a statement made by the Board of the Canadian Broadcasting Corporation it is stated, " The Board believes that in line with fundamental radio policies laid down by parliament for radio broadcasting, television should be developed in Canada so as to be of benefit to the greatest possible number of people; so that public air channels should be used in the public interest; and with the overall aim of stimulating Canadian national life and not merely of providing a means of broadcasting non-Canadian visual material in this country. The Board will strive for the maximum provision of Canadian television for Canadians."

•

At their exhibit at the Canadian International Trade Fair, Ruston and Hornsby Limited displayed eight diesel engines made at the Ruston and Hornsby plant, Lincoln, and by Davey, Paxman and Company, Ltd., of Colchester. The feature engine on display was Ruston and Hornsby's 80 B.H.P. marine diesel.

The only makers of a complete mining locomotive in the world, according to the Company, Ruston and Hornsby expect good sales in this direction when provincial legislation permits.

On June 17th Imperial Oil, Montreal East refinery, began test operations at one of its four main units. Work on the plant has been under way for the past two years and is now 95% complete.

The units include a 192-foot high fluid catalytic cracking plant or " cat cracker ", the design for which was developed in the U.S. during the war to furnish Allied air forces with high octane gasolines. It is the first of its kind in Canada.

Construction of the " cat cracker " and other units will increase the crude oil running capacity of the refinery by 13,200 barrels to more than 37,000 barrels a day to help meet the unprecedented demands for petroleum products in the province of Quebec.

In addition to the " cat cracker " the new installation includes a light ends recovery plant which prepares refinery feed stock for the manufacture of high octane gasolines, a 13,000 barrel-per-day crude distillation unit and a 4,200 barrel-per-day non-selective catalytic polymerization, or "cat poly" plant. A new water-cooling tower, capable of taking care of 16,000,000 gallons per day has been built. New storage tanks, with a capacity of 2,000,000 barrels have been erected.

•

The Walter Kidde Company of Canada, Ltd., wholly-owned subsidiary of Walter Kidde & Company, Inc., has purchased a new one-storey plant in Montreal, Quebec, basically for the manufacture of carbon dioxide fire protection equipment. The new plant consolidates factory, offices and warehouses, previously located at widely separated points.

Located at 6975 Jeanne Mance Street in a rapidly developing industrial section of the city, the new plant is of reinforced concrete and brick construction. It occupies 8,000 square feet of floor space, and 12,000 square feet of adjacent land has also been purchased for possible future expansion.

A modern sprinkler system and dioxide flooding installation protect production areas, offices, and record vaults from fire. The new plant will be served by the Canadian Pacific Railway.

•

Bucyrus-Erie, South Milwaukee, Wisconsin, has announced a new model in its line of walking draglines. It has been called the 450-W.

The manufacturer claims that it is easily manoeuvred, has great stability and accurate control. It is capable of swinging 8- to 10-cubic yard buckets from 200 to 165 foot booms. Power is supplied by heavy-duty diesel engine. Detailed information may be obtained from the manufacturer.

•

H. M. Turner, president of Canadian General Electric Limited has announced the purchase from War Assets Corporation of a plant at 5781 Notre Dame Street East, Montreal. It will be converted for the manufacture of electrical appliances and employment for 900 people is anticipated when the plant is in full production.

During the war the building was used for the manufacture of tanks. It includes 460,000 square feet of floor space and is of one storey steel construction.

•

Montreal Locomotive Works, Ltd., has received an order for 60 steam locomotives, valued at $7,500,000 from the Indian Government Railways. The locomotives are of the Pacific 4-6-2 type and delivery will begin in February, 1949. Payment will be made in U.S. dollars.

A new lubricator valve that delivers a positive metered amount of oil or grease to each bearing in lubricating systems has just been announced by Titeflex Inc., 738 Frelinghuysen Avenue, Newark 5, N.J.

For further information communicate with the manufacturer.

•

The Bucyrus-Erie Company of South Milwaukee, Wisconsin, has announced that it has acquired ownership of the Milwaukee Hydraulics Corporation, 7923 West Greenfield Ave., Milwaukee.

The Hydraulics Corporation manufactures the Hydro-Crane, a truck-mounted, hydraulically-operated crane. Bucyrus-Erie has acquired the drawings, designs and patent rights from R. O. Billings, who invented the device.

•

A compact, self-contained, d-c arc-welder that may be mounted on a trailer for mobile use, is now available from Canadian General Electric Company.

It is claimed to be ideal for small shop use. It consists of a 200 amp. G-E generator belt driven by a 4-cylinder Wisconsin motor and is mounted as a unit on a welded steel base.

An added convenience is an outlet for the operation of floodlights or standard 110-volt power tools.

•

Leo E. Tutt, Chairman of Directors of the Tutt-Bryant group of Companies, which distribute heavy machinery in Australia, is now touring on this continent. He recently completed a tour of England, Switzerland, Belgium, Denmark, Sweden and Norway.

Mr. Tutt has stated that there is now in progress in Australia a huge expansion programme. Public Works costing about 800 million dollars are to be undertaken and the programme includes roads and bridges, wharves, aerodromes, dams and reservoirs, water, sewerage and drainage schemes, canals and channels, forestry, etc. Mr. Tutt said " much of the work is being carried out in the inland areas and involves the use of great quantities of construction equipment. Since the war years, Australia has become extremely ' mechanically minded ' ".

The Canadian General Electric Company has developed a silicone Anti-Foam Compound to suppress foam in industrial processes.

The compound is a viscous, nontoxic liquid that can be added in concentrated form or as a solution either before or after foaming begins.

In concentrations of from 10 to 1000 parts per million, the compound is valuable in a wide variety of uses in the pulp and paper industry, in the manufacture of soap, paints, synthetic rubber and pharmaceutical products.

Inquiries should be sent to the Chemical Division of Canadian General Electric Company, 212 King Street West, Toronto.

•

R. G. LeTourneau, Inc., Longview, Texas, who recently offered to the construction and material handling market a newly designed 15-ton " Tournacrane ", has taken a further step to meet the smaller capacity lift-and-carry problems so prevalent in industry today. This latest evolution is a new 7-ton unit known as the " Model EC-7 Tournacrane ". For details communicate with the manufacturer, and ask for: Specification pamphlet on Model EC-7.

•

The Shell Oil Company of Canada Limited has announced that following preliminary geological work carried out last summer the Company now plans to drill its first test well about ten miles East of Sussex, N.B. In addition to this work the Company's present plans are for the drilling of at least one, and possibly two, more exploratory test wells in other areas.

The first test well is intended to test the Albert formation and it may be necessary to drill to a depth of 4,000 to 5,000 feet. It is reported that drilling started early in June and the final results should be forthcoming in September. It is interesting to note the Albert formation yields gas in the Stony Creek field which supplies the City of Moncton.

Appointments and Transfers

F. P. Labey has been appointed illumination manager of the Northern Electric Company, general sales division.

•

Prairie Equipment & Radiator, Ltd., 310-314 Burnell Street, Winnipeg, Manitoba, has been appointed distributor for the province of Manitoba for R. G. LeTourneau, Inc., Peoria, Illinois, manufacturers of heavy earthmoving, hauling and lifting equipment.

•

E. E. Hampson has been appointed sales manager of the steel and malleable foundries division, Canadian Car & Foundry Company Limited.

•

Russell M. Richardson has been appointed sales manager of the Arborite Company Limited. He was formerly head of the plastics division of Peckover's Ltd., Toronto. He is a graduate of the University of Toronto and has been engaged in the plastic and metal industries for over twenty years.

•

R. W. Mackay has recently been appointed to the aviation section of Canadian General Electric Company.

He has had exceptionally broad experience in many phases of aviation engineering.

During the war Mr. Mackay held an appointment as a Technical Officer at Britain's aircraft research establishment at Farnborough, England, and since then was a production development engineer with Miles Aircraft.

Born in South Africa, he received his education there, including an apprenticeship in electrical engineering on the South African gold mines. Following this training, he was for five years a member of an Antarctic Research and Exploration expedition.

Publications

For copies of the publications below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing

Canadian General Electric Company has completed production of a 39-page illustrated brochure on " Switchboard Instruments ". Features of the publications are application diagrams, instrument data and mounting dimensions. It also contains tables showing standard watt-meter scales for use with various instrument transformer ratios. Apply to your nearest C.G.E. office and ask for publication No. CGEA-1758E.

●

The Bristol Co. of Canada Ltd., 71 Duchess Street, Toronto, has issued a bulletin illustrating running-time recorders for recording operating time of machines, pumps, presses and other similar equipment. Ask for Specification Sheet OP1511, P.1.

●

The June issue of the Bepco Journal, published by Bepco Canada Limited, 4018 St. Catherine St. West, Montreal 6, contains a short, but most interesting, article on hydraulic log-barking.

●

Hercules Motor Corporation, Canton, Ohio, has published a " Textbook " on their diesel engines which range in horsepower from 12 to 400. For copies, apply for " Hercules Diesel Engines—General Information ".

●

Tracerlab Inc., 55 Oliver Street, Boston 10, Mass., publish a monthly semi-technical bulletin known as " Tracerlog ". Copies are available.

●

Kennametal Inc., Latrobe, Pa., has just published Catalogue RB-1. It describes in detail the company's newly-announced line of chisel-type cemented carbide rock bits for pneumatic percussion drilling.

●

Canadian General Electric Company has published a bulletin describing the wide range of power transformers it makes under Repetitive Manufacture (RM) methods. Ask for bulletin No. CGEA-4283.

●

Darling Brothers Limited, 140 Prince Street, Montreal, has obtained a sound movie entitled " Story of Metal Bellows ". The film was prepared by the Fulton Sylphon Co. of Knoxville, Tennessee. It deals, in a semi-technical manner, with the manufacture of both hydraulically-formed and roll-formed bellows from a disc of metal. It also shows the functioning of various types of pressure and thermostatic devices, fundamental bellows application and the operating principle of different types of temperature regulators. A small part of the film is devoted to the manufacture, assembling and testing of temperature controls. Running time is 28 minutes. The film is 16 mm. Applications for use of the film should be made on your official letterhead.

●

A catalogue supplement, WC-48, has been prepared by the B. Greening Wire Co. Limited, Hamilton, Ontario. It is intended for use in conjunction with their wire cloth and screens catalogue No. 36. It is in the form of a pocket-size volume.

●

The Louis Allis Co., Milwaukee 7, Wisconsin, has developed a specially-designed motor for the food processing dairy and beverage industries. Ask for Bulletin No. 711.

●

The International Nickel Co. of Canada, 25 King Street West, Toronto, has available an attractively-designed booklet outlining the background of the Canadian nickel industry. It also contains interesting descriptions of the many and varied uses of the metal, and an extensive list of Canadian producers of nickel alloys and manufacturing companies using nickel or nickel alloys. It reviews the various uses of nickel alloy steels, nickel alloy cast-iron, stainless and heat-resistant steels, nickel alloys, nickel plating and precious metals produced in conjuction with the nickel industry. The booklet is available in both French and English.

"Business & Industrial Briefs"

This section of the *Journal* is intended to keep readers informed on developments and changes in those business and industrial enterprises, and on new products, which affect the engineer.

If you write with respect to any of the items in this, or other, sections please mention

THE ENGINEERING JOURNAL

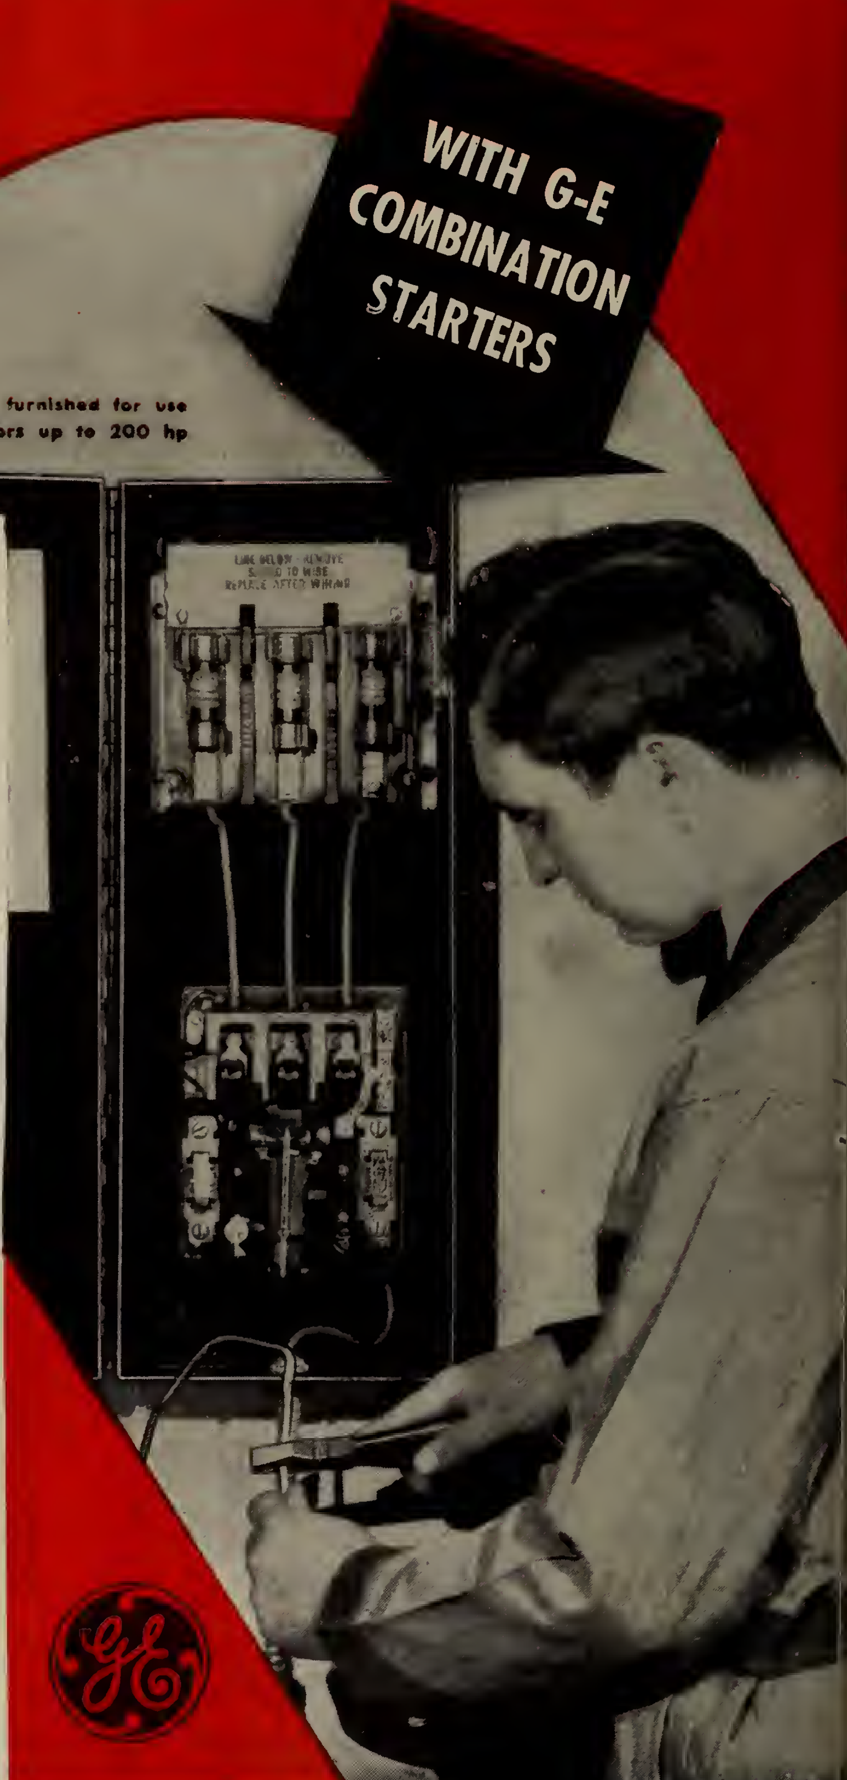
You can cut installation tim[e]
almost 50%



MOUNTING TIME CUT 50%

You avoid one complete mounting job on every installation when you use combinations — because combination starters combine both a motor switch and a magnetic starter in one compact unit.

WIRING TIME CUT 40%

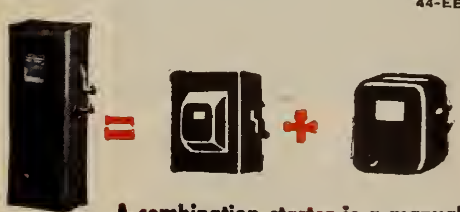
Users report that they're cutting wiring time as much as 40 per cent with G-E combination starters. That's because these combinations come to you already wired. Just connect the power and motor leads and you're ready to go.

COMPLETE PROTECTION FOR EQUIPMENT AND PERSONNEL

Fuses and overload relays are co-ordinated to provide complete protection for operating equipment. A special safety interlock —case cover can't be opened while power is ON, and power can't be thrown ON while cover is open—provides extra protection for your operators and maintenance men.

But these aren't the *only* advantages of G-E combinations. Their compact construction saves you valuable plant space. This same compactness can help you speed production—you mount the whole control close to the operator's work.

44-EB-5



A combination starter is a manual circuit switch plus a magnetic starter.

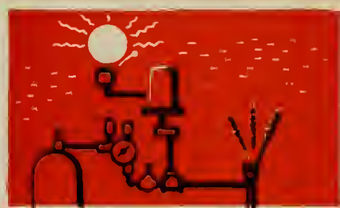
SELF-SUPERVISION PLUS

NOW CONFIRMED BY 10 Years of Service

Ratings: Low pressure, 10 to 40 kv; Medium pressure, 40 to 69 kv. High pressure, 69 kv and above.

CABLE THAT SHOUTS WHEN IT'S HURT. Any break in the sheath of G-E gas-filled cable operates a pressure relay and sounds an alarm. Ten years of service experience has shown that practically all breaks can be located and repaired before service is interrupted. The pressure-regulating system has been proved simple and successful.



"FIRST AID" BUILT IN. Controlled internal pressure in gas-filled cable levels out the stress on the sheath. Should falling pressure signal a leak, service can often be maintained by valving additional gas into the system, preventing penetration of moisture or other damage until a time when repair is practical.

MORE POWER THROUGH ANY DUCT. Uniform gas pressure means more uniform quality of insulation, permitting less insulation than is required in solid-type cable. The result is a conductor of higher current-carrying capacity for the same over-all diameter, or a smaller over-all diameter for the same conductor size. In one important installation, this made it possible to use present ducts and yet meet the need for increased capacity.

		GAS	SOLID
INSULATION	15 Kv	.130	.203
THICKNESS	27 Kv	.240	.297
(in inches)	40 Kv	.350	.390

INSULATING COMPOUND CAN'T SLIDE DOWN HILL. Because little or no excess compound is present, there's no tendency for compound migration to strain the sheath at the bottom of grades or risers, or for insulation to dry out at the top. Gas pressure and insulation remain uniform. Successful installations include risers of more than 200 feet.

48-JA-10

● Within its recommended voltage ranges, gas-filled cable offers the lowest long-term over-all cost (installation plus maintenance). It handles higher emergency overloads with lower internal stresses than solid-type cable. For full information, write the C-G-E office nearest you.

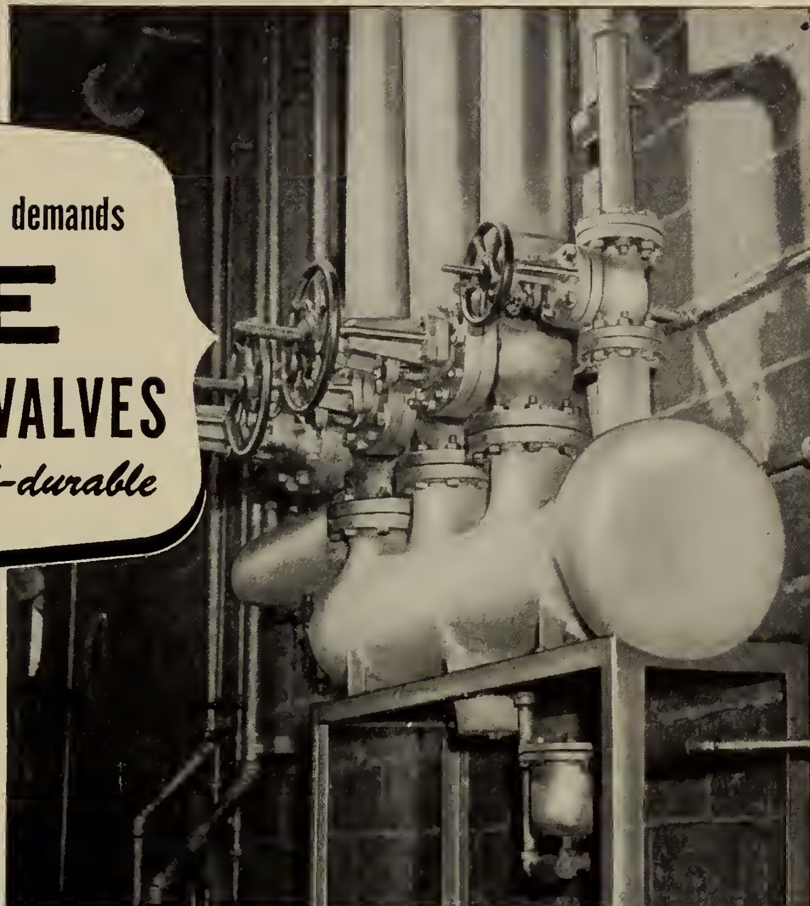
CRANE

Cast and Forged STEEL VALVES

unusually tough-rugged-durable



Crane cast steel valves in typical steam installation in industrial plant.

FOR industry's exacting operations involving high pressures and temperatures and/or unusual corrosive conditions—the CRANE line provides an unequalled selection of sturdy Steel Valves in a broad range of globe and gate types and in special designs.

These valves are available in standard sizes to suit all industrial piping systems, and in a choice of materials such as: carbon steel, carbon-moly., nickel-chrome, chrome-moly., etc.—with wearing parts of materials specially suited for specific services, as: Exelloy, nickel alloy, chrome-nickel-steel, 18-8 Mo, or Stellite-faced.

Whatever Your Requirements

you can depend on CRANE to deliver the valve to do the job. If corrosion is involved, be sure to write for Circular ADM-8009, "Aids to the Selection of Corrosion-Resistant Piping Material".

We welcome your inquiries on difficult valve problems. Ask your Crane Branch or write direct to—

CRANE LIMITED, General Office: 1170 Beaver Hall Square, Montreal

THE
PETROLEUM & NATURAL GAS SITUATION IN CANADA

by

Dr. G. S. Hume, M.C.I.M.

Chief, Geological Survey of Canada, Department of Mines and Resources, Ottawa, Ontario

A paper presented at the Annual General and Professional Meeting of The Engineering Institute of Canada, Banff, Alberta, June 3, 1948

Increasing demands for petroleum products, with rationing during the war years, have made the people of Canada conscious of their dependence on foreign sources for supplies of oil. In some areas oil has partly replaced coal as a domestic fuel because of convenience and higher efficiency. But shortages of fuel oil last winter, and higher prices, have caused concern and some re-conversion to coal. Natural gas is an ideal fuel. Alberta, in particular, has large quantities of natural gas, and the public is taking much interest in the available supplies and the uses to which they may be put.

Recently, Max W. Ball, director, Oil and Gas Division, Department of the Interior, Washington, D.C., made the striking statement[1] that " The United States is using more oil today than the entire world used in 1938 ". Herein lies the crux of the situation; the demand has increased so enormously that, with consumption now higher than at the peak of the war, production cannot be increased with sufficient rapidity to maintain a surplus. Futher, Ball states that " the oil fields of the United States are producing at or very close to their maximum efficient rates ", and that there is " no excess available crude oil productive capacity ". During the last three months of 1947, production in the United States amounted to 5.64 million barrels a day, whereas in 1945, peak production during the war was 5 million barrels a day. For many years the United States has been a net exporter of crude oil. In 1947 imports about equalled exports, and it is expected net imports will increase. These conditions are the results of a variety of causes, among them shortages of some materials. Yet the fundamental reason is that oil is becoming harder to find under conditions of vigorous search extending back for many years.

Dr. G. S. Hume

In recent years the number of new oil fields has increased, but the number of large or major fields discovered has declined markedly, and depths of drilling have become greater. In 1947, 33,646 wells[2] were drilled, of which 5,539 were exploratory, resulting in 1,130 productive wells and 4,409 " dry " holes. This gave 424 newly discovered oil fields and 293 newly discovered pay " sands " in old fields, 88 new gas fields and 29 new pay " sands ", and 44 new distillate fields and 54 new pay " sands ". The total number of discoveries of new oil, gas and distillate fields and new pay " sands " in old fields thus was 932,

Pointing out that demand for oil on this continent is increasing more rapidly than the discovery of new supplies, the author shows that Eastern Canada, where prospects of finding domestic supplies are generally poor, is becoming increasingly dependent on South American crude supplies. On the prairies, declining production has failed to meet prairie demand in recent years. The Leduc field will bring these into early balance, but cannot support exports from the Prairie Provinces for long. British Columbia produces no oil. Potential natural gas reserves on the prairies are shown to be sufficient for many years however, and their development is dependent only on price and market outlets.

[1] Ball, Max W., Report on the Oil Situation, Wolverton Committee on Interstate and Foreign Commerce, Feb. 1948.

[2] *World Oil,* Vol. 127, No. 11, p. 68, Feb. 1948.

an increase of 244 or 35.5 per cent over the previous year. From this it is obvious that new fields are being discovered in United States at a relatively fast rate, but even so the demand for oil has increased more rapidly than new supplies have been found.

The Situation in Eastern Canada

The situation in the United States is of great interest to Canadians, because for many years that country has occupied a predominant position in the oil industry among the countries of the world and has been the main source of our imports. It still remains the main source, but in view of the supply situation this position may not be maintained. Imports into Eastern Canada, where the demand is large, have been steadily increasing from South America, particularly from Venezuela, and we are now becoming more and more dependent on this source for an increasingly large part of our supply.

In 1940, for example, with total imports of crude oil into Canada amounting to 42 million barrels, 29 million came from the United States and 13.5 million from South America and Trinidad, with Venezuela supplying 3.2 million barrels and Colombia 9.7 million barrels. In 1947, crude oil imports into Canada were 70 million barrels, an increase of about 60 per cent over 1940. Of these imports 39 million barrels came from the United States and the remainder from the Caribbean area. These figures illustrate the proportional increase in crude oil imports from South America, and in particular from Venezuela, from which place most of the imported crude oil came into Eastern Canada. They do not include imports of oil products into Canada. In 1940 these, including all fuels from naphtha to heavy fuel oils, amounted to less than 3 million barrels, whereas in 1947 they were over 16 million barrels.

South American crude oil is brought by ocean tankers to east coast ports and refineries. From Portland, Maine, a 234-mile, 12-inch pipe line connects with Montreal. This pipe line now has a capacity of 60,000 to 70,000 barrels a day, and it is hoped when steel becomes available to construct a further 20-inch pipe line to raise the total capacity to 140,000 to 175,000 barrels a day. Venezuela crude oil is reaching the large Imperial Oil refinery at Sarnia by pipe line from the New Jersey area, which is supplied by ocean tankers from South America.

The total imports of crude oil into Ontario in 1947, most of which came from United States, were 27.5 million barrels or an average of about 75,500 barrels a day. In September, 1947, imports of Venezuela crude oil into the Maritimes-Quebec area amounted to 62,200 barrels a day, and into the Sarnia refinery 26.6 million barrels, or a total of 88.7 million barrels a day from that country alone. It is obvious, in view of the shortage of crude oil supplies in United States that Eastern Canada, now depending to a considerable extent on imports from Venezuela, will in the future continue to draw more heavily from this source where the production now has reached more than 1.2 million barrels a day. (*World Oil,* Jan. 1948, p. 226).

Prospects in East Not Encouraging

It is not surprising, in view of the demand for fuel in Eastern Canada that the search for oil and gas has continued for many years. Oil fields of southwestern Ontario were among the first to be discovered on this continent, and have had a continuous record of production extending back more than three-quarters of a century. The production, however, has now dwindled to from 100,000 to 150,000 barrels of oil a year, and is thus insignificant in relation to the volume required to meet the demand.

For many years, too, southwestern Ontario has produced considerable quantities of natural gas, and in view of the great importance of this for fuel the search for new fields has been vigorously continued to replace those from which the supply was becoming depleted. The search has met with some success, but, as was apparent under the severe weather conditions of last winter, the demand has greatly exceeded the supply, and costly shut downs occurred in industries that were dependent or partly dependent on natural gas. The natural gas supply has been augmented by the use of propane and manufactured gas, but it is admitted that future shortages are imminent, unless supplies can be obtained from sources outside the province. This does not mean that the prospects are exhausted, but the discovery rate has been less than the consumption rate in spite of well directed efforts to meet the emergency, and the hope of altering this condition seems remote.

In the Maritimes and Quebec the prospects of finding new supplies of oil or gas cannot be considered too attractive, in spite of considerable active exploration. For many years the Stony Creek field in New Brunswick has produced from 20,000 to 30,000 barrels of oil a year and sufficient gas to supply Moncton and adjoining communities. Geological parties working for one of the major oil companies last summer made a very detailed study of the stratigraphy and structure of New Brunswick from Sussex to Moncton, and it is possible that some wells will be drilled.

In past years drilling has been done in various other parts of the Maritimes without any success. The deepest hole ever drilled for oil in Canada was completed in 1945 at a depth of 14,696 feet off the coast of Prince Edward Island. This well was drilled from a pier built in Hillsboro Bay near Governor's Island. An adequate structure had been outlined by geological and geophysical methods, but the geological section proved thicker than had been anticipated, and the well failed to reach the objective where oil could possibly occur. It finished in salt beds well above the prospective oil zone.

In Gaspé Peninsula, seepages of oil were described in 1844 by Sir Wm. Logan, founder of the Geological Survey of Canada. Between 1889 and 1902 some wells were drilled and a small refinery was built, but the amount of oil produced was small, and the operation proved unprofitable and was abandoned. From time to time drilling has been resumed, and at present further drilling is being done. The region has always seemed to hold intriguing possibilities for oil production. Oil seepages have indicated the presence of petroliferous rocks, and the region is in the Appalachian belt, where numerous structures offer favourable conditions for oil and gas accumulations, and where drilling depths to possibly productive strata are not great.

The main lack to date has been the absence of adequate porosity in either sandstone or limestone rocks, to provide reservoirs that can hold sufficient oil to give commercial yields in wells. It would seem highly probable if strata with a 10 to 20 per cent porosity and a reasonable permeability could be found, that the prospects of discovering an oil field would be good.

Rocks may have very fine pore spaces that will "bleed" oil and give shows in wells, but will not give commercial yields. Such shows with oil in moderate amounts have been found in wells drilled in Gaspé, and the present hope of discovering production would seem to depend on finding adequate reservoir rocks.

The Situation in the Prairie Provinces

In 1941 almost no crude oil was imported into Alberta and Saskatchewan, and less than 200,000 barrels into Manitoba, in spite of the fact that Prairie refineries processed more than 9.5 million barrels. The main bulk of this oil came from Turner Valley, which reached its peak production of 10 million barrels in 1942. Since that time, however, due to decreased production and increased consumption, the spread between yield and amount used gradually increased, until in 1947 imports into the Prairie Provinces amounted to almost 20,000 barrels a day or a total for the year of 7.3 million barrels. The increase in consumption is shown by the fact that in 1947 Prairie refineries processed 14 million barrels of crude oil, an increase of 47 per cent over 1941.

The import situation for the Prairie Provinces might not have been so serious if oil had been readily available at nearby United States fields, but this was not so. During the war available crude oil supplies became increasingly difficult to find, and it became necessary to bring much of the oil for Prairie refineries from such far distant States as New Mexico and Northern Texas, with large amounts from the Midcontinent area of Oklahoma. In order to maintain price control, the Dominion paid a subsidy on the freight, but at the end of the war this was discontinued, and as the price of oil products necessarily had to carry the freight charges on the imported crude oil from distant areas, a considerable increase in price resulted.

In view of the enlarged demand for oil products in the Prairie Provinces the discovery of the Leduc field in February, 1947, came at a most opportune time. Certain shortages, particularly casing and other steel products, are affecting petroleum developments. With normal progress, however, within a year or so the Leduc field should be able to reach a productive capacity where it may be expected to overcome the Prairie deficiency, now around 20,000 barrels a day. From the publicity that has been given to a "wild" well at Leduc, some of the public have tended to regard the Leduc field as the answer to Canada's oil needs, but no one familiar with the facts would even suggest such a possibility.

Turner Valley has been regarded as a great oil field, and it will continue to yield oil for many years. It should be recalled, however, that crude oil was found on the west flank of Turner Valley in June, 1936, and the peak production was reached in February, 1942. From that time on production declined, in spite of Dominion Government sponsored efforts to maintain it during the war years. Today the yield from Turner Valley is less than half what it was at its peak of 29,000 barrels a day in 1942. Even so, Turner Valley, up to the present, has yielded more than 90 million barrels of oil and 1,427 MMMcf of gas, of which 1,000 MMMcf was wasted. A costly lesson was learned; it will not be repeated, but a large amount of oil was produced.

Leduc Unlikely to Fill Prairie Demand For Long

It is extremely difficult to assess the possible ultimate yield from Leduc. It is safe to infer, however, even at the present stage of development, that the yield of oil will considerably exceed that of Turner Valley, and it could be twice that amount. In Turner Valley, one drilling rig, operating at a high degree of efficiency, drilled two wells a year. In Leduc, some wells have been drilled in about a month. It is to be expected, therefore, that the development of Leduc will be accomplished relatively quickly. This, of course, means the yield ought to increase fairly rapidly. It will also mean that the field will reach its maximum efficient capacity in a relatively short time. The increase of 47 per cent between 1940 and 1947 in the demand for oil products on the Prairies is a fair indication of the rate of expansion that is still taking place. Under these conditions no one could reasonably expect the Leduc field alone to meet even the Prairie requirements for long after it reaches its peak. It is true, of course, that some other fields are producing, and will continue to produce, and that the Lloydminster field is still expanding at a moderate rate.

The oil from Leduc is a light oil, particularly suitable for making gasoline and light oil products. The oil from Lloydminster is heavy and asphaltic, and is particularly suited to yield heavy fuel oil and asphalt. Thus the two oils are complementary and, in general, not competitive in the same market. The situation on the Prairies, therefore, is a most fortunate one as the great needs for light and heavy oil products are both being largely met from domestic production. The situation at present, therefore, is quite satisfactory, with probable expansion in sight to meet all Prairie needs. However, as already indicated, the development of oil fields is relatively rapid, and an adequate provision for the Prairies for any extended period must necessitate new discoveries from time to time.

No attempt will be made here to outline the prospects for the discovery of new oil fields, but a few observations may be pertinent in relation to the hope of being able to meet future demands and, perhaps, create a surplus. The production in the lower or D_3 zone at Leduc is apparently related to reef conditions in the Upper Devonian. Drilling at Fort Norman in the Mackenzie River area, 950 miles northwest of Leduc, also disclosed that the Norman Wells field was an Upper Devonian reef. Field work by Geological Survey parties in 1921 and 1922 revealed the presence of Devonian reefs in the area southwest of the west end of Great Slave Lake, and in the North Nahanni River area near the big bend of the Mackenzie in front of the Camsell Range west of Fort Simpson. Also, an examination of the Devonian section on the face of the mountain at Brulé, northeast of Jasper, has disclosed beds of corals and associated fossil remains up to a few feet in thickness.

This is scant information on which to base any general statements, but it does seem to indicate the Devonian formations along the Rocky Mountain front and eastwards from it were deposited in part at least under conditions favourable for coral growth, that is, in warm clear seas. There is thus, the possibility that Upper Devonian coral reefs may have a reasonably wide distribution under conditions favourable for oil accumulations. If this is so, the hope of finding other areas in which conditions are similar to those at Leduc would appear to be fairly encouraging. The present activity by the oil companies indicates that this view is widely held.

Natural Gas Resources

The natural gas resources of the Prairie Provinces have been the subject of an intensive study for several months by A. Ignatieff and the writer, for the Department of Mines and Resources, Ottawa. This study has now been completed. In respect to the various producing gas fields and areas that have shut-in gas wells, with no present production, the amount and precision of the data available vary widely. For convenience, therefore, in making an appraisal the reserves were considered as: (1) proven; (2) probable; and (3) potential or possible. To the first group or proven reserves belong those fields that have a production history, and where the decline in pressure has been carefully recorded in relation to the volume of gas produced. Any appraisal based on the decline in pressure method is reasonably accurate where records have been kept, and, consequently, these reserves are regarded as proven. The fields so appraised with the amounts of their reserves to an abandonment pressure of 100 pounds per square inch absolute and 60° F. are as follows:

1. Viking-Kinsella-Fabyan	994	MMMcf.
2. Medicine Hat	78	"
3. Bow Island	25	"
4. Foremost	26	"
5. Brooks	11	"
6. Vermilion	9	"
7. Turner Valley (marketable reserves)	290	"
Total proven reserves	1,433	"

With the second group, or probable reserves, are included those fields where gas wells have been drilled, and where a sufficient amount of data on pressure and reservoir conditions are known to allow a calculation of reserves to be made. In this method the volume of gas in the reservoir is calculated. Sedimentary conditions over any considerable area may vary somewhat. Hence the thickness of a gas producing sand, its porosity, and connate water content may have to be considered uniform for the whole of a gas field on the data obtained from relatively few wells. The reserves calculated on these data cannot, therefore, be as accurately appraised as on the pressure decline method and are therefore considered probable. These reserves, to an abandonment pressure of 100 p.s.i.a., and 60° F. are as follows:

Alberta		
Foremost (California Standard well)	9	MMMcf.
Pendant d'Oreille	260	"
Manyberries	31	"
Black Butte and Pinhorn	39	"
Smith Coulee	2	"
Princess	405	"
Dunmore	8	"
Hanna	12	"
Provost	52	"
Elk Point	8	"
Jumpingpound	920	"
Leduc (gas cap only)	389	"
Athabaska (Deca wells)	16	"
Battleview	18	"
Lloydminster Alberta	15	"
Total Alberta	2,185	"
Saskatchewan		
Lloydminster	24	MMMcf.
Lone Rock	16	"
Unity	25	"
Total Saskatchewan	65	"

Total probable reserves of Prairie Provinces—2,250 MMMcf.

Thus the total proven and probable gas reserves, as calculated, are 3,618 MMMcf. for Alberta and 65 MMMcf. for Saskatchewan or a total of 3,683 MMMcf. for the Prairie Provinces. There are no developed natural gas fields in Manitoba.

Gas Reserves for Seventy Years

These figures seem large, and to get an approximate idea of their significance it should be recalled that in heat value 1 ton of high rank coal is equal to approximately 26,000 cubic feet of natural gas. If, however, the increased efficiency in burning gas is taken into account, 1 ton of coal equals about 20 Mcf. of natural gas. Thus the proven and probable reserves of 3,683 MMMcf. of gas are equal to about 184,150,000 tons of coal. This is equal to 20 years production of coal in the Prairie Provinces at the 1945 mining rate.

Perhaps, however, the magnitude can best be assessed in relation to the gas withdrawals for all purposes in 1947. These amounted to 49,000,000 Mcf. for Alberta and 274,628 Mcf. for Saskatchewan. Thus, without in any way trying to relate the local requirements to the accessibility of the presently developed fields, the appraised volume is equal to 70 years of present day gas production. This might not be considered a long period, because as fields decline in pressure there is also a drop in volume of gas that can be produced in a unit period. It does not however take into account the possible or potential reserves, which, if assessed even on an extremely conservative geological basis, are undoubtedly enormous. Although it would be impossible to estimate their amount in terms of billions or trillions of cubic feet, it is certainly safe to conclude they will eventually prove to be many times the presently developed reserves.

The reasons for such an optimistic view cannot fully be presented here, but perhaps one or two illustrations might be instructive and interesting. Recently the Canadian Gulf Company has made an important discovery in the Foothills, 20 miles southeast of Pincher Creek, in southern Alberta. The well reached the top of the Palaeozoic limestone at 11,700 feet, and tests made above 11,927 feet have shown the well to be capable of producing 44,000 Mcf. and at least 1,000 barrels of high-grade oil a day. The well is being deepened, as it may not have completely penetrated the porous, productive section, which in age is similar to the producing limestone of Turner Valley, the type section of which is the Rundle limestone on Rundle Mountain at Banff. This field, in type of structure, is similar to Turner Valley and Jumpingpound.

Turner Valley has already produced 1,400 MMMcf., and still contains a sufficient amount of gas to supply Calgary at present rates of withdrawal for 15 to 20 years. To appreciate what this means it should be remembered that 92 per cent of the fuel used in Calgary is natural gas, and that peak winter loads now exceed 100,000 Mcf. a day. It should not be concluded from the fact that the Pincher Creek structure is of the same type as Turner Valley that it will have an equal gas content. Turner Valley is unique among all known gas and oil fields in the world in having the greatest amount of productive closure, amounting to more than 5,000 feet.

Other fields such as Jumpingpound, with about 1,000 feet of productive closure, would be considered large, and although there is some uncertainty in Jumpingpound as to the amount of porosity of the reservoir rock which directly affects the gas appraisal, it is thought that the gas reserves may not be less than 900 MMMcf. in a field of 6,300 acres. In comparison, Turner Valley has a gas cap of 10,240 acres and an oil area somewhat greater, in which there are large amounts of gas dissolved in the oil. No doubt two or three Foothills fields similar in type to Jumpingpound or Turner Valley could double the present known gas reserves. One such field at Pincher Creek has been partly proved by one well, and other prospects of similar kind are already under development.

On the Plains a few areas have been drilled primarily in the search for, and the development of, gas fields. This is true of the Viking-Kinsella-Fabyan, Medicine Hat, Bow Island, and Foremost gas fields as well as the presently non-producing areas of Pendant d'Oreille, Manyberries, and other smaller areas such as have been drilled to supply gas for various towns, including Brooks, Vermilion, Hanna, St. Paul, and others. Much of the gas has, however, been found in drilling for oil, as in Turner Valley, Jumpingpound, Princess, Athabaska, and several other areas. This is an important consideration, because developments have shown that where gas reserves have been sought exceedingly large quantities have been found, as shown by the extension of the Viking-Kinsella area by Imperial Oil Limited and the discoveries of Pendant d'Oreille, Manyberries, and other fields in Southern Alberta by McColl Frontenac and Union Companies.

The drilling for gas was largely undertaken before the Leduc field was found, and at a time when it seemed that synthetic oil from natural gas might have to be made to meet the Prairie requirements. There would seem to be no doubt, therefore, based on past experience and known favourable geological conditions, that if large markets and a reasonably attractive price warranted a vigorous search for gas, further quantities would be found in amounts far exceeding those now proven and probable. The discovery of oil at Leduc has provided an incentive for an extensive programme of exploration by numerous oil companies. It will be surprising indeed if the history of the past is not repeated and if large amounts of gas are not found in the further search for oil. The outlook on the Prairies, therefore, is that further enormous supplies of gas will be found in a reasonably short time. Whether or not these are developed would seem to depend on the price offered for gas and the market outlets.

The Situation on the West Coast

No oil or gas is produced in British Columbia. Refineries in the Vancouver and New Westminster areas receive their supplies by ocean tankers, mostly from California but with small amounts from Colombia and Venezuela via the Panama Canal route. In 1947 the crude oil imports into British Columbia were 6.5 million barrels of which 97 per cent came from California and 3 per cent from South America. Thus the imports were at the rate of 17,840 barrels a day. Within the last few years production has been increased in California, but to maintain the reserves at a safe level new discoveries are needed at an increased rate to keep up with the consumption and ever-growing demand. California has the second largest oil production and reserves of any State in United States, but reserves are only 10.3 times the 1947 withdrawal rate.[3] There is, therefore, less optimism about finding new fields than in some other parts of the United States. It may be that in the future, as during part of the war period, the West Coast of Canada will have to depend more on imports from South American countries.

In appraising the gas reserves of the Prairie Provinces the Peace River area of Alberta and British Columbia was not included because of its distance from probable Prairie outlets. There seems good reason to believe that the oil and gas prospects of this area are as favourable as the Foothills and adjoining Plains in Alberta, but to date developments have been relatively small. A gas area of unknown but probably small extent has been found just east of the British Columbia boundary northeast of Pouce Coupe, and drilling in the same general area has given shows of oil in one or two wells. Drilling for gas is now proceeding in British Columbia, with the stated objective, if sufficient supplies can be found, to pipe it to Vancouver. Within the last year or so a certain amount of prospective oil land has been acquired by permit from the British Columbia Government, and it may be that some drilling will be done in the near future.

[3] *Oil and Gas Journal*, Jan. 29, 1948, p. 173.

It is general knowledge that the Nanaimo coal fields are declining and that there is need for new sources of coal on the West Coast. Under present conditions coal from Alberta is being shipped to the Far East and coal areas in the interior of British Columbia are now under investigation. It is thus apparent that the fuel situation on the West Coast is not too good from the long term viewpoint, unless adequate preparations are made to meet any future emergencies that might arise. Fortunately, however, it is known that the coal resources of the Province are adequate for all future requirements, and large areas of potential gas and oil lands await development in the Peace River area.

To the hazards of drilling, common to all areas in the search for oil and gas, the British Columbia Peace River district lacks roads, and is far removed from centres from which equipment supplies must come. Development costs will therefore be high. In order that adequate explorations may be undertaken to produce results, operational conditions must have sufficient appeal to warrant large capital expenditures. The history of development in this country and elsewhere is that in order to find oil and gas fields, many non-productive wells may have to be drilled, and the correlation of data from dry holes is an essential part of the oil-finding business.

Discussion

W. J. Dick, M.E.I.C. [4]

I want to congratulate Dr. Hume on his excellent paper, and to discuss briefly, that portion which deals with the natural gas reserves of Alberta. This paper, like almost all others given at this Convention, deals with the subject and need of Conservation.

The formation of natural gas, within the earth's crust, took hundreds of thousands of years and therefore, when this resource is used or wasted, it cannot be replenished. Dr. Hume has referred to the

HYDROCARBON SYNTHESIS

by

T. B. Doherty, M.E.I.C.

Engineering and Development Department, Imperial Oil Limited, Sarnia, Ont.

A paper presented at the Annual General and Professional Meeting of The Engineering Institute of Canada, Banff, Alta., June 3, 1948

This paper discusses the possibilities of producing synthetic liquid fuels from coal or natural gas. Synthetic production is explained by means of chemical equations—the methods employed in Germany are reviewed and the plants described, as well as the American methods of preparing synthesis gas and the proposed method of processing coal for its production. Noting the current progress in the United States towards production of synthetic fuels, the author concludes that the long range development there is most likely to be from coal. In Canada, while the gas process is economically more attractive than the coal process, reasons are given why synthesis is unlikely to be attempted in the near future.

The demand for petroleum products has increased tremendously over the past few years. Despite a current world crude production of 8,700,000 barrels daily, difficulty is being experienced in meeting this demand. At present levels, world production is almost 60 per cent higher than pre-war figures. The Western Hemisphere produces almost 80 per cent of this total, and has been the largest factor in increasing world production. Known oil reserves are capable of producing a great deal more oil, but rapidly increasing demand in conjunction with the shortage of steel to expand refinery and transportation facilities, has created a difficult supply problem. The United States, for instance, has for the first time become a net importer of oil. Canada, with a current consumption of 270,000 barrels per day, produces less than 10 per cent of its own requirements, and is virtually dependent on foreign sources.

Under these circumstances the possibilities of hydrocarbon synthesis have been receiving increasing attention, particularly from the standpoint of supplementing petroleum products in times of national emergency. This process bears some resemblance to the Fischer-Tropsch process, which was first developed in Germany, in that liquid hydrocarbons are produced by the reaction of carbon monoxide and hydrogen in the presence of a catalyst. However, as a result of research and development work carried on in the United States, by which the process has been improved and adapted to American requirements, this hydrocarbon synthesis process differs radically from the Fischer-Tropsch process in several important respects.

The Fischer-Tropsch synthesis was discovered in 1913, but no commercial application was made until Germany erected a plant in the Ruhr in 1933. Additional plants were installed, and by 1943 the yearly capacity of the nine German Fischer-Tropsch plants amounted to 5,590,000 barrels of liquid hydrocarbons and wax. The average daily production from a single plant was approximately 1,700 barrels. American interest in synthetic fuels dates back to the 1920's and, over the intervening years, a considerable sum has been spent by the government and industry on development work in this field. Last year, for example, it is estimated that the U.S. oil industry spent in excess of $10 millions on this type of research, most of this for processes employing hydrocarbon synthesis as the basic reaction.

The Hydrocarbon Synthesis process under consideration involves essentially three steps: (1) synthesis gas production; (2) synthesis; and (3) product recovery and treating. The first step involves the manufacture of a mixture of hydrogen and carbon monoxide from either coal or natural gas, although other materials containing carbon and hydrogen may be used. The second step involves the catalytic interaction of hydrogen with carbon monoxide to form hydrocarbons. In addition to hydrocarbons, a small quantity of compounds containing oxygen are also formed. The final step involves the recovery of the reaction products from the unconverted gases and their subsequent refining to meet product quality requirements.

Figure 1 shows the chemical equations written to represent the reaction carried out in the production of synthesis gas. The first equation is for the partial oxidation of natural gas which is mainly methane, to hydrogen and carbon monoxide. The reaction as written is exothermic, but additional heat is required to take care of heat losses and to raise the reactants to around 2500 deg. F. Conse-

FIG. 1.

SYNTHESIS GAS GENERATION

$$CH_4 + \tfrac{1}{2}O_2 \longrightarrow CO + 2H_2$$

$$\tfrac{16}{10}CH + \tfrac{1}{2}O_2 + \tfrac{7}{10}H_2O \longrightarrow 1\tfrac{1}{2}H_2 + 1\tfrac{1}{2}CO + \tfrac{1}{10}CO_2$$

quently, a slight excess of oxygen above that indicated by the equation is added, so that additional heat is liberated by the formation of small quantities of carbon dioxide and water vapour.

The second equation illustrates the production of synthesis gas from coal, the formula for coal being represented by CH. It shows the formation of a 1 to 1 ratio of hydrogen to carbon monoxide by the reaction of coal with oxygen and steam. By raising or lowering the proportion of steam used, the hydrogen to carbon monoxide ratio can be raised or lowered.

The synthesis reaction is represented by the idealized chemical equations in Fig. 2. The first equation shows the reaction of two volumes of hydrogen with one of carbon monoxide, to form the synthesis product designated as CH_2; the formulæ representing the approximate atomic proportions of carbon to hydrogen found in the product. The oxygen of the carbon monoxide appears as water. It has been found that the combining ratio of hydrogen and carbon monoxide varies in accordance with the ratio of these two reagents in the feed gas, the combining ratio generally being appreciably lower than the feed ratio. As the feed ratio changes, the manner in which the oxygen of the carbon monoxide is discarded is altered, and the second equation illustrates the reaction in which two volumes of carbon monoxide are combined with one of the hydrogen.

It will be seen that in this case the oxygen is discarded as carbon dioxide. All intermediate combining ratios may be considered to be combinations of these two equations. For example, the third equation illustrates the reaction occurring when equal volumes of hydrogen and carbon monoxide are consumed. In this case the oxygen of the carbon monoxide is discarded partly as water, partly as carbon dioxide. It should be noted that regardless of the combining ratio, the same amount of hydrocarbon product (CH_2) is formed from the same volume of hydrogen plus carbon monoxide in the synthesis gas.

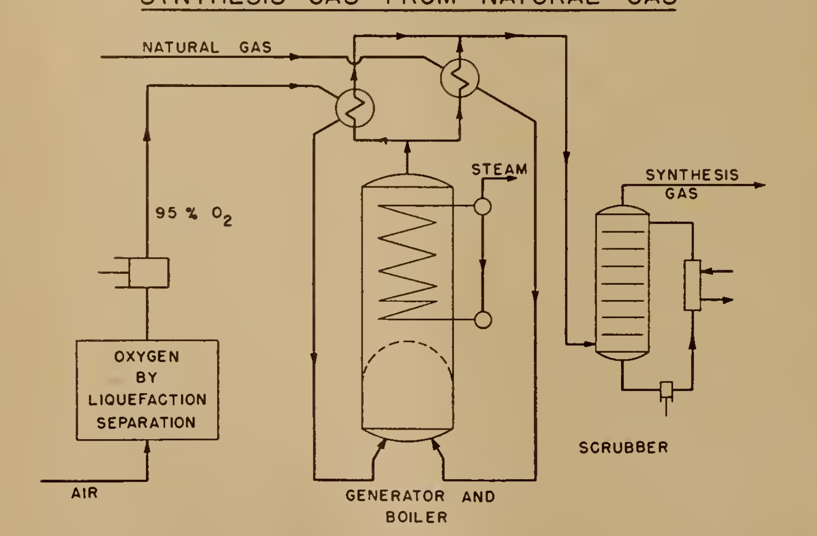
FIG. 3.

SYNTHESIS GAS FROM NATURAL GAS



Description of Plant and Operating Conditions

It might be of interest to briefly review the German operations before discussing the plant envisaged for erection in the United States. Synthesis gas was produced by the interaction of steam and coke in conventional water-gas generators, although some gasification units were in operation employing coke or coal and oxygen and steam. The hydrogen to carbon monoxide ratio in the synthesis gas was adjusted to about 2/1, since this is the ratio in which these components were consumed in the synthesis step. The gas produced was cooled, treated for sulphur removal and charged to the synthesis section. The plant-scale operations were all carried out with cobalt catalyst. This catalyst consisted mainly of cobalt and kieselguhr, with small amounts of thorium oxide and magnesium oxide.

The synthesis step was carried out at temperatures varying between 350 deg. F. and 400 deg. F., with pressures varying between one and ten atmospheres. The products were mainly straight chain hydrocarbons ranging from methane to heavy wax. The octane number of the material in the motor fuel boiling range was very low, in the range of 0 to 50, so that thermal cracking had to be employed to produce a gasoline of even moderate quality. The diesel fraction, however, was of superior quality. The production of fuels was not the primary objective of the operation, as the hydrocarbons produced were used largely as raw materials for synthetic fats, lubricating oils, detergents, etc.

One of the main problems in the design of the German plants was that of heat removal in the synthesis reactors. The volumetric heat effect was of the order of 60,000—300,000 B.t.u.'s per hr. per cu. ft. of reaction volume, depending on the space velocity employed. These are average figures for the entire catalyst bed. Indications are that at the entrance of the reactor the heat release may be much greater. In the latest reactor design, catalyst in the form of pills was contained in annular spaces between tubes, with a cooling medium (water) on both sides of the annulus.

The necessity of preventing local overheating at any point in the catalyst required that the annular spaces be no more than about ½ in. wide, and this led to an enormous tube area in the reactors. For example, a plant producing 10,000 barrels per day of synthetic oil products would require almost 6 million sq.ft. of heat exchange surface in the reactors. The complexity of the construction required that small capacity reaction units be used and a 10,000 barrels per day plant of this type would require 128 reactors.

Figure 3 shows the proposed American method of preparing synthesis gas. Natural gas and oxygen of 95 per cent purity, prepared from air by liquefaction separation, are preheated to 800-900 deg. F. in separate exchangers using the hot synthesis gas as a heating medium. These preheated gases are introduced into the synthesis gas generation vessel and partial oxidation, mainly to CO and H_2, occurs. The synthesis gas is generated preferably at some pressure slightly in excess of that required for synthesis, so that the gas produced need not be compressed. Natural gas is generally available at sufficient pressure, but the oxygen must be compressed to this high pressure.

The synthesis gas generator is a cylindrical vessel made of internally lined carbon steel. A system of boiler tubes is installed at the discharge end and this boiler produces high pressure steam in cooling the synthesis gas down to about 1,000 deg. F. The synthesis gas is further cooled by heat exchange with the incoming natural gas and oxygen, and is then discharged into the bottom of a scrubbing tower, wherein it is cooled to a temperature in the range of 100-150 deg. F. This flow plan assumes a natural gas of a low sulphur content otherwise a treating plant would have to be added to remove the sulphur present.

Figure 4 indicates a tentative method for processing coal for the production of synthesis gas. Crushed bituminous coal is fed to a generator, where synthesis gas is produced by the reaction between coal, steam and oxygen. The heat required for the reaction between steam and coal is supplied by burning some of the carbon with oxygen. The synthesis gas from the generator is then cooled and freed of sulphur.

Having produced our synthesis gas by two alternative methods, we can now proceed to the synthesis step. Figure 5 shows a flow plan of the proposed operation. The synthesis gas is charged to reactors, which contain a bed of powdered iron catalyst in the fluid state. The mass exerts a fluid pressure, which may be used to measure the quantity of solids in the vessel and is also the basis of a convenient method of circulating the solids to zones of higher pressure. The fact that it exists in a violently agitated state is a very effective way of establishing a uniform temperature throughout the bed. It is also the means of giving excellent heat transfer coefficients, so that the exchanger surface required to remove heat from the reacting components is only about ½ of 1 per cent of the exchanger area in a German installation of the same capacity. A considerable amount of experience with the fluid technique has been developed in petroleum refining, where it is employed in a gas-oil cracking process.

The catalyst employed will probably consist essentially of a reduced iron oxide ground to a fine particle size. Operating conditions contemplated are pressures in the order of 250-400 p.s.i, and temperatures in the range of 550-650 deg. F. The overhead gases are passed through cyclone separators for dust recovery and possibly final cleanup by means of filters or oil scrubbers should be incorporated. The gases are then cooled and passed through a separator where liquid products are removed.

At this point an oil and water layer are recovered. The water layer contains some alcohols, ketones, etc., in dilute solution. These may be recovered if desired. A part of the gas from the separator is recycled to the reactor inlet for further reaction. The balance of the gas and the oil layer are sent to the refining section. This is a conventional type of processing similar to that carried out in oil refineries. The gases are treated in an absorber for C_3 and C_4 recovery. A polymerization plant for converting unsaturated C_3 and C_4 to gasoline, a treater for the synthetic oil, and the necessary fractionating equipment are also provided.

One important consideration in determining the location of a hydrocarbon synthesis plant is the availability of water. The plant requires large quantities of water both for cooling and for steam generation. Availability of coal or gas and a market to absorb the products are thus not the only factors involved in selecting the site.

Products and Product Quality

Figure 6 indicates the material balance for the type of American synthesis plant outlined previously. This plant employs natural gas as the source of carbon and hydrogen. The quantities of natural gas and oxygen are based on measurement at 60 deg. F. and 1 atmosphere pressure. It will be noted that large quantities of oxygen are consumed and the success of the synthesis operation depends on the ability to meet these oxygen requirements at a low cost. The quantity of oxygenated compounds available for recovery from the water layer varies from 10 to 15 per cent of the total volume of gasoline plus gas oil produced.

The corresponding material balance for the coal operation has not been included, since the develop-

ment of the coal process has not reached the same stage as for gas. It would appear that as an approximate estimate, half a ton of good grade bituminous coal would be required to produce 1 barrel of total liquid products.

As pointed out previously, the oxygenated compounds are recovered in a dilute water solution. Their recovery as pure chemicals is economically attractive in locations where a market exists to absorb the large quantities produced. The compounds which may be recovered include ethyl, propyl, butyl and amyl alcohols, acetaldehyde, propionic aldehyde, acetone and higher homologs. Organic acids are also available for recovery. These consist mainly of acetic, propionic and butyric acids. It should be pointed out that relatively few plants of the size illustrated in the figure might satisfy the present U.S. requirements for many of the chemicals produced from the synthesis process.

Figure 7 indicates the quality of the gasoline and gas oil produced. The quality of the actual gasoline leaving the synthesis reactor has been considerably improved by the addition of polymer gasoline. This gasoline is produced by the polymerization of unsaturated C_3's and C_4's, which are produced in the synthesis step. It is a very high quality gasoline, much superior as far as octane number is concerned to any motor fuel being marketed at present.

Conclusion

In comparing the cost of gasoline produced from crude, natural gas and coal, it appears that in the United States the natural gas process can produce gasoline at a price competitive with gasoline from crude at present crude prices. Two synthesis plants employing natural gas are presently under construction; one by Carthage Hydrocol, at Brownsville, Texas, and another by Stanolind Oil and Gas in the Hugoton Gas Field in Kansas. Both plants produce approximately 7,000 barrels per day of gasoline and gas oil. The synthesis process employing coal is not as well advanced as the gas process, and more pilot plant development appears necessary. Owing to the limited supplies of natural gas in comparison with coal reserves, the long range development is most likely to be with coal. The indicated coal reserves of the United States are so tremendous, being in the order of 3 to 4 trillion tons, that there is sufficient coal to last for some thousands of years, even if to the present requirements we add the coal that would be required to meet the demand for petroleum products.

In studying the possibilities of the early application of the hydrocarbon synthesis process in Canada only the gas process will be considered. At the present time this appears to be economically more attractive than the coal process, and the only one competitive with crude refining. The only gas reserves large enough to support a synthesis plant are in Western Canada. The discovery of the Leduc oil field has greatly strengthened the widely held conviction that this area may ultimately become one of the major oil producing areas of the world. At the present time, Alberta is the fourth most active oil exploration area in the Western Hemisphere, which is an indication of the possibilities anticipated by the industry. The development of major production in this area would be accompanied by a reduction in crude prices as the economic orbit of the crude is extended. In this case the competitive position of a synthesis plant would rapidly deteriorate.

Another factor that makes the installation of a Synthesis plant something of a gamble at this stage is the fact that it is a new process undergoing intensive development. There is a possibility that some developments will take place in the next few years that would render present Synthesis plants obsolete. The investment involved in the construction of a Synthesis plant is of such a magnitude that the average individual or corporation would want to be reasonably certain that all possibilities of major improvements to the process had been explored before they would contract for a plant.

The limited market for chemicals in Canada makes the installation of a Synthesis plant less attractive in Canada than it would be in the United States. It appears that the first few American plants will be able to dispose of these chemicals at an attractive return. The Canadian market is so small that even the production from a moderate sized plant cannot be absorbed.

When the above factors are considered, it appears unlikely that a Synthesis plant will be constructed in Canada in the near future.

DISCUSSION

(Continued from page 424)

enormous increase in the use of petroleum in the United States and to the precarious position of Canada in regard to supply.

It is of interest to note that notwithstanding the fact that United States is the largest producer of oil in the world, it is now an importer of oil; also, that two large synthetic oil plants using natural gas are now being installed, one in Kansas, the other in Texas. It is understood that a similar plant using natural gas was to be installed in Alberta, but the advent of the discovery of oil in the Leduc area postponed the construction of this plant.

In view of the serious oil situation on this continent and Canada's dependence on oil from United States, it is logical to suppose that any consideration of the use of natural gas in Alberta should include reserves of gas for one or more synthetic oil plants in this province in the not too distant future.

The papers given at this meeting invariably show that the demand on our natural resources is increasing enormously as compared with the past and, no doubt, this will continue to be the case. Dr. Hume states that the actual and probable natural gas reserves of Alberta, based on our present consumption, are sufficient for seventy years. This figure was given for appraisal purposes but might be misleading to some people.

There are two natural gas pipeline proposals now being actively mooted for exporting gas from Alberta. These together would require about two hundred per cent more gas than is now consumed in Alberta. If you add to this our normal increase and the gas required for only one 10,000 bbl. per day synthetic oil plant, Alberta's actual and probable reserves would only be sufficient for some fifteen years. In this connection it is of interest to note that the gas consumption in Edmonton has doubled in the last seven years.

The export of gas from Alberta would not only tend to deplete our reserves, but would seriously affect our present coal-mining industry by replacing the use of coal by natural gas. While our gas reserves appear to be very large, serious consideration should be given to Alberta's needs before anything is done regarding the export of natural gas from the province.

The Engineering Phases of Oil Production

A paper presented at the Annual General and Professional Meeting, The Engineering Institute of Canada, Banff, Alberta, June 3, 1948.

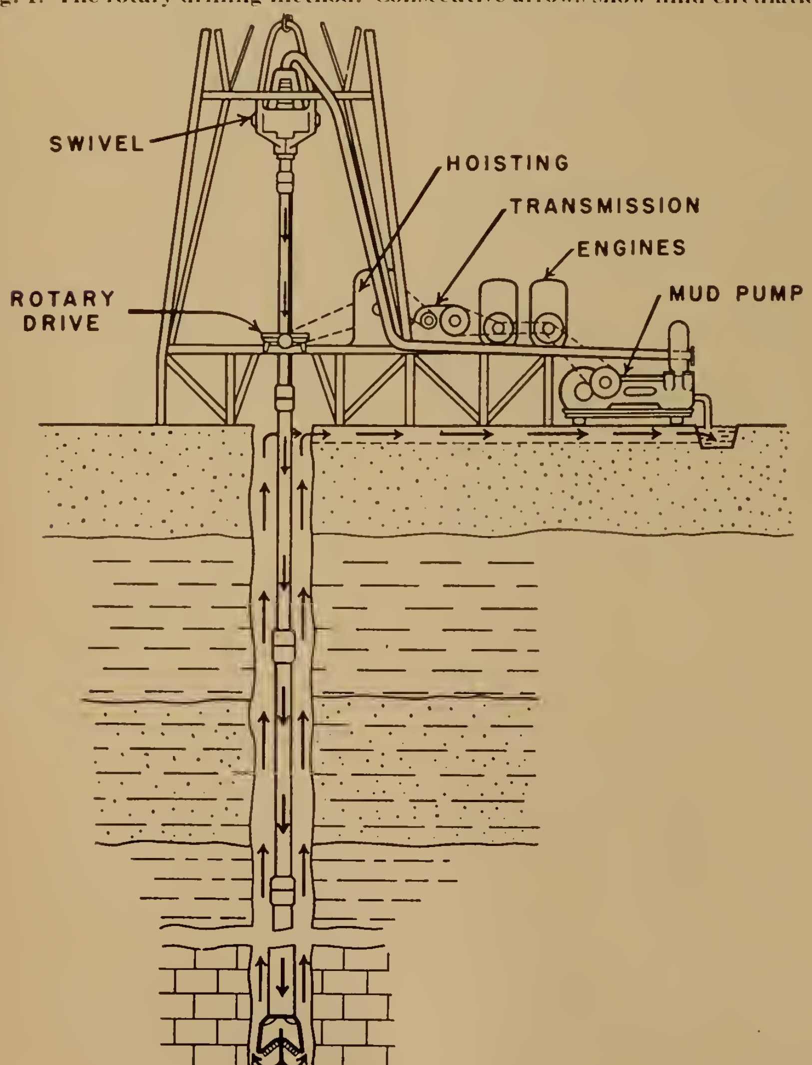
by

E. D. Wilson

Assistant Division Engineer, Imperial Oil Limited, Producing Department, Calgary, Alta.

In discussing the production of oil from an engineering standpoint it is considered appropriate to mention first the engineering aspects of the drilling operations, which are a necessary prerequisite. An attempt will be made, therefore, to point out briefly the application of the various branches of engineering in drilling and producing oil wells, and in studying and controlling the behaviour of petroleum reservoirs.

Fig. 1. The rotary drilling method. Consecutive arrows show mud circulation.



Drilling

The vast majority of wells are currently drilled with various types and sizes of rotary drilling rigs. The essential components of a typical rig are shown on Figure 1, and the principle of operation, which is illustrated, is that of rotating a rock cutting tool, at the same time circulating a drilling fluid to remove rock cuttings from the hole.

The development of the rotary rig and drilling tools has resulted from the application and advancement of mechanical and metallurgical engineering. Each component, from the largest to the smallest, has had to be designed to take care of severe stress, high pressures, corrosive action or extremely hard conditions of abrasion. Outstanding examples are found in the design and construction of the rock bit and the drill pipe.

Rock bits have been designed to withstand vertical compressive forces as high as 5000 pounds per inch of diameter, while being rotated at speeds of 50 r.p.m. or more. Each joint of drill pipe is a precision machined tool from the threads and the couplings throughout its length, and its design is a compromise between meeting specifications of pressure and tension, at the same time being as light in weight as possible and resistant to continuous abrasion.

The chemical engineer has also contributed largely to present day ability to drill deep holes through variable formations, by study and improvement in drilling fluid control. Drilling mud, as it is com-

The development of the rotary drilling rig to its present day form is a victory of achievement for the mechanical and metallurgical engineers. The great depths to which the drill now probes in the search for oil have been made possible also through the work of chemical engineers on drilling fluid control. A new phase of engineering has been developed during the last few years and is now termed Reservoir Engineering. The application of reservoir engineering methods has increased the oil reserves of the world by many millions of barrels.

monly termed, is a complex colloidal suspension and is called upon to meet rigid specifications of weight, viscosity, jel strength, and filtration characteristics. To enable the drilling of sections of salt and anhydrite, chemical treatment is required in order to counteract the flocculation of colloidal material and maintain the desired mud properties.

Heaving shale formations also present a difficult drilling problem, requiring careful control of filtration characteristics or the use of special silica base or oil base muds. To combat abnormally high pressures, drilling mud must be capable of carrying up to double its own weight in weighting material, while on the other hand, when highly porous formations are encountered, drilling mud is used to carry large quantities of various types of filler material into the porous zones.

Further improvements in drilling practices and drilling equipment are constantly under study as the search for oil carries the drill to greater depths and the operation of the drilling rig becomes more costly. Recent advances have been made in, and current energies are being directed towards, unitization and portability of the components of the drilling rig, and in mechanization of the operations required in order to reduce fatigue, eliminate hazardous working conditions and achieve greater speed of operation.

The Petroleum Reservoir

Before discussing the engineering aspects of production operations, a short description of petroleum reservoirs and the methods of production may be in order. The three primary requisites for the formation of a petroleum reservoir are, a source bed of the hydrocarbon components, a porous bed which will contain these hydrocarbons, and an impervious bed overlying the porous bed.

There are various types of reservoirs as shown in Figure 2, which are formed by changes in strata, by variation in permeability of the rock, or by a combination of these. Alberta's newly discovered Leduc Field provides an excellent example of a reservoir formed by variation in permeability in the upper zone, and by changes in the strata in the lower producing zone. A cross section of the field is shown in Figure 3.

Fig. 2. Various types of reservoir formations.

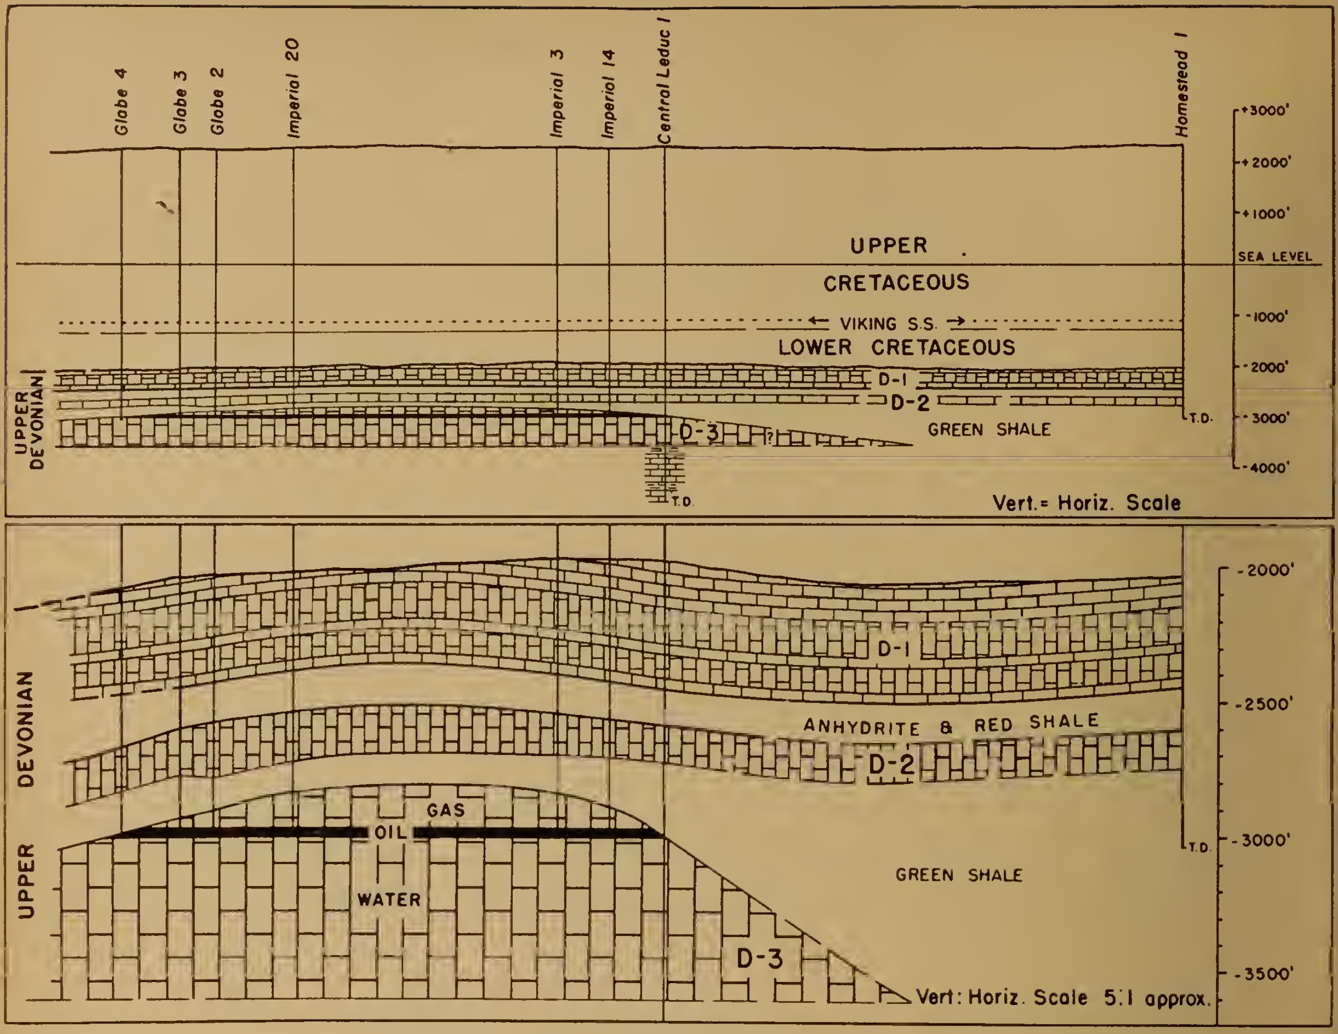

Fig. 3. Cross section — Leduc Oil Field.

The natural gas, oil and water which are trapped in petroleum reservoirs are generally found to be well segregated in the order of their respective specific gravities.

Methods of Production

The simplest method of production is that of natural flow, whereby the latent energies contained in the reservoir are allowed to bring the oil to the surface. This energy may be supplied by the gas in the gas-cap, if present, by the gas-in-solution in the oil, or by the water surrounding the reservoir, all of which are compressed under high pressures. A common method of completing an oil well, controlling the flow and separating the oil and gas is illustrated in Figure 4.

If there is not sufficient energy to cause the well to flow naturally, various types of artificial lift may be used to bring the oil to the surface. These are:

a. Mechanical pumping with
  - i. A sucker rod pump which is a highly improved version of the common water well pump.
  - ii. An electrically operated centrifugal pump, or
  - iii. A hydraulically operated pump.

b. The injection of air or gas to the bottom of the well to assist in lifting the oil to the surface.

Auxiliary Operations

Several methods are used to increase the ability of a well to produce oil. Of these, the commonest are

a. Shooting the productive zone with nytroglycerine, in order to create fractures around the well bore and enable the oil to flow more freely into the well. This method has its application mainly in sandstone formations.

b. Injecting hydrochloric acid into the formation in order to create or enlarge channels through which the oil flows into the well. This method is used mainly in limestone formations.

Engineering Phases of Field Operations

The chemical engineer in the field is concerned with problems of

a. The treating of emulsions which are formed when water is produced with the oil. The breaking down of oil-water emulsions involves careful control of the application of heat and the addition of de-mulsifying agents.

b. The treating and disposal of salt water produced with the oil.

c. The removal of deposits of paraffin from production equipment.

d. The lubrication of equipment.

e. The corrosion of equipment.

Mechanical engineering is ap-

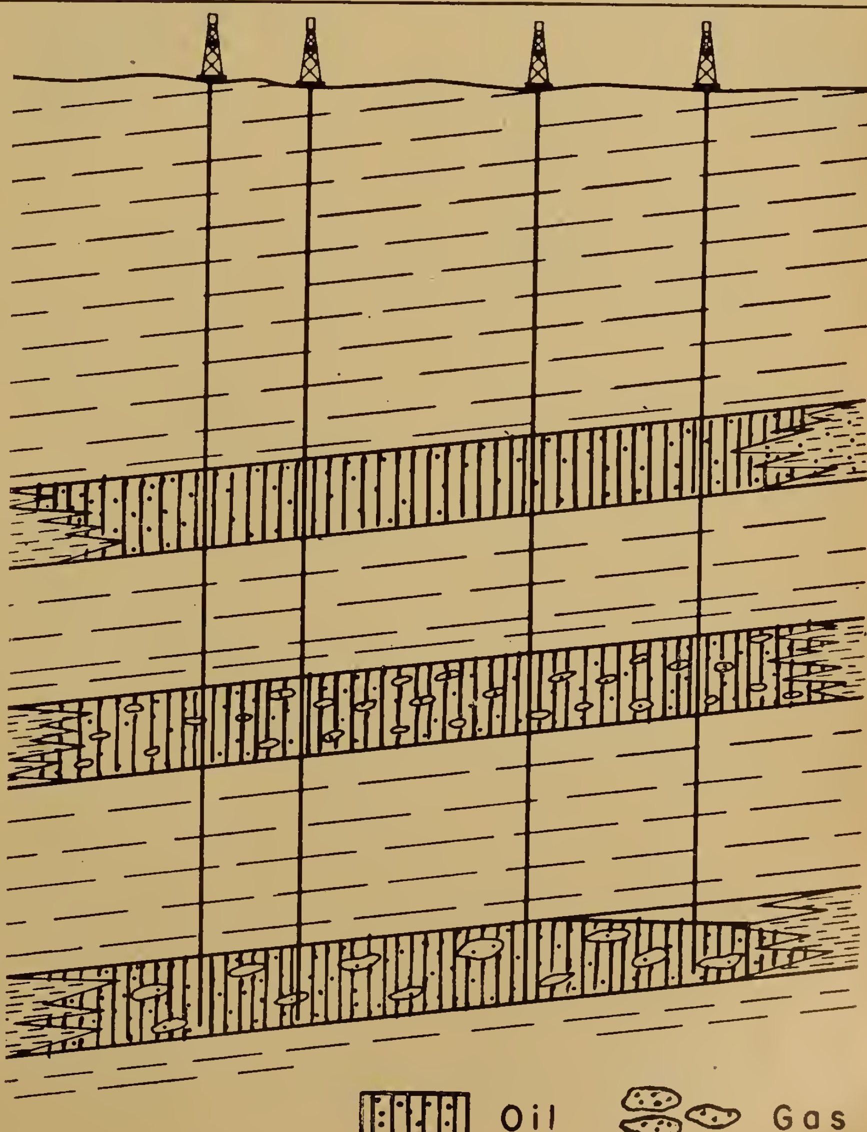
Fig. 5. (right). Reservoir using gas-in-solution drive.



plied in the field in the form of testing various types of equipment, investigating and reporting of equipment failures, and inventing and developing new or improved production equipment.

Electrical and diesel engineers find scope for their abilities in the many power installations that are required, while the civil engineer is concerned mainly with the construction of roads, production sites, surface drainage problems and camp maintenance.

Engineering in Laboratory and Office

Every oil field requires a service laboratory, where chemistry and physics are applied in the analysis of reservoir fluids and in the determination of the porosity, permeability, and connate water saturation of the reservoir rock. Many of the techniques used have been developed in the research laboratories of the major oil producing companies.

In connection with the production of oil there is a considerable amount of work of an engineering nature to be done in the office which is common to most industries. This work consists of technical report writing, cost estimation and analysis, production forecasting, lease evaluation, general design work, and advising and assisting management. In addition there has developed in the last few years a new phase of engineering which is peculiar to the oil industry and is termed Reservoir Engineering.

Reservoir Engineering

Reservoir engineering may be defined as the study of the extraction of fluids from a reservoir, and of the movements of fluids within a reservoir. The study of reservoirs has been going on for many years. It possibly was begun on fresh water reservoirs in connection with the supply of water for large centres of population. Reports of such studies are dated as far back as the 1880's and 1890's. However, it was not until the late '20's and early '30's that the application of reservoir studies was made to the production of petroleum reservoirs.

Since then the petroleum industry has devoted its best brains and

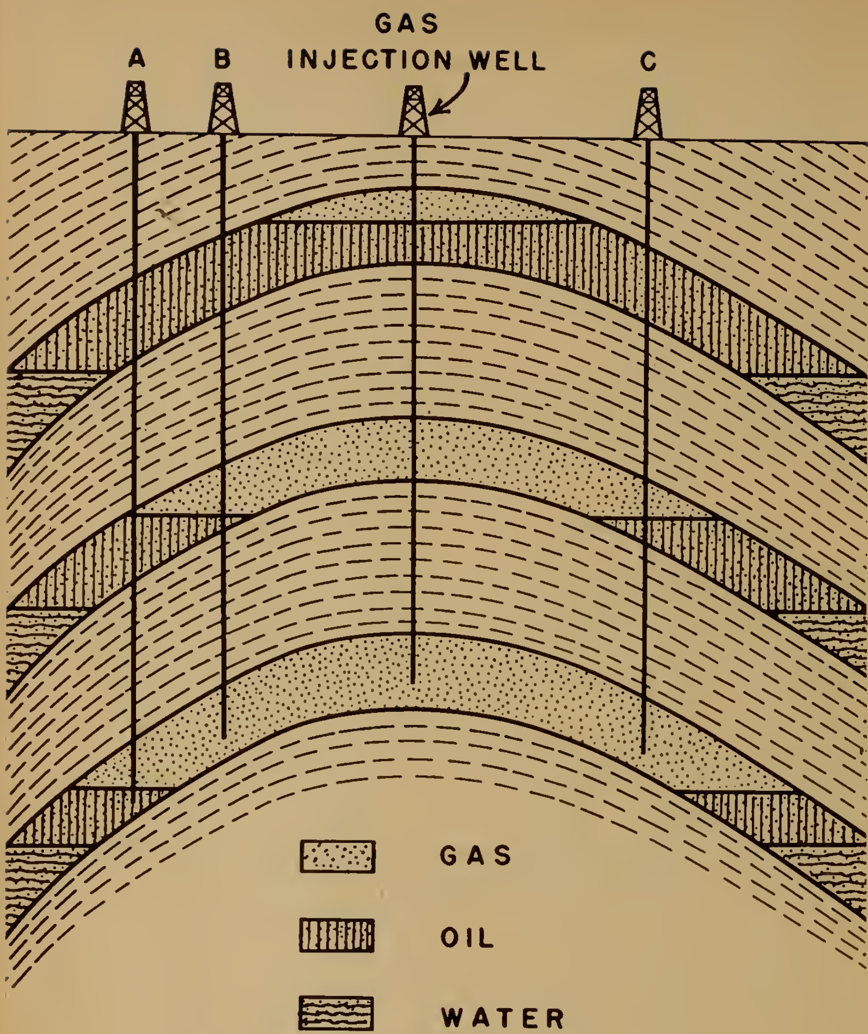


Fig. 6. Reservoir utilizing expanding gas cap drive.

many thousands of dollars to the development of the understanding of petroleum reservoirs. In practice today the diversities of fields in petroleum or production engineering are many, but it is considered that the real petroleum engineer must be one who has the ability to handle reservoir engineering problems.

Reservoirs are classified into three types, according to the drive or recovery mechanism which is functioning within the reservoir. The types of recovery mechanisms are:

a. The gas-in-solution drive, in which the only source of energy is from the gas which is dissolved in the oil. (Figure 5)

b. The gas-cap drive in which the energy required is supplied by an expanding gas-cap above the oil zone. (Figure 6)

c. The water drive in which the energy required is supplied by the expansion of water surrounding the petroleum reservoir. (Figure 7)

Combinations of the above recovery mechanism are common, also, gravitational segregation may play an important part in the three types of drives, and is sometimes classified as a separate type of drive.

Gas-in-Solution Drive: In dissolved gas drive reservoirs a continuous rapid drop in pressure may be expected, with a corresponding rapid rise in gas-oil ratio, which reaches a maximum and then falls off rapidly in the later life of the reservoir. Normally, wells require pumping fairly early and the recovery expectancy is in the range of from 10 to 40 per cent of the oil in place, depending on gravitational segregation.

Gas-Cap Drive: A slower but continuous drop in reservoir pressure characterizes the gas-cap drive reservoir, accompanied by a gradually increasing gas-oil ratio. As a rule, the wells will flow continuously throughout their life and the recovery expectancy may be from 30 to 80 per cent of the oil in place, dependent again on gravitational segregation and also on the degree of reservoir control.

Water Drive: In a water drive reservoir the pressure drops rapidly with initial production and then levels out and remains fairly constant over the remaining life of the reservoir. The gas-oil ratio remains low for a period and then gradually increases. With this type of drive from 50 to 80 per cent of the oil in place may be recovered.

The characteristics of the types of drives described above are illustrated in Figure 8.

Reservoir Analysis

The study of reservoir behaviour begins with the accumulation of data on the composition of the reservoir fluids, the volume of gas, oil and water that are produced, the sub-surface pressure history of the reservoir, details of completion and performance of individual wells, porosity, permeability, and connate water saturation of the reservoir rock and geologic data on the physical shape and size of the reservoir.

From the geologic data and average values of the properties of the reservoir rock it is relatively simple to calculate the volume of oil in place. However, the estimation of how much of this oil will be recovered and the prediction of the behaviour of the reservoir are much more complex problems.

From the reservoir data that have been assembled it may be possible by visual inspection to determine the type of recovery mechanism which is operating. The more exact determination of this information and the solution of several other problems in connection with reservoir behaviour are accomplished by means of volumetric balance.

Volumetric Balance

The volumetric balance is essentially an inventory of the reservoir fluids. This is an extremely useful tool for analyzing the past and predicting the future pressure behaviour under various operating conditions, also the behaviour of the gas-cap and the magnitude of water influx. By use of the volumetric balance and other equations at the same time it is further possible to determine the amount of regional field drainage, the effect of gravitational segregation, and the effect of pressure maintenance. It is also possible to plan artificial lift programmes in advance, and to estimate ultimate recovery and change of same with change in method of operation.

For gas-cap and gas-in-solution drive reservoirs, volumetric balance equations are derived by simply equating withdrawals from the reservoir to the expansion of the remaining oil and gas. In the case of a water drive, reservoir withdrawals are equated to the expansion of the remaining fluid plus the volume of water influx. The results of the volumetric balance may give a false picture of the behaviour of the reservoir. It is, therefore, necessary to check the results against the performance of individual wells before accepting the findings as being correct.

One of the most important applications of the analysis of reservoir behaviour is that of controlling the rate of fluid withdrawal, in order to increase the ultimate recovery of oil. In order to take full advantage of a water drive the rate of fluid withdrawal must be restricted, due to the nature of the action of the water drive. The rate of water influx into a reservoir is a function of time and of the pressure differentials in the reservoir. In years past, water drive reservoirs have been produced at such excessive rates that practically no benefit has been derived from the energy available from the water drive, with the result that large quantities of oil have been left in the ground.

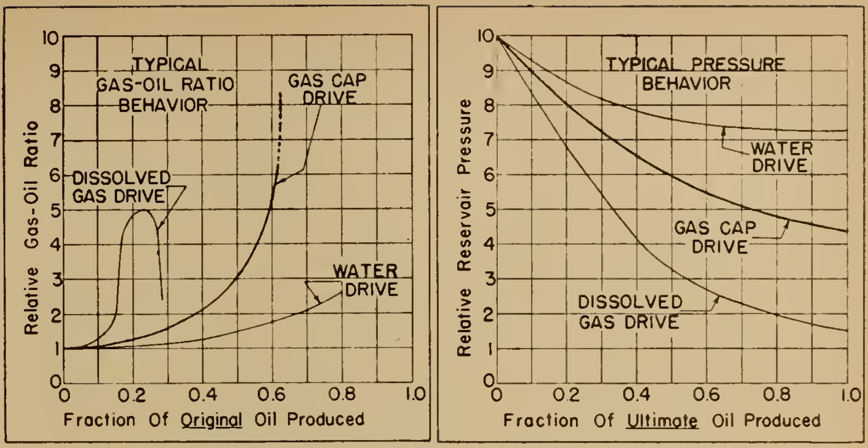

Fig. 8. Characteristics of various drives compared.

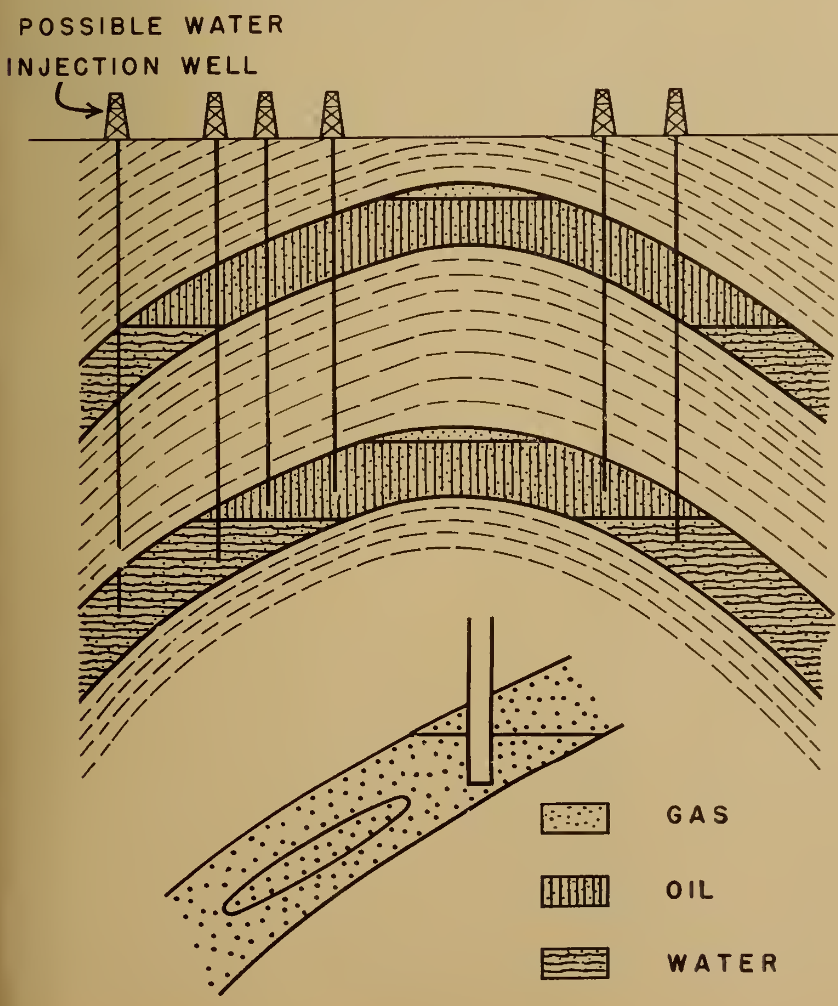

Fig. 7. Reservoir operated by means of water drive.

In addition to taking full advantage of the latent reservoir energies, it is also possible to supplement this energy by means of returning produced gas and water into the reservoir, thus reducing the net fluid withdrawals and maintaining the reservoir pressure. Such methods are referred to as pressure maintenance operations. These are actually secondary recovery methods. They are instituted while the primary recovery operation is still in effect, to differentiate between secondary recovery operations, which are instituted after the reservoir has been depleted by primary recovery methods.

When it is considered that pressure maintenance may result in an increase in ultimate recovery amounting to millions of barrels of oil, but that such operations involve large expenditures in capital equipment installations and operating costs, the importance of careful analysis of reservoir behaviour is easily recognized. The application of reservoir engineering methods has greatly increased the reserves of oil in the producing fields of today. It is hoped that in the future even more efficient reservoir control will be possible as a result of the continuing research and engineering effort which is being directed towards this goal.

Discussion follows.—Ed.

Discussion

J. W. Young, M.E.I.C.[1] In the time available to him, the author has succeeded in giving a broad and comprehensive picture of the services rendered by the engineer in modern oil production. It is regrettable that the time has not been available to permit the expansion of this paper into a review of the various methods in use today, as well as a prediction of what the future developments may be.

In discussing the treatment of oil field emulsions the author mentioned the use of chemical treatment with de-mulsifying agents, but did not discuss the use of electrical de-mulsification equipment. It would be of interest to obtain his opinion as to the relative merits of the two methods of treatment and their fields of application in the future.

F. F. Dyer, M.E.I.C.[2] The main purpose of these discussions as understood by the writer, is not to make the author happy, but to criticize the papers, and possibly bring out items that might have been further developed. If these few remarks appear to be critical it should not be inferred that Mr. Wilson's excellent paper warrants criticism.

The following remarks should be considered with the fact in mind that the writer is not an expert in petroleum production, but are made from the point of view of an interested amateur. His experience has been almost entirely in the refining end of the business which is a very different aspect of the petroleum industry to that of production. Perhaps, though, this is as it should be, since it is almost certain that most of us here are not experts in this subject, in spite of the saying that an expert is anybody more than sixty miles from home.

Mr. Wilson commences his topic at the time of drilling operations. Before the well can be drilled, however, a site must be chosen. In choosing that site engineering has come into play. Pure geology, the study of the rock formation in the area, is possibly not considered to be engineering, but there can be no argument that engineering principles are employed in the specialized processes applied to the search for oil underground. There is a tremendous amount of survey work to be done before drilling can commence. The seismographic surveys are highly technical fields in which engineering plays its part. The instruments used and the processes applied surely have an engineering background.

Again, with the thought that most of us know little about the actual drilling operation and procedure, it seems this paper could have been brought home to us more forcibly if it had gone into more detail on the actual drilling. It has always been a marvel to me how the drill can be directed far down in the earth, so that it will travel in the direction desired, even turning corners when necessary. How can a long, slender piece of steel, reaching say half a mile into the earth be operated so that it ends up at exactly the spot desired? These techniques are surely engineering.

The author has merely mentioned the safety engineering features applied to drilling, and the handling of crude oil. These are extremely important if the well is to be brought into production successfully, without disaster, and even possible loss of life. There have been instances right here in this province where the failure to follow the rules and regulations has had extremely unfortunate consequences.

The foregoing comments appear to be criticism of what the author has not said, rather than what he did cover. Mr. Wilson has a very general topic, and inevitably he could not include everything in the time and space available. He has covered a difficult subject in a very creditable manner.

H. E. Denton, M.E.I.C.[3] The author has delivered an excellent paper on the subject, and is to be commended not only by his audience but by the oil industry as a whole. He has passed on to this meeting valuable information which should be appreciated by everyone. The following comments on this paper are few and in the form of additions rather than criticism. There is no disagreement with a single statement, but a few remarks to cover a few important points are in order. This is such a broad subject, and the author has done well to consolidate so much information in such a short report.

The duties of the various types of engineers have been outlined. Those of the chemical engineer must not be underemphasized. Too much stress cannot be placed on the importance of the control of drilling muds. The use of properly controlled drilling mud makes possible the drilling of oil wells where otherwise it would be impossible. There is being developed lately a " mud engineer "; mostly his duties are in the field, putting into practice what the chemical engineer develops in the laboratory. Time will see much improvement in this phase of engineering.

In the production of oil and gas it is the duty of the chemical engineer to keep abreast of all analytical work so as to be able to advise management where the products can be best marketed and processed. The chemical engineer also plays a most important part in calculating ultimate recovery by the volumetric balance method.

Additional comments are in order on the topic " reservoir analysis ". The author has stated that in order to properly analyze a reservoir no less than nine properties are to be determined, namely: composition of the reservoir fluids; the volume of gas; oil and water that are produced; the subsurface pressure history of the reservoir; details of completion and performance of individual wells; porosity; permeability; connate water saturation of the reservoir rock, and geologic data on the shape and size of the reservoir.

The maximum benefit realized from a reservoir analysis is, of course, in a newly discovered field, in order that proper methods of production can be introduced, the result being the conservation of reservoir energy, which in turn reflects itself on the maximum ultimate recovery.

In a newly discovered oil field many assumptions and estimates have to be made. No back-log or history of the field is available. The production engineer is charged with the duty of making these assumptions and estimates, acquiring all known data, and deciding by which drive or combination of drives the field is energized. With this done he can then determine what the rate of production should be to conserve energy and what ultimate recovery can be expected.

The author has given the esti-

[2] Imperial Oil Limited, Sarnia, Ont.

[3] Denton Spencer Co. Ltd., Calgary, Alta.

mated minimum and maximum percentages of recovery for each type of " drive ". The averages of these are 30 per cent minimum and 66 2/3 per cent maximum. It is readily seen that a reservoir containing one billion barrels of oil could yield, if produced properly, 666 million barrels; if produced improperly 300 million barrels. It is little wonder that the oil industry is devoting much energy and money toward the improvement of technique used in " reservoir analysis ".

The term " primary recovery " was adopted after the commencement of repressuring operations. Repressuring resulted in what is commonly known as " secondary recovery ". With the improvement of production efficiency it is expected that secondary recovery operations will be unnecessary because of the total depletion of the reservoirs in the single operation.

Some mention should be made about the production of condensate wells, mostly found in the area surrounding the Gulf of Mexico. In that type of reservoir the fluid is principally gas, containing small amounts of condensate. These wells are produced and the condensate removed by stage separation and absorption. The gas is then returned to the formation from which it came. The volume of the liquid removed from the formation is comparatively small. The life of these wells as far as condensate is concerned will be as long as the value of the liquid recovered is in excess of the operational expense. Beyond that limit the reservoir would then contain a lean gas recoverable as it is consumed. Any condensate recovered from that time on would be a by-product. The operation of these wells during the past few years has done much to encourage and promote pressure maintenance in the more commonly known oil wells.

FROM MONTH TO MONTH

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

Collective Bargaining and The Institute

Collective bargaining for engineers has once again occupied the centre of the stage, this time perhaps for its final appearance. The new federal industrial relations legislation known as "An Act to provide for the Investigation, Conciliation and Settlement of Industrial Disputes" (Bill 195) has passed both Houses at Ottawa. Engineers are excluded from its provisions by the following clause—

> *(i)* "employee" means . . . .. but does not include
>
> (ii) a member of the medical, dental, architectural, engineering or legal professions, qualified to practise under the laws of a province and employed in that capacity;

Mention of this legislation has been made previously in the *Journal*, but now that the business has been concluded it may be of interest to members to know just what part the Institute took in it.

Months before the legislation first appeared in the House, the Institute was asked by members of the Cabinet for an expression of opinion. It was stated that what the Institute asked for would be incorporated in the Act. This placed a great responsibility on Council. Accordingly the Committee on Employment Conditions made a careful study of the situation, keeping in mind the experience that had been gained under Order-in-Council 1003. Their recommendation was that the Institute should ask for exclusion from the Act as it was evident from earlier experience that satisfactory legislation permitting bargaining for engineers by engineers was not attainable.

Council debated the committee's report and approved it with only one negative vote and one councillor not voting. The decision was then forwarded to the Minister of Labour. The correspondence covering this appeared on page 232 of the April 1948 *Journal*.

When the legislation made its appearance in the House it did provide exclusion for engineers. At this point members of parliament began to receive from engineers who wanted to be included, telegrams and other communications protesting the exclusion. When the House of Commons committee met, representations were made on both sides of the question.

The subsequent canvassing of branches and the president's talks with the western branches, the many meetings of the Institute's committee, the meetings with other societies, the endeavour to find a common policy acceptable to all, makes up a long and involved story. The outstanding development was that every branch from Lakehead west, supported Council's decision, and that most of the branches in the central and eastern provinces also wired their approval. Toronto, Peterborough and Moncton did not agree with Council's decision.

The wisdom of Council's policy was indicated late in the negotiations when requests for exclusion reached the Department of Labour from all the provincial professional associations and the Canadian Institute of Mining and Metallurgy, thus presenting a solid front on behalf of the profession. In addition, exclusion was asked by the Chemical Institute of Canada and the Royal Architectural Institute of Canada.

In all these deliberations the officers of the Institute were not unmindful of the wishes of those groups which had tried collective bargaining and found it helpful. They kept before them also the experiences of those groups, as in Quebec, which had tried collective bargaining and found it unsatisfactory.

The situation was confused but still all thinking brought Council back to the same conclusion, that the interests of the whole profession, including the younger members would be best served if they were divorced from collective bargaining, and all forms of trade unionism.

There must be other and better ways than collective bargaining for protecting the profession from exploitation by the employers, when such exploitation becomes apparent. The Institute stands ready at any time to discuss the welfare of individuals or groups and to take a part in securing alleviation of working conditions which are not just and fair. There is already a considerable record of attainment in such matters in the history of the organization.

The outstanding features of the long drawn out affair are two. In the first place this marks the first time that the federal government has recognized engineering as one of the professions. Hitherto in all groupings the engineers have been shown separately from the lawyers, doctors, architects, etc. This is indeed a great and necessary step in our ascent to professional recognition.

In the second place the campaign to secure this form of legislation found all the engineering organizations, "singing the same tune out of the same hymn book", as immediate Past-President Grant described it. This too is a unique accomplishment and may presage things for the future. If such unanimity is made possible by the travail of this latest experience, it will indeed have been a profitable one.

Canadian Wins Coveted Medal

A graduate of Toronto University and a Member of The Engineering Institute of Canada, has been awarded one of the most distinguished honours available to engineers in the United States. His many Canadian friends will join gladly with the Americans in applauding the award.

The Lamme Medal is sponsored by the American Society for Engineering Education and is awarded for "achievement in engineering education". This year's winner is Dr. Alexander Graham Christie, professor of mechanical engineering at Johns Hopkins University, a graduate of the School of Practical Science, Toronto, and a former citizen of the Province of Ontario. The following interesting biographical material is supplied by the American Society for Engineering Education.

Alexander Graham Christie, twenty-first Lamme medalist of this Society, was born at Manchester, Province of Ontario, Canada, on November 19, 1880. He was graduated in electrical and mechanical engineering from the School of Practical Science, University of Toronto in 1901 and received the degree of Mechanical Engineer there in 1913. The honorary degree of Doctor of Engineering was conferred upon him by Stevens Institute of Technology in 1939 and by Lehigh University in 1940.

From 1901 to 1904, Dr. Christie was employed by the Westinghouse Machine Company principally on early steam turbine construction and development and on gas engines. After a year as instructor in mechanical engineering at Sibley College, Cornell University, from 1905 to 1907 he was in charge of erection, test and operation of steam turbines, including the first ones made by the company, steam engines, and gas engines for the Allis Chalmers Company. He returned to Canada as mechanical engineer

Dr. A. G. Christie, M.E.I.C.

responsible for construction and operation of the power plant of the Western Canada Cement and Coal Company at Exshaw, Province of Alberta.

From 1909 to 1914, Dr. Christie served as assistant and later associate professor of steam and gas engineering at the University of Wisconsin where he was in charge of the experimental and research laboratories in mechanical engineering. In 1914 he became associate professor and later professor of mechanical engineering in charge of the department at Johns Hopkins University. He retires from that position this year. Since 1916, he has been director of night courses in technology at Johns Hopkins.

During World War I, Professor Christie assisted the Emergency Fleet Corporation in developing courses of training for ship building mechanics and foremen. During the second World War, he served as member of the Jet Propulsion Committee, National Advisory Committee for Aeronautics, as director of Vocational Training for Maryland, War Manpower Commission, and as consultant for the War Utilities Sub-Committee, Technical Industrial Intelligence Committee, War Production Board. Other public services include chairmanship of the Board of Engineers, Province of Alberta, which studied steam and hydro-power developments there in 1929, and membership on the Advisory Board of Engineers, Owens River Gorge Project of Hydro-Electric Development, California in 1942.

Since leaving full time industrial work in 1909, Professor Christie has acted as consultant on a very large number of engineering projects, not only in all parts of the United States and Canada but in England, other countries of Western Europe, and in the Far East. This activity has involved largely engineering of steam power plants on which he is recognized as one of the world's leading authorities, but has also included much work in the hydro-electric field and on a great variety of other projects.

A President is Appointed

Because of the contributions of the late Dr. W. E. Wickenden to the literature of the profession and in particular to the literature of the Institute, the appointment of his successor, Dr. T. Keith Glennan to the office of president of the Case Institute of Technology at Cleveland, will be of interest to the members of the Institute.

Dr. Glennan is a graduate in electrical engineering of the Sheffield Scientific School of Yale (1927). He had a distinguished career in the field of sound amplification, particularly in relation to the motion picture industry.

In 1942 he became director of the Navy's Underwater Sound and Detection Laboratory at New London, Conn., for which service he received the Medal of Merit.

Dr. Glennan follows a gentleman of great accomplishments, great renown and great character. It will be the wish of everyone that the success he has enjoyed in industrial life will follow him into academic life, and that through him Case may continue its excellent record of leadership.

An Encouraging Experiment

McGill University conducted a short course in land subdivision at Macdonald College, Ste. Anne de Bellevue, Que., from May 31 to June 9 last, under the direction of Professor H. J. Spence-Sales. The legal, social, engineering, architectural and other aspects of the laying out of housing developments were treated in considerable detail. The course was in the nature of an exploratory venture to determine the reception which might be expected for short practical courses in the different phases of community planning. The organization committee, which included Professor R. DeL. French as the Institute's representative, has expressed satisfaction with the results.

A nearby tract of about 75 acres was chosen as a guinea pig. After arriving at the fundamental basis of design through class discussion of desired population density, size of family, family income and age brackets, size of lots, width of streets, park and recreation areas and the like, each group of five or six students produced a subdivision of this area meeting the standards set as nearly as practicable. Financial matters were not neglected; an estimate of cost of development, including profit and selling expense, was made for each scheme and the selling price of lots was fixed.

Each group made a relief map in sand of its layout, a scheme which was found very useful in visualizing advantages and disadvantages. Unofficially, each group christened its brain child—few of the names would have met with the approval of the "realtor".

The 34 attending included representatives of federal, provincial and municipal planning authorities, surveyors, consulting engineers, lending institutions, real estate operators and property owners from Halifax to Fort William. Generally, they seemed to feel that they got their money's worth, and many expressed the hope that similar courses dealing with other aspects of planning might be given in years to come.

The School is particularly grateful for the financial support of the Government of the Province of Quebec and of the Central Mortgage and Housing Corporation. Further details of the accomplishments of the course will be reported when the proceedings have been prepared for publication.

Research Activity in India

Through the National Research Council, Ottawa, the Journal *has received the following information which will be of interest to members.—Ed.*

The Government of India has created a Department of Scientific Research with effect from 1st June, 1948. The Department will be in the charge of the Honourable Prime Minister of India and Dr. S. S. Bhatnagar, F.R.S, director of scientific and industrial research, has been appointed the secretary and principal executive officer. The Department will take over the work of the Board of Research on Atomic Energy and the Council of Scientific and Industrial Research. The latter body although attached to the new Department will retain its unofficial character and will continue to function as before.

The new Department will deal also with scientific advice to government departments, *ad-hoc* scientific research in universities and research institutions, research scholarships in applied scientific subjects, international scientific unions, scientific liaison offices, the Scientific Consultative Committee and such other subjects as may be transferred to it. The Department will co-ordinate the scientific activities of the other Ministries and in this work it will be assisted by a Co-ordination Committee consisting of eminent scientists.

Flood Control in British Columbia

It is a matter of interest to all Canadians that the federal and provincial governments have arranged to study jointly the Fraser River Valley in British Columbia. The recent disastrous flood in the most westerly province was a matter for official discussion at the recent Banff Annual Meeting of the Institute, where Prairie Water Problems had already been designated as the principal subject of the conference. From the meeting messages were sent by the president expressing through the Premier sympathy to the citizens who had lost so much, and encouragement to those engineers who were struggling to restrain the wild waters from doing further damage.

There will be general satisfaction over the selection of the personnel for the board. All are well experienced in this field and will be able to tackle the problem without any preliminary loss of time.

There are six engineers, two fisheries experts and one on lands. The complete list is as follows:— A. L. Carruthers, M.E.I.C., former deputy public works minister for British Columbia; Major R. C. Farrow, M.E.I.C., comptroller of water rights for B.C.; Bruce Dixon, M.E.I.C., provincial diking commissioner; F. G. Goodspeed, M.E.I.C., assistant chief engineer, federal Public Works Department; K. W. Morton, M.E.I.C., district engineer for B.C.-Yukon, federal Public Works Department; C. E. Webb, M.E.I.C., district chief engineer, Dominion Water and Power Bureau; George Alexander, deputy minister of fisheries for B.C.; A. J. Witmore, chief supervisor of fisheries for the federal fisheries department, and George Melrose, deputy minister of lands for B.C. Mr. Goodspeed has been proposed by British Columbia Public Works Minister as chairman of the nine-man board.

The purpose of the board will be to examine all existing reports and make other studies dealing with the general economy of the Fraser watershed. Problems of storage dams, flood control, power development, irrigation and the propagation of fish in the Fraser and its tributaries will be considered.

From such information it is expected an over-all programme may be developed for submission to the two governments in the hope that it can be carried out in various stages as the occasion permits or demands.

I thought this might be a suitable topic for discussion at any future meeting of the engineering society presidents. Do you think the case method a good way to develop professional relationships and public responsibilities?

Very truly yours,

F. W. Davidson, Jr.E.I.C.

March 11th, 1948.

My dear Davidson:

Your letter of the 5th was most enjoyable and I find myself fully in agreement with what you suggest.

The development of a spirit of professionalism is not easy to accomplish. You can teach a man how to hit a golf ball, how to address a public meeting and how to drive a motor car but it is a much more difficult undertaking to develop within him a professional spirit.

Like you, I feel that such a spirit must grow naturally within a person almost without any perceptible leadership from the outside. It is the sort of thing which I feel a person gets very largely from his parents and from his associates when he is young and I feel that he actually has it perhaps in an unrecognizable form even when he enters the university.

As you know we hear quite a bit these days about increasing the cultural subjects in an engineering course. I am not an enthusiast for such proposals. I think that one's appreciation of cultural subjects which itself is an indication of culture comes from a proper growing up. I do not think a person who is not fond of literature can be changed in the course of a few hours of lectures during his university years. He learns his love of literature as a small child and its greatest development comes during his high school years. If he doesn't have it when he enters the university I don't think he will ever have it.

I think your suggestion is worthy of a lot of consideration and it certainly should be put on the agenda of our next student conference. In the meantime, however, I'm wondering if you would let us print your letter in *The Engineering Journal*. I think many members would like to read it.

Yours sincerely,

L. Austin Wright,

General Secretary.

Correspondence

Mainly due to lack of space the printing of the following letters has been delayed. The subject matter is entirely timely, however, and should be of interest to members. —Ed.

Harvard University

Graduate School of Business Administration

March 5, 1948.

Dear Mr. Wright:

This letter contains a suggestion for the improvement and teaching of professional consciousness among student engineers.

I am a student of the Harvard Graduate School of Business Administration. I am a former President of the Engineering Society of U.N.B. and winner of the Martin Murphy Prize in 1945. You may recall I sat in as an observer at the first meeting of the Presidents of the Engineering Undergraduate Societies at the Annual Meeting of the Institute in Montreal in February, 1946.

I have followed with interest the enthusiasm shown for these meetings since that time. I feel it is a step forward in co-operative education between the interested parties of theory and practice.

The need for increased cognizance of intellectual honesty and moral force of character on the part of the neophyte is of growing concern. Increased efforts of engineers to bargain collectively, while of importance may relegate the profession to that of union status. I am not saying it is bad to seek more recognition and more pay, but I do think it imperative to preserve the opportunity for recognition of individual merit. Should those now entering university from high schools not gain sight of the profession and its responsibilties it would be most unfortunate.

Dean Young of Toronto has written extensively on the subject and I believe he has suggested that a separate course on professionalism would do more harm than good. He recommends that occasional mention of the subject by professors in the classes would be more practical. With this I can agree and I think it would be quite beneficial as long as faculty members co-operate, but I think a much stronger effort is needed.

The case method of instruction, while inapplicable to most courses in engineering might well be used to develop this professional consciousness in the neophyte. Extracts of legal cases involving fraud on the part of engineers, disguised case material of actual situations in business, and extracts of problems of the engineer in the civil service are a few sources of such material.

The danger of students rebelling against a short course in the regular curriculum could be obviated by having it introduced by students themselves in panel discussions at engineering society meetings. Outside speakers could lead discussions if deemed advisable. A further mixture of thought could be obtained by using practicing engineers and professors in the panels. Another method might be to have one man lead the discussion and the students themselves do all the talking. The advantage to the latter idea is that it builds greater confidence in the student and forces him to think his theme through to a conclusion. These are merely suggested as means of putting the case material across.

Initial instruction should be started early in the student's training at university. Thus the use of the student engineering societies would provide a means of bringing engineers together in their first year. The disadvantage of trying to introduce it in the regular classroom schedule in the early years is that many students have not been segregated into engineering.

BRANCH OFFICERS AT BANFF

(Top, left) G. J. (Skip) Currie, Ira P. Macnab, and M. L. Baker, were delegates from Halifax Branch.

(Left) N. F. McCaghey, Kenogami, Que., and R. N. Coke, chairman of Montreal Branch.

(Right) Delegates from Ontario branches. From top left: C. F. Morrison, Toronto; Major-General G. R. Turner, Ottawa; G. R. Henderson, Sarnia; D. C. Beam, Toronto; E. V. Buchanan, London, Ont.; F. F. Dyer, Sarnia; J. R. Dunbar, Hamilton; J. F. MacLaren, Toronto.

(Right) The Prairie Provinces were represented by (l. to r.): A. H. Douglas, Saskatoon; Stewart Young, Regina; G. R. Fanset, Winnipeg; A. G. Donaldson, Lethbridge; T. M. Parry, Calgary; G. W. Moule, Winnipeg; C. V. Antenbring, Winnipeg; E. K. Cumming, Edmonton; H. W. Tye, Edmonton.

(Lower right) Officers representing the British Columbia branches. Left to right: S. C. Montgomery and E. Mason, Trail, B.C.; G. W. Allan and Sidney Hogg, Vancouver; Kenneth Reid and S. H. Frame, Victoria.

(Facing) A group photo of the delegates to the Branch Officers Conference. Back row, l. to r.: Major-General G. R. Turner, Ottawa; S. C. Montgomery, Trail; Howard Douglas, Saskatoon; A. G. Donaldson, Lethbridge; G. R. Fanset, Winnipeg; E. V. Buchanan, London, Ont.; C. F. Morrison, Toronto; J. R. Dunbar, Hamilton; E. Mason, Trail; H. W. Tye, Edmonton.

Middle row, l. to r.: I. P. Macnab, Halifax; E. K. Cumming, Edmonton; T. M. Parry, Calgary; F. F. Dyer, Sarnia; Sidney Hogg, Vancouver; Stewart Young, Regina; M. L. Baker, Halifax.

Front row, l. to r.: Kenneth Reid, Victoria; N. F. McCaghey, Saguenay Branch; G. W. Moule, Winnipeg; S. H. Frame, Victoria; G. R. Henderson, Sarnia; C. V. Antenbring, Winnipeg; G. W. Allan, Vancouver; R. N. Coke, Montreal; J. F. MacLaren, Toronto.

The following attended the Branch Officers Conference, but were not present for these photographs: T. V. Berry, Vancouver; S. G. Coultis, Calgary; J. Mercier, Quebec City; K. W. Mitchell, Calgary; A. M. Thompson, Winnipeg.

MORE BANFF PICTURES

Largely through the efforts of S. G. Coultis, chairman of the Calgary Committee, arrangements were made to have a group of Indians from the reservation at Morley, Alberta, visit Banff, where they set up their tepees on the athletic grounds adjoining the hotel. The Indians proved to be a particularly interesting feature of the meeting, and their encampment was visited by most of the delegates, their families and their guests.

The Pacific coast features prominently in this photo showing delegates and their wives attending the Annual Meeting. Shown in the photo, taken outside the hotel, are (l. to r.): Mrs. K. Reid, Victoria; Mr. Reid; Mrs. R. F. Binnie, Shalalth, B.C.; Mrs. G. M. Irwin, Victoria; Nat Hunter of the Stoney Indian tribe; Mrs. G. W. Allan, Vancouver; H. N. MacPherson, Vancouver; Mrs. S. Hogg, Vancouver; Chief Enos Hunter of the Stoneys; Mrs. H. N. MacPherson, Vancouver; Miss M. E. Dolmage, Vancouver.

Albertans at Banff. This group includes (l. to r.): Mrs. S. G. Coultis, Calgary; Mrs. F. R. Burfield, Edmonton; Mrs. Howard Tye, Edmonton; Mrs. P. M. Sauder, Strathmore, Alta.; Chief Enos Hunter; Mrs. N. A. Bradley, Edmonton; Miss Linda Hamelin (in front); Mrs. H. J. Williamson, Edmonton; Mrs. D. F. Hamelin.

Winnipeg ladies meet Stoneys. Shown here, from left: Mrs. W. D. Hurst, Mrs. I. W. Beverly, Chief Nat Hunter of the Stoney Tribe, Mrs. F. V. Seibert, Mrs. C. V. Antenbring and Mrs. G. R. Fanset.

Ontario was never like this. Stoney Indian squaws and their children photographed with some of the ladies from Ontario. Left to right: Mrs. W. A. T. Gilmour, Hamilton; Mrs. P. H. Wallace, Cardinal, Ont.; Mrs. H. E. Adams, Walkerville, Ont.; Miss R. J. Gilmour, Hamilton; Mrs. Nat Gunter, and little John Hunter; Mrs. H. R. Henderson, Sarnia; Mrs. Enos Sunter and Miss Ann Poucette of the Ntoneys.

Paleface engineers from Quebec and their wives meet redskin braves at Banff. From left: Brig.-Gen. George Francoeur, Quebec City; Mrs. Tom Kakquitts of the Stoney Tribe; Mrs. Francoeur; A. G. Hibbard, Montreal; Mrs. Hibbard; Mrs. A. C. Trudel, Montreal; Chief Tom Kakquitts; Mrs. W. R. G. Ray, Quebec City, and Mr. Ray.

Mr. and Mrs. H. S. Weldon of Montreal receive the congratulations of Chief Tom Kakquitts on their 25th wedding anniversary. They were photographed on the grounds of Banff Springs Hotel during the Annual Meeting.

The photographs on these four pages were supplied through the courtesy of the Canadian Pacific Railway.

Personals

Notes of the Personal Activities of Members of the Institute

E. P. Murphy, M.E.I.C., Deputy Minister of Public Works, Ottawa received the honorary degree of doctor of laws from the University of Ottawa in June, 1948. Mr. Murphy graduated from Queen's University and joined the Department of Railways and Canals in 1907 as engineer on the Trent Canal. From 1914 to 1918 he was engineer on the St. Peter's Canal, Cape Breton. Later he worked on the Cornwall Canal and on the Severn division of the Trent Canal. From 1921 to 1930 he was division engineer on the construction of the Welland Ship Canal at Thorold, Welland and Port Colborne. From 1930 to 1934 he was superintendent of operations on the southern division of the Welland Canal and from 1934 to 1937 he was construction engineer. In 1937 he became engineer in the Department of Transport and at the outbreak of war in 1939 he was appointed construction engineer of the War Supply Board. Before being appointed deputy minister in 1942 Mr. Murphy was director of the Defence Projects Construction Branch in the Department of Munitions and Supply at Ottawa.

J. B. Carswell, M.E.I.C., the former president of War Assets Corporation, has been appointed chairman of the new Fraser Valley Diking Board. The three-man board, set up in consultation with the British Columbia Government, will be responsible for repairing, strengthening and reconstructing the dikes in the Fraser Valley and removing water and debris from land inundated by recent floods. The Federal Government will bear 75 percent of the costs of reconstruction. The new board will shortly establish offices in Vancouver.

During the war, Mr. Carswell served as representative of the Department of Munitions and Supply in Washington, and was the first president of War Assets Corporation. He retired from this post in 1945, and returned to private practice as consulting engineer in Vancouver. Prior to the war he was president of the Carswell Construction Company of Toronto.

F. G. Goodspeed, M.E.I.C., assistant chief engineer of the Federal Department of Public Works, Ottawa, and **Bruce Dixon,** M.E.I.C., British Columbia provincial diking commissioner are the other members of the board. These two engineers are also members of the Federal-Provincial Board which has been set up to study the overall problem of flood control in the Fraser Valley. Details of this board are discussed elsewhere in this Journal.

W. E. Bown, M.E.I.C., was appointed in May to the position of vice-president of Dominion Steel and Coal Corporation, Ltd., at Montreal. He received the degree of B.Sc. in chemical engineering from McGill University, Montreal, in

W. E. Bown, M.E.I.C.

1923. He had served with the Dominion Steel and Coal Corporation at Sydney, from 1917. He was made assistant superintendent of the coke oven department in 1924, and was promoted assistant general superintendent of the Sydney steel plant in 1930. He came to Montreal in 1943 as general manager of Canadian Tube and Steel Products, Ltd., where he was until his recent appointment.

Dr. J. J. Green, M.E.I.C., chief research aeronautical engineer of the Air Transport Board, Ottawa, was elected recently to fellowship in the Royal Aeronautical Society, England. Dr. Green obtained his doctorate in 1930 from London University (Royal College of Science), England. He had previously obtained degrees of B.Sc. and A.R.C.S., and D.I.C. at the same university. He was a junior research physicist for National Research Council here until 1934, and then assistant research engineer until 1943, and head of the aerodynamics laboratory. Then, with the rank of squadron leader, he was named chief research engineer of the Test and Development Establishment of the Royal Canadian Air Force. It was in 1945 that he assumed his present post with the Air Transport Board at Ottawa.

Group Captain H. H. Hendrick, M.E.I.C., has relinquished command of R.C.A.F. Station at Edmonton, Alta., which post he has held for the past six months. He is now at Headquarters, North-West Air Command, as senior air staff officer. There he will work directly under the air officer commanding, being concerned with operations and training. Before going to Edmonton he was director of signals in Ottawa for two and a half years.

Phil Roy, M.E.I.C., who has been elected chairman of the Kingston Branch of the Engineering Institute is plant engineer for Canadian Locomotive Company Limited at Kingston. Born at Ottawa, he studied engineering at Queen's University, graduating in 1929 with a B.Sc. degree. He worked for Dominion Bridge Company Limited for a short time and then went to the Brompton Pulp & Paper Company Limited, East Angus, Que., where he was concerned with steam plant control and later with electrical installatons and maintenance. From 1932 to 1937 he was in the employ of the city of Ottawa, becoming chief operator of the pumping and purification plant. He went to his present position in 1937 to work on electrical and mechanical maintenance.

Paul Vincent, M.E.I.C., is the new chairman of the Quebec Branch of the Institute. Mr. Vincent has served the Institute and the Quebec Branch on many previous occasions. He was councillor in 1946, and had served as secretary-treasurer of the Branch from 1940 to 1943. He is chief of the engineering

Paul Vincent, M.E.I.C.

division of the Department of Colonization of the Province of Quebec. Born in Montreal, he attended the University of Montreal, graduating with a B.A. degree in 1927. He then studied engineering at McGill University and after working for two years in the building industry, attended Ecole Polytechnique from which he graduated with honours in 1934. After taking a post-graduate course in radio engineering he acted as laboratory demonstrator in electrical engineering at the Ecole until 1935. He worked for three months on the construction of an extension plant of the Aluminum Company at Arvida, Que., after which he joined the Water Levels Board, Department of Transport, Ottawa, conducting hydrographic surveys, stream gauging and weir studies along the St. Lawrence River channel. In 1937 Mr. Vincent was called to direct two surveying parties for the Quebec Provincial Department of Highways. A few months later he took charge of bridges, roads, and drainage projects for the Department of Colonization of Quebec as district engineer. Following three years experience in this field he was made assistant chief engineer and in 1941, was called upon to act as superintendent of all civil engineering work in the Department of Colonization.

L. A. Fraikin, M.E.I.C., vice-president and general manager of Franki Compressed Pile Company of Canada Limited, has been awarded the Cross of Chevalier de l'Ordre de Leopold, by the Belgian Government, for services rendered during and after the war. Mr. Fraikin is a graduate of the University of Ghent, Belgium, 1929, and in 1931 received the degree of master of science from the Massachusetts Institute of Technology. After extensive engineering work in Belgium and Norway, in India, Egypt and England, he was appointed, in 1938, to his present position with the Franki Compressed Pile Company of Canada Limited at Montreal.

Mr. Fraikin served as a first lieutenant in the Belgian Artillery in the Belgian campaign of the recent war. He returned overseas again in 1941 in command of the second detachment of Belgian soldiers to go to England from Canada. On his return he was made head of the industrial section in the Belgian Government's Economic Mission in Canada, in Montreal.

C. E. Hond, M.E.I.C., is with Bloedel, Stewart and Welsh Limited, Pulp Division, at Port Alberni, B.C. He is electrical superintendent of the kraft pulp mill. He was previously at Baie Comeau, Que., as assistant electrical superintendent for the Quebec North Shore Paper Company.

P. B. Hughes, M.E.I.C., is promoted from lecturer to assistant professor in the faculty of applied science and engineering of the University of Toronto. He is a graduate of McGill University in mechanical engineering with extensive practical experience in industry. During the war, following some service at sea, he was an instructor in engineering at the Royal Naval College of Canada with the rank of Lieutenant-Commander. He joined the Ajax staff of the University of Toronto in 1945.

C. E. Olive, M.E.I.C., is promoted assistant professor, from the position of lecturer in the faculty of applied science and engineering of University of Toronto. He joined the University staff in 1945, a former engineer commander of the R.C.N.V.R. He is an honours graduate of the University of London, in mechanical and electrical engineering with varied experience in England, India and Canada. For fourteen years he was chief engineer for Canadian Celanese Limited.

J. A. Murray, Affiliate E.I.C., former lecturer in the school of architecture of University of Toronto is now made an assistant professor. He is a Toronto graduate who has combined teaching with a successful practice in his profession. For a time he held an important place on the staff of the City Planning Board of Toronto.

H. U. Ross, M.E.I.C., of the department of metallurgical engineering of University of Toronto is promoted to assistant professor, from the position of lecturer. He is an R.M.C. graduate, bachelor of engineering and master of science of McGill University. After several years of metallurgical and mining experience, notably with the Algoma Steel Corporation, he joined the R.C.N.V.R. as an engineer officer. As such he was a member of the staff of the Royal Canadian Naval College for the latter part of the War, coming to Toronto in 1946.

W. H. Schippel, M.E.I.C., of McGill University, Montreal, has been promoted from assistant professor to associate professor in the faculty of engineering. Professor Schippel obtained his B.Sc. degree at McGill in 1920, joined the staff as demonstrator the following year, and obtained a degree of master of engineering prior to his appointment as lecturer in 1927. He has been assistant professor since 1944.

K. H. Shone, M.E.I.C., former lecturer at McGill University, Montreal, has been named assistant professor in mechanical engineering. He obtained a B.A. degree from Cambridge, England, where he won the mechanical science Tripos (honours), and where he was twice college prizeman and senior scholar of his college. He obtained an M.A. degree in 1942, served with the Merchant Navy until 1946, and joined the McGill staff last year.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

John R. W. Ambrose, M.E.I.C., passed away on June 29, in Toronto. He had retired in 1944 as superintendent of Toronto Terminals Railway Company.

Mr. Ambrose was born at Watertown, Wisconsin, in 1878, and was educated at Ripon College and the University of Minnesota. In 1898 he was engineer for the electric light plant at Berlin, Wis., and entered railway work as assistant engineer for the Minneapolis and St. Louis Railroad, in charge of all field engineering and maintenance work. Later he became engineer for the Minneapolis, St. Paul and Sault Ste. Marie Railroad. In 1907 he joined the Grand Trunk Railway as assistant engineer. In 1910 he was appointed engineer on grade separations for the Grand Trunk, and in 1914 he was named chief engineer of the Toronto Terminals Railway Company, later being appointed superintendent.

He was a member of the Canadian Institute of Mining and Metallurgy, the American Engineering Association, and the Association of Professional Engineers of Ontario, and a fellow of the Royal Society of Arts. He was also a member of the Toronto Railway club, and its president in 1935. He joined the Institute in 1911 as an Associate Member, transferring to Member in 1913. He attained Life Membership in 1947.

C. K. S. Macdonell, M.E.I.C., who was divisional engineer for the Ontario Department of Highways at Sudbury, Ont., died on May 31, 1948, as the result of a heart attack.

Mr. Macdonnell was born at Collingwood, Ont., in 1883, but was educated in Dallas, Texas. He did railway work in Texas from 1904 until 1907 when he joined Canadian Pacific Railway. He was transitman for C.P.R., in charge of the construction of terminals at Strathcona, Alberta. The next year he went to Grand Trunk Pacific Railway, to work on alignment west from Saskatoon. In 1909 to 1912 he was town engineer for Collingwood, Ont. He was later engineer for the town of Penetanguishene, Ont., and was at Barrie, Ont., as town engineer from 1912 until his departure overseas in 1915 with the Canadian Expeditionary Force. He was attached to the Royal Engineers and worked on light railway and salvage operations, returning to Canada with the rank of Colonel.

He resumed his position at Barrie, but in 1920 he joined the Ontario Department of Public Works, being posted successively at Woodstock, Barrie, Chatham and Huntsville. He was made divisional engineer at Sudbury in 1914.

Mr. Macdonell joined the Institute in 1920 as an Associate Member, and transferred to Member in 1940. He served as commanding officer for the Grey and Simcoe Foresters from 1928 to 1933.

E. R. Love, M.E.I.C., of Winnipeg, Man., who died in hospital on July 17, 1948, was an associate professor of electrical engineering at the University of Manitoba.

He was born at Reading, Berkshire, England, in 1912, but was educated in Canada. He attended University of Manitoba and, when receiving the degree of B.Sc. in electrical engineering in 1934 he was gold medallist of his class. He did some tutoring in engineering subjects that summer and also worked for the Winnipeg Electric Company. He joined the staff of his University the same year, as demonstrator in charge of the electrical and mechanical engineering laboratories, and remained until 1936. He then spent two years with the

Canadian Westinghouse Company Limited graduate apprenticeship course at Hamilton, Ont., after which he was named sales engineer for electrical apparatus at Winnipeg. In 1940 he enlisted with the Royal Canadian Corps of Signals, serving at Kingston, Ont., with the rank of lieutenant. He was promoted captain and was made instructor at Kingston, in charge of wireless training for officers. In 1942 he was loaned to the University of Manitoba as associate professor, and at the end of the war he joined the staff permanently.

Professor Love joined the Institute in 1931 as a Student, transferring to Member in 1942. He held membership also in the Association of Professional Engineers of Manitoba and in the Institute of Radio Engineers. He was secretary-treasurer of the Engineers' Alumni of his University.

T. F. Leydon, M.E.I.C., of Halifax, N.S., who died recently, was associated with the Nova Scotia Highways Board.

He was born at Halifax, N.S., in 1884. Educated in that city, he started his engineering career in 1905 as chainman, rodman and topographer for the Transcontinental Railway survey. He was later instrumentman on construction for that organization. He worked on surveys and construction of roads from 1913 to 1915, and then he was appointed assistant camp engineer on construction of Camp Borden, Ont. In 1917 he was engineer for Bate McMahon & Company, Ottawa, on aviation camp construction in Ontario, for the Imperial Munitions Board. The next year he was named superintendent and appraisal engineer for the Halifax Relief Commission. In 1919 he was with the city engineer's department in Halifax. He was employed for some years by the Nova Scotia Highways Board and was still actively engaged in this work at the time of his death.

Mr. Leydon joined the Institute in 1940 as a Member.

B. F. Matthews, M.E.I.C., of Kitchener, Ont., died on January 7, 1948, as a result of a heart attack. He was works manager of Dominion Truck and Equipment Co. Limited, in that city.

Born in Bristol, England, in 1888, and educated there, he acquired his technical training at the Merchant Venturers Technical College, obtaining a diploma in 1903. He then spent two years as a junior in the office of the engineer to the urban district council of Portishead, Somerset, England.

Coming to Canada in 1905 he worked in various machine shops and foundries in Ontario and the U.S.A. In 1912 he obtained a position as a draughtsman with Sheldons Ltd., Galt, Ont. From 1916 to 1919 he served in the Royal Air Force as 1st class air mechanic, and he returned then to Sheldons Limited, to be chief draughtsman and estimator. In 1920 he joined A. R. Williams Machinery Company, Toronto, as sales engineer. From 1921 he was chief engineer for Roelofson Elevator Company at Galt, until 1926, when he was named superintendent. His association with Dominion Truck and Equipment Company Limited began in 1928 as chief engineer. He was appointed works manager in 1941 and vice-president in 1942.

Mr. Matthews joined the Institute in 1944 as a Member. He was a past president of the Army and Navy Veterans Association.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

On Thursday, May 27, the Niagara Peninsula Branch held a joint meeting with the American Society for Testing Materials.

Vice-chairman R. A. Coombes welcomed the members of the A.S.T.M. to the meeting and called on Dr. O. W. Ellis, district vice-chairman of the A.S.T.M. Western New York-Ontario Division. Dr. Ellis introduced Dr. R. B. Gordon, manager of the Metallurgical Development Section, Westinghouse Electric Corporation, as speaker of the evening.

Dr. Gordon gave a highly technical talk on the development and characteristics of alloy metals for use under high temperature (1200 to 1500 deg. F.) and high stress conditions met with in turbo-jet engines.

Over one hundred engineers from the adjoining sections of Ontario and Western New York attended the session.

❖ ❖ ❖

At the June meeting the guest speaker was W. J. Corbett, manager of industrial relations, Hayes Steel Company, and member of the Ontario Labour Relations Board. Mr. Corbett gave a most rousing and thought-provoking talk on the timely subject of **Labour Relations**. This subject provided the spark that touched off the most lively session of discussion that the branch has seen for many a day.

❖ ❖ ❖

On Thursday, June 3, M. F. Ker, branch chairman entertained the executive, the candidates for offices and the nominating committee, at dinner at the Red Casque Inn. The spirit of co-operation which has prevailed throughout the year was pleasantly high-lighted in the good fellowship and conviviality of the occasion.

Saguenay

J. E. Dyck, M.E.I.C.
Secretary-Treasurer

Junior Section

F. H. Duffy, Jr.E.I.C.
Secretary-Treasurer

A meeting of the Junior Section of the Saguenay Branch was held in the Arvida Protestant School at 8.15 p.m., Tuesday, June 15, 1948.

F. G. Baker, superintendent of the Fluoride Department, for Arvida Works of Aluminum Company of Canada Limited, described to the meeting his recent trip to Europe, where he attended the Centre d'Etudes Industrielles. This is the postgraduate school of international industrial administration founded by Aluminium Limited.

Mr. Barker's address was in the form of a travelogue and outlined many of his impressions and experiences as he travelled to various plants and offices in France, Switzerland, Italy, Holland and England. Working and social conditions in the countries visited were described and various items compared to or contrasted with similar ones in Canada. Some time was spent in outlining the speaker's impression of the Brown Boveri organization, the factories and the classes of workers making up this organization.

At the conclusion of the talk, slides were shown of many of the interesting scenes which had been visited and brief descriptions of the places were given. An interesting discussion period followed, and numerous questions were answered.

The speaker was introduced by the Chairman C. J. Tanner and thanked on behalf of the section by J. T. Madill.

Vancouver

Alan M. Eyre, Jr.E.I.C.
Secretary-Treasurer

Stuart Lefeaux, Jr.E.I.C.
Branch News Editor

The Vancouver Branch was honoured with an address by Dr. Huet Massue, M.E.I.C., on Wednesday, June 16, in the

THE PRESIDENT'S WESTERN TOUR

Winnipeg. H. W. McLeod presiding at the head table, with President Grant on his right.

Saskatoon. Left to right: Mrs. Grant, Professor I. M. Fraser, Mrs. E. K. Phillips, President Grant and A. Howard Douglas.

The dinner meeting of the Calgary Branch in the Palliser Hotel.

Regina. The head table at dinner. Left to right: Miss Young, the President, Saskatchewan Branch Chairman Stewart Young, Mrs. Grant, and A. Howard Douglas, vice-chairman of the Branch.

The Lethbridge Branch meeting, with A. G. Donaldson (centre) in the chair.

A part of the head table at the Edmonton meeting. Left to right: President Grant; His Honor the Lieutenant Governor of Alberta, Mr. J. C. Bowen; H. W. Tye, the branch chairman; Mrs. J. C. Bowen; the Honorable N. E. Tanner, Minister of Lands and Mines for the Province; Mrs. Grant; and Dean R. M. Hardy of the University of Alberta.

The President presents the certificate of the Institute prize to John Brant Kerby, third year engineering student at the University of Alberta.

"Stag" night at Trail, B.C. Back of tables, left to right: R. Pollard, H. P. Hamilton, E. M. Stiles, Branch Secretary E. B. Broadhurst, Dr. Austin Wright, President Grant, Branch Chairman E. Mason, J. W. Wellington, D. J. Irvine, H. M. Coverdale, C. G. Rodgers. Front of tables, left to right: J. M. Heaps, A. E. Ross, A. G. Ballantyne, A. C. Ridgers, A. H. W. Busby, D. Carruthers.

The illness and untimely death of Lorne A. Campbell prevented his receiving the Sir John Kennedy Medal which was to have been presented in Toronto last year. The President, at the meeting in Trail, honoured Mr. Campbell's memory in a presentation of the medal to his son Lorne Campbell, Jr.

The meeting at Kamloops resulted in an application for the opening of a branch in the area. At the head table, left to right, were Mrs. Austin Wright, H. L. Hayne, Mrs. Wade, the President, M. L. Wade in the chair, Mrs. Grant, Mrs. Hayne, and, in the foreground, Mr. Struve.

Vancouver. Left to right: the 1948 president, J. N. Finlayson; President Grant; and G. W. Allan, acting chairman of the Vancouver Branch. The sign may have been placed on the mantel as a reminder from the ladies—the meeting was "stag".

Medical Dental Auditorium. Eighty-five members and guests, including members of the Engineering Bureau of the Vancouver Board of Trade, were present to hear the address on **The Tennessee Valley Authority**.

Dr. Massue is a graduate of the Ecole Polytechnique of Montreal, and Massachusett's Institute of Technology. He was with the Quebec Streams Commission from 1915 to 1927 on investigation and construction, and his present position is economist and statistical engineer with the Shawinigan Water and Power Company of Montreal.

Dr. Massue was greatly impressed with the Pacific Coast area. He included a trip to Grand Coulee and Bonneville Dams on his way from the Banff meeting to Vancouver. The speaker illustrated his talks with slides of prepared statistics on power costs and potentials of North America and detailed figures of the T.V.A. project. The U.S.A. has a total hydroelectric potential of eighty million horse power and a development of nineteen million horse power. The T.V.A. total development to date is two and one half million horse pówer. In Quebec, 60 per cent of the power developed is used by the pulp and paper and aluminum industries. The cost of electricity takes approximately 1.7 cents of the wage earner's dollar for home operation.

Dr. Massue showed charts to illustrate the fact that the cost of electricity is a very small factor in most industrial production. Cheap electricity alone is not an incentive for locating industries. The statistics shown for the T.V.A. illustrated the fact that the reported cost of the government project plus interest charges and lost taxes gives a true picture of the actual cost. The reported cost of the T.V.A. project charged only 40 per cent against power production and the balance against navigation and flood control. Dr. Massue showed that the cost charged against navigation was out of proportion to the benefits to shipping on the Tennessee River. The cost charged against flood control was many times greater than the estimated annual flood damage.

The speaker was most concerned with the wrong impression given the public on the cost of public hydro-electric installations in comparison to private utilities. When taxes lost and interest charges are taken into account the cost of public installations are generally greater than comparable private enterprises.

Many questions were fired at the speaker and answered to the satisfaction of the members. Jack McDonald thanked him for a most enlightening presentation. Three distinguished guests were presented at the meeting: J. F. MacLaren, chairman of the Toronto Branch of the Institute, K. G. Cameron, councillor of the Montreal Branch, and C. E. Sisson of Toronto, past vice-president of the Institute.

T. V. Berry, councillor of the Vancouver Branch, gave a brief account of the 62nd Annual Meeting of the Institute held at Banff June 1 to 4.

BOOK REVIEW

TRADE UNIONS IN CANADA; THEIR DEVELOPMENT AND FUNCTIONING:

H. A. Logan. Toronto, Macmillan, 1948. 639 pp., illus., 9½ x 6½ in., cloth, $4.75.

This is a history of the growth of the trade union in Canada, its place in Canadian history, and the influences affecting it. It treats first of the history of unions from 1825 to the present day. It deals with unions in various industries—building, printing, pulp and paper, metal trades, railways, mining, clothing and textiles, the automobile industry, iron and steel, and several others. It traces the growth of national federations and congresses and their activities. The book ends with a discussion of union publications, public relations activity, research and education. There is a bibliography of labour books on Canada.

The work was developed according to the assumption that the trade union movement of a country can be portrayed only through an exploration of individual unions and allied groups of unions, taking into account their form of organization, their struggle for recognition, their association (sometimes their conflict) with each other, and their accomplishment through collective bargaining, quite as much as treating with the legislative activities of the over-all congresses and other expressions of the movement as a whole.

The author states in his preface that the book is mainly descriptive and gives more space to the structure and accomplishment of unions than to the portrayal of doctrines. It is an objective work of general reference. Though the author says that lack of background material made it difficult for a lone investigator to cover the whole field of trade unionism in Canada, the scope of the book is broad and it includes much detailed material. N.T.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Applied Physics; Electronics Optics, Metallurgy:

Edited by C. G. Suits, George R. Harrison, and Louis Jordan. Office of Scientific Research and Devclopment. Boston, Little, Brown; Toronto, McClelland & Stewart, 1948. 456 pp., illus., cloth. (Science in World War II).

Alternating Current Machines:

Thomas C. McFarland. New York, Toronto, London, Van Nostrand, 1948. 540 pp., illus., cloth.

Battlefronts of Industry; Westinghouse in World War II:

David O. Woodbury. New York, Wiley; London, Chapman & Hall, 1948. 342 pp., cloth.

Electricity; Text Book and Laboratory Manual:

M. M. Das. New York, Toronto, Van Nostrand, c1948. 483 pp., illus., cloth.

Handbook of Structural Design in the Aluminium Alloys:

J. E. Temple. Birmingham, James Booth, 1947. 147 pp., illus., cloth.

LIBRARY REGULATIONS

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

Heating Ventilating Air Conditioning Guide, 1948 (vol. 26):

American Society of Heating and Ventilating Engineers. New York, The Society, 1948. 1280 + 144 pp., illus., fabrikoid.

Heaton's Commercial Handbook of Canada (Heaton's Annual):

Heaton Publishing, Toronto, 1948. 988 pp., illus., fabrikoid.

Industrial Environment and its Control:

J. M. Dalla Valle. New York, Toronto, Pitman, 1948. 225 pp., illus., cloth.

Introduction to Aerodynamic Compressibility:

J. Black. London, Bunhill, 1947. 115 pp., illus., cloth.

Introduction to Color:

Ralph M. Evans. New York, Wiley; London, Chapman & Hall, 1948. 339 pp., illus., cloth.

Manual of Structural Design; 3rd ed.:

Jack Singleton. Topeka, Ives, 1947. 336 pp., illus., fabrikoid.

Pocket-Book for Mechanical Engineers:

David Allan Low, edited by Bevis Brunel Low. London, New York, Toronto, Longmans, Green, 1948. 778 pp., illus., fabrikoid.

Principles of Servomechanisms: Dynamics and Synthesis of Closed-Loop Control Systems:

Gordon S. Brown and Donald P. Campbell. New York, Wiley; London, Chapman & Hall, 1948. 400 pp., illus., cloth.

Quality Control: a Manual of Quality Control Procedure Based Upon Scientific Principles and Simplified for Practical Application in Various Types of Manufacturing Plants:

Norbert L. Enrick. New York, Industrial Press, c1948. 122 pp., illus., fabrikoid.

Reinforced Concrete Designer's Handbook; 4th ed.:

Chas. E. Reynolds. London, Concrete Publications, 1948. 351 pp., illus., cloth.

SPI Handbook:

Society of the Plastics Industry. New York, The Society, c1947. 451 pp., illus., fabrikoid.

Surveying:

W. Norman Thomas. London, Edward Arnold; Toronto, Longmans, Green, 1948. 564 pp., illus., cloth.

Theory of Servomechanisms:

Edited by H. M. James, N. B. Nichols and R. S. Phillips. Office of Scientific Research and Development. New York, Toronto, London, McGraw-Hill, 1947. 375 pp., illus., cloth. (Massachusetts Institute of Technology. Radiation Laboratory Series).

Trends in Engineering Education; The Columbia Experience:

James Kip Finch. New York, Columbia University Press, 1948. 140 pp., cloth.

PROCEEDINGS, TRANSACTIONS, ANNUALS, ETC.

Aeronautical Engineering Catalog; 4th ed., 1948:

Institute of the Aeronautical Sciences. New York, The Institute, 1948. 222 pp., illus., fabrikoid.

American Institute of Consulting Engineers:

Proceedings of the Annual Meeting, January, 1948.

American Institute of Electrical Engineers:

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text or the book.

Prepared by the Library of The Engineering Institute of Canada

AMERICAN STANDARD SAFETY CODE FOR CONVEYORS, CABLEWAYS, AND RELATED EQUIPMENT. ASA B20.1-1947:

New York, American Society of Mechanical Engineers, 1947. 90c.

Safety provisions for all types of conveyors are included in the new standard. Special provisions for safe operation are given for each type. The safety of the worker or operator is given first consideration, but the efficient use of the conveyor has also been kept in mind in selecting guard and other safety devices. The new standard will affect the safety of workers using conveyors in such widely diversified industries as coal mining, fish packing, and ice cream manufacture. This standard was approved by the American Standards Association, October, 1947.

BRITISH STANDARD FOR 30-AMP. FLAMEPROOF PLUGS-AND-SOCKETS AND CABLE-COUPLERS BS 1395-1948:

London, British Standards Institution, 1948. 3/6.

Two types of plugs-and-socket and cable-coupler are covered by this specification, the restrained type which is for use with electrical interlock and the bolted type which is for use with or without electrical interlock. The specification prescribes the dimensions necessary to ensure interchangeability of complete plugs in complete sockets of different makes, and deals with some electrical and mechanical requirements. It does not otherwise specify a fully-detailed design.

BRITISH STANDARD FOR PORTLAND CEMENT (ORDINARY AND RAPID-HARDENING). BS 12-1947:

London, British Standards Institution, 1948. 3/6.

In this revision, the tensile strength test is again retained. An alternative test for fineness has been introduced. The water content of a cement paste of standard consistency is used to determine the water content of mortar for testing tensile strength and of pastes for testing setting time and soundness. The upper limit for the lime content has been slightly increased. A method of determining the percentage of insoluble residue has been introduced as an appendix.

BRITISH STANDARD FOR PORTLAND-BLASTFURNACE CEMENT. BS 146-1947:

London, British Standards Institution, 1948. 3/6.

In this revision, the tensile strength test is again retained. An alternative test for fineness has been introduced. The water content of a cement paste of standard consistency is used to determine the water content of mortar for testing tensile strength and of pastes for testing setting time and soundness. A method of determining the percentage of insoluble residue has been introduced as an appendix.

BRITISH STANDARD SCHEDULE FOR COPPER ALLOY INGOTS AND CASTINGS. BS 1400:1948:

London, British Standards Institution 1948. 7/6.

This schedule brings together in one volume all current British standards for copper alloy ingots and castings. A number of new alloys have been included. The first part of the schedule contains the chemical composition limits and mechanical properties for each of the alloys, in the form both of ingots and castings. In parts two and three general clauses are given, applicable to ingots and castings respectively. A special feature of these general clauses is that they have been revised and co-ordinated to bring them into line with BS 1367—"Code of procedure in inspection of copper-base alloys and sand castings", ot which the schedule is complementary.

BRITISH STANDARDS FOR COPPER FOR ELECTRICAL PURPOSES. BS 1432:1948, 1433:1948, 1434:1948:

London, British Standards Institution, 1948. 2/- each.

These standards include sheet and strip, bar and rod, and commutator bars. They contain requirements concerning quality of material, finish, dimensional tolerances, tensile properties and electrical resistance. They also include a table of temperature co-efficients of resistance.

BRITISH STANDARD FOR GAS LIGHTING UNITS AND FITTINGS FOR SINGLE-FAMILY DWELLINGS. BS 1381:1947:

London, British Standards Institution, 1947. 2/6.

This standard lays down the minimum standards for the efficiency of burners and units, the thermal endurance of glass and silica ware, and the soundness of components of lighting units conveying or controlling gas. An appendix stresses the importance of designing units which combine attractive appearance with ease of maintenance and cleaning.

BRITISH STANDARD FOR HIGH ALUMINA CEMENT. BS 915:1947:

London, British Standards Institution, 1948. 3/6.

This is a revision of the standard published in 1940. The compressive strength test has been improved, and an alternative test for fineness has been introduced.

CANADIAN STANDARD SPECIFICATION FOR THE PHYSICAL PROPERTIES AND PRESERVATIVE TREATMENT OF JACK, LODGEPOLE AND RED PINE POLES AND REINFORCING STUBS, 2nd ed. C.S.A. C15(C)-1948:

Ottawa, Canadian Standards Association, 1948. 50c.

This revision of the 1940 standard differs from the previous issue mainly in the following respects: ultimate fibre stress of 7400 pounds per square inch has been specified for Jack Pine Poles and Stubs and 6600 for Lodgepole and Red Pine Poles and Stubs; reference has been made to the current specifications of the American Wood Preservers' Association instead of the CSA C15(D) for the pressure treatment; the general set-up of the specification has been brought into line with the latest proposed revision to ASA Specifications and Dimensions for Wood Poles.

INTERNATIONAL CIVIL AVIATION ORGANIZATION. STATISTICS DIVISION. FINAL REPORT. First Session, January 1948:

International Civil Aviation Organization, Montreal, 1948. 67 pp., illus., 10¼ x 8 in., paper, 25c. (Doc 5205-STA/526).

One of the basic principles of the International Civil Aviation Organization was that the sound economic development of world air transport depends first on the free and wide-spread dissemination and interchange of all the pertinent facts. The Convention of the Statistics Division, therefore, was framed with an eye to the evolution of statistical machinery that could cope with the facts relating to world air transport.

JACOB INTEGRAPH INSTRUCTION AND TYPICAL PROBLEMS:

Brent C. Jacob, 205 North Mountain St., Bay City, Mich., 1947. 126 pp., illus., 8¼ x 5½ in., paper, apply to author.

The Jacob Integraph is a small transparent triangle having ruled lines and small perforated holes so placed as to make it possible to perform graphically a variety of calculus, arithmetical and analytical computations. It may be used with an ordinary tee-square or triangle or as an attachment on a universal drafting machine. Its most important use is to integrate and differentiate graphically curves of any shape. The Jacob Integraph provides a method by which engineers can use graphical calculus with second or more integrations or differentiations. The accompanying instruction book gives a detailed explanation first, of the simple fundamental operations; and then, of more complex problems in mechanics and engineering, including a variety of practical applications such as determining bending moments and deflections in beams and shafts, impact or collision values, forces and accelerations, volumes of tanks, etc.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

METALLIZATION OF PLASTICS:

J. R. I. Hepburn, Cleaver-Hume Press Ltd., London, 1947. 71 pp., 6s.

CELLULOSE PLASTICS:

D. N. Buttrey. Cleaver-Hume Press, Ltd., London, 1947. 127 pp., 7/6.

FABRIC REINFORCED PLASTICS:

W. J. Brown. Cleaver-Hume Press, Ltd., London, 1947. 148 pp., 7/6. Illus., diagrs., charts, tables, 7¼ x 4¾ in., cloth.

Of these three volumes covering various aspects of the plastics field, the first one listed discusses the covering of plastic materials with a metallic deposit in order to modify their mechanical, optical, electrical, thermal or chemical properties. The plastics and metals most suitable for use, the various methods available, and the testing of the resultant deposits are treated.

The second volume emphasizes the general principles rather than specific commercial applications of cellulose plastics. The occurrence and chemical nature of the raw materials, the nitration of cellulose and the processing of nitrocellulose plastics, the manufacture and uses of cellulose acetate, and the preparation and applications of the recently developed cellulose esters are presented.

In the third volume, the manufacture and uses of fabric reinforced plastics are dealt with, and special attention is paid to those factors in resin, in fabric, and in manufacture which influence physical properties.

All three volumes contain bibliographies at the ends of chapters.

COURS DE MECANIQUE, Vol 2, DYNAMIQUE DES CORPS SOLIDES RIGIDES:

H. Favre. Dunod, Editeur, Paris; Leemann Fres., Editeurs, Zurich, Switzerland, 1947. 434 pp., diagrs., tables, 9¼ x 6¼ in., paper, 1380 frs.

Written for engineers, physicists and mathematicians who wish to acquire an overall view of classical mechanics, this book not only presents the theory, but gives the formulas in a direct method applicable to concrete cases. This second volume covers the dynamics of points, rigid bodies, and systems with a full analytical treatment. Problems for student solution follow each chapter. Volume I of the series covered statics, and volume III will deal with the theory of elasticity, elastic bodies and hydrodynamics.

DIESEL ENGINE CATALOG, Vol. 12:

Edited by R. W. Wadman, W. W. Young and B. C. Sisson. Diesel Engines, Inc., New York, 1947. 519 pp., illus., diagrs., charts, tables, 13¾ x 10¾ in., fabrikoid, $10.00.

Presenting a cross-section of the Diesel industry, this volume describes in detail all of the engines available, including new designs developed in the past year. Some forty pages are devoted to various accessories. Following a large advertising section there is an extensive classified listing of manufacturers of engines and accessories. The book is profusely illustrated by photographs, drawings, and diagrams of engine performance and characteristics.

ELECTRON MICROSCOPE:

D. Gabor. Chemical Publishing Co., Brooklyn, New York, 1948. 164 pp., illus., diagrs., charts, tables, 8¼ x 5¼ in., cloth, $4.75.

This book is both an introduction to the use of the electron microscope and a critical contribution to its theory. The fundamentals of electron optics are briefly explained in the early chapters. The concluding chapters on future developments and chemical and structural analysis are more advanced. An appendix considers the diffraction theory of the microscope. Constructional details, preparation of specimens, and description of "commercial" models are given.

ELEVEN AND FIFTEEN-PLACE TABLES OF BESSEL FUNCTIONS OF THE FIRST KIND, TO ALL SIGNIFICANT ORDERS.

E. Cambi. Dover Publications, 1780 Broadway, New York, 1948. 154 pp., tables, 10¾ x 8½ in., cloth., $3.95.

The main tables give $J_n(x)$ for x ranging from 0 to 10.5 at intervals of .01, to eleven places. Supplementary tables give $J_n(x)$ for x ranging from 0 to .500 at intervals of .001, to 15 places, and Taylor Series for J_n of even order for $x = 2$ to 10 inclusive. The introduction contains an explanation of the tables and graphs which show their accuracy.

FLUORESCENT AND OTHER GASEOUS DISCHARGE LAMPS:

W. E. Forsythe and E. Q. Adams, Murray Hill Books, Technical Division, New York and Toronto, 1948. 292 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

Starting with the earliest beginnings of the fluorescent lamp, this book takes the reader through an analytical treatment of the factors influencing the design, construction, operation and performance of gaseous discharge lamps including many lesser known types. From an introduction to light, radiation, and the discharge of electricity through gases, it progresses to complete coverage of fluorescent light principles, components, problems, efficiency, and related factors.

INTRODUCTION TO THE DIFFERENTIAL EQUATIONS OF PHYSICS:

L. Hopf, translated by W. Nef. Dover Publications, New York, 1948. 154 pp., diagrs., 6½ x 4¼ in., cloth, $1.95.

Basic mathematical concepts and methods are developed in close connection with the physical problems to which they can be traced historically. The intuitive rather than formal aspects of mathematical developments are emphasized, and the necessary mathematical background, beyond elementary calculus, is introduced along with the discussion.

LIGHTING DESIGN:

P. Moon and D. E. Spencer. Addison-Wesley Press, Kendall Square, Cambridge 42, Mass., 1948. 482 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

This book has two aims: to provide a text on lighting which rises above the descriptive level and which presents fundamental principles in a quantitative manner; and to present a comprehensive design method that can be used by practising engineers in devising high-quality lighting systems for rooms. The first three chapters give data on nomenclature, lamps and materials. Subsequent chapters deal with the calculation of light and the design of systems of exterior lighting. Graphs and tables are extensively used in the presentation of data.

MANAGEMENT PROCEDURES IN THE DETERMINATION OF INDUSTRIAL RELATIONS POLICIES:

H. Baker. Princeton University, Industrial Relations Section, Research Report Series No. 76, 1948. 81 pp., tables, 9¼ x 6 in., paper, $2.00.

This report considers the allocation of responsibility for final decisions on major personnel policies, as well as the procedures followed on their formation. Information was gathered from 84 companies with considerable experience in handling industrial relations problems. Including only companies engaged primarily in manufacturing, consideration is given to the representative nature of the group in respect to size and industry.

NATIONAL RESEARCH COUNCIL, HIGHWAY RESEARCH BOARD, PROCEEDINGS OF THE TWENTY-SIXTH ANNUAL MEETING, WASHINGTON, D.C., Dec. 5-8, 1946:

Edited by R. W. Crum, F. Burggraf and W. N. Carey, Jr., Washington, D.C., 1947. 618 pp., illus., diagrs., charts, tables, 10¾ x 6½ in., cloth, $7.50.

The papers presented at the 26th Annual Meeting are classified in six sections: three large groups dealing with design, traffic and operations, and soils investigations; and three small groups under maintenance, administration, and materials. The wide variety of topics is covered by authorities from both the practical and research aspects of highway engineering. There is an author index.

NOTES INTRODUCTORY TO THE THEORY AND DESIGN OF GAS TURBINES:

J. Small. Published by the author at the James Watt Engineering Laboratories University of Glasgow, Scotland, 1947. 67 pp., diagrs., charts, tables, 8¼ x 5½ in., paper, 7/6.

This book explains the principles of the gas turbine. It is intended for use by those in the engineering field who wish to understand the basis of this engine. Diagrams and calculations amplify the text. Descriptive and historical matter are omitted.

SIR WILLIAM J. LARKE MEDAL COMPETITION, PRIZEWINNING PAPERS:

Institute of Welding, London, S.W.1, 1946. 156 pp., illus., diagrs., charts tables, 8¾ x 5½ in., fabrikoid, 12/6.

This volume comprises the five papers for which prizes were awarded by the British Institute of Welding in 1944. The five papers deal, respectively, with the following topics: application of arc welding, embodying specific details; manipulators for arc welding, a discussion of machines for the support and positioning of work-pieces; arc welding fabrication from a practical point of view; production aspects in the fabrication of marine engine constructions; copper welding as applied to the repair of locomotive fireboxes.

SURVEYING INSTRUMENTS, THEIR HISTORY AND CLASSROOM USE:

E. R. Kiely. Columbia University, Bureau of Publications, Teachers College, New York, 1947. 411 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth. $3.00.

The first half of this book is devoted to the description of the instruments and methods developed during the period of time from ancient Egypt, China and Babylonia up through Renaissance Europe. The following chapter discusses the development in recent years of instruction in practical geometry and mensuration in the schools as opposed to purely classical treatment. Basic applications of geometry and trigonometry in simple surveying are presented as detailed problems, mainly selected from old practical geometries. A 20-page bibliography is included.

SYMPOSIUM ON METALLURGY OF STEEL WELDING:

Published by British Welding Research Association, 29 Park Crescent, London, W.1, 1947. 104 pp., illus., diagrs., charts, tables, 11¼ x 8¼ in., cloth, 10s.

This book is composed of the papers presented at the first post-war symposium of the British Welding Research Association. The first two sessions were devoted to weld metal, the third to hardened zone cracking and viscosity of welding slags, and the final session to current research. The papers given at this final session were on the electrophysics of the welding arc and the cracking of welded gas mains. Both the verbal and written discussions of the papers are included.

TIMBER DRYING AND THE BEHAVIOUR OF SEASONED TIMBER IN USE:

R. G. Bateson, 2 ed. Crosby Lockwood & Son, London; Technical Book Association of Canada, Vancouver, 1946. 129 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, 10/6.

The principles of timber drying are explained, and methods and equipment for both air-seasoning and kiln-seasoning are described in practical detail. Specific problems are discussed with their solutions, and one chapter is devoted to the behavior of seasoned timber in use.

TRANSMISSION BELTING AND BELT DRIVES.

H. S. Jude. Trade & Technical Press, London, 1947. 322 pp., diagrs., charts, tables, 8½ x 5¼ in., cloth, 30s.

Following a general introductory chapter is a discussion of power losses, the drive layout, and application rules. Leather, rubber, balata, solid woven hair, and cotton belts are discussed, including belts of two-fold construction. Special leather belts, belt fastenings, splices in fabric belts, V-ropes, pulleys and shaftings are considered as well as selection, installation, care, maintenance, and safety measures in the use of belts. British Standard Specifications, useful facts, technical data, and formulae are included in the final chapters.

WORKSHOP YEARBOOK AND PRODUCTION ENGINEERING MANUAL (II):

Edited by H. C. Town. Paul Elek Publishers Ltd., 38 Hatton Garden, London, E.C.1, 1947. 568 pp., illus., diagrs., charts, tables, 8¼ x 5½ in., cloth, 35s.

This book provides data valuable to the production engineer, the designer, and the engineering student. It is divided into three sections, the first consisting of a series of specialized articles on modern machine tool developments. Section 2 covers a wide field of engineering progress, including power transmission, industrial developments, precision tools and methods of machining, and offers descriptions of the latest machine tools. In Section 3 are abridged articles from British and American sources providing the latest information on machine design, press operations, gauging and inspection, metal and heat treatment, welding, electric and other drives, and controls.

Although not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

HANDBOOK OF INDUSTRIAL ELECTROPLATING.

E. A. Ollard and E. B. Smith; published by "Metal Industry" (Louis Cassier Co., Ltd.), distributed by Iliffe & Sons, Ltd., London, Birmingham, Coventry, Manchester & Glasgow, 1947. 308 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., linen, 15s.

Omitting theory, this book provides full practical information for all those whose duty it is to design, erect, maintain or operate electrodeposition plants, and for the laboratory worker who must deal with plating solutions. The book is divided into eight sections as follows: electrical equipment; deposition plant; solution formulas; special formulas; solution testing; deposit testing; glossary; miscellaneous information and tables.

HIGH POLYMERS, Volume VI: MECHANICAL BEHAVIOR OF HIGH POLYMERS.

T. Alfrey, Jr. Interscience Publishers, Inc., New York and London, 1948. 581 pp., illus., diagrs., charts, maps, tables, 9¼ x 6 in., cloth, $9.50.

The range of mechanical properties exhibited by high polymers permits them to be used as "rubbers", plastics, textile, fibers, films, etc. In a systematic treatment of these properties the author attempts to uncover the fundamental principles underlying the mechanical behavior of polymeric structures and to show how this behavior is correlated with the molecular structures involved. This analysis is made on two levels—a phenomenological description and a molecular interpretation. Polymer structures are classified and treated as amorphous linear, cross-linked, and crystalline polymers, and polymers admixed with components of low molecular weight. Original sources, to which reference is made in the text, are listed at the end of each section.

HISTORICAL APPRAISAL OF MECHANICS.

H. F. Girvin. International Textbook Co., Scranton, Pa., 1948. 275 pp., diagrs., tables, 9¼ x 6 in., cloth, $3.25.

Tracing the history of mechanics from the early Greeks to modern times, this book stresses the relationship of mechanics to engineering education. Divided into three parts, part one discusses the early development of science and scientific thinking. The contributions from the Renaissance through Newton are considered in Part II, while Part III is devoted to the mechanics of materials. A bibliography and chronological tables complete the text.

MICROWAVE RECEIVERS.

(Massachusetts Institute of Technology, Radiation Laboratory, Series Vol. 23.)

Edited by S. N. Van Voorhis. McGraw-Hill Book Co., New York, Toronto, London, 1948. 618 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $8.00.

All of the elements making up a wide-band receiver are covered in this volume. After a discussion of the individual circuit types from which a complete receiver is made, the book takes up general matters concerning the assembly, testing and maintenance of microwave receivers, and then deals with actual receivers chosen as examples because they are typical of the important combinations of circuits.

PROBLEMS ON APPLIED THERMODYNAMICS.

V. M. Faires, A. V. Brewer and C. M. Simmang. rev. ed. The Macmillan Company, New York, Toronto, 1948. 151 pp., diagrs., charts, tables, 9¼ x 6 in., paper, $1.70.

These problems are designed especially for use with the author's "Applied Thermodynamics", but may be combined with any text which uses the same terminology and emphasizes the general energy equation. Steam tables and other useful data are provided in an appendix. To suit the needs of individual instructors answers are given for only part of the more than 1400 problems included.

ROTARY VALVE ENGINES.

M. C. I. Hunter. Hutchinson's Scientific and Technical Publications, London, New York, Melbourne, Sydney, Cape Town, 1946. 216 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, 21s.

The author describes the general principles and applications of the rotary valve in detail and draws comparisons between it and the poppet-valve for use on internal-combustion engines. The development of the rotary valve up to the present time is also discussed with descriptions of various rotary and semi-rotary systems applied to various types of old and modern engines—steam, gas and gasoline. A brief, final chapter presents the author's conjectures on the future development of the rotary valve.

STRUCTURAL ENGINEERING.

J. Husband and W. Harby. 5th ed. rev. and enl. Longmans, Green and Co., London, New York, Toronto, 1947. 591 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $6.00.

This volume presents the principles of the design of steel, masonry, plain and reinforced concrete structures. Applications of these principles are given in detailed designs of the more commonly occurring structures. The new material included in this fifth edition is devoted to the principles and design of reinforced concrete construction. The general properties of structural materials and the structural analysis of beams and slabs, columns and footings, retaining walls, tanks and reservoirs are fully discussed. An appendix contains many useful charts and tables.

APPLIED JOB EVALUATION, A MANUAL OF INSTALLATION AND OPERATING METHODS.

H. G. Stanway. Ronald Press Co., New York, 1947. 81 pp., charts, tables, 9½ x 6 in., cloth, $3.50.

Intended as a manual of installation and operating methods, this book provides a definite and simple program for analyzing, describing, classifying and rating jobs. Detailed methods are given which may be applied to either large or small firms. A short list of books for reference reading is included.

ELEMENTARY INDUSTRIAL ELECTRONICS.

W. R. Wellman. D. Van Nostrand Company, New York, Toronto, London, 1948. 371 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00.

Of interest to the beginner rather than to the advanced student, this book contains the basic principles involved in electronic equipment now in industrial use. Following a review of alternating current fundamentals, the basic principles of vacuum tubes and gas-filled tubes are considered. Kenotrons, various rectifiers and amplifiers are discussed as well as high-frequency heating and electronic control of motors, generators, and resistance welding. Photoelectric devices and electronic lamps are also covered.

AN INTRODUCTION TO SOIL MECHANICS.

W. L. Lowe-Brown. 2 ed. Pitman Publishing Corp., New York and Chicago, 1947. 61 pp., diagrs., charts, tables, 9 x 5½ in., cloth, $1.75.

Presenting in simple language a short descriptive survey in soil mechanics this volume will be of interest to practising engineers. After some general introductory material, compression and consolidation of cohesive material are discussed, followed by material on the design of dams and weirs on permeable foundations. The fact is stressed that sound judgment and wide engineering experience are required in applying the principles of soil mechanics. A bibliography is included as well as several appendices on earth pressure theories, slope stability, calculations, etc.

JET PROPULSION PROGRESS, the Development of Aircraft Gas Turbines.

L. E. Neville and N. F. Silsbee. McGraw-Hill Book Co., Inc., New York, Toronto, London, 1948. 232 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50.

Presenting the fundamentals of the gas turbine as applied to aircraft, this book outlines the development of such units in Germany, Great Britain, and the United States. The problems of heat-resistant alloys, special fuels for jet propulsion, and maintenance of jet engines are indicated briefly, as well as future developments and possible uses. Although a considerable amount of technical material has been included, elaborate calculations, engineering formulas, and highly technical discussions have been avoided. Included are a chronology of aircraft gas-turbine developments, a glossary of technical terms and abbreviations, and a comprehensive bibliography covering the period 1941 to March 1947.

METAL PROCESS ENGINEERING.

N. E. Woldman. Reinhold Publishing Corp., New York, 1948. 291 pp., illus., diagrs., charts, tables, 9¼ x 6 in., $5.00.

Based on a post-graduate course, this book contains material on various practical phases of metallurgical engineering and metallurgical processes. It discusses casting, forging, joining of metals, and heat treatment as well as surface hardening and the machining of metals. Tool steels and the mechanical working of metals and alloys are treated. References to more detailed information follow each chapter. Many illustrations and diagrams complement he text.

METALLURGY FOR AIRCRAFT ENGINEERS, INSPECTORS AND ENGINEERING STUDENTS.

R. A. Beaumont. Sir Isaac Pitman & Sons, Ltd., London, 1946. 273 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 25s.

This book deals chiefly with alloy structural steels, case hardening steels, light alloys, and copper and its alloys which are used in aircraft construction. The production of steel, mechanical methods of working steel, steel-composition, structure, and heat treatment, defective materials and processes, mechanical testing, and temperature measurement equipment are considered. Tables of specifications are given for the steels, copper, and their alloys which are discussed.

MODERN TIMBER DESIGN.

H. J. Hansen. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 312 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $4.50.

The properties of various species of wood, the factors affecting their structure, their assigned working stresses, and modern timber design methods are covered with examples and formulas for use in design. Two new chapters appear in this revised edition, presenting the factors affecting the strength of wood, and a fuller explanation of wood testing methods. Material on the design of all types of joints, of glued laminated members, and of plywood is featured.

TABLES OF SUPERSONIC FLOW AROUND CONES.:

(Massachusetts Institute of Technology, Dept. of Electrical Engineering, Center of Analysis, Technical Report No. 1) 555 pp., $3.50.

FEW REMARKS ON THE LIMITATIONS OF LINEARIZED THEORY IN SUPERSONIC FLOW:

(Technical Report No. 2) 10 pp., free if claimed from M.I.T.)

TABLES OF SUPERSONIC FLOW AROUND YAWING CONES.:

(Technical Report No. 3) 321 pp., $2.50. Under direction of Z. Kopal, Massachusetts Institute of Technology, Department of Electrical Engineering, Cambridge 39, Mass., 1947. Charts, tables, 11 x 8 in., Nos. 1 and 3, cloth; No. 2, paper. (Nos 1 and 3 obtainable from Government Printing Office, Washington, D.C., at prices indicated above.

These volumes present data by means of which the physical characteristics of supersonic flow may be determined readily and with adequate precision. In Reports No. 1 and No. 3, the equations of the problem precede the tables. The construction of the tables is described in the first volume, which deals with cones whose axes are exactly parallel to the stream direction. Report No. 3 covering slightly yawing cones presents an outline of the hydrodynamical theory which is the basis of the computations. The merits and limitations of the theory are discussed. Report No. 2, a ten-page pamphlet without extensive tables, compares the consequences of certain axial-flow equations to non-axial flow, with rigorous solutions for the case in point.

THEORY AND APPLICATION OF MATHIEU FUNCTIONS.

N. W. McLachlan. Oxford University Press, New York; Clarendon Press, Oxford, England, 1947. 401 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $12.50.

Addressed to the technologist, the purpose of this volume is to give the theory of Mathieu functions and to demonstrate their application to representative problems in physics and engineering science. These applications are taken from the fields of radio, acoustics, mechanics, heat conduction, electromagnetism, and others in which oscillatory effects occur. A short historical introduction and a bibliography are included. Although not written for mathematicians, the mathematical treatment is thoroughly carried out.

THEORY AND APPLICATION OF RADIO-FREQUENCY HEATING.

G. H. Brown, C. N. Hoyler and R. A. Bierwirth. D. Van Nostrand Co., New York, 1947. 370 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.50.

Using mathematical analysis, the basic principles of radio-frequency heating are presented. Graphs are used to display results achieved by mathematics. Applications and illustrations of the principles are given from experimental data, including descriptions of laboratory equipment. The rationalized practical system of electrical units is used. Case hardening of steel, the wood-gluing process, and solutions to press problems are discussed as applications. RF dehydration, pasteurization, sterilization and food treatment are dealt with in the closing chapters.

THERMAL INSULATION OF BUILDINGS.

P. D. Close. Reinhold Publishing Corp., New York, 1947. 104 pp., illus., diagrs., charts, maps, tables, 9 x 6 in., paper, $1.75.

General theory and basic principles are followed by information on the calculation of heat losses and the estimation of fuel savings. The prevention of condensation is considered at some length. The types of manufactured insulations are described together with methods of application. The insulation of farm buildings other than residences is dealt with in a separate chapter. Lists of trade names, manufacturers, and trade associations are appended.

THEORY OF MATHEMATICAL MACHINES.

F. J. Murray. King's Crown Press, Morningside Heights, New York, 1947. 116 pp., diagrs., tables, 11 x 8½ in., stiff paper, $3.00.

In presenting a comprehensive discussion of basic principles, the fundamental requirements of both digital and continuous mechanisms are considered with the mechanical and electronic methods for meeting them. An operational approach to the general question of the solution of mathematical problems by machines is proposed. Apart from this, the book is devoted to such mathematical instruments as the planimeter and intograph. Modern devices for the same purposes, based on photoelectric techniques, are also studied.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

August 20th, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the September meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BLAIR-McGUFFIE—JAMES CARRUTHERS, of Montreal, Que. Born at Chapel en le Frith, Eng., June 2, 1903. Educ.: B.A., 1924; M.A., 1928 (Mech. Sciences) Cambridge Univ., England; 1924-26, jr. engr., Sir W. G. Armstrong Whitworth Co., Ltd., Glasgow, Scot.; with Francois Cementation Co., Ltd., London, Eng., as follows: 1926-27, asst. engr., 1927-28, engr. i/c, 1928-31, res. engr. i/c St. Paul's Cathedral preservation; 1931-32, tech. mgr., Eternit Pietra Artificiale (London) Ltd.; with Granitese (G.B.) Ltd. (divn. of Francois Cementation Co. Ltd.), as follows: 1932-37, techn mgr., 1937-40, genl. mgr.; 1940-45, Royal Engineers, 2nd Lieut., then Major; 1945-47, asst. to prod. director, Tarran Industries Ltd., London, Eng.; during period, 1931-47, initiation of ten patents relating to mfg. and appln. of Portland cement grouts, special cements, asbestos cement products and methods of curing concrete; at present, designer, reinf. concrete, Shawinigan Engineering Co., Ltd., Montreal, Que.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER, recent graduate required for position in Technical Department of a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 4181-V.

CIVIL

CIVIL ENGINEER required for mechanical logging department. Recent graduate, single. Must be prepared to spend major portion of time in field work. Salary open. Apply to File No. No 4168-V.

ELECTRICAL

*ELECTRICAL ENGINEER, recent graduate, required for junior position in the steam power plant of a manufacturer in Central Ontario. Duties of a general electrical engineering nature with particular reference to operation of the electrical equipment in the power plant. Salary $200. to $225. Apply to File No. 4164-V.

*ELECTRICAL ENGINEER preferably with sales experience but not essential required by Montreal firm for sales engineering. Considerable travelling. Salary open. Apply to File No. 4176-V.

MECHANICAL

MECHANICAL ENGINEER required for sales engineering by large engineering company. Age 25 to 30 years and preferably veteran. Salary around $275 00. Apply to File No. 4165-V.

MECHANICAL ENGINEER, recent graduate, required for manufacturing and related duties with well established reputable paper company. Salary open. Apply to File No. 4172-V.

MECHANIAL ENGINEER with three to five years experience required in Montreal by well established paper company for duties involving machine design, plant and general engineering. Salary open. Apply to File No. 4172-V.

MECHANICAL ENGINEER required for chief engineers department of pulp and paper company operating news and kraft mills. Must have at least 5 years experience in paper mill or with paper machinery manufacturing. Knowledge of Yankee and Fourdrinier special machines desirable. Salary open. Apply to File No 4173-V.

MISCELLANEOUS

GRADUATE ENGINEER required by Pulp and Paper Mill in Province of Quebec. Must have extensive experience in general maintenance, design and development of pulp and paper mill equipment. Excellent future advancement. Salary $6,000. to $9,000. depending on qualifications. Apply to File No. 4161-V.

*MECHANICAL OR ELECTRICAL ENGINEER, recent graduate, required by electrical firm in Ontario to be trained as Time Study Engineer. Salary $200 to $225. Apply to File No. 4169-V.

SALES ENGINEERS, one for Ontario and one for Quebec, required by tool and quality steel Branch Sales Office. Applicant should have some metallurgical training, some experience in tool and die manufacture, good personality and should own a car. Salary open. Apply to File No. 4170-V.

MECHANICAL OR ELECTRICAL ENGINEER, bilingual, experienced in standard investigations and observations. Time Study training not necessary. Required by Montreal firm. Salary open. Apply to File No. 4174-V.

GRADUATE ENGINEER with a few years experience in industrial engineering, methods, time study, etc., required by a well known engineering firm in Montreal. Salary $250. Apply to File No. 4175-V.

DRAUGHTSMAN required by Montreal firm with experience in structural steel or concrete detailing. Salary open. Apply to File No. 4177-V.

GRADUATE ENGINEER required by an oil company in the Maritimes must have sufficient experience in the oil business and the educational qualifications to enable him to determine the specifications of oils required for various industrial machinery. Salary open. Apply to File No. 4178-V.

CONSTRUCTION ENGINEER capable of supervising sundry engineering jobs and pipelines for oil company in the Maritimes. Salary open. Apply to File No. 4178-V.

PLANT MAINTENANCE ENGINEER, mechanical background, extensive experience in pulp and paper preferably Kraft. Required to take charge of Kraft mill maintenance in Province of Quebec. Executive ability. Salary open. Apply to File No. 4179-V.

GRADUATE ENGINEER required for veneer and plywood plant in the Maritimes. Must be fully qualified to assume responsibility for the management, production and general supervision of the plant. Salary open. Apply to File No. 4180-V.

RECENT GRADUATE required by a large National Organization. Must have the following qualifications:- Good appearance, personality, leadership and initiative. Salary $2,400. Apply to File No. 4194-V.

* Filled since appearance in advance notice.

The following advertisements are reprinted from last month's Journal, having not yet been filled:

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph. D., required by a pulp & paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp & paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp & paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

*SENIOR CHEMICAL ENGINEER OR CHEMIST, required by leading Paper Manufacturer in Eastern Canada. Applicant should have some experience in Paper Mill Control work. This position offers plenty of scope for advancement. Salary open. Apply to File No. 4013-V.

GRADUATE CHEMICAL ENGINEERS OR CHEMISTS required by an industrial chemical plant in the Montreal area. Preferably with experience in production and the operation of chemical equipment such as filters, presses etc. Must be able to organize work and direct workmen. Salary $200. up. Apply to File No. 4071-V.

CHEMICAL ENGINEER for work in the Development Department of a large chemical manufacturing company involving chemical engineering design, preparation of mass and descriptive flow sheets, specification of equipment, comparison of processes, pilot plant liaison work. Must have had from three to five years in chemical plant engineering, maintenance or operation, in order of decreasing preference. Must be able to co-operate well with other departments in the Company. Work would be in Montreal. Salary open. Apply to File No. 4119-V.

CHEMICAL ENGINEER for technical department of pulp and paper firm in the St. Maurice Valley. Applicant must have supervisory capacity and also be able to undertake investigational work involving the co-ordination of laboratory experiments and mill operations. Salary open. Apply to File No. 4130-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual. May be recent graduate. Salary $2,400. per annum for the first three months, $2,700. after 3 months and $3,000 after 12 months. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsman in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Salary open. Apply to File No. 3884-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Dept. Works Dept. also construction of a general nature for the Electric Light Dept. Salary open. Apply to File No. 3930-V.

JUNIOR ENGINEER preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds Salary open. Apply to File No. 3968-V.

CIVIL ENGINEERS required by a Montreal firm for field inspection in Ontario and North Shore St. Lawrence. Salary open. Apply to File No. 4084-V.

*CIVIL ENGINEER with at least two years experinece required in a Pulp and Paper Mill in the Province of Quebec for surveying and general paper mill engineering and draughting. Salary $250. to $300. Apply to File No. 4094-V.

CIVIL ENGINEER required for consulting engineer and surveyors' office in Montreal. Work includes surveying, topographical draughting, preparation of designs and plans of engineering work etc. Must be bilingual. Salary according to experience with future depending on ability. Apply to File No 4105-V.

CIVIL ENGINEER age 25 to 35 with experience in structural design required by an established firm of consulting engineers in Toronto. Opportunity for progressing in this work under proper supervision. Salary will be relative to experience and ability. Apply to File No. 4112-V.

CIVIL ENGINEER, thoroughly experienced and competent in structural design required by an established firm of consulting engineers in Toronto. Applications are invited from engineers with high qualifications and references Salary open. Apply to File No. 4112-V.

CIVIL ENGINEER around 30 years of age required as Assistant City Engineer of small city in Province of Quebec. General duties eventually to replace City Manager. Salary $3,000 to $3,600 according to qualifications. Apply to File No. 4144-V.

CIVIL ENGINEER. qualified to take charge of all town services including water and electric (distribution system) utilities required by a Town in Nova Scotia. Population 4,000. Salary open. Apply to File No. 4147-V.

CIVIL ENGINEERS required in Eastern Ontario for employment as designers of service systems for housing and other building projects. Preferably men with at least 10 years experience in that line Salary according to qualifications. Apply to File No. 4156-V.

CIVIL ENGINEER recent graduate with up to one year's experience since graduation. Preferably single man. Required by Northern Ontario Paper Mill. Salary around $250. Apply to File No. 4158-V.

ELECTRICAL

ELECTRICAL ENGINEER, recent graduate up required by a manufacturer in Montreal for sales engineering, Must be bilingual and familiar with rotating electrical equipment. Salary $200 up. Apply to File No. 3761-V.

GRADUATE ELECTRICAL ENGINEERS, with 3 to 10 years experience in design, operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced, bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEERS with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN for the design and layout of industrial power and control systems required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

ELECTRICAL ENGINEERS required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery design, lab., etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

ELECTRICAL ENGINEERS, age 30 to 40 required for the Commercial and Distribution Department of large Hydro Electric Untility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

ELECTRICAL ENGINEER, experienced in Power Station Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Salary open. Apply to File No. 4024-V.

JUNIOR ELECTRICAL ENGINEER required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

GRADUATE ELECTRICAL ENGINEER required for position with large Northern Ontario Paper Mill. Preferably man with some paper mill or other industrial experience. Salary commensurate with qualifications and experience. Apply stating experience and qualifications. Apply to File No. 4032-V.

GRADUATE ELECTRICAL ENGINEER with a minimum of 2 years practical experience to assist in electrical engineering design work, field work on construction and maintenance of structures, service and installation of equipment required by Manitoba City. Salary $226 to $257. Apply to File No. 4069-V.

ELECTRICAL ENGINEER required by company in Shawinigan Falls, Quebec. Vacancies exist for first class electrical engineer capable of taking entire charge of electrical department also electrical engineer for work as assistant plant engineer. Salary open. Apply to File No. 4106-V.

EXPERIENCED ELECTRICAL ENGINEERS required by consulting engineering office in Montreal as Assistant Engineers, Designers, Checkers, Draughtsmen and Quantity Estimator. Salaries open. Apply to File No. 4110-V.

ELECTRICAL ENGINEER, age 30-40, required as Sales Engineer for Electrical Power Apparatus Company, manufacturing motors, transformers, rectifiers, switchgear, etc. Test course graduate specializing in switchgear preferred. Sales experience desirable but not essential. Location Toronto. Salary open. Apply to File No. 4128-V.

ELECTRICAL DESIGNING DRAUGHTSMEN for work with a firm of consulting engineers in Southern Ontario. Must be experienced. Salary up to $300. Apply to File No. 4133-V.

ELECTRICAL ENGINEER required for Toronto area for engineering and design of power transformers. Salary will be commensurate with ability and experience. Apply to File No. 4141-V.

ELECTRICAL ENGINEER required as Senior Transformer Draughtsman by Canadian Company in Ontario. Must be experienced in layout and design of high voltage power transformers also capable of assuming responsibility. Salary open. Apply to File No. 4146-V.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience are required for armament research and development in the Quebec area in a government establishment. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEERS required by a Pulp and Paper Company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

JUNIOR MECHANICAL ENGINEER with knowlege of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

RECENT GRADUATES OR JUNIOR ENGINEERS with mechanical background required by a Montreal Engineering fabricating and contracting firm, for training purposes leading to sales and service. Montreal area. Salary $175 up. Apply to File No. 3810-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

*MECHANICAL ENGINEER age 30-38 required for Northern Ontario Paper Mills, preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in re-inforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3994-V.

MECHANICAL ENGINEER required in Ontario by a firm specializing in machine tools. Applicant must be experienced in production control. Salary open. Apply to File No. 4026-V.

MECHANICAL DRAUGHTSMAN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures, etc. Salary $250 up depending upon ability. Apply to File No. 4030-V.

CHIEF ENGINEER, mechanical background required by a specialized industrial plant in the Montreal area. Work covers mechanical design, preparation of work drawings, bills of materials, specifications and the ordering of all materials for contracts, also design of necessary tooling. Salary open. Apply to File No. 4066-V.

MECHANICAL ENGINEERS with experience in estimating or design required by well known general engineering firm in Montreal. Good future for those with right qualifications. Salary commensurate with ability. Apply to File No. 4074-V.

MECHANICAL ENGINEER with experience in the design of hydraulic turbines, valves, penstocks. surge tanks and associated equipment required by large manufacturer in Montreal to participate in expanding program of hydro electric development. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER with minimum of eight years experience in the design of heavy mechanical equipment required by well established firm in Montreal for general supervision and checking. Must be alert and aggressive. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER required in Montreal with considerable experience in machine shop practice and some administrative experience in shop work. Applicant should be around 35 years of age and bilingual. Salary depending on qualifications. Apply to File No. 4100-V.

EXPERIENCED MECHANICAL ENGINEERS required by consulting engineering office in Montreal as Assistant Engineers, Designers, Checkers, Draughtsmen and Quantity Estimator. Salaries open. Apply to File No. 4110-V.

JUNIOR MECHANICAL ENGINEER, age 25 to 27 years, preferably with three to four years experience required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

MECHANICAL ENGINEER with two or more years experience in machine shop practice required in Montreal as sales engineer handling cutting oils and other chemicals and oils used in machine shops. Salary open. Apply to File No. 4116-V.

MECHANICAL ENGINEER with at least ten years experience including plant maintenance and preferably in the pulp and paper industry required in New Brunswick. Salary open. Apply to File No. 4117-V.

* Filled since appearance in advance notice.

MECHANICAL ENGINEER for work in the Development Department of a large chemical manufacturing company involving chemical engineering design, preparation of mass and descriptive flow sheets, specification of equipment, comparison of processes, pilot plant liaison work. Must have had three to five years in chemical plant engineering, maintenance or operation, in order of decreasing preference. Must be able to cooperate well with other departments in the Company. Work would be in Montreal. Salary open. Apply to File 4119-V.

MECHANICAL ENGINEER preferably with two or three years general plant experience required as production engineer by National Beverage Company in Eastern Canada. Salary open. Apply to File No. 4122-V.

*MECHANICAL ENGINEER required for a Western industry engaged in the manufacturer of truck bodies and trailers, overhaul and repair of industrial engines and construction equipment, repair and maintenance of R.C.A.F. and civilian aircraft. Service as an Engineering Officer in the R.C.A.F. during the war will be an advantage. An excellent opportunity is offered to the right man. Apply to File No. 4129-V.

MECHANICAL ENGINEER required as Plant Engineer by large Pulp and Paper Mill. Must have paper mill engineering experience. Permanent position. Salary between $475 to $550 depending on experience. Apply to File No. 4132-V.

*MECHANICAL ENGINEER required for work in Alberta by a consulting engineer in Montreal. Duties include supervision of mining machinery. Salary up to $5,000. Apply to File No. 4134-V.

MECHANICAL ENGINEER with knowledge of design and considerable experience with steam and diesel engines and refrigeration equipment. Required in Montreal. Preferably bilingual. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4137-V.

MECHANICAL ENGINEER OR DRAUGHTSMAN with minimum of four or five years experience. Knowledge of paper mill engineering desirable but not essential. Required by large Pulp and Paper Mill for general engineering design and draughting. Salary up to $400. depending on qualifications. Apply to File No. 4138-V.

MECHANICAL ENGINEER, around 35 years of age required as Assistant to Project Engineer on construction of large pulp plant. Experience in design and piping essential. Duties in Montreal and British Columbia. Salary $5,000 to $6,000. Apply to File No. 4149-V.

MECHANICAL ENGINEER recent graduate required in Engineering and Servicing Department of Canadian Firm with Headquarters in Montreal. Duties include service work in connection with Railway, Pulp Mill and other Industrial Products. Salary open. Apply to File No. 4150-V.

MECHANICAL ENGINEER with 1 to 3 years experience in production required as Industrial Engineer by industrial and chemical organization with headquarters in Montreal. Duties include responsibility for conducting methods engineering studies using techniques of process charts, time and motion study. Salary open. Apply to File No. 4152-V.

MECHANICAL ENGINEER with 2 or 3 years experience, preferably bilingual, required as Mechanical Development Engineer by industrial and chemical organization with headquarters in Montreal. Duties will be conducting investigations on existing equipment and a certain amount of plant layout work and draughting. Salary open. Apply to File 4155-V.

METALLURGICAL

RECENT GRADUATES in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

*METALLURGICAL ENGINEER required by a farm implement manufacturer in Ontario to take over the necessary duties in new mechanized foundry. Salary open. Apply to File No. 4086-V.

* Filled since appearance in advance notice.

MINING

MINING ENGINEERS with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years experience required by a Company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

STRUCTURAL STEEL DRAUGHTSMAN AND CHECKERS, preferably graduate engineers but any experienced man acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER & DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

GRADUATE ENGINEER required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted. Apply to File No. 3780-V

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER wanted for large fabricating plant in Vancouver, B.C. Age between 30 to 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

STRUCTURAL ENGINEER required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No 3931-V.

TWO METALLURGICAL ENGINEERS and ONE CHEMICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training, etc. Salary open. Apply to File No. 3951-V.

*CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years experience for key position in moderate size plant in Manitoba, doing fabrication of Plate Work and Light Steel Work, also Gray Iron Foundry and Machine Shop. This will lead to a key position in a growing organization. Salary open. Apply to File No. 4003-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry required in Nfld. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and Paper experience is not necessary. Salary open. Apply to File No. 4009-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred to supervise steam power plant including operating, boiler cleaning and minor repairs Salary $375. U.S currency. Apply to File No. 4011-V.

*ELECTRICAL OR MECHANICAL ENGINEERS required by large Montreal firm to prepare and analyze specifications for telephone equipment manufacturing and installation. Other types of engineering work also available. Salary open. Please send photo together with particulars of education and experience. Apply to File No. 4018-V.

GRADUATE ENGINEER required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential also some sales ability. Salary around $400. Apply to File No. 4021-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships Good salary, permanent position to the right man. Apply to File No. 4031-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experienced in installations of production and cost control, wage incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

SALES ENGINEER for popular line of Diesel Engines. Applicants must be specialists on Power Units and Generator Sets, required for permanent employment with well established organization. Apply to File No. 4055-V.

*GRADUATE ENGINEER, preferably mechanical or electrical background required for drop forging plant operation and production in Province of Ontario by a steel company with headquarters in Ontario. Good commercial sense essential. Salary open. Apply to File No 4062-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience between 30 and 40 years of age required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

POWER STATION OPERATOR with about five years' experience principally in operation and maintenance of turbines and mechanical equipment of hydro-electric plants required by public utility in Brazil. Preferably not over 30 and single but will consider married man without minor dependents. Replies held in strictest confidence. Salary open. Apply to File No. 4073-V.

MECHANIAL OR CIVIL ENGINEER with at least four years experience in stress analysis and Vibration required by one of Canada's leading manufacturers of heavy mechanical equipment. Considerable scope for man of proper qualifications. Salary open. Apply to File No. 4074-V.

SALES ENGINEER required by well known engineering supply company doing business with Mining and Pulp and Paper companies. Excellent opportunity for advancement. Travelling not extensive. No experience necessary but desirable. Salary open. Apply to File No. 4079-V.

TOWN ENGINEER required by town in Ontario. Duties include the supervision of Board of Works and Sanitation Departments as well as acting in an advisory capacity to the telephone, electric and water utilities. Salary from $250. to $300. Apply to File No. 4087-V.

RECENT GRADUATE MECHANICAL OR ELECTRICAL background required by engineering firm in Montreal Duties include training in Public Utility in Administration Department. Eventually for South America. Salary to start $225. Apply to File No. 4089-V.

JUNIOR ENGINEER preferably with a few years experience in production control and some knowledge of the textile industry required for Montreal area. Salary $250. to $275. Apply to File No. 4092-V.

SENIOR INDUSTRIAL ENGINEER with business administration and mechanical background, bilingual, with at least five years experience in production control, wage incentives and cost control required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 4092-V.

SENIOR DESIGNER with from five to ten years experience and a general knowledge of structural design in relation to buildings and bridges required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

JUNIOR ENGINEER with from one to five years experience and at least a working knowledge of structural design of buildings required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

SALES ENGINEER required by large manufacturer of Air Handling equipment in Toronto area. Applicant should have either industrial or Public Building application and sales experience. Salary open. Apply to File No. 4101-V.

SALES ENGINEER required by Canadian Company in Ontario. Must have thorough knowledge of the preparation of tenders, propositions on Transformers, Motors and Switchgear equipment, also experience in the commercial side of the heavy electrical industry. Salary open. Apply to File No. 4102-V.

MAINTENANCE ENGINEER required in Quebec City to do installation work in heating, ventilating, refrigeration and air-conditioning, gas and diesel motors. Must be bilingual. Salary open. Apply to File No. 4104-V.

JUNIOR ENGINEER required in Quebec City. Preferably with three to five years experience in heating, ventilating and air-conditioning, gas and diesel motors. File No. 4104-V.

MECHANICAL OR ELECTRICAL GRADUATE, age about 35 years with experience in building construction machinery maintenance and repair capable of taking over the engineering and maintenance services in a large textile mill in Province of Quebec. Salary open. Apply to File No. 4114-V.

DRAUGHTSMEN with some experience in building design or architectural work required by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

SALES ENGINEERS, one experienced man also two juniors willing to learn required by an electrical and power house equipment manufacturer in Montreal. Salary open. Apply to File No. 4121-V.

RECENT GRADUATE preferably mechanical or civil background required by Maritime branch of large industrial Canadian firm. Duties of general engineering nature. Salary open. Apply to File No. 4125-V.

GRADUATE ENGINEERS required as Assistant Professors, Lecturers and Demonstrators in Civil, Electrical and Mechanical Engineering by a Canadian University. Salaries dependent on experience and general qualifications. Apply to File No 4127-V.

*JUNIOR ENGINEERS required as assistant engineers on construction work at Saint John Harbour. Salary $200 to $250. depending on training and experience. Apply to File No. 4131-V.

MECHANICAL OR CIVIL ENGINEER with shop experience required in Montreal. Duties include design on railway equipment. Salary open. Apply to File No. 4135-V.

*SALES ENGINEER required by prominent distributor of heavy equipment for forestry, road building and construction industries. Head office in Montreal. Working knowledge of French and executive ability necessary. Salary open. Apply to File No. 4140-V.

GRADUATE ENGINEER with engineering and sales experience required as a Street Lighting Specialist in Toronto area. Position involves direct sales engineering with municipalities and utilities also engineering and production problems directly concerned with the manufacture of street lighting equipment. Age under 35 years. Salary open. Apply to File No. 4141-V.

HEATING AND VENTILATING ENGINEER with considerable experience in mechanical equipment for buildings is wanted for office work on heating, ventilating and air conditioning by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 4142-V.

* Filled since appearance in advance notice.

MAINTENANCE ENGINEER, under 30 years of age, required by Public Institution for Montreal area. Duties include maintenance of buildings, heating plants, electric service, etc. Salary open. Apply to File No. 4143-V.

TOWN ENGINEER required for town in Nova Scotia. Applicant must be qualified to take charge of all town services including electric (distribution system) and water utilities. Salary open. Apply to File No. 4145-V.

MECHANICAL OR CHEMICAL ENGINEER with Masters' or Doctors' degree and several years' experience in industrial or University research work required to head the Engineering Development Section of the National Research Council, Atomic Energy Project. Salary open. Apply to File No. 4148-V.

GRADUATE ENGINEER age 32 up, preferably bilingual and with 10 years experience in industrial design required by chemical organization with headquarters in Montreal. Duties include supervision of works design department supply draughting and design service for plant, prepare appropriation requests, maintain cost estimating units, etc. Salary open. Apply to File 4153-V.

MECHANICAL ELECTRICAL OR CIVIL ENGINEER, age 23-30, preferably single and bilingual with some experience in maintenance required by an industrial and chemical organization with headquarters in Montreal. Duties include construction project and design studies. Salary open. Apply to File No. 4154-V.

ENGINEER required in Montreal. Applicant should have railroad construction experience and a knowledge of welding technique also the ability to organize and carry out special track construction jobs. Salary open. Apply to File No. 4157-V.

CIVIL OR STRUCTURAL ENGINEER, 24 to 35 years, required for Northern Ontario Paper Mill. At least four years experience, 2 of which should be on construction and 2 on design. Opportunity to train junior personnel. Salary not less than $400. Apply to File No. 4158-V.

SITUATIONS WANTED

MECHANICAL ENGINEER, M.E.I.C., P.Eng. Ont.; 36, married now employed on top responsible position, desires position with Airlines, or connected with flying. Man with wide technical experience and knowledge. Pilot since childhood, and ex-instructor in power and glider flying Speaks several foreign languages, good organizer, knows jet propulsion and safety of flying problems. Available for responsible, serious and permanent position with future on 6 months notice to the present employer. Will give priority for the position with available living quarters near work. Apply to File No. 140-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill University. Eight years experience Tool and Production Methods Engineer. Age 38. Married. Presently employed. Desires employment as Production Manager or Materials Engineer for large company. Preferably Montreal area. Apply to File No. 551-W.

CIVIL AND MECHANICAL ENGINEER M.E.I.C., aged 42. B.Sc. Civil Graduate work in industrial engineering at McGill University. Seventeen years experience in following field: Manufacture of welding rod and hardfacing alloys, installation of incentive bonus system in two of Canada's largest Aircraft Plants. Production planning on the manufacture of shells and shell parts. Design and construction of explosive proving equipment. Superintendent during construction of one of Canada's largest Shell Filling Plants. Other experience covering Oil Refining, Contracting, and installation of Pulp and Paper Mill Equipment. Interested in position with responsible firm or partnership with consultant. Home in Montreal area. Apply to File No. 981-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., Quebec, with more than 20 years experience in design and construction of dams and Power Plants in U.S.A. and Canada. Desire change in position preferably in the construction field. Apply to File No. 1527-W

ENGINEER, M.E.I.C., Prof.Eng., Que., with Bachelor and Master Degrees, over twenty years diversified background of experience, interested in post on plant operations, administration, or general management. Service overseas in army. Now employed but available on short notice. Apply to File No. 1645-W.

CIVIL ENGINEER, M.E.I.C, Prof.Eng., Quebec, age 39, married. Fluently bilingual with a certificate in Municipal Public Works administration. Experienced in Municipal, Highway Engineering, design of sewer and aqueduct, construction and maintenance. Seeks position as executive, Town Engineer, Construction Superintendent, Sales Engineer. Available on short notice. Apply to File No. 1859-W.

PART TIME WORK: Senior Design Engineer, B.A.Sc. P.Eng., M.E.I.C., has available an experienced group of engineers and draughtsmen desirous of obtaining evening work. Experience in the group includes municipal, mechanical, mining and water-power engineering ranging from the initial layout to the final design, as well as structural steel and reinforced concrete design and layout. All members of this group are permanently employed. Apply to File No. 2463-W.

GRADUATE ENGINEER (Civil & Mechanical), M.E.I.C., A.M.I.C.E., P.Eng. Ontario & Quebec, Member American Institute of Chemical Engineers, aged 43. Four years waterworks and filtration plant design and construction, sixteen years industrial process and heavy chemical plant engineering. Experienced complete process computations, layout design and specification of equipment for manufacturing and chemical processes. Accustomed to technical development and improvement of manufacturing processes, direction of operation and executive responsibility. Proven ability to direct complete projects from design stage to actual operation. Desires senior position or partnership established Consulting Engineers, or responsible position chemical or manufacturing company. Apply to File No. 2470-W.

MECHANICAL ENGINEER, B.Sc. (Queen's), M.E.I.C., P.Eng. Age 33, married. Presently employed Montreal area is desirous of obtaining position in Ontario. Offers experience in Engineering department management and organization, plant layout, machine design, jigs and tools, sheet metal work and building trades. Available one month's notice. Apply to File No. 2682-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., Que., with more than 25 years experience in reinforced concrete design and construction, interested in position with responsible firm or partnership with consultant would also consider government or municipal position. Apply to File No. 2695-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng. (N.S.), age 39, married, desires position in industrial part of Canada. Eight years experience in Mechanical Department shops and in the mills of large steel company. Five and one-half years Engineer Officer R.C.A.F.—rank Wing Commander. Five years Sales Engineering, conveyors, drives, pumps, heavy construction equipment. Particularly interested in Sales, Executive or Personnel work carrying responsibility and having a future. Employed at present, but desires to get out of the Maritimes to where there is greater opportunity. One month notice. Correspondence invited. References. Apply to File No. 2711-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill '45, age 24, single. Experienced in tool design and stress analysis also spent one term as demonstrator in Mechanical Engineering, desires permanent position in industry, preferably Montreal area but willing to travel. Available at once. Apply to File No. 2903-W.

GRADUATE ENGINEER S.E.I.C., Man., '47. Presently engaged in Plant layout and field supervision. Experienced in mechanical and electrical construction and maintenance. Responsible position desired in business and production engineering in progressive firm. Apply to File No. 2975-W.

EXECUTIVE ENGINEER, age 43, P.Eng., M.E.I.C, M.C.I.M., with Mechanical, Structural and Mining Engineering Background, desires contract for position in Executive or Management Field. Apply to File No. 2982-W.

ENGINEER, B.Sc. (Honors), McGill '31, M.E.I.C., P.Eng. (Quebec.) Married, age 40, 9 years experience in general business field, managing and organization of departments. Eight years mechanical engineering experience primarily in erection and maintenance of equipment in

Chemical and Metallurgical field. Last 3 years as Chief Engineer of Cement Plant in South America, reconditioning plant, designing and installing new equipment. Perfectly bilingual. (English and French.) Working knowledge of Portuguese. Desires position with reliable firm leading to position with a future. Locations preferred are B.C.-Montreal District or Southern Ontario—available on short notice. Apply to File No. 2987-W.

ENGLISH ENGINEER, A.M.I.E.E., 33 years of age, married. Wishing to emigrate requires post where his experience will be of most use; 17 years experience comprising workshop, test, development research on public address and television E.M.I. Co. Field and development engineering, radio navigation aids and radio teleprinter equipment. At present Technical Officer, Air Ministry. Could possibly arrange to visit Canada for interviews if required. Apply to File No. 2994-W.

MECHANICAL ENGINEER, M.A., M.I., Mech. E, wide experience in Vibrations and Balancing presently residing in England, interested in emigrating to Canada if suitable contacts could be arranged. For details of past experience apply to File No. 2995-V.

CIVIL ENGINEER, B.A.Sc., S.E.I.C., age 26, experience in surveying, industrial layout and inspection, construction of underground heating system. 1 year design and construction water and sewerage system. Presently employed in Ontario. Apply to File No. 2997-W.

CHEMICAL ENGINEER, B.Sc. Queen's, S.E.I.C., married, veteran. Employed at present. Experience in light metals industry; corrosion testing; production control; spectrographic analysis. Desires position in chemical or metallurgical process industry. Available on reasonable notice to present employer. Apply to File No. 2999-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.Eng. (McGill), Master of Commerce, Toronto '48), aged 27, experienced in Aircraft Industry, Petroleum oilfield work on drilling, production, construction and design. Presently situated in West, but would locate anywhere. Apply to File No. 3006-W.

SALES ENGINEER, Jr. E.I.C., graduate B.Sc., textile chemist, age 32 years, married. Four years of lab. research work, five years of technical sales experience in textiles, coated fabrics, yarns, textile machinery, machine tools, plastics and chemicals. Office and plant management experience. Capable of running business office, efficient correspondent, bilingual, drive own car. Apply to File No. 3019-W.

MECHANICAL ENGINEER, Ph.D. (London), A.M.I.M.E., with extensive mechanical and structural experience in Europe and England and post-graduate research in structures at London University. Age 34. Presently residing in England arriving in Canada August, 1948, and available for employment September, 1948. Apply to File No. 3021-W.

MINING ENGINEER, M.E.I.C., B.Sc., Queen's '33, P.Eng. Que., married, age 37, eighteen years experience in mining exploration, and development work. Desires work in the Rouyn area of Quebec. Apply to File No. 3022-W.

MECHANICAL ENGINEER, B.Sc. (Eng.), A.M.I. Mech.E., wide experience in the aircraft industry. Presently residing in England, but interested in emigrating to Canada. Employed in Canada during years 1941 to 1945. Would consider any appointment in engineering world to start with the assurance of being able to speedily prove worth and ability. Apply to File No. 3023-W.

THE BRITISH MINISTRY OF LABOUR *and* NATIONAL SERVICE

Has requested the Institute to supply names and addresses of Companies in need of Civil Engineers. The Ministry has stated that it has on record the names of a number of men who are anxious to take up residence in Canada. The qualifications of these men range from recent graduation to extensive experience.

Interested concerns are invited to send their requirements to:

The Employment Service,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, Quebec.

Experienced Maintenance Engineer

An important Pulp and Paper Mill in the Province of Quebec has attractive opening for an experienced engineer (preferably in the manufacture of Kraft). Must be capable of assuming complete charge of all maintenance work.

Excellent recreational and educational facilities in vicinity of plant. Good house available. Attractive salary.

Apply to File Number 4179-V.

WANTED—MAINTENANCE MANAGER

For Department of Health to assume responsibility for maintenance and operation of power plant, buildings and equipment of large Hospital. Knowledge of building construction; maintenance of heating, ventilating, plumbing, refrigeration and electrical and mechanical equipment required. Must have experience in power plant operation and capable of organizing and directing maintenance and operating staff.

Application forms may be obtained from the Nova Scotia Civil Service Commission, P.O. Box 943, Halifax, N.S., or by telephoning No. 3-7341-Br. 230.

THE PUBLIC SERVICE OF CANADA REQUIRES

A CHIEF, ENGINEERING AND CONSTRUCTION DIVISION

Department of Mines and Resources,

$6,600 - $7,200

Poster announcements giving full details on display — and application forms obtainable — at Post Offices, National Employment Service Offices, and Offices of the Civil Service Commission throughout Canada.

ENGINEERING INSTRUCTORS REQUIRED

The University of Toronto requires engineering instructors and demonstrators for its Ajax Division for the Session beginning September 20th, particularly in Electrical Engineering and in Engineering Problems and Drawing.

Apply to the Secretary, Faculty of Applied Science and Engineering, University of Toronto.

Position Vacant—Civil Engineering

Graduate in Civil Engineering with extensive experience in the use and design of Structural Steel. Duties will be primarily Public Relations with Architects, Engineers and Public Bodies and he will be required to act as Secretary of a Dominion Association. Applicant must have personality, appearance, the experience mentioned, and should be over thirty-five years of age. Headquarters will be in Toronto, with frequent visits to Ottawa, Montreal and other centres. Salary from $4,800.00 annually upward. Apply to File No. 4201-V.

DRAFTSMEN

THE ENGLISH ELECTRIC CO. OF CANADA LTD.
St. Catharines, Ont.

requires

4 Junior Draftsmen

Preferably with some experience in layout on large power transformers.

This is an excellent opportunity for selected applicants.

All replies to this advertisement held in strictest confidence.

Please address your letter of application to the

Personnel Manager
JOHN INGLIS CO. LTD.
14 Strachan Ave., Toronto

Chief Engineer

FOR

Mechanical Plant

A large general mechanical Engineering Plant in Montreal area has immediate vacancy for a chief engineer. Applicants must be graduate engineer with extensive design experience, must be capable of handling staff of fifty. Good salary, excellent prospects and most interesting work. Write, in detail, in own hand to File No. 4200-V.

Business & Industrial Briefs

A Digest of Information received by The Editor

New Equipment and Developments

Imperial Oil Limited has opened an $8,700,000 refinery in the suburbs of Edmonton, Alberta. The formal opening was attended by government, municipal and company officials. The ceremony was held on July 17, just seventeen months after Imperial Oil brought in the discovery well that established the Leduc field as the largest known source of crude oil in the Dominion.

The refinery will be in full production by the end of the year and will process 6,000 barrels of crude daily. An increase in its capacity to 11,000 barrels a day, at a further cost of $2,500,000 is under consideration. Much of the equipment at the new plant was originally located at Corpus Christi, Texas. When war in the Pacific broke out the equipment was moved, along with other units and parts from hundreds of centres in Canada and the United States, to Whitehorse, Yukon Territory.

The site of the refinery is on the south bank of the Saskatchewan River and it covers 360 acres of land. The plant contains a crude distillation plant and a "cracking" unit is now under construction. The possibility of providing facilities for the manufacture of lubricating oil is being considered.

•

New gas fired unit heaters that feature cast iron construction in both the heat exchanger and the combustion chamber have been placed on the market by Automatic Gas Equipment Company, 301 Bruston Avenue, Pittsburgh 21, Pa. They are known as Pittsburgh Gas Unit Heaters, Series "C". Descriptive literature is available on request.

Kennametal Inc., Latrobe, Penna., announce the development and availability of a new series of chisel type rock bits which can be screwed on standard drill rods. These new bits are offered in six sizes, ranging from 1⅜ ins. to 2¼ ins.

The manufacturer claims that they feature new construction throughout. The threads inside the body of the bit screw on steels that have F threads, H threads, and D threads; providing a shouldered contact between the bit body and the drill rod. The blade is held in the body of the bit by an exclusive method developed by the Company's engineers.

It is also claimed by the Company that the 2¼ in. diameter bits are the first cemented carbide bits of this size to be developed, marketed and manufactured in quantities. The manufacturer will supply additional information.

•

The annual reunion of the Canadian General Electric Test Alumni Association will be held at the Kawartha Golf and Country Club, Peterborough, on Saturday, September 11.

•

The Dominion Oxygen Company Ltd., 159 Bay Street, Toronto 1, Ont., claims that the Heliarc inert-gas-shielded arc welding process has simplified the fabrication of stainless steel trailer tanks. High purity argon gas shields the torch electrode and weld area thus eliminating the use of flux.

In tanks of 1000 gallons capacity, made for the transportation of milk from 14-ga. type 302 stainless steel, the welding time for 912 in. of welding was approximately 45 minutes.

The Company claims that the high sanitary standards required for such containers are easily met with Heliarc welding, because no flux is used. This eliminates spatter and corrosive inclusions, and the final welds are smooth and non-porous.

•

Alexander Gray, president and general manager of Gray-Bonney Tools Limited, Toronto, has just returned to Canada from a 42,000-mile air trip. He visited countries in Western Europe, Africa, Central and South America.

•

Holub Industries Inc., Sycamore, Illinois, U.S.A., has announced "Hi" Carbide Tipped Masonry Drills. These drills have been designed for use with electric rotary or breast drills. They are designed particularly for drilling hard materials, such as concrete, brick, stone, tile, marble, plaster, sheet rock, etc. Many special features are claimed for these drills. The Company will be pleased to supply additional information.

•

The thirty-fifth annual convention of the American Electroplaters' Society terminated on July 1 after a three-day session at Atlantic City. There were over 1200 registrants.

Papers read at the technical sessions covered the scientific, engineering and economic aspects of electroplating and metal finishing. Society honours were awarded to a number of the speakers. The 1948 convention will be held in Milwaukee and the dates will be announced by the society in the near future.

•

The Steel Company of Canada Ltd., P.O. Box 460, Montreal, Que., has announced that adjustable pipe hangers are again in plentiful supply. The Company's pipe hangers are made of soft ductible steel and are furnished in straight lengths ten feet long. The hangers can be bent on the job. The hangers are available in black or galvanized steel and are supplied in bundles of 100 or 200 feet.

The Consolidated Mining and Smelting Company of Canada Ltd., Trail, B.C., has announced the receipt of an order for a rod mill for the Sullivan mine. The mill will be part of the equipment for the sink and float project and will be installed at the Sullivan concentrator. It will be used for grinding mine ore and it is believed it is the largest of its kind ever constructed. It was designed by the Hardinge Company Inc., of York, Pa., and will be manufactured by the John Inglis Company Ltd., of Toronto. It will have a diameter of 11 ft. 5 in. and will be 12 ft. long. The rods will be a mixture of 3 in. and 3½ in. and will weigh 95 tons. Power will be supplied by a 720 r.p.m., 1,000 hp. synchronous motor manufactured by Canadian Westinghouse Co. Ltd., Hamilton, Ont.

Simon-Carves Limited of Stockport, England, has completed arrangements with E. C. Badger & Sons Co., for the erection in the United States of sulphur recovery plants. The first plant to be built under this arrangement will be for the Hancock Chemical Co. of Long Beach, California.

The RCA Victor Company Ltd., Montreal, Que., has announced the development of a new miniature " broadcast quality " microphone. The new microphone is smaller than a package of cigarettes and the manufacturer claims that it has the sensitivity of the finest broadcasting microphone. It is now in production and will be available shortly.

One of the smallest broadcast microphones yet developed, the new low-cost RCA " Bantam " velocity microphone is designed for use in radio studios, at remote broadcasts, at conventions and in clubs. The unit is so small that it will not hide the faces of singers, speakers, and other users. It fits comfortably into the palm of the hand and weighs only 12 ounces. The manufacturer will supply additional information on request.

Wheelco Instruments Company, 847 W. Harrison Street, Chicago, has announced the release of a new portable Solder Tin Content Indicator, a checking instrument for quick analysis of solder quality. It provides a means whereby manufacturers of metal containers may determine the ratio of the lead and tin content in solder for process standards and economy.

Please communicate with the Company for complete information.

R. G. LeTourneau, Inc., Peoria, Illinois, U.S.A., has available a folder-type publication describing " Tournarope " which is the trademark name for the cable manufactured by the Company.

Link-Belt Limited, Eastern Avenue at Leslie and Keating Streets, Toronto, 8, Ont., offers a 16-page illustrated book No. 2244 in which is described a new " PA " Positive-Action Oscillating-Trough Conveyor.

The Baldwin Locomotive Works, Philadelphia 42, Pa., offers readers of the " *Journal* " a new bulletin No. 262 in which is catalogued Baldwin Stress-Strain Recorders and Strain Followers. It describes the distinguishing features of twenty-four different recorders for all common makes of testing machines and more than 50 extensometers, compressometers and deflectometers which can be used with the recorders.

A Wiring Inspector's Test Set has been developed by Eastern Specialty Company, Philadelphia 40, Pa., to enable one person to make a complete test of the wiring in any building without additional help. For complete operating data ask for Bulletin No. 42.

Publications

For copies of the publications below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing

Dow Corning Corporation of Midland, Michigan, offers through the Canadian branch of the Company, Fiberglas (Canada) Limited, 1200 Bay Street, Toronto, a most interesting publication entitled " Dow Corning Silicone Mold Release Agents ". It contains technical data on the product and major applications in the fields of lubricating tire molds, curing bags, and in the lubrication of mechanical rubber goods, floor tile and plastics, etc.

Dresser Industries Inc., 1130 Terminal Tower, Cleveland 13, Ohio, will send on request a new 48-page, pocket-size booklet listing the 13 operating companies of Dresser Industries Inc., and identifying the products and services of each.

The booklet shows Dresser equipment at work in the oil, gas, chemical, mining and other industrial fields and it contains abbreviated lists of individual company products and their more important applications. There are also a number of pages covering the gas-fired heating systems, and automatic water heaters built by three Dresser companies for use in homes, institutions and commercial and industrial establishments.

The. B. F. Sturtevant Company of Canada Limited, 19 Melinda Street, Toronto, Ont., offers a new catalogue on their air systems. It covers all applications in dust, fume and vapour removal and pneumatic conveying. Ask for Catalogue No. 291.

The July issue of the " Dominion Engineer ", published by the Dominion Engineering Company Limited, P.O. Box 220, Montreal, contains interesting information on the paper machines manufactured by the Company. The publication is well produced and illustrated. Copies are avaliable.

S. A. Armstrong Limited, Toronto, offer readers of the *Journal* an 8½x11 in. illustrated publication entitled " Armstrong Heat Exchangers ". It contains twenty-seven pages of technical data on the heat exchangers manufactured by the Company. Ask for the publication by name " Armstrong Heat Exchangers ".

From Well to Consumer...

CRANE serves Canada's petroleum industry

IN every phase of handling and processing, Canada's petroleum industry uses Crane valves, fittings and fabricated piping. Crude flow is controlled from well to pipe line—or to tank car or other means of transportation—and into the refinery. There Crane equipment assures ease of control during processing. Then more Crane equipment controls the flow to bulk and service stations, to tanker terminals or elsewhere, en route to the ultimate consumer.

To the industry Crane's extensive manufacturing and distributing facilities provide a comprehensive service for the production, refining and marketing of petroleum products. It assures *one* dependable source of supply, *one* responsibility for all materials, *one* high standard of quality. Equipment has been developed to meet the requirements of high pressures and temperatures, corrosion resistance, and particular service conditions—and has been continually improved as operating experience and Crane research have shown the need.

ONE
SOURCE OF SUPPLY
RESPONSIBILITY
STANDARD OF QUALITY

In *your* plant, you will find there are many advantages to be derived from the use of Crane service-tested equipment and from consultation with Crane's service-wise sales and research staff.

CONCRETE *for* LAND CONSERVATION UNDER PRAIRIE FARM REHABILITATION ACT

Converting great areas of waste land into fertile soil has been an important part of P.F.R.A. conservation plans, under the Dominion Department of Agriculture (G. L. Mackenzie, Chief Engineer).

Where irrigation by gravity has not been possible, water has been diverted from the nearest source and stored behind the enduring strength of concrete dams until required to cultivate arid soil.

Without this modern construction material such projects as those illustrated would be virtually impossible. Concrete withstands extremes of heat and cold; it lends itself to speed of construction; permanence and low upkeep costs make it an economical material for any type of building. Write us for information on any construction or reconstruction work which you may have in mind.

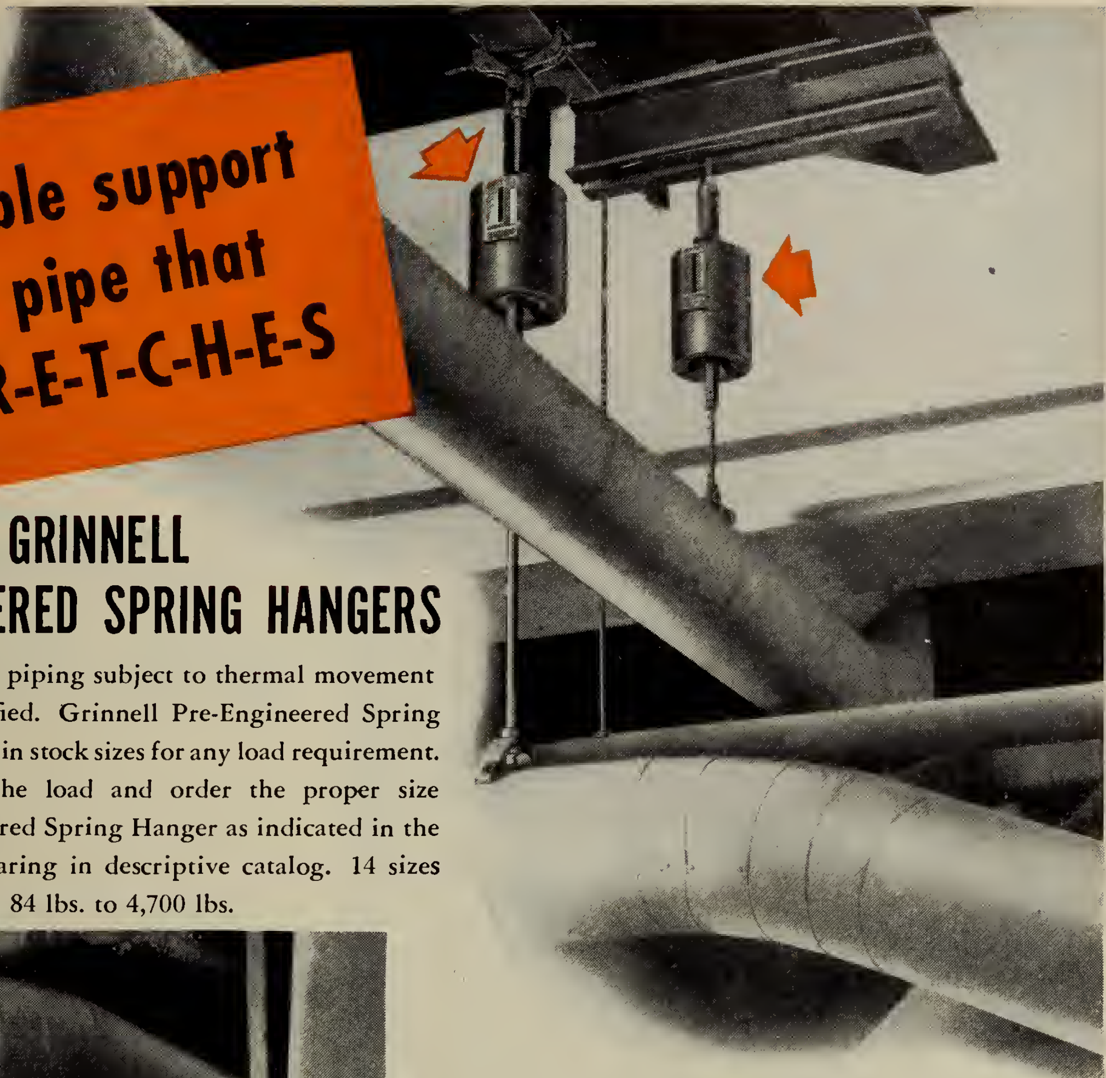
Flexible support for pipe that S-T-R-E-T-C-H-E-S

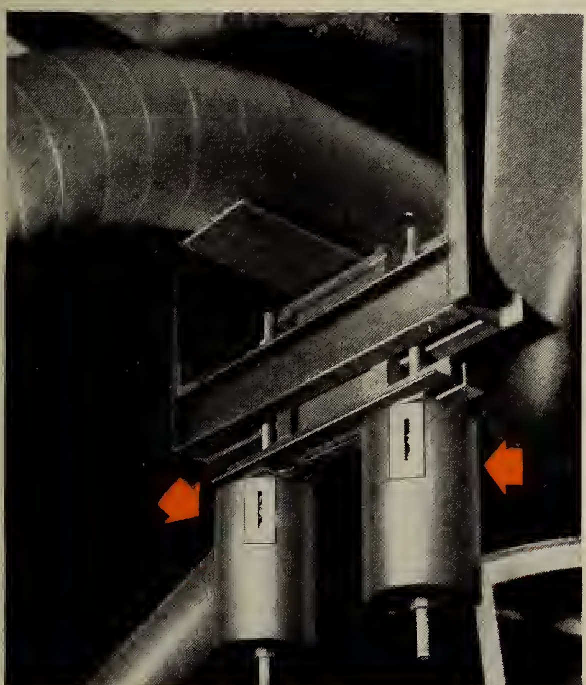
with GRINNELL PRE-ENGINEERED SPRING HANGERS



Selecting hangers for piping subject to thermal movement is completely simplified. Grinnell Pre-Engineered Spring Hangers are available in stock sizes for any load requirement.

Simply compute the load and order the proper size Grinnell Pre-Engineered Spring Hanger as indicated in the Capacity Table appearing in descriptive catalog. 14 sizes with load range from 84 lbs. to 4,700 lbs.

Flexible suspension of piping in one of world's largest catalytic cracking plants.



Showing reverse application of Spring Hangers on a flexible piping support.

LOOK AT THESE FEATURES . . .

- The maximum variation in supporting force per ½" of deflection is 10½% of rated capacity—in all sizes.
- Guides prevent contact of coils with casing wall or hanger rod and assure continuous alignment and concentric loading of spring.
- Compact—minimum headroom made possible by precompression*.
- Precompression* assures operation of spring within its proper working range where variation in supporting force is at a minimum.
- All-steel welded construction meets pressure piping code.
- 14 sizes available from stock—load range from 84 lbs. to 4700 lbs.
- Easy selection of proper sizes from simple capacity table.
- Installation is simplified by integral load scale and travel indicators.
- Unique swivel coupling provides adjustment and eliminates turnbuckle.

*Precompression is a patented feature

WHENEVER **PIPING** IS INVOLVED

TO BETTER SEWER CONSTRUCTION

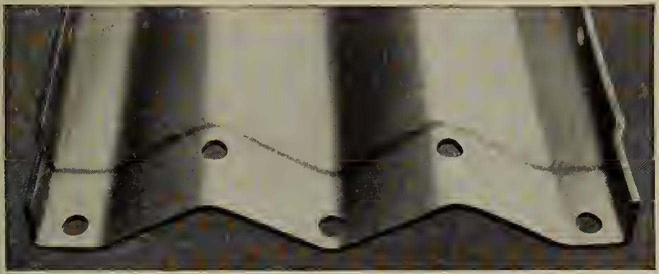
This group of ARMCO Products may be the answer to your sewer construction problems. They can help you cut installation and maintenance costs and assure more efficient sewerage systems.

ASBESTOS-BONDED SEWER PIPE. ARMCO'S Asbestos-Bonding process assures lasting service under severe corrosive conditions. Flexible, corrugated metal design take the impact and vibration of heavy traffic. For erosive conditions the pipe is provided with a thick bituminous pavement.

MULTI PLATE PIPE AND ARCHES. Speeds construction of large sewers. Pre-curved corrugated MULTI PLATE sections are easily handled and assembled by unskilled labor. The structure has ample strength. Manufactured for pipe 60″ to 180″ in diameter, and for arches 5′ to 25′ and larger.

PIPE-ARCH. Provides ample sewageway under limited headroom. Long lengths speed installation. Corrugated metal design assures ample strength under shallow cover. Small sizes are of pre-fabricated, riveted construction. For large sewers sturdy MULTI PLATE Pipe-Arches are avilable.

SHEETING. For trenches and other construction requiring a light-weight metal sheeting. Costs are low. You buy the exact weight you need. And this strong, easy-driving sheeting can be readily pulled and re-used many times. The sheets are nestable to conserve shipping and storage space.



TUNNEL LINER PLATE. Used for lining tunnels and shafts. The sturdy plate sections are easy to handle and intallation is quickly made by unskilled labor. Costs are low and the hazards and inconvenience of open trenching avoided.

FITTINGS. Standard fittings such as tee and wye branches are available. Special fittings—manholes, catch basins, elbows, reducers—are fabricated to fit specific requirements. They assure strong, durable connections.

MANITOBA

Home of Diversified Industry

THE PLANNERS of a new industry make a careful study of conditions before they choose a location. Since 1940, 216 new industries have been established in Manitoba, and for good reason.

The vast natural wealth, favourable labour conditions, and excellent transportation facilities to be found in Manitoba are valuable business assets.

Such industries as Agriculture, Fishing, Fur, Forestry and Mining combine to give Manitoba a stable, well balanced, diversified economy.

Those are some of the reasons why many additional enterprises are planned for the near future in Manitoba.

Looking for a site?

Finding a satisfactory plant site, Mr. Industrialist, is not so difficult . . . But are you looking in the right neighbourhood?

Many sites would accommodate that new plant design of yours but not in every locality will you find combined to the best advantage the physical and economic factors that make for success in your particular field of activity.

Plant location is not just a real estate problem. Somewhere, there is a community where your over-all manufacturing and distribution costs combine to show maximum economy. With our extensive sources of factual data and our broad experience in industrial placement, we are well equipped to make the studies and analyses that point to that community.

We invite you to avail yourself of our services, without any obligation on your part.

RM Transformers conform to the new C.S.A. Specification C88

REPETITIVE MANUFACTURE is quantity production of transformer components of standard design, adopted by Canadian General Electric as the logical and orderly method of building better power transformers—in less time and at less cost to you.

Standardization of design reduces engineering time, minimizes the number of drawings required, facilitates pre-fabrication, and enables us to stock parts.

These major production-time savings mean you get quicker deliveries at lower cost. More important—you get a better product because designs, manufacturing methods and materials can be studied and improved more rapidly on a standardized line.

Standard designs are available in single-and three-phase, 25-and 60-cycle ratings up to 69000 v, 5000 kva, conforming to Standard Specifications for Power Transformer C-88—1947. Naturally, every possible transformer rating cannot be included in our RM line. Special ratings may still be obtained, but your co-operation in adopting standard units will result in increased benefits for you.

For complete information on Repetitive Manufacture G-E Power Transformers, contact your nearest C-G-E office. Write for bulletin CGEA 4283.

COVER PICTURE

The economic welfare and development of the Western provinces is of such vital importance to the entire Dominion that the technical section of this issue of the *Journal* has been devoted to papers, delivered at the Annual General and Professional Meeting, on Prairie Water Problems and Achievements.

The authors of the papers are leading authorities on their subjects. The views they have presented and the procedures and processes they have described will be of extreme interest to all engineers.

To find a cover illustration which adequately illustrates all the major benefits to the West through the harnessing and utilization of water presented an impossible task and, therefore, it was decided to use a photograph of one of the simplest, but most important uses, a small irrigation ditch. The photograph is reproduced by permission of Canadian National Railways.

The Saskatchewan River and Manitoba's Water Problem

by

D. M. Stephens, M.E.I.C.

Deputy Minister of Mines and Resources, Province of Manitoba, Winnipeg

A paper presented at the Annual General and Professional Meeting of The Engineering Institute of Canada at Banff, Alberta, June 2nd, 1948

This paper will be of interest, not to engineers alone, but to every native of the Prairie Provinces. Indeed, what ultimately is done with Saskatchewan River water can affect the lives of Canadians from Alberni to Yarmouth. While primarily it is a statement of Manitoba's claims on Saskatchewan River water, the author points out that the Prairie Provinces must decide between more kilowatt hours in Manitoba, with the industrial development they will bring, and more irrigation in the two other Prairie Provinces with its resulting stimulus to farm production. The five regions of the Prairie Provinces are discussed in relation to their needs for water. The proposed diversion from the Saskatchewan for irrigation purposes is translated into hydro electric power lost to Manitoba, and the economic effects are evaluated. Maintaining that a piece-meal approach to prairie water problems is not good enough, the author urges the early formation of a Western Water Board.

The main elements of Manitoba's Water Problem can be briefly stated. In the first place, the Province is a sub-humid region. It lies in a low rainfall area where the annual precipitation ranges from 14 to 22 inches. Except for the occasional spring freshet, when local flooding might occur, we are likely to be chronically short of water. That is the first element of our problem. The second is to be found in the fact that we lie at the bottom of a whole series of drainage basins, the water courses of which rise in, and flow through, other jurisdictions. Many of these water courses flow through provinces or states which also suffer from chronic shortages of water. In some of these the shortages might be more acute than those suffered by Manitoba.

These conditions which exist in jurisdictions outside of Manitoba have given rise in the past, and will no doubt continue to give rise, to watershed developments and water uses which have had and will have an adverse effect upon Manitoba's water supply position. It will be obvious, of course, that to whatever extent water is extracted from streams flowing into Manitoba and is dissipated for irrigation or other similar purposes, Manitoba's chronically bad water supply situation will, to that extent, be worsened.

The third element of our water problem relates to the nature of our terrain. Manitoba is a region of relatively low relief. Surface elevations vary from a maximum of 2724 feet above sea level datum in the Duck Mountains to sea level along the shores of Hudson Bay. Lake Winnipeg, an immense collecting basin for the very large watersheds draining into Manitoba, lies at elevation 713 feet above sea level. The mean level of the Winnipeg River at the Manitoba-Ontario Boundary is approximately 982. The mean level of the Red River at the International Boundary is 750. The Souris River enters Manitoba from North Dakota at elevation 1402. The Assiniboine River enters from Saskatchewan at elevation 1375, and the level of the Saskatchewan River at the Manitoba-Saskatchewan Boundary is approximately 855.

Little Opportunity for Storage

With respect to water, Manitoba's relatively flat terrain imposes certain definite limitations upon us. Above Lake Winnipeg and with the exception of the Winnipeg and Churchill Rivers, there is little natural storage on any of our streams. This means relatively poor natural regulation and a very uneven stream regimen, with flows varying through wide extremes from season to season and from year to year. A second limitation is that there is exceedingly little scope within Manitoba for the creation of large storage reservoirs for the control of river flows. This applies particularly to the Red River, the Souris, the lower reaches of the Assiniboine, as well as the Saskatchewan above Cedar Lake.

The limitations imposed by lack of storage sites are particularly serious when considered in relation to the uneven regimen of our prairie rivers, such as the Red and the Assiniboine. It is with respect to these streams that we are likely to suffer extreme water shortages during certain periods. It is in these same watersheds that we are faced with most acute flood hazards. It is also on these watersheds that the nature of our terrain imposes the most severe limitations in the matter of water storage. With respect to the portion of the Red River within Manitoba, for example, it would be physically impossible to create sufficient storage to provide what might be called adequate river regulation. On the Assiniboine we would have some scope for the development of storage in the deeper portions of the valley in the extreme western portions of Manitoba.

Other and closely related limitations are imposed upon us by the nature of the Manitoba terrain. There are few places, for example, where large dams could be built for irrigation purposes and which would make it possible to command any substantial acreage by gravity. The relatively flat gradients which characterize our prairie streams, when considered in relation to the uneven stream regimen and the relative lack of storage possibilities means, of course, that the prairie streams are not well adapted to water power purposes.

Power is Vital to Manitoba

The fourth element of Manitoba's water problem becomes apparent when we examine water in relation to other resources. Here I would like to refer specifically to energy sources. There are at the present time no large known sources of coal, oil or natural gas in Manitoba. The water power resources, therefore, constitute our main known energy source and energy reserve. Any community which aspires toward an industrial future and which has most, if not all of its energy eggs in one basket would be wise to watch that basket very carefully. It is for this reason that the people of Manitoba place a good deal of emphasis upon water power matters. Water power management takes a rather high place in our thinking and planning.

There is another point which relates to the intense interest which Manitoba takes, and is likely to continue to take, in water power matters. Of the quarter of a million square miles contained within the Province, only 16 per cent is agricultural land. In most of the remainder we must look to forestry and mining to provide the main economic activities of the future. The forests are of such a type as to lend themselves more readily to pulp, paper and cellulose products than to lumber. There are most encouraging indications at the moment that in our northern areas we may relatively soon see some large mining developments, particularly with respect to base metals. The point is that the pulp, paper, cellulose and base metal industries are almost as dependent upon cheap power as they are upon the wood and ores that make up the raw materials.

Without Island Falls on the Churchill River, or some other water power site which would be equivalent in terms of capacity and costs, the Flin Flon mine which now supports a city of 10,000 people would never have been developed. It takes 100,000 hp. to keep Flin Flon going. There are other large known deposits of ore in the immediate vicinity of Flin Flon for the treatment of which still more power will be required. Without the water powers on the Winnipeg River there would be no paper industry at Pine Falls in Manitoba. It takes almost 35,000 hp. to support this community of approximately 1100 people and to provide an economic use for 2,000 square miles of bush land. The lack of cheap power in either of these instances would have resulted in the wastage of resources which otherwise could be and indeed have been enormously productive.

Four Main Regions Have Claim on Saskatchewan Water

It is against this background that we must examine Manitoba's interest in and concern about the Saskatchewan River. I think it would be safe to say that the co-ordinated development of the water and related resources of the Saskatchewan River watershed represents one of the most important and one of the most complex problems in the field of resources management with which Canada is faced today. There are two national governments, three provincial governments, one state government and literally hundreds of municipal governments, each having its own general or special interest in the Saskatchewan River.

There are as well, at least six separate and distinct geographic regions, each with its separate and distinct problems and possibilities relating to the control and use of water, not all of which are by any means compatible with all others. First there is the mountain and foothills area where forest protection, power and storage will probably remain the dominant problems respecting the Saskatchewan River.

Next there are the south-western prairie regions characterized by relatively steep river gradients, semi-arid climate, high summer temperatures, long growing seasons and, not the least important, populated by experienced irrigation farmers. These characteristics have been particularly favourable to irrigation. The steep slopes have made it possible, with a single dam and with a minimum of flooding damage, to command the maximum acreage solely by gravity. The climate has been favourable to irrigation not only because of the high summer temperatures and long growing seasons, but also because of the low precipitation which makes irrigation an *annual* necessity for the wide variety of cultivated crops grown in these localities. The steep river gradients which make it possible to command large land areas at relatively little cost also provide favourable conditions for the generation of hydro electric energy.

Then comes the central prairie portion of the Saskatchewan River watershed. Through this region the Saskatchewan and its tributaries flow through relatively deep valleys, usually several hundred feet below the general prairie level and the river gradients are relatively flat. As the river flows easterly it passes through areas that have somewhat lower summer temperatures and higher annual precipitation. Here dry-land farming is relatively less hazardous and great difficulties would be encountered in using water either for irrigation or for power purposes.

Between the prairie regions and Cedar Lake just above Lake Winnipeg, the river flows through a broad flat valley which is generally lightly wooded, but which is dotted with numerous shallow lakes and large open marshes. Throughout the eastern portion of this broad flat valley for many years the main economic return has been from aquatic fur bearing animals. These thrive in this immense marsh area wherein the water is periodically replenished as the Saskatchewan River overflows its low banks. Much of the eastern portion of this area is a flood plain or delta formation built up through the deposition of silt. During recent years two very interesting experiments have been going forward simultaneously in those portions of the Saskatchewan River delta or flood plain which lie between the Saskatchewan-Manitoba boundary and Cedar Lake.

Manitoba's Marshland Developments

From 1936 up to the present time the Province of Manitoba in co-operation with other agencies, including the Dominion Government and Ducks Unlimited (Canada) has carried out a large programme of engineering work to permit the close control of water levels in the large areas of the Saskatchewan River delta. The primary purpose of this work was to increase and stabilize the muskrat crop, upon which approximately one thousand Indian and halfbreed families have depended for a major source of their livelihood. Since 1940, when these areas first came into production, muskrat pelts to a value of almost $3 millions have been harvested from these marsh areas and $1,873,000 have been distributed, either in monthly payments or in supplies issued to trappers.

The second experiment which has been going forward simultaneously with muskrat rehabilitation in this region is with respect to agriculture. During recent years increasing use has been made of the rich soils of the delta for agricultural purposes. Along the higher lands of the lower Carrot River valley new areas are being brought under cultivation each year. There is now a thriving dairying and farming community just west of The Pas.

These two uses of the Saskatchewan delta, namely, muskrat ranching on the one hand and agriculture on the other, are not altogether compatible. For successful muskrat ranching the periodic peak flows of the Saskatchewan River are an essential requirement, since it is only under these conditions that we can be sure of adequate water for marsh purposes. From the standpoint of successful agriculture these same periodic peak flows, particularly the July and August peaks caused by the mountain water, hold out a constant threat of flooding and constitute the primary hazard.

Power from Diverting Saskatchewan to Big Lakes

The large lake basins of Manitoba might be considered as the fifth natural geographic region of the Saskatchewan-Nelson system. Lake Winnipeg, with an area of some 9,400 square miles, is the main lake of this region. This is the central collecting basin for the entire upper Nelson System. Lake Winnipegosis, with an area of 2,086 square miles, and Lake Manitoba, with an area of 1,817 square miles, lie parallel to and immediately west of Lake Winnipeg. Lake Winnipegosis, the upper of these two lakes, lies at approximately the same elevation as Cedar Lake on the Saskatchewan. It is separated from that lake by an isthmus four miles across at its narrowest point.

By excavating a canal across this isthmus, by constructing a control dam at the outlet of Cedar Lake, and by channel enlargements between Lake Winnipegosis and Lake Manitoba as well as between Lake Manitoba and Lake Winnipeg, it would be possible to divert the main flow of the Saskatchewan through the course described, and to concentrate a head of approximately 90 feet at a single site between Lake Manitoba and Lake Winnipeg.

Economic Value of Storage

The immense storage which would thus be afforded by Lakes Winnipegosis and Manitoba would be particularly advantageous from the standpoint of a low load-factor power plant. It is partly for this reason that in planning future water power developments in Manitoba, especial consideration is given to the Saskatchewan River diversion, and the development of power at what is called the Dauphin River site.

The main lake basins of Manitoba, comprising Lakes Winnipeg, Winnipegosis and Manitoba, are of substantial economic importance to the Province. These lakes are the mainstay of a large and important fishery, which keeps Manitoba in either first or second place amongst the Provinces of Canada with respect to the production of freshwater fish. These lakes are important to transportation and navigation. They bring large areas of the Province within economic hauling distance for forestry and other purposes. There are foreshore values which are of economic importance. These include summer resorts, hunting and trapping rights as well as haying and ranching areas.

Two Million hp. on the Nelson

The sixth important geographic region of the Saskatchewan-Nelson system comprises the valley of the Nelson proper, lying between Lake Winnipeg and Hudson Bay. Over this reach the Nelson falls through slightly over seven hundred feet from Lake Winnipeg to sea level at Hudson Bay. While no accurate long term hydrometric measurements are available, it is estimated that the flow at the outlet of Lake Winnipeg has ranged from a high of approximately 140,000 c.f.s. in 1927, to a low of 28,400 in January 1941. By adding slightly to the latter figure, out of regard to the improved regulation obtainable on Lake Winnipeg, and assuming the natural flow of the watershed were available, it would appear some 2 million hp. of 24 hr. power could be developed on the Nelson proper.

Reasons for Apprehension

Manitoba now has approximately 600,000 hp. either developed or under development. The undeveloped water power resources are estimated at approximately 3,500,000 hp. (ordinary minimum power). It will be seen, therefore, that something between a five-fold and six-fold increase in water power development would completely exhaust our known water power resources. It should be noted in passing that Ontario experienced a five-fold increase in water power development in the fifteen-year period between 1917 and 1931. It should also be noted that the Nelson River represents something over 57 per cent of Manitoba's reserve of undeveloped power.

Having regard to the overriding importance of Nelson River power in Manitoba's overall power picture on the one hand, and having regard to the further fact that, other than water powers, we have no important known fuel and energy reserves, Manitoba's concern about what happens to Nelson River power will be readily understood. It is in the light of these considerations that Manitoba must examine the overall economic effects which would be likely to follow upon large scale water losses from the Saskatchewan River.

Manitoba Power vs. Irrigation Further West

In July 1945 Mr. Ben Russell, Director of Water Resources for Alberta, prepared a very excellent paper entitled "The Saskatchewan Drainage Basin, Water Development Possibilities and Problems". In that paper Mr. Russell stated in part as follows:—

> "It has been estimated on the basis of gravity diversion that the irrigation requirements of the Saskatchewan River Drainage Basin in Alberta may ultimately

be 2,799,000 acre feet and in Saskatchewan 1,228,000 acre feet, or a total of 4,207,000 acre feet or sufficient for 2,539,000 acres. If and when pumping on a large scale is resorted to the limit will raised considerably. . . . "

In the same paper, Mr. Russell estimates that on the basis of the normal year, diversions to the extent of 4,207,000 acre feet would represent a 23 per cent reduction in the total flow of the Saskatchewan River at The Pas, Manitoba. In the low water year, which, of course would be the critical year, these diversions would reduce the flow into Manitoba by approximately 40 per cent. What are the effects which would follow upon these large diversions, in so far as the Province of Manitoba is concerned ? While quite prepared to accept Mr. Russell's estimates as to the amount of water which could be used for irrigation in Saskatchewan and Alberta, the Author is not altogether prepared to accept his appraisal as to the downstream effects of these diversions.

Effect on Manitoba Admitted

In the report already referred to, Mr. Russell says:—

"There is the problem of water levels in Manitoba. . . . When some 4,000,000 acre feet of water is diverted each year in Alberta and Saskatchewan for irrigation, such a diversion is bound to affect the lake levels in Manitoba and therefore protest will undoubtedly be made by that Province. The solution to this is simple, and consists of a control structure at the outlet of the lake to the Nelson River and less water wasted to Hudson Bay and therefore more water for the lakes."

It will be noted that in the matter of the deleterious effects which Manitoba would suffer as a result of large scale diversions from the Saskatchewan River, Mr. Russell confines himself to a consideration of the effect upon the levels of Lake Winnipeg. This would not be the total effect nor even the most important one. We might get a clearer picture of these deleterious effects and the rather profound influence which they would have upon Manitoba if we consider the various reaches of the Saskatchewan Nelson system in order,— starting at the Saskatchewan-Manitoba border.

Needs for Muskrat Farming

The very successful muskrat rehabilitation work which has been carried out in the marshlands of the Saskatchewan River delta has already been mentioned. These projects are regarded as amongst the most advanced and successful marsh management schemes attempted. They provide a sound economic use for large areas of what previously had been waste lands. These projects now supply the major source of income to something between 700 and 1000 families, and have added well over $3 millions of new wealth to the Province during the eight or nine years they have been in operation.

Adequate water supply for these projects depends very largely upon the high summer peak of the Saskatchewan River. Since the western diversion schemes would necessitate the creation of large storage reservoirs and the radical reduction of summer peaks, there is every likelihood that Manitoba's muskrat scheme in the delta area would be an early casualty of the proposed diversion.

The probability that well within the next decade we will be required to develop power from the Saskatchewan-Dauphin scheme and from the Nelson River has already been mentioned. It is important, therefore, that we examine the effect which large scale diversion of Saskatchewan River water would have upon our potential water power resources.

Diversions Mean Loss of Nearly a Million hp.

The first enlargement of the Saskatchewan River in Manitoba is at Cedar Lake which lies at the same elevation as Lake Winnipegosis. A simple calculation will show that at 80 per cent efficiency, the loss of 4,207,000 acre feet per year represents the loss of approximately 440,000 hp. of 24 hr. power. Depending upon the load factor which is used this would probably represent a loss in potential power installations, probably in the range of 650,000 to 750,000 horse-power. In a region which suffers an acute deficiency with respect to fuel or energy sources, 700,000 horse-power represents a lot of power. For purposes of comparison I should point out that when the present expansion programme on the Winnipeg River has been completed, the four large plants on that stream will have total installed capacities of something less than 600,000 hp.

Manitoba's potential water power resources are our major, in fact our only source of low cost energy. Let us translate 440,000 hp. of 24 hr. power into terms of fuels. For this purpose let us assume that it would cost $200.00 per installed horse-power to develop this power. Let us assume that the annual costs of delivering the power would be say 8 per cent of the capital investment. If 440,000 hp. of 24 hr. power were to be developed by the use of coal of say the grade of Alberta bituminous, it would require 1,880,000 tons of coal per year. If this power were to be made available at a cost corresponding with the costs assumed for hydro electric power, it would be necessary that the coal be laid down near the site of Manitoba's power requirements at something slightly under $1.90 per ton.

Loss of Power in Terms of Dollars

If we were to attempt an evaluation of these large energy losses, on the basis of substitute sources of energy in Manitoba, we would arrive at some very interesting figures. On the basis of the assumptions here stated it would be necessary for us to use 1,880,000 tons of Alberta bituminous grade coal each year to develop 440,000 hp. of 24 hr. power from steam plants; also it would be necessary to deliver this coal to Manitoba plants at something under $1.90 per ton if the costs of energy were to be kept in line with those likely to be experienced in hydro power. But the present cost of Alberta coal, or coal of equivalent grade in Manitoba runs from $12.00 to $15.00 per ton.

One method of arriving at the cost of substituting steam power for the 440,000 hp. loss of firm hydro power would be to evaluate the difference between the actual cost of coal and the hypothetical hydro-electric equivalent. This would amount to something between $10.10 and $13.10 per ton. The annual difference, on the basis of 440,000 hp. firm would be something between $19 millions and $25 millions. In so far as there might be an element of permanency to the situation which we are discussing, figures of hypothetical annual losses fail to give a clear picture. For this purpose it would be necessary to capitalize the annual figures referred to. If this were done at say 3 per cent, it would produce figures in the neighbourhood of $500 millions to $800 millions.

Economic Losses to Manitoba

It is not suggested that this is an adequate method for placing a dollar value upon potential water power resources, nor upon the damage which would result from their diminution or loss. This method simply indicates the offsetting amounts which would be necessary if we were to attempt to produce equivalent amounts of power at equivalent costs. It does not take into account the economic loss which would be suffered by the nation, or a province, or a region if, through lack of power, we were unable to develop our forest or base metal resources. It does not take account of the material nature of some water power sites, where a potential development may be an economic undertaking under certain conditions of river flow, but may become a wholly uneconomic undertaking under radically different conditions of flow.

In this latter connection let us examine the power project which we refer to as the Dauphin River scheme. In this case, and with the natural flow of the Saskatchewan River available, it is estimated that up to 250,000 hp. could be installed at the Dauphin River site. The costs would be relatively high, but the probabilities are that it would be an economic undertaking if the full natural flow of the Saskatchewan were available. If during the critical or low water year, however, the Saskatchewan flows were reduced to say 60 per cent of the natural low water flows, the result might be to reduce the potential installation from 250,000 hp. to 150,000 hp. Having regard to the fact that a major portion of the costs of this project would be represented by canals, diversion dams and channel improvements, and that the costs of these would be roughly the same for 150,000 hp. as for 250,000 hp., it will be seen that a drastic reduction of flow in the low water year might very easily change the Dauphin River scheme from an economic to an uneconomic undertaking.

All Three Provinces Need the Water

From the fuel or energy standpoint, Manitoba's concern about large scale diversion of water from the Saskatchewan River will be readily understood if we keep the following points clearly in mind.

1. Manitoba has no important known reserves of coal, petroleum or natural gas. Our water power resources, therefore, constitute the Province's only known energy source or energy reserve.
2. In relation to probable industrial demands for power, and in relation to the nature of our other resources, such as forests and base metal deposits, our water power resources are not large. Our total water power resources both *developed* and *undeveloped* are something less than 57 per cent of Quebec's *installed* capacity.
3. Manitoba would require only a five-fold or six-fold increase in power development to completely exhaust our water power resources. In the Dominion of Canada as a whole, there was better than a four-fold increase in water power development from 1920 to 1945. In Ontario there was a five-fold increase during the fifteen-year period 1917-1931.
4. Diversions from the Saskatchewan River, to the extent which have been proposed for irrigation by gravity alone would represent a direct loss to Manitoba of approximately 440,000 firm horsepower, or between 12 per cent and 13 per cent of our entire water power potential.
   Mr. Russell states, "if and when pumping on a large scale is resorted to, the limit will be raised considerably". It follows, of course, that "if and when pumping on a large scale is resorted to", Manitoba's energy position would be worsened considerably. It should also be pointed out that to whatever extent otherwise economic sites are made uneconomic, Manitoba's reserve of economic power will be to that extent reduced.
5. In this day and age almost every jurisdiction which has any industrial aspirations whatever is examining very closely into its energy resources and energy reserves. The Province of Alberta, which is bountifully supplied with fuel and energy resources, is now examining into its position with respect to natural gas before permitting export. Having regard to the fact that Manitoba is in a chronically "short" position with respect to fuel and energy sources, our concern about water power, our sole source of energy, will be understood.

Piece-meal Approach not Good Enough

This paper was not prepared as an argument against irrigation. The fact is that economic conditions in Manitoba will be favourably affected by whatever steps are taken to produce and maintain higher levels of prosperity throughout the Prairie Provinces. If there is a valid argument against anything in this matter, it is against what might be called a piece-meal approach to the development of this particular watershed. We need a comprehensive approach. We should treat the watershed as a whole. If so, it becomes necessary for us to fully examine the needs and interests of each region of the watershed. We must determine how these needs and interests can best be met. When we have done this, it is necessary that we examine the extent to which these various interests are compatible, and how the interests of each region can be met with the least possible deleterious effect upon all others.

The opinion has already been offered that the co-ordinated development of the water and related resources of the Saskatchewan River watershed represents one of the most important and one of the most complex problems in the field of resources management with which Canada is faced today. Fundamentally it is a problem of inter-relationships and integration.

Steps have already been taken with respect to forest protection on the eastern slopes of the Rockies. They recognize the inter-relationships between forest cover and river control. Immense strides have been taken in irrigation. These recognize the values which soils and water can give to one another. Investigations have been carried out to determine the possibilities of greatly expanding this work, and of enhancing the productivity of other large areas. Some studies have gone forward with respect to the further integration of power and irrigation. Earlier investigations had held out an encouraging prospect that, when additional agricultural lands were required, it would probably be feasible to reclaim for agricultural purposes several million acres in the lower Saskatchewan valley Still other studies have been made and are going forward with regard to power development in Manitoba; studies which recognize the values which power can give to forest and mineral resources, as well as the values which these resources can give to water power.

Western Water Board Needed

We have now reached the stage where planning within individual regions of this watershed is not enough. We have reached the time when inter-regional studies should go forward; when the effects upon each region which are likely to follow upon works in each other region should be thoroughly appraised and understood. The setting up of a Western Water Board, which has recently been agreed upon by the Governments of Canada, Alberta, Saskatchewan and Manitoba, will be accepted by the people interested in the Saskatchewan River as a most constructive step. This Board, with representatives from the four major jurisdictions concerned in the Saskatchewan River, should provide an excellent medium for the co-ordination of engineering work relating to this stream. In addition, it should facilitate the inter-regional studies referred to.

Discussion

T. C. Main, M.E.I.C.[1]

Mr. Stephens has ably and, I think, fairly presented Manitoba's claim for a fair share of water from the Saskatchewan river drainage basin. He has covered many aspects of Manitoba's water and power problems, but he has left no doubt in our minds that he and Manitoba are preparing to do battle for their share of the Saskatchewan River water. This is entirely as it should be. Mr. Russell has guardedly put in Alberta's claim for her share of the water. I am sorry indeed that a competent engineer from Saskatchewan has not done likewise for that province.

I was particularly interested to hear about Manitoba's marshland developments. Recent destructive flooding of farm lands adjacent to these marshes suggests that settlements have already encroached too far on areas that are essentially producers of fur-bearing animals and other useful wild life. My studies suggest that such areas will produce more wealth in fur if they are developed for that purpose than they will in wheat. To produce agricultural crops consistently, vast amounts of money will have to be expended to prevent annual flooding. An even greater amount must be spent to insure that during a year like the present, floods will not drown out the settlers. I am afraid that the unfortunate settlers now will bring pressure to bear on the Government to go in for costly drainage and diking. Such a programme, in my opinion, would be unwise. Manitoba now has enormous areas of farm lands. Her marshlands are extremely valuable and should be preserved and improved.

Mr. Stephens suggests that periodic floods in the Saskatchewan river are essential for replenishing the delta marshes. Economic development of power and a great increase in irrigation will tend to reduce and possibly eliminate entirely the high April and July peaks on the Saskatchewan. Important as the fur crop is to Manitoba and Canada, we cannot afford to curtail these more important industries merely to flood such marshes. It is certain that eventually pumping and possibly diversions from the Carrot and Pas rivers will be necessary to keep these marshes at an optimum elevation. As the pumping head would be low, pumping should be economically possible. In any case, high water is not an unmixed blessing to the muskrat population, as a large percentage of the current crop of muskrats is usually drowned due to flooding of muskrat houses. Such losses could be prevented if water elevation was maintained artificially.

I heartily agree with Mr. Stephens that piecemeal approach to the water problems of the Prairie Provinces is extremely wasteful. It is presumed that the proposed Prairie Provinces Water Board will carefully study the whole Saskatchewan river drainage basin, and compare the economic advantages to the Prairie Provinces from the developments of farm lands, power or other natural resources, before making allocations of the annual discharge to each province. To me, it seems extremely important that the commissioners study these problems not from the standpoint of three individual provinces, but thinking of the best interests of people from the Manitoba-Ontario boundary to the summit of the Rockies. I hope there will be no horse trading. This may be necessary when dealing with the United States, but is not in this case. Engineers of Western Canada will watch these developments with great interest.

[1] Main and Rensaa, Consulting Engineers, Edmonton, Alberta.

A. E. Palmer[2]

The concluding statement in Mr. Stephens' paper is fundamental. A study of the use of the waters of the Saskatchewan river system should be on an inter-regional basis. The history of the utilization of all river areas of deficient water supply substantiates this statement. Experience shows that water utilization eventually must be based on its greatest beneficial use to society.

If the waters of the Saskatchewan river are to give maximum service to Canada they must be used where they will produce the most in terms of supplying human needs. If the greatest benefit accrues from using the water for crops, it should be allocated to that purpose. If for power, then power should receive first consideration. Where it can be used for both the situation is fortunate. The people of Canada will expect any Board set up to plan the utilization of this great resource to keep the fundamental concept of beneficial use uppermost in mind. Regional requirements, of course, must be considered, but only in proper relation to the entire area the river serves.

One factor must be clearly kept in mind in considering the Saskatchewan river. That is that much of the water of the South Saskatchewan can be used for irrigation, while most of the flow of the North Saskatchewan will not be available for that purpose. It seems logical that much of the needs of the lower reaches of the basin must be supplied by the North Saskatchewan.

While a complete study of the eventual use of these waters is essential it does not necessarily follow that development should be halted until such a study is completed. Irrigation development is so slow that it will be many years before sufficient water is diverted to seriously affect the downstream users. But studies should be under way, because decisions on such a big problem cannot be made overnight. *(Continued on page 504)*

THE WATER RESOURCES OF ALBERTA

by

Ben Russell, M.E.I.C.
Director of Water Resources, Province of Alberta, Edmonton

A paper presented at the Annual General and Professional Meeting, The Engineering Institute of Canada, Banff, Alberta, June 2, 1948

The author outlines the Alberta Water Resources Act, and other Dominion and Provincial legislation affecting water resources of the province. Surface waters are classified, and the various drainage basins delimited. A brief description of the several irrigation projects, existing and projected, is given. Development of power in the province is noted and the growth of energy production recorded. Available water supplies are related to demand, and factors limiting beneficial use are enumerated. Possible benefits accruing from interconnection of power from the Bow and Red Deer are pointed out.

International and interprovincial problems respecting the division of water are discussed. Examples are shown of how wasted energy can be used for pumping. Control of the Bow River by the Province to satisfy needs of power and irrigation is explained. The paper concludes with a description of the administration of water areas and drainage districts, and an explanation of how the "duty" of water for irrigation has been determined.

All surface waters in Alberta were, by an Act of Parliament dated 1884, made the property of the Dominion. By terms of the Natural Resources Transfer Agreement dated 1929 they were transferred from the Dominion to the Province and have since been administered under the Water Resources Act. Under the provisions of this Act the Responsible Minister has very wide powers and responsibilities to promote the most beneficial use of the water supplies, and to estimate the extent and location of irrigable lands in the respective drainage basins.

Legislation

The Water Resources Act

This legislation provides that surface waters cannot be taken, diverted or impounded otherwise than by virtue of a licence, except by property owners or occupiers and then only for household, sanitary, fire protection, and stock-watering purposes. No one can divert or obstruct the flow or impound water unless authorized. No grants under the Act give any exclusive right in the water or the shores or beds of the waters. Applicants for the use of waters or the construction of works have precedence according to their respective dates of filing, subject to precedence in the following order (1) Domestic (2) Municipal (3) Industrial (4) Irrigation (5) Water Power (6) Other purposes.

The Act provides all of the conditions necessary to acquire a water right, and directs that water be granted for beneficial use only, and that licences can be cancelled for non-use and amended to meet requirements of beneficial use. Part II of the Act applies wholly to water powers. The Dominion Water Power Regulations of 1921 have been adopted by the Province. The Regulations provide that lands required for development remain vested in the Crown. The right to develop a water power may be granted to any approved applicant for a definite term of years under specified conditions. Control is provided over the development, storage, transmission, and management of the property.

The Irrigation Districts Act

To facilitate the development of irrigation and the financing of construction, the Irrigation Districts Act of 1922 provides the necessary machinery. It provides for an elected Board of Trustees, with power to conduct the affairs of the water users and sets out in great detail the procedure for erection, construction, financing, elections, and other necessary procedure for a District.

Legislation respecting Company Projects

A number of large irrigation projects were originally constructed by privately owned Companies, but have in recent years been taken over either by the water users or by the Provincial Government. Legislation was enacted to incorporate these Water Users Districts, providing for the transfer to a Board of Trustees of the Irrigation District, or to the Province, the entire irrigation works, as well as all rights and privileges of the Company from the Dominion and Provincial Governments.

By agreement between the Dominion, the Province and the Canada Land and Irrigation Company it is proposed to turn over to a Canal Association, consisting of water users, the main canal and appurtenant works of the Canada Land and Irrigation Company. The division of responsibility as between Dominion, Province and Company will be set out in detail by enactment.

The Prairie Farm Rehabilitation Act

As a result of a national emergency, due to prolonged drought in the thirties, the P.F.R. Act was passed by Parliament in 1935. It was amended in 1937 and again in 1939, but provides essentially for an Advisory Committee to advise the Minister of Agriculture as to the best methods to secure the rehabilitation of the drought and soil drifting areas of the Provinces of Alberta, Saskatchewan and Manitoba.

Other Acts

Some thirteen additional Acts are in force relating to surface waters, irrigation, drainage, and other related matters. A knowledge of the provisions of these Acts is essential for the administration of the Water Resources of the Province.

Classification and Extent of Water Resources

Surface waters in Alberta may be classified as: (1) permanent streams which have their source in the mountains, (2) the small and less permanent prairie streams, and (3) other miscellaneous streams of a sporadic nature which, during the summer, may go practically dry but which are most important in the aggregate primarily for domestic, stockwatering, and many other purposes.

With the exception of a few land locked streams they can all be included in the main drainage basins of the Milk, South Saskatchewan, North Saskatchewan, Peace, Athabaska and Hay Rivers.

Milk River Drainage Basin

The Milk River rises at the foot of the Mountains in the United States just east of the Hudson Bay divide. After flowing for some 216 miles through Alberta and Saskatchewan it recrosses the Boundary and joins the Missouri river. Although the flow is not great, the United States turns into it from the St. Mary River large quantities of water for use in the United States. It is quite feasible and economical to redivert this water in Canada from a point on this stream near the town of Milk River.

South Saskatchewan Drainage Basin

This basin is made up of the following main streams and drainage basins: Waterton, Belly, St. Mary, Old Man, Little Bow, Highwood, Bow and Red Deer rivers. These streams all join together in Alberta to form the main stream which, in Saskatchewan, is joined by a number of smaller streams from the Cypress Hills and is later joined by the North Saskatchewan river to form the Saskatchewan river. The stream is most important to Southern Alberta and Southern Saskatchewan and will require to be supplemented ultimately by a diversion from the North Saskatchewan river drainage basin. This is necessary in order to meet the ultimate requirements for irrigation in Alberta and Saskatchewan.

The following are the drainage areas from which stream flow measurements are available:—

above its mouth 53,325 square miles, 7.4 million acre feet; At Saskatoon: 50,900 square miles, 7.17 million acre feet; At the Alberta-Saskatchewan Boundary: 49,797 square miles, 7 million acre feet; At Medicine Hat 20,610 square miles, 5.5 million acre feet.

The Bow River is the most important stream for irrigation and power in the province. The area of the drainage basin is 9,770 square miles and an average annual run off close to 2.7 million acre feet.

The Drainage Basin of the Red Deer river is 18,160 square miles and the average annual run off exceeds 1.5 million acre feet. It is also an important stream for the development of irrigation and power.

North Saskatchewan River Drainage Basin

This basin is made up of the main streams and drainage basins of the Clearwater, Brazeau, Sturgeon, Battle, and Vermillion rivers. The drainage basin above the point where it is joined by the Clearwater is 2,948 square miles and the average run off 3.0 million acre feet. The drainage area above Edmonton is 10,495 square miles and the average annual run off 5.6 million acre feet. These streams all join in Alberta to form the North Saskatchewan river proper, which then flows through Saskatchewan to join the South Saskatchewan river. The drainage area of the Clearwater river is 1,214 square miles and the average annual run off 698,000 acre feet. The Clearwater itself and that portion of the North Saskatchewan above the Clearwater can be diverted to the Red River or to the South Saskatchewan Drainage Basin through the Raven river. The drainage area of the Brazeau River is 1,930 square miles and the average annual flow is unknown. The stream has possibilities of development for water power.

Surveys and Investigations

Since 1906, when water resources legislation was first enacted by the Dominion, surveys have been carried out in Alberta to determine the available water supplies, their most beneficial use for irrigation, water power and other purposes. Since 1931 such surveys and investigations have been the responsibility of the Province, and have been carried out with the assistance of the Water Power Bureau of the Department of Mines and Resources and the Water Development organization of the P.F.R.A.

Stream flow records, topographic maps, and other data prepared as a result of these surveys and investigations, furnish the basic data for irrigation, water power and other purposes. These basic surveys, supplemented by further details, will supply the data with which to plan the ultimate development of the Water Resources of the Prairie Provinces.

Since 1935, when the P.F.R.A. Water Development organization was set up in the Province, additional water development investigations have been made. Many small projects and some larger ones have been constructed. Several larger projects are now being surveyed and designed.

The Calgary Power Company has in recent years completed a fairly extensive and detailed water power investigation of the Bow River and its tributaries and, as a result has constructed a number of reservoirs and power stations on the stream.

Irrigation

Irrigation in Alberta was initiated by the Alberta Railway and Irrigation Company. This company was organized in 1883 for the purpose of irrigating a large tract of dry land to the south and east of Lethbridge. The project was initially developed to supply water from the St. Mary River for an irrigable area of some 36,000 acres but has been greatly extended since that time. Since this early development, fifteen large irrigation projects with a total irrigable area of 719,000 acres, have been constructed in the Province at a cost of some $35 millions. In addition to this some $700,000 has been spent on the construction of some 700 smaller and privately owned irrigation projects.

Milk and St. Mary River Development

The original plans of the Alberta Railway and Irrigation Company contemplated the full use of the St. Mary River, and extended far beyond its present bounds. The plans however were greatly curtailed when, after the United States Reclamation Act was passed by Congress in 1902, steps were taken to divert water from the St. Mary and Milk

Rivers for use in the United States. Subsequently the project was limited to an area some 120,000 acres, which it was considered could be adequately served from the St. Mary river without storage under the terms of an order by the International Joint Commission. The present St. Mary and Milk river Development is merely an extension of the original Alberta Railway and Irrigation Company project. It is described in another paper presented by Mr. Gordon MacKenzie. (see page 485).

Belly River Projects

In the general vicinity of Cardston there are four small projects irrigated from the Belly river as follows: The United, Mountain View, Leavitt and Aetna Districts. The latter three have a common intake on the Belly river, but the United District diverts its supply from a point on the stream below. The rainfall in this area is generally sufficient for the growth of cereal crops, but generally insufficient for such crops as alfalfa, clover and hay. The main purpose of these projects is to supplement the feed supply for stock in years of low precipitation.

The Macleod Irrigation District

The most recent development in the Province is the Macleod Irrigation District, which is now constructing an initial development for something like 10,000 acres. Depending upon the success of this initial development it is proposed to gradually extend the system to include 27,000 acres.

North Saskatchewan Project

This is a proposal by the late William Pearce of Calgary, to utilize the flow of the Red Deer, Clearwater, and North Saskatchewan rivers to irrigate a large area of country to the North of the South Saskatchewan river approximately from Hanna to the Alberta-Saskatchewan Boundary. The original surveys were made years ago by the Dominion Reclamation Service, but more recent surveys have been made by the Water Development Organization under the P.F.R.A.

As a result of these investigations the following are the general conclusions:

(1) It is feasible to utilize large quantities of water from the Red Deer, Clearwater and North Saskatchewan rivers and, by gravity canals and pumps to irrigate some 450,000 acres in Alberta.

(2) Water power developed at the diversion dam on the Red Deer River will pay for a large portion of the construction cost of the dam and plant.

(3) In the case of pumping water from Buffalo Lake by an exchange of power between the Red Deer and Bow River plants summer energy, now available from the Bow River, may be used for pumping purposes on the Red Deer River, thereby conserving the Red Deer river power for use in the winter. Thus by loaning and borrowing power as the need arises, these two complementary systems could provide for the maximum amount of power for industry and the maximum social service to the communities served.

P.F.R.A. Water Development in Alberta

Following is a summary of small projects constructed under the P.F.R.A. in Alberta up to March 31, 1947.

Type	Number	Financial Assistance
Dugouts	1372	$127,896.
Stockwatering dams	1392	119,953.
Irrigation Projects	365	58,785.
Total		$306,634.

In addition to the above, fourteen large water development projects, with a total irrigable area of 111,835 acres and total storage capacity of 42,310 acre feet, at a total cost of $786,890. have been undertaken in the Province to that date since 1935.

Water Power

Prior to the transfer of the water resources from the Dominion to the Province some water power surveys were made of the Bow, Red Deer, North Saskatchewan, Athabaska and Peace rivers. The Calgary Power Company has since made more detailed surveys of some of the power sites. In more recent years the Department of Water Resources, in cooperation with the Alberta Power Commission, has endeavoured to review most of the early investigations, and to carry out further investigations of power developments which might be incorporated into a comprehensive power system in Alberta. These investigations, made in the light of the present trend of development, and with a better knowledge of the existing and future power requirements, as well as with more recent knowledge of stream flow data and topography, will here be discussed.

Load Data

The Calgary Power Company power stations presently available to carry the company loads are listed in Table I.

The Calgary Power Ltd. system is inter-connected with the following plants in addition to the above.

Station	Capacity Horse-power	Kilo-watts
Edmonton Steam Plant	53,600	44,000
Lethbridge " "	10,550	7,890
Total	64,150	51,890

The growth in the production of energy in the Province may be summarized as follows:—

Total Generation capacity, 233,300 k.w
Generation for 1945 566,240,917 k.w.h.
Generation for 1946 599,328,668 k.w.h.
Increase, 1946 over 1945 33,087,751 k.w.h.
Generation for 1947 673,879,992 k.w.h.
Increase, 1946 over 1945 74,551,324 k.w.h.

The following reservoirs have been constructed on the Bow River by the Calgary Power Limited to increase the water flow of the stream:–Ghost reservoir, Lake Minnewanka, Upper Kananaskis Lake and the Barrier reservoir. The total capacity of these sites is approximately 368,000 acre feet. They serve to maintain an average winter flow of 1,700 c.f.s. The development of additional storage at Spray lakes will further increase the flow to approximately 2,300 c.f.s. In addition to the power sites which have been developed there are at least eight other sites which may be developed on the streams.

Factors Governing Amount of Water Available

Table II gives a summary of water available at possible points of diversion on various Alberta rivers.

Table I

Station	Head in ft.	Capacity Horsepower	Kilowatts
Ghost plant	105	37,450	28,000
Kananaskis Falls plant	77	11,600	8,653
Horseshoe " "	73	19,500	14,547
Cascade " "	345	23,000	17,158
Barrier " "	148	13,500	10,070
Calgary Steam "		14,000	10,444
Total		119,050	88,872

It will be quite evident that there is sufficient water in the streams to adequately serve all of the irrigable lands in the Province. However, average yearly flows tell only part of the story, because there are at least five governing factors which condition the actual available water supplies. The volume of water which can therefore actually be used beneficially must be some percentage of the annual output of the streams, depending upon these conditioning factors.

Storage factor. If the flow of streams were constant, the matter of providing diversion facilities would be comparatively simple. However most of the flow occurs in a few months, and on some streams in a few weeks, after which the subsequent supply is comparatively small. This means that without storage facilities to control and regulate the supply, most of the flow cannot be diverted economically.

Gravity Diversion Factor. The possibility of conveying water by gravity is dependent, first upon the distance of the stream below the lands to be irrigated, and second on the slope or fall of the stream itself. If, for instance, the river with a slope of 4 feet per mile is 200 feet below the general elevation of the lands to be irrigated, it would require a canal of from seventy-five to one hundred miles in length, depending upon the slope of the canal and other factors, to bring water by gravity to the prairie level. Without knowledge of the suitable location for gravity diversions, it is not possible to determine the irrigable areas. Because sufficient surveys have already been made for possible gravity diversions, irrigable areas can be approximately estimated.

Economic Value Factor. A most important factor is the economic value of irrigation. Should we regard irrigation in a narrow sense, namely whether it pays the water user or land owner, directly, to rehabilitate a certain tract of land? Or should the broader view be taken, having regard not only to the individual benefits, but also to the general community and the country as a whole?

Until recently the capital cost of irrigation works has been charged wholly to the lands benefited. These have been made to bear all of the costs. It has been determined, however, that the amount of such capital cost which the lands can support under average conditions, is something like from $20.00 to $25.00 per acre, depending upon soil, topography, location, and other factors. From the narrow view point therefore the irrigable areas are definitely limited by the ability of the land to pay the capital costs.

But what of the sociological view? The basis of this is that a rural population of prosperous and contented farmers are of benefit, not only to merchants of adjoining towns as reliable customers, but to the municipalities as taxpayers, the railways who transport the produce, and to the nation as a whole. Advocates of this latter or sociological view contend that other beneficiaries of the farmers' improved position should share the cost of such improvements. However, if the land is not to bear the whole of the cost, what proportion should it bear? Until the question can be answered, the ultimate development of irrigation cannot be predicted with any degree of certainty.

Pumping Factor. Still another important factor is that of pumping possiblities, which resolves into a question of economics. For example, it is manifestly uneconomical to spend a dollar to pump water to produce sixty cents worth of crops. There is a point however, where pumping with cheap power may be justified by the value of the crop grown. Gasoline or diesel power generally makes the cost of pumping much over thirty feet doubtful. Using cheaper fuel, the height may be increased, and by employing water power (and particularly the off-peak power available during the summer) the limit is still higher. Such latter schemes imply interconnected systems of water power and pumping plants. A project of immediate interest is the joint development of power and irrigation on the Bow and Red Deer rivers.

Double Harness for the Bow and Red Deer

The Bow is the most important river in the Province, for both irrigation and power, but most of the flow is required to irrigate adjoining lands. If however power facilities on the Bow, where large quantities of water are passed downstream for the irrigable lands below, were used to generate power for pumping purposes, such cheaper power could be utilized to pump water for irrigation purposes in some distant drainage basin such as the Red Deer basin.

The Red Deer has splendid storage facilities, adjacent to which, are large tracts of irrigable lands not yet developed, partly because the lands are above the general elevation of some of the reservoirs. If, however, the summer power now wasted on the Bow River were used to pump water to land in the Red Deer river drainage basin, considerable areas of good lands could be reclaimed, conserving the Red Deer river water for use in the winter. Thus by exchanging power as the need arises these complementary systems could provide for the maximum power and irrigation development, and the maximum service to the communities they serve.

The entire problem of water resources available for irrigation however is one of some complexity. Within broad limits it is possible to speak with some degree of certainty. Yet beyond these limits are numerous factors which make it impossible to estimate with confidence. Some of the complexities are due to the fact that statistics are not available. Others are due to human or sociological factors which cannot be gauged by methods known to engineers.

International Problems

Events leading up to the Boundary Waters Treaty are fully explained in the St. Mary and Milk River Water Development report already referred to. The situation with regard to the St. Mary and Milk rivers is very well summed up in that report as follows:—

"Reservoirs have been constructed within the United States of sufficient capacity to regulate the United States share of the St. Mary and Milk rivers. Preli-

TABLE II

Name of Stream	Diversion Point	Average Annual Flow
Waterton river	Sec. 3-4-28-4	486,000 acre feet
Belly "	" 21-4-27-4	229,500 " "
St. Mary "	" 1-5-24-4	574,700 " "
Oldman "	" 5-9-26-4	1,022,000 " "
Willow creek	Tp. 10-27-4	112,000 " "
Bow River	Sec. 36-20-19-4	3,000,000 " "
Red Deer River	" 32-38-23-4	1,346,000 " "
North Saskatchewan River	" 26-39-9-5	3,750,000 " "
Total		10,520,200 " "

minary surveys have been made of reservoirs in Canada which would enable Canada to use its full share of these waters. The findings of the Committee (the Meek Committee) are based on the assumption that the division of the water supply was finally settled by the International Joint Commission's Order of October 4th, 1921, and that Canada may proceed to construct the necessary works to utilize fully its share of the waters."

More recently however, the problem of how to make better use, not only of the Milk and St. Mary Rivers, but also of the Belly and Waterton Rivers, has been studied by the United States Bureau of Reclamation. In a report by W. G. Sloan, assistant director of the United States Reclamation Bureau, it is suggested that the Canadian interests are not yet aware of the great possibilities of the South Saskatchewan River; that the flow at Medicine Hat is approximately 11 million acre feet, and that a much greater and more beneficial use may be made of the water.

The present and prospective uses of the South Saskatchewan River are fully discussed in this paper. The average annual discharge at Medicine Hat is 5½ million acre feet. The stream is inter-provincial, and it is estimated that to meet the ultimate irrigation requirements in Alberta and Saskatchewan it will ultimately be necessary to divert into it considerable quantities of water during the summer from the North Saskatchewan Basin.

Reference to the International Joint Commission

The 1921 order of the International Joint Commission has never been completely acceptable to the Water Users Associations of Montana, who contend that the order does not effect an equal division of the St. Mary and Milk River waters. These Associations appear to take the view that new conditions arising since the Order was made should justify a new hearing by the Commission, and possibly a new division of waters crossing the Boundary. Included as well, they believe, should be the waters of the Belly and Waterton Rivers, the head waters of which lie in the United States. The Governments of Canada and the United States have, therefore, agreed to refer these questions to the International Joint Commission for joint examination and an advisory report, including recommendations.

Inter-Provincial Waters

All of the important streams in Southern Alberta, with the exception of the Milk River, contribute to the drainage basins of streams which cover two or all three of the provinces of Manitoba, Saskatchewan and Alberta. They consist of the North and South Saskatchewan river drainage basins and tributaries, and the Battle River, which joins the North Saskatchewan near Battleford. Other smaller streams which cross the Provincial boundary are the Lodge, Middle, Battle creeks, or tributaries of the Milk river and Boxelder, Eyehill, Blackfoot, Big Gully creeks as well as several other smaller streams. To apportion these and other inter-provincial or Dominion-Provincial streams, a Prairie Provinces Water Board will be established.

Allocation of Saskatchewan River between Alberta and Saskatchewan.

The area of the entire Saskatchewan River basin is 149,500 square miles or more than double the combined area of the Maritime Provinces. It contains most of the large centres of population, and a large percentage of the agricultural lands in Alberta and Saskatchewan. Water development projects must therefore, play a very important part in the agricultural and industrial development of the two provinces and of the country generally. The average annual discharge of the North and South Saskatchewan rivers combined as they pass into Saskatchewan, is estimated at 13 million acre feet. The average annual flow of the Saskatchewan as it passes into Manitoba is estimated at about 18 million acre feet.

An estimate of 1,923,305 acres has been made for the ultimate development of irrigation in Alberta. The best estimate available for Saskatchewan is 925,000 acres. Together, these give a total of 2,848,305 acres. Although the development of water power does not deplete the streams, it does decrease the summer flow and increase the winter flow.

In order to equitably allocate the inter-provincial waters it will be the duty of any Prairie Provinces Water Board, when set up, to make a comprehensive survey and study of the available supplies and probable uses in the Saskatchewan river drainage basin.

Irrigation by Pumping

There is considerable waste of energy in the presently designed and operated irrigation projects. Why should this potential energy be wasted? The answer to this probably is that the energy is seasonable, and therefore not suitable for most power loads. Furthermore it is generally not practical with present day equipment, to develop the energy. Much of the potential power could however be developed, to pump water to lands above the canal system. There seems little reason why costly drop structures should not be so designed as to develop the potential energy.

A more important use of irrigation structures for power development has already been referred to on the Bow and Red Deer Rivers. By the construction of a dam 190 feet high on the Red Deer River at Ardley it is possible to create some 370,000 acre feet of storage on the river above the irrigable areas. Some 300,000 acre feet of additional storage at Buffalo lake lies adjacent to the supply canal, but 45 feet below. This storage could be made to produce from 75 to 100 million kwh. of energy annually. Operated in cooperation with the Bow river plants such a power station could provide a large percentage of the winter energy required in Alberta, as well as additional summer energy to pump water to irrigate lands.

Provincial Control of the Bow River Flow

Water power undertakings on the Bow River, because of low winter flow, are faced with the necessity of storing summer water for winter use, whereas water in the summer is required for irrigation. The possibility of conflict betwen the interests therefore exists. The problem is to determine to what extent each should be allowed to develop, and in what order.

A series of low flow years began in 1936 and records obtained since that time have considerably modified previous estimates. The average flow of the Bow river at Calgary for the period 1911 to 1935 is 2.5 million acre feet per year. The average for the period 1936 to 1946 is 1.9 million acre feet per year. Based upon the early records it was considered that the water supply was adequate for an almost unlimited development of irrigation and power.

Fortunately for those responsible for the administration of the water resources of the Province the areas originally contemplated for irrigation, totalling 844,000 acres, have for a number of reasons been greatly reduced. They are now limited as follows:—

Western Irrigation District (C.P.R. Western section) . .	50,000 acres
Eastern Irrigation District (C.P.R. Eastern section	281,000 "
Bow River Project (C.L. & I. Co. and extensions)	240,000 "
	571,000 "

A comprehensive water supply study made of the Bow River by F. R. Burfield, M.E.I.C., chief engineer of the Water Resources Department, shows that in a normal year there is sufficient water for 571,000 acres from the Bow River, and that the regulations of the Bow River for power to a minimum average flow of 2,300 c.f.s. will not conflict with the use of the river for irrigation. The critical year, however, is 1941.

Until ways and means are determined to construct storage on the Bow river below Calgary and above the irrigation projects, it is proposed to limit further development of irrigation to the above areas, and to limit regulation of the river for power to an average minimum winter flow of 2,300 c.f.s.

Figure I is a mass diagram and hydrograph for the flow of the Bow River at Calgary for power development, and below Calgary for irrigation development for the low flow period March 4, 1940 to May 13, 1942.

The quantity of water which could be stored in power reservoirs between May 5th, 1940, and Sept. 17, 1940 is 248,995 c.f.s. days or approximately 497,990 acre feet. The storage capacity available at the head waters including the proposed Spray lakes reservoir is approximately 570,000 acre feet.

The release of this storage from September 24th to May 5th, 1941, together with the natural flow during the period, gives an average regulation for that period of 2,222 c.f.s. continuous flow. Which over the present heads on the Bow river is equivalent to firm power of approximately 51,500 hp.

The quantity of water which could be stored for the period May 20th 1941 to October 29th, 1941 is 178,832 c.f.s. days or approximately 357,664 acre feet. The release of this storage for the period November 5th 1941 to April 22nd 1942 together with the natural flow during the period would maintain a regulated flow of 1,813 c.f.s. continuous flow or equivalent to firm horse power of approximately 42,000 hp.

During the open water season at the critical period for irrigation say April 1st 1941 to October 31st 1941, the quantity available below Calgary for irrigation is 1,425,220 acre feet.

Water Areas

There has been for a considerable period of years a general lowering of lake levels in Alberta. This has been partly due to natural causes, but also due to land and road drainage, and extensive clearing and cultivation of lands in the drainage basins. Demands have arisen from land owners and would-be land owners to purchase or lease accrued areas and reclaim more lands by drainage. The result generally of depleting lakes and sloughs has been to destroy them as sources of surface and underground water supplies, while the value of the lands reclaimed has not been great.

Although lakes and sloughs are now abnormally low, there is evidence that they have been still lower. There is also good reason to believe that they are on their way back, and for this reason their beds and shores should not be permanently disposed of.

The experience in Alberta has been, that in order to protect their lands, owners of lakes and slough beds when flooded, immediately apply for permission to drain and this has been the cause of much difficulty and ill advised drainage projects. The Department of Water Resources has recently commenced a survey of all water areas in the Province with a view to replenishing all such areas either by control works at the outlets or by diversion from other sources.

Drainage

Drainage in Alberta must be considered a necessary evil. In the early days, in order to construct roads a certain amount of drainage was necessary, and in some areas is still necessary. Except where there is a reasonable chance of unwatering good agricultural lands, however, without destroying useful water areas, drainage is now discouraged in the Province.

Duty of Water and Canal Capacity

The original Regulations under the Irrigation Act provided for a second foot for each 150 acres of irrigable land. It so happens that one second foot flowing for 153 days (the irrigation season) will deliver an amount of water equivalent to two feet in depth over the area which considering losses is generally adequate. However, the rate is impractical, and it is thought that in fixing the duty it was intended that depth should apply, and not the rate. However, many of the early projects were designed for a rate of one second foot for each 150 acres, consequently the canals were too small for the areas contemplated.

As a result of certain experimental work carried out by the Dominion Reclamation Service some years ago in the Brooks area, it was determined that in addition to the precipitation, an average irrigation during the season of eighteen inches was adequate for the growth of crops, but no experiments were made to determine canal capacity.

The late Mr. S. G. Porter, M.E.I.C., with his extensive knowledge of irrigation in the United States, about 1917 derived a formula which was considered applicable to Canada. This was later adopted by the Dominion Reclamation Service and canals designed accordingly. The basis of the formula is that water can be rotated from one group of water users to another, thus saving capacity. The experience has been, however, that the season is so short that practically the whole of the irrigable lands require water almost at once, with the result that the demands are for larger and larger canals.

To admit the necessity for supplying all of the water users under canals with water at the same time, and to carry this out in connection with large projects, would be extravagant. Under such conditions it is doubtful whether it would be feasible or at least economical at all. There are many factors affecting canal design such as duty of water, diversity of crops, soil type, intensity and distribution of precipitation. These are all factors which should be studied by agriculturists and given proper consideration along with engineering and economic factors in designing canal systems.

Economics

One of the conditioning factors to the estimates of irrigable lands is the economic factor. This was discussed in a paper by D. W. Hays, M.E.I.C., published in the *Engineering Journal* of May 1941. It was further discussed by the late Mr. S. G. Porter, M.E.I.C. in his paper published in the semi-centen-

nial number of the *Journal*, dated June 1937.

Since that time Governments have begun to recognize the principles enumerated in these papers. It is hoped that before long definite rules, as suggested by the St. Mary and Milk River Water Development Committee, will be adopted by agreement. These rules provide for a definite division of cost between the Dominion, the Province, and the water users.

No more fitting conclusion to this paper could be made than to quote from the paper above referred to by the late Mr. S. G. Porter, who did so much to promote and encourage irrigation development.

"Further irrigation development by private capital probably cannot be expected in Western Canada, for the reason that its benefits are too widespread to be readily assessed. There is no practical way for an individual or corporation to levy and collect its costs. But it is a safe prediction that where a water supply is available and can be developed at a reasonable cost, its wealth producing value and possibilities of general benefits will be recognized, and will result sooner or later in development under a policy whose aims will be to distribute the burden of cost more evenly over all who enjoy its economic benefits."

Discussion

J. M. Wardle, M.E.I.C.[1]

Mr. Russell's paper gives a complete summary of the present situation in Alberta in regard to irrigation and water power. He has in addition presented an interesting possibility for consideration, namely, the feasibility of using surplus summer power from Bow river plants to pump water into storage reservoirs in the Red Deer River Basin. The amount of surplus power that would be available for pumping operations will, of course, depend upon the capacity of the eventual installations in the Bow river plants. Storage of water is again one of the important factors.

Mr. Russell mentions two important matters that will bear repetition. The first of these is the establishment of a Prairie Provinces Water Board to investigate and report on irrigation and power projects that might be planned to utilize the common waters of the Prairie Provinces, and to recommend the allocation of such waters. Just recently the set-up and functions of this Board were agreed upon between the three Prairie Provinces and the Dominion. Its members will consist of a representative from each of the Prairie Provinces, and a representative from each of the two Dominion Departments chiefly concerned, namely, the Department of Agriculture and the Department of Mines and Resources.

Recommendations of the Board to be effective must be approved by Orders in Council passed by the participating Governments. The formation of a Board of this nature was recommended by the Dominion Water and Power Bureau of the Dominion Government as far back as 1929-30, and its establishment now is a source of great satisfaction.

The second matter is related to the division of international waters as between Canada and the United States, and which is mentioned in Mr. Russell's reference to the International Joint Commission. The Dominion Government took the stand that the division of the St. Mary and Milk River waters should not be referred to the International Joint Commission for further review, but be regarded as finalized by the 1921 order of the Commission. References to the International Joint Commission are now confined to the Belly and Waterton Rivers and to the international waters east of the Milk River Watershed and including the Red River of the North.

Mr. Russell has dealt with the present status of the water resources of Alberta, and has outlined future irrigation possibilities. Let us now try and look ahead twenty-five years or more, and hazard a guess as to how future conditions may affect the regimen of the flow of the main rivers in the Prairie Provinces. There are some doubts as to whether we can expect there will be no great change in the present character of the flow in our rivers and streams. Unless there is fairly complete regulation by storage reservoirs, we must expect more rapid run-off in the spring, and greater variations in stream-flow.

During the time in which irrigation and power have been developed in the Prairie Provinces with water from the East Slope of the Rockies, we have had in the final stages of hot dry summers, a fairly substantial flow of water from the melting glaciers. Millions of acre-feet of water held in the glacial ice have already flowed down the Bow and the North and South Saskatchewan and their tributaries to the east. Now the great recession of glaciers on the East Slope has become very noticeable, and is confirmed by the surveys of typical glaciers commenced some three or four years ago by the Department of Mines and Resources. The gradual lessening of water supplies is touched on at two or three points in Mr. Russell's paper, namely, the lowering of Prairie lake levels and the reduction in the original irrigation areas planned in Alberta.

Many engineers attending this meeting will, themselves, have noticed the great changes in such glaciers as the Crowfoot, the Bow, the Peyto, and the Saskatchewan and the Athabasca glaciers in the Banff-Jasper area. At one time these glaciers filled the valleys they occupy, and kept these valleys at a fairly low temperature throughout the year. The cold ice underneath the winter snowfall retarded its melting and extended the run-off over a comparatively long period. As the glaciers melted away and receded, the temperature of these valleys increased and melting of the ice was greatly accelerated.

We have now come to the stage where it seems that between the next twenty-five and fifty years our glaciers, from the water supply standpoint, will be almost negligible. In the mountains we will be dependent for stream-flow on winter snowfall and on rain throughout all our large drainage basins. We will have a flashier run-off each spring, because of the higher temperatures of the mountain valleys, and the fact that snow melts much quicker than ice.

It is hoped that a quick run-off will be retarded by better forest

---

[1]Director of Special Projects, Department of Mines and Resources.

protection and by reforestation of the Eastern Slopes, towards which a start is being made this year by the Eastern Rockies Forest Conservation Board. Nevertheless, we have to face in future the diminution and eventual loss of any appreciable glacial flow of water. This loss will have to be made up by storage reservoirs at every point where these are feasible. Such reservoirs will be located not only in prairie areas, but in the foothills and in the lower mountain valleys.

In the low relief areas where there are possibilities of large storage reservoirs, these will have to be designed for more than seasonal supplies of water. They should be large enough to provide minimum supplies of water for four or five successive low-flow seasons. Extra storage in high-flow years might be obtained by high level reservoirs, and which would be filled by gravity or pumping after the ordinary or operating reservoirs are full. Just what storage should be provided for to make up for the loss of water from the glaciers is not known, although it is hoped that the Dominion Water and Power Bureau of the Department of Mines and Resources will be able to initiate measurements of streamflow from one or two typical glaciers next year.

A rough estimate of the amount of water held in ice storage gives an unexpectedly high figure. That section of the Columbia Ice Fields which will drain easterly has an area of some 200 square miles, when isolated glaciers and glacial tongues in that Ice Field area are taken into consideration. Averaging this ice at the conservative depth of 150 feet shows that there is stored in the Columbia Ice Fields 19,200,000 acre-feet of ice, which is equivalent to 17,600,000 acre-feet of water. Many times this amount of water has already flowed easterly from the glacial areas.

The statements made are somewhat in the field of conjecture, but it is believed they are worthy of serious consideration. It is certainly not too early to face the possibilities mentioned, and to plan for the surveys that will be necessary for a comprehensive water control and conservation programme. When we think that the major economy of the Prairie Provinces depends on water supply and power, and that this economy is of national interest, the need of action in the not too distant future seems very evident.

A. E. Palmer[2]

There is one paragraph of Mr. Russell's paper that calls for comment; that is his reference to required agricultural studies in relation to irrigation development. A statement as to such studies as have been made, are under way and are projected by the Dominion Experimental Station at Lethbridge should be of interest here.

The Department of Agriculture Farmers Bulletin No. 10, "Use of Irrigation Water on Farm Crops," reports the results of seventeen years of study of the seasonal water requirements of alfalfa, wheat, potatoes, sugar beets, and sunflowers. Several years of similar tests also have been conducted with barley, peas, and field beans. A summary of this data is included in a report of the station's activities now in the hands of the printer.

Quite extensive rotation and crop sequence studies under irrigation are under way at the Lethbridge station, and data is accumulating that will assist in the proper evaluation of crops in relation to fertility factors and seasonal water requirements. More detailed and accurate studies of the duty and economic use of water now are being established at Taber, which is more nearly representative than Lethbridge of conditions that prevail in the areas that will be brought under water in the St. Mary Milk River Development. The present plans of this work are: (A) Prototype studies of water use on the Taber Irrigation Project; respecting gross duty of water for the project and water used on individual farms. (B) Plot studies of water requirements of different crops in relation to soil moisture and fertility. Plot studies also are planned for the Red Deer project area.

W. L. Foss, M.E.I.C.[3]

The design of a canal system for irrigation purposes involves problems similar to those which arise in the design of a power distribution system. Diversity of use enters the picture and becomes more important as the project increases in size. Factors governing the capacity of canals cannot be completely evaluated without the benefits of actual operating experience.

Unfortunately, the older projects in Alberta suffer either from shortages of water due to lack of storage, or the canals have insufficient capacity. Further, there are no really large projects from which data can be obtained to evaluate the effect of size. It is therefore not possible to obtain from studies of existing projects all necessary information required for the sound design of a large project.

Studies of existing projects have been made and peak canal flows have been plotted against both acreage irrigated and the number of users under a given canal. Results from the different projects varied widely, but sifting the data and using what seemed to be the best, gave a curve covering areas up to about 30,000 acres. By extending the curve, estimates were made for larger acreages, and formulae worked out for the design of canal systems.

The law of probability governs some of the factors. Two main factors are: 1. Irrigation factor, and 2. Demand factor. The irrigation factor is the percentage of the total irrigable land in the project which is actually irrigated in any one year. The demand factor is the percentage of the total number of water users on the project expected to use water at the same time. Both of these factors, and more particularly the latter, will vary, roughly in order of importance, with size of project, type of crop grown, soil and climate, and the human factor, i.e. habits of users.

By far the most important of the above conditions is the size of the project. If water is being delivered to five users, the chances that all five will want water at the same time are high. If water is being delivered to 500 users, however, the probability that all will want water at the same time is very remote.

The problem, then, of designing canal systems resolves down to assessing the factors mentioned. It is not good enough to go to other countries for information, as conditions are apt to be so dissimilar as to be useless. The problem is our own and must be solved here in Western Canada. Some of the older projects are being studied further, and it is hoped that not too many mistakes will be made until more is known about the problem.

The St. Mary-Milk River Irrigation Project

by

G. L. MacKenzie, M.E.I.C.

Chief Engineer, Prairie Farm Rehabilitation Branch, Department of Agriculture, Canada

A paper presented at the Annual General and Professional Meeting, The Engineering Institute of Canada, Banff, Alberta, June 2, 1948

Outlining the early history of the Alberta Railway and Irrigation Company project at Lethbridge, Alberta, its subsequent extension to irrigate additional areas, and the investigations and planning which have led up to Canada's decision to make use of her full share of these boundary waters, the author describes the design of the component structures and tells how they are being built.

Of special interest to the engineer concerned with the handling of water are the descriptions of tunnel design and the methods employed in building Canada's highest earth fill dam.

The agricultural economy of large areas in Western Canada periodically experiences serious losses from drought conditions, with the result that the prosperity of these areas fluctuates widely: irrigation in areas of deficient rainfall not only stabilizes but also increases the overall production and prosperity of the region. The St. Mary-Milk River project will make a major contribution to the agricultural economy of Southern Alberta, as it will utilize the major portion of the waters of four rivers; the St. Mary, Milk, Belly, and Waterton, to irrigate a half a million acres of land.

This project has been under investigation by the Prairie Farm Rehabilitation Branch intermittently since 1939. The investigational work has included water studies, agricultural soil surveys, foundation exploration at dam sites, topographic surveys, preliminary structural designs and more recently the final structural designs and specifications. Construction of two of the main dams, the St. Mary and the Pothole, and the connecting canal, is under way.

What the Project Accomplishes

History of Irrigation on the St. Mary River

In January 1899, the Alberta Railway and Irrigation Company obtained authority under the North West Irrigation Act to divert from the St. Mary River the total low water flow and in addition they had authority to divert sufficient to make a total of 2,000 second feet during high stages. The Company, in 1902, planned to extend their proposed works and considered using water from other sources. Also at this time the United States Reclamation Service proposed to divert waters, in the United States, from the St. Mary to the Milk River for use on their projects. The Canadian Government protested the proposed diversion and as a result the Boundary Water Treaty of 1909 was negotiated. This treaty provided for the creation of the International Joint Commission to deal with boundary waters generally.

In 1921 the International Joint Commission apportioned the flow of the St. Mary and Milk Rivers. The tabulation below gives in round figures each country's share of the average annual flow for the period 1922 to 1940 on these streams.

During the 1922 to 1940 period, Canada had constructed irrigation works capable of using only 165,000 acre feet out of its share of 403,200 acre feet. During the same period the United States had constructed storage and irrigation works capable of utilizing its entire share of the two streams. This condition would jeopardize Canada's claim to her share of the waters of these streams if the United States decided to press for more water from these sources. It was, therefore, exceedingly important that construction should be started on the St. Mary project to safeguard Canada's right to her share of these International waters.

	Acre Feet

Existing Irrigation on St. Mary and Milk Rivers

A diversion was constructed on the St. Mary River in 1903 near Kimball. This diversion, which did not have any storage, provided water for irrigating nearly 113,000 acres of land south and east of Lethbridge. The Chin Reservoir, developed in 1921, supplied water for an additional 13,000 acres of land near Taber. This area has since grown to nearly 20,000 acres. The area actually irrigated has never exceeded 120,000 acres. The water supply for 100,000 acres of this land is very uncertain due to lack of storage and to the variability in river flow. The lands in these two areas are shown in the map, Figure 1.

Proposed Expansion of the Irrigable Lands

The St. Mary and Milk River Water Development Committee was established in February, 1941, to investigate the additional works required to utilize fully Canada's share of the St. Mary and Milk Rivers. This Committee was also charged with the responsibility of selecting the most feasible plan to put these waters to use and with the selection of areas to be irrigated. They were also to make recommendations regarding the share of the costs to be carried by the Dominion, the Province, and the Irrigation District. Their report was published in February, 1942, and recommended that Canada should construct, at an early date, the necessary irrigation works to utilize its share of the St. Mary and Milk Rivers. The Commission reviewed the difficulties encountered by existing irrigation districts and concluded that the practice of assessing all costs of construction against the irrigable lands was the primary cause of their financial difficulties. As a result, the Commission proposed that the Dominion assume the construction cost of main reservoirs and main canals and that the Province of Alberta should carry out the remainder of the construction programme. The Province could charge part of its costs to the farmers.

This project has been studied by the Dominion Reclamation Service and the Prairie Farm Rehabilitation Branch. The entire project has been carefully studied and scrutinized by the St. Mary and Milk River Water Development Committee. The scheme generally has been carefully considered and found to be feasible from an engineering and economic point of view.

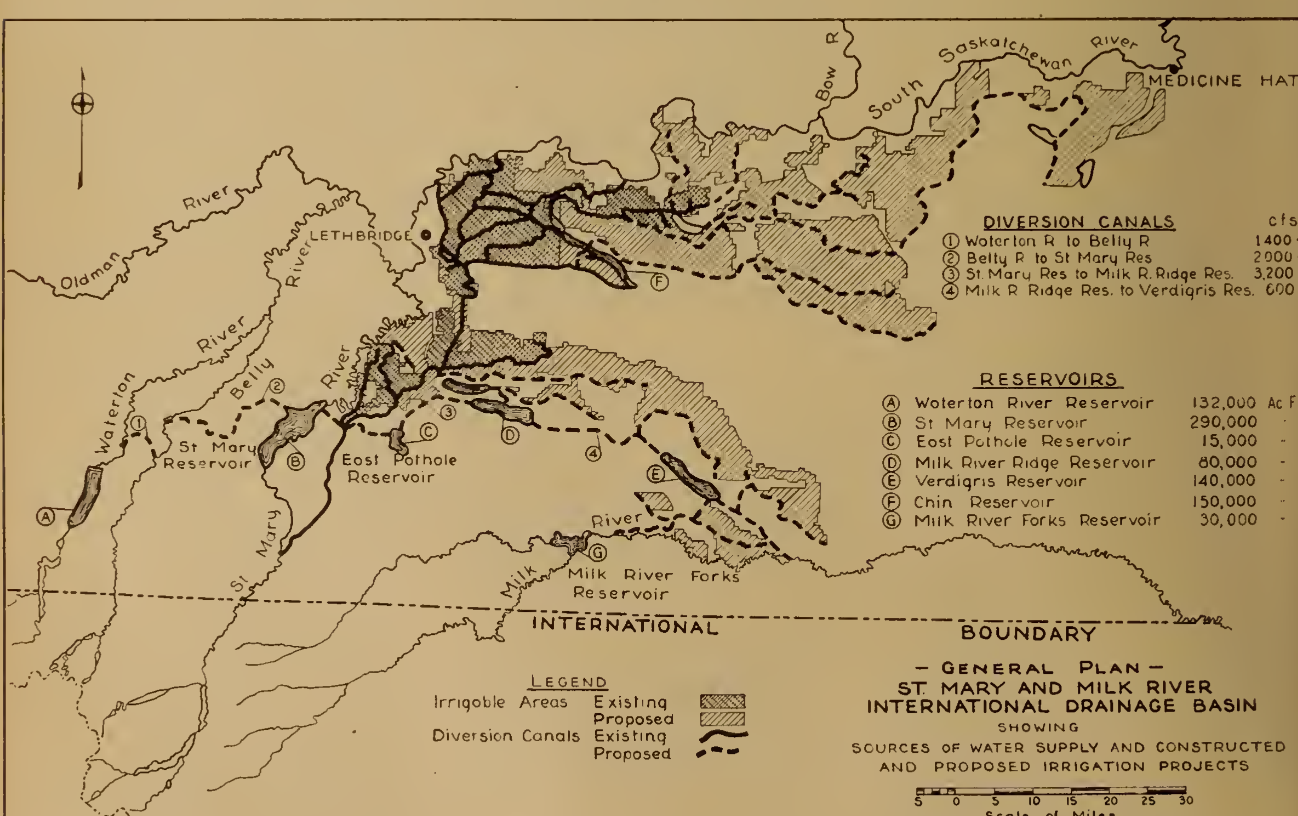
The plans for this development provide for a diversion canal from the Waterton River to the Belly River with a capacity of 1,400 c.f.s Then a diversion canal with a capacity of 2,000 c.f.s. will carry water from the Waterton and Belly Rivers into the St. Mary Reservoir. The main supply canal out of the St. Mary Reservoir will have a capacity of 3,200 c.f.s. and will supply water to irrigate a total of 513,000 acres of land. This means that the present area of 120,000 acres of land served by the St. Mary River will have an adequate supply and that an additional 393,000 acres of land will be brought under irrigation. Alberta now has approximately 509,000 acres of land under irrigation. The additional 393,000 acres represents a very substantial increase in the irrigable lands of Alberta, and will add stability to the agricultural economy of the Province. Figure 1 shows the location and extent of the new lands that can be irrigated by this project.

General Outline of Irrigation Scheme

Water Supply

Figure 1 shows the location of the streams providing the source of

Fig. 1



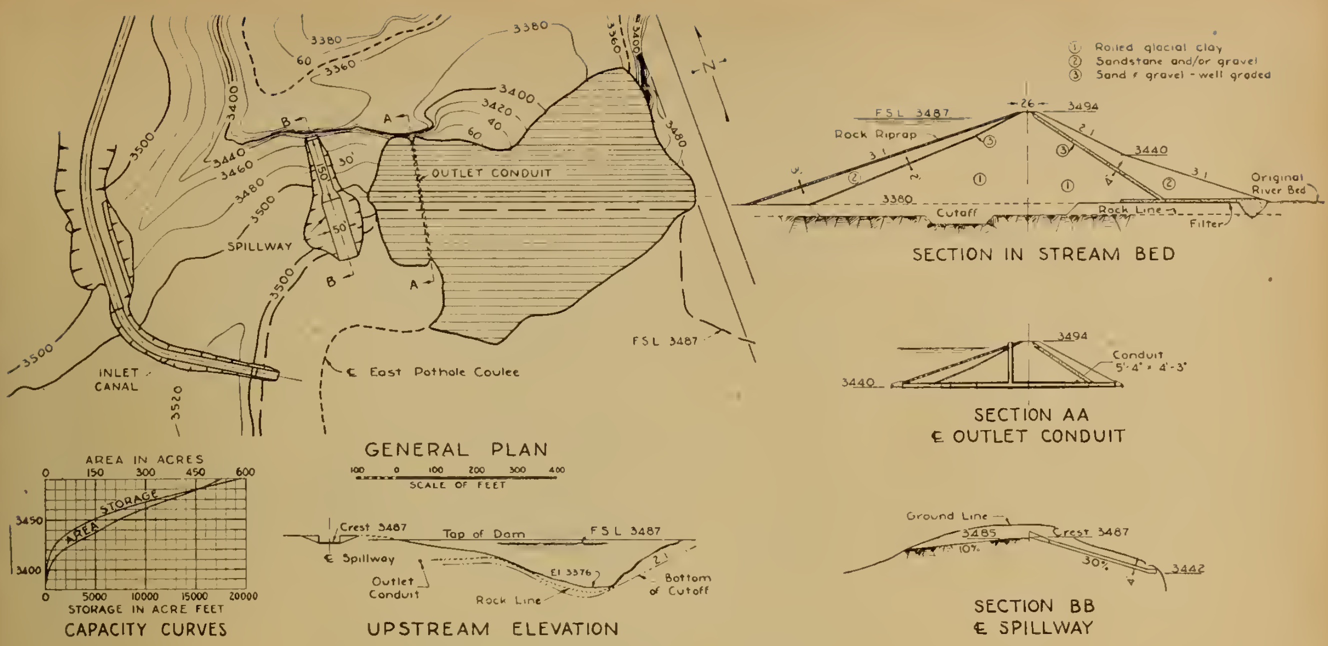


Fig. 2. Structure layout and details Pothole Dam

the water supply for the St. Mary-Milk River Project. The St. Mary River provides the main source of water supply and the Waterton and Belly Rivers provide additional water. It is not planned to divert any water from these last two rivers during the period of October 16th to April 15th each year. On the Waterton River it is planned to divert varying quantities of water during the period April 16th to October 15th. The maximum flow that will be diverted from this stream is 1,400 c.f.s. On the Belly River, water will be diverted during the same period (April 16 to October 15) and will reach a maximum of 628 c.f.s. during the month of heavy irrigation demands. The Milk River provides an independent source of water supply for a separate irrigation area of 18,000 acres.

Main Canals

Figure 1 also shows the location of the diversion canals from the Belly and Waterton Rivers, as well as the location and capacity of the main supply canals in the system. The main canal leading from the St. Mary Reservoir has a capacity of 3,200 c.f.s. and a bottom width of 56 feet with two-to-one side slopes and a depth of 16 feet. This main canal has been constructed as far as Pine Pound Coulee, which will probably be crossed with two 14 ft. diameter wood stave syphons. The map of Figure 1 also indicates that there are many miles of canals with capacities of over 2,000 c.f.s. These canals will require the construction of many structures such as bridges, drops and checks.

Storage Reservoirs

This project fortunately has a number of storage reservoirs located throughout the area in addition to the main supply reservoirs on the St. Mary and Waterton Rivers. The map of Figure 1 shows the location of these reservoirs with respect to the irrigable lands, and the following tabulation shows their capacities:

Reservoir	*Capacity*
Waterton	132,000 ac. ft.
St. Mary	290,000 " "
Milk River Ridge	80,000 " "
Verdigris	140,000 " "
Chin	150,000 " "
Milk River Forks	30,000 " "
Pothole Coulee	15,000 " "
Total Storage	837,000 " "

Fig. 3. The St. Mary River at the site of the St. Mary Dam.
National Film Board Photo

The estimated water supply needed for irrigation is approximately 740,000 acre feet, and with a total storage of 837,000 acre feet the project is in a good position for water supply during low flow periods.

Damages

The lake formed by the St. Mary Dam will flood about 11,600 acres of land and will interfere with the railway bridge on the Canadian Pacific Railway line from Cardston to Raymond. The lands on the west side of the river, having an area of 5,800 acres, belong to the Indians of the Blood Indian Reserve, and it has required lengthy negotiations to gain possession of them. The flooded area on the east side of the river includes two Hutterite colonies and a total area of 5,785 acres is involved. The Hutterite colonies contain 70 to 80 buildings of assorted sizes and designed for various uses. Many of the buildings are served with sewer and water and represent a serious problem in obtaining title to the lands that will eventually be part of the reservoir area. There will be no major damages resulting from the construction of the other reservoirs in the project.

Pothole Dam

The main canal from the St. Mary Reservoir has to cross the Pothole Creek soon after it leaves the reservoir. Pothole Creek flows in a comparatively narrow, but very deep, gorge and presents a difficult problem for a canal crossing. Consideration was given to crossing this creek with a syphon or a flume and it was finally decided to construct an earth dam and create a balancing pool on the canal that would have a usable storage of 14,000 acre feet. The construction of the earth dam appeared to possess some advantages over the other alternatives, although in the final analysis the dam was built for an entirely different reason.

In August 1943, the Raymond Irrigation District made a request to the P.F.R.A. to construct the

Fig. 4. Structure layout and details, St. Mary Dam.

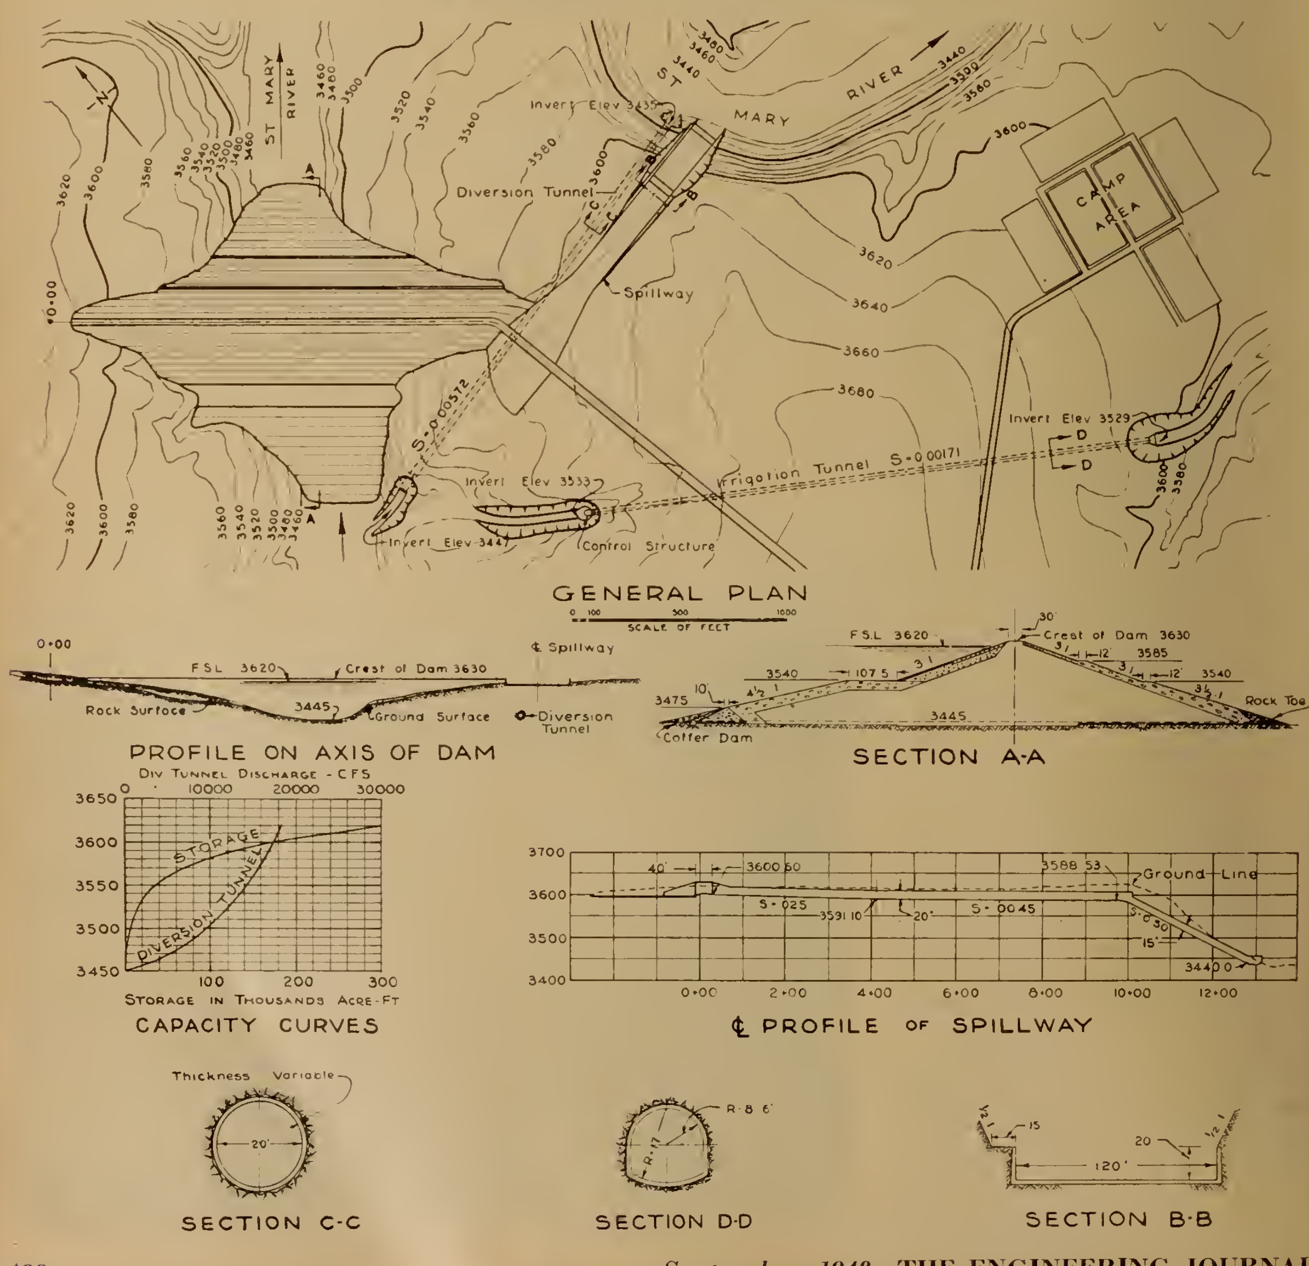

Fig. 5. Tunnel supports at inlet end of the diversion tunnel, St. Mary Dam.

" The rock under the dam consists of sandstones, more or less indurated, interbedded with soft shales, some of which are clay shales, carbonaceous shales, and one coal seam four to five feet in thickness. These rocks are of Upper Cretaceous age and are designated the Foxhills sandstones, which are overlain near the top of the valley by the St. Mary River formation. The rocks at the Pothole Dam are slightly older than those at the surface at the St. Mary River Dam."

The west abutment of the dam is a narrow ridge. This ridge at the site of the spillway has a width varying from 200 feet at full supply level (3487) to 500 feet at elevation 3410 at the bottom of the coulee. Bedrock occurs at about 3445 or slightly higher, and the material above the bedrock is boulder clay. The bedrock and the boulder clay appear to be quite impervious, but due to the short length of the seepage path it was considered desirable to place a clay blanket along the upstream side of this ridge, extending from the toe of the dam to the chute at the intake canal.

dam at Pothole Coulee to provide this 14,000 acre feet of storage for surplus water from the A. R. & I. canal. This could then be used to provide additional water to the Raymond Irrigation District, which suffered serious water shortages in low water years. The dam would also fit into the St. Mary-Milk River Project when its construction was approved. Their request received the approval and support of the Alberta Government, and as a result an agreement was negotiated between the Dominion Government and the Province of Alberta.

This agreement provided that the Province of Alberta would finance the construction and maintenance of Pothole works until it became a part of the St. Mary-Milk River Project. The Dominion agreed at that time to allow this cost to be credited to the Province's share of the cost of the St. Mary Project. This agreement resulted in work starting on the Pothole Dam before the work on the main dam at the St. Mary site. Work was begun in 1946 and is now nearing completion. Figure 2 shows the general layout of this dam. It shows the location of the inlet and outlet canal, and the principal features of the structure.

Geological and Foundation Conditions

Dr. John Allan, M.E.I.C., consulting geologist for the P.F.R.A., examined the site of the Pothole Dam and reports as follows:

Description of Pothole Dam

The dam is a rolled earth fill structure with a crest length of approximately 850 feet and a maximum height of 130 feet. The construction of this dam involves the stripping of approximately 100,000

Fig. 6. Drilling jumbo, diversion tunnel, St. Mary Dam.

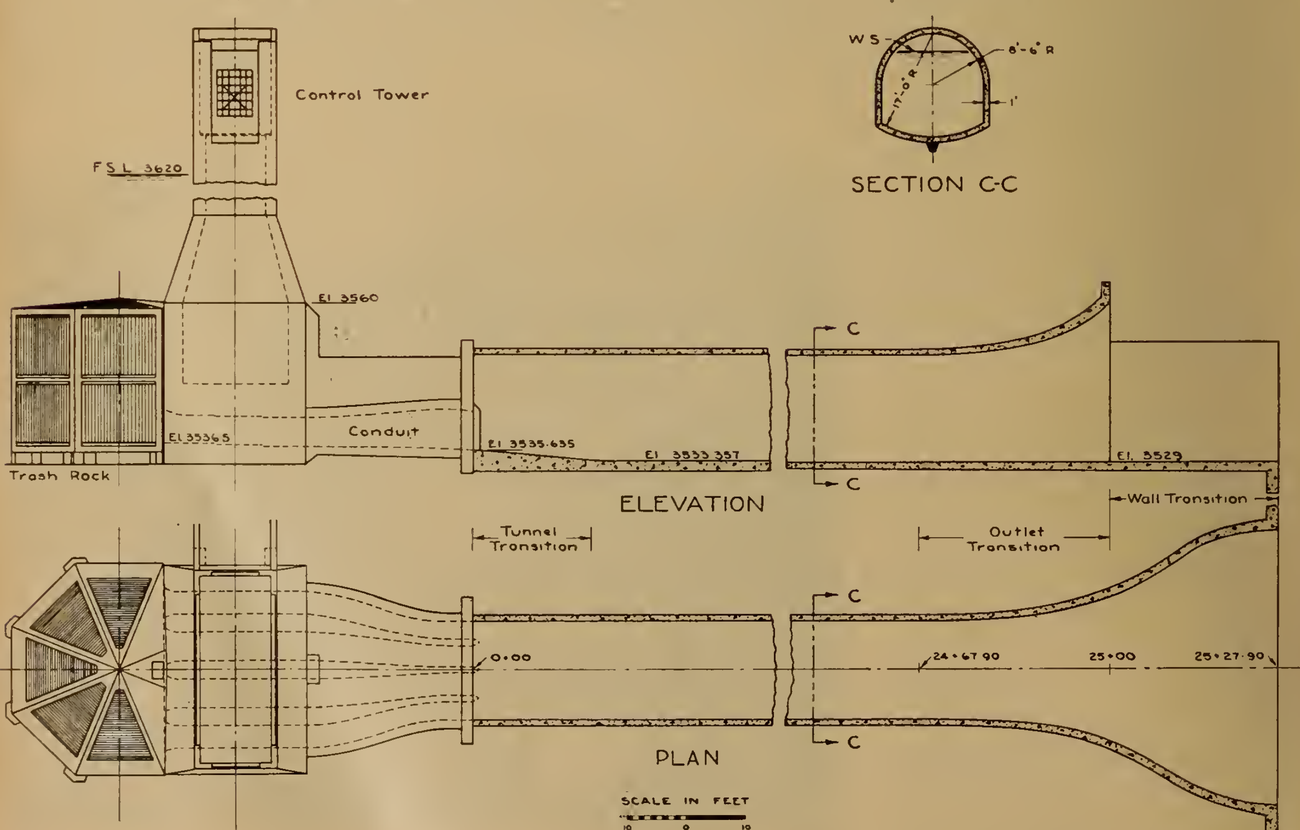
Fig. 7. Pouring concrete in diversion tunnel, St. Mary Dam, using travelling form for the crown.

cubic yards of material, and the placing of 350,000 cubic yards of impervious material in the rolled earth core, the placing of 30,000 cubic yards of gravel fill and the placing of 40,000 cubic yards of rock. Figure 2 shows a typical section through the dam, and shows the location of the cutoff trench and the manner in which the dam is zoned.

Construction Material

The material for the impervious rolled fill is obtained from two borrow pits adjacent to the site but on opposite sides of the valley. The material in these borrow pits is a silty glacial clay suitable for the core of a zoned dam, but not ideal for a homogeneous section. This soil, while very well graded from clay sizes up to sand, is quite plastic and exhibits the properties associated with clays. It is highly impervious, rather difficult to compact, and when compacted in the dry state absorbs water and swells. The natural water content of the soil in the borrow pits ranges from 7 per cent to 12 per cent. The required water content, as determined

Fig. 8. Plan and elevation of the irrigation tunnel as submitted for model test.



by the compaction tests, varied from 14 per cent to 17 per cent, so that from 2 per cent to 10 per cent has to be added to this material to bring it to the proper moisture content for efficient compaction.

The P.F.R.A. has followed the general practice of specifying that the material be brought to the proper water content in the borrow pit. At this project the borrow pit irrigation ditches were flooded previous to excavation, in order to increase the water content of the top 10 feet. The area was irrigated for a period of one month and then drained and allowed to dry for one month. The depth of penetration varied throughout the pit, but an average penetration of 8 feet was obtained. The water content, after the wetting and drying cycle, varied from 20 to 22 per cent at the surface to 14 per cent at a depth of 8 feet. Most of the material was excavated with shovels, which gave a fairly well mixed material.

The rolled fill was compacted with two types of rollers; one was the American Steel Works roller, which had feet 7 inches long and produced a foot pressure of 260 p.s.i. when ballasted with water; the other, a McCoy roller, Model USHD-2, which had feet 8¼ inches long, produced a foot pressure of 400 p.s.i. when ballasted with sand and gravel. An average of ten roller passes were applied to each layer and the compacted thickness averaged 4 inches. The average compacted dry density of the fill with this equipment was 105 pounds per cubic foot, which is 91 per cent of the modified Proctor density.

Pothole Spillway

The drainage area in the Pothole Coulee above the dam is 100 square miles and a concrete spillway, having a discharge capacity of 1,400 c.f.s. when the head on the crest is 4.00 feet, is provided to take storm flows that might originate in the drainage area. The spillway has a crest 50 feet in length, located at elevation 3487.0. The chute width narrows from 50 feet at the crest to a uniform width of 30 feet at a distance 25 feet downstream from the crest. The chute has a slope of 30 per cent down to elevation 3442.0 when it levels off, to discharge into the coulee. A concrete cutoff wall 18 inches thick and 5 ft. 6 in. deep is provided at the crest. A 6 inch layer of gravel is provided under the spillway chute slab to supply drainage.

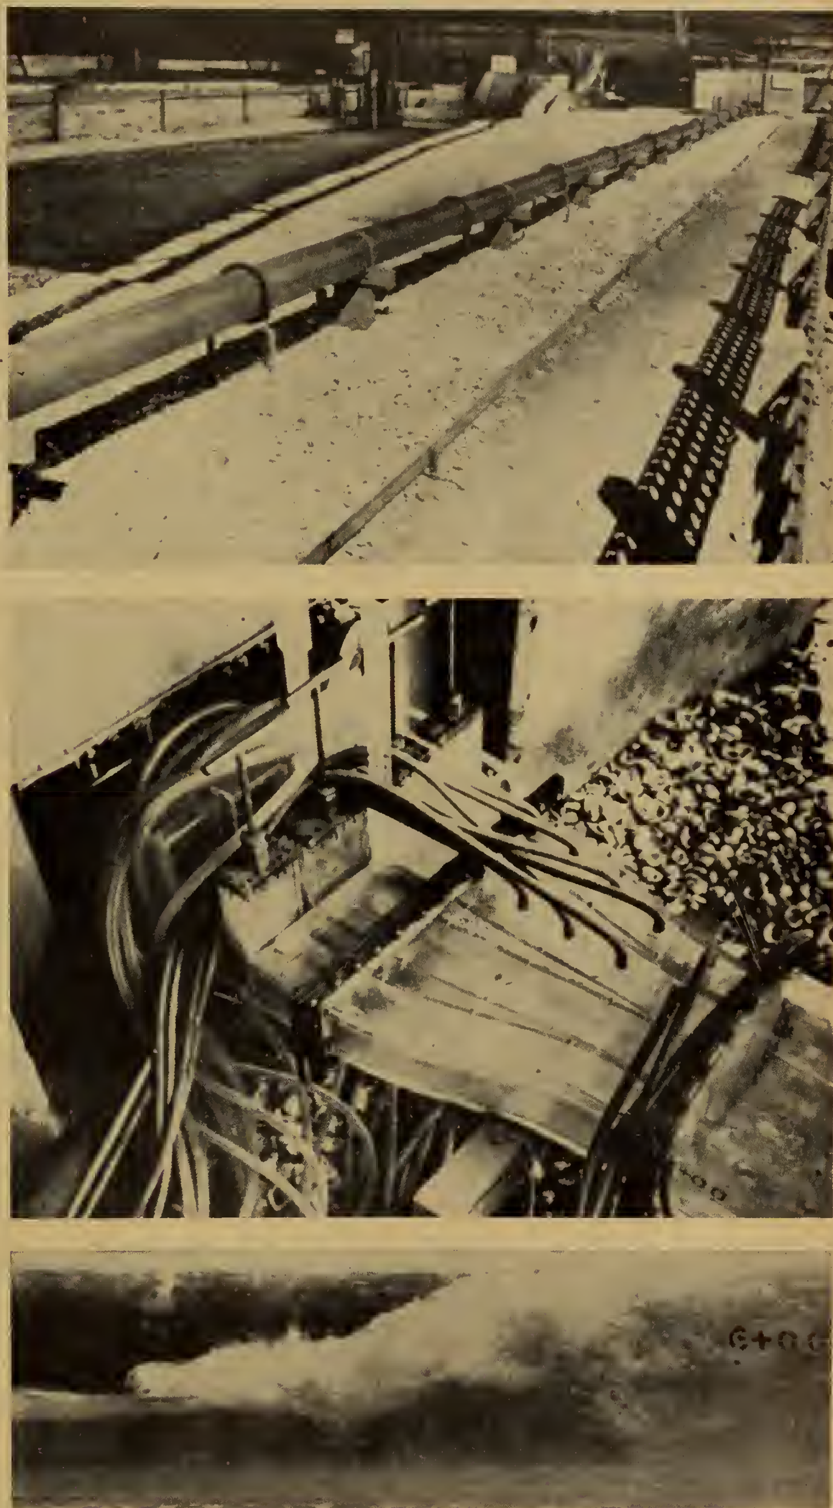
A reinforced concrete conduit equipped with control gates is provided to discharge water into Pothole Coulee to supply water for the Raymond Irrigation District and for stockwatering below the dam. The general details of this structure are shown in Figure 2.

St. Mary Dam

The St. Mary Dam is a zoned rolled earth fill with a maximum height of 186 feet and a crest length of 2,600 feet. The length at the base, across the stream bed, will be 300 feet. The length of the base

Fig. 9. Hydraulic model of irrigation tunnel.

Top—**General view of the 100-foot long model.**
Centre—**View of the gate control structure being tested.**
Bottom—**Photo of the hydraulic jump occurring at Sta. 6+ 00 with three gates open and discharging at design capacity.**



parallel to the stream is 1,450 feet. The construction of this dam will require placing 4,000,000 cubic yards of fill. Figure 3 shows the St. Mary River at the dam site.

The construction is being divided into three separate contracts. The first contract covered the construction of the diversion and irrigation tunnels, and was awarded to Bennett & White Calgary Limited in 1946. The second contract was awarded to the W. C. Wells Construction Company Limited, for the construction of the earth fill dam, in the fall of 1946. A third contract will be awarded in the near future for the construction of the spillway and control works. The total estimated cost of the dam is approximately $4,000,000.

Diversion Tunnel

Figure 4 shows the location of the diversion tunnel, the irrigation tunnel, and the cofferdam. It is planned to divert the flow of the St. Mary River through one circular tunnel 20 feet in diameter with a length of 2,115 feet. This tunnel is lined with reinforced concrete and will have a capacity of 6,500 c.f.s. under a head of 18 feet, which will be provided by the cofferdam. At the end of the diversion period it is planned to plug the diversion tunnel, making provision to pass enough water for riparian uses.

The rock in the region of the diversion tunnel is composed of interbedded layers of soft shale and sandstone with some mud seams. The rock has horizontal bedding planes with an upstream dip of about 3 per cent. The roof could not be arched successfully because of the horizontal bedding planes.

The general plan of the tunnelling operation was to tunnel approximately half the distance from the outlet end and then to tunnel the remainder from the inlet portal while concreting operations were performed from the outlet end. Tunnelling was started at the outlet portal on September 23rd, 1946, and a distance of 1,029 feet was driven by March 17th, 1947. The rock in this section of the tunnel did not require support and no serious rock falls occurred. The rock did, however, disintegrate readily when exposed to air, with the result that fragments of rock continued to spall off the roof.

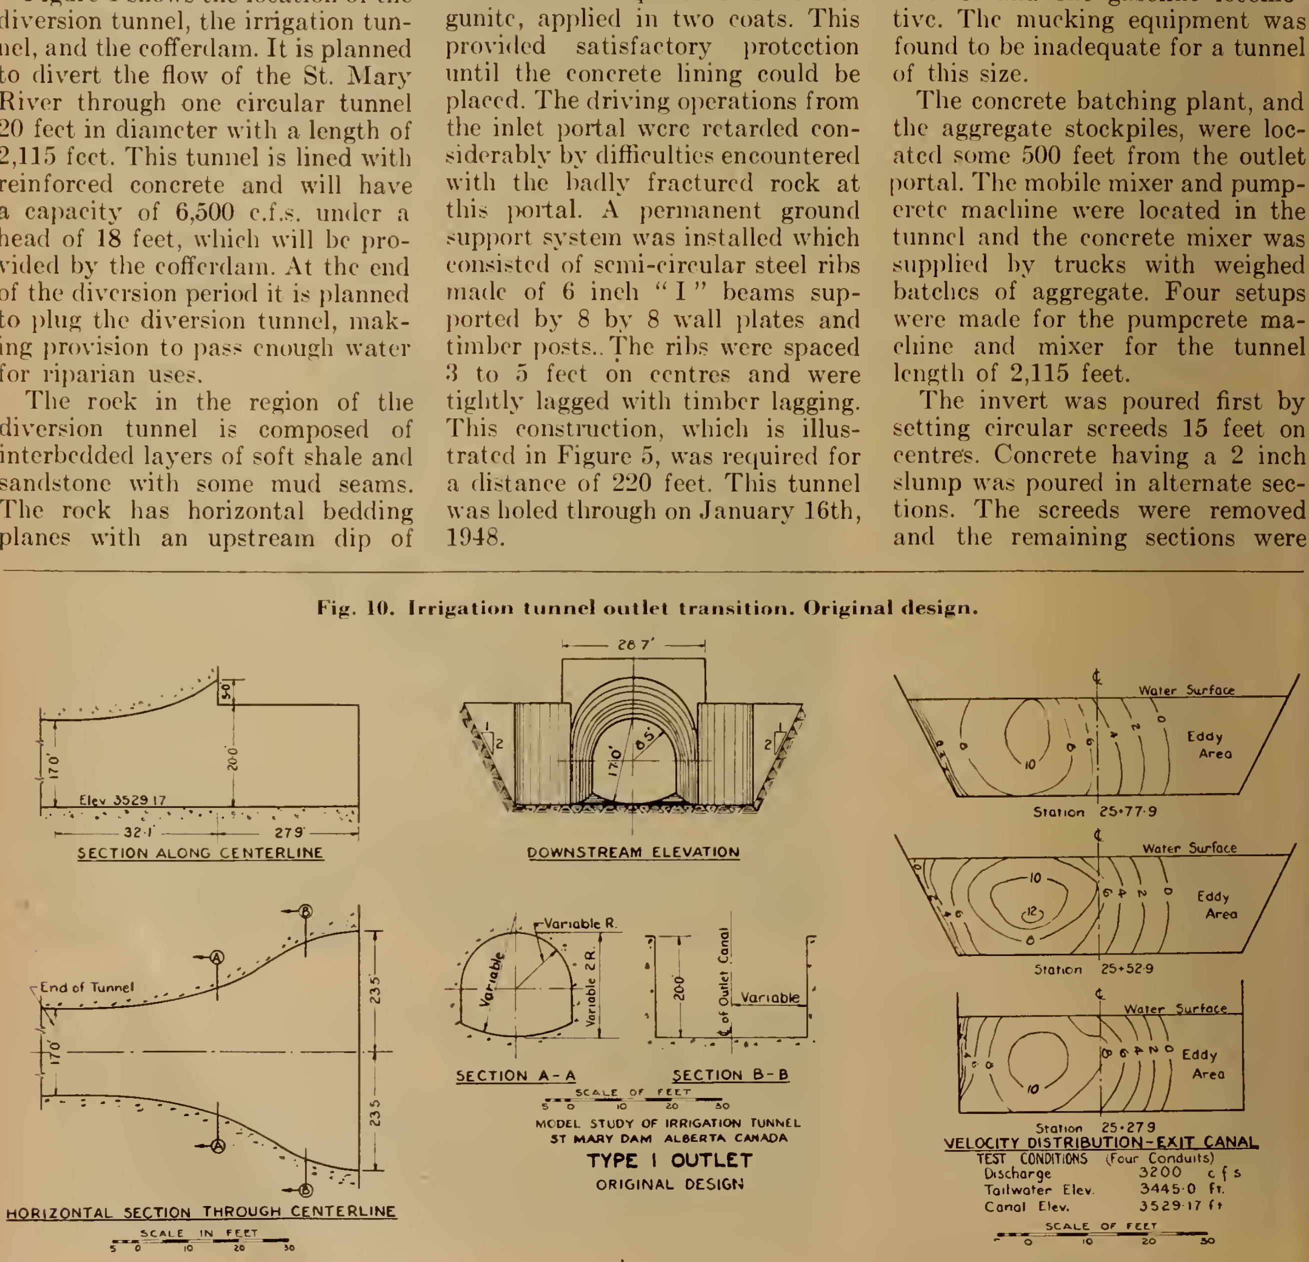
To control this, about 850 feet of this portion of the tunnel was coated with a 3/4 inch thickness of gunite, applied in two coats. This provided satisfactory protection until the concrete lining could be placed. The driving operations from the inlet portal were retarded considerably by difficulties encountered with the badly fractured rock at this portal. A permanent ground support system was installed which consisted of semi-circular steel ribs made of 6 inch "I" beams supported by 8 by 8 wall plates and timber posts. The ribs were spaced 3 to 5 feet on centres and were tightly lagged with timber lagging. This construction, which is illustrated in Figure 5, was required for a distance of 220 feet. This tunnel was holed through on January 16th, 1948.

Two methods were used in driving the tunnel. At first the bench and heading method was used with approximately 45 holes in the face and 16 holes in the bench. The length of round was 6 feet. Four feet of material was left in the invert to make a roadway for the mucking equipment. The muck was removed by overhead loaders and dumptors. The trimming and sizing costs were high in this method. The driving method was then changed to the full face heading method employing 6 automatic feed drills mounted on a 16 foot, 3 tier track-mounted jumbo, shown in Figure 6. Approximately 62 holes were drilled in the face and the length of round was 12 feet. The material from this driving method was mucked with a Conway 75 mucking machine, three 5 yard mine cars, two battery locomotives and one gasoline locomotive. The mucking equipment was found to be inadequate for a tunnel of this size.

The concrete batching plant, and the aggregate stockpiles, were located some 500 feet from the outlet portal. The mobile mixer and pumpcrete machine were located in the tunnel and the concrete mixer was supplied by trucks with weighed batches of aggregate. Four setups were made for the pumpcrete machine and mixer for the tunnel length of 2,115 feet.

The invert was poured first by setting circular screeds 15 feet on centres. Concrete having a 2 inch slump was poured in alternate sections. The screeds were removed and the remaining sections were

Fig. 10. Irrigation tunnel outlet transition. Original design.



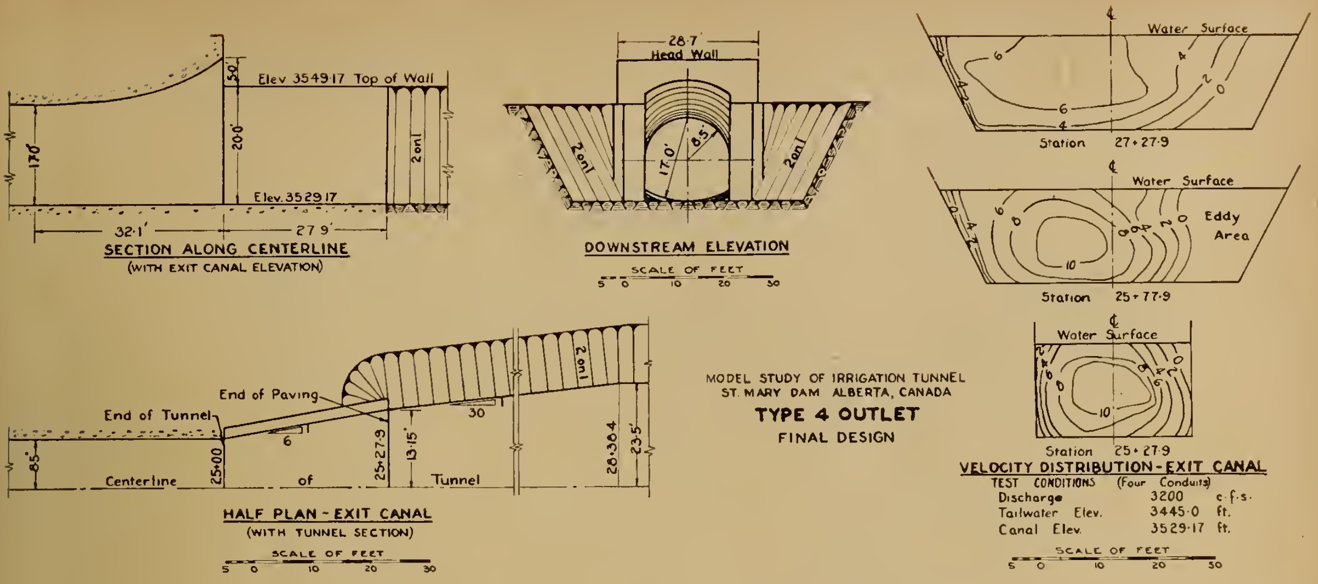


Fig. 11. Irrigation tunnel outlet transition. Final design.

poured. Four travelling retractable forms, 32 feet long, shown in Figure 7, were used to pour the arch concrete. The concrete was pumped through ports in the arch forms and vibrated with immersion type vibrators.

Irrigation Tunnel

The location of the irrigation tunnel is shown in Figure 4. It is 2,500 feet in length, is located some 90 feet above the stream bed, and is of the horseshoe section shown in Figure 8. It is to be used to supply water from the reservoir to the main supply canal. The plan and elevation of the irrigation tunnel, including the trash rack, control structure, gate transition and tunnel transition outlet are shown in Figure 8. The control structure will contain two 5 foot by 5 foot and two 4 foot by 5 foot high pressure gates, and the control is designed to pass 3,200 c.f.s. at heads varying from 25 to 81 feet. The structure was designed so that hydraulic jump would occur in the tunnel, without reaching the roof, for varying combinations of gate discharge. Model studies were made on this structure at the Waterway Experiment Station, Vicksburg, Mississippi, to check the hydraulic characteristics and to develop means for correcting any uneconomic, unsafe or undesirable conditions that might exist in the proposed design. Figure 9 shows photographs of this model. The model was also used to carefully check on the possibility of cavitation occurring in the structure. The only major alteration recommended to date is in the outlet transition. The original design, shown in Figure 10, resulted in an unbalanced velocity distribution pattern. The model studies have produced a simpler form of transition, shown in Figure 11, with a greatly improved velocity distribution at the outlet.

Foundations

The foundation for this dam was carefully explored by diamond drill holes and a thorough geological study of the area was made by Dr. Allan. Forty-three diamond drill holes were put down, varying in length from 30 to 220 feet, with a total footage of over 3,000 feet. The rock along the sides of the valley in the vicinity of the dam is quite uniform, and belongs to the St. Mary River formation. This formation is quite young and consists of interbedded shale and sandstones. The shales and sandstones of this formation have a very low resistance to weathering, but when protected from wetting and drying are as durable as rocks in older formations. This rock in the unweathered condition has a low permeability.

This property was tested by filling completed diamond drill holes with water and observing the time required for the water level to reach the ground water table. The results showed that the top portion of the bedrock was quite pervious, but that the rock became more impervious with depth. This was to be expected because in every hole, weathered and fractured bedrock was found for some distance below the contact with the overburden.

The field work and geological studies indicate that the site is satisfactory for a dam of the proposed size. Considerable stripping will be required to remove the fractured and weathered rock, so that fill can be placed on sound bedrock.

Fill Materials

Three types of materials will be used in the main fill:—impervious, selected pervious and random pervious. The impervious material will be secured from a borrow pit close to the north end of the dam, and the average haul will be about 2,000 feet. The selected pervious material is sand, gravel and rock up to 12 inch size with not more than 10 per cent smaller than the 100 mesh, and it must be free from shale and sandstone. It will be secured from a borrow pit on the north side and the average haul will be about one mile. The random pervious material is sand, gravel and rocks and may contain small amounts of shale and sandstone. It will be secured from a borrow pit on the north bank and the average haul will be about 2,000 feet.

The properties of the impervious fill materials were determined by exhaustive laboratory tests performed by the P.F.R.A. Soil Mechanics Laboratory in Saskatoon. The physical properties of this material were presented by Mr. R. Peterson, soil mechanics engineer, in his paper "Soil Mechanics as Applied to P.F.R.A. Problems with Special Reference to the Proposed St. Mary Dam", which was published in the

Fig. 12. Compaction curves of fill material for impervious section of St. Mary Dam.

May, 1945, issue of *The Engineering Journal*. The testing covered classification tests, compaction, shear and consolidation tests, and a brief summary only of the results will be presented here.

Classification Tests

Field Classification—Silty glacial clay (glacial till)

Specific Gravity of soil solids, average — 2.71

Percentage of soluble solids, average — 0.18

Water content in borrow pit Minimum—6%; Maximum—15%

Liquid Limit, average — 35.3

Plastic Limit, average — 14.5

Plasticity Index, average — 20.8

Clay sizes — 30%

Silt sizes — 35%

Sand sizes — 35%

The optimum moisture content was determined for five different methods of compaction and the compaction curves obtained are reproduced in Figure 12. These curves show that the density increases and the optimum water content decreases with an increase in compactive effort.

The tentative section originally proposed for the St. Mary Dam is shown in Figure 13. This section has been modified by flattening the slopes and increasing the base width, and the section that will be used is shown in the same figure. The section was increased and the pervious blankets thickened because the St. Mary glacial clay contains a higher percentage of clay and silt than is considered desirable. The original section would have required compaction equivalent to the high densities attained by the California method, which would have required very close control on the moisture content. The high densities in turn would have created difficulties due to the danger of swelling near the face of the slopes and at the top of the dam. For the adopted cross-section, it is planned to compact the material to a density slightly greater than the range given by the Standard Proctor method, or about 92 to 94 per cent of the Modified Proctor method.

Compaction

The specifications for compaction of the impervious section of the St. Mary Dam required the contractor to bid on the basis of nine passes of the roller over each six inch layer of compacted fill. He was also required to bid a unit price for extra rolling per hundred square feet per pass of the roller. If more than nine passes are required he will be paid for it at the tender price. If less than nine passes are required a deduction will be made at the same bid price per pass. This method of payment removes all hazard from the contractor's bid, and gives the engineer control over the amount of rolling without danger of friction with the contractor. It will, however, require some extra inspection.

The compaction equipment is being supplied by the Government but will be operated and maintained by the contractor, and will consist of: three double drum oscillating rollers with 7 inch feet yielding a foot pressure of 560 p.s.i. when loaded with sand and water; one double drum oscillating roller with 8 inch feet yielding a foot pressure of 208 p.s.i. without ballast and 436 p.s.i. when loaded with sand and water; one double drum oscillating roller with 10 inch feet yielding a foot pressure of 363 p.s.i. without ballast and 530 p.s.i when loaded with sand and water; one single drum roller with 10 inch feet yielding about 360 p.s.i. without ballast and 500 p.s.i. when loaded with sand and water. All rollers are 60 inches in diameter.

Riprap

The riprap for protecting the upstream slope of the dam from wave action presented a serious problem. The local shales and sandstone lacked sufficient durability to be considered for this purpose. Field boulders were the only local materials that possessed sufficient durability, but the supply was very uncertain. It was finally decided to ship rock from Frank, near Coleman, Alberta. This rock comes from the disastrous slide which buried the village in 1903. The rock is durable and is obtainable in the required sizes at a cost that is not excessive.

Spillway

The spillway will contain 12 stoplog openings 20 feet wide by 18 feet high. It will have a capacity of 60,000 c.f.s. with the pools at elevation 3621.5, or 53,000 c.f.s. with the pool at full pond level of 3620.0. The preliminary designs for this structure take the general form shown in Fig. 4. Stoplogs will supply the required control. It is planned to have the hydraulic properties of this structure thoroughly investigated by model tests, so the form shown in this paper should not be considered as final.

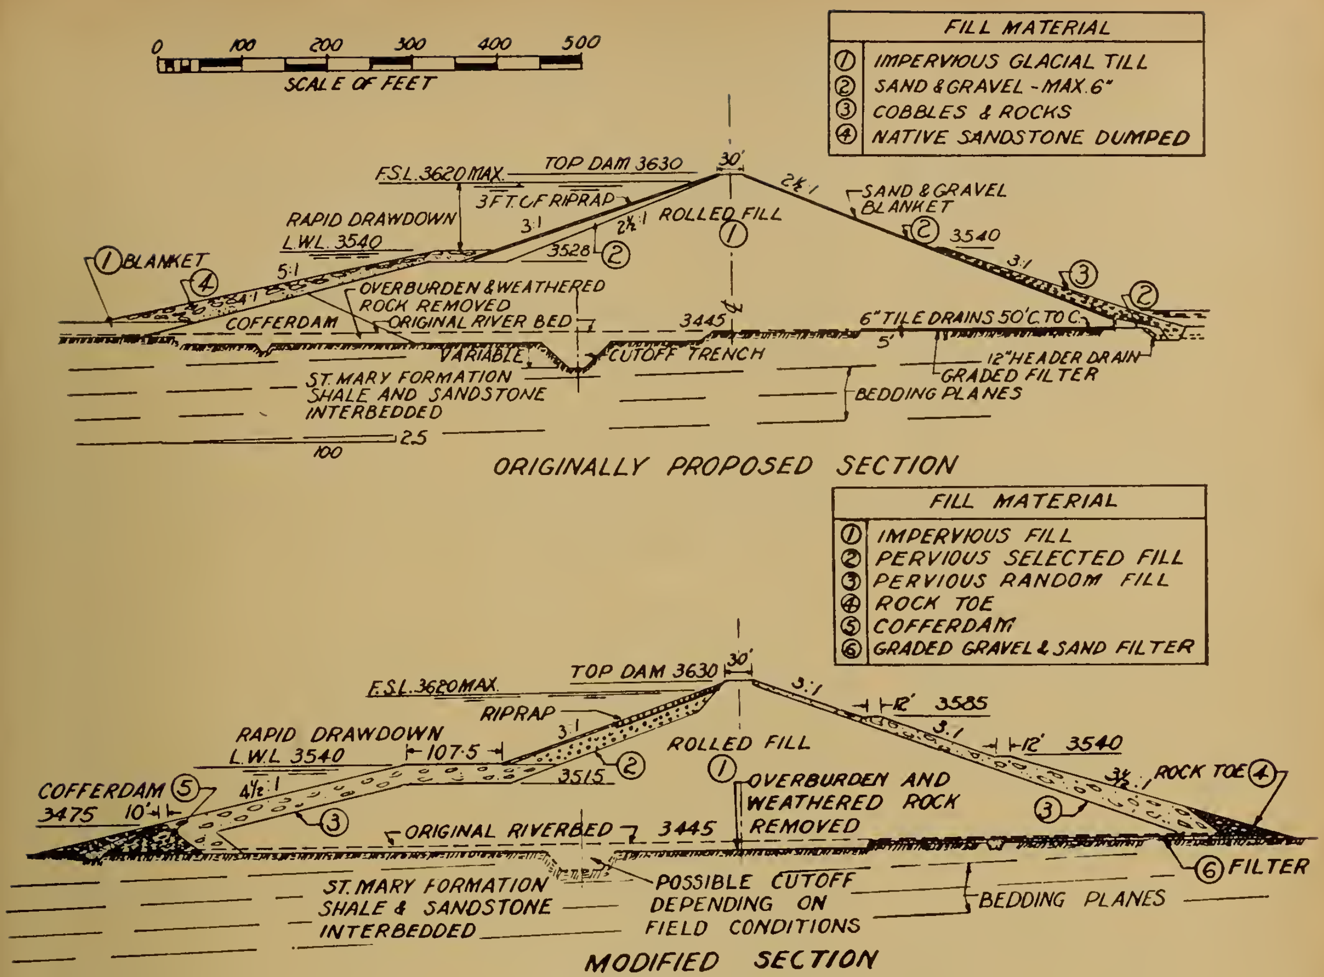

Fig. 13. Original and modified section for St. Mary Dam.

Test Installations

During the past few years more attention has been paid to soil studies previous to and during the construction of earth dams. In keeping with this trend, it is now becoming common practice to install apparatus in earth fills in order to observe their behaviour during construction and later during operation. This type of apparatus is used for the purpose of measuring the settlement or compression within the fill, the pore pressure within the soil structure, and the seepage or free water line through the structure.

Two types of pore pressure measuring devices and one type of settlement measuring device are being used by the P.F.R.A. These devices have been installed in the Pothole fill and it is planned to use similar equipment in the St. Mary fill.

The pore pressure installations will give warning of excessive pore pressures caused by consolidation in the impervious material. High pore pressures may cause a reduction in shear strength, and it may be necessary to either suspend fill construction until the pore pressures are dissipated through drainage, or in other cases it may be necessary to modify the design. Pore pressure measuring devices will also give valuable information on the location of the seepage line, the effectiveness of cutoffs, and the relative permeability of the various materials in the dam and foundations.

It is now recognized, in connection with the settlement of fills, that the best procedure is to compact impervious fill materials to such a density that they will neither consolidate nor swell. Settlement devices make it possible to determine this ideal density in the field and at the same time estimate the settlement that might still occur after construction.

The test installations at Pothole have, on the basis of results to date, provided valuable information that can be used in connection with the St. Mary Dam.

Progress

This outline presents the project as it stands today. The Pothole Dam is nearing completion and the St. Mary Dam is in active construction stage and should be completed in 1950. Some work has been done on the main canal, and completion of this and the construction of reservoirs will be the next stage. As the various stages proceed the water can be delivered to the different sections of the area. Before much of the land comes under the ditch it will be necessary to complete the diversions from the Waterton River and Belly River to complete the water supply for the project. The estimated cost of the whole project is $15,000,000.

Maj. Gen. H. B. Ferguson of Washington, D.C., is the consulting engineer for the St. Mary Dam, and Dr. J. A. Allan, M.E.I.C., of Edmonton, is consulting engineering geologist. The project and structures design is under the direct supervision of W. L. Foss, M.E.I.C., project engineer for the St. Mary-Milk River Project. J. G. Watson, M.E.I.C., is resident engineer on the St. Mary Dam, and J. H. Harding, JR.E.I.C., is resident engineer on the Pothole Dam.

Discussion

Ben Russell, M.E.I.C.[1]

Mr. MacKenzie gives the capacity of the main canal from the St. Mary River as 3200 c.f.s., which he states will supply water to irrigate a total of 513,000 acres in the project. While there is that amount of irrigable land and more which could be irrigated, the limiting factor is the available water supply. Heretofore, the project has been so limited to 465,000 acres, 120,000 of which are under presently constructed canals and 345,000 acres of new lands.

It is presumed that the additional water available is from the Waterton River and will be made available through storage, but such storage development will add considerably to the total construction cost, which will then considerably exceed $15,000,000. It would probably be interesting if Mr. MacKenzie could explain the situation with regard to the Waterton River diversion.

It might be pointed out that the St. Mary and Milk River development is an enlargement and extension of the Alberta Railway and Irrigation project, which to facilitate the development of the larger project, has recently been taken over by the Alberta Government. It is now operated for the Alberta Government by a manager, P. M. Sauder, M.E.I.C., and assistant manager, George Brown, M.E.I.C.

Further water appropriation from the St. Mary, Belly, and Waterton Rivers will require to be made for the projects by the Alberta Government, and the construction plans approved.

W. L. Foss, M.E.I.C.[2]

The author has perhaps attempted to cover too much territory in a single brief paper. Any one of the several subjects touched upon would provide data for a paper of equal length.

In discussing the irrigation tunnel, the author neglects to mention the outstanding feature of this design. This feature is the successful attempt on the part of the original designers to dissipate 30,000 hp. of energy without spending any money on stilling basins, baffles, or any other type of energy dissipator. The simple structure which was, in any case, required to carry irrigation water from the reservoir to the canals, is utilized "as is" for the dissipation of this rather large amount of energy.

It is not claimed that this is the first time energy has been dissipated in an outlet pipe, such as may be found through smaller dams and structures almost anywhere. It does seem, however, that the successful calculation of energy losses from point to point in the tunnel along with the prediction of water levels and location and height of jump is rather unique. Testing engineers at Vicksburg had not seen this attempted before, and agreed that the design was definitely original. The model tests bore out the original calculations exactly, even as to the location of the jump, and the magnitude of negative pressures.

The author might well have elaborated more on this point instead of devoting so much space to the outlet transition. Since there is a rock cut for some distance beyond the concrete transition, this feature of the test is not important. Even if it had been important, it is not agreed that the author is correct when he states that, quote: "The simpler form of transition, shown in Figure 11, shows a greatly improved velocity distribution at the outlet". If the section at station 25+77.9 in Figure 10 is compared with the section at the same station in Figure 11, it will be seen that they are almost identical. This section is 50 feet downstream from the end of concrete and is therefore significant.

The question of the design of the outlet transition was never considered to be one of the important problems. One reason for the model test was to check for negative pressures in and beyond the conduits, where velocities reach 63 feet per second. Another reason was to make certain that waves and pulsations in the high velocity jet would not reach proportions which may cause bad flow conditions.

In connection with the design of the earth dam on the St. Mary, the author failed to mention an important point. This point has to do with the discovery in 1946 of one and one-half million yards of pervious material right near the site. The cross-section in Figure 13 referred to as the "original design" was first drawn up in 1940 essentially as shown. This was done for estimating purposes only, and at that time it was agreed by various authorities consulted that gravel would have to be hauled fifteen miles or more. Exploration work for borrow material had hardly begun, but it was known that plenty of impervious glacial till was available for the construction of a dam of this size.

The desirability, if not the absolute necessity, of a fair percentage of pervious material for the construction of a dam of this size is universally known. It is necessary at times, however, to make the best use of the material at hand. If gravel had not been discovered, it would probably have been necessary to greatly increase the quantities in the dam, and close control during construction would have been essential.

The author has left the impression that the original section was submitted because at that time it was considered to be a satisfactory design. Nothing is further from the truth and the present design owes its superior qualities largely to the discovery of pervious material close at hand.

In conclusion it must be agreed that Mr. MacKenzie's paper is very comprehensive and enlightening to the general reader. It gives a clear picture of the project, and criticism is confined to technical details which will be of interest only to hydraulic engineers.

Irrigation in Western Canada

Its Possible Effect on Industry & Population

by

A. E. Palmer, M.Sc.

Superintendent, Dominion Experimental Station, Lethbridge, Alta.

A paper presented at the Annual General and Professional Meeting, The Engineering Institute of Canada, Banff, Alberta, June 2, 1948

This paper deals with the potential development of food processing industries arising from further irrigation development in the prairie provinces. Briefly describing existing plants and their annual value of production, the author discusses the possibilities for beet sugar production and its chances of competing with cane sugar, as well as the market prospects for canneries, creameries and other processing industries. Possible growth in rural and urban population resulting from irrigation development is assessed.

The possibilities for industrial development and land settlement that may accompany irrigation expansion in Western Canada are impressive. They may be predicted with some degree of certainty from the experiences of existing irrigation projects in Alberta and similar ones elsewhere, and by examining the potentiality for production that should exist on the projects as they are developed.

Industrial Development

The usual industrial development that accompanies dense settlement may be expected, as irrigation projects are constructed and become populated. The possibility of electric power production as an integral part of some of the projects will also stimulate certain industries. However, the type of industries that are almost certain to be of major importance are those devoted to the processing of bulky crops that cannot be shipped for long distances in their unprocessed state. This is the type of industrial development that will be considered in this discussion.

It should be understood that the establishment of food processing industries is a natural accompaniment of irrigation development under conditions as they exist on the Canadian prairies. One reason for this is that there are large acreages in block, with uniform soil and climatic conditions, where a sufficient supply of raw products can be secured without long freight hauls. A second reason is that a uniform supply of the raw material, both as to quantity and quality, may be expected each year because of small fluctuations in yields. This is because the drought factor has been eliminated in an arid area where there is but a minimum of other climatic hazards. Under irrigation a dry climate with long growing seasons becomes a valuable asset to those who make large investments in processing plants. This explains why the beet sugar and canning industries are growing in Southern Alberta.

Present Development of Industries

Now let us see what has taken place in this regard in the irrigated areas now operating. So far, most of the processing plants have been located in only three of the existing projects in Alberta, i.e. the A.R. & I., now the St. Mary Development, the Lethbridge Northern, and the Taber projects. These have a total irrigated area of 250,000 acres.

In these projects there are two sugar factories, with a third now under construction, and three canning factories, one of which has a freezing plant, and is one of the largest canning plants in Canada. The total value of these plants when the new sugar factory is completed at Taber will be about $9 millions, or an investment of about $36.00 per acre for each irrigated acre of the projects served. The revenue from sugar and canned goods in 1947 was about $9 millions.

Future Development of Industries

While the Lethbridge-Taber area has had important food processing development, this cannot be considered as complete. Neither is it safe to say that other areas yet to be brought under irrigation may have a similar growth of industries. Perhaps of the 1,000,000 additional acres projected for irrigation in Alberta, 750,000 acres would be potential sugar-beet and canning crop territory. 250,000 more acres of land now irrigated is satisfactory for these crops. With no more intensive development than now exists in the Lethbridge area the projected development in Alberta could well support 12 additional sugar factories and 12 canneries.

Obviously such expansion may not be feasible under existing market conditions. Twelve additional sugar factories could supply Canada with 65 to 70 per cent of her entire present sugar needs. The market for canned goods is problematical and may be greatly influenced by the extent of development that takes place in Canada's Northland. The growth of these industries thus depends on markets as well as on irrigation expansion.

The Position of Beet Sugar

While future market possibilities cannot be predicted, it should not be overlooked that the irrigable lands of our prairies are one of the world's natural sugar bowls, as well as a potential source of other processing crops. The average production in Alberta is now almost two tons of refined sugar per acre per year. That is about equal to the acre production from cane in some tropical areas, and it takes no more man hours of labour to produce a pound of beet sugar than it takes for a pound of cane sugar. This is partly due to the high sugar content of our beets, almost 18 per cent, which is higher than from most beet producing areas, and compares with 11 per cent of sugar in the cane plant. Considering all factors that go into the cost of producing sugar, the irrigated areas of the "dust bowl" of Western Canada should be able to compete with almost any other sugar producing locality where wage scales are similar.

Two factors will greatly affect the competitive position of this locality in sugar production. These are, the influence of the present social changes on wage rates in tropical sugar producing countries, and the mechanization of beet and cane agriculture. The agitation for better standards of living by the peons, if successful, may materially improve the position of beet sugar. Mechanization of sugar beet agriculture is progressing rapidly and is likely to be fairly complete in a decade. Mechanization of cane farming, especially harvesting, is not developing nearly as rapidly, but if both become fully mechanized the factor of wage differentials will be less important.

The position of the sugar beet is definitely improving in the world sugar picture, and this may have a marked influence on the proportion of Canada's sugar that the irrigated lands will produce. The total amount of sugar that the world will demand also is problematical, but a greater consumption is indicated because of increased industrial use.

Obviously the reason for considering the sugar situation in connection with irrigation is that sugar refining at present promises to be the most important food processing enterprise in our irrigation development. If a market is available it is likely to be as important as it has been in the localities now served by sugar factories in Alberta, and may duplicate the development of the northern irrigated prairie area of Colorado, which has soil and climatic conditions similar to ours. North of Denver, Colorado, twelve sugar factories are operating in an area having about 800,000 acres of irrigated land.

Vegetable Canning

Canning crops of importance today in Southern Alberta are peas, corn, beans, pumpkin, carrots, and table beets. Some pork and beans have been canned, and dry beans for such a product can be grown without difficulty. This year a start may be made with asparagus. Cabbage for kraut could well be added to the list. So far a tomato variety has not been found that is suitable for canning, and that is adapted to the climate of the area. However a breeding programme is under way at the Lethbridge Experimental Station that may produce such a tomato.

Other Processing Crops

Other food processing besides sugar and canning is not so far of great importance on present irrigated prairie lands. There is some production of creamery products, which could be developed to sizeable proportions by the use of irrigated pastures. Dairying may well become of major importance in the Youngstown to Coronation area if the Red Deer project is installed. Climate, soil, and topography there indicate that permanent pastures may be one of the logical uses for much of that area. It is almost impossible to predict other food processing that will develop. Much will depend on the use made of agricultural crops in the manufacture of plastics, fuel alcohol, and various synthetics. The irrigated lands are potential sources of large, concentrated production of carbohydrates from other crops besides sugar beets. The future of this is still to be explored.

Population Possibilities

The possibilities of food processing industries has been considered before discussing the population potential of irrigation projects. This was done because the number of people the land will carry will be much greater if specialized crops are produced for processing plants, than if grain or meat products are the principal sources of income. The present development in Alberta indicates this difference. In the sugar beet and canning crop areas, there is a farm family now for about each 80 acres of irrigated land. In the other districts this farm population is about one half as dense.

Should farming develop only as intensively as it is now in the Lethbridge-Taber area it is safe to estimate a farm family of five for each 80 acres, including farm labourer's families. This would give a population potential of 46,875 farm residents for the 750,000 acres of the projected development in Alberta considered to be climatically suited for intensive production of processing crops.

The number of urban people supported by the business created from the irrigated lands has been estimated at from one to two for each person on farms. If we take the mean of this figure, or $1\frac{1}{2}$, we get a possible urban population of some 70,000 and a total on farms and in towns of about 127,000 for the 750,000 acres of favourably situated lands. This is slightly over one person for each 6 irrigated acres.

The population possibilities of the additional 250,000 acres of projected irrigation development in Alberta would be less per acre. Perhaps it would not be more than one half, or about 12 acres per person on and off the farm, or a total for the area of just over 20,000. Thus the grand total for the million acres of expected additional irrigation in Alberta indicates a possible total of 147,000 increase in the population. The possibilities of the Saskatchewan area where large scale irrigation is being considered are not well enough known by the author to warrant discussion here.

Discussion

C. S. Clendening, M.E.I.C.[1]

The speaker, Mr. Palmer, has covered food processing of specialized crops on irrigation lands very fully as practised to date. He has mentioned that other products could be grown if markets are found. This is important, since there are great opportunities for research work in other crops that may be grown on irrigated land and manufactured into not only food stuffs, but other manufactured materials as well. Irrigation is a great asset to the country as a whole, and if this country of ours is to have the population it should have, these natural resources will have to be developed. A little study will show that our water resources protected and used properly will give as great a return as any other resource.

S. H. Hawkins, M.E.I.C.[2]

The subject of Mr. Palmer's paper is very timely. The question of the effect of fairly large scale irrigation development on population and industry is of very general interest to all of us. Present world trends appear to indicate that increasing populations and general demand for higher living standards will bring most of the remaining wide open spaces in the temperate zones under the plough in the not distant future.

Many of the still unproductive areas are arid or semi-arid, and of the latter class we possess a large share in Western Canada. It seems reasonable to suppose that much of this land where water is available and where soil, climate and topography are favourable will, as demand for production increases, be finally put under irrigation.

World population, despite the bigger and better wars of the twentieth century and despite birth control, the motor car and the airplane, is increasing at a terrifyingly accelerated pace. The subcontinent of India alone contributes an annual increase of something more than 5,000,000 people. One hundred and fifty years ago Malthus predicted that chronic hunger would be the lot of the vast majority of mankind, and for long his arguments appeared sound. Then the industrial era was born and the age of plenty arrived, and until quite recently Malthus has been generally discredited.

However, during the past twenty-five years many people have come to realize that the Malthusian theories may not be far off the beam. There have in that time been several terrible famines in China, India, and on the Volga and in the Ukraine, and of course the chronic food shortage of the past four or five years in Britain and in large areas of Europe. Rice has been terribly short in Asia and wheat, in spite of several enormous crops in Canada and the U.S.A., has had to be dealt out with care.

One of the obvious ways to increase world food supplies is by irrigation of areas in which soil and climate are favourable for agriculture, but where rainfall is inadequate for the production of cereals and root crops, or even of grass with any certainty. Man has, along the Nile, in Arabia and north Africa, in India and central Asia, and elsewhere since the very earliest times, diverted or pumped water from rivers or wells into the land to augment his food supply. Many historic cities and peoples depended almost entirely on these irrigated lands for their existence. Samarkand, Bokara and Babylon, and the Nile Valley cities are examples.

More recently, in the New World, and especially in the United States, men have turned their eyes to the streams which pour out of the Western mountains, and have, since 1900 brought many millions of acres under the ditch. The Bureau of Reclamation has, since 1902, expended about one billion dollars on irrigation, and now proposes to expend in the next ten years about two billion. This indicates the trend of thinking in Washington with one eye no doubt on the increasing population of the U.S.

Here in Canada we have no great and rapidly growing population to demand food in excess of our capacity to produce, but we have large semi-arid areas of fertile soil fairly adjacent to mountain sources of water supply. And, as Malthus pointed out, we have these swarming millions of Asia, and to a lesser degree of Europe, living on the thin edge of starvation, clamouring for food. Can one doubt that under the growing pressure of this demand, we will in some way be compelled to develop these great potential sources of supply. Mr. Palmer states that the several projects now under consideration in Alberta could add some million acres of irrigated land to the total for this Province.

Let us examine the arguments in Mr. Palmer's paper in reverse. What happens to an irrigated territory, when for some reason, generally war and anarchy, the canals and reservoirs fall into disuse or are destroyed? We have several historic examples. Samarkand, under the great Khans and until the death of Tamerlane, was the centre of a vast system of canals and ditches, fed by the Amu Darya River the Oxus of Alexander. Turkestan was one of the centres of world wealth and culture. After Tamerlane the empire disintegrated, the canals went unrepaired and the desert took over. One can read the same story in the histories of the Sumerians, the Babylonians, and the Assyrians, who successively occupied the Mesopotamian plain. These empires rose or fell with the waxing or waning of their great irrigation systems. What would happen to Egypt and the Nile Valley, should the Nilotic flood fail to arrive? The southern foothills of the Atlas were once well watered by mountain fed streams and supported a teeming population, as French and Algerian scientists have proved. The lower slopes were forested and animal life was abundant. But the streams dried up, desiccation followed, and the forest, and the animals and the men and their cities were swallowed by the desert.

Mr. Palmer is too modest. He points out only the direct gains in population and industry, which may be expected to follow successful irrigation under favourable soil and climatic conditions. There is also a great indirect gain in rail and road traffic, in demand for manufactured consumer goods, and cars and trucks and machines and building material. Every successful irrigation project is like an oasis in the desert, a focal point around which stability and prosperity will be created.

Denver, Salt Lake City, our own young Lethbridge, and scores of other western cities are irrigation babies. East and south of Hanna, on our projected Red Deer Project, lie two million acres of mostly fair quality land, from which

Hydro Power Development on the Eastern Slopes of the Canadian Rockies

A paper presented at the Annual General and Professional Meeting, The Engineering Institute of Canada, Banff, Alberta, June 2, 1948

by
T. D. Stanley, M.E.I.C.
Production Superintendent, Calgary Power Ltd.

Tracing the history of early hydro power development in Alberta, the author outlines early projects built by Calgary Power, as well as the more recent additions for storage and generation. The importance of storage on rivers arising on the Eastern Slopes of the Rockies is shown, as well as how Alberta rivers are naturally divided between storage and production sections. Various local problems in design and operation are discussed. Reasons are given why storage for power is advantageous to irrigation. In conclusion Alberta's hydro power resources are described and suggestions given as to how they may be fully utilized.

When the first white explorers travelled across the plains towards the snow capped Rocky Mountains, the peaks appeared only as a barrier to their progress westward towards the "North-West Passage". However, these mountains have turned out to be the source and reservoir for the rivers which water the great plains of the Prairie Provinces. As the main use of the waterways at that time was for transportation, the Bow River at Calgary was considered a "navigable stream". But it was soon discovered that this river had far too steep a gradient to be used for the transportation of anything but saw logs.

A sawmill was built in Calgary in 1886, and in connection with the mill pond a fall of 12 feet was developed. The electrical industry was in its infancy when the Calgary Water Power Company used this 12 feet of head to develop 280 hp. in the first hydro plant on the Bow. The plant, built in 1893, was authorized by the Dominion in Water Power License No. 6. This plant produced power until 1928, when obsolescence and small output dictated that it be shut down.

Early Calgary Power Co. Plants

As the country developed, so did the demand for building materials, and the Canada Cement Company built a cement plant at Exshaw. In 1909 the Calgary Power and Transmission Company, later to be known as the Calgary Power Company, and more recently as Calgary Power Ltd., was formed to develop the head on the Bow River at Horseshoe Falls near Seebe, nine miles from the Cement Plant at Exshaw. This cement plant was the first concentration of load in Alberta, and it was natural that nearby hydro power be used to oper.-ate it.

The Horseshoe plant of the Calgary Power Company was completed in 1911 with an installed capacity of 20,000 hp. It is still in operation, and is situated at Seebe, Alberta, about 60 miles west of Calgary. This plant was built on very meagre water records, and after the first winter of operation it became evident that the winter flow would have to be supplemented if firm winter power in any quantity was to be produced. In order to correct this deficiency the first storage development on the Bow River was constructed at Lake Minnewanka in the winter of 1912. This development raised the level of the Lake some 16 feet, with 12 feet of active storage, affording some 44,000 acre feet of storage.

In 1913 the Kananaskis Plant was built 2½ miles above the Horseshoe plant at Kananaskis Falls, just below the confluence of the Bow and Kananaskis Rivers. It has an installed capacity of 12,000 hp., and is operating today. These two plants develop a total head of 149 feet.

In 1911 and 1912 the Dominion Government realized the need to study the power resources of the Bow River basin. Mr. M. C. Hendry was given this assignment, the results of which are summarized in Water Resources Paper No. 2. This paper gives a very complete description of the power possibilities of the Bow and is a credit to the engineer who prepared it. Subsequent information and events have proven him right in most cases, although some variations have been necessary because of the developments in the art of power generation. It is interesting to talk to one of our prominent Western members, Mr. P. M. Sauder, when he tells of survey work done on the Bow River below its confluence with the Kananaskis in 1905.

More Recent Installations and Storage

The Kananaskis and Horseshoe plants, combined with the City of Calgary steam plant, and the steam and hydro plants of the Calgary Water Power Company, carried the load in the Calgary area until 1929. However, in 1921 the Calgary Power Company, wishing to start a programme of expansion to feed the many towns and hamlets in the Province, as well as to extend to the cities of Edmonton, Lethbridge and Drumheller, made application for the development of the Spray project (first investigated by M. C. Hendry in 1911 and 1912).

After years of negotiation this expansion programme was started in 1926, but included the Ghost plant instead of the Spray. The Spray was not developed due to its being in the National Parks, in spite of the fact that development of storage in the head waters was so essential. The Ghost plant, completed in 1929, was built just below the confluence of the Ghost River with the Bow. This plant has an installed capacity of 37,450 hp. with an ultimate capacity of 55,450 hp. A head of 110 feet was developed by a combined concrete and earth fill dam. 75,000 acre feet of storage is available.

In 1932 the initial development of storage at the Upper Kananaskis lakes was completed, giving a capacity of 40,000 acre feet. The depression which followed, and the slow recovery, meant that these plants were adequate until the beginning of the war, at which time industrial expansion for war purposes in the Calgary area required additional generating capacity. To meet this necessity the Cascade plant near Banff was constructed, and the Lake Minnewanka storage enlarged to 180,000 acre feet. This plant was completed in August, 1942, with an installed capacity of 23,000 hp. under a head of 340 feet.

The development has two interesting features, Firstly, the control dam between Lake Minnewanka and the canal to the power house where, although the top half of the reservoir comes off by gravity, the balance is pumped by means of three axial flow pumps, having a combined output of over 700 c.f.s., using 2200 hp., and raising the water an average of 14 feet. Secondly, in order to increase the inflow to storage a diversion scheme is in operation, whereby water is diverted from the head water of the Ghost River back into the mountains, to pass through three plants before it reaches the mouth of the Ghost River. The value of this water is also enhanced, because it is held in Lake Minnewanka for winter use.

The fall of 1942 saw the storage further developed on Upper Kananaskis Lake to its final capacity of 100,000 acre feet. It was considered this plant capacity would be adequate for some years to come, as it was expected the load would drop off following the war. However, in common with all other electric utilities, the load continued to increase, and the Calgary Power Company completed the Barrier plant on the Kananaskis some seven miles above Seebe in 1948. A head of 151 feet was created by means of an earth fill dam. The plant has a rated installed capacity of 13,500 hp. backed up by 15,000 acre feet of storage.

The loads have continued to grow at a phenomenal rate. Whereas the actual electrical load in this Province is small as compared with the load in other provinces of the Dominion, it is found that the rates of increase are greater, the average for the first four months of 1947 being in excess of 18 per cent. It is now evident that additional plant capacity is necessary in the Province. Even with the installation of 30,000 kw. in the Edmonton steam plant which is presently being carried on, additional hydro power or other development must be proceeded with at once.

So much for the history of the development of hydro power on the Bow River, which includes all the presently developed water power on the eastern slopes in Alberta. Mr. Russell, in his excellent paper, has mentioned that there are many power sites available in Alberta. It is not necessary to enumerate them here, but there are several factors which will influence the development of these sites, and which make the Bow the principal power stream of the Province now and in the immediate future.

Storage Important on "Eastern Slope" Rivers

The most significant phenomenon which affects the production of power on the eastern slopes of the Canadian Rockies is the seasonal variation in the flow of the rivers. During the winter, when all precipitation is in the form of snow, the only available water supply is from glacial melt due to pressure, ground water storage and the natural storage of relatively few lakes. Conversely, the late spring and early summer flows are very high when the winter snows are melted by excess rain during this period. On the average, 70 per cent of the total flow occurs during the three and one-half months from May 15 to Sept. 1.

The minimum flow at Calgary has been recorded as low as 360 c.f.s., whereas the estimated peak is 99,000 c.f.s., making a ratio between minimum and maximum of 1 to 275. It is thus necessary, both for power and irrigation, to store some of this excess run-off to be used in the late fall and winter. This condition is in contrast to many of the eastern streams in Canada, which are fed from the many lakes and muskegs of the Precambrian Shield, where the run-off is much more gradual due to the natural storage facilities in these lakes.

It becomes very essential early in the development of any stream for power purposes that storage be developed on its upper reaches, in order to supply additional water during the winter season. As the low water season extends for a period of from 200 to 220 days, the storage capacity required is appreciable in comparison to the flows in the river during the winter. The slopes of these mountain streams being very steep, it is essential in order to create large volumes of storage, that lakes exist in the headwaters. The levels of these lakes may be raised to afford the necessary storage; provided, of course, that there is sufficient drainage area above them to supply the required water during the high water period. The Bow River has these necessary lakes, both on the main stream and on its tributaries. However, the lakes on its tributaries are much more important than the Bow Lakes, which are on the main stream.

The winter flow of the Bow at Seebe, without storage, averages some 500 second feet, and by means of storage developments, this may be increased to between 2300 to 2500 second feet.

The best storage sites in the Bow basin are on the three main tributaries, namely, the Cascade, Spray and Kananaskis. The storage on the Cascade has already been developed in Lake Minnewanka, where 180,000 acre feet are available. The Upper Kananaskis lake has been developed with 100,000 acre feet of storage. For the future the Lower Kananaskis lake will afford an additional 100,000 acre feet, and the Spray Lakes area can produce 180,000 acre feet. It is thus apparent that approximately one-half of the available storage on the Bow has now been developed, and the average winter flow has been increased to between 1500 and 1700 second feet at Seebe.

Two other noteworthy streams in the Province are the Athabaska and the North Saskatchewan. The Athabaska has some similarity to the Bow, in that storage may be developed at Maligne Lake, Bruel Lake and Jasper Lake. For this reason, and others which will be pointed out later, it is a stream of some power potentialities. The North Saskatchewan has only small lakes in its upper reaches, and these would provide very little storage. Any storage which may be developed on this river would have to be done on its lower reaches, by means of extra large dams on the main river. However, as pointed out in Mr. Russell's paper, the North Saskatchewan can supply much needed water for both irrigation and power by diversion into the Red Deer.

Storage and Production Sections

The drainage basin of the Bow River in the mountains and foothill area may be divided into two sections. The first, the storage area mentioned above, which is upsteam from the Kananaskis plant; and second, the power producing area which extends from the Kananaskis forebay to below Calgary above the irrigation dam at Carseland. Between the Carseland dam and the point at which the Bow joins the Oldman to form the South Saskatchewan, the river has entered the plains area and its power possibilities have greatly reduced, but its irrigation potentialities have increased.

It is obvious that storage alone will not produce power, and head must be created to achieve power production. In the storage area all the above mentioned sites can produce power in connection with the storage developments. The Cascade has 340 feet developed, the Spray has 1285 feet capable of development, while the Kananaskis has 151 feet developed with at least an additional 600 feet for the future. In the power section of the river there is an over-all drop of some 1155 feet, of which 259 feet have now been developed, but power sites exist to develop 960 feet of this total. This shows the very high percentage of possible development, and when used in conjunction with the storage area, affords ample power potentialities to supply the adjacent industrial area for some years to come.

Bow the Principal Source of Power

There are several sites on the Athabaska River which also fall into this category. At the present time, however, they are too remote from existing load centres to afford economical development in comparison with the development of power on the Bow River.

Another reason why the Bow River is, at the present time, the principal power stream of the Province is that the demand for power first occurred in the settled areas adjacent to the Bow River, and as the first power plants were built along the Bow, and the storage developed as early as 1912, the Bow, so to speak, got a head start on the other streams in the Province.

Once development has started on a stream it becomes more and more necessary from a cost standpoint to continue its development, because the increment of costs of development becomes relatively less. This is an obvious fact to those interested in power development, but to illustrate: if the water in a reservoir can be used through say 200 feet of head, and another plant is constructed with an additional 200 feet of head, the value of the stored water in the reservoir has doubled. The Bow River, at the present time, has an average winter flow of around 1500 c.f.s., which means that about 1000 c.f.s. is available from storage, and with this start it is very hard for power sites on other rivers to compete on a cost basis.

Good Sites Only on Bow and Athabaska

As the waters on the eastern slopes which feed the prairies rise in the mountains, it is logical to suspect that in the general processes of geological change gravel and debris should be carried from the mountains to the plains area. We find this to be the case, as in practically all streams from the mountains huge gravel deposits can be found in the river beds. In fact, some of the streams are flowing on such tremendous deposits that very little of the stream is flowing on the surface. One of the notable streams in this regard is the Ghost River. It is an axiom that in order to build a dam one must have good foundation conditions in places where the river bed is narrow. Many of the streams on the eastern slopes have very deep valleys, which are reasonably narrow, but these valleys have been filled up with debris and gravels so porous that it is impossible to build structures on them.

The Bow River, in the power section referred to, is the exception to this general rule. Due to some unknown conditions the Bow has cut itself a narrow and deep bed in the bottom of a wide valley. In so doing, it has carried all the gravels and debris out on to the plains and exposed the bedrock in many places along its course, making available reasonably good foundations for dams at shallow depths.

The heavy glaciation which has taken place in the Bow River basin has left great deposits of glacial till, a material ideal for the construction of earth fill dams. This type of dam is much cheaper than concrete, provided suitable material is available for its construction. Whereas there is ten times more yardage in an earth fill dam than in concrete, the relative cost of moving dirt by modern dirt moving equipment has been going down through the years, while the cost of concrete is going up. Even if ten times the yardage has to be moved, it is much cheaper to move ten yards of earth at say 50c per yard than it is to place one yard of concrete at say \$15.00 or \$20.00 per yard. As the dams are relatively large in comparison with their power output it is necessary to achieve all the economies possible in these developments. If it were not possible to build earth dams the developments could not be constructed.

Bedrock is available on the Athabaska River, but the North Saskatchewan and the Red Deer, in common with most of the other rivers, when they reach the prairie regions, have poor foundation conditions. As they require high dams the problem of building structures becomes very expensive, if not prohibitive.

Problems in Design and Operation

The centers of hydro power production in Canada, as we all know, are in Ontario, Quebec and eastern Manitoba. It is characteristic of the Precambrian area that coal and natural gas are not present. In the area fed by the drainage from the eastern slopes of the Rockies, where the rocks are of sedimentary origin, there is an abundant supply of coal and natural gas. Hence the cost of power developed by fuel plants, as compared with what it would be in other sections of Canada, is reasonably lower. As a kilowatt hour, from the consumer's standpoint, is the same no matter how developed, it is the cheapest type of development which must be used. Thus, at all times the competition of fuel plants with hydro must be considered in the studying of possible power sites in this area.

In common with most parts of Canada, the difficulties of operating hydro plants on the eastern slopes during freezing temperatures are numerous. The steep river gradients and resulting high water velocities combine with low temperatures to form large quantities of frazil ice which, in the form of slush, is carried downstream and deposited in plant forebays or on other obstructions. If the forebay is large enough it will prevent this ice from reaching the plant. If the water comes from a large lake, operating a canal is not difficult; but the operation of a power and irrigation canal which takes off from a river running with slush is a real problem. If this can be solved the conflict with irrigation could be reduced, in that water could be passed to storage during the winter, also a development like Shepard, (in the Western Irrigation District east of Calgary) combining power and irrigation in a common canal would be practical.

In deciding whether or not a certain site is economical to develop, it is necessary to establish the amount of power required within the immediate and near future. There are sites, particularly in the northern part of the Province, which would be quite economical to develop if say 200,000 hp. were required. The cost per hp. would not be high excepting that if only an additional 50,000 hp. were required within the next few years, the carrying charges on the other 150,000 hp. would very soon "eat up" the economical advantages of developing such a site, as would the cost of transmission to the load centres.

The development in the art of electrical controls has strengthened the case for hydro power in this area. Many of the sites are in the 10,000 to 50,000 hp. capacity range and are most economically developed by a single unit plant. The operating costs for staff in a small plant are relatively high, as an operator can look after a 100,000 hp. plant as easily as he can a 10,000 hp. plant. However, remote control equipment has now developed to the state where a group of hydro plants can be operated from a central control room, and thus offer reasonable economies. An example of this is the 13,500 hp. Barrier plant, which is controlled by the operators at the Horseshoe plant.

Power and Irrigation Developments Mutually Advantageous

Mr. Russell, in his paper, mentioned the possible conflict between storage for power and irrigation requirements. This is such an important problem that it will bear mentioning again. There is no doubt that at first glance one would feel that the storing of water in the summer time, during the high water period, might be detrimental to irrigation. This is not the case. Most of the water stored is water which cannot be used due to lack of capacity in irrigation canals and irrigation storage. Even with all the economical power storage sites developed on the Bow, there is only 35 per cent of its total watershed under control, and the balance can still produce major floods and give sufficient water to carry on the irrigation projects.

It is possible, if one assumes that all water tributary to these reservoirs is stored in the months of April to October inclusive, the irrigation season, that there would be a shortage of water for irrigation in April, September and October. This shortage could also exist without storage. In actual operating practice it is always necessary to have water to carry the electrical load. As the flows in these periods tend to be low, water will be released from storage to carry the electrical load and supply additional water over and above the natural flow for irrigation purposes.

This applies particularly in April, the first two weeks in May before the spring runoff from the mountains starts, and in September and October when the approaching winter has reduced the natural flows but increased the electrical load. The inherent smoothing out of the flow which is achieved by storage allows the irrigation projects to receive water over a longer period of time, and thus reduces the canal capacity required. Therefore it is reasonably safe to say that the storage for power purposes helps, not hinders, irrigation.

In order to raise the water from the river bed so that it may be fed by gravity to the irrigation areas, it is often necessary to build high dams, as is the case of the proposed Ardley Dam in connection with the William Pierce irrigation scheme on the Red Deer River. As described in Mr. Russell's paper, these heads can be used for economical power developments, because for a combined project the cost chargeable to either irrigation or to power is not as great as if they were developed by themselves.

Alberta's Power Resources Abundant

There is at present developed in the Bow Basin some 106,000 hp., with an ultimate development of at least 550,000 hp. possible; however, to achieve this, careful planning in the selection of the plant capacities is necessary. The capacity of the plants at the storage site should be as small as possible and yet allow the passage of all the stored water during the drawdown period. Excess capacity should be installed in the main river plants, particularly those with good pondage, so that in summer the main river plants can carry the full load and make use of the high river flows. The plants at the storage reservoirs would not be operated at all, except for short time peak due to the necessity for storing water. During the winter, when the storage plants would operate at nearly base load, the main river plants would have the capacity to carry the short time peaks.

Investigations of other rivers in the Province have not been carried far enough to give a detailed picture of the possible power available. In their very conservative estimate, the Dominion Water and Power Bureau have estimated that a total of 1,250,000 hp. is available in Alberta. We in Alberta feel that this is very low, and with the combined irrigation and power schemes the total available is very much higher, although no actual revised estimate has been made as yet. It is certain that at the present rate of development there is enough power available to last this Province for some time to come. As far as the industrial development of the Province is concerned there is no reason for a shortage of power in the future, because the development of power by coal and gas in this Province is extensive. This certainly keeps the hydro engineer well aware of his economics.

There is no doubt that the Bow is the most important stream in the Province as regards both irrigation and power, although other streams can offer a goodly quantity of each. The Athabaska is the stream which most closely approximates the Bow as far as power is concerned. The North Saskatchewan can certainly supply large quantities of water by diversion to the Clearwater and the Red Deer for irrigation and some power. In general, the water supply on the eastern slopes is somewhat limited, but as the total head possible of development is very large, particularly on the Bow, the net result is that plenty of power is available, although the plants in themselves may have to be of small capacities. But if they are remotely controlled, the operating costs can be kept reasonable.

Co-operation From Park Authorities

One of the problems which arises in regard to development of power on the eastern slopes is that the best streams—namely the Bow and the Athabaska, rise within the National Parks. If anything like full use of these rivers is to be made in the future of the Prairie Provinces, both for power and irrigation, it will be necessary for the National Parks to take a more liberal view of any application for the diversion and use of these waters. With good co-operation by all the interests concerned, it would appear that there are plenty of economical power sites to be developed. As each site is developed, particularly those on the headwaters which contain storages, other sites lower down the river become economically feasible and, as the load grows, may be developed in progressive steps to keep pace with the electrical demand of the Province.

Discussions (*Continued*)

STEPHENS PAPER

(*Continued from page 475*)

W. L. Foss, M.E.I.C.[3]

The writer is not familiar with conditions in Manitoba and is, therefore, not qualified to discuss many points in this paper. Attention should be drawn, however, to certain figures pertaining to irrigation water requirements which the author quotes from an article by Mr. Ben Russell. The author assumes all water diverted from river beds for irrigation purposes is lost to the streams. If the irrigable areas are in the drainage basin of such streams, this assumption is not valid. There is considerable return flow, though the portion of the return flow due to deep percolation may have a considerable time lag.

The writer recently made a study of various projects in Alberta to find the net amount of irrigation water actually applied to the land. On the Lethbridge Northern Irrigation District, which is a typical example, the average is 1.35 ft. The average rainfall in this area during the growing season is about 7 inches, or 0.58 ft. The total water requirement for a maximum crop is then 1.90 feet, and this is slightly greater than the figure arrived at after extensive experiments at Brooks. On this basis, and introducing a factor of safety, the legal duty of irrigation water is set at 1.5 ft. The irrigation engineer adds from 10 to 30 per cent to this figure, depending upon the length of canals, type of soil and so on, to cover what he calls conveyance losses. These losses, however, are almost entirely seepage or percolation losses, and therefore, are not entirely lost to the drainage basin, but must appear in the streams at some future time.

Another source of return flow is surface waste. It is not possible to operate canals so that exactly the right amount of water is flowing to take care of farmers' requirements. Spillways are therefore provided, and it is difficult to operate a project without spilling back at least 20 per cent of the water diverted during the season.

A third source of return flow is that due to deep percolation through the land which is irrigated. A two ton crop of alfalfa will use about 0.75 feet of water through transpiration. The evaporation loss from the surface of cultivated soil is about 20 per cent of that from a free water surface, or about 0.45 feet, in Southern Alberta during the growing season. It is seen then that evaporation and transpiration losses total about 1.20 feet. Since experience indicates that, for maximum yield, a total of about 1.8 feet of water including rainfall, should be applied to the land, the difference of about 0.60 feet must be lost through runoff and percolation. At least some of this waste must return to the streams.

Another point to be considered in determining water consumption for irrigation is the irrigation factor. Even the best developed irrigation districts in the drier sections of Southern Alberta rarely actually irrigate more than 80 per cent of the irrigable area in any given year. Districts in slightly cooler and wetter areas have factors much less than this.

In conclusion, it is believed safe to say that from 30 to 35 per cent of water provided by irrigation water rights would find its way back to the streams. This would not be true, of course, if the diversion were made to some other drainage basin. However, the author's conclusion that the entire Saskatchewan River Basin should be the subject of an integrated study cannot be disputed. Mistakes can easily be made in planning if the overall picture is not available or is ignored.

[3] Supervising engineer, the St. Mary Milk River Project, Lethbridge, Alberta.

PALMER PAPER

(*Continued from page 499*)

the population, animal and human, have almost vanished, the victims of desiccation. This is the area which Mr. Palmer considers would, under irrigation, create and support a population of from 15,000 to 25,000 people, in a stable productive economy.

The other areas to which he refers offer even more attractive possibilities, being somewhat further south and having generally more favourable topography and soil conditions. These areas, when developed, will create the same sort of economy, which now prevails, in the country surrounding Lethbridge, Taber, and Brooks. Mr. Palmer gives a very reasonable estimate of the population and industrial gains which may be expected to result from the irrigation of our most favourable dry areas in Alberta.

FROM MONTH TO MONTH

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

Due Recognition

The many members of the Institute who met Air Commodore Frank Whittle, inventor of the turbo-jet engine, at the 1947 annual meeting in Toronto will be delighted to know that his great contribution to engineering knowledge and to his country's success in war, has been recognized officially by the granting of a knighthood. He is now Sir Frank Whittle, K.B.E., C.B., F.R.S., etc.

Further, for his inventions and his loyalty he has been awarded £100,000 tax-free. This is the second largest award ever made to a citizen by the British Government for " services rendered ". Sir Frank gave his patents, his incorporated company and his services to the nation without charge. At the conclusion of the war when such services were being appraised by the Government he declined to place any claim before the Government committee. Fortunately, his accomplishments were so clear and so readily recognized that the committee had no difficulty in reaching its decision—a decision that will be well received by the British people.

His Canadian friends join with others in many parts of the world in congratulating him. It is a pleasure to see outstanding merit and sacrifice recognized in so practical a manner.

Exchange of Greetings

The Societé des Ingenieurs Civils de France celebrated its one hundredth anniversary this summer at Paris. The Engineering Institute was represented by J. W. Simard of Montreal and Dean Adrien Pouliot of Quebec. The following message was presented on behalf of the Institute:—

" The Engineering Institute of Canada is happy to join with societies all over the world in celebration of this notable occasion.

" On behalf of the Council and members we offer congratulations on attaining this distinguished anniversary, and on the outstanding work accomplished in those many years. A pioneer and a leader in engineering organization the Societé has made great contributions to the profession, not only in France but throughout the world.

" It is our wish that the record of success may continue and that the future may be even more brilliant than the past ".

In reply the following cablegram was received from the Societé during the annual meeting at Banff:—

" Le président des Ingenieurs Civils de France celebrating the hundredth anniversary of the Societé in Paris begs me to forward to you his personal greetings and to all members in the name of those present here his wishes for a happy and successful meeting. (Signed) J. W. Simard ".

Found

Someone has lost a pocket book and some money. They were found in the reading room at Headquarters. Every effort has been made to trace the owner. Innumerable addresses in the book have been checked without disclosing the owner's identity—(or any other interesting information!) It is proposed to return the money to the person who found it if the rightful owner doesn't turn up soon. Please communicate with Headquarters if you are the owner.

New Degree Courses at Alberta

The office of the Dean of the Faculty of Applied Science, University of Alberta, Edmonton, has informed the Institute that several new courses are being inaugurated this year. They include Petroleum Engineering, Engineering Geology and Irrigation Engineering. Also a special sequence of courses is being offered in the third and fourth years of Mining Engineering to suit the needs of students primarily interested in Coal Mining as a career. In the following paragraphs details of each course are given.

Petroleum Engineering

The Petroleum Engineering course is being offered under the direction of the Department of Chemical Engineering. A sequence of fundamental courses of particular interest to a Petroleum Engineer is being offered during the third and fourth years. The third year work includes additional courses in Chemistry, Geology and Mechanical Engineering as compared to the regular Chemical Engineering curriculum and during the fourth year an additional course in Geology and two courses in the application of fundamental principles to Petroleum Engineering are included. At the present time about fifteen applications have been received for entrance to the third year of the course.

The course was established following strong representation by the Association of Professional Engineers of Alberta and the petroleum industry in the Province of Alberta. Western Canada Petroleum Association is cooperating with the University administration in the organization of the new course.

Engineering Geology

A course in Engineering Geology is being offered to engineering students whose academic record during the work of their first two years places them in about the top 20 per cent of their class. Such students will be permitted to select a special sequence of courses during their third and fourth years in the fields of Geology, Mining and Civil Engineering in addition to the basic courses common to all engineering degree courses.

Irrigation Engineering

A new degree course in Irrigation Engineering is being offered under the direction of the Department of Civil Engineering. It provides for a special sequence of options during the third and fourth years in which four courses in agricultural sciences and two special courses in the application of engineering principles to irrigation work may be taken in place of courses in Applied Mechanics and Structural Engineering in the regular Civil Engineering curriculum. The course is intended to suit the interests of students primarily concerned with a career in connection with the extensive irrigation projects now being proceeded with in the western provinces.

Mining Engineering

A special sequence of courses during the third and fourth years of Mining Engineering are being provided for students primarily interested in Coal Mining as a career. Options in the Department of Mining Engineering for such students have been available for a number of years but the curriculum has been completely re-organized in consultation with representatives of the coal mining industry in Alberta.

It is apparent that Alberta is trying to so educate its young men that they will be better able to avail themselves of opportunities in the fields of engineering concerned with the development of the resources of the Province. This policy may react to the benefit of Alberta in that it will tend to reduce the percentage of engineering graduates who leave the Province to earn their livelihood. Such a purpose would seem to well justify these changes and additions even though they are at variance with the trends in engineering education elsewhere.

There are clear signs in the United States that educationalists there, now favour fewer and fewer specialized courses. Experience has shown that the divisions of engineering mean less and less to the graduates. The majority do not follow the branch of engineering in which they specialized at university, nor do they find much difficulty in changing from one branch to another after graduation. All this has indicated to many who have studied the subject that a student at university should be given a basic training only,—such a training that upon graduation or later, he will be able to practise in any field without confusion or difficulty.

Alberta is rich in natural resources. Also it has certain problems of irrigation and flood control. The fields of irrigation, petroleum, coal and other minerals offer many good opportunities for engineers. It is natural that the provincial university should recognize this and so arrange its courses that the graduates are properly equipped to enter the local field. It will be helpful also to have suitable summer employment so readily available.

It will be interesting to watch the results. The university has shown courage and initiative, and a flexibility in its thinking that is encouraging. For these things it is to be congratulated.

American Institute of Electrical Engineers Meets in Mexico City

Leo Scharry, secretary of the Junior Section, Montreal Branch, has submitted an account of the summer meeting of the American Institute of Electrical Engineers. Leo represented the Institute and officially tendered the good wishes of our president, Council and members for the success of the meeting. Following are excerpts from his address delivered in Spanish at the General Business Meeting.

'Mr. Chairman, ladies and gentlemen. On the part of the president, the Council and the members of The Engineering Institute of Canada, I have the great pleasure of bringing to this assembly the best wishes for a most successful meeting.

'Last year at about the same time, the A.I.E.E. held its annual summer meeting in Montreal, Canada. The majority of the members who were your hosts are members of The Engineering Institute of Canada.

'The Engineering Institute of Canada was founded in 1887. It is a national body comprising engineers of every specialty from the Atlantic to the Pacific whose aim is to facilitate the acquirement and interchange of professional knowledge among its members, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public.

'It is not my intention to go into details relative to our organization of over 10,000 members, but it is my intention to tell you that as engineers we are very proud to associate with other engineers of other countries, whose interests parallel ours in striving to better our way of life.

'At the moment in Canada, there are thousands of engineers who are present at this Convention in spirit. They are looking forward to the results of the meeting. The hospitality of our Mexican hosts has done much to strengthen the ties between the engineers of our three countries.

Officers of Chemical Institute

The Institute received with interest the recent announcement of the election of officers of the Chemical Institute of Canada for the year 1948-49. The new president is Mr. T. W. Smith of Canadian Industries Limited, Montreal. Dr. E. W. R. Steacie, of National Research Council, Ottawa, is vice-president. Chairman of the board of directors is Mr. Eric B. Lusby of Imperial Oil Limited, Sarnia. Mr. J. Charles Honey of Canadian Johns-Manville Company Limited, Toronto, has been elected treasurer.

Surveyor's Level for Sale

The *Journal* is advised that a Gurley surveyor's Level, without tripod, is offered for sale by Mrs. N. Brockhurst, Apt. 5, 4530 Girouard Ave., Montreal. Interested readers should phone or write to Mrs. Brockhurst for further particulars. The telephone Number is EL. 7411.

Henry Girdlestone Acres Medal

Perpetuating the memory of the late Dr. Henry Girdlestone Acres, Mrs. Acres has established in the University of Toronto a medal in perpetuity, the first one of which was awarded in June of this year to George S. Collins, S.E.I.C., who graduated with high honours in electrical engineering.

Mr. Collins, who also won the Medal of the British Association for the Advancement of Science in his graduating year, was in his first year awarded the Baptie Scholarship, and the John M. Empey Scholarship; in his second year the Second Association of Professional Engineers of Ontario Scholarship; and in his third year the Jenkins Scholarship. While at the University he was active in athletics and music.

Employed during the summers by the Hydro-Electric Power Commission of Ontario, and by Canadian Currents, Limited, he has resumed work with the latter company on graduation.

It is gratifying to know that the extraordinary contribution made by Dr. Acres to the practice of engineering in Canada is being so fittingly marked by the medal established in his honour.

The medal is to be awarded annually to the student who stands highest in the work of the third and fourth years combined in either civil engineering, mechanical engineering or electrical engineering.

The designs were prepared, and the dies were made under the supervision of Mr. Emanuel Hahn, R.C.A.

Meetings of Other Societies

The 19th Annual Meeting of the **Canadian Chamber of Commerce** will be held at the Hotel Vancouver, Vancouver, B.C., October 26 to 28, 1948.

The programme will cover subjects of vital importance to business and to the welfare of all Canadians, such as, maintaining and improving our Canadian way of life, national transportation problems, foreign trade and the dollar shortage, and human relations in business. The business policy which will be adopted will provide a platform for business for the coming year.

Registration and reservation cards may be obtained from D. L. Morrell, executive secretary of Canadian Chamber of Commerce, Board of Trade Building, Montreal.

The 26th Annual Convention of the **American Institute of Steel Construction**, will be held in Quebec, October 4 to 7, 1948.

L. Abbett Post, executive vice-president of the American Institute, advises that hotel reservations should be arranged directly with G. J. Jessop, manager of the Chateau Frontenac, Quebec, Que.

R. S. Eadie, vice-president of The Engineering Institute of Canada will speak on Canadian Trends in Structural Steel Design at a session on October 6.

Personals

Notes of the Personal Activities of Members of the Institute

R. V. Macauley, M.E.I.C., who is executive vice-president of the Bell Telephone Company of Canada, was recently appointed a director of the Company and a member of the executive committee. Mr. Macauley has been connected with the Bell company since 1913.

Colonel J. P. Carriere, M.E.I.C., is now chief engineer of the Dufresne Engineering Company in Montreal. He had been city manager and chief engineer for the City of Hull, Que., since 1946. Colonel Carriere was retired from the Canadian Army to the reserve list in 1945, and returned to the Federal Department of Public Works for whom he had served at London, Ont., and at Montreal, before joining the R.C.E., and going overseas in the recent war. He was deputy chief engineer of the 1st Canadian Army in Europe, before his return to Canada.

H. R. Welch, M.E.I.C., president and general manager of Welch and Johnston Ltd., Ottawa, is a member of the newly formed Ottawa Transportation Commission which now operates the transportation system of the city. The system formerly owned by the Ottawa Electric Railway Company became municipally owned in August.

P. E. Radley, M.E.I.C., of The Aluminum Company of Canada, Ltd., has been appointed assistant general manager in charge of engineering, purchasing and traffic. Mr. Radley entered McGill University after serving as a gunner in the artillery in the first world war and in 1923 graduated with a B.Sc. in chemical engineering. Mr. Radley joined the Aluminum organization in 1923 at Shawinigan Falls as a member of the technical department. From 1930 to 1939 he was in Arvida, after which he was assigned to duties in England. On his return to Canada he was made works manager at Shawinigan Falls, and later works manager at Arvida. In 1944 he was named manager of the Smelter Division, and since then has held various important posts, leading up to his recent appointment.

W. L. Pugh, M.E.I.C., has been appointed chief engineer of the Aluminum Company of Canada, Ltd. Mr. Pugh graduated in civil engineering from Lehigh University, Pennsylvania, with a degree in civil engineering. Prior to joining the Aluminum Company in 1937 he worked with the Lehigh Railroad, the Canadian National Railway and Canadian Industries Limited. In 1941, he was appointed chief draughtsman of the Company, and in 1945 assistant chief engineer.

R. A. Lemieux, M.E.I.C., engineer and manager of the City of Arvida, was recently elected president of the Quebec section of the International City Managers Association. Mr. Lemieux graduated from Ecole Polytechnique, Montreal, in 1937, and for several years was with the Department of Roads of Quebec. In 1941 he was appointed city engineer and secretary treasurer of the municipality of Sillery, Que., and it was in 1943 that he went to his present position at Arvida.

W. L. Inglis, M.E.I.C., is now representative for British Columbia and Alberta for Dominion Tar and Chemical Company's fibre conduit division. His headquarters are in Vancouver. A civil engineering graduate of University of British Columbia, he was a wing commander during the war with the construction engineering branch of the R.C.A.F. After the war he was district manager in British Columbia for Housing Enterprises of Canada Limited, until his recent appointment.

J. M. Jopp, M.E.I.C., was appointed in April last as chief engineer of the Brown Corporation, La Tuque, Quebec. He had been design engineer for the Corporation from 1945, when he joined the organization, coming from the Abitibi Power and Paper Co. Limited, Sault Ste. Marie, Ont.

Bruce McColl, M.E.I.C., has been taken on the staff of the Woodlands Section of the Canadian Pulp and Paper Association. He will have charge of mechanization activities. Mr. McColl, a graduate in mechanical engineering of Queen's University, with particular experience in power plant design and development, comes to the Association from Canadair Limited, Montreal, where he was chief of the power plant section of the design office.

W. J. C. Gall, Jr.E.I.C., is engaged at the Swiss Federal Institute of Technology at Zurich. During July of this year he was in Jugoslavia during which time he had an opportunity to visit with the Canadian Minister to that country and to participate in certain social engagements attached with the diplomatic service of the Legation.

D. B. Mutton, S.E.I.C., third year engineering student at the University of Toronto, was awarded the Engineering Institute Prize for 1947-48 session. He further distinguished himself by winning the Wallberg Undergraduate Scholarship and the Chemical Institute of Canada Prize. The possession of the Wallberg Scholarship made him ineligible to hold three other scholarships which he won, and they were awarded by reversion to other students. Mr. Mutton's outstanding work in third year follows notable successes in the preceding years.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Richard John Durley

1868-1948

Richard John Durley, M.E.I.C.

In the death of Richard John Durley, the profession of engineering in Canada lost one of its most distinguished members — a man whose life, in the main was devoted to the welfare of the engineer and the betterment of the profession. By reason of his professional employment he had unusual opportunities to make and maintain contacts with engineers, and because of his keen sense of professional responsibility he neglected none of them. Hence his influence was broad in the land and his deeds constitute an important chapter in the history of the profession.

In 1938 Mr. Durley retired from the position of general secretary of the Institute, but for many years after maintained a close contact with it. His continued services to *The Engineering Journal* were of great value to the publication committee and his frequent appearance at Headquarters was a matter of pleasure and satisfaction to the staff. In these quarters he will indeed be greatly missed.

Mr. Durley was an example of the well developed engineer. He was interested in many things besides those strictly related to his profession. He was a great reader, a student of English literature, an enthusiastic and skilful follower of Isaac Walton, and a yachtsman. He was well informed on matters of the day, and with his keen intellect and his delightful sense of humour was able to discuss such things in a most entertaining manner. His ability to see through and understand people was unique, although he never spoke unkindly of any one.

Mr. Durley came to Canada in 1896 and for the following fifty-two years took a prominent part in engineering affairs, first as assistant professor of mechanical engineering at McGill, then as full professor. During the first world war he was in charge of gauges and standards for the Imperial Munitions Board, and at its conclusion became secretary of the Canadian Engineering Standards Association. In 1925 he was appointed general secretary of The Engineering Institute of Canada, a position he occupied for thirteen years.

He was born in Bierton, Bucks, England, in 1868 and graduated from University College in London in 1887 with the degree of B.Sc. His early training was in shipbuilding but in 1893 he won a Whitworth scholarship and at the end of the following year became chief lecturer at the Municipal Technical School, Hull.

He has served as honorary secretary and member of the Canadian committee of the Institution of Civil Engineers and also as the Canadian member of the council of that body. He was a life member of the American Society of Mechanical Engineers, the Canadian Standards Association and The Engineering Institute of Canada. He was the author of many technical papers and of the text book " Kinematics of Machines " which was adopted by several universities. In 1918 he was awarded the M.B.E. for his work with the Imperial Munitions Board. He is survived by his widow, one daughter, Mary Elizabeth, and one son, Thomas Richard, a member of the Institute.

It is to those who had the pleasure of working close to " R.J." that his loss is most poignant. He was a man who could be appreciated in the full only by close association. His modesty and reserve hid from many people the sterling qualities that endeared him to his friends. He worked industriously and intelligently but never sought public acclaim for his accomplishments. Although he had been in retirement for ten years he will be well remembered by those who had the privilege of knowing him. He was a grand gentleman and the profession has been greatly enriched by his association with it.—L. A. W.

Louis A. Amos, M.E.I.C., well known Montreal architect, and a former mayor of Lachine, Que., died at his Lachine home on August 20, 1948, after a brief illness.

Born in Montreal in 1869, Mr. Amos attended Royal Military College, Kingston, and was graduated with the Governor-General's Medal with honours in engineering.

Mr. Amos studied architecture under the late Arthur Cox. He became Mr. Cox's partner and for 20 years practised under the firm name of Cox and Amos. The company designed numerous churches, hospitals and banks in Montreal, Quebec and the Eastern Townships as well as the first 10-storey building in Montreal, the old Eastern Townships Bank, Victoria Square.

After the death of Mr. Cox, Mr. Amos practised alone for several years, then in 1925 took into partnership his son, P. C. Amos, who had graduated from McGill University.

Mr. Amos joined the Province of Quebec Association of Architects in 1894 and was one of the charter members. For many years he was member of the council and in 1934 became president of the association. He was elected a fellow of the Royal Architectural Institute of Canada and a Fellow of the Royal Institute of British Architects. He attained life membership in the Engineering Institute this year, having joined as a Student in 1893. He became an Associate Member in 1896, a member in 1915.

For 50 years he was architect for National Breweries Ltd., and designed the malting houses and the brewery stock cellars for Dow, Dawes and Ekers breweries in Lachine and Montreal.

As associate architect he designed the nurses home for Notre Dame Hospital, the power house there and the new Court House. He was awarded the gold medal of merit of the P.Q.A.A. He was associate architect for the Laurentien Hotel in Montreal.

E. W. Neelands, M.E.I.C., of Falconbridge, Ont., died in hospital in Toronto, on July 10, 1948.

He was born at Mount Pleasant, Michigan, in 1881. He taught public school for two years before entering University of Toronto, where he was graduated in 1907 with the degree of B.A.Sc. in civil engineering. He qualified as an Ontario land surveyor in 1909. On graduation he became associated with H. W. Sutcliffe, engineer, in New Liskeard, Ont. He specialized in water power and municipal engineering working in many Ontario cities and towns, among them Cochrane, Cobalt and Smooth Rock Falls. His firm handled a great deal of waterpower work in Northern Ontario for the provincial government.

In 1922-24 he was district engineer at Temiskaming, for the Department of Northern Development, and then for two years he was town engineer at Noranda Mines. He then practised engineering at New Liskeard for some years, but went to Newfoundland in 1930 to be chief engineer of roads. He was with the Ontario Department of Highways for two years and then joined the Falconbridge Nickel Mines where he was field engineer until the time of his death. While in the mining industry he was loaned in 1936-37 to be chief engineer of roads again for Newfoundland. Later, in 1947, he made plans for the townsite of Kerr Addison Gold Mines, through the courtesy of his company.

Mr. Neelands joined the Institute in 1912 as an Associate Member, becoming a Member in 1940. He attained life membership in 1946.

Seaforth Duff MacNab, M.E.I.C., who had recently retired after many years on the staff of McGill University, died in Montreal on July 27, 1948, after a long illness.

Mr. MacNab who joined the Institute in 1918, was born at Mahone Bay, N.S., in 1869, and was educated in Halifax. He served a full machine shop apprenticeship and then entered the Testing Laboratory of McGill University as assistant on the care of equipment and testing materials. In 1903 he was made assistant in charge of strength of materials and hydraulic laboratories, his work including maintenance and calibration of apparatus and equipment of laboratories, installation of new equipment, and design of accessories for special purposes. He was in charge of a great variety of commercial and scientific testing work, the design of special methods and appliances for conducting them, and their demonstration to classes. He was later made superintendent of the testing laboratory, and he remained in that position until his retirement.

John S. Misener, M.E.I.C., of Dartmouth, N.S., who died on October 11, 1947, was refinery manager for Acadia-Atlantic Sugar Refineries Limited of that city.

Born in Boston, Mass., in 1873, he started an apprenticeship with MacDonald & Company, Halifax, in 1888. He went to Acadia Sugar Refining Co. Ltd., at Woodside, N.S., in 1891. Promoted to chief engineer in 1893 and to assistant manager in 1916, he was made manager in 1924.

He was a Member of the Engineering Institute from 1919, attaining life membership in 1945. He was granted an honorary life membership in the Association of Professional Engineers of Nova Scotia in 1945. He served on the Wartime Housing Board and the Nova Scotia Fuel Board. He was an ex-commissioner of the board of the Nova Scotia Hospital.

William Frederick Casey, M.E.I.C., who was director, president and general manager of Canadian Locomotive Company Ltd., Kingston, Ont., died in hospital there on July 15, 1948, following a lengthy illness.

Employed by the Canadian Locomotive Company since he was 14 years old, Mr. Casey was influential in the rise of the concern from a small industry to a major Canadian one. During his direction locomotives were manufactured for the Canadian National and Canadian Pacific railways, and were also supplied for Russia, France, Belgium, India and Jamaica.

W. F. Casey, M.E.I.C.

Born at Kingston, Ont., in 1887, he attended St. Mary's School, and Regiopolis College there. In 1901 he entered the employ of the Canadian Locomotive Company as a machinist's apprentice. Promotions came rapidly and, between 1902 and 1911 he was successively draughtsman and foreman of shops. In 1911 he was placed in charge of estimating. After retaining this post for three years, he was appointed assistant to the vice-president. Two years later he became manager. In 1919 he was promoted to vice-president and general manager. In 1932 he became president. Last December he relinquished the managership but retained his presidency. He was also president of the Direct Steaming Company Limited of Canada.

Mr. Casey was a member of the Canadian Manufacturer's Association, and of the Association of Professional Engineers of Ontario, of the Newcomen Society, and the Engineers Club of Toronto. He joined the Engineering Institute in 1922.

His principal recreation was yachting. He was a member of the Kingston Yacht Club, the Royal Canadian Yacht Club in Toronto and the Lake Yacht Racing Association. He was also a member of the Kingston Flying Club.

Richard Lewis Waycott, M.E.I.C., of Halifax, N.S., died on November 17, 1947. He was born at Marysville, N.B., in

1886. However, he was educated in Fredericton, N.B., after which he spent seven years, 1906 to 1913, in the employ of the Grand Trunk Railway engineering department. in the Winnipeg and Sioux Lookout Districts. From 1913 to 1916 he was employed by Canadian National Railway engineering department in Nova Scotia. From 1916 to 1921 he was field engineer for the Nova Scotia Steel Company at New Glasgow, N.S. He was then in the employ of the Nova Scotia Department of Highways for five years, and he spent nine years in the Province of Quebec in the employ of the Canadian Pacific Railways, and the Shawinigan Engineering Company. In 1935 he returned to Nova Scotia and was with the Department of Highways, being located latterly at Halifax as resident engineer on surveys and construction work.

Mr. Waycott became a Member of the Institute in 1940.

G. W. LaMountain, M.E.I.C., who was with Aluminum Company of Canada at Arvida, Que., died in Montreal on April 21, 1948.

Mr. LaMountain, who was born at Champlain, N.Y., in 1888, attended the United States Naval Academy, graduating with a B.Sc. degree in 1912 and doing post graduate work in gas and diesel engines. In 1912 he was assigned duties, and until 1924 was general assistant engineer to the chief engineer on various types of ships in the U.S. Navy. He retired from the Navy in 1926 and accepted a position with Duke Price Power Company. He was appointed superintendent of properties of that company, whose name eventually was changed to Saguenay Power Company Ltd., and he remained there until 1939. Going to the Aluminum Company of Canada Limited, he was manager of personnel until 1942. He then received the appointment of superintendent of properties for Aluminum Company of Canada Ltd., and all its subsidiaries in the Chicoutimi-Lake St. John District of Quebec. His headquarters were at Arvida, Que. He was still in that position at the time of his death.

Mr. LaMountain joined the Institute as a Member in 1944.

Professor Ray H. Patten, M.E.I.C., of McGill University, Montreal, who died at his home on August 1, 1948, was born in Hamilton, Ont., in 1892.

Professor Patten had been on the faculty of McGill since 1920, when he received the degree of B.Sc. in mechanical engineering. He qualified in electrical engineering the next year while lecturing in mechanical engineering. In 1930 he was made assistant professor of mechanical engineering, and he was given the rank of associate professor in 1945.

He was always very active in research and made many contributions to advancement in the field of heat transfer and heating and ventilating of buildings. During the past 25 years, Professor Patten was associated with the National Research Council of Canada, and was particularly active during the recent war. He carried out an intensive research programme on substitute fuels for motor vehicles.

Professor Patten was a member of the Corporation of Professional Engineers of Quebec. He became a Member of the Institute in 1945.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Montreal

The annual visit of the President of the Institute, Dean J. N. Finlayson, to the Montreal Branch will coincide with the opening meeting for the autumn which is planned for the evening of 30th September 1948. The President will be entertained at dinner at the Mount Stephen Club. He has kindly consented to address the members at the opening meeting, which has been arranged to take place in Cardy Hall at the Mount Royal Hotel. The programme is similar to that of last year; a short business session, the president's address, and refreshments. Last year's meeting was well attended by the members and it is hoped that an even greater number will turn out this year. It is one of the occasions of the year when an opportunity is available for members, old and new, to meet old friends and make new ones.

Members are reminded of the exhibit of the work of Robert Maillart on Reinforced Concrete Bridges which will be on view at the Institute Headquarters from October 7th for several days.

The programme of the Junior Section will be printed on the Branch programme this year. All members are invited to attend the meetings. Those who are particularly interested in any feature of the Junior Section's activities are requested to contact the section secretary, Leo Scharry, LAncaster 8193, for further information.

St. Maurice Valley

G. W. Ince, s.E.I.C.
Secretary-Treasurer

J. G. MacLeod, M.E.I.C.
Branch News Editor

Junior Section

E. A. Love, s.E.I.C.
News Editor

On Tuesday evening, June 29th the Junior Section of the St. Maurice Valley Branch held the opening dinner of their summer activities at the Cascade Inn in Shawinigan Falls. Over 70 engineers and summer students attended.

Rex Ford, chairman, introduced the executive for the coming year: J. E. Muggah, vice-chairman, A. H. Baker, secretary-treasurer and E. A. Love, publicity. The chairman then gave an outline of the programme of activities for the coming season. Following the dinner, the speaker, E. R. Williams, works manager of the Shawinigan Chemicals Company, was introduced by T. S. Gambel.

Mr. Williams presented a chronological talk on his recent visit to the Union of South Africa. He also spoke of the various industries in the Union as well as some of the labour problems encountered there. A discussion period at the conclusion of his talk enabled the gathering to ask questions of interest to the individual. The speaker was thanked by J. O. Kelly.

Vancouver

Alan M. Eyre, jr.E.I.C.,
Secretary-Treasurer

Stuart Lefeaux, jr.E.I.C.,
Branch News Editor

On Wednesday, July 28th, the Vancouver Branch was entertained by the B.C. Research Council at the University of British Columbia. The members attended a complimentary dinner at the U.B.C. Faculty Club overlooking Howe Sound. George Allan, M.E.I.C., who arranged the visit for the Branch, took the chair in the absence of P. B. Stroyan. Dr. S. E. Maddigan, director of the Research Council, outlined the work of the Council and some of the present projects. Dean J. N. Finlayson, president of the Institute, and Dr. L. Austin Wright, secretary, honoured the branch by their presence and expressed their appreciation of the work of the Research Council. L. V. Kelly thanked Dr. Maddigan for the most excellent dinner and his able description of the projects. The meeting then adjourned to the B.C. Research Council Laboratories to view the work taking place.

The sixty-five members in attendance were dispersed into four groups: Dr. P. C. Trussell, Dr. R. H. Wright, Mr. Ronald Klinck and Mr. Don Smith acted as leaders of the groups. The experiments were demonstrated and explained by the staff of the Laboratory. The apparatus demonstrated included: a model foundry for the testing of alloys, a gasification oven for experiments with sawdust and wood waste, a Wilfey table for the specific gravity separation of minerals, a flotation machine for minerals, a centrifuge and apparatus for testing food products for micro-organisms, a di-electric apparatus for recording moisture content of materials with an oscilloscope, a viscosity test for the sodium alginate content of British Columbia seaweeds, an X-ray diffraction apparatus for determining the composition of compounds and many others of a complex arrangement.

The members expressed their appreciation of the visit by their intense interest and a multitude of questions; all agreed that the visit was most enlightening and entertaining.

BOOK REVIEW

THEORY OF SERVOMECHANISMS

Edited by H. M. James, N. B. Nichols, and R. S. Phillips. (Massachusetts Institute of Technology. Radiation Laboratory Series Vol. 25) N.Y., Toronto, London, McGraw-Hill, 1947. 375pp., illus., 9¼ x 6 in., cloth, $5.50. (in Canada)

In this presentation of the theory of servomechanisms, the emphasis has been affected by the special interests of the Radiation Laboratory. These were specifically automatic-tracking radar systems. However, the authors intended to provide a volume which would be, at least in part, of use to every designer of servomechanisms.

The book falls into two parts: the first is devoted to the sinusoidal steady-state analysis familiar to engineers in its application to electrical systems; the second to statistical methods of servomechanism design. Each part is provided with an extended mathematical introduction and abundant illustrations.

A servo system is defined here as a combination of elements for the control of a source of power in which the output of the system or some function of the output is fed back for comparison with the input and the difference between these quantities is used in controlling the power. The term "servomechanism" is restricted to servo systems involving mechanical motion.

Servo systems are dealt with as power amplifiers and as means of remote control; and also as transformers of information or data from one type of power to another, and as null instruments in computing machines. After the introduction, a mathematical background is given in detail. In the next chapter are given examples of the physical devices that are common components in electronic servo loops. General design principles for servomechanisms are dealt with next, followed by filters and servo systems with pulsed data and statistical properties of time-variable data. RMS-error criterion in servomechanism design is discussed, and the book ends with applications of the new design method, which includes the servo with proportional control and the tachometer feedback control. An appendix provides a table of integrals. M.B.

ABSTRACTS

INSTITUTION OF ELECTRICAL ENGINEERS

Summaries of Papers read in London, Second Half Session 1947-48.

Display of Three-Dimensional Information on a Cathode-Ray Tube, *E. Parker and P. R. Wallis.*

Considered with particular reference to a radar system in which a narrow pulsed beam of radio-frequency energy is used to explore automatically a volume of space.

Electrical Measurement of Pressure and Strain (with particular reference to the testing of Circuit-Breakers), *R. W. Wild.*

Gives specific design data of two known types of pressure recorders, which were designed for the short-circuit testing of circuit-breakers, and where the phenomena recorded could be readily correlated with all the other physical quantities involved in such tests.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Canada's New Northwest; a Study of the Present and Future Development of Mackenzie District of the Northwest Territories, Yukon Territory, and Northern Parts of Alberta and British Columbia:
North Pacific Planning Project, Ottawa, 1947. 155pp., illus., paper.

Design of Machine Elements:
M. F. Spotts. New York, Prentice-Hall, 1948. 402 pp., illus., cloth.

Dictionary of Terms used in the Paper, Printing and Allied Industries:
Gerard H. Lafontaine. Toronto, Howard Smith Paper Mills, 1948. 110 pp., paper.

Distillation and Rectification:
Emil Kirschbaum. Brooklyn, Chemical Publishing Co., 1948. 426 pp., illus., cloth.

Electric Power and Government Policy; a Survey of the Relations between the Government and the Electric Power Industry:
Twentieth Century Fund, New York, 1948. 860 pp., illus., cloth.

Elementary Steam Power Engineering, 3rd ed:
Edgar MacNaughton. New York, Wiley; London, Chapman and Hall, 1948. 640 pp., illus., cloth.

Elements of Fuel Technology:
Godfrey W. Himus. London, Leonard Hill, 1947. 506 pp., illus., cloth.

FBI Register of British Manufacturers, 20th ed., 1947-48:
Federation of British Industries, London, 1948. 646 pp., illus., cloth.

Fireproof Construction:
Walter C. Voss. New York, Toronto, Van Nostrand; London, Macmillan, 1948. 286 pp., illus., cloth.

Forming of Austenitic Chromium-Nickel Stainless Steels:
V. N. Krivobok and George Sachs. New York, International Nickel Co., 1947. 309 pp., illus., cloth.

Industrial Research, 1947:

Public Administration Service, Chicago, 1948. 137 pp., illus., paper.

PROCEEDINGS, TRANSACTIONS, ANNUALS, ETC.

National Electronics Conference:

Proceedings, Volume III, 1947.

TECHNICAL BULLETINS, ETC.

Institute of Metals. Reprints:

Effect of Crystal Arrangement on "Secondary Recrystallization" in Metals, J. S. Bowles and W. Boas.—Effect of Vibration on a Precipitation-Hardening Aluminium Alloy, R. F. Hanstock.—Lattice Spacings of the Solid Solution of Copper in Aluminium, E. C. Ellwood and J. M. Silcock.—Micro-Hardness Testing of Metals, E. W. Taylor.—Note on the Aluminium-Manganese G. Phase, K. Little, and W. Hume-Rothery.

Institution of Mechanical Engineers. Advance Papers:

Calculations of Compressible Fluid Flow by the Use of a Generalized Entropy Chart, J. Kestin and A. K. Oppenheim.—Comparison of Some Carbon Molybdenum Steels on the Basis of Various Creep Limits, A. E. Johnson and H. J. Tapsell.

International Civil Aviation Organization. Publications:

Aeronautical Chart Division (Map), Fourth Session, Final Report (DOC 5400, MAP/555).—Airworthiness (Air; Effect of Air Temperature upon the Rate of Climb of an Airplane Equipped with a Constant Speed Propeller (Circular 1—AN/1).—ICAO Regional Manual—North Atlantic, Amendment No. 16, July 15, 1948.—Rules of the Air and Air Traffic Control (RAC Division) (DOC 5500-RAC/566).

Ohio State University. Engineering Experiment Station. Bulletins:

No. 132—Investigation of Bridge Impacts with a Mechanical Oscillator, C. T. West.

Svenska Forskningsinstitutet for Cement och Betong Vid Kungl Tekniska Hogskolan I Stockholm. Meddelanden:

N:R 10—Method for Solving Partial Differential Equations with Application to Rectangular Plates, Sven T. A. Odman.

U.S. Bureau of Standards. Building Materials and Structures Reports:

BMS 109—Strength of Houses; Application of Engineering Principles to Structural Design, H. L. Whittemore and A. H. Stang.

U.S. Highway Research Board. Bulletins:

No. 11—Polarized Headlight System, E. H. Land, J. H. Hunt, and V. J. Roper.

STANDARDS, SPECIFICATIONS, ETC.

British Standards Institution. Standards:

No. 904:1948—Dimensions of Instrument Jewels.—1440:1948—Endless V-Belt Drives.—1443:1948—Sizes of X-Ray Film and Intensifying Screens.

...Codes of Practice:

CP(B) 754—Impulse Clock and Timing Systems.—CP(B) 760—Roof Slating.—CP(B) 761—Installation of Electrical Fire Alarms.

Edison Electric Institute. Publications:

No. Q-4—Guide for Specification on Indoor Metalclad Switchgear.

THE CIVIL ENGINEER IN WAR

The Institution of Civil Engineers, London, England, has announced the publication, in a strictly limited edition, of a comprehensive collection of papers on the engineering problems of the second World War.

The three volumes entitled, "The Civil Engineer in War" have been prepared in co-operation with the Admiralty, War Office, Air Ministry and other government departments. They comprise 1400 pages with 1000 diagrams and photographs. Lists of the titles are available, in limited quantity, from Institute Headquarters on request.

Under authority of the Institution of Civil Engineers, these important volumes will be issued in this country by the Engineering Institute of Canada. Orders may be placed now with the Library at Headquarters and should be accompanied by a remittance in the amount of $9.75 payable to the Institute to cover all charges.

PAMPHLETS, ETC.

Condensation in an Experimental Panel Cooling Installation:

A. D. Kent. Ottawa, National Research Council, 1948.

Deterioration of Structures of Timber, Metal, and Concrete Exposed to the Action of Sea-Water:

J. Bryan. London, Institution of Civil Engineers, 1947.

Measurement of Fluid Pressure; Pressure Gauge Equipment, its Application, Installation and Maintenance:

J. R. Fawcett. Manchester, Emmott, 1948. (Mechanical World Monographs No. 42).

Speed Control of Electric Motors:

Emmott, Manchester, 1948. (Mechanical World Monographs, No. 45).

Stormwater Standards Committee Draft Report on the Second Term of Reference:

Institution of Engineers, Australia; Sydney, 1948.

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

ALTERNATING CURRENT MACHINES.

T. C. McFarland. D. Van Nostrand Company, Toronto, New York, London, 1948. 540 pp., diagrs., charts, tables 9¼ x 6 in., cloth, $7.00 (in Canada).

Each chapter of this new textbook represents a broad subdivision of the general topic, thus preserving the logical unity of the several topics while allowing the instructor to do his own choosing of the order of presentation. These separate chapters cover single-phase and special-purpose transformers, polyphase transformations, induction machines, synchronous machines, both mechanical- and electronic-type power converters, single-phase motors, and alternating current motor controls.

APPLIED PHYSICS (Science in World War II).

ELECTRONICS, *edited, C. G. Suits with a foreword by K. T. Compton.*

OPTICS, *H. K. Stephenson and E. L. Jones, edited by G. R Harrison.*

METALLURGY, *L. Jordan.*

Little, Brown and Company (Atlantic Monthly Press Book), Boston, Mass.; McClelland & Stewart, Toronto, 1948. 456 pp., illus., diagrs., tables, 8½ x 5½ in., cloth, $7.00 (in Canada).

Written for both the layman and the scientist, this volume continues the report on the work of the Office of Scientific Research and Development. The first section is concerned with electronics and evaluates the work done on radar countermeasures, other related fields, and the propagation of airwaves. The second section deals with optical instruments of all kinds. It also discusses the work done on sound control and land-mine countermeasures. In the third section are descriptions of the work done on aircraft metals, armor, guns, metals for particular services, and an examination of enemy matériel.

HANDBOOK OF STRUCTURAL DESIGN IN THE ALUMINIUM ALLOYS.

J. E. Temple. James Booth & Company Limited, Argyle Street Works, Nechells, Birmingham 7, England, 1947. 147 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, 21s.

Of interest to engineers who deal with framed structures, this book covers the use of light-weight material in construction. It is divided into two parts. In Part I the most suitable alloys are described with regard to their general properties, characteristics of strength, and general working. Part II covers the more technical aspects of the subject. It is written for engineers already experienced in the design of steel structures. Stress is laid chiefly on those questions in which practice might be expected to differ in the usage of the light alloys and of steel.

(Continued on page 514)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

September 20th, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the October meeting.

L. AUSTIN WRIGHT, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ABBEY—DOUGLAS REEVES, of Chilliwack, B.C. Born at Moose Jaw, Sask., May 21, 1922. Educ.: B.Sc. (Chem. Engrg.), Sask., 1945; 1945 to date, R.C.E., with rank of Lieut., Instructor, School of Military Engineering, (RCSME), Chilliwack, B.C.

References: L. G. C. Lilley, W. W. Perrie, H. F. Wickware, R. A. Spencer. I. M. Fraser, E. K. Phillips.

BURNS—GORDON M., of London, Ont. Born at Toronto, Ont., Dec. 21, 1922. Educ,. B.A.Sc. (Mech.), Toronto. 1948; 1946 (summer), mechanic, Dominion Rubber Co.; 1947, (summer), dftsman., Babcock, Wilcox, Goldie, McCulloch; 1948 to date, asst. engr., Geo. E. Humphries of M. M. Dillon & Co., consultg. engrs., London, Ont.

References: M. M. Dillon, G. E. Humphries, E. A. Allcut, S. W. Archibald, A. M. Snider.

ELLIOTT—GORDON, of Saint John, N.B. Born at Morpeth, North. Eng., June 24, 1895. Educ.: Royal Navy, Harwich, Eng., School of Signals, 1912-14; 1914-19, Canadian Army, Signals; 1920-48, New Brunswick Telephone Co., at present, outside plant engr., co. supervision and direction of 5 asst. engrs. (Asks for Affiliate).

FREDERICK—MICHAEL, of Montreal, Que. Born at Cobalt, Ont., Nov. 21, 1919. Educ.: B.Sc., (Chem. Engrg.), Queen's, 1943; with Ayerst, McKenna & Harrison, St. Laurent, Que., as follows: 1943-44, jr. engr., pilot plant and prod. work initiating prod. of penicillin, 1944-47, jr. engr. & chief dftsman., worked on design of industrial bldgs. re additions to plant. Work included architectural, design of heating systems, elect. lighting, air-conditioning, sprinkler systems, sewer systems, etc.; 1947 to date, design engr., design of salt plant, flow sheets, equit. layout, bin design, pile foundations, Dominion Tar & Chemical Co., Ltd., Montreal, Que.

References: J. G. Welsh, D. S. Ellis, A. Jackson, S. D. Lash, W. S. Bowles.

LACOMBE—JEAN PAUL, of Montreal, Que. Born at Montreal, Que., June 20, 1915. Educ.: B.A.Sc., C.E., Ecole Poly., 1941; R.P.E., Quebec; 1939, (4 mos.), student tech., aid surveyer, Dept. of Mines & Resources, Ottawa; 1941-42, dftsman., structl dftng., design & estimates, Dominion Bridge Co., Lachine; 1942-44, pipe dftsman, pipe material checker, Fraser Brace Co., Ltd., Montreal; 1944 (2 mos.), tech. aid surveyer, C. C. Lindsay, Montreal; 1945, (2 mos.), dftsman., Wm. Baxter, Montreal; 1944-45, dftsman., amm. factory, Dr. R. F. Brown, St. Paul L'Hermite, Que., 1945-47, bridge engr. on constrn., bridge service, Prov. Min. Public Works, Quebec; 1948, (3 mos.). civil engr., grade 2, Dept. Public Works, wharf service, Rimouski, Que.

FOR TRANSFER FROM THE CLASS OF JUNIOR

CAVANAGH—JOHN RICHARD, of Toronto. Born at Winnipeg on Feb. 5, 1920. Educ.: B.A.Sc. (Civil), Toronto. 1944, R.P.E. Ont.; summer work as follows: 1941, Steel Co. of Canada; 1942, Vecyor Engineering; 1943, Massey Harris; 1944-46, Royal Canadian Engineers; 1946 to date, prof. engr. consultant in patent matters with Fetherstonhaugh & Co., Toronto. (St.1945, Jr.1946).

References: T. R. Loudon, E. A. Allcut, R. F. Legget, C. R. Young.

LUSCOMBE—WILLIAM CHARLES M., of Montreal. Born at Sarnia, Ont., on June 21, 1914. Educ.: B.Sc. (Elec.), Queen's, 1941, R.P.E. Que.; summer work as follows: 1932-36, radio operator & N.C.O.—R.C.S.; 1936-37, Dept. of Transport, N.C.O.; 1941-42, test engineer, Can. Gen. Elect. Co.; 1942-45, plant elect. engr. mtce. and constrn. dept., Aluminum Co. of Canada; with Dominion Textile Co. Ltd., as follows: 1945-46, purchasing agent, machinery—ACOC, resident elect. engr. i/c elect. mtce.; 1946-47, elect. mtce., asst. mech. supt. i/c plant mtce. & constrn.; 1947-48, elect. engr. i/c design, general elect. supvr. of company plants, Montreal. (St.1941, Jr.1944).

References: W. Pugh, A. D. Ross, F. L. Lawton, E. B. Jubien, H. S. Weldon.

NOBLE—WILLIAM LAWRENCE, of Windsor, Ont. Born at Winnipeg on June 9, 1921. Educ.: B.Sc. (Civil), Sask. 1941, R.P.E. Ont.; 1941, draftsman; 1942, estimator, Canadian Bridge Co. Ltd., Walkerville, Ont. (St.1941, Jr.1943).

LIBRARY NOTES

(Continued from page 512)

INDEX TO A.S.T.M. STANDARDS, December 1947.

American Society for Testing Materials, 1916 Race St., Philadelphia, Pa., 248 pp., 8½ x 5¾ in., paper, free upon request.

This index provides a ready reference for locating any of the some 1500 standards and tests issued by the A.S.T.M. It also serves those who wish to determine whether A.S.T.M. has issued standard specifications, test methods, or definitions covering a particular engineering material or subject.

INTRODUCTION TO AERODYNAMIC COMPRESSIBILITY.

J. Black. Bunhill Publications Ltd., 12 Bloomsbury Square, London, W.C.1, 1947. 115 pp., plates, illus., diagrs., charts, tables, 10 x 7 in., cloth, 18s.

Primarily intended for the student, this book serves as an introduction to problems, as yet but partially understood, of the fluid flow of air at high speeds. The author clarifies some of the many misconceptions and false premises at present current by both experimental and theoretical data. The book surveys the latest important results and should be of value to those who design streamline bodies, ducts, or turbines.

MANUAL OF STRUCTURAL DESIGN, 3rd ed:

J. Singleton. H. M. Ives & Son, 415 Kansas Ave., Topeka, Kansas, 1947. 336 pp., diagrs., charts, tables, 10¼ x 7 in., fabrikoid, $6.00.

Intended for the practising engineer, this book applies the fundamentals of structural design in the formulation of data that bear directly on specific cases. In order to keep the manual up to date, this edition contains the latest specifications of the American Institute of Steel Construction and other new material. The included data are presented chiefly in the form of tables or graphs for more effective use.

PREPARATION AND CHARACTERISTICS OF SOLID LUMINESCENT MATERIALS, Symposium held at Cornell University, October 24-26, 1946.

Sponsored by the Division of Electron Optics of the American Physical Society, edited by G. R. Fonda and F. Seitz. Published under the auspices of the National Research Council by John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 459 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $5.00.

The twenty-nine papers that appear in this monograph are the outcome of a conference on luminescence held at Cornell University in October, 1946. The material is a survey of present researches and affords a comprehensive review of accomplishments of the War years. General characteristics and methods of preparation, recent developments in theory and experiment, factors affecting fluorescence characteristics, storage of luminescence energy, and miscellaneous aspects of fluorescence are considered.

PRINCIPLES OF INDUSTRIAL MANAGEMENT, 4th ed.

E. A. Allcut. Sir Isaac Pitman & Sons, Toronto, Canada, 1947. 308 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00

Intended for use by students as a text, this volume does not attempt to describe the details of industrial administration. After a discussion of the general principles of management, the specific topics of organization, reports, purchasing, budgets, planning, work routing, and stockroom procedures are treated. A chapter on time and motion study is included as well as chapters on inspection, costs and cost keeping, industrial labor relations, and waste.

PRINCIPLES OF SERVOMECHANISMS, Dynamics and Synthesis of Closed-Loop Control Systems.

G. S. Brown and D. P. Campbell. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 400 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $5.00.

Of interest to the scientist, practicing engineer, teacher and student, this book offers a comprehensive treatment of closed-loop dynamics and synthesis. It describes the principles of the closed-loop automatic control, stressing actual system design, and offers a direct approach to system synthesis by interrelating the transient and frequency behavior. Techniques for laboratory studies are given as well as problems for student exercise.

S P I HANDBOOK.

Society of the Plastics Industry, Inc., 295 Madison Ave., New York, 1947. 451 pp., illus., diagrs., charts, tables 9¼ x 6 in., fabrikoid, $7.50 to non-members, $4.50 to members.

The results of six years of planning and four years of effort by 300 technicians in the plastics industry, this handbook covers the subjects of primary importance to good engineering of plastics. A classification of plastics molding materials is given. Molding processes, design of molded articles, cementing and assembling, testing, mold design, machining and finishing are covered. Included also are standards for the design of inserts, for tolerances on molded plastic parts, and for laminated products.

STEAM, AIR AND GAS POWER, 4th Ed.

W. H. Severns and H. E. Degler. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 509 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.75.

This standard text gives the student of power engineering the basic information he will use in his daily work. It presents modern practice with sufficient technical detail and mathematical calculation. Clear discussions and illustrations show the underlying theory of the construction, application and performance of modern heat-power plants and their correlated equipment. New material on the gas turbine and other recent developments have been added to this edition including new problems.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER, recent graduate, required for position in Technical Department of a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 4181-V.

CHEMICAL ENGINEER, recent graduate, required for a junior position in the Research Department of a manufacturer in Central Ontario. Salary open. Apply to File No. 4183-V.

CHEMICAL ENGINEER with around two years experience required by large Pulp and Paper Mill in Province of Quebec. Salary $250 per month. Apply to File No. 4199-V.

CIVIL

CIVIL ENGINEER required for Consulting Engineer and Land Surveyor's office in Western Ontario. Must be able to make urban and rural surveys, layout of sewers, waterworks and pavements, etc. Will applicants please state qualifications and references. Salary open. Apply to File No. 4204-V.

CIVIL ENGINEER with considerable experience in structural steel and reinforced concrete design. Preferably bilingual. Required in Montreal. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4205-V.

ELECTRICAL

ELECTRICAL ENGINEER preferably with some experience in paper industry required by large Pulp and Paper Mill to work under Electrical Superintendent. Salary $300 to $350 per month. Apply to File No. 4199-V.

MECHANICAL

MECHANICAL ENGINEER wanted for the position of Chief Engineer in large general Mechanical Engineering Plant in the Montreal area. Position covers supervision of mechanical product design also tool and process layout for manufacturing, preparation of estimates, shop drawings, bills of material and ordering of all material for contracts. Salary open. Apply to File No. 4066-V.

MECHANICAL ENGINEER, recent graduate, with some industrial background required for engineering department of a manufacturer in Central Ontario. Salary open. Apply to File No. 4183-V.

MECHANICAL MAINTENANCE ENGINEER with twelve to fifteen years experience required by Toronto office of Canadian firm. Must be between the ages of 35 and 40 and preferably located in the Toronto area. Salary open. Apply to File No. 4191-V.

MECHANICAL ENGINEER age 30 to 40 years required by a manufacturer of carpenters' and mechanics' tools in Province of Quebec for production supervision and methods engineering. Salary open. Apply to File No. 4202-V.

MECHANICAL ENGINEER, recent graduate, required by a manufacturer of carpenters' and mechanics' tools in Province of Quebec. One year training period in United States. Salary $225. Apply to File No. 4202-V.

GRADUATE MECHANICAL ENGINEERS for Sessional appointment as Instructors and Demonstrators for seven months from October 1st, 1948, required by Canadian University in Montreal. Apply giving qualifications and salary required to File No. 4207-V.

MISCELLANEOUS

STRUCTURAL DRAUGHTSMEN required by Alberta firm. One able to check all classes of structures and tanks. Another able to detail all types of structures and a third able to detail light structures and general handling machinery. Must be experienced. Salary open. Apply to File No. 4167-V.

PLANT MAINTENANCE ENGINEER, mechanical background, extensive experience in pulp and paper preferably kraft. Required to take charge of kraft mill maintenance in province of Quebec. Executive ability. Salary open. Apply to File No. 4179-V.

ARCHITECTURAL DRAUGHTSMAN required by large industrial concern. Must have 5 or more years on preparation of architectural working drawings, preferably on industrial type buildings. Age limit 30 years. Salary open. Apply to File No. 4185-V.

MAINTENANCE MANAGER required for large hospital in the Maritimes for maintenance and operation of power plant, buildings and equipment. Salary open. Apply to File No. 4186-V.

GRADUATE ENGINEER with not less than ten years experience in design and operations of hydraulic turbines, penstock valves and associated powerplant accessories. Position involves mechanical plant layout preparation of specifications, examination of manufacturer's drawings and inspection of equipment. Location Toronto. Salary open. Apply to File No. 4189-V.

GRADUATE ENGINEER between 28 to 30 years of age required for the following duties: Stream gauging, surveys, snow surveys, regulation and storage studies, hydraulic computations, power installation and economics. Salary open. Apply to File No. 4192-V.

INDUSTRIAL ENGINEERS with production experience required by a firm of industrial consultants in Montreal. Preferably with experience in time study, cost control, etc. Salary $400 up according to qualifications. Apply to File No. 4193-V.

PRODUCTION ENGINEER, required in Montreal by manufacturer of small machine parts. Must have some production experience. Salary according to qualifications. Apply to File No. 4195-V.

GRADUATE ENGINEER, required by manufacturer in Montreal, must be familiar with brake design and operation with particular reference to brakelining. Salary open. Apply to File No. 4196-V.

RECENT GRADUATES with mechanical or aeronautical background required in Montreal. Salary open. Apply to File No. 4197-V.

SALES ENGINEER, mechanical background, must be thoroughly experienced and capable of developing and maintaining connections of old established firm in road builders, contractors and industrial machinery equipment. Must possess executive ability and have command of the French language. Salary open. Apply to File No. 4203-V.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CHEMICAL

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knoweldge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

GRADUATE CHEMICAL ENGINEERS OR CHEMISTS required by an industrial chemical plant in the Montreal area. Preferably with experience in production and the operation of chemical equipment such as filters, presses, etc. Must be able to organize work and direct workmen. Salary open. Apply to File No. 4071-V.

CHEMICAL ENGINEER for technical department of pulp and paper firm in the St. Maurice Valley. Applicant must have supervisory capacity and also be able to undertake investigational work involving the coordination of laboratory experiments and mill operations. Salary open. Apply to File No. 4130-V.

CIVIL

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Dept., Works Dept., also construction of a general nature for the Electric Light Dept. Salary open. Apply to File No. 3930-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEER around 30 years of age required as Assistant City Engineer of small city in Province of Quebec. General duties eventually to replace City Manager. Salary $3,000 to $3,600 according to qualifications. Apply to File No. 4144-V.

CIVIL ENGINEER, qualified to take charge of all town services including water and electric (distribution system) utilities required by a Town in Nova Scotia. Population 4,000. Salary open. Apply to File No. 4147-V.

CIVIL ENGINEERS required in Eastern Ontario for employment as designers of service systems for housing and other building projects. Preferably men with at least 10 years experience in that line. Salary according to qualifications. Apply to File No. 4156-V.

CIVIL ENGINEER recent graduate with up to one year's experience since graduation. Preferably single man. Required by Northern Ontario Paper Mill. Salary around $250. Apply to File No. 4158-V.

CIVIL ENGINEER required for mechanical logging department. Recent graduate, single. Must be prepared to spend major portion of time in field work. Salary open. Apply to File No. 4168-V.

ELECTRICAL

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery, lab., etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

JUNIOR ELECTRICAL ENGINEER required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

GRADUATE ELECTRICAL ENGINEER required for position with large Northern Ontario Paper Mill. Preferably man with some paper mill or other industrial experience. Salary commensurate with qualifications and experince. Apply stating experience and qualifications. Apply to File No. 4032-V.

GRADUATE ELECTRICAL ENGINEER with a minimum of 2 years practical experience to assist in electrical engineering design work, field work on construction and maintenance of structures, service and installation of equipment required by Manitoba City. Salary $226 to $257. Apply to File No. 4069-V.

ELECTRICAL ENGINEER, age 30-40, required as Sales Engineer for Electrical Power Apparatus Company, manufacturing motors, transformers, rectifiers, switchgear, etc. Test course graduate specializing in switchgear preferred. Sales experience desirable but not essential. Location Toronto. Salary open. Apply to File No. 4128-V.

ELECTRICAL DESIGNING DRAUGHTSMEN for work with a firm of consulting engineers in Southern Ontario. Must be experienced. Salary up to $300. Apply to File No. 4133-V.

ELECTRICAL ENGINEER required for Toronto area for engineering and design of power transformers. Salary will be commensurate with ability and experience. Apply to File No. 4141-V.

ELECTRICAL ENGINEER required as Senior Transformer Draughtsman by Canadian Company in Ontario. Must be experienced in layout and design of high voltage power transformers also capable of assuming responsibility. Salary open. Apply to File No. 4146-V.

MECHANICAL

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures, etc. Salary $240 up, depending upon ability. Apply to File No. 4030-V.

MECHANICAL ENGINEER required in Montreal with considerable experience in machine shop practice and some administrative experience in shop work. Applicant should be around 35 years of age and bilingual. Salary depending on qualifications. Apply to File No. 4100-V.

JUNIOR MECHANICAL ENGINEER, age 25 to 27 years, preferably with three to four years experience required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

MECHANICAL ENGINEER with at least ten years experience including plant maintenance and preferably in the pulp and paper industry required in New Brunswick. Salary open. Apply to File No. 4117-V.

MECHANICAL ENGINEER required as Plant Engineer by large Pulp and Paper Mill. Must have paper mill engineering experience. Permanent position. Salary between $475 to $550 depending on experience. Apply to File No. 4132-V.

MECHANICAL ENGINEER with knowledge of design and considerable experience with steam and diesel engines and refrigeration equipment. Required in Montreal. Preferably bilingual. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4137-V.

MECHANICAL ENGINEER OR DRAUGHTSMAN with minimum of four or five years experience. Knowledge of paper mill engineering desirable but not essential. Required by large Pulp and Paper Mill for general engineering design and draughting. Salary up to $400 depending on qualifications. Apply to File No. 4138-V.

MECHANICAL ENGINEER, around 35 years of age required as Assistant to Project Engineer on construction of large pulp plant. Experience in design and piping essential. Duties in Montreal and British Columbia. Salary $5,000 to $6,000. Apply to File No. 4149-V.

MECHANICAL ENGINEER recent graduate required in Engineering and Servicing Department of Canadian Firm with Headquarters in Montreal. Duties include service work in connection with Railway, Pulp Mill and other Industrial Products. Salary open. Apply to File No. 4150-V.

MECHANICAL ENGINEER required for sales engineering by large engineering company. Age 25 to 30 years and preferably veteran. Salary around $275.00. Apply to File No. 4165-V.

MECHANICAL ENGINEER, recent graduate, required for manufacturing and related duties with well established reputable paper company. Salary open. Apply to File No. 4172-V.

MECHANICAL ENGINEER with three to five years experience required in Montreal by well established paper company for duties involving machine design, plant and general engineering. Salary open. Apply to File No. 4172-V.

MECHANICAL ENGINEER required for chief engineers department of pulp and paper company operating news and kraft mills. Must have at least 5 years experience in paper mill or with paper machinery manufacturing. Knowledge of Yankee and Fourdrinier special machines desirable. Salary open. Apply to File No. 4173-V.

METALLURGICAL

RECENT GRADUATES in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

MINING

MINING ENGINEERS with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years experience required by a Company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

GRADUATE ENGINEERS required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation, development, production and maintenance. Salaries open. Apply to File No. 3588-V.

METALLURGICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry required in Nfld. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and paper experience is not necessary. Salary open. Apply to File No. 4009-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred to supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375 U.S. currency. Apply to File No. 4011-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships. Good salary, permanent position to the right man. Apply to File No. 4031-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experienced in installations of production and cost control, wage incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

SALES ENGINEER for popular line of Diesel Engines. Applicants must be specialists on Power Units and Generator Sets, required for permanent employment with well established organization. Apply to File No. 4055-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience between 30 and 40 years of age required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

POWER STATION OPERATOR with about five years' experience principally in operation and maintenance of turbines and mechanical equipment of hydro-electric plants required by public utility in Brazil. Preferably not over 30 and single but will consider married man without minor dependents. Replies held in strictest confidence. Salary open. Apply to File No. 4073-V.

TOWN ENGINEER required by town in Ontario. Duties include the supervision of Board of Works and Sanitation Departments as well as acting in an advisory capacity to the telephone, electric and water utilities. Salary from $250 to $300. Apply to File No. 4087-V.

RECENT GRADUATE MECHANICAL OR ELECTRICAL background required by engineering firm in Montreal. Duties include training in Public Utility in Administration Department. Eventually for South America. Salary to start $225. Apply to File No. 4089-V.

JUNIOR ENGINEER preferably with a few years experience in production control and some knowledge of the textile industry required for Montreal area. Salary $250 to $275. Apply to File No. 4092-V.

SENIOR INDUSTRIAL ENGINEER with business administration and mechanical background, bilingual, with at least five years experience in production control, wage incentives and cost control required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 4092-V.

SENIOR DESIGNER with from five to ten years experience and a general knowledge of structural design in relation to buildings and bridges required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

JUNIOR ENGINEER with from one to five years experience and at least a working knowledge of structural design of buildings required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

SALES ENGINEER required by large manufacturer of Air Handling equipmet in Toronto area. Applicant should have either industrial or Public Building application and sales experience. Salary open. Apply to File No. 4101-V.

SALES ENGINEER required by Canadian Company in Ontario. Must have thorough knowledge of the preparation of tenders, propositions on Transformers, Motors and Switchgear equipment, also experience in the commercial side of the heavy electrical industry. Salary open. Apply to File No. 4102-V.

DRAUGHTSMEN with some experience in building design or architectural work required by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

MECHANICAL OR ELECTRICAL GRADUATE, age about 35 years with experience in building construction machinery maintenance and repair capable of taking over the engineering and maintenance services in a large textile mill in Province of Quebec. Salary open. Apply to File No. 4114-V.

SALES ENGINEERS, one experienced man also two juniors willing to learn required by an electrical and power house equipment manufacturer in Montreal. Salary open. Apply to File No. 4121-V.

GRADUATE ENGINEERS required as Assistant Professors, Lecturers and Demonstrators in Civil, Electrical and Mechanical Engineering by a Canadian University. Salaries dependent on experience and general qualifications. Apply to File No. 4127-V.

GRADUATE ENGINEER with engineering and sales experience required as a Street Lighting Specialist in Toronto area. Position involves direct sales engineering with municipalities and utilities also engineering and production problems directly concerned with the manufacture of street lighting equipment. Age under 35 years. Salary open. Apply to File No. 4141-V.

MAINTENANCE ENGINEER, under 30 years of age, required by Public Institution for Montreal area. Duties include maintenance of buildings, heating plants, electric services, etc. Salary open. Apply to File No. 4143-V.

TOWN ENGINEER required for town in Nova Scotia. Applicant must be qualified to take charge of all town services including electric (distribution system) and water utilities. Salary open. Apply to File No. 4145-V.

MECHANICAL OR CHEMICAL ENGINEER with Masters' or Doctors' degree and several years' experience in industrial or University research work required to head the Engineering Development Section of the National Research Council, Atomic Energy Project. Salary open. Apply to File No. 4148-V.

ENGINEER required in Montreal. Applicant should have railroad construction experience and a knowledge of welding technique also the ability to organize and carry out special track construction jobs. Salary open. Apply to File No. 4157-V.

CIVIL OR STRUCTURAL ENGINEER, 24 to 35 years, required for Northern Ontario Paper Mill. At least four years experience, 2 of which should be on construction and 2 on design. Opportunity to train junior personnel. Salary not less than $400 00. Apply to File No. 4158-V.

GRADUATE ENGINEER required by Pulp and Paper Mill in Province of Quebec. Must have extensive experience in general maintenance, design and development of pulp and paper mill equipment. Excellent future advancement. Salary $6,000 to $9,000 depending on qualifications. Apply to File No. 4161-V.

SALES ENGINEERS, one for Ontario and one for Quebec, required by tool and qualify steel Branch Sales Office. Applicant should have some metallurgical training, some experience in tool and die manufacture, good personality and should own car. Salary open. Apply to File No. 4170-V.

MECHANICAL OR ELECTRICAL ENGINEER, bilingual, experienced in standard investigations and observations. Time study training not necessary. Required by Montreal firm. Salary open. Apply to File No. 4174-V.

GRADUATE ENGINEER required by an oil company in the Maritimes must have sufficient experience in the oil business and the educational qualifications to enable him to determine the specifications of oils required for various industrial machinery. Salary open. Apply to File No. 4178-V.

CONSTRUCTION ENGINEER capable of supervising sundry engineering jobs and pipelines for oil company in the Maritimes. Salary open. Apply to File No. 4178-V.

GRADUATE ENGINEER required for veneer and plywood plant in the Maritimes. Must be fully qualified to assume responsibility for the management, production and general supervision of the plant. Salary open. Apply to File No. 4180-V.

RECENT GRADUATE required by a large National Organization. Must have the following qualifications: Good appearance, personality, leadership and initiative. Salary $2,400. Apply to File No. 4194-V.

Situations Wanted

MECHANICAL ENGINEER, M.E.I.C., P.Eng., Ont.; 36, married, now employed on top responsible position, desires position with Airlines, or connected with flying. Man with wide technical experience and knowledge. Pilot since childhood, and ex-instructor in power and glider flying. Speaks several foreign languages, good organizer, knows jet propulsion and safety of flying problems. Available for responsible, serious and permanent position with future on 6 months notice to the present employer. Will give priority for the position with available living quarters near work. Apply to File No. 140-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill University. Eight years experience Tool and Production Methods Engineer Age 38. Married. Presently employed. Desires employment as Production Manager or Materials Engineer for large company. Preferably Montreal area. Apply to File No. 551-W.

ELECTRICAL ENGINEER, M.E.I.C., Alberta 1931, P.Eng., Ontario, married. Experience in Engineering Department of large industrial plants and as Field Engineer on various plant and power construction projects. During the war was Sr. Engineer on design of Auxiliary Electrical equipment for Radar units and sub-contract work. Desire permanent position requiring initiative with good future prospects, preferably in Ontario. Apply to File No. 1249-W.

ENGINEER, M.E.I.C., P.Eng., Que., with Bachelor and Master Degrees, over twenty years diversified background of experience, interested in post on plant operations, administration, or general management. Service overseas in army. Now employed but available on short notice. Apply to File No. 1645-W.

CIVIL ENGINEER, M.E.I.C., Prof. Eng., Quebec, age 39, married. Fluently bilingual with a certificate in Municipal Public Works administration. Experienced in Municipal, Highway Engineering, design of sewer and aqueduct, construction and maintenance. Seeks position as executive, Town Engineer, Construction Superintendent, Sales Engineer. Available on short notice. Apply to File No. 1859-W.

INDUSTRIAL AND CIVIL ENGINEER, M.E.I.C., B.A.Sc., P.Eng., Quebec, age 39, married, fluently bilingual. Seeks position as Industrial Engineer, Executive, Town Engineer, Sales Engineer. Experienced in Motion and Time Study Methods, Process Development, Production Control, Costing, Plant Maintenance, Highway Engineering, Municipal Engineering, Sales. Available on short notice. Apply to File No. 2157-W.

PART TIME WORK: Senior Design Engineer, B.A.Sc., P.Eng., M.E.I.C., has available an experienced group of engineers and draughtsmen desirous of obtaining evening work. Experience in the group includes municipal, mechanical, mining and water-power engineering ranging from the initial layout to the final design, as well as structural steel and reinforced concrete design and layout. All members of this group are permanently employed. Apply to File No. 2463-W.

MECHANICAL ENGINEER, B.Sc. (Queen's), M.E.I.C., P.Eng. Age 33, married. Presently employed Montreal area is desirous of obtaining position in Ontario. Offers experience in Engineering department management and organization, plant layout, machine design, jigs and tools, sheet metal work and building trades. Available one month's notice. Apply to File No. 2682-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., Que., with more than 25 years experience in reinforced concrete design and construction, interested in position with responsible firm or partnership with consultant would also consider government or municipal position. Apply to File No. 2695-W.

CHEMICAL ENGINEER, Jr.E.I.C., McGill, age 28, married. Experience includes: control, research, development, production, supervision and sales. Synthetic resins, paints, varnishes, fermentation, detergents, acids, explosives. Organic and inorganic chemistry. Time study. Bilingual. Available immediately. Apply to File No. 2850-W.

GRADUATE ENGINEER, S.E.I.C., Man. '47. Presently engaged in plant layout and field supervision. Experienced in mechanical and electrical construction and maintenance. Responsible position desired in business and production engineering in progressive firm. Apply to File No. 2975-W.

EXECUTIVE ENGINEER, age 43, P.Eng., M.E.I.C., M.C.I.M., with Mechanical, Structural and Mining Engineering Background, desires contract for position in Executive or Management Field Apply to File No. 2982-W.

ENGINEER, M.E.I.C., B.Sc. (Honours) McGill '31, P.Eng. (Que.), M.A.S.L.E., married, 3 children, age 40. 9 years experience in general business field organizing sales, distribution and product servicing. 8 years mechanical engineering experience primarily in erection and installation of mechanical equipment and plant maintenance. Duties also included lubrication surveys and training of lubrication crews, as well as courses for foremen and mechanics, studies of cost accounting analysis for modifications. Last 3 years in charge of rehabilitation and reconditioning of plant, design and installation of new equipment and dust collecting installations. Perfectly bilingual. Desires position with future in a reliable firm. Location not important though British Columbia or Southern Ontario preferred. Apply to File No. 2987-W.

CIVIL ENGINEER, B.A.Sc., S.E.I.C., veteran, age 26, experience in surveying, industrial layout and inspection, construction of underground heating system. 1 year design and construction water and sewerage system. Presently employed in Ontario. Apply to File No. 2997-W.

CHEMICAL ENGINEER, B.Sc., Queen's, S.E.I.C., married, veteran. Employed at present. Experience in light metals industry; corrosion testing; production control; spectrographic analysis. Desires position in chemical or metallurgical process industry. Available on reasonable notice to present employer. Apply to File No. 2999-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.Eng. (McGill), Master of Commerce, Toronto, '48, age 27, experienced in Aircraft Industry, Petroleum oilfield work on drilling, production, construction and design. Presently situated in West, but would locate anywhere. Apply to File No. 3006-W.

MECHANICAL ENGINEER, Ph.D., (London), A.M.I.M.E., with extensive mechanical and structural experience in Europe and England and post-graduate research in structures at London University. Age 34. Presently residing in England, arriving in Canada August, 1948, and available for employment September, 1948. Apply to File No. 3021-W.

MINING ENGINEER, M.E.I.C., B.Sc., Queen's '33, P.Eng., Que., married, age 37, eighteen years experience in mining exploration, and development work. Desires work in the Rouyn area of Quebec. Apply to File No. 3022-W.

MECHANICAL ENGINEER, B.Sc. (Eng.), A.M.I., Mech.E., wide experience in the aircraft industry. Presently residing in England, but interested in emigrating to Canada. Employed in Canada during years 1941 to 1945. Would consider any appointment in engineering world to start with the assurance of being able to speedily prove worth and ability. Apply to File No. 3023-W.

CHEMICAL ENGINEER, M.E.I.C., age 35, married, no children, graduate of University of Toronto. Ten years experience supervising production of organic chemicals. Presently employed by old established U.S. firm manufacturing fine organic and inorganic chemicals. Desires responsible position in Canada. preferably Ontario location. Present salary $5,100. Apply to File No. 3031-W

ENGINEERING EXECUTIVE, A.I.E.E., A.F.R.Ae.S., with outstanding record in England seeks position of scope and responsibility in Canada. First class academic qualifications and exceptional experience at high level in aircraft and precision mechanical engineering fields comprising design and development, works management, manufacturing methods, production control, administration and sales. Reply to File No. 3033-W.

CHEMICAL ENGINEER, M.E.I.C., B.Sc (Alberta). Married, age 28. 5 years experience in research and development and statistical quality control. Desires change in position preferably in process or engineering department of industry. Apply to File No. 3034-W.

MECHANICAL ENGINEER, A.M.Int.C.E., age 38, manager in charge of small works in England designing, building and servicing special agricultural machinery and tractors (crop-spraying), keen to emigrate to suitable administrative position. Well educated, heavy engineering (steam) experience, special ability for craftsman training and selection. Apply to File No. 3039-W.

GRADUATE CIVIL ENGINEER, Jr.E.I.C., Alberta '43, veteran, with experience in construction, purchasing, sales. Desires position of an engineering nature with responsible firm or with consulting engineer. Alberta or B.C. preferred but would accept elsewhere. Available on reasonable notice to present employer. Apply to File No. 3040-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.E. (Chem.), Sask. '44, former P.Eng. (Ont.) and M.C.I.C., married, veteran, with experience in process development, desires position in that field. Engaged in post-graduate study at Mass. Inst. of Technology, leading to degree of S.M. (Chemical Engineering Practice). Available February, 1949. Apply to File No. 3041-W.

GRADUATE MECHANICAL ENGINEER, S.E.I.C., N.S.T.C., '48, desires part time employment in Heating and Ventilation —Ottawa area. Apply to File No. 3042-W.

Research Officer

A vacancy exists for a Research Officer on the staff of the Codes and Specifications Section, Division of Building Research, National Research Council, Ottawa. The salary range will depend on experience and qualifications.

Duties: To work in the Codes and Specifications Section of the Division of Building Research under the direct supervision of the Head of that Section. Work will consist mainly of the preparation of specifications concerned with textiles, leather, rubber and related commodities.

Qualifications: A degree from a recognized university, preferably in chemistry, chemical engineering or general science. Experience in the writing of specifications will be considered an asset, but is not essential, as training in this work will be provided.

Further particulars regarding this position can be obtained from Mr. David Wolochow, National Research Council, Ottawa, Telephone 9-2971.

Building Research

Engineers and Architects interested in the application of research to building and associated engineering problems are invited to enquire about employment possibilities with the newly formed Division of Building Research of the National Research Council. An enquiring mind is an essential; experience in building work in Canada is really necessary; bilingualism would be helpful. Salaries depend upon training and experience; opportunities for useful work are unlimited. Enquiries should be addressed to the Director, Division of Building Research, National Research Council, Ottawa.

McGill University

Requires

Graduate Mechanical Engineers for Sessional appointment as Instructors & Demonstrators for 7 months from 1st October, 1948 in THE DEPARTMENT OF MECHANICAL ENGINEERING. Apply to File No. 4207-V giving qualifications and salary required.

ENGINEERING INSTRUCTORS REQUIRED

The University of Toronto requires engineering instructors and demonstrators for its Ajax Division for the Session beginning September 20th, particularly in Electrical Engineering and in Engineering Problems and Drawing.

Apply to the Secretary, Faculty of Applied Science and Engineering, University of Toronto.

WANTED

Mechanical or Chemical Engineering Graduates

with five to ten years' experience on

MAINTENANCE AND ENGINEERING IN THE OIL INDUSTRY

APPLY: PERSONNEL DEPARTMENT,
BOX T.
SARNIA, ONTARIO.

Business & Industrial Briefs

A Digest of Information received by The Editor

New Equipment and Developments

The Westinghouse Research Laboratories claim that they have developed an electronic detector which is so sensitive that it can ferret out metal impurities weighing less than one-tenth of a billionth of an ounce.

Designed to aid in the search for improved metals, this "electronic sleuth" can spot—within five to 15 minutes—a trace of material comprising as little as one millionth part of the total sample. Many important uses are anticipated.

•

The United States Patent Office has granted a broad patent to the English Electric Co. of Canada Limited, St. Catharines, covering their basic type of high voltage transformer design. It is expected that a similar patent will shortly be issued by the Canadian Patent Office. Advantages claimed for this design include: reduced inherent reactance; ready adaptability to forced oil flow through the winding ducts; strategic distribution of voltage stress throughout the dielectric structure; simple and stable mechanical construction.

•

J. L. Demers, president of the Canadian Institute of Plumbing and Heating stated, at a recent meeting of the Institute in Quebec City, "The plumbing and heating industry is continuing to expand production beyond all previous records. However the increasing difficulty in obtaining supplies, particularly steel, may force some curtailment of production in the future. The industry is doing everything in its power to catch up to the demand but the uncertain steel picture in the United States may seriously affect production if allocations of raw materials are cut."

Commenting on the production during the first quarter of the year Mr. Demers said the industry had produced in three months 24,700 bathtubs, 35,000 sinks, 26,100 wash basins and 10,300 tons of cast iron, soil pipe and fittings and 30,800 tons of steel pipe and fittings. 12,300 warm air furnaces and 4,700 domestic heating boilers were also produced.

•

Canadian General Electric Company Limited, 212 King Street West, Toronto has produced a new series of dust explosion-proof motors to designs which have been listed by the Underwriters Laboratories as suitable for operation under dangerous dust conditions in grain elevators, flour mills, coal pulverizing plants and similar hazardous locations. Details may be obtained from the Company.

•

Shell Exploration New Brunswick Limited has completed preparations to drill a second test well in the Albert formation. The new well will be located two miles from Apohaqui in Kings County.

Drilling of the Albert formation, which is the present gas and oil producing formation in New Brunswick, was started by Shell in June. The first well, ten miles east of Sussex, is now down to a depth of 2204 feet.

According to a Company spokesman's statement "Two sandstone sections in the hole showed some porosity and have been tested without yielding any gas or oil. The fact that there are indications of oil having been present in the sandstone at one time is regarded as favourable to future prospects when the well drills deeper". It is anticipated that before a depth of 4000 feet is reached, the possibilities will be known.

•

The Steel Company of Canada Limited will hold an Open House at its steel mill in Hamilton on October 5 and 6. Visitors will be able to see the processes by which ore is converted to iron and steel, and steel ingots to sheets, bars, rods and other forms from which so many Canadian products are fabricated.

The management and employees are making preparations to play host to 30,000 people on the two days of the "Open House". Visiting hours will be from 9 a.m. to 4.30 p.m. each day.

Visits on the first day will be by invitation only and the visitors will be restricted to the families of employees in Hamilton, Brantford and Toronto. There will also be some specially invited guests.

On Wednesday, October 6, the plant will be open to the general public.

•

The development of a proportional current-input electronic pyrometer controller has been announced by the Bristol Company of Canada. The new instrument proportions the current input to electrically-heated furnaces, ovens, plastic molding machines, salt pots and other similar equipment to provide practically straight-line temperature control. It does this by time modulation of the input energy. The average energy supplied is proportional to the deviation of the temperature from the control point throughout a band width, which is adjustable from 0 to 2½ per cent of full scale reading.

Descriptive material may be obtained from the Company. The address is 71-79 Duchess Street, Toronto.

•

The Canadian Broadcasting Corporation has announced the following plans for expansion. In addition to three new 50-kilowatt transmitters at Lacombe, Parmin and Toronto and a 10-kilowatt station at Chicoutimi, it is proposed to increase the power of CBR Vancouver and CBM Montreal from 5 to 50 kilowatts. A 10-kilowatt station is planned for Windsor, Ontario, and a one-kilowatt station for Sydney, N.S.

CBR and CBM will remain on their present frequencies. The power increases will insure the retention of these frequencies as Class 1-B clear channels for Canada.

•

Canadian Industries Limited has announced the forth-coming construction of a single storey warehouse, costing approximately $300,000 on a newly purchased Terminal Avenue site in Vancouver.

It will be built with reinforced concrete floors and exterior walls and will provide 30,000 square feet of open floor space, outside storage platforms and facilities for receiving and shipping by both rail and truck.

Construction is expected to begin within the next few weeks.

•

An important United Kingdom Engineering Mission is visiting Canada. The mission arrived in Montreal on August 27 and will tour the Dominion until mid-October. An announcement of the tour was made by the Secretary for Overseas Trade in the United Kingdom House of Commons, on July 19. Mr. Bottomley said "the objects of the Mission are to investigate market possibilities mainly for the heavier types of industrial engineering equipment; to obtain first-hand information on any difficulties in regard to trade with Canada in the engineering industry, and to advise on the most suitable methods to adopt to secure a greater volume of exports from this Country (the United Kingdom)."

The Mission consists of 12 members, and is sponsored by the Board of Trade. Its leader is, E. H. Gilpin, director of Messrs. Baker Perkins Ltd., and chairman of the British Food Machinery Manufacturers' Association. The associate organizer is Norman Neville, O.B.E., director of the B.F.M.M.A., and of the British Chemical Plant Mfrs.' Ass'n.

The following is a list of the names of the members of the Mission:

E. L. Gilpin, director of Baker Perkins, Ltd., Peterborough; Norman Neville, director of the British Food Machinery Mfrs.' Ass'n., and of the British Chemical Plant Mfrs. Ass'n.; D. Maxwell Buist, director of the British Electrical and Allied Manufacturers' Association; A. W. Berry, M.I.Mech.E., M.I.E.E., director of the British Engineers' Association; E. Bruce Ball, director of Glenfield and Kennedy Ltd., Kilmarnock; W. R. Beswick, director of Power Gas Corp., and Ashmore, Benson, Pease & Co. Ltd.; A. G. Grant, director of Whessoe Ltd., Darlington Co.; C. S. Robinson, director of Thomas Robinson & Son, Ltd.; H. V. Yorke, director of Bennett, Sons & Shears Ltd., and H. Pontifex & Sons, Ltd.; F. C. Fitzpatrick, Office of the Amalgamated Engineering Union; Mrs. K. Gwynn-Jones, British Food Machinery Manufacturers Association; C. Bennett, M.B.E., assistant secretary, Ministry of Supply; the party will be accompanied by P. S. Young, United Kingdom Trade Commissioner, Montreal, throughout the tour.

•

On August 20th, Canadian Johns-Manville, 199 Bay St., Toronto, announced the development of an entirely new type of electrical insulation.

Known as "Quinterra" it is described by G. D. Poole, industrial products manager of the Company, as "an asbestos-base, completely inorganic electrical insulation." In describing its properties, Mr. Poole stated "it possesses properties of thinness and electrical insulating strength never before attained in a flexible, inorganic, asbestos sheet. In appearance it resembles paper and is furnished in long lengths in roll or tape form.

Manufactured by a special paper making process it can be varied from tissue-thin 1.5 mils to 20 mils in thickness. The Company's plans call for the manufacture of a variety of thicknesses and laminates for other electrical insulating purposes.

For complete details communicate with the manufacturer.

Publications

The August issue of the "Bepco Journal" contains an article on "Underground Battery Charging". Copies are available on application to Bepco Canada Limited, 4018 St. Catherine West, Montreal 6.

•

The International Nickel Co., 25 King St. West, Toronto, 1, has available copies of a 24-page two-colour brochure in which is described a new Monel roofing sheet which has been developed by the Company. This material is rust-proof and corrosion resistant and many other outstanding qualities are claimed for it by the manufacturer.

•

Carbide and Carbon Chemicals Corporation, 30 East 42nd St., New York, 17, has released a very informative bulletin "The Physical Properties of Synthetic Organic Chemicals". A feature of the publication is the care taken in its layout to facilitate reference.

•

An 8-page two-colour catalogue describing the complete line of Eriez permanent non-electric magnetic separators, is now available. Many types of magnetic equipment are fully illustrated through the use of photographs and engineering drawings. Ask for Catalogue No. 12. Address enquiries to Eriez Manufacturing Co., 69 East 12th St., Erie, Pa.

•

The Bristol Co. of Canada Limited, 71 Duchess St., Toronto, offer bulletin No. P1235 in which are described the Company's Thermocouple and Pyrometer equipment and auxiliaries.

For those interested in industrial relations, perusal of the Steel Company of Canada Limited, 1947 report to employees is recommended. Simple copy and charts and extensive use of photographs explain to employees the company's financial and production situation. Send requests to W. A. Bates, The Steel Co. of Canada Limited, 525 Dominion St., Montreal.

•

Heise Bourdon Tube Co. Inc., Newton, Conn., offer a well produced catalogue entitled "Heise Gauges". The Gauges described are for recording pressure up to and above 10,000 p.s.i.

•

The August issue of the "Dominion Engineer", produced by the Dominion Engineering Co. Ltd., Lachine, Que., is devoted to the third part of a series of articles on electric mine hoists. For copies of this issue and the two preceding numbers, address enquiries to the Company at P.O. Box 220, Montreal.

•

The United Kingdom Trade Commissioner Service, 1111 Beaver Hall Hill, Montreal, has informed the editor that copies of a brochure are available in connection with the Public Health and Municipal Engineering Congress and Exhibition, to be held in London, England, from November 15th to 20th.

Almost every type of municipal appliance and public works contracting plant will be demonstrated at the exhibition as well as equipment, stores and supplies used by local authorities in the very wide range of public health activities.

Copies of the brochure "A Century of Public Health" 1848-1948" will be forwarded to readers of the *Journal,* by the Trade Commissioner on request.

•

Catalogue No. 48-18 recently released by the Chain Belt Co., of Milwaukee, describes the Rex 34E Single and Double Drum Pavers which differ in many respects from former models produced by the Company.

The catalogue outlines the major features of the Pavers in detail. It is well illustrated, attractively designed, and contains 30 pages printed in four colours.

•

The Canadian Fairbanks-Morse Company Limited, 980 St. Antoine St., Montreal, P.Q., offers illustrated literature on strong steam traps of the open and inverted bucket types.

Appointments and Transfers

Westeel Products Limited has opened an office at 232 Botsford Street, Moncton, N.B.

W. A. Rozen has been appointed Maritimes manager and will make his headquarters at the newly-opened office.

•

Douglas O. Durkin has been appointed director of public relations and advertising of John Inglis Co. Ltd., Toronto. Mr. Durkin was formerly in charge of public relations for the Goodyear Rubber and Tire Co. of Canada, Limited. He is chairman of the Public Relations Committee of the Association of Canadian Advertisers and a member of the Education Committee of the Canadian Manufacturers Association.

•

Gutta Percha & Rubber Co. Ltd. has appointed C. A. Sellers manager of the Winnipeg Branch, embracing Manitoba and the Lakehead district.

Mr. Sellers was formerly stationed at London, Ontario. He succeeds the late R. A. McClellan.

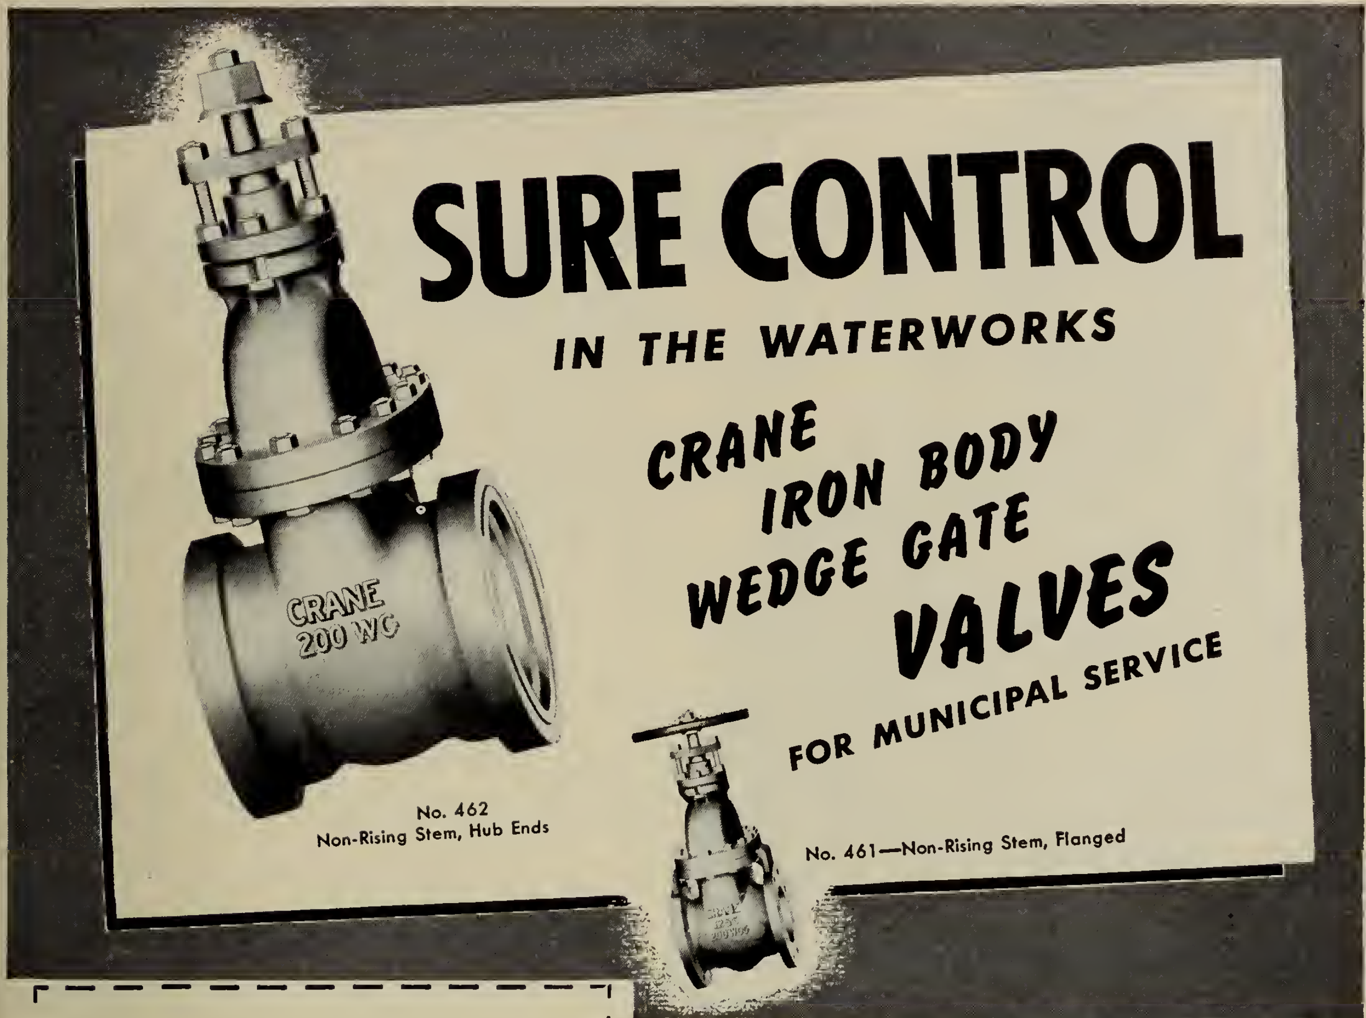
•

C. B. Sewell has been appointed a director and treasurer of LaSalle Builders Supply Limited, Montreal.

•

C. O. Monat & Company Limited, 6520 Park Avenue, has been appointed Canadian agent for Welin Lifeboats, Davits, and Winches and associated marine life-saving equipment.

Sales and distribution will be under the direction of E. R. Lambert, marine sales manager.



ONE SOURCE OF SUPPLY STANDARD OF QUALITY RESPONSIBILITY

Time and trouble are saved on every piping job when all materials are supplied by Crane. The complete Crane line—valves, fittings, fabricated piping, and accessories—offers many advantages:

Specifying and buying are simplified—one order to Crane covers everything.

Undivided responsibility for all materials helps get a better installation.

Crane quality in every part means uniform dependability throughout the piping system.

P-25

DESIGNED to operate precisely, ruggedly built to endure, Crane Valves are dependable public servants in the waterworks and sewage plants of hundreds of Canadian municipalities.

They can be relied upon for the efficient control which is essential in safeguarding public health. Their sturdy construction and unusually long life reduce maintenance, repair and replacement costs to a minimum.

The complete Crane line includes quality valves for every service requirement, ranging in sizes from the smallest up to 48-inch. Crane Iron Body Wedge Gate Valves, for example, are available either brass-trimmed or all-iron—Non-Rising Stem or Outside Screw and Yoke—screwed, flanged or with hub ends. Sturdy and well proportioned, they incorporate latest developments in modern valve design.

For complete information, see the Crane 41 Catalogue, or ask your Crane Branch.

he applies

CANADA'S NO. 1 ROOFS

He's a Barrett Approved Roofer

This is the man who applies your Barrett Specification* Roof. He is a Barrett Approved Roofer, selected for his business integrity and his thorough knowledge of the roofing business. You can count on him to live up to Barrett standards.

Approved Roofers were established by Barrett in 1916. First, as a guarantee that "SPECIFICATION" Roofs would be applied according to rigid Barrett standards. Second, in order to pass on to the applicators themselves the "know-how" gained from Barrett experience in the roofing business since 1854. Selected roofers play an important part on the Barrett team.

A Barrett Approved Roofer applied the first bonded built-up roof in Canada. It was Barrett "SPECIFICATION" Roof Job No. 1, a roof that outlived its bond by many years without maintenance or repair. This was the first of the famous line of "SPECIFICATION" Roofs now in service in every province . . . roofs whose outstanding performance records have earned them the name of "Canada's No. 1 Roofs." Each was applied by a Barrett Approved Roofer.

Barrett* Specification* Roofs

*Reg'd. Trade Mark

For proven, dependable built-up roofing, insist on a Barrett "SPECIFICATION" Roof.

The built-up felt, pitch and gravel roof, as supplied by Barrett in the record-making "SPECIFICATION" Roof, incorporates these special features:

1 Barrett "SPECIFICATION" felt—carefully processed from selected stock . . . must pass rigid tests for tensile strength and durability.

2 Barrett "SPECIFICATION" pitch—specially refined, straight-run, coal-tar pitch . . . mopped between layers of felt; *heavy-poured* on top.

3 Gravel or slag armoured top, embedded in hot pitch, protects roof against elements, mechanical damage, wear and tear. It interposes a surface of fireproof rock between building and flying embers.

Only these materials, applied by a Barrett Approved Roofer in accordance with time-tested Barrett requirements, and examined by a Barrett Inspector, make the Barrett "SPECIFICATION" Roof.

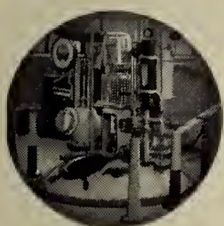
3 WAY LEADERSHIP

RESEARCH

Sherwin-Williams' Chemists and Research Experts have made steady progress through the years in helping to solve the industrialist's maintenance and finishing problems . . . to-day they have the answer in colors and new products which speed up production, reduce industrial accidents and add beauty and durability to whatever surface they are applied.



EQUIPMENT

More than two million dollars have been spent in converting research and manufacturing facilities to produce the new products which modern science has made possible. New Sherwin-Williams plants have been erected, equipment of the very latest design has been installed, and old methods have given way to new.

PRODUCTS

A Sherwin-Williams' quality product for every painting purpose! And to our list of paint products have been added new and revolutionary paint finishes, waxes, polishes and cleaners—each a leader in its field. Sherwin-Williams products will solve all your painting and finishing problems.

COVER THE EARTH

Let us help you solve your maintenance and industrial finishing problems. Write to: Industrial and Transportation Sales Department, The Sherwin-Williams Company of Canada Limited, Box 489, Montreal.

Look for the "Cover The Earth" trade mark. It is your guarantee of quality.

SHERWIN-WILLIAMS PAINTS

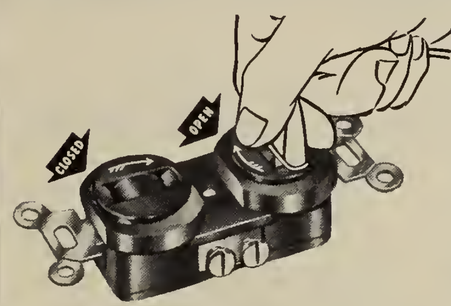
"NO-SHOK" DUPLEX RECEPTACLES



No Short Circuits • No Shocks • No Burns

Face Alway Closed

When plug is removed the face is closed tight with a snap-back spring action which prevents foreign particles from entering receptacle.

Lifetime spring action . . . firmer plug grasp . . . positive contact always.

NO-SHOK duplex receptacles are ideal for farms and industries, especially where dust, dirt and water are major hazards. Recommended for use in factories, flour mills, grain elevators, barns, etc. Closed cap keeps terminals dry and dust free.

It's a safeguard for children while playing at home and it may be the means of saving a life due to protection from shock.

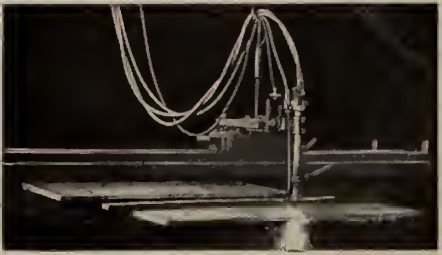
"Tailored steel" becomes a regular steel warehouse commodity when an Oxweld shape-cutting machine is used.

DOC process service cuts production corners

You may be taking advantage of all of the more apparent economies of DOC methods. Yet, through the broader and more comprehensive experience of the DOC service organization, important additional savings may be made.

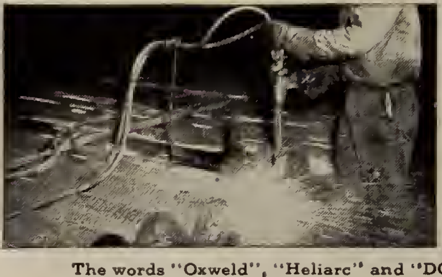
DOC Process Service is available to all DOC customers through any DOC office.



Stainless steel plate, difficult to oxygen-cut by usual methods, can be quickly cut to size and shape by powder-cutting.

Scrubbing steel with a brush of flame removes scale, rust, and surface moisture prior to painting. This is flame-priming, a DOC development.

Heliarc welding makes strong, clean welds in stainless steel tubing because the weld zone is protected from oxidation by a protecting envelope of argon or helium gas.



The design of a simple jig for centering cold rounds—or the design of a completely mechanized flame-conditioning installation—are examples of DOC Process Service.

DOC

The words "Oxweld", "Heliarc" and "DOC" are trade-marks.

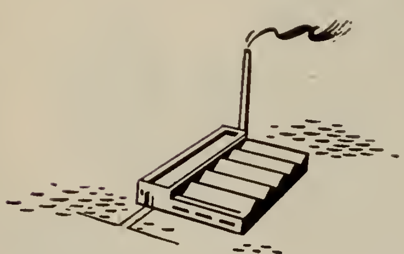
The DEPARTMENTAL STORE for CANADIAN INDUSTRY



The vast industrial growth of Canada has been closely paralleled by the growth and expansion of this Company. Moving apace with the needs of Canada, now fourth in the industrial nations of the world, Fairbanks-Morse has anticipated trends and developed services which, in turn, have enabled the Company to serve you better. This far-sighted policy will continue to shape the plans of the Company in the years ahead.

From giant Diesel engines to small portable pumps . . . from massive scales that weigh loaded freight cars to tiny screws and bolts . . . you'll find them all at Fairbanks-Morse . . . *the departmental store for Canadian industry!*

Forty-eight years of continuous service has placed this Company in an enviable position to advise you on any problem involving large or small industrial equipment. Besides its head office and warehouse in Montreal and its factory at Sherbrooke, P.Q., the Company maintains 15 strategically placed branch offices and warehouses throughout the Dominion, staffed by experts in their own divisions, to give you dependable Fairbanks-Morse service.

STEEL AND THE "NEW LOOK"

With the ever-increasing use of arc-welding, structural steel has developed a "new look" which is well demonstrated in the highway bridge pictured above.

Here the accent is on shallow, sweeping curves which are so pleasing to the eye. In addition to its aesthetic qualities, this all-welded bridge is economical, both in material and maintenance.

Modern arc-welding procedure, which made possible this 1550 foot continuous structure, is an effective tool in the hands of modern architects and engineers.

HERE IT IS!

THE CARSET JACKBIT

The Carset Jackbit is a revolutionary, new Jackbit set with cutting edges of tungsten-carbide, the hardest known metallic substance. We believe this new bit is the answer to many drilling problems. It is the fastest drilling and longest wearing rock drill bit we have ever developed.

Carset Jackbits are used with the Patented Jackstud Attachment, and either Carbon or Alloy Steel Jackrods.

THINK WHAT THESE ADVANTAGES MEAN:

- Drill continuously with one size bit.
- Use longer steel changes.
- Increased drilling speeds — 20% and higher.
- Changing of bits practically eliminated.
- Adaptability to all rock drills.
- Drill small-uniform diameter holes.
- Drill the hardest rock.
- More footage per round.

Carset Jackbit cutting edges, after long service, can be resharpened for additional footage.

Order Carset Jackbits and Jackrods now and determine the economics of their use in your operation.

Another FAIRBANKS-MORSE PUMP for Verdun, P.Q.

Emphasizing the efficient performance and dependable service of Fairbanks-Morse Pumps, Verdun, P. Q., has installed a second F-M horizontal non-clogging trash pump to handle unscreened sewage. A third unit of the same size, but of the vertical type, has also been ordered by the city. The first unit was installed in 1937.

Fairbanks-Morse Pumps offer three important advantages in addition to fine performance:

Combined Responsibility — Designed and built in one factory, pump and driver are perfectly matched and covered by a single guarantee.

Successful UNIT Performance — Tested in one plant under expert engineering supervision, pumps and drivers assure superior results to the buyer.

Service from One Source — One engineer is familiar with the entire installation — no question of who makes repairs and adjustments.

Whatever the application, there is a Fairbanks-Morse unit to give the kind of service required. One of our Pump Engineers will gladly discuss any installation that you have in mind. Just call or write our nearest office.

Unit illustrated has a capacity of 19,000 U.S.G.P.M. against a total dynamic head of 12 feet operating at 225 R.P.M. Direct connected to a 125 H.P. low-speed engine type synchronous motor. The motor has a 5KW belted type exciter.

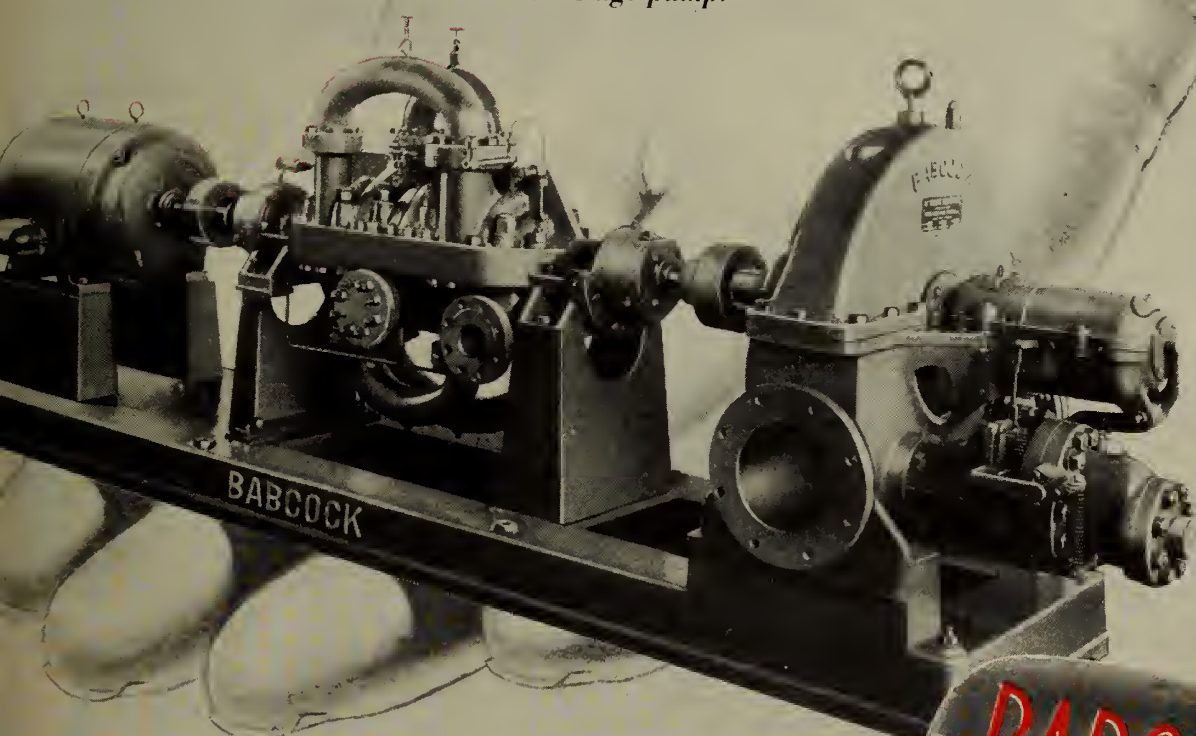
TAKE OUR NEW SIX-STAGE BOILER FEED PUMP...

IT HAS THESE ADVANTAGES:

- **EFFICIENT SEALING** Double V-groove bushings and rings provide long life and efficient interstage sealing.
- **MINIMUM PRESSURE DIFFERENTIAL** The stages of pumps are so arranged that only one stage pressure differential is allowed at each sealing point.
- **EASILY ACCESSIBLE** Volute type impellers allow full inspection of rotating element on removal of top casing. The V-groove casing rings and interstage bushings are split and therefore may be replaced without removal of rotating element from pump casing.
- **VIBRATIONLESS BALANCE** Complete axial and radial balance is maintained due to arrangement of impellers and volutes, resulting in steady, vibrationless operation.
- **EFFECTIVE STUFFING BOXES** Low pressure end of pump subjected to suction pressure only. At high pressure end, a leakage is bled to suction. V-groove pressure breakdown bushings are provided adjacent to stuffing boxes.
- **CHROME STEEL SLEEVES** All shaft sleeves are made of Chrome steel. End sleeves hardened to resist wear.
- **ANTI-FRICTION BEARINGS** Water-cooled, anti-friction type bearings are provided with circulated oil lubrication.

Illustrated below is a shop view of 6-stage BABCOCK Boiler Feed Pump. Motor and turbine-driven, mounted on unit base. These advantages are also incorporated in the 4-stage pump.



hen you have to move liquids, consult BABCOCK. We ave the engineers, equipment and experience to supply e pumps you need.

MATHEMATICAL MADNESS?

Not a bit of it! The calculation is correct when you're figuring aluminum against other metals.

You see, because of its light weight, aluminum gives you three times the volume, three times the area, three times the number of parts you would get from an equal weight of other primary metals.

That reason alone would be sufficient to give aluminum top rating with production men. But that's only part of the story. Aluminum is easier to handle and to machine. Its light weight cuts down shipping costs.

And it has lifetime durability — aluminum is strong, rustproof, corrosion resistant . . . it stands up to the toughest grind.

Interested in aluminum economies? Ask the nearest Alcan Sales Office to give you the whole story.

HOW'S YOUR VOLTAGE?

Right at Home in Oil and Grease

NEOPRENE

JACKETED

DROP CORD

Perhaps ordinary rubber drop cord can stand up to general wear and tear, but subject it to oil and grease and it will fail. NEOPRENE is different! Unlike natural rubber its resistance features show up best under conditions of oil and grease, heat, chemicals, sunlight, aging, etc.

NEOPRENE doesn't shirk its share of scuffing and general rough handling, either. This has been proved by gruelling laboratory tests and actual, on-the-job operation.

Drop cord jackets are but one of the hundreds of industrial uses for Neoprene. In fact wherever rubber-destroying conditions must be met—that is the place for Neoprene. So when replacements come due in *your* plant, be sure to specify Neoprene from your supplier . . . or write us for a list of manufacturers.

COVER PICTURE

The illustration on this month's front cover was taken at Canadian Industries Limited Nylon Plant, Kingston, Ontario. Nylon salt concentrate from the evaporator is polymerized in an autoclave and extruded on to a chilled revolving surface where it rapidly sets into an ivory-like, tough white ribbon. The chipper shown in the illustration breaks this substance into flakes.

The engineer has played a great part in the development of nylon. Here again is a typical example of the practical application of a scientific chemical process.

The Institute is indebted to Canadian Industries Limited for the illustration.

OIL, AIR-BLAST & MAGNETIC-BLAST CIRCUIT BREAKERS

by

G. R. Langley, M.E.I.C.

Chief Engineer, Canadian General Electric Co. Ltd., Peterborough, Ont.

A paper presented at a combined meeting of the American Institute of Electrical Engineers and The Engineering Institute of Canada, Montreal, Que., November 20, 1947

This paper on a-c Power Circuit Breakers has been prepared with the thought in mind that the majority of the audience may only have a casual acquaintance with breakers—yet would be interested in some of the thinking back of the design features of this important protective device. It is hoped that those who already have a broad and comprehensive knowledge of breakers, will excuse references to points with which they are already thoroughly conversant.

Power circuit breakers are divided into two classes:

(1) Low arc resistance interrupters, i.e. interrupters whose arc resistance is maintained at a low value till current zero,—at which point the arc products are suddenly replaced by a high resistance dielectric. Oil breakers and air blast breakers fall in this class.

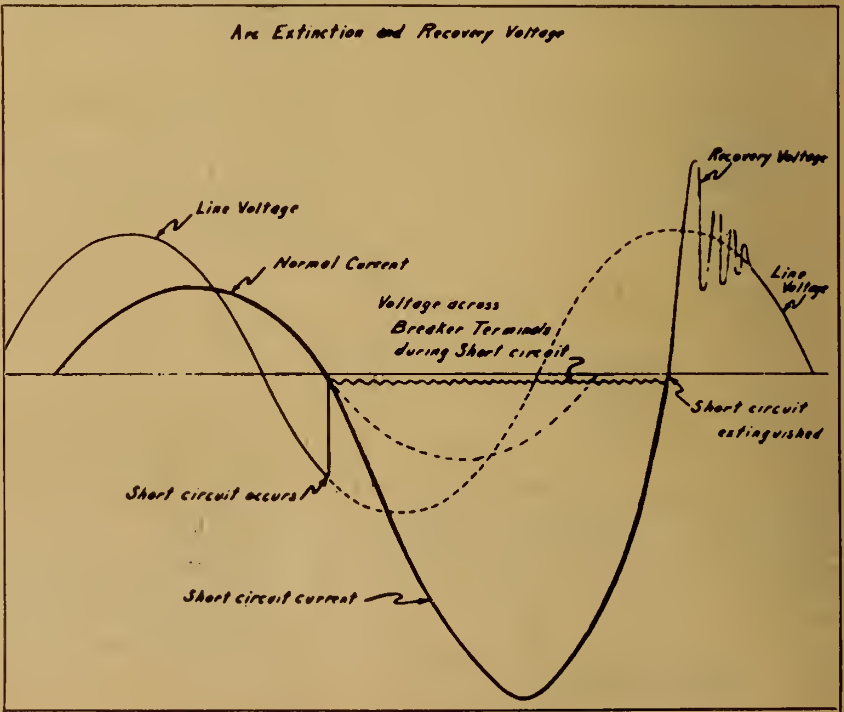
(2) High arc resistance interrupters, i.e. interrupters whose arc resistance is gradually increased to such a high value prior to current zero that arc re-establishment is easily prevented. This type of breaker acts in a very similar manner to a rheostat gradually cut into the circuit in series with the fault. Magnetic blast breakers fall in this class.

There is of course a third type of interrupter that deserves some mention. This is the type where no arc occurs when the contacts part. This vacuum breaker operates on the principle of removing neutral atoms from the path of the negative electrons driven off by the potential difference between electrodes. Some

The author defines the two main classes of circuit breakers in use today: low resistance interrupters and high resistance interrupters. Oil circuit breakers belong in the first of these categories; a discussion is presented of the many effective devices in use today for arc control. Pointing out that "a chain is as strong as its weakest link", the various components of a breaker that may cause failure are enumerated.

Requirements of a satisfactory oil are mentioned. Arc splitters are analysed, as well as their component parts. Solenoid, pneumatic and motor mechanisms used for circuit breakers are discussed at some length. In closing, a few tips are given regarding breaker maintenance.

Fig. 1. Curve illustrating the condition surrounding the interruption of a circuit by a low arc resistance breaker.



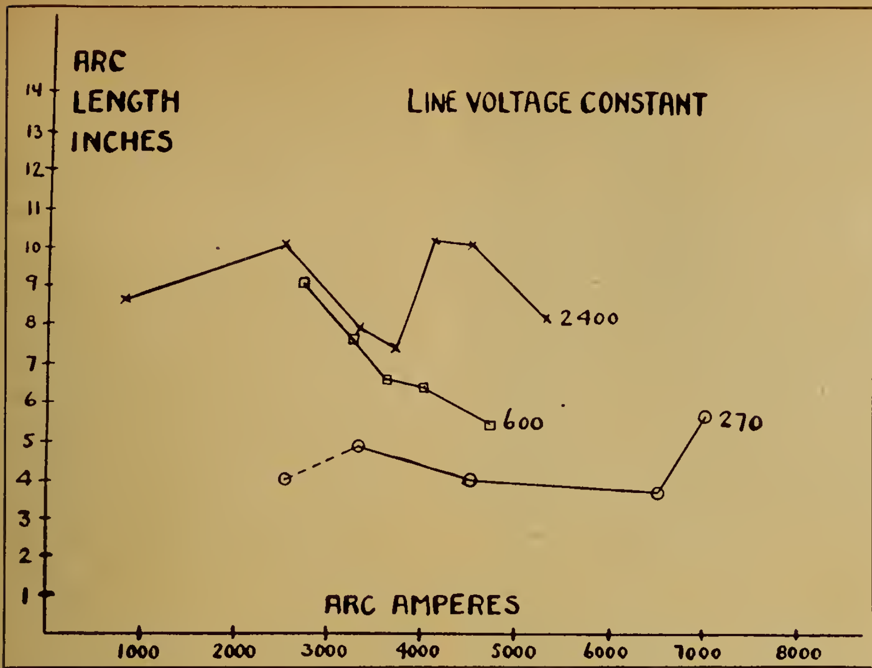


Fig. 2. Diagram illustrating the effect of the rate of rise of recovery voltage on the length of arc.

small vacuum breakers are available, but practical difficulties appear to have discouraged their development for large power. To-day all efforts are being directed towards breakers of the low or high arc resistance types.

Since the oil circuit breaker antedated the air blast and magnetic blast breaker for high voltage a-c circuits, we will discuss it first. A noted European Engineer, Prof. Bierman, once said, "It is amazing that such an illogical piece of equipment as an oil circuit breaker that extinguishes fires by oil, has been brought to such a degree of perfection." The accepted definition of successful circuit-breaker operation calls for the breaker to be in condition to be closed following a duty cycle, and to carry load till such time as maintenance is possible.

Of all the oil circuit breaker components contributing to successful operation, the tank structure ranks at the top, in that its failure to withstand the explosive pressures generated while closing or opening on a fault, would be disastrous. The tank of an oil circuit breaker is essentially an explosion container, since extremely rapid rates of pressure rise may occur either from gases generated by the hot arc during circuit interruption, or from the ignition of oil vapour and air in the air cushion above the oil level. While rectangular tanks are used (and quite legitimately, even on heavy duty breakers and of course on most lighter duty breakers) the round tank is generally preferred — due to its approach to the sphere—the ideal pressure container.

Fig. 1 illustrates the conditions surrounding the interruption of a circuit by a low arc-resistance breaker. Immediately following the current zero, the voltage across the contacts begins to rise towards the system generated voltage, which for a zero P.F. fault would be at its crest at that instant. Due to the energy stored in the circuit, the actual voltage appearing across the contacts will overshoot to probably twice the system voltage crest, and oscillate about it, as shown. It is generally recognized that the rate at which the recovery voltage rises is one measure of the severity of the interrupting duty imposed on a breaker.

Figure 2 was made up some time ago from field tests on a 138 kv. breaker, with what we would now call old fashioned explosion pots. It is an excellent example, however, of the effect that the rate of rise of recovery voltage has on the length of the arc. The longer arc and the longer duration of the arc both contribute to higher pressures and greater breaker distress.

Fig. 3. Interrupting chamber of air-blast circuit breaker with shunt resistor.

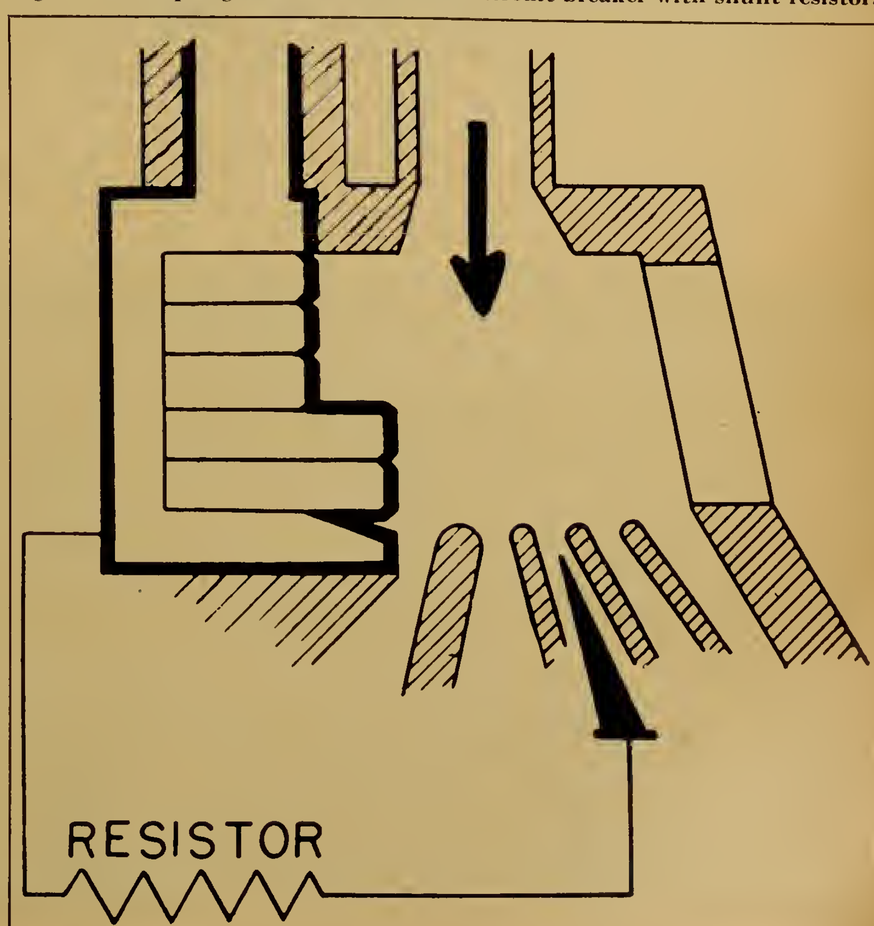

Figure 3 may be a little out of place, since we are dealing with oil breakers. It shows an interesting arrangement on an air blast breaker, where an auxiliary resistor is inserted into the circuit following current zero, to limit the rate and amplitude of the recovery voltage. Following current zero, if the recovery voltage restrikes, it restrikes to the resistor probe, but the current through the resistor is small and in phase, and is easily interrupted. Resistors such as this, shunted into the circuit in parallel with some portion of the contact break, absorb the energy of the transient voltage oscillations.

Figure 4 is an oscillogram of a high power make-break test on a 15 kv., 150,000 kva. oil blast breaker, at 4.1 volts, 23,000 rms. amps. Following are the symbols shown and what they stand for: *A*—trip coil current; *B*—alternator voltage; *C*—pressure above oil; *D*—current; *E*—arc voltage; *F*—pressure below oil; *G*—breaker travel (each dash = 1/10 ins.); *R*—shows normal 60 cycle recovery voltage associated with 1st phase to clear (i.e. 50 per cent over normal).

It is not an uncommon occurrence to have a system's capacity grow, or to have interconnections made that result in *calculated* fault currents far beyond the ratings of the installed breakers, and at the same time continue to have operating records show first class breaker performance. This is not

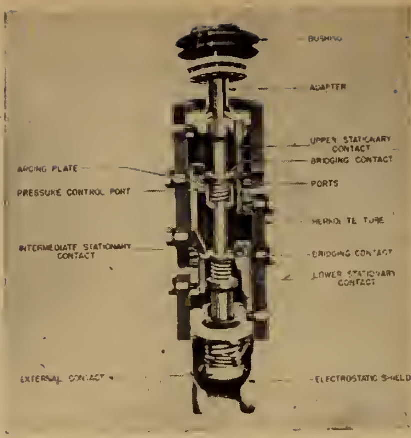

Fig. 5. Multi-break interrupter as used on 138-kv. oil blast circuit breaker.

surprising when one considers the conditions upon which fault current calculations are usually predicated and compares them with probable service conditions.

It is usually assumed that all generators are in operation at full voltage, rated kva. and 80 per cent power factor. This could occur, but it will be more likely that some generator or some station will be operating at less than full load, in order to provide a margin for regulation. It is also usual to neglect the shunt impedance of the loads on parallel feeder circuits. It is also usual to assume a zero impedance fault on the terminals of the feeder breaker. If such a fault actually occurred, the parallel load impedances could of course be rightfully neglected. The probabilities strong favour an imperfect fault with part of the feeder circuit in series, and since to have full load on the systems obviously calls for the condition of minimum feeder impedances, these may appreciably detract from the fault current.

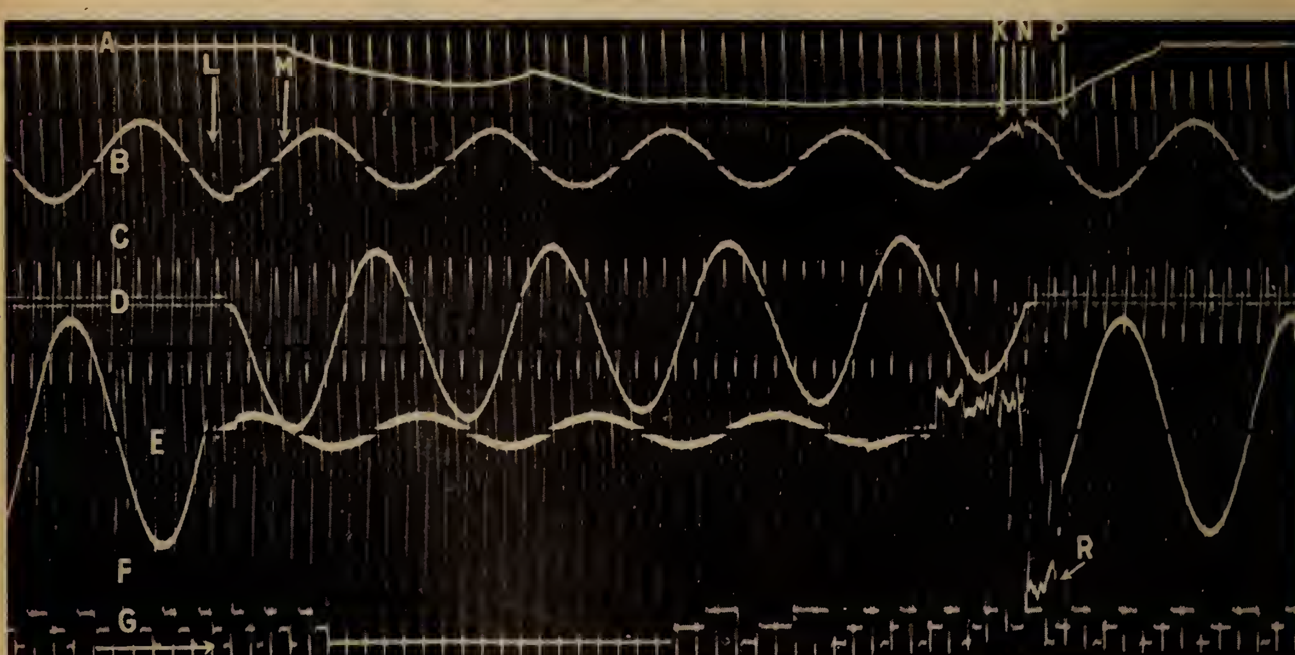
An MB duty cycle, especially on circuits up to 15,000 volts, is far more severe than straight breaking duty. The typical heavy duty utility feeder, or industrial feeder, is closed almost continuously. Hence the probability of simple break duty is far greater than the probability of an MB cycle. The rate of recovery voltage rise in high power testing laboratories is usually greater than the recovery rate met in the field. Hence a breaker that meets the high power lab. tests gains a safety factor in this regard in service.

These points in a sense constitute the safety factor of an accurately rated breaker. They also explain why some over-optimistically rated breakers may have long and successful operating records. Please do not take anything here said as advocating taking a chance on the probability of continually meeting favourable fault conditions.

Arc Control

In the plain break breaker, contacts are merely immersed in oil. The introduction of adequate insulation to the contact gap follow-

Fig. 4. Oscillogram of make-break test on 15-kv. 150-m.v.a. oil blast breaker.



ing a current zero, is largely a matter of chance. There are likely to be a number of restrikes before final extinction takes place. I believe it is correct to credit Mr. E. M. Hewlett of the G.E. Co. with the invention of the first correct arc-control scheme. The idea he used in the first H breakers more than 40 years ago is almost identical with the principal of the modern explosion chamber. This is a notable tribute to the logical thinking of the early pioneers who entirely lacked facilities for power testing or field testing for their ideas.

There are a number of effective arc control devices in use to-day, and a corresponding number of theories on why they are effective. This subject could of itself provide material for a series of discussions, and therefore only a small part will be touched on.

The original G.E. high voltage explosion pot was essentially the old low voltage H breaker pot turned upsidedown and fastened to the bottom of the high voltage bushing. Bayonets and segmental contacts of the male and female type were used, and 18 cycle interrupting time was obtained up to 69 kv. and 20-22 cycles for higher voltages.

Figure 5 shows what we term a " multibreak interrupter ", with 4 breaks in series as used for 5- and 3-cycle operation, or fast reclosure up to 154 kv. circuits. For higher voltages 6 breaks are used. A resistance not shown is connected in shunt with these contacts, and serves to equalize the recovery voltage across the two contacts, and also to damp the recovery voltage rate and oscillations, and assist in handling line charging current interruption.

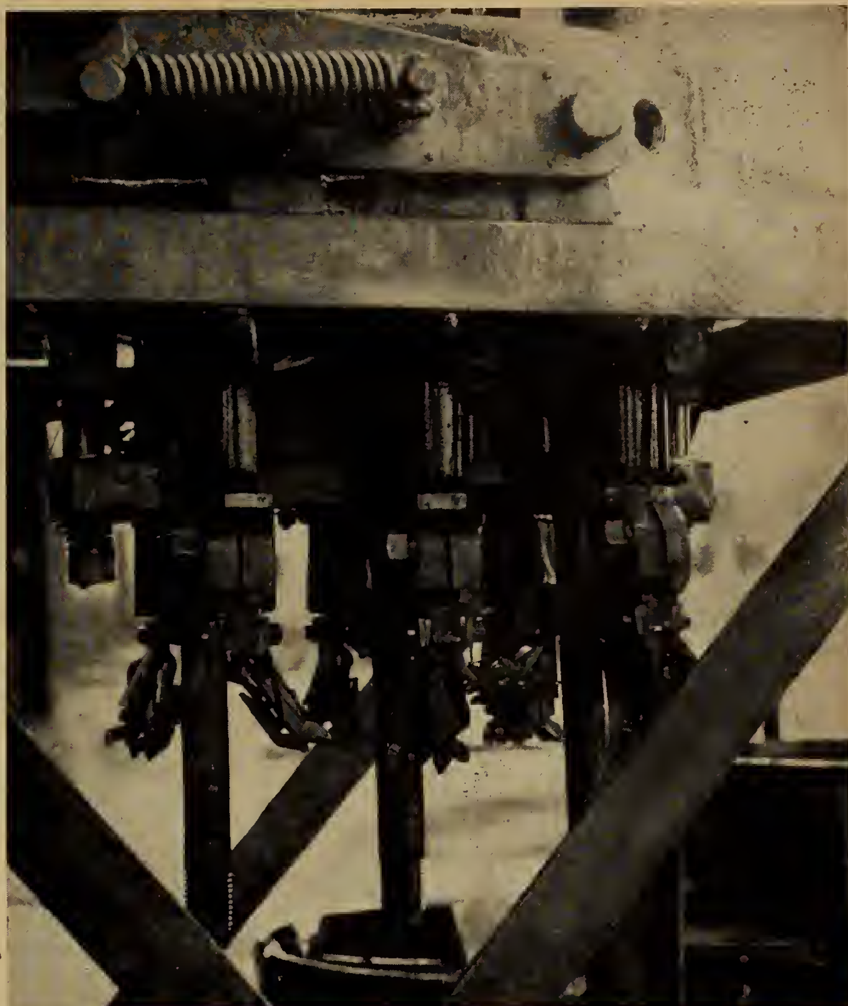


Fig. 7. Breaker tested to destruction in high power testing laboratory.

Fig. 6. Contact structure as used in 7.5- and 15-kv. breakers to withstand heavy fault currents.

The design of the interrupter is only partly responsible for the gains in speed. The time required for unlatching a mechanism and accelerating it to the break point is an increasingly important portion of the total time at the higher speeds.

The old saw:—" A chain is no stronger than its weakest link ", applies very strongly to circuit breakers. We will describe a few of these breaker links. In making the circuit against a fault on a high voltage circuit, the arc will strike slightly before the contacts touch. If finger contacts are used, the fault current will be in the same direction in both fingers. If the design is faulty, the fingers may be forcibly pulled together before the blade has had a chance to enter, giving what is known as a " stubbing effect, that will distort the fingers and possibly break bushings or lift rods.

A contact structure as used in 7.5 kv. and 15 kv. breakers, to withstand heavy current on closing, is illustrated in Fig. 6. A pin in the finger support passing through a slot in the finger, limits the distance that the finger can be pulled inward. A second danger that must be cared for lies in the possibility that the gas bubble due to heavy current may overcome the electro-magnetic inward pull and blow them apart. With this type of contact heavy spring pressure is applied at the tip of the finger to guard against this contingency. Design features such as these are subjected to numerous power tests in course of their development. These finger springs necessarily greatly increase the power required in closing the breaker. This is one of the reasons why heavy current breakers cannot be manually operated.

Figure 7 shows definite evidence that the risks just mentioned are not imaginary. The damage shown occurred on a duty cycle within the published rating of the breaker. It also demonstrates the need for dash pots to cushion the opening stroke. Typical no load or normal load opening speeds are in the range 4 ft. to 10 ft. per second, but with the added impetus supplied by the magnetic loop, corresponding to a fault current of say 40,000 amps., the speed will jump to several times normal.

Even at normal current the dash pots are usually necessary to prevent undue rebound, but at heavy fault currents their absence may well be disastrous, as indicated by this figure. One may well wonder if some university engineering course failed to drive home to the engineer who designed this breaker the practical applications of such fundamental formulæ as

$$F = \frac{\text{mass } (V_1\text{-}V_2)}{\text{Time}}.$$

The electromagnetic kick back is the main reason why manual operation of heavy duty breakers is inadvisable. The same magnetic loop that interferes with closure against heavy current faults, and accelerates breaker opening speeds, also puts a severe strain on the insulators tending to push them apart. Fig. 8 is particularly interesting in that the insulators show no distortion yet they have clearly moved sufficiently to break the wooden brace. It clearly demonstrates the need for bracing, and the value of high power testing in showing when a stronger brace is needed.

Fig 9. shows what can happen a tank lining that is not properly designed. Cylindrical tank linings made of material such as herkolite (paper with shellac or bakelite binder) have little ductility. If they do not fit in the tank tightly, fast pressure rises under the oil may burst them. A tight fit is hard to obtain, hence a covered vertical slit is the more usual design. At points where arcs may frequently touch the lining, it is usual to use fibre, due to its non charring properties.

A contact finger of British invention that is coming into frequent use in Canada is illustrated in Fig. 10. This finger not only provides a shorter path for the current from the blade to the stud, but introduces only two contacts in the path, whereas conventional fingers have the same two main contacts, plus a number of multiple contacts in the flexible conducting laminations. Silver gives the lowest initial contact drop and lowest rate of deterioration of any commercial material. Generous use of silver plating on joints is therefore one of the " hall marks " of a good breaker. Silver plating is of course not used on arcing contacts.

Fig. 8. High power testing demonstrates the necessity of adequate bracing.

Oil

Satisfactory oils have been available for many years past. They are usually bought to rigid specifications, not at all like a specification received some few years ago that stated " The oil on this requisition must be capable of withstanding a dielectric test of 40,000 volts between two ½-in. brass discs placed 200 miles apart ".

Typical switch oil has a pour point of – 40 deg., but at this temperature it is pretty viscous. For reliable breaker operation, it should never be allowed to fall below – 25 deg. C. When immersion heaters are used. they should be kept energized all through the cold period, (not the whole winter) since experience shows that carbonization is thus minimized. When oil has been subjected to arcing, its non-sludging properties are impaired, even though it is cleaned. This is not very important from the breaker standpoint, but it does point out the risk of mixing switch and transformer oils in a common storage tank. Breaker developments in recent years have notably shortened arcing time and hence oil deterioration.

Fig. 9. Tank linings must be properly designed to withstand pressure.

The search for a non-inflammable substitute for oil has, I believe, been abandoned. Substitutes investigated all showed one or all of the following faults: a—high cost; b—excessive deterioration under the influence of the arc; and c—objectionable reactions with other insulations used in the breaker.

Speaking in terms of modern, well designed and power tested oil circuit breakers, applied to circuits where fault currents are within the breaker rating, there is negligible danger of oil fires. There has been a regrettable number of oil fires however, in cases where the system

Fig. 10. Bushing and contact structure.

has outgrown the breaker, or where the breaker has been over-rated or poorly maintained. These unfortunate cases have created a trend toward oilless breakers, particularly for low voltage (up to 15 kv.) circuits.

For circuits 600 volt and below, the air circuit breaker is already quite standard. For 2500 to 15,000 volts the air blast breaker and the magnetic blast breaker are invading the field, and if the war had not interfered with the Canadian development of these types, the low voltage air blast breaker would unquestionably be in much more general use to-day.

For high voltage circuits the situation is rather different. The great majority of high voltage oil breakers are located outdoors, and their operating record has been excellent. Primary insulation for both current transformers and capacitance voltage dividers already exists in the oil circuit breaker. Availability of high permeability alloys makes it possible to obtain pretty much all the output required from the ring type, single primary current transformer.

This is not the case with air blast breakers. Especially in the case of higher voltages (110 kv. and up) the air blast breaker plus conventional current transformers, potential transformers and automatic disconnecting switches is inherently more costly to build than the corresponding oil circuit breaker. This has been the experience in England and on the Continent as well as on this side of the water. It is therefore at least doubtful if the high tension air blast breaker will make large inroads into the high tension field. The advent of a cheap high voltage current transformer could of course change the picture. The cost comparison may prove more favourable to the air blast breaker — in the case of three and five cycle breakers of 5,000,000 kva. and over.

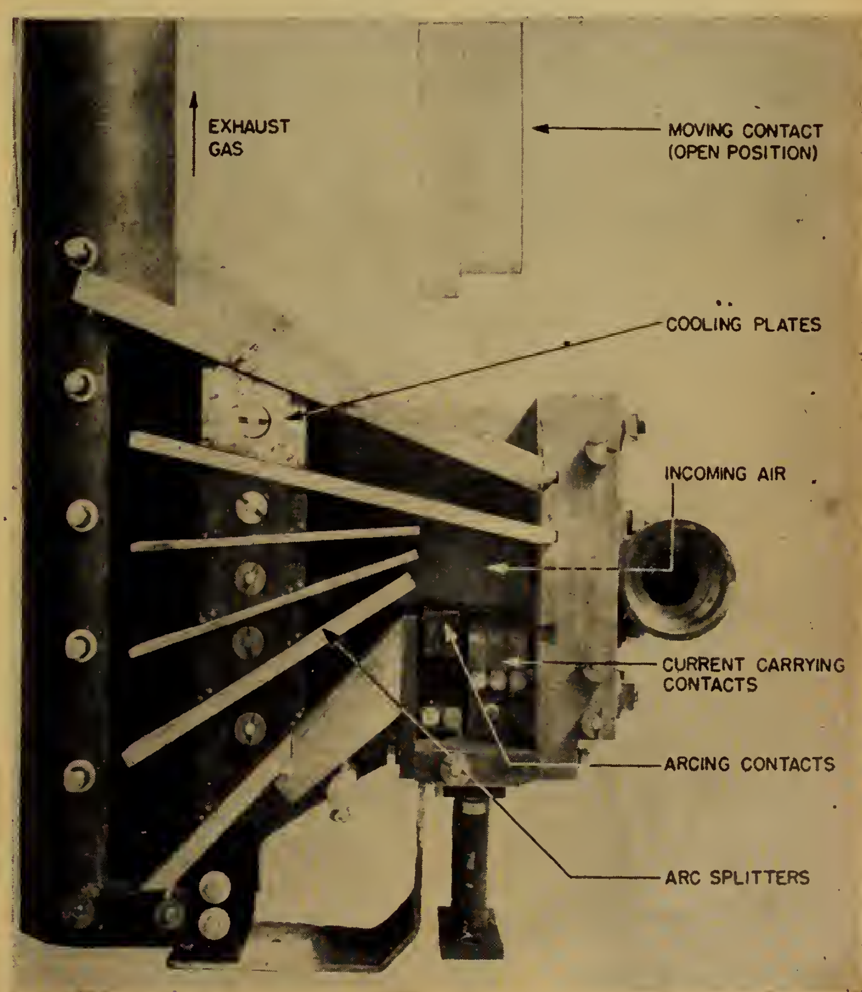
The purpose of the arc splitter shown in Fig. 11 is to permit the arc which is formed between the separating contacts to be blown into a series of loops. Except at current zero the arc path is continuous, but at current zero no energy is available to further ionize gas. Consequently the high velocity air parts the arc products at the forward edge of the barriers, and sweeps the arc products away into the exhaust structure. As the arc products are swept away they are replaced by fresh dielectric. For successful operation, this fresh dielectric must be inserted by the air stream at a rate that will be faster than the rate of rise of recovery voltage. In general an increase in the number of splitters increases the rate of recovery voltage that can be handled. Changes in air flow due to configuration of the arc chute, and the air pressure itself, also have an important bearing.

The use of gas-forming insulating barriers in the arc splitter is universal practice, in fact it is essential to the proper functioning of the splitter. Hard fibre is the material usually chosen. Non-gas-forming barriers of ceramic material would become conducting under the heat of the arc, whereas the gas forming material performs three functions:

(1) It provides thermal protection for the insulation surface.

(2) It forces the arc and arc products away from the barrier

Fig. 11. Interrupting chamber for 15-kv. air-blast breaker.



and into the region of high air velocity.

(3) It acts as a low viscosity, low density lubricant, making possible rapid insertion of a wedge of dielectric at current zero.

A different explanation of the beneficial action of the fibre barriers is given based on the assumption that it is important to approach the current zero with a highly turbulent atmosphere surrounding the arc core. If the barriers were of refractory material, there would be turbulence only on the air stream side of the arc, whereas with a gas generating barrier, the gas gives turbulence on the barrier side also, thus mixing the maximum amount of un-ionized air and gas with the arc products to promote rapid de-ionization. Regardless of theory, the gas forming barriers are definitely effective.

It will be noted that the type of breaker shown in Fig. 12 lends itself to an arrangement that gives no electromagnetic stress tending to prevent the full closure of the breaker, whereas the reverse is the case with the usual dead tank oil circuit breaker. Another interesting advantage lies in the possibility of using air across the contacts on closing as well as on opening, thus decreasing the distance through which the arc strikes, correspondingly increasing the circuit closing ability and reducing contact deterioration when closing against heavy faults. The oil and air blast breakers so far discussed were all low arc resistance interrupters.

The high arc resistance interrupter builds up a high arc resistance prior to the current zero, thereby modifying the circuit current and achieving an early interruption by advancing the current zero to, or near to, the recovery voltage zero. The rate of rise of recovery voltage is held to a low value, which permits the build up of insulation across the electrodes at the moderate rates achieved by rapid cooling of the arc products.

The obvious advantage compared to air blast, low arc resistance breakers lies in the avoidance of a high pressure air supply with all its auxiliaries. Due to this, this type of high arc resistance breaker can be made to conform to the

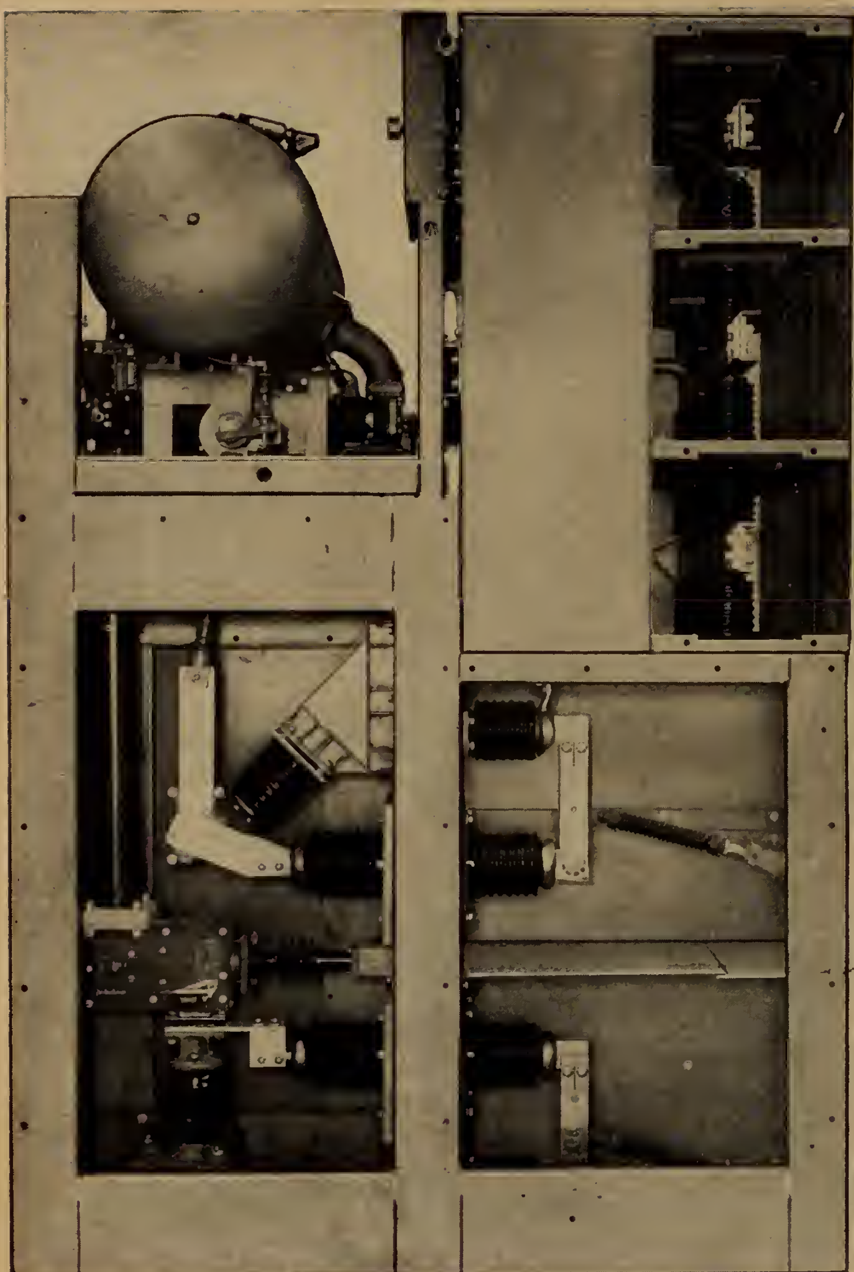


Fig. 12. 15-kv. air-blast breaker complete with interlocked disconnecting switches and bus.

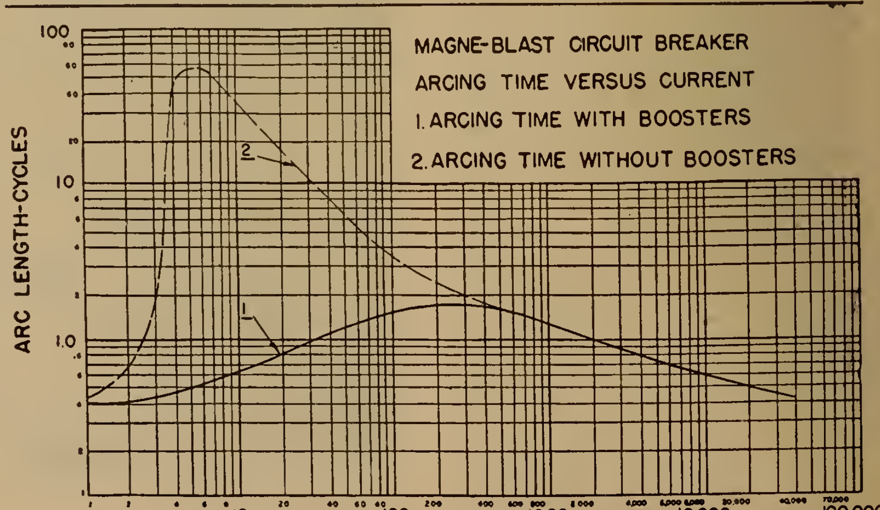
Fig. 13. (Below) Amperes interrupted. Comparison of arcing time vs. arc-chute current with piston booster (solid line) and without piston booster (dotted line).



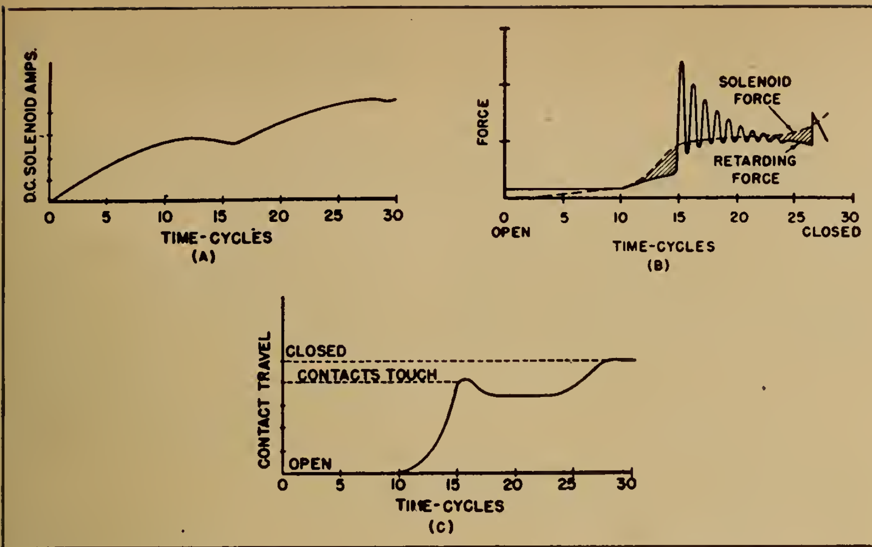


Fig. 14. Conventional solenoid current build-up, dynamic output force and stalling when closing 80,000 amp. short circuit.

general pattern and size of correspondingly rated oil circuit breakers, and it can therefore be readily applied in metal clad equipments.

Magnetic blow-out coils are used to drive the arc along arc runners and through an arc chute, elongating it, cooling it, and increasing its resistance and reducing the current. At low currents the magnetic field strength is weak, which would result in low arc speeds and long arc durations if this magnetic field were the only driving force. Simple air pistons supplement the magnetic field with a blast of air as the contacts part and effectively take care of this light current condition. Fig. 13 shows how effective these air pistons are in reducing arcing time.

Mechanisms

Little need be said about manual mechanisms. Their use is confined to light duty breakers. The finger pressures that are required for heavy duty breakers, combined with the retarding effect of electromagnetic forces and gas bubble formation, all combine to rule out the manual mechanism.

Solenoid, pneumatic and motor mechanisms are the types used for medium and heavy duty breakers. Of these the solenoid mechanism is the one most frequently used. In common with all other mechanisms, the solenoid must provide smooth and effective closing performance, even though it is closed against fault current and is thereby subjected to strong electromagnetic retarding forces during the final portion of the closing stroke. These retarding forces increase as the square of the current, and therefore may vary from ounces at normal load to thousands of pounds at high fault currents. If these retarding forces are not overcome by the instantaneous mechanism output plus the forces from kinetic energy in the moving parts, stalling may occur or the closing motion of the contacts may even be momentarily reversed.

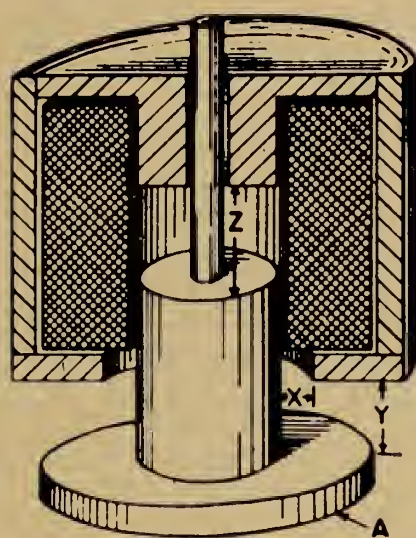

Fig. 15. Improved flux shifting closing solenoid coil design with bottom plate on plunger. "X" — air gap around circumference of plunger. "Y" — Air gap to bottom plate which shorts out gap "X" as plunger closes. "Z" — normal air gap at top of plunger.

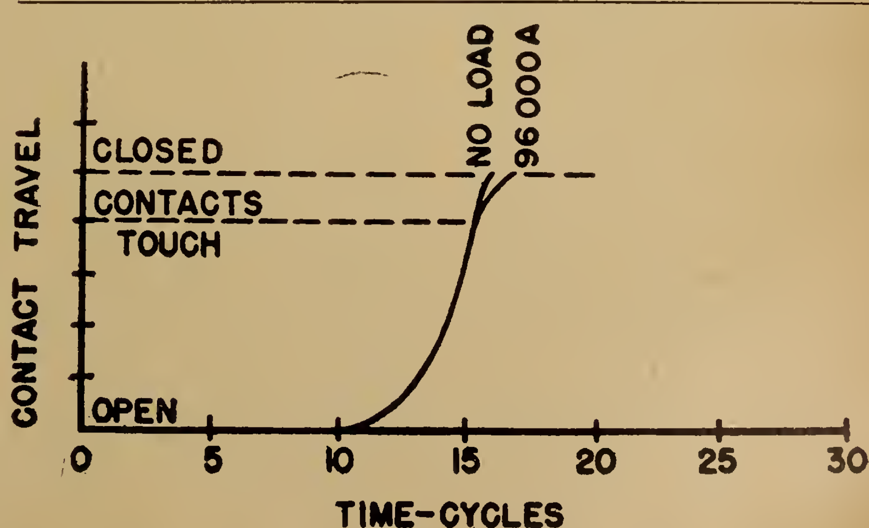
Fig. 14 shows conventional solenoid current build-up, dynamic output force and stalling when closing an 80,000 Amp. short circuit. *"C"* shows the stalling that can occur while the solenoid current is building up to a sufficient value to complete the stroke. *"B"* illustrates what occurs. The solid line represents the retarding force and in the first 10 cycles is due to the mass of the moving parts, in the next 5 cycles acceleration is added and in the next 10 cycles the electromagnetic forces. The shaded portions represent the margin of solenoid power over retarding forces. It is of course only in these shaded portion periods that the contacts can be moved towards the closed position.

The stalling would of course be worse when control voltage is below normal, and severe damage or failure of the breaker may result. When there is any danger of stalling, it is imperative that high speed instantaneous overcurrent relays be used. These relays need only be operative during the closing cycle, thereby largely avoiding interference with selective relaying. Such relays merely limit the stalling time and it is much more desirable to eliminate the stalling altogether.

Fig. 16. (Below) Improved flux shifting solenoid closing against 96,000 amp. 3 phase circuit.



One way to handle this would be to change the toggle action to require more input force at the commencement, with a faster decrease as the stroke progresses. This plan calls for higher force all through the stroke, increasing acceleration and speed, so that abnormal dashpots or closing buffers may be required to absorb the impact when closing at no load or normal load.

An ingenious plan to avoid this excess energy, and yet have the necessary power to prevent stalling, is illustrated in Fig. 15. A plate "*A*" has been added to the conventional solenoid plunger. In the open position the initial flux is across the annular gap " *X* ", — up through the plunger to the pulling gap " *Z* ". As the plunger closes in to the point where the breaker contacts touch, the added bottom plate approaches the bottom of the magnetic return circuit, so that the gap " *Y* " becomes shorter than " *X* ", and flux correspondingly shifts from the non pulling gap " *X* " to the pulling gap " *Y* ". Therefore, with no increase in total flux, this flux shifting scheme exerts a stronger pulling force during the latter part of the stroke.

Figure 16 shows that the stalling has been eliminated, and a close relation obtained between times required for full closing under no load and under heavy fault conditions.

Going back to Figure 14, it will be noticed from curve *A* that there is a distinct lag in the build up of solenoid current. This is of course mainly due to the inductance, which increases with the closing movement of the plunger. Well designed large solenoids usually include an auxiliary switch, mechanically connected to the plunger to de-energize the solenoid control relay immediately the full stroke is completed, thus preventing further growth of solenoid current, and correspondingly cutting down on battery drain.

The solenoid mechanism is rather restricted in its application to modern high voltage high-interrupting-rating breakers, inasmuch as the time lost (10 to 15 cycles) in building up magnetic flux rules it out for high speed closing or high speed reclosing duty.

There are several types of motor mechanisms: (1) Direct acting; (2) Centrifugal; and (3) Cam. In the direct acting type the motor is connected by a worm, pinion, and clutch directly to the breaker operating linkage. In the centrifugal type, the motor spins a pair of flyballs and the energy of the balls is used to close the breaker. This is a fast starting mechanism but slow and unsatisfactory if retarding forces are encountered when contacts make. In the cam type the motor drives a cam through a gear train, and the cam operates against a linkage to actuate the breaker contacts. All these motor mechanisms have a common characteristic in that they all require very careful and accurate adjustment.

The high closing speeds and high contact forces of modern breakers demand a large amount of closing power for a short interval of time. Some breakers require as much as an average of 15000 lbs. from the operating mechanism for a distance of 4 to 5 inches for 20 or 30 cycles during closing. Such a demand can best be supplied from accumulated energy located close to the breaker. Such energy can be economically and practically stored at each breaker in the form of compressed air or stressed springs.

With a pneumatic mechanism energy is accumulated through a standard fractional horsepower motor and standard air compressor, in a reservoir of sufficient capacity to give several operations of the breaker without any replenishment of the air supply. Furthermore the closing power is released and controlled through a low energy, direct - current - operated air valve.

Opening the air control valve admits air to a cylinder assembly, and movement of the piston actuates a linkage. This linkage is provided with a latching means and may or may not be provided with a tripping means. By means of an orifice in the air cylinder, or by suitable air pressure, the breaker contacts can be closed with desirable velocity and force characteristics. Compressed air has low inertia, and therefore it is a desirable means for high speed closing, since little time elapses from operation of the closing switch until the air pressure has built up to its nominal value in the cylinder.

The problems peculiar to compressed air mechanisms for circuit breakers include reliable air storage and freedom from air stoppages, due to freezing of accumulated moisture. With these in mind piping must be simplified as much as possible with a minimum number of joints. An after-cooler generally may be used consisting of several turns of copper tubing. This is usually located in the air line between the compressor and the air storage tank, and a sump is usually located at the lowest point in the system with a hand valve to blow off the sump.

If the equipment is indoors, or in an adequately heated weatherproof housing, no additional dehydrating is necessary. For outdoors, the usual plan is to compress to above the operating pressure and then pass the air through a dehydrating agent (such as silica-gel) and a throttle valve to the storage tank.

Pneumatic mechanisms are contained in a weatherproof housing for outdoor applications. Heaters are required for Canadian climates, and may be either spot heaters for critical parts such as check valves, control valves, etc., or strip heaters to keep the air temperature within the housing above freezing. With the latter arrangement for heating, pneumatic mechanisms have been in operation in one of the severest climates in Canada with satisfactory results.

Operating mechanisms may be classified as " non-trip-free " or " trip-free ". With a non-trip-free mechanism as long as the closing circuit is energized the breaker will remain closed. If as the result of an emergency, such as a short circuit on the line, the tripping means is energized, the breaker will remain closed until the closing force is removed.

To eliminate this objection most modern mechanisms are designed to trip free of the closing force. This is accomplished in some by having a linkage interposed between the closing member and the breaker mechanism which will collapse whenever the trip circuit is energized. Others, known as pneumatically trip-free, obtain equivalent action by quickly exhausting the air from the closing cylinder thus allowing the breaker to open. This elimination of the collapsible linkage greatly simplifies the mechanism.

In one form of pneumatically trip-free mechanism the release of air is controlled by a dump or release valve placed in the air line between the control valve and cylinder. It is closed when the control valve is open, the piston then closing the circuit breaker. If during the closing cycle the control

J. L. Orr, *National Research Council, Ottawa*

EDITOR'S NOTE

Late in 1945 a group of Canadian Scientists and Engineers visited Germany to investigate scientific and technological achievements of our former enemies. The authors of this paper, at that time on the staff of the National Research Council, were assigned to the field of aeronautics.

The report submitted by these scientists was long and comprehensive, but, in spite of heavy demands on their time, they have prepared a condensation specially for the JOURNAL. Even in this condensed form the report is of necessity being published in four instalments. When all four parts have been published it is hoped a consolidated reprint will be available for those interested in preserving the report in its entirety.

In this, the opening instalment, the Authors deal with the Hermann Göring Aeronautical Research Establishment, including the Institute for Aerodynamics, Wind Tunnels, Materials Laboratory, Weapons Institute and Engine Research. The Institute Graf Zeppelin at Munich and the High Speed Tunnel of the D.V.L., are also discussed.

Part I

In the latter part of 1945, the authors spent nine weeks in Germany as members of a group of Canadian scientists and engineers engaged in an investigation of German scientific and technological achievements. The information presented here was gathered by us during this visit. Apart from the time required, the condition of many of the establishments rendered it most difficult to secure details of all the work undertaken. In addition to the destruction in many cases by Allied bombing, most establishments bore eloquent testimony to the efficiency of the looting carried out by the armed forces, released slave labourers, and probably by the Germans themselves. Coupled with this disorder was the disappearance in many cases of drawings and documents, and the complete absence of the personnel who operated the plant. A word of praise is due to the British Scientific Officers who took charge of the establishments in the British Zone, restored some order, repaired equipment to make it serviceable and managed to collect the more important scientific personnel to assist them with the restoration and the recovery of missing equipment and documents wherever possible. As a result, much valuable experience with the very advanced experimental techniques employed by the Germans was gained and many important monographs containing unreported research were prepared by the German personnel themselves.

All German aeronautical research during the War had been under the control of a body known as the Forschungsführung (research directorate), which had begun as a small department under the German Air Ministry (Reich Luftfahrt Ministerium—R.L.M.). As the War developed, this small department was removed from the direct control of the R.L.M., became considerably expanded and acted in an advisory capacity to the R.L.M., reporting directly to General Milch. It coordinated the work of all the aeronautical research establishments.

The co-ordination of the large research centres was said to be very good although it frequently appeared to us that the liaison was not as good as it might have been. On several occasions scientific staff were interrogated and found to be completely unaware of the fact that others in Germany were working along identical lines. Liaison between the research establishments and the aircraft firms was only mediocre, despite the fact that the firms had direct access to the re-

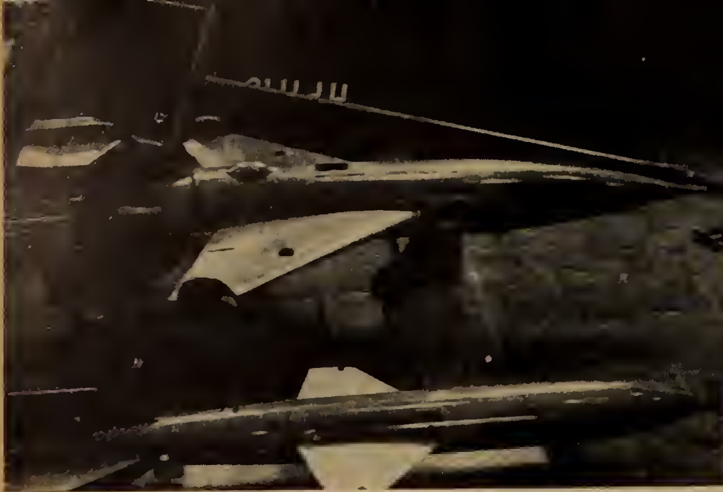

Fig. 1. Wind tunnel models of guided missiles "Feuerlilie" (upper) and "Wasserfall" (lower).

Fig. 3. The Hermann Göring wind tunnel (A.3) at L.F.A., showing nozzle and wing model in place.

Fig. 2. (below) High-speed wind tunnel. A.2. Entry door in roof.

search establishments. Still more surprising is the fact that the liaison and co-operation between the research establishments and the German Luftwaffe was practically non-existent. Knowing the excellent co-operation which existed between the Air Forces, the manufacturers and the research establishments of the Allies, one cannot but wonder how Germany, caught in a life and death struggle which she herself initiated at her own time and convenience, allowed such a state of affairs to persist, in an era when the waging of successful warfare depends so much upon the developments and application of scientific research. Truly the much vaunted German passion for organization must have been a blind passion.

The explanation for this peculiar myopia was not hard to find. Technical leadership was completely absent among the highest ranks of the German Air Ministry. All over Germany the luxury, style and permanence of the Luftwaffe stations bears evidence of the status of this service in the eyes of the German people. In the early months of the War the successes of the Luftwaffe gained them immense popularity. It is quite possible that their belief in their own invincibility may have gone to their heads and convinced them that they could get along without reliance on factory workers and the scientists. This suggestion may not be too far-fetched. General Udet, although not a technical man himself, was head of the technical branch of the R.L.M. and had

Fig. 4. (left) The collector of wind tunnel A.3.

collected together groups of civilian engineering personnel at the main flight-testing establishments. After his death these men were all replaced by service personnel and we were told that the establishments deteriorated from that time on. Another indication of this attitude is illustrated in the standardizing by the Luftwaffe on 1938 designs for quantity production reasons. It was the effect of this stagnation in development that lost them the Battle of Britain in 1940 and, when they finally realized their error, they frantically turned to their fantastic guided missiles to regain for them the air superiority their bombers and fighters had been unable to retain.

Most of the establishments had great difficulty in securing suitable staff. At A.V.A., for instance, there had been no new appointments for nearly ten years. In contrast, money for new equipment at new laboratories sponsored by the R.L.M. seemed to flow freely. Salaries paid by the research establishments were less than those received in industry and the latter was given a higher priority in the assignment of manpower. The larger research establishments were organized as incorporated bodies with boards of directors which included representatives of the universities, science, industry and of course the Nazi Party. The main reason for such an organization was to avoid control by the Civil Service and to allow the Director some leeway in the salaries he could pay his staff. The German Government set up the basic scales of salaries and these were dependent on training and experience, ability, marital status and number of children (up to five).

Of the extent and brilliance of

German research itself there is no doubt. The failure lay in its timing and in its gearing to the needs of the military machine. Too little and too late might best describe this failure which stemmed from the lack of a streamlined organization for long-range planning of requirements and the provision of close control and co-ordination of the work as it progressed from the basic research stages, through the development and production stages and even to the final operational use of the weapons involved.

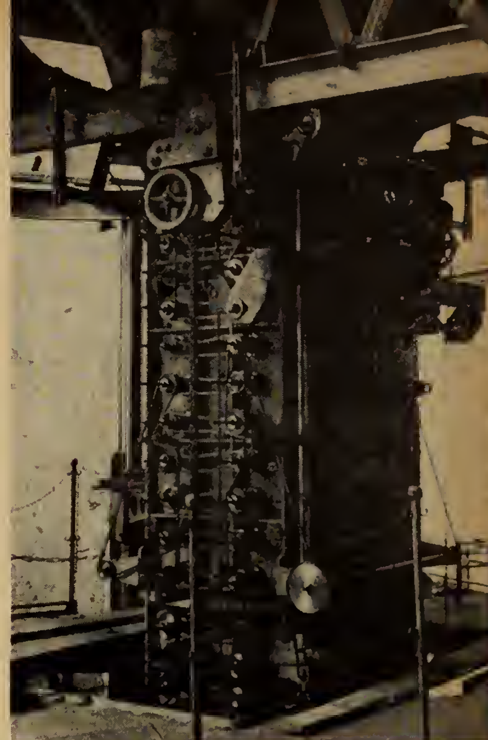

Fig. 8. (right) Closed working section of supersonic wind tunnel A.9b at L.F.A.

The Hermann Göring Aeronautical Research Establishment

Luftfahrtforschungsanstalt Hermann Göring, generally referred to as the L.F.A., was the most spectacular and impressive establishment seen in Germany. Together with its aerodrome, it occupied an area of approximately four square miles, with a total of some sixty buildings. The majority of the buildings were completely hidden in a forest and those that were exposed were cleverly camouflaged. The laboratories were invisible, as such, from the air even at low altitudes and the aerodrome itself was well camouflaged. Although the existence of such an establishment was known or suspected by the Allies, its precise location at Volkenrode, a few miles from Brunswick, was not discovered during the War. We can now feel rather pleased that it was not, for it has contributed extensively to our knowledge of German research equipment, methods and results. The large Herman Göring Wind Tunnel was too high to be hidden completely by the trees of the forest. Dummy pine trees were added around it and the roof was covered with a considerable depth of soil on which were growing a number of shrubs and bushes and a cover of long grass. Park benches completed the effect.

If the discovery of the establishment was a surprise, the realization of the scope and lavishness of its equipment was dramatic. Comparisons may be odious, but the L.F.A. has been described as the most magnificent aeronautical research establishment the world has ever seen. Certainly the planning and conception and the extravagant expenditure of money on the buildings, their equipment and supplies was most impressive.

The construction of the L.F.A. was approved in 1933 and commenced in 1935. The intention, when first conceived, was that the L.F.A. should concern itself with basic research, more so even than the world-famous research estab-

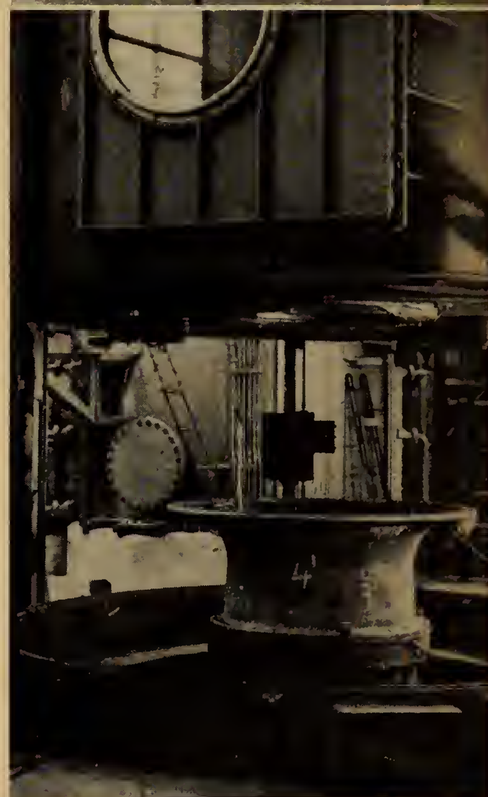

Fig. 7. (right) Open-jet working section of high-speed wind tunnel A.9a at L.F.A.

lishments of the D.V.L. (Deutsche Versuchsanstalt für Luftfahrt — German experimental establishment for flying) Berlin, and the Aerodynamic Research Establishment at Göttingen. L.F.A. employed about 1500 persons, of whom 150 were university graduates, but Professor Blenk, the Director, considered that only about 50 of them were good research men.

Institute for Aerodynamics

This was equipped with seven wind tunnels as follows:

Wind Tunnel A.1

This was a small, low-speed tunnel having a working section 8.2 ft. in diameter and an operating speed of 180 ft. per sec. The tunnel had been used for a long-term basic research on aircraft controls and had also contributed to the development of "Feuerlilie", an air to air flying rocket and "Hecht", a ground to air rocket. The Germans claimed that these rockets were originally developed for aerodynamic research at supersonic speeds and that their military application against hostile bombers was an afterthought. Fig. 1 shows wind tunnel models used in the development of "Feuerlilie" (upper) and "Wasserfall" (lower), another supersonic guided missile. Wind Tunnel A.1 had also been used in tests of low-drag wings and wings with swept back and swept forward plan forms. Other work included tests on conventional aircraft and on models of submarines and barrage balloons. The Blohm and Voss asymmetric aircraft had also been model-tested here.

Wind Tunnel A. 2

This was a high-speed tunnel with a 9.2 ft. diameter working section, in which Mach numbers of 0.8 to 0.95 were obtainable at maximum power of 12,000 kw. It was in this tunnel that the power plant for the V-1 flying bomb had been developed in co-operation with the Argus and Fieseler firms. A view of this tunnel is shown in Fig. 2. It was also in this tunnel that Dr. Zobel developed his interferometer method for the study of high-speed air flow. This in essence consists of the production of interference fringes by the optical interference of two beams of light, one of which passes through the wind tunnel working section and the other passes around it.

Changes in density of the air as it flows past the model under test are equivalent to a change in optical path length, which results in a change in the interference fringe pattern. The pattern can therefore be used to determine density and hence velocity distribution in the field of flow. This tunnel was used also for investigation of the cooling drag of radial engine installations, measurement of the drag of streamlined bodies and the thrust and drag of jet propulsion units. Some complete aircraft models, of types powered by jet engines were also tested in the tunnel.

Wind Tunnel A.3

This was the large Hermann Göring Tunnel with a 26.2 ft. diameter working section and an operating speed of 270 ft. per sec. Fig. 3 shows the nozzle with a wing model in the test position and Fig. 4 shows the collector of this tunnel. The peculiar flaps around the nozzle, the ring surrounding the collector and the gaps inside the collector are all for the purpose of suppressing the pulsating flow which is sometimes experienced with this type of open-jet tunnel.

About 90 per cent of the work done in this tunnel was for the aircraft industry and particularly on engine installations. By means of an air interchange system it was possible to do tests on aircraft engines in operation, without contaminating the air inside the building with excessive carbon monoxide. The aerodynamics of engine installations was studied with engines running and driving propellers, including cooling and exhaust system tests. A flutter model of the Junkers Ju 162, made from "Vinidur" plastic, was tested in this tunnel.

Submarine models were tested in this tunnel for stability and controllability. Full size torpedoes, both with and without engines running, also came in for study. Systematic tests on the effect of forward and backward sweep of wings were also in hand here.

Wind Tunnel A.6

This was a small high-speed subsonic tunnel operated from an evacuated sphere of 35,300 cu. ft. capacity. Speeds up to Mach number 0.9 could be obtained. Fig. 5 shows this tunnel in the foreground. Running time of the tunnel was only 25 seconds, after which the sphere had to be re-evacuated, which the compressor could do in 3½ minutes, driven by a 1000 kw. motor. The tunnel had been used to test the stability of projectile models and measurements of lift, moment and pressure distribution on aerofoils had been made for the industry.

Wind Tunnel A.7

This was a supersonic tunnel designed for continuous operation, as opposed to the intermittent operation of Tunnel A.6, and powered by the same compressor which was used to evacuate the sphere for Tunnel A.6. The working section was 25 cms. square and a Mach number of 1.0 could be reached. By employing shaped wooden blocks, to provide a Laval nozzle, supersonic speeds up to Mach number 3.9 were attained. The tunnel had been used for some work on gas turbine blades. Figure 6 is a general view of this tunnel, showing the interferometer mounted near the working section (right centre).

Wind Tunnels A.9 and A.9b

These were a sub-sonic, open-jet and a supersonic closed-jet tunnel, respectively, both of return circuit type and housed in the same building. Each was actuated by a single-stage centrifugal blower having a double-sided impeller driven by a 4500 kw. motor (6000 kw. peak load) and delivering 412,000 cu. ft. per minute. Both motors could be coupled together to drive either of the two compressors, thus giving 9000 kw. (12,000 kw. for 5 minutes) to provide the higher Mach numbers. Figure 7 shows the open jet of Tunnel A.9a, which was 1 metre in diameter. The tunnel had been used for pressure distribution measurements on aerofoils and drag measurements by surveys of the wake. The drag of jet motors and rocket projectiles had also been studied here. Fig. 8 shows the working section of Tunnel A.9b and Fig. 9 shows a corner of the tunnel, which is typical of the construction employed. The Germans were concerned with the corrections which would have to be applied to wind tunnel results in the transsonic region to obtain the correct values for free flight. It was hoped that free flight values would lie somewhere in between the values for the open Tunnel A.9a and the closed Tunnel A.9b.

Water Tunnel A.12

Figure 10 shows a view of the water tunnel. This had a working section about 8 ins. by 10 ins. and a maximum speed of 25 ft. per sec. Powdered amber, with particles about 0.035 ins. long, was used to render the flow visible. Such water tunnels seem to have been popular instruments for both basic and "ad hoc" research in Germany and some excellent work appears to have been done with them. This one had been used mainly for preliminary flow studies for radiator ducts, air intakes, nacelles, slots, etc.

Materials Laboratory

A ceramics section was devoted primarily to the measurement of the structural strength properties of commercial products over a very wide temperature range and to the development of temperature resistant materials for gas turbines. The structures laboratory was mainly equipped for basic investigations on fatigue. One interesting discovery was the adverse effect of chromium plating on fatigue strength in bending. Another study was the effect on fatigue of the super-position of small oscillations with simple harmonic motion. This is of great importance to fatigue, as the effects are not explained by the simple addition of amplitudes.

Some experimental and theoretical investigations had been made on wooden construction. The theoretical work included a study of stabilized panels, scale factors of wood in bending and the calculation of stress distribution for triangular plates with a compressive load at the apex, for comparison with experimental results using brittle lacquer.

Weapons Institute

The elaborate equipment for ballistic study at L.F.A. included the following important items:

Firing Range

This was some 330 ft. long, having a refrigerated firing chamber to enable the effects of low temperature on gun operation to be studied.

Evacuated Shooting Tunnel

This was 1300 ft. long and about 22 ft. in diameter, built of reinforced concrete, with an external seal of aluminum sheathing covered with bitumen. This tunnel could be evacuated to the equivalent pressure of 100,000 ft. altitude, an operation which took three hours. Projectiles up to 88 mm. calibre could be fired in this tunnel, their motion being studied by photographing them in two planes, at a number of stations, as they traversed the tunnel. Studies of projectile stability were carried out, including the influence of muzzle velocity and the effect of variation of gas pressure in the barrel.

Cross-Wind Tunnel

This was for the study of the ballistics of bullets fired sideways from aircraft. A large cylindrical chamber was evacuated. This chamber was connected to the working section of the tunnel by means of openings closed by thin aluminum panels. Around the periphery of these panels were explosive cords which instantaneously ruptured the panels when required. The gun was fired when conditions became steady so that as the bullet traversed the tunnel it was subjected to a strong side wind over almost 100 ft. of its path, the wind flowing across the working section from a trumpet-shaped intake, into the evacuated chamber. Wind speed could be roughly varied by choking the flow downstream from the working section, with rollers spaced across the tunnel. The behaviour of the bullet was recorded photographically.

Centrifuge

This was a 35 ft. diameter whirling arm, built in the open, for testing the operation of aircraft guns under accelerations up to ten times gravity, as might be experienced during sharp pull-outs in dog fights.

Additional buildings included a chemistry laboratory almost entirely devoted to the study of explosives and rocket fuels, an explosion chamber with a spherical dome, in which explosives were tested, a shell and bullet charging building and an electronic laboratory in which an oscilloscope was being developed for studying the stability of gyro controls for rockets, under yaw and spin conditions. The development of mixing nozzles for bi-fuel rockets was in progress in still another building, using predominantly, hydrazine hydrate (N_2H_4OH) and T-Stoff (80% H_2O_2). The main problem was to achieve efficient mixing of the two liquids and good ignition with freedom from explosion. Efficient mixing usually rendered the mixture safer and increased the ignition troubles. The nozzle designs aimed at providing relative rotation of the liquid streams, the mixture then impinging on small radial baffle plates disposed around the circumference of the nozzle chamber. Test pits were available for measuring thrust from these nozzles, using hydraulic rams. Thrusts were of the order of 200 lbs. per lb. of fuel consumed per second.

Institute for Applied Mathematics

This building contained offices, draughting rooms and photographic dark rooms, all in some disorder. The work of the institute appeared to have been mainly devoted to the study of ballistics. The major item of equipment was a Zeiss Kinétheodolite. This instrument has a 10 cm. lens and provision for manual operation of the altitude and azimuth controls by two observers. Associated equipment for it included two Zeiss stereo-comparators, a Zeiss plotting table and a Lytax projector for enlarging or tracing 35 mm. film.

Engine Research Institute

This Institute was well equipped for the testing of jet engines and reciprocating engines, two buildings being devoted to this work. In one of the buildings were three large Brown Boveri turbine type exhausters and two Jaeger vane type pumps for simulating altitude conditions at the exhaust and intake, respectively. Power absorption was by water - brake dynamometers made by Krupp and Junkers. For jet engines, thrust was measured by simple mechanical linkage. A supersonic wind tunnel had been planned for one of these buildings for the study of gas dynamic problems.

A large building containing a refrigerated chamber (40 ft. by 15 ft. approximately) had been used for cold starting tests on tanks and vehicles for the Russian campaign. In the machine-shop a medium-size interferometer was seen for the study of flow in combustion chambers and a rig for cooling tests on single stage water-cooled gas turbines. In another building, conductivity measurements were being made on glycol and lubricating oils at various temperatures and pressures, using more or less standard equipment and methods. Refrigerated decompression chambers were available, for tests on instruments down to − 60° C., one of which contained a small wind tunnel in which a small liquid type cabin heating radiator was set up for test.

Still another building was devoted to basic scientific research on gas turbines. The air flow past blade cascades and heat transfer

Fig. 9 (left) Construction detail of supersonic wind tunnel A.9b at L.F.A.

Fig. 10. (above) Water tunnel at L.F.A.

from blades, simulating gas turbine conditions, was being studied in a simple wind tunnel equipped with an interferometer. Care was taken to secure dynamic and thermodynamic similarity. The central blade of the cascade, on which the tests were made, was heated by steam, surface temperature measurements being made by thermocouples. Some very fine interferometer pictures were seen for various types of blade which revealed the velocity distribution, separation of the boundary layer and the blade wake.

A testing tunnel for measuring the air flow through stators and rotors at room temperature was also seen. The effect of varying blade pitch, axial velocity and spacing between stator and rotor was studied, measurements being made of the components of the airstream velocity. A special set-up was employed for the investigation of problems arising from the liquid cooling of turbine blades and for the determination of internal heat transfer coefficients. Some fundamental tests on heat transfer in long tubes carrying liquids and gases were also being done here, including the effects of turbulence, created by internal beads.

Aircraft power plant developments were the prime interest of a fourth Canadian Investigator. A rough outline of the Engine Institute has been given here in order to round out the picture of the L.F.A. Most of the Institutes at L.F.A. had their own well-equipped machine-shops in addition to the large central workshops. Figure 11 shows a mammoth planing machine, typical of the scale and lavishness of the workshop equipment.

Fig. 11. Large planing machine in central workshops at L.F.A.

Flight Testing

Very little important flight test work appears to have been done on aerodynamic matters. Flight tests on an Me. 109 had been made with spoiler type aileron controls ventilated to give instantaneous response. Most of the work of the Flight Test Section appears to have been done for the Weapons Institute. It was the opinion in Germany that they had engaged in far too little flight testing. Up to 1942 the aerodrome at Volkenrode had operated as a flying school for flugbaumeisters (civil engineer pilot) and the closing of this school was much regretted by the scientific staff.

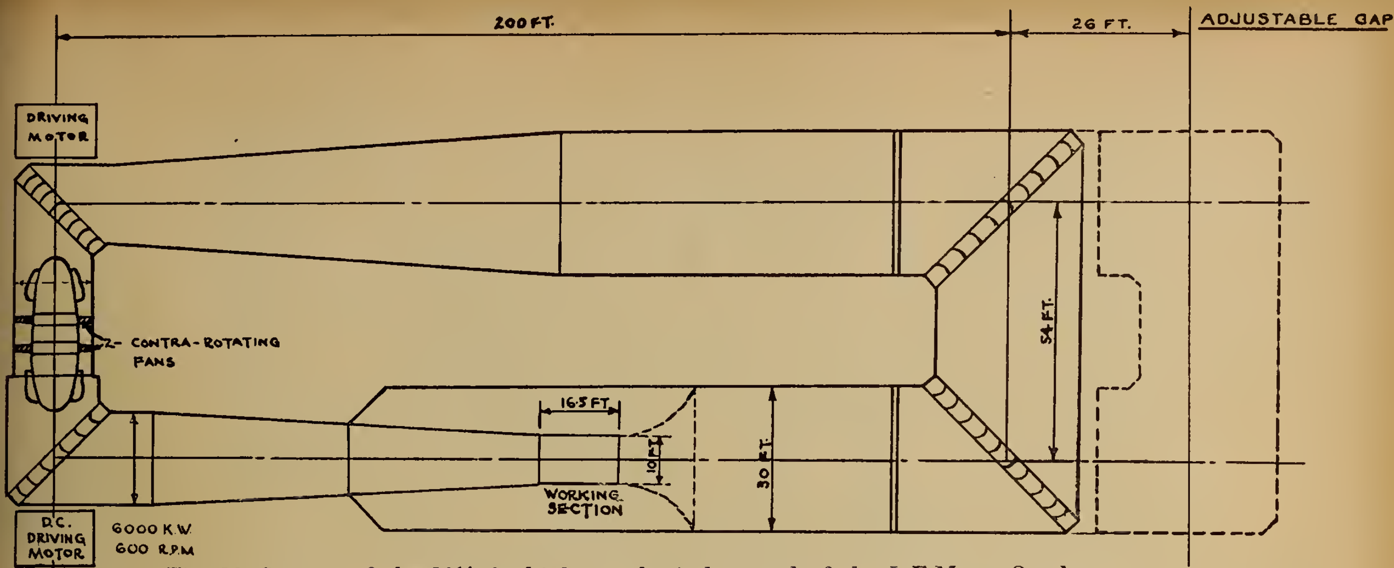

Fig. 12. Layout of the 10½-ft. high-speed wind tunnel of the L.F.M. at Ottobrun.

Luftforschungsinstitut Graf Zeppelin

This establishment, referred to as the L.G.Z., near Stuttgart, specialized in the study of the aerodynamics of bombs, torpedoes and parachutes. Some work was also concerned with the assisted take-off of aircraft using flywheels, falling weights, rockets and the type of take-off assister intended to be used for the V-1, in which successive charges are ignited in a long barrel traversed by a piston attached to the aircraft.

Four wind tunnels were seen, all of which operated in the sub-sonic range. No balances were available for any of these tunnels and none of them appeared to be of any particular interest.

The work done at L.G.Z. on parachutes was of the greatest interest. The developments in this field were directed to the stabilization of bombs, the provision of suitable supply-dropping parachutes and the braking of aircraft both in dives and in landings. The ribbon type of parachute developed here was of considerable interest and importance. This was designed to give high porosity and strength with great stability and only a 5 or 6 per cent increase in diameter over the conventional parachute of the same drag. The prototype parachute had the ribbons disposed radially and circumferentially, but this was expensive to fabricate. The final type had the ribbons disposed in an orthogonal grid arrangement, the complete parachute being of rectangular form. In order to prevent "squidding" (partial opening of a parachute with no tendency to open fully) small tapes were attached between the gores, externally, around the edge of the canopy, to control the material at the periphery and restrict its movement. This was

Fig. 13. (right) Detail of open section of the L.F.M. Ottobrun tunnel, showing cooling tubes in return passage.

Fig. 14. (below) 100,000 hp wind tunnel of the L.F.M., in the Ötztal Alps, with direct water power drive.

claimed to ensure full opening for any type of parachute.

A second interesting form of parachute, of great stability, was somewhat similar in shape to the conventional lobe parachute, except that the shape below the maximum diameter was made conical, with the virtual apex well above the attachment point of the shroud lines to the body. The shroud lines were conducted under the canopy by internal webs such that the lines assumed the form of a conventional canopy of slightly smaller diameter. With a parachute of this form its diameter need only be 75 per cent of that of the bomb it stabilizes. To control the opening of parachutes used for aircraft braking, both in dives and in landings, and to permit the closing and retraction of braking parachutes, a method of reefing was developed, requiring a pull of 2 per cent or less of the total load on the parachute.

Luftfahrtforschungsanstalt Munich

This establishment, referred to as L.F.M., was the most recent to be provided through the interest and enthusiasm of Herr Baeumker and he, in fact, was its Director. Construction had only begun in 1942 and it was far from complete.

At Ottobrun, just outside of Munich, were three of the wind tunnels of this establishment. The first tunnel, which had been looted from France, was being used for stability tests on projectiles and guided missiles. The second tunnel was a 6.6 ft. diameter open-jet one, giving a speed of 230 ft. per sec. from the 700 kw. drive. The most interesting of these tunnels was only just nearing completion, the layout being shown in Fig. 12. It had a closed working section and was powered by two 6000 kw. motors driving individual fans, which allowed a Mach number of 1.0 to be reached with the tunnel empty. The fans were located in the transverse section downstream from the working section, whilst the motors driving them were situated outside the tunnel and on either side thereof. Speed control was by variation of fan blade pitch. The working section was enclosed in a chamber which could be held at a pressure below that of the working section, to prevent leakage of air into the tunnel, which would disturb the flow. Pressure in the tunnel could also be lowered to 1/10 atmosphere if desired. Cooling of the air in the tunnel was effected by a large number of elliptical water tubes disposed axially in four vertical banks in the long return passage.

The entire transverse section upstream from the working section and including the two sets of corner vanes, was mounted on rails and could be displaced by an electric motor, to permit the tunnel to be operated as an open return tunnel for jet engine tests. It also permitted air exchange when operating as a closed return tunnel, by partial opening of this section. Fig. 13 shows the tunnel partially opened and gives a view of the banks of cooling tubes in the return passage. It was intended to install a six-component hydraulic balance. This tunnel had only run for five hours but had not been used for any tests. It was constructed entirely from welded steel and was of impressive dimensions. At Ottobrun was also seen a small sphere about 25 ft. in diameter intended for driving an intermittent supersonic tunnel with a working section about 16 ins. by 24 ins., which would give a Mach number of about 1.5 for 20 secs. duration.

At Ötztal, in the Alps south of Munich, L.F.M. was constructing a magnificent 26 ft. diameter open or closed working section tunnel, which was to have been used primarily for tests of jet engines. A Mach number 0.8 to 0.9 was anticipated. The tunnel (Fig. 14), was to be powered directly by water power driving two pelton wheels connected to counter-rotating fans. An artificial lake provided a head of water of 1300 ft. The water passages were tunnelled through the solid rock. The tunnel was of all-welded steel construction.

The High-speed Tunnel of the D.V.L. (Deutsche Versuchsanstalt für Luftfahrt)

The D.V.L. or German Experimental Establishment for Flying was the largest and possibly most important of all the aeronautical research organizations in the Reich, and was located in Berlin. During the latter part of the War it was dispersed to various places in Germany and an attempt was made to remove some of the smaller items of equipment to the dispersal sites. The original site of the D.V.L. falls within the Russian Zone and was not visited by us. However, we did have an opportunity of interrogating Dr. Göthert, who was in charge of the D.V.L. High-Speed Tunnel. This important piece of equipment was completed in 1939 and contributed very valuable information. The tunnel had a closed working section just under 9 ft. in diameter in which a Mach number of 1.0 could be reached. With the tunnel empty, this required only 60 per cent of the available power of 13,000 kw. Perhaps the most important work done here was the systematic series of tests carried out on some sixty different aerofoils. Force measurements, pressure distribution measurements and surveys of the wake were made. Except in the force measurements, end-plates were normally used on the models. The aerofoils tested included symmetrical sections with thickness/chord ratios ranging from 6 up to 21 per cent. At a later stage some cambered sections were tested in order to investigate the effect of camber at high speed. The models were all tested over a wide speed range and over a range of angles of attack. The results showed the superiority of the symmetrical sections for high speed.

The effect of wing leading edge radius was studied. With sharp leading edges the formation of a shock wave at high speed did not lead to separation of the flow. With such aerofoils there was a very considerable range of speed between the co-called critical speed, at which the air passing over the model reaches the speed of sound, and the speed at which the drag coefficient of the aerofoil begins to rise steeply. Over this speed range the drag coefficient is constant and in a few cases there was even a marked reduction in the drag coefficient, explained by a rearward movement, at the critical speed, of the point at which the boundary layer flow changed from laminar to turbulent. Separation of the flow occurred only at the speed where the drag coefficient began to increase.

Experiments were also conducted

Texas City fire.

THE ENGINEER & FIRE INSURANCE

by

T. R. Durley, M.E.I.C.

Manufacturers Mutual Fire Insurance Co. of Providence, R.I., Montreal, Que.

The author begins by defining the duties of an insurance inspector; telling how he goes about making an inspection; what points he watches for, such as general indications, electrical and wiring, inflammables, protective devices, water supply and alternatives, and buildings. Underwriting is explained. Inspection experience is seen as essential for sound rate making and underwriting.

The Standard Fire Policy is discussed; physical loss is covered by the Property Damage Policy, while loss of earnings and other contingent expense, is covered by the "Use and Occupancy" form. Endorsements found necessary in various provinces to qualify limitations set by statutory conditions, are discussed. The paper concludes by telling what the Standard Policy really covers.

Dr. L. F. Grant, Past President of the E.I.C., has suggested it would be of interest to Members to hear from some of the engineers whose work is no longer strictly of an engineering character. This paper will attempt to show how engineering is applied in connection with the insurance of large industrial plants.

In any business, service is what recommends a Company's product to the buyer, whether it be a tangible or intangible article. The insurance business seeks to provide the kind of protection an industrial property requires. It must endeavour by engineering advice and inspection to prevent losses occurring in those establishments. To that end, the company with which the author is associated maintains a staff of field engineers and inspectors throughout the United States and Canada. These assist in any problems that may arise, due either to new construction, changes in occupancy or process. They interpret the wording of the insurance policy, as well as the general arrangement of all the insurance the company requires to safeguard its balance sheet.

Duties Of Inspectors

The work of the regular and resident inspectors is confined to routine quarterly and special inspections of insured properties. This work is co-ordinated by the insurance company's Field Engineer, who, usually at some time in his career, has had experience as an inspector.

Any Inspection Bureau must be staffed with graduate engineers of the engineering school of a recognized university if it is to fulfil its proper function. Its duties are entirely of an engineering character, and it takes two to three years to give adequate training to a new employee after a few years in any industrial job. The finished Insurance Inspector, if there be such a person, must be a "jack-of-all-trades". He must have a sound knowledge of what each insured property does, the inherent hazards of the processes, and what protection is available to eliminate whatever the hazards may be. He must know something of building construction and hydraulics, and have a working knowledge of electrical equipment.

Almost any physical loss involves some loss of earnings, which in some cases, may be more serious than the property damage. The inspector should, therefore, also know something about the availability of materials and the volume of production of the article or goods the particular plant is manufacturing. He is supplied with a great deal of information in condensed form, but it does require a considerable time to assimilate the knowledge he needs and to learn where to find it. Let us therefore outline briefly some of the items an inspector must consider during a regular inspection. Let us assume that the inspector has received training in his first few years with the Inspection Bureau in all the various engineering subjects that are applicable.

He carries with him a copy of the previous inspection report, and a plan of the property. The report form is designed to give both the Insurance Company and the Assured a concise story of conditions at the plant. It contains any recommendations the inspector feels would minimize the possibility of loss. For brevity and clarity the general characteristics of the plant are rated as "excellent", "good", "fair" or "poor" as applicable, by underscoring the appropriate word on the form. The only writing necessary is to convey to the plant management suggestions for improvement, or to amplify poor rating of any item.

Making An Inspection

The insurance plan is an accurate plan and elevation of the buildings, indicating the type of construction, number of storeys, occupancy, fire protection provided, and water supplies. It is usually drawn on a scale of 50 ft. to the inch, and shows the surrounding properties as well. These plans are coloured and a variety of symbols are employed to denote fire walls and fire doors, elevators, valves, pumps, tanks, occupancies, etc.

The final advice given to the inspector before he is sent to the field is that his recommendations must be practical, and that he must discuss any suggestions for improvement, or faults that he has found, with the Management on completion of his visit. With a copy of the last report, the plan, and any other information concerning changes to be made that may affect the quality of the risk, the inspector starts out on his inspection with particular emphasis on the following items—

General

(a) Order and Neatness — This is the most important single item on the report. It indicates to the underwriting official in the insurance company office whether the risk is desirable business or not. This item covers the condition of the plant and all property covered by the policy. It is also a guide to the moral hazard which is associated with each insured property.

(b) Watchman's Service—There are a number of standards for watchman's service, depending on the size of the plant. In large properties hourly rounds are necessary, whereas in smaller properties watchmen can be dispensed with entirely if the sprinkler alarm is connected to a supervisory service. The inspector must check the clock cards and satisfy himself that the rounds are being made as intended.

(c) Water Flow Alarms — All water flow alarms are tested at each inspection. The inspector must therefore be familiar with the various types of alarm check valves and dry valves in use in modern sprinkler systems.

(d) General Construction — The insurance plan gives the inspector the percentage of each general type of construction used in the property. Reinforced concrete, non-combustible or mill type construction is desirable from the insurance point of view. Inferior types, such as boards on joists, are rather frowned on. This is reflected in the basic rate for fire insurance. The inspector checks whether there has been any new construction. If so, he makes a suitable sketch so the plan may be amended.

(e) Fire Doors and Floor Cut-Offs — Going through the plant, the inspector must notice the major fire walls, and determine whether the various floors in a multi-storey building are suitably cut off by proper stairway enclosures, with fire doors at the necessary openings. This also applies to elevators. If a new elevator or stairway is to be installed, it is of course proper for him to indicate that fire doors are needed, and that the enclosure around the stairway or elevator should be of equal fire resistance to the floors themselves. Much work has been done in the protection of conveyor openings through various fire walls and floors. The most recent practice is to protect these openings with spray nozzles where the conveyor is so arranged that an automatically closing door cannot be provided.

The inspector must also give consideration to the largest fire area that is found in the plant. Obviously in machine shops and similar industries much larger areas and values can be underwritten with safety than in cotton mills for example, where the combustibility and value per square foot would normally be high. If in the inspector's judgment, the area appears too large, or has an exceedingly high value, it is in order for him to recommend some practical rearrangement.

Electrical And Wiring

(f) Electrical Equipment — The average inspector is not an electrical engineer. Yet his training should enable him to judge whether the electrical equipment, for both power and lighting, is installed in accordance with the Electrical Code. If there are any parts of the installation that appear hazardous he should mention this on his report. He should, also, be familiar with the type of electrical equipment needed for hazardous locations. Of course it is not necessary that he should have any knowledge of the interrupting capacity of circuit breakers and the short circuit currents that

might be expected. Special engineers are available in the Inspection Bureau Office for consultation and advice.

He should consider what kind of a loss could occur in any part of electrical equipment containing oil, and whether there is sufficient oil to cause a serious fire. Generators, whether steam or water-wheel driven, should in certain cases be provided with special fire protection. If the unit is of such importance that the plant cannot operate without it, a recommendation for the necessary protection is in order. This has particular reference of course to "Use & Occupancy Insurance," where the destruction of a generator worth perhaps $10,000 or $15,000 could shut down a plant whose earnings may total that value per day.

Insurance companies in general have no objection to open wiring, so long as it is properly supported on insulators. Nor do they object to a certain amount of temporary wiring as long as it does not become permanent. They are, however, concerned about the destruction of combustible and lead-covered cables, and it is usual to advocate a wrapping of asbestos tape on such cables behind switchboards or in manholes.

(g) Special Hazards. — All inspection bureaus devote considerable study to the protection of ovens, flammable liquids and gases. The proper recommendations usually request adequate ventilation, oven controls, a proper storage of flammable liquids and the protection of dip tanks and spray booths by special extinguishing equipment.

Protective Devices

(h) Sprinklers — The inspector must also, in his travel through the plant watch for and report any locations where sprinklers have not been installed, and recommend them if they are deemed necessary. Most important in this category is the unprotected shed out in the yard, where the inspector may be told that it contains nothing of value, and on its destruction, the insurance company finds itself in for about a thirty or forty thousand dollar loss.

The inspector must be familiar with all the various types of sprinklers found in mill buildings and their weakness if any. Cold flow of the soldered link due to the proximity of a unit heater may cause premature operation, and the inspector should keep an eye open for this condition. He must also make sure the sprinkler piping is unobstructed by small stones or gravel, and if necessary some of the piping should be dismantled to see that it is clean.

(i) Valve Supervision — All industrial plants should institute a weekly inspection of all sprinkler control valves and other fire protective equipment. The valves are normally sealed open, but the inspectors do from time-to-time find a main control valve that has been shut to effect repairs never reopened. It is surprising how many major losses occur because of a shut valve which perhaps controls four to five hundred sprinklers. It is important to make sure the control valve is located where it is accessible, and outside of the area whose sprinklers it controls. In our survey of industrial properties in 1947, a total of three hundred and thirty-five valves were found shut during regular inspections. The inspector should therefore check the written weekly report made by the plant. During his visit he must test all valves, hydrants, first aid equipment and hose.

Water Supply

(j) Water Supply—Obviously no sprinkler system is effective unless it is supplied with ample water. This is usually supplied from two sources, the first usually being the public mains from the water department of the city where the plant is located; the second from either a gravity tank or fire pump and reservoir. Flow tests are made each year during the summer months, to make sure all valves are open, and that the supply for the sprinkler system remains adequate. Industrial development near the site of the plant may over a period of years so deplete the public water supply that it is no longer adequate for the plant which is being inspected.

A number of years ago a city in Canada found itself without any water. The cause is not important for this illustration, but as a service to the local industry, one of the Inspecting Bureaus made a complete survey of the pump house, distribution system and all other factors which had to be considered. It was determined that the maximum pumping capacity was inadequate to supply the anticipated volume of water which might be required in the heart of the business district, and also that the pipe sizes could not carry the volume of water recommended.

Alternate Supplies

Subsequently additional pumps and other improvements were carried out. But the cost of relaying the distribution mains was considered too high by the City Council. Sometime later, a major fire burned out of control for eighteen hours because of insufficient water to extinguish the blaze. There are many other examples in all provinces where much needed improvement is desirable, and in most of these cases industry has provided independent water supplies for its plants while paying taxes for adequate water supplies that it does not receive.

The secondary supplies are checked by the inspector who makes sure that the gravity tank is full and watertight, and the supporting tower in good condition. Fire pumps are tested during the summer inspection and are always turned over during regular inspections. If electrically driven, the inspector must decide whether the power supply is reliable, and if steam driven, that steam is available all the year round. When taking suction from a river or pond, he must satisfy himself that the suction supply is adequate, and, if under a lift, that priming facilities are available.

Having determined the volume of water available from both sources, the inspector must then satisfy himself that the supply is ample for the sprinkler systems and the largest fire area. For a small plant, a minimum supply of seven hundred and fifty gallons a minute at fifteen pounds on the highest sprinkler is usually considered adequate. For large plants, supplies of three to four thousand gallons a minute at fifty pounds pressure may be necessary. In paper mills and log yards even larger volumes are necessary. Finally, the inspector rates the total supply and extent of sprinklers as a guide to the chief underwriting officer of the Insurance Company.

Buildings

(k) Maintenance and Repairs—This item is rated by each inspector after a plant visit. He rates it, principally, according to the way in which the plant management takes care of the plant generally. Particular emphasis is placed on fire doors, whether floors are overloaded, or the condition of the roof and any advertising signs, and on

Windstorm loss.

the secure fastening of corrugated iron on buildings.

(l) Exposure — The final item is the exposure of the plant to damage from other properties nearby. Severe losses have occurred because fire walls have unprotected openings, permitting adjoining buildings, because of their occupancy, to present a serious potential hazard. A recent example of this in Montreal was the destruction of a gasoline station and several adjoining stores where two firemen lost their lives. Damage in an adjoining property was less than $500 because in this instance a twelve inch brick fire wall afforded good protection and stopped the spread of fire through the whole block.

Special Inspection Reports

In addition to the regular inspections of insured properties, each inspector must be able to make a first inspection, giving full description of the plant buildings, its occupancy, and all other factors which must be considered from the underwriting point of view. He must also be able to write loss reports, the principal object of which is to determine the cause of the loss and to suggest any needed improvements. Loss reports must also contain an estimate of the amount of loss. The inspector must be able to make a " use and occupancy " inspection, during which he considers the supply of essential materials, adequacy of the power supply for the plant, and adequacy of the protection provided for vital pieces of plant equipment in cases where the destruction of one piece of equipment could conceivably shut the entire plant down.

Explosion in cotton mill tanks.

Underwriting

On completion of the inspection, the report is duplicated. Together with any sketches it is then forwarded to the Insurance Company for study by the Chief Underwriting Officer. In the case of a first inspection it is used as a basis to determine the rate at which the insurance should be written.

It is the contention of the companies with which the author is associated that it is a short jump from insurance engineering to sound underwriting and that the reverse is impractical. Consequently, almost all officers of the companies are graduate engineers, and most of them have started with the Inspection Bureau, which serves as a training ground for company employees.

On leaving the Inspection Bureau, the employee's duties broaden. From this point, in addition to discussion of engineering details at an insured property, he must be able to discuss policies, their intent and wording, rates, the financial structure of the insurance company and safe underwriting limits. In soliciting new business, he must not submit for approval risks where the company may expose itself to a loss of such magnitude that its financial structure may be endangered. Good judgment becomes a very necessary attribute in both inspection and underwriting problems, just as it does in any other business, and this may take a long time to develop.

It may be of interest here to discuss briefly the protection provided by a standard fire policy. Very few executives seem to be familiar with this subject, but it is of great importance whenever a loss occurs. The intention of the insurance business is to provide industry in general with all the protection it requires for plant properties, to the end that financial compensation may be obtained no matter what the loss.

The " Fire or Property Damage " Policy pays for the physical loss, while the " Use & Occupancy " or " Loss of Profits Form " covers the accompanying consequential loss of earnings and other continuing expenses. In general, competing forms are nearly the same, although there are differences in the wording of various clauses, as well as minor differences in what it is intended to cover. It is not the intention to discuss this aspect, but to give a rather general outline and indicate the perils that are covered

Wrapping electrical cables.

by Fire and "Use and Occupancy" Policies.

Endorsements to Qualify Statutory Conditions

In Canada, we have two sets of statutory conditions: (a) Those of

(above) Hotel fire.

(right) Transformer fire.

the Province of Quebec and, (b) Those of the rest of the country.

These conditions, set up by the insurance departments of the Provincial Legislatures, are primarily intended to give protection to the small insurance buyer. They are badly in need of revision and are usually amended by the various insurance companies by endorsement to give greater freedom of action, while the restrictive conditions are modified. This endorsement waives the statutory conditions and also includes the additional perils other than fire that it is intended to cover. These are:

(a) Sprinkler Leakage — Obviously, if a property is protected by automatic sprinklers, serious water damage may result from operation of the sprinkler system. In practice we find sprinklers use water more economically than a public fire department. Water damage, therefore, is usually less when sprinklers have been installed throughout a property once a fire occurs. The policy also covers the premature operation of a sprinkler system and pays for damage caused by the discharge from any part of the fire protective system.

(b) Windstorm—While this subject is not of major importance in Canada, we do occasionally experience winds of high velocity during local thunderstorms. The policy provides protection for losses of this type.

(c) Lightning — Damage to any part of the plant, its electrical equipment, chimneys, etc., is covered by the policy.

(d) Explosion — This clause is usually limited and excludes the explosion of pressure vessels, boilers and other equipment for which the assured may or may not have obtained specific insurance. The explosion of unconsumed fuel in a boiler is covered by this clause, but the destruction of the boiler because of an inoperative safety valve would not be covered.

(e) Riot and Civil Commotion—Damage may be caused by strikers, rioters or by a single disgruntled employee. Protection against any of these conditions is available but the intent, under the policy, is to assure the policyholder that if fire, sprinkler leakage or other peril occurs during a strike or riot that the policy is still in force.

(f) Aircraft and Other Vehicle

Damage—This clause is to provide protection for damage which may be done to the plant by an unowned truck or railway car, or even by aircraft should it land on the property.

(g) Smoke Damage—This clause pays the damage caused by smoke resulting from unusual or faulty operation of a stationary furnace. It does not cover any cumulative damage or depreciation.

Standard Policy Covers Replacement Less Depreciation

It should be noted that the standard policy is usually written for the actual cash value or sound value of the property. This figure is the replacement value less what the insurance companies call normal depreciation. This depreciation is not that permitted by the Government for tax purposes, but contemplates good maintenance of equipment and buildings. A recent development is that a policy may now be written for the full replacement value, but this involves the placing of additional insurance, which in total represents the normal depreciation of the property.

Payment is effected in two parts, first, the actual cash value after the loss, and secondly, the depreciation when the destroyed plant is rebuilt. Such a policy should only be written when an appraisal of the property is available so accurate figures are obtainable, since it involves a co-insurance agreement. A co-insurance clause bluntly is protection for the Insurance Company against the dishonest insurer who does not purchase sufficient insurance. It states that the Insurance Company is liable only for that part of the loss that the amount of insurance in force bears to whatever percentage of the actual cash value is stipulated in the form. The actual cash value is determined by an appraisal.

Rates Must Pay Losses Plus Profit and Building Reserve

Finally a word should be said concerning the charges made for insurance. The business is unique in that it pays large sums of money in case of loss, for very little premium income. The basic rate for any property in cents per hundred dollars of insurance is dependent on the construction of the buildings, what they are used for, and the degree of fire protection provided. The rate varies in fully protected properties from four cents per hundred to perhaps twenty cents per hundred, although there are sprinklered rates higher than the maximum figure given. In unprotected properties they run from about twenty-five cents to a maximum of six per cent. In the final analysis, the rate must be such that the premium income from all properties, in any classification, will provide sufficient funds to pay losses, run the business, contribute to catastrophe reserve, as well as provide the company's profit and agents' commission if doing business as a Stock Company.

When one considers that one million dollars insurance a year costs as little as $500, underwriting judgment and rates must be sound if the company is to survive. The increasing amount of fire damage year by year has forced rates upward. It is to be hoped that the appalling waste which one reads about in the daily press will be reduced in the future. This needs education of all citizens in the elementary subjects of good housekeeping, safe installation of equipment, the use of good types of construction and provision of adequate fire protection. The revision of Building Codes in large and small cities is also a requirement.

OIL, AIR-BLAST & MAGNETIC CIRCUIT BREAKERS

(*Continued from page 530*)

valve is closed, the sudden loss of pressure on the control valve side of the release or dump valve moves it to the open position, exposing a port and exhausting the air in the main cylinder. With this sudden loss of pressure and closing force, the circuit breaker contacts return to their open position. Actual operating speeds equal or may exceed those of mechanically trip free mechanisms using collapsible linkages.

This type of mechanism is also ideally suited to high speed reclosing, since there is no " collapsible linkage " to reset before the closing operation can be started. Reclosing time becomes merely a matter of the size of the power unit and the operating pressure.

The speed of circuit breaker contacts is usually about 8 ft. per sec. as they approach the closed or open position. Means must be provided to decelerate the moving parts smoothly and not too quickly, so as to keep the resultant stresses within reason. This does not present a problem in bringing the contacts to rest in the open position, since an appreciable distance can be used for decelerating. An oil dashpot consisting of a cylinder with a snug-fitting piston and orifice-holes in the piston to restrict passage of oil is the usual type of opening buffer.

Deceleration on approaching the closed position is a different problem, since the usual type of contact does not permit much overtravel beyond the normally closed position, and the normally closed position must be reached finally within fairly close tolerances. This problem has been simplified in recent years by the trend to shorter breaker strokes, consequently smaller breaker mechanisms, and by the use of lighter weight, higher strength materials.

A spring type of buffer is usually used to operate against the end of the levers carrying the lift rods. Reduction of linkage masses has in some cases permitted deletion of this buffer and in these cases sufficient retarding force is supplied by the springs backing up the stationary contacts. In England a number of rather unique mechanisms are in use—operated by the energy derived from the explosion of a powder charge.

Maintenance

Speaking in a general way, maintenance of today's oil circuit breakers is chiefly in connection with contacts. Some years ago bushings would have had to be included, especially in the case of outdoor breakers. In the case of air blast breakers maintenance appears to be chiefly concerned with the mechanism and air supply.

Metal clad switchgear has several advantages over open type gear. One that perhaps does not get the emphasis it deserves lies in the fact that by carrying a spare breaker, a regular maintenance schedule can be carried out. This allows each breaker in turn to be thoroughly inspected and tuned up at regular intervals.

Designers are divided into two schools on the subject of adjustments, and both have good reasons for their position. Both schools favour making as complete adjustments as possible at the factory. One, however, leans towards permanently fixing these factory adjustments, whereas the other favours supplying adjustment instructions and making it possible to alter the adjustments in the field. Today's maintenance crews are in general so competent that the latter course appears the better one.

It may be well to mention the possible effects of a couple of typical maladjustments.

(1) Closing buffers, out of adjustment, may allow overtravel that could result in breaking of parts such as the lift rod, or in sharp rebound that may prevent consistent latching.

(2) An auxiliary switch, used to open the trip circuit when the breaker opens, could be the cause of a disaster, if out of adjustment, so that it did not close before breaker contacts touch, when closing on a fault capable of stalling the mechanism.

Breakers in Parallel for High Currents

When air circuit breakers, or knife switches, are required for heavy current circuits, it is the accepted practice to use two or more breakers or knife switches in parallel. This not only avoids the necessity for expensive, low production designs, but also decreases skin effect problems and simplifies the connections. It would be quite logical to use oil breakers in a similar way, but their actual use in this manner is rather infrequent, possibly due to space requirements.

WARTIME AERONAUTICAL RESEARCH & DEVELOPMENT IN GERMANY

(*Continued from page 538*)

on the value of sweepback in delaying compressibility effects. In practice, only about half the theoretical gain in speed at which compressibility effects occur was achieved, mainly because the centre section of swept back wings is devoid of the beneficial effect and this region becomes the critical one. The situation can be improved by employing large spans. It should also be possible to avoid trouble in this region by the use of special fuselage shapes and some work had been done on this at the D.V.L., but since the experiments had not been concluded no results were available. This tunnel appears to have been used on a 24-hour basis. Its work was not confined to basic research, and it seems to have been used extensively for manufacturers' tests on complete aircraft models.

(To be continued)

What the War Has Done to Engineering Education

DR. HARRY S. ROGERS

President,

Brooklyn Polytechnic Institute

The following is a portion of an address delivered at the 1946 Annual Meeting. Unfortunately Dr. Rogers spoke only from notes and a manuscript was not available at the time. The general theme of the address is still as poignant and as important as it was when delivered and should be of considerable assistance to many who are still pondering the problems of engineering education. At the time, Dr. Rogers was president of the American Society for Engineering Education.—Ed.

It is a great pleasure for me to be here today, for more reasons than one. First of all I am not on a busman's holiday, which I suppose one might call the attending of meetings of another society, but I come as president of the American Society for Engineering Education, which belongs as much to you as to the United States. Many members of your Institute have always belonged to the A.S.E.E. and we have held our convention in this delightful hotel.

We have now a larger registration in engineering than perhaps at any time in our history and that brings many problems to us. I am not going to discuss the problems of staff, facilities, conditions and enrollments because engineers always meet such practical problems as they come but I am going to discuss some of the problems in the programmes of engineering education which the war has brought to an hour of decision.

It is too early to appraise with certainty what the final form of new programmes may be, but developments are beginning to take shape and the prospect is that progress can be expected in some measure, if it has not already been determined. Following the practice of engineering educators since the 1940 report of the American Society for Engineering Education, I am going to divide these developments into two classifications, scientific-technological and humanistic-social. In the scientific-technological field we shall continue to emphasize the fundamentals but build our programmes at higher levels and we may expect to see continuing developments accompanied by expanding research. Along with such developments in technical programs we shall have developments in our humanistic-social studies.

The insistent needs of the war brought large research projects into many of our institutions. These projects have developed not alone in the basic fields of mathematics, physics and chemistry but also in the fields of technology, in aerodynamics, airplane structure, electronics, metallurgy, applied mechanics, measuring devices, machine design, servomechanisms, and in instrumentation; in x-ray and industrial radiography, vibration and dynamic machines.

The results of these developments in research are already beginning to find a place in our organized curricula and are advancing some curricula to higher levels in technology and in science. The watchwords of our nations have been "speed" and "high"—high speed for airplanes, high frequencies in communicating and detection devices, high polymers in rubber and plastics and also in textiles, high temperature steels, high tension alloys, and high speed production. The use of these two words over and over again emphasizes what the revisions in engineering education must be. They must carry that education on to higher levels.

Some schools are already preparing their new offerings. New curricula in electronics, both at the under-graduate and graduate levels, have been announced. Many schools are planning advanced work in aeronautics at the graduate level. Others are strengthening their programmes in metallurgy and a few organizing courses in gas turbines. Two of which I know are organizing curricula in applied mechanics. Practically all are looking forward to the continuation of research and to the further development of graduate instruction.

These developments together with the continuing programme of research, will give the student bodies of our institutions advancing programmes of technology at the higher levels. The engineering schools well recognize these needs and the demands and in most instances are well prepared to take care of them.

On the other hand, the question may well be raised: Do they understand the needs and demands in the humanistic—social field with equal clarity? We have laboured long under the scorn and derision of the liberally educated. The epitaphs with which they have labelled us are well known to most of you. We are familiar with the definition of a technically educated man as one who is prepared for earning a living in contradistinction to one who is prepared for living. We have listened to such criticisms at times without looking at them critically and making our own appraisal as to their accuracy. Having grown up in a family of boys who have had liberal educations, I have been unable to discover that they live differently from my friends trained in engineering. The students we have on our campi cannot be differentiated according to the various schools, when gathered together in our social assemblies.

We have been told that the educated man is one who, being in strange places, nevertheless does not feel strange. Now that sounds plausible until you test it to see whether it applies to those educated in various fields, as for instance other professional people as well as engineers. Then you raise the question: Does the mining engineer who travels all over the world feel strange when he is in strange places? Why of course he does not. Nor did the pirates (there is no analogy here) of former periods feel strange in strange places. Most statements to which we have listened for years are sheer nonsense.

To meet the acknowledged need for a wider perspective we have, however, endeavored to broaden our curricula by adding this and that from the liberal arts programme. We have added history that we might prepare our students better for citizenship. We have added psychology so that they might be better prepared for personal adjustment. Have we succeeded in achieving our objectives by such additions? Some of us have always been somewhat sceptical about the merits of such an approach.

The *New York Times*, a couple of years ago, brought out a great campaign to have more history taught in the schools. No one pointed out that the youngsters in school who seem to know most about history are the young communists.

Our boys have been told that, to understand human relationships better, they should take a course in psychology. I don't see how anyone could learn much about human relationships from the introductory courses in psychology given in most schools. They deal with brain physiology, the nervous system and the senses. It certainly would be more appropriate for one to read " How to Win Friends and Influence People " than to study elementary psychology. At least such a reading would call attention to the fundamental art of human relationships.

We have not understood general education, yet we cannot be criticized for it because general education has not understood itself. I always had a suspicion that such was the case and now I know, since the writing of the Harvard Report on education, that suspicion is true. If the general educators, however, will speak frankly and realistically as they did in that report we will be able to get something worthwhile from our associations with them.

We can, however, get some understanding of general education, if we review its history and if we make a critical examination of its present status. I should like to review this history briefly in the period prior to the revolutionary war, through the early period of American history, and through the industrial period up to the World War. Let us contrast the purposes in these periods with the purpose of training for responsible citizenship in a free society, where the obligations to contribute to social cohesion, as one develops his personal talents, are recognized by all.

The Harvard Charter of 1636 says the purpose of the College was " to advance learning and perpetuate it to posterity; dreading to leave an illiterate ministry to churches when our present ministers shall lie in the dust ". The purpose of Yale College was " to train youths for public employments both in Church and State ". The purpose of Dartmouth College was " to entertain as a primary objective the conversion of the Indian to Christianity ".

This form of churchism and classicism came directly to our country from Oxford and persisted up to the revolutionary war. Then Benjamin Franklin in speaking of the American spirit in education said, " the history of commerce, of the invention of arts, rise of manufacture, progress of trade, change of its seats, with the reasons and causes, may also be made entertaining to youth, and will be useful to all. And this, with the accounts of the prodigious force and effect of engines and machines used in war will naturally introduce a desire to be instructed in mechanics, and to be informed of the principles of that art by which weak men perform such wonders, labor is saved, and manufactures expedited ". We did not develop the type of education advocated by Franklin until almost a hundred years later but we did, with the turn of the eighteenth century, begin to get away from the form of education dominated by the Church and to develop secular influences in the early American period of the 19th century.

There is a long and interesting history of the change from religious to secular education which I shall have to omit.

Our next great change in education came with the passing of the Morrill Act in 1862, under which the aim was, " without excluding other scientific and classical studies and including military tactics, to teach such branches of learning as are related to agriculture and mechanic arts in such a manner as the legislatures of the States may respectively prescribe in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life". This new form of education was pretty much that advocated by Benjamin Franklin a hundred years earlier.

We may now take our present programmes of higher education and divide them into three primary functional types, (1) That which is directed toward the abstract, intellectual, moral and esthetic; (2) That which is directed toward personal and professional training, such as law, medicine, dentistry and architecture (I leave out engineering. Do not throw your hands up in horror. I think we are bound to say that our under-graduate studies provide a junior professional training, not a professional one. Our students cannot be admitted to the profession upon graduation. They are required to secure experience in the field before they can be admitted); (3) That which is directed toward the broad economic and social functions of society such as, agriculture, business, industry, home-making and education.

Under the Morrill Act, educators sought to give a liberal and practical education of this last type; it was desired to carry on the liberal aspects of general education in these technical programmes. However, the liberal got crowded out rather rapidly up to the turn of this century. Since that time we have been struggling to get it re-introduced but we have not known how to secure the objectives we hoped to attain. We have inserted courses of history and psychology, which are good enough but which are certainly not designed for the purposes for which we introduced them.

Now I can stand up here and tell you this with great courage because the Harvard Report on Education in a Free Society sustains me in it 100%. For the first time we have had such an acknowledgment from the liberal educators. In that report they say that our schools of liberal arts are really schools in which a great variety of specialties are taught and they say of these specialties that "Specialism is the means for advancement in our mobile social structure; yet we must envisage the fact that a society controlled wholly by specialists is not a wisely ordered society. We cannot, however, turn away from specialism. The problem is how to save general education and its values within a system where specialism is necessary."

Now I have never thought we needed Harvard to tell us that the boy who takes a major in psychology in the liberal arts school comes out just as much a specialist as the engineer. The boy who majors in economics likewise is just as much a specialist as an engineer. The boy who graduates in medicine and who has two, three or four years of liberal arts before his admission to medicine is just as much a specialist as an engineer.

There was a move in New York a few years ago to pass a law that those who sought admission to the practice of engineering must have a liberal arts training before they could be admitted to engineering training. This was predicated on the assumption that such a programme would parallel the programme in medical education. No one who has ever had an opportunity to examine a file of credentials of medical students could make such an assumption or hold such a belief. This is just another idea about general education which is not true. Such an examination will show most premedical students specialize in biological science. To say that the engineer should, therefore, have pre-professional training of a similar type is an entirely false line of reasoning.

In the Harvard Report it is suggested that the cultivation of certain abilities such as the ability to think effectively, to communicate ideas, to make relevant judgments and to discriminate among values should be the goals of general education. If you read the 1944 report of the American Society For Engineering Education you will find that we said the same thing in somewhat different words regarding the humanistic-social stem of engineering education. However, we did not clearly define how those objectives should be attained. We know in general that we seek for a better sense of responsibility among our citizens, that we seek a better foundation for a personal philosophy of life, that we seek an ability of expression and an ability to solve problems in the humanistic-social field with the same dispatch or facility with which we solve them in the scientific-technological field but we are not certain of the methods for developing these.

It is easier to state our objectives than it is to outline the manner in which they can be achieved. The achievement of objectives is the big problem before us in the development of the humanistic-social side of engineering education. Only now have the liberal arts colleges begun to recognize we cannot use the formal courses in history of western civilization, nor the formal courses in elementary psychology. We need new courses in democratic citizenship, new courses in psychology that have as their objective some functional achievement and ability on the part of the individual, courses that look forward to conduct, behavior and action and not solely information.

It will be some time before the progress of instruction in these fields will make it possible for us to obtain what we should have in engineering education. Meantime I think it is encumbent upon us to look at these problems realistically and to stop listening to the nonsense about the lack of culture on the part of the engineer.

We must try to define our objectives in general education more clearly and to determine how they can be achieved. This, I regard as the big task in engineering education, along with the other technological developments which I have mentioned. One of our institutions has inaugurated a five year programme to which new types of courses will be added in the social field. Another has inaugurated a five year programme into which more of these specialized courses of the liberal arts will be added. Another has announced a five year programme which is sort of a cross between the two. What we get out of these developments remains to be seen.

In general, I do not think there will be a great swing toward five-year courses. Only when we have a clearer understanding of our objectives of citizenship and personal development than we now have, will there be such a development. To attain that understanding we need the help of all the engineers in the profession and of the most able leaders in general education.

British Gas Turbine Development

From a report issued by The British Ministry of Information

The use of gas turbines as the power plants of jet-propelled aircraft is now widely known, but few, even in Britain, are aware of the developments which are taking place in other fields of gas turbine applications in the United Kingdom. The gas turbine is the only known type of prime mover which has applications over the whole range of power generation, from high speed aircraft to electric power stations. In the near future we can expect to see this new type of engine at work in locomotives, ships and power stations, as well as in industrial processes.

During the war years industry in Britain was directed towards the immediate aim of victory, to the exclusion of all else. As a result, work on the gas turbine was concentrated on development of the turbo-jet engine for aircraft, where the advantages to be gained in aircraft performance were immediate and obvious. The wisdom of this policy is shown by the fact that at the end of the war, Britain, alone among the allies, had gas turbine jet-propelled fighter aircraft in operation on the Western front. Nations whose fighting forces are now equipped with either Rolls-Royce or De Havilland engines include the U.S.A., Canada, Australia, Argentine, Sweden, Holland, Belgium, France, Switzerland, and Turkey.

Research Centres

The main centre for research on this new type of power plant is the National Gas Turbine Establishment at Whetstone, Leics., and Pyestock, Hants., where all aspects of the gas turbine are studied. Subjects under investigation include the basic problems of airflow, combustion, behaviour of materials at high temperature, compressor and turbine design, stresses in working components including vibration effects, and methods of manufacture. The manufacturing department makes experimental components of new design for test purposes and the results of these fundamental investigations are continually being passed on to industry. Technical assessment of new industrial designs and testing of complete engines is also undertaken.

The Establishment grew from the fusion of Air Commodore Whittle's team of engineers at Power Jets Limited with the gas turbine branch of the Royal Aircraft Establishment, but equally as much time is now devoted to industrial applications as to aero engines. Recent developments include, for example, an improved axial flow compressor and a combustion chamber having a pressure loss less than half that of previous designs; both of these developments are applicable to gas turbines in general. The aim is always to first obtain an understanding of fundamentals through research work, and then to apply this understanding to the design of components of the engines; in other words, to find out " why " before deciding " how ".

Patenting Arrangements

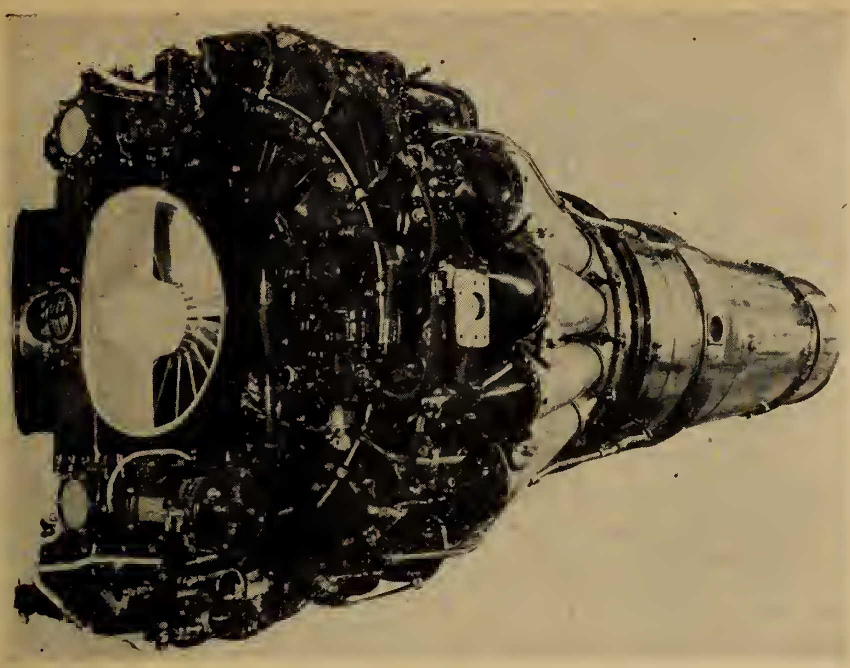
It is the policy of the Government to patent and exploit inventions of commercial importance made in their research establishments. To this end Power Jets (Research & Development) Limited now is a wholly government-owned company, responsible for holding and exploiting in the national interest, patents resulting from Government research and development in the gas turbine field. The Company possesses about 1,700 U.K. and foreign patents. These are based on some 250 inventions covering the early work of Air Commodore Whittle and his associates, and later activities of Power Jets (Research & Development) Limited and the National Gas Turbine Establishment.

To attract foreign manufacturers of gas turbines to British technology the company has recently held two courses at a school at Lutterworth near Rugby. These courses were attended by representatives of about a dozen foreign countries. Lectures were given on all aspects of gas turbine technology, and representatives of British industrial concerns gave talks on special aspects of the problem. Similar courses are also given at the school, for British engineers of the aircraft industry and engineers from marine, railway, and power station concerns.

Marine Applications

In addition, research into marine applications of the gas turbine is carried out in an experimental station on Tyneside under the Parsons and Marine Engineering Turbine Research and Development Association (PAMETRADA). This association has been set up by a number of shipbuilding and marine engineering firms engaged in the manufacture of turbine engines. The work is supported by the Department of Scientific and Industrial Research, and both the firms and the Admiralty advise on the programme to be carried out.

In the marine field the gas turbine scores by its low weight and volume compared with other forms of prime mover. It should offer higher efficiency than steam, combined with cheapness of first cost. Its reliability should be high when elimination of the boilers of the steam plant is considered. Engine room staff will be correspondingly reduced. A number of projects for marine purposes are being developed by British firms. The first marine craft in the world powered by a propeller-driving gas turbine was taken to sea by the Royal Navy in mid-summer 1947. Preliminary trials have been completed satisfactorily. The gas turbine used was developed by Metropolitan-Vickers Electrical Co. Ltd. from the Beryl aircraft engine and has



A British gas turbine achievement of particular interest in Canada. Pictured above is the De Havilland Goblin jet engine which powers the Vampire aircraft recently placed in service by the Royal Canadian Air Force. In contrast to the conventional piston engine which weighs something over 1 lb. per hp. the Goblin weighs only 1,550 lb. and delivers a static thrust of 3,000 lb.—equivalent to 3,000 hp. at speeds between 500 and 600 m.p.h. which are normal for jet engined fighter aircraft.

The single-sided centrifugal compressor and its driving turbine turn at 10,200 r.p.m. for take-off. At this speed, the engine consumes air at the rate of 108 tons per hr. and the jet leaves the tail pipe at 1,100 m.p.h. At this maximum performance the extreme temperatures of the flame tubes approach 2,000°C and the single turbine wheel only 27 ins. in diameter delivers almost 6,000 hp. with blade temperatures close to 800°C.

Engineers familiar with compressor and turbine design will appreciate the magnitude of the problems involved in obtaining such performance as these figures indicate.

been installed in H.M. Motor Gun Boat 2009, a triple-screw craft.

The basis of the engine is an aircraft jet propulsion engine which consists of an axial flow compressor. This supplies air to an annular combustion chamber where diesel fuel is burnt, followed by a two-stage turbine which drives the compressor. The exhaust gases, which would normally constitute the jet, are further expanded through a four-stage turbine coupled to the propeller shaft through gearing. The exhaust from this turbine then escapes to the air through a funnel. The propeller shaft power output is about 2,500 hp. As a next step the Admiralty has ordered larger gas turbine machinery from Rolls-Royce Limited, for installation in a vessel of the escort type, and a unit is also being built by the English Electric Company for a Royal Naval frigate.

Interest in the gas turbine for marine purposes is also shown by private companies. The Anglo-Saxon Petroleum Company intend to carry out gas turbine experiments in the 8,200-ton motor tanker 'Auris' and to this end have ordered from the British Thomson-Houston Co. a 1,200 hp. gas turbine. This company was associated with Power Jets Limited in the early days of gas turbine development. The 1,200 hp. unit is to replace one of the four diesel engines in the 'Auris'. Yet another firm active in the marine application of gas turbines is John Brown & Co., the Clydebank shipbuilders.

Railway Applications

The gas turbine has particular advantages, both actual and potential, in each field of application. For example, in the locomotive field, its advantages over the steam engine lie in its higher efficiency, cleanliness, independence from water, and less maintenance. By comparison with the diesel locomotive it should be cheaper in first cost and considerably less size and weight, thus effecting a great saving in locomotive size and thereby power. In addition, the gas turbine should in future be able to burn either heavy oil or powdered coal, and therefore has a further potential advantage over the diesel. The British railway companies are alive to these possibilities. Last year the Great Western Railway ordered from Metropolitan-Vickers a 2,500 hp. gas turbine locomotive. This engine will soon be on trial, when running experience will be built up. There is little doubt that the next few years will see a growing use of the gas turbine on the recently nationalized British Railways.

Applications to Power and Industrial Processes

In the field of electricity generation, the Central Electricity Board have already ordered from Metropolitan-Vickers a 15,000 kw. gas turbine generator to be installed at the Trafford Power Station of the Stretford and District Electricity Board. The plant should have an efficiency at least as high as, and probably rather higher than, the most efficient steam turbine plant in existence (26 per cent) and will probably be used for peak load duties, where the gas turbine shows to the best advantage by reason of its low capital cost, small volume, quick starting, and other favourable characteristics. A wide use of gas turbines can be envisaged in this field. In the generation of base load power, the gas turbine should be able to offer considerably higher efficiency than the best steam plant. But its use in this field will depend on its ability to burn cheap fuels such as boiler oil or powdered coal, and experiments to this end are proceeding at present. Other possible uses, include the provision of compressed air for industrial processes where large quantities of hot gases are available.

Government and Industry Co-operating

The initiative of private firms, co-operation of the engineering and chemical industries, research sponsored by Government departments including the Ministry of Supply and the Admiralty—all these are making their contribution to progress in the application of the gas turbine. Britain's acknowledged leadership in this field is a good augury both for advancement at home and for the success of the export drive.

Discussion of

Community Planning Standards

The paper "Some Standards and Procedures for Community Planning", which appeared in the May issue of the *Journal* was delivered by the author, J. Alexander Walker, M.E.I.C., at the Annual Meeting in Banff. These discussions were not available for the printing of the May *Journal* and are published at this time because of their valuable contribution to the subject.

W. G. Swan, M.E.I.C.[1]

I have read Mr. Walker's article with considerable interest and am generally in accord with his comments. I was a member and Vice-Chairman of the Vancouver Town Planning Commission from its inception, for a period of six years. Mr. Walker's thinking and my own on this subject are pretty much alike. I might, in fact, be said to be one of his pupils.

Under "Conditions Affecting Townsite Design" Para. (a), "If the townsite is situated on a harbour . . . the business district will be fixed for all time . . . etc." I believe it is impossible to foresee the ultimate growth which will occur on any townsite which is geographically advantageously located. It would therefore be impossible to foresee the final requirements of the business district. In the course of time, as a community continues to grow, there must necessarily be some re-zoning, particularly as between business and residential districts, to accommodate the need of the community for more places of business.

Under the same main heading, Para. (c) "Highways", "In spite of the usual protests from merchants . . . the trunk highway should be located to one side of the townsite." With this, I am entirely in accord, as tourist associations have found that the bypassing of through traffic means a very small loss indeed to any community. Purchases by tourists of any substantial value are made at over-night stops or at the turnaround point of the journey.

Under "Types of Street Patterns", there is reference to the fact under "Rectangular Layout", that no provision is made for any diagonal flow of traffic. This has been found to be true in some parts of Vancouver, particularly in the old South Vancouver area. At least one diagonal highway could have been used to advantage, was subsequently planned and adopted by the City as part of its major streets report and recommendation. It was found later, however, that it involved the acquisition of too much private property and had to be abandoned.

Under "Types of Street Patterns"—the author states that at "angled lots which the radials create, expensive construction results." It is my experience that engineers and architects go to undue lengths to avoid acute and obtuse angles in their building construction. There is no objection to obtuse angles, and unless the acute angles are extreme and wasteful of space, there is practically no difference in the square foot cost of such buildings.

Under "Street Widths", para. 2, "parking should be permitted on one side only." There is always resentment from the owner who is prevented from parking in front of his property. Minor streets should have at least 40 feet between curbs, though it is unnecessary to pave the entire width. This would answer the objection noted above and avoid a good many accidents.

Under "Relationship to Highways", "Others require that . . . from 100 to 150 feet . . . intervening land be dedicated as a park buffer." Unless the railway line passes through a residential area, the best buffer would seem to be an industrial area which is not only economical because of rail service but in addition, the industrial buildings place a damper on the noise created by the railway traffic.

Under "Transportation", reference is made to street services to the waterfront properly co-ordinating harbour and railway activities. This is one phase of the planning which has been given inadequate consideration. It should be the aim of every harbour development to provide a waterfront roadway of ample width between the service lines of the railway and the waterfront structures so that intercommunication between various points can be accomplished with a minimum of interference and delays, interrupted only by switching. Even these can be controlled in the matter of periods of switching. The most effective regulation of switching is that it shall be done after ordinary working hours, and where urgent during the noonhour period.

[1]Consulting engineer, Vancouver, B.C.

Stewart Young, M.E.I.C.[2]

In approaching Mr. Walker's excellent paper several points of view are possible—enlargement of content, criticism of the views expressed, benefit to the engineering profession. Mr. Walker is to be commended on his brief yet comprehensive presentation. From time to time, expression is given of a desire among members of the Engineering Institute for a reliable handbook on Community Planning. I suggest that Mr. Walker's paper sets a worthy pattern for such a handbook.

[2]Director of Community Planning Saskatchewan Government, Regina.

Yet there are details with which one may disagree or at least be critical. For example, the terms 'radial thoroughfares', 'secondary and minor streets', are commonly applied expressions. In reality there should be but one prime breakdown into (1) access streets and (2) trafficways; the last mentioned subdivided into various categories according to the nature and volume of traffic.

A good example of the compulsory type of access street is the dead-end or cul-de-sac. Notwithstanding public opinion and demand for the continuous or through street, much can be said in favour of the closed end street for residence purposes. As long as there are children they will play on our streets, regardless of all laws, controlled playgrounds and whatnot; and the sooner we realize and recognize this condition, the nearer will be the solution of traffic problems in residence areas. Mention is made of maximum gradients of 8 per cent on major streets and 12 per cent on minor streets. Without giving detailed reasons for thinking otherwise, strong exception may be taken to these figures which at least should be reduced to 5 and 8 respectively.

It is agreed that the provision of lanes in residence areas is highly controversial. But when one takes into account the objections, it is possible to classify them in terms of climatic conditions in relation to permissible use of rear yards, fuel consumption and ash disposal and removal. In many areas, rear yards from the point of view of privacy are useless for about nine months in each year, whereas fuel consumption in these months is high. This is the reverse of the conditions obtaining in areas of equable climatic conditions.

Mention is made of the usual size of business lots being 25 feet. For the smaller urban community this is too narrow, 30 feet being the considered desirable minimum for the Prairie Provinces.

Ross L. Dobbin, M.E.I.C.[3]

I would like to discuss Mr. Walker's paper from the viewpoint of an engineer who has to do with the supply of Utilities to the community.

Mr. Walker recommends rounded corners at street intersections. This is a good thing to do; it makes it much easier for traffic, and if known in advance the location of utilities can be made to suit. I would go farther, and not allow any buildings or other structures within ten feet of a corner. This would give good visibility when approaching these corners.

All intersections should be at right angles unless there is a good reason for any variation. Such an arrangement provides for lower costs of utilities, and also makes for the best use of the land.

Streets on the side of a hill should follow the contours as much as possible, and the grade of the roadway should not be too pronounced or there will be difficulties in severe winters. Mr. Walker's statement about grades is very much to the point. Dead-end streets should not be allowed except in special cases. They are hard to serve and tend to become neglected areas. Railway crossings should be kept to a minimum, and railways should not be allowed to use streets as a right of way. Lanes or alley-ways should be at least twenty feet wide, and should be owned by the municipality. They should be paved and cleaned by the city in the same manner as the other streets.

Mr. Walker has something to say about the length of city blocks. The width should not be more than 250 feet and not less than 200 feet. Mr. Walker's suggestions on this subject are very much in order. Width of lots will vary with the type of structure to be erected on them. Certainly a width of forty feet should be the minimum. If the minimum were increased to fifty feet the cost of utilities would be correspondingly higher.

Mr. Walker makes a good suggestion regarding water front properties. These should not be alienated and should belong to the public in perpetuity. A wide roadway should parallel the water front and buildings should be allowed only on the side away from the water. In conclusion I would congratulate Mr. Walker on the excellent common sense with which he has approached his subject.

[3]General Manager, Peterborough Utilities Commission.

List of Nominees for Officers

The report of the Nominating Committee, as accepted by Council at the meeting held on October 2nd, 1948, is published herewith for the information of all corporate members as required by sections 19 and 40 of the by-laws:

President	J. E. Armstrong	Montreal
Vice-Presidents:		
*Zone "A" (Western Provs.)	H. N. Macpherson	Vancouver
*Zone "B" (Prov. of Ont.)	W. J. W. Reid	Hamilton
*Zone "C" (Prov. of Que.)	R. E. Heartz	Montreal
Councillors:		
†Halifax Branch	E. C. O'Leary	Halifax
†Saint John Branch	L. O. Cass	Saint John
†Saguenay Branch	Name to be submitted later.	
†St. Maurice Valley Branch	F. W. Bradshaw	Grand'Mère
‡Montreal Branch	R. N. Coke	Montreal
	E. B. Jubien	Montreal
†Kingston Branch	R. D. Bennett	Kingston
†Ottawa Branch	J. L. Shearer	Ottawa
†London Branch	V. A. McKillop	London
§Toronto Branch	E. A. Cross	Toronto
†Border Cities Branch	Name to be submitted later.	
†Lakehead Branch	Name to be submitted later.	
†Saskatchewan Branch	J. G. Schaeffer	Regina
†Edmonton Branch	J. E. Cranswick	Edmonton
†Kootenay Branch	J. V. Rogers	Trail
†Vancouver	W. N. Kelly	Vancouver

* One vice-president to be elected for two years.
† One councillor to be elected for two years.
§ One councillor to be elected for three years.
‡ Two councillors to be elected for three years each.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

First Report of the Committee on Conservation

Editor's Note:-

At a meeting in Halifax on October 11 of last year, Council asked Dr. A. E. Cameron, M.E.I.C., president of Nova Scotia Technical College to head a committee which would investigate ways and means of implementing the Institute's interest in conservation of the natural resources of the Dominion. At the Annual Meeting in Banff, Dr. Cameron presented the first report of his Committee.

Origin

Section 1 (b) of the By-laws of The Engineering Institute of Canada specifies that one of the objects of the Institute is "to encourage original research, and the study, development and conservation of the Resources of the Dominion". This is a logical objective for the Institute because probably no other single body of Canadian citizens is more intimately concerned with, or responsible for, these important phases of Canadian life. The engineer, by virtue of his training, should be, in fact must be, a conservationist. We take pride in the definition that "an engineer is one who can do for one dollar what anyone else can do for more". Obviously that objective cannot be realized properly if we look only at the immediate dollar. True economics and proper development of natural resources must be founded as much upon the objective of maximum service as that of minimum cost. There is no economy if we denude the headwater areas of a stream of the timber reserves for a quick profit in lumber or pulp, and then are faced with costly problems of flood control or soil erosion. There is no economy in the rapid extraction of the near surface mineral wealth and then high cost development through abandoned workings to recover the additional wealth from depths below the surface. Planning of all these operations, be it cropping of forests, control of floods, irrigation of arid lands, or extraction of mineral wealth, is the work for engineers. Upon us lies the responsibility of the orderliness of development and the maximum use of the products of that development, and these are conservation.

A Committee on Conservation was officially authorized at a meeting of the Council of the Institute at Halifax, October 11, 1947 at which meeting Council unanimously resolved;—

> "that a committee be appointed to explore the situation and advise Council as to the action it should take in order to assist in this important work of conservation and protection of Canada's natural resources".

The Council asked the writer to be Chairman of this committee.

Organization of the Committee

Consideration of the terms of reference of the committee made it obvious that Council had in mind the question of ways and means by which the support of the members of the Institute can be enlisted for a rational and informed programme of conservation. The questions of development and conservation of natural resources, of course, cannot be left to the committee. Each and every one of us must play a part and for obvious reasons the part that each can play must be restricted to his own locality. The prime function of the committee, therefore, must be to keep alive interest in problems of natural resources conservation in each locality and in each phase of the industrial development that is based upon the local resources. In other words, although the committee may be a "headquarters" committee, nevertheless, its work cannot lie at headquarters, but must lie within the branches of the Institute. The make-up of the committee, therefore, has been planned from a regional as well as a resources point of view.

Resources development and conservation are of vital importance to many societies and organizations outside The Engineering Institute of Canada, and the problem of educating Canadians, and particularly Canadian engineers and scientists, to the need of conservation is one which cannot be tackled without the support of all the scientific minds of Canada. There are in existence similar committees in many other organizations. Dominion and Provincial authorities have set up Research Foundations and

Research Councils to study specific problems within the resources development. It appeared that a proper concept of the committee would envisage a membership which would automatically make available the work of those other bodies even though membership of the committee was not exclusively membership in the Institute.

The committee, as finally organized, is composed of the following personnel:—

A. E. Cameron, Nova Scotia (coal mining), Chairman.

H. W. McKiel, New Brunswick (education and research).

Fraser Keith, Quebec (forestry).

Gilbert C. Monture, Dominion (economic).

G. B. Langford, Ontario (metal mining).

Donald M. Stephens, Manitoba (settlement).

G. W. Worcester, Saskatchewan (ceramics and soils).

John A. Allen, Alberta (exploration and prospecting).

William N. Kelly, British Columbia (fisheries).

These make up the committee. Although each is responsible for a specialty within the general problem, their interest will lie well beyond their specialty and will include all phases of development and conservation within their geographic limits.

It is important to note that the committee can act only as a nucleus for the Institute's study of the problems of conservation. Proper Institute approach to the subject must be at branch level and it is to be expected that in time each branch will set up a sub-committee, if convenient, under the chairmanship of a member of the "headquarters" committee, and it will be the responsibility of those branch committees to keep the topic as a live and progressive subject at all meetings of the Branch.

Every technical paper presented at a general meeting of the Institute, at a Branch meeting, or through the pages of the *Journal*, will involve problems of conservation. As has been said, engineering is economics. True economics considers the long range view as well as the short view, and the long range view is conservation.

The Institute Committee on Conservation is set up as a continuing committee. Its objective is the simple one of enhancing the consciousness of members of the Institute in conservation as a vital factor in natural resources development and exploitation. The committee can only function through the branches and therefore can only function with sub-committees within the branches. Dr. John A. Allen addressed the Annual Meeting at Banff upon the problems of conservation within Alberta. It is to be hoped that he established a precedent and that at each general session of the Institute, the local member of the committee will present to the Institute sessions, a general picture of the local situation. Such action alone, however, will not suffice. Every paper presented before the Institute, or in the *Journal*, should emphasize the conservation features of the topic. Discussion on each paper should include consideration of the conservation features of the topic. In that way, we will all become conservation conscious to the benefit of ourselves, the project upon which we are working, the province within which we live, and this Dominion which we love.

Interesting Research in Reinforced Concrete

Creation of a Council to carry out studies and experimental research in reinforced concrete, under sponsorship of the Engineering Foundation, and to interpret the results in the form of a code for the design of concrete structures, was announced recently by Dr A. B. Kinzel, chairman of the Foundation's board. It is anticipated that such a code may permit the use of reinforced concrete in longer span structures than now considered possible and should eliminate much of the uncertainty in design.

The research will be undertaken with approval of The American Society of Civil Engineers, one of the four engineering societies that established the Foundation. It is one of two new projects receiving support from the Foundation this year.

In working with concrete, Dr. Kinzel pointed out, the engineer is dealing with a material in which deformation is not proportional to the stress. In the past, concrete and steel have been combined and the design was based on the incorrect assumption that the strain in the concrete is, as in steel, proportional to the stress.

The Committee on Masonry and Reinforced Concrete, of the American Society of Civil Engineers, has been studying reinforced concrete for several years, Dr. Kinzel explained. This Committee concluded that carefully planned laboratory tests are necessary as a guide to further study and recommended to the Engineering Foundation that the entire theory of reinforced concrete be studied critically with a view to evolving a workable scientific theory for the design of concrete structures.

"Until recently the methods used for the design of reinforced concrete were essentially empirical," Dr. Kinsel continued. "On the basis of results obtained from an extensive set of tests conducted by the University of Illinois and Lehigh University, rational procedures have been established for the design of centrally loaded reinforced concrete columns. These tests demonstrated the inadequacy of the old theory.

Two investigations have been recommended by the A.S.C.E. committee for immediate consideration by the Council.

The first is to be carried on at Ohio State University. Its purpose is to determine the shape of the stress block in reinforced concrete in the compression zone by means of photoelastic methods. This proposed study is a continuation of pilot tests which have already been made at the University.

The second investigation is to be conducted by Professor Richart and associates at the University of Illinois. It will be concerned with reinforced concrete members subject to combined bending and direct stress. It is proposed to build and test 126 eccentrically loaded specimens with varying eccentricity ratios, varying percentages of steel, and for three different strengths of concrete.

More About Ecole Polytechnique's Anniversary

In the " Month To Month " section of our April issue, on page 231, was reported briefly a gathering held at the Windsor Hotel, Montreal, April 15th to 18th, to celebrate the occasion of the seventy-fifth birthday of the Ecole Polytechnique. Following are the highlights of addresses presented by five principal guest speakers.

Dean Ignace Brouillet, of Ecole Polytechnique, saw the engineer as possessing marked aptitude for adaptability. His faculty was striving to prepare students more adequately for jobs in industrial production and in administration of industry. He felt more graduates should take positions with industrial organizations. He concurred with advocates of less specialization in undergraduate training. Engineering fields are so many and diverse today that the young engineer cannot be expected to decide what narrow path he desires to follow after graduation. Sound basic training is of value to him, whatever he may specialize in later.

Dr. Arthur Surveyer divided engineers roughly into two main groups; employees, and consulting engineers and contractors. Employees comprise by far the larger of these two groups. Two major careers open to them today are in industrial production and administration, and in industrial scientific research. Engineering curricula cannot adequately cover all phases of training for both these careers. Young engineers must take up post-graduate work in increasing numbers. Their ultimate success calls for continued self-training through reading and study.

Dean C. R. Young, of the faculty of applied science and engineering, University of Toronto, warned that as dependence of engineering on new extensions and development of scientific knowledge increased, training would become more rigorous, and higher qualifications would be needed for entering students. Pre-university training should be good in *all* subjects, not merely in maths and science. A student with little taste for the " humanities " would not develop it later, nor would he attain marked eminence in the engineering profession. Special opportunities should be accorded the ablest ten per cent of students, to fit them for the creative work on which industry primarily rests. More students should proceed beyond the B.Sc. degree. Ten per cent of all undergradutes should be registering for post graduate work, and undergraduates should get a preview of research methods in their final year.

Dean Adrien Pouliot, of Laval University, traced back in history the great men who have shown their ability to build works comparable in design and performance with those of actual professional men; philosophers, military engineers, artist engineers, scientists like Pascal, Newton, Descartes, Liebnitz and Vauban. All these were definitely imbued with the culture of the past. He expressed the hope that all engineers will understand the value of humanistic-social culture in literature, arts, history and philosophy.

Dr. Augustin Frigon, president of the Board of Directors of Ecole Polytechnique, the speaker at the annual dinner, pointed out that the term "scientific research" is loosely applied today to research for every purpose; actually it means the development of fundamental extensions to the realms of pure and applied science. Though fundamental research is of prime importance, industrial or applied science research must not be overlooked if we are to contribute to the Province's industrial development.

Few industrial firms can afford good research laboratories. Most States, and most of the other Provinces of Canada have established laboratories for the benefit of industries that cannot afford them. A year ago the Polytechnique Centre of Research was set up. It operates independently from the teaching organization, under a chemical professor who had spent a lifetime in chemical research. It is hoped this centre may be the nucleus of a large organization subsidized by public funds. Material and staff used for teaching is an excellent foundation on which to build a scientific research effort.

Changes in Architecture at Toronto

The University of Toronto announces that after fifty years as a department of the Faculty of Applied Science and Engineering, the subject of architecture is to be treated in a separate division. Starting this Fall the School of Architecture will be under the guidance of Professor H. H. Madill, himself a graduate of the Faculty and long associated with the department.

It is proposed that the new school will have a greater freedom in the design of its curriculum, and a greater scope in the integration of those courses which are peculiarly architectural with those in engineering and the humanities.

Meetings of Other Societies

The **American Institute of Chemical Engineers** has arranged a regional conference to be held in Montreal, September 19 to 22, 1949.

The Montreal Conference Committee of the Institute will make details of this meeting available at a later date.

The 18th National Exposition of Power and Mechanical Engineering will be held at Grand Central Palace, New York City, from November 29 to December 4, 1948, during the Annual Meeting of the **American Society of Mechanical Engineers.**

Among the exhibits will be a 2000-hp. fluid drive, a new " Robot-Eye " combustion control, a steam generator featuring provision for quick change-over of fuels, a recently developed method for sterilizing water without heat or chemicals, and extensive exhibits of instruments for control and recording of power plant performance.

The Annual Meeting of the **Society for Experimental Stress Analysis** will be held at the Hotel Commodore, New York, N.Y., on December 2, 3, 4, 1948.

Inquiries should be addressed to the Society, P.O. Box 168, Cambridge, 39, Mass.

Changes of Address

The efficiency of the service which members have a right to expect from Headquarters depends on the accuracy of the members' records.

Have you advised headquarters of your latest addresses and occupation?

Personals

Notes of the Personal Activities of Members of the Institute

Colonel E. C. Thorne, M.E.I.C., of the Export Division, Foreign Trade Service, is travelling in Mexico, Colombia, Venezuela and Cuba. Chief of the machinery, metals and chemicals section of the Export Division, Colonel Thorne is making a survey of the industrial requirements of those countries and discussing details of Canadian machinery and industrial equipment with businessmen in that area.

Col. E. C. Thorne, M.E.I.C.

G. C. Tollington, M.E.I.C., is chairman of the Peterborough Branch of the Institute. He is from Claresholm, Alberta, a graduate of University of Alberta, class of 1932, with the degree of B.Sc. in electrical engineering. He went to Canadian General Electric Company in 1934, followed the test course, and has remained with the Company, where he is now assistant induction motor engineer.

J. W. Millar, M.E.I.C., arrived in August in North Bay, Ont., to take up his duties as chief mechanical officer of the Ontario Northland Railway. Previously, at Squamish, B.C., he had been superintendent of the Pacific Great Eastern Railway. He joined the Canadian Pacific Railways after obtaining a degree in mechanical engineering from the University of British Columbia, and then went to Winnipeg where he worked in the draughting offices. Until four years ago, he served C.P.R. in various supervisory capacities throughout the West, and as far east as Kenora, Ont. He then joined the British Columbia Department of Railways as an inspector, with headquarters at Vancouver. In 1947 he was loaned by the Department to the Pacific Great Eastern Railway.

Dr. R. W. Boyle, M.E.I.C., director of the physics division of the National Research Council retired in October from that position.

Dr. Boyle, who was the Flavelle Medallist of the Royal Society of Canada in 1940, graduated in electrical engineering from McGill University in 1905. He worked under Lord Rutherford in Montreal and in Manchester where he held an "1851 Exhibition" scholarship. He did research on radioactivity, and ultrasonics, for which McGill University granted him both M.Sc. and Ph.D. degrees.

At the close of the first great war, he was in charge of the development of asdics, working in the anti-submarine division of the Admiralty Board of Inventions and Research. Modern submarine detection methods are a straight evolution of that early work. Dr. Boyle was assistant professor of physics at McGill University in 1912. He was then appointed professor of physics at the University of Alberta. He was overseas for three years and after his return was made dean of the faculty of applied science in Alberta. He was appointed to his Research Council post in 1929.

Major A. L. Maclean, of the R.C.E.M.E., returned to Canada, in July, from a tour of duty at Aberdeen Proving Ground, in Maryland, U.S., and was then appointed associate professor of mechanical engineering at the Royal Military College, Kingston, Ont. Graduating from University of Toronto in 1941 with the degree of B.A.Sc., he joined the R.C.O.C. as a lieutenant. Then, a captain in the R.C.E.M.E. he went overseas in 1942. Back in Canada in 1946, he was made officer commanding the R.C.E.M.E. workshop at London, Ont.

C. C. Simpson, M.E.I.C., of Northern Electric Company, was transferred from Montreal to Vancouver in July last. He is manager of power apparatus sales for Alberta and British Columbia. He was in power apparatus sales in Montreal from 1942, when he was transferred by the Company from Edmonton, Alta. He joined the Northern Electric upon graduation in electrical engineering from University of Alberta in 1937.

John E. Boyle, M.E.I.C., who was general manager of the Back River Power Company, left in August for St. Louis, Missouri, to take over the management of the mill of the Western Fibre Company just outside St. Louis at Caseyville, Illinois. Mr. Boyle received the degree of B.A.Sc. from University of Toronto in 1932, and studied business administration at University of Western Ontario.

W. W. Graham, M.E.I.C., of The Shawinigan Engineering Co. Limited, Montreal, has been appointed project engineer, and will be responsible for the design of several of the Company's larger projects. Mr. Graham joined the Company upon graduation from McGill University in mechanical engineering in 1925. He was the engineer representing the Company in the construction of the recently completed Shawinigan Building in Montreal.

J. A. Burke, M.E.I.C., of The Shawinigan Engineering Co. Limited, Montreal, is now general superintendent of construction in charge of all construction work undertaken by the Company. A graduate of University of Alberta in electrical engineering and later in civil engineering in 1937, Mr. Burke has been with the Company since that time, and has been intimately associated with the construction phases of the Company's work.

A. S. Poe, M.E.I.C., of The Shawinigan Engineering Co. Limited, Montreal, has been named project engineer, and will be responsible for the design of several of the Company's larger projects. Mr. Poe graduated from McGill in civil engineering in 1917, saw service in the First World War, and joined the Company on demobilization. For the past several years he has acted as office engineer in charge of design.

G. A. Nicholson, M.E.I.C., accepted the position of town engineer for the Town of New Glasgow, N.S., several months ago. He had been municipal engineer at Pictou, N.S.

T. M. Moran, M.E.I.C., of the British Columbia Electric Railway Company Limited, Vancouver, B.C., was appointed, in July, vice-president with jurisdiction over the gas and transportation divisions, B.C. Motor Transportation Limited, urban and interurban operations, shops and maintenance and the general freight and passenger agent's department. He is also retaining duties with respect to cost control. His former position was vice-president and assistant to the president. He went to British Columbia in 1946, from Toronto, where he was vice-president of Stevenson & Kellogg, Ltd.

T. M. Moran, M.E.I.C.

W. J. W. Reid, M.E.I.C., was appointed, in July, president of the Otis-Fensom Elevator Company Limited, Hamilton, Ont. He is a graduate in engineering of Toronto University and has served in various managerial positions with the Company since 1921. He is a member of the Senate of Toronto University, vice-president of the Association of Professional Engineers of Ontario, and actively interested in affairs of the Canadian Standards Association, and of the Engineering Institute. He was councillor of the Institute representing the Hamilton Branch in 1942-43.

Mr. Reid was with the Royal Canadian Engineers during the first World War, and was widely known as manager of the extensive Bofors Ordnance Plant operated by Otis-Fensom for the Crown during World War II.

F. A. Hunt, M.E.I.C., is at St. Catharines, Ont., an assistant engineer on the Niagara, St. Catharines and Toronto Railway. He was formerly at Toronto, assistant engineer in the Toronto Terminals Division of the Canadian National Railways.

J. E. Sears, M.E.I.C., Ontario Land Surveyor, has opened an office in Toronto. Specializing in summer resort properties, Mr. Sears also has a branch at Huntsville, Ont.

D. A. G. Smith, M.E.I.C., was recently engaged as mining engineer for the Winnipeg Supply and Fuel Company in Winnipeg, Man. He was previously with International Uranium Mining Company, at Edmonton, Alta., and at Yellowknife, N.W.T.

J. L. Halter, JR.E.I.C., was appointed recently as acting electrical superintendent for the Brompton Pulp and Paper Company Ltd., at Red Rock, Ont., with responsibility for all electrical maintenance and installation in the mill and town site. He had been an electrical designer with the Company for over a year. He was employed previously as electrical engineer in the mechanical department of Massey Harris Company, Toronto, after graduating from the University of Manitoba in 1946.

Rex Ford, JR.E.I.C., is chairman of the Junior Section of the St. Maurice Valley Branch of the Institute this year. Mr. Ford is a civil engineer with the Shawinigan Chemicals Co. Ltd., Shawinigan Falls, Que. He was graduated in 1944 from McGill University, Montreal, with the degree of B.Eng., and was a lieutenant in the active service forces from 1944 to 1946.

J. E. Kennedy, JR.E.I.C., is assistant design engineer with English Electric Company of Canada, St. Catharines, Ont. He was previously at Peterborough, Ont., an electrical engineer with Canadian General Electric Company. He graduated in 1946 from University of Toronto, with a B.A.Sc. degree in electrical engineering.

Flight Lieutenant C. E. F. Underwood, S.E.I.C., is now at the R.C.A.F. Station at Edmonton, Alta. He graduated this year from the University of British Columbia with the degree of B.A.Sc. in civil engineering.

W. J. W. Reid, M.E.I.C.

L. J. Debly, S.E.I.C., after graduating in 1947 from University of New Brunswick, with a B.Sc. degree in civil engineering, was employed by the Canadian Bridge Company, Walkerville, Ont., as a structural detailer. In July this year he was sent on loan to the International Nickel Company of Canada, Copper Cliff, Ont.

J. Harris Turner, JR.E.I.C., is with the Singer Manufacturing Company, Thurso, Que., where he is works engineer for the Company. A graduate of Toronto University in 1946, with the degree of B.A.Sc. in metallurgy, he was an engineer with Canadian Liquid Air Co. Ltd., Montreal, until his recent change.

Jean Carpentier, S.E.I.C., is now with the Shawinigan Water and Power Company, Montreal. He received the degree of B.A.Sc. from Laval University this year. He was vice-president of the faculty of science at the University, and president of the electronics club.

Paul R. Brown, S.E.I.C., is with Canadian Westinghouse Company, Hamilton, serving as an engineering apprentice. He obtained his degree in electrical engineering from Nova Scotia Technical College this year.

A. F. Chisholm, S.E.I.C., is now assistant professor of engineering at Dalhousie University, Halifax, N.S. He received the degree of B.Eng. (Civil), from Nova Scotia Technical College this year.

A. H. Boker, S.E.I.C., is secretary-treasurer of the Junior Section of the St. Maurice Valley Branch of the Institute this year. A graduate in mechanical engineering from Queens University, Kingston, in 1947, he is now with Canadian Industries Limited, Shawinigan Falls, Que., as development engineer.

J. D. Kean, S.E.I.C., has been county engineer and road superintendent for Peterborough, Ont., since June last. He attended University of Toronto, his engineering studies being interrupted by service in Canada and overseas with the R.C.E. In 1947 he received his B.A.Sc. degree in civil engineering, and then served as a junior engineer in the East York township of Ontario for a time. He was engineer for East Whitby township before going to Peterborough.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

J. Lorn Allan, M.E.I.C., whose death on September 1st has been reported from Dartmouth, N.S., had been a member of the Institute from 1899. He had been ill for some time and had retired from the position of city engineer for Dartmouth two years ago.

Born in Toronto in 1878, Mr. Allan graduated in civil engineering from the School of Practical Science of University of Toronto in 1900. He also attended Dalhousie University in Halifax. For one year he was assistant to the town engineer at Sydney and later was a draughtsman associated with the American Bridge Company in Trenton, N.J. Between 1902 and 1910 he was assistant to the provincial engineer for the Province of Nova Scotia.

Mr. Allan also played a big part in the development of the Halifax and Eastern Railway between Dartmouth and Musquodoboit between the years 1910 and 1916. He was office engineer for the railway at Dartmouth.

For the last three years of World War I he served as adjutant with the Royal Canadian Artillery in the Halifax Fortress. Following the war he became managing director of the Dartmount Development Company.

There followed some service with the Halifax Harbour Commission in 1929, and it was some time later that he received his appointment as town engineer at Dartmouth.

A Life Member of the Institute, he had joined it in 1899 as a Student. He transferred to Associate Member in 1904 and to Member in 1913. He served as chairman of the Halifax Branch in 1931. Mr. Allan was prominent in the Association of Professional Engineers of Nova Scotia, an honourary life member and past-president of that body.

W. H. Powell, M.E.I.C.

W. H. Powell, M.E.I.C., of Vancouver, B.C., engineer of the Greater Vancouver Water Board, passed away in Hospital on August 11, 1948, after a short illness. He had worked until three weeks before his death in the position which he assumed in 1928.

Twice an Institute prize winner, Mr. Powell was born in Pictou County, N.S., in 1884, and studied at St. Frances Xavier University, and McGill University, Montreal, graduating from the latter in 1909 with a B.Sc. degree. He qualified as a Dominion Land Surveyor, while serving as first assistant and articled pupil to B. J. Saunders, on base line surveys in Alberta in 1909. He served at the beginning of 1910 with the Maritime Bridge Company, New Glasgow, N.S., and later he went west to be assistant on the Dominion Hydrographic Service at Prince Rupert, B.C. During this time he qualified as a B.C. Land Surveyor. He headed a subdivision survey in Saskatchewan for the Department of the Interior the same year, and after miscellaneous surveying practice he entered the service of the city of Vancouver as city surveyor in 1912. He remained in that position for many years, working also as field instructor and lecturer in geodetic surveying and astronomy at the University of British Columbia.

He joined the Greater Vancouver Water District as engineer in 1928. He also served as engineer for the Vancouver & District Joint Sewerage & Drainage Board.

In 1934 Mr. Powell was awarded the Gzowski Medal of the Institute for a paper on the "First Narrows Pressure Tunnel" and three years later he received the Past President's prize for one dealing with "The Need of the Engineer's Participation in Public Affairs."

Mr. Powell, who joined the Institute in 1907 as a Student, transferred to Associate Member in 1913 and to Member in 1918. He represented the Vancouver Branch as Councillor of the Institute in 1928. He was also a member of the Corporation of B.C. Land Surveyors and a trustee of the American Waterworks Association.

Alan H. Munro, M.E.I.C., died on August 30th, 1948, at his home in Peterborough, Ont., where he was born in 1889. He was a graduate of the School of Practical Science, University of Toronto, and had, in the course of a lengthy career, done surveying and construction work in many parts of Canada.

On graduation in 1911 he was with Smith, Kerry & Chace on construction work. In 1912-1914 he was an instrumentman on the Trent Canal, and he returned to this project in 1919, after service overseas with the Canadian Engineers as a sapper and as a lieutenant.

He was connected with various projects thereafter, largely in the hydroelectric power development field. Among them were the construction of hydro-electric power plant of the Ontario Paper Co. Ltd. at Outarde Falls, Que., in 1927; design of a new development for Alcoa Power Company on the Saguenay River, Que., in 1928; projects of the Foundation Company of Canada Ltd. at Cochrane, Alta., in 1929; projects of the Ontario H.E.P.C. in Toronto, in 1930.

Later, with the Ontario Department of Highways, he was located at Hearst, at Bancroft and other points. He was with Polymer Corporation, Sarnia, in 1945.

Mr. Munro joined the Institute as a Student in 1911, transferring to Associate Member in 1920 and to Member in 1940. He was also a member of the Association of Professional Engineers of Ontario.

W. Robert Worthington, M.E.I.C., of Toronto, passed away on August 2nd, 1948, after a two-month illness.

The head of the W. R. Worthington Construction Co. Ltd., which he founded some years ago, Mr. Worthington was born in Toronto in 1881.

A lifelong resident of Toronto, he was a graduate of the School of Practical Science of University of Toronto, receiving the degree of B.A.Sc. in 1905. He had been employed during vacations by the City of Toronto, and on graduation he was made assistant engineer of the Sewer Section. In 1912 he was appointed chief engineer of that section of the city's Works Department, and among the various works designed and constructed under his supervision were the West Toronto drainage system and the Earlscourt & Moore Park Drainage System.

In his younger years Mr. Worthington had been active in track sports and was a keen bowler. He was a member and warden of the Church of St. Alban the Martyr and of the executive committee of the General Synod of the Church of England in Canada. He had been prominent in work with the West End and North Toronto Y.M.C.A.

He joined the Institute as an Associate Member in 1916 transferring to Member in 1940.

Harry L. Dowling, M.E.I.C., Toronto structural engineer, who died in hospital there on August 27th, was born at Bolton, Ont., in 1893.

An engineering graduate of Toronto University, class of 1919, Mr. Dowling had already some structural engineering experience with Dominion Bridge Company Limited, Toronto, when he went to Detroit in 1919 to be structural engineer for Albert Kahn, architect, in that city. In 1920 he was with the Solvay Process Company, Detroit.

Returning to Toronto in 1921 he was structural engineer for Barber, Wynne-Roberts and Seymour, but two years later he joined the Canadian & General Finance Co. Ltd., Toronto. He had been with the Canadian Brazilian Services for many years before his death, serving as a structural engineer.

Mr. Dowling joined the Institute in 1919 as a Student, transferring to Associate Member in 1922, and to Member in 1940.

N. M. Waddell, M.E.I.C., of Fort Garry, Man., a long-service employee of Canadian National Railways, died in hospital in Winnipeg on September 2nd, 1948. He was district engineer at Winnipeg for the Railway.

Born in Glasgow, Scotland, in 1887, he served an apprenticeship in engineering while studying at Technical College. He came to Canada in 1911 and worked at Winnipeg for C.N.R. as a draughtsman on maintenance of way. During the First World War he served with the R.C.E.C. in France and Belgium. On his return to Canada and to C.N.R., he was named resident engineer at Port Arthur, and in 1917 was given a similar position at Brandon, Man., later being named divisional engineer. He was assistant division engineer at Winnipeg for some years before being appointed district engineer there in 1945.

Mr. Waddell joined the Institute in 1919 as an Associate Member, transferring to Member in 1940.

F. H. Cothran, M.E.I.C., of Charlotte, N.C., who was well known for many years in Quebec, passed away at his home on September 1, 1948. He was president of the Piedmont & Northern Railway and the Durham & Southern Railway.

Born at Millway, S.C., in 1879, he studied at Clemson College, South Carolina, and did engineering work for a time in the U.S. Army. He began his engineering career in 1899, and was one of a group gathered to direct the Duke industrial enterprises in the United States and Canada.

During the First World War he directed field surveys for the Quebec Development Company and was in charge of construction on the Saguenay River projects. In 1923 he became vice-president and general manager of the Alma and Jonquiere Railway, the Duke-Price Power Company and the Quebec Development Company. Then for a time he was chief engineer of the Piedmont and Northern Lines. Later, in 1929, he headed hydro-electric projects for the Beauharnois Construction Company. After doing consulting engineering at Charlotte, N.C., for some years, he accepted the presidency of the aforementioned railroading organization in 1937.

Mr. Cothran joined the Institute in 1926 as a Member.

Robert N. Wornock, M.E.I.C., president of Charles Warnock & Co. Ltd., Montreal, died suddenly on August 23, 1948.

Mr. Warnock was born in Montreal in 1909. After graduating from Royal Military College, Kingston, Ont., he entered McGill University, receiving the degree of B.Sc. in civil engineering in 1931.

He entered the firm of inspection engineers founded by his father and was first occupied on inspection and office duties. He became secretary-treasurer in 1932 vice-president in 1936 and finally president, upon the death of his father.

Mr. Warnock joined the Institute as a Student in 1931, became a Junior in 1936, an Associate Member in 1938, a Member in 1940.

P. P. LeCointe, M.E.I.C., of Montreal, passed away May 3, 1948.

Born in Paris in 1882, Mr. LeCointe studied engineering at the Ecole National des Points et Chaussees in his native city, graduating as a civil engineer in 1908.

He did railway work in France, but came to Montreal in 1911 and was assistant designing engineer for Montreal Water Works for a time, before being named technical assistant to the superintendent of the Works. In 1916 he joined the Road department of the City of Montreal, as office engineer. The next year, however, he became professor of Industrial Chemistry at Ecole Polytechnique, Montreal, and remained until 1930. He then established a consulting engineering practice, retaining it until 1946, when he became engineer for the Jean Bonnel Societies in Montreal.

Mr. LeCointe joined the Institute as a Member in 1938. He also held membership in the Corporation of Professional Engineers of Quebec and in the Societe des Ingenieurs Civils de France.

Dow Vernon Conning, M.E.I.C., who was chairman of the board of education of Peterborough, Ontario, passed away on August 16, 1948, after a short illness. A graduate of McGill University, Montreal, Mr. Canning had been connected with Canadian General Electric since 1921.

He was born at Brockville, Ontario, in 1899. He received the degree of B.Sc. from McGill in 1921 and then entered C.G.E.s test course. He then served for 7 years as a switchboard engineer, and in 1931 was made chief design engineer on industrial control equipment. For the past year he was manager of the Company's Industrial Controls Division.

Active in civic affairs, Mr. Canning was elected to the Peterborough Board of Education in 1942 and was a member up to the time of his death, having served as chairman in 1947 and being re-elected to that post for 1948. For four years he was chairman of the Board's Property Committee. He was also a member of the Board of Health, and had been working on a plan of amalgamation of the city's health services.

Mr. Canning had become a Member of the Institute in 1939.

G. A. L'Hoir, M.E.I.C.

Georges A. L'Hoir, M.E.I.C., who was director, manager and owner of L'Hoir Aluminum & Stainless Steel Products, Inc., at Levis, Que., died on June 12, 1948.

Mr. L'Hoir was born in Jemappes, Belgium, in 1880. After finishing his studies and obtaining his certificate as an engineer of mines at the University of Mons, he obtained a degree as electrical engineer from the University of Louvain, completing these studies in 1903. Then, until 1914 he directed a metallurgical industry at Bouillon, Belgium, the "Ferronnerie Bouillonnaise." He installed the central hydro-electric plant at Bouillon, and was consulted on electrical work.

Volunteering for war service in 1914, he was taken prisoner at Namur but, escaping, rejoined the English forces. Back in France he entered the service of the Belgian general command at Paris and was sent as engineer to the Schneider Works at Le Creusot, France, war material and munitions factories. He was delegated by that organization to the United States as consulting engineer on the construction of a plant at Philadelphia, Pa., for the fabrication of a French-type shell.

Returning to France he participated in the Yser campaign. After the war he concerned himself with the aluminum and steel industries, owning and operating the Cie. d'Aluminum at Liege, Belgium; and the Societe Anonyme L'Aluminum du Nord, Salesmes Nord, France. It was in 1939 that he founded the plant at Levis.

Mr. L'Hoir joined the Institute as a Member in 1945.

Gerord Rousseau, S.E.I.C., student at Ecole Polytechnique, Montreal, died on August 22nd, 1948. He was in his 22nd year.

Born in Montreal, Mr. Rousseau was in his final year of engineering, having entered the Ecole from Plateau Academy, Montreal.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Montreal

In response to the demand for more plant visits, the following visits have been arranged for this Autumn:

October 16th: Canadian Tube & Steel Co.

November 27th: Imperial Oil Company.

The Entertainment Committee is making plans for a Dance to be held on February the 11th. It is hoped that the members will give their support to this event and ensure the same success as last year.

Members are reminded that membership certificates and badges are available at E.I.C. Headquarters and can be obtained upon application.

Junior Section

Leo Scharry
Secretary-Treasurer

On September 7, 1948, there was held an important meeting to adopt the programme of activities for the fall session of 1948. As lined up by the Papers Committee chairman, it was unanimously adopted. This fall, a diversified programme is offered to all members of the Montreal Branch, and is listed in detail as follows:

October 4th: (Opening Meeting)—**Effective Speaking** by Mr. Kurt Swinton. Refreshments served.

October 18th: (Technical: Mechanical)—**Magic of Heating Controls** by Mr. W. J. Robinson of Minneapolis Honeywell Co.

October 29th: (Social) — Oyster party. Preston Hall, Drummond and Dorchester St., at 8 p.m.

November 1st: **Services of a Bank** by Mr. J. L. Davignon, Assistant-General Manager of Banque Canadienne Nationale.

November 15th: (Non-Technical) — Students' Night and Film Night.

November 29th: (Technical: Civil)— **Building Materials for the Modern Home** by Mr. Paul Lapointe, Architect.

December 3rd: 4th Annual Dance at the Ritz-Carlton.

December 13th: (Social)—Ladies' Film night. Light refreshments served.

PUBLIC SPEAKING CLASSES

On Opening Night the subject of Mr. Swinton's talk will be—**How to Speak in Public.** This talk was purposely placed on this date because the executive wishes to organize a public speaking class. At present, Mr. Morrison has consented to be the monitor of such a class if the attendance on the part of members of the Junior Section warrants such a step.

RESIGNATIONS

Bob Killam who had been McGill University Staff Representative for the last three years has tendered his resignation as such. It was regretfully accepted by the Executive.

J. N. Galli who had offered his services to organize the Public Speaking group last spring has sent in his resignation. He is presently stationed at Iroquois Falls doing construction work. His resignation was accepted by the Executive.

OYSTER PARTY

The Executive of the Junior Section has set up a committee to organize an Oyster Party which will be the first in the annals of the Montreal Section.

Date: October 29th, 1948; Place: Preston Hall, Drummond and Dorchester St.; Time: 8 p.m.; Price: $3.00 per person. Members of the Senior Section are most cordially invited.

The hall is not large and the committee does not wish to overcrowd it. A limited number of tickets only is available, and late-comers must regretfully be turned away.

Tickets may be obtained by contacting: Bill Smith, Northern Electric Co. (WI. 3131, Loc. 461); Léo Scharry, Wagner Electric Co. (LA. 8193); or at the Institute Headquarters.

POST-GRADUATE COURSES

Would anyone interested in evening courses in Electrical Engineering (Power Section), leading to a Master's degree in Electrical Engineering, please get in touch with Jack Hahn, 2101 University St. (BE. 6298 after 6 p.m.) Such courses could possibly be arranged if enough interest is shown.

DANCE

November 29th, 1948.

Arrangements for the 4th Annual Dance are completed, and tickets may be obtained at the Institute Headquarters, or by contacting: John Bateman (BE. 3913); Léo Scharry (LA. 8193), or any councillor.

Saguenay

J. E. Dyck, M.E.I.C.
Secretary-Treasurer

On Friday, August 27, the Saguenay Branch was host to the presidential party which included President and Mrs. J. N. Finlayson of Vancouver, Vice-President and Mrs. R. S. Eadie of Montreal, Vice-President and Mrs. W. L. Saunders of Ottawa, Vice-President A. Larivière of Quebec, and General Secretary L. Austin Wright of Montreal.

The party was conducted on an industrial inspection tour of the Arvida Works of the Aluminum Company of Canada, Limited and the Shipshaw Power Development. This was followed by a dinner meeting of the Branch in the evening.

Addressing the Branch, Dean Finlayson advocated a maximum of co-operation between the Institute and other professional organizations and added that this would be discussed at the Annual meeting to be held at Quebec City in May, 1949.

In the matter of helping the young engineer starting out in his profession, Dean Finlayson said that he feels a great deal of responsibility falls on the Institute and that it is intended to place particular emphasis on this phase of its work.

Vice-President A. Larivière of Quebec, stated that the next Annual Meeting will be held in Quebec City, and he hopes that a large representation from the Saguenay Branch will be able to attend. He assured the Branch that those attending will find the meeting both profitable and enjoyable.

Vice-President W. L. Saunders of Ottawa discussed highways he had inspected in the Saguenay District. Having driven from Quebec to Chicoutimi on the old highway, he felt that the new highway under construction was definitely needed. He added that the new road, when completed, would be one of the best in Canada and would increase tremendously the tourist traffic into this district.

Vice-President R. S. Eadie of Montreal stated that he was disappointed in the lack of papers submitted for the Phelps Johnson prize and hoped that young engineers would become more interested in writing technical papers for submission to headquarters. Mr. Eadie also discussed briefly the fixed-arch Aluminum bridge to be erected over the Saguenay river at Shipshaw. Its erection, he said, will probably start in the spring.

Dr. Wright discussed the growth of the Institute, to over 10,000 members, making it the largest professional organization in Canada. He added that half the membership is made up of Student and Junior members who should have a definite voice in the policies of the Institute. He assured the Branch that any suggestions and opinions submitted to Headquarters are seriously considered. Dr. Wright reminded the Branch of the Annual Meeting to be held in Quebec in May, 1949, and stated that a paper would be given on the Aluminum Bridge at Shipshaw.

Chairman H. R. Fee expressed the appreciation of the Branch to the members of the presidential party before closing the meeting.

❖ ❖ ❖

Some World Problems, was the topic of an address given by Dr. R. C. Wallace, principal of Queen's University, to the Saguenay Branch of the Institute on September 8, 1948.

Dr. Wallace pointed out that Canada is in a favourable position in that she possesses the natural resources necessary to make her economically strong. The war had made money available for the development of these resources, which condition still exists. He added that, to carry any weight in world conferences, a nation must be strong economically as well as in a military sense. Canada is becoming an industrial nation since large quantities of cheap power so necessary for such development are available in this country.

In connection with industrial research, Dr. Wallace stated that, where large corporations such as the metal and chemical industries have carried on extensive research programmes, they have prospered, while those who have neglected to do this, as in the case of some coal mining concerns, have experienced economic difficulties.

Dr. Wallace pointed out the need for industrial research for small concerns who, in many cases, can not afford to set up research departments. He cited a case in England where a large number of companies in the same field had set up a common research section. This development work was financed jointly by the Government and the companies concerned. The idea of combining with one's competitors in a common research programme was not agreeable to some at first, but results in England have been very favourable.

Dr. Wallace, in speaking of Britain, said she is still in a poor position economically, but that he feels optimistic about her ability to work out her difficulties. As far as nationalization of industry is concerned, he believes that Britain will not go much farther along this line. In a world where different political ideologies are being tried, Dr. Wallace professed his belief in a true democracy, and defined the democratic way of life as one in which people abide by the majority decision, freely given by an intelligent people.

In connection with the effect of world conditions on our young people, Dr. Wallace said that a tendency toward unrest, and an attitude of living for the present instead of the future, are being created. He believes that since the future of the world depends upon the younger generation, they should be made to see the true values in life that do not change with the times, and taught to meet the future with courage and optimism.

C. J. Tanner thanked the speaker on behalf of the Branch.

Vancouver

Alan M. Eyre, Jr.E.I.C.
Secretary-Treasurer

Stuart Lefeaux, Jr.E.I.C.
Branch News Editor

On Wednesday, August 18th, members of the Vancouver Branch were guests of the B.C. Sugar Refining Company for a plant inspection tour and luncheon. Seventy-five members gathered for the occasion and were divided into eight parties to tour the eleven-acre plant.

The parties were first shown the main bulk storage bin where approximately thirteen million pounds of raw sugar can be stored for processing. The raw sugar arrives at the refinery wharf in jute bags from Fiji, British West Indies, and other plantation centres. The refining process is carried on largely by gravity flow in the nine-story main building. The separation of the pure sugar crystals from the sticky film of raw sugar syrup is accomplished with centrifugal machines; the raw sugar is then filtered through cloth and allowed to percolate through " char ", an animal charcoal, to remove the last trace of color. The white liquor is then concentrated under vacuum to form crystals of granulated sugar. The wet sugar is dried and screened to size and then packed by machinery for marketing. Other products such as brown sugar and syrup are obtained by the blending of syrups in the processing. Molasses is obtained as an end product; it is the final syrup containing all the impurities not removed in the refining process.

The refinery has its own steam electric plant consisting of two 1250-kw. turbo-generators and two coal-fired boilers of 72,500 lbs. per hour capacity at 475 p.s.i. and 650 degrees Fahrenheit total temperature. Approximately 450 people are employed steadily to meet the constant demand for the products. The refinery capacity averages 600 tons daily to supply Western Canada markets.

After developing huge appetites on the inspection tour the members were treated to an excellent luncheon at the plant cafeteria. The Chairman introduced the company executives responsible for the trip; Fred Ballou, M.E.I.C., chief engineer; Don Stewart, assistant chief engineer, Bill Perry, plant superintendent; Bill Blankenbach, chief chemist.

George Allan, vice chairman of the branch, was congratulated on arranging the most enjoyable outing for the Vancouver Branch.

BOOK REVIEWS

INDUSTRIAL ENVIRONMENT AND ITS CONTROL:

J. M. Dallavalle. London, Toronto, Pitman, 1948. 225 pp., illus., 9¼ x 6 in., cloth, $5.00.

Reviewed by L. C. A. Walford*

The opening sentence in the preface to the book reads "This book is intended chiefly for engineers interested in controlling those factors of the industrial environment which affect the health and welfare of workers". Gathering as it does, between two covers, a great deal of information which is otherwise obtainable only by searching through many books and periodicals, the book should be of value to a much wider field than the comparatively restricted one of the engineer; both management and union organizations could profit by the reading of it and the student should find it useful not only as a text, but also as a work of reference.

The first chapter is most interesting; the author has attempted to indicate the scope of industrial hygiene and in doing so leads the reader to the conclusion that whilst industrial hygiene is a very laudable objective and one which can be of great benefit to the community, it should also be considered only as one small aspect of a virile public-health programme. This chapter merits careful and thoughtful reading.

Taking the reader through the elements of Psychrometry in Chapter 2, the author discusses industrial air contamination in the form of dusts, gases and vapours; tables indicating permissible tolerance of these are included.

Separate chapters are devoted to Illumination and Radiant Energy—to Noise, Vibration and Fatigue and to the Thermal Environment.

The last six chapters treat of the practical methods which may be undertaken to eliminate or reduce air contamination. Much of the subject matter of these chapters will be recognized as having appeared in other publications during recent years. The value of it here is that a mass of material has been brought together in one place and presented in a clear straightforward manner with an adequate number of tables and illustrations. The discussion concerning filter efficiency is provocative and reflects dissatisfaction with the manner in which data applicable to filters is currently presented.

An appendix is a reiteration of the basic principles of Industrial Sanitation and an outline of the basic requirements for a safe and healthful environment for the workers. At the end of each chapter will be found a useful bibliography from which it will be seen that the author of the book under review has also produced a number of other books and articles.

Mr. Dallavalle, for many years an engineer in the U.S. Public Health Service, has indicated what is desirable and what is safe practice in the field of Industrial Environment.

**Wiggs, Walford, Frost, and Lindsay, Consulting Engineers.*

ABSTRACTS

INSTITUTION OF ELECTRICAL ENGINEERS

Summaries of Papers to be Read in London, first half Session 1948-49.

Aids to Training—the Design of Radar Synthetic Training Devices for the R.A.F.

G. W. A. Dummer.

Seventy types of ground synthetic trainers were designed during the war. Their scope varies from the provision of simple artificial echoes to the reproduction on the ground of a complete AI Night Fighter Interception.

Fixed Resistors for use in Communication Equipment, with Special Reference to "High-Stability" Resistors.

P. R. Coursey.

Begins with a history of the development of resistors for use in telecommunication equipment, and outlines the construction and properties of eight differing types of resistors, the differing characteristics of which determine uses for which they are most suited.

Protection of E.H.T. Overhead Lines against Lightning.

H. M. Lacey.

Object of this paper is to present, as briefly and simply as possible, the available knowledge relating to the protection of overhead lines, and of apparatus connected to overhead lines, against the effects of lightning.

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

A.S.T.M. STANDARDS INCLUDING TENTATIVES, 1947 Supplement, 5 Parts.

Part I-A, Ferrous Metals, 403 pp.
Part I-B, Non-Ferrous Metals, 319 pp.
Part II, Nonmetallic Materials—Constructional, 463 pp.
Part III-A, Nonmetallic Materials—Fuels, Petroleum, Aromatic Hydrocarbons, Soaps, Water, Textiles, 437 pp.
Part III-B, Nonmetallic Materials—Electrical Insulation, Plastics, Rubber, Paper, Shipping Containers, Adhesives, 305 pp.

American Society for Testing Materials; 1916 Race St., Philadelphia, Pa., 1947-1948. illus., diagrs., charts, maps, tables, 9 x 6 in., paper, $4.00 each.

These supplements give in their latest approved form some 330 specifications, tests, and definitions which were either issued for the first time in 1947 or revised since their appearance in the 1946 Book. The five separate parts correspond to the division of the triennially published complete Book of A.S.T.M. Standards: ferrous metals; non-ferrous metals; nonmetallic materials constructional; and two parts covering other nonmetallic materials, such as fuels, soaps, textiles, insulation, plastics, rubber, paper, etc.

BRITISH STANDARDS INSTITUTION. STANDARDS:

London, The Institution, 1948.

BS 381C: 1948 — British Standard Colour Card for Ready Mixed Paints.

Provides range of ninety-three colours. Large size specimen cards of each colour will soon be available from the Institution.

BS 720: 1948 — British Standard for Calibration of Carburettor Jets.

Applied to jets for all types of engines. Maximum fuel flow dealt with is 15,000 miles per minute. Defines and describes standard reference jets.

BS 904: 1948 — British Standard for Instrument Jewels.

Includes three types of compass jewels, and V-jewels, ring stones and end stones.

BS 1170: 1947 — British Standard for Treatment of Water for Marine Boilers.

Stresses need for training in control of treatment by testing. Deals with maintenance of boiler plant at full availability. Principles of chemical treatment are explained. Appendices give specifications for chemicals and reagents, detailed accounts of testing, methods recommended, and other data.

BROADCAST OPERATORS' HANDBOOK:

Harold E. Ennes. N.Y., Rider, 1947. 265 pp., illus., 8¾ x 5¾ in., cloth, $3.30.

This book covers the engineering development of broadcast equipment and its practical operation. The first four parts of the book cover operating practice in control rooms, the master control, remote controls, and the transmitter. The fifth and sixth sections discuss technical data for operators and technicians, including comprehensive preventive maintenance instructions; operational data for transmitter meters and indicators are included in the appendix, which is followed by a bibliography and index.

CONSTRUCTIVE LABOUR RELATIONS; EXPERIENCE IN FOUR FIRMS:

R. A. Lester and E. A. Robie. Princeton, N.J., Princeton University, Industrial Relations Section, 1948. (Research Report No. 75). 115 pp., 9¼ x 6 in., paper, $2.00.

The purpose of this report is an intensive study of a number of specific operating situations in which union-management relations were considered to be successful. Four companies, representing four different industries, are discussed in relation to the union with which each is associated. In each case the factors considered are labour relations in general, economic factors, company organization and administration, union organization and administration, and union-management relations.

DIESEL ENGINEERING HANDBOOK, rev. ed., 1946-47:

L. H. Morrison, editor. N.Y., Diesel Publications, 1947. 962 pp., illus., 9½ x 6 in., fabrikoid, $8.00 (in Canada).

The book opens with a discussion of the principles of combustion in general, going on to the evolution of diesel engines and descriptions of the various types of diesel engines. A chapter is devoted to each part of the engine, with detailed descriptions of its functions and operation. The last chapter is devoted to an outline of engineering fundamentals for diesel operators. There are many detailed illustrations.

FLOW THROUGH STANDARD NOZZLES, ORIFICE PLATES AND VENTURI TUBES:

J. R. Finniecome. Manchester, Emmott, 1948. (Mechanical World Monographs No. 39). 84 pp., illus., 7½ x 5 in., paper, 3/-.

This booklet is a survey of the general theory and test data relating to the rounded nozzle, the sharp-edged thin plate orifice, and standard types of venturi tubes. General formulae, standard dimensions, standard measuring devices and other such data are given, as well as information on such factors as the compressibility of air and steam; the variation of the critical pressure ratio for nozzles, etc. Formulae and graphs on the flow through measuring devices; graphs on kinematic viscosity; and charts on the Reynolds Number of air, steam, and water flowing in pipes, are included. Numerous charts and graphs are used throughout.

INCOMES OF PROFESSIONAL ENGINEERS IN PUBLIC EMPLOYMENT:

Arthur Richards. Chicago, American Association of Engineers, 1947. 24 pp., illus., 8½ x 5½ in., paper, $1.00.

The purpose of this pamphlet is to assist engineers and their employers in arriving at just agreements regarding salaries of engineers. Some of the subjects discussed are a classification of engineering positions; suggestions for beginning salaries; a comparison of salary increases to the cost of living; the salaries in different types of organizations. Illustrations and charts are used.

INTERNATIONAL CIVIL AVIATION ORGANIZATION. PUBLICATIONS:

Montreal, ICAO, 1948.

Air Mail Study (Doc 5348-AT/654). *50c.*

The purchaser of the air mail service rendered by an airline is invariably a government agency, and for that reason the airline, even if privately owned, becomes in a sense a government instrumentality; this raises a number of special problems in the international field, which are discussed here.

Final Report of the Personnel Licensing Division, Third Session. (Doc 5408-PEL/535). *50c.*

Gives a report on working arrangements; and recommendations for international standards and recommended practices. Discusses licences for pilots in all capacities, and other flight crew members.

Minutes and Documents of the Legal Committee, First Session (Doc 4635-LC/71). *75c.*

Includes the constitution of the Legal Committee, a summary of the documentation submitted at the first session, and the proposed agenda for the first session, as well as the minutes and documents of the meetings.

LITERATURE SEARCH ON THE SOLVENT EXTRACTION OF OLEAGINOUS MATERIALS, WITH ADDITIONAL REFERENCE TO BY-PRODUCTS FROM THE SOLVENT EXTRACTION OF PEANUTS:

B. H. Weil, Marjorie Bolen, and Nathan Sugarman. Atlanta, Georgia School of Technology, 1948. (Special Report No. 26). 190 pp., 8¾ x 5½ in., fabrikoid, $4.00.

This bibliography on the solvent extraction of oil from oily materials, and primarily from oilseeds, was prepared in an effort to gather together an indexed, annotated, expanded bibliography of the pertinent literature. The references included deal with the preparation of the seeds for extraction, solvents used, processes and apparatus involved, methods for separation of the various constituents following extraction, and uses of by-products from the process.

RADIO AMATEUR'S BEAM POINTER GUIDE:

John F. Rider, N.Y., 1948. 30 pp., illus., 11 x 8½ in., paper, $1.00.

This is a book of tables which show the direction — in degrees clockwise from the north—that an antenna should be oriented so that the radiated beam will go to any location on the earth. The tables are for nineteen cities in the United States and three foreign cities, but they can be used practically in any location in the United States. Detailed explanation of the tables is given.

RUBBER IN TEXTILE FACTORIES:

Colin Macbeth. London, British Rubber Development Board, 1948. 135 pp., illus., 8½ x 5¼ in., paper, apply.

This book deals with power transmission in textile factories, but what is said applies to any works wherein power is used. Some of the subjects treated are solid woven, cord constructed and accessory belts in cotton mills; V belt drives and vulcanised joints for belts; rubber in bleaching, printing, dyeing, and finishing of piece goods; its use in factories dealing with yarns in hank form; the manufacture of various utensils and garments, buckets, jugs, ladles, boots, and sheet rubber, as well as rubber bonded metal.

The following notes on new books appear here through the courtesy of The Engineering Societies Library of New York. The books are available at the Institute Library.

APPLIED PLASTIC PRODUCT DESIGN.

R. L. Davis and R. D. Beck. Prentice-Hall, Inc., New York, 1946. 285 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00.

Special design considerations are emphasized in this outline of fundamentals for those who wish to take full advantage of the possibilities. Mold practice, thread formation, inserts, decoration of molded parts, extrusion methods, laminated parts, and parts made from sheets, rods, and tubes are dealt with in separate chapters. Economic aspects and the properties of plastics are briefly discussed, and there is a glossary of technical words.

BATTLEFRONTS OF INDUSTRY, Westinghouse in World War II.

D. O. Woodbury. John Wiley & Sons, Inc., New York; Chapman & Hall, Ltd., London, 1948. 342 pp., illus., 9¼ x 6 in., cloth, $3.50.

This book which shows how American industry worked during the last war is primarily the story of Westinghouse's contributions. Such products as electric torpedoes, jet propulsion units, and atom bomb manufacturing equipment are considered. Two chapters on fissionable materials are included.

DIARY AND SUNDRY OBSERVATIONS OF THOMAS ALVA EDISON.

Edited by D. D. Runes. Philosophical Library, 15 East 40th St., New York, 1948. 247 pp., illus., 9 x 5½ in., cloth, $4.75.

Presents some of Edison's social and philosophical views by including a section of his diary of 1885 and other selections from his writings during the period 1921-1930. These include Edison's comments on the social effect of some of his inventions such as motion pictures and the phonograph and on such general topics as prevention of war, life after death, music, and education. The editor does not indicate the source of the material.

HEATING, VENTILATING, AIR CONDITIONING GUIDE 1948, 26th Edition.

American Society of Heating and Ventilating Engineers, 51 Madison Ave., New York, 1948. 1280 pp., plus Roll of Membership, 144 pp., illus., diagrs., charts, maps, tables, 9¼ x 6 in., fabrikoid, $7.50.

This standard manual constitutes both a textbook and handbook on the design and specification of heating, ventilating and air conditioning systems. The technical data section has been substantially revised to include present knowledge and engineering practice. A new chapter on corrosion and water-formed deposits, their cause and prevention, has been added. In the catalog section 230 manufacturers are represented. A convenient cross-index provides access to the more than 900 pages of technical information.

INTRODUCTION TO COLOR.

R. M. Evans. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 340 pp., coloured plates, diagrs. charts, tables, 9¾ x 7 in., linen, $6.00.

This book covers the combined effects of the physical properties of light, the properties of vision itself, and the action of the mind in interpreting colour. It is a completely non-mathematical text, and only a knowledge of the first principles of physics and psychology is assumed. There are sections which are of interest to photographers, artists, designers, engineers, and manufacturers of paints, textiles and coloured papers. The technical data are presented mainly in the form of graphs for more effective use.

QUALITY CONTROL.

N. L. Enrick. Industrial Press, New York; Machinery Publishing Co., Ltd., National House, West St., Brighton 1, England, 1948. 122 pp., diagrs., charts, tables, 9¼ x 6 in., fabrikoid, $3.00 (38c postage to Canada).

This book intended for the practical man explains statistical quality control in generally understandable terms. The author has confined himself to the essential methods and has purposely omitted all unnecessary refinements and formulas. The two concluding chapters show where and how statistics and probability enter into modern inspection.

REINFORCED CONCRETE DESIGNER'S HANDBOOK.

C. E. Reynolds. 4th ed. Concrete Publications, Ltd., 14 Dartmouth St., London, S.W.1, 1948. 351 pp., charts, tables, 9¾ x 6½ in., cloth, 15s.

Of interest to the designer and engineer, this volume considers the factors of design of reinforced concrete structures and describes numerous applications. Loads and pressures; calculations of bending moments and forces generally, and with reference to particular structures; and determination of stresses and the design of members are considered. No attempt is made to deal with construction except in so far as the work on the site affects that of the designer. The procedures recommended are in agreement with the 1948 British Standard code of practice for reinforced concrete buildings.

ROTARY VALVE ENGINES.

M. C. I. Hunter. John Wiley & Sons, New York, 1946. 216 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $5.00.

This book, now available from an American publisher, is a reprinting of a British book previously reviewed as follows: The author describes the general principles and applications of the rotary valve in detail, and draws comparisons between it and the poppet valve for use on internal-combustion engines. The development of the rotary valve up to the present time is also discussed with descriptions of various rotary and semi-rotary systems applied to various types of old and modern engines—steam, gas, and gasoline. A brief final chapter presents the author's conjectures on the future development of the rotary valve.

SUBSTRUCTURE ANALYSIS AND DESIGN.

P. Andersen. Irwin-Farnham Publishing Company, Chicago, Illinois, 1948. 305 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.50.

Emphasizing solutions to the problems of the designing engineer, this text deals exclusively with the analyses and designs of those portions of a structure which are located below the surface of the ground, water, or both. The first chapters are devoted to methods for evaluating lateral earth pressures with direct applications of these theories to the design of flexible bulkheads. The material on soil bearing power deals with allowable soil pressures. Another chapter discusses the current practice in footing design. Piles and groups of piles are considered at length. The last seven chapters present specialized phases of substructure analysis, extending into the fields of pier, dock and breakwater design.

SURVEY OF PERSONNEL PRACTICES IN LOS ANGELES COUNTY as of August 1, 1947, Bulletin No. 14.

Compiled by R. O. Sensor and M. F. Martin. California Institute of Technology, Industrial Relations Section, Pasadena 4, California. 45 pp., tables, 11 x 8½ in., paper, $2.50.

This condensed study covers work schedules, premium pay, incentive pay plans, wage schedules, job evaluation plans, holiday pay, shift differentials, and union representation. The information is presented in the form of detailed tables, and directions for the effective use of the data are given in the introduction.

SYMPOSIUM ON LOAD TESTS OF BEARING CAPACITY OF SOILS

(Special Technical Publication No. 79). 50th Annual Meeting, American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa., 1948. 148 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $3.00; to A.S.T.M. members, $2.25.

This volume is a compilation of recent information on the subject of load tests. The seven papers presented deal with applications of load test results to airport pavements and runways, pavement design, and cyclic load-test procedure. There are illustrations and much discussion. Also included is a bibliography of 76 references in addition to author's references.

Although the following new books are not available in the Institute's library, inquiries concerning them may be directed to the library or to the publishers.

ARGONARC WELDING (Collected Papers on Argonarc Welding presented to the LM.3 Committee on Fusion Welding of Magnesium-rich Alloys).

British Welding Research Association, 29 Park Crescent, London, W.1, May, 1947. 44 pp., illus., diagrs., charts, tables, 11 x 8½ in., paper, 7s. 6d.

The four papers collected in this publication give the results of certain investigations on the welding of magnesium alloys using the inert gas, argon, for shielding the arc. Diagram and tabular data are effectively used to illustrate and supplement the text.

AUDEL'S HOUSE HEATING GUIDE including Ventilating and Air Conditioning.

F. D. Graham. Theo. Audel & Co., 49 West 23rd St., New York, 1948. 966 pp., illus., diagrs., charts, tables, 6¾ x 4¾ in., fabrikoid, $4.00.

In simple question and answer style this manual covers in detail all aspects of operation, control and maintenance. Over 900 diagrams and photographs illustrate not only such mechanical characteristics sa internal constructions, piping, covering, etc., but also an elementary treatment of the thermal physics of water, steam and air. The book is designed to provide self-instruction for the house owner, building superintendent, maintenance man, and practical engineer. (*Continued on page 565*)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

October 20th, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the November meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

LIBRARY NOTES

(*Continued from page 563*)

CHEMICAL ENGINEERING ECONOMICS, 3rd ed.

C. Tyler. McGraw-Hill Book Company, New York, Toronto, London, 1948. 321 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00.

The purpose of this book is to assist the chemical engineer in dealing with the economic aspects of his work. This thoroughly revised edition contains material from fourteen contributing authors. It considers research, process development, plant location and design, plant operation and control, marketing, and general management. The essential aspects of cost accounting and patent law are also included. An outstanding feature of the chapter on market development and research is a selected bibliography on methods and sources of information.

CHEMICAL FORMULARY, Volume VIII.

Edited H. Bennett. Chemical Publishing Co., Brooklyn, N.Y., 1948. 448 pp., diagrs., tables, 8½ x 5½ in., cloth, 7.00.

This eighth volume contains new formulas which extend and bring up-to-date the first seven volumes. Many German formulas received from the Allied Intelligence Corps, and just released, have been included. Another feature is the enlarged directory of sources of chemicals and supplies.

COPPER AND COPPER ALLOYS.

O. W. Ellis. American Society for Metals, 7301 Euclid Ave., Cleveland, Ohio, 1948. 184 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50.

This series of lectures presented at the 1947 National Metal Congress begins with a short historical development followed by a general consideration of the metallurgy of copper. Succeeding chapters deal with the melting of copper and its alloys, with the complex alloys of copper and zinc, and with complex bronzes and other alloys of copper. Over 100 references, 28 tables and some 50 figures supplement the text.

EFFICIENT USE OF STEAM, written for the Fuel Efficiency Committee of the Ministry of Fuel and Power.

O. Lyle. His Majesty's Stationery Office, London, England, 1947. 912 pp., diagrs., charts, tables, 10 x 6 in., cloth, 15s.

This comprehensive work, a companion volume to the previously published "Efficient Use of Fuel", discusses the design, operation, control and maintenance of equipment for the use of heating, power, and process steam. The necessary minimum of theory is given, accessories are covered in detail, necessary tables and formulas are appended for quick reference, and a detailed index is provided. The book is designed not only for the steam specialist but also for the factory manager and any other non-technically trained persons who are concerned with steam.

ELECTRIC POWER STATIONS, Volume 1, 3rd ed.

T. H. Carr, with a foreword by Sir L. Pearce. Chapman & Hall, Ltd., London, 1947. 513 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 36s.

The opening chapters deal briefly with the fundamentals of station design and construction. Succeeding chapters give detailed information on the following major topics: circulating water systems; cooling towers; coal-handling plant; ash-handling plant; pipework; turbines; and a large section covering the boiler plant. A bibliography accompanies each chapter.

ELECTRICAL SOIL STERILIZATION BY IMMERSION HEATERS. Technical Report, Reference W/T14.

C. A. Cameron Brown and P. Wakeford. British Electrical and Allied Industries Research Association, 15 Savoy St., London, W.C.2, 1947. 17 pp., illus., diagrs., charts, tables, 11 x 8½ in., paper, 6s.6d.

This report describes an experimental investigation into the conditions governing the sterilization of soil for horticultural purposes by insulated heating tubes. Working details are given of actual sterilizers made up and worked successfully for several seasons.

ETUDE DE L'ETAGE AMPLIFICATEUR A RESISTANCES.

J. Schérer, préface E. Fromy, Dunod, Paris, 1947. 124 pp., diagrs., charts, tables, 9¼ x 6 in., paper, 480 frs.

This study considers analytically and functionally the stages of resistance-coupled amplifiers, taking into account the action and effects of the various included elements. The respective importance of these elements is taken into consideration, and certain approximations are worked out for the simpler aspects of the problems involved.

FRACTURE OF METALS.

M. Gensamer and others. American Welding Society, 33 West 39th St., New York, 1947. 84 pp., 9 x 6 in., paper, $1.00.

This booklet is a summary of review of the literature and direct interviews with outstanding men in the field. It is divided into two parts. Part I includes the original survey of the literature and an analysis of the theories of fracture and applications of principles. Part II considers a selected group of the more important and basic new results of research. In addition to a bibliography of over 300 references, a recommended research program is outlined.

HYDRAULIC MACHINERY.

S. R. Beitler and S. J. Lindahl. Irwin-Farnham Publishing Co., Chicago, Ill., 1947. 217 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50

Based on a course in hydraulic machinery for upper class students in mechanical engineering, this volume describes briefly the theory and practice of a variety of apparatus. Following a review of the fundamentals of the subject are chapters dealing with pipes, meters, weirs, flumes, pumps and turbines. Compressible fluid flow and fluid drives are also considered. Problems are found at the end of each chapter.

METHODS-TIME MEASUREMENT.

H. B. Maynard, G. J. Stegemerten and J. L. Schwab. McGraw-Hill Book Co., New York, Toronto, London, 1948. 292 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.75.

In practical language, this manual shows how to develop production standards without the use of the stopwatch, both in the shop and office. It describes the procedure involved in determining the motions required to perform an operation and it shows how to assign predetermined time standards to each limiting motion. Valuable in methods improvement, it enables the methods engineer to handle many types of engineering work with greater facility than ever before.

MICROWAVE TRANSMISSION CIRCUITS. (M.I.T. Radiation Laboratory Series, Vol. 9.)

Edited, G. L. Ragan. McGraw-Hill Book Co., New York, Toronto, London, 1948. 725 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $8.50.

The problems of the transmission of power from one place to another at microwave frequencies are fully discussed from a practical point of view. The elementary theory of operation and the complete design procedure are described for many essential components of transmission lines. Consideration of power-handling capacity, loss, and convenience of use are discussed in relation to the best choice of the type of transmission line for a given application. Methods for extending the frequency range for good operation are also treated.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment.*

Situations Vacant

CIVIL

RECENT GRADUATE, preferably civil, with some construction experience required for construction inspection work by large oil company in the west. Work will involve extensive travel and long periods absent from headquarters. This position provides opportunities for advancement. Salary open. Apply to File No. 1005-V.

CIVIL ENGINEER, construction experience, Bailey Bridging in the army preferred, to supervise erection and inspection of Bailey structures on projects in Ontario. Salary open. Apply to File No. 1007-V.

CIVIL ENGINEER with extensive experience in the use and design of Structural Steel. Duties primarily Public Relations with Architects, Engineers and Public Bodies and he will be required to act as Secretary of a Dominion Association. Headquarters Toronto. Salary $4,800 up. Apply to File No. 4201-V.

CIVIL ENGINEER required for South America. Must be single and between the ages of 25 and 40 years. Duties include: Supervise field survey parties doing triangulation and control work, perform drafting and layout work for construction projects as well as miscellaneous minor and major construction projects. Salary $390 U.S. currency. Apply to File No. 4221-V.

ELECTRICAL

RECENT GRADUATE in electrical engineering required by an industrial organization in Montreal. Salary open Apply to File No. 4214-V.

ELECTRICAL ENGINEER recent graduate, required as Assistant Professor in Electrical Engineering and work would be largely supervision of Laboratory classes. Salary $2,500 to start, summers free to take other employment. Location Maritimes. Apply to File No. 4218-V.

ELECTRICAL ENGINEER required by consulting office. Should have at least seven years experience in layouts for substations, switching, and motor distribution. Permanent position and good salary for right man. Location Northern Ontario mining district. Apply to File No. 4220-V.

ELECTRICAL DRAUGHTSMAN required by consulting firm. One capable of making detailed plans and diagrams from preliminary drawings prepared by designers. Work consists of layouts for substations, switching and motor distribution systems. Permanent position. Location Northern Ontario. Salary open. Apply to File No. 4220-V.

ELECTRICAL DISTRIBUTION SUPERVISOR required for South America. Preferably single and 35 years of age or more, with 10 years industrial experience. Duties include direct supervision of all power transmission and distribution lines, transformer stations, lighting installations, etc. Must have ability to direct and lead other skilled personnel. Salary $450 U.S. currency Apply to File No. 4221-V.

* Filled since appearance in Employment Bulletin.

MECHANICAL

MECHANICAL ENGINEERS with 3 to 5 years experience in mechanical design and general plant engineering, as well as field work required by firm in Quebec. Salary open. Apply to File No. 1001-V.

MECHANICAL ENGINEER required by firm in Province of Quebec to work mostly on mill design and layouts of new mill and improvements to others. Salary open. Apply to File No. 1001-V.

MECHANICAL ENGINEER required as assistant Superintendent for small establishment employing 60 men. Must have complete knowledge of machine shop methods in precision work, capable of making accurate estimates machines' times preparatory to bidding. Salary open. Apply to File No. 1002-V.

MECHANICAL ENGINEER, for design and development work, in large Montreal food industry. Must have 5 to 10 years experience, including some structural work. State age and full experience. Salary open. Apply to File No. 1008-V.

MECHANICAL ENGINEER, with considerable experience in all kinds of Brass-Valves (including foundry work) required as Production Manager in Ontario. Must be alert and aggressive. Salary open. Apply to File No. 1009-V.

MECHANICAL ENGINEER with about five years experience in the design of tractors and related accessories required as Automotive Engineer by one of Canada's leading manufacturers of heavy mechanical equipment. Salary open. Apply to File No. 4206-V.

MECHANICAL ENGINEER with at least ten years experience in general mechanical design in heavy engineering required by a large manufacturer in Montreal. Salary open. Apply to File No. 4206-V.

MECHANICAL ENGINEER with a minimum of five years experience in the design of hydraulic turbines, penstocks, surge tanks and associated hydraulic equipment. Required by well established firm in Montreal. Salary open. Apply to File No. 4206-V.

GRADUATE MECHANICAL ENGINEERS required by Canadian University in Montreal for Sessional appointment as Instructors and Demonstrators for seven months from October 1st, 1948. Apply giving qualifications and salary required. Apply to File No. 4207-V.

*MECHANICAL ENGINEER recent graduate, required by a Montreal firm handling heavy construction equipment, for general duties. Salary $225 up. Apply to File No. 4217-V.

JUNIOR MECHANICAL ENGINEER required by Canadian manufacturer in Toronto for general duties. Must be highly competent. Salary open. Apply to File No. 4219-V.

SENIOR MECHANICAL ENGINEER required in Toronto by Canadian manufacturer must have at least twenty years experience and would be responsible for all mechanical work in General Engineering Division. Salary open. Apply to File No. 4219-V.

MINING

MINING ENGINEERS for design and layout work also some field work required by firm in Province of Quebec. Salary open. Apply to File No. 1001-V.

MISCELLANEOUS

SALES ENGINEER required by well known manufacturer's representative, long established, handling electrical and engineering equipment including power and lighting transformers, to take charge of Montreal office. Bilingual preferred. Salary in accordance with experience. Apply to File No. 1006-V.

HEATING AND VENTILATING ENGINEER, graduate, required for Montreal Head Office of a Canadian Company for design, specification, and layout of Air-conditioning, ventilating, fan and duct work for industrial processes, factories, offices, and dust removal collecting systems, etc. Supervision of field installations, testing and making estimates. At least five years experience with the above. Must be familiar with all kinds of heating systems and relative apparatus equipment and with sheet metal, air duct work. Salary open. Apply to File No. 1015-V.

MECHANICAL OR CIVIL ENGINEER with four to five years experience in stress analysis of mechanical and structural equipment required by a large manufacturer in Montreal. Salary open. Apply to File No. 4206-V.

*MECHANICAL OR CHEMICAL ENGINEERS with five to ten years experience on maintenance and engineering in the oil industry required by a manufacturer in Central Ontario. Salary open. Apply to File No. 4208-V.

INSTRUCTORS AND DEMONSTRATORS required by a Canadian University for session beginning September 20th, 1948, particularly in Electrical Engineering and in Engineering Problems and Drawing. Salary open. Apply to File No. 4209-V.

SENIOR STAFF MEMBER required by Canadian University. Must have degree and industrial experience to teach Fluid Mechanics, Internal Combustion Engines, Refrigeration and Heating and Ventilation, all at IV year level. Salary open. Apply to File No. 4210-V.

SALES ENGINEER, mechanical background, required for sales engineering also general duties by a Montreal firm. Must be bilingual. Salary around $300. Apply to File No. 4212-V.

VILLAGE ENGINEER required by Village of Crystal Beach, Ontario. Applicants state qualifications and salary expected. Apply to File No. 4215-V.

SENIOR DRAUGHTSMAN with from 3 to 5 years experience required by an oil company in the Montreal area. Preferably under 35 years of age. Salary $250 to $300 per month. Apply to File No. 4216-V.

DRAUGHTSMAN required by manufacturer in Toronto. Standard draughting training is essential with a minimum of five years of actual paper mill machinery experience in the development and layout of the mill and its equipment. Salary open. Apply to File No. 4219-V.

HYDRAULIC ENGINEER at least 30 years of age with experience in hydraulic turbine design, Pelton Wheel design, hydraulic valve design and preferably with experience in river control required in Toronto by Canadian manufacturer. Salary open. Apply to File No. 4219-V.

GRADUATE ENGINEER with broad experience is required by manufacturer in Toronto must have experience in the design of small and large steam boilers together with their associate equipment, plate work and pressure vessel experience are essentials. Salary open. Apply to File No. 4219-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years of experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

CHEMICAL ENGINEER for technical department of pulp and paper firm in the St. Maurice Valley. Applicant must have supervisory capacity and also be able to undertake investigational work involving the coordination of laboratory experiments and mill operations. Salary open. Apply to File No. 4130-V.

CHEMICAL ENGINEER, recent graduate required for position in Technical Department of a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 4181-V.

CHEMICAL ENGINEER with around two years experience required by large Pulp and Paper Mill in Province of Quebec Salary $250 per month. Apply to File No. 4199-V.

CIVIL

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Dept., Works Dept., also construction of a general nature for the Electric Light Dept Salary open. Apply to File No. 3930-V.

CIVIL ENGINEER around 30 years of age required as Assistant City Engineer of small city in Province of Quebec. General duties eventually to replace City Manager. Salary $3,000 to $3,600 according to qualifications. Apply to File No. 4144-V.

CIVIL ENGINEER, qualified to take charge of all town services including water and electric (distribution system) utilities required by a Town in Nova Scotia. Population 4,000. Salary open. Apply to File No. 4147-V.

CIVIL ENGINEERS required in Eastern Ontario for employment as designers of service systems for housing and other building projects. Preferably men with at least 10 years experience in that line. Salary according to qualifications. Apply to File No. 4156-V.

CIVIL ENGINEER recent graduate with up to one year's experience since graduation. Preferably single man. Required by Northern Ontario Paper Mill. Salary around $250. Apply to File No. 4158-V.

*CIVIL ENGINEER required for mechanical logging department. Recent graduate, single. Must be prepared to spend major portion of time in field work. Salary open. Apply to File No. 4168-V.

CIVIL ENGINEER required for Consulting Engineer and Land Surveyor's office in Western Ontario. Must be able to make urban and rural surveys, layout of sewers, waterworks and pavements, etc. Will applicants please state qualifications and references. Salary open. Apply to File No. 4204-V.

CIVIL ENGINEER with considerable experience in structural steel and reinforced concrete design. Preferably bilingual. Required in Montreal. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4205-V.

ELECTRICAL

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery design, lab. etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

*JUNIOR ELECTRICAL ENGINEER, required by a mining company in northern Ontario. Salary open. Apply File No. 4028-V.

GRADUATE ELECTRICAL ENGINEER required for position with large Northern Ontario Paper Mill. Preferably man with some paper mill or other industrial experience. Salary commensurate with qualifications and experience. Apply stating experience and qualifications to File No. 4032-V.

ELECTRICAL ENGINEER, age 30-40, required as Sales Engineer for Electrical Power Apparatus Company, manufacturing motors, transformers, rectifiers, switchgear, etc. Test course graduate specializing in switchgear preferred. Sales experience desirable but not essential. Location Toronto. Salary open. Apply to File No. 4128-V.

ELECTRICAL DESIGNING DRAUGHTSMEN for work with a firm of consulting engineers in Southern Ontario. Must be experienced. Salary up to $300. Apply to File No. 4133-V.

ELECTRICAL ENGINEER required for Toronto area for engineering and design of power transformers. Salary will be commensurate with ability and experience. Apply to File No. 4141-V.

ELECTRICAL ENGINEER required as Senior Transformer Draughtsman by Canadian Company in Ontario. Must be experienced in layout and design of high voltage power transformers also capable of assuming responsibility. Salary open. Apply to File No. 4146-V.

ELECTRICAL ENGINEER preferably with some experience in paper industry required by large Pulp and Paper Mill to work under Electrical Superintendent. Salary $300 to $350 per month. Apply to File No. 4199-V.

MECHANICAL

MECHANICAL ENGINEER required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in re-inforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3994-V.

*MECHANICAL ENGINEER required in Ontario by a firm specializing in machine tools. Applicant must be experienced in production control. Salary open. Apply to File No. 4026-V.

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment hoists, simple steel structures, etc. Salary $240 up, depending upon ability. Apply to File No. 4030-V.

MECHANICAL ENGINEER wanted for the position of Chief Engineer in large general Mechanical Engineering Plant in the Montreal area. Position covers supervision of mechanical product design also tool and process layout for manufacturing, preparation of estimates, shop drawings, bills of material and ordering of all material for contracts. Salary open. Apply to File No. 4066-V.

MECHANICAL ENGINEER required in Montreal with considerable experience in machine shop practice and some administrative experience in shop work. Applicant should be around 35 years of age and bilingual. Salary depending on qualifications. Apply to File No. 4100-V.

JUNIOR MECHANICAL ENGINEER, age 25 to 27 years, preferably with three to four years experience required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 4114-V.

MECHANICAL ENGINEER with at least ten years experience including plant maintenance and preferably in the pulp and paper industry required in New Brunswick. Salary open. Apply to File No. 4117-V.

MECHANICAL ENGINEER with knowledge of design and considerable experience with steam and diesel engines and refrigeration equipment. Required in Montreal. Preferably bilingual. Must be veteran with overseas service. Applicants should state age, experience and salary expected. Apply to File No. 4137-V.

MECHANICAL ENGINEER OR DRAUGHTSMAN with minimum of four or five years experience. Knowledge of paper mill engineering desirable but not essential. Required by large Pulp and Paper Mill for general engineering design and draughting. Salary up to $400 depending on qualifications. Apply to File No. 4138-V.

MECHANICAL ENGINEER, around 35 years of age required as Assistant to Project Engineer on consrtuction of large pulp plant. Experience in design and piping essential. Duties in Montreal and British Columbia. Salary $5,000 to $6,000. Apply to File No. 4149-V.

*MECHANICAL ENGINEER recent graduate required in Engineering and Servicing Department of Canadian Firm with Headquarters in Montreal. Duties include service work in connection with Railway, Pulp Mill and other Industrial Products. Salary open. Apply to File No. 4150-V.

MECHANICAL ENGINEER required for sales engineering by large engineering company. Age 25 to 30 years and preferably veteran. Salary around $275.00. Apply to File No. 4165-V.

MECHANICAL ENGINEER, recent graduate, required for manufacturing and related duties with well established reputable paper company. Salary open. Apply to File No. 4172-V.

*MECHANICAL ENGINEER with three to five years experience required in Montreal by well established paper company for duties involving machine design, plant and general engineering. Salary open. Apply to File No. 4172-V.

*MECHANICAL ENGINEER, recent graduate, with some industrial background required for engineering department of a manufacturer in Central Ontario. Salary open. Apply to File No. 4183-V.

MECHANICAL MAINTENANCE ENGINEER with twelve to fifteen years experience required by Toronto office of Canadian firm. Must be between the ages of 35 and 40 and preferably located in the Toronto area. Salary open. Apply to File No. 4191-V.

MECHANICAL ENGINEER recent graduate, required by a manufacturer of carpenters and mechanics' tools in Province of Quebec. One year training period in United States. Salary $225 Apply to File No. 4202-V.

GRADUATE MECHANICAL ENGINEERS for Sessional appointment as Instructors and Demonstrators for seven months from October 1st, 1948, required by Canadian University in Montreal. Apply giving qualifications and salary required to File No. 4207-V.

METALLURGICAL

METALLURGICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

RECENT GRADUATE in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 3981-V.

MINING

MINING ENGINEER with several years experience required by a Company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

* Filled since appearance in Employment Bulletin.

DETAILER AND DESIGNER for reinforcing steel with considerable experience required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

*STRUCTURAL STEEL CHECKER AND ONE DETAIL CHECKER wanted for large fabricating plant in Vancouver, B.C. Age between 30 to 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

STRUCTURAL ENGINEER required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training etc. Salary open. Apply to File No. 3951-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of water-proofing compounds. Salary open Apply to File No. 3968-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships. Good salary, permanent position to the right man. Apply to File No. 4031-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experienced in installations of production and cost control, wage incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

SALES ENGINEER for popular line of Diesel Engines. Applicants must be specialists on Power Units and Generator Sets, required for permanent employment with well established organization. Apply to File No. 4055-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience between 30 and 40 years of age required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

POWER STATION OPERATOR with about five years' experience principally in operation and maintenance of turbines and mechanical equipment of hydro-electric plants required by public utility in Brazil. Preferably not over 30 and single but will consider married man without minor dependents. Replies held in strictest confidence. Salary open. Apply to File No. 4073-V.

SALES ENGINEER required by well known engineering supply company doing business with Mining and Pulp and Paper companies. Excellent opportunity for advancement. Travelling not extensive. No experience necessary but desirable. Salary open. Apply to File No. 4079-V.

RECENT GRADUATE MECHANICAL OR ELECTRICAL background required by engineering firm in Montreal. Duties include training in Public Utility in Administration Department. Eventually for South America. Salary to start $225. Apply to File No. 4089-V.

JUNIOR ENGINEER preferably with a few years experience in production control and some knowledge of the textile industry required for Montreal area. Salary $250 to $275. Apply to File No. 4092-V.

SENIOR INDUSTRIAL ENGINEER with business administration and mechanical background, bilingual, with at least five years experience in production control, wage incentives and cost control required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 4092-V.

SENIOR DESIGNER with from five to ten years experience and a general knowledge of structural design in relation to buildings and bridges required by a steel company in Southern Ontario Salary open. Apply to File No. 4093-V.

* Filled since appearance in Employment Bulletin.

JUNIOR ENGINEER with from one to five years experience and at least a working knowledge of structural design of buildings required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

SALES ENGINEER required by large manufacturer of Air Handling equipment in Toronto area. Applicant should have either industrial or Public Building application and sales experience. Salary open. Apply to File No. 4101-V.

SALES ENGINEER required by Canadian Company in Ontario. Must have thorough knowledge of the preparation of tenders, propositions on Transformers, Motors and Switchgear equipment, also experience in the commercial side of the heavy electrical industry. Salary open. Apply to File No. 4102-V.

MAINTENANCE ENGINEER required in Quebec City to do installation work in heating, ventilating, refrigeration and air-conditioning, gas and diesel motors. Must be bilingual. Salary open. Apply to File No. 4104-V.

JUNIOR ENGINEER required in Quebec City. Preferably with three to five years experience in heating, ventilating and air-conditioning. Salary open. Apply to File No. 4104-V.

DRAUGHTSMEN with some experience in building design or architectural work required by a textile manufacturing concern near Montreal. Salary open Apply to File No. 4114-V.

MECHANICAL OR ELECTRICAL GRADUATE, age aout 35 years with experience in building construction machinery maintenance and repair capable of taking over the engineering and maintenance services in a large textile mill in Provivnce of Quebec. Salary open. Apply to File No. 4114-V.

SALES ENGINEERS, one experienced man also two juniors willing to learn required by an electrical and power house equipment manufacturer in Montreal. Salary open. Apply to File No 4121-V.

RECENT GRADUATE preferably mechanical or civil background required by Maritime branch of large industrial Canadian firm. Duties of general engineering nature. Salary open. Apply to File No. 4125-V.

GRADUATE ENGINEERS required as Assistant Professors, Lecturers and Demonstrators in Civil, Electrical and Mechanical Engineering by a Canadian University. Salaries dependent on experience and general qualifications. Apply to File No. 4127-V.

JUNIOR ENGINEERS required as assistant engineers on construction work at Saint John Harbour. Salary $200 to $250 depending on training and experience. Apply to File No. 4131-V.

MECHANICAL OR CIVIL ENGINEER with shop experience required in Montreal. Duties include design on railway equipment. Salary open. Apply to File No. 4135-V.

GRADUATE ENGINEER with engineering and sales experience required as a Street Lighting Specialist in Toronto area. Position involves direct sales engineering with municipalities and utilities also engineering and production problems directly concerned with the manufacture of street lighting equipment. Age under 35 years. Salary open. Apply to File No. 4141-V.

HEATING AND VENTILATING ENGINEER with considerable experience in mechanical equipment for buildings is wanted for office work on heating, ventilating and air conditioning by a firm of consulting engineers in Montreal Salary open. Apply to File No. 4142-V.

MAINTENANCE ENGINEER, under 30 years of age, required by Public Institution for Montreal area. Duties include maintenance of buildings, heating plants, electric services, etc. Salary open. Apply to File No. 4143-V.

TOWN ENGINEER required for town in Nova Scotia. Applicant must be qualified to take charge of all town services including electric (distribution system) and water utilities. Salary open. Apply to File No. 4145-V.

ENGINEER required in Montreal. Applicant should have railroad construction experience and a knowledge of welding technique also the ability to organize and carry out special track construction jobs. Salary open. Apply to File No. 4157-V.

*CIVIL OR STRUCTURAL ENGINEER, 24 to 35 years, required for Northern Ontario Paper Mill. At least four years experience, 2 of which should be on construction and 2 on design. Opportunity to train junior personnel. Salary not less than $400.00. Apply to File No. 4158-V.

GRADUATE ENGINEER required by Pulp and Paper Mill in Province of Quebec. Must have extensive experience in general maintenance, design and development of pulp and paper mill equipment. Excellent future advancement. Salary $6,000 to $9,000 depending on qualifications. Apply to File No. 4161-V.

STRUCTURAL DRAUGHTSMEN required by Alberta firm. One able to check all classes of structures and tanks. Another able to detail all types of structures and a third able to detail light structures and general handling machinery. Must be experienced. Salary open. Apply to File No. 4167-V.

SALES ENGINEERS, one for Ontario and one for Quebec, required by tool and qualify steel Branch Sales Office. Applicant should have some metallurgical training, some experience in tool and die manufacture, good personality and should own car. Salary open. Apply to File No. 4170-V.

MECHANICAL OR ELECTRICAL ENGINEER, bilingual, experienced in standard investigations and observations. Time study training not necessary. Required by Montreal firm. Salary open. Apply to File No. 4174-V.

GRADUATE ENGINEER required by an oil company in the Maritimes must have sufficient experience in the oil business and the educational qualifications to enable him to determine the specifications of oils required for various industrial machinery. Salary open. Apply to File No. 4178-V.

CONSTRUCTION ENGINEER capable of supervising sundry engineering jobs and pipelines for oil company in the Maritimes. Salary open. Apply to File No. 4178-V.

PLANT MAINTENANCE ENGINEER, mechanical background, extensive experience in pulp and paper preferably Kraft. Required to take charge of Kraft mill maintenance in Province of Queoec. Executive ability. Salary open. Apply to File No. 4179-V.

GRADUATE ENGINEER required for veneer and plywood plant in the Maritimes. Must be fully qualified to assume responsibility for the management, production and general supervision of the plant. Salary open. Apply to File No. 4180-V.

MAINTENANCE MANAGER required for large hospital in the Maritimes for maintenance and operation of power plant, buildings and equipment. Salary open. Apply to File No. 4186-V.

GRADUATE ENGINEER with not less than ten years experience in design and operations of hydraulic turbines, penstock valves and associated power-plant accessories. Position involves mechanical plant layout preparation of specifications, examination of manufacturer's drawings, and inspection of equipment. Location Toronto. Salary open. Apply to File No. 4189-V.

*GRADUATE ENGINEER between 28 to 30 years of age required for the following duties: Stream gauging, surveys, snow surveys, regulation and storage studies, hydraulic computations, power installation and economics. Salary open. Apply to File No. 4192-V.

INDUSTRIAL ENGINEERS with production experience required by a firm of industrial consultants in Montreal. Preferably with experience in time study, cost control, etc. Salary $400 up, according to qualifications. Apply to File No. 4193-V.

RECENT GRADUATE required by a large National Organization. Must have the following qualifications: Good appearance, personality, leadership and Initiative. Salary $2,400. Apply to File No. 4194-V.

GRADUATE ENGINEER, required by manufacturer in Montreal, must be familiar with brake design and operation with particular reference to brake-lining. Salary open. Apply to File No. 4196-V.

RECENT GRADUATES with mechanical or aeronautical background required in Montreal. Salary open. Apply to File No. 4197-V.

SALES ENGINEER, mechanical background, must be thoroughly experienced and capable of developing and maintaining connections of old established firm in road builders, contractors and industrial machinery equipment. Must possess executive ability and have command of the French language. Salary open. Apply to File No. 4203-V.

Situations Wanted

MECHANICAL ENGINEER, M.E.I.C., P. Eng., Ont.; 36, married, now employed on top responsible position, desires position with Airlines, or connected with flying. Man with wide technical experience and knowledge. Pilot since childhood, and ex-instructor in power and glider flying. Speaks several foreign languages, good organizer, knows jet propulsion and safety of flying problems. Available for responsible, serious and permanent position with future on 6 months notice to the present employer. Will give priority for the position with available living quarters near work. Apply to File No. 140-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill University. Eight years experience Tool and Production Methods Engineer. Age 38. Married. Presently employed. Desires employment as Production Manager or Materials Engineer for large company. Preferably Montreal area. Apply to File No. 551-W.

CIVIL AND MECHANICAL ENGINEER, M.E.I.C., age 42, B.Sc. Civil Graduate work in Industrial Engineering at McGill University. Seventeen years experience in following field: Manufacture of welding rod and hardfacing alloys, installation of incentive bonus systems. Production planning on the manufacture of shells and shell parts. Design and construction of explosive proving equipment. Superintendent during construction of shell filling plants. Other experience covering oil refining, contracting, and installation of pulp and paper mill equipment. Interested in position with responsible firm or partnership with Consultant. Home in Montreal area. Apply to File No. 981-W.

PRODUCTION ENGINEER, M.E.I.C., McGill '33, (Electrical) P.Eng. Age 38, married. Experience includes all phases Production Engineering, Standard Costs, Budgetary Control, Time Study, Method Improvements, Financial Reports, Sales and General Engineering. Desire position pertaining to foregoing fields. Available immediately. Location Quebec or Ontario. Apply to File No. 1186-W.

ELECTRICAL ENGINEER, M.E.I.C., Alberta 1931, P.Eng., Ontario, married. Experience in Engineering Department of large industrial plants and as Field Engineer on various plant and power construction projects. During the war was Sr. Engineer on design of Auxiliary Electrical equipment for Radar units and sub-contract work. Desire permanent position requiring initiative with good future prospects, preferably in Ontario. Apply to file No. 1249-W.

INDUSTRIAL AND CIVIL ENGINEER, M.E.I.C., B.A.Sc., P.Eng., Quebec, age 39, married, fluently bilingual. Seeks position as Industrial Engineer, Executive, Town Engineer, Sales Engineer. Experienced in Motion and Time Study Methods, Process Development, Production Control, Costing, Plant Maintenance, Highway Engineering, Municipal Engineering, Sales. Available on short notice. Apply to File No. 2157-W.

MECHANICAL ENGINEER, Jr.E.I.C., is interested in short term projects, duration one month or more. Location anywhere. Production works, Incentives, Redesign, Surveys, Layouts, Job Evaluation, Methods and Materials Handling. Salary desired $500 per month. Apply to File No. 2338-W.

GRADUATE MECHANICAL ENGINEER, M.Sc.Eng., M.E.I.C., seventeen years of experience in design, development, research and production engineering. Proven executive ability and excellent references. At present employed in Montreal, desires permanent position requiring background, initiative, drive (and languages). Apply to File No. 2502-W.

MECHANICAL ENGINEER, B.Sc. (Queen's), M.E.I.C., P.Eng. Age 33, married. Presently employed Montreal area, is desirous of obtaining position in Ontario. Offers experience in Engineering department management and organization, plant layout, machine design, jigs and tools, sheet metal work and building trades. Available one month's notice. Apply to File No. 2682-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., Que., with more than 25 years experience in reinforced concrete design and construction, interested in position with responsible firm or partnership with consultant would also consider government or municipal position. Apply to File No. 2695-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B. Eng. (Honours), McGill, 1943, P.Eng., Que., desires position in Montreal or Ontario. Willing to travel. Interested in Commercial Aspects and Sales Engineering. Apply to File No. 2727-W.

CHEMICAL ENGINEER, Jr.E.I.C., McGill, age 28, married. Experience includes: control, research, development, production, supervision and sales. Synthetic resins, paints, varnishes, fermentation, detergents, acids, explosives. Organic and inorganic chemistry. Time study. Bilingual. Available immediately. Apply to file No. 2850-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng. Graduate '44, age 27, single, presently employed near Montreal. 8 years of engineering experience, machine tool engineering on Batch production. Fabrication and Assembly methods. Production supervision, Research, methods improvement in power transmission equipment. Layout estimating and installation of power apparatus and auxiliaries. Am seeking more exacting and progressive position with expanding organization located anywhere. Apply to File No. 2876-W.

ENGINEER, M.E.I.C., P.E., Queen's '37. Varied experience in Mining and Industrial work; 4½ years with R.C.A.F. as engineer officer. Desires position with progressive firm offering responsibility and opportunity. Interested particularly in mining, manufacturing, and processing of chemicals and industrial minerals. Location in B.C. or Alberta preferable. Apply to File No. 2892-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill '45, age 24, single. Experienced in tool design and stress analysis also spent one term as demonstrator in Mechanical Engineering, desires permanent position in industry, preferably Montreal area but willing to travel. Available at once. Apply to File No. 2903-W.

GRADUATE ELECTRICAL ENGINEER, McGill '24, M.E.I.C., Prof. Eng., Que.; over 20 years experience in high voltage transmission lines, design and construction. Interested in part time or temporary position in general engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No 2918-W.

MECHANICAL AND INDUSTRIAL ENGINEER, Ph.D. (Engineering) (London), M.E.I.C., A.M.I. Mech.E., P.Eng., age 36, eleven years' diversified industrial experience, desires position with duties involving: methods studies, research, development, engineering economics, management techniques, advisory service to the Board of Directors and similar. Apply to File No. 2929-W.

CHEMICAL, B.A.Sc., Toronto '46, ex-Signal Corps, age 24. Reliable, diligent, conscientious, aggressive, bilingual. Experience in the rubber, distilling and heavy chemical fields; in such phases as process and product control, design and engineering, and industrial research Presently employed but seeks an opening with a progressive company wherein he will have more scope in engineering work. Apply to File No. 2936-W.

EXECUTIVE ENGINEER, age 43, P.Eng., M.E.I.C., M.C.I.M., with Mechanical, Structural and Mining Engineering Background, desires contract for position in Executive or Management Field. Apply to File No. 2982-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc., P.Eng. (Ont.). Age 44. Single. Past experience includes administrative, executive and sales engineering in metal products, building materials and sub-contract work in construction industry. Also held responsible position in personnel administration. Desires permanent position requiring initiative with good future prospects. Apply to File No. 2983-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.Eng. (McGill), Master of Commerce, Toronto, '48, age 27, experienced in Aircraft Industry, Petroleum oilfield work on drilling, production, construction and design. Presently situated in West, but would locate anywhere. Apply to File No. 3006-W.

SALES ENGINEER, Jr.E.I.C., graduate B.Sc., textile chemist, age 32 years, married. Four years of lab. research work, five years of technical sales experience in textiles, coated fabrics, yarns, textile machinery, machine tools, plastics and chemicals. Office and plant management experience. Capable of running business office, efficient correspondent, bilingual, drive own car. Apply to File No. 3019-W.

MECHANICAL ENGINEER, Ph.D., (London) A.M.I.M.E., with extensive mechanical and structural experience in Europe and England and post-graduate research in structures at London University. Age 34. Available for employment. Apply to File No. 3021-W.

MINING ENGINEER, M.E.I.C., B.Sc., Queen's '33, P.Eng., Que., married, age 37, eighteen years experience in mining exploration, and development work. Desires work in the Rouyn area of Quebec. Apply to File No. 3022-W.

MECHANICAL ENGINEER, B.Sc. (Eng.), A.M.I., Mech.E., wide experience in the aircraft industry. Presently residing in England, but interested in emigrating to Canada. Employed in Canada during years 1941 to 1945. Would consider any appointment in engineering world to start with the assurance of being able to speedily prove worth and ability. Apply to File No. 3023-W.

CHEMICAL ENGINEER, M.E.I.C., age 35, married, no children, graduate of University of Toronto. Ten years experience supervising production of organic chemicals. Presently employed by old established U.S. firm manufacturing fine organic and inorganic chemicals. Desires responsible position in Canada, preferably Ontario location. Present salary $5,100. Apply to File No. 3031-W.

ENGINEERING EXECUTIVE, A.I.E.E., A.F.R.Ae.S., with outstanding record in England seeks position of scope and responsibility in Canada. First class academic qualifications and exceptional experience at high level in aircraft and precision mechanical engineering fields, comprising design and development, works management, manufacturing methods, production control, administration and sales. Apply to File No. 3033-W.

CHEMICAL ENGINEER, M.E.I.C., B.Sc. (Alberta). Married, age 28. 5 years experience in research and development and statistical quality control. Desires change in position preferably in process control or engineering department of industry. Apply to File No. 3034-W.

MECHANICAL ENGINEER, A.M.Int.C.E., age 38, manager in charge of small works in England designing, building and servicing special agricultural machinery and tractors (crops-spraying), keen to emigrate to suitable administrative position. Well educated, heavy engineering (steam) experience, special ability for craftsman training and selection. Apply to File No. 3039-W.

GRADUATE CIVIL ENGINEER, Jr.E.I.C., Alberta '43, veteran, with experience in construction, purchasing, sales. Desires position of an engineering nature with responsible firm or with consulting engineer. Alberta or B.C. preferred but would accept elsewhere. Available on reasonable notice to present employer. Apply to file No. 3040-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.E. (Chem.), Sask. '44, former P.Eng. (Ont.) and M.C.I.C., married, veteran, with experience in process development, desires position in that field. Engaged in post-graduate study at Mass. Inst. of Technology, leading to degree of S.M. (Chemical Engineering Practice). Available February, 1949. Apply to File No. 3041-W.

GRADUATE MECHANICAL ENGINEER, S.E.I.C., N.S.T.C., '48, desires part time employment in Heating and Ventilation —Ottawa area. Apply to File No. 3042-W.

MECHANICAL ENGINEER, M.E.I.C., Prof. Eng. (Quebec). 15 years of shop practice in maintenance and locomotive repair; 5 years machinery design, including welded vessels, process piping and pulp mill layout. Seeking responsible position, preferably in Montreal area. Available on short notice. Apply to File No. 3045-W.

SENIOR METALLURGIST, M.E.I.C., graduate, age 36. Fifteen years diversified experience in heavy steel mills, production, research and quality control. Practical experience of departmental management. Desires supervisory position of responsibility, preferably with progressive firm. Married, two children. Apply to File No. 3046-W.

PART TIME WORK: Graduate Chemical Engineer, B.Sc. (Chem.Eng), Jr.E.I.C., M.C.I.C. Now doing graduate work in Montreal. In Royal Canadian Engineers since graduation with experience in legal investigations, stores, and works. Desirous of obtaining part time work conducting Technical literary research or other technical work within limitations. Suggest could be useful to small out of city firms desiring advantages of Montreal libraries and Montreal Representative. Apply to File No. 3049-W.

Business & Industrial Briefs

A Digest of Information received by The Editor

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

The Landers-Segal Color Company, 78 Delevan Street, Brooklyn 31, N.Y., will furnish, on request, a colour card for their limeproof cement colours. The Company recommends these dry colours for cast stone, cement stucco, terrazzo, cement and lime paints, cement brick and tile, cement floors and sidewalks, ornamental plaster and ready mixed concrete.

●

Webster and Sons Limited, Canada Cement Building, Montreal, has issued a revised specification R.A.I.C. No. 37A & B for Zonolite Insulating Concrete for Structural Roofs and Roof Insulation.

●

International Nickel Company of Canada Limited, 25 King Street West, Toronto 1, Ontario, recently published a bulletin "Nickel Alloy Steel Castings in Industry". An attractive two-colour publication, it deals with uses of these castings in various industrial and construction fields and also covers processing of such castings and selection of alloy compositions.

●

"Pittsburgh" gas unit heaters, Series "C" are illustrated and described in a folder recently published by Automatic Gas Equipment Company, 301 Brushton Avenue, Pittsburgh 21, Pa.

●

Hagan Corporation, 323 Fourth Avenue, Pittsburgh 19, Pa., claims that its engineers have developed a simple method for selecting proper sizes of orifices and flow nozzles for the measurements of liquids, steam or gas flow in pipe lines. The method is described in bulletin T-100-M "Capacity Data for Concentric Orifices & Flow Nozzles" which may be obtained from the Corporation on request.

●

"Applications for Automatic pH recording and Control and Recording Flowmeter" is the title of a new industry data bulletin No. 138 recently compiled by the Bristol Company of Canada Limited, 71-79 Duchess Street, Toronto. The bulletin describes and illustrates applications of pH and flowmeter instruments to operations encountered in many industrial waste disposal plants.

●

"Your Best Booster" is the title of a catalogue recently issued by the New Holland Manufacturing Company, Mountville, Pa. This publication shows the adaptability of the Company's line of belt conveyors and includes specifications as to capacity, speeds, and power requirements.

●

Emmert Mfg. Co., Waynesboro, Pa. has released bulletins 6-48 and 7-48 describing their new stainless steel draughting machines and equipment which are claimed to save up to 50 per cent in draughting time and cost. The machines are said to be adaptable to any size or make of drawing board and can be operated in any position from true horizontal to true vertical.

●

The Young Radiator Company of Racine, Wisconsin, has just published Catalogue No. 6548 to cover the complete line of cabinet unit heaters. These new heaters can be used with either steam or hot water systems and feature attractive cabinet stylings to blend with the appearance of lobbies, vestibules in commercial buildings and similar locations.

●

A new Catalogue No. 49 has just been published by Miniature Precision Bearings Inc., of Keene, New Hampshire. It contains specifications for more than forty types and sizes of standard miniature ball bearings including radial, super-light, pivot, angular contact and thrust bearings—ranging in outside diameter from 2mm. to 5/16 in.

●

Canadian General Electric Company Limited has available a 4-page specification bulletin on the new Cochrane "CBA" high differential, high pressure condensate return systems. In addition to material and operating specifications, capacity ratings are given for the six different sizes available—3, 5, 7½, 10, 15 and 25 hp.—based on a maximum of 200 psi. pressure differential. Differential pressures of from 50 to 200 psi. are listed and capacities for each unit are tabulated after each differential pressure for unit inlet pressures varying from 0-39 psi., 40-99 psi. and for over 100 psi A 2-page dimension drawing in colour shows the design and construction of the new unit. Ask for publication No. 3250-1.

New Equipment and Developments

R. G. LeTourneau Inc., has recently added two new units to their line of earthmoving and material handling equipment.

One is a new small Tournapull prime mover the D-Roadster for use with the company's E-9 Carryall Scraper. It is powered by a 100 hp. Diesel or gas engine and features complete control of all steering and scraper operations by individual electric motors actuated through toggle switches located on the control panel of the prime mover. Further information can be obtained by writing to the Company's offices at Peoria, Illinois.

The other unit is the TH-4 Tournahauler, a vehicle designed for on or off road hauling of heavy length loads such as pipe, timber, steel, etc. It is claimed that in recent tests TH-4 moved 26,000 lb. loads of pipe through mud conditions so severe that the rear wheel hubs were submerged. Details can be obtained from the Longview, Texas, offices of R. G. LeTourneau Inc.

●

The Moto-Flow Company, 138A-23rd Street, Bay City, Michigan, has placed on the market a floor-to-floor conveyor called the "Stair Levayor" which is said to feature simple inexpensive installations, operational ease and adaptability to a wide range of uses and applications. Descriptive literature may be obtained from the Company.

●

Steep Rock Iron Mines Limited, one of North America's biggest producers of high grade iron ore last year established a production record of 1,206,406 tons with a gross value of $7,049,559.00. The annual report of the company for the year ended December 31, 1947, indicates that the company is in a favourable position and that the mine is in better physical condition than ever before.

The report of President D. M. Hogarth reveals plans for expansion and reports that operating efficiency of the Company's properties has been improved to a gratifying degree through improvement in personnel and operating methods and by the acquisition of new equipment.

●

RCA Victor Company Limited has developed a new electronic microammeter which is capable of accurately measuring minute electrical currents down to one billionth of an ampere. The Company's announcement describes this development as of outstanding importance to research and radio activity, television, astronomy and other scientific and industrial projects involving the measurements of faint electrical currents.

●

The English Electric Company of Canada Limited, St. Catharines, Ontario, has announced development of an electric motor which will operate equally well on 25 or 60 cycle current.

The Company believes that this motor will be of great benefit to Ontario taxpayers and Hydro consumers in view of the respective changeover in frequency by the Hydro Electric Power Commission of Ontario. The motors are externally re-connectible from 25 to 60 cycles and cover the Company's range of standard squirrel cage induction motors from 1 to 200 hp. at 220, 440 or 550 volts in all ratings or 2200 volts for larger ratings.

●

An "Ultrasonics Materials Tester" which uses high frequency sound waves to discover and record small flaws in metals has been developed by the General Engineering and Consulting Laboratory of the General Electric Company.

The instrument shoots 1,000,000 cycle-per-second sound waves through the metal to be tested, and simultaneously plots a graph which indicates any flaws in the metal's interior.

●

Eastern Steel Products Limited has announced the completion of a long term Manufacturing and Sales Agreement with Messrs. J. & E. Hall Limited of Dartford, England, to cover the provinces of Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island. The British firm is one of the oldest and most progressive engineering firms in England and has been engaged in the refrigerating business since 1877.

Mr. C. A. Davis, who has served J. & E. Hall Limited for twenty years, has joined the Eastern Steel Products organization in Toronto as technical representative of the new Refrigeration Division.

Appointments and Transfers

Canadian General Electric Co. Ltd., announces the appointment of M. T. Graham as manager of the Conduit Products Section at Head Office, Toronto. Mr. Graham will be responsible for the sales of all types of G-E conduit and conduit fittings and other raceway systems.

●

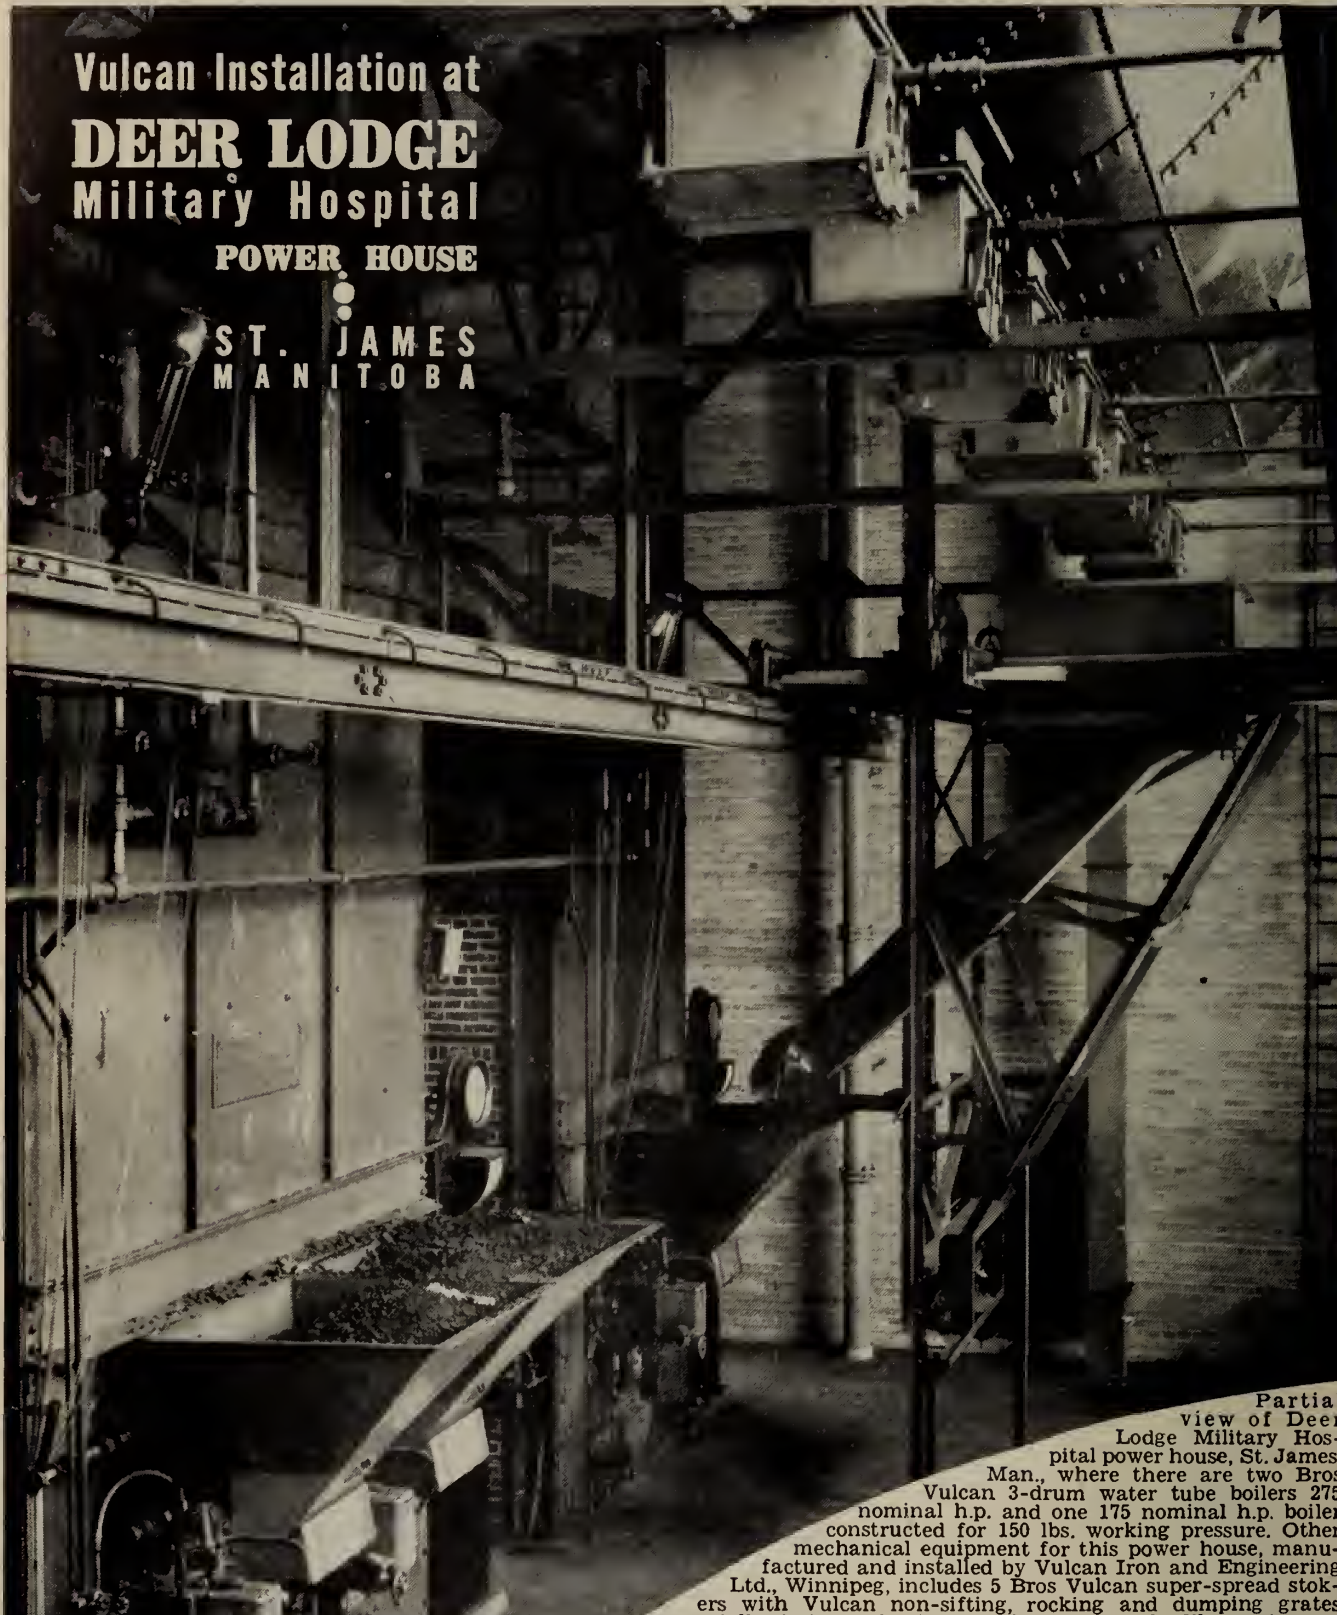
J. A. Bell has been appointed director of purchasing for Canadian General Electric Company, Ltd., succeeding E. K. M. Wedd who has retired. Mr. Bell has been with G.E. since 1925. He joined the Company via the "Test Course" in Schenectady, N.Y.

●

E. W. Miller has been appointed sales engineer in RCA Victor Co. Ltd. Engineering Products Sales Department. Mr. Miller will cover the Province of Quebec and the Ottawa Valley Territory.

●

George W. Ferrier has been appointed Montreal manager of The Bristol Co. of Canada Limited. He will be assisted by Larry E. Henne, who was formerly with Northern Electric Co. Ltd. The Bristol Company manufactures recording, indicating and control instruments and specialized mill supplies.



Partial view of Deer Lodge Military Hospital power house, St. James, Man., where there are two Bros Vulcan 3-drum water tube boilers 275 nominal h.p. and one 175 nominal h.p. boiler constructed for 150 lbs. working pressure. Other mechanical equipment for this power house, manufactured and installed by Vulcan Iron and Engineering Ltd., Winnipeg, includes 5 Bros Vulcan super-spread stokers with Vulcan non-sifting, rocking and dumping grates especially designed for burning low rank fuels. The grates are equipped with power-operated dumping mechanism. The stokers have automatic controls for coal feed and air supply and uptake damper on the boiler. Coal handling equipment consists of vertical elevators, horizontal conveyors, overhead bumpers and electrically operated travelling weight larry.

VULCAN IRON AND ENGINEERING LTD.

Winnipeg **Manitoba**

EST. 1874

IN NEW EQUIPMENT, or for replacement parts, where heavy loads and sudden shocks are factors, specify Nickel Alloy Steel, type 4340.

High hardenability gives "4340" good mechanical properties in heavy sections.

In shovels such as the one illustrated, for example, this nickel-chromium-molybdenum steel is used satisfactorily in dipper handles, boom parts, caterpillar mountings and propelling machinery.

You are invited to write for a recommendation regarding the best type of steel for your application and a suggested source of supply.

What does it take to make "canada's no. 1 roof"?

PLENTY. It takes experience, research, top-grade materials and expert application. Every one of these ingredients, and more, go into your Barrett Specification* Roof. That's why it's known as "Canada's No. 1 Roof".

Experience? Almost 100 years of it are behind the "SPECIFICATION" Roof. Barrett pioneered felt, pitch and gravel construction in 1854. Research? The Barrett research program has contributed more than a score of "firsts" to the roofing business. Materials? "SPECIFICATION" Felt and Pitch are made in Barrett's own plants . . . a guarantee that rigid Barrett standards will be maintained. Application? Only by Barrett Approved Roofers, supervised by Barrett Inspectors.

Barrett* Specification* Roofs

*Reg'd. Trade Mark

Complete control from raw material to finished product made possible a unique record in the roofing field . . . roofs that consistently outlast their bonded period. First it was Barrett "SPECIFICATION" Roof Job No. 1, the first bonded built-up roof in Canada. That roof outlived its 20-year bond by nine years without maintenance or repair before being removed for sample purposes. Now "SPECIFICATION" Roofs in every Province are equalling or *bettering* the Job No. 1 performance.

Be sure the roof you buy is "Canada's No. 1 Roof". Make it a Barrett "SPECIFICATION" Roof.

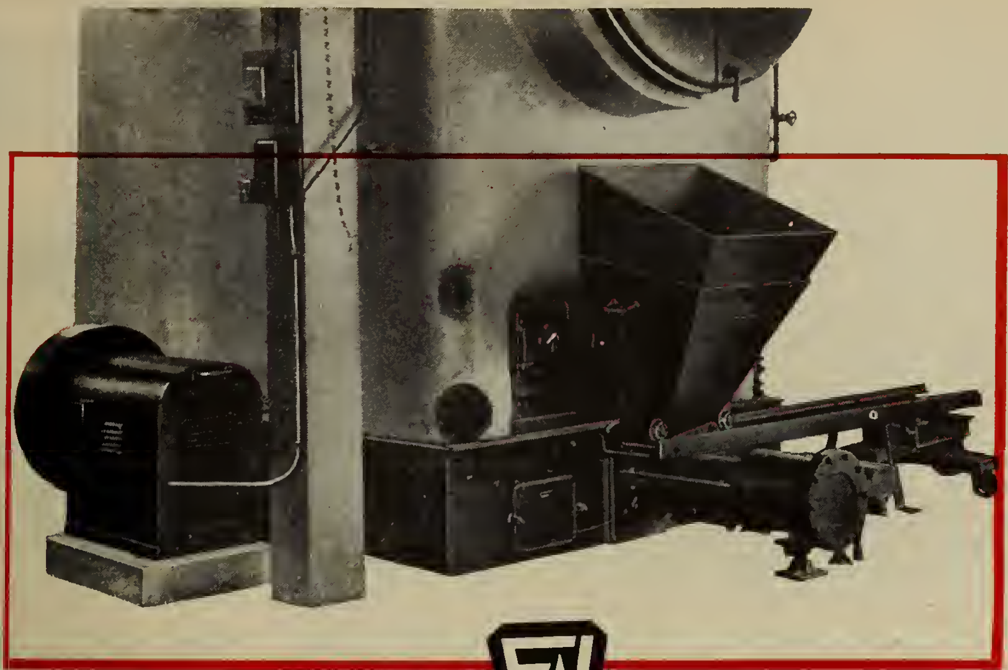
"CANADA'S No. 1 ROOF"



JONES UNDERFEED STOKER

has these special advantages

- **RAM TYPE FEED**
  with auxiliary distribution rod and shoes ensures proper coal feeding and distribution in retort with rugged simple moving parts and minimum maintenance.

- **HYDRAULIC DRIVE**
  with automatic ram reversing device eliminates shear pin, provides infinite coal feed variations and allows the power unit (fan, motor and pump) to be located out of the operator's way and away from corrosive ashes and dust.

- **ROLLING HOPPER**
  with jumping type agitator ensures continuity of coal feed and permits filling of the hopper in the coal bin by extension of the track or with a hopper truck as illustrated above.

- **AUTOMATIC OPERATION**
  without manual attention is possible because the hopper agitator ensures coal supply, the ram ensures coal feed without stalling or shear pin breakage and auxiliary distribution rod ensures proper fire condition.

FW *Jones Stokers are available on short delivery in sizes from 100 to 2500 lbs. of coal per hour. Write for further details.*

Speedaire-driven tumbler in plant of Kaydon Engineering Corp., manufacturers of all types of ball and roller bearings from 4" I D to 120" O D.

The white outline on the photograph indicates the much larger size of standard drive required to do the work of Speedaire.

Dollar saving is 35.3% with SPEEDAIRE

THIS large tumbling barrel runs 24 hours a day, carrying 2,200 pounds of Kaydon bearing rollers.

The Speedaire unit has proven to be the best of several drives tried in this heavy duty service. In addition to giving complete satisfaction, Speedaire saved the company $221.00, a 35.3% saving over the cost of a conventional worm gear unit of equal capacity.

Speedaire is Cleveland's new fan-cooled worm-gear speed reducer. Because it is fan-cooled, Speedaire will do more work—will deliver up to *double the horsepower* of standard worm units of equal frame size, at usual motor speeds. It can be installed economically on many applications where other types have been used heretofore—giving you the advantages of a compact right-angle drive. Speedaire gives the same long, trouble-free service characteristic of all Clevelands.

An Oil Seal as Simple as

A RIGID HEEL

provides a positive press fit in the cavity, assuring a leakproof seal at this point.

B FLEXIBLE LIP

an integral part of the seal, is available in a variety of designs to meet a wide range of conditions.

C GARTER SPRING

controls lip pressure to provide most effective sealing and maximum seal life.

• The J-M Clipper Seal has all the virtues of simplicity—plus the practical advantages of superior bearing protection, longer life and ease of installation and removal which only an oil seal of its unique design can provide.

Consisting only of a moulded one-piece body and a garter spring, the Clipper Seal has no metal case. This permits greater bore tolerances. The relatively dense, rigid heel, designed for a press fit in the packing recess, eliminates the need for a cover plate for pressures under 5 psi. The tough, flexible lip is held in light but firm contact with the shaft by the garter spring which causes it to seal with a minimum of friction and wear.

Clipper Seals are recommended for packing against oil, grease, water, air, grit and coolants at temperatures up to 225 F. They are available in sizes from ⅝″ diameter up.

For further details, write Johns-Manville, 199 Bay St., Toronto, Ont.

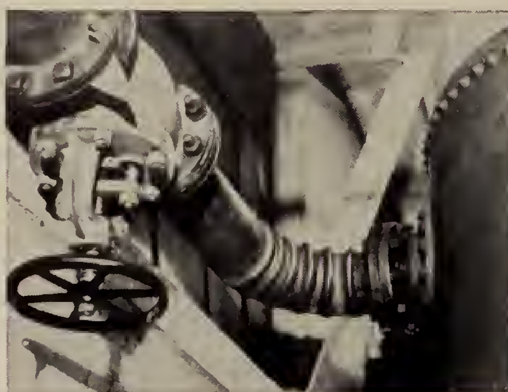
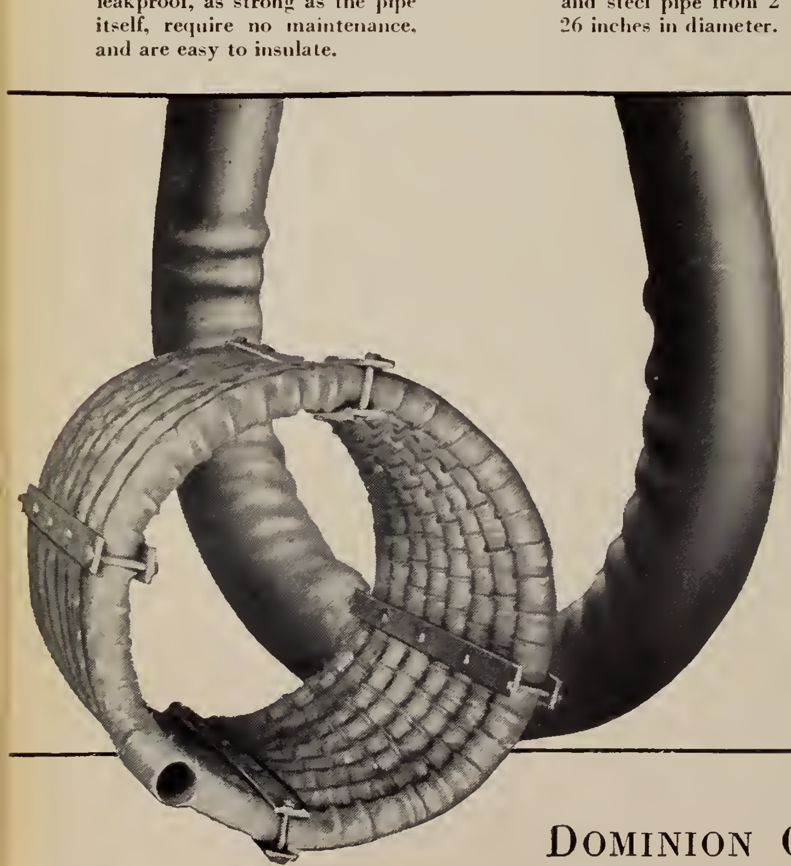
"Tailor-Made" Bends

Where compound bends are required in a continuous section of pipe, wrinkle-bends offer an ideal solution. Wrinkle-bends are leakproof, as strong as the pipe itself, require no maintenance, and are easy to insulate.



This short-radius wrinkle-bend joins a compressed air line to a reservoir. Wrinkle-bends can be made in brass, copper, aluminum, and steel pipe from 2 inches to 26 inches in diameter.

Pipe bends can be made right on the spot with the aid of an oxy-acetylene welding or heating blowpipe, a simple bending rig, and a few common tools. Wrinkle-bending does not reduce the thickness of pipe walls.



This condenser coil made from 2-inch stainless steel pipe has 350 wrinkle-bends.

There are many DOC methods for forming, cutting, joining, and treating metals. DOC engineering service is always on call to help customers with production, construction, and maintenance jobs. Just call the nearest DOC office.

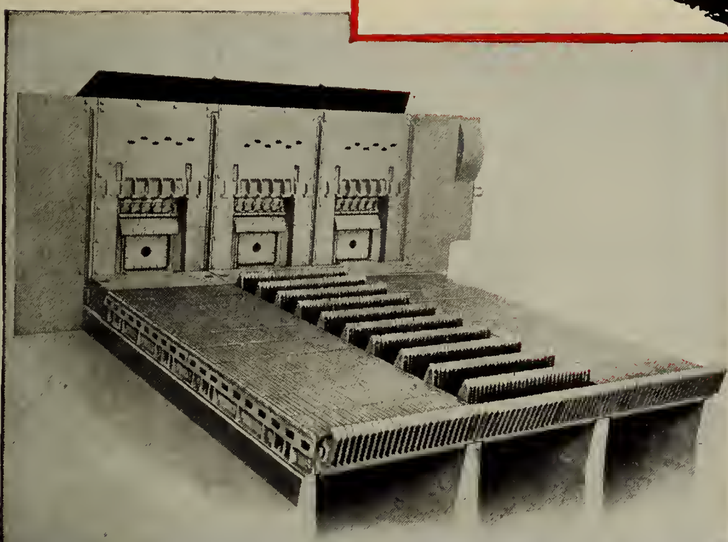
STOKER burns cheaper coals— EFFICIENTLY



Rear view of C-E Spreader Stoker with one section of grates in dumping position.

THE C-E SPREADER STOKER PAYS FOR ITSELF OVER AND OVER

In an average installation the cost of coal used in a year exceeds many times the initial cost of a C-E Spreader Stoker. Moreover, the first cost of the stoker is soon absorbed by its saving in coal cost — an economy cycle that is repeated throughout its many useful years.

Approximate application range of C-E Spreader Stoker — 150 boiler hp to largest units suitable for stoker firing. Simple, rugged construction. Hopper, feeding and distributing mechanism, variable-speed drive and motor are contained in a compact unit. Rotating spreader blades feed coal into furnace in crisscrossing streams which assure uniform distribution. Fines are burned in suspension and the rest of the coal is burned on a grate — stationary or dumping type. Grate surface is zoned for regulating air admission and to facilitate cleaning. Adapted to limited space. Easy operation. Low maintenance.

SELECT A SUITABLE METAL

Equipment breakdowns could often be avoided if the material chosen for the equipment had the necessary qualities to withstand the service conditions. When this happens, the loss of time, product spoilage and general inconvenience can be very costly. To builders and users alike of machinery and equipment, Inco offers a comprehensive technical service. With years of accumulated data, our technical staff will be pleased to help you select a suitable metal to meet your service conditions.

SELECT A QUALIFIED FABRICATOR

Assistance and advice in fabricating problems is another part of our service. Working closely with designers and fabricators of equipment for many years, our technical staff will be pleased to assist you in selecting a fabricator, qualified to make equipment to your specifications.

*Monel is the registered Canadian trade mark of The International Nickel Company, Inc.

HOW INCO HAS HELPED OTHERS

Monel* has proven itself an extremely useful metal for pulp and paper equipment. Prior to its introduction, considerable difficulties were encountered by many of the pulp and paper mills due to stock line failures. Monel had the qualities essential to withstand the corrosive effect of stock carried in these pipe lines. Produced by qualified fabricators, Monel stock lines are insuring years of trouble-free service. An example of longevity of Monel stock lines is an installation for the handling of bleached sulphite stock which is still in operation after 15 years of continuous service, whereas lines made from other non-ferrous pipes leaked and failed after 18 months' use. Let INCO'S DOUBLE SERVICE assist you to solve your equipment problem.

Stresses In Reinforced Concrete Columns With Bending In Two Directions

by

E. M. Rensaa, M.E.I.C.

Main and Rensaa, Consulting Engineers, Edmonton, Alta.

The design of columns is one of the fundamental engineering problems. Many engineers are not entirely satisfied with present methods — of which there are many — and proposals from authoritative sources are welcome additions to the literature on the subject. The *Journal* believes that Mr. Rensaa's paper is a valuable contribution.

Calculation of stresses in reinforced concrete columns with loads eccentric to both principal axes, and with tension over a part of the section, is a very difficult problem. If the usual assumption is made that concrete will crack when subjected to tensile stresses, it is then difficult to determine the position of the neutral axis. For single axial bending we have the simplifying condition that the neutral axis will be parallel to one of the symmetry axes, but that is not the case when there is bending in two directions. It has been found impracticable to develop and solve general exact equations for locating the neutral axis, as such equations become involved and of a high degree. Approximate equations may be written for some simplified conditions, but even such equations are not very simple (1).

Columns with double eccentric loading are quite common in building frames. Corner columns are almost always subjected to such loading. Both American and European textbooks have so far failed to give a simple and satisfactory method for calculating such stresses. The problem received much attention, however, during the early part of this decade and some methods of solution have been proposed. These methods, although in many cases sufficiently accurate, are often applicable only to special cases, and for more general solutions may involve a great deal of computation for accurate results. The methods of stress calculation proposed by the author in this paper are partly based on ideas set forth by Dr. Ing. Ernest Bittner (2). A method of successive approximations by the Swedish engineer, Dr. Techn. S. O. Asplund (3) has been used to some extent for checking the calculated stresses.

Only the problem of calculating stresses in square and rectangular columns will be considered in this paper, as those are the usual ones encountered in practice. Round columns with double axial loading form no special problem as the system of coordinate axes can be rotated so that there only will be bending about one axis.

Much work has been done to develop methods and diagrams for calculation of stresses in reinforced concrete columns with one-axial eccentric loading. Such methods and diagrams are made use of in this paper, as far as possible, for the more complex problem of calculating stresses under conditions of double eccentricity.

In the following, n will be taken as 10 for the sake of simplicity, and no deduction will be made for concrete displaced by steel. The refinement of using n-1 instead of n is in most cases unwarranted in view of the great uncertainty of the actual value of this rather variable "constant". A discussion of the effect of variation of n is outside the scope of this paper.

General Description of Stress Calculation

Calculation of stresses for double eccentric loading will be carried out in three steps. In the *first step* the column is analysed for a combination of direct load and the biggest bending moment, without consideration of the bending moment acting in the transverse direction. A preliminary position of the neutral axis for the assumed loading is found by this step and also the corresponding concrete and steel stresses.

The *second step* is to calculate the section modulus about the y-axis (see Fig. 1) for the uncracked part of column section found by the first step and for n times the reinforcing steel. Stresses caused by the transverse bending moment alone are then calculated for this assumed effective section. Stresses found by the two steps are then combined and a corrected position of the neutral axis found. The maximum combined concrete stress found by the two first steps is not very much in error and will, therefore, indicate if the assumed section can be used. The maximum calculated combined steel stress is generally too low, however.

When the corrected position of the neutral axis is drawn, it is found that the transverse bending moment has caused a portion of the concrete on the opposite side of the y-axis (see Fig. 2) to be in tension, and therefore ineffective, while a somewhat similar new portion on the same side of the y-axis as the load now is in compression and therefore effective. It follows that in the *first* and *second steps* we have included some tensile stresses which actually did not exist due to the cracked condition, while a certain section of column under compression has been excluded. In order to compensate for these errors it will be necessary to introduce corresponding forces. The effect of these must then be added to the external force system.

The *third* and, generally, last *step* is to analyse the column for corrected values of axial load and biggest bending moment, as in *step 1*. Stresses found by *steps 2* and *3* are then combined and considered to be final.

In this paper, use is often made of forces introduced to compensate for neglected internal stresses. This substitution may be explained by the following statement, which is self evident: *Any internal force assumed in error to act on a section in a certain direction may be neutralized by applying a similar force at the same point in the opposite direction.* Again: *Any internal force neglected may be compensated for by applying a similar force at the same point and acting in the same direction.*

Details of the First Step

Single axial loading forms the basis for calculating stresses under *steps 1* and *3*, and easy methods of solution are, therefore, very desirable. It is fairly easy to calculate stresses if the position of the neutral axis is known. A direct analytical calculation of its position, however, requires solving a cubic equation, and that is rather time-absorbing work. A special case is the square or rectangular column with equal reinforcement on both tension and compression sides and with no intermediate reinforcing. Both the position of the neutral axis and the stresses are easily found for this case by means of diagrams, such as those published by Turneaure & Maurer (4), or by the American Concrete Institute (5). The latter are perhaps best known by engineers and will, therefore, be used in this paper. They are also appended to make the reading of the paper easier.

The A.C.I. diagrams are not intended for columns with reinforcement distributed along all four sides. The error involved in using them for such columns, however, is not great, as will be shown in Example 1. The reason for this is that intermediate bars often have low stresses for symmetrical bending. A bar located directly on the neutral axis, of course, is wholly unstressed.

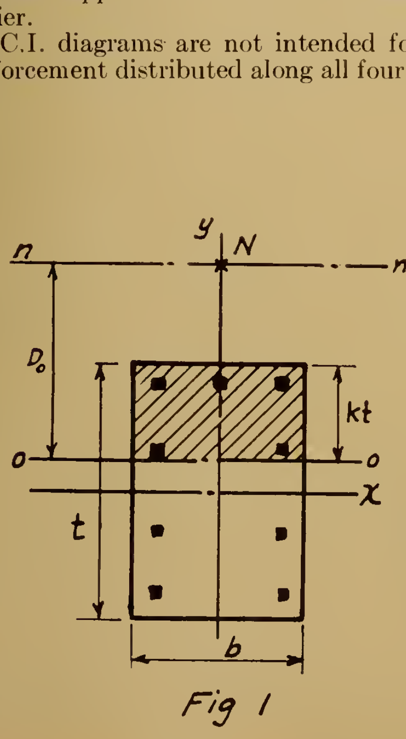

Fig 1

These diagrams are not applicable directly to columns with unsymmetrical reinforcement on tension and compression sides. There are cases, however, where unsymmetrical reinforcement has been used or is desirable. The author has, therefore, worked out a system of calculation by successive approximations which will quickly give sufficiently correct results. The application of this method is shown in Example 2.

A good method of calculating the position of the neutral axis was recently published in the *Journal of the American Concrete Institute* by Michel Bakhoum (6). The position of the neutral axis is found by trial solution of an equation. Stresses are afterwards found by equations established many years ago by European writers. This method will be described briefly as follows: It has been shown in earlier works (7) that the position of the neutral axis may be expressed by the formula:

$$D_o = \frac{I_o}{S_o} \quad . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \quad (1)$$

where D_o = distance from load to the neutral axis $o-o$ I_o = moment of inertia of steel and uncracked concrete about this axis. S_o = statical moment of n times the steel area and the uncracked concrete area about this axis.

Maximum concrete stress can then be found by means of either formula (2) or (3) below. Formula (3) gives the most accurate result if the eccentricity is great.

$$f_{c_y} = \frac{N\,k\,t}{S_o} \quad . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \quad (2)$$

$$f_{c_y} = \frac{N\,D_o\,k\,t}{I_o} \quad . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \quad (3)$$

Formula (1) must be solved by trials and that involves quite a lot of work. Bakhoum has shown that it requires fewer trials if the following equation is used:

$$D_o = \frac{I_n}{S_n} \quad . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \ . \quad (4)$$

where I_n and S_n represent moment of inertia and statical moment, respectively, calculated for an axis going through the point of application of external load, and being parallel to the neutral axis.

When using formula (4), I_n and S_n must first be calculated and D_o obtained from these. This will likely give a different position of the neutral axis from the one first assumed. If the difference between the assumed position and the calculated one is considerable, it will then be necessary to recalculate I_n and S_n on the basis of the last found D_o, and so on until the calculated value corresponds with the one previously calculated. The next step is to calculate I_o or S_o and use either equation (2) or (3) in order to find the maximum concrete stress. Very accurate results may be obtained by this method but the numerical work is considerable.

Details of Second Step

The section modulus is calculated about the y-axis for n times the steel area, and the effective concrete area found by *step 1*. Maximum steel and concrete stresses, due to the transverse bending moment in the x-direction without any axial load, are then calculated for this assumed effective section. The concrete and steel stresses found by *step 2* will be called f_{c_x} and f_{s_x} respectively.

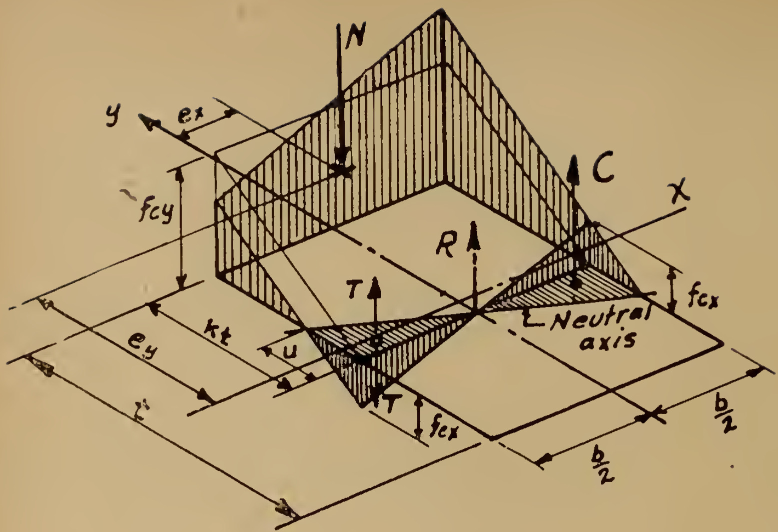

Fig. 2

Details of Third Step

Referring to Fig. 2 it will be seen that the rotation of the neutral axis, measured by distance u is:

$$u = kt.\frac{f_{c_x}}{f_{c_y}} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (5)$$

On the left side of the y-axis a triangular portion of the section with a base line of u and a height of $\frac{b}{2}$ will be in tension and therefore inactive. The stress figure is seen to be a pyramid with a right triangular base and with sides f_{c_x} and u and with altitude of $\frac{b}{2}$. The "volume" or magnitude of this force would be:

$$T = \frac{1}{6}\ u\, f_{c_x} \frac{b}{2} = \frac{b\, u\, f_{c_x}}{12} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (6)$$

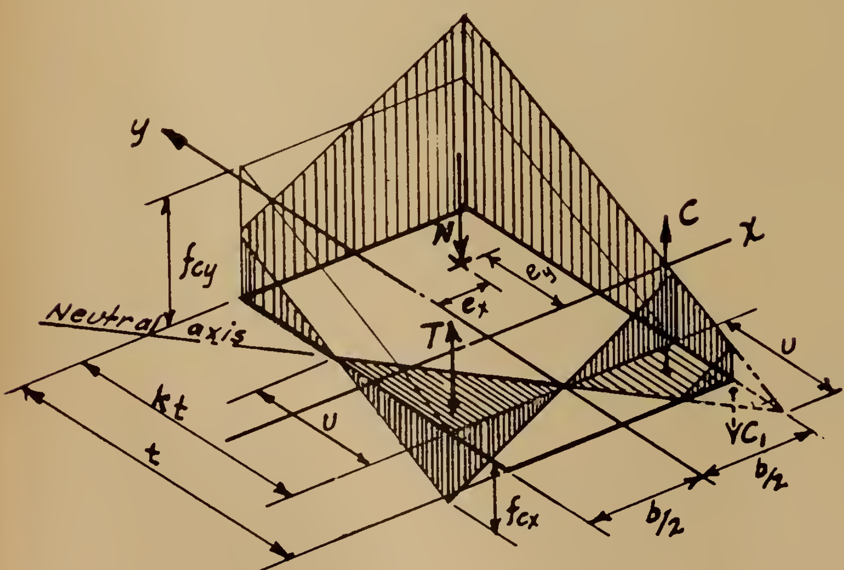

Fig. 3

and its point of application $\frac{3}{8}b$ from the y-axis. This downward-directed force must be neutralized by introducing a similar upward-directed force since concrete is assumed not to be able to resist any tension. On the right hand side of the y-axis a portion of the column which originally was assumed to be in tension has come into compression. The corresponding force C which acts upward must be added directly to the external force system. It is easily seen that for this case $C = T$.

This equality is not present if the neutral axis passes the corner on one of the opposite sides, but the error is not great if the point of intersection is fairly near the corner, and the true magnitude of the force can easily be calculated in any case. Two such special cases will be considered later.

It is also seen that for the case illustrated in Fig. 2, the magnitude of moment about the y-axis is the same for both C and T, and the resultant R of these forces will, therefore, fall on the intersection of the neutral axis with the y-axis. Since the algebraic sum of moments of C and T is zero, they will consequently not change the moment M_x in the transverse direction.

We can now combine the effect of $C + T = R$ with the external forces used under *step one*, and calculate new corrected values for direct load and bending along the y-axis. Steel and concrete stresses found by *steps* 2 and *3* are then combined as explained earlier and considered to be final.

It will be found from *step 3* that the intersection of the neutral axis with the y-axis is not exactly at the same point as was calculated by *step 1*. We have therefore in *step 2* used an effective concrete area which was not quite correct. The error involved is comparatively small, however, and can be neglected in most cases. If more exact results are required, we can repeat *step 2* with the corrected value of effective concrete section found by *step 3*, and thereafter repeat also *step 3*. The author considers that the greater accuracy obtained by the above mentioned repetitions is hardly worth while in view of the uncertainty of the actual value of n and its effect on the column bending moment.

Special Case I

Figure 3 shows a special case where the part of column section under tension is a triangle. If we draw the regular stress figure it will be seen that a part of the stress pyramid falls outside the column section and therefore is inactive. It is most convenient, however, also for this case to use an upward force C corresponding to the complete stress pyramid and then introduce a downward force C_1 corresponding to the "volume" of the small stress pyramid outside the section. The forces C and C_1 will act at the centres of gravity of the respective pyramids. It may be seen that C_1 will be comparatively small if the neutral axis passes near to the corner.

Steps 2 and *3* should be repeated for this case if C_1 has a considerable magnitude. The moment of C_1 about the y-axis should be added to M_x for calculating f_{c_x}. The sums of T, C and C_1 and their moments about the x-axis should be added algebraically to N and M_y respectively for calculating f_{c_y}.

It is seldom necessary for this special case to figure the steel stresses as the distance between the neutral axis and the tension steel will be comparatively short.

Special Case II

The column section under compression is a triangle and a part of the compressive stress pyramid corresponding to T_1 falls outside the column (Fig. 4). A similar procedure to the one outlined for Special

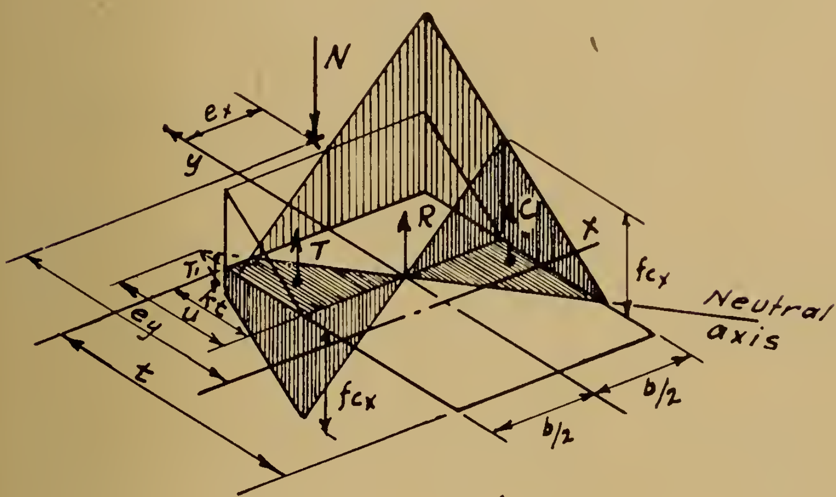

Fig. 4

Case I may be followed for this case for calculating the stresses.

The combined maximum steel stress must be calculated as it may be a deciding factor in this case.

Examples of Calculation

The application of the previously described theory will be shown by two numerical examples. Example 1 has previously been analysed by Professor Paul Andersen ① and has been chosen for the sake of convenience in giving a check.

Example 2 treats a column with unsymmetrical reinforcements, and shows how the stresses may be found by means of successive approximations. Diagrams published by the American Concrete Institute and appended to this paper will be used as an auxiliary in both examples.

Example 1

Step 1

Cross section of column and external loading as shown in Fig. 5.

$g = 0.8 \qquad gt = 20'' \qquad n = 10$

$$np = \frac{8 \times 10}{625} = 0.128$$

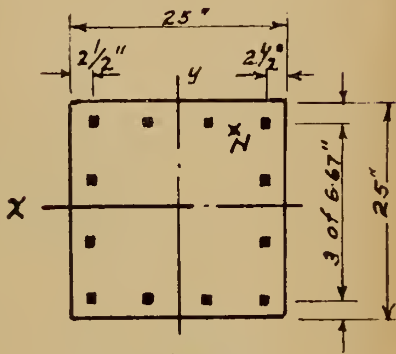
$$e_y = \frac{10766 \times 12}{137850} = 9.36''$$

$$\frac{e_y}{t} = \frac{9.36}{25} = 0.375$$

$k = 0.61 \qquad kt = 15.25'' \qquad Q = 3.05$

$$f_{c_y} = \frac{1378850}{25 \times 25} \times 3.05 = 672 \text{ psi.}$$

$$f_{s_y} = 10 \times 672 \left(\frac{1 + 0.8}{2 \times 0.61} - 1\right) = 3200 \text{ psi.}$$



12 - 1"φ bars
N = 137850
Mx = 60520 ft. lbs.
My = 107660 " "

Fig. 5

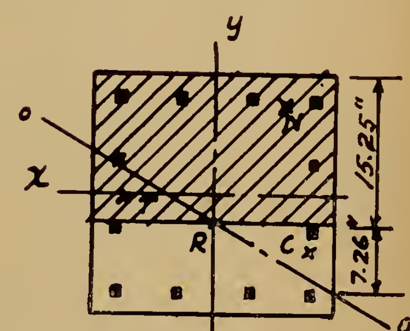


Fig. 6

Step 2

$$S_y = \frac{1}{6} \times 15.25^2 + \frac{10\,(8 \times 10^2 + 4 \times 3.33^2)}{12.5} = 2265 \text{ in.}^3$$

$$f_{c_x} = \frac{60520 \times 12}{2265} = 320 \text{ psi.}$$

$$f_{s_x} = 320 \times 10 \times \frac{10}{12.5} = 2560 \text{ psi.}$$

From *steps 1* and *2*

$$f_{c_{max}} = 672 + 320 = 992 \text{ psi.}$$

$$f_{s_{max}} = 3200 + 2560 = 5760 \text{ psi.}$$

Step 3

From equation (5)

$$u = 15.25 \times \frac{320}{672} = 7.26''$$

$$R = C + T = \frac{25}{6} \times 7.26 \times 320 = 9700 \text{ lbs.}$$

$$N = 137850 - 9700 = 128150 \text{ lbs.}$$

$$M_y = 107660 \times 12 + 9700\,(15.25 - 12.5) = 1318700 \text{ in. lbs.}$$

$$e_y = \frac{1318700}{128150} = 10.28''$$

$$\frac{e_y}{t} = \frac{10.28}{25} = 0.41 \qquad np = 0.128$$

From the diagram

$$k = 0.57 \qquad kt = 14.25'' \qquad Q = 3.25$$

$$f_{c_y} = \frac{128150}{625} \times 3.25 = 667 \text{ psi.}$$

$$f_{s_y} = 10 \times 667 \left(\frac{1 + 0.8}{1.14} - 1\right) = 3870 \text{ psi.}$$

Adding stresses found by *steps 1* and *2* we get:

$$f_{c_{max}} = 667 + 320 = 987 \text{ psi.}$$

$$f_{s_{max}} = 3870 + 2560 = 6430 \text{ psi.}$$

Step 3 shows the neutral axis to have moved one inch upward on the y-axis and we have therefore in *Step 2* used an effective concrete section which was too big. We may correct the section modulus and stresses for this error as follows:

$$S_y = 2265 - \frac{1}{6} \times 1 \times 25^2 = 2265 - 104 = 2161 \text{ in.}^3$$

$$f_{c_x} = \frac{60520 \times 12}{2160} = 336 \text{ psi.}$$

$$f_{s_x} = 336 \times 10 \times \frac{10}{12.5} = 2690 \text{ psi.}$$

Combining stresses found by *Step 3* and corrected *Step 2* we have:

$$f_{c_{max}} = 336 + 667 = 1003 \text{ psi.}$$

$$f_{s_{max}} = 2690 + 3870 = 6560 \text{ psi.}$$

We could also repeat *Step 3* with more correct values found by revised *Step 2* and would then have found $f_{c_{max}} = 1016$ psi. and $f_{s_{max}} = 6640$ psi. It is in this case unnecessary to carry the calculation too far because the A.C.I. diagrams cannot be read with unlimited accuracy. We have also in *Step 3* neglected the effect of four intermediate bars which is on the safe side but will result in calculated stresses somewhat higher than the actual ones.

This problem has also been checked by the very accurate (but laborious) method by Asplund, and the following values found:

$$f_{c_{max}} = 1000 \text{ psi.} \qquad f_{s_{max}} = 6530 \text{ psi.}$$

$$kt = 14.26'' \qquad u = 7.22''$$

Professor Paul Andersen found the following stresses:

$$f_{c_{max}} = 1003 \text{ psi. and } f_{s_{max}} = 6632 \text{ psi.}$$

It is seen that concrete stresses found by all the above methods are nearly the same, and the differences in steel stresses are also rather negligible.

Calculation of Stresses by Bakhoum's Method

We have in the above calculation disregarded the effect of some intermediate bars in *Steps 1* and *3* in order to use the A.C.I. diagrams. The position of the neutral axis and the stresses will therefore be checked by Bakhoum's method which for this case should be more accurate.

Step 1

$$e_y = 9.36''$$

$$I_n = \left(\frac{1}{12} \times 25 \times 15.25^3\right) + (15.25 \times 25 \times 4.485^2) + (10 \times 4 \times 0.64^2) + (10 \times 2 \times 6.03^2) + (10 \times 4 \times 19.36^2) + (10 \times 2 \times 12.7^2) = 33993 \text{ in.}^4$$

$$S_n = (15.25 \times 25 \times 4.485) - (40 \times 0.64) + (20 \times 6.03) + (20 \times 12.7) + (40 \times 19.36) = 2833 \text{ in.}^3$$

$$D_o = \frac{33993}{2833} = 12.0''$$

$$kt = 12 + (12.5 - 9.36) = 15.14''$$

$$I_o = \left(\frac{1}{3} \times 25 \times 15.14^3\right) + (40 \times 12.64^2) + (20 \times 5.97^2) + (20 \times 0.70^2) + (40 \times 7.37^2) = 38280 \text{ in.}^4$$

$$S_o = \left(25 \times \frac{15.14^2}{2}\right) + (40 \times 12.64) + (20 \times 5.97) - (20 \times 0.70) - (40 \times 7.37) = 3176 \text{ in.}^3$$

By formula (3)

$$f_{c_y} = \frac{137850 \times 12 \times 15.14}{38210} = 656 \text{ psi.}$$

By proportionality

$$f_{s_y} = 10 \times 656 \times \frac{22.5 - 15.14}{15.14} = 3190 \text{ psi.}$$

Step 2

$$S_y = \frac{1}{6} \times 15.14 \times 25^2 + \frac{10\,(8 \times 10^2 + 4 \times 3.33^2)}{12.5} = 2250 \text{ in.}^3$$

$$f_{c_x} = \frac{60520 \times 12}{2250} = 323 \text{ psi.}$$

$$f_{s_x} = 323 \times 10 \times \frac{10}{12.5} = 2580 \text{ psi.}$$

Step 3

By formula (5)

$$u = 15.14 \times \frac{323}{656} = 7.45''$$

and by formula (6)

$$R = C + T = \frac{25}{6} \times 7.45 \times 323 = 10000 \text{ lbs.}$$

The corrected external force and moment will be

$$N = 137850 - 10000 = 127850 \text{ lbs.}$$

$$M_y = 107660 \times 12 + 10000\,(15.14 - 12.5) = 1316400 \text{ in. lbs.}$$

$$e_y = \frac{1316400}{127850} = 10.3''$$

The position of the neutral axis will be checked by formula (4)

$$I_n = \left(\frac{1}{12} \times 25 \times 15.14^3\right) + (25 \times 15.14 \times 5.37^2) + (40 \times 0.3^2) + (20 \times 6.79^2) + (20 \times 13.64^2) + (40 \times 20.3^2) = 39330 \text{ in.}^4$$

$$S_n = (15.14 \times 25 \times 5.37) + (40 \times 0.3) + (20 \times 6.97) + (20 \times 13.64) + (40 \times 20.3) = 3266 \text{ in.}^3$$

$$D_o = \frac{39330}{3266} = 12.04''$$

$$kt = 12.04 + 2.2 = 14.24''$$

$$I_o = \left(\frac{1}{3} \times 25 \times 14.24^3\right) + (40 \times 11.74^2) + (20 \times 5.07^2) + (20 \times 1.5^2) + (40 \times 8.25^2) = 32780 \text{ in}^4.$$

From formula (3)

$$f_{c_y} = \frac{127850 \times 12.04 \times 14.24}{32780} = 668 \text{ psi.}$$

By proportionality

$$f_{s_y} = 668 \times 10 \times \frac{22.5 - 14.24}{14.24} = 3880 \text{ psi.}$$

Combining *Steps 1* and *2*

$$f_{c_{max}} = 323 + 668 = 991 \text{ psi.}$$

$$f_{s_{max}} = 2580 + 3880 = 6460 \text{ psi.}$$

Step 3 shows that the neutral axis has moved 0.9″ upward on the y-axis. If we correct *Step 2* for the effect of this we get

$$f_{c_{max}} = 1005 \text{ psi. and } f_{s_{max}} = 6580 \text{ psi.}$$

which agree quite well with the values previously found.

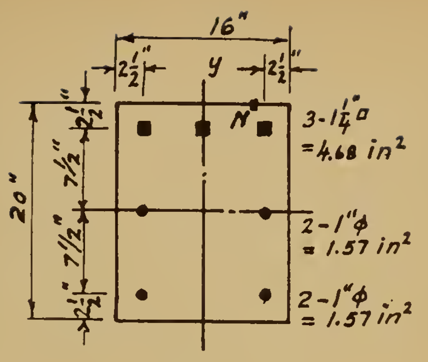

Fig. 7

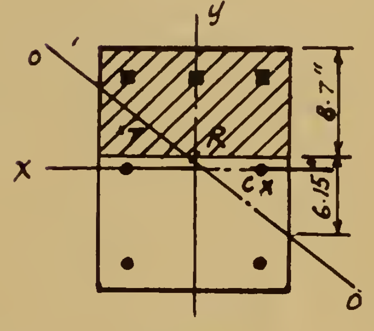

Fig. 8

Example 2

On Fig. 7 is shown a rectangular column with unsymmetrical reinforcement and with the following load and bending moments.

$$N = 60{,}000 \text{ lbs.}$$
$$M_y = 600{,}000 \text{ in. lbs.}$$
$$M_x = 300{,}000 \text{ in. lbs.}$$

A method of successive approximations developed by the author will be used for finding stresses for *step 1*.

It will first be assumed that the compression reinforcement is equal to the tension reinforcement or 1.57 in². The two bars at the middle of the long sides will be disregarded in *step 1* and we can then again use the A.C.I. diagrams.

$$np = \frac{10 \times 1.57 \times 2}{320} = 0.098 \qquad g = 0.75$$

There will be interpolated between the diagrams for $g = 0.7$ and $g = 0.8$

$$e = \frac{600{,}000}{60{,}000} = 10 \qquad \frac{e}{t} = \frac{10}{20} = 0.5$$

We find $Q = 4.6$ $\quad f_c = 862$ psi. $\quad f_s' = 6300$ psi.

These stresses would have been correct if we only had 1.57 in² on the compression side, but there is actually $4.68 - 1.57 = 3.11$ in² more on this side. Under the assumed deformation this will represent an upward directed force of $3.11 \times 6300 = 19{,}600$ lbs. This force and its moment will be added to the external system of forces and a new solution sought by means of the diagrams.

$$N = 60{,}000 - 19{,}600 = 40{,}400 \text{ lbs.}$$
$$M = 600{,}000 - (19{,}600 \times 7.5) = 453{,}000 \text{ in. lbs.}$$
$$e = \frac{453{,}000}{40{,}400} = 11.2'' \qquad \frac{e}{t} = \frac{11.2}{20} = 0.56$$

and from the diagrams,

$Q = 5.20$ $\quad f_c = 655$ psi. $\quad f_s' = 4650$ psi.

$$N = 60{,}000 - (4650 \times 3.11) = 60{,}000 - 14{,}600 = 45{,}540 \text{ lbs.}$$
$$M = 600{,}000 - (14{,}460 \times 7.5) = 491{,}550 \text{ in. lbs.}$$
$$e = \frac{491{,}550}{45{,}540} = 10.8'' \qquad \frac{e}{t} = 0.54$$

and from the diagrams:

$Q = 5.0$ $\quad f_c = 714$ psi. $\quad f_s' = 5120$ psi.

$$N = 60{,}000 - (5120 \times 3.11) = 60{,}000 - 15{,}900 = 44{,}100 \text{ lbs.}$$
$$M = 600{,}000 - (15{,}900 \times 7.5) = 481{,}000 \text{ in. lbs.}$$
$$e = \frac{481{,}000}{44{,}100} = 10.9'' \qquad \frac{e}{t} = 5.45$$

and again from the diagrams:

$Q = 5.07$ $\quad kt = 8.7''$ $\quad f_c = 698$ psi.
$f_s = 7050$ psi. and $f_s' = 5000$ psi.

It will be seen that the stresses approach the correct values very quickly and, so to speak, oscillate towards equilibrium. We might also have assumed the tension steel to have had the same value 4.68² as the compression steel, and applied the surplus force at the centre of the tension steel. This has also been tried but the convergence was not so rapid and six approximations were necessary before correct values were obtained.

There is no material error involved in this case by not taking into account the two bars at centres of the long sides under *step 1*, because the neutral axis passes very near the centre of column. The above method of successive approximations can be used, and correct results obtained, also for the case of reinforcing bars placed along the column sides. We may in the first approximation omit the effect of these bars. From the first found boundary stresses we may then calculate the stress in each group of bars at the same distance from the neutral axis. At the centre of each group a force is then applied, and its magnitude and moment added algebraically to the external force system. Compressive forces will evidently act upwards and tensile forces downwards. The procedure is from then on carried out in conjunction with the further work of successive approximations until equilibrium is established.

The second step is to calculate the section modulus about the y-axis for the uncracked concrete section and the steel. Stresses caused by the transverse bending moment M_x = 300,000 in. lbs. can then be computed. We have:

$$S_y = \frac{1}{6} \times 8.7 \times 16^2 + \frac{6.26 \times 10 \times 5.5^2}{6} = 371 + 237 = 608 \text{ in.}^3$$

$$f_{c_x} = \frac{300,000}{608} = 493 \text{ psi.}$$

$$f_{s_x} = 10 \times 493 \times \frac{5.5}{8} = 3390 \text{ psi.}$$

Referring to Fig. 3

$$u = \frac{8.7 \times 493}{698} = 6.15''$$

$$R = C + T = \frac{6.15 \times 16 \times 493}{6} = 8100 \text{ lbs.}$$

$$N = 60,000 - 8100 = 51900 \text{ lbs.}$$

$$M = 600,000 - 8100\ (10 - 8.7) = 589500 \text{ in. lbs.}$$

Step 3 may be made by several different methods:

a. We may use the method of successive approximations shown for *step 1*.

b. The new position of the neutral axis may be found by trial solutions of equation (4) and the stresses from equation (3).

c. The author has found it to be sufficiently accurate to calculate the moment of inertia about the gravity axis of the effective section found by *step 1*. The moment of the correction force R about this axis is then computed. Concrete and steel stresses due to the tensile force R and its moment about the gravity-axis may then be calculated and added to the stresses found by *step 1* and *2*. The last method is probably the shorter but the results are not quite as accurate as those obtained by using (a) or (b).

The distance to the neutral axis found by two substitutions into equation (4) is:

$$kt = 8.1''$$

and from equation (3)

$$f_{c_y} = 690 \text{ psi.}$$

By proportionality

$$f_{s_y} = 8000 \text{ psi.}$$

As the neutral axis has moved upward 8.7″ − 8.1″ = 0.6″ we will correct *step 2* for the corresponding decrease in effective concrete section.

$$S_y = 608 - \frac{1}{6} \times 0.7 \times 16^2 = 608 - 30 = 578 \text{ in.}^3$$

$$f_{c_x} = \frac{300,000}{578} = 518 \text{ psi.}$$

$$f_{s_x} = 10 \times 518 \times \frac{5.5}{8} = 3560 \text{ psi.}$$

Combining the stresses we have finally:

$$f_{c_{max}} = 690 + 518 = 1208 \text{ psi.}$$

$$f_{s_{max}} = 8000 + 3560 = 11560 \text{ psi.}$$

These results have been checked by Asplund's method of successive approximations. The 12th approximation which had not reached full convergence gave

$$f_{c_{max}} = 1172 \text{ psi.}$$

$$f_{s_{max}} = 10750 \text{ psi.}$$

The previously found maximum stresses are undoubtedly most accurate but the differences are in any case small.

Conclusion

The author has calculated several examples by the described methods and checked the found stresses. The maximum concrete stress has been found to check very closely. Concrete stress at other corners may vary somewhat from the true value but this is of no practical importance since it is the maximum concrete stress which generally decides the safety of the column. The calculated maximum tensile steel stress may also be somewhat inaccurate. The principal cause of this is that any small error in reading the diagrams is magnified n times. Tensile steel stresses in a column are generally far below allowable, however, and a correct calculation of these stresses in such cases has only academic value.

It will often be found that the maximum concrete stress at a corner will tend to be high for direct loading and double axial bending. The author's opinion is that a higher stress may be allowed at a corner if this stress is principally caused by diagonal bending. It should be considered that the high stress only prevails over a comparatively small area of the column section and that the carrying capacity is not to the same extent decreased by such overstressing as would have been the case if a greater proportion of the area had been overstressed. Tests also show that a column bent diagonally has a greater carrying capacity than indicated by its section modulus ⑧.

Part II

The Aerodynamic Research Establishment at Göttingen

The Aerodynamische Versuchsanstalt zu Göttingen, known for short as the A.V.A. was the premier centre for basic aerodynamic research in Germany. It was here that Prandtl, Betz and many others were able to make those important contributions to aerodynamic theory which won for Göttingen its international reputation. The Kaiser Wilhelm Institute for Flow Mechanics, described later, was actually situated within the grounds of A.V.A. During the War, additional wind tunnel facilities were constructed in an abandoned salt mine, a few miles north of Göttingen, where the old mine workings provided excellent camouflage.

The A.V.A. was founded as an incorporated body, the industry being assessed for test work done on its behalf. The accounts of the A.V.A. were examined annually by the Government and grants from the Air Ministry were adjusted to allow for fluctuation in the support received from the industry.

There was a total staff of about 700 at A.V.A. of whom some 30-50 were scientists, 100 were technical assistants and 100 were girl computers who were later used in the laboratories as technicians to replace the men who had entered military service. The most important work of the A.V.A., apart from routine tests for the aircraft manufacturers, was in the field of fundamental aerodynamics, and this was not restricted to aeronautics alone. In general, the equipment of the A.V.A. was smaller and less impressive than that of the newer laboratories such as L.F.A. and L.F.M. and much of it was quite old. On the other hand the calibre and ability of the staff appeared to be generally superior, judging by the results obtained.

Institute for Low-Speed Wind Tunnels

This institute was equipped with six tunnels at Göttingen and two low turbulence tunnels at Reyershausen. Of the tunnels at Göttingen, with the exception of a variable density tunnel with an elliptic jet, all were small and of low speed. Most of the tunnels were old and have already been described in the literature, none of them incorporating any unconventional features.

Behaviour of High Speed Wings at Low Speeds

One of the major projects in the Institute for low speed wind tunnels was the investigation of the behaviour of high speed aircraft at the low speeds encountered during take-off and landing. Models of several high speed jet aircraft used for this purpose were seen in the laboratories. The primary concern was the achievement of low speed control and stability for the swept-back wing which was coming into extensive use in Germany for high speed aircraft. The considerable advantage of the swept-back wing in delaying the onset of compressibility effects had been demonstrated in the high speed tunnels at A.V.A. and had become widely accepted in Germany. Unfortunately, sweepback has an adverse effect on lateral stability, maximum lift coefficient and on the effectiveness of controls and high lift devices, due principally to " out-flow " effects.

It was found that a swept-forward wing gave the same improvement in delaying compressibility effects, together with improved lateral stability and maximum lift coefficient, but had the disadvantage of an unfavourable rolling moment with yaw. In order to improve the maximum lift coefficient, a nose flap (Fig. 15) was developed. It appeared to be the only means of effectively increasing the maximum lift of swept-back wings. In a typical case, with 35° of sweepback, the nose flap gave a maximum lift coefficient of 2.0, in conjunction with conventional 20 per cent trailing edge flaps, representing a 35 per cent improvement over the wing without nose flap. To

EDITOR'S NOTE

Late in 1945 a group of Canadian scientists and engineers visited Germany to investigate scientific and technological achievements of our former enemies. The authors of this paper, at that time on the staff of the National Research Council, were assigned to the field of aeronautics.

The report submitted by these scientists was long and comprehensive, but, in spite of heavy demands on their time, they have prepared a condensation specially for the JOURNAL. Even in this condensed form the report is of necessity being published in four instalments. When all four parts have been published it is hoped a consolidated reprint will be available for those interested in preserving the report in its entirety.

In this second instalment the authors cover the Aerodynamic Research Establishment at Gottingen, including Low Speed Wind Tunnels; plants for study of Boundary Layer Control, Propeller Research, Flight Research, High Speed Flow and for Turbo Machines.

overcome wing-tip stalling and loss of stability and control at low speeds, a double split trailing edge flap (Fig. 16) was used. The low pressure region behind this flap serves to maintain the main flow around the wing. By rotating the flap about its apex, lateral control could be achieved.

Boundary Layer Control

Considerable work had been done here in the field of boundary layer control, utilizing both suction and blowing, the main aim being to achieve high maximum lift and possibly some drag reduction at lower lift values. The tests showed the superiority of suction over blowing. With an air entry located at the leading edge of the wing flap a maximum lift coefficient of 4.0 was obtained at the same stalling angle as for the wing without boundary layer control.

To overcome the practical difficulty of the large blowers required for boundary layer control, an attempt was made to use the low pressure at the centre of the wing tip vortex, for pumping purposes (Fig. 17). In order to get the most favourable results, the suction was applied to the wing trailing edge, through a spanwise slit. It was claimed that a 20 per cent drag reduction was obtained at high lift coefficients in addition to the increase in maximum lift. The overall drag was increased however at low lift coefficients. Boundary layer suction was also considered as a method for providing lateral control. In this case a small flap valve at the trailing edge of the wing (Fig. 18) allowed the suction to be applied to either the upper or lower wing surface boundary layer. It was claimed that this system was free from the time lag experienced with spoiler type controls.

Despite the extensive coverage and systematization of these tests, in comparison with the work done in England on boundary layer control, one can only conclude that the German work was completely uninspired and only revealed results that were either obtained or forecast years earlier.

Propeller Research

In addition to systematic tests on model propellers, an investigation had been made of propellers with swept-back tips (Fig. 19) in order to delay the approach of compressibility effects, as in the case of swept-back wings. Surprisingly larger efficiencies were obtained at high tip speeds than with conventional propellers. Wake surveys behind airscrews in flight and integration of the thrust elements over the disc gave good agreement with actual thrust values but the results were of no use in deducing blade element characteristics owing to the pulsating flow.

Some work had been done on ducted propellers, their advantage being a reduction in diameter and an increase in speed of rotation for the same thrust and power, thereby eliminating the need for reduction gearing. A nose flap on the duct improves the air flow at both high and low advance ratios. For snowmobile application such ducts improve the static thrust characteristics. This Institute had been associated with the development of snowmobiles for the Norwegian operations, in which a pontoon type had been used, permitting movement over snow, ice and open water.

Other work done in this Institute included the test of a lateral control system which it was hoped would not suffer from the usual deterioration at high lift coefficients. It consisted of extendable wing tip plates which moved in a spanwise direction to effect an increase in area of the lifting surface on one side of the aircraft, as shown in Fig. 20. This system suffered from the disadvantages of reversal in inverted flight and unfavourable yawing moment.

To provide data for the design of axial flow compressors, tests were also made on aerofoil cascades at both positive and negative angles of attack.

Work at Reyershausen

The large low turbulence tunnel was of very fine design and had a closed working section about 10 ft. in diameter or alternatively 10 ft. by 5 ft. rectangular section. A contraction ratio of 25 to 1 was employed, with a honeycomb and the wire mesh screens usual in this type of tunnel.

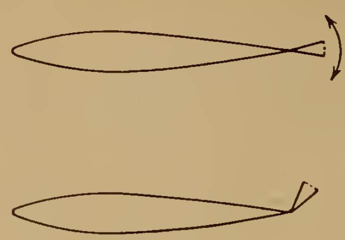
Some fundamental work had been done on the influence of surface roughness on boundary layer transition from laminar to turbulent flow and a few tests had been conducted on low-drag aerofoils derived from American and Russian aircraft, as well as on some profiles developed by the A.V.A. Another interesting project was the test of a cooling system for the Me 109 aircraft in which the ducted radiator was equipped with a by-pass for the removal of the thick boundary layer coming from the wing or fuselage, so that only high velocity air entered the radiator. This arrangement is schematically shown in Fig. 21.

Institute for Flight Research

Flight tests were confined entirely to fundamental aerodynamic work,

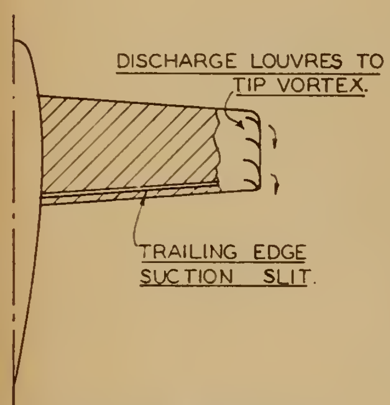
RETRACTIBLE NOSE FLAP FOR SWEPT-BACK WINGS.

FIG. 15



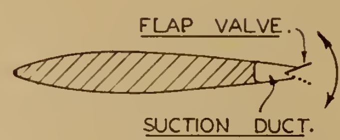
DOUBLE SPLIT TRAILING EDGE FLAP FOR SWEPT-BACK WINGS.

FIG. 16



HIGH LIFT BY SELF PUMPING BOUNDARY LAYER SUCTION.

FIG. 17



LATERAL CONTROL BY BOUNDARY LAYER SUCTION.

FIG. 18

no engine, structural or performance testing being undertaken. The Institute had between 12 and 15 aircraft and employed six civilian engineer pilots. Two aircraft were equipped with blowers, driven by auxiliary combustion engines, for flight testing the boundary layer control schemes developed in the wind tunnel. With power on, maximum lift coefficients of 5.5 were said to be achieved, without any increase in stalling angle, so that these high lifts greatly assisted the approach and landing. In take-offs, the ground run could be shortened but the high drag gave a poor climb performance so that the overall take-off was not improved. One difficulty encountered with boundary layer suction was a pronounced instability of the wings in roll at the stall.

Flight tests of reversible pitch propellers for shortening the landing run of an F.W. 190 indicated that a saving of some 75 per cent in landing distance could be achieved. Normal flap deflections were used in all cases and no tail buffeting or tendency of the aircraft to swing was encountered.

Some work had also been done on measuring the sound spectrum of typical aircraft, to assist in the problem of the acoustic detection and location of bombers from night fighters.

In the various special instruments used for the flight tests, the D.V.L. scratch recorder was widely used for all types of indication, to the exclusion of electrical recording systems and despite the microscopic size of the record so obtained. D.V.L. scratch recorders were also used, located at the control surface, for control position indicators.

Pressure Measurements

A D.V.L. sylphon capsule, linked to a mirror for photographic recording, was employed. A capacity type was under development at A.V.A. for dynamic pressure recording, in which the diaphragms of a two-chamber pressure capsule formed the condenser plates.

Temperature Measurements

Standard thermocouple installations were used with manually operated potentiometer and galvanometer indications. Free air temperatures were measured by the usual resistance thermometer, mounted in a forward facing vented cup to give a known kinetic temperature recovery.

Strain Gauges

D.V.L. scratch recorders were employed, the Germans being emphatically opposed to the use of electrical resistance methods. Inductance type strain gauges were used for dynamic measurements, while the capacity type were not considered satisfactory due to moisture effects.

Accelerometers

The standard uni-directional seismic type were in use, with D.V.L. scratch recorders. A three-directional type, developed by Betz, consisted of a glass cube mounted at the intersection of six air jets disposed at right angles to each other, as in Fig. 22, the movement of the cube under acceleration tending to throttle the air flow in some of the jets, giving a pressure change which could be observed or recorded. It was claimed to be a highly accurate instrument.

Air Speed Meters

The air log method was extensively used with a photo-electric transmitting system to reduce friction effects.

Institute for Theoretical Aerodynamics

Considerable work had been done on high speed air flow, in particular, theoretical calculations of the velocity and pressure distribution in compressible flow had been made using a theory which relates these quantities to the values in low speed or incompressible flow, for which there is a very broad theoretical and experimental foundation. The Institute had derived an improved value of the so-called Prandtl-Glauert factor which geometrically relates the compressible to the incompressible flow values. The electrical analogy method for studying compressible flows was also in use here.

Calculations of the stability of laminar boundary layers had also been made. These calculations predict a rising drag coefficient at high Reynolds number, which was confirmed by tunnel tests but at a somewhat higher Reynolds number than had been expected.

Other work included the study of turbulent boundary layers, and the development of improved air intakes for jet engines and coolers by theoretical calculation of the intake contours. The Germans were having trouble with air intakes located at the leading edge of swept-back wings, and similar difficulties had been experienced in other countries. Airscrew calculations, including contra - rotating propellers, and theoretical work on aerofoils had also engaged the attention of the staff here.

Institute for High Speed Flow

This Institute had three small, high speed wind tunnels at Göttingen and a fourth steam injector tunnel at Reyershausen. All were of simple design, as funds could not be obtained for more elaborate tunnels. The three tunnels at Göttingen were operated intermittently, from evacuated chambers totalling 14,100 cu. ft., with quick-acting valves to initiate the flow, reciprocating pumps having a total driving power of 600 kw. being used. This type of tunnel was popular in Germany, having the advantage of cheaper construction over the continuous type of tunnel. In the case of supersonic tests, steady conditions are achieved almost instantaneously in this type of tunnel, whereas the continuous tunnels gave considerable vibration and unsteadiness during passage through the sonic range. The disadvantage of the short test time available in the intermittent type of tunnel was claimed to be of secondary importance. It did not appear to restrict them seriously, except in the case of special work such as heat transfer tests.

The "1938" tunnel (Fig. 23) had a working section 11 cm. by 13 cm. and gave a Mach number of 3.0 to 3.2 for 30 seconds. This tunnel had been used mainly on projectile work, this Institute having been initially the main centre in Germany for the study of the aerodynamics of projectiles. It was also in this tunnel that the beneficial effect of wing sweepback in delaying compressibility effects was demonstrated in 1939. With 30° sweepback these effects are delayed by about 0.06 to 0.08 Mach number.

The "1942" tunnel (Fig. 24) had a circular open jet, 21.5 cm. diameter, giving a Mach number of 1.0 for 20 seconds. Speed was controlled by the axial motion of a streamlined body in the diffuser. Work in this tunnel included studies of projectiles in sub-sonic flow and tests of propeller profiles and swept-back wing profiles.

The "1945" tunnel (Figs. 25 & 27) had an open jet, 25 cm. square working section, giving speeds of Mach number 1.2 to 3.2 for 15 to 20 seconds. This tunnel had not been operated prior to the fall of Germany.

The open working section was preferred; among other advantages it facilitated mounting of the model. The length of the open jet could be varied in order to avoid shock waves, the entire jet being enclosed to permit control of the jet pressure. The roof and floor of the diffuser were flexible, to permit the formation of a second throat which is necessary for stability of flow in the working section. A silica gel drying system was required for the aspirated air, to prevent the formation of condensation shock waves which obscure the field and give rise to errors. A method for revitalizing the gel, which becomes necessary after several hours of operation, comprised an air circulation system with both electrical heating and refrigeration.

In this particular tunnel the quick-acting valve was a hydraulically operated, gate type, capable of full operation in one second. The conical rotary type of electrically actuated valve developed at A.V.A. was more popular, but owing to material shortages, could not be obtained for the "1945" tunnel.

A unique development at the

FIG. 22

A.V.A. was the use of a grid of Laval nozzles for obtaining supersonic flow. This consisted of a brass plate, about $\frac{3}{4}$ in. thick, in which a large number of holes had been drilled, arranged in rows and columns, as in a grid, each of the holes being shaped like a Laval nozzle. This arrangement was said to give better pressure distribution and lower losses than the single Laval nozzle usually employed. Different grid plates with different shaped holes were required for each supersonic speed.

An ingenious 3-component, spring type balance had been designed and built for this tunnel. This was of the double-ended type incorporating three sets of axes, arranged to measure lift, drag and pitching moment consecutively, by selection of the appropriate axis. Although it only measured one component at a time, an experienced operator could obtain a reading within 5 seconds. Optical observation of the air flow by Schlieren photography was also intended for this tunnel.

The steam injector tunnel at Reyershausen is shown in Figs. 26 & 28. This was a novel expedient to overcome the lack of suitable electrical driving equipment and shortage of power for high speed tunnels, and made use of the existing steam generating equipment at the abandoned salt mine. A large steam storage tank of about 4500 cu. ft. capacity, at eight atmospheres pressure, was adequate for intermittent operation of the tunnel, running time being two minutes. The steam was injected from an annular orifice approximately 1 in. wide, downstream from the working section, the steam being supplied by five 12 in. diameter pipes, visible in the photograph, and released through quick-acting pneumatically operated double-conical valves.

Speed control in this sonic tunnel was obtained by the movement of a streamlined body in the diffuser, to choke the flow. The closed working section of the tunnel was about $31\frac{1}{2}$ in. in diameter and was surrounded by a pressure chamber in which the 3-component hydraulic-capsule type balance was located. The diffuser was about 60 ft. in length. The tunnel was used for aerodynamic tests of projectiles, studies of air inlets for jet engines and tests of athodyds (aerothermodynamic ducts) or ramjets.

The operation of this tunnel caused a vortex-ring shaped cloud to sit over the diffuser exit. As this would be easy to spot from the air, the staff were always careful not to operate the tunnel when Allied aircraft were abroad.

This Institute seems to have

been primarily concerned with projectile shapes and the routine testing of projectile models. Some force measurements were also carried out on models of guided missiles.

Institute for Turbo-Machines

This Institute has been working for many years on axial blowers for stationary turbines and later, for jet propulsion units in aircraft. The work has been directed toward the development of a compact compressor of the axial flow type, by employing small diameter with high rotational speed and high rates of axial flow, combined with a high pressure rise at each stage. Working in the subsonic range it has been possible to obtain single stage efficiencies as high as 88 per cent with a blade tip speed of 650 feet per second under the above conditions. This work was carried out on small scale model compressors, and was supplemented by tests on cascades in order to separate out the influence of radial motion in the boundary layer and to supply basic design data. The tests established the importance of impeller 'solidity' (or number of blades); hub to blade diameter ratio, in which the relative magnitude of the boundary layer is important; Mach number at the blade tips; and Reynolds number.

Two small scale compressor test stands were available, incorporating a closed variable density air circuit for the test compressor, the first one for 6 in. wheels driven by a 90 hp. air turbine, and the second one for 8 in. dia. counter-rotating wheels, which is provided with two 100-kw. electric driving motors, giving speeds up to 33,000 r.p.m.

In addition, a large full-scale compressor test stand had recently been added to the equipment, having a driving power of 2900 kw. and capable of testing blowers up to 40 in. in diameter at speeds up to 12,000 r.p.m. This stand had been used for testing the 4-stage compressor on the new Heinkel Hirth He-S11 jet engine. A cascade testing tunnel for turbine and compressor blades was also under construction at this Institute. It was proposed to employ the same driving motor as for the full scale compressor test stand, with special blowers to give air speeds up to 820 feet per second in a working section 2 ft. square. The compressors of the German jet engines, including the Junkers Jumo 004, the BMW 003 and the Heinkel Hirth He-S11, were designed in consultation with this Institute.

(To be continued)

An Interesting Exhibit

Through the courtesy of the National Research Council we reproduce a photograph of great historical interest—the first radar magnetron tube seen in America.

In 1940, Sir Henry Tizard, one of a group of British Scientists working on the development of Radar, headed a mission to the United States to disclose "freely, completely and unconditionally, in the common interest, all that was known in the United Kingdom regarding the science of radiolocation". Among the mass of technical data and information brought to this continent by the Tizard Mission was a sample 10-cm. magnetron tube, the nucleus of successful centimetric radiolocation development and the pioneer of the vast family of radar magnetrons which have since been manufactured in North America.

This tube is now in the possession of the National Research Council where it serves as a reminder of and monument to that community of interest and understanding among scientists of the British Commonwealth and the United States which contributed so much to the successful prosecution of the second World War.

Making The Most of Engineering

*An Address delivered before the Detroit Section of the Society of Automotive Engineers on May 19, 1947.**

by

James C. Zeder

Chairman of The Engineering Board, The Chrysler Corporation, Detroit, Mich.

Although the following address has already received wide publicity, the Publications Committee believes it is

James C. Zeder

worthy of repetition in the *Journal*, due to the importance of the message it carries. Behind the light conversational style of the author there is much sound advice that, if heeded, can be really helpful in shaping the careers of those still willing to learn. Particularly it merits careful and thoughtful reading by the young engineer, for in it there is given a proven formula for success.

Technical proficiency, the author points out, is not enough. He urges engineers to apply the same scientific reasoning and research used in overcoming engineering problems, to their own personal problems—how to get along with others, how to extend their services, how to think ahead, how to undertake a serious programme of self-development and self-adjustment, based on reason rather than emotion.

This discussion will be in quite a different direction from the technical matters usually brought to engineers' meetings. In contrast, this is a report on observations made, and a few conclusions arrived at regarding a personal phase of engineering. This personal angle is important, because if we neglect it, we apply brakes to our progress. Yet if we develop it and put it to use, it becomes a powerful asset. How much more successful most of us would be as engineers if, at the same time, we were somehow able to be more successful as individuals! How much more we could make of Engineering if we could give the same effort and thought to engineering *ourselves* that we spend on materials and mechanisms.

This applies to all of us, and it doesn't matter what type of engineering progress we have in mind . . . it may be along the lines of research, of design, of some specific branch of science, or in the direction of greater executive responsibility. Each one of these objectives is necessary to the advancement of the profession. And fortunately we are enough different from each other in temperament and particular ability so that each direction of advancement represents a satisfactory goal for a certain number of us.

What we as engineers too often overlook is the fact that our individual success is measured not only by how much we know, but, of even greater importance, how much of our information we can pass on to others and how much of it gets into actual use. That in turn depends upon something more than an ability to solve technical problems. We must match that with an equal ability to make progress in fields beyond technology, so that our knowledge and experience can have practical application.

Yet, it is these non-technical obstacles that seriously bother us. What we *worry* and *complain* about are such things as how we can get more recognition, more money, more and better equipment, or a better job. But these are things we can't secure all alone—somebody besides ourselves has to do something about them.

Accordingly, to solve our really troublesome problems, we engineers should spend more time and thought in what is frequently called " human engineering ", so let's concentrate on the first step in such a project. That is to determine what engineering we should do *on our-*

*Published by permission of the Society of Automotive Engineers.

selves as individuals, to accelerate our progress.

Typical Complaints and Their Analysis

As in any engineering problem, it's important to determine right at the beginning what are the obstacles ahead. So, let's look at a few of the typical circumstances that confront us as engineers;

1. It is almost impossible to secure recognition or greater income.
2. The company is not progressive.
3. Progress in my company can be gained only by the " high pressure boys ".
4. There's no future because there are too many older men ahead of me.
5. There's no credit for routine work, and I never get the spectacular jobs.
6. The management completely disregards the true importance of the field of engineering I'm in, so that little attention is paid to my work.
7. There's no real money in engineering.
8. Engineering doesn't have enough voice in management decisions affecting engineering.
9. Engineering does the work, but someone else gets the credit.
10. Engineers spend most of their time correcting other people's mistakes.

We could go on for quite a while like this, but those are enough to show you the type of circumstances referred to.

There's neither the time nor the need to discuss each complaint. If we let them, they can put an overpowering drag on our progress. Or they can be actual starting points for continued advancement, if we put them to work. It all depends on *US*.

The seriousness of a complaint does not depend upon whether the circumstances are either worse or better than we think they are; instead, the important factor in the case is the *attitude* we take toward it. Too many times it is the *state of mind* that defeats us, far more seriously than the situation which prevails. As soon as we allow our attitude toward a complaint to degenerate into a state of chronic grumbling the more certain it is that we will be brought to a stop or even start sliding downhill.

Unfortunately, when we encounter obstacles outside our own back yard of engineering, we tend to throw away the precision tools of reasoning; instead, we start hacking away with the erratic implements of emotion. We lose all sense of proportion because, instead of using a steel rule, we try to size up the situation with an elastic tape measure. And the more disturbed we get, the more we stretch the tape! The natural result is that we become uncertain and confused. The surest evidence that we are disorganized is our inability to get our mind free from the complaint long enough to go to work on ways to get around it.

Confidence, the surest stimulant to action, gives way to fear. Medical men tell us that prolonged fear actually injects serious poisons into the system. Certainly its ability to magnify and intensify the hazards of any course of action sets up a paralysis which resists the strongest kind of effort. So, when we permit a complaint to get under our skin, we give ourselves over to a drug that really disorganizes us. Among other things, it blunts the sharp edge of our initiative, it neutralizes the finest technical proficiency, and it completely disrupts our ability to exercise good judgment.

Applying Scientific Approach to Circumstances

If we expect to make progress as engineers we must become better engineers, of course; but we must also improve our ability to make a constructive approach to the *circumstances* that bother us. That being true, we might learn something from our usual *engineering* approach to problems involving *physical laws*. When you stop to think ot it, we *could* have a lot of complaints against nature. Imagine the performance we'd get out of our cars if we could make a few exceptions to the law of gravity. How much easier it would be if nature didn't insist in using up a lot of energy in the form of friction and heat! Think of all the troubles we get into because mechanisms are subject to wear. How it would simplify things if there were no such thing as corrosion or rust!

Everywhere we turn we run into circumstances which slow down or limit our progress, or force us to go in some other direction. So what do we do . . . complain about it? Of course we do, but not seriously, and not for long. Why? . . . because we have come to accept natural law not as a reason for personal complaint, but as a challenge. The engineer has concentrated his time on finding ways either of using the forces of nature or of avoiding harmful conflict with them. Instead of being stopped by friction, we minimize it with lubrication and overcome it with power; and without it we'd be in a bad way both for the traction that makes travel possible, and for the braking that permits us to stop.

Corrosion is, perhaps, the finest example of all. There are no benefits of corrosion. Yet, out of the efforts to combat it have come some of the greatest sources of beauty we have. . . . Think of the many beautiful metallic platings, the style possibilities of stainless steel, the rich colours we now have from modern lacquers and enamels, to mention a few. Our experts in art and styling would have a pretty slim bag of tricks without all the decorative techniques which were first started as attempts to prevent corrosion.

The point of all this is to show how consistently we, as *engineers*, demonstrate that it's not the size of the obstacle but the constructive approach to its solution that's important. If we thought that gravity, friction, wear, and corrosion were unfair, and if we had the feeling that they were aimed directly at our personal engineering progress, we'd be licked before we started. There doesn't seem to be much pay dirt in trying to get them changed or repealed either, if the general standing of magicians and medicine men is any indication. They haven't gotten past first base, after centuries of plain and fancy trying.

Yet apparently the main difference between the magician and the engineer has been a state of mind . . . a method of approach. The laws of nature haven't changed. The same forces that today can drive a car over two miles a minute have existed since time began. The obstacles that made such performance seem fantastic even twenty years ago are also still there. But we ourselves have seen the tremendous strides made in the field of automotive engineering alone. Present day engineering accomplishments prove that there is no ceiling, no door completely closed, when the attack is made in a *constructive* state of mind.

The more closely we study this whole subject, the more clearly one fact emerges. The natural laws that have been the roughest on us have forced us to do hard work; but that very effort has been one of our greatest sources of scientific progress. In other words, instead of holding us back, the obstacles actually forced us further ahead than we otherwise might have been . . . as long as we concentrated on finding solutions, rather than squandering all our energy in complaints. The conclusion seems obvious . . . to make the most of engineering, we, *as people,* should apply the same approach to our complaints against *circumstances* that we, as engineers, have used so successfully in capitalizing on the obstacles we're continually fighting in natural laws.

It's not easy to take this objective view of *personal* obstacles, because when *people* oppose us, the most natural thing is to get upset. We have all kinds of energy to pour into impatience, anger, resentment, suspicion, and injured pride; but it's something else again to force our thoughts into channels of analysis, unprejudiced judgment, enterprise, and constructive action *in spite of disturbing circumstances.* It takes hard work, without much let up . . . but it's worth trying. If we succeed, it means we will replace bitterness and disappointment with assurance and satisfaction. What's more, when we try it, we discover that our growth and the measure of our success increases whenever we apply reason rather than emotion to *every* obstacle in our path.

This certainly is not to imply that we should never complain—far from it! A state of unruffled contentment with ourselves and our surroundings may look inviting from a distance. Yet, like a complete balance of forces, it means no movement, no forward progress, no development. Dissatisfaction with circumstances, and with our rate of progress, in itself, then is a *healthy* symptom. More than that, it's the initial spur to personal advancement. For whether it is real or imaginary, larger or smaller than it appears, if the obstacle is used as a starter, not a brake, it can serve as a sure means of driving us to greater efforts, the sure basis of continuous advancement. Walt Whitman has pointed this out in a famous passage. He asks:

> "Have you learned lessons *only* of those who admired you and were tender with you, and stood aside for you? Have you not learned great lessons from those who braced themselves against you, and disputed the passage with you?"

Looking at it from that viewpoint, our various complaints do not diminish in importance, they merely fall into another category. Instead of resenting them as irritating barriers, we can now recognize them as the potential starting points to substantial progress. That very kind of difficulty you may now be having has been an important spur to the growth and eventual progress of quite a few really successful engineers.

The Typical Engineer

To get a better perspective, let's set the stage with an automotive engineer . . . any typical member of S.A.E., who, of course, has been doing a good job. Everything is satisfactory, except one thing . . . the only *reward* he's had for doing good work is to have more of the same dumped in his lap in stifling quantities. And because nobody has taken him up to the mountain top to show him the new territory that's being turned over to him, he figures the road is permanently blocked and that the only solution is to find a new mountain!

There isn't one of us here who, like our typical engineer, doesn't feel perfectly capable of carrying greater responsibilities. We all *know* that, if we were given the opportunity, we could do more important work than we are doing today. The stronger we feel that way, the more disappointing it is for months or even years to roll by without the company showing any appreciable recognition of our real talent. Like us, this typical engineer can point to an excellent record. He's taken a personal interest in each new project. He's made many contributions beyond actual requirements. He's given unswerving loyalty to his superiors. He knows he is the type of person who should be a key man in the organization.

The company, while recognizing the value of these qualities, looks at each one of us from its own perspective, and through eyes which are looking for *other* qualifications as well. It must think in terms of group objectives, of broad purposes to be attained, and of progress through team work, and organization. There are various types of work to be done, but as a company grows in size, the more necessary it becomes that people must fit themselves to jobs rather than that jobs can be created to fit people.

While our typical engineer may be using a *foot* rule to mark off the extent of his abilities, the company may have to employ a *yardstick.* Our fitness to be given work of broader scope depends upon qualifications beyond the satisfactory performance of our present jobs. It isn't simply a matter of how far we personally have advanced during the past years. The deciding factor is how close we have managed to come to the *ideal* requirements for the particular position which needs to be filled. In this connection, how often do we stop to consider the ways in which we ourselves are being "typed" by our associates. We do that very thing, almost automatically, to those around us.

At the same time we are being catalogued . . . but under what headings, do you suppose? If we could only look at ourselves from the viewpoint of those who do the selecting for each new job, what do you expect we'd see? Are we "too cool and aloof to work with others". . . do others feel we're "too opinionated and know all the answers". . . . are we "impatient and short-tempered". . . are we continually being "misunderstood"? How do we really stack up as building material? Do we fit in with the rest of the structure? Are we fully prepared to carry our full share of the load? After a glimpse like that, every one of us would recognize that there *should* be a few changes made . . . in us.

The trouble with many of us in the engineering profession, however, is that we don't look too favourably on the necessity for the personal development and readjustment that is needed if we are to get the recognition we expect. Too often we assume that all we need is more engineering. That makes it all the more disturbing when someone moves ahead of us, who we think has nowhere near as comprehensive a background in engineering as ours.

Technical Proficiency Not Enough

As a matter of fact, the more you study individual cases of engineers whose progress has lagged seriously behind their engineering ability, one thing becomes increasingly evident . . . *technical proficiency, alone, is not enough.* In fact, too much emphasis on scientific achievement can, itself, be one of the very reasons why some engineers continue to be passed by. In concentrating on engineering, these men have completely neglected to consider or develop these *other* characteristics which carry men ahead. Unfortunately, as more and more interest is centered on engineering problems alone, the ability to find and make use of new avenues of personal development and progress seems to diminish.

As engineers, we have many fine prerequisites to success. The difficulty with many of us is that we're not prepared to make the best possible use of our equipment. Any of you who are fishermen and who have really whipped a stream know that there's a lot more to fly fishing than having just the right weight of rod, the most modern type reel, the finest, smoothest running line that's available, and the latest versions of the flymaker's art. For, even though the stream is well stocked, you can catch more frustration than fish if you don't cast in the right pools, drop the fly down in just the right way, and work with the sun, wind, and stream, rather than against them. Good equipment helps, but it's how you use it that really fills up the creel. So, just because you haven't caught any good-sized fish in the engineering stream you're working, don't blame the stream, or necessarily the equipment, which in this case is your own engineering training and experience. Instead, the chances are that it's the way you're using it that's at fault.

To get back to our hypothetical engineer, what is it that he should do if he is to make the most of himself and of his engineering. No two people can use an *identical* plan, because each of us is different, in background, in personality, and in our own interpretation of what constitutes a satisfactory objective. Yet, in any company, there are certain methods of approach, particular abilties or ways of doing things, which secure more favourable attention than others. Again, there are common denominators of personal advancement that have proved to be effective in one company after another.

Special Studies Already Made

Fortunately for us, extensive studies have already been made with which we can supplement our own findings. For instance, a few years ago a young man in the sales department of an entirely different industry became, like many of us, quite dissatisfied with the progress he was making. He kept asking himself what it could be that certain men, apparently no more intelligent than he, were using to get ahead so fast. So he set out to find some of the answers. For several years he made thorough-going studies of the successful men with whom he came in contact. He made the same *variety* of careful determinations that we would use in determining the characteristics of a new, super-strong metal suddenly put on the market. At weekly get-togethers of a few of his associates, men interested in the same thing, he checked his own observations with theirs.

In building up a pattern of success for themselves, these men soon discovered that they had evolved a highly marketable product. They had produced a system of personal behaviour and an analysis of ways to get things done that applied to widely differing occupations. What they had learned could be used to make progress in accounting, in salesmanship, in office management, in factory operations, and even in engineering. Literally thousands of individuals in hundreds of companies, many in some of our largest corporations, have learned to apply these fundamentals to their own jobs. As a result, most of them are more effective in their jobs. Consequently, they are getting more recognition and greater compensation. Many of the principles revealed are ones in which we as engineers, are particularly prone to be deficient, so they're worth considering right here.

Here's the first point . . . these investigators learned that above everything else the most widespread and useful characteristic of success is the *ability to get along with people.* That doesn't mean being an easy mark . . . letting others run over you. To get places, you must get things *done.* But some individuals seem to do that with an unusual amount of cooperation from others, and a minimum of opposition. In fact, that's how they manage to out-produce the rest of us by enough margin to secure the kind of recognition *we'd* like to get. Yet, along the way they make many real friends and few actual enemies.

We all can think of individual engineers who are brilliant men, but who have found themselves stopped time and time again because of failures in getting along with people. They are men of keen vision and truly advanced ideas, but they're always looking in vain for a congenial atmosphere. No matter where they go, things are never quite right for *them.* They are full of zeal, imagination and initiative . . . all prerequisites of success. The trouble is they have applied these talents to only *one* half of the job . . . the technical side. As a result they are continually in trouble because of the lofty, uncompromising attitude they feel they must take toward others. Quite unintentionally, they set up a corrosive action which undermines the best efforts of those around them with an atmosphere of antagonism. They honestly can't understand what causes the trouble. Eventually, they become convinced that everyone is lined up against them.

Other engineers seem to feel it necessary to develop what might be called the porcupine approach. They always know all the answers. So, whenever any outside suggestion is made, they invariably have a well-sharpened quill ready to puncture the would-be cooperator.

Then, there are those of us who tend to feel that compromise is just as unthinkable in actions or methods of operation as it would be in technical opinions. So we find ourselves inflexibly anchored to one spot. In addition, there's the super-scientist who always seems to be misunderstood. He *is,* simply because he never feels it worth while to put aside enough of his advanced technical terms to be understood by those outside his own highly specialized field. But most important of all, there are a lot of us, like you and me, who aren't prima donnas, but who still don't travel at anywhere near our potential rate. Like the others, we owe much of our own trouble to our failure to pay as much attention as we should to the important matter of human relations.

Here's a second characteristic of successful people. It's their habit of looking beyond their own department, or their own activity . . . and the object is seldom to locate greener pastures. Instead, they are continually searching for ways in which they can make their own efforts contribute more to the rest of the organization. That's not altruism . . . far from it. They've discovered that their own market value goes up whenever they extend their services. Greater recognition is theirs as fast as more people understand the use and importance of what they're doing.

A third avenue to progress, in whatever direction you want to go, is travelled by the numbers of people who are consistently moving up, entirely independently of company plans and any regular promotion schedules. Instead, they exercise considerable control of the time, rate, and direction of their progress by doing a great deal of planning of their own. In their efforts to move ahead, they work as untiringly and in as many directions on *personal development* as any engineer worth his salt expects to work on getting the bugs out of a new process or an experimental model. If one plan fails, they pick up the pieces, determine the probable cause of failure, and then put together another one. The next one should do better, because it avoids the pitfalls that apparently wrecked its predecessors.

Must Strengthen Personal Qualities

Right here one thought should be emphasized as strongly as possible. It's this: Personal progress, if it is to be lasting, must be based not on smart moves or clever scheming, but on the strengthening of fundamental qualities. The self-development must start from the core of the individual. A quick case-hardening of the surface won't take the load . . . the base material itself must be improved.

Every outstanding leader, the sort of man you and I recognize as a " topper ", gives us the finest proof of much that we've been discussing. His sincerity and genuineness are inescapable. He's not putting on an act—he's being himself. And the edge he has on the rest of us, above everything else, is the successful attitude, or state of mind we've talked about.

Each one of us has seen this kind of person in action at one time or another. Time and again he amazes us by pointing out many ways to improve something we thought was the last word. He *begins* where we are ready to stop. This happens in such widely different circumstances as designing a new model, planning a new engineering programme, appraising a new mechanism, or working out the basic lines of an entirely new activity. The amazing thing is that his suggestions seem to come readily, and are sound, no matter what the subject. His is an orderly, well-trained mind to which he adds an exceptional ability to see things in their right light and true perspective. With this combination, he can find the road through or around a difficult situation with few, if any, false starts, and with a minimum of wasted effort. His energy is concentrated on going beyond it.

He isn't blind to obstacles—far from it. As a matter of fact, he sees them more clearly than most of us, because his vision isn't cluttered up with worry over their existence. He knows there are always ways around even the most disturbing circumstances, so he looks *past* them. His mind is free from confusion. He moves without lost motion. His decisions are quick and clear. He *leads* because he's always *thinking* ahead of us.

Are men like these in a class set entirely apart, which we can but admire from afar? Are these men endowed with so much more talent than the rest of us? Are they gifted with aptitudes beyond our reach? Probably in some cases they are . . . but actually many of them are not much different from you and me . . . except in one all important particular. That's the matter of ATTITUDE . . . the state of mind with which they bring success to everything they do.

Men so fortified have been referred to as individuals who simply couldn't seem to avoid success. Many of them are men right here in the automotive industry . . . men we have worked with and seen in operation. Every one of them has had to overcome one obstacle after another. At least once or twice in the career of every successful engineer, there were times when all his efforts seemed to be ending in blind alleys. He wasn't stopped—certainly not for long. Why? Because of the state of mind with which he attacked the situation. It led him to use the same thoroughness in preparing himself to meet *circumstances* that he did to solve technical problems. He tackled *both* sides of the problem—that's why, whichever way he turned, he did a better job and made faster progress than the average individual.

Conclusions

In bringing this talk to a close, let us go back for just a minute to those ten complaints we listed right at the start. We can look at them either individually or as a group. In any case, we can agree that they *all* are vulnerable to *trained attack*. And there is no profession better equipped to make that kind of attack than the one represented by engineers.

We can do it by approaching obstacles involving circumstances with the same constructive state of mind that we use to solve strictly engineering problems. It means relying on reason, instead of giving way to emotion. It means developing the ability to get along with people. It means making continuous studies of the ways in which we can better relate our field of interest and our engineering accomplishments to the broad objectives of the company that employs us. It means applying engineering know-how to the progress of *engineers* — to the job of getting the utmost use from the engineering knowledge and experience of each individual.

What can we, personally, do about it? The answer (and the whole subject) boils down to this: Each one of us can make more progress in Engineering if we are willing to carry on a serious programme of self-development and self-adjustment. By so doing, we will gain the stature and maintain the attitude which will give us capacity for progress *beyond* whatever problems we meet.

If you can absorb that thought, *you* can do whatever is necessary to put it to work. And when you do, you'll be working toward a continually broadening conception of how much it can mean, *to you*, to " Make the Most of Engineering ".

From Month to Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

Canons of Ethics

Elsewhere in this *Journal* are printed the Canons of Ethics as prepared by the Engineers' Council for Professional Development (ECPD). They are the result of many years deliberations by a special committee appointed for the purpose, upon which the Institute was represented by Dr. C. R. Young, of Toronto.

It was the hope of ECPD that a code of ethics could be devised that would be acceptable to and adopted by all societies represented on the Council, and by others as well. This objective has been reached partially, in that the Code has been approved by all such member organizations. This approval was given by the Council of the Institute at the Banff meeting, upon the recommendation of a special committee appointed to make a study and a report.

The next step—and perhaps not an easy one—is to get each society to adopt the Code either in addition to its present code or in place of it. It would be a wonderful accomplishment in the interest of co-operation if such could be brought to pass. Already one or more organizations have agreed to its adoption, thus showing the way.

Earlier drafts of the Code were submitted to the Institute along with the other members for examination and comment. The Institute has set up two different committees at different times to study them and report. The latest draft was before a committee in Toronto with Otto Holden as chairman. This committee's recommendations were well received by ECPD's committee, and the final draft contains many of their suggestions.

The Code of Ethics presently used by the Institute goes back many years. It, too, was the product of a joint effort, and is used as well by the American Society of Mechanical Engineers. Perhaps this time a greater number of the participating organizations will take proper action.

Members are asked to read the Canons. Council would be interested in knowing their reactions. The time will come shortly when a decision must be made by the Institute as to their adoption. An expression of opinion from the membership would be helpful.

Echo of Collective Bargaining

Recently the Corporation of Professional Engineers of Quebec circularized its membership to obtain their ideas on the controversial subject of collective bargaining. As far as federal legislation was concerned the issue was closed but the Corporation thought it advisable to do now what time had prevented it from doing several months ago, i.e., consult the membership.

The questionnaire offered the four proposals which seemed to cover the whole field of possibility from actual inclusion in trade unions to complete exclusion from collective bargaining. Each member was asked to indicate his preference.

Proposal number one offered "unconditional inclusion under labour codes". It received support from twenty-one members.

Proposal number two was "inclusion under labour codes with preferential treatment". One hundred and forty-two voted for it.

Proposal number three was "exclusion from labour codes". Two hundred and eighty supported it.

Proposal number four offered "exclusion from labour codes" with the possible alternative of having the Corporation represent them in labour discussions. This was the favourite alternative and eight hundred and eight voted for it.

The outstanding feature of the results is that they leave no doubt as to the desire of the members to be excluded from collective bargaining legislation. There were some people who claimed that the council of the Corporation in asking recently for exclusion from the federal labour act were not acting in accordance with the wishes of the majority. The questionnaire surely clears up that situation nicely.

Progress at Ottawa

In the Spring of 1946 the Institute presented a brief to the Royal Commission then sitting at Ottawa to consider changes in the "administrative classification" of civil servants. Among the recommendations was one proposing that an Interdepartmental Panel be established, along the lines of that created by the Scientific Service of the British Civil Service. In the eventual report of the Commission no recommendation was made for such an establishment.

Actually it would have been a great surprise had the advice been accepted. Usually Royal Commissions ignore most of the good advice they get, and what they do accept is ignored in turn by the government. Apparently commissions and government alike have some sort of inferiority complex, which prompts them to decline proposals and advice from "outsiders" for fear it may be thought they have no ideas of their own.

However, it appears that at least one governmental department has the intelligence and courage to try out the idea within its own boundaries. Recently the Department of Mines and Resources has announced the formation of a Joint Council made up of representatives of the four branches of the Department. In addition, each branch will have a council of its own to deal with matters which relate directly to the administration of the branch.

The purpose of the Joint Council is to give all members of the staff the opportunity for direct representation in the discussion of matters affecting their welfare and conditions of work, and to make available to department heads their ideas and experiences in matters relating to the proper functioning of the department.

The four branches of the department are Mines, Forests and Scientific Services, Lands and Development, and Immigration and Indian Affairs. The proposal has the approval and support of such organizations as the Civil Service Association of Ottawa, the Civil Service Federation of Canada and the Professional Institute of the Civil Service of Canada.

It will be interesting to watch the work of the new council. Perhaps its success will be an inspiration to the government to adopt a similar plan for co-ordination between all departments—or is that too much to hope?

Conservation

The chairman of the Institute's Committee on Conservation of Natural Resources, Dr. Alan E. Cameron, presented on behalf of the committee, an interesting report to the Fifth Annual Conference of the Provincial Ministers of Mines held in September, 1948, at Jasper, Alberta.

The report outlines the objectives of the committee and offers to the conference its services, particularly in relation to conservation in the mineral industry. It refers to the peculiar economic conditions that apply to the development of an ore body, and suggests procedures that may be helpful in extending a development to its most economic conclusion.

The necessity of developing the other resources in the region in order to stabilize the community that rises around a mineral deposit is stressed. Reference is made to agricultural and forest resources along with power, highways and water supply, as necessary parallel developments if a community is to survive.

The report concludes with the statement that the proposals place a heavier burden and greater responsibility upon governments, but that as the natural resources belong to the Crown, it appears that these responsibilities cannot be placed elsewhere, in addition to which there is no other authority that has the power to establish and carry out the necessary regulations.

"The Civil Engineer in War"

Under this title the Institution of Civil Engineers has prepared a most informative publication, which is being distributed in Canada by the Engineering Institute and in the United States by the American Society of Civil Engineers.

The work has been in the course of preparation ever since the cessation of hostilities. It has been a huge task made more difficult by the reticence of the authorities to release much of the information, which until recently was still on the secret list. There are three volumes containing fourteen hundred pages and one thousand diagrams and photographs.

The work should be in the library of every civil engineer, and in university and public libraries as well. It is one of the most ambitious projects ever undertaken by an engineering society. It is a book of reference, a history, and a tribute to the profession.

The publication has been made possible only by the co-operation of the Admiralty, War Office, Air Ministry, and other government departments. It is a comprehensive and authoritative account of the main engineering works of the years 1939 to 1945. It describes the problems and their urgency, the methods of their solution, and still more important, the manner in which the solutions will benefit post-war engineering.

The subjects covered are air fields, roads, railways, and military bridging; docks and harbours, with a special section on "Mulberry"; materials, structures, hydraulics, water-supply, tunnelling, and surveying .

The price in Canada, if purchased through the Institute, is $9.75 for the set including all charges. A supply is now on the high seas to meet the needs of Canadians. If you are interested—and if a civil engineer you should be—send your order and remittance in the above amount (at par in Montreal) to Headquarters as quickly as possible. Only a limited quantity is available for distribution in this country. If you would like to see the table of contents before deciding just write in and say so. A six page folder giving all the details is yours for the asking.

Scientific Liaison Offices

The following information has been supplied by The National Research Council. (Ed.)

Most Canadian scientific workers already know the liaison office of the National Research Council in Ottawa as an agency from which reports on German science and technology can be borrowed. Those who have not yet used this service, but who are interested, may write directly for lists of publications available on loan. An examination of these lists will undoubtedly uncover some titles of interest.

The National Research Council operates liaison offices in London and Washington as well as in Ottawa, and Canadian scientists are invited to utilize the services of these offices. The offices are not intended to do for the scientist anything that he can easily arrange for himself, but they will assist in such matters as making contacts, securing information about scientific activities, scholarships, and availability of equipment, arranging visits and itineraries, and interviewing applicants for positions in Canada and reporting thereon.

For geographical reasons, demands on the Washington office will be relatively fewer because Canadians can make most of their American contacts personally and directly, but it is believed that the London office can very frequently be useful. Scientific workers interested in securing assistance in any matter in which they believe these offices can be useful may write directly to the Liaison Office, National Research Council, Ottawa.

Canons of Ethics for Engineers

Foreword

Honesty, justice, and courtesy form a moral philosophy which, associated with mutual interest among men, constitutes the foundation of ethics. The engineer should recognize such a standard, not in passive observance, but as a set of dynamic principles guiding his conduct and way of life. It is his duty to practise his profession according to these Canons of Ethics.

As the keystone of professional conduct is integrity, the engineer will discharge his duties with fidelity to the public, his employers, and clients, and with fairness and impartiality to all. It is his duty to interest himself in public welfare, and to be ready to apply his special knowledge for the benefit of mankind. He should uphold the honour and dignity of his profession and also avoid association with any enterprise of questionable character. In his dealings with fellow engineers he should be fair and tolerant.

Professional Life

Sec. 1. The engineer will co-operate in extending the effectiveness of the engineering profession by interchanging information and experience with other engineers and students and by contributing to the work of engineering societies, schools, and the scientific and engineering press.

Sec. 2. He will not advertise his work or merit in a self-laudatory manner, and he will avoid all conduct or practice likely to discredit or do injury to the dignity and honour of his profession.

Relations With the Public

Sec. 3. The engineer will endeavour to extend public knowledge of engineering, and will discourage the spreading of untrue, unfair, and exaggerated statements regarding engineering.

Sec. 4. He will have due regard for the safety of life and health of the public and employees who may be affected by the work for which he is responsible.

Sec. 5. He will express an opinion only when it is founded on adequate knowledge and honest conviction while he is serving as a witness before a court, commission, or other tribunal.

Sec. 6. He will not issue ex parte statements, criticisms, or arguments on matters connected with public policy which are inspired or paid for by private interests, unless he indicates on whose behalf he is making the statement.

Sec. 7. He will refrain from expressing publicly an opinion on an engineering subject unless he is informed as to the facts relating thereto.

Relations With Clients and Employers

Sec. 8. The engineer will act in professional matters for each client or employer as a faithful agent or trustee.

Sec. 9. He will act with fairness and justice between his client or employer and the contractor when dealing with contracts.

Sec. 10. He will make his status clear to his client or employer before undertaking an engagement if he may be called upon to decide on the use of inventions, apparatus, or any other thing in which he may have a financial interest.

Sec. 11. He will guard against conditions that are dangerous or threatening to life, limb, or property on work for which he is responsible, or if he is not responsible, will promptly call such conditions to the attention of those who are responsible.

Sec. 12. He will present clearly the consequences to be expected from deviations proposed if his engineering judgment is overruled by nontechnical authority in cases where he is responsible for the technical adequacy of engineering work.

Sec. 13. He will engage, or advise his client or employer to engage, and he will co-operate with, other experts and specialists whenever the client's or employer's interests are best served by such service.

Sec. 14. He will disclose no information concerning the business affairs or technical processes of clients or employers without their consent.

Sec. 15. He will not accept compensation, financial or otherwise, from more than one interested party for the same service, or for services pertaining to the same work, without the consent of all interested parties.

Sec. 16. He will not accept commissions or allowances, directly or indirectly, from contractors or other parties dealing with his client or employer in connection with work for which he is responsible.

Sec. 17. He will not be financially interested in the bids as or of a contractor on competitive work for which he is employed as an engineer unless he has the consent of his client or employer.

Sec. 18. He will promptly disclose to his client or employer any interest in a business which may compete with or affect the business of his client or employer. He will not allow an interest in any business to affect his decision regarding engineering work for which he is employed, or which he may be called upon to perform.

Relations With Engineer

Sec. 19. The engineer will endeavour to protect the engineering profession collectively and individually from misrepresentation and misunderstanding.

Sec. 20. He will take care that credit for engineering work is given to those to whom credit is properly due.

Sec. 21. He will uphold the principle of appropriate and adequate compensation for those engaged in engineering work, including those in subordinate capacities, as being in the public interest and maintaining the standards of the profession.

Sec. 22. He will endeavour to provide opportunity for the professional development and advancement of engineers in his employ.

Sec. 23. He will not directly or indirectly injure the professional reputation, prospects, or practice of another engineer. However, if he considers that an engineer is guilty of unethical, illegal, or unfair practice, he will present the information to the proper authority for action.

Sec. 24. He will exercise due restraint in criticizing another engineer's work in public, recognizing the fact that the engineering societies and the engineering press provide the proper forum for technical discussions and criticism.

Sec. 25. He will not try to supplant another engineer in a particular employment after becoming aware that definite steps have been taken toward the other's employment.

Sec. 26. He will not compete with another engineer on the basis of charges for work by underbidding, through reducing his normal fees after having been informed of the charges named by the other.

Sec. 27. He will not use the advantages of a salaried position to compete unfairly with another engineer.

Sec. 28. He will not become associated in responsibility for work with engineers who do not conform to ethical practices.

Presidential Tour

President Finlayson commenced his tour of the branches with an itinerary that set up a new record. As his home is in Vancouver it was necessary to do almost all the branches in the east on one trip, the balance remaining until his next trip east to attend the annual meeting at Quebec. Consequently the first tour covered everything in Nova Scotia, New Brunswick, Quebec and all but two branches in Ontario. The most northerly branches in the west were also included—a total of nineteen.

Accompanied by Mrs. Finlayson and the general secretary, his first call was at Arvida on August 27th. For this portion of the trip the party was pleasantly augmented by the presence of Vice-President Eadie and Mrs. Eadie of Montreal. At Arvida Vice-President Saunders and Mrs. Saunders of Ottawa joined the entourage, returning with them down the Saguenay and as far as Quebec.

The Sunday was spent at Quebec where Vice-President Lariviere took over, showing the party many of the famous features of the district both of engineering and historic interest.

The Maritimes

Moncton received the president on Monday. Before the branch meeting the mystery of "magnetic hill" was investigated, and "the Rocks" too were visited. The outstanding feature of course was the huge stack of lobsters awaiting the guests at the yacht club at Shediac. The president being a native of Nova Scotia did ample justice to the fare, but no more than did others of his party who were not so blessed in the place of their birth.

Top: President Finlayson, Branch Chairman J. H. McCann, Jr., Vice-President I. P. Macnab, and F. V. Burgess, at Cape Breton Branch meeting.

Bottom: The executive of the Halifax Branch held a luncheon for the president at the Lovett House, Chester, N.S.

At Halifax the usual hospitality was extended. The programme included a luncheon at Chester proffered by the officers of the Association of Professional Engineers of Nova Scotia—and the branch meeting at night held at the Lord Nelson Hotel. Here it was a treat to hear the president inform the Haligonians of their own engineering history—most of it known only to a few "old timers" in the audience who had lived through it.

From Halifax Vice-President Macnab accompanied by Mrs. Macnab motored the party to Sydney, where a meeting was held on the evening of Thursday, September 2nd. The "extra curricular" activities here included a visit to the old fort at Louisbourg, and a luncheon at the summer home of C. M. Anson, a past vice-president.

Monday, September 6th, was Labour Day, so the long week-end was spent on a tour of the famous Cabot Trail of Cape Breton, with a stop over at the Keltic Lodge at Ingonish. With Vice-President Macnab still at the wheel, the party continued on to St. Andrews-by-the-Sea, arriving Tuesday evening the 7th.

At St. Andrews the president presided at a regional meeting of Council on the 8th and was the speaker for the dinner on the 9th and in general took an active part in all phases of a very successful maritime professional meeting. A poem in his speech which parodied maritime place names made the names Skoodoowabskooksis and Skoodoowabskook by-words of the meeting.

Quebec

Leaving St. Andrews on Saturday, this time in the care of Mr. and Mrs. Paul Vincent of Quebec, the party proceeded by motor to Quebec via Fredericton, arriving Sunday evening, fatigued but in high spirits.

As usual the Quebec branch carried out a full and interesting programme. At noon on Monday, the branch meeting was held at Kent House at Montmorency the famous old home of Queen Victoria's father. The afternoon was devoted to a golf tournament, combining the membership of the branch with the local branch of the Ecole Polytechnique Alumni.

The president did not play golf, but in its place was motored around the Island of Orleans—once again in the competent care of Vice-President Lariviere. In the evening a joint dinner was held at the Royal Quebec Golf Club (Boischatel), after which great numbers of exceedingly fine prizes were distributed to winner and loser alike. Even Mrs. Finlayson and the president were recipients—apparently a reward for not playing.

The next morning (Tuesday the

14th) Transport Officer Lariviere was again in charge and the party arrived at Shawinigan Falls in time for luncheon with the executive of the branch and their wives. A tour of the industries and an official call on the mayor (see photo) rounded out the afternoon and led up to a dinner at the Cascade Inn that evening—a very successful affair.

From Shawinigan the trail led to Montreal—this time with Louis Trudel in charge. A stop-over of a few hours in Montreal permitted the party to overhaul their several pieces of luggage and to add to their wardrobe certain items that seemed appropriate in view of the drop in temperature. That night saw the group on their way to Hamilton—by rail.

Top: At the Ajax Division of University of Toronto. Front row (l. to r.), Prof. A. Wardell; J. F. Maclaren, Toronto Branch chairman; Prof. W. J. T. Wright; Dean C. R. Young. Back row (l. to r.), J. H. Follwell, Prof. H. L. Shepherd, Dean H. R. Perry, A. Russell, Brian Judges and R. G. Oxland of the University of Toronto Engineering Society, Rev. Carl Swan.

Centre: Shediac Yacht Club, scene of the Moncton Branch lobster party.

Bottom: Luncheon with the branch executive at the Saguenay Inn, Arvida, Que.

Left: "The Rocks", near Moncton, N.B.

Ontario

At Hamilton a delightful luncheon was arranged by the executive at the suburban "Estaminet", after which the party divided so that the president could visit some industries and Mrs. Finlayson see something of the city and the beautiful countryside.

The Branch meeting took the form of a smoker at the Mess of the 8th Field Regiment, R.C.A. preceded by a dinner with the executive and their wives at the Royal Connaught Hotel. The president presented the Institute's Plummer Medal to E. T. W. Bailey, M.E.I.C., for his paper "Oxygen Accelerated Combustion in Open Hearth Furnaces". He also presented the special awards of the branch to the winners of last season's Students and Juniors paper competition, G. L. Schneider, S.E.I.C., E. M. Tuff, Jr.E.I.C., and R. W. Kennedy, Jr.E.I.C.

On Friday morning Vice-President Vance and Mrs. Vance conducted the group by motor to London. Here the president was a luncheon guest of the Board of Directors of the Western Fair, and had an opportunity to extend the greetings of the Institute to the officers of this very successful enterprise.

In the afternoon Dean Finlayson called on the president of the University of Western Ontario, Dr. G. E. Hall and on other members of the faculty well-known to him. A visit to the new Collip Medical

---

Top: The president signs the "golden book" in Shawinigan Falls' new city hall. Left to right, Geoffrey Ince, branch secretary; Mayor François Roy of Shawinigan Falls; the president; Alex. Larivière, Quebec vice-president; the general secretary; and M. Eaton, chairman of the St. Maurice Valley Branch.

Centre: The head table at the St. Maurice Valley dinner.

Upper: Secretary Ince, Mr. Wright, Mayor Roy and the president. Lower: Mr. Eaton; Vice-president Larivière; Sidney Williams, vice-chairman of the Valley Branch; Colonel H. E. Bates; and Viggo Jepsen, councillor for the branch.

Bottom: London Branch dinner meeting. Left to right, Mrs. E. R. Jarmain; Dean Finlayson; E. R. Jarmain, branch chairman; Mrs. Finlayson; E. V. Buchanan; Mrs. V. A. McKillop and Vice-President J. A. Vance.

Research Building was also a part of the programme.

In the evening the branch met in the Officers' Mess of the Wolseley Barracks, the ladies being in attendance to enhance the occasion.

Saturday morning saw the party off again with Mr. Vance en route to Niagara Falls. At Woodstock a most enjoyable luncheon of twenty had been arranged by Mr. Vance. In the afternoon the extended itinerary took in some of the fine farms of the district, a quick inspection of many municipalities including Kitchener and Galt and some of the features of the Niagara district.

Week-end at Niagara

At Niagara Falls over the week-end there was time for some extra sightseeing, and the local members did a fine job of direction. The striking beauty of the district was well displayed in fine weather and good company. The presidential activities included most of the usual sight-seer's favourites, such as the Maid of the Mist and the Cave of the Winds. Naturally an inspection of the Welland Canal and many points of historic interest for the historically-minded president was a " must " on this programme.

The branch meeting was held on Monday the 20th at the Red Casque—a wayside inn outside the city—and a delightful spot, too. The next day saw the party move on to Toronto (en route to Ottawa), where branch chairman J. F. MacLaren took them in hand for lunch and for sight-seeing.

Leaving Toronto on the night of September 22nd, they spent the following day with the Ottawa Branch. The programme here was made up of a luncheon meeting at the Chateau Laurier where two hundred members and wives were present; a reception at the home of Mr. and Mrs. L. M. Christmas, an officer of the branch; and a dinner party with the executive officers and their wives in the evening at the Chateau Laurier. The recently-formed Engineers' Wives Association made its presence felt in a

The two upper pictures were taken at the dinner party of the Ottawa branch executive.

The Peterborough branch dined with the President at the Peterborough Golf and Country Club, where the two lower pictures were taken.

Top: At Hamilton the president presented the Plummer Medal to E. T. W. Bailey.

Centre: The president poses with the other prize winners of the Hamilton Branch. On his left are G. L. Schneider, E. M. Tuff, R. W. Kennedy, and W. E. Brown, branch chairman.

Bottom: Some of the engineers who attended the meeting of the Niagara Peninsula Branch at the Red Casque Inn.

most acceptable manner. The success of this organization, patterned on similar associations at Winnipeg and Calgary, might well be an inspiration to the ladies at other centres.

From Ottawa Vice-President W. L. Saunders provided the transportation to Peterborough, where a very successful meeting was held at the Peterborough Golf and Country Club. During the afternoon the president made a short motor tour of the city and Mrs. Finlayson with the ladies was driven to nearby Stoney Lake for dinner. A party of five members from the Kingston Branch added special interest to the function.

On the morning of Saturday the 25th, with Vice-President Saunders in charge the party motored to Cornwall, stopping at Picton for lunch and at Brockville to change " horses ". R. H. Wallace, of Cardinal, chairman of the Cornwall Branch, took over the party here and on the remainder of the trip pointed out the various sections of the country that would be submerged by the proposed St. Lawrence waterways proposal, a subject in which the president showed a special interest.

On Sunday the president was motored over a lot of the territory around Cornwall, which permitted him to see on the ground just what was proposed in the way of power development from the Long Sault Rapids.

On Monday the branch, including the ladies, met at dinner with the president at the King George Hotel. A special feature here was the singing of a ladies choir under the direction of Arthur Vogt. Vice-President R. S. Eadie and Councillor J. B. Stirling were welcome guests from the Montreal Branch as was also Vice-President Walter Saunders from Ottawa.

Tuesday saw the party at Kingston. In the evening the branch with their ladies to the number of ninety met for dinner at the Kingston Yacht Club. The president presented W. A. Trotter, S.E.I.C., a student of Queen's with the certificate for the students' prize.

It was a welcome surprise for the branch to find Col. J. A. Macdonald, immediate past chairman of the Cape Breton Branch, among the guests. He was accompanied by Mrs. Macdonald and his niece.

On Wednesday the president and general secretary spoke to the third and fourth year students of Queen's. Lectures were cancelled for the occasion which resulted in a packed Convocation Hall.

Montreal

Leaving Kingston by rail Tuesday the party arrived in Montreal that night. On Wednesday the branch held a dinner at the Mount Stephen Club to which were invited to meet the president, the officers of the branch, past-presidents and representatives of several sister societies. Later the branch meeting was held at the Mount Royal Hotel, concluding with very acceptable refreshments. The Julian C. Smith Medal was presented to Dr. P. L. Pratley, M.E.I.C., and also the certificate for a student prize to Guy M. Lord, S.E.I.C., of Ecole Polytechnique.

Back to Ontario

That night saw the travellers entrained for Toronto where a lengthy programme was in store. Proceedings opened on Friday afternoon with a talk to the third and fourth year students, and the presentation of the student prize to D. B. Mutton, S.E.I.C. Past-President Dr. C. R. Young presided. This was followed by a dinner of the executive and Institute officers in the graduates dining room of Hart House, after which the general meeting was held in the Debates Room. There was an excellent turn out of about two hundred members and guests. The Keefer Medal for 1947, won by E. P. Muntz, M.E.I.C., for his paper " Steel Rail Piles Replace Concrete Piles ", was presented by the president.

Saturday was given over to a regional meeting of Council in the library of the Royal York Hotel, presided over in turn by the president and by Vice-President Vance. That night Chairman MacLaren once again extended his delightful hospitality, the setting being the Granite Club.

During the two days Mrs. Finlayson was entertained by Mrs. MacLaren and other ladies at luncheons, fashion show and theatre.

Sunday was really a day of rest.

On Monday the president and general secretary were conducted by Mr. MacLaren and Past-President Dean Young to Ajax where they spoke to six hundred students of the first and second years. Luncheon at the staff house followed, and then a quick trip over the " lot " to see how a shell loading plant had been ingeniously converted into a university—a remarkable achievement—then back to Toronto.

Top: The Cornwall branch dinner was held at the King George Hotel, and included the ladies. Visitors from Montreal included J. B. Stirling and R. S. Eadie.

Centre: Head table at Kingston included (l. to r.) Mrs. R. C. Wallace, Past-President L. F. Grant, Mrs. Phil Roy, Dean Finlayson, Branch Chairman Phil Roy, Mrs. Finlayson, Principal R. C. Wallace of Queens University, Mrs. L. F. Grant, and Norman Simmons, president of Queens Engineering Society.

Bottom: The President awards the certificate for the student prize to W. A. Trotter, S.E.I.C., of Queens.

Go West

That evening at six o'clock saw the president and Mrs. Finlayson on the train for Sarnia where they were the house guests of J. W. MacDonald. Vice-President Vance and Mrs. Vance were again "on the job" to provide transportation. During the day on Tuesday the president visited the Imperial Oil and Polymer plants and did a quick tour of the whole industrial section of the community. At noon he dined with the branch executive and, in the evening, addressed a dinner meeting of the branch at the Sarnia Golf Club.

On Wednesday Mr. Vance motored the party to Windsor. During the afternoon after luncheon with the executive a visit was made to the Ford Plant. The branch meeting was held that evening.

From Windsor the president and Mrs. Finlayson crossed over to Detroit to embark for the west. They arrived in Winnipeg on Friday the 8th and left for Saskatoon, Prince Albert and Edmonton on the 11th, and by Oct. 17th they were home in Vancouver — and doubtless glad of it.

It has been a big undertaking—over two months of travel by boat, rail and motor, covering a distance of about eight thousand miles. Including meetings with branches, executives, students and other groups the president has participated in forty-two meetings on this trip alone. In the Spring he will visit the remainder of the western branches—ten in number, on his way to the Annual Meeting in Quebec in May.

(Ed. Note). The "reporter" of this saga left the party at Toronto on October 4th, and time has not permitted a proper check back on details, therefore the account of events after that date is very sketchy and doubtless inaccurate. Reports from branches subsequently will fill in all the missing detail and correct the errors.

"E.I.C. Week" at McGill

A number of student engineers on the McGill campus have just completed a job which may set an entirely new pattern for interesting students in The Engineering Institute of Canada.

James F. Harris, president of the McGill Undergraduate Engineering Society, was a delegate to the Institute Conference of students in Banff last June. During that meeting he outlined a project he had been developing for some time—the organization of an "E.I.C. week" at McGill. The week of November 1st saw the maturing of his plans with results which exceeded the most optimistic estimates. Mr. Harris and his associates by Friday, November 5th, had delivered to Headquarters three hundred and ninety completed applications for student membership.

This outstanding performance was accomplished with a minimum of outside help. Mr. Harris and Mr. H. Pragnell, chairman of the professional committee of the Undergraduate Society, organized a group of students who were satisfied in their own minds that membership in the Institute could help in developing the professional consciousness so necessary to success in engineering. The Undergraduate Society's Publication Board produced leaflets listing the arguments in favour of membership in the national professional body. *The McGill Daily* was supplied with editorial items every day during the week which told something about Institute activities. Posters and notices were prominently displayed throughout the engineering building. A desk was set up in the main lobby of the engineering building and kept well stocked with information booklets, application forms and blank cheques. Members of the faculty readily sponsored all applications.

If the new student members are willing to make the same kind of a working contribution to the life of the Institute as that which they have just seen made by the officers of their own society, they will have many occasions to be satisfied with their new affiliation.

Jim Harris was the prime mover of "E.I.C. week" at McGill. Much of the spade work was done by Herb Pragnell. Other members of the group, all student members of the E.I.C., were Wilton Davis, William Dixon, M. B. T. George, D. H. Evers, Doug Abbey, J. A. McCutcheon, Ed Gauthier, Claude Howard, John Harvey, John Taylor and Harold Kay. They have shown beyond any doubt just what can be done by a small enthusiastic group in the development of an idea.

Head table at the Halifax dinner. Past-President J. B. Hayes, the general secretary, Vice-President Macnab, Dean Finlayson, W. C. Risley, Halifax Branch chairman, and Mayor J. E. Ahern, mayor of Halifax.

Maritime Professional Meeting

Another outstanding regional meeting has been carried out by the engineers of the maritime provinces. This time the stage was set at the Algonquin Hotel, St. Andrews-by-the-Sea, N.B. The maritimers are fortunate in having such beautiful spots for gatherings of this kind—Digby, Pictou, White Point Beach, Keltic Lodge, and so on. The combination of maritime scenery and maritime hospitality is hard to beat.

The programme has been printed previously in the *Journal* and so this brief account makes no effort

---

In the picture at the top, W. T. Ross Flemmington, president of Mount Allison University, Sackville, is shown addressing the banquet on Friday night.

W. G. Macdonald of Halifax took this picture after the Friday night banquet. Front row—Mrs. Mellish Lane, Mrs. J. W. MacDonald, Mrs. A. R. Harrington, Mrs. W. G. Macdonald, and W. G. Macdonald. Back row—Mellish Lane, J. W. MacDonald, A. R. Harrington, Mrs. Harry Keddy, and Harry Keddy.

to cover that ground again. Suffice it to say that the technical sessions on both mornings were well attended and the papers will make valuable additions to the literature of the profession.

On the Wednesday preceding the two days of the meeting, a regional meeting of Council was held in the Casino. The attendance included representatives from all the Maritime branches and from London, Quebec and Montreal as well. President Finlayson of Vancouver presided. The Association of Professional Engineers of Ontario was represented by E. V. Buchanan a vice-president, and T. M. Medland, executive director, two very welcome guests.

To some extent the weather interfered with the lighter side of the programme. For the afternoon of Thursday a boat trip had been planned, but fog intervened and other arrangements had to be put together hurriedly by individuals and small groups. This change of programme seemed to disturb no one. After all, two hundred congenial people housed in the same hotel should have resources within themselves to overcome a little inconvenience such as a fog.

On both days there were many diversions to suit the many tastes, such as golf, bridge, movies, sightseeing and delightful motor trips to places like St. Stephen and Calais. Weather or no weather everyone had a good time.

Friday evening was devoted to dancing. The Casino, set apart from the hotel proper, was an excellent place for such entertainment. It was cool, comfortable, and commodious, and no one wanted to stop at the appointed hour, except the orchestra.

The committee in charge of the meeting deserves great praise. Arrangements were complete in every detail. Visitors from " Upper Canada " were enthusiastic in their comments and were most appreciative of the Maritime hospitality. Such meetings do much to develop a better knowledge of Canadian affairs and Canadian people. It is natural that the Institute as a national organization should take a part in the dissemination of this national knowledge which contributes so directly to a national spirit. The committee of Maritimers in charge of the meeting have done an excellent job on behalf of the Institute and the profession.

Engineers' Council for Professional Development

The 16th Annual Meeting of the Engineers' Council for Professional Development was held in Detroit on October 29th and 30th. Many members of this Institute will recall that last year's meeting was held in Montreal.

All sessions except the dinner were held at the Rockham Memorial Bldg., which is the Headquarters for the Engineering Society of Detroit, an overall organization that coordinates the activities of 28 member societies in that area. The wing of the building devoted to engineering affairs provides facilities almost beyond the fondest dreams of the most hopeful of engineers. It combines offices and auditoriums with the most luxurious of club accommodations.

The Engineering Institute representatives were Dr. L. F. Grant, a member of the Executive, James A. Vance, a councillor and the general secretary, a member of the Committee on Information.

The usual business of an annual meeting included the presentation of reports from chairmen of all committees and reports from the member societies on their year's activities concerned with E.C.P.D. policy and programme.

At the luncheon on the first day, Dr. H. P. Hammond, dean, School of Engineering, Pennsylvania State College, was the speaker. His subject was " The Young Engineer — His Professional Growth and Development. "

At dinner that night, Dr. Jas. W. Parker, chairman of E.C.P.D. and president of the Detroit Edison Co. presented his annual report and Dr. A. G. Ruthven, president of the University of Michigan, was the guest speaker. For luncheon on the second day, Dr. S. M. Dean gave an unusually interesting and useful talk on the development of a sense of civic responsibility in the young engineer. He is the president of the Engineering Society of Detroit. He spoke from notes only but a request was made — almost a demand — that he put it all on paper. The *Journal* will be delighted to print it, if as and when available. It should be in the hands of every junior engineer on this continent.

The report from standing committees showed the far reaching importance of the work within the purview of the Council. These standing committees deal with —

Student Selection and Guidance (Institute representative — Dr. G. R. Langley).

Engineering Schools (Institute representative — none).

Professional Training (Institute representative — Prof. R. DeL. French).

Professional Recognition (Institute representative — E. V. Buchanan).

In addition there are these special committees dealing with—

Principles of Engineering Ethics (Institute representative — Dr. C. R. Young).

Ways & Means (Institute representative — Dr. L. F. Grant).

Information (Institute representative — Dr. L. Austin Wright).

The purposes of this organization as outlined in the charter, and the programme as discernible in the titles of the committees are ambitious and comprehensive beyond any attempts made previously. The Council is the outstanding example of successful co-operation within engineering circles. This success in large measure, lies in the clearness of its purpose, its adherence to a policy of developing plans and methods to be enacted by the member bodies if they see fit, and the active support of outstanding personnel in the field of education and industry.

The *Journal* proposes to deal with the work of the committees, one at a time over a series of issues, so that members may become more aware of and better acquainted with the work and influence of this quiet working cooperative group — unique in professional circles anywhere. The significance of its purposes is important to the profession and should be better known to all members of the Institute.

Staff Change at A.I.E.E.

The American Institute of Electrical Engineers has announced that Charles S. Rich, formerly secretary of the Institute's technical programme committee has been appointed editor of *Electrical Engineering* and *Transactions* to succeed G. Ross Henninger who recently resigned.

Mr. Rich is a graduate in mechanical engineering from Cornell University and has been with the A.I.E.E. headquarters organization since 1930.

Mr. Henninger is well known to many E.I.C. members through his contributions to the work of the Engineers' Council for Professional Development.

Meetings of Other Societies

The fifteenth annual Chemical Engineering Symposium will be held at Massachusetts Institute of Technology on December 28 and 29, 1948, by the **American Chemical Society's** Division of Industrial and Engineering Chemistry, it is announced by Professor Joseph C. Elgin of Princeton University, chairman of the Division.

The third national Materials Handling Show will be held at Convention Hall, Philadelphia, January 10 to 14. The exposition is devoted to various systems of handling materials in production and shipment.

This year the show will be jointly sponsored by the management and materials handling divisions of the **American Society of Mechanical Engineers** and the **Materials Handling Institute.** The A.S.M.E. Groups will conduct a five-day Conference on Materials Handling concurrently with the exposition. A Materials Handling Theatre will exhibit recent films on handling subjects.

Advance registration cards may be obtained from Clapp and Poliak, Inc., 350 Fifth Ave., New York 1, N.Y. Hotel reservations may be obtained through the secretary, housing bureau, Materials Handling Show, 17th and Sansone, Philadelphia, 3, Pa.

The **American Society for Testing Materials** has announced that the 1949 Spring Meeting and A.S.T.M. Committee Week will take place at the Hotel Edgewater Beach, Chicago, Ill., February 28 to March 4.

The fourth Empire Mining and Metallurgical Congress will convene in Great Britain in July, 1949, under the auspices of the Empire Council of Mining and Metallurgical Institutions.

The chief object of the Congress is to afford an opportunity for scientists, engineers and others concerned with the mining and metallurgical industries to meet and discuss technical progress and problems, including the development of the mineral resources of the Commonwealth. President of the Congress is Sir Henry T. Tizard, K.C.B., A.F.C., F.R.S.

Correspondence

September 20, 1948

To the Editor,
The Engineering Journal.

One remark of Dr. L. Austin Wright in his comment on the letter of F. W. Davidson, both of which appeared in your August issue, prompts me to make an observation. It concerns the assertion that appreciation of cultural subjects comes largely in the high school years, if it is to come at all, and that later formative influences are largely ineffective.

It would be lamentable if this were true. It would debar from cultural understanding all of those who have had unsatisfactory secondary school training, or perhaps none at all. Few men have equalled Abraham Lincoln in his mastery of the written and spoken word and such circumstances as moulded it were not of the home or the school.

Actually, many persons do not develop a fondness for literature and the arts until they have gained maturity. I have known many to whom enlightenment and sensitive discrimination have come long after school days were over and the opportunity for reflection presented itself.

Those professional schools of engineering that have included in their curricula certain liberal subjects paralleling the technical ones, and most of the leading schools on this continent have done so, hold that through bringing to the attention of undergraduates fields of thought and wholesome enjoyment of which they had as yet but faint conception many would be led to explore them further. From conversations with those engineering students at the University of Toronto whose imaginations have been kindled I am confident that this will be the case.

To eliminate the liberal stem from engineering education would constitute an injustice to those students who have been deprived of the mellowing influences of a cultivated society before entering the university. Many of them lack only the kindling spark to light the train of humanistic understanding.

C. R. Young, M.E.I.C.

Port Coquitlam, B.C.,
Sept. 9, 1948.

The Library,
The Engineering Institute of Canada,
Montreal.

Dear Mrs. Short.

Thank you very much indeed for your letter of September 2, wherein you stated that you had so kindly tracked down the information which I needed . . . as far as I am concerned I get my money's worth and then some, from my fees out of the splendid service that your staff alone provides. It's a wonder to me that it isn't played up more, because I'd be sunk away out here, with no reference books to go back on.

When available could you please send a copy of the following on loan to me at the above address—etc.

Thanking you very much again,

Yours truly,

(Signed) S. M. Schofield, Jr.E.I.C.

The 1949 Annual Meeting

WILL BE HELD AT

The Chateau Frontenac, Quebec City

May 11-13, 1949

The Quebec Branch is preparing for an attendance of over one thousand. Many of your friends will be there.

Personals

Notes of the Personal Activities of Members of the Institute

J. B. Hayes, M.E.I.C., past president of the Institute, retired in September, due to ill health, from his position as manager of the Nova Scotia Light and Power Company Limited, Halifax. He had been appointed to that position in 1929.

He is a past president of the Halifax Board of Trade, the Canadian Electrical Association and the Canadian Transit Association, and a member of the Association of Professional Engineers of Nova Scotia.

W. M. Scott, M.E.I.C., chairman of commissioners, Greater Winnipeg Water District, has recently retired as lecturer in municipal engineering, University of Manitoba.

Prof. James A. Coote, M.E.I.C., has retired from the department of mechanical engineering in McGill University after thirty-two years of teaching. For the major part of this period he has been interested in industrial engineering and has directed the work under that option. Professor Coote will now be located in the offices of R. A. Rankin and Company, Montreal, where he will continue with consulting work in this field.

J. C. Davis, M.E.I.C., of St. Boniface, Man., was decorated in September with the Order of the British Empire. He is president and manager of J. C. Davis Limited, Winnipeg, Man.

A former Montrealer, he studied at University of Montreal, and at McGill University. He is an executive of the Greater Winnipeg Co-ordinating Board, and a member of the Greater Winnipeg Metropolitan Town Planning Board. During the recent war he worked on the advisory board of the Department of War Services.

E. L. Baillie, M.E.I.C., has been named division manager of Imperial Oil Limited, at Saint John's, Newfoundland.

After graduating in civil engineering from Nova Scotia Technical College in 1926, Mr. Baillie worked with the Dominion Bridge Company and later with the Nova Scotia Power Commission on the Mersey River development. He was professor of mathematics and general engineering subjects at St. Francis Xavier University for two years, after which he went as a construction engineer to the Nova Scotia Department of Highways. He joined Imperial Oil Limited in 1930 as asphalt sales engineer, and has served with the organization in various sales capacities, leading up to his recent appointment.

A. S. Mansbridge, M.E.I.C., has accepted the post of chief designing engineer with the pulp division of Bloedel Stewart and Welch Ltd., at Port Alberni, B.C. Mr Mansbridge worked on the design of that Company's pulp mill at Port Alberni until the end of last year, and has meanwhile been employed as designing engineer for Pacific Mills Limited, at Ocean Falls, B.C.

J. V. Rogers, M.E.I.C., has been named assistant chief engineer of the Consolidated Mining and Smelting Company of Canada Limited, Trail, B.C. Mr. Rogers started with the Company in 1940, but was sent on loan to the Dominion Government, as chief draughtsman on the construction of the Alberta Nitrogen Plant at Calgary, later acting as engineer for the plant. He returned to Trail in 1944 and worked on special problems for the chief engineer and was later appointed superintendent of construction and maintenance for the Company in the Trail area.

E. L. Baillie, M.E.I.C.

A graduate of the University of British Columbia, class of 1923, his work before going to C.M. and S. Company included mining engineering in British Columbia and hydro-electric construction in Saskatchewan and Ontario.

S. A. Willis, M.E.I.C., former works manager of the Canadian Gypsum Company, Windsor, Ont., has resigned that position to start an engineering and contracting firm in New Jersey. He was connected with Canadian Gypsum for some 12 years, during which time he has directed the modernization and expansion of gypsum production. Before coming to Windsor in 1936 he was in the operating and engineering departments of the U.S. Gypsum Company, at Philadelphia, New York and Farnams, Mass. He is a graduate of LaFayette College, Easton, Pa.

Lt.-Col. L. G. Lilley, M.E.I.C., commandant of the Royal Canadian School of Military Engineering, Chilliwack, B.C., was posted there in September, 1947. He will remain until January 1949, when he will be attending the Canadian Army Staff College at Kingston, Ont. A graduate of the University of New Brunswick, class of 1935, Col. Lilley worked with the Dominion Department of Public Works at Saint John, N.B., and with the Bell Telephone Company in Montreal, before joining the R.C.E. After service overseas, he was an executive officer at N.D.H.Q., Ottawa, before going to R.C.S.M.E.

J. V. Rogers, M.E.I.C.

Y. R. Tasse, M.E.I.C., is a vice-president of the Canadian General Electric Test Alumni Association. He was elected at the 20th Annual Reunion of the Association held in Peterborough, Ont., in September. He is apparatus engineer for C.G.E. at Quebec City.

G. M. Bell, M.E.I.C., is manager of the Montreal Office of Commonwealth Electric Corporation Limited. He has worked in engineering and sales with Canadian General Electric Company Limited and with Canadian Westinghouse Company Limited, serving recently with the latter as sales engineer in the Montreal office.

L. D. Briden, M.E.I.C., has been appointed resident construction engineer of the Bolivian Power Company Limited, at La Paz, Bolivia. His transfer to South America took place in August last. He was previously an engineer for the Newfoundland Light and Power Company, at Tors Cove, Nfld.

W. G. Enouy, M.E.I.C., is sales manager of the Robertson Division of Robertson-Irwin Limited, a new company formed by the amalgamation of H. H. Robertson Company Limited and Thomas Irwin & Son, Limited. Mr. Enouy is at the head office of the company in Hamilton. He was sales manager, there, for H. H. Robertson from 1946 when he transferred from the Montreal Office.

E. K. Cumming, M.E.I.C.

E. K. Cumming, M.E.I.C., has been named manager of the newly established Edmonton sales office of the C. A. Dunham Company Limited of Toronto. Mr. Cumming, who is secretary-treasurer of the Edmonton Branch of the Institute, has been on the staff of the University of Alberta, and has worked in the field of building design and construction.

F. S. Hutton, M.E.I.C., has been appointed division engineer for Canadian National Railways at Hornpayne, Ont. He joined the Company in 1936, and worked in various capacities on construction. He was in military service overseas with the R.C.E. and the Canadian Railway Operating Group from 1942 to 1946, with the rank of lieutenant. He was appointed in 1946 as assistant engineer at Stratford, Ont. Later that year he was made assistant division engineer at London, Ont.

G. J. Dodd, Jr., M.E.I.C., is sales representative in the State of Minnesota for the Hummel and Downing Company of Milwaukee, paper box manufacturers. He joined the Company in July last, coming from the Russell-Miller Milling Company in Minneapolis, Minn., where he was assistant to the chief engineer.

Capt. I. M. McLoughlin, M.E.I.C., will be on the technical staff course at the Military College of Science in England for the next two years. A graduate of Nova Scotia Technical College in 1941, he was with Defence Industries Limited, before joining the R.C.O.C. and later transferring to the R.C.E.M.E. In 1946 he was a technical staff officer in the Directorate of Mechanical Engineering. Later that year he was posted to the R.C.E.M.E school at Barriefield, Ont.

R. A. LeBlanc, JR.E.I.C., was named, in August last, service and sales representative of Otis Fensom Elevator Company Limited, with headquarters in Montreal. Mr. LeBlanc left the employ of National Breweries Limited, Quebec City, last November, and has assumed his recent appointment after a training period with the Otis Elevator Company in New York.

L. E. Henne, JR.E.I.C., is now on the Montreal staff of the Bristol Company of Canada Limited, Toronto. Mr. Henne was formerly with Northern Electric Company, Montreal. He is a graduate in electrical engineering of University of Manitoba.

J. D. Solomon, JR.E.I.C., has left his position with A. V. Roe Canada Limited and has formed the Suburban Engineering and Construction Company, in Toronto. He is a partner and engineer engaged in general construction. Mr. Solomon left Toronto University in 1942 with the degree of B.A.Sc. civil and was with Hamilton Bridge Company Limited, before going to A. V. Roe in 1946 as assistant design engineer.

Kenneth MacDonold, S.E.I.C., is a junior engineer with the New Brunswick International Paper Company at Dalhousie, N.B. He received a B.Sc. degree in mechanical engineering from Queen's University this year.

Visitors to Headquarters

Dr. Karl T. Compton, president of Massachusetts Institute of Technology, Cambridge, Mass., on October 22.

H. Brion White, JR.E.I.C., Toronto, Ont., on October 26.

Major C. Ben. Bate, M.E.I.C., Quebec City, Que., on October 29.

F. I. Lamb, British Trade Commissioner, Montreal, Que., on November 1.

W. E. Jefferson, M.E.I.C., secretary-treasurer of the Halifax Branch of the Institute, on November 2.

Alvin E. Dodd, honorary president, American Management Association, New York City, on November 3.

Air Commodore Sir Frank Whittle, consultant, British Overseas Airways Corporation, London, England, on November 10.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Edwin James Beugler, M.E.I.C., who was long associated with the railroad and utility fields in the United States, passed away at his home in Cheshire, Conn., on September 12, 1948. He was born at Williamsport, Pa., in 1869.

For fifteen years Mr. Beugler was consulting engineer for Westinghouse Church Kerr & Company of New York, in the design and construction of harbour works and power plants, which position required extensive foreign travel. For several years he was vice-president of The Foundation Company of New York, and latterly he was in private consulting practice in Cheshire. From 1935 to 1941 he served as the first secretary of the Connecticut State Registration Board for professional engineers and land surveyors.

Mr. Beugler became a member of the Engineering Institute in 1907, while he was with Westinghouse Church Kerr & Company. Then he had recently left the employ of the Boston Terminal Company after three years service in charge of engineering and maintenance departments of South Terminal Station. Previously he had worked with the New Haven and Hartford Railroad for nearly ten years. From 1890 to 1893 he was with the Philadelphia and Reading Railroad, working on locating, draughting, estimating, etc. He had previously been associated with the Penn. Railroad and with the Bloomsburg and Sullivan Railroad in Pennsylvania.

Mr. Beugler studied engineering at Massachusetts Institute of Technology from 1897 to 1899. He became a member of the American Society of Civil Engineers in 1904, and of the Boston Society of Civil Engineers in 1905. He was an honorary member of the Connecticut Society of Civil Engineers at the time of his death. His Life Membership in the Engineering Institute dated from 1942. He had then completed thirty-five years of active membership.

Lt.-Col. George Arthur McClintock, M.E.I.C., of Thetford Mines, Que., passed away in Quebec City on September 30,

G. A. McClintock, M.E.I.C.

1948. He was born in California, U.S., in 1890.

He did topographic work with a C.N.R. survey in British Columbia in 1911 and 1912, and he served for a time on the Pacific Great Eastern line. He did more railway work in the United States before entering University of Toronto in 1913 to study engineering.

He enlisted in 1914 and served overseas in the Royal Canadian Artillery. He was twice wounded and was awarded his commission in the field. On demobilization he re-entered university, completed his engineering studies and received the degree of B.A.Sc.

He was superintendent for J. A. Grant Construction Company for a time, before going to Cuba on surveying work. Returning in 1922, he was inspector on the erection of a mill at Thetford Mines, Que., for the Asbestos Corporation of Canada, and then went to the Bell Asbestos Mines Department of Keasbey and Mattison Company there. He remained with Bell Asbestos Company Limited, and was chief engineer at the time of his death.

In World War II he served with the R.C.E., and on demobilization commanded the Canadian Construction Corps R.C.E. Units. In the interval between the wars he had taken an active part in the organization and training of the N.P.A.M. Engineer Units in Military District No. 5.

Col. McClintock came into the Institute as a Student in 1904, transferring to Associate Member in 1925, and to Member in 1940. He was active in the Canadian Institute of Mining and Metallurgy.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Cornwall

G. G. M. Eastwood, M.E.I.C.
Secretary-Treasurer

T. B. Webster, M.E.I.C.
Branch News Editor

President Finlayson paid his visit to Cornwall on the week-end of September 26th. The Branch was thus given the privilege of entertaining the president on two separate occasions. The first, a visit to the site of the proposed St. Lawrence Power Project; the second, a dinner for the President and his party.

The visiting party and branch members and their wives were taken to the site of the proposed seaway and power development project at Sheek Island and Barnhart Island on Sunday afternoon where Dean Finlayson showed a keen interest in the scheme which he considered would eventually be undertaken.

On Monday evening there was a large turn-out of engineers and their wives for the Presidential dinner presided over by Chairman R. H. Wallace. In his address, the President stressed the need for a better grounding at the secondary school level in the fundamentals of mathematics, science and engineering so that greater progress in the field of pure research could be made in this country. Dean Finlayson was thanked by B. T. Yates.

Other guests of the evening were Vice-Presidents R. S. Eadie and W. L. Saunders, Councillor J. B. Stirling and General Secretary L. Austin Wright.

Halifax

W. E. Jefferson, M.E.I.C.
Secretary-Treasurer

M. L. Baker, M.E.I.C.
Branch News Editor

A dinner meeting was held jointly by the Halifax Branch of the Institute and the Association of Professional Engineers of Nova Scotia, at the Lord Nelson Hotel, on September 1, to welcome Dean J. N. Finlayson, president of the Institute, on his official visit to Halifax. Guests at the dinner included Mayor J. E. Ahern, Air Commodore F. G. Wait, O.B.E., officer commanding No. 10 Group, R.C.A.F.; and Major General H. W. Foster, officer commanding Eastern Command. Fifty members were present at the dinner. W. C. Risley, chairman of the branch, presided.

Preceding the dinner a short period of silence was observed in memory of J. Lorne Allen, M.E.I.C., former town engineer of Dartmouth, who died the morning before the meeting.

A most enjoyable talk was given by the president, in the course of which he spoke of the need of a united body in Canada to speak for all members of the engineering profession. Such a body could serve the engineering profession and industry alike by a study of industry's requirements and adoption of the latest scientific methods to foster industrial development. He mentioned that a suggestion was made that the representation on Dominion Council be expanded to include representatives from various scientific organizations.

On the topic of employment of engineers the president said the profession should make an earnest attempt to draw to employers' attention the value of trained engineers on the staff. He cited two examples of the results of a scientific approach to industrial problems, namely, the proven value of trained foresters to the lumbering industry and of trained metallurgists to foundries and machine companies.

Interesting remarks were made by the President, about the years he spent in Halifax as professor of civil engineering at Dalhousie University. He saw and had some part in the beginnings of two important engineering projects in the province,—the development of hydro-electric power, and the construction of the harbour terminals.

A welcome visitor accompanying Dean Finlayson was Dr. L. A. Wright, who reported on Institute affairs, mentioning particularly items of interest about membership and the *Journal*.

Included in the activities of the day was a luncheon at the Lovett House in Chester. Dean and Mrs. Finlayson, members of the Council of the Association and their wives, members of the executive of the Halifax branch and their wives, made up the group attending this event, which was under the direction of the Council of the Association.

Hamilton

I. M. MacDonald, Jr.E.I.C.
Secretary-Treasurer

L. C. Galloway, Jr.E.I.C.
Branch News Editor

The Hamilton branch of the Institute opened its winter series of meetings with a smoker on September 16 in the Royal Canadian Artillery Mess. Sixty-two members and guests attended, and the Hamilton branch was especially honoured by the presence of President J. N. Finlayson, Vice-President J. A. Vance, and General Secretary L. Austin Wright.

Chairman W. E. Brown introduced President Finlayson who spoke about his tour through eastern Canada and expressed his appreciation of the honour which his position carries. He praised the efforts and acomplishments of engineers in Canada and urged them not to be misled into a false sense of self-deprecation. Engineering is a mode of culture which is not to be despised, and which should not be considered secondary to other accomplishments of the human race.

Mr. Vance and Mr. Wright were prevailed upon to add a few remarks. Then President Finlayson presented four awards to Hamilton branch members.

To E. T. W. Bailey, M.E.I.C., was awarded the Plummer Medal in recognition of his outstanding paper entitled **Oxygen Accelerated Combustion in Open Hearth Furnaces.**

E. M. Tuff, Jr.E.I.C., G. L. Schneider, S.E.I.C., and R. W. Kennedy, Jr.E.I.C., were awarded certificates for the first, second and third prizes respectively, of which their papers had been judged worthy at the Students and Juniors Papers Competition in March 1948.

After Chairman Brown had adjourned the meeting, refreshments were served.

Stainless Clad Plate and Sheet was the subject of a speech by Mr. L. C. Grimshaw of the Jessop Steel Company, Washington, Pennsylvania, at the September meeting of the Hamilton branch, held at McMaster University on September 23 with Chairman W. E. Brown presiding. It proved to be a fine beginning for the promising series of meetings which have been planned for the 1948-49 programme. Neil Metcalfe introduced the speaker to the 78 members and guests present.

Mr. Grimshaw explained that stainless clad steel, as its name implies, is steel to which a thin sheet of stainless steel is bonded. The chief obstacle to the achievement of a welded bond over 100 per cent of the area of contact between steel and its stainless cladding, is the stubborn oxide film which quickly forms on any stainless steel exposed to air.

The manufacture of stainless steel begins with the provision of clean slabs of steel and stainless steel of the desired composition. The oxide film is removed from the stainless steel with hydrochloric acid, and a coating of electrolytic iron deposited in its place on the surface to be bonded. The bonding is achieved by heating the slabs and hot-rolling them together to the desired finished size. The rolling pressure welds the stainless steel to the steel backing.

Mr. Grimshaw enumerated the advantages of stainless clad plate and sheet. The advantage it possesses over ordinary steel is, of course, its resistance to corrosion. In many cases, especially in the thicker sizes, it is more economical to use stainless clad steel than solid stainless steel. It has higher heat conductivity, higher strength, and better heat-treating characteristics than solid stainless steel. In fabrication, it presents welding problems similar to those encountered with stainless steel, though generally easier to overcome. In conclusion, with aid of slides, Mr. Grimshaw described some of the present applications of stainless clad steel.

Mr. Grimshaw answered the numerous questions of the audience. Then Chairman W. E. Brown made several announcements and adjourned the meeting.

Moncton

V. C. Blackett, m.e.i.c.
Secretary-Treasurer

On August 30, a welcome was extended the president of the Institute, J. N. Finlayson, on the occasion of his official visit to the Moncton Branch. Accompanying the president were Mrs. Finlayson and General Secretary L. Austin Wright. On their arrival in Moncton, the visitors were met by the branch executive, and, later were entertained at a shore dinner at Shediac, attended by some fifty members of the branch and their ladies. Previous to the dinner, the presidential party, together with the majority of those present, were taken for a trip on Shediac Bay in sea-going motor boats. On their return, a lobster dinner was served in the Shediac Bay Yacht Club.

At the conclusion of the dinner, W. C. MacDonald, chairman of the branch, introduced the president to the gathering. Mr. Finlayson, who is a native of Pictou County, N.S., devoted the greater part of his address to historical reminiscences of the Maritimes and Maritime people. Referring to the Institute, he expressed pleasure at seeing so many young engineers taking an active interest in the Institute.

Dr. Wright spoke briefly on matters of interest to the members and gave statistics showing the phenomenal growth of the membership in recent years.

Other speakers included T. H. Dickson and S. R. Frost, who extended sincere greetings to Mr. and Mrs. Finlayson and Dr. Wright, and expressed the appreciation of the members in having them visit the branch.

Following the remarks of the various speakers, an enjoyable social evening was spent, and the return to Moncton made about midnight.

Acting under the direction of the executive, R. L. Parsons, vice-chairman of the branch, was responsible for all arrangements for the reception at Shediac, and G. L. Dickson was in charge of automobile transportation.

Next morning, the guests, accompanied by branch officers, motored to Moncton's famed Magnetic Hill, and afterwards down the Albert County side of the Petitcodiac River to view the "Rocks", one of the natural wonders of the Province.

Montreal

On September 30, the president of the Institute, Dean J. N. Finlayson, and 13 other guests were entertained at dinner at the Mount Stephen Club prior to the opening meeting which was held at the Cardy Hall of the Mount Royal Hotel.

Over 160 were present at the opening meeting, when J. W. Hughes of the Canadian Pacific Railway was elected to the Branch Nominating Committee. The president gave an interesting address, and presented the Julian C. Smith Medal to P. L. Pratley, m.e.i.c. Guy M. Lord, s.e.i.c., Ecole Polytechnique was presented with an Institute prize. Refreshments were served after the meeting.

It is unfortunate that more members do not turn out on these occasions which are intended to be social affairs rather than business meetings.

We were most fortunate, through the courtesy of the Canada Cement Company, and arrangements made by J. W. MacBride of the Programme Committee, in obtaining an exhibit of the work of Robert Maillart, a Swiss engineer, and displaying it for several days at Institute headquarters. To those not familiar with his work it was a revelation of what could be done to give grace and beauty to concrete structures.

Through the kindness of Mr. B. Rider, works manager of the Canadian Tube and Steel Products Ltd., about 150 members paid a very interesting and enjoyable visit to the Company's plant on Saturday morning, October 16. About 60 members went by autobus from Institute headquarters. Arrangements were made by R. E. Smallwood of the Programme Committee and A. E. Andrews, personnel manager of the Company. Mr. Andrews has expressed willingness to arrange further visits for any member or group of members desirous of seeing a particular phase of the Company's operations.

The branch dance is arranged for February 11, 1949, at the Mount Royal Hotel. Now is the time to plan on bringing a party to this event. The last dance was well attended and a great success and the entertainment committee promises that the February dance will be better still.

Saguenay

J. E. Dyck, m.e.i.c.
Secretary-Treasurer

Junior Section

F. H. Duffy, m.e.i.c.
Secretary-Treasurer

A meeting of the Junior Section of Saguenay Branch was held in the Arvida Protestant School on September 15, 1948. Mr. H. E. Brooker of the Aluminum Company of Canada Limited addressed the meeting on the subject of **Engineering Inspection—Dimensional.**

During the war Mr. Brooker was in charge of the draughting office and specification and gauging departments of Naval Ordnance in Canada, for the British Admiralty, and his talk was based on his work during that time.

The speaker described various methods of inspection and elaborated on the particular methods of the office with which he was connected. He traced the progress of an imaginary article from the design department, to gauging for mass production, to trials and to final design He then outlined the inspection methods used to guarantee a satisfactory product.

Materials used for gauges were described, as well as methods of sampling and gauging the finished product. Tolerances allowed on sample articles were discussed, as were the relationship between allowed tolerances and price; gauge tolerances, for sampling and check gauges; and the effect of these tolerances on the size of the sampled article. In conclusion Mr. Brooker described some of the multiple gauges used for inspection purposes. An interesting discussion period followed and the speaker was called upon to answer numerous questions.

The chairman, C. J. Tanner, introduced Mr. Brooker, who was thanked, on behalf of the section by B. F. Naismith.

St. Maurice Valley

G. W. Ince, s.e.i.c.
Secretary-Treasurer
J. G. MacLeod, m.e.i.c.
News Editor

The visit of Dean J. N. Finlayson, president of the Institute, to Shawinigan Falls, was the occasion of the opening dinner of the St. Maurice Valley Branch on September 14th.

Mr. Francois Roy, mayor of Shawinigan Falls, greeted Dean Finlayson, L. Austin Wright and other officials of the Institute in the afternoon at the City Hall, and the party visited the power house of the Shawinigan Water and Power Company in the City. Branch chairman M. Eaton presided at the dinner.

Mr. Roy, in welcoming the visitors and guests to Shawinigan Falls, emphasized the importance of the engineer's role in the development of Shawinigan Falls, and of the whole St. Maurice Valley region.

Mr. Wright reported on Institute affairs, mentioning that the membership of over 10,000 includes a large number of young engineers. He said that this trend should be encouraged in order to insure the future of the Institute.

Col. H. E. Bates introduced the president, who said that his pleasant association with fellow engineers during his Eastern Canada tour made him very proud of his profession. He was surprised to see at first hand the outstanding progress made in the field of electrical engineering in the St. Maurice Valley, and the evident prosperity engendered by these power developments.

Discussing the profession as a whole, President Finlayson expressed the hope that in the near future all branches of Canadian engineering would be organized as a body, capable of expressing the will of the group and charged with maintaining the status of the profession.

S. E. Williams thanked the president.

❖ ❖ ❖

Power Development in the St. Maurice Valley was the topic of an address by Guy Rinfret, supervising engineer of the Shawinigan Engineering Company, at a joint dinner meeting of the Branch and the St. Maurice Valley Sub-Section of the A.E.E.E., at La Tuque on Saturday, September 25. Branch Chairman M. Eaton presided.

The visiting engineers were officially welcomed by Mr. Omer Journeau, mayor of La Tuque, who commented on the importance of the engineer's role in the prosperity of the region

Mr. Rinfret traced development of power on the St. Maurice River from the original installation at Shawinigan Falls, to the Trenche Development which will be completed in 1952 and whose ultimate capacity will be 384,000 horse power. He also described the whole St. Maurice River system, which when completely developed will generate in excess of 2 million horse power, and whose storage reservoirs now impound over 300 billion cubic feet of water. Mr. Rinfret illustrated many of his statements with slides.

After the meeting, tours were conducted through the La Tuque Power Plant and the Brown Corporation Pulp Mill, after which refreshments were served at the La Tuque Golf Club.

Winnipeg

G. W. Moule, M.E.I.C.
Branch Secretary

R. H. Tivy, Jr.E.I.C.
Branch News Editor

Some 80 members of the Winnipeg Branch of the Institute and of the Association of Professional Engineers of Manitoba attended the first joint general meeting of the season to hear Dr. Huet Massue M.E.I.C., on the subject of **A Factual Analysis of the Tennessee Valley Authority**. The meeting was held the evening of September 23 in Theatre "F" of the University of Manitoba buildings on the Broadway site.

In his main paper, Dr. Massue, who is statistical engineer of the Shawinigan Water and Power Co., Montreal, showed by means of a statistical analysis what he felt to be a truer picture of the T.V.A. operations than propaganda in the past had sometimes presented.

Through a series of coloured slides the speaker dealt with the various phases of the undertaking from its inception to the present time. Dr. Massue stated that the present rates charged for electricity by this authority do not cover the true costs of its production. "If electricity rates were made to bear the full cost of operation of the T.V.A., the rates would have to be much higher than anywhere in the country," he said.

However, Dr. Massue pointed out that a certain proportion of the T.V.A. investment is charged to navigation, but of this he said: "When the true cost of navigation to the Government is considered, it is found to be at least three times more costly than railroad transportation".

"Flood control on the Tennessee has benefited from the construction of the several dams throughout the watershed. It is said, however, that the permanent flooding of about 1,000,000 acres of land has resulted in an annual loss in agricultural production, greater than the damage which used to result from the temporary floods in the valley".

Following the speaker's presentation, a number of questions from the floor brought up the social aspects of the project being discussed. In reply to these, Dr. Massue emphasized the fact that his analysis was mainly economic. He said he had no objection as such to government agencies selling power, but felt that they should not be on a subsidized basis in order to give private power companies a fair chance of survival.

In addition to his main paper, the speaker presented a short statistical analysis of the E.I.C. membership across Canada. This included also a group of lantern slides which Dr. Massue used for illustration. He presented a handsomely bound and illuminated copy of this analysis to the Branch.

The speaker was introduced by E. V. Caton of the Winnipeg Electric Company and thanked by J. W. Tomlinson of the Manitoba Power Commission. Harry McLeod was chairman of the meeting.

Electrical Section

J. C. Pratt, M.E.I.C.
News Editor

The Electrical Section of the Winnipeg Branch of the Institute held its first meeting of the season as guests of the speaker, R. Noonan, president and general manager of Pioneer Electric Ltd.

The Company at present specializes in 3-kva. rural distribution transformers and 7½, 15- and 50-kva. standard distribution transformers. It has, however, built transformers up to 1000 kva. Mr. Noonan's address consisted of a resumé of his experiences leading up to the establishment of the Pioneer Electric in Winnipeg and a brief outline of transformer construction. Following the talk a tour of the plant was made and the various manufacturing operations were explained and inspected.

This "In the Plant" meeting was the first of its kind held by the section, and it is hoped by all that were present that similar meetings can be arranged in the future.

FOURTH ANNUAL DANCE

Sponsored by the JUNIOR SECTION - MONTREAL BRANCH

Date: December 3rd.
Place: Ritz Carlton Hotel.
Time: 9.00 p.m.
Price: $3.00 per couple.
Orchestra: Al McGowan.

Tickets available from:
1. **Any member of the executive.**
2. **Institute Headquarters.**
3. **John Bateman, chairman. Entertainment Committee, BE. 3913.**

No tickets will be sold at the door

BOOK REVIEW

MASONRY SIMPLIFIED

J. R. Dalzell and Gilbert Townsend. Chicago, American Technical Society, 1948. 2 vols., illus., 8½ x 5½ in., cloth. Vol. I—$5.75, Vol. II—$6.75 in Canada.

This two-volume work on masonry covers the tools and materials used, the methods employed, and the problems confronted by the mason in actual construction.

Throughout the text emphasis has been placed on the fundamental aspects of masonry. Volume I begins with a study of the general knowledge necessary to the mason, dealing respectively with lime, mortar, and concrete as building materials. A thorough and well-illustrated study of blueprint-reading follows. On the assumption that the mason has now mastered the generalities behind building materials, the authors discuss each type of masonry separately: concrete, structural clay tile, brick, and special applications to sidewalks, driveways, floors, and steps.

Volume II, entitled "Practical Construction", claims to apply the fundamentals of masonry to every job the mason must perform, and to fulfil the needs of apprentices, tradesmen, teachers, and laymen home mechanics. After an introductory chapter on formwork, the authors deal with masonry in footings, foundations, beams and lintels, columns, chimneys, fireplaces, walls and partitions, and septic tanks.

As well as being a textbook these two volumes answer many of the demands of a handbook for masons, in that each topic is finely subdivided, titled and indexed. This, along with such factors as large, clear type and an abundance of illustrations, combine to make the book attractive to the reader. Each chapter opens with a list of the questions it will cover, followed by a short introduction designed to awaken interest in what is to come. At the end of each chapter is a checklist of information and a number of review questions, the answer to which the reader is supposed to have at his finger-tips. The great number of illustrations and diagrams not only add to the attractiveness of the book, but more important, their clarity and the fact that they are labelled in detail provide excellent aids to rendering the text entirely intelligible and instructive. L.S.

ABSTRACTS

INSTITUTION OF ELECTRICAL ENGINEERS

Summaries of Papers to be read in London, Second Half Session 1948-49

Analogies between the Vibrations of Elastic Membranes and the Electromagnetic Fields in Guides and Cavities (with the Development of Equivalent Circuits, *E. C. Cherry.*

Considers the electro-mechanical analogies between inductances, and capacities in lumped circuits, on one hand, and masses and springs on the other hand.

Errors at very High Frequencies, *H. G. Hopkins and F. Horner.*

Describes investigations into the cause and properties of site errors at metre wavelengths. Discusses difficulties encountered in calibrating a site, and practical techniques available for locating effective reflecting obstacles on a site and methods for suppressing unwanted reflections.

Scattering of Radio Waves by Metal Wires and Sheets, *F. Horner.*

Method is described and formulae are derived for estimating scattered fields using transmission line equations for wires and simple diffraction theory for sheets.

Storage System for Use with Binary Digital Computing Machines, *F. C. Williams and T. Kilburn.*

Properties required of a storage system and its operation as part of a machine are explained with reference to a much simplified and hypothetical machine.

Modern Methods of Home Heating:

J. L. Shank. (Reprinted from American Builder).

Report on the Work Carried out in the "Panel" or "Radiant" Heated Test

PUBLICATIONS OF OTHER ENGINEERING SOCIETIES

Exchange arrangements exist between The Engineering Institute of Canada and engineering societies in the British Empire and the United States whereby members of the Institute may secure the publications of these societies at special rates, which, in most instances, are the same as charged to their own members. A list of these publications with the amounts charged (not including bank charges and exchange) is given below. Subscriptions should be placed at E.I.C. Headquarters, 2050 Mansfield St., Montreal 2, Que., but no remittance should be made until an invoice has been received. These prices are subject to change without notice.

	Rate to E.I.C. Members	*Rate to Non-Members*
AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS		
Electrical Engineering—monthly, single copies	$ .75	$ 1.50
Per year (Plus postage to Canada 50c)	6.00	12.00
Transactions—annual, bound (Plus postage to Canada 50c)	6.00	12.00
AMERICAN SOCIETY OF CIVIL ENGINEERS		
Proceedings—monthly, single copies	$ .50	$ 1.00
Per year (Plus foreign postage 75c)	4.00*	8.00†
Civil Engineering—monthly, single copies	.50	.50
Per year (Plus 75c postage to Canada, elsewhere $1.50)	4.00	5.00
Transactions—annual, per year	6.00‡	12.00¶
(Other publications 50% reduction on catalogue price to E.I.C. members.)		

** If subscription received before Dec. 1st, otherwise $ 5.00*
† If subscription received before Dec. 1st, otherwise $10.00
‡ If subscription received before Jan. 1st, otherwise $ 8.00
¶ If subscription received before Jan. 1st, otherwise $16.00

AMERICAN SOCIETY OF MECHANICAL ENGINEERS		
Mechanical Engineering—monthly, single copies	$ .50	$ .75
Per year (Plus 75c postage to Canada, elsewhere $1.50)	4.00	7.00
Transactions—annual, bound, about March 1st (current volume)	10.00	15.00
Journal of Applied Mechanics—quarterly (Plus 25c postage)	4.00	5.00
Applied Mechanics Reviews—monthly, per year	9.00	12.50
(Other publications, same rate to E.I.C. members as to A.S.M.E. members.)		
INSTITUTION OF ELECTRICAL ENGINEERS		
Proceedings—three parts, per year	£1–16s–9d	£3–13s–6d
Part I—General—bi-monthly, per year	10s–6d	£1– 1s–0d
Part II—Power Engineering—bi-monthly, per year	15s–9d	£1–11s–6d
Part III—Communications Engineering—bi-monthly, per year	15s–9d	£1–11s–6d
Science Abstracts—two sections, per year	£1–10s–0d	£3– 0s–0d
Section A—Physics Abstracts, per year	17s–6d	£1–15s–0d
Section B—Electrical Engineering, per year	17s–6d	£1–15s–0d
INSTITUTION OF ENGINEERS, AUSTRALIA		
Journal—monthly, per year	£2– 2s–0d	£4– 4s–0d
INSTITUTION OF ENGINEERS (INDIA)		
Journal—quarterly, single copies	3s–0d	4s–5d
Per year	12s–0d	18s–0d
INSTITUTION OF MECHANICAL ENGINEERS		
Proceedings—quarterly, per year	£2–12s–3d	£3– 3s–0d
NEW ZEALAND INSTITUTION OF ENGINEERS		
Proceedings—annual, bound	10s–6d	£1– 1s–0d
SOUTH AFRICAN INSTITUTE OF ELECTRICAL ENGINEERS		
Transactions—monthly, single copies	2s–6d	3s–6d

Buildings at the National Council Laboratories, Ottawa, during the Winter 1947-1948:

C. D. Niven. Ottawa, National Research Council, 1948.

Research on Arc-Welded Butt Joints of Mild Steel:

Georges Welter. (Reprinted from Welding Journal Research Supplement, July 1947)

Theory of Buckling of Frameworks:

Thomas C. Kavanagh. Column Research Council, Engineering Foundation, 1948.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada.

INVENTOR AND HIS WORLD:

H. Stafford Hatfield. West Drayton, Middlesex, England; Penguin Books, 1948. 256 p., 7 x 4¼ in., paper, 25c.

The author discusses the nature of invention and the inventor, and leads up to the practical aspects of invention. He suggests methods for working out and financing of an invention, and includes general rules and warnings. He deals with invention in various fields—war, machinery, chemistry, electricity, psychology, biology—and also gives an outline of patent law. There is a fairly extensive bibliography.

PERSONAL AIRCRAFT BUSINESS AT AIRPORTS:

L. L. Bollinger and A. H. Tully, Jr. Boston, Harvard University, 1948. 348 p., illus., 8½ x 5½ p., cloth, $4.25

This is a study of aircraft financing and management, and deals with personal flying at airports. It focuses upon the fixed-base operation which is the key unit at airports concerned with aircraft sales and service, flight training, and other business activities related to personal flying.

PREFABS ON PARADE:

O. W. McKennee. N.Y., Housing Institute, 1948., 110 p., illus., 11 x 8½ p., paper, $2 50

This book gives a listing of prefabricated manufacturers in the United States, along with an introductory chapter on the various types of prefabricated construction, ground planning and a history of the prefab field For each manufacturer listed, a typical home is pictured and described, complete with specifications approximate cost, building information, and financing data. Prefab garages, accessories and similar buildings are also included.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

ANNUAL REPORT ON THE PROGRESS OF RUBBER TECHNOLOGY, Vol. XI, 1947.

Edited by T. J. Drakeley published by W. Heffer & Sons Ltd., Cambridge, England, for the Institution of the Rubber Industry, 12 Whitehall, London, S.W.1, England. 145 pp., tables, 9½ x 7¼ in., paper, 12s. 6d.; 4s. 6d. to members.

The current issue of this technical literature survey covers the important aspects of the planting and production, chemistry and physics, and processing of raw rubber and other natural rubber-like materials. Separate chapters are also devoted to synthetic rubber, cellular rubber, hard rubber, and all of the major classes of rubber products. The selected bibliographies accompany their respective chapters as usual

ELEMENTARY STEAM POWER ENGINEERING.

E. MacNaughton. 3 ed. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948 640 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.50.

This book presents in a clear and concise manner the fundamental principles underlying the construction and operation of steam power plants and equipment. New data on thermodynamic principles, turbines and boilers have been added to this edition, while the remaining material has been thoroughly revised and brought up to date. As in previous editions, practical applications have been introduced before discussions of the theoretical aspects.

ELEMENTS OF FUEL TECHNOLOGY.

G. W Himus. Leonard Hill Limited, 17 Stratford Pl., W.1, London, 1947. 506 pp., diagrs , charts, tables, 10 x 6 in., cloth, 42s.

This book gives an outline of some of the problems involved in the correct use of fuel. Both coal and oil are considered as well as the secondary fuels derived from them Numerous illustrations and references are included. The descriptions and illustrations of plant and apparatus have been taken from British practice.

LA FATIGUE DES METAUX.

R. Cazaud, preface by A. Caquot. 3 ed. Dunod, 92 Rue Bonaparte, Paris, 1948, 318 pp., illus., diagrs , charts, tables, 9¼ x 6¼ in., paper, 1650 frs.

The theory and characteristics of fatigue failure of metals are discussed in the light of recent developments in the field. Methods and machines for fatigue testing are described, and the influence of various factors on fatigue is considered. Separate chapters are devoted to the resistance of joints and machine assemblies to fatigue, and to the improvement in endurance of machine parts. Fatigue limit values for a large number of metals and alloys are given together with graphs and tables of other data.

FORMING OF AUSTENITIC CHROMIUM-NICKEL STAINLESS STEELS.

Assembled and edited by V. N. Krivobok and G. Sachs. International Nickel Co., New York; International Nickel Co. of Canada, 25 King St. W., Toronto, 1948. 309 pp., illus., diagrs., charts, tables, 11¼ x 8½ in., cloth, $4.00.

This book gives fabricators of metal equipment a better understanding of the adaptability of stainless steels to all modern processes of forming. It presents a detailed description of the modern forming procedures as applied to chromium-nickel stainless steels and as practiced in U.S. plants. Bending and straight flanging; forming of curved sections and tubing; deep drawing; die forming; forming of contour flanged parts, and forming by miscellaneous methods are discussed. The specific examples of forming technique are supplemented by details of tool design and tool materials, lubricants, data on dimensions, and consecutive steps on fabrication.

INDUSTRIAL RESEARCH, 1947.

Advisory Editor, P. Dunsheath. Todd Reference Books Limited, London andNew York; British Distributors; George G. Harrap & Co., Ltd., 182 High Holborn, London, W.C.1. 535 pp., 8¾ x 5½ in., cloth, 25s.

This British Empire directory contains statements on the character and activities of government, public and private organizations which have industrial research programs. Careers in industrial research are briefly described, with information on university requirements, grants, etc. Books periodicals, and films of interest are given in classified groups. The volume also contains lists of laboratories, technical colleges, consultants, libraries, and a "who's who" in industrial research.

N.F.P.A. HANDBOOK OF FIRE PROTECTION.

Crosby-Fiske-Forster. 10th ed. National Fire Protection Association, 60 Batterymarch St., Boston, Mass., 1948. 1544 pp., illus., diagrs., charts, tables 7-3/4 x 5 in., fabrikoid, $9.50.

This book, like its predecessors, aims to present in compact form, for ready reference, all the essential information on fire prevention that time has stabilized into good practice. Among the new features are a chapter on chemistry and physics of fire, a chapter on water spray protection, and a complete new treatment of the general field of building construction. The new chapter on magnesium and other combustible metals outlines fire hazards and methods of protection. A table of trade names of plastics gives the properties of each. The book is useful to experienced fire protection engineers as well as to students of fire protection, inspectors and property owners.

NATIONAL ELECTRONICS CONFERENCE, Proceedings, Volume 3, Chicago, Illinois, November 3-5, 1947.

(Obtainable from Dr. R. R. Buss, Electrical Engineering Dept., Northwestern University, Evanston, Ill.), 1948. 698 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $4.00.

Some sixty papers are printed in full, classified under the following subjects: noise suppression, electronic instrumentation, coaxial elements, microwaves, computers, electronic circuit analysis, industrial electronics, nucleonics, communication, television, antennas, FM broadcasting, military applications, and general basic or descriptive papers. Brief abstracts only are provided for twenty other papers that are scattered through the several subject groups. Similar compilations of the papers presented to the previous two conferences are also available.

REVIEWS OF PETROLEUM TECHNOLOGY, Vol 7 (covering 1941-45).

F. H. Garner and E. B. Evans, Editors, and G. Sell, Publications Secretary. Institute of Petroleum, Manson House, 25 Portland Pl., London, W.1, 1947. 535 pp., tables, 9¼ x 6 in., cloth, 21s.

Normally an annual publication, the present volume covers the gap resulting from the war in anticipation of the resumption of yearly issues. Reference to nearly 3,500 original articles is made in this comprehensive survey covering petroleum geology, geophysics, production and refinery engineering, the chemistry and physics of petroleum, specifications and test methods for petroleum products, and alternative and synthetic fuels. Detailed author and subject indexes are provided. The most important of the subjects which had to be omitted is gasoline and other light distillates, but these omitted topics are to be included in the next volume.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

November 15th, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the December meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BOELEN—JOAN WILLEM, of Montreal, Que. Born at Garoet, Neth. East Indies, Sept. 8, 1916, Educ.: Civil Engr., Univ. of Delft, Holland, 1942; R.P.E. of Netherlands; 1942-43, soil mech. laboratorium, Ooostplantsoen, Delft; 1943-47, divisional operating supt., Netherlands Railways, Utrecht; 1947-48, engr., Simon's Emb. fabr. en Houthandel, Ooosternout; at present, designer and dftsman., Stadler, Hurter & Co., consultg. engrs., Montreal, Que.

References: A. T. Hurter, C. J. Jeffreys, J. W. Roland, P. Bastien, L. A. Wright.

CAMPBELL—HOWARD, of Cardinal, Ont. Born at Calgary, Alta., March 14, 1919. Educ.: B.Eng., (Chem.), McGill, 1940; 1940-41, asst. chief chemist., Canada Starch Co.; with Welland Chemical Works, as follows: 1941-42, supervisor, operns., 1942-43, supvr., nitric acid operns., 1943-44, chem. engr., process costs, correlating work of engrg., process develp't. groups and operating dept., 1944-45, prod. engr., 1945-47, prod. supt.; 1947- to date, wet starch supt., (operating supervn.), Canada Starch Co., Cardinal, Ont.

References: R. H. Wallace, A. S. Fraser, J. B. Phillips, E. Brown, R. E. Jamieson, A. M. Fennis, R. T. Hollies.

CATFORD—DENIS ROLAND, of Three Rivers, Que. Born at Toronto, Ont., March 16, 1922. Educ.: B.A.Sc., (Chem. Engrg.), Toronto, 1946; with Canadian International Paper Co., as follows: 1945-46, lab. chemist, i/c contour testing in the mfg. of dissolving and bond pulps, bleach plant, Gatineau, Que., 1946-47, filter plant chemist, responsible to bleach plant supt. for prod. of suitable process water for bleach plant, 1947 to date, process engr., becoming familiar with and aiding in solution of problems dealing with unit processes in newsprint mfg., i.e., pressing, drying, screening, etc., Three Rivers, Que.

References: W. T. Bennett, C. F. Walker, G. B. Baxter, A. M. Hubley, C. H. Neil.

CHOUINARD—ROGER, of Montreal, Que. Born at Edmundston, N.B., Jan. 9, 1922. Educ.: B.Eng., (Elect.), Nova Scotia Tech., 1948; 1946, (summer), transmission lines, Canadian Comstock and Foundation Co. (for Quebec North Shore, Baie Comeau); 1947, (summer), asst. to town engr., Edmundston, N.B.; 1948, (June), to date, jr. engr., Shawinigan Engineering Co., Montreal, Que.

References: H. O. Wilson, R. E. Heartz, W. H. Sharples, D. S. Nicol, G. H. Burchill.

EASTON—HARRY LEONARD, of Deloro, Ont. Born at The Pas, Man., April 22, 1917. Educ.: B.Eng. (Metall.), McGill, 1940; 1936, (summer), labourer, B. F. Harris Lumber Co., Crooked River, Sask.; with Flin Flon Gold Mines Ltd., 1937-38, mine supervisor i/c of development, plant operating, road bldg., etc.; 1939, (summer), asst. miner, Britannia Mining & Smelting, B.C.; 1940-44, asst. to plant supt., i/c setting up process, machines, tech. control in new plant, finally sr. foreman i/c metall. tech. and plant control depts., Defence Industries Ltd., Brownsburg, Que., (small arms divn.); 1944-45, foundry & heat plant engrg., responsible for plant layout and design for foundry and furnace problems, etc., Ford Motor Co., Windsor; 1945-46, plant engr., directly responsible for plant layout, mchy. & process, etc., for six million dollar plant extension, Cleveland, for Freuhauf Trailer Co., Detroit, Mich., J. G. Turner, Cleveland; 1946, (7 mos.), asst. plant supt., Spurgeon Steel Co., Detroit; 1946-47, foundry metall. i/c foundry, furnace operations, Sorel Steel Foundries Ltd., Sorel, Que.; at present, plant metall., and since July 1947 training for plant supt.'s position, Deloro Smelting & Refining Co., Deloro, Ont.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

JUNIOR RESEARCH CHEMIST required by a manufacturer in Central Ontario to be trained in Research work. Salary open. Apply to File No. 1017-V.

MECHANICAL

GRADUATE ENGINEER preferably mechanical background and some industrial experience required for general duties by a Montreal manufacturer. Salary around $300.00. Apply to File No. 1011-V.

MECHANICAL ENGINEER required by a large industrial concern in the Province of Quebec. Good chance for advancement. Salary open. Apply to File No. 1014-V.

MECHANICAL ENGINEER required by large industrial concern in Montreal for the design of major electrical products. Salary according to qualifications. Apply to File No. 1016-V.

SENIOR MECHANICAL DRAUGHTSMAN for work in Ottawa. Ten years experience required in simple design layout and detail drawings for steam power plants, steam and hot water heating, ventilation and air conditioning. Four year contract if suitable. Reply in confidence, outlining experience and stating salary expected. Apply to File No. 1045-V.

METALLURGICAL

PHYSICAL METALLURGIST required by Ontario Research Foundation. Should be University graduate with from 3 to 5 years practical experience and should preferably have had some experience in electrolytic refining of metals. Salary commensurate with experience. Apply to File No. 1013-V.

MISCELLANEOUS

SALES ENGINEER required by Company manufacturing electrical switchgear, to represent them in Alberta and Sask. Salary and commission. A man with an aggressive personality and experience in this line of product can assure himself of a good income. Apply to File No. 1018-V.

SALES ENGINEER, recent graduate, mechanical background, required by Canadian manufacturer. Must be free to travel. Location Ontario. Salary $235. to $250. Apply to File No. 1019-V.

GRADUATE ENGINEER, preferably mechanical or chemical, required for sales engineering in the Toronto area. Should have some experience in sales and maintenance engineering. Salary open. Apply to File No. 1020-V.

MECHANICAL OR ELECTRICAL ENGINEER age about 35 years with experience in building construction and machinery, maintenance and repair, capable of taking over the engineering and maintenance service in a large textile mill in Province of Quebec. Salary open. Apply to File No. 1021-V.

SENIOR INDUSTRIAL ENGINEER required by firm in Province of Quebec. Duties include: Wage incentives, method studies, cost reduction etc. Should be graduate in mining or mechanical engineering. Salary open. Apply to File No. 1023-V.

GRADUATE ENGINEER mechanical or electrical background required to set up and organize a new department for a Canadian manufacturer. Must have plant and production experience. Preferably under 35 years. Salary open. Apply to File No. 1025-V.

FORESTRY ENGINEERS, recent graduates also class of 1949 required for extensive logging operations in Province of Quebec. Preferably but not necessarily bilingual. Current salaries paid. Apply to File No. 1026-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 1027-V.

GRADUATE ENGINEERS with mechanical and light structural experience, applicable to designing and detailing of conveyors, who are interested in establishing themselves with a well established growing concern to learn business in preparation for future advancement. Situated near Toronto. Salary open. Apply to File No. 1028-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER — with about two years experience required by large Pulp and Paper Mill in Province of Quebec. Salary $250. per month. Apply to File No. 4199-V.

CIVIL

RECENT GRADUATE, preferably civil, with some construction experience required for construction inspection work by large oil company in the West. Work will involve extensive travel and long periods absent from headquarters. This position provides opportunity for advancement. Salary open. Apply to. File No. 1005-V.

CIVIL ENGINEER, construction experience, Bailey bridging in the army preferred, to supervise erection and inspection of Bailey structures on projects in Ontario. Salary open. Apply to File No. 1007-V.

CIVIL ENGINEER — recent graduate with up to one year's experience since graduation. Preferably single man. Required by Northern Ontario Paper Mill. Salary around $250. Apply to File No. 4158-V.

CIVIL ENGINEER with extensive experience in the use and design of Structural Steel. Duties primarily Public Relations with Architects, Engineers and Public Bodies and he will be required to act as Secretary of a Dominion association. Headquarters Toronto. Salary $4,800. up. Apply to File No. 4201-V.

CIVIL ENGINEER required for Consulting Engineer and Land Surveyor's office in Western Ontario. Must be able to make urban and rural surveys, layout of sewers, waterworks and pavements, etc. Will applicants please state qualifications and references. Salary open. Apply to File No. 4204-V.

CIVIL ENGINEER with considerable experience in structural steel and reinforced concrete design. Preferably bilingual. Required in Montreal. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4205-V.

CIVIL ENGINEER required for South America. Must be single and between the ages of 25-40 years. Duties include: Supervise field survey parties doing triangulation and control work, perform draughting and layout work for construction projects as well as miscellaneous minor and major construction projects. Salary $390. U.S. currency. Apply to File No. 4221-V.

ELECTRICAL

ELECTRICAL ENGINEERS preferably with some experience in paper industry required by large Pulp and Paper mill to work under Electrical Superintendent. Salary $300 to $350. per month. Apply to File No. 4199-V.

RECENT GRADUATE IN ELECTRICAL ENGINEERING required by an industrial organization in Montreal. Salary open. Apply to File No. 4214-V.

ELECTRICAL ENGINEER, recent graduate, required as Assistant Professor in Electrical Engineering and work would be largely supervision of Laboratory classes. Salary $2,500. to start, summers free to take other employment. Location Maritimes. Apply to File No. 4218-V.

ELECTRICAL ENGINEER required by consulting office. Should have at least seven years experience in layouts for substations, switching and motor distribution. Permanent position and good salary for right man. Location Northern Ontario mining district. Apply to File No. 4220-V.

ELECTRICAL DRAUGHTSMAN required by consulting firm. One capable of making detailed plans and diagrams from preliminary drawings prepared by designers. Work consists of layouts for substations, switching and motor distribution systems. Permanent position. Location Northern Ontario. Salary open. Apply to File No. 4220-V.

ELECTRICAL DISTRIBUTION SUPERVISOR required for South America. Preferably single and 35 years of age or more, with 10 years industrial experience. Duties include direct supervision of all power transmission and distribution lines, transformer stations, lighting installations, etc. Must have ability to direct and lead other skilled personnel. Salary $450. U.S. currency. Apply to File No. 4221-V.

MECHANICAL

MECHANICAL ENGINEERS with 3 to 5 years experience in mechanical design and general plant engineering, as well as field work required by a firm in Quebec. Salary open. Apply to File No. 1001-V.

MECHANICAL ENGINEER required by firm in Province of Quebec, to work mostly on mill design and layouts of new mill and improvements to others. Salary open. Apply to File No. 1001-V.

MECHANICAL ENGINEER required as assistant superintendent for small establishment employing 60 men. Must have complete knowledge of machine shop methods in precision work capable of making accurate estimates machines times preparatory to bidding. Salary open. Apply to File No. 1002-V.

MECHANICAL ENGINEER for design and development work in large Montreal food industry. Must have 5 to 10 years experience including some structural work. State age and full experience. Salary open. Apply to File No. 1008-V.

MECHANICAL ENGINEER, recent graduate, required for manufacturing and related duties with well established reputable paper company. Salary open. Apply to File No. 4172-V.

MECHANICAL MAINTENANCE ENGINEER with twelve to fifteen years experience required by Toronto office of Canadian firm. Must be between the ages of 35 and 40 and preferably located in the Toronto area. Salary open. Apply to File No. 4191-V.

MECHANICAL ENGINEER with about five years experience in the design of tractors and related accessories required as Automotive Engineer by one of Canada's leading manufacturers of heavy mechanical equipment. Salary open. Apply to File No. 4206-V.

MECHANICAL ENGINEER with at least ten years experience in general mechanical design in heavy engineering required by a large manufacturer in Montreal. Salary open. Apply to File No. 4206-V.

MECHANICAL ENGINEER with a minimum of five years experience in the design of hydraulic turbines, penstocks, surge tanks and associated hydraulic equipment required by well established firm in Montreal. Salary open. Apply to File No. 4206-V.

JUNIOR MECHANICAL ENGINEER required by Canadian manufacturer in Toronto for general duties. Must be highly competent. Salary open. Apply to File No. 4219-V.

SENIOR MECHANICAL ENGINEER required by a Canadian manufacturer. Must have at least twenty years experience and would be responsible for all mechanical work in General Engineering Division. Salary open. Apply to File No. 4219-V.

METALLURGY

METALLURGICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

MINING

MINING ENGINEERS for design and layout work also some field work required by firm in Province of Quebec. Salary open. Apply to File No. 1001-V.

MISCELLANEOUS

SALES ENGINEER required by well-known manufacture's representative, long established, handling electrical and engineering equipment including power and lighting transformers, to take charge of Montreal office. Bilingual preferred. Salary in accordance with experience. Apply to File No. 1006-V.

HEATING AND VENTILATING ENGINEER, graduate, required for Montreal Head Office of a Canadian Company for design, specification and layout of air conditioning, ventilating, fan and duct work for industrial processes, factories, offices, dust removal collecting systems, etc. Supervision of field installations, testing, and making estimates. At least five years experience with the above. Must be familiar with all kinds of heating systems, relative apparatus and equipment with sheet metal air duct work. Apply to File No. 1015-V.

GRADUATE ENGINEER required by Pulp and Paper Mill in Province of Quebec. Must have extensive experience in general maintenance, design and development of pulp and paper mill equipment. Excellent future advancement. Salary $6,000. to $9,000., depending on qualifications. Apply to File No. 4161-V.

STRUCTURAL DRAUGHTSMEN required by Alberta firm. One able to check all classes of structures and tanks. Another able to detail all types of structures. A third able to detail light structures and general handling machinery. Must be experienced. Salary open. Apply to File No. 4167-V.

SALES ENGINEERS, one for Ontario and one for Quebec, required by tool and quality steel Branch Sales Office. Applicant should have some metallurgical training, some experience in tool and die manufacture, good personality and should own own car. Salary open. Apply to File No. 4170-V.

MECHANICAL OR ELECTRICAL ENGINEER, bilingual, experienced in standard investigations and observations. Time-study training not necessary, required by Montreal firm. Salary open. Apply to File No. 4174-V.

GRADUATE ENGINEER required by an oil company in the Maritimes, must have sufficient experience in the oil business and the educational qualifications to enable him to determine the specifications of oils required for various industrial machinery. Salary open. Apply to File No. 4178-V.

CONSTRUCTION ENGINEER capable of supervising sundry engineering jobs and pipelines for oil company in the Maritimes. Salary open. Apply to File No. 4178-V.

PLANT MAINTENANCE ENGINEER, mechanical background, extensive experience in pulp and paper preferably kraft. Required to take charge of kraft mill maintenance in province of Quebec. Executive ability. Salary open. Apply to File No. 4179-V.

GRADUATE ENGINEER required for veneer and plywood plant in the Maritimes. Must be fully qualified to assume responsibility for the management, production and general supervision of the plant. Salary open. Apply to File No. 4180-V.

MAINTENANCE MANAGER required for large hospital in the Maritimes for maintenance and operation of power plant, buildings and equipment. Salary open. Apply to File No. 4186-V.

RECENT GRADUATE required by a large National Organization. Must have the following qualifications: Good appearance, personality, leadership and initiative. Salary $2,400. Apply to File No. 4194-V.

SALES ENGINEER, mechanical background, must be thoroughly experienced and capable of developing and maintaining connections of old established firm in road builders, contractors and industrial machinery equipment. Must possess executive ability and have command of the French language. Salary open. Apply to File No. 4203-V.

MECHANICAL OR CIVIL ENGINEER with four to five years experience in stress analysis of mechanical and structural equipment required by a large manufacturer in Montreal. Salary open. Apply to File No. 4206-V.

INSTRUCTORS AND DEMONSTRATORS required by a Canadian University for session beginning September 20th, 1948, particularly in Electrical Engineering and in Engineering Problems and Drawing. Salary open. Apply to File No. 4209-V.

SENIOR STAFF MEMBER required by Canadian University. Must have degree and industrial experience to teach Fluid Mechanics, Internal Combustion Engines, Refrigeration, Heating and Ventilation, all at IV year level. Salary open. Apply to File No. 4210-V.

VILLAGE ENGINEER required by Village of Crystal Beach, Ontario. Applicants state qualifications and salary expected. Apply to File No. 4215-V.

SENIOR DRAUGHTSMAN with from 3 to 5 years experience required by an oil company in the Montreal area. Preferably under 35 years of age. Salary $250. to $300. per month. Apply to File No. 4216-V.

GRADUATE ENGINEER with broad experience is required by a manufacturer in Toronto. Must have experience in the design of small and large steam boilers together with their associate equipment, plate work and pressure vessel experience are essentials. Salary open. Apply to File No. 4219-V.

HYDRAULIC ENGINEER at least 30 years of age with experience in hydraulic turbine design, Pelton Wheel design, hydraulic valve design and preferably with experience in river control required in Toronto by Canadian manufacturer. Salary open. Apply to File No. 4219-V.

DRAUGHTSMAN required by manufacturer in Toronto. Standard draughting training is essential with a minimum of five years of actual paper mill machinery experience in the development and layout of the mill and its equipment. Salary open. Apply to File No. 4219-V.

Situations Wanted

CIVIL AND MECHANICAL ENGINEER, M.E.I.C., age 42, B.Sc. Civil Graduate work in industrial engineering at McGill University. Seventeen years experience in following field: Manufacture of welding rod and hard-facing alloys, installation of incentive bonus systems. Production planning on the manufacture of shells and shell parts. Design and construction of explosive proving equipment. Superintendent during construction of shell filling plants. Other experience covering oil refining, contracting, and installation of pulp and paper mill equipment. Interested in position with responsible firm or partnership with consultant. Home in Montreal area. Apply to File No. 981-W.

STRUCTURAL ENGINEER, M.E.I.C., P.Eng., experienced in design work and preparation of drawings for wood, structural steel and reinforced concrete structures. Interested in position or partnership with consulting engineering firm in Toronto, Hamilton or other city in the interlake region. Apply to File No. 1031-W.

PRODUCTION ENGINEER, M.E.I.C., P.Eng., McGill '33, (Electrical), age 38, married. Experience includes all phases Production Engineering, standard costs, budgetary control, time study, method improvements, financial reports, sales and general engineering. Desire position pertaining to foregoing fields. Available immediately. Location Quebec or Ontario. Apply to File No. 1186-W.

ELECTRICAL ENGINEER, M.E.I.C., Alberta 1931, P.Eng., Ontario, married. Experience in Engineering Department of large industrial plants and as Field Engineer on various plant and power construction projects. During the war was Senior Engineer on design of Auxiliary Electrical equipment for Radar units and sub-contract work. Desire permanent position requiring initiative with good future prospects preferably in Ontario. Apply to File No. 1249-W.

GRADUATE ELECTRICAL ENGINEER, M.E.I.C., age 31, with seven years experience in electronics and radio, including radar and microwave techniques, and three years experience in industrial and utility engineering and management, desires permanent, responsible position Montreal, Ottawa, Toronto region preferred. Apply to File No. 1689-W.

CHEMICAL ENGINEER, M.E.I.C., graduate of McGill, age 33, married, bilingual, presently located in Montreal, experienced in production and process control of dairy equipment, aluminum plant pot-rooms, gas scrubbing plant. Last three years in charge of lubricant and fuel oil sales in marketing organization of major oil company. Desires responsible position with well established firm leading to management. Available in November, 1948. Apply to File No. 1932-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. Que., has structural, mechanical, chemical and mining experience. Qualifications merit consideration for responsible position, contract work on design, associate with consulting engineer. Location is Montreal but would locate elsewhere. Interests are structural design, mechanical trades for buildings, power development, steam plant, process plant design, machine and tool design, pulp and paper plant engineering and engineering research. Would consider position as resident engineer, or municipal engineer. Apply to file No. 1935-W.

INDUSTRIAL AND CIVIL ENGINEER, M.E.I.C., B.A.Sc., P.Eng., Quebec, age 39, married, fluently bilingual. Seeks position as Industrial Engineer, Executive, Town Engineer, Sales Engineer. Experience in motion and time study, methods, process development, production control, costing, plant maintenance, highway engineering, municipal engineering, sales. Available on short notice. Apply to File No. 2157-W.

INDUSTRIAL ENGINEER, M.E.I.C., age 34. Five years practical experience in plant production and efficiency. Desires part time employment. Montreal area. Apply to File No. 2158-W.

EXECUTIVE ASSISTANT ENGINEER, M.E.I.C., background of Engineering, production, Business Organization, Cost Control, and Management. Age 37, married, and preference for permanent association with enterprise in Montreal area. Apply to File No. 2228-W.

MECHANICAL ENGINEER, Jr.E.I.C., is interested in short term projects, duration one month or more. Location anywhere. Production works, incentives, re-design, surveys, layouts, job evaluation, methods and materials handling. Salary desired $500 a month. Apply to File No. 2338-W.

CIVIL ENGINEER, Jr.E.I.C., McGill, '45, married, with experience in surveying and construction. Presently employed with small construction concern in the preparation of estimates, records and cost analyses. Experienced in writing contracts and specifications. Bilingual. Seeking responsible position in Montreal or Ottawa areas. Apply to File No. 2405-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., McGill '46, age 24, single. Presently employed as a machinist with a large concern. Employment in the past includes positions in tool design, air conditioning and methods engineering. Seeks responsible position with firm in production or shop management. Available on short notice. Apply to File No. 2707-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng., McGill 1943, (Honours), P.Eng., Quebec, desires position in Montreal or Ontario. Willing to travel. Interested in Commercial Aspects and Sales Engineering. Apply to File No. 2727-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng., graduate '44, age 27, single. Presently employed near Montreal, 8 years of engineering experience, machine tool engineering on Batch Production. Fabrication and assembly methods. Production supervision, research, methods improvement in power transmission equipment. Layout estimating and installation of power apparatus and auxiliaries. Am seeking more exacting and progressive position with expanding organization located anywhere. Apply to File No. 2876-W.

ENGINEER, M.E.I.C., P.E., Queen's '37, varied experience in Mining and Industrial work; 4½ years with R.C.A.F. as engineer officer. Desires position with progressive firm offering responsibility and opportunity. Interested particularly in mining, manufacturing and processing of chemicals and industrial minerals. Location in B.C. or Alberta preferably. Apply to File No. 2892-W.

GRADUATE ELECTRICAL ENGINEER, M.E.I.C., McGill '24, Prof. Eng., Quebec. Over 20 years experience in high voltage transmission line, design and construction. Interested in part time or temporary position in general engineering or transmission linework. Location preferably Montreal or in B.C. At present residing in Montreal area. Due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No. 2918-W.

MECHANICAL AND INDUSTRIAL ENGINEER, M.E.I.C, Ph.D. (Engineering, London), A.M.I.Mech.E., P.Eng., age 36, eleven years diversified industrial experience, desires position with duties involving: methods studies, research, development, engineering economics, management techniques, advisory service to the Board of Directors and similar. Apply to File No. 2929-W.

CHEMICAL, S.E.I.C., B.A.Sc., Toronto, '46, ex-Signal Corps, age 24. Reliable, diligent, conscientious, aggressive, bilingual. Experience in the rubber, distilling, and heavy chemical fields; in such phases as process and product control, design and engineering and industrial research. Presently employed but seeks an opening with a progressive company wherein he will have more scope in engineering work. Apply to File No. 2936-W.

GRADUATE ENGINEER, S.E.I.C., Man. '47. Presently engaged in plant layout and field supervision. Experienced in mechanical and electrical construction and maintenance. Responsible position desired in business and production engineering in progressive firm. Apply to File No. 2975-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc., P.Eng., (Ont.), age 44, single. Past experience includes administrative executive and sales engineering in metal products, building materials and subcontract work in construction industry. Also held responsible position in personnel administration. Desires permanent position requiring initiative with good future prospects. Apply to File No. 2983-W.

SALES ENGINEER, Jr.E.I.C., B.Sc., graduate in Electrical Engineering, Queen's, married. 2½ years in sales department of electrical manufacturer, anxious to move to probably a smaller company in Ontario or Montreal. Product need not be of an electrical nature, but that type preferred. Apply to File No. 3030-W.

ENGINEERING EXECUTIVE, A.I.E.E., A.F.R.Ae.S., with outstanding record in England seeks position of scope and responsibility in Canada. First class academic qualifications and exceptional experience at high level in aircraft and precision mechanical engineering fields, comprising design and development, works management, manufacturing methods, production control, administration and sales. Apply to File No. 3033-W.

MECHANICAL ENGINEER, A.M.Inst.C.E., age 38. Manager in charge of small works in England designing, building and servicing special agricultural machinery and tractors (crop-spraying), keen to emigrate to suitable administrative position. Well educated, heavy engineering (steam) experience, special ability for craftsman training and selection. Apply to File No. 3039-W.

GRADUATE CIVIL ENGINEER, Jr.E.I.C., Alberta '43, veteran, with experience in construction, purchasing, sales desires position of an engineering nature with responsible firm or with consulting engineer. Alberta or B.C. preferred but would accept elsewhere. Available on reasonable notice to present employer. Apply to File No. 3040-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.E. (Chem.), Sask. '44, former P.Eng (Ont.) and M.C.I.C., married, veteran, with experience in process development, desires position in that field. Engaged in post-graduate study at Mass. Inst. of Technology, leading to degree of S.M. (Chemical Engineering Practise). Available February, 1949. Apply to File No. 3041-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng. (Quebec). 15 years of shop practice in maintenance and locomotive repair; 5 years machinery design, including welded vessels, process piping and pulp mill layout. Seeking responsible position, preferably in Montreal area. Available on short notice. Apply to File No. 3045-W.

SENIOR METALLURGIST, M.E.I.C., graduate, age 36. Fifteen years diversified experience in heavy steel mills, production, research and quality control. Practical experience of departmental management. Desires supervisory position of responsibility, preferably with progressive firm; married, two children. Apply to File No. 3046-W.

PART TIME WORK: Graduate Chemical Engineer, B.Sc. (Chem. Eng.), Jr.E.I.C., M.C.I.C. Now doing graduate work in Montreal. In Royal Canadian Engineers since graduation with experience in legal investigations, stores and works. Desirous of obtaining part time work conducting Technical literary research or other technical work within limitations. Suggest could be useful to small out of town firm desiring advantages of Montreal libraries and Montreal representative. Apply to File No. 3049-W.

GRADUATE ELECTRICAL ENGINEER, M.E.I.C., P.Eng., Alberta, B.Sc. (Honors), Alberta, M.A.Sc., at Toronto. Married, age 25, 3 years experience in electric power utilization, some generation and distribution; 2 years as officer in electrical branch, R.C.N.V.R. supervision of electrical installations by civilian electricians. Particularly interested in permanent position in Western Canada. Available on one month notice. Apply to File No. 3050-W.

SALES ENGINEER, M.E.I.C., P.Eng., N.S. and P.Q., B.Sc. Married, age 44, 7 years railway construction, 8 years sales manager large gas and electric utility, 5 years R.C.N.V.R., 5 years naval architect. Desirous of moving to South America, wishes position as sales representative preferably with manufacturer of marine equipment. Apply to File No. 3057-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng.Q., G.I.Mech. E.; A.M.I.Loco. E. (Great Britain). Aged 30. Married. 6 years Locomotive design and Construction, machine shop production and assembly. 5½ years Engineer officer, Royal Air Force—rank Squadron Leader, Chief Technical Officer. Employed 18 month in Province of Quebec. Desires change to position with more responsibility and opportunity for advancement. Preferably Southern Ontario or Western Canada. Apply to File No. 3059-W.

Building Research

Engineers and Architects interested in the application of research to building and associated engineering problems are invited to enquire about employment possibilities with the newly formed Division of Building Research of the National Research Council. An enquiring mind is an essential; experience in building work in Canada is really necessary; bilingualism would be helpful. Salaries depend upon training and experience; opportunities for useful work are unlimited. Enquiries should be addressed to the Director, Division of Building Research, National Research Council, Ottawa.

FOREIGN TRADE REPRESENTATIVE FOR MIDDLE EAST AND FAR EAST FOR ONE OF CANADA'S LARGEST CHEMICAL MANUFACTURERS

•

Should have extensive experience and knowledge in establishing important contacts in overseas markets.

Canadian citizen, preferably 38 years or over, knowledge of French. Should be prepared to live abroad.

Must show ability to have earned at least $8,000. in similar position.

Outstanding opportunity for right man. Apply to File No. 1046-V.

Business & Industrial Briefs

A Digest of Information received by The Editor

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

A specification sheet describing a new gasoline-engine-powered chain saw is now available from McCulloch Motors Corp., 6101 W. Century Blvd., Los Angeles 45. Power of the saw is 5-hp. and blade lengths of 20-, 36-, 48- and 60-inches can be furnished. Applications of the saw are extensive in lumbering, construction, railroad, mining, farming and in other industries where wood cutting and land clearing is important. Ask for chain saw specification sheet.

•

Concrete and Building Specialties Ltd., 42 Leyton Avenue, Toronto, offers descriptive pamphlets on "Sure Grip Form Ties and Spreaders" and "Williams Form Clamps".

•

Leeds and Northrup Company, 4911 Stenton Avenue, Philadelphia 44, Pa., offers a 24-page catalogue No. ND4B (which replaces catalogue N-OOB) dealing with the L & N line of air-actuated controls.

•

The Aluminum Co. of Canada Limited, Sun Life Building, Montreal, Que., has released an interesting publication entitled "Machining Aluminum". The publication contains technical data on the machinability of various aluminium alloys, the coolants and lubricants used, and the tools and techniques required for turning, shaping, milling, drilling and other machining operations. It carries excellent illustrations. Much of the technical material is summarized in tabular form for easy reference.

•

The Farval Corporation, 3249 East Eightieth St., Cleveland 4, Ohio, offers the 1948 edition of a two-colour bulletin, "Studies in Centralized Lubrication".

Copies are available from the Company or through the Canadian representatives, Peacock Brothers Limited, Ville La Salle, Montreal. Ask for Farval Bulletin No. 25.

•

The ILG Electric Ventilating Company of Chicago, Ill., offers a new catalogue on ILG Self-Cooled Motor Propeller Fans. Three types of modern-styled propeller fans are featured in a range of sizes and capacities to handle the requirements of the majority of exhaust fan applications.

•

The International Nickel Co. of Canada Limited, 25 King St., West, Toronto 1, Ontario, offers the following interesting and informative publications: "Salt as a Corrosion Problem", a publication which emphasizes the advantages of nickel alloys in salt applications; "Fuel Into Food", in which is described the use of Monel equipment for producing ammonium sulphate as a by-product of coking coal. The problem of preventing corrosion during the manufacture of ammonium sulphate is also dealt with in this publication. "Nisiloy for Gray Iron Castings" gives specifications and information on this new alloying element which can be added in the ladle to produce machinability in cast iron.

•

The Canadian Ohio Brass Company Limited, Niagara Falls, Ont., offers a brochure on the "O-B Type-KG Permissible Distribution Box".

Acting as a portable "switch panel" for mechanized operations, the O-B Type-KG distribution box is built to handle the power requirements of two branch circuits. Mining men in particular are already familiar with the O-B three-circuit permissible box. The new KG is similar in design and construction. It is designed for 250 and 550 volt d.-c.

•

A new bulletin, "Electronic Controls", containing a listing of standard instrument models manufactured by the Wheelco Instruments Company, 847 W. Harrison Street, Chicago, has recently been released.

Copies of this condensed catalogue illustrating and describing the Company's line of indicators, controllers, recorders and combustion safeguards will be sent in response to letters written on an official letterhead. Ask for Bulletin Z6500.

•

The Hamilton Bridge Co. Limited, Hamilton, Ont., are now manufacturing the Dempster Balester. This line of baling presses is very well known in the United States. A well illustrated and informative pamphlet is available. Ask for Dempster Balester, Brochure No. 7008.

•

A new six-page bulletin fully describing the latest in Ettco-Emrick Tapping and Threading Attachments for drill presses has been released by the Ettco Tool Co. of 594 Johnson Ave., Brooklyn, N.Y.

The bulletin lists seven sizes of attachments made by this Company. Ask for Bulletin No. 22.

•

Bulletin A-550 issued by the Aget-Detroit Company, 329 Main at Washington, Ann Arbor, Mich., contains a description of a large capacity dust collection system for handling rubber, and wood dusts, chips, lint and similar large bulking dusts.

•

South Bend Lathe Works, 425 East Madison Street, South Bend, Indiana has produced a new catalogue No. 400 which is devoted exclusively to the South Bend 14-inch precision drill presses, drill press attachments and accessories.

Bench and floor models of these new drill presses are shown in the catalogue, which also contains illustrations and descriptions of motors, controls, extra spindles and other drill press accessories. Brief specifications and U.S. prices are listed.

•

Bepco Canada Limited, 4018 St. Catherine St. W., Montreal 6, Que., will be pleased to place the name of any "Journal" reader on the mailing list for the "Bepco Journal". This publication is used to describe operation and construction of the equipment, distributed by the Company in Canada. The October 1948 issue is devoted to a description of the "Harland" Drive recently installed by the Powell River Co.

•

The Lincoln Electric Co. of Canada Ltd., 179 Wicksteed Ave., Leaside, Ont., offers the use of a sound-colour motion picture entitled "Designing Machinery for Arc Welding".

The film is in full colour. The running time is fifteen minutes and the print is on 16 mm. sound-color film. Transportation costs must be paid by the user.

•

The Bristol Co. of Canada Ltd., 71 Duchess Street, Toronto 2, has available copies of their catalogue No. 854, which covers Bristol's Hex Socket Screws. The publication is 11″ by 8½″. It has 36 pages, and is printed in two colours.

Appointments and Transfers

W. F. Sinclair has been appointed to the newly-created post of general supervisor of Diesel equipment, Canadian Pacific Railway. Mr. Sinclair will be located in Montreal.

•

L. T. MacNaughton of Imperial Oil Limited is on a special assignment with International Petroleum Company Ltd. He is co-ordinating work on engineering problems. Mr. MacNaughton's former post at ICO Refinery has been filled by Charles Scrymgeour, M.E.I.C., formerly superintendent of the Company's Montreal refinery. E. Keith Lewis, M.E.I.C., is the new superintendent of the Montreal refinery.

•

L. L. W. Ashcroft has been appointed manager of a new C.G.E. office and warehouse in Sudbury. The new building contains 9,000 square feet of floor space and is equipped with the most modern lighting and air conditioning devices. The warehouse has been established to serve North Bay, Sault Ste. Marie and Manitoulin areas.

•

P. S. Young has been appointed United Kingdom trade commissioner for British Columbia and Alberta. He will make his headquarters at Vancouver. Since February 1947, Mr. Young has been stationed in the United Kingdom Trade Commissioner's office in Montreal.

•

W. A. Irvine has been appointed manager of the new Montreal Works of the Canadian General Electric Co.

Geo. W. Ferrier has been appointed Montreal manager of the Bristol Company of Canada Limited. Larry E. Henne, Jr.E.I.C., formerly of Northern Electric Co. Ltd., will serve on Mr. Ferrier's staff.

•

George Wellesly Lawrence has been elected president of the Canadian Electrical Manufacturers Association. Mr. Lawrence is president and general manager of Sangamo Co. Ltd., Toronto, and chairman of the special advisory committee on power conservation for Toronto.

•

G. A. Lowles has joined the Canadian sales engineering staff of the International Nickel Company of Canada Ltd., C. E. Macdonald, manager of Canadian sales announces. A graduate in chemical engineering from McGill University, with a background of 11 years in industrial sales and production, Mr. Lowles will handle sales development in chemical and allied industries.

•

C. M. Lovsted and Co. (Canada) Ltd., 1016 Mainland Street, Vancouver, B.C., has been appointed British Columbia representative of B. J. Coghlin Co. Ltd., Montreal, spring manufacturers. This firm is a wholesale dealer of railway and logging equipment and will be a sales agent for the entire range of Coghlin products.

New Equipment and Development

The C. A. Dunham Co. Ltd., Toronto, Ont., is introducing the "Dunham" Baseboard Convector Radiator unit, suitable for either hot water or steam.

The unit has been designed to replace the ordinary baseboard trim. It has a sheet steel back which provides a frictionless sweep for the air which is heated by a single copper tube with steel fins. The unit is fitted with a steel front panel which serves as a radiant heating member and warms the floor some distance from the wall. The manufacturer claims that this design accomplishes many other desirable features such as "low outlet velocity of heated air which minimizes wall discolouration"—"small difference in air temperatures between floor and ceiling".

Technical data is available on application.

•

Due to the power shortage in Ontario, Ferranti Electric Ltd., Mount Dennis, Toronto 15, has changed the work week to commence on Tuesdays and end on Saturdays. The plant is closed on Sundays and Mondays. Formerly the working week was Monday through Friday. A skeleton staff will be maintained in the office and sales department on Monday to handle emergencies.

•

Albi-R,—which is claimed to be the only fire-retardant coating listed and approved by Underwriters Laboratories—is now being distributed in Canada by Building Products Ltd. Developed in the United States during the war, Albi-R was widely used by the armed forces. It is now employed extensively by many Government departments and by a very wide list of U.S. industries and institutions as well as in the home field.

The manufacturer claims that Albi-R differs considerably from ordinary high-pigment types of non-combustible paints. It is stated that not only is it non-inflammable but its most important feature is that when it is exposed to intense heat or flame a tough thick cellular mat is formed which effectively insulates the protected surface and checks flame spread. In a recent test, two sheets of 24-gauge steel were exposed to an acetylene flame of approximately 1800° F. One sheet was coated with Albi-R and the other was uncoated. "After thirty minutes' exposure the uncoated steel recorded a temperature of over 1300° F. on a thermo-couple placed at the back. The metal coated with Albi-R recorded a temperature of only 383° F."

This product is an interior coating which gives a hard white flat finish. It may be tinted to any colour by adding pigments before applying. It may be overpainted with ordinary oil paints which do not affect its fire-retardant properties.

•

Twin Disc Clutch Co. announces a new hydraulic power transmission unit the Hydro-Sheave Drive.

It is claimed that the Hydro-Sheave Drive is a hydraulic-conversion device for small electric motors and internal combustion engines. The basis of the new unit is a Twin Disc small hydraulic coupling, "long successful in smothering shocks and smoothing flow of power from motors or engines in the ¾ to 25 hp. range." Complete details may be obtained from the Hydraulic Division of the company which is located at Rockford Illinois.

•

Porter Cable Machine Co., 1714 N. Salina Street, Syracuse 8, N.Y., has announced a multi-purpose tool, the D-6 which has been designed for tough jobs in industry. It is claimed that it will grind, polish, drill and cut by a simple change of attachments. It will drill holes in metal up to ¼ in. and wood up to ½ in. The drill chuck has been designed for use with numerous standard attachments. For complete details apply to the manufacturer.

•

Canadian General Electric Co. Ltd., 212 King St. W., Toronto 1, has available "an improved, compact, precision instrument for controlling photographic exposures which require time intervals of 3 seconds to 60 minutes".

•

Production of a new three ton capacity crane, Model H3, has just been announced by the Hydrocrane Division of Bucyrus-Erie Company, 7923 West Greenfield Avenue, Milwaukee 14, Wisconsin. The new unit is designed for the economical handling of small jobs on which the use of a conventional crane-excavator would be uneconomical.

•

The Northern Electric Company Ltd., has now occupied the new Company building on Guy and Dorchester Streets, Montreal. The building is 220 feet by 240 feet, two storeys high and has provision for an additional storey. It will be used exclusively for warehousing purposes.

•

Cooper-Bessemer Corporation, Mount Vernon, Ohio, has announced the adaption of Cooper-Bessemer's Turboflow development to the four-cycle gas engine, with improvements, it is claimed, "that produce 14 per cent more power while cutting fuel cost by at least 20 per cent."

The development is described by the Company's engineers, to be one of the most significant in the gas engine field in 20 years. First announcement of this development was made by Cooper-Bessemer a year ago in connection with the two-cycle natural gas engine. This is the first time that the principle has been successfully applied to the widely used four cycle engine. "The newest Turboflow is expected to be on the Cooper-Bessemer production line by July 1, of 1949," said Gordon Lefebvre, president and general manager of the Company.

•

The Canadian Liquid Air Company has stated that exceptionally enthusiastic field reports are being received on their new C-48 electrode. This mild steel electrode, which is manufactured in the Company's Montreal plant, incorporates a number of major improvements that have met with the approval of the practical welders.

The manufacturer claims the following advantages for the new C-48. "Smoother welds, particularly in vertical downhand position. Great reduction in spatter. Residual slag removes itself. The new flux coating is extremely tenacious and gives greater penetration."

Independent Pneumatic Tool Co., Aurora, Ill., announces a new Wagon Drill, Model BW-1, equipped with the new Thor Model 15, 1¼" Drifter Rock Drill.

A feature of the new drill is a single reversible pneumatic motor that feeds and raises the drill, thus eliminating the necessity of a hoist. Complete details are available from the manufacturer.

The Canadian Standards Association has announced that the following organizations have taken sustaining memberships: Coleman Lamp & Stove Co., Underwood, The Bank of Toronto, Remington Rand Ltd. Gypsum Lime and Alabastine, Hinde & Dauch Paper Co., Rowe Packaging, Wilson & Cousins, Hamilton Gear & Machine Co. Ltd., Babcock-Wilcox & Goldie-McCulloch Ltd., Turnbull Elevator, Lincoln Electric, National Cash Register, Thor-Canadian Company and National Iron Corporation.

Membership in the Association is open to any company, commercial association, public utility or individual wishing to benefit from the advantages of standardization and uniformity of processes, procedure and engineering.

The Ogilvie Press, 691 Fulton Street, Brooklyn 17, N.Y., has available samples of "Bondtex", a special paper made for tracing. A feature of this paper is that it is ruled in one quarter inch squares which, although clearly discernible to the initial user, will not show on the print made from the sketch. Limited quantities of this paper are available for trial purposes.

The Consolidated Mining and Smelting Company of Canada, in a release issued on October 16th, stated that the Campbell shear had been intersected in the east drive on the 2300 foot level of their Con Mine at Yellowknife, N.W.T.

A joint agreement between Frederic Flader Inc., North Tonawanda, N.Y., and Clark Bros. Co. Inc., Olean, N.Y., has been effected whereby Clark Bros Co. Inc., will manufacture and distribute gas turbines and axial compressors of the Flader design for general industrial use. The agreement contemplates that Flader will be responsible for research, engineering and design and that Clark Bros. Co. Inc., will manufacture and market these products. It is claimed that the Flader axial flow compressor is based on a new principle of design and Clark expects to develop a wide market for application in the mining, petroleum and chemical fields which the company presently serves.

Robertson-Irwin Limited is the registered name of a company which has been formed as the result of the amalgamation of H. H. Robertson Co. Ltd. and Thomas Irwin & Son Ltd. Associated for many years, the two companies will continue under the new name to serve the construction industry and the industrial steel products field. T. A. Irwin, is president and general manager of the company. A. S. Hallamore is comptroller. W. G. Enouy, M.E.I.C., is sales manager of the Robertson division and J. H. Thomson, sales manager of the Irwin division. Head office of the new Company is located in Hamilton and district sales offices will be maintained in Toronto, Montreal and Hamilton.

The nutritional aspects of glyceridic and edible oils, and the large part they are playing in the national economy, was examined at the fall convention of the American Oil Chemists' Society which was held in New York City, November 15th to 18th.

Johnson and Phillips Ltd., Charlton, London, England, has announced the manufacture of an aluminum sheathed electrical transmission cable. Although it has not yet been possible to extrude aluminum continuously, directly around the cable, as is done with lead, this handicap has been overcome by threading the insulated cable into long lengths of extruded sheathing and joining the sheathing to provide "endless" cable in standard lengths. The aluminum, it is claimed, "provides a weight saving of 26-60% in unarmoured cable and 25-30% in steel armoured cable."

The Hamilton Bridge Co. Ltd., Hamilton, Ont., has just completed a new addition to their machine shop. The extension is 100' x 120' and additional equipment is being installed to permit a wider range of machine shop work. In addition to the manufacture of some new lines of machinery the new plant will enable the company to undertake an increased volume of contract machine work.

The Special Products Section of the Canadian General Electric Co. Ltd. has announced the introduction of a new recording vibrometer. It measures and records frequency, displacement and wave shape of mechanical vibration.

This new equipment is built to operate either when mounted on a fixed base or held in the hands. It weighs 7 lbs. and is less than 8 inches in length. It records both steady-state and transient vibrations. It was developed for application in testing all types of reciprocating and rotating machinery within a vibration frequency range of 10 to 120 cycles per second.

On September 14, the Canadian Westinghouse Company opened a branch in Calgary, Alberta. The opening ceremonies were performed in the presence of invited guests of the Company and representatives of the electrical industry. They were welcomed by H. J. McEwen, M.E.I.C., Alberta district manager; S. W. Brown, service department manager from the head office of the Company; and L. Schofield, the district engineer.

The building will house sales departments, engineering and service offices. It is fully equipped for repair work and the main warehouse covers 10,000 square feet of floor space. It is located at 940 Eighth Avenue West. Construction is of brick and steel with aluminum trim.

Three new voltage stabilizer units have been added to Canadian General Electric's standard automatic voltage stabilizer line. The new units are 115-volt, 60-cycle designs in 15-, 25- and 50- va ratings. Low case height and small size make them particularly suitable for shallow depth installations. Detailed information is contained in bulletin CEA-3634 which may be obtained on application to the Specialty Transformer Section of Canadian General Electric Co., 212 King Street West, Toronto.

In a summary of the activities of Canadian Car and Foundry Company, published in the Company's house magazine, the Canadian Car Journal, it is stated that the Company's plants are working to capacity.

Despite the steel shortages, it is stated, good progress is being made on the Canadian National and Canadian Pacific car orders and that, contingent upon the material situation, work can soon commence for railway equipment for the South African Railways. It is estimated that this order and those of the Canadian railways will keep the plants of the company occupied well into 1950.

The Company is shifting the manufacture of street cars from the Montreal area to the Fort William plant. This change has been made to facilitate the production of railway cars in Montreal.

The cumulative shipments of manufactured goods by the Company at the end of the third quarter of 1948 were over twice as large as shipments for the corresponding period in 1947.

A new small sized unit for high production earthmoving on small projects has been added to the line of earthmoving equipment manufactured by R. G. LeTourneau, Inc., Peoria, Illinois. This new unit is known as the "Model D Roadster Tournapull".

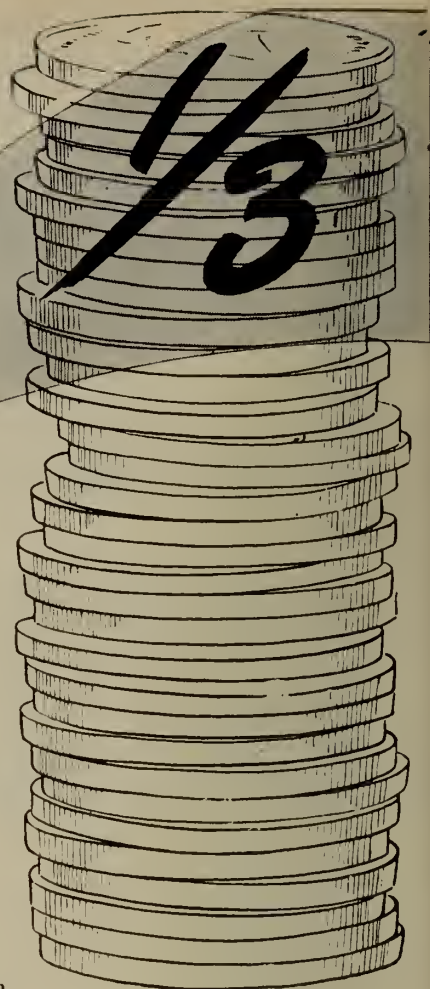
Heat Comfort with Economy!



With Dunham Differential Heating there is no premium paid for achieving the ultimate in heat comfort. Evidence of definite savings in fuel dollars, amounting to more than 30% after modernization of old installations, is on record and will be furnished upon request.

Once installed, this system operates with a minimum of attention and maintenance.

Dunham Differential Heating provides maximum heat comfort with the utmost economy. The supply of steam is continuous and in the proper amounts to meet changing demands. Thus, the discomfort and waste caused by "on and off", cycling or pulsating heat supply are avoided.

Dunham engineers will collaborate on installation of Dunham Differential Heating in new buildings and make recommendations for modernization of present systems. C. A. Dunham Co. Ltd., 1523 Davenport Rd., Toronto 4, Ontario. Sales Offices in Halifax, Quebec City, Montreal, Sherbrooke, Ottawa, Toronto, Hamilton, Winnipeg, Calgary and Vancouver.

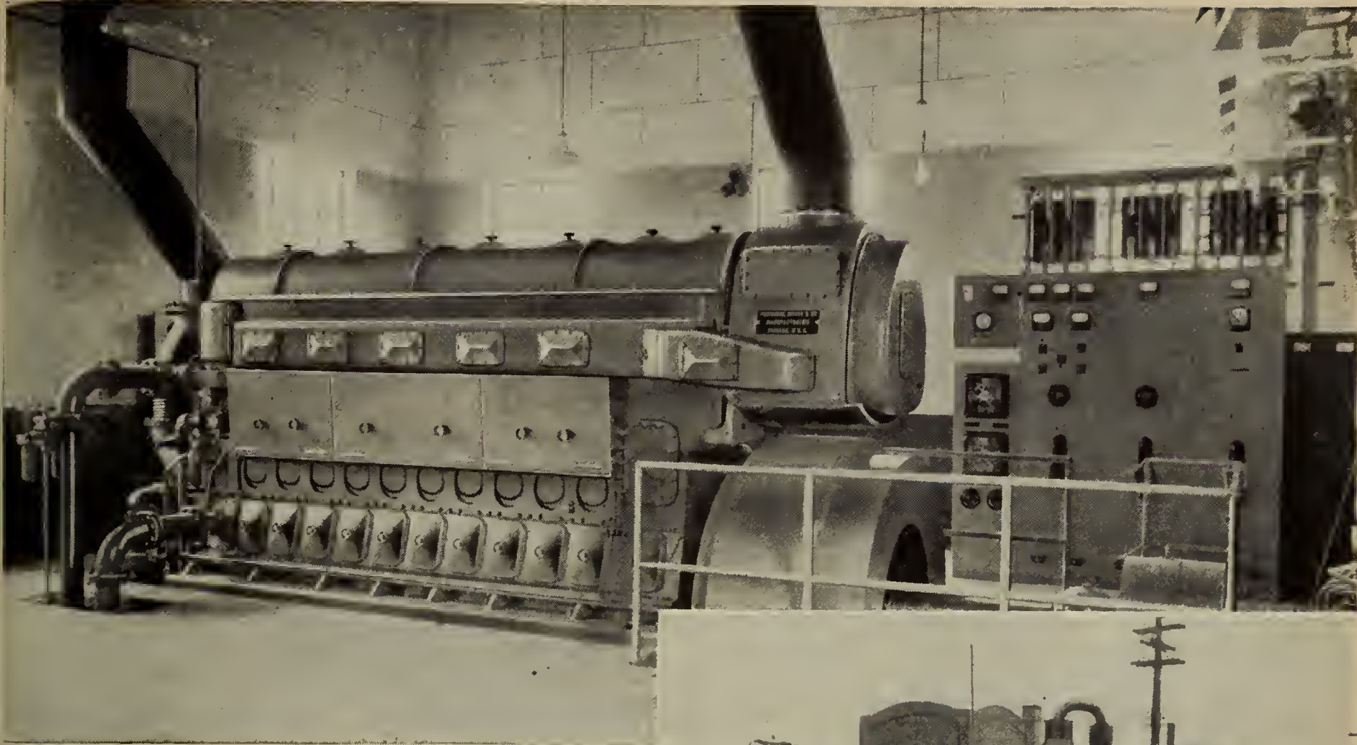
THE PRIME FUNCTION OF HEAT IN A BUILDING IS TO PROVIDE COMFORT



FAIRBANKS-MORSE DIESELS power TOWN OF CAMPBELLTON

Faced with a serious power shortage, the Town of Campbellton, N.B., turned to Fairbanks-Morse for a permanent solution to their power problem. F-M Engineers surveyed the situation and installed the world-famous "Model 38" Opposed-Piston Diesel with a rated horsepower of 1600 and a direct connected alternator with a rated capacity of 1136 kilowatts.*

"Model 38" — in addition to its importance in the field of municipal power and pumping service — is one of the most popular engines used in modern streamlined Diesel locomotives.

In the Fairbanks-Morse Opposed-Piston Diesel, each cylinder contains not just one — but two pistons. The two pistons are driven apart by a central explosion. No power is dissipated against cylinder heads. This basically different design is the primary reason for the light weight per horsepower.

**This unit went into operation in May 1948. Another unit a 360 H.P. Type "V" was installed in 1946 and is still in service.*

DRAWING PENCILS AND LEADS

Strength and lightness of construction, besides its telescopic design and hydraulic operation, combine to make its all-welded boom an important factor in the Gradall's high performance. Three reinforcing tubular members provide added rigidity for heavy duty work.

Mounted on a heavy duty truck chassis, Gradall can be driven from job to job at normal highway speed, and in travelling position easily negotiates city traffic, bridges, country lanes, or driveways.

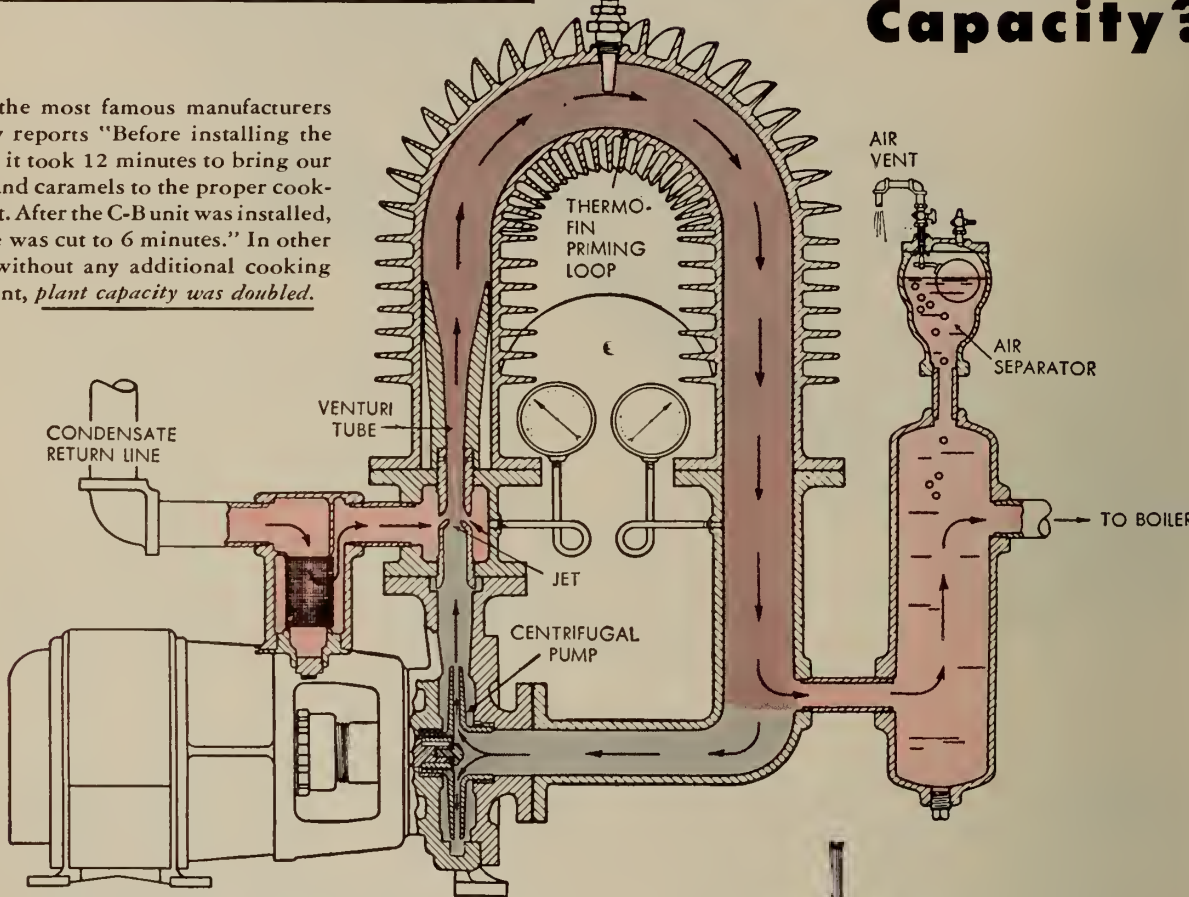
How Can This Simple Pump Double a Plant's Capacity?

One of the most famous manufacturers of candy reports "Before installing the C-B unit it took 12 minutes to bring our creams and caramels to the proper cooking point. After the C-B unit was installed, this time was cut to 6 minutes." In other words, without any additional cooking equipment, *plant capacity was doubled.*



COCHRANE
C-B SYSTEM

The most remarkable results in the field of process cooking, drying, heating, etc. are being obtained by this new method of utilizing or saving the heat units contained in the condensate draining from the process equipment, and returning every Btu possible back to the boiler. The C-B System, a "closed" system based on the aspirator or injector principle, has been proven in over 400 installations in the past 7 years. Results are almost unbelievable. Write for Bulletin No. 3250.

This is the heart of the Cochrane C-B System. The motor, jet pump, priming loop and air relief and safety valve.

NOVEMBER 1948

On your jobs...in your plant

WE WILL PROVE THIS-

Under today's conditions there are many production and maintenance operations on which Ingersoll-Rand Air Power equipment saves enough to pay for itself *in a matter of days.*

Air-Driven Impact Wrench on an automobile production job

PAID FOR ITSELF—IN 10 DAYS

Air-Buck Riveter on clutch & brake band fabricating job

PAID FOR ITSELF—IN 15 DAYS

Air-Powered Screwdriver on meter assembly job

SAVED $20,800 IN FIRST YEAR

At no cost to you, C-I-R field engineers will make a job study with actual Air Tool performance tests on your own operations in your own plant. You can use the equipment yourself, try it in any way you like, keep your own time and cost records. Then you will know how much it can save you and how soon it will pay for itself on your jobs. To have this job study made in your plant, call your C-I-R branch office now.

Similar studies in many plants have proven this important fact; Ingersoll-Rand Air Power equipment which, a few years ago, saved enough to pay for itself in 30 days, now pays for itself in only 18 days on the same operations under today's conditions.

These examples show the time in which typical I-R AIR POWER EQUIPMENT paid for itself in actual use on production and maintenance jobs because AIR TOOLS enable the workman to do more with less effort.

1936 First! Dominion Introduces Royal Cord Hose with Exclusive Winder Process!

1946 Dominion Presents Complete Line M.L.P. Hose!

1949 Now! Dominion Presents

P.L.P. HOSE

POLED LEAD PRESS

Canada's Most Spectacular Advance in Decades of Hose Making!

Dominion rings up another great "first" — the sensational, new Dominion P.L.P. Hose with distinctive brown, live, resilient cover! It's the greatest advance in hose development ever offered to Canadian industry!

The whole Dominion P.L.P. Hose family is radically new in design, outstanding in performance. You can *see* the difference . . . you can *feel* the difference . . . from streamlined, brown cover to super-smooth tube!

Engineered to give the most desirable features of both pole made and lead press hose, Dominion P.L.P. Hose is compact, rugged, built to close O.D. and I.D. tolerances — *and 30% to 50% lighter than conventional hose recommended for equivalent service!* Its exclusive new cover provides exceptional flexibility, superior resiliency and durability resulting in wearing qualities never before possible. Improved cushion-cord carcass, produced by Dominion's exclusive "winder" process, combined with inseparably bonded tube and cover, gives P.L.P. Hose unparalleled strength.

Dominion P.L.P. Hose has proved its superiority in exhaustive field tests. This premium product offers advantages unobtainable in any other hose on the market!

MORE CARE HERE

These are the steps taken to build into windings and insulation of English Electric Motors the utmost possible protection against moisture and abrasion.

1. There is a coating of polyvar insulating material on the wire itself.
2. Ends of coils are held and protected by tape which absorbs the insulating varnish.
3. Phase insulation is provided, consisting of two layers of heavy varnished cloth.
4. Slot cells of pressed paper and varnished cloth extending well beyond stator iron insulate coils from the stator.
5. A "middle stick" separates coils in the slot.
6. A channel-shaped "wedge" of hard insulating material closes the top of the slot cell, completely shutting out foreign matter and holding the wires rigidly in place.
7. The completely wound stator is given several dips and bakes in special insulating varnish.

LONGER SERVICE HERE

Because "the life of the insulation is the life of the motor," such extra precautions to ensure long life of insulation pay dividends in longer useful life of English Electric Motors. In addition to the steps enumerated above, other precautions are taken where motors are required to work under unusually moist or difficult conditions.

English Electric Motors of every type are available for all conditions of service. See the nearest English Electric representative.

COVER PICTURE

Canada's pulp and paper industry is of vital importance to her economy. This fact was never more evident than under present conditions when the supply of American dollars is a governing factor in the standard of living of every Canadian citizen.

The cover picture was chosen because it effectively illustrates one of the reasons why the Industry has been able to attain its present proportions. Engineers have made great progress in the mechanization of woods operations and this phase of the industry is under particular scrutiny at the moment.

It is to be one of the subjects for discussion at the Institute's 1949 annual meeting in Quebec City.

OFFICE OF THE PRESIDENT

VANCOUVER, B.C.

I wish all the members of the Institute, their wives, families and associates a pleasant and prosperous New Year. One of the most enjoyable of all the duties pertaining to the presidency is the opportunity of visiting the Branches, of renewing old friendships and making new ones, of observing at first hand the useful contributions made by the Engineers in their respective communities. My wife and I have been guests of twenty of the Branches and are most grateful for the warm reception and bounteous hospitality that we received all along the line. We look forward to visits with the other Branches on our way to the annual meeting in Quebec, where we hope to meet again a goodly number of our many friends from Sydney to Victoria.

J. N. Finlayson.

Institute for Unsteady Fluid Motion

This Institute was responsible for basic work on flutter and vibration. Little flight testing was engaged in but when this was carried out, the conventional practice of employing unbalanced rotating weights, located at various points on the aircraft, was employed for investigating the vibration characteristics of the structure. Much theoretical work had been done, but as yet no solution had been found for calculating the critical flutter speed within a reasonable margin. For complex problems, where the validity of the necessary assumptions was doubtful, it was preferred to employ flutter models made of " Vinidur " plastic, which reproduces the characteristics of aircraft structural materials and is easily fabricated, being thermoplastic.

During the war, many troubles were experienced with oscillations of the control surface spring tabs. Considerable study had been devoted to this problem, but it was considered that the best solution was to eliminate such tabs. The flutter of wings with large sweepback presents new problems, and a good deal of theoretical work had recently been concerned with this. The major problem in present times was the calculation of aerodynamic flutter derivatives applicable to flight at subsonic and sonic speeds. It was stated that all of the German aircraft firms maintained flutter departments, which kept vibration difficulties on prototypes of new designs to a minimum.

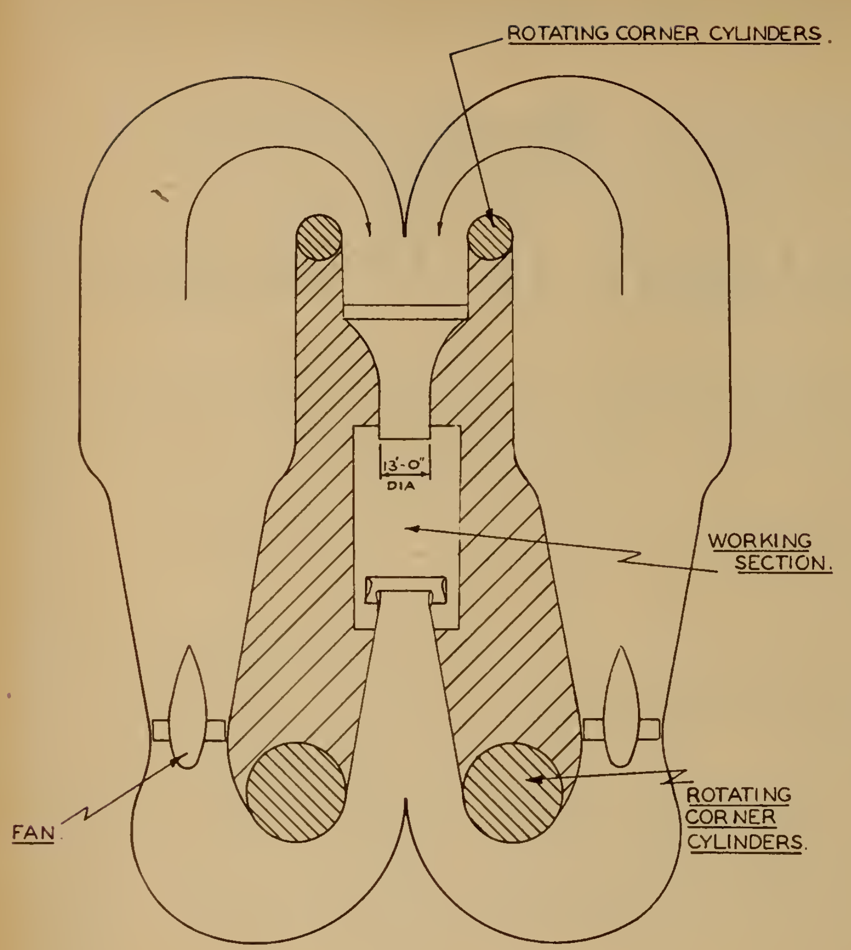
Most of the experimental work of this Institute was carried out in water tunnels, which permitted the use of a wide range of Reynolds numbers, combined with the ability to vary the inertia and elastic constants over large ranges as well. Three water tunnels were available; a small horizontal tunnel 8 in. by 16 in., a vertical tunnel identical with the horizontal one, and a large horizontal tunnel, 5 ft. by 4 ft. The primary purpose of these tunnels was to render the flow characteristics visible, which was accomplished by the injection

EDITOR'S NOTE

Late in 1945 a group of Canadian scientists and engineers visited Germany to investigate scientific and technological achievements of our former enemies. The authors of this paper, at that time on the staff of the National Research Council, were assigned to the field of aeronautics.

The report submitted by these scientists was long and comprehensive, but, in spite of heavy demands on their time, they have prepared a condensation specially for the JOURNAL. Even in this condensed form the report is of necessity being published in four instalments. When all four parts have been published it is hoped a consolidated reprint will be available for those interested in preserving the report in its entirety.

In this third instalment the description of the Gottingen Aerodynamic Research Establishment is concluded. Sections covered include Institutes for Unsteady Fluid Motion, Low Temperature Research, Meteorology, Wings, Propellers, Wind Screens, Instruments, Jet Engines, Supercooling, Regenerative Heat Exchangers and Coal Utilization for Gas Turbines. The Kaiser Wilhelm Institute for Flow Mechanics is also described.



LARGE REFRIGERATED HIGH ALTITUDE TUNNEL.

FIG. 29

of aniline dyes, air bubbles, or aluminum filings. One and three-component balances of the hydraulic capsule type were used for force measurements.

In addition to a very extensive flutter investigation, studies have been made on flow and pressure distribution associated with oscillating aerofoils and aerofoils with oscillating flaps. Other work included a study of the flow in wing and fuselage radiator ducts; boundary layer transition and separation over aerofoils, including the effects of boundary layer suction; the effects of airscrew slipstream on flow over wings and nacelles; and an investigation of vortices from wing tips and airscrews. The impression was gained that flow studies were carried out in the water tunnels as a preliminary to wind tunnel tests, the results serving as a guide for the design of the larger and more expensive wind tunnel models.

Institute for Low Temperature Research

Aircraft De-icing Research

The A.V.A. was the sole establishment responsible for research on aircraft icing in Germany and this had engaged their attention during the past ten years. In addition to the laboratory facilities and icing tunnels provided at Göttingen, flight tests of de-icing equipment under natural icing conditions over the Alps were carried out from Munich Airport, in conjunction with the Luftwaffe. Meteorological flights were made from Prague and there was a cold weather experimental ground station in Norway where simulated icing tests of propellers were undertaken. The A.V.A. was also responsible for the design of de-icing installations on new aircraft and prototype flight testing.

Most of the fundamental icing research had been carried out initially in a small icing tunnel, subsequent confirmation of the final results being obtained in flight. This tunnel was of simple design, of the NPL type, comprising an open return tunnel enclosed in an insulated chamber. The closed working section was 40 in. by 16 in. and speeds of 230 ft. per sec. were obtained with an 80 kw. electric drive. Effective cooling of the airstream was obtained by means of a calcium chloride spray, cooled by an ammonia refrigeration system to give a minimum tunnel temperature of —30°C. The chemical spray had the disadvantage of causing serious corrosion, necessitating careful protective treatment of the tunnel parts. Ice was formed by the injection of a water spray from heated pneumatic nozzles (Fig. 33).

A magnificent, large, refrigerated and pressurized tunnel was under construction, for high altitude tests of jet and rocket motors, as well as for icing tests. The open working section was 10 ft. by 6½ ft. and a speed of 425 ft. per sec. was obtainable, using four fans having a total driving power of 1640 kw. The layout of this tunnel is shown in Fig. 29, and it will be seen to include many novel aerodynamic features. Perhaps the most interesting feature was the absence of turning vanes. These were replaced by rotating cylinders at each of the four corners, which prevented separation of the boundary layer from the inner walls and thereby enabled the air to turn the corners with practically no aerodynamic losses. In addition to overcoming the icing problem associated with turning vanes, this scheme also permitted the use of a very short diffuser length, giving a compact tunnel, thereby reducing refrigeration requirements. The refrigeration comprised a 4-stage ammonia system with a driving power of 2150 kw. giving a minimum tunnel temperature of – 55°C. The tunnel could be evacuated to 0.1 atmospheres pressure by means of three 4-stage centrifugal compressors, which would also exhaust the products of combustion from jet engines which were to be tested here.

The concrete walls of this tunnel were 5 feet thick and were covered with cork insulation 12 inches thick. Unfortunately as the tunnel was nearing completion in 1942, a spark from a welding torch ignited the cork insulation and the entire tunnel section was damaged beyond repair.

Meteorology

Three fundamental types of ice were recognized as follows: Glaze ice, occurring at temperatures near 0°C. with free water contents up to 4 grams per cubic metre and droplet sizes up to 50 microns; Rime ice, occurring at temperatures below − 8°C. with free water contents up to 2 grams per cubic meter and droplet sizes up to 16 microns; and an intermediate type called "doubleheaded" or "hammerhead". An interesting point was that the maximum free water content had never been observed to exceed the saturation water vapour content of the air at any given temperature. Droplet sizes and water content were measured by using a multicylinder method to collect ice samples or alternatively by measuring the amount of power required to maintain a given dry surface temperature on an electrically heated cylinder.

Wings

The air heating system for wing de-icing was originally developed here in 1938, and was subsequently fitted as standard equipment on most German military aircraft. Considerable operational experience had been gained and it was considered that this system was entirely satisfactory. Originally, hot air was supplied from heat exchangers on the engine exhaust system, but owing to weight and corrosion difficulties this had been replaced by the use of exhaust gases diluted with 90 per cent air. This gave a resultant mixture temperature of 120°C., which was circulated through the wing heating system with no apparent adverse effects on the structure. For the heating of empennage and other parts remote from the engines, a ram-operated combustion heater was developed.

In the original installations, the hot air duct was applied externally to the wing leading edge, the heating gases being discharged tangentially into the boundary layer aft of the heated area (Fig. 30). With this configuration it was necessary to separate the heating air into two parts, owing to the differing discharge pressures on the top and bottom wing surfaces.

An alternative scheme is also shown in Fig. 30 where the air is discharged only on the top surface of the wing. No serious adverse performance effects from the discharge of air into the boundary layer had been observed. The foregoing schemes were used where existing wing structures were modified, whereas, if considered in the design stage, it was possible to employ internal heating systems (Fig. 31). Where feasible, the air after passage through the leading edge double skin was dumped into the afterbody of the wing and escaped at the aileron or flap openings. Where the presence of fuel tanks in the wing or wing structure precludes this method, the second scheme shown could be employed where the air is discharged into the boundary layer on the upper surface of the wing.

For fighter aircraft, where air heating systems could not be fitted for structural and space reasons, an interesting electrical ice-shedding system had been developed. This consisted of a wire type heater element imbedded in plastic or rubber layers, cemented to the leading edge of the wing, the necessary power being supplied from an unregulated standard engine-driven generator at 50 volts d-c. A heat concentration of 6.5 watts per square inch was applied continuously to a "parting" strip of 0.8 in. width, located on the stagnation line, while a power input of 2.6 watts per square inch was intermittently applied for 30 seconds in every 3 minutes to the "shedding" strips, which extended aft to about 15 per cent chord on both surfaces as illustrated in Fig. 32. The cyclic application of power to the shedding area melted a thin layer of ice at the interface and permitted removal of the ice cap by the aerodynamic forces.

Considerable work on de-icing pastes and lacquers had been carried out in the early days, over 200 compounds being tested. It was concluded that this method could not afford adequate protection for aircraft, due to the removal of the

FIG. 32

active ingredients by flight through rain or cloud. A glycol paste, however, had been developed for use on the V-1 buzz bombs where it was difficult to provide any other means of protection. Tests of a glycol distribution system similar to the British TKS system had been made, but the quantities of fluid required were found to be prohibitive, while the pneumatic wing overshoes, developed by Goodrich, were considered to be only partially satisfactory.

Propellers

Considerable work had been done originally in an attempt to develop the alcohol distribution system for propellers with wooden blades, using submerged distribution tubes. However, the Germans had learned of the development by the National Research Council in Canada of the electro-thermal method of propeller de-icing and had decided to use this method exclusively at the cessation of hostilities. For this purpose they developed a wire mesh type of heater element protected by a thin metal sheath, which was riveted to the leading edge of the propeller blade. They had attempted to use conducting rubber as at N.R.C. but without success. Here, heat was applied cyclically to the entire area, a power concentration of 9 watts per sq. in. being used on the leading edge and 4 watts per sq. in. on the remainder, extending aft to 25 per cent chord. The cycles employed were 20 seconds every 2 minutes to the leading edge and one minute every six minutes to the after portions. Power was supplied from the regular aircraft supply through slip rings, and although a hub generator scheme had been designed, it was not placed in production owing to manufacturing difficulties.

Windscreens

Electrically heated windscreens were fitted as standard on most military aircraft, where it was required both for internal mist prevention and for external ice prevention. The heater element consisted of extremely fine wires, 0.002 in. in diameter spaced at 0.02 in. intervals, imbedded in the plastic interlayer, giving a power input of 6.5 watts per square in.

Instruments

The standard pitot head was provided with the conventional electric heating system consuming 150 watts. A special "ice-resistant" unheated type of pitot head was developed for use on the V-1 (Fig. 34), the total head tube facing rearward into a forward-facing cup, designed so as to delay blockage by ice.

No automatic ice detectors were used for warning the pilot, the de-icing equipment being switched on by the pilot whenever the outside air temperature fell to 0°C. Several interesting methods of ice detection had been tried at A.V.A., including one in which the variation in the frequency of vibraton of a membrane was employed, and another in which a beam of light is progressively extinguished as the ice thickens, thereby actuating a photronic cell.

Jet Engines

Tentative designs had been prepared for the heating of the jet engine surfaces by hot air and electrical means, but these were very complex and had not been developed owing to the mechanical and production difficulties. The most promising method under development appeared to be the use of an electrically heated grid, the grid having a conical shape (Fig. 35), so that a certain amount of the ice formation might be blown off by the airstream under severe conditions.

As a temporary expedient, an unheated cup type ice guard (Fig. 36), similar to that fitted to reciprocating engine air intakes, had been developed whereby the forward-facing screens become blocked under icing conditions, so that air is taken in through an alternative shielded air intake providing water separation by centrifugal action.

Supercooling of Water

Some interesting experiments on the supercooling of water have been carried out in which it had been found possible to lower the temperature to − 70°C before spon-

taneous freezing occurred. This was accomplished by subjecting the water to successive melting and refreezing, accompanied by continuous agitation. It was found that the spontaneous freezing temperature dropped by steps rather than by uniform progression. This was explained on the basis of the pulverizing of the precipitation nuclei after several freezings.

Another interesting fact was that even with ordinary tap water, it was found that after supercooling, freezing could only be initiated by the introduction of an ice crystal, all other crystals and particles, including quartz which has a similar crystalline structure to ice, failing to initiate freezing.

Regenerative Heat Exchanger For Gas Turbines

Arising out of the work of this laboratory on aircraft de-icing, the problem of heat exchangers for improving the efficiency of gas turbines by recovering heat from the exhaust gases was considered. It was concluded that a counter-flow type of exchanger would be best. A revolutionary innovation in heat exchangers was developed, whereby the heat transfer material is alternately exposed to the heating gases and the cooling gases. In the axial flow version, the heat exchanger consists of a series of ceramic honeycomb segments mounted on the disc of a large rotor, one half of which is exposed to hot gas flow in one direction, while the other half is exposed to cold gas flow in the opposite direction (Fig. 37). A unique method of fabricating the ceramic honeycomb was employed, in which cores of a plastic material were used during formation, being subsequently burned out, leaving tubular passages for the gases. As an alternative, the ceramic may be extruded in the desired form.

A radial flow type (Fig. 38), was also developed, which employed a series of meshes built up from stranded quartz fibre. This type usually involved radial flow as opposed to the axial flow required with the parallel flow type.

With either of these heat exchangers a heat transfer effectiveness of 95 per cent was claimed, giving an extremely low weight of 0.33 lb. per hp. As an example of the improvements in efficiency to be expected with the regenerative heat exchanger on a gas turbine engine, a comparison was made on the Messerschmitt Me264 long range aircraft. For the same range of 11,200 miles at a cruising-speed of 620 miles per hour, at an altitude of 32,800 feet, and carrying the same useful load of 11,000 lbs., the following table illustrates the great saving in fuel weight and aircraft weight to be effected.

Engine Type	Fuel Weight	Gross Weight
Piston . . .	51,500 lbs.	101,000 lbs.
Turbine . .	20,100 lbs.	56,500 lbs.

(with regenerative heat exchanger)

Coal Utilization for Gas Turbines

Considerable research was directed toward the possibility of utilizing the plentiful supplies of coal available in Germany to overcome the shortage of petroleum required for operating gas turbines, both in the air and on the ground. The first attempts were directed toward mixing approximately one third of powdered coal into fuel oil and injecting it into the combustion chamber as usual, but further efforts were directed to the use of 100 per cent coal.

A method of producing blocks of compressed coal powder and subsequently degassing the powder gave satisfactory combustion characteristics, the removal of the gas eliminating the swelling which usually occurs with such compressed coal, and which would seriously interfere with airflow over the plates. An engine utilizing plates of compressed coal was developed for the V-1 bomb, but was not used in service. The plates employed were about 2 in. wide by ½ in. thick, and were arranged edge-on to the airflow. This compressed coal could be employed for gas turbines by utilizing a gas producer in which the coal was burned to produce the necessary combustible gas.

Another method of utilizing coal

for gas turbines employed a special pneumatic nozzle for pulverizing the coal. The lumps of coal were injected into a vertical air jet supplied with air under 4 atmospheres pressure, which then passed through a nozzle having a contraction ratio of 10:1 (Fig. 39). The resulting high accelerations in the jet caused the smaller particles to speed up and the impact of the smaller particles upon the larger ones tended to break up the larger particles.

The jet was arranged vertically as illustrated, so that the particles impinged upon a plate, the larger ones falling to the bottom of the chamber for recirculation, while the smaller, having diameters of 0.008 in. or less, were carried in the air blast to the combusion chamber. The combustion chamber comprised a scroll-type casing with central guide vanes (Fig. 40). The compressed air entered the outside of the casing while the coal dust was injected at the centre where combustion occurred, the products of combustion leaving the chamber at the centre. Owing to the centrifugal action, the coal particles could not leave the chamber, while the lighter ash particles were swept out by the exhaust gases.

In view of the considerably higher thermal efficiences which are possible with gas turbines, it would appear that the possibilities for utilizing low grade coal, which have been opened up by the A.V.A. experiments, might be of extreme value to Canada for transportation and other power applications.

Kaiser Wilhelm Institute for Flow Mechanics

This Laboratory, which is a branch of the privately-endowed Kaiser Wilhelm Institute, is located on the grounds of the A.V.A. at Göttingen. At one time it was a part of the A.V.A. but its official connection with the A.V.A. was severed in 1933. However, there is a very close co-ordination between the K.W.I. and A.V.A., Prandtl, the director of the K.W.I., being one of the governors of the A.V.A. The work of the K.W.I. was entirely basic in character, and included both the hydrodynamic and aerodynamic problems associated with meteorology and oceanography, as well as aircraft and watercraft of all kinds.

One of the most interesting pieces of equipment at the K.W.I. was a cavitation tunnel having a free water jet, 8 in. by 6 in., enclosed in an air chamber, in which the pressure could be reduced. A speed of 165 feet per second was provided by an electric drive of only 50 hp. By reducing the air pressure in the jet, cavitation bubbles could be produced at moderately low water speeds. The tunnel was originally intended for torpedo studies, but was mainly utilized in the study of problems associated with projectiles, bombs and high speed aircraft.

For instance, photographs of the cavitation bubble profiles were used as a guide to the best shape of aircraft fuselages and nacelles to be free of compressibility troubles at high speeds. In this way optimum shapes for given subsonic speeds could be derived. The tunnel was also used to investigate compressibility troubles on existing aircraft, using partial models. For example, on the Messerschmitt 262, which gave considerable trouble near the wing root, the formation of the cavitation bubble indicated the region where the compressibility effects were occurring and the shape of the bubble was used as the basis for a fairing which would eliminate the trouble.

A small supersonic wind tunnel, having a working section 8 in. by 2 in., giving a Mach number of 2, was being used for an investigation of compressible flow over curved walls. It was in this tunnel that Oswatitsch was doing some very interesting work on diffusers for supersonic propulsive ducts, in the course of which he developed a special diffuser having a central conical plug (Fig. 41), which accomplished the compression of the entering air, through a series of

ECONOMIC & ECONOMICAL ASPECTS *of* FARM ELECTRIFICATION

by

F. T. Gale, M.E.I.C.

Superintendent of Rural Electrification, Calgary Power Company, Calgary, Alberta

A paper presented at the Annual General and Professional Meeting of The Engineering Institute of Canada, Banff, Alberta, June 4, 1948

In this paper the author describes the various uses to which electric energy is applied in farming, and the contribution it makes towards better living for the farmer. The need for guidance and education of our farm population as to the benefits of electrification is stressed. The coming of an industrial agricultural revolution is predicted as electrification of farms becomes more widespread. Examples of power services per farm in Alberta are given, as well as methods of assessing charges. The formation of Cooperative Associations for furthering the extension of electric power service to farm areas is discussed.

The two adjectives, " economic " and " economical " have a particular attraction in their application to this phase of farm electrification. An economic consideration is usually thought of as one in which the laws of supply and demand have had free play, and an economical consideration one that is not extravagant. In more general interpretation, the first generally means a cost consideration not too low for self support and the second, one not too high for the farmer—consumer.

It is well to remind ourselves that this problem obviously varies more or less with the density of farms. The cost of line construction per farm is much less in areas where there are four or five farms to the mile, than in those where there are only one or two farms per mile. It varies with the type of farming. It has been proved that on a dairy farm of thirty milking cows, electricity can save one hired man's time and that, along with improved quality given to the milk by refrigeration, could quite easily spell the difference between success and failure. On a large grain farm the uses for energy are not quite so obvious.

Again there is variation in the amount of support which may be provided from other industry. The electrification of the most easily reached fifty per cent of the farms in Alberta would require new capital equal to the capital investment of existing facilities supplying all present domestic, commercial and industrial load. If these farms had an average monthly use of 100 kilowatt hours, they would use less than 4 per cent of the energy generated last year (considering only the systems that would supply the farm load).

This capital figure is somewhere in the neighborhood of forty million dollars. The $40 millions would not mean so much to a system that plans to spend about $20 millions on a frequency conversion in a very small area. (This $40 millions is about 8 per cent of the Ontario Hydro's total capitalization) but you can well imagine the poser it presents to us when it represents 100 per cent of the present capitalization.

There are also variations in the problem due to political considerations. It might be said then, that Ontario's problem is not necessarily that of Manitoba, and naturally this part of the discussion will be intentionally colored by experience here in Alberta. In thumbing through a collection of articles on this subject of Farm Electrification, one finds more than the usual amount of romantic phraseology—most of it stems from the enthusiasm of those of us engaged in the distribution of energy, attempting to justify our economics. We must satisfy the farmer, the investor, the taxpayer, the politician, and ourselves as engineers, that this job of electrifying farms is being planned in a manner that can be justified.

It is not a difficult matter to determine costs, particularly those of farm power-line construction, operation, and amortization. The difficulty lies in apportioning the proper share of these costs, not to productive farm work, but to such indeterminate things as social betterment and indirect effect on urban living. This indirect effect was emphasized in Mr. Palmer's paper (see " Irrigation in Western Canada " by A. E. Palmer, The Eng. Journal Sept. 1948) when he said that one person on an irrigated farm created business to support one and one-half urban persons.

Objectives of Farm Electrification

At the outset we do realize that farming is more than this country's most important industry, more than a primary industry and leading business; it is a way of life. The purpose of electrifying this industry then is also more than to improve and increase farm production. Its other purpose is to free the farm home from household drudgery, and to make rural living more pleasant. If you have carried a smoky lantern with a cracked chimney to do your chores in its half light, or been afraid to turn your back on two of your squabbling offspring because of the fire hazard of an upset oil lamp, or if you have packed water into the house and out again in a bucket on wash-day,—you will know which of these two reasons for farm electrification is of primary importance to the farmer at present.

Farm electrification, like electrification of other industry, starts from improved lighting. In the case of other industry, however, the use of electricity has been developed by economic necessity; in the case of farming the use of electricity is developing first through the convenience and farm-home-comfort stage, in other words, the non-income-producing stage. This results in the demand for service exceeding the willingness and perhaps the ability to pay for it. It results in the thought that installation costs and energy rates are prices paid for luxury or convenience, instead of being mostly elements of farm production costs.

It seems that the struggle has been to get electric service to the farmer *and then* when it is there, teach him how to use the service at a profit to himself and, of course, in doing this establish the necessary works as self-supporting. As an example of this trend of thought, we do not have to exercise our imaginations much to realize the value of a small a-c welder on the present day highly mechanized farm. Welding a broken member of a machine might be a matter of minutes, while if the part had to be disassembled, taken to town for mending and re-assembled, it might mean days lost at a time when hours spell the difference between profit and disastrous loss.

To mix a metaphor slightly—the economic cart is before the horse—the availability of electricity makes a-c welding possible instead of the demand for a-c welding on the farm requiring electric service. The fact that the market has to be almost completely supplied before it can be developed causes nine-tenths of the economic problems of rural electrification. The supplier of electricity to farmers is faced with extremely heavy expenditures for line construction and educational programs without much hope that these expenditures will come near being self-supporting for a few years.

Guidance and Education Needed

In going back over the development of farm electrification, we read that there have been many false starts but no complete stops in the electrification of rural Canada. It is now an accepted fact that the job is to be completed as rapidly as material and labor will permit. There is of necessity then no period which can be taken by the farmers of any particular area to watch their neighbors develop the use of electrical income producing tools, no period such as was taken to accept the tractor as a replacement for horses.

The reasons are two-fold; first, because the construction of lines to the few who usually pioneer advanced ideas is financially out of the question. More than fifty per cent acceptance is necessary to bring the line construction cost per farm within the realm of financial possibility; and second, because though electricity is accepted first for its luxury use and is heavily subsidized to make this possible, that use cannot remain its only one or even its chief use unless farm electrification is to remain under the shadow of perpetual subsidy and eventual failure.

It is the luxury use of things that goes first when savings have to be made. It might be argued here that a farmer is not going to do without his lights and household appliances once he has experienced their use. Unfortunately our record of casualties in the thirties does not bear this out. However, I do not think we need be too pessimistic on this score, because I believe the responsibility for these casualties rests at least partly with the suppliers, in not providing more guidance to the farmer in the field of profitable farm use of electricity.

On the other hand too much emphasis cannot be placed on the need for this guidance—we must not think that once electricity is on a farm, it will be harnessed for work without education. Even now with all agencies working to teach the farmer, and with the farmer in the best financial position he has ever been in, less than one electrified farm in five in all Canada has a water pressure system and inside plumbing. This might seem incredible to people in a building with a tub in every room. This thought advances a further economic consideration; how much can we afford *not* to put substantial funds into an educational programme, and should part of this cost be borne by the tax-payer through the Department of Agriculture and other Government educational agencies?

We subscribe whole-heartedly to the benefits that accrue to the electrified farm. We agree that farm electrification is the concern of all Canadians, not just that of the Utilities and Manufacturers. This is not altogether altruistic or unselfish because suppliers of electricity, be they Governments or Power Companies can, in the long run, be no more prosperous than those they serve. Certainly our prairie economy is very much dependent on the farmer.

However, the farmer is very susceptible to price changes not easily controlled, and an agricultural depression would undoubtedly cause many to give up the use of electricity if their use of it had not progressed beyond the convenience stage. Or if their voices were combined for a lowering of rates, it would cause the tariff to fall below the sustaining level. In both cases, the result would be the same, the wiping out of invested capital.

The construction of hard surfaced roads did not precede the automobile. Yet the development of electrical farm distribution systems does not follow a natural parallel to road development as might be expected. It is necessary to build electrical distribution facilities of a capacity to more than take care of their initial convenience use. They must be constructed with consideration for reasonable future demand, and to give a continuity and reliability of service that modern power equipment requires. It is fairly obvious that at the outset convenience use will not support this kind of line. The removal of the risk element described above, to attract capital and the quick development of the efficient productive use of electrical energy to sustain it, appear to be the answer.

A Coming Agricultural Industrial Revolution

Do you realize that in our lifetime the farm field operations have been improved by mechanization beyond early imagination. Such things as the horse-drawn binder, the old sulky plow, have given way to the self-propelled combine and the one way disk. Labor in grain growing has been reduced from an average of one man-hour per bushel to less than one man-hour for twenty bushels. Surely we can look forward to a similar agricultural industrial revolution made possible by electricity; a similar reduction in the muscle power and increase in efficiency and production. We are on the threshold of this development now, and here in the West helping ourselves over the threshold is an economic problem of some dimension.

The economical uses of electricity in farming operations have been proven beyond dispute. In these days of scarce, costly, and indifferent help, electricity can be the most efficient hired hand. It will prepare feeds, milk cows, cool milk, dry hay, clean barns, heat water for cleaning, provide automatic water under pressure, provide protection against disease through the use of ultra violet light, increase egg production, send more pigs and sheep to market through the use of brooders.

These jobs can be enumerated without end. They are jobs which require initial capital to set them up electrically, but jobs which pay real dividends in the form of increased and improved production. We conclude that rural electrification or the utilization of electricity on farms is more of an agricultural problem than an electrical one, and just as the development of field machinery is producing amazing production results, so will the development of devices to use electricity change the face of farming.

Power Service Per Farm In Alberta

Let us reduce the problem of power supply to farms down to a few figures: In Alberta, the average farm within 15 to 20 miles of a transmission line requires ¾ of a mile of distribution line, a 3 kva. transformer, meter, etc. and a share of switching and step-down substation. The average cost of this share of a distribution system is between $750 and $800 for material, labor, engineering, and very nominal overheads. A group farm distribution system of this kind is 6900-volt, single phase, two wire grounded neutral type, and every known economy of construction is used; 450 feet average span on Class 6, 35 foot butt-treated cedar poles, using high strength No. 4 ACSR, No. 6 and No. 8 Steel, no individual transformer fusing, and co-ordinated arc gaps with small automatic oil circuit reclosers. Pole metering with no-fuz secondary breakers is used.

Lines are designed so that their regulation is not more than 15 per cent with a voltage drop not greater than 10 per cent. (This has so far not exceeded 5 per cent drop). A line supplying 100 farms is designed to operate within these limits when the coincident demand is one kw. per farm. The lines are so designed that their capacities may be progressively increased through the addition of regulators and capacitors, the changing of conductor sizes without changing supports, or the stringing of three phase. Our existing 22000-volt lines are tapped with a 50 kva. substation every six or eight miles, and the 6900 volt distribution system built out on either side to distances up to 25 miles, and branched like a tree to supply the farms. Our systems are planned after similar ones in the United States, with what changes we could make to lighten construction costs and improve operating conditions.

There is no doubt that if these farm lines were built originally to take care of their eventual load 15 years from now, when they can be self supporting, the cost of building them would necessitate rates which would discourage their present acceptance to the point where they could not be built at all. Even now those suppliers of electricity who are supplying areas where there are less than two farms to the mile (ours is less than 1½ per mile) are finding the going a little rough, unless the public treasury can be relied on to smooth things a little. On many systems the percentage of farm to industrial business is very very small, and hence industry can support the farm electrification program. On other systems the industrial centres are served by municipally owned electrical works which are separate from the rural supply, and of course cannot be called upon for subsidy.

To further complicate the matter, a very low rate must be given to the farmer for promotional purposes. The difficulty of encouraging the investor to supply the funds for construction of farm electrical systems is realized when we break down the per farm cost per month to support the $800.00 worth of capital investment. Since investment money has reached the low in returns and is now on the way up, it is fair to assume that 5 per cent would be as low a figure as this work could command and even then, in view of the risk involved would probably require backing of other assets. Investment capital probably would demand a depreciation of around 3 per cent. This makes a capital charge of 8 per cent or $5.33 per month, to which must be added operating costs and cost of energy and taxes. If this rate is to be lowered eventually, then a further charge for return of capital must be levied. The result is a fantastic figure.

In the United States the Federal Government has developed the R.E.A. plan of supplying construction capital to Rural Electrification Co-operative Associations, as an answer to these high capital costs. Money is lent at a very nominal rate of 2 per cent. Interest and capital are repayable in 35 years, except that payments are deferred for the first 5 years of the loan. A mortgage on the works is taken as security.

Co-operative Associations Being Tried

Similarly, here in Alberta where our density of farms is light—our best areas compare with what is left to electrify in the States today—we are now trying the Co-operative Association as an experiment. In 1943 we began a program of electrifying large groups of farms. At that time we asked each farmer for a contribution of $100.00 towards the average $600.00 cost of construction. In the face of roughly 1/3 increase in construction costs we were unable to continue the low promotional rate on which this plan began. Changing the rate to take care of the rise in cost would have made an already precarious situation worse. The casualties in times of agricultural depression would, we think, not only have destroyed the invested capital, but would be a deterrent to the whole plan.

The Co-operative plan in which the farmer owned the system appeared to be a partial answer. Unfortunately there is no source of 2 per cent money in this country. Fortunately, however, the average farmer is in the best financial position he has ever been in, and is able to find the money for construction out of his own earnings. It is encouraging that in some 40 Associations that have been formed he is willing to find it. Some assistance is necessary in a few cases, but in the main the farmer has been willing to assume the obligation. By making the outlay at the start, not only are the capital carrying charges eliminated, but the depreciation reserve necessary is considerably reduced, due to the fact that capital risk is not a factor. It is not difficult to convince the farmer of this advantage, and only in the odd case is it necessary to convince a man that financing a power line which he owns is not much different than financing his automobile, tractor or other piece of farm equipment.

Naturally Co-operatives of this sort must have some directing body. Co-operatives generally come under the jurisdiction of the Provincial Government director of Co-operatives; Electrical Co-ops. also come under the jurisdiction of the Provincial Board of Public Utility Commissioners, just as do other distributors of this service, and the Provincial Power Commission. However, in order to facilitate the construction of the rural systems, and their operation once they have been built, the Power Company has incorporated a subsidiary known as Farm Electric Services Ltd. This company was formed for one purpose—to organize, construct and operate farm systems at cost. It is hoped that the directors of Farm Electric Services will represent the Power Company, the Farmers Co-operatives and a Government appointee.

According to the Provincial Co-operatives Act any 10 farmers may form an Association. Usually an interested few obtain preliminary information from us and then call a meeting of the people in the area in which they are interested. If the meeting is interested, a provisional Board of Directors for a co-operative association is elected. It is the duty of this Board to survey the area, making sure that everyone within natural boundaries is given a chance to become a member of the R.E.A. Sometimes a small deposit of $50.00 is asked for as evidence of good faith. The information gathered by the Board is sent in to Farm Electric Services. The Service Company satisfies itself that the area selected by the Co-operatives has natural boundaries that conform to economic construction and complete coverage of the farms. Care is taken to see that service has been offered to everyone in the area, and no attempt made to lighten the cost by "cream-skimming" those farms closely grouped and neglecting those not so fortunately situated.

How Assessments of Costs Are Made

After proper mapping, an estimate of the cost is prepared and presented to the Board of Directors. If they consider this acceptable, a public meeting is called at which a representative of the Service Company outlines the cost, the Association-Member contract and other matters and details of the operation of the system. If these are acceptable, the Co-operative Association is duly registered with the Government by the Service Company and the directors of the Association proceed to collect their members' contribution towards construction cost and to sign the contracts.

Each member within the limits set pays an equal share, regardless of his distance from the road allowance, etc. The limits usually set are: An average of not more than ¾ miles of line per farm with a limit of 1¼ miles for any individual farm. Farms requiring more than 1¼ miles of line can obtain the service by paying for the additional cost as well as the average share.

A rough guide on which the farmer can make his own approximation of cost is given as follows:

Farm transmission line — 12c per foot or $634.00 per mile.

Average cost of farm connection to this line — $250.00 each including 3 kw. transformer, meter, guys, etc.)

Share of main substation and switching in 100 farm area — $40.00.

Total cost per farm where the average is one farm every ¾ mile is then $765.00.

All material, labor and engineering costs are included except brush cutting. The farmer is encouraged to contribute as much of the labor as possible and is paid for the work which he does. It might be added here that to wire and only moderately equip the average farm to use electricity will require an outlay of an amount equivalent to the line costs at least.

The Service Company undertakes to build the farm lines at cost which is subject to the Co-op. or Government audit. To provide assistance to those who are not in a position to put up all of the cash the Co-op. may borrow a Provincial Government backed loan at 4 per cent.

Building a Reserve

The service Company also undertakes to operate these systems at cost, making use of the Power Company facilities and personnel where it is economical to do so. At the present time, for ¾ mile of line and 3-kw. transformer, the cost of operation is $2.00 per farm per month, plus 50c per month for a reserve fund to take care of inadequacy, renewals and extensive storm damage, and liability. The costs of operation are pooled for all co-operatives, and the costs of liability and storm damage are shared equally by all Co-ops.

Now it is realized that 50c a month or $180.00 in 30 years, even if not drawn on in that time, is an inadequate amount to take care of inadequacy, renewals, storm damage, liability, on an outlay of between $750.00 and $800.00. It is planned to build this reserve through crediting it with surplus funds. For example, there is a requirement that no future farm can be connected to the lines for less than the average share. Now a farm along an existing line might contribute the average cost of $750.00, but the actual cost might be only $250.00. The surplus $500.00 would be credited to the reserve fund.

In this description most of the details have had to be neglected. However, an attempt has been made to point out some of the more common economic difficulties of farm electrification with a possible solution which is being attempted here. The problem is of extreme importance to this agricultural province and to those of us engaged in the work.

Discussion

J. E. Bagshaw[1]

Mr. Gale, in his talk, has pointed out the economic obstacle to farm electrification on the prairies, and has indicated the possible transfer of electric distribution lines from the Power Company to the Farmer.

The Prairie Provinces' entrance into the field of farm electrification was fortunately deliberate and well planned. The prairie power companies, including both private and publicly owned bodies, got together and agreed on a uniform type of construction which was low in cost yet substantial. They agreed to standardize on many items, such as transformers, meter boxes, conductors, etc., and to use the same materials. In this way, we have all benefited and kept costs to a minimum. At a general meeting of E.I.C. held in Winnipeg in 1945 these methods of construction were discussed by Mr. E. G. Kelly of Canadian Utilities Limited and Mr. J. W. Tomlinson of the Manitoba Power Commission. The methods outlined then have been adhered to by the various companies.

However, the average costs, which at that time were about $600 per farm, have now risen to the point where it will probably cost in the neighborhood of $780 in 1948. At the original figure of $600 per farm this business was not self supporting and now, with the construction costs up, farm electrification extensions are definitely a losing proposition to power supply concerns under present conditions and at the present revenues that are available from farm areas. One solution, as Mr. Gale has said, is to get the farmer to pay for his own lines. While this solution gets you out of one hole, it gently deposits you into another for, if a farmer has to contribute $750 to line construction costs and a like amount, as has been suggested, for wiring and appliances, he has an investment that certainly all farmers cannot or will not be able to raise. The cash must be found for the line construction, and so it seems that the wiring and appliances will receive a minimum of attention.

This would not be so bad if it were not for the fact that through this latter medium comes the future revenue. If a farmer can't buy electrical equipment and hasn't a good wiring job, he cannot use the electricity to advantage. And, of course, those farmers who are not making full use of electricity are the first to discontinue service in times of low incomes. Our experience has been that a farmer who has the electrified equipment can operate it so much more economically that he can do the chore any other way, that he cannot afford to use any other method. This keeps him on the line when his income is low.

At Swalwell, Alberta, which is our Experimental Area No. 1 constructed in 1944, most of the farmers have a dairy " set-up ", and sell milk to a local cheese factory. They have small farms, so are more thickly settled, which means more farms per mile of line. Here we now have nearly two farms per mile of line and, counting a small hamlet served, have about three customers per mile. In the first year of operation, the revenue per mile of line was $190 and in the third year it is $254. Kilowatt hours have increased from 1200 per farm in 1945 to 1800 in 1947, a 50 per cent increase. Active load building was conducted in this area and the farmers are well aware of benefits to be obtained from electricity. As equipment becomes available, we expect a further large increase in revenue here. If all farm areas were equal to this, there would not be an economic problem. The peak substation demand here averages 720 watts per customer.

Our No. 2 Area is a mixed farming district; the farms are farther apart, and it takes three quarters of a mile of line to serve each farm. The revenue per mile of line three years ago was $104 and this last year it was $139, so you can see how far behind the dairy area this is, and how much slower it is developing. This is probably an average district and typical of many on the prairies. The k.w.h. consumption per farm in 1945 was 700 and in 1947 it was 970. Load promotion was also actively conducted by our rural representative in this district, but the results were not as good. The peak demand here averaged 620 watts per customer, as compared with 720 watts in the dairy area, yet the k.w.h. consumption per customer was only about half as great.

In another mixed farming district, Area No. 4 on which we have only one full year's operating experience, we find the figures are just about the same as our No. 2 Area in its first year of operation. In Area No. 5, a straight grain growing district where the farms were large, we had only one customer per mile and naturally the construction costs were much higher, yet the revenues are lower. In the past twelve months the revenue per mile of line was only $77. From this you can judge the variety of conditions existing in the farm areas of the prairies, and the reason we are so concerned with the economic problem.

As regards the Farmer owned Co-Operative arrangement being tried out by the Company Mr. Gale represents, it is not a nice arrangement to have the lines owned by your customer; however, when such lines are a liability, it may be the best solution to this great problem.

three oblique and one plane shock waves, with remarkably low losses. Another related project was the study of muzzle brakes for guns.

The remaining equipment at K.W.I. was being used for fundamental scientific work. A study of the effects of vertical temperature gradients on laminar air flow was being made in a special convection channel which would have application to meteorological and hydraulic problems. Other studies being carried out, in a special laminar flow tunnel having a glass wall, included boundary layer transition phenomena, and the effect of surface roughness and pressure gradients on skin friction. An open jet wind tunnel was being used to study mixing at jet boundaries and, in another tunnel, the effect of ground topography on surface winds was being investigated.

The interesting Reichardt ultra-low pressure manometer of the piston type (Fig. 42), having a sensitivity of 0.00001 in. of water, was developed here.

(To Be Continued.)

WAITING FOR THE DAYLIGHT

by

F. Cyril James

Principal and Vice-Chancellor, McGill University, Montreal

An address delivered before the Newcomen Society in Montreal, October 21, 1948

The Early Days

More than two centuries have passed since 1710 when Thomas Newcomen of Dartmouth, in that pleasant county of Devon, constructed the "first self-acting steam-engine" in order to pump water out of coal mines, and it must be a matter of sadness to the members of this Society that he died in London before he was able to obtain a patent on his invention.

Those early years of the eighteenth century seem very distant. When Newcomen was making his steam engine, Isaac Watts had just published his book of *Hymns* and Bishop Berkeley was correcting the proofs of his *Principles of Human Knowledge.* The Duke of Marlborough, great ancestor of Mr. Winston Churchill, had defeated French armies in the historic battles of Blenheim, Ramillies, Oudenarde and Malplaquet during the five years before that steam engine was born; and although the British expedition against Port Royal in 1707 had been unsuccessful, the Treaty of Utrecht was soon to give Great Britain its first foothold in Canada. In those older British colonies that are now a part of the United States, the first paper money was issued in New York (and the first post-office opened) in the very year when Thomas Newcomen perfected his engine. Yale College was less than ten years old, and Indian wars were ravaging the Carolinas.

There was no modern plumbing in the stately Blenheim Palace that Vanbrugh soon designed as a gift from the people of England to the victorious Marlborough, and the great Duke, like his Queen, travelled in a springless coach, rather similar to that which had carried Queen Elizabeth, or Julius Caesar. But the Industrial Revolution was already stirring. The demand for iron and steel was growing, and since the forests of England were exhausted and charcoal had become expensive, Newcomen must invent a steam engine to drain the mines in order that coal production could be increased. Necessity, great mother of Invention, was bringing wondrous things to birth.

It is a wise man who can read the signs aright when revolutionary forces begin to operate. The courtiers who attended Queen Anne were not much worried by industrial processes; but two generations later there were many Englishmen, in the reign of George III, who found the Industrial Revolution more important than that other revolution — the War of Independence — which was laying the political foundations of the United States! It was in 1776, a

The Newcomen Society of England was founded in 1920 with the object of fostering research and study of the history of material civilization throughout the world. Because such an objective comes very close to the work and to the hearts of engineers, the Society's membership is built up largely of engineers, physicists and industrialists.

To be invited to speak at a Newcomen dinner is a high honour indeed. At the meeting in Montreal on October 21, 1948, the honour was shared by Dr. Karl T. Compton, president of Massachusetts Institute of Technology, and Dr. F. Cyril James, principal and vice-chancellor of McGill University. Dr. James' address is published here and the Journal hopes to be able to publish Dr. Compton's speech in an early issue.

Permission to publish these Newcomen addresses has been extended by Dr. Charles Penrose, senior vice-president of the Society for North America.

year memorable in the political history of this continent, that a young mechanic at the University of Glasgow (contemporary of James McGill, who founded our University) improved Newcomen's engine to such an extent, by economizing in the use of fuel, that it could be used far away from the coal-pits.

To that idea of Thomas Newcomen, and its successive development by James Watt and many others, the modern world owes its prosperity and comfort. It may be that during the coming years of this atomic age we shall witness even greater changes, but it was the steam engine that freed mankind from the thralldom of the Middle Ages. Steam augmented the strength of the human arm. It multiplied the output of factories and knit the nations of the world together by railways and steamships. If we remember Newcomen as the original begetter of this revolutionary use of power, as we must remember him whenever this Society meets, we should also remember that James Watt, in partnership with Matthew Boulton, laid the foundation of that engineering profession whose development Dr. Compton has so splendidly described.

A Golden Age

To this audience I need not describe the successive stages of the industrial revolution. You are familiar with them. I should like to emphasize the fact, however, that, by the second half of the nineteenth century, the use of power and machinery had enriched mankind beyond the dreams of avarice. The great Exhibition, opened by Albert, Prince Consort, in 1851, seemed to usher in the golden age of mankind. Individual initiative flourished, political democracy was expanding the sphere of its operation, the standard of living of the average family was rising and most men were confident that all things were working out together for good in the best of all possible worlds. Seldom has mankind been as confident, or as prosperous! Although everyone was not *A Man of Property,* you can catch the flavour of the age in Galsworthy's *Forsyte Saga*. On one side of the Atlantic it was reflected in the Diamond Jubilee of Queen Victoria: on the other it inspired the doctrine of "Manifest Destiny" that awaited with enthusiasm the opportunities of the twentieth century.

How distant that daylight seems! As we look backward to the glad confidence of that period, we sometimes feel, perhaps, as one of my friends suggested to me the other day, that the years from McKinley's election in 1896 to the panic of 1907 were the golden age of the modern world. Was there any other period in human history when so many people lived peacefully and prosperously on the face of this earth?

The Gathering Storm

Dark night has fallen on our western civilization since those days. As we look backwards we can see the gathering dusk of rearmament and national antagonism during the years immediately before 1914. Men had thought a major war to be impossible; but war came, and mankind experienced all the misery of Armageddon for four long years. We half expected dawn to break after the victory of 1918; and for a few years we deceived ourselves with confident expectations that there would arise a world "fit for heroes to live in". We realize now that those expectations were ill-founded. Although the phrase "cold war" had not been invented, we experienced the reality of bitter international antagonisms after the financial crash of 1929. The darkness deepened during the 'thirties, and became tenebrous, almost to the point of despair during the bitter years of struggle from which we have just emerged. Even now, three years after the celebrations of victory in Europe and Japan, the dawn has not yet come. In Palestine and in India, men are still fighting bitterly. Assassination, rather than the ballot-box, determines the succession to leadership in those countries while, in Berlin, we are conscious that the "cold war" has reached an intensity which reveals its significance as a determinant of the pattern of human life in our western world for many years to come.

During those years of confident prosperity in the nineteenth century, men delighted to amuse themselves with forecasting the shape of things to come. Jules Verne prophesied the feats of men armed by the steadily growing knowledge of science, indicating more than once that these powers might be turned to illegal and even anti-social purposes. Mr. H. G. Wells took up the theme, and delineated the grim outlines of the society that might develop, while "Saki" enlarged on the potential dangers of national complacency. Yet none of these, I think, would have dared to sketch the kind of reality with which we are familiar today. If any bright young author had attempted to describe the horrors of Belsen or Buchenwald in 1944, or the Siberian slave camps of 1948 (to say nothing of the daily dull routine of the lives of millions of people who live within the nations that create such establishments) a wiser and more urbane publisher would have refused to invest his money in such a book. A voyage to the moon, the depredations of an *Iron Pirate,* or even the conquest of England by Imperial Germany (made ridiculous in its sequel by the patriotism of boy scouts), these things were within the scope of imagination and, to use a phrase that would have annoyed the Edwardians, of "reader-interest". But any factual description of the things that have happened in this generation would have seemed beyond all the bounds of thought.

State or Individual?

Why has the night fallen so deeply? We still possess all the scientific knowledge and technological skill that made the world so fair a place in the times of our grandfathers. Indeed, we have added greatly to their store of knowledge, augmenting the steam engine with electricity, internal combustion, and nowadays atomic energy. Why have we lost their confidence in the continuance of human freedom and prosperity? Why are we trembling in our dreams, afraid that the true dawn of world peace may never come?

Mr. H. G. Wells, in *The Croquet Player,* one of the last of his novels, suggests that we are haunted by the ghosts of Cain and all the ancient malefactors, ghosts that rise from the ground to madden us and visit the penalties of their own crimes upon their descendants. There may be a germ of truth in that idea, if we can convince ourselves that institutions, as well as individuals, can haunt us.

The fundamental basis of nineteenth century optimism was to be found in the combination of steadily increasing human liberty with mounting economic prosperity. The two were inextricably interwoven. That century was singularly free from the menace of imperial megalomania. The menace of Napoleon had been dispelled at Waterloo, and the Duke of Wellington, who had once led Europe to the victory of free peoples, was an old man when he attended the Great Exhibition of 1851. The threat of the young German Empire had not yet begun to develop. Liberalism and democracy were the sunlight of the new day. Despotism seemed to be old-fashioned, and men believed confidently that their new-found freedom was the foundation of a better world. In every corner of the world new constitutions were adopted. Serfdom was abolished in Russia. The Reichstag and the Duma put on the ancient mantle of the Mother of Parliaments.

Today we continue triumphantly our economic march. Our productivity is rising to new heights. But we are terrified at the growing loss of human freedom and fearful that we, too, must be engulfed in the black night of revived slavery. The ghosts of the old totalitarian empires stalk the earth once more, and we face the menace which our ancestors escaped when they sent Napoleon to St. Helena. The modern totalitarian state, whether it be the Italy and Germany of yesteryear or the Soviet Russia of today, is no new invention. It is the direct descendant of that old Roman *Imperium* but it has lost the dignity, the *gravitas,* of the Roman power, so that its grossness and stark brutality stand out the more clearly. Rome, which began as a republic, tried in the Augustan Age to combine liberty with empire. It failed to do so, and the modern inheritors of the old imperial concept have from the outset decided that human liberty must be jettisoned in order that the glory of the state, and its power, may be perpetually enhanced.

Might or Right?

Man's memory of autarchic empire, of ruthless totalitarian government dominating its own people by repression and its neighbours by conquest, stretches back to the early days of the human race, to Hammurabi, in Babylon, when Abraham was young. The succession of empires through Assyrian, Hellenistic, Roman, Caroligian, Spanish, French, German and Italian rulers is continuous to our own day. Soviet Russia is but the latest of the totalitarian powers to seek world dominion. Its ambitions, like its methods, are not new. They are very old. For thousands of years it has seemed to man, caught in the web of military conquest, that Might must sadly be recognized as Right. Power is the final arbitration. Why kick against the pricks? Why not make terms? Why not appease the potential conqueror in order that we of this generation at least may live out our lives in peace, and leave our descendants to solve their own problems?

It is a tenable doctrine, if one has no spiritual courage and no care for posterity. It is the doctrine of the Danegeld, of Munich. But it was not the philosophy of Pitt in the face of Napoleon, or of Abraham Lincoln during the dark days of the Civil War.

Democratic Failures

Three times at least, in the history of mankind, democratic institutions have come to birth. Twice they were blotted out of existence by imperial conquest and gave place to a new imposition of the old despotism. The fate of this third experiment depends upon you and me—the free peoples of the democratic nations.

Of the first attempt to achieve democracy we still know very little, and the archaeological record unfolds slowly. More than six thousand years ago free men lived in independent cities in Mesopotamia, electing their own leaders and governing the community by their joint efforts. We know that when they fell to quarreling among themselves the leaders retained power for life, to hand on to their sons, and democracy was swallowed up in a totalitarian empire that lasted more than two thousand years.

That first attempt failed because men could not live up to the responsibilities of democracy in the face of repeated crises. But there was a second, splendid attempt to create a democratic society in the cities of the Greek Peninsula during the second half of the last millenium before Christ. You know the history of that effort. Its splendour is comprised in the names of Pericles and Solon, Sophocles and Aristophanes, Phidias and Plato. Its tragedy is recorded in the failure to use power wisely, in fratricidal strife among the cities and in the ultimate military conquest of all of them by the Macedonian dictator whose son laid the foundations of the Hellenistic Empire and built the road along which Rome was soon to travel.

Twice in man's history democracy was unable to survive and empire triumphed. On two occasions, free men failed to measure up to the tests, and democracy was followed by long centuries of imperial autarchy. You and I, the free peoples of this generation, must, I repeat, decide whether the third attempt is also doomed to failure.

Can Democracy Survive?

I need not describe the political history of the democracy that we now enjoy. Its roots go deep into English history, but its traditions have been enriched by the peoples of the United States, Canada, France, and many another country. We have a common tradition —a priceless tradition that recognizes the value of the individual and protects his liberties.

We have splendidly defended this tradition during the long months, the long years, of the recent war. But our task is not yet finished. Russia, which has never known nor understood democracy throughout its history, is ambitious for power and world dominion. It is not a conflict between Russia and the Western powers that finds its focus on the airfields around Berlin at this moment. It is a conflict between two philosophies of life. If human liberty is really precious to us, it is no exaggeration to say that the forces of light are engaged in battle with the forces of darkness—and we are waiting for daylight to bring the final triumph of human freedom.

Waiting for the daylight! The simile is apt. But we must do more than wait: we must work. Democracy was not developed by men and women who left things to chance. The record of man's increasing freedom is the story of persistent human struggle, of unending perseverance. The torch is in our hands to carry forward.

If we are alive to our responsibilities, let us first of all take stock of the situation. The outlook is not as black as it sometimes seems. Democracy has not been completely extinguished in any country where it was firmly established before 1914. The autarchy of the Soviets is not much different from the autocracy of the Czars, and Stalin is closer kin to Ivan the Terrible than to Karl Marx. Russian policy today is not greatly different from that with which our grandfathers reckoned. In central and southern Europe, where the Treaty of Versailles carved new nations out of the Empires of Hapsburg and Hohenzollern, democracy was at best a tender plant. The present situation is serious. We have lost the fruit of two or three generations. But it is not hopeless. It is no worse than that which our ancestors successfully confronted, and our task is not an impossible one.

Realizing the fact, we can see clearly the two things that we must do in our generation, if we hope to bring the world closer to that ultimate ideal in which all men and women shall be free. We must strengthen democracy in our own countries, and we must coordinate the efforts of all the democratic nations throughout the world.

Domestically, we sometimes forget the extent to which the pattern of democratic society is changing. We have subscribed to the ancient rule that in times of acute emergency all power and responsibility must be vested in the state, but we have forgotten that democracy is lost if the individual does not again assume his full responsibility as soon as the emergency is past. The pattern of human freedom is diverse, not uniform. It depends upon the wholehearted efforts of every man and woman.

May I read you a short paragraph from the Chancellor Dunning Lecture recently delivered at Queen's University by Dr. T. E. Jessop?

> "We are deserting the voluntary principle and are following the state principle. . . . When a people turns over its problems easily to the state, it is not really shouldering them in a collective way. It is getting rid of troublesome matters by laying them on a small group of men, the government of that day. It deals with them by proxy; in other words, it — the people — does not deal with them at all. At most, it will dip its hands into its pockets to pay in taxation the cost of the solutions, sometimes with surprise and resentment at there being any cost. . . . The trouble with contemporary democracies is that the government has far too much to do and the citizens far too little."

Democracy An Attitude

Do not those sentences shed light upon the present situation in Canada, in the United States of America, in Great Britain? "Democracy is an attitude, not a constitution". How many of us can place our hands on our hearts and testify that we have done all that we could for the educational institutions, the hospitals, the welfare of the afflicted, the efficiency of government — both in our local communities and in the nation of which we are citizens? How much of our time and attention have we given to them? Have we given of our treasure as generously on a voluntary basis for all these things as we shall have to give compulsorily in taxation if they are left to the government? Democracy will be safe in its own countries when each of us consciously assumes his full responsibility, so that these questions can be answered by a great shout of confident initiative — a shout comparable to that which would have answered them in Canada and the United States a hundred years ago.

But our preparation for the day which is now dawning must extend beyond the task of putting our domestic house in order. No country can live to itself. If the democracies of the world do not stand together, democracy must perish under the steady pressure of a dictatorship that, by virtue of its stark ruthlessness and brutal force, is ambitious to undertake the task of world government. Let us remember that twice in human history democracies surrendered to dictatorship rather than cooperate in the task of solving their own problems.

Cooperation Essential

Democracy is a code of human conduct, a philosophy of government, a way of life. The strength of democracy in the world will grow when nations with similar ideals work together wholeheartedly, whether they are bound by treaty or not. The pattern of our association cannot be that tradition of rigid federalism which has characterized the history of the United States. The nations of the world are not ready for a federal constitution—perhaps they never will be ready. But, in the British Commonwealth of Nations we have an alternative pattern. The members are sovereign states, proud of their independence, bound together not by force nor by the meticulous provisions of a treaty, but by a common way of life. The collaboration of Great Britain and France during the nineteenth century, like the friendly relationships between Canada and the United States, proves that this concept can extend beyond the limits of the British Empire, and Winston Churchill is at this moment advocating the same method of cooperation for the nations of Western Europe.

A Challenge to Us

The peoples of the world look to us—the American and Canadian peoples of North America—for leadership. They are waiting for the daylight — many of them despairingly, in such places as Prague and Riga, where they can do little to help themselves. Will we measure up to the challenge? Let us do more than wait. Let us accept the facts of our situation realistically and work for the dawn. Let us make our own democracy more perfect, so that it refutes the ideologies that assail it. If we do that, if we stand together with the other democracies of the world in a common determination to preserve our liberties, there is no force on earth that threatens our welfare. The dawn will come, to usher in a day more gloriously brilliant for all mankind than that nineteenth century dawn to which we now look back.

□ □ □

Campbell River Power Development

by

Kenneth Reid, M.E.I.C.

City Electrical Engineer, City of Victoria, B.C.

On Vancouver Island, one hundred and eighty miles by road north of Victoria, B.C., is Campbell River, the scene of British Columbia's latest power development currently being built by the British Columbia Power Commission.

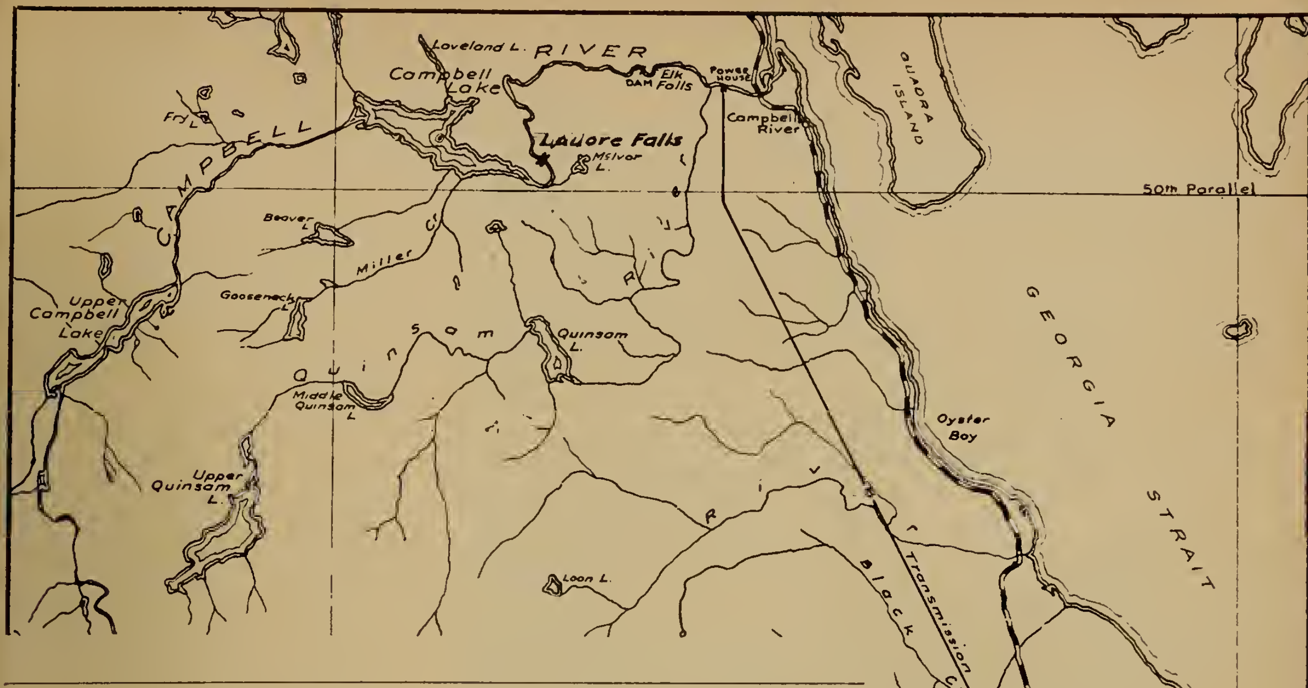
In its final form, the plant will comprise six units of 25,000 hp. each. The first two generators commenced operation on January 11, 1948, and the third and fourth units will be in operation in the near future. The last pair of units will be installed as the load develops. The head is 406 ft.

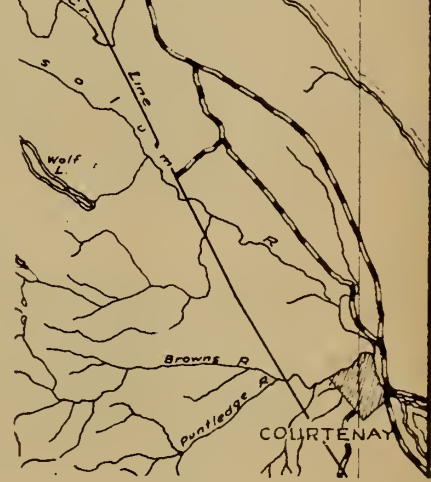
The B.C. Power Commission

The British Columbia Power Commission had its origin in the "Electric Power Act" of March 28, 1945, the purpose of which was the improvement of the supply of electric service to the province. The Commission itself has not unlimited funds available. The government of B.C. advances the capital and the Commission must pay its own way through returns received for electric service on a 40 year amortisation plan.

Of the 65 producers of electric power in B.C., 60 lack adequate generation or distribution capacity and are financially unable to improve their systems. Rates in the province were found to vary from 23 cents per kwh in isolated areas to 2 cents per kwh in metropolitan centres. By June 1947 the Commission had absorbed twelve plants and was operating in fifteen separate areas serving more than 25,000 customers. The equipment or the organization is by no means complete yet. The Campbell River development is the first major source of new power developed by the Commission and it is expected that the plant there will be developing 100,000 hp. by the end of this year. The ultimate capacity of this development is 150,000 hp.

Above, general view of main dam, showing mixing plant, present river channel and new bed of river below sluices.





The Campbell River

The firm of H. G. Acres and Company, consulting engineers of Niagara Falls was retained by the Commission to review all available power resources on Vancouver Island, and to determine and recommend a potential source of power capable of supplying the growing demand. Their report showed that of the six principal sources of power available on Vancouver Island the Campbell River site was outstanding in its suitability for economic development. It is located practically on the transverse centre line of the Island, and from the standpoint of load growth in the north as well as in the south half of the Island, it holds the best strategic position.

Campbell River has its source in the central island group of mountains. Several of the highest peaks lie within or border upon its watershed, which covers an area of 542 square miles. A major portion of the drainage area is within the boundaries of the provincial reserve of Strathcona Park. Draining the snow fields and glaciers of this area the river flows first through Buttle Lake (storage No. 1), which has an area of about twelve square miles. Some ten miles downstream in a northerly direction is upper Campbell Lake (Storage No. 2), and seven or eight miles further downstream again is Lower Campbell Lake (Storage No. 3). From here to the sea, there is a series of sharp descents and rapids, and it is on this stretch that sufficient head may be utilized for a first class water power development.

Leaving Lower Campbell Lake, the river falls some twenty-eight feet in a distance of 4,000 feet, while at Ladore Falls a drop of twenty-two feet occurs. Immediately below Lower Campbell Lake, a head of about 75 ft. can be obtained at Ladore Falls. Below Irene Pool, an enlargement of the river six miles below the Falls, the river flows through a steep canyon, dropping successively through Bear, Moose, Deer, and finally Elk Falls, eventually emerging from this rocky canyon at Trout Pool. The normal drop in gradient at low water from Irene Pool to Trout Pool is some 400 feet. Below Trout Pool the river flows rapidly over a bed of gravel and boulders for a distance of about 2½ miles to Discovery Passage. It is in the area between Irene Pool and Trout Pool that the Campbell River plant is being built.

In June 1947 some sixty members of the Victoria Branch visited the Campbell River Power Development of the British Columbia Power Commission. Mr. Reid submitted this paper shortly afterward but space requirements precluded its publication until the present issue of the Journal. The first two units at Campbell River commenced operation on January 11 of this year and work is nearing completion to enable the third and fourth generators to be put into service. The author gives an account of the objectives of the B.C. Power Commission and its plans for developing the Campbell River as well as details and descriptions of the plant at Irene Pool and Elk Falls.

At the official ceremonies on Dec. 15, 1947, the plant was named "The John Hart Development" after the Premier of British Columbia whose government created the British Columbia Power Commission.

Programme of Development

The development of Campbell River is planned in stages corresponding to the anticipated growth in demand for energy. Stage one, phase one, consists of the construction of head works and intake at Irene Pool, together with a surge tank and a closed conduit of sufficient size to operate two 25,000 hp. units. Stage one also provides for the construction of the first bay of the power house to house one unit, and the installation of this unit. Phase two consists of the completion of the second power house bay and the installation of the second unit. The third and final phase of stage one provides for the construction of the dam at Ladore Falls to raise the level of the waters of Campbell Lake.

In July, 1945, approval was given and work commenced on the first stage. Authorization was given to install the first unit and to complete one circuit of a 132 kv. transmission line from the plant to Nanaimo, a distance of ninety transmission miles, as well as for the provision of a tap-off from Dunsmuir to Alberni and Port Alberni. The plant is designed for further development according to the anticipated requirements of the future, and provision has been made for the installation of other units as required. The capacity of the first unit will be required to supply the Vancouver Island customers of the Commission and other demands, including the new pulp mill now under construction at Port Alberni for Messrs. Bloedel, Stewart and Welsh, Ltd.

Surveys were also made of suitable access roads, and, after careful review of existing wharfage facilities, arrangements were made to construct an unloading wharf with a grid at Duncan Bay, about five miles from the power house site. All materials and equipment required for the project, with the exception of lumber and aggregate, will pass over this wharf. Rail head is at Courtenay, about 32 miles to the south.

The immediate market for power under the Commission's authorized programme consists of the present demand of services formerly operated by the Nanaimo-Duncan Utilities, Ltd., and the new pulp mill at Alberni. As there is a large potential market from other sources on Vancouver Island, it is anticipated that the demand in the first year may exceed the capacity of the first unit. This necessitates, therefore, the completion of the second unit as early as is economically feasible after the completion of the first unit, bringing the total capacity up to 50,000 hp. The Commission would then have two units on which to depend for adequate peak load capacity. This would complete phase two of stage one.

Construction of power house at Trout Pool, showing entrance to two of six turbine units and location of centre penstock and wye.

Structures

Ladore Falls Dam

A detailed description of the project should logically start with the storage dam at Ladore Falls, the structure furthest upstream, and proceed down river to the power house at Trout Pool.

At Ladore Falls a reinforced concrete dam is ultimately to be constructed, the deck elevation of which will be at elevation 589.0. Crest elevation 554 feet. This dam will contain three rectangular sluice or waste gates, together capable of discharging 50,000 c.f.s. The maximum recorded flood is 30,300 c.f.s. Near the base of the dam there will be three 8 ft. diameter regulating valves, electrically controlled from the generating station at Trout Pool.

These valves will be used to discharge water stored in Lower Campbell Lake, and the intakes of the two 8 ft. valves have been designed so that, if it is found desirable at a later date to erect a generating station, the two intakes will be available by removing the valves from the lower ends of the discharge pipes. Sluice gates and regulating valves will be electrically operated by remote control from the generating station. Valve position indications and water levels will be electrically transmitted to the power house by means of Selsyn indicators and lead-covered paired telephone cables.

The work at Ladore Falls will include the removal of about 11,000 cubic yards of rock and the placing of 30,600 cubic yards of concrete. The dam will raise the level of Lower Campbell Lake by about 58 feet, and will produce storage such that a regulated flow of 1800 c.f.s. will be available. Ladore Falls will admit of a later installation of turbines to develop the ultimate flow of 2500 c.f.s., at a head varying from 67 to 125 feet.

The Main Dam

This structure at Irene Pool, is of the concrete gravity type, with wing walls of sealed earth embankments. The dam will be 650 feet long at the crest, with base thicknesses varying from a maximum of 100 feet in the bed of the stream, to 78 feet at the base of the sluice section and 55 feet at the ends of the structure. The high water elevation was established at elevation 459.0 and the horizontal centre line of the turbines in the powerhouse at 56.0 geodetic datum.

Approximately 45,000 cubic yards of concrete will be required for the construction of this dam. Incorporated in it are three sluice gates capable of discharging a flood flow of 50,000 c.f.s., as in the case of the structure to be built later at Ladore Falls. These gates will also be electrically controlled, but for emergency use a gasoline engine-driven alternating current generator will also be installed.

Powerhouse and penstock in foreground. Switching station and operators' cottages at rear.

Inspection Tour of the Work In Progress

At the time of the Victoria Branch visit the head dam at Irene Pool was nearing completion. The various aspects of the dam were of real interest—the interlocking steel piling being driven by steam hammer to bed rock in the earth wings of the dam, the concrete mixing plant and the Rex Pumpcrete machine pumping fresh concrete through a 6 inch pipe line to the waiting forms. Another point of interest was the old B.C. Forest Service bridge, now dwarfed by the huge dam immediately above it. This bridge was built by the Forest Service with the aid of single unemployed men as a relief project in the early thirties. This old bridge across the river will be replaced by a new roadway on the crest of the dam.

Powerhouse, penstock and surge tank.

Intake and Penstocks

The reinforced concrete intake structure is located at a point about 1500 feet beyond the southern end of the dam. This structure is connected to the south end of the dam by means of a sheet pile sealed earth dam. The earth for this dam was obtained from the cut made immediately towards the power house to accommodate the wood stave penstocks. There will ultimately be three penstocks, each 12 ft. in diameter.

Two fixed roller type rectangular intake gates control the discharge into a steel wye, to one leg of which is connected a wood stave conduit. Each gate is 16 feet square. The rollers have self-lubricating bronze bearings, and turn on fixed chrome nickel steel pins, the rollers having slightly crowned faces to take care of gate deflection. To prevent icing, provision is made for the insertion of electric heaters in ducts at and for the full length of the roller paths, if found necessary.

Normally the gate speeds are uniformly controlled by squirrel cage motors so that they close at from 3 to 4 f.p.m. Emergency closure however may be secured by means of push button control from the power house, under which condition the gate will fall of its own weight, the lowering speed being controlled by means of a centrifugal fan mounted on the motor shaft. Under normal opening operation, a gate is raised 6 inches until the water passages are filled. Limit switches are provided to stop the gate at this 6-inch position, also at the full open position. There is a limit switch to stop the gate at the 6-inch position during the lowering operation.

The three sluice gates are of the rectangular roller type, 30 ft. 6 inches square. They have a 33 ft. lift, with individual raising screw hoists. The lifting speed is 2½ feet per minute. Provision is made so that the gates are self-locking in any suspended position, and an electric brake is provided in addition. High torque squirrel cage motors are used with push button controls. Sluice and intake gate positions and water levels are electrically transmitted to the power house similarly to those from Ladore Falls.

From the intake structure, a wood stave penstock extends for two thirds of a mile at a gradient of 3 feet per thousand. Steel cradles set on reinforced concrete bases support the pipe. Owing to an abrupt drop in grade of approximately 185 feet, water is conducted for the remaining half mile distance to the power house in a 12-inch steel pipe. This pipe terminates in a steel wye on the upstream side of the power house. It is of welded construction supported on cradles similar to those used for the wood stave penstock.

Over 390,000 cubic yards of earth and 40,000 cubic yards of rock were excavated in the preparation of the penstock and pipe line courses.

During the Victoria Branch visit, it was noted with interest that the details of the intake section, penstocks and head-gates of the six main intakes were designed by D. H. R. Blake, S.E.I.C., a student engineer with the Vancouver Engineering Works Ltd., and son of J. H. Blake, mechanical engineer of the B.C. Forest Service and member of the Victoria Branch who accompanied the party.

Surge Tank

To provide for pressure changes in the pipe line and penstock, a differential surge tank is erected near the power house. This structure is over 300 feet in height, and since its base is at elevation 200, or about 100 feet above the power house roof, it is an imposing affair in appearance. Surge tanks for the first and third pipes will be offset, as there will not be sufficient space directly over the pipes. The second pipe is presently being installed.

The Power House

The power house is of substantial construction, with concrete substructure, steel frame and concrete wall superstructure with pre-cast slab roof. As each bay of the power house is completed, a certain amount of foundation work will be carried on in the next succeeding bay or bays. The amount of such work will depend on the unwatering problems of the power house site as a whole.

Turbines

The two arms of the wye terminate with hydraulically operated butterfly valves. Each arm is connected to a Francis vertical type reaction turbine. These turbines, of which there will ultimately be six, are rated at 28,000 h.p. each at 327.3 r.p.m. The runners are of steel, cast in one piece. The back of each runner vane is faced with stainless steel. The water passages at the entrance to the runner are renewable, wearing plates being secured to the lower face of

Discussion of

PRAIRIE WATER PROBLEMS

These discussions were not published with the papers in the September issue of the *Journal* because of space restrictions and because some of them were not available at the time. The subject is of importance not only to engineers but to Canadians everywhere and further comment is invited — for publication or for consideration by the Institute's Committee on Prairie Water Problems.

C. E. Webb, M.E.I.C.[1]

In his paper "The Water Resources of Alberta" (*Eng Journal*, Sept. 1948) Mr. Ben Russell has outlined concisely the present overall water supply situation in the province of Alberta. Compared to Manitoba, whose water problems were explained by Mr. D. M. Stephens, Alberta appears to be more favoured in this respect.

The author has summarized the pertinent water legislation of the province, outlining the various Dominion and Provincial acts governing the use of the water resources. The classification of surface waters and the delineation of principal drainage areas are helpful in considering the remainder of the paper which, like Mr. Stephens' paper, leads one to the conclusion that co-ordinated planning of the water resources of the Prairie Provinces as a unit is becoming increasingly essential.

It is apparent that such a coordinated plan would require the distribution of the available water supply in such a manner that no one essential use of water would be expanded at the expense of another equally essential use. In other words, the use of water directly for irrigation, and for power production to be used in pumping water for irrigation, cannot be extended indefinitely at the expense of production of electrical energy for other uses—or vice versa. Saskatchewan and Manitoba are deficient in other forms of fuel which enhances the value of hydro-electric power for industrial and domestic use.

An Inter-provincial Committee with adequate technical representation thereon appears essential to administer the overall allocation of water resources of the three Prairie Provinces. No comprehensive plan of optimum development can be worked out without careful consideration by such a committee of the most economic uses of the water available.

Mr. Stephens has presented a thought-provoking paper (The Saskatchewan River and Manitoba's Water Problem,, — *Eng. Journal*, Sept. 1948). Due to their location in a region of deficient water supply, the three Prairie Provinces must be vitally interested in seeing that the supply available to them is utilized to the optimum advantage for all concerned. Manitoba is probably the worst situated of these three provinces, in that its principal water supply is from a river system which has already traversed much of the area of two "dry" provinces. This condition, combined with Manitoba's flat terrain, suggests that the time is at hand for co-ordinated planning of the water resources of the Prairie Provinces, on the basis of the greatest benefits to the local and national economies.

Such a procedure appears to require a radical departure from the principle that each province should administer its own water rights. However, the parallel to the problem of transboundary waters between the United States and Canada is obvious. This problem led to the Boundary Water Treaty of 1909 and the organizing of the International Joint Commission. It is apparent that the organization of a form of Interprovincial Joint Board or Commission composed largely of technical personnel would be highly desirable to administer the overall allocation of available water to these three provinces, having in mind its most advantageous use. Allocation of water within each province could continue to be handled by the appropriate provincial authorities.

F. R. Burfield, M.E.I.C.[2]

I think that anyone unfamiliar with the subject, who listened to the Prairie Water Problems papers and discussion would get the impression that the granting of water rights had been in a chaotic condition since the transfer of the natural resources from the Dominion to the provinces of Alberta and Saskatchewan in 1930. This is not the case.

Granting of water rights in the two provinces has actually continued in the same manner since 1930 as it did before. Each province has respected the other's grants, and no stream crossing the boundary has been over-appropriated by one at the expense of existing rights in the other. This is the system to which lip service has been paid by several speakers, and then repudiated by statements of what they thought should be done.

If the function of a Water Board will be to apportion the water mathematically between the provinces then, in my opinion, its institution is a retrograde step. A mathematical division may be necessary between sovereign governments such as Canada and the U.S.A., but between provinces, readiness to make beneficial use of the water should be the requirement for obtaining a right to it.

Actually what is to be apportioned is not water but Dominion government aid. At the present time the cost of construction of irrigation undertakings is not borne by the operators—it is borne in very large part by the Dominion Government. There may be good political, even statesmanlike, reasons why federal aid should not be given entirely to one province even

[1] District Chief Engineer, Dominion Water and Power Bureau, Vancouver, B.C.

[2] Chief Engineer, Water Resources Branch, Alberta Government, Edmonton.

though the best or cheapest irrigation may be concentrated there. The practical result is that division of water is necessarily subservient to division of federal aid. This will be decided by politicians not by a water board.

The lower courses of the Saskatchewan and the Nelson lie in that part of the North-West Territories added to Manitoba in 1912. Water administration was retained by the Dominion; perhaps it still is. There are no records of any water rights having been granted up to 1930.

Mr. Stephens' plea for floods to continue is something almost unique. We engineers are inclined to think that anything we can do to iron out river fluctuations is so much gained. I personally, have been somewhat concerned about the tendency of irrigation interests to take the last drop out of the streams at low stages but to let the floods go on.

In spite of reservoirs and re-afforestation, I expect this to continue. That is to say, the disparity between flood and low stages will increase. The whole cycle will be on a lower absolute plane so that the agricultural and hay lands in Manitoba will creep down on the fur farming lands, which in turn will encroach on the duck and fish areas. This would seem to be a gain rather than a loss.

Mr. Stephens' study of the economic effects of diverting 4,207,000 acre-feet of water from the Saskatchewan River provokes some rather fascinating speculations. He values the water power lost at between $19 and $25 millions per annum. If that water were used to irrigate 2,539,000 acres of sugar beets, the farmers would get four hundred million dollars for one year's crop at present prices. Of course irrigating two and a half million acres of sugar beets is a fanciful idea, but so at present is the utilization of two million horsepower on the Nelson River. If we take a reasonable figure of $20.00 per acre per annum as the increased value of crops due to irrigation we arrive at $50,000,000 or about twice the value of the water power.

In an earlier part of his paper Mr. Stephens stresses the economic value of storage in Manitoba's lake basins. I do not want to deprecate the value of lakes but, when we are discussing the economic value of water and turning it into dollars and cents, we should not lose sight of the fact that the evaporation from the 13,303 square miles in the three big Manitoba lakes must be more than three times as much as the suggested four million acre-feet for irrigation.

I think that some parts of Mr. Stanley's paper rather ignore the fact that the irrigation interests have definite property rights in the waters of the Bow River. These are based on a system of priority and the Dominion Irrigation Act specified that licenses were to be numbered as applications were received, and each licensee would be entitled to receive the whole of the supply to which his license entitled him before any licensee whose license bears a higher number has any claim to a supply.

To require the old licensees to fill their reservoirs at such times as it is convenient to the power interests to empty theirs is about the same as taking land without compensation. This is not by any means a theoretical question; the irrigation licensees need the short periods of open weather when they do not have to deliver water, to do repair work on their canals. If winter operation of canals is possible, hydro-electric power might be developed that way, rather than requiring irrigation canals to be so used.

Planning sounds like an excellent idea, and it would be that, if planners were gifted with wisdom above their fellows. Unfortunately, experience would indicate that they are not. The collective wisdom of the people backing their judgment with their own wealth seems to show more foresight than the planners.

A. E. Palmer[3]

I fully agree with Mr. Burfield that the water of the Saskatchewan River System cannot, at this stage, be intelligently apportioned to the various Provinces simply because no one is wise enough to foresee the best future use for these waters. Undoubtedly, the proper method would be to study each application for water diversion in the light of the knowledge existing at the time.

It would seem advisable to make a detailed study of the possibilities of diverting water from the Churchill River System into the Saskatchewan to supply part of Manitoba's needs.

[3] Superintendent, Dominion Experimental Station, Lethbridge.

T. D. Stanley, M.E.I.C.[4]

As I am personally interested in the use of water for power, which does not deplete the total flow of the rivers, I will not comment on Mr. Burfield's discussion on the division of waters between the Provinces. However, I feel that in his reference to my paper he is taking a very extreme view of the situation. It is not a matter of ignoring the fact that irrigation interests have been set up, nor is it a case of operating power reservoirs for the convenience of the power interests. It is a matter of so handling the available water, which in total is not depleted by its use for hydro plants, in such a manner that the maximum possible benefit may be obtained for all. If, in order to do this, it is necessary to operate irrigation canals at seasons of the year other than those that have been customary in the past, I think it only right that this should be done. If, by changing the times at which water is put into storage, more beneficial use may be made of the total water available, then I believe such changes should be made.

In regard to operating hydro-electric power canals in the wintertime, I would like to point out that the Cascade Development includes a two and one-half mile canal, and the proposed Spray Lakes Development will include a much longer canal. Information is being gathered on the possibilities of using power canals in the winter time on other proposed developments. At certain seasons of the year when it is possible to operate canals, more water is available from hydro storage than is normally available in the river, and peak flows which would otherwise be passed by the irrigation projects are stored for use at a more opportune time.

Ben Russell, M.E.I.C.[5]

If Mr. Burfield is correct that the papers presented give the impression that the granting of water rights is in a chaotic condition, this is very unfortunate because such is not the case. However, I cannot recall anything in the papers which might create such an impression. As more and more appropriations are made in the respec-

[4] Production Superintendent, Calgary Power Ltd., Calgary, Alta.

[5] Director of Water Resources, Province of Alberta, Edmonton, Alta.

tive Provinces, particularly for large diversions for irrigation, it is natural to expect that some conflict of interests will arise. It is my opinion that such conflict can be largely avoided by a Water Board appointed at this time.

I do not think the function of the Board should or will be to apportion water by some rule as suspected by Mr. Burfield, but rather in the best interests of the drainage basins as a whole. I would hope that the Board in its recommendations would give consideration mainly to the most economical and beneficial uses of the waters to be appropriated. If, however, there should be a tendency in the allocation of funds, to distribute such funds by Provinces rather than by projects, then I think the Water Board would at least have the effect of curbing any such tendencies. A Board composed mostly of those who have to do with the actual administration of streams should be most competent to judge the merits or demerits of the respective projects and I believe that the recommendations of such a Board will be respected by the Governments.

I would not interpret anything in Mr. Stephens' paper to suggest opposition to stream regulation and I think it quite natural that the Manitoba officials should become a little apprehensive as to Manitoba's position, partly because it is at the lower end of the streams and partly because of the publicity which has been given to a number of large diversions proposed in Alberta and Saskatchewan. I am quite sure, however, that while Mr. Stephens in his paper endeavoured to make sure that Manitoba's interests would not be overlooked, he did not intend to make a plea for the continuation of floods.

With regard to the economics of the various uses of the waters, whether for irrigation, power, or any other purpose, I think this can be safely left to the Water Board and I do not think that any speculation as to the future uses of the streams should be too fanciful for the consideration of the Board.

I cannot see the point in referring to the huge water losses in the three big lakes in Manitoba. These lakes have always been there and I do not think anybody would suggest that we should dry them up in order to avoid losses. I think we will have to recognize that any depletion of the streams in Alberta and Saskatchewan will decrease the power production possibilities of the Nelson River. It will, therefore be necessary for the Board to endeavour to assess the respective values of the water, whether for irrigation in Alberta or Saskatchewan, or for water power purposes in Manitoba.

I am not sure just what part of Mr. Stanley's paper is referred to by Mr. Burfield, but whether or not the paper can be interpreted as suggested by Mr. Burfield there will be no conflict between irrigation and water power interests on the Bow River under the presently proposed plans of development.

With regard to the last paragraph of Mr. Burfield's discussion, it is my opinion that some planning is advisable even in a democratic country. Even if it is true that the collective wisdom of the people is more reliable than the planners, some planning is necessary for the consideration and judgment of the people or their respective Governments.

Discussion of RECENT CANADIAN RADAR

J. L. Rannie, M.E.I.C.[1]

Mr. B. G. Ballard, M.E.I.C., in his informative article **Recent Canadian Radar**, *(The Engineering Journal, July, 1948)* gives a few highlights on the development of radar research and a description of some of the electronic equipment used on this type of work. He outlines several applications of these new developments to surveying and other technical fields.

Shoran, a development of radar, has been attracting the attention of geodesists and photogrammatrists both in Europe and North America during the last few years. It may be of interest to enlarge on its application to the geodetic problem of providing accurately positioned points for the control of mapping and other engineering projects in the huge area of Northern Canada in which geodetic triangulation has not yet been carried out.

By the use of Shoran principles the distance between points on the earth's surface from 100 to 350 miles apart have been measured with a precision approaching that of second-order triangulation. A network of triangulation may be laid down, the lengths of the triangle sides measured by Shoran, and the angles of the triangles and the geographical positions of the stations can then be calculated. This is the reverse of ordinary triangulation methods in which the angles are measured and the lengths of the sides calculated. The precision of Shoran measurements to date has been of the order of 1 part in 25,000 or better. Further research can doubtless provide a higher degree of precision.

As indicated by Mr. Ballard, the Shoran method depends primarily on the extremely accurate measurement of the interval of time required for a radio signal to pass from one point to another and return. As the speed of propagation of radio waves is approximately equivalent to that of light, 186,000 miles per second, the time intervals involved in measuring distances of several hundred miles are of the order of one or two thousandths of a second. The unit of time measurement adopted for position fixation work is the microsecond, equal to 1/1,000,000 of a second of time, corresponding approximately to a linear distance of 1,000 feet on the earth's surface.

As the allowable error in distance measurements on second-order geodetic triangulation lines is of the order of 1/40,000 (about 13 feet in 100 miles) it follows that the time intervals must be determined to a small fraction of a microsecond if the Shoran method is to measure distances as accurately as geodetic triangulation. Recent comparisons of Shoran measurements with distances determined by primary geodetic triangulation indicate that there may be a more or less accidental error of 20 or more feet irrespective of the length of the line. For this reason, Shoran is not suitable for the *really accurate* measurement of very short distances.

[1] Dominion Geodesist, Geodetic Survey of Canada, Ottawa.

The actual measurements of the time intervals are made electronically. On instruments of recent design, the measured distances to stations may be read directly in miles and fractions of a mile on illuminated rotary dials. During the reading of the dials, the instrument must be kept carefully adjusted by aligning visually the traces of the form of the incoming radio waves with a stationary zero mark on the face of a cathode ray tube.

The most accurate method of length determination is the "line-crossing" method. Shoran ground equipment is set up at the ends of the line to be measured. Another instrument is installed in a plane which flies back and forth across the line near the midway point. The Shoran transmitters are tuned to such high frequencies that the emitted pulses have quasi-optical characteristics; for this reason there must be an unobstructed path between the plane and the ground stations; for 300-mile lines the plane may have to fly at a height of 10,000 to 15,000 feet to secure this necessary condition. Each time the plane approaches the line, a movie camera is set in operation to record the dial readings showing the distances to the ground stations, together with the readings of various accessory instruments. As the plane approaches the line-crossing, the sum of the distances from the plane to the ground stations, as indicated by the dial readings, decreases in value until a minimum is reached when the plane is directly over the line. After crossing the line, the sum of the dial readings increases in value.

The photographic film record of the dial readings is used in a mathematical analysis to determine the accurate value of the minimum distance between the ground stations. To the distances thus derived, corrections must be applied for variations in the meteorological conditions which affect the speed of propagation of the radio waves; other corrections are applied for elevation of the plane and ground stations above sea level. Twenty or more line-crossings are made to reduce as far as possible the above mentioned accidental errors of measurement.

When the sides of all the triangles involved in a Shoran triangulation scheme have been measured, it is found that the measured lengths will not exactly satisfy certain mathematical conditions involved in the geometrical figures constituting the net. A mathematical adjustment of all the measured lengths is then made, so that the errors of measurement may be reduced to a minimum and all the geometrical conditions satisfied. When the adjusted lengths are determined, the angles of the triangles and the geographical positions of the stations are computed. Various methods are available for making the above adjustments and calculations.

As in standard triangulation, so in Shoran, it is essential that more lines be measured than the minimum required to calculate preliminary positions of Shoran triangulation stations. A series of simple triangles is the minimum. The more surplus lines measured, the more reliable will be the lengths derived from the adjustment of the measured length data mentioned above.

Shoran triangulation with 100 to 300-mile sides is particularly adapted to the development of northern Canada in a short time. Standard triangulation has been confined to the settled areas of southern Canada, and its extension to the huge northern areas would take many years, owing to the short summer season, difficulties of transport and short triangulation sides averaging 20 miles in length. Shoran appears to be one of the answers to the need of early development.

The Shoran method has another decided advantage — clear weather is not essential, and cloudy or hazy weather offers little handicap. Indeed the original Shoran apparatus was developed during the war for precision bombing from high over the overcast. In this case remote control points were employed whose distances from the target were pre-calculated. When a point was reached such that these pre-calculated distances were indicated on the dials, the bombs were released (with very satisfactory results, it is said). Obviously the reverse of this technique has had an application to aerial photography, using the dial distances from remote control points to indicate the positions of the photographic plane.

It must not be inferred, however, that Shoran can replace the standard methods of triangulation. For ground control for large-scale mapping and for the development of engineering projects where high accuracy is required, standard triangulation remains unsurpassed. Standard triangulation will also be required to "fill in" ground control between widely-spaced Shoran stations where more dense control is required.

FROM MONTH TO MONTH

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

The Sixty-third Annual General Meeting

Notice is hereby given, in accordance with the by-laws, that the Annual General Meeting of The Engineering Institute of Canada for 1949 will be convened at Headquarters at eight o'clock p.m. on Thursday, January 27th, 1949, for the transaction of necessary formal business, including the appointment of scrutineers for the officers' ballot. It will then be adjourned to reconvene at the Chateau Frontenac, Quebec City, on Wednesday, May 11, 1949, at 8:15 o'clock p.m.

International Conference of Engineers

Recently a conference was held in London at the invitation of The Institution of Civil Engineers, The Institution of Mechanical Engineers and The Institution of Electrical Engineers, with representatives of the following engineering institutions:—

Belgium — Société Royale Belge des Ingénieurs et des Industriels.

Denmark — Dansk Ingenirforeningen.

France — Société des Ingénieurs Civils de France.

Holland — Koninklijk Instituut van Ingenieurs.

Norway — Den Norske Ingeniorforening.

Sweden — Svenska Teknologföreningen.

Switzerland — Schweizerischer Ingenieur und Architekten-Verein.

United States of America — Engineers Joint Council:—

American Society of Civil Engineers.

American Institution of Mining and Metallurgical Engineers.

American Society of Mechanical Engineers.

American Institute of Electrical Engineers.

American Institute of Chemical Engineers.

Great Britain —

Institution of Civil Engineers.

Institution of Mechanical Engineers.

Institution of Electrical Engineers.

By prior arrangement, the Institute and other Professional Societies in the British Commonwealth were represented at the conference by the three British Institutions.

The Conference considered various questions concerned with the operation and policy of their Institutions and how, by developing more intimate collaboration and an exchange of facilities and information, they could more effectively accomplish the purposes for which they were founded.

Early reports indicate that the Conference was a great success. It is hoped that eventually the conclusions of the meetings may be published in the *Journal.*

Engineers and Senators

A report on the recent ballot for election to the Senate of the University of Toronto reveals that several members of the Institute have been successful candidates for representation of the Faculty of Applied Science and Engineering. These are R. L. Dobbin, Peterborough; J. S. Galbraith, Midland; T. H. Hogg, Toronto; J. C. Keith, Windsor; H. W. Tate, Toronto, and J. J. Traill, Toronto. The two other successful candidates are M. B. Hastings and E. J. Tyrell.

The *Journal* is happy to congratulate all these gentlemen and to express its appreciation of their work on behalf of the profession.

Meetings of Other Societies

Construction executives from all parts of Canada will convene at the Royal York Hotel, Toronto, commencing January 23rd, 1949, and continuing through to the 26th, when the *Canadian Construction Association* will hold its 31st Annual Meeting.

Construction leaders will direct attention to labour and material shortages, construction costs, low-cost housing, management efficiency, new techniques, immigration, labour relations, apprenticeship, building research, road building and public projects planning.

Headquarters of the Association are at the Ottawa Electric Bldg., Ottawa, Ont.

†Alberta includes Irrigation Engineering, 3rd Year 3 (2).
NOTE—The figures shown in brackets indicate, in each case, the number of veterans included in the figure immediately preceding.

This tabulation has for some years been a feature of the December *Journal* and has a particular value in this period of intense activity in all spheres of engineering. It will indicate to employers of engineers the prospects of finding the engineers they require in the next few years and it will guide the prospective engineering graduates in determining how keen may be the competition for engineering jobs if the present intense activity should slacken.

Last year's table indicated that the peak of veteran enrolment had been reached. The figures this year show a definite decline in this category. As expected new veteran enrolment in first year is down considerably in every university although non-veteran registration continues at a high level. There does not appear to be much variation in the popularity of the various branches of engineering.

The normal reduction in numbers is evident from year to year which would seem to indicate that the universities are continuing to maintain high standards of scholarship.

World Power Conference Statistics

The Fourth Statistical Year Book of the World Power Conference has been released recently. It is reviewed elsewhere in this *Journal* (page 663). Persons interested in securing a copy may do so through the Engineering Institute at 2050 Mansfield Street, Montreal 2. The price is $9.50 including postage and exchange on your cheque.

This is the first book to be issued since 1936 and therefore contains figures for eleven years.

There will be some very interesting discussions at the 1949 Annual Meeting. Here are some of the subjects:

Mechanization of Woods Operations
Electronic Control of Paper Machines
The Aluminum Bridge at Arvida
Quebec's Iron and Titanium Developments
Television
Management

● ***The dates are* MAY 11-13 . . . *at the***
CHATEAU FRONTENAC, QUEBEC

Campbell River Power Development

(*Continued from page 646*)

the head cover, and to the upper face of the lower distributor ring.

The gate operating mechanism is protected by shearing pins from possible damage due to the entrance of foreign objects. Woodward governors are used, having a safety shutdown device capable of moving the gates through full travel in three seconds.

Generators

The generators are 3-phase, 60-cycle, 13,200-volts, rated at 25,000 kva. at 0.8 power factor. They are of the three-bearing type, with top thrust bearing and direct connected main and pilot exciters. There is no switching at generator voltage other than that required for the station and local services. Each generator is self-ventilating and uses approximately 50,000 cubic feet of air per minute for ventilation at full load.

Transmission Line

The three phase transmission line is of the loop or closed circuit design, so protected that if trouble occurs in one section it will isolate itself and continue to supply electricity into the other sections not affected. The conductors of the transmission line are seven eighths of an inch in diameter, with twenty strands of aluminum and a sixteen-stranded steel core.

There are approximately 650 towers in the line, spaced about six per mile. These are 85 feet in height, and for erection purposes, the ruling span was 1,000 feet for the Alberni tap, and 1,200 feet for the main line. The longest span is 2,200 feet over the Qualicum River. All changes in direction above 9 deg. are turned on dead end structures.

The towers are of earth grillage footing type, the base of each leg terminating in a galvanized grid about five feet square, set to lie parallel to the surface grade, and at a depth of 8 feet. Galvanizing complies with the standard 6 dip test. The total weight of steel is just under 6 million lb., the average weight of the standard 85-ft. tower being 8,300 lb., and of the anchor tower, 16,800 lb.

The tower line is located along the centre of a 90 ft. right of way, completely cleared. In addition, any trees outside the right of way, which, in falling, could endanger the line, have been removed. There were 30,800 of such trees to be disposed of and anyone with knowledge of the size of Vancouver Island trees will appreciate what this meant.

Substations

As stated earlier, there are two substations, one each at Alberni and Nanaimo. At Alberni, the design provides for two banks, each comprising three single phase transformers. The initial capacity is 15,000 kva. A distribution switchboard of several panels is installed at this station, and, in designing the building for its enclosure, it was deemed advisable to provide space for an indoor type synchronous condenser.

At Nanaimo, no local distribution will be required, and this station will step the voltage down to 60 kv. the voltage of the existing transmission lines in the Nanaimo Area. The transformer capacity at Nanaimo is 15,000 ka. in three single phase units.

Acknowledgements

Grateful acknowledgement is made to the following for valuable assistance and data supplied in the preparation of this paper:—

S. R. Weston M.E.I.C., chairman, B.C. Power Commission, Victoria.

T. Hogg, M.E.I.C., executive assistant, British Columbia Power Commission, Victoria; technical data, maps and description of the development.

H. J. Napier-Hemy, M.E.I.C.; personal photographic record of expedition.

J. B. Curran, reporter, Nanaimo Free Press, Nanaimo.

Personals

Notes of the Personal Activities of Members of the Institute

Professor J. J. O'Neill, M.E.I.C., dean of faculty of engineering at McGill University, Montreal, has been appointed vice-principal of the University. The vice-principal is to assist Dr. F. Cyril James, principal and vice-chancellor, in the general academic work of the University and will be in direct and active charge of the detailed planning of the Physical Sciences Centre. Vice-Principal O'Neill is also Dawson professor of geology, and chairman of the department of geological sciences.

He is from Port Colborne, Ont. He entered McGill where he obtained a B.Sc. degree in mining, and an M.Sc. in geology. He then went to Yale University, New Haven, Conn., where he won a Ph.D., and continued his post-graduate work at the University of Wisconsin in geology. Returning to Canada, he joined the staff of McGill as a lecturer in 1921. He was promoted to assistant professor in 1924, associate professor in 1927, Daw-

Photo by Blank & Stoller, Montreal.

Dean J. J. O'Neill, M.E.I.C.

son professor in 1929, dean of the science division in 1935, dean of the faculty of graduate studies in 1939, and dean of the faculty of engineering in 1942.

During his earlier years he was active in field work. He was a member of the Canadian Arctic Expedition in 1913-1916. From 1920 to 1921 he was engaged in geological work in British India and Kashmir. He has done consulting work in all the Canadian provinces.

Vice-Principal O'Neill is a member of the Professional Engineers of Quebec, the Canadian Institute of Mining and Metallurgy, the American Institute of Mining, the Geological Society of America, the Society of Economic Geologists, the Canadian Association of Geologists. He is vice-chairman of the Board of Governors of the Arctic Institute of North America, and a Fellow of the Royal Society of Canada.

Paul F. Sise, M.E.I.C., president of Northern Electric Company Ltd. for the past twenty-nine years, tendered his resignation at a meeting of the board of directors held on October 28. Mr. Sise's resignation became effective November 30, at which time he became chairman of the board of directors.

Photo by Associated Screen News Ltd., Montreal.
Paul F. Sise, M.E.I.C.

Col. R. Dickson Harkness, M.E.I.C., succeeds Mr. Sise as president of the Company. He was vice-president, general manager and director since 1938.

Mr. Sise joined the Northern Electric and Manufacturing Company in Montreal in 1904. He became managing director in 1910, and four years later, when this company merged with the Imperial Wire and Cable Company to become Northern Electric Company Limited, he was appointed vice-president and general manager. After serving with the Canadian army overseas during the first Great War, Mr. Sise returned to Canada in 1919 and in the same year became president of the company.

After temporary employment for two summers as an operator in the company's telephone shops, Col. Harkness' regular service with Northern Electric began in 1913 in what was then known as the general manufacturing department. At the outbreak of war in 1914 he enlisted in the army. He served with distinction overseas during the entire period of the war, rising from private to major, and was awarded the D.S.O. and the M.C. His interest in military affairs continued after the end of the war and his ability and further service were again recognized in his later promotion to the rank of colonel.

In 1919, Col. Harkness returned to Northern Electric as assistant cable sales manager in Montreal. He was appointed district manager in Winnipeg in 1925, and later in the same year, returned to Montreal as telephone contract manager. In 1928 he became general commercial manager and was appointed to his present position in 1938.

W. D. Jewett, M.E.I.C., of Montreal, has been elected president of the Canadian Exporters' Association. He had been a director of the Association for some time and was elected to the post of vice-president in 1946.

Mr. Jewett has been actively engaged in the export field since his appointment in 1945 to the position of export manager for Dominion Bridge Company Limited. He studied engineering at University of Toronto, graduating in 1923, joined Dominion Bridge then, and has held numerous responsibilities in engineering design, field engineering, sales and advertising.

Mr. Jewett is now on a second visit

Photo by Associated Screen News Ltd., Montreal.
Col. R. Dickson Harkness, M.E.I.C.

to the South American Republics and, following his return, will deliver an account of his visit to several branches of the Exporters' Association.

P. R. Sandwell, M.E.I.C., of Vancouver, and H. W. Beecher of Seattle, Wash., have announced the formation of the firm, Beecher and Sandwell, for the practice of consulting engineering.

Mr. Beecher has been heat and power consultant for the Powell River Company Limited of Vancouver.

Mr. Sandwell, a 1935 graduate of the University of British Columbia, has been engaged in the pulp and paper field since graduation. His activities have extended to Ontario, Quebec, and Australia. He has been chief engineer for Powell River Company Limited, which company has announced that Beecher and Sandwell have been retained as general consultants.

W. L. Dutton, M.E.I.C., has been appointed operations manager of Union Gas Company of Canada Limited, Chatham, Ont.

Mr. Dutton was with the Company as

W. D. Jewett, M.E.I.C.

a student, and rejoined it upon graduation in civil engineering from the University of Toronto in 1931. Since that time he has worked in all branches of the engineering department, and was its head at the time of his present appointment.

Mr. Dutton, joined the Reserve Army in 1923 and enlisted on the mobilization of the Kent Regiment. He served in Europe with the rank of lieutenant-colonel and was awarded the O.B.E. He returned to the Company on his discharge in November, 1945. Since then he has been commanding officer of the Kent Regiment Reserve, a position he has just relinquished owing to pressure of civilian duties.

H. J. McEwen, M.E.I.C., whose 35th anniversary of service in Calgary for the Canadian Westinghouse Company, coincided with the recent official opening of new extended premises of the Company there, is Alberta district manager.

A graduate in electrical engineering of Toronto University, he has taken an active part in the extension of the Company's service in the west since his arrival in Calgary as sales engineer in 1913. He was placed in charge of sales of the company in that Province, and in 1919 was appointed branch manager, later receiving his present appointment.

Mr. McEwen has been active in Institute affairs, serving as chairman of the Calgary Branch in 1942.

A. A. Buchanan, M.E.I.C., is a wing commander in the R.C.A.F. He has been transferred to England for a two-year post-graduate course in aeronautical engineering at the City and Guilds College of the Imperial College of Science and Technology, University of London. A graduate in mechanical engineering of McGill University, Montreal, class of 1939, Wing-Commander Buchanan joined the R.C.A.F. soon after graduation.

R. A. Coombes, M.E.I.C., has been elected chairman of the Niagara Peninsula Branch of the Institute. He is a switchgear engineer at English Electric Company, St. Catharines, Ont.

Mr. Coombes is from North Devon, N.B., a graduate of University of New Brunswick, having received a B.Sc. degree in 1942. From 1942 to 1945 he was in the R.C.N.V.R., serving as a naval engineer. He entered the English Electric Company in 1946.

W. A. Newman, M.E.I.C., of Montreal, manager of the Canadian Pacific Railway's department of research, received honours recently from two American organizations.

The American Society for Metals, in convention at Philadelphia, selected him to receive their distinguished service award, citing his "valuable contribution to the advancement and progress of alloy steel."

W. A. Newman, M.E.I.C.

The Engineering Foundation, which provides grants from its endowments for research work, appointed him at its annual meeting in New York as a member of its research procedure committee.

Mr. Newman's work in alloy steel goes back to 1918 when he conducted the Canadian Pacific's development of heat-treated alloy steel frames for locomotives and the use of alloy steel plates for pressure vessels.

E. D'Appolonia, M.E.I.C., was awarded the degree of doctor of philosophy in civil engineering in October last by the University of Illinois. Since September 1, 1948, Dr. D'Appolonia has been assistant professor of civil engineering at Carnegie Institute of Technology, Pittsburgh, Penn.

He attended the University of Alberta, and after receiving a B.Sc. degree in civil engineering in 1942, he taught at the university until 1946, when he received the degree of master of science.

Lt.-Col. R. E. Wilkins, M.E.I.C., who relinquished command of the Royal Canadian School of Military Engineering in September, 1947, was posted to the Directorate of Works and Accommodation, Ottawa. He recently took his discharge from the Canadian Army and is employed as a logging engineer with B.C. Forest Products Limited, at Port Renfrew, B.C.

Col. Wilkins graduated from Royal Military College, Kingston, in 1935, and received the degree of B.Sc. from Queen's University a year later. In 1936, a lieutenant in the R.C.E., he was stationed at Esquimalt, B.C. He served later at Sydney, N.S., at National Defence Headquarters, Ottawa, and at Halifax. He went overseas in 1942 with the rank of major. Returning, he was made commandant of the R.C.S.M.E. at Chilliwack, in 1946, with the rank of lieutenant colonel.

A. G. Hibbard, M.E.I.C., has been promoted from assistant roadmaster, Montreal Terminals Division, Canadian Pacific Railway, to roadmaster on the Smiths Falls Division, with headquarters at Union Station, Ottawa. Mr. Hibbard graduated from McGill University in 1941 with the degree of B.Eng. He joined C.P.R. that year.

David Whittaker, M.E.I.C., is at Mattawa, Ont., assistant supervising surveyor on the relocating of some 40 miles of Canadian Pacific Railway in the interests of the Hydro Electric Power Commission of Ontario. His headquarters are at H.E.P.C., Toronto.

David Whittaker, M.E.I.C., is at Mattawa, the Roads Department of the Province of Quebec, but has entered the Public Works Department, technical division of the City of Montreal.

Mr. Quintal graduated in 1944 from Ecole Polytechnique with the degree of M.A.Sc. He entered the Highway Department that year as an engineer in the soils department.

A. P. Wiles, JR.E.I.C., has been appointed municipal engineer of Richmond, B.C. He was previously at University of Saskatchewan, instructing and doing research work since 1946, when he graduated with the degree of B.Sc. in engineering physics.

C. H. Olson, S.E.I.C., is with the Hudsons Bay Oil and Gas Company Limited in Calgary, Alta. Mr. Olson graduated in civil engineering at University of Alberta in 1947.

J. A. Paxton, S.E.I.C., **J. P. Watkins,** and **L. R. Coleman,** S.E.I.C., of the University of Saskatchewan, received scholarships recently. On October 13, President J. S. Thomson of the University presented Massey-Harris scholarships to the total value of $1,000 to these three senior engineering students who had worked with the Company during the past summer.

Bob Butler, S.E.I.C., is president of the Students' Representative Council of the University of Saskatchewan this year. He is a fourth year student in mechanical engineering. **Stan Rakosh,** S.E.I.C., is leader of the Student Engineering Society of University of Saskatchewan for the current year.

Visitors to Headquarters

F. E. Bronson, M.E.I.C., Ottawa, chairman of the Federal District Planning Commission on November 9.

Norman Eager, M.E.I.C., general manager of Burlington Steel Company Limited, Hamilton, Ont., on November 10.

G. K. Bell, Wilton and Bell, consulting engineers, Westminster, London, England, on November 17.

Dr. T. H. Hogg, M.E.I.C., consulting engineer, Toronto, Ont., on November 22.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Dr. Daniel W. Mead, HON.M.E.I.C., one of America's outstanding engineers and professor emeritus of hydraulic and sanitary engineering at the University of Wisconsin, died at his home in Madison, Wisconsin, on October 13, 1948. He had been in ill health for several years.

For many years Dr. Mead was associated with the late C. V. Seastone under the firm name of Mead and Seastone, consulting engineers. After retiring as a member of the firm, he continued as a consultant. Dr. Mead was also senior member of the engineering firm of Mead and Scheidenham, New York City.

He joined the staff of the University of Wisconsin in 1904 and served as part time professor until 1932 when he retired as professor emeritus. After his retirement from the University he continued to give lectures for five years. During the entire time he served the University he was also engaged as a consulting engineer. He built water works in Rockford and Fort Worth, Tex., Danville and Moline, Ill., and supervised the building of the Kilbourn and Prairie du Sacs hydro-electric plants.

Dr. Daniel W. Mead, Hon.M.E.I.C.

Dr. Mead was much in demand as consultant. In 1914 he was named as a member of the Red Cross commission to China, on flood protection of the Huni River. He spent six months in

Canada. In 1922 President Coolidge appointed him to the Colorado river board to pass on the Boulder Canyon Project. He was also named chairman of a committee to make a study of the conditions of Madison and surrounding lakes. He served at one time on the Mississippi flood control committee of the U.S. Chamber of Commerce.

In Madison he served as chairman of the Wisconsin section of the American Waterworks Association and was later elected an honorary member of the national group. He was a past president of the American Society of Civil Engineers and was made an honorary member of the Society in 1931. He was a life member of the Western Society of Engineers, which presented him with the Washington award in recognition of "devoted, unselfish and prominent service in advancing human progress." He also held membership in the Wisconsin Society of Professional Engineers, was a fellow of the American Institute of Electrical Engineers, and was a member of the board of the American Society of Mechanical Engineers.

In 1941 Dr. Mead was awarded an honorary citation by State College, Pa. In 1931 he had been granted the degree of LL.D. by University of Wisconsin. He was the author of several engineering publications. In 1937 the American Society of Engineers presented him with the Norman Medal for his paper on "Waterpower Development of the St. Lawrence River."

Dr. Mead was born at Fulton, in New York State, in 1862. He graduated from Cornell University in 1884, after which he took a position with the U.S. Geological Survey. In 1885 he became city engineer for Rockford, Ill. Two years later he resigned to become general manager of the Rockford Construction Company. In 1896 he opened an office as a consulting engineer on hydraulic works and power plants. He later joined Mr. Seastone in Madison.

"*The Wisconsin State Journal*", commenting on the loss of Dr. Mead to the profession, referred to him as "one of the World's giants". That the Engineering Institute of Canada has shared in that estimation was signified by the conferring upon Dr. Mead in 1944 of an Honorary Membership. He attended the Annual Meeting in Quebec City in 1944 to receive the certificate in person.

William Chase Thomson, M.E.I.C., senior engineer of the Department of Public Works, Province of Quebec, who died at his home in Quebec recently, was a student member of the Institute at its foundation in 1887 as the Canadian Society of Civil Engineers.

Born in Saint John, N.B., in 1866, he was with the Intercolonial Railway in the chief engineer's office at Moncton, N.B., when he joined the Institute. He had already done railway work in Nova Scotia for the Great American and European Short Line Railway and in Maine for the New Brunswick Railway.

In 1891 he joined the King Bridge Company, Cleveland, Ohio, designers of railway and highway bridges, and three years later joined Dominion Bridge Company Limited, Montreal, where he remained for many years.

In 1915 while a consulting engineer in Montreal, he went to Le Pas, Manitoba, in connection with the Kettle Rapids Bridge on the Hudson's Bay Railroad. As a consulting engineer he worked for the Canadian Pacific Railway on the design of the tower of the famous Chateau Frontenac in Quebec City. He also represented the Cleveland Bridge Company of Darlington, England.

From 1925 to 1927 he was a structural engineer for the Canadian Section of the Joint Board of Engineers studying development of the St. Lawrence River. In 1927 he accepted an appointment as designer for Dominion Bridge Company, Lachine, Que. In 1932 he was with the Lake St. Louis Bridge Corporation, as consulting engineer. Joining the Department of Public Works of Quebec in 1938, he was on the engineering staff, being named senior engineer in 1946.

Mr. Thomson transferred to Associate Member of the Institute in 1894, and to Member in 1900. He became a Life Member in 1936.

Prof. Ernest A. Stone, M.E.I.C., well-known civil engineer passed away in hospital in Toronto, on October 9, 1948, after a short illness. He had resided in Toronto from 1943, and had retired a year ago from consulting work.

Born at Charlottetown, P.E.I., in 1870, in 1891 he graduated with honours from McGill University with a degree in engineering. He entered railway work the same year as assistant engineer on construction of the Montreal-Ottawa line. Then for two years he was an engineer for Canada Switch Manufacturing Company Limited. In 1894 he was awarded a masters degree in engineering by McGill, and thereafter did engineering work for Canadian Pacific Railway, until 1899 when he joined the Lake Superior Power Company. He later worked for Canadian Electro-Chemical Company; and for the Canada Foundry Co. Ltd.

He joined the staff of Dalhousie University as a professor in civil engineering, and later transferred to the University of New Brunswick, where he served for three years as dean of applied science.

Entering private practice in Vancouver, he designed many structural steel plants of note, and built the famous bridge which spans the Fraser River at Lytton, B.C. During this time he also lectured at University of British Columbia.

During World War I, he became associated with Queen's University and, while there, received an invitation to occupy the chair of engineering at the Chinese Government university of Tang Sing. Later he accepted a similar offer from King's College, Windsor, N.S., where he was awarded an honorary degree for his outstanding work in engineering. He was asked at one time to teach in Bergen, Norway, but preferred to remain in Canada.

Professor Stone designed structural steel plants for Hepburn Company during World War II, and since the war he had done consulting work in reinforced concrete.

Professor Stone was a Life Member of the Engineering Institute from 1930. He had joined as a Student in 1888, transferring to Associate Member in 1895, and to Member in 1906.

Professor Stone's scholastic record at McGill was rivalled by that of his son, also a gold medallist on graduation. Captain Rendle Stone, M.B.E., who was British vice-consul at Detroit, U.S.A., predeceased his father.

Major J. C. Macdonald, M.E.I.C., whose accidental death on October 11, 1948, has been reported with regret from Victoria, was born in Londonderry, N.S., in 1880.

Major Macdonald, a veteran of the South African War, studied engineering at Dalhousie University, receiving the degree of bachelor of engineering in 1906. For several years he worked on railway construction in British Columbia for the Canadian Pacific Railway, and the Grand Trunk Pacific. He worked also in New Brunswick and Northern Ontario on similar work. In British Columbia he did preliminary work on the Second Narrows Bridge at Vancouver; and on the staff of Cleveland & Cameron, Vancouver, he was in charge of installation of municipal water systems in Richmond and Burnaby, B.C. He continued in general practice with that firm, where his work included development of mining properties.

In 1914 he went overseas with the Canadian Engineers, attained the rank of major, and returned in 1919 when he was placed in command of the Canadian Engineer Depot in Vancouver. He had been mentioned in despatches and had been awarded the Military Cross.

On his release later in 1919, he was given charge by the Department of Lands of B.C., of the reorganization of the irrigation systems in the interior of the Province. In 1926 he was named comptroller of water rights for the Province of B.C. In 1939 he resigned that post, to act on the newly established British Columbia Public Utilities Commission. He remained with the Commission until his death.

Major MacDonald joined the Institute as a Student in 1908, transferring to Associate Member in 1912, and to Member in 1923. He was made a Life Member in 1947.

John Gerard O'Donnell, M.E.I.C., of Quebec City died at his home on October 31, 1948.

Mr. O'Donnell was born in Quebec City in 1889 and was educated at Quebec Seminary and McGill University, receiving from the latter in 1916 the degree of B.Sc. in civil engineering.

After graduating he served with the Imperial Ministry of Munitions as testing engineer; with the Canada Foundries & Forgings of Welland, Ont., as chief inspector; with the Davie Shipbuilding Co. at Lauzon, Que., as assistant engineer in charge of wharf construction; with the National Shipbuilding Corporation of Three Rivers, as engineer in charge of the construction of shipways; and with the Jos. Gosselin Co. Ltd., general contractors, of Quebec, as chief engineer.

In 1922 Mr. O'Donnell entered the service of the Quebec Provincial Government and was called upon to organize the Maintenance Branch of Bridges in the Department of Public Works. He was given charge of this branch and served as maintenance engineer until 1945 when, due to ill health, he was obliged to relinquish his arduous duties. The branch was then divided into two parts with an engineer in charge of the Montreal territory and another in charge of the Quebec territory. Mr.

O'Donnell remained in the service as consulting engineer until 1947 when his failing health obliged him to retire. Mr. O'Donnell joined the Institute in 1916 as a Junior, transferring to Associate Member in 1921, and to Member in 1940.

Albert George Garner, M.E.I.C., consulting engineer of Stratford, Ont., died in an automobile accident on October 1, 1948.

Mr. Garner was born in London, England, in 1883, where he studied building construction. He did some engineering work in London but came to Canada in 1907. He joined the staff of the Stratford Bridge and Iron Works, Stratford, in 1909, as chief draughtsman. He was named chief engineer in 1913, and held the post of vice-president and chief engineer from 1918 to 1926. He then joined the McGregor-McIntyre organization as a sales engineer, and was later connected in that capacity with the Dominion Bridge Company, and with the engineering and contracting department of the Hamilton Bridge Company. Meanwhile, from 1931 he had also been in private practice in Stratford. This practice was maintained up to Mr. Garner's death.

Mr. Garner was active in civic affairs, having served at one time on the Public Utility Commission. He was an honorary life member of the Canadian Legion. He had been a Member of the Engineering Institute from 1945.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Cornwall

G. G. M. Eastwood, M.E.I.C.
Secretary-Treasurer

T. B. Webster, M.E.I.C.
Branch News Editor

An interesting lecture entitled **Modern Water Treatment** was presented on October 17 by J. D. Lee, assistant professor of civil engineering at Queen's University. Branch Chairman R. H. Wallace presided over the short business meeting preceding the lecture. Mr. Nesbitt, chairman of the Civic Affairs Committee, outlined the work done by his committee and appealed to all members for co-operation and assistance in studies of water purification and sewage disposal.

Professor Lee declared that water treatment is the most important problem facing a community and that water is the cheapest utility. To satisfy domestic users, water must be safe and pleasant to drink; and to satisfy industrial users, it must be non-scale-forming and non-corrosive.

A typical water treatment plant performing complete treatment was shown by means of lantern slides. Water enters a settling tank from a lake or river and chemicals are added after the first low-head pumps. The treatment varies with the quality of the raw water supply and the degree of purity desired but the chemicals added may be aluminum sulphate, activated charcoal, chlorine and ammonia. The water passes to a sedimentation tank where coagulated solids may settle. In the second stage of treatment, lime, chlorine, and ammonia may be added before the water passes sand filter beds. From these filters, the water drops to a clear well and filtered water storage and is ready for pumping to the city mains. In modern stations, control panels ease the work of the operator, and measure and record the treatment.

In the discussion following the lecture, Professor Lee spoke of the Brantford water treatment where the addition of fluorides to water to inhibit dental decay is being practised. When asked if the St. Lawrence Power Project would be detrimental to Cornwall's water supply due to the elimination of aeration in the Longue Sault Rapids, Professor Lee replied, "While the adage 'Running water purifies itself' is true, it is also true that stagnant water purifies itself more quickly."

Edmonton

E. K. Cumming, M.E.I.C.
Secretary-Treasurer

On October 14 and 15, 1948, Dean J. N. Finlayson, president of the Institute, visited the Edmonton Branch. He was entertained by the executive of the Edmonton Branch at a luncheon held at the Mayfair Golf and Country Club. In the evening, Dean Finlayson addressed the members of the Edmonton Branch at a dinner meeting held in the Macdonald Hotel. The following day he was shown the Leduc oilfield by Dean R. M. Hardy, and in the evening he addressed the Engineering Students' Society of the University of Alberta.

In his address to the branch members at the dinner meeting, Dean Finlayson expressed regret at not being able to attend the First Annual Engineers' Ball. He thanked the Branch for its cordial welcome on his arrival in Edmonton and went on to describe his trip in the East, mentioning the power shortage in Ontario and Quebec, the proposed bridge across the Strait of Canso and other engineering projects. He stated that in all parts of Canada people expressed a high regard for the engineering profession. The president then discussed ideas currently under the attention of Council, including ways and means of improving the *Journal*, widening of the field of membership, and the endeavour of Dominion Council to bring representatives of all engineering groups around a conference table to discuss mutual problems. Dean Finlayson stressed the fact that engineers should speak with a united voice. In closing he asked that the Branches pass on to Council any ideas which they might have with regard to policies of the Institute.

The speaker was introduced by one of his former students, Dean R. M. Hardy, of the University of Alberta and a vote of thanks was moved by Mr. C. W. Carry, another former student. Both men expressed admiration of the President's public speaking ability and members at the meeting showed their hearty agreement.

❖ ❖ ❖

On Friday evening, October 8, members of the engineering profession in the City of Edmonton, and their friends, attended the Engineers' First Annual Ball in the Trocadero Ballroom. This Ball, the first of its kind to be held in Edmonton, was sponsored by the Edmonton Branches of The Engineering Institute of Canada and the Military Engineers Association of Canada.

Members of the Association of Professional Engineers of Alberta, and the Edmonton Branches of the Canadian Institute of Mining and Metallurgy and the Chemical Institute of Canada were invited to attend. About four hundred people attended, making this function a real success. Guests were received by H. W. Tye, chairman of the Edmonton Branch of the E.I.C. and Mrs. Tye, and Mr. and Mrs. J. E. Cranswick. Invited guests included: Hon. N. E. Tanner, minister of lands and mines for the Province of Alberta; B. M. Hill, president, Canadian Electrical Association; J. E. Oberholtzer, chairman, Chemical Institute of Canada; C. S. Clendening, president, Association of Professional Engineers of Alberta; R. M. Hardy, dean, Faculty of Engineering, University of Alberta; R. M. Watson, chairman, Edmonton Branch of the Canadian Institute of Mining and Metallurgy; Lt. Col. J. S. Beeman, command engineer officer, Western Army Command; G/C M. M. Hendrick, senior air staff officer, R.C.A.F., North West Air

Command; D. D. Dick, president, Engineering Students' Society, University of Alberta.

As a result of the success of this First Ball, the members of the engineering profession in Edmonton hope that it may be made an annual event.

Kingston

D. L. Rigsby, M.E.I.C.
Secretary-Treasurer

G. L. Macpherson of Sarnia, president of the Professional Engineers Association of Ontario, addressed a joint meeting of the Association of Professional Engineers of Ontario and the Kingston Branch of The Engineering Institute of Canada.

Mr. Macpherson sketched the growth of the engineering profession generally, and in Ontario particularly. To the E.I.C., established in 1887, every engineer owes a great debt, Mr. Macpherson said. He spoke of legislation benefiting public interest primarily, and, secondarily, engineers themselves. This year a code of ethics has been incorporated into Association by-laws. Benefits of the Association include "The Professional Engineer," a plan of group insurance, initiated this year; and plans for medical services are now under consideration. The association also awards several scholarships to engineering students in two Ontario universities.

"The industrial organization . . . without engineering personnel is out of date and it is doubtful if it can survive," said Mr. Macpherson.

Col. L. F. Grant, past president of the E.I.C., introduced Mr. Macpherson.

Col. T. M. Medland, executive director of the Ontario Association described in detail some activities carried on by the Association to protect the public from persons who may not be qualified to do work which they undertake.

Legislation, Col. Medland said, is being watched to see that careful consideration is given to all items affecting the engineering profession and engineers, since the legal aspects of engineering are becoming more important as time goes on.

A discussion period which followed covered such topics as activities of the association with respect to undergraduate engineers and engineers in politics.

❖ ❖ ❖

On Tuesday, November 10, Brig. Geoffrey Walsh, M.E.I.C., commander of the Eastern Ontario Area, addressed the Kingston Branch of the Institute on the subject of **The Alaska Highway.**

The speaker, introduced by Lt. Col. W. S. Hunt, officer commanding, R.C.E. M.E. Barriefield, stressed the technical difficulties encountered in the construction of the Alaska Highway, and described the organization required in the construction and maintenance of this large project. The nature of the terrain, the climate, and the general difficulties in transportation, were described. A discussion period followed this most interesting talk.

The technicolour film "Men Against Rock", produced by the Gardner-Denver Company, was shown at this meeting. The film features heavy rock excavation on four large United States projects, including highways, dams, canals, and tunnels and showed current methods used in the construction of these services. C. D. Rees of the Gardner-Denver Company, Toronto, was present to discuss the film.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer
C. A. O. Dell, M.E.I.C.
Branch News Editor

Over fifty members and friends of the Niagara Peninsula Branch were conducted on a tour through the Ontario Paper Company mill at Thorold, Ont., on Thursday, Oct. 21. The arrangement was made through the kind co-operation of Mr. R. Comette divisional manager of the Company.

The visitors convened in the auditorium of the company's new office building, where each person was provided with an elementary flow sheet and an index of the various machines in the plant. Parties of seven or eight were provided with guides and, starting at the docks where pulpwood is unloaded from lake boats, were provided a panoramic view of the complete paper making process. At 6.00 p.m. all parties assembled in the company's dining room where a very fine dinner was served. Later the visitors again assembled in the auditorium and heard the very interesting address of Dr. Sankey of the Ontario Paper Company.

Dr. Sankey was able to throw into sharp relief some of the major problems of the paper making industry and also to bring to light the very important position of this industry in Canadian economy as a provider of United States dollars.

Comparing the groundwood pulp making process with the sulphite process, the speaker stated that one hundred pounds of wood will resolve into about ninety-eight pounds of groundwood fibre, while the same quantity of wood will result in only forty-eight pounds of fibre suitable for newsprint under the sulphite process, but both types of fibre are necessary for successful paper making. The long sulphite fibre forms the foundation mesh and the short groundwood fibre forms the filler for the newsprint sheet.

One of the most important requisites of a pulp mixture as used in modern high-speed paper making machines is that it must be free draining. This property is provided by the long fibre sulphite pulp. The importance of free drainage becomes self evident when it is realized that one pound of paper at the dry end of a paper making machine is made from roughly two hundred pounds of soupy pulp which enters at the wet end of the machine. With paper coming off the machine at the rate of fifteen hundred to seventeen hundred feet per minute it is necessary to remove most of the one hundred ninety-nine pounds of water in one to two seconds.

Production of one ton of paper requires roughly the use of two hundred tons of water, and a short calculation will serve to illustrate the magnitude of quantities handled in the paper machines of a paper mill. For example, a mill producing 500 tons of paper per day must handle 100,000 tons or 200 million pounds of water per day.

After Mr. Sankey's address several films were shown which illustrated the paper making industry and other subjects.

Peterborough

J. M. King, M.E.I.C.
Secretary-Treasurer
J. C. Allan, M.E.I.C.
Branch News Editor

The 29th annual dinner of the Peterborough Branch was held at the Peterborough Golf and Country Club on the occasion of the President's visit on September 24. G. C. Tollington, chairman of the branch introduced Mr. Roy from the Kingston Branch and asked him to introduce the members of a visiting group from Kingston who were heartily welcomed.

C. E. Sisson, A. L. Killaly and M. G. Saunders briefly addressed the branch with news of the progress of other branches. G. R. Langley then introduced Dean J. N. Finlayson, president of the Institute as speaker of the evening.

Dean Finlayson spoke of his pleasure at meeting former pupils from several engineering colleges at Peterborough and wove a story around the large U.B.C. crest behind him with its motto "*Tuum Est*".

Of particular interest was news of the growth of the Branch at Arvida and the buoyant optimism among engineers in that developing area.

Dr. Finlayson called on Canadian scientists to concentrate more on fundamental research. While America has developed applied science to an extraordinary degree, the fundamental research on which most of it is built has come from Europe. As a result of the war British researches have been interrupted, German research men scattered and in Russia the work of scientists is kept secret.

Mr. Tollington thanked the president for his inspiring address and called on General Secretary L. A. Wright for a brief report on the progress of the Institute, to conclude the evening.

Saguenay

J. E. Dyck, M.E.I.C.
Acting Secretary-Treasurer

Some Aspects of Distribution Cables, was the topic of an address by P. J. Croft to the Saguenay Branch on October 28, 1948. Mr. Croft is chief engineer for the Canada Wire and Cable Company Limited, Montreal, Quebec.

In his address Mr. Croft pointed out that distribution cables are expected to give trouble free service over long periods and that the conditions under which these cables have to operate vary considerably in different installations. As a result the insulating materials used to cover the conductors might be expected to withstand considerable flexing, extreme temperatures, moisture and oil conditions in addition to having the necessary dielectric and insulating properties. Since considerable research has been done on insulating materials, Mr. Croft pointed out that a suitable conductor covering can be provided for any particular condition. He added that his company is in a position to recommend the best cable, providing the conditions under which the cable would have to operate are clearly defined.

Mr. Croft showed, by means of slides, the properties of numerous synthetic insulating materials, comparing these in each case with natural rubber. The properties compared were: tensile strength, elongation, resistance to cold, heat, ozone, oil, sunlight, flame and moisture, as well as dielectric strength, insulation resistance and dielectric constant. He pointed out that to prevent failure of an insulating material the dissipation of heat must be sufficient so that a thermal balance is set up before the conductor temperature reaches the point at which the insulation loses it's original properties.

Mr. Croft, before closing showed slides illustrating underground transmission lines as applied to new housing projects.

H. R. Fee thanked the speaker on behalf of the Branch.

Montreal

The Junior Section and the Branch Membership Committee are to be congratulated on the results of their efforts to obtain an increase in the Student Membership. This matter was reviewed last year and it was found that the number of Student Members was far from satisfactory. To overcome this situation, Mr. J. B. Challies agreed to give a talk to the engineering undergraduates at McGill and in addition the various professors were interviewed. The results of the steps taken have been most encouraging in that more than 300 student members have been obtained from McGill University alone.

The symposium on Community Planning which was to be presented on December the 16th has been postponed until February the 3rd, 1949. This change in the programme has been made in order to permit members to attend a lecture by Mr. Lewis Mumford of New York, which is being given under the auspices of the McGill Extension Course. Mr. Mumford's lecture deals with Community Planning and is entitled **The Achievement of Utopias.** Members of McGill Extension Course have been invited to attend Mr. Cousineau's lecture on February the 3rd, 1949 and arrangements are now being made to obtain a larger hall, as it is felt that there will not be sufficient accommodation at Headquarters to seat all those interested.

Members are reminded of the Annual Meeting which will take place on January the 27th, 1949, and of the Dance which is to be held at the Mount Royal Hotel on February the 11th, 1949 Tickets for the Dance will be sold in advance and it is hoped that an attendance of over 500 will be obtained.

Members are requested to advise Headquarters of any change in address so that they will be sure of receiving notices of meetings and other information in regard to Branch Activities.

MONTREAL JUNIOR SECTION OYSTER PARTY

Upper photo—Clockwise around the table are: Jim Rutter, Len Deshaw, Ted Trott, Mel. Bentham, Geo. Morrison, "Mac" MacBride, Jim Scott, Everett Magnusson and Neil Neufeld.

Lower—As the illustration indicates, Irving Tait kept official tally on Norman Coke's consumption. Mr. Coke's modesty prohibits the printing of the official total.

Junior Section

Leo Scharry, Jr.E.I.C.
Secretary-Treasurer

Since the last issue of the *Journal*, activities have been proceeding at a very fast pace in the Section. The executive committee very gratefully accepts the notable increase in attendance as a tribute to the efforts of the many committees who provide meetings of interest to the membership. However, so far this year there has not been one meeting at which the attendance was more than 10 per cent.

The following is a summary of the recent activities of the Section.

On October 18, Mr. W. J. Robinson of Minneapolis-Honeywell spoke on the **Magic of Heating Controls,** and with charts and instruments he demonstrated to the audience the fine results to be had with controls that properly operate.

The Oyster Party on October 29 will be remembered by all those who showed their encouragement in the best tangible way—by attending it. The praise received by the Committee justifies the organization of another party next year, but on a bigger scale. It was a stag party with 100 members attending. As an experiment it came off with a bang!

The Second Ladies' Film Night on November 1 was so successful that the Executive have already drawn up plans for the next one and will add something new to the activities, if circumstances permit. The attendance was approximately 125 with 40 ladies present.

For Students Night on November 15, four speakers were chosen from ten candidates. Two students from Ecole

Top—We pulled the executive away from their shells long enough to take this picture. Bill Smith, Junior Section councillor; Norman Coke, Branch chairman; Irving Tait, Branch vice-chairman; (in rear) J. A. Beauchemin; Paul Salvas, Junior Section chairman; Huet Massue; Leo Scharry, secretary of the Junior Section.

Centre—We haven't been able to identify the first and third oyster enthusiasts but the remainder (clockwise around the table) are: second, Sid Thomas; fourth, Bob Wright; and from his left, A. Cohen, Don Lappi, Bruce Tirrell, Gord. Jeffrey, H. Hunter, Bill Smith and Art Phelan. Leo Scharry, with the beret, is coaching the attack on the obstinate bivalves.

Bottom—A clue to the success of the party was the enthusiasm with which the Junior executives themselves went after the oysters. Reading clockwise around the table, Bill Smith; Leo Scharry; Assistant General Secretary Doug Laird; Paul Salvas; John McPherson, vice-chairman of the Junior Section; Ian Mann; Bob Griesbach, past-chairman of the Junior Section; and J. C. Blair-McGuffy, a recent arrival from the old country.

Polytechnique and two from McGill gave 12 minute talks. Jules A. Tourillon (Polytechnique) spoke on: **The Improvement of the Richelieu Waterway. Tunnelling to Freedom** was the topic discussed by G. D. Harvey (McGill). Clement D. Ratelle (Polytechnique) gave an account of his work on **Brake Lining and Clutches.** J. H. Wright (McGill) had chosen as his subject **Aluminum as a Ship Building Material.**

The Richelieu Chambre de Commerce des Jeunes had delegated a committee of 6 members to attend the talk by Jules A. Tourillon. The evening concluded with the showing of a 30-minute coloured film on Mexico.

The interest shown in the public speaking classes has been more than expected so new quarters have had to be located. At present, each Tuesday night at 8 p.m. at the Ecole Polytechnique, the class is monitored by Mr. De Costa and Mr. Morrison. The procedure is to divide the class and provide each member with the opportunity to stand up and speak. Individual advice is given by the monitors. New members are accepted at any time. For further information, please phone Mr. Morrison at PL. 2211, local 359.

We would like to bring to the attention of all the membership that a magnificent campaign for new members at McGill was held a few weeks ago. The success of this drive was amazing. The Junior Section wishes to extend to the 350 new members a fraternal welcome.

Saskatchewan

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bing-Wo, M.E.I.C.
Branch News Editor

Regina Section

The first joint meeting of the 1948-49 season for the Saskatchewan Branch of the Institute and the Association of Professional Engineers of Saskatchewan was held on Friday, October 22, in the Kitchener Hotel, Regina. Professor A. H. Douglas, vice president of the Branch, was chairman of the meeting. S. R. Muirhead, manager, Saskatchewan Government Telephones, was in charge of "Telephone Night", the main event of the evening.

There were approximately fifty members and guests present. Special guests present and seated at the head table were the Hon. I. C. Nollett, minister of agriculture and a director of the Saskatchewan Government Telephones, and Messrs. J. A. Young, E. Black, also directors of telephones.

Mr. Muirhead gave a very interesting resumé of the difficulties being encountered by the Telephones Department, and how these are being met. At the present time there are some 7,900 telephones on the waiting list. In the last eight months, 3,660 instruments were installed. This rate of 457 per month compares with an average of 151 per month in 1939-1940. There were 4,830,000 long distance messages completed from September, 1947, to August, 1948, of which 204,000 were trans-Canada. During the same period of 1939-1940 there were only 2,310,000 messages completed.

In the present year, to date, some 4,500 circuit miles of new long distance wire have been completed and another 2,500 to 3,000 miles are expected to be installed by the end of the year.

A very interesting film, "Telephone Courtesy", was then shown.

The evening was climaxed by a conducted tour of the Lorne Street Telephone Exchange. The group was shown through the building from the generator and battery room to the long distance toll room. The functioning and operation of various pieces of telephonic equipment was explained and a large number of interesting questions were asked.

The appreciation and thanks of the group was ably expressed by A. B. Olson, Association councillor from Saskatoon.

Saskatoon Section

J. B. Mantle, M.E.I.C.
Secretary

The Saskatoon Section resumed its activities for the year on October 13 with a dinner meeting. The Section was honoured on that occasion by having Institute President J. N. Finlayson as guest speaker.

Dean Finlayson began by recalling some of his early life in Pictou County, Nova Scotia and the growth of the steel industry at Sydney. He related some of his experiences during his present tour of branches and everywhere noted great interest in two particular aspects of Saskatchewan engineering. The harmonious joint operation of the Institute and Association, as well as the recent forward steps with respect to the Engineers Act in the province were looked upon with envy by other branches. In discussing the young engineer and engineering education, President Finlayson suggested that a profound knowledge of technical subjects could provide the much sought after "engineering culture" and would also better suit the engineer to pure research. He was very pleased with the degree of co-operation that the engineering faculties were receiving from practising engineers and contractors.

The gathering was well attended, 70 members and student members being present. This was thought to be a record number for a dinner meeting. Howard Douglas extended a warm welcome to the many student-members attending.

On Oct. 13th, President and Mrs. Finlayson spent a busy day in Saskatoon. In the afternoon the president addressed a group of 450 third and fourth year engineering students at the University. At that time he presented the Institute prize and certificate to chemical engineering student C. J. Brounstein. Later in the afternoon he was present at a round-table discussion with members of the faculty of engineering and conveyed to the group many valuable ideas on engineering education. That evening he was guest speaker at a dinner meeting of the local section of the Institute and Association.

Mrs. Finlayson was guest of honour at a tea in the home of Mrs. I. M. Fraser. Some 50 engineers' wives were present, among them several from out-of-town points who were in Saskatoon accompanying their husbands to the conference of the Western Canada Association of Highway Officials.

Sarnia

B. B. Hillary, M.E.I.C.
Secretary-Treasurer

The Branch was pleased to welcome President J. N. Finlayson in Sarnia, in October. On the morning of the 5th, the president was taken on a tour of local plants including the Imperial Oil Limited, Polymer Corporation Limited and the Dow Chemical of Canada, Limited.

President Finlayson at Sarnia. Left to right, G. R. Henderson, Mrs. Vance, Mrs. Finlayson, the president, Mrs. Henderson, Vice-President J. A. Vance.

A luncheon was held at St. Clair Inn, which is about twelve miles down the St. Clair River from Sarnia. For transportation one of the local businessmen supplied his large cabin cruiser which provided a most enjoyable cruise. The President enjoyed himself immensely at the helm of the "Gennie K". The party included Vice-President and Mrs. Vance of Woodstock. The luncheon and the return voyage occupied the better part of the afternoon.

In the evening cocktails were served at the Golf Club where the president had the opportunity of greeting and chatting with most of the members of the Sarnia Branch and their wives. This was followed by dinner and the president's address.

The next morning Dean Finlayson motored to Windsor with Mr. and Mrs. Vance.

Toronto

R. A. Muller, M.E.I.C.
Secretary-Treasurer

Junior Section

David Beattie, Jr.E.I.C.
Publicity Chairman

The first meeting of the season was held on Thursday, November 11 in the Electrical Building of the University of Toronto. The new executive was introduced to the membership for the first time by the Chairman, Kenneth A. Brown.

The speakers of the evening were very well received by an audience of about 100. G. F. C. Weedon spoke on **Communications in field and industry** emphasizing the possibility of utilizing modern electronic gadgets to facilitate the progress of engineering projects. He illustrated his talk with slides and typical equipment. F. R. Duncan followed, discussing **Applications of law to engineering.** The topic proved very interesting, as indicated by the vigorous questioning of the speaker during the discussion period which followed. D. H. W. Kirkwood then offered a review of atomic energy development, under the title, **Some Aspects of Atomic Energy.** The philosophical as well as the scientific application of this new discovery was emphasized by the speaker. The thanks of all present were tendered by the section's vice-chairman, T. Ivory.

Vancouver

Alan M. Eyre, Jr.E.I.C.
Secretary-Treasurer

Stuart Lefeaux, Jr.E.I.C.
Branch News Editor

On Wednesday, October 20th, the Vancouver Branch was favoured with an address by F. G. Kerry, of Montreal, **The Production and Industrial Application of Tonnage Oxygen.**

Mr. Kerry was introduced by Fred Adams, local manager of the Canadian Liquid Air Company Limited. He is manager of the Development and Engineering department of the Canadian Liquid Air Company Limited. During the past year he has done considerable research work on tonnage oxygen uses in steel production.

Mr. Kerry limited his address to an outline of recent developments in the production and use of cheap industrial oxygen. The oxygen used commercially for steel cutting, etc., must have a purity of 99.5 per cent or better and must be stored in cylinders.

Industrial or "tonnage" oxygen as produced in the recently developed plants has a maximum purity of 95 per cent and is suitable only for metallurgical and chemical operations; it is not economically feasible to store tonnage oxygen as the process is continuous and the capacity 500 to 1,000 tons per day.

In the production of steel by the open-hearth process, the use of tonnage oxygen as a primary element in combustion and not as an air-enriching agent has proved highly efficient and speedy. Oxygen-enriched air for Bessemer furnaces has increased the amount of scrap that can be handled and has reduced the blow-time necessary. Pyritic smelting has been proved practical with the use of tonnage quantities of cheap oxygen.

Other uses for tonnage oxygen include: enriching of producer gas, cracking of methane and propane, the production of synthetic gasoline. The high capital investment involved and the high production output of tonnage oxygen plants are the important limiting factors in their use.

The speaker concluded that the ever-increasing shortages of primary materials and rising labor costs are quickly turning tonnage oxygen from an academic curiosity into a necessity.

Many interesting questions were fired at Mr. Kerry and a lively discussion ensued. H. T. Libby, thanked the speaker for the excellent address. The chairman announced the branch field trip to Chilliwack on November 6th as guests of the R.C.E.

❖ ❖ ❖

On Saturday, November 6, forty-four members of the Vancouver Branch travelled by chartered bus to the Royal Canadian School of Military Engineering at Chilliwack. The party was met by Lieutenant-Colonel L. G. C. Lilley, D.S.O., R.C.E. and fellow officers who welcomed the members in the officers mess. After toasting the Army, the members were served a hearty lunch and the chairman outlined the inspection trip for the afternoon.

Colonel Lilley explained the operation of the school and outlined the dispersal of the 650 personnel. The school is at present the only R.C.E. corps active force training camp operating in Canada. The work of the school includes basic training, trades training, N.C.O. qualifying courses, officer qualifying courses, C.O.T.C. summer training and reserve force summer training. Recruits are given six months basic training and six months trades training before being sent to a works unit as a helper or a tradesman, group one.

The members formed five parties to be guided by Major N. Sadlier-Brown, Major A. J. Abbott, Major S. B. Sweeney, M.C., Major R. T. Miller, and Major R. H. Young.

The members returned to the officers' quarters for a welcome cup of coffee and sandwiches before boarding the bus for Vancouver. The feeling of those present was summed up by Colonel Lilley who stated that the exchange of visits and ideas by the civilian and military engineers makes for better understanding and progress in the profession. P. B. Stroyan, on behalf of the Vancouver Branch, thanked Colonel Lilley and his staff for the excellent hospitality and programme shown the members.

Victoria

S. H. Frame, M.E.I.C.
Secretary-Treasurer

T. A. J. Leach, M.E.I.C.
Branch News Editor

Mining Coal under the Sea was the topic of an interesting address given by Dr. F. W. Gray to the Victoria branch on October 22nd.

Dr. Gray, who was assistant general manager of the Dominion Steel and Coal Corporation at Sydney, from 1927 to 1945, dealt in particular with this field.

Although containing only 3 per cent of Canada's coal resources, the Sydney fields have in the past contributed from 50 to 100 per cent of the total Canadian coal output. Its ten submarine collieries at present produce 5 million tons annually which is about one third of the country's production. It has been estimated that this rate of production can be maintained for a period of from 150 to 180 years. This rate cannot be exceeded without seriously limiting the ultimate yield of the mine. Such a limitation is not generally known by the public.

The Sydney under-sea mines stretch along a coastal frontage of 20 miles with working faces extending seaward a maximum distance of 4 miles. This working face, like the front line of an advancing army, is dependent upon its lines of communication. Mine cars filled at the face must be delivered to the surface, unloaded and returned. A continuous circulation of fresh air must be available at the face and in turn, the spent air intermixed with the existing gases, must be forced out.

Dr. Gray estimated that the penetration seaward might eventually reach 10 miles. However, with increasing distance, transportation of the miners becomes the main problem and present rate of travel places the economical limit at 6½ miles. The allowable over lap depth for the mine is estimated to be 4000 feet, which is considerably greater that the existing overlap and it will not be approached even for maximum penetration. Other problems of under sea mining include power, transmission and haulage.

Canada's only bituminious coal supplies, once the Sydney fields have been exhausted will be west of the foothills of the Rockies. It is therefore necessary, from a national point of view, to win all the coal possible from the under sea field for the longest possible future.

Finally, the speaker pointed out that the recent cut in the importation of U.S. steel, would indicate the importance of the Sydney fields, in connection with the iron ore deposits under Conception Bay on Newfoundland. This iron ore, also won entirely under the sea, is melted in the blast furnaces at Sydney. Such a combination, with its defence implications, does not exist elsewhere in our country.

BOOK REVIEWS

STATISTICAL YEAR-BOOK OF THE WORLD POWER CONFERENCE: No. 4 — Data on Resources and Annual Statistics for 1936-1946.

Edited by Frederick Brown. London, World Power Conference, 1948. 212 pp., tables, cloth, 45 shillings, net. (Distributed in Canada by The Engineering Institute of Canada, 2050 Mansfield Street, Montreal 2, Que.)

Reviewed by Huet Massue, M.E.I.C.*

The first post war issue of the Statistical Year-Book of the World Power Conference is the most comprehensive collection of power statistics yet published by that organization. It contains information on the resources, production and utilization of solid, liquid and gaseous fuels as well as water power and electricity. The statistics, the latest available, cover the years 1936 to 1946 and relate to more than sixty countries with such continental and world totals as it was practicable to calculate. No other organization could furnish a more authoritative collection of comparable information. The World Power Conference being a federation of national committees, made up in general of representatives of government, industry, and science, is indeed in a unique position to make such a contribution.

Owing to the war, data for some mid-European countries could not always be included and recent information regarding the U.S.S.R. is not available. The introduction, in addition to indicating the scope of the year-book and giving certain definitions, shows the area and the population of the countries concerned.

SOLID FUELS—coals, brown coal, lignite, peat, coke and other manufactured fuels and wood—are dealt with in the second section. Of the world proven reserves, Europe is found to contain 90% of the coal and 66% of the brown coal and lignite On the other hand, of the probable world total reserves, America is indicated as having 42% of the coal, 75% of the brown coal and lignite and 10% of the peat.

The United States, with 539 million metric tons of coal produced in 1946, leads all the countries of the world. With 193 million tons the United Kingdom came second, Germany was third with 66 and France fourth with 47 million tons. While, in comparison with 1936, the production of 1946 was 20% higher in the United States and 5% higher in France, it was lower by 17% in the United Kingdom and by 65% in Germany.

WOOD—Forest areas in the U.S.S.R.,

**Statistical Engineer, Shawinigan Water & Power Co., Montreal, Que.*

at 634 million hectares, are somewhat larger than the 607 million hectares in the United States. In Europe there are 131 million hectares of forest, Asia has 153 and Africa 127. Annual wood cutting is by far the largest in the United States; the 377 billion cubic meters of solid volumes of products in 1943 compare with 60 for Canada, 44 for Sweden and 36 for France.

LIQUID FUELS—petroleum, benzoles and alcohols—are analyzed in the third section. With 273 millions of kilolitres, the production of petroleum in the United States far exceeds the production of any other country. In Canada the production only amounts to some 10 million kilolitres; in France and in the United Kingdom it amounts to about 3 million

GASEOUS FUELS—natural and manufactured—are considered in the fourth section. With 159 billion cubic meters of production of natural gas in 1944, the United States lead the world. Of the countries recently reporting, Canada is second with 1.3 billion and Argentine third with 0.7 billion. The 36 billion cubic meters of manufactured gas in the United States compare with 18 billions in the United Kingdom and 8 billions in Poland.

WATER POWER AND ELECTRICITY are studied in the fifth and last section. Water power resources, at arithmetical mean flow, are indicated to amount to 82 million kilowatts in the United States, 54 in Canada, 20 in Norway, 16 in Sweden, 12 in Italy and 8 million in France. The capacity of installed water wheels amounts to 14 million kilowatts in the United States, 7.4 in Canada, 4.9 in Italy, about 3.4 in France, 2.7 in Switzerland and 2.4 millions in both Norway and Sweden.

Since 1936 the production of electricity has increased all over the world. In the United States it grew from 109 to 223 billion kilowatt-hours, in Canada from 25 to 41 billion kilowatt-hours. In Great Britain it also nearly doubled by increasing from 20.5 to 41.3 billion kilowatt-hours. In Norway and Sweden it also more than doubled during the period by increasing from 3.2 and 5.0 billion kilowatt-hours to 6.7 and 10.4 billion kilowatt-hours respectively.

In short the Statistical Year Book No. 4 of the World Power Conference will be a valuable addition to any library.

CHAMBERS' TECHNICAL DICTIONARY, rev. ed.:

C. F. Tweney and L. E. C. Hughes. N.Y., Toronto, Macmillan, 1944. 975 pp., illus., 8¼ x 5¾ in., cloth, $6.00 in Cana a.

A good technical dictionary is an indispensable reference tool for all engineers, as well as for students and technically-minded laymen. Included in this dictionary are terms used in pure and applied science, medicine, the chief manufacturing industries, engineering, construction and the mechanic trades. The scope is defined in its preface, and it is claimed that in engineering, the terms used in every branch, including metallurgy, are fully dealt with. The editors stress that in electrical engineering, due consideration has been given to such newly-developed and ever-changing subjects as electrical communication, telephony, radio, television, acoustics and cinematography.

Each term is clearly listed in bold face type. In all cases the specific branch of science or technology to which the term belongs is given. Definition is not confined to single words, but also to numerous short phrases, such as "control room", "electroplating generator", and "pillar drill". Alternative meanings are noted; "see" references, linking related terms, are abundant; pronunciation of words is indicated. Where illustration of a meaning is necessary, as for instance in the case of a formula or an organic chemical compound, such an illustration is included, although this does not occur frequently. An appendix contains the Greek alphabet, a table of chemical elements with their properties, and various other chemical, botanical, and zoological tables

In such wide, varied, and rapidly-changing fields as the technical ones, it is difficult, but it is also indispensable, to find a comprehensive dictionary that adequately fulfils its purpose. While this dictionary was published in 1944, and therefore lacks the very latest developments, it has been found, in five months continual use in the Library of the Engineering Institute of Canada, the most complete and satisfactory of its size and range in the engineering field. It is practically all-inclusive, and the definitions are excellent in conciseness and clarity.

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library but may not borrow material.

ABSTRACTS

INSTITUTION OF ELECTRICAL ENGINEERS

Summaries of Papers to be read in London, first half session 1948-49

Waterworks Power Plant Practice; the Costs of Alternative Steam, Diesel and Electrically Operated Machinery,

T. P. Wakeford.

Outlines kinds of machinery available; capital charges, cost of plant; means of calculating running costs. Estimated annual charges of six stations are set out in tabular form followed by some notes on the results obtained.

Factors Influencing the Design of High Voltage Air-Blast Circuit Breakers,

C. H. Flurscheim and E. L. L'Estrange.

Deals especially with 66-264 kv. Discusses effect of air pressure and storage on breaking capacity rating; limitations and advantages of multi-break interruption, and the special advantages possible with air-blast breakers in connection with automatic high-speed reclosure, insulation, and maintenance requirements.

Application of the Recurrent Surge Oscillograph to the Study of Surge Phenomena in Transformers,

E. L. White and W. Nethercot.

Evaluates recurrent surge oscillograph for transformer investigations. Discusses methods of applying oscillograph and its position with regard to transformer research.

AIEE No. 551—October 1948—Master Test Code for Temperature Measurement Of Electric Apparatus (Published for Trial Use).

British Standards Institution. Standards:

BS 15:1948—Structural Steel.—BS 348: 1948—Compressed Natural Rock Asphalt.—BS 460 & 1205:1948—Cast Iron Rainwater Goods.—BS 1438:1948—Media for Biological Percolating Filters.—BS 1446:1948—Mastic Asphalt (Natural Rock Asphalt Aggregate) for Roads and Footways.—BS 1447:1948—Mastic Asphalt (Limestone Aggregate) for Roads and Footways.

...Codes of Practice:

CP(B)787—Flues for Domestic Appliances Burning Solid Fuel.—CP(B)788—Gas Fired Boilers for Central Heating by Hot Water.—CP(B)790—Staff Location Systems.—CP(B)792—Chemical Extinguishers and other Hand Appliances.

Canadian Standards Association. Specifications:

CSA Z7-1 Series-1948—Specifications for Motion Picture Photography.

PAMPHLETS, ETC.

Beacon Laboratories:

Texas Company, Beacon, New York, 1948.

Climatic Summaries for Selected Meteorological Stations in Canada, Newfoundland and Labrador; Volume II—Humidity, Wind Speed and Direction:

C. C. Boughner and M. K. Thomas. Toronto, Canadian Department of Transport, Meteorological Division, 1948.

Community Planning is Common Sense!

Community Planning Association of Canada, Ottawa, 1948.

St. Lawrence Waterway:

J G. G. Kerry, MEIC. (Reprinted from Shipping Register and Shipbuilder, Sept. 1948).

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARDS INSTITUTION. STANDARDS.

London, the Institution, 1948.

BS 1440:1948 — Endless V-Belt Drives. 3/-.

Deals with endless V-belts having an included angle of 40° and consisting of rubber and textile materials; and with V-groove pulleys, used primarily for power transmission for industrial purposes.

BS 1441:1948 — Galvanized High Tensile Steel Wire for Armouring Submarine Cables. 2/-.

Covers wire in sizes ranging from 0.134 inches to 0.083 inches. Methods of test, test requirements and tolerances are specified and details are provided relating to selection of test samples, retests, galvanizing, size and weight of coils and packing and identification.

BS 1442:1948 — Galvanized Mild Steel Wire for Armouring Cables. *2/–.*

Covers wire ranging in size from 0.400 inches to 0.028 inches, and includes the same information as BS 1441.

BS 1443:1948 — Sizes of X-Ray Film and Intensifying Screens. *2/–.*

Specifies minimum and maximum cutting sizes for X-ray film and intensifying screens, and also provides for a standard minimum size of cassettes; care has been taken to ensure that films and screens of these sizes will be capable of satisfactory use in all existing equipment.

BS 1452:1948 — Grey Iron Castings. *2/6–.*

Covers the requirements of seven grades of iron castings, the grades being numbered in accordance with their tensile strength on a 1.2 inch diameter test bar.

CANADA'S NEW NORTHWEST.

North Pacific Planning Project. Ottawa, King's Printer, 1947. 155 pp., illus., 11¼ x 8½ in , paper, $1.00.

This book is the result of a survey that was begun in co-operation with the United States "to study the possibilities for the economic development of the Region (Canadian North Pacific and Alaska) for the benefit of the two countries . . .". The U.S. withdrew, but studies of the Canadian section have continued. The aim of the book was to set out a broad picture with more particularized discussion of its natural features and resources, its people and their way of life, its climatic conditions, its industry and its channels of transportation, present and potential. Conclusions have been drawn on which are based suggestions for policies.

CANADIAN STANDARDS ASSOCIATION. STANDARDS.

Ottawa, the Association.

C22. 2No. 83-1948.—Canadian Electrical Code—Pt. II—Specification No. 83—Construction and Test of Electrical Metallic Tubing. *50c.*

This specification covers electrical metallic tubing fabricated from mild steel (ferrous), or from some other suitable metal such as aluminum or copper-alloy (non-ferrous). These are minimum requirements. They are based upon records of tests and field experience and are subject to revision as further experience and investigation may show to be necessary or desirable.

CANADIAN TRADE INDEX, 1948.

Canadian Manufacturers' Association, Toronto, 1948. 1122 pp., illus., 10¼ x 6½ in., cloth, $6.00.

The object of the Canadian Trade Index is to provide buyers and sellers of Canada and ninety other countries with a directory of products manufactured in Canada and the names of the firms making them. It includes an alphabetical list of approximately 10,000 manufacturing firms with addresses, branches, brands and trade names, cable addresses and foreign representatives, and a classified list of thousands of industrial products with the names of firms manufacturing them. It also contains a Special Export Section giving basic information in regard to government services, foreign trade controls, methods, financing, price quotations, and British Empire tariff preferences.

CONDENSATION IN AN EXPERIMENTAL PANEL COOLING INSTALLATION.

A. D. Kent. Ottawa, National Research Council, 1948. 14 pp., illus , 10½ x 8¼ in., paper, 25c.

This publication is the result of experiments with a panel cooling system employing wrought iron pipes embedded in a plaster ceiling for the purpose of studying the amount of condensation on the ceiling. Results were obtained which indicate how the amount of condensation can be materially reduced for the same cooling effect.

DICTIONARY OF TERMS USED IN THE PAPER, PRINTING AND ALLIED INDUSTRIES.

Gerard H. Lafontaine. Toronto, Howard Smith Paper Mills, 1948. 110 pp., 11 x 8½ in., paper.

This is a dictionary of the technical language that has developed in connection with the paper and printing industries. French equivalents to the terms are included, with an index to them. The definitions are concise and in many cases contain examples. The book concludes with a short history of papermaking.

FBI REGISTER OF BRITISH MANUFACTURERS, 20th ed., 1947-48.

Iliffe, for the Federation of British Industries, London, 1948. 646 pp., illus., 9½ x 7¼ in., cloth, 30/–.

This is the first post-war edition of this index and lists some 5000 firms and 5250 classes of products and services. One section is devoted to products with their manufacturers; another lists the firms that are members of the FBI, with their addresses and the products manufactured; and a third lists trade names with their identification and a reproduction of trade-marks.

FILING SYSTEMS FOR ENGINEERING OFFICES; A SELECTED LIST OF REFERENCES.

Engineering Societies Library, New York, 1948. 6 pp., 11 x 8½ in., paper, $2.00. (Engineering Societies Library, Bibliography No. 1).

This selected list of references, covering the years 1919 to 1947, has been compiled to aid the engineer who wants information on how to systematize his engineering office files. Forty-one references to books and articles are listed. Information includes author, title, number of pages, publisher (or periodical in which the article appears), and an annotation on the content of each book or article. This is the first of a series of bibliographies on subjects of interest to engineers.

SKID RESISTANCE MEASUREMENTS OF VIRGINIA PAVEMENTS.

T. E. Shelburne and R. L Sheppe. Washington, D.C., Highway Research Board, 1948. 27 pp., illus., 9¾ x 7 in., paper. (U.S. Highway Research Board. Research Report No. 5-B).

The purpose of this study was to obtain data on surface characteristics that could be used as a guide for establishing future design, construction, and maintenance policies. Both good and worn tread synthetic and natural rubber tires were employed. More than 1000 measurements of forward skidding distances on 32 pavement surfaces both in a dry and in a wet condition are reported.

The following notes on new books appear here through the courtesy of The Engineering Societies Library of New York. The books are available at the Institute Library.

ALTERNATING-CURRENT CIRCUIT THEORY.

M. B. Reed. Harper & Brothers, New York, 1948. 603 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $5.50.

This volume contains both fundamentals and applications. Experimental evidence for a theory is followed by a complete mathematical development. Particular attention is paid to the establishment of a working knowledge of reference directions and polarities of currents and voltages. Illustrative examples are used profusely, and there is an extensive list of problems at the end of each chapter.

DESIGN OF MACHINE ELEMENTS.

M. F. Spotts. Prentice-Hall, Inc., New York, 1948. 402 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth. $6.65.

This book opens with a survey of prerequisite theory, and continues with consideration of individual machine elements. Methods based on rational analysis are utilized. Well-known basic theories of design are presented as well as some of the newer methods. Design data usually obtained from catalogs are omitted. The text contains many illustrative examples and solutions, besides a large number of problems to be worked by the student. Each chapter is concluded with a brief bibliography.

DISTILLATION AND RECTIFICATION.

E. Kirschbaum, translated by M. Wulfinghoff. Chemical Publishing Co., Brooklyn and New York, 1948. 426 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $10.00.

Of value to the student and practicing engineer, this book presents both the fundamentals and practical factors. Principles and generally suitable designs have been stressed while numerical and descriptive examples have been referred to specific industries. As far as possible, graphic methods have been used in preference to those requiring involved calculations. Many tables and graphs are included.

ELECTRIC POWER AND GOVERNMENT POLICY, a Survey of the Relations between the Government and the Electric Power Industry.

Twentieth Century Fund, 330 West 42nd St., New York, 1948. 860 pp., charts, maps, tables, 9¼ x 6 in., cloth, $5.00.

This volume is based upon the findings of a comprehensive survey of the relations between government and the electric power industry. The project was designed to give the public an unbiased picture of how these relations have worked out, and develop some constructive plants for a national power policy platform in the interest of the public as a whole.

FIREPROOF CONSTRUCTION.

W. C. Voss. D. Van Nostrand Company, Inc., Toronto, New York, London, 1948. 286 pp., illus., diagrs. charts, tables, 9¼ x 6 in., cloth, $7.50 (in Canada).

Illustrating the accepted fundamental practice in each of the various stages of building construction, this volume supplies a basis for extended discussion and for innovations which do not violate basic principles. Each phase of construction of fire-resistant buildings is considered individually from preliminary work and rock excavation to interior finish and building services. Many diagrams illustrate the text.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

December 20th, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the January meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BRYANT—JAMES LEWTHWAITE, of Montreal, Que. Born at Ocean Falls, B.C., May 24, 1923. Educ.: B.A.Sc., (Mech.), B.C., 1945., Junior, A.S.M.E.; 1944-45-47, (summers), dftsman., jr. mech. engr., Pacific Mills Ltd.; with Ross Engineering of Canada Limited, Montreal, as follows: 1947-48, sales engr., and at present, design engr., high temp. drying & paper mill heating & ventilating, paper mill dept.

References: R. R. Willis, S. McEachern, P. A. Frattinger, J. N. Finlayson, C. W. E. Locke.

COLLIER—ROBERT DOUGLAS, of Baie Comeau, Que. Born at Brooklyn, N.Y., Jan. 19, 1924. Educ.: B.Eng., (Mech.), McGill, 1948; 1942, assi. engr., Canadian International Paper Co.; 1947 to date, asst. engr., and at present, asst. logging engr. on mech. logging operation, planning, administration, supervision and direct cost control, Quebec North Shore Paper Co., Baie Comeau, Que.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

GRADUATE preferably in chemistry or chemical engineering required as Research Officer in Ottawa. Duties mainly preparation of specifications concerned with textiles, leather, rubber and related commodities training in this work will be provided. Salary open. Apply to File No. 1003-V.

CHEMICAL ENGINEER, recent graduate, is needed for production work by chemical manufacturing firm situated in the Province of Quebec. Some experience in chemical production of synthetic resin manufacture would be advantageous. Salary open. Apply to File No. 1064-V.

CIVIL

CIVIL ENGINEER with three or four years experience required by Montreal firm for general duties. Salary open. Apply to File No. 1038-V.

CIVIL ENGINEER required for Consulting Engineers office in Western Canada. Must have extensive experience water, sewer and pavement layouts capable of taking charge office staff and field parties. Partnership offered to right man. Salary open. Apply to File No. 1042-V.

CIVIL ENGINEERING GRADUATES with several years experience in building construction and estimating for permanent senior and junior positions in Winnipeg. Good prospects and pension benefits. Starting salary $250.00 and up per month with yearly increments. Apply to File No. 1061-V.

ELECTRICAL

ELECTRICAL ENGINEER required for Toronto area for engineering and design of power transformers. Salary will be commensurate with ability and experience. Apply to File No. 1035-V.

ELECTRICAL ENGINEER with at least five years experience in Central Station and Substation installation and maintenance required by a Maritime Public Utility. Apply to File No. 1043-V.

MECHANICAL

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 1029-V.

MECHANICAL ENGINEER recent graduate, required for Engineering Department of a farm implement manufacturer in Ontario. Salary open. Apply to File No. 1030-V.

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for ordinary colliery plant, screening equipment, hoists, simple steel structures etc. Salary $240 up depending upon ability. Apply to File No. 1032-V.

MECHANICAL ENGINEER preferably with a few years experience and some knowledge of pulp and paper required for design and layout by a company in New Brunswick. Salary open. Apply to File No. 1036-V.

SENIOR MECHANICAL DRAUGHTSMAN required by a machinery manufacturer in Central Ontario. Salary open. Apply to File No. 1044-V.

MECHANICAL ENGINEER with industrial background required as sales engineer by a consulting firm in Montreal. Salary $300 up according to experience. Apply to File No. 1049-V.

MECHANICAL ENGINEER thoroughly experienced in machine design with some background and experience in the printing trades required as methods engineer by manufacturer in Ontario. Must also have knowledge of production problems. Salary open. Apply to File No. 1050-V.

MECHANICAL ENGINEER with 5 or more years experience in industry, preferably pulp and paper required by manufacturer in Province of Quebec for duties involving organization of improvements, job schedules, machinery maintenance and some mechanical draughting. Salary $300-$350. Apply to File No. 1052-V.

METALLURGICAL

RECENT GRADUATES in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 1029-V.

MISCELLANEOUS

JUNIOR ENGINEER preferably with civil background required for sales and service by a Montreal manufacturer of water-proofing compounds. Salary open. Apply to File No. 1033-V.

SALES ENGINEER under 35 years of age, preferably with engineering and sales experience required in Toronto, to become a specialist in capacitor sales. Salary according to qualifications and experience. Apply to File No. 1035-V.

GRADUATE ENGINEER with engineering and sales experience required as a street lighting specialist in Toronto area. Position involves direct sales engineering with municipalities and utilities also engineering and production problems, directly concerned with the manufacture of street lighting equipment. Age under 35 years. Salary open. Apply to File No. 1035-V.

SALES ENGINEERS one experienced man also two juniors willing to learn required by an electrical and power house equipment manufacturer in Montreal. Salary open. Apply to File No. 1035-V.

CONCRETE DESIGNERS with experience and preferably under 35 years of age required by construction company in Montreal. Salary open. Apply to File No. 1037-V.

MECHANICAL OR ELECTRICAL ENGINEER required as Montreal representative of a Canadian manufacturer with Headquarters in Ontario. Preferably some sales experience. Salary open. Apply to File No. 1039-V.

JUNIOR ENGINEER preferably with a few years experience required by Construction Company in Montreal. Salary open. Apply to File No. 1040-V.

GRADUATE ENGINEER for urban transportation system 25 to 40 years of age with at least five years experience. Hydro-Elect. plant operation experience essential. Steam or diesel electric generating plants desirable. A knowledge of time and motion study and evaluation would be a definite advantage. Salary open. Please send photograph and full particulars of education and experience. Apply to File No. 1041-V.

FOREIGN TRADE REPRESENTATIVE for Middle and Far East for one of Canada's largest chemical manufacturers. Must have extensive experience and knowledge in establishing important contacts in overseas markets. Canadian citizen. Knowledge of French. Salary $8,000 up. Apply to File No. 1046-V.

JUNIOR ENGINEER mechanical or chemical preferably with industrial background required for general duties by a Montreal firm. Salary open. Apply to File No. 1047-V.

GRADUATE ENGINEER required by a consulting engineer in Montreal. Must have experience in boiler plant design and general knowledge of heating. Salary open. Apply to File No. 1048-V.

DRAUGHTSMAN required by industrial organization in Toronto. Must have plant and structural experience. Salary open. Apply to File No. 1051-V.

MECHANICAL OR CIVIL ENGINEER with 3 or more years experience in industry, preferably pulp and paper required by a manufacturer in Province of Quebec for duties involving study and preparation of improvement projects, such as, installation of machinery, piping, etc. Salary $250 to $300. Apply to File No. 1052-V.

MINING OR METALLURGICAL ENGINEER capable of taking charge of a plant control laboratory for plant and control work, required by a manufacturer in the St. Maurice Valley. Age should be between 30 to 40 years. Salary open. Apply to File No. 1054-V.

SALES MANAGER with executive ability and preferably with knowledge of French required by old established construction equipment sales organization. Engineering training and experience essential, applications treated in strictest confidence. Salary open. Apply to File No. 1056-V.

GRADUATE ENGINEERS required for sales staff of a manufacturer in Montreal. Preferably background in mechanical, chemical or mining engineering. Permanent position and good salary for right man. Apply to File No. 1057-V.

DESIGN ENGINEER for concrete machinery and mixers required by well established Ontario manufacturing company. Good opportunity. Good salary. Apply to File No. 1067-V.

ASSSISTANT PLANT ENGINEER required for textile plant in Montreal. Age 27 to 35 and must have maintenance experience. Salary open. Apply to File No. 1068-V.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CHEMICAL

JUNIOR RESEARCH CHEMIST required by a manufacturer in Central Ontario to be trained in Research work. Salary open. Apply to File No. 1017-V.

CIVIL

RECENT GRADUATE, preferably civil, with some construction experience required for construction inspection work by large oil company in the West. Work will involve extensive travel and long periods absent from headquarters. This position provides opportunity for advancement. Salary open. Apply to File No. 1005-V.

CIVIL ENGINEER, recent graduate with up to one year's experience since graduation. Preferably single man. Required by Northern Ontario Paper Mill. Salary around $250. Apply to File No. 4158-V.

CIVIL ENGINEER required for Consulting Engineer and Land Surveyor's office in Western Ontario. Must be able to make urban and rural surveys, layout of sewers, waterworks and pavement, etc. Will applicants please state qualifications and references. Salary open. Apply to File No. 4204-V.

CIVIL ENGINEER with considerable experience in structural steel and reinforced concrete design. Preferably bilingual. Required in Montreal. Must be veteran with overseas service. Applicant should state age, experience and salary expected. Apply to File No. 4205-V.

CIVIL ENGINEER required for South America. Must be single and between the ages of 25-40 years. Duties include: Supervise field survey parties doing triangulation and control work, perform draughting and layout work for construction projects as well as miscellaneous minor and major construction projects. Salary $390. U.S. currency. Apply to File No. 4221-V.

ELECTRICAL

RECENT GRADUATE IN ELECTRICAL ENGINEERING required by an industrial organization in Montreal. Salary open. Apply to File No. 4214-V.

ELECTRICAL ENGINEER required by consulting office. Should have at least seven years experience in layouts for substations, switching and motor distribution. Permanent position and good salary for right man. Location Northern Ontario mining district. Apply to File No. 4220-V.

ELECTRICAL DRAUGHTSMAN required by consulting firm. One capable of making detailed plans and diagrams from preliminary drawings prepared by designers. Work consists of layouts for substations, switching and motor distribution systems. Permanent position. Location Northern Ontario. Salary Open. Apply to File No. 4220-V.

ELECTRICAL DISTRIBUTION SUPERVISOR required for South America. Preferably single and 35 years of age or more, with 10 years industrial experience. Duties include direct supervision of all power transmission and distribution lines, transformer stations, lighting installations, etc. Must have ability to direct and lead other skilled personnel. Salary $450. U.S. currency. Apply to File No. 4221-V.

MECHANICAL

MECHANICAL ENGINEERS with 3 to 5 years experience in mechanical design and general plant engineering, as well as field work required by a firm in Quebec. Salary open. Apply to File No. 1001-V.

MECHANICAL ENGINEER required as assistant superintendent for small establishment employing 60 men. Must have complete knowledge of machine shop methods in precision work capable of making accurate estimates machines' times preparatory to bidding. Salary open. Apply to File No. 1002-V.

MECHANICAL ENGINEER for design and development work in large Montreal food industry. Must have 5 to 10 years experience including some structural work. State age and full experience. Salary open. Apply to File No. 1008-V.

MECHANICAL ENGINEER required by a large industrial concern in the Province of Quebec. Good chances for advancement. Salary open. Apply to File No. 1014-V.

MECHANICAL ENGINEER required by large indsutrial concern in Montreal for the design of major electrical products. Salary according to qualifications. Apply to File No. 1016-V.

SENIOR MECHANICAL DRAUGHTSMAN for work in Ottawa. Ten years experience required in simple design layout and detail drawings for steam power plants, steam and hot water heating, ventilation and air conditioning. Four year contract if suitable. Reply in confidence, outlining experience and stating salary expected. Apply to File No. 1045-V.

MECHANICAL ENGINEER, recent graduate, required for manufacturing and related duties with well established reputable paper company. Salary open. Apply to File No. 4172-V.

MECHANICAL ENGINEER with about five years experience in the design of tractors and related accessories required as Automotive Engineer by one of Canada's leading manufacturers of heavy mechanical equipment. Salary open. Apply to File No. 4206-V.

MECHANICAL ENGINEER with at least ten years experience in general mechanical design in heavy engineering required by a large manufacturer in Montreal. Salary open. Apply to File No. 4206-V.

MECHANICAL ENGINEER with a minimum of five years experience in the design of hydraulic turbines, penstocks, surge tanks and associated hydraulic equipment required by well established firm in Montreal. Salary open. Apply to File No. 4206-V.

JUNIOR MECHANICAL ENGINEER required by Canadian manufacturer in Toronto for general duties. Must be highly competent. Salary open. Apply to File No. 4219-V.

SENIOR MECHANICAL ENGINEER required in Toronto by a Canadian manufacturer. Must have at least twenty years experience and would be responsible for all mechanical work in General Engineering Division. Salary open. Apply to File No. 4219-V.

METALLURGICAL

PHYSICAL METALLURGIST required by Ontario Research Foundation. Should be University graduate with from 3 to 5 years practical experience and should preferably have had some experience in electrolytic refining of metals. Salary commensurate with experience. Apply to File No. 1013-V.

METALLURGICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

MINING

MINING ENGINEERS for design and layout work also some field work required by firm in Province of Quebec. Salary open. Apply to File No. 1001-V.

MISCELLANEOUS

SALES ENGINEER required by well-known manufacture's representative, long established, handling electrical and engineering equipment including power and lighting transformers, to take charge of Montreal office. Bilingual preferred. Salary in accordance with experience. Apply to File No. 1006-V.

HEATING AND VENTILATING ENGINEER, graduate, required for Montreal Head Office of a Canadian Company for design, specification, and layout of air conditioning, ventilating, fan and duct work for industrial processes, factories, offices, dust removal collecting systems, etc. Supervision of field installations, testing, and making estimates. At least five years experience with the above. Must be familiar with all kinds of heating systems, relative apparatus and equipment and with sheet metal air duct work. Apply to File No. 1015-V.

SALES ENGINEER required by Company manufacturing electrical switchgear, to represent them in Alberta and Sask. Salary and commission. A man with an aggressive personality and experience in this line of product can assure himself of a good income. Apply to File No. 1018-V.

SALES ENGINEER, recent graduate, mechanical background, required by Canadian manufacturer. Must be free to travel. Location Ontario. Salary $235 to $250. Apply to File No. 1019-V.

GRADUATE ENGINEER, preferably mechanical or chemical, required for sales engineering in the Toronto area. Should have some experience in sales and maintenance engineering. Salary open. Apply to File No. 1020-V.

MECHANICAL OR ELECTRICAL ENGINEER age about 35 years with experience in building construction and machinery, maintenance and repair, capable of taking over the engineering and maintenance service in a large textile mill in Province of Quebec. Salary open. Apply to File No. 1021-V.

SENIOR INDUSTRIAL ENGINEER required by firm in Province of Quebec. Duties include: Wage incentives, method studies, cost reduction etc. Should be graduate in mining or mechanical engineering. Salary open. Apply to File No. 1023-V.

GRADUATE ENGINEER mechanical or electrical background required to set up and organize a new department for a Canadian manufacturer. Must have plant and production experience. Preferably under 35 years. Salary open. Apply to File No. 1025-V.

FORESTRY ENGINEERS, recent graduates also class of 1949 required for extensive logging operations in Province of Quebec. Preferably but not necessarily bilingual. Current salaries paid. Apply to File No. 1026-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 1027-V.

GRADUATE ENGINEERS with mechanical and light structural experience, applicable to designing and detailing of conveyors, who are interested in establishing themselves with a well established growing concern to learn business in preparation for future advancement. Situated near Toronto. Salary open. Apply to File No. 1028-V.

GRADUATE ENGINEER required by Pulp and Paper Mill in Province of Quebec. Must have extensive experience in general maintenance, design and development of pulp and paper mill equipment. Excellent future advancement. Salary $6,000 to $9,000, depending on qualifications. Apply to File No. 4161-V.

STRUCTURAL DRAUGHTSMEN required by Alberta firm. One able to check all classes of structures and tanks. Another able to detail all types of structures. A third able to detail light structures and general handling machinery. Must be experienced. Salary open. Apply to File No. 4167-V.

SALES ENGINEERS, one for Ontario and one for Quebec, required by tool and quality steel Branch Sales Office. Applicant should have some metallurgical training, some experience in tool and die manufacture, good personality and should own car. Salary open. Apply to File No. 4170-V.

MECHANICAL OR ELECTRICAL ENGINEER, bilingual, experienced in standard investigations and observations. Time-study training not necessary, required by Montreal firm. Salary open. Apply to File No. 4174-V.

GRADUATE ENGINEER required by an oil company in the Maritimes, must have sufficient experience in the oil business and the educational qualifications to enable him to determine the specifications of oils required for various industrial machinery. Salary open. Apply to File No. 4178-V.

CONSTRUCTION ENGINEER capable of supervising sundry engineering jobs and pipelines for oil company in the Maritimes. Salary open. Apply to File No. 4178-V.

PLANT MAINTENANCE ENGINEER, mechanical background, extensive experience in pulp and paper preferbly kraft. Required to take charge of kraft mill maintenance in province of Quebec. Executive ability. Salary open. Apply to File No. 4179-V.

GRADUATE ENGINEER required for veneer and plywood plant in the Maritimes. Must be fully qualified to assume responsibility for the management, production and general supervision of the plant. Salary open. Apply to File No. 4180-V.

MAINTENANCE MANAGER required for large hospital in the Maritimes for maintenance and operation of power plant, buildings and equipment. Salary open. Apply to File No. 4186-V.

INDUSTRIAL ENGINEERS, with production experience required by a firm of industrial consultants in Montreal. Preferably with experience in time study, cost control, etc. Salary $400. up according to qualifications. Apply to File No. 4193-V.

RECENT GRADUATE required by a large National Organization. Must have the following qualifications: Good appearance, personality, leadership and initiative. Salary $2,400. Apply to File No. 4194-V.

SALES ENGINEER, mechanical background, must be thoroughly experienced and capable of developing and maintaining connections of old established firm in road builders, contractors and industrial machinery equipment. Must possess executive ability and have command of the French language. Salary open. Apply to File No. 4203-V.

MECHANICAL OR CIVIL ENGINEER with four to five years experience in stress analysis of mechanical and structural equipment required by a large manufacturer in Montreal. Salary open Apply to File No. 4206-V.

INSTRUCTORS AND DEMONSTRATORS required by a Canadian University for session beginning September 20th, 1948, particularly in Electrical Engineering and in Engineering Problems and Drawing. Salary open. Apply to File No. 4209-V.

SENIOR STAFF MEMBER required by Canadian University. Must have degree and industrial experience to teach Fluid Mechanics, Internal Combustion Engines, Refrigeration, Heating and Ventilation, all at IV year level. Salary open. Apply to File No. 4210-V.

VILLAGE ENGINEER required by Village of Crystal Beach, Ontario. Applicants state qualifications and salary expected. Apply to File No. 4215-V.

GRADUATE ENGINEER with broad experience is required by a manufacturer in Toronto. Must have experience in the design of small and large steam boilers together with their associate equipment, plate work and pressure vessel experience are essentials. Salary open. Apply to File No. 4219-V.

Situations Wanted

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.) Manitoba 1943. Age, 27. Married. Electrical experience with R. C. Signals and 2½ years general electrical experience in industry. Sales training. Presently employed but desires position offering wider scope and opportunity. Preferably Montreal area. Apply to File No. 925-W.

CIVIL AND MECHANICAL ENGINEER, M.E.I.C. Age 42, B.Sc. Civil Graduate work in industrial engineering at McGill University. Seventeen years experience in following field: Manufacture of welding rod and hard-facing alloys, installation of incentive bonus systems. Production planning on the manufacture of shells and shell parts. Design and construction of explosive proving equipment. Superintendent during construction of shell filling plants. Other experience covering oil refining, contracting, and installation of pulp and paper mill equipment. Interested in position with responsible firm or partnership with consultant. Home in Montreal area. Apply to File No. 981-W.

STRUCTURAL ENGINEER, M.E.I.C., P. Eng., experienced in design work and preparation of drawings for wood, structural steel, and reinforced concrete structures. Interested in position or partnership with consulting engineering firm in Toronto, Hamilton or other city in the interlake region, or Vancouver. Apply to File No. 1031-W.

ENGINEER, M.E.I.C. Graduate Civil and Electrical. Age 40. Single. Experience covers engineering and building construction and maintenance, works maintenance, general and heavy construction machinery sales and service, shop management. Past seven years in executive and administrative capacity. Seek wider opportunities or position leading to same in business, engineering, or business engineering. Free to travel, any location including foreign, available one month notice. Apply to File No. 1266-W.

GRADUATE ELECTRICAL ENGINEER, M.E.I.C., age 31, with seven years experience in electronics and radio, including radar and microwave techniques and three years experience in industrial and utility engineering and management, desires permanent, responsible position Montreal, Ottawa, Toronto region preferred. Apply to File No. 1689-W.

CHEMICAL ENGINEER, M.E.I.C., Graduate of McGill, age 33, married, bilingual, presently located in Montreal, experienced in production and process control of dairy equipment, aluminum plant pot-rooms, gas scrubbing plant. Last three years in charge of lubricant and fuel oil sales in marketing organization of major oil company. Desires responsible position with well established firm leading to management. Available in November, 1948. Apply to File No. 1932-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. Que., has structural, mechanical, chemical and mining experience. Qualifications merit consideration for responsible position, contract work on design, associate with consulting engineer. Location is Montreal but would locate elsewhere. Interests are structural design, mechanical trades for buildings, power development, steam plant, process plant design, machine and tool design, pulp and paper plant engineering and engineering research. Would consider position as resident engineer, or municipal engineer. Apply to File No. 1935-W.

INDUSTRIAL ENGINEER, M.E.I.C., age 34. Five years practical experience in Plant production and efficiency. Desires part time employment, Montreal area. Apply to File No. 2158-W.

EXECUTIVE ASSISTANT ENGINEER, M.E.I.C. Background of engineering, production, business organization, cost control, and management. Age 37, married, and preference for permanent association with enterprize in Montreal area. Apply to File No. 2228-W.

MECHANICAL ENGINEER, Jr.E.I.C., is interested in short term projects, duration one month or more. Location anywhere. Production works. Incentives, redesign, surveys, layouts, job evaluation, methods and materials handling. Salary desired $500 a month. Apply to File No. 2338-W.

CIVIL ENGINEER, Jr.E.I.C., McGill, '45, married, with experience in surveying & construction. Presently employed with small construction concern in the preparation of estimates, records & cost analyses. Experienced in writing contracts and specifications. Bilingual. Seeking responsible position in Montreal or Ottawa Areas. Apply to File No. 2405-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., McGill '46, age 24, single. Presently employed as a machinist with a large concern. Employment in the past includes positions in tool design, air conditioning and methods engineering. Seeks responsible position with firm in production or shop management. Available on short notice. Apply to File No. 2707-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng., McGill 1943, (Honours) P.Eng. Quebec, desires position in Montreal or Ontario. Willing to travel. Interested in commercial aspects and sales engineering. Apply to File No. 2727-W.

MECHANICAL ENGINEER, Jr.E.I.C., Sask. '46, P.Eng., Ont. 23, married. Experience primarily in Pulp and Paper industry in maintenance engineering, layouts and small construction jobs. Earnestly desires to enter industrial engineering field either with Consulting Engineer of Industrial Methods or Production Department. Location immaterial, available experience most important. Available on one month's notice. Apply to File No. 2795-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng., Graduate '44, age 27, single. Presently employed near Montreal, 8 years of Engineering experience, machine tool engineering on Batch Production. Fabrication and assembly methods. Production supervision, research, methods improvement in power transmission equipment. Layout estimating and installation of power apparatus and auxiliaries. Am seeking more exacting and progressive position with expanding organization located anywhere. Apply to File No. 2876-W.

ENGINEER, M.E.I.C., P.E., Queen's '37, varied expierence in Mining and Industrial work; 4½ years with R.C.A.F. as engineer officer. Desires position with progressive firm offering responsibility and opportunity. Interested particularly in mining, manufacturing and processing of chemicals and industrial minerals. Location in B.C. or Alberta preferably. Apply to File No. 2892-W.

MECHANICAL & INDUSTRIAL ENGINEER, Jr.E.I.C., McGill '44, 7 years industrial experience. Welding application and metallurgy, production supervision, production specifications, purchasing, wage incentives, time study, estimating, costing, design. Available 4 weeks notice. Apply to File No. 2920-W.

MECHANICAL AND INDUSTRIAL ENGINEER, M.E.I.C., Ph.D. (Engineering, London), A.M.I.Mech.E., P.Eng., age 36, eleven years diversified industrial experience, desires position with duties involving: methods studies, research, development, engineering economics, management techniques, advisory service to the Board of Directors and similar. Apply to File No. 2929-W.

CHEMICAL, S.E.I.C., B.A.Sc., Toronto, '46, ex-Signal Corps, age 24. Reliable, diligent, conscientious, aggressive, bilingual. Experience in the rubber, distilling, and heavy chemical fields; in such phases as process and product control, design and engineering and industrial research. Presently employed but seeks an opening with a progressive company wherein he will have more scope in engineering work. Apply to File No. 2936-W.

CHEMICAL ENGINEER, M.E.I.C., P.Eng., with considerable mechanical experience in plant construction, piping layouts and welding, 14 years industrial practice on positions of responsibility, desire a change of employment preferably in Montreal area. Bilingual. Apply to File No. 2940-W.

GRADUATE ENGINEER, S.E.I.C., Man. '47. Presently engaged in plant layout and field supervision. Experienced in mechanical and electrical construction and maintenance. Responsible position desired in business and production engineering in progressive firm. Apply to File No. 2975-W.

CIVIL ENGINEER, M.E.I.C., B.A. Sc., P.Eng., (Ont.). Age 44. Single. Past experience includes administrative, executive and sales engineering in metal products, building materials and sub-contract work in construction industry. Also held responsible position in personnel administration. Desires permanent position requiring initiative with good future prospects. Apply to File No. 2983-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng. (Quebec). 15 years of shop practice in maintenance and locomotive repair; 5 years machinery design, including welded vessels, process piping and pulp mill layout. Seeking responsible position, preferably in Montreal area. Available on short notice. Apply to File No. 3045-W.

SENIOR METALLURGIST, M.E.I.C., Graduate, age 36. Fifteen years diversified experience in heavy steel mills, production, research and quality control. Practical experience of departmental management. Desires supervisory position of responsibility, preferably with progressive firm; married, two children. Apply to File No. 3046-W.

PART TIME WORK: Graduate Chemical Engineer, B.Sc. (Chem. Eng.) Jr.E.I.C., M.C.I.C., now doing graduate work in Montreal. In Royal Canadian Engineers since graduation with experience in legal investigations, stores and works. Desirous of obtaining part time work conducting Technical literary research or other technical work within limitations. Suggest could be useful to small out of town firm desiring advantages of Montreal libraries and Montreal representative. Apply to File No. 3049-W.

GRADUATE ELECTRICAL ENGINEER, M.E.I.C., P.Eng., Alberta, B.Sc. (Honors) Alberta, M.A.Sc. at Toronto. Married, age 25, 3 years experience in electric power utilization, some generation and distribution; 2 years as officer in electrical branch, R.C.N.V.R. supervision of electrical installations by civilians electricians. Particularly interested in permanent position in Western Canada. Available on one month notice. Apply to File No. 3050-W.

SALES ENGINEER, M.E.I.C., P.Eng., N.S. and P.Q., B.Sc., married, age 44, 7 yrs. railway construction. 8 yrs. sales manager large gas and electric utility, 5 yrs. R.C.N.V.R., 5 yrs. naval architect. Desirous of moving to South America, wishes position as sales representative preferably with manufacturer of marine equipment. Apply to File No. 3057-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng.Q., G.I.Mech.E.; A.M.I.Loco.E. (Great Britain). Aged 30. Married. 6 years Locomotive design and Construction, machine shop production and assembly. 5½ years Engineer Officer, Royal Air Force: rank Squadron Leader, Chief Technical Officer. Employed 18 months in Province of Quebec. Desires change to position with more responsibility and opportunity for advancement. Preferably Southern Ontario or Western Canada. Apply to File No. 3059-W.

MECHANICAL ENGINEER, S.E.I.C., B.A.Sc., Toronto, age 26, single, experience in operation planning and detailing, also sales. Presently employed with Importers as Correspondent and Interpreter. Languages: English and German perfect; French reading knowledge only. Desires employment as industrial engineer, preferably in Toronto area. Apply to File No. 3065-W.

SALES ENGINEER, S.E.I.C. Recent graduate in Mech. Eng., N.S.T.C. At present very successful N.S. Representative of Non-Engineering Organization, also desires to represent Engineering firm as well, part time or full time. Apply to File No. 3068-W.

MECHANICAL ENGINEER, A.M.I.Mech.E., P.Eng.Que., Graduate London 1935; age 37, married. 10 years experience in design, testing and installation supervision of all classes of I.C. engines, supercharging, steam machinery and plant layout in the U.K. 3 years technical executive and administrative experience in policy and production with responsibility of Government level. Trilingual, English, German, Russian. Desires responsible position covering design, administrative or sales with progressive and reliable employers, anywhere in Canada. At present resident in Montreal. Apply to File No. 3069-W.

PART TIME WORK, 3rd Year Electrical Engineer, McGill S.E.I.C. Anxious to obtain part-time employment, preferably in electrical field. Have considerable free time available. Summer experience in textile plant also telegraph department of railroad company. Apply to File No. 3075-W.

SENIOR MECHANICAL ENGINEER, M.E.I.C., B.Eng., McGill '34, desires responsible position with a future. Presently employed with firm of chemical consulting engineers. Previous experience includes several years in charge of airplane design, planning, cost estimating and construction. Accustomed to directing technical staff and shop operations. Apply to File No. 1151-W.

Building Research

Engineers and Architects interested in the application of research to building and associated engineering problems are invited to enquire about employment possibilities with the newly formed Division of Building Research of the National Research Council. An enquiring mind is an essential; experience in building work in Canada is really necessary; bilingualism would be helpful. Salaries depend upon training and experience; opportunities for useful work are unlimited. Enquiries should be addressed to the Director, Division of Building Research, National Research Council, Ottawa.

Engineer

who is interested in hydro-electric investigations and who can carry out current metering and determination of river discharge, install and maintain automatic water level gauges and prepare reports.

•

Assignment in Tropics — three year contract.

•

Apply to File No. 3882-V.

Mechanical Engineer REQUIRED

•

Two or Three Years Experience in Chemical or Allied Industries Essential
Apply in writing giving:
Education, Experience, References, Salary Expected and Photo
to

DOW CHEMICAL OF CANADA LIMITED
P.O. Box "F",
Sarnia, Ontario

CIVIL ENGINEER

•

To act as assistant to Senior Officer of a well-established General Contracting firm in Montreal.

Applicant should have about five years experience and have some knowledge of all phases of building construction.

This is a good opportunity for a person with proper background and training.

Apply
File No. 1038-V

Senior Time Study Men

Must be competent in methods improvement, and have experience in developing standard data on machine tool and other operations. Reply, stating age, experience in detail, present and past employment, references, marital status and salary expected to

Windsor, Ontario.

Business & Industrial Briefs

A Digest of Information received by The Editor

New Equipment and Developments

Power Survey and Equipment Limited is the name of a newly incorporated firm which is located at 852 Notre Dame St. West., Montreal. The Company will specialize in electrical tests in industry, municipalities and among other important power consumers by means of graphic wattmeters, voltmeters, ammeters, power factor meters and other recording instruments. They are in the process of publishing a booklet describing their method of eliminating costly power peaks without interfering with the plant's normal operations. They also handle a complete line of peak alarm systems and other equipment including dry type transformers insulated with the recently developed Johns-Manville "Quinterra" heatproof material. A. Dugas, M.E.I.C., is the president.

•

On December 1st work will begin on the breaking up of the former U.S.S. Aircraft carrier "Sable". The scrapping of this vessel will be carried out in the dismantling basin of the Steel Company of Canada, Hamilton, Ontario. It is anticipated that 5000 odd tons of scrap steel will be recovered from her hull and decks. The vessel, which was formerly on the Great Lakes, was towed to Hamilton. Owing to the breadth of the ship it was necessary to shear 16 feet from each side to get her through the canal locks. This work was accomplished by means of oxy-acetylene cutting machines and hand torches.

•

Peacock Brothers Limited, P.O. Box 6070, Montreal, offers complete information on Jerguson Gauges for which they are Canadian representatives.

A recent addition to this well-known line of gauges is a new large chamber gauge which, it is claimed, "gives an accuracy of level reading never before possible". It is intended for use in gauging liquids that boil, where the liquid fluctuates rapidly in the glass.

•

R. G. LeTourneau Inc., Peoria, Illinois, states that they have developed a new type of snow plow for use with their "Model C Tournadozer". Some of the principal specifications of the snow plow are—width at cutting edges of moldboard 12 ft. 3 in.; size of cutting edges (two) ½ in. x 10 in. x 9 ft. 3 in.; width at top of moldboard 13 ft. 7½ in.; height at front of "V" 4 ft. 7½ in.; height at top of moldboard 6 ft. 4⅝ in.; thickness of moldboard 3/16 in.; shoes (three) 8 in. by 14 in.; height moldboard can be raised 5 ft. 6 in.; weight (with Tournadozer) 32,200 lbs.

•

A new design of a power industrial truck with platform 12 feet long and a very low-lift for its capacity is announced by Elwell-Parker Electric Co., Cleveland, Ohio. Complete details may be obtained from the manufacturer.

•

Titanium which combines lightness with strength, is being produced at the Dominion Magnesium Company's Haley plant.

The Company claims that it has developed a process superior to and less expensive than any method used in the United States for the production of this new metal. Company officials are of the opinion that they will eventually be able to produce titanium at a price of $1.50 per pound on quantity production —purity 99.5 per cent plus. In the U.S. the currently offered price of the metal is $5.00 per pound in lots of 100 pounds or more. In describing the operation at Haley the Company emphasizes that the plant at the moment is on pilot scale and that production to full scale proportions can be accomplished in a matter of weeks.

•

The Diamond Core Drill Manufacturers Association, 90 West Street, New York 6, N.Y., has approved and adopted standards for diamond bit and reaming shell dimensions. Details of these standards may be obtained from C. C. Rohrbach, secretary of the Association.

•

Dominion Engineering Works Limited will produce 1000 hp. diesel engines for the diesel-electric locomotives which are being manufactured by the Montreal Locomotive Works. Operations will commence early in 1949. It is estimated that the necessary re-tooling and relocation of plant facilities will cost the Company approximately $750,000.

•

The Canadian Electrical Manufacturers Association, 126 Davenport Road, Toronto 5, reports that considerable progress is being made with respect to the standardization of transformers. Investigations on the standardization of transformer bushings up to and including 69 kv. have been completed and considerable progress has been made with respect to the proposed CEMA specification for three-phase distribution transformers and on the proposed CEMA specification for dry type transformers. The Association's specification for single-phase rural transformers was approved by the Codes and Standards Committee for forwarding to the Canadian Standards Association. Many other important items are under discussion.

•

The use of inert-arc welding is a new development in Canada's growing aluminum fabrication industry.

•

John R. Pheazey, works director of Standard Telephones and Cables, large British manufacturers of telephone equipment visited the Shearer Street, Montreal, and Lachine plants of the Northern Electric Company a few weeks ago. He was accompanied by G. K. Reynolds, superintendent of Northern Electric Lachine Wire and Cable plant and by W. H. Eastlake, manager of the wire and cable division. Other British and Canadian officials were on the tour.

•

What is claimed to be the most modern chemical plant of its type in the world has just been officially opened by Canadian Industries Limited at Hamilton, Ontario. It is a sulphuric acid processing unit of which the construction cost was in excess of one and a quarter million dollars. The new plant has been erected in the Company's present premises on East Burlington Street to replace older units. The plant has been designed to produce 250 tons of acid daily and is expected to increase Canada's annual sulphuric acid production about 30,000 tons to 80,000 tons. Present output of the older units is 50,000 tons annually.

Construction work was carried out by the Pigott Construction Company of Hamilton and supervised by I. R. Tait, M.E.I.C., chief engineer of the company.

Announcement

Commencing with the January 1949 issue of *The Journal* illustrations will be used in Business and Industrial Briefs. For details regarding illustration sizes please communicate with the editor. If engravings are made by *The Journal* these will be charged at cost to the company or individual concerned.

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

Baldwin Locomotive Works, Philadelphia 42, P.A. offers Bulletin 291, "The ABC-C-C of Simulated Service Testing." It features simple cartoon sketches to emphasize the importance of the effect of dynamic and cyclic stresses on many machine parts and structural members.

•

Bulletin 4340A, a C.G.E. publication which may be obtained from any C.G.E. branch, describes the application and uses of "Glyptal" Cement a C.G.E. product. This general purpose cement is intended for use with wood, glass, china, metals, paper, leather, fabrics, plastics, etc.

•

A new model of the "Audigage" Thickness Detector has been announced by Branson Instruments, Inc., of Danbury, Conn. This instrument is intended for use in taking non-destructive thickness measurements of steel, copper, aluminum, glass, unfilled plastics and other materials *from one side*. Typical applications include tanks, pipes, ship hulls, boilers, pressure vessels and sheetmetals. Copies of the bulletin and further information with respect to the new detector may be obtained from Electrodesign, 445 St. Peter Street, Montreal, Que.

•

The Canadian Machine Tool Builders' Association, Room 1405, 320 Bay Street, Toronto 1, Ont., has prepared a bulletin of machine tools produced in Canada. Copies may be obtained on application to the Association.

•

The Canadian Fairbanks-Morse Co Ltd., 980 St. Antoine Street, Montreal 3, Que., offers Bulletin G-181 issued by the American Brass Company of Waterbury, Connecticut. The bulletin features flexible metal hose and tubing for use in various types of industry.

•

The Canadian General Electric Co. Ltd., has recently published an illustrated pamphlet on its Standard Protected-Type Induction Motor. Requests for the pamphlet—4067D should be addressed to your nearest C.G.E. office.

•

Alpha Metals Inc., 363 Hudson Ave., Brooklyn 1, N.Y., has issued a condensed catalogue of its products. A feature of this four page publication is a comprehensive solder selection guide which lists the sixteen metals that are most frequently soldered. Ask for catalogue No. 201.

•

Crane Limited, P.O. Box 70, Montreal has issued a new forty page hospital catalogue. It is a handy and very complete reference guide to the correct selection of hospital fixtures. Ask for catalogue AdM-8010.

R. G. LeTourneau Inc., Peoria, Ill., has issued two new broadsides. TP-163 lists the complete specifications of the "B. Tournapull" and TD-119 lists the features of size, power and speed available in the "B. Tournadozer".

•

Standard Tube Company Ltd., head office Woodstock, Ont., offers literature describing the "Stan-Steel" Nesting Chairs and Tables. These chairs are particularly suitable for conference rooms, assembly rooms, cafeterias, etc.

•

Atlas Asbestos Co. Ltd., 110 McGill Street, Montreal and also of Toronto, Winnipeg and Vancouver offer a pocket size 20 page booklet in which are described the Company's asbestos gaskets. Ask for "New Gasket Booklet".

•

Orr and Sembower Inc. of Reading, Pennsylvania, has prepared a bulletin, No. 1216, in which is described the "Powermaster" multiple-fuel steam generator. This generator burns light oil, heavy oil or gas and it is a recent development of the company. Complete details are contained in the bulletin.

•

The American Gas Accumulator Company, 1027 Newark Ave., Elizabeth 3, New Jersey, has available copies of bulletin R-1 which describes "Stimsonite" all-plastic reflectors. These reflectors are claimed to be of particular use for railroad and highway signs.

•

Canadian General Electric Co. Ltd. describes, in bulletin No. 4429, which may be obtained from any C.G.E. office, EMT electrical metal tubing. This lightweight, threadless raceway has been designed to meet modern building needs.

•

The Dominion Engineering Co. Ltd., P.O. Box 220, Montreal, will be pleased to add the names of *Journal* readers to their mailing list for the "Dominion Engineer" the Company magazine. The October issue features the mechanical parts of electric mine hoists and the November issue part three of the description of the Company's centrifugal pumps.

•

A 20 page well illustrated booklet on Thyrite Lightning Arresters has been released by Canadian General Electric Co. The publication should be of particular use to utility engineers. It provides complete operation and installation data for this type of arrester. The number of the bulletin is CGEA-1304H. All branches of the Company have copies.

•

Canadian Allis-Chalmers Ltd., 212 King Street West, Toronto 1, Ont., offers "Plain Facts on the care of Rubber V-Belts". The booklet is pocket size and contains 15 pages.

Wheelco Instruments Company, 847 W. Harrison St., Chicago 7, Illinois, offers a 40 page bulletin in which are described the company's thermocouple units. Some excellent technical data and tabulated material are contained in the publication. Ask for bulletin T/C 7.

•

Canadian Liquid Air Company Ltd., 1111 Beaver Hall Hill, Mtl., has issued a brochure on "Premier Welders". Requests for copies should be addressed to the Company's Montreal office.

•

Cobra (Wood Treatment) Ltd. of 84 High Street, Braintree, Essex, England, is now in the process of forming a Canadian Company. Pending completion of arrangements for distribution from Canada the British Company offers copies of the publication "The Cobra Process for the Preservation of Wood Poles".

Appointments and Transfers

F. J. Lockhart has been appointed Toronto district manager for Atlas Steels Limited.

•

John E. Oberholtzer has been appointed deputy minister of industries and labour by the Alberta Provincial Government.

•

W. E. Ross is now assistant to the president of Canadian General Electric Co. Ltd. and A. M. Doyle is manager of the Company's Apparatus Department.

•

F. A. Lucas was recently elected to the board of directors of Peacock Brothers Ltd. Mr. Lucas joined the Company in 1926 and has been district manager for Southern Ontario for the past fifteen years, which post he will continue to hold.

•

George N. Sieger is president, for the year 1948-49, of the American Welding Society. Mr. Sieger is an authority on the principles and practice of resistance welding. He is a past president of the Resistance Welder Manufacturers Association.

•

W. M. V. Ash has been appointed president of the Shell Oil Company of Canada Limited. Formerly general manager of United British Oilfields, in Trinidad, B.W.I., Mr. Ash succeeds P. M. Fowlie, who will undertake new administrative duties for the company in London, England.

•

J. W. Milne has been promoted to the post of assistant manager of Canadian General Electric Company's Apparatus Department.

•

W. H. Meyer is now in the Industrial Heating Section of C.G.E.'s supply department.

DECEMBER 1948

NEW

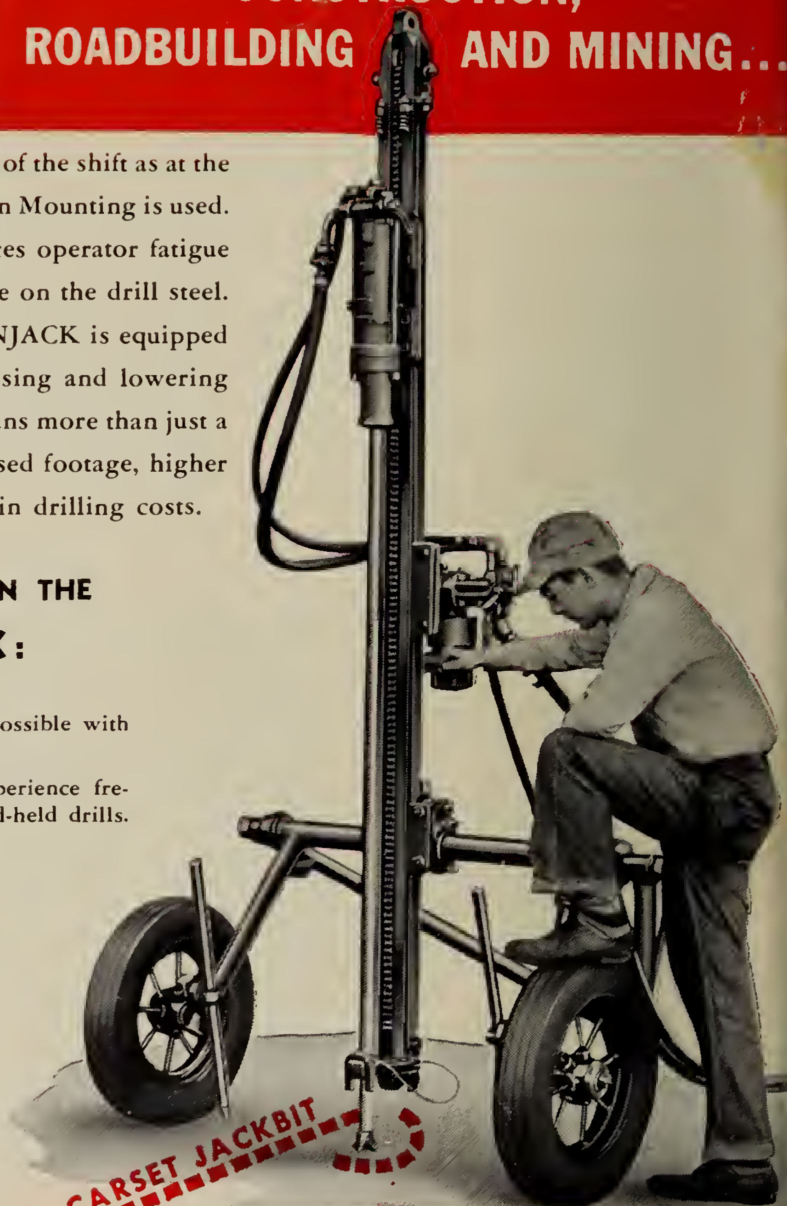
C-I-R WAGONJACK

FOR CUTTING COSTS IN CONSTRUCTION, ROADBUILDING AND MINING...

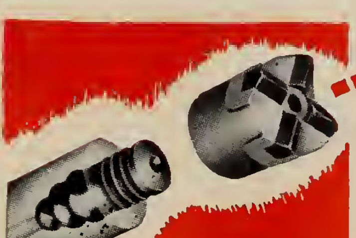
DRILLING is just as fast at the end of the shift as at the beginning when this light Wagon Mounting is used. The elimination of hand holding reduces operator fatigue and ensures continuous correct pressure on the drill steel. A real one-man mounting, the WAGONJACK is equipped with a power-feed arrangement for raising and lowering the frame. The use of this mounting means more than just a saving in manpower — it means increased footage, higher efficiency, and an important reduction in drilling costs.

YOU GET ALL THIS IN THE WAGONJACK:

- Uniform positive feeding pressures not possible with hand-held drills.
- Great savings in air consumption — experience frequently shows double the footage of hand-held drills.
- Long steel changes mean less steel to handle and fewer steels needed on the job.
- A powered steel puller saves many a hole and steel . . . a big help in ravelly or fitchery ground.
- Drill in any direction with equal ease. Toe holes, breast holes, or any variety of setups needed for rough ground are easily available because of the flexibility built into this light wagon mounting. The power arrangement for raising and lowering the frame makes it a truly "one-man mounting".



YES! IT'S THE CARSET JACKBIT



CARSET JACKBITS saved one shaft contractor 18 man-hours per foot of shaft.

Write for Form 4070. Get acquainted with the new Wagonjack.
